## **1. INTRODUCTION**

Leviathan Mine is a former sulfur mine that the State of California acquired in the early 1980s to address water quality problems caused by historic mining. Jurisdiction over Leviathan Mine rests with the State Water Resources Control Board, which, in turn, has delegated jurisdiction over clean up work to the California Regional Water Quality Control Board, Lahontan Region (Water Board). On May 11, 2000, the United States Environmental Protection Agency (USEPA) placed Leviathan Mine on the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) National Priorities List, thus making Leviathan Mine a federal Superfund site.

On July 19, 2000, pursuant to its authority under CERCLA, USEPA issued an Administrative Abatement Action (AAA) to the Water Board and directed the Water Board to implement certain pollution abatement and site characterization activities at Leviathan Mine. With slight modifications, USEPA subsequently reissued the AAA in 2001, 2002, 2003, 2004, and 2005. In its 2005 AAA, USEPA decided to, instead of issuing AAA every year; allow its Remedial Project Manager, for each year that the first phase of Non-Time Critical Removal Action continues, to notify Water Board of the necessity to continue the Work for an additional year. It is expected that USEPA will direct the Water Board to continue work at Leviathan Mine until a final remedy addressing all releases of hazardous substances at Leviathan Mine is implemented.

This Year-End Report for the 2008 Field Season at Leviathan Mine (Year-End Report) has been prepared by the Water Board for the USEPA. This Year-End Report was prepared to comply with Paragraph No. 50 of USEPA's July 14, 2005 Administrative Abatement Action (AAA) which states:

"Within thirty (30) days after the LRWQCB concludes that the seasonal work on the NTCRA has been fully performed, the LRWQCB shall so notify EPA and shall schedule and conduct a pre-certification inspection to be attended by the LRWQCB and EPA. The pre-certification inspection shall be followed by a written report submitted within ninety (90) days of the inspection by the LRWQCB's Project Coordinator certifying that all work to date on the NTCRA has been completed in full satisfaction of the requirements of this Administrative Action."

The pre-certification inspection occurred on October 7, 2008. In a letter dated October 14, 2008, Water Board staff requested, and the USEPA granted in their letter dated November 21, 2008, an extension of the due date for the 2008 Year-End Report until March 7, 2009.

This Year-End Report constitutes the "*written report*" as referenced in Paragraph No. 50 of the AAA, and contains year-end summaries of Water Board field activities performed in 2008. The activities required of the Water Board by the USEPA are described in Paragraph No. 37 of the AAA. These activities consist of:

1. summer treatment of Acid Mine Drainage (AMD) captured year-round in a series of ponds;
2. site maintenance of ponds, drainage and diversion channels, and gates and fences; and

3. site monitoring of water quality, water quantity, and meteorological information.

Water Board staff conducted the above-listed activities in accordance with the *2008 Work Plan for Leviathan Mine, Alpine County, California* (Work Plan) prepared by the Water Board. The Work Plan was transmitted to, and approved by, the USEPA.

This report describes the details of site activities performed in 2008, and is organized into the following sections:

- A background section that describes the site setting and history; collection and storage of AMD; and the treatment process;
- A sludge removal and pond water treatment section describing the removal and disposal of sludge and treatment of AMD in 2008;
- A site monitoring of surface water section; and
- A site maintenance section.

The report summarizes data collected by the Water Board in two appendices. Appendix A summarizes the results of Pond Water Treatment (PWT) monitoring. Appendix B summarizes the results of Surface Water Monitoring (SWM).

## **2. BACKGROUND**

### **2.1 SITE SETTING AND HISTORY**

Leviathan Mine is located on the eastern slope of the Sierra Nevada Mountains in Alpine County, California (Figure 1). The mine is approximately six miles east of Markleeville, California and five miles west of Topaz Lake, Nevada. The Leviathan Mine encompasses thirty-two patented mineral claims and a patented mill site. Based on the Final Title Search and Survey Report conducted by SAIC for the USEPA on January 31, 2000, the State-owned portion of the Leviathan Mine site encompasses 479.928 acres. Mining disturbance is evident on 252.71 acres and, of which, the State own 231.39 acres. The majority of mining disturbance is on state-owned property, with approximately 21 acres of the disturbance found on property owned by the United States Department of Agriculture, Forest Service, Humboldt-Toiyabe National Forest (USFS). The USFS owns the majority of surrounding land, with the exception of ten private parcels along the southern boundary of the mine site.

Leviathan and Aspen Creeks (Figure 2) flow across the mine site and join below the mine. Approximately 1.5 miles downstream of the confluence of Leviathan and Aspen Creeks, Leviathan Creek joins Mountaineer Creek. The combined flow of Leviathan and Mountaineer Creeks forms Bryant Creek. Approximately 3.5 miles downstream of the confluence of Leviathan and Mountaineer Creeks, Bryant Creek flows across the Nevada state line. Approximately 1.8 miles downstream of the Nevada state line, Doud Springs enters Bryant Creek. Just below this confluence, an irrigation ditch seasonally diverts flow from Bryant Creek to the River Ranch property. Approximately 1.5 miles downstream from the irrigation diversion, Bryant Creek joins the East Fork of the Carson River.

Historic mining activities at Leviathan Mine included underground and open pit extraction of sulfur-rich ore. These activities resulted in the exposure of naturally occurring sulfide minerals to air and water. This exposure triggered a series of chemical reactions that caused local groundwater to become acidic and metal-rich. The acidic groundwater discharges from an old mine tunnel as well as seeps at several locations within the Leviathan Mine site. When this AMD enters local surface water bodies, it adversely affects water quality, which in turn affects algae, insect, and fish growth, and damages the in-stream habitat through deposition of metal-rich precipitates.

The Water Board has implemented several projects to abate AMD from entering local surface water bodies. In 1985, the Water Board completed construction of a pollution abatement project at Leviathan Mine to address certain specific problem areas. This project included the construction of AMD storage and evaporation ponds, which are a major component of the Water Board's pond water collection and treatment activities.

## **2.2 AMD Collection and Storage**

The 1985 pollution abatement project included construction of five lined evaporation ponds (Figure 3) to capture and evaporate AMD from remnant underground mine workings. The primary sources of AMD to the pond system are the Adit and the Pit Under-Drain (PUD).

- The Adit is the location where acidic groundwater emanated from a remnant tunnel excavated during underground mining activities in the 1930s. The exact condition of the interior of the tunnel is unknown, but it is likely that portions of the tunnel have collapsed. The approximate location of the tunnel and other site features are shown in Figure 3. As part of the 1985 pollution abatement project, the Water Board Contractor installed an underground drain to collect acidic groundwater emanating from the Adit. The underground drain consists of 12-inch-diameter perforated pipe in a bed of drain rock. The perforated pipe is connected to a non-perforated 12-inch pipe that carries the AMD to a concrete flow control structure (FCS). AMD from the Adit has a pH of less than 3.0 and typically has a discharge rate between 9 and 15 gallons per minute (gpm) with a maximum rate measured to approximately 42 gpm (flow data collected from 1999 to 2008).
- The Water Board contracted Mittry-G.E.B. Inc., and installed the PUD during construction of the 1985 pollution abatement project to dewater saturated soils in the bottom of the open pit prior to backfilling the pit to its current elevation. The PUD consists of approximately 1,500 linear feet of 12-inch-diameter perforated pipe set in a bed of drain rock beneath the pit bottom, buried in pit backfill material. The perforated pipes connect to a non-perforated 18-inch-diameter pipe that conveys the PUD discharge to the FCS. AMD from the PUD has a pH of less than 3.0 and typically has a flow rate between 0.1 and 4 gpm, with rates as high as approximately 38 gpm (flow data collected from 1999 to 2008).
- The five evaporation ponds (Ponds 1, 2 South, 2 North, 3, and 4 on Figure 3) cover a combined surface area of approximately 12.8 acres with a cumulative holding capacity of approximately 16.5 million gallons based on an October 1998

survey conducted by ARCO Environmental Remediation, LLC. AMD from the FCS can be routed directly to Leviathan Creek or to the pond system via a weir gate. When the AMD is directed to the pond system, it can be distributed to any combination of Ponds 1, 2 South, and 2 North via a series of valves, as these ponds are interconnected and are at the same elevation. These three ponds are commonly called the "upper ponds" and have a combined volume of approximately 14 million gallons. Pond 3 receives overflow from the upper ponds via PVC overflow pipes. Overflow from Pond 3 flows in PVC piping and can be directed, via valves, to either the Leviathan Creek or to the Pond 4. Pond 4 overflows directly to the Leviathan Creek via PVC piping.

- Currently, Pond 4 is utilized by Atlantic Richfield (AR) for storage and treatment of other AMD sources. Pond 3 overflow is currently controlled, via valves, in the event of any overflow; the overflow water would be directed to the Leviathan Creek.

The Water Board treats and discharges pond water during the summer months. These activities renew pond storage capacity for the subsequent winter and spring months. The Water Board assembled a treatment system during the 1999 field season on the northeast corner of Pond 1 and tested the process at full-scale during the 1999 and 2000 field seasons. The typical field season at Leviathan Mine runs from mid-June through mid-October. The Water Board has continued to operate the lime treatment system adjacent to Pond 1 during the summer months from 2001 through 2008.

## **2.3 Pond Water Treatment Plant Process Summary**

The Water Board's treatment of AMD contained in the pond system is accomplished through lime neutralization. The neutralization of AMD by the addition of lime has long been accepted as an effective means to raise pH and remove metals in AMD. Lime (calcium hydroxide or  $\text{Ca}[\text{OH}]_2$ ), is mixed into the AMD from the pond system; the addition of lime causes an increase in pH and the precipitation of dissolved constituents, including metals, contained in the AMD. The metals are precipitated out of solution in an earthen clarifier, and the final products are: 1) a nearly metal-free effluent with near neutral pH, and 2) waste sludge.

The PWT Plant (Plant) treats the AMD stored in the three upper ponds. The process has also been referred to as Pond 1 lime treatment because the treatment system is located on the north side of Pond 1. The treatment system draws the AMD from Pond 1 for treatment, thus lowering the water elevation of Pond 1. The lower water level in Pond 1 causes AMD from Pond 2 North and Pond 2 South to flow by gravity to Pond 1 to be treated by the treatment system. The Plant operates optimally in the warm summer months. Cold temperatures encountered in the late summer and early fall appear to cause slow reaction times, and consequently, decreases in treatment rates.

### **3. 2008 SLUDGE REMOVAL AND POND WATER TREATMENT**

#### **3.1 Sludge Removal and Disposal**

Approximately 315 tons of sludge generated during operation of the 2007 PWT effort was removed from the Pit Clarifier by DECON Environmental Services, Inc. of Hayward, California (Decon) in July 2008. The sludge had been previously sampled, analyzed, and characterized in the fall of 2007; the results were reported in the Water Board's 2007 year-end report. The sludge was disposed of in July 2008 at a Class I hazardous waste landfill in Buttonwillow, California. Hazardous waste manifests are available for review at the Water Board's office in South Lake Tahoe, CA.

#### **3.2 2008 Pond Water Treatment Plant Operation**

The Water Board contracted with Decon for Plant operations for the 2008 field season. Decon chose to operate the Plant, with a few exceptions, during daylight hours on weekdays only. This is in contrast to past treatment seasons when the Plant was operated 24 hours per day, 7 days per week. An additional modification made by Decon for 2008 was the delivery of dry lime and make up lime slurry on site to neutralize AMD in the pond system. In past treatment seasons, a 45% lime slurry was delivered to the site and fed directly into the Plant. In 2008, dry lime was delivered to the site in pallets of 50 pound bags. Decon staff mixed a nominal 20% by weight lime slurry (using Leviathan Creek water from upstream of the mine) in a 1000-gallon polyethylene tank during daily operations. The benefits of using dry lime included a substantial reduction in overall lime costs, an approximate 50% reduction in lime deliveries to the site, and a streamlining of the scheduling, handling, and storage of lime. Approximately 10 tons of dry lime remains stored on site following the 2008 treatment season. This lime will facilitate efficient startup of the Plant next year. A summary of the treatment process used in 2008 is described in the following paragraphs; there are minor modifications to the reactor mixing and pH monitoring from the past several years.

A 5-horsepower (hp) electric pump conveyed AMD from Pond 1 to a 10,000-gallon fiberglass Phase 1 reaction tank (R-1). A pH probe installed in R-1 measured pH in R-1 and controlled the amount of the 20% lime slurry added to R-1. A 3-hp mixer mixed AMD and lime slurry in R-1. The lime slurry raised the pH of the AMD from 2.5 to an approximate range of 3.5 to 5.

The partially treated AMD flowed by gravity from R-1 through a two-chambered combination flash/flocculation mix tank (FF-1) and into a Lamella clarifier (CL-1). Two 1.5-inch air diaphragm pumps removed precipitates from the bottom of CL-1. One of the 1.5-inch air diaphragm pumps is used to pump a portion of the precipitates back into the top of R-1. The second 1.5-inch air diaphragm pump is used to pump remaining precipitates from the bottom of CL-1 back into the top of CL-1 in an effort to keep precipitates from settling out and potentially clogging the bottom of CL-1 with solids. In 2008, to increase mixing energies and keep precipitates in suspension, Decon used two mixers in the flash/flocculation tank and added an additional mixer to CL-1.

Supernatant and precipitates from CL-1 flowed by gravity to the Phase 2 reaction tank (a second 10,000-gallon fiberglass tank) referred to as R-2. A pH probe in R-2 measured pH and controlled the amount of lime slurry added to R-2. This is the second of a two-point lime addition process. A 7.5-hp mixer on R-2 mixed the partially treated AMD, precipitates, and lime slurry. In R-2, the lime slurry raised the pH of the partially treated AMD to approximately 8.4, which caused all but trace amounts of remaining metals to precipitate out of solution.

Treated AMD and precipitates then flowed through the Phase 2 flash/flocculation mix tank (FF-2) and into the Phase 2 Lamella clarifier (CL-2). Two 10-hp mud pumps transferred the water/solid mixture from the bottom of CL-2 to the Pit Clarifier. A polyacrylamide polymer solution was injected into the sludge slurry line just upstream of the two 10-hp mud pumps to promote flocculation and settling in the Pit Clarifier. In 2008, Decon installed a pH probe in FF-2. The pH probe controlled an additional lime pump capable of rapidly adding lime slurry to R-2 if the pH in FF-2 dropped below 8.2. This pH probe, controller, and pump combination provided additional reliability as well as a final confirmation pH measurement.

The Pit Clarifier is an earthen reservoir located in the bottom of the Leviathan Mine open pit. The Pit Clarifier has plan dimensions of approximately 150-feet by 150-feet, and includes a gravel/sand covered perforated pipe under-drain. The sludge slurry from CL-2 was pumped to the Pit Clarifier where solids settled out in near-quiescent conditions. The treated water collected from the Pit Clarifier under-drain piping flowed through a weir box, where stage data was recorded and water quality control samples were collected. The weir box has a 90-degree V-notch weir and stage data were recorded at 15-minute intervals by a combination data logger/pressure transducer system. Using a valve on the Pit Clarifier under-drain piping, the controlled release of treated water from the Pit Clarifier occurred only during days Decon was treating water.

Decon began treating AMD contained in the pond system on July 21, 2008. Discharge of treated water from the Pit Clarifier to Leviathan Creek began on July 25, 2008. The treatment plant was shut down on September 17, 2008 after almost all the AMD contained in the upper ponds was treated.

After the pond water was treated and the Plant was shut down on September 17, 2008, treated water continued to be discharged from the Pit Clarifier and the Water Board continued to collect samples of effluent discharging from the Pit Clarifier until October 1, 2008. Effluent flow rates from the Pit Clarifier under-drain dropped to below 5 gpm on October 2, 2008 and effluent sample collection was terminated as per approved 2008 Work Plan. By mid-October 2008, approximately 3.0 million gallons of treated pond water had been discharged from the Pit Clarifier to Leviathan Creek.

The 2008 PWT Plant operation consumed approximately 58 standard tons of dry lime; 2500 pounds of polymer; 2037 gallons of diesel fuel; and 851 gallons of gasoline. The Water Board's treatment effort in 2008 combined with natural evaporation resulted in the upper pond system being essentially dry and leaving the maximum available storage capacity of approximately 14 million gallons.

Sludge generated by the Plant in 2008 is contained in the Pit Clarifier to allow for further dewatering. The Plant operation generated an estimated 550 cubic yards (wet volume) of sludge. Dewatering of the sludge over the winter will increase solids content and reduce both the volume and mass of the sludge. Water Board staff estimates that the 550 cubic yards of wet sludge will result in approximately 300 tons of dry sludge being disposed in 2009.

### 3.3 Pond Water Treatment Monitoring and Sampling

Treatment process monitoring, sampling and analysis were performed in accordance with the Water Board's *Sampling and Analysis Plan for Leviathan Mine Site Pond Water Treatment (May 2008)* (PWT SAP), with a few deviations noted in Section 3.4.4. Effluent samples were collected for comparison with USEPA Discharge Criteria (Table 1). A summary of the monitoring parameters, locations, and frequencies for the 2008 PWT monitoring program is presented in Table 2. Specific details of sample collection and handling are described in the PWT SAP. Both sludge and aqueous samples were analyzed by the Water Board's contracted off-site laboratory, Basic Laboratory, Inc. of Redding, California.

To characterize discharge water quality, Water Board staff collected grab samples of the treated effluent each day the system discharged to Leviathan Creek until the discharge from the weir dropped below 5 gpm as prescribed in the approved 2008 Work Plan. In 2008, Water Board staff collected 43 treated effluent samples and 8 treated effluent duplicate samples between July 24 and October 1. Water Board staff also collected pre-treatment influent samples on a weekly basis; a total of 8 influent samples were collected in 2008. During influent and effluent sample collection activities, Water Board staff monitored and recorded pH and temperature in the field.

A portion of each grab sample was field filtered, preserved with nitric acid, and submitted to the Water Board's contracted off-site laboratory to be analyzed for dissolved: aluminum (Al), arsenic (As), copper (Cu), chromium (Cr), cadmium (Cd), nickel (Ni), iron (Fe), lead (Pb), and zinc (Zn). An unfiltered portion of the daily grab sample was preserved with nitric acid and submitted for Total Recoverable Selenium (Se). Once per week, in addition to the above analyses, Water Board staff submitted samples of influent and treated effluent for sulfate ( $\text{SO}_4$ ), total dissolved solids (TDS), and dissolved: calcium (Ca), cobalt (Co), manganese (Mn), and magnesium (Mg). Sample identification tracking forms and field log notebook are available for review at the Water Board office in South Lake Tahoe, CA.

Analytical and field monitoring results of treated effluent samples and influent samples are summarized in Tables A-1 and A-2 of Appendix A (*Data Summary for 2008 Pond Water Treatment Plant Monitoring*). Table A-3 presents calculated 4-day averages for comparison with USEPA's 4-day average effluent discharge criteria.

To provide "real-time" information on effluent quality and system operation, Plant operators measured the pH and temperature at four mid-process locations (R-1, R-2, FF-2, and influent to Pit Clarifier) and at one effluent location (weir box) approximately every two hours while the system was operating. Operators used these data to moderate lime additions and maintain effluent quality. On a daily basis, Plant operators

also recorded flow rate, pH, and temperature of untreated Plant influent. The data collected by the system operators are summarized in Table A-5 of Appendix A.

Sludge generated during the 2008 treatment effort, and contained in the Pit Clarifier, was sampled in October 2008 for waste characterization and disposal purposes. The sludge was sampled directly from the Pit Clarifier following partial dewatering of sludge. Three sludge samples were collected from three different locations in the Pit Clarifier. Sludge samples were collected from a vertical profile that represented the complete thickness of sludge. Sludge samples were analyzed for comparisons with Total Threshold Limit Concentrations (TTLCs) and Soluble Threshold Limit Concentrations (STLCs) for Title 22 metals, and aluminum and iron. Analytical results for the sludge samples are summarized in Table A-5 of Appendix A.

### **3.4 Sampling Results from Pond Water Treatment Monitoring**

#### **3.4.1 Monitoring Objectives**

The overall objective of the monitoring program for PWT was to collect data to evaluate the effectiveness of the treatment process in terms of effluent and sludge quality.

Specific monitoring objectives are as follows:

- Identify the chemical characteristics of the Plant influent.
- Identify the chemical characteristics of the treated effluent.
- Identify the chemical characteristics of solids generated in the treatment process.
- Monitor the effectiveness in meeting USEPA discharge criteria.
- Monitor field pH at critical points within the treatment system and at the discharge point as a means to monitor Plant effectiveness.

#### **3.4.2 Data Summary**

The results of PWT monitoring are summarized in Tables A-1 through A-9 of Appendix A. Appendix A also includes the PWT Level A/B and field data validation checklists. Basic Laboratory produced laboratory Data Validation Checklists, as described in the *Draft Leviathan Mine Site-Specific Sampling and Analysis Plan, Montgomery Watson Harza, April 2002* (Site-Wide SAP), for all of their laboratory reports. They are not included in this report, but can be reviewed at the Water Board office.

Laboratory analytical results for treated effluent are summarized in Table A-1. These data are collected for comparison with the USEPA Daily Maximum Discharge Criteria, also included in Table A-1. No laboratory confirmed exceedences of the daily maximum discharge criteria concentrations occurred in 2008. Table A-2 summarizes Plant influent sample results.

Table A-3 shows the calculated 4-day averages for the effluent concentrations. Discharge only occurred 5 days per week (rather than 7 days per week as in past

years). Therefore, rolling 4-day averages could not be calculated for all days of discharge. Two series of 4-day average concentrations were calculated for each full treatment week. Data from Monday through Thursday were used to calculate the first series, and data from Tuesday through Friday were used to calculate the second series. Twelve sets of 4-day average concentrations were calculated in 2008. All parameters analyzed in the effluent samples except selenium were well below their respective 4-day average criteria. Total recoverable selenium (Se) slightly exceeded the 4-day average criteria of 0.005 milligrams per liter (mg/L) in 9 of the 12 calculated 4-day averages. However, laboratory Matrix Spike (MS) recoveries for all of these data were outside of acceptable limits due to matrix interference and were qualified by the analytical laboratory. Additional discussion of Se Quality Assurance/Quality Control (QA/QC) findings is presented in 3.4.3.

Results of pH and temperature are included in Table A-1 for data collected by Water Board staff and in Table A-4 for data collected by Plant operators. pH measurements taken by Water Board staff and system operators confirmed that the discharge of treated effluent to Leviathan Creek was within USEPA's discharge criteria for pH of 6.0 to 9.0.

Results of the sludge characterization analyses are presented in Table A-5. The three sludge samples collected from the Pit Clarifier averaged approximately 12.5 percent solids. With the exception of the total concentrations for arsenic, the sludge did not exceed any other STLC or TTLC limits. The total concentrations for arsenic exceeded TTLC in all three samples collected from the Pit Clarifier. The arithmetic average arsenic concentration for the three samples was 614 milligrams per kilogram (mg/kg). The TTLC for arsenic is 500 mg/kg. These results are generally consistent with past sludge generated at the Pond 1 treatment system. In past years, Nickel typically exceeded the STLC, however, in 2008, this did not occur.

A summary of daily discharge flow data is included in Table A-6. Typical treated effluent discharge flow rates during the treatment season were between 50 to 60 gallons per minute. Approximately a total of 3.0 million gallons of treated effluent was discharged to Leviathan Creek in 2008. The stage data which measures the water level above the v-notch of the Pit Clarifier weir was recorded at 15 minutes intervals by a data logger. The stage data is not included in this report due to the large volume of data recorded by the data logger; but it is available for review at the Water Board's South Lake Tahoe office. The stage data collected at the v-notch was later converted into flow rate in "gallons per minute" and is included in Table A-6 of this report.

### **3.4.3 Data Quality Evaluation**

As part of the Site QA/QC process, Water Board staff reviewed the data quality of the PWT laboratory reports. Laboratory-assigned data qualifiers are presented with the PWT data in Tables A-1, A-2, and A-5. Water Board staff's data review included evaluation of sample holding times, an assessment of precision, and an assessment of anomalous data.

In 2008, Water Board staff assigned a data qualifier of "\*" for data that did not meet our field duplicate assessment, and an "A" qualifier for anomalous data. These data are

summarized in Table A-9, and Water Board staff qualifiers are also included in Tables A-1 and A-2.

Water Board staff assessed the data to confirm that holding times were met. No holding times were exceeded for the 51 treated effluent and effluent duplicate samples during the 2008 field season.

As discussed in the Data Summary Section (3.4.2), the laboratory had consistent matrix interferences when trying to quantify Se in the treated effluent samples. It is important to note that the USEPA Discharge Criteria for Se (0.005 mg/L) is close to the laboratory's reporting limit (0.0025 mg/L). All of the 51 Se analyses of the treated effluent samples were qualified by the contract laboratory as having the MS recovery outside of acceptance limits. Water Board staff reviewed the laboratory QA/QC data and noted that all of the Se MS recoveries were biased high. Or, in other words, the laboratory-spiked, treated effluent samples consistently showed significantly more Se than what could have been in the sample. At Water Board staff's request, the laboratory re-analyzed 10 treated effluent samples at twice the dilution and found comparable concentrations to the original analyses. The MS and MS Duplicate (MSD) samples associated with re-analysis both showed recoveries outside of acceptance limits and biased high. A summary of MS/MSD qualified Se data are shown in Table A-7.

Water Board staff submitted field duplicate samples of the treated effluent to the laboratory to measure the precision of the entire measurement system including sampling and analytical procedures. Water Board staff collected one duplicate sample per week of treatment; a total of 8 field duplicates of treated effluent were submitted to the laboratory in 2008. The Relative Percent Difference (RPD) was calculated for each analyte in the duplicate and corresponding primary sample, as follows:

- If both the sample and duplicate values were equal to or greater than five times the Reporting Limit (RL), then the RPD was calculated using the standard method of dividing the absolute value of the difference of the two measurements by the average of the two measurements and multiplying by 100. The RPD must be equal to or less than 25% to be in control limits.
- If either the sample or duplicate value was less than five times the RL, then the absolute difference between the sample and duplicate values had to be equal to or less than the RL to be in control limits.

Only one set of sample and duplicate results for dissolved aluminum, collected on September 17, 2008, were qualified for exceeding the control limits for RPD. RPDs that were out of control limits were qualified with a “\*\*” in Table A-1 and are summarized in Table A-9.

Field Method Blanks (FMBs) were also collected once per week (9 total samples) and submitted to Basic Laboratories for analysis of the same parameters as PWT effluent samples. FMBs were collected and processed in the same method as that of effluent samples except using commercially available distilled water for each blank.

The five following dissolved metals were detected in the field method blank samples collected as part of the PWT monitoring program:

- Iron was detected in all nine FMB samples at concentrations ranging from 0.019 to 0.052 mg/L; the USEPA 4-day average discharge criterion for iron is 1.0 mg/L. Iron concentrations in the treated effluent samples ranged from 0.003 to 0.055 mg/L.
- Zinc was detected in five FMB samples at concentrations ranging from 0.0021 to 0.0035; the USEPA 4-day average discharge criterion for zinc is 0.21 mg/L.
- Copper was detected in two FMB samples at concentrations of 0.0006 and 0.0008 mg/L; the USEPA 4-day average discharge criterion for copper is 0.016 mg/L.
- Chromium was detected in one FMB sample at a concentration of 0.0005 mg/L; the USEPA 4-day average discharge criterion for chromium is 0.31 mg/L.
- Aluminum was detected in one FMB sample at a concentration of 0.002 mg/L; the USEPA 4-day discharge criterion for aluminum is 2.0 mg/L.

The metal concentrations detected in the field method blank samples are not considered as having an effect on the use of effluent sample data for comparison with the USEPA maximum or 4-day average discharge criteria.

Water Board staff also identified two influent samples collected on August 11 and August 18, 2008 as having anomalous TDS and sulfate data. In both cases, sulfate concentrations significantly exceeded TDS concentrations; these data are summarized in Table A-9.

#### **3.4.4 Deviations from the PWT SAP**

Three deviations from the PWT SAP occurred during the 2008 field season.

Basic Labs used their own data qualifiers rather than those identified in Table D-1 of the PWT SAP. The qualifiers used are shown in Tables A-1, A-2 and A-5, and are included in the database files to be submitted to AR for inclusion in the Site-wide database.

Table 1 of the Water Board's *2008 Work Plan for Leviathan Mine* indicated that Water Board staff would collect daily influent pH measurements. Water Board staff collected influent pH measurements weekly during influent sample collection activities. These data are presented in Table A-3. Plant operators collected influent pH measurement daily beginning on July 30, 2008. These data are summarized in Table A-4.

In a letter to the USEPA dated July 14, 2008, Water Board staff proposed modifications to the sample collection procedures used for PWT monitoring. The USEPA approved the method in an email to Water Board staff dated July 25, 2008. As part of the USEPA's approval, they requested that "...one sampling round be conducted using both the existing and proposed methods. This will allow Water Board and EPA staff to

evaluate any possible differences resulting from use of the two methods." On August 5, 2008, Water Board staff collected primary and duplicate treated effluent samples (089PWT014 and 089PWT015, respectively) using the new methodology. Additionally, Water Board staff collected primary and duplicate treated effluent samples (089PWT017 and 089PWT018, respectively) using the previous collections method. The results were presented to USEPA and are included in Table A-8 of this report; no significant differences were observed between the two methods.

Staff implemented the new sample collection method which consisted of the use of a peristaltic pump, new disposable C-Flex® tubing, and new disposable filters for each sample. Because only new sampling equipments were used, no equipment rinsate blanks (ERBs) were collected in 2008. The new collection method is also consistent with collection of surface water samples for the Water Board's Surface Water Monitoring program.

## **4. SURFACE WATER MONITORING AND METEOROLOGICAL INFORMATION**

As required by the USEPA, the Water Board continued their efforts in 2008 field season to monitor surface water flow and quality, and to collect meteorological information in the vicinity of Leviathan Mine. The results of these ongoing monitoring activities supplement the existing data contained within the Leviathan Mine Site-wide database that is maintained by Atlantic Richfield Company (AR). All surface water data and flow data are forwarded to AR for incorporation into the Site-wide database.

### **4.1 Meteorological Monitoring**

A weather station is located on the Water Board's construction trailer near Pond 1. It is a Davis Integrated Sensor Suite model and has been operational since its installation in November 2002. The system measures the following conditions hourly: wind speed, wind direction, rainfall, outside temperature, outside humidity, ultraviolet radiation, and solar radiation. Water Board staff download data from this weather station periodically and transmit the data to AR for incorporation into the Leviathan Mine Site-wide database.

### **4.2 Flow Monitoring**

Flow data are reported on the basis of water year. The 2008 water year begins October 1, 2007 and ends September 30, 2008. Under contract to the Water Board, the United States Geological Survey (USGS) monitored water flows and pond water level elevations for the 2008 water year. Flow monitoring locations and equipment are detailed in Table 3. Daily average flow data for stations with continuous recorders are included in Appendix B *Data Summary for 2008 Surface Water Monitoring*, Tables B-1 to B-13. Included in these tables are the daily and monthly average flow data for 11 stations with continuous flow recorders and daily and monthly average stage data for water levels in Pond 1 and Pond 4. Six of the stations (the Adit, PUD, CUD, Station 15,

Pond 1, and Pond 4) can be viewed in real-time through the USGS's website, <http://waterdata.usgs.gov/ca/nwis/current?type=flow>.

#### **4.3 Surface Water Monitoring**

Surface water sampling and analysis was performed in compliance with the *Sampling and Analysis Plan for Leviathan Mine Site Surface Water Monitoring (January 2004)* (SWM SAP), with two deviations noted in Section 4.4.3. The SWM SAP is not included in this report, but copies are available for review at Water Board's South Lake Tahoe office.

The Water Board conducted 10 monthly surface water quality monitoring events during the 2008 water year. Monthly sampling did not occur in January and February 2008. The Water Board's monthly and semi-annual surface water quality monitoring stations are shown in Figure 4. Measured parameters and sampling frequencies are summarized in Table 4.

Samples were collected for laboratory analysis of total and dissolved: aluminum, arsenic, calcium, cadmium, chromium, cobalt, copper, iron, magnesium, manganese, nickel, and zinc using a peristaltic pump equipped with new disposable C-Flex® tubing for each sample. Samples collected for analysis of dissolved metals, TDS, and sulfate were field filtered through a new, disposable 0.45-micron filter for each sample. Water Board staff collected all samples in clean, new sample containers provided by the contract laboratory. Sample containers used for metals analyses were pre-preserved with nitric acid. A duplicate sample and a field method blank were collected for each sampling event. Detailed sample collection and handling procedures and QA/QC protocols are described in the SWM SAP.

Basic Laboratory in Redding, CA, analyzed all surface water samples collected during 2008 water year.

#### **4.4 Sampling Results From Surface Water Monitoring**

##### **4.4.1 Monitoring Objectives**

The monitoring objectives of the SWM program, as outlined in the SWM SAP, were to collect data of sufficient quality to:

- Identify the chemical characteristics of the various surface waters in the vicinity of Leviathan Mine, including AMD sources and creek waters.
- Monitor flows of AMD discharges and selected creeks.
- Track the impacts of remediation projects on downstream surface waters.

- Identify seasonal and annual variations in the chemical characteristics and field parameters of surface waters in the vicinity of Leviathan Mine.
- Calculate the loading of metals to the downstream surface waters from the various discharges at Leviathan Mine.

#### **4.4.2 Data Quality Evaluation and Summary**

Surface water data collected for this water year is summarized in the Appendix B, *Data Summary for 2008 Surface Water Monitoring*. The analytical results of the surface water monitoring sampling, along with any qualifiers, are presented in Tables B-14 to B-26. The tables also show the field data measurements collected by Water Board staff at the time of sampling, including pH, temperature, electrical conductivity, and specific conductance.

As part of the Site QA/QC process, Water Board staff reviewed the data quality of the SWM laboratory reports. Laboratory-assigned data qualifiers are presented with the SWM data in Tables B-14 through B-25. Water Board staff's data review included evaluation of sample holding times, an assessment of precision, and an assessment of anomalous data.

In 2008, Water Board staff assigned a data qualifier of “\*\*” for data that did not meet our field duplicate assessment, and an “A” qualifier for anomalous data. Explanations of the Water Board staff-assigned data qualifiers are summarized in Table B-26, and are also included in Tables B-14 through B-25.

Water Board staff assessed the data to confirm that holding times were met. All samples analyzed for TDS for the September 2008 event were initially run within holding time. However, the laboratory observed that the Laboratory Control Sample (LCS) recovery was biased high. Therefore, they re-analyzed all of the TDS samples outside the 7-day holding time. The re-analyzed results met laboratory QA/QC requirements and were reported with an “I-04” qualifier to denote the holding time had expired. Re-analysis for one sulfate sample from September 2008 sampling event was requested by the water board and performed outside the 28-day holding time. This result was also reported using the I-04 qualifier. No other holding times were exceeded for the surface water samples collected during the 2008 field season.

An evaluation of the completeness of the required sample collection shows that 138 samples were to be collected during the water-year (eleven stations to be sampled monthly and three stations to be sampled semi-annually). Two of the 12 sampling events (January and February 2008) were canceled due to insufficient time to procure over-snow transportation. The semi-annual monitoring station at 4L Creek (just above its confluence with Leviathan Creek) was not sampled during the October 2007 event as the creek had no flow at the time of sampling. All other stations and sampling events were conducted in accordance with the SWM SAP. In total, 115 of the planned 138 samples were collected. Of the 115 samples collected, none of the data were rejected.

Basic Laboratories completed Data Validation Checklists for all sample analytical reports. They are not included in this report but are available for viewing at the Water Board's South Lake Tahoe office. Appendix B, Attachment B-1 contains the SWM Data Validation Checklists for Field QC and Level A/B Screening Checklists completed by Water Board staff for each sampling event.

Water Board staff collected one field duplicate per sampling event as required in the SWM SAP. The RPD was calculated for the duplicate and corresponding sample as described in Section 3.4.3.

Data with RPD assessment results out of control limits were flagged with “\*” qualifier in Appendix B, Tables B-14 to B-26. Out of 260 paired results, nine sets of sample and duplicate results were flagged for exceeding the control limits for RPD.

FMBs were also collected once per sampling event (10 total samples this Water Year) and submitted to Basic Laboratories for analysis of the same parameters evaluated in the surface water monitoring program. FMBs were collected and processed in the same method as surface water samples using the Water Board's in-house laboratory distilled de-ionized water for each blank.

Five metals were detected at low levels above the RL in the FMB samples that were collected as part of the SWM program:

- Dissolved iron was detected in three FMB samples at concentrations ranging from 0.012 to 0.020 mg/L. The reporting limit for iron was 0.010 mg/L.
- Total nickel was detected in one FMB sample at a concentration of 0.0018 mg/L. The reporting limit for nickel was 0.0012 mg/L.
- Total copper was detected in one FMB sample at a concentration of 0.0008 mg/L. The reporting limit for copper was 0.0006 mg/L.
- Total chromium was detected in six FMB samples at concentrations ranging from 0.0007 to 0.0027. Reporting limits for chromium ranged from 0.0006 to 0.001 mg/L.
- Total aluminum was detected in three FMB samples at a concentrations ranging from 0.0044 to 0.0078 mg/L. The reporting limit for aluminum was 0.0025 mg/L.

No data qualifiers were added by the Water Board based on FMB results.

#### **4.4.3 Deviations from the SWM SAP**

There were two deviations from the SWM SAP.

Basic Labs used their own data qualifiers rather than those identified in Table D-1 of the SAP. The qualifiers used are shown in Tables B-14 through B-25, and are included in the database files to be submitted to AR for inclusion in the Site-wide database.

The methods detailed in the SWM SAP for metals analysis are USEPA 6010 and 6020. Basic Labs used USEPA Method 200.8 rather than 6020 for selected metals analyses for the surface water samples. These are essentially equivalent methods that were developed by different branches of EPA but produce similar results and are run on the same instrumentation (ICP and ICP-MS). We are considering adding Methods 200.7 and 200.8 to the table of methods in the future SAP.

## **5. SITE MAINTENANCE**

The Water Board conducted site maintenance work during the 2008 field season in accordance with the USEPA-approved Work Plan. Routine maintenance activities include repairing perimeter fencing, removing sediment from storm water ditches, covering exposed pond liners and minor road repair.

### **5.1 Repairing Perimeter Fencing**

A barbed-wire fence surrounds the majority of the site. In June and July 2008, Water Board staff inspected and repaired the perimeter fence.

### **5.2 Storm Water Conveyance Clean-out**

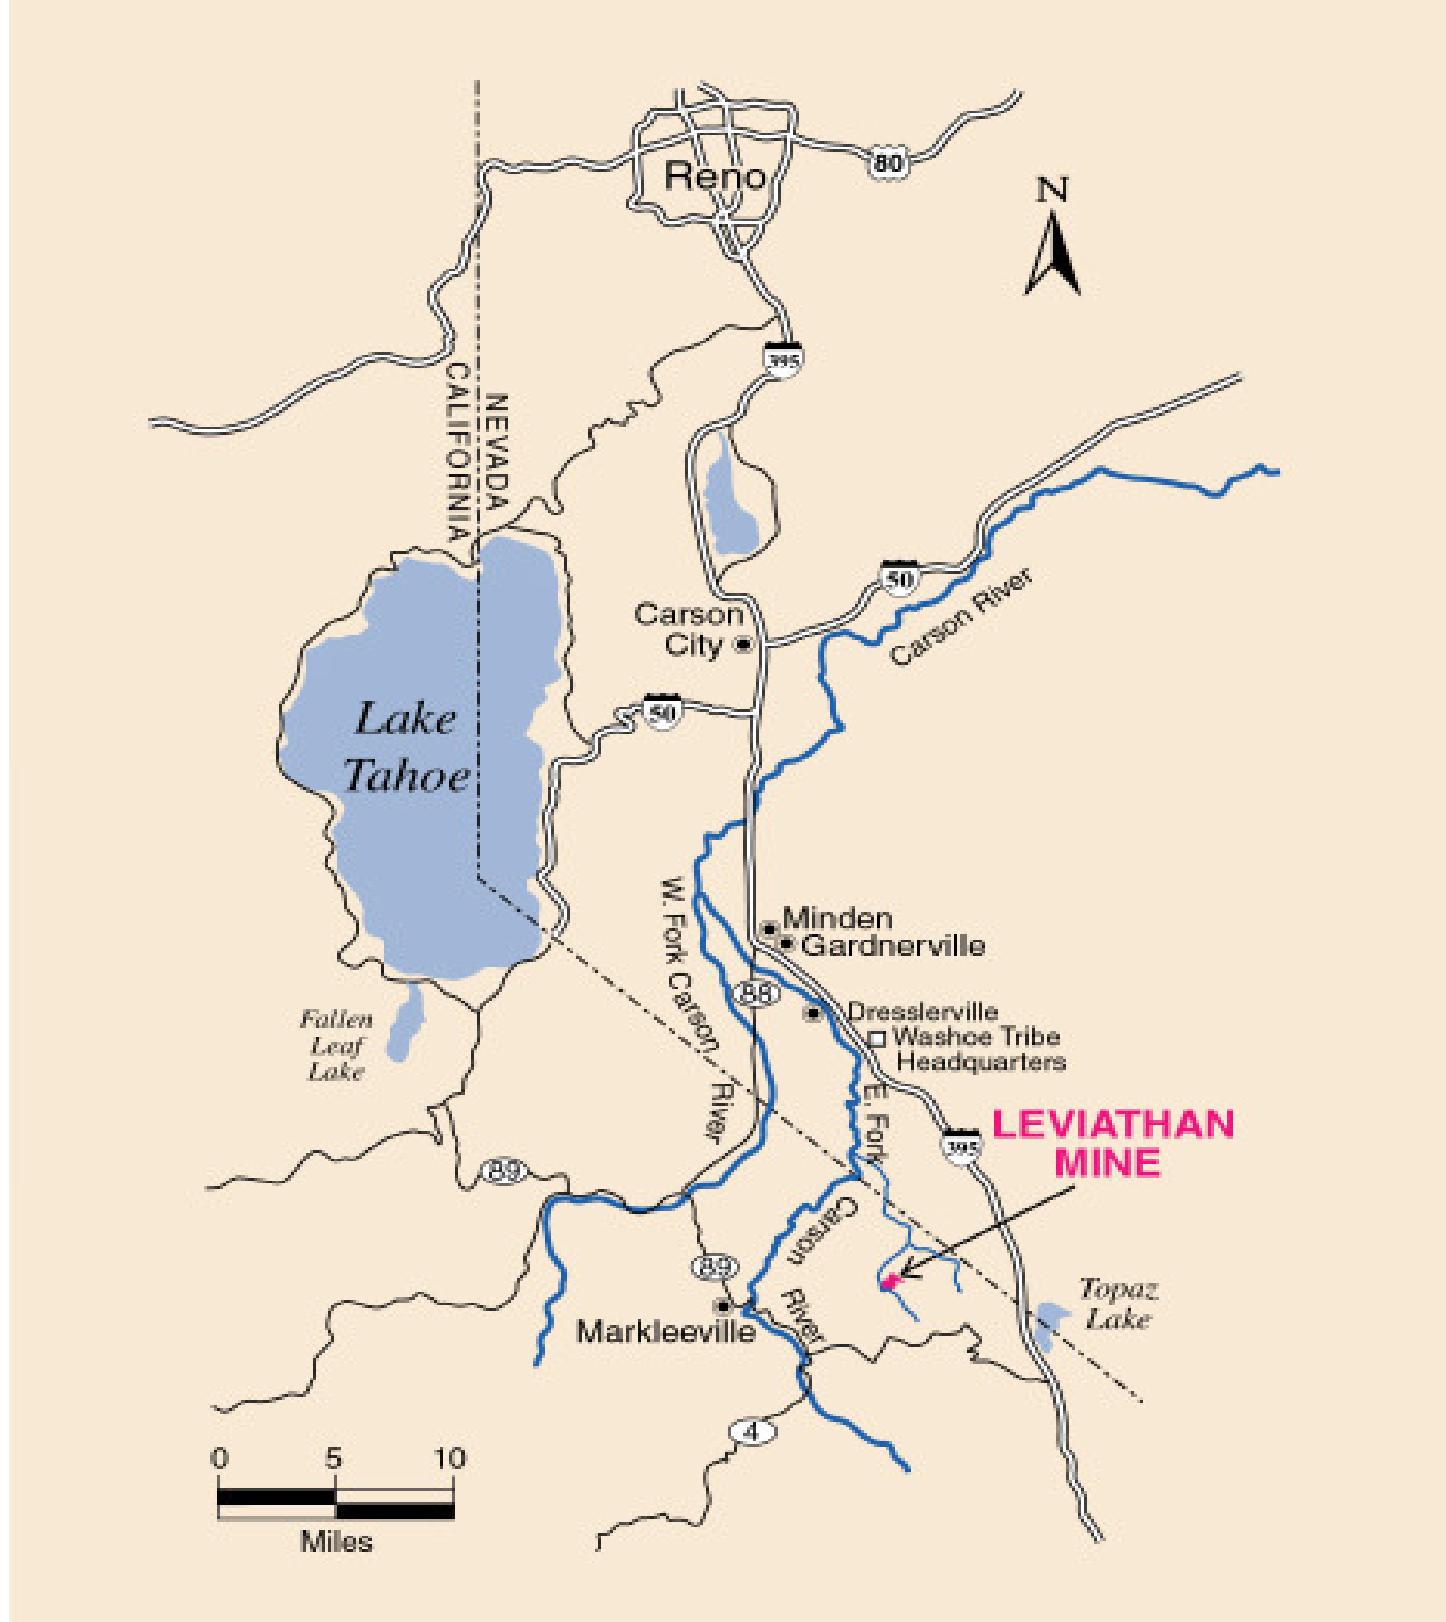

The Water Board contracted with Decon to remove accumulated sediment in the concrete-lined, storm water conveyance ditches across the site. Decon utilized a backhoe with a custom-made V-shaped bucket and a crew of hand laborers to accomplish the task. The ditches located in the Pit, around Ponds 1 and 3, and on the slopes below Ponds 2 South and 2 North were cleaned out. A total of 13,085 linear feet of ditches were cleaned. Sediment removed from the ditches was used to fill riling on the slopes adjacent to the ditches.

### **5.3 Covering Exposed Liner**

Water Board staff visually inspected cover material around each pond and detected areas where earthen cover had eroded. Minor amounts of liner were exposed, and Water Board staff covered the exposed liner with material from storm water conveyances.

### **5.4 Invasive Plant Control**

The El Dorado County, Department of Agriculture (EDCDA) visited Leviathan Mine and applied herbicide (Telar<sup>®</sup>) on invasive plants in September 2008. This year (2008), as in 2002 through 2007, the EDCDA sprayed to eradicate tall whitetop (*Lepidium latifolium*).

**TABLE 1**  
**2008 DISCHARGE CRITERIA FOR POND WATER TREATMENT**  
**LEVIATHAN MINE, ALPINE COUNTY, CALIFORNIA**

Water Quality Parameter	Maximum	Four Day Average
pH	--	Between 6.0 – 9.0 SU <sub>f2</sub>
Arsenic	0.34 mg/L f <sub>1</sub>	0.15 mg/L f <sub>4</sub>
Aluminum	4.0 mg/L f <sub>1</sub>	2.0 mg/L f <sub>4</sub>
Cadmium	0.009 mg/L f <sub>1</sub>	0.004mg/L f <sub>4</sub>
Chromium	0.97 mg/L f <sub>1</sub>	0.31 mg/L f <sub>4</sub>
Copper	0.026 mg/L f <sub>1</sub>	0.016 mg/L f <sub>4</sub>
Iron	2.0 mg/L f <sub>1</sub>	1.0 mg/L f <sub>4</sub>
Lead	0.136 mg/L f <sub>1</sub>	0.005 mg/L f <sub>4</sub>
Nickel	0.84 mg/L f <sub>1</sub>	0.094 mg/L f <sub>4</sub>
Selenium (Total Recoverable)	Not Promulgated f <sub>3</sub>	0.005 mg/L f <sub>4</sub>
Zinc	0.21 mg/L f <sub>1</sub>	0.21 mg/L f <sub>4</sub>

Notes:

mg/L: milligrams per liter

f1: Dissolved concentration in a daily grab sample that has been field-filtered (0.45 micron) and acid fixed.

f2: pH measurement based on 24-hour average discharge.

f3: Total recoverable concentration in a daily grab sample that is acid fixed, but not filtered.

f4: The sum of the detected concentration in four daily grab samples, from four consecutive discharge days, divided by four. If the concentration detected by the laboratory is less than the detection limit, one-half of the detection limit shall be used in calculating the average concentration.

**TABLE 2**  
**SUMMARY OF 2008 POND WATER TREATMENT MONITORING**  
**LEVIATHAN MINE, ALPINE COUNTY, CALIFORNIA**

SAMPLE LOCATION	LOCATION DESCRIPTION	ANALYSES	SCHEDULE	SAMPLER
Influent	Sampling Port just prior to Reactor 1	pH and temperature (field)	daily	contractor
		EPA-Required Discharge Criteria <sup>1</sup> with Additional Analytes <sup>2</sup> ; pH and temperature (field)	weekly	Water Board staff
Mid Process	Reactor 1	pH and temperature (field)	every 2 hours	contractor
Mid Process	Reactor 2	pH and temperature (field)	every 2 hours	contractor
Mid Process	Influent to Pit Clarifier	pH and temperature (field)	every 2 hours	contractor
Effluent	Weir Box	pH and temperature (field)	every 2 hours	contractor
		EPA-Required Discharge Criteria; pH and temperature (field)	daily (during discharge)	Water Board staff
		EPA-Required Discharge Criteria with Additional Analytes ; pH and temperature (field)	weekly (during discharge)	Water Board staff
Duplicate Samples	Effluent samples at weir box; assesses laboratory precision	EPA-Required Discharge Criteria	weekly (during discharge)	Water Board staff
Field Method Blank	tests sampling procedure and equipment	EPA-Required Discharge Criteria	weekly (during discharge)	Water Board staff
Sludge	Pit Clarifier	CAM-17 <sup>3</sup> metals plus Al and Fe (for comparison with STLC and TTLC) <sup>4</sup>	three composite samples collected after treatment season	Water Board staff

Notes:

1. Dissolved As, Al, Cd, Cr, Cu, Fe, Pb, Ni, Zn, total recoverable Se (off-site laboratory); pH (field)

2. Ca, Co, Mg, Mn, TDS, sulfate (off-site laboratory analysis)

3. CAM-17 metals: Sb, As, Ba, Be, Cd, Cr, Co, Cu, Pb, Hg, Mo, Ni, Se, Ag, Tl, V, Zn (off-site laboratory analysis)

4. STLC is the Soluble Threshold Limit Concentration and TTLC is the Total Threshold Limit Concentration.

**TABLE 3**  
**SUMMARY OF SURFACE WATER STAGE AND FLOW MONITORING**  
**LOCATIONS**  
**LEVIATHAN MINE, ALPINE COUNTY, CALIFORNIA**

Station Location/Description	Equipment	USGS Startup Date
Leviathan Creek above the mine ( <b>Station 1</b> )	Continuous stage/flow recorder and appurtenances, solar power supply.	October-98
Pit Under-Drain at the flow control structure ( <b>PUD</b> )	Continuous stage/flow recorder and appurtenances, solar power supply, telemetry.	October-99
Adit at the flow control Structure ( <b>Adit</b> )	Continuous stage/flow recorder and appurtenances, solar power supply, telemetry.	October-99
Pond 1 Stage	Continuous stage recorder and appurtenances, solar power supply, telemetry.	October-99
Pond 4 Stage	Continuous stage recorder and appurtenances, solar power supply, telemetry.	October-99
Channel Under-Drain ( <b>CUD</b> )	Continuous stage/flow recorder and appurtenances, solar power supply, telemetry.	October-99
Aspen Creek above the mine ( <b>Station 22</b> )	Continuous stage/flow recorder and appurtenances, solar power supply.	October-09
4L Creek above its confluence with Leviathan Creek ( <b>4L Creek</b> )	Continuous stage/flow recorder and appurtenances, solar power supply.	October-09
Leviathan Creek above its confluence with Aspen Creek ( <b>Station 15</b> )	Continuous stage/flow recorder and appurtenances, solar power supply, telemetry.	October-98
Aspen Creek above its confluence with Leviathan Creek ( <b>Station 16</b> )	None. Monthly flow measurements to establish relationship w/STA 15.	October-98
Overburden (Aspen) Seep, above the Bioreactors ( <b>OS</b> )	Continuous stage/flow recorder and appurtenances, solar power supply.	October-98
Bryant Creek just below the confluence of Mountaineer and Leviathan Creeks ( <b>Station 25</b> )	Continuous stage/flow recorder and appurtenances, solar power supply.	October-98
Leviathan Creek just above the confluence of Mountaineer and Leviathan Creeks ( <b>Station 23</b> )	Continuous stage/flow recorder and appurtenances, solar power supply	November-99
Mountaineer Creek just above the confluence of Leviathan and Mountaineer Creeks ( <b>Station 24</b> )	None. Monthly flow measurements to establish relationship w/STA 23.	December-99
Bryant Creek just above confluence with Doud Springs ( <b>Station 26</b> )	Continuous stage/flow recorder and appurtenances, solar power supply	August-01

**TABLE 4**  
**SURFACE WATER QUALITY MONITORING STATIONS**  
**LEVIATHAN MINE, ALPINE COUNTY, CALIFORNIA**

Station Identification	Site Description	Sampling Frequency
Station 1	Leviathan Creek above Leviathan Mine.	Monthly
Adit	Drainage from Tunnel #5 (the Adit), prior to entering evaporation ponds.	Monthly
Pit Under-Drain (PUD)	Drainage from shallow ground water collection pipes in pit, prior to entering evaporation ponds.	Monthly
Channel Under-Drain (CUD)	Discharge from Channel Under-Drain below Leviathan Creek concrete channel.	Monthly
Delta Seep (DS)	Seepage from the toe of the Delta Slope, located north of Pond 4.	Semi-annual
Station 15	Leviathan Creek, above the confluence of Leviathan and Aspen creeks.	Monthly
Station 16	Aspen Creek, above the confluence of Leviathan and Aspen creeks.	Monthly
4L Creek	4L Creek, just above the confluence of Leviathan Creek.	Semi-annual
Station 22	Aspen Creek above Leviathan Mine.	Monthly
Overburden Seep (OS)	Overburden seepage (a.k.a. Aspen Seep), above the bioreactors.	Monthly
Station 23	Leviathan Creek above the confluence of Leviathan and Mountaineer creeks.	Monthly
Station 24	Mountaineer above the confluence of Leviathan and Mountaineer creeks.	Monthly
Station 25	Bryant Creek below the confluence of Leviathan and Mountaineer creeks.	Monthly
Station 26	Bryant Creek above the confluence of Doud Springs and Bryant Creek.	Semi-annual

Laboratory Analytical and Field Monitoring Parameters for all Stations:

1. Laboratory: Total and Dissolved Metals (aluminum, arsenic, calcium, cadmium, cobalt, chromium, copper, iron, magnesium, manganese, nickel, zinc)
2. Laboratory: Total Dissolved Solids (TDS)
3. Laboratory: Sulfate
4. Field: pH, temperature, electrical conductivity, and specific conductance

**Notes:**

All values reported in milligrams/liter (mg/L), except pH and temperature which are in Standard Units and degrees Celsius, respectively.

All parameters are dissolved, except Selenium, which is total recoverable.

**Qualifiers:**

U - Analyte not detected at the given Method Detection Limit.

J - Analyte detected between the Method Detection Limit and the Reporting Limit

QM-4X: The spike recovery was outside acceptance limits for the MS and/or MSD due to analyte concentration being greater than 4 times the spike concentration. The batch was accepted based on acceptable LCS and/or LCSD recovery.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

R-08: Sample was diluted due to sample matrix resulting in elevated reporting limits.

Z-01: The final residue weight exceeded the method limit of 0.2000 grams (0.2720 grams was the final weight) using only 30 milliliter of sample for the TDS analysis. Reanalysis with a smaller sample volume was not performed due to 24-hour turn around time requested.

A: Anomalous value, see Table A-9 for further description.

Notes:

All values reported in milligrams/liter (mg/L).

All parameters and Discharge Criteria are dissolved, except Selenium which is total recoverable.

For results reported as non-detect, half the value of the Method Detection Limit was used to calculate the average.

**Bold** indicates 4-Day average concentration is above the Discharge Criteria.

Flow rates are in gallons/minute (gpm)

pH in Standard Units

Temperature in degrees Celsius

**Table A-5**  
**2008 Pond Water Treatment Sludge Analytical Results**

## **Qualifiers:**

NP - not promulgated

U - Analyte not detected at the given Method Detection Limit.

J - Analyte detected between the Method Detection Limit and the Reporting Limit.

**Bold** indicates concentration is above regulatory criteria.

<b>TOTAL 2008 TREATED DISCHARGE (gallons)</b>	<b>3,020,207</b>
---	------------------

**Notes:**

Flow represents discharge of treated water to Leviathan Creek via Pit Clarifier weir.

Mean daily flow rate determined from mean daily weir stage.

**NOTE**

Laboratory Percent Recovery Control Limits

QM-07: The spike recovery was outside acceptance limits for the matrix spike (MS) and the matrix spike duplicate (MSD).

The batch was accepted based on acceptable laboratory control sample (LCS) recovery.

QM-05: The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCS duplicate were within acceptance limits showing that the laboratory is in control and the data are acceptable.

J = Analyte detected between the Method Detection Limit and the Reporting Limit.

**Notes:**

PWT Effluent and PWT Effluent (dup) samples collected using 2008 collection procedures.

EPA1 and EPA2 (dup) samples collected using historic (2000-2007) PWT collection procedures.

All values reported in milligrams/liter (mg/L), except pH, which is reported in Standard Units.

All parameters are dissolved, except Selenium, which is total recoverable.

**Qualifiers:**

U - Analyte not detected at the given Method Detection Limit.

J - Analyte detected between the Method Detection Limit and the Reporting Limit

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

**Table A-9**  
**2008 Pond Water Treatment Water Board Assigned Data Qualifiers**

Station Identification	Laboratory Report #	Sample Date	Sample Identification	Water Board Assigned Data Qualifier	Qualified Parameter(s)	Description of Anomalous Value(s)
PWT Influent	8080441	8/11/2008	089PWT023-INF	A	TDS / Sulfate	TDS = 5620, sulfate = 10300; sulfate significantly exceeds TDS
PWT Influent	8080734	8/18/2008	089PWT031-INF	A	TDS / Sulfate	TDS = 9100, sulfate = 12400; sulfate significantly exceeds TDS
PWT Effluent	8090861	9/17/2008	089PWT063-EFF	*	Dissolved AI	fails field duplicate RPD assessment (duplicate sample = 089PWT064-EFF)

**Qualifiers**

\*: failed Relative Percent Difference (RPD) assessment

A: Anomalous Value

9/24/2008	10:40:00 AM	2.5	12.5	2829	3724	12.7	12.6

**Field Data:**

EC: Electrical Conductivity

SpC: Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; gpm - gallons per minute

1: Provisional data provided by the United States Geological Survey

**Q - Qualifiers:**

J: Analyte detected between the MDL and the Practical Quantitation Limit.

\* : Failed Relative Percent Difference assessment.

A: Anomalous value, see Table B-26, Water Board 2008 Year-End Report.

I-04: Sample was re-analyzed past the EPA recommended holding time.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

QM-4X : The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCSD recoveries within the acceptance limits.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

Z-01: The sample was originally analyzed within holding time. However, the LCS recovery was >120%, so the sample batch was re-analyzed outside of holding time. A high bias of approximately 20% was confirmed, so the data from the re-analysis batch is reported.

**Field Data:**

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; gpm - gallons per minute

e - estimated

1: Provisional data provided by the United States Geological Survey.

**Q - Qualifiers:**

J: Analyte detected between the MDL and the Practical Quantitation Limit.

A: Anomalous value, see Table B-26, Water Board 2008 Year-End Report.

I-04: Sample was re-analyzed past the EPA recommended holding time.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

QM-4X : The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCSD recoveries within the acceptance limits.

Z-01: The sample was originally analyzed within holding time. However, the LCS recovery was >120%, so the sample batch was re-analyzed outside of holding time. A high bias of approximately 20% was confirmed, so the data from the re-analysis batch is reported.

**Field Data:**

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; gpm - gallons per minute

1: Provisional data provided by the United States Geological Survey.

**Q - Qualifiers:**

U - Analyte not detected at the given Method Detection Limit (MDL).

J - Analyte detected between the MDL and the Practical Quantitation Limit.

I-04: Sample was re-analyzed past the EPA recommended holding time.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

QM-4X : The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCSD recoveries within the acceptance limits.

Z-01: The sample was originally analyzed within holding time. However, the LCS recovery was >120%, so the sample batch was re-analyzed outside of holding time. A high bias of approximately 20% was confirmed, so the data from the re-analysis batch is reported.

**Field Data:**

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.

e - estimated

1: Provisional data provided by the United States Geological Survey.

**Q - Qualifiers:**

U - Analyte not detected at the given Method Detection Limit (MDL).

J - Analyte detected between the MDL and the Practical Quantitation Limit.

A: Anomalous value, see Table B-26, Water Board 2008 Year-End Report.

CONF: Sample was re-analyzed and confirmed.

I-04: Sample was re-analyzed past the EPA recommended holding time.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

QM-4X : The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCSD recoveries within the acceptance limits.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

Z-01: The sample was originally analyzed within holding time. However, the LCS recovery was >120%, so the sample batch was re-analyzed outside of holding time. A high bias of approximately 20% was confirmed, so the data from the re-analysis batch is reported.

**Field Data:**

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.

e - estimated

1: Provisional data provided by the United States Geological Survey.

**Q - Qualifiers:**

U - Analyte not detected at the given Method Detection Limit (MDL).

J - Analyte detected between the MDL and the Practical Quantitation Limit.

\* : Failed Relative Percent Difference assessment.

A: Anomalous value, see Table B-26, Water Board 2008 Year-End Report.

CONF: Sample was re-analyzed and confirmed.

I-04: Sample was re-analyzed past the EPA recommended holding time.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

QM-4X : The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCSD recoveries within the acceptance limits.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

Z-01: The sample was originally analyzed within holding time. However, the LCS recovery was >120%, so the sample batch was re-analyzed outside of holding time. A high bias of approximately 20% was confirmed, so the data from the re-analysis batch is reported.

**Field Data:**

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; us/cm - micro siemen per centimeter; cfs - cubic feet per second

e - estimated

1: Provisional data provided by the United States Geological Survey.

**Q - Qualifiers:**

U - Analyte not detected at the given Method Detection Limit (MDL).

J - Analyte detected between the MDL and the Practical Quantitation Limit.

\* : Failed Relative Percent Difference assessment

A: Anomalous value, see Table B-26, Water Board 2008 Year-End Report.

CONF: Sample was re-analyzed and confirmed.

I-04: Sample was re-analyzed past the EPA recommended holding time.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

QM-04X : The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCSD recoveries within the acceptance limits.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

Z-01: The sample was originally analyzed within holding time. However, the LCS recovery was >120%, so the sample batch was re-analyzed outside of holding time. A high bias of approximately 20% was confirmed, so the data from the re-analysis batch is reported.

**Field Data:**

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.

e - estimated

1: Provisional data provided by the United States Geological Survey.

**Q - Qualifiers:**

U - Analyte not detected at the given Method Detection Limit (MDL).

J - Analyte detected between the MDL and the Practical Quantitation Limit.

CONF: Sample was re-analyzed and confirmed.

I-04: Sample was re-analyzed past the EPA recommended holding time.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

QM-4X : The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCSD recoveries within the acceptance limits.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

Z-01: The sample was originally analyzed within holding time. However, the LCS recovery was >120%, so the sample batch was re-analyzed outside of holding time. A high bias of approximately 20% was confirmed, so the data from the re-analysis batch is reported.

**Field Data:**

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.

e - estimated

1: Provisional data provided by the United States Geological Survey.

**Q - Qualifiers:**

U - Analyte not detected at the given Method Detection Limit (MDL).

J - Analyte detected between the MDL and the Practical Quantitation Limit.

CONF: Sample was re-analyzed and confirmed.

I-04: Sample was re-analyzed past the EPA recommended holding time.

QR-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

QM-4X : The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCSD recoveries within the acceptance limits.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

Z-01: The sample was originally analyzed within holding time. However, the LCS recovery was >120%, so the sample batch was re-analyzed outside of holding time. A high bias of approximately 20% was confirmed, so the data from the re-analysis batch is reported.

**Field Data:**

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

NA - Not Available

1: Provisional data provided by the United States Geological Survey.

**Q - Qualifiers:**

U - Analyte not detected at the given Method Detection Limit (MDL).

J - Analyte detected between the MDL and the Practical Quantitation Limit.

A: Anomalous value, see Table B-26, Water Board 2008 Year-End Report.

QM-04: Duplicate results are within one reporting limit and pass all necessary QC criteria.

QM-4X : The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCSD recoveries within the acceptance limits.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

**2008 Surface Water Monitoring**  
**Water Board Assigned Data Qualifiers**

Station Identification	Laboratory Report #	Sample Date	Sample Identification	LRWQCB-assigned Data Qualifier	Qualified Parameter(s)	Description of Anomalous Value(s)
Sta 26	7100644	10/16/2007	078LM071-Sta 26	A	TDS	TDS = 1530 mg/L; result appears about an order of magnitude high compared to historical results for this station
ADIT	7110951	11/28/2007	078LM073-Adit	A	Dissolved Ca	Ca = 21 mg/L; result appears about an order of magnitude low compared to historical results for this station
ADIT	7110951	11/28/2007	078LM073-Adit	A	Dissolved Mg	Mg = 6 mg/L; result appears about an order of magnitude low compared to historical results for this station
Sta 1	7110951	11/28/2007	078LM072-Sta 1	A	Dissolved Co, Total Co	diss = 0.0042 mg/L; total = <0.0005 mg/L; dissolved concentration significantly exceeds total concentration
Sta 1	7110951	11/28/2007	078LM072-Sta 1	A	Dissolved Mn, Total Mn	diss = 0.0101 mg/L; total = 0.0057 mg/L; dissolved concentration significantly exceeds total concentration
Sta 24	8030887	3/25/2008	078LM106-Sta 24	*	Total Cu	fails field duplicate RPD assessment (duplicate sample = 089LM110-Sta 24D)
Sta 1	8040510	4/14/2008	078LM114-Sta 1	A	Dissolved Co, Total Co	diss = 0.0020 mg/L; total = 0.0004 J mg/L; dissolved concentration significantly exceeds total concentration
Sta 15	8040510	4/14/2008	078LM115-Sta 15	*	Dissolved Al	fails field duplicate RPD assessment (duplicate sample = 078LM123-Sta 15D)
Sta 15	8040510	4/14/2008	078LM115-Sta 15	*	Dissolved As	fails field duplicate RPD assessment (duplicate sample = 078LM123-Sta 15D)
Sta 15	8040510	4/14/2008	078LM115-Sta 15	*	Dissolved Cu	fails field duplicate RPD assessment (duplicate sample = 078LM123-Sta 15D)
Sta 15	8040510	4/14/2008	078LM115-Sta 15	*	Dissolved Fe	fails field duplicate RPD assessment (duplicate sample = 078LM123-Sta 15D)
Sta 15	8040510	4/14/2008	078LM115-Sta 15	*	Dissolved Zn	fails field duplicate RPD assessment (duplicate sample = 078LM123-Sta 15D)
Sta 15	8040510	4/14/2008	078LM115-Sta 15	A	Dissolved Al, Total Al	diss = 5.13 mg/L; total = 3.79 mg/L; dissolved concentration significantly exceeds total concentration
Sta 16	8040510	4/14/2008	078LM116-Sta 16	A	Dissolved Co, Total Co	diss = 0.0031 mg/L; total = 0.0017 mg/L; dissolved concentration significantly exceeds total concentration
Sta 22	8040510	4/14/2008	078LM117-Sta 22	A	Dissolved Cr, Total Cr	diss = 0.0025 mg/L; total = 0.0013 mg/L; dissolved concentration significantly exceeds total concentration
Sta 24	8050550	5/13/2008	078LM1132-Sta 24	A	Dissolved Cr, Total Cr	diss = 0.0021 mg/L; total = 0.0014 mg/L; dissolved concentration significantly exceeds total concentration
Sta 22	8060700	6/17/2008	078LM146-Sta 22	*	Dissolved Cr	fails field duplicate RPD assessment (duplicate sample = 078LM152-Sta D)
OS	8070853	7/23/2008	089LM011-OS	*	Dissolved Cu	fails field duplicate RPD assessment (duplicate sample = 089LM013-Sta D)
OS	8070853	7/23/2008	089LM013-Sta D	A	Dissolved Cr, Total Cr	diss = 0.0049 mg/L; total = 0.0034 mg/L; dissolved concentration significantly exceeds total concentration
Sta 22	8070853	7/23/2008	089LM007-Sta 22	A	Dissolved Cr, Total Cr	diss = 0.0021 mg/L; total = 0.0005 (J) mg/L; dissolved concentration significantly exceeds total concentration
ADIT	8080738	8/18/2008	089LM014-Adit	*	Diss Al	fails field duplicate RPD assessment (duplicate sample = 089LM026-Sta D)
PUD	8080738	8/18/2008	089LM015-PUD	A	Sulfate / TDS	Sulfate = 11,000 mg/L ; TDS = 7,780 mg/L; sulfate concentration significantly exceeds TDS concentration
Sta 1	8080738	8/18/2008	089LM017-Sta 1	A	Total Ca	Ca = 38 mg/L; (1) relatively high compared to historic data, and (2) typically Ca(dissolved) is equivalent to Ca(total); in this sample Ca(dissolved) = 15 mg/L.
Sta 22	8080738	8/18/2008	089LM020-Sta 22	A	Dissolved Co, Total Co	diss = 0.0010 mg/L; total = 0.0001 mg/L; dissolved concentration significantly exceeds total concentration
