

# Characterizing, Predicting, and Modeling Water from Mine Sites

May 18-21, 2009  
Sacramento, California

# Course Outline

- Day 1: Mine site overview, Advanced acid generation, Mine site characterization
- Day 2: Modeling and case studies
- Day 3: Site Tour of Jamestown Mine
- Day 4: Use of prediction information in mine permitting and case studies

# Introduction

- Instructors
- Objectives
- Participants

# Course Instructors

- Instructors
  - Charlie Alpers, USGS
  - John Hillenbrand, EPA Region 9
  - Rick Humphreys, SWRCB
  - Jim Kuipers, Kuipers & Associates
  - Ann Maest, Stratus Consulting
  - Kirk Nordstrom, USGS
  - Connie Travers, Stratus Consulting
- Field Trip Leaders
  - Roger Ashley, USGS
  - JC Isham, Shaw Environmental
  - Victor Izzo, RWQCB

# Objectives of Course

- Increased scientific understanding of one of the biggest challenges at mine sites – predicting long-term geochemical and hydrologic behavior
  - Unlike other industrial facilities, contaminant discharges from mine sites can take years, decades, or longer to develop and are subject to climatic and seasonal variability in concentrations and flow
  - Hydrologic conditions difficult to predict over long-term
  - Costs of poor predictions can be high
- Learn how to design a characterization, modeling, and mitigation program that has the best chance of protecting the environment and minimizing costs of future remediation

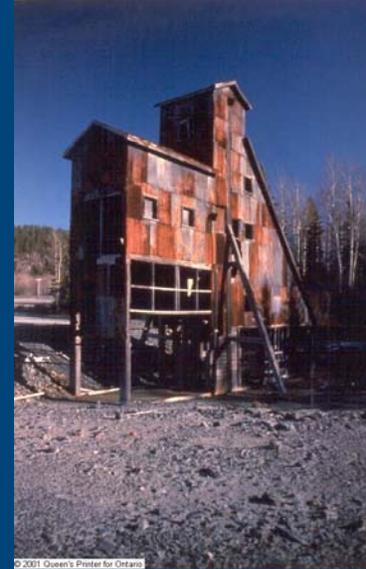

What would you like to get out of the course?  
Any specific questions?

# Hardrock Mines

# Mining Operations

- Phases of mining
  - Exploration
  - Development
  - Active Mining
    - Extraction
    - Beneficiation/processing
  - Reclamation, closure, post-closure

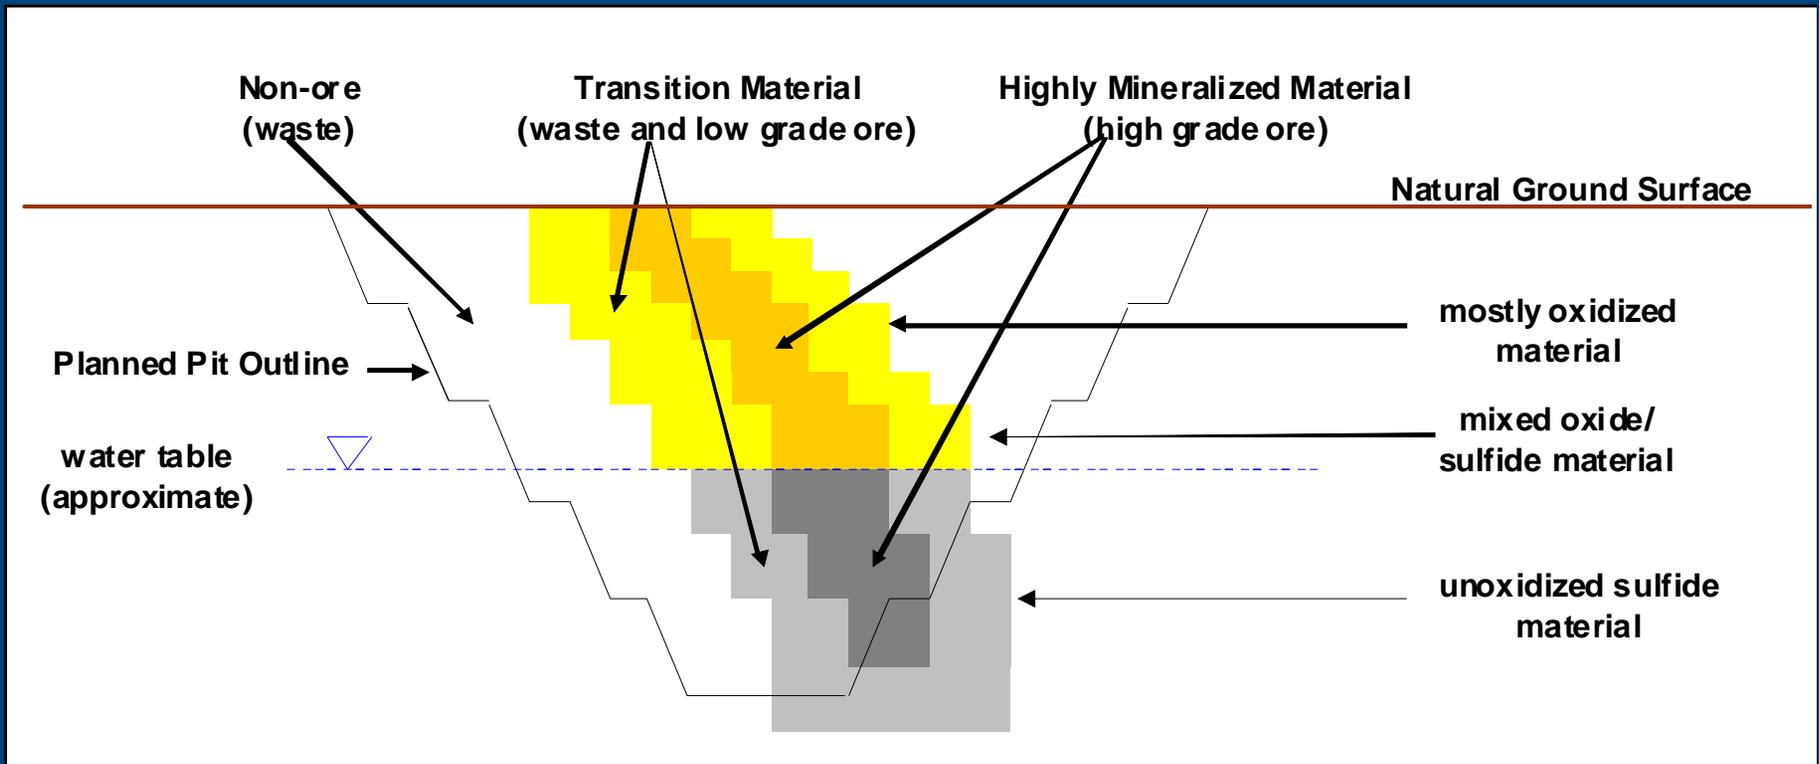

© 2011 Queen's Printer for Ontario

# Cartoon of Mining Process at Yanacocha Mine, Northern Peru (Newmont)

<http://www.yanacocha.com.pe/extrac/oro.asp>

# Ore Deposit

Maest et al., 2005

# Exploration

- Exploration
  - Mapping and sampling to define extent of ore body; drilling and access roads
  - Potential impacts: land rights/use; noise; surface disturbance and water quality

# Development

- Development: preparing deposit for extraction
  - Roads, power, water, mineral processing facility; remove overlying soil, waste rock/overburden; drill drifts, crosscuts; mitigation
- Potential impacts: erosion, water quality, noise, dust, loss of vegetation, water quantity changes

# Extraction

- Extraction: removing ore from the ground
- Drilling, blasting, mucking, hauling
- Potential impacts: noise, nitrate from blasting, dust, start of accelerated leaching of ore, water quality, water quantity changes

# Processing/Beneficiation

- Processing/beneficiation: concentrating metals from ore
  - Crushing, grinding, physical/chemical separation of concentrate (flotation, leaching)
  - Final product (smelting, SX/EW, Carbon-in-Leach for Au)
- Potential impacts: cyanide/acid spills, leaching of tailings and spent heap leach, smelter emissions, slag leaching, water quality, water quantity changes

# Reclamation

- Reclamation: returning to beneficial use after mining
  - lessening slopes, capping, removing buildings and roads, revegetation
- Potential impacts: temporary construction impacts, introduction of non-native plants, rising groundwater levels after dewatering

# Closure/Post-closure

- Closure/post-closure: ongoing period after mining and reclamation are completed
  - Can last for tens of years (CERCLA = 30 yrs) and requires bonding for water treatment (if necessary), maintenance, monitoring, and unexpected environmental impacts
- Potential impacts: ongoing groundwater/surface water quality impacts

# Types of Mines and Sources of Contamination at Mine Sites

- Open pits
- Underground workings
- Waste rock
- Tailings
- Smelters and smelter slag
- Cyanide heap leach piles
- Acid leach piles
- Liquid and solid storage facilities

# Contaminants of Concern

- Metals
- Acid/base
- Radionuclides
- Sulfate, nitrate
- Extraction/beneficiation reagents

# Periodic Table of the Elements

		IA																				0
1	1																					2

# Metals and Metalloids

- Cadmium, copper, lead, zinc
  - Copper mines
  - Gold mines
- Iron, manganese
  - Potential baseline issues
- Thallium, beryllium
  - ‘rare’ contaminants that are toxic in low concentrations
- Metalloids/oxyanions
  - Arsenic
  - Selenium
  - Molybdenum...

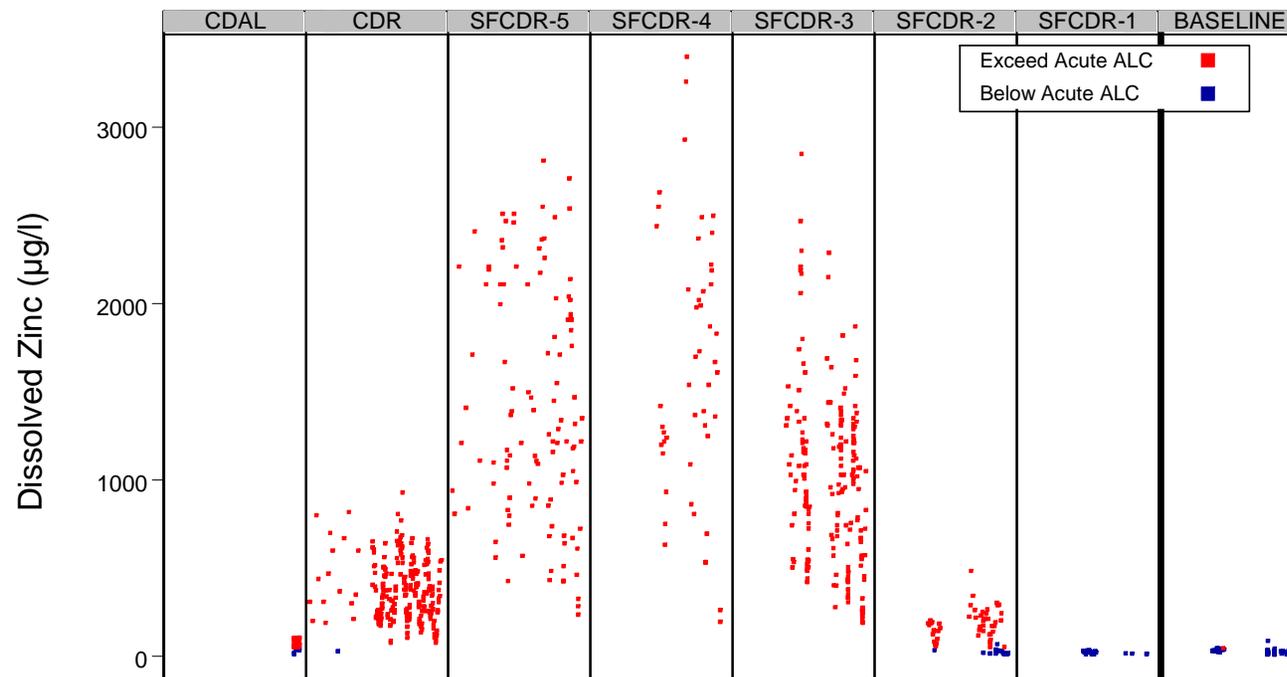

# Water Quality Standards ( $\mu\text{g/l}$ )

Standard	Cadmium	Copper	Lead	Zinc	Arsenic
Aquatic Life: Chronic (CCC)	0.25	9.0	2.5	118	150
Aquatic Life: Acute (CMC)	2.01	13.4	65	117	340
Drinking Water: MCL/SMCL	5	1,300 (action level)	15 (action level)	5,000	10
Drinking Water: MCLG	5	1,300	0	5,000	0

*Aquatic life criteria @ 100 mg/l hardness*

# Zinc in Coeur d'Alene River, Idaho

## Zinc Concentrations in Mainstem Reaches - Acute

1024c

# Acid/Base

- Acid (mine/rock) drainage (pH <1 to 6)
  - One of largest water quality problems at hard rock mine sites (groundwater, surface water, aquatic biota, wildlife)
  - Pyrite + air + water = acid + sulfate + iron
  - Leaches more metals
- Basic mine drainage (pH 8.5 to 12+)
  - Tailings, cyanide, weathering of rocks, oxyanions

# Acid Drainage: Eagle Mine, Colorado

Photos by Ann Maest

# Acid Drainage: Colorado

[http://www.mines.edu/fs\\_home/jhoran/ch126/amd.htm](http://www.mines.edu/fs_home/jhoran/ch126/amd.htm)

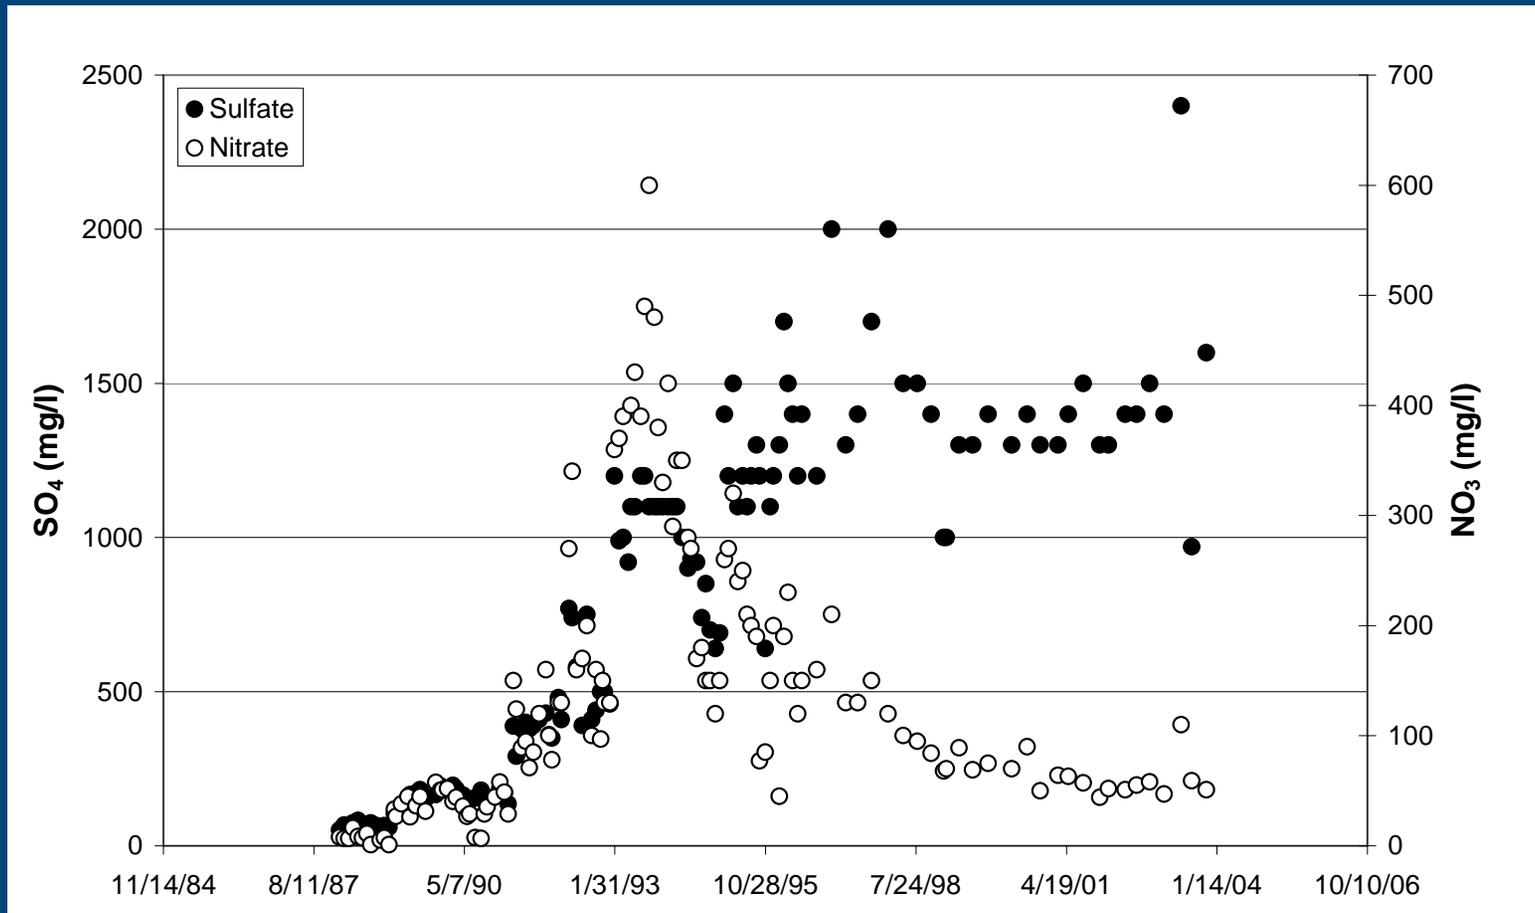

# Radionuclides

- Gamma emissions from adits
- Uranium, thorium, radon
- Humans most sensitive species

# Sulfate and Nitrogen Compounds

- Sulfate in groundwater and surface water
  - Sources: pyrite and other sulfides
  - Delayed reaction – can take years for acid drainage and sulfate to impact waters
- Nitrate and ammonia in groundwater and surface water
  - Main source: blasting (TNT or ammonium nitrate)
  - Usually dissipates in 5 to 15 years after blasting stops

# Jamestown Mine, California

*Groundwater downgradient of tailings and waste rock*

*Kuipers et al., 2006*

# Extraction/Beneficiation Reagents

- Flotation reagents
  - Xanthates, carbamates, thiophosphates, mercaptobenzthiazole, frothing reagent, cyanide
  - Toxic to microorganisms, aquatic biota, but concentrations generally low
- Beneficiation reagents
  - Cyanide
  - Cyanide alternatives
  - Bacteria

*Montana Tunnels, MT (Pb, Zn) Flotation*

*Photo by Ann Maest*

# Transport of Contaminants from Mining Sources

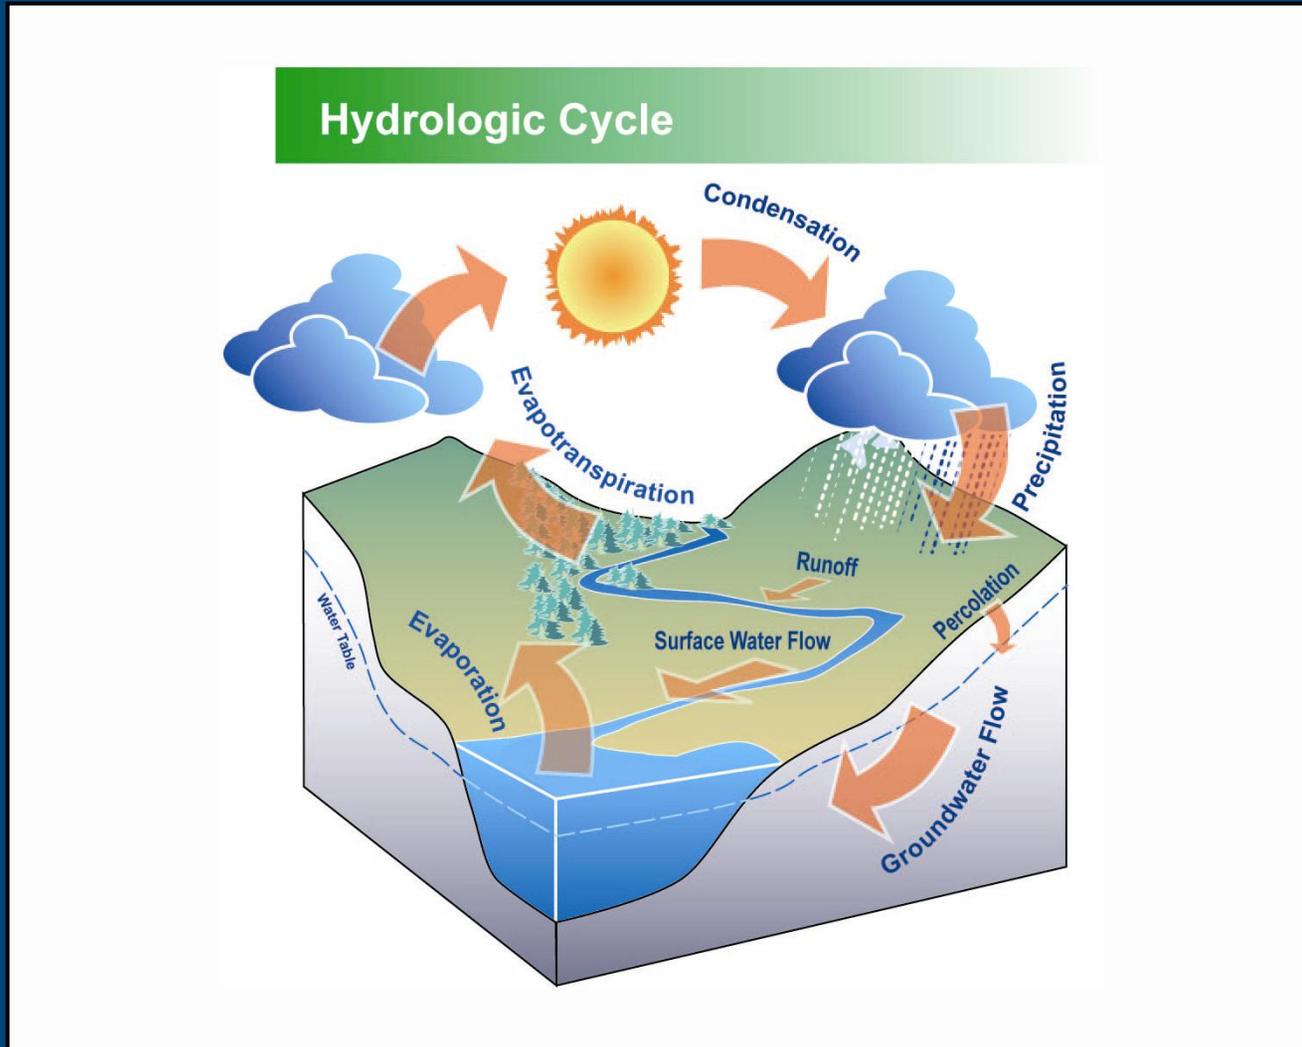

*Grasberg Open Pit, New York Times, 12/27/05*

# Fate and Transport

- Physical movement of chemical constituents from sources to receptors
- Chemical changes and interactions along that pathway

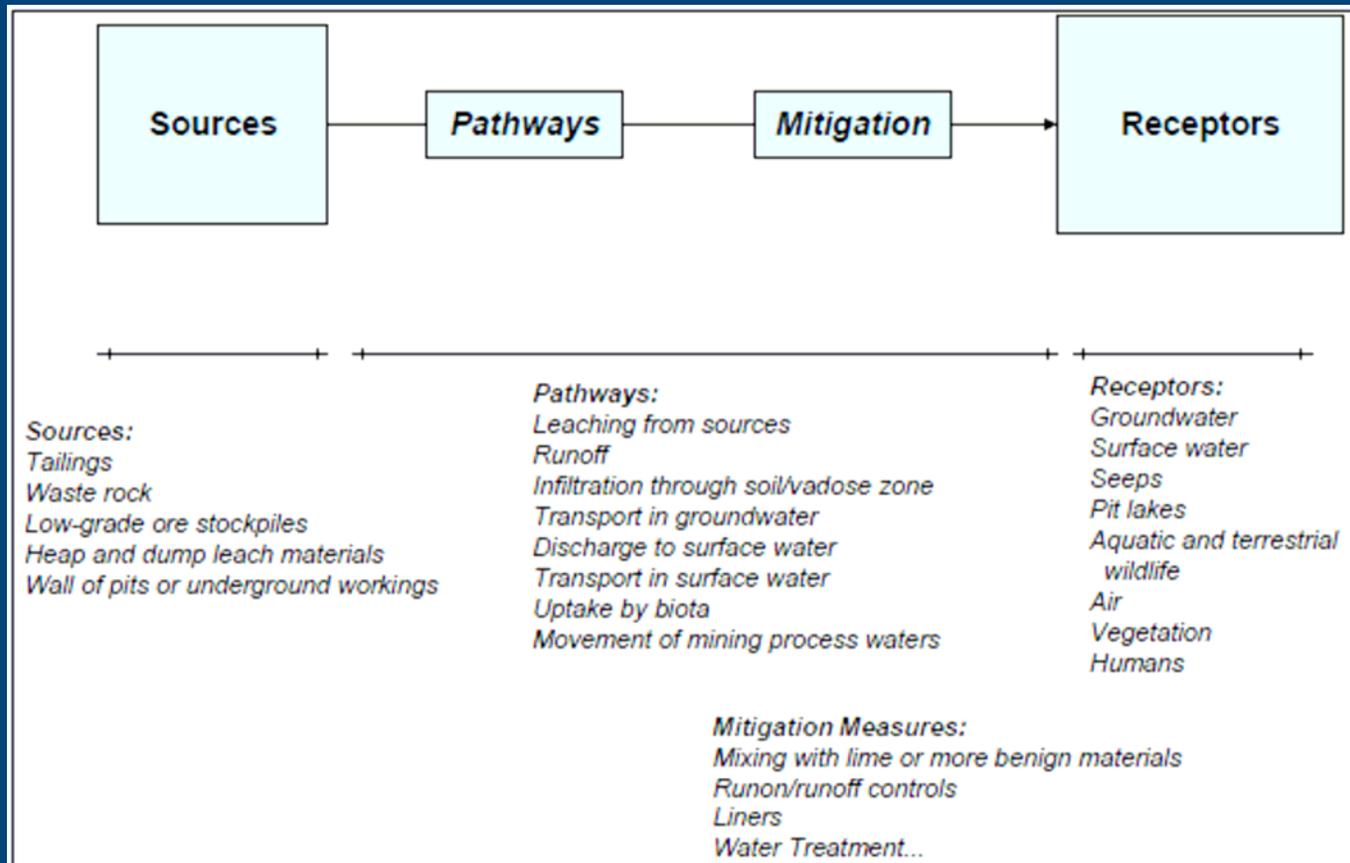

# Pathways: Hydrologic Cycle

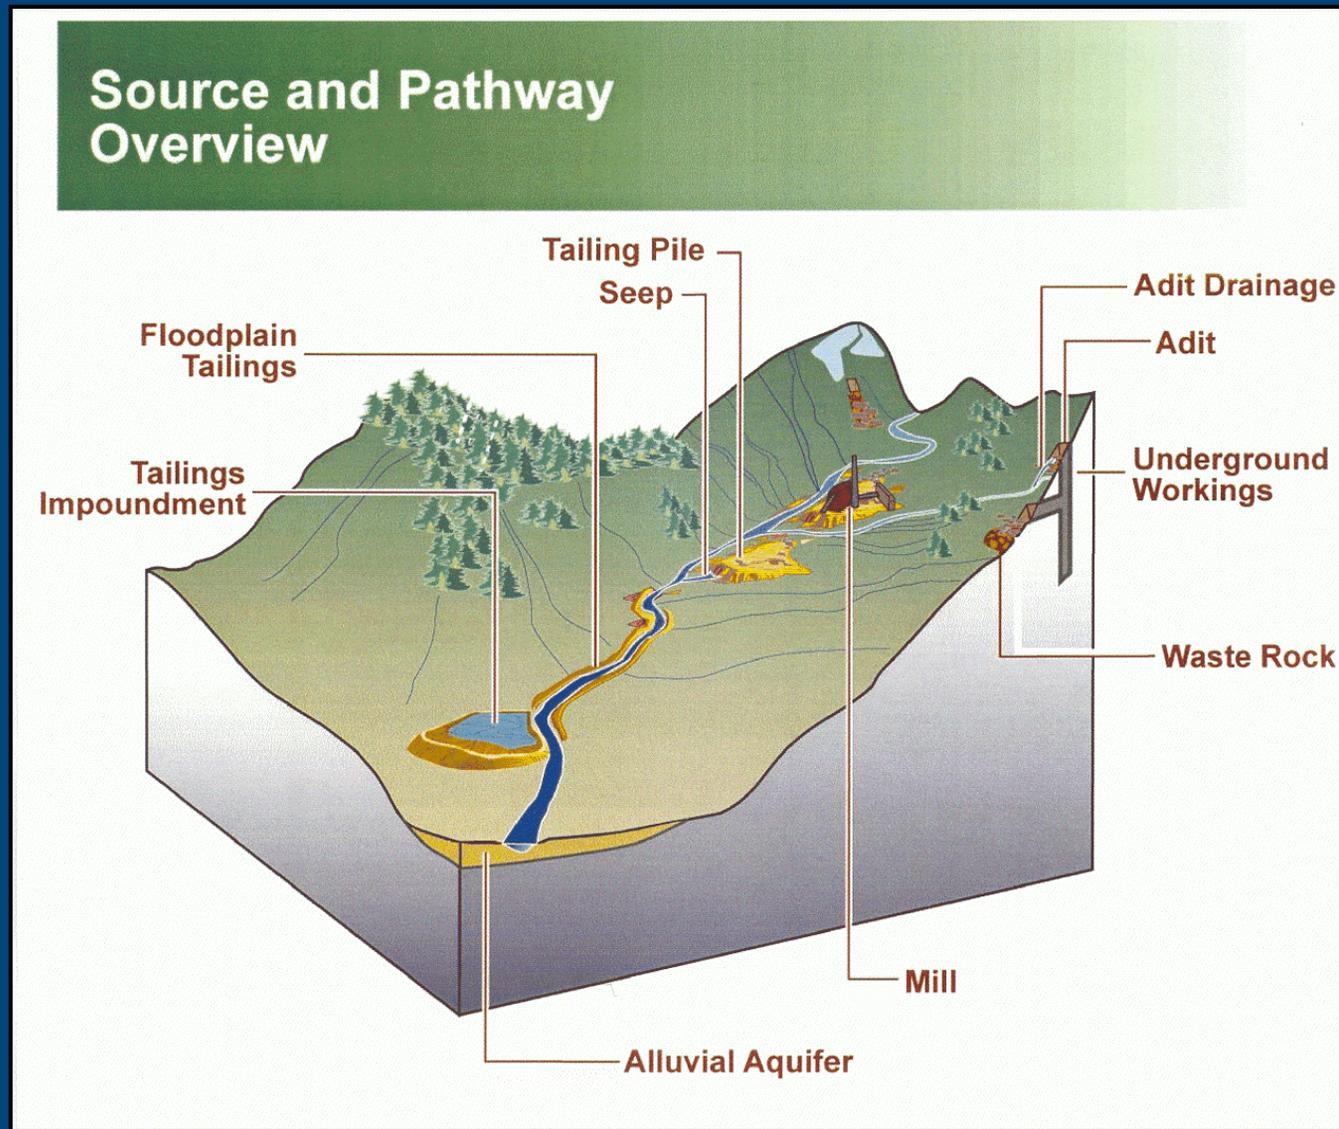

# Primary Sources at Mine Sites

- Underground workings
- Open pits
- Waste rock
- Tailings
- Leach pads, solution ponds
- Stock piles
- Smelter emissions

# Generalized Mine Site Fate and Transport

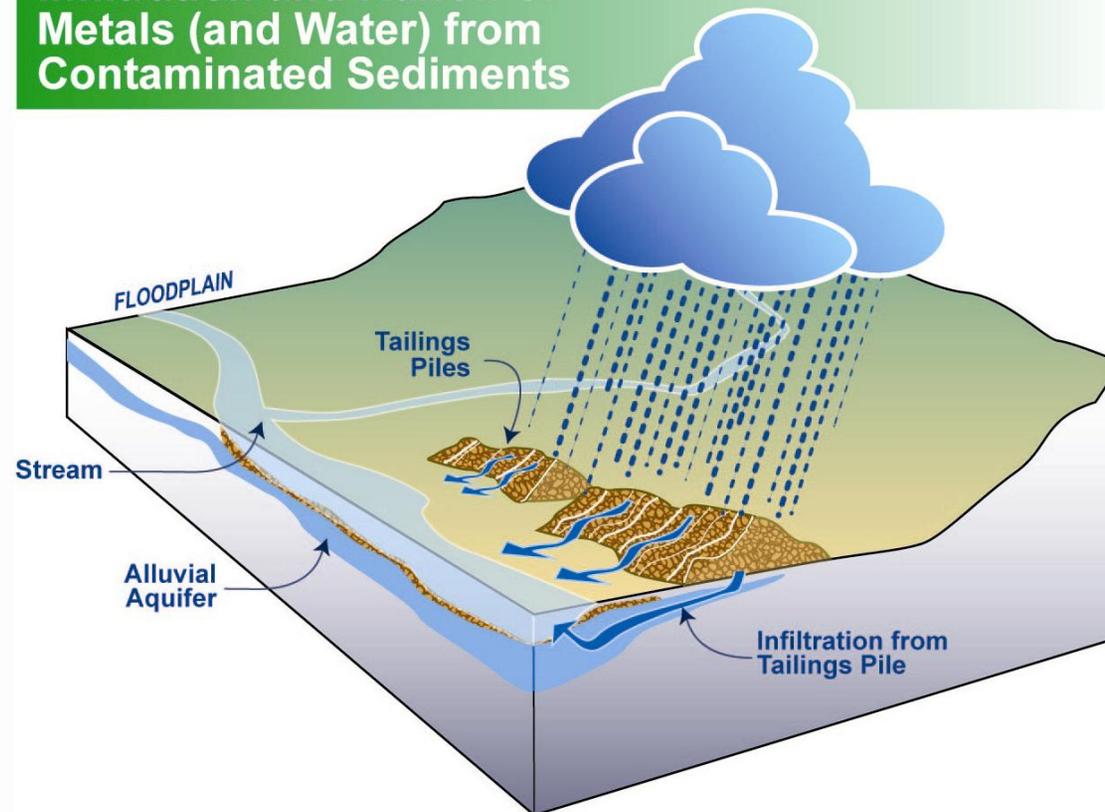

# Source and Pathway Overview

# Pathways: Infiltration and Runoff

## Infiltration and Runoff of Metals (and Water) from Contaminated Sediments

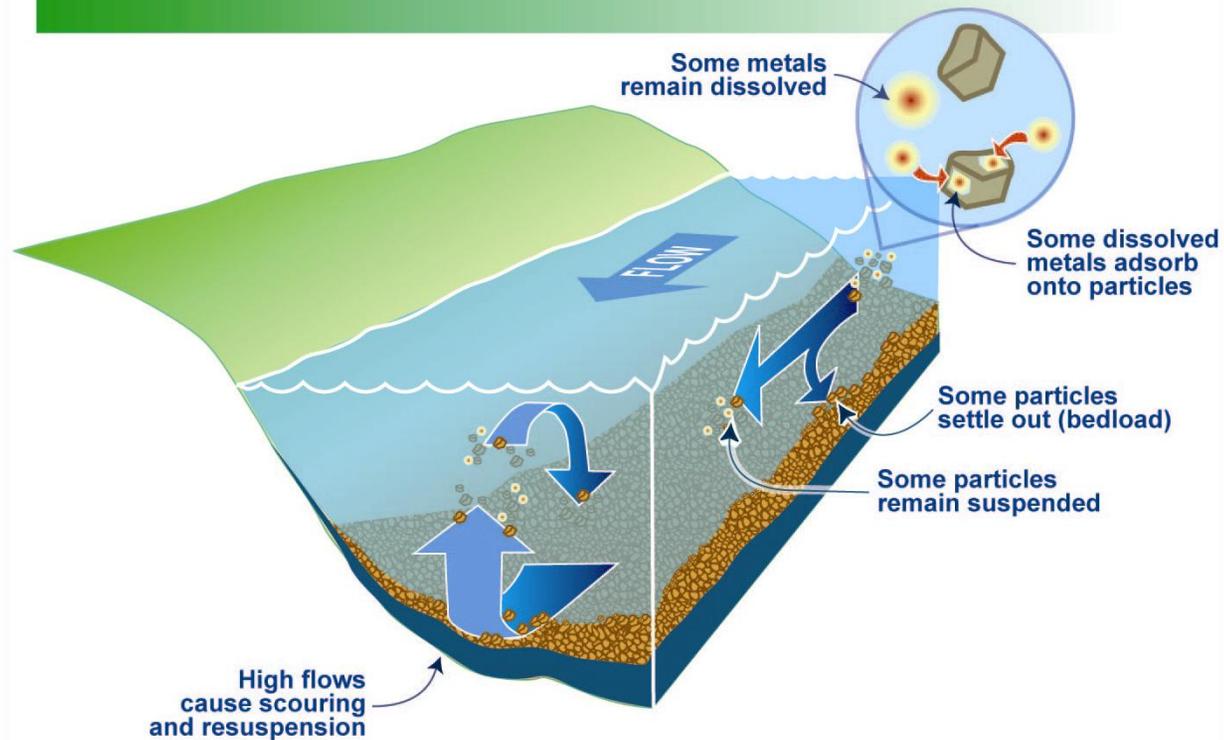

# Pathway: Leaching of Mine Materials

- Moving from solid to liquid
  - Acid and/or metal-rich drainage, metal salts/crusts
- How to test or predict/simulate
  - Before mining begins: leach tests – short term, long term
  - Active mining: sample drainage

# Pathway: Transport in Streams

## Particulate, Dissolved, Suspended, and Bed Loads in River

# Receptor: Runoff from Blackbird Mine, Idaho – Panther Creek
