Protecting and Restoring Floodplains to Manage Stream Health

Chris Bowles, Ph.D., **cbec**
SWRCB Training Academy -
Stream Channel Naturalization
May 29, 2008

2701 Del Paso Road, Suite 130/232, Sacramento, CA 95835, USA
T/F 916 570 2502 C 916 243 8290 chrisbowles@mac.com

Environmentally sustainable solutions for the water resources industry

Overview of Presentation

- 1. Floodplains and where have they gone?**
- 2. The importance of floodplains.**
- 3. Multi-objective floodplain management.**
- 4. Examples of what we are trying to do and what we have done (success?)**

Photo: Roman Loranc

1. Floodplains and where have they gone?

Traditional Flood Engineering

**Floods Have Been Around For
A Long Time...**

The Floodplain Management Association

Friday, May 30, 2008

Traditional Flood Engineering

Southwest Flooding

Great Flood of 1862

- ✓ Inundated the Sacramento and San Joaquin Valleys for 300 miles with an average breadth of 20 miles
- ✓ Four weeks of rain
- ✓ Inland Sea in Orange County

The Floodplain Management Association

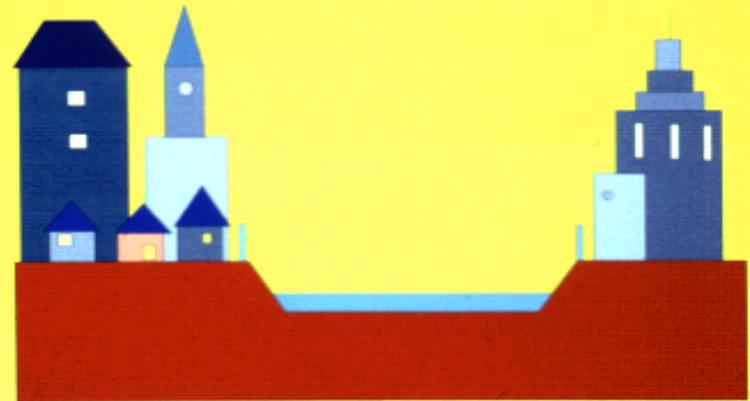

Traditional Flood Engineering

THAMES WATER - ANNUAL REPORT, 1974

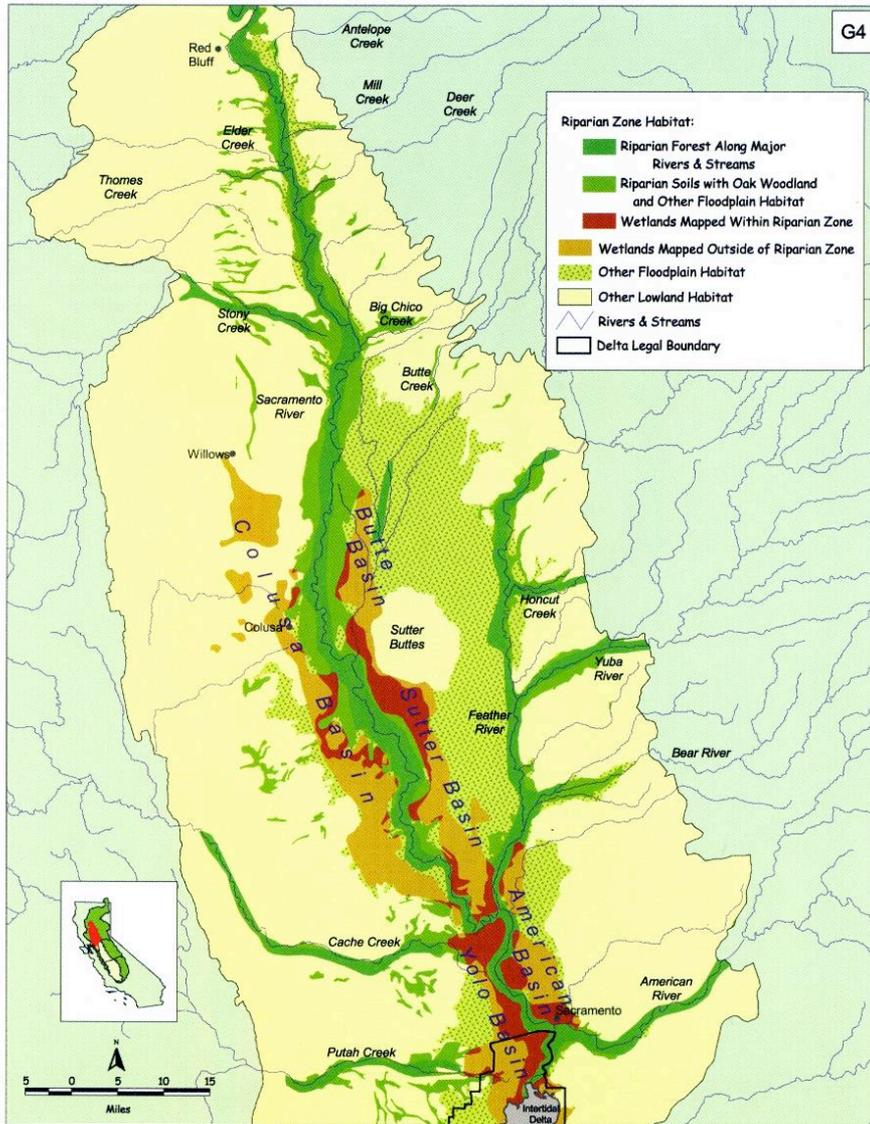

- Rivers as formed by nature are seldom ideally suited for our work.
- ...Ditches and streams must often be straightened.

Traditional Management Philosophy

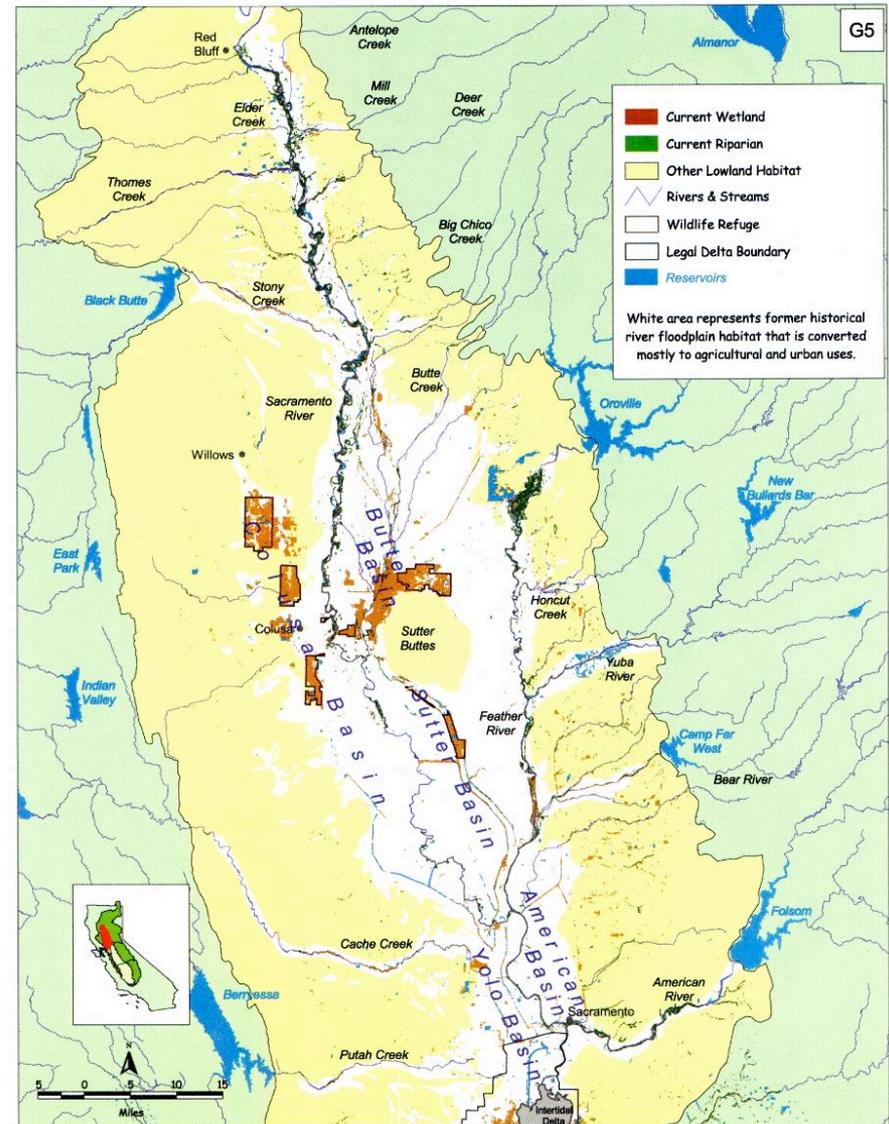

- * Control of Nature
- * Single objective: flood control
- * Protection of lives and property
- * Minimum flood channel width
- * Hydraulic engineering
- * Channelization
- * Separation of community from rivers and creeks

The Sacramento River's Wetlands, Then and Now

300,000 yd³**

Actual = X3

Case Studies - We have got better...but

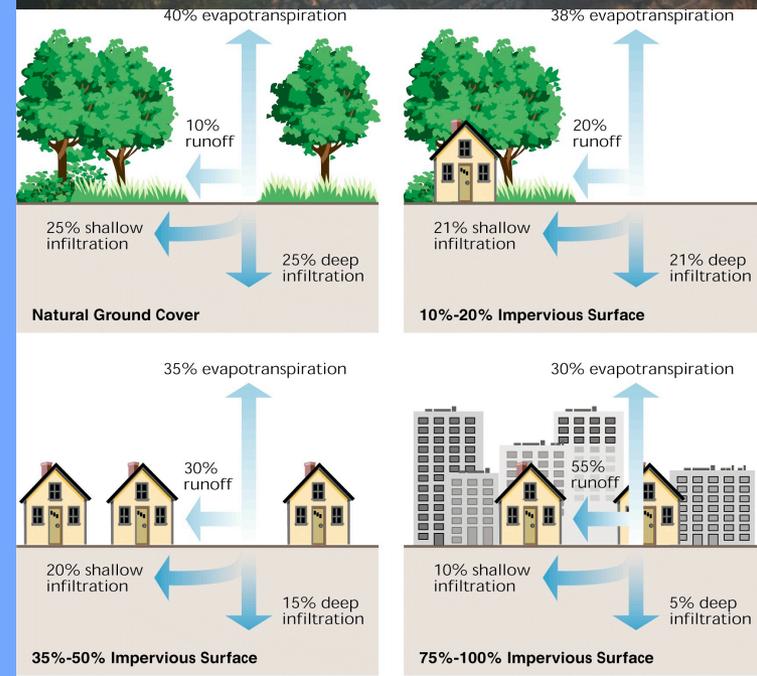

SWRCB Urban Stream Workshop, May 29, 2008

Friday, May 30, 2008

How Floodplains Have Been Disconnected from the River

- Landscape modifications
 - Levee construction
- Hydrologic changes:
 - Upstream reservoir ‘flatlining’ flood flows
 - Diversions and watershed changes upstream
 - Climate change
- Geomorphic changes:
 - Channel degradation:
 - Reservoir bed load capture
 - Gravel and sand mining
 - Floodplain aggradation
- Hydraulic changes
 - Channelization
 - Riparian vegetation removal

2. The importance of floodplains

Floodplains – so what?

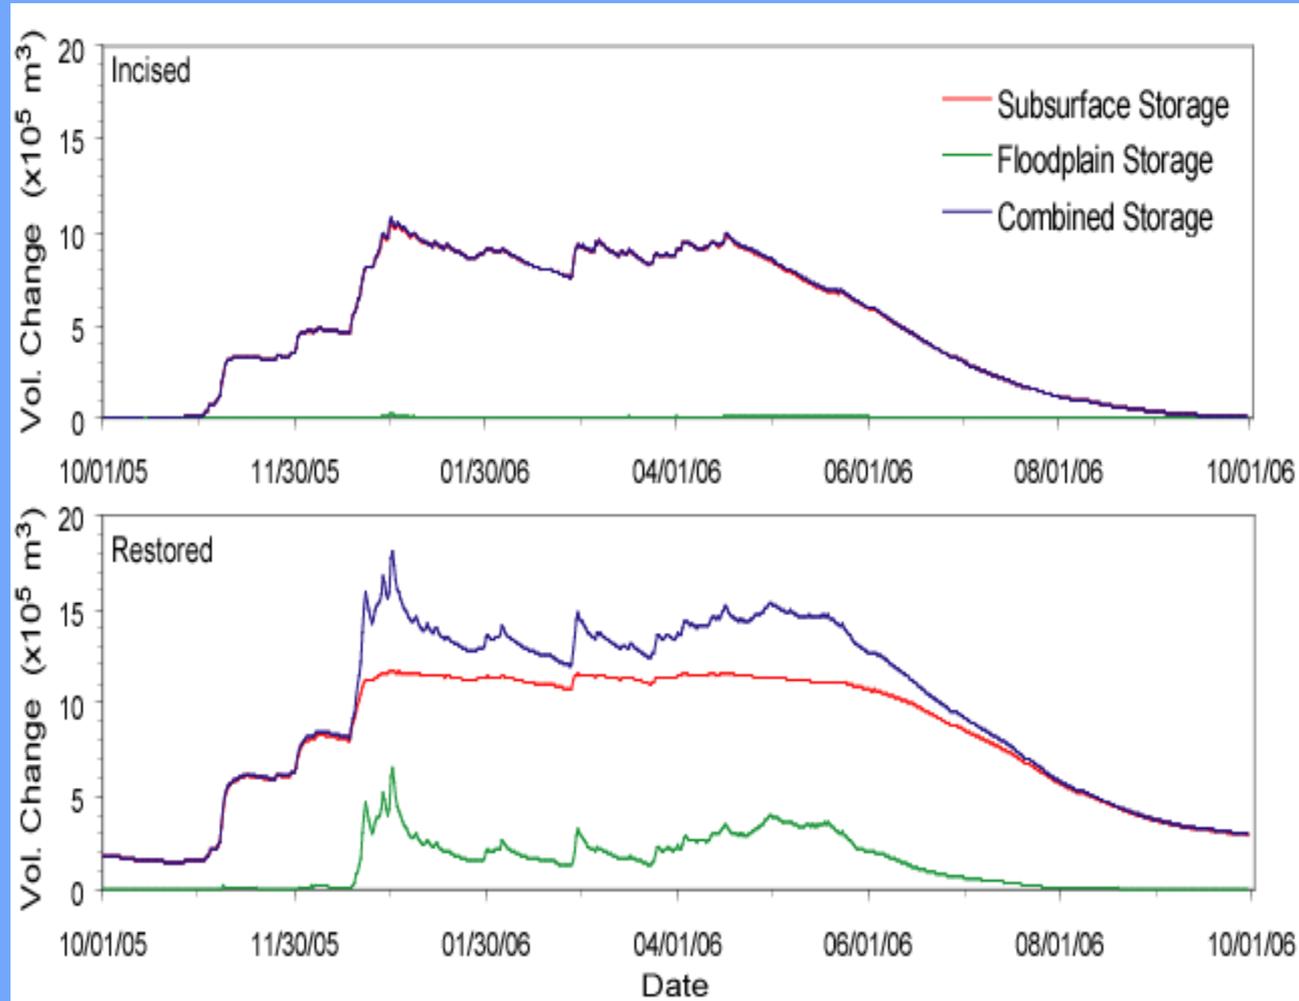

CHRIS BOWLES, 2006

- Floodplains are the sponges of our ecosystems.

Floodplains – so what?

- Floodplains are the sponges of our ecosystems.

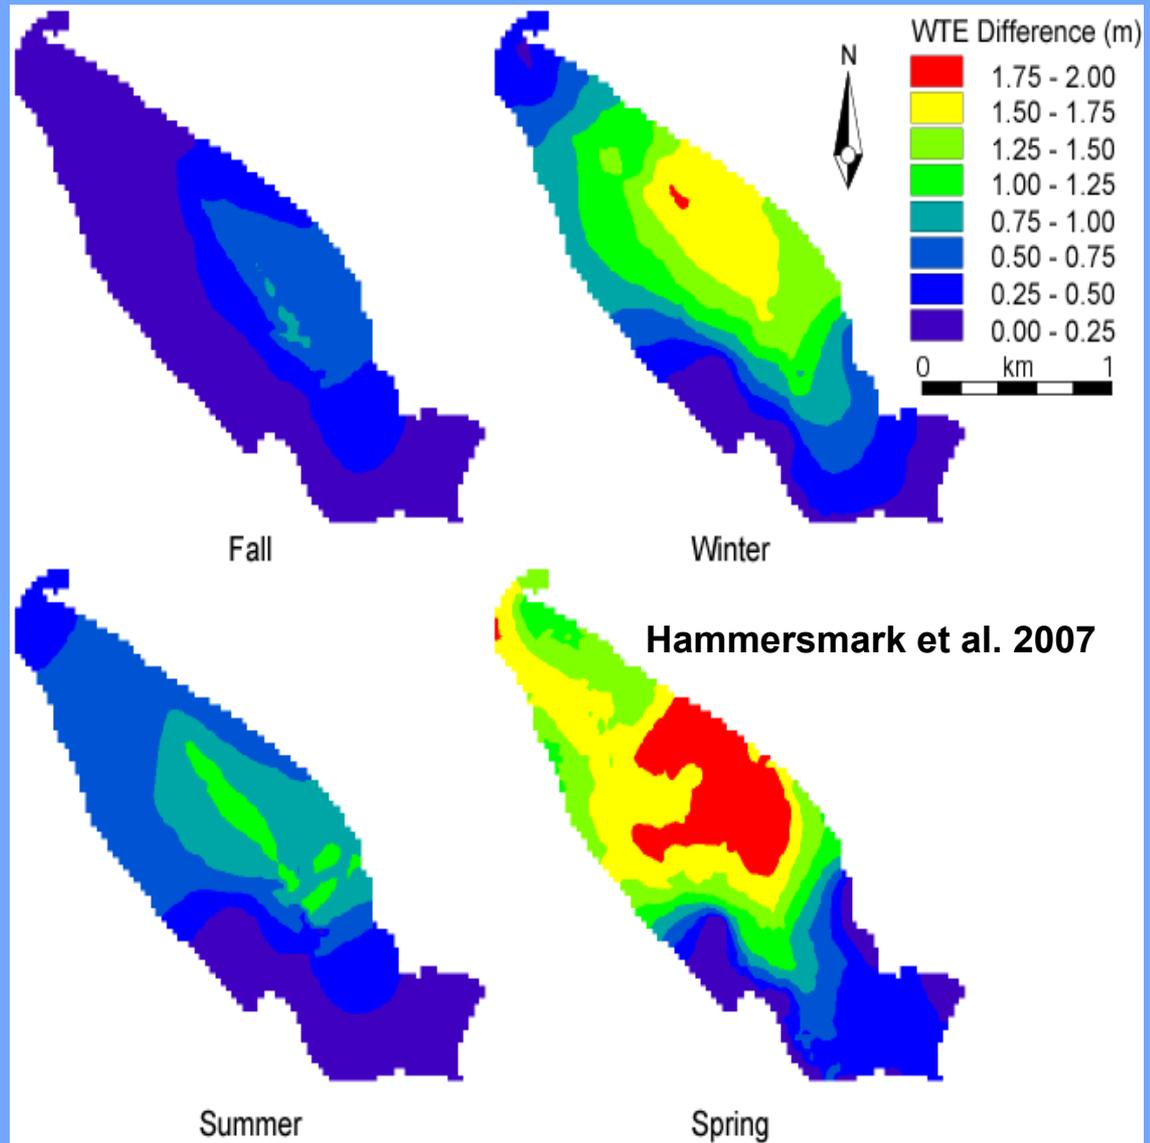

Bear Creek,
California

Hammersmark et al. 2007

Groundwater

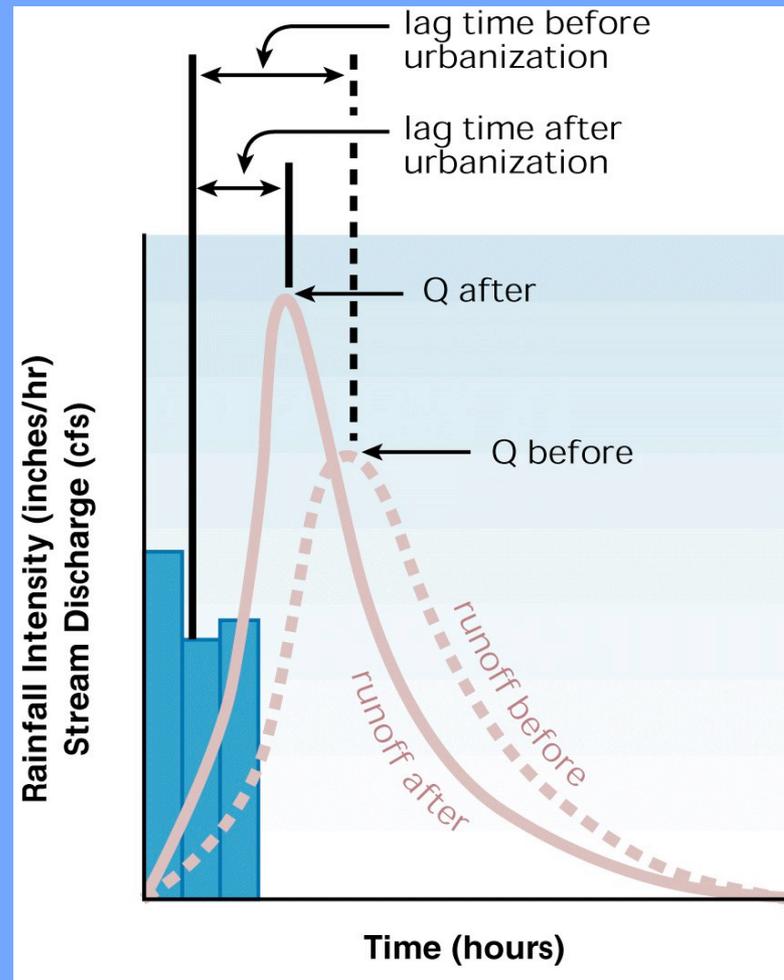

- Groundwater levels raised
- Largest difference in winter and spring
- Complex response due to channel realignment
- Larger maximum and residual volume stored

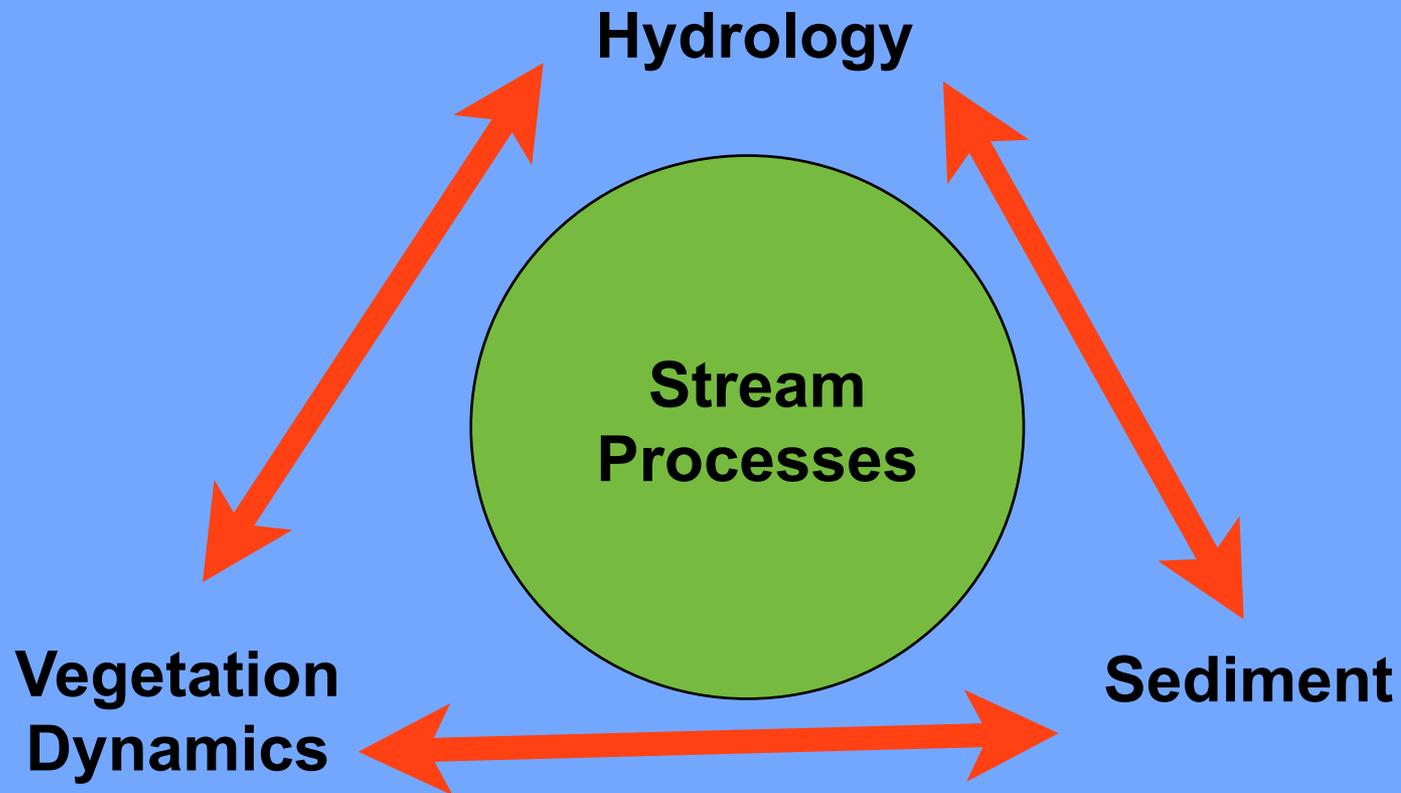

HYDROGRAPH PROCESSES

Urbanization tends to increase stormwater runoff:

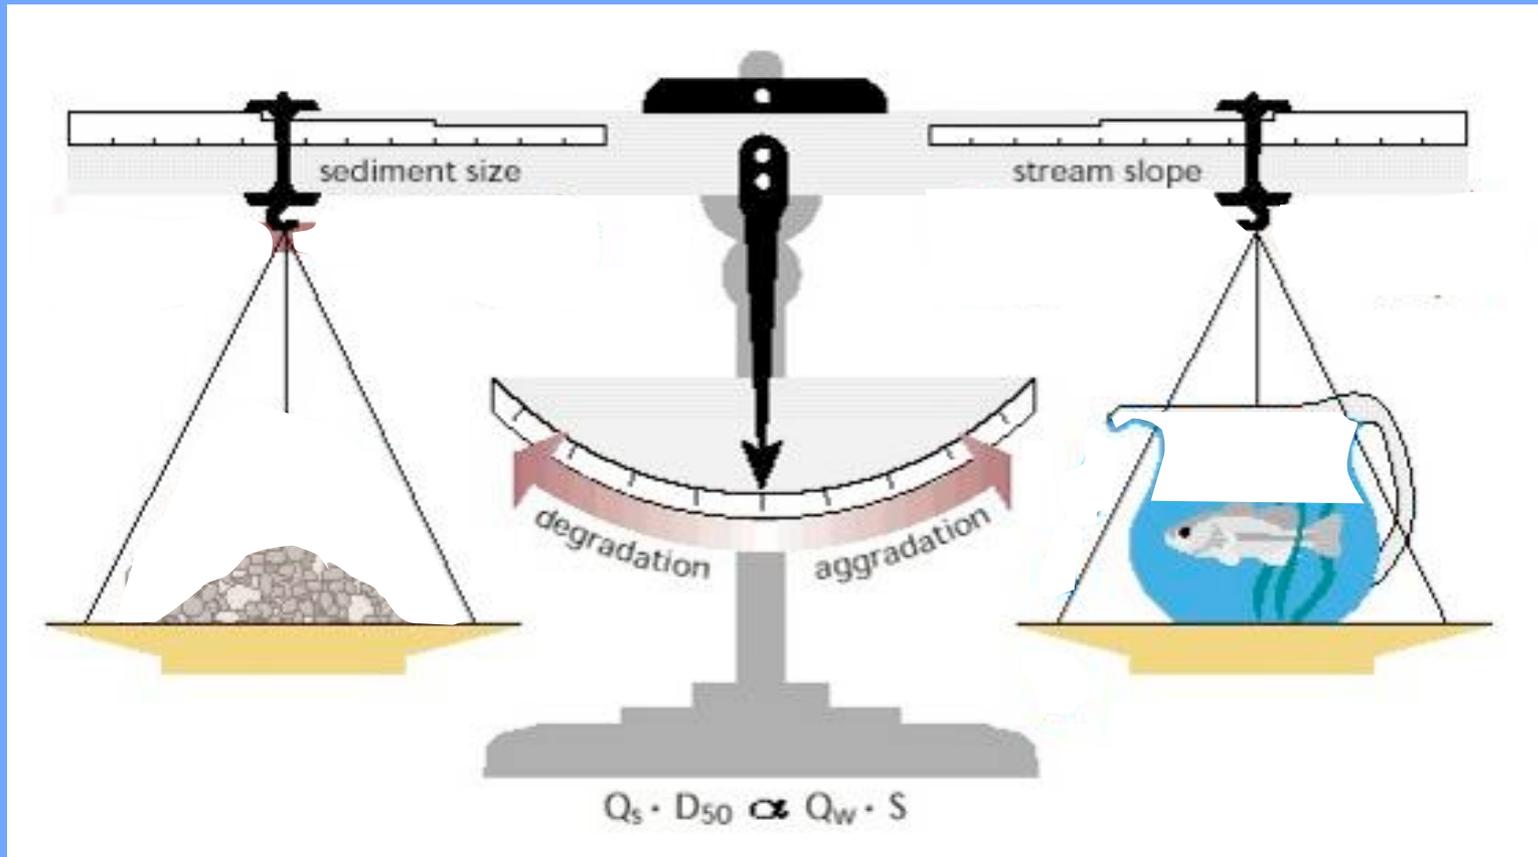

- peak flows
- volume
- frequency

It's not just about the hydrology...

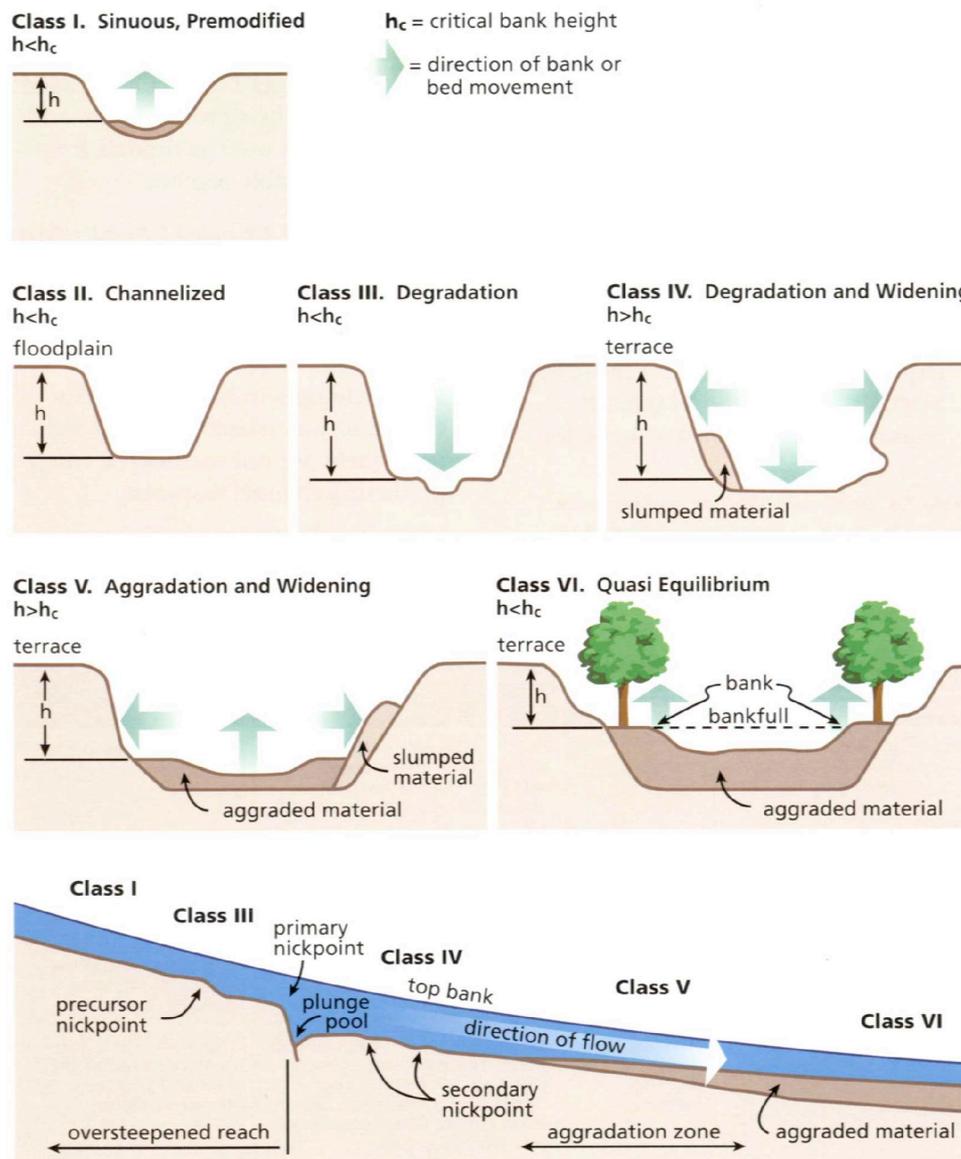

Lane's Diagram by Rosgen, 1996

Over time channel geometry (width, depth, gradient) adjusts to be in equilibrium with water and sediment load

IMPACTS TO RIVERS AND CREEKS

Simon, 1989
Schumm, 1977

IMPACTS TO RIVERS AND CREEKS

Aliso Creek,
Orange County
(Geosyntec)

IMPACTS TO RIVERS AND CREEKS

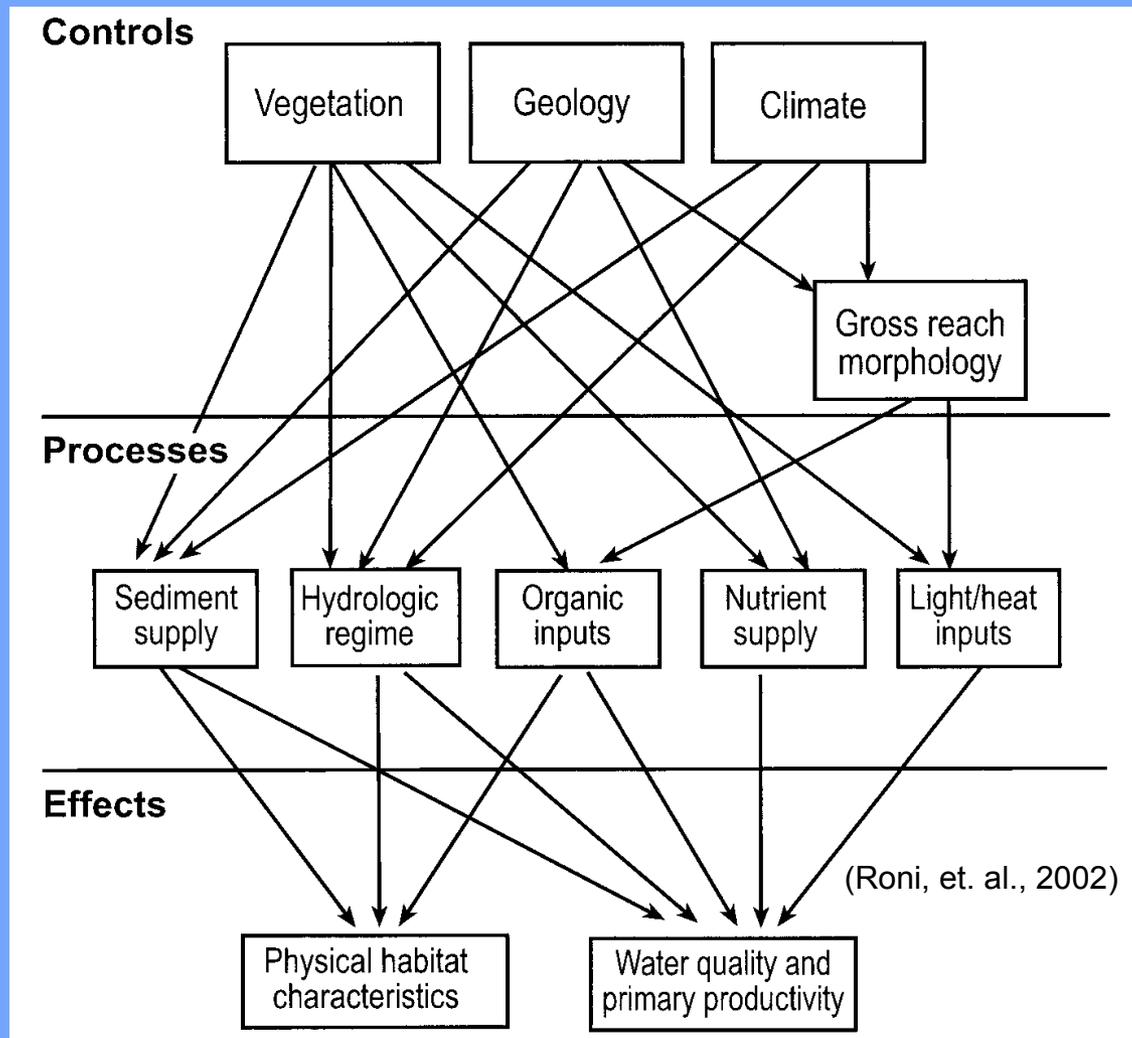

Thompson/Lower Silver
Creeks (San Jose)
(Geosyntec)

Ecological Importance of Floodplains

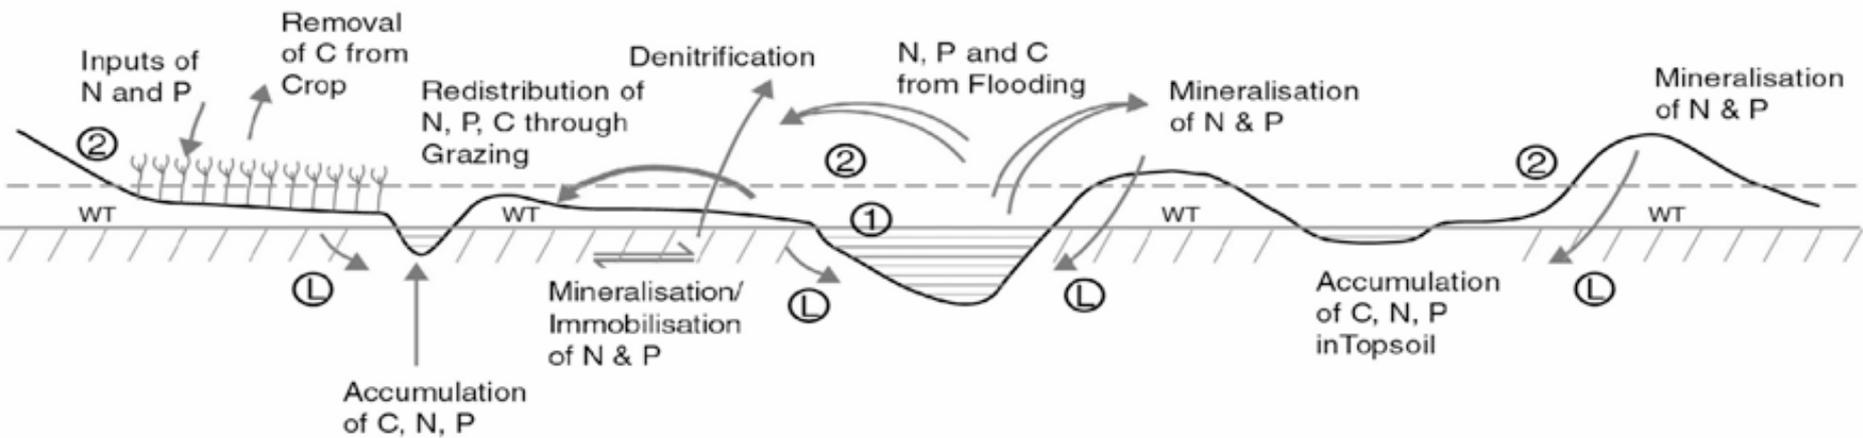

- Magnitude
- Timing
- Frequency
- Duration
- Rate of change

Real data – other benefits of multi-objectives...

FIGURE 4. Schematic of nitrogen, phosphorus and carbon behaviour at sites.

Topographic Feature	Floodplain	Drainage Ditch	Floodplain Meadow	River Channel	Natural Levée	Flood Plain 'Basin'	Flood Embankment
Land Use	Arable		Grazing			Grazing	
Inundation	Average	Average	Common		Infrequent	Common	Rare

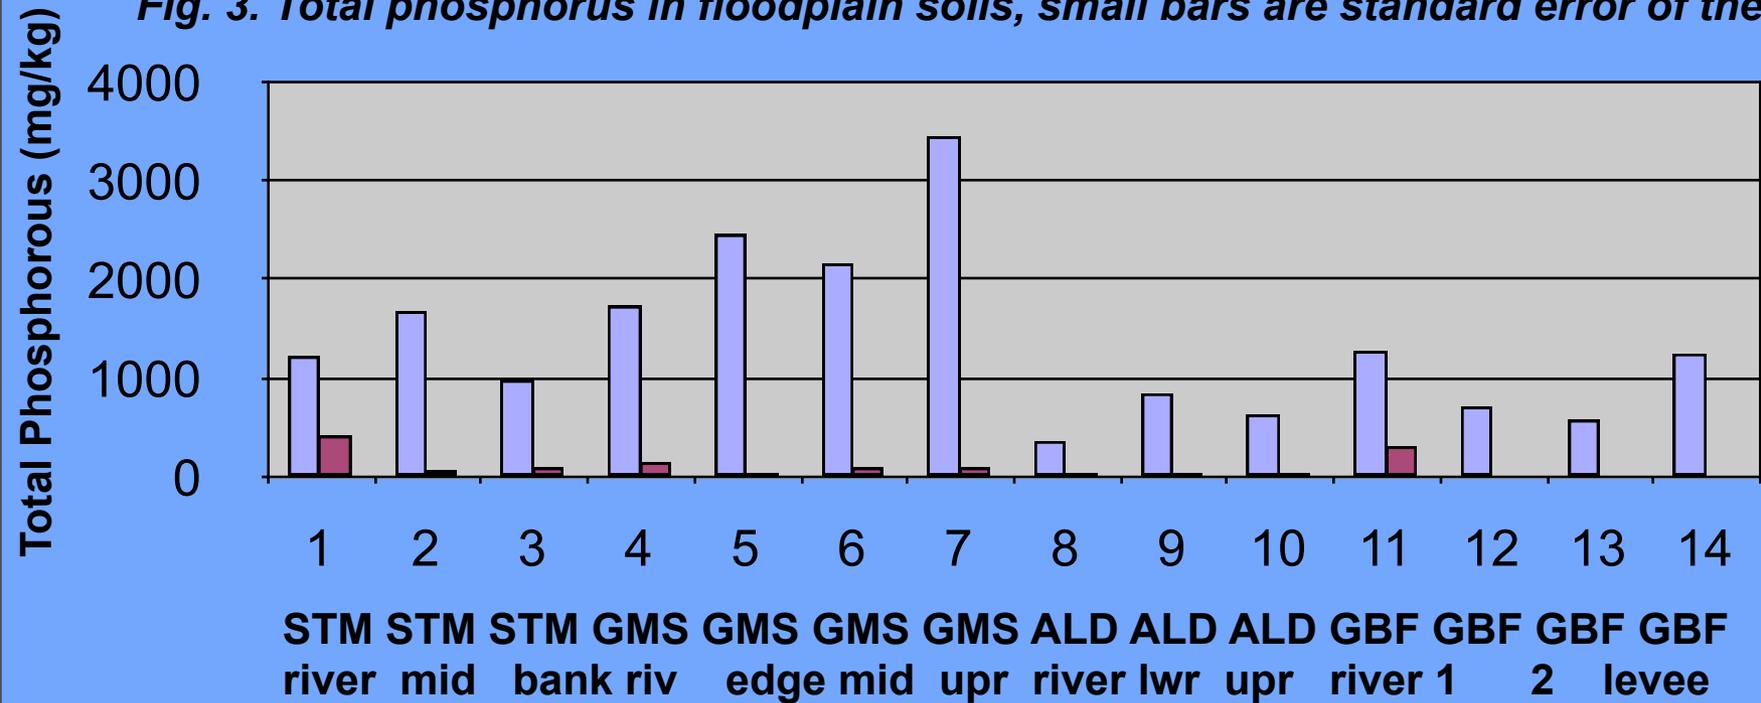

- Key:
- ① Riverstage at mean flow
 - ② Riverstage at mean annual flood ($Q_{2.33}$)
 - Ⓛ Significant leaching occurs
 - WT Watertable at stage 1

Cook, et al., 2007 (Dr Hadrian F Cook MCIWEM, Harnham Water Meadows Trust, UK)

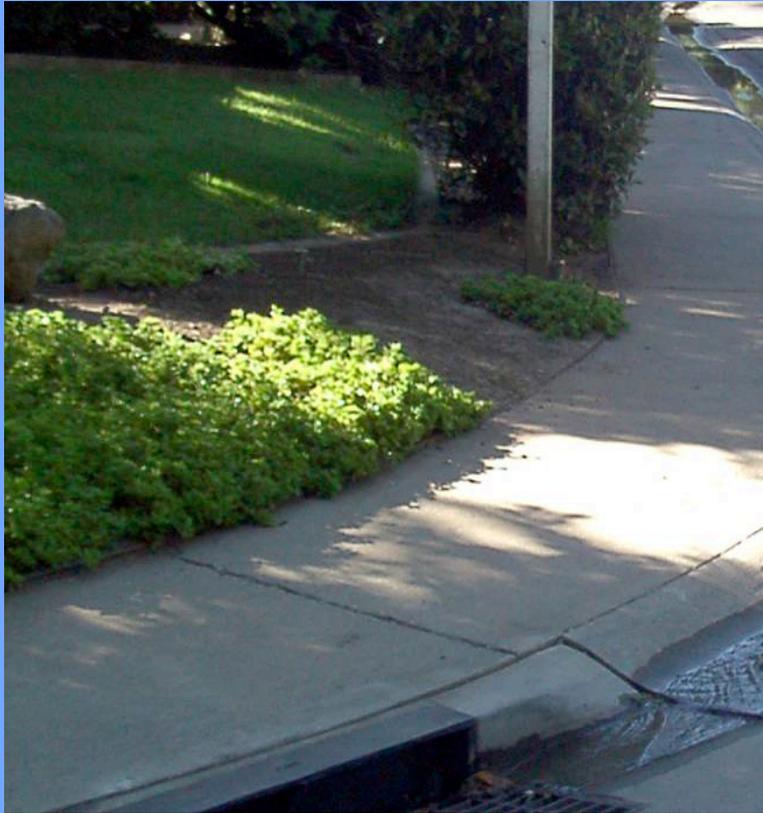

Real data...from the UK

Friday, May 30, 2008

3. Multi-objective floodplain management

Overview of Presentation

Multi-Objective Flood Corridor Management
=
Flood Risk Reduction
(aka - OFFLOAD VOLUME WHEREVER POSSIBLE!!!)
+
Socio-Economic Issues (Development, etc.)
+
Maintenance
+
Water Quality
+
Ecosystem
+
Recreation

Floodplains – so what?

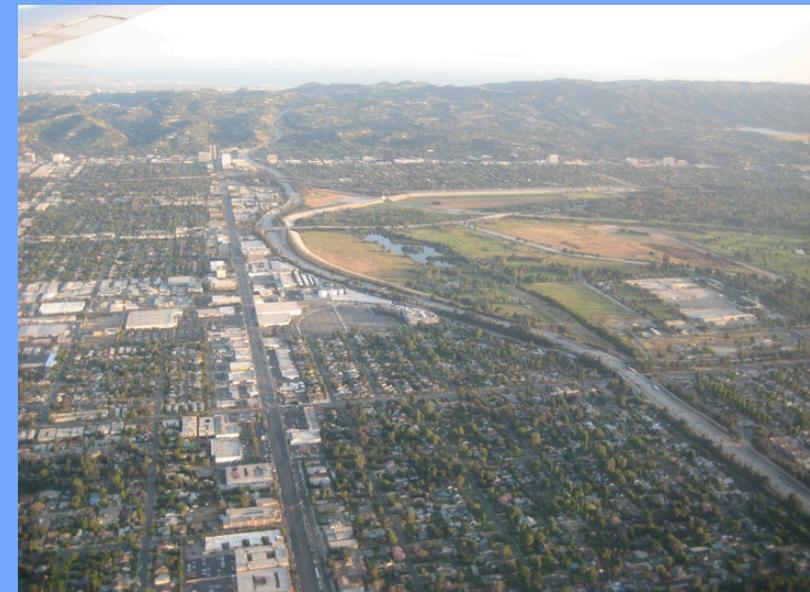

Multi-Objective Floodplain Management

1. Alleviates flood risks.
 - a) Protects lives and properties up to the design flood.
 - b) Minimizes damages for larger floods.

2. Preserves natural channel morphology and character.

3. Minimizes long-term maintenance
 - a) Sediment excavation costs.
 - b) Vegetation management
 - c) Structural repair

Multi-Objective Floodplain Management - Cont.

4. Enhances biological resources
5. Improves water quality
6. Mitigates ecological impacts within project boundaries
7. Accounts for watershed evolution and accounts for river as a system
8. Integrates recreational and aesthetic opportunities
9. Is supported by community and regulatory agencies

4. Examples of what we are trying to do and what we have done (success?)

Friday, May 30, 2008

Santa Clara River

- A Resource of Local, State and National Importance
- Largest river in southern California and most significant (ie. One of the last in a relatively natural state)
- River Parkway: the largest river restoration project in southern California

Santa Clara River Enhancement and Management Plan Issues

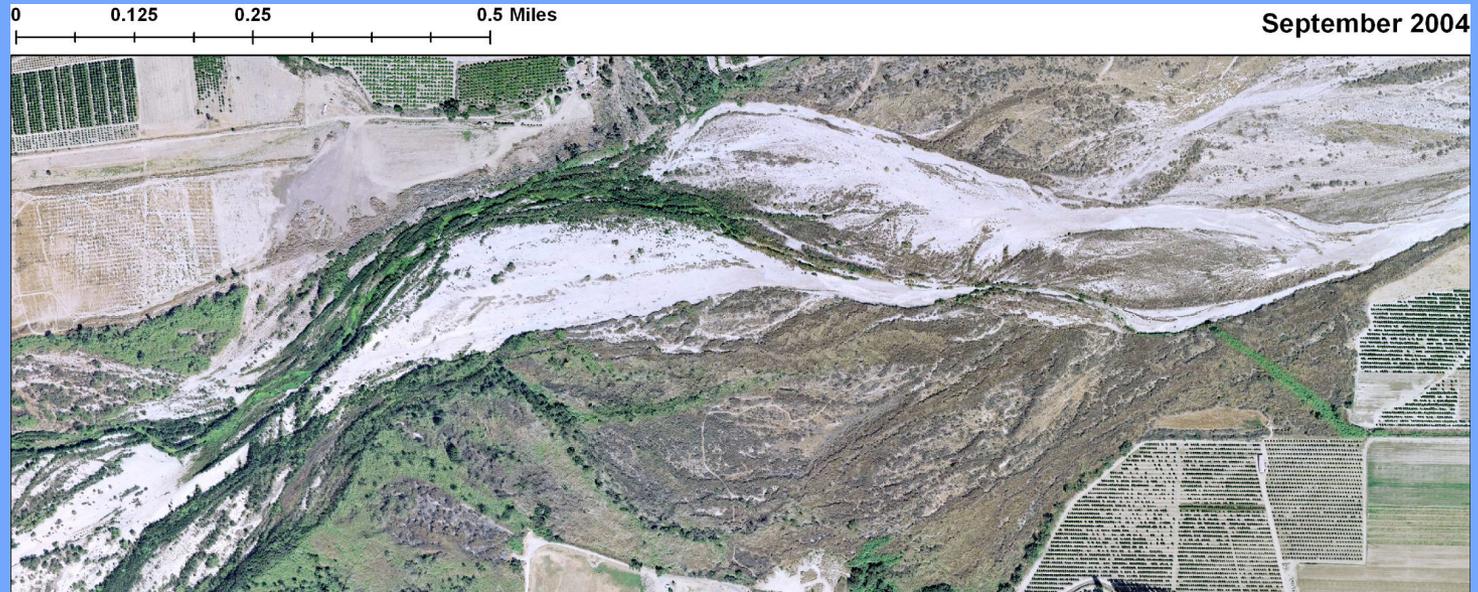

- Private Property Rights
- Agricultural Land Use Preservation
- Permit Streamlining
- Flood Protection
- Preservation/Enhancement of Species Habitat
- Aggregate Harvesting
- Beach Erosion and Replenishment
- Recreation
- Cultural Resources
- Water Supply/Water Quality/Water Recharge

A Coastal Conservancy Project
Developed with property owners of
the Santa Clara River
and in partnership with the Nature
Conservancy

River Parkway Concept

- Acquisition and public management of the river corridor for habitat restoration, flood management, public enjoyment and environmental education
- Restoration of the natural processes of the river to prevent continued catastrophic losses of habitat, farmland, and public facilities

Dynamics

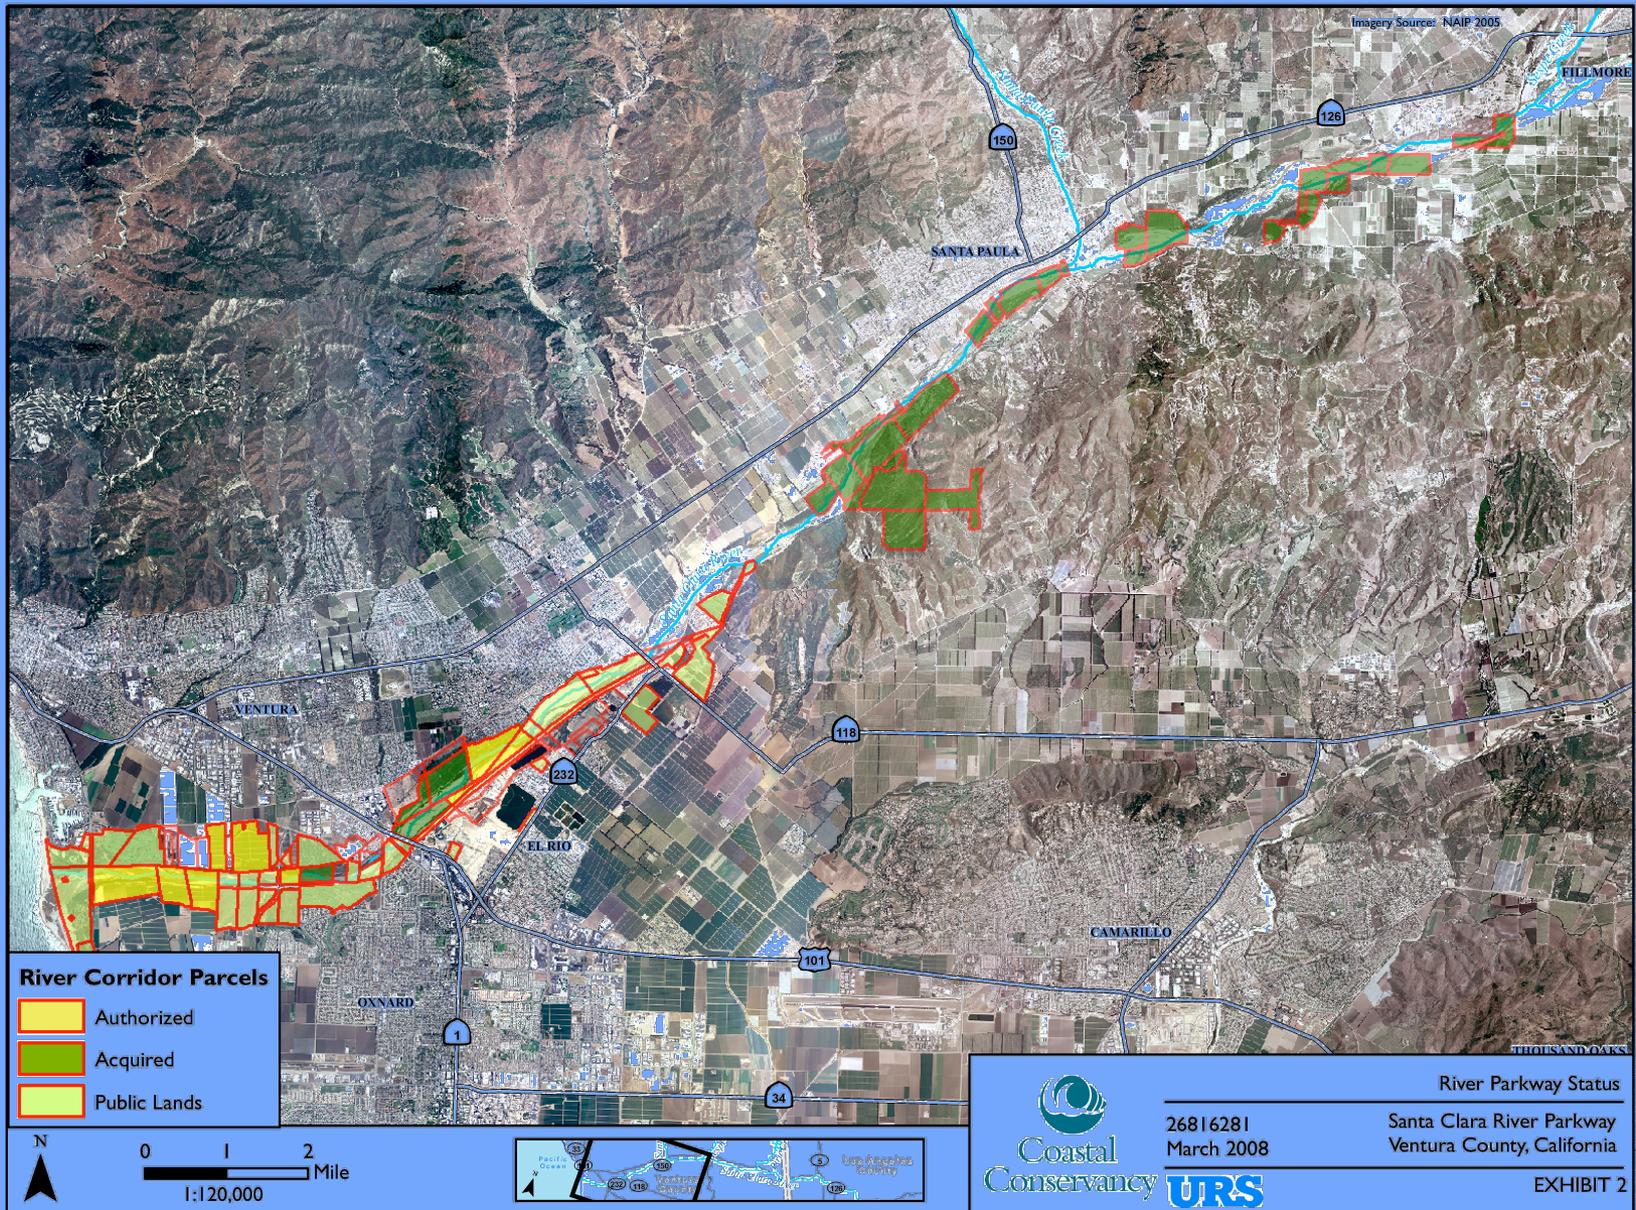

September 2004

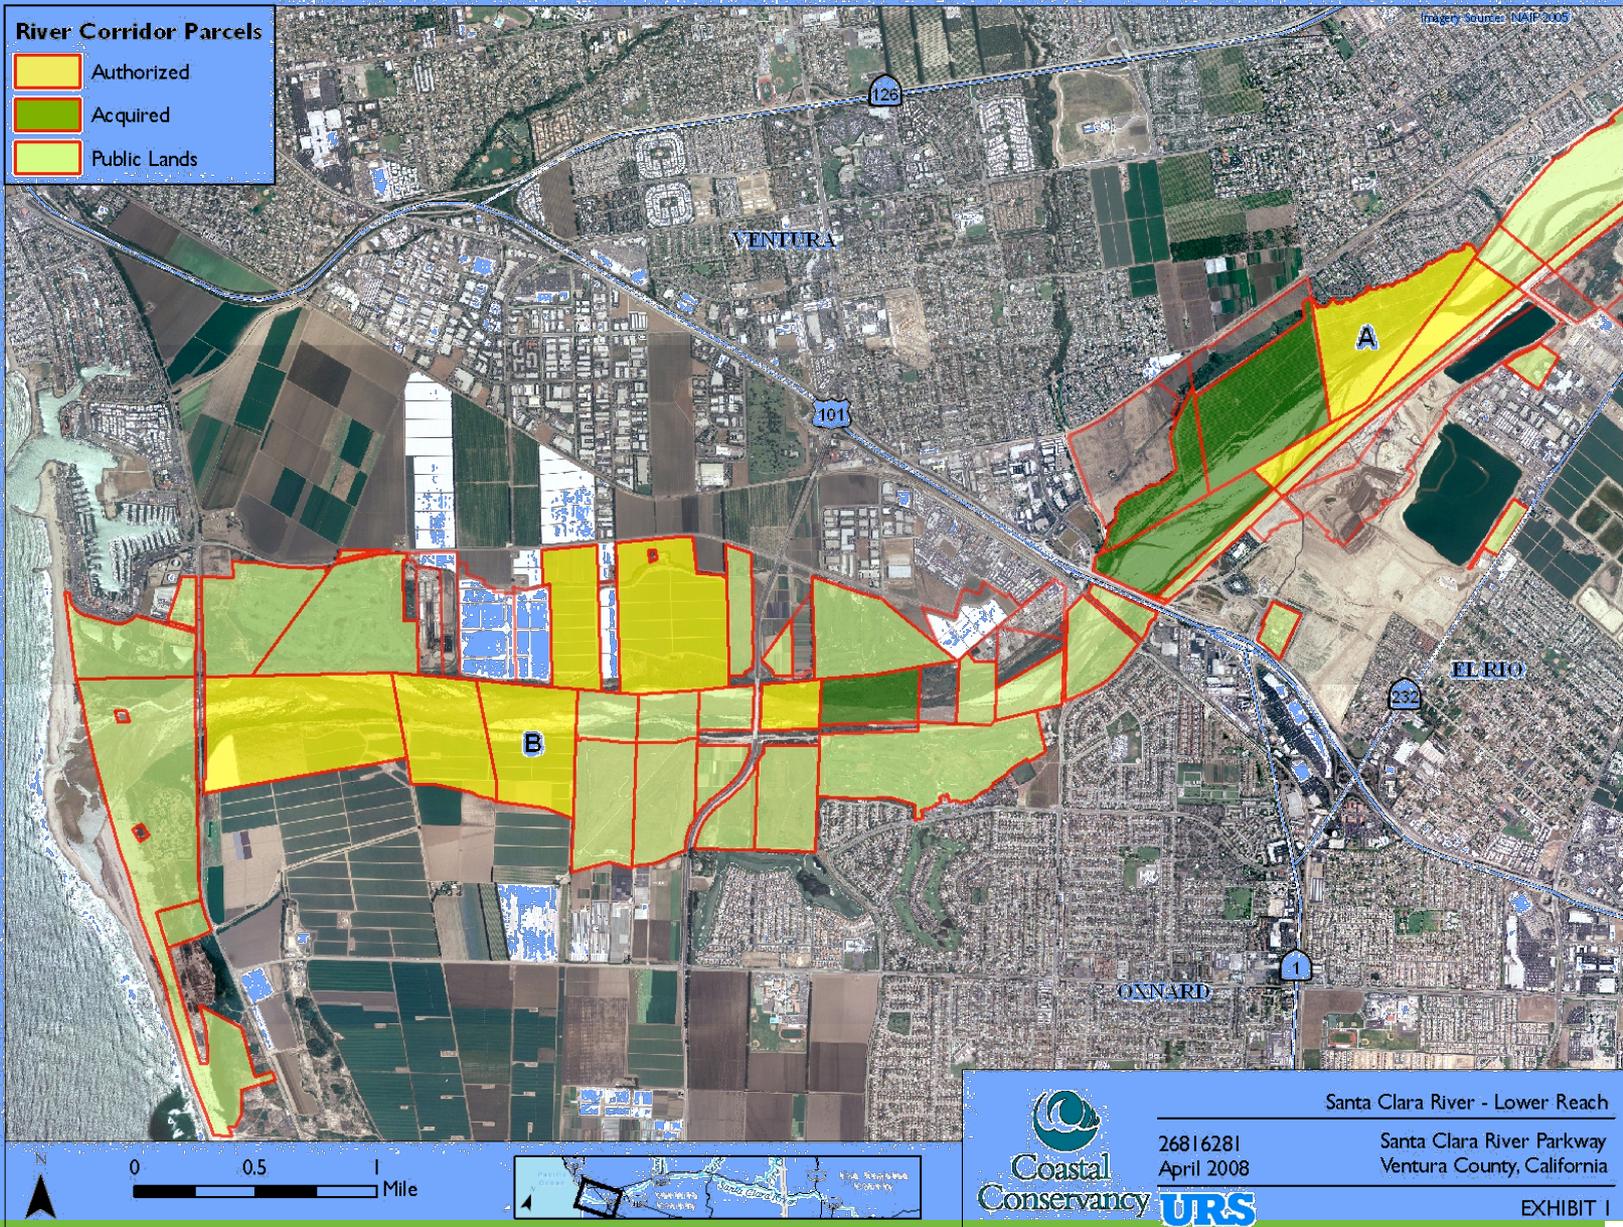

February 2005 (post flood)

Santa Clara River Parkway: Status

- Acquisition Phase: 17 properties acquired since 2000; 2,700 acres; 12 miles of river
- Coastal Conservancy expended approx. \$12 million to date
- SCC Restoration Feasibility Study: \$1 million study recently completed.

Bringing it all together: Laguna Creek Watershed Council

Image Courtesy of Laguna Creek Watershed Council: <http://www.lagunacreek.org/>

Conclusions

- Forensic studies have shown that the benefits of channelization and levees have been over-estimated.
- Floodplain restoration can reduce downstream flood risks whilst providing ecological enhancement, recreational opportunities, water quality improvement and economic benefits.
- New technology can allow non-traditional approaches to be evaluated at the local and watershed scale.
