1. INTRODUCTION

Ramboll Environ US Corporation (Ramboll Environ, formerly ENVIRON International Corporation) in association with Weston Solutions, Inc. (Weston) have prepared this Sampling and Analysis Report (SAR) to provide results for Phase 2 of the low detection limit water column study to assess spatial variability in concentrations of polychlorinated biphenyls (PCBs) and dichlorodiphenyltrichloroethane and its derivatives (DDXs) in the water column throughout Los Angeles and Long Beach Harbor waters and Eastern San Pedro Bay during wet and dry seasons and across depths. The results of this study will be used to fill data gaps in the bioaccumulation model as part of a Sediment Quality Objective (SQO) Indirect Effects Tier III assessment for the Los Angeles/Long Beach Harbor as well as the Water Resources Action Plan (WRAP) Model to understand chemical fate and sediment transport mechanisms in the Los Angeles/Long Beach Harbor Watershed. These models will be utilized to achieve compliance with Harbor Toxics Total Maximum Daily Load (TMDL) fish tissue and sediment targets from the Final Basin Plan Amendment to the Water Quality Control Plan – Los Angeles Region to Incorporate the Total Maximum Daily Load for Toxic Pollutants in Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters (RWQCB, 2011).

This SAR details the collection and analysis efforts to obtain the PCB and DDX measurements in water (via solid phase microextraction, SPME), as well as surface water grab samples for additional chemical and physical analysis in support of the PCB and DDX measurements. The sampling was conducted in accordance with the Programmatic Quality Assurance Project Plan (PQAPP). As detailed below, the Ramboll Environ team conducted sampling in accordance with procedures outlined in Sampling and Analysis Plan (SAP): Low Detection Limit Water Column Study Phase 2, Greater Los Angeles and Long Beach Harbor Waters as prepared by Anchor QEA, LLC (Anchor; Anchor, 2014), and Supplemental Sampling and Analysis Plan for Low Detection Limit Water Column Study Phase 2 (ENVIRON and Weston, 2014).

1.1 Project Location

The Project location is the greater Los Angeles and Long Beach Harbor waters (Figure 1). The nearby areas are industrial, commercial, and residential use with a watershed that includes 21 municipalities and 1 million residents (RWQCB and USEPA, 2011). The Ports of Los Angeles and Long Beach covers 7,500 acres of land, and over 11,000 acres of land and water combined. Ship loading and unloading operation on the piers as well as marinas occupy the Inner Harbors. Discharges from the Dominguez Channel, Los Angeles River, and San Gabriel River flow to San Pedro Bay. The Dominguez Channel, Los Angeles River watershed and San Gabriel watershed are the focus of the Harbor Toxics TMDL, with a watershed that drains primarily underground storm drains over a dominantly urban area of approximately 133 square miles.

1.2 Project Team

- Ramboll Environ provided oversight of all field sampling and processing activities as well as data validation and reporting and coordinated with team members Weston (deployment of the SPME assemblies and collection of grab samples); Tierra Data (TDI) (vessel support and retrieval of SPME assemblies); Vista Analytical (SPME fiber analysis); and Eurofins Calscience Inc. (Eurofins) and the Marine Science Institute (MSI); water grab sample analysis)

- Weston coordinated field sampling and processing activities for water grab samples; provided vessel support for SPME assembly deployment and water grab sampling; designed and deployed SPME assembly moorings, conducted water profile and grab sampling, handling, and shipping; coordinated water grab sample analysis with Eurofins; and maintained water profile data.
- Eurofins filtered samples for dissolved organic carbon (DOC) analysis, shipped samples to MSI for DOC and total organic carbon (TOC) analysis, and performed DOC, total suspended solids (TSS), and particle size analyses of water grab samples for Event 1. Eurofins also archived samples for particulate organic carbon (POC) and TOC for Event 1. For Event 2, Eurofins performed TSS analysis and filtered and preserved samples for DOC before shipping samples to MSI for analysis of DOC, TOC and POC.
- MSI performed DOC, TOC, and POC analysis on water grab samples.
- Vista Analytical performed extraction and high-resolution PCB and DDX analysis of SPME fiber samples, and archived water grab samples for Event 2.
- TDI provided vessel and diver support for the SPME assembly retrievals.
- Anchor provided SPME assemblies. One scientist was on board to oversee the processing, handling and preparation of SPME fibers for shipment to Vista Analytical during retrieval for Event 1.

2. SAMPLE COLLECTION, HANDLING, AND SHIPPING

2.1 Sampling Design

The Phase 2 low detection limit water column study included two sampling events, one wet (Event 1) and one dry (Event 2) season event.

Each sampling event included measurement of freely-dissolved DDXs and PCBs in the water column at nine stations (Figure 1). At six stations, measurements were conducted at a mid-water column depth. At three stations, measurements were obtained at a mid-water column depth and a bottom water column depth (1 meter [m] above sediment). Thus, 12 primary measurements were conducted for each event. One field duplicate SPME assembly and grab sample were used for quality assurance/quality control (QA/QC) procedures. Sample location IDs, location descriptions, coordinates, deployment systems, mudline elevations, and sampling depths are shown for Event 1 and Event 2 in Tables 1 and 2, respectively. Field notes from all sampling events are provided in Appendix A-1.

Measurement of freely-dissolved DDXs and PCBs in the water column was conducted by deployment of SPME fibers in assemblies. SPME fibers were exposed to the water column for at least 28 days, during which the SPME fibers absorbed freely-dissolved PCBs and DDXs from the water column. After the exposure period was complete, the fibers were collected and analyzed by Vista Analytical Laboratories for PCBs by United States Environmental Protection Agency (USEPA) method 1668C and DDXs by USEPA method 1699. For Event 1, SPME assemblies were deployed on December 9 and 10, 2014 and retrieved on January 7 and 8, 2015 for a 29 day exposure time. For Event 2, the SPME assemblies were deployed on May 5 and 6, 2015 and retrieved June 15 and 16, 2015 for a 41 day exposure time. Event 2 was intended to represent the dry season sampling event; however, storm events that occurred shortly after deployment generated concerns that SPME sample results may not represent a true dry weather period exposure concentration. Since SPME samples represent a time integrated exposure over the deployment period, a decision was made to delay retrieval in order to better reflect dry weather exposure concentrations.

During both sampling events, water column profiles and water grab samples were obtained at each of the stations during SPME assembly deployment and retrieval. Water profiles at each station (one reading per meter of water depth) were obtained using a Seabird SBE 25 Sealogger conductivity-temperature-depth (CTD) logger. Water grab samples were obtained at the same depths of the SPME assembly deployment at each station using a 2.5 liter Kemmerer sampler. During the Event 2 retrieval, additional grab samples were obtained at mid-depth for each station and archived for potential future analysis of PCBs and DDXs.

2.2 Vessels and Divers

SPME assembly deployment, water profile measurements, and water grab sampling vessel support was provided by Weston. Weston's vessel, the research vessel (R/V) Water Line, is a 24-foot (ft) Radon Survey Vessel equipped with marine running lights, marine very high frequency (VHF) radio, signal flares, and personal flotation devices (PFDs) as per coast guard requirements. Vessel position was maintained via a Wide Area Augmentation System (WAAS) enabled global positioning system (GPS) unit.

SPME assembly retrieval vessel support was provided by TDI. TDI's vessel, the R/V Suzy II, is a 27-ft Wilson Survey Vessel equipped with marine running lights, marine VHF radio,

signal flares, and PFDs as per coast guard requirements. Vessel position was maintained via WAAS enabled GPS unit.

TDI also provided diver support for SPME assembly retrieval. All dives were completed by two American Academy of Underwater Scientist divers (EM385-1-1 compliant). All divers were certified by the TDI Dive Program or had documented scientific diving experience that meets the minimum requirements as specified in the TDI Safe Practices Manual for Scientific Diving. Divemasters had current cardio-pulmonary resuscitation (CPR) and First-Aid training certificates. A dedicated Captain for top side support was on board during all dive activities.

2.3 Navigation, Horizontal Positioning, and Water Depth

Differential GPS was used to navigate and position the vessel. The vessels were positioned as closely as possible to the target sampling location before sampling and SPME assembly deployment. The coordinates were recorded directly over the location of SPME deployment in latitude and longitude in decimal degrees (to five decimal places) in World Geodetic System 1984 (WGS84). Station location coordinates for Event 1 and Event 2 are provided in Table 1 and Table 2, respectively, and shown in Figure 1.

Water depth was measured at the sample location with an onboard, calibrated fathometer and confirmed with a leadline. The mudline elevation relative to mean lower low water (MLLW) datum was estimated by adding the measured depth and the tidal elevation. Vertical elevations measured to the nearest 0.01 ft relative to MLLW are reported in Tables 1 and 2.

2.4 SPME Assembly Deployment

Each SPME assembly consisted of SPME fibers contained in a copper mesh housing which was secured with twist ties within a larger protective stainless steel and second copper mesh housing. SPME assemblies and field QA/QC samples were prepared, labeled, and shipped by Anchor as described in Anchor (2014).

Two SPME assemblies were deployed at each location and water depth (ft MLLW) measured. One SPME assembly was for DDX and PCB primary sample analysis ("Primary Sample SPME") and contained twelve 33-centimeter (cm) SPME fibers. The other assembly contains two 24-cm SPME fibers that had been pre-spiked with PCB and DDX performance reference compounds (PRCs) ("PRC SPME"). Five 13C labeled PCBs (13C-PCB-8, -31, -79, -133 and -179) and four deuterated DDXs (4,4'- dichlorodiphenyldichloroethylene (DDE)-d8, 2,4'-DDE-d8, 4,4'- dichlorodiphenyldichloroethane (DDD)-d8, and 4,4'- dichlorodiphenyltrichloroethane (DDT)-d8) were used as PRCs for PCBs and DDXs, respectively. PRCs are analytically non-interfering chemicals used to determine the fraction of steady-state obtained by the SPME fiber during the deployment period, since absorption of PCBs and DDXs onto the fiber may not reach approximate steady state concentrations during the deployment. The PRC SPMEs are spiked with known amounts of PRC analytes and the reduction in this concentration over the exposure period is used to determine the fraction of steady state reached. The PRC-spiked SPME assembly was deployed on the same anchor line as the un-spiked primary sample SPME assembly or parallel to the primary assembly, but offset by approximately 0.5 ft (0.15m) to avoid uptake of released PRCs by clean, un-spiked fibers.

SPME assemblies were suspended in the water column with submerged mooring buoys. The submerged mooring buoys were placed in the water column at a depth equal to approximately 9.8 ft (3.0m) below the anticipated lowest sea level relative to MLLW during the period of deployment to ensure mooring buoys stay submerged during low tide events

and deeper than most recreational and commercial vessel traffic. The mooring buoys were of sufficient size to provide adequate buoyancy to ensure the SPME assembly was maintained at the target depth within the water column. At five stations, SPME assemblies were tied to private, secured docks or piers to ensure the assemblies remained at the target location. The remaining four stations were not tied to an existing structure but were anchored in the sediment using 90 pounds (lbs) of weight.

2.5 SPME Assembly Retrieval and SPME Fiber Handling and Shipping

Retrieval at the five stations with tie-offs (CS-01, IA-01, IB-01, FH-01, and LARE-01) was conducted from the boat by detaching the anchor line and pulling the assembly into the boat. Retrieval at the remaining stations was conducted with diver assistance. During Event 1, the use of acoustic releases was attempted, however retrieval via acoustic release was found to be problematic especially in those instances where the mooring assembly did not remain intact. Consequently, only diver assistance was used for Event 2.

SPME assemblies (one PRC SPME assembly, one primary sample SPME assembly) were untied from the anchor line, assemblies were dissembled, and fibers were removed from the assembly and photographed. Photo logs from Event 1 and Event 2 are included in Appendix A-2. Some photos from Event 1 are maintained by Anchor and not provided here. Any biofouling, color change, breakage, or loss of fiber was recorded. Fibers were then wiped with Kim wipes dampened with laboratory e-pure water provided by Vista.

For the 12 primary SPME samples and 1 field duplicate sample, 1 of the 2 PRC fibers was combined with 6 of the 12 un-spiked (primary sample) SPME fibers and transferred into a 60 milliliter (mL) ultra-clean amber glass vial and retained for PCB analysis. The remaining 1 PRC fiber and 6 un-spiked (primary sample) SPME fibers were transferred into another 60 mL vial and retained for DDX analysis. At three stations (LARE-01, REF-01, and IA-01), the PRC fibers were analyzed separately from the primary sample fibers for Event 1 (one PRC fiber in one vial for PCB analysis and one PRC fiber in a second vial for DDX analysis). For Event 2, the primary and PRC fibers were combined for all stations. A pre-cleaned ceramic column cutter provided by Anchor was used to cut the SPME fibers to appropriate lengths to fit into the amber vials. Lengths of SPME fibers were recorded and are provided in Tables 1 and 2.

Three PRC field blanks for PCB analysis and three PRC field blanks for DDX analysis were collected and analyzed to account for volatilization of PRCs from SPME fibers during deployment. Additionally, two SPME field blank fibers were exposed during each deployment to ambient air for five minutes to account for any potential adsorption of PCBs or DDXs onto SPME fibers during sampling, handling, and transport.

After SPME samples were placed in amber vials, closed and sealed with tape, vials were placed in protective bubble wrap bags and stored in a cooler on ice. Coolers were shipped over night to Vista via FedEx. All samples were shipped to Vista under Chain of Custody (COC). Copies of COCs are provided in Appendix A-3.

2.6 Water Profile Sample Collection

At each sample location, during deployment and retrieval of the SPME assemblies, in situ water quality parameters were measured using a Seabird SBE 25 Sealogger CTD logger equipped with sensors to measure depth, dissolved oxygen, transmissivity, pH, temperature, conductivity, and salinity. The Seabird SBE 25 Sealogger water quality profiler was calibrated one week prior to deployment and one week after deployment per the manufacturer's

recommendations. The instrument scanned all sensors at eight scans per second as the instrument was lowered through the water column. The data was stored in the unit's memory and was also recorded in real time on a field computer.

2.7 Grab Sample Collection, Handling and Shipping

At each sample location, during deployment and retrieval of the SPME assemblies, grab samples were collected using a 2.5 liter Kemmerer water sampler. Grab samples were collected at the same depth(s) that SPME assemblies were deployed. An equipment/rinsate blank for the water grab sample was collected by filling the water sampling device with clean laboratory-provided water and then pouring directly into sampling bottles for TOC, DOC and POC analysis. Water grab samples were stored in coolers, on ice, until delivery in person to Eurofin's Garden Grove facility. Grab samples for archive during Event 2, were packaged on ice in coolers and shipped overnight to Vista via FedEx.

3. ANALYSIS AND RESULTS

3.1 Event 1 –Water Grab Samples

Event 1 water grab samples were collected on December 9 and 10 2014 during SPME assembly deployment and on January 8 2015 during SPME assembly retrieval. Grab sample dates and times are shown in Table 3. Water grab samples were submitted to Eurofins under COC and analyzed for:

- DOC (split samples) by Eurofins (method SM5310D) and MSI (methods outlined in Carlson et al. 2010);
- TOC by methods outlined in Carlson et al. 2010 by MSI;
- POC by method CHN EPA 440 by MSI;
- TSS by method SM 2540D by Eurofins;
- Particle size analysis was attempted by Eurofins, but due to low suspended solids content of the water samples analysis was not successful.
- Additional TOC and POC samples were archived by Eurofins

Results of all analyses are shown in Table 3. Miscommunication between Eurofins and MSI resulted in duplicate sample runs for each DOC sample, and these results have subsequently been treated as lab replicate samples. Additionally, the matrix spike/matrix spike duplicate TOC sample was not spiked due to lab error and was subsequently treated as a lab replicate. Concentrations shown in Table 3 were reported as blank corrected by the lab, or were corrected for filter blank concentrations as reported by MSI.

3.2 Event 1 – Water Column Profile

Water column parameters were taken with a Seabird SBE 25 Sealogger water quality profiler at the time of deployment and retrieval, and are reported in Appendix B-1.1 and Appendix B-1.2, respectively.

3.3 Event 1 – SPME Samples

SPME assemblies were deployed on December 9 and 10, 2014 and retrieved on January 7 and 8, 2015 following 29 days of exposure. Field blank and field blank PRC samples were submitted at the time of deployment. Dates and times of Event 1 SPME samples are shown in Table 4.

Some assemblies were unable to be recovered and/or were not retrieved from the deployed water depths (Table 1):

- At sample location CS-01 bottom depth, the shackle was lost at the top of the primary assembly; as a consequence the sampling depth was likely deeper than targeted.
- At sample location CP-01, the PRC assembly and mooring buoy were missing upon retrieval, and the primary sample SPME assembly was retrieved by diver from the sediment surface.
- At sample location SP-01, the top mooring buoy was absent upon retrieval and SPME assemblies were retrieved by diver from the sediment surface.
- At sample location ID IB-01, the field duplicate assembly was lost and could not be retrieved likely due to broken shackles meant to hold the assembly in place.

- At sample location ID LARE-01, the PRC assembly and top mooring buoy was missing upon retrieval; as a consequence of the loss of additional buoyancy, the sampling depth was likely deeper than initially targeted.
 - Due to PRC assembly loss at LARE-01, and additional PRC sample was created (CS-RW-01-S-M-PRC-20150107) at CS-01 mid-depth. Rather than combining the PRC and primary fibers as initially planned for this sample, the PRC fibers were placed into separate vials and analyzed as a unique PRC sample.

Fiber recovery from SPME assemblies was good, with minimal breakage of PRC fibers and minor breakage of primary fibers (primary fibers are longer than PRC and this may contribute to increased fiber breakage at the ends). SPME retrieval notes for Event 1 were maintained by Anchor and are not included here. SPME fibers from the primary assembly and the PRC assembly were combined into 60-ml sample vials as described above.

SPME fibers were analyzed for PCBs and PCB PRCs by USEPA 1668C and for DDXs and DDX PRCs by USEPA 1699. Results for PCB and DDX analyses are summarized in Table 4 and detailed in Appendix B-2.1.

3.4 Event 2 –Water Grab Samples

Water grab samples were collected from each station during deployment on May 5 and 6, 2015 and during retrieval on June 15, 2015. Water samples were submitted to Eurofins under chain of custody. Event 2 grab sample dates and times are shown in Table 5. Samples were filtered and preserved as needed by Eurofins before analysis of:

- TOC and DOC by methods outlined in Carlson et al. 2010 by MSI
- POC by method CHN EPA 440 by MSI
- TSS at Eurofins by method SM 2540D.
- It was determined not to attempt split sample analysis of DOC following review of Event 1 results. Results of DOC analysis provided by Eurofins were an order of magnitude higher and did not show the same level of precision as the MSI results, therefore it was determined to only have MSI perform DOC analysis for Event 2.
- Eurofins was unable to run particle size analysis in Event 1 due to a low volume of suspended solids, therefore it was determined not to request this analysis in Event 2.

Results of all analyses are shown in Table 5. Additionally during retrieval, water grab samples were collected at mid-depth for potential analysis of PCBs and DDXs, due to the potential for Event 2 SPME results to be unrepresentative of a dry weather event. As SPME samples integrate contaminant concentrations over a longer period of time, there was concern that rain events shortly after deployment would result in SPME sample results that were perhaps more indicative of wet weather conditions, rather than the dry weather conditions intended for this event. Consequently, a decision was made to collect discrete water grab samples following several weeks of dry weather conditions to be analyzed should the SPME results not be representative of a dry weather event. Water grab samples are being archived at Vista Analytical Laboratories.

3.5 Event 2 – Water Column Profile

Water column parameters were taken with a Seabird SBE 25 Sealogger water quality profiler at the time of deployment and retrieval, and are reported in Appendix B-1.3 and Appendix B-1.4, respectively.

3.6 Event 2 – SPME Samples

SPME assemblies were deployed on May 5 and 6, 2015 and retrieved on June 15 and 16, 2015, following 41 days of exposure. Field blank and field blank PRC samples were submitted at the time of deployment. All Event 2 SPME sample dates and times are shown in Table 6. All SPME assemblies were retrieved without loss of assembly or buoys. Biofouling was noted where present and occurred on most SPME assemblies.

Fiber recovery from SPME assemblies was good, with minimal breakage of PRC fibers and minor breakage of primary fibers. SPME fibers from the primary assembly and the PRC assembly were combined into 60-ml sample vials as described above.

SPME samples were shipped to Vista Analytical under COC and analyzed for PCBs and PCB PRCs by US EPA 1668C and for DDXs and DDX PRCs by US EPA 1699. Results for PCB and DDT analyses are summarized in Table 6 and detailed in Appendix B-2.2.

4. QUALITY ASSURANCE AND QUALITY CONTROL

QA/QC methods are detailed the Sampling and Analysis Plan (Anchor, 2014) and Supplemental Sampling and Analysis Plan (ENVIRON, 2014). Laboratory QA/QC included calibration, control samples, standard reference materials, replicates, matrix spikes, matrix spike duplicates, surrogate spikes, method blanks, and internal standards. QA/QC reports are provided by the analytical laboratories and included as Appendix C.

Data validation was performed by Ramboll Environ. Ramboll Environ's data validator performed data validation review based on procedures published by the EPA Contract Laboratory Program in their National Functional Guidelines for both organic and inorganic data review (USEPA 2014a; USEPA 2014b). Data validation reports are provided in Appendix D.

For Event 1, data qualifiers were added to Electronic Data Deliverables (EDDs) as provided by the lab based on the results of Ramboll Environ's review before providing EDDs to Anchor. For Event 2, all lab provided EDDs were sent to Anchor without modification, for uploading into the EQuIS database system. Anchor then provided an EDD for data validation to which the data qualifiers were added based on Ramboll Environ's data validation review. All validated data are provided as Electronic Data Deliverables (Appendix E).

TABLES

Table 1. Sample Locations and SPME Deployment Notes - Event 1

The Ports of Los Angeles and Long Beach

San Pedro and Long Beach, California

Sample Location ID	Location Description	Targeted Sampling Depth(s)	SPME Order on Assembly (top/bottom)	Deployment System	Deployment Date	Latitude	Longitude	Mudline Elevation (meters MLLW)	SPME Assembly Retrieval Notes
REF-01	Reference Station: San Pedro Shelf (just outside breakwater)	Mid-depth	PRC/1°	Diver	12/9/2014	33.7179167	-118.2073667	17.25	Both primary and PRC assemblies were retrieved.
OB-01	Long Beach Outer Harbor (Shallow Water Habitat Area)	Mid-depth	PRC/1°	Diver	12/9/2014	33.731133	-118.235267	8.96	Both primary and PRC assemblies were retrieved.
		Bottom (1 m above sediment)	PRC/1°						Both primary and PRC assemblies were retrieved.
SP-01	Eastern San Pedro Bay (west of the Alamitos Bay entrance channel)	Mid-depth	PRC/1°	Diver	12/9/2014	33.7369667	-118.1348333	8.82	Both primary and PRC assemblies were retrieved. (The thimble was bent on the mooring assembly and no buoys were present - potentially due to vessel traffic; sampling depth lower than target - both assemblies were on top of the sediment surface)
LARE-01	Los Angeles River Estuary (Harborlight Marina)	Mid-depth	Parallel	Tie off to dock	12/9/2014	33.7563	-118.1964833	2.60	Primary assembly was retrieved. (No hard hat buoy was present - potentially theft; sampling depth likely lower than target since hard hat buoy was not present)
CP-01	Cabrillo Pier vicinity	Mid-depth	Parallel	Diver	12/10/2014	33.7051667	-118.2713333	3.22	Primary assembly was retrieved. (The line was cut and the hard hat buoy was not present - potentially theft; sampling depth was lower than target - primary assembly was on top of the sediment surface)
FH-01	Fish Harbor (Dock off Berth 260)	Mid-depth	PRC/1°	Tie off to dock	12/10/2014	33.7360833	-118.2694167	5.40	Both primary and PRC assemblies were retrieved.
IA-01	Los Angeles Inner Harbor (Near Berth 225)	Mid-depth	PRC/1°	Tie off to dock	12/10/2014	33.7493667	-118.26905	9.25	Both primary and PRC assemblies were retrieved.
CS-01	Consolidated Slip (Tenant Dock)	Mid-depth	1°/PRC	Tie off to dock	12/10/2014	33.772233	-118.249600	8.20	Both primary and PRC assemblies were retrieved.
		Bottom (1 m above sediment)	PRC/1°						Both primary and PRC assemblies were retrieved. (No shackle was present on the top of the primary assembly that connects the assembly to the mooring line; therefore, sampling depth may have been lower than the target)
IB-01	Long Beach Inner Harbor (Channel 2 - off Pier C)	Mid-depth	Parallel	Tie off to piling	12/10/2014	33.771667	-118.219867	5.24	One primary assembly and two PRC assemblies were retrieved. (Note, two of each PRC and primary assemblies were deployed at this station and depth for the field duplicate. Shackle to shackle connections that held the SPME assemblies to the mooring line were broken on the missing assembly - potentially due to twisting/spinning of the assembly with each other and retrieval line)
		Bottom (1 m above sediment)	Parallel						Both primary and PRC assemblies were retrieved.

Notes:

1. PRC assemblies had a zip tie around the eyehook shaft.
2. Coordinates are in decimal degrees (NAD83).

Abbreviations:

1° = primary

m = meters

MLLW = mean lower low water

PRC = performance reference compound

SPME = solid phase microextraction

Table 2. Sample Locations and SPME Deployment Notes - Event 2

The Ports of Los Angeles and Long Beach

San Pedro and Long Beach, California

Sample Location ID	Location Description	Targeted Sampling Depth(s)	SPME Order on Assembly (top/bottom)	Deployment / Retrieval System	Deployment Date	Latitude	Longitude	Mudline Elevation (meters MLLW)	Deployment and Retrieval Notes
REF-01	Reference Station: San Pedro Shelf (just outside breakwater)	Mid-depth	PRC/1°	Diver	5/5/2015	33.71791	-118.20729	17.30	Deployed at 8.6 m MLLW. Both assemblies retrieved.
OB-01	Long Beach Outer Harbor (Shallow Water Habitat Area)	Mid-depth	PRC/1°	Diver	5/5/2015	33.73117	-118.23515	9.00	Deployed at 4.5 and 8.0 m MLLW. Both assemblies retrieved.
		Bottom (1 m above sediment)	PRC/1°						
SP-01	Eastern San Pedro Bay (west of the Alamitos Bay entrance channel)	Mid-depth	PRC/1°	Diver	5/5/2015	33.73709	-118.13503	8.80	Deployed at 4.4 m MLLW. Both assemblies retrieved.
LARE-01	Los Angeles River Estuary (Harborlight Marina)	Mid-depth	Parallel	Tie off to dock	5/5/2015	33.75633	-118.19646	2.57	Tied to piling at 1.3 m MLLW. Both assemblies retrieved.
CP-01	Cabrillo Pier vicinity	Mid-depth	Parallel	Diver	5/6/2015	33.70520	-118.27134	3.25	Deployed at 1.6 m MLLW. Both assemblies retrieved.
FH-01	Fish Harbor (Dock off Berth 260)	Mid-depth	Parallel	Tie off to dock	5/6/2015	33.73608	-118.26943	5.40	Tied to piling at 2.7 m MLLW. Both assemblies retrieved.
IA-01	Los Angeles Inner Harbor (Near Berth 225)	Mid-depth	PRC/1°	Tie off to dock	5/5/2015	33.74932	-118.26901	9.30	Tied to ladder at 4.6 m MLLW. Both assemblies retrieved.
CS-01	Consolidated Slip (Tenant Dock)	Mid-depth	1°/PRC	Tie off to dock	5/5/2015	33.77221	-118.24962	8.20	Tied to piling at 4.1 and 7.2 m MLLW. Both assemblies retrieved.
		Bottom (1 m above sediment)	PRC/1°						
IB-01	Long Beach Inner Harbor (Channel 2 - off Pier C)	Mid-depth	1° / PRC (plus Duplicate)	Tie off to dock	5/5/2015	33.77172	-118.29184	5.30	Tied to piling at 2.65 and 4.3 m MLLW. Both assemblies retrieved.
		Bottom (1 m above sediment)	Parallel						

Notes:

1. PRC assemblies were labeled with Sharpie at deployment.
2. Coordinates are in decimal degrees (NAD83).

Abbreviations:

1° = primary

m = meters

MLLW = mean lower low water

PRC = performance reference compound

SPME = solid phase microextraction

Notes:

1: DOC samples for December event were run twice by MSI. Both values are reported here, with the second value considered a laboratory duplicate.

2: TOC and DOC Data were reported as filter blank corrected by the lab.

3: POC data was not provided as blank corrected by the lab, but are presented here as blank corrected for filter blank concentration. The filter blank result for the March 9, 2015 (December samples) run was 0.0185 mg/L; filter blank result for the March 16, 2015 run (January samples) was 0.00628 mg/L.

Abbreviations:

DOC = Dissolved organic carbon

mg/L = milligrams per liter

MSI = Marine Science Institute

NR = Not reported

POC= Particulate organic carbon

TOC = Total organic carbon

Notes:

1: Concentrations were not reported by the lab as filter blank corrected, but are presented here as corrected values.

The filter blank result for the May 5th & 6th samples was 0.262 mg/L. Filter blank results for the June 15th samples was 0.076 mg/L.

2: Concentrations were not reported by the lab as filter blank corrected, but are presented here as corrected values.

Filter blank result for the May 5th & 6th samples was 0.01223 mg/L. Filter blank results for the June 15th samples was 0.015 mg/L.

3: The filter blank reported for May 5th, 2015 was greater than the equipment blank DOC sample (0.174 mg/L), therefore the result is reported as zero.

Abbreviations:

NR = Not reported

MSI = Marine Science Institute

mg/L = milligrams per liter

FIELD INVESTIGATION DAILY LOG

PROJECT NAME: POLA/POLB LDL WC Study FIELD PERSON: M. Gruber

PROJECT NUMBER: 0433310A11 PROJECT MANAGER: D. Moore

PROJECT LOCATION: San Pedro/Long Beach DATE: 12/9/14

DAILY SUMMARY: Deploy SPME Assemblies at stations: REF-01, OB-01, SP-01, + LARE-01. Blank samples.

WEATHER CONDITIONS: 68°F , Clear skies, Wind N

VISITORS/SUBCONTRACTORS: Damon Owen and Nick, Weston Solutions, Inc.

MILITARY TIME	ACTIVITIES
6:00	Meet Damon and Nick at South Shores Boat Launch Ramp.
8:00	Depart boat ramp for REF-01
8:20	Arrive REF-01. Anchored boat on station. Weston obtained water samples then water quality profile. Damon Set up ^{mooring} SPME assembly with hard hat buoy, buoy, SPME assemblies (Weston maintaining notes on which is on top, PRC marked with zip tie), buoy, acoustic release, and anchor. Acoustic release is Seatrionics. $33^{\circ}43.075$, $118^{\circ}12.442$ (NAD83)
9:10	Depart REF-01.
9:40	Arrive OB-01. Diver retrieval. mid + bottom depths. Same as REF-01 and other stations unless otherwise specified, water samples and profile obtained while Damon prepares mooring assembly. $33^{\circ}43.818$, $118^{\circ}14.116$
10:40	Depart OB-01
11:11	Arrive SP-01. Diver retrieval. $33^{\circ}44.218$, $118^{\circ}08.090$.
12:15	Depart SP-01.
12:48	Arrive LARE-01. Tied to dock at corner by piling and phone. Water too shallow to deploy SPME assemblies

	sequentially; therefore, the SPME assemblies were deployed parallel. Retrieval rope tied to anchor. Retrieval rope was tied to the dock. $33^{\circ}45.378'$, $118^{\circ}11.789'$. Damon noted the fiber was broken.
14:53	Depart LARE-01. Return to South Shores Boat Ramp. Expose field blanks and place in vials. Place PRC field blank in vials.
	Place Length to mass determination fibers in vials.
16:58	Depart for FedEx at 555 East Ocean Boulevard, Long Beach. Last express drop off 5:30 pm (7:30 pm extended).
17:06	FedEx drop off - Head to hotel (Queen Mary). ^{also note!} Depth readings on Raymarine Axiom. Compared to Lead line (used at every station) and found monitor 0.4 m foot less than Lead line. GPS map 7leCX Garmin. 7m accuracy.

DAILY SUMMARY: Deploy SPME assemblies (stations: CP-01, CS-01, FH-01, IA-01, IB-01)

WEATHER CONDITIONS: 62°F , clear skies, 3 mph SSE

VISITORS/SUBCONTRACTORS: Damen Onyen + Nick, Weston Solutions, Inc.

MILITARY TIME	ACTIVITIES
6:15	Meet at boat launch.
7:00	Depart for CP-01.
7:30	Arrive CP-01. Acoustic release. Parallel since water shallow. Close to riprap. $33^{\circ}42.310, 118^{\circ}16.280$.
9:05	Depart CP-01.
10:00	Arrive FH-01. Tied to piling at end of pier. Next to Sheriff's piers. Lift up by hand. Note: pinch points on shackles for all mooring assemblies. Piling is to the right of fish receiver when facing Sheriff's. Cheat Contact for building next door (SCMI-Southern California Marine Science Institute) is Carrie Wolff. $33^{\circ}44.115, 118^{\circ}16.115$.
10:50	Depart FH-01
12:00	Arrive IA-01. Tied to ladder. Under bridge. $33^{\circ}44.962, 118^{\circ}16.143$
12:40	Depart IA-01.
12:48	Arrive CS-01. Tied to piling at corner (next to fish receiver - receiver on left). Mid+bottom depths.

WEATHER CONDITIONS:

VISITORS/SUBCONTRACTORS: Brent Mardian, Chris Clark, Casey Tierra Data, Inc.
Xiaoxia Lu; Anchor & EA LLC

MILITARY TIME	ACTIVITIES
7:00	Meet team at Cabrillo Boat Ramp. Load boat. Conduct Health & Safety Meeting. Contact Port Police Watch Commander. The line that extends into the water for the acoustic release signal was not transferred from Weston to Tierra Data. Therefore, acoustic retrieval sites were retrieved by divers.
7:45	Depart boat ramp.
8:00	Arrive CP-01. The mooring assembly was cut likely in theft of the hard hat buoy. The primary sample SPME assembly was present but on the sediment surface with one small buoy attached (minor water column exposure). Divers took photos under water at all sites. PRC assembly ^{not present} .
8:40	Depart CP-01.
9:10	Arrive REF-01. All SPME assemblies retrieved with minimal fiber breakage.
10:00	Depart REF-01.
10:15	Arrive OB-01. All SPME assemblies retrieved with minimal fiber breakage.
11:30	Depart OB-01.
12:00	Arrive SP-01. Hard hat buoy not present. Thimble bent.

08 55	Head to LARE-01.
09 15	Dock @ LARE-01. Deploy water meter
09 30	Take grab samples & deploy SPME tied. in dock @ 1.3m.
10 20	On station OB-01. Deploy water meter. Prep SPMEs.
10 30	Take Bottom grab sample.
10 40	Take mid-depth grab sample.
10 45	Deploy SPME w/ mid & bottom SPMEs.
11 25	On IB-01. Deploy water meter.
11 35	Take bottom grab sample.
11 45	Take Mid-depth & Mid-depth FD sample.
11 55	Take us/MSD & LR sample water
12 00	Deploy SPMEs.
13 00	On station CS-01, deploy water meter

PROJECT LOCATION: San Pedro/Long Beach DATE: 5 May 2015

DAILY SUMMARY: LDL Deployment

WEATHER CONDITIONS: Overcast.

VISITORS/SUBCONTRACTORS: Weston

MILITARY TIME	ACTIVITIES
13 15	Take bottom grab sample
13 25	Take mid depth sample *
13 30	Deploy SPME bed to side of dock @ 4.1 + 3.2 m.
14 15	On 1A-01. Deploy water meter
14 30	Take grab sample
14 40	SPME deployed @ 4.2 m, tied to ladder.
14 50	Head back to Caballito Marina
16 30	Done QC-ing all samples & preping COCs. Head off site.

PROJECT NAME: LDL Study

FIELD PERSON: J. Arblaster

PROJECT NUMBER: B4 33310 A11

PROJECT MANAGER: D. Moore

PROJECT LOCATION: San Pedro / Long Beach

DATE: May 6 2015

DAILY SUMMARY: LDL Deployment - Day 2.

WEATHER CONDITIONS: Overcast

VISITORS/SUBCONTRACTORS: Weston Salin

MILITARY TIME	ACTIVITIES
06 30	Head to pick up ice, meet Nick & Damon
07 05	Load up boat & depart.
07 20	Arrive @ CP-01, deploy water meter
07 30	Take grab sample.
07 35	Deploy SPME @ 1.6 m; parallel.
08 00	Arrive @ FH-01
08 15	Take grab sample. Set up & deploy SPME tied to dock @ 2.7 m
08 45	Head back to dock.
09 00	Expose FB SPMEs to air,
09 30	Take FB samples.
09 45	Take FBPCR samples. Head to warehouse for additional packing material for cooler & to ship samples.
11 00	Arrive @ warehouse. Finish packing samples
11 20	Head to FedEx & ship samples
11 30	offsite Head home.

DAILY SUMMARY:		<u>LDL Retrieval - Deep</u>)
WEATHER CONDITIONS:		<u>Overcast, clearing up afternoon.</u>
VISITORS/SUBCONTRACTORS:		<u>Tierra Dater (Brent, Chris + Chase).</u>
MILITARY TIME		ACTIVITIES
05 30	Depart for Cabrillo Boat Launch.	
06 40	Pick up ice. Arrive @ CB Launch.	
07 15	Launch boat, set up for diving. H2S tailgate.	
08 00	On CP-01. Divers in to retrieve SPMES.	
08 10	CP-01 retrieved. Some biofouling. Clean + cut SPMES. + place in vials 59 + 60 for CP-01 (08 10).	
08 55	On REF-01. Divers in to retrieve @ 09 11.	
09 55	Finish processing SPMES RGF → some biofoul @ ends.	
10 12	Move to CB + retrieve assemblies.	
10 55	Retrieved SPMES. Process Mid-depth - sample 11 20.	
11 40	Finish processing bottom depth.	
12 00	Move to SP + retrieve SPMES.	
12 30	Finish processing SPMES. Move to LARE	
13 20	LARE processed. Slight Biofoul on all SPMES today;	
13 30	Move to 1B-01. Retrieved SPMES + process see table.	
14 50	Done processing 1B-01 + 1B-1001 (FD)	
15 45	Done processing 1B-01 (Bottom).	
16 15	Move to 1A	
	Done processing 1A-01 SPMES.

Notes:

1: pH values for REF-01 appear to indicate the data logger was not functioning correctly as pH does not typically change significantly with depth.

Notes:

1: Detection limits not reported for Performance Reference Compounds (PRCs)

2: Total DDTs is the sum of detected DDX congeners only. If all congeners were below detection limits, the highest detection limit is reported.

3: Validation qualifiers are not presented in table

Abbreviations:

PCB: Polychlorinated biphenyl

DDD: Dichlorodiphenyldichloroethane

DDE: Dichlorodiphenyldichloroethylene

DDT: Dichlorodiphenyltrichloroethane

DDMU: 1-chloro-2,2-bis(p-chlorophenyl)ethene

pg: picograms

NR: Not Reported

ND: Not detected above method detection limit

PCR: Performance Reference Compounds

Notes:

1: Detection limits not reported for Performance Reference Compounds (PRCs)

2: Total DDTs is the sum of detected DDX congeners only. If all congeners were below detection limits, the highest detection limit is reported.

3: Validation qualifiers are not presented in table

Abbreviations:

PCB: Polychlorinated biphenyl

DDD: Dichlorodiphenyldichloroethane

DDE: Dichlorodiphenyldichloroethylene

DDT: Dichlorodiphenyltrichloroethane

DDMU: 1-chloro-2,2-6w(p-chlorophenyl)ethene

pg: picograms

NR: Not Reported

ND: Not detected above method detection limit

PCR: Performance Reference Compounds
