ADDRESS ALL CORRESPONDENCE TO:
P.O. BOX 1460
ALHAMBRA, CALIFORNIA 91802-1460

IN REPLY PLEASE
REFER TO FILE WM-9

January 31, 2001

Mr. Dennis A. Dickerson, Executive Officer
California Regional Water Quality
Control Board - Los Angeles Region
320 West Fourth Street, Suite 200
Los Angeles, CA 90013-1105

Dear Mr. Dickerson:

REPORT OF WASTE DISCHARGE FOR MUNICIPAL STORMWATER AND URBAN RUNOFF DISCHARGES IN THE COUNTY OF LOS ANGELES (ORDER NO. 96-054, NPDES NO. CAS614001)

Enclosed is the Report of Waste Discharge for the Los Angeles River, San Gabriel River, Dominguez Channel, Ballona Creek, and Malibu Creek Watersheds in Los Angeles County.

The Report consists of the following components:

- Permit Application
- Performance Standards
- Watershed Management Area Plans

We look forward to working with your staff to expedite the approval process of the Report. I have directed my staff to work with the Regional Water Quality Control Board in making any necessary modifications.

If you have any additional questions, please contact Mr. Mustafa Ariki at (626) 458-5948, Monday through Thursday, 7:30 a.m. to 6 p.m.

Very truly yours,

HARRY W. STONE
Director of Public Works

BRIAN T. SASAKI
Deputy Director

ORDER NO. xx-xxx
(NPDES NO. CASxxxxxx)

WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORMWATER AND URBAN RUNOFF DISCHARGES WITHIN THE LOS ANGELES COUNTY FLOOD CONTROL DISTRICT, COUNTY OF LOS ANGELES, AND THE CITIES OF LOS ANGELES COUNTY

TABLE OF CONTENTS

WASTE DISCHARGE REQUIREMENTS

FINDINGS

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter referred to as the Regional Board), finds:

Existing Permit and Report of Waste Discharge

1. The Los Angeles County Flood Control District, Los Angeles County, and 83 incorporated cities within the Los Angeles County Flood Control District (see Attachment A, List of Permittees), hereinafter referred to separately as Permittees and jointly as the Discharger, discharge or contribute to discharges of stormwater and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems, and water courses within the Los Angeles County Flood Control District into receiving waters of the Los Angeles Basin under countywide waste discharge requirements contained in Order No. 96-054 adopted by this Regional Board on July 15, 1996. That Order also serves as a National Pollutant Discharge Elimination System (NPDES) permit (CAS614001).

2. On February 1, 2001, the Discharger submitted a Report of Waste Discharge (ROWD) as an application for re-issuance of waste discharge requirements and an NPDES permit.

Nature of Discharges and Sources of Pollutants

3. Stormwater discharges consist of surface runoff generated from various land uses in all the hydrologic drainage basins that discharge into water bodies of the State. The quality of these discharges varies considerably and is affected by the hydrology, geology, land use, season, and sequence and duration of hydrologic events. The primary constituents of concern currently identified by the Los Angeles County Flood Control District 1994-2000 Integrated Receiving Water Impacts Report are cyanide, indicator bacteria, total dissolved solids, turbidity, total suspended solids, nutrients, total aluminum, dissolved cadmium, copper, lead, total mercury, nickel, zinc, bis(2-ethylhexyl)phthalate, polycyclic aromatic hydrocarbons (PAHs), Diazinon, and chlorpyrifos.

4. Certain pollutants present in stormwater and/or urban runoff may be contributed by activities which the Permittees cannot control. Examples of such pollutants and their respective sources are: PAHs which are products of internal combustion engine operation, nitrates from atmospheric deposition, heavy metals, lead from fuels, copper from brake pad wear, zinc from tire wear, dioxins as products of combustion, and bis (2-ethylhexyl) phthalate and mercury as resulting from atmospheric deposition, and natural-occurring minerals from local geology. However, Permittees can implement measures to attempt to reduce entry of these pollutants into stormwater.

5. These compounds can have damaging effects on both human health and aquatic ecosystems. In addition, the high volumes of stormwater discharged from MS4s in areas of urbanization can significantly impact aquatic ecosystems due to physical modifications

such as bank erosion and widening of channels. It is anticipated that, due to the nature of stormwater events (i.e., large volumes of water and high velocities) that there will be short-term, reversible impacts to beneficial uses that are not directly related to water quality.

6. Water quality assessments conducted by the Regional Board identified impairment, or threatened impairment, of beneficial uses of water bodies in the Los Angeles County Watersheds. These impairments include many of the pollutants of concern identified by the Los Angeles County Flood Control District 1994-2000 Integrated Receiving Water Impacts Report.

Permit Background

7. The Discharger has filed a Report of Waste Discharge (ROWD) and has applied for renewal of its waste discharge requirements and an NPDES permit to discharge wastes to surface waters. The ROWD includes the Watershed Management Area Plans (WMAPs), proposed permit and Performance Standards (PS).

8. The Stormwater Quality Management Plan (SQMP) refers to the five Model Programs collectively developed by the Permittees in accordance with provisions of the NPDES Permit Order Number 96-054. The SQMP will be included in the WMAPs. The Model Programs are the following:

Public Information and Participation
Development Construction
Illicit Connection/Illicit Discharge Elimination Program
Development Planning
Public Agency Activities

The monitoring program herein consists of land-use based monitoring combined with receiving water monitoring and modeling.

9. The Regional Board has reviewed the ROWD and has determined it to be complete under the reapplication policy of MS4s issued by the USEPA in July 1996. The Regional Board finds that the Permittee's proposed Storm Water Management Plan is acceptable and when fully implemented will be consistent with the statutory standard of Maximum Extent Practicable (MEP) and in compliance with the Federal Clean Water Act (CWA) and the Porter-Cologne Water Quality Control Act.

Coverage

10. The requirements in this Order cover all areas within the boundaries of the cities (see Attachment A) as well as unincorporated areas in Los Angeles County Flood Control District within the jurisdiction of the Regional Board. The Permittees serve a population of about 11.4 million [Reference: *2000 Census of Population and Housing,* Bureau of the Census, U.S.

Department of Commerce (1992)] in an area of approximately 3,100 square miles. Attachment B shows the map of the permitted area in Los Angeles County Flood Control District. The Regional Board will coordinate to implement programs that are consistent with the requirements of this Order.

11. Federal, state, regional or local entities within the Permittees' boundaries or in jurisdictions outside the Los Angeles County Flood Control District, and not currently named in this Order, may operate storm drain facilities and/or discharge stormwater to storm drains and watercourses covered by this Order. The Permittees may lack legal jurisdiction over these entities under state and federal constitutions. Consequently, the Regional Board recognizes that the Permittees will not be held responsible for such facilities and/or discharges. The Regional Board will coordinate with these facilities to implement programs that are consistent with the requirements of this Order.

12. Sources of discharges into receiving waters in the Los Angeles County Flood Control District but in jurisdictions outside its boundary include the following:

    a. About 34 square miles of unincorporated area in Ventura County drain into Malibu Creek, thence to Santa Monica Bay,

    b. About 9 square miles of the City of Thousand Oaks also drain into Malibu Creek, thence to Santa Monica Bay, and

    c. About 86 square miles of area in Orange County drain into Coyote Creek, thence into the San Gabriel River Watershed in the Los Angeles County Flood Control District.

    The Regional Board will ensure that stormwater management programs for the areas in Ventura County and the City of Thousand Oaks that drain into Santa Monica Bay are consistent with the requirements of this Order. The Regional Board will coordinate with the Santa Ana Regional Board so that stormwater management programs for the areas in Orange County that drain into Coyote Creek are consistent with the requirements of this Order.

13. This permit is intended to develop, achieve, and implement a timely, comprehensive, cost-effective stormwater pollution control program to minimize pollutants, to the maximum extent practicable, in stormwater discharges from the permitted areas in Los Angeles County Flood Control District to the waters of the United States.

Federal, State, and Regional Regulations

14. The Water Quality Act of 1987 added Section 402(p) to the Federal Clean Water Act (CWA). This section requires the U.S. Environmental Protection Agency (EPA) to establish regulations setting forth NPDES requirements for stormwater discharges. The first phase of these requirements was directed at municipal separate storm sewer systems (MS4)

serving a population of 100,000 or more and stormwater discharges associated with industrial activities, including construction activities. On November 16, 1990, EPA published these final regulations in the Federal Register under Part 122 Code of Federal Regulations. The second phase of these requirements covers other dischargers, including municipalities with a population of less than 100,000, for which the U.S. EPA Administrator or the State determines that the stormwater discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the United States. U.S. EPA published the final regulations on the second phase on December 8, 1999 in the Federal Register.

15. The CWA allows the EPA to delegate its NPDES permitting authority to states with an approved environmental regulatory program. The State of California is a delegated State. The Porter-Cologne Water Quality Control Act (California Water Code) authorized the State Water Resources Control Board (State Board), through the Regional Boards, to regulate and control the discharge of pollutants into waters of the State and tributaries thereto.

16 Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA addresses five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category, with the exception of septic systems. The Regional Board addresses septic systems through the administration of other programs.

17. The State Water Resources Control Board adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on July 23, 1997. The Ocean Plan contains water quality objectives for the coastal waters of California.

18. The Regional Board adopted an updated Water Quality Control Plan (Basin Plan) for the Los Angeles Region on June 13, 1994, *'Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*, (1994).' The Basin Plan, which is incorporated in this Order by reference, specifies the beneficial uses of receiving waters and contains both narrative and numerical water quality objectives for the receiving waters in the Los Angeles County.

19. The Regional Board has implemented a Watershed Management Approach to address water quality protection in the region. The objective of the Watershed Management Approach is to provide a comprehensive and integrated strategy towards water resource protection, enhancement, and restoration while balancing economic and environmental impacts within a hydrologically defined drainage basin or watershed. It emphasizes cooperative relationships between regulatory agencies, the regulated community, environmental groups, and other stakeholders in the watershed to achieve the greatest environmental improvements with available resources.

20. To implement the Watershed Management Approach, as well as facilitate compliance with this Order, the Los Angeles County Flood Control District is divided into five Watershed Management Areas (WMAs) as follows:

a. Malibu Creek and Rural Santa Monica Bay WMA
b. Ballona Creek and Urban Santa Monica Bay WMA
c. Los Angeles River WMA
d. San Gabriel River WMA
e. Dominguez Channel/Los Angeles Harbor WMA

To further facilitate compliance with this Order, permittees may form sub-watershed groups within the WMA.

Attachment A, shows the list of Permittees under each WMA.

21. To facilitate compliance with federal regulation, the State Water Resources Control Board (State Board) has issued two statewide general NPDES permits: one for stormwater from industrial sites [NPDES No. CAS000001, General Industrial Activity Stormwater Permit (GIASP)] and the other for stormwater from construction sites [NPDES No. CAS000002, General Construction Activity Stormwater Permit (GCASP)]. The GCASP was reissued on August 19, 1999. The GIASP was reissued on April 17, 1997. Facilities discharging stormwater associated with industrial activities and construction projects with a disturbed area of five acres or more are required to obtain individual NPDES permits for stormwater discharges, or be covered by these statewide general permits by completing and filing a Notice of Intent (NOI) with the State Board. The USEPA guidance anticipates coordination of the state-administered programs for industrial and construction activities with the local agency program to reduce pollutants in stormwater discharges to the MS4.

22. The State Board, on October 28, 1968, adopted Resolution No. 68-16, "Maintaining High Quality Water" which established an anti-degradation policy for State and Regional Boards.

23. The State Board, on June 17, 1999, adopted Order No. WQ 99-05, which specifies standard receiving water limitations language to be included in all municipal stormwater permits issued by the State and Regional Boards.

24. California Water Code (CWC) Section 13263(a) requires that waste discharge requirements issued by the Regional Board shall implement any relevant water quality control plans that have been adopted; shall take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose; other waste discharges; and, the need to prevent nuisance.

25. California Water Code Section 13370*et seq.* requires that waste discharge requirements issued by the Regional Boards comply with provisions of the Federal Clean Water Act and its amendments.

Other Findings

26. The Regional Board is the enforcing authority in the Los Angeles region for the two statewide general permits, described in Finding 21, which regulate discharges from industrial facilities and construction sites, and all NPDES storm water and non-storm water permits issued by the Regional Board. These industrial and construction sites are also regulated under local laws and regulations.

27. Studies indicate that facilities with paved surfaces subject to frequent motor vehicular traffic (such as parking lots and retail gasoline stations), or facilities which perform vehicle repair, maintenance, or fueling (such as retail gasoline outlets with service bays) are potential sources of pollutants of concern in storm water. [References: Pitt *et al.*,*Urban Storm Water Toxic Pollutants: Assessment, Sources, and Treatability*, Water Environment Res., 67, 260 (1995); *Results of Retail Gas Outlet and Commercial Parking Lot Storm Water Runoff Study*, Western States Petroleum Association and American Petroleum Institute, (1994); Action Plan Demonstration Project, Demonstration of Gasoline Fueling Station Best Management Practices, Final Report, County of Sacramento (1993).]

28. A review of industrial waste/pretreatment records in Los Angeles County Flood Control District on illicit discharges indicate that automotive service facilities and food service facilities sometimes discharge polluted washwaters to the MS4. The pollutants of concern in such washwaters include food waste, oil and grease, and toxic chemicals. Other storm water/industrial waste programs in California have reported similar observations.

29. The objective of this Order is to protect the beneficial uses of receiving waters in Los Angeles County Flood Control District. To meet this objective, this Order requires implementation of BMPs intended to reduce pollutants in storm water and urban runoff such that ultimately their discharge will neither cause violations of water quality objectives nor create conditions of nuisance in receiving waters.

30. The Regional Board recognizes the unique challenges to regulating storm water discharges through municipal storm sewer systems, including intermittent and variable nature of discharges, difficulties in monitoring, and limited physical control over the discharge, and that it will require adequate time to implement and evaluate the effectiveness of best management practices required in this Order and to determine whether they will adequately protect the receiving water.

31. The SQMP required in this Order builds upon the foundation established in Order No. 90-079, consists of the components recommended in the USEPA guidance manual, and was developed with the cooperation of representatives from the regulated community and environmental groups. The SQMP includes provisions that promote customized initiatives, both on a countywide and watershed basis, in developing and implementing cost-effective measures to minimize discharge of pollutants to the receiving water. The various

components of the SQMP, taken as a whole rather than individually, are expected to reduce pollutants in storm water and urban runoff to the maximum extent practicable.

32. The main focus of the SQMP is pollution prevention through education, public outreach, planning, and implementation of BMPs. Successful implementation of the provisions of the SQMP will require cooperation and coordination of all public agencies in each Permittee's organization, among Permittees, and the regulated community. To minimize cost, the Permittees are encouraged to utilize their existing organizational framework to implement the various activities required in this Order.

33. This Order provides the flexibility for the Permittees to petition the Regional Board Executive Officer to substitute a BMP or requirement under the SQMP with an alternative BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order.

34. This order contemplates that the Permittees are responsible for considering potential stormwater impacts when making planning decisions. However, neither this order nor any of its requirements are intended to restrict or control local land use decision-making authority.

Public Process

35. The Regional Board has notified the Discharger and interested agencies and persons of its intent to issue waste discharge requirements for this discharge, and has provided them with an opportunity to submit their written view and recommendations.

36. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

37. This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit, pursuant to Section 402 of the Federal Clean Water Act, or amendments thereto, and shall take effect 50 days from permit adoption provided the Regional Administrator of the EPA has no objections.

38. This Order may be modified or alternatively revoked or reissued prior to its expiration date, in accordance with the procedural requirements of the federal NPDES program, and the California Water Code for the issuance of waste discharge requirements.

IT IS HEREBY ORDERED that the Los Angeles County Flood Control District, Los Angeles County, and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita,Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

PART 1. DISCHARGE PROHIBITION

A. Each Permittee shall, within its jurisdiction, effectively prohibit non-stormwater discharges into the MS4 (storm drain systems) and watercourses, except where such discharges:

1. Are covered by a separate individual or general NPDES permit, or granted an exemption by the Regional Board, the Executive Officer, or the State Water Resources Control Board; or

2. Meet one of the conditions below:

   a. Not identified as a significant source of pollutants:

      1. Flows from riparian habitats or wetlands;
      2. Diverted stream flows;
      3. Natural springs;
      4. Rising ground waters;
      5. Uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)];
      6. Discharges or flows from emergency fire fighting activities; or

   b. Not identified as a significant source of pollutants, subject to conditions:

      7. Landscape irrigation;
      8. Drinking water line flushing;

9. Discharges from potable water sources;
10. Foundation drains;
11. Grading drains;
12. Footing drains;
13. Emergency floor drain;
14. Non-profit car washing;
15. Street washing;
16. Wash water runoff from the cleaning of fire fighting vehicles;
17. Air conditioning condensate;
18. Water from crawl space pumps;
19. Reclaimed and potable irrigation water;
20. Dechlorinated swimming pool discharges;
21. Individual residential car washing;
22. Sidewalk washing;
23. Lake dewatering;
24. Wash water runoff of blood and other human tissues from the cleaning of accident sites or accidental spills.

If any of the above categories of non-stormwater discharges (Part I, A.2.b) are determined to be a significant source of pollutants by the Regional Board Executive Officer, the discharge need not be prohibited if the Permittee implements appropriate BMPs to ensure that the discharge will not be a significant source of pollutants.

The Permittee(s) may, for any of the above non-stormwater categories, require BMPs deemed necessary to ensure that the discharge will not be a significant source of pollutants.

c. The Regional Board Executive Officer may authorize the discharge of additional categories of non-stormwater upon presentation of evidence in accordance with Part 1.A.4., and may include other categories of non-stormwater discharges under this subsection.

3. Discharges originating from federal, state, or other facilities which the Discharger is pre-empted by law from regulating, or for which the Discharger has no authority to enforce the requirements of this Order.

4. A Permittee may identify and describe additional categories of non-storm water discharges to be considered by the Executive Officer for exemption from the Discharge Prohibitions. The criteria to be considered for a request for exemption include one or more of the following:

a. Documentation that the discharge is not a significant source

of pollutants to receiving waters or does not cause impairment of beneficial uses of receiving waters;

b. Special circumstances that have been defined in which the discharge has been found not to be a significant sources of pollutants to, or does not cause impairment of beneficial uses of receiving waters;

c. Specific BMPs, where determined feasible, that have been identified to reduce pollutants in the discharge to the maximum extent practicable and minimize adverse impacts of such source, with an implementation schedule; or

d. Established procedures to ensure BMP implementation, including an implementation schedule, performance standards, monitoring and record keeping.

The exemption request for additional non-storm water discharges may be submitted to the Executive Officer, beginning with the first Annual Report. The exemption becomes effective upon approval by the Executive Officer.

If a presentation is made in writing with supporting documentation by a Permittee to the Executive Officer, and if the Executive Officer does not respond in writing within 60 days, then addition to the categorical exempt discharge may be considered approved.

Compliance with this Order through timely development and implementation of programs described herein shall constitute compliance with this prohibition.

PART 2. RECEIVING WATER LIMITATIONS

A. Discharges from the MS4 that scientific studies have demonstrated will cause or contribute to the exceedance of water quality objectives are prohibited.

B. Discharges from the MS4 of stormwater, or non-stormwater, for which a Discharger is responsible, shall not cause nuisance, continuing or recurring impairment of beneficial uses, or exceedances of water quality objectives in the receiving waters.

C. The Discharger shall comply with Parts A and B of this section through timely implementation of control measures and other actions to reduce pollutants to the maximum extent possible in the discharges in accordance with the SQMP and other requirements of this permit, including any modifications. The SQMP shall be designed to achieve compliance with receiving water limitations. If exceedance(s)

of applicable water quality objectives persist, notwithstanding implementation of the SQMP and other requirements of this permit, the Permittee(s) shall assure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:

1. Upon a determination by either the Permittee(s) or the Regional Board, that discharges are causing or contributing to an exceedance of an applicable water quality objectives, the Permittee(s) shall promptly notify and thereafter submit a report to the Regional Board that describes BMPs that are currently being implemented, and additional BMPs that will be implemented, to prevent or reduce any pollutants that are causing or contributing to the exceedances of water quality objectives. This report may be included with the Annual Stormwater Report and Assessment, unless the Regional Board directs an earlier submittal. The report shall include a reasonable implementation schedule of necessary additional BMPs. The Regional Board may require modifications to the report within 30 days, in consultation with the Discharger.

2. Submit any modifications to the report required by the Regional Board within 90 days of notification.

3. Within 90 days following the approval of the report, the Permittee(s) shall revise the SQMP and monitoring program to incorporate the approved, modified suite of BMPs, implementation schedule, and any additional monitoring required.

4. Implement the revised SQMP and monitoring program according to the approved schedule.

D. So long as the Permittee(s) complies with the procedures set forth in Part C above and is implementing the revised SQMP, the Permittee(s) does not have to repeat the procedure for continuing or recurring exceedances of the same water quality standard(s) unless directed by the Regional Board to develop additional BMPs.

E. Timely and complete implementation by a Permittee(s) of the stormwater management programs prescribed in this Order shall satisfy the requirements of this section and constitute compliance with receiving water limitations.

PART 3. STORMWATER QUALITY MANAGEMENT PLAN IMPLEMENTATION, MONITORING, AND REPORTING

A. Responsibilities of the Principal Permittee

The Principal Permittee will coordinate and facilitate activities necessary to comply with the requirements of this Order, but is not responsible for ensuring compliance

of any individual Permittee. The Los Angeles County Flood Control District is hereby designated as the Principal Permittee, and as such shall:

1. Coordinate permit activities among Permittees and negotiate NPDES requirements with the Regional Board.

   All Permittees will be given the opportunity to have an active role in and provide input for the negotiation of permit requirements. However, formal negotiation with the Regional Board will be conducted by the Principal Permittee and the watershed Executive Advisory Committee (EAC) representative(s).

2. Provide personnel and fiscal resources for the necessary update of the WMAPs and their components;

3. Convene the Watershed Management Committees (WMCs) constituted pursuant to Part C, below, upon designation of representatives;

4. Provide technical and administrative support for committees that will be organized to implement the SQMP and WMAPs;

5. Implement the Countywide Monitoring Program required in this Order;

6. Provide personnel and fiscal resources for the preparation and submittal to the Regional Board of annual reports and summaries of other reports required under the SQMP; and

7. Comply with the "Responsibilities of the Permittees" in Part B, below;

B. Responsibilities of the Permittees

Each Permittee is only responsible for the implementation of the appropriate stormwater management program developed pursuant to the requirements of this Order, and not for the implementation of the provisions applicable to the Principal Permittee or other Permittees. A Permittee is required to comply only with the requirements of this Order applicable to discharges which originate from places within its boundaries over which it has authority to enforce the requirements of this Order. Each Permittee shall, within its geographic jurisdiction:

1. Comply with the requirements of the SQMP and its amendments;

2. Coordinate among its internal departments and agencies as appropriate, to facilitate the implementation of the requirements of the SQMP applicable to such Permittee in an efficient and cost-effective manner;

3. Participate in the update, if necessary, of the WMAPs;

4. Appoint a technically knowledgeable representative to the appropriate WMC;

5. Implement the SQMP upon approval by the Executive Officer; and,

6. Work with other agencies, to the extent necessary, and submit a report to the Executive Officer on recommendations to resolve any conflicts identified between the provisions of the SQMP and WMAPs and the requirements of other regulatory agencies, if the Permitee considers it necessary.

C. Watershed Management Committees (WMCs)

1. Each WMC shall be comprised of a voting representative from each Permittee in the Watershed Management Area (WMA).

2. The WMC's chair and secretary shall be chosen by the WMC upon permit adoption and on an annual basis, thereafter. In the absence of volunteer Permittee(s) for the positions, the Principal Permittee shall assume those roles until the WMC chooses members of the committee for the positions.

3. Each WMC shall:

a. Facilitate cooperation and exchange of information among Permittees;

b. Establish goals and objectives for the WMA;

c. Prioritize pollution control efforts based on beneficial use impairment;

d. Develop and/or update, on an annual basis, priority project list for the WMA;

e. Assess the effectiveness of, prepare revisions for, and recommend appropriate changes to the WMAP including the SQMP;

f. Conduct joint WMC meetings at least four times per year and, as necessary.

g. Identify, if needed, as part of the Industrial/Commercial Source Identification program, additional SIC industrial/commercial groups selected as priority to be included in the database described in the SQMP. The following criteria shall be considered in the identification

process:

i. Extent of exposure of the industrial/commerical activity to stormwater;

ii. Types and quality of non-stormwater discharges;

iii. Similarity of industrial/commercial activity to industrial activity regulated under the USEPA Phase I facilities;

iv. Types of chemicals and wastes generated that can contaminate stormwater;

v. Existence of duplicate regulatory programs with other agencies that emphasize waste management and minimize exposure of the industrial/commercial activity to stormwater;

vi. Number of facilities in the WMA;

vii. Professional understanding of the industrial/commercial sector's waste management practices;

viii. Experience of local agency industrial waste inspection programs; and

ix. Any other information that indicates a significant potential for contamination of stormwater.

D. Executive Advisory Committee (EAC)

1. The EAC shall be attended by one representative from Malibu Creek and by two representatives from each of the other watersheds, along with representatives from the City of Los Angeles, and the Los Angeles County Flood Control District.

2. The Committee shall facilitate program compliance in each watershed and enhance consistency among permittees.

E. General Requirements

1. The Permittees shall, at a minimum implement the elements of the SQMP that are consistent with the terms of this permit.

Additionally, modifications to the SQMP made during the term of the permit including those made in accordance with Part 3.B. of this permit shall be implemented.

2. The SQMP shall, at a minimum, comply with applicable requirements of 40 CFR 122.26(d)(2). The SQMP shall be implemented so as to reduce the discharges of pollutants in stormwater to the maximum extent practicable.

3. Each Permittee shall be responsible for implementation of the relevant portions of the SQMP within its jurisdiction. The Principal Permittee shall be responsible for program coordination as described in Part 3.A,as well as, compliance with the relevant portions of the permit within its jurisdiction.

F. WMAP Modifications

The initial SQMP, as delineated in the WMAPs may need to be modified, revised, or amended periodically to respond to changed conditions and to incorporate more effective approaches to pollutant controls. Minor changes may be made at the direction of the Executive Officer. Minor changes requested by the Permittees shall become effective upon written approval of the Executive Officer. If proposed changes involve a major revision in the overall scope of the program, such changes must be approved by the Regional Board as amendments to this Order.

Modifications to the WMAP may be made in the following manners:

1. The Regional Board Executive Officer may approve changes to the WMAPs:

   a. Upon petition by the Permittee(s) or interested parties, and after providing for, and considering public comments;

   b. Upon a Permittee petition to the Executive Officer to:

      i. Substitute any Best Management Practice (BMP) or Program identified in the SQMP, if the Permittee can document that:

         (a) The proposed alternative BMP or program will meet or exceed the objective of the original BMP or program in the reduction of stormwater pollutants; or

         (b) The fiscal burden of the original BMP or program is substantially greater than the proposed alternative and does not achieve a substantially greater improvement in stormwater quality; and,

(c) The proposed alternative BMP or program will be implemented within a similar period of time.

ii. Eliminate any BMP or program identified in the SQMP, if the Permittee can document that:

(a) The BMP or program is not technically feasible and no substitute is available; or

(b) The cost of implementation outweighs the pollution control benefits; or

(c) The BMP or program is not applicable in the Permittee's jurisdiction.

The Executive Officer may approve or disapprove the petition in accordance with Part 6 D; or,

2. The Permittee(s) shall modify the WMAPs at the direction of the Regional Board Executive Officer, to incorporate applicable regional provisions approved by the Regional Board Executive Officer in plans for watersheds shared by the Permittee(s) with other MS4 programs.

G. Upon Administrative Review

The administrative review process formalizes the procedure for review and acceptance of reports and documents submitted to the Regional Board under this Order. In addition, it provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement action.

1. Stormwater program documents, including progress reports, guidelines, checklists, BMPs, databases, program summaries, and implementation and compliance schedules, developed by the Principal Permittee or a Permittee under the provisions of this Order, shall be submitted to the Executive Officer of the Regional Board, where required for approval. The process is as follows:

a. For documents that require Executive Officer's approval, the Executive Officer will notify the Principal Permittee and/or Permittee of the results of the review and approval or disapproval within 120 days. If the Executive Officer has not responded within 120 days following submittal, the Permittee shall notify the Regional Board of

its intent to implement the program components as submitted. If after 10 days the Executive Officer has not responded, the Permittee will implement the submitted program and the Executive Officer may not make modifications; and,

b. Documents that require formal Regional Board approval will undergo public review and comment before Board consideration at a public meeting.

2. If the Executive Officer determines that a Permittee's stormwater program is insufficient to meet the provisions of this Order, the Executive Officer shall send a "Notice of Intent to Meet and Confer (NIMC)" to the Permittee, with specific information in support of the determination. The NIMC shall include a timeframe by which the Permittee must meet with Regional Board staff. The processes are as follows:

a. The Permittee, upon receipt of an NIMC, shall meet and confer with Regional Board staff to demonstrate that the Permittee's program is sufficient to meet the requirements of this Order; and, if not, seek clarification on the steps to be taken to completely meet the provisions of this Order. The meet and confer period will conclude with either a written notice of program sufficiency from the Excutive Officer to the Permittee, or the submittal to and acceptance by the Executive Officer of a written "Stormwater Program Compliance Amendment (SPCA)", prepared by the Permittee, which shall include implementation deadlines. The Executive Officer may terminate the meet and confer period after a reasonable period due to a lack of progress on issues and may order submittal of the SPCA by a specified date. Failure to submit an acceptable SPCA by the specified date shall constitute a violation of this Order;

b. The Executive Officer will approve or reject the submitted SPCA or an amended SPCA within 120 days. Rejection of an SPCA by the Executive Officer shall state the reasons for the failure to approve the SPCA. A Permittee that receives a rejection of an SPCA shall have 120 days to remedy the specified deficiency and resubmit the SPCA. If the Executive Officer has not responded within 120 days following submittal of an SPCA, the Permittee shall notify the Executive Officer in writing following the notification of its intent to implement the SPCA as submitted. If after 10 days the Executive Officer has not responded, the Permittee will implement the submitted SPCA and the Executive Officer may not make modifications;

c. The Permittee shall comply with the terms of the SPCA. The

Permittee shall submit reports to the Executive Officer on the progress made under the SPCA. The frequency of the progress report submittal shall be quarterly unless otherwise prescribed by the Executive Officer. Failure to comply with the terms and conditions of the SPCA shall constitute a violation of this Order and shall be a cause for enforcement action by the Regional Board; and,

d. The Executive Officer shall not take enforcement action against a Permittee until the Executive Officer has notified the Permittee in writing that the Administrative Review Process has been exhausted and that the Executive Officer has determined that a violation exists and it warrants enforcement.

H. Legal Authority

1. Permittees shall possess the necessary legal authority to prohibit non-stormwater discharges, to the maximum extent practicable, to the storm drain system, including, but not limited to:

a. A prohibition on illicit discharges and illicit connections and a requirement for removal of illicit connections;

i. Prohibit the discharge of wash waters to the MS4 from the cleaning of gas stations, auto repair garages, or other types of automotive service facilities;

ii. Prohibit the discharge of runoff to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

iii. Prohibit the discharge of runoff to the MS4 from areas where repair of machinery and equipment which are visibly leaking oil, fluid or antifreeze, is undertaken;

iv. Prohibit the discharge of runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials, unless such containers are new and unopened with a visibly clean exterior;

v. Prohibit the discharge of chlorinated swimming pool water and filter backwash to the MS4;

vi. Prohibit the discharge of runoff from the washing of toxic

materials to the MS4;

vii. Prohibit washing impervious surfaces in industrial/commercial areas that results in a discharge of runoff to the MS4; and

viii. Prohibit the discharge from washing out concrete trucks, pumps, tools, and equipment to the MS4.

b. Control spills, dumping, or disposal of materials into the MS4, such as;

i. Litter, landscape debris and construction debris;

ii. Any state or federally banned pesticide, fungicide or herbicide;

iii. Food wastes; and

iv. Fuel and chemical wastes, animal wastes, garbage, batteries, and other materials that have potential adverse impacts on water quality.

c. A requirement for compliance with conditions in ordinances, permits, contracts, or orders; and,

d. The ability to carry out all inspection, surveillance and monitoring procedures, within the Permitttee's legal jurisdiction, necessary to determine compliance and non-compliance with permit conditions, including the prohibition of illicit discharges to the MS4.

I. Annual Stormwater Program Report, Assessment, and Budget Summary

1. The Discharger shall submit, by October 15 of each year beginning the Year 2002, an Annual Stormwater Program Report, Assessment, and Budget Summary documenting the status of the general program and individual tasks contained in the WMAPs, in accordance with the requirements identified in the Monitoring and Reporting Program Part I.A of this order. The Annual Stormwater Program Report, Assessment, and Budget Summary shall cover the previous fiscal year from July 1 through June 30, and shall include the information necessary to assess the Discharger's compliance status relative to this Order, and the effectiveness of implementation of permit requirements on stormwater quality. The Annual Stormwater Program Report, Assessment, and Budget Summary shall include any proposed changes to the WMAPs.

2. Stormwater Management Program Budget

a. The Discharger shall prepare annually a budget summary on resources applied to the stormwater management program using the form attached (Attachment C). This budget summary shall include an annual summary identifying the stormwater budget for the following year, using estimated percentages and written explanations where necessary, for the specific categories noted below:

i. Program management
ii. Illicit connection/illicit discharge
iii. Development planning/development construction
iv. Public Agency Activities
v. Public Information and Participation
vi. Monitoring Program
vii. Other

Permittees, in addition to the budget summary, may report supplemental dedicated budgets, if any, for the same categories.

J. Stormwater Quality Monitoring Report

1. The Principal Permittee shall submit a Stormwater Quality Monitoring Report on October 15, 2002 and annually on October 15 thereafter, in accordance with the requirements identified in the Monitoring and Reporting Program Part I.B of this order. The report shall include:

a. Status of implementation of the stormwater quality monitoring program as described in the attached Monitoring and Reporting Program;

b. Results of the stormwater quality monitoring program: and

c. A general interpretation of the significance of the results, to the extent that data allows.

K. Stormwater Quality Monitoring Program Modifications

1. The Regional Board Executive Officer or the Regional Board consistent with 40 CFR 122.41 may approve changes to the Los Angeles County Flood Control District Stormwater Quality Monitoring Program, after providing the opportunity for public comment, either:

a. By petition of the Permittee or by petition of interested parties, after the submittal of the Annual Stormwater Quality Monitoring Program Report. Such petition shall be filed not later than 60 days after the Annual Monitoring Program Report submittal date; or

b. As deemed necessary by the Regional Board Executive Officer following notice to the Permittee.

PART 4. SPECIAL PROVISIONS

Requirements of the permit shall take effect 60 days from permit adoption provided the US EPA Regional Administrator has no objections unless new permit requirements require additional resources and budgeting, wherein effective date will be 90 days after the next budget cycle.

Implementation Plans for any future watershed based requirement modifications, will be formulated and added to the SQMP at that time.

All requirements listed in the SQMP are to be applied. The following special provisions were either extracted from the SQMP or are additional requirements and are only presented hereafter for emphasis because of their importance.

A. Public Information and Participation

1. Programs for the General Public

a. The 888-CLEAN-LA hotline will serve as the general public reporting contact for reporting clogged catch basin inlets and illicit discharges/dumping, and general stormwater management information. Each Permittee may establish its own hotline if preferred. Permittees shall include this information, updated when necessary, in public information, and the government pages of the telephone book as they are developed/published.

b. Permittees shall mark storm drain inlets with a legible "no dumping" message. In addition, signs with language prohibiting illegal dumping must be posted at designated public access points to creeks, other relevant water bodies, and channels under Permittee's jurisdiction.

c. Each Permittee shall conduct educational activities within its jurisdiction and participate in countywide events to the extent possible.

d. Each Permittee shall distribute outreach materials to the general public and school children at appropriate public counters and events. Outreach material shall include information such as proper disposal of litter, green waste, and pet waste, proper vehicle maintenance techniques, proper lawn care, and water conservation practices.

2 Programs for Industrial/Commercial Businesses

a. Permittees shall implement an industrial/commercial educational site

visit program.

b. Permittees shall visit automotive service and food service facilities as outlined in the SQMP in its jurisdiction once every two years. During site visits, Permittees shall:

i. Consult with a representative of the facility to explain applicable stormwater regulations;

ii. Distribute and discuss applicable BMP and educational materials; and,

iii. Conduct a site walk-through to verify for, at a minimum, evidence of BMP implementation.

c. Permittees shall revisit automotive and food service facilities where evidence of illicit discharge is found within six months of the date of the initial visit. If necessary, Permittees will begin enforcement action to remove sources of illicit discharges.

d. Based on Pollutants of Concern source identification, additional target businesses may be identified to be included in the site visit program. Each Permittee shall visit a maximum of 125 such businesses twice during the term of this permit. Permittees shall report on the types and proposed actions to be taken in regard to the additional target businesses in annual reports.

e. Permittees shall provide an annual update of the visited automotive service, food service, and other targeted facilities to the Regional Board in the annual report. The database shall include at a minimum: facility name, site address, applicable SIC code(s), and NPDES stormwater permit coverage.

f. Permittees shall train their employees in targeted positions (whose jobs or activities directly affect stormwater quality, or those who respond to questions from the public), including inspection staff, on the requirements of the SQMP within one year from the date of the permit adoption, and annually thereafter, as necessary.

B. Programs for Development Planning

1. The Discharger shall implement the approved Standard Urban Stormwater Mitigation Plan (SUSMP) (See SQMP, Development Planning). The SUSMP addresses conditions and requirements for discretionary development and

redevelopment projects. Appropriate elements of the SUSMP will be included as project requirements.

2. Permittees shall make appropriate modifications to their internal planning procedures for preparing/reviewing CEQA documents, and for linking stormwater quality mitigation conditions to legal discretionary project approvals.

3. Permittees shall train their employees in targeted positions (whose jobs or activities are engaged in development planning) on the requirements of the SUSMP within one year from the date of the permit adoption, and annually thereafter, as necessary.

4. The Permittee shall include watershed and stormwater management considerations in the appropriate elements of the Permittee's General Plan whenever these elements are significantly rewritten. Appropriate elements include, but are not limited to, water quality protection, development goals and policies, open space goals and policies, preservation of and integration with natural features, and water conservation policies.

C. Programs for Development Construction

1. Permittees shall require the preparation, submittal, and implementation of a Local Stormwater Pollution Prevention Plan (Local SWPPP) prior to issuance of a grading permit for priority construction projects unless the project falls under the requirements of the State's General Construction Activities Permit.

2. Permittees shall prepare and implement a Local SWPPP on Permittee's construction projects, as required in Part 4.C.1.

3. The Local SWPPP shall include appropriate construction site BMPs selected from documents such as the California Stormwater BMP Handbook, the Caltrans Stormwater Quality Handbook, EPA database and American Society of Civil Engineers (ASCE) database. In addition, Permittees shall ensure the following minimum requirements are met, to the maximum extent practicable, at construction sites regardless of size:

   a. Sediments generated on the project site shall be retained using structural drainage controls;

   b. Construction-related materials, wastes, spills, or residues shall be retained on project sites:

   c. Non-stormwater runoff from equipment and vehicle washing and any

other activity shall be contained at project sites;

d. Erosion from slopes and channels will be minimized, by implementing BMPs, including, but not limited to, limiting grading scheduled during the wet season, inspecting graded areas during rain events, planting and maintaining of vegetation on slopes, and covering slopes susceptible to erosion.

4. Local SWPPPs must include the rationale used for selecting or rejecting BMPs. The project architect, engineer of record, or authorized qualified designee, must sign a statement on the submitted Local SWPPP to the effect:

"As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project's construction activities on stormwater quality. The project owner and contractor are aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activities."

The landowner shall sign a statement to the effect:

"I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is true, accurate, and complete. I am aware that submitting false and/or inaccurate information, failing to update the Local SWPPP to reflect correct conditions, or failing to properly and/or adequately implement the Local SWPPP may result in revocation of grading and/or other permits or other sanctions provided by law."

The Local SWPPP certification shall be signed by the landowner as follows:

i. For a corporation: by a responsible corporate officer which means (a) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or (b) the manager of the construction activity if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

ii. For a partnership or sole proprietorship: by a general partner or the proprietor; or

iii. For a municipality or other public agency: by an elected official, a ranking management official (e.g., County Administrative Officer, City Manager, Director of Public Works, District Engineer, City Engineer, District Manager), or the manager of the construction activity if authority to sign stormwater quality plans has been assigned or delegated to the manager in accordance with established agency policy.

5. Permittees shall require proof of filing a Notice of Intent for coverage under the State General Construction Activity Stormwater Permit and a State SWPPP prior to issuing a grading permit for all projects requiring coverage under the state general permit.

6. Permittees shall inspect sites with Local SWPPP and Wet Weather Erosion Control Plan (WWECP) for stormwater quality requirements during routine inspection a minimum of once during the wet season. For inspected sites that have not adequately implemented their local SWPPP, a follow-up inspection to ensure compliance will take place within 2 weeks.

7. Permittees shall discuss stormwater controls and provide stormwater control educational materials targeted to the construction community when requested by the public and/or inspectors.

8. Permittees shall train employees in targeted positions (whose jobs or activities are engaged in construction activities including construction inspection staff) on the requirements of the SQMP within one year from the date of adoption of the permit, and annually thereafter, as necessary.

D. Public Agency Activities

Corporation Yards

1. Permittees shall prohibit the discharge of untreated stormwater runoff to the storm drain system from toxic or hazardous material storage areas no later than one year from the adoption of the permit, where practicable.

2. Permittees shall prohibit the discharge of untreated stormwater runoff to the storm drain system from new fueling areas and new repair/maintenance areas for vehicle maintenance and repair facilities no later than one year from the adoption of the permit.

A public vehicle maintenance or material storage facility is a Permittee-owned or operated facility or a portion thereof that:

a. Conducts industrial activity, operates equipment, handles materials, and provides services similar to Federal Phase 1 facilities;

b. Performs fleet vehicle maintenance on ten or more vehicles per day including repair, maintenance, washing, and fueling;

c. Performs maintenance and/or repair of heavy industrial machinery/equipment; and

d. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control, and Counter-measures (SPCC) plan.

3. Permittees shall require that all vehicle/equipment wash areas must be self-contained; or equipped with a clarifier, or other pretreatment facility properly connected to a sanitary sewer. The provision does not apply to fire fighting vehicles.

Other Facilities

4. The Permittees shall perform maintenance on the MS4 as outlined in the SQMP.

5. Permittees shall conduct street sweeping on curbed public streets in their permitted area according to the following schedule:

   a. Average once every 4 weeks with a minimum of 12 times per year; and

   b. Where feasible, more frequently in areas generating significant refuse.

6. Permittees shall avoid street saw cutting and paving during storm events or if the runoff is sufficient to carry the saw cutting or paving debris (except during emergency conditions).

7. Permittees shall prohibit discharge of polluted stormwater runoff from temporary or permanent street maintenance stockpiled material and waste storage areas.

8. There shall be no application of pesticides or fertilizers during a rain event that results in runoff.

   Permittees shall ensure that staff applying pesticides are either certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator.

9. Permittees shall train their employees in targeted positions (whose jobs and activities affect stormwater quality) regarding the requirements of the SQMP within one year from the adoption of the permit, and annually thereafter, as necessary.

10. Permittees shall conduct trash collection along, or in improved open channels within their jurisdiction.

11. The Discharger shall encourage the establishment of voluntary programs for the collection of trash in natural stream channels.

E. Programs for Illicit Connections and Illicit Discharges

1. Refer to Part 1.A.2. for conditions of illicit discharges.

2. Permittees shall investigate the cause, determine the nature and estimated amount of reported illicit discharge/dumping incidents, and refer documented non-stormwater discharges/connections or dumping to an appropriate agency for investigation, containment and cleanup. If the source of the illicit discharge has been identified, appropriate action including issuance of an enforcement order that will result in cessation of the illicit discharge, and/or elimination of the illicit connection, shall take place after the Permittee gains knowledge of the discharge/connection.

3. Each Permitee shall train its employees in targeted positions, as defined by the SQMP, on how to identify and report illicit discharges within one year from the date of the permit adoption, and annually thereafter, as necessary.

4. Automotive, food facility, construction and Permittee facility site visits shall include distribution of educational material that describes illicit discharges and provides a contact number for reporting illicit discharges.

5. New information developed for Phase I industrial facility educational material shall include information describing illicit discharges. The information shall include: types of discharges prohibited, how to prevent illicit discharges, what to do in the event of an illicit discharge, and the array of enforcement action the facility may be subjected to, including penalties that can be assessed.

PART 5. DEFINITIONS

40 CFR: Title 40 of the Code of Federal Regulations, which is the codification of the general and permanent rules published in the Federal Register by the executive departments and agencies of the federal government.

Adverse Impact: A detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants. See also "Impact".

Authorized Discharge: Any discharge that is authorized pursuant to an NPDES permit or meets the conditions set forth in this Order.

BMP: See Best Management Practice

Basin Plan: Refers to the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Board on June 13, 1994 and subsequent amendments.

Beneficial Uses: Existing or potential uses of receiving waters in the permit area as designated by the Regional Board in the Basin Plan.

BAT/BCT Criteria: Treatment-based standards for reducing the discharge of pollutants, as defined in 40 CFR subchapter N, for specific categories of industrial facilities subject to stormwater effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards. Effluent limitations have been defined in 40 CFR for the reduction of toxic pollutants using Best Available Technology Economically Achievable (BAT) and for the reduction of conventional pollutants using Best Conventional Pollutant Control Technology (BCT).

Best Management Practice (BMP): Activities, practices, facilities, and/or procedures that when implemented to their maximum efficiency will prevent or reduce pollutants in discharges. Examples of BMPs may include public education and outreach, proper planning of development projects, proper clean out of catch basin inlets, and proper sludge or waste handling and disposal, among others.

Bioaccumulate: The build up of a substance in the tissues of an organism to a higher concentration than in the surrounding environment, generally as a result of the organism's ingestion and internal storage of the substance over time.

Biostimulatory: An agent, action, or condition that arouses, elicits or accelerates physiological or organic activity. For example, the introduction of excessive nutrients to an aquatic system has a biostimulatory effect which manifests itself as excessive growth of algae in the aquatic systems. As the algae decomposes, dissolved oxygen in the water column is depleted, potentially leading to excessively low dissolved oxygen levels which can lead to suffocation of aquatic life, i.e., fish kills.

CFR: See Code of Federal Regulations.

CRWQCB: The California Regional Water Quality Control Board, Los Angeles Region. See also Regional Board.

California Storm Water Best Management Practice Handbooks: The technical manuals prepared under direction of the Storm Water Quality Task Force, representing California members of the American Public Works Association (APWA). Comprising three volumes—Municipal, Industrial, and Construction—they provide guidance for selecting BMPs to reduce pollutants in storm water discharges. These manuals are currently available from Blue Print Service, 1700 Jefferson Street, Oakland, CA 94612, (510) 444-6771 or Fax (510) 444-1262.

Clean Water Act (CWA): The Federal Water Pollution Control Act enacted in 1972 by Public Law 92-500 and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to Waters of the United States unless said discharge is in accordance with an NPDES permit. The 1987 amendments include guidelines for regulating municipal, industrial, and construction stormwater discharges under the NPDES program.

Code of Federal Regulations: A codification of the general and permanent rules published in the Federal Register by the Executive departments and agencies of the Federal Government.

Construction Activity: Clearing, grading, or excavation that results in soil disturbance. Construction activity does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility, nor does it include emergency construction activities required to immediately protect public health and safety.

Control: To minimize, reduce or eliminate by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

Corporation Yards: Any Permittee-owned and/or operated facility that is: used for vehicle or equipment maintenance, repair, washing, or fueling; and/or is required to prepare a hazardous materials business plan.

Dechlorinated Swimming Pool Discharges: Swimming pool discharges which have no measurable chlorine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term swimming pool discharges does not include swimming pool filter backwash.

Discharge: Any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid or solid substance.

Discharger: A joint reference to the Los Angeles County Flood Control District and 83 incorporated cities within the County covered by this permit.

Disposal: Affirmative act in the placement of wastes or other materials to be thrown out or thrown away.

Disturbed Area: Area altered as a result of clearing, grading, and/or excavation of earth.

Do-it-yourselfers: Any person or persons who repair or maintain their own vehicle(s) and/or home(s).

Effectiveness: A direct or indirect measure or indicator of how well a program, plan, or best management practice achieves its intended purpose. Measures or indicators of effectiveness include, but are not limited to, detailed accounting of program accomplishments, funds expended, staff hours utilized, field surveys, amount of pollutants reduced, biosurveys, and quantitative data from water quality and sediment sampling.

Erosion: The wearing away of land surface primarily by wind or water. Erosion occurs naturally as a result

of weather or runoff but can be intensified by clearing, grading, or excavation of the land surface.

Exceedance: Concentrations found above the standard in comparison.

Executive Advisory Committee (EAC): A committee composed of representatives of the Los Angeles County Flood Control District, the City of Los Angeles, and the five Watershed Management Areas.

Executive Officer: The Executive Officer of the California Regional Water Quality Control Board, Los Angeles Region, or an authorized representative.

Food Distribution Industry: Establishments primarily engaged in the warehousing and storage of perishable goods under refrigeration described by SIC 4222, and establishments primarily engaged in retail selling of food for home preparation and consumption described by SIC Major Group 54.

Food Service Industry: Establishments primarily engaged in the retail sale of prepared food and drinks for on-premise consumption or immediate consumption described by SIC 5812

GCASP: See General Construction Activity Storm Water Discharge Permit.

GIASP: See General Industrial Activity Storm Water Discharge Permit.

General Construction Activity Storm Water Discharge Permit (GCASP). The NPDES permit adopted by the State Water Resources Control Board which authorizes the discharge of stormwater under certain conditions.

General Industrial Activity Storm Water Discharge Permit (GIASP). The NPDES permit adopted by the State Water Resources Control Board which authorizes the discharge of stormwater under certain conditions.

Good Housekeeping Practice: A common practice related to the storage, use, or cleanup of materials, performed in a manner that minimizes the discharge of pollutants. Examples include purchasing only the quantity of materials to be used at a given time, use of alternative and less harmful products, cleaning up spills and leaks, and storing materials in a manner that will contain any leaks or spills.

Hazardous Material: Any material defined as hazardous by Chapter 6.95 of the California Health and Safety Code.

Hazardous Substance: Any substance designated pursuant to 40 CFR 302. This also includes unlisted hazardous substances which is a solid waste, as defined in 40 CFR 261.2, which is not excluded from regulation as a hazardous waste under 40 CFR 261 4(b), is a hazardous substance under section 101(14) of the CWA if it exhibits any of the characteristics identified in 40 CFR 261.20 through 261.24.
Examples of hazardous substances include any substance or chemical product for which one or more of the following applies:

- A material safety data sheet (MSDS) is required
- The substance is listed as radioactive by the Nuclear Regulatory Commission
- The substance is listed as hazardous by the U.S. Department of Transportation
- The material is listed in Labor Code §6382(b).

Hazardous Waste: A 'Hazardous Substance' or 'Hazardous Material' which is to be discharged, discarded,

recycled, or processed.

IPM: See Integrated Pest Management.

Illicit Connection: Any human-made conveyance that is connected to the storm drain system without a permit, excluding roof-drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

Illicit Discharge: Any discharge to the storm drain system that is prohibited under local, state or federal statutes, ordinances, codes or regulations. This includes all non-stormwater discharges except discharges pursuant to an NPDES permit and discharges that are exempted or conditionally exempted in accordance with Section II of this Order.

Illicit Disposal: Any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute stormwater or urban runoff.

Impact: Any actual or potential effect caused either directly or indirectly by the discharge of pollutants.

Impervious Surface: Surface that prevents or significantly reduces the entry of water into the underlying soil, resulting in runoff from the surface in greater quantities and/or at an increased rate when compared to natural conditions prior to development. Examples of places that commonly exhibit impervious surfaces include parking lots, driveways, roadways, storage areas, and rooftops. The imperviousness of these areas commonly results from paving, compacted gravel, compacted earth, and oiled earth.

In Consultation With: The Principal Permittee and Permittees work cooperatively towards the development of programs.

Industrial Activity: The term "industrial activity" is defined in 40 CFR 122.26(b)(14) and refers to 11 categories of activities required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for stormwater discharges associated with "industrial activity" as required by 40 CFR 122.26(c). See Phase I Facilities.

Industrial/Commercial Facility: Any facility involved and/or used in either the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facility includes, but is not limited to, any facility defined by the Standard Industrial Classifications (SIC). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

Integrated Pest Management (IPM): Pest management practice that considers the whole ecosystem when determining potential pest control strategies. IPM emphasizes use of a hierarchy of controls, with a preference for mechanical controls (e.g., mowing) and biological controls (e.g., beneficial insects, pheromones) before chemical controls (e.g., pesticides).

Jurisdiction: The geographic area within the Permittee's boundaries that are required under this Order to be under the Permittee's regulatory control. The term is not intended to include facilities which the Permittee is preempted or otherwise precluded from regulating, such as federal and state facilities, school districts, and similar governmental (non-municipally owned or operated) entities.

Legal Authority: The ability of a Permittee to impose and enforce statutes, ordinances, and regulations to

require control of pollutant sources and regulate the discharge of pollutants to the storm drain system, and to enter into interagency agreements, contracts, and memorandums of understanding. These powers are granted to the Permittees by the Constitution of the State of California and the General Laws of the State (for General Law Cities/Counties) or individual constitutions (for Charter Cities/Counties). These powers are promulgated by the Permittee through their municipal codes, ordinances, and statutes duly adopted by their governing body.

Local Stormwater Pollution Prevention Plan (Local SWPPP): A SWPPP if the project is not subject to the General Construction Permit, otherwise, a state SWPPP is required.

MS4: See Municipal Separate Storm Sewer System

Maximum Extent Practicable (MEP): The standard for implementation of stormwater management programs to reduce pollutants in stormwater. MEP refers to stormwater management programs taken as a whole. It is the maximum extent possible taking into account equitable consideration and competing facts, including, but not limited to: the gravity of the problem, public health risk, societal concern, environmental benefits, pollutant removal effectiveness, regulatory compliance, public acceptance, implementability, cost and technical feasibility. Section 402(p)(3)(B)(iii) of the Clean Water Act requires that municipal permits "...shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

Municipal Activities: all activities performed by the Permittee or performed by a contractor hired by the Permittee.

Municipal Separate Storm Sewer System (MS4): See Storm Drain System.

NPDES: See National Pollutant Discharge Elimination System

National Pollutant Discharge Elimination System (NPDES): A permit issued by the USEPA, SWRCB, or CRWQCB pursuant to the Clean Water Act that authorizes discharges to waters of the United States and requires the reduction of pollutants in the discharge.

Non-Stormwater Discharge: Any discharge to a municipal storm drain system that is not composed entirely of stormwater.

Notice of Intent to Meet and Confer (NIMC): A letter sent to a Permittee or Permittees by the Regional Board Executive Officer as an invitation to discuss the implementation of requirements under this Order and is made when it is suspected that a Permittee or Permittees has/have an insufficient program based upon performance and submittals made under this Order. The NIMC is a part of the Administrative Review section of this Order and provides an opportunity for the Permittee(s) to meet with Regional Board staff to clarify any potential misunderstandings prior to, or in lieu of the Regional Board taking enforcement action for "non-compliance".

Nuisance: Anything which meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; (3) occurs during, or as a result of, the treatment or disposal of wastes.

Permittee(s): Any agency named in the NPDES stormwater permit as being responsible for permit conditions within its jurisdiction. Permittees to the NPDES stormwater permit presently include the Los Angeles County Flood Control District, Los Angeles County, and the cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier.

Pervious: Natural or man-made surfaces that allow the entry of water into the underlying soil, resulting in less runoff from the surface when compared to impervious surfaces. Examples of pervious surfaces include vegetated areas, most undeveloped areas, uncompacted earth surfaces, and lattice type modular pavements.

Phase I Facilities: This term refers to categories of facilities which are required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for stormwater discharges associated with "industrial activity" as required by 40 CFR 122.26(c). The term "industrial activity" is defined in 40 CFR 122.26(b)(14) and in general refers to 11 categories of activities. These categories include:

i FACILITIES SUBJECT TO STORM WATER EFFLUENT LIMITATIONS GUIDELINES, NEW SOURCE PERFORMANCE STANDARDS, OR TOXIC POLLUTANT EFFLUENT STANDARDS (40 CFR SUBCHAPTER N). Currently, categories of facilities subject to storm water effluent limitations guideline are Cement Manufacturing (40 CFR Part 411), Feedlots (40 CFR Part 412), Fertilizer Manufacturing (40 CFR Part 418), Petroleum Refining (40 CFR Part 419), Phosphate Manufacturing (40 CFR Part 422), Steam Electric (40 CFR Part 423), Coal Mining (40 CFR Part 434), Mineral Mining and Processing (40 CFR Part 436), Ore Mining and Dressing (40 CFR Part 440), and Asphalt Emulsion (40 CFR Part 442). The fact sheet accompanying this general permit contains additional information pertaining to facilities subject to new source performance standards or toxic pollutant effluent standards.

ii MANUFACTURING FACILITIES: Standard Industrial Classifications (SICs) 24 (except 2411 and 2434), 26 (except 265 and 267), 28 (except 283 and 285) 29, 311, 32 (except 323), 33, 3441, and 373.

iii OIL AND GAS/MINING FACILITIES: SICs 10 through 14 including active or inactive mining operations (except for areas of coal mining operations meeting the definition of a reclamation area under 40 CFR 434.11(1) because of performance bond issued to the facility by the appropriate Surface Mining Control and Reclamation Act (SMCRA) authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge stormwater contaminated by contact with or that has come into contact with any overburden, raw material, intermediate products, finished products, by products, or waste products located on the site of such operations. Inactive mining operations are mined sites that are not being actively mined, but which have an identifiable owner/operator. Inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined material, or sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim.

iv HAZARDOUS WASTE TREATMENT, STORAGE, OR DISPOSAL FACILITIES: Includes those operating under interim status or a general permit under Subtitle C of the Federal Resource Conservation and Recovery Act (RCRA).

v. LANDFILLS, LAND APPLICATION SITES, AND OPEN DUMPS: Sites that receive or have received industrial waste from any of the facilities covered by this general permit, sites subject to regulation under Subtitle D of RCRA, and sites that have accepted waste from construction activities (construction activities include any clearing, grading, or excavation that results in disturbance of five acres or more).

vi. RECYCLING FACILITIES: SICs 5015 and 5093. These codes include metal scrap yards, battery reclaimers, salvage yards, motor vehicle dismantlers and wreckers, and recycling facilities that are engaged in assembling, breaking up, sorting, and wholesale distribution of scrap and waste material such as bottles, wastepaper, textile wastes, oil waste, etc.

vii. STEAM ELECTRIC POWER GENERATING FACILITIES: Includes any facility that generates steam for electric power through the combustion of coal, oil, wood, etc.

viii. TRANSPORTATION FACILITIES: SICs 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication) or other operations identified herein that are associated with industrial activity.

ix. SEWAGE OR WASTEWATER TREATMENT WORKS: Facilities used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including lands dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of one million gallons per day or more, or required to have an approved pretreatment program under 40 CFR Part 403. Not included are farm lands, domestic gardens, or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with Section 405 of the CWA.

xi. MANUFACTURING FACILITIES WHERE MATERIALS ARE EXPOSED TO STORM WATER: SICs 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 3441), 35, 36, 37 (except 373), 38, 39, and 4221-4225.

Note: Category x, Construction activity, is covered by a separate general permit.

Pollutant: Those "pollutants" defined in Section 502(6) of the federal Clean Water Act (33 U.S.C.§1362(6)), or incorporated into California Water Code §13373. Examples of pollutants include, but are not limited to the following:

- Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash, and sludge);

- Metals such as cadmium, lead, zinc, copper, silver, nickel, chromium, and non-metals such as phosphorus and arsenic;

- Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants, and grease);

- Excessive eroded soils, sediment, and particulate materials in amounts which may adversely affect the beneficial use of the receiving waters, flora or fauna of the State;

- Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables, and show facilities);

- Substances having characteristics such as pH less than 6 or greater than 9, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus;

The term "Pollutant" shall not include uncontaminated stormwater, potable water or reclaimed water generated by a lawfully permitted water or wastewater treatment facility.

The term "Pollutant" also shall not include any substance identified in this definition, if through compliance with the best management practices available, the discharge of such substance has been eliminated to the maximum extent practicable. In an enforcement action, the burden shall be on the person who is the subject of such action to establish the elimination of the discharge to the maximum extent practicable through compliance with the best management practices available.

Pollutant Loading: The quantity of a pollutant found in stormwater and/or non-stormwater often expressed in mass per unit of time. Pollutant loadings are commonly expressed in units of tons/year or pounds/year.

Pollutants of Concern: Constituents identified in the annual monitoring report as being "Constituents of Concern" or "Pollutants of Concern".

Pollution Prevention: Includes any planning, schedules of activities, prohibitions of practices, implementation of maintenance procedures, public education, and other management practices, to prevent or reduce pollutants in stormwater / urban runoff discharges.

Polluted Stormwater Runoff: Stormwater runoff that contains any pollutants that could impair the beneficial use of a receiving water body.

Potable Water Sources: Flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, well development, pump testing, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and wells.

Principal Permittee: The agency named in the NPDES stormwater permit to serve as permit coordinator, responsible for general administration of the permit, and coordinating cooperation by other Permittees, including but not limited to the implementation of local self-monitoring programs and BMPs, and preparation and submittal of reports required by the permit. The Principal Permittee under this Order is the Los Angeles County Flood Control District.

Priority Catch Basins: Catch basins that appear on the list of Priority Catch Basins generated through the Public Agency Model Program.

Proper Disposal: The act of disposing of material(s) in a lawful manner and which ensures the protection of water quality and beneficial uses of receiving waters.

Public Agency Vehicle Maintenance/Material Storage Facility: Any Permittee-owned and/or operated facility that is: used for vehicle or equipment maintenance, repair, washing, or fueling; and/or is required to prepare a hazardous materials business plan. (See Corporation Yard)

Receiving Water Objectives: Objectives of the California Ocean Plan, the Los Angeles Basin Plan, and the California Toxics Rule.

Receiving Waters: All surface water bodies within the permit area that are identified in the Basin Plan.

Redevelopment: Projects creating or adding 5,000 square feet or more of impervious surface on an already developed site.

Regional Board: The Governing Board of the California Regional Water Quality Control Board State agency with primary responsibility for the coordination and control of water quality. This means the California Regional Water Quality Control Board, Los Angeles Region. The Los Angeles Region is comprised of all basins draining into the Pacific Ocean between the southeasterly boundary, located in the westerly part of Ventura County, of the watershed of Rincon Creek and a line which coincides with the southeasterly boundary of Los Angeles County Flood Control District from the ocean to San Antonio Peak and follows thence the divide between San Gabriel River and Lytle Creek drainage to the divide between Sheep Creek

and San Gabriel River drainage.

Reportable Quantity: Quantity of a hazardous substance, as set forth in 40 CFR 302, which requires notification pursuant to 40 CFR 302 in the event of that quantity release.

Runoff: Means any runoff including stormwater and dry-weather flows from a drainage area that reaches a receiving water body or sub-surface. During dry weather it is typically comprised of many base flow components either contaminated with pollutants or uncontaminated.

SIC: See Standard Industrial Classification.

SPCA: See Storm Water Program Compliance Amendment

SQMP: See Stormwater Quality Management Plan.

SWRCB: State Water Resources Control Board

Secondary Containment: Structures, usually dikes or berms, surrounding tanks or other storage containers to catch spilled or leaked materials to prevent their discharge to the MS4.

Sediment: Organic or inorganic material that is carried by or suspended in water and settles to form deposits in the storm drain system or receiving waters.

Source Minimization: Planning or operational practices that reduce the amount of materials stored at a site.

Standard Industrial Classification (SIC): The statistical classification standard, organized by industry, underlying all establishment-based federal economic statistics. The SIC of a particular industry is determined using the latest Standard Industrial Classification Manual as prepared by the Executive Office of the President, Office of Management and Budget.

State Storm Water Pollution Prevention Plan (SWPPP): A plan required by and for which contents are specified in the State of California General Permit for Storm Water Discharges Associated with Industrial Activities, and the General Permit for Storm Water Discharges Associated with Construction Activities. The purpose of the plan is to help identify the sources of pollution that affect the quality of stormwater discharges from a site and to describe and ensure the implementation of practices to reduce pollutants in stormwater discharges.

Storm Drain System: Streets, gutters, conduits, natural or artificial drains, channels and watercourses, or other facilities that are owned, operated, maintained or controlled by any Permittee and used for the purpose of collecting, storing, transporting, or disposing of stormwater.

Stormwater: Water which originates from atmospheric moisture (rainfall or snowmelt) and that falls onto land, water, or other surfaces.

Stormwater Management Plan: This is the sum of all requirements of this Order. This in not to be confused with the SQMP.

Stormwater Pollution Prevention Plan (SWPPP): A plan describing proposed design, placement, and implementation of BMPs.

Stormwater Program Compliance Amendment (SPCA): The SPCA is a report prepared by a Permittee if directed to by the Regional Board Executive Officer for insufficient submittals made under this Order. The SPCA is a part of the Administrative Review section of this Order and will include additions and enhancements to the jurisdiction's stormwater program with enforceable implementation deadlines.

Stormwater Quality Management Plan (SQMP): The five Model Programs collectively developed by the Permittees in accordance with provisions of the NPDES Permit Order Number 96-054, to comply with applicable federal and state laws.

Stormwater Runoff: That part of precipitation (rainfall or snowmelt) which travels via flow across a surface to the storm drain system or receiving waters. Examples of this phenomenon include: the water that flows from a building's roof when it rains (runoff from an impervious surface); the water that flows into streams when snow on the ground begins to melt (runoff from a semi-pervious surface); and the water that flows from a vegetated surface when rainfall is in excess of the rate at which it can infiltrate into the underlying soil (runoff from a pervious surface). When all other factors are equal, runoff increases as the perviousness of a surface decreases.

Standard Urban Stormwater Mitigation Plan: A plan, to be submitted prior to the submittal of an application for the first planning or building approval for a new development project, that sets forth stormwater pollution controls to be incorporated into development projects. The plan shall:

- be designed to reduce the runoff volume from the site and the pollutant load contributed by the site through incorporation of design elements and practices that address each of the following goals:

- maximize, to the extent practicable, the percentage of permeable surfaces in order to allow more percolation,

- minimize, to the extent practicable, the amount of runoff directed to impermeable areas to the storm drain system,

- maximize, to the extent practicable, stormwater filtration and storage for reuse through the use of sediment traps, cisterns or other means,

- minimize, to the extent practicable, parking lot pollution through the use of porous materials to allow percolation of stormwater, through the installation of appropriate treatment controls, or through other means.

Street Washing: The practice of washing of streets and sidewalks using water or other cleaning fluids.

Toxic Materials: For the purposes of this Order, toxic materials means any material(s) or combination of materials which directly or indirectly cause(s) either acute or chronic toxicity in the water column.

Toxic Pollutant: Those pollutants, or combinations of pollutants, defined in Section 502(13) or 307(a)(1) of the federal Clean Water Act (33 U.S.C.§1362(13)).

Undesirable Coloration: See "Color" in the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties (page 3-9) June 13, 1994.

USEPA: United States Environmental Protection Agency

Waste Minimization: Operational practices that reduce the amount of waste materials generated. Practices may include recycling and reuse.

Watershed Management Area (WMA): Any one of the general watershed areas covered by this NPDES stormwater permit consisting of: Malibu Creek and other rural areas discharging to Santa Monica Bay, Dominguez Channel/Los Angeles Harbor, San Gabriel River, Los Angeles River, and Ballona Creek and other urban areas discharging to the Santa Monica Bay watersheds.

Watershed Management Area Plan (WMAP): A plan for implementation of permit requirements that is based on the Stormwater Quality Management Plan (SQMP) but further addresses specific issues, pollutants of concern, and BMPs that are unique to the specific Watershed Management Area.

Watershed Management Committee (WMC): A committee composed of representatives from each Permittee in a Watershed Management Area. Duties include establishing goals and objectives for the Watershed; prioritizing pollution control efforts; developing a specific Watershed Management Plan; coordinating and facilitating annual reports for the watershed; and facilitating compliance by Permittees in the watershed.

PART 6. STANDARD PROVISIONS

A. Should the Discharger discover that it failed to submit any relevant facts or that it submitted incorrect information in a report, it shall promptly submit the missing or correct information.

B. The Discharger shall report all instances of non-compliance not otherwise reported at the time monitoring reports are submitted.

C. This Order includes the attached Monitoring and Reporting Program, and Standard Urban Stormwater Mitigation Plan, which are a part of the permit and must be complied with in the same manner as with the rest of the requirements in the permit.

D. Public Review

1. All documents submitted to the Regional Board in compliance with the terms and conditions of this Permit shall be made available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. Section 552 (as amended) and the Public Records Act (California Government Code Section 6250 *et seq.*)).

2. All documents submitted to the Executive Officer for approval shall be made available to the public for a 30-day period to allow for public comment.

E. Duty to Comply [40 CFR 122.41(a)]

1. The Discharger must comply with all the terms, requirements, and conditions of this Order. Any violation of this Order constitutes a violation of the Clean Water Act, its regulations and the California Water Code, and is grounds for enforcement action, Order termination, Order revocation and reissuance, denial of an application for reissuance; or a combination thereof.

2. A copy of these waste discharge specifications shall be maintained by the Discharger so as to be available during normal business hours to Discharger employees and members of the public.

3. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.

F. Duty to Mitigate [40 CFR 122.41(d)]

The Discharger shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

G. Inspection and Entry [40 CFR 122.41(i)]

The Regional Board, USEPA, and other authorized representatives shall be allowed:

1. Entry upon premises where a regulated facility is located or conducted, or where records are kept under conditions of this Order;

2. Access to copy any records that are kept under the conditions of this Order;

3. To inspect any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and,

4. To photograph, sample, and monitor for the purpose of assuring compliance with this Order, or as otherwise authorized by the Clean Water Act and the California Water Code.

H. Proper Operation and Maintenance [40 CFR 122.41(e)]

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment (and related appurtenances) that are installed or used by the Discharger to achieve compliance with this Order. Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar system that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order.

I. Signatory Requirements [40 CFR 122.41(k)]

Except as otherwise provided in this Order, all applications, reports, or information submitted to the Regional Board shall be signed by the Director of Public Works, City Engineer, or authorized designee under penalty of perjury.

J. Permit Action [40 CFR 122.41(f)]

1. This Order may only be modified, revoked, or reissued, prior to the expiration date, by the Regional Board, in accordance with the procedural requirements of the Water Code and Title 23 of the California Code of Regulations for the issuance of waste discharge requirements, and upon prior notice and hearing, to:

   a. Address changed conditions identified in the required reports or other sources deemed significant by the Regional Board;

b. Incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c. Comply with any applicable requirements, guidelines, and/or regulations issued or approved pursuant to CWA Section 402(p);

d. Consider any other federal or state laws or regulations that became effective after adoption of this Order ; and/or,

e. Address any amendments under the Clean Water Act.

2. After notice and opportunity for a hearing, this Order may be terminated, revoked and reissued, or modified for cause, including, but not limited to:

a. Violation of any term or condition contained in this Order;

b. Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; or,

c. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

3. The filing of a request by the Discharger for a modification, revocation and re-issuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.

4. This Order may be modified to make corrections or allowances for changes in the permitted activity listed in this section, following the procedures at 40 CFR Part 122.63, if processed as a minor modification.

K. Severability

The provisions of this permit are severable; and if any provision of this permit or the application of any provision of this permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected.

L. Duty to Provide Information [40 CFR 122.41(h)]

The Discharger shall furnish, within a reasonable time, any information the Regional Board or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order. The Discharger shall also furnish to the Regional Board, upon request, copies of records required to be kept by this Order.

M. Ninety-Six Hour Reporting[1]

1. The Discharger shall report any noncompliance than may endanger health or the environment. Any information shall be provided orally within 96 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within 10 working days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

2. The Executive Officer may waive the required written report on a permittee-by-permittee basis.

N. Bypass [40 CFR 122.41(m)][2]

Bypass (the intentional diversion of waste streams from any portion of a treatment facility) is prohibited unless it is to facilitate maintenance of stormwater BMPs. The Regional Board may take enforcement action against the Discharger for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage. (Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production);

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment down time. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventive maintenance;

---

[1]This provision applies to incidents where effluent limitations (numerical or narrative) as provided in this Order or in the SQMP are exceeded, and which endanger public health or the environment.

[2]This provision applies to the operation and maintenance of stormwater controls and BMPs as provided in this Order or in the SQMP.

3. The Discharger submitted a notice at least ten days in advance of the need for a bypass to the Regional Board; or,

4. The Discharger may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to assure efficient operation. In such a case, the above bypass conditions are not applicable.

O. Upset [40 CFR 122.41(n)][3]

1. A Discharger that wishes to establish the affirmative defense of an upset in an action brought for noncompliance shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

   a. An upset occurred and that the Discharger can identify the cause(s) of the upset;

   b. The permitted facility was being properly operated by the time of the upset;

   c. The Discharger submitted notice of the upset as required; and,

   d. The Discharger complied with any remedial measures required.

2. No determination made before an action for noncompliance, such as during administrative review of claims that noncompliance was caused by an upset, is final administrative action subject to judicial review.

3. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof.

P. Property Rights [40 CFR 122.41(g)]

This Order does not convey any property rights of any sort, or any exclusive privilege.

Q. Enforcement

1. Violation of any of the provisions of the NPDES permit or any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalty may be applied for

[3] *Supra.* See footnote number 2.

each kind of violation. The Clean Water Act provides the following:

Criminal Penalties

a. *Negligent Violations*
The CWA provides that any person who negligently violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

b. *Knowing Violations*
The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

c. *Knowing Endangerment*
The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

d. *False Statement*
The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years, or by both. If a conviction is for a violation committed after a first conviction of such a person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or by both. (See section 309(c)(4) of the Clean Water Act.)

Civil Penalties

e. The CWA provides that any person who violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the

Act is subject to a civil penalty not to exceed $27,500 per day for each violation.

2. The California Water Code provides that any person who violates a waste discharge requirement provision of the ~~California Water~~ Code is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation; or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day or $25 per gallon per day of violation; or some combination thereof, depending on the violation or combination of violations.

R. Need to Halt or Reduce Activity not a Defense [40 CFR 122.41(c)]

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order.

S. Regional Board Order No. 96-054 is hereby rescinded.

T. This Order expires five years from permit adoption. The Discharger must submit a Report of Waste Discharge (ROWD) in accordance with Title 23, California Code of Regulation, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Dennis A. Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on date of permit adoption.

_____

Dennis A. Dickerson
Executive Officer

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

MONITORING AND REPORTING PROGRAM NO. CIXXX

FOR

STORMWATER MANAGEMENT/URBAN RUNOFF DISCHARGES
FOR
LOS ANGELES COUNTY FLOOD CONTROL DISTRICT,
COUNTY OF LOS ANGELES, AND THE CITIES OF LOS ANGELES COUNTY

NPDES PERMIT NO. CASXXXXXX

I. Program Reporting Requirements

A. The Permittees shall submit, by October 15 of each year beginning the year 2002, an Annual Stormwater Program Report, Assessment, and Budget Summary documenting the status of the general program and individual tasks contained in the WMAPs.

The Permittees shall submit standard annual reporting forms to the Principal Permittee or Regional Board including information on items 1-6 below.

The Annual Stormwater Program Report, Assessment, and Budget Summary shall include any proposed changes to the WMAPs. The Annual Stormwater Program Report, Assessment, and Budget Summary shall cover the previous fiscal year from July 1 through June 30. At a minimum, the annual report will include the following:

1. Program Management

   a. Status of compliance with permit requirements including implementation dates for all time-specific deadlines. If permit deadlines are not met, the Discharger shall report the reasons why the requirement was not met and how the requirements will be met in the future, including projected implementation date.

2. Public Information and Participation

a. Programs for Residents

i. Description of activities on distributing brochures, community outreach efforts, public communication efforts and educational programs in schools including an estimate of the number of impressions per year made on the general public about stormwater quality via print, local TV access, local radio presentations, meetings or other appropriate media.

3. Programs for Development Planning

a. The status of significant rewrite of the Permittees' General Plan;

b. A summary of the accomplishments of the program.

4. Programs for Development Construction

a. Number of exempt construction projects, non-priority projects, and priority projects requiring coverage under the General Construction Activity Permit;

b. Number and type of enforcement actions, applicable to stormwater enforcement, taken at construction sites during the past year.

5. Programs for Illicit Connection and Illicit Discharge Control

a. Number of reports of illicit discharges that Permittees responded to, percentage that were identified as actual illicit discharges, and percentage of the actual illicit discharges where the incident was either cleaned up, referred to another responsible agency and/or follow up/education with the discharger was conducted;

b. Number of illicit connections investigated in the past year

c. Number of illicit connections eliminated in the past year;

d. Number and type of enforcement actions for stormwater illicit connections taken in the past year;

e. A summary from records on illicit discharges and connections which includes type of material, type of source, date of initial inspection, enforcement action taken, date of follow-up inspection, date of conclusion/cleanup/removal/ follow-up/education.

6. Programs for Public Agency Activities

   a. The discharger shall provide a summary, which at a minimum, includes an estimate of the quantity of trash removed from catch basin inlets;

   b. A summary of the total tonnage of debris that were removed annually by street sweeping and the total miles of curbed streets within the permittee's juridiction;

   c. Evaluate the training provided to field road maintenance personnel.

B. The discharger shall submit a Stormwater Monitoring Report on October 15, 2002, and annually on October 15, thereafter. The report shall include:

1. Status of implementation of the monitoring program;
2. Results of the monitoring program;
3. A general interpretation of the results; and,
4 Both tabular and graphical summaries of the monitoring data obtained during the previous year.

C. All applications, reports, or information submitted to the Regional Board shall be signed and certified pursuant to EPA regulations 40 CFR 122.22 (b). Each report shall contain the following completed declaration:

> "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.
>
> Executed on the _____day of _____, 20___,
>
> at _____
>
> (Signature)_____(Title)_____";

Permittee submittals to the Principal Permittee shall also be signed and certified pursuant to EPA regulations 40 CFR 122.22 (b).

D. The Discharger shall mail the original of each annual report to:

CALIFORNIA REGIONAL WATER QUALITY
CONTROL BOARD - LOS ANGELES REGION
320 W. 4TH STREET, SUITE 200
LOS ANGELES, CA 90013

II. Monitoring Requirements

A. The Discharger shall implement the Countywide Monitoring Plan as follows.

Land Use

1. The Principal Permittee shall monitor a total of 200 station events per storm season at land use stations, provided there are sufficient storm events during the season. A station event is defined as one sampling event per station.

2. All samples for land use station monitoring may be taken at the same locations and with the same type of automatic sampler used under Order 96-054. The samplers shall be set to monitor storms totaling 0.25 inches or greater of rainfall.

3. The land use stations shall be monitored during the term of this Order or until such time that event mean concentrations (EMC) are derived, at the 25% error rate, for the following constituents at their respective sites:

Table 1
Land Use Constituents

LAND USE TYPE	LOCATION	CONSTITUENTS
Retail/Commercial	Santa Monica Pier Drain	Ammonia, total and dissolved copper, nitrate, total lead, total suspended solids (TSS), PAH, diazinon, chlorpyrifos
Vacant	Sawpit Wash	Total kjeldahl nitrogen (TKN), TSS, PAH, diazinon, chlorpyrifos
High Density Single Family Residential	Bond Issue Project 620	Total lead, PAH, diazinon, chlorpyrifos
Transportation	Dominguez Channel	PAH, diazinon, chlorpyrifos

Light Industrial	Bond Issue Project 1202	Total copper, PAH, diazinon, chlorpyrifos
Education	Bond Issue Project 474	Total copper, total zinc, TSS, PAH, diazinon, chlorpyrifos
Multifamily Residential	Bond Issue Project 404	Ammonia, ammonia nitrogen, nitrite nitrogen, TSS, PAH, diazinon, chlorpyrifos
Mixed Residential	Bond Issue Project 156	Ammonia, nitrate, total zinc, PAH, diazinon, chlorpyrifos

Mass Emissions

4. The Principal Permittee shall monitor a total of four mass emission stations. Monitoring shall not exceed five storm events per station for each storm season. Composite samples may also be taken at Coyote Creek.

5. Samples for mass emission station monitoring may be taken at the same locations and with the same type of automatic sampler used under Order 96-054, as well as through grab sampling. The samplers shall be set to monitor storms totaling 0.25 inches or greater of rainfall. The minimum required constituents to be analyzed for samples taken at mass emission stations are listed in Table 2 below.

6. If a constituent is not detected at the method detection limit for its respective test method listed in Table 2 above in more than 25 percent of the first ten sampling events or on a rolling basis using ten consecutive sampling events, it will not be further analyzed unless the observed occurrences show concentrations greater than ten times the detection limit and are cause for concern.

7. Receiving Waters Studies

a. San Pedro Bay

The Principal Permittee, in conjunction with other Permittee(s), could partially fund a study of receiving waters impacted by stormwater, subject to revisions as set forth below in II.A.7.c. The purpose of the study will be to study the impacts, if any, of stormwater/non-stormwater discharges on the beneficial uses of San Pedro Bay and to assist the Permittees in developing stormwater management programs. The obligation of the Principal Permittee with respect to the receiving waters study could consist of the following:

i. Plume Study: The Principal Permittee would support a plume study to evaluate the dispersion, fate, and transport of stormwater pollutants in Dominguez Channel, Los Angeles River, and San Gabriel River.

ii. Benthic Study: The Principal Permittee would support a study to assess impacts of stormwater on the marine benthic community near the mouths of Dominguez Channel, Los Angeles River, and San Gabriel River. If it is the consensus of project scientists that a third year of benthic study is advisable to meet the goals of the receiving waters study, the Principal Permittee would consider further contribution.

iii. Toxicity Study: The Principal Permittee would support a study to evaluate sediment and water column toxicity on appropriate marine species in Dominguez Channel, Los Angeles River, and San Gabriel River. If it is the consensus of the project scientists that a third year of toxicity studies is advisable to meet the goals of the receiving waters study, the Principal Permittee would consider further contribution.

b. Santa Monica Bay

i. Plume Study: To study the persistence of stormwater plumes;

ii. Toxicity: Toxicity Identification Evaluations (TIEs) on species to find the impacts of constituents other than metals; and,

iii. Sediments: Fate of sediments in the Bay.

c. Project Design: The receiving waters studies shall initially contain the elements established in II.A.7.a and b. However, the scientists conducting the receiving waters studies may alter the parameters of the second and (if necessary) the third year of the receiving waters

studies so as to meet the objectives of each study. Such alterations may include changing of sampling locations, use of different sampling techniques, or other pertinent redirection of resources. The Principal Permittee shall notify the Executive Officer of any revisions to the second and (if necessary) third years of the receiving waters studies for review and approval.

d. Study Reports: The Principal Permittee shall require the project scientists conducting the study to prepare an annual report covering study activities of the previous year, and any interim/final assessments. Such reports shall be submitted by the Principal Permittee to the Executive Officer with the Annual Monitoring Report.

e. Principal Permittee Responsibilities: The commitments of the Principal Permittee toward performance of a receiving waters studies could be: providing funding, and submittal of progress and final reports.

8. River Toxicity Studies: The Principal Permittee would take two storm weather and two dry weather water samples in the Los Angeles River, Coyote Creek, and Dominguez Channel. Toxicity Identification Evaluations shall be conducted for a full range of constituents on appropriate freshwater species.

   Wet weather Toxicity Identification Evaluations shall be conducted for a full range of constituents on appropriate freshwater species on the San Gabriel River.

9. Bacteria: The Principal Permittee shall participate in the Southern California Coastal Waters Research Project's development and calibration of water quality models in an effort to characterize the presence and persistence of indicator bacteria in dry and wet weather.

   The Principal Permittee could participate in similar studies initiated for other parts of the County where indicator bacteria impair beneficial uses.

10. Contaminated Sediments: The Principal Permittee could participate in the Corps of Engineers' Sediment Control Management Plan and the Coastal Commission Sediment Task Force.

11. Aerial deposition: The Principal Permittee could fund, in whole or in part, a study of the receiving water impacts due to aerial deposition on inland watersheds.

PERFORMANCE STANDARDS

Permittees shall meet the following minimum requirements and strive to achieve the goals. Precise data regarding annual status of the tasks shall be submitted to the Principal Permittee or Regional Board in the form of annual reports.

Public Agency

Street Sweeping for curbed public streets

Minimum: Average once every 4 weeks with a minimum of 12 times per year

Catch Basin Clean-Out (applies to all catch basins)

Minimum: One time per year between April 16 and October 14

Priority Catch Basin Clean-Out

Minimum: If 50% full between Oct 15 and April 15

Open Channel Clean-Out

Goal: One time per year

Illicit Connection/Illicit Discharge

Number of Investigated Reported Illicit Discharges

Goal: 100%

Number of Corrected Illicit Connections Identified by Field Crews while Investigating Reported Illicit Discharges

Goal: 100%

Open Channel Walkthrough Visits

Minimum: One time per year

Public Information and Participation

Total number of flyers, pamphlets, radio ads, and other messages made to the public

Minimum: 2.1 Million impressions per year

Percent of catch basins marked "no dumping"

Goal: 100%

Number of Site Inspections conducted

Minimum: Each site visited two times during permit term. Site visits should be equally spaced.

Development Planning

Applicable projects implementing SUSMP requirements

Goal: 100%

Development Construction

Construction projects applying for grading and/or building permits will be required to submit applicable water quality protection plans and certifications; local SWPPPs, Wet Weather Erosion Control Plans, and certifications; and state NOI and state SWPPP.

Goal: 100%

1.0 Watershed Management Area Plan Objective

In compliance with the 1996 municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Order No. 96-054), Los Angeles County (Principal Permittee) is required to develop a Watershed Management Area Plan (WMAP) for each Watershed Management Area (WMA) in coordination with the cities (Permittees) in each WMA. The WMAP consists of the following: a description of each watershed's characteristics; the Stormwater Quality Management Plan (SQMP), formally known as the five Model Programs (see Appendix); quality of stormwater runoff analyses; identified projects to improve quality of stormwater and urban runoff; and available funding resources.

2.0 Watershed Characteristics

2.1 Watershed Area

The Ballona Creek Watershed is located in the southwestern portion of Los Angeles County. It is bound by the Pacific Ocean to the west and the Santa Monica Mountains to the north. The watershed is composed of approximately 212 square miles with approximately 83% of its total area developed. Ballona Creek discharges to the Santa Monica Bay through Marina del Rey while some cities drain directly into the Santa Monica Bay (Figure 1). The major tributaries to the Ballona Creek include Centinela Creek, Sepulveda Canyon Channel, Benedict Canyon Channel, and numerous storm drains.

In accordance with the 1996 NPDES Permit, the County of Los Angeles is divided into six WMAs. The Permittees within the Ballona Creek WMA, as listed in the Permit, are as follows:

Beverly Hills
Culver City
El Segundo
Hermosa Beach
City of Los Angeles
Los Angeles County
Manhattan Beach
Palos Verdes Estates
Rancho Palos Verdes
Redondo Beach
Rolling Hills
Rolling Hills Estates
Santa Monica
West Hollywood

There are other Permittees that may drain to this watershed, but are not formally listed as Permittees in this WMA.

2.2 Natural Characteristics

2.2.1 Topography

The watershed terrain consists of mountains and coastal plain. The northerly portion of the watershed has the highest elevation in the Santa Monica Mountains. Figure 3 shows the watershed's contour lines at 50-foot increments.

2.2.2 Climate

The mean annual precipitation in the watershed is about 14.88 inches. Although large year-to-year variations are common, most rainfall events are associated with winter cold fronts. These cold fronts typically occur during the wet season (October 15 to April 15). The remainder of the year from April 16 to October 14, the dry season, has significantly lower precipitation.

2.2.3 Hydrology

A comprehensive network of flood control facilities exist in the watershed to sustain the development in the region. A portion of the annual rainfall in the watershed escapes to the Pacific Ocean via the concrete-lined Ballona Creek. The remaining amount discharges directly into the Pacific Ocean.

2.2.4 Flow Characteristics

2.2.4.1 Flow Direction

Runoff in the watershed flows in a generally southwesterly direction in flood control channels or overland eventually draining into the Pacific Ocean (Figure 2).

2.2.4.2 Sub-Basins

The sub-basins delineated in Figure 2 show hydrological areas and where they drain. They are based on the contour lines in Figure 3.

2.2.5 Land Use

As shown in Table 1, the land use in the watershed is "High-Density Single-Family Residential" covering about 36% of area (Figure 6).

Table 1. Land Use Distribution

Land Use Category	Percent by Area
Vacant	21.86
Transportation	2.97
High-Density Single-Family Residential (HDSFR)	35.71
Light Industrial	2.65
Multiple-Family Residential	9.92
Retail/Commercial	6.42
Education	2.76
Mixed Residential	3.69
All Other	14.02

The Los Angeles County land use monitoring program under the 1996 NPDES permit is a result of a site selection study entitled *Evaluation of Land Use Monitoring Stations* (Woodward-Clyde and Psomas and Associates, 1996). This study identified the most significant land use categories within the permit area regarding stormwater quality. The selection study yielded eight land use monitoring stations. These eight land use monitoring stations represent over 86% of all the land uses within the permit area. These stations monitor flow and have automated samplers to collect flow-weighted composite stormwater samples during storm events. The 34 categories shown in Table 2 cover 100% of the land uses in the County.

Figure 6 depicts the eight land use categories currently monitored with their respective percent by area within the watershed. The remaining land use categories are summarized as "All Other" in Table 1.

Table 2. Land Use Categories

Land Use Category	**Inclusive SCAG Land Use Codes** [1]
High Density Single Family Residential [2]	1111
Light Industrial [2]	1311 through 1315, 1340
Vacant [2]	3100, 3200, 3300, 3400
Retail/Commercial [2]	1221 through 1224
Multiple Family Residential [2]	1121 through 1125
Transportation [2]	1411 through 1416, 1418
Education [2]	1261 through 1266
Low Density Single-Family Residential	1112
Mixed Residential [2]	1140
General Office	1211 through 1213
Natural Resources Extraction	1331, 1332
Institutional	1241 through 1247, 1251 through 1253
Heavy Industrial	1321 through 1325
Other Commercial	1231 through 1234
Open Space/Recreation	1820, 1830, 1840, 1850, 1860, 1870, 1880
Utility Facilities	1431, 1432, 1433, 1435, 1436, 1438
Mobile Homes and Trailer Parks	1131, 1132
Mixed Transportation and Utility	1450, 1460
Floodways and Structures	1434, 1437
Rural Residential	1151, 1152, 1439
Under Construction	1700
Golf Courses	1810
Nurseries and Vineyards	2200, 2300
Maintenance Yards	1440
Urban Vacant	1900

Military Installations	1271 through 1273
Agriculture	2100, 2110, 2120, 2600
Harbor Facilities	1417, 4401
Animal Husbandry	2400, 2500, 2700
Mixed Commercial and Industrial	1500
Communication Facilities	1420, 1421
Mixed Urban	1600
Marina Facilities	4300
Receiving Waters	4100, 4200, 4400, 4500

(1) Based on Anderson Land Use Level III/IV Classification.
(2) Land use monitored

2.2.6 Geology/Soil

The Santa Monica Mountains are in the northwest portion of the watershed. Soil types for the remaining portions of the watershed are the following: Altamont Clay Loam, Yolo clay loam, Chino Silt Loam, Diablo Clay Loam, Hanford Fine Sandy Loam, Hanford Gravelly sandy Loam, Hanford Silt Loam, Montezuma Clay Adobe, Oakley fine Sand, Ramona Clay Loam, Ramona Loam, Ramona Sandy Loam, Santa Monica Mountains, Upper Los Angeles River, Yolo Loam, and Yolo Sandy Loam (Figure 7).

2.2.7 Significant Ecological Areas

Significant Ecological Areas (SEAs) are defined and delineated in conjunction with the Land Use and Open Space Elements of the Los Angeles County General Plan.

An area qualifies for recognition as an SEA if it possesses one or more of the following features, or classes:

i. Is the habitat of rare, endangered, or threatened plant or animal species.
ii Represents biotic communities, vegetative associations, or habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution on a regional basis.
iii. Represents biotic communities, vegetative associations, or

habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution in Los Angeles County.

iv Is habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, or migrating grounds, and is limited in availability

v. Represents biotic resources that are of scientific interest because they are either extreme in physical/geographical limitations, or they represent an unusual variation in a population or community.

vi. Is an area important as game species habitat or as fisheries.

vii. Is an area that would provide for the preservaion of relatively undisturbed examples of the natural biotic communities in Los Angeles County.

viii. Is a special area, worthy of inclusion, but one which does not fit any of the other seven criteria.

Los Angeles County Department of Regional Planning (Regional Planning) is in the process of updating the SEAs coverage. The final SEAs information will be included in this plan when Regional Planning has finalized the SEAs coverage.

2.2.8 Threatened and Endangered Species

The watershed supports a variety of threatened and endangered species according to the California Department of Fish and Game's November 2000 California Natural Diversity Database (CNDDB). The CNDDB provides both state and federally listed threatened and endangered species of plants and animals (Figures 8b and 8a respectively).

The watershed hosts the following threatened or endangered plants:

- Beach Spectaclepod,
- Braunton's Milk-Vetch,
- Coastal Dunes Milk-Vetch,
- Lyon's Pentachaeta,
- Mexican Flannelbush,
- Salt Marsh Bird's-Beak, and
- Ventura Marsh Milk-Vetch.

These plants are scattered throughout the watershed with the Coastal Dunes Milk-Vetch spread over the largest area in the central portion of the watershed and the City of Santa Monica. Several parks host the plant species, Braunton's Milk-Vetch. Mexican Flannelbush may be found in the Palos Verdes Golf Club and surrounding area. Salt Marsh Bird's-Beak may be found across most of the city of Santa Monica.

Beach Spectaclepod may be found along the coastline of Manhattan Beach, Hermosa Beach, El Segundo, Marina Del Rey, and Santa Monica. Ventura Marsh Milk-Vetch may be found in portions of Marina Del Rey and the City of Los Angeles.

The watershed hosts the following threatened or endangered animals:

- Belding's Savannah Sparrow,
- California Black Rail,
- California Least Tern,
- Coastal California Gnatcatcher,
- El Segundo Blue Butterfly,
- Palos Verdes Blue Butterfly,
- Steelhead-Southern California ESU,
- Western Snowy Plover

These animals are predominantly found along the watershed's coastline. The Belding's Savannah Sparrow, California Black Rail, California Least Tern, Coastal California Gnatcatcher and the Western Snowy Plover are the five endangered or threatened birds that inhabit the watershed. Belding's Savannah Sparrow may be found in the City of Santa Monica as well as the central portion of the watershed. The California Black Rail and the Western Snowy Plover may be found along part of Dockweiler State Beach. The California Least Tern may be found occupying a small area just south of Marina Del Rey's channel entrance. The Coastal California Gnatcatcher species may be found in the central portion of the watershed as well as scattered throughout the southern portion of the watershed.

Three other animal species inhabit the watershed. El Segundo Blue Butterfly may be found in the vicinity of the Los Angeles airport and the Palos Verdes Blue Butterfly may be found scattered throughout the southern portion of the watershed. The Pacific Pocket Mouse, may be found in the coastal region from Marina Del Rey to Manhattan Beach as well as the coastal region in Redondo Beach. The Steelhead Southern-California ESU may be found near the southern tip of the watershed.

2.2.9 Sub-Drainage Areas

The watershed has five dominant drainage areas, which have been previously identified in the Santa Monica Bay Restoration Plan.

1) Pico Kenter Drainage Area (including the area known as Pacific Palisades)

   This drainage area encompasses approximately 42 square miles

and extends from the border with Castellammare, Pacific Palisades and the Santa Monica Canyon drainage areas in the north to the Ballona Creek drainage area in the south. The Pico Kenter Drain services the central and southern portions of the city of Santa Monica, extending northward into Brentwood. Two smaller drains service the northern portion of the city (along Montana Avenue and Wilshire Boulevard). The extreme southern portion of the city and the Venice area of Los Angeles are also serviced by two smaller drains (along Rose Avenue and Abbot Kinney Boulevard). Other small, local drains may be present.

2) Ballona Creek Drainage Area

Ballona Creek has the largest drainage area of approximately 130 square miles and effectively bisects the watershed, with the Pico-Kenter drainage area to the north and the remaining areas to the south.

3) South Bay/El Segundo Drainage Area

This 12 square mile area begins to the south of Ballona Creek, and extends southward to the city border of El Segundo and Manhattan Beach. Inland, this drainage area generally ends at Sepulveda Boulevard, areas to the east drain to the Dominguez Channel. There are four major outfalls in this area, serving Playa Del Rey, LA International Airport, a portion of Westchester and the western portion of El Segundo.

4) Manhattan/Hermosa/Redondo Beach drainage area

This drainage area covers approximately 12 square miles and generally follows the political boundaries of the cities of Manhattan Beach, Hermosa Beach and Redondo Beach, and includes small portions of Torrance and possibly the southern portion of Lawndale. The main outfall in this area is the Herondo Drain, but the area is served by numerous smaller drains that discharge directly to the beach.

5) Palos Verdes Peninsula Drainage Area

The Palos Verdes peninsula forms the southern end of the watershed. This area is unique as it is essentially a hilly area with short segments of storm drains flowing to the ocean. This drainage area is approximately 16 square miles.

2.3 Quality of Stormwater Runoff

2.3.1 Monitoring Activities

To characterize the quality of stormwater runoff in Los Angeles County, sampling of large area mass emissions sites has been performed under the 1990 and 1996 NPDES permits.

2.3.1.1 Monitoring Station Location

Los Angeles County Department of Public Works (LACDPW) has been monitoring four major drainage areas near their outfalls to the ocean. The following mass emission monitoring stations installed under the original 1990 Permit were retained under the 1996 Permit: the Los Angeles River Monitoring Station, the San Gabriel River Monitoring Station, the Ballona Creek Monitoring Station, and the Malibu Creek Monitoring Station.

The Ballona Creek Monitoring Station is located at the existing stream gage station (Stream Gage No. F38C-R) between Sawtelle Boulevard and Sepulveda Boulevard in the City of Los Angeles. At this location, which was chosen to avoid tidal influences, the upstream tributary watershed of Ballona Creek is 88.8 square miles. The entire watershed is 127.1 square miles. At the gauging station, Ballona Creek is a concrete lined trapezoidal channel.

2.3.1.2 Stormwater Sample Collection Methods

Grab and composite sample collection methods, defined below, are used to collect samples.

- Grab Sample - a discrete, individual sample taken within a short period of time. This method is used to collect samples for constituents that have very short holding times and specific collection or preservation needs. For example, samples for coliforms are taken directly into a sterile container to avoid non-resident bacterial contamination.
- Composite Sample - a mixed or combined sample created by combining a series of discrete samples (aliquots) of specific volume. Composite sampling is ideally conducted over the duration of the storm event.

Flow composite storm samples are obtained using an

automated sampler to collect samples at flow-paced intervals. Samples collected at each station are combined in the laboratory to create a single flow-weighted sample for analysis.

2.3.2 Comparison of Mass Emissions Concentrations to the Ocean Plan, Basin Plan, and California Toxics Rule

It should be noted that except for bacteria indicators, there are no numerical water quality standards that apply to stormwater or nonpoint source pollution. Current federal and state numerical standards apply only to point source pollution, such as sanitary sewage, industrial and point source discharges to the ocean and other water bodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff. An exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, the sampling results used to produce Tables 4 and 5 (see Appendix) are detected values before dilution, a factor allowed by the Ocean Plan.

Both the annual mean and median of the analyses of some 209 constituents sampled were compared to the water quality objectives outlined in the California Ocean Plan, the Los Angeles Basin Plan, and the California Toxics Rule. For stormwater bacteria indicators, the log mean of the Most Probable Number per 100 ml was compared to the objectives of AB411.

Table 4 shows constituents whose annual mean or median virtually exceeded the water quality objectives described above. Eleven chemical constituents were identified as constituents of concern from the comparison. For bacteria indicators, the log mean of the Most Probable Number per 100 ml was compared to the objectives of AB411. Total coliform and fecal coliform, and enterococcus are included due to their exceedance of AB411.

R0000087

2.3.3 Long-term Trend Analysis

A long-term trend analysis was performed for the fourteen water quality constituents selected through the screening procedure over the period from 1994 to 2000. The constituents analyzed include: total coliform, fecal coliform, fecal enterococcus, turbidity, total aluminum, dissolved copper, total copper, dissolved lead, total lead, total mercury, dissolved nickel, dissolved zinc, total zinc and bis(2-ethylhexyl)phthalate. Table 5 shows a summary of statistical analysis results of water quality data collected from the Ballona Creek Monitoring Station.

Tables 4 and 5 show that the bacteria indicator standards for total and fecal coliform were exceeded for every year. The tables also show that 1997-1998, the El Niño season, contributed the most virtual

exceedances (Twelve constituents exceeded the water quality objectives). It should be noted that there were no virtual exceedances by nutrients (compounds of nitrogen and phosphorus) of the three water quality objectives. The following represents a summary of water quality trends:

Total Coliform
High fluctuation of total coliform counts is noted over the monitoring period. All data during the entire monitoring period has exceeded the Basin Plan, Ocean Plan and AB 411 objective limits.

Fecal Coliform
Counts of fecal coliform fluctuate in a horizontal pattern, exceeding the Basin Plan, Ocean Plan and AB 411 objective limits throughout the entire monitoring period.

Fecal Enterococcus
The data exhibit an increasing trend for the first two storm seasons and a decreasing trend thereafter. It should be noted that not enough data was available for the statistical analysis between the 1996-1997 and 1997-1998 storm seasons.

Turbidity
The highest median concentration occurred in the 1997-1998 storm season which exceeded the Ocean Plan water quality objective; however, this appeared to be only temporary and median concentrations again plunged below the objective limit for the remaining monitoring period.

Total Aluminum
The highest median concentration occurred in the 1997-1998 storm season which exceeded the Basin Plan water quality objective; however, median concentrations dropped below the objective limit for the remaining monitoring period.

Dissolved Copper
Both mean and median concentrations exceeded the California Toxics Rule objective limit for the last three storm seasons. These concentrations have sharply decreased during this time period.

Total Copper
A peak median concentration was observed in the 1997-1998 storm season. Significant reduction in total copper concentrations is noted between the 1998-1999 and 1999-2000 storm seasons; however, both mean and median concentrations still exceed the Ocean Plan objective limit.

Dissolved Lead
Both mean and median concentrations exceeded the California Toxics Rule objective limits in the 1997-1998 storm season. Not enough data was available for the analysis during the rest of the monitoring period.

Total Lead
The data shows that median concentrations generally complied with the Ocean Plan objective limit, except for the 1997-1998 storm season's median concentration which exceeded the objective limit.

Total Mercury
Both mean and median concentrations exceeded the Ocean Plan and Basin Plan objective limits in the 1996-1997 storm season. Not enough data was available over the rest of the monitoring period for statistical analysis.

Dissolved Nickel
The median concentrations stayed constant below the California Toxics Rule objective limits between the 1996-1997 and 1997-1998 storm seasons. Not enough data was available over the rest of the monitoring period for the statistical analysis.

Dissolved Zinc
Dissolved zinc concentrations generally complied with the California Toxics Rule objective limits, except the mean concentration that was observed in the 1997-1998 storm season.

Total Zinc
Both mean and median concentrations of total zinc exceeded the Ocean Plan objective limit from the 1996-1997 storm season to the 1998-1999 storm season. No trend was observed during the monitoring period.

Bis(2-ethylhexyl)phthalate
Both mean and median concentrations exceeded the Ocean Plan objective limit from the 1996-1997 storm season to the 1998-1999 storm season. Not enough data was available for the analysis during the rest of the monitoring period.

2.3.4 Santa Monica Bay Receiving Water Impact Study

The Santa Monica Bay Receiving Waters Impact Study concludes that zinc was the most important toxic constituent identified in Santa Monica Bay stormwater, even though zinc concentrations in the toxic portion of the discharge plume were typically below laboratory toxicity levels. Copper and other unidentified constituents may also be responsible for some of the toxicity measured in Santa Monica Bay. The measured concentrations of zinc and copper in Ballona Creek stormwater were estimated to account for 5% - 44% of the observed toxicity. Sediments

offshore of Ballona Creek generally had higher concentrations of urban contaminants, including common stormwater constituents, such as lead and zinc. Virtually every stormwater sample tested in the study was toxic to sea urchin fertilization.

2.4 Significant Stormwater Issues Within the WMA

A modified list of significant stormwater issues within the WMA identified in the Los Angeles Regional Water Quality Control Board's (Regional Board) Watershed Management Initiative Chapter is as follows:

- Trash loading from creek (Trash Total Maximum Daily Load, TMDL),
- Sediment contamination by heavy metals from creek to Marina del Rey Harbor and offshore,
- Toxicity of both dry weather and storm runoff in creek,
- High bacterial indicators at mouth of creek (TMDL), and
- Currently scheduled TMDLs for the next 6-years are: trash, Nutrients, Coliform, Metals, and Chlorpyrifos.

3.0 Watershed Management Plan

3.1 Source Control Strategies

3.1.1 Non-structural Controls - regulatory policies/programs to minimize threats to stormwater and urban runoff quality.

Permittees within this WMA have adopted the SQMP, jointly developed under the 1996 NPDES Permit, in its entirety as effective and comprehensive procedures for controlling pollution runoff. The Permittees within this WMA are implementing all applicable requirements of the SQMP. Through the extensive effort to meet all the Permit requirements, the Permittees within this WMA have made significant progress in reducing urban runoff pollution. The Permittees within this WMA anticipate further success as SQMP requirements are carried forward and reinforced in future years. The SQMP serves as guidance and requirements under this WMAP.

LACDPW has updated the Development Planning and Public Agency Activities Model Program of the SQMP to reflect the recent approval of a Standard Urban Stormwater Mitigation Plan (SUSMP) requirements. An executive summary of the SQMP has also been added to the beginning of each individual model program of the SQMP. Additional revisions to all model programs will be made following the adoption of the 2001 NPDES Permit.

Under the 2001 NPDES permit, the Permittees within this WMA anticipate that additional efforts will be focused on controlling trash, nutrients, coliform, metals, and Chlorpyrifos. The Permittees within this WMA anticipate working with the Regional Board staff to develop and implement a plan for the TMDLs to monitor and control these pollutants to the maximum extent practicable.

3.1.2 Structural Controls - any existing and proposed potential projects to reduce/minimize pollutants of stormwater and urban runoff.

Table 3. Improvement Projects for Stormwater and Urban Runoff

Permittee	Projects:
Beverly Hills	Current projects: ▸ Installed a filter in one of their catch basins on the southeast corner of Palm Avenue in December of 1999 ▸ Installed inserts in 3 catch basin which separately located on Palm Drive, Gale Drive, and Schuyler Road ▸ Continue testing new BMPs as they are developed.
Caltrans	Future/Proposed Projects: ▸ Designed a Mulit-Chambered Treatment Train at their Metro Maintenance Station.

LACDPW	Current projects: ▸ Installed a debris net in the Ballona Creek in 1993. The net is located downstream of Lincoln Avenue in the Playa Del Rey area. The amount of debris it captures is dependant on the size of the first flush. From 1997-1998 the net captured 180 cubic yards and from 1998-1999 it captured 25 cubic yards. The county has recently purchased a conveyer that will collect and lift the debris into a truck. ▸ Installed four low flow diversions in the Watershed in the year 2000. They are located at Ashland Avenue in City of Santa Monica, Herondo Street in City of Redondo Beach, Brooks Avenue and Pershing Drive in City of Los Angeles. Residual flows of 25 gallons/minute. ▸ Installed a Stormceptor in a County Road Maintenance Field Facility located in Westchester, but no measurements have been taken to determine the amount of debris it has collected. Future/Proposed Projects: ▸ Received funds for the construction of a Continuous Deflection Separator (CDS). ▸ Received funds from an MTA grant to install 200 catch basin screens. ▸ Los Angeles County Beaches and Harbors plans to install a trash separator (CDS unit) in Marina Del Rey on Fiji Way. ▸ Plan on installing catch basin inserts in all maintenance yards' catch basins, catch basin debris excluders in selected catch basins, and in-line storm water clean-up devices in selected storm drains. ▸ Investigate the construction of permanent roof cover for existing and new material storage areas and fuel dispensing islands in some of their field facilities.
Hermosa Beach	Current projects: ▸ Received Prop. A fund to install a CDS and 40 catch basin inserts.

City of L.A.	Current projects: ▸ Grated Drop Catch Basin inlet with filter, NW corner of Union Ave. and 11th St., installed in June 99 and 8461 Vermont Ave., May 96. ▸ Catch Basin inlet with filter, SE corner of 6th and Bixel St., installed in August 99. ▸ Catch Basin inlet with filter, NE corner of 20th St. and Maple Ave., June 99. ▸ Catch Basin Inlet with liner Grated, 1700 Wilshire Blvd. across Little St., June 99. ▸ Infiltration Basin, 8461 Vermont Ave., May 96 and 800 N. Venice Blvd., May 99. ▸ San Filter, SE corner of Pico Blvd. & Midvale, June 93. ▸ Oil and water separators, 300 N. Venice Blvd., May 99. ▸ Low Flow Diversion, Thornton Ave., October 99. ▸ BMP house, 1828 50th St., August 98. ▸ Catch basin screens, Convention Center & Vermont Ave., July 00. Future/Proposed Projects: ▸ Trash separators - 3 locations ▸ Oil & water separators - 3 locations ▸ Catch basin inlets - 6 locations ▸ Low-flow diversion - 4 locations ▸ Urban runoff reclamation facility - 1 location ▸ Catch basin filters - along the Venice canals
Manhattan Beach	Current projects: ▸ Installed two CDS units, one at City Yard on Bell Avenue and one at the El Porto Parking Lot. ▸ Received funding from Proposition 13 to install another CDS unit in Polliwog Park. Within the next month the city plans to install ten catch basin inserts in their coastal area.
Rancho Palos Verdes	Current projects: ▸ Received Prop. A fund to install 24 catch basin inserts.
Santa Monica	Current projects: ▸ Installed 485 catch basin inlet screens and filters and 5 storm treatment systems at Bergamot Station and Beach facility. ▸ Installed 3 CDS units - City yards, Pier & Pico Kenter Storm Drains. ▸ Constructed the first urban runoff recycling facility in the Country.

3.2 Recommended Studies

Over the next five years, the Permittees within this WMA anticipate providing guidance on the scope of work for any studies related to receiving water impacts. In particular, the Permittees within this WMA anticipate that future studies may address the following issues:

i. The removal efficiency vs. cost comparison for all adopted Performance Standards to assist in effectively focusing resources.

ii The pollutant removal efficiencies of all structural devices required for new development to assist in properly sizing devices and in excluding ineffective ones.

iii. An evaluation of the current vs. "natural state" of the Ballona Creek's sediment loading, sediment discharge periods, sediment gradation, and environmental impact taking into account factors such as paved areas and riparian corridor restriction.

iv. Investigate regional solutions to address stormwater quality (i.e. use of Spreading Grounds, Retention Basins, and other similar activities).

v. Studies that evaluate the actual impact of pollutants, and pollutant levels, on the beneficial uses of receiving waters.

3.3 Funding Resources

A variety of different grant funding sources are available to assist in implementing the NPDES permit requirements. They can generally be categorized into specific grant programs and on-going grant programs, or legislative appropriations.

3.3.1 Specific Grant Programs

These are usually bond issues or legislative funded programs administered by state, local agencies or conservancies. The most recent of these is Proposition 13. The majority of funds not specifically identified and budgeted by the state are being administered through competitive grant programs by the following state agencies:

i State Water Resources Control Board. The State Board is in turn delegating certain responsibilities to the Regional Boards. For more information, please see their website, http://www.swrcb.ca.gov/prop13/ index.html

ii Resources Agency. This large "umbrella" state agency has either assigned or had appropriated/designated certain funding to the various departments, boards and commissions, conservancies,

and special programs. This agency has just recently been legislatively charged with the responsibility to develop a comprehensive listing of the available funding sources, including federal, state, local, and private, for water quality improvements. It is to be posted on the internet by November 1, 2002. For more information, see their website, http://ceres.ca.gov/cra

iii Department of Water Resources. This Department within the Resources Agency has funding available for water replenishment projects. For more information, please see their website. http://wwwdwr.water.ca.gov/WaterBond2000

3.3.2 On-Going Grant Programs

i The state agencies noted above also have on-going grant programs. Their websites are excellent information sources.

ii Federal Government. There are many funding sources for water quality improvements. The sources are too numerous to list, however there is an excellent website at the Federal EPA that lists the federal and other sources. The site is: http://www.epa.gov/OWOW/watershed/wacademy/fund.html

3.3.3 Legislative Appropriations.

Local jurisdictions can also work with stakeholders (Table 6) and elected representatives to pass legislation that funds water quality improvements. This can be done at both the local and national levels. Bond issues are another local and state method to fund improvements.

X = Greater than objective. Except for indicator bactena, there are no numerical water quality standards that apply to stormwater or "non-point source" pollution.

Current federal and state numerical standards apply only to "point source pollution," such as sanitary sewage, industrial and commercial discharges to the ocean,

and other waterbodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff, and any exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, a direct comparison of the sampling results with the Ocean Plan standards cannot be made since the results presented in the table are detected values before dilution, a factor allowed by the Ocean Plan.

^ = Rain gage not active

- = Statistically invalid data, not enough samples or data above detection limit collected

NS = Not Sampled

Blank = No Exceedance

DL = Detection Limit

a) Criteria based on daily maximum

b) Criteria based on 30-day average

c) Criteria for the sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo(k)fluoranthene, 1,12-benzoperylene, benzo(a)pyrene, chrysene, dibenzo(ah)anthracene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene and pyrene.

d) Criteria continuous concentration which equals the highest concentration of pollutant to which aquatic life can be exposed for an extended period time (4 days) without deleterious effects.

e) Criterion expressed in the total recoverable form.

f) Criteria maximum concentration which equals the highest concentration of pollutant to which aquatic life can be exposed for a short period time without deleterious effects.

g) Except for indicator bactena, there are no numerical water quality standards that apply to stormwater or "non-point source" pollution. Current federal and state numerical standards apply only to "point source pollution," such as sanitary sewage, industrial and commercial discharges to the ocean, and other waterbodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff, and any exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, a direct comparison of the sampling results with the Ocean Plan standards cannot be made since the results presented in the table are detected values before dilution, a factor allowed by the Ocean Plan.

n) Detection limits have changed throughout the monitoring process. Only data matching the current detection limit is displayed in this table. The Data Included Since field indicates the first year of the storm season with the current detection limit.

List of Tables

1.0 Watershed Management Area Plan Overview

In compliance with the 1996 municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Order No. 96-054), Los Angeles County (Principal Permittee) is required to develop a Watershed Management Area Plan (WMAP) for each Watershed Management Area (WMA) in coordination with the cities (Permittees) in each WMA. The WMAP consists of the following: a description of each watershed's characteristics; the Stormwater Quality Management Plan (SQMP), formally known as the five Model Programs (see Appendix); quality of stormwater runoff analyses; identified projects to improve quality of stormwater and urban runoff; and available funding resources.

2.0 Watershed Characteristics

2.1 Watershed Area

The Dominguez Channel Watershed is comprised of approximately 110 square miles of land in the southern portion of Los Angeles County. Ninety-Six percent of its total area is developed and the overall watershed land use is predominantly transportation. Tributaries to the Dominguez Channel include several storm drains and minor channels. The Channel empties into the East Basin of Los Angeles Harbor (Figure 1).

In accordance with the NPDES Permit, the County of Los Angeles is divided into six WMAs. The Permittees within the Dominguez Channel/Los Angeles Harbor WMA, as listed in the Permit, are as follows:

Carson
Gardena
Hawthorne
Inglewood
Lawndale
Lomita
Los Angeles
Los Angeles County
Torrance

There are other Permittees that may drain to this watershed, but are not formally listed as Permittees in this WMA.

2.2 Natural Characteristics

2.2.1 Topography

Figure 3 shows the watershed's contour lines at 50-foot increments. The southwestern portions of the watershed display the highest elevations.

2.2.2 Climate

The mean annual precipitation in the watershed is approximately 13.71 inches. Although large year-to-year variations are common, most rainfall events are associated with winter cold fronts. These winter fronts typically occur during the wet season (October 15 to April 15). The remainder of the year from April 16 to October 14, the dry season, has significantly lower precipitation.

2.2.3 Hydrology

This watershed has the highest impervious value at 62 percent.

2.2.4 Flow Characteristics

2.2.4.1 Flow Direction

Runoff in the watershed flows in a generally southeasterly direction in storm channels all of which ultimately drain into the Pacific Ocean in San Pedro area (Figure 2).

2.2.4.2 Sub-Basins

The sub-basins delineated in Figure 2 show hydrological areas and where they drain. They are based on the contour lines in Figure 3.

2.2.5 Land Use

The principal land use in this watershed is residential covering about 50%. Below is a break down of land use distribution in this watershed (Figure 5).

Table 1. Land Use Distribution

Land Use Category	Percent by Area
Vacant	4.18
Transportation	21.57
High-Density Single-Family Residential (HDSFR)	45.73
Light Industrial	6.43
Multiple-Family Residential	2.64
Retail/Commercial	2.95
Education	1.59
Mixed Residential	2.43
All Other	12.48

The Los Angeles County land use monitoring program under the 1996 NPDES permit is a result of a site selection study entitled *Evaluation of Land Use Monitoring Stations* (Woodward-Clyde and Psomas and Associates, 1996). This study identified the most significant land use categories within the permit area regarding stormwater quality. The selection study yielded eight land use monitoring stations. These eight land use monitoring stations represent over 86% of all the land uses within the permit area. These stations monitor flow and have automated samplers to collect flow-weighted composite stormwater samples during storm events. The 34 categories shown in Table 2 cover 100% of the land uses in the County.

Figure 5 depicts the eight land use categories currently monitored with their respective percent by area within the watershed. The remaining land use categories are summarized as "All Other" in Table 1.

Table 2. Land Use Categories

Land Use Category	Inclusive SCAG Land Use Codes [1]
High Density Single Family Residential [2]	1111
Light Industrial [2]	1311 through 1315, 1340

Vacant [2]	3100, 3200, 3300, 3400
Retail/Commercial [2]	1221 through 1224
Multiple Family Residential [2]	1121 through 1125
Transportation [2]	1411 through 1416, 1418
Education [2]	1261 through 1266
Low Density Single Family Residential	1112
Mixed Residential [2]	1140
General Office	1211 through 1213
Natural Resources Extraction	1331, 1332
Institutional	1241 through 1247, 1251 through 1253
Heavy Industrial	1321 through 1325
Other Commercial	1231 through 1234
Open Space/Recreation	1820, 1830, 1840, 1850, 1860, 1870, 1880
Utility Facilities	1431, 1432, 1433, 1435, 1436, 1438
Mobile Homes and Trailer Parks	1131, 1132
Mixed Transportation and Utility	1450, 1460
Floodways and Structures	1434, 1437
Rural Residential	1151, 1152, 1439
Under Construction	1700
Golf Courses	1810
Nurseries and Vineyards	2200, 2300
Maintenance Yards	1440
Urban Vacant	1900
Military Installations	1271 through 1273
Agriculture	2100, 2110, 2120, 2600
Harbor Facilities	1417, 4401
Animal Husbandry	2400, 2500, 2700
Mixed Commercial and Industrial	1500
Communication Facilities	1420, 1421

Mixed Urban	1600
Marina Facilities	4300
Receiving Waters	4100, 4200, 4400, 4500

(1) Based on Anderson Land Use Level III/IV Classification.

(2) Land use monitored

2.2.6 Geology/Soil

Soil classifications vary throughout the watershed (Figure 6). The soil types include Altatamont Clay Loam, Chino Silt Loam, Diablo Clay Loam, Hanford Fine Sandy Loam, Montezuma Clay Adobe, Oakley Fine Sand, Ramona Clay Loam, Ramona Loam, Ramona Sandy Loam, Tujunga Fine Sandy Loam, Yolo Loam, Yolo Sandy Loam.

2.2.7 Significant Ecological Areas

Significant Ecological Areas (SEAs) are defined and delineated in conjunction with the Land Use and Open Space Elements of the Los Angeles County General Plan.

An area qualifies for recognition as an SEA if it possesses one or more of the following features, or classes:

i. Is the habitat of rare, endangered, or threatened plant or animal species.
ii. Represents biotic communities, vegetative associations, or habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution on a regional basis.
iii. Represents biotic communities, vegetative associations, or habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution in Los Angeles County.
iv. Is habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, or migrating grounds, and is limited in availability.
v. Represents biotic resources that are of scientific interest because they are either extreme in physical/geographical limitations, or they represent an unusual variation in a population or community.
vi. Is an area important as game species habitat or as fisheries.
vii. Is an area that would provide for the preservaion of relatively undisturbed examples of the natural biotic communities in Los Angeles County.
viii. Is a special area, worthy of inclusion, but one which does not fit

any of the other seven criteria.

Los Angeles County Department of Regional Planning (Regional Planning) is in the process of updating the SEAs coverage. The final SEAs information will be included in this plan when Regional Planning has finalized the SEAs coverage.

2.2.8 Threatened and Endangered Species

The watershed supports a variety of threatened and endangered species according to the California Department of Fish and Game's November 2000 California Natural Diversity Database (CNDDB). The CNDDB provides both state and federally listed threatened and endangered species of plants and animals (Figure 7b and 7a, respectively).

The watershed hosts the following threatened or endangered plants:

- California Orcutt Grass,
- Coastal Dunes Milk-Vetch,
- Lyon's Pentachaeta, and
- Mexican Flannelbush.

These plants are scattered throughout the watershed. The plant population that is spread out over the largest area in the watershed is the Coastal Dunes Milk-Vetch. This plant may be found in the north portion of the watershed. California Orcutt Grass is found over most of Gardena. Mexican Flannelbush partially surrounds Palos Verdes Tennis Club. Point Fermin and Angel's Park, located in the southernmost portion of the watershed, may host Lyon's Pentachaeta.

The watershed hosts the following threatened or endangered animals:

- California Least Tern,
- Coastal California Gnatcatcher,
- Mohave Tui Chub,
- Pacific Pocket Mouse, and
- Palos Verdes Blue Butterfly.

The California Least Tern may be found in the Harbor Regional Park Golf Course. The second bird, the Coastal California Gnatcatcher may be found in and around the South Coast Park and the Naval Reservation. Another species, the Mohave Tui Chub, may be found in the South Coast Botanic Garden's water body. The Pacific Pocket Mouse may be found in an area west of Dominguez Channel and South of Sepulveda Boulevard. The Palos Verdes Blue Butterfly may be found

in the Angels Gate Park and the Naval Reservation.

2.3 Significant Stormwater Issues Within the WMA

A modified list of significant stormwater issues within this WMA identified in the Los Angeles Regional Water Quality Control Board's (Regional Board) Watershed Management Initiative Chapter, is as follows:

- Historical deposits of pesticide dichlro-diphenyl-trichloroethane (DDT) and polychlorinated biphenyls (PCBs) in sediment,
- Discharges from Publicly Operated Treatment Works (POTW) & refineries,
- Spills from ships and industrial facilities,
- stormwater runoff, and
- Currently scheduled Total Maximum Daily Load (TMDL) for the next 6-years is coliform.

3.0 Watershed Management Plan

3.1 Source Control Strategies

3.1.1 Non-structural Controls - regulatory policies/programs to minimize threats to stormwater and urban runoff quality.

Permittees within this WMA have adopted the SQMP, jointly developed under the 1996 NPDES Permit, in its entirety as effective and comprehensive procedures for controlling pollution runoff. The Permittees within this WMA are implementing all applicable requirements of the SQMP. Through the extensive effort to meet all the Permit requirements, the Permittees within this WMA have made significant progress in reducing urban runoff pollution. The Permittees within this WMA anticipate further success as SQMP requirements are carried forward and reinforced in future years. The SQMP serves as guidance and requirements under this WMAP.

LACDPW has updated the Development Planning and Public Agency Activities Model Program of the SQMP to reflect the recent approval of a Standard Urban Stormwater Mitigation Plan (SUSMP) requirements. An executive summary of the SQMP has also been added to the beginning of each individual model program of the SQMP.

Under the next NPDES permit, the Permittees within this WMA anticipate that additional efforts will be focused on controlling coliform. The Permittees within this WMA anticipate working with Regional Board staff to develop and implement a plan for the TMDL to monitor and

control coliform to the maximum extent practicable.

3.1.2 Structural Controls - any existing and proposed projects to reduce/minimize pollutants of stormwater and urban runoff.

Table 3. Improvement Projects for Stormwater and Urban Runoff

Permittees	Projects:
LACDPW	Future/Proposed Projects: ▸ Install catch basin inserts in all maintenance yards' catch basins, Catch Basin Debris Excluders in selected catch basins, and in-line storm water clean-up devices in selected storm drains. ▸ Investigate the construction of permanent roof cover for existing and new material storage areas and fuel dispensing islands in some of their field facilities.
City of L.A.	Current projects: ▸ The Port of Los Angeles installed a catch basin inlet with filter on Palos Verdes Street in San Pedro in June of 1998. ▸ The Bureau of Sanitation built a Vortechnics, Inc. system at the Harbor Refuse Yard to capture and treat stormwater runoff.
Torrance	▸ Madrona Mash enhancement and restoration projects: Install Catch Basin Excluders in selected catch basins; Construct a strip berm at the northwest of the preserve to prevent trash from entering the preserve; and Reconstruct a portion of Madrona Ave. in order to increase the level and quantity of water retained. ▸ Torrance Beach Water Quality Improvement Project - install a device to address beach parking lot runoff water quality. ▸ Capacity and effluent discharge water quality improvements and enhancements projects for El Dorado Basin, Mobil Oil Basin, Pioneer Basin, Amie Basin, Doris Basin, Entradero Basin, and Henrietta Basin.

3.2 Recommended Studies

Over the next five years, the Permittees within this WMA anticipate providing guidance on the scope of work for any studies related to receiving water impacts. In particular, the Permittees within this WMA anticipate that future studies may address the following issues:

i The removal efficiency vs. cost comparison for all adopted Performance Standards to assist in effectively focusing

resources,

ii The pollutant removal efficiencies of all structural devices required for new development to assist in properly sizing devices and in excluding ineffective ones,

iii An evaluation of the current vs. "natural state" of the Dominguez Channel's sediment loading, sediment discharge periods, sediment gradation, and environmental impact taking into account factors such as paved areas and riparian corridor restriction,

iv Investigate regional solutions to address stormwater quality (i.e. use of spreading grounds, retention basins, and other similar activities), and

v Studies that evaluate the actual impact of pollutants, and pollutant levels, on the beneficial uses of receiving waters.

3.3 Funding Resources

A variety of different grant funding sources are available to assist in implementing the NPDES permit requirements. They can generally be categorized into specific grant programs and on-going grant programs, or legislative appropriations.

3.3.1 Specific Grant Programs

These are usually bond issues or legislative funded programs administered by state, local agencies or conservancies. The most recent of these is Proposition 13. The majority of funds not specifically identified and budgeted by the state are being administered through competitive grant programs by the following state agencies:

i. State Water Resources Control Board. The State Board is in turn delegating certain responsibilities to the Regional Boards. For more information, please see their website, http://www.swrcb.ca.gov/prop13/ index.html

ii. Resources Agency. This large "umbrella" state agency has either assigned or had appropriated/designated certain funding to the various departments, boards and commissions, conservancies, and special programs. This agency has just recently been legislatively charged with the responsibility to develop a comprehensive listing of the available funding sources, including federal, state, local, and private, for water quality improvements. It is to be posted on the internet by November 1, 2002. For more information, see their website, http://ceres.ca.gov/cra

iii. Department of Water Resources. This Department within the

Resources Agency has funding available for water replenishment projects. For more information, please see their website, http://wwwdwr.water.ca.gov/WaterBond2000

3.3.2 On-Going Grant Programs

i. The state agencies noted above also have on-going grant programs. Their websites are excellent information sources.

ii. Federal Government. There are many funding sources for water quality improvements. The sources are too numerous to list, however there is an excellent website at the Federal EPA that lists the federal and other sources. The site is: http://www.epa.gov/OWOW/watershed/wacademy/fund.html

3.3.3 Legislative Appropriations

Local jurisdictions can also work with stakeholders (Table 4) and elected representatives to pass legislation that funds water quality improvements. This can be done at both the local and national levels. Bond issues are another local and state method to fund improvements.

1.0 Watershed Management Area Plan Overview

In compliance with the 1996 municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Order No. 96-054), Los Angeles County (Principal Permittee) is required to develop a Watershed Management Area Plan (WMAP) for each Watershed Management Area (WMA) in coordination with the cities (Permittees) in each WMA. The WMAP consists of the following: a description of each watershed's characteristics; the Stormwater Quality Management Plan (SQMP), formally known as the five Model Programs (see Appendix); quality of stormwater runoff analyses; identified projects to improve quality of stormwater and urban runoff; and available funding resources.

2.0 Watershed Characteristics

2.1 Watershed Area

The Los Angeles River Watershed is centrally located in Los Angeles County (Figure 1). It is bound by the San Gabriel Mountains to the east, the Santa Susanna Mountains to the north, Santa Monica Mountains to the west, and Pacific Ocean to the south. The watershed is comprised of approximately 834 square miles of land with 60% of its total area developed. The overall imperviousness of the tributary watershed is 35%. The watershed drains into the Los Angeles River from the Santa Susanna Mountains to the Pacific Ocean. The major tributaries to the Los Angeles River include Pacoima Wash, Tujunga Wash, Burbank-Western Channel, Verdugo Wash, Sycamore Channel, Arroyo Seco Wash, Rio Hondo Channel, Compton Creek, and numerous other storm drains (Figure 4).

In accordance with the 1996 NPDES Permit, the County of Los Angeles is divided into six WMAs. The Permittees within the Los Angeles River WMA, as listed in the Permit, are as follows:

Alhambra
Arcadia
Bell
Bell Gardens
Burbank
Commerce
Compton
Cudahy
El Monte
Glendale
Hidden Hills
Huntington Park
La Canada Flintridge

Long Beach*
Los Angeles
Los Angeles County
Lynwood
Maywood
Montebello
Monterey Park
Paramount
Pasadena
Rosemead
San Fernando
San Gabriel
San Marino
Sierra Madre
Signal Hill
South Gate
South Pasadena
Temple City
Vernon

*Note: As of June 30, 1999, the City of Long Beach has its own NPDES permit for municipal storm water and urban runoff discharges.

There are other Permittees which may drain to this watershed, but are not formally listed as Permittees in this WMA.

2.2 Natural Characteristics

2.2.1 Topography

The watershed has a varied terrain consisting of mountains, low lying foothills, valleys and coastal plains. Figure 3 shows the watershed's contour lines at 50-foot increments. The highest elevations occur in the San Gabriel Mountains, located in the northeasterly portion of the watershed.

2.2.2 Climate

The watershed consists of portions of the San Gabriel Mountains, San Fernando Valley, San Gabriel Valley, and the Coastal Plain. For the mountains, valley, and coastal, the normal seasonal rainfalls are 27.5 inches, 17.64 inches, and 13.71 inches respectively.

The average rainfall of these four regions yields an average annual precipitation on the watershed of 19.12 inches. Although large year-to-year variations are common, most rainfall events are associated

with winter cold fronts. These winter fronts typically occur during the wet season (October 15 to April 15). The remainder of the year from April 16 to October 14, the dry season, has significantly lower precipitation.

2.2.3 Hydrology

A comprehensive network of flood control and water conservation facilities exist in the watershed to sustain the ever-increasing development in the region. A significant portion of the annual rainfall in the watershed escapes directly to the Pacific Ocean, facilitated by the channelization of the Los Angeles River which is concrete-lined throughout much of its length. The remaining amount percolates into the ground and is conserved in a number of groundwater aquifers. Groundwater aquifer recharge takes place predominantly via artificial groundwater recharge facilities operated by Los Angeles County Department of Public Works (LACDPW). The largest groundwater aquifer in the area is the Central Basin, underlying the Downtown area and the surrounding areas of the City of Los Angeles.

2.2.4 Flow Characteristics

2.2.4.1 Flow Direction

The Los Angeles River is the main watercourse that runs through the watershed, and it extends from San Fernando Valley to the Pacific Ocean. The River is approximately 51 miles long and has an elevation drop of approximately 4,500-feet from the highest peaks.

Runoff in the watershed flows in a generally southerly direction in flood control channels which finally drain into the Pacific Ocean via San Pedro Bay (Figure 2).

2.2.4.2 Sub-Basins

The sub-basins delineated in Figure 2 show hydrological areas and where they drain. They are based on the contour lines in Figure 3.

2.2.5 Land Use

The northeastern portion of the watershed is predominantly part of the Angeles National Forest (categorized mostly as Vacant type per Anderson Land Use Level III/IV classification). Vacant Land Use covers almost 40% of the watershed. The next major land use category for the

remaining portion of the watershed is high density single-family residential covering about 30%. Below is a break down of land use distribution in this Watershed (Figure 5).

Table 1. Land Use Distribution

Land Use Category	Percent by Area
Vacant	39.82
Transportation	2.44
High-Density Single-Family Residential (HDSFR)	28.82
Light Industrial	5.13
Multiple-Family Residential	3.85
Retail/Commercial	3.74
Education	1.91
Mixed Residential	1.83
All Other	12.46

The Los Angeles County land use monitoring program under the 1996 NPDES permit is a result of a site selection study entitled *Evaluation of Land Use Monitoring Stations* (Woodward-Clyde and Psomas and Associates, 1996). This study identified the most significant land use categories within the permit area regarding stormwater quality. The selection study yielded eight land use monitoring stations. These eight land use monitoring stations represent over 86% of all the land uses within the permit area. These stations monitor flow and have automated samplers to collect flow-weighted composite stormwater samples during storm events. The 34 categories shown in Table 2 cover 100% of the land uses in the County.

Figure 5 depicts the eight land use categories currently monitored with their respective percent by area within the watershed. The remaining land use categories are summarized as "All Other" in Table 1.

Table 2. Land Use Categories

Land Use Category	Inclusive SCAG Land Use Codes [1]
High Density Single Family Residential [2]	1111
Light Industrial [2]	1311 through 1315, 1340
Vacant [2]	3100, 3200, 3300, 3400

Receiving Waters	4100, 4200, 4400, 4500

(1) Based on Anderson Land Use Level III/IV Classification.
(2) Land use monitored

2.2.6 Geology/Soil

Los Angeles and nearby cities are located in a relatively flat alluvial plain lying on uplifted terraces surrounded by the mountain ranges. The San Gabriel, Santa Susanna and Santa Monica Mountains are formed of deeply weathered granite rock. These mountains are among the most erodible mountain ranges in the world. Forest fires within these mountains increase the debris potential tremendously during storms. Damages resulting from the local torrential floods are immense considering the size of the area from which the floods originate.

Soil classification at the northern portion of the watershed is mainly Upper Los Angeles River. The other types of soil classification in the watershed are the following: Altamont Clay Loam, Chino Silt Loam, Diablo Clay Loam, Hanford Fine Sandy Loam, Hanford Gravelly Sandy Loam, Hanford Silt Loam, Little Rock Creek, Montezuma Clay Adobe, Oakley fine Sand, Placentia Loam, Ramona Clay Loam, Ramona Loam, Ramona Sandy Loam, Santa Clara River, Santa Monica Mountains, Tujunga Fine Sandy Loam, Upper San Gabriel River, Yolo Clay Loam, Yolo Loam, and Yolo Sandy Loam. The Tujunga Fine Sandy Loam occurs in and adjacent to river beds (Figure 6).

2.2.7 Significant Ecological Areas

Significant Ecological Areas (SEAs) are defined and delineated in conjunction with the Land Use and Open Space Elements of the Los Angeles County General Plan.

An area qualifies for recognition as a SEA if it possesses one or more of the following features, or classes:

i. Is the habitat of rare, endangered, or threatened plant or animal species.
ii. Represents biotic communities, vegetative associations, or habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution on a regional basis.
iii. Represents biotic communities, vegetative associations, or habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution in Los Angeles County.
iv. Is habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, or migrating grounds, and is limited in availability.
v. Represents biotic resources that are of scientific interest because they are either extreme in physical/geographical limitations, or they represent an unusual variation in a population or community.
vi. Is an area important as game species habitat or as fisheries.
vii. Is an area that would provide for the preservation of relatively undisturbed examples of the natural biotic communities in Los Angeles County.
viii. Is a special area, worthy of inclusion, but one which does not fit any of the other seven criteria.

Los Angeles County Department of Regional Planning (Regional Planning) is in the process of updating the SEAs coverage. The final SEAs information will be included in this plan when Regional Planning has finalized the SEAs coverage.

2.2.8 Threatened and Endangered Species

The watershed supports a variety of threatened and endangered species according to the California Department of Fish and Game's November 2000 California Natural Diversity Database (CNDDB). The CNDDB provides both state and federally listed threatened and endangered species of plants and animals (Figures 7b and 7a, respectively).

The watershed hosts the following threatened or endangered plants:

- Braunton's Milk-Vetch,
- Coastal Dunes Milk-Vetch,
- Nevin's Barberry,
- Salt Marsh Bird's-Beak, and
- Slender-Horned Spineflower.

These plants are scattered throughout the watershed in various regions, such as riparian corridors and developed areas.

The watershed hosts the following threatened or endangered animals:

- Coastal California Gnatcatcher,
- Santa Ana Sucker,
- Least Bell's Vireo, and
- Western Yellow-Billed Cuckoo.

Two of these three birds may be found primarily around bodies of water. The Coastal California Gnatcatcher may be found around the Tujunga Wash or Santa Anita Wash while the Least Bell's Vireo may be found around the Los Angeles Reservoir. The Western Yellow-Billed Cuckoo may be found in the San Fernando Valley.

2.3 Quality of Stormwater Runoff

2.3.1 Monitoring Activities

To characterize the quality of stormwater runoff in Los Angeles County, sampling of large area mass emissions sites has been performed under the 1990 and 1996 municipal stormwater NPDES permits.

2.3.1.1 Monitoring Station Location

LACDPW has been monitoring four major drainage areas near their outfalls to the ocean. The following mass emission monitoring stations installed under the original 1990 Permit were retained under the 1996 Permit: the Los Angeles River Monitoring Station, the San Gabriel River Monitoring Station, the Ballona Creek Monitoring Station, and the Malibu Creek Monitoring Station.

The Los Angeles River Monitoring Station is located at the existing stream gage station (Stream Gage No. F319-R) between Willow Street and Wardlow Road in the City of Long Beach. The location was chosen to avoid tidal influences and is able to capture 99 percent of the L.A. River WMA drainage. This river is the largest watershed outlet to the Pacific Ocean in Los Angeles County. At the site, the river is a concrete lined trapezoidal channel.

2.3.1.2 Stormwater Sample Collection Methods

below, are used to collect samples.

- Grab Sample - a discrete, individual sample taken within a short period of time. This method is used to collect samples for constituents that have very short holding times and specific collection or preservation needs. For example, samples for coliforms are taken directly into a sterile container to avoid non-resident bacterial contamination.
- Composite Sample - a mixed or combined sample created by combining a series of discrete samples (aliquots) of specific volumes. Composite sampling is ideally conducted over the duration of the storm event.

During a storm event, grab samples are collected during the initial portion of the storm event and taken directly to the laboratory.

Flow composite storm samples were obtained using an automated sampler to collect samples at flow-paced intervals. Samples collected at each station were combined in the laboratory to create a single flow-weighted sample for analysis.

2.3.2 Comparison of Mass Emissions Concentrations to the Ocean Plan, Basin Plan, and California Toxics Rule

It should be noted that, except for bacteria indicators, there are no numerical water quality standards that apply to stormwater or nonpoint source pollution. Current federal and state numerical standards apply only to point source pollution, such as sanitary sewage, industrial and point source discharges to the ocean and other water bodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff. An exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, the sampling results used to produce Tables 4 and 5 (see Appendix) are detected values before dilution, a factor allowed by the Ocean Plan.

Both the annual mean and median of the analyses of some 209 constituents sampled were compared to the water quality objectives outlined in the California Ocean Plan, the Los Angeles Region Basin Plan, and the California Toxics Rule. For stormwater bacteria indicators, the log mean of the Most Probable Number per 100 ml was compared to the objectives of AB411.

Table 4 shows constituents whose annual mean or median virtually exceeded the water quality objectives described above. Fourteen chemical constituents were identified as constituents of concern from the comparison. For bacteria indicators, the log mean of the Most Probable Number per 100 ml was compared to the objectives of AB411. Total coliform and fecal coliform, and enterococcus are included due to their exceedance of AB411.

2.3.3 Long-term Trend Analysis

A long-term trend analysis was performed for the seventeen water quality constituents selected through the screening procedure over the period from 1995 to 2000. The constituents analyzed include: cyanide, total coliform, fecal coliform, fecal enterococcus, total dissolved solids, turbidity, total aluminum, dissolved cadmium, dissolved copper, total copper, dissolved lead, total lead, dissolved nickel, nickel, dissolved zinc, total zinc and bis(2-ethylhexyl)phthalate. Table 5 shows a summary of statistical analysis results of water quality data collected from the Los Angeles River Monitoring Station.

Tables 4 and 5 show that the bacteria indicator standards for total and fecal coliform were exceeded for every year. The most prominent virtual exceedances occurred with total and dissolved copper and total lead, followed by turbidity, total zinc, and dissolved lead. The tables also show that 1997-1998, the El Niño season, contributed the most virtual exceedances (fourteen constituents exceeded the water quality objectives). It should be noted that there were no virtual exceedances by nutrients (compounds of nitrogen and phosphorus) of the three water quality objectives. The following represents a summary of water quality trends:

Total Coliform

Peak concentrations were observed in the 1995-1996 and 1997-1998 storm seasons. A sharply decreasing trend is noted between the 1998-1999 and 1999-2000 storm seasons. Throughout the entire monitoring period, most data have been shown to largely exceed the Basin Plan, Ocean Plan and AB 411 objective limits.

Fecal Coliform

The highest median concentration was observed in the 1995-1996 storm season. Although there has been a drastic reduction in fecal coliform since the 1995-1996 storm season, its populations still exceed the Basin Plan, Ocean Plan and AB 411 objective limits.

Fecal Enterococcus

The data show a general trend of reduction on fecal enterococcus concentration since 1995. It should be noted that there were not enough data was available for the statistical analysis in the 1996-1997 and 1997-1998 storm seasons.

Total Dissolved Solids

Total dissolved solids concentrations generally complied with the water quality objectives, except with a high mean concentration observed in the 1998-1999 storm season.

Turbidity

The turbidity concentrations fluctuated over the monitoring period with some peaks above the Ocean Plan objective limit.

Total Aluminum

The highest median concentration occurred in the 1997-1998 storm season, exceeding the Basin Plan water quality objective; however, this appeared to be only temporary and median concentrations again dropped below the objective limit for the remaining monitoring period.

Dissolved Cadmium

Only one exceedence of the California Toxics Rule water quality objective limits was observed in the 1997-1998 storm season. Not enough data was available for the statistical analysis for the rest of the monitoring period.

Dissolved Copper

The concentrations stayed consistantly below the California Toxics Rule objective limits between the 1995-1996 and 1996-1997 storm seasons. In the 1997-1998 storm season, however, dissolved copper levels experienced a rapid increase. Since then, median concentrations have displayed a sharply decreasing trend with the concentrations still above the objective limits.

Total Copper

Total copper concentrations have experienced high fluctuations over the monitoring period. During this period, the median concentrations have exceeded the Ocean Plan objective limit.

Lead

The median concentrations of both dissolved and total lead peaked in the 1997-1998 storm season. No trend was observed prior to or after that storm season.

Nickel

Nickel concentrations generally complied with the water quality objectives with one exception. Both mean and median concentrations of dissolved nickel and mean concentration of nickel exceeded the objective limits in the 1997-1998 storm season.

Zinc

Dissolved zinc concentrations generally complied with the California Toxics Rule water quality objective limits, except that high mean and median concentrations were observed in the 1997-1998 storm season. Total zinc concentrations generally decreased from 1995 to 2000, with a surge observed in the 1997-1998 storm season. Since the 1997-1998 storm season, median total zinc concentrations are in compliance with the Ocean Plan objective.

Bis(2-ethylhexyl)phthalate

The median concentrations of bis(2-ethylhexyl)phthalate exceeded the Ocean Plan objective twice over the monitoring period. Not enough water quality data for statistical analysis existed between the 1998-1999 and 1999-2000 storm seasons.

2.4 Significant Storm Water Issues Within the WMA

A modified list of significant stormwater issues within this WMA identified in the Los Angeles Regional Water Quality Control Board's (Regional Board) Watershed Management Initiative Chapter is as follows:

- Other nonpoint sources (horse stables, golf courses),
- Cross-contamination between surface and groundwater,
- Protection and enhancement of fish and wildlife habitat and recreational areas,
- Removal of exotic vegetation,
- Attaining a balance between water reclamation and minimum flows to support habitat,
- Contaminated sediments within the Los Angeles River estuary, and
- Currently scheduled Total Maximum Daily Loads (TMDLs) for the next 6-years are: trash, nutrients, coliform, metals, and chlorpyrifos.

3.0 Watershed Management Plan

3.1 Source Control Strategies

3.1.1 Non-structural Controls - regulatory policies designed to minimize threats to stormwater and urban runoff quality .

Permittees within this WMA have adopted the SQMP, jointly developed under the 1996 NPDES Permit, in its entirety as effective and comprehensive procedures for controlling pollution runoff. The Permittees within this WMA are implementing all applicable requirements of the SQMP. Through the extensive effort to meet all Permit requirements, the Permittees within this WMA have made significant progress in reducing urban runoff pollution. The Permittees within this WMA anticipate further success as SQMP requirements are carried forward and reinforced in future years. The SQMP serves as guidance and requirements under this WMAP.

LACDPW has updated the Development Planning and Public Agency Activities Model Program of the SQMP to reflect the recent approval of Standard Urban Stormwater Mitigation Plan (SUSMP) requirements. An executive summary of the SQMP has also been added to the beginning of each individual model program of the SQMP. Additional revisions to all model programs will be made following the adoption of the 2001 NPDES Permit.

Under the next NPDES permit, the Permittees within this WMA anticipate that additional efforts will be focused on controlling trash, nutrients, coliform, metals, and chlorpyrifos. The Permittees within this WMA anticipate working with Regional Board staff to develop and implement a plan for the TMDLs to monitor and control these pollutants to the maximum extent practicable.

3.1.2 Structural Controls - any existing and proposed projects to reduce/minimize pollutants of stormwater and urban runoff.

Table 3 Improvement Projects for Stormwater and Urban Runoff

Permittee	Projects:
LACDPW	Current Projects: • Los Angeles County Environmental Enhancement Project - The project is located at the LACDPW headquarters building. Various structural BMPs will be installed to test and monitor the effectiveness. • Tujunga Wash Restoration Demonstration Project - The project is located in the City of Los Angeles. Various BMP's such as vegetated swales, and a settling basin will be installed to improve the water quality. • Los Angeles River Litter Monitoring Plan - The Plan will focus on the use of in-flow monitoring devices for litter collection in the storm drain. The plan will result in a better understanding of the amount of litter entering the storm drain and aid in the reduction of that litter in the storm drain. Future/Proposed Projects: • Plan on installing catch basin inserts in all maintenance yards' catch basins, Catch Basin Debris Excluders in selected catch basins, and in-line storm water clean-up devices in selected storm drains. • Investigate the construction of permanent roof cover for existing and new material storage areas and fuel dispensing islands in some of their field facilities.
City of L.A.	Current Projects: • Installed 2 catch basin trash screens • Los Angeles River Litter Monitoring Plan Future/Proposed Projects: • Install one Trash Containment System • Construct one Low-Flow Diversion • Install porous pavement

3.2 Recommended Studies

Over the next five years, the Permittees within this WMA anticipate providing guidance on the scope of work for any studies related to receiving water impacts. In particular, the Permittees within this WMA anticipate that future studies may address the following issues:

i. The removal efficiency vs. cost comparison for all adopted Performance Standards to assist in effectively focusing resources.

ii. The pollutant removal efficiencies of all structural devices required for new development to assist in properly sizing devices and in excluding ineffective ones.

iii. An evaluation of the current vs. "natural state" of the Los Angeles River's sediment loading, sediment discharge periods, sediment gradation, and environmental impact taking into account factors such as paved areas and riparian corridor restriction.

iv. Investigate regional solutions to address stormwater quality (i.e. use of spreading grounds, retention basins, and other similar activities).

v. Studies that evaluate the actual impact of pollutants, and pollutant levels, on the beneficial uses of receiving waters.

3.3 Funding Resources

A variety of different grant funding sources are available to assist in implementing the NPDES permit requirements. They can generally be categorized into specific grant programs and on-going grant programs, or legislative appropriations.

3.3.1 Specific Grant Programs

These are usually bond issues or legislative funded programs administered by state, local agencies or conservancies. The most recent of these is Proposition 13. The majority of funds not specifically identified and budgeted by the state are being administered through competitive grant programs by the following state agencies:

i. State Water Resources Control Board. The State Board is in turn delegating certain responsibilities to the Regional Boards. For more information, please see their website, http://www.swrcb.ca.gov/prop13/ index.html

ii. Resources Agency. This large "umbrella" state agency has either assigned or had appropriated/designated certain funding to the various departments, boards and commissions, conservancies, and special programs. This agency has just recently been legislatively charged with the responsibility to develop a comprehensive listing of the available funding sources, including federal, state, local, and private, for water quality improvements. It is to be posted on the internet by November 1, 2002. For more information, see their website, http://ceres.ca.gov/cra

iii. Department of Water Resources. This Department within the Resources Agency has funding available for water replenishment projects. For more information, please see their website,

http://wwwdwr.water.ca.gov/WaterBond2000

3.3.2 On-Going Grant Programs

i. The state agencies noted above also have on-going grant programs. Their websites are excellent information sources.

ii Federal Government. There are many funding sources for water quality improvements. The sources are too numerous to list, however there is an excellent website at the Federal EPA that lists the federal and other sources. The site is: http://www.epa.gov/OWOW/watershed/wacademy/fund.html

3.3.3 Legislative Appropriations

Local jurisdictions can also work with stakeholders (Table 6) and elected representatives to pass legislation that funds water quality improvements. This can be done at both the local and national levels. Bond issues are another local and state method to fund improvements.

MEETING SUMMARY

Meeting Date: Saturday January 27, 2001 (8:00 a.m. to 1:30 p.m.)

Location: LA River Center & Gardens

Project: Greening Institute

Attendance: Approximately 80-90 Attendees (Maria Lopez, Scott Schales, and Maged El-Rabaa of DPW)

Meeting Summary:

This was the introductory session of the Greening Institute. The Agenda covered was as follows: 1) Kathleen Bullard gave an introduction to the River Center and SD1's efforts, 2) Supervisor Gloria Molina spoke about the program and $4.5 million in Prop A funds available to the public for park developments in SD1, 3) the Resource Partners gave an individual introduction (both Scott Schales and I spoke, individually, about Watershed Management's mission and the involvement we have had thus far - as in the Master Plan in which we have worked with stakeholders to identify development opportunities), 4) Scott Wilson (NET) gave a slide presentation and overview of his agency's efforts to work with partnerships to develop parks 5) the constituents broke up into different groups to identify potential projects and their specific needs to be able to apply for funding, 6) Teresa Villegas (TPL) gave an introduction into available funding, and 7) Curt Robertson spoke about Prop A and the grant application due by March 15, 2001. After the presentations the group had lunch and the Resource Partners were available for additional discussions.

Conclusion:

Overall, I sensed that the group was mainly composed of representatives from established agencies, about 30% were actual residents. The Prop A presentation clarified that only non-profit organizations and public agencies would be able to apply for funding. There is no clear direction as to how the Resource Partners will be able to help constituents apply for projects, other than providing information, that the established agencies may already know.

Follow-Up Action:

1. Attend the next Resource Partner planning meeting on January 30, 2001 at 3:00 p.m.

Prepared by: Maria Lopez **Date:** January 29, 2001

X = Greater than objective. Except for indicator bacteria, there are no numerical water quality standards that apply to stormwater or "non-point source" pollution. Current federal and state numerical standards apply only to "point source pollution," such as sanitary sewage, industrial and commercial discharges to the ocean, and other waterbodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff, and any exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, a direct comparison of the sampling results with the Ocean Plan standards cannot be made since the results presented in the table are detected values before dilution, a factor allowed by the Ocean Plan.

^ = Rain gage not active

- = Statistically invalid data, not enough samples or data above detection limit collecte

NS = Not Sampled

Blank = No Exceedance

DL = Detection Limit

a) Criteria based on daily maximum

b) Criteria based on 30-day average

c) Criteria for the sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo(k)fluoranthene, 1,12-benzoperylene, benzo(a)pyrene, chrysene, dibenzo(ah)anthracene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene and pyrene

d) Criteria continuous concentration which equals the highest concentration of pollutant to which aquatic life can be exposed for an extended period time (4 days) without deleterious effects.

e) Criterion expressed in the total recoverable form.

f) Criteria maximum concentration which equals the highest concentration of pollutant to which aquatic life can be exposed for a short period time without deleterious effects.

g) Except for indicator bacteria, there are no numerical water quality standards that apply to stormwater or "non-point source" pollution. Current federal and state numerical standards apply only to "point source pollution," such as sanitary sewage, industrial and commercial discharges to the ocean, and other waterbodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff, and any exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, a direct comparison of the sampling results with the Ocean Plan standards cannot be made since the results presented in the table are detected values before dilution, a factor allowed by the Ocean Plan.

h) Detection limits have changed throughout the monitoring process. Only data matching the current detection limit is displayed in this table. The Data Included Since field indicates the first year of the storm season with the current detection limit.

1.0 Watershed Management Area Plan Overview

In compliance with the 1996 municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Order No. 96-054), Los Angeles County (Principal Permittee) is required to develop a Watershed Management Area Plan (WMAP) for each Watershed Management Area (WMA) in coordination with the cities (Permittees) in each WMA. The WMAP consists of the following: a description of each watershed's characteristics; the Stormwater Quality Management Plan (SQMP), formally known as the five Model Programs (see Appendix); quality of stormwater runoff analyses; identified projects to improve quality of stormwater and urban runoff; and available funding resources.

2.0 Watershed Characteristics

2.1 Watershed Area

The Malibu Creek Watershed is located in the southwest corner of Los Angeles County. It is bounded on the north and west by Ventura County, on the north and east by the Los Angeles city limits and on the south by the Pacific Ocean. The watershed area is comprised of approximately 109 square miles (Figure 1).

In accordance with the 1996 NPDES Permit, the County of Los Angeles is divided into six WMAs. The Permittees within the Malibu Creek WMA, as listed in the Permit, are as follows:

Agoura Hills
Calabasas
Los Angeles County
Malibu
Westlake Village

2.2 Natural Characteristics

2.2.1 Topography

Figure 3 shows the watershed's contour lines at 50-foot increments. Topographically, the area is characterized by steep, rough mountainous terrain. The predominant drainage is towards the Pacific Ocean. A narrow belt of marine terraces extends along the ocean west from Malibu to the Ventura County line. There are also numerous small valleys throughout the area. Some of the largest of these are Las Virgenes Canyon and the Agoura area. Elevations range from sea level to 2,824 feet at Castro Peak, the highest point in the area.

2.2.2 Climate

The mean annual precipitation in the watershed is about 18.79 inches. The Santa Monica Mountains have a seasonal rainfall of about 19.96 inches, and the San Fernando Valley has 17.62 inches per year. Although large year-to-year variations are common, most rainfall events are associated with winter fronts. Precipitation is significantly lower in the dry season (April 16 to October 14) than in the wet season (October 15 to April 15). Average summer temperature in the watershed is 71°F, average winter temperature is 53°F, and average annual temperature is 61°F, with an average frost-free season of 275-325 days.

2.2.3 Hydrology

Runoff rates from the exposed rock formations of the mountain rim of the watershed may be high. Although infiltration into rock formations does occur, these rates have not been quantified. Historically, many streams of the upper watershed are intermittent to ephemeral USGS blue-line channels, drying up in the mid-summer until the onset of the rainy season. Given their position in the watershed, local residents' comment and substrate type, it is reasonable to assume that Las Virgenes Creek, lower Medea Creek and Cold Creek were historically perennial to intermittent. These streams are historically losing streams, delivering most of their flow to groundwater, with exceptions of discontinuous stream segments on Malibu Creek below the confluence with Las Virgenes Creek. Except for springs emanating from the Lower Topanga Formation, groundwater fed by precipitation roughly parallels the topography, converging in the valleys. Groundwater continues on a downstream gradient toward the ocean, emerging as a gaining stream below the Las Virgenes confluence.

2.2.4 Flow Characteristics

2.2.4.1 Flow Direction

Runoff in the natural canyons and streams flow in a generally southerly direction toward culverts underneath the Pacific Coast Highway and the Pacific Ocean (Figure 2).

2.2.4.2 Sub-Basins

The sub-basins delineated in Figure 2 show hydrological areas and where they drain. They are based on the contour lines in Figure 3.

2.2.5 Land Use

As shown in Table 1, most of the land in the watershed is "vacant", or undeveloped (Figures 5 and 6).

Table 1. Land Use Distribution

Land Use Category	Percent by Area
Vacant	85.38
Transportation	2.53
High-Density Single-Family Residential (HDSFR)	2.8
Light Industrial	0.12
Multiple-Family Residential	0.51
Retail/Commercial	0.21
Education	0.27
All Other	8.18

The Los Angeles County land use monitoring program under the 1996 NPDES permit is a result of a site selection study entitled *Evaluation of Land Use Monitoring Stations* (Woodward-Clyde and Psomas and Associates, 1996). This study identified the most significant land use categories within the permit area regarding stormwater quality. The selection study yielded eight land use monitoring stations. These eight land use monitoring stations represent over 86% of all the land uses within the permit area. These stations monitor flow and have automated samplers to collect flow-weighted composite stormwater samples during storm events. The 34 categories shown in Table 2 cover 100% of the land uses in the County.

Figure 6 depicts the eight land use categories currently monitored with their respective percent by area within the watershed. The remaining land use categories are summarized as "All Other" in Table 1.

Table 2. Land Use categories

Land Use Category	Inclusive Scag Land Use Codes [1]
High Density Single Family Residential [2]	1111
Light Industrial [2]	1311 through 1315, 1340

(1) Based on Anderson Land Use Level III/IV Classification.

(2) Land use monitored

2.2.6 Geology/Soil

The watershed mainly consists of undeveloped mountainous terrain known as the Santa Monica Mountains. The other types of soil classification in the watershed are Altamont Clay Loam and Diablo Clay Loam (Figure 7).

2.2.7 Significant Ecological Areas

Significant Ecological Areas (SEAs) are defined and delineated in conjunction with the Land Use and Open Space Elements of the Los Angeles County General Plan.

An area qualifies for recognition as an SEA if it possesses one or more of the following features, or classes:

i. Is the habitat of rare, endangered, or threatened plant or animal species.

ii Represents biotic communities, vegetative associations, or habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution on a regional basis.

iii. Represents biotic communities, vegetative associations, or habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution in Los Angeles County.

vi. Is habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, or migrating grounds, and is limited in availability

v. Represents biotic resources that are of scientific interest because they are either extreme in physical/geographical limitations, or they represent an unusual variation in a population or community.

iv Is an area important as game species habitat or as fisheries.

vii. Is an area that would provide for the preservation of relatively undisturbed examples of the natural biotic communities in Los Angeles County.

viii. Is a special area, worthy of inclusion, but one which does not fit any of the other seven criteria.

Los Angeles County Department of Regional Planning (Regional Planning) is in the process of updating the SEAs coverage. The final SEAs information will be included in this plan when Regional Planning has finalized the SEAs coverage.

2.2.8 Threatened and Endangered Species

The watershed supports a variety of Threatened and Endangered Species according to the California Department of Fish and Game's November 2000 California Natural Diversity Database (CNDDB). The CNDDB provides both state and federally listed Threatened and Endangered species of plants and animals (Figures 7b and 7a, respectively).

The watershed hosts the following threatened or endangered plants:

- Braunton's Milk-Vetch,
- Lyon's Pentachaeta,
- Marcescent Dudleya and
- Santa Monica Mountains Dudleya.

These plants are primarily located in and around the waterways of Arroyo Sequit, Malibu Creek, and Topanga Canyon.

The watershed hosts the following threatened or endangered animals:

- Steelhead-Southern California ESU, and
- Tidewater Goby.

These fish may be found in the same waterways as the plant species.

2.2.9 Vegetation and Wildlife Ecology

The vegetation and ecology of the Santa Monica Mountains (SMM), including the watershed, is consistent with that of a Mediterranean climate with mild winters, warm dry summers, and seasonal coastal fog. It is these unique conditions which have created the diverse assemblage of plant communities and habitat types within the watershed. This diversity is also reflective of the complex topography, underlying geology, and soils of the watershed. The southern slopes of the SMM are strongly affected by the marine weather conditions

while the northern slopes are influenced by drier inland weather conditions.

Most of the watershed is heavily vegetated with native plant communities. Vegetation in general plays an important role in stabilizing soils and preventing erosion. Within the watershed this role is crucial in many areas where chaparral covers steep slopes with sandy soils. This role functions to protect not only freshwater stream habitat but coastal marsh habitat at the mouth of Malibu Creek as well. The watershed contains diverse plant communities including oak woodland, walnut woodland, riparian woodland, valley oak savannah, grassland, coastal sage scrub, chaparral, wetland, coastal marsh, ornamental, landscapes and disturbed lands.

The diversity of vegetation types and the large acreage of natural open space within the watershed provides habitat for an abundant and diverse wildlife community. While a few wildlife species are entirely dependent on a single vegetative community, the entire mosaic of all the vegetation types within the watershed and adjoining areas constitutes a functional ecosystem for a variety of wildlife species, both within the watershed and as part of the regional Santa Monica Mountains ecosystem.

Amphibian populations are plentiful due to the high moisture content provided by coastal conditions, as well as the large number of drainages and year-round surface water sources. Amphibians are likely to be in highest numbers within the moister woodland areas and canyon bottoms. Many reptilian habitat characteristics can also be found scattered throughout the watershed such as rock outcrops which allow for high visibility, and small mammal burrows which allow for cover and escape from predators and extreme weather. Over 35 species of reptiles and amphibians have been recorded within the watershed. Several invertebrate studies have been performed in the watershed, including two under the auspices of UCLA - funded through the Coastal Conservancy (Ambrose, 2000) and the SMMRCD (1994). These studies concluded that there is some invertebrate diversity problems within the watershed. Further work in this area is needed.

Birds diversity in the watershed is high. The scrubland, woodland, riparian, and grassland habitats within the watershed provide foraging and cover habitat for year round residents, seasonal residents, and migrating song birds. Many year-round water sources located throughout the watershed provide abundant foraging, perching, and nesting habitat along the northern slopes of the watershed. The southern edge of the watershed, along the coast rim, is also part of the Pacific Flyway migration route. The combination of these

resources as well as the confluence of many community types supports an unusually high diversity of bird species. Records from within the watershed indicate that nearly 400 species of birds utilize the habitat within the watershed at some point in their life cycle.

Mammal diversity, not surprisingly, is also high within the watershed. Fifty species of mammals have been observed in the watershed including mountain lions, mule deer, bobcat, badgers, and many others. While most of these species can be found in other areas within the region, the watershed and the Santa Monica Mountains are unique in the number of coexisting populations of so many species.

While all of the habitat types within the watershed ecosystem play important roles, riparian habitats and salt marsh are integral to the maintenance of high species diversity. Riparian communities, including southern willow scrub, sycamore-alder woodland, southern cottonwood-willow riparian forest, oak riparian forest, freshwater marsh, salt marsh, and mulefat scrub can be found along all the major drainages and many of their tributaries throughout the watershed. Although the acreage of these communities is much smaller than the adjacent upland communities, they concentrate many essential resources which are generally scarcer in upland communities, including food, water, and shelter in a variety of accessible forms. Shelter may be simply the shade of trees that can substantially decrease air and water temperatures. Furthermore, it is estimated that at least 85% of all wildlife utilize riparian areas at some point in their life cycle (Washington State Department of Biology). Clearly these communities are important to upland species and are essential in maintaining the diversity of wildlife occupying the watershed.

The salt marsh habitat of Malibu Lagoon, at the mouth of Malibu Creek, is an uncommon wetland resource in the region. This community provides habitat to a multitude of bird species for both foraging and breeding. Records indicate more than 260 bird species have been identified in the lagoon and adjacent upstream riparian habitat. In addition, this marsh represents one of the few remaining salt marsh communities in the region. The brackish conditions of this community create habitat for a variety of species not found in any other community. Although the lagoon is relatively small, its existence substantially increases the diversity of species within the watershed. The Malibu Lagoon is Santa Monica Bay's only remaining brackish water lagoon.

2.3 Quality of Stormwater Runoff

2.3.1 Monitoring Activities

To characterize the quality of stormwater runoff in Los Angeles County, sampling of large area Mass Emissions sites has been performed under the 1990 and 1996 municipal stormwater NPDES permits.

2.3.1.1 Monitoring Station Location

Los Angeles County Department of Public Works (LACDPW) has been monitoring four major drainage areas near their outfalls to the ocean. The following mass emission monitoring stations installed under the original 1990 Permit were retained under the 1996 Permit: the Los Angeles River Monitoring Station, the San Gabriel River Monitoring Station, the Ballona Creek Monitoring Station, and the Malibu Creek Monitoring Station.

The Malibu Creek Monitoring Station is located at the existing stream gage station (Stream Gage No. F130-9-R) near Malibu Canyon Road, south of Piuma Road. At this location, the tributary watershed to Malibu Creek is 104.9 square miles. The entire watershed is 109.9 square miles.

2.3.1.2 Stormwater Sample Collection Methods

Grab and composite sample collection methods, defined below, are used to collect samples.

- Grab Sample - a discrete, individual sample taken within a short period of time, usually less than 15 minutes. This method is used to collect samples for constituents that have very short holding times and specific collection or preservation needs. For example, samples for coliforms are taken directly into a sterile container to avoid non-resident bacterial contamination.
- Composite Sample - a mixed or combined sample created by combining a series of discrete samples (aliquots) of specific volume, collected at specific flow-volume intervals. Composite sampling is ideally conducted over the duration of the storm event.

Grab samples are collected during the initial portion of the storm event and then taken to the laboratory.

Flow composite storm samples were obtained using an automated sampler to collect samples at flow-paced intervals. Samples collected at each station were combined in the laboratory to create a single flow-weighted sample for analysis.

2.3.2 Comparison of Mass Emissions Concentrations to the Ocean Plan, Basin Plan, and California Toxics Rule

It should be noted that, except for bacteria indicators, there are no numerical water quality standards that apply to stormwater or nonpoint source pollution. Current federal and state numerical standards apply only to point source pollution, such as sanitary sewage, industrial and point source discharges to the ocean and other water bodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff. An exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, the sampling results used to produce Tables 5 and 6 (see Appendix) are detected values before dilution, a factor allowed by the Ocean Plan.

Both the annual mean and median of the analyses of some 209 constituents sampled were compared to the water quality objectives outlined in the California Ocean Plan, the Los Angeles Basin Plan, and the California Toxics Rule. For stormwater bacteria indicators, the log mean of the Most Probable Number per 100 ml was compared to the objectives of AB411.

Table 5 shows constituents whose annual mean or median virtually exceeded the water quality objectives described above. Eleven chemical constituents were identified as constituents of concern from the comparison. For bacteria indicators, the log mean of the Most Probable Number per 100 ml was compared to the objectives of AB411. Total coliform and fecal coliform, and enterococcus are included due to their exceedance of AB411.

2.3.3 Long-term Trend Analysis

A long-term trend analysis was performed for the fourteen water quality constituents selected through the screening procedure over the period from 1994 to 2000. The constituents analyzed include: cyanide, total coliform, fecal coliform, fecal enterococcus, total dissolved solids, turbidity, total aluminum, dissolved copper, total copper, total lead, dissolved nickel, nickel, total zinc and bis(2-ethylhexyl)phthalate. Table 6 shows a summary of statistical analysis results of water quality data collected from the Malibu Creek Monitoring Station.

Tables 5 and 6 show that the bacteria indicator standards for total and fecal coliform were exceeded for every year. The prominent virtual exceedances occurred with fecal enterococcus, turbidity, and total dissolved solids. The tables also show that the 1997-1998 storm season, the El Niño season, contributed the most virtual exceedances (Thirteen constituents exceeded the water quality objectives). It should be noted that there were no virtual exceedances by nutrients (compounds of nitrogen and phosphorus) of the three water quality objectives. The following represents a summary of water quality trends:

Total Coliform

The median concentrations were relatively steady from the 1994-1995 storm season to the 1997-1998 storm season. Although there has been a drastic reduction in total coliform since the 1997-1998 storm season, its populations still exceed the Basin Plan, Ocean Plan and AB 411 objective limits.

Fecal Coliform

The highest median concentration was observed in the 1994-1995 storm season. Significant reduction in fecal coliform concentrations is noted from the 1995-1996 storm season with an isolated peak occurring in the 1997-1998 storm season. Nevertheless, all mean and median concentrations are largely above the water quality objective limits throughout the entire monitoring period.

Fecal Enterococcus

The data show a general trend of reduction on fecal enterococcus concentration since 1994. It should be noted that there were not enough data available for the statistical analysis between the 1996-1997 and 1997-1998 storm seasons.

Total Dissolved Solids

There were not enough data available for the statistical analysis for the first three storm seasons. After that, the median concentrations stayed virtually constant above the Basin Plan water quality objective limit from the 1997-1998 storm season to the 1999-2000 storm season.

Turbidity

The highest median concentration occurred in the 1997-1998 storm season, exceeding the Ocean Plan water quality objective limit. Between the 1998-1999 and 1999-2000 storm seasons, there was a significant reduction of turbidity and median concentrations during this period were below the water quality objective.

Total Aluminum

There was no data available for the analysis from the 1994-1995 storm season to the 1996-1997 storm season. One exceedance of the Basin Plan water quality objective limit was observed in the 1997-1998 storm season; however, this appeared to be only temporary and concentrations again dropped below the water quality objective limit for the remaining monitoring period.

Dissolved Copper

Peak dissolved copper concentrations were observed in the 1997-1998 and 1999-2000 storm seasons and only one of median concentrations exceeded the California Toxics Rule limit for saltwater in the 1997-1998 storm season. There were not enough water quality data available for the analysis for the rest of the monitoring period.

Total Copper

Both mean and median concentrations exceeded the Ocean Plan water quality objective limit in the 1997-1998 storm season. Between the 1998-1999 and 1999-2000 storm seasons, there is a rapid decreasing trend for total copper, and mean and median concentrations are in compliance with the Ocean Plan objective.

Other Metals

Only mean concentrations of total lead, dissolved nickel, nickel and total zinc exceeded the water quality objective limits in the 1997-1998 storm season. No exceedance of the water quality objective limits was observed for the rest of the monitoring period.

Bis(2-ethylhexyl)phthalate

The highest median concentration occurred in the 1997-1998 storm season, exceeding the Ocean Plan water quality objective. Between the 1998-1999 and 1999-2000 storm seasons there was a significant reduction of Bis(2-ethylhexyl)phthalate and median concentrations during this period were below the objective limit.

2.4 Significant Stormwater Issues Within the WMA

A modified list of significant stormwater issues within the WMA identified in the Los Angeles Regional Water Quality Control Board's (Regional Board) Watershed Management Initiative Chapter, is as follows:

- Excessive freshwater, nutrients, and coliform in lagoon,
- Septic tanks in lower watershed,
- Appropriate restoration and management of lagoon,
- Access to creek and lagoon by endangered fish, and
- Currently scheduled Total Maximum Daily Loads (TMDLs) for the next 6-years are: coliform, nutrients, and metals.

3.0 Watershed Management Plan

3.1 Source Control Strategies

3.1.1 Non-structural Controls - regulatory policies/programs to minimize threats to stormwater and urban runoff quality.

Permittees within this WMA have adopted the SQMP, jointly developed under the 1996 NPDES Permit, in its entirety as effective and comprehensive procedures for controlling pollution runoff. The Permittees within this WMA are implementing all applicable requirements of the SQMP. Through the extensive effort to meet all the Permit requirements, the Permittees within this WMA have made significant progress in reducing urban runoff pollution. The Permittees within this WMA anticipate further success as SQMP requirements are carried forward and reinforced in future years. The SQMP serves as guidance and requirements under this WMAP.

LACDPW has updated the Development Planning and Public Agency Activities Model Program of the SQMP to reflect the recent approval of a Standard Urban Stormwater Mitigation Plan (SUSMP) requirements. An executive summary of the SQMP has also been added to the beginning of each individual model program of the SQMP. Additional revisions to all model programs will be made following the adoption of the 2001 NPDES Permit.

Under the 2001 NPDES permit, the Permittees within this WMA anticipate that additional efforts will be focused on controlling coliform, nutrients, and metals. The Permittees within this WMA anticipate working with Regional Board staff to develop and implement a plan for the TMDLs to monitor and control these pollutants to the maximum extent practicable.

3.1.2 Structural Controls - any existing and proposed projects to reduce/minimize pollutants of stormwater and urban runoff.

Table 3. Improvement Projects for Stormwater and Urban Runoff

Permittee	Projects:
Agoura Hills	Current projects: Installed a sediment basin to reduce sediment at the entrance of the Chesebro Canyon.
Calabasas	Current projects: Installed Fossil Filters in every drain in the Agoura/Calabasas Community Center parking lot to reduce the amount of oil and grease released from cars parked at the facility. Installed a CDS unit and Abtech Filters to prevent some trash from entering the creeks from Calabasas Road.
LACDPW	Future/Proposed Projects: Plan on installing catch basin inserts in all maintenance yards' catch basins, Catch Basin Debris Excluders in selected catch basins, and in-line storm water clean-up devices in selected storm drains. Investigate the construction of permanent roof cover for existing and new material storage areas and fuel dispensing islands in some of their field facilities.
Malibu	Current projects: Installed a Stormceptor with a Purizer Disinfection Facility on the major storm drain which outlets directly into Malibu Lagoon. A complete results will be released by the end of year 2000. Future/Proposed Projects: Seek grant funding to install two more Purizer Disinfection Facilities on the other two major storm drains from the Civic Center area.

3.1.3 Table 4, Recommendations for the NPDES Permit Requirements, lists numerous activities suggested to the 2001 NPDES permit.

Table 4
RECOMMENDATIONS FOR THE NPDES PERMIT REQUIREMENTS

		Goals:	Improve WQ	Manage Water Quality	Natural Resources	Reduce Development WQ Impacts	Reduce Health Risks	By Whom?	Lead?
1	**Policy and Planning**								
1.1	Consider the need for and the implementation of riparian buffer zones at the municipal, county and state level.		x		x	x	x	ALL	COG
1.2	Promote the use of native plant species and the removal invasive exotics on residential landscapes, rural county lands, urban public space, and commercial/industrial landscapes.			X	x			ALL	
1.3	Review all policies, ordinances and codes in light of the principles of sustainable development, where necessary.		x	x	x	x	x	ALL	
1.4	Work regionally with other agencies and groups to research and apply for foundation and grant funding.		x		x			ALL	
1.5	Investigate land parcels in undeveloped areas that promote water quality and critical habitat protection to develop a priority list for protection.		x	x	x	x		ALL	
1.6	Integrate a watershed planning perspective into General Plans and local ordinances when General Plans are significantly rewritten.			x	x	x		ALL	
1.7	Promote low flush toilets and minimize leakage from domestic water pipes.		x	x	x	x		ALL	
1.8	Promote voluntary reduction of stormwater runoff from private property.		x	x	x	x	x	ALL	
1.9	Support State and federal septic system siting, performance, and monitoring.		x	x		x	x	ALL	

1.1	Work regionally with other agencies/groups to advance knowledge relating to watershed management.		x	x	x	x		ALL	
2	**Watershed Studies and Programs**								
2.1	Map and digitize all stormdrains and outfalls in the watershed.		X	X		X		ALL	
3	**Reduce Excess Flows**								
3.1	Promote alternative water source to potable water where appropriate for toilets and irrigation.			X		X		ALL	
3.2	Consider the need for and the implementation of riparian buffer zones at the municipal, county and state level.		X	X		X	X		
3.3	Develop education and public outreach program to discourage residents on hosing driveway and washing cars on driveways.			X		X	X		
3.4	Establish educational programs in hotels/motels to encourage water conservation.			X		X			
4	**Implementation Measures**								
4.1	In cooperation with Malibu RCD, install demonstration project for livestock BMPs for horse owners and cattle pasture.		X		X	X	X	Malibu, Calabas, and Agoura Hills; County-Public Ed. BMPs only	
4.2	Develop and conduct general and focused education programs watershed-wide. Specifically, improve outreach to horse and other livestock owners about how animal waste impacts water quality, and ways to minimize this source of pollution.		X			X	X		
5	**Existing Programs**								
5.1	Prevent excess erosion and sedimentation along roadways and at construction sites.		X			X		ALL	CLB/LAC
5.2	BMP implementation at construction sites.		X			X		ALL	LAC
5.3	Educate business regarding polluted discharges from restaurants and gas stations.		X			X		ALL	LAC

5.4	Identify and eliminate illicit connections on a regular basis.		X			X		ALL	LAC
5.5	Educate business regarding retail and commercial impacts to stormwater runoff.		X			X		ALL	LAC
5.6	Educate landscape architects, designers, and engineers on stormwater program requirements.		X	X		X		ALL	LAC
5.7	Facilitate children and School programs.			X		X		ALL	LAC

3.2 Recommended Studies

Over the next five years, the Permittees within this WMA anticipate providing guidance on the scope of work for any studies related to receiving water impacts. In particular, the Permittees within this WMA anticipate that future studies may address the following issues:

i. The removal efficiency vs. cost comparison for all adopted Performance Standards to assist in effectively focusing resources.
ii. The pollutant removal efficiencies of all structural devices required for new development to assist in properly sizing devices and in excluding ineffective ones.
iii. An evaluation of the current vs. "natural state" of the Malibu Creek's sediment loading, sediment discharge periods, sediment gradation, and environmental impact taking into account factors such as paved areas and riparian corridor restriction.
iv. Investigate regional solutions to address stormwater quality (i.e. use of spreading grounds, retention basins, and other similar activities).
v. Studies that evaluate the actual impact of pollutants, and pollutant levels, on the beneficial uses of receiving waters.

3.3 Funding Resources

A variety of different grant funding sources are available to assist in implementing the NPDES permit requirements. They can generally be categorized into specific grant programs and on-going grant programs, or legislative appropriations.

3.3.1 SpecificGrant Programs

These are usually bond issues or legislative funded programs administered by state, local agencies or conservancies. The most recent of these is Proposition 13. The majority of funds not specifically identified and budgeted by the state are being administered through competitive grant programs by the following state agencies:

i. State Water Resources Control Board. The State Board is in turn delegating certain responsibilities to the Regional Boards. For more information, please see their website, http://www.swrcb.ca.gov/prop13/ index.html
ii. Resources Agency. This large "umbrella" state agency has either assigned or had appropriated/designated certain funding to the various departments, boards and commissions, conservancies, and special programs. This agency has just recently been legislatively charged with the responsibility to develop a comprehensive listing of the available funding sources, including federal, state, local, and private, for water quality improvements.

It is to be posted on the internet by November 1, 2002. For more information, see their website, http://ceres.ca.gov/cra

iii. Department of Water Resources. This Department within the Resources Agency has funding available for water replenishment projects. For more information, please see their website, http://wwwdwr.water.ca.gov/WaterBond2000

3.3.2 On-Going Grant Programs

i. The state agencies noted above also have on-going grant programs. Their websites are excellent information sources.

ii. Federal Government. There are many funding sources for water quality improvements. The sources are too numerous to list, however there is an excellent website at the Federal EPA that lists the federal and other sources. The site is: http://www.epa.gov/OWOW/watershed/wacademy/fund.html

3.3.3 Legislative Appropriations

Local jurisdictions can also work with stakeholders (Table 7) and elected representatives to pass legislation that funds water quality improvements. This can be done at both the local and national levels. Bond issues are another local and state method to fund improvements.

X = Greater than objective. Except for indicator bacteria, there are no numerical water quality standards that apply to stormwater or "non-point source" pollution. Current federal and state numerical standards apply only to "point source pollution," such as sanitary sewage, industrial and commercial discharges to the ocean, and other waterbodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff, and any exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, a direct comparison of the sampling results with the Ocean Plan standards cannot be made since the results presented in the table are detected values before dilution, a factor allowed by the Ocean Plan

^ = Rain gage not active

- = Statistically invalid data, not enough samples or data above detection limit collected

NS = Not Sampled

Blank = No Exceedance

DL = Detection Limit

a) Criteria based on daily maximum

b) Criteria based on 30-day average

c) Criteria for the sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo(k)fluoranthene, 1,12-benzoperylene, benzo(a)pyrene, chrysene, dibenzo(an)anthracene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene and pyrene.

d) Criteria continuous concentration which equals the highest concentration of pollutant to which aquatic life can be exposed for an extended period time (4 days) without deleterious effects.

e) Criterion expressed in the total recoverable form.

f) Criteria maximum concentration which equals the highest concentration of pollutant to which aquatic life can be exposed for a short period time without deleterious effects

g) Except for indicator bacteria, there are no numerical water quality standards that apply to stormwater or "non-point source" pollution. Current federal and state numerical standards apply only to "point source pollution," such as sanitary sewage, industrial and commercial discharges to the ocean, and other waterbodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff, and any exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, a direct comparison of the sampling results with the Ocean Plan standards cannot be made since the results presented in the table are detected values before dilution, a factor allowed by the Ocean Plan

h) Detection limits have changed throughout the monitoring process. Only data matching the current detection limit is displayed in this table. The Data Includes Since field indicates the first year of the storm season with the current detection limit

1.0 Watershed Management Area Plan Overview

In compliance with the 1996 municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Order No. 96-054), Los Angeles County (Principal Permittee) is required to develop a Watershed Management Area Plan (WMAP) for each Watershed Management Area (WMA) in coordination with the cities (Permittees) in each WMA. The WMAP consists of the following: a description of each watershed's characteristics; the Stormwater Quality Management Plan (SQMP), formally known as the five Model Programs (see Appendix); quality of stormwater runoff analyses; identified projects to improve quality of stormwater and urban runoff; and available funding resources.

2.0 Watershed Characteristics

2.1 Watershed Area

The San Gabriel River Watershed is located in the eastern portion of Los Angeles County (Figure 1). It is bound by the San Gabriel Mountains to the north, most of the San Bernardino/Orange County to the east, the division of the Los Angeles River from the San Gabriel River to the west, and the Pacific Ocean to the south. The watershed is composed of approximately 640 square miles of land with 26% of its total area developed. The watershed drains into the San Gabriel River from the San Gabriel Mountains to the Pacific Ocean. The major tributaries to the San Gabriel River include Walnut Creek, San Jose Creek, Coyote Creek, and numerous storm drains (Figure 4).

In accordance with the 1996 NPDES Permit, the County of Los Angeles is divided into six WMAs. The Permittees within the San Gabriel WMA, as listed in the Permit, are as follows:

Artesia
Azusa
Baldwin Park
Bellflower
Bradbury
Cerritos
Claremont
Covina
Diamond Bar
Downey
Duarte
Glendora
Hawaiian Gardens
Industry
Irwindale

La Habra Heights
La Mirada
La Puente
La Verne
Lakewood
Long Beach*
Los Angeles County
Monrovia
Norwalk
Pomona
Pico Rivera
San Dimas
Santa Fe Springs
South El Monte
Walnut
West Covina
Whittier

*Note: As of June 30, 1999, the City of Long Beach has its own NPDES permit for municipal storm water and urban runoff discharges.

There are other Permittees that may drain to this watershed, but are not formally listed as Permittees in this WMA.

2.2 Natural Characteristics

2.2.1 Topography

The watershed has a varied terrain consisting of mountains, low-lying foothills, valleys and coastal plain. The northerly portion of the watershed has the highest elevation in the San Gabriel Mountains. Figure 3 shows the watershed's contour lines at 50-foot increments.

2.2.2 Climate

The watershed consists of the San Gabriel Mountains, the San Gabriel Valley, and coastal plain. For the mountains, valley, and coastal, the normal seasonal rainfall 27.50 inches,17.64 inches, and 13.71 inches respectively.

The entire watershed's mean annual precipitation is approximately 19.62 inches. It is common for mean annual precipitation to vary from year-to-year, even though the winter fronts that cause the rainfall events typically occur annually. These winter fronts typically occur during the wet season (October 15 to April 15). The remainder of the year from April 16 to October 14, the dry season, has significantly

lower precipitation.

2.2.3 Hydrology

A comprehensive network of flood control and water conservation facilities exist in the watershed to sustain the ever-increasing development in the region. The runoff that reaches the San Gabriel River may be diverted into spreading grounds located along the river or allowed to empty into the Pacific Ocean in Seal Beach. The Rio Hondo/San Gabriel spreading grounds are located south of Whittier Narrows and have highly permeable soils. This soil characteristic enables any flow diverted into the spreading grounds to recharge the groundwater aquifer.

2.2.4 Flow Characteristics

2.2.4.1 Flow Direction

The watershed's runoff flows in a generally southwesterly direction overland or in the flood control channels and if it is not intercepted, eventually discharges into the Pacific Ocean (Figure 3).

2.2.4.2 Sub-Basins

The sub-basins in Figure 3 show hydrological areas and where they drain. These sub-basins were delineated based on the contour lines shown in Figure 2.

2.2.5 Land Use

As shown in Table 1, most of the land in the watershed is "vacant", or undeveloped. Developed land use in the watershed consists primarily of high-density single-family residential, industrial, and retail/commercial (Figure 5).

Table 1. Land Use Distribution

Land Use Category	**Percent by Area**
Vacant	47.69
Transportation	1.66
High-Density Single-Family Residential (HDSFR)	23.96
Light Industrial	4.07

Multiple-Family Residential	3.02
Retail/Commercial	2.92
Education	2.63
Mixed Residential	0.25
All Other	13.8

The Los Angeles County land use monitoring program under the 1996 NPDES permit is a result of a site selection study entitled *Evaluation of Land Use Monitoring Stations* (Woodward-Clyde and Psomas and Associates, 1996). This study identified the most significant land use categories within the permit area regarding stormwater quality. The selection study yielded eight land use monitoring stations. These eight land use monitoring stations represent over 86% of all the land uses within the permit area. These stations monitor flow and have automated samplers to collect flow-weighted composite stormwater samples during storm events. The 34 categories shown in Table 2 cover 100% of the land uses in the County.

Figure 5 depicts the eight land use categories currently monitored with their respective percent by area within the watershed. The remaining land use categories are summarized as "All Other" in Table 1.

Table 2. Land Use Categories

Land Use Category	**Inclusive SCAG Land Use Codes** [1]
High Density Single Family Residential [2]	1111
Light Industrial [2]	1311 through 1315, 1340
Vacant [2]	3100, 3200, 3300, 3400
Retail/Commercial [2]	1221 through 1224
Multiple Family Residential [2]	1121 through 1125
Transportation [2]	1411 through 1416, 1418
Education [2]	1261 through 1266
Low Density Single Family Residential	1112
Mixed Residential [2]	1140
General Office	1211 through 1213

Natural Resources Extraction	1331, 1332
Institutional	1241 through 1247, 1251 through 1253
Heavy Industrial	1321 through 1325
Other Commercial	1231 through 1234
Open Space/Recreation	1820, 1830, 1840, 1850, 1860, 1870, 1880
Utility Facilities	1431, 1432, 1433, 1435, 1436, 1438
Mobile Homes and Trailer Parks	1131, 1132
Mixed Transportation and Utility	1450, 1460
Floodways and Structures	1434, 1437
Rural Residential	1151, 1152, 1439
Under Construction	1700
Golf Courses	1810
Nurseries and Vineyards	2200, 2300
Maintenance Yards	1440
Urban Vacant	1900
Military Installations	1271 through 1273
Agriculture	2100, 2110, 2120, 2600
Harbor Facilities	1417, 4401
Animal Husbandry	2400, 2500, 2700
Mixed Commercial and Industrial	1500
Communication Facilities	1420, 1421
Mixed Urban	1600
Marina Facilities	4300
Receiving Waters	4100, 4200, 4400, 4500

(1) Based on Anderson Land Use Level III/IV Classification.
(2) Land use monitored

2.2.6 Geology/Soil

The San Gabriel Mountains constitute the north portion of the watershed. The mountainous terrain consists of Upper San Gabriel River soil. The mountain's alluvial fans primarily consist of Hanford

Gravelly Sandy Loam and Tujunga Fine Sandy Loam. Additional types of soil classification in the watershed are the following: Altamont Clay Loam, Chino Silt Loam, Diablo Clay Loam, Hanford Silt Loam, Montezuma Clay Adobe, Oakley Fine Sand, Placentia Loam, Ramona Clay Loam, Ramona Loam, Ramona Sandy Loam, Yolo Clay Loam, Yolo Fine Sandy Loam, Yolo Gravelly Sandy Loam, Yolo Loam, and Yolo Sandy Loam (Figure 6).

2.2.7 Significant Ecological Areas

Significant Ecological Areas (SEAs) are defined and delineated in conjunction with the Land Use and Open Space Elements of the Los Angeles County General Plan.

An area qualifies for recognition as a SEA if it possesses one or more of the following features or classes:

i. Is the habitat of rare, endangered, or threatened plant or animal species.
ii Represents biotic communities, vegetative associations, or habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution on a regional basis.
iii Represents biotic communities, vegetative associations, or habitat of plant or animal species that are either one-of-a-kind, or are restricted in distribution in Los Angeles County.
iv Is habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, or migrating grounds, and is limited in availability
v. Represents biotic resources that are of scientific interest because they are either extreme in physical/geographical limitations, or they represent an unusual variation in a population or community.
vi. Is an area important as game species habitat or as fisheries.
vii. Is an area that would provide for the preservaion of relatively undisturbed examples of the natural biotic communities in Los Angeles County.
viii. Is a special area, worthy of inclusion, but one which does not fit any of the other seven criteria.

Los Angeles County Department of Regional Planning (Regional Planning) is in the process of updating the SEAs coverage. The final SEAs information will be included in this plan after Regional Planning has finalized the SEAs coverage.

2.2.8 Threatened and Endangered Species

The watershed supports a variety of threatened and endangered species according to the California Department of Fish and Game's November 2000 California Natural Diversity Database (CNDDB). The CNDDB provides both the state and federally listed threatened and endangered species of plants and animals (Figure 7a and 7b respectively).

The watershed hosts the following threatened and endangered plants and animals:

- Nevin's Barberry,
- Salt Marsh Bird's-Beak,
- Santa Ana Sucker,
- Slender-Horned Spineflower, and
- Thread-Leaved Brodiaea.

The Santa Ana Sucker is primarily located around the San Gabriel River's North Fork, East Fork and West Fork. The Slender-Horned Spineflower is located around San Gabriel River's West Fork. A large population of Salt Marsh Bird's-Beak may be found in the quadrant bordered by 195th Street and Orange Avenue with Norwalk Boulevard and Walker Street. Small pockets of Thread-Leaved Brodiaea may be found in the foothills of the Los Angeles National Forest.

The five birds that constitute the Threatened and Endangered Species Animal list may be found scattered across the watershed typically near open spaces or waterways. Coastal California Gnatcatcher primarily occupies the Forrest Lawn Memorial Park in Covina Hills. The second largest bird population, the Least Bell's Vireo, is predominant near the San Gabriel River and Big Dalton River. The California Least Tern may be found near Marine Stadium and the San Gabriel River in Long Beach. The Belding's Savannah Sparrow may be found near the Los Cerritos Channel. The Western Yellow-Billed Cuckoo is located near the San Gabriel River.

2.3 Quality of Stormwater Runoff

2.3.1 Monitoring Activities

To characterize the quality of stormwater runoff in Los Angeles County, sampling of large area mass emissions sites has been performed under the 1990 and 1996 municipal stormwater NPDES permits.

2.3.1.1 Monitoring Station Location

Los Angeles County Department of Public Works (LACDPW) has been monitoring four major drainage areas near their outfalls to the ocean. The following mass emission monitoring stations installed under the original 1990 Permit were retained under the 1996 Permit: the Los Angeles River Monitoring Station, the San Gabriel River Monitoring Station, the Ballona Creek Monitoring Station, and the Malibu Creek Monitoring Station. The Coyote Creek Monitoring Station, which was required under the 1990 Permit but not under the 1996 Permit, was also monitored during the 1997-98, 1998-99, and 1999-2000 seasons. This station was retained in the program to provide data for the calculation of mass loading in the San Gabriel River Watershed. The five mass emission monitoring stations were used to collect water quality data from over 1,619 square miles and have produced the data used to calculate total loading to the ocean from the Los Angeles River, the San Gabriel River, the Ballona Creek, and the Malib Creek Watersheds.

The San Gabriel River Monitoring Station is located at a historic stream gage station (Stream Gage No. F263C-R), below San Gabriel River Parkway in Pico Rivera. At this location, the upstream tributary area is 450 square miles. The San Gabriel River, at the gauging station, is a grouted rock-concrete stabilizer along the western levee and a natural section on the eastern side. Flow measurement and water sampling are conducted in the grouted rock area along the western levee of the river. The length of the concrete stabilizer is nearly 70 feet. The San Gabriel River sampling location has been an active stream gauging station since 1968.

The Coyote Creek Monitoring Station is located at the existing Army Corps of Engineers stream gage station (Stream Gage No. F354-R) below Spring Street in the lower San Gabriel River Watershed. Although this site is not required for monitoring per the NPDES Permit, the site was added to assist in determining mass loading for the San Gabriel River Watershed. At this location, the upstream tributary area is 150 square miles (extending into Orange County). The sampling site was chosen to avoid backwater effects from the San Gabriel River. Coyote Creek, at the gauging station, is a concrete lined trapezoidal channel. The Coyote Creek sampling location has been an active stream

gauging station since 1963.

2.3.1.2 Stormwater Sample Collection Methods

Grab and composite sample collection methods, defined below, are used to collect samples.

- Grab Sample - a discrete, individual sample within a short period of time. This method is used to collect samples for constituents that have very short holding times and specific collection or preservation needs. For example, samples for coliforms are taken directly into a sterile container to avoid non-resident bacterial contamination.
- Composite Sample - a mixed or combined sample created by combining a series of discrete samples (aliquots) of specific volume. Composite sampling is ideally conducted over the duration of the storm event.

Grab samples are collected during the initial portion of the storm event and then taken to the laboratory.

Flow composite storm samples are obtained using an automated sampler to collect samples at flow-paced intervals. Samples collected at each station are combined in the laboratory to create a single flow-weighted sample for analysis.

It should be noted that only composite samples have been collected at the Coyote Creek Monitoring Station since the 1995-1996 storm season because the monitoring station was not required under the 1996 Permit.

2.3.2 Comparison of Mass Emissions Concentrations to the Ocean Plan, Basin Plan, and California Toxics Rule

It should be noted that, except for bacteria indicators, there are no numerical water quality standards that apply to stormwater or nonpoint source pollution. Current federal and state numerical standards apply only to point source pollution, such as sanitary sewage, industrial and point source discharges to the ocean and other water bodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff. An exceedence of values should not indicate violation nor noncompliance with the plans. Furthermore, the sampling results used to produce Tables 4 and 5 (see Appendix) are

detected values before dilution, a factor allowed by the Ocean Plan. Both the annual mean and median of the analyses of some 209 constituents sampled were compared to the water quality objectives outlined in the California Ocean Plan, the Los Angeles Basin Plan, and the California Toxics Rule. For stormwater bacteria indicators, the log mean of the Most Probable Number per 100 ml was compared to the objectives of AB411.

Table 4 shows constituents whose annual mean or median virtually exceeded the water quality objectives described above at the San Gabriel Monitoring Station. Eleven chemical constituents were identified as constituents of concern from the comparison. Total coliform and fecal coliform, and enterococcus are included due to their exceedance of AB411.

Table 5 contains constituents that exceeded the water quality objectives at the Coyote Creek Monitoring Station. A total of thirteen constituents were identified as constituents of concern, including three bacteria indicators.

2.3.3 Long-term Trend Analysis

A long-term trend analysis was performed for the water quality constituents selected through a screening procedure over the period from 1995 to 2000. Tables 6 and 7 (see Appendix) show summaries of statistical analysis results from water quality data collected from the San Gabriel River Monitoring Station and the Coyote Creek Monitoring Station, respectively.

Tables 4 and 6 show that the bacteria indicator standards for total and fecal coliform were exceeded every year at the San Gabriel Monitoring Station. The prominent virtual exceedances occurred with cyanide and total dissolved solids. The tables also show that the 1997-1998 storm season, the El Niño season, contributed the most virtual exceedances (twelve constituents exceeded the water quality objectives). It should be noted that there were no virtual exceedances by nutrients (compounds of nitrogen and phosphorus) of the three water quality objectives. The following represents a summary of water quality trends at the San Gabriel Monitoring Station:

Total Coliform

A peak median concentration was observed in the 1995-1996 storm season. Although there has been a drastic reduction in total coliform, its populations still exceed the water quality objective limits.

Fecal Coliform

The highest median concentration was observed in the 1995-1996 storm season. Significant reduction in fecal coliform concentrations has been noted since the 1995-1996 storm season with an isolated peak occurring in the 1997-1998 storm season. Nevertheless, all mean and median concentrations are largely above the water quality objective limits throughout the entire monitoring period.

Fecal Enterococcus

The data show a general trend of reduction on fecal enterococcus concentrations since the 1995-1996 storm season. It should be noted that there were not enough data available for the statistical analysis between the 1996-1997 and 1997-1998 storm seasons.

Total Dissolved Solids

The median concentrations do not show any significant change or trend over the entire monitoring period, except for an isolated peak in the 1998-1999 storm season.

Turbidity

The highest median concentration occurred in the 1997-1998 storm season, exceeding the Ocean Plan water quality objective limit. Median concentrations were in compliance with the Ocean Plan objective for the rest of the monitoring period.

Total Copper

Median concentrations exceeded the Ocean Plan water quality objective for the first three storm seasons. Between the 1998-1999 and 1999-2000 storm seasons, there was a significant reduction of total copper, and both mean and median concentrations during this period were below the Ocean Plan objective.

Dissolved Zinc

Only one of mean concentrations exceeded the California Toxics Rule limit for saltwater in the 1997-1998 storm season. There were not enough water quality data available for analysis in the 1995-1996, 1996-1997 and 1999-2000 storm seasons.

Other Metals

The data show that the median concentrations of total aluminum, dissolved copper, dissolved lead, total lead, and total zinc generally complied with the water quality objective limits over the monitoring period, except for the 1997-1998 storm season.

Bis(2-ethylhexyl)phthalate
Both mean and median concentrations exceeded the Ocean Plan water quality objective limit for the first three storm seasons. Between the 1998-1999 and 1999-2000 storm seasons there were not enough water quality data available for the analysis.

Tables 2 and 4 show that the bacteria indicator data were not available except for the 1995-1996 storm season at the Coyote Creek monitoring station. The prominent virtual exceedances occurred with dissolved and total copper and Bis(2-ethylhexyl)phthalate. The tables also show that the 1995-1996 storm season contributed to the most virtual exceedances (Ten constituents exceeded the water quality objectives). The following represents a summary of water quality trends at the Coyote monitoring station:

Bacteria Indicators
Median concentrations of total coliform, fecal coliform and fecal enterococcus largely exceeded the Basin Plan, Ocean Plan and AB411 objective limits in the 1995-1996 storm season. There was no water quality data available for the analysis from the 1996-1997 storm season to the 1999-2000 storm season because grab samples were not collected during this period.

Total Dissolved Solids
The median concentrations exceed the Basin Plan objective twice over the monitoring period. They do not show any particular trend.

Turbidity
The data show median concentrations generally complied with the Ocean Plan objective, except that the high median concentration exceeded the objective limit in the 1997-1998 storm season.

Total Aluminum
Peak concentrations were observed between the 1996-1997 and 1997-1998 storm seasons, exceeding the Basin Plan water quality objective; however, both mean and median concentrations dropped below the objective limit for the remaining monitoring period.

Dissolved Copper
Median concentrations exhibit an increasing trend for the first three storm seasons with a decreasing trend thereafter. Both mean and median concentrations exceeded the California Toxics Rule objective limits from the 1997-1998 storm season to the 1999-2000 storm season.

Total Copper

The data show both mean and median concentrations generally exceed the Ocean Plan objective limit, except that the concentrations observed in the 1999-2000 storm season were below the objective limit.

Dissolved Lead
The median concentrations exceeded the California Toxics Rule for freshwater twice over the entire monitoring period. Not enough water quality data was available for the statistical analysis for the rest of the monitoring period.

Total Lead
The median concentration observed in the 1995-1996 storm season was below the Ocean Plan objective. Between the 1996-1997 and 1997-1998 storm seasons, the median concentrations displayed a sharply increasing trend with the concentrations above the objective limit. Not enough water quality data was available for the statistical analysis for the remaining monitoring period.

Dissolved Zinc
The highest mean and median concentrations occurred in the 1997-1998 storm season, exceeding the California Toxics Rule objective limits; however, this appeared to be only temporary and median concentrations plunged below the objective limits in the next storm season.

Total Zinc
Escalation in total zinc concentrations was noticed for the first three storm seasons. However, the concentrations exhibit a rapid decreasing trend between the 1998-1999 and 1999-2000 storm seasons.

Bis(2-ethylhexyl)phthalate
The trend fluctuated slightly with no significant change until the 1999-2000 storm season. Not enough data from the storm season was available to perform the statistical analysis. The median concentrations exceed the Ocean Plan objective limit for the first three storm seasons.

2.4 Significant Storm Water Issues Within the WMA

A modified list of significant stormwater issues within the WMA identified in the Los Angeles Regional Water Quality Control Board's (Regional Board) Watershed Management Initiative Chapter, is as follows:

- Reservoir sluicing and reservoir sediment,

- Trash in upper watershed,
- Mining/stream modifications,
- Urban and storm water runoff quality,
- Nonpoint source loading from nurseries and horse stables, and
- Currently scheduled Total Maximum Daily Loads (TMDLs) for the next 6-years are: nutrients, coliform, and metals.

3.0 Watershed Management Plan

3.1 Source Control Strategies

3.1.1 Non-structural Controls - regulatory policies/programs to minimize threats to quality of stormwater and urban runoff.

Permittees within this WMA have adopted the SQMP, jointly developed under the 1996 NPDES Permit, in its entirety as effective and comprehensive procedures for controlling pollution runoff. The Permittees within this WMA are implementing all applicable requirements of the SQMP. Through the extensive effort to meet all the Permit requirements, the Permittees within this WMA have made significant progress in reducing urban runoff pollution. The Permittees within this WMA anticipate further success as SQMP requirements are carried forward and reinforced in future years. The SQMP serves as guidance and requirements under this WMAP.

LACDPW has updated the Development Planning and Public Agency Activities Model Program of the SQMP to reflect the recent approval of a Standard Urban Stormwater Mitigation Plan (SUSMP) requirements. An executive summary of the SQMP has also been added to the beginning of each individual model program of the SQMP. Additional revisions to all model programs will be made following the adoption of the 2001 NPDES Permit.

Under the next NPDES permit, the Permittees wthin this WMA anticipate that additional efforts will be focused on controlling nutrients, coliform, and metals. The Permittees within this WMA anticipate working with the Regional Board staff to develop and implement a plan for the TMDLs to monitor and control these pollutants to the maximum extent practicable.

3.1.2 Structural Controls - any existing and proposed projects to reduce/minimize pollutants of stormwater and urban runoff.

Table 3 Improvement Projects for Stormwater and Urban Runoff

Permittee	Projects:
LACDPW	Current projects: • Installed a low flow diversion in Alamitos Bay Pump Station. Future/Proposed Projects: • Plan on installing catch basin inserts in all maintenance yards' catch basins, Catch Basin Debris Excluders in selected catch basins, and in-line storm water clean-up devices in selected storm drains, and • Investigate the construction of permanent roof cover for existing and new material storage areas and fuel dispensing islands in some of their field facilities.
Caltrans	Current Projects: • Installed two different types of drain inlet inserts at Foothill Maintenance Station, • Installed one Bio strip at I-605/SR91, • Installed three Bio Swales at I-605/SR91, Cerritos Maintenance Station, and I-605/Del Amo Avenue, • Installed an infiltration basin at I-605/SR91, • Installed two extended detention basins at I-5/I-605 Intersection and I-605/SR91 Intersection, • Installed three media filters at Eastern Regional Maintenance Station, Foothill Maintenance Station, and Termination Park and Ride, and • Installed a multi-chambered treatment trains at Via Verde Park and Ride. Future/Proposed Projects: • Designed a Multi-Chambered Treatment Train at their Metro Maintenance Station.

3.2 Recommended Studies

Over the next five years, the Permittees within this WMA anticipate providing guidance on the scope of work for any studies related to receiving water impacts. In particular, Permittees within this WMA anticipate that future studies may address the following issues:

i. The removal efficiency vs. cost comparison for all adopted Performance Standards to assist in effectively focusing resources,
ii. The pollutant removal efficiencies of all structural devices required for

new development to assist in properly sizing devices and in excluding ineffective ones,

iii. An evaluation of the current vs. "natural state" of the San Gabriel River's sediment loading, sediment discharge periods, sediment gradation, and environmental impact taking into account factors such as paved areas and riparian corridor restriction,

iv. Investigate regional solutions to address stormwater quality (i.e. use of spreading grounds, retention basins, and other similar activities), and

v. Studies that evaluate the actual impact of pollutants, and pollutant levels, on the beneficial uses of receiving waters.

3.3 Funding Resources

A variety of different grant funding sources are available to assist in implementing the NPDES Permit. They can generally be categorized into specific grant programs and on-going grant programs, or legislative appropriations.

3.3.1 Specific Grant Programs

These are usually bond issues or legislative funded programs administered by state, local agencies or conservancies. The most recent of these is Proposition 13. The majority of funds not specifically identified and budgeted by the state are being administered through competitive grant programs by the following state agencies:

i. State Water Resources Control Board. The State Board is in turn delegating certain responsibilities to the Regional Boards. For more information, please see their website, http://www.swrcb.ca.gov/prop13/index.html.

ii. Resources Agency. This large "umbrella" state agency has either assigned or had appropriated/designated certain funding to the various departments, boards and commissions, conservancies, and special programs. This agency has just recently been legislatively charged with the responsibility to develop a comprehensive listing of the available funding sources, including federal, state, local, and private, for water quality improvements. It is to be posted on the internet by

November 1, 2002. For more information, see their website, http://ceres.ca.gov/cra

iii. Department of Water Resources. This Department within the Resources Agency has funding available for water replenishment projects. For more information, please see their website, http://wwwdwr.water.ca.gov/WaterBond2000

3.3.2 On-Going Grant Programs

i. The state agencies noted above also have on-going grant programs. Their websites are excellent information sources.

ii. Federal Government. There are many funding sources for water quality improvements. The sources are too numerous to list, however there is an excellent website at the Federal EPA that lists the federal and other sources. The site is: http://www.epa.gov/OWOW/watershed/wacademy/fund.html

3.3.3 Legislative Appropriations

Local jurisdictions can also work with stakeholders (Table 8) and elected representatives to pass legislation that funds water quality improvements. This can be done at both the local and national levels. Bond issues are another local and state method to fund improvements.

Total								7	8	12	5	5	37

X = Greater than objective. Except for indicator bacteria, there are no numerical water quality standards that apply to stormwater or "non-point source" pollution. Current federal and state numerical standards apply only to "point source pollution," such as sanitary sewage, industrial and commercial discharges to the ocean and other waterbodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff and any exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, a direct comparison of the sampling results with the Ocean Plan standards cannot be made since the results presented in the table are detected values before dilution, a factor allowed by the Ocean Plan.

^ = Rain gage not active

~ = Statistically invalid data, not enough samples or data above detection limit collected

NS = Not Sampled

Blank = No Exceedance

DL = Detection Limit

a) Criteria based on daily maximum

b) Criteria based on 30-day average

c) Criteria for the sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo(k)fluoranthene, 1,12-benzoperylene, benzo(a)pyrene, chrysene, dibenzo(ah)anthracene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene and pyrene

d) Criteria continuous concentration which equals the highest concentration of pollutant to which aquatic life can be exposed for an extended period time (4 days) without deleterious effects.

e) Criterion expressed in the total recoverable form.

f) Criteria maximum concentration which equals the highest concentration of pollutant to which aquatic life can be exposed for a short period time without deleterious effects.

g) Except for indicator bacteria, there are no numerical water quality standards that apply to stormwater or "non-point source" pollution. Current federal and state numerical standards apply only to "point source pollution," such as sanitary sewage, industrial and commercial discharges to the ocean, and other waterbodies. Water quality standards described in the 1995 Los Angeles Region Basin Plan or the 1997 California Ocean Plan do not apply to stormwater runoff, and any exceedance of values should not indicate violation nor noncompliance with the plans. Furthermore, a direct comparison of the sampling results with the Ocean Plan standards cannot be made since the results presented in the table are detected values before dilution, a factor allowed by the Ocean Plan.

h) Detection limits have changed throughout the monitoring process. Only data matching the current detection limit is displayed in this table. The Data Included Since field indicates the first year of the storm season with the current detection limit.

R0000250

ES.1 Overview

On July 15, 1996, the Los Angeles Regional Water Quality Control Board (Regional Board) issued a municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Permit) to the County of Los Angeles and 85 cities (Permittees). This Permit contains a requirement for Permittees to develop and implement within their jurisdiction a Storm Water Management Program (SWMP). The Countywide Storm Water Management Plan (CSWMP) is the unified plan consisting of model programs developed under the Storm Water Management Program requirements as established by the Permit. These model programs are aimed to reduce pollutant discharges to the maximum extent practicable for attaining water quality objectives and protecting beneficial uses of receiving waters in Los Angeles County.

In the 2001 NPDES permit, the CSWMP has been renamed to the Stormwater Quality Management Plan (SQMP). For the remainder of this document, the acronym SQMP is used.

The Permit required the Permittees to develop a model program to address each of the following:

- Illicit Connections and Illicit Discharges,
- Development Planning,
- Development Construction,
- Public Agency Activities, and
- Public Information and Participation

Each model program is a "stand-alone" document that describes one of these five elements of the SQMP. Record-keeping and reporting requirements are also associated with each model program. This Executive Summary describes the primary requirements of each of the model programs comprising the SQMP. The remainder of this document is the SQMP element referred to as the Industrial and Commercial Educational Program, which was approved by the Regional Board in April 1998.

ES.2 Model Illicit Connections / Illicit Discharge Elimination Program

Part 2.II of the Permit contains requirements specifically for the identification and elimination of illicit connections and illicit discharges to the municipal separate storm sewer system (MS4), generally referred to in this document as "storm drain system." The Permit requirements include five components for the elimination of illicit connections and illicit discharges. Those five components are:

- Illicit connection elimination,
- Illicit discharge elimination,
- Best management practices (BMPs) program for designated non-stormwater discharges,
- Public reporting of illicit discharge and disposal practices, and
- Hazardous waste reporting program.

Illicit Connection Elimination

The goal of this component is to detect and eliminate illicit connections in order to reduce pollutants discharged through such connections to the maximum extent practical. The objectives are to:

- Conduct storm drain system field screening for illicit connections during scheduled infrastructure maintenance by maintenance personnel.
- Determine the source and nature of suspected illicit discharges by investigating connections to the storm drain system.

The model program also describes a methodology that Permittees may use in prioritizing areas of their jurisdiction for investigation. Once the illicit connection/discharge has been investigated, one of the following actions must occur:

- If the discharge is determined to consist only of exempted non-stormwater, the connection will be allowed to remain and will no longer be considered an illicit connection. Permittees may elect to issue a permit for the connection or allow the connection to remain if information on the connection is documented; or
- The discharger will be required to obtain an NPDES permit; or
- The connection will be terminated through voluntary action or enforcement proceedings.

Permittees may prioritize potential problem areas for detection and investigation efforts under this program component, using the methodology defined in this model program.

Illicit Discharge Elimination

The goal of this component is to detect and eliminate illicit discharges from entering the storm drain system to reduce pollutants from such discharge to the maximum extent practicable. The objectives are to:

- Investigate, contain, and clean up incidental spills reported by the public, other agencies or observed by Permittee field staff during the course of their normal daily activities,
- Eliminate through voluntary termination or enforcement action prohibited non-stormwater discharges to the storm drain system, and
- Investigate to determine the nature and source of the discharge and eliminate through voluntary termination or enforcement action suspected prohibited non-storm discharges in the storm drain system.

BMPs for Designated Non-Stormwater Discharges

The Permit required the City of Los Angeles to conduct a study on pollutants entering storm drains from street and sidewalk washing operation to:

(i.) Characterize discharges from municipal street washing and sidewalk washing

(ii.) Assess the impacts of such activities and

(iii.) Recommend appropriate BMPs to control any adverse impacts.

The City of Los Angeles completed the study and prepared a report entitled, "A Study of Pollutants Entering Storm Drains from Street and Sidewalk Washing Operations in Los Angeles, California." The Regional Board approved recommended BMPs for street and sidewalk washing activities.

Public Reporting

The goal of this component is to promote, publicize and facilitate public reporting of illicit discharges and illicit disposal practices. Permittees must implement a system for complainant documentation and a follow up response for calls received from the public regarding potential illicit discharges and illicit disposal practices.

Reporting Hazardous Substances Entering the Storm Drain System

The goal of this component is to facilitate appropriate reporting of hazardous substances entering the storm drain system as a result of an illicit discharge. The Permittees must implement a reporting program to document quantities of hazardous substances entering the storm drain system.

ES.3 MODEL DEVELOPMENT PLANNING PROGRAM

"Development" Projects encompass those projects that are subject to a planning and permitting review process by a Permittee. A "Development" Project may be new development, redevelopment, renovation, remodeling, rehabilitation, infill, or other terms that may be used in a Permittee's ordinances and/or building code. The planning and design of public facilities have similar requirements described in the Model Public Agency Activities Program, another component of the Countywide Storm Water Management Plan.

The fundamental concept of this program component is to identify development that may significantly impact stormwater quality and to then to include permanent BMPs in the project's design. Development projects that may significantly impact stormwater quality are Planning "Priority" Projects. Other projects are deemed "Exempt" from these program requirements.

Each Permittee will implement a development-planning program that includes the following components:

- System for determining the appropriate category (Priority or Exempt) for a Development Project;
- Recommended list of BMPs to be considered, and as appropriate, implemented for Development Projects;
- Process to ensure that Planning Priority Projects incorporate the Standard Urban Storm Water Mitigation Plans using the recommended list of BMPs;
- Guidelines for California Environmental Quality Act (CEQA) compliance;
- Guidelines for the revision of General Plan elements to include watershed and stormwater quality management considerations, when General Plan elements are being significantly rewritten; and
- Developer information program that provides general guidance on the Permittee's development planning program, and specific guidance on BMP selection and the Standard Urban Storm Water Mitigation Plans.

A checklist and flowchart are included in the Model Development Planning Program to assist Permittees in determining whether a project is Priority or Exempt.

ES.4 MODEL DEVELOPMENT CONSTRUCTION PROGRAM

Permittees must also implement a program to manage stormwater and urban runoff associated with construction activities within their jurisdictions. The Model Development Construction Program addresses:

- Development and implementation of construction site BMPs;
- Implementation of procedures to verify Notice of Intent (NOI) filing with the State Water Resources Control Board and completion of stormwater pollution prevention plan (SWPPP) for projects subject to the California General Construction Permit, and
- Implementation of a construction inspection program.

Construction Site BMPs

A Development Construction Project is defined as projects for which site activities such as clearing, grading, excavation, road construction, structure construction, or structure demolition results in the disturbance of soil.

In certain situations, where impact to stormwater quality is a greater threat, Development Construction Projects should be given greater scrutiny to ensure that minimum requirements are met. These projects which present a greater threat to water quality, *but are not subject to the California General Permit for Storm Water Discharges Associated with Construction Activity*[1] are called Construction Priority Projects.

Unless specifically exempted, all Development Construction Projects will be required to implement BMPs to meet minimum water quality protection requirements. As a condition for issuing a grading or building permit, applicants for covered Development Construction Projects shall be required to certify that they understand and will comply with the minimum BMPs requirements related to construction site runoff.

Projects Subject to the General Construction Permit

Developers of construction sites subject to the General Construction Permit are required to prepare and implement a Storm Water Pollution Prevention Plan (state SWPPP). Before issuing building or grading permits, Permittees will require applicants to demonstrate that a Notice of Intent (NOI) has been filed with the State Water Resources Control Board (SWRCB), and that a state SWPPP has been prepared for projects subject to the General Construction Permit.

Requirements for Construction Priority Projects

Prior to receiving a building or grading permit, applicants for Construction Priority Projects must prepare a local stormwater pollution prevention plan (local SWPPP) covering construction materials and waste

[1] A project is subject to the General Construction Permit if it disturbs 5 acres or more of soil, or the project results in the disturbance of less than 5 acres but is part of a larger common plan of development or sale that exceeds 5 acres.

management control, and must certify that they will implement the local SWPPP year-round. Applicants for Construction Priority projects must also prepare and implement a Wet Weather Erosion Control Plan (WWECP) if the project will leave soil disturbed during the rainy season (November 1 through April 15).

Site Inspection and Enforcement

Each Permittee will implement site inspection procedures to assess whether the minimum requirements for Development Construction Projects are being achieved and appropriate BMPs are being implemented. Site inspections will also determine if local SWPPPs are being implemented at projects where they apply. Developers and/or contractors will also be required to conduct and document self-inspections of their construction site. Each Permittee will also develop and implement enforcement procedures to require that corrective actions be undertaken when the requirements are not met.

ES.5 MODEL PUBLIC AGENCY ACTIVITIES PROGRAM

Part IV.C of the Permit contains requirements specifically for public agency activities and facilities. Components of the Public Agency Activities Model Program describe measures to be taken by Permittees to reduce stormwater impacts from public agency activities and facilities such as sanitary sewer systems, public construction activities, vehicle maintenance and material storage facilities, recreation facilities, stormwater drainage systems, streets and roads, etc.

Sewage Systems Operations

This program component is applicable to all Permittees who own and operate a sewage collection system. Although sewage systems themselves are not a regular source of stormwater pollution, raw sewage contains pollutants that can pose a serious threat to both human health and the quality of receiving waters if they enter the storm drain system through incidents such as spills, leaks, or overflows. The goal of this program is to reduce the impact of Permittee-owned sewage system operations on stormwater quality.

The objectives of this program component are to:

- Keep any sewage overflows or leaks from entering the storm drain system or receiving waters.
- Identify and repair sewage system blockages, exfiltrations, overflows and implement procedures for investigating the causes.
- Notify public health authorities in cases where threats to public health exist.

Public Construction Activities Management

This program component is applicable to all Permittees who construct or contract to construct public facilities, including infrastructure. The program component requires the use of temporary best management practices (BMPs) to reduce the discharge of pollutants from public construction sites. In addition, public agency facilities with the potential for having a significant effect on stormwater quality when completed by virtue of their size, nature of on-site activities, or other factors must incorporate permanent BMPs in the planning and design of the project.

The objectives of this program component are to:

- Select and incorporate appropriate construction control measures for stormwater quality management from construction sites.
- Conduct and inspection program, including enforcement procedures as necessary, to verify that the construction control measures are implemented and performed effectively throughout the construction period.

Vehicle Maintenance / Material Storage Facilities Management

This program component is applicable to all Permittees who own and operate vehicle maintenance or materials storage facilities. Activities at these facilities may generate waste, spills and leaks that could potentially reach the storm drain system and receiving waters. The goal of this program is to make stormwater quality a consideration when conducting activities at municipal facilities.

The objectives of this program component are to:

- Identify and evaluate sources of pollutants from public vehicle maintenance/material storage facilities that may affect the quality of stormwater discharge from the facility.
- Identify and implement site-specific best management practices to reduce or prevent pollutants in stormwater discharges.

Landscape and Recreational Facilities Management

This program component is applicable to all Permittees who own and operate recreational facilities. Maintenance practices at parks and recreation facilities generally include fertilizer and pesticide applications, vegetation maintenance and disposal, swimming pool chemical maintenance and draining, and trash and debris management. All of these activities have the potential to contribute pollutants to the storm drain system. If improperly managed, potential pollutants can be transported in runoff (stormwater and non-stormwater discharges) to the storm drain system and subsequently to receiving waters. The goal of the program for landscape and recreational facilities management is to make the stormwater quality a consideration when conducting operation and maintenance activities.

The objectives of this program component are to:

- Minimize the discharge of pesticides, herbicides and fertilizers to the storm drain system and receiving waters.
- Prevent the disposal of landscape waste into the storm drain system.
- Minimize the trash, debris and other pollutants from entering Permitee-owned recreational water bodies.
- Discharge municipal swimming pool water in a manner that will not contribute pollutants to receiving waters.

Storm Drain Operation and Management

The storm drain system functions primarily to collect and convey surface runoff to receiving waters during storms in order to prevent flooding. A common municipal activity includes the maintenance of the storm drain system to maintain hydraulic function as intended during storms. The goal of this program is to reduce the impact of storm drain operation and maintenance activities on stormwater quality.

The objectives of this program component are to:

- Inspect and clean catch basins annually and keep appropriate records.
- Remove trash and debris annually from open channels and properly dispose of these materials to prevent them from being washed to receiving waters.
- Report prohibited non-stormwater discharges observed during the course of normal daily activities so they can be investigated, contained and cleaned up, or eliminated.
- Review maintenance activities to verify that they minimize the amount of pollutants discharged to receiving waters.

Streets and Roads Maintenance

Streets and roads may collect litter and debris from nearby activities, as well as from vehicular traffic. During the course of routine maintenance waste materials are often generated. The goal of this component is to reduce the impact of Permittee street and road operations and maintenance on stormwater quality.

The objectives of this program component are to:

- Sweep curbed streets to reduce the discharge of pollutants associated with activities occurring in street and road rights-of-way.
- Minimize the discharge of pollutants associated with the maintenance of streets and roads.

Parking Facilities Management

Permittees who own parking lots with more than 25 parking spaces located in areas with potential exposure to stormwater must have a parking facilities management plan. The goal of this component is to reduce the impact of these parking facilities on the quality of stormwater discharges and receiving waters. The object of this program component is to remove debris from parking facilities to reduce the amount of material that comes into contact with stormwater.

Public Industrial Activities

Industrial activities, whether private or public, have the potential to discharge pollutants to the storm drain system. Many industrial facilities are subject to the California General Industrial Activities Storm Water Permit (General Industrial Permit) for control of stormwater pollution. The goal of the General Industrial Permit is to reduce the impact of industrial facilities on stormwater quality. This provision of the Permit may procedurally simplify and reduce the cost of Permittees' compliance for their industrial facilities (Phase 1) by providing the option to obtain coverage under the Permit in lieu of the General Industrial Permit.

The objective of this program component is to comply with all requirements and conditions contained in the General Industrial Permit.

Emergency Procedures

Each Permittee must consider the impact of discharges to the storm drain system during emergency repairs of essential public services and infrastructure, and response to natural disasters. The goal is to reduce the impact of emergency response activities on receiving waters, to the extent possible, without compromising public health and safety.

The objectives of this program component are to:

- Recognize that public health and safety are the highest priority when conducting emergency response activities.
- Protect surface water quality by incorporating appropriate BMPs into emergency response activities to the extent possible.

ES.6 Model Public Information and Participation Program

The purpose of the Stormwater/Urban Runoff Public Information and Participation Program (Five-Year Public Education Plan) is to provide the framework for a comprehensive educational stormwater and urban runoff outreach approach that will reach as many Los Angeles County residents as possible. The Five-Year Public Education Plan is research-based, broad-based with overarching themes, flexible, adaptable, and simplistic in order to produce behavior change.

Groups of residents differ significantly in terms of the amount of pollution they contribute, their demographics and lifestyle, attitudes related to stormwater pollution, and probability of changing their behaviors. By better understanding the general County resident population, resources may be directed to those segments of the population that pose the greatest threat to stormwater quality and who represent the greatest opportunity to respond to a public education campaign.

Some key strategies developed for successful implementation of the education model include:

- Creating Overarching Approach – A unified overall public education approach sets a "tone" for the program and once established helps target audiences identify the program with its pollution prevention message.
- Building Partnerships – Integrate County and city programs, cooperate with environmental groups, co-Permittees, and other public and business groups to disseminate public education program materials and special events information.
- Unify Pollution Prevention Efforts – Link all pollution prevention efforts (such as recycling, used oil and household waste) under a single agenda rather than under multiple prevention splinter programs.

- Develop "How To" Instructions – Provide specific guidelines supported by simple easy to remember tasks and concise "how to" instructions for pollution prevention actions that residents and business may incorporate into their everyday routines.
- Monitoring and Evaluation System – Establish an evaluation system to measure program effectiveness by assessing the number of people who show increased awareness, intent and/or actions in reducing stormwater pollution. Re-evaluate and enhance program components on continually based on program effectiveness.
- Multiple Audience Impact – Develop program materials and activities that may be implemented and have impact on more than one audience at a time.

The Model Public Information and Participation Program also includes reporting requirements for Permittees to support the Annual Program Report to the Regional Board. These reporting requirements include the documentation of information such as:

- Number of media outlets contacted to run public service announcements (PSAs),
- Dollar value and number of media buys.
- Audience of the media PSAs,
- List of local businesses enlisted to place non-traditional advertising (point-of-purchase displays, product neck hangers, etc.)
- Numbers and types of stormwater pollution prevention materials distributed, and
- Whether there is an increase in the number of illicit discharge reports to the Permittee.

The municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities by the Los Angeles Regional Water Quality Control Board on July 15, 1996 contains a requirement for Permittees to develop and implement an Industrial/Commercial Educational Program. This document provides guidance that Permittees can follow to implement their own Industrial/Commercial Educational Program in compliance with the Permit.

Part 2.V.B of the Permit requires Permittees to conduct specific activities related to industrial/commercial education, as shown in Table 1. They must collect information on industrial/commercial facilities, conduct educational site visits at those facilities, incorporate information from an approved BMP list into their outreach measures, and report quarterly on the facilities visited. This document is not a model program, but is provided as guidance to assist Permittees with the implementation of their programs. Only the list of BMPs, discussed later in Section 3.2, will be submitted to, reviewed and approved by the Regional Board staff (Executive Officer) and can be changed by approval of the Executive Officer.

Table 1
Permit Requirements -Industrial/Commercial Educational Program

Permit Section	Requirement	Compliance Date
2.V.B.1.b	Collect information on industrial/commercial facilities within jurisdiction and submit to Principal Permittee.	Must complete by May 1998 for industrial, motor vehicle, gas stations, and restaurants. (Not later than one year after Principal Permittee provides the database format to the Permittees.) For additional SIC groups: Not later than one year after Watershed Management Committee (WMC) designation.
2.V.B.3.a	Begin to implement an industrial/commercial facility educational site visit program.	Upon Regional Board approval of BMP checklist, and in accordance with the applicable schedule.
2.V.B.3.b	Distribute and discuss applicable BMPs during educational site visit.	Upon Regional Board approval of BMP checklist.
2.V.B.3.c	Submit list of facilities visited to the Principal Permittee.	Quarterly

The requirement to implement an Industrial/Commercial Educational Program is based on the two primary objectives listed below, set forth in the Federal Clean Water Act amendments of 1987, which established the framework for regulating stormwater discharges from municipal, industrial and construction activities under the NPDES system:

- Effectively prohibit non-stormwater discharges (unless NPDES permitted, specifically exempted, or proven not to be a significant source of pollutants).
- Reduce the discharge of pollutants from storm drainage systems to the maximum extent practicable (MEP).

To meet this statutory objective, the federal regulatory requirements for municipal Permittees include implementing a comprehensive program to control pollutants in stormwater discharges to municipal systems from certain industrial facilities.

To meet this statutory objective, the federal regulatory requirements for municipal Permittees include implementing a comprehensive program to control pollutants in stormwater discharges to municipal systems from certain industrial facilities.

The Permit names specific groups of facilities that must be included in the educational site visit program. These groups of facilities include:

- All industrial groups regulated under Phase 1 of the federal stormwater program (Phase 1 facilities), discussed in Section 2.1.
- Motor vehicle repair shops, motor vehicle body shops, motor vehicle parts and accessories facilities, gas stations, and restaurants, discussed in Section 2.2.
- Additional groups of industrial/commercial facilities as specified by the WMCs, discussed in Section 2.3.

2.1 PHASE 1 FACILITIES

Facilities listed in the Permit are described in the federal regulations under the following 10 categories:

i. Facilities subject to stormwater effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR Subchapter N)

ii. Manufacturing facilities

iii. Mining and oil and gas facilities

iv. Hazardous waste treatment, storage, or disposal facilities

v. Landfills, land application sites, and open dumps that receive industrial waste

vi. Recycling facilities

vii. Steam electric generating facilities

viii. Transportation facilities

ix. Sewage treatment plants

xi. Certain facilities if materials are exposed to stormwater

In California, these facilities are regulated under the California General Industrial Stormwater Permit (General Industrial Permit). The State Water Resources Control Board and the nine Regional Water Quality Control Boards are responsible for enforcing the General Industrial Permit.

2.2 OTHER SPECIFIC FACILITIES

In addition to Phase 1 facilities, the Permit names three groups of specific facilities:

- Vehicle repair shops, vehicle body shops, vehicle parts and accessories
- Gasoline stations
- Restaurants

2.3 OTHER FACILITIES DESIGNATED BY THE WMC

Each WMC may identify additional SIC industrial/commercial groups that will receive educational site visits from Permittees in the watershed. Criteria the WMCs will use are listed in Part 2.1.C.3.g of the Permit.

Each Permittee will implement an Industrial/Commercial Educational Program, which includes the following components:

- Source Identification
- Source Control Measures
- Educational Site Visits

A brief summary of the program components follows. A Permittee may petition the Executive Officer to substitute this program with an alternative, equally effective industrial/commercial educational program.

3.1 SOURCE IDENTIFICATION

Permittees must collect information to identify industrial/commercial facilities within the local jurisdiction. The procedures include:

- Collect information on all industrial/commercial facilities targeted in the Permit, using the database format developed by the Principal Permittee.
- Submit initial required information to the Principal Permittee by May 1998.

Guidance to collect the facility information and the database format that must be used are included as Appendix A.

3.2 SOURCE CONTROL MEASURES

Permittees must incorporate the Best Management Practices (BMPs) information on effective stormwater pollution control, as approved by the Regional Board, into educational site visit outreach measures. The lists of BMPs and guidance to using them are included as Appendix B.

3.3 EDUCATIONAL SITE VISITS

Permittees must conduct industrial/commercial educational site visits at all facilities identified in the Permit. The purpose of the site visits will be solely educational. The procedures include:

- Conduct educational site visits at each facility at the frequency specified in Table 2.
- Consult with a representative of the facility to explain applicable stormwater regulations.
- Distribute and discuss applicable BMP and educational materials.
- Where applicable, notify industrial facilities of requirements under the General Industrial Permit.
- Follow up with facilities, as necessary, to provide advice in complying with local legal authority.
- Submit a list of facilities visited each quarter to the Principal Permittee.

Guidance to conduct the site visits is included as Appendix C.

Table 2
Schedule of Educational Site Visits

Facilities	Site Visit Frequency (Number of contacts / time period)
Industrial groups i through ix regulated under Phase I of the federal stormwater program.	1 / 24 months At least twice in the five-year permit term
Industrial group xi regulated under Phase I of the federal stormwater program because materials are exposed to stormwater [1].	1 / 5 years
All motor vehicle repair shops, motor vehicle body shops, motor vehicle parts and accessories facilities, gas stations, and restaurants.	1 / 24 months At least twice in the five-year permit term
Facilities selected by WMCs	1 / 36 months

(1) A phone call, mailed out educational materials, or other method to inform facilities of General Industrial Permit requirements may be used in lieu of a site visit.

Appendix A
Source Identification Guidance

Appendix A
Source Identification Guidance

The Permit requires each Permittee to develop information on all industrial/commercial facilities targeted by the Permit, and listed in Table A-1, that are within their jurisdiction. Note that these are industrial facilities subject to the General Industrial Permit, as well as other selected commercial facilities. The list includes certain categories of facilities such as wastewater treatment plants, landfills, large transportation yards, and airports that are subject to the General Industrial Permit and may be publicly-owned by Permittees, but does *not* include public facilities such as municipal maintenance yards that may contain industrial types of activity. Permittee-owned facilities are not subject to the Industrial/Commercial Educational Program. Requirements for these public facilities are discussed in a separate model program document titled *Public Agency Activities*.

Each Permittee must collect the initial information on these facilities and provide the data to the Principal Permittee (County) by May 1998. At a minimum, Permittees must collect the information required by the database format described in Section A.1. This database format was provided to all Permittees on disk for ease of use and reporting. The County compiled the information into a single database in June 1998. The database will serve as a reference resource for the public, business, industry, local government, the Regional Board, and other public agencies. Permittees will conduct educational site visits of all of these facilities.

Many Permittees may already have a database established, or have much of this initial information compiled from various department programs. Resources for identifying the facilities include:

- the State Water Resources Control Board (SWRCB) database of businesses covered by the General Industrial Permit
- hazardous materials inventories maintained by the fire or environmental health departments
- lists of businesses subject to the local wastewater utility's industrial pretreatment program
- city business license records
- commercially available business listings (e.g., the Dun & Bradstreet database)
- the Yellow Pages

An important parameter to help determine if a facility is subject to this program is its Standard Industrial Classification (SIC) code. For this reason, Table A-1 includes the SIC codes for all facilities named in this Permit. Guidance to help identify facilities subject to the General Industrial Permit is provided in Section A.2.

Table A-1
SIC Codes of Industrial/Commercial Facilities Targeted by the Permit

Categories	SIC Codes (exceptions in parentheses)	Industry/Commercial Types
I. 40 CFR Subchapter N	Included below.	Included below.
ii. Manufacturing	24 (2434) 26 (265 & 267) 28 (283) 29 311 32 (323) 33 3441 373	Lumber & wood Paper Chemicals Petroleum refining Leather Stone, clay, glass Primary metal Fabricated structural. metal Ship & boat
iii. Mining/Oil	10 12 13 14	Metal Coal Oil & gas Nonmetallic minerals
iv. Hazardous Waste TSD	4953	Refuse systems
v. Landfills, etc.	4953	Refuse systems
vi. Recycling	5015 5093	Motor vehicle parts, used Scrap & waste
vii. Steam Electric Generation	4911	Steam electric generation
viii. Transportation	40 41 42 (4221-25) 43 5171 44 45	Railroad Local transit Motor freight USPS Petroleum bulk stations Water Air
ix. Sewage Treatment	4952	Sewage treatment
xi. Other Manufacturing Exposed to Stormwater	20 21 22 23 2434 25 265 267 27 283 285 30 31 (311) 323 34 (3441) 35 36 37 (373) 38 39 4221-25	Food Tobacco Textile Apparel Wood kitchen cabinet Furniture Paperboard Converted paper/board Printing/publishing Drugs Paints, varnishes, lacquers Rubber Leather Glass Fabricated metal Indust./comm. machinery Electronic Transportation Instruments, photo, med. Misc. manufacturing Warehousing

Categories	SIC Codes (exceptions in parentheses)	Industry/Commercial Types
Vehicle repair shops, vehicle body shops, vehicle parts and accessories	7532 7533 7534 7536 7537 7538 7539 5013 5014	Top, body, upholstery repair and paint Auto exhaust system repair Tire retreading and repair Auto glass replacement Auto transmission repair General auto repair Auto repair, not elsewhere classified Motor vehicle supplies and new parts Tires and tubes
Gasoline stations	5541	Gasoline service stations
Restaurants	5812	Eating places

A.1 DATABASE FORMAT

A.1.1 Overview of the Database

To facilitate the collection, aggregation and reporting of the industrial and commercial facilities within each jurisdiction, the following database content is recommended. The database is divided into two sections: "Required" data and "optional" data. Each Permittee will collect the required information and forward to the County a digital copy of the updated database on a quarterly basis. The optional information as shown in this database design *may* be collected as appropriate by each Permittee, but is *not* required in the quarterly submissions. In addition, any other information collected by each Permittee is not required to be submitted.

Submissions to the County shall be in electronic format. Permittees will utilize the database format and application provided by the County. Special arrangements will be made for those Permittees who can not utilize the application provided by the County due to hardware or software complications. The following sections describe the required and optional database contents for the industrial/commercial educational program.

A.1.2 Required Information

The following information will be collected and forwarded to the County on a quarterly basis as required by the Permit.

Required Database Information

1. Name of facility
2. Facility street address
3. City
4. 5 digit zip code
5. Watershed Management Area
6. Primary SIC code

7. NPDES stormwater permit coverage status, if applicable
8. Permittee responsible for visiting facility
9. Date of site visit

A more detailed database design including fields, field description and format is included in Table A-2. It is intended that the County-supplied format and application will provide some level of data validation during entry and updating. This will provide better overall data consistency and facilitate quicker data aggregation for reporting to the Regional Water Quality Control Board.

Table A-2
Required Database Fields

Field	Field Name	Field Description	Format
1	FACILITY[1]	Name of facility	C(32)
2	STR_NUM	Street number of facility address	I(5)
3	STR_FRAC	Street number fraction (if any)	F(3.2)
4	STR_PREF	Street direction prefix (if any)	C(1)
5	STR_NAME	Street name	C(24)
6	STR_SUFF	Street type suffix	C(3)
7	UNIT_NUM	Unit or suite number of facility	C(5)
8	CITY	City	C(24)
9	ZIP	5 digit zip code	I(5)
10	WMA[2]	Watershed Management Area	I(1)
11	SIC	Primary SIC	I(4)
12	NOI_FLAG[3]	Permit coverage	C(1)
13	PERMTE	Permittee responsible for facility	C(24)
14	VIS_DATE	Date of site visit	DATE

Notes
(1) FACILITY is designated to represent the "Doing Business As" name
(2) WMA - Watershed Management Area - valid entries
1 = Malibu Creek/Rural Santa Monica Bay
2 = Ballona Creek/Urban Santa Monica Bay
3 = Los Angeles River
4 = Dominquez Creek/Los Angeles Harbor
5 = San Gabriel River
6 = Santa Clara River
(3) NOI_FLAG - Permit Coverage Field - valid entries = Yes, No, Unknown, or Individual Stormwater Permit

A.1.3 Optional Information

The following information is optional and is *not* required to be forwarded to the County or reported to the Regional Board. It is provided only to assist those Permittees who wish to track additional information for their own internal program use. Permittees may have the need or desire to add their own additional data pertinent to the educational site visits. Each is encouraged to track whatever information is important for their purposes. A more detailed database design, including fields, field description and format, is included in Table A-3.

Optional Database Information

1. Contact person at facility
2. Phone number for contact person
3. Mailing address for facility (if different)
4. Mailing address city
5. Mailing address 5 digit zip code
6. Secondary SIC
7. Name of person visiting facility
8. Date for next facility visit
9. Reason for next visit
10. Comments field

Table A-3
Optional Database Fields

Field	Field Name	Field Description	Format
15	FN_CONT	First name of contact person	C(10)
16	LN_CONT	Last name of contact person	C(15)
17	PH_NUM	Phone number for contact person	I(10)
18	MST_NUM	Mailing address street number	I(5)
19	MST_FRAC	Mailing address street number fraction	F(3.2)
20	MST_PREF	Mailing street direction prefix (if any)	C(1)
21	MST_NAM	Mailing address street name	C(24)
22	MST_SUFF	Mailing address street type suffix	C(3)
23	MUN_NUM	Mailing address unit or suite no.	C(5)
24	MCITY	Mailing address city	C(24)
25	MZIP	Mailing address 5 digit zip code	I(5)
26	SIC2[1]	Secondary SIC	I(4)
27	SIC3[1]	Additional SIC	I(4)
26	FN_INSP	First name of person visiting facility	C(10)
27	LN_INSP	Last name of person visiting facility	C(15)
28	NXT_DATE[2]	Date for next facility visit	DATE
29	NXT_REAS[3]	Reason for next visit	I(1)
30	VST_FLAG[4]	Flag to indicate site visits complete	C(1)
31	COMMNTS	Comments field	LONG

Notes

(1) SIC2, SIC3: secondary and additional SIC to indicate additional activities occur onsite

(2) NXT-DATE: date for next facility visit will be set based on reason for next site visit and will be checked against the permit required frequency depending on facility. Valid entries will be set to: 3,6,9,12,18,24, or 36 months or other user specified date.

(3) NXT_REASON: reason for next visit - valid entries will be set to a predefined list of "other," with "other□ " being described in the comments field. Valid entries are: 1 = Permit defined frequency; 2 = Additional technical help requested; 3 = Contact person not in attendance; 4 = Other

(4) +VST_FLAG flag to indicate site visits complete - this field will be set automatically when the required number of visits as defined in the permit have been accomplished for the facility.

A.2 GUIDANCE TO IDENTIFY INDUSTRIAL FACILITIES

In April 1992 the American Public Works Association (APWA) Storm Water Task Force prepared an overview of the NPDES General Permit for Storm Water Discharges Associated with Industrial Activity. The overview was developed to assist businesses, municipalities and other interested parties in understanding the permit and in identifying the facilities subject to the regulations.

The overview prepared by APWA Storm Water Task Force can be found in Appendix B of the *California Storm Water Best Management Practice Handbooks. Industrial/Commercial* (1993). Copies of the California Storm Water Best Management Practice Handbooks can be purchased at:

Los Angeles County Department of Public Works
Cashiers Office
900 S. Fremont Avenue
Alhambra, California 91803
Telephone No.: 626.458.6959

Appendix B
BMP Lists For Industrial/Commercial Site Visits

Appendix B
BMP Lists For Industrial/Commercial Site Visits

The Permit requires the Principal Permittee, in consultation with the Permittees, to develop BMP lists for each group of facilities that requires educational site visits. These groups of facilities include:

- All industrial groups regulated under Phase 1 of the Federal stormwater program (Phase 1 Facilities)
- Motor vehicle repair shops, motor vehicle body shops, motor vehicle parts and accessories facilities, gas stations, and restaurants (Other Specific Facilities).

The BMPs must:

- Address multiple pollutants.
- Initially focus on pollutant source minimization, education, good housekeeping, and site design alternatives.
- Target source areas and activities with the highest potential to generate substantial pollutant loads.

The BMP lists are included as Appendix B1 (Phase 1 Facilities) and Appendix B2 (Other Specific Facilities). These BMP lists must be incorporated into outreach measures conducted during the educational site visits. This may include using them as fact sheets to hand out to appropriate facilities, incorporating their information into educational materials, or using them to increase the knowledge of staff who will be conducting the site visits.

There is no expectation on the part of the Regional Board, nor does the Permit require, that such lists be completed by a Permittee during the course of conducting an educational site visit at a facility. In addition, there is no expectation on the part of the Regional Board that these lists be utilized by Permittees at their own municipal facilities. BMPs appropriate for municipal facilities are described in the Model Public Agency Activities Program. Permittees must comply with the requirements of that model program at their own municipal facilities.

The BMP lists are *not* required to be implemented by all facilities but are only *suggested* BMPs. They are provided as guidance to help facility owners develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Some facilities may be subject to other state or federal environmental protection programs such as the Resource Conservation and Recovery Act (RCRA) and the Underground Storage Tank (UST) program. Implementing the BMPs suggested in this document does not replace a facility's requirement to comply with these other programs.

Generally, source controls will be easier and less costly for facilities to implement in the near term. These types of controls include good housekeeping activities, employee training, and methods to reduce the source of pollutants by substituting products, reducing their use, and using/storing them inside. Structural controls may need to be carefully considered to ensure they are appropriate and cost-effective. For some activities, however, such as land disturbing activities, structural controls may be the primary solution.

B.1 PHASE 1 FACILITIES

In California, the *General Industrial Storm Water Permit* (General Industrial Permit) is the stormwater regulatory document for industrial facilities. On September 29, 1995, USEPA issued the *NPDES Storm*

Water Multi-Sector General Permit for Industrial Activities (Multi-Sector Permit) to serve as a general permit for industrial facilities in most other areas of the United States. The Multi-Sector Permit provides lists of typical activities, pollutant sources, pollutants, and suggested BMPs for industrial facilities, breaking them out into 29 "sectors" of industrial activity. The lists of BMPs in the Multi-Sector Permit were developed following an extensive survey of facilities, a review of existing Stormwater Pollution Prevention Plans, and additional discussion and review. With this in rnind, the list of BMPs in Appendix B1 was taken directly from the Multi-Sector Permit. The BMPs were edited slightly to put them in a common format. Care was taken to avoid interpreting the BMP, adding to or deleting from its intent. For additional guidance on pollutant sources, special considerations and references, please see the original Multi-Sector Permit.

B.2 OTHER SPECIFIC FACILITIES

The BMP lists for these facilities are arranged into three sections: Vehicle Service Facilities, Gasoline Stations, and Restaurants. The BMP lists represent a compilation of activities developed by other stormwater management programs and wastewater agencies. The basis for the vehicle service facility BMPs is the document *Your Shop Can Make a Difference! What vehicle service shops can do to protect water quality in the Bay and Delta* (Bay Area Stormwater Management Agencies Association and Bay Area Dischargers Association, 1995). The Gasoline Station BMPs are based on the document *Retail Gasoline Outlet BMPs* (California Storm Water Quality Task Force, March 1997). These BMPs are very detailed due to extensive refinement over several years by state task forces and committees that included industry representatives. The bases for the restaurant BMPs are a wide range of documents created throughout Los Angeles County.

B.3 BMP LIST INDEX

Table B-1 is an index to all BMP lists, their categories and SIC codes.

Table B-1
Index of BMP Lists for Industrial/Commercial Facilities

EPA Sectors	SIC Codes (exceptions in parentheses)	Industry Types/Sector Title
A	24 (2434)	Timber Products Facilities
B	26	Paper and Allied Products Mfg Facilities
C	28 (283)	Chemicals and Allied Products Mfg Facilities
D	29	Asphalt Paving and Roofing Materials Manufacturers and Lubricant Manufacturers
E	32	Glass, Clay, Concrete, and Gypsum Product Facilities
F	33	Primary Metals Facilities
G	10	Metal Mining Facilities
H	12	Coal Mines and Coal Mining-Related Facilities
I	13	Oil & Gas Extraction Facilities
J	14	Mineral Mining and Processing Facilities
K	4953	Hazardous Waste Treatment, Storage or Disposal Facilities
L	4953	Landfills and Land Application Sites
M	5015	Automobile Salvage Yards
N	5093	Scrap & Waste Recycling

R0000275

EPA Sectors	SIC Codes (exceptions in parentheses)	Industry Types/Sector Title
O	4911	Steam Electric Power Generating Facilities
P	40 41 42 43 5171	Vehicle and Equipment Maintenance Areas at Land Transportation Facilities
Q	44	Vehicle and Equipment Maintenance Areas at Water Transportation Facilities
R	373	Ship & Boat Building or Repairing Yards
S	45	Vehicle and Equipment Maintenance and Deicing Areas at Air Transportation Facilities
T	4952	Treatment Works
U	20 21	Food and Kindred Products Facilities
V	22 23	Textile Mills, Apparel, and Other Fabric Product Manufacturing Facilities
W	2434 25	Wood and Metal Furniture and Fixture Manufacturing Facilities
X	27	Printing and Publishing Facilities
Y	30 39	Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries
Z	31	Leather Tanning and Finishing Facilities
AA	34	Fabricated Metal Products Industry
AB	35 (357) 37 (373)	Facilities that Manufacture Transportation Equip., Industrial, or Commercial Machinery
AC	357 38 36	Manufacturers of Electronic and Electrical Equipment
SIC Codes (exceptions in parentheses)		**Commercial Types**
5013 5014 5541 7532-7534 7536-7539		Vehicle Service Facilities
5812		Restaurants

Appendix B1
BMPs for Phase 1 Facilities

Timber Products Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Log, Lumber, and Other Wood Product Storage Areas

- ❑ Divert storm water around storage areas with ditches, swales and/or berms.
- ❑ Locate storage areas on stable, well-drained soils with slopes of 2-5 percent.
- ❑ Line storage areas with crushed rock or gravel or porous pavement to promote infiltration, minimize discharge and provide sediment and erosion control.
- ❑ Stack materials to minimize surface areas of materials exposed to precipitation.
- ❑ Practice good housekeeping measures such as frequent removal of debris.
- ❑ Provide collection and treatment of runoff with containment basins, sedimentation ponds and infiltration basins.
- ❑ Use ponds for collection, containment and recycle for log spraying operations.
- ❑ Use silt fence and rip rap check dams in drainage ways.

Residue Storage Areas

- ❑ Locate stored residues away from drainage pathways and surface waters.
- ❑ Avoid contamination of residues with oil, solvents, chemically treated wood, trash, etc.
- ❑ Limit storage time of residues to prevent degradation and generation of leachates.
- ❑ Divert storm water around residue storage areas with ditches, swales and/or berms.
- ❑ Assemble piles to minimize surface areas exposed to precipitation.
- ❑ Spray surfaces to reduce windblown dust and residue particles.
- ❑ Place materials on raised pads of compacted earth, clay, shale, or stone to collect and drain runoff.
- ❑ Cover and/or enclose stored residues to prevent contact with precipitation using silos, van trailers, shed, roofs, buildings or tarps.
- ❑ Limit slopes of storage areas to minimize velocities of runoff which may transport residues.
- ❑ Provide collection and treatment of runoff with containment basins, sedimentation ponds and infiltration basins.
- ❑ Use silt fence and rip rap check dams in drainage ways.

Loading and Unloading and Material Handling Areas

- ❑ Provide diversion berms and dikes to limit run on.
- ❑ Cover loading and unloading areas.
- ❑ Enclose material handling systems for wood wastes.
- ❑ Cover materials entering and leaving areas.
- ❑ Provide good housekeeping measures to limit debris and to provide dust control.
- ❑ Provide paved areas to enable easy collection of spilled materials.

Chemical Storage Areas

- ❑ Provide secondary containment around chemical storage areas.
- ❑ Inventory of fluids to identify leakage.
- ❑ Locate storage areas away from high traffic areas and surface waters.
- ❑ Develop spill prevention, containment and countermeasure (SPCC) plans and implement.
- ❑ Cover and/or enclose chemical storage areas.
- ❑ Provide drip pads to allow for recycling of spills and leaks.

Wood Surface Protection and Preserving Activities

- ❑ Extend drip time in process areas before moving to storage areas.
- ❑ Pave and berm areas used by equipment that has come in contact with treatment chemicals.
- ❑ Dedicate equipment that is used for treatment activities to that specific purpose only to prevent the tracking of treatment chemicals to other areas on the site.
- ❑ Locate treatment chemical loading and unloading areas away from high traffic areas where tracking of the chemical may occur.
- ❑ Provide drip pads under conveyance equipment from treatment process areas.
- ❑ Provide frequent visual inspections of treatment chemical loading and unloading areas during and after activities occur to identify any spills or leaks needing clean-up.
- ❑ Cover and/or enclose treatment areas.
- ❑ Provide containment in treated wood storage areas.
- ❑ Cover storage areas to prevent contact of treated wood products with precipitation.
- ❑ Elevate stored, treated wood products to prevent contact with run on/runoff.

Paper and Allied Products Manufacturing Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Outdoor Loading and Unloading

- ❑ Confine loading/unloading activities to a designated response and control area.
- ❑ Avoid loading/unloading materials in the rain.
- ❑ Cover loading/unloading area/or conduct these activities indoors.
- ❑ Develop and implement spill plans.
- ❑ Use berms or dikes around area page 50850.
- ❑ Inspect containers for leaks or damage prior to loading.
- ❑ Use catch buckets, drop cloths, and other spill prevention measures where liquid materials are loaded/unloaded.
- ❑ Provide paved areas to enable easy collection of spilled materials.

Raw and/or Waste Material Storage Areas

- ❑ Confine storage to a designated area.
- ❑ Store materials inside.
- ❑ Cover storage areas with a roof or tarp.
- ❑ Use dikes or berms for storage tanks and drum storage.
- ❑ Cover dumpsters used for waste paper and other materials.
- ❑ Store materials on concrete pads to allow for recycling and spills of leaks.
- ❑ Expedite recycling process for exposed scrap paper.
- ❑ Develop and implement spill plans.
- ❑ Provide paved areas to enable easy collection of spilled materials.
- ❑ Provide good housekeeping (i.e., dust and debris collection) where cyclones are utilized.

Log, Lumber and Other Wood Product Storage Areas

- ❑ Divert storm water around storage areas with ditches, swales, and/or berms.
- ❑ Practice good housekeeping measures such as frequent removal of debris.
- ❑ Line storage areas with crushed rock or gravel or porous pavement to promote infiltration, minimize discharge and provide sediment and erosion control.
- ❑ Use ponds for collection, containment and recycle for log spraying operations.

Chemical and Allied Products Manufacturing Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Good Housekeeping

- ❑ Schedule regular pickup and disposal of garbage and waste materials or other measures to dispose of waste. Individuals responsible for waste management and disposal should be informed of the procedures established under the plan.
- ❑ Routinely inspect for leaks and conditions of drums, tanks and containers. Ensure that spill cleanup procedures are understood by employees.
- ❑ Keep an up to date inventory of all materials present at the facility. While preparing the inventory, all containers should be clearly labeled. Hazardous containers that require special handling, storage, use and disposal considerations should be clearly marked and readily recognizable.
- ❑ Maintain clean ground surfaces by using brooms, shovels, vacuum cleaners or cleaning machines. Employee training should address procedures for equipment and containers cleaning and washing. The training should emphasize the human hazards and the potential environmental impacts from the discharges of washwaters.
- ❑ Facilities should consider evaluating existing security systems such as fencing, lighting, vehicular traffic control, and securing of equipment and to prevent accidental or intentional entry which could cause a discharge of pollutants to waters of the United States.

Material Handling and Storage Areas

- ❑ For areas where liquid or powdered materials are stored, facilities should consider providing either diking, curbing, or berms.
- ❑ For all other outside storage areas including storage of used containers, machinery, scrap and construction materials, and pallets, facilities should consider preventing or minimizing storm water runon to the storage area by using curbing, culverting, gutters, sewers or other forms of drainage control.
- ❑ For all storage areas, roofs, covers or other forms of appropriate protection should be considered to prevent exposure to weather. In areas where liquid or powdered materials are transferred in bulk from truck or rail cars, permittees should consider appropriate measures to minimize contact of material with precipitation.
- ❑ Permittees should consider providing for hose connection points at storage containers to be inside containment areas and drip pans to be used in areas which are not in a containment area, where spillage may occur (e.g., hose reels, connection points with rail cars or trucks) or equivalent measures.
- ❑ In areas of transfer of contained or packaged materials and loading/unloading areas, permittees should consider providing appropriate protection such as overhangs or door skirts to enclose trailer ends at truck loading/unloading docks or an equivalent.
- ❑ In order to prevent facilities from discharging contaminated storm water from areas where precipitation is contained, contained areas should be restrained by valves or other positive means to prevent the discharge of a spill or leak. Containment units may be emptied by pumps or ejectors; however, these should be manually activated. Flapper type drain valves should not be used to drain containment areas. Valves used for the drainage of containment areas should, as far as is practical, be of manual, open or closed design. If facility drainage is not engineered as above, the final discharge point of all in-facility sewers should be equipped to prevent the discharge in the event of an uncontrolled spill of materials.
- ❑ Use storm water management practices to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site.
- ❑ For areas with a potential for significant soil erosion, use permanent stabilization practices to stabilize disturbed areas. The measures will minimize the amount of sediment materials in the discharge.

Asphalt Paving and Roofing Materials Manufacturers and Lubricant Manufacturers

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Material Storage, Handling, and Processing

- ❑ Cover material storage and handling areas with an awning tarp or roof.
- ❑ Practice good stockpiling practices such as: storing materials on concrete or asphalt pads; surrounding stockpiles with diversion dikes or curbs; and revegetating areas used for stockpiling in order to slow runoff.
- ❑ Use curbing, diking or channelization around material storage, handling and processing areas to divert run on around areas where it can come into contact with material stored or spilled on the ground.
- ❑ Utilize secondary containment measures such as dikes or berms around asphalt storage tanks and fuel oil tanks.
- ❑ Use dust collection systems (i.e., baghouses) to collect airborne particles generated as a result of material handling operations or aggregate drying.
- ❑ Properly dispose of waste materials from dust collection systems and other operations.
- ❑ Remove spilled material and dust from paved portions of the facility by shoveling and sweeping on a regular basis.
- ❑ Utilize catch basins to collect potentially contaminated storm water.
- ❑ Implement spill plans to prevent contact of runoff with spills of significant materials.
- ❑ Clean material handling equipment and vehicles to remove accumulated dust and residue.
- ❑ Use a detention pond or sedimentation basin to reduce suspended solids.
- ❑ Use an oil/water separator to reduce the discharge of oil/ grease.

Glass, Clay, Cement, Concrete, and Gypsum Product Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Storing Dry Bulk Materials

- ❑ Store materials in an enclosed silo or building. Materials may include sand, gravel, clay, cement, fly ash, kiln dust, and gypsum.
- ❑ Cover material storage piles with a tarp or awning.
- ❑ Divert run on around storage areas using curbs, dikes, diversion swales or positive drainage away from the storage piles.
- ❑ Install sediment basins, silt fence, vegetated filter strips, or other sediment removal measures downstream/downslope.
- ❑ Only store washed sand and gravel outdoors.

Handling Bulk Materials

- ❑ Use dust collection systems (e.g., bag houses) to collect airborne particles generated as a result of handling operations.
- ❑ Remove spilled material and settled dust from paved portions of the facility by shoveling and sweeping on a regular basis.
- ❑ Periodically clean material handling equipment and vehicles to remove accumulated dust and residue.
- ❑ Install sediment basins, silt fence, vegetated filter strips, or other sediment removal measures downstream/downslope.

Mixing Operations

- ❑ Use dust collection systems (e.g., bag houses) to collect airborne particles generated as a result of mixing operations.
- ❑ Remove spilled material and settled dust from the mixing area by shoveling and sweeping on a regular basis.
- ❑ Clean exposed mixing equipment after mixing operations are complete.
- ❑ Install sediment basins, silt fence, vegetated filter strips, or other sediment removal measures downstream/downslope.

Vehicle and Equipment Washing

- ❑ Designate vehicle and equipment wash areas that drain to recycle ponds or process wastewater treatment systems.
- ❑ Train employees on proper procedure for washing vehicles and equipment including a discussion of the appropriate location for vehicle washing.
- ❑ Conduct vehicle washing operation indoors or in a covered area.
- ❑ Clean wash water residue from portions of the site that drain to storm water discharges.

Dust Collection

- ❑ Maintain dust collection system and baghouse. Properly remove and recycle or dispose of collected dust to minimize exposure of collected dust to.

Pouring and Curing Pre-cast Concrete Products

- ❑ Pour and cure precast products in a covered area.
- ❑ Clean forms before storing outdoors.

Primary Metals Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Metal Product Stored Outside Such as Returns, Scrap Metal, Turnings, Fines, Ingots, Bars, Pigs, Wire

- ❑ Store all wastes indoors or in sealed drums, covered dumpsters, etc.
- ❑ Minimize raw material storage through effective inventory control.
- ❑ Minimize run on from adjacent properties and stabilized areas to areas with exposed soil with diversion dikes, berms, curbing, concrete pads, etc.

Outdoor Storage or Handling of Fluxes

- ❑ Store fluxes in covered hoppers, silos, or indoors and protect from wind-blown losses.
- ❑ Stabilize areas surrounding storage and material handling areas and establish schedule for sweeping.

Storage Piles, Bins, or Material Handling of Coke or Coal

- ❑ Where possible store coke and coal under cover or indoors and protect from wind-blown losses.
- ❑ Prevent or divert run on from adjacent areas with swales, dikes, or curbs.
- ❑ Minimize quantities of coke or coal stored onsite through implementation of effective inventory control.
- ❑ Trap particulates originating in coke or coal storage or handling areas with filter fabric fences, gravel outlet protection, sediment traps, vegetated swales, buffer strips of vegetation, catch-basin filters, retention/detention basins or equivalent.

Storage or Handling of Casting Sand

- ❑ Store raw sand in silos, covered hoppers, or indoor whenever possible.
- ❑ Prevent or divert run on from adjacent areas with swales, dikes, or curbs.
- ❑ Minimize quantities of sand stored onsite through implementation of effective inventory control.
- ❑ Tarp or otherwise cover piles.
- ❑ Trap particulates originating in coke or coal storage or handling areas with filter fabric fences, gravel outlet protection, sediment traps, vegetated swales, buffer of vegetation, catch-basin filters, retention/detention basins or equivalent.

Vehicle Fueling and Maintenance

- ❑ See the fact sheet AVehicle and Equipment Maintenance Areas at Land Transportation Facilities.

Outdoor Storage Tanks or Drums of Gas, Diesel, Kerosene, Lubricants, Solvents

- ❑ Store tanks and drums inside when possible.
- ❑ Establish regular inspection of all tanks and drums for leaks, spills, corrosion, damage, etc.
- ❑ Utilize effective inventory control to reduce the volume of chemicals stored onsite.
- ❑ Prevent run on to and runoff from tank and drum storage areas, provide adequate containment to hold spills and leaks.
- ❑ Prepare and train employees in dealing with spills and leaks properly, use dry clean-up methods when possible.

Slag or Dross Stored or Disposed of Outside in Piles or Drums

- ❑ Collect waste waters used for granulation of slag.
- ❑ Store slag and dross indoors, under cover, or in sealed containers.
- ❑ Establish regular disposal of slag or dross to minimize quantities stored and handled onsite.
- ❑ Minimize run on to slag storage areas with diversion dikes, berms, curbing, vegetated swales.
- ❑ Trap particulates originating in slag storage areas with filter fabric fences, gravel outlet protection, sediment traps, vegetated swales, buffer strips of vegetation, catch-basin filters, retention/detention basins or equivalent.

Fly Ash, Particulate Emissions, Dust Collector Sludges and Solids, Baghouse Dust

- ❑ Store all dusts and sludges indoors to prevent contact with storm water or losses due to wind.
- ❑ Establish regular disposal schedule to minimize quantities of pollutants stored and handled onsite.

Storage and Disposal of Waste Sand or Refractory Rubble in Piles Outside

- ❑ Move piles under cover or tarps whenever possible.
- ❑ Establish regular disposal schedule to minimize quantities stored onsite.
- ❑ Stabilize areas of waste product storage and perform regular sweeping of area.

Scrap Processing Activities (Shredding Etc.)

- ❑ See the fact sheet AScrap and Waste Recycling Facilities.

Machining Waste Stored Outside or Exposed to Storm Water-fines, Turnings, Oil, Borings, Gates, Sprues, Scale

- ❑ Store all wastes indoors or in sealed drums, covered dumpsters, etc.
- ❑ Stabilize areas of waste product storage and perform regular sweeping and cleaning of any residues.
- ❑ Consider using booms, oil/water separators, sand filters, etc. for outfalls draining areas where oil is potentially present.
- ❑ Minimize run on from adjacent properties and stabilized areas to areas with exposed soil with diversion dikes, berms, curbing, concrete pads, etc.

Obsolete Equipment Stored Outside

- ❑ Where possible, dispose of unused equipment properly, or move indoors.
- ❑ Cover obsolete equipment with a tarp or roof.
- ❑ Consider using booms, oil/water separators, sand filters, etc. for outfalls draining areas where oil is potentially present.
- ❑ Minimize runoff coming into contact with old equipment through berms, curbs, or placement on a concrete pad.

Material Losses from Handling Equipment Such as Conveyors, Trucks, Pallets, Hoppers, Etc.

- ❑ Schedule frequent inspections of equipment for spills or leakage of fluids, oil, or fuel.
- ❑ Inspect for collection of particulate matter on and around equipment and clean. Where possible cover these areas to prevent losses to wind and precipitation.
- ❑ Store pallets, hoppers, etc. which have residual materials on them under cover, with tarps, or inside.

Losses During Charging of Coke Ovens or Sintering Plants

- ❑ Cover any exposed areas related to furnace charging/material handling activities.
- ❑ Stabilize areas around all material handling areas and establish regular sweeping.
- ❑ Route runoff from particulate generating operations to sediment traps, vegetated swales, buffer strips of vegetation, catch-basin filters, retention/detention basins or equivalent.

Particulate Emissions from Blast Furnaces, Electric Arc Furnaces, Induction Furnaces and Fugitive Emissions from Poorly Maintained or Malfunctioning Baghouses, Scrubbers, Electrostatic Precipitators, Cyclones

- ❑ Establish schedule for inspection and maintenance of all pollution control equipment-check for any particulate deposition from leaks, spills, or improper operation of equipment and remedy.
- ❑ Route runoff from particulate generating operations to sediment traps, vegetated swales, buffer strips of vegetation, catch-basin filters, retention/detention basins or equivalent.

Storage of Products Outside after Painting, Pickling, or Cleaning Operations

- ❑ Store all materials inside or under cover whenever possible.
- ❑ Prevent run on to product storage areas through curbs, berms, dikes, etc.
- ❑ Consider using booms, oil/water separators, sand filters, etc. for outfalls draining areas where oil is potentially present.
- ❑ Remove residual chemicals from intermediate or finished products before storage or transport outside.

Casting Cooling or Shakeout Operations Exposed to Precipitation or Wind

- ❑ Perform all pouring, cooling, and shakeout operations indoors in areas with roof vents to trap fugitive particulate emissions.
- ❑ Recycle into process as much casting sand as possible.

Landfilling or Open Pit Disposal of Wastes Onsite

- ❑ See the fact sheet ALandfills and Land Application Sites.≡

Losses of Particulate Matter from Machining Operations (Grinding, Drilling, Boring, Cutting). Through Deposition or Storage of Products Outside.

- ❑ Store all intermediate and finished products inside or under cover.
- ❑ Consider using booms, oil/water separators, sand filters, etc. for outfalls draining areas where oil is potentially present.
- ❑ Clean products of residual materials before storage outside.
- ❑ Stabilize storage areas and establish sweeping schedule.

Areas of the Facility with Unstabilized Soils Subject to Erosion.

- ❑ Minimize run on from adjacent properties and stabilized areas to areas with exposed soil with diversion dikes, berms, vegetated swales, etc.
- ❑ Stabilize all high traffic areas including all vehicle entrances, exits, loading, unloading, and vehicle storage areas.
- ❑ Conduct periodic sweeping of all traffic areas.
- ❑ Trap sediment originating in unstabilized areas. Filter fabric fences, gravel outlet protection, sediment traps, vegetated swales, buffer strips of vegetation, catch-basin filters, retention/detention basins or equivalent.
- ❑ Inspect and maintain all BMPs on a regular basis.
- ❑ Provide employee training on proper installation and maintenance of sediment and erosion controls.

Improper Connection of Floor, Sink, or Process Wastewater Drains.

- ❑ Inspect and test all floor, sink, and process wastewater drains for proper connection to sanitary sewer and remove any improper connections to storm sewer or waters of the United States.

Metal Mining Facilities; Coal Mines and Coal Mining-Related Facilities; Mineral Mining and Processing Facilities

Land Disturbance Activities

Land-disturbed Area	*Discharge Diversions*	*Conveyance Systems*	*Runoff Dispersion*	*Sediment Control and Collection*	*Vegetation*	*Containment*	*Treatment*
Haul Roads and Access Roads	Dikes, curbs, berms	Channels, gutters, culverts, rolling dips, road sloping, roadway water deflectors	Check dams, rock outlet protection, level spreaders, stream alteration, drop structures	Gabions, riprap, native rock retaining walls, straw bale barriers, sediment traps/catch basins, vegetated buffer strips	Seeding, willow cutting establishment		
Pits, Quarries, or Underground Mines.	Dikes, curbs, berms	Channels, gutters	Serrated slopes, benched slopes, contouring, stream alteration	Sediment settling ponds, straw bale barrier, siltation berms	Seeding	Plugging and grouting	Chemical/ physical treatment
Overburden, Waste Rock and Raw Material Piles	Dikes, curbs, berms	Channels, gutters	Serrated slopes, benched slopes, contouring, stream alteration	Plastic matting, plastic netting, erosion control blankets, mulch-straw, compaction, sediment/settling ponds, silt fences, siltation berms	Topsoiling, seedbed preparation, seeding	Capping	Chemical/ physical treatment, artificial wetlands
Reclamation	Dikes, curbs, berms	Channels, gutters	Check dams, rock outlet protection, level spreaders, serrated slopes, benched slopes, contouring, drain fields, stream alteration, drop structures	Gabions, riprap, native rock retaining walls, biotechnical stabilization, straw bale barriers, sediment traps/catch basins, vegetated buffer strips, silt fences, siltation berms, brush sediment barriers	Topsoiling, seedbed preparation, seeding, willow cutting establishment	Capping, plugging and grouting	Chemical/ physical treatment, wetlands

R0000290

Oil and Gas Extraction Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

General Activities

- ❑ Utilize diking and other forms of containment and diversion around storage tanks, drums of oil, acid, production chemicals, and liquids, reserve pits, and impoundments.
- ❑ Use diking and other forms of containment and diversion around material handling and processing areas.
- ❑ Use porous pads under drum and tank storage areas.
- ❑ Use covers and/or lining for waste reserve and sludge pits to avoid overflows and leaks.
- ❑ Use drip pans, catch basins, or liners during handling of materials such as tank bottoms.
- ❑ Reinject or treat produced water instead of discharging it.
- ❑ Limit the amount of land disturbed during construction of access roads and facilities.
- ❑ Employ spill plans for pipelines, tanks, drums, etc.
- ❑ Recycle oily wastes, drilling fluids and other materials onsite, or dispose of properly.
- ❑ Take wastes offsite to be disposed of instead of burying them.
- ❑ Use oil water separators.

Hazardous Waste Treatment, Storage, or Disposal Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Outdoor Unloading and Loading

- ❑ Confine loading/unloading activities to a designated area.
- ❑ Consider performing loading/unloading activities indoors or in a covered area.
- ❑ Consider covering loading/unloading area with permanent cover (e.g., roofs) or temporary cover (e.g., tarps).
- ❑ Close storm drains during loading/unloading activities in surrounding areas.
- ❑ Avoid loading/unloading materials in the rain.
- ❑ Inspect the unloading/loading areas to detect problems before they occur.
- ❑ Inspect all containers prior to loading/unloading of any raw or spent materials.
- ❑ Consider berming, curbing, or diking loading/ unloading areas.
- ❑ Use dry clean-up methods instead of washing the areas down.
- ❑ Train employees on proper loading/unloading techniques.

Landfills and Land Application Sites

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Land Disturbance Activities

- ❑ Stabilize soils with temporary seeding, mulching, and geotextiles; leave vegetative filter strips along streams.
- ❑ Implement structural controls such as dikes, swales, silt fences, filter berms, sediment traps and ponds, outlet protection, pipe slope drains, check dams, and terraces to convey runoff, to divert storm water flows away from areas susceptible to erosion, and to prevent sediments from entering water bodies.
- ❑ Frequently inspect all stabilization and structural erosion control measures and perform all necessary maintenance and repairs.
- ❑ Stabilize haul roads and entrances to landfill with gravel or stone.
- ❑ Construct vegetated swales along road.
- ❑ Clean wheels and body of trucks or other equipment as necessary to minimize sediment tracking (but contain any wash waters [process wastewaters]).
- ❑ Frequently inspect all stabilization and structural erosion control measures and perform all necessary maintenance and repairs.

Application of Fertilizers, Pesticides, and Herbicides

- ❑ Observe all applicable Federal, State, and local regulations when using these products.
- ❑ Strictly follow recommended application rates and methods (i.e., do not apply in excess of vegetative requirements).
- ❑ Have materials such as absorbent pads easily accessible to clean up spills.

Exposure of Chemical Material Storage Areas to Precipitation

- ❑ Provide barriers such as dikes to contain spills.
- ❑ Provide cover for outside storage areas.
- ❑ Have materials such as absorbent pads easily accessible to clean up spills.

Exposure of Waste at Open Face

- ❑ Minimize the area of exposed open face as much as is practicable.
- ❑ Divert flows around open face using structural measures such as dikes, berms, swales, and pipe slope drains.
- ❑ Frequently inspect erosion and sedimentation controls.

Waste Tracking Onsite

- ❑ Clean wheels and exterior of trucks or other equipment as necessary to minimize waste tracking (but contain any wash waters [process wastewaters]).

Uncontrolled Leachate

- ❑ Frequently inspect leachate collection system and landfill for leachate leaks.
- ❑ Maintain landfill cover and vegetation.
- ❑ Maintain leachate collection system

Automobile Salvage Yards

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Dismantling and Vehicle Maintenance

- ❑ Drain all fluids from vehicles upon arrival at the site.
- ❑ Segregate the fluids and properly store or dispose of them.
- ❑ Maintain an organized inventory of materials used in the maintenance shop.
- ❑ Keep waste streams separate (e.g., waste oil and mineral spirits). Nonhazardous substances that are contaminated with a hazardous substance is considered a hazardous substance.
- ❑ Recycle anti-freeze, gasoline, used oil, mineral spirits, and solvents.
- ❑ Dispose of greasy rags, oil filters, air filters, batteries, spent coolant, and degreasers properly.
- ❑ Label and track the recycling of waste material (e.g., used oil, spent solvents, batteries).
- ❑ Drain oil filters before disposal or recycling.
- ❑ Store cracked batteries in a non-leaking secondary container.
- ❑ Promptly transfer used fluids to the proper container. Do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers.
- ❑ Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets.
- ❑ Plug floor drains that are connected to the storm or sanitary sewer. If necessary, install a sump that is pumped regularly.
- ❑ Inspect the maintenance area regularly for proper implementation of control measures.
- ❑ Filtering storm water discharges with devices such as oil-water separators.
- ❑ Train employees on proper waste control and disposal procedures.

Outdoor Vehicle, Equipment, and Parts Storage

- ❑ Use drip pans under all vehicles and equipment waiting for maintenance and during maintenance.
- ❑ Store batteries on impervious surfaces. Curb, dike or berm this area.
- ❑ Confine storage of parts, equipment and vehicles to designated areas.
- ❑ Cover all storage areas with a permanent cover (e.g., roofs) or temporary cover (e.g., canvas tarps).

Vehicle, Equipment and Parts Washing Areas

- ❑ Avoid washing parts or equipment outside.
- ❑ Use phosphate-free biodegradable detergents.
- ❑ Consider using detergent-based or water-based cleaning systems in place of organic solvent degreasers.
- ❑ Designate an area for cleaning activities.
- ❑ Contain steam cleaning washwaters or discharge under an applicable NPDES permit.
- ❑ Ensure that washwaters drain well.
- ❑ Inspect cleaning area regularly.
- ❑ Install curbing, berms or dikes around cleaning areas.
- ❑ Train employees on proper washing procedures.

Liquid Storage in Above Ground Containers

- ❑ Maintain good integrity of all storage containers.
- ❑ Install safeguards (such as diking or berming) against accidental releases at the storage area.
- ❑ Inspect storage tanks to detect potential leaks and perform preventive maintenance.
- ❑ Inspect piping systems (pipes, pumps, flanges, couplings, hoses, and valves) for failures or leaks.
- ❑ Train employees on proper filling and transfer procedures.

Improper Connection with Storm Drains

- ❑ Plug all floor drains if it is unknown whether the connection is to storm drain or sanitary sewer systems.
- ❑ Alternatively, install a sump that is pumped regularly.
- ❑ Perform dye testing to determine if interconnections exist between sanitary water system and storm drain system.
- ❑ Update facility schematics to accurately reflect all plumbing connections.
- ❑ Install a safeguard against vehicle washwaters and parts cleaning waters entering the storm drain unless permitted.
- ❑ Maintain and inspect the integrity of all underground storage tanks; replace when necessary.
- ❑ Train employees on proper disposal practices for all material.

Scrap and Waste Recycling Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Inbound Recyclable and Waste Material Control

- ❑ Provide public education brochures on acceptable recyclable materials.
- ❑ Educate curbside pick-up drivers on acceptable materials. Reject unacceptable materials at the source.
- ❑ Employee training.
- ❑ Provide totally-enclosed drop-off containers for public.
- ❑ Establish program to encourage suppliers of scrap, waste and other salvageable materials to drain residual fluids prior to arrival at the facility.
- ❑ Establish acceptance program for handling, storage and disposal of lead-acid batteries.
- ❑ Establish procedures for rejecting or handling, storing and disposal of hazardous wastes and other nonhazardous residual fluids.
- ❑ Establish procedures to properly handle industrial turnings and cuttings and prohibiting cutting oils and metallic fines from coming in contact with runoff.
- ❑ Identify inspector training requirements.

Outside Scrap Material Storage: Liquids

- ❑ Conduct inspections for fluids, e.g., oils, transmission fluids, antifreeze, brake fluid, and fuels. Establish handling/ storage/disposal procedures for these materials.
- ❑ Drain and collect liquids in a designated area.
- ❑ Provide covered storage or impervious areas with curbing/berms or other appropriate containment.
- ❑ Store liquid materials in covered areas or impervious areas with curbing/berms or other appropriate measure.
- ❑ Establish spill prevention procedures.
- ❑ Provide adequate supply of materials for dry clean up of spills or leaks.
- ❑ Prevent runoff into liquid storage areas. Store liquid wastes in materially compatible containers.
- ❑ Minimize/eliminate the accumulation of liquid wastes.
- ❑ Establish procedures if hazardous wastes are discovered after material accepted.
- ❑ Conduct periodic inspections of storage areas.
- ❑ Conduct preventative maintenance of BMPs as necessary.

Outside Scrap Material Storage: Bulk Solid Materials

- ❑ Store only processed materials, i.e., baled plastic and aluminum and glass cullet.
- ❑ Provide containment pits with sumps pumps that discharge to sanitary sewer system. Prevent discharge of residual fluids to storm sewer.
- ❑ Provide dikes and curbs around bales of waste paper.
- ❑ Use tarpaulins or covers over bales of wastepaper.
- ❑ Conduct regularly scheduled sweeping of storage areas to minimize particulate buildup.
- ❑ Minimize runoff from coming into areas where significant materials are stored, e.g., diversion structures such as curbing, berms, containment trenches, surface grading, and elevated concrete pads or other equivalent measure.
- ❑ Use adsorbents to collect leaking or spills of oil, fuel, transmission and brake fluids, e.g., dry absorbent, drip pans.
- ❑ Install media filters such as catch basin filters and sand filters.
- ❑ Install oil/water separator in storage areas with vehicle transmissions and engines. Locate spill plans under stored vehicles.
- ❑ Provide non-recyclable waste storage bins and containers.
- ❑ Conduct periodic inspections.
- ❑ Conduct preventative maintenance as necessary.
- ❑ Provide equipment operator training to minimize damage to controls, e.g., curbing and berms.

Storage Other: Lightweight Materials

- ❑ Store equivalent of the average daily volume of recyclable materials indoors.
- ❑ Provide good housekeeping.
- ❑ Disconnect all floor drains from storm sewer system.
- ❑ Prohibit illicit discharges and illegal dumping to floor drains that are connected to the storm sewer.
- ❑ Direct tipping floor washwaters to sanitary sewer system if permitted by local sanitary authority.
- ❑ Identify/provide supplier training or information bulletins on requirements for acceptance of lightweight materials.
- ❑ Encourage supplier participation in program to minimize/eliminate, as practicable, volume of semisolid and liquid residues in recyclable materials, e.g., residual fluids in aluminum and plastic containers.
- ❑ Provide covered storage, container bins or equivalent for lighter-weight materials such as glass, plastics, aluminum cans, paper, cardboard.
- ❑ Minimize/eliminate residue from bottles, containers, etc. from coming in contact with runoff. Establish dry clean up methods.
- ❑ Establish procedures and employee training for the handling, storage and disposal of residual fluids from small containers.
- ❑ Prohibit washdown of tipping floor areas.
- ❑ Provide good housekeeping to eliminate particulate and residual materials buildup. Establish cleaning schedule for high traffic areas.
- ❑ Provide covered disposal containers or equivalent for residual waste materials.
- ❑ Eliminate floor drains discharging to storm sewer.

Residual Non-recyclable Materials

- ❑ Store residual non-recyclable materials in covered containers for transport to a proper disposal facility.
- ❑ Bale residual non-recyclable materials and cover with tarpaulin or equivalent.

Recyclable Material Processing

- ❑ Conduct processing operations indoors. Clean up residual fluids.
- ❑ Conduct routine preventive maintenance on all processing equipment.
- ❑ Schedule frequent good housekeeping to minimize particulate and residual materials buildup.

Scrap Processing Operations

- ❑ Provide training to equipment operators on how to minimize exposure of runoff to scrap processing areas.
- ❑ Schedule frequent cleaning of accumulated fluids and particulate residue around all scrap processing equipment.
- ❑ Schedule frequent inspections of equipment for spills or leakage of fluids, oil, fuel, hydraulic fluids.
- ❑ Conduct routine preventive maintenance of equipment per original manufacturer's equipment (OME) recommendations. Replace worn or malfunctioning parts.
- ❑ Site process equipment on elevated concrete pads or provide runoff diversion structures around process equipment, berms, containment trenches or surface grading or other equivalent measure. Discharge runoff from within bermed areas to a sump, oil/ water separator, media filter or discharge to sanitary sewer.
- ❑ Conduct periodic maintenance and clean out of all sumps, oil/water separators, media filters.
- ❑ Dispose of residual waste materials properly (e.g., according to RCRA).
- ❑ Provide curbing, dikes, and berms around scrap processing equipment to prevent contact with runoff.
- ❑ Where practicable, locate process equipment (e.g., balers, briquetters, small compactors) under an appropriate cover.
- ❑ Provide cover over hydraulic equipment and combustion engines. Provide dry clean up materials, e.g., dry-adsorbents, drip pans, absorbent booms, etc. to prevent contact of hydraulic fluids, oils, fuels, etc., with storm water runoff.
- ❑ Provide alarm, pump shutoff, or sufficient containment for hydraulic reservoirs in the event of a line break.
- ❑ Stabilize high traffic areas (e.g., concrete pads, gravel, pavement) around processing equipment, where practicable.
- ❑ Provide site gages or overfill protection devices for all liquid and fuel storage reservoirs and tanks.
- ❑ Establish spill prevention and response procedures, including employee training.
- ❑ Provide containment bins or equivalent for shredded material, especially lightweight materials such as fluff (preferably at the discharge of these materials from the air classification system).

Supplies for Process Equipment

- ❑ Locate storage drums containing liquids, including oils and lubricants indoors. Alternatively, site palletized drums and containers on an impervious surface and provide sufficient containment around the materials. Provide sumps, oil/water separators, if necessary.
- ❑ Conduct periodic inspections of containment areas and containers/drums for corrosion.
- ❑ Perform preventive maintenance of BMPs, as necessary.
- ❑ Instruct employees on proper material handling and storage procedures.

Scrap Lead Acid Battery Program

- ❑ Establish inspection and acceptance procedures for scrap lead-acid batteries.
- ❑ Provide supplier training on acceptance practices for scrap batteries.
- ❑ Provide employee training on the safe handling, storage and disposition of scrap batteries.
- ❑ Separate all scrap batteries from other scrap materials.
- ❑ Store scrap batteries under cover or equivalent.
- ❑ Establish procedures for the storage, handling, disposition of cracked or broken batteries in accordance with applicable Federal regulations, e.g., RCRA.
- ❑ Establish procedures to collect and dispose of leaking battery acid according to Federal regulations, e.g., RCRA.
- ❑ Provide covered storage or equivalent to prevent exposure to either precipitation or runoff.

Vehicle and Equipment Maintenance

- ❑ Avoid washing equipment and vehicles outdoors.
- ❑ Eliminate outdoor maintenance areas.
- ❑ Establish an inventory of materials used in the maintenance shop that could become a potential pollutant source with storm water runoff, e.g., fuels, solvents, oils, lubricants.
- ❑ Store and dispose of oily rags, filters (oil and air), batteries, engine coolant, transmission fluid, use oil, brake fluid, and solvents in a manner that minimizes potential contact with runoff and in compliance with State and Federal regulations.
- ❑ Label and track recycling of waste materials, e.g., batteries, solvent, used oil.
- ❑ Drain oil filters before disposal or recycling.
- ❑ Drain all fluids from all parts or components that will become scrap material or secondhand parts.
- ❑ Store liquid waste materials in compatible containers.
- ❑ Store and dispose used batteries in accordance with scrap lead acid battery program.
- ❑ Disconnect all floor drains connected to storm sewer system.
- ❑ Prohibit non-storm water discharges, e.g., dumping of used liquids down floor drains and washdown of maintenance areas.
- ❑ Provide employee training on appropriate storage and disposal of waste materials.
- ❑ Provide good housekeeping measures.
- ❑ Conduct inspections of work areas for compliance with BMPs.

Fueling

- ❑ Establish spill prevention and clean-up procedures.
- ❑ Provide dry-absorbent materials or equivalent.
- ❑ Provide employee training, i.e., avoid topping off fuel tanks.
- ❑ Divert runoff from fueling areas.
- ❑ Use spill and overflow protection devices.
- ❑ Provide high level alarm on fuel storage tanks.
- ❑ Minimize/eliminate runoff onto fueling areas.
- ❑ Reduce exposure of fueling areas to precipitation by covering the fueling area.
- ❑ Provide dry adsorbents to clean up fuel spills.
- ❑ Conduct periodic inspections of fueling areas.
- ❑ Provide curbing or posts around fuel pumps to prevent collisions during vehicle ingress and egress.

Vehicle and Equipment Washing

- ❑ Avoid washing vehicles and equipment outdoors.
- ❑ Use biodegradable, phosphate free detergents.
- ❑ Recycle wash water.
- ❑ Provide vehicle wash rack with dedicated trap.
- ❑ Use autoshut-off valves on washing equipment.

Outdoor Vehicle Parking and Storage

- ❑ Use drip pans under all equipment and vehicles waiting maintenance.
- ❑ Cover vehicle and equipment storage areas.
- ❑ Conduct inspections of storage and parking areas for leaks and filled drip pans.
- ❑ Provide employee training.

Vehicle and Equipment Painting (where applicable)

- ❑ Keep paint and solvents away from traffic areas.
- ❑ Conduct sanding and painting in nonexposed areas, e.g., under cover, in accordance with OSHA standards.
- ❑ Cleanup accumulated particulate matter.
- ❑ Minimize overspraying parts.
- ❑ Dispose or recycle paint, solvents and thinner properly.
- ❑ Provide training to employees.
- ❑ Conduct periodic inspections of paint spraying areas.

Erosion and Sediment Control

- ❑ Minimize runon from adjacent properties, e.g., diversion dikes, berms, or equivalent.
- ❑ Trap sediment at downgradient locations and outlets serving unstabilized areas. This may include filter fabric fences, gravel outlet protection, sediment traps, vegetated or riprap swales, vegetated strips, diversion structures, catch- basin filters, retention/detention basins or equivalent.
- ❑ Runoff containing oil and grease may include the use of absorbent booms or sand filters in front of outlet structures or other equivalent measures.
- ❑ Stabilize all high traffic areas, including all vehicle entrances and exit points.
- ❑ Conduct periodic sweeping of all traffic areas.
- ❑ Conduct inspections of BMPs.
- ❑ Perform preventative maintenance as needed on BMPs.
- ❑ Provide employee training on the proper installation and maintenance of erosion and sediment controls.

Activities Specific to Liquid Waste Recycling Facilities

Individual Drum/Container Storage

- ❑ Ensure container/drums are in good condition. Store waste materials in materially compatible drums.
- ❑ Use containers that meet National Fire Protection Association (NFPA) guidelines.
- ❑ Put individual containers on pallets. Limit stack height of individual containers/drums. Provide straps, plastic wrap, or equivalent around stacked containers to provided stability.
- ❑ Label/mark drums. Segregate hazardous and flammable wastes. Comply with NFPA guidelines for segregation of flammable wastes.
- ❑ Provide adequate clearance to allow material movement and access by material handling equipment.
- ❑ Provide semipermanent or permanent cover over wastes.
- ❑ Provide adequate clearance between stored materials to allow movement and handling.
- ❑ Establish clean up procedures, including the use of dry adsorbents, in the event of spills or leaks.
- ❑ Prohibit washing down of material storage areas.
- ❑ Disconnect or seal all floor drains from storm sewer system.
- ❑ Develop spill prevention, countermeasures and control (SPCC) procedures for all liquid container storage areas. Ensure employees are familiar with SPCC procedures. Schedule/conduct periodic employee training.
- ❑ Provide secondary containment, dikes, berms, containment trench, sumps, or other equivalent measure, in all storage areas.

Bulk Liquid Storage

- ❑ Use welded pipe connections versus flange connections. Inspect all flange gaskets for deterioration.
- ❑ Apply corrosion inhibitors to exposed metal surfaces.
- ❑ Provide high level alarms for storage tanks.
- ❑ Provide redundant piping, valves, pumps, motors, as necessary, at all pumping stations.
- ❑ Provide manually activated shutoff valves in the event of spill. Install visible and/or audible alarms in the event of a spill.
- ❑ Install manually activated drainage values, or equivalent, versus flapper-type drain values.
- ❑ Provide adequate security against vandalism and tampering.
- ❑ Provide secondary containment around all bulk storage tanks, including berms, dikes, surface impoundments or equivalent. Ensure surfaces of secondary containment areas are adequately sealed to prevent leaks.
- ❑ Provide stationary boxes around all return and fill stations to eliminate/minimize hose drainage and minor waste transfer spills.

Waste Transfer Areas

- ❑ Provide secondary containment or equivalent measures around all liquid waste transfer facilities.
- ❑ Provide cover over liquid waste transfer areas.
- ❑ Establish clean up procedures for minor spills including the use of dry adsorbents.

Inspections

- ❑ Conduct inspections of all material storage, handling and transfer areas.
- ❑ Document signs of corrosion, worn parts or components on pumps and motors, leaking seals and gaskets.
- ❑ Conduct periodic nondestructive testing (NDT) of all bulk storage tanks for signs of deteriorating structural integrity.

Preventive Maintenance

- ❑ Conduct periodic preventive maintenance of all structural controls, replace worn parts on components on valves, pumps, motors per manufacturer's recommendations.

Vehicle Maintenance (if applicable)

- ❑ Establish an inventory of materials used in the maintenance shop that could become a potential pollutant source with storm water runoff, e.g., fuels, solvents, oils, lubricants.
- ❑ Store and dispose of oily rags, filters (oil and air), batteries, engine coolant, transmission fluid, use oil, brake fluid, and solvents in a manner that minimizes potential contact with runoff and in compliance with State and Federal regulations.
- ❑ Label and track recycling of waste materials, e.g., batteries, solvent, used oil.
- ❑ Drain oil filters before disposal or recycling.
- ❑ Drain all fluids from all parts or components that will become scrap material or secondhand parts.
- ❑ Store liquid waste materials in compatible containers.
- ❑ Store and dispose used batteries in accordance with scrap lead acid battery program.
- ❑ Disconnect all floor drains connected to storm sewer system.
- ❑ Prohibit non-storm water discharges, e.g., dumping of used liquids down floor drains and washdown of maintenance areas.
- ❑ Provide employee training on appropriate storage and disposal of waste materials.
- ❑ Provide good housekeeping measures.
- ❑ Conduct inspections of work areas for compliance with BMPs.

Vehicle Cleaning (if applicable)

- ❑ Avoid washing vehicles and equipment outdoors.
- ❑ Use biodegradable, phosphate free detergents.
- ❑ Recycle wash water
- ❑ Provide vehicle wasn rack with dedicated sediment trap.
- ❑ Use autoshut-off valves on washing equipment.

Training

- ❑ Provide employee training on proper material handling and storage procedures. Require familiarization with applicable SPCC measures.

Steam Electric Power Generating Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Fugitive Dust Emissions

- ❑ Consider establishing procedures to minimize offsite tracking of coal dust. To prevent offsite tracking the facility may consider specially designed tires, or washing vehicles in a designated area before they leave the site, and controlling the wash water.

Delivery Vehicles

- ❑ Develop procedures for the inspection of delivery vehicles arriving on the plant site, and ensure overall integrity of the body or container.
- ❑ Develop procedures to control leakage or spillage from vehicles or containers, and ensure that proper protective measures are available for personnel and environment.

Fuel Oil Unloading Areas

- ❑ Use containment curbs in unloading areas.
- ❑ During deliveries station personnel familiar with spill prevention and response procedures may be present to ensure that any leaks or spills are immediately contained and cleaned up.
- ❑ Use spill and overflow protection (drip pans, drip diapers, and/or other containment devices should be placed beneath fuel oil connectors to contain any spillage that may occur during deliveries or due to leaks at such connectors).

Chemical Loading/Unloading Areas

- ❑ Use containment curbs at chemical loading/unloading areas to contain spills.
- ❑ During deliveries station personnel familiar with spill prevention and response procedures may be present to ensure that any leaks or spills are immediately contained and cleaned up.
- ❑ Where practicable chemical loading/unloading areas should be covered, and chemicals should be stored indoors.

Miscellaneous Loading/Unloading Areas

- ❑ Consider covering the loading area.
- ❑ Minimize storm water runon to the loading area by grading, berming, or curbing the area around the loading area to direct storm water away from the area.
- ❑ Locate the loading/unloading equipment and vehicles so that leaks can be controlled in existing containment and flow diversion systems.

Liquid Storage Tanks

- ❑ Use protective guards around tanks.
- ❑ Use containment curbs.
- ❑ Use spill and overflow protection (drip pans, drip diapers, and/or other containment devices should be placed beneath chemical connectors to contain any spillage that may occur during deliveries or due to leaks at such connectors).
- ❑ Use dry cleanup methods.

Large Bulk Fuel Storage Tanks

- ❑ Comply with applicable State and Federal laws, including Spill Prevention Control and Countermeasures (SPCC).
- ❑ Use containment berms.

Oil/Chemical Storage

- ❑ The structural integrity of all above ground tanks, pipelines, pumps and other related equipment should be visually inspected on a weekly basis.
- ❑ All repairs deemed necessary based on the findings of the inspections should be completed immediately to reduce the incidence of spills and leaks occurring from such faulty equipment.

Oil Bearing Equipment in Switchyards

- ❑ Consider level grades and gravel surfaces to retard flows and limit the spread of spills.
- ❑ Collect storm water runoff in perimeter ditches.

Residue Hauling Vehicles

- ❑ Inspect all residue hauling vehicles for proper covering over the load, adequate gate sealing and overall integrity of the body or container.
- ❑ Vehicles without load covers or adequate gate sealing, or with poor body or container conditions may be repaired as soon as practicable.

Ash Loading Areas

- ❑ Reduce and/or control the tracking of ash or residue from ash loading areas. Where practicable, clear the ash building floor and immediately adjacent roadways of spillage, debris and excess water before each loaded vehicle departs.

Areas Adjacent to Disposal Ponds or Landfills

- ❑ Develop procedures to reduce ash residue which may be tracked on to access roads traveled by residue trucks or residue handling vehicles.
- ❑ Reduce ash residue on exit roads leading into and out of residue handling areas.

Landfills, Scrapyards, and General Refuse Sites

- ❑ See the fact sheet AScrap and Waste Recycling Facilities.

Vehicle Maintenance Activities

- ❑ See the fact sheet AVehicle and Equipment Maintenance Areas at Land Transportation Facilities.

Material Storage Areas

- ❑ Consider flat yard grades, runoff collection in graded swales or ditches, erosion protection measures at steep outfall sites (e.g., concrete chutes, riprap, stilling basins), covering lay down areas, storing the materials indoors, covering the material with a temporary covering made of polyethylene, polyurethane, polypropylene, or hypalon.
- ❑ Storm water runon may be minimized by constructing an enclosure or building a berm around the area.

Vehicle and Equipment Maintenance Areas at Land Transportation Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Fueling

- ❑ Use spill and overflow protection.
- ❑ Minimize runon of storm water into the fueling area by grading the area such that storm water only runs off.
- ❑ Reduce exposure of the fuel area to storm water by covering the area.
- ❑ Use dry cleanup methods for fuel area rather than hosing the fuel area down.
- ❑ Use proper petroleum spill control.
- ❑ Perform preventive maintenance on storage tanks to detect potential leaks before they occur.
- ❑ Inspect the fueling area to detect problems before they occur.
- ❑ Train employees on proper fueling techniques.

Vehicle and Equipment Maintenance

- ❑ Maintain an organized inventory of materials used in the maintenance shop.
- ❑ Dispose of greasy rags, oil filters, air filters, batteries, spent coolant, and degreasers properly.
- ❑ Label and track the recycling of waste material (e.g., used oil, spent solvents, batteries).
- ❑ Drain oil filters before disposal or recycling.
- ❑ Drain and contain all fluids from wrecked vehicles and Aparts≅ cars.
- ❑ Store cracked batteries in a nonleaking secondary container.
- ❑ Promptly transfer used fluids to the proper container; do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers.
- ❑ Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets.
- ❑ Plug floor drains that are connected to the storm or sanitary sewer. Alternatively, install a sump that is pumped regularly.
- ❑ Inspect the maintenance area regularly for proper implementation of control measures.
- ❑ Train employees on proper waste control and disposal procedures.

Outdoor Vehicle and Equipment Storage and Parking

- ❑ Use drip pans under all vehicles and equipment waiting for maintenance.
- ❑ Cover the storage area with a roof.
- ❑ Inspect the storage yard for filling drip pans and other problems regularly.
- ❑ Train employees on procedures for storage and inspection items.

Locomotive Sanding Areas

- ❑ Cover sand storage piles.
- ❑ Install sediment traps.
- ❑ Install curbs or dikes around storage piles to minimize storm water runon.

Painting Areas

- ❑ Keep paint and paint thinner away from traffic areas to avoid spills.
- ❑ Spray paint in an Occupational Safety and Health Act (OSHA) approved hood.
- ❑ Use effective spray equipment that delivers more paint to the target and less over-spray.
- ❑ Avoid sanding in windy weather and collect and dispose of waste properly.
- ❑ Recycle paint, paint thinner, and solvents.
- ❑ Inspect painting procedures to ensure that they are conducted properly.
- ❑ Train employees on proper sanding, painting, and spraying techniques.

Vehicle or Equipment Washing Areas

- ❑ Avoid washing parts or equipment outside.
- ❑ Use phosphate-free biodegradable detergents.
- ❑ Designate an area for cleaning activities.
- ❑ Contain and recycle washwaters.
- ❑ Ensure that washwaters drain well.
- ❑ Inspect cleaning area regularly.
- ❑ Train employees on proper washing procedures.

Liquid Storage in Above Ground Storage

- ❑ Maintain good integrity of all storage containers.
- ❑ Install safeguards (such as diking or berming) against accidental releases at the storage area.
- ❑ Inspect storage tanks to detect potential leaks and perform preventive maintenance.
- ❑ Inspect piping systems (pipes, pumps, flanges, couplings, hoses, and valves) for failures or leaks.
- ❑ Train employees on proper filling and transfer procedures.

Cold Weather Activities

- ❑ Minimize salt application.
- ❑ Use uncontaminated dirt or ash, if use is necessary.
- ❑ Train employees on proper salt, dirt, sand, or ash application.

Improper Connections to Storm Drain

- ❑ Plug all floor drains connected to storm drain or if connection is unknown. Alternatively, install a sump that is pumped regularly.
- ❑ Perform smoke or dye testing to determine if interconnections exist between sanitary water system and storm drain system.
- ❑ Update facility schematics to accurately reflect all plumbing connections.
- ❑ Install a safeguard against vehicle washwaters entering the storm sewer unless permitted.
- ❑ Maintain and inspect the integrity of all underground storage tanks; replace when necessary.
- ❑ Train employees on proper disposal practices for all materials.

Vehicle and Equipment Maintenance Areas at Water Transportation Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Pressure Washing

- ❑ Collect discharge water and remove all visible solids before discharging to a sewer system, or where permitted, to a drainage system, or receiving water.
- ❑ Perform pressure washing only in designated areas where wash water containment can be effectively achieved.
- ❑ Use no detergents or additives in the pressure wash water.
- ❑ Direct deck drainage to a collection system sump for settling and/or additional treatment.
- ❑ Implement diagonal trenches or berms and sumps to contain and collect wash water at marine railways.
- ❑ Use solid decking, gutters, and sumps at lift platforms to contain and collect wash water for possible reuse.

Surface Preparation Sanding, and Paint Removal.

- ❑ Enclose, cover, or contain blasting and sanding activities to the extent practical to prevent abrasives, dust, and paint chips from reaching storm sewers or receiving water.
- ❑ Where feasible, cover drains, trenches, and drainage channels to prevent entry of blasting debris to the system.
- ❑ Prohibit uncontained blasting or sanding activities performed over open water.
- ❑ Prohibit blasting or sanding activities performed during windy conditions which render containment ineffective.
- ❑ Inspect and clean sediment traps to ensure the interception and retention of solids prior to entering the drainage system.
- ❑ Sweep accessible areas of the drydock to remove debris and spent sandblasting material prior to flooding.
- ❑ Collect spent abrasives routinely and store under a cover to await proper disposal.

Painting

- ❑ Enclose, cover, or contain painting activities to the maximum extent practical to prevent overspray from reaching the receiving water.
- ❑ Prohibit uncontained spray painting activities over open water.
- ❑ Prohibit spray painting activities during windy conditions which render containment ineffective.
- ❑ Mix paints and solvents in designated areas away from drains, ditches, piers, and surface waters, preferably indoors or under cover.
- ❑ Have absorbent and other cleanup items readily available for immediate cleanup of spills.
- ❑ Allow empty paint cans to dry before disposal.
- ❑ Keep paint and paint thinner away from traffic areas to avoid spills.
- ❑ Recycle paint, paint thinner, and solvents.
- ❑ Train employees on proper painting and spraying techniques, and use effective spray equipment that delivers more paint to the target and less overspray.

Drydock Maintenance

- ❑ Clean and maintain drydock on a regular basis to minimize the potential for pollutants in the storm water runoff.
- ❑ Sweep accessible areas of the drydock to remove debris and spent sandblasting material prior to flooding.
- ❑ If hosing may be used as a removal method, collect wash water to remove solids and potential metals.
- ❑ Clean the remaining areas of the dock after a vessel has been removed and the dock raised.
- ❑ Remove and properly dispose of floatable and other low-density waste (wood, plastic, insulations, etc.).

Drydocking

- ❑ Use plastic barriers beneath the hull, between the hull and drydock walls for containment.
- ❑ Use plastic barriers hung from the flying bridge of the drydock, from the bow or stern of the vessel, or from temporary structures for containment.
- ❑ Weight the bottom edge of the containment tarpaulins or plastic sheeting during a light breeze.
- ❑ Use plywood and/or plastic sheeting to cover open areas between decks when sandblasting (scuppers, railings, freeing ports, ladders, and doorways).
- ❑ Install tie rings or cleats, cable suspension systems, or scaffolding to make implementation containment easier.

Nondrydock Containment

- ❑ Hang tarpaulin from the boat, fixed, or floating platforms to reduce pollutants transported by wind.
- ❑ Pave or tarp surfaces under marine railways.
- ❑ Clean railways before the incoming tide.
- ❑ Haul vessels beyond the high tide zone before work commences or halt work during high tide.
- ❑ Place plastic sheeting or tarpaulin underneath boats to contain and collect waste and spent materials and clean and sweep regularly to remove debris.
- ❑ Use fixed or floating platforms with appropriate plastic or tarpaulin barriers as work surfaces and for containment when work is performed on a vessel in the water to prevent blast material or paint overspray from contacting storm water or the receiving water.
- ❑ Sweep, rather than hose, debris present on the dock.

Engine Maintenance and Repairs

- ❑ Maintain an organized inventory of materials used in the maintenance shop.
- ❑ Dispose of greasy rag, oil filters, air filters, batteries, spent coolant, and degreasers properly.
- ❑ Label and track the recycling of waste material (i.e., used oil, spent solvents, batteries).
- ❑ Drain oil filters before disposal or recycling.
- ❑ Store cracked batteries in a non-leaking secondary container.
- ❑ Promptly transfer used fluids to the proper container; do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers.
- ❑ Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets.
- ❑ Plug floor drains that are connected to the storm or sanitary sewer; if necessary, install a sump that is pumped regularly.
- ❑ Inspect the maintenance area regularly for proper implementation of control measures.
- ❑ Train employees on proper waste control and disposal procedures.

Material Handling: Bulk Liquid Storage and Containment.

- ❑ Store permanent tanks in a paved area surrounded by a dike system that provides sufficient containment for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.
- ❑ Maintain good integrity of all storage tanks.
- ❑ Inspect storage tanks to detect potential leaks and perform preventive maintenance.
- ❑ Inspect piping systems (pipes, pumps, flanges, couplings, hoses, valves) for failures or leaks.
- ❑ Train employees on proper filling and transfer procedures.

Material Handling: Containerized Material Storage

- ❑ Store containerized materials (fuels, paints, solvents, etc. in a protected, secure location and away from drains.
- ❑ Store reactive, ignitable, or flammable liquids in compliance with the local fire code.
- ❑ Identify potentially hazardous materials, their characteristics, and use.
- ❑ Control excessive purchasing, storage, and handling of potentially hazardous materials.
- ❑ Keep records to identify quantity, receipt date, service life, users, and disposal routes.
- ❑ Secure and carefully monitor hazardous materials to prevent theft, vandalism, and misuse of materials.
- ❑ Educate personnel for proper storage, use, cleanup, and disposal of materials.
- ❑ Provide sufficient containment for outdoor storage areas the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.
- ❑ Use temporary containment where required by portable drip pans.
- ❑ Use spill troughs for drums with taps.

Material Handling Designated Material Mixing Areas

- ❑ Mix paints and solvents in designated areas away from drains, ditches, piers, and surface waters. Locate designated areas preferably indoors or under a shed.
- ❑ If spills occur,
    - stop the source of the spill immediately
    - contain the liquid until cleanup is complete
    - deploy oil containment booms if the spill may reach the water
    - cover the spill with absorbent material
    - keep the area well ventilated
    - dispose of cleanup materials properly
    - do not use emulsifier or dispersant

Shipboard Process Water Handling

- ❑ Keep process and cooling water used aboard ships separate from sanitary wastes to minimize disposal costs for the sanitary wastes.
- ❑ Keep process and cooling water from contact with spent abrasives and paint to avoid discharging these pollutants.
- ❑ Inspect connecting hoses for leaks.

Shipboard Sanitary Waste Disposal

- ❑ Discharge sanitary wastes from the ship being repaired to the yard's sanitary system or dispose of by a commercial waste disposal company.
- ❑ Use appropriate material transfer procedures, including spill prevention and containment activities.

Bilge and Ballast Water

- ❑ Collect and dispose of bilge and ballast waters that contain oils, solvents, detergents, or other additives to a licensed waste disposal company.

Ship and Boat Building or Repairing Yards

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Pressure Washing

- ❑ Collect discharge water and remove all visible solids before discharging to a sewer system, or where permitted, to a drainage system, or receiving water.
- ❑ Perform pressure washing only in designated areas where wash water containment can be effectively achieved.
- ❑ Use no detergents or additives in the pressure wash water.
- ❑ Direct deck drainage to a collection system sump for settling and/or additional treatment.
- ❑ Implement diagonal trenches or berms and sumps to contain and collect wash water at marine railways.
- ❑ Use solid decking, gutters, and sumps at lift platforms to contain and collect wash water for possible reuse.

Surface Preparation, Sanding, and Paint Removal

- ❑ Enclose, cover, or contain blasting and sanding activities to the extent practical to prevent abrasives, dust, and paint chips from reaching storm sewers or receiving water.
- ❑ Where feasible, cover drains, trenches, and drainage channels to prevent entry of blasting debris to the system.
- ❑ Prohibit uncontained blasting or sanding activities performed over open water.
- ❑ Prohibit blasting or sanding activities performed during windy conditions that render containment ineffective.
- ❑ Inspect and clean sediment traps to ensure the interception and retention of solids prior to entering the drainage system.
- ❑ Sweep accessible areas of the drydock to remove debris and spent sandblasting material prior to flooding.
- ❑ Collect spent abrasives routinely and store under a cover to await proper disposal.

Painting

- ❑ Enclose, cover, or contain painting activities to the maximum extent practical to prevent overspray from reaching the receiving water.
- ❑ Prohibit uncontained spray painting activities over open water.
- ❑ Prohibit spray painting activities during windy conditions which render containment ineffective.
- ❑ Mix paints and solvents in designated areas away from drains, ditches, piers, and surface waters, preferably indoors or under cover.
- ❑ Have absorbent and other cleanup items readily available for immediate cleanup of spills.
- ❑ Allow empty paint cans to dry before disposal.
- ❑ Keep paint and paint thinner away from traffic areas to avoid spills.
- ❑ Recycle paint, paint thinner, and solvents.
- ❑ Train employees on proper painting and spraying techniques, and use effective spray equipment that delivers more paint to the target and less overspray.

Drydock Maintenance

- ❑ Clean and maintain drydock on a regular basis to minimize the potential for pollutants in the storm water runoff.
- ❑ Sweep accessible areas of the drydock to remove debris and spent sandblasting material prior to flooding.
- ❑ If hosing may be used as a removal method, collect wash water to remove solids and potential metals.
- ❑ Clean the remaining areas of the dock after a vessel has been removed and the dock raised.
- ❑ Remove and properly dispose of floatable and other low-density waste (wood, plastic, insulations, etc.).

Drydocking

- ❑ Use plastic barriers beneath the hull, between the hull and drydock walls for containment.
- ❑ Use plastic barriers hung from the flying bridge of the drydock, from the bow or stern of the vessel, or from temporary structures for containment.
- ❑ Weight the bottom edge of the containment tarpaulins or plastic sheeting during a light breeze.
- ❑ Use plywood and/or plastic sheeting to cover open areas between decks when sandblasting (scuppers, railings, freeing ports, ladders, and doorways).
- ❑ Install tie rings or cleats, cable suspension systems, or scaffolding to make implementation containment easier.

Nondrydock Containment

- ❑ Hang tarpaulin from the boat, fixed, or floating platforms to reduce pollutants transported by wind.
- ❑ Pave or tarp surfaces under marine railways.
- ❑ Clean railways before the incoming tide.
- ❑ Haul vessels beyond the high tide zone before work commences or halt work during high tide.
- ❑ Place plastic sheeting or tarpaulin underneath boats to contain and collect waste and spent materials and clean and sweep regularly to remove debris.
- ❑ Use fixed or floating platforms with appropriate plastic or tarpaulin barriers as work surfaces and for containment when work is performed on a vessel in the water to prevent blast material or paint overspray from contacting storm water or the receiving water.
- ❑ Sweep, rather than hose, debris present on the dock.

Engine Maintenance and Repairs

- ❑ Maintain an organized inventory of materials used in the maintenance shop.
- ❑ Dispose of greasy rag, oil filters, air filters, batteries, spent coolant, and degreasers properly.
- ❑ Label and track the recycling of waste material (i.e., used oil, spent solvents, batteries).
- ❑ Drain oil filters before disposal or recycling.
- ❑ Store cracked batteries in a non-leaking secondary container.
- ❑ Promptly transfer used fluids to the proper container; do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers.
- ❑ Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets.
- ❑ Plug floor drains that are connected to the storm or sanitary sewer; if necessary, install a sump that is pumped regularly.
- ❑ Inspect the maintenance area regularly for proper implementation of control measures.
- ❑ Train employees on proper waste control and disposal procedures.

Material Handling: Bulk Liquid Storage and Containment

- ❑ Store permanent tanks in a paved area surrounded by a dike system which provides sufficient containment for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.
- ❑ Maintain good integrity of all storage tanks.
- ❑ Inspect storage tanks to detect potential leaks and perform preventive maintenance.
- ❑ Inspect piping systems (pipes, pumps, flanges, couplings, hoses, valves) for failures or leaks.
- ❑ Train employees on proper filling and transfer procedures.

Material Handling: Containerized Material Storage

- ❑ Store containerized materials (fuels, paints, solvents, etc. in a protected, secure location and away from drains.
- ❑ Store reactive, ignitable, or flammable liquids in compliance with the local fire code.
- ❑ Identify potentially hazardous materials, their characteristics, and use.
- ❑ Control excessive purchasing, storage, and handling of potentially hazardous materials.
- ❑ Keep records to identify quantity, receipt date, service life, users, and disposal routes.
- ❑ Secure and carefully monitor hazardous materials to prevent theft, vandalism, and misuse of materials.
- ❑ Educate personnel for proper storage, use, cleanup, and disposal of materials.
- ❑ Provide sufficient containment for outdoor storage areas the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.
- ❑ Use temporary containment where required by portable drip pans.
- ❑ Use spill troughs for drums with taps.

Material Handling Designated Material Mixing Areas

- ❑ Mix paints and solvents in designated areas away from drains, ditches, piers, and surface waters. Locate designated areas preferably indoors or under a shed.
- ❑ If spills occur,
    - stop the source of the spill immediately
    - contain the liquid until cleanup is complete
    - deploy oil containment booms if the spill may reach the water
    - cover the spill with absorbent material
    - keep the area well ventilated
    - dispose of cleanup materials properly
    - do not use emulsifier or dispersant

Shipboard Process Water Handling

- ❑ Keep process and cooling water used aboard ships separate from sanitary wastes to minimize disposal costs for the sanitary wastes.
- ❑ Keep process and cooling water from contact with spent abrasives and paint to avoid discharging these pollutants.
- ❑ Inspect connecting hoses for leaks.

Shipboard Sanitary Waste Disposal

- ❑ Discharge sanitary wastes from the ship being repaired to the yard's sanitary system or dispose of by a commercial waste disposal company.
- ❑ Use appropriate material transfer procedures, including spill prevention and containment activities.

Bilge and Ballast Water

- ❑ Collect and dispose of bilge and ballast waters that contain oils, solvents, detergents, or other additives to a licensed waste disposal company.

Vehicle and Equipment Maintenance and Deicing Areas at Air Transportation Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Aircraft, Ground Vehicle and Equipment Maintenance Areas

- ❑ Perform all maintenance activities indoors.
- ❑ Maintain an organized inventory of materials used.
- ❑ Drain all parts of fluids prior to disposal.
- ❑ Prohibit the practice of hosing down the apron or hangar floor.
- ❑ Use dry cleanup methods in the event of spills.
- ❑ Collect the storm water runoff from maintenance and/or service areas and provide treatment or recycling.

Aircraft, Ground Vehicle, and Equipment Cleaning Areas

- ❑ Perform all cleaning operations indoors.
- ❑ Collect the storm water runoff from the area and provide treatment or recycling.

Aircraft, Ground Vehicle, and Equipment Storage Areas

- ❑ The storage of aircraft, ground vehicles, and equipment awaiting maintenance may be confined to designated areas.
- ❑ Store aircraft and ground vehicles indoors.
- ❑ Use drip pans for the collection of fluid leaks.
- ❑ Consider perimeter drains, dikes or berms surrounding storage areas.

Material Storage Areas

- ❑ Storage units of all materials (e.g., used oils, hydraulic fluids, spent solvents and waste aircraft fuel) may be maintained in good condition, so as to prevent contamination of storm water, and plainly labeled (e.g., "used oil", "contaminated Jet A", etc.).
- ❑ Store materials indoors.
- ❑ Maintain a centralized storage areas for waste materials.
- ❑ Install berms and dikes around storage areas.

Airport Fuel System and Fueling Areas

- ❑ Where above ground storage timers are present, pollution prevention plan requirements should be consistent with requirements established in 40 CFR 112.7 guidelines for the preparation and implementation of a Spill Prevention Control and Countermeasure (SPCC) plan.

Deicing Operations

- ❑ Evaluate present chemical application rates to ensure against excessive over application. Devices which meter the amount of chemical being applied to runways help to prevent over application.
- ❑ Emphasize anti-icing operations which would preclude the need to deice; less chemical is required to prevent the formation of ice on a runway than is required to remove ice from a runway.
- ❑ Consider installing runway ice detection systems (RID) otherwise known as Apavement sensors≡ which monitor runway temperatures. Pavement sensors provide an indication of when runway temperatures are approaching freezing conditions, thus alerting operators of the need to conduct anti-icing operations.
- ❑ Deicing/anti-icing chemicals applied during extremely cold, dry conditions, are often ineffective since they do not adhere to the ice surface and may be scattered as a result of windy conditions or aircraft movement. In an effort to improve the efficiency of the application, operators should consider prewetting the deicing chemical to improve the adhesion to the iced surface.
- ❑ Consider using chemicals which have less of an environmental impact on receiving waters. Potassium acetate, has a lower oxygen demand than glycol, is nontoxic to aquatic habitat or humans, and was approved by the FAA for runway deicing operations in November, 1991 (AC No. 150/520030A CHG 1).
- ❑ Consider pretreating aircraft with hot water or forced air prior to the application of chemical deicer to reduce the amount of chemical deicer used during the operation.
- ❑ When deicing/anti-icing operations are conducted on aircraft during periods of dry weather, operators should ensure that storm water inlets are blocked to prevent the discharge of deicing/anti-icing chemicals to the storm sewer system. Mechanical vacuum systems or other similar devices can then be used to collect the spent deicing chemical from the apron surface for proper disposal to prevent those materials from later becoming a source of storm water contamination.
- ❑ Establishing a centralized deicing station would provide better control over aircraft deicing/anti-icing operations in that it enables operators to readily collect spent deicing/anti-icing chemicals.
- ❑ Once spent deicer/anti-icer chemicals are collected, operators can select from various methods of disposal such as disposal to sanitary sewer facility, retention and detention ponds, or recycling.

Treatment Works

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Preparation of Biological and Physical Treatment Process

- ❑ Use drip pans under drums and equipment where feasible.
- ❑ Store process chemicals inside buildings.
- ❑ Inspect the storage yard for filling drip pans and other problems regularly.
- ❑ Train employees on procedures for storing and inspecting chemicals.

Soil Amending and Grass Fertilizing

- ❑ Use the appropriate amount of fertilizer.
- ❑ Do not overfertilize.
- ❑ Train employee on proper fertilizing techniques.

Liquid Storage in Above Ground Storage Containers

- ❑ Maintain good integrity of all storage containers.
- ❑ Install safeguards (such as diking or berming) against accidental releases at the storage area.
- ❑ Inspect storage tanks to detect potential leaks and perform preventive maintenance.
- ❑ Inspect piping systems (pipes, pumps, flanges, couplings, hoses, and valves) for failures or leaks.
- ❑ Train employees on proper filling and transfer procedures.

Pest Control

- ❑ Minimize pesticide application.
- ❑ Only apply pesticide if needed.
- ❑ Train employees on proper pesticide application.

Sludge Drying Beds

- ❑ Ensure drying bed is draining properly (e.g., check for clogging); avoid overfilling drying bed; grade the land to divert flow around drying bed; berm, dike, or curb drying bed areas; cover drying beds.

Sludge Storage Piles

- ❑ Confine storage of sludge to a designated area as far from any receiving water body as possible; store sludge on an impervious surface (e.g., concrete pad); grade the land to divert flow around storage piles; berm, dike, or curb sludge storage piles; cover sludge storage piles.

Sludge Transfer

- ❑ Promptly remove any sludge spilled during transfer; conduct transfer operations over an impervious surface; avoid transferring sludge during rain events; grade the land to divert flow around transfer areas; berm, curb, or dike transfer areas; avoid locating transfer operations near receiving water bodies.

Incineration-Ash Impoundments/ Piles

- ❑ Line ash impoundments with clay (or other type of impervious material); ensure ash impoundments will hold maximum volume of ash and a 10-year, 24-hour rain event; curb, berm, or dike ash storage areas; avoid locating ash storage areas near receiving water bodies.

Miscellaneous

- ❑ Properly dispose of grit/scum; properly dispose of screens on a daily basis; maximize vegetative cover to stabilize soil and reduce erosion.

Food and Kindred Products Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Raw Material Unloading/Product Loading

- ❑ Ensure that a facility representative is present during unloading/loading activities.
- ❑ Inspect the unloading/loading areas to detect problems before they occur.
- ❑ Close storm drains during loading/unloading activities in surrounding area.
- ❑ Inspect all containers prior to unloading/loading of any raw or spent materials.
- ❑ Install backflow prevention devices on liquid transfer equipment.
- ❑ Inspect all connection equipment (e.g., hoses and couplings), and replace when necessary, before performing unloading/loading activities.
- ❑ Perform all unloading/loading activities in a covered and/or enclosed areas.
- ❑ Use drip pans when loading/unloading liquid product.
- ❑ Situate loading/unloading areas indoors or in a covered area.
- ❑ Use rubber seals in truck loading dock areas to contain spills indoors.
- ❑ Drain hoses back into truck, railcar, etc. after loading/unloading materials.
- ❑ Install high level alarm on tanks to prevent overfilling.
- ❑ Ensure that berms and dikes are built around the unloading/loading areas, if applicable.
- ❑ If outside or in covered areas, minimize run on of storm water into the unloading/loading areas by grading the areas to ensure that storm water runs off.
- ❑ Use dry cleanup methods for unloading/loading areas rather than washing the areas down.
- ❑ Train employees on proper unloading/loading techniques.
- ❑ Initiate an inventory control for all raw and spent materials.

Storage Containers: Liquid Storage

- ❑ Inspect the external condition (corrosion, leaks) of the containers.
- ❑ Inspect the general area around the containers.
- ❑ Ensure that beams and dikes are built around the containers.
- ❑ Cover and/or enclose.
- ❑ Bulkhead liquid storage tanks indoors (i.e., tank outlets located inside buildings).
- ❑ Ensure that all containers are closed (e.g., valves shut, lids and manways sealed, caps closed).
- ❑ Wash containers indoors before storing empty containers outdoors.
- ❑ If outside or in a covered area, minimize run on of storm water into a storage area by grading area to ensure that storm water runs Aoff≅ and not Aon≅.
- ❑ Train employees on proper storage techniques (e.g., filling and transferring contents).
- ❑ Maintain employee training on proper handling and transportation of materials.
- ❑ Maintain an inventory control of all raw and spent materials.
- ❑ Employ measures to protect against spillage from the overflows (e.g., high level sensors, alarms).

Storage Containers: Solid Storage

- ❑ Consider vacuum emission control systems for airborne dust and particulate matter.

Waste Management: Wastewater

- ❑ Perform treatment processes in-house, if possible.
- ❑ Inspect the outside pipe connections (couplings, valve seals and gaskets, flanges, etc.) of the treatment system for leaks, corrosion, and poor maintenance upkeep.

Waste Management: Solid Waste

- ❑ Inspect the general area around the solid waste (e.g., look for signs of leaching).
- ❑ Store waste so that it is physically contained (dumpsters, drums, bags).
- ❑ Store waste in an enclosed/covered area.
- ❑ If outside or in a covered area, minimize exposure to storm water by grading the area to ensure that storm water runs Aoff≅ and not Aon≅.
- ❑ Ensure hazardous waste disposal practices are performed in accordance with Federal, State, and local requirements.
- ❑ Route trash compactor leakage to treatment system or sanitary sewer.

Waste Management: Air Emissions

- ❑ Clean around vents and stacks to atmosphere from process and storage areas.
- ❑ Place tubs around vents and stacks for easy collection of settling particles.
- ❑ Inspect air emission control systems (e.g., baghouses) regularly and repair and replace as necessary.
- ❑ Route overflows/condensates from process vents to onsite treatment system or to the sanitary sewer.

Pest Control

- ❑ Follow manufacturers directions for application of pest control materials to site.
- ❑ Time application for dry weather conditions.
- ❑ Store partially full containers indoors or undercover.
- ❑ Apply insecticides during breeding months.
- ❑ Protect rat bait houses from storm water.

Improper Connections to the Storm Drain

- ❑ Perform smoke or dye testing to determine if interconnections exist between the sanitary sewer and storm drain.
- ❑ Plug all floor drains leading to storm drains.
- ❑ Update facility schematics to accurately reflect all plumbing connections.

General

- ❑ Offer employee incentives so that employees will develop cost effective, worker efficient BMPs.
- ❑ Request outside firm to conduct a storm water inspection/audit.
- ❑ Inspect material transfer lines/connections for leaks or signs of wear and repair or replace as necessary.

Activities for Specific Facilities:

Meat Products

- ❑ Inspect area around animal holding pens.
- ❑ Enclose/cover fowl hanging area.
- ❑ Enclose/cover the animal holding pens.
- ❑ Grade the areas around the animal holding pens to ensure storm water runs Aoff≡ and not Aon≡ to the holding pen.
- ❑ Train employees on proper material (i.e., hide, hair, feathers, animal parts) clean-up procedures around and within the animal holding pens.
- ❑ Store animal manure and other materials from clean-up activities in appropriate containers in an enclosed/covered area.
- ❑ Area for trailers holding empty bird cages should have storm water run on/runoff controls in place.
- ❑ Use mechanical sweepers around site to clean up fugitive feathers, dust, and manure.

Dairy Products

- ❑ Inspect area around aged/spoiled dairy products.
- ❑ Store aged/spoiled dairy products in enclosed area.
- ❑ Train employees on proper disposal methods for all aged/spoiled dairy products.
- ❑ Ensure that all aged/spoiled product (e.g., bottles, cartons, plastic containers) are disposed of in a proper manner (bagged, covered).

Canned Frozen and Preserved Fruits, Vegetables, and Frozen Specialties

- ❑ Inspect all fruit and vegetable storage areas.
- ❑ Store all fruits and vegetables in appropriate containers (e.g., bins, bushels, baskets, buckets) and in enclosed/covered areas.
- ❑ Store empty fruit and vegetable containers in an enclosed/covered area.
- ❑ Train employees on proper handling/disposal methods for fresh/rotten fruits and vegetables.
- ❑ Consider air emission control systems for all cooking processes to reduce particulate matter.
- ❑ Minimize fruit and vegetable storage time outdoors.

Grain Mills

- ❑ Inspect the general area around the grain storage.
- ❑ Store all grain in appropriate containers (e.g., silos, hoppers) in an enclosed/covered area.
- ❑ Train employees on grain handling procedures.
- ❑ Consider a vacuum control system in all grain mixing areas.

Bakery Products

- ❑ Inspect ingredient storage areas.
- ❑ Store all ingredients (e.g., corn sweeteners, flour, shortening, syrup, vegetable oils) in appropriate containers (e.g., tanks, drums, bags) in an enclosed/covered area.
- ❑ Remove flour/oil dust accumulation around ventilation exhaust systems.
- ❑ Install an air emission control system for all baking processes to reduce particulate matter.

Sugar and Confectionery

- ❑ Consider a vacuum control system in all granular and powdered processing areas.

Fats & Oils

- ❑ Inspect all fats and oils storage areas.
- ❑ Store all fats and oils, (e.g., butcher shop materials, hair, hide, tallow, bone meal, and offal) in enclosed/covered areas.
- ❑ Ensure all fats and oils are physically contained.

Beverages

- ❑ Ensure grain is stored in enclosed/covered area.
- ❑ Consider an air emission control system for all grain handling and brewing processes.
- ❑ Protect reusable beverage containers that are stored outdoors from storm water contact.

Textile Mills, Apparel, and Other Fabric Product Manufacturing Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Preparation (e.g., Desizing and Scouring).

- ❑ Waste stream reuse for typical bleach unit processing; recycle J-box or kier drain wastes to saturator.
- ❑ Make use of countercurrent washing.
- ❑ Use washer waste from scour operation for batch scouring.

Dyeing

- ❑ Perform analysis of spent dye baths for residual materials.
- ❑ Where feasible, obtain background information and data necessary before making product substitutions. This includes OSHA form 20 data and technical data.
- ❑ Be aware of potential problem chemicals, such as aryl phenol ethoxylates, chlorinated aromatics, chlorinated aromatics, and metals.
- ❑ Employ pad batch dyeing to eliminate the need for salts and chemical specialties from the dyebath, with associated reduction in cost and pollution source reduction.

Finishing

- ❑ Reuse residual portions of finish mixes as much as possible by adding back to them the required components to make up the next mix.
- ❑ Return noncontact cooling water and stream condensates to either a hot water holding tank or a clear well. If neither is available, segregate waste streams from sources which do not generally require treatment from other waste streams that do require treatment.

General Water Conservation Techniques

- ❑ Use "low liquor ratio" dyeing machines where practicable.
- ❑ Use of foam processing (mercerizing, bleaching, dyeing, finishing) where practicable as a water conservation process.

Chemical Screening and Inventory Control

- ❑ Employ prescreening practices to evaluate and consider chemicals on a wide range of environmental and health impact criteria.
- ❑ Develop and perform a routine raw material quality control program.
- ❑ Review and develop procedures for source reduction of metals.
- ❑ Promptly transfer used fluids to the proper container; do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers.
- ❑ Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets.
- ❑ Plug floor drains that are connected to the storm or sanitary sewer; if necessary, install a sump that is pumped regularly.
- ❑ Inspect the maintenance area regularly for proper implementation of control measures.
- ❑ Train employees on proper waste control and disposal procedures.

Material Handling: Bulk Liquid Storage and Containment

- ❑ Store permanent tanks in a paved area surrounded by a dike system which provides sufficient containment for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.
- ❑ Maintain good integrity of all storage tanks.
- ❑ Inspect storage tanks to detect potential leaks and perform preventive maintenance.
- ❑ Inspect piping systems (pipes, pumps, flanges, couplings, hoses, valves) for failures or leaks.
- ❑ Train employees on proper filling and transfer procedures.

Material Handling: Containerized Material Storage

- ❑ Store containerized materials (fuels, paints, solvents, etc.) in a protected, secure location and away from drains.
- ❑ Store reactive, ignitable, or flammable liquids in compliance with the local fire code.
- ❑ Label all materials clearly.
- ❑ Identify potentially hazardous materials, their characteristics, and use.
- ❑ Control excessive purchasing, storage, and handling of potentially hazardous materials.
- ❑ Keep records to identify quantity, receipt date, service life, users, and disposal routes.
- ❑ Secure and carefully monitor hazardous materials to prevent theft, vandalism, and misuse of materials.
- ❑ Educate personnel for proper storage, use, cleanup, and disposal of materials.
- ❑ Provide sufficient containment for outdoor storage areas for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.
- ❑ Use temporary containment where required by portable drip pans.
- ❑ Use spill troughs for drums with taps.

Material Handling: Designated Material Mixing Areas

- ❑ Mix solvents in designated areas away from drains, ditches, and surface waters.
- ❑ If spills occur,
  - stop the source of the spill immediately
  - contain the liquid until cleanup is complete
  - deploy oil containment booms if the spill may reach the water
  - cover the spill with absorbent material
  - keep the area well ventilated
  - dispose of cleanup materials properly
  - do not use emulsifier or dispersant

Wood and Metal Furniture and Fixture Manufacturing Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Outdoor Unloading and Loading

- ❑ Confine loading/unloading activities to a designated area.
- ❑ Perform all loading/unloading activities in a covered or enclosed area.
- ❑ Close storm drains during loading/unloading activities in surrounding areas.
- ❑ Avoid loading/unloading materials in the rain.
- ❑ Inspect all containers prior to loading/unloading of any raw or spent materials.
- ❑ Berm, curb, or dike loading/unloading areas.
- ❑ Use dry clean-up methods instead of washing the areas down.
- ❑ Train employees on proper loading/unloading techniques.

Outdoor Material Storage

- ❑ Confine storage of raw materials, parts, and equipment to designated areas.
- ❑ Train employees on proper waste control and disposal.
- ❑ Berm, curb, or dike any areas around tanks.
- ❑ Ensure that all containers are properly sealed and valves closed.
- ❑ Inventory all raw and spent materials.
- ❑ Inspect air emission control systems regularly, and repair or replace when necessary.
- ❑ Store wastes in covered, leak proof containers (e.g., dumpsters, drums).
- ❑ Store wastes in enclosed and/or covered areas.
- ❑ Ensure hazardous and solid waste disposal practices are performed in accordance with applicable Federal, State, and local requirements.
- ❑ Ship all wastes to offsite landfills or treatment facilities.

Printing and Publishing Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Plate Preparation

- ❑ Use aqueous-developed lithographic plates or wipe-on plates.

Printing

- ❑ Use press wipes as long as possible before discarding or laundering; dirty ones for the first pass, clean ones for the second pass.
- ❑ Squeeze or centrifuge solvent out of dirty rags.
- ❑ Set up an in-house dirty rag cleaning operation if warranted or send to approved industrial laundries, if available.
- ❑ Dedicate press for inks with hazardous pigments/solvents.
- ❑ Segregate used oil from solvents or other materials.
- ❑ Use water-based inks in gravure and flexographic printing process.

Clean Up

- ❑ Label sinks as to proper disposal of liquids.
- ❑ Keep equipment in good condition.
- ❑ Use doctor blades and squeegees to remove as much ink as possible prior to cleaning with solvent and rags.
- ❑ Control solvent use during equipment cleaning, use only what you need.
- ❑ Designate special areas for draining or replacing fluids.
- ❑ Substitute nontoxic or less toxic cleaning solvents.
- ❑ Recover waste solvents onsite with batch distillation if warranted or utilize professional solvent recyclers.
- ❑ Centralize liquid solvent cleaning in one location. Have refresher courses in operating and safety procedures.

Stencil Preparation for Screen Printing

- ❑ Recapture excess ink from silkscreen process before washing the screen to decrease amount of ink used and cleaning emulsion used.

Material Handling and Storage Areas

- ❑ Store containerized materials (fuels, paints, inks, solvents, etc.) in a protected, secure location and away from drains.
- ❑ Store reactive, ignitable, or flammable liquids in compliance with the local fire code.
- ❑ Identify potentially hazardous materials, their characteristics, and use.
- ❑ Eliminate/reduce exposure to storm water.
- ❑ Control excessive purchasing, storage, and handling of potentially hazardous materials.
- ❑ Keep records to identify quantity, receipt date, service life, users, and disposal routes secure and carefully monitor hazardous materials to prevent theft, vandalism, and misuse of materials.
- ❑ Educate personnel for proper storage, use, cleanup, and disposal of materials.
- ❑ Maintain good integrity of all storage tanks inspect storage tanks to detect potential leaks and perform preventive maintenance.
- ❑ Provide sufficient containment for outdoor storage areas for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.
- ❑ Use temporary containment where required by portable drip pans.
- ❑ Use spill troughs for drums with taps.
- ❑ Train employees on proper filling and transfer procedures.
- ❑ Inspect piping systems (pipes, pumps, flanges, couplings, hoses, valves) for failures or leaks.
- ❑ Handle solvents in designated areas away from drains, ditches, and surface waters. Locate designated areas preferably indoors or under a shed.
- ❑ If spills occur,
    - stop the source of the spill immediately
    - contain the liquid until cleanup is complete
    - deploy oil containment booms if the spill may reach the water
    - cover the spill with absorbent material
    - keep the area well ventilated
    - dispose of cleanup materials properly
    - do not use emulsifier or dispersant

Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Outdoor Unloading and Loading

- ❑ Confine loading/unloading activities to a designated area.
- ❑ Consider performing loading/unloading activities indoors or in a covered area.
- ❑ Consider covering loading/unloading area with permanent cover (e.g., roofs) or temporary cover (e.g., tarps).
- ❑ Close storm drains during loading/unloading activities in surrounding areas.
- ❑ Avoid loading/unloading materials in the rain.
- ❑ Inspect the unloading/loading areas to detect problems before they occur.
- ❑ Inspect all containers prior to loading/unloading of any raw or spent materials.
- ❑ Consider berming, curbing, or diking loading/unloading areas.
- ❑ Dead-end sump where spilled materials could be directed.
- ❑ Drip pans under hoses.
- ❑ Use dry clean-up methods instead of washing the areas down.
- ❑ Train employees on proper loading/unloading techniques and spill prevention and response.

Outdoor Material Storage

- ❑ Confine storage of materials, parts, and equipment to designated areas.
- ❑ Consider secondary containment using curbing, berming, or diking all liquid storage areas.
- ❑ Train employees on proper waste control and disposal.
- ❑ Train employees in spill prevention and response.
- ❑ Consider covering tanks.
- ❑ Ensure that all containers are closed (e.g., valves shut, lids sealed, caps closed).
- ❑ Wash and rinse containers indoors before storing them outdoors.
- ❑ If outside or in covered areas, minimize run on by grading the land to divert flow away from containers.
- ❑ Leak detection and container integrity testing.
- ❑ Direct runoff to onsite retention pond.
- ❑ Inventory all raw and spent materials.
- ❑ Clean around vents and stacks.
- ❑ Place tubs around vents and stacks to collect particulate.
- ❑ Inspect air emission control systems (e.g., baghouses) regularly, and repair or replace when necessary.
- ❑ Store wastes in covered, leak proof containers (e.g., dumpsters, drums).
- ❑ Consider shipping all wastes to offsite landfills or treatment facilities.
- ❑ Ensure hazardous waste disposal practices are performed in accordance with Federal, State, and local requirements.

Zinc Handling

- ❑ Train employee train regarding the handling and emptying of zinc bags.
- ❑ Indoor storage of zinc bags.
- ❑ Thoroughly cleanup zinc spills without washing the zinc into a storm drain.
- ❑ Consider the use of 2,500 pound sacks (from which spills are less likely) rather than 50 to 100 pound sacks.
- ❑ Provide a cover for the dumpster or move the dumpster inside.
- ❑ Provide a lining for the dumpster.
- ❑ Review dust collectors and baghouses as possible sources of zinc. Improperly operating dust collectors or baghouses may be replaced or repaired as appropriate; the plan may also provide for regular maintenance of these facilities.
- ❑ Review dust generation from rubber grinding operations and as appropriate, install a dust collection system.
- ❑ Prevent and/or clean up drips or spills of zinc stearate slurry that may be released to a storm drain. Alternate compounds to zinc stearate may also be considered.

Leather Tanning and Finishing Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Temporary Outdoor Storage of Fresh or Brine Cured Hides

- ❑ Store hides indoors if possible.
- ❑ Cover the hides with a roof or temporary covering (e.g.,polyethylene, tarpaulin etc.).
- ❑ Minimize storm water run on by enclosing the area or building a berm around the area.
- ❑ Inspect area regularly for proper implementation of good housekeeping and control measures.

Beamhouse Operations

- ❑ Store chemical drums & bags and empty lime & depilatory chemical containers indoors if possible, preventive maintenance.
- ❑ Cover chemical drums & bags, empty lime & depilatory chemical containers and leather scraps with roof or temporary covering (e.g., tarpaulins, polyethylene) and store on elevated impermeable surface.
- ❑ Curbing, containment dikes around chemical storage, empty lime & depilatory chemical containers and leather scrap storage area.
- ❑ Inspect area regularly for leaking drums, broken bags, proper implementation of good housekeeping and control measures, (broken cracked dikes), material inventory, material storage and operation & maintenance.
- ❑ Clean up leaks & spills quickly & completely, use drip pans for leaking equipment.
- ❑ Good Housekeeping-all paved areas should be swept regularly, eliminate unnecessary flushing with water and label chemical drums and containers.
- ❑ Employee training on good housekeeping, proper handling of chemicals.

Tanyards

- ❑ BMPs for Tanyards (empty chemical containers and hides, leather dust, shavings) are the same as those listed above for Beamhouse Activities.

Retan and Wet Finish

- ❑ Dust reduction through frequent inspection of vacuum, collector (bag & cyclone), and filter systems.
- ❑ Dust reduction through enclosure and covering.
- ❑ Preventive maintenance/inspection of dust collection systems.
- ❑ Good Housekeeping-regular sweeping of paved areas, eliminate unnecessary flushing with water and label chemical drums and containers.
- ❑ Employee training on good housekeeping, proper handling of chemicals.

Dry Finish

- ❑ Preventive maintenance, inspection of spray booths.
- ❑ Employee training on proper disposal of spent solvents.

Receiving and Shipping

- ❑ Cover shipping & receiving area.
- ❑ Cover trucks.
- ❑ Vehicle positioning-locating trucks while transferring materials to prevent spills onto the ground surface.
- ❑ Grade berm or curb area to prevent storm water run on contamination, divert rain gutters away from loading area.
- ❑ Clean spills immediately.
- ❑ Inspect trucks for leaks.
- ❑ Employee training in spill prevention.

Liquid Storage in Above Ground Tanks

- ❑ Clearly tag valves to avoid human error.
- ❑ Install overflow protection devices on tank systems to warn operator or to automatically shut down transfer pumps when tanks reach full capacity.
- ❑ Secondary containment around tanks.
- ❑ Employee training.
- ❑ Inspection of tank foundations, connections, coatings, valves and piping systems.
- ❑ Comply with existing spill prevention, cleanup and countermeasure plans (SPCC plan) and State and Federal laws.
- ❑ Integrity testing by qualified professional.

Improper Connections to Storm Drains

- ❑ Plug all floor drains connected to storm drain.
- ❑ Perform smoke or dye testing to determine if interconnections exist between sanitary water system and storm drain system.
- ❑ Update facility schematics to accurately reflect all plumbing connections.
- ❑ Install a safeguard against washwaters from processing areas entering the storm sewer unless permitted.
- ❑ Train employees on proper disposal practices for all materials.

Waste Management

- ❑ Conduct waste reduction assessment-develop guidelines for the elimination of waste generation emissions.
- ❑ Institute industrial waste source reduction and recycling BMPs.
- ❑ Move waste management activities indoors (after safety concerns are addressed) and cover waste piles, dumpsters, hoppers, place on impermeable elevated surfaces.
- ❑ Prevent storm water run on by curbing, building berms.
- ❑ Cover trucks & inspect for leaking wastes.
- ❑ Inspection of waste management areas for leaking containers, spills, damaged containers, uncovered waste piles, dumpsters, hoppers.
- ❑ Inspection of roof areas & outside equipment.
- ❑ Develop and maintain proper erosion control or site stabilization measures.
- ❑ Train employees on proper disposal practices for all materials.

Fabricated Metal Products Industry

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Metal Fabricating Areas

- ❑ Sweep fabrication areas. Absorb dust through a vacuum system to avoid accumulation on roof tops and onto the ground.
- ❑ Sweep on a regular basis all accessible paved areas.
- ❑ Maintain floors in a clean and dry condition.
- ❑ Remove waste and dispose of regularly.
- ❑ Remove obsolete equipment expeditiously.
- ❑ Train employees on good housekeeping measures.

Storage Areas for Raw Metal

- ❑ The storage of raw materials should be under a covered area whenever possible and protected from contact with the ground.
- ❑ The amount of material stored should be minimized to avoid corrosive activity from longterm exposed materials.
- ❑ Diking or berming the area to prevent or minimize runon may be considered.
- ❑ Check raw metals for corrosion.
- ❑ Keep area neat and orderly, stack neatly on pallets or off the ground; and cover exposed materials.

Receiving, Unloading, and Loading Areas

- ❑ These areas should be enclosed where feasible using either curbing, berming, diking or other accepted containment systems in case of spills during delivery of chemicals such as lubricants, coolants, rust preventatives, solvents, oil, sodium hydroxide, hydrochloric acid, calcium chloride, polymers, sulfuric acid, and other chemicals used in the metal fabricating processes.
- ❑ Directing roof down spouts away from loading sites and equipment and onto grassy or vegetated areas should help prevent storm water contamination by pollutants that have accumulated in these areas.
- ❑ Clean up spills immediately.
- ❑ Check for leaks and remedy problems regularly.
- ❑ Unload under covered areas when possible.

Storage of Heavy Equipment

- ❑ Vehicles should be stored indoors when possible.
- ❑ If stored outdoors, the use of gravel, concrete or other porous surfaces should be considered to minimize or prevent heavy equipment from creating ditches or other conveyances that would cause sedimentation runoff and increase TSS loadings.
- ❑ Clean equipment prior to storage.
- ❑ Divert drainage to the grass swales, filter strips, retention ponds, or holding tanks.

Metal Working Fluid Areas

- ❑ Store used metal working fluid with fine metal dust indoors.
- ❑ Use tight sealing lids on all fluid containers.
- ❑ Use straw, clay absorbents, sawdust, or synthetic absorbents to confine or contain any spills, or other absorbent material and establish recycling programs for used fluids when possible.

Unprotected Liquid Storage Tanks

- ❑ Cover all tanks whenever possible.
- ❑ Berm tanks whenever possible.
- ❑ Dike area or install grass filters to contain spills.
- ❑ Keep area clean.
- ❑ Check piping, valves and other related equipment on a regular basis.

Chemical Cleaners and Rinse Water

- ❑ Use drip pans and other spill devices to collect spills or solvents and other liquid cleaners.
- ❑ Recycle wastewater.
- ❑ Store recyclable waste indoors or in covered containers.
- ❑ Substitute nontoxic cleaning agents when possible.

Raw Steel Collection Areas

- ❑ Materials should be kept in a covered storage bin or kept inside until pickup.
- ❑ The use of pitched structures should be considered.
- ❑ Collect scrap metals, fines, iron dust and store under cover and recycle.

Paints and Painting Equipment

- ❑ Paint and sand indoors when possible.
- ❑ Avoid painting and sandblasting operations outdoors in windy weather conditions.
- ❑ If done outside, enclose sanding and painting areas with tarps or plastic sheeting.
- ❑ Use waterbased paints when possible.
- ❑ Use tarps, drip pans, or other spill collection devices to contain and collect spills of paints, solvents or other liquid material.

Vehicle and Equipment Maintenance Areas

- ❑ Changing fluids or parts should be done indoors when possible.
- ❑ If maintenance is performed outdoors, fluids used in maintaining these vehicles should be contained in the area by using drip pans, large plastic sheets, canvas or other similar controls under the vehicles, or berming the area.
- ❑ Hydraulic fluids should be properly stored to prevent leakage and storm water contamination.
- ❑ Discard fluids properly or recycle if possible.

Hazardous Waste Storage Areas

- ❑ All hazardous waste may be stored in sealed drums.
- ❑ Establish centralized drum storage satellite areas throughout the complex to store these materials.
- ❑ Store indoors or under cover where possible.
- ❑ Do not stack containers in such a way as to cause leaks or damage to the containers.
- ❑ Use pallets to store containers when possible.
- ❑ Store materials with adequate space for traffic without disturbing drums.
- ❑ Maintain low inventory level of chemicals based on need.
- ❑ Dike or use grass swales, ditches or other containment to prevent runon or runoff in case of spills.
- ❑ Label materials clearly.
- ❑ Check for corrosion and leakage of storage containers.
- ❑ Properly dispose of outdated materials.
- ❑ Post notices prohibiting dumping of materials into storm drains.
- ❑ All other applicable Federal, State, and local regulations may be followed.

Transporting Chemicals to Storage Areas

- ❑ Forklift operators should be trained to avoid puncturing drums.
- ❑ Store drums as close to operational building as possible.
- ❑ Label all drums with proper warning and handling instructions.

Finished Products (Galvanized) Storage

- ❑ Materials should be stored in such a way to minimize contact with precipitation and runoff.
- ❑ Consider storing finished products indoors, on a wooden pallets concrete pad, gravel surface, or other impervious surface.

Wooden Pallets and Empty Drums

- ❑ Clean contaminated wooden pallets.
- ❑ Cover empty drums.
- ❑ Cover contaminated wooden pallets.
- ❑ Store drums and pallets indoors.
- ❑ Clean empty drums.
- ❑ Store pallets and drums on concrete pads.

Retention Ponds (Lagoon)

- ❑ Provide routine maintenance.
- ❑ Remove excess sludge periodically.
- ❑ Aerate periodically to maintain pond's aerobic character and ecological balance.

Facilities that Manufacture Transportation Equipment, Industrial, or Commercial Machinery

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Outdoor Unloading and Loading

- ❑ Confine loading/unloading activities to a designated area.
- ❑ Consider performing loading/unloading activities indoors or in a covered area.
- ❑ Consider covering loading/unloading area with permanent cover (e.g., roofs) or temporary cover (e.g., tarps).
- ❑ Close storm drains during loading/unloading activities in surrounding areas.
- ❑ Avoid loading/unloading materials in the rain.
- ❑ Inspect the unloading/loading areas to detect problems before they occur.
- ❑ Inspect all containers prior to loading/unloading of any raw or spent materials.
- ❑ Consider berming, curbing, or diking loading/unloading areas.
- ❑ Use dry cleanup methods instead of washing the areas down.
- ❑ Train employees on proper loading/unloading techniques.

Outdoor Material Storage

- ❑ Confine storage of materials, parts, and equipment to designated areas.
- ❑ Consider curbing, berming, or diking all liquid storage areas.
- ❑ Train employees on proper waste control and disposal.
- ❑ Consider covering tanks.
- ❑ Ensure that all containers are closed (e.g., valves shut, lids sealed, caps closed).
- ❑ Wash and rinse containers indoors before storing them outdoors.
- ❑ If outside or in covered areas, minimize runon of storm water by grading the land to divert flow away from containers.
- ❑ Inventory all raw and spent materials.
- ❑ Clean around vents and stacks.
- ❑ Place tubs around vents and stacks to collect particulate.
- ❑ Inspect air emission control systems (e.g., baghouses) regularly, and repair or replace when necessary.
- ❑ Store wastes in covered, leak proof containers (e.g., dumpsters, drums).
- ❑ Consider shipping all wastes to offsite landfills or treatment facilities.
- ❑ Ensure hazardous waste disposal practices are performed in accordance with Federal, State, and local requirements.

Manufacturers of Electronic and Electrical Equipment

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Outdoor Unloading and Loading

- ❑ Confine loading/unloading activities to a designated area.
- ❑ Consider performing loading/unloading activities indoors or in a covered area.
- ❑ Consider covering loading/unloading area with permanent cover (e.g., roofs) or temporary cover (e.g., tarps).
- ❑ Close storm drains during loading/unloading activities in surrounding areas.
- ❑ Avoid loading/unloading materials in the rain.
- ❑ Inspect the unloading/loading areas to detect problems before they occur.
- ❑ Inspect all containers prior to loading/unloading of any raw or spent materials.
- ❑ Consider berming, curbing, or diking loading/unloading areas.
- ❑ Dead-end sump where spilled materials could be directed.
- ❑ Drip pans under hoses.
- ❑ Use dry clean-up methods instead of washing the areas down.
- ❑ Train employees on proper loading/unloading techniques and spill prevention and response.

Outdoor Material Storage

- ❑ Confine storage of materials, parts, and equipment to designated areas.
- ❑ Consider secondary containment using curbing, berming, or diking all liquid storage areas.
- ❑ Train employees in spill prevention and response techniques.
- ❑ Train employees on proper waste control and disposal.
- ❑ Consider covering tanks.
- ❑ Ensure that all containers are closed (e.g., valves shut, lids sealed, caps closed).
- ❑ Wash and rinse containers indoors before storing them outdoors.
- ❑ If outside or in covered areas, minimize run on of storm water by grading the land to divert flow away from containers.
- ❑ Leak detection and container integrity testing.
- ❑ Direct runoff to onsite retention pond.
- ❑ Inventory all raw and spent materials.
- ❑ Clean around vents and stacks.
- ❑ Place tubs around vents and stacks to collect particulate.
- ❑ Inspect air emission control systems (e.g., baghouses) regularly, and repair or replace when necessary.
- ❑ Store wastes in covered, leak proof containers (e.g., dumpsters, drums).
- ❑ Consider shipping all wastes to offsite landfills or treatment facilities.
- ❑ Ensure hazardous waste disposal practices are performed in accordance with Federal, State, and local requirements.

Appendix B2

BMPs for Other Specifications

Vehicle Service Facilities

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Changing Oil and Other Fluids

- ❑ Whenever possible, change vehicle fluids indoors and only on floors constructed of non-porous materials. Avoid working over asphalt and dirt floors – surfaces that absorb vehicle fluids.
- ❑ If vehicle fluids must be removed outdoors, always use a drip pan. Prevent spills from reaching the street or storm drain by working over an absorbent mat and covering nearby storm drains, or working in a bermed area. If necessary, use absorbent socks to create a bermed area.
- ❑ When draining fluids into a drain pan, place a larger drip pan (e.g., 3' x 4') under the primary drain pan to catch any spilled fluids.
- ❑ Divert storm water around storage areas with ditches, swales and/or berms. Transfer fluids drained from vehicles to a designated waste storage area as soon as possible. Drain pans and other open containers of fluids should not be left unattended unless they are covered and within secondary containment.
- ❑ Store waste containers of antifreeze and oil within secondary containment. Antifreeze and waste oil should be stored separately and recycled, or disposed of as hazardous waste.
- ❑ Never pour vehicle fluids or other hazardous wastes into sinks, toilets, floor drains, outside storm drains, or in the garbage. These substances should be kept in designated storage areas until recycled or safe disposal.
- ❑ Drain fluids from leaking or wrecked vehicles as soon a possible, to avoid leaks and spills.
- ❑ Consider using a quarter barrel, vacuum pump, or drain pan with built-in pump to transfer fluids.

Cleaning Engines and Parts, and Flushing Radiators

- ❑ Eliminate discharges from these operations to the sanitary sewer and storm drains. Use a licensed service to haul and recycle or dispose of wastes.
- ❑ Designate specific areas or service bays for engine, parts, or radiator cleaning. Do not wash or rinse parts outdoors.
- ❑ Use self-contained sinks and tanks when working with solvents. Keep sinks and tanks covered when not in use.
- ❑ Inspect degreasing solvent sinks regularly for leaks, and make necessary repairs immediately.
- ❑ Avoid soldering over drip tanks. Sweep up drippings and recycle or dispose as hazardous waste.
- ❑ Rinse and drain parts over the solvent sink or tank, so that solvents will not drip or spill onto the floor. Use drip boards or pans to catch excess solutions and divert them back to a sink or tank.
- ❑ Allow parts to dry over the hot tank. If rinsing is required, rinse over the tank as well.
- ❑ Collect and reuse parts cleaning solvents and water used in flushing and testing radiators. When reuse is no longer possible, these solutions may be hazardous wastes, and must be disposed of properly.
- ❑ Never discharge cleaning solutions used for engines or parts into the sewer system without adequate treatment. Most facilities have these solutions hauled off-site as hazardous waste because of the permits necessary for on-site treatment.
- ❑ Rinse water may only be discharged to the sanitary sewer with adequate treatment and approval of the sewage treatment plant.
- ❑ Never discharge wastewater from steam cleaning, or engine/parts cleaning to a street, gutter, or storm drain.
- ❑ Sweep or use a vacuum to clean up dust and debris from scraping or bead blasting radiators.
- ❑ Use static tanks for rinsing to reduce the volume of discharged rinse water.
- ❑ Use counter-current rinsing to reduce water usage and rinse water discharges.

Washing Cars and Other Vehicles

Regular Activity

- ❑ If car washing is a central business activity, the most desirable option is to treat and recycle the wash water.
- ❑ Designate a vehicle washing area and wash cars and trucks only in that area. This "wash pad" should be bermed or protected from storm drains and should drain to an oil/water separator before discharging to the sewer.
- ❑ Cover an outside wash pad or minimize the area of an uncovered pad to reduce the amount of rainwater reaching the sewer. Consult the local sewage treatment plant for guidance.
- ❑ Minimize the use of acid-based wheel cleaners. These products may require additional treatment (beyond oil/water separation) before discharge to the sewer.

Occasional Activity

- ❑ Even biodegradable soap is toxic to fish and wildlife. Whenever possible, take vehicles to a commercial car wash.
- ❑ If soap is used in washing, the wash water must be collected and discharged, preferably with treatment, to the sanitary sewer. This water cannot be discharged to a storm drain.
- ❑ Never rinse off spray-on acid-based wheel cleaners where rinse water may flow to a street, gutter, or storm drain.

New Vehicles

- ❑ If cleaning the exterior of new vehicles with only water, the discharged water may go directly to the storm drain.
- ❑ Always protect the storm drains from solvents used to remove protective coatings from new cars. Discharges of these solvents to the sanitary sewer must receive adequate treatment and approval of the sewage treatment plant.

Body Repair and Painting

- ❑ Whenever possible, conduct all body repair and painting work indoors or under cover.
- ❑ When receiving damaged vehicles, inspect for leaks. Use drip pans if necessary.
- ❑ When cleaning auto body parts before painting, minimize use of hose-off degreasers. Brush off loose debris and use rags to wipe down parts.
- ❑ Use dry cleanup methods such as vacuuming or sweeping to clean up dust from sanding metal or body filler. Debris from wet sanding can be allowed to dry overnight on the shop floor, then swept and vacuumed. Liquid from wet sanding should not be discharged to the storm drain.
- ❑ Minimize waste paint and thinner by carefully calculating paint needs based on surface area and using the proper sprayer cup size.
- ❑ Do not use water to control overspray or dust in the paint booth unless this wastewater is collected. This water should be treated before discharge into the sewer system.
- ❑ Clean spray guns in a self-contained cleaner. Recycle the cleaning solution when it becomes too dirty to use. Never discharge cleaning waste to the sewer or storm drain.
- ❑ Use sanding tools equipped with a vacuum to pick up debris and dust.
- ❑ Reduce waste by using low-volume paint mixing equipment and high-efficiency painting tools.

Keeping a Clean Shop

- ❑ Use drip pans under leaking vehicles to capture fluids.
- ❑ Sweep or vacuum the shop floor frequently. Use mopping as an alternative to hosing down work areas.
- ❑ If mopping is used to clean shop floors:
  - Spot clean any spilled oil or fluids using absorbents or rags.
  - Use dry cleanup methods: Sweep the floor using absorbents.
  - After steps 1 and 2 above (if mopping is still needed), mop and discharge mop water to the sanitary sewer.
- ❑ Do not pour mop water into the parking lot, street, gutter, or storm drain.
- ❑ Remove unnecessary hoses to discourage washing down floors and outside paved areas.
- ❑ Regularly sweep parking lots and areas around facility instead of washing them down with water.
- ❑ Clean fuel dispensing areas with absorbent instead of water.
- ❑ Collect all metal filings, dust, and paint chips from grinding, shaving, and sanding, and dispose of the waste properly. Never discharge these wastes to the storm drain or sanitary sewer.
- ❑ Collect all dust from brake pads separately and dispose of the waste properly. Never discharge these wastes to the storm drain or sanitary sewer.
- ❑ Send rags to an industrial laundry.
- ❑ Consider using an oleophilic mop (picks up oil and not water) to reduce the volume of waste liquids collected and to reduce disposal cost.

Storage

- ❑ Store hazardous materials and wastes where they are protected from rain and in a way that prevents spills from reaching the sanitary sewer or storm drain.
- ❑ Keep lids on waste barrels and containers, and store them indoors or under cover to reduce exposure to rain.
- ❑ All hazardous wastes must be labeled according to hazardous waste regulations. Consult the Fire Department or a local hazardous waste agency for details.
- ❑ Keep wastes separated to increase waste recycling/disposal options and to reduce costs.
- ❑ Never mix waste oil with fuel, antifreeze, or chlorinated solvents. Consult a hazardous waste hauler for details.
- ❑ Double-contain all bulk fluids to prevent accidental discharges to the sewer and storm drain. Consult the Fire Department for details.
- ❑ Keep storage areas clean and dry. Conduct regular inspections so that leaks and spills are detected as soon as possible.
- ❑ Carefully transfer fluids from drip pans or collection devices to designated waste storage areas, as soon as possible.
- ❑ When receiving vehicles to be parted or scavenged, park them on a paved surface and immediately drain and collect gasoline and other fluids properly.
- ❑ Drain all fluids from components, such as engine blocks, that may be stored for reuse or reclamation. Keep these components under cover and on a drip pan or sealed floor.
- ❑ Store new batteries securely to avoid breakage and acid spills during earthquakes. Shelving should be secured to the wall. Store used batteries indoors and in plastic trays to contain potential leaks. Recycle old batteries.

Spill Control

- ❑ The best spill control is prevention.
- ❑ Maintain and keep current, as required by other regulations, a spill response plan and ensure that employees are trained on the elements of the plan.
- ❑ Minimize the distance between waste collection points and storage areas.
- ❑ Contain and cover all solid and liquid wastes – especially during transfer.
- ❑ Purchase and maintain the proper absorbent materials for containment and cleanup of different spills, and make sure they are easily accessible anywhere in the shop. Saturated absorbents generally must be disposed of as hazardous waste.
- ❑ Clean up spills immediately and completely. Spills are not considered cleaned up until the absorbent is picked up.
- ❑ Cover nearby downstream storm drains when transferring fuel from tank truck to fuel tank.
- ❑ Seal or remove floor drains to prevent accidental discharge to the sewer system.

Recycling / Treatment

- ❑ Recycle solvents, paints, oil filters, antifreeze, motor oil, batteries, and lubricants.
- ❑ Set up a system (separate, well-labeled containers in a convenient location) to make it easy for employees to separate wastes and to recycle.
- ❑ Choose treatment systems that are easy to maintain and repair.
- ❑ Properly maintain and service all pretreatment equipment, including sumps, separators, and grease traps to ensure proper functioning. Follow manufacturer's maintenance instructions and consider using a licensed service to conduct maintenance on a regular basis.
- ❑ Frequently inspect equipment for malfunctioning parts, leaks, and the accumulation of pollutants such as oil and grease. Since pretreatment equipment is supposed to remove pollutants, a lack of accumulation may be a sign of a malfunction.
- ❑ Retain only a licensed service to haul away and dispose of wastes.
- ❑ Install self-contained, zero-discharge treatment systems that recycle wastewater.

Purchasing

- ❑ Ask a local supplier for information on less toxic chemical cleaners and other products. There are alternatives to chlorinated solvents; chlorofluorocarbons; and 1,1,1, trichloroethane (TCA).
- ❑ Ask a local supplier for information on the composition of brake pads. Recent studies have shown that brake dust washed off streets by rain may be the single biggest contributor of copper, a major pollutant, to waterways. Awareness and understanding of this problem and the available alternatives will help create future solutions.
- ❑ Minimize inventory by purchasing only as much product as needed in the foreseeable future. This will reduce storage space needs, inventory tracking costs, and liability for storing hazardous materials and waste.

Education and Training

- ❑ Train all employees upon hiring, and annually thereafter, on personal safety, chemical management, and proper methods for handling and disposing of waste. Make sure that all employees understand stormwater discharge prohibitions, wastewater discharge requirements, and these best management practices. Use a training log or similar method to document training.
- ❑ Post instructional/informational signs around the shop for customers and employees. Put signs above all sinks prohibiting discharges of vehicle fluids and wastes. Put signs on faucets (hose bibbs) reminding employees and customers to conserve water and not to use water to clean up spills.
- ❑ Label drains within the facility boundary, by paint/stencil (or equivalent), to indicate whether they flow to an oil/water separator, directly to the sewer, or to a storm drain. Labels are not necessary for plumbing fixtures directly connected to the sanitary sewer.

Gasoline Stations

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Existing Facilities:

Fuel Dispensing Areas

- ❑ Maintain fuel dispensing areas using dry cleanup methods such as sweeping for removal of litter and debris, or use of rags and absorbents for leaks and spills. Fueling areas should never be washed down unless the wash water is collected and disposed of properly.
- ❑ Fit underground storage tanks with spill containment and overfill prevention systems meeting the requirements of Section 2635(b) of Title 23 of the California Code of Regulations.
- ❑ Fit fuel dispensing nozzles with "hold-open latches" (automatic shutoffs) except where prohibited by local fire departments.
- ❑ Post signs at the fuel dispenser or fuel island warning vehicle owners/operators against "topping off" of vehicle fuel tanks.

Facility - General

- ❑ "Spot clean" leaks and drips routinely. Leaks are not cleaned up until the absorbent is picked up and disposed of properly.
- ❑ Maintain and keep current, as required by other regulations, a spill response plan and ensure that employees are trained on the elements of the plan.
- ❑ Manage materials and waste to reduce adverse impacts on storm water quality.
- ❑ Train all employees upon hiring and annually thereafter on proper methods for handling and disposing of waste. Make sure that all employees understand storm water discharge prohibitions, wastewater discharge requirements, and these best management practices. Use a training log or similar method to document training.
- ❑ Label drains within the facility boundary, by paint/stencil (or equivalent), to indicate whether they flow to an oil/water separator, directly to the sewer, or to a storm drain. Labels are not necessary for plumbing fixtures directly connected to the sanitary sewer.
- ❑ Inspect and clean if necessary, storm drain inlets and catch basins within the facility boundary before October 1 each year.

Outdoor Waste Receptacle Area

- ❑ Spot clean leaks and drips routinely to prevent runoff of spillage.
- ❑ Minimize the possibility of storm water pollution from outside waste receptacles by doing at least one of the following:
  - use only watertight waste receptacle(s) and keep the lid(s) closed, or
    grade and pave the waste receptacle area to prevent run-on of storm water, or
  - install a roof over the waste receptacle area, or
  - install a low containment berm around the waste receptacle area, or
  - use and maintain drip pans under waste receptacles.

Air/Water Supply Area

- ❑ Minimize the possibility of storm water pollution from air/water supply areas by doing at least one of the following:
- ❑ Spot clean leaks and drips routinely to prevent runoff of spillage, or
  - grade and pave the air/water supply area to prevent run-on of storm water, or
  - install a roof over the air/water supply area, or
  - install a low containment berm around the air/water supply area.

New or Substantially Remodeled Facilities:

Note: Substantially Remodeled Facilities - One of the following criteria must be met before a facility is deemed to be substantially remodeled and the design elements described above are required to be included in the new design and construction:

- the canopy cover over the fuel dispensing area is new or is being substantially replaced (not including cosmetic/facial appearance changes only) and the footing is structurally sufficient to support a cover of the minimum dimensions described above, or
- one or more fuel dispensers are relocated or added in such a way that the Portland cement concrete (or, equivalent) paving and grade break or the canopy cover over the fuel dispensing area do not meet the minimum dimensions as defined above. Replacement of existing dispensers or underground storage tanks do not, by themselves, constitute a substantial remodel.

Fuel Dispensing Areas

- ❑ Fuel dispensing areas must be paved with Portland cement concrete (or, equivalent smooth impervious surface), with a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable. The fuel dispensing area is defined as extending 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus 1 foot, whichever is less. The paving around the fuel dispensing area may exceed the minimum dimensions of the "fuel dispensing area" stated above.
- ❑ The fuel dispensing area must be covered, and the cover's minimum dimensions must be equal to or greater than the area within the grade break or the fuel dispensing area, as defined above. The cover must not drain onto the fuel dispensing area.

Note: Special note on the paving BMP. This best management practice is not specifically intended to apply to facilities that install a new canopy where no canopy existed.

Note: Special note on the canopy BMP. This best management practice is not specifically intended to apply to facilities that:

- are located in geographic areas not subject to federal or state storm water regulations
- do not discharge storm water either directly to surface waters or indirectly, through municipal separate storm drain systems
- do not add fuel dispensers
- replace, relocate, or add fuel dispensers within the parameters described in the BMP
- increase their throughput of fuel dispensed without modifying their equipment
- make only cosmetic or facial appearance changes to their existing canopy

Outdoor Waste Receptacle Area

- ❑ Grade and pave the outdoor waste receptacle area to prevent run-on of storm water to the extent practicable.

Air/Water Supply Area

- ❑ Grade and pave the air/water supply area to prevent run-on of storm water to the extent practicable.

Note: For the purposes of the waste receptacle area and air/water supply area BMPs only, the facility is considered substantially remodeled if the area around the waste receptacle area or air/water supply area is being regraded or repaved.

Restaurants

The following comprehensive list of Best Management Practices (BMPs) are not required to be implemented by all facilities but are only *suggested BMPs* that may be appropriate for this industry type or sector. The BMPs are provided as guidance to help facility owners conduct a site-specific assessment and develop their own programs to reduce potential pollutants to the storm drain system and receiving waters. Facility owners may develop and use additional BMPs if desired.

Housekeeping

- ❑ Clean floor mats, filters, and garbage cans in a mop sink, floor drain, or proper outside area connected to the sanitary sewer with an oil/water separator. Don't wash them in a parking lot, alley, sidewalk, or street.
- ❑ Pour washwater into a janitorial or mop sink. Don't pour onto a parking lot, alley, sidewalk, or street.
- ❑ Use dry methods for spill cleanup (sweeping, cat litter, etc.). Don't hose down spills.
- ❑ Keep dumpster area clean and lid closed. Don't fill it with liquid waste or hose it out.
- ❑ Cover, repair or replace leaky dumpsters and compactors, and/or drain the pavement beneath them to the sanitary sewer.

Recycling and Disposal

- ❑ Separate wastes. Keep recyclable wastes in separate containers according to the type of material. They are easier to recycle if separated.
- ❑ Recycle grease and oil. Don't pour it into sinks, floor drains, or onto a parking lot or street. Look in the yellow pages for "Renderers" or call the County of Los Angeles' Recycling & Household Hazardous Waste Hotline (888) CLEANLA.
- ❑ Recycle the following materials:
  - food waste (non-greasy, non-animal food waste can be composted)
  - paper and cardboard
  - container glass, aluminum, and tin
  - pallets and drums
- ❑ Dispose of toxic waste properly. Toxic waste includes used cleaners, and rags (soaked with solvents, floor cleaners, and detergents). For disposal information call: (888) CLEANLA.

Purchasing

- ❑ Look for and purchase "recycled" and "recyclable" containers. In doing so, a use for the recyclable materials that people collect and recycle is ensured.

Education and Training

- By including urban runoff training in employee orientations and reviews, employees can help prevent pollution. Promote these BMPs:
  - Storage containers should be regularly inspected and kept in good condition.
  - Place materials inside rigid, durable, water-tight and rodent-proof containers with tight fitting covers.
  - Store materials inside a building or build a covered area that is paved and designed to prevent runoff from entering storm drains.
  - Place temporary plastic sheeting over materials or containers and secure the cover with ties and weighted objects. (Not appropriate for storing liquids.)
  - Post BMPs where employees and customers can see them. Showing customers ocean protection is good public relations.
  - Explain BMPs to other food businesses through business associations or chambers of commerce.
  - Stencil catch basins near the workplace with Stormwater Program stencils that say "No Dumping: This drains to ocean."

Appendix C
Site Visit Guidance

As specified in the Permit, the minimum activities that must be conducted during the educational site visit are the following:

- Consult with a representative of the facility to explain applicable stormwater regulations.
- Distribute and discuss applicable BMP and educational materials.
- Where applicable, notify industrial facilities of requirements under the General Industrial Permit.
- Follow up with facilities, as necessary, to provide advice in complying with local legal authority.
- Submit a list of facilities visited each quarter to the Principal Permittee.

These visits are intended to be solely educational. An effective education program can improve business compliance with stormwater regulations using a minimum of enforcement activity. Staff should provide the facilities with information regarding the local stormwater program and, when requested, provide advice on understanding and complying with the local stormwater regulations. The following sections describe guidance for conducting the site visit program.

C.1 PRE-VISIT CONTACT (OPTIONAL)

Some municipalities have found it effective to seek the advice of groups representing the businesses in the site visit program. Groups representing businesses may include the chamber of commerce and trade associations for the specific business type. The Permittee may wish to participate in group meetings, meet with representatives one-on-one, or form a business committee. There, they may seek the group's advice in formulating the program, request membership lists for identifying specific businesses, and seek co-sponsorship of the program. Businesses are often more receptive to contacts from groups/individuals they are familiar with than from Permittee representatives.

Some California permittees contact businesses prior to the site visit. A pre-visit contact usually improves the responsiveness of the business to the visit if there is no existing relationship between the Permittee representative and the business. A letter may be sent to the business describing the program, preferably signed by the mayor or other well known Permittee representative. In some cases, such as for large groups of a particular business type, a workshop may be practical.

C.2 EDUCATIONAL SITE VISIT

Site visits can be conducted as a stand-alone visit or in conjunction with other programs where public agency staff are already on site for other purposes. This may include an Industrial Waste, Fire Department, or Health Department inspection. It may be preferable to use staff who already have a working relationship with the business, or who have some knowledge of the particular business type, as they may be able to get the most attention and cooperation from the facility staff.

The site visit should be conducted with an employee of the business with the appropriate knowledge of, and responsibility for the operations. Setting up appointments could help target the appropriate individual, but is not necessary if this presents scheduling problems.

The visitor should introduce the purpose of the visit, discuss the goals of the stormwater program, and describe applicable codes and ordinances. This is also a good time to verify the database information regarding the facility, and make a note of any changes.

The visitor should distribute educational materials about the stormwater program and best management practices (BMPs). Some facilities that are regulated under the General Industrial Permit may not be aware of the requirements. These facilities should be given the necessary information about their requirements to file a notice of intent (NOI), develop a stormwater pollution prevention plan (SWPPP), conduct monitoring and submit annual reports.

Much of this information can be distributed in the form of handouts. A general stormwater quality brochure for industrial/commercial facilities and information on the requirements of the General Industrial Permit will be developed as a joint effort between the Industrial/Commercial Educational Program and the Five-Year Storm Water Public Education Strategy component of the Public Information and Participation Program and will be complete in time to use in this program. In addition, Appendix B contains BMP lists for all industrial groups regulated under Phase 1 of the federal stormwater program that may be used as a basis for fact sheets to distribute as needed.

At the discretion of the Permittee and the site visit representative, and with full voluntary cooperation of the owner, the site visit could also include a "walk-through" of the facility to observe existing operations, point out potential problems or illicit discharges, and discuss possible BMPs. This would not be mandatory, but could provide more effective education when the business representative is cooperative and interested in improving conditions.

If desired, a form could be used to list specific activities and/or areas at the facility that may be potential sources of stormwater pollution, with suggestions for controlling the pollution. The form could be provided to the business representative for use in implementing the selected controls. It is not necessary for the Permittee to keep a copy of the form--many businesses may be more responsive if no detailed record of the assessment leaves the site.

Permittees are not required to conduct all visits at the same time and may want to stagger the visits, using the first round as a pilot program to receive feedback on the effectiveness of the educational message, gain practical experience on effective ways to initiate business visits, and define the level of effort needed for effective educational visits. Many other municipalities have conducted similar site visits, and could be a valuable source of information. Following the pilot program, the educational materials, means of contact, and other aspects of the program could be revised to reflect lessons learned.

C.3 FOLLOW-UP (OPTIONAL)

Follow-up will be conducted as deemed necessary and appropriate by the Permittee. In many cases, no follow-up action will be required (e.g., the business representative clearly comprehends the educational material, and no evidence of significant stormwater pollution or illicit discharges exist). In other cases, follow-up may consist of a mailed package of items such as pertinent regulatory and technical information. In cases where the Permittee representative notices potential pollutants or illicit discharges during the site visit, follow-up site visits may be a way to provide additional assistance to the business in complying with existing regulations. This type of follow-up would be conducted with the cooperation of the business and would be solely educational in nature.

Some Permittees may choose to conduct a formal inspection as follow-up according to the Permittee's inspection and enforcement strategy. Regulatory follow-ups would be conducted with trained staff to determine if possible ordinance violations exist and, if necessary, to initiate enforcement action. This step would be taken only if a condition was observed on site during the educational site visit which resulted in a readily apparent illicit discharge or illicit connection to the storm drain system.

C.4 REPORTING

A list of facilities visited will be submitted to the Principal Permittee on a quarterly basis. If all facilities have previously been reported using the database format, this can be done as a simple list of facility names identified by category. Alternatively, facilities can be reported using the database format, and any changes in facility information noted during the visit or from other means can be submitted at that time.

Department of Public Works

Stormwater/Urban Runoff Public Education Program

EXECUTIVE SUMMARY

Purpose of the Five-Year Public Education Plan

Under the 1996 NPDES Los Angeles County Municipal Stormwater Permit, the County was required to develop a comprehensive educational stormwater and urban runoff outreach program to reach as many Los Angeles County residents as possible. The County will continue with a public education and outreach program based on the results of research conducted during the final year of the campaign and in compliance with the 2001 NPDES permit. The County will choose an appropriate combination of educational outreach tools and activities to measurably increase the knowledge of the target audiences about the impacts of stormwater pollution and potential solutions to reduce the problems caused; and attempt to change the behavior of target audiences by encouraging those audiences to implement appropriate solutions.

What Can the County and the Co-permittees Accomplish Through the Plan?

In developing and implementing the second Five-Year Public Education Plan, Los Angeles County and its Co-permittees will meet the basic requirements outlined in the Permit using methods that are cost-efficient and that may change behavior. Through a unified and coordinated effort, the plan can:

- change the mind-set of a large, diverse population while educating target audiences about solutions to stormwater pollution;
- create synergy by using an overarching campaign approach, "look" and tone, and by unifying multiple pollution prevention efforts;
- impact more than one audience at a time with a single campaign;
- build bridges and forge partnerships that integrate city and jurisdictional programs; and,
- document whether the education outreach effort resulted in behavior change that reduced pollution.

EXECUTIVE SUMMARY

Addressing the Greatest Challenges

Research will continue to play an integral role in the development of the Five-Year Public Education Plan. Through focus groups and quantitative surveys, as well as secondary research, the challenges listed below will be addressed.

- Deciding specifically on which target audiences to focus that will produce the best results in reducing pollution activities
- Discovering exactly what motivates or influences behavior change in each target audience
- Addressing the ethnic, cultural, geographical and socio-economic diversity of the County
- Demonstrating whether the public education effort has helped to reduce stormwater/urban runoff pollution
- Finding the most effective, and cost-effective means of educating the public.

The Five-Year Public Education Plan -- In A Nutshell

- Founded on research
- Meets the requirements of the NPDES Permit
- Broad-based with an overarching theme
- Flexible, adaptable, cost-effective
- Provide simple, everyday actions that will make a difference
- Integrated and coordinated
- Results-oriented

Overarching Approach

In order to achieve maximum effectiveness, and build on the recognition already gained under the first Five-Year Plan, the communications program developed for this Five-Year Public Education Plan will continue to use the overarching approach developed in 1996. The overarching approach provides a campaign identity, a personalized feel and applicable "how to" information about how to solve the stormwater pollution problem. The approach is defined for the Education Plan as a whole and remains consistent throughout the life of the Plan;

however, the components within the phases that roll-out over the next four years will be fluid to reflect the evolving message for each targeted audience.

Research supports the value of a "problem/solution"-oriented approach with strong, impactful visuals and an identifying "signature." The common elements of the overarching approach include: (1) an identified problem caused by stormwater pollution; (2) an identified solution(s) to the particular problem; (3) the campaign theme tagline; (4) 1-888-CLEAN-LA hotline number and 888CleanLA.com website if applicable; and (5) **Project Pollution Prevention** identifying signature.

General Public/Residents

Past research shows 83% of the County's population can be reached through an integrated, multi-faceted communications campaign which focuses on a desire to "do the right thing" and provides how to information about alternative, anti-polluting behaviors. This population group also will be impacted by credible messages that imply that a change in their behavior will help protect children, and preserve the environment for the future. An additional 9% -- a harder-to-reach, but high polluting population -- needs a more highly-focused campaign and is not likely to be motivated by doing the right thing, or preserving the environment. However, they will listen to messages that involve protecting children and the beach or other watersport areas.

Mass media has proven to be the key source of pollution prevention information for the general public. Other General Public/Residents communications tools -- media relations, public service announcements (PSAs), instructional materials, corporate and entertainment industry tie-ins, community events, and the 1-888-CLEAN-LA hotline and website -- are planned to work in-concert with the advertising.

Businesses

The Businesses portion of the Five-Year Public Education Plan will be updated significantly based on the results of the research conducted in Summer 2001. Past efforts can be evaluated for effectiveness and a new approach will be developed based on the need for education and the requirements of the new NPDES permit.

EXECUTIVE SUMMARY

School Education

Given the existence of current and successful school education programs in Los Angeles County, an alliance with one or more of these programs is the most effective and cost-efficient method of communicating with school children. For the 886,000 K-6 children, the County's school program and youth events will provide the vehicle to teach children to reduce, reuse and recycle, thereby eliminating pollution. For the County's more than 621,000 middle- and high-school children, the County-sponsored Secondary Student Environmental Education Program presented by TreePeople will create a higher understanding of environmental issues and motivate teenagers to take action.

Measure of Effectiveness

To assess the overall effectiveness of the Five-Year Public Education Plan, research will be conducted after large-scale media campaigns, whenever feasible for additional efforts at public outreach, and at the conclusion of the plan. This research will encompass quantitative studies in the General Public/Residents and Businesses audiences. It will include a component to assess why and how the program is working so that the research will continue to help in the refinement and improvement of the program over the life of the Plan. Additionally, other anecdotal, qualitative and quantitative measurements will be implemented periodically to assess the effectiveness of the program among specific audiences or in different media channels.

Evaluation data will be collected through a telephone survey of men and women, 16+ years old, who have been residents of Los Angeles County for at least six months. Focus groups or other survey methods may be used as well. Analysis of the data will include correlating the information gathered against the benchmark established in the pre-campaign segmentation study.

Format of the Five-Year Public Education Plan

This preliminary draft of the Five-Year Public Education Plan contains two sections:

1. Overview
2. Implementation by Target Audience

EXECUTIVE SUMMARY

Within Section 2, Implementation by Target Audience, the audience subsections detail the situation analysis for each respective audience, goals and overall communications approach, and an idea of the activities to be implemented.

Urban Runoff and Its Impact on the County's Resources

On a daily basis, millions of gallons of untreated water flush into regional lakes, rivers and the Pacific Ocean. On rainy days, it can jump to six billion gallons. These polluted flows cause public health and safety concerns at the beaches, and leave behind hundreds of tons of solid waste to be cleaned up, costing millions of dollars annually.

Even after a generation of fighting water pollution, studies show the danger of illness to people swimming in waters near urban storm drain outfalls. The urban runoff that drains into the County's storm channels first litters and contaminates neighborhood streets and walks. Litter, fertilizers, pesticides, automobile soot and oil drippings, pet waste, and deteriorating leaves and plant debris not only make our communities unattractive, but also are swept untreated down the storm drains into our waterways.

In total, the impacts of stormwater/urban runoff pollution encompass:

- losses to the County's $2 billion a year tourism economy
- health risks associated with swimming in areas near storm drain outfalls
- loss of recreational resources
- dramatic cost increases for cleaning up contaminated sediments
- impaired function and vitality of our natural resources
- losses to Southern California's commercial and sportfishing industry
- contamination of marine life

Opportunities for the Five-Year Public Education Plan

In developing and implementing this Five-Year Public Education Plan, Los Angeles County hasan important opportunity to meet the basic requirements outlined in the NPDES Permit (Immediate Outreach, Industrial/Commercial Education Program, Five-Year Public Education Strategy) using methods that are cost-efficient and that effectively change behavior. Through a unified and coordinated effort, the plan can:

- change the mind-set of a large, diverse population and educate target audiences about solutions to stormwater pollution;
- create a broad-based model with a long-term vision for pollution prevention in large geographic areas;

- create synergy by unifying multiple pollution prevention efforts (such as recycling and household hazardous waste) rather than conducting individual, splinter programs;
- build bridges and forge partnerships that integrate city and jurisdictional programs, combine educational outreach with technical understanding, and leverage resources; and,
- document whether the education outreach effort resulted in a behavior change that substantially reduced pollution.

This program will continue to be research-based. It will draw from the experiences and best programs of existing local, state and national programs, as well as create original qualitative and quantitative research to support the development of a comprehensive public education plan. A united effort is the most viable and cost-effective way to achieve success.

Additionally, the County and the Co-permittees are in general agreement about the concept of a campaign overarching approach, "look" and tone that clearly and concisely identifies the program, breaks through the information clutter and, at the same time, allows tailoring by Co-permittees for specific needs.

Additionally, and of equal importance, the overarching approach should not be exclusive to stormwater pollution. Rather, multiple pollution prevention efforts -- solid waste recycling and disposal, household hazardous waste and used oil recycling -- should be coordinated within the overarching approach in their respective efforts and messages.

Our Greatest Challenges

Research served as part of the Plan development process, and on-going monitoring will allow for program adjustments throughout the five years. Overall challenges are:

- discovering exactly what motivates or influences behavior change in each target audience;
- deciding who to target within each audience segment; prioritizing audiences to maximize the budget;
- addressing the vast ethnic, cultural, geographical and socioeconomic diversity of the County; and,
- demonstrating whether the education effort has indeed helped to reduce stormwater/urban runoff pollution.

Maximizing Public Education Budgets

The estimated budget for the Los Angeles County Department of Public Works Five-Year Stormwater/Urban Runoff Public Education Program is $7.5 million, with the Co-permittees having individual budgets for local education efforts. While $7.5 million over five years appears to be a large sum of money, there are almost 10 million people in Los Angeles County to reach with stormwater pollution prevention messages. With an audience of this size, the funds available to the overall effort -- even combined with the Co-permittees' funds -- must be allocated carefully and effectively so that each dollar is directed towards changes in behaviors. Therefore, targeted audiences, and the communications programs aimed at each of these audiences, must be prioritized according to their relative impact on pollution and their willingness to try new behaviors that will reduce the greatest amount of pollutants entering the storm drain system.

The Five-Year Public Education Plan -- In A Nutshell

- Founded on research
- Broad-based with an overarching approach
- Flexible, adaptable, cost-effective
- Provide simple, everyday actions that will make a difference
- Integrated and coordinated
- Results-oriented

◆ OVERALL GOALS ◆

- Reduce the amount of stormwater/urban runoff pollution in Los Angeles County.
- Integrate County, city and jurisdictional programs, appropriately mix educational outreach with technical understanding, and leverage resources.
- Improve general understanding of stormwater/urban runoff pollution prevention methods.
- Incorporate stormwater activities into other County environmental education programs.

◆ OVERARCHING APPROACH ◆

The overarching approach was defined for the 1996 Five-Year Public Education Plan and remains consistent. However, the components that roll-out over the next five years will be fluid to reflect the evolving messages for each targeted audience. The overarching approach will provide a campaign identity, a personalized feel and applicable "how to" information on solving the stormwater pollution problem.

Benefits of the Overarching Approach -- Los Angeles County

- Builds a distinct and distinguishing identity that is visually impactful
- Sends clear, concise and applicable message to the target audiences
- Sets a consistent tone and feel for the entire communications program
- Provides specific information in a personal manner making it more identifiable to the recipient
- Creates unity between all pollution prevention programs (e.g., recycling, household hazardous waste, water pollution)
- Tailorable to and flexible for specific programs, localities, topics and messages

Benefits of the Overarching Approach -- Co-permittees

- Increases efficiencies in cost and production
- Enables Co-permittees to tie-in to the County's program without feeling they are losing their own identity to a county or geographical name
- Raises the synergy and broadens the reach and impact of local campaigns through multiple communications contacts on a variety of levels -- community to countywide -- and through a variety of communications tools

Common Elements of the Overarching Approach

- An identified problem caused by stormwater pollution
- An identified solution(s) to the particular problem
- Campaign theme tagline
- An appeal for personal responsibility to do the right thing

- 1-888-CLEAN-LA hotline number and website (local information can be added for Co-permittee tailoring)
- **Project Pollution Prevention** identifying signature (city logo/name can be included for Co-permittee tailoring)

Campaign Signature

The 5-Year Plan will continue to use the "signature" developed for advertising, collateral materials, media relations and other campaign components to identify a united alliance in preventing pollution in all communities around Los Angeles County.

Potential adaptations/usage in advertising and collateral materials include:

PROJECT Pollution PREVENTION

County signature:	County of Los Angeles (seal optional) **Project Pollution Prevention**
Co-permittee signature: (example only)	City of Long Beach (w/logo, optional) **Project Pollution Prevention**
STOPP signature:	East Los Angeles **Project Pollution Prevention** *"Clean Communities for Economic Growth"*

Situation Analysis Overview

The cities of Los Angeles County and the unincorporated area encompass nearly 10 million people whose socioeconomic levels vary from great wealth to welfare, and who collectively speak more than 90 languages/dialects. It is important that the education program makes an impression on as many of these people as possible and that they understand the actions of each individual *will* make a difference.

Unfortunately, there is no simple solution, no single action, no easy "fix" that will singularly prevent stormwater pollution. A combination of efforts - education, technology, partnerships with business and industry - will be necessary to meet our goals.

The problem is complex from both an action and result standpoint. Stormwater carries nonpoint source pollutants from different and sometimes unidentified sources and flow rates can fluctuate from thousands to billions of gallons in a short time. The education program and prevention solutions must take into account the impact of these many sources of pollution.

From Awareness to Behavior Change

The ongoing stormwater public education programs in Los Angeles County have heightened *awareness* of the problem among media, influential business and government leaders, and certain segments of the general public. These programs have laid a foundation to make the transition from basic education to a call-to-action that motivates and allows for behavior changes. As outlined in the first section, one of the greatest challenges to the program will be to measure behavior changes that actually reduce stormwater pollution. Without the benefit of scientific data that can tell us specifically which pollutants have decreased and in what geographic locale this decrease was found, we are relying on individuals to report on themselves and their neighbors.

Regional Considerations

With many issues within the 4,070-square miles of Los Angeles County being regional in nature, the Permit defines six Watershed Management Areas (WMAs) and calls for the cities within these WMAs to work collaboratively to address education and outreach efforts countywide as well as in their watershed. Currently, many cities have widely differing goals and resources and it is a challenge to forge the cooperative partnerships necessary for Co-permittees to work collaboratively beyond their jurisdictions for the benefit of the entire watershed, and the entire County.

The term "watershed management area" is not part of the general public vocabulary and research has indicated that educating the public about simple everyday actions to enable behavior changes is a more efficient use of funds than educating them on WMAs. This is even more true for Los Angeles County which must address six different WMAs -- many of which are concrete channels not bucolic creeks or rivers.

Given the need to change specific behaviors in order to improve water quality, materials will not address watersheds per se. However, this might be an option for a Co-permittee with messages targeted to address specific waterbody pollution concerns and actions within a specific WMA.

What the General Public Knows or Believes

Although quantitative studies have shown that general awareness of storm drain issues is increasing, previous focus groups[1] indicate that the public has minimal knowledge regarding specific activities that contribute to stormwater/urban runoff pollution (with the notable exception of used motor oil dumping). Research on the effectiveness of the 1996 Five-Year Plan will be available for evaluation in Summer 2001 and will be used to develop the 2001 Five-Year Plan.

---

[1] *Residents and Industry Stormwater Awareness, Practices and Communications Report,* -- Focus Groups, Los Angeles County Department of Public Works, conducted by Pelegrin Research Group, November 1996.

Substances not perceived as environmentally dangerous, such as car washing detergents, garden fertilizers and pesticides, are used freely with no thought to storm drains or urban runoff. With respect to litter in neighborhoods, most residents claim that they, themselves are not at fault. Instead they blame others for the unsightly mess.

There is a low level of knowledge about the *connection* between storm drains and the ocean; that pollutants placed into the storm drain flow directly to an open waterbody without being first treated in some manner. Finally, the level of basic knowledge between English-speaking and Spanish-speaking residents is very similar; however, understanding the difference between the storm drain system and household drains is more confusing for the Spanish-speaking population since the word "alcantarilla" refers to both systems.

Issues of Importance to the General Public

Residents are concerned about the aesthetics associated with storm drains including unsightly garbage, unpleasant smells and the resulting attraction of undesirable animals. Pollutants that offend the senses are universally disliked. Cigarette butts are in this category, not only as a pollutant, but because they are perceived as a sign of uncleanliness. Garbage in the gutter is seen as both offensive to the eyes and nose as well as a great threat to the environment.

Toxicity and health are also important issues with residents. However, national research,[2] as well as local focus groups,[3] confirm there is a lack of understanding about how certain substances people consider to be harmless actually hurt the environment. In the research and in the focus groups, people thought of dog droppings as "fertilizer" and not connected to bacteria found in stormwater. Leaves and yard trimmings are "natural" and not understood as causing an imbalance in the supply of oxygen in the water needed by marine plants and animals. Pesticides and fertilizers are associated with the wholesome activity of home gardening -- and the philosophy of "more is better" unfortunately prevails.[4] Lastly, sediment actually smothers aquatic plants, but the public typically thinks of it in terms of being soil -- a basic component of raising food.[5]

---

[2] *National Geographic*, "Our Polluted Runoff," February 1996.

[3] *Residents and Industry Stormwater Awareness, Practices and Communications Report*, -- Focus Groups, Los Angeles County Department of Public Works, conducted by Pelegrin Research Group, November 1996.

[4] Panel discussion on pollutants, State of Sacramento River Conference, September 1996.

[5] *Residents and Industry Stormwater Awareness, Practices and Communications Report* -- Focus Groups. Ibid.

Many residents fear gutters because of health reasons ... "all the diseases down there." Avoidance of floods was discussed in focus groups as another reason to keep storm drains clean; however, the segmentation study research indicated that only 27% of the general population are very concerned about flooding. And while runoff from sprinklers was considered wasteful, it was not seen as a potential carrier of pollutants. A few residents, however, made the connection between water runoff and dissolved chemicals that can seep from lawn fertilizing and be carried in flowing water to the storm drain.

Themes and Messages Targeted to the General Public/Residents

During previous focus groups, participants were exposed to a series of test themelines and asked to choose the ones they found most compelling. Because general public/residents were less educated about stormwater pollution prevention than the commercial/industry sector participants, they were more attracted to broader themelines (e.g., "You're the solution. Prevent pollution."). Abstract themelines (e.g., "Gone, but not for long." "Can it. Don't dump it.") were seen as confusing and meaningless to residents.

Based on focus group feedback, the final program theme should:

- incorporate personal responsibility and individual empowerment
- be simple and straightforward
- validate and lend importance to individual actions

The focus groups revealed common threads that can be of assistance in designing the Five-Year Public Education Program. In addition, segmentation research provided some additional information about what would motivate key targets to change their behavior. These recommendations are summarized:

- ***Give action-oriented, specific messages.*** Short, specific "do's and don'ts" are favored by many because they are unambiguous, implementable and point to tangible practices that can be adopted or changed.

- ***Emphasize personal responsibility and empowerment.*** Messages that indicate that the individual can make a difference are generally motivating and well received. This type of message is uplifting and diminishes the feeling of powerlessness or despair tied to the perception of a rapidly deteriorating environment.

- ***Build on existing aesthetic concerns for the immediate neighborhood.*** Since the general public is concerned with the offensive effects of urban pollution within their immediate surroundings and neighborhoods, messages that address such concerns have a wide appeal. The well-being of the ocean and beaches, while theoretically important, is not as compelling, especially for those who live away from the coastline.

- ***Build on concerns for children's future and welfare.*** The need to protect children from dirt and disease within their immediate surroundings is a powerful incentive to maintain storm drains that are clean and free of pollutants.

- ***Build on existing knowledge or existing positive practices.*** Messages that amplify and connect to existing positive practices are well received. Messages that connect recycling with urban runoff have the potential to build on an existing momentum as well as of increasing awareness of specific pollutants. The well-established fear of motor oil can be expanded to other pollutants by establishing a similarity.

- ***Build on guilt or shock.*** Messages based on guilt or shock are appealing to those who give pollution a low priority or to those who are cynical about the willingness of others to change behaviors.

- ***Minimize differences by adopting an overarching approach.*** Since there are significant differences in the degree of knowledge and compliance with good practices within the general public audience and between audiences, an overarching message accompanied by different sub-messages can specifically address such differences and be tailored by audiences.

- ***Make information easily accessible for those who want it.*** Ease and convenience are keys in getting people to change behaviors. Those individuals who express an initial interest in pollution prevention practices should be able to obtain additional information in an easily accessible manner.

Communications Approach

There is little disagreement that the general public, as a whole, is concerned about the environment and that most people want to "do the right thing." Research[6] supports this belief and further concludes that "doing the right thing" messages would be well received by some target audiences. The residents in these groups also will be motivated by credible messages related to protecting children and would be inclined to act upon basic information about alternative behaviors.

Other general public/residents communications tools -- media relations, public service announcements (PSAs), instructional materials, corporate and entertainment industry tie-ins, community events, and the 1-888-CLEAN-LA hotline and website -- will be planned to work in-concert with the advertising campaign. A single communications tool should not function as a stand-alone component. Working alone, a single component cannot have the impact that a group of well-timed and integrated activities will have on the target audiences. Messages must be heard repeatedly through a variety of tools and applications in order to make an impression and change behavior.

Snapshot of Activities

1. Advertising
2. Media Relations
3. Public Service Announcements (radio, cable television, print)
4. Instructional Materials Distributed in a Targeted and Activity-Related Manner
5. Corporate/Entertainment Industry Tie-Ins
6. 1-888-CLEAN-LA and 888CleanLA.com
7. Events Targeted to Specific Activities and Population Sub-Groups

[6] Los Angeles County Stormwater Segmentation Study, Resident Population. Ibid.

Activity 1 Advertising

Description -- Overview

The advertising campaign will be "problem/solution"-oriented and designed to communicate using an overarching approach with strong visuals and "how to" messages throughout all media components. Messages will emphasize each person's ability to prevent storm drain pollution through simple behavior changes, and potential consequences if behaviors are not changed. All advertising campaigns will include the 1-888-CLEAN-LA hotline and website, the theme tagline and the signature **Project Pollution Prevention**.

Advertising buys will be planned on an annual basis, and in conjunction with the buy, free media time and space will always be negotiated to maximize reach and dollars spent. Co-permittees can help expand the reach of the campaign by contributing to this annual buy to purchase the most media for the money. They can also play an important role in securing local public service announcements and free media opportunities.

County Responsibilities -- Activity 1

- Concept and production of advertising campaign
- Adapt advertising to other languages as needed
- Provide artwork on disk or photostat to Co-permittees for local tailoring and placement; provide hard copy or tape of radio advertising with a spot for local identification; provide video PSAs in VHS or beta format.
- Create a countywide media plan; initiate countywide media buy and negotiate PSA placements
- Provide counsel and information to Co-permittees for localizing and placing advertising messages within individual cities

Co-permittee Responsibilities -- Activity 1

- Write endorsement/encouragement letters to local radio stations and newspapers supporting and encouraging them to extend or increase usage of PSAs

Activity 2 Media Relations

Description

A successful education and outreach program will require the support of print and electronic media to report on the activities of the program and communicate "how to" messages to residents. Components of a comprehensive media relations program that will ensure the media receives accurate, timely information include:

- media kit
- media releases and advisories
- fact sheets, issue papers, update reports, feature articles, case studies
- editorial board meetings and press briefings
- community/public affairs talk shows
- on-line reporting

Many of the collateral materials developed for the General Public/Residents, Businesses and Public Agency Employees audiences will be included in media information kits along with specific, localized information from the Co-permittees.

Reporters will be approached with relevant stories timed to coincide with the advertising campaign, seasonal activities and other events planned within the Five-Year Public Education Campaign. For example, media releases and advisories update the media on new information, specific program elements, upcoming meetings and activities, and are normally followed by a telephone call to pitch the story. Issue papers will be used to highlight and analyze a specific aspect or topic, provide an expert opinion, and/or propose solutional measures. Update reports are results, successes and/or failures of certain programs, pollution monitoring, regulatory measures enacted; in essence, the "State of Stormwater."

Description -- "Guide to Local Media Relations"

Each Co-permittee will receive a "Guide to Local Media Relations" that will provide the following "how to" information for working with media in their individual communities:

- tips for working with local print and electronic media
- tips for communicating/pitching stories and the types of stories/opportunities to be on the lookout for
- format and examples of media releases, advisories, fact sheets
- distribution practices/policies
- protocol for media interviews
- how to place public service announcements

County Responsibilities -- Activity 2

- Create and produce overarching media kit cover and enclosure information. Media kit cover available for Co-permittee purchase through "group printing" system
- Create and update regularly a countywide media contact/outlet database
- Provide media lists, information, case studies; main source of countywide media information
- Develop and implement annual countywide media relations plan
- Develop and distribute "Guide to Local Media Relations"
- Produce appropriate artwork photostats

Co-permittee Responsibilities -- Activity 2

- Provide local media contacts/outlets for database
- Use the "Guide to Local Media Relations" to implement local media relations

Activity 3 Public Service Announcements

Description

A Public Service Announcement (PSA) is defined by its message, not whether it is free or paid. In reality, a PSA can be either a paid spot or a free spot, and its definition is reflective of the fact that the message is not based on a product sale, but is a service or information provided in the public interest or safety.

While the ultimate goal of a PSA is to have it placed pró bono (free), it is sometimes necessary to pay for the spot, possibly at a reduced rate, to ensure a strong air time or specific newspaper section targeted to the primary audiences. Advertising mediums negotiated for PSAs will be based on the results of the research and supported by budgetary parameters.

County Responsibilities -- Activity 3

- Development and production of PSAs
- Distribute PSA templates, copy, tape to Co-permittees for local placement
- Negotiate countywide PSA time and placement
- Track and evaluate PSA placement

Co-permittee Responsibilities -- Activity 3

- Play broadcast PSA on city news outlets or cable station and place print PSA in city newsletter

Optional

- Negotiate PSA time and space in the local market

Activity 4 "How To" Instructional Materials Distributed in a Targeted and Activity- Related Manner

Description

In the focus groups, general information brochures were rated very low by the general public, mainly due to the time it takes to read them. However, in keeping with the "problem/solution" communications approach, "how to" instructional materials can prove valuable if the information is simple -- stating the problem and a personal, easy solution -- and is distributed in a manner that makes the material meaningful and increases the probability that the recipient will actually read the piece.

Similar to the non-traditional advertising components, "how to" instructional materials should be produced to correspond with the advertising campaign and seasonal activities. For example, during the Spring and Summer, lawncare tip cards can be distributed through nursery/garden stores, garden and horticultural clubs, botanical gardens, lawncare services and homeowners associations.

The basis of the information for the tip cards will be provided by the BMP fact sheets and the many excellent brochures that already exist, having been prepared by the County program or by individual Co-permittees. Technical information and other educational materials will be adapted for general public understanding and relevance.

County Responsibilities --Activity 4

- Determine "how to" materials to be developed and develop format of each
- Write copy for materials and obtain technical and information approvals
- Design and produce materials. Ensure availability of materials to Co-permittees through "group printing" system
- Develop and implement countywide distribution plan

Co-permittee Responsibilities -- Activity 4

- Obtain materials through the "group printing" system and distribute through local channels
- Provide input on "how to" materials needed, preferred formats, or distribution methods.

Activity 5 Corporate, Community Association, Environmental Organization and Entertainment Industry Tie-ins

Description

Partnerships with corporations and businesses, environmental organizations and the entertainment industry are essential to reach audiences on a variety of levels. In many cases, messages tied-in to these types of organizations have more credibility and therefore more potential to be effective. Relationships and partnerships with corporations, environmental organizations and the entertainment industry can expand the message distribution avenues and activities, and supplement program budgets through the following:

- Personal and business endorsements
- Cooperative traditional and non-traditional advertising in the consumer marketplace
- Information distribution through POP displays, product neck-hangers, mailings, tip cards
- Sponsorship of community events and special activities
- Celebrity spokespersons to media and at events
- Special messages on established product packages (e.g., Northern California Coca-Cola and Sprite cans carrying a stormwater awareness message and a 1-800 information number, Spring/Summer 1997)

County Responsibilities -- Activity 5

- Identify countywide corporations, environmental and entertainment industry organizations. Develop and maintain database
- Solicit and implement countywide partnerships
- Provide materials (i.e., advertising, POP display materials, tips cards) as needed for mailings, information counters, ad placement, etc.
- Develop specific materials co-sponsored with corporations and organizations

Co-permittee Responsibilities -- Activity 5

- Identify and pursue any appropriate local partnerships with corporations, and community and environmental organizations to assist in distribution of stormwater education materials. Templates for local tailoring or materials for purchase are available through the County's "group printing" system (This activity can be combined with Activity 4 in the upcoming Businesses audience section)
- Utilize the "Guide to Local Partnerships"
- Support the countywide efforts with a local "thank you" to stores/partners in the local community. Have a telephone conversation with and send a letter to the participating store manager/partner

Activity 6 1-888-CLEAN-LA and 888CleanLA.com

Description

The County of Los Angeles currently advertises and operates 1-888-CLEAN-LA and several of the larger Co-permittees have their own hotline telephone numbers. The County's 24-hour hotline number allows callers to find out about household hazardous waste roundups and used oil recycling, as well as to report clogged catch basin inlets and dumping and illicit discharge violations. The County already has placed this phone number in all appropriate County telephone directories.

The County infrastructure capability and capacity of the 1-888-CLEAN-LA phone number makes it able to handle thousands of calls per day. Coordination between the County and the Co-permittees with individual hotlines numbers is important for dissemination of cohesive information and call handling. Many cities uses the 888 number and website to provide information for their residents.

County Responsibilities -- Activity 6

- Operate effectively and continue to expand the information provided by the 1-888-CLEAN-LA hotline and website
- Promote 1-888-CLEAN-LA through as many vehicles as possible

Co-permittee Responsibilities -- Activity 6

- If a Co-permittee hotline already is in operation, it should be reviewed and updated once annually to ensure that it is easy for the public to use

Activity 7 Events Targeted to Specific Activities and Population Sub-Groups

Description

Events can serve as focal points for the diverse communities of Los Angeles and they bring added dimension to the Five-Year Public Education Plan when incorporated with other communications components. Events provide an opportunity for people with similar interests and a positive inclination to do the right thing to gather and gain "how to" information about preventing stormwater/urban runoff pollution.

Samples of potential events include:

Event	Pre-Qualified Population
♦ Already-scheduled County and local household hazardous waste round-ups	Attending residents are already doing the right thing by recycling HHW, and most are likely to take another step in pollution prevention if handed simple "how to" information as they drive through the round-up.
♦ Cleanup/beautification campaigns (i.e. Coastal Cleanup, neighborhood cleanups, tree-planting)	Residents are already demonstrating their willingness to do the right thing by volunteering to make a community beautiful. If given information in conjunction with this type of event about simple things to do at home or work, these people are most likely to take another step in pollution prevention.
♦ Community fairs and festivals	Fairs and festivals targeted in neighborhoods in which the two primary audiences reside.
♦ Large events (e.g., Earth Day Celebrations, Eco Expo, LA Times Festival of Books, LA County Fair)	These types of events normally attract people who either are already participating in some form of pollution prevention/recycling activities or belong to one of the two primary target audiences.
♦ Ethnic Events (i.e., Cinco de Mayo, Fiesta Broadway)	Hispanic events are a potential means of reaching the Neat Neighbors, Fix It Foul-Ups and particularly the Rubbish Rebels, who are an important audience due to the amount of pollution they create but need a separate message and theme to reach them.

County Responsibilities -- Activity 7

- Determine the most cost-effective countywide events to participate in
- Distribute potential event information to Co-permittees on a regular basis
- Collaborate with Co-Permittees on event attendance whenever possible
- Distribute Co-Permittee materials at events attended whenever possible

Co-permittee Responsibilities -- Activity 7

- Provide local event input to countywide database
- Provide staffing support, if possible, to events
- Target local events and participate on a city-level

◆ BUSINESSES ◆

Situation Analysis Overview

For the business communities, many of the salient points of the general public apply. The focus groups conducted by the County in November 1996 revealed that the *individual people* working within this audience have a moderate to well-informed base of general information about stormwater/urban runoff pollution. This is likely due to the previous outreach efforts targeted to members of the general public. However, with few exceptions, the Businesses audience *as a whole* needs more information and better knowledge of good, anti-polluting business practices. BMP manuals and training programs should not only provide basic education, but also provide specific industry-related information and "how to" activities that are meaningful and motivate businesses to change behavior.

The Fall 1996 focus groups were conducted with managers and employees of restaurants, auto repair shops and construction companies to gain insight related to the current practices, concerns and motivations for these businesses that were specifically identified in the NPDES Permit. In addition, baseline awareness surveys were conducted for the same business groups in Spring 1997. The following sections include many of the findings of the focus groups and awareness surveys. They provide an overview of some of the barriers and issues that make BMP compliance challenging for both the environmental regulator and the businesses being regulated. These barriers and issues must be kept in mind as the Public Education Plans are developed and implemented. The research conducted in Summer 2001 will be used to evaluate the effectiveness of the effort under the first Five-Year Plan and design the 2001 Five-Year Plan.

Target Audiences

Outreach and education to businesses in Los Angeles County will support the Model Programs which target the following groups of facilities or businesses:

- Phase 1 facilities
- Specific businesses identified in the Permit: motor vehicle repair and body shops, automotive parts/accessories facilities and restaurants
- Construction and new development
- Any additional industrial/commercial facilities that are identified by the Watershed Management Committee as having high pollution generating activities with widespread impact on the County

Regulations and Conflicting Regulatory Solutions

While many owners and workers feel burdened by regulations, they also realize they are necessary. Penalties and fines are still the most powerful incentives for compliance; however, many high-risk industrial businesses also want to feel that they are part of the solution, not part of the problem. Beyond pollution prevention, avoidance of work accidents and disposal of waste in a safe manner are strong motivators.

In some cases, businesses report that solving one problem through regulation or practice creates another. For example, it is against food handling regulations to wash non-food materials (i.e., floor mats) in sinks where food is handled; however, these materials invariably are then carried outside to be cleaned where the water and debris wash into the storm drains.

Additionally, related businesses can impact each other's BMP compliance. For example, if a business contracts with a waste disposal company to provide roll-off containers to collect waste, and the container leaks, BMP compliance has been negatively impacted by a force outside their control and becomes another problem to be addressed.

Compliance Can Be As Easy As "Good Housekeeping"

In many instances, implementing BMPs is a simple matter of good housekeeping. However, the degree of thoroughness and completion is impacted by time, convenience and equipment. Also impacting BMP compliance is training the appropriate personnel -- management as opposed to the workers who are most responsible for basic housekeeping jobs such as cleaning, disposal of waste, tidying areas and putting things in proper places. The high rate of turnover in many industries and the consequent need for ongoing training can be a burden to businesses.

Community Reputation

A company's or business's desire to continue to enhance its good reputation within the community can provide a strong motivator in complying with BMPs -- particularly if the company can tap into a customer base that shows a preference for doing business with an environmentally friendly enterprise. In order to take advantage of this motivator, appropriate publicity for compliant businesses should be part of the plan.

Size of Operation Counts

Focus groups brought out that compliance with BMPs varies according to the size of the operation. Typically, larger companies/businesses already have some form of BMP program in place.[7] Infractions are more prevalent in the small, owner-operated businesses where cost impacts can be greater than in larger businesses, especially if specialized equipment or time-consuming procedures are needed. Small companies use BMPs if they: (1) help them comply with regulations; (2) are easy; and, (3) don't cost (or even save) money.

Threats to Compliance

While some BMPs are as easy as good housekeeping, others can be more difficult to implement. There can be increased costs of doing business with some BMP implementation, especially when a business lacks the specialized equipment or the facility set-up, and can't afford the cost of obtaining this equipment. Costs of compliance would be passed on to the customer in higher charges or higher bid prices for proposed jobs. These can decrease a business' competitiveness. The cost of doing business in an already tenuous business climate can be impacted when new or expanding companies feel they are burdened with BMP implementation costs. The challenge is compounded when established businesses that have always done business a certain way are now expected to implement changes that cost money.

Reasons for Adherence to BMPs

According to focus group findings, individuals in the business sectors follow waste disposal rules for a variety of reasons:

- personal safety
- fear of fines and penalties
- fear of exposure to carcinogenic materials
- customers' expectations

---

[7] *Residents and Industry Stormwater Awareness, Practices and Communications Report*, Ibid. And, confirmed by inspectors of the Los Angeles County Department of Public Works, November 1996.

Barriers to BMP Compliance

Barriers to BMP compliance were discussed in the focus groups and include the following:

- lack of financial incentive and/or financial disincentives
- scarcity of recycling centers
- difficulty in teaching workers
- lack of information
- lack of proper equipment
- lack of personal empowerment

Messages and Practices

The business/industry focus groups indicate that much of the themeline and message discussion in the General Public/Residents section (pages 37 and 38) holds true for the Businesses audience. In addition to comments in this earlier discussion, the business/industry focus group found it especially important that messages and activities positively reinforce exemplary practices. Additionally, consideration must be given to some business programs and activities that may need to be modified to address cultural and business sensitivities within certain ethnic communities.

◆ BUSINESSES ◆

Communications Approach

The business outreach component of the Five-Year Public Education Plan is intended to be practical, efficient, and good for businesses as well as the environment in Los Angeles County. The activities described in this section will meet the requirements of the NPDES Permit and work within the parameters of the Model Programs.

The communications activities for business audiences also will take into account that many Los Angeles County enterprises are trying to do the right thing, but have achieved limited success because of the lack of finances and/or a misunderstanding of their own potential to pollute. Education activities implemented in the General Public/Residents Audience will have a spillover effect on the individuals working in the targeted businesses and industries, and education activities within Businesses will have application to many sub-segments of Public Agency Employees. Strategies will be employed to provide resource assistance information (including information about financial assistance) and broad-based education on sound alternatives (BMPs) to prohibited, polluting activities.

Snapshot of Activities

1. "How To" Printed Materials for Broad Range of Businesses
2. Other Educational Printed Materials (Posters, Signage)
3. BMP Workshops for Phase I and II Businesses; Forums and Educational Partnerships
4. Partnerships with Chambers of Commerce, Trade/Business Associations; "Hard-to-Reach" Businesses Outreach
5. Targeted Trade and Business Media Relations
6. Targeted Small Space Print Trade and Business Advertising
7. Advanced Technology and Telecommunications

Activity 1 Production of Printed Materials for Use in Business Outreach Efforts

Description

The County will continue to develop modular BMP "how to" materials: (1) an overview BMP handbook and (2) specific BMP fact sheets-by-industry (for restaurants, automotive businesses, construction companies and related businesses) and by-activity (for Phase I facilities) based on information provided by the Model Program.

The overview handbook will be updated and improved as the foundation of the business/industry information and education package. It will provide a summary of stormwater management in Los Angeles County as well as a good housekeeping philosophy and practices that are applicable to all businesses.

The handbook contains modular and specific industry BMP fact sheets, checklists and applicable posters/flyers that can specifically targeted to the business(es) being educated.

The BMP fact sheets and checklists will:

- be developed with the Industrial/Commercial, New Development/Construction and Educational Site Visit Model Programs;[8]
- encompass a broad range and variety of Phase I and other specified businesses and industries;
- provide practical, "how-to" information presented in a user-friendly manner;
- have countywide application; and,
- be printed under a "group printing"[9] system for cost-effective procurement by Co-permittees (as will the overall handbook)

Other educational information that can be inserted in the overview handbook includes:

- posters already developed by the County for the food and restaurant industry, auto repair, gas stations. Procurement of these posters is available under the "group printing" system

---

[8] Please see Appendices for a complete listing of BMPs developed through the Model Programs.

[9] "Group printing" is a large quantity print run of a single item that provides a lower per unit cost than small quantity runs. This lower cost not only will reduce the printing costs for the Co-permittees, it also will reduce the man-hours in design, copywriting and pre-production work.

- *Blueprint for a Clean Ocean* already developed by the County. Procurement available under "group printing" system
- posters/flyers/brochures developed by individual Co-permittees
- personal communications from individual Co-permittees to specific businesses
- health, safety and product information sheets
- references and resources for further information

Distribution -- Activity 1

- Through County and City's permitting process
- 1-888-CLEAN-LA and 888CleanLA.com
- Public information counters

In addition, these BMP materials will be appropriate for use by public employees who work in the fields of construction, including plan checking, permit review and inspections; educational site visits; food preparation; fleet services/vehicle maintenance; grounds/park maintenance; materials purchasing and storage; environmental education; and waste management. (See Public Agency Employees, page 113)

County Responsibilities -- Activity 1

- Continue to refine BMP materials packages (overall handbook and fact sheets) including industry- and activity-specific, concise "how to" materials
- Provide translation/interpretation to appropriate languages as needed

Co-permittee Responsibilities -- Activity 1

- Purchase materials through the County's "group printing" system of BMP materials and distribute them at City public counters, in appropriate workshops, during educational site visits and other business outreach opportunities
- *Optional:* Add City-produced materials to packets, as appropriate

Activity 2 Other Educational Printed Materials

Description

The purpose of posters, flyers, signage and other similar printed materials is to relay relevant information about stormwater/urban runoff BMPs in a graphic format that is space-effective and that can be understood at a glance. These materials are typically displayed in high-traffic areas of businesses, so information can be viewed by employees repetitively, reinforcing the messages.

Factors to consider when selecting or developing BMP posters, flyers and signage are:

- Illustrations that are striking and show BMPs so well that only a short caption or written explanation is required
- Information that is fundamental, rather than in-depth or detailed
- Information that is reflective and supportive of the BMPs developed by the Model Programs
- Size of the material should take into account the potential of limited available space
- Production of the materials should take into account interior or exterior (weather-proof) posting and should be easily movable if the job is progressive
- Languages -- the most frequently used languages are English, Spanish and Chinese

Signage is particularly suited to help general contractors overcome worker-related challenges, such as training employees and subcontractors, including those who do not speak English. In addition, construction is allowed to progress only by passing permit inspection milestones; control of stormwater runoff is a permit requirement. Having highly visible and durable signage will help reinforce awareness of and cooperation with implementation of BMPs.

Distribution -- Activity 2

- Inside the modular overview handbook
- By County and City inspectors during site visits
- Through County and City's permitting process
- 1-888-CLEAN-LA and 888CleanLA.com
- Public information counters

In addition, these BMP materials will be appropriate for individual merchants who wash sidewalks and for use by public employees who work in the fields of construction, including plan checking, permit review, and inspections; educational site visits; food preparation; fleet services/vehicle maintenance; grounds/park maintenance; materials purchasing and storage; environmental education; and waste management.

County Responsibilities -- Activity 2

- Make existing posters (food and restaurant industry, auto repair, gas station) available to Co-permittees through the "group printing" system
- Develop additional posters for high-priority business activities identified by the Model Programs and through the Baseline Business Survey
- Provide appropriate language translation/interpretation as needed
- Distribute materials through County distribution channels -- site visits, permit process, 1-888-CLEAN-LA phone number, website, workshops, conferences
- Produce a flyer on sidewalk washing for individual businesses

Co-permittee Responsibilities -- Activity 2

- Purchase and distribute existing posters (food and restaurant industry, auto repair, gas station) and any new posters (e.g., sidewalk washing) made available by the County through its "group printing" system. Co-permittee distribution avenues: site visits, permit process, local hotline/help phone number, workshops, conferences

Activity 3 BMP Workshops for High-Risk Businesses in Conjunction With Model Programs. Forums and Educational Partnerships Targeting Polluting Activities Common to a Broad Range of Businesses.

Description

For businesses and/or activities that are identified as high-priority -- those in large numbers and/or have a greater potential to pollute -- workshops will be developed and produced by the County. Specific businesses targeted for workshops include: auto repair shops, restaurants and new development/construction.

Workshops targeting Phase I businesses will focus on specific activities found to be of high priority in the Industrial/Commercial Model Program, such as manufacturers dealing with safe storage and handling of chemicals and other hazardous materials. It should also be noted that the Model Programs and Baseline survey may identify additional businesses that would benefit from BMP workshops.

The purpose of these workshops is to create a training opportunity to educate owners, managers and supervisors about stormwater/urban runoff BMPs related to their professions and the simple, relevant techniques and operations that can be used. In addition to educating these professions about stormwater pollution management, training should reinforce the incentives for businesses to implement BMPs -- achieve cost savings (when applicable), promote a safe working environment, protect employee health, comply with local, state and federal regulations and provide customer satisfaction.

Additionally, invitations will be extended to public agency employees (Public Agency Employee Activity 3) who hold municipal jobs in the professions and business practices presented in the business/industry annual workshops and partnerships' outreach.

Workshop Targets

- Auto repair shop owners/managers
- Restaurant owners/managers
- New Development/Construction managers/supervisors
- Phase I Business owners/managers
- Other specific businesses indicated by Model Programs
- Municipal employees engaged in any of above activities
  - Chambers of Commerce

Forum/Partnership Targets

- Professional Trade Schools
- Trade Assn. Local Chapters
- General Contractors Licensing
- Vocational Programs
- Continuing Education
- Trade Shows and Conferences
- Public Agency Employees

Materials Utilized -- Activity 3

- Overview BMP handbook and appropriate BMP inserts/check lists (See Activity 1)
- Other printed materials (See Activity 2)
- For construction and municipal activities workshops, the Public Employee's Trainer's Manual[10] produced by the County includes slides, videos and handouts that can be used
- Materials and procedures identified in reports on the pilot business outreach program -- Southeastern Targeted Opportunities for Pollution Prevention (STOPP)[11]
- Database of Phase I and other specific businesses being created for Model Programs (for notification purposes)

County Responsibilities -- Activity 3

- Develop and produce annual workshops. Once the initial format is set (agenda, publicity, materials), it should be utilized for each workshop to avoid duplication and provide maximum cost- and time-effectiveness
- Research, develop and implement countywide business partnerships (chambers of commerce, trade/business associations) and programs for collaborative forums, conferences, trade shows, speakers bureau opportunities and expanded message distribution
- Determine effectiveness of the workshops as an educational tool early in the Five-Year Public Education Plan and adjust the approach if participation is low compared to the amount of effort required to produce the events
- As Principal Permittee, the County is responsible for assembling and maintaining a database of industrial/commercial facilities for use in the education site visit program. Note: This database will

---

[10] *Municipal Activities-Volume 1* and *Construction-Volume 2, Public Employee Trainer Manual* produced by Larry Walker Associates, with Harris & Company and Rogers & Associates. February 1997. One free set was distributed to each Co-permittee in March 1997.

[11] For a copy of the final report of the STOPP pilot program please contact the County of Los Angeles Department of Public Works Environmental Programs Division or the State of California Department of Toxic Substances Control in Long Beach.

be an important tool to be used to invite businesses to appropriate workshops. The County's responsibility for creating the database is being *recognized* -- but *not repeated* -- in this activity of the Five-Year Public Education Plan

Co-permittee Responsibilities -- Activity 3

- Assist in publicizing the workshops, encouraging participation among local business owners/ managers and appropriate public agency employees, providing expert speakers, if needed
- Support the County in its countywide partnerships through business/industry and public agency employee attendance, local publicity, and providing expert speakers and case studies, if needed

Activity 4 Partnerships with Business Associations, Chambers of Commerce, and Other Business-Oriented Organizations. Coordination with Local Business Development Programs for Outreach to "Hard-to-Reach" Businesses.

Description

Partnerships with business organizations are essential for the business outreach component for three major reasons: (1) The Permit requires (page 59, subsection dd) Co-permittees to promote public participation through cooperative outreach such as "adopt-a" programs. A more effective alternative to "adopt-a" programs is developing local business partnerships, which are not only cooperative, but also target audiences that have been prioritized. (2) Business organizations serve as credible messengers for the business owners, managers, and employees who are members. Therefore, educational programs that are co-sponsored with these organizations have the potential to be more effective than similar programs sponsored by the governments of the County and Co-Permittees alone. (3) The business community has little free time -- by partnering with their business organizations and communicating through their existing meetings and newsletters, an opportunity has been created to deliver targeted stormwater messages in a relevant and time-saving manner.

Relationships and partnerships with mid- to large-size business/trade organizations can expand the message distribution avenues and activities, and supplement program costs through the following:

- Educational forums and/or seminars to communicate BMP "how to" information and provide posters, signage and other materials for use in the work place (Activities 1, 2, 3)
- Targeted small-space advertising in trade publications and association newsletters (Activity 6)
- News articles, case studies and other educational media relations in trade publications and association newsletters (Activity 5)
- Targeted direct mail to managers of specific industries (within this Activity)
- Distribution of materials at meetings, membership drives and information counters (Activities 1, 2)

Independently-owned and community-based businesses typically do not affiliate with the mid- to large-sized business/trade organizations, yet they represent a vast number of stormwater polluters and potential polluters. Reaching these "mom and pop" businesses will involve working with local business development offices, community-based programs and organizations and vendors. Motivating factors for adopting stormwater pollution prevention practices focus on cost, value and regulatory compliance. Many of the activities listed above are applicable to this business/industry sub-set, but will have to be adjusted for a more grassroots, one-on-one effort.

County Responsibilities

- Identify countywide professional associations with whom to develop the most effective partnerships, based upon target audiences, membership and level of activity of the organization. Develop and maintain a contact database
- Identify countywide pollution prevention organizations and other environmental education programs that target similar segments of the business community and develop effective partnerships to coordinate and share outreach. Develop and maintain a contact database
- Solicit countywide alliances with Chambers of Commerce and other business-oriented organizations to expand message distribution, enhance credibility of messages and activities, and to supplement program costs
- Provide printed BMP materials as needed for mailings, information counters, etc.
- Develop trade associations' publications list for news bureau and provide news articles for trade association newsletters
- Incorporate business/industry activity-specific information into news bureau
- Develop educational materials co-sponsored with business associations
- Prepare news articles for trade publications and association newsletters
- Develop targeted direct mail to managers of specific industries

County Responsibilities, cont.:

- Develop presentation/exhibit materials for participation in business/industry events
- Develop a "Guide to Local Partnerships" manual as a resource and reference for Co-permittees working on the local level

Co-permittee Responsibilities:

- Identify business/trade organizations with which to partner for programs and information distribution
- Identify appropriate local business events in which to participate
- Support local and countywide business/trade association events with personnel and local information
- Provide media list of local business/trade organizations' newsletters and publications
- Utilize the "Guide to Local Partnerships" to create business/industry grassroots outreach opportunities

Note to Co-permittees:

The range of ways for Co-permittees to satisfy this requirement is quite wide -- from minimal to highly participatory. Examples include: (1) have a telephone conversation with, and send a letter to the manager of the local Chamber of Commerce to inform him/her of County-sponsored workshops that will be available to businesses in the community. The manager of the Chamber would then be able to pass along important information about the workshops to members. (2) Provide BMP materials to local businesses for distribution to the public at the check-out counters or information centers. (3) Enlist financial and "in-kind" support from major businesses or organizations to co-sponsor local stormwater education events, such as providing meeting room space at no charge, contributing money to cover a portion of the costs of the event, or providing expert speakers, refreshments or free samples. (4) Participate in a local event as a speaker or provide materials to attendees.

Activity 5 Targeted Trade and Business Media Relations

Description

Business people get substantial information related to their professions from a variety of periodicals -- such as trade association newsletters/publications (discussed in Activity 4), professional periodicals, the business section of daily and weekly newspapers, and business-oriented radio and television.

The basic components of a business/industry media relations campaign will be incorporated into the overarching General Public/Residents media relations program discussed in the previous section (Activity 3).

Specifically these components include:

- Overarching media information kit including modular countywide and city-specific business/industry information
- Media releases reporting on or announcing business/industry events, issues and activities around the County
- Media advisories announcing business/industry events or specific happenings
- Editorial placements in trade publications, business reporters of newspapers, radio and television
- Meetings with editorial boards to encourage coverage and support of business stormwater pollution prevention
- Public service announcements

County Responsibilities -- Activity 5

- Develop a business publications list including association and organizational newsletters
- Supplement the News Bureau discussed in General Public/Residents Activity 3 with business-related case studies, resources, references
- Develop a "Guide to Local Business Media Relations" manual to serve as a reference and resource for Co-permittees' local media relations efforts
- Draft and distribute media releases reporting on or announcing countywide activities, events and issues. Provide "template" releases to the Co-permittees in advance of the release date for localized use

- Develop and place countywide business stories

Co-permittee Responsibilities -- Activity 5

- Utilize the "Guide to Local Media Relations" manual to implement media relations activities within the community -- press releases, story placement and PSAs

Optional:

- Provide the countywide News Bureau with local case studies, media outlet lists, resources and references

Activity 6 Targeted Small-Space Print Trade and Business Advertising

Description

The advertising campaign within this audience will be limited to small-space print advertisements that are placed in specific and targeted business and industry publications. The message(s) will be focused on educating business readers about particular clean business practices in the industry that is the subject of the publication. General awareness ads that speak to a broad range of businesses as a group are *not* part of this program. In addition to media buys in trade and business publications, print advertising space will be purchased in appropriate local community and ethnic newspapers to reach the small, mid-size and "mom and pop" businesses.

A series of small-space template "good practice" ads for each of the high-risk businesses will be developed along with ads for other potentially high-polluting businesses as determined and directed through the Model Programs. These ads will incorporate and follow the overarching approach discussed in Chapter III, Five-Year Public Education Plan Overview. These templates will be available to the Co-permittees as photostats or on computer disk for placement in their community newspapers as part of their local media plan and in appropriate City agency and departmental newsletters.

If a Co-permittee has a business recognition program, it can use the "good practice" ad templates and add the business logo(s) to acknowledge the specific businesses that are doing a good job while educating other businesses about the practices they implement in their operations.

Targeted Publications -- Activity 6

- Trade and business monthly publications for the high-risk businesses (many of these are glossy national publications and will have reach outside the Southern California area)
- Local trade and business publications published by local organizations such as unions, trade associations, chambers of commerce, small business organizations, ethnic business associations and vendor newsletters
- Community-based and ethnic newspapers
- Public agency, City and departmental newsletters
- Business websites as appropriate

County Responsibilities -- Activity 6

- Develop series of small-space print advertising templates and make these available to Co-permittees as photostats or on disk
- Provide language interpretation of print ad series, as needed
- Develop a countywide media buy in business periodicals and publications produced by unions, trade associations, chambers of commerce
- Provide information/ideas for localizing advertising messages for Co-permittee use
- Negotiate, as available, PSA space in these publications

Co-permittee Responsibilities -- Activity 6

- Supplement County media buys by funding additional buys in the local market

Optional:

- Negotiate PSA space in the local market

Activity 7 Advanced Technology and Telecommunications

Description -- 1-888-CLEAN-LA and 888CleanLA.com

The County of Los Angeles currently advertises and operates 1-888-CLEAN-LA and 888CleanLA.com. The County's 24-hour hotline number allows callers to find out about household hazardous waste roundups and used oil recycling as well as to report clogged catch basin inlets, and dumping and illicit discharge violations. The website offers this information online as well as additional information that cannot be accommodated by a telephone system.

The County infrastructure capability and capacity of the 1-888-CLEAN-LA phone number makes it able to handle thousands of calls per day.

Coordination between the County and the Co-permittees with individual hotline numbers is important for dissemination of cohesive information and call handling.

County Responsibilities -- Activity 7

- Include these resource websites in the County News Bureau
- In the event a County of Los Angeles website is developed, include the stormwater BMP information as provided by the Model Programs and link all appropriate and related websites to its design
- Operate effectively and continue to expand the information provided by the 1-888-CLEAN-LA hotline number
- Provide a guide manual to Co-permittees with individual 1-800 hotlines that provides an information and call handling resources link allowing cohesive dissemination of pollution prevention practices
- Promote 1-888-CLEAN-LA and 888CleanLA.com through as many vehicles as possible (media relations, flyers, posters, advertising, etc.)

Co-permittee Responsibilities -- Activity 7

- Provide addresses for new websites to the County News Bureau as they come on-line
- Promote the addresses of existing websites through appropriate channels (e.g., newsletters, publications, media releases)
- In the event a Co-permittee has a City website or develops a City website, include the stormwater BMP information as provided by the Model Programs

- If a Co-permittee 1-800 hotline number already is in operation, it should be reviewed and updated, if necessary, with an infrastructure that will effectively disseminate information about pollution prevention practices in a consumer-friendly manner
- Work with the County and utilize the provided guide manual to coordinate information and call handling between the County and the Co-permittees so the system appears to be seamless throughout the County
- Promote both the 1-888-CLEAN-LA and local number through as many vehicles as possible (media relations, flyers, posters, advertising, etc.)

Situation Analysis Overview

While there is little existing statistical information on children and their polluting and pollution prevention behaviors, it is generally accepted that children are commonly the trend setters or "influencers," the people who break ground for the widespread changes of the future. For example, children have been the critical players in the education/action process for the recycling movement. Recycling activities that are conducted in the classroom and schoolwide, either curriculum projects or as fund-raisers, almost always translate into direct or indirect parental involvement. Either the parent has to collect glass, aluminum or plastic for their children to take to school, or they are reminded by their children during the course of normal family life to recycle that glass, aluminum or plastic bottle.

While children have been very successful home messengers for recycling; in reality, they don't naturally segment environmental issues into individual topics like recycling, used oil or water pollution. Teachers and other adults tend to do that and present them as specific topics -- sometimes in a related context and sometimes as separate subjects presented throughout the year. Pollution prevention should be taught to children as a single overarching topic and reinforced as such throughout the year.

Curriculum Challenges

The challenge faced by Los Angeles County and its Co-permittees -- the same challenge found with the General Public/Residents audience -- is to rise above the clutter and become known for materials that are teacher-useful and student-helpful. This means the materials must be:

- be linked to State Standards for education;
- fun and enjoyable;
- flexible with supportive resources;
- appropriate for specific grade levels;
- do-able within potentially limited classroom budgets, resources, and time;
- expandable beyond the curriculum and the classroom; and,
- contain practical and usable information that can be interwoven into science, math, art and other curriculum subjects for greater reach and re-enforcement.

The effectiveness of the school education program will be reinforced by the materials, activities, the "messenger," and its ability to carry beyond the classroom. This is particularly true when

activities can be developed that require family involvement and that tie back into and support programs within the General Public/Residents.

Youthful Motivation

Information from teachers indicates that children in the K-3 grades have the most natural curiosity and are the most motivated and enthusiastic to carry messages home, and to share activities with their parents or guardians. As children get older -- 4th through 7th grades -- they more often share ideas and activities with their peers than with their parents, and curriculum activities should reflect this inclination. Activities have been designed for teams or groups of youth so they are part not only of the implementation process, but also in decision making and have some form of control over the final result. These children also can become team peer teachers, presenting their projects and accomplishments to the children in the lower grades. High school students require a different focus. While most are more concerned about themselves and their future, this self-interest can be translated into environmental "lessons" through career exploration programs.

The Los Angeles County School System

The 1,650 public schools, 1,320 private schools and 2 percent home-taught student population in Los Angeles County make the diversity of this population as daunting as the general population. Added to this challenge are the restrictive budgetary parameters that prevent schools from doing many of the basic educational activities they would like to do. This situation is complicated by the bureaucratic approval process to implement new programs even when funding is supplied.

Existing Programs

There are a large number of existing environmental education programs available in Los Angeles County including:

- the County's current elementary school program which covers the spectrum of environmental topics from recycling to stormwater pollution and includes outreach beyond the classroom through community-based youth events
- the County's secondary environmental education school program which covers the full range of environmental issues through the subject of solid waste management

- the County's annual sponsorship of the "Plan-It-Earth" program and competition for grades 6-9 in conjunction with Times in Education. The complete teachers' package includes project management guidelines, a poster timeline and teacher orientations providing step-by-step directions
- the City of Los Angeles' K-6 assembly-style program which covers the full range of environmental subjects including recycling, water and air pollution, composting, etc.
- "Think Earth" Environmental Education Foundation's curriculum program for children in K-6. An instructional unit is provided for each grade level and each unit interrelates all elements of the environment -- air, land, water and energy -- while emphasizing a specific theme. Each Think Earth unit contains: a teacher guide, two to three full-color posters, story cards, resource/product/trash cards, reproducible worksheet/activity masters and a video
- California Integrated Waste Management Board's "Closing the Loop," a curriculum-based, activity program for school and home designed for teachers and students, K-12

◆ SCHOOL EDUCATION -- GOALS ◆

- Introduce and initiate an anti-pollution ethic at an early age that should carry through to adulthood and to future generations.
- Develop (or integrate) this ethic into an umbrella pollution program that can be implemented with various grades of school children.
- Provide information to school districts once per year on environmental/stormwater education resources.

*Note: The focus of these messages are specified in the NPDES Permit for school children: educate about the difference between sanitary sewers and storm drains; the importance of preventing stormwater pollution; illicit discharge reporting procedures; source minimization and general pollution prevention.

Communications Approach

Given the existence of current and successful school education programs in Los Angeles County, an alliance with one or more of these programs is the most efficient and cost-effective method of communicating with school children.

More than 886,000 elementary school children are enrolled in Los Angeles County schools. For these K-6 children, the County's school program and coordinating youth events will provide the vehicles to teach pollution prevention activities. For the County's more than 621,000 middle- and high school children, the Secondary Student Environmental Education Program (SSEEP) will create a higher understanding of environmental issues and motivate teenagers to take action.

Both of these programs encompass a variety of environmental subjects, including stormwater pollution. The subject content is in keeping with the findings of the focus group research and segmentation study which concluded that the education emphasis should be on providing practical, "how to" information rather than an analysis of the storm drain system.

County Responsibilities -- School Education

- Examine all existing, comprehensive school programs and develop an alliance with the programs best suited to meet the Five-Year Public Education Plan and NPDES goals and objectives:

- integrates multiple environmental messages (e.g., recycling, water pollution, solid waste)
- expandable beyond the curriculum and classroom
- utilizes program activities/format that already has been approved by the schools and teachers
- do-able within potentially limited classroom and County budgets, resources and time

Co-permittee Responsibilities -- School Education

- Encourage local school districts/systems to take advantage of selected Countywide programs

Note:

Co-permittees will not be responsible for distribution of materials to public or private schools within their respective jurisdictions.

ES.1 OVERVIEW

On July 15, 1996, the Los Angeles Regional Water Quality Control Board (Regional Board) issued a municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Permit) to the County of Los Angeles and 85 cities (Permittees). This Permit contains a requirement for Permittees to develop and implement within their jurisdiction a Storm Water Management Program (SWMP). The Countywide Storm Water Management Plan (CSWMP) is the unified plan consisting of model programs developed under the Storm Water Management Program requirements as established by the Permit. These model programs are aimed to reduce pollutant discharges to the maximum extent practicable for attaining water quality objectives and protecting beneficial uses of receiving waters in Los Angeles County.

In the 2001 NPDES permit, the CSWMP has been renamed to the Stormwater Quality Management Plan (SQMP). For the remainder of this document, the acronym SQMP is used.

The Permit required the Permittees to develop a model program to address each of the following:

- Illicit Connections and Illicit Discharges,
- Development Planning,
- Development Construction,
- Public Agency Activities, and
- Public Information and Participation

Each model program is a "stand-alone" document that describes one of these five elements of the SQMP. Record-keeping and reporting requirements are also associated with each model program. This Executive Summary describes the primary requirements of each of the model programs comprising the SQMP. The remainder of this document is the SQMP element referred to as the Development Construction Program, which was approved by the Regional Board in February 1999.

ES.2 MODEL ILLICIT CONNECTIONS / ILLICIT DISCHARGE ELIMINATION PROGRAM

Part 2.II of the Permit contains requirements specifically for the identification and elimination of illicit connections and illicit discharges to the municipal separate storm sewer system (MS4), generally referred to in this document as "storm drain system." The Permit requirements include

five components for the elimination of illicit connections and illicit discharges. Those five components are:

- Illicit connection elimination,
- Illicit discharge elimination,
- Best management practices (BMPs) program for designated non-stormwater discharges,
- Public reporting of illicit discharge and disposal practices, and
- Hazardous waste reporting program.

Illicit Connection Elimination

The goal of this component is to detect and eliminate illicit connections in order to reduce pollutants discharged through such connections to the maximum extent practical. The objectives are to:

- Conduct storm drain system field screening for illicit connections during scheduled infrastructure maintenance by maintenance personnel.
- Determine the source and nature of suspected illicit discharges by investigating connections to the storm drain system.

The model program also describes a methodology that Pemittees may use in prioritizing areas of their jurisdiction for investigation. Once the illicit connection/discharge has been investigated, one of the following actions must occur:

- If the discharge is determined to consist only of exempted non-stormwater, the connection will be allowed to remain and will no longer be considered an illicit connection. Permittees may elect to issue a permit for the connection or allow the connection to remain if information on the connection is documented; or
- The discharger will be required to obtain an NPDES permit; or
- The connection will be terminated through voluntary action or enforcement proceedings.

Permittees may prioritize potential problem areas for detection and investigation efforts under this program component, using the methodology defined in this model program.

Illicit Discharge Elimination

The goal of this component is to detect and eliminate illicit discharges from entering the storm drain system to reduce pollutants from such discharge to the maximum extent practicable. The objectives are to:

- Investigate, contain, and clean up incidental spills reported by the public, other agencies or observed by Permittee field staff during the course of their normal daily activities,
- Eliminate through voluntary termination or enforcement action prohibited non-stormwater discharges to the storm drain system, and
- Investigate to determine the nature and source of the discharge and eliminate through voluntary termination or enforcement action suspected prohibited non-storm discharges in the storm drain system.

BMPs for Designated Non-Stormwater Discharges

The Permit required the City of Los Angeles to conduct a study on pollutants entering storm drains from street and sidewalk washing operation to:

(i.) Characterize discharges from municipal street washing and sidewalk washing

(ii.) Assess the impacts of such activities and

(iii.) Recommend appropriate BMPs to control any adverse impacts.

The City of Los Angeles completed the study and prepared a report entitled, "A Study of Pollutants Entering Storm Drains from Street and Sidewalk Washing Operations in Los Angeles, California." The Regional Board approved recommended BMPs for street and sidewalk washing activities.

Public Reporting

The goal of this component is to promote, publicize and facilitate public reporting of illicit discharges and illicit disposal practices. Permittees must implement a system for complainant documentation and a follow up response for calls received from the public regarding potential illicit discharges and illicit disposal practices.

Reporting Hazardous Substances Entering the Storm Drain System

The goal of this component is to facilitate appropriate reporting of hazardous substances entering the storm drain system as a result of an illicit discharge. The Permittees must implement a

reporting program to document quantities of hazardous substances entering the storm drain system.

ES.3 MODEL DEVELOPMENT PLANNING PROGRAM

"Development" Projects encompass those projects that are subject to a planning and permitting review process by a Permittee. A "Development" Project may be new development, redevelopment, renovation, remodeling, rehabilitation, infill, or other terms that may be used in a Permittee's ordinances and/or building code. The planning and design of public facilities have similar requirements described in the Model Public Agency Activities Program, another component of the Countywide Storm Water Management Plan.

The fundamental concept of this program component is to identify development that may significantly impact stormwater quality and to then to include permanent BMPs in the project's design. Development projects that may significantly impact stormwater quality are Planning "Priority" Projects. Other projects are deemed "Exempt" from these program requirements.

Each Permittee will implement a development-planning program that includes the following components:

- System for determining the appropriate category (Priority or Exempt) for a Development Project;
- Recommended list of BMPs to be considered, and as appropriate, implemented for Development Projects;
- Process to ensure that Planning Priority Projects incorporate the Standard Urban Storm Water Mitigation Plans using the recommended list of BMPs;
- Guidelines for California Environmental Quality Act (CEQA) compliance;
- Guidelines for the revision of General Plan elements to include watershed and stormwater quality management considerations, when General Plan elements are being significantly rewritten; and
- Developer information program that provides general guidance on the Permittee's development planning program, and specific guidance on BMP selection and the Standard Urban Storm Water Mitigation Plans.

A checklist and flowchart are included in the Model Development Planning Program to assist Permittees in determining whether a project is Priority or Exempt.

ES.4 MODEL DEVELOPMENT CONSTRUCTION PROGRAM

Permittees must also implement a program to manage stormwater and urban runoff associated with construction activities within their jurisdictions. The Model Development Construction Program addresses:

- Development and implementation of construction site BMPs;
- Implementation of procedures to verify Notice of Intent (NOI) filing with the State Water Resources Control Board and completion of stormwater pollution prevention plan (SWPPP) for projects subject to the California General Construction Permit, and
- Implementation of a construction inspection program.

Construction Site BMPs

A Development Construction Project is defined as projects for which site activities such as clearing, grading, excavation, road construction, structure construction, or structure demolition results in the disturbance of soil.

In certain situations, where impact to stormwater quality is a greater threat, Development Construction Projects should be given greater scrutiny to ensure that minimum requirements are met. These projects which present a greater threat to water quality, *but are not subject to the California General Permit for Storm Water Discharges Associated with Construction Activity*[1] are called Construction Priority Projects.

Unless specifically exempted, all Development Construction Projects will be required to implement BMPs to meet minimum water quality protection requirements. As a condition for issuing a grading or building permit, applicants for covered Development Construction Projects shall be required to certify that they understand and will comply with the minimum BMPs requirements related to construction site runoff.

Projects Subject to the General Construction Permit

Developers of construction sites subject to the General Construction Permit are required to prepare and implement a Storm Water Pollution Prevention Plan (state SWPPP). Before issuing building or grading permits, Permittees will require applicants to demonstrate that a Notice of Intent (NOI) has been filed with the State Water Resources Control Board (SWRCB), and that a state SWPPP has been prepared for projects subject to the General Construction Permit.

[1] A project is subject to the General Construction Permit if it disturbs 5 acres or more of soil, or the project results in the disturbance of less than 5 acres but is part of a larger common plan of development or sale that exceeds 5 acres.

Requirements for Construction Priority Projects

Prior to receiving a building or grading permit, applicants for Construction Priority Projects must prepare a local stormwater pollution prevention plan (local SWPPP) covering construction materials and waste management control, and must certify that they will implement the local SWPPP year-round. Applicants for Construction Priority projects must also prepare and implement a Wet Weather Erosion Control Plan (WWECP) if the project will leave soil disturbed during the rainy season (November 1 through April 15).

Site Inspection and Enforcement

Each Permittee will implement site inspection procedures to assess whether the minimum requirements for Development Construction Projects are being achieved and appropriate BMPs are being implemented. Site inspections will also determine if local SWPPPs are being implemented at projects where they apply. Developers and/or contractors will also be required to conduct and document self-inspections of their construction site. Each Permittee will also develop and implement enforcement procedures to require that corrective actions be undertaken when the requirements are not met.

ES.5 MODEL PUBLIC AGENCY ACTIVITIES PROGRAM

Part IV.C of the Permit contains requirements specifically for public agency activities and facilities. Components of the Public Agency Activities Model Program describe measures to be taken by Permittees to reduce stormwater impacts from public agency activities and facilities such as sanitary sewer systems, public construction activities, vehicle maintenance and material storage facilities, recreation facilities, stormwater drainage systems, streets and roads, etc.

Sewage Systems Operations

This program component is applicable to all Permittees who own and operate a sewage collection system. Although sewage systems themselves are not a regular source of stormwater pollution, raw sewage contains pollutants that can pose a serious threat to both human health and the quality of receiving waters if they enter the storm drain system through incidents such as spills, leaks, or overflows. The goal of this program is to reduce the impact of Permittee-owned sewage system operations on stormwater quality.

The objectives of this program component are to:

- Keep any sewage overflows or leaks from entering the storm drain system or receiving waters.

- Identify and repair sewage system blockages, exfiltrations, overflows and implement procedures for investigating the causes.
- Notify public health authorities in cases where threats to public health exist.

Public Construction Activities Management

This program component is applicable to all Permittees who construct or contract to construct public facilities, including infrastructure. The program component requires the use of temporary best management practices (BMPs) to reduce the discharge of pollutants from public construction sites. In addition, public agency facilities with the potential for having a significant effect on stormwater quality when completed by virtue of their size, nature of on-site activities, or other factors must incorporate permanent BMPs in the planning and design of the project.

The objectives of this program component are to:

- Select and incorporate appropriate construction control measures for stormwater quality management from construction sites.
- Conduct and inspection program, including enforcement procedures as necessary, to verify that the construction control measures are implemented and performed effectively throughout the construction period.

Vehicle Maintenance / Material Storage Facilities Management

This program component is applicable to all Permittees who own and operate vehicle maintenance or materials storage facilities. Activities at these facilities may generate waste, spills and leaks that could potentially reach the storm drain system and receiving waters. The goal of this program is to make stormwater quality a consideration when conducting activities at municipal facilities.

The objectives of this program component are to:

- Identify and evaluate sources of pollutants from public vehicle maintenance/material storage facilities that may affect the quality of stormwater discharge from the facility.
- Identify and implement site-specific best management practices to reduce or prevent pollutants in stormwater discharges.

Landscape and Recreational Facilities Management

This program component is applicable to all Permittees who own and operate recreational facilities. Maintenance practices at parks and recreation facilities generally include fertilizer and pesticide applications, vegetation maintenance and disposal, swimming pool chemical

maintenance and draining, and trash and debris management. All of these activities have the potential to contribute pollutants to the storm drain system. If improperly managed, potential pollutants can be transported in runoff (stormwater and non-stormwater discharges) to the storm drain system and subsequently to receiving waters. The goal of the program for landscape and recreational facilities management is to make the stormwater quality a consideration when conducting operation and maintenance activities.

The objectives of this program component are to:

- Minimize the discharge of pesticides, herbicides and fertilizers to the storm drain system and receiving waters.
- Prevent the disposal of landscape waste into the storm drain system.
- Minimize the trash, debris and other pollutants from entering Permitee-owned recreational water bodies.
- Discharge municipal swimming pool water in a manner that will not contribute pollutants to receiving waters.

Storm Drain Operation and Management

The storm drain system functions primarily to collect and convey surface runoff to receiving waters during storms in order to prevent flooding. A common municipal activity includes the maintenance of the storm drain system to maintain hydraulic function as intended during storms. The goal of this program is to reduce the impact of storm drain operation and maintenance activities on stormwater quality.

The objectives of this program component are to:

- Inspect and clean catch basins annually and keep appropriate records.
- Remove trash and debris annually from open channels and properly dispose of these materials to prevent them from being washed to receiving waters.
- Report prohibited non-stormwater discharges observed during the course of normal daily activities so they can be investigated, contained and cleaned up, or eliminated.
- Review maintenance activities to verify that they minimize the amount of pollutants discharged to receiving waters.

Streets and Roads Maintenance

Streets and roads may collect litter and debris from nearby activities, as well as from vehicular traffic. During the course of routine maintenance waste materials are often generated. The goal

of this component is to reduce the impact of Permittee street and road operations and maintenance on stormwater quality.

The objectives of this program component are to:

- Sweep curbed streets to reduce the discharge of pollutants associated with activities occurring in street and road rights-of-way.
- Minimize the discharge of pollutants associated with the maintenance of streets and roads.

Parking Facilities Management

Permittees who own parking lots with more than 25 parking spaces located in areas with potential exposure to stormwater must have a parking facilities management plan. The goal of this component is to reduce the impact of these parking facilities on the quality of stormwater discharges and receiving waters. The objective of this program component is to remove debris from parking facilities to reduce the amount of material that comes into contact with stormwater.

Public Industrial Activities

Industrial activities, whether private or public, have the potential to discharge pollutants to the storm drain system. Many industrial facilities are subject to the California General Industrial Activities Storm Water Permit (General Industrial Permit) for control of stormwater pollution. The goal of the General Industrial Permit is to reduce the impact of industrial facilities on stormwater quality. This provision of the Permit may procedurally simplify and reduce the cost of Permittees' compliance for their industrial facilities (Phase 1) by providing the option to obtain coverage under the Permit in lieu of the General Industrial Permit. The objective of this program component is to comply with all requirements and conditions contained in the General Industrial Permit.

Emergency Procedures

Each Permittee must consider the impact of discharges to the storm drain system during emergency repairs of essential public services and infrastructure, and response to natural disasters. The goal is to reduce the impact of emergency response activities on receiving waters, to the extent possible, without compromising public health and safety.

The objectives of this program component are to:

- Recognize that public health and safety are the highest priority when conducting emergency response activities.

The objectives of this program component are to:

- Recognize that public health and safety are the highest priority when conducting emergency response activities.
- Protect surface water quality by incorporating appropriate BMPs into emergency response activities to the extent possible.

ES.6 MODEL PUBLIC INFORMATION AND PARTICIPATION PROGRAM

The purpose of the Public Information and Participation Program (Five-Year Public Education Plan) is to provide the framework for a comprehensive educational stormwater and urban runoff outreach approach that will reach as many Los Angeles County residents as possible. The Five-Year Public Education Plan is research-based, broad-based with overarching themes, flexible, adaptable, and simplistic in order to produce behavior change.

Groups of residents differ significantly in terms of the amount of pollution they contribute, their demographics and lifestyle, attitudes related to stormwater pollution, and probability of changing their behaviors. By better understanding the general County resident population, resources may be directed to those segments of the population that pose the greatest threat to stormwater quality and who represent the greatest opportunity to respond to a public education campaign.

Some key strategies developed for successful implementation of the education model include:

- Creating Overarching Approach – A unified overall public education approach sets a "tone" for the program and once established helps target audiences identify the program with its pollution prevention message.
- Building Partnerships – Integrate County and city programs, cooperate with environmental groups, co-Permittees, and other public and business groups to disseminate public education program materials and special events information.
- Unify Pollution Prevention Efforts – Link all pollution prevention efforts (such as recycling, used oil and household waste) under a single agenda rather than under multiple prevention splinter programs.
- Develop "How To" Instructions – Provide specific guidelines supported by simple easy to remember tasks and concise "how to" instructions for pollution prevention actions that residents and business may incorporate into their everyday routines.
- Monitoring and Evaluation System – Establish an evaluation system to measure program effectiveness by assessing the number of people who show increased awareness, intent and/or actions in reducing stormwater pollution. Re-evaluate and enhance program components on continually based on program effectiveness.

- Multiple Audience Impact – Develop program materials and activities that may be implemented and have impact on more than one audience at a time.

The Model Public Information and Participation Program also includes reporting requirements for Permittees to support the Annual Program Report to the Regional Board. These reporting requirements include the documentation of information such as:

- Number of media outlets contacted to run public service announcements (PSAs),
- Dollar value and number of media buys,
- Audience of the media PSAs,
- List of local businesses enlisted to place non-traditional advertising (point-of-purchase displays, product neck hangers, etc.)
- Numbers and types of stormwater pollution prevention materials distributed, and
- Whether there is an increase in the number of illicit discharge reports to the Permittee.

1.1 BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996 requires for Permittees to develop and implement a Model Development Construction Program (Model Program). This Model Program describes the actions that Permittees should take to meet the requirements for this provision of the Permit.

More generally, development construction activities identified by the Permit are summarized in Table 1-1. Permit requirements are fully enforceable and may only be changed through action by the Regional Board. The Model Program is to be approved by the Regional Board staff (Executive Officer) and may be changed only by approval of the Executive Officer. The applicable portion of the Permit that covers development construction is included as Appendix A to this Model Program.

Table 1-1

Permit Requirements - Development Construction

Permit Section	Requirement	Compliance Date
III.B.2.a	Develop and implement a program of construction control measures. Address minimum requirements and recommended BMPs.	6 months after commencement of next fiscal year following Executive Officer approval of model program, but no later than 7/30/99.(1)
III.B.2.b	Implement a procedure to require grading permit applicants covered by the California General Permit for Storm Water Discharges Associated with Construction Activity to show NOI filed and SWPPP prepared.	1/31/97
III.B.3.b	Implement a construction inspection program.	6 months after commencement of next fiscal year following Executive Officer approval of model program, but no later than 7/30/99.(1)

(1) Provided that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year.

1.2 OVERVIEW OF PROJECTS SUBJECT TO THE MODEL PROGRAM

Construction Projects

A Development Construction Project is a site where activities such as clearing, grading, excavation, road construction, structure construction, or structure demolition results in the disturbance of soil.

Unless otherwise designated as a Construction Priority Project or an Exempt Project, all Development Construction Projects are required to meet the minimum water quality protection requirements for construction permits discussed in Section 2.1.

Construction Priority Project

In certain situations, where impact to storm water quality is a greater threat, Development Construction Projects should be given greater scrutiny to ensure that minimum requirements are met. These situations are:

Projects where a greater threat to water quality exists, *but which are not subject to the California General Permit for Storm Water Discharges Associated with Construction Activity* are called Construction Priority Projects. Three conditions determine a Construction Priority Project:

1) the project is in or adjacent to an environmentally sensitive area, or
2) the project will disturb greater than two acres, or
3) the project is located in a hillside area (as defined by the local jurisdiction) where soil disturbance occurs during the rainy season.

Projects Subject to the General Construction Permit

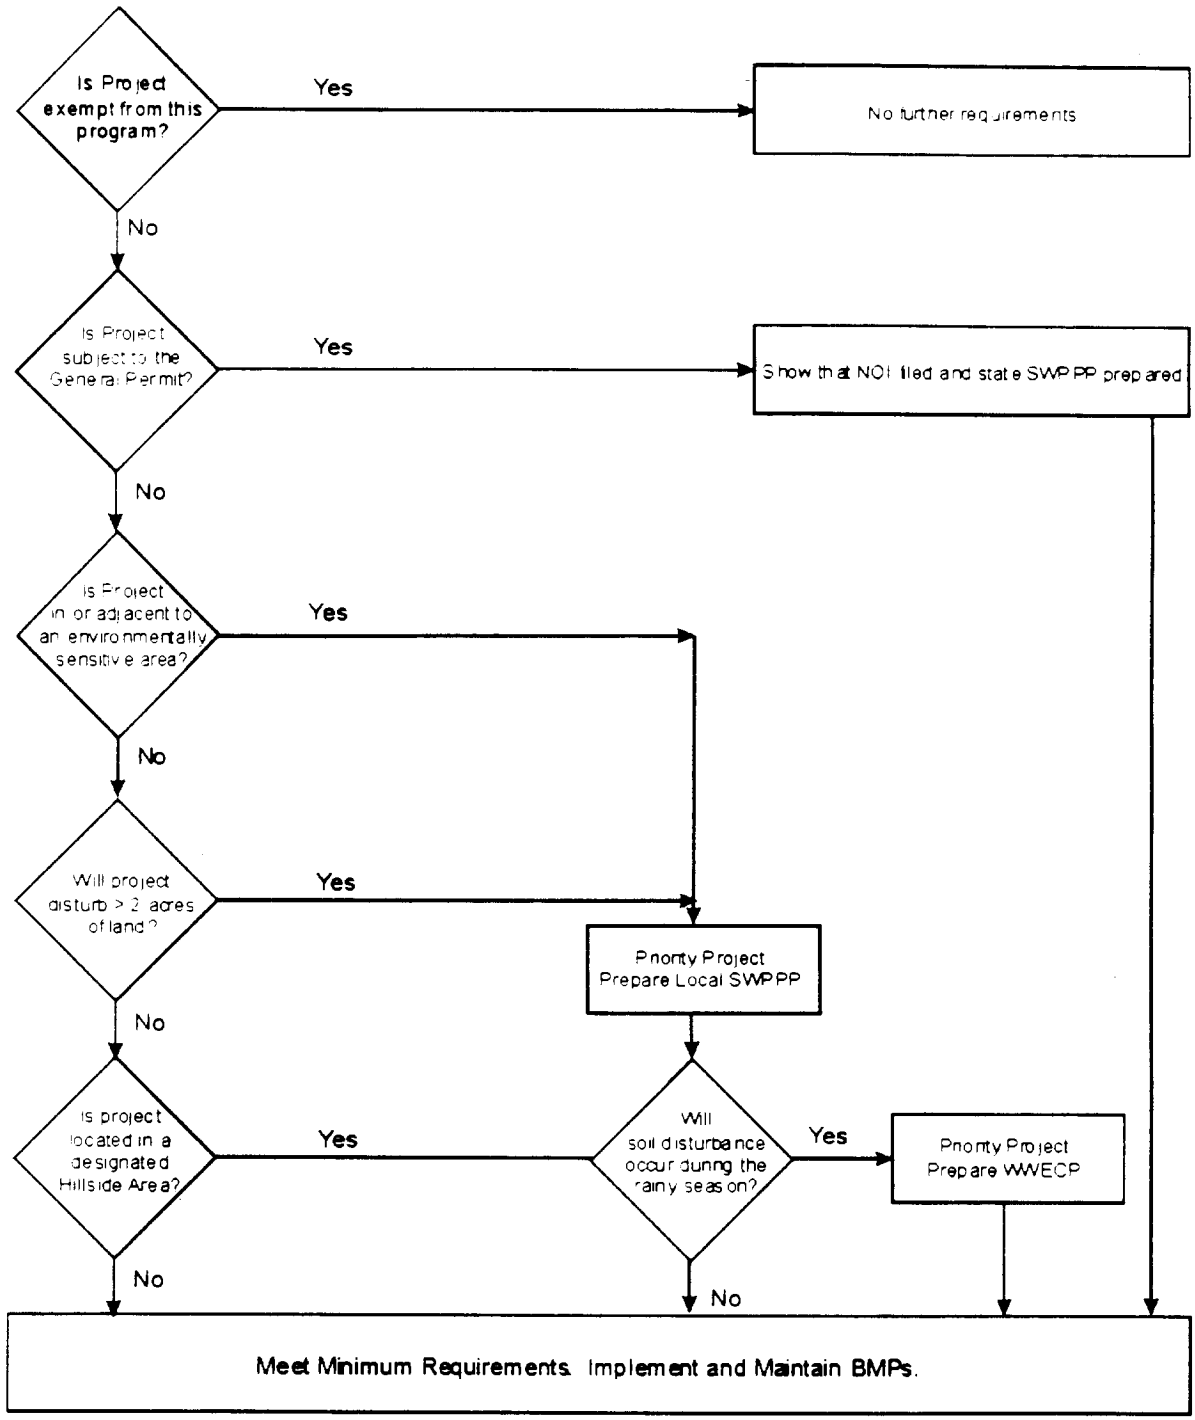
A project is subject to the California General Permit for Storm Water Discharges Associated with Construction Activity (hereinafter referred to as the General Construction Permit) if it disturbs 5 acres or more of soil, or the project results in the disturbance of less than 5 acres but is part of a larger common plan of development or sale that exceeds 5 acres.

Exempt Projects

Permittees may exempt certain types of Development Construction Projects that pose minimum risk of storm water pollution as defined in Section 2.4.

A process flow chart for the application of this Model Program is shown in Figure 1-1.

Figure 1-1. Construction Control Measures



2.1 MINIMUM WATER QUALITY PROTECTION REQUIREMENTS FOR DEVELOPMENT CONSTRUCTION PROJECTS

Unless specifically exempted, all Development Construction Projects will be required to implement best management practices (BMPs) necessary to reduce pollutants to the Maximum Extent Practicable[2] (MEP) to meet the minimum water quality protection requirements as defined in Table 2-1. Development Construction Projects covered under this program include any action proposed by a property owner/developer which requires the issuance of a building or grading permit and includes construction activities, except projects determined to be exempt (as discussed in Section 2.4). Construction activities include activities such as clearing, grading, excavation, road construction, structure construction, or structure demolition that result in soil disturbance.

As a condition for issuing a grading or building permit, ***applicants for covered Development Construction Projects shall be required to certify that they understand and will comply with the minimum requirements defined in Table 2-1.*** Appendix B provides an example certification statement regarding compliance with these minimum standards that project applicants may use.

Table 2-1
Minimum Water Quality Protection Requirements for Development Construction Projects Subject to Storm Water Construction Controls

Category	Minimum Requirements	BMPs(1)
1. Erosion and Sediment Control	Sediments from areas disturbed by construction shall be retained on site, using structural drainage controls to the maximum extent practicable, and stockpiles of soil shall be properly contained to minimize sediment transport from the site to streets, drainage facilities or adjacent properties via runoff, vehicle tracking, or wind.	Sediment Controls
2. Construction Materials Control	Construction-related materials, wastes, spills or residues shall be retained on site to minimize transport from the site to streets, drainage facilities or adjoining properties by wind or runoff. Runoff from equipment and vehicle washing shall be contained at construction sites unless treated to remove sediments and pollutants.	Site Management: Material and Waste Management

(1) BMPs that may be used to meet the minimum requirements are described in Section 2.5

[2] Maximum Extent Practicable (MEP) is the standard for implementation of storm water management programs to reduce pollutants in storm water. MEP refers to storm water management programs taken as a whole. It is the maximum extent possible taking into account equitable consideration and competing facts, including, but not limited to: the gravity of the problem, public health risk, societal concern, environmental benefits, pollutant removal effectiveness, regulatory compliance, public acceptance, implementability, cost and technical feasibility. Section 402(p)(3)(B)(iii) of the Clean Water Act requires that municipal permits "...shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

2.2 CONSTRUCTION PRIORITY PROJECTS

2.2.1 Criteria for Construction Priority Projects

Construction Priority Projects are projects that have the potential to significantly affect storm water quality during construction but which do not meet the criteria (i.e., acreage[3]) to be subject to the state General Construction Permit. Construction Priority Projects will be identified through a grading or building permit application, using the following criteria:

- The project is not exempt from this Model Program and not subject to the General Construction Permit; and
- The project will result in soil disturbance of more than 2 acres of land; or
- The project is in or adjacent to an environmentally sensitive area[4]; or
- The project is located in a designated hillside area and soil disturbance will occur at the project site in the rainy season.

Determination of whether a project is a Construction Priority Project will be made by the applicant and then evaluated and approved by the Permittee according to these criteria listed above.

2.2.2 Developer Requirements for Construction Priority Projects

Prior to receiving a building or grading permit, applicants for Construction Priority Projects must prepare a local storm water pollution prevention plan (Local SWPPP) covering construction materials and waste management control, and must certify that they will implement the Local SWPPP year-round. The Local SWPPP shall include:

- The name, location, period of construction, and a brief description of the project;
- Contact information for the owner and contractor;
- Name, location, and description of any environmentally sensitive areas located in or adjacent to the project;
- A list of major construction materials, wastes, and activities at the project site;

---

[3] A construction project of 5 acres or more or that which is less than 5 acres but is part of a larger common plan of development or sale. This acreage criteria may be revised downward by the USEPA under Phase II storm water regulations.

[4] Since the Permit does not define "designated environmentally sensitive area," Permittees will designate areas within their jurisdiction as "environmentally sensitive" utilizing criteria such as, but not limited to, the presence of the following: endangered, threatened, or rare species or their habitats; locally designated species (e.g., heritage trees); locally designated natural communities (e.g., oak forest, coastal habitat, etc.); and wildlife dispersal or migration corridors.

- A list of best management practices to be used to control pollutant discharges from major construction materials, wastes, and activities;
- A site plan (construction plans may be used) indicating the selection of BMPs and their location where appropriate; and
- A developer's certification statement that all required and selected BMPs will be effectively implemented.

A copy of the developer's certification statement (Appendix B) must be submitted prior to issuance of a building or grading permit. A copy of the Local SWPPP must be kept on the project site at all times after the start of construction.

Developers are required to complete an inspection checklist (see Appendix C) to document site observations associated with rain events as follows:

- Before every rainfall event that is predicted to produce observable runoff and after every rainfall event that produces observable runoff, and
- At 24-hour intervals during extended rainfall events (excepting weekends or holidays when there is no ongoing site activity on those days).

Applicants for Construction Priority Projects must also prepare and implement a Wet Weather Erosion Control Plan (WWECP) if the project will leave soil disturbed during the rainy season, defined as November 1 through April 15. The WWECP must be prepared, for projects that have already broken ground, not later than 30 days prior to the beginning of each rainy season (i.e., by October 1) during which soil will be disturbed, and implemented throughout the entire rainy season. For projects that will begin construction during the rainy season, the WWECP must be available 30 days before construction commences. The WWECP shall include the following information:

- The name, location, period of construction, and a brief description of the project
- Contact information for the owner and contractor
- A site map (construction plans may be used) showing the location of erosion control and sediment control BMPs that will be implemented for the rainy season
- A certification statement that all required and selected BMPs will be effectively implemented (see Appendix B).

A copy of the WWECP must be kept on the project site at all times beginning 30 days prior to the start of the rainy season through the end of the rainy season (October 1 - April 15).

Guidance and example forms for preparation of Local SWPPPs and WWECPs are included in Appendix D.

2.3 PROJECTS SUBJECT TO THE GENERAL CONSTRUCTION PERMIT

2.3.1 Developer Requirements for Projects Subject to General Construction Permit

Developers of construction sites subject to the General Construction Permit are required to prepare and implement a Storm Water Pollution Prevention Plan. A storm water pollution prevention plan prepared for projects subject to and in conformance with the requirements of the General Construction Permit is referred to herein as a "state SWPPP". The state SWPPP will address all categories of control measures, and has specific documentation requirements. The General Construction Permit can be viewed or downloaded from the State Water Resources Control Board's web page: www.swrcb.ca.gov/stormwtr/construction.htm.[5] It is the obligation of the developer to determine whether a project is subject to the General Construction Permit.

2.3.2 Permittee Requirements for Projects Subject to the General Construction Permit

Before issuing building or grading permits, Permittees will require applicants to demonstrate that a Notice of Intent (NOI) has been filed with the State Water Resources Control Board (SWRCB), and that a state SWPPP has been prepared for projects subject to the General Construction Permit. An example certification form is included in Appendix E that may be used for this purpose. Permittees may require that the SWRCB's letter of filing confirmation be attached to the certification form prior to issuance of building or grading permits.

2.4 EXEMPT PROJECTS

Permittees may exempt certain types of Development Construction Projects from the program that pose a minimum risk of storm water pollution. These projects are exempt from any storm water construction control measures including the minimum BMP requirements. A specific listing of exempt projects is included in this section. Additional exemptions may be determined by the local building official (or equivalent municipal authority) and shall be provided to the Regional Board with a justification for their designation (for purposes of notification).

A list of specific types of Development Construction Projects that are deemed to be exempt include:

- Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility (Permit definition);

[5] A copy of the General Construction Permit can also be obtained from the Los Angeles Regional Board at 320 W. 4th Street, Suite 200, Los Angeles, CA 90013; telephone 213.576.6600.

- Emergency construction activities required to immediately protect public health and safety;
- Interior remodeling with no outside exposure of construction materials or construction waste to storm water;
- Mechanical permit work;
- Electrical permit work; and
- Sign permit work.

Other types of Development Construction Projects may be designated as except if all three of the following criteria are met:

- No significant soil disturbing activity;
- No outside storage or exposure to storm water of construction materials or construction wastes (unless adequate controls are provided); and
- The activity poses a minimal risk of storm water pollution.

2.5 BEST MANAGEMENT PRACTICES

Best Management Practices (BMPs) are the specific storm water management techniques that are applied to manage construction site runoff. A listing of specific BMPs appropriate for construction activities are summarized in Table 2-2 and have been organized into four major categories:

- ***Sediment Control.*** Feasible methods of trapping eroded sediments so as to prevent a net increase in sediment load in storm water discharges from the site.
- ***Erosion Control.*** Measures that prevent erosion and keep soil particles from entering storm water, lessening the eroded sediment that must be trapped, both during and at the completion of construction.
- ***Site Management.*** Methods to manage the construction site and construction activities in a manner that prevents pollutants from entering storm water, drainage systems or receiving waters.
- ***Materials and Waste Management.*** Methods to manage construction materials and wastes that prevent their entry into storm water, drainage systems, or receiving waters.

These BMPs address multiple construction activity-related pollutants and focus on erosion and sediment control practices, source minimization, education, good housekeeping, good waste

management, and good site planning. Under this Model Program, additional BMPs are applied when the potential for adverse environmental effects from storm water runoff increases. For example, non-priority project developers/contractors may use any combination of BMPs to meet the minimum requirements. However, Construction Priority Projects developers should consider all listed BMPs and, at a minimum, must prepare a Local SWPPP and a WWECP that include the following BMPs:

- ***Sediment Control*** - At site perimeters, below significant slopes (as defined by the local authority but at a minimum applied to grades of 1:5 V:H or greater), and at other similar locations, the use of at least one type of BMP such as silt fence, straw bale, or sand bag barrier to minimize the transport of sediment. At interior storm drain inlets the use of at least one type of inlet protection BMP to minimize the transport of sediment off-site.

- ***Erosion Control*** - On completed disturbed surfaces, the use of at least one type of erosion control (soil stabilization) BMP during the rainy season.

- ***General Site Management and Materials and Waste Management*** - All BMPs applicable to specific construction operations, if such construction operations will occur at the site.

Since avoiding construction activities and/or disturbing soil during the rainy season is the most effective approach to minimize water quality impacts, developers should be advised of this concern and encouraged to minimize such impacts. SWPPP/WWECPs and/or BMPs may be submitted in the form of plan sheets.

2.5.1 Permittee BMP-Related Requirements

Guidance material about the BMPs that may be implemented to meet minimum requirements will be provided by the Permittees to developers/contractors when requested. Permittes will inform developers/contractors that this guidance material is available. Similar guidance material will be provided to site inspectors for use in assisting contractors to meet the minimum requirements. Three forms of guidance material are included in this Model Program:

- A BMP selection matrix in Table 2-2 provides guidance for selecting BMPs for different types of construction activities. The columns on Table 2-2 list the types of construction activities that pose a risk of causing storm water pollution. Each "x" within a column indicates a BMP that should be considered for this type of construction activity.
- BMP selection guidance is provided in Appendix F.

- BMP fact sheets describing each BMP are provided in Appendix G.

2.5.2 Principal Permittee BMP-Related Requirements

The Principal Permittee will develop and provide informational materials to Permittees to provide to developers/contractors through the Developer Information Program conducted under Part 2.III.A of the Permit. These materials will also be developed and made available through the Five-Year Storm Water Public Education Strategy, under Part 2.V.C. of the Permit.

Table 2-2. Stormwater Pollution Controls for Construction Activities

Stormwater Best Management Practices	BMP No. (1)	Categories of Activities																						
		Site Preparation/ Earthmoving		Construction of Underground Structures				Construction of Above Ground Structures				Construction of Roadways, Walkways & Parking Lots			Waterways					Planting & Landscaping			
		Clearing & Grubbing	Earthwork	Foundations	Conduits (Open Cut) Drilling		Tunnels	Wood Frame	Structural Steel	Masonry & Concrete	Roofing & Coating	Concrete	Asphalt	Base & Subgrade	Channel Improvement	Water & Sediment Impoundment	Over Crossing	Under Crossing	Waterfront Construction	Irrigation Facilities	Seeding & Sodding	Mulching	Planting

R0000446

Each Permittee will seek to achieve compliance by developers with minimum water quality protection requirements (Table 2-1) and applicable BMPs through site inspections, review of self-audits by developers/contractors, enforcement procedures, and other means as described in this section.

3.1 PERMITTEE SITE INSPECTION RESPONSIBILITIES

Each Permittee will adopt site inspection procedures, as necessary, to assess whether the minimum requirements for Development Construction Projects are being achieved and applicable BMPs are being implemented. Site inspections will also determine if Local SWPPPs/WWECPs are being implemented at projects where they apply. Each Permittee will also develop and implement enforcement procedures to require that corrective actions be undertaken when the requirements are not met. The program will include the following elements:

- Permittee Inspections;
- Developer/Contractor Self-Inspections; and
- Enforcement Procedures

3.2 INSPECTION PROCEDURES

Development Construction Projects are routinely checked by municipal inspectors to verify that the construction work is being performed in accordance with the project plans, building and grading permits, and applicable municipal codes. When a project is in violation of these permits or codes, inspectors have the authority to enforce respective permit conditions by issuing verbal warnings, written notices, or stop work orders. Additional administrative actions may be taken, including revoking the building or grading permit or issuing fines. Inspections may be conducted for various reasons, and at various times and include Permittee site inspections currently performed in ongoing programs, as well as routine owner/contractor self-inspections. At their sole discretion, and when warranted, the Permittee may implement SWPPP/WWECPs and take other measures deemed necessary to protect public health, safety, and welfare with their own resources or by contract.

3.2.1 Permittee Inspections

Permittees or their designated agents must conduct at least one inspection of all Construction Priority Projects and all projects subject to the state General Construction Permit active during the rainy season. If the inspected site is not meeting minimum water quality protection requirements, Permittee inspectors must follow-up within a reasonable time frame to assure that

the minimum requirements are implemented. When conducting an inspection, the Permittee's inspector shall observe the site for compliance with the minimum water quality protection requirements. Permittee inspections shall include observations of storm water management practices.

The primary mechanism Permittee inspectors will use to determine if minimum water quality protection requirements and BMPs for development construction are being met will be to assess the site against the narrative requirements in Table 2-1. These narrative requirements are intended to be easy to interpret field observations that allow an assessment of site conditions during both dry and wet conditions. Inspection training will focus on how to recognize whether minimum water quality protection requirements are being achieved at any time during the year.

Each Permittee must be able to demonstrate the existence of a site inspection and enforcement program to achieve compliance with minimum BMP requirements. Appendix H provides a model checklist that is particularly suited for more detailed inspections if it is determined that minimum water quality protection requirements are not being achieved and corrective actions need to be documented.

Additional inspections should be conducted at the discretion of the Permittee to verify compliance with storm water pollution prevention measures, particularly when grading activities are being conducted during the rainy season. The need for such inspections may vary depending upon several factors including:

- Site conditions;
- Previous violations;
- History of developer or contractor performance; and
- Weather patterns.

3.2.2 Developer/Contractor Self-Inspection Requirements

Construction is a dynamic operation where changes are expected. BMPs for construction sites are usually temporary measures that require frequent maintenance to maintain their effectiveness and may require relocation and re-installation, particularly as project grading progresses. Therefore, developer/construction self-inspections are required, particularly during the rainy season.

There are two primary purposes of the self-inspections conducted by developers and contractors:

- To ensure that BMPs are properly implemented and functioning effectively, and
- To identify maintenance (e.g., sediment removal) and repair needs.

An example form is provided in Appendix C that may be provided to developers and contractors by the Permittee for use in recording self-inspection results. When requested, self-inspection forms are to be made available to Permittee inspectors for their review.

Developers and/or contractors of projects subject to the General Construction Permit are required to perform self-inspections. In addition, self-inspections are required for Construction Priority Projects. At a minimum, a developer self-inspection checklist, noting date, time, conditions and inspection date, must be kept on-site and made available for inspection, if requested. Self-inspections must be performed according to the following schedule:

- Before every rainfall event that is predicted to produce observable runoff and after every rainfall event that produces observable runoff, and
- At 24-hour intervals during extended rainfall events (except weekends or holidays when there is no ongoing site activity on those days).

More frequent inspections to ensure that developers are maintaining BMPs in good condition would be of benefit and Permittees may elect to require additional inspections by developers. For example, weekly self-inspections could be conducted during the wet season.

3.3 INSPECTION CRITERIA

3.3.1 Criteria for All Development Construction Projects

When conducting permittee inspections, the most important element of the inspection is to ensure that appropriate controls are in place that reduce pollutants from entering the storm drainage system. One element of which is to determine that the minimum requirements for Development Construction Projects are being achieved. If the inspector cannot affirmatively find that the minimum requirements are being achieved, the inspector shall require the developer to conform with those requirements.

The inspector may utilize the following framework when conducting an inspection:

1) Determine what BMPs are necessary to meet the minimum requirements;
2) Determine if BMPs are being used;
3) Determine whether BMPs are being implemented properly; and

4) Review developer's self-inspection checklist to determine whether minimum self-inspections have been performed.

An example checklist for documenting deficiencies and identifying corrective actions when conducting Permittee inspections is provided in Appendix H. If BMPs are either lacking or being implemented improperly, Section 3.4 provides a discussion of appropriate enforcement actions.

3.3.2 Criteria for Construction Priority Projects

Permittees must conduct at least one inspection of all active Construction Priority Projects during the rainy season. If the inspected site is not meeting minimum water quality protection requirements, Permittee inspectors must immediately direct compliance with these requirements and conduct a follow-up inspection to confirm that compliance is attained.

When conducting the initial Permittee inspection of Construction Priority Projects, the inspector will use the inspection checklist (or an equivalent) to evaluate conformance with minimum requirements and required BMPs and to document deficiencies and corrective actions. If BMPs are either lacking or improperly implemented, refer to Section 3.4 for a discussion of appropriate enforcement actions. Appendix H provides an example checklist for site inspections.

3.3.3 Criteria for Development Construction Projects Subject to General Construction Permit

The Regional Board is responsible for verifying and enforcing requirements of the General Construction Permit. When Permittee inspections are conducted at sites covered by the General Construction Permit, the inspector will document observations of potential violations using a checklist similar to the example provided in Appendix H. If violations are observed during the inspection, the Permittee must notify the Regional Board of the possible violation and the location of the construction site via facsimile or telephone within the next 2 business days.

3.4 PROCEDURES FOR CORRECTIVE AND ENFORCEMENT ACTIONS

Enforcement of storm water pollution prevention requirements for Development Construction Projects will be conducted by the Permittee's inspectors and/or other Permittee staff with enforcement authority. Violations observed will be documented by the inspectors in accordance with the Permittee's existing procedures for recording violations. Depending on the severity of the violation, enforcement can range from a verbal warning, to a written notice, stop work order, having the work performed by the Permittee's own staff or by a contractor secured by the

Permittee, or prosecution. Violations of the minimum requirements listed in Section 2.1 are to be treated with the same seriousness as violations of code provisions of similar importance.

Permittee inspectors will conduct a follow-up inspection to determine if corrective actions have been taken in accordance with minimum requirements. Escalating enforcement steps, leading up to the issuance of stop work orders and providing flexibility for the inspector to establish appropriate compliance time frames on a case-by-case basis, are to be used as needed to ensure compliance. Existing inspection/enforcement procedures should be used to achieve this result. *If a significant and/or immediate threat to water quality is observed by a Permittee's inspector, action should be taken to require the developer/contractor to immediately cease the discharge.* The threat to water quality shall be assessed by the inspector considering if runoff from a construction site will not be reasonably controlled by the protective measures in place or if a failure of BMPs is resulting in the release of sediments or other pollutants to a degree that may be substantially degrading water quality. The typical progressive enforcement steps that each Permittee should apply to the inspection enforcement program are:

1) Verbal warnings;
2) Written warnings; and
3) Stop work orders.

A discussion of these measures is provided below. While the provisions are not binding, the elements of these provisions should be incorporated in the Permittee's enforcement approach to the maximum extent practicable. Each Permittee's program should be consistent with existing enforcement mechanisms while generally conforming to the elements described in Sections 3.4.1 through 3.4.4.

3.4.1 Verbal Warnings

A common initial method of requesting corrective action and enforcing compliance is a verbal warning from the Permittee's inspector to the private contractor. Verbal warnings are often sufficient to achieve correction of the violation, often while the inspector is present at the construction site. The inspector will notify the developer/contractor's project supervisor of the violation, and document the violation and the notification to the project supervisor in the inspection file. A specific time frame for correcting the problem and a follow-up inspection date should be documented by the inspector. In judging the degree of severity, the Permittee inspector may also take into account any history of similar or repeated violations by the same developer or contractor at this or other sites.

3.4.2 Written Warnings

If the deficiency noted in the verbal warning is not corrected by the next inspection, a written notice of violation shall be issued describing the infraction that is to be corrected and the time frame for correction and for a follow-up inspection. A copy of the notice is to be given to the contractor's project supervisor and placed in the active inspection file. If the violation has been corrected to the satisfaction of the inspector, the inspector will document compliance in the inspection file. An example of a notice of violation form and a notice of correction form are provided in Appendix I. [Note that use of the specific forms provided as examples in Appendix I is not required.]

3.4.3 Stop Work Orders

If a notice of violation has not been addressed by the next inspection, or if the developer has not complied with their permit requirements, *or if a significant threat to water quality is observed* (such as a failure of BMPs resulting in a significant release of sediment or other pollutants off site), a stop work order may be issued by the appropriate municipal official. Stop work orders prohibit further construction activity until the problem is resolved and provide a time frame for correcting the problem. The stop work order will describe the infraction and specify what corrective action must be taken. A copy of the stop work order will be given to the private contractor's project supervisor and placed in the active inspection file. To restart work once a stop work order has been issued, the private contractor's project supervisor must request the inspector to re-inspect the project and verify that the deficiencies have been satisfactorily corrected. If the inspector is satisfied with the corrections, the inspector may sign off on that phase of the project, and work may proceed. A copy of a sample stop work order form is provided in Appendix I. In severe cases, the building or grading permit may be revoked.

3.4.4 Fines

A fine may also be issued if the Permittee has the authority to do so.

3.5 SITE INSPECTION AND ENFORCEMENT EMPLOYEE TRAINING

Each Permittee will implement a training program for staff involved with development construction activities. The minimum requirements are:

- Training must promote a clear understanding of the potential for construction activities to pollute storm water; and
- Training must cover the identification of violations of minimum water quality protection requirements for developer construction and implementation of corrective BMPs.

All existing construction inspection staff and other staff directly involved in development construction activities should receive formal training at least once after implementation of the Permittee's development construction program, and new staff should receive formal training after assignment to Permittee's development construction staff. Refresher training will be conducted periodically as necessary.

Training should cover the following areas:

- Minimum BMP requirements for Development Construction Projects;
- Description and contents of Local SWPPPs and WWECPs;
- Appropriate BMP applications and implementation;
- Inspection and enforcement procedures; and
- Use of inspection checklists.

Additional guidance for training employees involved in development construction activities is contained in Appendix J.

Relevant materials should be distributed to staff as appropriate. These may include checklists, guidance documents, materials included as appendices to this document, or other documentation that may be used later as reference information. The training program for construction inspection staff developed by Los Angeles County has been distributed to all Permittees and may be utilized to conduct formal training.

Informal training will be conducted periodically in conjunction with routine staff meetings, site inspections, or other opportunities as appropriate. Informal training is encouraged to include discussion of "lessons learned" in the field, introduction of new information, and periodic review of normal storm water inspection procedures.

The appendices of this Model Program (excluding Appendix A) are advisory only unless specifically identified in this Model Program as a requirement.

R0000454

Appendix A
Excerpts From Permit

b. Maximization of pervious areas and storm water infiltration (where geology and topography permit); and

c. Cost effective storm water pollution control measures.

The program shall provide specific guidance on selecting BMPs to reduce pollutants in storm water discharges from urbanized areas, and include appropriate BMPs, educational materials, and handbooks and guidelines described in Part 2. III.A.3.

Each Permittee shall implement a developer information program consistent with the model program not later than six months after commencement of its next fiscal year following approval of the model by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999. Each Permittee's program shall include information about its legal authorities. Permittees are encouraged to engage in joint efforts in implementing the program.

B. Development Construction

Table 4 on the following page shows the summary of requirements and corresponding compliance dates under this section.

This space is left intentionally blank.

Table 4
Development Construction Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Develop minimum requirements, recommended BMPs, and design checklists for construction	III.B.1	✓		14 (September 30, 1998)	Regional Board
Develop and implement a program for construction control measures	III.B.2.a		✓	≤ 36 months (July 30, 1999)	N/A
Require applicants to demonstrate coverage under State Construction General Permit prior to issuance of grading permits	III.B.2.b		✓	6 (January 31, 1997)	N/A
Develop a model construction inspection program	III.B.3.a	✓		14 (September 30, 1997)	Executive Officer
Implement a construction inspection program	III.B.3.b		✓	≤ 36 months (July 30, 1999)	N/A

1. Countywide Development Construction Guidance

The Principal Permittee, in consultation with the Permittees and appropriate stakeholder organizations, shall develop not later than September 30, 1998, the following development construction guidance materials for all development project construction activities: minimum recommended requirements, BMPs appropriate for various activities, and checklists for use in design and inspection. The Countywide minimum requirements and recommended BMPs shall:

a. Include erosion and sediment control practices;

b. Address multiple construction activity-related pollutants;

c. Focus on BMPs such as source minimization, education, good housekeeping, good waste management, and good site planning;

d. Target construction areas and activities with the potential to generate significant pollutant loads;

e. Require retention on the site, to the maximum extent practicable, of sediment, construction waste, and other pollutants from construction activity;

f. Require, to the maximum extent practicable, management of excavated soil on site to minimize the amount of sediment that escapes to streets, drainage facilities, or adjoining properties;

g. Require, to the maximum extent practicable, use of structural drainage controls to minimize the escape of sediment and other pollutants from the site.

h. Require, to the maximum extent practicable, containment of runoff from equipment and vehicle washing at construction sites, unless treated to remove sediments and pollutants.

The lists of BMPs shall be submitted to the Regional Board for approval.

2. Construction Control Measures

a. Each Permittee shall develop a regulatory program for construction activities as defined in Part 2.III.A.1.a. consistent with the Countywide Development Construction Guidance not later than six months after commencement of its next fiscal year following approval of the minimum recommended requirements and BMPs in Part 2.III.B.1. by the Regional Board , provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

The Program shall require, prior to the issuance of any building or grading permit, preparation of appropriate wet weather erosion control and storm water pollution prevention plans which include, by detail or reference, all appropriate construction BMPs developed under Part 2.III.B.1.

Priority Project plans must include a narrative discussion of the reasons used for selecting or rejecting BMPs. In lieu of a narrative, the project architect or engineer of record may sign a statement on the plan to the effect: "As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project owner and contractor are aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activities."

b. Each Permittee shall implement a procedure not later than January 31, 1997, whereby the Permittee shall not issue a grading permit for developments with disturbed areas of five acres or greater unless the applicant can show that (i) a Notice of Intent (NOI) to comply with the State Construction Activity Storm Water Permit has been filed and (ii) a Storm Water Pollution Prevention Plan (SWPPP) has been prepared.

3. Site Inspection

a. The Principal Permittee, in consultation with the Permittees, shall develop a model construction activity inspection program, which includes checklists, not later than September 30, 1997. The model program shall include but not be limited to:

i. Procedures for construction site inspections;

ii. Procedures to require corrective action be undertaken by contractors at noncomplying sites;

iii. Procedures for enforcement action against noncomplying construction activity; and

iv. Appropriate training for program staff.

b. Each Permittee shall implement a construction activities inspection program based on the model program not later than six months after commencement of its next fiscal year following approval of the model program by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such

program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999. The program may be integrated with the Permittees regular program of construction inspection for maximum efficiency

This space is left intentionally blank.

Appendix B

Owner's Certification Statement for Minimum Requirements

Appendix B
Owner's Certification Statement for Minimum Requirements

National Pollutant Discharge Elimination System (NPDES) is the portion of the Clean Water Act that applies to protection of receiving waters. Under permits from the Los Angeles Regional Water Quality Control Board (RWQCB), certain activities are subject to RWQCB enforcement. To meet the requirements of the Los Angeles County Municipal Storm water Permit (CAS614001), the City (County) of _____ has adopted minimum requirements for storm water runoff management from development construction activities. These include requirements for sediment control, erosion control and construction activities control to be implemented on each project site.

Site Address or Tract No:_____Building/Grading Permit No:_____

Owner:_____Contractor:_____

I have read and understand the requirements indicated above.

_____ _____

Owner or Authorized Representative Date

In compliance with the above requirements, I certify that I understand and will comply with the minimum requirements noted above.

_____ _____

Owner or Authorized Representative Date

Appendix C

Developer/Contractor Self-Inspection Form

CONSTRUCTION SITE INSPECTION CHECKLIST

Inspected By: _____

Project: _____

Contractor: _____

Date: _____

Check "Yes" or "No" or "N/A" if not applicable.

YES	NO	N/A		
_____	_____	_____	1.	Has there been rain at the site since the last inspection?
_____	_____	_____	2.	Are all sediment barriers (e.g., sandbags, straw bales, and silt fences) in place in accordance with the Plan and are they functioning properly?
_____	_____	_____	3.	If present, are all exposed slopes protected from erosion through the implementation of acceptable soil stabilization practices?
_____	_____	_____	4.	If present, are all sediment traps/basins installed and functioning properly?
_____	_____	_____	5.	Are all material handling and storage areas reasonably clean and free of spills, leaks, or other deleterious materials?
_____	_____	_____	6.	Are all equipment storage and maintenance areas reasonably clean and free of spills, leaks, or any other deleterious materials?
_____	_____	_____	7.	Are all materials and equipment properly covered?
_____	_____	_____	8.	Are all external discharge points (i.e., outfalls) reasonably free of any noticeable pollutant discharges?
_____	_____	_____	9.	Are all internal discharge points (i.e., storm drain inlets) provided with inlet protection?

Check "Yes" or "No" or "N/A" if not applicable.

YES	NO	N/A		
_____	_____	_____	10	Are all external discharge points reasonably free of any significant erosion or sediment transport?
_____	_____	_____	11.	Are all BMPs identified on the Plan installed in the proper locations and according to the specifications for the Plan?
_____	_____	_____	12.	Are all structural control practices in good repair and maintained in functional order?
_____	_____	_____	13.	Are all on-site traffic routes, parking, and storage of equipment and supplies restricted to areas designated in the Plan for those uses?
_____	_____	_____	14.	Are all locations of temporary soil stockpiles or construction materials in approved areas and properly contained?
_____	_____	_____	15.	Are all seeded or landscaped areas properly maintained?
_____	_____	_____	16.	Are sediment controls in place at discharge points from the site?
_____	_____	_____	17.	Are slopes free of significant erosion?
_____	_____	_____	18	Are all points of ingress and egress from the site provided with stabilized construction entrances?
_____	_____	_____	19.	Is sediment, debris, or mud being cleaned from public roads at intersections with site access roads?
_____	_____	_____	20.	Does the Plan reflect current site conditions?

If you answered "no" to any of the above questions (except Number 1), describe any corrective action(s) that must be taken to remedy the problem and when the corrective action is to be completed:

Checklist Item	Corrective Action(s) Needed	Date to be Completed

INSPECTION LOG

The site shall be inspected before and after storm events with 0.25 inches or greater predicted or actual precipitation, and documented on the Construction Site Inspection Checklist Form. Incidents of noncompliance must be reported to the Engineer. A log of all inspections, as shown below, shall be kept current.

Date	Inspector	Type of Inspection			Observations (If post-storm inspection, note size of storm in inches)
		Routine	Pre-Storm	Post-Storm	

Appendix D

Guidance for Local SWPPP/WWECP

Section 2.2.1 of this Model Program provides criteria for identifying Construction Priority Projects if the project is in or adjacent to an environmentally sensitive area, in a designated hillside area, or if the project disturbs more than 2 acres of soil, and describes the additional documentation requirements for these projects. Construction Priority Projects require the project owner to prepare a:

- Local Storm Water Pollution Prevention Plan (SWPPP); and a
- Wet Weather Erosion Control Plan (WWECP) if the soil for a priority project will be disturbed during the rainy season.

The Local SWPPP must be prepared before the project owner, developer, or contractor receives a grading or building permit and must be implemented year-round throughout construction. A WWECP must be prepared prior to each rainy season, and must be implemented throughout that rainy season. This appendix provides guidance for preparing these plans, including sample forms that permittees may provide to the project owner, developer, and/or contractor.

If a Local SWPPP or WWECP is required, it may be prepared by the owner, the construction contractor or a consultant. Permittees may elect to determine who must prepare the Local SWPPP/WWECP for specific project types. When developing a Local SWPPP or WWECP, the preparer should assess site conditions, identify construction activities with the potential to cause storm water pollution, and then identify the BMPs that will best suit the construction activities. A well developed plan will provide sufficient detail to properly implement and maintain the BMPs, yet be sufficiently flexible to allow for minor field modifications without making formal plan amendments.

The Local SWPPP/WWECP must include a site map of the project (a copy of the grading or drainage plan may be used) showing:

- The project boundary and/or limits of grading. (Permittees may elect to require site limit maps to extend 50 feet beyond property line and/or grading limits.)
- The footprint of existing facilities and facilities that will be built during construction.
- Specific locations where construction materials, vehicles, and equipment will be stored, handled, used, maintained, and disposed, along with locations of structural measures that will be used to contain these materials on site.
- The existing and final grades of the site, along with any intermediate grades during construction that will significantly affect site drainage patterns.

- The location(s) where runoff from the site may enter storm drain(s), channel(s), and/or receiving water(s).
- Specific locations where erosion and sediment control measures will be installed for each permanent or temporary site drainage pattern that will occur before, during and after construction.

The plan must provide:

- Information about the project location, owner, and contractor;
- A brief narrative description on the nature of the construction activity and special site conditions; and,
- A list of BMPs for managing targeted construction activities.

The plan must also include a BMP checklist with a discussion of the reasons for selecting or rejecting BMPs such as shown in the attached example, and must contain a signed certification statement.

Suggested formats for a Local SWPPP and WWECP follow.

Section 1 - Project Description and Information

1. The name of the project:

2. The address or location of the project:

3. The building permit number for the project:

4. The grading permit number for the project (if applicable):

5. The owner/developer's name, address, phone number and contact person:

6. Contractor's name, address, phone number and contact person:

7. What are the major features that the project will provide? (e.g., low density residential, commercial development, etc.)

Section 1 - Project Description and Information (cont'd)

8. What are the estimated construction start and finish dates?

   Project Start Date:_____

   Project Finish Date:_____

9. What are the estimated dates during which soil will be disturbed?

   Start Grading:_____

   Finish Grading:_____

10 Are there any unique features relating to adjacent water bodies (i.e., in or around a wetland, river, stream, or estuary)?

   _____

   _____

Section 2 - Best Management Practices

Use the following tables to indicate the BMPs that will be used to control storm water pollution. Attach additional written documentation if necessary.

2.1 General Site Management

BMP Description	Will BMP Be Used? Yes	No	If Yes, Explain How / If No, State Reason
Site Planning Considerations			
Scheduling (ESC01)			
Preservation of Existing Vegetation (ESC02)			
Construction Practices			
Dewatering Operations (CA01)			
Paving Operations (CA02)			
Structure Construction & Painting (CA03)			
Dust Control (ESC21)			
Vehicle & Equipment Management			
Vehicle & Equipment Cleaning (CA30)			
Vehicle & Equipment Fueling (CA31)			
Vehicle & Equipment Maintenance (CA32)			
Tracking Control			
Stabilized Construction Entrance (ESC24)			
Contractor Training			
Employee/Subcontractor Training (CA40)			

2.2 Construction Materials and Waste Management

BMP Description	Will BMP Be Used? Yes	No	If Yes, Explain How / If No, State Reason
Material Management			
Material Delivery and Storage (CA10)			
Material Use (CA11)			
Spill Prevention and Control (CA12)			
Waste Management			
Solid Waste Management (CA20)			
Hazardous Waste Management (CA21)			
Contaminated Soil Management (CA22)			
Concrete Waste Management (CA23)			
Sanitary/Septic Waste Management (CA24)			

Section 3 - Site Map Checklist

____ The project boundary and/or limits of grading. *(Option: 50 feet beyond property line or grading limits)*

____ The footprint of existing facilities and facilities that will be built during construction.

____ The existing and final grades of the site, along with any intermediate grades during construction that will significantly affect site drainage patterns.

____ The location(s) where runoff from the site may enter storm drain(s), channel(s), and/or receiving water(s).

____ Specific locations where construction materials, vehicles, and equipment will be stored, handled, used, maintained, and disposed, along with locations of structural measures that will be used to contain these materials on site.

Section 4 - Certification

As the project owner, I certify that appropriate BMPs will be implemented to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project contractor is aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activities.

Section 2 - Best Management Practices

Use the following checklists to indicate the BMPs that will be used to control wet weather erosion and off site sedimentation. Attach additional written documentation if necessary.

2.1 Erosion Control Practices

BMP Description	Will BMP Be Used? Yes	No	If Yes, Explain How / If No, State Reason
Site Planning Considerations			
Scheduling (ESC01)			
Preservation of Existing Vegetation (ESC02)			
Vegetative Stabilization			
Seeding & Planting (ESC10)			
Mulching (ESC11)			
Physical Stabilization			
Geotextiles & Mats(ESC20)			
Dust Control (ESC21)			
Temporary Stream Crossing (ESC22)			
Construction Road Stabilization (ESC23)			
Diversion of Runoff			
Earth Dike (ESC30)			
Temporary Drains & Swales (ESC31)			
Slope Drain (ESC32)			
Velocity Reduction			
Outlet Protection (ESC40)			
Check Dams (ESC41)			
Slope Roughening/Terracing (ESC42)			

2.2 *Sediment Control Practices*

BMP Description	Will BMP Be Used? Yes	No	If Yes, Explain How / If No, State Reason
Sediment Control			
Silt Fence (ESC50)			
Straw Bale Barrier (ESC51)			
Sand Bag Barrier (ESC52)			
Brush or Rock Filter (ESC53)			
Storm Drain Inlet Protection (ESC54)			
Sediment Trap (ESC55)			
Sediment Basin (ESC56)			

Section 3 - Site Map Checklist

____ The project boundary and/or limits of grading. *(Option: 50 feet beyond property line or grading limits)*

____ The footprint of existing facilities and facilities that will be built during construction.

____ The existing and final grades of the site, along with any intermediate grades during construction that will significantly affect site drainage patterns.

____ The location(s) where runoff from the site may enter storm drain(s), channel(s), and/or receiving water(s).

____ Specific locations where erosion and sediment control measures will be installed for each permanent or temporary site drainage pattern that will occur before, during and after construction.

Section 4 - Certification

As the project owner, I certify that appropriate BMPs will be implemented to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project contractor is aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activities for the reasons cited above.

Owner's NOI/SWPPP Certification Form

Appendix E
Owner's NOI/SWPPP Certification Form

National Pollutant Discharge Elimination System (NPDES) is the portion of the Clean Water Act that applies to protection of receiving waters. Construction activity that will disturb a ground surface area of 5 acres or more (about 220.000 square feet or 2.02 hectares), or if the project results in the disturbance of less than 5 acres of soil but is part of a larger common plan of development or site that exceeds 5 acres, is subject to requirements of the California General Permit for Storm water Discharges Associated with Construction Activity (Permit No. CAS000002) under the NPDES Program. A Notice of Intent (NOI) is required to be filed with the SWRCB and a Storm Water Pollution Prevention Plan (SWPPP) is required to be prepared, implemented and available at the job site for review and verification at all times for such projects.

Site Address or Tract No:_____ Permit No:_____

Owner:_____ Contractor:_____

I have read and understand the requirements indicated above.

_____ _____

Owner or Authorized Representative Date

In compliance with the above requirements, I certify that a Notice of Intent has been filed with the State Water Resources Control Board and that a Storm Water Pollution Prevention Plan has been prepared.

ıction Projects

In planning a construction project, the developer/contractor must answer three key questions with respect to storm water quality control: (1) what kind of water quality controls are needed?; (2) where should the controls be implemented?; and (3) how much control is enough? In order to answer these questions, the developer/contractor should use a documentable, defensible process to identify potential water quality problems, develop design objectives, formulate and evaluate alternatives, select the most appropriate alternatives, and design the plan. A suggested BMP selection process particularly applicable to Construction Priority Projects and projects subject to the California General Permit for Storm Water Discharges Associated with Construction Activity is described herein.

F.1 DEVELOP GOALS AND OBJECTIVES

Site specific conditions of Development Construction Projects determine which BMPs are most applicable for a site. The BMPs selected for a site should fulfill the following goals and objectives:

- Be appropriate for the given site constraints
- Have a beneficial or neutral impact on the environment
- Provide moderate to high pollutant source control and/or removal capability
- Meet regulatory requirements
- Minimize changes in hydrological conditions
- Be cost effective.

F.2 BMP SELECTION CRITERIA

In order to fulfill the above goals and objectives, BMPs should be selected by using appropriate selection criteria that serve to identify the capabilities and limitations of each BMP. Criteria to be considered in screening and selecting BMPs for the construction stage are:

- Site factors (e.g., slope, high water table, soils, potential risks below or downstream of site, etc.)
- Project Characteristics (e.g. type, size, and duration of project)
- Pollutant avoidance (source control) or removal capability (effectiveness)
- Cost of implementation
- Environmental compatibility

These criteria may be given equal weight during the BMP selection process, or they may be weighted differentially, depending on the relative importance of each factor for the particular project.

Several general principals that should be considered in selecting erosion and sediment control BMPs include:

- Prevention of pollutant release is superior to pollutant capture later. Select source control BMPs as a first step.
- Selection of BMPs must depend on site characteristics and the construction plan.
- The proper first step is a site drainage analysis. Determine where runoff will enter, cross and exit the site.
- Divert runoff from exposed areas wherever possible.
- Existing vegetation is the most effective erosion control.
- Limit and phase clearing.
- Incorporate natural drainage features whenever possible, using adequate buffers and protecting areas where flow enters the drainage system.
- Minimize slope length and steepness.
- Keep runoff velocities low.
- Reduce the tracking of sediment off-site.
- Select and install controls that can be maintained.

F.3 NOMINATE AND EVALUATE ALTERNATIVES

A number of BMPs applicable to Development Construction Projects have been identified in Section 2.5 of this Model Program. The BMPs were nominated from the *California Storm Water Best Management Practices Handbooks*. Other BMPs from other manuals and sources were also considered.

F.4 SELECT BEST ALTERNATIVES

Based on the list of recommended BMPs for Development Construction Projects provided in this Model Program, the developer/contractor should use the selection criteria described above to select the best alternatives for the project conditions, characteristics, and concerns. This may be done numerically, by weighting the selection criteria, rating each BMP against each criteria, and summing up a weighted rating for each BMP, which then becomes a relative ranking. Or the

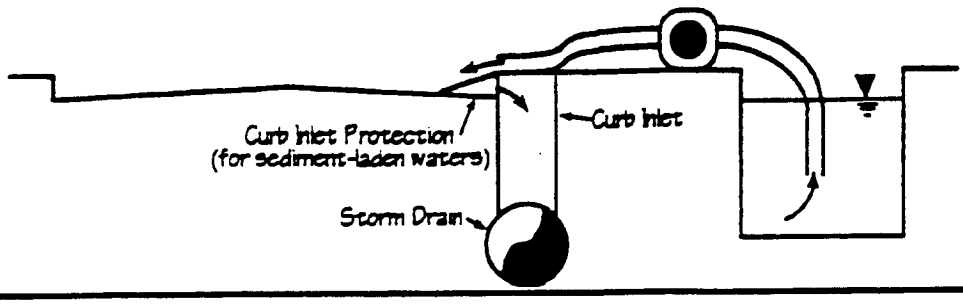
selection process may be done in a more subjective, non-numerical way using experience and professional judgment to select the best alternative BMPs. Either way, the developer/contractor should document the selection process and provide support for the selected system of controls.

F.5 DESIGN, IMPLEMENT, AND MAINTAIN THE BMPs

After the appropriate BMPs are selected for a given project, the developer/contractor should document those selected on the standard checklist and show the selected BMPs on the plans, as discussed in Section 3 of this document. It is important that the control measures be properly installed and maintained. Improper installation and poor maintenance are the most common reasons for storm water controls to not function as designed. Therefore, it is incumbent on the designer to provide sufficient information in the project plans and specifications for their proper installation, and to provide adequate guidance on their proper maintenance so that the installation and maintenance procedures may be incorporated into the state SWPPP, Local SWPPP, or WWECP.

Appendix G
BMP Fact Sheets

ACTIVITY: DEWATERING OPERATIONS



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from dewatering operations by using sediment controls and by testing the groundwater for pollution.

APPROACH

There are two general classes of pollutants that may result from dewatering operations; sediment, and toxics and petroleum products. A high sediment content in dewatering discharges is common because of the nature of the operation. On the other hand, toxics and petroleum products are not commonly found in dewatering discharges unless, the site or surrounding area has been used for light or heavy industrial activities, or the area has a history of groundwater contamination. The following steps will help reduce storm water pollution from dewatering discharges:

Sediment

- Use sediment controls to remove sediment from water generated by dewatering (See Sediment Trap (ESC 55) and Sediment Basin (ESC 56) in Chapter 5).
- Use filtration to remove sediment from a sediment trap or basin. Filtration can be achieved with:
  - Sump pit and a perforated or slit standpipe with holes and wrapped in filter fabric. The standpipe is surrounded by stones which filters the water as it collects in the pit before being pumped out. Wrapping the standpipe in filter fabric may require an increased suction inlet area to avoid clogging and unacceptable pump operation.
  - Floating suction hose to allow cleaner surface water to be pumped out.

Toxics and Petroleum Products

- In areas suspected of having groundwater pollution, sample the groundwater near the excavation site and have the water tested for known or suspected pollutants at a certified laboratory. Check with the Regional Water Quality Control Board and the local wastewater treatment plant for their requirements for dewatering, additional water quality tests, and disposal options.
- With a permit from the Regional Water Quality Control Board, you may be able to recycle/reuse pumped groundwater for landscape irrigation, or discharge to the storm sewer. With a permit from the local agency, you may be able to treat pumped groundwater and discharge it to the municipal wastewater treatment plant via the sanitary sewer.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ◒ Capital Costs
- ◒ O&M Costs

- ◒ Training
- ○ Suitability for Slopes >5%

● High ○ Low

CA1

Best Management Practices

CONTRACTOR ACTIVITY: DEWATERING OPERATIONS (Continue)

REQUIREMENTS

- Costs (Capital, O&M)
  - Sediment controls are low cost measures.
  - Treatment and/or discharge of polluted groundwater can be quite expensive.
- Maintenance
  - Maintain sediment controls and filters in good working order. (See Chapter 5 for details)
  - Inspect excavated areas daily for signs of contaminated water as evidenced by discoloration, oily sheen, or odors.

LIMITATIONS

- The presence of contaminated water may indicate contaminated soil as well. See CA22 (Contaminated Soil Management) in this chapter for more information.

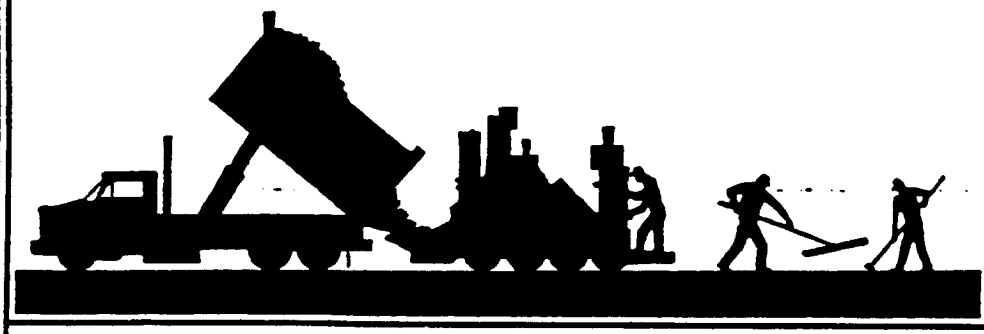
CA1

ACTIVITY: PAVING OPERATIONS

Graphic: North Central Texas COG, 1993



DESCRIPTION

Prevent or reduce the discharge of pollutants from paving operations, using measures to prevent runon and runoff pollution, properly disposing of wastes, and training employees and subcontractors.

APPROACH

- Avoid paving during wet weather.
- Store materials away from drainage courses to prevent storm water runon (see CA10 Material Delivery and Storage).
- Protect drainage courses, particularly in areas with a grade, by employing BMPs to divert runoff or trap/filter sediment (see Chapter 5).
- Leaks and spills from paving equipment can contain toxic levels of heavy metals and oil and grease. Place drip pans or absorbent materials under paving equipment when not in use. Clean up spills with absorbent materials rather than burying. See CA32 (Vehicle and Equipment Maintenance) and CA12 (Spill Prevention and Control) in this chapter.
- Cover catch basins and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.
- Shovel or vacuum saw-cut slurry and remove from site. Cover or barricade storm drains during saw cutting to contain slurry.
- If paving involves portland cement concrete, see CA23 (Concrete Waste Management) in this chapter.
- If paving involves asphaltic concrete, follow these steps:
  - Do not allow sand or gravel placed over new asphalt to wash into storm drains, streets, or creeks by sweeping. Properly dispose of this waste by referring to CA20 (Solid Waste Management) in this chapter.
  - Old asphalt must be disposed of properly. Collect and remove all broken asphalt from the site and recycle whenever possible.
  - If paving involves on-site mixing plant, follow the storm water permitting requirements for industrial activities.
- Train employees and subcontractors.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect employees and subcontractors to ensure that measures are being followed.
  - Keep ample supplies of drip pans or absorbent materials on-site.

LIMITATIONS

- There are no major limitations to this best management practice.

Objectives

- **Housekeeping Practices**
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

CA2

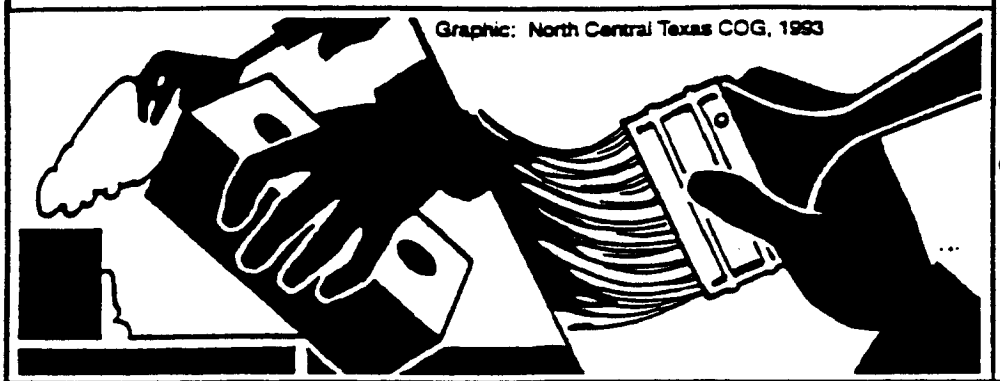
ACTIVITY: STRUCTURE CONSTRUCTION AND PAINTING



Graphic: North Central Texas COG, 1993

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from structure construction and painting by enclosing or covering or berming building material storage areas, using good housekeeping practices, using safer alternative products, and training employees and subcontractors.

APPROACH

- Keep the work site clean and orderly. Remove debris in a timely fashion. Sweep the area.
- Use soil erosion control techniques if bare ground is exposed (See Chapter 5).
- Buy recycled or less hazardous products to the maximum extent practicable.
- Conduct painting operations consistent with local air quality and OSHA regulations.
- Properly store paints and solvents. See CA10 (Material Delivery and Storage) in this chapter.
- Properly store and dispose waste materials generated from the activity. See the waste management BMPs (CA20 to CA24) in this chapter.
- Recycle residual paints, solvents, lumber, and other materials to the maximum extent practicable.
- Make sure that nearby storm drains are well marked to minimize the chance of inadvertent disposal of residual paints and other liquids.
- Clean the storm drain system in the immediate construction area after construction is completed.
- Educate employees who are doing the work.
- Inform subcontractors of company policy on these matters and include appropriate provisions in their contract to make certain proper housekeeping and disposal practices are implemented.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - These BMPs are generally of low to moderate cost.
- Maintenance
  - Maintenance should be minimal.

LIMITATIONS

- Safer alternative products may not be available, suitable, or effective in every case.
- Hazardous waste that cannot be re-used or recycled must be disposed of by a licensed hazardous waste hauler.

Objectives

- **Housekeeping Practices**
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

- ○ Suitability for Slopes >5%

● High ○ Low

CA3

Best Management Practices

ACTIVITY: STRUCTURE CONSTRUCTION AND PAINTING (Continue)

- Be certain that actions to help storm water quality are consistent with Cal- and Fed-OSHA and air quality regulations.

Construction and painting activities can generate pollutants that can reach storm water if proper care is not taken. The sources of these contaminants may be solvents, paints, paint and varnish removers, finishing residues, spent thinners, soap cleaners, kerosene, asphalt and concrete materials, adhesive residues, and old asbestos insulation. For specific information on some of these wastes see the following BMPs in this chapter:

CA20 Solid Waste,
CA21 Hazardous Waste, and
CA23 Concrete Waste.

More specific information on structure construction practices is listed below.

Erosion and Sediment Control

If the work involves exposing large areas of soil or if old buildings are being torn down and not replaced in the near future, employ the appropriate soil erosion and control techniques described in Chapter 5.

Storm/Sanitary Sewer Connections

Carefully install all plumbing and drainage systems. Cross connections between the sanitary and storm drain systems, as well as any other connections into the drainage system from inside a building, are illegal. Color code or flag pipelines on the project site to prevent such connections, and train construction personnel.

Painting

Local air pollution regulations may, in many areas of the state, specify painting procedures which if properly carried out are usually sufficient to protect storm water quality. These regulations may require that painting operations be properly enclosed or covered to avoid drift. Use temporary scaffolding to hang drop cloths or draperies to prevent drift. Application equipment that minimizes overspray also helps. When using sealants on wood, pavement, roofs, etc, quickly clean up spills. Remove excess liquid with absorbent material or rags.

If painting requires scraping or sand blasting of the existing surface, use a drop cloth to collect most of the chips. Dispose the residue properly. If the paint contains lead or tributyl tin, it is considered a hazardous waste. Refer to the waste management BMPs in this chapter for more information.

Mix paint indoors, in a containment area, or in a flat unpaved area not subject to significant erosion. Do so even during dry weather because cleanup of a spill will never be 100% effective. Dried paint will erode from sloped surfaces and be washed away by storms. If using water based paints, clean the application equipment in a sink that is connected to the sanitary sewer or in a containment area where the dried paint can be readily removed. Properly store leftover paints if they are to be kept for the next job, or dispose of properly.

Roof work

When working on roofs, if small particles have accumulated in the gutter, either sweep out the gutter or wash the gutter and trap the particles at the outlet of the downspout. A sock or geofabric placed over the outlet may effectively trap the materials. If the downspout is lined tight, place a temporary plug at the first convenient point in the storm drain and pump out the water with a vactor truck, and clean the catch basin sump where you placed the plug.

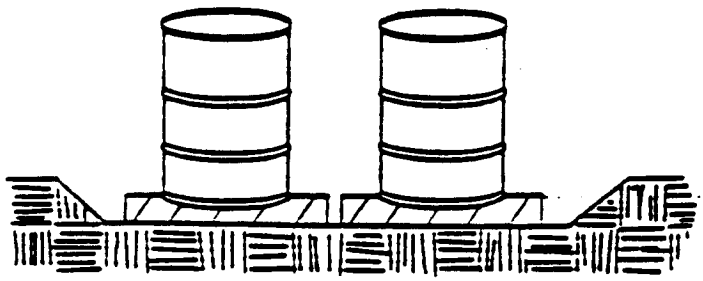
CA3

R0000492

ACTIVITY: MATERIAL DELIVERY AND STORAGE



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from material delivery and storage by minimizing the storage of hazardous materials on-site, storing materials in a designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see CA11 (Material Use), or CA12 (Spill Prevention and Control). For information on wastes, see the waste management BMPs in this chapter.

APPROACH

The following materials are commonly stored on construction sites:

- Soil,
- Pesticides and herbicides,
- Fertilizers,
- Detergents,
- Plaster or other products,
- Petroleum products such as fuel, oil, and grease, and
- Other hazardous chemicals such as acids, lime, glues, paints, solvents, and curing compounds.

Storage of these materials on-site can pose the following risks:

- Storm water pollution,
- Injury to workers or visitors,
- Groundwater pollution, and
- Soil contamination.

Therefore, the following steps should be taken to minimize your risk:

- Designate areas of the construction site for material delivery and storage.
  - Place near the construction entrances, away from waterways
  - Avoid transport near drainage paths or waterways
  - Surround with earth berms (see ESC30, Earth Dike.)
  - Place in an area which will be paved
- Storage of reactive, ignitable, or flammable liquids must comply with the fire codes of your area. Contact the local Fire Marshal to review site materials, quantities, and proposed storage area to determine specific requirements. See the Flammable and Combustible Liquid Code, NFPA30.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.
- Keep an accurate, up-to-date inventory of materials delivered and stored on-site.
- Keep your inventory down.

Targeted Pollutants

- ◒ Sediment
- ◒ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ◒ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Capital Costs
- ○ O&M Costs
- ○ Maintenance
- ◒ Training
- ○ Suitability for Slopes >5%

● High ○ Low

CA10

Best Management Practices

ACTIVITY: MATERIAL DELIVERY AND STORAGE (Continue)

- Minimize hazardous materials on-site storage.
- Handle hazardous materials as infrequently as possible.
- During the rainy season, consider storing materials in a covered area. Store materials in secondary containments such as an earthen dike, horse trough, or even a children's wading pool for non-reactive materials such as detergents, oil, grease, and paints. Small amounts of material may be secondarily contained in "bus boy" trays or concrete mixing trays.
- Do not store chemicals, drums, or bagged materials directly on the ground. Place these items on a pallet and, when possible, in secondary containment.
- If drums must be kept uncovered, store them at a slight angle to reduce ponding of rainwater on the lids and to reduce corrosion.
- Try to keep chemicals in their original containers, and keep them well labeled.
- Train employees and subcontractors.
- Employees trained in emergency spill cleanup procedures should be present when dangerous materials or liquid chemicals are unloaded.
- If significant residual materials remain on the ground after construction is complete, properly remove materials and any contaminated soil (See CA22). If the area is to be paved, pave as soon as materials are removed to stabilize the soil.

REQUIREMENTS

- Cost (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Keep the designated storage area clean and well organized.
  - Conduct routine weekly inspections and check for external corrosion of material containers.
  - Keep an ample supply of spill cleanup materials near the storage area.

LIMITATIONS

- Storage sheds often must meet building and fire code requirements.

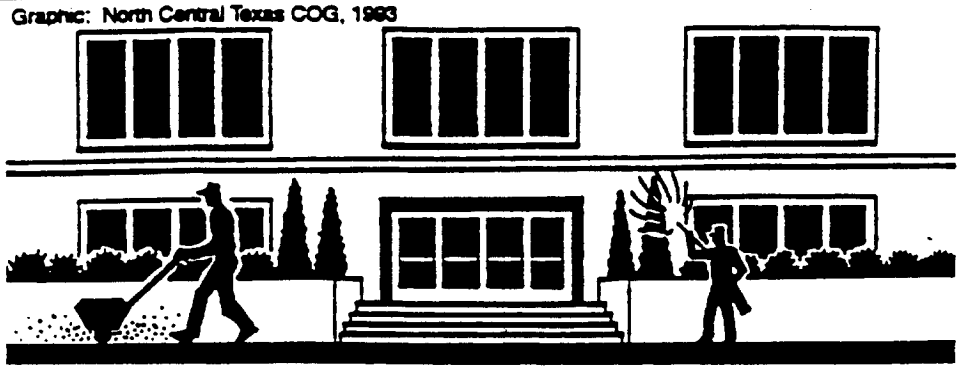
CA10

R0000494

ACTIVITY: MATERIAL USE

Graphic: North Central Texas COG, 1993



DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from material use by using alternative products, minimizing hazardous material use on-site, and training employees and subcontractors.

APPROACH

The following materials are commonly used on construction sites:

- Pesticides and herbicides,
- Fertilizers,
- Detergents,
- Plaster and other products,
- Petroleum products such as fuel, oil, and grease, and
- Other hazardous chemicals such as acids, lime, glues, paints, solvents, and curing compounds.

Use of these materials on-site can pose the following risks:

- Storm water pollution,
- Injury to workers or visitors,
- Groundwater pollution, and
- Soil contamination.

Therefore, the following steps should be taken to minimize your risk:

- Use less hazardous, alternative materials as much as possible.
- Minimize use of hazardous materials on-site.
- Use materials only where and when needed to complete the construction activity.
- Follow manufacturer's instructions regarding uses, protective equipment, ventilation, flammability, and mixing of chemicals.
- Personnel who use pesticides should be trained in their use. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct on-site inspections.
- Do not over-apply fertilizers, herbicides, and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Unless on steep slopes, till fertilizers into the soil rather than hydroseeding. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried off-site by runoff. Do not apply these chemicals just before it rains.
- Train employees and subcontractors in proper material use.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

CA11

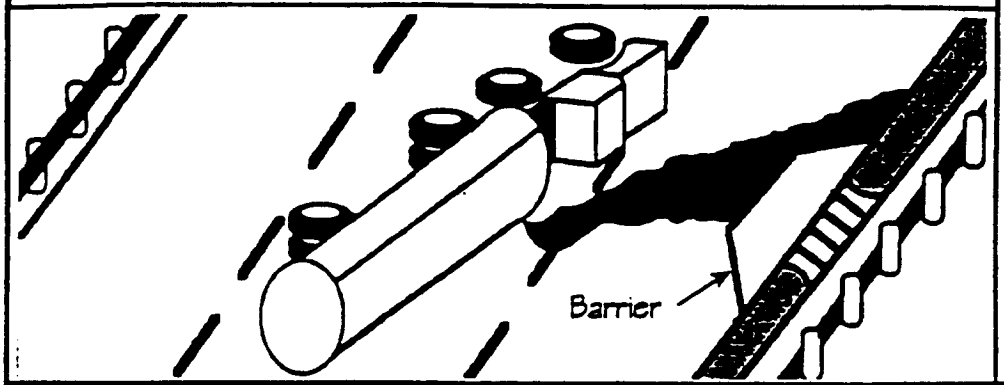
ACTIVITY: SPILL PREVENTION AND CONTROL



Objectives

- ***Housekeeping Practices*** (●)
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas*
- *Protect Slopes/Channels*
- *Control Site Perimeter*
- *Control Internal Erosion*

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, CA10 (Material Delivery and Storage) and CA11 (Material Use), also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this chapter.

APPROACH

The following steps will help reduce the storm water impacts of leaks and spills:

Define "Significant Spill"

- Different materials pollute in different amounts. Make sure that each employee knows what a "significant spill" is for each material they use, and what is the appropriate response for "significant" and "insignificant" spills.

General Measures

- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Train employees in spill prevention and cleanup.
- Designate responsible individuals.

Cleanup

- Clean up leaks and spills immediately.
- On paved surfaces, clean up spills with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to either a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly. See the waste management BMPs in this chapter for specific information.

Reporting

- Report significant spills to local agencies, such as the Fire Department; they can assist in cleanup.
- Federal regulations require that any significant oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hour).

Best Management Practices

ACTIVITY: SPILL PREVENTION AND CONTROL (Continue)

Use the following measures related to specific activities:

Vehicle and Equipment Maintenance

- If maintenance must occur on-site, use a designated area and/or a secondary containment, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Regularly inspect on-site vehicles and equipment for leaks, and repair immediately.
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment on-site.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place drip pans or absorbent materials under paving equipment when not in use.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around.
- Oil filters disposed of in trash cans or dumpsters can leak oil and pollute storm water. Place the oil filter in a funnel over a waste oil recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask your oil supplier or recycler about recycling oil filters.
- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- If fueling must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Discourage "topping-off" of fuel tanks.
- Always use secondary containment, such as a drain pan, when fueling to catch spills/leaks.

REQUIREMENTS

- Costs (Capital, O&M)
  - Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil or water can be quite expensive.
- Maintenance
  - Keep ample supplies of spill control and cleanup materials on-site, near storage, unloading, and maintenance areas.
  - Update your spill prevention and control plan and stock cleanup materials as changes occur in the types of chemicals on-site.

LIMITATIONS

- If necessary, use a private spill cleanup company.

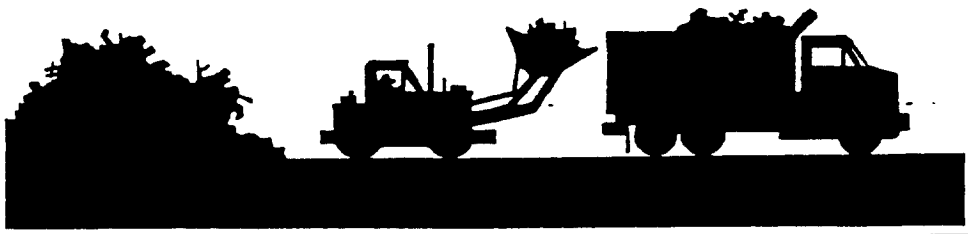
R0000498

ACTIVITY: SOLID WASTE MANAGEMENT

Graphic: North Central Texas COG, 1993



DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

APPROACH

Solid waste is one of the major pollutants resulting from construction. Construction debris includes:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction;
- Packaging materials including wood, paper and plastic;
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products; and
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, and plastic wrappers, and cigarettes.

The following steps will help keep a clean site and reduce storm water pollution:

- Select designated waste collection areas on-site.
- Inform trash hauling contractors that you will accept only water-tight dumpsters for on-site use. Inspect dumpsters for leaks and repair any dumpster that is not water tight.
- Locate containers in a covered area and/or in a secondary containment.
- Provide an adequate number of containers with lids or covers that can be placed over the container to keep rain out or to prevent loss of wastes when it's windy.
- Plan for additional containers and more frequent pickup during the demolition phase of construction.
- Collect site trash daily, especially during rainy and windy conditions.
- Erosion and sediment control devices tend to collect litter. Remove this solid waste promptly.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Salvage or recycle any useful material. For example, trees and shrubs from land clearing can be used as a brush barrier (see ESC53), or converted into wood chips, then used as mulch on graded areas (see ESC11).
- Do not hose out dumpsters on the construction site. Leave dumpster cleaning to trash hauling contractor.
- Arrange for regular waste collection before containers overflow.

Objectives

- Housekeeping Practices
- **Contain Waste**
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

● High ○ Low

CA20

Best Management Practices

ACTIVITY: SOLID WASTE MANAGEMENT (Continue)

- If a container does spill, clean up immediately.
- Make sure that construction waste is collected, removed, and disposed of only at authorized disposal areas.
- Train employees and subcontractors in proper solid waste management.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Collect site trash daily.
  - Inspect construction waste area regularly.
  - Arrange for regular waste collection.

LIMITATIONS

- There are no major limitations to this best management practice.

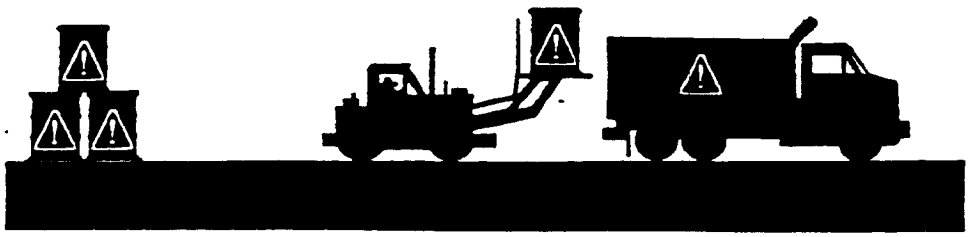
CA20

R0000500

ACTIVITY: HAZARDOUS WASTE MANAGEMENT

Graphic: North Central Texas COG, 1993



DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from hazardous waste through proper material use, waste disposal, and training of employees and subcontractors.

APPROACH

Many of the chemicals used on-site can be hazardous materials which become hazardous waste upon disposal. These wastes may include:

- Paints and solvents;
- Petroleum products such as oils, fuels, and grease;
- Herbicides and pesticides;
- Acids for cleaning masonry; and
- Concrete curing compounds.

In addition, sites with existing structures may contain wastes which must be disposed of in accordance with Federal, State, and local regulations. These wastes include:

- Sandblasting grit mixed with lead-, cadmium-, or chromium-based paints;
- Asbestos; and
- PCBs (particularly in older transformers).

The following steps will help reduce storm water pollution from hazardous wastes:

Material Use

- Use all of the product before disposing of the container.
- Do not remove the original product label, it contains important safety and disposal information.
- Do not over-apply herbicides and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried off-site by runoff. Do not apply these chemicals just before it rains. People applying pesticides must be certified in accordance with Federal and State regulations.
- Do not clean out brushes or rinse paint containers into the dirt, street, gutter, storm drain, or stream. "Paint out" brushes as much as possible. Rinse water-based paints to the sanitary sewer. Filter and re-use thinners and solvents. Dispose of excess oil-based paints and sludge as hazardous waste.

Objectives

- Housekeeping Practices
- **Contain Waste**
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Capital Costs
- ○ O&M Costs
- ◒ Maintenance
- ◒ Training
- ○ Suitability for Slopes >5%

● High ○ Low

CA21

Best Management Practices

ACTIVITY: HAZARDOUS WASTE MANAGEMENT (Continue)

Waste Recycling/Disposal

- Select designated hazardous waste collection areas on-site.
- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place hazardous waste containers in secondary containment.
- Do not mix wastes, this can cause chemical reactions, make recycling impossible, and complicate disposal.
- Recycle any useful material such as used oil or water-based paint.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Arrange for regular waste collection before containers overflow.
- Make sure that hazardous waste (e.g. excess oil-based paint and sludges) is collected, removed, and disposed of only at authorized disposal areas.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

Training

- Train employees and subcontractors in proper hazardous waste management.
- Warning signs should be placed in areas recently treated with chemicals.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- If a container does spill, clean up immediately.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect hazardous waste receptacles and area regularly.
  - Arrange for regular hazardous waste collection.

LIMITATIONS

- Hazardous waste that cannot be reused or recycled must be disposed of by a licensed hazardous waste hauler.

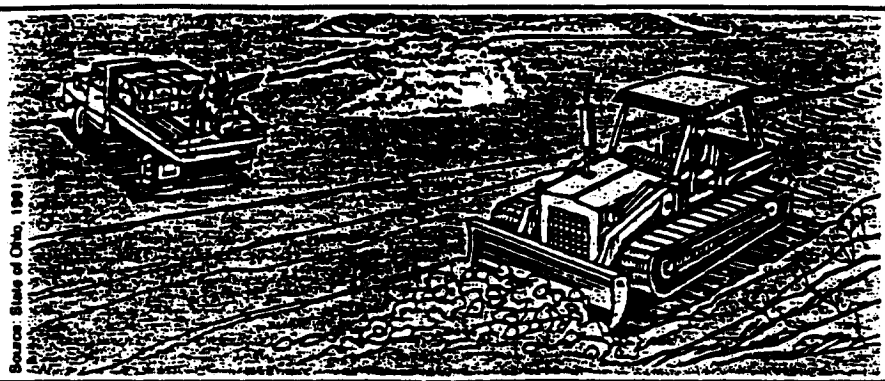
CA21

ACTIVITY: CONTAMINATED SOIL MANAGEMENT



DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.

APPROACH

Contaminated soils may occur on your site for several reasons including:

- Past site uses and activities;
- Detected or undetected spills and leaks; and
- Acid or alkaline solutions from exposed soil or rock formations high in acid or alkaline-forming elements.

Most developers conduct pre-construction environmental assessments as a matter of routine. Recent court rulings holding contractors liable for cleanup costs when they unknowingly move contaminated soil, highlight the need for contractors to confirm that a site assessment is completed before earth moving begins.

The following steps will help reduce storm water pollution from contaminated soil:

- Conduct thorough site planning including pre-construction geologic surveys.
- Look for contaminated soil as evidenced by discoloration, odors, differences in soil properties, abandoned underground tanks or pipes, or buried debris.
- Prevent leaks and spills to the maximum extent practicable. Contaminated soil can be expensive to treat and/or dispose of properly. However, addressing the problem before construction is much less expensive than after the structures are in place.
- Test suspected soils at a certified laboratory.
- If the soil is contaminated, work with the local regulatory agencies to develop options for treatment and/or disposal.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil can be quite expensive.
- Maintenance
  - Inspect excavated areas daily for signs of contaminated soil.
  - Implement CA12, Spill Prevention and Control, to prevent leaks and spills as much as possible.

Objectives

- Housekeeping Practices
- **Contain Waste**
- **Minimize Disturbed Areas**
- **Stabilize Disturbed Areas**
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

CA22

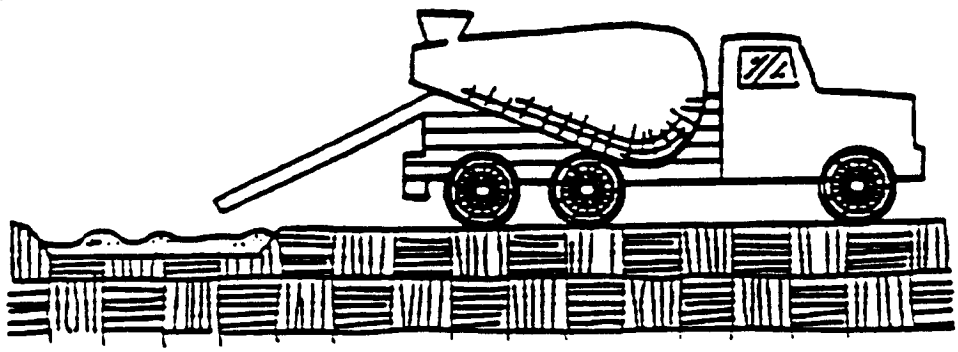
ACTIVITY: CONCRETE WASTE MANAGEMENT



Objectives

- Housekeeping Practices
- **Contain Waste**
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from concrete waste by conducting washout off-site, performing on-site washout in a designated area, and training employees and subcontractors.

APPROACH

The following steps will help reduce storm water pollution from concrete wastes:

- Store dry and wet materials under cover, away from drainage areas.
- Avoid mixing excess amounts of fresh concrete or cement on-site.
- Perform washout of concrete trucks off site or in designated areas only.
- Do not wash out concrete trucks into storm drains, open ditches, streets, or streams.
- Do not allow excess concrete to be dumped on-site, except in designated areas.
- For on-site washout:
  - locate washout area at least 50 feet from storm drains, open ditches, or water bodies. Do not allow runoff from this area by constructing a temporary pit or bermed area large enough for liquid and solid waste;
  - wash out wastes into the temporary pit where the concrete can set, be broken up, and then disposed of properly.
- When washing concrete to remove fine particles and expose the aggregate, avoid creating runoff by draining the water to a bermed or level area.
- Do not wash sweepings from exposed aggregate concrete into the street or storm drain. Collect and return sweepings to aggregate base stock pile, or dispose in the trash.
- Train employees and subcontractors in proper concrete waste management.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect subcontractors to ensure that concrete wastes are being properly managed.
  - If using a temporary pit, dispose hardened concrete on a regular basis.

LIMITATIONS

- Off-site washout of concrete wastes may not always be possible.

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ◒ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

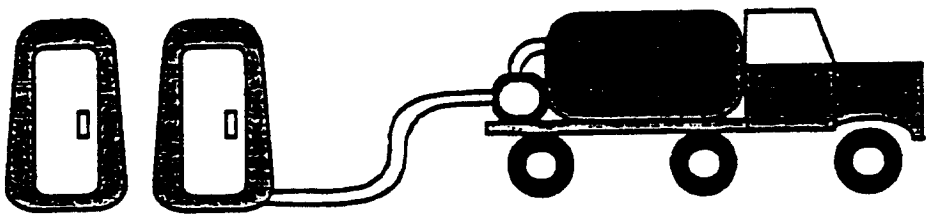
ACTIVITY: SANITARY/SEPTIC WASTE MANAGEMENT



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas*
- *Protect Slopes/Channels*
- *Control Site Perimeter*
- *Control Internal Erosion*

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from sanitary/septic waste by providing convenient, well-maintained facilities, and arranging for regular service and disposal.

APPROACH

Sanitary or septic wastes should be treated or disposed of in accordance with State and local requirements. These requirements may include:

- Locate sanitary facilities in a convenient location.
- Untreated raw wastewater should never be discharged or buried.
- Temporary septic systems should treat wastes to appropriate levels before discharging.
- If using an on-site disposal system (OSDS), such as a septic system, comply with local health agency requirements.
- Temporary sanitary facilities that discharge to the sanitary sewer system should be properly connected to avoid illicit discharges.
- If discharging to the sanitary sewer, contact the local wastewater treatment plant for their requirements
- Sanitary/septic facilities should be maintained in good working order by a licensed service.
- Arrange for regular waste collection by a licensed hauler before facilities overflow.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect facilities regularly.
  - Arrange for regular waste collection.

LIMITATIONS

- There are no major limitations to this best management practice.

Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT CLEANING

Graphic: North Central Texas COG, 1993

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment cleaning by using off-site facilities, washing in designated, contained areas only, eliminating discharges to the storm drain by infiltrating or recycling the wash water, and/or training employees and subcontractors.

APPROACH

- Use off-site commercial washing businesses as much as possible. Washing vehicles and equipment outdoors or in areas where wash water flows onto paved surfaces or into drainage pathways can pollute storm water. If you wash a large number of vehicles or pieces of equipment, consider conducting this work at an off-site commercial business. These businesses are better equipped to handle and dispose of the wash waters properly. Performing this work off-site can also be economical by eliminating the need for a separate washing operation at your site.
- If washing must occur on-site, use designated, bermed wash areas to prevent wash water contact with storm water, creeks, rivers, and other water bodies. The wash area can be sloped for wash water collection and subsequent infiltration into the ground.
- Use as little water as possible to avoid having to install erosion and sediment controls for the wash area.
- Use phosphate-free, biodegradable soaps.
- Educate employees and subcontractors on pollution prevention measures.
- Do not permit steam cleaning on-site. Steam cleaning can generate significant pollutant concentrations.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Minimal, some berm repair may be necessary.

LIMITATIONS

- Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades.
- Sending vehicles/equipment off-site should be done in conjunction with ESC24 (Stabilized Construction Entrance).

REFERENCE

Swisher, R.D., 1987. Surfactant Biodegradation, Marcel Decker Corporation

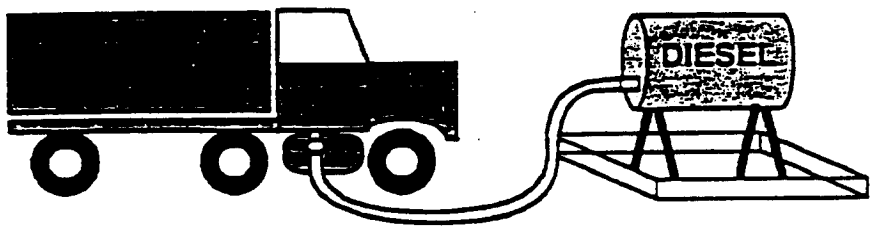
Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT FUELING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent fuel spills and leaks, and reduce their impacts to storm water by using off-site facilities, fueling in designated areas only, enclosing or covering stored fuel, implementing spill controls, and training employees and subcontractors.

APPROACH

- Use off-site fueling stations as much as possible. Fueling vehicles and equipment outdoors or in areas where fuel may spill/leak onto paved surfaces or into drainage pathways can pollute storm water. If you fuel a large number of vehicles or pieces of equipment, consider using an off-site fueling station. These businesses are better equipped to handle fuel and spills properly. Performing this work off-site can also be economical by eliminating the need for a separate fueling area at your site.
- If fueling must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Discourage "topping-off" of fuel tanks.
- Always use secondary containment, such as a drain pan or drop cloth, when fueling to catch spills/leaks.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Carry out all Federal and State requirements regarding stationary above ground storage tanks.
- Avoid mobile fueling of mobile construction equipment around the site; rather, transport the equipment to designated fueling areas. With the exception of tracked equipment such as bulldozers and perhaps forklifts, most vehicles should be able to travel to a designated area with little lost time.
- Train employees and subcontractors in proper fueling and cleanup procedures.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above measures are low cost, except for the capital costs of above ground tanks that meet all local environmental, zoning, and fire codes.
- Maintenance
  - Keep ample supplies of spill cleanup materials on-site.
  - Inspect fueling areas and storage tanks on a regular schedule.

LIMITATIONS

- Sending vehicles/equipment off-site should be done in conjunction with ESC24 (Stabilized Construction Entrance).

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials

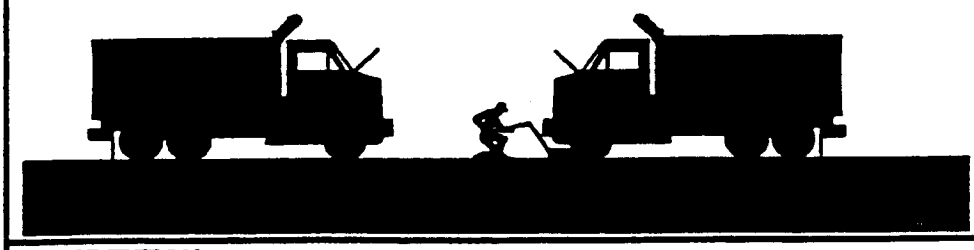
CA31

Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT MAINTENANCE

Graphic: North Central Texas COG, 1993



DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment maintenance by running a "dry site". This involves using off-site facilities, performing work in designated areas only, providing cover for materials stored outside, checking for leaks and spills, containing and cleaning up spills immediately, and training employees and subcontractors.

APPROACH

- Keep vehicles and equipment clean, don't allow excessive build-up of oil and grease.
- Use off-site repair shops as much as possible. Maintaining vehicles and equipment outdoors or in areas where vehicle or equipment fluids may spill or leak onto the ground can pollute storm water. If you maintain a large number of vehicles or pieces of equipment, consider using an off-site repair shop. These businesses are better equipped to handle vehicle fluids and spills properly. Performing this work off-site can also be economical by eliminating the need for a separate maintenance area.
- If maintenance must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Regularly inspect on-site vehicles and equipment for leaks, and repair immediately.
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment on-site.
- Segregate and recycle wastes, such as greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic, and transmission fluids.
- Train employees and subcontractors in proper maintenance and spill cleanup procedures.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Keep ample supplies of spill cleanup materials on-site.
  - Inspect maintenance areas on a regular schedule.

Objectives

- **Housekeeping Practices**
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

CA32

Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT MAINTENANCE (Continue)

LIMITATIONS

- Sending vehicles/equipment off-site should be done in conjunction with ESC24 (Stabilized Construction Entrance).

Outdoor vehicle or equipment maintenance is a potentially significant source of storm water pollution. Activities that can contaminate storm water include engine repair and service, particularly changing or replacement of fluids, and outdoor equipment storage and parking (dripping engines). For further information on vehicle or equipment servicing, see CA30, Vehicle and Equipment Cleaning, and CA31, Vehicle and Equipment Fueling.

Listed below is further information if you must perform vehicle or equipment maintenance on-site.

Waste Reduction

Parts are often cleaned using solvents such as trichloroethylene, 1,1,1-trichloroethane, or methylene chloride. Many of these parts cleaners are harmful and must be disposed of as a hazardous waste. Reducing the number of solvents makes recycling easier and reduces hazardous waste management costs. Often, one solvent can perform a job as well as two different solvents. Also, if possible, eliminate or reduce the amount of hazardous materials and waste by substituting non-hazardous or less hazardous materials. For example, replace chlorinated organic solvents (1,1,1-trichloroethane, methylene chloride, etc.) with non-chlorinated solvents. Non-chlorinated solvents like kerosene or mineral spirits are less toxic and less expensive to dispose of properly. Check list of active ingredients to see whether it contains chlorinated solvents. The "chlor" term indicates that the solvent is chlorinated. Also, try substituting a wire brush for solvents to clean parts.

Recycling/Disposal

Separating wastes allows for easier recycling and may reduce disposal costs. Keep hazardous and non-hazardous wastes separate, do not mix used oil and solvents, and keep chlorinated solvents (like 1,1,1-trichloroethane) separate from non-chlorinated solvents (like kerosene and mineral spirits). Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around.

Oil filters disposed of in trash cans or dumpsters can leak oil and contaminate storm water. Place the oil filter in a funnel over a waste oil recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask your oil supplier or recycler about recycling oil filters.

Do not dispose of extra paints and coatings by dumping liquid onto the ground or throwing it into dumpsters. Allow coatings to dry or harden before disposal into covered dumpsters.

Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Do not bury used tires.

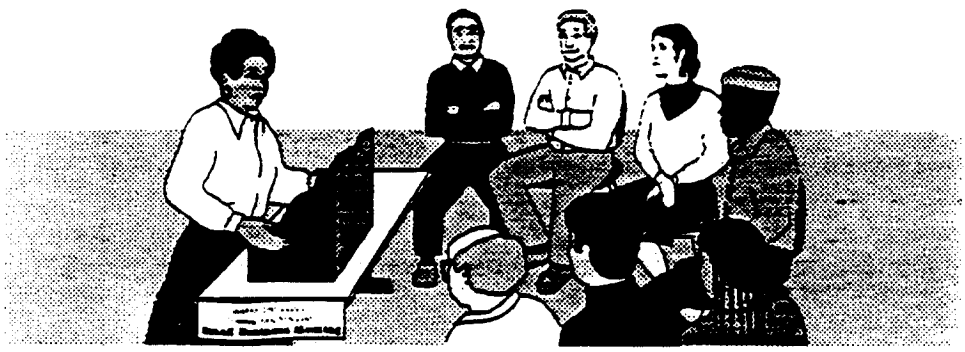
ACTIVITY: EMPLOYEE/SUBCONTRACTOR TRAINING



Objectives

- ***Housekeeping Practices***
- ***Contain Waste***
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas*
- *Protect Slopes/Channels*
- *Control Site Perimeter*
- *Control Internal Erosion*

DESCRIPTION

Employee/subcontractor training, like maintenance or a piece of equipment, is not so much a best management practice as it is a method by which to implement BMPs. This fact sheet highlights the importance of training and of integrating the elements of employee/subcontractor training from the individual source controls into a comprehensive training program as part of a company's Storm Water Pollution Prevention Plan (SWPPP).

The specific employee/subcontractor training aspects of each of the source controls are highlighted in the individual fact sheets. The focus of this fact sheet is more general, and includes the overall objectives and approach for assuring employee/subcontractor training in storm water pollution prevention. Accordingly, the organization of this fact sheet differs somewhat from the other fact sheets in this chapter.

OBJECTIVES

Employee/subcontractor training should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute storm water;
- Identify solutions (BMPs);
- Promote employee/subcontractor ownership of the problems and the solutions; and
- Integrate employee/subcontractor feedback into training and BMP implementation.

APPROACH

- Integrate training regarding storm water quality management with existing training programs that may be required for your business by other regulations such as: the Illness and Injury Prevention Program (IIPP) (SB 198) (California Code of Regulations Title 8, Section 3203), the Hazardous Waste Operations and Emergency Response (HAZWOPER) standard (29 CFR 1910.120), the Spill Prevention Control and Countermeasure (SPCC) Plan (40 CFR 112), and the Hazardous Materials Management Plan (Business Plan) (California Health and Safety Code, Section 6.95).
- Businesses, particularly smaller ones that may not be regulated by Federal, State, or local regulations, may use the information in this Handbook to develop a training program to reduce their potential to pollute storm water.
- Use the quick reference on disposal alternatives (Table 4.2) to train employee/subcontractors in proper and consistent methods for disposal.

CA40

Best Management Practices

ACTIVITY: EMPLOYEE/SUBCONTRACTOR TRAINING (Continue)

- Consider posting the quick reference table around the job site or in the on-site office trailer to reinforce training.
- Train employee/subcontractors in standard operating procedures and spill cleanup techniques described in the fact sheets. Employee/subcontractors trained in spill containment and cleanup should be present during the loading/ unloading and handling of materials.
- Personnel who use pesticides should be trained in their use. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct on-site inspections.
- Proper education of off-site contractors is often overlooked. The conscientious efforts of well trained employee/ subcontractors can be lost by unknowing off-site contractors, so make sure they are well informed about what they are expected to do on-site.

CA40

R0000513

TABLE 4.2 QUICK REFERENCE - DISPOSAL ALTERNATIVES
(Adopted from Santa Clara County Nonpoint Source Pollution Control Program - December 1992)

All of the waste products on this chart are prohibited from discharge to the storm drain system. Use this matrix to decide which alternative disposal strategies to use. **ALTERNATIVES ARE LISTED IN PRIORITY ORDER.**

Key: HHW Household hazardous waste (Government-sponsored drop-off events)
POTW Publically Owned Treatment Plant
Reg.Bd. Regional Water Quality Control Board (Oakland)
"Dispose to sanitary sewer" means dispose into sink, toilet, or sanitary sewer clean-out connection.
"Dispose as trash" means dispose in dumpsters or trash containers for pickup and/or eventual disposal in landfill.
"Dispose as hazardous waste" for business/commercial means contract with a hazardous waste hauler to remove and dispose.

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
General Construction and Painting; Street and Utility Maintenance			
Excess paint (oil-based)	1. Recycle/reuse. 2. Dispose as hazardous waste.		1. Recycle/reuse. 2. Take to HHW drop-off.
Excess paint (water-based)	1. Recycle/reuse. 2. Dry residue in cans, dispose as trash. 3. If volume is too much to dry, dispose as hazardous waste.		1. Recycle/reuse. 2. Dry residue in cans, dispose as trash. 3. If volume is too much to dry, take to HHW drop-off
Paint cleanup (oil-based)	Wipe paint out of brushes, then: 1. Filter & reuse thinners, solvents. 2. Dispose as hazardous waste.		Wipe paint out of brushes, then: 1. Filter & reuse thinners, solvents. 2. Take to HHW drop-off.
Paint cleanup (water-based)	Wipe paint out of brushes, then: 1. Rinse to sanitary sewer.		Wipe paint out of brushes, then: 1. Rinse to sanitary sewer.
Empty paint cans (dry)	1. Remove lids, dispose as trash.		1. Remove lids, dispose as trash.
Paint stripping (with solvent)	1. Dispose as hazardous waste.		1. Take to HHW drop-off.
Building exterior cleaning (high-pressure water)	1. Prevent entry into storm drain and remove offsite 2. Wash onto dirt area, spade in 3. Collect (e.g. mop up) and discharge to sanitary sewer	POTW	
Cleaning of building exteriors which have **HAZARDOUS MATERIALS** (e.g. mercury, lead) in paints	1. Use dry cleaning methods 2. Contain and dispose washwater as hazardous waste (Suggestion: dry material first to reduce volume)		

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
General Construction and Painting; Street and Utility Maintenance (cont'd)			
Non-hazardous paint scraping/ sand blasting	1. Dry sweep, dispose as trash		1. Dry sweep, dispose as trash
HAZARDOUS paint scraping/sand blasting (e.g. marine paints or paints containing lead or tributyl tin)	1. Dry sweep, dispose as hazardous waste		1. Dry sweep, take to HHW drop-off
Soil from excavations during periods when storms are forecast	1. Should not be placed in street or on paved areas 2. Remove from site or backfill by end of day 3. Cover with tarpaulin or surround with hay bales, or use other runoff controls 4. Place filter mat over storm drain Note: Thoroughly sweep following removal of dirt in all four alternatives.		
Soil from excavations placed on paved surfaces during periods when storms are not forecast	1. Keep material out of storm conveyance systems and thoroughly remove via sweeping following removal of dirt		
Cleaning streets in construction areas	1. Dry sweep and minimize tracking of mud 2. Use silt ponds and/or similar pollutant reduction techniques when flushing pavement		
Soil erosion, sediments	1. Cover disturbed soils, use erosion controls, block entry to storm drain. 2. Seed or plant immediately.		
Fresh cement, grout, mortar	1. Use/reuse excess 2. Dispose to trash		1. Use/reuse excess 2. Dispose as trash
Washwater from concrete/mortar (etc.) cleanup	1. Wash onto dirt area, spade in 2. Pump and remove to appropriate disposal facility 3. Settle, pump water to sanitary sewer	POTW	1. Wash onto dirt area, spade in 2. Pump and remove to appropriate disposal facility 3. Settle, pump water to sanitary sewer
Aggregate wash from driveway/patio construction	1. Wash onto dirt area, spade in 2. Pump and remove to appropriate disposal facility 3. Settle, pump water to sanitary sewer	POTW	1. Wash onto dirt area, spade in 2. Pump and remove to appropriate disposal facility 3. Settle, pump water to sanitary sewer

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
General Construction and Painting; Street and Utility Maintenance (cont'd)			
Rinsewater from concrete mixing trucks	1. Return truck to yard for rinsing into pond or dirt area 2. At construction site, wash into pond or dirt area		
Non-hazardous construction and demolition debris	1. Recycle/reuse (concrete, wood, etc.) 2. Dispose as trash		1. Recycle/reuse (concrete, wood, etc. 2. Dispose as trash
Hazardous demolition and construction debris (e.g. asbestos)	1. Dispose as hazardous waste		1. Do not attempt to remove yourself. Contact asbestos removal service for safe removal and disposal 2. Very small amounts (less than 5 lbs) may be double-wrapped in plastic and taken to HHW drop-off
Saw-cut slurry	1. Use dry cutting technique and sweep up residue 2. Vacuum slurry and dispose off-site. 3. Block storm drain or berm with low weir as necessary to allow most solids to settle. Shovel out gutters; dispose residue to dirt area, construction yard or landfill.		
Construction dewatering (Nonturbid, uncontaminated groundwater)	1. Recycle/Reuse 2. Discharge to storm drain		
Construction dewatering (Other than nonturbid, uncontaminated groundwater)	1. Recycle/reuse 2. Discharge to sanitary sewer 3. As appropriate, treat prior to discharge to storm drain	POTW Reg. Bd.	
Portable toilet waste	1. Leasing company shall dispose to sanitary sewer at POTW	POTW	
Leaks from garbage dumpsters	1. Collect, contain leaking material. Eliminate leak, keep covered, return to leasing company for immediate repair 2. If dumpster is used for liquid waste, use plastic liner		

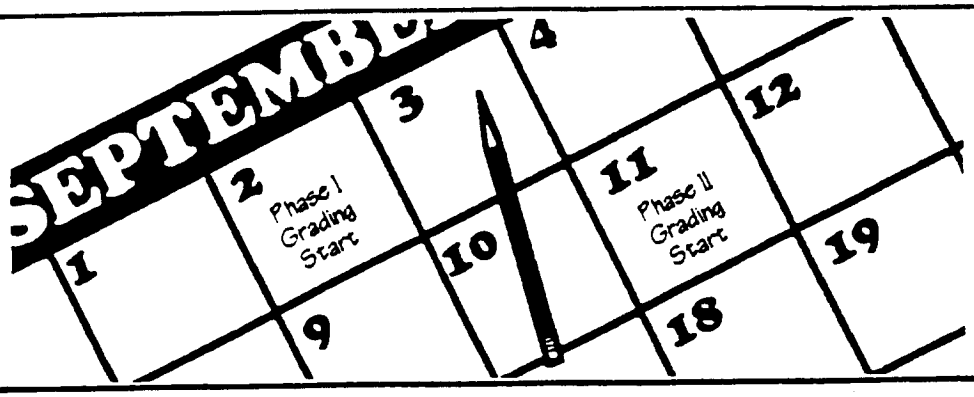
DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
General Construction and Painting; Street and Utility Maintenance (cont'd)			
Leaks from construction debris bins	1. Insure that bins are used for dry nonhazardous materials only (Suggestion: Fencing, covering help prevent misuse)		
Dumpster cleaning water	1. Clean at dumpster owner's facility and discharge waste through grease interceptor to sanitary sewer 2. Clean on site and discharge through grease interceptor to sanitary sewer	POTW POTW	
Cleaning driveways, paved areas * (Special Focus = Restaurant alleys Grocery dumpster areas) * Note: Local drought ordinances may contain additional restrictions	1. Sweep and dispose as trash (Dry cleaning only). 2. For vehicle leaks, restaurant/grocery alleys, follow this 3-step process: a. Clean up leaks with rags or absorbents. b. Sweep, using granular absorbent material (cat litter). c. Mop and dispose of mopwater to sanitary sewer (or collect rinsewater and pump to the sanitary sewer). 3. Same as 2 above, but with rinsewater (2c)(no soap) discharged to storm drain.		1. Sweep and dispose as trash (Dry cleaning only). 2. For vehicle leaks, follow this 3-step process: a. Clean up leaks with rags or absorbents; dispose as hazardous waste. b. Sweep, using granular absorbent material (cat litter). c. Mop and dispose of mopwater to sanitary sewer.
Steam cleaning of sidewalks, plazas * * Note: Local drought ordinances may contain additional restrictions	1. Collect all water and pump to sanitary sewer. 2. Follow this 3-step process: a. Clean oil leaks with rags or adsorbents b. Sweep (Use dry absorbent as needed) c. Use no soap, discharge to storm drain		
Potable water/line flushing Hydrant testing	1. Deactivate chlorine by maximizing time water will travel before reaching creeks		
Super-chlorinated (above 1 ppm) water from line flushing	1. Discharge to sanitary sewer 2. Complete dechlorination required before discharge to storm drain		

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
Landscape/Garden Maintenance			
Pesticides	1. Use up. Rinse containers use rinsewater as product. Dispose rinsed containers as trash 2. Dispose unused pesticide as hazardous waste		1. Use up. Rinse containers, use rinsewater as pesticide. Dispose rinsed container as trash. 2. Take unused pesticide to HHW drop-off
Garden clippings	1. Compost 2. Take to Landfill		1. Compost 2. Dispose as trash.
Tree trimming	1. Chip if necessary, before composting or recycling		1. Chip if necessary, before composting or recycling
Swimming pool, spa, fountain water (emptying)	1. Do not use metal-based algicides (i.e. Copper Sulfate) 2. Recycle/reuse (e.g. irrigation) 3. Determine chlorine residual = 0, wait 24 hours and then discharge to storm drain.	POTW	1. Do not use metal-based algicides (i.e. Copper Sulfate) 2. Recycle/reuse (e.g. irrigation) 3. Determine chlorine residual = 0, wait 24 hours and then discharge to storm drain.
Acid or other pool/spa/fountain cleaning	1. Neutralize and discharge to sanitary sewer	POTW	
Swimming pool, spa filter backwash	1. Reuse for irrigation 2. Dispose on dirt area 3. Settle, dispose to sanitary sewer		1. Use for landscape irrigation 2. Dispose on dirt area 3. Settle, dispose to sanitary sewer
Vehicle Wastes			
Used motor oil	1. Use secondary containment while storing, send to recycler.		1. Put out for curbside recycling pickup where available 2. Take to Recycling Facility or auto service facility with recycling program 3. Take to HHW events accepting motor oil
Antifreeze	1. Use secondary containment while storing, send to recycler.		1. Take to Recycling Facility
Other vehicle fluids and solvents	1. Dispose as hazardous waste		1. Take to HHW event
Automobile batteries	1. Send to auto battery recycler 2. Take to Recycling Center		1. Exchange at retail outlet 2. Take to Recycling Facility or HHW event where batteries are accepted
Motor home/construction trailer waste	1. Use holding tank. Dispose to sanitary sewer		1. Use holding tank, dispose to sanitary sewer.

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
Vehicle Wastes (cont'd)			
Vehicle Washing	1. Recycle 2. Discharge to sanitary sewer, never to storm drain	POTW	1. Take to Commercial Car Wash. 2. Wash over lawn or dirt area 3. If soap is used, use a bucket for soapy water and discharge remaining soapy water to sanitary sewer.
Mobile Vehicle Washing	1. Collect washwater and discharge to sanitary sewer.	POTW	
Rinsewater from dust removal at new car fleets	1. Discharge to sanitary sewer 2. If rinsing dust from exterior surfaces from appearance purposes, use no soap (water only); discharge to storm drain.	POTW	
Vehicle leaks at Vehicle Repair Facilities	Follow this 3-step process: 1. Clean up leaks with rags or absorbents 2. Sweep, using granular absorbent material (cat litter) 3. Mop and dispose of mopwater to sanitary sewer.		
Other Wastes			
Carpet cleaning solutions & other mobile washing services	1. Dispose to sanitary sewer	POTW	1. Dispose to sanitary sewer
Roof drains	1. If roof is contaminated with industrial waste products, discharge to sanitary sewer 2. If no contamination is present, discharge to storm drain		
Cooling water Air conditioning condensate	1. Recycle/reuse 2. Discharge to sanitary sewer	POTW	
Pumped groundwater, infiltration/ foundation drainage (contaminated)	1. Recycle/reuse (landscaping, etc.) 2. Treat if necessary; discharge to sanitary sewer 3. Treat and discharge to storm drain	Reg. Bd. POTW Reg. Bd.	
Fire fighting flows	If contamination is present, Fire Dept. will attempt to prevent flow to stream or storm drain		

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
Other Wastes (cont'd)			
Kitchen Grease	1. Provide secondary containment, collect, send to recyler. 2. Provide secondary containment, collect, send to POTW via hauler.	POTW	1. Collect, solidify, dispose as trash
Restaurant cleaning of floor mats, exhaust filters, etc.	1. Clean inside building with discharge through grease trap to sanitary sewer. 2. Clean outside in container or bermed area with discharge to sanitary sewer.		
Clean-up wastewater from sewer back-up	1. Follow this procedure: a. Block storm drain, contain, collect, and return spilled material to the sanitary sewer. b. Block storm drain, rinse remaining material to collection point and pump to sanitary sewer. (no rinse-water may flow to storm drain)		

BMP: SCHEDULING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Sequencing the construction project to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking.

SUITABLE APPLICATIONS

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project. Use of other, more costly yet less effective, erosion and sedimentation controls, may often be reduced through proper construction sequencing.

APPROACH

- Project design considerations: Design project to integrate into existing land contours. Significant regrading of a site will require more costly erosion and sedimentation control measures and may require that on-site drainage facilities be installed.
- Incorporate existing, natural areas: Inventory and evaluate the existing site terrain and vegetation. Disturbance of highly erosive natural areas (e.g., steep, unstable slope areas, watercourses) should be minimized, while protecting other areas may enhance site aesthetics. Construction should not disturb these areas (see ESC2).
- Avoid rainy periods: Schedule major grading operations during dry months. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means (see ESC 10 to 24) or to install temporary sediment trapping devices (see ESC 50 to 56).
- Practice erosion and sediment control year round: Erosion may be caused during dry seasons by "freak" rainfall, wind and vehicle tracking. Therefore, keep the site stabilized year-round, and retain wet season sediment trapping devices.
- Minimize soil exposed at one time: Schedule projects to disturb only small portions of the site at any one time. Complete grading as soon as possible. Immediately stabilize the disturbed portion before grading the next portion. Practice staged seeding—revegetate cut and fill slopes as the work progresses.
- Trenching: Close and stabilize open trenches as soon as possible. Sequence trenching projects so that most open portions of the trench are closed before new trenching is begun.

REQUIREMENTS

- Cost
  - Construction scheduling to reduce erosion may increase other construction costs due to reduced economies of scale in performing site grading. The cost-effectiveness of scheduling techniques should be compared with the other, less effective erosion and sedimentation controls to achieve a cost-effective balance.

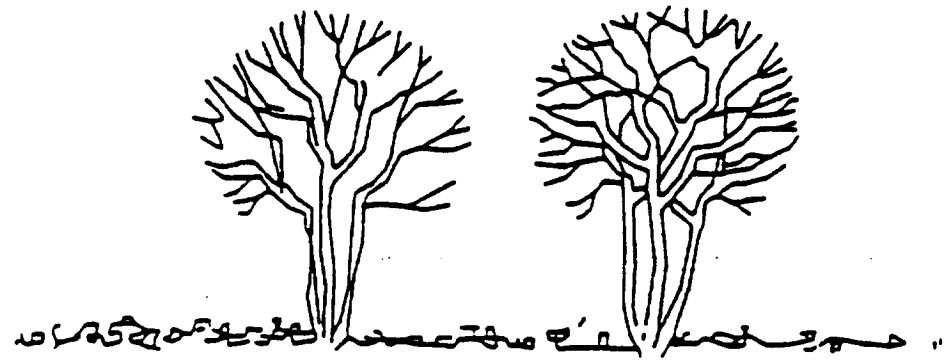
Virginia Erosion and Sediment Control Handbook, Third Edition, Virginia Department of Conservation and Recreation, Division of Soil and Water Conservation - 1992.

SUPPLEMENTAL INFORMATION, JUNE 1998

Limit and phase clearing. By clearing only those areas immediately essential for completing site construction, buffer zones are preserved and soil remains undisturbed until construction begins in a particular area. Additionally, the proposed limits of land disturbance should be physically marked off to ensure that no more than the required land area is cleared.

ESC1

BMP: PRESERVATION OF EXISTING VEGETATION



GENERAL DESCRIPTION

Carefully planned preservation of existing vegetation minimizes the potential of removing or injuring existing trees, vines, shrubs and/or grasses that serve as erosion controls.

SUITABLE APPLICATIONS

- Areas within site where no construction activity occurs, or occurs at a later date.
- Sensitive areas where natural vegetation exist and should be preserved, such as: steep slopes, watercourses, and building sites in wooded areas.
- Areas where local, state and federal government requires preservation, such as: vernal pools, wetlands, marshes, certain oak trees, etc.

INSTALLATION/APPLICATION CRITERIA

- Clearly mark, flag or fence vegetation or areas where vegetation should be preserved.
- Prepare landscaping plans which include as much existing vegetation as possible and state proper care of this vegetation both during and after construction.
- Define and protect with berms, fencing, signs, etc., a setback area from vegetation to be preserved. Setback area size should be based on the location, species, size, age and potential impact of adjacent construction activities or permanent improvements.
- Proposed landscaping plans which do not include plant species that compete with the existing vegetation.
- Do not locate construction traffic routes, spoil piles, etc., where significant adverse impact on existing vegetation may occur.

REQUIREMENTS

- Maintenance
  - Inspection and maintenance requirements for protection of vegetation are low.
  - During construction the limits of grading or disturbance should be clearly marked at all times.
  - Irrigation or maintenance of native trees or vegetation should conform to specifications on the Landscape Plan.
- Cost
  - There is little cost associated with preserving existing vegetation if properly planned during the project design, and may yield aesthetic benefits which enhance property values.

LIMITATIONS

- Requires forward planning by the owner/developer, contractor and design staff.
- For sites with diverse topography, it is often difficult and expensive to save existing trees while grading the site satisfactorily for the planned development.

Objectives

- *Housekeeping Practices*
- *Contain Waste*

Best Management Practices

Additional Information — Preservation of Existing Vegetation

The best way to prevent excessive erosion is to not disturb the land. On a construction site, where extensive land disturbance is necessary, a reasonable BMP would be to not disturb land in sensitive areas of the site which need not be altered for the project to be viable (e.g., natural watercourses, steep slopes), and to design the site to incorporate particularly unique or desireable existing vegetation into the site landscaping plan. Clearly marking and leaving a buffer area around these unique areas will both help to preserve these areas as well as take advantage of natural erosion prevention and sediment trapping in naturally vegetated areas.

Existing vegetation to be preserved on the site must be protected from mechanical and other injury while the land is being developed. The purpose of protecting existing vegetation is to insure the survival of desirable vegetation for shade, beautification, and erosion protection. Mature vegetation has extensive root systems that help to hold soil in place, thus reducing erosion. Also, vegetation helps to keep soil from drying rapidly and becoming susceptible to erosion. To effectively save existing vegetation, no disturbances of any kind should be allowed within a defined area around the vegetation. For trees, no construction activity should occur within the drip line of the tree.

The following criteria may be used for deciding which vegetation will remain on the site:

- Aesthetic values: Consideration should be given to foliage, flowering habits, bark and crown characteristics (for trees).
- Freedom from disease and rot.
- Life span of trees: Short-lived trees need not be preserved.
- Environmental values: Habitat; screening; and buffers.
- Sudden exposure: Save vegetation which grows in direct sunlight and is able to withstand radiated heat from proposed buildings and pavement.
- Space needed: Sufficient space must be provided between the vegetation and any structures, electric and telephone lines, water and sewer lines, driveways and streets. Mark trees and shrubs with bright paint or ribbon so there is no doubt as to which trees and shrubs are to be left and protected from damage during construction.

Saving existing vegetation and mature trees on-site, beautifies the area and may save money by reducing new landscaping requirements. Mature trees also increase property values and satisfy consumer aesthetic needs.

Preserving and protecting existing vegetation can often result in more stable soil conditions during construction. Careful site planning and identification of plantings to preserve can provide erosion and sedimentation controls during construction, and contribute to the aesthetics of the development. For example, in Sacramento County a tree ordinance has been adopted that protects the native California Oak tree. Provisions to protect the tree and its root system during construction must be specified in the project plans, and an area must be provided where the soil stability may not be disturbed. No grading or construction storage within the tree dripline is allowed.

Installation/Application

Building sites may be planned to integrate existing vegetation and trees. Construction impacts must be considered. Trench width for pipe construction projects and the location of permanent structures, such as buildings, needs to be considered when preserving existing vegetation, including mature trees and their root system. Native vegetation should be preserved since it is able to adapt to the climate. The USDA Soil Conservation Service should be contacted about existing vegetation for sites throughout California. Mature trees are generally preferable to newly planted trees because of the greater soil stabilization provided by the extensive root system of a mature tree.

ESC2

Additional Information — Preservation of Existing Vegetation

Methods for protecting existing vegetation and trees:

- Stake off root system limits (drip line of tree). Some counties limit construction within 5 feet of the tree drip line.
- Fence off the area to be preserved or along the tree drip line.
- Flag or mark trees to remain in place.
- Tree wells and retaining walls (permanent) help preserve existing vegetation, but must be large enough to protect the root system (see below).
- For the California Oak tree, no trenching or irrigation should be allowed within the driplines of the tree, since both these activities are detrimental to the preservation of the tree.
- Where grading under trees is necessary, excavation and fill should be limited to 1 foot within the driplines.

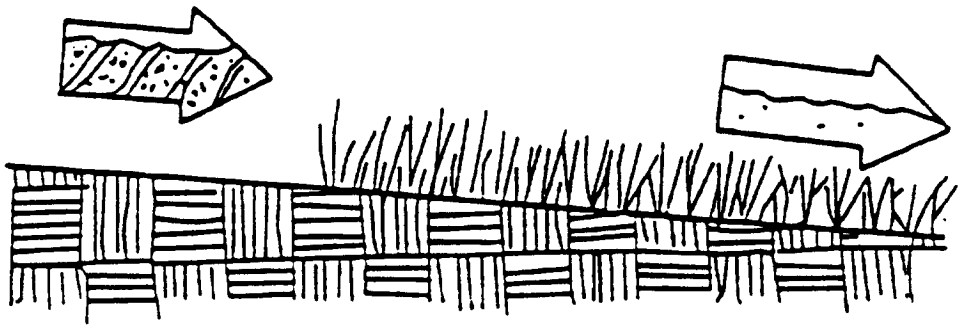
SUPPLEMENTAL INFORMATION, JUNE 1998

Limit and phase clearing. By clearing only those areas immediately essential for completing site construction, buffer zones are preserved and soil remains undisturbed until construction begins in a particular area. Additionally, the proposed limits of land disturbance should be physically marked off to ensure that no more than the required land area is cleared.

ESC2

BMP: SEEDING AND PLANTING



GENERAL DESCRIPTION

Seeding of grasses and plantings of trees, shrubs, vines and ground covers provide long-term stabilization of soil. In some areas, with suitable climates, grasses can be planted for temporary stabilization.

SUITABLE APPLICATIONS

- Appropriate for site stabilization both during construction and post-construction.
- Any graded/cleared areas where construction activities have ceased.
- Open space cut and fill areas.
- Steep slopes.
- Spoil piles.
- Vegetated swales.
- Landscape corridors.
- Stream banks.

INSTALLATION/APPLICATION CRITERIA

Type of vegetation, site and seedbed preparation, planting time, fertilization and water requirements should be considered for each application.

Grasses:

- Ground preparation: fertilize and mechanically stabilize the soil.
- Tolerant of short-term temperature extremes and waterlogged soil conditions.
- Appropriate soil conditions: shallow soil base, good drainage, slope 2:1 or flatter.
- Develop well and quickly from seeds.
- Mowing, irrigating, and fertilizing are vital for promoting vigorous grass growth.

Trees and Shrubs:

- Selection Criteria: vigor, species, size, shape & wildlife food source.
- Soil conditions: select species appropriate for soil,drainage & acidity.
- Other Factors: wind/exposure, temperature extremes, and irrigation needs.

Vines and Ground Covers:

- Ground preparation: lime and fertilizer preparation.
- Use proper seeding rates.
- Appropriate soil conditions: drainage, acidity, slopes.
- Generally avoid species requiring irrigation.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

ESC10

Best Management Practices

BMP: SEEDING AND PLANTING (Continue)

REQUIREMENTS

- Maintenance
  - Shrubs and trees must be adequately watered and fertilized and if needed pruned.
  - Grasses may need to be watered and mowed.
- Cost: Average annual cost for installation and maintenance (2 year useful life, source: EPA, 1992)
  - Seeding: $300 per acre, appropriate for flat slopes and stable soils.
  - Seeding with Mulching: $1,100 per acre, appropriate for moderate to steep slopes and/or erosive soils.
  - Trees, shrubs, vines, and ground cover: Cost, applicability based on species used and terrain features.

LIMITATIONS

- Permanent and temporary vegetation may not be appropriate in dry periods without irrigation.
- Fertilizer requirements may have potential to create storm water pollution if improperly applied.

SUPPLEMENTAL INFORMATION, JUNE 1998

Limit and phase clearing. By clearing only those areas immediately essential for completing site construction, buffer zones are preserved and soil remains undisturbed until construction begins in a particular area. Additionally, the proposed limits of land disturbance should be physically marked off to ensure that no more than the required land area is cleared.

Stockpile topsoil and re-apply when revegetating the site. Top soil with high organic content is a valuable resource essential to establish new vegetation and can only be replaced with expensive hauling from other sites, or with many years of the natural process of soil formation.

Develop and implement nutrient management plans. Properly time applications and work fertilizers and liming materials into the soil to depths of 4 to 6 inches. Using soil tests to determine specific nutrient needs at the site can greatly decrease the amount of nutrients applied.

ESC10

Additional Information — Seeding and Planting

Permanent seeding of grasses, sodding, and planting of trees, shrubs, vines and ground covers can provide long-term stabilization of soil. Permanent seeding and planting contributes to long-term site aesthetics and helps reduce erosion by reducing the velocity of runoff, allowing infiltration to occur, filtering sediments, and by holding soil particles in place.

Seeding and planting should be applied as soon as final grading is done to all graded and cleared areas of the construction site where plant cover is ultimately desired. For example, vegetation may be established along landscaped corridors and buffer zones where they may act as filter strips (see TC6 in Chapter 5 of the Municipal Handbook). Additionally, vegetated swales, steep and/or rocky slopes and stream banks can also serve as appropriate areas for seeding and plantings.

Installation/Application Criteria

Application of appropriate vegetation must consider: the seedbed or plantbed, proper seasonal planting times, water requirements fertilizer requirements and availability of the selected vegetation within the project's region. Permanent plantings during the construction stage of projects require careful coordination between the local agency inspectors, project managers, construction managers, and landscape contractor. Protocols for coordination and implementation procedures regarding site access, construction staging, and short- and long-term planting areas should be developed prior to the construction bid process. Where possible, these protocols should be established by and remain the responsibility of the site owner.

Because of the many available types of plants and ground covers and because site conditions and land use vary so widely within California, a set of general guidelines is included for installation/application of grasses, trees and shrubs, vines and ground covers. However, your local municipality, Soil Conservation Service, agricultural extention, or other resources should be consulted on appropriate species, planting requirements, and maintenance needs for your climate and soils.

Grasses

Grasses, depending on the type, provide short-term soil stabilization during construction or can serve as long- term/ permanent soil stabilization for disturbed areas. In general, grasses provide low maintenance to areas that have been cleared, graded and mechanically stabilized.

Selection:

The selection of the grass type is determined by the climate, irrigation, mowing frequency, maintenance effort and soil-bed conditions. Although grasses provide quick germination and rapid growth, they also have a shallow root system and are not as effective in stabilizing deep soils, where trees, shrubs and deep rooted ground covers may be more appropriate. Several grasses are adaptable to the various California climates. The figure at the end of these fact sheets shows appropriate grasses for regions within California. Blue grass is well adapted throughout California except for in the valley regions. The blue grass is found on dry, sandy soils that have good drainage. Bermuda grass, on the other hand is well adapted in the valley region where soils are dry, coarse and heavier. Specific seed mix and/or varieties for each site should be provided by an approved/qualified plant materials specialist.

ESC10

Additional Information — Seeding and Planting

Planting:
The following steps should be followed to ensure established growth:

1. Select the proper grass for the site.
2. Prepare the seedbed; soil should be fertilized and contain good topsoil or soil at least a 2:1 or flatter slope.
3. Broadcast the seedings in the late fall or early spring. In the late fall, seedings should be planted by mid- September to have established grass by the October rainy season.
4. Initial irrigation will be required often for most grasses, with follow-up irrigation and fertilization as needed. Mulching may be required in dry climates or during drought years.

Trees & Shrubs

Selection:
Trees and shrubs, when properly selected, are low maintenance plantings that stabilize adjacent soils, moderate the adjacent temperatures, filter air pollutants, and serve as a barrier to wind. Some desirable characteristics to consider in selecting trees and shrubs include: vigor, species, age, size and shape, and use as a wildlife food source and habitat.

Trees and shrubs to be saved should be clearly marked so that no construction activity will take place within the dripline of the plant. The sites for new plantings should be evaluated. Consider the prior use of the land: adverse soil conditions such as poor drainage or acidity; exposure to wind; temperature extremes; location of utilities, paved areas, and security lighting and traffic problems.

Transplanting:
Time of Year - Late fall through winter (November to February) is the preferred time for transplanting in most of California.

Preparation - Proper digging of a tree/shrub includes the conservation of as much of the root system as possible. Soil adhering to the roots should be damp when the tree is dug, and kept moist until re-planting. The soil ball should be 12 inches in diameter for each inch of diameter of the trunk.

Site preparation - Refer to landscape plans and specifications for site and soil preparation, and for ability to coordinate construction strategy with permanent vegetation.

Supporting the trunk - Many newly planted trees/shrubs need artificial support to prevent excessive swaying.

Watering - Soil around the tree should be thoroughly watered after the tree is set in place. When the soil becomes dry, the tree should be watered deeply, but not often. Mulching around the base of the tree is helpful in preventing roots from drying out.

Vines & Ground Covers

Selection:
Vines, ground covers, and low growing plants, that can quickly spread, come in many types, colors, and growth habits. Some are suitable only as part of a small maintained landscape area, while some can stabilize large areas with little maintenance. Flowers, which provide little long-term erosion control may be planted to add color and varietal appearances.

ESC10

R0000529

Additional Information — Seeding and Planting

Caution should be exercised in the non-native vegetation because of impacts to native vegetation on adjacent lands. For example, species that may be planted at the construction site can quickly spread and compete with originally undisturbed vegetation such as the California Poppy and California buckwheat, both of which complete poorly with introduced grasses (e.g., planting wild oats is illegal in California). In addition to stabilizing disturbed soil, vines and ground covers can perform the following functions:

1. Provide attractive cover that does not need mowing.
2. Help to define traffic areas and control pedestrian movement.

Site Preparation:
Ground covers are plants that naturally grow very close together, causing severe competition for space nutrients and water. Soil for ground covers should be well prepared. The entire area should be spaded, disced, or rototilled to a depth of six to eight inches. Two to three inches of organic material, such as good topsoil or peat, should be spread over the entire area.

Planting:
The following steps will help ensure good plant growth.

1. Make the plantings following the contours of the land.
2. Dig the holes 1/3 larger than the plant root ball.
3. Know what depth to place the plants.
4. Use good topsoil or soil mixture with a lot of organic matter.
5. Fill hole 1/3 to 1/2 full, shake plants to settle soil among roots, then water.
6. Leave saucer-shaped depression around the plant to hold water.
7. Water thoroughly and regularly.
8. Space plants according to the type of plant and the extent of covering desired.

Materials:
There are many different species of vines and ground covers from which to choose, but care must be taken in their selection. It is essential to select planting materials suited to both the intended use and specific site characteristics. The plants discussed in this handbook are those which are known to be adapted to California, and commonly available from commercial nurseries. Additional information can be obtained from local nurserymen, landscape architects, and extension agents. An approved low water use plant list may be obtained from the State Department of Water Resources or the Soils Conservation Service.

Requirements
Maintenance

General requirements include:

- Grass maintenance should be minimal to none. Irrigation and regular fertilizing may be required for some types of grasses. Mowing is only required in areas where aesthetics or fire hazards are a concern.
- Young trees should receive an inch of water each week for the first two years after planting. The tree should be watered deeply, but not more often than once per week.
- Transplanted trees should be fertilized on an annual basis.
- Proper pruning, watering, and application of fertilizer is necessary to maintain healthy and vigorous shrubs. A heavy layer of mulch applied around the shrubs reduces weeds and retains moisture.
- Trim old growth as needed to improve the appearance of ground covers. Most covers need once-a-year trimming to promote growth.

ESC10

R0000530

Additional Information — Seeding and Planting

Limitations

- Construction activities are likely to injure or kill trees unless adequate protective measures are taken. Direct contact by equipment is the most obvious problem, but damage is also caused by root stress from filling, excavation, or compacting too close to trees.
- Temporary seeding can only be viable when adequate time is available for plants to grow and establish.
- Over fertilizing of plants may cause pollution of storm water runoff.
- Irrigation source and supply may be limiting.

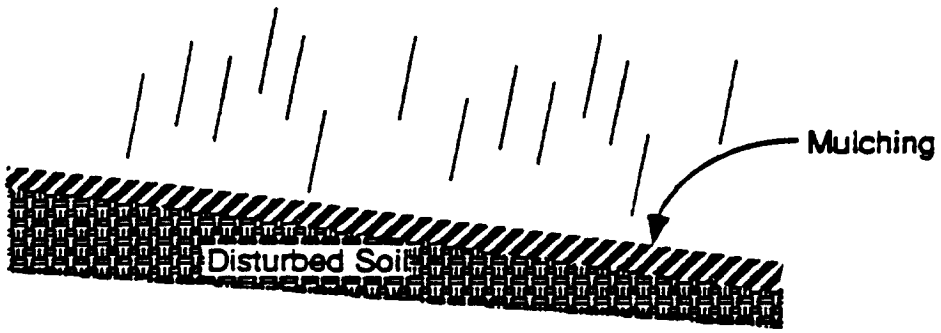
BMP: MULCHING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Mulching is used to temporarily and permanently stabilize cleared or freshly seeded areas. Types of mulches include organic materials, straw, wood chips, bark or other wood fibers, decomposed granite, and gravel.

SUITABLE APPLICATIONS

- Temporary stabilization of freshly seeded and planted areas.
- Temporary stabilization during periods unsuitable for growing vegetation.
- Temporary stabilization of areas that cannot be seeded or planted (e.g., insufficient rain, steep slope).
- Mulches such as gravel and decomposed soils may be used as post-construction BMPs, particularly in arid regions.

INSTALLATION/APPLICATION CRITERIA

Mulch prevents erosion by protecting the soil surface and fostering growth of new seedings that do not stabilize by themselves.

- May be used with netting to supplement soil stabilization.
- Apply to planting areas where slopes are 2:1 or greater.
- Binders may be required for steep areas, or if wind and runoff is a problem.
- Type of mulch, binders, and application rates should be recommended by manufacturer/contractor.

REQUIREMENTS

- Maintenance
  - Must be inspected weekly and after rain for damage or deterioration.
- Cost: Average annual cost for installation and maintenance (3–4 month useful life, source: EPA, 1992)
  - Straw Mulch: $7,500 per acre.
  - Wood Fiber Mulch: $3,500 per acre.
  - Jute Netting: $12,500 per acre.

LIMITATIONS

- Wood fiber mulches should be used only in areas with over 20 inches annual precipitation.
- Organic mulches are not permanent erosion control measures.
- Mulches tend to lower the soil surface temperature, and may delay germination of some seeds.
- Permanent mulches for arid regions should include gravel and decomposed soils.

Targeted Pollutants

- ● Sediment
- ◒ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Training
- ● Suitability for Slopes >5%

● High ○ Low

ESC11

Best Management Practices

Additional Information — Mulching

Mulching protects the soil from rainfall impact; increases infiltration; conserves moisture around trees, shrubs and seedings; prevents compaction and cracking of soil; and aids plant growth for seedings and plantings by holding the seeds, fertilizers and topsoil in place until growth occurs. Mulches include organic materials, straw, wood chips, bark or other wood fibers, decomposed granite and gravel. A variety of nettings or mats of organic or non-organic materials and chemical soil stabilization are practices that may be used conjunctively with mulching.

Mulching may be applied to all graded and cleared areas of the construction site:

- Areas which have been permanently seeded to assist in retaining moisture, and to hold seedings;
- Areas which need temporary soil surface protection because seeding cannot occur due to the season;
- Areas between trees, shrubs and certain ground covers;
- Areas where climatic conditions require a soil moisture retention aid to avoid cracking of the soil and associated compaction, and require soil temperature modification.

Installation/Application Criteria

Only a set of general guidelines is included for application and installation of mulching on disturbed lands because of the various climates, soil conditions and land uses in California. Installation of mulch consists of furnishing all materials, preparing the soil surface and applying the mulch to all soil surface areas designated on the project plans or established by the site engineer.

Materials

Organic mulch materials, such as straw, wood chips, bark and wood fiber, have been found to be most effective where re-vegetation will be provided by reseeding. The choice of mulch should be based on the size of the area, site slopes, surface conditions such as hardness and moisture; weed growth and availability of mulch materials.

Wood Fiber Mulches: Wood fiber mulches consist of specially prepared wood fiber processed to contain no growth germination inhibiting factors. The mulch should be from virgin wood, and be manufactured and processed so the fibers will remain in uniform suspension in water under agitation to form a homogenous slurry. The fiber lengths should be as long as possible to increase the effectiveness for erosion control. Wood fiber mulching should not be used in areas of extremely hot summer and late fall seasons because of fire danger. When used as a tackifier with straw mulch, wood fiber mulches are good for steep slopes and severe climates. The California Office of the Soils Conservation Service recommends a non-toxic mulch green dye be used to provide a visual aid in metering applications.

Wood Chips and Bark Chips: Wood and bark chips are suitable for application in landscaped areas that will not be closely mowed. Wood chips do not require tacking, but do require nitrogen treatment (12 pounds/ton) to prevent nutrient deficiency. Bark chips do not require additional nitrogen fertilizer. When the wood source is near the project site, wood and bark chips can be very inexpensive. Caution must be used in areas of steep slopes, since both wood and bark chips tend to wash down slopes exceeding 6 percent.

Straw Mulch: Straw mulch is a good short-term protection most commonly used with seeding. The mulch should be from the current season's crop. A letter of certification from the supplier should be required to show that the straw was baled less than 12 months from the delivery date. Wheat or oat straw is recommended.

Emulsified Asphalt: Asphalt is used to adhere the mulch to the ground surface, preventing the mulch from blowing or washing off. The type and quantity of asphalt used should not result in a storm water pollution problem.

Binder: Binder should be free flowing, noncorrosive powder produced from natural plant gum such as those marketed under M-Binder, M145 Binder, or AZ-TAC. Synthetic, spray-on materials are not recommended since they tend to create an impervious surface, and may enter the stormwater sewer system via discharge runoff.

ESC11

R0000533

Additional Information — Mulching

Preparations/Methods and Equipment

Straw Mulch: Should be applied in an even, uniform manner, either by hand or by mulch blowing equipment. Straw mulches must be anchored to prevent the mulch from being blown or washed off the site. Anchoring is achieved in two ways:

- Crimping: The mulch is anchored by running a heavy disc with flat, dull, serrated, closely-spaced blades over the mulched soil. Effective crimping embeds the mulch about 2 inches into the soil without completely covering it. The disc should be run once or twice across the soil. About 2 1/2 tons of straw mulch per acre should be applied if the mulch is anchored by crimping.
- Tacking: Achieved using a emulsified asphalt or binder either independently or followed by crimping. If tacked, straw mulch may be applied at a rate of 1 3/4 ton per acre, and tacked with emulsified asphalt at a rate of 500 gallons per acre.

Wood Fiber Mulch: Typically applied with a hydroseeder at a rate of about 1000 to 1500 pounds per acre, or as a slurry consisting of at least 150 pounds of binder, 400 pounds of wood fiber mulch, and 200 gallons of water per acre.

Requirements

Maintenance: Mulched areas require frequent inspection for damage and deterioration. Requirements will vary greatly based on the type of mulch used and the type of vegetation to be established. Vegetative mulches are usually not intended to be permanent; but are extended only as a base for re-seeding or re-vegetation. Where a permanent anchor for vegetation is required, along steep slopes or areas of higher velocity flows, then a geotextile mat or net is recommended (see ESC20).

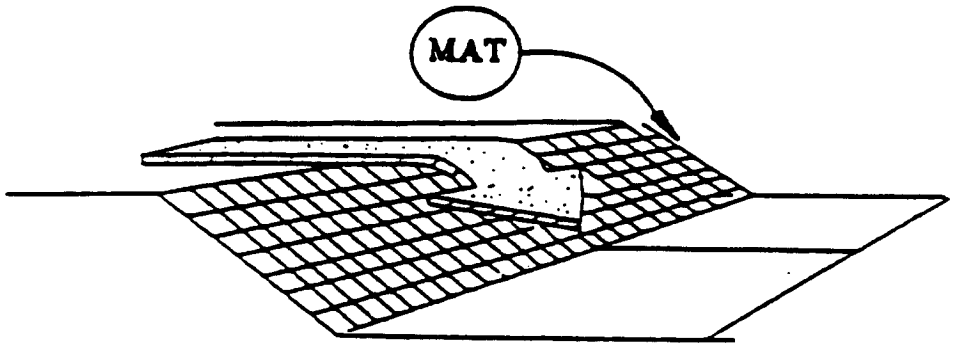
BMP: GEOTEXTILES AND MATS



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Mattings made of natural or synthetic material which are used to temporarily or permanently stabilize soil.

SUITABLE APPLICATIONS

Typically suited for post-construction site stabilization, but may be used for temporary stabilization of highly erosive soils.

- Channels and streams.
- Steep slopes.

INSTALLATION/APPLICATION CRITERIA

Mattings may be applied to disturbed soils and where existing vegetation has been removed. The following organic matting materials provide temporary protection until permanent vegetation is established, or when seasonal circumstances dictate the need for temporary stabilization until weather or construction delays are resolved.

- Jute mattings.
- Straw mattings.

The following synthetic mattings may be used for either temporary or post-construction stabilization, both with and without vegetation

- Excelsior matting.
- Glass fiber matting.
- Staples.
- Mulch nettings.

REQUIREMENTS

- Maintenance
  - Inspect monthly and after significant rainfall.
  - Re-anchor loosened matting and replace missing matting and staples as required.
- Cost
  - Relatively high compared to other BMPs.

LIMITATIONS

- Mattings are more costly than other BMP practices, limiting their use to areas where other BMPs are ineffective (e.g., channels, steep slopes).
- May delay seed germination, due to reduction in soil temperature.
- Installation requires experienced contractor to ensure soil stabilization and erosion protection.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ● Capital Costs
- ◒ O&M Costs
- ◒ Maintenance
- ○ Training
- ● Suitability for Slopes >5%

● High ○ Low

ESC20

Best Management Practices

Additional Information — Geotextiles and Mats

Mattings are used to reduce erosion from rainfall impact, hold soil in place, and absorb and hold moisture near the soil surface. Additionally, mattings may be used to stabilize soils until vegetation is established. This practice may be used alone or with a mulch during the establishment of protective cover on critical slopes (see ESC11, Mulching).

Suitable Applications

Mattings are commonly applied on short, steep slopes where erosion hazard is high and vegetation will be slow to establish. Mattings are also used on stream banks where moving water at velocities between 3 fps and 6 fps is likely to wash out new vegetation, and in areas where the soil surface is disturbed and where existing vegetation has been removed. Matting may also be used when seeding cannot occur (e.g., late season construction and/or the arrival of an early rain season). Erosion control matting should be considered when the soils are fine grained and potentially erosive.

The following natural or synthetic mattings are commonly used:

Jute Mat - should be cloth of a uniform plain weave of undyed and unbleached single jute yarn, 48" in width, and weighing an average of 1.2 pounds per linear yard of cloth with a tolerance of plus or minus five (5) percent, with approximately 78 warp ends per width of cloth and 41 weft ends per linear yard of cloth. The yarn should be of a loosely twisted construction having an average twist of not less than 1.6 turns per inch and shall not vary in thickness by more than its normal diameter.

Straw Mat - should be a machine produced mat consisting of 70% (±3%) agricultural straw and 30% (±3%) coconut fiber. The blanket should be of consistent thickness with the straw and coconut fiber evenly distributed over the entire area of the mat. The blanket should be covered on the top side with polypropylene netting having an approximate 5/8" x 5/8" mesh containing ultraviolet additives to resist breakdown, and on the bottom with a polypropylene netting with an approximate " x " mesh. The blanket should be sewn together with cotton thread.

Excelsior Mat - should be wood excelsior, 48 inches in width plus or minus one inch and weighing 0.8 pound per square yard plus or minus ten percent. The excelsior material should be covered with a netting to facilitate handling and to increase strength.

Glass Fiber Matting - should be of bonded textile glass fibers with an average fiber diameter of eight to twelve microns, two to four inch strands of fiber bonded with phenol formaldehyde resin. Mat should be roll type, water permeable, minimum thickness inch, maximum thickness inch, density not less than three pounds per cubic foot.

Staples for anchoring soil stabilizing materials should be Number 11 gauge wire or heavier. Their length should be six to ten inches, with longer staples used in loose, unstable soils.

Other Mulch Netting - such as paper, plastic, cotton or fiber glass matting should be installed according to the manufacturer's recommendations.

Installation/Application Criteria

Organic matting materials have been found to be effective where re-vegetation will be provided by re-seeding. The choice of matting should be based on the size of area, side slopes, surface conditions such as hardness and moisture; weed growth and availability of materials. Matting strengths and uses vary, therefore, manufacturer's specifications must be followed. Proper installation of mattings is critical in order to obtain firm, continuous contact with the soil.

ESC20

R0000536

Additional Information — Geotextiles and Mats

Site Preparation: After the site has been shaped and graded to the approved design, prepare a friable seed bed relatively free from clods and rocks more than 1 inches in diameter and any foreign material that will prevent contact of the protective mat with the soil surface.

Planting: Fertilize and seed in accordance with seeding specifications or other types of landscaping plans. When using jute matting on a seeded area, apply approximately half the seed before laying the mat and the remainder after laying the mat. The protective matting can be laid over areas where grass has been planted and the seedlings have emerged. Where vines or other ground covers are to be planted, lay the protective matting first and then plant through matting according to design of planting.

Erosion Stops: Erosion stops are made of glass fiber strips, excelsior matting strips or tight-folded jute matting blanket or strips for use on steep, highly erodible watercourses. The stops are placed in narrow trenches six to twelve inches deep across the channel and left flush with the soil surface. They are to cover the full cross section of designed flow.

Laying and Securing Matting: Before laying the matting, all erosion stops should be installed and the friable seed bed made free from clods, rocks, and roots. The surface upon which the separation fabric will be placed should be compacted and finished according to the requirements of the manufacturer's recommendations.

Most matting comes with the manufacturer's recommendations for installation. Most channels will require multiple widths of matting, and the matting should be unrolled starting at the upper end of the channel, allowing a four inch overlap of mattings along the center of the channel. To secure, bury the top ends of the matting in a narrow trench, a minimum of six inches deep. Backfill trench and tamp firmly to conform to channel cross section. Secure with a row of staples about four inches down slope from the trench with staples twelve inches apart.

Where matting crosses erosion stops, reinforce with a double row of staples at six inch spacing, using a staggered pattern on either side of the erosion stop. When the matting is overlapped, the discharge end of the matting liner should be similarly secured with a double row of staples.

Mechanical or manual laydown equipment should be capable of handling full rolls of fabric, and laying the fabric smoothly, without wrinkles or folds. The equipment should meet the fabric manufacturer's recommendations or equivalent standards.

Final Check: Check the following after the mating is installed:

- Make sure matting is uniformly in contact with the soil.
- All lap joints are secure.
- All staples are flush with the ground.
- All disturbed areas seeded.

Limitations

Properly installed mattings provide excellent erosion control but do so at relatively high cost. This high cost typically limits the use of mattings to areas of concentrated channel flow and steep slopes.

Installation is critical and requires experienced contractors. The contractor should install the matting material in such a manner that continuous contact between the material and the soil occurs, otherwise the material will not stabilize the soil and erosion will occur beneath the material. Ultraviolet protection may be required on some geotextiles. Matting strengths and uses vary; the manufacturer's specifications should be followed.

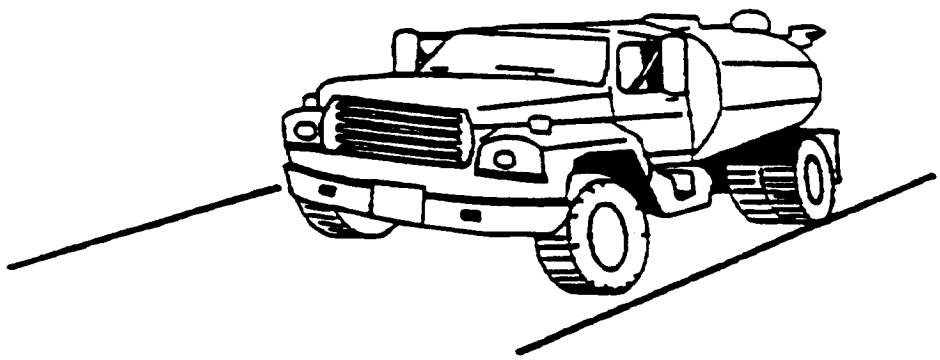
R0000540

BMP: DUST CONTROLS



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Dust control measures are used to stabilize soil from wind erosion, and reduce dust generated by construction activities.

SUITABLE APPLICATIONS

- Clearing and grading activities.
- Construction vehicle traffic on unpaved roads.
- Drilling and blasting activities.
- Sediment tracking onto paved roads.
- Soil and debris storage piles.
- Batch drop from front end loaders.
- Areas with unstabilized soil.
- Final grading/site stabilization usually is sufficient to control post-construction dust sources.

INSTALLATION/APPLICATION CRITERIA

- Schedule construction activities to minimize exposed area (See ESC 1).
- Quickly stabilize exposed soils using vegetation, mulching, spray-on adhesives, calcium chloride, sprinkling, and stone/gravel layering (See ESC 10 and 11).
- Identify and stabilize key access points prior to commencement of construction (See ESC 24).
- Minimizing the impact of dust by anticipating the direction of prevailing winds.
- Direct most construction traffic to stabilized roadways within the project site (See ESC 23).

REQUIREMENTS

- Maintenance
  - Most dust control measures require frequent, often daily, attention.
- Cost
  - Installation costs for water/chemical dust suppression are low, but annual costs may be quite high since these measures are effective for only a few hours to a few days.

LIMITATIONS

- Watering prevents dust only for a short period and should be applied daily (or more often) to be effective.
- Overwatering may cause erosion.
- Oil should not be used for dust control because the oil may migrate into drainageway and/or seep into the soil.
- Certain chemically-treated subgrades may make soil water repellant, increasing runoff.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Capital Costs

- ○ Training
- ○ Suitability for Slopes >5%

● High ○ Low

ESC21

Best Management Practices

Additional Information — Dust Controls

California's mediterranean climate, with short wet seasons and long hot dry seasons, allow the soils to thoroughly dry out. During these dry seasons, construction activities are at their peak, and disturbance and exposed areas are increasingly subject to wind erosion, sediment tracking and dust generated by construction equipment.

Dust control, as a BMP, is a practice that is already in place for many construction activities. Los Angeles, the North Coast and Sacramento, among others have enacted dust control ordinances for construction activities that cause dust to be transported beyond the construction project property line. Recently, the State Air Resources Control Board has, under the authority of the Clean Air Act, started to address air quality in relation to inhalable particulate matter less than 10 microns (PM-10). 90% of these small particles are considered to be dust. Existing dust control regulations by local agencies, municipal departments, public works department, and/or public health departments are in place in some regions within California. For jurisdictions that have no formal dust control regulations and/or standards, Sections 10, 17 and 18 of CalTrans' Standard Specifications provide detailed provisions for dust control practices.

Many local agencies require dust control in order to comply with local nuisance laws, opacity laws (visibility impairment) and the requirements of the Clean Air Act. The following are measures that local agencies may have already implemented as requirements for dust control from contractors:

- Construction & Grading Permits: Require provisions for dust control plans;
- Opacity Emission Limits: Enforce compliance with California air pollution control laws;
- Increase overall enforcement activities: Priority given to cases involving citizen complaints;
- Maintain Field Application Records: Require records of dust control measures from contractor;
- Stormwater Pollution Prevention Plan: (SWPPP): Integrate dust control measures into SWPPP.

Dust Control Practices

Dust control BMP's generally stabilize exposed surfaces and minimize activities that suspend or track dust particles. Table ESC21.1 shows which Dust Control BMPs apply to site conditions which cause dust. For heavily traveled and disturbed areas, wet suppression (watering), chemical dust suppression, gravel or asphalt surfacing, temporary gravel construction entrances, equipment wash-out areas, and haul truck covers can be employed as dust control applications. Permanent or temporary vegetation and mulching and sand fences can be employed for areas of occasional or no construction traffic. Preventive measures would include minimizing surface areas to be disturbed, limiting on-site vehicle traffic to 15 miles per hour, and controlling the number and activity of vehicles on a site at any given time.

Many of the reasonably available control measures for controlling dust from construction sites can also be implemented as BMPs for storm water pollution prevention. Those BMPs include:

- Pave, vegetate, or chemically stabilize access points where unpaved traffic surfaces adjoin paved roads.
- Provide covers for haul trucks transporting materials that contribute to dust.
- Provide for wet suppression or chemical stabilization of exposed soils.
- Provide for rapid clean-up of sediments deposited on paved roads. Furnish stabilized construction road entrances and vehicle wash down areas.
- Stabilize unpaved haul roads, parking and staging areas. Reduce speed and trips on unpaved roads.
- Implement dust control measures for material stockpiles.
- Prevent drainage of sediment laden storm water onto paved surfaces.
- Stabilize abandoned construction sites using vegetation or chemical stabilization methods.
- Limit the amount of areas disturbed by clearing and earth moving operations by scheduling these activities in phases.

For the chemical stabilization, there are many products available for chemically stabilizing gravel roadways and stockpiles. The types of chemicals available and recommendations for their use are tabulated in Table ESC 21.2, Commonly Used Chemicals for Dust Control.

ESC21

R0000542

Additional Information — Dust Controls

In addition, there are many other BMPs identified in this handbook that provide dust control including:

- Seeding and Plantings (ESC 10)
- Mulching (ESC 11)
- Construction Road Stabilization (ESC 23)
- Stabilized Construction Entrances (ESC 24)

Limitations

- Oil treated subgrades should not be used because the oil may migrate into drainageways and/or seep into the soil.
- Chemically treated subgrades may make the soil water repellant, interfering with long-term infiltration, and the vegetation/re-vegetation of the site. Some chemical dust suppressants may be subject to freezing and may contain solvents and should be handled properly.
- Asphalt, as a mulch tack or chemical mulch, requires a 24 hour curing time to avoid adherence to equipment, worker shoes, etc. Application should be limited because asphalt surfacing may eventually migrate into the drainage system.
- In compacted areas, watering and other liquid dust control measures may wash sediment or other constituents into the drainage system.

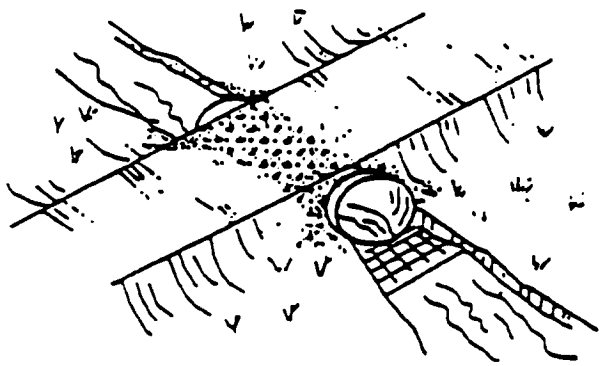
	SALTS	ORGANIC, NON PETROLEUM-BASED	PETROLEUM BASED PRODUCTS[1]
CHEMICAL TYPES	• Calcium Chloride[2] • Magnesium Chloride • Natural Brines	• Calcium Lignosulfonate • Sodium Lignosulfonate • Ammonium Lignosulfonate	• Bunker Oil • Asphalt Primer • Emulsified Asphalt
LIMITATIONS	Can lose effectiveness in dry periods with low humidity. Leaches from road in heavy rain Not recommended for gravel road surfaces with low fines. Recommended 10-20% fines.	Not affected by dry weather and low humidity. Leached from road in heavy rain if not sufficiently cured. Best performance on gravel roads with high surface fines (10-30%) and dense compact surface with loose gravel.	Generally effective regardless of climatic conditions may pothole in wet weather. Best performance on gravel roads with 5-10% fines.
COMMENTS	Calcium Chloride is popular. May become slippery when wet on gravel surfaces with high fines.	Ineffective on gravel surfaces low in fines. May become slippery when wet on gravel surfaces with high fines content.	Creates a hardened crust.

[1] Motor oils and oil treatments are not recommended due to adverse effects on plant life and groundwater.

[2] Not recommended due to adverse effects on plant life.

BMP: TEMPORARY STREAM CROSSING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

A temporary access stream crossing is a temporary culvert, ford or bridge placed across a waterway to provide access for construction purposes for a period of less than one year. Temporary access crossings are not intended to be used to maintain traffic for the general public.

SUITABLE APPLICATIONS

Temporary stream crossings should be installed at all designated crossings of perennial and intermittent streams on the construction site, as well as for dry channels which may be significantly eroded by construction traffic.

INSTALLATION/APPLICATION CRITERIA

Requires knowledge of stream flows and soil strength and should be designed under the direction of a California registered engineer with knowledge of both hydraulics and construction loading requirements for structures.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each significant rainfall, including assessment of foundations.
  - Periodically remove silt from crossings.
  - Replace lost aggregate from inlets and outlets of culverts.
- Cost
  - CalTrans Construction Cost Index for temporary bridge crossing is $45-$95 per square feet.

LIMITATIONS

- May be an expensive for a temporary improvement.
- Requires other BMPs to minimize soil disturbance during installation and removal.
- Fords should only be used in dry weather.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ◒ Capital Costs
- ○ O&M Costs
- ◒ Maintenance
- ○ Training
- ○ Suitability for Slopes >5%

● High ○ Low

ESC22

Best Management Practices

Additional Information — Temporary Stream Crossing

A temporary access stream crossing is a culvert, ford, or bridge placed across a waterway to provide access for construction for a period of less than one year. Temporary access crossings are not intended to be used for general public traffic.

The purpose of this BMP is to provide a safe, erosion-free access across a stream for construction equipment. Minimum standards and specifications for the design, construction, maintenance, and removal of the structure should be established by an engineer registered in California. Temporary stream crossings may be necessary to prevent construction equipment from causing erosion of the stream and tracking sediment and other pollutants into the stream.

Temporary stream crossings are used as access points to construction sites when other detour routes may be too long or burdensome for the construction equipment. Often heavy construction equipment must cross streams or creeks, and detour routes may impose too many constraints such as being too narrow or poor soil strength for the equipment loadings. Additionally, the contractor may find a temporary stream crossing more economical for light-duty vehicles to use for frequent crossings, and may have less environmental impact than construction of a temporary access road.

Installation/Application

Temporary access stream crossings should be sized and installed according to the drainage design criteria of the local municipality. Design criteria should be based on standard engineering practices for culvert design with provisions for minimizing impacts on disturbed crossing areas. Three types of temporary access stream crossings may be considered:

Temporary Access Culvert: A temporary access culvert is effective in controlling erosion but will cause erosion during installation and removal. A temporary culvert can be easily constructed and allows for heavy equipment loads.

Temporary Access Ford: A temporary access ford provides little sediment and erosion control and is ineffective in controlling erosion in the stream channel. A temporary ford is the least expensive stream crossing and allows for maximum load limits. It also offers very low maintenance. Fords are more appropriate during the dry season and in arid areas of California.

Temporary Access Bridge: With the appropriate materials and designs, a temporary access bridge causes the least erosion of the stream channel crossing during its installation and removal.

During the long summer construction season in California, rainfall is infrequent and many streams are dry. Under these conditions, a temporary access ford may be sufficient. A ford is not appropriate if construction will continue through the winter rainy season, if summer thunderstorms are likely, or if the stream flows during most of the year. Temporary access culverts and bridges should then be considered and, if used, should be sized to pass a significant design storm (i.e., at least a 10-year storm). The temporary stream crossing should be protected against erosion, both to prevent excessive sedimentation in the stream and to prevent washout of the crossing (and, consequently, costly construction delays).

Limitations

Special care must be taken when crossing an environmentally sensitive waterway. Oils or other potentially hazardous materials shall not be used for surface treatments. Street runoff should not be allowed to spill down crossing sideslopes. Construction in watercourses should be at or near the natural elevation of the stream bed to prevent any potential flooding upstream of the crossing. In addition, the following limitations may apply:

ESC22

R0000547

Additional Information — Temporary Stream Crossing

- May be expensive temporary cost
- Increased soil disturbance upon installation and removal
- Temporary culverts need regular maintenance and can cause erosion if the culvert becomes clogged.
- A temporary ford offers little if any erosion control in flowing streams and can often make erosion worse. Fords should only be used in the dry season on dry streams.

Construction in waterways is subject to additional permit requirements. Contact the local municipal storm water agency for additional information.

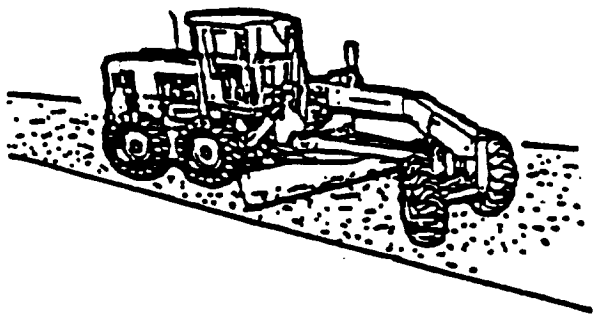
BMP: CONSTRUCTION ROAD STABILIZATION



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Access roads, subdivision roads, parking areas, and other on-site vehicle transportation routes should be stabilized immediately after grading and frequently maintained to prevent erosion and control dust.

SUITABLE APPLICATIONS

- Temporary construction traffic.
- Phased construction projects and off-site road access.
- Detour roads.
- Construction during wet weather.

INSTALLATION/APPLICATION CRITERIA

- Road should follow topographic contours to reduce erosion of the roadway.
- The roadway slope should not exceed 15 percent.
- Gravel roads should be a minimum 4-inch thick, 2-3 inch coarse aggregate base applied immediately after grading, or as recommended by soils engineer.
- Chemical stabilizers or water are usually required on gravel or dirt roads to prevent dust (see Dust Control ESC 21).

REQUIREMENTS

- Maintenance
  - Periodically apply additional aggregate on gravel roads.
  - Active dirt construction roads are commonly watered three or more times per day during the dry season.
  - Inspect weekly, and after each rain.
  - Repair any eroded areas immediately.
- Cost
  - Gravel construction roads are moderately expensive, but cost is often balanced by reductions in construction delay.
  - No additional costs for dust control on construction roads should be required above that needed to meet local air quality requirements.

LIMITATIONS

- The roadway must be removed or paved when construction is complete.
- Certain chemical stabilization methods may cause storm water or soil pollution and should not be used (see Dust Control ESC 21).
- Management of construction traffic is subject to air quality control measures. Contact the local air quality management agency.

Targeted Pollutants

- ○ Training
- ◒ Suitability for Slopes >5%

● High ○ Low

ESC23

Best Management Practices

Additional Information — Construction Road Stabilization

Areas which are graded for construction vehicle transport and parking purposes are especially susceptible to erosion and dust. The exposed soil surface is continually disturbed, leaving no opportunity for vegetative stabilization. Such areas also tend to collect and transport runoff waters along their surfaces. During wet weather, they often become muddy quagmires which generate significant quantities of sediment that may pollute nearby streams or be transported off-site on the wheels of construction vehicles. Dirt roads can become so unstable during wet weather that they are virtually unusable.

Efficient construction road stabilization not only reduces on-site erosion but can significantly speed on-site work, avoid instances of immobilized machinery and delivery vehicles, and generally improve site efficiency and working conditions during adverse weather.

Installation/Application Criteria

Where feasible, alternative routes should be made for construction traffic; one for use in dry condition, the other for wet conditions which incorporate the measures listed for this BMP. Permanent roads and parking areas should be paved as soon as possible after grading. As an alternative where construction will be phased, the early application of gravel or chemical stabilization may solve potential erosion and stability problems. Temporary gravel roadway should be considered during the rainy season and/or on slopes greater than 5 percent.

When gravel road is needed, apply a minimum 4-inch course of 2 to 4-inch crushed rock, gravel base, or crushed surfacing base course immediately after grading or the completion of utility installation within the right-of-way. Chemical stabilization may also be used upon compacted native sub-grade (see the Dust Control BMP ESC 21). These chemical controls should be applied per the manufacturer's directions.

Temporary roads should follow the contour of the natural terrain to the maximum extent possible. Slope should not exceed 15 percent. Roadways should be carefully graded to drain transversely. Provide drainage swales on each side of the roadway in the case of a crowned section, or one side in the case of super-elevated section. Simple gravel berms without a trench can also be used.

Installed inlets should be protected to prevent sediment-laden water from entering the storm sewer system (see "Storm Drain Inlet Protection" ESC 54).

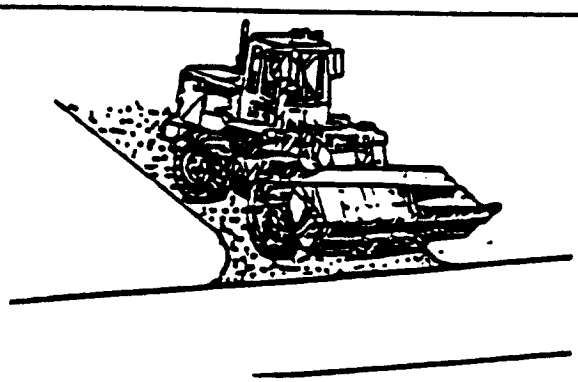
R0000552

BMP: STABILIZED CONSTRUCTION ENTRANCE



GENERAL DESCRIPTION

The construction entrance practice is a stabilized pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right-of-way, street, alley, sidewalk or parking area. Stabalizing the construction entrance significantly reduces the amount of sediment (dust, mud) tracked off-site, especially if a washrack incorporated for removing caked on sediment.

SUITABLE APPLICATIONS

- All points of construction ingress and egress.
- Unpaved areas where sediment tracking occurs from site onto paved roads.

INSTALLATION/APPLICATION CRITERIA

- Construct on level ground where possible.
- Stones should be 1-3 inches.
- Minimum depth of stones should be 6 inches or as recommended by soils engineer.
- Length should be 50-foot minimum, and 30-foot minimum width.
- Provide ample turning radii as part of entrance.

REQUIREMENTS

- Maintenance
  - Inspect monthly and after each rainfall.
  - Replace gravel material when surface voids are visible.
  - Remove all sediment deposited on paved roadways within 24 hours.
  - Remove gravel and filter fabric at completion of construction
- Cost: Average annual cost for installation and maintenance (Source: EPA, 1992)
  - Without Wash Rack: $1500 each.
  - With Wash Rack: $2200 each.

LIMITATIONS

- Requires periodic top dressing with additional stones.
- Should be used in conjunction with street sweeping on adjacent public right-of-way.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels

Best Management Practices

Additional Information — Stabilized Construction Entrance

A stabilized construction entrance is a pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right-of-way, street, alley, sidewalk or parking area. The purpose of a stabilized construction entrance is to reduce or eliminate the tracking of sediment onto public rights-of-way or streets. Reducing trackout of sediments and other pollutants onto paved roads helps prevent deposition of sediments into local storm drains and production of airborne dust.

Where traffic will be entering or leaving, a stabilized construction entrance should be used at all points of construction ingress and egress. NPDES permits require that appropriate measures be implemented to prevent trackout of sediments onto paved roadways, which is a significant source of sediments derived from mud and dirt carryout from the unpaved roads and construction sites.

Stabilized construction entrances are moderately effective in removing sediment from equipment leaving a construction site. The entrance should be build on the level ground. Advantages of the Stabilized Construction Entrance is that it does remove some sediment from equipment and serves to channel construction traffic in and out of the site at specified locations. Efficiency is greatly increased when a washing rack is included as part of a stabilized construction entrance.

The aggregate for a stabilized construction entrance aprons should be 1 to 3 inches in size, washed, well-graded gravel or crushed rock. Minimum apron dimensions of 30 ft. x 50 ft. and 6 inches deep is adequate for two-way ingress/egress traffic.

The entrance must be properly graded to prevent runoff from leaving the construction site.
When wash areas are provided, washing is done on a reinforced concrete pad (if significant washing is necessary) or in an area stabilized with crushed stone which drains into a properly constructed sediment trap or basin (ESC 55 and 56). Sediment barriers are provided to prevent sediments from entering into the stormwater sewer system, ditch, or waterway.

Limitations

- Construct on level ground.
- Stabilized construction entrances are rather expensive to construct and when a wash rack is included, a sediment trap of some kind must also be provided to collect wash water runoff.
- Requires periodic top dressing with additional stones.
- Should be used in conjunction with street sweeping on adjacent public right-of-way.

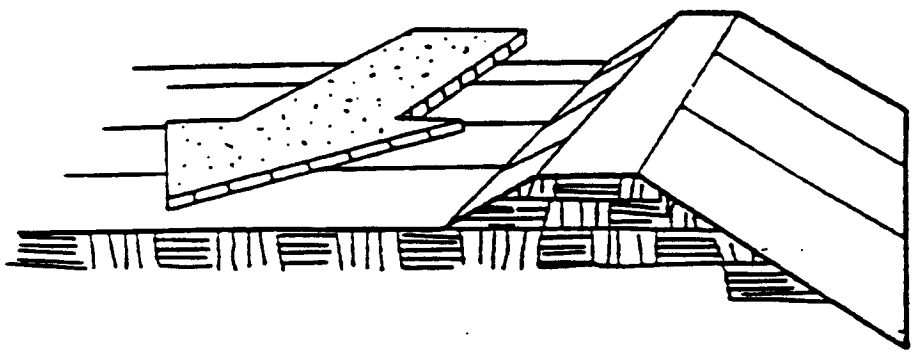
BMP: EARTH DIKE



Objectives

- Housekeeping Practices
- **Contain Waste**
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DESCRIPTION

The temporary earth dike is a temporary berm or ridge of compacted soil, used to divert runoff or channel water to a desired location.

SUITABLE APPLICATIONS

Earth dikes are typically used to divert concentrated runoff through disturbed areas into another BMP (e.g., sediment basins), to divert runoff away from disturbed or unstable slopes, to divert runoff from off-site and undisturbed areas around disturbed areas, and as a containment for construction materials and wastes. The dikes should remain in place until the disturbed areas are permanently stabilized. The dikes must be on-site and must safely convey anticipated flood flows.

INSTALLATION/APPLICATION CRITERIA

- All dikes should be compacted by earth-moving equipment.
- All dikes should have positive drainage to a stabilized outlet.
- Top width may be wider and side slopes may be flatter at crossings for construction traffic.
- Dikes should direct sediment-laden runoff into a sediment trapping device.
- Dikes should be stabilized with vegetation, chemicals, or physical devices.

REQUIREMENTS

- Maintenance
  - Inspect periodically and after every significant rainfall; repair as necessary.
- Cost
  - Cost ranges from $15 to $55 per foot for both earthwork and stabilization and depends on availability of material, site location, and access.

LIMITATIONS

Dikes should not be used for drainage areas greater than 10 acres, or along slopes greater than 10 percent. For larger areas more permanent drainage structures should be built. All drainage structures should be built in compliance with local municipal requirements.

- Earth dikes may create more disturbed area on site and become barriers to construction equipment.
- Earth dikes must be stabilized immediately, which adds cost and maintenance concerns.
- Diverted storm water may cause downstream flood damage.
- Dikes should not be constructed of soils which may be easily eroded.
- Regrading the site to remove the dike may add additional cost.

Targeted Pollutants

ESC30

Best Management Practices

Additional Information — Earth Dike

The temporary earth dike is a berm or ridge of compacted soil, located in such a manner as to divert storm water to a sediment trapping device or stabilized outlet, thereby reducing the potential for erosion and offsite sedimentation. Earth dikes can also be used to divert runoff from off-site and from undisturbed areas away from disturbed areas, and to divert sheet flows away from unprotected slopes.

An earth dike does not itself control erosion or remove sediment from runoff; a dike prevents erosion by directing runoff to an erosion control device such as a sediment trap or directing runoff away from an erodible area. Temporary diversion dikes should not adversely impact adjacent properties and must conform to local floodplain management regulations, and should not be used in areas with slopes steeper than 10%.

- The advantages of the temporary earth dike include the ability to handle flows from large drainage areas.
- Once stabilized, earth dikes require relatively little maintenance. Additionally, the earth dikes are relatively inexpensive to install since the soil material required for construction may be available on-site, and can be constructed as part of the initial grading operations, while the equipment is on-site.
- Uses on-site materials.

Installation/Application Criteria

Temporary earth dikes are a practical, inexpensive BMP used to divert storm water runoff. Temporary diversion dikes should be installed in the following manner:

1. All dikes should be compacted by earth-moving equipment.
2. All dikes should have positive drainage to an outlet.
3. All dikes should have 2:1 side slopes, 18 inches minimum height, and a minimum top width of 24 inches. Top width may be wider and side slopes may be flatter at crossings for construction traffic.
4. The outlet from the earth dike must function with a minimum of erosion. Runoff should be conveyed to a sediment trapping device such as a sediment trap (ESC 55) or sediment basin (ESC 56)when either the dike channel or the drainage area above the dike are not adequately stabilized.
5. Temporary stabilization may be achieved using seed and mulching for slopes less than 5%, and either rip-rap or sod for slopes in excess of 5%. In either case, stabilization of the earth dike should be completed immediately after construction or prior to the first rain.
6. If riprap is used to stabilize the channel formed along the toe of the dike, the following typical specifications apply:

CHANNEL GRADE	RIPRAP STABILIZATION
0.5-1.0%	4" Rock
1.1-2.0%	6" Rock
2.1-4.0%	8" Rock
4.1-5.0%	8-12" Riprap

7. The stone riprap, recycled concrete, etc. used for stabilization should be pressed into the soil with construction equipment.
8. Filter cloth may be used to cover dikes in use for long periods.
9. Construction activity on the earth dike should be kept to a minimum.

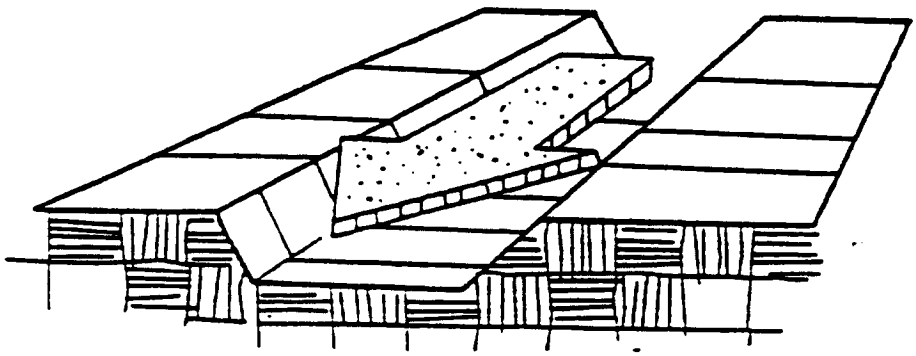
BMP: TEMPORARY DRAINS AND SWALES



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DESCRIPTION

Temporary drains and swales are used to divert off-site runoff around the construction site, divert runoff from stabilized areas around disturbed areas, and direct runoff into sediment basins or traps.

SUITABLE APPLICATIONS

Temporary drains and swales are appropriate for diverting any upslope runoff around unstabilized or disturbed areas of the construction site:

- Prevent slope failures.
- Prevent damage to adjacent property.
- Prevents erosion and transport of sediments into water ways.
- Increases the potential for infiltration.
- Diverts sediment-laden runoff into sediment basins or traps.

INSTALLATION/APPLICATION CRITERIA

Temporary drainage swales will effectively convey runoff and avoid erosion if built properly:

- Size temporary drainage swales using local drainage design criteria.
- A permanent drainage channel must be designed by a professional engineer (see the local drainage design criteria for proper design).
- At a minimum, the drain/swale should conform to predevelopment drainage patterns and capacities.
- Construct the drain/swale with an uninterrupted, positive grade to a stabilized outlet.
- Provide erosion protection or energy dissipation measures if the flow out of the drain or swale can reach an erosive velocity.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Repair any erosion immediately.
  - Remove sediment which builds up in the swale and restricts its flow capacity.
- Cost
  - The cost of a drainage swale increases with drainage area and slope. Typical. swales for controlling internal erosion are inexpensive.

LIMITATIONS

- Temporary drains and swales or any other diversion of runoff should not adversely impact upstream or downstream properties.
- Temporary drains and swales must conform to local floodplain management requirements.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ◒ Capital Costs

- ○ Maintenance
- ○ Training
- ◒ Suitability for Slopes >5%

● High ○ Low

ESC31

Best Management Practices

Additional Information — Temporary Drains and Swales

Slopes that are formed during cut and fill operations should be protected from erosion by runoff. A combination of a temporary drainage swale and an earth dike (see ESC30) at the top of a slope can safely divert runoff to a location where it can safely be brought to the bottom of the slope (see Pipe Slope Drain ESC32). A combination dike and swale is easily constructed by a single pass of a bulldozer or grader and compacted by a second pass of the tracks or wheels over the ridge. Diversion structures should be installed when the site is initially graded, and remain in place until post-construction BMPs are installed and/or the slopes are stabilized.

Diversion practices concentrate the volume of surface runoff, increasing its velocity and erosive force. Thus, the flow out of the drain or swale must be directed onto a stabilized area or into a grade stabilization structure. A swale should be stabilized using vegetation, chemical treatment, rock rip-rap, matting, or other physical means of stabilization, if significant erosion will occur. Any drain or swale which conveys sediment-laden runoff must be diverted into a sediment basin or trap before it is discharged from the site.

Installation/Application Criteria

Diversion drains or swales are only effective if they are properly installed. Swales are more effective than dikes because they tend to be more stable. The combination of a swale with a dike on the downhill side is the most cost-effective diversion.

Standard engineering design criteria for small open channel and closed conveyance systems should be used (see the local drainage design manual). Unless local drainage design criteria state otherwise, drains or swales should be designed as follows:

- No more than 5 acres may drain to a temporary drain or swale
- Place the drain or swale above, not on, a cut and fill slope
- Swale bottom width should be at least 2 ft
- Depth of the swale should be at least 18 inches
- Side slopes should be 2:1 or flatter
- Drain or swale should be layed at a grade of at least 1 percent, but not more than 15 percent
- The swale must not be overtopped by the 10-year, 24-hour storm, irrespective of the design criteria stated above
- Remove all trees, stumps, obstructions, and other objectionable material from the swale when it is built
- Compact any fill material along the path of the swale
- Stabilize all swales immediately. Seed and mulch swales at a slope of less than 5 percent, and use rip-rap or sod for swales with a slope between 5 and 15 percent
- Do not operate construction vehicles across a swale unless a stabilized crossing is provided.
- The cost of swales and other diversion devices is generally included in the earthwork cost, as a separate item under the grading budget of the project construction contract.

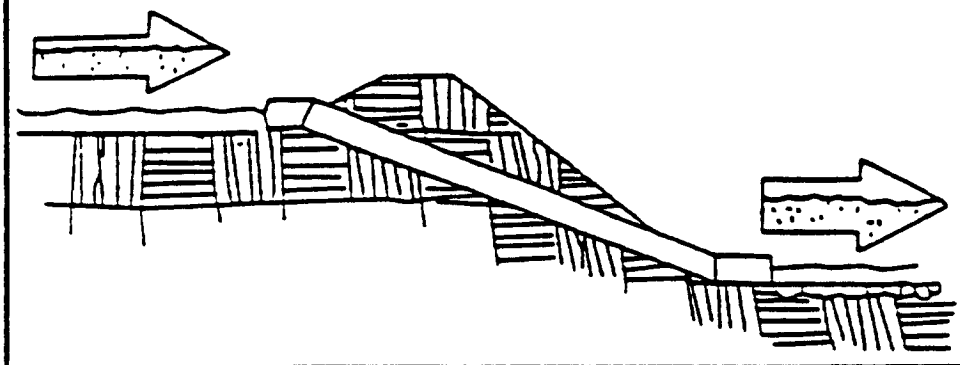
BMP: SLOPE DRAIN



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

A temporary pipe or lined channel to drain the top of a slope to a stable discharge point at the bottom of a slope without causing erosion.

SUITABLE APPLICATIONS

- Where concentrated flow of surface runoff must be conveyed down a slope in order to prevent erosion.
- Drainage for top of slope diversion dikes or swales.
- Emergency spillway for a sediment basin.
- Drainage for top of cut/fill slopes where water can accumulate.

The types of slope drain can include:

- Pipe drops.
- Flexible downdrains.
- Sectional downdrains.
- Lined terrace drains.

INSTALLATION/APPLICATION CRITERIA

- Secure inlet and surround with dikes to prevent gully erosion, and anchor pipe to slope.
- Size to convey at least the peak of a 10-year, 24-hour storm (See local flood control agency for requirements).
- Stabilize outlet.

REQUIREMENTS

- Maintenance
  - Structure must be inspected regularly and after storms.
  - Inlet must be free of undercutting and no water should circumvent the entry.
  - Outlet should not produce erosion; velocity dissipators must be maintained.
  - Pipe anchors must be checked to ensure that the pipe remains anchored to the slope.
- Cost
  - CalTrans Cost Schedule gives regional cost ranges.

LIMITATIONS

- Maximum drainage area per slope drain is 5 acres. (For large areas use a paved chute, rock lined channel or additional pipes.)
- Clogged slope drains will force water around the pipe and cause slope erosion.
- Dissipation of high flow velocities at the pipe outlet is required to avoid downstream erosion.
- Failure can result in flooding and severe erosion.

Targeted Pollutants

Best Management Practices

R0000567

Additional Information — Slope Drain

The slope drain may be a rigid pipe, such as corrugated metal, a flexible conduit, or a lined terrace drain with the inlet placed on the top of a slope. The drain conveys concentrated runoff down to the bottom of the slope. The BMP typically is used in combination with a diversion control, such as a temporary dike or swale, at the top of the slope, and serves as a temporary BMP to reduce or eliminate slope erosion until permanent BMPs are installed and the slope is stabilized.

The slope drain is applicable for any construction site where concentrated surface runoff can accumulate and must be conveyed down the slope in order to prevent erosion. The slope drain is effective because it prevents the stormwater from flowing directly down the slope by confining all the runoff into an enclosed pipe or channel. Due to the time lag between grading slopes and installation of permanent storm water collection systems and slope stabilization measures, temporary provisions to intercept runoff are sometimes necessary. Particularly in steep terrain, slope drains can protect unstabilized areas from erosion. Typical uses include:

- Emergency spillway for a sediment basin.
- Drainage for top of cut/fill slopes where storm water can accumulate and must be conveyed down the slope.

Installation/Application Criteria

Temporary slope drains are highly effective in eliminating slope erosion. Installation and maintenance requirements are small, especially when flexible pipe is used. General criteria:

- Gully erosion is the major problem with slope drains. Inlet structures must be securely entrenched and compacted to avoid severe gully erosion.
- The drain must be securely anchored to the slope and must be adequately sized to carry the capacity of the design storm and associated forces.
- The outlet must be stabilized with rip-rap, concrete or other type of energy dissipator, or directed into a stable sediment trap or basin.
- A debris rack is recommended at the inlet, and should be encouraged for larger pipes and at the outlet as a safety device to prevent small children from entering the pipe.

Materials:

Material selection and criteria for the pipe slope drain is often established by the local municipality. Soil type, rainfall patterns, construction schedule, and available supply are some of the factors to be considered. The following types of slope drains are commonly used:

- Rigid Pipe: This type of slope drain is also known as a pipe drop. The pipe usually consists of corrugated metal pipe or rigid plastic pipe. The pipe is placed on undisturbed or compacted soil and secured into the slope. One foot minimum cover is required on the pipe, and concrete thrust blocks must be used when required by the municipality or warranted by the calculated thrust forces. Collars should be properly installed and secured with metal strappings or watertight collars.
- Flexible Pipe: The flexible pipe slope drain consists of a flexible conduit of heavy duty material. The conduit material is securely anchored into the slope and connections are watertight. The conduit should be securely fastened to the metal inlet and outlet conduit sections with metal strappings or water tight collars.
- Sectional Downdrains: The sectional downdrain consists of pre-fabricated, sectional conduit of half-round or third-round material. The sectional downdrain performs similar to a flume or chute. The pipe must be placed on undisturbed or compacted soil and secured into the slope.
- Concrete-lined Terrace Drain: This is a concrete channel for draining water from a terrace on a slope to the next level. These drains are after permenant strucures which should be designed according to local drainage design criteria.

ESC32

R0000568

Additional Information — Slope Drain

Design:
Unless specified by the local municipality, the capacity for temporary drains should be sufficient to handle the peak runoff from a 10-year, 24-hour rainfall event. The pipe size may be computed using the Rational Method or a method established by the local municipality. Higher flows must be safely stored or routed to prevent any offsite concentration of flow, and any erosion of the slope.

As a guide, temporary pipe slope drains should not be sized smaller than shown in the following table:

MINIMUM PIPE DIAMETER	MAXIMUM DRAINAGE AREA (ACRES)
12"	0.5
18"	1.5
21"	2.5
24"	3.5
30"	5.0

Permanent improvements must be designed and installed if the drainage area is greater than 5 acres.

The following additional design criteria should be considered:

- Construct the pipe slope drain entrance of a standard flared end section with a minimum 6-inch metal toe plate to prevent runoff from undercutting the pipe inlet. The slope of the entrance is usually at least 3 percent.
- Thoroughly compact the soil around and under the pipe and entrance section.
- Securely fasten the slope drain sections together, have gasketed watertight fittings, and securely anchored into the soil.
- Secure the flared inlet section to the slope drain and have watertight connecting bands.
- Use interceptor dikes to direct runoff into a slope drain. The height of the dike should be at least 1 foot higher at all points than the top of the inlet pipe.
- If the pipe slope drain is conveying sediment-laden water, direct all flows into a sediment trap (ESC55) or sediment basin (ESC56).
- Unless the pipe directly enters a sediment trap/basin, stabilize the area below the outlet with a riprap apron.

Limitations
Installation is critical for effective use of the pipe slope drain to minimize potential gully erosion. Maximum drainage area per pipe slope drain is 5 acres. For larger areas use a paved chute, rock lined channel or additional pipes. (See the local municipality for drainage requirements)

- During large storms, pipe slope drains may become clogged or overcharged, forcing water around the pipe and causing extreme slope erosion.
- Structures for dissipation of high flow velocities at the pipe outlet must be constructed to avoid downstream erosion.
- Failure of this type of temporary structure may result in flooding and severe erosion.
- If the sectional downdrain is not sized correctly, the runoff can spill over the drain sides causing gully erosion, and potential failure of the structure.

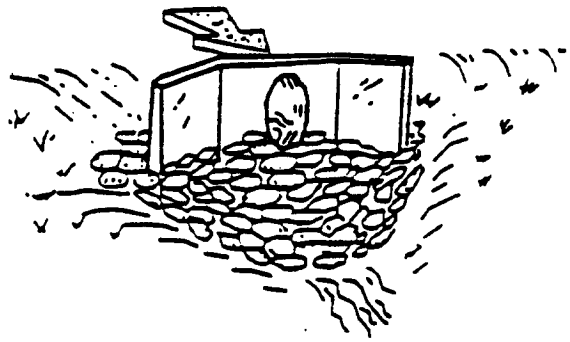
BMP: OUTLET PROTECTION



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas*
- *Protect Slopes/Channels* (●)
- *Control Site Perimeter*
- *Control Internal Erosion*

GENERAL DESCRIPTION

Rock outlet protection is a physical device composed of rock, grouted riprap, or concrete rubble which is placed at the outlet of a pipe to prevent scour of the soil caused by high pipe flow velocities, and to absorb flow energy to produce non-erosive velocities.

SUITABLE APPLICATIONS

- Wherever discharge velocities and energies at the outlets of culverts, conduits or channels are sufficient to erode the next downstream reach.
- Rock outlet protection is best suited for temporary use during construction because it is usually less expensive and easier to install than concrete aprons or energy dissipators.
- A sediment trap below the pipe outlet is recommended if runoff is sediment laden.
- Permanent rock riprap protection should be designed and sized by the engineer as part of the culvert, conduit or channel design.
- Grouted riprap should be avoided in areas of freeze and thaw because the grout will break up.

INSTALLATION/APPLICATION CRITERIA

Rock outlet protection is effective when the rock is sized and placed properly. When this is accomplished, rock outlets do much to limit erosion at pipe outlets. Rock size should be increased for high velocity flows. General recommendations for rock size and length of outlet protection mat are presented in the additional information sheet. Best results are obtained when sound, durable, angular rock is used. CalTrans Standard Specifications or the local municipality can provide additional specifications for constructing outlet protection devices.

REQUIREMENTS

- Maintenance
  - Inspect after each significant rain for erosion and/or disruption of the rock, and repair immediately.
  - Grouted or wire-tied rock riprap can minimize maintenance requirements.
- Cost
  - CalTrans Cost Schedule gives regional cost ranges.

LIMITATIONS

- Large storms often wash away the rock outlet protection and leave the area susceptible to erosion.
- Sediment captured by the rock outlet protection may be difficult to remove without removing the rock.
- Outlet protection may negatively impact the channel habitat.

ESC40

Best Management Practices

R0000573

Additional Information — Outlet Protection

Outlet protection is needed where discharge velocities and energies at the outlets of culverts, conduits or channels are sufficient to erode the immediate downstream reach. This practice protects the inlet or outlet from developing small eroded pools (plunge pools), and protects against gully erosion resulting from scouring at a culvert mouth.

Rock outlet protection is usually less expensive and easier to install than concrete aprons or energy dissipators. It also serves to trap sediment and reduce flow velocities.

As with most channel design projects, depth of flow, roughness, gradient, side slopes, discharge rate and velocity should be considered in the outlet design. Compliance to local and state regulations should also be considered while working in environmentally sensitive streambeds. General recommendations for rock size and length of outlet protection mat is shown in the rock outlet protection figure. Best results are obtained when sound, durable, angular rock is used. Rock depth and outlet protection length are governed by the discharge pipe size, but hydraulic calculations and velocities should be used to determine length. Your local municipality or CalTrans should be consulted for appropriate sizing criteria in your area.

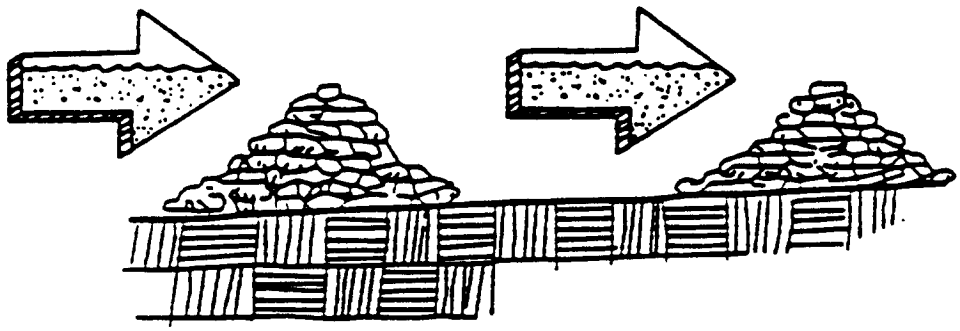
PIPE OUTLET CONDITIONS

BMP: CHECK DAMS



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Small temporary dams constructed across a swale or drainage ditch. Check dams reduce the velocity of concentrated stormwater flows, thereby reducing erosion of the swale or ditch, and promoting sedimentation behind the dam. If properly anchored, brush or rock filter berms (ESC53) may be used for check dams.

SUITABLE APPLICATIONS

- Used to prevent erosion by reducing the velocity of channel flow in small intermittent channels and temporary swales.
- May also promote sedimentation behind the dam, but should not be considered to be a primary sediment trapping device because subsequent storms will scour and resuspend much of the trapped sediment.

INSTALLATION/APPLICATION CRITERIA

- Check dams should be placed at a distance and height to allow small pools to form between each one.
- Backwater from a downstream check dam should reach the toe of the upstream check dam.
- Major floods (2 year storm or larger) should safely flow over the check dam without an increase in upstream flooding or destruction of the checkdam.
- Primarily used in small, steep channels where velocities exceed 2 fps.
- Used in steep terrain where velocity reduction is required.
- A deep sump may be provided immediately upstream of the check dam to capture excessive sediment.
- Check dams may be built of rocks or logs, which are secured against damage during significant floods.

REQUIREMENTS

- Maintenance
  - Inspect for sediment buildup behind the check dam and signs of erosion around the check dam after each rain.
  - Remove accumulated sediment whenever it reaches one-half the sump depth.
- Cost
  - See CalTrans Cost Schedule for regional cost data.

LIMITATIONS

- Use only in small open channels which drain 10 acres of less.
- Not to be used in live streams.
- Do not install in lined or vegetated channels.

ESC41

Best Management Practices

Additional Information — Check Dams

Check dams create small pools in swales and ditches which drain 10 acres or less. These pools reduce the velocity of storm water flows, thus reducing erosion of the swale/ditch. Sedimentation also occurs in these small pools, but probably results in little net sediment removal because of the small detention time and probable scour during longer storms. A sediment trap (ESC55) may be placed immediately upstream of the check dam to increase sediment removal efficiency (but never in a natural stream or channel). Check dams should not be placed in swales/ditches with a base flow during some or all of the year.

Installation/Application Criteria

Check dams must be sized and constructed correctly and maintained properly, or they will be either washed out or cause flooding. Check dams can be constructed of either rock or logs. Use of other natural materials available on-site that can withstand the stormwater flow velocities is acceptable, such as pea-gravel filled in sand bags. Check dams should not be constructed from straw bales or silt fences, since concentrated flows quickly wash out these materials.

A sediment trap (ESC55) may be installed immediately upstream of the check dam, but may be of limited effectiveness if channel flows are large enough to scour the trap during moderate to large storms. Maximum velocity reduction is achieved if the toe of the upstream dam is at the same elevation as the top of the downstream dam. The center section of the dam should be lower than the edge sections so that the check dam will act like a weir during major floods.

Rock check dams are usually constructed of appropriately 8"-12" rock. The rock is placed either by hand or mechanically, but never just dumped into the channel. The dam must completely span the ditch or swale to prevent washout. The rock used must be large enough to stay in place given the expected design flow through the channel.

Log check dams are usually constructed of 4 to 6-inch diameter logs. The logs should be embedded into the soil at least 18 inches.

If grass is planted to stabilize the ditch or swale, the check dam should be removed when the grass has matured (unless the slope of the swale is greater than 4 percent).

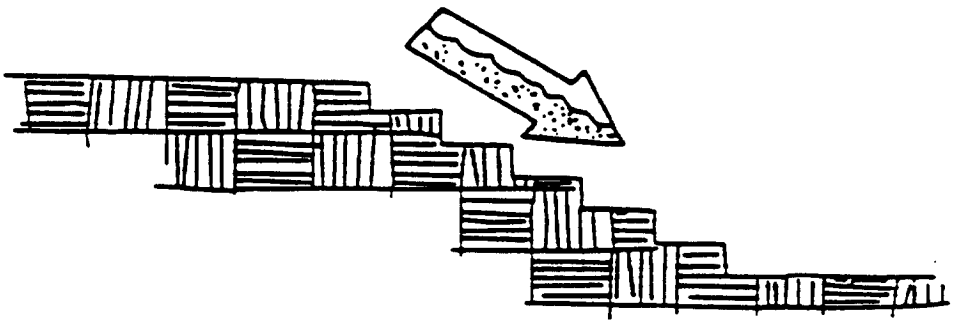
BMP: SLOPE ROUGHENING/TERRACING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DEFINITION

Slope roughening/terracing creates microclimates for establishing vegetation, reduces runoff velocity, increases infiltration, and provides small depressions for trapping sediment.

SUITABLE APPLICATIONS

- Any cleared area prior to seeding and planting.
- Required for cleared, erodible slopes steeper than 3:1 and higher than 5 feet prior to seeding and planting.

INSTALLATION/APPLICATION CRITERIA

Slope roughening/terracing is performed in several ways:

- Stair-step grading.
- Grooving.
- Furrowing.
- Tracking.
- Rough grading.
- No grading.

REQUIREMENTS

- Maintenance
  - Inspect roughened slopes weekly and after rainfall for excessive erosion.
  - Revegetate as quickly as possible.
- Cost (source: EPA, 1992)
  - Surface Roughening: Performed at no (e.g., rough grading) to low (e.g., tracking) cost.
  - Terracing: Average annual cost is $4 per linear foot (2 year useful life).

LIMITATIONS

- Roughening is of limited effectiveness on its own, but is used to speed revegetation.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Training
- ● Suitability for Slopes >5%

● High ○ Low

ESC42

Best Management Practices

R0000579

Additional Information — Slope Roughening/Terracing

Slope roughening/terracing creates uneven depressions, steps or grooves on the soil surface to aid in establishment of vegetation, reduce runoff velocity, increase infiltration, and provide for sediment trapping.

Surface roughening may be applied to all slopes steeper than 3:1, and greater than 5 vertical feet, providing some instant erosion protection on bare soil while vegetative cover is being established. It is an inexpensive, simple and short-term erosion control measure for roadway cut slopes.

Terracing usually is a more permanent measure used to stabilize a steep slope. Terraces should be designed by a registered professional engineer and included in the project construction plans. Local design criteria should be used.

Installation/Application

Graded areas with smooth, hard surfaces give a false impression of "finished grading" and a job well done. It is difficult to establish vegetation on such surfaces due to reduced water infiltration and the potential for erosion. Rough slope surfaces with uneven soil and rocks left in place may appear unattractive or unfinished at first, but they encourage water infiltration, speed the establishment of vegetation, and decreased runoff velocity. Rough, loose soil surfaces give lime, fertilizer, and seed some natural coverage. Niches in the surface provide microclimates which generally provide a cooler and more favorable moisture level than hard flat surfaces; this aids seed germination.

There are different methods for achieving a roughened soil surface on a slope, and the selection of an appropriate method depends upon the type of slope. Roughening methods include stair-step grading, grooving, and tracking. Factors to be considered in choosing a method are slope steepness, mowing requirements, and whether the slope is formed by cutting or filling.

1. Disturbed areas which will not require mowing may be stair-step graded, grooved, or left rough after filling.
2. Graded areas steeper than 3:1 should be stair-stepped with benches (See figure at end of fact sheet). The stair-steping will help vegetation become attached and also trap soil eroded from the slopes above. Stair-step grading is particularly appropriate in soils containing large amounts of soft rock. Each "step" catches material which sloughs from above, and provides a level site where vegetation can become established. Stairs should be wide enough to work with standard earth moving equipment.
3. Areas which will be mowed (there areas should have slopes less than 3:1) may have small furrows left by disking, harrowing, raking, or seed-planting machinery operated on the contour.
4. It is important to avoid excessive compacting of the soil surface when scarifying. Tracking with bulldozer treads is preferable to not roughening at all, but is not as effective as other forms of roughening, as the soil surface is severely compacted and runoff is increased. Tracking can be accomplished in a variety of ways, including "track walking," or driving a crawler tractor up and down the slope, in leaving a pattern of cleat imprints parallel to slope contours.

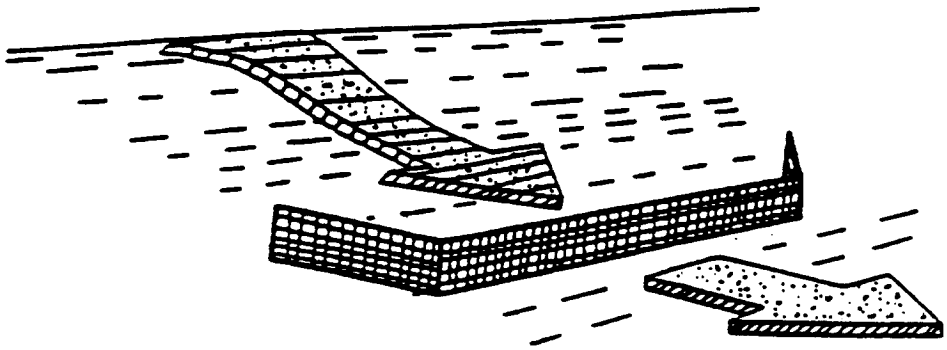
BMP: SILT FENCE



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DESCRIPTION

A silt fence is made of a filter fabric which has been entrenched, attached to supporting poles, and sometimes backed by a wire fence for support. The silt fence detains sediment-laden water, promoting sedimentation behind the fence.

SUITABLE APPLICATIONS

- Along the perimeter of the site.
- Below the toe of a cleared slope.
- Along streams and channels.
- Around temporary spoil areas.
- Across swales with catchments less than 1 acre.
- Below other small cleared areas.

INSTALLATION/APPLICATION

- Use principally in areas where sheet flow occurs.
- Install along a level contour, so water does not pond more than 1.5 feet at any point.
- No more than 1 acre, 100 ft., or 0.5 cfs of concentrated flow should drain to any point along the silt fence.
- Turn ends of fence uphill.
- Provide area behind the fence for runoff to pond and sediment to settle (approx. 1200 sq. ft. per acre draining to the silt fence).
- Select filter fabric which retains 85% of the soil, by weight, based on sieve analysis, but is not finer than an equivalent opening size of 70.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rainfall.
  - Repair wherever fence is damaged.
  - Remove sediment when it reaches 1/3 the height of the fence.
- Cost (source: EPA, 1992)
  - Average annual cost for installation and maintenance (assumes 6 month useful life): $7 per lineal foot ($850 per drainage acre)

LIMITATIONS

- Do not use where 85% of the soil, by weight, passes through a No. 200 sieve because the filter fabric will clog.
- Do not place fence on a slope, or across any contour line.
- Do not use in streams, channels, or anywhere flow has concentrated.
- Do not use in locations where ponded water may cause flooding.

Targeted Pollutants

- ● Sediment

ESC50

Best Management Practices

R0000582

Additional Information — Silt Fence

A silt fence is a temporary sediment barrier consisting of filter fabric stretched across and attached to supporting posts, entrenched, and, depending upon the strength of the fabric used, supported with wire fence. Silt fences trap sediment in two ways: (1) by intercepting and detaining small amounts of sediment from disturbed areas during construction operations in order to promote sedimentation behind the fence; and (2) by decreasing the velocity of low flows (up to 0.5 cfs) in swales.

Silt fences may be used for perimeter control, placed upstream of the point(s) of discharge of sheet flow from a site. They may also be used as interior controls below disturbed areas where runoff may occur in the form of sheet and rill erosion, and perpendicular to minor swales or ditch lines for up to one acre contributing drainage areas. Silt fences are generally ineffective in locations where the flow is concentrated and are only applicable for sheet or overland flows.

Installation/Application

Planning:

Silt fences are generally most effective when the following placement criteria are followed:

- Limit the upstream drainage area to 1 acre or less when used alone or in combination with sediment basin in a larger site.
- The maximum slope perpendicular to the fence line should be 1:1.
- Limit the maximum sheet or overland flow path length to any point along the fence to 100 feet.
- Limit the concentrated flows reaching the fence to 0.5 cfs.

Silt fences are preferable to straw barriers in many cases. Laboratory work at the Virginia Highway and Transportation Research Council has shown that silt fences can trap a much higher percentage of suspended sediments than can straw bales. While the failure rate of silt fences is lower than that of straw barriers, there are many instances where silt fences have been improperly installed. The following installation methods can improve performance and should be followed:

- Construct the silt fence along a level contour.
- Silt fences should remain in place until the disturbed area is permanently stabilized.
- Provide sufficient room for runoff to pond behind the fence and to allow sediment removal equipment to pass between the silt fence and toes of slopes or other obstructions. About 1200 sq. ft. of ponding area should be provided for every acre draining to the fence.
- Turn the ends of the filter fence uphill to prevent storm water from flowing around the fence.
- Leave an undisturbed or stabilized area immediately downslope from the fence.
- Do not place in live streams or intermittently flowing channels.

Design:

Selection of a filter fabric is based on soil conditions at the construction site (which affect the equivalent opening size (EOS) fabric specification) and characteristics of the support fence (which affect the choice of tensile strength). The designer should specify a filter fabric that retains the soil found on the construction site yet will have openings large enough to permit drainage and prevent clogging. The following criteria is recommended for selection of the equivalent opening size:

1. If 50 percent or less of the soil, by weight, will pass the U.S. standard sieve No. 200, select the EOS to retain 85 percent of the soil. The EOS should not be finer than EOS 70.
2. For all other soil types, the EOS should be no larger than the openings in the U.S. Standard Sieve No. 70 [0.0083 in. (0.21 mm.)] except where direct discharge to a stream, lake, or wetland will occur, then the EOS should be no larger than Standard Sieve No. 100.

ESC50

R0000583

Additional Information — Silt Fence

To reduce the chance of clogging, it is preferable to specify a fabric with openings as large as allowed by the criteria. No fabric should be specified with an EOS smaller than U.S. Standard Sieve No. 100 [0.0059 in. (0.15 mm.)]. If 85 percent or more of a soil, by weight, passes through the openings in a No. 200 sieve [0.0029 in. (0.074 mm.)], filter fabric should not be used. Most of the particles in such a soil would not be retained if the EOS was too large, and they would clog the fabric quickly if the EOS was small enough to capture the soil.

The fence should be supported by a wire mesh if the fabric selected does not have sufficient strength and bursting strength characteristics for the planned application (as recommended by the fabric manufacturer). Filter fabric material should contain ultraviolet ray inhibitors and stabilizers to provide a minimum of six months of expected usable construction life at a temperature range of 0° F. to 120° F.

Installation Guidelines:
Filter fences are to be constructed on a level contour. Sufficient area should exist behind the fence for ponding to occur without flooding or overtopping the fence.

- Posts should be spaced a maximum of 6 feet apart and driven securely into the ground a minimum of 30 inches.
- A trench should be excavated approximately 8 inches wide and 12 inches deep along the line of posts and upslope from the barrier.
- When standard strength filter fabric is used, a wire mesh support fence should be fastened securely to the upslope side of the posts using heavy-duty wire staples at least 1 inch long, tie wires or hog rings. The wire should extend into the trench a minimum of 4 inches.
- The standard strength filter fabric should be stapled or wired to the fence, and 40 inches of the fabric should extend into the trench. When extra-strength filter fabric and closer post spacing are used, the wire mesh support fence may be eliminated and the filter fabric stapled or wired directly to the posts.
- Avoid the use of joints. The filter fabric should be purchased in a continuous roll, then cut to the length of the barrier. When joints are necessary, filter cloth should be spliced together only at a support post, with a minimum 6 inch overlap, and both ends securely fastened to the post.
- The trench should be backfilled with compacted native material.

Requirements
Maintenance:

Inspect monthly during dry periods and immediately after each rainfall. Repair as necessary. Sediment must be removed when it reaches approximately one third the height of the fence, especially if heavy rains are expected.

Filter fences should not be removed until the upslope area has been permanently stabilized.

Limitations
- Filter fences will create a temporary sedimentation pond on the upstream side of the fence and may cause temporary flooding. Fences not constructed on a level contour will be overtopped by concentrated flow resulting in failure of the filter fence.
- Filter fences are not practical where large flows of water are involved, hence the need to restrict their use to drainage areas of one acre or less, and flow rates of less than 0.5 cfs.
- Problems may arise from incorrect selection of pore size and/or improper installation.
- Do not allow water depth to exceed 1.5 ft. at any point.
- Improperly installed fences are subject to failure from undercutting, overlapping, or collapsing.

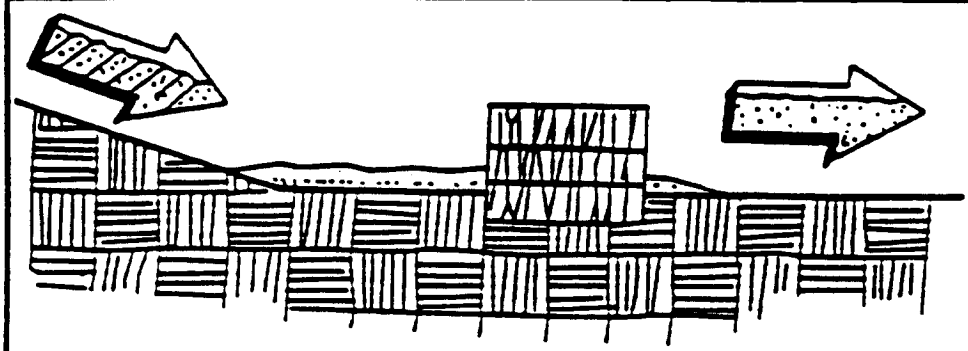
BMP: STRAW BALE BARRIERS



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- (Control Site Perimeter)
- (Control Internal Erosion)

GENERAL DEFINITION

A straw bale barrier consists of straw bales placed end to end along a level contour in a shallow trench and staked to hold them in place. The barrier detains runoff, creating a pond behind the barrier where sedimentation occurs.

SUITABLE APPLICATIONS

- Along the perimeter of the site.
- Along streams and channels.
- Across swales with small catchments.
- Around temporary spoil areas.
- Below other small, cleared areas.

INSTALLATION/APPLICATION CRITERIA

- Use primarily in areas where sheet or rill flow occurs.
- No more than 1/4 acre per 100 feet of barrier should drain to the barrier.
- Install along a level contour.
- Place in a 4-inch deep trench.
- Backfill and compact the excavated soil on the upstream face of the barrier.
- Secure each bale with two stakes.
- Leave enough area (about 1200 sq. ft. per acre) behind the barrier for runoff to pond (no more than 1.5 ft. depth) and sediment to settle.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Replace bales which have decomposed or whose bindings have broken.
  - Remove sediment behind the barrier when it reaches a depth of 6 inches.
- Costs (source: EPA, 1992)
  - Average annual cost for installation and maintenance (assumes 3 month useful life): $17 per lineal foot ($6,800 per drainage acre).

LIMITATIONS

- Straw bale barriers are not to be used for extended periods of time because they tend to rot and fall apart.
- Suitable only for sheet flow on slopes of 2% or flatter.
- Not appropriate for large drainage areas, limit to one acre or less.
- Straw bales lose their effectiveness rapidly due to rotting, thus constant maintenance is required.
- Not recommended for concentrated flow, inlet protection, channel flow, and live streams.
- Bale bindings of jute or cotton not recommended.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

● High ○ Low

ESC51

Best Management Practices

R0000587

BMP: STRAW BALE BARRIERS (Continue)

- Straw bale barriers have not been as effective as expected due to improper use. These barriers have been placed in streams and drainageways where runoff volumes and velocities have caused the barriers to wash out. In addition, failure to stake and entrench the straw bale has allowed undercutting and end flow.

ESC51

R0000588

Additional Information — Straw Bale Barrier

A straw bale barrier consists of a series of secured anchored bales placed to intercept sediment-laden runoff from small drainage areas of disturbed soil. The barrier ponds runoff and allow sediment to settle. Straw bale dikes should not be used for extended periods of time because they tend to rot and fall apart.

The straw bale barrier is used where there are no concentrations of water in a channel or drainageway, and where erosion would occur from sheet flow. These barriers are typically constructed below disturbed areas subject to sheet flow of runoff.

Installation/Application

Straw bale barriers should be used for drainage areas no more than 1/4 acre per 100 feet of barrier length, with no more than 100 ft upstream of any point along the barrier. The barrier should be placed along a level contour no greater than 2:1. When installed and maintained according to the guidelines on this fact sheet, straw bale dikes remove approximately 67% of the sediment transported in construction site runoff. This optimum efficiency can only be achieved through careful maintenance, with special attention to replacing rotted or broken bales. The barrier should be constructed on a level contour to prevent concentration of flow against a small portion of the barrier.

An effective straw bale barrier should be installed in the following manner:

1. Bales should be placed on the contour and in a row with ends tightly abutting the adjacent bales.
2. Leave area for runoff to pond upstream of the barrier by locating barrier away from the toe of slopes. This also provides access for maintenance.
3. Each bale should be embedded in the soil a minimum of (4) inches and placed so the bindings are horizontal. Bindings placed on soil will soon disintegrate and cause the barrier to fail.
4. Bales should be securely anchored in place by either two stakes or re-bars driven through the bale. The first stake in each bale should be driven toward the previously laid bale at an angle to force the bales together. Stakes should be driven flush with the bale.
5. Backfill and compact the excavated soil along the upstream face of the barrier.
6. Remove the barrier when it has served its usefulness so as not to block or impede storm flow or drainage.

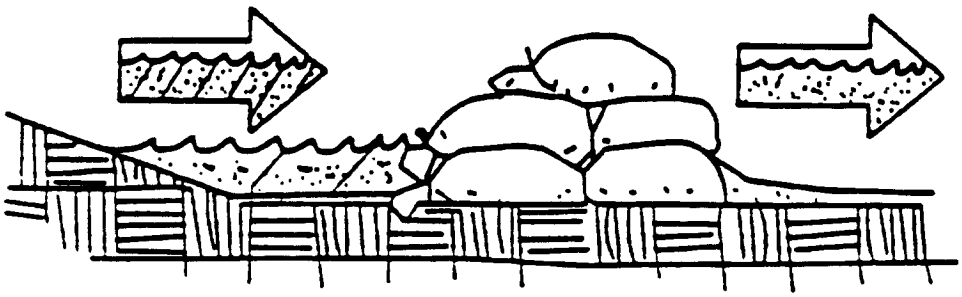
BMP: SAND BAG BARRIER



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DEFINITION

Stacking sand bags along a level contour creates a barrier which detains sediment-laden water, ponding water upstream of the barrier and promoting sedimentation.

SUITABLE APPLICATIONS

- Along the perimeter of the site.
- Check dams across streams and channels.
- Along streams and channels.
- Barrier for utility trenches in a channel.
- Across swales with small catchments.
- Division dike or berm.
- Below the toe of a cleared slope.
- Create a temporary sediment trap.
- Around temporary spoil areas.
- Below other small cleared areas.

INSTALLATION/APPLICATION CRITERIA

- May be used in drainage areas up to 5 acres.
- Install along a level contour.
- Base of sand bag barrier should be at least 48 inches wide.
- Height of sand bag barrier should be at least 18 inches high.
- 4 inch PVC pipe may be installed between the top layer of sand bags to drain large flood flows.
- Provide area behind barrier for runoff to pond and sediment to settle, size according to sediment trap BMP criteria (ESC55).
- Place below the toe of a slope.
- Use sand bags large enough and sturdy enough to withstand major flooding.

REQUIREMENTS

- Maintenance
  - Inspect after each rain.
  - Reshape or replace damaged sand bags immediately.
  - Remove sediment when it reaches six inches in depth.
- Cost
  - Sand bag barriers are more costly, but typically have a longer useful life than other barriers.

LIMITATIONS

- Sand bags are more expensive than other barriers, but also more durable.
- Burlap should not be used for sand bags.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

● High ○ Low

ESC52

Best Management Practices

Additional Information — Sand Bag Barrier

Suitable Applications

Sand bag berms may be used during construction activities in stream beds and utility construction in channels, temporary channel crossing for construction equipment, etc. Sand bag berms may also be installed parallel to roadway construction. Sand bag berms may also be used to create temporary sediment traps, retention basins and in place of straw bales or silt fences. Examples of applications include:

- Check dams across stream channels.
- Barriers for utility trenches or other construction in a stream channel.
- At temporary channel crossings.
- May be used on a slope where straw bales and silt fences are not appropriate.
- As a diversion dike.
- Embankment for a temporary sediment basin or retention basin.
- Sediment barriers near the toe of slopes.
- At construction perimeter.

Advantages

- Provides a semi-permeable barrier in potentially wet areas.
- More permanent than silt fences or straw bales.
- Allows for easy relocation on site to meet changing needs during construction.

Installation/Application

Sand bag barriers may be used for sediment trapping in locations where silt fences and straw bale barriers are not strong enough. In addition, sand bag barriers are appropriate to use when construction of check dams or sumps in a stream is undesirable. The sand bag berms can provide the same function as a check dam without disturbing the stream or vegetation. The sand bag berm will also allow a small sediment retention area to be created prior to construction of final detention basins. For installation of a sand bag berm, the following criteria should be observed:

- Drainage Area - Up to five (5) acres.
- Height of Berm - 18 inches minimum height, measured from the top of the existing ground at the upslope toe to the top of the barrier.
- Width of Berm - 48 inches minimum width measured at the bottom of the barrier; 18 inches at the top.
- Sand bag Size - Length 24 to 30 inches, width 16 to 18 inches and thickness six (6) to eight (8) inches. Weight 90 to 125 pounds.
- Sand bag Material - Polypropylene, polyethylene or polyamide woven fabric, minimum unit weight four (4) ounces per square yard, mullen burst strength exceeding 300 psi and ultraviolet stability exceeding 70 percent. Use of burlap is discouraged since it rots and deteriorates easily.
- Grade of Sand - Coarse sand, gravel.
- Runoff water should be allowed to flow over the tops of the sand bags or through four (4) inch polyvinyl chloride pipes embedded below the top layer of bags.
- Area behind the sand bag barrier should be established according to sizing criteria for sediment trap BMP (ESC55).

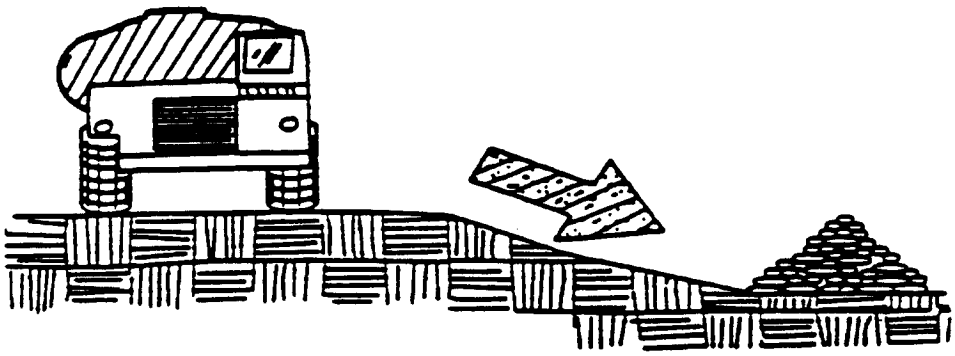
BMP: BRUSH OR ROCK FILTER



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas*
- *Protect Slopes/Channels* (●)
- *Control Site Perimeter* (●)
- *Control Internal Erosion* (●)

GENERAL DEFINITION

A rock filter berm is made of rock 3/4 to 3 inches in diameter and placed along a level contour where sheet flow may be detained and ponded, promoting sedimentation. A brush barrier is composed of brush (usually obtained during the site clearing) wrapped in filter cloth and anchored to the toe of the slope. If properly anchored brush or rock filters may be used for sediment trapping and velocity reduction. See Check Dam BMP (ESC41) for more information.

SUITABLE APPLICATIONS

- As check dams across mildly sloped construction roads.
- Below the toe of slopes.
- Along the site perimeter.
- Along streams and channels.
- Around temporary spoil areas.
- Below other small cleared areas.
- At sediment traps at culvert/pipe outlets.

INSTALLATION/APPLICATION CRITERIA

- Use principally in areas where sheet or rill flow occurs.
- For rock filter, use larger rock and place in a staked, woven wire sheathing if placed where concentrated flows occur.
- Install along a level contour.
- Leave area behind berm where runoff can pond and sediment can settle.
- Drainage area should not exceed 5 acres.

REQUIREMENTS

- Maintenance
  - Inspect monthly and after each rainfall.
  - If berm damaged, reshape and replace lost/dislodged rock.
  - Remove sediments when depth reaches 1/3 of berm height, or 1 ft.
- Cost
  - Brush filter: Low to moderate cost if debris from on-site clearing and grubbing is used.
  - Rock filter: Expensive, since off-site materials, hand construction and demolition/ removal are usually required.

Targeted Pollutants

- ● *Sediment*
- ○ *Nutrients*
- ○ *Toxic Materials*
- ○ *Oil & Grease*
- ○ *Floatable Materials*
- ○ *Other Construction Waste*

ESC53

Best Management Practices

R0000594

BMP: BRUSH OR ROCK FILTER (Continue)

LIMITATIONS

- Rock berms may be difficult to remove.
- Removal problems limit their usefulness in landscaped areas.
- Not appropriate for drainage areas greater than 5 acres.
- Runoff will pond upstream of the filter, possibly causing flooding if sufficient space does not exist.

ESC53

R0000595

Additional Information — Brush or Rock Filter

Rock Filter

A rock filter consists of open graded rock installed at the toe of a slope, along the perimeter of a developing or disturbed area, and as a checkdam across construction roads. Their purpose is to intercept sediment laden runoff from disturbed areas of the site, allow the runoff to pond, promote sedimentation behind the filter, and slowly release the water as sheet flow.

Rock filters are appropriate where a temporary measure is needed to prevent sediments from entering right-of-ways of traffic areas such as near the toe of slopes, incorporated into temporary stabilized construction entrances (ESC 26), or at other locations along the construction site perimeter. Rock filters may also be used as check dams across one or more lanes of construction traffic temporary roads, or unsurfaced rights of way subject to construction traffic.

Advantages of the rock filters are that they may be less costly than other temporary barriers, and are relatively efficient at sediment removal.

Installation/Application:

Planning:

- Rock filters should be placed along a level contour to intercept sheet flow.
- Allow ample room for ponding, sedimentation, and access by sediment removal equipment between the berm and the toes of slopes.
- Flow through the filter should occur as sheet flow into an undisturbed or stabilized area.
- Installation in stream beds requires large rock, staking of woven wire sheathing, and daily inspection.

Design & Sizing Criteria:

The following design criteria are commonly used to construct filters:

- In Non-Traffic Areas:
  - Maximum flow-through rate per square foot of filter = 60 gpm
  - Height = 18 inches minimum
  - Top width = 24 inches minimum
  - Side slopes = 2:1 or flatter
  - Woven wire sheathing (poultry netting) is recommended in areas of concentrated flow. The wire should be 1 inch diameter hexagonal mesh, galvanized 20 gauge.
  - Build the filter along on a level contour.
  - Rock: 3/4 to 3 inches open graded for sheet flow, 3 to 5 inches open graded for concentrated flow.

- In Construction Traffic Areas:
  - Height = 12" maximum
  - Provide multiple filters in series, spaced as shown.
    Every 300 ft on slopes less than 5 percent
    Every 200 ft on slopes 5 to 10 percent
    Every 100 ft on slopes greater than 10 percent.

Brush Filter

Brush filters trap and filter sediments in a manner similar to other barriers in this handbook (e.g., silt fence, straw bale barrier, rock filter), but have the advantage of being constructed from brush cleared from the site and usually disposed off-site at a cost.

ESC53

R0000596

Additional Information — Brush or Rock Filter

Steps in Construction of a Brush Filter:

1. Stack the brush at the toe of a slope or along the perimeter of the site just outside the limits of clearing and grabbing. The brush may be stacked up to 15 ft. high and 15 ft. wide.
2. Construct a trench 1 to 3 ft. deep immediately upslope from the brush.
3. Place filter fabric over the brush filter and in the trench, extending 1 to 2 ft. upslope of the trench.
4. Backfill the trench with aggregate or compacted soil. The trench should be deep enough and backfill material sufficient to hold the barrier in place during a storm.

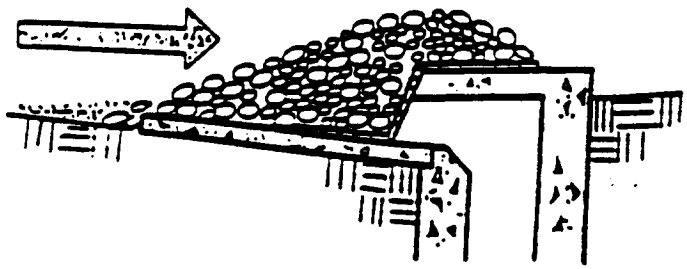
BMP: STORM DRAIN INLET PROTECTION



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas*
- *Protect Slopes/Channels*
- *Control Site Perimeter*
- *Control Internal Erosion*

GENERAL DEFINITION

Devices of various designs which detain sediment-laden runoff and allow the sediment it to settle prior to discharge into a storm drain inlet or catch basin.

SUITABLE APPLICATIONS

- Every storm drain inlet receiving sediment-laden runoff should be protected, either by covering the inlet or promoting sedimentation upstream of the inlet.

INSTALLATION/APPLICATION

- Five types of inlet protection are presented below, however, it is recognized that other effective methods and proprietary device, exist and may be selected:
  - Filter Fabric Fence: Appropriate for drainage basins less than one acre with less than a 5 percent slope.
  - Block and Gravel Filter: Appropriate for flows greater than 0.5 cfs.
  - Gravel and Wire Mesh Filter: Used on curb or drop inlets where construction equipment may drive over the inlet.
  - Sand bag barrier: Used to create a small sediment trap upstream of inlets on sloped, paved streets.
  - Excavated Drop Inlet Sediment Trap: An excavated area around the inlet to trap sediment (see Sediment Trap ESC 55).
- Select the appropriate type of inlet protection and design as referred to or as described in this fact sheet.
- Use only for drainage areas smaller than one acre unless a sediment trap first intercepts the runoff.
- Provide area around the inlet for water to pond without flooding structures and property.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Replace clogged filter fabric or stone filters immediately.
  - Remove sediment when depth exceeds half the height of the filter, or half the depth of the sediment trap.
  - Remove as soon as upstream soils are stabilized and streets are swept.
- Cost (source: EPA, 1992)
  - Average annual cost for installation and maintenance (1 year useful life) is $150 per inlet.

Best Management Practices

BMP: STORM DRAIN INLET PROTECTION (Continue)

LIMITATIONS

- Drainage area should not exceed 1 acre.
- Runoff will bypass protected inlets on slopes.
- Ponding will occur at a protected inlet, with possible short-term flooding.
- Straw bales are <u>not</u> effective for inlet protection.

R0000600

ESC54

Additional Information — Storm Drain Inlet Protection

Storm drain inlet protection consists of a sediment filter or an impounding area around or upstream of a storm drain, drop inlet, or curb inlet. This erosion and sedimentation control BMP prevents excessive sediment from entering storm drainage systems prior to permanent stabilization of the disturbed area.

All on-site storm drain inlets should be protected. Off-site, inlets should be protected in areas where construction activity tracks sediment onto paved areas or where inlets receive runoff from disturbed areas.

Installation/Application Criteria

Planning

Large amounts of sediment may enter the storm drain system when storm drains are installed before the upslope drainage area is stabilized, or where construction is adjacent to an existing storm drain. In cases of extreme sediment loading, the storm drain itself may clog and lose a major portion of its capacity. To avoid these problems, it is necessary to prevent sediment from entering the system at the inlets.

Inlet control measures presented in this handbook should not be used for inlets draining more than one acre. Runoff from larger disturbed areas should be first routed through a Temporary Sediment Trap (see ESC 56). Different types of inlet protection are appropriate for different applications depending on site conditions and the type of inlet. Inlet protection methods not presented in this handbook should be approved by the local storm water management agency.

General Design and sizing criteria:

- Grates and spaces around all inlets should be sealed to prevent seepage of sediment-laden water.
- Excavate sediment sumps (where needed)1 to 2 feet with 2:1 side slopes around the inlet.

Installation procedures for filter fabric fence:

a. Place 2 inch by 2 inch wooden stakes around the perimeter of the inlet a maximum of 3 feet apart and drive them at least 8 inches into the ground. The stakes must be at least 3 feet long.
b. Excavate a trench approximately 8 inches wide and 12 inches deep around the outside perimeter of the stakes.
c. Staple the filter fabric (for materials and specifications, see Silt Fence ESC 50) to wooden stakes so that 32 inches of the fabric extends out and can be formed into the trench. Use heavy-duty wire staples at least one inch in length.
d. Backfill the trench with 3/4 inch or less washed gravel all the way around.

Installation procedure for block and gravel filter:

a. Place hardware cloth or comparable wire mesh with one-half inch openings over the drop inlet so that the wire extends a minimum of 1 foot beyond each side of the inlet structure. If more than one strip is necessary, overlap the strips. Place filter fabric over the wire mesh.
b. Place concrete blocks lengthwise on their sides in a single row around the perimeter of the inlet, so that the open ends face outward, not upward. The ends of adjacent blocks should abut. The height of the barrier can be varied, depending on design needs, by stacking combinations of blocks that are 4 inches, 8 inches, and 12 inches wide. The row of blocks should be at least 12 inches but no greater than 24 inches high.
c. Place wire mesh over the outside vertical face (open end) of the concrete blocks to prevent stone from being washed through the blocks. Use hardware cloth or comparable wire mesh with one half inch openings.
d. Pile washed stone against the wire mesh to the top of the blocks. Use 3/4 to 3 inch gravel.

Installation procedure for gravel and wire mesh filters:

a. Place wire mesh over the drop inlet so that the wire extends a minimum of 1 foot beyond each side of the inlet structure. Use hardware cloth or comparable wire mesh with one-half inch openings. If more than one strip of mesh is necessary, overlap the strips. Place filter fabric over wire mesh.

ESC54

R0000601

Additional Information — Storm Drain Inlet Protection

b. Place 3/4 to 3 inch gravel over the filter fabric/wire mesh. The depth of the gravel should be at least 12 inches over the entire inlet opening (see attached figure).

Installation procedure for sand bag barrier:

a. Use sand bag made of geotextile fabric (not burlap), and fill with 3/4 in. rock or 1/4 in. pea gravel.
b. Construct on gently sloping street.
c. Leave room upstream of barrier for water to pond and sediment to settle.
d. Place several layers of sand bags—overlapping the bags and packing them tightly together.
e. Leave gap of one bag on the top row to serve as a spillway. Flow from a severe storm (e.g., 10-year storm) should not overtop the curb.

Maintenance Requirements

- For filter fabric fences: Inspections should be made on a regular basis, especially after large storm events. If the fabric becomes clogged, it should be replaced. Sediment should be removed when it reaches approximately one-half the height of the fence. If a sump is used, sediment should be removed when it fills approximately one-half the depth of the hole.
- For gravel filters: If the gravel becomes clogged with sediment, it must be carefully removed from the inlet, and either cleaned or replaced. Since cleaning gravel at a construction site may be difficult, use the sediment-laden stone instead as fill and put fresh stone around the inlet.
- The inlet protection should be removed 30 days after the upslope area has been fully stabilized. Any sediment around the inlet must be carefully removed and disposed.

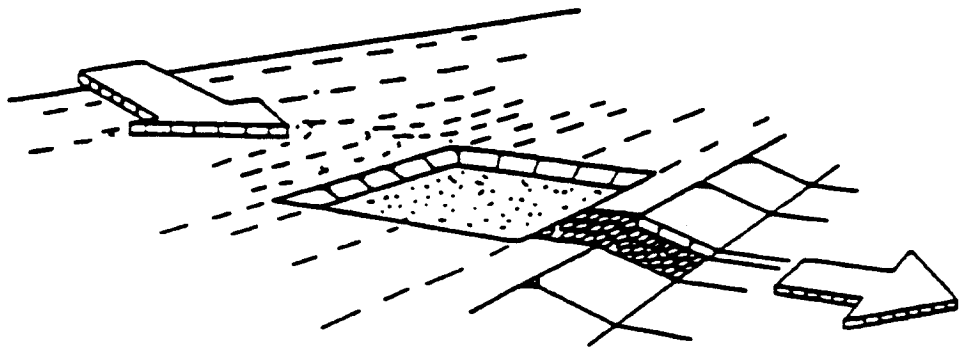
BMP: SEDIMENT TRAP



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabalize Disturbed Areas*
- *Protect Slopes/Channels*
- *Control Site Perimeter*
- *Control Internal Erosion*

GENERAL DEFINITION

A sediment trap is a small, excavated or bermed area where runoff from small drainage areas is detained and sediment can settle.

SUITABLE APPLICATIONS

- Any disturbed area less than 5 acres. (Sediment Basins, ESC56, must be used for drainage areas greater than 5 acres).
- Along the perimeter of the site at locations where sediment-laden runoff is discharged off-site.
- Around and/or upslope from storm drain inlet protection measures.
- At any point within the site where sediment-laden runoff can enter stabilized or natural areas or waterways.

INSTALLATION/APPLICATION CRITERIA

- Build outside the area to be graded before clearing, grubbing, and grading begin.
- Locate where the trap can be easily cleared of sediment.
- Trap size depends on the type of soil, size of the drainage area, and desired sediment removal efficiency.
- The larger the trap, the less frequently sediment must be removed.
- The outlet of the trap must be stabilized with rock, vegetation, or another suitable material.
- A stable emergency spillway must be installed to safely convey major floods (see your local flood control agency).

REQUIREMENTS

- Maintenance
  - Remove sediment when the sediment storage zone is no more than 1 ft. from being full.
  - Inspect weekly and after each rain.
- Cost (source: EPA, 1992)
  - Average annual cost per installation and maintenance (18 month useful life) is $0.70 per $ft.^3$ ($1,300 per drainage acre).

LIMITATIONS

- Only use for drainage areas up to 5 acres (see Sedimentation Basin BMP ST8 for larger areas).
- Only removes coarse sediment (medium silt size and larger) unless sized like a sedimentation basin.

Additional Information — Sediment Trap

A sediment trap is a small temporary ponding area, usually with a gravel outlet, formed by excavation and/or by constructing an earthen embankment. Its purpose is to collect and store sediment from sites cleared and/or graded during construction. It is intended for use on small drainage areas, with no unusual drainage features, and projected for a quick build-out time. It should help in removing coarse sediment from runoff. The trap is a temporary measure with a design life of approximately 6 months, and is to be maintained until the site area is permanently protected against erosion by vegetation and/or structures.

Application Criteria

Planning:

Sediment traps should be used only for small drainage areas. If the contributing drainage area is greater than 5 acres, refer to Sediment Basins (ST8), or subdivide the catchment area into smaller drainage basins.

Sediment usually must be removed from the trap after each rainfall event. The SWPPP should detail how this sediment is to be disposed of, such as for in fill areas on-site, or removal to an approved off-site dump. Sediment traps used as a perimeter control should be installed before any land disturbance takes place in the drainage area.

Sediment traps are usually small enough that a failure of the structure would not result in a loss of life, damage to home or buildings, or interruption in the use of public roads or utilities. Also, sediment traps are attractive to children and can be dangerous. The following recommendations should be implemented to reduce risks.

1. Install continuous fencing around the sediment trap or pond. Consult local ordinances regarding requirements for maintaining health and safety.
2. Restrict basin side slopes to 3:1 or flatter.

Design:

Sediment trap size depends on the type of soil, size of the drainage area, and desired sediment removal efficiency (see Sedimentation Basin ESC56). As a rule of thumb, the larger the basin volume the greater the sediment removal efficiency. Sizing criteria are typically established under the local grading ordinance or equivalent. The runoff volume from a two-year, 24-hour storm is a common design criteria for sedimentation trap. The sizing criteria below assume that this runoff volume is 0.042 ac-ft/ac (0.5 inches of runoff). While the climatic, topographic, and soil type extremes make it difficult to establish a statewide standard, the following criteria should trap moderate to high amounts of sediment in most areas of California.

- Trap settling volume at least 67 cu. yd. per acre.
- Trap sediment storage volume at least 33 cu. yd. per acre (note: the larger this volume, the less frequently the trap must be cleaned out).
- Trap length greater than twice the basin width.
- Flood volume large enough to contain a major flood without upstream damage and overtopping the embankment.

Installation

Sediment traps can be constructed by excavating a depression in the ground or creating an impoundment with a barrier or low-head dam. Sediment traps should be installed outside the area being graded and should be built prior to the start of the grading activities or removal of vegetation. To minimize the area disturbed by them, sediment traps should be installed in natural depressions or in small swales or drainageways. The following steps must be followed during installation.

1. The area under the embankment must be cleared, grubbed, and stripped of any vegetation and root mat. The pool area should be cleared.
2. The fill material for the embankment must be free of roots or other woody vegetation as well as oversized stones, rocks, organic material, or other objectionable material. The embankment may be compacted by traversing with equipment while it is being constructed.

ESC55

R0000608

Additional Information — Sediment Trap

3. The trap is removed and the area stabilized when the upslope drainage area has been properly stabilized.
4. All cut-and-fill slopes should be 3:1 or flatter.
5. When a riser is used, all pipe joints must be watertight.
6. When a riser is used, at least the top two-thirds of the riser shall be perforated with 1/2-inch diameter holes spaced 8 inches vertically and 10 to 12 inches horizontally. (See Sediment Basin, ESC56)
7. When an earth or stone outlet is used, the outlet crest elevation should be at least 1 foot below the top of the embankment.
8. When a crushed stone outlet is used, the crushed stone used in the outlet should meet AASHTO M43, size No. 2 or 24, or its equivalent such as MSHA No. 2. Gravel meeting the above gradation may be used if crushed stone is not available.

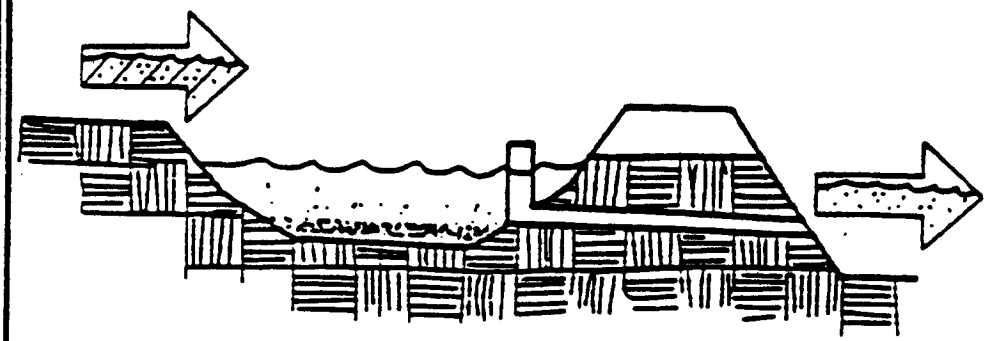
BMP: SEDIMENT BASIN



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabalize Disturbed Areas*
- *Protect Slopes/Channels*
- *Control Site Perimeter*
- *Control Internal Erosion* (●)

GENERAL DEFINITION

A pond created by excavation or constructing an embankment, and designed to retain or detain runoff sufficiently to allow excessive sediment to settle.

SUITABLE APPLICATIONS

- At the outlet of all disturbed watershed 10 acres or larger.
- At the outlet of smaller disturbed watersheds, as necessary.
- Where post construction detention basins will be located.
- Should be used in association with dikes, temporary channels, and pipes used to divert disturbed areas into the basin and undisturbed areas around the basin.

INSTALLATION/APPLICATION

- Construct before clearing and grading work begins.
- Do not locate in a stream.
- All basin sites should be located where failure of the embankment would not cause loss of life/property damage.
- Large basins are subject to state/local dam safety requirements.
- Securely anchor and install an anti-seep collar on the outlet pipe/riser, and provide an emergency spillway for passing major floods (see local flood control agency).
- The basin volume should be sized to capture runoff from a 2-year, 24-hour storm, or other appropriate design storms specified by the local agency. A detention time of 24 to 40 hours should allow 70 to 80 percent of sediment to settle.
- The basin volume consists of two zones:
  - A sediment storage zone at least 1 foot deep.
  - A settling zone at least 2 feet deep.
- The length to settling depth ratio (L/SD) should be less than 200.
- The length to width ratio should be greater than 6:1, or baffles are required to prevent short circuiting.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Remove sediment where the sediment storage zone is half full.
- Cost: Average annual cost for installation and maintenance (2 year useful life, source: EPA, 1992)
  - Basin less than 50,000 $ft.^3$: $0.40 per $ft.^3$ ($700 per drainage acre)
  - Basin size greater than 50,000 $ft.^3$: $0.20 per $ft.^3$ ($350 per drainage acre)

ESC56

Best Management Practices

R0000610

BMP: SEDIMENT BASIN (Continue)

LIMITATIONS

- The basin should have shallow side slopes (minimum 4:1) or be fenced to prevent drowning.
- Sites with very fine sediments (fine silt and clay) may require longer detention times for effective sediment removal.
- Basins in excess of 25 feet height and/or an impounding capacity of 50 ac. ft. must obtain approval from Division of Safety of Dams.
- Standing water may cause mosquitos or other pests to breed.
- Basins in excess of certain depth and storage volume criteria must meet State Division of Safety of Dams (DSOD) and local safety requirements.

R0000611

ESC56

Additional Information — Sediment Basin

A sediment basin is a controlled storm water release structure formed by excavation or by constructing an embankment of compacted soil across a drainageway, or other suitable location. Its purpose is to collect and store sediment from sites cleared and/or graded during construction or for extended periods of time before reestablishment of permanent vegetation and/or construction of permanent drainage structures. It is intended to trap sediment before it leaves the construction site. The basin is a temporary measure (with a design life of 12 to 18 months) and is to be maintained until the site area is permanently protected against erosion or a permanent detention basin is constructed.

Sedimentation basins are suitable for nearly all types of construction projects. Whenever possible, construct the sedimentation basins before clearing and grading work begins.
Basins should be located at the stormwater outlet from the site, but not in any natural or undisturbed stream. A typical application would include temporary dikes, pipes, and/or channels to divert runoff to the basin inlet.

Many development projects in California will be required by local ordinances to provide a storm water detention basin for post-construction flood control, desiltation, or storm water pollution control. A temporary sediment basin may be constructed by rough grading the post-construction control basins early in the project.

Sediment basins trap 70-80 percent of the sediment which flows into them if designed according to this handbook. Therefore, they should be used in conjunction with erosion control practices such as temporary seeding, mulching, diversion dikes, etc., to reduce the amount of sediment flowing into the basin.

Installation/Application Criteria
Planning:
To improve the effectiveness of the basin, it should be located to intercept runoff from the largest possible amount of disturbed area. The best locations are generally low areas below disturbed areas. Drainage into the basin can be improved by the use of diversion dikes and ditches. The basin must not be located in a stream but should be located to trap sediment-laden runoff before it enters the stream. The basin should not be located where its failure would result in the loss of life or interruption of the use or service of public utilities or roads.

Design:
- The sedimentation basin volume consists of two zones:
  - The sediment storage zone (at least 1 foot in depth).
  - A settling zone at least 2 feet in depth.
- The sedimentation basin may be formed by partial excavation and/or by construction of a compacted embankment. It may have one or more inflow points.
- A securely anchored riser pipe with an anti-seep collar is the principal outlet, along with an emergency overflow spillway. A solid riser pipe with two 1-inch diameter dewatering holes located at the top of the sediment storage volume on opposite sides of the riser pipe usually provides sufficient detention time for basins draining about 10 acres. Rock, rip-rap, or other suitable outlet protection is provided to reduce erosion at the riser pipe outlet.
- Settling Zone Volume

ESC56

R0000612

Additional Information — Sediment Basin

The settling zone volume is determined by the following equation:

$$(V) = 1.2(SD)Q / V_{SED}$$

Q = design inflow based on the peak discharge from a specified design storm (e.g., a 2-year, 24-hour duration design storm event) from the tributary drainage area as computed using the methods required by the local flood control agency. Provide a minimum of 67 cubic yards of settling volume per acre of drainage if a design storm is not specified.

V_{SED} = the settling velocity of the design soil particle. The design particle chosen is medium silt (0.02 mm). This has a settling velocity (V_{SED}) of 0.00096 ft/sec. As a general rule it will not be necessary to design for a particle of size less than 0.02 mm, especially since the surface area requirement increases dramatically for smaller particle sizes. For example, a design particle of 0.01 mm requires about three times the surface area of 0.02 mm. Note also that choosing V_{SED} of 0.00096 ft/sec equates to a surface area (SA) of 1250 sq. ft. per cfs of inflow.

SD = settling depth, which should be at least 2 ft., and no shallower than the average distance from the inlet to the outlet of the pond (L) divided by 200 (i.e., SD > L/200).

Total sediment basin volume and dimension are determined as outlined below:

a. The details shown in the attached figure may be useful in designing the sediment basin.
b. Determine basin geometry for the sediment storage volume calculated above using a minimum of 1 ft depth and 3:1 side slopes from the bottom of the basin. Note, the basin bottom is level.
c. Extend the basin side slopes (at 3:1 max.) as necessary to obtain the settling zone volume as determined above.
d. Adjust the geometry of the basin to effectively combine the settling zone volume and sediment storage volumes while preserving the depth and side slope criteria.
e. Provide an emergency spillway with a crest elevation one foot above the top of the riser pipe.
f. The ratio between the basin length and width of the pond should either be greater than 6:1, or baffles should be installed to prevent short-circuiting.

Limitations

Sediment traps and ponds must be installed only within the property limits. Failure of the structure must not result in loss of life, damage to homes or buildings, or interruption of use or service of public roads or utilities. Also, sediment traps and ponds are attractive to children and can be very dangerous. Local ordinances regarding health and safety must be adhered to. If fencing of the pond is required, the type of fence and its location shall be shown in the SWPPP and in the construction specifications.

- Generally, temporary sedimentation ponds are limited to drainage of 5 acres or more.
- Sediment ponds may be capable of trapping smaller sediment particles if additional detention time is provided. However, they are most effective when used in conjunction with other BMPs such as seeding or mulching.
- Ponds may become an "attractive nuisance" and care must be taken to adhere to all safety practices.
- Sediment ponds designed according to this handbook are only practically effective in removing sediment down to about the medium silt size fraction. Sediment-laden runoff with smaller size fractions (fine silt and clay) will pass through untreated emphasizing the need to stabilize the soil quickly.

CONSTRUCTION SITE INSPECTION CHECKLIST

Inspected By: _____

Project: _____

Contractor: _____

Date: _____

Check "Yes" or "No" or "N/A" if not applicable.

YES	NO	N/A		
_____	_____	_____	1.	Has there been rain at the site since the last inspection?
_____	_____	_____	2.	Are all sediment barriers (e.g., sandbags, straw bales, and silt fences) in place in accordance with the Plan and are they functioning properly?
_____	_____	_____	3.	If present, are all exposed slopes protected from erosion through the implementation of acceptable soil stabilization practices?
_____	_____	_____	4.	If present, are all sediment traps/basins installed and functioning properly?
_____	_____	_____	5.	Are all material handling and storage areas reasonably clean and free of spills, leaks, or other deleterious materials?
_____	_____	_____	6.	Are all equipment storage and maintenance areas reasonably clean and free of spills, leaks, or any other deleterious materials?
_____	_____	_____	7.	Are all materials and equipment properly covered?
_____	_____	_____	8.	Are all external discharge points (i.e., outfalls) reasonably free of any noticeable pollutant discharges?
_____	_____	_____	9.	Are all internal discharge points (i.e., storm drain inlets) provided with inlet protection?

R0000617

Check "Yes" or "No" or "N/A" if not applicable.

YES	NO	N/A		
_____	_____	_____	10	Are all external discharge points reasonably free of any significant erosion or sediment transport?
_____	_____	_____	11.	Are all BMPs identified on the Plan installed in the proper locations and according to the specifications for the Plan?
_____	_____	_____	12.	Are all structural control practices in good repair and maintained in functional order?
_____	_____	_____	13.	Are all on-site traffic routes, parking, and storage of equipment and supplies restricted to areas designated in the Plan for those uses?
_____	_____	_____	14.	Are all locations of temporary soil stockpiles or construction materials in approved areas and properly contained?
_____	_____	_____	15.	Are all seeded or landscaped areas properly maintained?
_____	_____	_____	16.	Are sediment controls in place at discharge points from the site?
_____	_____	_____	17.	Are slopes free of significant erosion?
_____	_____	_____	18	Are all points of ingress and egress from the site provided with stabilized construction entrances?
_____	_____	_____	19.	Is sediment, debris, or mud being cleaned from public roads at intersections with site access roads?
_____	_____	_____	20.	Does the Plan reflect current site conditions?

If you answered "no" to any of the above questions (except Number 1), describe any corrective action(s) that must be taken to remedy the problem and when the corrective action is to be completed:

Checklist Item	Corrective Action(s) Needed	Date to be Completed

R0000618

INSPECTION LOG

The site shall be inspected before and after storm events with 0.25 inches or greater predicted or actual precipitation, and documented on the Construction Site Inspection Checklist Form. Incidents of noncompliance must be reported to the Engineer. A log of all inspections, as shown below, shall be kept current.

Date	Inspector	Type of Inspection			Observations (If post-storm inspection, note size of storm in inches)
		Routine	Pre-Storm	Post-Storm

Appendix J
Employee Training Guidance

Appendix J
Employee Training Guidance

The following guidance may be used to develop and implement a development construction employee training program:

- Identify all appropriate departments and employees who should receive training. Appropriate departments and employees are those involved in administration, inspection, and enforcement of building and grading permits.
- Develop a training program that describes general storm water program requirements and that establishes the relationship between construction site activities and conditions and the potential for storm water pollution or non-storm water discharges to the storm drain system and the associated impacts on receiving waters.
- Include in the training program a discussion of the minimum requirements for development construction projects and how to determine during an inspection if construction sites are meeting the minimum requirements.
- Present guidance on the selection of appropriate BMPs for both erosion and sediment control and non-storm water management. Include examples or case studies to illustrate proper BMP selection and implementation for construction sites.
- Review the content and format of a Local SWPPP and WWECP.
- Provide employees with handouts, checklists, manuals or other resources that can be used later for reference. Reference sources can include material from this Model Program, the training program developed by the Los Angeles County Department of Public Works, the California Best Management Practices Handbook, and the California Department of Transportation Storm Water Quality Handbooks.
- Refer to the Five-Year Public Education Plan, Implementation by Target Audience, Development Construction employees for a description of activities, training materials, etc.

Stormwater Quality Management Plan (SQMP)

Illicit Connection and Illicit Discharge Elimination

List of Tables

List of Figures

ES.1 OVERVIEW

On July 15, 1996, the Los Angeles Regional Water Quality Control Board (Regional Board) issued a municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Permit) to the County of Los Angeles and 85 cities (Permittees). This Permit contains a requirement for Permittees to develop and implement within their jurisdiction a Storm Water Management Program (SWMP). The Countywide Storm Water Management Plan (CSWMP) is the unified plan consisting of model programs developed under the Storm Water Management Program requirements as established by the Permit. These model programs are aimed to reduce pollutant discharges to the maximum extent practicable for attaining water quality objectives and protecting beneficial uses of receiving waters in Los Angeles County.

In the 2001 NPDES permit, the CSWMP has been renamed to the Stormwater Quality Management Plan (SQMP). For the remainder of this document, the acronym SQMP is used.

The Permit required the Permittees to develop a model program to address each of the following:

- Illicit Connections and Illicit Discharges,
- Development Planning,
- Development Construction,
- Public Agency Activities, and
- Public Information and Participation.

Each model program is a "stand-alone" document that describes one of these five elements of the SQMP. Record-keeping and reporting requirements are also associated with each model program. This Executive Summary describes the primary requirements of each of the model programs comprising the SQMP. The remainder of this document is the SQMP element referred to as the Illicit Connection and Illicit Discharge Elimination Program, which was approved by the Regional Board in March 1999.

ES.2 MODEL ILLICIT CONNECTIONS / ILLICIT DISCHARGE ELIMINATION PROGRAM

Part 2.II of the Permit contains requirements specifically for the identification and elimination of illicit connections and illicit discharges to the municipal separate storm sewer system (MS4), generally referred to in this document as "storm drain system." The Permit requirements include five components for the elimination of illicit connections and illicit discharges. Those five components are:

- Illicit connection elimination,
- Illicit discharge elimination,
- Best management practices (BMPs) program for designated non-stormwater discharges,
- Public reporting of illicit discharge and disposal practices, and
- Hazardous waste reporting program.

Illicit Connection Elimination

The goal of this component is to detect and eliminate illicit connections in order to reduce pollutants discharged through such connections to the maximum extent practical. The objectives are to:

- Conduct storm drain system field screening for illicit connections during scheduled infrastructure maintenance by maintenance personnel.
- Determine the source and nature of suspected illicit discharges by investigating connections to the storm drain system.

The model program also describes a methodology that Pemittees may use in prioritizing areas of their jurisdiction for investigation. Once the illicit connection/discharge has been investigated, one of the following actions must occur:

- If the discharge is determined to consist only of exempted non-stormwater, the connection will be allowed to remain and will no longer be considered an illicit connection. Permittees may elect to issue a permit for the connection or allow the connection to remain if information on the connection is documented; or
- The discharger will be required to obtain an NPDES permit; or
- The connection will be terminated through voluntary action or enforcement proceedings.

Permittees may prioritize potential problem areas for detection and investigation efforts under this program component, using the methodology defined in this model program.

R0000630

Illicit Discharge Elimination

The goal of this component is to detect and eliminate illicit discharges from entering the storm drain system to reduce pollutants from such discharge to the maximum extent practicable. The objectives are to:

- Investigate, contain, and clean up incidental spills reported by the public, other agencies or observed by Permittee field staff during the course of their normal daily activities,
- Eliminate through voluntary termination or enforcement action prohibited non-stormwater discharges to the storm drain system, and
- Investigate to determine the nature and source of the discharge and eliminate through voluntary termination or enforcement action suspected prohibited non-storm discharges in the storm drain system.

BMPs for Designated Non-Stormwater Discharges

The Permit required the City of Los Angeles to conduct a study on pollutants entering storm drains from street and sidewalk washing operation to:

(i.) Characterize discharges from municipal street washing and sidewalk washing

(ii.)Assess the impacts of such activities and

(iii.) Recommend appropriate BMPs to control any adverse impacts.

The City of Los Angeles completed the study and prepared a report entitled, "A Study of Pollutants Entering Storm Drains from Street and Sidewalk Washing Operations in Los Angeles, California." The Regional Board approved recommended BMPs for street and sidewalk washing activities.

Public Reporting

The goal of this component is to promote, publicize and facilitate public reporting of illicit discharges and illicit disposal practices. Permittees must implement a system for complainant documentation and a follow up response for calls received from the public regarding potential illicit discharges and illicit disposal practices.

Reporting Hazardous Substances Entering the Storm Drain System

The goal of this component is to facilitate appropriate reporting of hazardous substances entering the storm drain system as a result of an illicit discharge. The Permittees must implement a reporting program to document quantities of hazardous substances entering the storm drain system.

ES.3 MODEL DEVELOPMENT PLANNING PROGRAM

"Development" Projects encompass those projects that are subject to a planning and permitting review process by a Permittee. A "Development" Project may be new development, redevelopment, renovation, remodeling, rehabilitation, infill, or other terms that may be used in a Permittee's ordinances and/or building code. The planning and design of public facilities have similar requirements described in the Model Public Agency Activities Program, another component of the Countywide Storm Water Management Plan.

The fundamental concept of this program component is to identify development that may significantly impact stormwater quality and to then to include permanent BMPs in the project's design. Development projects that may significantly impact stormwater quality are Planning "Priority" Projects. Other projects are deemed "Exempt" from these program requirements.

Each Permittee will implement a development-planning program that includes the following components:

- System for determining the appropriate category (Priority or Exempt) for a Development Project;
- Recommended list of BMPs to be considered, and as appropriate, implemented for Development Projects;
- Process to ensure that Planning Priority Projects incorporate the Standard Urban Storm Water Mitigation Plans using the recommended list of BMPs;
- Guidelines for California Environmental Quality Act (CEQA) compliance;
- Guidelines for the revision of General Plan elements to include watershed and stormwater quality management considerations, when General Plan elements are being significantly rewritten; and
- Developer information program that provides general guidance on the Permittee's development planning program, and specific guidance on BMP selection and the Standard Urban Storm Water Mitigation Plans.

A checklist and flowchart are included in the Model Development Planning Program to assist Permittees in determining whether a project is Priority or Exempt.

ES.4 MODEL DEVELOPMENT CONSTRUCTION PROGRAM

Permittees must also implement a program to manage stormwater and urban runoff associated with construction activities within their jurisdictions. The Model Development Construction Program addresses:

- Development and implementation of construction site BMPs;

- Implementation of procedures to verify Notice of Intent (NOI) filing with the State Water Resources Control Board and completion of stormwater pollution prevention plan (SWPPP) for projects subject to the California General Construction Permit, and
- Implementation of a construction inspection program.

Construction Site BMPs

A Development Construction Project is defined as projects for which site activities such as clearing, grading, excavation, road construction, structure construction, or structure demolition results in the disturbance of soil.

In certain situations, where impact to stormwater quality is a greater threat, Development Construction Projects should be given greater scrutiny to ensure that minimum requirements are met. These projects which present a greater threat to water quality, *but are not subject to the California General Permit for Storm Water Discharges Associated with Construction Activity*[1] are called Construction Priority Projects.

Unless specifically exempted, all Development Construction Projects will be required to implement BMPs to meet minimum water quality protection requirements. As a condition for issuing a grading or building permit, applicants for covered Development Construction Projects shall be required to certify that they understand and will comply with the minimum BMPs requirements related to construction site runoff.

Projects Subject to the General Construction Permit

Developers of construction sites subject to the General Construction Permit are required to prepare and implement a Storm Water Pollution Prevention Plan (state SWPPP). Before issuing building or grading permits, Permittees will require applicants to demonstrate that a Notice of Intent (NOI) has been filed with the State Water Resources Control Board (SWRCB), and that a state SWPPP has been prepared for projects subject to the General Construction Permit.

Requirements for Construction Priority Projects

Prior to receiving a building or grading permit, applicants for Construction Priority Projects must prepare a local stormwater pollution prevention plan (local SWPPP) covering construction materials and waste management control, and must certify that they will implement the local SWPPP year-round. Applicants for Construction Priority projects must also prepare and

[1] A project is subject to the General Construction Permit if it disturbs 5 acres or more of soil, or the project results in the disturbance of less than 5 acres but is part of a larger common plan of development or sale that exceeds 5 acres.

implement a Wet Weather Erosion Control Plan (WWECP) if the project will leave soil disturbed during the rainy season (November 1 through April 15).

Site Inspection and Enforcement

Each Permittee will implement site inspection procedures to assess whether the minimum requirements for Development Construction Projects are being achieved and appropriate BMPs are being implemented. Site inspections will also determine if local SWPPPs are being implemented at projects where they apply. Developers and/or contractors will also be required to conduct and document self-inspections of their construction site. Each Permittee will also develop and implement enforcement procedures to require that corrective actions be undertaken when the requirements are not met.

ES.5 MODEL PUBLIC AGENCY ACTIVITIES PROGRAM

Part IV.C of the Permit contains requirements specifically for public agency activities and facilities. Components of the Public Agency Activities Model Program describe measures to be taken by Permittees to reduce stormwater impacts from public agency activities and facilities such as sanitary sewer systems, public construction activities, vehicle maintenance and material storage facilities, recreation facilities, stormwater drainage systems, streets and roads, etc.

Sewage Systems Operations

This program component is applicable to all Permittees who own and operate a sewage collection system. Although sewage systems themselves are not a regular source of stormwater pollution, raw sewage contains pollutants that can pose a serious threat to both human health and the quality of receiving waters if they enter the storm drain system through incidents such as spills, leaks, or overflows. The goal of this program is to reduce the impact of Permittee-owned sewage system operations on stormwater quality.

The objectives of this program component are to:

- Keep any sewage overflows or leaks from entering the storm drain system or receiving waters.
- Identify and repair sewage system blockages, exfiltrations, overflows and implement procedures for investigating the causes.
- Notify public health authorities in cases where threats to public health exist.

Public Construction Activities Management

This program component is applicable to all Permittees who construct or contract to construct public facilities, including infrastructure. The program component requires the use of temporary best management practices (BMPs) to reduce the discharge of pollutants from public construction sites. In addition, public agency facilities with the potential for having a significant effect on stormwater quality when completed by virtue of their size, nature of on-site activities, or other factors must incorporate permanent BMPs in the planning and design of the project.

The objectives of this program component are to:

- Select and incorporate appropriate construction control measures for stormwater quality management from construction sites.
- Conduct and inspection program, including enforcement procedures as necessary, to verify that the construction control measures are implemented and performed effectively throughout the construction period.

Vehicle Maintenance / Material Storage Facilities Management

This program component is applicable to all Permittees who own and operate vehicle maintenance or materials storage facilities. Activities at these facilities may generate waste, spills and leaks that could potentially reach the storm drain system and receiving waters. The goal of this program is to make stormwater quality a consideration when conducting activities at municipal facilities.

The objectives of this program component are to:

- Identify and evaluate sources of pollutants from public vehicle maintenance/material storage facilities that may affect the quality of stormwater discharge from the facility.
- Identify and implement site-specific best management practices to reduce or prevent pollutants in stormwater discharges.

Landscape and Recreational Facilities Management

This program component is applicable to all Permittees who own and operate recreational facilities. Maintenance practices at parks and recreation facilities generally include fertilizer and pesticide applications, vegetation maintenance and disposal, swimming pool chemical maintenance and draining, and trash and debris management. All of these activities have the potential to contribute pollutants to the storm drain system. If improperly managed, potential pollutants can be transported in runoff (stormwater and non-stormwater discharges) to the storm drain system and subsequently to receiving waters. The goal of the program for landscape and

recreational facilities management is to make the stormwater quality a consideration when conducting operation and maintenance activities.

The objectives of this program component are to:

- Minimize the discharge of pesticides, herbicides and fertilizers to the storm drain system and receiving waters.
- Prevent the disposal of landscape waste into the storm drain system.
- Minimize the trash, debris and other pollutants from entering Permitee-owned recreational water bodies.
- Discharge municipal swimming pool water in a manner that will not contribute pollutants to receiving waters.

Storm Drain Operation and Management

The storm drain system functions primarily to collect and convey surface runoff to receiving waters during storms in order to prevent flooding. A common municipal activity includes the maintenance of the storm drain system to maintain hydraulic function as intended during storms. The goal of this program is to reduce the impact of storm drain operation and maintenance activities on stormwater quality.

The objectives of this program component are to:

- Inspect and clean catch basins annually and keep appropriate records.
- Remove trash and debris annually from open channels and properly dispose of these materials to prevent them from being washed to receiving waters.
- Report prohibited non-stormwater discharges observed during the course of normal daily activities so they can be investigated, contained and cleaned up, or eliminated.
- Review maintenance activities to verify that they minimize the amount of pollutants discharged to receiving waters.

Streets and Roads Maintenance

Streets and roads may collect litter and debris from nearby activities, as well as from vehicular traffic. During the course of routine maintenance waste materials are often generated. The goal of this component is to reduce the impact of Permittee street and road operations and maintenance on stormwater quality.

The objectives of this program component are to:

- Sweep curbed streets to reduce the discharge of pollutants associated with activities occurring in street and road rights-of-way.
- Minimize the discharge of pollutants associated with the maintenance of streets and roads.

Parking Facilities Management

Permittees who own parking lots with more than 25 parking spaces located in areas with potential exposure to stormwater must have a parking facilities management plan. The goal of this component is to reduce the impact of these parking facilities on the quality of stormwater discharges and receiving waters. The object of this program component is to remove debris from parking facilities to reduce the amount of material that comes into contact with stormwater.

Public Industrial Activities

Industrial activities, whether private or public, have the potential to discharge pollutants to the storm drain system. Many industrial facilities are subject to the California General Industrial Activities Storm Water Permit (General Industrial Permit) for control of stormwater pollution. The goal of the General Industrial Permit is to reduce the impact of industrial facilities on stormwater quality. This provision of the Permit may procedurally simplify and reduce the cost of Permittees' compliance for their industrial facilities (Phase 1) by providing the option to obtain coverage under the Permit in lieu of the General Industrial Permit.

The objective of this program component is to comply with all requirements and conditions contained in the General Industrial Permit.

Emergency Procedures

Each Permittee must consider the impact of discharges to the storm drain system during emergency repairs of essential public services and infrastructure, and response to natural disasters. The goal is to reduce the impact of emergency response activities on receiving waters, to the extent possible, without compromising public health and safety.

The objectives of this program component are to:

- Recognize that public health and safety are the highest priority when conducting emergency response activities.
- Protect surface water quality by incorporating appropriate BMPs into emergency response activities to the extent possible.

ES.6 Model Public Information and Participation Program

The purpose of the Stormwater/Urban Runoff Public Information and Participation Program (Five-Year Public Education Plan) is to provide the framework for a comprehensive educational stormwater and urban runoff outreach approach that will reach as many Los Angeles County residents as possible. The Five-Year Public Education Plan is research-based, broad-based with overarching themes, flexible, adaptable, and simplistic in order to produce behavior change.

Groups of residents differ significantly in terms of the amount of pollution they contribute, their demographics and lifestyle, attitudes related to stormwater pollution, and probability of changing their behaviors. By better understanding the general County resident population, resources may be directed to those segments of the population that pose the greatest threat to stormwater quality and who represent the greatest opportunity to respond to a public education campaign.

Some key strategies developed for successful implementation of the education model include:

- Creating Overarching Approach A unified overall public education approach sets a "tone" for the program and once established helps target audiences identify the program with its pollution prevention message.
- Building Partnerships Integrate County and city programs, cooperate with environmental groups, co-Permittees, and other public and business groups to disseminate public education program materials and special events information.
- Unify Pollution Prevention Efforts Link all pollution prevention efforts (such as recycling, used oil and household waste) under a single agenda rather than under multiple prevention splinter programs.
- Develop "How To" Instructions Provide specific guidelines supported by simple easy to remember tasks and concise "how to" instructions for pollution prevention actions that residents and business may incorporate into their everyday routines.
- Monitoring and Evaluation System Establish an evaluation system to measure program effectiveness by assessing the number of people who show increased awareness, intent and/or actions in reducing stormwater pollution. Re-evaluate and enhance program components on continually based on program effectiveness.
- Multiple Audience Impact Develop program materials and activities that may be implemented and have impact on more than one audience at a time.

The Model Public Information and Participation Program also includes reporting requirements for

Permittees to support the Annual Program Report to the Regional Board. These reporting requirements include the documentation of information such as:

- Number of media outlets contacted to run public service announcements (PSAs),
- Dollar value and number of media buys,
- Audience of the media PSAs,
- List of local businesses enlisted to place non-traditional advertising (point-of-purchase displays, product neck hangers, etc.)
- Numbers and types of stormwater pollution prevention materials distributed, and
- Whether there is an increase in the number of illicit discharge reports to the Permittee.

1.1 BACKGROUND

The municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities by the Los Angeles Regional Water Quality Control Board on July 15, 1996 contains a requirement for Permittees to develop and implement an Illicit Connection/Illicit Discharge Elimination Program. This document describes a model program that Permittees can follow to implement their own Illicit Connection/Illicit Discharge Elimination Program in compliance with the Permit.

Part 2.II of the Permit contains requirements specifically for the identification and elimination of illicit connections and illicit discharges to the municipal separate storm sewer system (MS4), generally referred to in this document as "storm drain system." The Permit requirements are shown in Table 1-1. They are fully enforceable and can only be changed through action by the Regional Board. The model program contents will be reviewed and approved by the Regional Board staff (Executive Officer) and can be changed by approval of the Executive Officer.

Table 1-1
Permit Requirements - Illicit Connections and Illicit Discharges

Permit Section	Requirement	Compliance Date
2.II.A.2	Implement illicit connection elimination program.	Four months after commencement of next fiscal year following Executive Officer approval of model program, but no later than 7/30/99[1].
2.II.B.2	Implement illicit discharge elimination program.	Four months after commencement of next fiscal year following Executive Officer approval of model program, but no later than 7/30/99[1].
2.II.C.3	Implement non-stormwater management program BMPs for designated discharges (municipal street washing and sidewalk washing) if required by the Regional Board.	To be determined by Regional Board, but no later than 7/30/99.
2.II.D.2	Implement standard program to facilitate public reporting of illicit discharges and illicit disposal practices.	Four months after commencement of next fiscal year following Executive Officer approval of program, but no later than 7/30/99[1].
2.II.D.4	Implement standard program for reporting hazardous substances.	Four months after commencement of next fiscal year following Executive Officer approval of program, but no later than 7/30/99[1].

(1) Provided that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year.

The requirement to implement an Illicit Connection/Illicit Discharge Elimination Program is based on one of the two primary objectives set forth in the Federal Clean Water Act amendments of 1987 which established the framework for regulating stormwater discharges from municipal, industrial and construction activities under the NPDES system:

- Effectively prohibit non-stormwater discharges.
- Reduce the discharge of pollutants to the maximum extent practicable (MEP).

To meet this statutory objective, the federal regulatory requirements for municipal Permittees include implementing a comprehensive program, and best management practices (BMPs) to ***detect and remove illicit discharges and improper disposal into the storm drain system***.

1.2 NATURE AND TYPES OF ILLICIT DISCHARGES AND ILLICIT CONNECTIONS

1.2.1 Illicit Discharges

The Permit has established definitions of illicit discharge and illicit disposal as follows:

> *"Illicit Disposal: Any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute storm water or urban runoff."*
>
> *"Illicit Discharge: Any discharge to the storm drain system that is prohibited under local, state or federal statutes, ordinances, codes or regulations. This includes all non-storm water discharges except discharges pursuant to an NPDES permit and discharges that are exempted or conditionally exempted in accordance with Section II of this Order."*

Categories of non-stormwater discharges that are not prohibited (exempted or conditionally exempted) under the Permit are listed in Table 1-2.

The context of illicit discharges and illicit disposal used in this model program includes several categories as follows:

- Incidental spills or disposal of wastes or non-stormwater. These may be intentional, unintentional or accidental and would typically enter the storm drain system directly through drain inlets, catch basins or manholes or be deposited in the public right-of-way such that wash-off would reach the storm drain system.
- Discharges of sanitary sewage due to overflows or leaks; usually incidental but may be continuous.
- Continuous or intermittent discharges of prohibited non-stormwater other than through an illicit connection. These typically occur as surface runoff from outside the public right-of-way (e.g., area washdown from an industrial site).

- Continuous or intermittent non-stormwater discharges through an illicit connection (see Section 1.2.2).

Table 1-2
Exempt and Conditionally Exempt Discharges[1]

- Discharges in compliance with a separate NPDES permit/waste discharge requirements (WDR) or granted a discharge exemption by the Regional Board, the Executive Officer, or the State Water Resources Control Board.

- Exempted discharges (2) including:
  a. Flows from riparian habitats or wetlands;
  b. Diverted stream flows;
  c. Springs;
  d. Rising ground waters;
  e. Uncontaminated groundwater infiltration; and
  f. Discharges or flows from emergency fire fighting activities.

- Conditionally exempted discharges (3) including:
  a. Landscape irrigation;
  b. Water line flushing;
  c. Potable water sources provided the discharges are managed in accordance with an approved Industry-wide Standard Pollution Prevention Practices developed by the American Water Works Association, California-Nevada Section, or equivalent document; and in compliance with any requirements established by the Permittee(s);
  d. Foundation drains;
  e. Footing drains;
  f. Air conditioning condensate;
  g. Irrigation water;
  h. Lawn watering;
  i. Water from crawl space pumps;
  j. Dechlorinated swimming pool discharges;
  k. Individual residential car washing; and,
  l. Street washing (including sidewalk washing), except municipal street washing.

(1) The Executive Officer, upon presentation of evidence in accordance with Part 2.II.C.4 of the Permit, may include other categories of non-stormwater discharges under this subsection.
(2) The Executive Officer, upon presentation of evidence in accordance with Part 2.II.C.4 of the Permit, may include other categories of non-stormwater discharges under this subsection.
(3) However, if any such discharges are identified by either a Permittee or the Executive Officer as being significant sources of pollutants to receiving waters, then appropriate BMPs to minimize the adverse effects of these sources shall be developed and implemented under the Countywide Storm Water Management Plan or local Watershed Management Area Plans.

1.2.2 Illicit Connections

The Permit defines illicit connection as:

"Illicit Connection: Any man-made conveyance that is connected to the storm drain system without a permit, excluding roof-drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system."

However, since not all agencies formally permit connections, as used in this model program an illicit connection is any man-made conveyance that is connected to the storm drain system and through which prohibited non-stormwater flows are discharged. This includes channels,

pipelines, conduits, inlets or outlets that are connected directly to the storm drain system. Roof drains, area drains, and other similar connections which are intended to convey only stormwater runoff are excluded, unless they are also used to convey an illicit discharge.

1.3 PROGRAM SUMMARY

Each Permittee will implement an illicit connection/illicit discharge elimination program that includes the following components:

- Illicit discharge elimination
- Illicit connection elimination
- Public reporting
- Reporting hazardous substances entering the storm drain system

A brief summary of the baseline objectives of each component relative to the nature and type of illicit discharges and illicit connections follows.

1.3.1 Illicit Discharge Elimination

The goal of this component is to detect and eliminate illicit discharges from entering the storm drain system to reduce pollutants from such discharge to the maximum extent practicable. The baseline objectives are:

- Incidental spills, or disposal (including sanitary sewer leaks or overflows) reported by the public or other agencies or observed by Permittee field staff during the course of their normal daily activities will be investigated, contained and cleaned up.
- Prohibited non-stormwater discharges to the storm drain system reported by the public or other agencies or observed by Permittee field staff during the course of their normal daily activities (such as surface runoff associated with washdown from an industrial site) will be eliminated through voluntary termination or enforcement action.
- Suspected prohibited non-storm discharges in the storm drain system reported by the public or other agencies or observed by Permittee staff during the course of their normal daily activities, that may result from illicit connections or whose origin is unknown, will be investigated to determine the nature and source of the discharge and eliminated through voluntary termination or enforcement action.

Permittees may prioritize problem areas of illicit disposal for inspection, cleanup and enforcement using the methods defined in this model program.

Implementation requirements for this component of the program are contained in Section 2.

R0000643

1.3.2 Illicit Connection Elimination

The goal of this component is to detect and eliminate illicit connections to reduce pollutants discharged through such connections to the maximum extent practicable. The baseline objectives are:

- A screen of the storm drain system will be conducted for illicit connections during scheduled infrastructure maintenance by maintenance personnel.
- A connection to the storm drain system, that is suspected or observed to be the source of an illicit discharge, will be investigated to determine the source and nature of the discharge. The connection may be discovered while investigating a suspected illicit discharge, or detected by field staff during the course of their normal daily activities.
- Once the illicit connection/discharge has been investigated as described in Section 2, one of the following actions must occur:
  - If the discharge is determined to consist only of exempted non-stormwater, the connection will be allowed to remain and will no longer be considered an illicit connection. Permittees may elect to issue a permit for the connection or allow the connection to remain if information on the connection is recorded as described in the model program; or
  - The discharge will be permitted through a separate NPDES permit; or
  - The connection will be terminated through voluntary action or enforcement proceedings.

Permittees may prioritize potential problem areas for detection and investigation efforts under this program component, using the methodology defined in this model program.

Implementation requirements for this component of the program are contained in Section 3.

1.3.3 Public Reporting

The goal of this component is to promote, publicize and facilitate public reporting of illicit discharges and illicit disposal practices. The baseline objective is that a program will be implemented to receive incoming calls from the public regarding potential illicit discharges and illicit disposal practices, communicate and coordinate a response, follow up with the complainant, and maintain documentation.

Implementation requirements for this component of the program are contained in Section 4.

1.3.4 Reporting Hazardous Substances Entering the Storm Drain System

The goal of this component is to facilitate appropriate reporting of hazardous substances entering the storm drain system as a result of an illicit discharge. The baseline objective is that a program will be implemented to report and document reportable quantities of hazardous substances

entering the storm drain system. Implementation requirements for this component of the program are contained in Section 5.

1.4 PERFORMANCE MEASURES

Performance measures define the level of Permittee program activities that are needed to ensure compliance with this model program and the goals outlined under the Permit. Appendix A outlines the specific activities to be tracked through the use of performance measures, and representative target goals for each measure.

The program activities discussed in this model program are intended to identify and eliminate discharges associated with illegal dumping or illicit connections to the storm drain system. As a result, the performance measures in Appendix A are based upon accepted practices described in this model program and performance standards in compliance with NPDES permit conditions.

2.1 INTRODUCTION

The goal of the illicit discharge elimination program is to detect and eliminate non-stormwater discharges (except those that are exempt or conditionally exempt) from entering the storm drain system to reduce pollutants from such discharge to the maximum extent practicable. Each Permittee's program must meet the requirements of the Los Angeles County municipal stormwater permit (Permit), as shown in Table 2-1.

Table 2-1
Permit Requirements - Illicit Discharge Elimination

Report Section	Requirement	Permit Section
2.2.2 2.2.3	Implement procedures for investigation, containment and cleanup of spills.	2.II.B.1.b
2.2.4	Implement a method to prioritize problem areas of illicit disposal.	2.II.D.1.c
2.2.5	Implement procedures to educate inspectors, maintenance workers and other field staff to notice illicit discharges during the course of their daily activities and report such occurrences.	2.II.D.1.d
2.2.6	Implement enforcement procedures to eliminate illicit discharges.	2.II.B.1.a
2.2.7	Implement a record keeping system to document illicit discharges.	2.II.D.1.e
2.2.8	Maintain and use industrial/commercial education and outreach materials.	2.II.D.1.f

The baseline objectives of the program are:

- Incidental spills, or disposal (including sanitary sewer leaks or overflows) reported by the public or other agencies or observed by Permittee field staff during the course of their normal daily activities will be investigated, contained and cleaned up.
- Prohibited non-stormwater discharges to the storm drain system reported by the public or other agencies or observed by Permittee field staff during the course of their normal daily activities (such as surface runoff associated with washdown from an industrial site) will be eliminated through voluntary termination or enforcement action.
- Suspected prohibited non-storm discharges in the storm drain system reported by the public or other agencies or observed by Permittee staff during the course of their normal daily activities, that may result from illicit connections or whose origin is unknown, will be investigated to determine the nature and source of the discharge and eliminated through voluntary termination or enforcement action.

Permittees may prioritize problem areas of illicit disposal where inspection, cleanup and enforcement are necessary to prevent the discharge of contaminants using the methods defined in this model program.

R0000646

2.2 PROGRAM IMPLEMENTATION ELEMENTS

2.2.1 Spill Prevention Methods

The best way to contend with spills is to prevent them from occurring. Guidance is included in Appendix B1.

2.2.2 Spill Prevention Coordination

Within agency responding divisions or sections, responsible staff, and level of support provided to lead emergency response agencies, will be identified. Within agency, spill response training, spill response equipment and activities to improve spill response procedures will be identified. Guidance is included in Appendix B2.

2.2.3 Spill Investigation, Containment and Cleanup

Standardized procedures will be implemented to investigate, contain and clean up spills. These must include procedures to ensure that sewage treated with disinfection agents will not be discharged into the storm drain system to the extent practicable. The standard procedures include:

- Receive call on spill (see also Section 4, Public Reporting).
- Dispatch appropriate personnel to perform material investigation and cleanup.
- Contain spill/material and minimize release to storm drain system or receiving waters.
- Record required information at spill site.
- Perform field tests as necessary to determine type and source of spill.
- If the call was received through the LACDPW Hotline, notify the LACDPW dispatcher upon incident closure.

Guidance is included in Appendix B3.

2.2.4 Prioritization for Investigation of Illicit Disposal

If the investigation and elimination of all illicit disposal incidents cannot be completed within a timely manner, a prioritization process can be used to determine in what order the incidents should be investigated. If necessary, the following methods will be implemented to prioritize problem areas of illicit disposal where inspection, cleanup, and enforcement are necessary to prevent the discharge of contaminants:

- Compile information on areas of illicit disposal.

- Determine drainage areas where disposal incidents have the greatest potential negative effect on stormwater quality.
- Determine drainage areas that have recurring incidents of illicit disposal.

Guidance is included in Appendix C.

A prioritization process for investigation and elimination of illicit connections and associated suspected illicit discharges is discussed in Section 3.2.2.

2.2.5 Education Program for Inspectors, Maintenance and Field Staff

Permittee staff will be required to implement the baseline objectives of observing, reporting, investigating and eliminating illicit discharges to the storm drain system.

Standardized procedures will be implemented to educate inspectors, maintenance workers, and other field staff to notice illicit discharges during the course of their daily activities and report them. The standard procedures include:

- Compile and/or prepare training materials, such as handouts and posters. Topics will include:
  - Stormwater quality requirements
  - Types of illicit discharges/disposal
  - Reporting forms
- Identify staff who conduct field activities and others who may benefit from training.
- Present information on illicit discharges during regular safety and tailgate meetings.
- Discuss how to report illicit discharges:
  - Call in report to request investigation and cleanup.
  - Fill out illicit discharge reporting forms.

Guidance for conducting the staff educational program for noticing and reporting illicit discharges is included in Appendix D.

The education program will also help appropriate Permittee staff to determine the appropriate follow-up activity when evidence of illicit discharges is observed. This includes:

- If the nature and source of the discharge is known or readily apparent, enforcement procedures will be initiated as discussed in Section 2.2.6.
- If the nature and source of the discharge is not known, additional investigation techniques will be used to determine the nature of the material and investigate the source. Guidance is included in Appendix E.

- If the illicit discharge is suspected to be through an illicit connection, procedures described in Section 3, Illicit Connection Elimination, will also be followed.

2.2.6 Standardized Enforcement Procedures

Enforcement procedures will be implemented to eliminate illicit disposal or discharges. The procedures will be followed when the source and nature of the discharge is known. Enforcement procedures will be consistent with the Permittee's legal authority. While legal authority for Permittees varies, most enforcement processes follow a common sequence. Typically they include:

- Verbal or written warnings for minor violations
- Formal notice of violation or non-compliance with specific actions and time frames for compliance
- Cease and desist or similar order to comply
- Specific remedies such as civil penalties (e.g., infraction), non-voluntary termination with cost recovery, or referral for criminal penalties or further legal action

Enforcement activity will begin at the appropriate level as determined by the Permittee's authorized representative. It need not necessarily be imposed sequentially. For incidents that are more severe or threatening at the outset, enforcement will start at an increased level. Enforcement steps will be accelerated if there is evidence of a clear failure to act, or an increasing severity of the discharge. A sample enforcement strategy and guidance are included in Appendix F.

2.2.7 Record Keeping and Documentation

A standardized record keeping system will be implemented to document illicit discharges detected within the local jurisdiction. The standard elements are:

- Record the following minimum information on all detected illicit discharges:
  - Date/time of the incident
  - Location
  - Type of material
  - Source, if determined
  - Action taken
  - Date incident was closed
- Forward the information to a designated individual/department.

A form that can be used to collect this information, *Illicit Discharge/Connection Reporting and Response* form, is included in Appendix G.

2.2.8 Industrial/Commercial Outreach Materials

Industrial/commercial education and outreach materials will be made available to field staff to be handed out as needed whenever illicit discharges are observed. The following materials have been developed for use by all Permittees under the Immediate Outreach component of the Public Information and Participation Program:

- Flyers/posters of Good Operating Practices for:
  - Auto repair industry
  - Gas stations
  - Food and restaurant industry

Copies of the materials are included as Appendix H.

The following materials will be developed as a joint effort between the Industrial/Commercial Educational Program and the Five-Year Storm Water Public Education Strategy component of the Public Information and Participation Program, and will be available in time to use for this Illicit Connection/Illicit Discharge Elimination Program:

- General stormwater quality brochure for industrial/commercial facilities.
- Fact sheets on all industrial groups regulated under Phase 1 of the federal stormwater program.

3.1 INTRODUCTION

Illicit connections are defined here as specific pathways for illicit discharges, even though a discharge may be infrequent or intermittent. The goal of the illicit connection elimination program is to eliminate these connections to the maximum extent practicable. Each Permittee's program must meet the requirements of the Los Angeles County municipal stormwater permit (Permit), as shown in Table 3-1.

Table 3-1
Permit Requirements - Illicit Connection Elimination

Report Section	Requirement	Permit Section
3.2.1	Implement storm drain inspection and illicit connection identification and elimination procedures.	2.II.A.1.a
3.2.1	Implement methods to use the results of field screening and other information.	2.II.A.1.c
3.2.2	Implement a method to prioritize potential problem areas of illicit connections.	2.II.A.1.b
3.2.3	Implement enforcement procedures to eliminate illicit connections.	2.II.A.1.e
3.2.4	Implement a record keeping system to document illicit connections.	2.II.A.1.d

The baseline objectives of the program are:

- A screen of the storm drain system will be conducted for illicit connections during scheduled infrastructure maintenance by maintenance personnel.
- A connection to the storm drain system, that is suspected or observed to be the source of an illicit discharge, will be investigated to determine the source and nature of the discharge. The connection may be discovered while investigating a suspected illicit discharge, or detected by field staff during the course of their normal daily activities.
- Once the illicit discharge has been investigated as described in Section 2, one of the following actions must occur:
  - If the discharge is determined to consist only of exempted non-stormwater, the connection will be allowed to remain and will no longer be considered an illicit connection. Permittees may elect to issue a permit for the connection or allow the connection to remain if information on the connection is recorded as described in the model program; or
  - The discharge will be permitted through a separate NPDES permit; or
  - The connection will be terminated through voluntary action or enforcement proceedings.

This strategy is summarized in Figure 3-1. Permittees may prioritize potential problem areas for detection and investigation efforts under this program component, using the methodology defined in this model program.

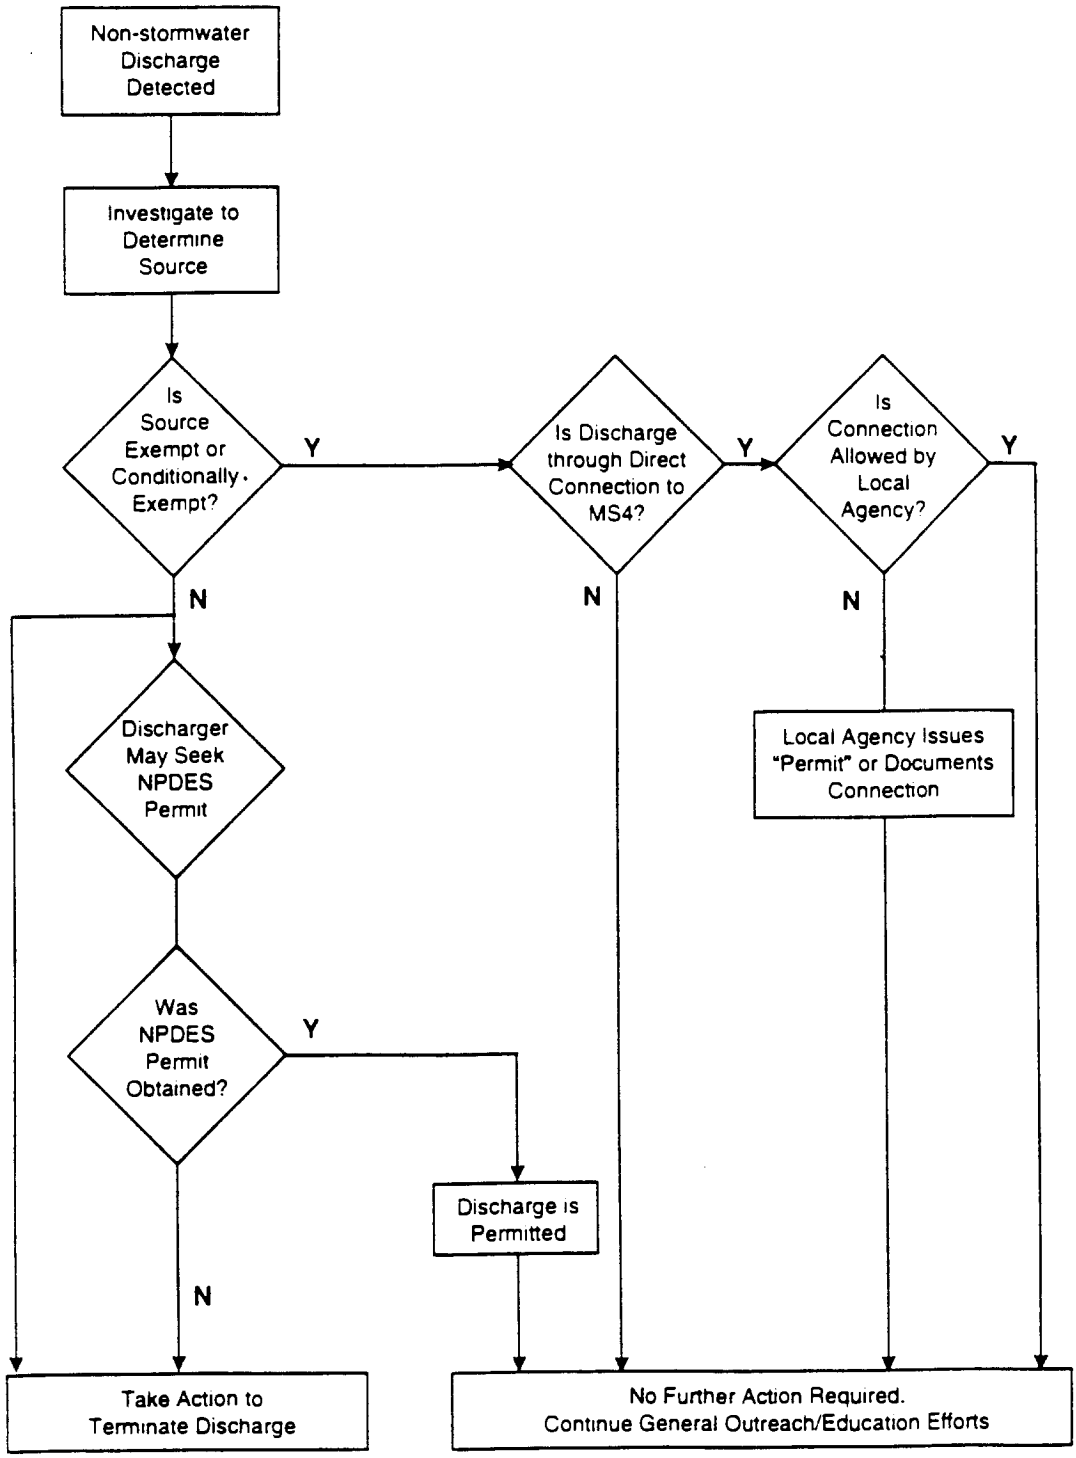

Figure 3-1
Illicit Discharge/Illicit Connection Elimination Strategy

3.2 PROGRAM IMPLEMENTATION ELEMENTS

3.2.1 Illicit Connection Investigation

Standardized storm drain inspection and illicit connection identification and elimination procedures will be implemented. The procedures include:

- During routine site inspections (e.g., Industrial Waste, Hazardous Materials, construction), storm drain system infrastructure surveys, or normal storm drain maintenance activities, look for connections that exhibit evidence of suspected illicit discharges.
- If evidence of an illicit discharge is detected, as discussed in Section 2, and the source does not appear to be evident or above ground, investigate to determine if the discharge is being conveyed through an illicit connection. Methods to locate illicit connections include:
  - Document research (e.g., storm drain system maps, prior investigation documents, permit files)
  - Physical inspections of catch basins, manholes, and lines large enough for safe entry
  - Dye test
  - Smoke tests
  - T.V. inspections

Guidance for the selection and use of appropriate field screening techniques is included in Appendix I.

Once a suspected illicit connection has been located and the nature and source of the discharge has been identified, follow-up action will be initiated in one of the following ways:

- If the discharge is determined to be exempt or conditionally exempt, the connection may be left intact. The connection must either be permitted or a record of the connection investigation will be kept on file as described in Section 3.2.4.
- If the discharger applies for and receives a separate NPDES permit, the connection may be left intact.
- If the connection is the source of continuous or intermittent illicit discharges, either the discharge must be terminated as discussed in Section 2 and a record of the connection kept on file, or the connection must be terminated, either voluntarily or through additional enforcement, as discussed in Section 3.2.3.

If the investigation and elimination of illicit connections cannot be accomplished within a timely manner, the prioritization process described in Section 3.2.2 can be used to determine in what order they should be investigated.

Appropriate staff, such as inspectors and field crews, should be educated about how to conduct illicit connection investigations. Guidance for conducting an educational program is included in Appendix D.

3.2.2 Prioritization

All suspected illicit connections should be investigated in a timely manner. However, if prioritization is necessary, the following methods will be implemented to prioritize potential problem areas to begin illicit connection investigation and elimination:

- Determine drainage areas of old commercial/industrial facilities and areas with heavy industry listed under subchapter N of 40 CFR Parts 405-471. These facilities are discussed in Appendix J.
- Determine drainage areas with drainage system facilities older than 30 years.
- Determine drainage areas with the highest number of detected or reported incidents of illicit discharge per year.

Guidance to prioritize illicit connections is included in Appendix J.

3.2.3 Standardized Enforcement Procedures

Enforcement procedures will be implemented when terminating illicit connections. Enforcement procedures will be consistent with the Permittee's legal authority. While legal authority for Permittees varies, most enforcement processes follow a common sequence. Typically they include:

- Verbal or written warnings for minor violations
- Formal notice of violation or non-compliance with specific actions and time frames for compliance
- Cease and desist or similar order to comply
- Specific remedies such as civil penalties (e.g., infraction), non-voluntary termination with cost recovery, or referral for criminal penalties or further legal action

Enforcement activity will begin at the appropriate level as determined by the Permittee's authorized representative. It need not necessarily be imposed sequentially. For incidents that are more severe or threatening at the outset, enforcement will start at an increased level. Enforcement steps will be accelerated if there is evidence of a clear failure to act, or an increasing severity of the discharge. An example of enforcement strategy and guidance is included in Appendix F.

3.2.4 Record Keeping and Documentation

A standardized record keeping system will be implemented to document illicit connections detected within the local jurisdiction. The standards elements are:

- Record the following minimum information on all suspected illicit connections:
  - Type of connection
  - Location
  - Evidence of illicit discharge
  - Action taken
  - Date incident was closed
- Forward the information to a designated individual/department.

A form that can be used to collect this information, *Illicit Discharge/Connection Reporting and Response*, is included in Appendix G.

4.1 INTRODUCTION

The goal of the public reporting program is to promote, publicize, and facilitate public reporting of illicit discharges and illicit disposal incidents. Each Permittee's program must meet the requirements of the Los Angeles County municipal stormwater permit (Permit), as shown in Table 4-1.

Table 4-1
Permit Requirements - Public Reporting

Report Section	Requirement	Permit Section
4.2.1	Implement a system to receive incoming complaints.	2.II.D.1.a
4.2.2	Implement a communication network to link Permittees so that action can be coordinated and complaints can be investigated promptly.	2.II.D.1.b
4.2.3	Implement a system to notify the complainant of any action taken, if appropriate.	2.II.D.1.c

The baseline objective of the program is that a program will be implemented to receive incoming calls from the public regarding potential illicit discharges and illicit disposal practices, communicate and coordinate a response, follow up with the complainant, and maintain documentation. Guidance for conducting all public reporting activities is included in Appendix K.

4.2 PROGRAM IMPLEMENTATION ELEMENTS

4.2.1 Receiving Incoming Calls

Procedures will be implemented to receive incoming reports of illicit discharge/disposal incidents. The procedures include:

- If desired, use the countywide hotline reporting system maintained by LACDPW.
- If the LACDPW system is not used, establish and maintain a local hotline reporting system.
- Receive calls and collect relevant information about the discharge/disposal.
- Promote and publicize the appropriate hotline number to the public.

4.2.2 Communications and Coordination

Procedures will be implemented to communicate with and coordinate activities between Permittees to promptly investigate reports of illicit discharge/disposal. The procedures include:

- Determine jurisdiction of the reported illicit discharge/disposal incident.
- If within Permittee's jurisdiction, dispatch appropriate personnel to perform material investigation and cleanup, in accordance with procedures described in Section 2, Illicit Discharge Elimination.
- If incident is under another jurisdiction, call and/or fax known information about the discharge/disposal to the appropriate agency.
- If the call was received through the LACDPW Hotline, notify the LACDPW dispatcher upon incident closure.

4.2.3 Follow up with Complainant

Procedures will be implemented to notify the complainant of any action taken, if appropriate. The elements are:

- Determine which reports of illicit discharge/disposal were received from individuals who gave a name and address or phone number.
- Periodically notify the individual of the status of the incident, including a final notification upon incident closure.

4.2.4 Record Keeping and Documentation

As discussed in Section 2, Illicit Discharge Elimination, a standardized record keeping system will be implemented to document illicit discharges detected within the local jurisdiction. Staff involved with receiving public reports of illicit discharge/disposal will forward all necessary information to a designated individual/department for incorporation into illicit discharge records.

5.1 INTRODUCTION

The goal of this program is to facilitate appropriate reporting of hazardous substances as a result of an illicit discharge. Each Permittee's program must meet the requirements of the Los Angeles County municipal stormwater permit (Permit), as shown in Table 5-1.

Table 5-1
Permit Requirements - Reporting Hazardous Substances

Report Section	Requirement	Permit Section
5.3.1	Implement a program for reporting incidents of "reportable quantity" of hazardous substances entering the MS4.	2.II.D.3

The baseline objective of the program is that a program will be implemented to report and document reportable quantities of hazardous substances entering the storm drain system.

5.2 DEFINITIONS OF HAZARDOUS SUBSTANCES AND REPORTABLE QUANTITIES

The Permit defines a hazardous substance as a material defined under 40 Code of Federal Regulations (CFR) ∋ 302. These are categorized as either "listed" or "unlisted" hazardous substances. Listed hazardous substances are contained in a table, Table 302.4, which is included in Appendix L. Unlisted hazardous substances are certain items of solid waste that exhibit characteristics identified in 40 CFR ∋ 261.20 through 261.24. Copies of these sections are also included in Appendix L. Examples of hazardous substances include any substance or chemical product for which one or more of the following applies:

- A material safety data sheet (MSDS) is required
- The substance is listed as radioactive by the Nuclear Regulatory Commission
- The substance is listed as hazardous by the U.S. Department of Transportation
- The material is listed in Labor Code ∋ 6382(b)

The above four categories are described in the California Health and Safety Code, Division 20, Chapter 6.95, Hazardous Materials Release Response Plans and Inventory.

The Permit defines a reportable quantity of hazardous substance as the quantity set forth in 40 CFR ∋ 302. For listed hazardous substances, this amount is the quantity listed in the column AFinal RQ≡ on Table 302.4. For unlisted hazardous substances, this amount is generally 100 pounds.

5.3 PROGRAM IMPLEMENTATION ELEMENTS

5.3.1 Notification Procedures

Procedures will be implemented to report incidents of "reportable quantity" of hazardous substances entering the storm drain system. The procedures include:

- When spill/illicit discharge/disposal materials are suspected to be hazardous, notify the appropriate Administering Agency.
- The Administering Agency will conduct a material investigation.
- If the material is hazardous, the Administering Agency will notify local, state and federal agencies and private contractors as necessary.
- If the material equals or exceeds the reportable quantity in a 24-hour period, the Administering Agency (or a designated individual/department) will notify the California Office of Emergency Services (OES) and the National Response Center.

A complete description of procedures for handling releases of hazardous substances is contained in each agency's *Emergency Response Procedures* manual. Additional guidance is included in Appendix M.

5.3.2 Record Keeping and Documentation

As discussed in Section 2, Illicit Discharge Elimination, a standardized record keeping system will be implemented to document illicit discharges detected within the local jurisdiction, including hazardous substances. Staff involved with reporting hazardous substances will forward all necessary information to a designated individual/department for incorporation into illicit discharge records.

Other reporting requirements for hazardous substances, unrelated to stormwater quality, are covered in a number of federal and state regulations. Details are contained in each agency' *Emergency Response Procedures* manual. Guidance is included in Appendix M.

Appendix A

Performance Measures For Illicit Connections/Illicit Discharges

A.1 TRAINING

Provide training for all municipal personnel involved in IC/ID and spill response activities, including annual training for all IC/ID inspectors.

A.2 FIELD SURVEYS

Conduct field investigations of the municipal storm drain system to identify sources of non-stormwater discharges.

- Survey high priority areas (as defined under the model program) and make observations. Record observed or suspected dry weather flows.
- Determine the type of flow and try to trace the flow to its source by following storm drain maps, inspecting manholes, and making surface observations.

During the term of the permit, tabulate the following:

- Number of illicit connections / discharges calls and reports
- Number of illicit connections / discharges investigated.
- Number of illicit connections / discharges eliminated.
- Educate any identified responsible parties to the impacts of their actions, explain the stormwater requirements, and provide best management practices.

A.3 SPILL RESPONSE

Implement a spill response program as described in the model program.

- Train all designated spill response agencies in existing spill response and clean-up programs and coordinate illicit discharge programs with neighboring jurisdictions.
- Encourage the use of appropriate spill notification programs.

A.4 PUBLIC REPORTING

Develop an information tracking system for the following:

- Document and compile data on IC/ID inspection, enforcement, and public education activities for an annual report.
- Document and compile data on spill response, enforcement, and public education activities for an annual report.
- Develop a tracking system designed to identify and prioritize target areas for proactive investigations.

Appendix B2
Spill Prevention Coordination

B2.1 PROCEDURES

This appendix discusses spill prevention coordination procedures that identify:

- Divisions or sections responsible for responding to reports of spills
- General and specific spill response procedures including responsible division or section
- Spill response training activities
- Activities conducted to improve spill response procedures and equipment

B2.1.1 Divisions or Sections Responsible for Responding to Reports of Spills

Identify the divisions or sections responsible for responding to reports of spills and note divisions or sections that respond to specific types of spills such as hazardous materials spills or sewagespills. Also indicate the specific field staff who respond to spills and the level of support they provide to lead emergency response agencies and source of spill investigations.

B2.1.2 General and Specific Spill Response Procedures

Describe or reference general spill response procedures involved in responding to complaints and identifying spills through inspections. Include the spill response process from the spill identification stage through clean up and report preparation. Copies of the forms and reports prepared to document spills should also be included. Specific procedures for hazardous materials spills, floods, and sewage spills should be referenced. Contractor support for spill events, if applicable, should also be noted.

B2.1.3 Spill Response Training Activities

Provide an overview of all spill response training that is conducted within the various divisions and sections of the agencies.

B2.1.4 Activities to Improve Spill Response Procedures and Equipment

List all activities conducted within the implementing agency to improve spill response procedures and update equipment. Explain how improvements are identified, prioritized, and implemented. Include a schedule of how often spill response procedures and equipment are evaluated.

Appendix B3

Spill Investigation, Containment And Cleanup

B3.1 INVESTIGATION

Depending on the location of the spill and the type of material, the appropriate department/agency should be notified. This may include:

- Storm drain maintenance, if the spill reaches the storm drain system
- Street and road maintenance, if the spill is in the public right-of-ways
- Sewer system maintenance, if the material is from the sewage system
- Industrial waste inspection, if the material is from industrial facilities
- Fire Departments/"first responders," if the material may be hazardous
- Contractors for hazardous materials, if the material is hazardous

These departments/agencies should determine the nature of the material and the extent of the spill. If any agency determines there is a chance that the spill involves hazardous materials, then the local Administering Agency will be notified. An example of spill investigation procedures is depicted in Figure B3-1. Reporting procedures for hazardous substances are discussed further in Section 5 of this Illicit Connection/Illicit Discharge Elimination model program.

B3.2 CONTAINMENT AND CLEANUP

Once the nature and extent of the spill is determined, the appropriate departments and field superintendents will be notified to contain and clean up the spill. The three types of cleanup scenarios are (1) hazardous, (2) wastewater, and (3) other non-hazardous materials.

B3.2.1 Hazardous

Handling procedures regarding releases of hazardous or potentially hazardous substances into the environment are covered in a number of federal and state regulations, including: Comprehensive Environmental Response, Compensation and Liability Act (CERCLA); Superfund Amendments and Reauthorization Act (SARA); Resource Conservation and Recovery Act (RCRA); and multiple bills codified under Division 20 of the California Health and Safety Code. These procedures are well established and are practiced by local hazardous materials response teams - generally a local Fire Department.

Material determined to be hazardous will be contained by the appropriate hazardous material response team. The team will contact an approved contractor for cleanup. Details are contained in the local *Emergency Response Procedures* manual.

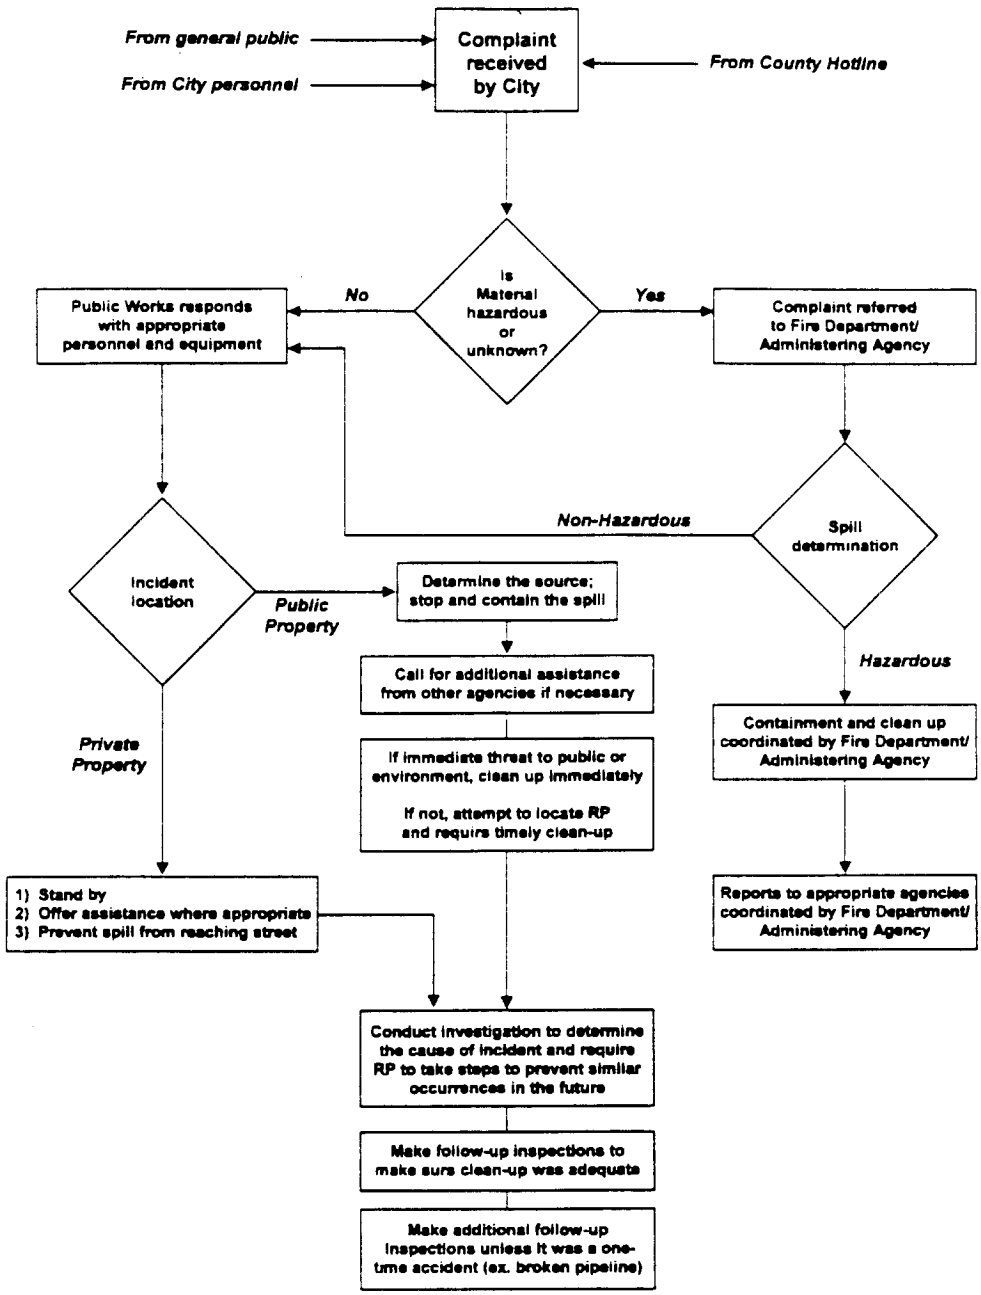

Figure B3-1
Spill Investigation, Containment and Cleanup

B3.2.2 Wastewater

Field crews responding to a sewage spill or overflow should contain the spill to prevent entry of the sewage into the storm drain system or natural watercourse. This will involve a coordinated effort between the sewer, street, and storm drain maintenance crews.

To the maximum extent possible, sewage should be prevented from entering the storm drain system by covering or blocking storm drain inlets and catch basins or by containing or diverting the overflow away from open channels and other storm drain fixtures (using sandbags, inflatable dams, etc.).

In the event that raw sewage enters a storm drain catch basin, where possible the sewage should be vacuumed or pumped out of the catch basin. If a sewage overflow enters a storm drain channel, where possible the downstream channel area should be blocked, flushed with potable water and the captured water pumped to a nearby sewer manhole. Any time a sewage spill enters the storm drain system and has the potential to reach coastal waterways, the local agency and L.A. County Dept. of Health Services, Bureau of Environmental Protection must be notified (323) 881-4147.

Once the spill is contained, it should be removed and the area disinfected. Every effort should be made to ensure that the disinfectant is not discharged to the storm drain system, using methods such as those described above.

B3.2.3 Other Non-hazardous Materials

Non-hazardous materials should generally be removed by appropriate crews with knowledge of or jurisdiction over the location of the spill, as indicated in Section B3.1. Because the situations and materials will vary widely, procedures will vary as well.

All materials should be prevented from entering waterways to the maximum extent possible. Many materials in sufficient quantities can deplete the oxygen level in receiving waters, or smother benthic communities. Typical examples of these materials include landscape waste, milk, flour, and many other organic liquids and solids or fine powders. These materials should generally be removed by first collecting and/or sweeping up all solids and disposing them in a landfill or other approved location. Liquids should be diverted to an area away from waterways where they may be removed with a vacuum truck or can soak into the ground.

Appendix C
Illicit Disposal Prioritization Guidance

If prioritization is necessary, evaluate and prioritize the illicit disposal incidents and their drainage areas to determine in what order they should be investigated. Compile information on previous reports of illicit disposal from various local sources such as Public Works, Fire, and Environmental Health Departments. Arrange the data by drainage area subunit of each watershed. Use this information to determine the highest priority areas for inspection, cleanup, and enforcement using a method such as the one shown in Table C-1.

Table C-1
Drainage Area Priorities for Illicit Disposal

Priority	Characteristic
Priority 1	Drainage area contains disposal incidents that have the greatest potential negative effect on stormwater quality. Materials may include - significant hazardous materials - materials from industrial/manufacturing facilities - large quantities of material, especially near receiving waters
Priority 2	Drainage area contains the highest number of detected or reported incidents of illicit disposal per year (this amount will vary among Permittees).
Priority 3	All other incidents of illicit disposal.

Appendix D

Education Program Guidance for Inspectors, Maintenance and Field Staff

General training will be conducted as part of the Five-Year Storm Water Public Education Strategy described in Section 2.V.C.1.b.iv of the Permit. Specific training on illicit discharges should be conducted for inspectors, maintenance and field staff who may encounter illicit discharges during their regular activities. The following are some of the issues that should be considered when conducting a training program.

- **Who should be trained?** Training for noticing and reporting suspected discharge or disposal may target a broad range of Permittee staff including all field workers and supervisors involved in storm drain system operation and maintenance as well as field inspectors. Training for investigation and follow-up may be targeted at selected Permittee staff with designated inspection, investigation and enforcement responsibility.
- **Who should train?** Trainers selected to conduct employee training should be familiar with both the work performed by the staff and stormwater pollution control principles. A trainer would typically be a superintendent, foreman, or lead worker who oversees the work of small to large crews or inspection staff.
- **What?** The training should cover two major areas: observation/noticing and reporting suspected illicit discharges or disposal; and follow-up to identify the nature and source of the discharge and take appropriate enforcement action to eliminate the discharge.
- **When?** Training can be conducted during regular safety or tailgate meetings or can be scheduled separately. All targeted employees should receive training at least once per year.

The scope of the training should include:

All staff:

- Overview of Clean Water Act and NPDES program
- Potential sources of stormwater pollution
- Potential impact of illicit non-stormwater discharges on receiving waters
- Field observation of illicit discharges/disposal/connections
- Reporting procedures and forms

Staff responsible for investigation and enforcement:

- Identification of nature and source of illicit discharges/disposal
- Municipal code requirements for stormwater pollution prevention on private property

In March 1997, a comprehensive training curriculum reference document, the *Municipal Activities, Public Employee Trainer Manual*, was distributed to all Permittees for their use. It was developed in response to Permit requirements that Permittees have "training materials for

educating appropriate Permittee employees regarding compliance with applicable stormwater permits." It contains suggestions on how to conduct an effective training program, such as:

- How to determine the appropriate audience
- Steps to organize, prepare and conduct a training session
- How to select appropriate presentation materials for specific categories of employees
- Who to contact regarding questions on the training program

The manual also contains all of the materials necessary to conduct the training sessions, including the presentation narrative, slides, video, and handouts.

Appendix C5 of the manual contains specific information for training staff in illicit discharge control, and suggests best management practices that should be used. Copies of the first two pages of Appendix C5 are attached.

APPENDIX C5
ACTIVITY CATEGORY: ILLICIT DISCHARGE CONTROL

This activity involves routine inspection for illegal connections to the storm drain system and evidence of illegal dumping activities. Many municipal employees; such as road maintenance crews, storm drain maintenance personnel, inspectors, sanitation workers, etc., can routinely look for and report incidents of illicit discharges to the storm drain system.

[*Word Slide MA-C5-1 Illicit Discharge Control Activities*]

Illicit Discharge Control Activities

- Illicit connection prevention, detection and removal
- Illegal dumping control

Word Slide MA-C5-1

Illicit discharge control is different from the other categories. Most of these BMPs are preventative measures taken by employees to control pollutant sources from the public's activities. Preventative measures include:

- **Illicit connection prevention, detection and removal**
- **Illegal dumping control**

Activity: Illicit Connection Prevention, Detection and Removal

[*Word Slide MA-C5-2 Activity: Illicit Connection Prevention, Detection and Removal*]

SUGGESTED BMPS
Activity: Illicit Connection Prevention, Detection and Removal

- Prohibit non-stormwater physical connections to the storm drain system
- Conduct visual inspections during construction
- Conduct field screenings
- If needed, use methods to verify physical connections
- Keep accurate records

Word Slide MA-C5-2

- **Prohibit non-stormwater physical connections to the storm drain system** - Ensure that existing building and plumbing codes prohibit non-stormwater physical connections to the storm drain system.
- **Conduct visual inspections during construction** - During the construction phase of new developments, conduct visual inspections to determine if any illegal connections are present.
- **Conduct field screenings** - Conduct field screenings to identify outfalls with characteristics of illegal connections.
- **If needed, use methods to verify physical connections** - Use smoke and dye testing or television camera inspections to verify physical connections.
- **Keep accurate records** - Keep records to track inspections and catalog the storm drain system.

APPENDIX C5
ACTIVITY CATEGORY: ILLICIT DISCHARGE CONTROL

Activity: Illegal Dumping Control

[*Word Slide MA-C5-3 Activity: Illegal Dumping Control*]

- **Train all employees to recognize and report illegal dumping** - Visual observations of catch basins and outfalls can be used to identify areas of suspected illegal dumpings. The following observations at a site could be indications of illegal dumping.
  - Odors
  - Deposits and stains
  - Liquid present during dry weather, especially if it is colored or is associated with an odor.

  Field analysis of the deposits and liquids present also helps to identify dumpings. pH, dissolved oxygen levels, water temperature, chlorine levels, copper levels, detergents and phenols are all useful analysis to help identify areas of illegal dumping.
- **Call 1-888-CLEANLA or City specific number** - Use this hotline to report illegal dumping and to ask questions about suspected dumping. Several other offices are available for questions and reporting:
  - Stormwater program offices - Your city may have an office devoted to the stormwater program. They should have information about illegal dumping available.
  - Call 911 or the police or fire department to report illegal dumping of hazardous material.

[*Note to Trainer: Determine if your city has a specific number for reporting illegal dumping. If there is such a number, provide it in this section.*]

SUGGESTED BMPs
Activity: Illegal Dumping Control

- Train employees to recognize and report illegal dumping
- Call 1-888-CLEANLA or City specific number

Word Slide MA-C5-3

[*Picture Slide MA-C5-4 Illegal Dumping*]

- Example of illegal dumping. Any substance being dumped down a storm drain is an example of illegal dumping.
- Call 1-888-CLEANLA to report the incident.

Illegal Dumping

Picture Slide MA-C5-4

Question and Answer Session

[*Note to Trainer: Provide some time now for questions on the last section of material.*]

Appendix E

Illicit Discharge Investigation and Elimination Guidance

E.1 INTRODUCTION

Once illicit discharges/disposal are detected and identified, they must be eliminated. Sometimes the source of the spill or discharge/disposal is apparent. The incident can be removed through voluntary cleanup/termination or enforcement procedures, and steps can be taken to prevent its recurrence. These prevention methods can include education and outreach materials for residents and businesses; preventive maintenance practices for infrastructure, vehicles and equipment; or additional enforcement.

When the source of the discharge is not apparent, further investigation will be necessary to eliminate it and prevent it from recurring. The following discusses methods that can be used to document the incident, determine the nature of the material, and investigate the source.

E.2 ADVANCE PLANNING

An effective investigation program requires good advance planning. Sufficient staff should be trained to conduct investigations so that qualified staff are available whenever investigations are necessary. Staff should become familiar with illicit discharge investigation and sampling procedures. A good source of information includes *Investigation of Inappropriate Pollutant Entries into Storm Drainage Systems* (EPA/600/R-92/238, 1993, Pitt et al.). General guidance follows below to assist with overall planning, but should not be considered complete for proper sampling quality assurance purposes.

E.2.1 Equipment

Appropriate equipment for field investigations may include:

- Inspection checklists
- Storm drain system map
- Field data log book
- Pens, pencils
- Camera and film
- Flashlight
- Graduated container
- Tape measure
- Ping pong ball or other light floatable
- Stopwatch

- Temperature/pH/conductivity (EC) probe
- Field test kits (e.g., Lamotte test kit)
- 12 1-liter amber glass sample bottles
- 12 1-liter HDPE sample bottles
- Cooler with ice for sample preservation
- Gloves
- Splash goggles/safety glasses
- Deionized water in wash bottle
- First aid kit

E.2.2 Data Collection

Before entering the field, the inspection crew should locate information such as the following on a storm drain/street map for areas that will be investigated:

- All known or suspected pollutant generating activities
- Locations of NPDES dischargers
- All locations where storm drains enter open channels
- Catch basins and storm drain manholes

E.3 VISUAL OBSERVATION

Visual observation of the storm drain system and/or of activities on the surface can provide information on the source of illicit discharges. It is the simplest method to begin with and the least costly. Evidence of illicit discharges may only consist of visual observations because most illicit discharges are intermittent and will probably not be flowing when inspected. A field inspection crew should investigate the surface drainage system in the vicinity of suspected illicit discharges. This may include accessible areas in the public right-of-way adjacent to residences and businesses, catch basins, open channels near known points of discharge, and upstream manholes.

Photos of visual observations should be taken to aid subsequent data analysis and follow-up planning. The following types of visual observations should be recorded on an investigation checklist, such as the one attached to this appendix:

- Location
- General site description

- Amount, appearance of discharge/disposal
- Stains
- Structural cracking and corrosion
- Vegetative growth
- Nearby facilities with poor outside housekeeping practices
- Pipes/hoses connected to/directed toward drainage system

If the source of the discharge is determined, appropriate methods should be used to eliminate it through voluntary cleanup/termination or enforcement procedures, and steps should be taken to prevent its recurrence.

E.4 SAMPLING AND TESTING

If flow is observed, and the source of the discharge is not apparent, the crew should collect a sample and measure flow. Several tests should be conducted to determine the nature of the material. This can be compared to records of local facilities and possible pollutant generating activities as an aid in determining the possible sources of the flow.

The sample should be measured for pH, temperature and conductivity (EC). If any of these parameters are abnormal, or strong odors or flow discoloration are detected, the sample should be analyzed. This can be done with a field test kit, which will detect the presence of copper, phenols, detergents, and chlorine. Findings should be recorded on the inspection checklist.

If visual observations are abnormal and/or the field tests detect high concentrations of any constituent, the crew should consider collecting samples for laboratory analysis. The laboratory can usually supply properly cleaned sample bottles and specify either amber glass or plastic (HDPE) bottles depending on the analyses required. If there is enough flow, the field crew should fill several of each type of bottle to obtain enough sample volume for a range of analyses. If there is a limited quantity or sampling is difficult, the field crew should collect as much sample as possible so that the laboratory can run a limited set of analyses. The samples should be placed in a cooler filled with ice and transported to the lab(s) on the same day. Arrangements should be made prior to the field inspection with an analytical laboratory capable of performing the required analyses.

The laboratory analyses run on each sample should be carefully considered. Given the potential high cost for laboratory work, it is prudent to limit the number of analytical parameters (or analytes) tested for each sample. Tests may be selected based on the findings of indicator analyses, visual observations, field tests, and information collected about the types of materials processed, stored and/or spilled within each drainage area.

Guidance to selecting appropriate sampling methods and analyses can be found in the document referenced in Section E.2.

Appendix F
Enforcement Procedures Guidance

At a minimum, the enforcement strategy must contain the standard procedures listed in Sections 2.2.6 and 3.2.3 of this Illicit Connection/Illicit Discharge Elimination model program. The strategy should be adapted to each Permittee's normal enforcement procedures, and should contain guidance for the appropriate use of different levels of enforcement steps. While legal authority for Permittees varies, most enforcement processes follow a common sequence. The following example is the strategy adopted by Los Angeles County, which illustrates this approach:

1. Verbal Warning. Minor violations that may immediately be terminated.
2. Information Notice of Violation. First level of enforcement action for a minor violation not causing ongoing harm. Given 30 days to achieve compliance.
3. Notice of Noncompliance. Used where there is failure to abide by some specific directive, permit, ordinance section or regulation. May be given up to 30 days to achieve compliance.
4. Notice of Violation and Order to Comply. Generally in the form of an immediate cease and desist order. May be used at any time where continued discharge would cause a threat to the public health and safety, pollution, nuisance or damage to public or private property. Additional requirements may be imposed to provide a work plan for permanent correction of violation, cleanup, repair damage, etc.
5. Final Letter Notice. A letter notice sent in addition to any field issued Order to comply and may also be sent following lesser field actions if compliance is not achieved within the time constraints.
6. Where violation of multiple statutes is suspected, the agency staff should immediately report the incident to the Los Angeles County District Attorney's Environmental Crimes Strike Force. Where appropriate, the Strike Force will coordinate joint investigations with appropriate agencies. Investigations of criminal activity are treated as confidential. Cases accepted by the District Attorney are not to be reported under Proposition 65 while under active investigation.
7. If a specific act in violation of a city ordinance or county statute has occurred, the agency staff may formally request the District Attorney to file a complaint. The District Attorney may also unilaterally take such action on the basis of its own investigation.

Appendix G
Record Keeping and Documentation

On the pages that follow are examples of forms that can be used to document illicit discharges/disposal and illicit connections.

Illicit Discharge/Connection Reporting and Response

Date/Time: _____

Reported by: _____

Address: _____

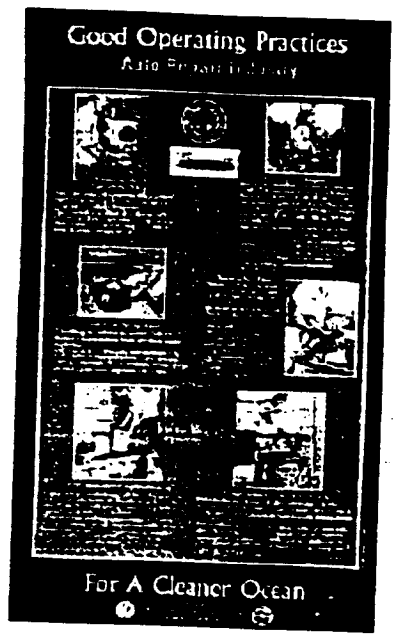
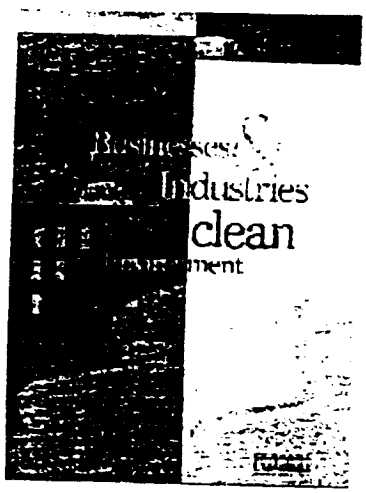
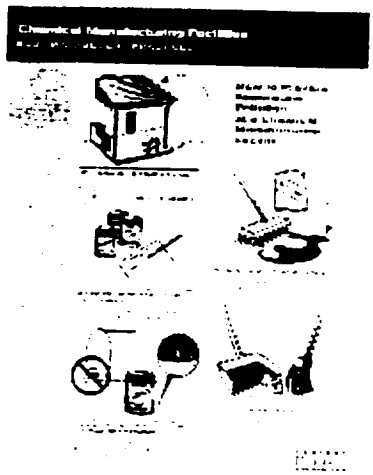
Appendix H
Existing Outreach Materials

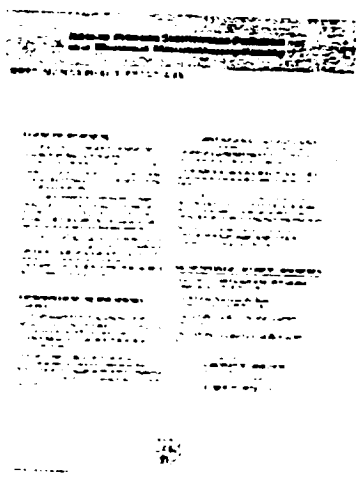
Appendix H
Existing Outreach Materials

The following are samples of existing outreach materials that can be used to educate the public about stormwater quality and potential illicit discharges. Additional materials are available from LACDPW by calling the Environmental Affairs Section at 626-458-3541.









R0000690

Appendix I

Illicit Connection Investigations Guidance

I.1 FIELD SCREENING TECHNIQUES

If evidence of an illicit discharge is detected, as described in Section 2, and the source does not appear to be evident or above ground, investigations will be conducted to determine if the discharge is being conveyed through an illicit connection. A good source of information includes *Investigation of Inappropriate Pollutant Entries into Storm Drainage Systems* (EPA/600/R-92/238.1993, Pitt et al). General guidance follows below. These techniques can also be used if a Permittee elects to survey sections of their system for illicit connections.

I.1.1 Document Research

Maps of drainage facilities can be reviewed to locate upstream connections and drainage basins as an initial step to locate potential illicit connections. Other records, such as connection permits and discharge permits, can also be reviewed to determine if legal connections may be the source.

I.1.2 Physical Inspections

Catch basins, manholes and other facilities that can be safely investigated from the surface should be physically checked for evidence of connections. This may be a hard pipe connection, or could be a hose or other conveyance that directs a discharge into the storm drain facility.

Facilities that are large enough for personnel to enter can also be physically inspected, however, entry into facilities requires strict adherence to health and safety procedures, including confined space entry procedures. In general, a space is "confined" if it is not intended for human occupancy, has limited openings for entry or exit, and has insufficient natural or mechanical ventilation. Information on safety procedures can be found in many documents, including the *Occupational Safety and Health Guidance Manual*, National Institute for Occupational Safety and Health; *OSHA Safety and Health Standards 29 CFR 1910 (General Industry)*, US Department of Labor, and *Title 8 of the California Code of Regulations, General Industry Safety Order*.

I.1.3 Dye Tests

Dye tests can reveal illicit connections in areas where storm drain flows are unexplained and the Permittee has access to suspect facilities. Typical dye tests consist of the addition of fluorescent dye to a floor drain or waste line from a domestic, commercial or industrial process, followed by monitoring for the dye in downstream storm drains. Permittees should conduct dye testing facility by facility (in each area where unexplained flow exists) until all facilities in the area are tested.

I.1.4 Smoke Tests

Smoke tests can reveal if illicit connections exist, and can reveal their source. Storm drains are sealed via sandbags or other sealing devices (plugs, etc.) and smoking incendiary devices are ignited upstream of the seal. Simultaneous inspections inside area facilities should reveal illicit connections even in the absence of flow. As illicit discharges are intermittent, smoke tests offer real advantages over other types of illicit discharge source identification methods. However, as many legitimate connections to a storm drain may exist (roof drains, street drains, etc.) smoke may be observed extensively. This may cause some illicit connections to be missed, and create a problem with area businesses and residents as excessive smoke begins to enter private property.

I.1.5 T.V. Inspections

T.V. inspections can reveal if illicit connections exist, but cannot be used to view up the connection to determine the source. Robotized or otherwise mobile television cameras allow visual inspection of storm drains (pipes) too small or dangerous for personnel to enter. Although an excellent method of identifying and documenting illicit connections, T.V. inspections have high costs unless the equipment is already owned or can be borrowed from neighboring agencies.

Appendix J

Illicit Connection Prioritization Guidance

If prioritization is necessary, evaluate and prioritize the suspected illicit connections and their drainage areas to determine in what order they should be investigated. Compile information on areas of old commercial/industrial facilities and areas where drainage facilities are older than 30 years. Also compile information on previous reports of illicit discharge/dumping and spills from various local sources such as Public Works, Fire, and Environmental Health Departments. Arrange the data by drainage area subunit of each watershed. Use this information to determine the highest priority areas for inspection, cleanup, and enforcement using a method such as the one shown in Table J-1.

Table J-1
Drainage Area Priorities for Illicit Connections

Priority	Characteristic
Priority 1	- Drainage area contains - old commercial/industrial facilities and areas with heavy industry listed under subchapter N of 40 CFR Parts 405-471, - drainage system facilities older than 30 years, and - the highest number of detected or reported incidents of illicit discharge per year (this amount will vary among Permittees).
Priority 2	Drainage area contains - old commercial/industrial facilities and areas with heavy industry listed under subchapter N of 40 CFR Parts 405-471, and - drainage system facilities older than 30 years
Priority 3	Drainage area contains - old commercial/industrial facilities and areas with heavy industry listed under subchapter N of 40 CFR Parts 405-471.
Priority 4	All other suspected illicit connections.

The industries listed in the Code of Federal Regulations, Parts 405 to 471 are as follows (Note: not all numbers between 405 and 471 have been assigned):

405 Dairy Products Processing
406 Grain Mills
407 Canned and Preserved Fruits and Vegetables Processing
408 Canned and Preserved Seafood Processing
409 Sugar Processing
410 Textile Mills
411 Cement Manufacturing
412 Feedlots
413 Electroplating
414 Organic Chemicals, Plastics, and Synthetic Fibers
415 Inorganic Chemicals Manufacturing
417 Soap and Detergent Manufacturing
418 Fertilizer Manufacturing

419 Petroleum Refining
420 Iron and Steel Manufacturing
421 Nonferrous Metals Manufacturing
422 Phosphate Manufacturing
423 Steam Electric Power Generating
424 Ferroalloy Manufacturing
425 Leather Tanning and Finishing
426 Glass Manufacturing
427 Asbestos Manufacturing
428 Rubber Manufacturing
429 Timber Products Processing
430 Pulp, Paper, and Paperboard
431 The Builders' Paper and Board Mills
432 Meat Products
433 Metal Finishing
434 Coal Mining
435 Oil and Gas Extraction
436 Mineral Mining and Processing
439 Pharmaceutical Manufacturing
440 Ore Mining and Dressing
443 Paving and Roofing Materials (Tars and Asphalt)
446 Paint Formulating
447 Ink Formulating
454 Gum and Wood Chemicals Manufacturing
455 Pesticide Chemicals
457 Explosives manufacturing
458 Carbon Black Manufacturing
459 Photographic
460 Hospital
461 Battery Manufacturing
463 Plastics Molding and Forming
464 Metal Molding and Casting
465 Coil Coating
466 Porcelain Enameling
467 Aluminum forming
468 Copper Forming
469 Electrical and Electronic Components
Nonferrous Metals Forming and Metal Powders

Appendix K
Public Reporting

K.1 GENERAL

A method to receive reports from the public regarding illicit discharges was established by LACDPW for use by all Permittees. Permittees may choose to use this system, or may establish and maintain a local system that contains similar elements. Permittees who choose to establish their own system should model their procedures after those of the countywide system described below. The system must have a method to receive incoming calls, document necessary information about the incident, and dispatch the appropriate personnel or forward the information to the appropriate jurisdiction.

K.2 COUNTYWIDE REPORTING SYSTEM MAINTAINED BY LACDPW

K.2.1 Receiving Incoming Calls

In August 1993, the LACDPW established a Hotline number for all residents throughout the county to report illicit discharges and dumping into storm drains. That number was (800) 303-0003. In May 1996, the LACDPW established a new number to provide the public with information about several pollution prevention programs as well as reporting illicit discharges and dumping into storm drains:

(888) CLEAN LA

The LACDPW will publicize the number countywide, receive calls and collect relevant information, and route the calls to the appropriate local agency for investigation and cleanup. The number has 24-hour automated information that can access the dispatcher

K.2.2 Communications and Coordination

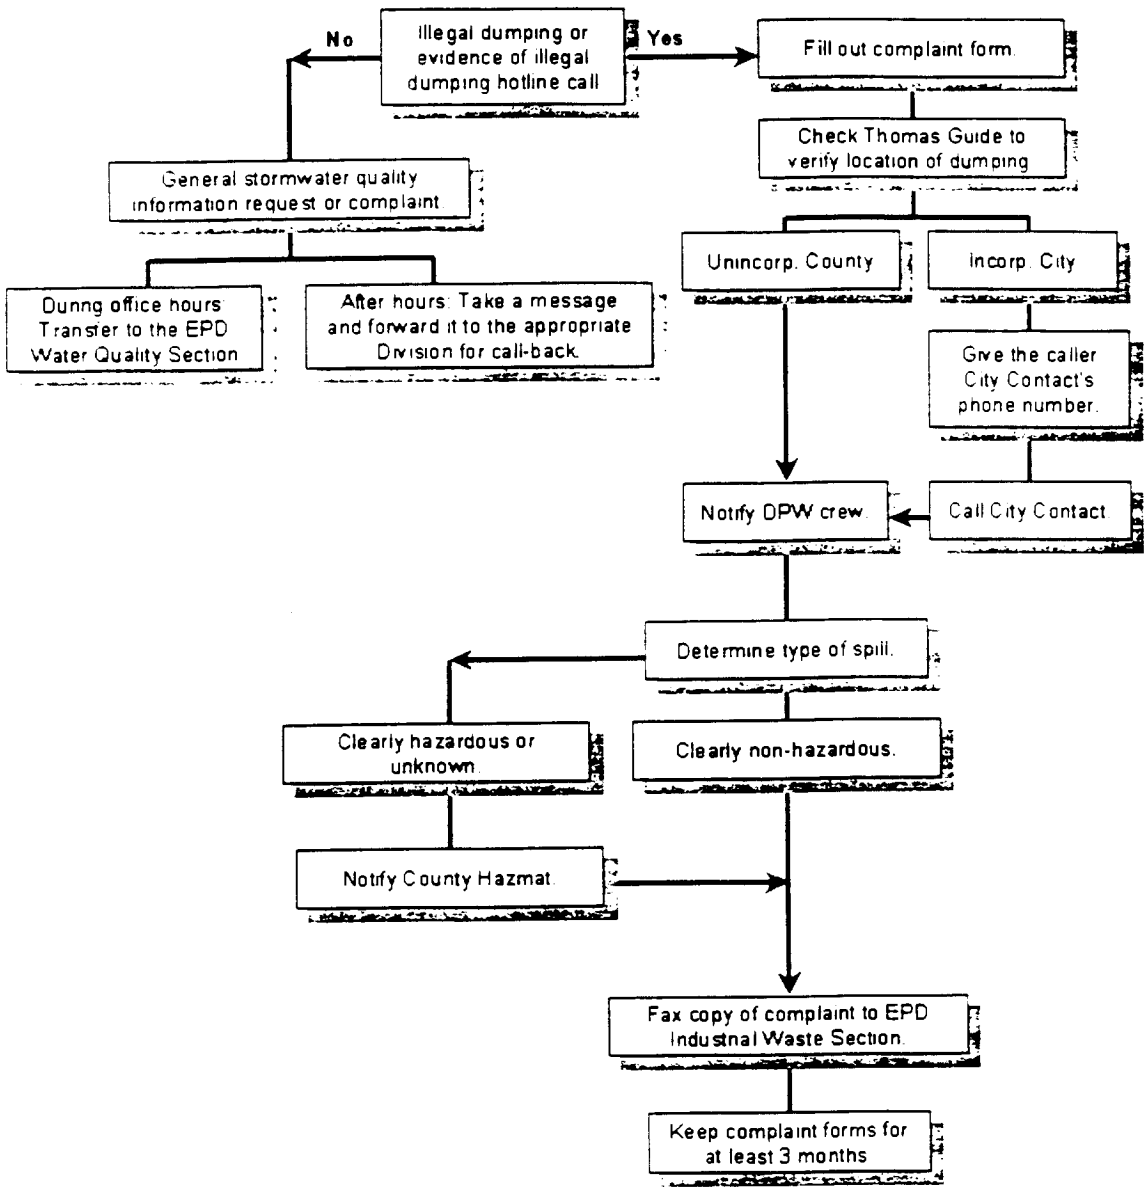
When Hotline calls come in, the LACDPW dispatcher will solicit information from the callers, fill out the LACDPW internal reporting form *Illegal Dumping Complaint*, and enter all information into the Hazardous Materials System Database (HMS Database). The dispatcher will check the Thomas Guide to verify the location of the incident then notify the designated local contact by phone and by faxing a copy of the *Illegal Dumping Complaint* form. The dispatcher will also give the caller the name and phone number of the local contact for his/her future reference. A flowchart depicting the Hotline response activities and a list of local Permittee contacts is attached. This list may be updated in the future as department contacts and phone numbers change.

For incidents under Los Angeles County's jurisdiction, the dispatcher will notify the appropriate field superintendent to ensure pollution prevention actions are taken. If the dispatcher suspects

that the incident involves hazardous materials, then the local Administering Agency will be notified.

The LACDPW will track all reports of illicit discharges within the unincorporated areas and where the County has jurisdiction by assigning each call a job order number. This job order number will remain open until all investigations and follow-up procedures have been completed, and staff phone and/or fax the dispatcher final information. The LACDPW will periodically generate reports on the status of open jobs to ensure that all reports are being fully addressed and response activities are being coordinated. All Hotline calls that are referred to the local jurisdiction will also receive a job order number. Once the incident is resolved, Permittees must notify the dispatcher, and the file will be closed.

Hotline Response Flowchart



24-HOUR SPILL RESPONSE TELEPHONE NUMBERS			
AGENCY	**NUMBER**	**TIME**	**CONTACT**
Agoura Hills	818-597-7300	7am-6pm/M-TH	Public Works Department

Appendix L
Hazardous Substances

L.1 Code of Federal Regulations (CFR) References

The following items are included here:

- The characteristics of "unlisted" hazardous substances from 40 CFR § 261.20 through 261.24
- "Listed" hazardous substances from Table 302.4 of 40 CFR § 302

L.1.1 Characteristics of "Unlisted" Hazardous Substances

261.20 General.

(a) A solid waste, as defined in 261.2, which is not excluded from regulation as a hazardous waste under 261.4(b), is a hazardous waste if it exhibits any of the characteristics identified in this subpart.

[Comment: 262.11 of this chapter sets forth the generator's responsibility to determine whether his waste exhibits one or more of the characteristics identified in this subpart]

(b) A hazardous waste which is identified by a characteristic in this subpart is assigned every EPA Hazardous Waste Number that is applicable as set forth in this subpart. This number must be used in complying with the notification requirements of section 3010 of the Act and all applicable recordkeeping and reporting requirements under parts 262 through 265, 268, and 270 of this chapter.

(c) For purposes of this subpart, the Administrator will consider a sample obtained using any of the applicable sampling methods specified in appendix I to be a representative sample within the meaning of part 260 of this chapter.

[Comment: Since the appendix I sampling methods are not being formally adopted by the Administrator, a person who desires to employ an alternative sampling method is not required to demonstrate the equivalency of his method under the procedures set forth in 260.20 and 260.21.]

[45 FR 33119, May 19, 1980, as amended at 51 FR 40636, Nov. 7, 1986; 55 FR 22684, June 1, 1990; 56 FR 3876, Jan. 31, 1991]

261.21 Characteristic of ignitability.

(a) A solid waste exhibits the characteristic of ignitability if a representative sample of the waste has any of the following properties:

(1) It is a liquid, other than an aqueous solution containing less than 24 percent alcohol by volume and has flash point less than 60øC (140øF), as determined by a Pensky-Martens Closed Cup Tester, using the test method

specified in ASTM Standard D-93-79 or D-93-80 (incorporated by reference, see 260.11), or a Setaflash Closed Cup Tester, using the test method specified in ASTM Standard D-3278-78 (incorporated by reference, see 260.11), or as determined by an equivalent test method approved by the Administrator under procedures set forth in 260.20 and 260.21.

(2) It is not a liquid and is capable, under standard temperature and pressure, of causing fire through friction, absorption of moisture or spontaneous chemical changes and, when ignited, burns so vigorously and persistently that it creates a hazard.

(3) It is an ignitable compressed gas as defined in 49 CFR 173.300 and as determined by the test methods described in that regulation or equivalent test methods approved by the Administrator under 260.20 and 260.21.

(4) It is an oxidizer as defined in 49 CFR 173.151.

(b) A solid waste that exhibits the characteristic of ignitability has the EPA Hazardous Waste Number of D001.

[45 FR 33119, May 19, 1980, as amended at 46 FR 35247, July 7, 1981; 55 FR 22684, June 1, 1990]

261.22 Characteristic of corrosivity.

(a) A solid waste exhibits the characteristic of corrosivity if a representative sample of the waste has either of the following properties:

(1) It is aqueous and has a pH less than or equal to 2 or greater than or equal to 12.5, as determined by a pH meter using Method 9040 in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication SW-846, as incorporated by reference in 260.11 of this chapter.

(2) It is a liquid and corrodes steel (SAE 1020) at a rate greater than 6.35 mm (0.250 inch) per year at a test temperature of 55øC (130øF) as determined by the test method specified in NACE (National Association of Corrosion Engineers) Standard TM-01-69 as standardized in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication SW-846, as incorporated by reference in 260.11 of this chapter.

(b) A solid waste that exhibits the characteristic of corrosivity has the EPA Hazardous Waste Number of D002.

[45 FR 33119, May 19, 1980, as amended at 46 FR 35247, July 7, 1981; 55 FR 22684, June 1, 1990; 58 FR 46049, Aug. 31, 1993]

261.23 Characteristic of reactivity.

(a) A solid waste exhibits the characteristic of reactivity if a representative sample of the waste has any of the following properties:

(1) It is normally unstable and readily undergoes violent change without detonating.

(2) It reacts violently with water.

(3) It forms potentially explosive mixtures with water.

(4) When mixed with water, it generates toxic gases, vapors or fumes in a quantity sufficient to present a danger to human health or the environment.

(5) It is a cyanide or sulfide bearing waste which, when exposed to pH conditions between 2 and 12.5, can generate toxic gases, vapors or fumes in a quantity sufficient to present a danger to human health or the environment.

(6) It is capable of detonation or explosive reaction if it is subjected to a strong initiating source or if heated under confinement.

(7) It is readily capable of detonation or explosive decomposition or reaction at standard temperature and pressure.

(8) It is a forbidden explosive as defined in 49 CFR 173.51, or a Class A explosive as defined in 49 CFR 173.53 or a Class B explosive as defined in 49 CFR 173.88.

(b) A solid waste that exhibits the characteristic of reactivity has the EPA Hazardous Waste Number of D003.

[45 FR 33119, May 19, 1980, as amended at 55 FR 22684, June 1, 1990]

261.24 Toxicity characteristic.

(a) A solid waste exhibits the characteristic of toxicity if, using the Toxicity Characteristic Leaching Procedure, test Method 1311 in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication SW-846, as incorporated by reference in 260.11 of this chapter, the extract from a representative sample of the waste contains any of the contaminants listed in table 1 at the concentration equal to or greater than the respective value given in that table. Where the waste contains less than 0.5 percent filterable solids, the waste itself, after filtering using the methodology outlined in Method 1311, is considered to be the extract for the purpose of this section.

(b) A solid waste that exhibits the characteristic of toxicity has the EPA Hazardous Waste Number specified in Table I which corresponds to the toxic contaminant causing it to be hazardous.

Table 1-Maximum Concentration of Contaminants for the Toxicity Characteristic

EPA HW No. (1)	Contaminant	CAS No. (2)	Regulatory Level (mg/L)
D004	Arsenic	7440-38-2	5.0
D005	Barium	7440-39-3	100.0
D018	Benzene	71-43-2	0.5
D006	Cadmium	7440-43-9	1.0

D043	Vinyl chloride	75-01-4	0.2

(1)Hazardous waste number.

(2)Chemical abstracts service number.

(3)Quantitation limit is greater than the calculated regulatory level. The quantitation limit therefore becomes the regulatory level.

(4)If o-, m-, and p-Cresol concentrations cannot be differentiated, the total cresol (D026) concentration is used. The regulatory level of total cresol is 200 mg/l.

[55 FR 11862, Mar. 29, 1990, as amended at 55 FR 22684, June 1, 1990; 55 FR 26987, June 29, 1990; 58 FR 46049, Aug. 31, 1993]

F006 10 (4.54)			1*	4	F006	A
Wastewater treatment sludges from electroplating operations except from the following processes: (1) sulfuric acid anodizing of aluminum, (2) tin plating on carbon steel, (3) zinc plating (segregated basis) on carbon steel, (4) aluminum or zinc-aluminum plating on carbon steel, (5) cleaning/stripping associated with tin, zinc and aluminum plating on carbon steel, and (6) chemical etching and milling of aluminum.						
F007 10 (4.54)			1*	4	F007	A
Spent cyanide plating bath solutions from electroplating operations.						
F008 10 (4.54)			1*	4	F008	A
Plating bath residues from the bottom of plating baths from electroplating operations where cyanides are used in the process.						
F009 10 (4.54)			1*	4	F009	A
Spent stripping and cleaning bath solutions from electroplating operations where cyanides are used in the process.						
F010 10 (4.54)			1*	4	F010	A
Quenching bath residues from oil baths from metal heat treating operations where cyanides are used in the process.						
F011 10 (4.54)			1*	4	F011	A
Spent cyanide solution from salt bath pot cleaning from metal heat						

treating operations.					
F012	10 (4.54)	1*	4	F012	A
Quenching wastewater treatment sludges from metal heat treating operations where cyanides are used in the process.					
F019	10 (4.54)	1	4	F019	A
Wastewater treatment sludges from the chemical conversion coating of aluminum except from zirconium phospnating in aluminum can washing when such phosphating is an exclusive conversion coating process					
F020	1 (0.454)	1*	4	F020	X
Wastes (except wastewater and spent carbon from hydrogen chloride purification) from the production or manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of tri-or-tetrachlorophenol, or of intermediates used to produce their pesticide derivatives. (This listing does not include wastes from the production of hexachlorophene from highly purified 2,4,5-trichlorophenol.)					
F021	1 (0.454)	1*	4	F021	X
Wastes (except wastewater and spent carbon from hydrogen chloride purification) from the production or manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of pentachlorophenol, or of intermediates used to produce its derivatives.					
F022	1 (0.454)	1*	4	F022	X
Wastes (except wastewater and spent carbon from hydrogen chloride purification) from the manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of tetra-, penta-, or hexachlorobenzenes under alkaline conditions.					
F023	1 (0.454)	1*	4	F023	X
Wastes (except wastewater and spent carbon from hydrogen chloride purification) from the production of materials on equipment previously used for the production or manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of tri- and					

tetrachlorophenols. (This listing does not include wastes from equipment used only for the production or use of hexachlorophene from highly purified 2,4,5-tri-chlorophenol.)					
F024	1 (0.454)	1*	4	F024	X
Wastes, including but not limited to distillation residues, heavy ends, tars, and reactor cleanout wastes, from the production of chlorinated aliphatic hydrocarbons, having carbon content from one to five, utilizing free radical catalyzed processes. (This listing does not include light ends, spent filters and filter aids, spent dessicants (sic), wastewater, wastewater treatment sludges, spent catalysts, and wastes listed in Section 261.32)					
F025	1 (0.454)	1*	4	F025	X
Condensed light ends, spent filters and filter aids, and spent desiccant wastes from the production of certain chlorinated aliphatic hydrocarbons, by free radical catalyzed processes. These chlorinated aliphatic hydrocarbons are those having carbon chain lengths ranging from one to and including five, with varying amounts and positions of chlorine substitution.					
F026	1 (0.454)	1*	4	F026	X
Wastes (except wastewater and spent carbon from hydrogen chloride purification) from the production of materials on equipment previously used for the manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of tetra-, penta-, or hexachlorobenzene under alkaline conditions.					
F027	1 (0.454)	1*	4	F027	X
Discarded unused formulations containing tri-, tetra-, or pentachlorophenol or discarded unused formulations containing compounds derived from these chlorophenols. (This listing does not include formulations containing hexachlorophene synthesized from prepurified 2,4,5-tri-chlorophenol as the sole					

component.)					
F028		1*	4	F028	X
1 (0.454)					
Residues resulting from the incineration or thermal treatment of soil contaminated with EPA Hazardous Waste Nos. F020, F021, F022, F023, F026, and F027.					
F032		1**	4	F032	
X 1 (0.454)					
Wastewaters (except those that have not come into contact with process contaminants), process residuals, preservative drippage, and spent formulations from wood preserving processes generated at plants that currently use or have previously used chlorophenolic formulations (except potentially cross-contaminated wastes that have had the F032 waste code deleted in accordance with 261.35 of this chapter or potentially cross-contaminated wastes that are otherwise currently regulated as hazardous wastes (i.e., F034 or F035), and where the generator does not resume or initiate use of chlorophenolic formulations. This listing does not include K001 bottom sediment sludge from the treatment of wastewater from wood preserving processes that use creosote and or pentachlorophenol.					
F034		1**	4	F034	
X 1 (0.454)					
Wastewaters (except those that have not come into contact with process contaminants), process residuals, preservative drippage, and spent formulations from wood preserving processes generated at plants that use cresote formulations. This listing does not include K001 bottom sediment sludge from the treatment of wastewater from wood preserving processes that use creosote and/or pentachlorophenol					
F035		1*	4	F035	
X 1 (0.454)					
Wastewaters (except those that have not come into contact with process contaminants), process residuals, preservative drippage, and spent formulations from wood preserving processes generated					

at plants that use inorganic preservatives containing arsenic or chromium. This listing does not include K001 bottom sediment sludge from the treatment of wastewater from wood preserving processes that use creosote and/or pentachlorophenol.						
F037 (10 454) Petroleum refinery primary oil water/ solids separation sludge-Any sludge generated from the gravitational separation of oil water solids during the storage or treatment of process wastewaters from petroleum refineries Such sludges include, but are not limited to, those generated in oil water/solids separators; tanks and impoundments; ditches and other conveyances; sumps; and stormwater units receiving dry weather flow. Sludge generated in stormwater units that do not receive dry weather flow, sludges generated from non-contact once-through cooling waters segregated for treatment from other process or oily cooling waters, sludges generated in aggressive biological treatment units as defined in 261.31(b)(2) including sludges generated in one or more additional units after wastewaters have been treated in aggressive biological treatment units; and K051 wastes are not included in this				1*	4	F037	X

listing						
F038 (0.454)			1*	4	F038	X
Petroleum refinery secondary (emulsified) oil/ water/solids separation sludge- Any sludge and/or float generated from the physical and/or chemical separation of oil watersolids in process wastewaters and oily cooling wastewaters from petroleum refineries. Such wastes include, but are not limited to, all sludges and floats generated in: induced air flotation (IAF) units, tanks and impoundments, and all sludges generated in DAFunits. Sludges generated in stormwater units that do not receive dry weather flow, sludges generated from once-through non-contact cooling waters segregated for treatment from other process or oil cooling wastes, sludges and floats generated in aggressive biological treatment units as defined in 261.31(b)(2) (including sludges and floats generated in one or more additional units after wastewaters have been treated in aggressive biological treatment units) and F037, K048, and K051 wastes are not included in this listing.						
K001 (0.454)			1*	5	K001	X
Bottom sediment sludge from the						

treatment of wastewaters from wood preserving processes that use creosote and/or pentachlorophenol.					
K002 Wastewater treatment sludge from the production of chrome yellow and orange pigments.	10 (4.54)	1*	4	K002	A
K003 Wastewater treatment sludge from the production of molybdate orange pigments.	10 (4.54)	1*	4	K003	A
K004 Wastewater treatment sludge from the production of zinc yellow pigments.	10 (4.54)	1*	4	K004	A
K005 Wastewater treatment sludge from the production of chrome green pigments.	10 (4.54)	1*	4	K005	A
K006 Wastewater treatment sludge from the production of chrome oxide green pigments (anhydrous and hydrated).	10 (4.54)	1*	4	K006	A
K007 Wastewater treatment sludge from the production of iron blue pigments.	10 (4.54)	1*	4	K007	A
K008 Oven residue from the production of chrome oxide green pigments.	10 (4.54)	1*	4	K008	A
K009 Distillation bottoms from the production of acetaldehyde from ethylene.	10 (4.54)	1*	4	K009	A
K010 Distillation side cuts from the production of acetaldehyde from ethylene.	10 (4.54)	1*	4	K010	A
K011 Bottom stream from the wastewater stripper in the production of acrylonitrile.	10 (4.54)	1*	4	K011	A

Condensed liquid light ends from the purification of toluenediamine in the production of toluenediamine via hydrogenation of dinitrotoluene.					
K114	10 (4.54)	1*	4	K114	A
Vicinals from the purification of toluenediamine in the production of toluenediamine via hydrogenation of dinitrotoluene					
K115	10 (4.54)	1*	4	K115	A
Heavy ends from the purification of toluenediamine in the production of toluenediamine via hydrogenation of dinitrotoluene.					
K116	10 (4.54)	1*	4	K116	A
Organic condensate from the solvent recovery column in the production of toluene diisocyanate via phosgenation of toluenediamine					
K117	1 (0.454)	1*	4	K117	X
Wastewater from the reaction vent gas scrubber in the production of ethylene bromide via bromination of ethene.					
K118	1 (0.454)	1*	4	K118	X
Spent absorbent solids from purification of ethylene dibromide in the production of ethylene dibromide.					
K123	10 (4.54)	1*	4	K123	A
Process wastewater (including supernates, filtrates, and washwaters) from the production of ethylenebisdithiocarbamic acid and its salts.					
K124	10 (4.54)	1*	4	K124	A
Reactor vent scrubber water from the production of ethylenebisdithiocarbamic acid and its salts					
K125	10 (4.54)	1*	4	K125	A
Filtration, evaporation, and centrifugation solids from the production of ethylenebisdithiocarbamic acid and its salts					
K126	10 (4.54)	1*	4	K126	A

Baghouse dust and floor sweepings in milling and packaging operations from the production or formulation of ethylenebisdithiocarbamic acid and its salts.						
K131 100 (45.4)		100		4	K131	X
Wastewater from the reactor and spent sulfuric acid from the acid dryer in the production of methyl bromide.						
K132 1000 (454)		1000		4	K132	X
Spent absorbent and wastewater solids from the production of methyl bromide.						
K136 1 (0.454)		1*		4	K136	X
Still bottoms from the purification of ethylene dibromide in the production of ethylene dibromide via bromination of ethene.						
K141 1 (0.454)		1*		4	K141	X
Process related from the recovery of coal tar, including, but not limited to, tar collecting sump residues from the production of coke by-products produced from coal. This listing does not include K087 (decanter tank tar sludge from coking operations.)						
K142 1 (0.454)		1*		4	K142	X
Tar storage tank residues from the production of coke from coal or from the recovery of coke by-products produced from coal.						
K143 1 (0.454)		1*		4	K143	X
Process residues from the recovery of light oil, including, but not limited to, those generated in stills, decanters, and wash oil recovery units from the recovery of coke by-products produced from coal.						
K144 1 (0.454)		1*		4	K144	X
Wastewater sump residues from light oil refining, including, but not limited to, intercepting or contamination sump sludges from the recovery of coke by-products produced from coal.						
K145 1 (0.454)		1*		4	K145	X
Residues from naphthalene collection and recovery operations from the recovery of coke by-products produced from coal.						
K147 1 (0.454)		1*		4	K147	X
Tar storage tank residues from coal tar refining.						
K148 1 (0.454)		1*		4	K148	X

Residues from coal tar distillation, including, but not limited to, still bottoms.					
K149 10 (4.54) Distillation bottoms from the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups. (This waste does not include still bottoms from the distillation of benzyl chloride.)		1*	4	K149	A
K150 10 (4.54) Organic residuals, excluding spent carbon adsorbent, from the spent chlorine gas and hydrochloric acid recovery processes associated with the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups		1*	4	K150	A
K151 10 (4.54) Wastewater treatment sludges, excluding neutralization		1*	4	K151	A

and biological sludges, generated during the treatment of wastewaters from the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups				
K156 Organic waste (including heavy ends, still bottoms, light ends, spent solvents, filtrates, and decantates) from the production of carbamates and carbamoyl oximes.		1*	4	K156
K157 Wastewaters (including scrubber waters, condenser waters, washwaters, and separation waters) from the production of carbamates and carbamoyl oximes (This listing does not include sludges derived from the treatment of these wastewaters)		1*	4	K157
K158 Bag house dusts and filter separation solids from the production of carbamates and carbamoyl oximes		1*	4	K158
K159 Organics from the treatment of thiocarbamate wastes.		1*	4	K159
K160 Solids (including filter wastes, separation solids, and spent catalysts) from the production of thiocarbamates and solids from the treatment of thiocarbamate wastes		1*	4	K160
K161 Purification solids (including filtration, evaporation, and centrifugation solids, bag house dust, and floor sweepings from the production of dithiocarbamate acids and their salts (This listing does not include K125 or K126).		1*	4	K161

* a Indicates the statutory source as defined by 1, 2, 3, and 4 below.
** No reporting of releases of this hazardous substance is required if the diameter of the pieces of the solid metal released is equal to or exceeds

- 100 micrometers (0.004 inches).
- *** The RQ for asbestos is limited to friable forms only.
- 1-indicates that the statutory source for designation of this hazardous substance under CERCLA is CWA Section 311(b)(4).
- 2-indicates that the statutory source for designation of this hazardous substance under CERCLA is CWA Section 307(a).
- 3-indicates that the statutory source for designation of this hazardous substance under CERCLA is CAA Section 112.
- 4-Indicates that the statutory source for designation of this hazardous substance under CERCLA is RCRA Section 3001.
- 1*-Indicates that the 1-pound RQ is a CERCLA statutory RQ.
- s-Indicates that the RQ is subject to change when the assessment of potential carcinogenicity is completed.
- ss-The Agency may adjust the statutory RQ for this hazardous substance in a future rulemaking; until then the statutory RQ applies
- b-The adjusted RQs for radionuclides may be found in Appendix B to this table.
- ***-Indicates that no RQ is being assigned to the generic or broad class.
- (a)Benzene was already a CERCLA hazardous substance prior to the CAA Amendments of 1990 and received an adjusted 10-pound RQ based
- on potential carcinogenicity in an August 14, 1989, final rule (54 FR 33418). The CAA Amendments specify that " benzene (including
- benzene from gasoline)" is a hazardous air pollutant and, thus, a CERCLA hazardous substance
- (b)The CAA Amendments of 1990 list DDE (3547-04-4) as a CAA hazardous air pollutant. The CAS number, 3547-04-4, is for the chemical,
- p,p'-dichlorodiphenylethane, DDE or p,p'-dichlorodiphenyldichloroethylene, CAS number 72-55-9, is already listed in Table 302.4
- with a final RQ of 1 pound. The substance identified by the CAS number 3547-04-4 has been evaluated and listed as DDE to be
- consistent with the CAA seciton 112 listing, as amended.
- (c)Includes mineral fiber emissions from facilities manufacturing or processing glass, rock, or slag fibers (or other mineral
- derived fibers) of average diameter 1 micrometer or less.
- (d)Includes mono- and di- ethers of ethylene glycol, diethylene glycol, and triethylene glycol R-(OCH2CH2)N-OR' where
- n=1, 2, or 3
- R=alkyl or aryl groups
- R'=R, H, or groups which, when removed, yield glycol ethers with the structure: R-(OCH2CH2)N-OH. Polymers are excluded from the
- glycol category.
- (e)Includes organic compounds with more than one benzene ring, and which have a boiling point greater than or equal to 100 oC.
-

[Amended 60 FR 30926, July 12, 1995; 60 FR 7824, Aug. 9, 1995]

Appendix M
Hazardous Substances Reporting

Reporting procedures for hazardous substances are already regulated under a number of federal and state laws including: Comprehensive Environmental Response, Compensation and Liability Act (CERCLA); Superfund Amendments and Reauthorization Act (SARA); Resource Conservation and Recovery Act (RCRA); and multiple bills codified under Division 20 of the California Health and Safety Code. These reporting requirements are too numerous to list here, but have generally been implemented for many years by local hazardous materials response teams or "Administering Agencies"--generally a local fire department. In some areas, the Administering Agency delegates some of the reporting activities (generally the local reporting) to the agency that has jurisdiction over the release. In this case, Permittees should designate an individual/department to report hazardous substances releases.

If the release of a hazardous substance equals or exceeds the reportable quantity in a 24-hour period, the Administering Agency will notify the California Office of Emergency Services (OES) and the National Response Center. There are also many other agencies that could potentially be contacted depending on the location and nature of the release.

Hazardous substances releases, if they enter the storm drain system, are also illicit discharges, and must be documented for the Stormwater Program in the same manner as all other illicit discharges, as described in Section 2. Permittees should coordinate with Administering Agencies to ensure all necessary information is forwarded to a designated individual/department for incorporation into illicit discharge records.

The following are agencies that may be contacted:

Agency	Phone Number
California Office of Emergency Services	(800) 852-7550
National Response Center	(800) 424-8802
Local	
Police agency	Various
Schools	Various
Flood Department	Various
Road Department	Various
County Environmental Health Department	(213) 881-4000
County Agricultural Commissioner	(626) 575-5471
County Air Quality Management District	(909) 396-2000
State	
Fish and Game	(562) 590-5132
Highway Patrol	(213) 664-0695
Caltrans	(213) 897-3656
California Environmental Protection Agency	
Department of Toxic Substances Control	(800) 698-6942
Regional Water Quality Control Board	(213) 266-7500
Federal	
U.S. Coast Guard	(510) 437-3196

Additional agencies such as U.S. Fish and Wildlife, Department of Oil and Gas, and FEMA may also be notified, but these tasks will be carried out by OES or the National Response Center.

ES.1 Overview

On July 15, 1996, the Los Angeles Regional Water Quality Control Board (Regional Board) issued a municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) to the County of Los Angeles and 85 cities (Permittees). This Permit contains a requirement for Permittees to develop and implement within their jurisdiction a Storm Water Management Program (SWMP). The Countywide Storm Water Management Plan (CSWMP) is the unified plan consisting of model programs developed under the Storm Water Management Program requirements as established by the Permit. These model programs are aimed to reduce pollutant discharges to the maximum extent practicable for attaining water quality objectives and protecting beneficial uses of receiving waters in Los Angeles County.

In the 2001 NPDES permit, the CSWMP has been renamed to the Stormwater Quality Management Plan (SQMP). For the remainder of this document, the acronym SQMP is used.

The Permit required the Permittees to develop a model program to address each of the following:

- Illicit Connections and Illicit Discharges,
- Development Planning,
- Development Construction,
- Public Agency Activities, and
- Public Information and Participation.

Each model program is a "stand-alone" document that describes one of these five elements of the SQMP. Record-keeping and reporting requirements are also associated with each model program. This Executive Summary describes the primary requirements of each of the model programs comprising the SQMP. The remainder of this document is the SQMP element referred to as the Development Planning Program, which was approved by the Regional Board in February 1999.

ES.2 Model Illicit Connections / Illicit Discharge Elimination Program

Part 2.II of the Permit contains requirements specifically for the identification and elimination of illicit connections and illicit discharges to the municipal separate storm sewer system (MS4), generally referred to in this document as "storm drain system." The Permit requirements include five components for the

five components for the elimination of illicit connections and illicit discharges. Those five components are:

- Illicit connection elimination,
- Illicit discharge elimination,
- Best management practices (BMPs) program for designated non-storm water discharges,
- Public reporting of illicit discharge and disposal practices, and
- Hazardous waste reporting program.

Illicit Connection Elimination

The goal of this component is to detect and eliminate illicit connections in order to reduce pollutants discharged through such connections to the maximum extent practical. The objectives are to:

- Conduct storm drain system field screening for illicit connections during scheduled infrastructure maintenance by maintenance personnel.
- Determine the source and nature of suspected illicit discharges by investigating connections to the storm drain system.

The model program also describes a methodology that Pemittees may use in prioritizing areas of their jurisdiction for investigation. Once the illicit connection/discharge has been investigated, one of the following actions must occur:

- If the discharge is determined to consist only of exempted non-storm water, the connection will be allowed to remain and will no longer be considered an illicit connection. Permittees may elect to issue a permit for the connection or allow the connection to remain if information on the connection is documented; or
- The discharger will be required to obtain an NPDES permit; or
- The connection will be terminated through voluntary action or enforcement proceedings.

Permittees may prioritize potential problem areas for detection and investigation efforts under this program component, using the methodology defined in this model program.

Illicit Discharge Elimination

The goal of this component is to detect and eliminate illicit discharges from entering the storm drain system to reduce pollutants from such discharge to the maximum extent practicable. The objectives are to:

- Investigate, contain, and clean up incidental spills reported by the public, other agencies or observed by Permittee field staff during the course of their normal daily activities,
- Eliminate through voluntary termination or enforcement action prohibited non-storm water discharges to the storm drain system, and
- Investigate to determine the nature and source of the discharge and eliminate through voluntary termination or enforcement action suspected prohibited non-storm discharges in the storm drain system.

BMPs for Designated Non-Storm Water Discharges

The Permit required the City of Los Angeles to conduct a study on pollutants entering storm drains from street and sidewalk washing operation to:

(i.) Characterize discharges from municipal street washing and sidewalk washing

(ii.) Assess the impacts of such activities and

(iii.) Recommend appropriate BMPs to control any adverse impacts.

The City of Los Angeles completed the study and prepared a report entitled, "A Study of Pollutants Entering Storm Drains from Street and Sidewalk Washing Operations in Los Angeles, California." The Regional Board approved recommended BMPs for street and sidewalk washing activities.

Public Reporting

The goal of this component is to promote, publicize and facilitate public reporting of illicit discharges and illicit disposal practices. Permittees must implement a system for complainant documentation and a follow up response for calls received from the public regarding potential illicit discharges and illicit disposal practices.

Reporting Hazardous Substances Entering the Storm Drain System

The goal of this component is to facilitate appropriate reporting of hazardous substances entering the storm drain system as a result of an illicit discharge. The Permittees must implement a

reporting program to document quantities of hazardous substances entering the storm drain system.

ES.3 MODEL DEVELOPMENT PLANNING PROGRAM

"Development" Projects encompass those projects that are subject to a planning and permitting review process by a Permittee. A "Development" Project may be new development, redevelopment, renovation, remodeling, rehabilitation, infill, or other terms that may be used in a Permittee's ordinances and/or building code. The planning and design of public facilities have similar requirements described in the Model Public Agency Activities Program, another component of the Countywide Storm Water Management Plan.

The fundamental concept of this program component is to identify development that may significantly impact storm water quality and to then to include permanent BMPs in the project's design. Development projects that may significantly impact storm water quality are Planning "Priority" Projects. Other projects are deemed "Exempt" from these program requirements.

Each Permittee will implement a development-planning program that includes the following components:

- System for determining the appropriate category (Priority or Exempt) for a Development Project;
- Recommended list of BMPs to be considered, and as appropriate, implemented for Development Projects;
- Process to ensure that Planning Priority Projects incorporate the Standard Urban Storm Water Mitigation Plans using the recommended list of BMPs;
- Guidelines for California Environmental Quality Act (CEQA) compliance;
- Guidelines for the revision of General Plan elements to include watershed and storm water quality management considerations, when General Plan elements are being significantly rewritten; and
- Developer information program that provides general guidance on the Permittee's development planning program, and specific guidance on BMP selection and the Standard Urban Storm Water Mitigation Plans.

A checklist and flowchart are included in the Model Development Planning Program to assist Permittees in determining whether a project is Priority or Exempt.

ES.4 MODEL DEVELOPMENT CONSTRUCTION PROGRAM

Permittees must also implement a program to manage storm water and urban runoff associated with construction activities within their jurisdictions. The Model Development Construction Program addresses:

- Development and implementation of construction site BMPs;
- Implementation of procedures to verify Notice of Intent (NOI) filing with the State Water Resources Control Board and completion of storm water pollution prevention plan (SWPPP) for projects subject to the California General Construction Permit. and
- Implementation of a construction inspection program.

Construction Site BMPs

A Development Construction Project is defined as projects for which site activities such as clearing, grading, excavation, road construction, structure construction, or structure demolition results in the disturbance of soil.

In certain situations, where impact to storm water quality is a greater threat, Development Construction Projects should be given greater scrutiny to ensure that minimum requirements are met. These projects which present a greater threat to water quality, *but are not subject to the California General Permit for Storm Water Discharges Associated with Construction Activity*[1] are called Construction Priority Projects.

Unless specifically exempted, all Development Construction Projects will be required to implement BMPs to meet minimum water quality protection requirements. As a condition for issuing a grading or building permit, applicants for covered Development Construction Projects shall be required to certify that they understand and will comply with the minimum BMPs requirements related to construction site runoff.

Projects Subject to the General Construction Permit

Developers of construction sites subject to the General Construction Permit are required to prepare and implement a Storm Water Pollution Prevention Plan (state SWPPP). Before issuing building or grading permits, Permittees will require applicants to demonstrate that a Notice of Intent (NOI) has been filed with the State Water Resources Control Board (SWRCB), and that a state SWPPP has been prepared for projects subject to the General Construction Permit.

[1] A project is subject to the General Construction Permit if it disturbs 5 acres or more of soil, or the project results in the disturbance of less than 5 acres but is part of a larger common plan of development or sale that exceeds 5 acres.

Requirements for Construction Priority Projects

Prior to receiving a building or grading permit, applicants for Construction Priority Projects must prepare a local storm water pollution prevention plan (local SWPPP) covering construction materials and waste management control, and must certify that they will implement the local SWPPP year-round. Applicants for Construction Priority projects must also prepare and implement a Wet Weather Erosion Control Plan (WWECP) if the project will leave soil disturbed during the rainy season (November 1 through April 15).

Site Inspection and Enforcement

Each Permittee will implement site inspection procedures to assess whether the minimum requirements for Development Construction Projects are being achieved and appropriate BMPs are being implemented. Site inspections will also determine if local SWPPPs are being implemented at projects where they apply. Developers and/or contractors will also be required to conduct and document self-inspections of their construction site. Each Permittee will also develop and implement enforcement procedures to require that corrective actions be undertaken when the requirements are not met.

ES.5 MODEL PUBLIC AGENCY ACTIVITIES PROGRAM

Part IV.C of the Permit contains requirements specifically for public agency activities and facilities. Components of the Public Agency Activities Model Program describe measures to be taken by Permittees to reduce storm water impacts from public agency activities and facilities such as sanitary sewer systems, public construction activities, vehicle maintenance and material storage facilities, recreation facilities, storm water drainage systems, streets and roads, etc.

Sewage Systems Operations

This program component is applicable to all Permittees who own and operate a sewage collection system. Although sewage systems themselves are not a regular source of storm water pollution, raw sewage contains pollutants that can pose a serious threat to both human health and the quality of receiving waters if they enter the storm drain system through incidents such as spills, leaks, or overflows. The goal of this program is to reduce the impact of Permittee-owned sewage system operations on storm water quality.

The objectives of this program component are to:

- Keep any sewage overflows or leaks from entering the storm drain system or receiving waters.

- Identify and repair sewage system blockages, exfiltrations, overflows and implement procedures for investigating the causes.
- Notify public health authorities in cases where threats to public health exist.

Public Construction Activities Management

This program component is applicable to all Permittees who construct or contract to construct public facilities, including infrastructure. The program component requires the use of temporary best management practices (BMPs) to reduce the discharge of pollutants from public construction sites. In addition, public agency facilities with the potential for having a significant effect on storm water quality when completed by virtue of their size, nature of on-site activities, or other factors must incorporate permanent BMPs in the planning and design of the project.

The objectives of this program component are to:

- Select and incorporate appropriate construction control measures for storm water quality management from construction sites.
- Conduct and inspection program, including enforcement procedures as necessary, to verify that the construction control measures are implemented and performed effectively throughout the construction period.

Vehicle Maintenance / Material Storage Facilities Management

This program component is applicable to all Permittees who own and operate vehicle maintenance or materials storage facilities. Activities at these facilities may generate waste, spills and leaks that could potentially reach the storm drain system and receiving waters. The goal of this program is to make storm water quality a consideration when conducting activities at municipal facilities.

The objectives of this program component are to:

- Identify and evaluate sources of pollutants from public vehicle maintenance/material storage facilities that may affect the quality of storm water discharge from the facility.
- Identify and implement site-specific best management practices to reduce or prevent pollutants in storm water discharges.

Landscape and Recreational Facilities Management

This program component is applicable to all Permittees who own and operate recreational facilities. Maintenance practices at parks and recreation facilities generally include fertilizer and pesticide applications, vegetation maintenance and disposal, swimming pool chemical

maintenance and draining, and trash and debris management. All of these activities have the potential to contribute pollutants to the storm drain system. If improperly managed, potential pollutants can be transported in runoff (storm water and non-storm water discharges) to the storm drain system and subsequently to receiving waters. The goal of the program for landscape and recreational facilities management is to make the storm water quality a consideration when conducting operation and maintenance activities.

The objectives of this program component are to:

- Minimize the discharge of pesticides, herbicides and fertilizers to the storm drain system and receiving waters.
- Prevent the disposal of landscape waste into the storm drain system.
- Minimize the trash, debris and other pollutants from entering Permitee-owned recreational water bodies.
- Discharge municipal swimming pool water in a manner that will not contribute pollutants to receiving waters.

Storm Drain Operation and Management

The storm drain system functions primarily to collect and convey surface runoff to receiving waters during storms in order to prevent flooding. A common municipal activity includes the maintenance of the storm drain system to maintain hydraulic function as intended during storms. The goal of this program is to reduce the impact of storm drain operation and maintenance activities on storm water quality.

The objectives of this program component are to:

- Inspect and clean catch basins annually and keep appropriate records.
- Remove trash and debris annually from open channels and properly dispose of these materials to prevent them from being washed to receiving waters.
- Report prohibited non-storm water discharges observed during the course of normal daily activities so they can be investigated, contained and cleaned up, or eliminated.
- Review maintenance activities to verify that they minimize the amount of pollutants discharged to receiving waters.

Streets and Roads Maintenance

Streets and roads may collect litter and debris from nearby activities, as well as from vehicular traffic. During the course of routine maintenance waste materials are often generated. The goal

of this component is to reduce the impact of Permittee street and road operations and maintenance on storm water quality.

The objectives of this program component are to:

- Sweep curbed streets to reduce the discharge of pollutants associated with activities occurring in street and road rights-of-way.
- Minimize the discharge of pollutants associated with the maintenance of streets and roads.

Parking Facilities Management

Permittees who own parking lots with more than 25 parking spaces located in areas with potential exposure to storm water must have a parking facilities management plan. The goal of this component is to reduce the impact of these parking facilities on the quality of storm water discharges and receiving waters. The objective of this program component is to remove debris from parking facilities to reduce the amount of material that comes into contact with storm water.

Public Industrial Activities

Industrial activities, whether private or public, have the potential to discharge pollutants to the storm drain system. Many industrial facilities are subject to the California General Industrial Activities Storm Water Permit (General Industrial Permit) for control of storm water pollution. The goal of the General Industrial Permit is to reduce the impact of industrial facilities on storm water quality. This provision of the Permit may procedurally simplify and reduce the cost of Permittees' compliance for their industrial facilities (Phase 1) by providing the option to obtain coverage under the Permit in lieu of the General Industrial Permit. The objective of this program component is to comply with all requirements and conditions contained in the General Industrial Permit.

Emergency Procedures

Each Permittee must consider the impact of discharges to the storm drain system during emergency repairs of essential public services and infrastructure, and response to natural disasters. The goal is to reduce the impact of emergency response activities on receiving waters, to the extent possible, without compromising public health and safety.

The objectives of this program component are to:

- Recognize that public health and safety are the highest priority when conducting emergency response activities.

- Protect surface water quality by incorporating appropriate BMPs into emergency response activities to the extent possible.

ES.6 Model Public Information and Participation Program

The purpose of the Storm Water/Urban Runoff Public Information and Participation Program (Five-Year Public Education Plan) is to provide the framework for a comprehensive educational storm water and urban runoff outreach approach that will reach as many Los Angeles County residents as possible. The Five-Year Public Education Plan is research-based, broad-based with overarching themes, flexible, adaptable, and simplistic in order to produce behavior change.

Groups of residents differ significantly in terms of the amount of pollution they contribute, their demographics and lifestyle, attitudes related to storm water pollution, and probability of changing their behaviors. By better understanding the general County resident population, resources may be directed to those segments of the population that pose the greatest threat to storm water quality and who represent the greatest opportunity to respond to a public education campaign.

Some key strategies developed for successful implementation of the education model include:

- Creating Overarching Approach – A unified overall public education approach sets a "tone" for the program and once established helps target audiences identify the program with its pollution prevention message.
- Building Partnerships – Integrate County and city programs, cooperate with environmental groups, co-Permittees, and other public and business groups to disseminate public education program materials and special events information.
- Unify Pollution Prevention Efforts – Link all pollution prevention efforts (such as recycling, used oil and household waste) under a single agenda rather than under multiple prevention splinter programs.
- Develop "How To" Instructions – Provide specific guidelines supported by simple easy to remember tasks and concise "how to" instructions for pollution prevention actions that residents and business may incorporate into their everyday routines.
- Monitoring and Evaluation System – Establish an evaluation system to measure program effectiveness by assessing the number of people who show increased awareness, intent and/or actions in reducing storm water pollution. Re-evaluate and enhance program components on continually based on program effectiveness.
- Multiple Audience Impact – Develop program materials and activities that may be implemented and have impact on more than one audience at a time.

The Model Public Information and Participation Program also includes reporting requirements for Permittees to support the Annual Program Report to the Regional Board. These reporting requirements include the documentation of information such as:

- Number of media outlets contacted to run public service announcements (PSAs),
- Dollar value and number of media buys,
- Audience of the media PSAs,
- List of local businesses enlisted to place non-traditional advertising (point-of-purchase displays, product neck hangers, etc.)
- Numbers and types of storm water pollution prevention materials distributed, and
- Whether there is an increase in the number of illicit discharge reports to the Permittee.

1.1 BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, requires the Permittees to develop and implement a program addressing Development Planning for the private sector. This Model Development Planning Program (Model Program) describes the acceptable minimum standards that Permittees are to follow to implement their own development planning programs in compliance with the Permit. Part 2.III.A of the Permit contains requirements specifically for development planning as summarized in Table 1-1. (A copy of the applicable Permit section is included as Appendix A.) The Permit requirements are fully enforceable by the Regional Board and may be changed only through action by the Regional Board. This Model Program was reviewed and approved by the Executive Officer of the Regional Board staff, and may be changed by approval of the Executive Officer. The Permit (Part 2.I.E.1) requires that "...each Permittee shall demonstrate that it possesses the legal authority necessary to control discharges to and from those portions of the Municipal Separate Storm Sewer System (MS4) over which it has jurisdiction so as to comply with this Order." Therefore, each Permittee must have adequate legal authority to implement and enforce its adaptation of this Model Program.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- effectively prohibit non-storm water discharges, and
- reduce the discharge of pollutants from storm water systems to the Maximum Extent Practicable[2] (MEP).

Under the Code of Federal Regulations (CFR) at 40 CFR § 122, NPDES storm water permit applicants are required to implement a comprehensive storm water management program that includes the use of best management practices (BMPs) to reduce pollutants discharged from the

[2] Maximum Extent Practicable (MEP) is the standard for implementation of storm water management programs to reduce pollutants in storm water. MEP refers to storm water management programs taken as a whole. It is the maximum extent possible taking into account equitable consideration and competing facts, including, but not limited to: the gravity of the problem, public health risk, societal concern, environmental benefits, pollutant removal effectiveness, regulatory compliance, public acceptance, implementability, cost and technical feasibility. Section 402(p)(3)(B)(iii) of the Clean Water Act requires that municipal permits "...shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

MS4 to the MEP. In part, 40 CFR § 122 requires that storm water management program must include elements that address new development, significant redevelopment, and construction.

Table 1-1. Development Planning Requirements

Permit Section	Requirement Summary [1]	Section of This Document	Permit Schedule
Part 2.III.A.1.a	Develop a model system for determining development projects as either Priority or Exempt.	2.1	01/30/98
Part 2.III.A.1.a	Permittees implement their own substantially similar system for determining development projects as either Priority or Exempt.	Not Applicable	Not later than 07/30/99
Part 2.III.A.1.b	Develop list of recommended BMPs for development projects.	2.2	01/30/98
Part 2.III.A.1.c	Develop Standard Urban Storm Water Mitigation Plans and guidelines for their preparation for a minimum of seven specified categories of development.	2.3	6 months after approval list of recommended BMPs
Part 2.III.A.2	Permittees implement own program of planning control measures consistent with model program elements developed in accordance with Part 2.III.A.1.a-c.	Not Applicable	02/15/01[2]
Part 2.III.A.3.a	Develop guidelines for preparing and reviewing CEQA documents, and for linking storm water quality mitigation conditions to local discretionary project approvals.	2.4	01/30/98
Part 2.III.A.3.b	Permittees include watershed and storm water management consideration into General Plan revisions when elements of General Plans are rewritten.	2.5	As General Plan elements are rewritten
Part 2.III.A.4	Develop a model developer information program.	3.0	01/30/98
Part 2.III.A.4	Permittees implement own developer information program consistent with model program developed in accordance with Part 2.III.A.4.	Not Applicable	Not later than 07/30/99

[1] For actual text of requirements, see the Permit excerpt in Appendix A.

[2] Pursuant to State Water Resources Control Board Order No. WQ 2000 - 11 of October 5, 2000.

R0000781

1.2 PROGRAM SUMMARY

This Model Program addresses the planning of Development Projects. The term "Development Projects" as used in this Model Program encompasses those projects that are subject to a planning and permitting review/process by a Permittee. A Development Project may be new development, redevelopment, renovation, remodeling, rehabilitation, infill, or other terms that may be used in a Permittee's ordinances and/or building code. Development Projects by public agencies have similar requirements that are addressed in the Model Public Agency Activities Program, another component of the Countywide Storm Water Management Plan.

Each Permittee will implement a development planning program based on this Model Program, which includes the following components:

1) a system for determining the appropriate category (Priority or Exempt) for a Development Project;
2) a recommended list of BMPs to be considered, and as appropriate, implemented at Development Projects;
3) a process to ensure that Planning Priority Projects incorporate the recommended list of BMPs and the Standard Urban Storm Water Mitigation Plan (SUSMP);
4) guidelines for California Environmental Quality Act (CEQA) compliance;
5) guidelines for the revision of General Plan elements to include watershed and storm water quality management considerations, when General Plan elements are being significantly rewritten; and
6) a developer information program that provides general guidance on the Permittee's development planning program, and specific guidance on BMP selection and the SUSMP.

1.3 USE OF THE MODEL PROGRAM

This Model Program sets the minimum requirements for Permittees to follow in implementing their own program. Permittees may modify the Model Program prior to adoption for their jurisdiction to address particular issues, concerns, or constraints that are unique to a particular watershed or to an individual municipality. Appendix B provides some guidance on ways that this Model Program may be modified to address particular local concerns. The requirements that a Permittee must fulfill to modify any of the model programs are specified in Part I.F of the Permit.

2.1 DETERMINATION OF DEVELOPMENT PROJECTS AS PRIORITY OR EXEMPT

The Permit defines Priority and Exempt projects as follows:

- Planning Priority Projects are development and redevelopment projects requiring discretionary approval which the Building Official (or equivalent municipal authority) determines may have a potential significant effect on storm water quality;" and
- Planning Exempt Projects are development and redevelopment projects which the Building Official (or equivalent municipal authority) determines will not have a potential significant impact on storm water quality." [Note: This definition of exempt projects differs from that found in the Development Construction Model Program.]

The process for determining whether a Development Project is a Planning Priority Project or a Planning Exempt Project is shown on Figure 1 and is described in the remainder of this section. Part 2.III.A.2 of the Permit requires that no later than July 30, 1999, each Permittee shall incorporate into its procedures a substantially similar process for categorizing Development Projects as Priority or Exempt.

2.1.1 Projects Requiring Discretionary Approval

The first factor in categorizing a project as either a Planning Priority Project or a Planning Exempt Project is to determine if the project requires discretionary approval. If a proposed project does not require discretionary approval, the project is a Planning Exempt Project and is exempt from the requirements of this Model Program.

Project approvals by Permittees are either discretionary or ministerial. Discretionary approval for purposes of this Model Program will be interpreted consistent with Section 15357 of the California Environmental Quality Act (CEQA) Guidelines. Section 15357 states:

> *"Discretionary project" means a project which requires the exercise of judgment or deliberation when the public agency or body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.*

Ministerial approvals are defined in Section 15369 of the CEQA Guidelines, which states:

> *"Ministerial" describes a government decision involving little or no personal judgment by the public official as to the wisdom or manner of carrying out the project. The public official merely applies the law to the facts as presented but uses no special discretion or judgment in reaching a decision. A ministerial action involves only the use of fixed standards or objective measurements, and the*

public official cannot use personal, subjective judgment in deciding whether or how the project should be carried out.

Ministerial approvals should not be confused with projects that are determined to be Categorically Exempt under CEQA. Categorically Exempt projects are a distinct type of exemption under CEQA. By definition, any type or category of project that is treated by a particular jurisdiction as typically being Categorically Exempt under CEQA, is a project requiring discretionary approval.

Consistent with Section 15268(d) of the CEQA Guidelines, "Where a project involves an approval that contains elements of both a ministerial action and a discretionary action, the project will be deemed to be discretionary..." Throughout the remainder of this Model Program document, such a discretionary approval or discretionary action by a public agency or body will be referred to as a "discretionary action."

While the definitions of "discretionary" and "ministerial" as used in this Model Program rely on language from CEQA Guidelines, the process outlined in this Model Program is independent of any CEQA determination.

2.1.2 Projects Subject to the SUSMP

The second factor in categorizing a project as a Planning Priority Project or a Planning Exempt Project is to determine if the project falls into one of the eight categories subject to the SUSMP. Those eight categories are:

- Single-family hillside residences
- 100,000+ square foot commercial developments
- Automotive repair shops
- Retail gasoline outlets
- Restaurants
- Home subdivisions with 10 to 99 housing units
- Home subdivisions with 100 or more housing units
- Parking lots 5,000 square feet or more or with 25 or more parking spaces, and potentially exposed to storm water runoff

Part A of the model Planning Priority/Exempt Checklist provided as Figure 2 may be used to indicate whether a proposed project falls into one of these eight categories,

For consistency across the various component programs of the Countywide Storm Water Management Plan, a restaurant is a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption [Standard Industrial Classification (SIC) code of 5812]. An automotive repair shop is a facility that would use one of the following SIC codes: 5013, 5014, 5541, 7532-7534, or 7536-7539. There are three exceptions regarding automotive repair shops:

1) SIC code 5013, if the business has no outside storage of any recycled oil or other hazardous substances it will not be included
2) SIC code 5014, if the business does not engage in any repair work it shall not be included
3) SIC code 5541, if the business does not engage in any onsite repair work, it shall not be included.

Commercial development includes any development on private land that is not considered heavy industrial or residential, including, but not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car wash facilities, mini-malls, and other business complexes, shopping malls, hotels, office buildings, public warehouses, and other light industrial complexes. The number of square feet of development will be based on total impermeable area, including parking areas, as opposed to lot size or building footprint. This interpretation is used in this Model Program because of the intent to manage storm water runoff from paved areas associated with buildings.

If a proposed project requires a discretionary action and falls into one of the aforementioned eight categories of development projects, the project is a Planning Priority Project, and the project proponent will be required to incorporate the respective requirements of the SUSMP into the project plans. If the SUSMP is not appropriate and/or not adequate for the specific project in review, the project proponent will be required to develop a site-specific urban storm water mitigation plan subject to the Permittee's approval. For a Planning Priority Project, the respective requirements of the SUSMP or the site-specific urban storm water mitigation plan will be incorporated into the project design prior to the issuance of any grading or building permits.

2.1.3 Other Project Characteristics

If a proposed project requires a discretionary action and does not fall into one of the eight categories listed in Section 2.1.2, Part B of the model Planning Priority/Exempt Checklist, or a substantially similar checklist, shall be completed for the proposed project to identify potentially significant post-construction sources of storm water pollutants.

- If in completing the Planning Priority/Exempt Checklist, no potentially significant post-construction sources of storm water pollutants are identified, the project is Exempt from the requirements of this Model Program.
- If one or more potentially significant post-construction sources of storm water pollutants is identified in completing Part B of the model Planning Priority/Exempt Checklist, the project is a Planning Priority Project subject to the requirements of this Model Program. The project proponent will be required to incorporate appropriate post-construction BMPs into project design and plans. In accordance with Permit Part 2.III.A.2, each Permittee shall require that a project applicant submit an Urban Storm Water Mitigation Plan appropriate and applicable to the project, and the Permittee shall approve the plan prior to the issuance of any grading or building permits.

Part B of the model Planning Priority/Exempt Checklist provided as Figure 2 lists project characteristics that will be used to identify potentially significant sources affecting storm water quality. These project characteristics[3] are:

- Vehicle or equipment fueling areas;
- Vehicle or equipment maintenance areas, including washing;
- Commercial or industrial waste handling or storage, excluding typical office or household waste;
- Outdoor handling or storage of hazardous materials or waste;
- Hillside location, which will be defined as any natural slope of 25 percent or greater with known erosive soil conditions;
- Outdoor work areas for activities such as, but not limited to: welding; cutting; metal fabrication; assembly; application of paints, coatings, or finishes; pre-cast concrete fabrication; etc.;
- Location adjoining to, bisected by, or directly discharging to a designated environmentally sensitive area, riparian corridor, or wetland; and
- A 100,000+ square foot industrial development.

2.1.4 Changes in Project After Initiation of Construction

Prior to final approval of project permits, projects previously designated as Exempt may become subject to the requirements of Priority projects. If the proposed changes would make the project fall into one of the eight categories of development listed in Section 2.1.2 or would include project characteristics included in Part B of the model Planning Priority/Exempt Checklist, the

[3] Activities or materials potentially exposed to storm water and not protected by storm-resistant sheltering. Such activities include industrial and commercial facilities operations and construction work. Such materials include material handling equipment, industrial machinery, raw materials, intermediate products, byproducts, and waste products however packaged.

project shall be required to incorporate appropriate post-construction BMPs into the project's revised design and plans.

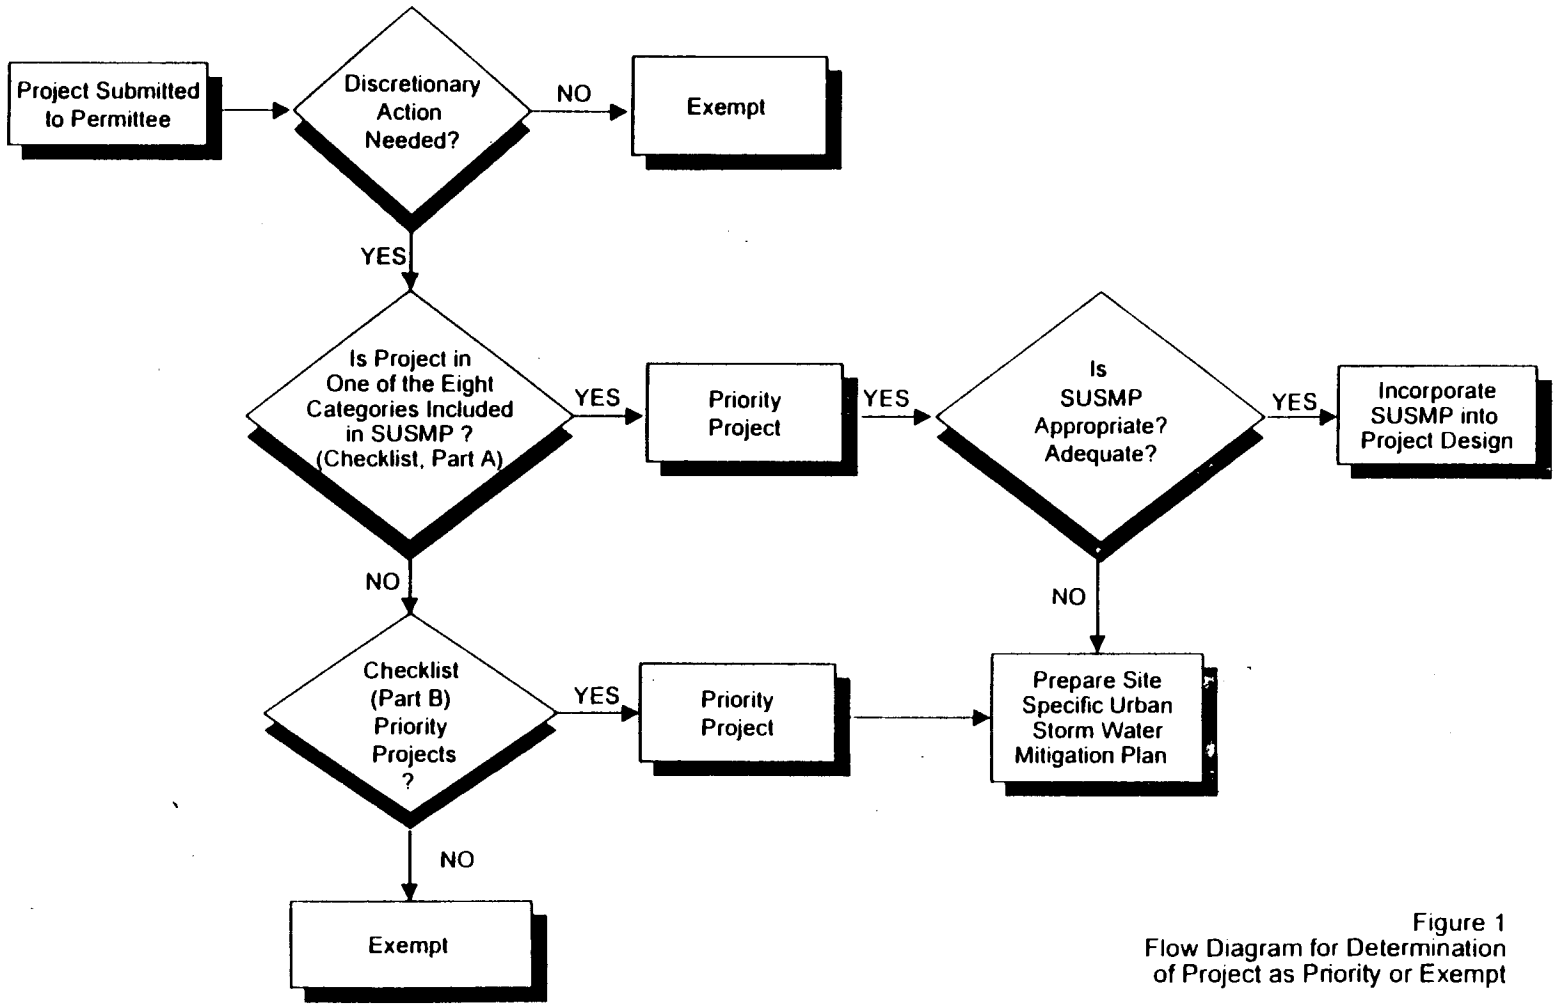

Figure 1
Flow Diagram for Determination
of Project as Priority or Exempt

R0000788

Figure 2. Model Checklist for Categorizing Discretionary Development Planning Projects[4] as Priority or Exempt

Project Name: _____

Project Location: _____

Description of Project: _____

_____

Part A. Proposed Discretionary Project Is:	Yes	No
1. A single-family hillside residence		
2. A 100,000+ square-foot commercial development		
3. An automotive repair shop (SIC codes 5013, 5014, 5541, 7532-7534, and 7536-7539)		
4. A retail gasoline outlet		
5. A restaurant (SIC code 5812)		
6. A home subdivision with 10 to 99 housing units		
7. A home subdivision with 100 or more housing units		
8. Parking lot 5,000 square feet or more or with 25 or more parking spaces, and potentially exposed to storm water runoff		

If all answers to Part A are No, continue to Part B.

Part B. Proposed Discretionary Project Characteristics[5]:	Yes	No
1. Vehicle or equipment fueling areas?		
2. Vehicle or equipment maintenance areas, including washing?		
3. Commercial or industrial waste handling or storage, excluding typical office or household waste?		
4. Outdoor handling or storage of hazardous materials or waste?		
5. Hillside location (as defined by the local jurisdiction)?		
6. Outdoor work areas for activities such as, but not limited to: welding; cutting; metal fabrication; assembly; application of paints, coatings, or finishes; pre-cast concrete fabrication; etc.?		
7. Location adjoining to, bisected by, or directly discharging to a designated environmentally sensitive area[6], riparian corridor, or wetland?		
8. A 100,000+ square-foot industrial development?		
9. Outdoor animal confinement (e.g., stables, kennels, etc.)?		

EXEMPT PROJECT: Every question in Part A and Part B is answered "NO."

PRIORITY PROJECT: Any question in Part A or Part B is answered "YES."

R0000789

[4] This example checklist applies only to Development Projects as defined in Section 1.2 of this Model Program.

[5] Activities or materials potentially exposed to storm water and not protected by storm-resistant sheltering. Activities include industrial and commercial facilities operations and construction work. Materials include material handling equipment, industrial machinery, raw materials, intermediate products, byproducts, and waste products however packaged.

[6] The Permit does not define "designated environmentally sensitive area." Examples of such areas may be wetlands, habitats of endangered, threatened, or rare species, wildlife dispersal or migration corridors, areas of locally-designated species such as heritage trees, or locally-designated natural communities such as oak forest or coastal habitat.

2.2 BMP SELECTION PROCESS FOR PRIORITY PROJECTS

Municipalities and developers should address the potential water quality impacts of storm water discharges associated with development activities early in the project planning and design process. In general, the sooner developers and municipal planning staff consider potential storm water impacts, the greater the opportunity to include efficient and effective BMPs into project design and plans.

In planning a development project, the designer must answer three key questions with respect to storm water quality control: (1) what kind of water quality controls are needed?; (2) where should the controls be implemented?; and (3) how much control is enough? In order to answer these questions, the designer should document the process used to identify potential storm water quality problems, develop design objectives, formulate and evaluate alternatives, select the most appropriate alternatives, and design the plan.

The Permittees have developed a process for selecting the appropriate BMPs for a specific project and three lists of recommended BMPs for Development Projects (Permit Part 2.III.A.1.b). The recommended BMP selection process is described in the remainder of Section 2.2, and the recommended BMPs for consideration in Planning Priority Projects are provided in Appendix C.

2.2.1 Goals and Objectives

Site-specific conditions of Development Projects determine which BMPs are most appropriate for a site. Prior to selecting BMPs, a good understanding of post-construction activities and potential sources of storm water pollutants is needed. The BMPs considered should address the potential pollutants reasonably expected at the site once the site is occupied or operational. BMPs for the project construction phase are addressed in the Development Construction Model Program. The permanent BMPs planned for a site should fulfill the following goals and objectives:

- be appropriate for the given site constraints;
- be feasible to implement and maintain;
- ensure no adverse storm water quality impacts;
- promote improved water quality;
- provide effective pollutant source control or removal capability;
- meet regulatory requirements; and
- be economically feasible.

R0000790

2.2.2 BMP Selection Criteria

In order to fulfill the goals and objectives, described in Section 2.2.1 appropriate BMPs should be selected by using selection criteria that identify the capabilities and limitations of each BMP. Common criteria used in screening and selecting BMPs during the planning stage are:

- project characteristics (e.g., potential sources of storm water pollutants after construction is completed);
- site factors (e.g., slope, high water table, soils, etc.);
- pollutant removal capability;
- short-term and long-term costs;
- responsibility for maintenance;
- contributing watershed area; and
- environmental impact and enhancement.

The BMP selection criteria listed above should be applied in accordance with the overall objective of this Model Program, i.e., to reduce pollutants in discharges to the MEP to achieve the attainment of Regional Board water quality objectives and protection of the beneficial uses of receiving waters. Some BMPs will clearly be more appropriate and effective in some site-specific situations than others, and BMP selections should reflect this variability. These factors are described in more detail in Appendix D.

2.2.3 Nominate and Evaluate Alternatives

The Permittees have nominated and evaluated alternative BMPs for development projects. The BMPs were nominated from the *California Storm Water Best Management Practices Handbooks*, as well as BMPs from other manuals and resources. Based on feasibility and appropriateness to the area, the Permittees have developed three lists of recommended BMPs for Planning Priority Projects. These BMPs are described in Appendix C.

2.2.4 Select Best Alternatives

Using the list of recommended BMPs for Planning Priority Projects, the developer/designer should use the selection criteria described in Section 2.2.2 to select the best alternatives for the project conditions, characteristics, and concerns. This may be done numerically, by rating and then ranking the BMPs. Or the selection process may be done in a more subjective, non-numerical way using experience and professional judgment to select the best alternative BMPs.

Either way, the designer should document the selection process to provide justification for the system of BMPs incorporated into project plans and designs.

2.2.5 Design and Installation

After the appropriate BMPs are selected for a given project, the designer should design the BMPs and incorporate them into the project plans and specifications. It is important that the project plans and specifications include adequate information for the BMPs to be properly installed. Improper installation is one of the most common reasons for water quality controls to not function as designed. Therefore, the designer must provide sufficient information in the project plans and specifications for proper BMP installation since improper installation is a common cause of BMP failure or ineffectiveness.

2.2.6 Maintenance

Maintenance is crucial to the proper and continued functioning and effectiveness of the BMPs. Designers should provide guidance on the proper maintenance of the BMPs to the developer/owner so it may be provided to the entity responsible for their maintenance (e.g., home owners association). Additionally, some Permittees may elect to provide maintenance guidelines in their modified program that is developed from this Model Program (see Appendix B).

2.2.7 BMPs For Planning Priority Projects

Planning Priority Projects will be required to incorporate appropriate BMPs in keeping with the size of the project and potential for storm water pollution, in order to reduce the discharge of pollutants into the storm drain system to the MEP. These BMPs address site planning practices, post-construction, and redevelopment/infill practices, and have been approved by the Regional Board. The lists of recommended BMPs are provided in Appendix C. If appropriate, other BMPs may be considered by developers or required by Permitees.

2.3 STANDARD URBAN STORM WATER MITIGATION PLANS

A SUSMP was developed and subsequently adopted by the Regional Board. As described in Section 2.1.2, all discretionary development and redevelopment projects that fall into one of the eight following categories are subject to the requirements of the SUSMP:

- Single-family hillside residences
- 100,000+ square foot commercial developments

- Automotive repair shops
- Retail gasoline outlets
- Restaurants
- Home subdivisions with 10 to 99 housing units
- Home subdivisions with 100 or more housing units
- Parking lots 5,000 square feet or more or with 25 or more parking spaces, and potentially exposed to storm water runoff

The SUSMP provides the minimum required BMPs that must be incorporated into project plans and designs before building or grading permits are issued by a Permittee. The SUSMP and project-specific Urban Storm Water Mitigation Plans are intended to assure that appropriate post-construction BMPs are included in project plans and designs to:

a. minimize, to the MEP, impacts from storm water runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the Clean Water Act, local ordinances, and other legal authorities;

b. maximize, to the MEP, the percentage of permeable surfaces to allow more percolation of storm water into the ground;

c. minimize, to the MEP, the amount of storm water directed to impermeable areas and to the municipal separate storm sewer system;

d. minimize, to the MEP, parking lot pollution through the use of appropriate BMPs such as retention, infiltration, and good housekeeping;

e. establish reasonable limits on the clearing of vegetation from the project site including, but not limited to, regulation of the length of time during which soil may be exposed and, in certain sensitive cases, the prohibition of bare soil; and

f. provide for appropriate permanent measures to reduce storm water pollutant loads from the development site to the MEP.

Permittees shall amend ordinances and codes not later than January 15, 2001, to give legal effect to the SUSMP requirements. The SUSMP requirements shall take effect not later than February 15, 2001. A copy of the SUSMP is included in Appendix E.

2.4 GUIDELINES FOR REVIEW AND APPROVAL OF LOCAL DISCRETIONARY PROJECTS

2.4.1 Preparation and Review of CEQA Documents

The Permit requires that the impacts of development projects on storm water quality be assessed during the early planning stages of a project, including CEQA document preparation and review.

The purpose of CEQA document review procedures is to ensure that the potentially significant environmental impacts of a project are disclosed and that mitigation measures are incorporated to reduce the impacts to a level that is less than significant. The following storm water management guidelines have been developed for use in preparing and reviewing CEQA documents to specifically ensure that storm water impacts are considered and that storm water quality mitigation conditions are linked to local discretionary project approvals:

- CEQA documents will be reviewed by Permittees for compliance with General Plans, and specifically with storm water and natural resource protection elements of such plans.
- CEQA documents will be reviewed by Permittees for impacts on storm water, will contain mitigation measures for identified significant adverse impacts, and at a minimum will include measures required by this countywide Model Development Planning Program.
- Project approval will be conditioned to require a review of storm water mitigation measures during the plan check process to ensure that measures have been incorporated into the design plans.
- Project approval will be conditioned upon inspection of required storm water impact mitigation measures to ensure that all such measures have been installed prior to issuance of a Certificate of Occupancy.

These guidelines are intended to address water quality impacts to all surface waters including but not limited to riparian corridors and wetlands, and to promote protection of the biological integrity of drainage systems and receiving waters. Each Permittee must review these guidelines for the purpose of making appropriate modifications in their internal procedures within 6 months after commencement of the next fiscal year following approval of the program by the Executive Officer of the Regional Board, but no later than July 30, 1999.

Existing environmental review procedures for development activities typically use checklists similar to the model forms provided in CEQA Guidelines. Although these checklists have been developed in accordance with the CEQA Guidelines, they may be inadequate to prompt consideration of the potential environmental impacts resulting from the quality of storm water discharges or impacts to natural features that contribute to water quality protection.

The following questions should be used as guidance in completing the CEQA checklist relative to impacts related to storm water management:

- Would the proposed Development Project result in storm water system discharges from areas for materials storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas?
- Would the proposed Development Project result in significant and environmentally harmful increases in the flow rate or volume of storm water runoff?
- Would the proposed Development Project result in significant and environmentally harmful increases in erosion of the project site or surrounding areas?
- Would the proposed Development Project result in storm water discharges that would significantly impair the beneficial uses of receiving waters or areas that provide water quality benefits (e.g., riparian corridors, wetlands, etc.)?
- Would the proposed Development Project cause significant harm to the biological integrity of drainage systems and water bodies?

A Permittee may develop additional guidance questions specific to storm water pollution impacts to reflect particular issues, concerns, or characteristics unique to a particular watershed, receiving water body, or to an individual municipality.

Based on the answers to these questions, if a CEQA reviewer determines that a project would have a potentially significant adverse impact on storm water quality, a CEQA document will be required to clearly identify the potential impacts and appropriate BMPs to mitigate the identified adverse impacts.

2.4.2 Review and Approval of Local Permits

The mitigation of storm water quality impacts will be linked to discretionary project approval by the requirement to incorporate mitigation measures during design. It is during the design review process that:

- plans will be verified as being in compliance with the General Plans, zoning ordinances, and other applicable local ordinances and codes;
- plans and specifications will be verified as incorporating appropriate BMPs; and
- the reviewer will require projects to be redesigned, if necessary, to address storm water pollution prevention goals.

Approval of Development Projects will not be granted until storm water mitigation measures appropriate and applicable to the project are incorporated into project plans. Construction,

building. or grading permits will not be issued by a Permittee until post-construction (permanent) storm water mitigation measures appropriate and applicable to the project are incorporated into project plans. Occupancy permits will not be issued until the Permittee's inspector(s) verify correct installation of post-construction (permanent) storm water mitigation measures.

2.5 GENERAL PLANS

The Permit requires that each Permittee shall include watershed and storm water management considerations in appropriate elements of the Permittee's General Plan, whenever such elements are significantly rewritten. Guidelines to assist Permittees in conforming to this requirement are provided in Appendix F.

3.1 PROGRAM REQUIREMENTS FOR DEVELOPER INFORMATION

The Permit requires that the Principal Permittee, in consultation with the Permittees, create a model program to inform developers seeking discretionary approvals about storm water management activities associated with project development and construction; maximization of pervious areas and storm water infiltration; and economically feasible storm water pollution control measures.

This Model Developer Information Program provides information and sample materials that may be used to inform developers of the storm water permit requirements and identifies storm water management issues to be considered by the developer during the planning, design, and construction phases of projects.

3.2 HANDOUT MATERIALS FOR PUBLIC COUNTERS

As part of the developer information program, Permittees shall provide handout materials at their public counters for developers and contractors requesting project approvals and construction permits, as well as, including such handouts with other materials distributed to project applicants. These handout materials will address the following elements:

- a general description of the nature of storm water pollution, its causes, and environmental consequences.
- a general description of the Permittee's municipal storm water management program and its requirements that relate to development activity.
- a description of required and/or suggested BMPs that may be considered for incorporation into Development Projects to reduce pollutants in storm water discharges from urbanized areas.
- guidance information on selecting BMPs for Development Projects, including BMP suggestions that may be particularly appropriate for specific development categories.
- a list of reference materials that provide detailed information on BMP objectives and implementation, as well as sources of the reference materials.
- copies of ordinances or other documents that provide the Permittee with the legal authority to control storm water discharges.

Because of the varying nature of project types, and developer and contractor general awareness of storm water quality management issues, example handout materials have been developed to provide several levels of information.

The handout materials are divided into the following general categories:

- General Information. Materials presented in this information category provide an overview of the Permittee's storm water quality management program through a discussion of the goals and objectives. The intent of this information is to raise the level of general awareness of developers and contractors about the program and its influence on the project planning, design, and construction process.
- Planning Information. Documents and information in this category provide guidance to the developer or contractor during preparation of the project planning and preliminary design documents. Materials available include: guidance on BMP selection; planning and design BMPs; and the SUSMP.
- Construction Information. The construction information category of documents provides guidance to the developer or contractor during preparation of the project final design documents, and during project construction. Materials available in this category include: guidance on construction BMP selection; temporary and permanent construction BMPs; and the SUSMP.

Example handout materials for each of these information categories are provided in Appendix G (general information), Appendix H (planning information) and Appendix I (construction information). Permittees may use these materials as is, or may modify them to address specific needs or issues within their jurisdiction.

The appendices to this document (excluding Appendix A) are advisory only unless specifically identified in this Model Program as a requirement.

Order No. 96-054 CAS614001

Table 3
Development Planning Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Develop a model system for prioritization of development projects	III.A 1.a	✓		18 (January 30, 1998)	Executive Officer
Implement a system for prioritization of development projects	III.A.1.a		✓	≤ 36 months (July 30, 1999)	N/A
Develop list of recommended BMPs for development projects (countywide guidelines)	III.A.1.b	✓		18 (January 30, 1998)	Regional Board
Develop Standard Urban Storm Water Mitigation Plans (SUSMP)	III.A.1.c	✓		6 months after Regional Board approval of countywide guidelines	Executive Officer
evelop and submit a nedule of implementation for a program for planning measures consistent with the Standard Urban Storm Water Mitigation Plan (SUSMP) for priority projects	III.A.2		✓	≤ 36 months (July 30, 1999)	N/A
Develop guidelines for preparing/reviewing CEQA documents	III.A.3.a	✓		18 (January 30, 1998)	Executive Officer
Incorporate CEQA guidelines into internal procedures	III.A.3.a		✓	≤ 36 months (July 30, 1999)	N/A
Include watershed and storm water management consideration into General Plan revisions	III.A.4 3.b		✓	During General Plan revisions	N/A
Develop model program for developers	III.A.4	✓		18 (January 30, 1998)	Executive Officer
Implement developer information program	III.A.4		✓	≤ 36 months (July 30, 1999)	N/A

1. Countywide Development Planning Guidance

The Principal Permittee, in consultation with the Permittees, shall develop the following development planning guidance materials for use during planning and permitting of all development projects requiring discretionary approval:

a. A model documented system, such as a checklist, for determining priority projects as well as a list of specifically exempt projects not later that January 30, 1998. Priority and exempt projects are defined as follows:

i. Priority Projects are development and redevelopment projects requiring discretionary approval which the Building Official (or equivalent municipal authority) determines may have a potential significant effect on storm water quality.

ii. Exempt Projects are development and redevelopment projects which the Building Official (or equivalent municipal authority) determines will not have a potential significant impact on storm water quality.

The documented system shall consider location of the project with respect to designated environmentally sensitive areas and the slope and erosion potential of the site and surrounding areas.

Each Permittee shall incorporate a substantially similar system into its procedures not later than six months after commencement of its next fiscal year following approval of the of the documented system by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

b. A list of recommended BMPs not later than January 30, 1998. The list of BMPs shall include:

i. Site planning practices;
ii. Post-construction best management practices; and
iii. Redevelopment and infill practices.

Consideration shall be given to the type of development and the potential for storm water pollution when determining the applicability of BMPs. Cost effectiveness, ease of maintenance, and consistency with other environmental mandates may also be considered.

For developments where increased storm water discharge rates will result in an increase in downstream erosion potential, the list of recommended BMPs shall include those BMPs which can be used to maintain peak runoff rates at pre-development levels to the maximum extent feasible.

The list of recommended BMPs shall be submitted to the Regional Board for approval.

c. Standard Urban Storm Water Mitigation Plans (SUSMPs) and guidelines for their preparation not later than six months after Regional Board approval of the BMPs in Part 2.III.A.1.b. The SUSMPs shall incorporate the appropriate elements of the recommended BMPs list. At the minimum, SUSMPs and guidelines shall be prepared for the following development categories:

i. a 100+ home subdivision;
ii. a 10-home subdivision;
iii. a 100,000+ square-foot commercial development;
iv. an automotive repair shop;
v. a retail gasoline outlet;
vi. a restaurant; and
vii. a hillside-located single-family dwelling.

2. Planning Control Measures

Each Permittee shall develop a program on planning control measures for priority projects (Part 2.III.A.1.a) consistent with the programs developed under Part 2.III.A.1.b. & c.. Each Permittee shall initiate implementation of its program not later than six months after commencement of its next fiscal year following approval of the model Standard Urban Storm Water Mitigation Plans by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be initiated later than July 30, 1999. Each Permittee shall require that the project applicant submit an Urban Storm Water

Mitigation Plan appropriate and applicable to the project, and that the Permittee approve the Plan prior to the issuance of any grading or building permit. The Urban Storm Water Mitigation Plan shall incorporate by detail or reference appropriate post-construction BMPs to:

a. Implement, to the maximum extent practicable, requirements established by appropriate governmental agencies under CEQA, Section 404 of the Clean Water Act, local ordinances and other legal authorities intended to minimize impacts from storm water runoff on the biological integrity of natural drainage systems and water bodies;

b. Maximize, to the maximum extent practicable, the percentage of permeable surfaces to allow more percolation of storm water into the ground;

c. Minimize, to the maximum extent practicable, the amount of storm water directed to impermeable areas and to the MS4;

d. Minimize, to the maximum extent practicable, parking lot pollution through the use of appropriate BMPs such as retention, infiltration, and good housekeeping;

e. Establish reasonable limits on the clearing of vegetation from the project site including, but not limited to, regulation of the length of time during which soil may be exposed and, in certain sensitive cases, the prohibition of bare soil; and

f. Provide for appropriate permanent controls to reduce storm water pollutant load produced by the development site to the maximum extent practicable.

The Permittee may refer applicants to the *'California Storm Water Best Management Practice Handbooks*, California Storm Water Quality Task Force, Sacramento, CA (1992)' and its revisions; the Countywide Storm Water Management Plan; *'USEPA Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters, Issued under the Authority of Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990*, Document No. EPA 840 B 92-002 (1993),'; and similar manuals for specific guidance on selecting post-construction BMPs for reducing pollutants in storm water discharges.

3. Planning Process

In order to integrate storm water management considerations into

discretionary development projects at the time that they are first proposed to jurisdictions, and to support other provisions of this Order:

a. The Principal Permittee, in consultation with the Permittees, shall develop storm water management guidelines for use in preparing/reviewing CEQA documents, and in linking storm water quality mitigation conditions to local discretionary project approvals not later than January 30, 1998.

The guidelines shall address the preservation of areas that provide water quality benefits such as riparian corridors and wetlands and shall promote protection of the biological integrity of drainage systems and water bodies.

Each Permittee shall review the guidelines for the purpose of making appropriate modifications in their internal procedures not later than six months after commencement of its next fiscal year following approval of the program by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

b. Each Permittee shall include watershed and storm water management considerations in the appropriate elements of the Permittee's General Plan, whenever said elements are significantly rewritten. Appropriate elements may include the following:

i. Conservation; and/or
ii. Open space; and/or
iii. Land-use; and/or
iv. Public utilities; and/or
v. Infrastructure; and/or
vi. Other appropriate elements.

4. Developer Information Program

The Principal Permittee, in consultation with the Permittees, shall develop a model program not later than January 30, 1998, to inform developers seeking discretionary approvals about:

a. Development and construction storm water management;

b. Maximization of pervious areas and storm water infiltration (where geology and topography permit); and

c. Cost effective storm water pollution control measures.

The program shall provide specific guidance on selecting BMPs to reduce pollutants in storm water discharges from urbanized areas, and include appropriate BMPs, educational materials, and handbooks and guidelines described in Part 2. III.A.3.

Each Permittee shall implement a developer information program consistent with the model program not later than six months after commencement of its next fiscal year following approval of the model by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999. Each Permittee's program shall include information about its legal authorities. Permittees are encouraged to engage in joint efforts in implementing the program.

B. Development Construction

Table 4 on the following page shows the summary of requirements and corresponding compliance dates under this section.

This space is left intentionally blank.

Appendix B
Ways To Modify This Model Program

B.1 MINIMUM REQUIREMENTS

Some Permittees, through new or modified ordinances, statutes, codes, or other legal authority, may want to designate minimum requirements for storm water pollution control measures for all development projects. In that case, this model program should be modified to identify which BMPs are required as minimum BMPs, and which BMPs must be considered in addition to the minimum BMPs.

B.2 DESIGN STANDARDS

The objective of the model program requirements prescribed in the Permit (Order No. 96-054, NPDES CAS614001), is to reduce pollutants in discharges to the MEP in order to attain the water quality objectives and protect the beneficial uses of the receiving waters for Los Angeles County.

The federal regulations for municipal storm water upon which the Permit is based provide that management programs shall include a description of both structural and non-structural control measures that will be implemented and maintained to reduce pollutants from runoff from commercial areas, residential areas, and construction sites to the MEP. Some cities, counties, and states have developed design standards for structural control measures to assure that structural control measures are designed to reduce pollutants in storm water runoff to the MEP. One advantage of developing design standards is that it allows for equity among development projects in terms of level of treatment provided by the structural control measures. Additionally, design standards specific to a municipal jurisdiction can reflect the local hydrologic conditions and soil types, and provide defensible support for the attainment of the standard of MEP.

The SUSMP adopted by the Regional Board requires that post-construction structural or treatment control BMPs be designed to:

A. mitigate (infiltrate or treat) storm water runoff from either:

   1. the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

   2. the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial*, (1993), or

   3. the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

4. the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,

AND

B. control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.

Some Permittees may already have, or may want to develop, further design standards for structural control measures. Design standards can be based on the size of storm (amount of rainfall), volume of runoff captured by the structural control, or the percent removal of some indicator pollutant, such as total suspended solids (TSS). The design standards would be incorporated into a Permittee's customized program and adopted for use within the Permittee's jurisdiction.

B.3 ENHANCED ENFORCEMENT AUTHORITY

In order to enhance the ability to enforce the new or existing ordinances, statutes, or codes that pertain to storm water pollution control, many cities and counties are adopting more aggressive enforcement authority. Enforcement authority and actions may include the following:

- Warning Notice;
- Notice of Violation;
- Stop Work Order and permit suspension;
- Stop Work Order and permit revocation;
- fines and penalties; and
- action against security (bond).

Depending on the needs and problems experienced by a Permittee, other more aggressive authority may be warranted. For example, a city may want to provide the power of arrest to the field inspectors, which would give them the authority to immediately stop illegal grading activities, if this has been a recurring problem. Another example would be for a city to adopt extremely high retroactive grading permit fees as a deterrent to those who have started grading without a permit, but apply for one later, if this has been a recurring problem. Permittees may want to describe such enhanced enforcement authority in their customized program.

B.4 MANUALS OF STANDARDS

The Permit refers to several manuals that provide information on the design, installation, and maintenance of storm water BMPs. A Permittee may want to adopt or refer to other manuals in addition to the ones cited in the Permit. This could be included in the program that is customized from this model program for adoption and use by a Permittee.

Alternatively, a Permittee may want to extract detailed BMP design, installation, and maintenance guidelines from reference manuals and incorporate the information directly into the customized program, as an Appendix, for example. This would provide designers and developers with more focused and specific guidance by a Permittee, which is helpful if there is variation in the information provided in the different manuals cited in the Permit.

B.5 ZONING EVALUATION

Another modification to the model program that Permittees may want to consider is to evaluate existing zoning ordinances, designations, and standards: revise permitted uses: develop ancillary use standards: revise general construction and operational standards; and revise rezoning and permitting requirements. Storm water pollution controls should be integrated locally with other provisions of the zoning ordinance. Therefore, each Permittee would first evaluate its ordinance with respect to activities that may increase the risk of storm water pollution discharges, control storm water pollution, or interfere with adequate storm water pollution control. When considering the existing zoning maps, some areas may require rezoning action based on the proposed changes to the General Plans.

The zoning ordinance designates each piece of property within a zone, and within each zone a range of land uses is permitted. Each type of use permitted in each zone should be evaluated for its potential to cause or to reduce the discharge of pollutants via the storm water drainage system. Storm water pollution control may be partially achieved by limiting the range of permitted uses within each zone. Zoning ordinances should be amended to define construction and operational standards for areas that are potential storm water pollutant sources. Application materials for rezoning requests and discretionary approvals will be designed to elicit sufficient information to evaluate the potential storm water pollution risk that may occur as a result of the request being granted (e.g., is use subject to an industrial NPDES permit, what kinds of activities and materials are being stored, how close is the nearest water body or flood control channel, etc.).

B.6 COVENANTS, CODES, AND RESTRICTIONS FOR RESIDENTIAL AND COMMERCIAL DEVELOPMENTS (CC&RS)

One opportunity to provide controls for development projects that address over-watering, washing of paved areas, illegal storage and disposal practices, illegal product use, litter control, proper turf and landscape management, proper disposal of household materials, and leaking vehicles is through CC&Rs that are enforced by Homeowners and Tenants Associations. Draft CC&Rs could be provided in a Permittee's customized program that is adapted from this model program for use within their jurisdiction.

B.7 BMP MAINTENANCE GUIDELINES

Improper maintenance is one of the most common reasons for water quality controls to not function as designed, or to fail entirely. While Permittees in most cases will not retain the responsibility for maintenance of water quality controls that are installed in private development projects, it would be beneficial to the program and the long-term effectiveness of the BMPs if guidance were provided for the proper maintenance of the BMPs. These guidelines could then be incorporated by the developer into the Homeowners or Tenants Association CC&Rs (see B.6).

Appendix C
Recommended BMPs for
Site Planning, Post-Construction, and Redevelopment/Infill

Appendix C
Recommended BMPs for Site Planning, Post-Construction, and Redevelopment/Infill

Site Planning BMPs
Minimize Storm Water Runoff
Pervious Drainage System
Reduce Area of Impervious Surface
Site Layout

Post-Construction BMPs	
BMP Name	**BMP Identification No. and Name [a]**
Aboveground Tank Berms	SC41, Aboveground Tank Berms
Car Wash Facility	SC3, Vehicle and Equipment Washing and Steam Cleaning
Catch basin insert	Not applicable.
Catch-basin screen	Not applicable.
Cistern collection systems	Not applicable.
Clarifiers	Not applicable.
Constructed Wetlands	TC3, Constructed Wetlands
Continuous flow deflection/separation systems	Not applicable.
Control of Impervious Runoff	Not applicable.
Curb elimination on landscape areas	Not applicable.
Detention/Infiltration device maintenance	SC75, Has the developer/owner determined how detention/infiltration devices planned for the site will be maintained
Drip Irrigation systems	Not applicable.
Efficient Irrigation	Not applicable
Energy Dissipaters	ESC40, Outlet Protection
Extended Detention Basins	TC5, Extended Detention Basin
Facility design to divert wash-off to sanitary sewers	Not applicable.
Filtration systems	Not applicable.
Flow diversion to landscape or pervious areas	Not applicable.
Geotextiles and Mats	ESC20, Geotextiles and Mats
Illicit Connection Prevention	SC60, Illicit Connection Prevention – Will any planned connections to the storm drain carry non-storm water discharges
Infiltration Basins	TC1, Infiltration
Infiltration Trenches	TC1, Infiltration
Inlet Trash Racks	Not applicable.
Landscape Design	ESC2, Preservation of Existing Vegetation; ECS10, Seeding and Planting; ESC11, Mulching
Linings for Urban Runoff Conveyance Channels	Not applicable.
Materials Management	SC5, Outdoor Loading/Unloading of Materials; SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products
Material storage management	SC20, Material storage control – Design site with bermed and covered storage areas for material storage located away from storm drains
Media Filtration	TC6, Media Filtration

[a] Corresponds to the BMP number and name as in the *California Storm Water Best Management Practice Handbooks* (1993).

Post-Construction BMPs	
BMP Name	**BMP Identification No. and Name [a]**
Motor Fuel Concrete Dispensing Areas	SC2, Vehicle and Equipment Fueling
Motor Fuel Dispensing Area Canopy	SC2, Vehicle and Equipment Fueling
Multiple treatment systems in combination	TC8, Multiple treatment systems in combination
Normal flow separation/storage systems	Not applicable.
Non-storm water discharges elimination	SC1, Eliminate non-storm water discharges to the storm drain collection system
Oil/Water Separators and Water Quality Inlets	TC7, Oil/Water Separators and Water Quality Inlets
Outdoor Process Equipment Operation and Maintenance	SC7, Outdoor Process Equipment Operation and Maintenance – Design site to include a canopy over outdoor processes
Outdoor Storage	SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products
Pesticide and fertilizer use elimination or reduction	Not applicable.
Porous Pavement and Alternative Surfaces	TC1, Infiltration
Post signs to caution improper practices or to educate	Not applicable.
Primary waste-water treatment systems	Not applicable.
Protect Slopes and Channels	ECS40, Outlet Protection; ESC42, Slope Roughening and Terracing
Retention grading	Not applicable.
Scheduling	ESC1, Scheduling activity
Secondary waste-water treatment systems	Not applicable.
Self -Contained Areas for Vehicle or Equipment Washing, Steam Cleaning, Maintenance, Repair, or Material Processing	SC3, Vehicle and Equipment Washing and Steam Cleaning; SC4, Vehicle and Equipment Maintenance and Repair; SC7, Outdoor Process Equipment Operations and Maintenance
Storm Drain System Stenciling and Signage	SC30, Storm Drain System Signs
Trash Container Areas	SC9, Waste Handling and Disposal
Vacuum sweeping of parking lots	Not applicable
Vegetated buffer zones	Not applicable.
Vegetated Swales and Strips	TC4, Bio-filters
Wet Pond	TC2, Wet Pond

Appendix D
BMP Selection Criteria

The following criteria should be considered during the process of assessing the appropriateness (benefits and limitations) of BMPs for a particular project:

- project characteristics;
- site factors;
- pollutant removal capability;
- short-term and long-term costs;
- responsibility for maintenance;
- contributing watershed area; and
- environmental enhancement.

D.1 PROJECT CHARACTERISTICS

Selection of BMPs for a project is a function of project characteristics, such as type or size of project. Post-construction activities and operations that may be potential sources of storm water pollution are often the same for a given type of project. Projects developed on large sites provide the opportunity to incorporate a wider variety of BMPs, whereas smaller sites often have physical constraints precluding implementation of BMPs requiring large land areas.

D.2 SITE FACTORS

Site factors have common physical restrictions on BMPs and include:

Steep Slopes: Steep slopes restrict the use of several BMPs. Porous pavement must be situated in sites with slopes of 5 percent or less. Swales can only be used if their slope is less than 5 percent; however, swales often can be used perpendicular to the slope or with a drop structure. Also, because of slope stability concerns, infiltration trenches and filter strips are not practical when slopes exceed 20 percent.

High Water Table: The water table acts as an effective barrier to exfiltration and can sharply reduce the ability of an infiltration BMP to drain properly. If the height of the seasonally high water table extends to within 4 feet (1.2 meters) of the bottom of an infiltration BMP, the site is seldom considered suitable. Given the climate and geology of Southern California, this is typically not an issue, except for some areas adjacent to surface water bodies.

Soil Permeability: The type of soil is an important characteristic that can limit the applicability of a particular BMP at a particular site since the long term percolation rate is governed by soil type. This soil permeability factor is particularly relevant to infiltration BMPs, which should not be applied to sites with infiltration rates of less than 0.27 inch per hour (0.686 centimeters), as

defined by the least permeable layer in the shallow soil profile. This limiting rate excludes most "C" and "D" soils (Soil Classification System), which cannot exfiltrate enough runoff through the subsoil. In addition, extremely permeable sandy soils may not maintain adequate water levels in wet ponds.

Proximity to Foundations and Wells: Since infiltration BMPs divert runoff back into the soil, some development sites may experience difficulty with local seepage, especially if located near a building foundation. Another risk due to diverted runoff through infiltration may be contamination of groundwater supplies. Limited research has been performed to evaluate this risk, however, it is advisable to maintain infiltration BMPs at least 100 feet (30 meters) from drinking water wells. The risk is greater when shallow soils with organic materials are bypassed.

Climatic Region: BMPs should include appropriate designs to address issues of rainfall volume and intensity during wet weather seasons so as to consider the economic feasibility of using such BMPs and/or designs. Typically, the evaluation of long term rainfall records must be considered together with site conditions to properly size structural treatment BMPs. In addition, wet ponds require some continuous flow (dry weather water source) to keep them from stagnating or developing odor and mosquito problems.

Land Consumption: Some sites are too intensively developed or limited in area to allow for some BMPs, such as pond BMPs and porous pavement, which require a large surface area and buffer area

Maximum Depth: To preserve storage capacity for subsequent rain events, keep water from stagnating, and provide optimal pollutant removal conditions, infiltration BMPs must be designed to completely drain within 2 to 3 days after a storm. If the infiltration rates of the underlying soils are slow, the available depth of the infiltration facility may be limited. These restrictions vary depending on whether the facility is a trench, basin, injection well, or porous pavement.

Restricted Land Uses: Certain BMPs can only be applied to particular land uses, and are not broadly applicable for all development sites. Porous pavement can only be used for sites with parking lots not expected to receive heavy car or truck traffic, or much sediment.

High Sediment Input: Most BMPs are unable to handle the large loads of sediment that may be generated during the construction phase of development. Infiltration BMPs are particularly susceptible to rapid clogging and subsequent failure if significant sediment loads are allowed to enter the structure. As a general rule, these BMPs should not be installed until all of the land to be disturbed by construction in the contributing watershed is effectively stabilized and will

remain stabilized. Contractors must often take unusual steps during the actual installation of the infiltration BMPs to prevent soil compaction or contamination by sediment. To prevent clogging of the infiltration BMPs after construction, many designs call for the use of a pre-treatment device to filter sediment and other coarse particles before they reach the infiltration BMP. In addition, in areas where large amounts of fine sediment may occur even in the absence of upstream construction, BMPs such as porous pavement are not recommended.

Landscape Enhancement: If properly designed, many BMP options have the potential to enhance the urban landscape. Wet ponds and wetlands are frequently used to create a waterfront effect in residential developments, and may actually increase the value of the adjacent property. Dry extended detention areas can serve as attractive parks, either manicured or natural in design, or sports fields. Given the typical rainfall patterns in Southern California, these open areas would be available for public use most of the year. Most infiltration BMPs or lined detention areas have a neutral or negative effect on landscape appearance. In general, BMPs may be visually attractive or aesthetically unappealing, depending upon the creativity of the project designer.

D.3 POLLUTANT REMOVAL CAPABILITY

The nature of the pollutant being removed and its concentration often sets an upper limit on the potential removal rate that can be achieved with a given BMP. The pollutant removal capability of a BMP is primarily governed by three interrelated factors: removal mechanisms as affected by the design of the BMP, fraction of the annual runoff volume that is effectively treated, and nature of the urban pollutant being treated.

Pollutants such as sediment and lead (which is typically bound to fine sediment) can be removed effectively by common BMP removal mechanisms, including settling and filtering. Soluble pollutants such as nitrate, phosphate, and some trace metals are more difficult to remove and require biological and/or chemical mechanisms, such as uptake by bacteria, algae, rooted aquatic plants, organic material, terrestrial vegetation, or soils.

D.4 SHORT-TERM AND LONG-TERM COSTS

The appropriateness of a BMP for a particular site can be affected by economic feasibility considerations that encompass short- and long-term cost factors. Short-term costs include installation costs for both materials and labor. Long-term costs include maintenance. To sustain proper function, some BMPs require low level maintenance on a regular and frequent basis, whereas other BMPs require infrequent maintenance of a more extensive nature. Maintenance costs will include the proper disposal of accumulated material. In selecting a control method,

cost considerations—construction, installation, and maintenance—associated with the BMP should be considered.

D.5 RESPONSIBILITY FOR MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly.

D.6 CONTRIBUTING WATERSHED AREA

The feasibility of a particular BMP depends on the contributing watershed area. A BMP cannot be practically suitable for all urban area sizes. For instance, wet pond BMPs generally require a significant contributing watershed area of greater than 10 acres (4 hectares), and in locales such as Southern California, a dry weather source of water. By contrast, infiltration and vegetative BMPs are applicable for catchments less than 10 acres (4 hectares), due to space, economic, or flow volume constraints.

It should be noted that the contributing watershed area does not have to be limited to the development project site. By using local topography and drainage, the contributing watershed area may be increased or decreased to better accommodate a particular BMP. For example, additional runoff generated away from the development project may be routed to the BMP, thereby increasing total catchment area and making pond options more feasible. Conversely, various portions of the total runoff from a development project site may be diverted to smaller, individual BMPs, thereby decreasing the contributing watershed area and making infiltration and vegetative BMPs more practical.

D.7 ENVIRONMENTAL IMPACT AND ENHANCEMENT

Low Flow Maintenance: Downstream aquatic life may be jeopardized when the natural low flow levels experienced during the dry weather season decline even further because of reduced infiltration in urbanized watersheds. However, this is sometimes offset by irrigation return flows, which may cause unnatural dry weather flow. Infiltration BMPs can contribute significantly to groundwater recharge and may be able to help the watershed better mimic its past hydrologic behavior. Vegetative BMPs such as swales and filter strips appear to have modest potential in this regard, while pond BMPs have little effect in maintaining low flows.

Streambank Erosion Control: Streambank erosion not only contributes large sediment loads to receiving waters, but also has an adverse impact on the habitat quality for downstream aquatic life. Some BMPs, including extended detention ponds, and full exfiltration BMPs, can reduce erosive storm flows enough to keep downstream channels and banks relatively stable, whereas most other BMPs have only marginal capabilities in this regard.

Aquatic/Wildlife Habitat Creation: Some BMP options create wetland or open water areas utilized by waterfowl, marsh birds, and other wildlife. Shallow marshes and wet ponds are particularly well suited for this role, if relatively small investments are made in landscaping design and plant selection. Consideration would have to be given to a dry weather source of water, unless a seasonally wet area is desired. Terrestrial wildlife habitat may be created through the incorporation of BMPs such as wet ponds, extended detention ponds, infiltration basins, and filter strips. Relatively diverse biological communities may further be enhanced through judicious planting of trees, shrubs, and grasses that provide food and cover for the target wildlife.

Appendix E

STANDARD URBAN STORM WATER MITIGATION PLAN

LOS ANGELES COUNTY URBAN RUNOFF AND STORM WATER NPDES PERMIT
STANDARD URBAN STORM WATER MITIGATION PLAN

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Los Angeles County Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, requires the development and implementation of a program addressing storm water pollution issues in development planning for private projects. The same requirements are applicable to the City of Long Beach under its separate municipal storm water permit (City of Long Beach MS4 Permit), which was issued on June 30, 1999.

The requirement to implement a program for development planning is based on, federal and state statutes including: Section 402 (p) of the Clean Water Act, Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 ("CZARA"), and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. The primary objectives of the municipal storm water program requirements are to:

1. Effectively prohibit non-storm water discharges, and
2. Reduce the discharge of pollutants from storm water conveyance systems to the Maximum Extent Practicable (MEP statutory standard).

The Standard Urban Storm Water Mitigation Plan (SUSMP) was developed as part of the municipal storm water program to address storm water pollution from new Development and Redevelopment by the private sector. This SUSMP contains a list of the minimum required Best Management Practices (BMPs) that must be used for a designated project. Additional BMPs may be required by ordinance or code adopted by the Permittee and applied generally or on a case-by-case basis. The Permittees are required to adopt the requirements set herein in their own SUSMP. Developers must incorporate appropriate SUSMP requirements into their project plans. Each Permittee will approve the project plan as part of the development plan approval process and prior to issuing building and grading permits for the projects covered by the SUSMP requirements.

All discretionary development and redevelopment projects that fall into one of the following categories are subject to these SUSMPs. These categories are:

- Single-Family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units
- Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff

The City of Long Beach permit requires a SUSMP for the following categories only: (i) 10-99 home subdivisions; (ii) 100 or more home subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Plan.

Permittees shall amend codes, and promulgate ordinances, if necessary, not later than January 15, 2001, to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect not later than February 15, 2001.

DEFINITIONS

"100,000 Square Foot Commercial Development" means any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas. "Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

"Best Management Practice (BMP)" means any program, technology, process, siting criteria, operational methods or measures, or engineered systems, which when implemented prevent, control, remove, or reduce pollution.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Directly Connected Impervious Area (DCIA)" means the area covered by a building, impermeable pavement, and/ or other impervious surfaces, which drains directly into the storm drain without first flowing across permeable land area (e.g. lawns).

"Discretionary Project" means a project which requires the exercise of judgment or deliberation when the public agency or public body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.

"Greater than (>) 9 unit home subdivision" means any subdivision being developed for 10 or more single-family or multi-family dwelling units.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25 percent or greater.

"Infiltration" means the downward entry of water into the surface of the soil.

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Parking Lot" means land area or facility for the temporary parking or storage of motor vehicles used personally, for business or for commerce with a lot size of 5,000 square feet or more, or with 25 or more parking spaces.

"Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/ or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces. Where redevelopment results in an increase of less than 50 percent of the impervious surfaces of a previously existing development, and the existing development was not subject to these SUSMPs, the Design Standards apply only to the addition, and not to the entire development.

"Restaurant" means a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"Storm Event" means a rainfall event that produces more than 0.1 inch of precipitation and that, which is separated from the previous storm event by at least 72 hours of dry weather.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological, or chemical process.

Where provisions of the SUSMP requirements conflict with established local codes, (e.g., specific language of signage used on storm drain stenciling), the Permittee may continue the local practice and modify the SUSMP to be consistent with the code, except that to the extent that the standards in the SUSMP are more stringent than those under local codes, such more stringent standards shall apply.

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Post-development peak storm water runoff discharge rates shall not exceed the estimated pre-development rate for developments where the increased peak storm water discharge rate will result in increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural undisturbed condition.

Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.

Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.

Promote natural vegetation by using parking lot islands and other landscaped areas.

Preserve riparian areas and wetlands.

3. MINIMIZE STORM WATER POLLUTANTS OF CONCERN

Storm water runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the storm water conveyance system. The development must be designed so as to minimize, to the maximum extent practicable, the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official. Pollutants of concern, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a concentrations or loads considered potentially toxic to humans and/or flora and fauna.

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the Maximum Extent Practicable. Those BMPs best suited for that purpose are those listed in the *California Storm Water Best Management Practices Handbooks*; *Caltrans Storm Water Quality Handbook: Planning and Design Staff Guide*; *Manual for Storm Water Management in Washington State*; *The Maryland Stormwater Design Manual*; *Florida Development Manual: A Guide to Sound Land and Water Management*; Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices* and *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* , USEPA Report No. EPA-840-B-92-002, as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated, may in a particular circumstance, be better suited to maximize the reduction of the pollutants.

Examples of BMPs that can be used for minimizing the introduction of pollutants of concern generated from site runoff are identified in Table 2. Any BMP not specifically approved by the Regional Board in Resolution No. 99-03, "Approving Best Management Practices for Municipal Storm Water and Urban

Runoff Programs in Los Angeles County", for development planning may be used if they have been recommended in one of the above references.

4. PROTECT SLOPES AND CHANNELS

Project plans must include BMPs consistent with local codes and ordinances and the SUSMP to decrease the potential of slopes and/or channels from eroding and impacting storm water runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Utilize natural drainage systems to the maximum extent practicable
- Control or reduce or eliminate flow to natural drainage systems to the maximum extent practicable
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion, with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers and the California Department of Fish and Game

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the storm water conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins within the project area must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.
- Signs and prohibitive language and/or graphical icons, which prohibit illegal dumping, must be posted at public access points along channels and creeks within the project area.
- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials. Improper storage of materials outdoors may provide an opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the storm water conveyance system.

Where proposed project plans include outdoor areas for storage of materials that may contribute pollutants to the storm water conveyance system, the following Structural or Treatment BMPs are required:

- Materials with the potential to contaminate storm water must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.
- The storage area must be paved and sufficiently impervious to contain leaks and spills.
- The storage area must have a roof or awning to minimize collection of storm water within the secondary containment area.

7. PROPERLY DESIGN TRASH STORAGE AREAS

A trash storage area refers to an area where a trash receptacle or receptacles are located for use as a repository for solid wastes. Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following Structural or Treatment Control BMP requirements (individual single family residences are exempt from these requirements):

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).
- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons why water quality controls will not function as designed or which may cause the system to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included or is required to include, Structural or Treatment Control BMPs in project plans, the Permittee shall require that the applicant provide verification of maintenance provisions through such means as may be appropriate, including, but not limited to legal agreements, covenants, CEQA mitigation requirements and/or Conditional Use Permits.

For all properties, the verification will include the developer's signed statement, as part of the project application, accepting responsibility for all structural and treatment control BMP maintenance until the time the property is transferred and, where applicable, a signed agreement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance. The transfer of property to a private or public owner must have conditions requiring the recipient to assume responsibility for maintenance of any Structural or Treatment Control BMP to be included in the sales or lease agreement for that property, and will be the owner's responsibility. The condition of transfer shall include a provision that the property owners conduct maintenance inspection of all Structural or Treatment Control BMPs at least once a year and retain proof of inspection. For residential properties where the Structural or Treatment Control BMPs are located within a common area that will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what storm water management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. The transfer of this information shall also be required with any subsequent sale of the property.

If Structural or Treatment Control BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. Structural or Treatment Control BMPs proposed for transfer must meet design standards adopted by the public entity for the BMP installed and should be approved by the County or other appropriate public agency prior to its installation.

9. DESIGN STANDARDS FOR STRUCTURAL OR TREATMENT CONTROL BMPs

Structural or Treatment control BMPs selected for use at any project covered by this SUSMP shall meet the design standards of this Section unless specifically exempted.

Post-construction Structural or Treatment Control BMPs shall be designed to:

A. mitigate (infiltrate or treat) storm water runoff from either:

1. the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or
2. the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial*, (1993), or
3. the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or
4. the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,

AND

B. control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.

Limited Exclusion

Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, and Retail Gasoline Outlets are excluded from the numerical Structural or Treatment Control BMP design standard requirement only.

R0000831

10. PROVISIONS APPLICABLE TO INDIVIDUAL PRIORITY PROJECT CATEGORIES

REQUIREMENTS

A. 100,000 SQUARE FOOT COMMERCIAL DEVELOPMENTS

1. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water run-on or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all wash water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. The area in the site design must be:

- Self-contained and/ or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

B. RESTAURANTS

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

The activity of outdoor equipment/accessory washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for the washing/steam cleaning of equipment and accessories. This area must be:

- Self-contained, equipped with a grease trap, and properly connected to a sanitary sewer.
- If the wash area is to be located outdoors, it must be covered, paved, have secondary containment, and be connected to the sanitary sewer.

C. RETAIL GASOLINE OUTLETS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. The project plans must include the following BMPs:

- The fuel dispensing area must be covered with an overhanging roof structure or canopy. The canopy's minimum dimensions must be equal to or greater than the area within the grade break. The canopy must not drain onto the fuel dispensing area, and the canopy downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing area must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

D. AUTOMOTIVE REPAIR SHOPS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. Therefore, design plans, which include fueling areas, must contain the following:

- The fuel dispensing area should be covered with an overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing areas must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water run-on or contact with storm water runoff.

- Design a repair/maintenance bay drainage system to capture all wash-water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. This area must be:

- Self-contained and/or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer or to a permitted disposal facility.

4. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

E. PARKING LOTS

1. PROPERLY DESIGN PARKING AREA

Parking lots contain pollutants such as heavy metals, oil and grease, and polycyclic aromatic hydrocarbons that are deposited on parking lot surfaces by motor vehicles. These pollutants are directly transported to surface waters. To minimize the offsite transport of pollutants, the following design criteria are required:

- Reduce impervious land coverage of parking areas
- Infiltrate runoff before it reaches storm drain system.
- Treat runoff before it reaches storm drain system

2. PROPERLY DESIGN TO LIMIT OIL CONTAMINATION AND PERFORM MAINTENANCE

Parking lots may accumulate oil, grease, and water insoluble hydrocarbons from vehicle drippings and engine system leaks.

- Treat to remove oil and petroleum hydrocarbons at parking lots that are heavily used (e.g. fast food outlets, lots with 25 or more parking spaces, sports event parking lots, shopping malls, grocery stores, discount warehouse stores)
- Ensure adequate operation and maintenance of treatment systems particularly sludge and oil removal, and system fouling and plugging prevention control

11. WAIVER

A Permittee may, through adoption of an ordinance or code incorporating the treatment requirements of the SUSMP, provide for a waiver from the requirement if impracticability for a specific property can be established. A waiver of impracticability shall be granted only when all other Structural or Treatment Control BMPs have been considered and rejected as infeasible. Recognized situations of impracticability include, (i) extreme limitations of space for treatment on a redevelopment project, (ii) unfavorable or unstable soil conditions at a site to attempt infiltration, and (iii) risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than 10 feet from the soil surface. Any other justification for impracticability must be separately petitioned by the Permittee and submitted to the Regional Board for consideration. The Regional Board may consider approval of the waiver justification or may delegate the authority to approve a class of waiver justifications to the Regional Board Executive Officer. The supplementary waiver justification becomes recognized and effective only after approval by the Regional Board or the Regional Board Executive Officer. A waiver granted by a Permittee to any development or redevelopment project may be revoked by the Regional Board Executive Officer for cause and with proper notice upon petition.

12. LIMITATION ON USE OF INFILTRATION BMPs

Three factors significantly influence the potential for storm water to contaminate ground water. They are (i) pollutant mobility, (ii) pollutant abundance in storm water, (iii) and soluble fraction of pollutant. The risk of contamination of groundwater may be reduced by pretreatment of storm water. A discussion of limitations and guidance for infiltration practices is contained in, *Potential Groundwater Contamination from Intentional and Non-Intentional Stormwater Infiltration, Report No. EPA/600/R-94/051, USEPA (1994).*

In addition, the distance of the groundwater table from the infiltration BMP may also be a factor determining the risk of contamination. A water table distance separation of ten feet depth in California presumptively poses negligible risk for storm water not associated with industrial activity or high vehicular traffic.

Infiltration BMPs are not recommended for areas of industrial activity or areas subject to high vehicular traffic (25,000 or greater average daily traffic (ADT) on main roadway or 15,000 or more ADT on any intersecting roadway) unless appropriate pretreatment is provided to ensure groundwater is protected and the infiltration BMP is not rendered ineffective by overload.

13. ALTERNATIVE CERTIFICATION FOR STORM WATER TREATMENT MITIGATION

In lieu of conducting detailed BMP review to verify Structural or Treatment Control BMPs adequacy, a Permittee may elect to accept a signed certification from a Civil Engineer or a Licensed Architect registered in the State of California, that the plan meets the criteria established herein. The Permittee is encouraged to verify that certifying person(s) have been trained on BMP design for water quality, not more than two years prior to the signature date. Training conducted by an organization with storm water BMP design expertise (e.g., a University, American Society of Civil Engineers, American Society of Landscape Architects, American Public Works Association, or the California Water Environment Association) may be considered qualifying.

TABLE 2
EXAMPLE BEST MANAGEMENT PRACTICES (BMPs)

The following are examples of BMPs that can be used for minimizing the introduction of pollutants of concern that may result in significant impacts, generated from site runoff to the storm water conveyance system. (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.
- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes; on-street parking; emergency, maintenance, and service vehicle access; sidewalks; and vegetated open channels.
- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.
- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).
- Use open space development that incorporates smaller lot sizes.
- Reduce building density.
- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.
- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.
- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the storm water conveyance system.
- Vegetated swales and strips
- Extended/dry detention basins
- Infiltration basin
- Infiltration trenches
- Wet ponds
- Constructed wetlands
- Oil/Water separators
- Catch basin inserts
- Continuous flow deflection/ separation systems
- Storm drain inserts
- Media filtration
- Bioretention facility
- Dry-wells
- Cisterns
- Foundation planting
- Catch basin screens
- Normal flow storage/ separation systems
- Clarifiers
- Filtration systems
- Primary waste water treatment systems

Appendix F
Guidelines for General Plan Modification

The State Planning and Zoning Law provides that requirements placed on land development projects must be compatible with a community's General Plan. Therefore, storm water pollution control objectives for land development should be reflected in the appropriate policies, goals, and objectives of each Permittee's General Plan. Whenever elements of a Permittee's General Plan are significantly rewritten, the Permittee will incorporate watershed and storm water management considerations into the General Plan elements being rewritten. General Plan elements that may be particularly appropriate to reflect watershed and storm water quality considerations are:

- growth management;
- land use;
- circulation (i.e., transportation);
- public facilities;
- open space; and
- conservation.

When updating a General Plan, special attention should be given to how the plan addresses water quality protection, development goals and policies, open space goals and policies, preservation of or integration with natural features, and water conservation policies. Typically, most General Plans have provisions that protect water quality and the environment.

Adapting a General Plan to incorporate storm water quality concerns may be as simple as modifying existing text so that it specifically includes storm water quality and protection. The General Plan should include goals and policies in its various elements that are affected by land development, and which require mitigation of storm water quality impacts from land development projects. The General Plan land use map should conform to revised storm water quality policies and eliminate conflicts among land use districts, permitted land uses, and storm water-specific goals and policies.

Storm water quality may be influenced by controlling the type, location, and density of development. Such controls may be established through policies commonly found in the land use and open space elements of the General Plan (e.g., development policies, development location guidelines, open space policies, policies on preservation of and integration with natural features). It is usually advisable to establish such policies through a storm water quality master plan, which evaluates proposed development patterns, their impact on the environment, and the pollution control effectiveness of these policies. Sections of the General Plan that address overall water quality, environmental protection, water resources conservation, and landscaping may be modified. A section could be added that requires compliance with existing NPDES

permits and the Clean Water Act. Changes or additions to General Plans should include objectives such as:

- minimizing, to the maximum extent practicable, the impacts from storm water runoff on the biological integrity of natural drainage systems and water bodies;
- putting emphasis on cumulative storm water impacts and the need to mitigate cumulative impacts to less than significant levels;
- maximizing, to the maximum extent practicable, the percentage of permeable surfaces to allow more percolation of storm water runoff into the ground;
- minimizing, to the maximum extent practicable, the amount of storm water directed to impermeable areas and to the municipal separate storm sewer system;
- linking groundwater and storm water flows so that storm water is considered in the hydrologic cycle;
- building storm water pollution prevention requirements into other existing requirements (e.g., landscaping) to ensure that requirements do not themselves indirectly encourage practices that can cause pollution;
- requiring proposed projects to be conditioned to comply with California's general storm water permits for construction and industrial activities and the Clean Water Act;
- requiring erosion and sediment controls for developments to minimize erosion damage and sediment transport off site;
- requiring proposed projects to be conditioned with reasonable limits on the clearing of vegetation from development sites, and limits on the length of time during which soil may be exposed; and
- requiring proposed projects to be conditioned with appropriate permanent controls to reduce storm water pollutant loads discharged from the development site (including parking lots) to the maximum extent practicable.

Additional policies, goals, or objectives may be beneficial in General Plans to stress the importance of storm water quality control or to implement certain types of storm water management programs. Changing a General Plan to incorporate storm water quality concerns may be a simple process of adding the word "quality" to items referencing storm water quantity or adding the word "storm water" to items referencing water quality.

Appendix G

Storm Water Quality Management Program

Developer Information For Project Planning, Design, And Construction

G.1 PROGRAM SUMMARY

All projects submitted to the City for review and approval are required to comply with the requirements of the City's storm water quality management program. At the time of submittal of an application for project review and approval, the project will be screened to determine if a project is Exempt or will be considered a Planning Priority Project and/or Construction Priority Project. Development Projects considered to be either Planning Priority Projects or Construction Priority Projects will be subject to special requirements as part of the City's storm water quality management program.

Federal regulations for controlling the discharge of pollutants from storm water drainage systems were issued by the U.S. Environmental Protection Agency (USEPA) in 1990. These regulations require that discharges from defined municipal separate storm sewer systems, industrial facilities, and construction activities must obtain and comply with National Pollutant Discharge Elimination System (NPDES) permit conditions intended to reduce or eliminate the discharge of pollutants from storm water drainage systems. In California, the USEPA has delegated its authority to issue NPDES permits to the State Water Resources Control Board and the nine Regional Water Quality Control Boards.

The City of _____ is a Permittee with Los Angeles County in the California Regional Water Quality Control Board, Los Angeles Region, Order No. 96-054, NPDES Permit No. CAS614001 ("Permit"). As a Permittee, the City has the responsibility for implementing the requirements of that Permit within the City.

A requirement of the Permit is the implementation of practices during the planning, design, and construction of a project which reduce or eliminate the potential for discharge of pollutants from the storm water drainage system, and maximize pervious areas and storm water infiltration to the extent possible. Every project submitted to the City for review and approval, which is determined to be either a Planning Priority Project or a Construction Priority Project will be required to incorporate such practices.

G.1.1 Project Planning and Design

For project planning and design, a Planning Priority Project is defined in the Permit as "development and redevelopment projects requiring discretionary approval which the Building Official (or equivalent municipal authority) determines may have a potential significant effect on storm water quality." The checklist that the City will use in determining if a development project is Exempt or is a Planning Priority Project is provided as Attachment G1.

G.1.2 Project Construction

Construction Priority Projects will be identified using the following criteria:

- The project is not exempt from the Development Construction component of the City's storm water quality management program and not subject to the General Construction Permit; and
- The project will result in soil disturbance of more than 2 acres of land; or
- The project is in or adjacent to an environmentally sensitive area[7]; or
- The project is located in a designated hillside area and soil disturbance will occur at the project site in the rainy season.

Determination of whether a project is a Construction Priority Project will be made by the project applicant and then evaluated and approved by the City according to these criteria listed above.

The City may exempt certain types of projects from the program that pose a minimum risk of storm water pollution. For example, the City considers the following construction projects to be exempt:

- routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility;
- emergency construction activities required to immediately protect public health and safety;
- interior remodeling with no outside exposure of construction materials or construction waste to storm water;
- mechanical permit work;
- electrical permit work, and
- sign permit work.

G.2 GOALS AND OBJECTIVES

Development of any site creates the potential for pollution of storm water runoff from the site. Storm water pollution can occur both during project construction and after construction is complete and the project site is in use. The City's storm water quality management program has

[7] Since the Permit does not define "designated environmentally sensitive area," Permittees will designate areas within their jurisdiction as "environmentally sensitive" utilizing criteria such as, but not limited to, the presence of the following: endangered, threatened, or rare species or their habitats; locally designated species (e.g., heritage trees); locally designated natural communities (e.g., oak forest, coastal habitat, etc.); and wildlife dispersal or migration corridors.

been developed to provide a process by which various measures can be implemented to control and minimize the potential for pollution from storm water drainage systems.

At the beginning of the planning phase for a site, the developer must consider storm water and urban runoff and the potential for the discharge of pollutants from the storm water drainage system of the project site. Activities that will occur during the construction phase and later when the site is being used for its planned function must be evaluated for this potential. Consideration of potential pollution via urban and storm water runoff at the early stages of a project will allow the developer to incorporate design measures that will reduce the potential for discharge of pollutants from the project via the storm water drainage system. These measures can become an integral part of the project design without creating a significant adverse impact to the project development program.

During construction of a project, the developer and/or contractor must implement measures to effectively prohibit non-storm water discharges to the storm water drainage system, and to reduce discharge of pollutants via the storm water drainage system to the maximum extent practicable.

G.3 BEST MANAGEMENT PRACTICES

Reduction of pollutants in discharges from storm water drainage systems can be accomplished through the incorporation of best management practices (BMPs) during the project planning, design, and construction phases. BMPs are those storm water management practices selected for implementation by meeting the Maximum Extent Practicable (MEP) criteria. MEP may be considered as:

> The extent of implementation of storm water management practices that are effective at reducing storm water pollution except when any of the following conditions are met: (1) other effective management practices would achieve greater or substantially the same pollution control benefits; (2) the management practice would not be technically feasible; (3) the cost of management practice implementation would greatly outweigh the probable pollution control benefits; or (4) implementation of the management practice would compromise other legal and institutional constraints, expectations, or obligations imposed by federal or state statute or case law.

The BMPs described in the Planning and Design Information and Construction Information must be considered during the planning, design, and construction phases of a project (as applicable) to effectively prohibit non-storm water discharges, and to reduce the discharge of pollutants to the storm water drainage system. The Standard Urban Storm Water Mitigation Plan (SUSMP) provides the minimum required post-construction BMPs for eight different categories of development and redevelopment projects.

These BMPs have been selected from the *California Storm Water Best Management Practices Handbook, Municipal, Industrial, and Construction Volumes* (May 1993). These handbooks contain a full description of each BMP and provide guidance for its implementation. Copies of the handbooks may be obtained from:

Los Angeles County Dept. of Public Works

Checklist for Categorizing Discretionary Development Planning Projects as Priority or Exempt

Project Name: _____

Project Location: _____

Description of Project: _____

Part A. Proposed Discretionary Project Is:	Yes	No
1. A single-family hillside residence		
2. A 100,000+ square-foot commercial development		
3. An automotive repair shop (SIC codes 5013, 5014, 5541, 7532-7534, and 7536-7539)		
4. A retail gasoline outlet		
5. A restaurant (SIC code 5812)		
6. A home subdivision with 10 to 99 housing units		
7. A home subdivision with 100 or more housing units		
8. Parking lot 5,000 square feet or more or with 25 or more parking spaces, and potentially exposed to storm water runoff		

If all answers to Part A are No, continue to Part B.

Part B. Proposed Discretionary Project Characteristics[8]:	Yes	No
1. Vehicle or equipment fueling areas?		
2. Vehicle or equipment maintenance areas, including washing?		
3. Commercial or industrial waste handling or storage, excluding typical office or household waste?		
4. Outdoor handling or storage of hazardous materials or waste?		
5. Hillside location (as defined by the local jurisdiction)?		
6. Outdoor work areas for activities such as, but not limited to: welding; cutting; metal fabrication; assembly; application of paints, coatings, or finishes; pre-cast concrete fabrication; etc.?		
7. Location adjoining to, bisected by, or directly discharging to a designated environmentally sensitive area[9], riparian corridor, or wetland?		
8. A 100,000+ square-foot industrial development?		
9. Outdoor animal confinement (e.g., stables, kennels, etc.)?		

EXEMPT PROJECT: Every question in Part A and Part B is answered "NO."

PRIORITY PROJECT: Any question in Part A or Part B is answered "YES."

---

[8] Activities or materials potentially exposed to storm water and not protected by storm-resistant sheltering. Activities include industrial and commercial facilities operations and construction work. Materials include material handling equipment, industrial machinery, raw materials, intermediate products, byproducts, and waste products however packaged.

[9] The Permit does not define "designated environmentally sensitive area." Examples of such areas may be wetlands, habitats of endangered, threatened, or rare species, wildlife dispersal or migration corridors, areas of locally-designated species such as heritage trees, or locally-designated natural communities such as oak forest or coastal habitat.

Appendix H

Developer Information For Project Planning And Design

H.1 BMP SELECTION PROCESS FOR PROJECT PLANNING AND DESIGN

In planning a development project, the designer must answer three key questions with respect to storm water quality control: (1) what kind of storm water quality controls are needed?; (2) where should the controls be implemented?; and (3) how much control is enough? In order to answer these questions, the designer should document the process used to identify potential storm water quality problems, develop design objectives, formulate and evaluate alternatives, select the most appropriate alternatives, and design the plan.

A list of recommended BMPs for development planning and design has been compiled, and a process has been identified for selecting the appropriate BMPs for a specific project. This list of BMPs and the selection process are appropriate for use in addressing site planning issues and post-construction site uses for development projects. BMPs should be selected based upon criteria such as: type of development and its related potential for contributing to storm water pollution, environmental benefit to be gained, pollutant removal effectiveness, economic and technical feasibility, ease of maintenance for ongoing implementation of BMPs, and consistency with other environmental mandates.

The recommended BMP selection process is described in Sections H.2 through H.6. The recommended BMPs for consideration for planning and design projects are provided in Section H.7.

H.2 DEVELOP GOALS AND OBJECTIVES

Site-specific conditions of development planning projects determine which BMPs are most appropriate for a site. Prior to selecting BMPs, a good understanding of post-construction activities and potential sources of storm water pollutants is needed. The BMPs considered should address the potential pollutants reasonably expected at the site once the site is occupied or operational. The permanent BMPs planned for a site should fulfill the following goals and objectives:

- be appropriate for the given site constraints;
- ease of implementation and maintenance;
- ensure no adverse impacts to storm water quality;
- promote improved water quality;
- provide effective pollutant source control or removal capability;
- meet regulatory requirements; and

- be economically feasible.

H.3 BMP SELECTION CRITERIA

In order to fulfill the preceding goals and objectives, appropriate BMPs should be selected by using selection criteria that serve to identify the capabilities and limitations of each BMP. Common criteria used in screening and selecting BMPs during the planning stage are:

- project characteristics (e.g., potential sources of storm water pollutants after construction is completed);
- site factors (e.g., slope, high water table, soils, etc.);
- pollutant removal capability;
- short-term and long-term costs;
- responsibility for maintenance;
- contributing watershed; and
- environmental enhancement.

These criteria may be given equal weight during the BMP selection process, or they may be weighted differentially, depending on the relative importance of each factor for the particular project. These factors are described in more detail in Attachment H1.

H.4 SELECT BEST ALTERNATIVES

Using the list of recommended BMPs for Planning Priority Projects, the developer/designer should use the selection criteria described in Attachment 1 to select the best alternatives for the project conditions, characteristics, and concerns. This may be done numerically, by weighting the selection criteria, rating each BMP against each criteria, and summing up a weighted rating for each BMP, which then becomes a relative ranking. Or the selection process may be done in a more subjective, non-numerical way using experience and professional judgment to select the best alternative BMPs. Either way, the project designer should document the BMP selection process to provide justification for the system of BMPs incorporated into project plans and designs.

H.5 DESIGN AND INSTALLATION OF THE BMPS

After the appropriate BMPs are selected for a given project, the designer may complete the design of the BMPs and complete the project plans and specifications. Post-construction structural or treatment control BMPs for must be designed to:

A. mitigate (infiltrate or treat) storm water runoff from either:

1. the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or
2. the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial*, (1993), or
3. the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or
4. the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event.

AND

B. control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.

Further, it is important that the project plans and specifications include adequate information for the BMPs to be properly installed. Improper installation is one of the most common reasons for water quality controls to not function as designed. Therefore, the designer must provide sufficient information in the project plans for their proper installation.

H.6 MAINTENANCE OF THE BMPS

Typically, maintenance of the permanent BMPs will not be the responsibility of the City, but will be the responsibility of the owner, occupant, owner's association, etc. However, maintenance is crucial to the proper and continued functioning and effectiveness of the BMPs. The developer or contractor must consider the ongoing maintenance responsibility required for each BMP selected.

H.7 RECOMMENDED BMPS

Table H-1 lists recommended BMPs as related to site planning practices, post-construction measures, and redevelopment and infill practices. Where applicable, the numerical designation

for a BMP as used in the *California Storm Water Best Management Practices Handbook* is noted. Erosion control BMPs are included here because maintenance of soil stabilization measures is important on an ongoing basis (i.e., for the life of the site). A brief description of each BMP is provided in Attachment H2. BMP Fact Sheets for each of these BMPs are provided in Attachment H3.

Table H-1. Recommended BMPs

BMP Name	BMP Identification No. and Name[1]	Site Planning Practices	Post-Construction	Redevelopment & Infill Practices
Car Wash Facility	SC3, Vehicle and Equipment Washing and Steam Cleaning		x	x
Constructed Wetlands	TC3, Constructed Wetlands		x	
Control of Impervious Runoff	Not applicable.		x	x
Efficient Irrigation	Not applicable.		x	x
Energy Dissipaters	ESC40, Outlet Protection		x	x
Extended Detention Basins	TC5, Extended Detention Basin		x	
Infiltration Basins	TC1, Infiltration		x	x
Infiltration Trenches	TC1, Infiltration		x	x
Inlet Trash Racks	Not applicable.		x	x
Landscape Design	ESC2, Preservation of Existing Vegetation; ECS10, Seeding and Planting; ESC11, Mulching		x	x
Linings for Urban Runoff Conveyance Channel	Not applicable.		x	x
Materials Management	SC5, Outdoor Loading/Unloading of Materials; SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products		x	x
Media Filtration	TC6, Media Filtration		x	x
Minimize Storm Water Runoff	Not applicable.	x		
Motor Fuel Concrete Dispensing Areas	SC2, Vehicle and Equipment Fueling		x	x
Motor Fuel Dispensing Area Canopy	SC2, Vehicle and Equipment Fueling		x	x
Oil/Water Separators and Water Quality Inlets	TC7, Oil/Water Separators and Water Quality Inlets		x	x
Outdoor Storage	SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products		x	x
Pervious Drainage System	Not applicable.	x		
Porous Pavement and Alternative Surfaces	TC1, Infiltration		x	x

R0000857

H.8 STANDARD URBAN STORM WATER MITIGATION PLAN

Selection of permanent (post-construction) BMPs for a project is a function of the type, size, and location of the project. Projects developed on large sites provide the opportunity to incorporate a wide variety of BMPs, whereas smaller sites may present physical constraints on the implementation of BMPs requiring allocation of larger land areas. Similarly, for projects located in an existing urban environment (for example, redevelopment or infill projects), opportunities may not exist to implement BMPs that focus on the preservation of existing natural vegetation.

Al discretionary development and redevelopment projects that fall into one of the eight following categories are subject to the requirements of the SUSMP:

- Single-family hillside residences
- 100,000+ square foot commercial developments
- Automotive repair shops
- Retail gasoline outlets
- Restaurants
- Home subdivisions with 10 to 99 housing units
- Home subdivisions with 100 or more housing units
- Parking lots 5,000 square feet or more or with 25 or more parking spaces, and potentially exposed to storm water runoff

The SUSMP provides the minimum required BMPs that must be incorporated into project plans and designs before building or grading permits will be issued. The SUSMP or a project-specific Urban Storm Water Mitigation Plans are intended to assure that appropriate post-construction BMPs are included in project plans and designs to:

a. minimize, to the MEP, impacts from storm water runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the Clean Water Act, local ordinances, and other legal authorities;

b. maximize, to the MEP, the percentage of permeable surfaces to allow more percolation of storm water into the ground;

c. minimize, to the MEP, the amount of storm water directed to impermeable areas and to the municipal separate storm sewer system;

d. minimize, to the MEP, parking lot pollution through the use of appropriate BMPs such as retention, infiltration, and good housekeeping;

e. establish reasonable limits on the clearing of vegetation from the project site including, but not limited to, regulation of the length of time during which soil may be exposed and, in certain sensitive cases, the prohibition of bare soil; and

f. provide for appropriate permanent measures to reduce storm water pollutant loads from the development site to the MEP.

A copy of the SUSMP is available at the City's public counter.

Attachment H1

Developer Information For Project Planning And Design

The following criteria should be considered during the process of assessing the appropriateness (benefits and limitations) of BMPs for a particular project:

- project characteristics;
- site factors;
- pollutant removal capability;
- short-term and long-term costs;
- responsibility for maintenance;
- contributing watershed area; and
- environmental enhancement.

H1.1 PROJECT CHARACTERISTICS

Selection of BMPs for a project is a function of project characteristics such as type or size of project. Post-construction activities and operations that may be potential sources of storm water pollution are often the same for a given type of project. Projects developed on large sites provide the opportunity to incorporate a wider variety of BMPs, whereas smaller sites often have physical constraints precluding implementation of BMPs requiring large land areas.

H1.2 SITE FACTORS

Site factors have common physical restrictions on BMPs and include:

Steep Slopes: Steep slopes restrict the use of several BMPs. Porous pavement must be situated in sites with slopes of 5 percent or less. Swales can only be used if their slope is less than 5 percent; however, swales often can be used perpendicular to the slope or with a drop structure. Also, because of slope stability concerns, infiltration trenches and filter strips are not practical when slopes exceed 20 percent.

High Water Table: The water table acts as an effective barrier to exfiltration and can sharply reduce the ability of an infiltration BMP to drain properly. If the height of the seasonally high water table extends to within 4 feet (1.2 meters) of the bottom of an infiltration BMP, the site is seldom considered suitable. Given the climate and geology of Southern California, this is typically not an issue, except for some areas adjacent to surface water bodies.

Soil Permeability: The type of soil is an important characteristic that can limit the applicability of a particular BMP at a particular site since the long term percolation rate is governed by soil type. This soil permeability factor is particularly relevant to infiltration BMPs, which should not be applied to sites with infiltration rates of less than 0.27 inch per hour (0.686 centimeters), as

defined by the least permeable layer in the shallow soil profile. This limiting rate excludes most "C" and "D" soils (Soil Classification System), which cannot exfiltrate enough runoff through the subsoil. In addition, extremely permeable sandy soils may not maintain adequate water levels in wet ponds

Proximity to Foundations and Wells: Since infiltration BMPs divert runoff back into the soil, some development sites may experience difficulty with local seepage, especially if located near a building foundation. Another risk due to diverted runoff through infiltration may be contamination of groundwater supplies. Limited research has been performed to evaluate this risk, however, it is advisable to maintain infiltration BMPs at least 100 feet (30 meters) from drinking water wells. The risk is greater when shallow soils with organic materials are bypassed.

Climatic Region: BMPs should include appropriate designs to address issues of rainfall volume and intensity during wet weather seasons so as to consider the economic feasibility of using such BMPs and/or designs. Typically, the evaluation of long term rainfall records must be considered together with site conditions to properly size structural treatment BMPs.

In addition, wet ponds require some continuous flow (dry weather water source) to keep them from stagnating or developing odor and mosquito problems.

Land Consumption: Some sites are too intensively developed or limited in area to allow for some BMPs, such as pond BMPs and porous pavement, which require a large surface area and buffer area.

Maximum Depth: To preserve storage capacity for subsequent rain events, keep water from stagnating, and provide optimal pollutant removal conditions, infiltration BMPs must be designed to completely drain within 2 to 3 days after a storm. If the infiltration rates of the underlying soils are slow, the available depth of the infiltration facility may be limited. These restrictions vary depending on whether the facility is a trench, basin, injection well, or porous pavement.

Restricted Land Uses: Certain BMPs can only be applied to particular land uses, and are not broadly applicable for all development sites. Porous pavement can only be used for sites with parking lots not expected to receive heavy car or truck traffic, or much sediment.

High Sediment Input: Most BMPs are unable to handle the large loads of sediment that may be generated during the construction phase of development. Infiltration BMPs are particularly susceptible to rapid clogging and subsequent failure if significant sediment loads are allowed to enter the structure. As a general rule, these BMPs should not be installed until all of the land to be disturbed by construction in the contributing watershed is effectively stabilized and will

remain stabilized. Contractors must often take unusual steps during the actual installation of the infiltration BMPs to prevent soil compaction or contamination by sediment. To prevent clogging of the infiltration BMPs after construction, many designs call for the use of a pre-treatment device to filter sediment and other coarse particles before they reach the infiltration BMP. In addition, in areas where large amounts of fine sediment may occur even in the absence of upstream construction, BMPs such as porous pavement are not recommended.

Landscape Enhancement: If properly designed, many BMP options have the potential to enhance the urban landscape. Wet ponds and wetlands are frequently used to create a waterfront effect in residential developments, and may actually increase the value of the adjacent property. Dry extended detention areas can serve as attractive parks, either manicured or natural in design, or sports fields. Given the typical rainfall patterns in Southern California, these open areas would be available for public use most of the year. Most infiltration BMPs or lined detention areas have a neutral or negative effect on landscape appearance. In general, BMPs may be visually attractive or aesthetically unappealing depending upon the creativity of the project designer.

H1.3 POLLUTANT REMOVAL CAPABILITY

The nature of the pollutant being removed and its concentration often sets an upper limit on the potential removal rate that can be achieved with a given BMP. The pollutant removal capability of a BMP is primarily governed by three interrelated factors: removal mechanisms as affected by the design of the BMP, fraction of the annual runoff volume that is effectively treated, and nature of the urban pollutant being treated.

Pollutants such as sediment and lead (which is typically bound to fine sediment) can be removed effectively by common BMP removal mechanisms, including settling and filtering. Soluble pollutants such as nitrate, phosphate, and some trace metals are more difficult to remove and require biological and/or chemical mechanisms, such as uptake by bacteria, algae, rooted aquatic plants, organic material, terrestrial vegetation, or soils.

R0000863

H1.4 SHORT-TERM AND LONG-TERM COSTS

The appropriateness of a BMP for a particular site can be affected by short-term and long-term cost considerations. Short-term costs include installation costs for both materials and labor. Long-term costs include maintenance. To sustain proper function, some BMPs require low level maintenance on a regular and frequent basis, whereas other BMPs require infrequent maintenance of a more extensive nature. Maintenance costs will include the proper disposal of

accumulated material. In selecting a control method, cost considerations—construction, installation, and maintenance—associated with the BMP should be considered.

H1.5 RESPONSIBILITY FOR MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly.

H1.6 CONTRIBUTING WATERSHED AREA

The feasibility of a particular BMP depends on the contributing watershed area. A BMP cannot be practically suitable for all urban area sizes. For instance, wet pond BMPs generally require a significant contributing watershed area of greater than 10 acres (4 hectares), and in locales such as Southern California, a dry weather source of water. By contrast, infiltration and vegetative BMPs are applicable for catchments less than 10 acres (4 hectares), due to space, economic, or flow volume constraints.

It should be noted that the contributing watershed area does not have to be limited to the development project site. By using local topography and drainage, the contributing watershed area may be increased or decreased to better accommodate a particular BMP. For example, additional runoff generated away from the development project may be routed to the BMP, thereby increasing total catchment area and making pond options more feasible. Conversely, various portions of the total runoff from a development project site may be diverted to smaller, individual BMPs, thereby decreasing the contributing watershed area and making infiltration and vegetative BMPs more practical.

H1.7 ENVIRONMENTAL IMPACT AND ENHANCEMENT

Low Flow Maintenance: Downstream aquatic life may be jeopardized when the natural low flow levels experienced during the dry weather season decline even further because of reduced infiltration in urbanized watersheds. However, this is sometimes offset by irrigation return flows, which may cause unnatural dry weather flow. Infiltration BMPs can contribute significantly to groundwater recharge and may be able to help the watershed better mimic its past hydrologic behavior. Vegetative BMPs such as swales and filter strips appear to have modest potential in this regard, while pond BMPs have little effect in maintaining low flows.

Streambank Erosion Control: Streambank erosion not only contributes large sediment loads to receiving waters, but also has an adverse impact on the habitat quality for downstream aquatic life. Some BMPs, including extended detention ponds, and full exfiltration BMPs, can reduce erosive storm flows enough to keep downstream channels and banks relatively stable, whereas most other BMPs have only marginal capabilities in this regard.

Aquatic/Wildlife Habitat Creation: Some BMP options create wetland or open water areas utilized by waterfowl, marsh birds, and other wildlife. Shallow marshes and wet ponds are particularly well suited for this role, if relatively small investments are made in landscaping design and plant selection. Consideration would have to be given to a dry weather source of water, unless a seasonally wet area is desired. Terrestrial wildlife habitat may be created through the incorporation of BMPs such as wet ponds, extended detention ponds, infiltration basins, and filter strips. Relatively diverse biological communities may further be enhanced through judicious planting of trees, shrubs, and grasses that provide food and cover for the target wildlife.

Attachment H2

Developer Information For Project Planning And Design

H2.1 SOURCE CONTROL BMPS

Efficient Irrigation: The timing and application methods of irrigation water should be designed to minimize the runoff of excess irrigation water into the storm water drainage system. Rain shutoff devices should be employed to prevent irrigation after significant precipitation and to shut off before runoff occurs. Irrigation systems should be designed so areas that have different water use requirements are not mixed on the same station, to avoid over-watering problems. The use of drip irrigation should be considered for all planter areas that have a shrub density that will cause excessive spray interference of an overhead irrigation system. Flow reducers or shutoff valves triggered by a pressure drop should be used to mitigate broken heads or lines.

Energy Dissipaters: Energy dissipaters, such as riprap, shall be installed at the outlets of new storm drains that enter unlined channels in accordance with applicable agency specifications to minimize erosion. [*California Best Management Practice Handbook*: ESC40 - Outlet Protection]

Landscape Design: Choose plants with low irrigation requirements (for example, native or drought tolerant species) and group plants with similar water requirements in order to reduce excess irrigation runoff, where practical. Consider other design features, such as:

- Use mulches (such as wood chips or bark) in planter areas without ground cover to minimize sediment in runoff.
- Install appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant material where possible and/or as recommended by the landscape architect.
- Leave a vegetative barrier along the property boundary and interior water courses, to act as a pollutant filter, where appropriate and feasible.
- Choose plants that do not require fertilizer or pesticides to sustain growth.

[*California Best Management Practice Handbook*: ESC2 - Preservation of Existing Vegetation, ESC10 - Seeding and Planting, and ESC11 - Mulching]

Linings for Urban Runoff Conveyance Channels: Onsite conveyance channels should be lined, where appropriate, to reduce erosion caused by increased flow velocity due to increases in tributary impervious area. The first choice for linings should be grass or some other vegetative surface, since these materials not only reduce runoff velocities, but also provide water quality benefits from filtration and infiltration. If velocities in the channel are large enough to erode grass or other vegetative linings, riprap, concrete soil cement or geo-grid stabilization may be substituted or used in combination with grass or other vegetation stabilization.

Materials Management: Project designs should be developed so as to minimize the potential of pollutants to contact rainfall or storm water runoff. Materials should be stored inside or under cover on paved surfaces. Secondary containment should be provided. The outdoor storage of hazardous materials should be minimized or eliminated. [*California Best Management Practice Handbook*: SC5 - Outdoor Loading/Unloading of Materials, SC6 - Outdoor Container Storage of Liquids, SC8 - Outdoor Storage of Raw Materials, Products, and By-Products]

Minimize Storm Water Runoff: Minimize the volume of post-development storm water runoff to an amount approximately equal to an undeveloped vegetated site by utilizing measures that increase infiltration. A reduction in the storm water runoff from a development project should yield a corresponding reduction in the amount of pollutants transported from the property. The undeveloped runoff volume should be determined by considering the project site to be in a natural condition with surface vegetation in place. The storm water runoff volume can be reduced by a variety of measures, including:

- increased use of landscape areas;
- increased use of vegetated drainage swales in lieu of underground piping or imperviously lined swales; and
- construction of onsite ponding areas or retention facilities to increase opportunities for infiltration.

Motor Fuel Concrete Dispensing Areas: Areas used for fuel dispensing shall be paved with portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited. The fuel dispensing area shall have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable. At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less. [*California Best Management Practice Handbook*: SC2 - Vehicle and Equipment Fueling]

Motor Fuel Dispensing Area Canopy: All motor fuel concrete dispensing areas must have a canopy structure. The canopy's minimum dimensions must be equal to or greater than the area within the grade break. The canopy must not drain onto the fuel dispensing area, and the canopy downspouts must be routed to prevent drainage across the concrete fueling area. [*California Best Management Practice Handbook*: SC2 - Vehicle and Equipment Fueling]

Outdoor Storage: Where proposed project building plans include outdoor areas for storage or use of containers of oils, fuels, solvents, coolants, wastes, or other chemicals, the areas where these materials are to be used or stored must be protected by secondary containment structures

such as berms, dikes, or curbs, as well as a roof or awning to minimize collection of storm water within the secondary containment area. In cases where storage areas are will be contained but not covered with roof or awning, provisions must be made for proper disposal of storm water that collects in secondary containment due to potential contamination. [*California Best Management Practice Handbook*: SC6 - Outdoor Container Storage of Liquids, SC8 - Outdoor Storage of Raw Materials, Products, an By-Products]

Pervious Drainage System: Provide pervious drainage systems, where possible, to reduce the volume of runoff through the opportunity for storm water infiltration. The primary objective of pervious drainage systems is to allow the storm water to flow over a natural surface or other constructed pervious materials as much as practical, thereby increasing opportunities for infiltration and pollutant removal. Methods of providing such drainage include:

- discharge roof drains onto lawn or vegetated areas, and not directly into a storm drain system;
- provide vegetated drainage swales on the developed site;
- use natural water courses or unlined channels to convey storm water runoff;
- use open jointed paving materials in walkway or parking areas; and
- where soils conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration.

Protect Slopes and Channels: Apart from approved grading plan areas, avoid disturbing steep or unstable slopes. Safely convey runoff from the tops of slopes, and stabilize disturbed slopes as quickly as possible. Avoid disturbing natural channels. Stabilize temporary and permanent channel crossings as quickly as possible, and ensure that increases in runoff velocity and frequency caused by the project do not erode the channel. [*California Best Management Practice Handbook*: ESC40 - Outlet Protection and ESC42 - Slope Roughening and Terracing]

Reduce Area of Impervious Surface: Reduce the area of impervious surfaces to minimize the storm water runoff volume and flow generated by the development project. The area of impervious surfaces in a development can be reduced by either reducing the physical size of the surface or by using a porous material for the paved surface. Some specific options to reduce impervious surfaces include:

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.
- Use permeable materials for sidewalk, driveway parking lot or roadway surfacing, where practicable.

- Reduce widths of street where off-street parking is available. However, street widths must still comply with life safety requirements for fire and emergency vehicle access.

Self-Contained Areas for Vehicle or Equipment Washing, Steam Cleaning, Maintenance, Repair, or Material Processing: For retail, commercial, or industrial development projects, self-contained areas shall be required for washing/steam cleaning, wet material processing, and maintenance activities. Specifically, where:

- washing of vehicles without steam cleaning occurs, provide wash racks constructed in accordance with local sewering agency guidelines or other acceptable standard, and obtain the prior approval of the sewering agency;
- steam cleaning occurs, provide wash racks or structurally contain (with a cover to restrict the entry of storm water during rain events) runoff from such areas on site for commercial waste removal;
- wet material processing occurs, secondary containment structures shall be provided to hold spills resulting from accidents, leaking tanks or equipment, or any other unplanned releases; and
- vehicle repair/maintenance occurs, impermeable berms, drop inlets, trench catch basins, or overflow containment structures shall be provided around repair/maintenance areas to prevent spilled materials and wash-down waters from entering the storm drain system.

[*California Best Management Practice Handbook*: SC3 - Vehicle and Equipment Washing and Steam Cleaning, SC4 - Vehicle and Equipment Maintenance and Repair, and SC7 - Outdoor Process Equipment Operations and Maintenance]

Site Layout: Preserve natural drainage features, natural depression storage areas, and avoid development on steep hillside areas to the extent practicable. Consideration should be given to concentrating or clustering development on one part of a site while leaving the remaining land in a natural undisturbed condition. Clustering of development for a project entails decreasing the allowable lot size and set-back requirements while maintaining the number of allowable units on the site. Such an approach can provide the flexibility to locate buildings and development on areas of the property more suitable for the project while leaving areas of environmental value in an undeveloped or natural state. Clustering may reduce lengths of roads, walkways, driveways and other impervious surfaces, thereby reducing the amount of runoff from the project. More concentrated development may also provide opportunities to intercept and manage pollutants generated by the development.

Storm Drain System Stenciling and Signage: Storm drain inlets and catch basins shall be stenciled with prohibitive language and/or graphical icons to discourage illegal dumping. Signs with prohibitive language and/or graphical icons discouraging illegal dumping may also be

posted along channels and creeks. All storm drain facilities constructed or modified will require the addition of standard stenciling or signage. [*California Best Management Practice Handbook*: SC30 - Storm Drain System Signs]

Trash Container Areas: Trash container areas, such as those for multi-family housing and commercial and industrial facilities, shall have drainage from adjoining roofs and pavements diverted around the area(s). Trash container areas shall be screened or walled to prevent off-site transport of trash, and shall have a solid roof or awning, where practicable. [*California Best Management Practice Handbook*: SC9 - Waste Handling and Disposal]

H2-2 TREATMENT CONTROL BMPS

Car Wash Facility: If a proposed project includes a designated car wash area, the area shall not discharge directly to the storm drain system. All wash water shall be directed to the sanitary sewer (with prior approval of the sewering agency), engineered infiltration device, or equally effective alternative. [*California Best Management Practice Handbook*: SC3, Vehicle and Equipment Washing and Steam Cleaning]

Constructed Wetlands: Create a wetland that is designed specifically for treating storm water runoff. A simple constructed wetland shall include a rectangular basin with a forebay and wetland vegetation area. The constructed wetland shall be shallower than a wet pond, allowing for greater contact between water, soil, and vegetation, and consequently, more phosphorus and metals removal potential. In Southern California, constructed wetlands would require a dry weather source of water. [*California Best Management Practice Handbook*: TC3 - Constructed Wetlands]

Control of Impervious Area Runoff: Direct drainage from impervious areas, including roofs, to the street or a storm drain shall be avoided. Impervious areas should be graded and constructed to drain to a filtration BMP, such as a landscaped area, infiltration area, detention basin or equally effective alternative, wherever practicable, and as recommended by the engineer of record. Roof runoff should also be directed to a filtration BMP, wherever practicable, and as recommended by the engineer of record. Some examples to control impervious runoff are:

- parking lot catch basins could be placed in landscaped areas, and roof downspouts could discharge onto landscaped areas which are designed to allow minor ponding
- site drainage systems could be designed to provide a low flow bypass into a filtration basin or similar BMP.

Extended Detention Basins: Provide an extended detention basin that fills with storm water runoff and then releases the storm water slowly through a bottom outlet to provide time for

sediments to settle. Extended detention basins are dry between storm events. Extended detention basins are appropriate where dry weather base flow cannot be used to maintain water levels, as required in treatment BMPs such as wet ponds or constructed wetlands. These systems are suitable for any size tributary area. Extended detention ponds have lower removal efficiency than wet ponds and constructed wetlands with respect to particulate pollutants, and have less capability for dissolved contaminant removal. [*California Best Management Practice Handbook*: TC5 - Extended Detention Basin]

Infiltration Basins: Provide infiltration basins as effective means of removing both soluble and fine particulate pollutants borne in urban runoff. Coarse-grained pollutants should generally be removed before they enter the basin. Unlike other infiltration systems, basins can be easily adapted to provide a reduction of peak discharges for large design storms by storing flow. Depending on the degree of storage/exfiltration achieved in the basin, significant groundwater recharge, low flow augmentation and reduced streambank erosion can be achieved. Basins are a feasible option where soils are permeable and the water table and bedrock are situated well below the soil surface. Infiltration basins can serve relatively large drainage areas. However, infiltration basins that serve larger watersheds can be problematic because it becomes more difficult to control the sediment input. Both the construction costs and maintenance requirements for basins are similar to those for conventional dry ponds. Infiltration basins do need to be inspected regularly to check for standing water. [*California Best Management Practice Handbook*: TC1 - Infiltration]

Infiltration Trenches: Install infiltration trenches as adaptable BMPs that effectively remove both soluble and particulate pollutants from surface flows. As with other infiltration systems, trenches are not intended to trap coarse sediments. Grass buffers or special inlets must be installed to capture coarse sediment before it enters the trench. Depending on the degree of storage/exfiltration achieved, trenches can provide groundwater recharge, low flow augmentation and reduced streambank erosion. Individual trenches are primarily an on-site control, and are seldom practical or economical on sites with contributing areas larger than 5 to 10 acres (2 to 4 hectares). Infiltration trenches are only feasible when soils are permeable and the water table and bedrock are situated well below the bottom of the trench. Aside from regular inspection and effective upstream sediment and erosion control, trenches have limited routine maintenance requirements. However, trenches will prematurely clog if sediment is not kept out before, during, and after construction activities in the contributing drainage area. An infiltration trench will eventually clog and require periodic excavation and reconstruction. This BMP will typically not work in areas with predominantly fine-grained soils. [*California Best Management Practice Handbook*: TC1 - Infiltration]

Inlet Trash Racks: Install trash racks, gratings, screens or other devices in catch basins and inlet structures where appropriate to reduce the amount of debris, litter, and other trash entering a storm water system. The design and use of trash racks, screens or grates must consider hydraulic capacity requirements to prevent flooding. Because of the potential for flooding if a blockage occurs, prior to project approval or the issuance of permits, the development project should have a maintenance plan for the inlet trash racks, screens, and other devices for the portions of the storm drain system that do not revert to municipal ownership and operation.

Media Filtration: Use media filtration in watersheds where soils do not permit infiltration or where concerns over groundwater quality prevent the use of infiltration. Media filtration is a relatively new technique for treating storm water, whereby some portion of runoff is diverted onto a self-contained bed of sand or other media, often preceded by a small sediment basin. The runoff is then strained through the sand, collected in underground pipes and returned back to the stream or channel. This BMP has the following advantages: moderate to high pollutant removal capability; very few environmental limitations; small land requirement; and broad application to most development sites, large or small. Media filtration can be used on areas with thin soils, high evaporation rates, low soil infiltration rates, and limited space. Many media filtration devices have been used on small parking lots, and numerous media filtration devices have been used for municipal runoff. The required surface area of the filter is usually a direct function of the impervious area treated, and varies regionally due to rainfall patterns and local criteria for the volume needed for water quality treatment. A disadvantage of media filtration is that it does not provide storm water quantity control, unless coupled with detention. Media filtration systems are moderately expensive, and require the sand to be replaced every 1 to 3 years. [*California Best Management Practice Handbook*: TC6 - Media Filtration]

Oil/Water Separators and Water Quality Inlets: Provide oil/water separators or water quality inlets for situations where concentrations of oil, grease, and related compounds are high and not controlled effectively by source control methods. This type of treatment control is designed to remove petroleum compounds and grease, and is also capable of removing floatable debris and settleable solids. Businesses with a high likelihood of oil and grease concentrations include truck, car, and equipment maintenance and washing businesses, as well as facilities such as marinas, marine ports, airfields, and mass transit park-and-ride lots. Oil/water separators and water quality inlets are only effective with a prescribed and diligent maintenance program, and only if they are designed as off-line systems. [*California Best Management Practice Handbook*: TC7 - Oil/Water Separators and Water Quality Inlets]

Porous Pavement and Alternative Surfaces: Install porous pavement or an alternative surface which has a high capability to remove both soluble and fine particulate pollutants in urban runoff, and can also provide groundwater recharge, low flow augmentation, and reduction in

streambank erosion. Installation of infiltration devices in conjunction with porous pavement allows capture of the runoff and percolation through the soil column. As the storm water percolates through the soil column, many pollutants are removed by filtration and soil bacteria. The use of porous pavement is generally restricted to low vehicle traffic volume and parking areas; it can accept runoff from rooftops or adjacent conventionally paved areas. As a BMP, porous pavement is only feasible on sites with gentle slopes, permeable soils, minimal (ideally no) sediment input, and relatively deep water table and bedrock levels. The disadvantages of porous pavement include the inability to bear heavy weight vehicles, the tendency to clog (which is costly to remedy), and the necessity of ongoing special maintenance to sustain function. Construction and installation of porous pavement also requires high levels of workmanship. [*California Best Management Practice Handbook*: TC1 - Infiltration]

Vegetated Swales and Strips: Install vegetated swales and strips to convey and treat storm water prior to discharge to a storm drain or surface water body. Treatment is achieved by sedimentation, filtration through the vegetation, adsorption to soil particles, and by bacteria present in the soil and on the plant stems. Vegetated swales are channels lined with grass that treat storm water flows. Swales are wider than typical storm water conveyance channels to maintain lower velocities and keep the depth of the water below the height of the vegetation (up to a particular runoff design flow rate). Implementation of vegetated swales is most appropriate for small drainage areas. Vegetated strips treat sheet flow and are placed parallel to the contributing surface, such as a parking lot. The strips should be greater than 10 feet (3 meters) long to establish sheet flow and should be sized to treat drainage areas of less than 5 acres (2 hectares). [*California Best Management Practice Handbook*: TC4 - Bio-filters]

Wet Pond: Install a wet pond where removal of dissolved constituents such as metals and nutrients are of concern. A wet pond is a small water body with rooted wetland vegetation along the perimeter that has a permanent water pool to treat incoming storm water. Wet ponds can be combined with extended detention basins. In Southern California, wet ponds require a dry weather source of water. [*California Best Management Practice Handbook*: TC2 - Wet Pond]

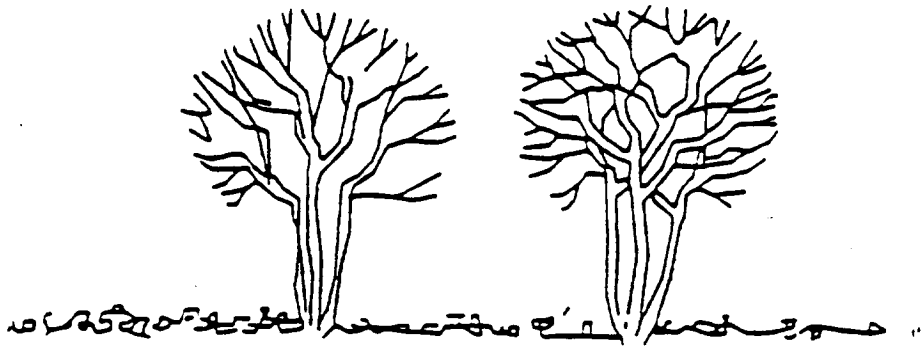
Developer Information For Project Planning And Design

BMP Fact Sheets - California Best Management Practice Handbooks (1993)

BMP: PRESERVATION OF EXISTING VEGETATION



GENERAL DESCRIPTION

Carefully planned preservation of existing vegetation minimizes the potential of removing or injuring existing trees, vines, shrubs and/or grasses that serve as erosion controls.

SUITABLE APPLICATIONS

- Areas within site where no construction activity occurs, or occurs at a later date.
- Sensitive areas where natural vegetation exist and should be preserved, such as: steep slopes, watercourses, and building sites in wooded areas.
- Areas where local, state and federal government requires preservation, such as: vernal pools, wetlands, marshes, certain oak trees, etc.

INSTALLATION/APPLICATION CRITERIA

- Clearly mark, flag or fence vegetation or areas where vegetation should be preserved.
- Prepare landscaping plans which include as much existing vegetation as possible and state proper care of this vegetation both during and after construction.
- Define and protect with berms, fencing, signs, etc., a setback area from vegetation to be preserved. Setback area size should be based on the location, species, size, age and potential impact of adjacent construction activities or permanent improvements.
- Proposed landscaping plans which do not include plant species that compete with the existing vegetation.
- Do not locate construction traffic routes, spoil piles, etc., where significant adverse impact on existing vegetation may occur.

REQUIREMENTS

- Maintenance
  - Inspection and maintenance requirements for protection of vegetation are low.
  - During construction the limits of grading or disturbance should be clearly marked at all times.
  - Irrigation or maintenance of native trees or vegetation should conform to specifications on the Landscape Plan.
- Cost
  - There is little cost associated with preserving existing vegetation if properly planned during the project design, and may yield aesthetic benefits which enhance property values.

LIMITATIONS

- Requires forward planning by the owner/developer, contractor and design staff.
- For sites with diverse topography, it is often difficult and expensive to save existing trees while grading the site satisfactorily for the planned development.

Objectives

- Housekeeping Practices
- Contain Waste
- **Minimize Disturbed Areas**
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- Control Internal Erosion

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Capital Costs
- ○ O&M Costs
- ○ Maintenance
- ○ Training
- ● Suitability for Slopes >5%

● High ○ Low

ESC2

Best Management Practices

Additional Information — Preservation of Existing Vegetation

Methods for protecting existing vegetation and trees:

- Stake off root system limits (drip line of tree). Some counties limit construction within 5 feet of the tree drip line.
- Fence off the area to be preserved or along the tree drip line.
- Flag or mark trees to remain in place.
- Tree wells and retaining walls (permanent) help preserve existing vegetation, but must be large enough to protect the root system (see below).
- For the California Oak tree, no trenching or irrigation should be allowed within the driplines of the tree, since both these activities are detrimental to the preservation of the tree.
- Where grading under trees is necessary, excavation and fill should be limited to 1 foot within the driplines.

County of Sacramento Tree Preservation Ordinance - September 1981.

Stormwater Management Water for the Puget Sound Basin. Washington State Department of Ecology, The Technical Manual - February 1992, Publication # 91-75.

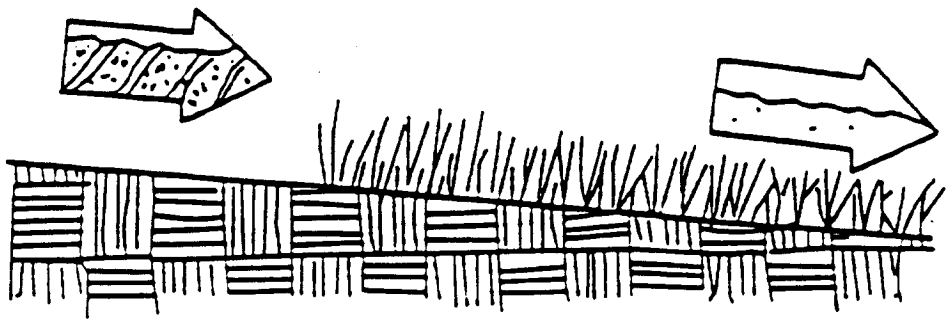
Water Quality Management Plan for the Lake Tahoe Region, Volume II, Handbook of Management Practices, Tahoe Regional Planning Agency - November 1988.

SUPPLEMENTAL INFORMATION, JUNE 1998

Limit and phase clearing. By clearing only those areas immediately essential for completing site construction, buffer zones are preserved and soil remains undisturbed until construction begins in a particular area. Additionally, the proposed limits of land disturbance should be physically marked off to ensure that no more than the required land area is cleared.

ESC2

BMP: SEEDING AND PLANTING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Seeding of grasses and plantings of trees, shrubs, vines and ground covers provide long-term stabilization of soil. In some areas, with suitable climates, grasses can be planted for temporary stabilization.

SUITABLE APPLICATIONS

- Appropriate for site stabilization both during construction and post-construction.
- Any graded/cleared areas where construction activities have ceased.
- Open space cut and fill areas.
- Steep slopes.
- Spoil piles.
- Vegetated swales.
- Landscape corridors.
- Stream banks.

INSTALLATION/APPLICATION CRITERIA

Type of vegetation, site and seedbed preparation, planting time, fertilization and water requirements should be considered for each application.

Grasses:

- Ground preparation: fertilize and mechanically stabilize the soil.
- Tolerant of short-term temperature extremes and waterlogged soil conditions.
- Appropriate soil conditions: shallow soil base, good drainage, slope 2:1 or flatter.
- Develop well and quickly from seeds.
- Mowing, irrigating, and fertilizing are vital for promoting vigorous grass growth.

Trees and Shrubs:

- Selection Criteria: vigor, species, size, shape & wildlife food source.
- Soil conditions: select species appropriate for soil,drainage & acidity.
- Other Factors: wind/exposure, temperature extremes, and irrigation needs.

Vines and Ground Covers:

- Ground preparation: lime and fertilizer preparation.
- Use proper seeding rates.
- Appropriate soil conditions: drainage, acidity, slopes.
- Generally avoid species requiring irrigation.

Targeted Pollutants

ESC10

Best Management Practices

Additional Information — Seeding and Planting

Permanent seeding of grasses, sodding, and planting of trees, shrubs, vines and ground covers can provide long-term stabilization of soil. Permanent seeding and planting contributes to long-term site aesthetics and helps reduce erosion by reducing the velocity of runoff, allowing infiltration to occur, filtering sediments, and by holding soil particles in place.

Seeding and planting should be applied as soon as final grading is done to all graded and cleared areas of the construction site where plant cover is ultimately desired. For example, vegetation may be established along landscaped corridors and buffer zones where they may act as filter strips (see TC6 in Chapter 5 of the Municipal Handbook). Additionally, vegetated swales, steep and/or rocky slopes and stream banks can also serve as appropriate areas for seeding and plantings.

Installation/Application Criteria

Application of appropriate vegetation must consider: the seedbed or plantbed, proper seasonal planting times, water requirements fertilizer requirements and availability of the selected vegetation within the project's region. Permanent plantings during the construction stage of projects require careful coordination between the local agency inspectors, project managers, construction managers, and landscape contractor. Protocols for coordination and implementation procedures regarding site access, construction staging, and short- and long-term planting areas should be developed prior to the construction bid process. Where possible, these protocols should be established by and remain the responsibility of the site owner.

Because of the many available types of plants and ground covers and because site conditions and land use vary so widely within California, a set of general guidelines is included for installation/application of grasses, trees and shrubs, vines and ground covers. However, your local municipality, Soil Conservation Service, agricultural extention, or other resources should be consulted on appropriate species, planting requirements, and maintenance needs for your climate and soils.

Grasses

Grasses, depending on the type, provide short-term soil stabilization during construction or can serve as long- term/ permanent soil stabilization for disturbed areas. In general, grasses provide low maintenance to areas that have been cleared, graded and mechanically stabilized.

Selection:

The selection of the grass type is determined by the climate, irrigation, mowing frequency, maintenance effort and soil-bed conditions. Although grasses provide quick germination and rapid growth, they also have a shallow root system and are not as effective in stabilizing deep soils, where trees, shrubs and deep rooted ground covers may be more appropriate. Several grasses are adaptable to the various California climates. The figure at the end of these fact sheets shows appropriate grasses for regions within California. Blue grass is well adapted throughout California except for in the valley regions. The blue grass is found on dry, sandy soils that have good drainage. Bermuda grass, on the other hand is well adapted in the valley region where soils are dry, coarse and heavier. Specific seed mix and/or varieties for each site should be provided by an approved/qualified plant materials specialist.

ESC10

Additional Information — Seeding and Planting

Caution should be exercised in the non-native vegetation because of impacts to native vegetation on adjacent lands. For example, species that may be planted at the construction site can quickly spread and compete with originally undisturbed vegetation such as the California Poppy and California buckwheat, both of which complete poorly with introduced grasses (e.g., planting wild oats is illegal in California). In addition to stabilizing disturbed soil, vines and ground covers can perform the following functions:

1. Provide attractive cover that does not need mowing.
2. Help to define traffic areas and control pedestrian movement.

Site Preparation:
Ground covers are plants that naturally grow very close together, causing severe competition for space nutrients and water. Soil for ground covers should be well prepared. The entire area should be spaded, disced, or rototilled to a depth of six to eight inches. Two to three inches of organic material, such as good topsoil or peat, should be spread over the entire area.

Planting:
The following steps will help ensure good plant growth.

1. Make the plantings following the contours of the land.
2. Dig the holes 1/3 larger than the plant root ball.
3. Know what depth to place the plants.
4. Use good topsoil or soil mixture with a lot of organic matter.
5. Fill hole 1/3 to 1/2 full, shake plants to settle soil among roots, then water.
6. Leave saucer-shaped depression around the plant to hold water.
7. Water thoroughly and regularly.
8. Space plants according to the type of plant and the extent of covering desired.

Materials:
There are many different species of vines and ground covers from which to choose, but care must be taken in their selection. It is essential to select planting materials suited to both the intended use and specific site characteristics. The plants discussed in this handbook are those which are known to be adapted to California, and commonly available from commercial nurseries. Additional information can be obtained from local nurserymen, landscape architects, and extension agents. An approved low water use plant list may be obtained from the State Department of Water Resources or the Soils Conservation Service.

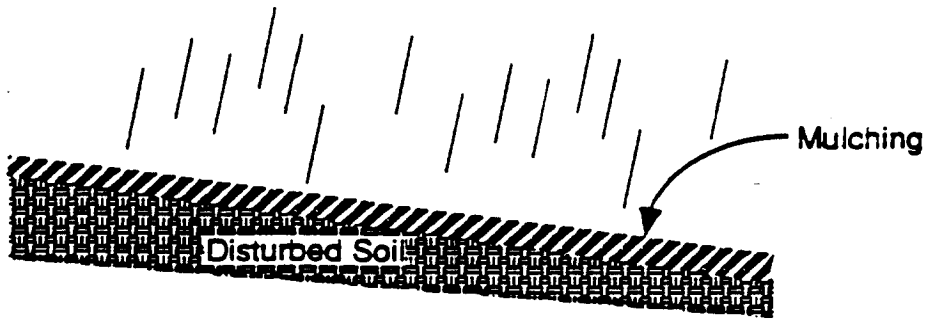
Requirements
Maintenance

General requirements include:

- Grass maintenance should be minimal to none. Irrigation and regular fertilizing may be required for some types of grasses. Mowing is only required in areas where aesthetics or fire hazards are a concern.
- Young trees should receive an inch of water each week for the first two years after planting. The tree should be watered deeply, but not more often than once per week.
- Transplanted trees should be fertilized on an annual basis.
- Proper pruning, watering, and application of fertilizer is necessary to maintain healthy and vigorous shrubs. A heavy layer of mulch applied around the shrubs reduces weeds and retains moisture.
- Trim old growth as needed to improve the appearance of ground covers. Most covers need once-a-year trimming to promote growth.

ESC10

BMP: MULCHING



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas* ●
- *Protect Slopes/Channels* ●
- *Control Site Perimeter*
- *Control Internal Erosion*

GENERAL DESCRIPTION

Mulching is used to temporarily and permanently stabilize cleared or freshly seeded areas. Types of mulches include organic materials, straw, wood chips, bark or other wood fibers, decomposed granite, and gravel.

SUITABLE APPLICATIONS

- Temporary stabilization of freshly seeded and planted areas.
- Temporary stabilization during periods unsuitable for growing vegetation.
- Temporary stabilization of areas that cannot be seeded or planted (e.g., insufficient rain, steep slope).
- Mulches such as gravel and decomposed soils may be used as post-construction BMPs, particularly in arid regions.

INSTALLATION/APPLICATION CRITERIA

Mulch prevents erosion by protecting the soil surface and fostering growth of new seedings that do not stabilize by themselves.

- May be used with netting to supplement soil stabilization.
- Apply to planting areas where slopes are 2:1 or greater.
- Binders may be required for steep areas, or if wind and runoff is a problem.
- Type of mulch, binders, and application rates should be recommended by manufacturer/contractor.

REQUIREMENTS

- Maintenance
  - Must be inspected weekly and after rain for damage or deterioration.
- Cost: Average annual cost for installation and maintenance (3-4 month useful life, source: EPA, 1992)
  - Straw Mulch: $7,500 per acre.
  - Wood Fiber Mulch: $3,500 per acre.
  - Jute Netting: $12,500 per acre.

LIMITATIONS

- Wood fiber mulches should be used only in areas with over 20 inches annual precipitation.
- Organic mulches are not permanent erosion control measures.
- Mulches tend to lower the soil surface temperature, and may delay germination of some seeds.
- Permanent mulches for arid regions should include gravel and decomposed soils.

ESC11

Best Management Practices

Additional Information — Mulching

Preparations/Methods and Equipment

Straw Mulch: Should be applied in an even, uniform manner, either by hand or by mulch blowing equipment. Straw mulches must be anchored to prevent the mulch from being blown or washed off the site. Anchoring is achieved in two ways:

- Crimping: The mulch is anchored by running a heavy disc with flat, dull, serrated, closely-spaced blades over the mulched soil. Effective crimping embeds the mulch about 2 inches into the soil without completely covering it. The disc should be run once or twice across the soil. About 2 1/2 tons of straw mulch per acre should be applied if the mulch is anchored by crimping.
- Tacking: Achieved using a emulsified asphalt or binder either independently or followed by crimping. If tacked, straw mulch may be applied at a rate of 1 3/4 ton per acre, and tacked with emulsified asphalt at a rate of 500 gallons per acre.

Wood Fiber Mulch: Typically applied with a hydroseeder at a rate of about 1000 to 1500 pounds per acre, or as a slurry consisting of at least 150 pounds of binder, 400 pounds of wood fiber mulch, and 200 gallons of water per acre.

Requirements

Maintenance: Mulched areas require frequent inspection for damage and deterioration. Requirements will vary greatly based on the type of mulch used and the type of vegetation to be established. Vegetative mulches are usually not intended to be permanent but are extended only as a base for re-seeding or re-vegetation. Where a permanent anchor for vegetation is required, along steep slopes or areas of higher velocity flows, then a geotextile mat or net is recommended (see ESC20).

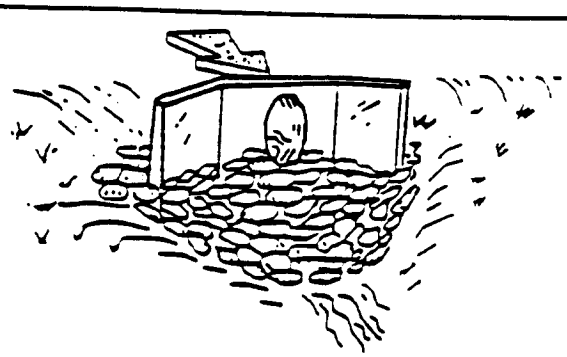
BMP: OUTLET PROTECTION



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Rock outlet protection is a physical device composed of rock, grouted riprap, or concrete rubble which is placed at the outlet of a pipe to prevent scour of the soil caused by high pipe flow velocities, and to absorb flow energy to produce non-erosive velocities.

SUITABLE APPLICATIONS

- Wherever discharge velocities and energies at the outlets of culverts, conduits or channels are sufficient to erode the next downstream reach.
- Rock outlet protection is best suited for temporary use during construction because it is usually less expensive and easier to install than concrete aprons or energy dissipators.
- A sediment trap below the pipe outlet is recommended if runoff is sediment laden.
- Permanent rock riprap protection should be designed and sized by the engineer as part of the culvert, conduit or channel design.
- Grouted riprap should be avoided in areas of freeze and thaw because the grout will break up.

INSTALLATION/APPLICATION CRITERIA

Rock outlet protection is effective when the rock is sized and placed properly. When this is accomplished, rock outlets do much to limit erosion at pipe outlets. Rock size should be increased for high velocity flows. General recommendations for rock size and length of outlet protection mat are presented in the additional information sheet. Best results are obtained when sound, durable, angular rock is used. CalTrans Standard Specifications or the local municipality can provide additional specifications for constructing outlet protection devices.

REQUIREMENTS

- Maintenance
  - Inspect after each significant rain for erosion and/or disruption of the rock, and repair immediately.
  - Grouted or wire-tied rock riprap can minimize maintenance requirements.
- Cost
  - CalTrans Cost Schedule gives regional cost ranges.

LIMITATIONS

- Large storms often wash away the rock outlet protection and leave the area susceptible to erosion.
- Sediment captured by the rock outlet protection may be difficult to remove without removing the rock.
- Outlet protection may negatively impact the channel habitat.

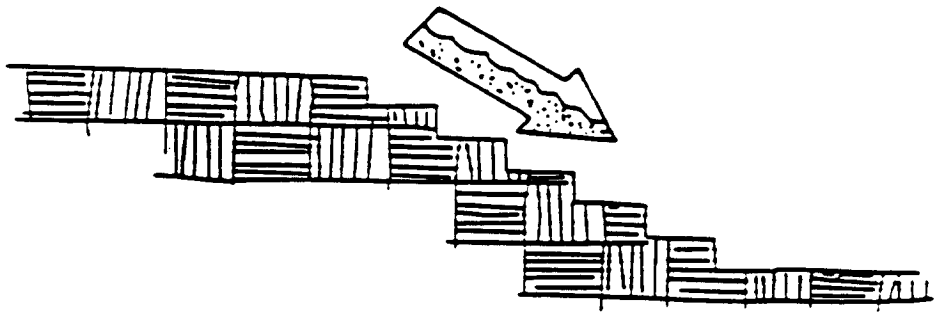
BMP: SLOPE ROUGHENING/TERRACING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DEFINITION

Slope roughening/terracing creates microclimates for establishing vegetation, reduces runoff velocity, increases infiltration, and provides small depressions for trapping sediment.

SUITABLE APPLICATIONS

- Any cleared area prior to seeding and planting.
- Required for cleared, erodible slopes steeper than 3:1 and higher than 5 feet prior to seeding and planting.

INSTALLATION/APPLICATION CRITERIA

Slope roughening/terracing is performed in several ways:

- Stair-step grading.
- Grooving.
- Furrowing.
- Tracking.
- Rough grading.
- No grading.

REQUIREMENTS

- Maintenance
  - Inspect roughened slopes weekly and after rainfall for excessive erosion.
  - Revegetate as quickly as possible.
- Cost (source: EPA, 1992)
  - Surface Roughening: Performed at no (e.g., rough grading) to low (e.g., tracking) cost.
  - Terracing: Average annual cost is $4 per linear foot (2 year useful life).

LIMITATIONS

- Roughening is of limited effectiveness on its own, but is used to speed revegetation.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact

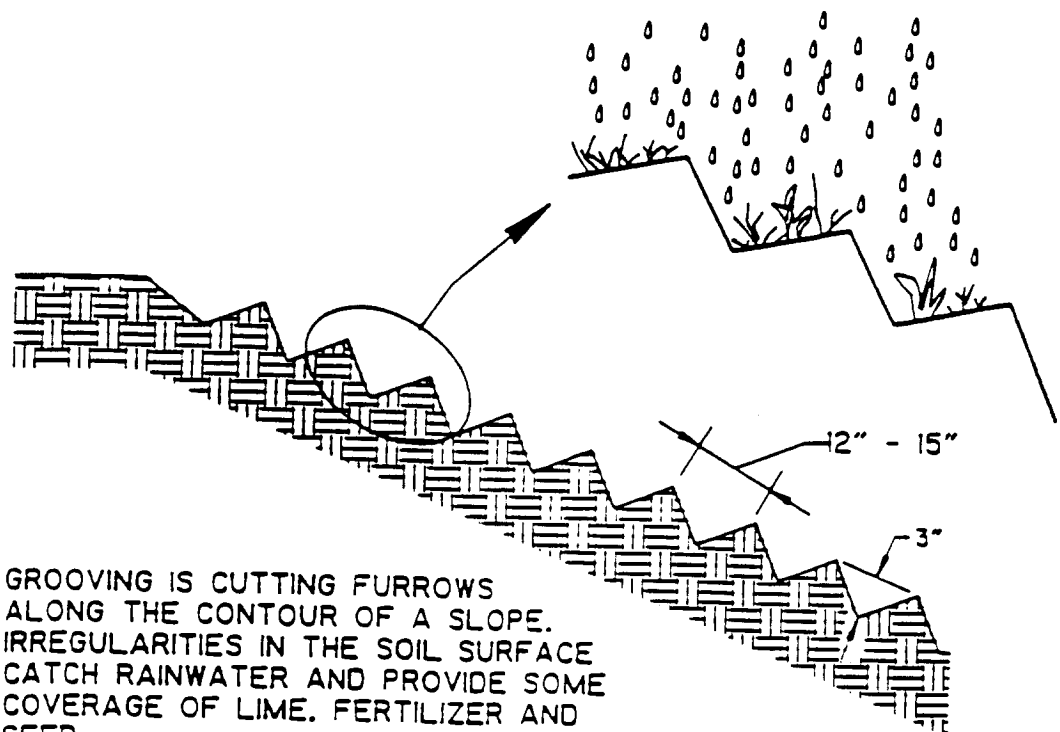
STAIR STEPPING CUT SLOPES



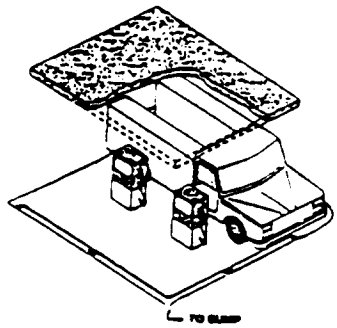
GROOVING IS CUTTING FURROWS ALONG THE CONTOUR OF A SLOPE. IRREGULARITIES IN THE SOIL SURFACE CATCH RAINWATER AND PROVIDE SOME COVERAGE OF LIME, FERTILIZER AND SEED.

GROOVING SLOPES

ESC42

STAIR-STEPPING CUT SLOPES AND GROOVING SLOPES

ACTIVITY: VEHICLE AND EQUIPMENT FUELING



DESCRIPTION

Prevent fuel spills and leaks, and reduce their impacts to storm water.

APPROACH

- Design the fueling area to prevent the runon of storm water and the runoff of spills:
  - Cover fueling area if possible.
  - Use a perimeter drain or slope pavement inward with drainage to sump.
  - Pave fueling area with concrete rather than asphalt.
- Where covering is infeasible and the fuel island is surrounded by pavement, apply a suitable sealant that protects the asphalt from spilled fuels.
- If dead-end sump is not used to collect spills, install an oil/water separator.
- Install vapor recovery nozzles to help control drips as well as air pollution.
- Discourage "topping-off" of fuel tanks.
- Use secondary containment when transferring fuel from the tank truck to the fuel tank.
- Use adsorbent materials on small spills and general cleaning rather than hosing down the area. Remove the adsorbent materials promptly.
- Carry out all Federal and State requirements regarding underground storage tanks, or install above ground tanks.
- Do not use mobile fueling of mobile industrial equipment around the facility; rather, transport the equipment to designated fueling areas.
- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Train employees in proper fueling and cleanup procedures.
- For a quick reference on disposal alternatives for specific wastes see Table 4.1, SC1.

REQUIREMENTS

- Costs (Capital, O&M)
  - The retrofitting of existing fueling areas to minimize storm water exposure or spill runoff can be expensive. Good design must occur during the initial installation. Extruded curb along the "upstream" side of the fueling area to prevent storm water runon is of modest cost.
- Maintenance
  - Clean oil/water separators at the appropriate intervals.
  - Keep ample supplies of spill cleanup materials on-site.
  - Inspect fueling areas and storage tanks on a regular schedule.

LIMITATIONS

- Oil/water separators are only as effective as their maintenance program.

Applications

- Manufacturing
- Material Handling
- Vehicle Maintenance
- Construction
- Commercial Activities
- Roadways
- Waste Containment
- Housekeeping Practices

Targeted Constituents

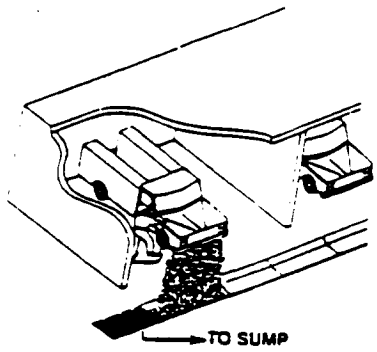
ACTIVITY: VEHICLE AND EQUIPMENT WASHING & STEAM CLEANING



Applications

- *Manufacturing*
- *Material Handling*
- *Vehicle Maintenance*
- *Construction*
- *Commercial Activities*
- *Roadways*
- *Waste Containment*
- *Housekeeping Practices*

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment washing and steam cleaning.

APPROACH

- Consider off-site commercial washing and steam cleaning businesses.
- Use designated wash areas, preferably covered to prevent contact with storm water and bermed to contain wash water.
- Discharge wash water to sanitary sewer, after contacting local sewer authority to find out if pretreatment is required.
- Educate employees on pollution prevention measures.
- Consider filtering and recycling wash water.
- Do not permit steam cleaning wash water to enter the storm drain.
- For a quick reference on disposal alternatives for specific wastes see Table 4.1, SC1.

REQUIREMENTS

- Capital costs vary depending on measures implemented.
  - Low cost ($500-1,000) for berm construction.
  - Medium cost ($5,000-20,000) for plumbing modifications (including re-routing discharge to sanitary sewer and installing simple sump).
  - High cost ($30,000-150,000) for on-site treatment and recycling.
- O&M costs increase with increasing capital investment.
- Maintenance
  - Berm repair and patching.
  - Inspection and maintenance of sumps, oil/water separators, and on-site treatment/ recycling units.

LIMITATIONS

- Some municipalities may require pretreatment and monitoring of wash water discharges to the sanitary sewer.
- Steam cleaning can generate significant pollutant concentrations requiring permitting, monitoring, pretreatment, and inspections. The measures outlined in this fact sheet are insufficient to address all the environmental impacts and compliance issues related to steam cleaning.

Targeted Constituents

- ● *Sediment*
- ● *Nutrients*

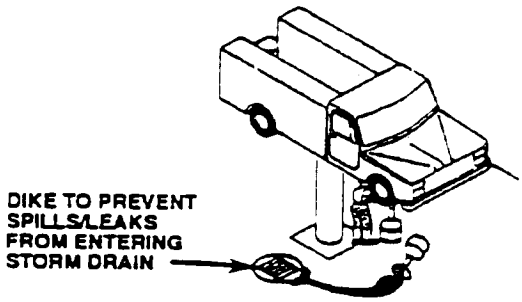
Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT MAINTENANCE AND REPAIR



Applications

- Manufacturing
- Material Handling
- Vehicle Maintenance
- Construction
- Commercial Activities
- Roadways
- Waste Containment
- Housekeeping Practices

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment maintenance and repair by running a dry shop.

APPROACH

- Keep equipment clean, don't allow excessive build-up of oil and grease.
- Keep drip pans or containers under the areas that might drip.
- Do not change motor oil or perform equipment maintenance in non-appropriate areas. Use a vehicle maintenance area designed to prevent storm water pollution.
- Inspect equipment for leaks on a regular basis.
- Segregate wastes.
- Make sure oil filters are completely drained and crushed before recycling or disposal..
- Make sure incoming vehicles are checked for leaking oil and fluids.
- Clean yard storm drain inlets(s) regularly and especially after large storms.
- Do not pour materials down drains or hose down work areas: use dry sweeping.
- Store idle equipment under cover.
- Drain all fluids from wrecked vehicles.
- Recycle greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic, and transmission fluids.
- Switch to non-toxic chemicals for maintenance when possible.
- Clean small spills with rags, general clean-up with damp mops and larger spills with absorbent material.
- Paint signs on storm drain inlets to indicate that they are not to receive liquid or solid wastes.
- Train employees.
- Minimize use of solvents.
- For a quick reference on disposal alternatives for specific wastes see Table 4.1, SC1.

REQUIREMENTS

- Costs (Capital, O&M) - Should be low, but will vary depending on the size of the facility.
- Maintenance - Should be low if procedures for the approach are followed.

LIMITATIONS

- Space and time limitations may preclude all work being conducted indoors.
- It may not be possible to contain and clean up spills from vehicles/equipment brought on-site after working hours.
- Drain pans (usually 1 ft. x 1 ft.) are generally too small to contain antifreeze, which may gush from some vehicles, so drip pans (3 ft. x 3 ft.) may have to be purchased or fabricated.
- Dry floor cleaning methods may not be sufficient for some spills. Use three-step method instead.
- Identification of engine leaks may require some use of solvents.

Targeted Constituents

Additional Information — Vehicle and Equipment Maintenance and Repair

Good Housekeeping

Also consider the following measures:

- Avoid hosing down your work areas. If work areas are washed, direct wash water to sanitary sewer.
- Collect leaking or dripping fluids in drip pans or containers. Fluids are easier to recycle if kept separate.
- Keep a drip pan under the vehicle while you unclip hoses, unscrew filters, or remove other parts. Use a drip pan under any vehicle that might leak while you work on it to keep splatters or drips off the shop floor.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around.

Do not pour liquid waste to floor drains, sinks, outdoor storm drain inlets, or other storm drains or sewer connections. Used or leftover cleaning solutions, solvents, and automotive fluids and oil are toxic and should not be put in the sanitary sewer. Post signs at sinks to remind employees, and paint stencils at outdoor drains to tell customer and others not to pour wastes down drains.

Oil filters disposed of in trash cans or dumpsters can leak oil and contaminate storm water. Most municipalities prohibit or discourage disposal of these items in solid waste facilities. Place the oil filter in a funnel over the waste oil recycling or disposal collection tank to drain excess oil before disposal. Oil filters can be crushed and recycled. Ask your oil supplier or recycler about recycling oil filters.

Put pans under leaks to collect fluids for proper recycling or disposal. Keeping leaks off the ground reduces the potential for storm water contamination and reduces cleanup time and costs. If the vehicle or equipment is to be stored outdoors, oil and other fluids should be drained first.

Designate a special area to drain and replace motor oil, coolant, and other fluids, where there are no connections to the storm drain or the sanitary sewer and drips and spills can be easily cleaned up.

Be especially careful with wrecked vehicles, whether you keep them indoors or out, as well as vehicles kept on-site for scrap or salvage. Wrecked or damaged vehicles often drip oil and other fluids for several days.

- As the vehicles arrive, place drip pans under them immediately, even if you believe that the fluids have leaked out before the car reaches your shop.
- Build a shed or temporary roof over areas where you park cars awaiting repair or salvage, especially if you handle wrecked vehicles. Build a roof over vehicles you keep for parts.
- Drain all fluids, including air conditioner coolant, from wrecked vehicles and "part" cars. Also drain engines, transmission, and other used parts.
- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Examples of Effective Programs

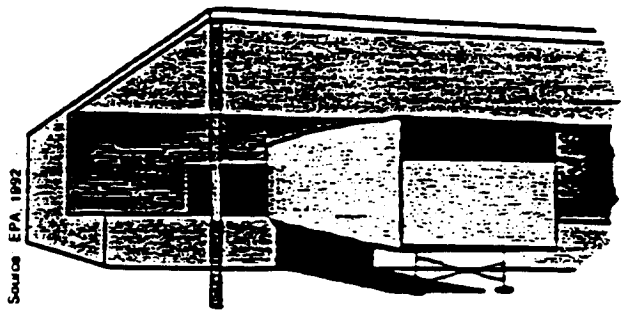
The City of Palo Alto has an effective program for commercial vehicle service facilities. Many of the program's elements, including specific BMP guidance and lists of equipment suppliers, are also applicable to industrial vehicle service facilities.

Pick N Pull Auto Dismantlers in Rancho Cordova drains all fluids from automobiles before they enter the yard.

Ecology Auto Wrecking in Rialto is surrounded by a steel plate/concrete fence and has a completely paved lot that is graded to a central low point. Collected storm water is channeled through an underground drainage system of clarifiers

SC4

ACTIVITY: OUTDOOR LOADING/UNLOADING OF MATERIALS



DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from outdoor loading/unloading of materials.

APPROACH

- Park tank trucks or delivery vehicles so that spills or leaks can be contained.
- Cover the loading/unloading docks to reduce exposure of materials to rain.
- Seal or door skirt between trailer and building can also prevent exposure to rain.
- Design loading/unloading area to prevent storm water runon:
  - grading or berming, and
  - position roof downspouts to direct storm water away from loading/unloading areas.
- Contain leaks during transfer.
- Use drip pans under hoses.
- Make sure fork lift operators are properly trained.
- Employee training for spill containment and cleanup.

REQUIREMENTS

- Costs (Capital, O&M) - Should be low except when covering a large loading/unloading area.
- Maintenance
  - Conduct regular inspections and make repairs as necessary. The frequency of repairs will depend on the age of the facility.
  - Check loading and unloading equipment regularly for leaks:
    - valves,
    - pumps,
    - flanges, and
    - connections.

LIMITATIONS

- Space and time limitations may preclude all transfers from being performed indoors or under cover.
- It may not be possible to conduct transfers only during dry weather.

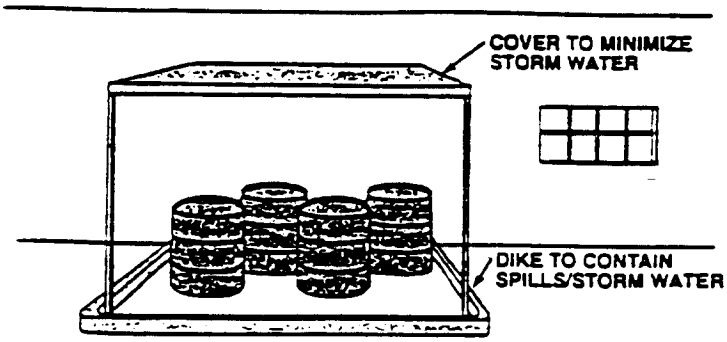
Best Management Practices

ACTIVITY: OUTDOOR CONTAINER STORAGE OF LIQUIDS



Applications

- Manufacturing
- **Material Handling**
- Vehicle Maintenance
- **Construction**
- **Commercial Activities**
- Roadways
- Waste Containment
- **Housekeeping Practices**

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from outdoor container storage areas by installing safeguards against accidental releases, installing secondary containment, conducting regular inspections, and training employees in standard operating procedures and spill cleanup techniques.

APPROACH

- Protect materials from rainfall, runon, runoff, and wind dispersal:
  - Store materials indoors.
  - Cover the storage area with a roof.
  - Minize storm water runon by enclosing the area or buiding a berm around it.
  - Use "doghouse" for storage of liquid containers.
  - Use covered dumpsters for waste product containers.
- Storage of oil and hazardous materials must meet specific Federal and State standards including:
  - Spill Prevention Control and Countermeasure Plan (SPCC) Plan,
  - secondary containment,
  - integrity and leak detection monitoring, and
  - emergency preparedness plans.
- Train operator on proper storage.
- Safeguards against accidental releases:
  - overflow protecuon devices to warn operator or automauc shut down transfer pumps,
  - protecuon guards (bollards) around tanks and piping to prevent vehicle or forklift damage, and
  - clear tagging or labeling, and restricting access to valves to reduce human error.
- Berm or surround tank or container with secondary containment system:
  - dikes, liners, vaults, or double walled tanks.
- Some municipalities require that secondary containment areas be connected to the sanitary sewer, prohibiting any hard connecuons to the storm drain.
- Facilities with "spill ponds" designed to intercept, treat, and/or divert spills should contact the appropriate regulatory agency regarding envirnmental compliance.

REQUIREMENTS

- Cost (Capital, O&M)
  - Will vary depending on the size of the facility and the necessary controls.
- Maintenance: Conduct routine weekly inspecuons.

LIMITATIONS

- Storage sheds often must meet building and fire code requirements.

Targeted Constituents

- ○ Sediment
- ○ Nutrients
- ● Heavy Metals
- ● Toxic Materials
- ○ Floatable Materials
- ● Oxygen Demanding Substances
- ○ Oil & Grease
- ○ Bacteria & Viruses

● Likely to Have Significant Impact
○ Probable Low or Unknown Impact

Implementation Requirements

SC6

Best Management Practices

immediately begin cleaning up a spill if one should occur. Operator errors can be prevented by using engineering safe guards and thus reducing accidental releases of pollutant. Safeguards include:

- Overflow protection devices on tank systems to warn the operator to automatically shutdown transfer pumps when the tank reaches full capacity,
- Protecive guards (bollards) around tanks and piping to prevent vehicle or forklift damage, and
- Clearly tagging or labeling all valves to reduce human error.

Tank systems should be inspected and tank integrity tested regularly. Problem areas can often be detected by visually inspecting the tanks frequently. Problems or potential problems should be corrected as soon as possible. Registered and specifically trained professional engineers can identify and correct potential problems such as loose fittings, poor welding, and improper or poorly fitted gaskets for newly installed tank systems. The tank foundations, connections, coatings, and tank walls and piping systems also should be inspected. Inspection for corrosion, leaks, cracks, scratches in protective coatings, or other physical damage that may weaken the tank system should be a part of regular integrity testing.

Secondary Containment

Tanks should be bermed or surrounded by a secondary containment system. Leaks can be detected more easily and spills can be contained when a secondary containment systems are installed. Berms, dikes, liners, vaults, and double-wall tanks are examples of secondary containment systems.

One of the best protective measures against contamination of storm water is diking. Containment dikes are berms or retaining walls that are designed to hold spills. Diking is an effective pollution prevention measure for above ground storage tanks and railcar or tank truck loading and unloading areas. The dike surrounds the area of concern and holds the spill, keeping spill materials separated from the storm water side of the dike area. Diking can be used in any industrial facility, but it is most commonly used for controlling large spills or releases from liquid storage areas and liquid transfer areas.

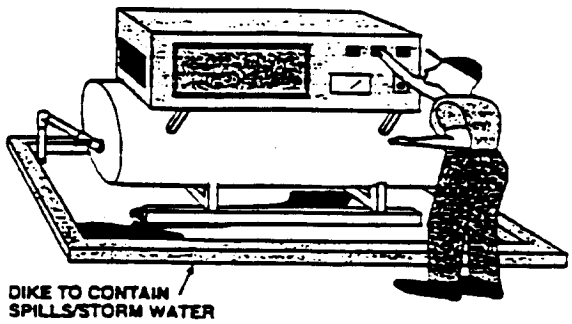
For single-wall tanks, containment dikes should be large enough to hold the contents of the storage tank for the facility plus rain water. For trucks, diked areas should be capable of holding an amount equal to the volume of the tank truck compartment. Diked construction material should be strong enough to safely hold spilled materials. Dike materials can consist of earth, concrete, synthetic materials, metal, or other impervious materials. Strong acids or bases may react with metal containers, concrete, and some plastics. Where strong acids or bases or stored, alternative dike materials should be considered. More acuve organic chemicals may need certain special liners for dikes. Dikes may also be designed with impermeable materials to increase containment capabilities. Dikes should be inspected during or after significant storms or spills to check for washouts or overflows. Regular checks of containment dikes to insure the dikes are capable of holding spills should be conducted. Inability of a structure to retain storm water, dike erosion, soggy areas, or changes in vegetation indicate problems with dike structures. Damaged areas should be patched and stabilized immediately. Earthen dikes may require special maintenance of vegetation such as mulching and irrigation.

Curbing is a barrier that surrounds an area of concern. Curbing is similar to containment diking in the way that it prevents spills and leaks from being released into the environment. The curbing is usually small scaled and does not contain large spills like diking. Curbing is common at many facilities in small areas where handling and transfer liquid materials occur. Curbing can redirect contaminated storm water away from the storage area. It is useful in areas where liquid materials are transferred from one container to another. Asphalt is a common material used for curbing; however, curbing materials include earth, concrete, synthetic materials, metal, or other impenetrable materials. Spilled materials should be removed immediately from curbed areas to allow space for future spills. Curbs should have manually-controlled pump systems rather than common drainage systems for collection of spilled materials. The curbed area should be inspected regularly to clear clogging debris. Maintenance should also be conducted frequently to prevent overflow of any spilled materials as curbed areas are designed only for smaller spills. Curbing has the following advantages:

- Excellent runon control,
- Inexpensive,
- Ease of installment,
- Provides option to recycle materials spilled in curb areas, and
- Common industry practice.

SC6

ACTIVITY: OUTDOOR PROCESS EQUIPMENT OPERATIONS AND MAINTENANCE



Applications

- Manufacturing
- Material Handling
- Vehicle Maintenance
- Construction
- Commercial Activities
- Roadways
- Waste Containment
- Housekeeping Practices

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from outdoor process equipment operations and maintenance by reducing the amount of waste created, enclosing or covering all or some of the equipment, installing secondary containment, and training employees.

APPROACH

- Alter the activity to prevent exposure of pollutants to storm water.
- Move activity indoors.
- Cover the area with a permanent roof.
- Minimize contact of storm water with outside manufacturing operations through berming and drainage routing (run on prevention).
- Connect process equipment area to pubic sewer or facility wastewater treatment system.
- Clean regularly the storm drainage system.
- Use catch basin filtration inserts (Chapter 5, TC6, Media Filtration) as a means to capture particulate pollutants.
- Some municipalities require that secondary containment areas (regardless of size) be connected to the sanitary sewer, prohibiting any hard connections to the storm drain.

REQUIREMENTS

- Costs (Capital, O&M)
  - Variable depending on the complexity of the operation and the amount of control necessary for storm water pollution control..
- Maintenance
  - Routine preventive maintenance, including checking process equipment for leaks.

LIMITATIONS

- Providing cover may be expensive.
- Space limitations may preclude enclosing some equipment.
- Storage sheds often must meet building and fire code requirements.

Targeted Constituents

- ● Sediment
- ○ Nutrients
- ● Heavy Metals
- ● Toxic Materials
- ○ Floatable Materials

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from outdoor material and product storage areas by enclosing or covering materials, installing secondary containment, and preventing storm water runon.

APPROACH

- Protect materials from rainfall, runon, runoff and wind dispersal:
  - Store material indoors.
  - Cover the storage area with a roof.
  - Cover the material with a temporary covering made of polyethylene, polypropylene, or hypalon.
  - Minimize storm water runon by enclosing the area or building a berm around the area.
  - Use "doghouse" for storage of liquid containers.
- Parking lots or other surfaces near bulk materials storage areas should be swept periodically to remove debris blown or washed from storage area.
- Install pellet traps at storm water discharge points where plastic pellets are loaded and unloaded.
- Keep liquids in a designated area on a paved impervious surface within a secondary containment.
- Keep outdoor storage containers in good condition.
- Use berms and curbing.
- Use catch basin filtration inserts (Chapter 5, TC6, Media Filtration)

REQUIREMENTS

- Costs (Capital, O&M)
  - Costs should be low except where large areas may have to be covered.
- Maintenance
  - Berm and curbing repair and patching.

LIMITATIONS

- Space limitations may preclude storing some materials indoors.
- Some municipalities require that secondary containment areas (regardless of size) be connected to the sanitary sewer, prohibiting any hard connections to the storm drain.

ACTIVITY: WASTE HANDLING AND DISPOSAL

Applications

- *Manufacturing*
- *Material Handling*
- *Vehicle Maintenance*
- *Construction*
- *Commercial Activities*
- *Roadways*
- *Waste Containment*
- *Housekeeping Practices*

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from waste handling and disposal by tracking waste generation, storage, and disposal; reducing waste generation and disposal through source reduction, re-use, and recycling; and preventing runon and runoff from waste management areas.

APPROACH

- Maintain usage inventory to limit waste generation.
- Raw material substitution or elimination.
- Process or equipment modification.
- Production planning and sequencing.
- SARA Title III, Section 313 requires reporting for over 300 listed chemicals and chemical compounds. This requirement should be used to track these chemicals although this is not as accurate a means of tracking as other approaches.
- Track waste generated.
  - Characterize waste stream.
  - Evaluate the process generating the waste.
  - Prioritize waste streams using: manifests, biennial reports, permits, environmental audits, SARA Title III reports, emission reports, NPDES monitoring reports.
  - Inventory reports.
  - Data on chemical spills.
  - Emissions.
  - Shelf life expiration.
- Use design data and review: process flow diagram, materials and applications diagram, piping and instructions, equipment list, plot plan.
- Use raw material and production data and review: composition sheets, materials safety data sheets (MSDS), batch sheets, product or raw material inventory records, production schedule, operator data log.
- Use economic data and review:
  - Waste treatment and disposal cost.
  - Product utility and economic cost.
  - Operation and maintenance labor cost.
- Recycle materials whenever possible.
- Maintain list of and the amounts of materials disposed.
- Waste segregation and separation.
- Check industrial waste management areas for spills and leaks.
- Cover, enclose, or berm industrial wastewater management areas whenever possible to prevent contact with runon or runoff.
- Equip waste transport vehicles with anti-spill equipment.

Targeted Constituents

- ○ *Sediment*
- ○ *Nutrients*
- ● *Heavy Metals*
- ● *Toxic Materials*
- ○ *Floatable Materials*

SC9

Best Management Practices

Additional Information — Waste Handling and Disposal

Industrial waste management activities occur in areas that can contaminate storm water and include landfills, waste piles, wastewater and solid waste treatment and disposal, and land application. Typical operations which affect storm water pollution may include waste pumping, treatment chemicals storage, mixing, aeration, clarification, and solids dewatering.

Waste Reduction

Waste spilled, leaked, or lost from waste management areas or outside manufacturing activities may build up in soils or in other surfaces and be carried away by storm water runoff. There is also a potential for liquid waste from lagoons or surface impoundments to overflow to surface waters or soak the soil where pollutants may be picked up by storm water runoff.

Waste reduction for manufacturing activities is the best way to reduce the potential of storm water contamination from waste management areas. Reduction in the amount of industrial waste generated can be accomplished using many different types of source controls such as:

- Production planning and sequencing.
- Process or equipment modification.
- Raw material substitution or elimination.
- Loss prevention and housekeeping.
- Waste segregation and separation.
- Close loop recycling.

An approach to reduce storm water pollution from waste handling and disposal is to assess process activities at the facility and reduce waste generation. The assessment is designed to find situations where waste can be eliminated or reduced and emissions and environmental damage can be minimized. The assessment involves collecting process specific information, setting pollution prevention targets, and developing, screening and selecting waste reduction options for further study. Starting a waste reduction program is economically beneficial because of reduced raw material purchases and lower waste disposal fees. In addition, material tracking systems to increase awareness about material usage can reduce spills and minimize contamination, thus reducing the amount of waste produced.

Spill/Leak Control

Waste can be prevented from contaminating storm water by checking waste management areas for leaking containers or spills. Corroded or damaged containers can begin to leak at any time. Transfer waste from these damaged containers into safe containers. Dumpsters should be covered to prevent rain from washing waste out of holes or cracks in the bottom of the dumpster. Leaking equipment including valves, lines, seals, or pumps should be repaired promptly.

Vehicles transporting waste should have spill prevention equipment that can prevent spills during transport. The spill prevention equipment includes:

- Vehicles equipped with baffles for liquid waste.
- Trucks with sealed gates and spill guards for solid waste.

Loading or unloading wastes can contaminate storm water when the wastes are lost from the transfer. Loading systems can also be used to minimize spills and fugitive emission losses such as dust or mist. Vacuum transfer systems can minimize waste loss.

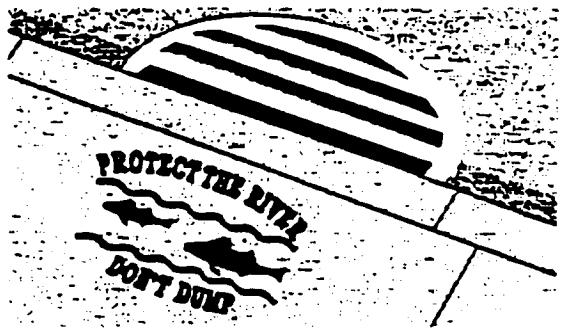
Runon/Runoff Prevention

Storm water runon should be prevented from entering the waste management area. Storm water pollution from runon can be prevented by enclosing the area or building a berm around the area. Other alternatives for reducing storm water pollution include:

- Preventing the waste materials from directly contacting rain.

SC9

BMP: STORM DRAIN SYSTEM SIGNS



Program Elements

- New Development
- Residential
- Commercial Activities
- Industrial Activities
- Municipal Facilities
- Illegal Discharges

DESCRIPTION

Stenciling of the storm drain system (inlets, catch basins, channels, and creeks) with prohibitive language/graphic icons discourages the illegal dumping of unwanted materials.

APPROACH

- Create a volunteer work force to stencil storm drain inlets, and use municipal staff to erect signs near drainage channels and creeks.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.1, SC50, Illegal Dumping Control.

REQUIREMENTS

- Cost Considerations
  - Volunteer work force serves to lower program cost.
  - Stenciling kits require procurement of durable/disposable items.
  - Need for storage/maintenance of stenciling kits requires planning.
  - Program can aid in the cataloging of the storm drain system.
- Regulations
  - Develop and enforce an ordinance that requires inlets, catch basins, channels, and creeks to be fitted with anti-dumping, pollution prevention signs.
- Administrative/Staffing
  - Primary staff demand is for program setup to provide marketing and training.
  - Ongoing/follow-up staff time is minimal because of volunteer services.
  - Minimum 2 persons are required for high traffic areas, commercial and industrial zones.
  - Staff requirement at program headquarters for emergencies, questions, etc.
- Equipment
  - Storm drain stenciling kits.
- Training
  - Training sessions of approximately 10-15 minutes will cover stenciling procedures, including how to stencil, record keeping, problem drain notation, etc.
  - Proper health and safety protocol (buddy system, traffic, health concerns, etc.).

PUBLIC EDUCATION/PARTICIPATION

- Promote volunteer services (individual and business) through radio/television and mail-out campaigns.
- Public reporting of improper waste disposal by a HOTLINE number stenciled onto the storm drain inlet.

Targeted Constituents

- ● Sediment
- ● Nutrients
- ○ Heavy Metals
- ● Toxic Materials
- ● Floatable Materials
- ● Oxygen Demanding Substances
- ● Oil & Grease
- ○ Bacteria & Viruses

- ● Likely to Have Significant Impact

SC30

Best Management Practices

Additional Information — Storm Drain System Signs

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. The signs contain brief statements that discourage the dumping of improper materials into the storm drain system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message. The intent of such a storm drain system stenciling program is to enhance public awareness of the pollutant effect on local receiving waters from storm water runoff and also to discourage individual's habitual waste disposal actions (e.g. automotive fluids and landscaping wastes).

Approach

An effectively implemented stenciling program encourages change in personal behavior and helps minimize non-point source pollutants from entering the storm drain system. An additional benefit is that waste and catch basin maintenance is minimized through the reduction of disposed materials into storm drain inlets. Finally, some stenciling programs include posting of community hotline numbers for effective reporting and monitoring of improper disposal practices, plus the encouragement of use of household hazardous waste collection and used oil recycling programs.

An important aspect of a stenciling program is the distribution of informational flyers that educate the neighborhood (business or residential) about storm water pollution, the storm drain system, and the watershed, and that provides information on alternatives such as recycling, household hazardous waste disposal, and safer products.

Storm drain inlet stenciling programs are generally handled through community volunteer efforts. Municipal staff must first organize, market, and provide training for program initialization. However, through an aggressive public education program, the majority of the labor should be generated through volunteer services. Successful programs have involved substantial input from business, civic, school, neighborhood, and environmental organizations. Encourage schools, churches, girl/boy scout troops, and environmental groups to add storm drain stenciling as a lesson/field trip to existing activities. This provides a ready-made labor force to use the stenciling materials developed by the municipality.

The stenciling project can be part of a larger volunteer "watershed awareness" public education program. Stenciling should be the easiest volunteer activity, or the first step in "watershed awareness" education, ultimately leading to an all volunteer water quality monitoring program. Municipal staff must initially provide an inventory of curb inlets and develop the stencil. The stenciled language is most effective if it represents a consistent message adopted from the city's public education department. Communities in California have used messages such as: "No Dumping, Flows to Bay", "Protect the Bay, Don't Dump", and "Dump No Waste, Flows to Bay." Program logos and generalized drawings of a fish or a bird may be added to provide a visual aid as well. Once the storm inlet language is determined, stencil painting kits must be ordered and training programs/instruction sheets may be developed.

The storm drain stenciling kits include stencil, paint, paint brush, plastic gloves, catch basin map, clipboard, instructions, liability release form, identification form, rags, whisk broom or brush, paper towels, trash bags, safety vests, and a 5-gallon bucket to hold materials.

Readability of stencils is critical to their effectiveness. Wherever possible stencils should be painted on a smooth surface such as cement, as opposed to asphalt. As with any painting, surface preparation is key to paint adhesion and thus readability and durability. Extra effort expended to clean the surface during the initial painting helps reduce the need for re-painting. Some programs have gone so far as to paint a background color first followed by the stencil in a contrasting color to increase readability.

Many communities use water-based latex exterior paint from their traffic control departments. Brands include: Fuller O'Brien, Arvoe Stripping Paint, Sherman-Williams Metalex, and All-Kids Traffic Paint. Spray paints should have a VOC rating of less than 250 (required by EPA). If there is concern over spray paints, a refillable paint brush called

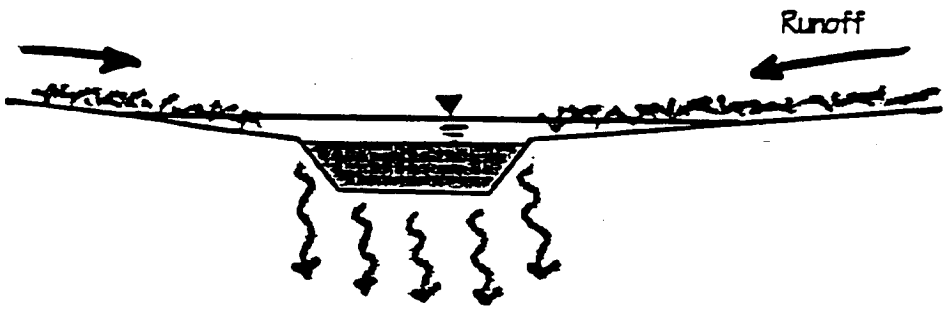
BMP: INFILTRATION



DESCRIPTION

A family of systems in which the majority of the runoff from small storms is infiltrated into the ground rather than discharged to a surface water body. Infiltration systems include: ponds, vaults, trenches, dry wells, porous pavement, and concrete grids.

EXPERIENCE IN CALIFORNIA

Infiltration ponds have been used by many local jurisdictions and CalTrans in the Central Valley for about three decades.

SELECTION CRITERIA

- Need to achieve high level of particulate and dissolved pollutant removal.
- Suitable site soils and geologic conditions: low potential for long-term erosion in the watershed.
- Multiple management objectives (e.g., ground water recharge or runoff volume control).

LIMITATIONS

- Loss of infiltrative capacity and high maintenance cost in fine soils.
- Low removal of dissolved pollutants in very coarse soils.
- Not suitable on fill sites or steep slopes.
- Risk of ground water contamination in very coarse soils, may require ground water monitoring.
- Should not use until upstream drainage area is stabilized.
- Infiltration facilities could fall under Chapter 15, Title 23, of California Code of Regulations regarding waste disposal to land.

DESIGN AND SIZING CONSIDERATIONS

- Volume sized to capture a particular fraction of annual runoff.
- Pretreatment in fine soils.
- Emergency overflow or bypass for larger storms.
- Observation well in trenches.

CONSTRUCTION/INSPECTION CONSIDERATIONS

- Protect infiltration surface during construction.
- Vegetation of pond sides to prevent erosion.
- Frequent inspection for clogging during construction.

Considerations

- Soils
- Area Required
- Slope
- Water Availability
- Aesthetics
- Hydraulic Head
- Environmental Side Effects

● High ○ Low

TC1

Best Management Practices

Additional Information — Infiltration

General Information

Where conditions are suitable infiltration systems may be the preferred choice because storm water is placed into the ground thereby reducing excess runoff and providing groundwater recharge.

Infiltration systems include:

- Infiltration basin which is an open surface pond or underground vault (Figure 1A)
- Infiltration trench which is an underground chamber filled with rock, also called a rock well (Figure 1B).
- Dry well or "vertical" infiltration trench (Figure 1C)
- Porous pavement both asphalt and concrete (Figure 1D).
- Concrete grid and modular pavement which are lattice grid structures with grassed, pervious material placed in the openings (Figure 1E).

Infiltration basins are generally used for areas less than five acres but can handle tributary areas up to 50 acres if the soil is very permeable. The other systems are suitable only for small sites of a few acres. Porous pavement and concrete grids should only be used in low traffic areas like parking areas. Studies have shown that porous pavement is strong and will last as long as conventional pavement (Field, et al. 1982; Gburek and Urban, 1980). Experience in Florida and Maryland indicates that concrete porous pavement performs better than porous asphalt. Porous pavements and underground facilities may be favored at industrial sites where land is already needed for business activities.

Infiltration systems should be considered where dissolved pollutants are of concern. However, satisfactory removal efficiencies require soils that contain loam. Coarse soils are not effective at removing dissolved pollutants and fine particulates before the storm water reaches the ground water aquifer.

Local jurisdictions may not feel that infiltration systems are appropriate on industrial sites where spills of hazardous chemicals can occur. However, spill control procedures may provide satisfactory control (Chapter 4). Care should be taken when considering the multiple objectives of using infiltration systems for water quality treatment, ground water recharge, and flood control. Infiltration basins, trenches, and porous pavement can meet storm water detention requirements.

Three concerns with infiltration systems are clogging, accumulation of metals, and ground water contamination. Infiltration systems have been used successfully on sandy soils in the Central Valley of California and Long Island, New York for many years without operational problems. In both instances the primary objectives are ground water recharge and flood control, not water quality treatment.

Problems can be expected with infiltration systems placed in finer soils. The State of Maryland has emphasized these systems for about 10 years where they have been installed in soils with infiltration rates as low as 0.27 inches per hour. A recent survey (Lindsey, et al., 1991) found that a third of the facilities examined (177) were clogged and another 18% were experiencing slow infiltration. Dry wells that treat roof runoff had the fewest failures (4%) and porous pavement the most (77%). Dry wells may have the lowest failure rate because they only handle roof runoff. The primary causes of failure appear to be inadequate pretreatment and lack of soil stabilization in the tributary watershed, as well as poor construction practices (Shaver, pers. comm.). Erosion of the slopes of infiltration ponds was a significant problem in almost half the facilities surveyed. Problems have occurred in the Central Valley with facilities placed on finer soils, as in the case of Modesto. (Tulloch, pers. comm.).

Based on a review of several studies of infiltration facilities in sandy and loamy soils concluded that "monitoring ... has not demonstrated significant contamination ... although highly soluble pollutants such as nitrate and chloride have been shown to migrate to ground water" (USEPA, 1991). However, pollution has been found in ground water where infiltration devices are in coarse gravels (Adophson, 1989; Miller, 1987).

TC1

Additional Information — Infiltration

Suggested references on the design of porous pavement include Maryland (1984) and Florida (1988).

Additional design considerations

- For basins and trenches, pretreat the storm water to remove the floatables and settleable solids, particularly when placing these systems in finer soils. Pretreatment can be accomplished with any of the other treatment control BMPs in this handbook.

Communities and CalTrans have used infiltration systems in the Central Valley for more than two decades without pretreatment. Clogging has not been a problem with well maintained systems discharging to sands and courser soils, suggesting that pretreatment is of limited value. Pretreatment when infiltrating to finer soils is suggested by the experience of Maryland described previously. An infiltration facility sized only for treatment is much smaller than one sized for flood control and therefore may be more susceptible to clogging. Communities in the Central Valley (Fresno, Modesto) require a retention volume that captures the 100 year event or about 20,000 ft^3 per impervious tributary acre. In comparison, above Equation (1) will provide a volume in the range of 2,000 ft^3 per impervious acre.

For small systems treating less than a few acres of pavement, pretreatment can be accomplished with a Type 2 catch basin and a submerged outlet. The diameter and depth of the sump should be at least four times the diameter of the outlet pipe to the infiltration system (Lager, et al., 1977). See Figure 1C. The catch basin cover should be stenciled "dump no waste". Vegetated biofilters can also be used although they will not likely be feasible in industrial sites which tend to be fully utilized.

Additional design considerations for basins include:

- Do not locate on fill sites, or on or near steep slopes
- Energy dissipation at inlet to minimize erosion
- Vegetate the slopes for the same reason
- Vegetate the bottom to reduce tendency to clog with fines
- Freeboard of 1 foot
- Side slopes of at least 3:1 for safety, and for ease of mowing (4:1 slopes are prefered)
- Incorporate bypass or overflow for large events
- Provide dedicated access to the basin bottom (minimum 4:1) for maintenance vehicles

Vegetating the slopes and bottom will be difficult unless the facility can be [illegible]ted during the summer. Drought tolerant ground cover species may be more suitable. See TC4 Biofilters for recommended species.

Additional design considerations for trenches include:

- Do not locate on fill sites, or on or near steep slopes
- A 4 inch or 6 inch diameter observation well with locking cap, to check for loss of infiltrative capacity
- 6 inch sand layer or geofabric at the bottom
- Geofabric around trench walls to prevent soils from migrating into the trench rock matrix
- Geofabric 12 inches below ground surface with 3/4 rock placed on top, which serves as filter for coarse solids
- Backfill and filter rock should be clean washed aggregate 1 inch to 3 inches diameter
- Incorporate bypass or overflow for large events
- Provide dedicated access for maintenance vehicles

For porous pavement, experience in Maryland suggest that asphalt pavement has continuous plugging problems and a limited life. Frequent maintenance is required. For drywells where access for maintenance is difficult if not impossible pretreatment of the storm water is highly recommended. Such pretreatment may include biofilters, sumps, etc. Consultation with the local jurisdiction regarding the design of drywells is required.

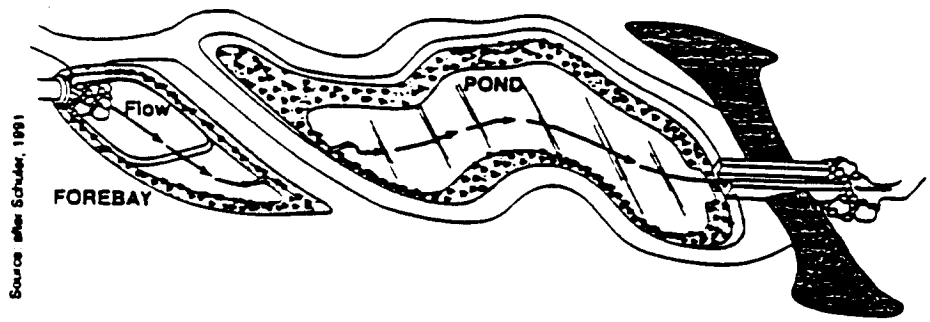
BMP: WET PONDS



Source after Schueler, 1991

DESCRIPTION

A wet pond has a permanent water pool to treat incoming storm water. An enhanced wet pond includes a pretreatment sediment forebay

CALIFORNIA EXPERIENCE

There are regional flood control basins in California that function like wet ponds or constructed wetlands (TC3).

SELECTION CRITERIA

- Need to achieve high level of particulate and some dissolved contaminant removal.
- Ideal for large, regional tributary areas.
- Multiple benefits of passive recreation (e.g., bird watching, wildlife habitat).

LIMITATIONS

- Concern for mosquitoes and maintaining oxygen in ponds.
- Cannot be placed on steep unstable slopes.
- Need base flow or supplemental water if water level is to be maintained.
- Infeasible in very dense urban areas.
- In California the wet season is coincident with minimal plant growth.
- Could be regulated as a wetlands or under Chapter 15, Title 23, California Code of Regulations regarding waste disposal to lands.
- Pending volume and depth, pond designs may require approval from State Division of Safety of Dams.

DESIGN AND SIZING CONSIDERATIONS

- Wet pool volume determined by Figures 2B and C.
- Water depth of 3 to 9 feet.
- Wetland vegetation, occupying 25-50% of water surface area.
- Design to minimize short-circuiting.
- Bypass storms greater than two year storm.

CONSTRUCTION/INSPECTION CONSIDERATIONS

- Be careful when installing wetland vegetation.

MAINTENANCE REQUIREMENTS

- Remove floatables and sediment build-up.
- Correct erosion spots in banks.
- Control mosquitoes.
- May require permits from various regulatory agencies, e.g. Corps of Engineers.

COST CONSIDERATIONS

- Costs for providing supplemental water may be prohibitive.

Considerations

Best Management Practices

Additional Information — Wet Ponds

Sizing the Permanent Pool

Figure 2B shows the relationship between performance and the long-term removal efficiency for average conditions in California (USEPA (1986) as adapted in FHWA (1989)). V_b/V_r is the ratio of the volume of the wet pond to the volume of the runoff of the mean storm event from the tributary watershed. The depth of the mean storm for various areas of California is shown in Figure 2C. The recommended performance goal is 80%. The volume of the pond is therefore calculated as follows:

$$V_b = 3S_d A_i 43560/12 = 10890 S_d A_i \quad (1)$$

where: V_b = pond volume (ft^3)
S_d = mean storm depth (inches)
A_i = impervious acres in the tributary watershed

For A_i the engineer may use directly connected impervious acres because it more correctly represents the area being treated and would allow a smaller facility. Although impervious area and directly connected impervious area are not the same, they are reasonable given the uncertainty of the methodology and expected pond performance.

This volume should be compared with the 14 days detention time criterion and the more conservative volume (i.e., larger volume) should be used for sizing.

Adding Detention Storage to the Permanent Pool

Some investigators believe that detention volume added above the permanent pool enhances pool performance. The State of Florida, for example, requires one basin inch of detention storage be added to the permanent pool and be bled down over a 60 hour period. This requirement, however, adds considerably to the size of the basin, and the literature does not indicate that water quality performance is improved. Therefore detention storage should be added only if the pond is to be used for drainage control in addition to water quality control. As with extended detention, consideration should be given to bypassing the facility for flows greater than the two year storm so that bed load is not trapped in the pond.

A perforated riser outlet recommended by the Denver Urban Drainage and Flood Control Districts is illustrated in Figures 2D and 2E. Other outlet concepts are illustrated in TC5, Extended Detention Basins, Figure 5B.

Additional Considerations

- Place wetland vegetation around the pond perimeter and near the outlet.

Rooted vegetation around the pond perimeter serves several functions (Figure 2A). It enhances the removal of dissolved pollutants (see T3, Constructed Wetlands); it may reduce the formation of floating algal mats; it reduces the risk of people falling into the deeper areas of the pond; and, it provides some habitat for insects, aquatic life, and wetland wildlife. The "shelf" for the vegetation should be about 10 feet wide with a water depth of 1 to 2 feet. The total area of the "shelf" should be 25-50% of the water surface area. Vegetation near the exit will assist settling of solids. An alternative is a rock filter which is used in many wastewater oxidation ponds where loss of algae in the effluent is a common problem during the growth season (Rich, L., 1988).

If mesquites are of particular concern, it would be advisable to inhibit the growth of emergent wetland vegetation around the perimeter by using steep slopes, say, 2:1, and by minimizing the amount of pond area that has a depth less than 18". Gambusia (mosquito fish) can also be planted in larger ponds but the water level must be maintained to insure their survival during the dry season.

TC2

Additional Information — Wet Ponds

The sides of an earthen wall should be vegetated to avoid erosion. Drought tolerant groundcover species should be used if irrigation can not occur during the summer. See TC4, Biofilters regarding recommended plant species.

Maintenance
Check at least annually and after each extreme storm event. The facility should be cleaned of accumulated debris. The banks of surface ponds should be checked and areas of erosion repaired. Remove nuisance wetland species and take appropriate measures to control mosquitoes. Solids should be removed when 10 to 15% of the storage capacity has been lost.

Limited studies (Dewberry and Davis, 1990; Meiorin, 1991; Florida, 1991; Livingstone, pers. comm.) of the bottom sediments indicate that toxicity limits specified by final disposal regulations are not exceeded. Concentrations observed by Dewberry and Davis (1990) were less than 1/1000 of toxicity limits. If this problem is occurring it suggests that source control BMPs need to be improved.

If algal blooms are excessive consider alum treatment or the use of devices that retain non-rooted vegetation as discussed above.

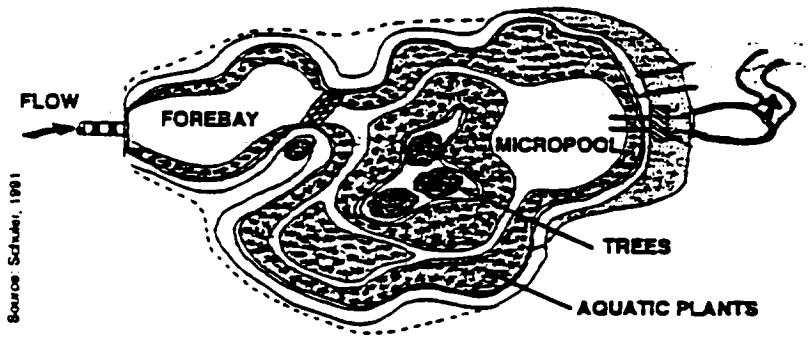
BMP: CONSTRUCTED WETLANDS



DESCRIPTION

Constructed wetlands have a significant percentage of the facility covered by wetland vegetation.

EXPERIENCE IN CALIFORNIA

Research facility constructed in Fremont in 1983 by the Association of Bay Area Governments. Several communities (Davis, Orange County) have regional detention ponds that are essentially constructed wetlands.

SELECTION CRITERIA

- Need to achieve high level of particulate and some dissolved contaminant removal.
- Ideal for large, regional tributary areas.
- Multiple benefits of passive recreation and wildlife.

LIMITATIONS

- Concern for mosquitoes.
- Cannot be placed on steep unstable slopes.
- Need base flow to maintain water level.
- Not feasible in densely developed areas.
- Wet season coincident with minimal plant growth.
- Nutrient release may occur during winter.
- Overgrowth can lead to reduced hydraulic capacity.
- Regulatory agencies may limit water quality to constructed wetlands.
- May be regulated under Chapter 15, Title 23, California Code of Regulations regarding waste disposal to lands.

DESIGN AND SIZING CONSIDERATIONS

- Suitable soils for wetland vegetation.
- Surface area equal to at least 1% and preferably 2% of the tributary watershed.
- Forebay.

CONSTRUCTION/INSPECTION CONSIDERATIONS

- Involve qualified wetland ecologist to design and install wetland vegetation.
- Establishing wetland vegetation may be difficult.

MAINTENANCE REQUIREMENTS

- Remove foreign debris and sediment build-up.
- Areas of bank erosion should be repaired.
- Remove nuisance species.
- Control mosquitoes.

Considerations

- Soils
- Area Required
- Slope
- Water Availability
- Aesthetics
- Hydraulic Head

Best Management Practices

Additional Information — Constructed Wetlands

General Information

Although natural wetlands are being used to treat storm water, regulatory agencies do not favor this use, except as a final "polishing" step after treatment by one or more of the treatment control BMPs presented in this chapter. Constructed wetlands, in contrast, are built specifically for treating storm water runoff. They are not wetlands created as mitigation for the loss of natural wetlands. Consequently, there is no intention to replicate the complete array of ecological functions of a wetland (e.g., the presence of wildlife), although it can be done. A constructed wetland is generally one of the more aesthetic than the treatment systems. It is likely that constructed wetlands will be used only in very large industrial sites, but small facilities with concrete retaining walls to conserve space will also likely be effective.

The simplest form of a constructed wetland includes a rectangular basin with a forebay and wetland vegetation area. The deeper forebay (3 to 6 feet) traps floatables and the larger settleable solids, facilitating maintenance as well as protecting the wetland vegetation. Alternatively, a detention pond may be placed before the wetland, to remove settleable solids and to protect the wetland from extreme increases in water elevation. The wetland vegetation is placed in a shallow pool that extends laterally across the basin. Construction of low flow channels through emergent vegetation can cause storm water to short circuit through channels rather than through the wetland vegetation.

Placing rooted wetland species through the majority of the facility adds to the cost, in comparison to a wet pond. However, it is believed by many practitioners that the vegetation improves performance. Placing the vegetation across the facility as illustrated in Figure 3A improves settling of particulates and uptake of dissolved contaminants. As the constructed wetland is shallower than a wet pond, there may be better contact between the water and soil which may be the primary remover of dissolved phosphorus and metals.

The vegetation reduces the effect of wind which can cause significant short-circuiting in a wet pond. Water loss in a wetland may not be greater and possibly less than a wet pond. Evapotranspiration from the plants will be greater in a wetland but evaporation from the water surface may be less because the dense vegetation eliminates the effect of the wind. The net result may be a slower rate of water loss. Conceivably a constructed wetland could be made smaller than a wet pond, given the benefits of the vegetation. But experience is too limited to identify how the size might be altered from what is calculated for a wet pond.

Relying on volunteer plants to cover the vegetated area will delay complete coverage for several years and may allow the invasion of undesirable species or dominance by one or two species such as cattails which tend to flourish in disturbed conditions. Complexity is promoted by varying water depth through the vegetated area rather than keeping the depth uniform. Preferred species to maximize the removal of dissolved metals are Salicornia pacifica (cadmium, copper and lead), Justicia americana (copper), Potamogeton crispus (cadmium), Phragmites communis (zinc), Carex stricta (zinc), and Scirpus lacustris (zinc) (Silverman, 1982).

There is some question as to the incremental benefit of wetland vegetation in California, inasmuch as most of the wet season occurs when the vegetation is dormant. The minimum desirable temperature for cattails, sedges, and bulrushes is 10°C, 14°C, and 16°C, respectively (USEPA, 1988). For most of California, mean temperatures during the winter months are 5 to 10°C; along the south coast they range from 10°C to 15°C. The primary removal mechanisms for dissolved phosphorus and metals are adsorption by the soil and use by non-rooted vegetation. Rooted vegetation obtains nutrients from the soils, not from the water, unless the vegetation is placed in gravel. In contrast non-rooted vegetation removes nutrients and metals from the water (Guntenspergen, et al., 1991). It can be expected that soil adsorption will continue during the winter to some extent. Removal of metals and nutrients by non-rooted vegetation may not occur, or will at least be significantly reduced because of the lack of growth. In contrast, loss will occur from vegetation die-off or dormancy. The net effect over a 12 month period may be that a constructed wetland is no more effective than a wet pond, particularly with regard to the removal of dissolved phosphorus and metals.

TC3

- Freeboard of at least 1 foot.
- With earthen contained facilities, install an antiseep collar on the outlet pipe.
- The soils must be suitable for wetland vegetation. If necessary organic soils (18 to 24 in.) must be imported to the site.
- The soil must have an affinity for phosphorus. Soils with aluminum and iron are best. Soils saturated with phosphorus or a metal specie may cause the concentrations of these contaminants to increase in the overlying water.
- Minimize short-circuiting by placing energy dissipators at the inlet, and by having a high length to width ratio.

Short circuiting must be minimized by using a generally rectangular configuration with a length to width ratio of a least 3:1 and by placing the inlet and outlet at opposite ends. The inlet and outlet can be placed at the same end if baffling (islands) is installed to direct the water to the opposite end before returning to the outlet. If topography or aesthetics requires the wetland to have an irregular shape, the pond area and volume should be increased to compensate for the dead spaces. Energy dissipators and entrance baffles will spread the water laterally across the facility.

- Minimize water loss by infiltration through the wetland bottom.
- Supplemental water may be needed to avoid loss of rooted vegetation during the dry period.

To maintain the wet pool to the maximum extent possible excessive losses by infiltration through the bottom must be avoided. Depending on the soils, this can be accomplished by compaction, incorporating clay into the soil, or an artificial liner. Wetland vegetation species have evolved to handle the stress of seasonal variations in water availability. However, during the dry season there must be sufficient water to avoid complete desiccation of plant roots. Consequently, constructed wetlands are infeasible in areas where there is a lack of either a baseflow or near-surface ground water during the dry season. Supplemental water such as pumped ground water and treated process wastewater may have to be used.

- A wetland ecologist should prepare the planting design and specifications, and oversee the planting.

Constructed wetlands may not need antivortex and trash rack devices on their outlets like a wet pond because of the rooted vegetation. See TC2, Wet Ponds regarding inlet design. Design concepts for outlet devices are discussed in TC5 Extended Detention Ponds. See Josselyn (1982) regarding wetland plant considerations. Establishing wetland vegetation initially may be difficult and require multiple plantings.

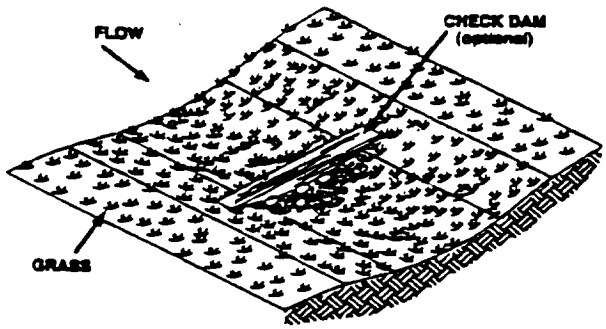
Maintenance

- Check at least annually and after each extreme storm event.
- Remove accumulated foreign debris.
- Repair areas of slope erosion.
- Employ mosquito countermeasures as required by local authorities.
- Clean deposits from the forebay when a loss of capacity is significant, probably every 3 to 5 years depending on the land use (see TC2, Wet Ponds), or when the concentrations of toxicants in the sediments are reaching a level of concern.

There is some question as to whether annual harvesting of rooted vegetation is either practical or effective at reducing seasonal losses of nutrients and prolonging the life of the facility (USEPA, 1988). The benefits of harvesting may depend upon the wetland specie (Suzuki, T. et al., 1991). Placing rooted vegetation in gravel beds rather than soil may make harvesting practical. If harvesting is to be done, it should occur twice per season, in the early summer when nutrient content in the plant material is at its peak, and in the fall before plant dormancy. Given the significant role of the bottom soil in removing metals and phosphorus its replacement may be required, although, probably not more frequently than once every few decades. Cleaning the forebay more frequently is important as noted above.

TC3

BMP: BIOFILTERS



DESCRIPTION

Biofilters are of two types: swale and strip. A swale is a vegetated channel that treats concentrated flow. A strip treats sheet flow and is placed parallel to the contributing surface.

EXPERIENCE IN CALIFORNIA

No biofilters specifically designed to treat storm water have been located. However, instances of "biofilter by happenstance" exist in northern communities (Davis, Sacramento, Turlock, Fresno) where storm water is discharged to a grassed area prior to an inlet or an infiltration area.

SELECTION CRITERIA

- Comparable performance to wet ponds and constructed wetlands.
- Limited to treating a few acres.
- Availability of water during dry season.

LIMITATIONS

- Poor performance has occurred but this appears to be due to poor design.
- May be limited to areas where summer irrigation is feasible.
- Can be difficult to maintain sheet flow in strips.
- Can be difficult to avoid channelization in swales.
- Cannot be placed on steep slope.
- Area required may make infeasible on industrial sites.
- Proper maintenance required to maintain health and density of vegetation.

DESIGN AND SIZING CONSIDERATIONS

- The surface area is defined by Figure 4A.
- The minimum width for a swale is determined by Mannings Equation.
- Minimum length of a strip is 10 feet.
- The longitudinal slope must not exceed 5%.
- Use a flow spreader and energy dissipator at the entrance of a swale.
- Good soils are important to achieve good vegetation cover.

CONSTRUCTION/INSPECTION CONSIDERATIONS

- Make sure soils are suitable for healthy vegetation.
- Level cross-section and even longitudinal slope for swales.
- Achieve sheet flow with strips.

TC4

Best Management Practices

Additional Information — Biofilters

Figure 4A is meant for guidance only and should be used with caution in areas where precipitation varies greatly because of terrain.

The design engineer must determine the width of a swale using Manning's Equation and the 2-year rainfall intensity (California, 1976) appropriate to the site. An "n" of 0.20 is recommended (Metro, 1992). The design engineer must also calculate the peak flow of the 100-year event to determine the depth of a swale. Since a width using an "n" of 0.20 is generally wider than what is required of a grass lined channel, channel stability should not be of concern. It is generally not necessary to have a bypass for the extreme events because the minimum width specification combined with the relatively gentle slope avoids excessive velocities. If erosion at extreme events is of concern, consider the above concepts to minimize erosion.

The design engineer can make the swale wider than determined in the above step, with a corresponding shortening of the swale length to obtain the same surface area. However, there is a practical limitation on how wide the swale can be and still be able to spread the flow across the swale width. Splitting the flow into multiple inlets and/or placing a flow spreader near the storm inlet should be incorporated into the design. A concept that may work is to place a level 2"x 12" timber across the width of the swale perhaps 10 feet from the pipe outlet. Place gravel between the outlet and the timber, to within 2 inches or so of the top of the timber. Place large rock immediately near the outlet to dissipate the flow energy; the rock also may help distribute the flow. The timber will function like a weir. Flow spreaders have seen limited application and their effect on performance has not been evaluated.

The problem of spreading the flow across the width of the swale may limit its use to tributary catchments of only a few acres. The minimum width based on using Manning's Equation results in widths of 3 to 12 feet per acre of impervious tributary surface, depending on the location and longitudinal slope.

A minimum length of 10 feet is recommended for biofilter strips. Length here is defined as the measurement in the direction of flow from the adjoining pavement. Lengths of 20 to 50 feet have been recommended by most practitioners perhaps because of the concern that sheet flow cannot be maintained. Wherever room permits a length greater than 10 feet should be used. The short length is recommended in this handbook because space is at a premium at most existing industrial sites: 10 feet should work satisfactory if good sheet flow is maintained and no obstructions such as curbs are placed along the pavement edge.

The type of strip discussed here is not to be confused with the natural vegetated buffer strip used in residential developments to separate the housing from a stream or wetland. As the later type follows the natural contour flow channelization is more likely and lengths of 75 to 150 feet are recommended.

The length of pavement prior to the strip should not exceed a few hundred feet to avoid channelization of large aggregates of runoff along the pavement before it reaches the pavement edge. To avoid channelization, care must be taken during construction to make sure that the cross-section of the biofilter is level and that its longitudinal slope is even. Channelization will reduce the effective area of the biofilter used for treatment and may erode the grass because of excessive velocities.

Maintenance

The facility should be checked annually for signs of erosion, vegetation loss, and channelization of the flow. The grass should be mowed when it reaches a height of 6 inches. Allowing the grass to grow taller may cause it to thin and become less effective. The clippings should be removed.

TC4

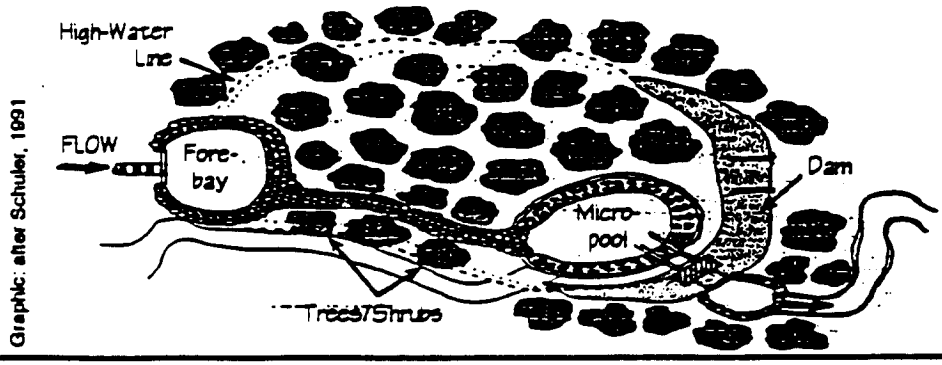
FIGURE 4C. ADDITIONAL INFORMATION ON THE SUITABILITY OF TURF GRASS SPECIES

BMP: EXTENDED DETENTION BASINS



Graphic: after Schuler, 1991

DESCRIPTION

Extended detention basins are dry between storms. During a storm the basin fills. A bottom outlet releases the storm water slowly to provide time for sediments to settle.

EXPERIENCE IN CALIFORNIA

There are no known basins in California. Hydraulic detention basins may function like extended detention basins if the former has been sized to control the pre-development 2-year event. More liberal standards do not provide sufficient detention time.

SELECTION CRITERIA

- Objective is to remove only particulate pollutants.
- Use where lack of water prevents the use of wet ponds, wetlands or biofilters.
- Use where wet ponds or wetlands would cause unacceptable mosquito conditions.

LIMITATIONS

- May be less reliable than other treatment control BMPs.
- Inability to vegetate banks and bottom may result in erosion and resuspension.
- Limitation of the orifice diameter may preclude use in small watersheds.
- Requires differential elevation between inlet and outlet.
- Pending their volume and depth basin designs may require approval from State Division of Safety of Dams.

DESIGN AND SIZING CONSIDERATIONS

- Basin volume is sized to capture a particular fraction of the runoff.
- Drawdown time of 24 to 40 hours.
- Shallow basin with large surface area performs better than deep basin with same volume.
- Place energy dissipators at the entrance to minimize bottom erosion and resuspension.
- Vegetate side slopes and bottom to the maximum extent practical.
- If side erosion is particularly severe, consider paving or soil stabilization.
- If floatables are a problem, protect outlet with trash rack or other device.
- Provide bypass or pass through capabilities for 100 year storm.

CONSTRUCTION/INSPECTION CONSIDERATIONS

- Make sure the outlet is installed as designed.

Best Management Practices

Additional Information — Extended Detention Basins

General

Extended detention ponds and vaults may be particularly appropriate to California where dry weather base flow cannot be used to maintain water levels, as is required for wet ponds and constructed wetlands. These systems are suitable for essentially any size tributary area from an individual commercial development to a large residential area. Surface ponds are less expensive to construct, but underground vaults may be appropriate in commercial developments. Use of concrete retaining walls will reduce the space required by a pond. The basic elements of an extended detention basin are illustrated in Figure 5A. The configuration shown in Figure 5A is most appropriate for large sites.

Extended detention provides a lower removal efficiency than wet ponds and constructed wetlands: the facilities are smaller thereby reducing their effectiveness with particulate pollutants, and they do not have the ability to remove dissolved contaminants. Also, extended detention facilities may be less reliable than constructed wetlands or wet ponds because of the lack of a permanent water pool (See Figure 5A). But if desired, a shallow pool of 1 to 3 feet could be included in the design but this is more of an aesthetic consideration. If irrigation water is available, a thick grass turf on the bottom of the facility may provide some removal of dissolved contaminants, like a vegetated biofilter. See TC4 Biofilters for recommendations on turf grass and groundcover species.

Where irrigation water is not available, there may be concerns about erosion and resuspension of particulate pollutants in surface ponds. This, however, has not been a significant problem in Austin, Texas where sand filters are preceded by dry settling ponds (Hartigan, pers. comm.). However, the design must incorporate several features to minimize the potential for this problem. Drought tolerant vegetation may work but has not been evaluated. Nonvegetative materials may help such as concrete or plastic grids, small riprap, erosion matting, or paving. A paved forebay may facilitate maintenance thereby reducing the material available for resuspension.

The recommended drawdown time of 24 to 40 hours for a full pond is based on very limited laboratory data. A few extended detention ponds have been monitored and generally provide a removal efficiency of 60 to 80% with a drawdown time of about 24 hours. Forty hours is recommended in order to settle out the finer clay particles in California sediment that typically adsorb toxic pollutants.

Design

Determine the volume of the basin using the appropriate figure from Appendix D. The procedure is as follows: (1) select the appropriate figure for your area; (2) determine for the catchment the percentage of impervious area directly connected to the storm drain system; (3) choose a capture goal, and read the required unit volume required for the basin; and (4) multiply this unit volume times the total acreage of the catchment and convert to cubic feet. This volume is also referred to as water quality capture volume shown in Figure 5A. Total impervious acres may be used in lieu of directly connected impervious acres if it is easier to determine the former, although this will result in a larger facility. Although these variations are not equivalent, they are reasonable given the uncertainty of the methodology and expected basin performance.

What should be the capture goal? To achieve an equivalent pollutant capture percentage as a wet pond, 85 to 95 percent of the runoff must be captured and detained. But capture volumes over 85 percent are not cost effective as the capture cases in Appendix D show. Therefore it is recommended that a capture volume of 85 percent be used for determining the detention basin size required. Because of the possibility of resuspension of materials during extreme storms consideration should be given to placing the basin off line, that is, it should have a bypass for the extreme events. Bypassing larger events will also allow the bedload carried by the storm and is necessary for beach replenishment to move downstream.

A drawdown time of 40 hours is recommended in order to settle out the finer clay particles as stated above; however, 24 hours can be used if it can be demonstrated that this rate will remove 80% of the solids. The analysis of runoff using

TC5

Equation (1) defines the orifice area where a single orifice outlet is used to regulate the detention basin outflow. However, a recent survey of extended detention facilities (Galli, pers. comm.) found the drawdown time of small storms that do not fill the facility to be too short to provide effective treatment. The facilities surveyed were designed for a drawdown time of 24 hours. A 40 hour drawdown may provide sufficient time for the smaller storms. But it may be prudent to take additional steps to be certain that the small storms, which represent the majority of pollution, are effectively treated. One approach would be to check the design analysis to determine if the facility takes at least 24 hours to drain when half full. If not, either modify the design to achieve this objective, or install a two orifice outlet. The lower outlet is sized to drain a half-full facility in 24 hours. The second orifice is placed at the mid-water elevation and is sized in combination with the lower orifice to drain the entire facility in 40 hours. Another approach is to install the outlet about one foot above the bottom of the pond (essentially enlarging the micropool area). This lower area will dry up between storms and will capture much of the volume of small storms and improving pollutant removal.

Three alternative outlet structures are suggested (Figure 5B). The concrete block structure is appropriate for large ponds. The riser pipe is suggested for small to large ponds. Placing the outlet control in the berm or in a manhole located downstream of the facility is most suitable for small ponds.

Recommendations regarding the design of a riser pipe are shown in Table 5A for Austin (1988). Table 5A provides guidance on the location of holes. To prevent clogging of this orifice and the bottom orifices of the riser pipe, wrap the bottom three rows of orifices with geotextile fabric and a cone of one to three inch rock. The holes in the riser pipe should not be modified to achieve a 40 hour drawdown time. Rather, the control orifice should be placed downstream. For small facilities, place the control orifice in a manhole between the pond and the filter as shown in Figure 5B. Use a "T-pipe" (Figure 5B) to submerge the orifice.

TABLE 5A PERFORATED OUTLET RISER PIPE ORIFICES (Austin, 1988)

RISER PIPE DIAMETER	VERTICAL SPACING BETWEEN ROWS (center to center)	NUMBER OF PERFORMATIONS	PERFORATION DIAMETER
6 in.	2.5 in.	9 per row	1 in.
8 in.	2.5 in.	12	1 in.
10 in.	2.5 in.	16	1 in.

Clogging of the bottom holes has been observed in riser pipes in the mid-Atlantic states (MWCOG, 1992) suggesting that the diameter of the riser holes should not be less than 3/4 to 1" (MWCOG, 1992) although a minimum diameter of 2" is now being considered (Galli, pers comm.). However, most of the facilities surveyed had risers without the gravel cone and the outlet holes were modified to provide drawdown control. Modifying the holes in the riser to control the outlet rate reduces the diameter of the holes and increases the risk of clogging. However, gravel packing the riser pipe as shown in Figure 5B.2 and 5C.1 will minimize this risk. Submerging the control orifice as shown in Figure 5B.3 will allow the use of a smaller orifice diameter. One orifice with a diameter of 1/2 inch, or 1 inch to be conservative, allows the use of extended detention for very small catchments. Detention facilities in western Washington use this concept and have not experienced clogging problems.

Flow Control Using the Perforated Riser

For outlet control using the perforated riser as the outflow control, it is recommended that the procedure developed by the Denver Urban Drainage and Flood Control District be used (UDFCD, 1992) as illustrated in Figures 5C and 5D. Figure 5D uses a valve for C_d of 0.65. This design incorporates flow control for the small storms in the perforated riser but also, provides an overflow outlet for large storms. If properly designed, the facility can be used for both water quality and

TC5

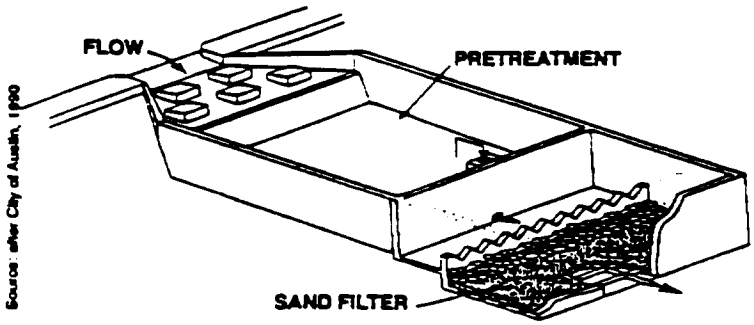
BMP: MEDIA FILTRATION



DESCRIPTION

Consists of a settling basin followed by a filter. The most common filter media is sand; some use peat/sand mixture.

EXPERIENCE IN CALIFORNIA

- A tenant at the Port of Long Beach recently installed a sand filter. The City of Los Angeles will soon install several experimental filters.

SELECTION CRITERIA

- Objective is to remove only sediment (particulate pollutants).
- Use where unavailability of water prevents the use of wet ponds, wetlands, or biofilters.
- Can be placed underground.
- Suitable for individual developments and small tributary areas up to about 100 acres.
- May require less space than other treatment control BMPs.

LIMITATIONS

- Filter may require more frequent maintenance than most of the other BMPs.
- Head loss.
- Dissolved pollutants are not captured by sand.
- Severe clogging potential if exposed soil surfaces exist upstream.

DESIGN AND SIZING CONSIDERATIONS

- Settling basin smaller than wet or extended detention basin.
- Spread flow across filter.
- Place filter offline to protect from extreme events.
- Minimize erosion in settling basin.

CONSTRUCTION/INSPECTION CONSIDERATIONS

- Be certain filter sand is clean and the outlet device from the basin to the filter is level.

MAINTENANCE REQUIREMENTS

- Clean filter surface about twice annually; or more often if watershed is excessively erosive.

COST CONSIDERATIONS

- Filtration system may use less space than other systems.
- Smaller media improves performance but increases maintenance costs.

TC6

Best Management Practices

Additional Information — Media Filtration

Determining the surface area of the filter

The following equation is derived from Austin (1988) for a maximum (full pretreatment basin) filtration time of 24 hours:

$$\text{Filter area } (ft^2) = 3630 S_u AH/K(D+H) \quad (1)$$

where: S_u = unit storage (inches-acre) from Appendix D
A = area in acres draining to facility
H = depth (ft) of the sand filter
D = average water depth (ft) over the filter taken to be one-half the difference between the top of the filter and the maximum water surface elevation
K = filter coefficient recommended as 3.5 (Austin)

Equation (1) is appropriate for the filter media size recommended by the City of Austin, diameter of 0.02 to 0.04 inches. The filter area must be increased if a smaller media is used (see Austin, Texas (1988)).

Configuring a surface sand filter (City of Austin concept)

Additional design criteria for the settling basin (Austin, 1988):

- For the outlet use a perforated riser pipe, as described in TC5, Extended Detention
- Size the outlet orifice for a 24 hour drawdown
- Energy dissipator at the inlet to the settling basin
- Trash rack at outlets to the filter
- Vegetate slopes to the extent possible (see Vegetated Biofilters)
- Access ramp (4:1 or less) for maintenance vehicles
- One foot of freeboard
- Length to width ratio of at least 3:1 and preferably 5:1
- Sediment trap at inlet to reduce resuspension. One concept is shown in Figure 6E.

Additional design criteria for the filter:

- Use a flow spreader (Figure 6A).
- Use either of two alternative sand bed designs (Figure 6F).
- Use clean sand 0.02 to 0.04 inch diameter.
- Some have placed geofabric on sand surface to facilitate maintenance.
- Underdrains (Figure 6A).
  - Schedule 40 PVC.
  - 4 inch diameter.
  - 3/8 inch perforations placed around the pipe, with 6 inch space between each perforation cluster.
  - maximum 10 foot spacing between laterals.
  - minimum grade of 1/8" per foot.

Configuring the linear filter

Take the volume for the pretreatment unit and the filter area identified above and configure into a structure similar to that shown in Figure 6B. The structural design in Figure 6B assumes traffic loads over the filter. The structure can be less robust if it is located along the edge of the pavement, away from traffic. Other recommendations (Shaver, 1991):

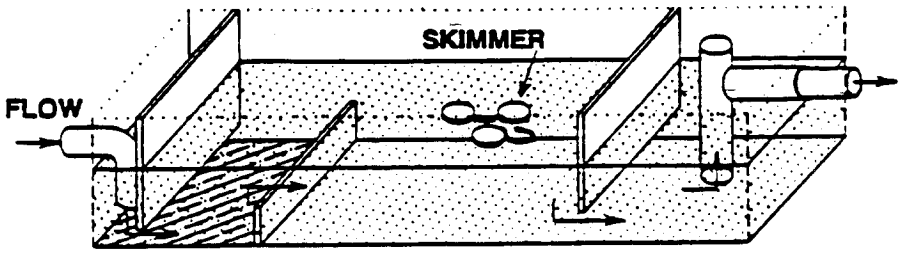
BMP: OIL/WATER SEPARATORS AND WATER QUALITY INLETS



DESCRIPTION

Oil/water separators are designed to remove one specific group of contaminants: petroleum compounds and grease. However, separators will also remove floatable debris and settleable solids. Two general types of oil/water separators are used: conventional gravity separator and the coalescing plate interceptor (CPI).

EXPERIENCE IN CALIFORNIA

Oil/water separators are in use throughout California at industrial sites. Oil/water separators are used at all bulk petroleum storage and refinery facilities. A few jurisdictions require new commercial developments to install separators under certain situations that are environmentally sensitive.

SELECTION CRITERIA

Applicable to situations where the concentration of oil and grease related compounds will be abnormally high and source control cannot provide effective control. The general types of businesses where this situation is likely are truck, car, and equipment maintenance and washing businesses, as well as a business that performs maintenance on its own equipment and vehicles. Public facilities where separators may be required include marine ports, airfields, fleet vehicle maintenance and washing, facilities, and mass transit park-and-ride lots. Conventional separators are capable of removing oil droplets with diameters equal to or greater than 150 microns. A CPI separator should be used if smaller droplets must be removed.

LIMITATIONS

- Little data on oil characteristics in storm water leads to considerable uncertainty about performance.
- Air quality permit (conditional authorization) permit-by-rule from DTSC may be required.

DESIGN AND SIZING CONSIDERATIONS

- Sizing related to anticipated influent oil concentration, water temperature and velocity, and the effluent goal. To maintain reasonable separator size, it should be designed to bypass flows in excess of first flush.

CONSTRUCTION/INSPECTION CONSIDERATIONS

- None identified.

MAINTENANCE REQUIREMENTS

- Clean frequently of accumulated oil, grease, and floating debris.

COST CONSIDERATIONS

- Coalescing plate material is costly but requires less space than the conventional separator.

TC7

Best Management Practices

A water temperature must be assumed to select the appropriate values for water density and viscosity from Table 7A. The engineer should use the expected temperature of the storm water during the December-January period. There are no data on the density of petroleum products in urban storm water but it can be expected to lie between 0.85 and 0.95. To select the droplet diameter the engineer must identify an efficiency goal based on an understanding of the distribution of droplet sizes in storm water. However, there is no information on the size distribution of oil droplets in urban storm water. Figure 7C is a size and volume distribution for storm water from a petroleum products storage facility (Branion, undated). The engineer must also select a design influent concentration, which carries considerable uncertainty because it will vary widely within and between storms.

To illustrate Equation 1: if the effluent goal is 10 mg/l and the design influent concentration is 50 mg/l, a removal efficiency of 80% is required. From Figure 7C: this efficiency can be achieved by removing all droplets with diameters 90 microns or larger. Using a water temperature of 10°C gives a water density of 0.998. Using an oil density of 0.898, the rise rate for a 90 micron droplet is 0.0011 feet per second.

It is generally believed that conventional separators are not effective at removing droplets smaller than of 150 microns (API, 1990). Theoretically, a conventional separator can be sized to remove a smaller droplet but the facility may be so large as to make the CPI separator more cost-effective.

Sizing conventional separator (modified from API, 1990).

$$D = (Q/2V)^{0.5} \qquad (2)$$

where: D = depth, which should be between 3 and 8 feet
Q = design flow rate (cfs)
V = allowable horizontal velocity which is equal to 15 times the design oil rise rate but not greater than 0.05 feet per second

If the depth exceeds 8 feet, design parallel units dividing the design flow rate by the number of units needed to reach the maximum recommended depth of 8 feet. Equation (2) is simplified from equations in API (1990) based on a recommended width to depth ratio of 2. The constant in Equation (2) can be changed accordingly if a different ratio is assumed. Some engineers may wish to increase the facility size to account for flow turbulence. See API (1990) for the design procedure.

Then:

- Calculate length, $L = VD/V_p$
- Compute width, $W = Q/(VD)$. This should be 2 to 3 times the depth, but not to exceed 20 feet
- Baffle height to depth ratio of 0.85 for top baffles and 0.15 for bottom baffles
- Locate the distribution baffle at 0.10L from the entrance
- Add one foot for freeboard
- Install a bypass for flows in excess of the design flow

Determining the design flow, Q, requires identification of the design storm. The separator is expected to operate effectively at all flow rates equal to or less than the peak runoff rate of the design storm. The design storm need not be an extreme event, as is typically used in the sizing of flood control facilities. If sized to handle a storm frequency between the 3-month to 1-year event, the facility will effectively treat the vast majority of storm water that occurs over time. All events equal to or less than the 6-month event represents about 90% of the precipitation over time; designing for a 2-year

$$P_V = \frac{(NS + LCosineH)(WLSineH)}{12} \quad (4)$$

- Add a foot beneath the plates for sediment storage.
- Add 6" to 12" above the plates for water clearance so that the oil accumulates above the plates.
- Add one foot for freeboard.
- Add a forebay for floatables and distribution of flow if more than one plate unit is needed.
- Add after bay for collection of the effluent from the plate pack area.
- For larger units include device to remove and store oil from the water surface.

Horizontal plates require the least plate volume to achieve a particular removal efficiency. However, settleable solids will accumulate on the plates complicating maintenance procedures. The plates may be damaged by the weight when removed for cleaning. The plates should be placed at an angle of 45° to 60° so that settleable solids slide to the facility bottom. Experience shows that even with slanted plates some solids will "stick" to the plates because of the oil and grease. Placing the plates closer together reduces the plate volume. However, if debris is expected such as twigs, plastics, and paper, select a larger plate separation distance. Or install ahead of the plates a trash rack and/or screens with a diameter somewhat smaller than the plate spacing.

Recognizing that an oil/water separator also removes settleable solids, it can also be considered a wet vault (TC2). The engineer can use Figure 2B (See TC2) to estimate the efficiency of both the conventional and CPI separators. As Figure 2B does not include the effect of plate technology, a CPI separator should perform considerably better than indicated in Figure 2B for the same V_b/V_r ratio.

See API (1990) for further design concepts for both the conventional and CPI separators.

Maintenance

Check monthly during the wet season and clean several times a year. Always clean in October before the start of the wet season. Properly dispose the oil.

Developer Information For Project Construction

I.1 BMP SELECTION PROCESS FOR PROJECT CONSTRUCTION

In planning a construction project, the developer/contractor must answer three key questions with respect to storm water quality control: (1) what kind of water quality controls are needed?; (2) where should the controls be implemented?; and (3) how much control is enough? In order to answer these questions, the developer/contractor should use a documentable, defensible process to identify potential water quality problems, develop design objectives, formulate and evaluate alternatives, select the most appropriate alternatives, and design the plan.

I.2 DEVELOP GOALS AND OBJECTIVES

Site-specific conditions of development construction projects determine which BMPs are most applicable for a site. The BMP plan for a site should fulfill the following goals and objectives:

- be appropriate for the given site constraints;
- ease of implementation and maintenance;
- have a net beneficial impact on the environment;
- provide effective pollutant source control or removal capability;
- meet regulatory requirements;
- maximize, to the extent practicable, the percentage of permeable surfaces; and
- be economically feasible.

I.3 BMP SELECTION CRITERIA

In order to fulfill the above goals and objectives, BMPs should be selected by using appropriate selection criteria that serve to identify the capabilities and limitations of each BMP. The criteria to be used in screening and selecting BMPs during the planning stage are:

- site factors (e.g., slope, high water table, soils, etc.);
- pollutant avoidance (source control) or removal capability;
- cost of implementation; and
- environmental compatibility.

These criteria may be given equal weight during the BMP selection process, or they may be weighted differentially, depending on the relative importance of each factor for the particular project.

I.4 NOMINATE AND EVALUATE ALTERNATIVES

A number of applicable BMPs have been identified in Section H.10 of this document for construction projects. The BMPs were nominated from the *California Storm Water Best Management Practices Handbook* (1993). Other BMPs from other manuals and sources were also considered.

I.5 SELECT BEST ALTERNATIVES

Based on the list of recommended BMPs for construction projects provided in this program, the developer/contractor should use the selection criteria described herein to select the best alternatives for the project conditions, characteristics, and concerns. This may be done numerically, by weighting the selection criteria, rating each BMP against each criteria, and summing up a weighted rating for each BMP, which then becomes a relative ranking. Or the selection process may be done in a more subjective, non-numerical way using experience and professional judgment to select the best alternative BMPs. Either way, the developer/contractor should document the selection process and provide support for the selected system of controls.

I.6 DESIGN, IMPLEMENT, AND MAINTAIN THE BMPS

After the appropriate BMPs are selected for a given project, the developer/contractor should document those selected on the standard checklist and show the selected BMPs on the plans. It is important that the control measures be properly installed and maintained. Improper installation and maintenance are the most common reasons for storm water controls to not function as designed. Therefore, the designer must provide sufficient information in the project plans and specifications for proper BMP installation, and to provide adequate guidance on BMP proper maintenance so that the maintenance procedures may be incorporated into the local storm water pollution prevention plan (Local SWPPP), Wet Weather Erosion Control Plan (WWECP), or state Storm Water Pollution Prevention Plan (state SWPPP) in accordance with the California General Permit for Storm Water Discharges Associated with Construction Activity (Construction General Permit).

I.7 MINIMUM REQUIREMENTS FOR CONSTRUCTION PROJECTS

All construction projects covered under the City's storm water quality management program shall be required to implement BMPs as necessary to reduce pollutants to adhere to the following minimum requirements:

Minimum Water Quality Protection Requirements for Development Construction Projects Subject to Storm Water Construction Controls

Category	Minimum Requirements	BMPs[1]
1. Erosion and Sediment Control	Sediments from areas disturbed by construction shall be retained on site, using structural drainage controls to the maximum extent practicable, and stockpiles of soil shall be properly contained to minimize sediment transport from the site to streets, drainage facilities or adjacent properties via runoff, vehicle tracking, or wind.	Sediment Controls
2. Construction Materials Control	Construction-related materials, wastes, spills or residues shall be retained on site to minimize transport from the site to streets, drainage facilities or adjoining properties by wind or runoff. Runoff from equipment and vehicle washing shall be contained at construction sites unless treated to remove sediments and pollutants.	Site Management; Material and Waste Management

[1] BMPs that may be used to meet the minimum requirements are described in Section I.10.

I.8 PRIORITY PROJECTS

Prior to receiving a building or grading permit, applicants for Construction Priority Projects must prepare a Local SWPPP covering construction materials and waste management control, and must certify that they will implement the Local SWPPP year-round. The Local SWPPP shall include:

- the name, location, period of construction, and a brief description of the project;
- contact information for the owner and contractor;
- name, location, and description of any environmentally sensitive areas located in or adjacent to the project;
- a list of major construction materials, wastes, and activities at the project site;
- a list of BMPs to be used to control pollutant discharges from major construction materials, wastes, and activities;
- a site plan (construction plans may be used) indicating the location of BMPs where appropriate; and
- A developer's certification statement that all required and selected BMPs will be effectively implemented.

Applicants for Construction Priority Projects must also prepare and implement a WWECP if the project will leave soil disturbed during the rainy season, defined as November 1 through

April 15. The WWECP must be prepared, for projects that have already broken ground, not later than 30 days prior to the beginning of each rainy season (i.e., by October 1) during which soil will be disturbed, and implemented throughout the entire rainy season. For projects that will begin construction during the rainy season, the WWECP must be available 30 days before construction commences. The WWECP shall include the following information:

- the name, location, period of construction, and a brief description of the project;
- contact information for the owner and contractor;
- a site map (construction plans may be used) showing the location of erosion control and sediment control BMPs that will be implemented for the rainy season; and
- a certification statement that all selected BMPs will be effectively implemented.

A certification statement of compliance with the minimum requirements must be submitted prior to issuance of a building or grading permit. A copy of the Local SWPPP must be kept on the project site at all times after the start of construction. A copy of the WWECP must be kept on the project site at all times after 30 days prior to the start of the rainy season through the end of the rainy season.

Guidance and sample forms for preparation of Local SWPPPs and WWECPs are included in Attachment I1.

I.9 PROJECTS SUBJECT TO THE GENERAL PERMIT FOR STORM WATER DISCHARGES ASSOCIATED WITH CONSTRUCTION ACTIVITY

A project is subject to the Construction General Permit if it disturbs 5 acres or more of soil, or the project results in the disturbance of less than 5 acres but is part of a larger common plan of development or sale that exceeds 5 acres. Construction sites that result in soil disturbance of 5 acres or greater will require the preparation and implementation of a storm water pollution prevention plan meeting the requirements of the Construction General Permit. A storm water pollution prevention plan prepared in compliance with the Construction General Permit is referred to as a "state SWPPP." A properly prepared state SWPPP may satisfy the requirements of a Local SWPPP and WWECP required under the City's storm water quality management program.

Before issuing building or grading permits, the City will require applicants to certify that a Notice of Intent (NOI) has been filed with the State Water Resources Control Board (SWRCB), and that a state SWPPP has been prepared for projects subject to the Construction General Permit. The City may require that the SWRCB's letter of filing confirmation be

attached to the certification form prior to issuance of building or grading permits. An example certification form is included as Attachment I2.

I.10 CONSTRUCTION SITE INSPECTION

Development construction projects are routinely checked by County/City inspectors to verify that the construction work is being done in accordance with the project plans, building and grading permits, and applicable municipal codes. BMPs for construction sites are usually temporary measures that require frequent maintenance to maintain their effectiveness and may require relocation and re-installation, particularly as project grading progresses. Therefore, regular inspections are required, particularly during the rainy season. Developers and/or contractors of projects subject to the Construction General Permit are required to perform self-inspections. In addition, self-inspections will be required for all Construction Priority Projects.

At a minimum, a developer/contractor self-inspection checklist, noting date, time, conditions and inspection date, must be kept on-site and made available for inspection, if requested. Self-inspections must be performed according to the following schedule:

- Before every rainfall event that is predicted to produce observable runoff and after every rainfall event that produces observable runoff, and
- At 24-hour intervals during extended rainfall events (except weekends or holidays when there is no ongoing site activity on those days).

More frequent inspections would be effective to ensure that BMPs are maintained in good condition. Suggested frequencies include monthly during the dry season and weekly during the wet season.

There are two primary purposes of the self-inspections conducted by developers and contractors:

- To ensure that BMPs are properly implemented and functioning effectively, and
- To identify maintenance (e.g., sediment removal) and repair needs.

An example form that may be used for developer/contractor self-inspection is included as Attachment I3. When requested, self-inspection forms will be made available to County/City inspectors for review.

I.11 BMPs FOR CONSIDERATION

The table on the next two pages provides guidance for selecting BMPs for different types of construction activities. The columns on the table list the types of construction activities that pose a risk of discharging pollutants to the storm water drainage system. Each "x" within a column indicates that the BMP should be considered for the associated construction activity. The numerical designation for each BMP corresponds to the BMP number used in the *California Storm Water Best Management Practices Handbook* (1993). The BMP Fact Sheets for each of these BMPs listed are provided in Attachment I4.

Attachment I1

Owner's Certification of Compliance with Minimum Requirements

Attachment I1
Owner's Certification of Compliance with Minimum Requirements

National Pollutant Discharge Elimination System (NPDES) is the portion of the Clean Water Act that applies to protection of receiving waters. Under permits from the Los Angeles Regional Water Quality Control Board (RWQCB), certain activities are subject to RWQCB enforcement. To meet the requirements of the Los Angeles County Municipal Storm water Permit (CAS614001), the City (County) of _____ has adopted minimum requirements for storm water runoff management from development construction activities. These include requirements for sediment control, erosion control and construction activities control to be implemented on each project site.

Site Address or Tract No:_____Building/Grading Permit No:_____

Owner:_____Contractor:_____

I have read and understand the requirements indicated above.

_____ _____

Owner or Authorized Representative Date

In compliance with the above requirements, I certify that I understand and will comply with the minimum requirements noted above.

_____ _____

Owner or Authorized Representative Date

Construction Priority Projects require the project owner to prepare:

- A Local SWPPP and
- A WWECP if the soil for a priority project will be disturbed during the rainy season.

The Local SWPPP must be prepared before the project owner, developer, or contractor receives a grading or building permit and must be implemented year-round throughout construction. A WWECP must be prepared prior to each rainy season, and must be implemented throughout that rainy season.

If a Local SWPPP or WWECP is required, it may be prepared by the owner, the construction contractor, or a consultant. When developing a Local SWPPP or WWECP, the preparer should assess site conditions, identify construction activities with the potential to cause storm water pollution, and then identify the BMPs that will best suit the construction activities. A well-developed plan will provide sufficient detail to properly implement and maintain the BMPs, yet be sufficiently flexible to allow for minor field modifications without making formal plan amendments.

The Local SWPPP and the WWECP must include a site map of the project (a copy of the grading or drainage plan may be used) showing:

- The project boundary and/or limits of grading. The City may elect to require site limit maps to extend 50 feet beyond property line and/or grading limits.
- The footprint of existing facilities and facilities that will be built during construction.
- Specific locations where construction materials, vehicles, and equipment will be stored, handled, used, maintained, and disposed, along with locations of structural measures that will be used to contain these materials on site.
- The existing and final grades of the site, along with any intermediate grades during construction that will significantly affect site drainage patterns.
- The location(s) where runoff from the site may enter storm drains, channels, and/or receiving waters.

The plan must provide information about the project location, owner, and contractor; and include a brief narrative description on the nature of the construction activity and special site conditions, and a list of BMPs for managing targeted construction activities. The plan must also include a BMP checklist with a discussion of the reasons for selecting or rejecting BMPs such as shown in the attached example, and must contain a signed certification statement.

Section 1 - Project Description and Information

1. The name of the project:

_____

2. The address or location of the project:

_____

_____

3. The building permit number for the project:

_____

4. The grading permit number for the project (if applicable):

_____

5. The owner/developer's name, address, phone number and contact person:

_____

_____

6. Contractor's name, address, phone number and contact person:

_____

_____

_____

7. What are the major features that the project will provide? (e.g., low density residential, commercial development, etc.)

_____

_____

_____

_____

Section 1 - Project Description and Information *(continued)*

8. What are the estimated construction start and finish dates?

   Project Start Date:_____

   Project Finish Date:_____

9. What are the estimated dates during which soil will be disturbed?

   Start Grading:_____

   Finish Grading:_____

10 Are there any unique features relating to adjacent water bodies (i.e., in or around a wetland, river, stream, or estuary)?

   _____

   _____

Section 2 - Best Management Practices

Use the following tables to indicate the BMPs that will be used to control storm water pollution. Attach additional written documentation if necessary.

2.1 General Site Management

BMP Description	Will BMP Be Used? Yes	No	If Yes, Explain How / If No, State Reason
Site Planning Considerations			
Scheduling (ESC01)			
Preservation of Existing Vegetation (ESC02)			
Construction Practices			
Dewatering Operations (CA01)			
Paving Operations (CA02)			
Structure Construction & Painting (CA03)			
Dust Control (ESC21)			
Vehicle & Equipment Management			
Vehicle & Equipment Cleaning (CA30)			
Vehicle & Equipment Fueling (CA31)			
Vehicle & Equipment Maintenance (CA32)			
Tracking Control			
Stabilized Construction Entrance (ESC24)			
Contractor Training			
Employee/Subcontractor Training (CA40)			

2.2 Construction Materials and Waste Management

BMP Description	Will BMP Be Used? Yes	No	If Yes, Explain How / If No, State Reason
Material Management			
Material Delivery and Storage (CA10)			
Material Use (CA11)			
Spill Prevention and Control (CA12)			
Waste Management			
Solid Waste Management (CA20)			
Hazardous Waste Management (CA21)			
Contaminated Soil Management (CA22)			
Concrete Waste Management (CA23)			
Sanitary/Septic Waste Management (CA24)			

Section 3 - Site Map Checklist

____ The project boundary and/or limits of grading. *(Option: 50 feet beyond property line or grading limits)*

____ The footprint of existing facilities and facilities that will be built during construction.

____ The existing and final grades of the site, along with any intermediate grades during construction that will significantly affect site drainage patterns.

____ The location(s) where runoff from the site may enter storm drain(s), channel(s), and/or receiving water(s).

____ Specific locations where construction materials, vehicles, and equipment will be stored, handled, used, maintained, and disposed, along with locations of structural measures that will be used to contain these materials on site.

Section 4 - Certification

As the project owner, I certify that appropriate BMPs will be implemented to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project contractor is aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activities.

Attachment I2
Owner's NOI/SWPPP Certification Form

National Pollutant Discharge Elimination System (NPDES) is the portion of the Clean Water Act that applies to protection of receiving waters. Construction activity that will disturb a ground surface area of 5 acres or more (about 220,000 square feet or 2.02 hectares), or if the project results in the disturbance of less than 5 acres of soil but is part of a larger common plan of development or site that exceeds 5 acres, is subject to requirements of the California General Permit for Storm water Discharges Associated with Construction Activity (Permit No. CAS000002) under the NPDES Program. A Notice of Intent (NOI) is required to be filed with the SWRCB and a Storm Water Pollution Prevention Plan (SWPPP) is required to be prepared, implemented and available at the job site for review and verification at all times for such projects.

Site Address or Tract No:_____ Permit No:_____

Owner:_____ Contractor:_____

I have read and understand the requirements indicated above.

_____ _____

Owner or Authorized Representative Date

In compliance with the above requirements, I certify that a Notice of Intent has been filed with the State Water Resources Control Board and that a Storm Water Pollution Prevention Plan has been prepared.

_____ _____

Owner or Authorized Representative Date

Attachment I3

Developer/Contractor Self-Inspection Form

CONSTRUCTION SITE INSPECTION CHECKLIST

Inspected By: _____

Project: _____

Contractor: _____

Date: _____

Check "Yes" or "No" or "N/A" if not applicable.

YES	NO	N/A		
_____	_____	_____	1.	Has there been rain at the site since the last inspection?
_____	_____	_____	2.	Are all sediment barriers (e.g., sandbags, straw bales, and silt fences) in place in accordance with the Plan and are they functioning properly?
_____	_____	_____	3.	If present, are all exposed slopes protected from erosion through the implementation of acceptable soil stabilization practices?
_____	_____	_____	4.	If present, are all sediment traps/basins installed and functioning properly?
_____	_____	_____	5.	Are all material handling and storage areas reasonably clean and free of spills, leaks, or other deleterious materials?
_____	_____	_____	6.	Are all equipment storage and maintenance areas reasonably clean and free of spills, leaks, or any other deleterious materials?
_____	_____	_____	7.	Are all materials and equipment properly covered?
_____	_____	_____	8.	Are all external discharge points (i.e., outfalls) reasonably free of any noticeable pollutant discharges?
_____	_____	_____	9.	Are all internal discharge points (i.e., storm drain inlets) provided with inlet protection?

INSPECTION LOG

The site shall be inspected before and after storm events with 0.25 inches or greater predicted or actual precipitation, and documented on the Construction Site Inspection Checklist Form. Incidents of noncompliance must be reported to the Engineer. A log of all inspections, as shown below, shall be kept current.

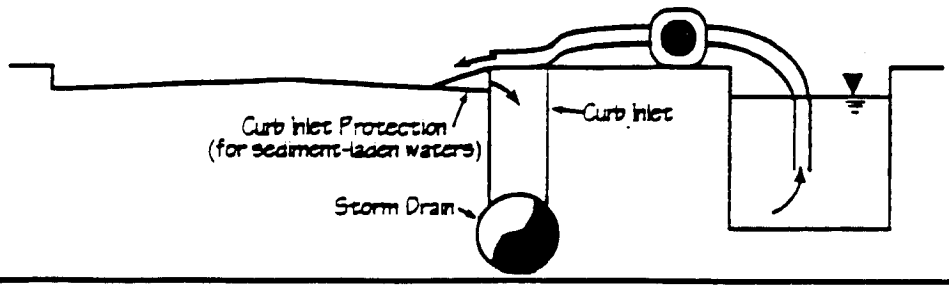
Date	Inspector	Type of Inspection			Observations (If post-storm inspection, note size of storm in inches)
		Routine	Pre-Storm	Post-Storm	

Attachment I4

Developer Information For Project Construction

BMP Fact Sheets - California Best Management Practice Handbooks (1993)

ACTIVITY: DEWATERING OPERATIONS



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from dewatering operations by using sediment controls and by testing the groundwater for pollution.

APPROACH

There are two general classes of pollutants that may result from dewatering operations: sediment, and toxics and petroleum products. A high sediment content in dewatering discharges is common because of the nature of the operation. On the other hand, toxics and petroleum products are not commonly found in dewatering discharges unless, the site or surrounding area has been used for light or heavy industrial activities, or the area has a history of groundwater contamination. The following steps will help reduce storm water pollution from dewatering discharges:

Sediment

- Use sediment controls to remove sediment from water generated by dewatering (See Sediment Trap (ESC 55) and Sediment Basin (ESC 56) in Chapter 5).
- Use filtration to remove sediment from a sediment trap or basin. Filtration can be achieved with:
  - Sump pit and a perforated or slit standpipe with holes and wrapped in filter fabric. The standpipe is surrounded by stones which filters the water as it collects in the pit before being pumped out. Wrapping the standpipe in filter fabric may require an increased suction inlet area to avoid clogging and unacceptable pump operation.
  - Floating suction hose to allow cleaner surface water to be pumped out.

Toxics and Petroleum Products

- In areas suspected of having groundwater pollution, sample the groundwater near the excavation site and have the water tested for known or suspected pollutants at a certified laboratory. Check with the Regional Water Quality Control Board and the local wastewater treatment plant for their requirements for dewatering, additional water quality tests, and disposal options.
- With a permit from the Regional Water Quality Control Board, you may be able to recycle/reuse pumped groundwater for landscape irrigation, or discharge to the storm sewer. With a permit from the local agency, you may be able to treat pumped groundwater and discharge it to the municipal wastewater treatment plant via the sanitary sewer.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ◒ Capital Costs

- ◒ Maintenance
- ◒ Training
- ○ Suitability for Slopes >5%

● High ○ Low

CA1

Best Management Practices

ACTIVITY: PAVING OPERATIONS

Graphic: North Central Texas COG, 1993

DESCRIPTION

Prevent or reduce the discharge of pollutants from paving operations, using measures to prevent runon and runoff pollution, properly disposing of wastes, and training employees and subcontractors.

APPROACH

- Avoid paving during wet weather.
- Store materials away from drainage courses to prevent storm water runon (see CA10 Material Delivery and Storage).
- Protect drainage courses, particularly in areas with a grade, by employing BMPs to divert runoff or trap/filter sediment (see Chapter 5).
- Leaks and spills from paving equipment can contain toxic levels of heavy metals and oil and grease. Place drip pans or absorbent materials under paving equipment when not in use. Clean up spills with absorbent materials rather than burying. See CA32 (Vehicle and Equipment Maintenance) and CA12 (Spill Prevention and Control) in this chapter.
- Cover catch basins and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.
- Shovel or vacuum saw-cut slurry and remove from site. Cover or barricade storm drains during saw cutting to contain slurry.
- If paving involves portland cement concrete, see CA23 (Concrete Waste Management) in this chapter.
- If paving involves asphaltic concrete, follow these steps:
  - Do not allow sand or gravel placed over new asphalt to wash into storm drains, streets, or creeks by sweeping. Properly dispose of this waste by referring to CA20 (Solid Waste Management) in this chapter.
  - Old asphalt must be disposed of properly. Collect and remove all broken asphalt from the site and recycle whenever possible.
  - If paving involves on-site mixing plant, follow the storm water permitting requirements for industrial activities.
- Train employees and subcontractors.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect employees and subcontractors to ensure that measures are being followed.
  - Keep ample supplies of drip pans or absorbent materials on-site.

LIMITATIONS

- There are no major limitations to this best management practice.

Objectives

- **Housekeeping Practices** (selected)
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

- ◒ Sediment
- ○ Nutrients

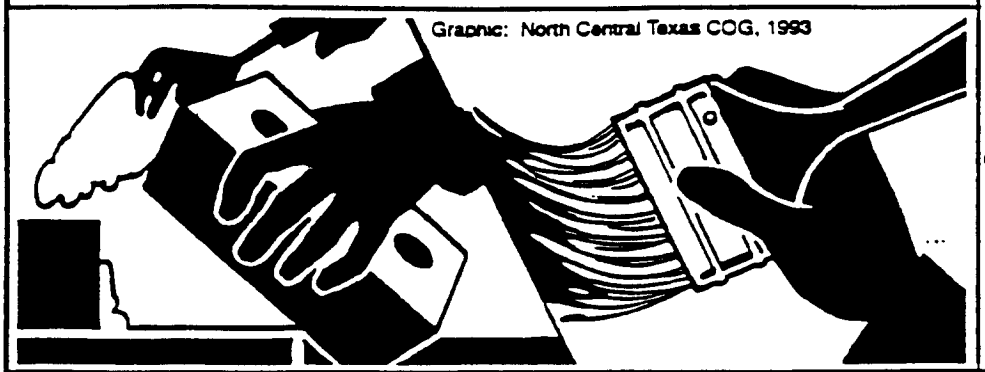
CA2

Best Management Practices

ACTIVITY: STRUCTURE CONSTRUCTION AND PAINTING



Graphic: North Central Texas COG, 1993

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from structure construction and painting by enclosing or covering or berming building material storage areas, using good housekeeping practices, using safer alternative products, and training employees and subcontractors.

APPROACH

- Keep the work site clean and orderly. Remove debris in a timely fashion. Sweep the area.
- Use soil erosion control techniques if bare ground is exposed (See Chapter 5).
- Buy recycled or less hazardous products to the maximum extent practicable.
- Conduct painting operations consistent with local air quality and OSHA regulations.
- Properly store paints and solvents. See CA10 (Material Delivery and Storage) in this chapter.
- Properly store and dispose waste materials generated from the activity. See the waste management BMPs (CA20 to CA24) in this chapter.
- Recycle residual paints, solvents, lumber, and other materials to the maximum extent practicable.
- Make sure that nearby storm drains are well marked to minimize the chance of inadvertent disposal of residual paints and other liquids.
- Clean the storm drain system in the immediate construction area after construction is completed.
- Educate employees who are doing the work.
- Inform subcontractors of company policy on these matters and include appropriate provisions in their contract to make certain proper housekeeping and disposal practices are implemented.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - These BMPs are generally of low to moderate cost.
- Maintenance
  - Maintenance should be minimal.

LIMITATIONS

- Safer alternative products may not be available, suitable, or effective in every case.
- Hazardous waste that cannot be re-used or recycled must be disposed of by a licensed hazardous waste hauler.

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ○ Oil & Grease
- ● Floatable Materials
- ● Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Capital Costs
- ○ O&M Costs
- ○ Maintenance

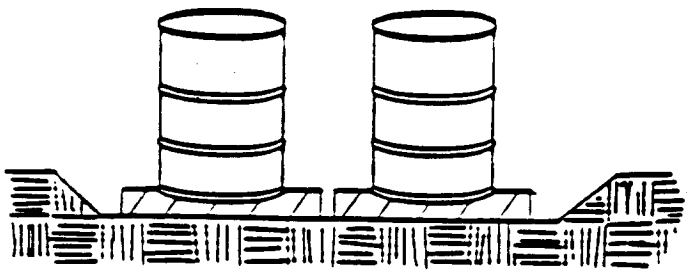
● High ○ Low

CA3

Best Management Practices

ACTIVITY: MATERIAL DELIVERY AND STORAGE



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from material delivery and storage by minimizing the storage of hazardous materials on-site, storing materials in a designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see CA11 (Material Use), or CA12 (Spill Prevention and Control). For information on wastes, see the waste management BMPs in this chapter.

APPROACH

The following materials are commonly stored on construction sites:

- Soil,
- Pesticides and herbicides,
- Fertilizers,
- Detergents,
- Plaster or other products,
- Petroleum products such as fuel, oil, and grease, and
- Other hazardous chemicals such as acids, lime, glues, paints, solvents, and curing compounds.

Storage of these materials on-site can pose the following risks:

- Storm water pollution,
- Injury to workers or visitors,
- Groundwater pollution, and
- Soil contamination.

Therefore, the following steps should be taken to minimize your risk:

- Designate areas of the construction site for material delivery and storage.
  - Place near the construction entrances, away from waterways
  - Avoid transport near drainage paths or waterways
  - Surround with earth berms (see ESC30, Earth Dike.)
  - Place in an area which will be paved
- Storage of reactive, ignitable, or flammable liquids must comply with the fire codes of your area. Contact the local Fire Marshal to review site materials, quantities, and proposed storage area to determine specific requirements. See the Flammable and Combustible Liquid Code, NFPA30.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.
- Keep an accurate, up-to-date inventory of materials delivered and stored on-site.
- Keep your inventory down.

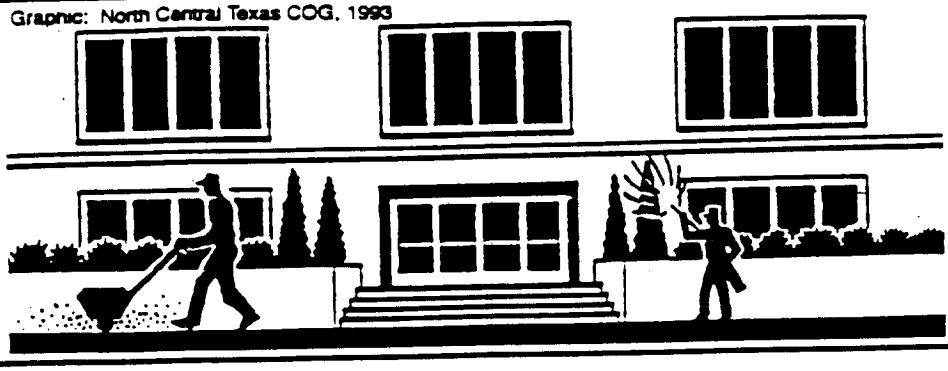
Best Management Practices

ACTIVITY: MATERIAL USE

Graphic: North Central Texas COG, 1993



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from material use by using alternative products, minimizing hazardous material use on-site, and training employees and subcontractors.

APPROACH

The following materials are commonly used on construction sites:

- Pesticides and herbicides,
- Fertilizers,
- Detergents,
- Plaster and other products,
- Petroleum products such as fuel, oil, and grease, and
- Other hazardous chemicals such as acids, lime, glues, paints, solvents, and curing compounds.

Use of these materials on-site can pose the following risks:

- Storm water pollution,
- Injury to workers or visitors,
- Groundwater pollution, and
- Soil contamination.

Therefore, the following steps should be taken to minimize your risk:

- Use less hazardous, alternative materials as much as possible.
- Minimize use of hazardous materials on-site.
- Use materials only where and when needed to complete the construction activity.
- Follow manufacturer's instructions regarding uses, protective equipment, ventilation, flammability, and mixing of chemicals.
- Personnel who use pesticides should be trained in their use. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct on-site inspections.
- Do not over-apply fertilizers, herbicides, and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Unless on steep slopes, till fertilizers into the soil rather than hydroseeding. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried off-site by runoff. Do not apply these chemicals just before it rains.
- Train employees and subcontractors in proper material use.

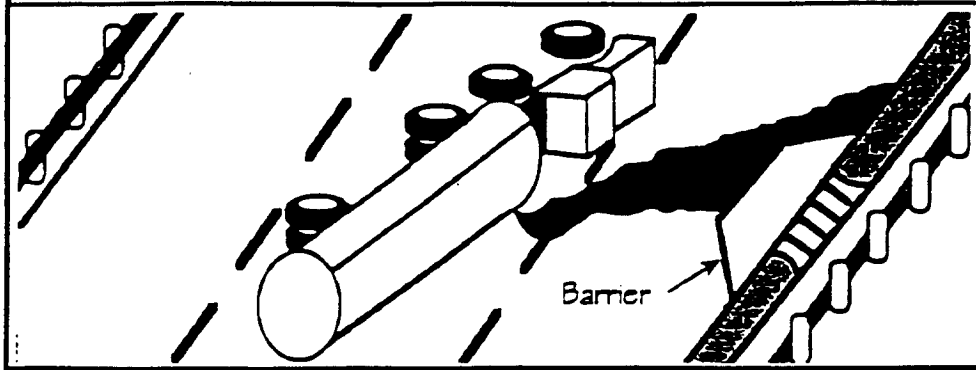
Best Management Practices

ACTIVITY: SPILL PREVENTION AND CONTROL



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, CA10 (Material Delivery and Storage) and CA11 (Material Use), also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this chapter.

APPROACH

The following steps will help reduce the storm water impacts of leaks and spills:

Define "Significant Spill"

- Different materials pollute in different amounts. Make sure that each employee knows what a "significant spill" is for each material they use, and what is the appropriate response for "significant" and "insignificant" spills.

General Measures

- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Train employees in spill prevention and cleanup.
- Designate responsible individuals.

Cleanup

- Clean up leaks and spills immediately.
- On paved surfaces, clean up spills with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to either a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly. See the waste management BMPs in this chapter for specific information.

Reporting

- Report significant spills to local agencies, such as the Fire Department; they can assist in cleanup.
- Federal regulations require that any significant oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hour).

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials

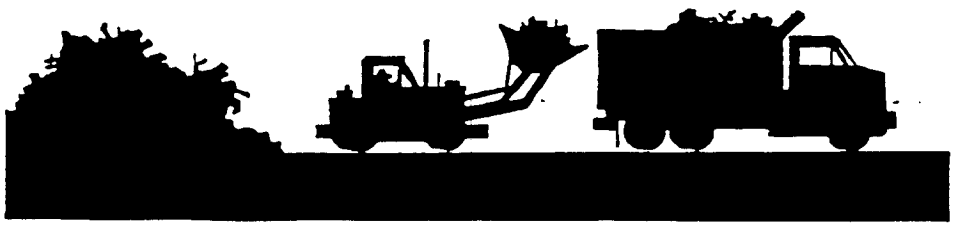
CA12

Best Management Practices

ACTIVITY: SOLID WASTE MANAGEMENT

Graphic: North Central Texas COG, 1993



DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

APPROACH

Solid waste is one of the major pollutants resulting from construction. Construction debris includes:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction;
- Packaging materials including wood, paper and plastic;
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products; and
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, and plastic wrappers, and cigarettes.

The following steps will help keep a clean site and reduce storm water pollution:

- Select designated waste collection areas on-site.
- Inform trash hauling contractors that you will accept only water-tight dumpsters for on-site use. Inspect dumpsters for leaks and repair any dumpster that is not water tight.
- Locate containers in a covered area and/or in a secondary containment.
- Provide an adequate number of containers with lids or covers that can be placed over the container to keep rain out or to prevent loss of wastes when it's windy.
- Plan for additional containers and more frequent pickup during the demolition phase of construction.
- Collect site trash daily, especially during rainy and windy conditions.
- Erosion and sediment control devices tend to collect litter. Remove this solid waste promptly.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Salvage or recycle any useful material. For example, trees and shrubs from land clearing can be used as a brush barrier (see ESC53), or converted into wood chips, then used as mulch on graded areas (see ESC11).
- Do not hose out dumpsters on the construction site. Leave dumpster cleaning to trash hauling contractor.
- Arrange for regular waste collection before containers overflow.

Objectives

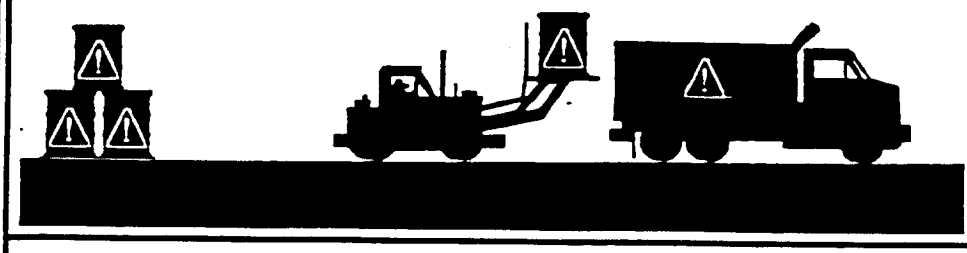
CA20

Best Management Practices

ACTIVITY: HAZARDOUS WASTE MANAGEMENT

Graphic: North Central Texas COG, 1993



DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from hazardous waste through proper material use, waste disposal, and training of employees and subcontractors.

APPROACH

Many of the chemicals used on-site can be hazardous materials which become hazardous waste upon disposal. These wastes may include:

- Paints and solvents;
- Petroleum products such as oils, fuels, and grease;
- Herbicides and pesticides;
- Acids for cleaning masonry; and
- Concrete curing compounds.

In addition, sites with existing structures may contain wastes which must be disposed of in accordance with Federal, State, and local regulations. These wastes include:

- Sandblasting grit mixed with lead-, cadmium-, or chromium-based paints;
- Asbestos; and
- PCBs (particularly in older transformers).

The following steps will help reduce storm water pollution from hazardous wastes:

Material Use

- Use all of the product before disposing of the container.
- Do not remove the original product label, it contains important safety and disposal information.
- Do not over-apply herbicides and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried off-site by runoff. Do not apply these chemicals just before it rains. People applying pesticides must be certified in accordance with Federal and State regulations.
- Do not clean out brushes or rinse paint containers into the dirt, street, gutter, storm drain, or stream. "Paint out" brushes as much as possible. Rinse water-based paints to the sanitary sewer. Filter and re-use thinners and solvents. Dispose of excess oil-based paints and sludge as hazardous waste.

Objectives

- Housekeeping Practices
- **Contain Waste**
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

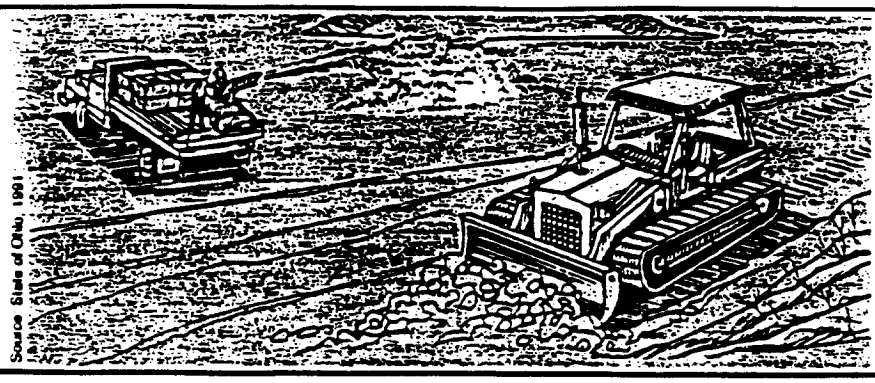
CA21

Best Management Practices

ACTIVITY: CONTAMINATED SOIL MANAGEMENT



Objectives

- Housekeeping Practices
- **Contain Waste**
- **Minimize Disturbed Areas**
- **Stabilize Disturbed Areas**
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.

APPROACH

Contaminated soils may occur on your site for several reasons including:

- Past site uses and activities;
- Detected or undetected spills and leaks; and
- Acid or alkaline solutions from exposed soil or rock formations high in acid or alkaline-forming elements.

Most developers conduct pre-construction environmental assessments as a matter of routine. Recent court rulings holding contractors liable for cleanup costs when they unknowingly move contaminated soil, highlight the need for contractors to confirm that a site assessment is completed before earth moving begins.

The following steps will help reduce storm water pollution from contaminated soil:

- Conduct thorough site planning including pre-construction geologic surveys.
- Look for contaminated soil as evidenced by discoloration, odors, differences in soil properties, abandoned underground tanks or pipes, or buried debris.
- Prevent leaks and spills to the maximum extent practicable. Contaminated soil can be expensive to treat and/or dispose of properly. However, addressing the problem before construction is much less expensive than after the structures are in place.
- Test suspected soils at a certified laboratory.
- If the soil is contaminated, work with the local regulatory agencies to develop options for treatment and/or disposal.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil can be quite expensive.
- Maintenance
  - Inspect excavated areas daily for signs of contaminated soil.
  - Implement CA12, Spill Prevention and Control, to prevent leaks and spills as much as possible.

Targeted Pollutants

- ◒ Sediment
- ○ Nutrients
- ● Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

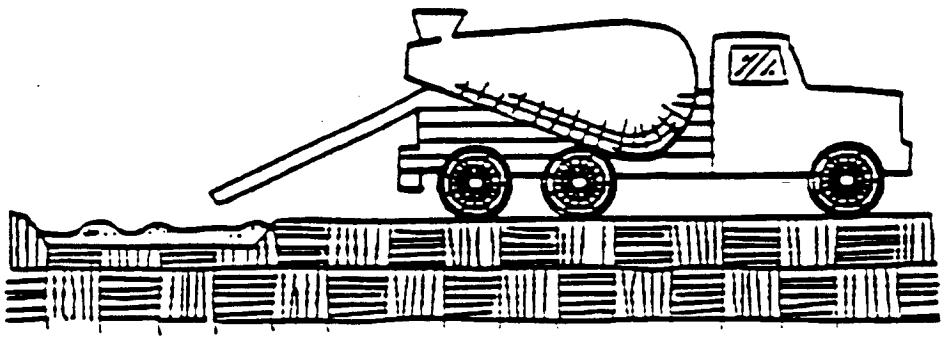
CA22

Best Management Practices

ACTIVITY: CONCRETE WASTE MANAGEMENT



Objectives

- *Housekeeping Practices*
- *Contain Waste* (●)
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas*
- *Protect Slopes/Channels*
- *Control Site Perimeter*
- *Control Internal Erosion*

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from concrete waste by conducting washout off-site, performing on-site washout in a designated area, and training employees and subcontractors.

APPROACH

The following steps will help reduce storm water pollution from concrete wastes:

- Store dry and wet materials under cover, away from drainage areas.
- Avoid mixing excess amounts of fresh concrete or cement on-site.
- Perform washout of concrete trucks off site or in designated areas only.
- Do not wash out concrete trucks into storm drains, open ditches, streets, or streams.
- Do not allow excess concrete to be dumped on-site, except in designated areas.
- For on-site washout:
  - locate washout area at least 50 feet from storm drains, open ditches, or water bodies. Do not allow runoff from this area by constructing a temporary pit or bermed area large enough for liquid and solid waste;
  - wash out wastes into the temporary pit where the concrete can set, be broken up, and then disposed of properly.
- When washing concrete to remove fine particles and expose the aggregate, avoid creating runoff by draining the water to a bermed or level area.
- Do not wash sweepings from exposed aggregate concrete into the street or storm drain. Collect and return sweepings to aggregate base stock pile, or dispose in the trash.
- Train employees and subcontractors in proper concrete waste management.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect subcontractors to ensure that concrete wastes are being properly managed.
  - If using a temporary pit, dispose hardened concrete on a regular basis.

LIMITATIONS

- Off-site washout of concrete wastes may not always be possible.

Targeted Pollutants

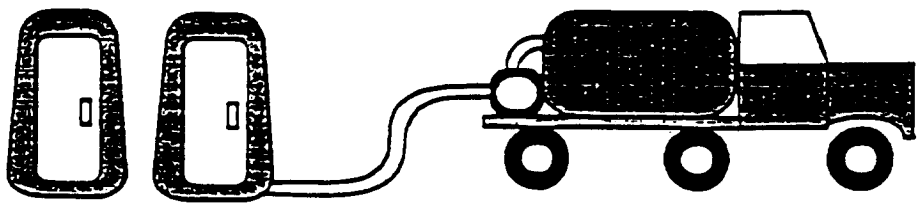
Best Management Practices

ACTIVITY: SANITARY/SEPTIC WASTE MANAGEMENT



Objectives

- Housekeeping Practices
- **Contain Waste**
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from sanitary/septic waste by providing convenient, well-maintained facilities, and arranging for regular service and disposal.

APPROACH

Sanitary or septic wastes should be treated or disposed of in accordance with State and local requirements. These requirements may include:

- Locate sanitary facilities in a convenient location.
- Untreated raw wastewater should never be discharged or buried.
- Temporary septic systems should treat wastes to appropriate levels before discharging.
- If using an on-site disposal system (OSDS), such as a septic system, comply with local health agency requirements.
- Temporary sanitary facilities that discharge to the sanitary sewer system should be properly connected to avoid illicit discharges.
- If discharging to the sanitary sewer, contact the local wastewater treatment plant for their requirements.
- Sanitary/septic facilities should be maintained in good working order by a licensed service.
- Arrange for regular waste collection by a licensed hauler before facilities overflow.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect facilities regularly.
  - Arrange for regular waste collection.

LIMITATIONS

- There are no major limitations to this best management practice.

CA24

Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT CLEANING

Graphic: North Central Texas COG, 1993

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment cleaning by using off-site facilities, washing in designated, contained areas only, eliminating discharges to the storm drain by infiltrating or recycling the wash water, and/or training employees and subcontractors.

APPROACH

- Use off-site commercial washing businesses as much as possible. Washing vehicles and equipment outdoors or in areas where wash water flows onto paved surfaces or into drainage pathways can pollute storm water. If you wash a large number of vehicles or pieces of equipment, consider conducting this work at an off-site commercial business. These businesses are better equipped to handle and dispose of the wash waters properly. Performing this work off-site can also be economical by eliminating the need for a separate washing operation at your site.
- If washing must occur on-site, use designated, bermed wash areas to prevent wash water contact with storm water, creeks, rivers, and other water bodies. The wash area can be sloped for wash water collection and subsequent infiltration into the ground.
- Use as little water as possible to avoid having to install erosion and sediment controls for the wash area.
- Use phosphate-free, biodegradable soaps.
- Educate employees and subcontractors on pollution prevention measures.
- Do not permit steam cleaning on-site. Steam cleaning can generate significant pollutant concentrations.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Minimal, some berm repair may be necessary.

LIMITATIONS

- Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades.
- Sending vehicles/equipment off-site should be done in conjunction with ESC24 (Stabilized Construction Entrance).

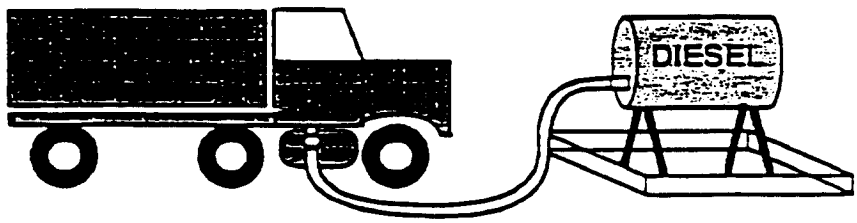
Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT FUELING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent fuel spills and leaks, and reduce their impacts to storm water by using off-site facilities, fueling in designated areas only, enclosing or covering stored fuel, implementing spill controls, and training employees and subcontractors.

APPROACH

- Use off-site fueling stations as much as possible. Fueling vehicles and equipment outdoors or in areas where fuel may spill/leak onto paved surfaces or into drainage pathways can pollute storm water. If you fuel a large number of vehicles or pieces of equipment, consider using an off-site fueling station. These businesses are better equipped to handle fuel and spills properly. Performing this work off-site can also be economical by eliminating the need for a separate fueling area at your site.
- If fueling must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Discourage "topping-off" of fuel tanks.
- Always use secondary containment, such as a drain pan or drop cloth, when fueling to catch spills/leaks.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Carry out all Federal and State requirements regarding stationary above ground storage tanks.
- Avoid mobile fueling of mobile construction equipment around the site; rather, transport the equipment to designated fueling areas. With the exception of tracked equipment such as bulldozers and perhaps forklifts, most vehicles should be able to travel to a designated area with little lost time.
- Train employees and subcontractors in proper fueling and cleanup procedures.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above measures are low cost, except for the capital costs of above ground tanks that meet all local environmental, zoning, and fire codes.
- Maintenance
  - Keep ample supplies of spill cleanup materials on-site.
  - Inspect fueling areas and storage tanks on a regular schedule.

LIMITATIONS

- Sending vehicles/equipment off-site should be done in conjunction with ESC24 (Stabilized Construction Entrance).

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials

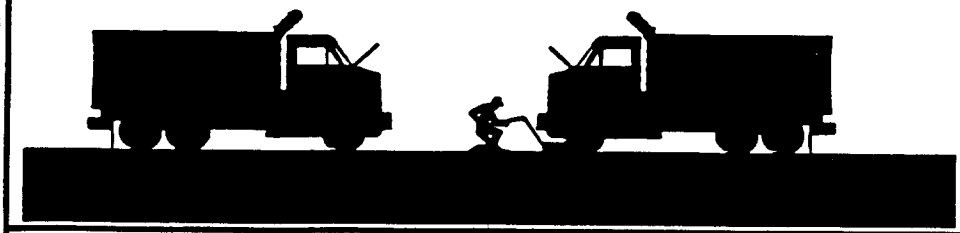
CA31

Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT MAINTENANCE

Graphic: North Central Texas COG, 1993



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment maintenance by running a "dry site". This involves using off-site facilities, performing work in designated areas only, providing cover for materials stored outside, checking for leaks and spills, containing and cleaning up spills immediately, and training employees and subcontractors.

APPROACH

- Keep vehicles and equipment clean, don't allow excessive build-up of oil and grease.
- Use off-site repair shops as much as possible. Maintaining vehicles and equipment outdoors or in areas where vehicle or equipment fluids may spill or leak onto the ground can pollute storm water. If you maintain a large number of vehicles or pieces of equipment, consider using an off-site repair shop. These businesses are better equipped to handle vehicle fluids and spills properly. Performing this work off-site can also be economical by eliminating the need for a separate maintenance area.
- If maintenance must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Regularly inspect on-site vehicles and equipment for leaks, and repair immediately.
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment on-site.
- Segregate and recycle wastes, such as greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic, and transmission fluids.
- Train employees and subcontractors in proper maintenance and spill cleanup procedures.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Keep ample supplies of spill cleanup materials on-site.
  - Inspect maintenance areas on a regular schedule.

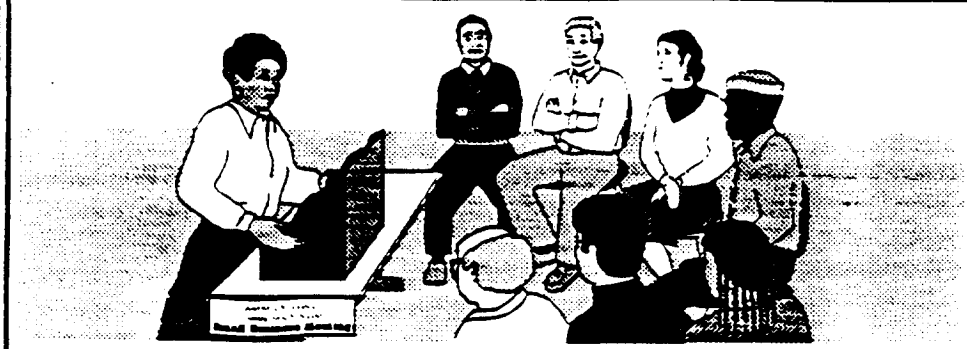
CA32

Best Management Practices

ACTIVITY: EMPLOYEE/SUBCONTRACTOR TRAINING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Employee/subcontractor training, like maintenance or a piece of equipment, is not so much a best management practice as it is a method by which to implement BMPs. This fact sheet highlights the importance of training and of integrating the elements of employee/subcontractor training from the individual source controls into a comprehensive training program as part of a company's Storm Water Pollution Prevention Plan (SWPPP).

The specific employee/subcontractor training aspects of each of the source controls are highlighted in the individual fact sheets. The focus of this fact sheet is more general, and includes the overall objectives and approach for assuring employee/subcontractor training in storm water pollution prevention. Accordingly, the organization of this fact sheet differs somewhat from the other fact sheets in this chapter.

OBJECTIVES

Employee/subcontractor training should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute storm water;
- Identify solutions (BMPs);
- Promote employee/subcontractor ownership of the problems and the solutions; and
- Integrate employee/subcontractor feedback into training and BMP implementation.

APPROACH

- Integrate training regarding storm water quality management with existing training programs that may be required for your business by other regulations such as: the Illness and Injury Prevention Program (IIPP) (SB 198) (California Code of Regulations Title 8, Section 3203), the Hazardous Waste Operations and Emergency Response (HAZWOPER) standard (29 CFR 1910.120), the Spill Prevention Control and Countermeasure (SPCC) Plan (40 CFR 112), and the Hazardous Materials Management Plan (Business Plan) (California Health and Safety Code, Section 6.95).
- Businesses, particularly smaller ones that may not be regulated by Federal, State, or local regulations, may use the information in this Handbook to develop a training program to reduce their potential to pollute storm water.
- Use the quick reference on disposal alternatives (Table 4.2) to train employee/subcontractors in proper and consistent methods for disposal.

CA40

Best Management Practices

TABLE 4.2 QUICK REFERENCE - DISPOSAL ALTERNATIVES
(Adopted from Santa Clara County Nonpoint Source Pollution Control Program - December 1992)

All of the waste products on this chart are prohibited from discharge to the storm drain system. Use this matrix to decide which alternative disposal strategies to use. **ALTERNATIVES ARE LISTED IN PRIORITY ORDER.**

Key: HHW Household hazardous waste (Government-sponsored drop-off events)
POTW Publically Owned Treatment Plant
Reg.Bd. Regional Water Quality Control Board (Oakland)
"Dispose to sanitary sewer" means dispose into sink, toilet, or sanitary sewer clean-out connection.
"Dispose as trash" means dispose in dumpsters or trash containers for pickup and/or eventual disposal in landfill.
"Dispose as hazardous waste" for business/commercial means contract with a hazardous waste hauler to remove and dispose.

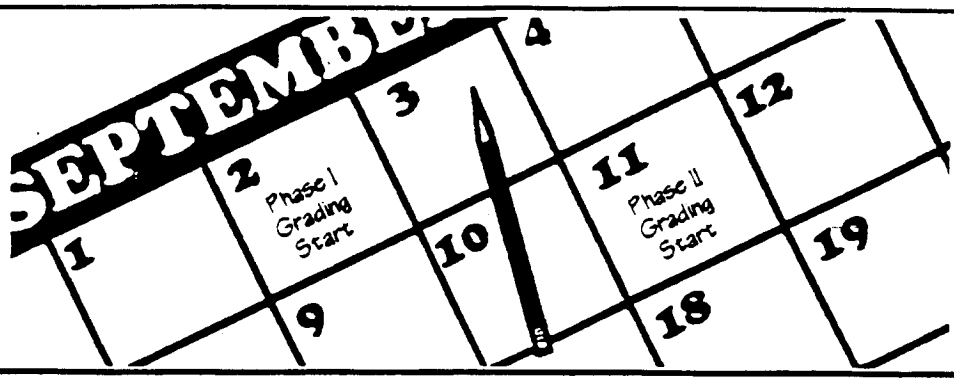
DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
General Construction and Painting; Street and Utility Maintenance			
Excess paint (oil-based)	1. Recycle/reuse. 2. Dispose as hazardous waste.		1. Recycle/reuse. 2. Take to HHW drop-off.
Excess paint (water-based)	1. Recycle/reuse. 2. Dry residue in cans, dispose as trash. 3. If volume is too much to dry, dispose as hazardous waste.		1. Recycle/reuse. 2. Dry residue in cans, dispose as trash. 3. If volume is too much to dry, take to HHW drop-off
Paint cleanup (oil-based)	Wipe paint out of brushes, then: 1. Filter & reuse thinners, solvents. 2. Dispose as hazardous waste.		Wipe paint out of brushes, then: 1. Filter & reuse thinners, solvents. 2. Take to HHW drop-off.
Paint cleanup (water-based)	Wipe paint out of brushes, then: 1. Rinse to sanitary sewer.		Wipe paint out of brushes, then: 1. Rinse to sanitary sewer.
Empty paint cans (dry)	1. Remove lids, dispose as trash.		1. Remove lids, dispose as trash.
Paint stripping (with solvent)	1. Dispose as hazardous waste.		1. Take to HHW drop-off.
Building exterior cleaning (high-pressure water)	1. Prevent entry into storm drain and remove offsite 2. Wash onto dirt area, spade in 3. Collect (e.g. mop up) and discharge to sanitary sewer	POTW	
Cleaning of building exteriors which have **HAZARDOUS MATERIALS** (e.g. mercury, lead) in paints	1. Use dry cleaning methods 2. Contain and dispose washwater as hazardous waste (Suggestion: dry material first to reduce volume)		

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
General Construction and Painting; Street and Utility Maintenance (cont'd)			
Rinsewater from concrete mixing trucks	1. Return truck to yard for rinsing into pond or dirt area 2. At construction site, wash into pond or dirt area		
Non-hazardous construction and demolition debris	1. Recycle/reuse (concrete, wood, etc.) 2. Dispose as trash		1. Recycle/reuse (concrete, wood, etc. 2. Dispose as trash
Hazardous demolition and construction debris (e.g. asbestos)	1. Dispose as hazardous waste		1. Do not attempt to remove yourself. Contact asbestos removal service for safe removal and disposal 2. Very small amounts (less than 5 lbs) may be double-wrapped in plastic and taken to HHW drop-off
Saw-cut slurry	1. Use dry cutting technique and sweep up residue 2. Vacuum slurry and dispose off-site. 3. Block storm drain or berm with low weir as necessary to allow most solids to settle. Shovel out gutters; dispose residue to dirt area, construction yard or landfill.		
Construction dewatering (Nonturbid, uncontaminated groundwater)	1. Recycle/Reuse 2. Discharge to storm drain		
Construction dewatering (Other than nonturbid, uncontaminated groundwater)	1. Recycle/reuse 2. Discharge to sanitary sewer 3. As appropriate, treat prior to discharge to storm drain	POTW Reg. Bd.	
Portable toilet waste	1. Leasing company shall dispose to sanitary sewer at POTW	POTW	
Leaks from garbage dumpsters	1. Collect, contain leaking material. Eliminate leak, keep covered, return to leasing company for immediate repair 2. If dumpster is used for liquid waste, use plastic liner		

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
Landscape/Garden Maintenance			
Pesticides	1. Use up. Rinse containers use rinsewater as product. Dispose rinsed containers as trash 2. Dispose unused pesticide as hazardous waste		1. Use up. Rinse containers, use rinsewater as pesticide. Dispose rinsed container as trash. 2. Take unused pesticide to HHW drop-off
Garden clippings	1. Compost 2. Take to Landfill		1. Compost 2. Dispose as trash.
Tree trimming	1. Chip if necessary, before composting or recycling		1. Chip if necessary, before composting or recycling
Swimming pool, spa, fountain water (emptying)	1. Do not use metal-based algicides (i.e. Copper Sulfate) 2. Recycle/reuse (e.g. irrigation) 3. Determine chlorine residual = 0, wait 24 hours and then discharge to storm drain.	POTW	1. Do not use metal-based algicides (i.e. Copper Sulfate) 2. Recycle/reuse (e.g. irrigation) 3. Determine chlorine residual = 0, wait 24 hours and then discharge to storm drain.
Acid or other pool/spa/fountain cleaning	1. Neutralize and discharge to sanitary sewer	POTW	
Swimming pool, spa filter backwash	1. Reuse for irrigation 2. Dispose on dirt area 3. Settle, dispose to sanitary sewer		1. Use for landscape irrigation 2. Dispose on dirt area 3. Settle, dispose to sanitary sewer
Vehicle Wastes			
Used motor oil	1. Use secondary containment while storing, send to recycler.		1. Put out for curbside recycling pickup where available 2. Take to Recycling Facility or auto service facility with recycling program 3. Take to HHW events accepting motor oil
Antifreeze	1. Use secondary containment while storing, send to recycler.		1. Take to Recycling Facility
Other vehicle fluids and solvents	1. Dispose as hazardous waste		1. Take to HHW event
Automobile batteries	1. Send to auto battery recycler 2. Take to Recycling Center		1. Exchange at retail outlet 2. Take to Recycling Facility or HHW event where batteries are accepted
Motor home/construction trailer waste	1. Use holding tank. Dispose to		1. Use holding tank, dispose to sanitary

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
Other Wastes (cont'd)			
Kitchen Grease	1. Provide secondary containment, collect, send to recyler. 2. Provide secondary containment, collect, send to POTW via hauler.	POTW	1. Collect, solidify, dispose as trash
Restaurant cleaning of floor mats, exhaust filters, etc.	1. Clean inside building with discharge through grease trap to sanitary sewer. 2. Clean outside in container or bermed area with discharge to sanitary sewer.		
Clean-up wastewater from sewer back-up	1. Follow this procedure: a. Block storm drain, contain, collect, and return spilled material to the sanitary sewer. b. Block storm drain, rinse remaining material to collection point and pump to sanitary sewer. (no rinse-water may flow to storm drain)		

BMP: SCHEDULING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Sequencing the construction project to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking.

SUITABLE APPLICATIONS

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project. Use of other, more costly yet less effective, erosion and sedimentation controls, may often be reduced through proper construction sequencing.

APPROACH

- Project design considerations: Design project to integrate into existing land contours. Significant regrading of a site will require more costly erosion and sedimentation control measures and may require that on-site drainage facilities be installed.
- Incorporate existing, natural areas: Inventory and evaluate the existing site terrain and vegetation. Disturbance of highly erosive natural areas (e.g., steep, unstable slope areas, watercourses) should be minimized, while protecting other areas may enhance site aesthetics. Construction should not disturb these areas (see ESC2).
- Avoid rainy periods: Schedule major grading operations during dry months. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means (see ESC 10 to 24) or to install temporary sediment trapping devices (see ESC 50 to 56).
- Practice erosion and sediment control year round: Erosion may be caused during dry seasons by "freak" rainfall, wind and vehicle tracking. Therefore, keep the site stabilized year-round, and retain wet season sediment trapping devices.
- Minimize soil exposed at one time: Schedule projects to disturb only small portions of the site at any one time. Complete grading as soon as possible. Immediately stabilize the disturbed portion before grading the next portion. Practice staged seeding—revegetate cut and fill slopes as the work progresses.
- Trenching: Close and stabilize open trenches as soon as possible. Sequence trenching projects so that most open portions of the trench are closed before new trenching is begun.

REQUIREMENTS

- Cost
  - Construction scheduling to reduce erosion may increase other construction costs due to reduced economies of scale in performing site grading. The cost-effectiveness of scheduling techniques should be compared with the other, less effective erosion and sedimentation controls to achieve a cost-effective balance.

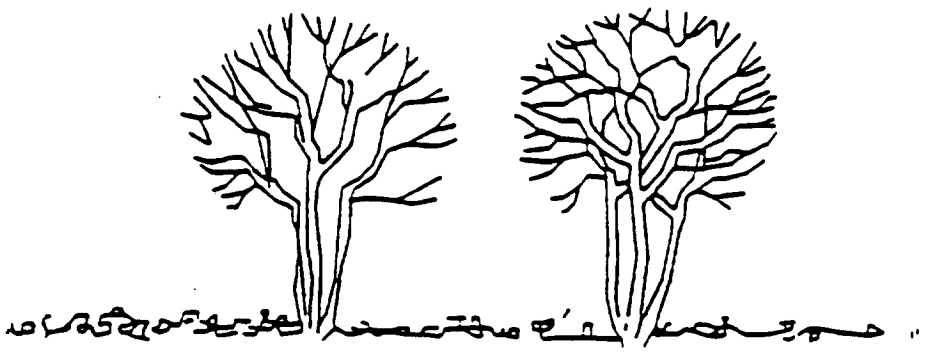
Best Management Practices

BMP: PRESERVATION OF EXISTING VEGETATION



Objectives

- Housekeeping Practices
- Contain Waste
- **Minimize Disturbed Areas**
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- Control Internal Erosion

GENERAL DESCRIPTION

Carefully planned preservation of existing vegetation minimizes the potential of removing or injuring existing trees, vines, shrubs and/or grasses that serve as erosion controls.

SUITABLE APPLICATIONS

- Areas within site where no construction activity occurs, or occurs at a later date.
- Sensitive areas where natural vegetation exist and should be preserved, such as: steep slopes, watercourses, and building sites in wooded areas.
- Areas where local, state and federal government requires preservation, such as: vernal pools, wetlands, marshes, certain oak trees, etc.

INSTALLATION/APPLICATION CRITERIA

- Clearly mark, flag or fence vegetation or areas where vegetation should be preserved.
- Prepare landscaping plans which include as much existing vegetation as possible and state proper care of this vegetation both during and after construction.
- Define and protect with berms, fencing, signs, etc., a setback area from vegetation to be preserved. Setback area size should be based on the location, species, size, age and potential impact of adjacent construction activities or permanent improvements.
- Proposed landscaping plans which do not include plant species that compete with the existing vegetation.
- Do not locate construction traffic routes, spoil piles, etc., where significant adverse impact on existing vegetation may occur.

REQUIREMENTS

- Maintenance
  - Inspection and maintenance requirements for protection of vegetation are low.
  - During construction the limits of grading or disturbance should be clearly marked at all times.
  - Irrigation or maintenance of native trees or vegetation should conform to specifications on the Landscape Plan.
- Cost
  - There is little cost associated with preserving existing vegetation if properly planned during the project design, and may yield aesthetic benefits which enhance property values.

LIMITATIONS

- Requires forward planning by the owner/developer, contractor and design staff.
- For sites with diverse topography, it is often difficult and expensive to save existing trees while grading the site satisfactorily for the planned development.

Targeted Pollutants

- ● **Sediment**
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials

- ● Suitability for Slopes >5%

● High ○ Low

ESC2

Best Management Practices

Additional Information — Preservation of Existing Vegetation

Methods for protecting existing vegetation and trees:

- Stake off root system limits (drip line of tree). Some counties limit construction within 5 feet of the tree drip line.
- Fence off the area to be preserved or along the tree drip line.
- Flag or mark trees to remain in place.
- Tree wells and retaining walls (permanent) help preserve existing vegetation, but must be large enough to protect the root system (see below).
- For the California Oak tree, no trenching or irrigation should be allowed within the driplines of the tree, since both these activities are detrimental to the preservation of the tree.
- Where grading under trees is necessary, excavation and fill should be limited to 1 foot within the driplines.

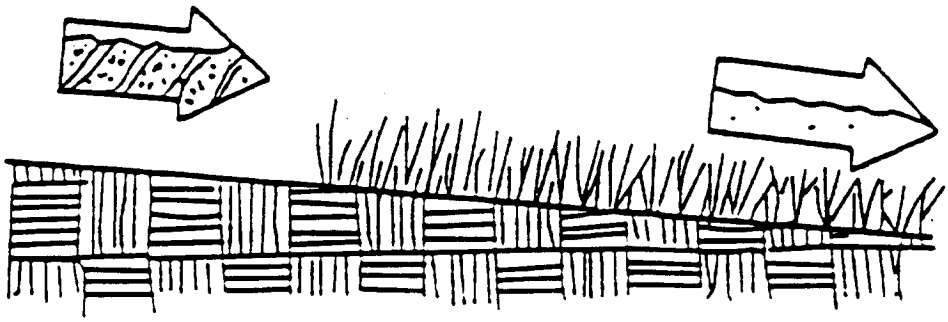
Water Quality Management Plan for the Lake Tahoe Region, Volume II, Handbook of Management Practices, Tahoe Regional Planning Agency - November 1988.

SUPPLEMENTAL INFORMATION, JUNE 1998

Limit and phase clearing. By clearing only those areas immediately essential for completing site construction, buffer zones are preserved and soil remains undisturbed until construction begins in a particular area. Additionally, the proposed limits of land disturbance should be physically marked off to ensure that no more than the required land area is cleared.

ESC2

BMP: SEEDING AND PLANTING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Seeding of grasses and plantings of trees, shrubs, vines and ground covers provide long-term stabilization of soil. In some areas, with suitable climates, grasses can be planted for temporary stabilization.

SUITABLE APPLICATIONS

- Appropriate for site stabilization both during construction and post-construction.
- Any graded/cleared areas where construction activities have ceased.
- Open space cut and fill areas.
- Steep slopes.
- Spoil piles.
- Vegetated swales.
- Landscape corridors.
- Stream banks.

INSTALLATION/APPLICATION CRITERIA

Type of vegetation, site and seedbed preparation, planting time, fertilization and water requirements should be considered for each application.

Grasses:

- Ground preparation: fertilize and mechanically stabilize the soil.
- Tolerant of short-term temperature extremes and waterlogged soil conditions.
- Appropriate soil conditions: shallow soil base, good drainage, slope 2:1 or flatter.
- Develop well and quickly from seeds.
- Mowing, irrigating, and fertilizing are vital for promoting vigorous grass growth.

Trees and Shrubs:

- Selection Criteria: vigor, species, size, shape & wildlife food source.
- Soil conditions: select species appropriate for soil,drainage & acidity.
- Other Factors: wind/exposure, temperature extremes, and irrigation needs.

Vines and Ground Covers:

- Ground preparation: lime and fertilizer preparation.
- Use proper seeding rates.
- Appropriate soil conditions: drainage, acidity, slopes.
- Generally avoid species requiring irrigation.

ESC10

Best Management Practices

Additional Information — Seeding and Planting

Permanent seeding of grasses, sodding, and planting of trees, shrubs, vines and ground covers can provide long-term stabilization of soil. Permanent seeding and planting contributes to long-term site aesthetics and helps reduce erosion by reducing the velocity of runoff, allowing infiltration to occur, filtering sediments, and by holding soil particles in place.

Seeding and planting should be applied as soon as final grading is done to all graded and cleared areas of the construction site where plant cover is ultimately desired. For example, vegetation may be established along landscaped corridors and buffer zones where they may act as filter strips (see TC6 in Chapter 5 of the Municipal Handbook). Additionally, vegetated swales, steep and/or rocky slopes and stream banks can also serve as appropriate areas for seeding and plantings.

Installation/Application Criteria

Application of appropriate vegetation must consider: the seedbed or plantbed, proper seasonal planting times, water requirements fertilizer requirements and availability of the selected vegetation within the project's region. Permanent plantings during the construction stage of projects require careful coordination between the local agency inspectors, project managers, construction managers, and landscape contractor. Protocols for coordination and implementation procedures regarding site access, construction staging, and short- and long-term planting areas should be developed prior to the construction bid process. Where possible, these protocols should be established by and remain the responsibility of the site owner.

Because of the many available types of plants and ground covers and because site conditions and land use vary so widely within California, a set of general guidelines is included for installation/application of grasses, trees and shrubs, vines and ground covers. However, your local municipality, Soil Conservation Service, agricultural extention, or other resources should be consulted on appropriate species, planting requirements, and maintenance needs for your climate and soils.

Grasses

Grasses, depending on the type, provide short-term soil stabilization during construction or can serve as long- term/ permanent soil stabilization for disturbed areas. In general, grasses provide low maintenance to areas that have been cleared, graded and mechanically stabilized.

Selection:

The selection of the grass type is determined by the climate, irrigation, mowing frequency, maintenance effort and soil-bed conditions. Although grasses provide quick germination and rapid growth, they also have a shallow root system and are not as effective in stabilizing deep soils, where trees, shrubs and deep rooted ground covers may be more appropriate. Several grasses are adaptable to the various California climates. The figure at the end of these fact sheets shows appropriate grasses for regions within California. Blue grass is well adapted throughout California except for in the valley regions. The blue grass is found on dry, sandy soils that have good drainage. Bermuda grass, on the other hand is well adapted in the valley region where soils are dry, coarse and heavier. Specific seed mix and/or varieties for each site should be provided by an approved/qualified plant materials specialist.

ESC10

Caution should be exercised in the non-native vegetation because of impacts to native vegetation on adjacent lands. For example, species that may be planted at the construction site can quickly spread and compete with originally undisturbed vegetation such as the California Poppy and California buckwheat, both of which complete poorly with introduced grasses (e.g., planting wild oats is illegal in California). In addition to stabilizing disturbed soil, vines and ground covers can perform the following functions:

1. Provide attractive cover that does not need mowing.
2. Help to define traffic areas and control pedestrian movement.

Site Preparation:
Ground covers are plants that naturally grow very close together, causing severe competition for space nutrients and water. Soil for ground covers should be well prepared. The entire area should be spaded, disced, or rototilled to a depth of six to eight inches. Two to three inches of organic material, such as good topsoil or peat, should be spread over the entire area.

Planting:
The following steps will help ensure good plant growth.

1. Make the plantings following the contours of the land.
2. Dig the holes 1/3 larger than the plant root ball.
3. Know what depth to place the plants.
4. Use good topsoil or soil mixture with a lot of organic matter.
5. Fill hole 1/3 to 1/2 full, shake plants to settle soil among roots, then water.
6. Leave saucer-shaped depression around the plant to hold water.
7. Water thoroughly and regularly.
8. Space plants according to the type of plant and the extent of covering desired.

Materials:
There are many different species of vines and ground covers from which to choose, but care must be taken in their selection. It is essential to select planting materials suited to both the intended use and specific site characteristics. The plants discussed in this handbook are those which are known to be adapted to California, and commonly available from commercial nurseries. Additional information can be obtained from local nurserymen, landscape architects, and extension agents. An approved low water use plant list may be obtained from the State Department of Water Resources or the Soils Conservation Service.

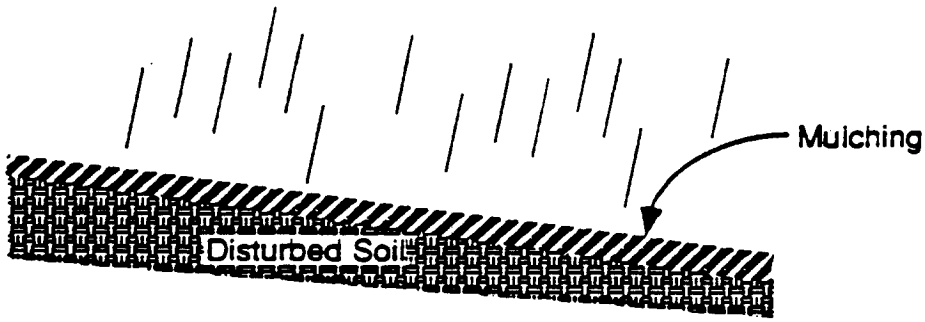
Requirements
Maintenance

General requirements include:

- Grass maintenance should be minimal to none. Irrigation and regular fertilizing may be required for some types of grasses. Mowing is only required in areas where aesthetics or fire hazards are a concern.
- Young trees should receive an inch of water each week for the first two years after planting. The tree should be watered deeply, but not more often than once per week.
- Transplanted trees should be fertilized on an annual basis.
- Proper pruning, watering, and application of fertilizer is necessary to maintain healthy and vigorous shrubs. A heavy layer of mulch applied around the shrubs reduces weeds and retains moisture.
- Trim old growth as needed to improve the appearance of ground covers. Most covers need once-a-year trimming to promote growth.

ESC10

BMP: MULCHING



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- ***Stabilize Disturbed Areas***
- ***Protect Slopes/Channels***
- *Control Site Perimeter*
- *Control Internal Erosion*

GENERAL DESCRIPTION

Mulching is used to temporarily and permanently stabilize cleared or freshly seeded areas. Types of mulches include organic materials, straw, wood chips, bark or other wood fibers, decomposed granite, and gravel.

SUITABLE APPLICATIONS

- Temporary stabilization of freshly seeded and planted areas.
- Temporary stabilization during periods unsuitable for growing vegetation.
- Temporary stabilization of areas that cannot be seeded or planted (e.g., insufficient rain, steep slope).
- Mulches such as gravel and decomposed soils may be used as post-construction BMPs, particularly in arid regions.

INSTALLATION/APPLICATION CRITERIA

Mulch prevents erosion by protecting the soil surface and fostering growth of new seedings that do not stabilize by themselves.

- May be used with netting to supplement soil stabilization.
- Apply to planting areas where slopes are 2:1 or greater.
- Binders may be required for steep areas, or if wind and runoff is a problem.
- Type of mulch, binders, and application rates should be recommended by manufacturer/contractor.

REQUIREMENTS

- Maintenance
  - Must be inspected weekly and after rain for damage or deterioration.
- Cost: Average annual cost for installation and maintenance (3-4 month useful life, source: EPA, 1992)
  - Straw Mulch: $7,500 per acre.
  - Wood Fiber Mulch: $3,500 per acre.
  - Jute Netting: $12,500 per acre.

LIMITATIONS

- Wood fiber mulches should be used only in areas with over 20 inches annual precipitation.
- Organic mulches are not permanent erosion control measures.
- Mulches tend to lower the soil surface temperature, and may delay germination of some seeds.
- Permanent mulches for arid regions should include gravel and decomposed soils.

ESC11

Best Management Practices

Additional Information — Mulching

Preparations/Methods and Equipment

Straw Mulch: Should be applied in an even, uniform manner, either by hand or by mulch blowing equipment. Straw mulches must be anchored to prevent the mulch from being blown or washed off the site. Anchoring is achieved in two ways:

- Crimping: The mulch is anchored by running a heavy disc with flat, dull, serrated, closely-spaced blades over the mulched soil. Effective crimping embeds the mulch about 2 inches into the soil without completely covering it. The disc should be run once or twice across the soil. About 2 1/2 tons of straw mulch per acre should be applied if the mulch is anchored by crimping.
- Tacking: Achieved using a emulsified asphalt or binder either independently or followed by crimping. If tacked, straw mulch may be applied at a rate of 1 3/4 ton per acre, and tacked with emulsified asphalt at a rate of 500 gallons per acre.

Wood Fiber Mulch: Typically applied with a hydroseeder at a rate of about 1000 to 1500 pounds per acre, or as a slurry consisting of at least 150 pounds of binder, 400 pounds of wood fiber mulch, and 200 gallons of water per acre.

Requirements

Maintenance: Mulched areas require frequent inspection for damage and deterioration. Requirements will vary greatly based on the type of mulch used and the type of vegetation to be established. Vegetative mulches are usually not intended to be permanent; but are extended only as a base for re-seeding or re-vegetation. Where a permanent anchor for vegetation is required, along steep slopes or areas of higher velocity flows, then a geotextile mat or net is recommended (see ESC20).

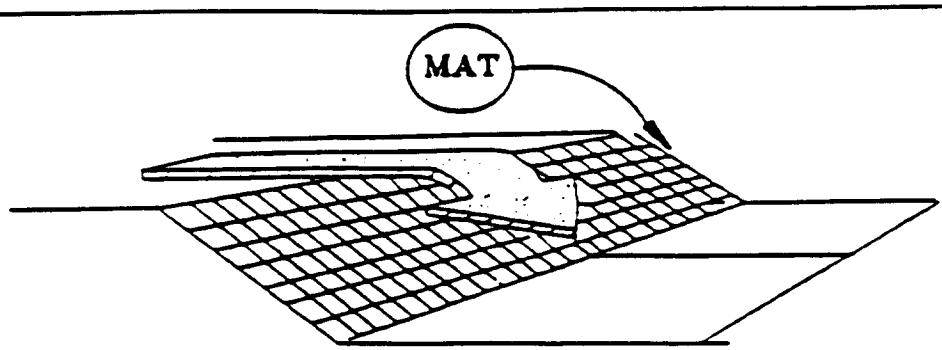
ESC11

BMP: GEOTEXTILES AND MATS



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Mattings made of natural or synthetic material which are used to temporarily or permanently stabilize soil.

SUITABLE APPLICATIONS

Typically suited for post-construction site stabilization, but may be used for temporary stabilization of highly erosive soils.

- Channels and streams.
- Steep slopes.

INSTALLATION/APPLICATION CRITERIA

Mattings may be applied to disturbed soils and where existing vegetation has been removed. The following organic matting materials provide temporary protection until permanent vegetation is established, or when seasonal circumstances dictate the need for temporary stabilization until weather or construction delays are resolved.

- Jute mattings.
- Straw mattings.

The following synthetic mattings may be used for either temporary or post-construction stabilization, both with and without vegetation

- Excelsior matting.
- Glass fiber matting.
- Staples.
- Mulch nettings.

REQUIREMENTS

- Maintenance
  - Inspect monthly and after significant rainfall.
  - Re-anchor loosened matting and replace missing matting and staples as required.
- Cost
  - Relatively high compared to other BMPs.

LIMITATIONS

- Mattings are more costly than other BMP practices, limiting their use to areas where other BMPs are ineffective (e.g., channels, steep slopes).
- May delay seed germination, due to reduction in soil temperature.
- Installation requires experienced contractor to ensure soil stabilization and erosion protection.

Targeted Pollutants

ESC20

Best Management Practices

Additional Information — Geotextiles and Mats

Site Preparation: After the site has been shaped and graded to the approved design, prepare a friable seed bed relatively free from clods and rocks more than 1 inches in diameter and any foreign material that will prevent contact of the protective mat with the soil surface.

Planting: Fertilize and seed in accordance with seeding specifications or other types of landscaping plans. When using jute matting on a seeded area, apply approximately half the seed before laying the mat and the remainder after laying the mat. The protective matting can be laid over areas where grass has been planted and the seedlings have emerged. Where vines or other ground covers are to be planted, lay the protective matting first and then plant through matting according to design of planting.

Erosion Stops: Erosion stops are made of glass fiber strips, excelsior matting strips or tight-folded jute matting blanket or strips for use on steep, highly erodible watercourses. The stops are placed in narrow trenches six to twelve inches deep across the channel and left flush with the soil surface. They are to cover the full cross section of designed flow.

Laying and Securing Matting: Before laying the matting, all erosion stops should be installed and the friable seed bed made free from clods, rocks, and roots. The surface upon which the separation fabric will be placed should be compacted and finished according to the requirements of the manufacturer's recommendations.

Most matting comes with the manufacturer's recommendations for installation. Most channels will require multiple widths of matting, and the matting should be unrolled starting at the upper end of the channel, allowing a four inch overlap of mattings along the center of the channel. To secure, bury the top ends of the matting in a narrow trench, a minimum of six inches deep. Backfill trench and tamp firmly to conform to channel cross section. Secure with a row of staples about four inches down slope from the trench with staples twelve inches apart.

Where matting crosses erosion stops, reinforce with a double row of staples at six inch spacing, using a staggered pattern on either side of the erosion stop. When the matting is overlapped, the discharge end of the matting liner should be similarly secured with a double row of staples.

Mechanical or manual laydown equipment should be capable of handling full rolls of fabric, and laying the fabric smoothly, without wrinkles or folds. The equipment should meet the fabric manufacturer's recommendations or equivalent standards.

Final Check: Check the following after the matting is installed:

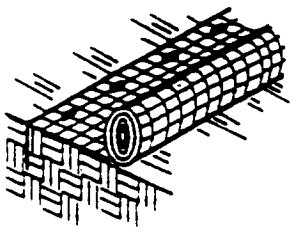
- Make sure matting is uniformly in contact with the soil.
- All lap joints are secure.
- All staples are flush with the ground.
- All disturbed areas seeded.

Limitations

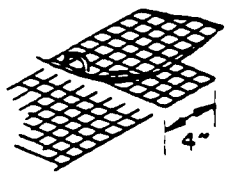
Properly installed mattings provide excellent erosion control but do so at relatively high cost. This high cost typically limits the use of mattings to areas of concentrated channel flow and steep slopes.

Installation is critical and requires experienced contractors. The contractor should install the matting material in such a manner that continuous contact between the material and the soil occurs, otherwise the material will not stabilize the soil and erosion will occur beneath the material. Ultraviolet protection may be required on some geotextiles. Matting strengths and uses vary; the manufacturer's specifications should be followed.

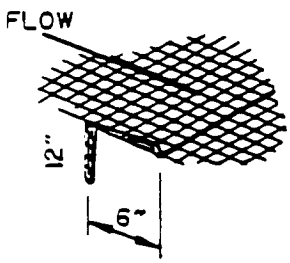
ESC20



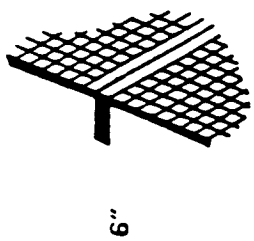
ANCHOR SLOT: BURY THE UP-CHANNEL END OF THE NET IN A 12" DEEP TRENCH. TAMP THE SOIL FIRMLY. STAPLE AT 12" INTERVALS ACROSS THE NET.



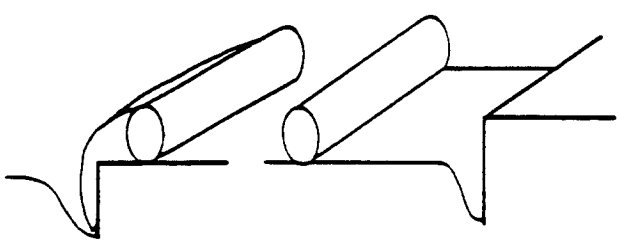
OVERLAP: OVERLAP EDGES OF THE STRIPS AT LEAST 4". STAPLE EVERY 12" DOWN THE CENTER OF THE STRIP.



JOINING STRIPS: INSERT THE NEW ROLL OR NET IN A TRENCH, AS WITH THE ANCHOR SLOT. OVERLAP THE UP-CHANNEL END OF THE PREVIOUS ROLL 18" AND TURN THE END OF THE PREVIOUS ROLL JUST BELOW THE ANCHOR SLOT, LEAVING 6" OVERLAP.



CHECK SLOTS: ON ERODIBLE SOILS OR STEEP SLOPES, CHECK SLOTS SHOULD BE MADE EVERY 15 FEET. INSERT A FOLD OF THE NET INTO A 6" TRENCH AND TRAMP FIRMLY. STAPLE AT 12" INTERVALS ACROSS THE NET. LAY THE NET SMOOTHLY ON THE SURFACE OF THE SOIL - DO NOT STRETCH THE NET, AND DO NOT ALLOW WRINKLES.

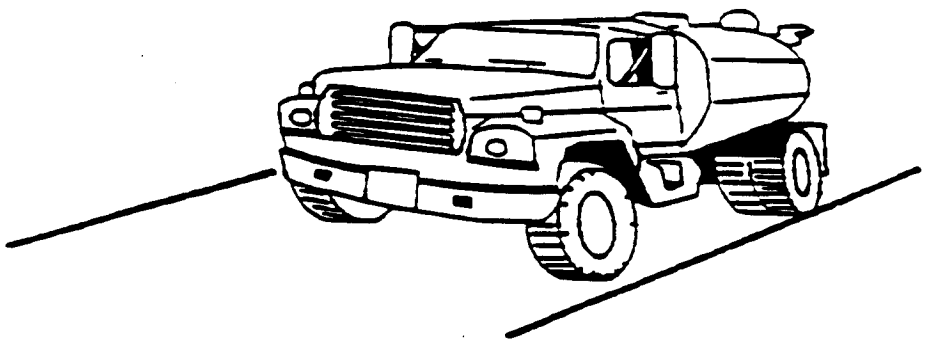


ANCHORING ENDS AT STRUCTURES:
PLACE THE END OF THE NET IN A 12" SLOT ON THE UP-CHANNEL SIDE OF THE STRUCTURE.
FILL THE TRENCH AND TAMP FIRMLY.
ROLL THE NET UP THE CHANNEL.
PLACE STAPLES AT 12" INTERVALS ALONG THE ANCHOR END OF THE NET.

INSTALLATION OF NETTING AND MATTING

ESC20

BMP: DUST CONTROLS



GENERAL DESCRIPTION

Dust control measures are used to stabilize soil from wind erosion, and reduce dust generated by construction activities.

SUITABLE APPLICATIONS

- Clearing and grading activities.
- Construction vehicle traffic on unpaved roads.
- Drilling and blasting activities.
- Sediment tracking onto paved roads.
- Soil and debris storage piles.
- Batch drop from front end loaders.
- Areas with unstabilized soil.
- Final grading/site stabilization usually is sufficient to control post-construction dust sources.

INSTALLATION/APPLICATION CRITERIA

- Schedule construction activities to minimize exposed area (See ESC 1).
- Quickly stabilize exposed soils using vegetation, mulching, spray-on adhesives, calcium chloride, sprinkling, and stone/gravel layering (See ESC 10 and 11).
- Identify and stabilize key access points prior to commencement of construction (See ESC 24).
- Minimizing the impact of dust by anticipating the direction of prevailing winds.
- Direct most construction traffic to stabilized roadways within the project site (See ESC 23).

REQUIREMENTS

- Maintenance
  - Most dust control measures require frequent, often daily, attention.
- Cost
  - Installation costs for water/chemical dust suppression are low, but annual costs may be quite high since these measures are effective for only a few hours to a few days.

LIMITATIONS

- Watering prevents dust only for a short period and should be applied daily (or more often) to be effective.
- Overwatering may cause erosion.
- Oil should not be used for dust control because the oil may migrate into drainageway and/or seep into the soil.
- Certain chemically-treated subgrades may make soil water repellant, increasing runoff.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Capital Costs

- ○ Suitability for Slopes >5%

● High ○ Low

ESC21

Best Management Practices

Additional Information — Dust Controls

In addition, there are many other BMPs identified in this handbook that provide dust control including:

- Seeding and Plantings (ESC 10)
- Mulching (ESC 11)
- Construction Road Stabilization (ESC 23)
- Stabilized Construction Entrances (ESC 24)

Limitations

- Oil treated subgrades should not be used because the oil may migrate into drainageways and/or seep into the soil.
- Chemically treated subgrades may make the soil water repellant, interfering with long-term infiltration, and the vegetation/re-vegetation of the site. Some chemical dust suppressants may be subject to freezing and may contain solvents and should be handled properly.
- Asphalt, as a mulch tack or chemical mulch, requires a 24 hour curing time to avoid adherence to equipment, worker shoes, etc. Application should be limited because asphalt surfacing may eventually migrate into the drainage system.
- In compacted areas, watering and other liquid dust control measures may wash sediment or other constituents into the drainage system.

ESC21

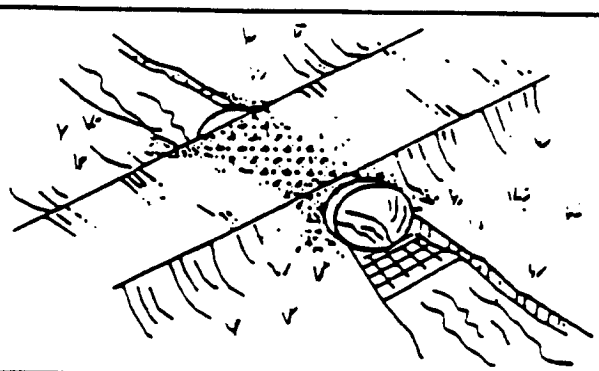
TABLE ESC 21.2 COMMONLY USED CHEMICALS FOR DUST CONTROL

	SALTS	ORGANIC, NON PETROLEUM-BASED	PETROLEUM BASED PRODUCTS[1]
CHEMICAL TYPES	• Calcium Chloride[2] • Magnesium Chloride • Natural Brines	• Calcium Lignosulfonate • Sodium Lignosulfonate • Ammonium Lignosulfonate	• Bunker Oil • Asphalt Primer • Emulsified Asphalt
LIMITATIONS	Can lose effectiveness in dry periods with low humidity. Leaches from road in heavy rain Not recommended for gravel road surfaces with low fines. Recommended 10-20% fines.	Not affected by dry weather and low humidity. Leached from road in heavy rain if not sufficiently cured. Best performance on gravel roads with high surface fines (10-30%) and dense compact surface with loose gravel.	Generally effective regardless of climatic conditions may pothole in wet weather. Best performance on gravel roads with 5-10% fines.
COMMENTS	Calcium Chloride is popular. May become slippery when wet on gravel surfaces with high fines.	Ineffective on gravel surfaces low in fines. May become slippery when wet on gravel surfaces with high fines content.	Creates a hardened crust.

[1] Motor oils and oil treatments are not recommended due to adverse effects on plant life and groundwater.

[2] Not recommended due to adverse effects on plant life.

BMP: TEMPORARY STREAM CROSSING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

A temporary access stream crossing is a temporary culvert, ford or bridge placed across a waterway to provide access for construction purposes for a period of less than one year. Temporary access crossings are not intended to be used to maintain traffic for the general public.

SUITABLE APPLICATIONS

Temporary stream crossings should be installed at all designated crossings of perennial and intermittent streams on the construction site, as well as for dry channels which may be significantly eroded by construction traffic.

INSTALLATION/APPLICATION CRITERIA

Requires knowledge of stream flows and soil strength and should be designed under the direction of a California registered engineer with knowledge of both hydraulics and construction loading requirements for structures.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each significant rainfall, including assessment of foundations.
  - Periodically remove silt from crossings.
  - Replace lost aggregate from inlets and outlets of culverts.
- Cost
  - CalTrans Construction Cost Index for temporary bridge crossing is $45-$95 per square feet.

LIMITATIONS

- May be an expensive for a temporary improvement.
- Requires other BMPs to minimize soil disturbance during installation and removal.
- Fords should only be used in dry weather.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ◒ Capital Costs
- ○ O&M Costs
- ◒ Maintenance
- ○ Training
- ○ Suitability for Slopes >5%

● High ○ Low

ESC22

Best Management Practices

Additional Information — Temporary Stream Crossing

- May be expensive temporary cost
- Increased soil disturbance upon installation and removal
- Temporary culverts need regular maintenance and can cause erosion if the culvert becomes clogged.
- A temporary ford offers little if any erosion control in flowing streams and can often make erosion worse. Fords should only be used in the dry season on dry streams.

Construction in waterways is subject to additional permit requirements. Contact the local municipal storm water agency for additional information.

ESC22

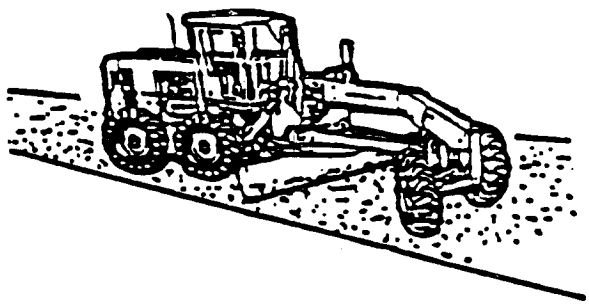
BMP: CONSTRUCTION ROAD STABILIZATION



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Access roads, subdivision roads, parking areas, and other on-site vehicle transportation routes should be stabilized immediately after grading and frequently maintained to prevent erosion and control dust.

SUITABLE APPLICATIONS

- Temporary construction traffic.
- Phased construction projects and off-site road access.
- Detour roads.
- Construction during wet weather.

INSTALLATION/APPLICATION CRITERIA

- Road should follow topographic contours to reduce erosion of the roadway.
- The roadway slope should not exceed 15 percent.
- Gravel roads should be a minimum 4-inch thick, 2-3 inch coarse aggregate base applied immediately after grading, or as recommended by soils engineer.
- Chemical stabilizers or water are usually required on gravel or dirt roads to prevent dust (see Dust Control ESC 21).

REQUIREMENTS

- Maintenance
  - Periodically apply additional aggregate on gravel roads.
  - Active dirt construction roads are commonly watered three or more times per day during the dry season.
  - Inspect weekly, and after each rain.
  - Repair any eroded areas immediately.
- Cost
  - Gravel construction roads are moderately expensive, but cost is often balanced by reductions in construction delay.
  - No additional costs for dust control on construction roads should be required above that needed to meet local air quality requirements.

LIMITATIONS

- The roadway must be removed or paved when construction is complete.
- Certain chemical stabilization methods may cause storm water or soil pollution and should not be used (see Dust Control ESC 21).
- Management of construction traffic is subject to air quality control measures. Contact the local air quality management agency.

Targeted Pollutants

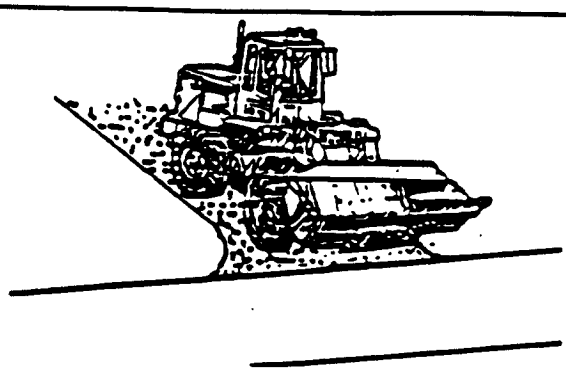
BMP: STABILIZED CONSTRUCTION ENTRANCE



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

The construction entrance practice is a stabilized pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right-of-way, street, alley, sidewalk or parking area. Stabalizing the construction entrance significantly reduces the amount of sediment (dust, mud) tracked off-site, especially if a washrack incorporated for removing caked on sediment.

SUITABLE APPLICATIONS

- All points of construction ingress and egress.
- Unpaved areas where sediment tracking occurs from site onto paved roads.

INSTALLATION/APPLICATION CRITERIA

- Construct on level ground where possible.
- Stones should be 1-3 inches.
- Minimum depth of stones should be 6 inches or as recommended by soils engineer.
- Length should be 50-foot minimum, and 30-foot minimum width.
- Provide ample turning radii as part of entrance.

REQUIREMENTS

- Maintenance
  - Inspect monthly and after each rainfall.
  - Replace gravel material when surface voids are visible.
  - Remove all sediment deposited on paved roadways within 24 hours.
  - Remove gravel and filter fabric at completion of construction
- Cost: Average annual cost for installation and maintenance (Source: EPA, 1992)
  - Without Wash Rock: $1500 each.
  - With Wash Rock: $2200 each.

LIMITATIONS

- Requires periodic top dressing with additional stones.
- Should be used in conjunction with street sweeping on adjacent public right-of-way.

Targeted Pollutants

- ◒ Sediment
- ◒ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

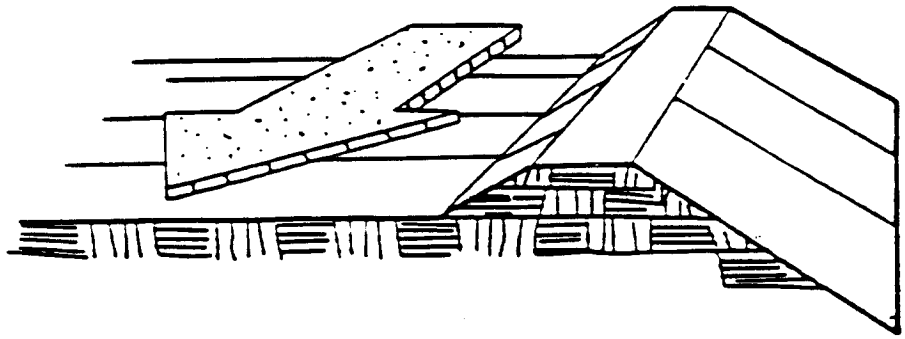
BMP: EARTH DIKE



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

The temporary earth dike is a temporary berm or ridge of compacted soil, used to divert runoff or channel water to a desired location.

SUITABLE APPLICATIONS

Earth dikes are typically used to divert concentrated runoff through disturbed areas into another BMP (e.g., sediment basins), to divert runoff away from disturbed or unstable slopes, to divert runoff from off-site and undisturbed areas around disturbed areas, and as a containment for construction materials and wastes. The dikes should remain in place until the disturbed areas are permanently stabilized. The dikes must be on-site and must safely convey anticipated flood flows.

INSTALLATION/APPLICATION CRITERIA

- All dikes should be compacted by earth-moving equipment.
- All dikes should have positive drainage to a stabilized outlet.
- Top width may be wider and side slopes may be flatter at crossings for construction traffic.
- Dikes should direct sediment-laden runoff into a sediment trapping device.
- Dikes should be stabilized with vegetation, chemicals, or physical devices.

REQUIREMENTS

- Maintenance
  - Inspect periodically and after every significant rainfall; repair as necessary.
- Cost
  - Cost ranges from $15 to $55 per foot for both earthwork and stabilization and depends on availability of material, site location, and access.

LIMITATIONS

Dikes should not be used for drainage areas greater than 10 acres, or along slopes greater than 10 percent. For larger areas more permanent drainage structures should be built. All drainage structures should be built in compliance with local municipal requirements.

- Earth dikes may create more disturbed area on site and become barriers to construction equipment.
- Earth dikes must be stabilized immediately, which adds cost and maintenance concerns.
- Diverted storm water may cause downstream flood damage.
- Dikes should not be constructed of soils which may be easily eroded.
- Regrading the site to remove the dike may add additional cost.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ◒ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

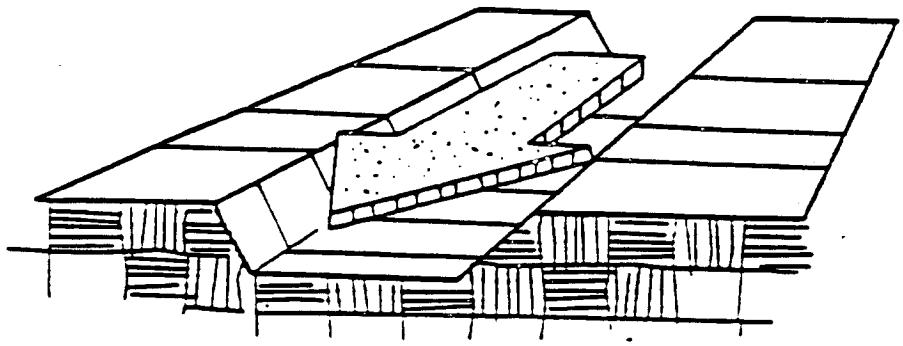
BMP: TEMPORARY DRAINS AND SWALES



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DESCRIPTION

Temporary drains and swales are used to divert off-site runoff around the construction site, divert runoff from stabilized areas around disturbed areas, and direct runoff into sediment basins or traps.

SUITABLE APPLICATIONS

Temporary drains and swales are appropriate for diverting any upslope runoff around unstabilized or disturbed areas of the construction site:

- Prevent slope failures.
- Prevent damage to adjacent property.
- Prevents erosion and transport of sediments into water ways.
- Increases the potential for infiltration.
- Diverts sediment-laden runoff into sediment basins or traps.

INSTALLATION/APPLICATION CRITERIA

Temporary drainage swales will effectively convey runoff and avoid erosion if built properly:

- Size temporary drainage swales using local drainage design criteria.
- A permanent drainage channel must be designed by a professional engineer (see the local drainage design criteria for proper design).
- At a minimum, the drain/swale should conform to predevelopment drainage patterns and capacities.
- Construct the drain/swale with an uninterrupted, positive grade to a stabilized outlet.
- Provide erosion protection or energy dissipation measures if the flow out of the drain or swale can reach an erosive velocity.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Repair any erosion immediately.
  - Remove sediment which builds up in the swale and restricts its flow capacity.
- Cost
  - The cost of a drainage swale increases with drainage area and slope. Typical. swales for controlling internal erosion are inexpensive.

LIMITATIONS

- Temporary drains and swales or any other diversion of runoff should not adversely impact upstream or downstream properties.
- Temporary drains and swales must conform to local floodplain management requirements.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

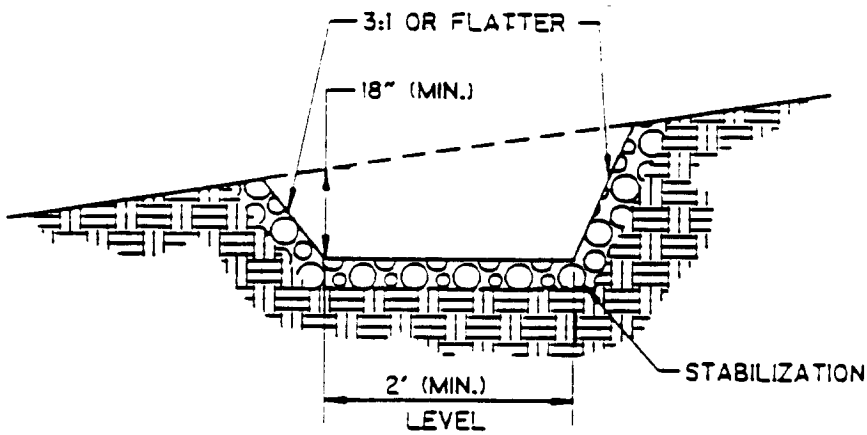
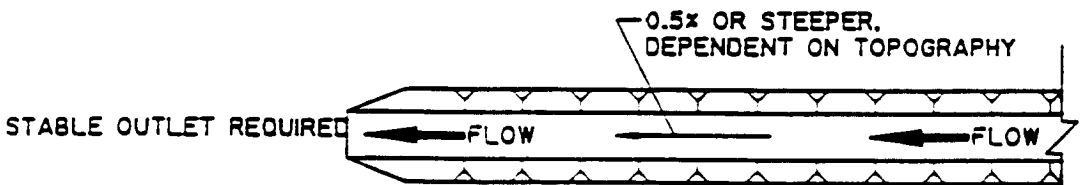
Best Management Practices



CROSS SECTION

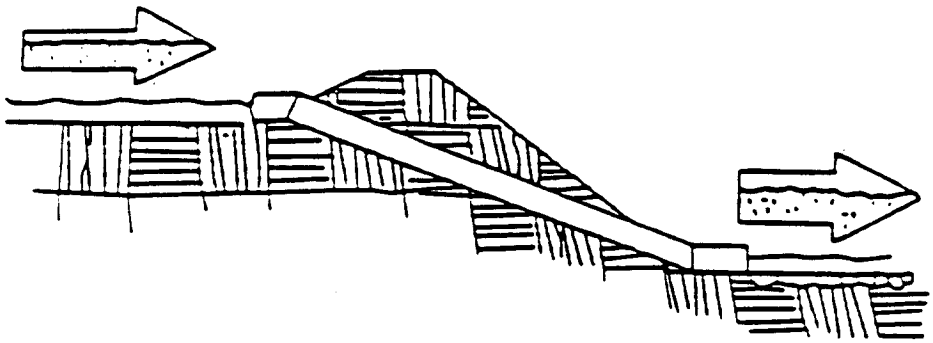


PLAN

TEMPORARY DRAINAGE SWALE

ESC31

BMP: SLOPE DRAIN



GENERAL DESCRIPTION

A temporary pipe or lined channel to drain the top of a slope to a stable discharge point at the bottom of a slope without causing erosion.

SUITABLE APPLICATIONS

- Where concentrated flow of surface runoff must be conveyed down a slope in order to prevent erosion.
- Drainage for top of slope diversion dikes or swales.
- Emergency spillway for a sediment basin.
- Drainage for top of cut/fill slopes where water can accumulate.

The types of slope drain can include:

- Pipe drops.
- Flexible downdrains.
- Sectional downdrains.
- Lined terrace drains.

INSTALLATION/APPLICATION CRITERIA

- Secure inlet and surround with dikes to prevent gully erosion. and anchor pipe to slope.
- Size to convey at least the peak of a 10-year, 24-hour storm (See local flood control agency for requirements).
- Stabilize outlet.

REQUIREMENTS

- Maintenance
  - Structure must be inspected regularly and after storms.
  - Inlet must be free of undercutting and no water should circumvent the entry.
  - Outlet should not produce erosion; velocity dissipators must be maintained.
  - Pipe anchors must be checked to ensure that the pipe remains anchored to the slope.
- Cost
  - CalTrans Cost Schedule gives regional cost ranges.

LIMITATIONS

- Maximum drainage area per slope drain is 5 acres. (For large areas use a paved chute, rock lined channel or additional pipes.)
- Clogged slope drains will force water around the pipe and cause slope erosion.
- Dissipation of high flow velocities at the pipe outlet is required to avoid downstream erosion.
- Failure can result in flooding and severe erosion.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

- ◒ Maintenance
- ○ Training
- ◒ Suitability for Slopes >5%

● High ○ Low

ESC32

Best Management Practices

Additional Information — Slope Drain

Design:
Unless specified by the local municipality, the capacity for temporary drains should be sufficient to handle the peak runoff from a 10-year, 24-hour rainfall event. The pipe size may be computed using the Rational Method or a method established by the local municipality. Higher flows must be safely stored or routed to prevent any offsite concentration of flow, and any erosion of the slope.

As a guide, temporary pipe slope drains should not be sized smaller than shown in the following table:

MINIMUM PIPE DIAMETER	MAXIMUM DRAINAGE AREA (ACRES)
12"	0.5
18"	1.5
21"	2.5
24"	3.5
30"	5.0

Permanent improvements must be designed and installed if the drainage area is greater than 5 acres.

The following additional design criteria should be considered:

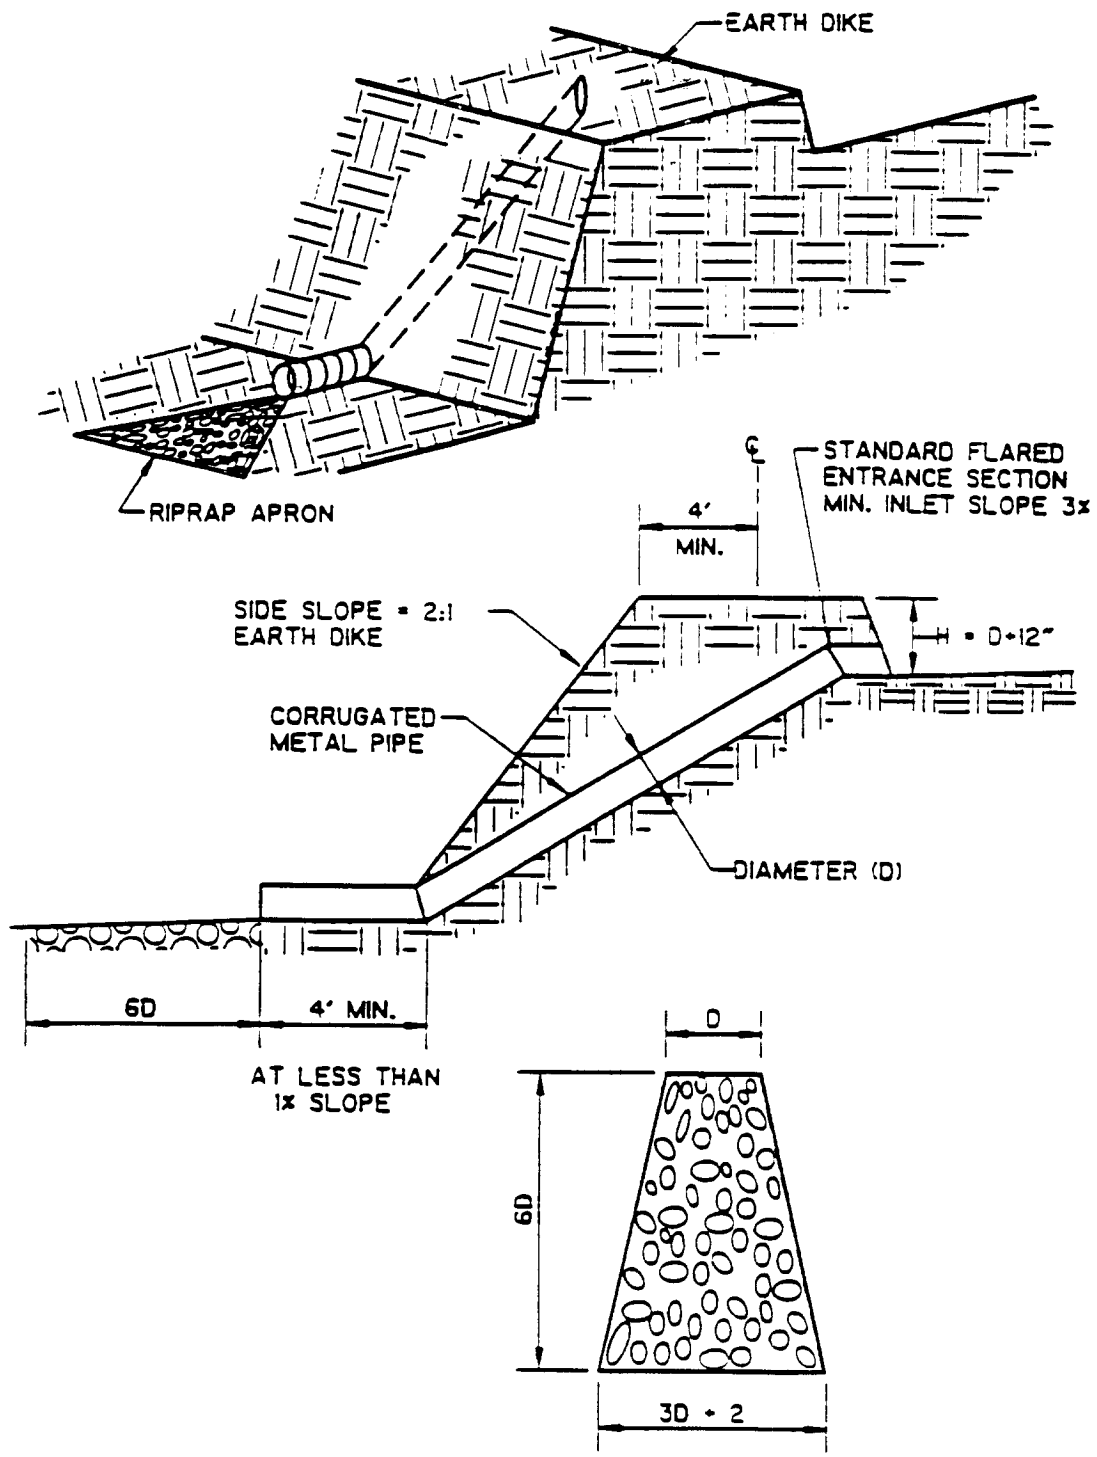
- Construct the pipe slope drain entrance of a standard flared end section with a minimum 6-inch metal toe plate to prevent runoff from undercutting the pipe inlet. The slope of the entrance is usually at least 3 percent.
- Thoroughly compact the soil around and under the pipe and entrance section.
- Securely fasten the slope drain sections together, have gasketed watertight fittings, and securely anchored into the soil.
- Secure the flared inlet section to the slope drain and have watertight connecting bands.
- Use interceptor dikes to direct runoff into a slope drain. The height of the dike should be at least 1 foot higher at all points than the top of the inlet pipe.
- If the pipe slope drain is conveying sediment-laden water, direct all flows into a sediment trap (ESC55) or sediment basin (ESC56).
- Unless the pipe directly enters a sediment trap/basin, stabilize the area below the outlet with a riprap apron.

Limitations
Installation is critical for effective use of the pipe slope drain to minimize potential gully erosion. Maximum drainage area per pipe slope drain is 5 acres. For larger areas use a paved chute, rock lined channel or additional pipes. (See the local municipality for drainage requirements)

- During large storms, pipe slope drains may become clogged or overcharged, forcing water around the pipe and causing extreme slope erosion.
- Structures for dissipation of high flow velocities at the pipe outlet must be constructed to avoid downstream erosion.
- Failure of this type of temporary structure may result in flooding and severe erosion.
- If the sectional downdrain is not sized correctly, the runoff can spill over the drain sides causing gully erosion, and potential failure of the structure.

ESC32

Additional Information — Slope Drain

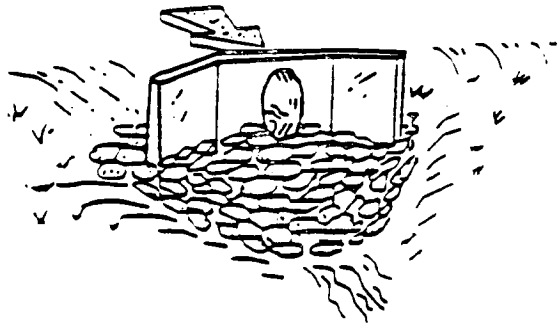


RIPRAP SHOULD CONSIST OF 6" DIAMETER STONE PLACED AS SHOWN AND SHOULD BE A MINIMUM OF 12" IN THICKNESS.

PIPE SLOPE DRAIN (RIGID)

ESC32

BMP: OUTLET PROTECTION



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas*
- *Protect Slopes/Channels* (●)
- *Control Site Perimeter*
- *Control Internal Erosion*

GENERAL DESCRIPTION

Rock outlet protection is a physical device composed of rock, grouted riprap, or concrete rubble which is placed at the outlet of a pipe to prevent scour of the soil caused by high pipe flow velocities, and to absorb flow energy to produce non-erosive velocities.

SUITABLE APPLICATIONS

- Wherever discharge velocities and energies at the outlets of culverts, conduits or channels are sufficient to erode the next downstream reach.
- Rock outlet protection is best suited for temporary use during construction because it is usually less expensive and easier to install than concrete aprons or energy dissipators.
- A sediment trap below the pipe outlet is recommended if runoff is sediment laden.
- Permanent rock riprap protection should be designed and sized by the engineer as part of the culvert, conduit or channel design.
- Grouted riprap should be avoided in areas of freeze and thaw because the grout will break up.

INSTALLATION/APPLICATION CRITERIA

Rock outlet protection is effective when the rock is sized and placed properly. When this is accomplished, rock outlets do much to limit erosion at pipe outlets. Rock size should be increased for high velocity flows. General recommendations for rock size and length of outlet protection mat are presented in the additional information sheet. Best results are obtained when sound, durable, angular rock is used. CalTrans Standard Specifications or the local municipality can provide additional specifications for constructing outlet protection devices.

REQUIREMENTS

- Maintenance
  - Inspect after each significant rain for erosion and/or disruption of the rock, and repair immediately.
  - Grouted or wire-ued rock riprap can minimize maintenance requirements.
- Cost
  - CalTrans Cost Schedule gives regional cost ranges.

LIMITATIONS

- Large storms often wash away the rock outlet protection and leave the area susceptible to erosion.
- Sediment captured by the rock outlet protection may be difficult to remove without removing the rock.
- Outlet protection may negatively impact the channel habitat.

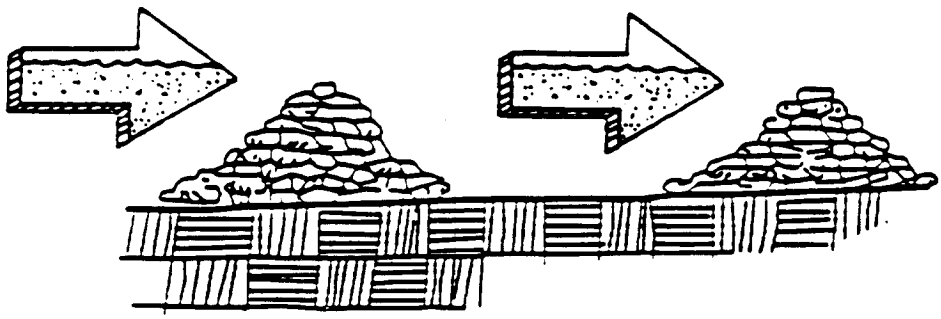
BMP: CHECK DAMS



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Small temporary dams constructed across a swale or drainage ditch. Check dams reduce the velocity of concentrated stormwater flows, thereby reducing erosion of the swale or ditch, and promoting sedimentation behind the dam. If properly anchored, brush or rock filter berms (ESC53) may be used for check dams.

SUITABLE APPLICATIONS

- Used to prevent erosion by reducing the velocity of channel flow in small intermittent channels and temporary swales.
- May also promote sedimentation behind the dam, but should not be considered to be a primary sediment trapping device because subsequent storms will scour and resuspend much of the trapped sediment.

INSTALLATION/APPLICATION CRITERIA

- Check dams should be placed at a distance and height to allow small pools to form between each one.
- Backwater from a downstream check dam should reach the toe of the upstream check dam.
- Major floods (2 year storm or larger) should safely flow over the check dam without an increase in upstream flooding or destruction of the checkdam.
- Primarily used in small, steep channels where velocities exceed 2 fps.
- Used in steep terrain where velocity reduction is required.
- A deep sump may be provided immediately upstream of the check dam to capture excessive sediment.
- Check dams may be built of rocks or logs, which are secured against damage during significant floods.

REQUIREMENTS

- Maintenance
  - Inspect for sediment buildup behind the check dam and signs of erosion around the check dam after each rain.
  - Remove accumulated sediment whenever it reaches one-half the sump depth.
- Cost
  - See CalTrans Cost Schedule for regional cost data.

LIMITATIONS

- Use only in small open channels which drain 10 acres of less.
- Not to be used in live streams.
- Do not install in lined or vegetated channels.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

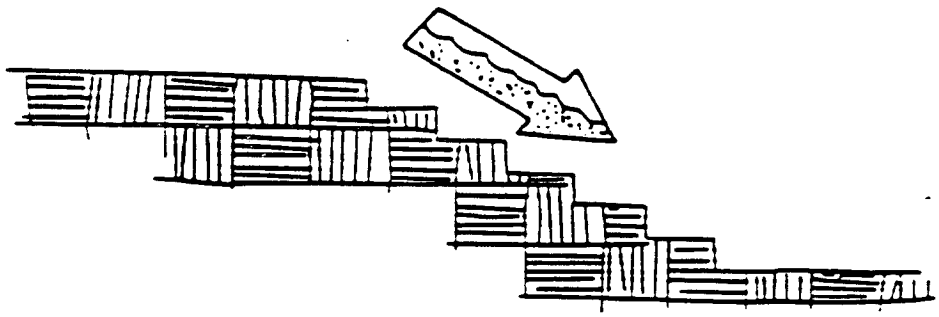
BMP: SLOPE ROUGHENING/TERRACING



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas** ●
- **Protect Slopes/Channels** ●
- Control Site Perimeter
- Control Internal Erosion

GENERAL DEFINITION

Slope roughening/terracing creates microclimates for establishing vegetation, reduces runoff velocity, increases infiltration, and provides small depressions for trapping sediment.

SUITABLE APPLICATIONS

- Any cleared area prior to seeding and planting.
- Required for cleared, erodible slopes steeper than 3:1 and higher than 5 feet prior to seeding and planting.

INSTALLATION/APPLICATION CRITERIA

Slope roughening/terracing is performed in several ways:

- Stair-step grading.
- Grooving.
- Furrowing.
- Tracking.
- Rough grading.
- No grading.

REQUIREMENTS

- Maintenance
  - Inspect roughened slopes weekly and after rainfall for excessive erosion.
  - Revegetate as quickly as possible.
- Cost (source: EPA, 1992)
  - Surface Roughening: Performed at no (e.g., rough grading) to low (e.g., tracking) cost.
  - Terracing: Average annual cost is $4 per linear foot (2 year useful life).

LIMITATIONS

- Roughening is of limited effectiveness on its own, but is used to speed revegetation.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials

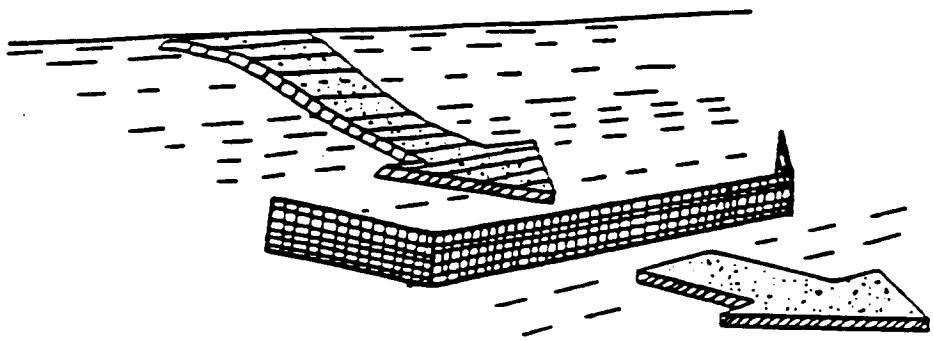
STAIR-STEPPING CUT SLOPES AND GROOVING SLOPES

BMP: SILT FENCE



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

A silt fence is made of a filter fabric which has been entrenched, attached to supporting poles, and sometimes backed by a wire fence for support. The silt fence detains sediment-laden water, promoting sedimentation behind the fence.

SUITABLE APPLICATIONS

- Along the perimeter of the site.
- Below the toe of a cleared slope.
- Along streams and channels.
- Around temporary spoil areas.
- Across swales with catchments less than 1 acre.
- Below other small cleared areas.

INSTALLATION/APPLICATION

- Use principally in areas where sheet flow occurs.
- Install along a level contour, so water does not pond more than 1.5 feet at any point.
- No more than 1 acre, 100 ft., or 0.5 cfs of concentrated flow should drain to any point along the silt fence.
- Turn ends of fence uphill.
- Provide area behind the fence for runoff to pond and sediment to settle (approx. 1200 sq. ft. per acre draining to the silt fence).
- Select filter fabric which retains 85% of the soil by weight, based on sieve analysis, but is not finer than an equivalent opening size of 70.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rainfall.
  - Repair wherever fence is damaged.
  - Remove sediment when it reaches 1/3 the height of the fence.
- Cost (source: EPA, 1992)
  - Average annual cost for installation and maintenance (assumes 6 month useful life): $7 per lineal foot ($850 per drainage acre)

LIMITATIONS

- Do not use where 85% of the soil, by weight, passes through a No. 200 sieve because the filter fabric will clog.
- Do not place fence on a slope, or across any contour line.
- Do not use in streams, channels, or anywhere flow has concentrated.
- Do not use in locations where ponded water may cause flooding.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

- ○ Training
- ○ Suitability for Slopes >5%

● High ○ Low

ESC50

Best Management Practices

Additional Information — Silt Fence

To reduce the chance of clogging, it is preferable to specify a fabric with openings as large as allowed by the criteria. No fabric should be specified with an EOS smaller than U.S. Standard Sieve No. 100 [0.0059 in. (0.15 mm.)]. If 85 percent or more of a soil, by weight, passes through the openings in a No. 200 sieve [0.0029 in. (0.074 mm.)], filter fabric should not be used. Most of the particles in such a soil would not be retained if the EOS was too large, and they would clog the fabric quickly if the EOS was small enough to capture the soil.

The fence should be supported by a wire mesh if the fabric selected does not have sufficient strength and bursting strength characteristics for the planned application (as recommended by the fabric manufacturer). Filter fabric material should contain ultraviolet ray inhibitors and stabilizers to provide a minimum of six months of expected usable construction life at a temperature range of 0° F. to 120° F.

Installation Guidelines:
Filter fences are to be constructed on a level contour. Sufficient area should exist behind the fence for ponding to occur without flooding or overtopping the fence.

- Posts should be spaced a maximum of 6 feet apart and driven securely into the ground a minimum of 30 inches.
- A trench should be excavated approximately 8 inches wide and 12 inches deep along the line of posts and upslope from the barrier.
- When standard strength filter fabric is used, a wire mesh support fence should be fastened securely to the upslope side of the posts using heavy-duty wire staples at least 1 inch long, tie wires or hog rings. The wire should extend into the trench a minimum of 4 inches.
- The standard strength filter fabric should be stapled or wired to the fence, and 40 inches of the fabric should extend into the trench. When extra-strength filter fabric and closer post spacing are used, the wire mesh support fence may be eliminated and the filter fabric stapled or wired directly to the posts.
- Avoid the use of joints. The filter fabric should be purchased in a continuous roll, then cut to the length of the barrier. When joints are necessary, filter cloth should be spliced together only at a support post, with a minimum 6 inch overlap, and both ends securely fastened to the post.
- The trench should be backfilled with compacted native material.

Requirements
Maintenance:

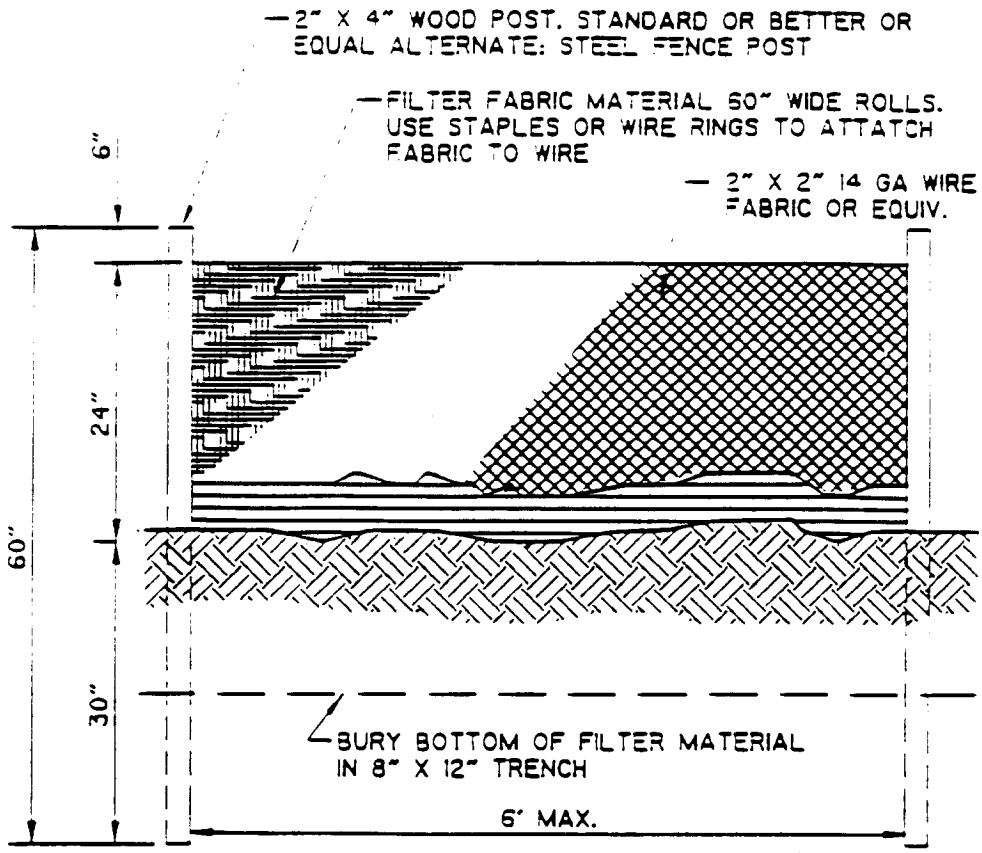
Inspect monthly during dry periods and immediately after each rainfall. Repair as necessary. Sediment must be removed when it reaches approximately one third the height of the fence, especially if heavy rains are expected.

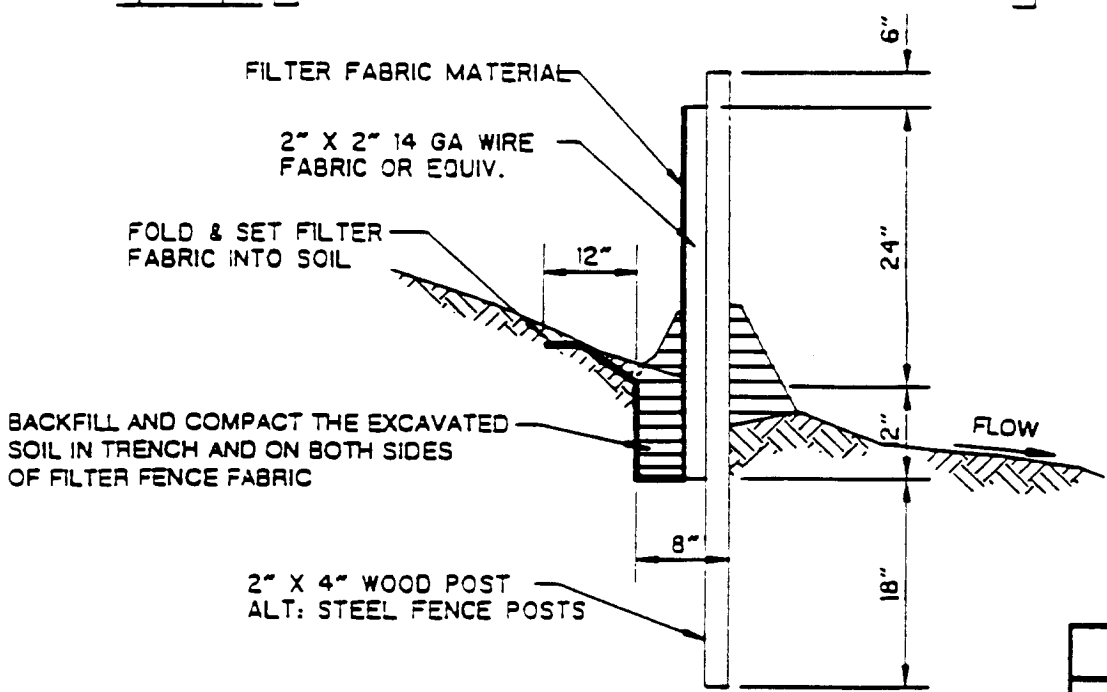
Filter fences should not be removed until the upslope area has been permanently stabilized.

Limitations
- Filter fences will create a temporary sedimentation pond on the upstream side of the fence and may cause temporary flooding. Fences not constructed on a level contour will be overtopped by concentrated flow resulting in failure of the filter fence.
- Filter fences are not practical where large flows of water are involved, hence the need to restrict their use to drainage areas of one acre or less, and flow rates of less than 0.5 cfs.
- Problems may arise from incorrect selection of pore size and/or improper installation.
- Do not allow water depth to exceed 1.5 ft. at any point.
- Improperly installed fences are subject to failure from undercutting, overlapping, or collapsing.

ESC50

Additional Information — Silt Fence





SILT FENCE

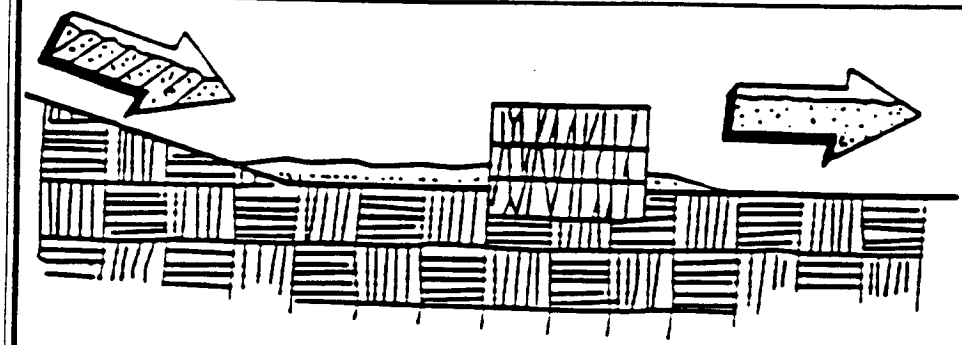
R0001019

BMP: STRAW BALE BARRIERS



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DEFINITION

A straw bale barrier consists of straw bales placed end to end along a level contour in a shallow trench and staked to hold them in place. The barrier detains runoff, creating a pond behind the barrier where sedimentation occurs.

SUITABLE APPLICATIONS

- Along the perimeter of the site.
- Along streams and channels.
- Across swales with small catchments.
- Around temporary spoil areas.
- Below other small, cleared areas.

INSTALLATION/APPLICATION CRITERIA

- Use primarily in areas where sheet or rill flow occurs.
- No more than 1/4 acre per 100 feet of barrier should drain to the barrier.
- Install along a level contour.
- Place in a 4-inch deep trench.
- Backfill and compact the excavated soil on the upstream face of the barrier.
- Secure each bale with two stakes.
- Leave enough area (about 1200 sq. ft. per acre) behind the barrier for runoff to pond (no more than 1.5 ft. depth) and sediment to settle.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Replace bales which have decomposed or whose bindings have broken.
  - Remove sediment behind the barrier when it reaches a depth of 6 inches.
- Costs (source: EPA, 1992)
  - Average annual cost for installation and maintenance (assumes 3 month useful life): $17 per lineal foot ($6,800 per drainage acre).

LIMITATIONS

- Straw bale barriers are not to be used for extended periods of time because they tend to rot and fall apart.
- Suitable only for sheet flow on slopes of 2% or flatter.
- Not appropriate for large drainage areas, limit to one acre or less.
- Straw bales lose their effectiveness rapidly due to rotting, thus constant maintenance is required.
- Not recommended for concentrated flow, inlet protection, channel flow, and live streams.
- Bale bindings of jute or cotton not recommended.

Best Management Practices

Additional Information — Straw Bale Barrier

A straw bale barrier consists of a series of secured anchored bales placed to intercept sediment-laden runoff from small drainage areas of disturbed soil. The barrier ponds runoff and allow sediment to settle. Straw bale dikes should not be used for extended periods of time because they tend to rot and fall apart.

The straw bale barrier is used where there are no concentrations of water in a channel or drainageway, and where erosion would occur from sheet flow. These barriers are typically constructed below disturbed areas subject to sheet flow of runoff.

Installation/Application

Straw bale barriers should be used for drainage areas no more than 1/4 acre per 100 feet of barrier length, with no more than 100 ft upstream of any point along the barrier. The barrier should be placed along a level contour no greater than 2:1. When installed and maintained according to the guidelines on this fact sheet, straw bale dikes remove approximately 67% of the sediment transported in construction site runoff. This optimum efficiency can only be achieved through careful maintenance, with special attention to replacing rotted or broken bales. The barrier should be constructed on a level contour to prevent concentration of flow against a small portion of the barrier.

An effective straw bale barrier should be installed in the following manner:

1. Bales should be placed on the contour and in a row with ends tightly abutting the adjacent bales.
2. Leave area for runoff to pond upstream of the barrier by locating barrier away from the toe of slopes. This also provides access for maintenance.
3. Each bale should be embedded in the soil a minimum of (4) inches and placed so the bindings are horizontal. Bindings placed on soil will soon disintegrate and cause the barrier to fail.
4. Bales should be securely anchored in place by either two stakes or re-bars driven through the bale. The first stake in each bale should be driven toward the previously laid bale at an angle to force the bales together. Stakes should be driven flush with the bale.
5. Backfill and compact the excavated soil along the upstream face of the barrier.
6. Remove the barrier when it has served its usefulness so as not to block or impede storm flow or drainage.

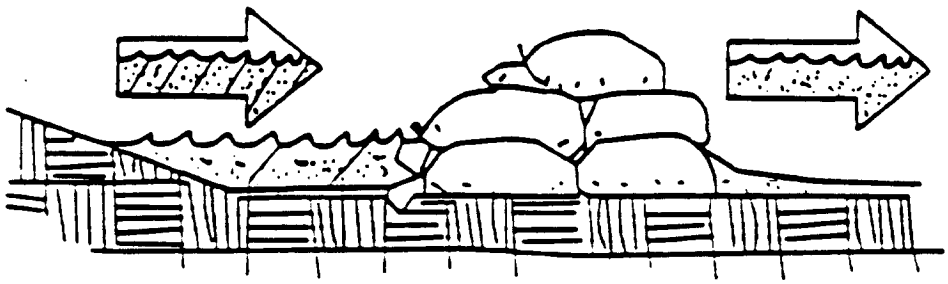
BMP: SAND BAG BARRIER



GENERAL DEFINITION

Stacking sand bags along a level contour creates a barrier which detains sediment-laden water, ponding water upstream of the barrier and promoting sedimentation.

SUITABLE APPLICATIONS

- Along the perimeter of the site.
- Check dams across streams and channels.
- Along streams and channels.
- Barrier for utility trenches in a channel.
- Across swales with small catchments.
- Division dike or berm.
- Below the toe of a cleared slope.
- Create a temporary sediment trap.
- Around temporary spoil areas.
- Below other small cleared areas.

INSTALLATION/APPLICATION CRITERIA

- May be used in drainage areas up to 5 acres.
- Install along a level contour.
- Base of sand bag barrier should be at least 48 inches wide.
- Height of sand bag barrier should be at least 18 inches high.
- 4 inch PVC pipe may be installed between the top layer of sand bags to drain large flood flows.
- Provide area behind barrier for runoff to pond and sediment to settle. size according to sediment trap BMP criteria (ESC55).
- Place below the toe of a slope.
- Use sand bags large enough and sturdy enough to withstand major flooding.

REQUIREMENTS

- Maintenance
  - Inspect after each rain.
  - Reshape or replace damaged sand bags immediately.
  - Remove sediment when it reaches six inches in depth.
- Cost
  - Sand bag barriers are more costly, but typically have a longer useful life than other barriers.

LIMITATIONS

- Sand bags are more expensive than other barriers, but also more durable.
- Burlap should not be used for sand bags.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- **Control Internal Erosion**

Targeted Pollutants

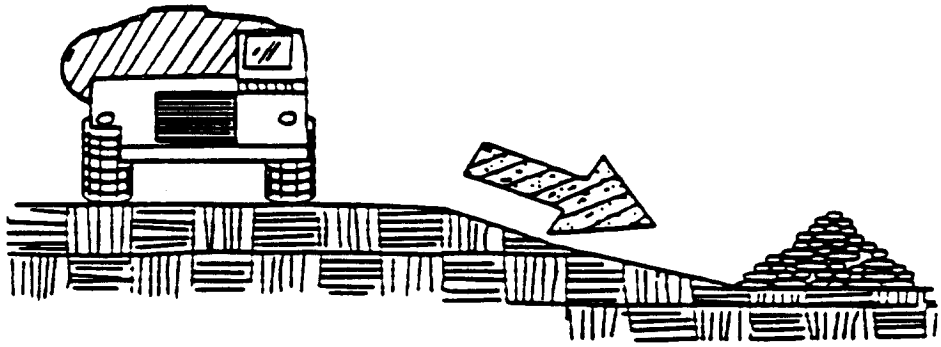
BMP: BRUSH OR ROCK FILTER



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas*
- *Protect Slopes/Channels* (●)
- *Control Site Perimeter* (●)
- *Control Internal Erosion* (●)

GENERAL DEFINITION

A rock filter berm is made of rock 3/4 to 3 inches in diameter and placed along a level contour where sheet flow may be detained and ponded, promoting sedimentation. A brush barrier is composed of brush (usually obtained during the site clearing) wrapped in filter cloth and anchored to the toe of the slope. If properly anchored brush or rock filters may be used for sediment trapping and velocity reduction. See Check Dam BMP (ESC41) for more information.

SUITABLE APPLICATIONS

- As check dams across mildly sloped construction roads.
- Below the toe of slopes.
- Along the site perimeter.
- Along streams and channels.
- Around temporary spoil areas.
- Below other small cleared areas.
- At sediment traps at culvert/pipe outlets.

INSTALLATION/APPLICATION CRITERIA

- Use principally in areas where sheet or rill flow occurs.
- For rock filter, use larger rock and place in a staked, woven wire sheathing if placed where concentrated flows occur.
- Install along a level contour.
- Leave area behind berm where runoff can pond and sediment can settle.
- Drainage area should not exceed 5 acres.

REQUIREMENTS

- Maintenance
  - Inspect monthly and after each rainfall.
  - If berm damaged, reshape and replace lost/dislodged rock.
  - Remove sediments when depth reaches 1/3 of berm height, or 1 ft.
- Cost
  - Brush filter: Low to moderate cost if debris from on-site clearing and grubbing is used.
  - Rock filter: Expensive, since off-site materials, hand construction and demolition/ removal are usually required.

Targeted Pollutants

- ● *Sediment*
- ○ *Nutrients*

ESC53

Best Management Practices

Additional Information — Brush or Rock Filter

Rock Filter

A rock filter consists of open graded rock installed at the toe of a slope, along the perimeter of a developing or disturbed area, and as a checkdam across construction roads. Their purpose is to intercept sediment laden runoff from disturbed areas of the site, allow the runoff to pond, promote sedimentation behind the filter, and slowly release the water as sheet flow.

Rock filters are appropriate where a temporary measure is needed to prevent sediments from entering right-of-ways of traffic areas such as near the toe of slopes, incorporated into temporary stabilized construction entrances (ESC 26), or at other locations along the construction site perimeter. Rock filters may also be used as check dams across one or more lanes of construction traffic temporary roads, or unsurfaced rights of way subject to construction traffic.

Advantages of the rock filters are that they may be less costly than other temporary barriers, and are relatively efficient at sediment removal.

Installation/Application:

Planning:

- Rock filters should be placed along a level contour to intercept sheet flow.
- Allow ample room for ponding, sedimentation, and access by sediment removal equipment between the berm and the toes of slopes.
- Flow through the filter should occur as sheet flow into an undisturbed or stabilized area.
- Installation in stream beds requires large rock, staking of woven wire sheathing, and daily inspection.

Design & Sizing Criteria:

The following design criteria are commonly used to construct filters:

- In Non-Traffic Areas:
  - Maximum flow-through rate per square foot of filter = 60 gpm
  - Height = 18 inches minimum
  - Top width = 24 inches minimum
  - Side slopes = 2:1 or flatter
  - Woven wire sheathing (poultry netting) is recommended in areas of concentrated flow. The wire should be 1 inch diameter hexagonal mesh, galvanized 20 gauge.
  - Build the filter along on a level contour.
  - Rock: 3/4 to 3 inches open graded for sheet flow, 3 to 5 inches open graded for concentrated flow.

- In Construction Traffic Areas:
  - Height = 12" maximum
  - Provide multiple filters in series, spaced as shown.
    Every 300 ft on slopes less than 5 percent
    Every 200 ft on slopes 5 to 10 percent
    Every 100 ft on slopes greater than 10 percent.

Brush Filter

Brush filters trap and filter sediments in a manner similar to other barriers in this handbook (e.g., silt fence, straw bale barrier, rock filter), but have the advantage of being constructed from brush cleared from the site and usually disposed off-site at a cost.

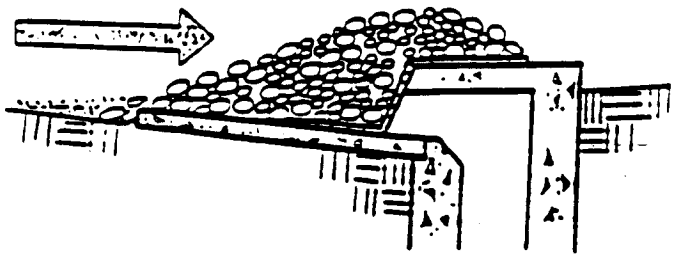
BMP: STORM DRAIN INLET PROTECTION



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DEFINITION

Devices of various designs which detain sediment-laden runoff and allow the sediment it to settle prior to discharge into a storm drain inlet or catch basin.

SUITABLE APPLICATIONS

- Every storm drain inlet receiving sediment-laden runoff should be protected, either by covering the inlet or promoting sedimentation upstream of the inlet.

INSTALLATION/APPLICATION

- Five types of inlet protection are presented below, however, it is recognized that other effective methods and proprietary device, exist and may be selected:
  - Filter Fabric Fence: Appropriate for drainage basins less than one acre with less than a 5 percent slope.
  - Block and Gravel Filter: Appropriate for flows greater than 0.5 cfs.
  - Gravel and Wire Mesh Filter: Used on curb or drop inlets where construction equipment may drive over the inlet.
  - Sand bag barrier: Used to create a small sediment trap upstream of inlets on sloped, paved streets.
  - Excavated Drop Inlet Sediment Trap: An excavated area around the inlet to trap sediment (see Sediment Trap ESC 55).
- Select the appropriate type of inlet protection and design as referred to or as described in this fact sheet.
- Use only for drainage areas smaller than one acre unless a sediment trap first intercepts the runoff.
- Provide area around the inlet for water to pond without flooding structures and property.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Replace clogged filter fabric or stone filters immediately.
  - Remove sediment when depth exceeds half the height of the filter, or half the depth of the sediment trap.
  - Remove as soon as upstream soils are stabilized and streets are swept.
- Cost (source: EPA, 1992)
  - Average annual cost for installation and maintenance (1 year useful life) is $150 per inlet.

Targeted Pollutants

ESC54

Best Management Practices

Additional Information — Storm Drain Inlet Protection

Storm drain inlet protection consists of a sediment filter or an impounding area around or upstream of a storm drain, drop inlet, or curb inlet. This erosion and sedimentation control BMP prevents excessive sediment from entering storm drainage systems prior to permanent stabilization of the disturbed area.

All on-site storm drain inlets should be protected. Off-site, inlets should be protected in areas where construction activity tracks sediment onto paved areas or where inlets receive runoff from disturbed areas.

Installation/Application Criteria

Planning

Large amounts of sediment may enter the storm drain system when storm drains are installed before the upslope drainage area is stabilized, or where construction is adjacent to an existing storm drain. In cases of extreme sediment loading, the storm drain itself may clog and lose a major portion of its capacity. To avoid these problems, it is necessary to prevent sediment from entering the system at the inlets.

Inlet control measures presented in this handbook should not be used for inlets draining more than one acre. Runoff from larger disturbed areas should be first routed through a Temporary Sediment Trap (see ESC 56). Different types of inlet protection are appropriate for different applications depending on site conditions and the type of inlet. Inlet protection methods not presented in this handbook should be approved by the local storm water management agency.

General Design and sizing criteria:

- Grates and spaces around all inlets should be sealed to prevent seepage of sediment-laden water.
- Excavate sediment sumps (where needed) 1 to 2 feet with 2:1 side slopes around the inlet.

Installation procedures for filter fabric fence:

a. Place 2 inch by 2 inch wooden stakes around the perimeter of the inlet a maximum of 3 feet apart and drive them at least 8 inches into the ground. The stakes must be at least 3 feet long.
b. Excavate a trench approximately 8 inches wide and 12 inches deep around the outside perimeter of the stakes.
c. Staple the filter fabric (for materials and specifications, see Silt Fence ESC 50) to wooden stakes so that 32 inches of the fabric extends out and can be formed into the trench. Use heavy-duty wire staples at least one inch in length.
d. Backfill the trench with 3/4 inch or less washed gravel all the way around.

Installation procedure for block and gravel filter:

a. Place hardware cloth or comparable wire mesh with one-half inch openings over the drop inlet so that the wire extends a minimum of 1 foot beyond each side of the inlet structure. If more than one strip is necessary, overlap the strips. Place filter fabric over the wire mesh.
b. Place concrete blocks lengthwise on their sides in a single row around the perimeter of the inlet, so that the open ends face outward, not upward. The ends of adjacent blocks should abut. The height of the barrier can be varied, depending on design needs, by stacking combinations of blocks that are 4 inches, 8 inches, and 12 inches wide. The row of blocks should be at least 12 inches but no greater than 24 inches high.
c. Place wire mesh over the outside vertical face (open end) of the concrete blocks to prevent stone from being washed through the blocks. Use hardware cloth or comparable wire mesh with one half inch openings.
d. Pile washed stone against the wire mesh to the top of the blocks. Use 3/4 to 3 inch gravel.

Installation procedure for gravel and wire mesh filters:

a. Place wire mesh over the drop inlet so that the wire extends a minimum of 1 foot beyond each side of the inlet structure. Use hardware cloth or comparable wire mesh with one-half inch openings. If more than one strip of mesh is necessary, overlap the strips. Place filter fabric over wire mesh.

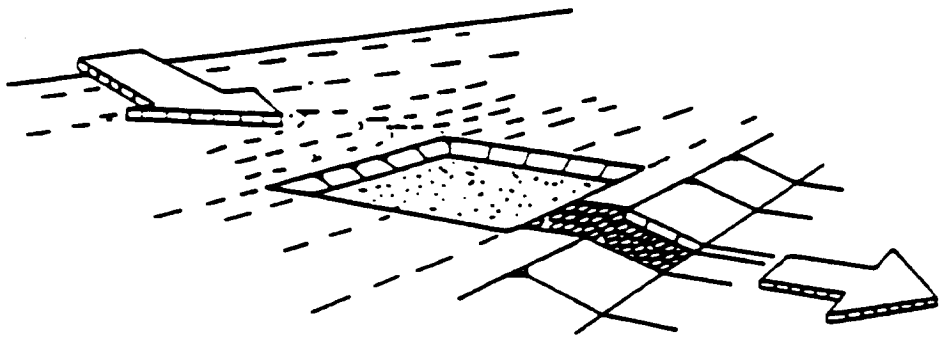
EXCAVATED DROP INLET SEDIMENT TRAP

ESC54

BMP: SEDIMENT TRAP



Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabalize Disturbed Areas*
- *Protect Slopes/Channels*
- *Control Site Perimeter*
- *Control Internal Erosion*

GENERAL DEFINITION

A sediment trap is a small, excavated or bermed area where runoff from small drainage areas is detained and sediment can settle.

SUITABLE APPLICATIONS

- Any disturbed area less than 5 acres. (Sediment Basins, ESC56, must be used for drainage areas greater than 5 acres).
- Along the perimeter of the site at locations where sediment-laden runoff is discharged off-site.
- Around and/or upslope from storm drain inlet protection measures.
- At any point within the site where sediment-laden runoff can enter stabilized or natural areas or waterways.

INSTALLATION/APPLICATION CRITERIA

- Build outside the area to be graded before clearing, grubbing, and grading begin.
- Locate where the trap can be easily cleared of sediment.
- Trap size depends on the type of soil, size of the drainage area, and desired sediment removal efficiency.
- The larger the trap, the less frequently sediment must be removed.
- The outlet of the trap must be stabilized with rock, vegetation, or another suitable material.
- A stable emergency spillway must be installed to safely convey major floods (see your local flood control agency).

REQUIREMENTS

- Maintenance
  - Remove sediment when the sediment storage zone is no more than 1 ft. from being full.
  - Inspect weekly and after each rain.
- Cost (source: EPA, 1992)
  - Average annual cost per installation and maintenance (18 month useful life) is $0.70 per $ft.^3$ ($1,300 per drainage acre).

LIMITATIONS

- Only use for drainage areas up to 5 acres (see Sedimentation Basin BMP ST8 for larger areas).
- Only removes coarse sediment (medium silt size and larger) unless sized like a sedimentation basin.

Targeted Pollutants

- ● *Sediment*
- ○ *Nutrients*

ESC 55

Best Management Practices

Additional Information — Sediment Trap

3. The trap is removed and the area stabilized when the upslope drainage area has been properly stabilized.
4. All cut-and-fill slopes should be 3:1 or flatter.
5. When a riser is used, all pipe joints must be watertight.
6. When a riser is used, at least the top two-thirds of the riser shall be perforated with 1/2-inch diameter holes spaced 8 inches vertically and 10 to 12 inches horizontally. (See Sediment Basin, ESC56)
7. When an earth or stone outlet is used, the outlet crest elevation should be at least 1 foot below the top of the embankment.
8. When a crushed stone outlet is used, the crushed stone used in the outlet should meet AASHTO M43, size No. 2 or 24, or its equivalent such as MSHA No. 2. Gravel meeting the above gradation may be used if crushed stone is not available.

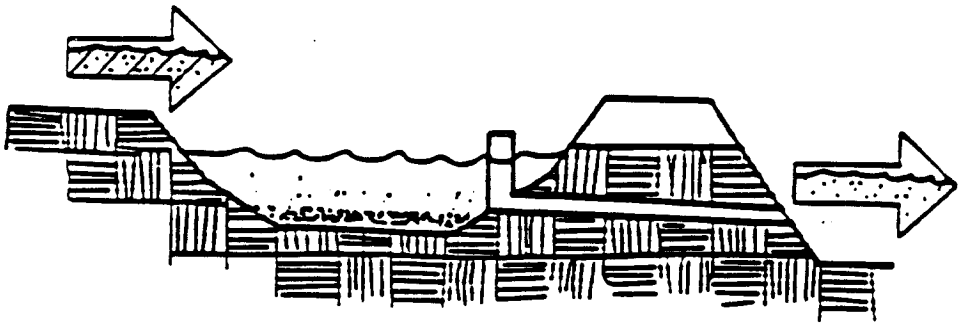
ESC55

BMP: SEDIMENT BASIN



Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabalize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- **Control Internal Erosion**

GENERAL DEFINITION

A pond created by excavation or constructing an embankment, and designed to retain or detain runoff sufficiently to allow excessive sediment to settle.

SUITABLE APPLICATIONS

- At the outlet of all disturbed watershed 10 acres or larger.
- At the outlet of smaller disturbed watersheds, as necessary.
- Where post construction detention basins will be located.
- Should be used in association with dikes, temporary channels, and pipes used to divert disturbed areas into the basin and undisturbed areas around the basin.

INSTALLATION/APPLICATION

- Construct before clearing and grading work begins.
- Do not locate in a stream.
- All basin sites should be located where failure of the embankment would not cause loss of life/property damage.
- Large basins are subject to state/local dam safety requirements.
- Securely anchor and install an anti-seep collar on the outlet pipe/riser, and provide an emergency spillway for passing major floods (see local flood control agency).
- The basin volume should be sized to capture runoff from a 2-year, 24-hour storm, or other appropriate design storms specified by the local agency. A detention time of 24 to 40 hours should allow 70 to 80 percent of sediment to settle.
- The basin volume consists of two zones:
  - A sediment storage zone at least 1 foot deep.
  - A settling zone at least 2 feet deep.
- The length to settling depth ratio (L/SD) should be less than 200.
- The length to width ratio should be greater than 6:1, or baffles are required to prevent short circuiting.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Remove sediment where the sediment storage zone is half full.
- Cost: Average annual cost for installation and maintenance (2 year useful life, source: EPA, 1992)
  - Basin less than 50,000 $ft.^3$: $0.40 per $ft.^3$ ($700 per drainage acre)
  - Basin size greater than 50,000 $ft.^3$: $0.20 per $ft.^3$ ($350 per drainage acre)

ESC56

Best Management Practices

Additional Information — Sediment Basin

A sediment basin is a controlled storm water release structure formed by excavation or by constructing an embankment of compacted soil across a drainageway, or other suitable location. Its purpose is to collect and store sediment from sites cleared and/or graded during construction or for extended periods of time before reestablishment of permanent vegetation and/or construction of permanent drainage structures. It is intended to trap sediment before it leaves the construction site. The basin is a temporary measure (with a design life of 12 to 18 months) and is to be maintained until the site area is permanently protected against erosion or a permanent detention basin is constructed.

Sedimentation basins are suitable for nearly all types of construction projects. Whenever possible, construct the sedimentation basins before clearing and grading work begins.
Basins should be located at the stormwater outlet from the site, but not in any natural or undisturbed stream. A typical application would include temporary dikes, pipes, and/or channels to divert runoff to the basin inlet.

Many development projects in California will be required by local ordinances to provide a storm water detention basin for post-construction flood control, desiltation, or storm water pollution control. A temporary sediment basin may be constructed by rough grading the post-construction control basins early in the project.

Sediment basins trap 70-80 percent of the sediment which flows into them if designed according to this handbook. Therefore, they should be used in conjunction with erosion control practices such as temporary seeding, mulching, diversion dikes, etc., to reduce the amount of sediment flowing into the basin.

Installation/Application Criteria
Planning:
To improve the effectiveness of the basin, it should be located to intercept runoff from the largest possible amount of disturbed area. The best locations are generally low areas below disturbed areas. Drainage into the basin can be improved by the use of diversion dikes and ditches. The basin must not be located in a stream but should be located to trap sediment-laden runoff before it enters the stream. The basin should not be located where its failure would result in the loss of life or interruption of the use or service of public utilities or roads.

Design:
- The sedimentation basin volume consists of two zones:
  - The sediment storage zone (at least 1 foot in depth).
  - A settling zone at least 2 feet in depth.
- The sedimentation basin may be formed by partial excavation and/or by construction of a compacted embankment. It may have one or more inflow points.
- A securely anchored riser pipe with an anti-seep collar is the principal outlet, along with an emergency overflow spillway. A solid riser pipe with two 1-inch diameter dewatering holes located at the top of the sediment storage volume on opposite sides of the riser pipe usually provides sufficient detention time for basins draining about 10 acres. Rock, rip-rap, or other suitable outlet protection is provided to reduce erosion at the riser pipe outlet.
- Settling Zone Volume

ES.1 OVERVIEW

On July 15, 1996, the Los Angeles Regional Water Quality Control Board (Regional Board) issued a municipal stormwater National Pollutant Discharge Elimination System (NPDES) permit (Permit) to the County of Los Angeles and 85 cities (Permittees). This Permit contains a requirement for Permittees to develop and implement within their jurisdiction a Storm Water Management Program (SWMP). The Countywide Storm Water Management Plan (CSWMP) is the unified plan consisting of model programs developed under the Storm Water Management Program requirements as established by the Permit. These model programs are aimed to reduce pollutant discharges to the maximum extent practicable for attaining water quality objectives and protecting beneficial uses of receiving waters in Los Angeles County.

In the 2001 NPDES permit, the CSWMP has been renamed to the Stormwater Quality Management Plan (SQMP). For the remainder of this document, the acronym SQMP is used.

The Permit required the Permittees to develop a model program to address each of the following:

- Illicit Connections and Illicit Discharges,
- Development Planning,
- Development Construction,
- Public Agency Activities, and
- Public Information and Participation

Each model program is a "stand-alone" document that describes one of these five elements of the SQMP. Record-keeping and reporting requirements are also associated with each model program. This Executive Summary describes the primary requirements of each of the model programs comprising the SQMP. The remainder of this document is the SQMP element referred to as the Public Agency Activities Program, which was approved by the Regional Board in July 1998.

ES.2 MODEL ILLICIT CONNECTIONS / ILLICIT DISCHARGE ELIMINATION PROGRAM

Part 2.II of the Permit contains requirements specifically for the identification and elimination of illicit connections and illicit discharges to the municipal separate storm sewer system (MS4), generally referred to in this document as "storm drain system." The Permit requirements include

five components for the elimination of illicit connections and illicit discharges. Those five components are:

- Illicit connection elimination,
- Illicit discharge elimination,
- Best management practices (BMPs) program for designated non-stormwater discharges,
- Public reporting of illicit discharge and disposal practices, and
- Hazardous waste reporting program.

Illicit Connection Elimination

The goal of this component is to detect and eliminate illicit connections in order to reduce pollutants discharged through such connections to the maximum extent practical. The objectives are to:

- Conduct storm drain system field screening for illicit connections during scheduled infrastructure maintenance by maintenance personnel.
- Determine the source and nature of suspected illicit discharges by investigating connections to the storm drain system.

The model program also describes a methodology that Permittees may use in prioritizing areas of their jurisdiction for investigation. Once the illicit connection/discharge has been investigated, one of the following actions must occur:

- If the discharge is determined to consist only of exempted non-stormwater, the connection will be allowed to remain and will no longer be considered an illicit connection. Permittees may elect to issue a permit for the connection or allow the connection to remain if information on the connection is documented; or
- The discharger will be required to obtain an NPDES permit; or
- The connection will be terminated through voluntary action or enforcement proceedings.

Permittees may prioritize potential problem areas for detection and investigation efforts under this program component, using the methodology defined in this model program.

Illicit Discharge Elimination

The goal of this component is to detect and eliminate illicit discharges from entering the storm drain system to reduce pollutants from such discharge to the maximum extent practicable. The objectives are to:

- Investigate, contain, and clean up incidental spills reported by the public, other agencies or observed by Permittee field staff during the course of their normal daily activities,
- Eliminate through voluntary termination or enforcement action prohibited non-stormwater discharges to the storm drain system, and
- Investigate to determine the nature and source of the discharge and eliminate through voluntary termination or enforcement action suspected prohibited non-storm discharges in the storm drain system.

BMPs for Designated Non-Stormwater Discharges

The Permit required the City of Los Angeles to conduct a study on pollutants entering storm drains from street and sidewalk washing operation to:

(i.) Characterize discharges from municipal street washing and sidewalk washing

(ii.) Assess the impacts of such activities and

(iii.) Recommend appropriate BMPs to control any adverse impacts.

The City of Los Angeles completed the study and prepared a report entitled, "A Study of Pollutants Entering Storm Drains from Street and Sidewalk Washing Operations in Los Angeles, California." The Regional Board approved recommended BMPs for street and sidewalk washing activities.

Public Reporting

The goal of this component is to promote, publicize and facilitate public reporting of illicit discharges and illicit disposal practices. Permittees must implement a system for complainant documentation and a follow up response for calls received from the public regarding potential illicit discharges and illicit disposal practices.

Reporting Hazardous Substances Entering the Storm Drain System

The goal of this component is to facilitate appropriate reporting of hazardous substances entering the storm drain system as a result of an illicit discharge. The Permittees must implement a reporting program to document quantities of hazardous substances entering the storm drain system.

ES.3 MODEL DEVELOPMENT PLANNING PROGRAM

"Development" Projects encompass those projects that are subject to a planning and permitting review process by a Permittee. A "Development" Project may be new development, redevelopment, renovation, remodeling, rehabilitation, infill, or other terms that may be used in a Permittee's ordinances and/or building code. The planning and design of public facilities have similar requirements described in the Model Public Agency Activities Program, another component of the Countywide Storm Water Management Plan.

The fundamental concept of this program component is to identify development that may significantly impact stormwater quality and to then to include permanent BMPs in the project's design. Development projects that may significantly impact stormwater quality are Planning "Priority" Projects. Other projects are deemed "Exempt" from these program requirements.

Each Permittee will implement a development-planning program that includes the following components:

- System for determining the appropriate category (Priority or Exempt) for a Development Project;
- Recommended list of BMPs to be considered, and as appropriate, implemented for Development Projects;
- Process to ensure that Planning Priority Projects incorporate the Standard Urban Storm Water Mitigation Plans using the recommended list of BMPs;
- Guidelines for California Environmental Quality Act (CEQA) compliance;
- Guidelines for the revision of General Plan elements to include watershed and stormwater quality management considerations, when General Plan elements are being significantly rewritten; and
- Developer information program that provides general guidance on the Permittee's development planning program, and specific guidance on BMP selection and the Standard Urban Storm Water Mitigation Plans.

A checklist and flowchart are included in the Model Development Planning Program to assist Permittees in determining whether a project is Priority or Exempt.

ES.4 MODEL DEVELOPMENT CONSTRUCTION PROGRAM

Permittees must also implement a program to manage stormwater and urban runoff associated with construction activities within their jurisdictions. The Model Development Construction Program addresses:

- Development and implementation of construction site BMPs;
- Implementation of procedures to verify Notice of Intent (NOI) filing with the State Water Resources Control Board (SWRCB) and completion of stormwater pollution prevention plan (SWPPP) for projects subject to the California General Construction Permit, and
- Implementation of a construction inspection program.

Construction Site BMPs

A Development Construction Project is defined as projects for which site activities such as clearing, grading, excavation, road construction, structure construction, or structure demolition results in the disturbance of soil.

In certain situations, where impact to stormwater quality is a greater threat, Development Construction Projects should be given greater scrutiny to ensure that minimum requirements are met. These projects which present a greater threat to water quality, *but are not subject to the California General Permit for Storm Water Discharges Associated with Construction Activity*[1] are called Construction Priority Projects.

Unless specifically exempted, all Development Construction Projects will be required to implement BMPs to meet minimum water quality protection requirements. As a condition for issuing a grading or building permit, applicants for covered Development Construction Projects shall be required to certify that they understand and will comply with the minimum BMPs requirements related to construction site runoff.

Projects Subject to the General Construction Permit

Developers of construction sites subject to the General Construction Permit are required to prepare and implement a Storm Water Pollution Prevention Plan (state SWPPP). Before issuing building or grading permits, Permittees will require applicants to demonstrate that a Notice of Intent (NOI) has been filed with the SWRCB, and that a state SWPPP has been prepared for projects subject to the General Construction Permit.

---

1 A project is subject to the General Construction Permit if it disturbs 5 acres or more of soil, or the project results in the disturbance of less than 5 acres but is part of a larger common plan of development or sale that exceeds 5 acres.

Requirements for Construction Priority Projects

Prior to receiving a building or grading permit, applicants for Construction Priority Projects must prepare a local stormwater pollution prevention plan (local SWPPP) covering construction materials and waste management control, and must certify that they will implement the local SWPPP year-round. Applicants for Construction Priority projects must also prepare and implement a Wet Weather Erosion Control Plan (WWECP) if the project will leave soil disturbed during the rainy season (November 1 through April 15).

Site Inspection and Enforcement

Each Permittee will implement site inspection procedures to assess whether the minimum requirements for Development Construction Projects are being achieved and appropriate BMPs are being implemented. Site inspections will also determine if local SWPPPs are being implemented at projects where they apply. Developers and/or contractors will also be required to conduct and document self-inspections of their construction site. Each Permittee will also develop and implement enforcement procedures to require that corrective actions be undertaken when the requirements are not met.

ES.5 MODEL PUBLIC AGENCY ACTIVITIES PROGRAM

Part IV.C of the Permit contains requirements specifically for public agency activities and facilities. Components of the Public Agency Activities Model Program describe measures to be taken by Permittees to reduce stormwater impacts from public agency activities and facilities such as sanitary sewer systems, public construction activities, vehicle maintenance and material storage facilities, recreation facilities, stormwater drainage systems, streets and roads, etc.

Sewage Systems Operations

This program component is applicable to all Permittees who own and operate a sewage collection system. Although sewage systems themselves are not a regular source of stormwater pollution, raw sewage contains pollutants that can pose a serious threat to both human health and the quality of receiving waters if they enter the storm drain system through incidents such as spills, leaks, or overflows. The goal of this program is to reduce the impact of Permittee-owned sewage system operations on stormwater quality.

The objectives of this program component are to:

- Keep any sewage overflows or leaks from entering the storm drain system or receiving waters.
- Identify and repair sewage system blockages, exfiltrations, overflows and implement procedures for investigating the causes.
- Notify public health authorities in cases where threats to public health exist.

Public Construction Activities Management

This program component is applicable to all Permittees who construct or contract to construct public facilities, including infrastructure. The program component requires the use of temporary best management practices (BMPs) to reduce the discharge of pollutants from public construction sites. In addition, public agency facilities with the potential for having a significant effect on stormwater quality when completed by virtue of their size, nature of on-site activities, or other factors must incorporate permanent BMPs in the planning and design of the project.

The objectives of this program component are to:

- Select and incorporate appropriate construction control measures for stormwater quality management from construction sites.
- Conduct and inspection program, including enforcement procedures as necessary, to verify that the construction control measures are implemented and performed effectively throughout the construction period.

Vehicle Maintenance / Material Storage Facilities Management

This program component is applicable to all Permittees who own and operate vehicle maintenance or materials storage facilities. Activities at these facilities may generate waste, spills and leaks that could potentially reach the storm drain system and receiving waters. The goal of this program is to make stormwater quality a consideration when conducting activities at municipal facilities.

The objectives of this program component are to:

- Identify and evaluate sources of pollutants from public vehicle maintenance/material storage facilities that may affect the quality of stormwater discharge from the facility.
- Identify and implement site-specific best management practices to reduce or prevent pollutants in stormwater discharges.

Landscape and Recreational Facilities Management

This program component is applicable to all Permittees who own and operate recreational facilities. Maintenance practices at parks and recreation facilities generally include fertilizer and pesticide applications, vegetation maintenance and disposal, swimming pool chemical maintenance and draining, and trash and debris management. All of these activities have the potential to contribute pollutants to the storm drain system. If improperly managed, potential pollutants can be transported in runoff (stormwater and non-stormwater discharges) to the storm drain system and subsequently to receiving waters. The goal of the program for landscape and recreational facilities management is to make the stormwater quality a consideration when conducting operation and maintenance activities.

The objectives of this program component are to:

- Minimize the discharge of pesticides, herbicides and fertilizers to the storm drain system and receiving waters.
- Prevent the disposal of landscape waste into the storm drain system.
- Minimize the trash, debris and other pollutants from entering Permitee-owned recreational water bodies.
- Discharge municipal swimming pool water in a manner that will not contribute pollutants to receiving waters.

Storm Drain Operation and Management

The storm drain system functions primarily to collect and convey surface runoff to receiving waters during storms in order to prevent flooding. A common municipal activity includes the maintenance of the storm drain system to maintain hydraulic function as intended during storms. The goal of this program is to reduce the impact of storm drain operation and maintenance activities on stormwater quality.

The objectives of this program component are to:

- Inspect and clean catch basins annually and keep appropriate records.
- Remove trash and debris annually from open channels and properly dispose of these materials to prevent them from being washed to receiving waters.
- Report prohibited non-stormwater discharges observed during the course of normal daily activities so they can be investigated, contained and cleaned up, or eliminated.
- Review maintenance activities to verify that they minimize the amount of pollutants discharged to receiving waters.

Streets and Roads Maintenance

Streets and roads may collect litter and debris from nearby activities, as well as from vehicular traffic. During the course of routine maintenance waste materials are often generated. The goal of this component is to reduce the impact of Permittee street and road operations and maintenance on stormwater quality.

The objectives of this program component are to:

- Sweep curbed streets to reduce the discharge of pollutants associated with activities occurring in street and road rights-of-way.
- Minimize the discharge of pollutants associated with the maintenance of streets and roads.

Parking Facilities Management

Permittees who own parking lots with more than 25 parking spaces located in areas with potential exposure to stormwater must have a parking facilities management plan. The goal of this component is to reduce the impact of these parking facilities on the quality of stormwater discharges and receiving waters. The objective of this program component is to remove debris from parking facilities to reduce the amount of material that comes into contact with stormwater.

Public Industrial Activities

Industrial activities, whether private or public, have the potential to discharge pollutants to the storm drain system. Many industrial facilities are subject to the California General Industrial Activities Storm Water Permit (General Industrial Permit) for control of stormwater pollution. The goal of the General Industrial Permit is to reduce the impact of industrial facilities on stormwater quality. This provision of the Permit may procedurally simplify and reduce the cost of Permittees' compliance for their industrial facilities (Phase 1) by providing the option to obtain coverage under the Permit in lieu of the General Industrial Permit. The objective of this program component is to comply with all requirements and conditions contained in the General Industrial Permit.

Emergency Procedures

Each Permittee must consider the impact of discharges to the storm drain system during emergency repairs of essential public services and infrastructure, and response to natural disasters. The goal is to reduce the impact of emergency response activities on receiving waters, to the extent possible, without compromising public health and safety.

The objectives of this program component are to:

- Recognize that public health and safety are the highest priority when conducting emergency response activities.
- Protect surface water quality by incorporating appropriate BMPs into emergency response activities to the extent possible.

ES.6 MODEL PUBLIC INFORMATION AND PARTICIPATION PROGRAM

The purpose of the Public Information and Participation Program (Five-Year Public Education Plan) is to provide the framework for a comprehensive educational stormwater and urban runoff outreach approach that will reach as many Los Angeles County residents as possible. The Five-Year Public Education Plan is research-based, broad-based with overarching themes, flexible, adaptable, and simplistic in order to produce behavior change.

Groups of residents differ significantly in terms of the amount of pollution they contribute, their demographics and lifestyle, attitudes related to stormwater pollution, and probability of changing their behaviors. By better understanding the general County resident population, resources may be directed to those segments of the population that pose the greatest threat to stormwater quality and who represent the greatest opportunity to respond to a public education campaign.

Some key strategies developed for successful implementation of the education model include:

- Creating Overarching Approach – A unified overall public education approach sets a "tone" for the program and once established helps target audiences identify the program with its pollution prevention message.
- Building Partnerships – Integrate County and city programs, cooperate with environmental groups, co-Permittees, and other public and business groups to disseminate public education program materials and special events information.
- Unify Pollution Prevention Efforts – Link all pollution prevention efforts (such as recycling, used oil and household waste) under a single agenda rather than under multiple prevention splinter programs.
- Develop "How To" Instructions – Provide specific guidelines supported by simple easy to remember tasks and concise "how to" instructions for pollution prevention actions that residents and business may incorporate into their everyday routines.
- Monitoring and Evaluation System – Establish an evaluation system to measure program effectiveness by assessing the number of people who show increased awareness, intent and/or actions in reducing stormwater pollution. Re-evaluate and enhance program components on continually based on program effectiveness.

- Multiple Audience Impact – Develop program materials and activities that may be implemented and have impact on more than one audience at a time.

The Model Public Information and Participation Program also includes reporting requirements for Permittees to support the Annual Program Report to the Regional Board. These reporting requirements include the documentation of information such as:

- Number of media outlets contacted to run public service announcements (PSAs),
- Dollar value and number of media buys,
- Audience of the media PSAs,
- List of local businesses enlisted to place non-traditional advertising (point-of-purchase displays, product neck hangers, etc.)
- Numbers and types of stormwater pollution prevention materials distributed, and
- Whether there is an increase in the number of illicit discharge reports to the Permittee.

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996 contains a requirement for Permittees to develop and implement a Public Agency Activities Program. This document describes a model program that Permittees can use to develop and implement their own Public Agency Activities Program in compliance with the Permit.

Part IV.C of the Permit contains requirements specifically for public agency activities, as summarized in Table 1. A copy of the applicable Permit section is included as Appendix A and can be used to determine specific language. The Permit requirements are fully enforceable and can only be changed through action by the Regional Board. The model program contents will be reviewed and approved by the Regional Board staff (Executive Officer) and can be changed by approval of the Executive Officer.

Table 1

Permit Requirements - Public Agency Activities

Permit Section	*Requirement (Summary)*	*Compliance Date*
IV.B	Develop and implement a program to reduce storm water impacts from public agency activities. The program shall include, at a minimum, procedures for the following:	Four months after commencement of next fiscal year following Executive Officer approval of model program, but no later than 7/30/99.(1)
IV.C.1	Sewage systems operations	
IV.C.2	Public construction activities management	
IV.C.3	Vehicle maintenance/ material storage facilities management	
IV.C.4	Landscape and recreational facilities management	
IV.C.5	Storm drain operation and management	
IV.C.6	Streets and roads maintenance	
IV.C.7	Parking facilities management	
IV.C.8	Public industrial activities (optional)	
IV.C.9	Emergency procedures	

(1) Provided that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year.

Implementation activities for each of the nine program components are discussed in the first nine sections of this model program. Additionally, the Permit contains a requirement to "include a discussion of the ongoing investigation of the feasibility of dry weather flow diversion from the MS4 (municipal storm drain system) to municipal wastewater treatment plants, where appropriate." The discussion of dry weather flow investigations is included as Section 10. There are no requirements for Permittee implementation activities related to dry weather flow diversion.

1.1 INTRODUCTION

1.1.1 Program Goal and Objectives

This program component is applicable to all Permittees who own and operate a sewage collection system. Although sewage systems themselves are not a regular source of storm water pollution, raw sewage contains pollutants that can pose a serious threat to both human health and the quality of receiving waters if they enter the storm drain system through incidents such as spills, leaks, or overflows. The goal of this program is to reduce the impact of Permittee-owned sewage system operations on storm water quality.

Each Permittee's program must meet the requirements of the Los Angeles County municipal storm water permit (Permit), as summarized in Table 1-1.

Table 1-1

Permit Requirements - Sewage Systems Operations

Report Section	*Requirement (Summary)*	*Permit Section*
1.2.1	Implement procedures to keep sewage spills or leaks from facilities operated by a Permittee from entering the municipal storm drain system to the maximum extent practicable.	IV.C.1.a
1.2.1	Implement procedures to respond to overflows and investigate complaints.	IV.C.1.c
1.2.2	Implement procedures to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers operated by a Permittee to the municipal storm drain system.	IV.C.1.b
1.2.3	Implement procedures to insure that the Permittee is able to investigate any suspected connections or cross-connections from the sanitary sewer systems to the municipal storm drain system.	IV.C.1.d
1.2.4	Implement procedures to notify public health agencies with discretionary decision authority on beach closures when there is a threat to public health.	IV.C.1.e

The objectives of this program component are to:

- Keep any sewage system overflows or leaks from entering the storm drain system or receiving waters to the maximum extent practicable.
- Identify, repair and remediate sewage system blockages, exfiltration, and overflows, and implement procedures for investigating suspected cross-connections.
- Notify public health authorities when there is a threat to public health.

1.1.2 Facilities Covered by the Permit

Facilities that are covered under this program include sanitary sewer pipes and pump stations owned and operated by the Permittee. The owner of the sanitary sewer facilities is the entity responsible for carrying out this prevention and response program.

1.2 PROGRAM IMPLEMENTATION ELEMENTS

1.2.1 Spill/Leak/Overflow Response and Containment

The following procedures will be implemented, where applicable, to contain spills, leaks and overflows from sanitary sewer pipes and pump stations.

- When a spill, leak, and/or overflow occurs, keep sewage from entering the storm drain system to the maximum extent practicable by covering or blocking storm drain inlets and catch basins, or by containing and diverting the sewage away from open channels and other storm drain facilities (using sandbags, inflatable dams, etc.).
- Remove the sewage using vacuum equipment or use other measures to divert it back to the sanitary sewer system.
- When disinfecting a sewage contaminated area, take every effort to ensure that the disinfectant or sewage treated with the disinfectant is not discharged to the storm drain system or receiving waters. Methods may include blocking storm drain inlets, containing and diverting disinfectant and sewage away from open channels and other storm drain fixtures, and removing the material with vacuum equipment.

General guidance on responding to overflows and investigating complaints is included in Appendix B, Section B.1, and detailed guidance is provided in the model Illicit Connection/Illicit Discharge Elimination Program.

1.2.2 Preventive and Corrective Maintenance

The following procedures will be implemented, where applicable, to identify, repair and remediate sanitary sewer blockages, exfiltration, and overflows.

- During routine maintenance and inspection, note the condition of sanitary sewer structures and identify areas that need repair or maintenance.
- Document suggestions and requests for repair and report the information to the appropriate manager or supervisor.
- Prioritize repairs based on the nature and severity of the problem.

R0001056

Guidance on identifying, reporting, and repairing potential sewage system problems is included in Appendix B, Section B.2.

1.2.3 Cross-Connections

The following procedures will be implemented, where applicable, to verify that suspected connections or cross-connections are investigated.

- Educate field staff to recognize suspected cross-connections to the sanitary sewer system during their daily activities.
- Maintain accurate records of both sewer connections and new sewer lines.

Guidance on maintaining records is included in Appendix B, Section B.3. Guidance on conducting cross-connection and other illicit connection investigations is provided in the model Illicit Connection/Illicit Discharge Elimination Program.

1.2.4 Public Health Agency Notification

The following procedures will be implemented, where applicable, to notify public health agencies with discretionary decision authority to close beaches when a sewage release may pose a threat to public health.

- Notify the County Department of Health Services, or other local health agency, of the spill location and potential discharge point to the receiving water. The County may be reached by calling the Hotline number (800) 303-0003 or (888) CLEANLA.
- Notify other agencies as needed to help determine the extent of the threat and document the release.

The 24-hour spill response telephone numbers for all Permittees are included in Appendix B, Section B.4.

2.1 INTRODUCTION

2.1.1 Program Goal and Objectives

This program component is applicable to all Permittees who conduct or contract out the planning, design, or construction of public facilities. One goal of this program component is that appropriate permanent BMPs are incorporated into the planning and design of public facility projects with the potential for having a significant effect on storm water quality when completed by virtue of their size, nature of on site activities, or other factors. The second goal of this program is that temporary best management practices (BMPs) are implemented to reduce the discharge of pollutants from the construction sites of public facility projects.

Each Permittee's program must meet the requirements of the Los Angeles County municipal storm water permit (Permit), as described in Table 2-1.

Table 2-1

Permit Requirements - Public Construction Activities Management

Report Section	*Requirement (Summary)*	*Permit Section*
2.2.1	Implement storm water management requirements for the design and construction of public facilities consistent with the requirements and time lines specified for private development in Part 2.III.A and III.B.	IV.C.2.a
2.2.2 (optional)	Implement procedures to seek coverage, as an option, under this Order for construction activity with a disturbed area of five acres or more (Phase 1, 40 CFR 122.26) which is undertaken by or on behalf of the Permittee.	IV.C.2.b

The objectives of this program component are to:

- Identify public facility projects that when completed (operational phase) have the potential for significantly effecting storm water quality.
- Select and incorporate appropriate permanent BMPs into the planning and design of public facility projects.
- Select and incorporate appropriate construction control measures for storm water quality management from construction sites.
- Conduct an inspection program, including enforcement procedures as necessary, to verify that construction control measures are implemented and performed effectively throughout the construction period.

2.1.2 Public Facilities Subject to the Model Program

This program element applies to all public works Development Construction Projects in Los Angeles County owned or operated by a Permittee including, but not limited to, site development, building, roadway, drainage, utility and other infrastructure projects, except for projects determined to be exempt from this program. Projects exempt from the planning and design requirements are discussed in Section 2.2.1, and projects exempt from temporary construction site requirements are discussed in Section 2.2.2.

A public works Development Construction Project is a site where construction activities such as clearing, grading, excavation, road construction, structure construction, or structure teardown results in soil disturbance. Construction activity does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility, nor does it include emergency construction activities required to immediately protect public health and safety."

2.2 PROGRAM IMPLEMENTATION ELEMENTS

2.2.1 Planning and Design Requirements

The Permit (Part 2.IV.C.2.a) requires that the stormwater management requirements for the design and construction of public facilities be consistent with the requirements for private development projects. A Standard Urban Storm Water Mitigation Plan (SUSMP) was adopted by the Regional Board for eight enumerated categories of private development projects. Although public agencies do not plan and design these eight categories of projects, public facilities may have similar functions or characteristics or may conduct similar activities after construction is completed.

The planning, design, approval, and oversight of public facility projects differ from private development projects. For example, private development projects are regulated through a process of a development plan approval (i.e., conditions of approval), building or grading permit applications, and permit conditions. Public facility projects undergo design review by the contracting agency; are issued permits or similar administrative authorizations; and are then regulated through the enforcement of contract terms and approved plans and specifications. Since the municipality is also the project owner, construction of public facilities according to approved plans and specifications is ensured through inspection and oversight by the project owner and enforcement of contract provisions. Review, approval, and inspection of public

facilities and private development projects are generally performed by different municipal departments.

Each Permittee shall implement a planning and design program for their public facility projects that includes the following components:

1) a system for determining the appropriate category (Priority or Exempt) for a public facility project;
2) a recommended list of BMPs to be considered during planning and design of public facility projects; and
3) a process to ensure that public facility projects incorporate appropriate BMPs into project plans or design.

The Permit defines Priority and Exempt projects as follows:

- Planning Priority Projects are development and redevelopment projects requiring discretionary approval which the Building Official (or equivalent municipal authority) determines may have a potential significant effect on storm water quality;" and
- Planning Exempt Projects are development and redevelopment projects which the Building Official (or equivalent municipal authority) determines will not have a potential significant impact on storm water quality." [Note: This definition of "exempt" projects differs from that found in the Public Agency Construction Model Program.]

The process for determining whether a public facility project is a Planning Priority Project or a Planning Exempt Project is shown on Figure 2-1 and is described in the remainder of this section.

2.2.1.1 *Projects Requiring Discretionary Approval*

The first factor in categorizing a public facility project as either a Planning Priority Project or a Planning Exempt Project is to determine if the project requires discretionary approval. If a proposed project does not require discretionary approval, the project is a Planning Exempt Project and is exempt from the requirements described herein.

Discretionary approval for purposes of this Model Program will be interpreted consistent with Section 15357 of the California Environmental Quality Act (CEQA) Guidelines. Section 15357 states:

> *"Discretionary project" means a project which requires the exercise of judgment or deliberation when the public agency or body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body*

merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.

Ministerial approvals are defined in Section 15369 of the CEQA Guidelines, which states:

"Ministerial" describes a government decision involving little or no personal judgment by the public official as to the wisdom or manner of carrying out the project. The public official merely applies the law to the facts as presented but uses no special discretion or judgment in reaching a decision. A ministerial action involves only the use of fixed standards or objective measurements, and the public official cannot use personal, subjective judgment in deciding whether or how the project should be carried out.

Ministerial approvals should not be confused with projects that are determined to be Categorically Exempt under CEQA. Categorically Exempt projects are a distinct type of exemption under CEQA. By definition, any type or category of project that is treated by a particular jurisdiction as typically being Categorically Exempt under CEQA, is a project requiring discretionary approval.

Consistent with Section 15268(d) of the CEQA Guidelines, "Where a project involves an approval that contains elements of both a ministerial action and a discretionary action, the project will be deemed to be discretionary..." Throughout the remainder of this Section 2.2.1, such a discretionary approval or discretionary action by a public agency or body will be referred to as a "discretionary action."

While the definitions of "discretionary" and "ministerial" as used in this section of the Model Program rely on language from CEQA Guidelines, the process outlined herein for public facility projects is independent of the CEQA determination.

2.2.1.2 Project Determination as Planning Priority or Planning Exempt

The second factor in categorizing whether a public facility project is a Planning Priority Project or a Planning Exempt Project shall be based upon the contemplated project characteristics. The model checklist provided in Figure 2-2, or a substantially similar checklist, shall be completed for the proposed project.

The model checklist lists project characteristics that may be used to identify potentially significant sources of storm water pollutants. Those project characteristics[2] are:

- A public facility greater than 100,000+ square feet?
- Vehicle or equipment maintenance areas or structures, including washing?
- Fuel dispensing?
- Food service facility?
- Waste handling or storage, excluding typical office waste?
- Outdoor handling or storage of hazardous materials or waste?
- Hillside location (as defined by the local jurisdiction)?
- Outdoor work areas for activities such as, but not limited to, welding; cutting; metal fabrication; assembly; application of paints, coatings, or finishes; pre-cast concrete fabrication; etc.?
- Parking lots ≥ 5,000 square feet or with ≥ 25 parking spaces and potentially exposed to stormwater?

For consistency across the various component programs of the Countywide Storm Water Management Plan:

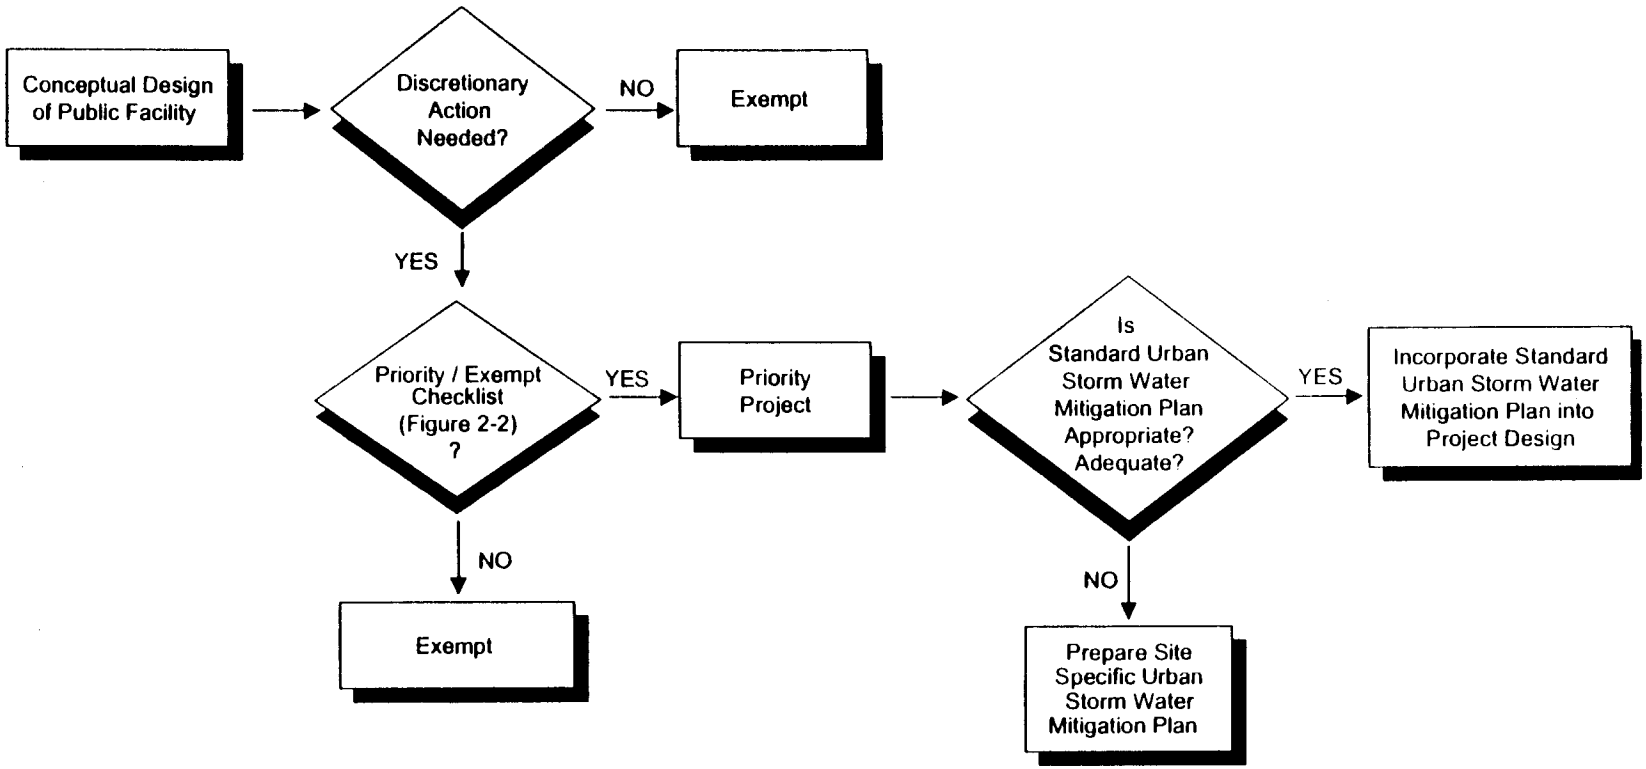
- The determination of the number of square feet for a public facility will be based on total impermeable area as opposed to lot size or building footprint. This interpretation is used because storm water runoff from paved areas associated with buildings must be managed.
- Hillside is defined as a parcel (or parcels) located in an area with known erosive soil conditions, where the project plans include grading on any natural slope that is 25 percent or greater.

If in completing the Planning Priority/Exempt Checklist, no project characteristics are identified, the project is exempt from the requirements of this Model Program.

If one or more project characteristics are identified in completing the Planning Priority/Exempt Checklist, the project is a Planning Priority Project subject to the requirements of this Model Program.

2 Activities or materials potentially exposed to stormwater and not protected by storm-resistant sheltering. Such activities include public facilities operation and construction work. Such materials include material handling equipment, industrial machinery, raw materials, intermediate products, by-products, and waste products however packaged.

Figure 2-1. Flow Diagram for Determination of Project as Priority or Exempt



R0001063

Figure 2-2. Planning Priority / Exempt Checklist

MODEL CHECKLIST FOR CATEGORIZING DISCRETIONARY PUBLIC FACILITY PROJECTS[3] AS PRIORITY OR EXEMPT

Project Name: _____

Project Location: _____

Description of Project: _____

_____

PRIORITY PROJECT: Any question is answered "YES."

EXEMPT PROJECT: Every question is answered "NO."

Project Characteristics	Yes	No
A public facility greater than 100,000+ square feet?		
Vehicle or equipment maintenance areas or structures, including washing?		
Fuel dispensing?		
Food service facility?		
Waste handling or storage, excluding typical office waste?		
Outdoor handling or storage of hazardous materials or waste?		
Hillside location (as defined by the local jurisdiction)?		
Outdoor work areas for activities such as, but not limited to, welding; cutting; metal fabrication; assembly; application of paints, coatings, or finishes; pre-cast concrete fabrication; etc.?		
Parking lots ≥ 5,000 square feet or with ≥ 25 parking spaces and potentially exposed to stormwater?		
Outdoor animal confinement (e.g., stables, kennels, etc.)?		

3 This model checklist applies only to Public Agency Planning Projects as defined in Section 2.1.2 of this Model Program.

2.2.1.3 Storm Water Mitigation Plan

Prior to administrative authorizations or issuance of permits for Planning Priority Projects, the Permittee shall require that the pertinent requirements of the SUSMP be incorporated into the planning and design of the Planning Priority Project.

2.2.1.4 BMP Selection for Priority Projects

The Permittee should address the potential water quality impacts of storm water discharges associated with public facilities early in the project planning and design process. In general, the sooner potential storm water impacts are considered, the greater the opportunity to include efficient and effective BMPs into project design and plans. A recommended BMP selection process is described in the remainder of this Section 2.2.1.4, and the recommended BMPs for consideration in Planning Priority Projects are provided in Appendix C.

Goals and Objectives

Site-specific conditions for a public facility project determine which BMPs are most appropriate for a site. Prior to selecting BMPs, a good understanding of post-construction activities and potential sources of storm water pollutants is needed. The BMPs considered should address the potential pollutants reasonably expected at the site once the facility is occupied or operational. The permanent BMPs planned for a public facility should fulfill the following goals and objectives:

- be appropriate for the given site constraints;
- be feasible to implement and maintain;
- ensure no adverse storm water quality impacts;
- promote improved water quality;
- provide effective pollutant source control or removal capability;
- meet regulatory requirements; and
- be economically feasible.

R0001065

BMP Selection Criteria

Appropriate BMPs may be selected by using selection criteria that identify the capabilities and limitations of each BMP. Common criteria used in screening and selecting BMPs during the planning and design stage are:

- project characteristics (e.g., potential sources of storm water pollutants after construction is completed);
- site factors (e.g., slope, high water table, soils, etc.);
- pollutant removal capability;
- short-term and long-term costs;
- responsibility for maintenance;
- contributing watershed area; and
- environmental impact and enhancement.

The BMP selection criteria listed above should be applied in accordance with the overall objective of this Model Program, i.e., to reduce pollutants in discharges to the MEP to achieve water quality objectives and protection of the beneficial uses of receiving waters. Some BMPs will clearly be more appropriate and effective in some site-specific situations than others, and BMP selections should reflect this variability. These factors are described in more detail in Appendix D.

Select Best Alternatives

Using the list of recommended BMPs for Planning Priority Projects, the designer should use the selection criteria to select the best alternatives for the project conditions, characteristics, and concerns. This may be done numerically, by rating and then ranking the BMPs. Or the selection process may be done in a more subjective, non-numerical way using experience and professional judgment to select the best alternative BMPs. Either way, the designer should document the selection process to provide justification for the system of BMPs incorporated into project plans and designs.

R0001066

Design and Installation

After the appropriate BMPs are selected for a given project, the designer should design the BMPs and incorporate them into the project plans and specifications. It is important that the project plans and specifications include adequate information for the BMPs to be properly installed. Improper installation is one of the most common reasons for water quality controls to not function as designed.

Maintenance

Maintenance is crucial to the proper and continued functioning and effectiveness of the BMPs. Designers should provide guidance on the proper maintenance of the BMPs so that it may be provided to the entity responsible for BMP maintenance.

2.2.1.5 Changes in Project after Initiation of Construction

Prior to final administrative authorization or approval of project permits, projects previously designated as Planning Exempt may become subject to the requirements of Planning Priority Projects. If the proposed changes would add project characteristics included in the model Planning Priority/Exempt Checklist, the project shall be required to incorporate appropriate permanent BMPs into the project's revised design and plans.

2.2.2 Construction Activity Requirements

2.2.2.1 Overview of Development Construction Projects Subject to the Model Program

The overall process of determining what requirements are applicable to a public agency Development Construction Project is depicted in the flowchart shown in Figure 2-3.

Construction Priority Project

In certain situations, where impact to storm water quality is a greater threat, Development Construction Projects should be given greater scrutiny to ensure that minimum requirements are met. These situations are:

Projects where a greater threat to water quality exists, but which are not subject to the California General Permit for Storm Water Discharges Associated with Construction Activity are called Construction Priority Projects. Three conditions determine a Construction Priority Project:

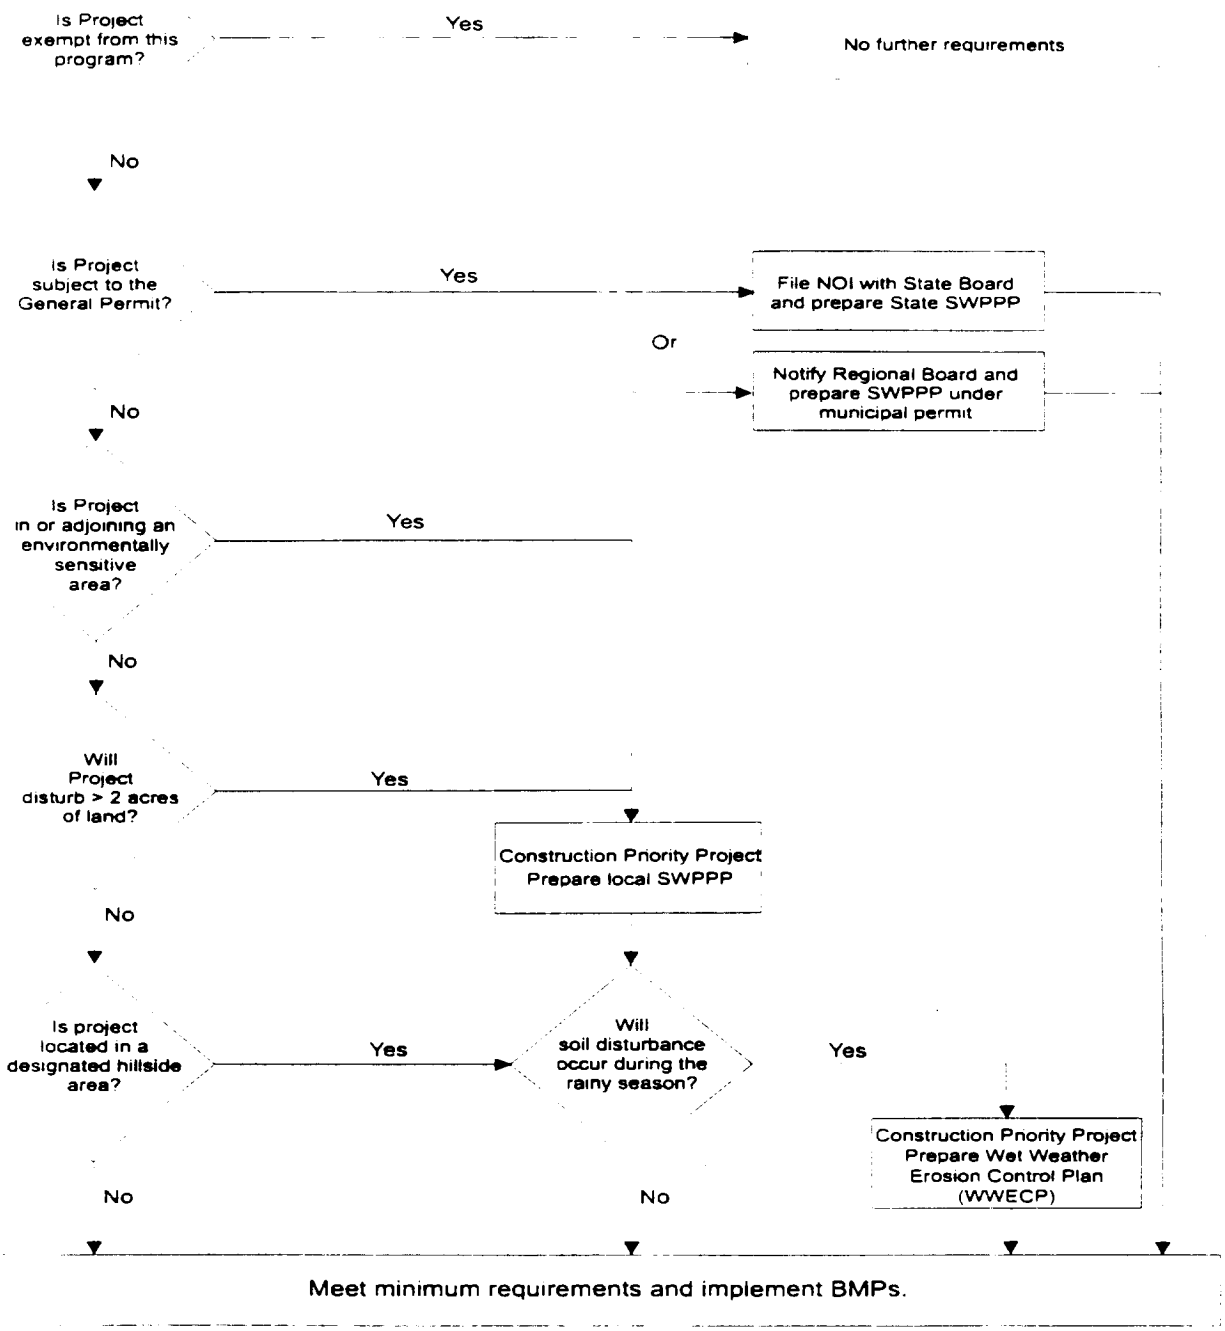
1) The project is in or adjacent to an environmentally sensitive area, or

2) The project will disturb greater than two acres, or

3) The project is located in a hillside area (as defined by the local jurisdiction) where soil disturbance occurs during the rainy season.

R0001067

Figure 2-3. Construction Control Measures



Projects Subject to the General Construction Permit

A project is subject to the California General Permit for Storm Water Discharges Associated with Construction Activity (hereinafter referred to as the General Construction Storm Water Permit) if it disturbs 5 acres or more of soil, or the project results in the disturbance of less than 5 acres but is part of a larger common plan of development or sale that exceeds 5 acres.

Exempt Projects

Permittees may exempt certain types of Development Construction Projects that pose minimum risk of storm water pollution as defined in Section 2.2.2.1.4.

2.2.2.1.1 Minimum Requirements

All public agency Development Construction Projects covered under this program must implement BMPs as necessary to reduce pollutants to the Maximum Extent Practicable[4] (MEP) to meet the minimum water quality protection requirements as defined in Table 2-2. Construction contract documents (plans and specifications) for all covered projects will include these minimum requirements.

Table 2-2
Minimum Water Quality Protection Requirements for Development Construction Projects

Category	Minimum Requirements	BMPs(1)
Erosion and Sediment Control	Sediments from areas disturbed by construction shall be retained on site, using structural drainage controls to the MEP, and stockpiles of soil shall be properly contained to minimize sediment transport from the site to streets, drainage facilities or adjacent properties via runoff, vehicle tracking, or wind.	Sediment Controls
Construction Materials Control	Construction-related materials, wastes, spills or residues shall be retained on site to minimize transport from the site to streets, drainage facilities or adjoining properties via runoff, vehicle tracking, or wind. Runoff from equipment and vehicle washing shall be contained at construction sites unless treated to remove sediment and pollutants.	Site Management; Material and Waste Management

(1) BMPs that may be used to meet the minimum requirements are described in Section 2.2.2.1.5.

4 Maximum Extent Practicable (MEP) is the standard for implementation of storm water management programs to reduce pollutants in storm water. MEP refers to storm water management programs taken as a whole. It is the maximum extent possible taking into account equitable consideration and competing facts, including, but not limited to: the gravity of the problem, public health risk, societal concern, environmental benefits, pollutant removal effectiveness, regulatory compliance, public acceptance, implementability, cost and technical feasibility. Section 402(p)(3)(B)(iii) of the Clean Water Act requires that municipal permits "...shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

2.2.2.1.2 Construction Priority Projects

Construction Priority Projects are projects that have the potential to significantly affect storm water quality during construction but which do not meet the criteria (i.e., acreage[5]) to be subject to the General Construction Storm Water Permit. Construction Priority Projects will be identified by the Permittee during the design process, using the following criteria:

- The project is not exempt from this program and not subject to the General Construction Storm Water Permit, and
- The project will result in soil disturbance of more than 2 acres of land; or
- The project is in or adjacent to an environmentally sensitive area[6], or
- The project is located in a designated hillside area and soil disturbance will occur at the project site in the rainy season.

Application of these criteria is depicted in the flow diagram in Figure 2-3.

Construction Priority Projects will require preparation of a Local Storm Water Pollution Prevention Plan (SWPPP) covering construction materials and waste management control prior to beginning construction and implementation of the Local SWPPP year-round. A copy of the Local SWPPP must be kept on the project site at all times after the start of construction. It shall include:

- The name, location, period of construction, and a brief description of the project
- Contact information for the Permittee and contractor
- Name, location, and description of any environmentally sensitive areas located in or adjoining the project
- A list of major construction materials, wastes, and activities at the project site
- A list of best management practices to be used to control pollutant discharges from major construction materials, wastes, and activities
- A site plan indicating the selection of BMPs and their location, where appropriate.

Construction Priority Projects will also require preparation and implementation of a Wet Weather Erosion Control Plan (WWECP) if the project will leave soil disturbed during the rainy

5 A construction project of 5 acres or more or that which is less than 5 acres but is part of a larger common plan of development or sale. This acreage criteria may be revised downward by the USEPA under Phase II storm water regulations.

6 Examples of such areas may be wetlands, habitats of endangered, threatened, or rare species, wildlife dispersal or migration corridors, areas of locally designated species such as heritage trees, or locally designated natural communities such as oak forest or coastal habitat.

season, defined as November 1 through April 15. The WWECP must be prepared not later than 30 days prior to the beginning of each rainy season (i.e., by October 1) during which soil will be disturbed, and implemented throughout the entire rainy season. The WWECP shall include the following information:

- The name, location, period of construction, and a brief description of the project
- Contact information for the Permittee and contractor
- A site map showing the location of erosion control and sediment control BMPs that will be implemented for the rainy season.

For Construction Priority Projects, Permittees may elect to prepare the Local SWPPP and the WWECP (if required) as part of the construction contract bid package, or they may include the requirement in the contract documents for the contractor to prepare these plans. In either case, the contract documents must require the contractor to implement the Local SWPPP throughout the duration of the construction project and the WWECP throughout the duration of the rainy season. Construction contract documents will require that:

(1) The Local SWPPP be prepared before any work can start on the project and be kept on the project site at all times after the start of construction, and

(2) The WWECP (if required) be prepared within 30 days of the start of the rainy season before any soil disturbing activity can start and be kept on the project site through the end of the rainy season.

2.2.2.1.3 Projects Subject to the General Construction Permit

A project is subject to the General Construction Storm Water Permit if it disturbs five acres or more of soil, or the project results in the disturbance of less than five acres but is part of a larger common plan of development or sale that exceeds five acres. Construction sites that result in soil disturbance of five acres or greater will require the preparation and implementation of a state SWPPP meeting the requirements of the General Construction Storm Water Permit. The state SWPPP must address all categories of control measures, and has specific documentation requirements. The General Construction Storm Water Permit can be viewed or downloaded from the SWRCB's web page: www.swrcb.ca.gov/stormwtr/construction.htm.[7] A properly prepared state SWPPP satisfies all requirements of a Local SWPPP and WWECP required under this model program.

R0001071

7 A copy of the General Construction Permit can also be obtained from the Los Angeles Regional Board at 320 W. 4th Street, Suite 200, Los Angeles, CA 90013; telephone 213.576.6600.

For public agency Development Construction Projects subject to General Construction Storm Water Permit, Permittees must file a Notice of Intent with the SWRCB and prepare the state SWPPP (or require the construction contractor to prepare it) before construction can begin. As an alternative, Permittees may seek coverage for such projects under the municipal Permit, as described in Section 2.2.3.

2.2.2.1.4 Exempt Projects

Permittees may exempt certain types of projects from the program that pose a minimum risk of storm water pollution as determined by the local building official or equivalent municipal authority. Exemptions established for public agency Development Construction Projects shall be the same as those established for private development construction projects.

A list of specific types of projects that are deemed to be exempt include:

- Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility (permit definition)
- Emergency construction activities required to protect public health and safety (permit definition)
- Interior remodeling with no outside exposure of construction materials or construction waste to storm water
- Mechanical work
- Electrical work
- Sign work

The local building official (or equivalent municipal authority) may designate additional types of projects as exempt projects. Types of Development Construction Projects may be designated exempt if the project type meets all of the following criteria:

- No significant soil disturbing activity
- No outside storage or exposure of construction materials or construction wastes to storm water
- The activity poses a minimal risk of storm water pollution

2.2.2.1.5 Best Management Practices

BMPs that may be implemented for Construction Priority Projects to meet the minimum water quality protection requirements are summarized in Table 2-3. These BMPs have been organized into four major categories:

- ***Sediment Control.*** Feasible methods of trapping eroded sediment so as to prevent a net increase in sediment load in storm water discharges from the site.
- ***Erosion Control.*** Measures that prevent erosion and keep soil particles from entering storm water, lessening the eroded sediment that must be trapped, both during and after the completion of construction.
- ***Site Management.*** Methods to manage the construction site and construction activities in a manner that prevent pollutants from entering storm water, drainage systems or receiving waters.
- ***Materials and Waste Management.*** Methods to manage construction materials and wastes that prevent their entry into storm water, drainage systems, or receiving waters.

For non-priority projects any combination of BMPs that meet the minimum water quality protection requirements may be utilized. Construction Priority Projects must prepare a Local SWPPP and WWECP that considers all listed BMPs, and, at a minimum, must include the following BMPs:

- ***Sediment Control.*** At site perimeters, below significant slopes (at a minimum applied to grades of 1:5 V:H or greater), and at other similar locations, the use of at least one type of BMP such as silt fence, straw bale or sand bag barrier to minimize the transport of sediment. At interior storm drain inlets the use of at least one type of inlet protection BMP to minimize the transport of sediment offsite.
- ***Erosion Control.*** On completed disturbed surfaces, the use of at least one type of erosion control (soil stabilization) BMP during the rainy season.
- ***General Site Management and Materials and Waste Management.*** All BMPs applicable to specific construction operations, if such construction operations will occur at the site.

Guidance material about the BMPs that may be implemented to meet minimum water quality protection requirements will be provided by the Permittees to contractors. Similar guidance material will also be provided to site inspectors for use in assisting contractors to meet the minimum requirements. Three forms of guidance material are included in this model program:

- ***BMP Selection Matrix*** in Table 2-3 provides guidance for selecting BMPs for different types of construction activities. The columns on Table 2-3 list the types of

construction activities that pose a risk of causing storm water pollution. Each "x" within a column indicates a BMP that should be considered for this type of construction activity.

- ***BMP Selection Guidance*** is provided in Appendix E.
- ***BMP Fact Sheets*** describing each BMP are found in the California Storm Water Best Management Practice Handbooks. Construction Activities and are included in the model program for private Development Construction.

Additional informational materials will be developed and provided to developers/contractors through the Developer Information Program conducted under Part 2.III.A of the Permit and through the Five-Year Storm Water Public Education strategy, under Part 2.V.C. of the Permit.

R0001077

2.2.2.2 Site Inspection

Permittees will implement a site inspection program will to evaluate if the minimum water quality protection requirements are being met and to evaluate if Local SWPPPs and WWECPs or state SWPPPs are being implemented. Permittees will adopt and implement enforcement procedures to require that corrective actions be undertaken when the minimum water quality protection requirements are not being met. The site inspection program will include the following elements:

- Contractor self-inspections
- Permittee inspections
- Enforcement procedures.

2.2.2.2.1 Inspection Procedures

Public agency development construction projects are routinely checked by municipal inspectors to verify that the construction work is being done in accordance with the contract documents and applicable municipal codes. When a project is not in compliance with the contract documents or municipal codes, the inspectors have the authority to enforce the contract by issuing verbal warnings, written notices, withholding progress payments, or suspending work. Additional contract remedies may be taken for extreme cases, such as contract termination, or assessing penalties. Inspections may be conducted for various reasons, and at various times, and include inspections by the Permittee and routine contractor self-inspections.

Permittee Inspections

During the rainy season Permittees (or their designated agent) must conduct at least one inspection of all Construction Priority Projects and all projects subject to the General Construction Storm Water Permit. Designated inspectors (municipal or contracted consultant staff) will verify compliance with storm water quality requirements in the construction contract documents as part of the regular inspection process for public agency projects. When conducting inspections, the inspector will verify that the contractor is conducting the required self-inspections and will observe whether storm water quality management requirements are being met using the criteria discussed below in Section 2.2.2.2.2.

R0001078

Contractor Self-Inspections

Permittee construction contract documents will require the contractor to perform self-inspections for Construction Priority Projects. (Contractor self-inspections are a requirement of the General Construction Storm Water Permit.) Construction is a dynamic operation where changes are expected. BMPs for construction sites are usually temporary measures that require frequent maintenance to maintain effectiveness and may require relocation and re-installation, particularly as project grading progresses. Therefore, contractor self-inspections are required, particularly during the rainy season.

There are two primary purposes of contractor self-inspections:

- To ensure that BMPs are properly implemented and functioning effectively, and
- To identify maintenance (e.g., sediment removal) and repair needs.

Self-inspection records must be kept on site and made available for review by municipal inspectors during all inspections. At a minimum, contractor self-inspection records must note the inspection date, time, and observed conditions. An example form is included in Appendix E that may be provided to contractors by the Permittee for use in recording contractor self-inspection results.

At a minimum, contractor self-inspections must be performed according to the following schedule:

- Before every rainfall event that is predicted to produce observable runoff and after every rainfall event that produces observable runoff, and
- At 24-hour intervals during extended rainfall events (except weekends or holidays when there is no ongoing site activity on those days).

More frequent inspections would be effective to verify that contractors are maintaining BMPs in good condition, and Permittees may elect to require additional inspections. Suggested frequencies for additional inspections include monthly during the dry season and weekly during the rainy season.

2.2.2.2.2 *Inspection Criteria*

Criteria for All Sites

When conducting inspections, the most important element of the inspection is to ensure that appropriate controls are in place that reduce pollutants from entering the storm drainage system. If the inspector cannot affirmatively find that the minimum water quality protection requirements are being achieved, the inspector shall require the contractor to conform with those requirements.

The inspector may utilize the following framework when conducting an inspection:

(1) Determine what BMPs are necessary to meet the minimum requirements;

(2) Determine if BMPs are being used;

(3) Determine whether BMPs are being implemented properly; and

(4) Review developer's self-inspection checklist to determine whether minimum self-inspections have been performed.

An example checklist for documenting deficiencies and identifying corrective actions when conducting Permittee inspections is provided in Appendix E. If BMPs are either lacking or being implemented improperly. Section 2.2.2.2.3 provides a discussion of appropriate enforcement actions.

Criteria for Construction Priority Sites or Sites Subject to the General Construction Storm Water Permit

During the rainy season Permittees must conduct at least one inspection of all active Construction Priority Projects and all active projects subject to the General Construction Storm Water Permit. If the inspected site is not meeting minimum water quality protection requirements, Permittee inspectors must immediately direct compliance with these requirements and conduct a follow-up inspection to confirm that compliance is attained.

When conducting inspections of Construction Priority Projects or projects subject to the General Construction Storm Water Permit, the inspector will use the inspection checklist (or an equivalent) to evaluate conformance with minimum requirements and required BMPs and to document deficiencies and corrective actions. Appendix E provides an example checklist for site inspections.

If BMPs are either lacking or improperly implemented, Section 2.2.2.2.3 provides a discussion of appropriate enforcement actions. For sites subject to the General Construction Storm Water

Permit, if the SWPPP is not being implemented, notification of the Regional Board may be necessary. Guidance regarding notification of the Regional Board is provided in Section 2.2.2.2.4.

2.2.2.2.3 Procedures for Corrective and Enforcement Actions

Enforcement of storm water pollution prevention requirements for public agency Development Construction Projects will be done by municipal inspectors or contract inspection staff. Any conditions observed that constitute non-compliance with the contract documents are subject to enforcement action. Municipal or contract inspectors will conduct a follow-up inspection to determine if corrective actions have been taken in accordance with minimum requirements. Escalating enforcement steps, leading up to the issuance of stop work orders and providing flexibility for the inspector to establish appropriate compliance time frames on a case-by-case basis, are to be used as needed to ensure compliance. Existing inspection/enforcement procedures should be used to achieve this result. Depending on the severity of the violation, enforcement can range from a verbal warning to a written notice, withholding payment or suspension of work.

If a significant and/or immediate threat to water quality is observed by an inspector, action should be taken to require the contractor to immediately cease the discharge. A threat to water quality shall be based on an assessment by the inspector that runoff from a construction site will not be reasonably controlled by the protective measures in place or if a failure of BMPs is resulting in the release of sediments or other pollutants to a degree that may be substantially degrading water quality.

The following subsections contain an overview of typical enforcement steps that each Permittee should consider. However, each Permittee's program should be consistent with existing contract enforcement mechanisms while generally conforming to the elements described below.

Verbal Warnings

The most common initial method of requesting corrective action and enforcing compliance is a verbal warning from the inspector to the contractor. Verbal warnings are often sufficient to achieve correction of the violation, often while the inspector is present at the site. The inspector will notify the contractor's project supervisor of the violation, and document the violation and the notification of the project supervisor in the inspection file. In judging the degree of severity, the inspector may also take into account past history of similar or repeated violations by the same contractor at other sites.

Written Notices

If the deficiency noted in the verbal warning is not corrected within the time given, a written notice of violation may be issued describing the condition that is to be corrected and the time frame for correction and the follow-up inspection. A copy of the written notice will be given to the contractor's project supervisor and placed in the project file.

Withholding Payment

If deficiencies noted in written notices are not corrected within the required time frame, monies may be withheld from monthly progress payments until the contractor corrects the deficiency and comes into compliance with the contract.

Suspension of Work

If a written notice of violation is not addressed within the required time frame and a major violation is observed, such as a failure of BMPs that results in a significant release of sediment or other pollutants off site, the work may be suspended. A suspension of work order prohibits further construction activity until the problem is resolved and provides a time frame for correcting the problem. The suspension order may describe the infraction and specify what corrective action must be taken. To resume work the inspector must verify that the deficiencies have been satisfactorily corrected.

2.2.2.2.4 Report of Non-Compliance to the Regional Board

For projects subject to compliance with the General Construction Storm Water Permit or for which the Permittee has elected optional coverage under the municipal Permit, significant violations of state SWPPP requirements or conditions that are producing an immediate impact on receiving waters may be observed. Such significant violations may include, but are not limited to, the absence of a SWPPP on site and negligence in BMP implementation. In this case, in addition to taking appropriate contract enforcement action against the contractor, a Notice of Non-Compliance must be submitted by the Permittee to the Regional Board via facsimile or telephone within the next 2 business days.

2.2.3 Procedures to Seek Coverage under the Municipal Permit (Optional)

For public agency Development Construction Projects subject to the General Construction Storm Water Permit (greater than five acres), coverage may be obtained under the Municipal Permit for public construction projects if the following procedures are followed:

- Notify the Executive Officer of the Regional Board of the construction activity.
- Use a checklist of construction activity BMPs using BAT/BCT criteria for public construction activity as defined by the General Construction Storm Water Permit.
- Verify implementation of construction activity BMPs.
- Require a state SWPPP to be prepared and retained on site for each project.
- Report annually to the Executive Officer of the Regional Board as part of the Permittee's Annual Report under the Municipal Permit on the effectiveness of State SWPPPs for public construction activity sites, and certify compliance with the requirements in this program.

Guidance on conducting these procedures is included in Appendix E.

3.1 INTRODUCTION

3.1.1 Program Goal and Objectives

This program component is applicable to all Permittees who own and operate certain vehicle maintenance/materials storage facilities described in the Permit and detailed in Section 3.1.2. Activities at these facilities may generate waste, spills and leaks that could potentially reach the storm drain system and receiving waters in storm water runoff or as non-storm water discharges. The goal of this program is to make storm water quality a concern when conducting activities at municipal facilities.

Each Permittee's program must meet the requirements of the Los Angeles County municipal storm water permit (Permit), as summarized in Table 3-1.

Table 3-1

Permit Requirements - Vehicle Maintenance/Material Storage Facilities Management

Report Section	*Requirement (Summary)*	*Permit Section*
3.2.1	Develop pollution prevention plans for public vehicle maintenance/material storage facilities which have the potential to discharge pollutants into storm water.	IV.C.3.a
3.2.2	Implement BMPs to improve site-specific pollutant control including but not limited to good housekeeping practices; material storage control; vehicle leaks and spill control; illicit discharge control; training for employees on proper outdoor loading/unloading of materials; vehicle and equipment washing area control; regular maintenance of treatment structures such as sumps, oil/water separators, or equivalent; and proper waste handling and disposal.	IV.C.3.b

The objectives of this program component are to:

- Identify and evaluate sources of pollutants from public vehicle maintenance/material storage facilities that may affect the quality of storm water discharges from the facility.
- Identify and implement site-specific best management practices to reduce or prevent pollutants in storm water discharges.

R0001084

3.1.2 Facilities Covered by the Permit

Section IV.C.3.a of the Permit defines public vehicle maintenance/material storage facilities as "...any Permittee-owned or operated facility or portion thereof that:

i. Conducts industrial activity, operates equipment, handles materials, and provides services similar to federal Phase 1 facilities;

ii. Performs fleet vehicle maintenance on ten or more vehicles per day including repair, maintenance, washing, and fueling;

iii. Performs maintenance and/or repair of heavy industrial machinery/equipment; and

iv. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control, and Countermeasures (SPCC) plan."

Guidance on determining covered facilities is provided in Appendix F.

3.2 PROGRAM IMPLEMENTATION ELEMENTS

3.2.1 Pollution Prevention Plan

A pollution prevention plan will be developed and implemented, where applicable, for public vehicle maintenance/material storage facilities, as defined in Section IV.C.3.a of the Permit, to minimize the potential for pollutant discharges to the storm drain system. A model pollution prevention plan and guidance on how to develop and implement the plan are provided in Appendix F.

3.2.2 Best Management Practices for Site Specific Control

As part of the pollution prevention plan, BMPs must be selected and implemented, where applicable, that are appropriate to prevent or mitigate pollution generated from the specific activities at the site. A list of appropriate BMPs and guidance for BMP selection are provided in Appendix F.

4.1 INTRODUCTION

4.1.1 Program Goal and Objectives

This program component is applicable to all Permittees who own and operate recreational facilities. Maintenance practices at parks and recreation facilities generally include fertilizer and pesticide applications, vegetation maintenance and disposal, swimming pool chemical maintenance and draining, and trash and debris management. All of these maintenance practices have the potential to contribute pollutants to the storm drain system. If improperly managed, potential pollutants can be transported in runoff to the storm drain system and subsequently discharged to receiving waters. The goal of the program for landscape and recreational facilities management is to make storm water quality a concern when conducting operation and maintenance activities.

Each Permittee's program must meet the requirements of the Los Angeles County municipal storm water permit (Permit), as summarized in Table 4-1.

Table 4-1

Permit Requirements - Landscape and Recreational Facilities Management

Report Section	*Requirement (Summary)*	*Permit Section*
4.2.1	Implement procedures for application of pesticides, herbicides, and fertilizers that will include: a list of approved pesticides and selective and environmentally responsible uses, product and application information, application equipment use and maintenance, and record keeping.	IV.C.4.a
4.2.1	Implement procedures to minimize storm water pollution by pesticides and fertilizers used for landscape maintenance, including the utilization of Integrated Pest Management (IPM) techniques to the maximum extent practicable.	IV.C.4.b
4.2.1	Implement BMPs to reduce exposure of fertilizers and pesticides to storm water during storage, to include as applicable: storage indoors or under cover on paved surfaces, secondary containment, reduction in storage and handling of hazardous materials, and regular inspection of storage areas.	IV.C.4.e
4.2.1	Implement guidelines to schedule irrigation and fertilization to minimize chemical application during the wet season, to terminate chemical application during storm events, and to minimize overwatering and nutrients/pesticides entrainment.	IV.C.4.f
4.2.2	Implement procedures to prevent the disposal of landscape waste into the municipal storm drain system.	IV.C.4.c
4.2.3	Implement procedures to encourage retention and planting of native vegetation to reduce water, fertilizer, and pesticide needs.	IV.C.4.d

Table 4-1
Permit Requirements - Landscape and Recreational Facilities Management

Report Section	Requirement (Summary)	Permit Section
4.2.4	Implement procedures to manage discharges of municipal swimming pool water into the municipal storm drain system, including: dechlorination practices, proper disposal of clean-out waters, and piping of filter backwash to the sanitary sewer.	IV.C.4.g
4.2.5	Implement BMPs to minimize trash, debris, and other pollutants from entering recreational water bodies, including: routine trash collection along, on, and/or in water bodies, where feasible; and public outreach to educate the public about the impacts of illicit disposal.	IV.C.4.h

The objectives of this program component are to:

- Minimize the discharge of pesticides, herbicides and fertilizers to the storm drain system and receiving waters.
- Prevent the disposal of landscape waste into the storm drain system.
- Minimize trash, debris and other pollutants from entering Permittee-owned recreational water bodies.
- Discharge municipal swimming pool water in a manner that will not contribute pollutants to receiving waters.

4.1.2 Facilities Covered by the Permit

Landscape and recreational facilities include, but are not limited to:

- Parks
- Golf courses
- Swimming pools
- Riding trails
- Recreational water bodies
- Picnic areas
- Sports fields
- Landscaped areas in parking lots

R0001087

4.2 PROGRAM IMPLEMENTATION ELEMENTS

4.2.1 Pesticide, Herbicide and Fertilizer Management

4.2.1.1 Application and Record Keeping

The following procedures will be implemented, where applicable, to ensure that pesticides, herbicides and fertilizers are properly applied and handled to minimize their exposure to storm water. Application and handling procedures will be in compliance with federal, state and county regulations, as follows:

- Apply and handle pesticides and herbicides and keep detailed records in accordance with existing state regulations (California Title 3, Division 6, Pesticides and Pest Control Operations). The regulations cover a list of approved chemicals, product and application information, equipment use and maintenance procedures, and record keeping.
- Apply and handle fertilizers in strict accordance with the label directions.

Guidance on applying and handling these materials and a summary of the state regulations are provided in Appendix G.

4.2.1.2 Minimizing the Use of Pesticides and Fertilizers

The following pest control strategies will be implemented, where applicable, to emphasize the use of a hierarchy of controls, with a preference for mechanical controls (e.g., mowing) and biological controls (e.g., beneficial insects, pheromones) before chemical controls (e.g., pesticides, herbicides). This practice is often referred to as Integrated Pest Management (IPM), a pest management practice that considers the entire ecosystem when determining potential pest control strategies.

- Use mechanical control of vegetation whenever possible, such as mowing with tractor-type or pushmowers and hand cutting with gas or electric powered weed trimmers.
- Use hand weeding where practical.
- Consider the use of beneficial insects to control pests as part of a Preventive Maintenance Program.
- Incorporate the above requirements into application contracts.

Guidance on minimizing product use is provided in Appendix G.

4.2.1.3 Storage and Inspection

The following procedures will be implemented, where applicable, to handle pesticides and fertilizers in a manner that minimizes their exposure to storm water. Storage and inspection will be in compliance with federal, state and county regulations.

- Store materials in enclosed sheds or buildings or under cover on an impervious surface.
- Provide secondary containment around materials if stored outdoors or if material from a spill could flow outdoors.
- Keep only the minimum amount of hazardous materials on site.
- Periodically check areas for spills, leaks, or unsafe storage methods.

Guidance on storage and a summary of the state regulations are provided in Appendix G.

4.2.1.4 Scheduling

The following procedures will be implemented, where applicable, to schedule irrigation and fertilization application to minimize the discharge of pollutants that enter the storm drain system:

- Do not overwater landscaped areas, especially when irrigating after fertilizer/pesticide applications. Adjust watering locations and amounts to minimize non-storm water runoff.
- Avoid chemical applications during the wet season to minimize the amount of pollutant runoff in storm water.
- Do not apply chemicals during storm events.

4.2.2 Landscape Waste

Landscape waste consists of clippings, cuttings and droppings of leafy and woody materials. The following procedures will be implemented, where applicable, to assure that exposed materials and accumulated sediment, trimmings and litter will be disposed of properly and not to the storm drain system:

- Require all employees and contractors who generate landscape waste to dispose of it at a Permittee-approved composting location or permitted landfill; include such provisions in landscape maintenance contracts.
- Place temporarily stockpiled material away from watercourses, and berm or cover stockpiles to prevent material releases to the storm drain system.

4.2.3 Native Vegetation

The following procedures will be implemented, where applicable, to retain and plant native vegetation when practical to reduce water, fertilizer and pesticide needs.

- Determine existing native vegetation features (location, species, size, function, importance) and consider the feasibility of protecting them.
- Consider elements such as their effect on drainage and erosion, hardiness, maintenance requirements, and possible conflicts between preserving vegetation and the resulting maintenance needs.
- Where feasible, retain and/or plant selected native vegetation whose features are determined to be beneficial.

4.2.4 Municipal Swimming Pools

The following procedures will be implemented, where applicable, to manage discharges of municipal swimming pool water:

- Discharge filter backwash water and chemically treated water to the sanitary sewer, unless not possible.
- If discharging to the storm drainage system, dechlorinate the water through mechanical means (such as letting the water sit for several days without adding chlorine) or chemical means (such as by adding sodium bisulfite).
- Neutralize all other chemicals in discharges, such as acid wash residue, before discharging to the storm drain system.
- Incorporate the above requirements into maintenance contracts.

Guidance on dechlorination practices is provided in Appendix G.

4.2.5 Recreational Water Bodies

Beaches, picnic areas, lakes, and ponds receive a large number of visitors and may collect a large amount of litter, debris and other pollutants. To minimize the amount of potential pollutants that reach the water body, the following procedures will be implemented, where applicable:

- Provide and maintain trash receptacles to hold refuse generated by the public.
- Collect trash and debris from bins and along water bodies to minimize the amount of trash and debris that may contact the water.
- Collect trash and debris from within waterbodies where feasible.
- When necessary, increase collection during peak visitation months (generally June, July and August).

5.1 INTRODUCTION

5.1.1 Program Goal and Objectives

This program component is applicable to all Permittees who own and operate a storm drain system. The storm drain system functions primarily to collect and convey surface runoff to receiving waters during storms in order to prevent flooding. It is a common activity to maintain the storm drain system so that it functions hydraulically as intended during storms. The goal of this program is to reduce the impact of storm drain operation and maintenance activities on storm water quality.

Each Permittee's program must meet the requirements of the Los Angeles County municipal storm water permit (Permit), as summarized in Table 5-1.

Table 5-1

Permit Requirements – Storm Drain Operation and Management

Report Section	*Requirement (Summary)*	*Permit Section*
5.2.1	Implement BMPs for inlet maintenance to the maximum extent practicable, including but not limited to: inspection and cleaning of catch basins between May 1 and September 30 of each year; additional cleaning of catch basins, as necessary, between October 1 and April 30; record keeping of catch basins cleaned; and recording of the overall quantity of catch basin waste collected.	IV.C.5.a
5.2.2	Implement BMPs for storm drain maintenance to the maximum extent practicable, including but not limited to: proper disposal of material removed; removal of trash and debris from open channel storm drains at least annually between May 1 and September 30 of each year; and surveillance for debris buildup in open channels during the rainy season.	IV.C.5.b
5.2.3	Implement a waste management program to include: procedures to identify problem areas of illicit discharges for regular inspection, procedures to minimize to the maximum extent practicable the discharge of contaminants during municipal storm drain system cleanup to maintain optimum channel capacity, and a review of current maintenance activities to assure that appropriate storm water BMPs are being utilized.	IV.C.5.c

The objectives of this program component are to:

- Inspect and clean catch basins annually and keep appropriate records.
- Remove trash and debris annually from open channels and properly dispose of these materials to prevent them from being washed to receiving waters.
- Report prohibited non-storm water discharges observed during the course of normal daily activities so they can be investigated, contained and cleaned up or eliminated.
- Review maintenance activities to verify that they minimize the amount of pollutants discharged to receiving waters.

5.1.2 Facilities Covered by the Permit

Facilities covered under this program include storm drain systems owned and operated by the Permittee.

5.2 PROGRAM IMPLEMENTATION ELEMENTS

5.2.1 Catch Basins

The following BMPs will be implemented for inspection and cleaning of catch basins and associated recordkeeping.

- Compile a list that provides the location of all catch basins.
- Inspect and clean catch basins at least once per year between May 1 and September 30.
- Compile a list of Priority Catch Basins, which are catch basins in areas that generate significant refuse. Between October 1 and April 30, Priority Catch Basins must be cleaned before the sump is 40 percent full.
- Between October 1 and April 30, conduct any additional cleaning as needed to minimize the amount of litter and debris that washes to receiving waters.
- Record the following minimum information when inspecting or cleaning catch basins:
  - Dates inspected or cleaned
  - Locations of catch basins inspected or cleaned
  - Overall amount of material removed (estimated in either volume or dry weight)

R0001092

Guidance on conducting maintenance activities is provided in Appendix H, Section H.1. Examples of forms that may be used to collect information and additional guidance are provided in Appendix H, Section H.2.

5.2.2 Storm Drains

The following BMPs will be implemented, where applicable, to remove trash and debris from improved open channels and properly dispose of material removed during storm drain maintenance activities, assuming the Permittee can get any necessary approvals and permits for channel maintenance.

- Remove trash and debris from open channels at least once per year between May 1 and September 30.
- Between October 1 and April 30, check open channels for debris buildup and conduct additional removal as needed.
- Properly dispose of all material removed during storm drain cleaning and maintenance at an approved landfill or recycling facility.

Guidance on conducting maintenance activities is provided in Appendix H, Section H.1.

5.2.3 Waste Management

5.2.3.1 Illicit Discharge Identification

Illicit discharges may be encountered in any part of the storm drain system. Implement procedures, where applicable, to identify problem areas of illicit discharge. Guidance on identifying, reporting and responding to illicit discharges are discussed in the model Illicit Connection/Illicit Discharge Elimination Program.

5.2.3.2 Minimization of Contaminant Discharge

The following procedure will be implemented to the maximum extent practicable, where applicable, to minimize the amount of contaminants discharged when conducting storm drain maintenance activities:

- Properly handle materials and dispose of waste removed during maintenance activities in a manner that will not release the material to the storm drain system, or in any other way contaminate storm water runoff.

Guidance is provided in Appendix H, Section H.3.

R0001093

5.2.3.3 Maintenance Activity Review

The following procedures will be implemented, where applicable, to verify that appropriate storm water best management practices are incorporated into maintenance activities:

- Review current maintenance activities.
- Evaluate if they directly or indirectly contribute pollutants to receiving waters.
- Revise procedures as necessary to reduce the contribution of pollutants to receiving waters.
- Educate employees on revised procedures during regular safety and tailgate meetings.

6.1 INTRODUCTION

6.1.1 Program Goal and Objectives

This program component is applicable to all Permittees who own and/or operate streets and roads. Streets and roads may collect litter and debris from nearby activities, as well as from vehicular traffic. They also require routine maintenance that may generate waste materials. The goal of this component is to reduce the impact of Permittee street and road operations and maintenance on storm water quality.

Each Permittee's program must meet the requirements of the Los Angeles County municipal storm water permit (Permit), as summarized in Table 6-1.

Table 6-1

Permit Requirements - Streets and Roads Maintenance

Report Section	*Requirement (Summary)*	*Permit Section*
6.2.1	Implement a program to sweep curbed streets at a targeted frequency of at least monthly, and where feasible, more frequently in areas generating significant refuse.	IV.C.6.a
6.2.2	Implement a streets and roads maintenance program of BMPs for existing saw-cut management and paving practices, to include but not be limited to: avoidance during wet weather to the extent feasible, and material storage away from drainage areas to prevent storm water pollution or other equally effective BMPs.	IV.C.6.b.i
6.2.2	Implement a streets and roads maintenance program for management of concrete materials and wastes, including but not limited to: washout of concrete trucks off or on site in designated areas and not into storm drains, open ditches, streets, or catch basins; material storage under cover, away from drainage areas or other equally effective BMPs; and avoidance of excess mixing of concrete or cement on site.	IV.C.6.b.iv
6.2.3	Implement a streets and roads maintenance program including good housekeeping practices to insure proper management of any wastes that are generated.	IV.C.6.b.ii
6.2.4	Implement a streets and roads maintenance program including collection, transport, and disposal of maintenance waste at appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations.	IV.C.6.b.iii
6.2.5	Implement a streets and roads maintenance program including employee training to promote a clear understanding of the potential for maintenance activities to pollute storm water, and to identify and select appropriate BMPs.	IV.C.6.b.v

The objectives of this program component are to:

- Sweep curbed streets to reduce the discharge of pollutants associated with activities occurring in street and road rights-of-way.
- Minimize the discharge of pollutants associated with the maintenance of streets and roads.

6.1.2 Facilities Covered by the Permit

Facilities covered under this program include streets and roads owned and operated by the Permittee.

6.2 PROGRAM IMPLEMENTATION ELEMENTS

6.2.1 Sweeping

The following procedures will be implemented, where applicable:

- Sweep curbed streets at a targeted frequency of at least monthly (or 12 times per year); and
- Where feasible, sweep areas that generate significant refuse more frequently than monthly.

Guidance for establishing a more frequent sweeping schedule in areas generating significant refuse is provided in Appendix I, Section I.1.1. In implementing the street sweeping program, Permittees must also comply with the South Coast Air Quality Management District (SCAQMD) Rule 1186, which addresses particulate matter emissions from paved and unpaved roads and livestock operations. Additional information on SCAQMD Rule 1186 is included in Appendix I, Section I.1.2.

The two common types of sweepers used by Permittees are vacuum sweepers and mechanical broom/brush sweepers. Permittees have flexibility to use either type of sweeper except as regulated by SCAQMD Rule 1186. Guidance on operating street sweepers at optimum efficiency is provided in Appendix I, Section I.1.3.

6.2.2 Material Management

Street and road maintenance operations may include saw cutting, paving, or the use of concrete materials. Source control BMPs will be implemented to address each of these activities individually, and are described below.

6.2.2.1 Saw-Cut Slurry

Saw-cut activities can be conducted either with (wet) or without (dry) water. In either case, to the extent feasible, care will be taken to prevent materials resulting from saw-cut activities from entering the storm drain system. The following procedures will be implemented, where applicable:

- Do not perform saw-cut activities during wet weather, to the extent feasible.
- Remove wet slurry from street or gutter and dispose of at an appropriate designated location.
- Prevent slurry material from entering catch basin openings, maintenance holes, and storm drain inlets to the extent possible during wet cutting and, where feasible, collect captured flow for proper disposal.
- Clean up spills from equipment and activities and dispose properly.
- Store sawcutting materials away from drainage areas to prevent storm water pollution, or implement other equally effective BMPs.

Other BMPs that may be implemented during saw-cut activities are listed in Appendix I, Section I.2.1.

6.2.2.2 Paving

The following procedures will be implemented, where applicable:

- Do not conduct paving activities during wet weather to the extent feasible.
- Prevent paving materials from entering catch basin openings, maintenance holes, and storm drain inlets to the extent possible during application of liquid or emulsified asphalt, seal coat, tack coat, slurry seal, fog seal, etc.
- Store paving materials away from drainage areas to prevent storm water pollution or implement other equally effective BMPs.
- Do not clean paving equipment on site; restrict equipment cleaning to an appropriate designated location.

R0001097

Other BMPs that may be implemented during paving activities are listed in Appendix I, Section I.2.2.

6.2.2.3 Concrete

The following procedures will be implemented, where applicable:

- Wash concrete trucks off site or in designated areas on site, such that there is no discharge of concrete washwater into storm drains, open ditches, streets, catch basins, or other storm water conveyance structures.
- When washing poured concrete areas to remove fine particles and expose the aggregate, contain the wash water for proper disposal.
- Store concrete materials under cover, away from drainage areas, or implement other equally effective BMPs.
- Avoid mixing excess amounts of concrete on site.

Other BMPs that may be implemented for the management of concrete materials and wastes are provided in Appendix I, Section I.2.3.

6.2.3 Good Housekeeping

Good housekeeping practices will be implemented to properly manage wastes that are generated during streets and roads maintenance activities. The following procedures will be implemented to the maximum extent practicable:

- Prevent debris from entering the storm drain.
- Clean up spills and leaks immediately using dry methods, whenever possible.
- Sweep up dry materials and residue from cleaning operations.
- Collect non-hazardous dry waste in designated, leak-proof containers and dispose properly.
- Do not wash materials into a storm drain or bury spilled dry material.
- Promptly clean up trash, debris, and litter from job sites and dispose properly.
- Inspect vehicles and equipment regularly for leaks.
- Place stockpiled materials away from catch basins, storm drain inlets, drainage paths, and natural waterways.
- Control stockpiled materials if windy or rainy weather is predicted (e.g., tarps, berming, sandbags, etc.).

- Prevent storm water from eroding loose soil and stockpiles.
- Inspect stockpiles regularly and after significant rain events.
- Keep paved areas adjacent to stockpiles and earthwork sites free from loose sediment and tracked materials.
- Apply and store all products in accordance with manufacturer's instructions and proper safety measures.
- Store products in labeled containers and with covers or lids.
- Do not clean or rinse equipment into a street, gutter, or storm drain.

Other good housekeeping BMPs that may be implemented are provided in Appendix I, Section I.3.

6.2.4 Maintenance Waste Disposal

Procedures will be implemented, where applicable, to collect, transport, and dispose of maintenance waste at appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations. Optional disposal options include the reuse and recycling of appropriate materials.

6.2.5 Employee Training

Employee training programs will be carried out such that staff who conduct streets and roads maintenance activities will:

- Be educated about the potential pollutants that may be released as a result of maintenance activities,
- Be educated regarding procedures and specific BMPs to be implemented during street sweeping, road maintenance, waste disposal, as well as regarding general good housekeeping practices, and
- Know how to effectively implement all applicable procedures and BMPs while conducting streets and roads maintenance activities.

Guidance for training employees who are charged with the responsibility for implementing streets and roads maintenance activities is provided in Appendix I, Section I.4.

7.1 INTRODUCTION

7.1.1 Program Goal and Objectives

As part of their storm water quality management plan, all Permittees who own parking lots with more than 25 parking spaces that are located in areas potentially exposed to storm water must have a parking facilities management plan. The goal of this component is to reduce the impact of these parking facilities on the quality of storm water discharges and receiving waters.

Each Permittee's program must meet the requirements of the Los Angeles County municipal storm water permit (Permit), as summarized in Table 7-1.

Table 7-1
Permit Requirement - Parking Facilities Management

Report Section	*Requirement (Summary)*	*Permit Section*
7.2	Implement a parking facilities management plan that includes sweeping or other equally effective measures to remove debris from Permittee-owned parking lots with more than 25 parking spaces that are located in areas potentially exposed to storm water.	IV.C.7

The objective of this program component is to remove debris from parking facilities to reduce the amount of material that comes into contact with storm water.

7.1.2 Facilities Covered by the Permit

Facilities covered by this section include any Permittee-owned parking lots with more than 25 parking spaces that are located in areas potentially exposed to storm water. This may include public parking areas and municipal parking lots at facilities such as City Hall.

7.2 PROGRAM IMPLEMENTATION ELEMENTS

The following procedures will be implemented to remove debris from parking facilities:

- Conduct regular sweeping or other equally effective measures to remove debris from Permittee-owned parking lots covered by this program.
- Sweep Permittee-owned parking lots covered by this program at least once between August 15 and October 15 of each year.

Additional information on sweeping, including types of sweeping equipment and guidance for sweeper operation, is provided in Appendix I. Additional guidance for cleaning parking lots and implementing other BMPs at parking facilities is included in Appendix J.

8.1 INTRODUCTION

8.1.1 Program Goal and Objectives

Industrial activities, whether private or public, have the potential to contribute pollutants to storm water runoff. Many industrial facilities (Phase 1 facilities) are subject to the California General Industrial Activities Storm Water Permit (General Industrial Permit) for control of storm water pollution. The goal of the General Industrial Permit is to reduce the impact of industrial facilities on storm water quality. The goal of this section of the program is to procedurally simplify and reduce the cost of Permittees' compliance for their own industrial facilities by providing the option to obtain coverage under the Los Angeles County municipal storm water permit (Permit) in lieu of the General Industrial Permit.

If a Permittee desires to obtain coverage under this Permit for a Phase 1 facility, the Permittee's program must meet the requirements of the Permit, as summarized in Table 8-1.

Table 8-1

Permit Requirements - Public Industrial Activities

Report Section	*Requirement (Summary)*	*Permit Section*
8.2 (optional)	Implement procedures to seek coverage, as an option, under this Order for Phase I industrial facilities which are owned or operated by a Permittee.	IV.C.8.a

The objective of this program component is to comply with all requirements and conditions contained in the General Industrial Permit.

8.1.2 Facilities Covered by the General Industrial Permit

Facilities subject to the General Industrial Permit are those facilities owned or operated by a Permittee that are listed by category in 40 Code of Federal Regulations (CFR) Section 122.26(b)(14):

i. Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR Subchapter N)

ii. Manufacturing facilities

iii. Mining and oil and gas facilities

iv. Hazardous waste treatment, storage, or disposal facilities

v. Landfills, land application sites, and open dumps that receive industrial waste

vi. Recycling facilities

vii. Steam electric generating facilities

viii. Transportation facilities

ix. Sewage treatment plants

xi. Certain facilities if materials are exposed to storm water

Typical publicly-owned industrial facilities include airports, POTWs, vehicle maintenance facilities, and landfills. The impact of the regulations will vary depending on the type of facility. Most, if not all, airports have obtained coverage under an individual or group NPDES permit. POTWs are affected only if the facility's storm water runoff is not directed to the treatment facility or contained in some other way on site. Landfills are affected only if they receive or have received waste from industrial facilities covered by the Phase 1 regulations.

Corporation yards and the associated vehicle maintenance activities are technically not covered by the General Industrial Permit except for certain major vehicle maintenance facilities servicing a transportation fleet (i.e., bus system). However, under the Los Angeles County Permit, Permittees must develop pollution prevention plans for these facilities. See Section 4 of this document for more information on a program for corporation yards.

8.2 PROGRAM IMPLEMENTATION ELEMENTS (OPTIONAL)

Some, if not all, publicly-owned or operated industrial facilities are likely already covered (if the municipality has filed for coverage) by the General Industrial Permit or USEPA's Multi-sector Permit. Rather than file for separate General Industrial Permit coverage or renewal, equivalent coverage may be obtained for these facilities under the Los Angeles County Permit if the following procedures are implemented:

- Notify the Executive Officer of public industrial facilities owned or operated by the Permittee as defined in the General Industrial Permit.
- Use a checklist of BMPs using BAT/BCT criteria for public industrial facilities.
- Use a procedure to verify implementation of industrial facility BMPs.
- Prepare and retain site-specific SWPPPs.
- Report annually, to the Executive Officer of the Regional Board as part of the Permittee's Annual Report under the municipal storm water Permit, on the

R0001103

effectiveness of the SWPPPs and the results of the facility monitoring programs at public Phase 1 industrial facilities.

Guidance is provided in Appendix K.

9.1 INTRODUCTION

As part of their storm water quality management program, each Permittee must include a component addressing emergency repairs of essential public services and infrastructure, and response to natural disasters. The goal is to reduce the impact of emergency response activities on receiving waters, to the extent possible, without compromising public health and safety.

Each Permittee's program must meet the requirements of the Los Angeles County municipal storm water permit (Permit), as summarized in Table 9-1.

Table 9-1

Permit Requirement - Emergency Procedures

Report Section	*Requirement (Summary)*	*Permit Section*
9.2	Implement procedures for addressing emergency repairs of essential public services and infrastructure and responding to natural disasters.	IV.C.9

The objectives of this program component are to:

- Recognize that public health and safety are the highest priority when conducting emergency response activities.
- Protect surface water quality by incorporating appropriate BMPs into emergency response activities to the extent possible.

9.2 PROGRAM IMPLEMENTATION ELEMENTS

While responding to emergency situations and natural disasters such as, but not limited to, earthquakes, fires, floods, landslides, or windstorms, it is recognized that the highest priority for Permittees is public health and safety. The following procedures will be implemented, where applicable, to address receiving water quality during emergency repairs: **R0001105**

- BMPs to reduce impacts to the storm drain system and receiving waters will be considered and implemented during emergency response and repair activities, to the extent that such measures do not compromise public health and safety.
- After initial emergency response or emergency repair activities have been completed and essential public services have been restored, implement all appropriate BMPs as described in Sections 2 through 8 when performing additional repairs, clearing conveyance structures, repairing or rebuilding infrastructure, etc.

- As needed, coordinate with governmental agencies including, but not limited to, the Los Angeles County Department of Public Health, Los Angeles Regional Water Quality Control Board, California Department of Toxic Substances Control, and the California Office of Emergency Services.

BMPs that may be considered and other guidance on emergency procedures are provided in Appendix L.

10.1 INTRODUCTION

In accordance with the Permit model program requirement, the following is a discussion of the ongoing investigation of the feasibility of dry weather flow diversion from the storm drain system to municipal wastewater treatment plants. No action is required by the Permittees under this section. Dry weather flow diversion is currently being used, or its feasibility is being investigated, in several coastal cities in Los Angeles County. The purpose of dry weather or low-flow diversion is to direct pollutants in dry weather flows to wastewater treatment plants instead of the receiving waters.

10.2 EXISTING PROGRAMS

10.2.1 Santa Monica

The City of Santa Monica currently maintains two low-flow diversions: Pico-Kenter Storm Drain and the Santa Monica Pier Storm Drain, as described below.

Ponding and stagnation at the Pico-Kenter Storm Drain prompted one of the first diversion activities in early 1993. The dry weather flow is diverted by means of a vault and pump and then eventually gravity flows to the Moss Avenue Pump Station and then to the Hyperion Treatment Facility.

The Santa Monica Pier Storm Drain empties a small, commercial watershed known as the Promenade. During dry weather flow, stagnation occurs due to the shallow slope of the drain, which results in high concentrations of pollutants. While no diversion system has been built, the low flow is manually pumped to the Hyperion Treatment Facility.

10.2.2 Manhattan Beach

The City of Manhattan Beach currently maintains one dry weather flow division at the Manhattan Beach Pier. Prior to the implementation of the diversion, runoff would accumulate and ponding would occur below the pier. Now in place, a rain switch diversion allows wet weather flow to runoff directly into the ocean and dry weather flow to be diverted to a treatment facility. This is achieved using a system involving a wet well, pump, vault, and weir.

10.2.3 Los Angeles City

The major storm drains that flow from the City of Los Angeles to Santa Monica Bay were evaluated to determine if storm drain runoff and adjacent beach water quality justify the need for dry-weather low-flow diversions. Twelve low-flow diversion projects were identified. As of January 2001, five projects have been completed or are under construction, as summarized below:

Construction Completed

1. Pico-Kenter Low-Flow Diversion - constructed and to be operated in equal partnership with the City of Santa Monica, and will flow to the Santa Monica Urban Runoff Recycling Facility (SMURRF, see below).
2. Thornton Avenue Low-Flow Diversion - flows to the Hyperion Treatment Plant.
3. Bay Club Low-Flow Diversion - flows to the Hyperion Treatment Plant.

In Construction

1. Santa Monica Urban Runoff Recycling Facility (SMURRF) - in construction and to be operated in equal partnership with the City of Santa Monica.
2. Palisades Park Low-Flow Diversion - will flow to the Hyperion Treatment Plant.

10.2.4 Los Angeles County Department of Public Works

The Los Angeles County Department of Public Works has completed or is in the process of constructing the following five dry weather flow diversion projects:

- Alamitos Bay Pump Station (City of Long Beach) – completed and operational;
- Ashland Avenue Drain (City of Santa Monica) – undergoing design modifications and expected to be operational in the summer of 2001;
- Brooks Avenue Drain (City of Los Angeles) – completed and operational;
- Herondo Drain (City of Redondo Beach) – completed and operational; and
- Pershing Drive Drain (City of Los Angeles) – undergoing design modifications and expected to be operational in the summer of 2001.

[Information updated 12/2000.]

10.2.5 Torrance, Hermosa Beach, and Redondo Beach

The cities of Torrance, Hermosa Beach, and Redondo Beach applied for state funding in a joint effort to divert the dry weather flow of the Herondo Drain. The problem was that sand

accumulated at the drain outlet and dry weather flow subsequently built up, overflowing onto the street and inducing street closures for cleanup and repair. The Los Angeles County Department of Public Works was the lead agency for this diversion project. The project has been completed and is operational. *[Information updated 12/2000.]*

10.3 FEASIBILITY STUDIES

10.3.1 Santa Monica

Both the Pico-Kenter and Santa Monica Pier Storm Drain low-flow diversions are temporary implementation measures to reduce bay pollution. The City of Santa Monica is currently in the process of designing the Pico-Kenter Storm Water reclamation plant to treat low-flow storm water. Feasibility studies have been performed and the design process will be completed in less than a year, with anticipated facility completion in 1999. This reclaimed water will be used for aquifer recharge, highway vegetation, and sold for reuse purposes such as irrigation.

10.3.2 Malibu

The City of Malibu recently received a 1992 Proposition A grant worth $1.3 million to remediate the Malibu Lagoon and study alternatives to prevent its future contamination. One such alternative is dry weather flow diversion. Approximately $150,000 has been allocated for preliminary engineering and environmental analyses to be performed over an 18-month period. The anticipated time of completion for the cleanup of the Malibu Lagoon is the summer of the year 2000.

APPENDIX A

EXCERPTS FROM THE PERMIT

IV. Public Agency Activities

Table 5 shows the summary of requirements under this section and their corresponding compliance dates.

Table 5
Public Agency Activities Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Evaluate existing public agency activities and develop a model program to reduce storm water impacts	IV.A	✓		16 (December 1, 1997)	Executive Officer
Develop a program to reduce storm water impacts from public agency activities with a schedule for implementation	IV.B		✓	4 months after Executive Officer approval of model ≤ 36 months (July 30, 1999)	N/A

A. Public Agency Model Program

The Principal Permittee, in consultation with the Permittees, shall develop a model program to reduce the impact of public agency activities on storm water quality not later than December 1, 1997. The model program shall include a discussion of the on-going investigation of the feasibility of dry weather flow diversion from the MS4 to municipal waste water treatment plants, where appropriate. The model shall be submitted to the Regional Board for approval.

To minimize costs and avoid duplication of effort, it is encouraged to incorporate and recognize in the model program existing regulations, requirements and plans, such as waste minimization plans, spill prevention control and countermeasures, and business plans.

B. Permittee Public Agency Programs

Each Permittee shall develop and implement a Public Agency Program based on the model program developed by the Principal Permittee not later than four

months after commencement of its next fiscal year following approval of the model program by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

C. Program Requirements

Both the model program and the Permittee programs shall at a minimum include, where applicable:

1. Sewage Systems Operations

   a. Procedures to keep sewage spills or leaks from facilities operated by a Permittee from entering the MS4 to the maximum extent practicable;

   b. Procedures to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers operated by a Permittee to the MS4;

   c. Procedures to respond to overflows and investigate complaints;

   d. Procedures to insure that the Permittee is able to investigate any suspected connections or cross connections from the sanitary sewer systems to the MS4; and

   e. Procedures to notify public health agencies with discretionary decision authority on beach closures when there is a threat to public health.

2. Public Construction Activities Management

   a. Storm water management requirements for the design and construction of public facilities consistent with the requirements and time lines specified for private development in Part 2.III.A and III.B.

   b. Procedures to seek coverage, as an option, under this Order for construction activity with a disturbed area of five acres or more (Phase 1, 40 CFR 122.26) which is under taken by or on behalf of the Permittee, if the Permittee develops:

i. A process for notifying the Executive Officer of Permittee's construction activity;

ii. A checklist of construction activity BMPs using BAT/BCT criteria for public construction activity;

iii. A procedure to verify implementation of construction activity BMPs;

iv. A requirement to prepare and retain site-specific SWPPPs;

v. A procedure to report annually on the effectiveness of SWPPPs at public construction activity sites, and certify compliance with the requirements in this Order.

3. Vehicle Maintenance/Material Storage Facilities Management

a. Model pollution prevention plan for public vehicle maintenance/material storage facilities which have the potential to discharge pollutants into storm water. A public vehicle maintenance/material storage facility is any Permittee-owned or operated facility or portion thereof that:

i. Conducts industrial activity, operates equipment, handles materials, and provides services similar to Federal Phase 1 facilities;

ii. Performs fleet vehicle maintenance on ten or more vehicles per day including repair, maintenance, washing, and fueling;

iii. Performs maintenance and/or repair of heavy industrial machinery/equipment; and

iv. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control, and Counter-measures (SPCC) plan.

b. BMPs to improve site specific pollutant control including but not be limited to:

i. Good housekeeping practices;

ii. Material storage control;

iii. Vehicle leaks and spill control;

iv. Illicit discharge control;

v. Training for employees on proper outdoor loading/unloading of materials;

vi. Vehicle and equipment washing area control;

vii. Regular maintenance of treatment structures such as sumps, oil/water separators, or equivalent; and

viii. Proper waste handling disposal.

4. Landscape and Recreational Facilities Management

a. Procedures for application of pesticides, herbicides, and fertilizers that will include:

i. List of approved pesticides and selective and environmentally responsible uses;

ii. Product and application information;

iii. Application equipment use and maintenance; and

iv. Record keeping.

b. Procedures to minimize storm water pollution by pesticides and fertilizers used for landscape maintenance, including the utilization of Integrated Pest Management (IPM) techniques to the maximum extent practicable;

c. Procedures to prevent the disposal of landscape waste into the MS4;

d. Procedures to encourage retention and planting of native vegetation to reduce water, fertilizer, and pesticide needs;

e. BMPs to reduce exposure of fertilizers and pesticides to storm water during storage, to include as applicable, the following:

i. Storage indoors or under cover on paved surfaces;

ii. Secondary containment;

iii. Reduction in storage and handling of hazardous materials;

iv. Regular inspection of storage areas;

f. Guidelines to schedule irrigation and fertilization to minimize:

i. Chemical application during wet season and to terminate chemical application during storm events; and

ii. Over-watering and nutrients/pesticides entrainment.

g. Procedures to manage discharges of municipal swimming pool water into the MS4, including dechlonnation practices, proper disposal of clean-out waters, and piping of filter backwash to the sanitary sewer;

h. BMPs to minimize trash, debris, and other pollutants from entering Permittee-owned recreational water bodies, to include:

i. Routine trash collection along, on, and/or in, water bodies, where feasible; and

ii. Public outreach to educate the public about impacts of illicit disposal.

5. Storm Drain Operation and Management

a. BMPs for Inlet Maintenance to be implemented to the maximum extent practicable, including but not be limited to:

i. Inspection and cleaning of catch basins between May 1 and September 30 of each year;

ii. Additional cleaning of catch basins, as necessary, between October 1 and April 30;

iii. Record keeping of catch basins cleaned; and

iv. Recording of the overall quantity of catch basin waste collected.

b. BMPs for Storm Drain Maintenance to be implemented to the maximum extent practicable, including but not be limited to:

i. Proper disposal of material removed;

ii. Removal of trash and debris from open channel storm drains at least annually between May 1 and September 30 of each year;

iii. Surveillance for debris buildup in open channels during the rainy season.

c. Waste Management program to include:

i. Procedures to identify problem areas of illicit discharge for regular inspection;

ii. Procedures to minimize to the maximum extent practicable the discharge of contaminants during MS4 cleanup to maintain optimum channel capacity; and

iii. A review of current maintenance activities to assure that appropriate storm water BMPs are being utilized.

6. Streets and Roads Maintenance

a. Program to sweep curbed streets at a targeted frequency of:

i. At least monthly; and,

ii. Where feasible, more frequently in areas generating significant refuse.

b. Streets and roads maintenance program including:

i. BMPs for existing saw-cut management and paving practices to include but not be limited to:

aa. Avoidance during wet weather to the extent feasible; and

bb. Material storage away from drainage areas to prevent storm water pollution or other equally effective BMPs.

ii. Good housekeeping practices to insure proper management of any wastes that are generated;

iii. Collection, transport, and disposal of maintenance waste at appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations;

iv. Management of concrete materials and wastes including but not limited to:

aa. Washout of concrete trucks off- or on-site in designated areas and not into storm drains, open ditches, streets, or catch basins;

bb. Material storage under cover, away from drainage areas or other equally effective BMPs; and

cc. Avoidance of excess mixing of concrete or cement on-site.

v. Employee training to:

aa. Promote a clear understanding of the potential for maintenance activities to pollute storm water; and

bb. Identify and select appropriate BMPs.

7. Parking Facilities Management

Parking Facilities Management Plan to include sweeping or other equally effective measures to remove debris from Permittee-owned parking lots with more than twenty-five parking spaces that are located in areas potentially exposed to storm water.

8. Public Industrial Activities

a. Procedures to seek coverage, as an option, under this Order for Phase I industrial facilities which are owned or operated by a Permittee, if the Permittee develops:

i. A process for notifying the Executive Officer of public industrial facilities owned or operated by the Permittee;

ii. A checklist of BMPs using BAT/BCT criteria for public industrial facilities;

iii. A procedure to verify implementation of industrial facility BMPs;

iv. A requirement to prepare and retain site specific SWPPPs; and

v. A procedure to report annually on the effectiveness of SWPPPs and the results of the facility monitoring programs at public

Phase 1 industrial facilities, and certify compliance with the requirements of this Order.

9. Emergency Procedures

Procedures for addressing emergency repairs of essential public services and infrastructure and responding to natural disasters.

This space is left intentionally blank.

APPENDIX B

SEWAGE SYSTEMS OPERATIONS GUIDANCE

B.1 SPILL/LEAK/OVERFLOW RESPONSE AND INVESTIGATION

Sewage incident response and investigation may involve a coordinated effort between staff from a number of different departments/agencies. These will include staff from sewer system maintenance and may involve street and road maintenance, if the incident is in the public right-of-way; storm drain maintenance, if the incident reaches the storm drain system; and LACDPW if the incident reaches the county storm drain system. When an incident is reported, staff shall at a minimum:

- Dispatch appropriate personnel to perform material cleanup.
- Contain the spill and minimize the release to the storm drain system or receiving waters.
- Record required information at the spill site.
- Perform field tests as necessary to determine the source of the spill.

Additional investigations of the sewer system should be conducted to determine the cause of the incident, and steps should be taken to prevent similar occurrences in the future.

Permittees who own and/or operate sanitary sewer facilities will be responsible for carrying out this prevention and response program. Therefore, Permittees who contract with the Los Angeles County Sanitation District (LACSD) or any other agency for collection, transmission and treatment of their wastewater flows should develop a cooperative policy with the agency, either formal or informal, that addresses similar spill/leak/overflow response procedures and protection of the storm drain system.

Any existing local standard operating procedures and spill response plans should be reviewed to confirm that the response to sewage overflows or spills contains the procedures discussed in Section 1 of this document. Where applicable, procedure changes should be made to protect the storm drain system from sewage spills.

B.2 PREVENTIVE AND CORRECTIVE MAINTENANCE

Routine preventive and corrective maintenance is one method to prevent sewage overflows from occurring. These procedures may reveal portions of the sewage system that have blockages or other problems. Existing sewer maintenance procedures and activities should be reviewed to make sure a procedure is documented and in place for identifying potential problems in the

sewer system, reporting potential problems to the appropriate supervisor, and having problems repaired.

B.2.1 Identifying Potential Problems

During routine maintenance and inspection, crews observe portions of the sewage system on a regular basis. To identify potential problems, crews should note the condition of various structures and identify areas that need repair. Items to note may include the following:

- Cracked/deteriorating pipes
- Leaking joints/seals at manhole
- Line plugs frequently
- Line generally flows at or near capacity
- Suspected exfiltration
- Other

B.2.2 Reporting and Repairing Potential Problems

Potential problems noted in B.2.1 should be documented and reported to the appropriate manager or supervisor in charge of sewer system repairs. This manager or supervisor should be responsible for prioritizing and coordinating repair work.

There are three general priorities that may be used: immediate repair, scheduled repair, and capital improvement. The priority of the repair depends on the nature and severity of the problem.

- Immediate repair is for overflow that is currently occurring, or for urgent problems which may cause an imminent overflow. This may be the case for pump station failures, sewer line ruptures, sewer line blockages, etc. These repairs may be temporary until scheduled or capital improvements can be completed.
- Scheduled repair is for problems that do not require immediate attention, and are relatively simple to repair within the capabilities of available maintenance personnel. Examples include lubricating pump motors, sealing cracks, flushing sewer lines, repairing manholes, etc.
- Capital improvements are for large scale repair or replacement projects. Examples include rehabilitating sewer lines, constructing or replacing new pump stations, installing new sewer lines, etc.

B.3 CROSS-CONNECTIONS

To ensure that suspected cross-connections are investigated, Permittees should consider keeping detailed records and/or issuing permits for all sewer and storm drain connections and lines. This would create a permanent record of all known facilities. Information on both sewer connections and storm drain connections should describe where and when the connection was made and to what pipe the connection was made. Information on new sewer lines or storm drain lines should describe the alignment of the new sewer or storm drain line and when the line was constructed.

B.4 PUBLIC HEALTH AGENCY NOTIFICATION

In addition to notifying the public health agency with discretionary decision authority to close beaches, Permittees should contact the spill response phone number of any municipality where a sewage spill may discharge. A list of spill response telephone numbers is included as Attachment B1.

APPENDIX C

RECOMMENDED BMPs for SITE PLANNING, POST-CONSTRUCTION, and REDEVELOPMENT/INFILL

Appendix C
Recommended BMPs for Site Planning, Post-Construction, and Redevelopment/Infill

Site Planning BMPs
Minimize Storm Water Runoff
Pervious Drainage System
Reduce Area of Impervious Surface
Site Layout

Post-Construction BMPs	
BMP Name	**BMP Identification No. and Name [a]**
Aboveground Tank Berms	SC41, Aboveground Tank Berms
Car Wash Facility	SC3, Vehicle and Equipment Washing and Steam Cleaning
Catch basin insert	Not applicable.
Catch-basin screen	Not applicable.
Cistern collection systems	Not applicable.
Clarifiers	Not applicable.
Constructed Wetlands	TC3, Constructed Wetlands
Continuous flow deflection/separation systems	Not applicable.
Control of Impervious Runoff	Not applicable.
Curb elimination on landscape areas	Not applicable.
Detention/Infiltration device maintenance	SC75, Has the developer/owner determined how detention/infiltration devices planned for the site will be maintained
Drip Irrigation systems	Not applicable.
Efficient Irrigation	Not applicable
Energy Dissipaters	ESC40, Outlet Protection
Extended Detention Basins	TC5, Extended Detention Basin
Facility design to divert wash-off to sanitary sewers	Not applicable.
Filtration systems	Not applicable.
Flow diversion to landscape or pervious areas	Not applicable.
Geotextiles and Mats	ESC20, Geotextiles and Mats
Illicit Connection Prevention	SC60, Illicit Connection Prevention – Will any planned connections to the storm drain carry non-storm water discharges
Infiltration Basins	TC1, Infiltration
Infiltration Trenches	TC1, Infiltration
Inlet Trash Racks	Not applicable.
Landscape Design	ESC2, Preservation of Existing Vegetation; ECS10, Seeding and Planting; ESC11, Mulching
Linings for Urban Runoff Conveyance Channels	Not applicable.
Materials Management	SC5, Outdoor Loading/Unloading of Materials; SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products
Material storage management	SC20, Material storage control – Design site with bermed and covered storage areas for material storage located away from storm drains
Media Filtration	TC6, Media Filtration

[a] Corresponds to the BMP number and name as in the *California Storm Water Best Management Practice Handbooks* (1993).

Post-Construction BMPs (continued)	
BMP Name	**BMP Identification No. and Name [a]**
Motor Fuel Concrete Dispensing Areas	SC2, Vehicle and Equipment Fueling
Motor Fuel Dispensing Area Canopy	SC2, Vehicle and Equipment Fueling
Multiple treatment systems in combination	TC8, Multiple treatment systems in combination
Normal flow separation/storage systems	Not applicable.
Non-storm water discharges elimination	SC1, Eliminate non-storm water discharges to the storm drain collection system
Oil/Water Separators and Water Quality Inlets	TC7, Oil/Water Separators and Water Quality Inlets
Outdoor Process Equipment Operation and Maintenance	SC7, Outdoor Process Equipment Operation and Maintenance – Design site to include a canopy over outdoor processes
Outdoor Storage	SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products
Pesticide and fertilizer use elimination or reduction	Not applicable.
Porous Pavement and Alternative Surfaces	TC1, Infiltration
Post signs to caution improper practices or to educate	Not applicable.
Primary waste-water treatment systems	Not applicable.
Protect Slopes and Channels	ECS40, Outlet Protection; ESC42, Slope Roughening and Terracing
Retention grading	Not applicable.
Scheduling	ESC1, Scheduling activity
Secondary waste-water treatment systems	Not applicable.
Self -Contained Areas for Vehicle or Equipment Washing, Steam Cleaning, Maintenance, Repair, or Material Processing	SC3, Vehicle and Equipment Washing and Steam Cleaning; SC4, Vehicle and Equipment Maintenance and Repair; SC7, Outdoor Process Equipment Operations and Maintenance
Storm Drain System Stenciling and Signage	SC30, Storm Drain System Signs
Trash Container Areas	SC9, Waste Handling and Disposal
Vacuum sweeping of parking lots	Not applicable
Vegetated buffer zones	Not applicable.
Vegetated Swales and Strips	TC4, Bio-filters
Wet Pond	TC2,Wet Pond

[a] Corresponds to the BMP number and name as in the *California Storm Water Best Management Practice Handbooks* (1993).

Redevelopment and Infill BMPs	
BMP Name	**BMP Identification No. and Name [a]**
Aboveground Tank Berms	SC41, Aboveground Tank Berms
Car Wash Facilities	SC3, Vehicle and Equipment Washing and Steam Cleaning
Catch basin insert	Not applicable.
Catch-basin screen	Not applicable.
Cistern collection systems	Not applicable.
Clarifiers	Not applicable.
Continuous flow deflection/separation systems	Not applicable.
Control of Impervious Runoff	Not applicable.
Curb elimination on landscape areas	Not applicable.
Detention/Infiltration device maintenance	SC75, Has the developer/owner determined how detention/infiltration devices planned for the site will be maintained
Drip Irrigation systems	Not applicable.
Efficient Irrigation	Not applicable.
Energy Dissipaters	ESC40, Outlet Protection
Facility design to divert wash-off to sanitary sewers	Not applicable.
Filtration systems	Not applicable.
Flow diversion to landscape or pervious areas	Not applicable.
Geotextiles and Mats	ESC20, Geotextiles and Mats
Illicit Connection Prevention	SC60, Illicit Connection Prevention – Will any planned connections to the storm drain carry non-storm water discharges
Landscape Design	ESC2, Preservation of Existing Vegetation; ECS10, Seeding and Planting; ESC11, Mulching
Linings for Urban Runoff Conveyance Channels	Not applicable.
Materials Management	SC5, Outdoor Loading/Unloading of Materials; SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products
Material storage management	SC20, Material storage control – Design site with bermed and covered storage areas for material storage located away from storm drains
Media Filtration	TC6, Media Filtration
Motor Fuel Concrete Dispensing Areas	SC2, Vehicle and Equipment Fueling
Motor Fuel Dispensing Area Canopy	SC2, Vehicle and Equipment Fueling
Multiple treatment systems in combination	TC8, Multiple treatment systems in combination
Non-storm water discharges elimination	SC1, Eliminate non-storm water discharges to the storm drain collection system
Normal flow separation/storage systems	Not applicable.
Oil/Water Separators and Water Quality Inlets	TC7, Oil/Water Separators and Water Quality Inlets
Outdoor Process Equipment Operation and Maintenance	SC7, Outdoor Process Equipment Operation and Maintenance – Design site to include a canopy over outdoor processes

[a] Corresponds to the BMP number and name as in the *California Storm Water Best Management Practice Handbooks* (1993).

Redevelopment and Infill BMPs (continued)	
BMP Name	**BMP Identification No. and Name [a]**
Outdoor Storage	SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products
Pesticide and fertilizer use elimination or reduction	Not applicable.
Porous Pavement and Alternative Surfaces	TC1, Infiltration
Post signs to caution improper practices or to educate	Not applicable.
Primary waste-water treatment system	Not applicable.
Protect Slopes and Channels	ECS40, Outlet Protection; ESC42, Slope Roughening and Terracing
Retention grading	Not applicable.
Scheduling	ESC20, Scheduling activity
Secondary waste-water treatment systems	Not applicable.
Self-Contained Areas for Vehicle or Equipment Washing, Steam Cleaning, Maintenance, Repair, or Material Processing	SC3, Vehicle and Equipment Washing and Steam Cleaning; SC4, Vehicle and Equipment Maintenance and Repair; SC7, Outdoor Process Equipment Operations and Maintenance
Storm Drain System Stenciling and Signage	SC30, Storm Drain System Signs
Trash Container Areas	SC9, Waste Handling and Disposal
Vacuum sweeping of parking lot	Not applicable.
Vegetated buffer zones	Not applicable.
Vegetated Swales and Strips	TC4, Bio-filters

[a] Corresponds to the BMP number and name as in the *California Storm Water Best Management Practice Handbooks* (1993).

R0001133

APPENDIX D

BMP SELECTION CRITERIA

The following criteria should be considered during the process of assessing the appropriateness (benefits and limitations) of BMPs for a particular project:

- project characteristics;
- site factors;
- pollutant removal capability;
- short-term and long-term costs;
- responsibility for maintenance;
- contributing watershed area; and
- environmental enhancement.

D.1 PROJECT CHARACTERISTICS

Selection of BMPs for a project is a function of project characteristics, such as type or size of project. Post-construction activities and operations that may be potential sources of storm water pollution are often the same for a given type of project. Projects developed on large sites provide the opportunity to incorporate a wider variety of BMPs, whereas smaller sites often have physical constraints precluding implementation of BMPs requiring large land areas.

D.2 SITE FACTORS

Site factors have common physical restrictions on BMPs and include:

Steep Slopes: Steep slopes restrict the use of several BMPs. Porous pavement must be situated in sites with slopes of 5 percent or less. Swales can only be used if their slope is less than 5 percent; however, swales often can be used perpendicular to the slope or with a drop structure. Also, because of slope stability concerns, infiltration trenches and filter strips are not practical when slopes exceed 20 percent.

High Water Table: The water table acts as an effective barrier to exfiltration and can sharply reduce the ability of an infiltration BMP to drain properly. If the height of the seasonally high water table extends to within 4 feet (1.2 meters) of the bottom of an infiltration BMP, the site is seldom considered suitable. Given the climate and geology of Southern California, this is typically not an issue, except for some areas adjacent to surface water bodies.

Soil Permeability: The type of soil is an important characteristic that can limit the applicability of a particular BMP at a particular site since the long term percolation rate is governed by soil type. This

soil permeability factor is particularly relevant to infiltration BMPs, which should not be applied to sites with infiltration rates of less than 0.27 inch per hour (0.686 centimeters), as defined by the least permeable layer in the shallow soil profile. This limiting rate excludes most "C" and "D" soils (Soil Classification System) which cannot exfiltrate enough runoff through the subsoil. In addition, extremely permeable sandy soils may not maintain adequate water levels in wet ponds.

Proximity to Foundations and Wells: Since infiltration BMPs divert runoff back into the soil, some development sites may experience difficulty with local seepage, especially if located near a building foundation. Another risk due to diverted runoff through infiltration may be contamination of groundwater supplies. Limited research has been performed to evaluate this risk, however, it is advisable to maintain infiltration BMPs at least 100 feet (30 meters) from drinking water wells. The risk is greater when shallow soils with organic materials are bypassed.

Climatic Region: BMPs should include appropriate designs to address issues of rainfall volume and intensity during wet weather seasons so as to consider the economic feasibility of using such BMPs and/or designs. Typically, the evaluation of long term rainfall records must be considered together with site conditions to properly size structural treatment BMPs. In addition, wet ponds require some continuous flow (dry weather water source) to keep them from stagnating or developing odor and mosquito problems.

Land Consumption: Some sites are too intensively developed or limited in area to allow for some BMPs, such as pond BMPs and porous pavement, which require a large surface area and buffer area.

Maximum Depth: To preserve storage capacity for subsequent rain events, keep water from stagnating, and provide optimal pollutant removal conditions, infiltration BMPs must be designed to completely drain within 2 to 3 days after a storm. If the infiltration rates of the underlying soils are slow, the available depth of the infiltration facility may be limited. These restrictions vary depending on whether the facility is a trench, basin, injection well, or porous pavement.

Restricted Land Uses: Certain BMPs can only be applied to particular land uses, and are not broadly applicable for all development sites. Porous pavement can only be used for sites with parking lots not expected to receive heavy car or truck traffic, or much sediment.

High Sediment Input: Most BMPs are unable to handle the large loads of sediment that may be generated during the construction phase of development. Infiltration BMPs are particularly susceptible to rapid clogging and subsequent failure if significant sediment loads are allowed to enter the structure. As a general rule, these BMPs should not be installed until all of the land to be disturbed by construction in the contributing watershed is effectively stabilized and will remain

stabilized. Contractors must often take unusual steps during the actual installation of the infiltration BMPs to prevent soil compaction or contamination by sediment. To prevent clogging of the infiltration BMPs after construction, many designs call for the use of a pre-treatment device to filter sediment and other coarse particles before they reach the infiltration BMP. In addition, in areas where large amounts of fine sediment may occur even in the absence of upstream construction, BMPs such as porous pavement are not recommended.

Landscape Enhancement: If properly designed, many BMP options have the potential to enhance the urban landscape. Wet ponds and wetlands are frequently used to create a waterfront effect in residential developments, and may actually increase the value of the adjacent property. Dry extended detention areas can serve as attractive parks, either manicured or natural in design, or sports fields. Given the typical rainfall patterns in Southern California, these open areas would be available for public use most of the year. Most infiltration BMPs or lined detention areas have a neutral or negative effect on landscape appearance. In general, BMPs may be visually attractive or aesthetically unappealing, depending upon the creativity of the project designer.

D.3 POLLUTANT REMOVAL CAPABILITY

The nature of the pollutant being removed and its concentration often sets an upper limit on the potential removal rate that can be achieved with a given BMP. The pollutant removal capability of a BMP is primarily governed by three interrelated factors: removal mechanisms as affected by the design of the BMP, fraction of the annual runoff volume that is effectively treated, and nature of the urban pollutant being treated.

Pollutants such as sediment and lead (which is typically bound to fine sediment) can be removed effectively by common BMP removal mechanisms, including settling and filtering. Soluble pollutants such as nitrate, phosphate, and some trace metals are more difficult to remove and require biological and/or chemical mechanisms, such as uptake by bacteria, algae, rooted aquatic plants, organic material, terrestrial vegetation, or soils.

D.4 SHORT-TERM AND LONG-TERM COSTS

The appropriateness of a BMP for a particular site can be affected by economic feasibility considerations that encompass short- and long-term cost factors. Short-term costs include installation costs for both materials and labor. Long-term costs include maintenance. To sustain proper function, some BMPs require low level maintenance on a regular and frequent basis, whereas other BMPs require infrequent maintenance of a more extensive nature. Maintenance costs will

include the proper disposal of accumulated material. In selecting a control method, cost considerations—construction, installation, and maintenance—associated with the BMP should be considered.

D.5 RESPONSIBILITY FOR MAINTENANCE
