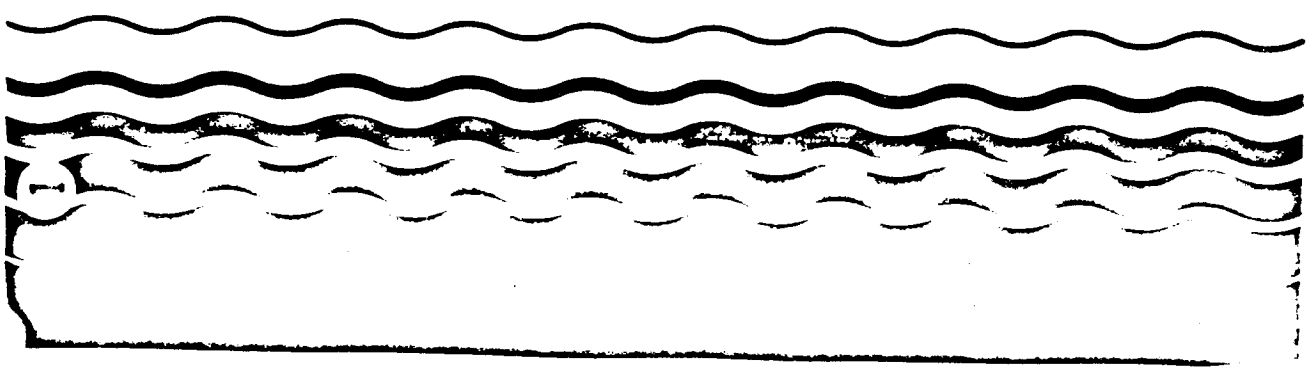
Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges From Municipal Separate Storm Sewer Systems

VOL 2 3

0595



FOREWORD

This manual provides detailed guidance on the development of Part 2 permit applications for municipal separate storm sewer systems. It provides technical assistance and support for all municipal separate storm sewer systems subject to regulatory requirements under the National Pollutant Discharge Elimination System (NPDES) program for storm water point source discharges. This manual also emphasizes the application of pollution prevention measures and implementation of Best Management Practices (BMPs) to reduce pollutant loadings and improve water quality.

The control of pollution from urban and industrial storm water discharges is critical in maintaining and improving the quality of the Nation's waters. Pollutants in storm water discharges from many sources are largely uncontrolled. The *National Water Quality Inventory, 1990 Report to Congress*, provides a general assessment of water quality based on biennial reports submitted by the States under Section 305(b) of the Clean Water Act (CWA). The report indicates that roughly one third of the impairment in assessed waters is due to storm water runoff.

This document was issued in support of Environmental Protection Agency (EPA) regulations and policy initiatives involving the development and implementation of a national storm water program. This document is Agency guidance only. It does not establish or affect legal rights or obligations. Agency decisions in any particular case will be made applying the laws and regulations on the basis of specific facts when permits are issued or regulations promulgated.

This document will be revised and expanded periodically to reflect additional guidance. Comments from users are welcomed. Send comments to U.S. EPA, Office of Wastewater Enforcement and Compliance, 401 M Street, SW, Mail Code EN-336, Washington, D.C. 20460.

Michael B. Cook,
Director

CHAPTER 1
INTRODUCTION

06002

1.0 INTRODUCTION

1.1 OVERVIEW

Control of pollution from urban and industrial storm water discharges is an important factor in maintaining and improving the quality of the Nation's waters. To help improve the quality of storm water discharges, Congress passed the Water Quality Act (WQA) in 1987. The WQA added to the Clean Water Act (CWA) a provision [Section 402(p)] that directed the U.S. Environmental Protection Agency (EPA) to establish final regulations governing storm water discharges under the National Pollutant Discharge Elimination System (NPDES) program.

In response, EPA published regulations in the November 16, 1990, Federal Register (55 FR 47990) that established NPDES permit application requirements for storm water point source discharges. As part of these regulations, municipal separate storm sewer systems (MS4s) that serve populations greater than 250,000 ("large MS4s"), MS4s that serve populations between 100,000 and 250,000 ("medium MS4s"), and other MS4s identified by the permitting authority must be covered by NPDES permits. The regulations establish a two-part application process for these MS4s. In April 1991, EPA issued guidance on the preparation of Part 1 of the NPDES permit application for discharges from MS4s (EPA, 1991b). The present manual provides guidance on the preparation of Part 2 applications. The information in this manual should help municipalities focus their efforts on activities that meet the application requirements.

1.2 SUMMARY OF THE CLEAN WATER ACT REQUIREMENTS

Section 402 of the CWA prohibits the discharge of any pollutant to waters of the United States from a point source, unless that discharge is authorized by a NPDES permit.

Efforts to improve water quality under the NPDES program have traditionally focused on reducing pollutants in discharges of industrial process wastewater and municipal sewage. As pollution control measures have been implemented for these discharges, it has become evident that diffuse sources of water pollution (those occurring over a wide area) are also major contributors to water quality degradation. Recent studies, including the Nationwide Urban Runoff Program (NURP) study (EPA, 1983), have shown that storm water runoff from urban and industrial areas typically contains the same general types of pollutants that are often found in wastewater in industrial discharges. Pollutants commonly found in storm water runoff include heavy metals, pesticides, herbicides, and synthetic organic compounds such as fuels, waste oils, solvents, lubricants, and grease. These compounds can have damaging effect on both human health and aquatic ecosystems. In addition to pollutants, the high volumes of storm water discharged from MS4s in areas of rapid urbanization have had significant impacts on aquatic ecosystems due to physical modifications such as bank erosion and widening of channels.

The statutory provisions governing discharges from MS4s are contained in CWA Section 402(p)(3)(B). In general, Congress provided that permits for discharges from MS4s:

- May be issued on either a system- or jurisdiction-wide basis;
- Shall effectively prohibit non-storm water discharges into the MS4; and
- Shall require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP).

Under the storm water program, the initial round of NPDES permits will emphasize the use of Best Management Practices (BMPs) to reduce pollutant loadings from MS4s. These BMPs include pollution prevention measures, management practices, control techniques, and design and engineering practices. As with any discharger subject to the NPDES program, MS4s must meet technology-based requirements [in this case, the "maximum extent practicable" standard of Section 402(p)] as well as applicable water quality standards.

1.3 THE PERMIT APPLICATION PROCESS

The goal of the NPDES program for municipal storm water is the reduction and elimination of pollutants in storm water discharges from large and medium MS4s. The permit application process in 40 CFR 122.26(d) is designed to meet this goal by developing site-specific NPDES permits containing storm water management programs for individual MS4s. Site-specific permitting is crucial given the differing nature of discharges from MS4s in different parts of the country and the varying impacts of these discharges on receiving waters. To facilitate this process, the regulations specify a two-part permit application.

Part 1 of the permit application initiates the process through which municipalities began to identify sources of pollutants to the municipal storm sewer system. Part 1 also requires municipalities to propose strategies to characterize storm water discharges from their municipal separate storm sewer systems. *Guidance for the Preparation of Part 1 of The NPDES Permit Applications for Discharges From Municipal Separate Storm Sewer Systems* was issued in April 1991, and is available through EPA's Storm Water Hotline [(703) 821-4823].

The present manual describes how to meet the Part 2 permit application requirements for storm water discharges from large and medium MS4s. Part 2 of the permit application builds upon the foundation established in Part 1 and provides for the development of comprehensive storm water management programs. Part 2 requires particular information that MS4s must have developed to have an effective storm water control plan. However, each applicant is given flexibility on how to present and organize this information in a way which best suits the MS4's needs and is most consistent with its overall storm water management strategy. This guidance presents examples which illustrate some alternative ways to present information that will fulfill the Part 2 permit application requirements.

1.4 WHO MUST SUBMIT A PART 2 APPLICATION

Municipalities, incorporated places, and counties with unincorporated urban areas that own or operate a large or medium MS4 that discharges to waters of the United States are required to obtain a NPDES storm water permit. In addition, small MS4s (less than 100,000) that are owned or operated by a municipality other than those identified in the NPDES regulation can be designated by the permitting authority as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers.

Under EPA's definition of MS4, "large" MS4s serve populations greater than 250,000, and "medium" MS4s serve populations of at least 100,000, but less than 250,000. Population is determined by the most recent Decennial Census by the Bureau of the Census. A list of large and medium municipalities identified in the November 16, 1990, rule is contained in Exhibit 1-1, in which population was based on the 1980 Census. After the publication of the November 16, 1990, rule, the Bureau of the Census released data for 1990, and, as a result, some additional municipalities may be required to submit applications, while others may fall below 100,000. These changes are not reflected in Exhibit 1-1.

Source: 55 FR 48073, November 16, 1990.

The definition of MS4 excludes those conveyances that are designed to discharge storm water runoff combined with municipal sanitary sewers ("combined sewer systems"). Therefore, municipalities that own or operate combined sewer systems may petition to have their population, based on Bureau of the Census figures, reduced by the number of people served by the combined sewer system. If the total population served by the separate storm sewer system alone is less than 100,000, the municipality may be eligible for an exemption from NPDES storm water permit requirements. Municipalities should contact their permitting authority for additional information. Exhibit 1-1 does not reflect any modifications in the application requirements for cities with combined sewer systems.

1.5 SUBMITTING THE PART 2 APPLICATION

Completed Part 2 applications should be submitted to the appropriate permitting authority listed in Exhibit 1-2. For municipalities in States with authorized NPDES programs, the permitting authority is the State office listed in Exhibit 1-2. Because some of these States may have application requirements in addition to EPA's, municipalities in States with authorized NPDES programs should contact their States for guidance. For municipalities in States without approved NPDES programs, the permitting authority is the EPA Regional Office listed in Exhibit 1-2.

Municipalities with populations greater than 250,000 (large MS4s) were to submit their Part 2 applications by November 16, 1992. Municipalities with populations greater than 100,000, but less than 250,000 (medium MS4s), must submit Part 2 applications by May 17, 1993. Inquiries regarding Part 2 applications or the permitting process should be directed to the appropriate permitting authority.

1.6 USE OF INFORMATION IN PART 1 AND PART 2 APPLICATIONS

The information submitted in the Part 1 and Part 2 permit applications provides applicants with a starting point for developing comprehensive storm water management programs. For example, the field screening data submitted with the Part 1 application provides a basis for a program to control illicit discharges. Also, the application information may assist in prioritizing controls and in long-term tracking of program effectiveness.

Permitting authorities will use the information from each municipality's Part 1 and 2 applications as the basis for establishing conditions in that municipality's NPDES storm water permit. For example, if a municipality submits a satisfactory application, all or part of its proposed storm water management program is likely to become an integral part of its permit.

1.7 ORGANIZATION OF THIS MANUAL

Chapter 1, *Introduction*, provides a brief overview of the Part 2 permit application process. It discusses who must submit a Part 2 application and how the information in the applications will be used. It also contains a summary of the statutory and regulatory basis for the NPDES storm water program.

Chapter 2, *The Part 2 Application*, describes the statutory and regulatory requirements of municipal NPDES storm water permit applications in more detail. Chapter 2 outlines the specific requirements of the Part 1 and Part 2 applications, explains how Part 2 builds on the Part 1 application, and describes the interconnection among the various components of the Part 2 application.

Chapter 3, *Adequate Legal Authority*, describes how municipalities must demonstrate that they have adequate legal authority to carry out the program requirements [§122.26(d)(2)(i)].

Chapter 4, *Source Identification*, provides guidance on identifying major outfalls and inventorying dischargers to the MS4 [§122.26(d)(2)(ii)].

Chapter 5, *Discharge Characterization*, provides guidance for submitting quantitative data on the MS4 and developing a proposed monitoring program [§122.26(d)(2)(iii)].

Chapter 6, *Proposed Management Program*, describes the steps municipalities must take when they develop site-specific storm water management programs [§122.26(d)(2)(iv)]. These plans are the heart of the municipal permit application, and the permitting authority will probably incorporate all or part of the municipality's proposed management program into their NPDES storm water permit. In their proposed management programs, municipalities must describe management practices, control techniques and systems, design and engineering methods, and other provisions that are aimed at reducing the discharge of pollutants to the "maximum extent practicable."

Chapter 7, *Assessment of Controls*, explains how a municipality can assess the effectiveness of its storm water management program and target priorities through the use of direct and indirect measures [§122.26(d)(2)(v)].

Chapter 8, *Fiscal Analysis*, provides guidance on estimating necessary capital and operation and maintenance expenditures, and financing these expenditures [§122.26(d)(2)(vi)].

1.8 OTHER GUIDANCE AVAILABLE

Municipalities should use this guidance document together with the Part 1 guidance (EPA, 1991b). Exhibit 1-3 lists other sources of guidance available from EPA's Storm Water Hotline [(703) 821-4823]. In addition, applicants may wish to obtain further information from the documents identified in the bibliography at the end of this guidance (Appendix A).

CHAPTER 2
THE PART 2 APPLICATION

0614

2.0 THE PART 2 APPLICATION

2.1 BACKGROUND

The NPDES permit application requirements for MS4s [40 CFR 122.26(d)] establish a two-part application designed to meet the goal of developing comprehensive site-specific storm water quality management programs for MS4s.

The purpose of the two-part application process is to develop information, in a reasonable time frame, that will build successful storm water management programs and allow permitting authorities to make informed decisions about permit conditions. The application process is designed to focus the efforts of municipalities in two areas: prohibiting non-storm water discharges into storm sewers, and implementing controls that reduce the discharge of pollutants from MS4s to the maximum extent practicable.

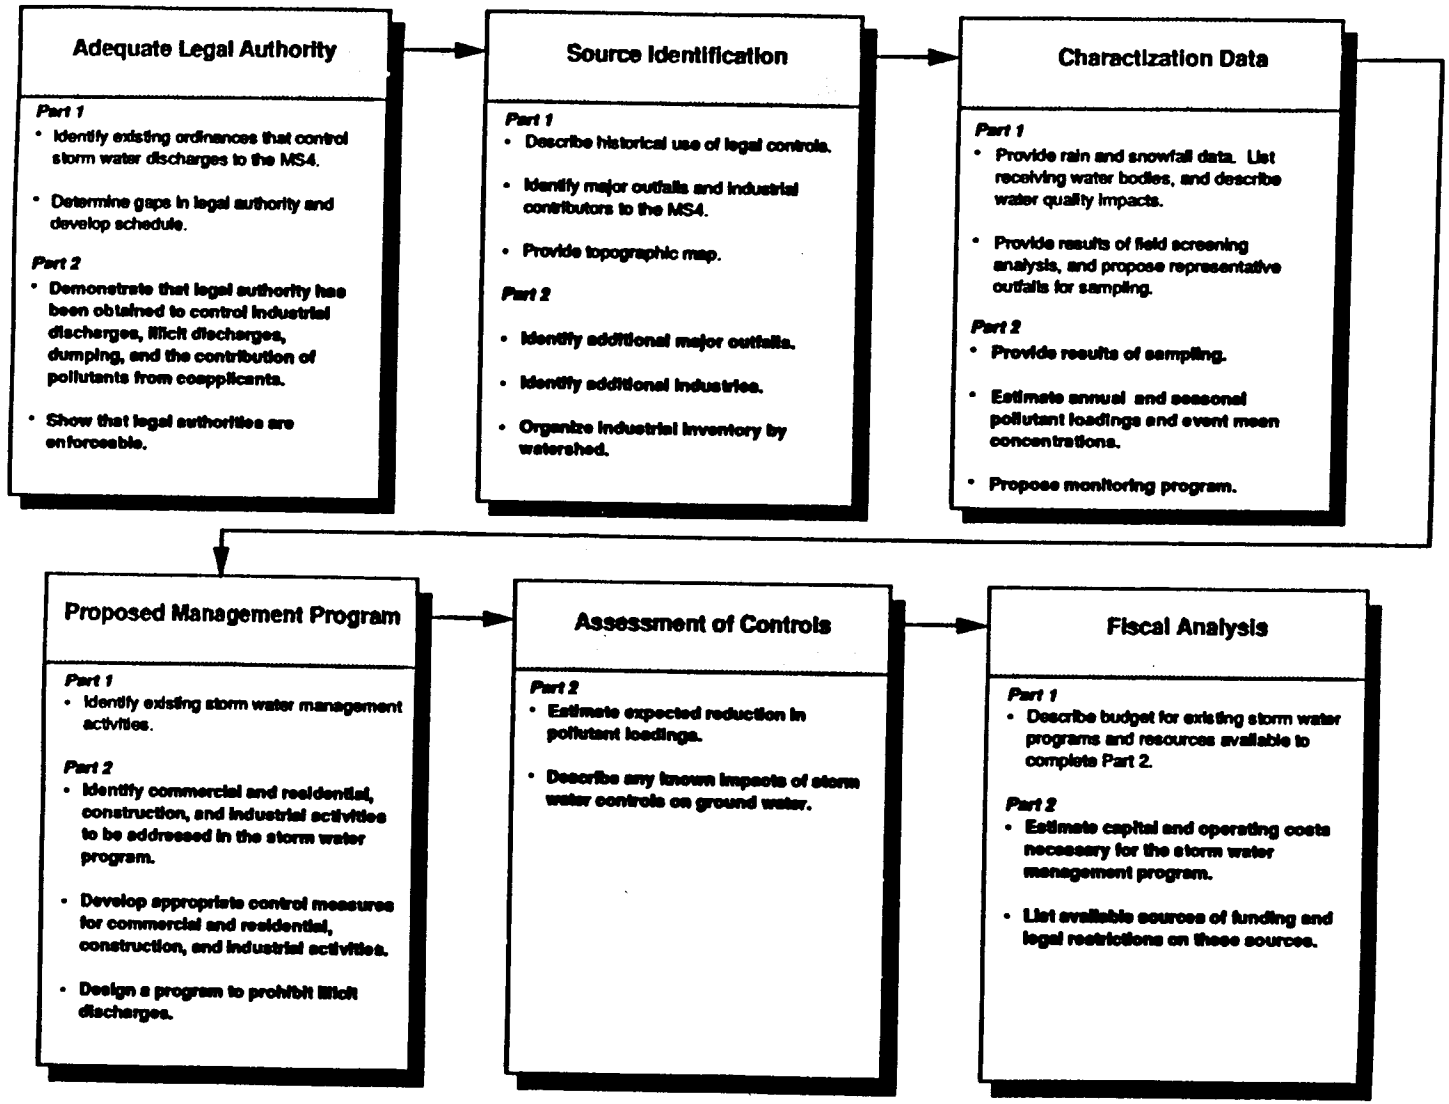
Part 1 of the application requires information on existing programs and legal authority. In addition, Part 1 requires the results from field screening of major outfalls to detect illicit connections. The Part 2 application requirements are intended to build upon the information submitted with the Part 1 application. Each part has virtually the same major areas of concern, but the Part 2 application requires a greater level of detail. Part 2 of the permit application requires a demonstration of adequate legal authority, additional information on pollutant sources and outfalls, a limited amount of representative quantitative sampling data, a proposed monitoring program, a proposed storm water management program, an estimate of the effectiveness of storm water controls, and a fiscal analysis. The requirements for the Part 1 and Part 2 applications are summarized briefly in Exhibit 2-1, and described in more detail in Section 2.2. The storm water regulations underlying this guidance can be found in Appendix B.

Before applicants proceed with the detailed development of their permit applications, they should recognize the fundamental requirements:

- Who or what are the primary contributors of pollutants in storm water discharges from MS4s?
- Where are these sources of pollutants located in relation to receiving water resources?
- What is the magnitude of these pollutant sources and their potential impact on receiving waters?
- How does the municipality plan to reduce or eliminate the contribution of pollutants in storm water discharges or prevent the damaging influences of these discharges?
- Why did the municipality select the activities or best management practices (BMPs) it proposes?
- When will the municipality implement its proposed program?
- How will the applicant assess the effectiveness of the program? What criteria or measures will apply?
- How will the municipality fund proposed program activities?

Wherever appropriate, the applicant must also show that it has adequate legal authority to implement, enforce, or mandate compliance with applicable ordinances, statutes, contracts, or other similar vehicles as required by the storm water regulation.

Exhibit 2-1: Part 1 and Part 2 Storm Water Application Requirements.



These questions (described above) that an applicant must address follow a natural progression or development. For example, before applicants can identify how they will reduce the contribution of pollutants in storm water discharges (the fourth bullet point above), they must identify pollutant sources and estimate the magnitude of pollutant loads (bullet points 1-3 above).

2.2 PART 1 APPLICATIONS

Sections 2.2.1 and 2.2.2 provide overviews of the regulatory requirements of §122.26(d). Section 2.2.3 describes the relationship among the various application provisions.

2.2.1 Overview of the Part 1 Application

Part 1 applications consist of the following six elements:

- **General information.** The applicant's name, address, telephone number of contact person, ownership status and status as a State or local government entity.

- **Legal authority.** A description of existing legal authority to control discharges to the MS4, and if this authority does not meet the required criteria, a list of additional authority needed and a schedule and commitment to seek such authority.

- **Source identification.** A description of the historic use of ordinances, guidance, or other controls that limit non-storm water discharges to any publicly owned treatment works (POTW), and a topographic map covering an area one mile beyond the service boundaries of the MS4 showing:

  - the location of known municipal sewer system outfalls;
  - a description of all land use activities;
  - the location and activities of landfills;
  - the location and permit number of any known discharge to the MS4;
  - the location of major structural controls for storm water discharges (such as retention basins, or major infiltration devices); and
  - identification of publicly owned parks, recreational areas, and other open lands.

- **Discharge characterization.** A summary of the types and characteristics of storm water discharges, including:

  - monthly mean rain and snowfall estimates and the average number of storm events per month;
  - existing quantitative data describing the volume and quality of discharges from the MS4, including a description of the outfalls and sampling methods used;
  - a list of "downstream" water bodies receiving discharge from the MS4, and a description of the impact of outfall upon them;
  - the results of field screening analysis for illicit discharges at either selected field screening points or major outfalls covered in the permit application; and
  - a proposed characterization plan for conducting sampling and obtaining the quantitative data necessary to complete Part 2 of the application.

- **Management programs.** A description of existing management programs to control pollutants from the municipal separate storm sewer system. For example, what procedures are in place to control pollution from construction activities, and how do they work? What is the program (such as investigation procedures and how they operate) for identifying illicit connections to the municipal storm sewer system?

- **Fiscal resources.** A presentation of the municipality's budget for existing storm water programs and for completing Part 2 of the permit application.

2.2.2 Overview of the Part 2 Application

The Part 2 application must include the following elements:

- **Adequate legal authority.** A demonstration that the municipality can operate according to the legal authority established by ordinance, statute, or series of contracts. The municipality also must demonstrate that its authority is enforceable. A discussion of how adequate legal authority may be demonstrated appears in Chapter 3 of this guidance.

- **Source identification.** An inventory, organized by watershed, of the facilities that may discharge storm water associated with industrial activity to the MS4. The applicant also must identify the location of any major outfall that discharges to waters of the United States that was not reported in Part 1. A discussion of the information to be submitted for each such facility in the inventory appears in Chapter 4 of this guidance.

- **Characterization data.** Sampling results for 5-10 outfalls designated by the permitting authority, estimates of cumulative annual pollutant loadings and event mean concentrations, and a proposed schedule to submit estimates of seasonal pollutant loadings and event mean concentrations for each major outfall identified in the source identification sections of Part 1 and 2. The *Characterization Data* provision of the Part 2 application also requires the development of an on-going monitoring program covering the term of the permit. Procedures for meeting the requirements of this section appear in Chapter 5.

- **Proposed management program.** A program that shows the municipality's comprehensive planning process for the reduction and control of pollutants, the staff and equipment available to implement the program, and a full description of how controls will be implemented to reduce pollutants from all sources of storm water. Municipalities must also describe how the program will be implemented and maintained. The Part 2 requirements for a proposed management program are described in Chapter 6.

- **Assessment of controls.** An estimate of the projected effectiveness of the municipal storm water management program, and an identification of the known impacts of storm water controls on ground water. The assessment of controls is discussed in Chapter 7.

- **Fiscal analysis.** A fiscal analysis of the capital and operation and maintenance expenditures needed to accomplish the activities (including implementation) required by the characterization data and proposed management program sections of the Part 2 application. This fiscal analysis must include projected expenses for each fiscal year of the permit term. A discussion of the fiscal analysis is included in Chapter 8.

2.2.3 Relationship Among Application Requirements

The required elements of the Part 2 application are related to each other. As a result, this guidance addresses how the application elements are related, and how information gathered for one requirement will assist the applicant in meeting other requirements. For example, the information gathered for the *Industrial Source Identification* provision of the Part 2 application will assist the municipality in:

- Targeting monitoring goals to potential pollutant sources, which may include selecting monitoring locations and chemical specific sampling frequencies (a requirement of the *Characterization Data* provision);
- Identifying illicit discharges (a requirement of the *Proposed Management Program's* illicit connection provision);
- Identifying facilities with the greatest potential for degrading receiving water quality (a requirement of the *Proposed Management Program's* industrial program provision); and
- Targeting sites that handle, store, or transport toxic or hazardous materials for on-site inspections (another requirement of the *Proposed Management Program's* industrial program provision).

As another example, the information that the applicant must prepare for the *Characterization Data* provision (e.g., the results of the sampling requirement and the estimated event mean concentrations and annual pollutant loads) may help the municipality:

- Evaluate the contribution of pollutants in storm water discharges from individual sources and determine which sources may require inspections or controls (a requirement of the *Proposed Management Program's* industrial program provision);
- Predict the impact of storm water discharges on receiving waters known to be impacted. (In the *Proposed Management Program*, additional controls may be warranted for construction sites or other industrial activities that discharge to these waters); and
- Determine what BMPs may be appropriate for given areas (another requirement of the *Proposed Management Program*).

Exhibit 2-2 summarizes some of these key interrelationships, although many other interrelationships exist. A more detailed discussion of specific information requirements and interrelationships among provisions is provided in subsequent chapters. As municipalities prepare their permit applications, they should coordinate all program requirements.

Exhibit 2-2
Examples of Relationship Among Part 2 Requirements

					Fiscal Analysis
				Assessment of Controls	Cost/benefit analysis identifies the most cost-effective BMPs.
			Proposed Management Program	Estimates of reductions in pollutant loadings predicts impact of storm water management activities	Fiscal analysis considers costs of controls, maintenance, and capital improvements. Management program may include feasibility analyses that consider cost.
		Characterization Data	Annual pollutant loads help prioritize areas for BMPS. On-going monitoring indicates success of BMPs and need to re-prioritize.	On-going monitoring program verifies program effectiveness. Instream monitoring verifies biological recovery.	Fiscal analysis considers cost of on-going monitoring
	Source Identification	Land use information and organization of industry by watershed defines representative sampling points.	Inventory of industrial users helps the city target facilities for inspections and control measures.	Estimates of pollutant load reductions depend on land use.	Industrial inventory identifies potential sources of storm water utility fees.
Adequate Legal Authority	Some sources or outfalls may be outside a city's jurisdiction. Interjurisdictional agreements may be necessary.	Authority to require sampling and obtain information for industries and dischargers outside of the MS4's jurisdiction at sampling points.	Legal authority needed to implement BMPS, control and inspect industry, and prohibit dumping and illicit discharge.	Need information gathering and inspection authority where it is necessary to inspect, monitor, and enter the facility or the site.	Legal authority is required for some financing plans, such as a storm water utility.

2.3 ADDITIONAL FACTORS TO BE CONSIDERED IN DEVELOPING THE PART 2 APPLICATION

As discussed in the previous section, the various provisions of the Part 2 application process are interconnected.

All municipalities covered by §122.26(d) must submit a Part 2 permit application that meets the requirements of the storm water permit application regulations. However, each MS4 is unique, and each Part 2 submission will be different. Municipal separate storm sewer systems differ in many ways, including population served, geologic and climatologic settings, density of development, and form of government. These underlying factors make each applicant unique.

The major factors that applicants should consider are:

- Population and projected growth rate;
- Zoning and existing land use patterns;
- Nature of watershed and receiving waters;
- Climatic conditions, soil types, and watershed delineations;
- Existing municipal functions and municipal lands;
- Other environmental impacts;
- Public involvement; and
- Intergovernmental coordination.

In addition, municipalities must implement their storm water management programs in a manner that is consistent with other applicable Federal, State, and local environmental laws.

Population and Projected Growth Rates

Some storm water BMPs are more appropriate for densely developed areas, while other methods may be more useful in developing areas. Consequently, defining current population densities and projecting future areas of population growth provides the basic information that can assist in the evaluation and prioritization of appropriate storm water control strategies.

Zoning and Existing Land Use Patterns

Through ordinances, permits, or contracts, municipalities may mandate storm water controls for new residential, commercial, or industrial developments in order to improve or assure maintenance of the quality of receiving waters at or near pre-development levels. The Nationwide Urban Runoff Program (NURP) study (EPA, 1983), pointed out that some of the best opportunities for implementing cost effective measures to prevent or reduce pollutants in storm water occur during new development. These measures may include structural controls, such as storm water detention basins or constructed storm water wetlands, or nonstructural alternatives such as cluster development and buffer zones. Sections 122.26(d)(1)(iii)(B)(2) and 122.26(d)(2)(ii) require the municipality to establish comprehensive management plans for new development (see Chapter 6).

Nature of Watershed and Receiving Waters

The types of storm water controls appropriate for a MS4 depend on the nature of the watershed and the receiving waters. This includes geologic and hydrologic features such as slope drainage patterns and stream size. For example, roadside swales may not be practical in areas with steep terrain, but can be very useful in flat areas. In addition, structural BMPs or other management measures that control the volume and timing of release are appropriate where uncontrolled storm water may cause physical impacts to receiving waters (especially small streams, rivers, and wetlands).

Information on the watershed and the receiving waters is required in the Part 1 permit application [§122.26(d)(1)(iv)(C)]. In Part 1, applicants are required to list water bodies that receive discharges from the MS4. The list of water bodies includes downstream segments, lakes, and estuaries where pollutants from the system discharges may accumulate and result in non-attainment of State water quality standards. Part 1 also requires a description of known water quality impacts. Applicants must include a discussion of water bodies that were cited in:

- State reports required by CWA Sections 305(b), 304(l), and 314(a);
- The State Nonpoint Source Report; and
- Other reports identifying sensitive watersheds.

Part 1 applicants should also include in this discussion a description of impacts caused by dissolved oxygen depression, bioaccumulation of toxics, excessive sedimentation, hydrologic modification, habitat destruction, etc.

Municipalities are expected to give priority consideration to those classes of pollutant sources that contribute significant loadings or pose a significant impact on receiving waters. Applicants must consider control methods that address storm water discharges from commercial and residential areas; illicit discharges and illegal disposal; storm water discharges from industrial areas; and storm water runoff from construction sites. Municipalities' permits will differ substantially in the emphasis placed on controlling various sources of pollutants in discharges from the MS4. Permits for older municipalities may emphasize control of cross-connections, while permits for municipalities with large areas of new development may emphasize the installation of permanent structural controls during construction.

The Part 2 storm water permit application requires descriptions of management programs to address sources of pollutants discharged to separate storm sewer systems. For management strategies to be effective, municipalities must give prior consideration to the nature (e.g., physical and biological parameters) and the designated uses of receiving waters such as streams, tributaries, and natural wetlands. For example, a storm water management program for a newly developing area with an existing shallow, slow-moving stream could include provisions to ensure that the post-development peak discharge flow rate for the stream is held to a certain percentage of its historical or pre-development peak discharge flow rate.

Climatic Conditions, Soil Types, and Watershed Delineations

Seasonal variations in precipitation can have a significant impact on storm water quality. For example, extended dry seasons in areas such as the southwestern United States result in pollutant loads distinctly higher than in other parts of the country during the first several storms of the wet season. Areas with more frequent rain and snowfall throughout the year may have more storm water discharges, but the discharges may have consistently lower pollutant concentrations than those in the Southwest. In addition, areas with significant snowfall may experience a peak in storm water discharge volume and pollutant concentration during the spring thaw.

Natural soil conditions affect the potential for storm water to recharge ground water. Porosity and permeability are properties of the soil that govern the size and number of the interstitial spaces through which water may flow. Compaction (e.g., compression of the soil by heavy machinery) will reduce the amount of void space in the soil and thereby reduce the amount of rainfall that infiltrates through the soil to ground water. Natural soil conditions are very important when siting structures designed for storm water infiltration. In addition, identifying such sites must take into consideration potential ground water impacts

that may result whenever infiltration is part of the storm water management program.

Existing Municipal Functions and Municipal Lands

The Part 2 application affords municipalities the opportunity to discuss alternatives in the *Proposed Storm Water Management Program*. When considering the wide range of municipal functions, applicants need to establish which agencies will be responsible for implementing each portion of a storm water management program. (This could be outlined in the *Adequate Legal Authority* chapter of the Part 2 application, as discussed in Chapter 3 of this guidance.) Many of these agencies, will have primary missions other than dealing with storm water or water quality. Expansion of the established charter of an agency to include an element of storm water control may require legislative action, moderately expanding the scope of other municipal agencies' missions to include storm water concerns can be much more cost effective than the initiation of entirely new programs.

Applicants should identify existing municipal functions that impact the quality of storm water discharges. These functions may include snow removal activities such as road deicing, vehicle maintenance operations, and herbicide, pesticide, and fertilizer application to public lands. Municipalities can modify these activities to improve storm water quality through oversight of future land development, modifications to flood management structures, changes in materials used or in material handling or application practices, maintenance of roads, and installation of structures such as retention basins.

The municipal agency (or agencies) responsible for storm water runoff control should also consider the extent to which municipal lands and activities contribute pollutants to runoff. The same BMPs recommended for private lands may also be incorporated into the development and maintenance of a municipality's own lands and activities. For example, reduced use of pesticides and fertilizers on park land and open spaces usually decreases the contribution of these contaminants to storm water runoff. Implementing BMPs on municipal lands also shows the municipality's commitment to an effective storm water management program. BMPs are discussed in greater detail in Section 6.4 of this guidance.

Other Environmental Impacts

Municipalities should consider those activities that can directly or indirectly alter the natural hydrograph of a stream and potentially degrade an otherwise stable aquatic habitat. These factors are particularly important when considering impacts to wetlands, riparian areas, ground water, small rivers, and streams. In addition, the installation of detention or rapid infiltration ponds may have negative impacts on ground water. The installation of culverts or concrete drainage channels and other such structures typically increases the volume and velocity of runoff, which can lead to increased erosion, siltation, and sedimentation in receiving waters. Therefore, installation of these structures can contribute to the degradation of a neighboring habitat.

Public Involvement

Municipal applicants must ensure that they provide adequate public education and ample opportunities for public participation. Public participation should focus on spreading awareness of program objectives and components. Education and public involvement programs must be defined as part of the *Proposed Storm Water Management Program* [§122.26(d)(2)(iv)]. Generally, the public should be involved as early as possible in storm water management initiatives.

Conflict and confusion can be minimized if the program includes a schedule for initial public contact and milestones for public involvement throughout the development and implementation phases. Public education programs are expected to target specific

audiences, including those regulated or affected by the storm water management program (e.g., developers, building contractors, and industrial operators) and those that can assist with program implementation (e.g., volunteers and citizens). For example, one large municipal applicant (Seattle) described an existing public participation program in its Part 1 Application submission. Elements of this program may be instructive to municipalities completing Part 2 of the application because it has generic components that are likely to be applicable to other large (and perhaps medium) municipalities. Excerpts from Seattle's public involvement program are provided in Exhibit 2-3 for reference.

Elements of this municipality's program that are particularly important to consider include of the role of an advisory and outreach group and its relationship to the entire process. Effective public participation programs clearly identify the role of the public.

The potential exists for a considerable range in the level of participation the public may actually have in the decision-making process. Generally, the municipal authority is going to make the decisions. However, the authority can choose to use the "participation" process to simply inform the public of decisions, or to allow the views of the public to be registered prior to decision milestones. In other cases, although uncommon, the public may have an actual voice or vote in making decisions.

The timing and frequency of meetings and the duration of the groups established for public participation will usually be dictated by the nature of the issues being addressed. For example, an ad hoc group established to address a single issue may discover that the issue cannot be effectively addressed without consideration of a broader range of issues that the municipality may also be considering. In this instance it may be appropriate for the group to expand its scope, hold regular meetings, and actively participate in the authority's decision making process. Therefore, applicants should outline in their Part 2 applications how such coordination will be accomplished.

Intergovernmental Coordination

If a number of municipal entities (e.g., multiple cities or a city and a county) are participating in the permit application process as coapplicants, various mechanisms can be used to improve intergovernmental coordination to ensure that the roles and responsibilities of each entity are well defined. Each entity must fulfill its responsibilities to implement applicable program measures. Examples of some of the appropriate coordination techniques and their benefits include:

- **Memoranda of agreement (MOA).** MOAs can define specific municipal roles, responsibilities, and points of coordination that help minimize duplication of effort and ensure accountability;

- **Cross-training of staff.** This allows for the identification of gaps in staffing (e.g., neglected areas of responsibility or insufficient staff levels) as well as providing the benefits of increased versatility and opportunities for learning from others;

- **Interagency advisory committees.** Their objective is to arm decision makers with a comprehensive understanding of the implications of proposed activities or decisions; and

- **Regularly scheduled intermunicipal staff meetings.** These can facilitate an open and thorough exchange of information and solidify new lines of communication.

Exhibit 2-3
Excerpts from a Public Involvement Program

The public involvement program [of the City of Seattle] has been designed to assist in developing an acceptable city-wide plan for addressing drainage and water quality problems. Acceptable is defined as a plan that is both technically sound and sensitive to the needs and interests of the citizens. The involvement program has two major elements: a Citizen Advisory Committee (CAC) and a community outreach effort. The initial role of the CAC was to provide guidance to City staff and consultants preparing various sections of a Comprehensive Drainage Plan. Until the adoption of the Comprehensive Drainage Plan by the City Council, the CAC provided direction on drainage policy issues, assisted with the public review of the draft plan and environmental impact statement (EIS), and helped coordinate comments sent to the city from the public during the review period. Following council adoption of the plan, the CAC was reconstituted into a Drainage and Wastewater Advisory Committee which serves as an on-going sounding board to the Drainage and Wastewater Utility, the mayor, and the City Council on both sewer and drainage matters.

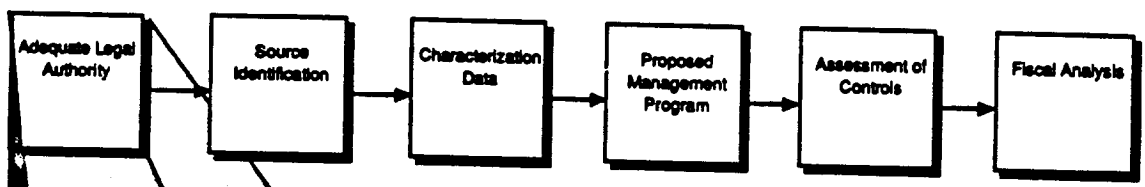
The community outreach effort was established for two purposes. The first was to ensure adequate public review and support of the Comprehensive Drainage Plan and EIS. Comments received during the review were used by the Drainage and Wastewater Utility, the mayor, and the City Council in making decisions about the Drainage Plan and the City's on-going drainage program. The second purpose was to begin educating residents and business people about the importance of their role in solving flooding, landslide, and water quality problems throughout the city. This community outreach/education role remains an on-going effort of the Drainage and Wastewater Utility.

Source: City of Seattle, *NPDES Storm Water Permit Application, Part 1*, City of Seattle, November 1991: 37.

Single municipalities with separate governing functions may face the same challenges as coapplicants when they prepare their Part 2 applications. Many of the same coordination steps may be necessary within a single municipal jurisdiction. The need for *intra*governmental coordination may be most crucial in large municipalities that have functions that impact storm water quality spread throughout the organizational structure of the municipality. For example, a planning department may be in charge of implementing a stream buffer policy, while a public works department may plan, site, and construct storm water BMPs. Still other agencies may be responsible for implementing erosion and sediment control requirements, and permitting and inspection functions. Storm water-related responsibilities within governmental organizations may be allocated in this manner due to the relatively recent emergence of storm water quality as an important issue. Nonetheless, effective coordination within the government of a single municipality may be as critical to the success of the storm water management program as is intergovernmental coordination for coapplicants. Therefore, applicants should outline in their Part 2 applications how such coordination will be accomplished.

VOL 23

CHAPTER 3
ADEQUATE LEGAL AUTHORITY



Adequate Legal Authority

Part 1

- Identify existing ordinances that control storm water discharges to the MS4.
- Determine gaps in legal authority and develop schedule.

Part 2

- Demonstrate that legal authority has been obtained to control industrial discharges, illicit discharges, dumping, and contributions of pollutants from coapplicants.
- Show that legal authorities are enforceable.

0626

3.0 ADEQUATE LEGAL AUTHORITY

3.1 BACKGROUND

A crucial requirement of the NPDES storm water regulation is that a municipality must demonstrate that it has adequate legal authority to control the contribution of pollutants in storm water discharged to its MS4. This guidance manual and the storm water program emphasize development and implementation of storm water management programs as described in Chapter 6. In order to have an effective municipal storm water management program, a municipality must have adequate legal authority to control the contribution of pollutants discharged to the MS4.

Part 1 of the permit application requires applicants to describe their existing legal authority to control the discharge of pollutants from MS4s and evaluate the adequacy of these ordinances. Where existing ordinances were lacking, a proposed schedule to obtain the necessary authority was included with the Part 1 application. In Part 2 of the application, municipal applicants must demonstrate that they now possess adequate legal authority to:

- Control construction site and other industrial discharges to the MS4;
- Prohibit illicit discharges and control spills and dumping;
- Control potential sources of pollutants from discharges to or from coapplicants' MS4s, or MS4s that are interconnected or shared with other entities;
- Require compliance with all regulations and statutes; and
- Carry out inspection, surveillance, and monitoring procedures.

Section 3.2 reviews each of these regulatory requirements. Section 3.3 describes specific procedures a municipality may use to demonstrate adequate legal authority.

3.2 SUMMARY OF REGULATORY REQUIREMENTS

3.2.1 Control Construction Site and Other Industrial Discharges to the MS4.

> §122.26(d)(2)(i)(A). [The applicant must demonstrate that it can control] through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity.

The municipality, as a permittee, is responsible for compliance with its permit and must have the authority to implement the conditions in its permit. To comply with its permit, a municipality must have the authority to hold dischargers accountable for their contributions to separate storm sewers.

"Control," in this context, means not only to require disclosure of information, but also to limit, discourage, or terminate a storm water discharge to the MS4. For example, construction sites (of 5 or more acres) and other industrial activities that discharge storm water through MS4s are required to obtain individual NPDES permits or coverage under general NPDES permits from EPA or an authorized NPDES State. These permits require compliance with applicable Federal and State regulations. However, a municipality, to satisfy its permit conditions, may need to impose additional requirements on discharges

from permitted industrial facilities, as well as discharges from industrial facilities and construction sites not required to obtain permits. Therefore, a municipality should develop a mechanism to assure that all industrial facilities and constructions sites that discharge to the MS4 know their obligation to comply with the applicable terms of the municipality's storm water ordinances.

3.2.2 Prohibit Illicit Discharges and Control Spills and Dumping

> §122.26(d)(2)(i)(B). [The applicant must demonstrate that it can prohibit] through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer.
>
> §122.26(d)(2)(i)(C) [The applicant must demonstrate that it can control] through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water.

To demonstrate that it possesses adequate legal authority to control storm water discharges, a municipality must be able to effectively prohibit illicit discharges and illegal dumping. An illicit discharge is "any discharge that is not composed entirely of storm water except discharges pursuant to a NPDES permit . . . and discharges resulting from fire fighting activities" [40 CFR 122.26(b)(2)].

3.2.3 Control Contributions of Coapplicants

> §122.26(d)(2)(i)(D). [The applicant must demonstrate that it can control] through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system.

An operator of a MS4 may participate in an application with one or more other operators, or may submit an individual application for the separate storm sewer it operates. As indicated in the box above, the operator of a discharge from a large or medium MS4 may submit, through the use of interjurisdictional agreements, a system-wide permit application. The system-wide application can accommodate existing storm water programs, on a watershed basis, as well as programs which must take into account regional differences in climate, geography, and political institutions. Such an application should cover issues of liability, financial contributions, access to records, enforcement responsibilities, and any other applicable areas of mutual concern.

When two or more municipalities submit a joint application, each coapplicant must demonstrate that it individually possesses adequate legal authority over the entire municipal system it operates or owns. A coapplicant need not fulfill every component of legal authority specified in the regulations, as long as the combined legal authority of all coapplicants satisfies the regulatory criteria for every segment of the MS4 (including authority over all sources that discharge to the MS4).

As coapplicants, for example, a county and a flood control district within that county may together possess adequate legal authority. The flood control district may have legal authority to build, operate, and maintain structures associated with major drainage channels within the county. The county itself may have legal authority to control pollutants in discharges from privately owned lands to the MS4s and legal authority to build, operate, and maintain structures associated with minor drainage channels that tie into major drainage channels. In this situation, the combined legal authority of the coapplicants may be adequate for the system, provided that the only discharge to major drainage channels comes from the county's separate storm sewer system. As another example, a department of transportation or flood control district with no land use authority could be a co-permittee with

a city that does possess land use authority over the entire jurisdiction.

Coapplicants also may use interjurisdictional agreements to show adequate legal authority and to ensure planning, coordination, and the sharing of the resource burden of permit compliance. When more than one entity is submitting an application for a MS4 (either as coapplicants or as individual applicants for different parts of a system), the role of each party must be well defined. Each applicant or coapplicant must show the ability to fulfill its responsibilities, including legal authority for the separate storm sewers it owns or operates.

Applicants and coapplicants may use the procedures outlined in Section 3.3 to demonstrate adequate legal authority in their Part 2 permit applications. These procedures are guidelines, however, and are not intended to be the only possible approaches that applicants may follow.

3.2.4 Require Compliance with all Regulations and Statutes

To meet the requirements of §122.26(d)(2)(i)(E), the applicant must show that it has adequate authority to enforce its ordinances.

> §122.26(d)(2)(i)(E). [The applicant must demonstrate that it can require] compliance with conditions in ordinances, permits, contracts or orders.

One acceptable way to support a declaration of adequate legal authority, including the ability to enforce appropriate ordinances, is for the municipality to provide a certification from the Municipal General Counsel or equivalent. The certification should state that the applicant has the legal authority to apply and enforce the requirements of §122.26(d)(2)(i)(A)-(F) in State or local courts. The certification would, therefore, cite specific ordinances and the reasons why they are enforceable. The statement should discuss what the municipality can do to ensure full compliance with §122.26(d)(2)(i).

In a Part 2 application, through a statement from the Municipal General Counsel or through some other method, a municipality should identify the administrative and legal procedures available to mandate compliance with appropriate ordinances, and, therefore, with permit conditions. Applications should contain descriptions of how ordinances are implemented and appealed. In particular, a municipality should indicate if it can issue administrative orders and injunctions or if it must go through the court system for enforcement actions.

3.2.5 Carry Out Inspection, Surveillance, and Monitoring Procedures

In their Part 2 applications, municipalities must propose programs to control the contributions of pollutants from industrial facilities and prohibit illicit discharges. For both of these activities, municipalities must have the legal authority to carry out inspection, surveillance, and monitoring procedures necessary to determine compliance.

> §122.26(d)(2)(i)(F). [The applicant must demonstrate that it can carry] out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

To meet this requirement, municipalities may wish to consider establishing ordinances that require industrial facilities to perform inspections and report the results to the city. In many municipalities, these facilities may perform similar inspections under a pretreatment program. In their Part 2 applications, municipalities should provide

documentation of their authority to enter, sample, inspect, review, and copy records, etc., as well as demonstrate their authority to require regular reports.

3.3 PROCEDURES FOR DEMONSTRATING ADEQUATE LEGAL AUTHORITY

The Part 2 application requires the applicant or coapplicants to cite and describe specific ordinances currently in effect and demonstrate that the jurisdiction for these ordinances covers the entire area served by the MS4. In addition, the applicant may elect to discuss specific changes in ordinances passed since the submission of the Part 1 permit application to illustrate how legal authority has evolved to meet the regulatory requirements in §122.26(d)(2)(i). One method by which an applicant can partially demonstrate that it has adequate legal authority is to develop a matrix that compares, in a side-by-side format, the regulatory requirements in §122.26(d)(2)(i)(A)-(F) and the municipality's legal authority. Once completed, the matrix would indicate whether an adequate legal framework exists to address all key regulatory requirements identified in §122.26(d)(2)(i)(A)-(F). Furthermore, the matrix could also illustrate where the authority to mandate compliance is vested.

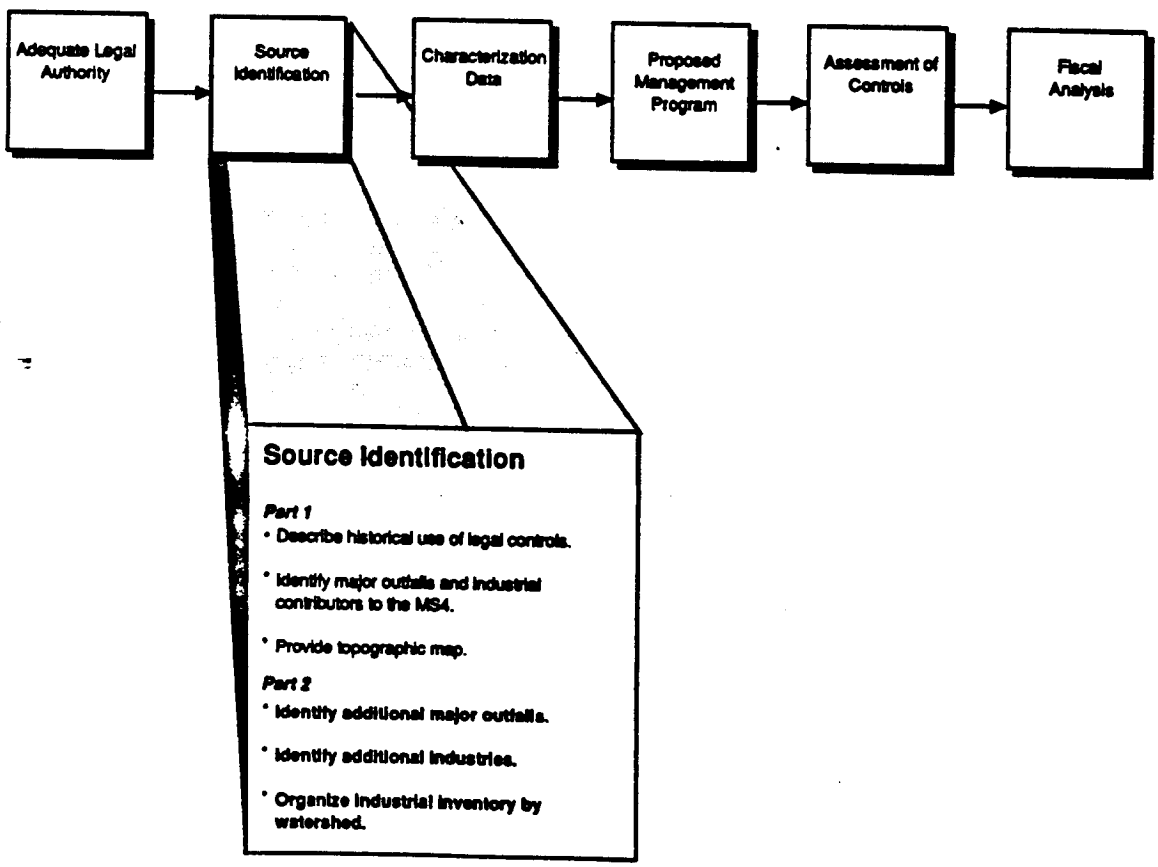
In order to support an assertion of adequate legal authority, applicants should include the complete text of the applicable portions of the ordinances or other such provisions in the application. The applicant should also provide a specific explanation of why and how the language of a particular ordinance or other authority meets Federal regulatory requirements. The application should indicate to whom the ordinance applies and how it will operate to control, prevent, or stop discharges that violate permit conditions. For example, the municipality may describe and provide an excerpt from a city ordinance that prohibits non-storm water discharges to the MS4.

Appendix C illustrates one way to detail the existence of ordinances that establish the legal authority required in §122.26(d)(2)(i). A narrative discussion of the historical use of these ordinances to control pollutants in storm water discharges also may be included. The example in Appendix C shows what the applicant may do to satisfy §122.26(d)(2)(i).

Substantial effort should be devoted to obtaining the necessary legal authority before the Part 2 application is submitted. However, some municipalities may find that the two-year application process does not allow enough time to secure adequate legal authority as described in this section. This may be due to the need for State statutory or legislative changes. In this instance, the Part 2 application must include a detailed description of what changes are needed and a schedule of when they will be accomplished. The schedule must include timetables for drafting proposed changes, public comment periods, and final authorizations.

VOL 23

CHAPTER 4
SOURCE IDENTIFICATION



0631

4.0 SOURCE IDENTIFICATION

4.1 BACKGROUND

In Part 1 of the NPDES storm water permit application, applicants are required to identify the location of known major outfalls discharging to waters of the United States from MS4s. Applicants also are required to provide information and data on existing land use activities. The identification of outfalls and land use activities is the first step in the process of:

- Identifying the sources of pollutants in storm water runoff;
- Linking the sources of pollutants in runoff to specific water quality impacts and other impacts that may result in degradation of aquatic resources;
- Identifying those activities or physical factors that have the most significant impact on water quality;
- Defining control measures that yield improvements in storm water quality; and
- Developing methodologies by which engineers, urban planners, and managers can make long term decisions that not only provide for economic growth, but also have discernible environmental benefits through imposed storm water controls.

The source identification requirements in the Part 2 permit application reflect three basic steps. First, municipalities must identify any major outfalls that were not already identified in the Part 1 application. Second, applicants must compile an inventory of industrial activities that may discharge storm water to a MS4. Third and finally, applicants must organize the inventory of industrial activities on a watershed basis.

Organizing the inventory by watershed allows the municipality to focus on activities within discrete areas that may contribute pollutants in storm water discharges to waters of the United States. For example, combining outfall data with the industrial inventory organized by watershed may help the municipality to identify probable areas of illicit connections. This information will also be useful for municipalities when they develop specific strategies [e.g., best management practices (BMP's)] as part of their proposed storm water management programs. The following sections discuss regulatory requirements and procedures for completing the source identification section of the Part 2 permit application. Section 4.2 provides guidance on identifying major outfalls, Section 4.3 provides guidance on compiling an inventory of industrial dischargers, and Section 4.4 provides guidance on organizing the inventory of industrial discharges by watershed.

4.2 MAJOR OUTFALLS

The first portion of the Part 2 Source Identification provision states:

> §122.26(d)(2)(ii). *Source Identification.* [The applicant must provide the] location of any major outfall that discharges to waters of the United States that was not reported [in Part 1 of the application] . . . .

4.2.1 Definition of a Major Outfall

According to 40 CFR 122.26(b)(5), a major outfall is a MS4 outfall that discharges from a single pipe with an inside diameter of at least 36 inches. The term also includes discharges from a single conveyance other than a circular pipe serving a drainage area of more than 50 acres.

For those municipal separate storm sewer systems that receive storm water runoff from lands zoned for industrial activity, major outfalls also include outfalls that discharge from a single pipe with an inside diameter of 12 inches or more, or discharge from other than a circular pipe associated with a drainage area of 2 acres or more. This definition also applies to outfalls of drainage areas that have both industrial and non-industrial activity. For example, if a three acre drainage area is zoned half woodland and half industrial, the discharges from that area would still be considered a major outfall. Because the definition of major outfall includes consideration of drainage area, municipalities may need to consider conveyances such as ditches and swales when identifying major outfalls.

4.2.2 Identifying Major Outfalls

The first step in this section of the Part 2 application is the identification of major outfalls not identified in the Part 1 application [§122.26(d)(2)(ii), cited in box above]. When identifying these major outfalls, municipalities should build upon the approach used in the Part 1 application. One way to identify major outfalls is a review of sewer system maps. These maps can provide information on sewer system type (e.g., separate storm versus combined sewer), pipe size, and outfall location. However, depending upon the age of the sewer system maps, they may not provide complete information about newly developed areas or improvements to older areas. Often, interviews with sewer system maintenance personnel can provide information on the most recent changes to the sewer system. The municipality should also consider conducting field surveys (e.g., visual inspection of the banks of receiving waters) to locate major outfalls.

When submitting a Part 2 permit application, municipalities should include a brief description of how additional major outfalls were identified. This description is not intended to be a lengthy list of each sewer system employee interviewed, but rather an outline of the methods employed.

4.3 INVENTORY OF INDUSTRIAL DISCHARGERS

The second step in this portion of the Part 2 application is assembling an inventory of industrial storm water dischargers.

> §122.26(d)(2)(ii). *Source Identification.* . . . Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity.

This section describes how municipalities may develop the inventory of industrial facilities. Section 4.4, below, provides guidance on organizing these facilities by watershed.

4.3.1 Facilities that must be Included in the Inventory

As stated above, applicants must provide an inventory of each facility that may discharge to the MS4 storm water associated with industrial activity. Industrial storm water dischargers that must be included in this inventory fall into 11 classes of industrial activities as defined in the November 1990

regulations. Six of these classes were defined in a narrative format and five were defined by Standard Industrial Classification (SIC) codes. Specific categories of industries are identified in §122.26(b)(14)(i)-(xi). Exhibit 4-1 provides a list of the SIC codes and industry categories cited in the regulatory definition.

4.3.2 Identifying the Industrial Facilities

As a first step in developing a comprehensive industrial storm water inventory, the applicant must review facility notifications. Industrial facilities were required to notify municipalities by May 15, 1991, of their intent to discharge storm water to the municipal storm sewer system [§122.26(a)(vi)(4)]. Each facility should have submitted to the municipality information including facility name, facility location, and facility type (such as SIC code or other industry categorization).

In addition, municipalities should explore other sources of information on industrial facilities to help identify gaps in inventory. One specific source of information a municipality should review is facility information submitted under other programs. For example, SIC codes are often required for air pollution permit applications, hazardous materials management permits, pretreatment program applications, building permits, business licenses, or local tax rolls. A municipality may take the list of SIC codes provided in Exhibit 4-1 and compare it with existing information on SIC codes or industrial categories which has been submitted by industrial facilities under other programs.

Under 40 CFR 122.28, facilities that discharge storm water associated with industrial activity must submit an individual permit application, participate in a storm water group permit application, or file a Notice of Intent (NOI) to be covered by a general permit. These applications and NOIs are another source of information on industrial dischargers. For existing facilities, applications or NOIs were to be submitted by October 1, 1992; for new facilities, they must be submitted prior to the commencement of industrial activity. However, in the Intermodel Surface Transportation Efficiency Act of 1991, Congress provided that permit application requirements be reserved for industrial activities owned or operated by municipalities with a population of less than 100,000, with the exception of airports, power plants, and uncontrolled sanitary landfills. If EPA is the permitting authority in a State, applications and NOIs should be submitted to EPA; if a State has NPDES authority, they should be submitted to the State. Section 308 of the CWA provides the legal authority for any individual (including a municipality) to obtain information from the NPDES permitting authority. A municipality may be able to obtain a list of the facilities in its jurisdiction that have applied for coverage under a general or individual permit or that have applied for coverage as a member of a group.

Additional sources of information on industrial facilities may include zoning maps showing industrial parks, manufacturing and industrial listings in telephone books, trade association listings, pretreatment industrial waste surveys, the Chamber of Commerce Manufacturing Directory, and Dunn and Bradstreet.

In the Part 2 application, a municipality should provide a brief description of the sources it reviewed in identifying the industrial dischargers. As part of the proposed storm water management program, which is described in Chapter 6, municipalities should describe a plan for collecting new or updated information on industrial dischargers throughout the life of the permit.

Exhibit 4-1
Industry Categories Cited in the
Definition of Storm Water Associated with Industrial Activity

1. Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR Subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category 11 below.

2. Facilities described by SIC 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373.*

3. Facilities described by SIC 10 through 14 (mineral industry), including:

   - active or inactive mining operations, except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(1) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990; and

   - oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, by-products, or waste products located on the site of such operations.

4. Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under Subtitle C of RCRA.

5. Landfills, land application sites, and open dumps that receive or have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under Subtitle D of RCRA.

6. Facilities involved in the recycling of materials (metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards) including but not limited to SIC 5015 and 5093.

7. Steam electric power generating facilities, including coal handling sites.

8. Transportation facilities described by SIC 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171, which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under 1 - 7 or 9 - 11 are associated with industrial activity.

(Continued)

Exhibit 4-1 (continued)

9. Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that is located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR Part 403. Not included are farm lands, domestic gardens, or lands used for sludge management where sludge is beneficially reused and which are not located within the facility, or areas that are in compliance with Section 405 of the CWA.

10. Construction activity including clearing, grading, and excavation activities except operations that result in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale.**

11. Facilities described by SIC 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221-25, (and which are not otherwise included within categories 2 - 10).*

Source: 55 FR 48065, November 16, 1990.

*Please note the SIC 285 is covered under Category 11. Also note that for the industries identified in Category 11, the term includes only storm water discharges from all areas (except access roads and rail lines) where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water.

**On June 4, 1992, the United States Court of Appeals for the Ninth Circuit found that EPA's rationale for exempting construction sites of less than five acres and certain uncontaminated storm water discharges from Category 11 light industrial facilities from Phase I of the storm water program to be invalid and has remanded these exemptions for further proceedings (see *Natural Resources Defense Council* v. *EPA* No. 91-70176).

4.4 ORGANIZING THE INDUSTRIAL INVENTORY BY WATERSHED

Once the industrial inventory is complete, the applicant must organize the inventory by watershed, or drainage area. The main objective of this requirement is to associate discrete discharges with specific watersheds, which may help the municipality identify relationships between pollutant sources and receiving water quality problems. To help organize the industrial inventory by watershed, municipalities should consider the long-term benefits of using automated database systems to help organize and update information on:

- Locations of major outfalls or system modifications;
- Land use designations and composition;
- Dischargers of storm water associated with industrial activity;
- Other NPDES permit holders;
- Location/inventory of structural controls; and
- Locations of illicit connections.

This information can help satisfy the requirement that discharges of storm water associated with industrial activity be organized by watershed. Using an automated database system or the map submitted in the Part 1 application may be helpful in satisfying this requirement. However, the regulations do not require Part 2 applicants to use a particular database or submit certain information, and municipalities may elect to use other methods.

The following procedure is provided as an example of one way to organize industrial dischargers by watershed:

1. Create a transparent overlay of tax maps covering the entire area served by the MS4.

2. Indicate on the maps the location of each industrial activity according to its address with an appropriate symbol or code.

3. Produce an overlay of existing watersheds from a topographical map, for example, United States Geological Survey (USGS) maps, covering the area that the MS4 supports. Previously performed hydrological surveys may be helpful in delineating the boundaries of existing watersheds. Municipalities may elect to sub-divide existing watersheds into smaller units if this will assist in management planning.

4. Align the tax map and watershed overlay so that industrial activity locations can be transposed to the watershed overlay.

A number of PC-based tools can be used to organize information on facilities and outfalls. For example, computer-aided design (CAD) packages, in conjunction with third-party software packages, are specifically designed to present information on separate transparent layers that can be "turned off and on" when necessary. One layer could contain information on watershed topography and another could contain the locations of industrial storm water dischargers. Additional layers might contain information on the layout of the municipal system, locations of structural source controls and outfalls, and land-use patterns (both present and future).

A CAD-based system can be useful, not only in presenting information easily and graphically, but also in its ability to transfer spatial data, such as XYZ coordinates, to commonly available PC-based database applications. This spatial data can be merged with other databases containing more generic information including facility name, address, and SIC codes. However, one potential drawback to CAD systems is that most of them cannot store "real-world" (e.g., latitude-longitude) coordinates and are not generally designed for spatial analyses.

Information stored in a CAD format may also be input into a Geographic Information System (GIS). With some conversion, the CAD system coordinates may be transformed into the "real-world" coordinates typically employed by GIS. GIS are integrated database management systems designed for the input, storage, retrieval, analysis, output, and display of geographically or spatially indexed data.

The key attribute of GIS is the relational database capabilities that make these systems powerful tools for conducting spatial analyses. Using GIS, a municipality could overlay several layers of data and derive new information from this existing information. For example, using GIS, an applicant could overlay a map showing the 100-year flood plain with a map showing locations of industrial facilities. The GIS could then calculate the amount of industrial area within the 100-year flood plain and plot this data on a new overlay. This type of spatial analysis might be a powerful tool in the design of the municipality's storm water management program.

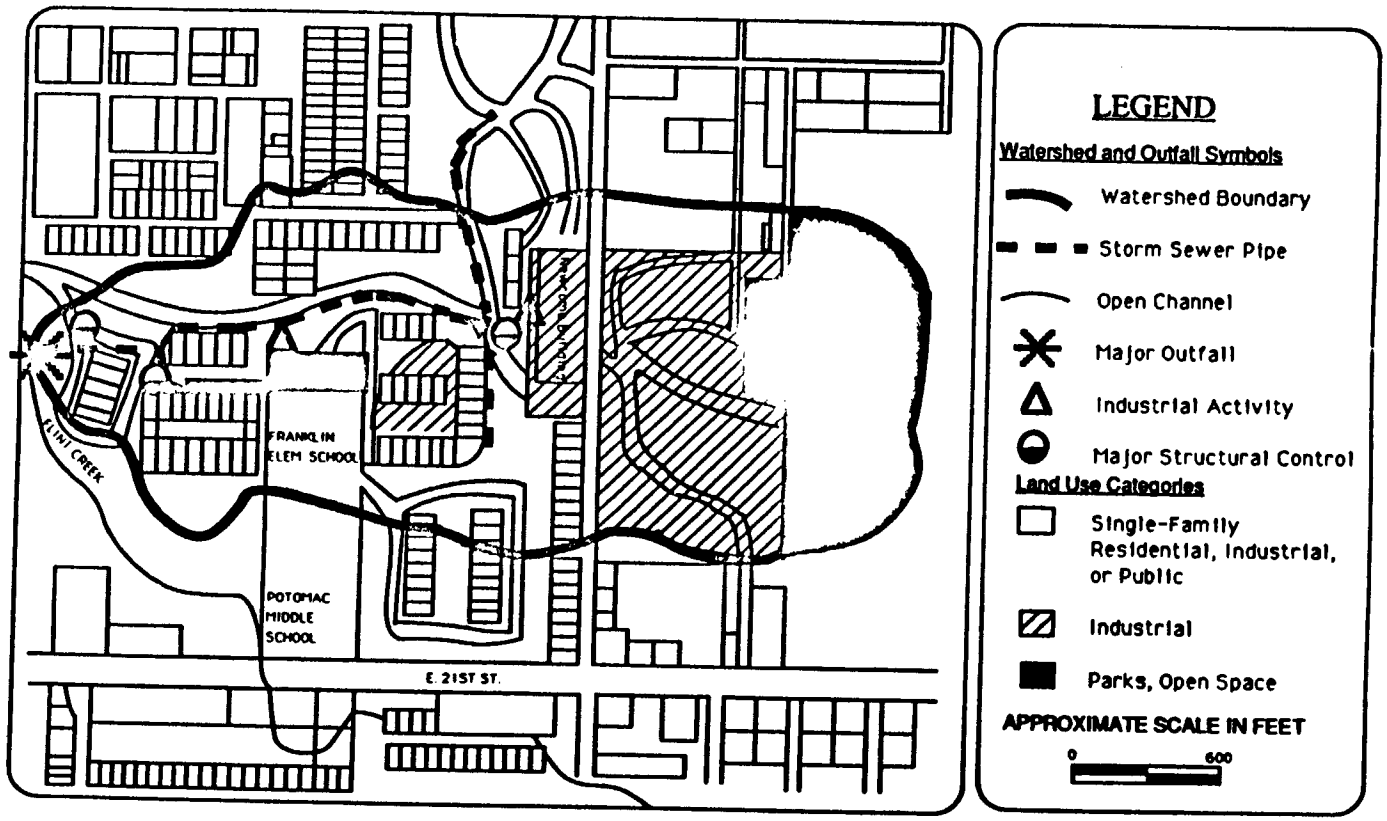
Another benefit of GIS is the ability for common data to be shared efficiently among several agencies. For example, the flood management agency, department of transportation, and storm water control agency could all contribute data to and use analyses from the same GIS. On the other hand, one potential drawback to GIS is their relatively high cost. Often, developing accurate, appropriate base maps is one of the most resource intensive parts of the system.

The techniques presented in this section to organize industrial dischargers by watershed are not the only methods that the applicant can use. For example, municipalities may elect to present the information in tabular form. Using a CAD, GIS, or other automated system is entirely up to the municipality. There is no requirement that municipalities use these systems in the development of either the Part 1 or Part 2 NPDES permit applications. Each applicant will have to examine its existing resources (including computer systems, personnel, and budget) and projected needs before deciding which method will be the most efficient and most useful in the long term.

A discussion of maintaining and/or updating the industrial inventory is provided in Section 6.3.3.2 of this guidance.

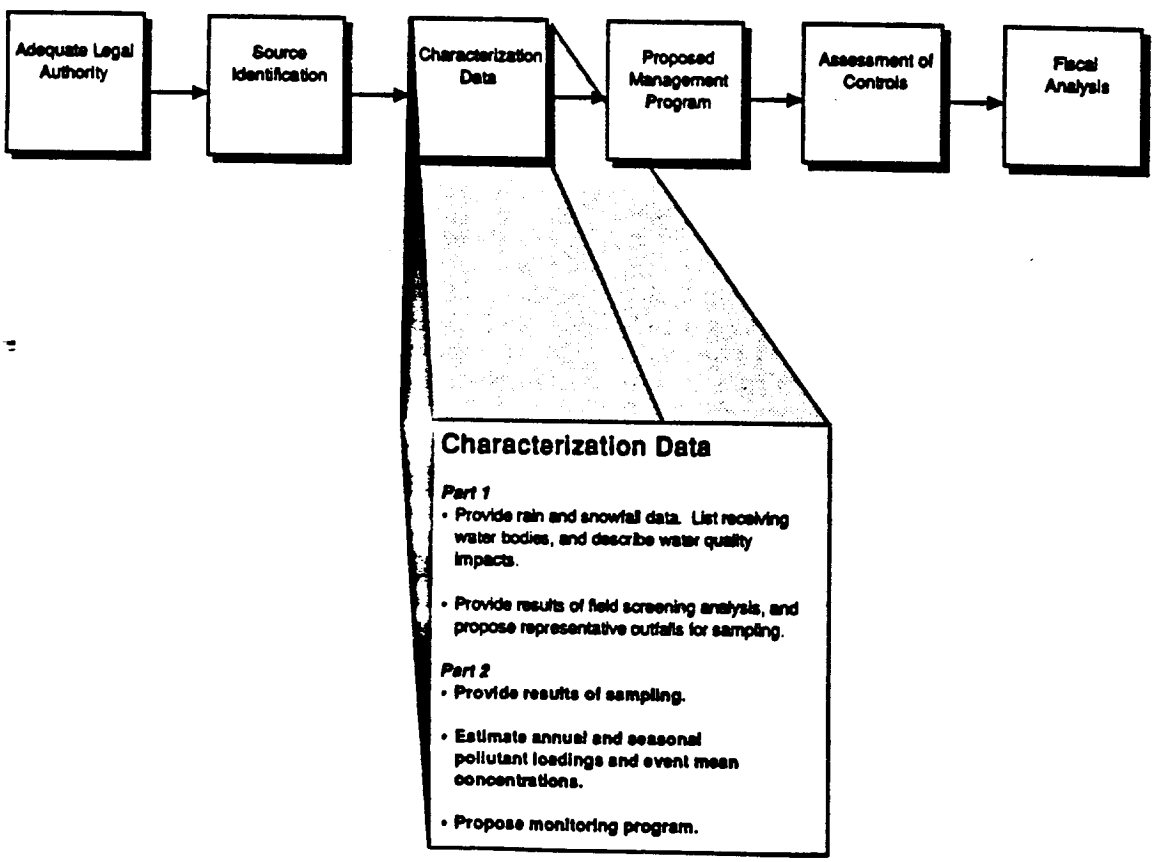
Exhibit 4-2 illustrates an example of the procedure discussed in Sections 4.3 and 4.4.

Exhibit 4-2
Example of a Map Organizing Industry by Watershed



VOL 23

CHAPTER 5
CHARACTERIZATION DATA



0640

5.0 CHARACTERIZATION DATA

5.1 BACKGROUND

5.1.1 Objective of this Section

This section addresses the requirements for reporting the physical and chemical characteristics of municipal storm water runoff as specified by 40 CFR 122.26(d)(2)(iii). These requirements describe the minimum quantitative and descriptive data necessary to begin characterizing storm water discharges.

The applicant is encouraged to provide additional information, if available, which may provide a basis for a more effective storm water management program. The additional information may also help the permitting authority make more informed decisions regarding the specifications of the permit to be issued.

The NPDES permit application regulations require the applicant to identify all major outfalls that are part of the MS4 [§122.26(d)(1)(iii) and 126(d)(2)(ii)]. Part 1 requires the municipality to propose a sampling plan that identifies 5-10 outfalls that would be appropriate for representative data collection under Part 2 of the application [§122.26(d)(1)(iv)(E)]. The next step is to collect and analyze samples from these outfalls (or others designated by the permitting authority) for a variety of pollutant parameters from 3 representative storm events.

5.1.2 Potential Impacts of Storm Water Runoff

The Nationwide Urban Runoff Program (NURP) study showed that discharges from MS4s contribute to the degradation of water quality in the Nation's waters (EPA, 1983). The NURP study also concluded that the effects of urban runoff on receiving water quality are very site specific. The effects depend on the types, size, and hydrology of the water body, the designated beneficial use, the pollutants which affect that use, the urban runoff quality characteristics, and the amounts of urban runoff dictated by local rainfall patterns and land use. *The National Water Quality Inventory, 1990 Report to Congress* as required by Section 305(b) of the Clean Water Act, stated that one-third of the impairment in assessed waters is due to storm water runoff (EPA, 1990d).

Quantity Impacts

Urbanization often increases the quantity and reduces the quality of storm water runoff. For example, vegetated or forested areas with pervious surfaces are often replaced with impervious surfaces (e.g., concrete and asphalt) that prevent or minimize the amount of rainfall available for ground water recharge. This increases the volume and velocity of storm water runoff.

Vegetated areas play a crucial role in ground water recharge and in the maintenance of stream baseflow. This is especially true during extended dry periods, when ground water is often the only source that preserves stream baseflow. In highly urbanized areas, ground water recharge may be so severely reduced that ground water flow to perennial streams during dry periods is not sufficient. Further, the natural hydrology of a watershed is often altered by urbanization, because developing areas often provide drainage appurtenances that rapidly conduct storm water runoff away from these areas. Such drainage may also affect the geometry of natural streams, especially where natural streams have been modified through the installation of man-made channels. Ultimately, reduced perviousness due to urbanization increases the magnitude and the frequency of localized flooding which can have the long term effect of substantially increasing the width of natural streams through erosion and scouring.

Increases in peak discharge velocity and runoff volume can also result in substantial erosion of natural streambanks and the washout of benthic habitats. Since streambeds often consist of unconsolidated silt and sediment, they may be stripped away substantially by excessive discharge velocities. Increased discharge velocities can also lead to undercutting and destabilization of streambanks, which may cause erosion that extends beyond the natural boundary of the streambank.

Further, silt and sediment can increase the turbidity of the receiving water, thus interfering with the growth of aquatic plants which depend on photosynthesis. Increased turbidity can also interfere with aquatic feeding, eliminate spawning areas for fish, and cause abrasion and clogging of fish gills. Also, because silt and sediment may remain in the watershed, they can blanket benthic habitats and severely reduce streamflow capacity.

In the presence of excessive volumes of storm water runoff and discharge velocities, the net impact on receiving waters can be almost indistinguishable from impacts commonly associated with the discharge of toxics (e.g., increased mortality, reduced biodiversity, and reduced reproduction).

Deposition and Resuspension of Toxicants

Research is currently on-going to examine the impact of the deposition and resuspension of toxicants as a result of wet weather events. Questions about the survivability of benthic habitats when exposed to toxicants in deposited sediments still remain. The impact of resuspended toxicants from the sediments is not well known since toxics are often bound to sediment particles that may reduce the concentrations available for biological uptake and subsequent bioaccumulation. The applicant should also be aware that different metal contaminants in sediments can exhibit different solubilities. Under varying conditions of pH and temperatures, metals deposited in sediment can become soluble again and be reintroduced into the water column.

Excessive Bacterial Levels

The NURP study final report concluded that "coliform bacteria are present at high levels in urban runoff and can be expected to exceed EPA water quality criteria during and immediately after storm events." This is of significant concern, particularly in swimming and shellfish areas.

Dissolved Oxygen Depression

The presence of oxygen-consuming pollutants in receiving waters can lead to severe dissolved oxygen depression. Factors that can cause dissolved oxygen depression include the resuspension of biodegradable organic material (which can occur in the presence of high flow velocities) or the discharge of organic pollutants in storm water discharges. The NURP study demonstrated that storm water discharges exhibit biochemical oxygen demand (BOD) levels in excess of levels commonly associated with secondary treated effluent from publicly owned treatment works (POTWs). Severe dissolved oxygen depression could contribute to fish kills, which are one of the most readily observable impacts of pollution on receiving waters.

Eutrophication

Eutrophication, or the aging of a water body, can be accelerated by excessive nutrient loadings from storm water. Advanced stages of eutrophication are often associated with substantial variations in dissolved oxygen concentration. Nutrients of concern are nitrogen and phosphorus. Phosphorus is typically the growth-limiting nutrient for plants in fresh water systems. Storm water discharges routinely contain excess concentrations of these nutrients, which can lead to excessive algal growth, commonly referred to as algal blooms. Excessive concentrations of algae can cause odor and taste problems in drinking water and can result in aesthetically unpleasant

environments. In addition, the eventual decomposition of large concentrations of algae can depress dissolved oxygen in the water body to levels where fish kills occur. In nature, the process of eutrophication occurs over a substantial period of time; however, storm water discharges can rapidly accelerate this process.

Exceedance of Chronic Toxicity Criterion

Long-term exposure to toxics in excess of chronic toxicity criteria can cause sublethal effects on aquatic life. Indicators of chronic toxicity include reduced fertility, reproduction, and growth rates and a decline in the diversity of aquatic organisms. The NURP study clearly indicated that storm water discharges contain concentrations of trace metals, such as lead, cadmium, zinc, and copper in amounts that exceed the chronic toxicity criteria. Prolonged exposure to chronic concentration levels of toxics can also be lethal to aquatic organisms, primarily from the bioaccumulation of toxics within the cell tissue of the organism over a extended period of time.

Thermal Impacts

The temperature of storm water runoff may become significantly elevated via conductive and convective heat transfer with impervious, man-made surfaces. In the case of contact with impervious surfaces, the resulting temperature elevation of storm water runoff can be substantial. For example, the surface temperature of parking lots during summer months may exceed 100 degrees Fahrenheit. Consequently, storm water runoff from these parking lots will be elevated in temperature. Many aquatic organisms are extremely sensitive to changes in water temperature. Increased water temperature also reduces dissolved oxygen in streams, rivers, lakes, and wetlands. Therefore, significant discharges of storm water at elevated temperatures can, over the long term, lead to the alteration of aquatic populations.

5.1.3 Use of the Characterization Data

The NURP study analyzed storm water discharge from 28 sites representing 12 major river basins of the United States. NURP detected 77 EPA priority pollutants present in the storm water discharges sampled, including samples with concentrations that exceeded water quality criteria for certain pollutants. Those pollutants detected in at least 10 percent of the samples studied in NURP are identified in Exhibit 5-1.

The data gathered for storm water discharge characterization can be used to create a baseline measurement of pollutant concentration and loadings. The data also can be used to evaluate the effectiveness of best management practices (BMPs) as well as help identify storm water control priorities. In addition, it can be used to help identify the sources of pollutants in storm water runoff, to help establish an effective monitoring program for the life of the permit, and to help predict the impact of storm water runoff on receiving waters that are known to be impaired.

5.1.4 Storm Water Sampling and Analysis Procedures

The regulation requires that the process of collecting quantitative data for storm water characterization follow certain guidelines.

> §122.26(d)(2)(iii) *Characterization data*. When "quantitative data" for a pollutant are required under paragraph (d)(1)(iii)(A)(3) of this paragraph, the applicant must collect a sample of effluent in accordance with 40 CFR 122.21(g)(7) and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method.

Exhibit 5-1. Priority Pollutants Detected in at Least 10% of NURP Samples.

PARAMETERS	FREQUENCY OF DETECTION (%)
Metals and inorganics:	
Antimony	13
Arsenic	52
Beryllium	12
Cadmium	48
Chromium	58
Copper	91
Cyanides	23
Lead	94
Nickel	43
Selenium	11
Zinc	94
Pesticides:	
Alpha-hexachlorocyclohexane (alpha-BHC)	20
Alpha-endosulfan	19
Chlordane	17
Lindane (gamma-BHC)	15
Halogenated aliphatics:	
Methane, dichloro-	11
Phenols and cresols:	
Phenol	14
Phenol, pentachloro-	19
Phenol, 4-nitro	10
Phthalate esters:	
Phthalate, bis(2-ethylhexyl)	22
Polycyclic aromatic hydrocarbons:	
Chrysene	10
Fluoranthene	16
Phenanthrene	12
Pyrene	15

Source: U.S. Environmental Protection Agency, *Results of the Nationwide Urban Runoff Program*, EPA Planning Division (National Technical Information Service (NTIS) Accession No. PB84-8552). December 1983.

The data collection procedures must follow the guidelines for storm water sampling outlined in §122.21(g)(7), *Effluent Characteristics*. This portion of the NPDES regulation describes the conditions under which a storm water discharge will be sampled, and which collection procedure (grab sample versus flow-weighted composite sample) is required for the water quality parameter being analyzed. These guidelines are discussed in more detail in Sections 5.3.2 and 5.3.4 of this guidance manual. In addition, EPA has available a *Storm Water Sampling Guidance Document* that describes in detail the methods used for storm water discharge sampling (EPA, 1992a).

The methods for the chemical analyses of storm water discharge samples must be conducted in accordance with 40 CFR Part 136, *Guidelines for Establishing Test Procedures for the Analysis of Pollutants*. These guidelines refer the applicant to EPA-approved methods and cite the source of the approved methods (e.g., Standard Methods for the Examination of Water and Wastewater, ASTM methods, etc.). Note that alternative methods (i.e., those not included in Part 136) may be used under certain circumstances (see Section 5.3.4) as described in 40 CFR Part 136, and reiterated in the Characterization Data section of Part 2 of the storm water discharge NPDES permit.

The specific constituent pollutants and water quality parameters that must be analyzed in the storm water samples are presented in Section 5.3.4.

5.2 SUMMARY OF REGULATORY REQUIREMENTS

The following is a summary of the characterization data requirements for the Part 2 application:

- Quantitative data on physical and chemical characteristics of the discharge taken from at least 5 to 10 representative outfalls chosen by the permitting authority (Section 5.3);
- Estimates of both the annual pollutant load and event mean concentration of the cumulative discharges from all municipal outfalls during a storm event (Section 5.4);
- A proposed schedule to provide estimates for each major outfall of the seasonal pollutant load and the event mean concentration for constituents detected in required sampling (Section 5.5); and
- A proposed monitoring program for the life of the permit that meets specific requirements established in the regulations (Section 5.6).

5.3 QUANTITATIVE AND QUALITATIVE DATA REQUIREMENTS

5.3.1 Selection of Representative Sampling Sites

In the Part 1 application, the municipality is required to describe a plan for obtaining characterization data [§122.26(d)(1)(iv)(E)]. The plan should reflect the requirements of §122.26(d)(2)(iii).

Different types and intensities of land use activities influence, in part, the types of pollutants and the pollutant concentrations in municipal storm water runoff. Therefore, Part 1 of the permit application [§122.26(d)(1)(iii)(B)(2)] requires the applicant to describe the land use activity within the area to be covered by the permit. In Part 1, the applicant also must select a subset of all the major outfalls (see Section 4.2.1 for definition of major outfall) identified that represented surface runoff discharge of the various land use activities described. In some cases, a municipality preparing a Part 2 application may want to supplement its sampling program by collecting and analyzing samples from major outfalls that were not identified in the Part 1 application or designated by the permitting authority. This additional sampling may provide the

municipality with data that better characterizes its MS4 discharges.

5.3.2 Criteria for Storm Water Discharge Sampling

Land use activities are not the only factors that affect the pollutant composition of storm water runoff. Storm water composition also varies according to the nature of the storm event (e.g., duration, volume), and the composition may vary throughout the duration of a single storm event (i.e., the initial discharge, or "first flush," tends to have higher pollutant loads). In order to obtain data that represents an "average" storm event, EPA requires samples from three separate storm events to characterize the surface water runoff; however, the permitting authority may allow exemptions.

> §122.26(d)(2)(iii)(A)(1) For each outfall or field screening point designated under this subparagraph, samples shall be collected of storm water discharges from three storm events occurring at least one month apart in accordance with the requirements at §122.21(g)(7) (the Director may allow exemptions to sampling three storm events when climatic conditions create good cause for such exemptions);

The criteria for sampling storm water discharge are detailed in §122.21(g)(7), *Effluent Characterization*. EPA's *Storm Water Sampling Guidance Document* addresses these criteria. For the purpose of this discussion, a brief synopsis of these criteria follows:

- For each outfall or field screening point selected, samples must be collected from three separate storm events.
- The three storm events must be at least one month apart.
- Each sampled storm event must have a rainfall of at least 0.1 inch in the drainage area.
- There must be no storm event in excess of 0.1 inch in the drainage area for at least 72 hours prior to the sampled storm event.
- The rainfall event should not vary by plus or minus 50 percent from the average or median per storm volume and duration for the region.

EPA understands that climatic conditions may make it difficult for some municipalities to sample storm events meeting these criteria. For example, storm events may be so infrequent in arid and semi-arid areas that sufficient samples cannot be obtained by the application deadline. In other areas, storms may be so frequent that it may not be possible to wait the required 72 hours between storm events. In such cases, the applicant should confer with the permitting authority in advance. In instances where representative storm events do not occur prior to the application due date, the municipality should submit its application with as much information as possible. It should include an explanation [certified by a principal executive officer or ranking elected official in accordance with §122.22(a)(3)] as to why sampling data were unavailable.

The municipality may need to perform some initial research and calculation to meet the requirements listed above. In order to determine what constitutes an average storm event for the area, the applicant should contact the National Weather Service or National Oceanographic and Atmospheric Administration's National Climate Center. Weather data is also available commercially and from airports. The applicant may also refer to the information provided in the *Storm Water Sampling Guidance Document*.

5.3.3 Narrative Description of Storm Event

> §122.26(d)(2)(iii)(A)(2) A narrative description shall be provided of the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

Under §122.26(d)(2)(iii)(A)(2), the municipality must provide a narrative description of each storm that produced the discharge to be chemically and physically characterized. Such a narrative description must include:

- The date and duration of the rainfall event that produced the discharge sampled. Measurements describing the peak intensity of the storm, if available, should also be reported;
- The amount of rainfall. Rainfall conditions may vary significantly across large drainage areas, so rainfall characteristics should be spatially averaged over the drainage area, if possible. If more than one rain gauge is used, averages should be reported. Rain gauges operated near the drainage area by the National Weather Service may be used, or the discharger may collect this information;
- The time elapsed since the last rainfall event greater than 0.1 inches. Historical rainfall data from rainfall gauges can be used to provide this information. If a gauge records only daily data, municipal field personnel could be asked to provide information on times during the day a rainfall event began or ended.

5.3.4 Chemicals/Water Quality Parameters to be Measured

The storm water discharge samples must be analyzed for a number of pollutant parameters.

> §122.26(d)(2)(iii)(A)(3) For samples collected and described under paragraphs (d)(2)(iii)(A)(1) and (A)(2) of this section, quantitative data shall be provided for: the organic pollutants listed in Table II; the pollutants listed in Table III (toxic metals, cyanide, and total phenols) of appendix D of 40 CFR part 122, and for the following pollutants:
>
> Total suspended solids (TSS)
> Total dissolved solids (TDS)
> COD
> BOD_5
> Oil and grease
> Fecal coliform
> Fecal streptococcus
> Ph
> Total Kjeldahl nitrogen
> Nitrate plus nitrite
> Dissolved phosphorus
> Total ammonia plus organic nitrogen
> Total phosphorus
>
> *[Note that total kjeldahl nitrogen is actually a substitute for total ammonia plus organic nitrogen.]*

The complete list of chemicals is provided in Exhibits 5-2, 5-3, and 5-4. Exhibits 5-2 and 5-3 are derived from 40 CFR Part 122, Appendix D, Tables II and III, respectively. Exhibit 5-4 comes from the text of the regulation (see box above). The EPA-approved analysis procedure for the pollutants in Exhibits 5-2 and 5-3 can be found in 40 CFR Part 136. If a municipality is seeking approval to use an alternative method of analysis, then a request should be made according to procedures outlined in 40 CFR 136.4.

Exhibit 5-2: Pollutants Listed in Table II in Appendix D of 40 CFR Part 122

Pollutant		Pollutant	
Volatiles		**Acid Compounds**	
Acrolein	1,2-Dichloropropane	2-Chlorophenol	
Acrylonitrile	1,3-Dichloropropylene	2,4-Dichlorophenol

Fecal streptococcus	

* Total ammonia plus organic nitrogen is interchangeable with TKN.

Source: 40 CFR 122.26(d)(2)(iii)(A)(3)

Section 122.21(g)(7) specifies that certain pollutant parameters will be analyzed on grab samples taken from the outfall, whereas the remainder of the pollutant parameters require that composite samples be taken from the outfall. These types of sampling procedures are differentiated as follows:

Grab samples: discrete, individual samples taken within a short period of time (usually less than 15 minutes). Analysis of grab samples characterizes the quality of a storm water discharge at a given time of the discharge. The following measurements must be made from grab samples:

- pH
- Temperature
- Cyanide
- Total phenols
- Residual chlorine
- Oil and grease
- Fecal coliform
- Fecal streptococcus

Note that measurements of temperature and pH must be taken in the field to avoid time-dependent changes that may occur between sampling time and actual analyses.

Flow-weighted composite samples: single unit volumes composed of a mixture of samples collected proportional to flow throughout the entire runoff event or at least for the first three hours of the storm water event, if it lasts more than three hours. The flow-weighted composite sample must consist of at least three discrete aliquots per hour from the storm water discharge, or a continuous sampler may be used.

All parameters (see Exhibits 5-2, 5-3, 5-4) not listed under the description of grab samples above must be analyzed from flow-

weighted composite samples. Details on taking flow-weighted composite samples may be found in the EPA *Storm Water Sampling Guidance Document*.

5.3.5 Additional Quantitative Data

Section 122.26(d)(2)(iii)(A) concludes with a provision that allows the permitting authority to request additional quantitative data if necessary to determine permit conditions.

> §122.26 (d)(2)(iii)(A)(4) Additional limited quantitative data required by the Director for determining permit conditions (the Director may require that quantitative data shall be provided for additional parameters, and may establish sampling conditions such as the location, season of sample collection, form of precipitation (snow melt, rainfall) and other parameters necessary to insure representativeness);

To ensure the storm water discharge system is accurately represented, the permitting authority may require that quantitative data include additional parameters and may establish specific sampling conditions, such as:

- Location where the sample is taken;
- Season of sample collection;
- Form of precipitation (snowmelt, rainfall);
- Evidence of impact to aquatic ecosystems; or
- Other parameters necessary to ensure the system is accurately characterized.

The data generated from the qualitative and quantitative analyses described under §122.26 (d)(2)(iii)(A) will be used to calculate the annual pollutant loads and event mean concentrations for each pollutant as described in subsequent parts of this section. Estimates of annual pollutant loads and event mean concentrations would then be used to assist in establishing storm water management priorities and selecting BMPs.

5.4 ESTIMATION OF SYSTEM-WIDE EVENT MEAN CONCENTRATIONS AND ANNUAL POLLUTANT LOADS

The applicant must submit estimates of the event mean concentration and annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls.

> §122.26(d)(2)(iii)(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under §122.21(g)(7)) for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods;

Estimates of annual pollutant loads will be somewhat imprecise; however, municipalities should exercise best professional judgement in deriving these estimates. A description of what assumptions were made to derive pollutant loadings must be included.

Under §122.26(d)(2)(iii)(B) (see box above) applicants must provide the following:

- Estimates for the event mean concentration for pollutants listed in Exhibit 5-5 below, which can be used to estimate the annual pollutant load associated with all municipal outfalls identified under §122.26(d)(1)(iii) and (d)(2)(ii);

- A description of the procedures for estimating constituent loads and concentrations; and

- Details on data analysis, models used, and calculation methods.

Data sources and procedures that municipal applicants may use to estimate event mean concentrations and annual pollutant loads of the cumulative discharges are discussed below.

The primary purpose for estimating annual pollutant loads and event mean concentrations is to assign priorities for implementing BMPs. Municipalities should consider the magnitude of individual pollutant loadings when assigning priorities to resources to reduce these loadings. The areas receiving the highest priority for implementation of BMPs will be those portions of the MS4 that appear to contribute the largest load of pollutants to the system. Therefore, it is the relative value of these calculations that is of importance within this regulation, not the absolute value.

Over time the accuracy of the available methods to calculate loads and concentrations will improve and the use of these estimates may assume a larger role in determining permit conditions and estimating the success of the comprehensive municipal storm water management program. The emphasis for now, however, is on the application of the most practicable methods to reasonably estimate annual loads and event mean concentrations.

5.4.1 Data Sources

The Part 1 application requires municipalities to submit all existing storm water sampling data, along with all relevant water quality data, sediment data, fish tissue or other biosurvey data taken over the past 10 years. All historical data must accompanied by a narrative description of the watershed served by the outfall from which the data are obtained, a description of the sampling and quality control program, and the monitoring location of the receiving water.

To estimate an annual pollutant load for a given pollutant, a value must be derived for the average concentration, or event mean concentration, of that pollutant. To derive this value, applicants may use either site-specific data, or data from a national or regional study, such as NURP.

Municipalities with adequate historical data may choose to use these data to estimate annual pollutant loads in the Part 2 application. However, many applicants may not have enough site-specific data to develop valid estimates. These applicants may choose to use generic data (e.g., from regional and national studies), such as the data provided in the NURP study. The NURP study's estimated range of detected concentration for specific pollutants is summarized in Exhibit 5-6.

Exhibit 5-5: Pollutants for which Event Mean Concentrations and Annual Pollutant Loads Must be Calculated

Pollutant	Pollutant
BOD_5	Total phosphorus
COD	Dissolved phosphorus
TSS	Cadmium
Dissolved solids	Copper
Total nitrogen	Lead
Total ammonia plus organic nitrogen	Zinc

Source: 40 CFR 122.26(d)(2)(iii)(B) (55 FR 48070, November 16, 1990)

Exhibit 5-6. NURP Study Range of Detected Concentration for Specific Pollutants

Parameter	Concentration µg/L
Metals and inorganics:	
Antimony	2.6 - 23
Arsenic	1 - 50.5
Beryllium	1 - 49
Cadmium	1 - 14
Chromium	1 - 90
Copper	1 - 100
Cyanides	2 - 300
Lead	4 - 23,000
Nickel	1 - 182
Selenium	0.2 - 0.8
Zinc	10 - 2400
Pesticides:	
Alpha-hexachlorocyclohexane (alpha-BHC)	0.027 - 0.10
Alpha-endosulfan	0.008 - 0.20
Chlordane	n/a
Lindane (gamma-BHC)	0.007 - 0.1

Phenol, pentachloro-	1 - 115
Phenol, 4-nitro	1 - 37
Phthalate esters:	
Phthalate, bis(2-ethylhexyl)	4 - 62
Polycyclic aromatic hydrocarbons:	
Chrysene	0.6 - 10
Fluoranthene	0.3 - 2
Phenanthrene	0.3 - 10
Pyrene	0.3 - 16

Source: U.S. Environmental Protection Agency, *Results of the Nationwide Urban Runoff Program*, EPA Planning Division (National Technical Information Service (NTIS) Accession No. PB84-8552). December 1983.

The applicant should be aware of limitations associated with data from national and regional studies before deciding on methods to estimate pollutant loadings. In some cases, it may be more appropriate to use any available site-specific data rather than data from national or regional studies. For example, the NURP study did not collect pollutant concentration data from industrial areas. In this instance, even limited site specific concentration data from industrial areas may be more meaningful.

EPA encourages applicants to seek data from a variety of sources to better characterize the quality of their storm water discharges. Regardless of the data source, a description of the procedures for estimating constituent loads and concentrations, including any modeling, data analysis, and calculation methods, must be included.

There will be a degree of uncertainty associated with estimating pollutant loadings in the Part 2 application. The requirement to calculate pollutant loadings and concentrations is intended to be a planning and screening effort to assign program priorities, and not necessarily to determine absolute values.

5.4.2 Event Mean Concentrations

Event mean concentrations (C_i in Equation 1 on page 5-16) are determined from analyses of flow-weighted composite samples collected from each of the designated field screening points. Section 2.2.4 of the *Storm Water Sampling Guidance Document* describes procedures for collecting flow-weighted composite samples (EPA, 1992a). Concentration values must be reported in the applicant's Part 2 Permit Application for each representative storm event sampled. The applicant should report the average of these results as the event mean concentration for each parameter measured. Municipalities are encouraged to present data in a tabular format. However, the applicant has flexibility to present the data in other ways, provided the data is clearly presented.

As stated previously, applicants must sample storm events for at least three hours, or for the entire storm event if it lasts less than three hours. If a storm event lasts more than three hours, the applicant may choose among three approaches for calculating the event mean concentration of the storm. First, the applicant may report the event mean concentration for the first three hours of the event (or longer, if the applicant monitored more than three hours). Second, if the applicant has data available on the correlation between flow and concentration which allows it to be more specific about the event mean concentration, an estimation technique may be used to derive the event mean concentration. If the applicant uses such an estimation technique, the methodology must be explained. Third and finally, the applicant may monitor the entire storm event and report the actual event mean concentration.

Whichever approach the applicant uses, the same method should be used to derive event mean concentrations in the future. This will assist the applicant in identifying meaningful trends in changes in event mean concentrations over time.

5.4.3 Annual Pollutant Loadings

Municipalities may choose from a variety of acceptable procedures for estimating the annual pollutant loads of the cumulative discharge. This guidance contains an example of calculating the annual pollutant loads using the "simple method," which is adapted from Schueler (1987). The guidance also discusses some dynamic models that applicants may wish to employ.

Regardless of which method applicants choose, they must describe and document the specific technique used. The description should include (but is not limited to) the key equations used to calculate reported values, such as:

- Assumptions for selecting site-specific parameters (e.g., runoff coefficients);

- References to any source documentation (e.g., previously completed studies or reference textbooks); and
- Justification for any assumed parameter values.

The Simple Method

The following method of computing pollutant loadings is referred to as the "simple method" and is adapted from Schueler (1987). For purposes of satisfying Part 2 application requirements, the simple method provides a quick and reasonable estimate of pollutant loadings with a minimal amount of data required. Although the regulations require a system wide (cumulative) annual pollutant load calculation for each of the pollutants listed in Exhibit 5-5 (above), the single pollutant load values provide limited insights into potential problem areas and what BMPs might yield the best results. Consequently, the municipality may want to consider using the simple method to estimate "individual" pollutant loadings from drainage areas. The individual pollutant loadings can be aggregated to derive a cumulative annual pollutant loading for the entire MS4. In the procedure below, for example, Step 1 computes the annual loading for each outfall of the MS4. Then in Step 2, the resulting pollutant loadings are summed to derive annual pollutant loads on a per-watershed basis. In Step 3, the annual pollutants loads for each watershed are summed to derive a system-wide annual pollutant load.

As stated above, this procedure is only one example of how a municipality could calculate a system-wide annual pollutant load. Estimates of annual pollutant loads for individual outfalls, watersheds, or other discrete areas are not specifically required by the regulations. However, municipalities will find such estimates helpful in making relative comparisons among different areas of the MS4. Ultimately, these estimates could assist the municipality with selecting BMPs and assigning priorities to potential problem areas.

Step 1: Use the Simple Method to Calculate Annual Pollutant Loads on a Per-Outfall Basis

The first step in this example is to calculate annual pollutant loads for individual outfalls. However, the applicant may choose to begin by calculating annual pollutant loads for each watershed or other discrete area. As stated above, this example uses the simple method, which is given by the following equation:

EQUATION 1:

$$L_i = \left[\frac{(P)(CF)(Rv_i)}{12}\right](C_i)(A_i)(2.72)$$

where: L_i = Annual pollutant load (lb/outfall/yr)
P = Annual precipitation (in/yr)
CF = Correction factor that adjusts for storms where no runoff occurs (a value of 0.9 is typically used)
Rv_i = Weighted-average runoff coefficient for the area served by the outfall (the calculation of runoff coefficients is discussed below)
C_i = Event mean concentration of pollutant (mg/L)
A_i = Catchment area (acres)

The numbers 12 and 2.72 are conversion factors that account for unit conversions.

Each of the parameters in Equation 1 is defined below:

- **Annual pollutant load** is the total amount of a specific pollutant discharged in pounds per time period (in this case, per year) for the particular segment of the MS4 being modeled (in this case for each outfall). Pollutant loads may also be expressed for alternative time periods, or on a system-wide or watershed basis.

- **Annual precipitation** is the total inches of rainfall occurring in a single year plus the contribution of snowmelt. Estimates of the annual rainfall can be based on the rainfall data provided in Part 1 of the application.

- **Correction factor** is an adjustment factor for the number of storm events that do not actually produce any runoff (i.e., the percentage of storm events that have a total accumulation greater than a specific threshold value). This value will vary by region. Without this adjustment factor, the municipality would be assuming that all storm events produce runoff, which may or may not be the case. A typical value for this correction factor is 0.9 (90%). However, this value can vary between climatic regions. Municipalities should review historical rainfall data to estimate the percentage of storm events that produce runoff versus the number of storm events per year.

- **Weighted-average runoff coefficient** is a relative measure of imperviousness or the percentage of rainfall that becomes surface runoff. Runoff coefficients are a function of the type of surface, intensity of the rainfall, the degree of soil saturation and storativity (storage capacity) of the soil. To deterimine runoff coefficients, the municipality may use Equations 2 or 3 (which follow). Alternatively, the municipality may use actual field measurements, relevant hydrologic studies, average values published in civil engineering reference manuals, or default values provided in Exhibit 3-12 of EPA's *NPDES Storm Water Sampling Guidance Document*.

- **Event mean concentration of pollutant** is the event mean concentration value for the specific pollutant determined from the analysis of flow-weighted composite samples. Equation 1 requires a value for each pollutant concentration. As discussed previously, the applicant may use site-specific concentration data (e.g., storm water sampling data) or generic (e.g., NURP) data to derive event mean concentrations. In other words, the applicant should use best professional judgement to decide which of the following concentration values to use:

  - a mean concentration value from the NURP study;

    OR

  - an average of all event mean concentrations from all samples over three representative storm events;

    OR

  - an event mean concentration attributable to a specific land use activity.

  The applicant will have to consider the extent of the variability of the data when selecting an appropriate concentration value. NURP or other regional studies used to estimate pollutant concentrations can be compared to existing site-specific data in order to assess the uncertainty associated with generic approaches.

- **Catchment area** is the size of the drainage area for the particular segment of the MS4 being modeled (in this case, the outfall drainage area). Areas that are served by combined sewers or that are not otherwise served by the MS4 should not be included.

Weighted-average runoff coefficient. Runoff coefficients can be based on flow measurements or estimated from land use characteristics. In order to determine an average runoff coefficient for an area with a diversity of land

use activities, the following equation should be used to estimate a weighted-average runoff coefficient:

EQUATION 2

$$Rv_i = \frac{(\sum A_i R_v)}{\sum A_i}$$

where: Rv_i = Weighted-average runoff coefficient
A_i = Catchment area (acres)
R_v = Catchment runoff coefficient

As an alternative to Equation 2, Equation 3 can be used to estimate weighted-average runoff coefficients from percent imperviousness data (Shelley, 1986):

EQUATION 3

$$Rv_i = 0.05 + 0.009 * I$$

where: Rv_i = Weighted-average runoff coefficient
I = Percent imperviousness

The percent imperviousness can be estimated from land use data. Residential land can be assumed to be 24% impervious; commercial land 75% impervious; industrial land 55% impervious; and open space 15% impervious. The percent imperviousness of residential land was estimated from the following empirical equation of NURP and USGS data, which relates population density to percent imperviousness:

EQUATION 4

$$I = 9 * D^{0.5}$$

where: I = Percent imperviousness
D = Population density (persons/acre)

Similar to Equation 1, individual parameters for Equations 2, 3, and 4 can be used on a system-wide basis, or modified to reflect more realistic conditions within smaller or discrete segments (e.g., individual watersheds or outfalls).

Step 2. Use the Per-Outfall Annual Pollutant Loads to Calculate Per-Watershed Annual Pollutant Loads

If the simple method is used to compute the annual loading on a per-outfall basis, Equation 5 may be used to estimate annual pollutant loadings on a per watershed basis. The approach of computing pollutant loadings on a watershed basis is used by some counties where larger watersheds are segregated into smaller watersheds or drainage areas on the basis of similar land use designations. One county uses this method in conjunction with forecasts of future development within the county to develop preliminary estimates of future pollutant loadings. This approach minimizes the possibility of computing an annual pollutant loading that is too conservative.

EQUATION 5

$$L_w = \sum L_i$$

where: L_w = Annual pollutant load for a particular watershed
ΣL_i = Summation of individual annual pollutant loadings from all major outfalls within a specific watershed

Step 3: Use the Watershed-Based Annual Pollutant Loads to Calculate System-Wide Annual Pollutant Loads

To calculate the annual loadings system-wide, use the following equation:

EQUATION 6

$$L_a = \sum L_w$$

where: L_a = Annual pollutant load for an entire MS4

ΣL_w = Summation of individual annual pollutant loadings from all watersheds within a municipal separate storm sewer system

Dynamic Models

In instances where a municipality has a significant amount of historical data for the drainage areas serviced by storm sewer outfalls, including historical precipitation data and receiving water concentration and flow data, the MS4 may elect to use dynamic models to derive pollutant loads and to analyze the effects of MS4 discharges on receiving waters.

Dynamic models are designed to calculate a complete probability distribution for the output being modeled. Therefore, dynamic models take into consideration the inherent variability of data associated with MS4 discharges, such as variations in concentration, flow rate, and runoff volume.

One benefit of using a dynamic model is that the calculation of a complete probability distribution allows the modeler to consider a multitude of "what-if" scenarios. For example, when sufficient historical data is available, the modeler could consider the benefits and risks associated with alternative BMP strategies.

Dynamic models have one additional benefit over steady-state models in that dynamic models determine the entire discharge concentration frequency distribution. Consequently, this would enable the modeler to examine the effects of storm water discharges on receiving water quality in terms of the frequency by which water quality standards may be exceeded. For purposes of computing pollutant loadings, a number of models are available including EPA's Stormwater Management Model (SWMM) and Hydrologic Simulation Program (HSPF); U.S. Army Corps of Engineers' Storage, Treatment, Overflow, Runoff Model (STORM); and Illinois State Water Survey's Model QILLUDAS (or Auto-QI).

Regardless of the method employed, the applicant must document how pollutant loadings are derived. Applicants must provide estimates of annual pollutant loads and event mean concentrations for each outfall with their Part 2 applications. However, some outfalls will need to be more completely characterized, and conditions will change after the permit is approved. This is one reason why, as described in Section 5.4, data collection will continue throughout the term of the permit. Estimates of the individual contribution of pollutant loadings for each watershed or major outfall will help the applicant select priorities for specific watersheds.

5.5 PROPOSED SCHEDULE FOR SEASONAL LOADS AND REPRESENTATIVE EVENT MEAN CONCENTRATIONS OF MAJOR OUTFALLS

> §122.26(d)(2)(iii)(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(1) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section;

Seasonal pollutant loads are important because they are a more accurate representation of loadings that may occur during a short time interval. To further refine the annual pollutant load estimates, Part 2 requires the applicant to propose a schedule to estimate seasonal

pollutant loadings and event mean concentrations for each major outfall.

The quality of the data available when the Part 2 application is prepared will affect the accuracy and usefulness of the initial estimates of pollutant loadings and average concentrations. These estimates can be improved as more site-specific data are collected during the term of the permit. A long-term site specific monitoring program will capture the variability in data that is essential to estimate more accurate pollutant loadings over time. Therefore, the impacts associated with these loadings can also be estimated with greater certainty. In addition, a site specific record collected over a longer time frame allows the effectiveness of the comprehensive municipal storm water management program to be evaluated.

Estimates must be submitted for any contaminant detected in any sample required under the Part 2 sampling effort [§122.26(d)(2)(iii)(B)]. Seasonal pollutant load estimates are required for any pollutants listed in Exhibits 5-2, 5-3, and 5-4 that were detected during the sampling procedure described in Section 5.3.4. Therefore, the analyses required for seasonal pollutant loads will potentially be more comprehensive than the analyses of annual pollutant loads. This results from the possibility that additional pollutants will be detected as part of the storm water characterization studies.

In some regions, precipitation patterns vary significantly from season to season, resulting in significantly different pollutant loadings throughout the year. In arid and semi-arid parts of the country, pollutants accumulate during dry spells, resulting in significantly higher pollutant concentrations in storm water discharges after extended dry weather. Because of the buildup of accumulated pollutants, pollutant concentrations in discharges from MS4s are typically highest during the "first flush," or initial discharge.

In other regions, pollutants that accumulate in snow may lead to high pollutant concentrations in runoff from the spring thaw. Therefore, using an annual average pollutant loading might disguise the impact of shock loadings (discharges that occur within a very short time period and which often exceed acute toxicity criteria) of certain pollutants. Numerous factors contribute to the total volume of snowmelt runoff including shortwave and longwave radiation, condensation or vaporization, convected heat transfer by wind, heat content of rain water, and conductive heat transfer from the ground. Therefore, for regions with significant snowfall, pollutant loading estimates need to be adjusted to account for the additional volume of runoff attributable to snowmelt.

Since snowmelt runoff can occur in either the presence or absence of a storm event, the computation of seasonal pollutant loadings becomes significantly more complex. The determination of total snowmelt runoff, however, is beyond the scope of this manual. Affected municipalities are encouraged to contact the U.S. Geological Survey or the Army Corps of Engineers for historical data on snowmelt runoff.

The effects of pollutant load can also vary by season. Nutrient pollutant loads from storm water discharges can promote algal blooms in receiving waters during the spring and summer, but they may be of little consequence during winter in surface waters with good flushing characteristics. Quantifying seasonal variations in pollutant loads may aid the development of more cost-effective storm water management programs.

Pollutant loads also may vary significantly from one outfall to another. Within a drainage area, the type of land use, the percent of surface that is impervious, and the extent of exposure of storm water to contaminants affect the pollutant load from an outfall. Procedures for estimating seasonal pollutant loadings must be proposed for major outfalls only.

Under §122.26(d)(2)(iii)(C) the regulation requires a schedule to provide estimates of:

- The seasonal pollutant load for each identified major outfall.
- The event mean concentration of a representative storm for any constituent detected in any sample required.

The following steps can be taken to develop a proposed schedule for estimating seasonal loadings at major outfalls:

1. Use historical or long-term hydrologic data to define seasons.
2. Describe the procedure to be used to estimate seasonal loads. This could be an adaption of the simple method or another mathematical model used for annual loads (e.g., instead of using a total annual rainfall accumulation, use an average rainfall accumulation associated with a specific season). If the simple method is used, the municipality could still use Equation 1. However, the amount of rainfall (P) would no longer be an annual value. Instead, it would be the amount of rainfall associated with a particular season defined by the municipality. In addition, the applicant may have to adjust the average runoff coefficient to reflect seasonal changes (e.g., frozen ground can behave like an impervious surface and substantially increase the amount of runoff). Lastly, substantial differences in the frequency and duration of seasonal storm events may increase or decrease the correction factor *CF* (e.g., during a dry season, the number of storms that actually produce runoff may be substantially lower than during a wet weather season).
3. Identify data elements that need to be refined. In cases where there is substantial seasonal variation, revised runoff coefficient values may be necessary. For example, during rainy seasons, ground surfaces are more saturated than during the dry season. As a result, the same amount of rainfall in the wet season will lead to a greater volume of storm water runoff than in the dry season.
4. Proposed procedures for collecting the appropriate data or otherwise improving estimates.
5. Provide an approximate time frame for data collection and submission of seasonal load estimates.

Proposed procedures for estimating seasonal pollutant loadings and event mean concentrations should explain when and how data used for the estimates will be obtained. The data can be based on site-specific information, or they can be obtained from municipal systems with similar characteristics (such as Regional NURP data).

5.6 COLLECTION OF REPRESENTATIVE DATA FOR PROPOSED MONITORING PROGRAM FOR THE TERM OF THE PERMIT

Under §122.26(d)(2)(iii)(D), applicants are given the opportunity to propose monitoring programs to be carried out during the term of the permit.

> §122.26(d)(2)(iii)(D) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

Applicants should consider their specific needs and identify priorities for the proposed

monitoring program. After receiving the Part 2 application, the permitting authority will review proposed monitoring programs and make appropriate adjustments when establishing permit conditions.

The applicant must propose a monitoring program for representative data collection for the term of the permit that describes:

- The location of outfalls or field screening points to be sampled (or the location of instream stations);
- Why the location is representative;
- The frequency of sampling;
- Parameters to be sampled; and
- A description of sampling equipment.

Municipalities must submit sampling data over the life of a permit so that changes in storm water quality can be assessed. Like initial sampling data, the data from an ongoing monitoring program can be used by the municipality to allocate resources to achieve reduction in pollutants. The monitoring data will also serve as an environmental indicator of the success of the storm water management program. Many municipalities may require an extended period of time (possibly the entire permit term) and substantial data to definitively evaluate the effectiveness of a storm water management program. Therefore, a plan for data collection must be proposed by the municipality for the five-year term of the permit. During the permit term, the results of the monitoring program will be submitted in the municipality's annual report [§122.42(c)(4), discussed in Section 7.3 of this guidance].

5.6.1 Goals of a Monitoring Program

The first and most important step in developing a proposed monitoring program is to define the program's objectives as clearly as possible. Development of monitoring program goals should be closely coordinated with development of the proposed storm water management program. Applicants are required to propose monitoring programs as part of their proposed management programs to reduce pollutants from industrial site runoff. The monitoring plan is part of *Characterization Data* [§122.26(d)(2)(iii)]. The storm water management program is discussed in Section 6.

A comprehensive monitoring program should be designed to support specific goals, including:

- Characterizing discharges;
- Evaluating the source of specific pollutants;
- Evaluating the performance of specific source controls; and
- Identifying the full range of chemical, physical, and biological water quality impacts.

5.6.1.1 Characterizing Discharges

Monitoring pollutants in discharges from MS4s serves several purposes. Quantitative data on specific pollutants in storm water runoff can support estimates of annual and seasonal pollutant loadings and modelling efforts to identify the magnitude of water quality impacts. Over the long term, monitoring data may suggest that new outfalls should be selected for sampling. As municipalities gain experience in storm water sampling, they likely will target BMPs that achieve the greatest improvements in storm water quality.

5.6.1.2 Evaluating the Source(s) of Specific Pollutants

Some sources of storm water (e.g., industrial sources that must be covered by NPDES permits, highways with heavy traffic flows, and large parking lots) are expected to generate significantly higher concentrations of pollutants than typical urban runoff. Monitoring efforts to quantify sources of

priority pollutants can provide support for resource allocations to address pollutant sources posing the greatest environmental risk. How proposed monitoring efforts will be structured to identify and quantify pollutant sources should be discussed in proposed storm water management programs.

The monitoring program may also include procedures to conduct dry-weather monitoring over the term of the permit to help detect illicit discharges and improper dumping. This can include recording visual observations and odors observed in dry weather flows.

5.6.1.3 Evaluating the Performance of Specific Controls

Pollutant removal efficiencies are fairly well known for certain structural BMPs. However, sampling may still be necessary to ensure that the BMP is meeting original design expectations. The expected pollutant removal efficiency for a structural control must take into account site-specific conditions. For example, an infiltration basin has a certain expected pollutant removal efficiency, but actual field efficiency is affected by subsurface soil conditions and the extent and frequency of maintenance.

The efficiency of a particular structural control will be affected by many factors, such as detention time. However, efforts to determine the efficiency of structural controls must include consideration of pollutant concentrations and flow volumes into and out of the control. The efficiency of nonstructural source controls can be characterized by comparing discharges at a given location before and after the control measures are implemented. Over time, sufficient monitoring data may be gathered to draw substantive conclusions about the effectiveness of certain BMPs. Alternatively, discharges from a sampling site with source controls can be compared with discharges from a similar site that lacks source controls. Efforts to monitor the effectiveness of controls should be closely coordinated with the assessment of control efficiencies discussed in Chapter 7.

5.6.1.4 Identifying the Full Range of Chemical, Physical, and Biological Water Quality Impacts

Characterizing the effect of storm water discharges on water quality is complicated by a number of factors. EPA recommends an integrated approach to assessing water quality impacts associated with discharges from MS4s. Monitoring procedures that help assess water quality impacts include:

- Discharge and receiving water monitoring to support water quality models and to identify hydraulic impacts of increased peak flows and to identify parameters of concern; and
- In-stream monitoring of water chemistry;
- Bioassessments and biosurveys; and
- Sediment sampling.

Discharge and Receiving Water Monitoring to Support Water Quality Models

As discussed above, when there is sufficient historical data available from monitoring, these data may be used as inputs to models that predict or validate the effects of pollutant loadings from MS4s on receiving water quality characteristics. In addition to monitoring data, data on receiving water quality characteristics are also necessary to calibrate a particular model.

Once the model has been calibrated to reflect site-specific conditions, future monitoring data could be used to validate long term reductions in pollutant loadings, the effectiveness of nonstructural BMPs, and/or pollutant removal efficiencies of existing structural controls.

The information gathered from this approach may also help define those BMPs that which appear to be the most effective. For example, in developing areas, monitoring data could eventually support future planning efforts that would seek to minimize the impact of future development on local receiving waters.

In-stream Monitoring

Using models to estimate pollutant concentrations in receiving waters can be inaccurate. In-stream monitoring can directly measure pollutant concentrations. General designs for in-stream monitoring are:

- **Monitoring above and below a set location.** This method is generally more useful for evaluating control effectiveness than documenting the severity of a diffuse source of pollutants.

- **Monitoring at different times.** Monitoring at different times and seasons can provide valuable information on seasonal variations in pollutant concentrations. Dry weather in-stream monitoring can be compared with in-stream monitoring during storm events.

- **Paired watersheds.** Evaluating similar water bodies can document management program improvements by controlling for meteorologic and hydrologic variability. This approach can also be used to compare receiving waters to background conditions associated with undeveloped watersheds.

Detailed guidance on applying these approaches is provided in the draft *Nonpoint Source Monitoring and Evaluation Guide*, February 26, 1988, Nonpoint Source Branch, U.S. EPA.

Bioassessments and Biosurveys

A biological assessment, or "bioassessment," is an evaluation of the biological condition of a water body using biological surveys and other direct measurements of resident biota in surface waters. A biological survey or "biosurvey," consists of collecting, processing, and analyzing representative portions of a resident aquatic community to determine the community structure and function. Biosurveys and bioassessments can be used directly to evaluate the overall biological integrity (structure and/or functional characteristics) of an aquatic community. Deviations from the biological integrity can be measured directly using biosurveys only when the impacted community is compared against a predetermined reference condition. Without the proper reference conditions, biosurveys may underestimate the extent of impairment.

Biosurveys are useful in that they can assess or detect the aggregate effect of impacts upon an aquatic community where discharges are multiple, complex, and variable, and where point, nonpoint, and storm water discharges are all affecting the biological condition of the receiving water. Because of this, biosurveys cannot measure the impacts of one particular discharge or effluent being discharged to receiving waters. Currently, biosurveys cannot be used as a predictive water quality assessment tools.

Biosurveys provide a useful monitor of both aggregate ecological impact and historical trends in the condition of an aquatic ecosystem. They can also detect impacts that other assessment methods may miss. More importantly, biosurveys can detect impacts caused by habitat degradation such as channelization, sedimentation, and historical contamination that disrupt the interactive balance of the components of the aquatic community.

Sediment Sampling

Pollutants, both organic and inorganic, associated with storm water discharges may become physically or chemically bound with sediment particles. Depending upon the size distribution of the sediment particles, a portion of the contaminated sediment particles will settle out of the water column. Consequently, the potential exists for a buildup of contaminated sediment over time. The effects of heavily contaminated sediments on both benthic habitat and water quality have been documented to the extent that EPA is developing sediment quality criteria (SQC) that will allow assessments of the toxicological effects of contaminated sediments on varying types of receiving waters.

The amount of sediment material found in storm water discharges suggests that applying sediment quality criteria could be a useful component of a monitoring program. For example, sediment quality criteria could be a valuable preventative tool to ensure that point source discharges of storm water do not cause or contribute to the contamination of sediments.

In addition, a MS4 could make comparisons of field measurements to sediment quality criteria as a means of providing an early warning of a potential problem. Consequently, an early warning could provide an opportunity to take corrective action to prevent further contamination. For long term planning, consideration could also be given to the feasibility of establishing target levels or goals that would ensure that point sources discharges of storm water do not contribute to sediment contamination.

5.6.2 Monitoring Procedures

Monitoring procedures will depend on the objectives of the monitoring effort. To a large extent, the type of receiving water will be an important factor in developing monitoring procedures and techniques. For example, grab samples may be appropriate for monitoring discharges from a retention pond, while composite samples may be appropriate for monitoring flows into the pond. The following information, at a minimum, should be included for each sampling site:

- The criteria for storm selection;
- Whether grab, composite, continuous, or other sampling techniques are to be used;
- The criteria on when to begin and end sample collection;
- The basis for selecting the time interval between sequentially collected samples;
- How seasonal factors affect the selection of monitoring frequencies;
- The method of estimating rates or volumes of flow passing the sampling point; and
- The analytical methods used for analyzing pollutant parameters and their detection limits.

Location of Monitoring Sites and Description of Drainage Basins

The selection of monitoring sites should depend on the goals of the monitoring program. Applicants should identify the location of each proposed monitoring site and the boundary of its drainage basin. They should describe the estimated size and land use characteristics of the drainage basin for each sampling location. The applicant also should explain why the sampling sites are representative or will otherwise provide information to support a monitoring program goal. Other monitoring sites can be selected to evaluate unique conditions in the drainage area that have significant or unusual potential for generating pollutants in storm water discharges.

Samples should be analyzed in accordance with the analytical methods approved under 40 CFR Part 136.

Parameters to be Analyzed

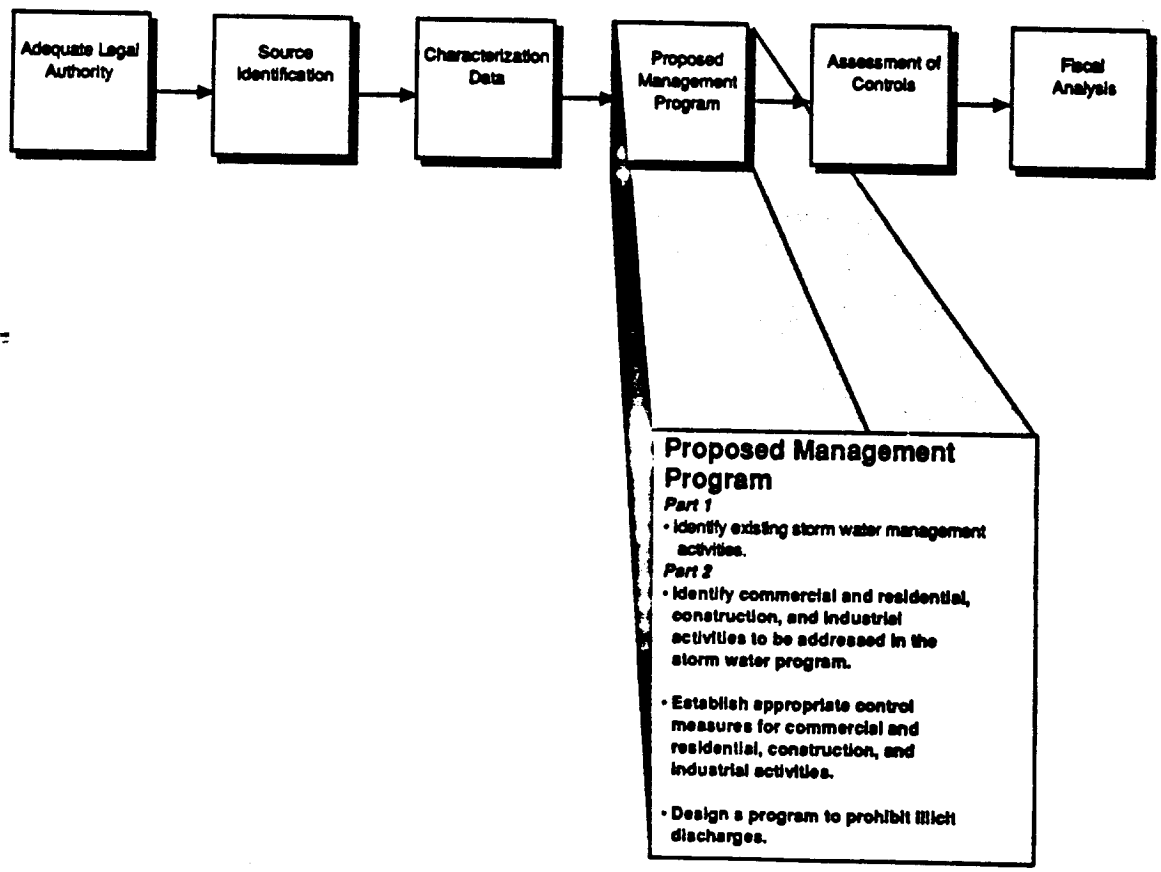
The applicant must list all parameters to be analyzed, which should depend on the objective of the sampling effort. For example, it may only be necessary to monitor several indicator parameters (such as TSS, settleable solids, nutrient, and a metal) to characterize the pollutant removal efficiency of a wet pond.

Sampling Equipment

The applicant must describe the equipment to be used in the proposed sampling program. Only the primary pieces of equipment need be identified. Descriptions can be made by reference to equipment supplied by a vendor or manufacturer if distinctive enough to be readily identified.

VOL 2 3

CHAPTER 6
PROPOSED MANAGEMENT PROGRAM



0665

6.0 PROPOSED MANAGEMENT PROGRAM

6.1 BACKGROUND

Under the Part 2 application requirements, municipalities must propose site-specific storm water management programs. This is the most important aspect of the permit application. The Part 2 application requirements provide each MS4 with the flexibility to design a program that best suits its site-specific factors and priorities.

The regulations require the applicant to provide a description of the range of control measures considered for implementation during the term of the permit. Applicants must meet all the requirements of the Part 2 application regulation. However, flexibility in developing permit conditions is encouraged by allowing municipalities to emphasize the controls that best apply to their MS4. For example, a municipality that expects significant new development may focus more on requirements for new development and construction, while a municipality that does not expect significant new development may focus more on a program to prohibit illicit discharges or control industrial contributions. In any case, a satisfactory proposed management program will address: management practices; control techniques and systems; design and engineering methods; and other measures to ensure the reduction of pollutants to the "maximum extent practicable (MEP)."

If the municipality proposes a thorough and complete program, the permitting authority is likely to incorporate all or part of the proposed management program into the NPDES storm water permit written for that municipality. Therefore, the proposed programs provide municipalities with the opportunity to have substantial input into their NPDES permit conditions.

This section of the guidance manual describes the minimum information requirements for proposed storm water management programs. Examples of how the program elements should be addressed are provided. These examples illustrate minimum information requirements for the program elements, and occasions when municipalities may opt to go beyond minimum requirements in order to meet the MEP standard.

6.2 SUMMARY OF REGULATORY REQUIREMENTS

The municipality must develop and submit a proposed management program that covers the duration of the permit. The program must integrate the information and actions described in the Part 1 application and portions of the Part 2 application (see Chapters 3, 4, and 5 of this guidance). The regulatory requirements for the proposed management program are in 40 CFR 122.26(d)(2)(iv).

At a minimum, the proposed management program must include:

- A comprehensive planning process that involves both public participation and intergovernmental coordination;
- A description of management practices, control techniques, and system design and engineering methods to reduce the discharge of pollutants to the MEP; and
- A description of staff and equipment available to set up and assess the storm water management program.

Additional provisions under §122.26(d)(2)(iv)(A) require applicants to include:

- Programs to control storm water runoff from commercial and residential areas, construction sites, and industrial

facilities (including waste handling sites), (Section 6.3);

- Identification of structural control measures to be included in these proposed programs, such as detention controls, infiltration controls, and filtration controls that the municipality plans to apply to the activities addressed in its storm water management program (Section 6.4); and

- Programs to detect and remove illicit discharges, and to control and prevent improper disposal into the MS4 of materials such as used oil or seepage from municipal sanitary sewers (Section 6.5).

6.3 PROGRAMS TO CONTROL STORM WATER RUNOFF FROM COMMERCIAL AND RESIDENTIAL AREAS, CONSTRUCTION SITES, AND INDUSTRIAL FACILITIES

A proposed management program must identify the activities or areas that require controls to reduce pollutants in storm water runoff. Specifically, a proposed management program must address storm water runoff from **commercial and residential areas** (Section 6.3.1), **construction sites** (Section 6.3.2), and **industrial facilities** (Section 6.3.3). Also, areas where illicit connections or illegal discharges may occur must be identified (Section 6.5).

In addition to the requirements of the proposed storm water management program, other provisions of the Part 1 and Part 2 applications require information that will help enable the municipality to focus on identifying activities and areas that may need control measures. Examples of these provisions include:

- Identification of sources [Part 1, §122.2(d)(1)(iii)(B)(3)-(4), and Part 2, §122.26(d)(2)(ii)];

- Identification of water bodies that may be adversely affected by storm water runoff [Part 1, §122.26(d)(1)(iv)(C)];

- Organization of sources by watershed [Part 2, §122.26(d)(2)(ii)];

- Description of land use activities [Part 1, §122.26(d)(1)(iii)(B)(2)];

- Results of field screening analysis [Part 1, §122.26(d)(1)(iv)(D)];

- Results of the sampling program [Part 2, §122.26(d)(2)(iii)(A)(3)];

- Estimates of annual pollutant loads and event mean concentrations, and schedules to submit seasonal pollutant loads and event mean concentrations [Part 2, §122.26(d)(2)(iii)(B) and (C)]; and

- Findings from an on-going monitoring program [Part 2, §122.26(d)(2)(iii)(D)].

6.3.1 Commercial and Residential Activities

Under §122.26(d)(2)(iv)(A), applicants must propose structural and source control measures to reduce pollutants from commercial and residential areas.

> §122.26(d)(2)(iv)(A). [The proposed management program must include a] description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls.

To ensure that proposed control measures are effective, the applicant should study how storm water runoff from pollutant sources affects the existing municipal system, how the proposed

control measures will enhance the existing system, and what impact the proposed measures will have on receiving waters. The control measures should recognize and emphasize the interaction between pollutant sources and the physical attributes of the municipal system and receiving waters.

Specific commercial and residential activities that must be addressed include maintenance activities and a maintenance schedule for structural controls to reduce pollutants in storm water runoff. This provision is discussed in Section 6.4.2. Other activities to be addressed include:

- Post-construction controls to reduce pollutants in discharges to MS4s resulting from new development and significant redevelopment (Section 6.3.1.1);
- Practices for maintaining and operating public streets, roads, and highways that will reduce the impact on receiving waters from storm water runoff discharges (Section 6.3.1.2);
- Procedures to assure that the impacts on receiving waters from flood management projects are assessed, and that existing structural control devices have been evaluated to determine if retrofit controls are feasible (Section 6.3.1.3);
- A program to monitor pollutants in runoff from operating or closed municipal landfills that identifies priorities and procedures for inspections and establishing and implementing control measures (Section 6.3.1.4); and
- A program to reduce to the maximum extent practicable, pollutants in storm water runoff associated with the application of pesticides, herbicides, and fertilizer (Section 6.3.1.5).

To reduce pollutants in storm water runoff from commercial and residential activities, a proposed management program might include the use of infiltration devices, detention and retention basins, vegetated swales, water quality inlets (which may include oil and water or oil/grit separators), screens, channel stabilization/riparian habitat enhancement efforts, wetland restoration and preservation projects, as well as various source control strategies and other nonstructural control measures.

6.3.1.1 New Development and Significant Redevelopment

Summary of Regulatory Requirement

New development or redevelopment often increases impervious land surfaces, which usually leads to increased pollutant levels in storm water runoff. Chemical and thermal changes in storm water runoff are commonly associated with new development and can adversely affect the quality of receiving waters. In addition, urbanization results in an increase in the volume of storm water discharges.

The Nationwide Urban Runoff Program (NURP) study (EPA, 1983) and more recent investigations indicate that controlling the contribution of pollutants in storm water discharges at the onset of land development is the most cost-effective approach to storm water quality management. Mitigating problems caused by pollutants after they have entered a MS4 is often more expensive and less efficient than preventing or reducing the discharge of pollutants at the source. Therefore, a satisfactory proposed management program will propose structural and nonstructural measures to reduce pollutants in storm water discharges from areas of new development and redevelopment. Examples of such measures are discussed below.

> §122.26(d)(2)(iv)(A)(2). [The applicant must include a] description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed.

Provisions under §122.26(d)(2)(iv)(A)(2) focus on the reduction of pollutants in storm water runoff after construction in areas where new development or redevelopment is completed. Controls that are required during construction are discussed in Section 6.3.2 of this guidance.

Post-Construction Controls

Proposed storm water management programs should include planning procedures for both during and after construction to implement control measures to ensure that pollution is reduced to the maximum extent practicable in areas of new development and redevelopment. Design criteria and performance standards may be used to assist in meeting this objective.

Further, storm water management program goals should be reviewed during planning processes that guide development to appropriate locations and steer intensive land uses away from sensitive environmental areas. A municipality may, for example, include provisions in the planning process that ensure that all new development in targeted areas or zones provides for a certain percentage of undisturbed area to assist in preserving post-development runoff quality and velocity as similar as possible to pre-development conditions. In its Part 2 application, a municipality should describe how it plans to implement the proposed standards (e.g., through an ordinance requiring approval of storm water management programs, a review and approval process, and adequate enforcement).

The proposed storm water management program should identify and include planning procedures and control measures that will be used in the municipality.

Planning Procedures

Comprehensive planning procedures typically involve incorporation of land use goals and objectives into a plan document or a plan map. These plans are often called Master Plans, Comprehensive Land Use Plans, or Comprehensive Zoning Plans.

Comprehensive or master plans are often non-binding. They provide support and direction to local officials that have the authority to make land use decisions.

While applicants do not need to submit a complete comprehensive or master plan with the Part 2 application, they should detail the planning process employed by the municipality. They must thoroughly describe how the municipality's comprehensive plan is compatible with the storm water regulations. The description should clearly:

- Identify management objectives for streams, wetlands, and other receiving waters;
- Identify areas where urban development is likely to occur and areas that are sensitive to the effects of urbanization. Consideration should be given to receiving waters, topography, soil types, ground water uses and potential impacts, and other relevant factors;
- Describe standards such as design criteria and performance standards for storm water controls for new developments, such as buffer zones,

open space preservation, erosion and sediment controls, etc.;

- Describe other measures to minimize the effects of new development on storm water quality (these may include local code and ordinance requirements); and

- Identify or discuss the site development review process for the evaluation and approval of storm drainage or storm water management programs. Requirements in drainage or storm water management programs can be coordinated with review of other related plans such as those for site grading or landscaping.

There will be great variation among municipalities in their sophistication of land use planning. If the municipality has recently updated its land use plan, it may detail storm water quality issues. In other instances, there may be no policy to include storm water quality considerations in land use decisions. In such cases, the applicant must describe how consideration of those activities that affect storm water quality are to be incorporated into the municipality's comprehensive or master plan and its approval process for construction projects.

Control Measures

Most traditional storm water control measures focus on efficient collection and conveyance of storm water runoff to an offsite location. This approach can increase downstream property damage due to increased storm water runoff quantity and flow velocity. Corrective action often involves expensive public works projects, such as enlarging and reinforcing channels or constructing swales to provide an adequate outfall from affected or damaged areas. The traditional approach has typically involved downstream channel stabilization projects. However, these projects may also result in increased storm water runoff quantity and flow velocity.

Some recent approaches to storm water management include preserving the natural features of a watershed by maintaining vegetative cover and establishing buffer zones and open space or green areas. The benefit of employing this approach is the protection afforded to riparian areas and wetlands, as well as the preservation of a stable watershed. One additional benefit from this approach includes maintaining ground water recharge through infiltration. These approaches to storm water management minimize the impact of erosion, flooding, and other damage to natural drainage features such as streams, wetlands, and lakes. Preservation of natural habitat can be achieved through effective storm water quality control measures. More recent approaches use storm water to:

- Recharge ground water sources with runoff from impervious areas;

- Preserve baseflows of surface water bodies;

- Augment water supplies used for street cleaning and other municipal functions, such as watering public lawns;

- Increase recreational opportunities including swimming, fishing, and boating; and

- Sometimes, augment drinking water supplies if it is treated and in compliance with all applicable drinking water standards.

The municipality should consider storm water controls and structural concerns in planning, zoning, and site or subdivision plan approval. An example of effective structural control is described in Exhibit 6-1. Non-structural control measures are highly recommended for new development. They can be included during the planning, site-selection, and development stages. Examples of non-structural controls include street sweeping, buffer strip preservation, and public education.

Exhibit 6-1
Storm Water Programs in Delaware and Florida

Delaware requirements for on-site measures include water quality ponds with permanent pools. Ponds must be designed to release the equivalent volume of runoff from the first 1/2 inch of runoff from the site over a 24-hour period and have a storage volume designed to accommodate at least 1/2 inch of runoff from the site. Water quality ponds without permanent pools may also be used in Delaware's program. These pools are to be designed to release the first inch of runoff from the site over a 24-hour period.

Developers are instructed to consider infiltration practices only after ponds are eliminated for engineering or hardship reasons. Infiltration structures must be designed to accept at least the first inch of runoff from all streets, roadways, and parking lots. Other practices may be acceptable if they meet the equivalent removal efficiency of 80 percent for suspended solids. More stringent requirements may be established on a case-by-case basis.

The 80 percent removal efficiency for suspended solids that Delaware requires takes into account pollutant settling. The 24-hour detention period allows for substantial settling where most of the pollutant removal occurs. In addition, the requirement that the first inch of runoff be released over a period of no less than 24 hours reduces downstream erosion.

Source: Schueler, 1987.

For significant redevelopment, municipalities can incorporate both structural and nonstructural storm water controls. However, there are generally far more constraints and limitations on the control opportunities available at redevelopment sites. One of the primary constraints is the availability of sufficient open area to accommodate structural controls such as detention ponds. In instances where redevelopment is occurring in densely urbanized areas, storm water runoff volumes may be so large that sufficient storage capacity can not be provided without further compounding problems associated with siting and retrofitting existing storm water conveyance systems. In such cases, the municipality should consider nonstructural control measures such as traffic flow control, the use of porous construction materials for roads and parking lots, revisions to street sweeping or deicing policies, or public education programs.

6.3.1.2 Public Streets, Roads, and Highways

Summary of Regulatory Requirement

Public streets, roads, and highways can be significant sources of pollutants in discharges from MS4s. Therefore, proposed management programs must include a description of practices for operation and maintenance of public streets, roads, and highways, and procedures for reducing the impact of runoff from these areas on receiving waters.

§122.26(d)(2)(iv)(A)(3). [The application must include a] description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities.

Road maintenance practices, especially snow management and road repair, and traffic are significant sources of pollutants in storm water discharges. Measures to reduce the pollutants in storm water runoff from these sources should be addressed in the proposed management program.

Snow Management

Deicing salts are the main source of pollutants in runoff of urban snowmelt. Municipalities can reduce these pollutants by calibrating equipment, educating equipment operators, using alternative deicing materials, and properly storing deicing materials. As alternatives to deicing salts, the Federal Highway Administration is considering many materials that may be less polluting. However, most of these deicers contain sodium or chloride ions that are harmful to roadside trees, shrubs, and soils. One deicer, calcium magnesium acetate (CMA) may be the best option for environmentally sensitive areas (Chollar, 1990). In salt storage facilities, salt piles should be completely covered, storage and handling areas should have impervious surfaces, and contaminated runoff should be contained.

Road Repair

Road maintenance and repair activities may contribute pollutants through erosion caused by the elimination of stabilizing vegetation from roadside shoulders and ditches. Maintenance crews can decrease the potential for erosion by disturbing only the area under repair. Graded areas should also be limited in size so that repairs can be completed the same day and graded areas stabilized by the end of the workday. Other measures to reduce pollutants in storm water include scheduling potential pollutant-causing repair work during dry seasons, when possible.

Municipal equipment yards and maintenance shops that support road maintenance activities can also be significant sources of pollutants. Therefore, municipalities should consider instituting procedures that address spill prevention, material management practices, and good housekeeping.

Traffic

Oil and grease and metals from traffic are the pollutants of most concern with respect to aquatic toxicity and their ability to "wash off" roadways and enter a MS4.

In almost all instances, the pollutant concentrations in initial storm water discharge from heavily travelled streets is significant. When the initial runoff reaches the velocity needed to entrain particulates, highly soluble pollutants that have accumulated between storms are transported to the storm sewer system. Therefore, shortly after a storm event begins, the pollutant loading in the initial flow to a MS4 is often the greatest.

Pollutants from traffic can be minimized by using nonstructural controls (e.g., traffic reduction and improved traffic management), structural controls (e.g., traditional and innovative BMPs), and changing maintenance activities. Traditional structural controls to reduce pollutants in road runoff include vegetated swales, infiltration devices and detention/retention basins. Highways often afford opportunities for using structural controls such as detention basins on entrance or exit ramps and upstream or downstream of culvert crossings (Steward, 1992). Smaller roads may also have low-cost structural control opportunities available at culvert crossings such as vegetated swales. Many structural controls can also be placed on public or private land that is outside the right-of-way, but still may be proximate enough to capture road runoff. Any time controls are placed at culvert crossings, potential wetland impacts and instream treatment issues need to be considered.

Maintenance activities that can reduce pollutants in storm water discharges include catch basin cleaning, litter control, and targeted street sweeping. For municipalities that have

developed transportation plans under the Clean Air Act, applicants should describe how they will review the plan, and amend it where appropriate, to address water quality concerns. Potential locations for installing new structural controls to reduce pollutants from road and highway runoff should be identified by applicants.

6.3.1.3 Flood Management Projects

Summary of Regulatory Requirement

The traditional focus of storm water management in many communities has been water quantity (i.e., flood) control. The proposed management program must demonstrate that flood management projects take into account the effects on the water quality of receiving water bodies, and the program must discuss whether existing structural flood control devices can be retrofitted to control water quality.

> §122.26(d)(2)(iv)(A)(4). [The application must include a] description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible.

Opportunities for pollutant reduction should be considered when determining specific controls to be proposed as the MEP standard in the storm water management program.

Control Measures

Storm water management devices and structures that focus solely on water quantity are usually not designed to remove pollutants, and may sometimes harm aquatic habitat and aesthetic values. For example, channels that are completely lined with concrete typically do not provide for aquatic habitat and tend to increase potentially erosive velocities and elevate ambient water temperatures, resulting in downstream channel enlargement and increased pollutant loadings. However, this condition can be mitigated through alternative stabilization methods.

Channel management measures that can enhance streams and their ecological values include corridor preservation, biological bank treatment, and, where necessary, geomorphic restoration (Ferguson, 1991). The municipality may also install structural devices to dampen the hydraulic energy of the flow and minimize downstream erosion. As another example, willow saplings could be planted between rip-rap, timbers, and other stabilization structures that are anchored into terraces on the side of the streambank.

Flood-control projects can be built or subsequently modified to address water quantity and water quality concerns. Sometimes existing flood control structures can be retrofitted to provide water quality benefits as well as water quantity control (EPA, 1989b). Basin retrofits are a common example. For such a retrofit, dry flood control or detention basins can be converted to wet basins by modifying outlet orifices. Additional storage can be obtained by raising the elevation of the basin embankment.

Dry retention basins, or extended dry or wet retention basins can be used to improve water quality. Dry retention basins are not as efficient or as effective in improving water quality as extended dry or wet retention basins, but dry retention basins are generally less costly to design and maintain. The decision to use dry retention or extended dry or wet retention basins should consider all these factors.

Optimally, such measures should be considered in the planning process (discussed previously). However, they can also be implemented later in the land development

process (e.g., site review or public facilities requirements stage).

If a flood control authority is responsible for a portion of the MS4, the applicant should take the lead in coordinating efforts to incorporate pollutant reduction considerations in flood control projects. EPA recommends the use of Memoranda of Agreement and Memoranda of Understanding to clarify roles and responsibilities between two or more political entities.

6.3.1.4 Municipal Waste Facilities

Applicants must describe programs that identify measures to monitor and reduce pollutants in storm water discharges from facilities that handle municipal waste, including sewage sludge.

> §122.26(d)(2)(iv)(A)(5). [The application must include a] description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges.

The first step is to identify facilities that handle municipal waste and summarize their operations. The types of facilities that should be included are:

- Active or closed municipal waste landfills;
- Publicly owned treatment works, including water and wastewater treatment plants;
- Incinerators;
- Municipal solid waste transfer facilities;
- Land application sites;
- Uncontrolled sanitary landfills;
- Maintenance and storage yards for waste transportation fleets and equipment;
- Sites for disposing or treating sludge from municipal treatment works; and
- Other treatment, storage, or disposal facilities for municipal waste.

Applicants may combine this part of the proposed management program with the program established under §122.26(d)(2)(iv)(C), which sets standards for monitoring and controlling pollutants from similar types of solid waste facilities (e.g., those with hazardous wastes, or subject to the requirements of SARA Title III—Section 313 of the Emergency Protection and Community Right-to-Know Act). Monitoring should include all the parameters listed in §122.26(d)(2)(iv)(C) and any additional parameters listed in an effluent guideline. Procedures to evaluate, inspect, monitor, and establish control measures for municipal waste sites over the term of the NPDES permit should be described. For example, after one year of monitoring each waste handling facility category listed above, the municipality may have collected enough data to decide which facilities or types of facilities should receive a higher priority for pollutant reduction. More attention could then be focused on the high-priority sites.

6.3.1.5 Pesticides, Herbicides, and Fertilizers

The proposed management program must include a description of procedures to reduce the contribution of pollutants associated with pesticides, herbicides, and fertilizers discharged to the MS4.

§122.26(d)(2)(iv)(A)(6). [The application must include a] description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

The proposed program should include educational measures for the public and commercial applicators, and should include integrated pest management measures that rely on non-chemical solutions to pest control. The program should also describe how educational materials will be developed and distributed. Applicants are encouraged to consider providing information for the collection and proper disposal of unused pesticides, herbicides, and fertilizers, or to establish their own program. An effective and safe program would include:

- Development of an inventory of products that may be accepted under the program, and collection of the Material Safety Data Sheets (MSDSs) for these products;
- Identification of transportation, storage, and disposal requirements;
- A shelf-life program to dispose of expired products;
- Applicator training or certification (the pretreatment program may be helpful as a source of industry-specific information or as a model approach for obtaining and tracking information on chemical applicators and distributors); and
- Safety training.

Any certification/training program for the collection and disposal of pesticides, herbicides, and fertilizers must be in compliance with Federal, State, and local laws such as the Resource Conservation and Recovery Act; the Federal Insecticide, Fungicide, and Rodenticide Act; the Department of Transportation's hazardous materials regulations; and State and local ordinances.

In addition, applicants must include a discussion of controls for the application of pesticides, herbicides, and fertilizers in public-rights-of-way and at municipal facilities. Planting low-maintenance vegetation, such as perennial ground covers, reduces pesticide and herbicide use. Native vegetation is often preferable because there is less need to apply fertilizers and herbicides, and to perform other forms of maintenance, such as mowing (Horner, 1988).

If herbicides are used, a herbicide-use plan must be proposed as part of the storm water management program. The plan might include:

- A list of selected herbicides and their specific uses;
- Information about the formulations of various products, including how to recognize the chemical constituents from the label, and directions and precautions for applicators that explain if products should be diluted, mixed, or only used alone;
- Application methods and estimated quantities to be used;
- Equipment use and maintenance;
- Training in safe use, storage, and disposal of pesticides (safety requirements for individual products are listed on the products' MSDSs);
- Inspection and monitoring procedures; and

- Recordkeeping and public notice procedures.

6.3.2 Construction Sites

As specified in §122.26(d)(2)(iv)(D), applicants must describe proposed regulatory programs to reduce pollutants in storm water runoff from construction sites to the MS4.

> §122.26(d)(2)(iv)(D). [The application must include a] description of a program to implement and maintain structural and nonstructural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system.

This part of the proposed management program must address:

- Implementation of BMPs;
- Procedures for reviewing site plans to ensure that they are consistent with local sediment and erosion control plans;
- Inspection of construction sites; and
- Enforcement measures and educational activities for construction site developers and operators.

EPA encourages municipalities to (1) coordinate requirements to reduce pollutants in construction site runoff with management programs to reduce pollutants from new development, and (2) maintain, to the degree possible, pre-construction hydrologic conditions (Section 6.3.1.1). Applicants are encouraged to describe these two proposed management program components together. Implementation of this program component will rely on the establishment and maintenance of both structural and nonstructural BMPs. This requirement extends to all construction activity within the municipality.

All construction sites, regardless of size, must be addressed by the municipality. To begin to identify these sites, the applicant should obtain lists of construction site operators that are covered by general or individual storm water NPDES permits from the NPDES permitting authority. However, construction sites not covered by a storm water discharge permit also need to be addressed by the municipality. The best way to identify these construction sites and implement an effective BMP program to reduce pollutants in their runoff is through the site planning process (see Section 6.3.2.1).

The BMPs envisioned for construction site runoff are generally well established technologies and practices. They rely predominantly on erosion and sediment controls and other measures applicable to construction sites (e.g., control of solid wastes, and prohibitions on discharging concrete truck washing runoff into storm drains). The technologies proposed should be referenced, and a description of when and how the controls will be used should be included. Municipality-specific technical guidance for construction site operators, such as handbooks and inspection checklists, are examples of suitable reference sources. If an applicant chooses to develop such handbooks and checklists, they should be referenced and described in the application.

The major requirements of this program component include:

- Site planning that considers the potential impacts on water quality;
- Nonstructural and structural best management practices;
- Procedures that consider physical site characteristics when identifying priorities for inspection and enforcement; and
- Educational and training measures for construction site operators.

Each of these requirements, and the reasons that they are important elements of a proposed storm water management program, is described in more detail below.

6.3.2.1 Site Planning

Sediment runoff rates from construction sites are typically 10 to 20 times greater than those of agricultural lands, and 1,000 to 2,000 times those of forest lands. Over a short period, construction sites can contribute more sediment to streams than had been deposited over several decades. Runoff from construction sites can also include other pollutants such as phosphorus and nitrogen from fertilizer, pesticides, petroleum derivatives, construction chemicals, and solid wastes.

To address these problems, the proposed management program should describe procedures for site planning that consider potential water quality impacts.

> §122.26(d)(2)(iv)(D)(1). [The program for construction sites must include a] description of procedures for site planning which incorporate consideration of potential water quality impacts.

The objective is for the municipality and the developer to address storm water discharges from construction activity early in the project design process so that potential water quality impacts can be eliminated or minimized and consequences to the aquatic environment assessed. Nonstructural approaches to minimize the generation of runoff from the construction site will also need to be considered. These measures may include phasing development to coincide with seasonal dry periods, minimizing areas that are cleared and graded to only the portion of the site that is necessary for construction, exposing areas for the briefest period possible, and stabilizing and reseeding disturbed areas rapidly after construction activity is completed.

It is often easier and more effective to incorporate storm water quality controls during the site plan review process or earlier. The process typically culminates with the developer of the construction site submitting detailed engineering plans to the municipality for review and approval.

Upon completion of the site plan review stage, the developer and the municipality have invested considerable time and money into the project. If storm water quality issues are considered only after significant detailed engineering has gone into the project, municipal site reviewers may only address minor drainage issues. In recent years, however, many municipalities have developed separate teams of site inspectors to implement erosion and sediment control measures in the field. In these municipalities, site inspectors should be part of the site review team (if they are not already) in order to incorporate their expertise on the appropriate erosion and sediment controls for the given circumstances.

The above discussion reinforces the importance of site planning, as described in the section on site planning for new development (Section 6.3.1). In general, the sooner planners consider storm water quality issues, the better the opportunity for efficient and effective pollutant reduction. In some cases storm water issues should be considered in the conceptual stage of planning (e.g., as a planning or zoning function).

Some municipalities include a final step in the planning process that requires a developer to provide a far greater level of design detail than earlier conceptual design approvals. This step may be required as a condition of the final approval for certain zoning categories. Municipalities with such a step in the development process can consider potential storm water quality issues in detail at this stage. Municipalities that do not currently require such detailed plans should consider adopting this procedure as part of their storm water management program.

6.3.2.2 Nonstructural and Structural BMPs for Construction Activities

This component of the proposed management program should describe requirements for nonstructural and structural BMPs that operators of construction activities that discharge to MS4s must meet.

> §122.26(d)(2)(iv)(D)(2). [The program for construction sites must include a] description of requirements for nonstructural and structural best management practices.

As indicated above, applicants must propose site review and approval procedures that address sediment and erosion controls, storm water management, and other appropriate measures. Approvals should be clearly tied to commitments to implement structural and nonstructural BMPs during the construction process. Appropriate structural and nonstructural control requirements will vary by project. Project type, size, and duration, as well as soil composition, site slope, and proximity to sensitive receiving waters will determine the appropriate structural and nonstructural BMPs. Municipalities should acquire the authority to require operators to install and maintain applicable erosion and sediment control plans. Exhibit 6-2 summarizes common construction-site BMPs.

A description of the local erosion and sediment control law or ordinance is needed to satisfy this program requirement. The description should include information that links the enforcement of the law or ordinance to the legal authority of the applicant, as discussed in Section 3 of this manual.

While many municipalities have erosion and sediment control ordinances in place, their effectiveness is often limited because they are not adequately implemented and enforced. Examples include silt fencing that is not maintained, or excavated soils that are placed directly on top of the silt fencing. Therefore, construction sites covered under NPDES permit regulations must indicate whether they are in compliance with State and local sediment and erosion control plans. Site inspections are expected to be the primary enforcement mechanism by which erosion and sediment controls are maintained.

To ensure that developers are in compliance with erosion and sediment control plans, applicants may wish to consider expanding the use of performance bonds. This approach might depart from a traditional site bonding approach. For example, the size of bonds could be based on the amount of earth disturbed, the slope of the site, changes in grades, soil type, proximity to surface waters, sensitivity of surrounding area, and other relevant factors. In addition, the bond could clearly specify the storm water quality controls that must be included in the development. Appropriate maintenance and site cleanup could be tied to the bond-release process.

6.3.2.3 Site Inspections and Enforcement of Controls For Construction Sites

Storm water BMPs associated with construction activities are highly susceptible to damage due to the intensity of activities commonly associated with construction. Consequently, inspections are crucial to the effective operation of storm water BMPs. Therefore, the proposed management program should describe construction site inspection and enforcement procedures. The procedures should be flexible so that they can be tailored to specific construction activities and physical characteristics of the construction site.

> §122.26(d)(2)(iv)(D)(3). [The program for construction sites must include a] description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality.

Source: Modified from WDOE, *Public Review Draft - Stormwater Management Manual for the Puget Sound Basin*, Washington State Department of Ecology, Publication #90-73. June 1991.

Effective inspection and enforcement requires adequate staff, systematic inspection procedures, penalties to deter infractions, and intervention by the municipal authority to correct violations. Enforcement mechanisms, such as the ability to require additional storm water controls, administrative penalties (e.g., stop work orders) and injunctive relief (via citizen suits) also must be described. In addition, the applicant should describe who has the authority to require compliance.

Proposed procedures for inspecting construction sites may include minimum frequencies and an inspector's checklist. For example, the State of Delaware requires a minimum of one inspection every two weeks for sites over 50,000 square feet.

The proposed program should also specify the minimum number of inspectors that will be employed during the permit term and how they will be trained. For example, some erosion and sediment control programs require that certified private inspectors be used. In such case, procedures for inspector training and certification must also be described.

In formulating procedures to identify priorities for inspecting sites and enforcing control measures, applicants are encouraged to begin early in the process (i.e., at the site planning stage, as discussed previously) and continue throughout all ground disturbing activities. Once the nature of the construction activity has been established or perhaps modified during the site plan review process, the physical site constraints can be evaluated so that effective controls can be implemented.

For example, if the controls specified in the site plan prove to be ineffective, or if changes occur that were not anticipated during the planning process, site inspection and enforcement mechanisms can be required to mitigate the potential for pollutants to enter a downstream MS4. In this instance, a perimeter barrier, such as a temporary diversion dike, could be used to divert the concentrated runoff to a pipe slope drain terminating with a level spreader. The spreader would dissipate the erosive velocity of the runoff and release it into an undisturbed area beyond the limits of the clearing and grading at the toe of the slope.

The proximity and sensitivity of the receiving water to which the construction site discharges is an important consideration. For construction sites that discharge to receiving waters that do not support their designated use or other waters of special concern, additional construction site controls are probably warranted and should be strongly considered. These receiving waters are identified in the Part 1 municipal NPDES storm water permit application [§122.26(d)(1)(i)(C)].

6.3.2.4 Educational Measures for Construction Site Operators

Construction site operators often need training and education about the sources, control, and impacts of pollutants in runoff from construction sites (see Virginia, 1988). Therefore, applicants must describe examples of informational materials and activities to be used in education programs.

> §122.26(d)(2)(iv)(D)(4). [The program for construction sites must include a] description of appropriate educational and training measures for construction site operators.

Implementation and enforcement of erosion and sediment controls have historically been major problems even with many programs that may be otherwise exemplary. Therefore, technical information on how to incorporate storm water management with erosion and sediment control and other BMP training courses are recommended for municipal employees and construction site operators. Training on the available alternatives will help operators recognize and correct problems promptly. Tools for such training include videos, workshops, seminars, and demonstrations or field trips.

An acceptable program must include a training program, which should be supplemented by a certification program for all construction site operators (contractors and developers), plan reviewers, and inspectors that work on sites that discharge to a MS4. For example, one NPDES State has a certification program based on adequate training and minimum-competency level testing of all private individuals involved in the preparation and implementation of erosion and sediment control plans.

6.3.3 Program to Control Pollutants in Storm Water Discharges from Waste Handling Sites and from Industrial Facilities

> §122.26(d)(2)(iv)(C). [The application must include a] description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to Section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system.

The storm water regulations envision that NPDES permitting authorities and municipal operators will cooperate to develop programs to monitor and control pollutants in storm water discharges to municipal systems from various sites that handle waste and certain industrial facilities.

Operators responsible for storm water discharges associated with industrial activity must obtain NPDES permits from EPA or an authorized NPDES State. These industrial storm water permits will establish requirements such as controls, practices, and monitoring for storm water discharges from the industrial facilities to the MS4. The industrial storm water permits will also provide a basis for enforcement actions directly against the industrial owner or operator.

NPDES permits for MS4s will establish responsibilities for municipal system operators to control pollutants from industrial storm water discharged through their system. Proposed storm water management programs must address the reduction of pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage and disposal facilities; facilities subject to SARA Title III; and other priority industrial facilities, as determined by the applicant. Municipalities should consider the information gathered for the Part 1 application and other parts of the Part 2 application (particularly the Source Identification and Characterization Data components) when prioritizing storm water discharges from these sites. In addition, Appendix B contains a list of pollutants commonly associated with various industries.

In the Part 2 application, the Source Identification component (see Section 4 of this guidance manual) requires the applicant to provide an inventory of pollutant sources, organized by watershed. This inventory identifies and describes the products and services of each industrial facility that may discharge storm water to the MS4. The *Source Identification* component suggests applicants use standard industrial classification (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites that do not meet the regulatory definition of "storm water discharge associated with industrial activity" (i.e. not included in the *Source Identification* and *Discharge Characterization* components), but are identified as a high priority under the proposed management program. Applicants can obtain information on how SIC codes are used to describe the industrial facilities located within their jurisdictions from their NPDES permitting authority.

Characterization data should also be evaluated. Applicants should analyze quantitative data from representative outfalls to establish a monitoring and control program.

An integral part of this requirement is the adequacy of the applicant's legal authority. If a municipality believes that a discharge of storm water associated with industrial activity violates the industrial facility's NPDES permit limits, but the municipality does not have authority over the discharge, the municipality should contact the NPDES permitting authority for appropriate action. Examples of possible actions by the NPDES permitting authority are:

- For a facility that already has a NPDES individual permit, the permit may be reopened and further controls imposed;
- For a facility covered by a NPDES general permit, an individual site-specific permit application may be required; or
- For a facility not covered by a NPDES storm water permit, a permit may be required.

The municipality is ultimately responsible for discharges from their MS4. Consequently, the proposed storm water management program should describe how the municipality will help EPA and authorized NPDES States:

- Identify priority industries discharging to their systems;
- Review and evaluate storm water pollution prevention plans and other procedures that industrial facilities must develop under general or individual permits;
- Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- Inspect and monitor industrial facilities to verify that the industries discharging storm water to the municipal systems are in compliance with their NPDES storm water permit, if required.

6.3.3.1 Identifying Priorities

Proposed management programs must clearly identify priority industrial facilities.

> §122.26(d)(2)(iv)(C)(1). [The applicant must] identify priorities and procedures for inspections and establishing and implementing control measures for such discharges.

This section discusses how applicants might identify priority facilities. Section 6.3.3.2 discusses how municipalities might develop procedures for inspections and implementation of control measures.

At a minimum, priority facilities include:

- Operating and closed municipal landfills;
- Hazardous waste treatment, disposal or recovery facilities; and
- Facilities subject to SARA Title III.

Municipalities must identify these and other priority industrial facilities and describe the criteria used to identify them. For example, information from the Toxics Release Inventory is one source a municipality could use to identify industrial facilities subject to SARA Title III. Other sources may include CWA Section 205 or 208 use-attainability studies, other studies that indicate a site-specific beneficial use impairment immediately downstream of a storm water outfall, or records of industrial pretreatment programs or other permit programs that identify facilities that may be the source of a use impairment or

a major contribution of pollutants. The program should also describe procedures for modifying the inventory of priority industries based on additional evaluation that occurs throughout the permit term.

Applicants may initially focus their implementation efforts on known pollution sources. The municipality may have previously identified these sources, or they may be identified through existing information compiled during the permit application process. However, the initial management program implementation strategy should be based on information gathered while completing the *Adequate Legal Authority, Source Identification,* and *Discharge Characterization* sections of the permit application (See Chapters 3, 4, and 5, respectively.)

During the term of the permit, as additional information becomes available, the municipality should target and set priorities for other program elements that emerge. For example, if the municipality has incomplete characterization data about waste handling sites identified in this program component because the inventory of dischargers to the MS4 has not been completed, the municipality could propose to direct monitoring programs to those areas. Upon acquiring sufficient characterization data, the priority of the sites discharging to these portions of the MS4 can be either determined or modified.

As noted above, when identifying priority sites, applicants must consider all the facilities listed in §122.26(d)(2)(iv)(C)(*1*). When municipalities develop criteria for identifying additional priority industrial facilities, they are advised to consider, at a minimum:

- The type of industrial activity (SIC codes can help characterize the type of industrial activity);
- The use and management of chemicals or raw products at the facility and the likelihood that storm water discharge from the site will be contaminated; and
- The size and location of the facility in relation to sensitive watersheds.

6.3.3.2 Developing Procedures

This program component should describe the specific steps that the municipality will take if it identifies a waste handling site or priority industrial facility when preparing the Part 2 application or during the permit term [§122.26(d)(2)(iv)(C)(*1*), printed in the box above]. The proposed management program must include procedures for inspecting priority industrial sites. The results of inspection may be used as a basis for requiring storm water management controls and enhanced pollution prevention measures. It should also establish an inspection schedule for each priority facility at the time it is identified.

Applicants may want to consider establishing prior notification procedures. The applicant will need to evaluate the legal authority it has over priority facilities to determine if prior notification is required. This is another example of how EPA expects the different components of the application process to be linked. In this instance, the Adequate Legal Authority section is tied directly to the prior notification procedure of the inspection and evaluation component of the proposed management plan.

Applicants also should consider developing inspection documents such as standard forms or checklists for recording observations. Forms and checklists can be used to identify high risk areas of priority facilities and to make comparisons among sites. When characterization data or baseline estimates are factored into the evaluation process, the effectiveness of pollution prevention activities at a particular site could be quantified and compared to similar sites. Other procedures that applicants should describe to effectively incorporate inspections as well as establish and implement control measures for these types of discharges can be derived from monitoring data.

Applicants also should describe a procedure for conducting follow-up inspections, where necessary, as part of this program component. For example, follow-up inspections might be needed to verify the installation of a specific control or implementation of a practice specified in a negotiated agreement between the municipality and the industrial site. A system-wide approach to establishing priorities for inspection procedures is recommended. The system-wide approach should begin with the evaluation of existing information, followed by the identification and evaluation of new information during the permit term. Therefore, applicants should link these procedures with information from the *Source Identification* and *Discharge Characterization* components.

6.3.3.3 Establishing and Implementing Controls

A municipality must consider if it should place more stringent controls on discharges associated with industrial activity than are required in an industrial facility's existing NPDES storm water permit [§122.26(d)(2)(iv)(C)(*1*), printed in box above]. Usually, the municipality will not need to impose controls beyond those required in the industrial facility's NPDES storm water permit (for more information on appropriate controls, refer to *Storm Water Management for Industrial Activities, Developing Pollution Prevention Plans and Best Management Practices*, EPA 832-R-92-006, September, 1992).

However, nothing in the Federal regulations would prohibit the municipality from requiring additional controls beyond the permit requirements for industrial activities. For this reason, EPA recommends that municipal applicants incorporate a provision in the proposed storm water management program that allows the municipality to require priority industrial facilities to implement the controls necessary for the municipality to meet its permit responsibilities.

Finally, the applicant should suggest procedures for requiring pollutant control measures in runoff from priority industrial facilities. Applicants should provide information to the industrial facilities that discharge to the MS4s and industry-specific guidance on appropriate control measures that industries discharging to their systems should follow (WDOE, 1991).

Priority industrial facilities should focus on controlling activities such as the use, storage, and handling of toxic chemicals. Standard methods for implementing control measures at different types of facilities should be described. To facilitate this, municipalities should obtain copies of the pollution prevention plans developed by industrial permittees. Control measures that the municipality may suggest include preventing exposure of pollutant sources to precipitation, on-site pretreatment, and oil/water separators. Applicants should provide a schedule for setting up this program component at priority industrial facilities. The schedule should include educational services for industrial site operators and technical BMP guidance, training courses, videos, workshops, and seminars for plan reviewers, inspectors, contractors, and developers.

6.3.3.4 Inspection and Monitoring

The proposed management program should describe the inspection procedures that will be followed. Storm water inspections can be coupled with inspections for other purposes (e.g., pretreatment programs, fire and safety). Proposed management programs should address minimum frequency for routine inspections. For example, how often, how much of the site, and how long an inspection may take are appropriate to explain in this proposed management program component. Applicants should also describe procedures for conducting inspections and provide an inspector's checklist.

In addition, these inspection procedures should identify the minimum number of inspectors that will be employed and describe

the programs to train them. For example, if the number of inspectors is expected to increase over the term of the permit, it should be noted in the proposed management program. Also, if storm water inspections are combined with other program inspections, means of cross-training inspectors and coordinating schedules should be outlined.

Municipalities are urged to evaluate pollution prevention plans and discharge monitoring data collected by the industrial facility to ensure that the facility is in compliance with its NPDES storm water permit. Site inspections should include (1) an evaluation of the pollution prevention plan and any other pertinent documents, and (2) an on-site visual inspection of the facility to evaluate the potential for discharges of contaminated storm water from the site and to assess the effectiveness of the pollution prevention plan. A municipality could begin the inspection process with information from the facility's notification to the municipality, which should have been submitted by May 15, 1991. Industrial facilities must also submit an individual NPDES permit application, participate in a group storm water permit application, or file a Notice of Intent (NOI) to be covered by a general permit to the NPDES permitting authority. Section 308 of the CWA provides the legal authority for any individual (including a municipality) to obtain information from the NPDES permitting authority.

The proposed management program also must include a description of a monitoring program for storm water discharges associated with industrial facilities [§122.26(d)(2)(iv)(C)(2)].

The monitoring program should describe the framework and rationale for selecting monitoring sites. Sites that may be appropriate for monitoring include locations with several upstream industrial facilities, industrial facilities that are representative of a significant number of similar facilities, and priority industrial sites with significant potential for high levels of pollutants in their storm water discharges. The description of the proposed monitoring program should address how the monitoring data will be used and what the frequency of the monitoring will be.

> §122.26(d)(2)(iv)(C)(2). [The application must describe] a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of qualitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

Identifying who will actually conduct the monitoring (e.g., industry or municipality) is appropriate to include in the program description. Linking this element of the monitoring program to the Adequate Legal Authority section of the permit application is vital. The legal authority to require monitoring should prescribe the specific monitoring protocols required elsewhere in the regulation [§122.26(d)(2)(i)(F)]. Applicants should describe proposed procedures for monitoring industrial facilities, including methods for determining parameters to be sampled throughout the term of the permit. At a minimum, parameters that must be considered for monitoring include:

- Any pollutant limited in effluent limitations guidelines for the subcategory of industry;
- Any pollutant that is controlled in a NPDES permit for the process discharge from an industrial site;
- Oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen; and

- Certain pollutant(s) known or suspected to be in the discharge, based on §122.21(g)(7)(iii) and (iv) (Section 5.3).

If a municipality believes (based on the results of monitoring and inspections) that an industrial facility is not meeting its NPDES permit requirements, the municipality should petition the NPDES authority to either require the facility to change its pollution prevention plan or institute an enforcement action. Municipalities may also file citizen suits under CWA Section 505 to enforce the conditions of the NPDES permit.

6.4 STRUCTURAL CONTROLS

6.4.1 Description of Structural Controls

Applicants are required to identify the location of major structural controls for storm water (retention basins, detention basins, major infiltration devices, etc.) in Part 1 of the application [§122.26(d)(1)(iii)(B)(5)]. In Part 2, applicants must describe additional controls that they plan to implement [§122.26(d)(2)(iv)]. The controls must address the activities described in Section 6.3. In addition, the applicant must describe maintenance procedures [§122.26(d)(2)(iv)(A)(1), discussed in Section 6.4.2]. Later, when the municipality submits its annual report, it will have to report on its progress in implementing these controls [§122.42(c)(1), discussed in Section 7.3 of this guidance].

The matrix in Exhibit 6-3 provides information on commonly used structural and source control BMPs. Structural practices to control urban storm water runoff rely on three basic mechanisms: detention, infiltration, and filtration. More detailed technical information about source controls (particularly in the selection of structural BMPs) is available in the technical BMP manuals (MWCOG, 1991; Schueler, 1987; WDOE 1991; and EPA 1990c). The following summary of structural and source control BMPs draws extensively from those manuals.

Applicants should note that CWA Section 404 permits may be required for some structural controls, including any control projects that involve the discharge of dredged or fill material into waters of the United States, including wetlands. States may also require permits that address water quality and quantity. To the extent possible, municipalities should avoid locating structural controls in natural wetlands. Before considering siting of controls in a natural wetland, the municipality should demonstrate that it is not possible or practicable to construct them in sites that do not contain natural wetlands, and that the use of other nonstructural or source controls are not practicable or as effective. In addition, impacts to wetlands should be minimized by identifying those wetlands that are severely degraded or that depend on runoff as the primary water source. Moreover, natural wetlands should only be used in conjunction with other practices, so that the wetland serves a "final polishing" function (usually targeting reduction of primary nutrients and sediments). Finally, practices should be used that settle solids, regulate flow, and remove contaminants prior to discharging storm water into a wetland.

Another concern for siting controls is the possible adverse effect that infiltration and detention controls may have on ground water. This issue is addressed in more detail in Section 7.2.3.

Exhibit 6-3
Structural Controls Matrix

CONTROL AND MAINTENANCE REQUIREMENTS	ADVANTAGES	DISADVANTAGES
Extended Detention Dry Basin • Periodic mowing • Regular debris removal • Sediment removal annually	• Provides peak flow control • Possible to provide good particulates removal • Can serve large development • Requires less capital cost and land area when compared to wet basin • Does not usually release warmed or oxygen-depleted water downstream • Protects against downstream channel erosion • Can create valuable wetland and meadow habitat when properly landscaped	• Low removal rates for soluble pollutants • Generally not feasible for drainage areas less than 10 acres • If not adequately maintained, can become a nuisance; (becomes unsightly, breeds mosquitos, and creates undesirable odors) • Periodic mowing and maintenance can be detrimental to nesting birds or other animals inhabiting the area
Vegetative Filter Strip • Inspection • Fertilizer use if necessary to maintain stable vegetation	• Low maintenance requirements • Can be used as part of the runoff conveyance system to provide pretreatment • Can reduce particulate pollutant levels in areas where runoff velocity is low to moderate • Enhances urban wildlife habitat diversity • Economical	• May concentrate water, significantly reducing effectiveness • Soluble pollutant removal highly variable • Limited feasibility in highly urbanized areas where runoff velocities are high and flow is concentrated • Requires periodic repair, regrading, and sediment removal to prevent channelization • Maintenance can be detrimental to nesting birds or other animals inhabiting the area • Fertilizer use can lead to higher nutrient loadings in storm water runoff
Grassed Swale • Periodic mowing • Fertilizer use if necessary to maintain stable vegetation	• Requires minimal land area • Can be used as part of the runoff conveyance system to provide pretreatment • Can provide sufficient runoff control to replace curb and gutter in single-family residential subdivisions and on highway medians • Economical and aesthetically pleasing	• Low pollutant removal rates • Leaching from culverts and fertilized lawns may actually increase the presence of trace metals and nutrients • Fertilizer use can lead to higher nutrient loadings in storm water runoff

Exhibit 6-3 (continued)
Structural Controls Matrix

CONTROL AND MAINTENANCE REQUIREMENTS	ADVANTAGES	DISADVANTAGES
Porous Pavement • Routine removal of fine particles from surface • May need weight limit of traffic imposed for protection	• Provides ground water recharge • Provides water quality control without additional consumption of land • Can provide peak flow control • High removal rates for sediment, nutrients, organic matter, and trace metals • When operating properly can replicate pre-development hydrologic conditions • Eliminates the need for storm water drainage, conveyance, and treatment systems off-site	• Requires regular maintenance • Possible risks of ground water contamination • Only feasible where soil is permeable, of sufficient depth to bedrock and water table, and gentle slopes are present • Not suitable for areas with high traffic volume or heavy vehicles • Need extensive feasibility tests, inspections, and very high level of construction workmanship • High failure rate due to clogging • Not suitable to serve large offsite pervious areas • Limited use in snowy climates where sanding and salting operations occur
Concrete Grid Pavement • Periodic mowing, if planted	• Provides peak flow control • Provides ground water recharge • Provides water quality control without additional consumption of land	• Requires regular maintenance • Not suitable for area with high traffic volume • Possible risk of contaminating ground water • Only feasible where soil is permeable, of sufficient depth to bedrock and water table, and gentle slopes are present
Filtration Basin • Periodic vacuuming and power washing	• Ability to accommodate moderately large-sized development (3-80 acres) • Flexibility to provide or not provide ground water recharge • Can provide peak volume control	• Requires pretreatment of storm water through sedimentation to prevent filter media from premature clogging

Exhibit 6-3 (continued)
Structural Controls Matrix

CONTROL AND MAINTENANCE REQUIREMENTS	ADVANTAGES	DISADVANTAGES
Wet Retention Basin • Periodic dredging, preferably from forebay area, if properly designed • Mowing of impoundment to prevent successional growth	• Provides peak flow control • Can serve large developments; most effective for large, intensively developed sites • Enhances species diversity, aesthetics, and provides recreational benefits • Little ground water discharge • Permanent pool in wet ponds helps prevent scour and resuspension of sediments • Provides moderate to high removal of both particulate and soluble pollutants	• Generally not feasible for drainage area less than 10 acres • Potential for safety and liability issues if not properly built and maintained • If not adequately maintained, can become a nuisance; (becomes unsightly, breeds mosquitos, and creates undesirable odors) • Requires considerable space, which limits use in densely urbanized areas with expensive land and property values • Not suitable for hydrologic soil groups "A" and "B" (SCS classification) • Potential for thermal discharge and oxygen depletion, which may severely impact downstream aquatic life
Extended Detention Wet Basin • Periodic dredging of sediment forebay	• Provides peak flow control • Can serve large developments; most effective for large, intensively developed sites • Enhances species diversity, aesthetics, and provides recreational benefits • Permanent pool in wet ponds helps prevent scour and resuspension of sediments • Provides better nutrient removal than traditional wet basin	• Not feasible for drainage area less than 10 acres • Potential for safety and liability issues if not properly built and maintained • If not adequately maintained, can become a nuisance; (becomes unsightly, breeds mosquitoes, and creates undesirable odors) • Requires considerable space, which limits use in densely urbanized areas with expensive land and property values • Not suitable for hydrologic soil groups "A" and "B" (SCS classification) • Potential for thermal discharge and oxygen depletion, which may severely impact downstream aquatic life

Sources: Modified from MWCOG, 1991; Schueler 1987; and WDOE, 1991.

6.4.1.1 Detention Controls

Detention controls temporarily store storm water runoff to control peak runoff rates and provide a reduction in pollutant concentrations by the gravitational settling of suspended solids and associated contaminants. Except for incidental losses due to evaporation or percolation, essentially all the detained water is subsequently discharged to a surface water conveyance (e.g., a stream or MS4). The most common examples of detention practices are extended detention basins and wet (retention) basins.

Variations on these basic detention controls include constructed storm water wetlands and multiple pond systems. These types of controls also rely on detaining flows (leading to sedimentation) as the primary means of pollutant removal. Recent investigations suggest that wetlands vegetation within a detention control can also reduce nutrient loads and certain other pollutants by incorporating them into plant tissue.

If properly designed, detention controls can protect downstream channels by reducing the frequency of bankfull flood events and associated erosion. Reduction in velocity and sediment load is also important for minimizing the adverse impacts of discharges to MS4s. Detention facilities also can provide terrestrial and aquatic wildlife habitat if they are landscaped and planted appropriately.

When considering detention controls, the municipality should consider the potential negative effects of downstream warming that may be caused by the shallowness of the water in the control. The municipality should also consider negative impacts of detention controls, such as reduced baseflow; bacterial contamination due to waterfowl; and potential impacts to wildlife from concentrated contaminants, waterfowl diseases, and maintenance practices. Safety and liability issues and nuisance factors, such as mosquitoes and odor, also should be considered. Setting detention controls in sensitive floodplains or in existing wetlands should generally be avoided. The flooding effect of impounding and detaining water is a particular concern if the upstream watershed drains more than 250 acres, because the volume of runoff and required detention times can cause inundation of upstream channels to occur.

Detention controls incorporating multiple pond systems and/or constructed storm water wetlands also treat runoff through the processes of absorption, filtration, biological uptake, volatilization, precipitation, and microbial decomposition. Recent investigations by the Metropolitan Washington Council of Governments suggest that multiple pond systems, in particular, have shown potential to provide higher and more consistent levels of treatment than traditional detention controls. The redundancy afforded by the multiple pond system generally increases the reliability of the control. However, the potential concerns and drawbacks affecting retention basins also apply to these systems. Many of these systems are currently being designed to include vegetative buffers and deep water areas to enhance wildlife habitat and to improve the appearance of the facility. If a municipality selects one of these more innovative designs, it should recognize that periodic maintenance is necessary. The effectiveness of these controls, like most controls, depends on proper operation, maintenance, and monitoring of the entire system.

Wet (Retention) Basins

Wet (retention) basins are designed to maintain a permanent pool of water and temporarily store storm water runoff until it is released at a controlled rate. Unlike extended detention ponds, wet basins cannot detain runoff for long times, because most of their storage capacity is needed for holding the permanent pool. Enhanced designs include a forebay to trap incoming sediment where it can be easily removed. A fringe wetland also can be established around the perimeter of the basin. Similar to detention controls, locating

retention basins in sensitive floodplains or existing wetlands should be avoided if possible.

Extended Detention Basins

Extended detention basins temporarily detain a portion of storm water runoff for 24 to 48 hours after a storm, gradually releasing the stored water through a fixed opening to allow urban pollutants to settle out. The basins normally return to a "dry" condition between storm events and do not have any permanent standing water. These basins are typically composed of two stages: an upper stage, which remains dry except during larger storms, and a lower stage, which is designed for typical storms. Pollutant removal from extended detention basins can be enhanced if they are equipped with plunge pools near the inlet, a micropool at the outlet, and an adjustable reverse-sloped pipe as the extended detention control device.

Water Quality Inlets

Water quality inlets (also referred to as catch basins) are small underground systems that, like retention basins, rely on settling to remove pollutants before discharging water to the MS4. Several designs of water quality inlets exist. In their simplest form, catch basins are single-chambered storm water inlets with the bottom lowered to provide 2 to 4 feet of additional space between the outlet pipe and the bottom of the structure for collection of trash and sediment. Some water quality inlets include a second chamber with a sand filter to provide additional removal by filtration. The first chamber provides effective removal of coarse particles and helps prevent premature clogging of the filter media.

Water quality inlets may include an oil/grit separator. There are 3 basic types of oil/grit separators: the spill control (SC), the coalescing plate interceptor (CPI), and a design credited to the American Petroleum Institute (API). Most of the oil/grit separators that are promoted for use in reducing hydrocarbon loads in storm water are a modification of the API design, although there are appropriate applications for all three separator designs. Oil/grit separators based on the API design consist of three chambers. The first chamber removes coarse material and debris. The second chamber provides separation of oil, grease, and gasoline from the storm water runoff; and the third chamber provides a safety relief should a blockage occur.

Recent experiences have shown that, because of their volume limitations, oil/grit separators have limited pollutant removal effectiveness. They are perhaps the best example of a structural control that is only effective with frequent maintenance. Proper disposal of the standing water, trapped sediments, and floating hydrocarbons are problems in the few locations that have been studied.

Constructed Storm Water Wetlands

Constructed storm water wetlands are a hybrid, drawing on elements of detention and retention basins. Constructed storm water wetlands are shallow pools and are often designed to simulate the pollutant removal functions of natural wetlands. Enhanced designs may include a sediment forebay, carefully contoured topography, and multiple species of wetland plants. Constructed storm water wetlands, while a promising technology for pollutant removal from storm water, may not replicate all the ecological functions of natural wetlands.

6.4.1.2 Infiltration Controls

Infiltration controls rely chiefly on absorption to treat storm water discharges. In the ideal case, storm water percolates through a porous medium and into native soils where filtration and biological action remove pollutants. Typical controls of this type include infiltration trenches, infiltration basins, filtration basins, porous pavement, and concrete or block pavers. Systems that rely on soil absorption work best in deep, highly permeable soils that

are at least four feet away from the seasonal ground-water table.

The Soil Conservation Service (SCS) classifies soils into four major soil groups A-D. The soil groups are as follows:

Group A: Sand, loamy sand
Group B: Sandy loam, loam
Group C: Silt loam, sandy clay loam
Group D: Clay loam, silty clay loam, sandy clay, silty clay, and clay

Soils in Group A provide the highest infiltration rate while soils in Group D provide the lowest. Suitable soils for infiltration-type controls typically fall in soil groups A and B. Other types of soils may be suitable, provided the clay content does not exceed 30 percent (clay has very low hydraulic conductivity). The clay content of soil may be determined from the SCS soil textural triangle, which can be found in many civil engineering references texts.

If suitable soils are available, the widespread use of infiltration in a watershed can be useful in helping to maintain, restore, or replicate pre-development hydrology. Specific benefits of infiltration often include increased dry-weather baseflow in streams and a reduction in the frequency of bankfull floods. However, infiltration systems are not recommended unless soil conditions warrant. Also, infiltration should not be used where ground water requires protection. For example, the use of infiltration-type controls may not be appropriate in areas that recharge sole source aquifers.

Infiltration Basins

Infiltration basins are areas that intercept incoming storm water runoff and temporarily store it until it gradually infiltrates into the soil surrounding the basin. Infiltration basins should be designed to control drainage areas ranging from about 5 to 50 acres. They also should drain within 48 to 72 hours to maintain aerobic conditions favoring bacteria that aid in pollutant removal, and to ensure that the basin is ready to receive the next storm. The runoff entering the basin is usually pretreated to remove coarse sediment that may clog the surface soil pores on the basin floor. Concentrated runoff may flow through a sediment trap or by sheet flow (vegetative filter strip).

Infiltration Trenches

Infiltration trenches are shallow (e.g., 2 to 10 feet deep) excavated ditches or vaults that have been backfilled with a coarse stone aggregate. The aggregate forms an underground reservoir that has approximately 40 percent void space. Storm water runoff diverted into the trench gradually infiltrates from the bottom of the trench into the subsoil and eventually into the ground water. Variations in the design of infiltration trenches include dry wells and percolation pits that are designed to control small volumes of runoff, such as the runoff from a rooftop. A more complex variation is the enhanced infiltration trench, which is equipped with filter fabric or a more extensive pretreatment system to remove sediment and oil. Depending on the quality of the runoff, pretreatment may be necessary to lower the failure rate of the trench. Infiltration trenches are generally best suited for drainage areas of less than 10 acres. They are particularly applicable for use on residential lots, small commercial areas, down slope from parking lots, and under drainage swales.

Grassed Swales

A grassed swale is an infiltration method that is usually used as a form of pretreatment before discharging runoff to another storm water control device (e.g., a detention basin). However, the grassed swale itself is a control that can remove significant amounts of pollutants through sediment entrainment. A grassed swale is a shallow, vegetated, man-made ditch with the bottom elevation above the water table to allow runoff to infiltrate into the ground water. The vegetation helps to

prevent erosion, filters sediment, and allows for some uptake of nutrients.

Porous Pavement

Porous pavement, which is basically traditional asphalt aggregate without the fine particles, is an alternative to conventional pavement. Proper design and application of this control can reduce or eliminate the need for curbs and gutters, storm drains and sewers, and offside controls. Instead, runoff is diverted through a porous asphalt layer into an underground stone reservoir. The stored runoff gradually exfiltrates out of the stone reservoir into the subsoil. Soil considerations are important when evaluating the appropriateness of this control. Generally, grades should be gentle, and subsoil should be at least 3 feet thick (to bedrock) and moderately permeable (capable of infiltrating about one half inch per hour). Because porous pavement tends to clog with fine sediments and because it loses its effectiveness under heavy loads, its application should generally be limited to low-traffic areas (e.g., overflow parking areas) and areas that are not exposed to large bearing loads caused by heavy vehicles.

Concrete Grid Pavement

Concrete grid pavement has concrete blocks with regularly interdispersed void areas that are filled with pervious materials, such as gravel, sand, or grass. The blocks are typically placed on a sand or gravel base. They are usually designed to provide a load-bearing surface adequate for supporting vehicles, while allowing infiltration of surface water into the underlying soil.

6.4.1.3 Filtration Controls

Filtration controls treat storm water flows by using vegetation or sand to filter and settle pollutants. Generally, these controls are most effective before the flows become concentrated (e.g., sheet flow). In certain instances, infiltration and treatment in the subsoil also may occur through the processes of absorption and adsorption. After passing through the filtration media, the treated water is usually directed to a stream or MS4, although it may be evaporated or percolated into the ground. Filtration controls include filter strips, grass swales, and sand filters. Sand filters are particularly useful for ground water protection. Applicants must consider the influence of climate when they select vegetative systems.

Vegetative Filter Strips

Vegetative filter strips (also called bio-filters) are vegetated sections of land designed to accept runoff as overland sheet flow from upstream development. They may adopt any natural vegetated form, from grassy meadow to small forest. The dense vegetative cover facilitates sediment reduction and pollutant removal. Filter strips cannot treat high-velocity flows. Therefore, these strips generally have been recommended for use in agriculture and low-density development and other situations where runoff does not tend to be concentrated. Unlike grassed swales, filter strips are effective only for overland sheet flow, as opposed to concentrated flow. Grading and level spreaders can be used to reduce the energy of concentrated flows and distribute the runoff evenly across the filter strip. Vegetative filter strips are often used as pretreatment for other structural practices, such as infiltration trenches. Leaving a buffer of natural vegetation along an urban stream valley is an example of a vegetative filter strip and also an example of a nonstructural control.

Filtration Basins

Filtration basins are usually small impoundments lined with filter media, such as sand or gravel. Storm water drains through the filter media and perforated pipes into the subsoil. For optimal pollutant removal, recommended detention times range from 24 to 48 hours with a maximum drainage area of about 50 acres. Grassed swales or other structural controls can be used to filter coarse sediments and thereby minimize clogging of the filter medium.

6.4.2 Maintenance Activities

After summarizing the location of major structural storm water controls, applicants must submit a description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants.

> §122.26(d)(2)(iv)(A)(1). [The application must include a] description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers.

Typical maintenance requirements include:

- Inspection of basins and ponds after every major storm for the first few months after construction and annually thereafter;
- Mowing of grass filter strips and swales at the frequency necessary to prevent woody growth and promote dense vegetation;
- Regular removal of litter and debris from dry ponds, forebays, and water quality inlets;
- Periodic stabilization and revegetation of eroded areas;
- Periodic removal and replacement of filter media from infiltration trenches and filtration ponds;
- Deep tilling of infiltration basins to maintain infiltrative capability; and
- Frequent vacuuming or jet hosing of porous pavement or concrete grid pavements.

Lack of maintenance often limits the effectiveness of storm water structural controls such as detention/retention basins and infiltration devices. Maintenance programs should address measures for catch basins and drainage channels in addition to major structural controls.

The proposed program should provide for maintenance logs and identify specific maintenance activities for each class of control, such as removing sediment from retention ponds every five years, cleaning catch basins annually, and removing litter from channels twice a year. If maintenance activities are scheduled infrequently, inspections must be scheduled to ensure that the control is operating adequately. In cases where scheduled maintenance is not appropriate, maintenance should be based on inspections of the control structure or frequency of storm events. If maintenance depends on the results of inspections or if it occurs infrequently, the applicant must provide an inspection schedule. The applicant should also identify the municipal department(s) responsible for the maintenance program.

Municipalities should use caution in adopting controls that do not have sufficient history of use for their performance characteristics and maintenance requirements to be adequately evaluated. A good example is the oil/grit separator used on small commercial or retail sites. Some municipalities have required the use of these technologies, but due to poor performance, municipalities have often rescinded the requirement. In these cases, it is not clear whether the control technology was ineffective or the maintenance program was flawed.

Because maintenance is critical to successful program implementation, it must be considered throughout the term of the permit. Applicants may wish to develop a matrix that identifies maintenance tasks on a timeline indicating criteria for inspection, repair, and replacement. PERT charts, GANT charts, or other critical path analyses (available for personal computers) can help organize a maintenance program and schedule. For a summarized

listing of appropriate maintenance activities and schedules refer to the matrix in Exhibit 6-3.

6.4.3 Considerations for Planning and Siting Controls

The storm water management program should describe the criteria used to identify that a particular structural control is warranted and the circumstances under which it will be required. The possibilities for new control sites should be evaluated for their storm water quality control potential. Guidelines and performance standards that identify specific structural controls for new development should be proposed in the procedures for new development. From this evaluation, priorities based on the feasibility of implementing a particular control at a given location can be determined.

6.4.3.1 Use of Municipal Lands

Applicants should discuss existing major structural controls and sites that have the potential for new structural controls which could be installed on municipal lands and other major rights-of-way (e.g., major roads and highways). Note that existing controls are identified in Part 1 applications [(§122.26(d)(1)(iii)(B)(5)]. The location of publicly owned parks, recreational areas, and other open areas are also identified [§122.26(d)(1)(iii)(6)].

To determine what storm water quality controls are necessary for public lands and facilities, current activities and functions that may affect the quality of storm water discharges should be identified. Such activities and functions include parks, trails, and other recreational land uses, road maintenance and snow management, and storage and repair yards/shops for municipal vehicles. An inventory of public land uses may be necessary to help make determinations of what controls are needed. An effective inventory should involve coordination among all of the local departments and agencies that have authority over the use of public lands and facilities.

Opportunities for controlling storm water quality problems that are identified through the inventory process can be evaluated on a site-specific basis and included in the proposed management program.

There are several benefits to the establishment of structural controls on municipal lands:

- Municipal lands often provide greater retrofit opportunities because they typically do not require additional property purchases;
- Municipal lands ensure opportunities to provide future maintenance and security in preservation of the retrofit control;
- Applicants may be able to adapt existing municipal functions (such as industrial pretreatment program implementation, fire-safety inspections, and flood-control activities) to address storm water quality concerns (Expanding their mission to address storm water concerns may be more cost-effective than initiating entirely new programs.);
- Applicants may be able to adapt functions of development on municipal lands (such as planning, zoning, and construction oversight functions); and
- After considering controls on municipal lands, the applicant will be in a better position to address the private land under its jurisdiction.

As a precaution, however, applicants need to consider potential conflicts arising over the multiple use of public lands. Criteria other than land ownership (e.g., locating controls downstream of developed areas) also should be considered when deciding where to locate storm water runoff controls.

6.4.3.2 Use of Private Lands

A municipality also may incorporate storm water quality controls into its land use plan to indicate controls that may be necessary for new development. Some of the best opportunities to prevent pollution and to implement effective storm water quality controls occur during development. Local governments typically play a strong role in overseeing new development and have, or can adapt, administrative infrastructure to address storm water quality concerns.

The storm water management process should begin with land use planning and zoning and continue through the development and redevelopment processes. Municipalities generally can obtain commitments from land developers more easily prior to relinquishing jurisdictional leverage over the parcel where the potential control is to be located. Leverage can be achieved through plan approval or zoning changes. The negotiation process for the dedication, condemnation, or other acquisition of land and the process for getting the land developer to construct or otherwise implement controls will vary dramatically among municipalities, particularly among those in different States.

Source and structural controls are most cost-effective when development is planned with storm water quality controls in mind. However, it is probably more appropriate for the municipality to propose a flexible plan that specifies a variety of program objectives through the development process rather than identifying a certain priority and rigid schedule. Other benefits of early and flexible planning include ecological diversity, wetlands preservation, and the creation of controls that also function as amenities. Comprehensive land use plans, zoning ordinances, and subdivision ordinances are important mechanisms to implement these controls early in the development process. Consideration of storm water quality during pre-development is one of the most effective ways to implement controls. This is because the maximum flexibility (and opportunity) to incorporate BMPs exists prior to final land use decisions and construction activities (see Section 6.3.1.1)

6.4.3.3 Siting Considerations

Imperviousness

The degree of imperviousness affects the concentration of pollutants in storm water, which in turn affects the type of structural controls that may be necessary. As the imperviousness of an area increases, the runoff volume and the pollutant loading increase. Studies show that runoff from industrial areas, which generally have a high degree of imperviousness, can have a wider variety and greater concentration of pollutants than runoff from other land uses. Recent studies also indicate that the degree of imperviousness can be inferred from the level of degradation in urban receiving streams. (For example, see Schueler 1991 and Klien 1979.) Population projections will not indicate the degree to which industrial land use will increase unless planning and zoning information is also considered.

Soil Conditions

Controls designed to infiltrate storm water will be affected by site specific soil conditions. For example, clay content of the soil and the antecedent moisture content (degree of soil saturation at the time of a given storm event) will strongly influence the effectiveness, and therefore the applicability, of infiltration controls for a given location.

6.5 PROGRAM AND SCHEDULE TO DETECT AND REMOVE ILLICIT DISCHARGES AND IMPROPER DISPOSAL

NPDES permits for discharges from MS4s require effective detection and removal from the MS4 of illicit or improper discharges and disposal.

§122.26(d)(2)(iv)(B). [The application must include a] description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer.

The NURP study concluded that the quality of urban runoff can be adversely impacted by illicit connections and illegal dumping. Often, large amounts of wastes, particularly used oils, are improperly disposed of in storm sewers. Elimination of these sources of pollutants would result in a dramatic improvement in the quality of storm water discharges from MS4s. Procedures to eliminate such discharges should be an important part of the proposed management program.

The regulatory requirement cited above is intended to directly implement the mandate of Section 402(p)(3)(B)(ii) of the CWA, which requires permits for MS4s to effectively prohibit non-storm water discharges into storm sewers. In certain instances, the most appropriate action will be for the municipality to ensure that illicit discharges become covered by a NPDES permit. However, in most cases, elimination of illicit discharges or improper dumping is the appropriate focus of this program component. The quality of storm water runoff from inner-city core areas, particularly in older parts of the country, would benefit most from this component.

The applicant should propose a schedule for implementing this program component throughout the initial permit term. This schedule should reflect the priorities identified by the municipality during the application process and be based on the problems particular to the specific MS4.

6.5.1 Prohibiting Illicit Discharges

The proposed management program must include a description of inspection procedures, orders, ordinances, and other legal authorities necessary to prevent illicit discharges to the MS4.

§122.26(d)(2)(iv)(B)(*1*). [The application must include a] description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States . . . . *[these sources are listed in the guidance].*

This proposed management program component also should describe how the prohibition on illicit discharges will be implemented and enforced. The description should include a schedule and allocation of staff and resources. A direct linkage should exist between this program component and the adequate legal authority requirements for the ordinances and orders to effectively implement the prohibition of illicit discharges.

While this program component is required to prohibit all types of illicit discharges, the following categories of non-storm water discharges need only be prohibited by the MS4 when they are identified by the MS4 as sources of pollutants to waters of the United States:

- Water line flushing
- Landscape irrigation
- Diverted stream flows
- Rising ground waters
- Uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to separate storm sewers
- Uncontaminated pumped ground water
- Discharges from potable water sources
- Foundation drains
- Air conditioning condensation
- Irrigation water

- Springs
- Water from crawl space pumps
- Footing drains
- Lawn watering
- Individual residential car washing
- Flows from riparian habitats and wetlands
- Dechlorinated swimming pool discharges
- Street wash water

While EPA does not consider these flows to be innocuous, they are only regulated by the storm water program to the extent that they may be identified as significant sources of pollutants to waters of the United States under certain circumstances. If an applicant knows, for example, that landscape irrigation water from a particular site flows through and picks up pesticides or excess nutrients from fertilizer applications, there may be a reasonable potential for a storm water discharge to result in a water quality impact. In such an event, the applicant should contact the NPDES permitting authority to request that the authority order the discharger to the MS4 to obtain a separate NPDES permit (or in this case, the discharge could be controlled through the storm water management program of the MS4).

The applicant should consider the specific land use, age, and stage of development in this program component. For example, one study in an established metropolitan area found that 60 percent of automobile-related businesses had improper storm drain connections. While some of the problems discovered in this study were the result of improper plumbing or illegal connections to storm drains, the majority of the connections were approved by the municipality when they were built.

For problem identification and problem-solving, a municipality may elect to implement a follow-up study that traces identified pollution incidents to their source (e.g., up the system). A variety of pollutant-tracing techniques and field screening can be used to identify illicit discharges.

6.5.2 Field Screening

Part 1 of the application requires applicants to submit the results of field screening studies to evaluate the possible occurrence of illicit connections and improper dumping [§122.26(d)(1)(iv)(D)]. Dry weather flows that were encountered during the initial field screening were sampled and analyzed. The analysis was intended to provide information about illicit connections and improper dumping.

In Part 2, applicants are required to propose procedures for continued field screening during the term of the permit.

> §122.26(d)(2)(iv)(B)(2). [The application must include a] description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens.

Applicants can propose to use procedures similar to those used for field screening required in Part 1 of the application or they can propose alternative procedures and techniques. The Part 1 field screening requirements are found in §122.26(d)(1)(iv)(D) and are explained in the Part 1 guidance manual.

The Part 2 proposed field screening program component should describe areas of the system where the continuation of the field screening program will be conducted and the rationale for selecting these areas. For example, the rationale for continuing field screening at a given location might be that a wide variation in results was obtained during the initial screens. In addition, the applicant should propose field screening for a portion of any recently-identified major outfalls that were not known to the applicant when it prepared its Part 1 application, provided sampling of these outfalls is safe and practicable.

The potential for illicit discharges and improper disposal is generally higher for areas of older development, areas with many automobile-related industries, and areas with significant numbers of heavy industrial facilities. Therefore, in most cases applicants should include these areas in the proposed field screening program.

The description of the field screening component should provide a detailed summary of the departmental responsibility for field activities, frequency of inspections, procedures and equipment to be used, and the procedures for documenting field activities, both in the field and in the office. Generally, the Part 2 field screening program should reflect a continuously narrowing process to trace illicit and improper sources.

6.5.3 Investigation of Potential Illicit Discharges

In order to submit a comprehensive proposed management program, applicants are required to describe procedures for investigating portions of the municipal system where field screening or other information indicates a reasonable potential for illicit discharges.

> §122.26(d)(2)(iv)(B)(3). [The application must include a] description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water (such procedures may include: sampling procedures for constituents such as fecal coliform, fecal streptococcus, surfactants (MBAS), residual chlorine, fluorides and potassium; testing with fluorometric dyes; or conducting in storm sewer inspections where safety and other considerations allow. Such description shall include the location of storm sewers that have been identified for such evaluation).

Applicants should propose criteria to identify portions of the system where follow-up investigations are appropriate. For example, calculating a frequency distribution of dry weather flows at each screening site could aid in establishing criteria to identify where follow-up investigations are appropriate.

Procedures to investigate priority locations for illicit connections include inspection of the storm sewer system, use of remote-control cameras, on-site inspections and dye-testing at priority or suspect facilities, and additional discharge monitoring to pinpoint pollutant sources. In some cases, these investigations may be coordinated with pretreatment program inspections. Such approaches are summarized in Exhibit 6-4. Coordinating inspections can be a very effective use of resources. For example, portions of the sanitary sewer system that need evaluation to detect illicit discharge may already be undergoing inspection by operators of the municipal treatment plant.

A checklist should be developed for inspectors to use to detect illicit connections. The checklist should be structured to ensure a comprehensive evaluation of the problem and stipulate the use of the easiest and least expensive detection methods first.

Regardless of the format in which information is compiled (e.g., table, list, text description), EPA suggests that the applicant prepare a map identifying the location of suspected problem areas. The map should be provided as part of the Part 2 application.

The proposed program component description should describe a step-by-step process to investigate, identify, and prohibit illicit discharges. If field screening leads to positive tests of fecal coliform, fecal streptococcus, surfactants, residual chlorine, fluorides, or potassium, a municipality should reconsider whether any of the non-storm water discharges described in Section 6.5.1 are the source (see previous section).

Exhibit 6-4
Sample Illicit Discharge Investigation Procedures Options

Results of Initial Field Screen	Procedures for Detailed Analysis	Comments
Plumbing unidentifiable	Cameras	Effective for identifying deterioration
Uncertain use of facility	On-site inspections	May be combined with other inspections
Several facilities or complex plumbing	Dye-testing	Simple and accurate if system not interconnected
Unusual pollutants	Monitoring	Particularly useful for fingerprinting

6.5.4 Spill Response and Prevention

The proposed management program must describe procedures that the municipality will implement during the term of the permit to prevent, contain, and respond to spills that may discharge into the MS4.

> §122.26(d)(2)(iv)(B)(4). [The application must include a] description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer.

The municipality and the property owners (and/or operators) of sites where spills may occur need to implement procedures to prevent, contain and respond to spills. One way to implement these procedures is to modify the land use planning process and ordinance enforcement. Such modifications would require notification and emergency preparedness procedures for any land use activity that could lead to leaks and spills. Another method is to coordinate with on-going programs in other regulated areas where detection of spills is important, such as pretreatment and hazardous materials management. The goal of a spill-prevention program is to reduce the frequency and extent of spills of hazardous materials, oils, and other materials which can cause water quality impairment. Spill-containment programs may establish minimum chemical storage and handling requirements, require users to submit prevention and control plans, and ensure site inspections. The content of the descriptions that should be submitted with the Part 2 application for each of these program elements is discussed in more detail below.

Spill-response programs are intended to reduce risk to the public and the environment. Although these programs tend to focus on issues of public health and safety, such as exposure to toxic materials, fires, or explosions, spill-response teams should attempt to prevent or minimize contamination of surface water, ground water, and soil. Spill-response programs often require a coordinated response from a number of municipal departments (e.g., fire, police, health, and public works). Municipalities should describe how response procedures within these programs attempt to mitigate potential pollutant discharges to surface waters.

For example, some industrial pretreatment programs specifically require that leaks or spills be routed to the storm sewer rather than the sanitary sewer generally to protect worker health and safety and to protect biological treatment capabilities. This issue serves to reinforce the need for coordination between the various municipal programs that are related in some way to storm water.

The proposed program should identify the municipal departments responsible for implementing the program, and also should address employee training, reporting procedures, containment of spills, storage and disposal activities, documentation, and follow-up procedures. Generally, the proposed program for spill response and prevention should focus on good housekeeping and materials management practices, which are discussed in more detail below.

One of the initial elements in the development of a successful spill response and prevention program is to assess the potential of various sources at a particular property to contribute pollutants to the storm water discharges from the site. This assessment should inventory the land use, types of materials handled, and the location and types of materials management activities. Factors to consider when evaluating the pollution potential of runoff from various portions of a site include those that are likely to lead to the identification of specific structural or nonstructural controls to address problems.

Other factors to consider are the toxicity and quantity of any chemicals used, produced, stored, or discharged from the site; the history of any NPDES permit violations from a site; history of significant leaks or spills of toxic or hazardous pollutants; and the designated uses of the receiving waters.

This program element should also include a description of storm water management controls that are appropriate for the site that would control or allow for the mitigation of any leak or spill and a proposal to implement such controls. The priorities developed in the implementation proposal should reflect the nature of identified sources of pollutants at the site.

The description of spill response and prevention activities should include the steps a municipality will take to prevent, and when necessary, adequately respond to spills discharged to its MS4. The MS4 might identify special training requirements for municipal employees in order to respond to spills of hazardous chemicals from a particular facility into the storm sewer system.

Sources with the greatest potential for spills to occur (or cause the most severe damage) should be identified in the proposed storm water management program. If appropriate, specific materials handling procedures and storage requirements should be identified for these sources. Requirements for these sources could be modeled after the Spill Prevention, Control, and Countermeasure (SPCC) Plans that are required for certain facilities under Section 311 of the CWA.

Under the SPCC program, for example, personnel are trained and given responsibility for inspecting the facility for leaks and spills. These inspections include equipment and materials handling areas, which need to be investigated for evidence of, or the potential for, pollutants entering the drainage system. Procedures to ensure the availability of appropriate personnel and equipment for cleaning up spills must be identified. A system to ensure that appropriate corrective action has occurred in response to inadequacies identified during the inspection is also established under the program.

Not all of the SPCC program elements may be necessary for municipal applicants. However, EPA recommends that the proposed storm water management program describe how the records of inspections will be maintained and made available for investigations of causal factors and program effectiveness. Incidents of leaks, spills, and

improper dumping, along with other information describing the quality and quantity of storm water discharges should be included in the records. Inspections and maintenance activities, such as containment berm integrity testing or the cleaning of oil/water separators should be documented and recorded in a maintenance log.

6.5.5 Public Awareness and Reporting Program

Applicants must propose a management program component that promotes, publicizes, and facilitates public reporting of illicit discharges or water quality impacts associated with discharges from MS4s.

> §122.26(d)(2)(iv)(B)(5). [The application must include a] description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers.

Timely reporting by the public of improper disposal and illicit discharges are critical components of programs to control such sources.

To enhance public awareness, programs may include setting up a public information hotline number; educating school students; establishing community and volunteer "watchdog" groups (e.g., "Adopt-a-Stream Program"); using inserts into utility bills; and newspaper, television and radio announcements to inform the public about what to look for and how to report incidents. The public awareness efforts should clarify to the public that they are the ultimate beneficiaries of a successful storm water management program.

6.5.6 Proper Management of Used Oil and Toxics

EPA estimates that annually, 267 million gallons of used oil, including 135 million gallons of used oil from do-it-yourself automobile oil changes, are disposed of improperly. An additional 70 million gallons of used oil, most coming from service stations and repair shops, are used for road oiling (55 FR 48056, November 16, 1990). If private individuals find the proper disposal of used oil or toxic materials difficult, incidents of improper disposal increase. For example, when a large fraction of service stations do not accept do-it-yourself used oil, improper disposal into the municipal storm sewer rises. Therefore, applicants are required to propose a program component that will facilitate the proper disposal of used oil and toxics from households by establishing municipally operated collection sites, or ensuring that privately-operated collection sites are available.

> §122.26(d)(2)(iv)(B)(6). [The application must include a] description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials.

The proposed program should describe outreach plans to handlers of used oil and to the public, and operating plans for oil and household waste collection programs.

Examples of effective public outreach for these types of programs include dedicated municipal phone numbers (e.g., a used oil/toxic materials hotline), pamphlets, and requirements that oil retailers post the location of the nearest used oil collection facility. Programs can also inform the public about alternatives to toxic materials. Catch basin/storm sewer inlet stenciling programs can also be proposed as part of the program to increase public awareness of the connection between storm sewers and local water resources.

6.5.7 Infiltration of Seepage

In order to effectively complete this portion of a proposed management plan, the applicant must describe controls to limit infiltration of seepage from municipal sanitary sewers to MS4s, if necessary.

> §122.26(d)(2)(iv)(B)(7). [The application must include a] description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary.

Raw sewage can seep from sanitary sewage collection systems through leaks and cracks in aging pipes, poorly constructed manholes and joints, and main breaks. Sewage from a leaky sanitary system can flow to storm sewers or contaminate ground water supplies. Interaction between sanitary sewers and separate storm sewers may occur at manholes and where sanitary sewer laterals and storm sewer trenches cross. Separate storm sewers and sanitary sewers may share the same trench, which is generally filled with very porous material such as gravel.

One indication of seepage from a sewage collection system may be infiltration of water. Often, the rate of exfiltration (seepage) from sanitary collection systems is significantly greater than the rate of infiltration into the system. An EPA study on sewer exfiltration found significant ratios of the rate of exfiltration of sewage to the rate of infiltration of ground water or storm water into sanitary sewers. Field and laboratory results found this ratio to vary between 1.5 to 1 and 14 to 1.

In some cases, preventive maintenance surveys or on-going infiltration and inflow (I&I) programs to determine where water is entering a sanitary sewer system may be modified to locate the source and fate of exfiltration from the system.

Identifying infiltration of seepage into a MS4 is a good example of the need for various municipal functions to be effectively coordinated. Proposed storm water management programs might discuss how personnel responsible for inspections of the sanitary sewer system could inspect for sources of exfiltration during I&I inspections, and pass any findings to personnel responsible for maintaining the MS4. If seepage is believed to be a problem, a coordinated effort with the maintenance department of the municipal sanitary sewer system is recommended.

The proposed storm water management program also should include provisions to address the discovery of previously unknown problems. There should be procedures to enact a coordinated program between the operators of the storm sewer and sanitary sewer (which in many cases will be within the same municipal agency or department).

EPA recommends that the proposed storm water management program describe controls that will be used to address seepage from malfunctioning septic systems in areas not served by a sewage treatment works. Malfunctioning septic systems may lead to more significant surface runoff pollution problems than ground water problems. A malfunctioning septic system is less likely to cause ground water contamination where an impervious bacterial mat in the soil retards the downward movement of wastewater. (Poorly located septic systems that are operating properly are the greatest threat to ground water).

Surface malfunctions of septic systems are caused by clogged or impermeable soils, or when stopped up or collapsed pipes force untreated wastewater to the surface. Surface malfunctions can vary in degree from occasional damp patches on the surface to constant pooling or runoff of wastewater to a storm sewer. An improper remedy for a surface malfunction is to install a pipe or trench over soil absorption systems to route untreated overflow away from the septic

system. This results in direct discharges to drainage ditches, empty lots, or surface waters.

Proper controls range from prescribing maximum intervals between tank pump-out to the installation of sand filters. Discharge from sand filters to surface waters may require a separate NPDES permit, because such discharge is not storm water.

Additional information about the most appropriate controls for use in correcting malfunctioning septic systems is probably best obtained from local or regional sources. Organizations such as extension services, soil and water conservation districts, and planning agencies may be good sources of information about methods that have been successful (and also those that have failed).

By obtaining this type of information, the applicant can determine what control techniques have been successful in correcting malfunctioning septic systems in similar types of soils. The value of this approach is that the applicant will know that a certain control technique has been used to correct a malfunctioning septic system in the same types of soils that occur in the municipality. Where only part of the MS4 drainage area is served by septic systems, proposed programs should address setting and maintenance of septic systems, including draft requirements and implementation procedures.

6.6 SIGNATORY AND CERTIFICATION REQUIREMENTS

Under the Federal NPDES regulations [§122.22(a)], all NPDES permit applications (including municipal storm water permit applications) must be signed by an authorized person, as defined in the regulations. Permit applications submitted by a municipality, State, Federal, or other public agency must be signed by either a principal executive officer or ranking elected official [§122.22(a)(3)]. To fulfill the signatory requirements, the person signing the municipal application must provide his or her name (printed or typed), title, and date signed. In addition, the applicant should provide the name, address, and telephone number of the person signing the application or another point of contact that can answer questions about the application.

In addition, §122.22(d) states that any person signing a permit application must make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

6.7 IMPLEMENTATION OF THE STORM WATER PROGRAM

EPA anticipates that municipal storm water management programs will mature over time to reflect advances in technology, additional data collection, changing conditions, program development, stage of implementation, and improvements in water quality. Therefore, applicants may emphasize different program components to reflect implementation priorities. The proposed management program should clearly identify each of the program components and include a schedule for implementation. Each component of the Part 2 application should be classified as: full implementation, phased implementation, pilot study, or feasibility analysis. In annual reports on the progress of storm water management programs, municipalities must report on the status of implementing program provisions [§122.42(c)(1), or Section 7.3 of the guidance].

- **Full Implementation.** Fully implemented components should be proposed when the municipality is

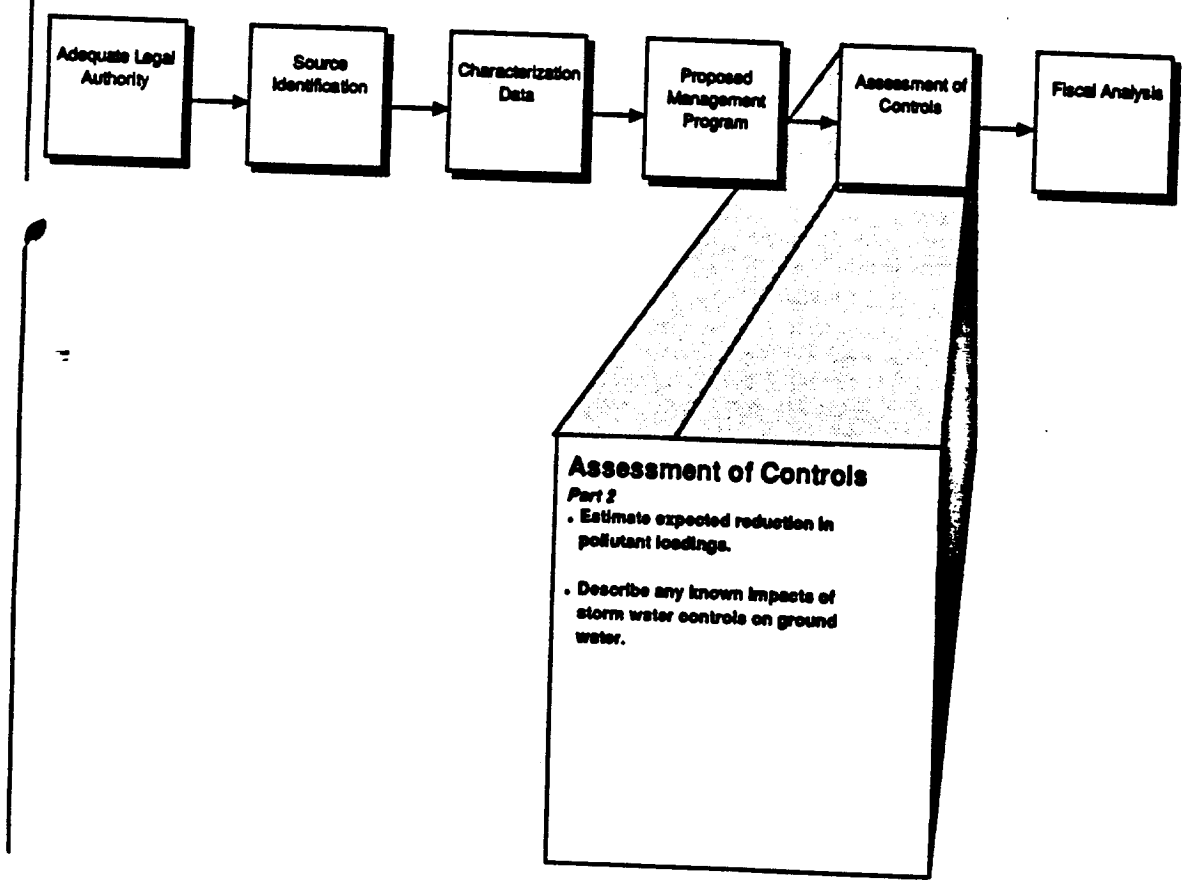
prepared to begin or continue full implementation after its permit is issued and it expects to continue the component throughout the life of the permit. Full implementation of a program component is generally the preferred way of demonstrating the required level of control.

- **Phased Implementation.** Phased implementation should be proposed when the level of effort to implement the component will vary during the term of the permit. Phased implementation may be appropriate when additional data must be collected or technical guidance, training materials, or appropriate ordinances must be developed prior to full implementation. A schedule that includes milestones should be part of the description.

- **Pilot Studies.** Although the municipality must implement and comply with *each* provision of the municipal storm water permit, the municipality may choose to carry out pilot studies that involve limited experimental implementation of a program component. In some cases, pilot studies may be authorized by the permit. Used to evaluate the effectiveness of a program component, pilot studies may be appropriate when a technology is unproven or when data must be collected to develop operating standards or procedures. A schedule including milestones should be included in the description of a pilot study. This schedule should provide options for phased implementation of the program component, showing alternatives based on various possible results of the pilot study.

VOL 23

CHAPTER 7
ASSESSMENT OF CONTROLS



07106

7.0 ASSESSMENT OF CONTROLS

7.1 BACKGROUND

Part 2 applications require that municipalities estimate the effectiveness of their proposed storm water quality management programs. The regulations require an initial estimate or assessment because the performance of appropriate management controls is highly dependent on site-specific factors. Program effectiveness can be estimated through both direct measurements (such as reductions in annual pollutant loads) and indirect measurements (such as measurements that demonstrate increased public awareness of storm water quality issues). At a minimum, applicants must submit estimated reductions in pollutant loads expected to result from implemented controls and describe known impacts of storm water controls on ground water.

> 122.26(d)(2)(v). *Assessment of controls.* [The application must include] estimated reductions in loadings of pollutants for discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.

Reductions in pollutant loads due to the implementation and maintenance of structural controls provide direct measurements of the effectiveness of the storm water management program. In addition, EPA encourages applicants to go beyond the minimum requirement and assess the effectiveness of their storm water management program through other direct measurements as well as indirect measurements. As discussed below, indirect measurements provide surrogate estimates of qualitative factors, such as increased public awareness of storm water quality issues.

Estimates of the effectiveness of the storm water management program will assist the municipality and the permit writer in:

- Determining whether the most cost-effective best management practices (BMPs) are included in the storm water management program;
- Ensuring that the storm water management program includes adequate public participation programs and intergovernmental coordination;
- Establishing on-going monitoring inspection and surveillance programs that help refine estimates of program effectiveness; and
- Developing a strategy to evaluate progress toward achieving water quality goals.

7.2 ASSESSMENT OF STORM WATER MANAGEMENT PROGRAM

For some components of a proposed storm water management program, such as structural controls (e.g., vegetative streambank stabilization, sediment pond or basin, etc.), the effect on pollution in storm water runoff is observable, and pollutant removal efficiencies can be estimated directly. For other components, pollutant reductions may be difficult to quantify. Applicants may need to use indirect estimates. For example, a program component may address source controls such as changing the behavior of citizens in the community, or improving the municipal control of industrial or commercial runoff. For

components of the proposed management program where pollutant removal efficiency cannot be reasonably estimated, applicants are strongly encouraged to identify some indirect measurement that can be used to evaluate the success of the practice.

7.2.1 Direct Measurements of Program Effectiveness

As discussed above, 40 CFR 122.26(d)(2)(v) requires that applicants submit estimates of expected pollutant load reductions with their Part 2 applications. To supplement these estimates, applicants could provide estimates of other direct measurements of program effectiveness, including:

- Removal efficiencies of BMPs that control storm water quality;
- Reductions in the volume of storm water discharged;
- Reductions in event mean concentrations; or
- Reductions in seasonal pollutant loadings.

Such direct estimates do not have to be verified with quantitative data, but can be based on accepted engineering design practices. However, the applicant should describe its procedures for estimating the effectiveness of the control. Applicants should present estimates of pollutant load reductions or other measurements separately for each component of the proposed management program. Applicants should provide estimated reductions on a watershed basis and system-wide basis.

Reductions in pollutant loadings can be estimated by first estimating the pollutant loading (based on concentrations and flows) that would result without the control measure. This value should then be multiplied by the efficiency of the control expressed in terms of a fraction or percentage. Estimated control efficiencies can be obtained from published sources, such as Schueler (1987) (see bibliography in Appendix A). Note that for most control measures, the pollutant removal efficiency differs for different classes of pollutants.

After the municipality's storm water management program is implemented, the municipality can work to refine its initial assessment of the program. For example, the permit will require applicants to submit estimates of event mean concentrations and estimates of annual pollutant loadings for each outfall in the system [§122.26(d)(2)(iii)(C), discussed in Section 5.5 of this guidance]. These estimates can be compared with the applicant's initial estimates.

In addition, the estimated removal efficiencies can be refined through the monitoring program required by §122.26(d)(2)(iii)(D) (discussed in Section 5.6 of this guidance). To refine these estimates, the monitoring program should include measurements at the inflow and outflow points of the control. Throughout the permit term, the municipality must submit refinements to its assessment or additional direct measurements of program effectiveness in its annual report (Section 7.3).

The applicant should use direct measurements of program effectiveness as it begins to assess its long-term progress in improving water quality through storm water management practices. Direct measurements of program effectiveness may not provide meaningful conclusions on trends in water quality improvements for a couple of permit terms. However, applicants are encouraged to use direct measurements of program effectiveness, such as annual pollutant loads, event mean concentrations, and seasonal pollutant loadings, to begin to estimate long-term trends. Several statistical methods that rely on linear regression have been developed

to model these measurements to determine if trends exist.

7.2.2 Indirect Measurements of Program Effectiveness

When pollutant reductions cannot be estimated through direct measurement, appropriate indirect measurements may be used. These may include the estimated level of increased enforcement activity, increased public awareness, or reduction in number of illegal dumping incidents. For example, a field screening program to identify illicit connections and improper dumping in Fort Worth, Texas, used reductions in observations of indicator pollutants as a measure of the success of the program (Fort Worth, 1988).

Other possible indirect measurements include:

- Gallons of used oil recycled;
- Amount of household hazardous waste collected;
- Number of educational brochures on storm water quality distributed;
- Number of public hearings on storm water and attendance at these hearings;
- Circulation of an annual report or periodic newsletters on progress in meeting storm water quality goals;
- Number of reports of illicit discharges or illegal dumping;
- Number of spill clean-ups;
- Number of sewer inlets stenciled;
- Acres of open space;
- Number of construction and erosion and sediment control plans submitted and approved.

Many of these indirect measurements will help to indicate whether the storm water management program includes adequate public participation and intergovernmental coordination.

7.2.3 Impacts of Storm Water Controls on Ground Water

Structural BMPs may have an impact on other media. Therefore, the Part 2 application requires that applicants discuss known impacts of storm water controls on ground water. Impacts should be identified separately for each component of the proposed management program. These controls may increase the quantity of ground water (such as infiltration leading to recharge), but degrade the quality of the ground water. For example, in arid parts of the Southwest, imported water is often used for irrigation. This increases the quantity of ground water, but, because of high levels of nutrients and total suspended and dissolved solids in the irrigation water, also results in impacts on ground water quality.

In addition, the applicant should evaluate whether structural controls for storm water impact other media, such as wetlands.

7.3. ANNUAL REPORTS ON THE EFFECTIVENESS OF THE STORM WATER MANAGEMENT PROGRAM

Under §122.42(c), applicants must provide annual reports on the progress of their storm water management programs. These reports, which are due on the anniversaries of permit issuance, must include:

- The status of implementing the components of the storm water management program that are required by the permit;
- Proposed changes to the storm water management programs that are established as permit conditions;

- Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application;
- Summary of data, including monitoring data, that are accumulated throughout the reporting year;
- Projected annual expenditures and budget for the year following each annual report;
- A summary describing the number and nature of enforcement actions, inspections, and public education programs; and
- Identification of water quality improvements or degradation.

Applicants should refer to the specific regulatory language in §122.42(c) for a more complete discussion of annual reporting requirements.

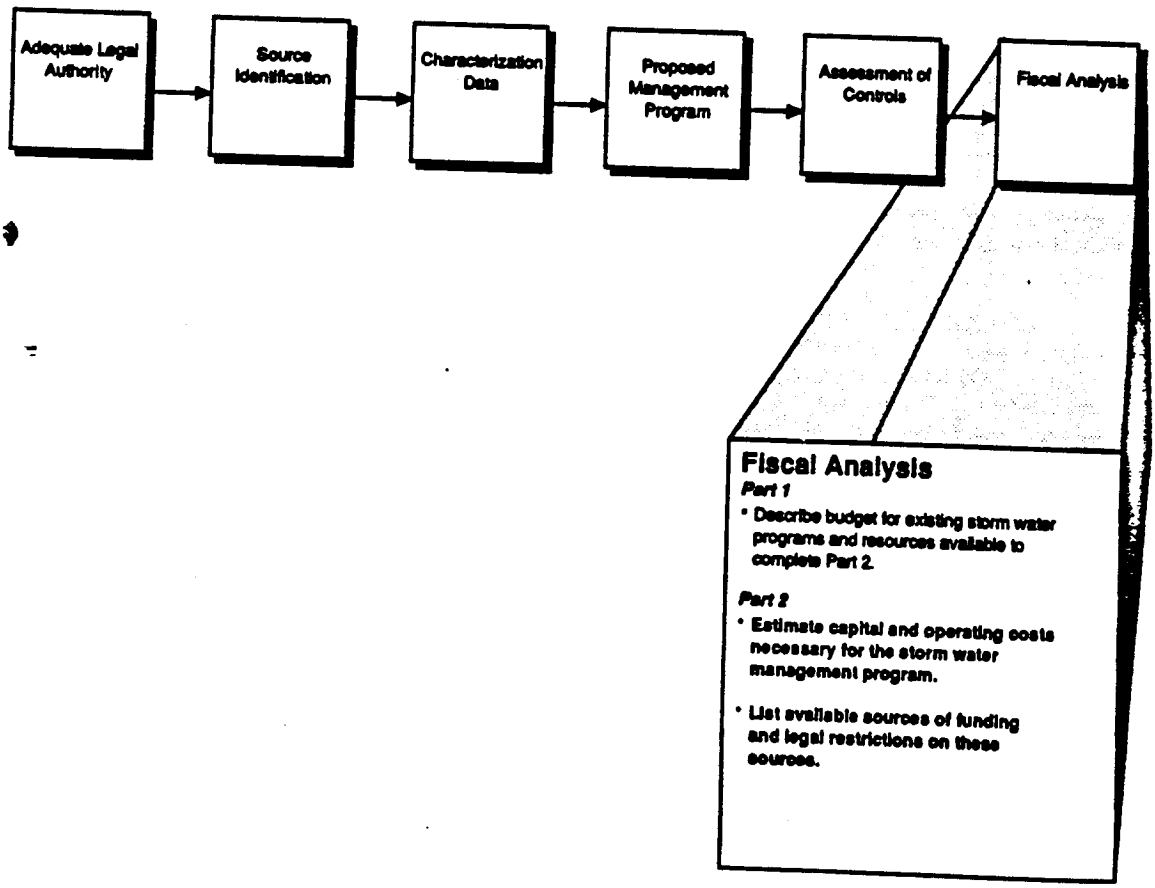
Although the Part 2 application requirements do not specifically address annual reporting requirements, applicants should consider their strategy for preparing annual reports when they complete their Part 2 applications. A municipality may develop a strategy to assess the progress of its storm water management program throughout the term of the permit in addition to providing a baseline assessment of its program. To develop the strategy, applicants should:

- Identify the direct or indirect measurements that will be used to track the long-term progress of the applicant's program towards achieving improvements in storm water quality (the results of this assessment would appear in the municipality's annual report);
- Discuss the role of monitoring data in substantiating or refining their assessment of the progress of their program towards established objectives and goals; and
- Discuss how future additions or revisions to the assessment measurements or strategy will be implemented by the municipality (e.g., what roles and responsibilities will participating municipal agencies and/or organizations have in this area).

It is anticipated that many municipalities will use the same criteria or measurements that were used in the baseline assessment to develop their long-term assessment strategy. This is an acceptable approach provided that the municipality delineates how their program provides for a longer term assessment of the progress of their storm water management program. The municipality is encouraged to consider in advance the information requirements for annual reporting that are identified above when developing their long-term assessment strategy.

VOL 23

CHAPTER 8
FISCAL ANALYSIS



0711

8.0 FISCAL ANALYSIS

8.1 BACKGROUND

NPDES permits for discharges from MS4s will require municipal permittees to implement management programs, conduct long term storm water monitoring, and provide other information. Because these activities will result in expense to the municipality, a fiscal analysis is required in the Part 2 application.

Applicants must provide yearly cost estimates for these programs. Applicants also must provide a schedule indicating when funds will be available. Examining the levels of proposed spending and funding allows the permitting authority to gauge the ability of the applicant to implement the program and predict its effectiveness. The fiscal analysis also will help the permit writer determine whether the applicant has met the statutory requirement of reducing the discharge of pollutant to the MS4 to the maximum extent practicable. Finally, the estimates help the applicant evaluate the feasibility and cost-effectiveness of its program. A municipality must update its fiscal analysis each year for the annual report on the progress in implementing their storm water management program [40 CFR 122.42(c)(3) and (5), discussed in Section 7.3 of this guidance].

8.2 PROCEDURE FOR CONDUCTING A FISCAL ANALYSIS

Under §122.26(d)(2)(vi), each applicant must demonstrate sufficient financial resources to implement the conditions of the permit.

Adequate resources may be demonstrated by performing a fiscal analysis of the estimated capital and operation and maintenance expenditures required to complete the activities required by the regulations. This fiscal analysis must be performed for each fiscal year to be covered by the permit (5 years, in most cases). The analysis must describe the source of the funds used to meet the necessary expenditures, including any legal restrictions on the appropriated funds.

> §122.26(d)(2)(vi). [The application must include] for each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2)(iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

The following procedure is an example of a method of conducting the necessary fiscal analysis.

Step 1. Identify the major tasks for each component covered by this application requirement, including:

- Elements of the proposed management program;
- Estimates of seasonal loads and event mean concentrations for each major outfall covered by the permit; and
- Proposed monitoring program.

Step 2. Develop a schedule outlining when each of the tasks identified in Step 1 will be undertaken. Some tasks may be performed just once, others may be on-going. For example, the schedule should include, among other things:

- The installation of any new control measures identified in the proposed

management program [§122.26(d)(2)(iv), discussed in Section 6.4];

- A maintenance schedule for structural best management practices (BMPs) [§122.26(d)(2)(iv)(A)(1), discussed in Section 6.4.3];

- Development of seasonal pollutant loadings and event mean concentrations of a representative storm [§122.26(d)(2)(iii)(C), discussed in Section 5.5];

- Monitoring program for representative data collection for the term of the permit [§122.26(d)(2)(iii)(D), discussed in Section 5.6];

- Monitoring program for industrial facilities [§122.26(d)(2)(iv)(C)(2), discussed in Section 6.3.3];

- On-going field screening program for illicit discharges [§122.26(d)(2)(iv)(B), discussed in Section 6.5];

- Development of certification programs for construction workers or pesticide applicators, if appropriate [§122.26(d)(2)(iv), discussed in Sections 6.3.1 and 6.3.2]; and

- Implementation schedules for other components of the storm water application that have not been fully implemented at the time of application, such as additional legal authority or comprehensive development plans.

Step 3. Estimate the capital expenses necessary to accomplish the tasks identified in Step 1 and determine a schedule for purchase. Applicants may elect to define categories of capital expenditures such as "monitoring equipment," "miscellaneous monitoring supplies," "personal protective equipment," etc.

Step 4. Estimate other non-capital costs to implement the tasks identified in Step 1. Use the schedule developed in Step 2 to spread costs over the term of the permit. Costs should be presented as a total annual cost for each proposed program component. In addition, estimates of the total annual costs and annual per capita costs should be provided. Per capita costs can be compared with the per capita costs of other programs, such as sewage treatment programs.

These costs may include items such as :

- Newspaper ads announcing new programs or recycling centers;

- Holding public meetings or hearings; and

- Labor for department personnel to speak to citizens groups.

Step 5. Identify funding to be applied. Applicants must describe the sources of funding and any legal restrictions on that funding. Sources may include general revenues, storm water utilities, plan review fees, permit fees, industrial/commercial user fees, special assessment district funds, and revenue bonds. Some funding sources, such as general revenues based on property taxes, are generally unrestricted, but can be allocated by local officials annually. In a few cases, a local property tax may be dedicated to finance a storm water management program. For example, one county finances its storm water management program through a dedicated property tax of $0.135 per $100 assessed valuation. Other municipalities add special assessments to property tax bills.

A storm water utility is another source of funding dedicated to financing storm water management activities. The storm water utility offers the advantage of a stable and predictable source of funds. Other advantages of storm water utilities over general revenues are that utility charges can be more equitably based on

the user's contribution to local storm water problems, and a utility provides a mechanism to incorporate incentives for on-site storm water management.

In many cases, municipalities will evaluate sources of funds that are not currently available, such as a new storm water utility. In these cases, applicants must include a schedule of when funds will be available. For example, it usually takes a municipality 18 to 24 months of planning before local elected officials authorize a storm water utility, and another 6 to 12 months to implement the utility (Lindsey, 1988). Key milestones for planning and implementing the funding mechanism must be identified in the schedule. The following components have been found to be important in establishing storm water utilities:

- Determining the most appropriate administrative structure for implementing a storm water management program;
- Adopting a storm water utility ordinance;
- Estimating revenue needs and planning for cost recovery;
- Establishing a utility rate structure and billing system;
- Establishing a system for developer contributions; and
- Implementing a public information program.

Step 6. Compare the funding sources with the funding needs. As a last step in this process, the municipality must ensure that adequate funding is available to cover the cost of implementing the storm water management program. If adequate funding is not available, the municipality must consider alternate sources of funding, such as a storm water utility.

VOL 23

APPENDIX B:
PART 2 APPLICATION REQUIREMENTS

07120

certify, pursuant to 5 U.S.C. 605(b), that these amendments do not have a significant impact on a substantial number of small entities.

List of Subjects in 40 CFR Parts 122, 123, and 124

Administrative practice and procedure, Environmental protection, Reporting and recordkeeping requirements, Water pollution control.

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

Dated: October 31, 1990.

William K. Reilly,

Administrator.

For the reasons stated in the preamble, parts 122, 123, and 124 of title 40 of the Code of Federal Regulations are amended as follows:

PART 122—EPA ADMINISTERED PERMIT PROGRAMS; THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

Subpart B—Permit Application and Special NPDES Program Requirements

1. The authority citation for part 122 continues to read as follows:

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

2. Section 122.1 is amended by revising paragraph (b)(2)(iv) to read as follows:

§ 122.1 Purpose and scope.

* * * * *

(b) * * *

(2) * * *

(iv) Discharges of storm water as set forth in § 122.26; and

* * * * *

3. Section 122.21 is amended by revising paragraph (c)(1), by removing the last sentence of paragraph (f)(7), by removing paragraph (f)(9), by adding two sentences at the end of paragraph (g)(3), by revising paragraph (g)(7) introductory text, by removing and reserving paragraph (g)(10) and by revising the introductory text of paragraph (k) to read as follows:

§ 122.21 Application for a permit (applicable to State programs, see § 123.25).

* * * * *

(c) *Time to apply.* (1) Any person proposing a new discharge, shall submit an application at least 180 days before the date on which the discharge is to commence, unless permission for a later date has been granted by the Director. Facilities proposing a new discharge of storm water associated with industrial activity shall submit an application 180 days before that facility commences industrial activity which may result in a discharge of storm water associated with that industrial activity. Facilities described under § 122.26(b)(14)(x) shall submit applications at least 90 days before the date on which construction is to commence. Different submittal dates may be required under the terms of applicable general permits. Persons proposing a new discharge are encouraged to submit their applications well in advance of the 90 or 180 day requirements to avoid delay. See also paragraph (k) of this section and § 122.26 (c)(1)(i)(G) and (c)(1)(ii).

* * * * *

(g) * * *

(3) * * * The average flow of point sources composed of storm water may be estimated. The basis for the rainfall event and the method of estimation must be indicated.

* * * * *

(7) *Effluent characteristics.* Information on the discharge of pollutants specified in this paragraph (except information on storm water discharges which is to be provided as specified in § 122.26). When "quantitative data" for a pollutant are required, the applicant must collect a sample of effluent and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. When an applicant has two or more outfalls with substantially identical effluents, the Director may allow the applicant to test only one outfall and report that the quantitative data also apply to the substantially identical outfalls. The requirements in paragraphs (g)(7) (iii) and (iv) of this section that an applicant must provide quantitative data for certain pollutants known or believed to be present do not apply to pollutants present in a discharge solely as the result of their presence in intake water; however, an applicant must report such pollutants as present. Grab samples must be used for pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform and fecal streptococcus. For all other pollutants, 24-hour composite samples must be used. However, a minimum of one grab sample may be taken for effluents from holding ponds or other impoundments with a retention period greater than 24 hours. In addition, for discharges other than storm water discharges, the Director may waive composite sampling for any outfall for which the applicant demonstrates that the use of an automatic sampler is infeasible and that the minimum of four (4) grab samples will be a representative sample of the effluent being discharged. For storm water discharges, all samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inch and at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where feasible, the variance in the duration of the event and the total rainfall of the event should not exceed 50 percent from the average or median rainfall event in that area. For all applicants, a flow-weighted composite shall be taken for either the entire discharge or for the first three hours of the discharge. The flow-weighted composite sample for a storm water discharge may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes (applicants submitting permit applications for storm water discharges under § 122.26(d) may collect flow weighted composite samples using different protocols with respect to the time duration between the collection of sample aliquots, subject to the approval of the Director). However, a minimum of one grab sample may be taken for storm water discharges from holding ponds or other impoundments with a retention period greater than 24 hours. For a flow-weighted composite sample, only one analysis of the composite of aliquots is required. For storm water discharge samples taken from discharges associated with industrial activities, quantitative data must be reported for the grab sample taken during the first thirty minutes (or as soon thereafter as practicable) of the discharge for all pollutants specified in § 122.26(c)(1). For all storm water permit applicants taking flow-weighted composites, quantitative data must be reported for all pollutants specified in § 122.26 except pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform, and fecal streptococcus. The Director may allow or establish appropriate site-specific sampling procedures or requirements, including sampling locations, the season in which the sampling takes place, the minimum duration between the previous measurable storm event and the storm event sampled, the minimum or maximum level of precipitation required for an appropriate storm event, the form of precipitation sampled (snow melt or rain fall), protocols for collecting samples under 40 CFR part 136, and additional time for submitting data on a

case-by-case basis. An applicant is expected to "know or have reason to believe" that a pollutant is present in an effluent based on an evaluation of the expected use, production, or storage of the pollutant, or on any previous analyses for the pollutant. (For example, any pesticide manufactured by a facility may be expected to be present in contaminated storm water runoff from the facility.)

• • • • •

(k) *Application requirements for new sources and new discharges.* New manufacturing, commercial, mining and silvicultural dischargers applying for NPDES permits (except for new discharges of facilities subject to the requirements of paragraph (h) of this section or new discharges of storm water associated with industrial activity which are subject to the requirements of § 122.26(c)(1) and this section (except as provided by § 122.26(c)(1)(ii)) shall provide the following information to the Director, using the application forms provided by the Director:

• • • • •

4. Section 122.22(b) introductory text is revised to read as follows:

§ 122.22 Signatories to permit applications and reports (applicable to State programs, see § 123.25).

• • • • •

(b) All reports required by permits, and other information requested by the Director shall be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

• • • • •

5. Section 122.26 is revised to read as follows:

§ 122.26 Storm water discharges (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* (1) Prior to October 1, 1992, discharges composed entirely of storm water shall not be required to obtain a NPDES permit except:

(i) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(ii) A discharge associated with industrial activity (see § 122.26(a)(4));

(iii) A discharge from a large municipal separate storm sewer system;

(iv) A discharge from a medium municipal separate storm sewer system;

(v) A discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. This designation may include a discharge from any conveyance or system of conveyances used for collecting and conveying storm water runoff or a system of discharges from municipal separate storm sewers, except for those discharges from conveyances which do not require a permit under paragraph (a)(2) of this section or agricultural storm water runoff which is exempted from the definition of point source at § 122.2.

The Director may designate discharges from municipal separate storm sewers on a system-wide or jurisdiction-wide basis. In making this determination the Director may consider the following factors:

(A) The location of the discharge with respect to waters of the United States as defined at 40 CFR 122.2.

(B) The size of the discharge;

(C) The quantity and nature of the pollutants discharged to waters of the United States; and

(D) Other relevant factors.

(2) The Director may not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing or treatment operations or transmission facilities, composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with or that has not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(3) *Large and medium municipal separate storm sewer systems.* (i) Permits must be obtained for all discharges from large and medium municipal separate storm sewer systems.

(ii) The Director may either issue one system-wide permit covering all discharges from municipal separate storm sewers within a large or medium municipal storm sewer system or issue distinct permits for appropriate categories of discharges within a large or medium municipal separate storm sewer system including, but not limited to: all discharges owned or operated by the same municipality; located within the same jurisdiction; all discharges within a system that discharge to the same watershed; discharges within a system that are similar in nature; or for individual discharges from municipal separate storm sewers within the system.

(iii) The operator of a discharge from a municipal separate storm sewer which is part of a large or medium municipal separate storm sewer system must either:

(A) Participate in a permit application (to be a permittee or a co-permittee) with one or more other operators of discharges from the large or medium municipal storm sewer system which covers all, or a portion of all, discharges from the municipal separate storm sewer system;

(B) Submit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible; or

(C) A regional authority may be responsible for submitting a permit application under the following guidelines:

(*1*) The regional authority together with co-applicants shall have authority over a storm water management program that is in existence, or shall be in existence at the time part 1 of the application is due;

(*2*) The permit applicant or co-applicants shall establish their ability to make a timely submission of part 1 and part 2 of the municipal application;

(*3*) Each of the operators of municipal separate storm sewers within the systems described in paragraphs (b)(4)(i), (ii), and (iii) or (b)(7)(i), (ii), and (iii) of this section, that are under the purview of the designated regional authority, shall comply with the application requirements of paragraph (d) of this section.

(iv) One permit application may be submitted for all or a portion of all municipal separate storm sewers within adjacent or interconnected large or medium municipal separate storm sewer systems. The Director may issue one system-wide permit covering all, or a portion of all municipal separate storm sewers in adjacent or interconnected large or medium municipal separate storm sewer systems.

(v) Permits for all or a portion of all discharges from large or medium municipal separate storm sewer systems that are issued on a system-wide, jurisdiction-wide, watershed or other basis may specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas which contribute storm water to the system.

(vi) Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators.

(4) *Discharges through large and medium municipal separate storm sewer systems.* In addition to meeting the requirements of paragraph (c) of this section, an operator of a storm water discharge associated with industrial activity which discharges through a large or medium municipal separate storm sewer system shall submit, to the operator of the municipal separate storm sewer system receiving the discharge no later than May 15, 1991, or 180 days prior to commencing such discharge: the name of the facility; a contact person and phone number; the location of the discharge; a description, including Standard Industrial Classification, which best reflects the principal products or services provided by each facility; and any existing NPDES permit number.

(5) *Other municipal separate storm sewers.* The Director may issue permits for municipal separate storm sewers that are designated under paragraph (a)(1)(v) of this section on a system-wide basis, jurisdiction-wide basis, watershed basis or other appropriate basis, or may issue permits for individual discharges.

(6) *Non-municipal separate storm sewers.* For storm water discharges associated with industrial activity from point sources which discharge through a non-municipal or non-publicly owned separate storm sewer system, the Director, in his discretion, may issue: a single NPDES permit, with each discharger a co-permittee to a permit issued to the operator of the portion of the system that discharges into waters of the United States; or, individual permits to each discharger of storm water associated with industrial activity through the non-municipal conveyance system.

(i) All storm water discharges associated with industrial activity that discharge through a storm water discharge system that is not a municipal separate storm sewer must be covered by an individual permit, or a permit issued to the operator of the portion of the system that discharges to waters of the United States, with each discharger to the non-municipal conveyance a co-permittee to that permit.

(ii) Where there is more than one operator of a single system of such conveyances, all operators of storm water discharges associated with industrial activity must submit applications.

(iii) Any permit covering more than one operator shall identify the effluent limitations, or other permit conditions, if any, that apply to each operator.

(7) *Combined sewer systems.* Conveyances that discharge storm water runoff combined with municipal sewage are point sources that must obtain NPDES permits in accordance with the procedures of § 122.21 and are not subject to the provisions of this section.

(8) Whether a discharge from a municipal separate storm sewer is or is not subject to regulation under this section shall have no bearing on whether the owner or operator of the discharge is eligible for funding under title II, title III or title VI of the Clean Water Act. *See* 40 CFR part 35, subpart I, appendix A(b)H.2.j.

(b) *Definitions.* (1) *Co-permittee* means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

(2) *Illicit discharge* means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

(3) *Incorporated place* means the District of Columbia, or a city, town, township, or village that is incorporated under the laws of the State in which it is located.

(4) *Large municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 250,000 or more as determined by the latest Decennial Census by the Bureau of Census (appendix F); or

(ii) Located in the counties listed in appendix H, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(4)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; and

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraph (b)(4) (i), (ii), (iii) of this section.

(5) *Major municipal separate storm sewer outfall* (or "major outfall") means a municipal separate storm sewer outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

(6) *Major outfall* means a major municipal separate storm sewer outfall.

(7) *Medium municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 100,000 or more but less than 250,000, as determined by the latest Decennial Census by the Bureau of Census (appendix G); or

(ii) Located in the counties listed in appendix I, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(7)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a medium municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (b)(7) (i), (ii), (iii) of this section.

(8) *Municipal separate storm sewer* means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) Designed or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

(9) *Outfall* means a *point source* as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

(10) *Overburden* means any material of any nature, consolidated or unconsolidated, that overlies a mineral deposit, excluding topsoil or similar naturally-occurring surface materials that are not disturbed by mining operations.

(11) *Runoff coefficient* means the fraction of total rainfall that will appear at a conveyance as runoff.

(12) *Significant materials* includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under section 101(14) of CERCLA; any chemical the facility is required to report pursuant to section 313 of title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

(13) *Storm water* means storm water runoff, snow melt runoff, and surface runoff and drainage.

(14) *Storm water discharge associated with industrial activity* means the discharge from any conveyance which is used for collecting and conveying storm water and which is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program under 40 CFR part 122. For the categories of industries identified in paragraphs (b)(14) (i) through (x) of this section, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at 40 CFR part 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the categories of industries identified in paragraph (b)(14)(xi) of this section, the term includes only storm water discharges from all the areas (except access roads and rail lines) that are listed in the previous sentence where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water. For the purposes of this paragraph, material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are Federally, State, or municipally owned or operated that meet the description of the facilities listed in this paragraph (b)(14)(i)–(xi) of this section) include those facilities designated under the provisions of paragraph (a)(1)(v) of this section. The following categories of facilities are considered to be engaging in "industrial activity" for purposes of this subsection:

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category (xi) in paragraph (b)(14) of this section);

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373;

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(1) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; (inactive mining operations are mining sites that are not being actively mined, but which have an identifiable owner/operator; inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined

materials, nor sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim);

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that receive or have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under paragraphs (b)(14) (i)–(vii) or (ix)–(xi) of this section are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR part 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with section 405 of the CWA;

(x) Construction activity including clearing, grading and excavation activities except: operations that result in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221–25, (and which are not otherwise included within categories (ii)–(x));

(c) *Application requirements for storm water discharges associated with industrial activity*—(1) *Individual application.* Dischargers of storm water associated with industrial activity are required to apply for an individual permit, apply for a permit through a group application, or seek coverage under a promulgated storm water general permit. Facilities that are required to obtain an individual permit, or any discharge of storm water which the Director is evaluating for designation (*see* 40 CFR 124.52(c)) under paragraph (a)(1)(v) of this section and is not a municipal separate storm sewer, and which is not part of a group application described under paragraph (c)(2) of this section, shall submit an NPDES application in accordance with the requirements of § 122.21 as modified and supplemented by the provisions of the remainder of this paragraph. Applicants for discharges composed entirely of storm water shall submit Form 1 and Form 2F. Applicants for discharges composed of storm water and non-storm water shall submit Form 1, Form 2C, and Form 2F. Applicants for new sources or new discharges (as defined in § 122.2 of this part) composed of storm water and non-storm water shall submit Form 1, Form 2D, and Form 2F.

(i) Except as provided in § 122.26(c)(1)(ii)–(iv), the operator of a storm water discharge associated with industrial activity subject to this section shall provide:

(A) A site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) of the facility including: each of its drainage and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each past or present area used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied, each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility;

(B) An estimate of the area of impervious surfaces (including paved areas and building roofs) and the total area drained by each outfall (within a mile radius of the facility) and a narrative description of the following: Significant materials that in the three years prior to the submittal of this application have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal of such materials; materials management practices employed, in the three years prior to the submittal of this application, to minimize contact by these materials with storm water runoff; materials loading and access areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; the location and a description of existing structural and non-structural control measures to reduce pollutants in storm water runoff; and a description of the treatment the storm water receives, including the ultimate disposal of any solid or fluid wastes other than by discharge;

(C) A certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested or evaluated for the presence of non-storm water discharges which are not covered by a NPDES permit; tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. The certification shall include a description of the method used, the date of any testing, and the on-site drainage points that were directly observed during a test;

(D) Existing information regarding significant leaks or spills of toxic or hazardous pollutants at the facility that have taken place within the three years prior to the submittal of this application;

(E) Quantitative data based on samples collected during storm events and collected in accordance with § 122.21 of this part from all outfalls containing a storm water discharge associated with industrial activity for the following parameters:

(*1*) Any pollutant limited in an effluent guideline to which the facility is subject;

(*2*) Any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit);

(*3*) Oil and grease, pH, BOD5, COD, TSS, total phosphorus, total Kjeldahl nitrogen, and nitrate plus nitrite nitrogen;

(*4*) Any information on the discharge required under paragraph § 122.21(g)(7)(iii) and (iv) of this part;

(5) Flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, and the method of flow measurement or estimation; and

(6) The date and duration (in hours) of the storm event(s) sampled, rainfall measurements or estimates of the storm event (in inches) which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event (in hours);

(F) Operators of a discharge which is composed entirely of storm water are exempt from the requirements of § 122.21 (g)(2), (g)(3), (g)(4), (g)(5), (g)(7)(i), (g)(7)(ii), and (g)(7)(v); and

(G) Operators of new sources or new discharges (as defined in § 122.2 of this part) which are composed in part or entirely of storm water must include estimates for the pollutants or parameters listed in paragraph (c)(1)(i)(E) of this section instead of actual sampling data, along with the source of each estimate. Operators of new sources or new discharges composed in part or entirely of storm water must provide quantitative data for the parameters listed in paragraph (c)(1)(i)(E) of this section within two years after commencement of discharge, unless such data has already been reported under the monitoring requirements of the NPDES permit for the discharge. Operators of a new source or new discharge which is composed entirely of storm water are exempt from the requirements of § 122.21 (k)(3)(ii), (k)(3)(iii), and (k)(5).

(ii) The operator of an existing or new storm water discharge that is associated with industrial activity solely under paragraph (b)(14)(x) of this section, is exempt from the requirements of § 122.21(g) and paragraph (c)(1)(i) of this section. Such operator shall provide a narrative description of:

(A) The location (including a map) and the nature of the construction activity;

(B) The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;

(C) Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a brief description of applicable State and local erosion and sediment control requirements;

(D) Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a brief description of applicable State or local erosion and sediment control requirements;

(E) An estimate of the runoff coefficient of the site and the increase in impervious area after the construction addressed in the permit application is completed, the nature of fill material and existing data describing the soil or the quality of the discharge; and

(F) The name of the receiving water.

(iii) The operator of an existing or new discharge composed entirely of storm water from an oil or gas exploration, production, processing, or treatment operation, or transmission facility is not required to submit a permit application in accordance with paragraph (c)(1)(i) of this section, unless the facility:

(A) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 117.21 or 40 CFR 302.6 at anytime since November 16, 1987; or

(B) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 110.6 at any time since November 16, 1987; or

(C) Contributes to a violation of a water quality standard.

(iv) The operator of an existing or new discharge composed entirely of storm water from a mining operation is not required to submit a permit application unless the discharge has come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(v) Applicants shall provide such other information the Director may reasonably require under § 122.21(g)(13) of this part to determine whether to issue a permit and may require any facility subject to paragraph (c)(1)(ii) of this section to comply with paragraph (c)(1)(i) of this section.

(2) *Group application for discharges associated with industrial activity.* In lieu of individual applications or notice of intent to be covered by a general permit for storm water discharges associated with industrial activity, a group application may be filed by an entity representing a group of applicants (except facilities that have existing individual NPDES permits for storm water) that are part of the same subcategory (see 40 CFR subchapter N, part 405 to 471) or, where such grouping is inapplicable, are sufficiently similar as to be appropriate for general permit coverage under § 122.28 of this part. The part 1 application shall be submitted to the Office of Water Enforcement and Permits, U.S. EPA, 401 M Street, SW., Washington, DC 20460 (EN-336) for approval. Once a part 1 application is approved, group applicants are to submit Part 2 of the group application to the Office of Water Enforcement and Permits. A group application shall consist of:

(i) *Part 1.* Part 1 of a group application shall:

(A) Identify the participants in the group application by name and location. Facilities participating in the group application shall be listed in nine subdivisions, based on the facility location relative to the nine precipitation zones indicated in appendix E to this part.

(B) Include a narrative description summarizing the industrial activities of participants of the group application and explaining why the participants, as a whole, are sufficiently similar to be a covered by a general permit;

(C) Include a list of significant materials stored exposed to precipitation by participants in the group application and materials management practices employed to diminish contact by these materials with precipitation and storm water runoff;

(D) Identify ten percent of the dischargers participating in the group application (with a minimum of 10 dischargers, and either a minimum of two dischargers from each precipitation zone indicated in appendix E of this part in which ten or more members of the group are located, or one discharger from each precipitation zone indicated in appendix E of this part in which nine or fewer members of the group are located) from which quantitative data will be submitted in part 2. If more than 1,000 facilities are identified in a group application, no more than 100 dischargers must submit quantitative data in Part 2. Groups of between four and ten dischargers may be formed. However, in groups of between four and ten, at least half the facilities must submit quantitative data, and at least one facility in each precipitation zone in which members of the group are located must submit data. A description of why the facilities selected to perform sampling and analysis are representative of the group as a whole in terms of the information provided in paragraph (c)(1)(i)(B) and (i)(C) of this section, shall accompany this section. Different factors impacting the nature of the storm water discharges, such as processes used and material management, shall be represented, to the extent feasible, in a manner roughly equivalent to their proportion in the group.

(ii) *Part 2.* Part 2 of a group application shall contain quantitative

data (NPDES Form 2F), as modified by paragraph (c)(1) of this section, so that when part 1 and part 2 of the group application are taken together, a complete NPDES application (Form 1, Form 2C, and Form 2F) can be evaluated for each discharger identified in paragraph (c)(2)(i)(D) of this section.

(d) *Application requirements for large and medium municipal separate storm sewer discharges.* The operator of a discharge from a large or medium municipal separate storm sewer or a municipal separate storm sewer that is designated by the Director under paragraph (a)(1)(v) of this section, may submit a jurisdiction-wide or system-wide permit application. Where more than one public entity owns or operates a municipal separate storm sewer within a geographic area (including adjacent or interconnected municipal separate storm sewer systems), such operators may be a coapplicant to the same application. Permit applications for discharges from large and medium municipal storm sewers or municipal storm sewers designated under paragraph (a)(1)(v) of this section shall include:

(1) *Part 1.* Part 1 of the application shall consist of:

(i) *General information.* The applicants' name, address, telephone number of contact person, ownership status and status as a State or local government entity.

(ii) *Legal authority.* A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(i) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

(iii) *Source identification.* (A) A description of the historic use of ordinances, guidance or other controls which limited the discharge of non-storm water discharges to any Publicly Owned Treatment Works serving the same area as the municipal separate storm sewer system.

(B) A USGS 7.5 minute topographic map (or equivalent topographic map with a scale between 1:10,000 and 1:24,000 if cost effective) extending one mile beyond the service boundaries of the municipal storm sewer system covered by the permit application. The following information shall be provided:

(*1*) The location of known municipal storm sewer system outfalls discharging to waters of the United States;

(*2*) A description of the land use activities (e.g. divisions indicating undeveloped, residential, commercial, agricultural and industrial uses) accompanied with estimates of population densities and projected growth for a ten year period within the drainage area served by the separate storm sewer. For each land use type, an estimate of an average runoff coefficient shall be provided;

(*3*) The location and a description of the activities of the facility of each currently operating or closed municipal landfill or other treatment, storage or disposal facility for municipal waste;

(*4*) The location and the permit number of any known discharge to the municipal storm sewer that has been issued a NPDES permit;

(*5*) The location of major structural controls for storm water discharge (retention basins, detention basins, major infiltration devices, etc.); and

(*6*) The identification of publicly owned parks, recreational areas, and other open lands.

(iv) *Discharge characterization.* (A) Monthly mean rain and snow fall estimates (or summary of weather bureau data) and the monthly average number of storm events.

(B) Existing quantitative data describing the volume and quality of discharges from the municipal storm sewer, including a description of the outfalls sampled, sampling procedures and analytical methods used.

(C) A list of water bodies that receive discharges from the municipal separate storm sewer system, including downstream segments, lakes and estuaries, where pollutants from the system discharges may accumulate and cause water degradation and a brief description of known water quality impacts. At a minimum, the description of impacts shall include a description of whether the water bodies receiving such discharges have been:

(*1*) Assessed and reported in section 305(b) reports submitted by the State, the basis for the assessment (evaluated or monitored), a summary of designated use support and attainment of Clean Water Act (CWA) goals (fishable and swimmable waters), and causes of nonsupport of designated uses;

(*2*) Listed under section 304(l)(1)(A)(i), section 304(l)(1)(A)(ii), or section 304(l)(1)(B) of the CWA that is not expected to meet water quality standards or water quality goals;

(*3*) Listed in State Nonpoint Source Assessments required by section 319(a) of the CWA that, without additional action to control nonpoint sources of pollution, cannot reasonably be expected to attain or maintain water quality standards due to storm sewers, construction, highway maintenance and runoff from municipal landfills and municipal sludge adding significant pollution (or contributing to a violation of water quality standards);

(*4*) Identified and classified according to eutrophic condition of publicly owned lakes listed in State reports required under section 314(a) of the CWA (include the following: A description of those publicly owned lakes for which uses are known to be impaired; a description of procedures, processes and methods to control the discharge of pollutants from municipal separate storm sewers into such lakes; and a description of methods and procedures to restore the quality of such lakes);

(*5*) Areas of concern of the Great Lakes identified by the International Joint Commission;

(*6*) Designated estuaries under the National Estuary Program under section 320 of the CWA;

(*7*) Recognized by the applicant as highly valued or sensitive waters;

(*8*) Defined by the State or U.S. Fish and Wildlife Services's National Wetlands Inventory as wetlands; and

(*9*) Found to have pollutants in bottom sediments, fish tissue or biosurvey data.

(D) *Field screening.* Results of a field screening analysis for illicit connections and illegal dumping for either selected field screening points or major outfalls covered in the permit application. At a minimum, a screening analysis shall include a narrative description, for either each field screening point or major outfall, of visual observations made during dry weather periods. If any flow is observed, two grab samples shall be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a narrative description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observations regarding the potential presence of non-storm water discharges or illegal dumping shall be provided. In addition, a narrative description of the results of a field analysis using suitable methods to estimate pH, total chlorine, total copper, total phenol, and detergents (or surfactants) shall be provided along with a description of the flow rate. Where the field analysis does not involve analytical methods approved under 40 CFR part 136, the applicant shall provide a description of the method used including the name of the manufacturer of the test method along with the range and accuracy of the test. Field screening points shall be either major outfalls or other outfall points (or

any other point of access such as manholes) randomly located throughout the storm sewer system by placing a grid over a drainage system map and identifying those cells of the grid which contain a segment of the storm sewer system or major outfall. The field screening points shall be established using the following guidelines and criteria:

(*1*) A grid system consisting of perpendicular north-south and east-west lines spaced ¼ mile apart shall be overlayed on a map of the municipal storm sewer system, creating a series of cells;

(*2*) All cells that contain a segment of the storm sewer system shall be identified; one field screening point shall be selected in each cell; major outfalls may be used as field screening points;

(*3*) Field screening points should be located downstream of any sources of suspected illegal or illicit activity;

(*4*) Field screening points shall be located to the degree practicable at the farthest manhole or other accessible location downstream in the system, within each cell; however, safety of personnel and accessibility of the location should be considered in making this determination;

(*5*) Hydrological conditions; total drainage area of the site; population density of the site; traffic density; age of the structures or buildings in the area; history of the area; and land use types;

(*6*) For medium municipal separate storm sewer systems, no more than 250 cells need to have identified field screening points; in large municipal separate storm sewer systems, no more than 500 cells need to have identified field screening points; cells established by the grid that contain no storm sewer segments will be eliminated from consideration; if fewer than 250 cells in medium municipal sewers are created, and fewer than 500 in large systems are created by the overlay on the municipal sewer map, then all those cells which contain a segment of the sewer system shall be subject to field screening (unless access to the separate storm sewer system is impossible); and

(*7*) Large or medium municipal separate storm sewer systems which are unable to utilize the procedures described in paragraphs (d)(1)(iv)(D) (*1*) through (*6*) of this section, because a sufficiently detailed map of the separate storm sewer systems is unavailable, shall field screen no more than 500 or 250 major outfalls respectively (or all major outfalls in the system, if less); in such circumstances, the applicant shall establish a grid system consisting of north-south and east-west lines spaced ¼ mile apart as an overlay to the boundaries of the municipal storm sewer system, thereby creating a series of cells; the applicant will then select major outfalls in as many cells as possible until at least 500 major outfalls (large municipalities) or 250 major outfalls (medium municipalities) are selected; a field screening analysis shall be undertaken at these major outfalls.

(E) *Characterization plan.* Information and a proposed program to meet the requirements of paragraph (d)(2)(iii) of this section. Such description shall include: the location of outfalls or field screening points appropriate for representative data collection under paragraph (d)(2)(iii)(A) of this section, a description of why the outfall or field screening point is representative, the seasons during which sampling is intended, a description of the sampling equipment. The proposed location of outfalls or field screening points for such sampling should reflect water quality concerns (*see* paragraph (d)(1)(iv)(C) of this section) to the extent practicable.

(v) *Management programs.* (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

(B) A description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.

(vi) *Fiscal resources.* (A) A description of the financial resources currently available to the municipality to complete part 2 of the permit application. A description of the municipality's budget for existing storm water programs, including an overview of the municipality's financial resources and budget, including overall indebtedness and assets, and sources of funds for storm water programs.

(2) *Part 2.* Part 2 of the application shall consist of:

(i) *Adequate legal authority:* A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;

(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;

(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

(E) Require compliance with conditions in ordinances, permits, contracts or orders; and

(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

(ii) *Source identification.* The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(*1*) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

(iii) *Characterization data.* When "quantitative data" for a pollutant are required under paragraph (d)(s)(iii)(A)(*3*) of this paragraph, the applicant must collect a sample of effluent in accordance with 40 CFR 122.21(g)(7) and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. The applicant must provide information characterizing the quality and quantity of discharges covered in the permit application, including:

(A) Quantitative data from representative outfalls designated by the Director (based on information received

in part 1 of the application, the Director shall designate between five and ten outfalls or field screening points as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system or, where there are less than five outfalls covered in the application, the Director shall designate all outfalls) developed as follows:

(*1*) For each outfall or field screening point designated under this subparagraph, samples shall be collected of storm water discharges from three storm events occurring at least one month apart in accordance with the requirements at § 122.21(g)(7) (the Director may allow exemptions to sampling three storm events when climatic conditions create good cause for such exemptions);

(*2*) A narrative description shall be provided of the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(*3*) For samples collected and described under paragraphs (d)(2)(iii)(A)(*1*) and (A)(*2*) of this section, quantitative data shall be provided for: the organic pollutants listed in Table II; the pollutants listed in Table III (toxic metals, cyanide, and total phenols) of appendix D of 40 CFR part 122, and for the following pollutants:

Total suspended solids (TSS)
Total dissolved solids (TDS)
COD
BOD_5
Oil and grease
Fecal coliform
Fecal streptococcus
pH
Total Kjeldahl nitrogen
Nitrate plus nitrite
Dissolved phosphorus
Total ammonia plus organic nitrogen
Total phosphorus

(*4*) Additional limited quantitative data required by the Director for determining permit conditions (the Director may require that quantitative data shall be provided for additional parameters, and may establish sampling conditions such as the location, season of sample collection, form of precipitation (snow melt, rainfall) and other parameters necessary to insure representativeness);

(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under § 122.21(c)(7)) for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods;

(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(*1*) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section; and

(D) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

(iv) *Proposed management program.* A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls. Such programs shall be based on:

(A) A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls. At a minimum, the description shall include:

(*1*) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;

(*2*) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed. (Controls to reduce pollutants in discharges from municipal separate storm sewers containing construction site runoff are addressed in paragraph (d)(2)(iv)(D) of this section;

(*3*) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities;

(*4*) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible;

(*5*) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section); and

(*6*) A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

(B) A description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer. The proposed program shall include:

(1) A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers, uncontaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water (program descriptions shall address discharges or flows from fire fighting only where such discharges or flows are identified as significant sources of pollutants to waters of the United States);

(2) A description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens;

(3) A description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water (such procedures may include: sampling procedures for constituents such as fecal coliform, fecal streptococcus, surfactants (MBAS), residual chlorine, fluorides and potassium; testing with fluorometric dyes; or conducting in storm sewer inspections where safety and other considerations allow. Such description shall include the location of storm sewers that have been identified for such evaluation);

(4) A description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer;

(5) A description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers;

(6) A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials; and

(7) A description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary;

(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:

(1) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;

(2) Describe a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of quantitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD$_5$, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7) (iii) and (iv).

(D) A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include:

(1) A description of procedures for site planning which incorporate consideration of potential water quality impacts;

(2) A description of requirements for nonstructural and structural best management practices;

(3) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and

(4) A description of appropriate educational and training measures for construction site operators.

(v) *Assessment of controls.* Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.

(vi) *Fiscal analysis.* For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2) (iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination.

(viii) Where requirements under paragraph (d)(1)(iv)(E), (d)(2)(ii), (d)(2)(iii)(B) and (d)(2)(iv) of this section are not practicable or are not applicable, the Director may exclude any operator of a discharge from a municipal separate storm sewer which is designated under paragraph (a)(1)(v), (b)(4)(ii) or (b)(7)(ii) of this section from such requirements. The Director shall not exclude the operator of a discharge from a municipal separate storm sewer identified in appendix F, G, H or I of part 122, from any of the permit application requirements under this paragraph except where authorized under this section.

(e) *Application deadlines.* Any operator of a point source required to obtain a permit under paragraph (a)(1) of this section that does not have an effective NPDES permit covering its storm water outfalls shall submit an application in accordance with the following deadlines:

(1) For any storm water discharge associated with industrial activity identified in paragraph (b)(14) (i)–(xi) of this section, that is not part of a group application as described in paragraph (c)(2) of this section or which is not covered under a promulgated storm water general permit, a permit application made pursuant to paragraph (c) of this section shall be submitted to the Director by November 18, 1991;

(2) For any group application submitted in accordance with paragraph (c)(2) of this section:

(i) Part 1 of the application shall be submitted to the Director, Office of Water Enforcement and Permits by March 18, 1991;

(ii) Based on information in the part 1 application, the Director will approve or deny the members in the group application within 60 days after receiving part 1 of the group application.

(iii) Part 2 of the application shall be submitted to the Director, Office of Water Enforcement and Permits no later than 12 months after the date of approval of the part 1 application.

(iv) Facilities that are rejected as members of a group by the permitting authority shall have 12 months to file an individual permit application from the date they receive notification of their rejection.

(v) A facility listed under paragraph (b)(14) (i)–(xi) of this section may add on to a group application submitted in accordance with paragraph (a)(2)(i) of this section at the discretion of the Office of Water Enforcement and Permits, and only upon a showing of good cause by the facility and the group applicant: the request for the addition of the facility shall be made no later than February 18,1992; the addition of the facility shall not cause the percentage of the facilities that are required to submit quantitative data to be less than 10%, unless there are over 100 facilities in the group that are submitting quantitative data; approval to become part of group application must be obtained from the group or the trade association representing the individual facilities.

(3) For any discharge from a large municipal separate storm sewer system:

(i) Part 1 of the application shall be submitted to the Director by November 18, 1991;

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application;

(iii) Part 2 of the application shall be submitted to the Director by November 16, 1992.

(4) For any discharge from a medium municipal separate storm sewer system:

(i) Part 1 of the application shall be submitted to the Director by May 18, 1992.

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application.

(iii) Part 2 of the application shall be submitted to the Director by May 17, 1993.

(5) A permit application shall be submitted to the Director within 60 days of notice, unless permission for a later date is granted by the Director (*see* 40 CFR 124.52(c)), for:

(i) A storm water discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines that the discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States (see paragraph (a)(1)(v) of this section);

(ii) A storm water discharge subject to paragraph (c)(1)(v) of this section.

(6) Facilities with existing NPDES permits for storm water discharges associated with industrial activity shall maintain existing permits. New applications shall be submitted in accordance with the requirements of 40 CFR 122.21 and 40 CFR 122.26(c) 180 days before the expiration of such permits. Facilities with expired permits or permits due to expire before May 18, 1992, shall submit applications in accordance with the deadline set forth under paragraph (c)(1) of this section.

(f) *Petitions.* (1) Any operator of a municipal separate storm sewer system may petition the Director to require a separate NPDES permit (or a permit issued under an approved NPDES State program) for any discharge into the municipal separate storm sewer system.

(2) Any person may petition the Director to require a NPDES permit for a discharge which is composed entirely of storm water which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(3) The owner or operator of a municipal separate storm sewer system may petition the Director to reduce the Census estimates of the population served by such separate system to account for storm water discharged to combined sewers as defined by 40 CFR 35.2005(b)(11) that is treated in a publicly owned treatment works. In municipalities in which combined sewers are operated, the Census estimates of population may be reduced proportional to the fraction, based on estimated lengths, of the length of combined sewers over the sum of the length of combined sewers and municipal separate storm sewers where an applicant has submitted the NPDES permit number associated with each discharge point and a map indicating areas served by combined sewers and the location of any combined sewer overflow discharge point.

(4) Any person may petition the Director for the designation of a large or medium municipal separate storm sewer system as defined by paragraphs (b)(4)(iv) or (b)(7)(iv) of this section.

(5) The Director shall make a final determination on any petition received under this section within 90 days after receiving the petition.

8. Section 122.28(b)(2)(i) is revised to read as follows:

§ 122.28 General permits (applicable to State NPDES programs, see § 123.25).

* * * * *

(b) * * *

(2) *Requiring an individual permit.* (i) The Director may require any discharger authorized by a general permit to apply for and obtain an individual NPDES permit. Any interested person may petition the Director to take action under this paragraph. Cases where an individual NPDES permit may be required include the following:

(A) The discharger or "treatment works treating domestic sewage" is not in compliance with the conditions of the general NPDES permit;

(B) A change has occurred in the availability of demonstrated technology or practices for the control or abatement of pollutants applicable to the point source or treatment works treating domestic sewage;

(C) Effluent limitation guidelines are promulgated for point sources covered by the general NPDES permit;

(D) A Water Quality Management plan containing requirements applicable to such point sources is approved;

(E) Circumstances have changed since the time of the request to be covered so that the discharger is no longer appropriately controlled under the general permit, or either a temporary or permanent reduction or elimination of the authorized discharge is necessary;

(F) Standards for sewage sludge use or disposal have been promulgated for the sludge use and disposal practice covered by the general NPDES permit; or

(G) The discharge(s) is a significant contributor of pollutants. In making this determination, the Director may consider the following factors:

(*1*) The location of the discharge with respect to waters of the United States;

(*2*) The size of the discharge;

(*3*) The quantity and nature of the pollutants discharged to waters of the United States; and

(*4*) Other relevant factors;

* * * * *

7. Section 122.42 is amended by adding paragraph (c) to read as follows:

§ 122.42 Additional conditions applicable to specified categories of NPDES permits (applicable to State NPDES programs, see § 123.25).

* * * * *

(c) *Municipal separate storm sewer systems.* The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the Director under § 122.26(a)(1)(v) of this part must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report shall include:

(1) The status of implementing the components of the storm water management program that are established as permit conditions;

(2) Proposed changes to the storm water management programs that are established as permit condition. Such proposed changes shall be consistent with § 122.26(d)(2)(iii) of this part; and

(3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under § 122.26(d)(2)(iv) and (d)(2)(v) of this part;

(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year;

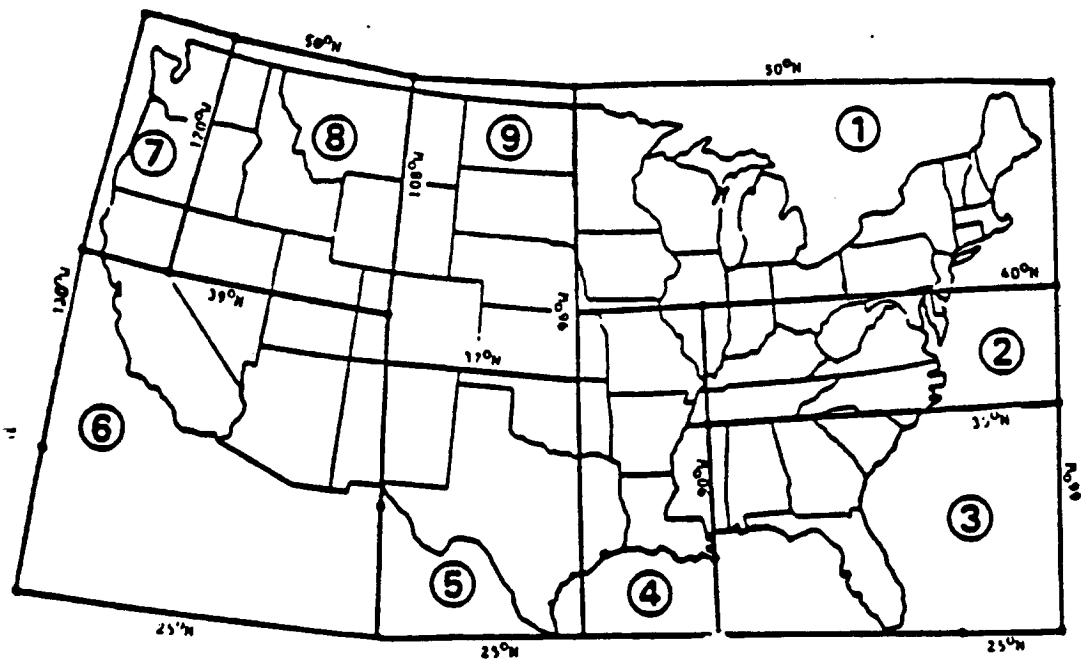
(5) Annual expenditures and budget for year following each annual report;

(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs;

(7) Identification of water quality improvements or degradation;

7a. Part 122 is amended by adding appendices E through I as follows:

Appendix E to Part 122—Rainfall Zones of the United States



Not Shown: Alaska (Zone 7); Hawaii (Zone 7); Northern Mariana Islands (Zone 7); Guam (Zone 7); American Samoa (Zone 7); Trust Territory of the Pacific Islands (Zone 7); Puerto Rico (Zone 3) Virgin Islands (Zone 3).

PART 123—STATE PROGRAM REQUIREMENTS

8. The authority citation for part 123 continues to read as follows:

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

9. Section 123.25 is amended by revising paragraph (a)(9) to read as follows:

§ 123.25 Requirements for permitting.

(a) * * *

(9) § 122.26—(Storm water discharges);

* * * * *

PART 124—PROCEDURES FOR DECISIONMAKING

10. The authority citation for part 124 continues to read as follows:

Authority: Resource Conservation and Recovery Act, 42 U.S.C. 6901 *et seq.*; Safe Drinking Water Act, 42 U.S.C. 300f *et seq.*; Clean Water Act, 33 U.S.C. 1251 *et seq.*; and Clean Air Act, 42 U.S.C. 1857 *et seq.*

11. Section 124.52 is revised to read as follows:

§ 124.52 Permits required on a case-by-case basis.

(a) Various sections of part 122, subpart B allow the Director to determine, on a case-by-case basis, that certain concentrated animal feeding operations (§ 122.23), concentrated aquatic animal production facilities (§ 122.24), storm water discharges (§ 122.26), and certain other facilities covered by general permits (§ 122.28) that do not generally require an individual permit may be required to obtain an individual permit because of their contributions to water pollution.

(b) Whenever the Regional Administrator decides that an individual permit is required under this section, except as provided in paragraph (c) of this section, the Regional Administrator shall notify the discharger in writing of that decision and the reasons for it, and shall send an application form with the notice. The discharger must apply for a permit under § 122.21 within 60 days of notice, unless permission for a later date is granted by the Regional Administrator. The question whether the designation was proper will remain open for consideration during the public comment period under § 124.11 or § 124.118 and in any subsequent hearing.

(c) Prior to a case-by-case determination that an individual permit is required for a storm water discharge under this section (*see* 40 CFR 122.26 (a)(1)(v) and (c)(1)(v)), the Regional Administrator may require the discharger to submit a permit application or other information regarding the discharge under section 308 of the CWA. In requiring such information, the Regional Administrator shall notify the discharger in writing and shall send an application form with the notice. The discharger must apply for a permit under § 122.26 within 60 days of notice, unless permission for a later date is granted by the Regional Administrator. The question whether the initial designation was proper will remain open for consideration during the public comment period under § 124.11 or § 124.118 and in any subsequent hearing.

Note: The following form will not appear in the Code of Federal Regulations.

BILLING CODE 6560-50-M

VOL 23

0735

APPENDIX C:
ADEQUATE LEGAL AUTHORITY

(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;

(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

(E) Require compliance with conditions in ordinances, permits, contracts or order; and

(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

The City Code sections identified above are referenced in an assessment of the individual Part 2 legal authority criteria.

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer system by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity. Section 39.1-19 of the City Code prohibits the discharge of sanitary sewer flow to the storm sewer system. Section 39.2-5 of the City Code prohibits the discharge of any sewage from a private sewage disposal facility on any public or private property in the City. Section 41.1-4 of the City Code prohibits pollutants to be discharged to the storm sewer system including the discharge of industrial process water, wash water, or other unpermitted industrial discharges in Section 41.1-4(c). Section 41.1-5 of the City Code provides the City with authority to order the correction of drainage problems on any site in the City. Sections 9-10, 30-69, 41-16, and 41-17 of the City Code prohibit pollution of waters of the City and littering. Sections 42-20.1 and 42-20.2 of the City Code prohibit the obstruction of drains or drainage areas. Sections 42-24, 42-25, and 42-46 of the City Code establish regulations for protecting the City from spills or deposits of liquid wastes. Section 46-28 of the City Code prohibits pollution of the City's water supply.

contrivance for the elimination or destruction of human waste, within those portions of the watershed of the city contiguous to the intake of the city's water supply, as hereinafter described, or by placing any foul or putrescible substance, whether solid or liquid, and whether the same be buried or not, within the limits of the portion of the watershed so described.

Sec. 49-6. Application for permit.

(a) Any person who desires to use or develop any vegetated wetland and on and after January 1, 1983, any nonvegetated wetland, within this city, other than for those activities specified in section 49-3 above, shall first file an application for a permit with the wetlands board.

Sec. 49-22. Application for permit.

(a) Any person who desires to use or alter any coastal primary sand dune within this city, other than for those activities specified in section 49-20 above, shall first file an application for a permit with the wetlands board.

1.6 Authority to Meet Part 2 Permit Requirements

The NPDES stormwater permit application regulations require an assessment of whether existing legal authority is sufficient to meet the criteria for Part 2 of the permit application provided in *40 CFR 122.26(d)(2)(i)* as follows:

40 CFR 122.26(d)(2)(i)

A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer system by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;

(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water. Section 39.1-19 of the City Code prohibits the discharge of sanitary sewer flow to the storm sewer system. Section 39.2-5 of the City Code prohibits the discharge of any sewage from a private sewage disposal facility on any public or private property in the City. Section 41.1-4 of the City Code prohibits pollutants to be discharged to the storm sewer system. Sections 9-10, 30-69, 41-16, and 41-17 of the City Code prohibit pollution of waters of the City and littering. Sections 42-24, 42-25, and 42-46 of the City Code establish regulations for protecting the City from spills or deposits of liquid wastes. Section 46-28 of the City Code prohibits pollution of the City's water supply.

Enforcement provisions and penalties for violations of the referenced sections of City Code are also provided in specific chapters. Chapter 27 of the City Code provides additional authority for the abatement of nuisances.

(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system. The City of Norfolk owns the entire separate storm water system and is an individual NPDES permit applicant.

The City of Norfolk relies on its In-Town Reservoir System as a vital part of the water supply system. To protect water quality within the In-Town Reservoir System, the City of Norfolk will seek an intermunicipal agreement with the City of Virginia Beach to control nonpoint source pollution for the areas of the In-Town Reservoir System bordering and located within the jurisdiction of the City of Virginia Beach. After approval of Part 1 of the application by the EPA, the City of Norfolk will meet with the City of Virginia Beach to discuss the development of an agreement before submittal of Part 2 of the application on November 16, 1992.

(E) Require compliance with conditions in ordinances, permits, contracts or order. Enforcement provisions and penalties for violations of the referenced sections of City Code are provided in specific chapters. Chapter 27 of the City Codes provides additional authority for the abatement of nuisances.

For development or redevelopment of industrial sites, the City's Zoning Ordinance establishes lot size, yard size, and maximum lot coverage requirements for industrial activity. Chapter 15 of the City Code establishes erosion and sedimentation control regulations. If development or redevelopment of industrial sites occurs within a Chesapeake Bay Preservation Area, Section 494 of the City's Zoning Ordinance and Chapter 32.2 of the City Code establish stringent criteria for stormwater management, protection of water quality, and use of Best Management Practices. Chapter 49 of the City Code protects development within wetlands or coastal primary sand dunes by requiring a permit application with the wetlands board.

Enforcement provisions and penalties for violations of the referenced sections of City Code are also provided in specific chapters. Chapter 27 of the City Code provides additional authority for the abatement of nuisances.

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer. Section 39.1-19 of the City Code prohibits the discharge of sanitary sewer flow to the storm sewer system. Section 39.2-5 of the City Code prohibits the discharge of any sewage from a private sewage disposal facility on any public or private property in the City. Section 41.1-4 of the City Code prohibits pollutants to be discharged to the storm sewer system. Section 41.1-5 of the City Code provides the City with authority to order the correction of drainage problems on any site in the City. Sections 9-10, 30-69, 41-16, and 41-17 of the City Code prohibit pollution of waters of the City and littering. Sections 42-20.1 and 42-20.2 of the City Code prohibit the obstruction of drains or drainage areas. Sections 42-24, 42-25, and 42-46 of the City Code establish regulations for protecting the City from spills or deposits of liquid wastes. Section 46-28 of the City Code prohibits pollution of the City's water supply.

Enforcement provisions and penalties for violations of the referenced sections of City Code are also provided in specific chapters. Chapter 27 of the City Code provides additional authority for the abatement of nuisances.

VOL 23

103191
17875

R0066720

(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer. Chapter 41.1, entitled "Storm Water Management", provides authority for the City's Director of Public Works to establish procedures and enforce regulations pertaining to the storm water system in Section 41.1-3. Authority to prohibit and inspect for illicit connections to the storm sewer system is provided to the Department of City Planning and Codes Administration in Section 39.1-19. Authority to enforce violations of private sewage disposal regulations is provided to the Department of Health in Section 39.2-1 of the City Code. For development and redevelopment, the Department of City Planning and Codes Administration has authority over erosion and sediment control plans, the site review process, and stormwater management regulations required for activity within the Chesapeake Bay Preservation Area. Additional authority for enforcement of erosion and sediment control regulations and stormwater management is being established for the Department of Public Works in an ordinance currently under review by the state. Authority to enforce regulations and permits of the City's Tree Ordinance is provided in Section 30-23 of the City Code.

1.7 Legal Authority Overview

Overall, the City of Norfolk has the existing legal authority, or is in the process of modifying existing City Code with ordinances, to control discharges to the municipal storm sewer system and meet the legal authority requirements of *40 CFR 122.26(d)(2)(i).*

Subject: COVERAGE OF STATE HIGHWAYS UNDER MUNICIPAL STORM WATER PERMITS

ISSUE

Must the State Department of Transportation (CalTrans) obtain a municipal storm water permit for discharges of storm water from state highways in urban areas which have large and medium municipal separate storm sewer systems?

CONCLUSION

CalTrans is required to obtain a municipal storm water permit for discharges of storm water from state-owned roads located in geographic areas which have large or medium municipal separate storm sewer systems. CalTrans may either be issued a separate permit, or the appropriate Regional Water Board may require CalTrans to join as a co-permittee with the local agency which has jurisdiction over disposal of storm water.

DISCUSSION

The federal Clean Water Act requires the issuance of storm water permits for discharges "from a municipal separate storm sewer system serving a population of 250,000 or more" (Section 402(p)(2)(C)) and "from a municipal separate storm sewer system serving a population of 100,000 or more but less than 250,000" (Section 402(p)(2)(D)). The issue which you have asked me to address is whether highways operated by CalTrans situated in areas which meet these population requirements are part of the municipal seaparte storm sewer system and must be covered by a municipal storm water permit.

VOL 23

0741

In regulations adopted in November 1990, the federal Environmental Protection Agency (EPA) defined "municipal separate storm sewer" to mean:

> "A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):
>
> "(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;
>
> "(ii) Designed or used for collecting or conveying storm water;
>
> "(iii) Which is not a combined sewer; and
>
> "(iv) Which is not part of a [POTW]." 40 CFR Section 122.26(b)(8). (Emphasis added.)

EPA's regulations require issuance of permits for discharges from large and medium municipal separate storm sewer systems. These systems are described as "all municipal separate storm sewers" located in incorporated areas with populations over 250,000 or between 100,000 and 250,000, or in urban, unincorporated areas of counties with populations over 250,000 or between 100,000 and 250,000. (40 CFR 122.26(b)(4)(i) and (ii); 40 CFR 122.26(b)(7)(i) and (ii).)

In reviewing EPA's regulations, along with the Preamble for adoption of the regulations, it appears that state highways located in geographic areas with large and medium municipal separate storm sewer systems constitute a portion of such systems. CalTrans, as a state operator and owner of municipal separate storm sewers, is required to be named in storm water permits for municipal separate storm water discharges.

As noted above, the definition of municipal separate storm sewer includes "roads with drainage systems" which are operated by "a State". As explained in the Preamble, the reference to "roads"

and the inclusion of "State" ownership indicates EPA's intention that state highway systems are included within the definition of municipal separate storm sewer system. EPA's intention to include the state highway system is explained in the Preamble to the November 1990 regulation. (Vol. 55, Federal Register, pages 47990 and following, November 16, 1990.)

At page 48036, EPA states broadly:

> "Today's rule defines 'municipal separate storm sewer' at Section 122.26(b)(8) to include any conveyance or system of conveyances that is owned or operated by a State or local government entity and is designed for collecting and conveying storm water which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2."

Regarding the inclusion of streets in the definition, the Preamble states:

> "[Commenters] recommended that further clarifying language should be added so that owners and operators of roads and streets understand that they are covered by this regulation. In light of these comments, EPA has clarified that municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains that discharge into the waters of the United States are municipal separate storm sewers." Id.

While the regulations refer to "roads" rather than to "highways", the explanation for the inclusion of "roads" in the Preamble refers to "State highways" and "systems owned and operated by States or State departments of transportation." (See, e.g. 55 Fed. Reg. at 48039.) From the context of the Preamble, it is obvious that EPA uses the terms "roads" and "highways" and "streets" interchangeably.

In order to clarify that state-owned roads are included within the meaning of "municipal separate storm sewer" EPA specifically included the term "State" within Section 122.26(b)(8) as a potential operator of a municipal storm sewer. This is at variance from the definition of "municipality" which applies to the rest of the Clean Water Act, and which does not include states. (Clean Water Act Section 502(4).) As EPA explains in the Preamble, the draft storm water regulations did not include the term "State" within the meaning of "municipal separate storm sewer" because EPA thought that it would be difficult to issue permits to various governmental entities with jurisdiction over storm sewers. (See, 55 Fed. Reg. at 48039; see, also, proposed rule, 53 Fed. Reg. pages 49416 and following, Dec. 7, 1988.)

In the Preamble, EPA explains the development of its decision to include state-owned highways as municipal separate storm sewers. EPA had originally proposed "options that relied primarily on the municipal entity which owns or operates or otherwise has jurisdiction over storm waters." 55 Fed. Reg., at p.48039. However, one of the most pervasive comments received was that:

> "Discharges from State highways, identified as a significant source of runoff and pollutants, should be included in the program and combined in some manner with one or more of the other options." Id.

In response to this comment, EPA included state-owned roads within the definition of municipal separate storm sewers. In order to avoid the problems associated with multiple permittees for system-wide discharges (see, 55 Fed. Reg. at 48039), the regulations include a method whereby systems owned and operated by local agencies and state-owned highways may be combined into a single permit. This option is contained in 40 CFR 122.26(b)(4)(iv) (large municipal systems) and 40 CFR 122.26(b)(7)(iv) (medium municipal systems). Section 122.26(b)(4)(iv) states: "The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdiction, watershed, or other appropriate basis that includes [a large municipal separate sewer system]." (Section 122.26(b)(7)(iv) is identical, except that it refers to medium systems.)

The Preamble explains that sections 122.26(b)(4)(iv) and 122.26(b)(7)(iv) allow the use of single permits for geographic areas which include more than one operator of a municipal storm sewer system:

> "This definition creates a system by virtue of the fact that storm sewers within defined geographical and political areas, and the owner/operators of separate storm sewers in those areas, are addressed or required to obtain permits. Although within these systems, different segments and discharges of storm water conveyances may be owned or operated by different public entities, EPA is convinced by comments that discharges from such conveyances are interrelated to such an extent that all of these conveyances may be properly considered a 'system.'" 55 Fed. Reg., at p. 48040.

The Preamble further states that the authority to include different municipal permittees in a single permit was specifically an outgrowth of the comments on the need to include state-owned highways within the municipal storm water framework.

The Preamble states that inclusion of subsections 122.26(b)(4)(iv) and 122.26(b)(7)(iv) "is an outgrowth of comments on all options, especially Option 4 (State owned systems/State highways)...." Id. EPA wished to accommodate the commenters who wanted state highways to be included in municipal permits, while minimizing the bureaucratic difficulties of issuing permits to various governmental entities within a single geographic area. If state-owned highways were not meant to be included within the definition of municipal storm water systems, the quoted reference to Option 4 would not make sense. At page 48043, EPA explains that under the permit application requirements, if the appropriate co-applicants are identified, one permit application may be submitted for a large or medium municipal separate storm sewer system. System-wide permit applications can then be used to issue system-wide permits which could cover all discharges in the system.

EPA further explains that, while it will encourage system-wide permits involving several governmental entities, there may be cases where it is undesirable for all municipal entities with storm water responsibility within a municipal system to be co-permittees under one system-wide permit. The permit application requirements therefore allow individual municipal entities within the system to submit permit applications and obtain a permit for that portion of the storm sewer system for which they are responsible. Thus, several permits may be issued to cover various subdivisions of a single municipal system. (See, 55 Fed. Reg. at p.48043).

Finally, I have discussed this matter verbally with Randy Hill, the EPA attorney responsible for overseeing development of the storm water regulations. He has told me that EPA's intent in adopting the regulation was to include state highways within the definition of municipal storm sewer systems, and to name state highway departments in permits for large and medium municipal separate storm sewer systems. The interpretation by an administrative agency of its own regulations is entitled to great deference.

In conclusion, the EPA regulations, when read in conjunction with the Preamble, demonstrate that EPA, after first proposing to exclude state-owned highways from municipal separate storm sewer systems, revised that position after receiving comments on its draft regulations. The final regulations do require that state-owned highways and roads, which are located within geographic areas which meet the population requirements for large and medium municipal separate storm sewer systems, must be subject to NPDES permits for municipal storm water discharges. The regulations also provide flexibility in allowing the state transportation agency either to be named as a co-permittee in a system-wide permit, or to be named in a separate municipal permit.

Mail Code: G-8

Subject: MUNICIPAL STORM WATER PERMIT FOR STOCKTON

The purpose of this memorandum is to comment on some of the statements made in the letter addressed to you from the Port of Stockton, dated April 7, 1993. I will also include some general comments on the legal requirements for adoption of a municipal storm water permit for Stockton.

The statutory requirements for adoption of permits regulating the discharge of storm water are found in Section 402(p) of the Clean Water Act. These requirements are amplified in regulations adopted by the federal Environmental Protection Agency (EPA) in 40 CFR, Part 122. (Unless otherwise noted, code section references will be to the EPA regulations.) Many of the issues raised in the letter from the Port of Stockton are addressed in the EPA regulations and in the Preamble thereto (Vol. 55, Federal Register, pages 47990 and following).

The Clean Water Act requires the issuance of national pollutant discharge elimination system (NPDES) permits for several categories of storm water discharges, including discharges associated with industrial activity and discharges from large and medium municipal separate storm sewer systems. (Section 122.26(a).) In the Preamble to its regulations, EPA clarified that it requires the issuance of "industrial" permits for storm water discharged from industrial facilities through municipal storm sewers. See Preamble at page 47999. Thus, there is a "double" system of permitting for discharges which are characterized as industrial and which are discharged through municipal systems. These discharges are regulated both by industrial permits issued to the industrial discharger and by

VOL 23

0746

R0066727

municipal permits issued to the municipal discharger. Id. Therefore, where the Port states that it has complied with the State Water Board's industrial permit, this does not satisfy any requirements which may exist for compliance with a municipal permit. Furthermore, the fact that a discharge may be characterized as "industrial" does not mean that the discharger may not be a municipal. A review of the discharges characterized as industrial (Section 122.26(b)(14)) reveals that many of these activities are traditionally carried out by municipalities. (See, for example, Section 122.26(b)(14)(v) (landfills) and 122.26(b)(14)(ix) (treatment works).) The fact that the Port is subject to a permit for industrial discharges is not relevant to the question whether it must be subject to a municipal storm water permit.

The requirement for issuance of a municipal storm water permit for Stockton is found in Section 122.26(a)(1)(iv). That section requires issuance of a NPDES permit for discharges from a "medium municipal separate storm sewer system". Medium municipal separate storm sewer system is defined to include "all municipal separate storm sewers" which are "located in an incorporated place" with a population over 100,000 and under 250,000. Stockton is listed by the EPA as an incorporated place which meets this definition. (See Appendix G to Part 122.) Therefore, all municipal separate storm sewers which are located within the boundaries of Stockton must be subject to a municipal storm water permit. (See Preamble at page 48040.)

The term "municipal separate storm sewer" is defined as:

> "'A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains)' which are 'owned or operated by a State, city, town, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts ....'" Section 122.26(b)(8) (emphasis added).

From the documents I have reviewed, it is apparent that the storm sewers (including the streets and storm drains) located at the Port of Stockton are part of a medium municipal separate storm sewer system. It appears that all sides agree that the Port is located within the physical boundaries of Stockton. (Even if the Port was not within the boundaries of the City, the Regional Water Board could issue a municipal storm water permit by making the findings of interrelationship described in Section 122.26(b)(7)(iii).) Therefore, the storm sewers are part of the

municipal system. The question which is posed is which agency is responsible for the storm system, and must it be named in the municipal permit--the City or the Port?

First, it is clear that both the Port and the City are considered "municipal" in the EPA regulations. Municipal storm sewer systems may be owned or operated by a city or by a special district. (Section 122.26(b)(8)(i).) Second, it is quite possible that both the City and the Port may be considered municipalities which own or operate the storm sewer system. In fact, the April 7 letter from the Port seems to indicate that this is true. According to the letter, the Port owns the storm drain system while the City has generally (but not always) operated the system. The two operative requirements are that the system be owned or operated by a municipality. This is clearly the case. Where there are different owners and operators, or where there is confusion regarding jurisdiction of various municipalities, the regulations give discretion to the permit writer (the Regional Water Board) to develop an appropriate permit or permits.

Section 122.26(a)(3) explains the rules which apply where more than one municipal discharger exists within a geographical area. First, it is clear that some municipal permits must apply to all discharges from large and medium municipal separate storm sewer system. (Section 122.26(a)(3)(i), see also Preamble at page 48040.) Once it has been determined that a municipal storm sewer exists within the boundaries of a municipal system termed large or medium, all public storm sewers within that area must be subject to a NPDES permit for municipal storm water discharges. The agency issuing the permit has discretion either to issue one system-wide permit covering all discharges, or to issue separate permits for different categories of discharges within the system. Section 122.26(a)(3)(ii). Separate permits may be issued for discharges owned or operated by each municipality. Id. Furthermore, the Preamble to the EPA regulation makes clear that, in EPA's view, much of the confusion over which entity owns or operates the storm sewer system (as evidenced in this case) will become irrelevant if each municipality which owns or operates a portion of the municipal separate storm sewer system is named as a copermittee on one permit. (See, Preamble, at page 48041.) Therefore, while leaving discretion to adopt one or more permits to the permit writer, EPA encourages system-wide permits involving all municipal entities. (Preamble at page 48043.)

Before closing, I would like to address a few additional points raised by the Port in its April 7 letter. First, the Port claims that while it has legal authority over various municipal functions, including streets and storm water disposal, it has

not chosen to exercise this authority. The only criterion set forth in the EPA regulations is that the municipal entity has "jurisdiction" over such functions. (Section 122.26(b)(8)(i).) It appears that the Port does have such jurisdiction, and it is recommended that it be named so that, in the case of any necessary enforcement actions, all responsible parties could be named. Second, the Port's claim that it is not a "municipality", is clearly refuted by the broad definition of "municipal separate storm sewer" and the references in the regulation and the Preamble to various municipal discharges into one system. (For example, at page 48040 of the Preamble, it is stated that the "rule covers all municipal separate storm sewers within certain areas rather than only those operated by an incorporated place".) Finally, the Port states that where the regulations allow issuance of a system-wide permit (Section 122.26(a)(3)(ii), the Port assumes this means that the City would be responsible for the Port's sewers. Based on the regulations, and the full description of the problem of various municipal dischargers into a single system, it is clear that the Port is mistaken. Where a single system-wide permit is issued, all municipal owners and operators should be named. The regulations do indicate that where there are different owners and operators for the same storm sewers, it is the operator who should submit the application. (Section 122.26(a)(3)(iii).) If the City and the Port both agree that the City operates the sewers within the Port, the City should include those sewers in its application. If the City and Port disagree, and an application is not received, the Regional Water Board may take an enforcement action against whichever entity it determines is the operator.

In conclusion, assuming that the Port of Stockton is within the boundaries of the City of Stockton, the storm sewers (including the streets) within the Port must be subject to a municipal storm water permit. So long as the Port either owns or operates its storm sewer system, the Port must be named in a NPDES permit for municipal storm water discharges. The Regional Water Board has the discretion to issue a single permit for all municipal storm water permits within the City boundaries, or to issue a separate permit for the storm sewers at the Port, and also to any other municipal dischargers within the City's boundaries.

STORM WATER QUESTIONS AND ANSWERS PART II

I. General Applicability

1. **What kinds of storm water discharges are required to obtain an NPDES permit under Phase I of the storm water program?**

A. The National Pollutant Discharge Elimination System (NPDES) storm water permit application regulations, promulgated by the U.S. Environmental Protection Agency (EPA), require that the following storm water discharges apply for an NPDES permit: (1) a discharge associated with industrial activity; (2) a discharge from a large or medium municipal separate storm sewer system; or (3) a discharge which EPA or the State determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. The permit application deadlines are specified in EPA's regulations.

2. **What is a "storm water discharge associated with industrial activity?"**

A. The term "storm water discharge associated with industrial activity" means a storm water discharge from one of the eleven categories of industrial activity defined at 40 Code of Federal Regulations (CFR) 122.26(b)(14)(i) through (xi). Five of these categories are identified by Standard Industrial Classification (SIC) code and the other six categories provide narrative descriptions of the industrial activity. The complete definition is included in Section XIII of this document.

If any activity at a facility is covered by one of the five categories which provide narrative descriptions, storm water discharges from that activity of facility are subject to storm water permit application requirements. If the primary SIC code of the facility is identified in one of the remaining six categories, the facility is subject to the storm water permit application requirements. Note that only those facilities/activities described above having point source discharges of storm water to waters of the United States or to a municipal separate storm sewer system or other conveyance are required to submit a storm water permit application. The definition of "point source" is provided at 40 CFR 122.2. The definition is included in Section XIII of this document.

3. **What are SIC codes and how can a facility find out its proper SIC code?**

A. SIC codes are four-digit industry codes that were created by the Office of Management and Budget (OMB) for statistical purposes. Other

governmental organizations sometimes use these codes when classifying business establishments. To find the correct SIC code, an applicant might check his or her unemployment insurance forms or contact the appropriate State unemployment services department. In addition, applicants may consult the Standard Industrial Classification Manual (SIC Manual), published by OMB in 1987. This manual is available in the resource section of most public libraries. Questions regarding assignment of particular codes can be addressed to your State permitting authority. A list of telephone numbers and addresses for State storm water contacts is provided as an attachment to this document.

4. **What SIC code should a facility use when there are multiple activities occurring at the site?**

A. For the purposes of the storm water program, a facility must determine its primary SIC code based on the primary activity occurring at the site. To determine the primary industrial activity, the SIC Manual recommends using the value of receipts or revenues. If such information is not available for a particular facility, the number of employees or production rate for each process may be compared. The operation that generates the most revenue or employs the most personnel is the operation in which the facility is primarily engaged. For case-specific determinations, contact the permitting authority for your State.

5. **How is a facility regulated when multiple activities conducted by different operators are occurring on the same site (airports, for example)?**

A. When multiple activities are conducted by different operators at a single location, each industrial activity is assigned its own SIC code. At an airport, for example, a passenger airline carrier will receive one SIC code, but an overnight courier located in the same hanger may receive another SIC code. Whereas the SIC codes may differ, if both are regulated industrial activities, EPA generally encourages these operators to become co-applicants (submit storm water permit application forms together) when they are located at the same site and when industrial areas/drainage basins are shared. When a permit is issued (or if the operators are filing for a general permit) the co-applicants will become co-permittees and share responsibility of permit compliance.

6. **If a facility's primary SIC code is not listed in the regulations, but an activity that occurs on site is described in one of the narrative categories of industrial activity, does that facility have to apply for a permit?**

A. If a facility conducts an activity on the site identified in the narrative descriptions of categories (i), (iv), (v), (vii), (ix) or (x), then the facility would be required to submit a storm water permit application for discharges from those portions of the facility where the activity occurs. Such narrative activities/facilities include: (i) activities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards; (iv) hazardous waste treatment storage, or disposal facilities including those that are operating under interim status or a permit under subtitle C of the Resource Conservation and Recovery Act (RCRA); (v) landfills, land application sites and open dumps that receive or have received industrial wastes; (vii) steam electric power generating facilities; (ix) sewage treatment works with a design flow of 1.0 mgd or more; and (x) construction activity disturbing five or more acres of land.

7. **Do storm water discharges from non-industrial areas at an industrial facility (employee parking lots, rental car operations at an airport) have to be addressed in an NPDES permit?**

A. No. Only storm water discharges from those areas that are associated with industrial activity, as defined at 40 CFR 122.26(b)(14) must be addressed in the permit. However, if storm water runoff from a non-industrial area commingles with runoff from a regulated industrial area, the combined discharge would require permit coverage.

8. **How are off site facilities (such as distribution centers, storage facilities, vehicle maintenance shops) regulated under the storm water program?**

A. To determine the regulatory status of off site facilities, first the operator of a facility must determine if that off site operation can be classified according to its own SIC code. If there is no SIC code which describes the off site facility independently, then it would assume the SIC code of the parent facility it supports. However, certain off site facilities that fall within the categories of auxiliary facilities described in Section XIV of this document (or which are specifically described in the SIC code description) would, in most cases, be classified according to the parent facility they support. Such supporting establishments include central administrative offices, research and development laboratories, maintenance garages, and local trucking terminals.

EPA has determined that off site vehicle maintenance facilities that service trucks used for local transportation of goods or for local services are generally considered supporting establishments which would not be assigned a transportation SIC code; rather, such facilities are classified

according to the SIC code of the facility they support. Please refer to Section II of this document for a discussion of off-site vehicle maintenance facilities.

9. **Can authorized NPDES States be more expansive in their use of the assignment of SIC codes? For example, can they make the rule applicable to secondary activities?**

A. Yes, State storm water regulations can be more expansive and cover more activities than the Federal regulations.

10. **Are all storm water discharges to sanitary sewers exempt from storm water permitting requirements? What about discharges to combined sewer systems?**

A. Any storm water discharge to a Publicly Owned Treatment Works (POTW) or to a sanitary sewer is exempt from storm water permit application requirements. However, it may be subject to EPA's pretreatment program under Section 307(b) of the CWA. Discharges to combined sewer systems are also exempt from NPDES permitting but may be subject to pretreatment requirements.

11. **Is a storm water permit application required for an industrial facility that has constructed a holding pond that usually does not discharge storm water, but could in the event of a large enough storm?**

A. All point source discharges of storm water associated with industrial activity that discharge to waters of the U.S. or through a municipal separate storm sewer system must be permitted. Therefore, if an industrial facility does not have a storm water discharge from its holding pond during typical storm events but has a storm water discharge in the event of a large storm, that discharge must be covered under an NPDES permit. In NPDES authorized States (a list is provided in Section XII of this document), facilities should consult their permitting authority for State-specific determinations on such "potential discharges."

12. **If a facility is <u>not</u> engaged in industrial activity as defined under 40 CFR 122.26(b)(14)(i)-(xi), but discharges contaminated flows comprised entirely of storm water into a nearby municipal separate storm sewer system, is the facility required to obtain a storm water permit?**

A. No, unless EPA or the State designates the discharge as contributing to a violation of a water quality standard or as significantly contributing pollutants to waters of the United States. However, industrial dischargers

should note that large and medium municipalities (population 100,000 or more) are currently designing storm water management programs that will control contaminated storm water discharges from entering their separate storm sewer systems. Additional storm water discharges may be regulated under Phase II of the storm water program. EPA is currently in the process of developing Phase II.

13. **Are activities associated with industrial activity that occur on agricultural lands exempted from storm water permitting requirements?**

A. No. If a storm water discharge is associated with industrial activity as defined at 40 CFR 122.26(b)(14), it is subject to permit application requirements regardless of the location of the industrial activity. For example, if a gravel extraction activity occurred on land leased from a farm, the activity would be classified as mining under SIC code 1442 or 1446 and therefore would be considered a storm water discharge associated with industrial activity and require a permit.

14. **Are NPDES permits transferable from one facility owner to the next?**

A. Individual NPDES permits may be transferred to a new owner or operator if the permit is modified. These procedures are described at 40 CFR 122.61. Under the general permits for storm water discharges, issued by EPA in the September 9, 1992 and September 25, 1992, Federal Register notices (57 FR 41176 and 57 FR 44412), the new operator can submit an NOI two days prior to the change of ownership but must include the facility's existing general permit number on the NOI form. Many NPDES authorized States have similar provisions in their general permits.

15. **How does storm water permitting differ in States with approved State NPDES programs compared to States without NPDES State permit programs?**

A. While Federal storm water regulations (i.e., the November 16, 1990, storm water permit application regulations) establish minimum requirements nationwide. State permitting authorities may impose more stringent requirements or decide to expand the scope of its program to meet State priorities. EPA Regional offices are the permitting authorities for 12 States and most Territories; the remaining 38 States and the Virgin Islands administer their own storm water programs and issue permits to regulate municipalities and industries in their States. Regulated facilities in these States should contact the appropriate State permitting authority for guidance, application forms, general permits and other materials. Please

note that some of the NPDES States do not issue permits for Federal facilities located in their States.

For regulated facilities in the 12 non-delegated States (MA, NH, ME, FL, TX, OK, LA, NM, SD, AZ, AK, ID), the Territories (all except the Virgin Islands), the District of Columbia, and for facilities located on Indian lands (in most, if not all, delegated States and in all non-delegated States), and for Federal facilities in the States of DE, CO, IA, KS, NH, NY, OH, SC, VT and WA, the storm water program is administered through EPA Regional offices. Such facilities may be eligible for coverage under the general permits issued by EPA in the September 9, 1992, and September 25, 1992, Federal Register notices (57 FR 41176 and 57 FR 44412).

II. Definition of Storm Water Discharge Associated With Industrial Activity

Category (i): Facilities subject to storm water effluent limitations guidelines, new source performance standards or toxic pollutant effluent standards under 40 CFR subchapter N.

16. **What are toxic pollutant effluent standards?**

A. 40 CFR 122.26(b)(14)(i) includes facilities that are subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards. The phrase "toxic pollutant effluent standards" refers to the standards established pursuant to CWA section 307(a)(2) and codified at 40 CFR Part 129. Part 129 applies only to manufacturers of six specific pesticide products which are defined as toxic pollutants. Please note that the phrase "facilities subject to toxic pollutant effluent standards" does not refer to those industries subject to effluent limitation guidelines for toxics under 40 CFR subchapter N.

Category (iii): Mining and oil and gas operations classified as SIC codes 10-14.

17. **What constitutes "contamination" at an oil and gas facility?**

A. Oil and gas facilities classified as SIC code 13 are required to apply for a storm water permit if the facility has had a release of a Reportable Quantity (RQ) in storm water for which notification has been required any time since November 16, 1987, or if the discharge contributes to a

violation of a water quality standard. RQs for which notification is required are defined at 40 CFR Parts 110, 117, and 302. An RQ for oil is defined at 40 CFR 110 as the amount of oil that violates applicable water quality standards or causes a film or sheen upon or a discoloration of the water surface or adjoining shorelines, or causes a sludge or emulsion to be deposited beneath the water surface or upon adjoining shorelines. For other substances, RQ levels are expressed in terms of pounds released over any 24 hour period and are listed at 40 CFR 117.3 and 40 CFR 302.4. A list of these RQ levels is available from the Storm Water Hotline at (703) 821-4823.

18. **Do EPA's industrial storm water general permits apply to discharges from mine sites that are subject to storm water effluent limitations guidelines, but which are not covered by an existing NPDES permit?**

A. No, storm water discharges from mine sites that are subject to storm water effluent limitation guidelines are not authorized by industrial storm water general permits issued by EPA in the September 9, 1992, and September 25, 1992, Federal Register notices (57 FR 41176 and 57 FR 44412). In States without NPDES permitting authority, the mine operators submit an individual application to address those storm water discharges, or could have participated in a group application prior to October 1, 1992 (note: any facility which did not submit an individual application prior to October 1, 1992 or participate in a timely group application missed EPA's regulatory deadline and may be subject to enforcement action). However, certain authorized States may issue general permits authorizing such storm water discharges from mine sites provided that those permits contain the applicable guideline requirements.

19. **Can point source discharges of contaminated ground water from mine adits and seeps at active or inactive mine sites be permitted under the storm water program?**

Point source discharges of non-storm water to waters of the United States must be authorized by an NPDES permit. Point source discharges of either contaminated ground water from a mine adit or seep that are not related to specific storm events would not be considered to be storm water. Discharges that are composed in whole or in part of non-storm water cannot be addressed solely by the permit applications for storm water (Forms 1 and 2F), and cannot be authorized by NPDES permits that only authorize discharges composed entirely of storm water. Rather, Forms 1 and 2C or 2D (and Form 2F if the discharge is mixed with storm water) must be used when applying for a NPDES permit for non-storm water.

Category (iv): Hazardous waste treatment, storage or disposal facilities.

20. **If the primary SIC code of a facility is not covered under the regulations, but there is a hazardous waste treatment, storage or disposal facility (TSDF) on site, is the TSDF subject to storm water permitting requirements?**

A. Yes. If the hazardous waste TSDF is or should be operating under interim status or a permit under Subtitle C of the Resource Conservation and Recovery Act (RCRA), regardless of the facility's primary activity, the storm water discharges from that portion of the site are subject to the narrative definition of storm water discharges associated with industrial activity under category (iv). Even if a facility's SIC code is not included in the regulations, any activity described by one of the narrative categories of "industrial activity" that is occurring on the site would be regulated under the storm water program.

Category (v): Landfills, land application sites and open dumps that receive industrial waste.

21. **At what point does an inactive, closed, or capped landfill cease being an industrial activity?**

A. An inactive, closed or capped landfill is no longer subject to storm water permit application requirements when the permitting authority determines the land use has been altered such that there is no exposure of significant materials to storm water at the site. For example, if an impervious surface (such as a parking lot or shopping center) now covers the closed landfill, the permitting authority could determine that storm water discharges from the area are no longer associated with the previous landfill activity. These determinations must be made by the permitting authority on a case-by-case basis.

22. **If construction of cells at a landfill disturbs greater than five acres of land, is coverage under EPA's construction general permits required?**

A. No. EPA considers construction of new cells to be routine landfill operations that are covered by the landfill's industrial storm water general permit. However, the storm water pollution prevention plan for the landfill must incorporate best management practices (BMPs) that address sediment and erosion control. Where a new landfill is being constructed

and five or more acres of land are being disturbed, such activity would need to be covered under EPA's construction general permit until the time that initial construction is completed and industrial waste is received. Please note that NPDES authorized States may address this situation differently.

Category (viii): Transportation facilities

23. **If all vehicle maintenance and equipment cleaning operations occur indoors at a transportation facility, as defined at 40 CFR 122.26(b)(14)(viii), is a permit application required for discharges from the roofs of these buildings?**

A. Yes. Storm water discharges from all areas that are "associated with industrial activity," described at 40 CFR 122.26(b)(14), are subject to the storm water permit application requirements. This would include discharges from roofs of buildings that are within areas associated with industrial activity. In addition, storage areas of materials used in vehicle maintenance or equipment cleaning operations and holding yards or parking lots used to store vehicles awaiting maintenance are also considered areas associated with industrial activity.

24. **For a facility classified as SIC code 5171 (bulk petroleum storage), is the transfer of petroleum product from the storage tanks to the distribution truck considered "fueling", and therefore an industrial activity as defined by the regulations?**

A. No. The transfer of petroleum product from the storage tanks to the tanker truck is not considered fueling and would not require a storm water permit. However, fueling of the tanker truck itself at the 5171 facility is considered to be part of routine vehicle maintenance, and storm water discharges from these areas must be covered under a storm water permit application.

25. **Is a retail fueling operation that occurs at an SIC code 5171 petroleum bulk storage facility regulated?**

A. No. The provisions of 40 CFR 122.26(b)(14)(viii) apply to fueling operations conducted at petroleum bulk storage facilities where the vehicles being fueled are involved with the petroleum bulk storage operation. Retail fueling of vehicles at such sites does not constitute "vehicle maintenance" (as defined in the November 16, 1990 Federal

Register page 48066), and a storm water permit is not required for the discharges from that area. Only those portions of the SIC code 5171 facility where vehicle maintenance operations (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication) and equipment cleaning take place are required to be covered under a storm water permit application.

26. **Are off site vehicle maintenance areas required to submit permit applications for their storm water discharges?**

A. As discussed in Section I of this document, to determine the regulatory status of off site vehicle maintenance operations, the operator of a facility must first determine if that off site operation can be classified according to its own SIC code. If there is no SIC code which describes the off site facility independently, then it would assume the SIC code of the parent facility it supports. However, please note that off-site facilities that fall within the nine categories listed on page 17 of the SIC Manual (or which are specifically described in the SIC code description) would, in most cases, be classified according to the parent facility they support. See Section XIII of this document for the complete list. Such supporting establishments include central administrative offices, research and development laboratories, maintenance garages, and local trucking terminals. EPA has determined that off site vehicle maintenance facilities that primarily service trucks used for local transportation of goods or for local services are generally considered supporting establishments which do not assume a transportation SIC code; rather, such facilities are classified according to the SIC code of the facility they support. Long-distance trucking centers, on the other hand, are generally classified as SIC code 4213, and are subject to regulation under 40 CFR 122.26(b)(14)(viii)).

Category (x): Construction activity

27. **Who must apply for permit coverage for construction activities?**

A. Under the NPDES storm water program, the operator of a regulated activity or discharge must apply for a storm water permit. EPA clarified that the operator of a construction activity is the party or parties that either individually or taken together meet the following two criteria: (1) they have operational control over the site specifications (including the ability to make modifications in specifications); and (2) they have the day-to-day operational control of those activities at the site necessary to ensure compliance with plan requirements and permit conditions (9/9/92 Federal Register page 41190). If more than one party meets the above criteria,

then each party involved must become a co-permittee with any other operator(s). For example, if the site owner has operational control over site specifications and a general contractor has day-to-day operational control of site activities, then both parties will be co-permittees.

When two or more parties meet EPA's definition of operator, each operator must submit an NOI, and either include a photocopy of the other operators' NOI(s) or the general permit number that was assigned for that project. Under EPA's storm water construction general permits, the co-permittees are expected to join in implementing a common pollution prevention plan prior to submittal of the NOI, and in the retention of all plans and reports required by the permit for a period of at least three years from the date that the site is finally stabilized.

For individual storm water discharge permits, applications must be filed 90 days prior to the commencement of construction. If a contractor has not been selected at the time of application, the owner of the project site would initially file the application and the contractor should sign on when selected. Under an individual storm water permit for construction, multiple operators would have to sign onto the permit, instead of submitting a new application. Please note that authorized NPDES States may have varying NOI and/or permit requirements and should be contacted on this issue.

28. **What are the responsibilities of subcontractors at the construction site under EPA's storm water construction general permits?**

A. EPA storm water construction general permits require subcontractors to implement the measures stated in the pollution prevention plan and to certify that he/she understands the terms and conditions of the permit requirements. Under EPA's general permits, subcontractors are not required to submit NOIs.

29. **What is meant by a "larger common plan of development or sale?"**

A. A "larger common plan of development or sale" is a contiguous area where multiple separate and distinct construction activities may be taking place at different times on different schedules under one plan. For example, if a developer buys a 20-acre lot and builds roads, installs pipes, and runs electricity with the intention of constructing homes or other structures sometime in the future, this would be considered a common plan of development or sale. If the land is parceled off or sold, and construction occurs on plots that are less than five acres by separate, independent builders, this activity still would be subject to storm water permitting requirements if the smaller plots were included on the original site plan.

30. **Does construction activity encompass repaving of roads?**

A. Repaving is not regulated under the storm water program unless five or more acres of underlying and/or surrounding soil are cleared, graded or excavated as part of the repaving operation.

31. **Is clearing of lands specifically for agricultural purposes regulated construction activity (40 CFR 122.26(b)(14)(x)) under the storm water program?**

A. No. Although the clearing of land may be greater than five acres, any amount of clearing for agricultural purposes is not considered an industrial activity under the storm water regulations. Section 402(l)(1) of the 1987 Water Quality Act exempts agricultural storm water discharges from NPDES permitting requirements including storm water permitting. This exemption only applies, however, if the clearing of land is solely for agricultural purposes. (See Question 13).

32. **If a construction activity that disturbs five or more acres commences on a site covered by an existing industrial storm water permit, are the storm water discharges from the construction area covered by the existing permit or is a separate permit required?**

A. If the existing permit is an individual permit, then the operator must either request a modification of the existing permit to include the construction storm water discharges or apply for coverage under a separate permit that specifically addresses that construction activity. If the permittee decides to modify the existing individual permit, permit modifications must be approved prior to initiating any construction activity. If the existing permit is an EPA storm water industrial general permit, the operator should submit an NOI for coverage under EPA's storm water general permit for construction activities. States with NPDES permitting authority may have different requirements.

33. **If a construction activity that disturbs less than five acres occurs on site of a regulated industrial activity currently covered by EPA's industrial storm water general permit, does the regulated industry have to modify its pollution prevention plan to include controls for the area of construction?**

A. Yes. Regulated industrial activities covered by EPA's storm water industrial general permit must revise their pollution prevention plan to address all new sources of pollution and runoff including those from construction activities disturbing less than five acres, that occurred on the site of the regulated industry. However, if less than five acres, a separate

storm water permit for the construction activity is not required (see Question 32).

34. For projects such as a 100-mile highway construction project, what location should be provided on the NOI?

A. The midpoint of a linear construction project should be used as the site location on EPA's NOI form. For construction projects that span across more than one State, the project must meet the application requirements of each State.

35. Are long-term maintenance programs for flood control channels (such as vegetation removal) or similar roadside maintenance programs subject to permitting if five or more acres are disturbed?

A. If grading, clearing or excavation activities disturb five or more acres of land either for an individual project or as part of a long-term maintenance plan, then the activity is subject to storm water permit application requirements.

36. For a construction activity that uses off site "borrow pits" for excavation of fill material or sand and gravel, should the number of disturbed acres at the borrow pit be added to the number of acres at the construction site to determine the total number of disturbed acres?

A. No, off site borrow pits are not considered part of the on site construction activity. If a borrow pit is specifically used for the removal of materials such as sand, gravel, and clay, the pit is considered a mine and is classified under SIC code 14. Such sites would be regulated as industrial activity as defined at 40 CFR 122.26(b)(14)(iii). However, if the borrow pit is utilized for the removal of general fill material (e.g. dirt) and disturbs five or more acres of land, the pit would be considered a construction activity as defined at 40 CFR 122.26(b)(14)(x).

37. Would building demolition constitute a land disturbing activity and require a storm water construction permit application?

A. The definition of land disturbing activity includes but is not limited to clearing, grading and excavation. At a demolition site, disturbed areas might include the site where building materials, demolition equipment, or disturbed soil are situated, which may alter the surface of the land. Therefore, demolition activities that disturb five or more acres of land would be subject to storm water construction permit application requirements.

38. **What are the legal responsibilities and liabilities for construction activities disturbing less than five acres, pursuant to the Ninth Circuit U.S. Court of Appeals decision on June 4, 1992?**

A. In NRDC v. EPA, 966 F.2d 1292, the Ninth Circuit U.S. Court of Appeals remanded for further rulemaking, EPA's exemption of construction sites less than five acres which are not part of a larger common plan of development or sale. The Agency intends to undergo further rulemaking proceedings for construction sites less than five acres. Until further rulemaking is completed, permit applications for such activities need not be submitted to EPA. However, States with NPDES permitting authority may have more stringent requirements.

39. **Do storm water construction general permits authorize non-storm water discharges?**

A. Under EPA's storm water construction general permits, issued on September 9, 1992, and September 25, 1992, the following non-storm water discharges are conditionally authorized (57 FR 41219) and (57 FR 44419): discharges from fire fighting activities; fire hydrant flushings; waters used to wash vehicles or control dust; potable water sources including waterline flushings; irrigation drainage; routine external building washdown which does not use detergents; pavement washwaters where spills or leaks of toxic or hazardous materials have not occurred (unless all spilled material has been removed) and where detergents are not used; air conditioning condensate; springs; uncontaminated ground water; and foundation or footing drains where flows are not contaminated with process materials such as solvents. These discharges, except for flows from fire fighting activities, must be identified in the pollution prevention plan and the plan must address the appropriate measures for controlling the identified non-storm water discharges. Other non-storm water discharges not listed above or not identified in the storm water pollution prevention plan, must be covered by a different NPDES permit.

Category (xi): Light manufacturing facilities :

40. **If oil drums or contained materials are exposed during loading or unloading at a category (xi) facility, are storm water discharges from this area subject to the storm water regulations?**

A. The storm water regulations require category (xi) facilities to apply for a storm water permit where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water. If there is a

reasonable potential for leaks or spills from these drums which could be exposed to storm water, discharges from that area would be subject to storm water permitting requirements. Completely covering loading and unloading activities may eliminate exposure. Note that permitting authorities may have more stringent interpretations with respect to exposure on industrial sites and should be consulted for case-by-case determinations. For a discussion on the 9th Circuit Court of Appeals decision (June 1992) and future EPA rulemakings on category (xi) facilities, please refer to Section IX of this document.

41. **Does the storage of materials under a roof at a category (xi) facility constitute exposure?**

A. If materials or products at a light industrial facility are stored outside under a roof and there is no reasonable potential for wind blown rain, snow, or runoff coming into contact with the materials or product, then there may not be exposure at that area. However, if materials are stored under a structure without sides and storm water comes into contact with material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products or industrial machinery, the discharge from that area must be permitted. The permitting authority should be contacted for specific issues related to exposure.

III. Individual Permits

42. **Will individual permits include requirements for storm water pollution prevention plans and monitoring?**

A. EPA anticipates that many individual permits will include storm water pollution prevention plans as a means of satisfying Best Available Technology (BAT)/Best Conventional Technology (BCT) requirements established in the Clean Water Act (CWA). With regard to monitoring requirements under individual permits, such requirements will be determined by the permit writer on a case-by-case basis. At a minimum, all facilities with storm water discharges associated with industrial activity must conduct an annual site inspection as prescribed at 40 CFR 122.44(i)(4).

43. **Do permitting authorities have the option of subjecting facilities that have submitted individual storm water permit applications to general permits?**

A. Yes, permitting authorities may subject facilities that have submitted individual permit applications to general permits. Facilities that are covered

by a general permit may petition the permitting authority to be covered under an individual permit by submitting an individual permit application with reasons supporting the request to the permitting authority, pursuant to 40 CFR 122.28(b)(2)(iii).

44. **What are the benefits/drawbacks of pursuing an individual storm water permit over a general permit?**

A. An individual storm water permit may be advantageous, as it is designed to reflect a facility's site-specific conditions, whereas general permits are much broader in scope, particularly in terms of monitoring requirements. However, the individual permit application is generally more difficult to prepare than submitting EPA's notice of intent (NOI) to be covered under a general permit (in part because the individual permit application requires sampling and EPA's NOI does not). General permits may be advantageous because regulated facilities know, in advance of submitting their NOI, the requirements of the permit. In addition, coverage under a general permit may be automatic (depending on how the permit is written), whereas the individual permitting process takes longer.

45. **When does EPA anticipate that individual permits will be issued?**

A. Issuance of individual permits may vary on a State by State basis, as permitting priorities and resources allow. The December 18, 1992, Federal Register (57 FR 60447) established October 1, 1993, as the deadline by which individual permits are to be issued. Many authorized States are already issuing individual permits.

46. **Can a facility that has submitted an individual permit application obtain general permit coverage upon issuance of a general permit in its State?**

A. Yes, an eligible facility may opt for coverage under a general permit (by submitting an NOI) up until the time that the permitting authority issues such facility its individual permit. Authorized States may require a written request for withdrawal from the individual permit application process. EPA recommends submitting such requests to the appropriate Regional office.

VOL 23 0769

IV. EPA General Permits (issued on 9/9/92 and 9/25/92)

47. **What is the difference between EPA's construction and industrial general permits?**

A. Because the nature of construction activity varies considerably from other industrial activities, EPA developed two separate general permits: one covering storm water discharges from construction activity and one for other storm water industrial discharges. Whereas the pollution prevention plan for the construction permit focuses on sediment and erosion controls and storm water management, the pollution prevention plan for industry emphasizes general site management. Note that some authorized States have industrial general permits that authorize storm water discharges from construction activity.

EPA's general permits for storm water discharges associated with industrial activity, issued on 9/9/92 (57 FR 41236) and 9/25/92 (57 FR 44438), authorize storm water discharges from all new and existing point source discharges of storm water associated with industrial activity, as defined at 40 CFR 122.26(b)(14), to waters of the U.S., except for ineligible storm water discharges that are listed at I.B.3. (9/9/92 Federal Register page 41305) and (9/25/92 Federal Register page 44444) in EPA's general permits.

EPA's general permits for storm water discharges associated with construction activity, which were issued on 9/9/92 (57 FR 41176) and 9/25/92 (57 FR 44412), authorize storm water discharges associated with construction activity, as defined at 40 CFR 122.26(b)(14)(x), except for ineligible discharges that are listed at I.B.3 (9/9/92 Federal Register page 41217) and (9/25/92 Federal Register page 44418) in EPA's general permits.

48. **What is the procedure for applying for coverage under EPA's industrial or construction general permits?**

A. Dischargers of storm water associated with industrial activity located in non-NPDES States must submit a Notice of Intent (NOI) to be authorized to discharge under the general permit. The NOI form is a one-page document requesting basic information about the nature of the facility and the particular storm water discharge under consideration. Under EPA's general permits, monitoring is not required for submittal of the NOI. States with NPDES authority may have different requirements for their NOI and should be contacted directly.

49. **Will a facility automatically be covered by an EPA general permit upon submittal of an NOI or will it have to cease operations until the Agency provides notification of acceptance?**

A. Permit coverage begins two days after the postmark date on the NOI, provided the storm water discharges from the facility are eligible for coverage as established by the permit conditions (see 9/9/92 Federal Register page 41305 for limitations on coverage). The permitting authority can require the submittal of an individual application at any time. However, the facility may continue to discharge under the general permit until an individual permit is issued or denied.

50. **What are the deadlines for compliance with EPA's general permits?**

A. Individuals who intend to obtain coverage for a storm water discharge associated with industrial activity that commenced on or before October 1, 1992, were required to submit an NOI by October 1, 1992; however, EPA is accepting late NOIs. Regulated facilities wishing to obtain coverage under the general permit that have not yet submitted an NOI should do so immediately. EPA's storm water general permits require permittees to develop and implement a storm water pollution prevention plan. Deadlines for NOI submittal and development and implementation of plans are listed in the table below.

Facilities with salt storage or facilities that were not required to report under Emergency Planning Community Right to Know (EPCRA) Section 313 prior to July 1, 1992, (but must report after that date) must comply with the special requirements for section 313 facilities and salt storage (if applicable) within 3 years of the date on which the facility is required to first report under section 313. All other conditions in the permit must be met within the deadlines listed above. Plans do not have to be submitted to the Agency but must be kept on site and made available upon request.

Type of Discharge	NOI Deadline	Pollution Prevention Plan Development Deadline	Pollution Prevention Plan Implementation Deadline
Existing industrial activities (other than construction)	October 1, 1992	April 1, 1993	October 1, 1993

Type of Discharge	NOI Deadline	Pollution Prevention Plan Development Deadline	Pollution Prevention Plan Implementation Deadline
Industrial activities (other than construction) that begin between October 1, 1992 and January 1, 1993	2 days prior to the start of industrial activity	Within 60 days of commencement of operations	Within 60 days of commencement of operations
Industrial activities (other than construction) that begin on or after January 1, 1993	2 days prior to the start of industrial activity	Within 60 days of commencement of operations	Upon commencement of operations
Oil and gas facilities previously not required to be permitted that have an RQ after October 1, 1992	Within 14 days of first knowledge of the release	Within 60 days of first knowledge of the release	Within 60 days of first knowledge of the release
Municipally-owned or operated industrial activities that were rejected or denied from a group application	Within 180 days of the date of rejection or denial	Within 365 days of the date of rejection or denial	Within 545 days of the date of rejection or denial
Construction sites in operation on October 1, 1992	October 1, 1992	October 1, 1992	October 1, 1992
Construction sites that begin operation after October 1, 1992	2 days prior to the start of construction	Prior to the submittal of the NOI	With the initiation of construction activities

51. Is there a fee for NOI applications?

A. EPA's general permits do not require fees at this time. However, authorized NPDES States may levy fees and should be contacted directly.

52. Where should NOIs be submitted?

A. Facilities in States and Territories where EPA is the permitting authority submit NOIs to the central processing center at the following address:

Storm Water Notice of Intent
P.O. Box 1215
Newington, VA 22122.

All permittees in States with NPDES authority submit the NOI to their State permitting authority except those in New York, who submit to the processing center at the above address. Note that authorized NPDES States may develop NOI forms that are different from EPA's NOI form. Under EPA's general permits, the operator of any industrial activity that discharges storm water through a municipal separate storm sewer system in a medium or large municipality must also submit a copy of the NOI to that municipality. In addition, operators of construction activities must provide a copy of all applicable NOIs for a site to the local agency approving sediment and erosion plans or storm water management plans.

53. Is an operating regulated industrial facility required to submit a separate NOI for each outfall that discharges storm water associated with industrial activity at the site?

A. Under EPA's general permits, one NOI is generally sufficient for the entire site, provided there is one operator. In this case, the pollution prevention plan must address all discharges of storm water associated with industrial activity from the site. If there are multiple operators at the site, each operator must submit an NOI. In addition, if a facility that is covered under EPA's industrial storm water general permit undertakes a construction activity disturbing more than five acres of land, then the facility must submit an NOI for those construction-related storm water discharges for coverage under EPA's construction general permit (or submit an individual permit application).

54. **Will a facility receive any notification from EPA after submitting an NOI under EPA's general permit?**

A. Yes, EPA confirms the receipt of NOIs and will provide the applicant with a permit number and explains how to get a summary of the guidance on preparing storm water pollution prevention plans.

55. **Is an entire facility excluded from coverage under EPA's general permits if a single discharge at the site is excluded from coverage?**

A. No. Eligibility under EPA's general permits should be applied on a discharge-specific basis. Thus, a site with multiple discharges can be covered under two different permits: a general permit for some discharges and a separate NPDES permit for any discharges excluded from coverage under the general permit. NPDES States should be contacted for additional guidance on this issue.

56. **Does an industrial facility operating under an EPA industrial general permit have to apply for a separate permit for all on site construction activities that disturb more than five acres of land?**

A. Storm water discharges from construction activities that disturb five or more acres of land must be covered under a separate NPDES permit that specifically addresses storm water discharges from construction activity. EPA's industrial storm water general permits do not provide coverage for storm water discharges from regulated construction activities. Construction activities that disturb less than five acres of land do not require a storm water permit at this time. The pollution prevention plan for the industrial facility must be modified to address site changes due to that amount of construction activity.

57. **Can a facility submit one NOI for similar but separately located industrial facilities which are owned by the same corporation?**

A. No. One NOI must be submitted by the operator of each individual facility that intends to obtain coverage under a general permit, regardless of common ownership.

58. **Does an asphalt/concrete batch plant have to submit a new NOI each time it changes location?**

A. Under EPA's general permits, an NOI must be submitted each time the plant moves to a new site of operation. However, some authorized States may have different requirements with respect to asphalt/concrete batch

plants and, therefore, facilities in such States should contact their permitting authorities.

59. **Who is required to monitor under the conditions of EPA's storm water general permits?**

A. EPA established tiered monitoring requirements in its final industrial storm water general permits based on the potential to contribute pollutants to storm water (4/2/92 Federal Register page 11394). Six classes of facilities are required to monitor semiannually and report annually, ten classes of facilities are required to monitor annually and keep the data on site, and all other classes of facilities are not required to monitor. All facilities authorized by general permits (including those facilities not otherwise required to monitor) must still conduct an annual site inspection, except for inactive mining sites where this may be impractical due to remote location and inaccessibility of sites (inspection no less than once in three years). The sixteen classes of facilities that are required to monitor are specified in EPA's industrial general permits (9/9/92 Federal Register page 41248), which are available from the Storm Water Hotline. EPA's construction storm water general permits require periodic inspections in lieu of monitoring.

60. **If an industrial facility that is required to monitor under EPA's industrial storm water general permits does not have any exposure of materials or activities to storm water, does it still have to conduct sampling?**

A. Under EPA's industrial storm water general permits, industrial facilities can provide a certification in lieu of monitoring results for a given outfall, that materials and activities are not presently exposed to storm water and will not be exposed during the certification period (see 9/9/92 Federal Register page 41314 for a more detailed description). This determination should be applied on outfall-by-outfall basis (e.g., permittees may elect to monitor certain outfalls while providing certification for others). The certification must be updated on an annual basis and retained in the pollution prevention plan. The six classes of facilities that are required to report monitoring results annually must submit this certification to the permitting authority in lieu of the Discharge Monitoring Report (DMR).

61. **Within one drainage area leading to a single outfall, if a facility conducts two separate industrial activities that are subject to both semiannual and annual monitoring requirements, which set of monitoring requirements will apply?**

A. If the discharges cannot be segregated, the combined discharge would be subject to both sets of monitoring requirements. In effect, a combined

discharge could be subject to annual monitoring requirements for certain parameters and semi-annual monitoring for others. If a facility can segregate the discharges from the different activities, separate monitoring requirements would apply to each discharge.

62. **Is it possible to sample only one of several identical outfalls under the provisions of EPA's general permits?**

Yes. To reduce the monitoring burden on the facility, the permit allows an operator to sample one outfall where it is substantially identical to the other outfalls. Permittees that intend to use this provision must justify and document in writing why one outfall is substantially identical to the others. Criteria for making this determination are presented in the NPDES Storm Water Sampling Guidance Document. Facilities using this provision must include the written justification in their storm water pollution prevention plan. Facilities that are subject to semiannual monitoring requirements must submit the justification of why an outfall is substantially identical to the others with the Discharge Monitoring Report. Other facilities required to monitor under the permit are not required to submit the justification unless it is requested by the permitting authority.

63. **If a facility had to report under section 313 of the Emergency Planning and Community Right to Know Act (EPCRA) when its NOI was submitted but no longer uses the quantity of water priority chemicals that makes such reporting necessary, is that facility still subject to special requirements in EPA's industrial storm water general permits for facilities that handle EPCRA section 313 water priority chemicals?**

A. No. Such facilities are no longer subject to the special EPCRA requirements contained in EPA's industrial storm water general permit and should accordingly modify their pollution prevention plan to indicate the changes in industrial activity at the facility.

64. **Under EPA's general permits, when and where must Discharge Monitoring Reports (DMR) be submitted for semi-annual monitoring facilities?**

A. DMRs must be submitted to the permitting authority according to the following schedule: a) certain EPCRA section 313 facilities and wood treatment facilities monitor from January to June and July to December and report no later than January 28 following the second monitoring period; b) Primary metal facilities, facilities with coal pile runoff, and battery reclaimers monitor from March to August and September to February and report no later than April 28; and c) land disposal facilities monitor from October to March and from April to September and report no later than October 28. For facilities in non-NPDES States, DMRs must be

submitted to the EPA Regional office (Section XI of this document includes storm water list of contacts for addresses). In States with approved NPDES permit programs, DMRs must be sent to the location specified in the State's general permit. The general permits in such States may also have different schedules for submitting DMRs than the one specified above.

65. **Under the industrial general permit, coal-fired steam electric facilities have annual monitoring requirements for storm water discharges from coal handling sites (other than from coal pile runoff). Are access roads considered coal handling sites?**

A. Coal handling sites include those areas of the facility where coal is either loaded or unloaded. Therefore, those portions of access roads where loading/unloading operations do not occur are not considered to be coal handling sites and, therefore, are not subject to annual monitoring requirements under EPA's general permits.

66. **Are there specific numeric effluent limits in EPA's storm water general permits?**

A. EPA's general permits establish pollutant discharge limits for total suspended solids (TSS) and pH in coal pile runoff. In most other situations, EPA's industrial storm water general permits focus on storm water management and the implementation of facility-specific pollution prevention plans; however, EPA's industrial general permits also include State-specific conditions that may include additional numeric effluent limits.

67. **What is a storm water "best management practice" (BMP)?**

A. A BMP (defined at 9/9/92 Federal Register page 41319) is a technique, process, activity or structure used to reduce the pollutant content of a storm water discharge. BMPs include simple, nonstructural methods such as good housekeeping and preventive maintenance. Additionally, BMPs may include sophisticated, structural modifications such as the installation of sediment basins. The focus of EPA's general permits is on preventative BMPs which limit the release of pollutants into storm water discharges. EPA has published guidance materials to assist in the selection of appropriate BMPs in the preparation of storm water pollution prevention plans, including: *Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices (PB-92-235969)* and *Storm Water Management for Construction Activities: Developing Pollution Prevention Plans and Best Management Practices (PB-*

92-235951). These Manuals are available from NTIS at (703) 487-1650 and the Office of Water Resource Center at (202)260-7786.

68. **What should a facility do when the nature of its activities changes?**

A. When the nature of a facility's activities changes, the facility must modify the pollution prevention plan accordingly. If the facility is subject to new monitoring requirements as a result of the changes, sampling must begin at the start of the next monitoring period.

69. **Is there a procedure for notifying EPA when a storm water discharge associated with industrial activity covered by EPA's general permit has been eliminated?**

A. Yes. EPA's general permits include procedures for filing a Notice of Termination (NOT) form when there is no longer a potential for storm water discharges associated with industrial activity to occur. Operators of construction activities can submit an NOT once they have finally stabilized all areas that were disturbed. For construction activity, final stabilization means that all soil disturbing activities at the site have been completed, and that a uniform perennial vegetative cover has been established or equivalent permanent stabilization measures (such as the use of riprap, gabions, or geotextiles) have been employed with a density of 70% of the previously existing/background cover for unpaved areas and areas not covered by permanent structures. A copy of the NOT can be found in Federal Register notices dated September 9, 1992 (57 FR 41232 and 41341), and September 25, 1992 (57 FR 44434 and 44469).

70. **If a NPDES authorized State has general permitting authority but has not yet finalized an applicable general permit, can a facility still submit an NOI and assume general permit coverage?**

A. No, a facility cannot submit an NOI to obtain coverage under a general permit until that permit has been finalized. Furthermore, a facility located in an NPDES State cannot seek coverage under one of EPA's general permits.

71. **Will State general permit requirements vary and to what extent?**

A. General permit requirements for authorized NPDES States may vary considerably because these States develop and issue permits independently from EPA. However, all NPDES permits must meet minimum technical and water quality-based requirements of the Clean Water Act. Permittees in NPDES authorized States should consult with their permitting authorities regarding particular State conditions. Under EPA's storm water general permits, State-specific requirements vary

because of different water quality concerns in different States. Each of the 12 non-authorized States and Territories provided certification that EPA's general permits comply with State water quality standards, and added permit requirements where necessary to achieve compliance with those standards in the final general permits.

72. **Can discharges from industrial areas at a construction site such as portable asphalt plants and/or concrete batch plants be covered under EPA's construction general permits?**

A. No. EPA's construction general permits only authorize discharges from the construction area; these permits do not authorize storm water discharges from industrial activities other than construction that are located on the construction site. Portable asphalt plants and/or concrete batch plants are considered to be "industrial activity," as defined 40 CFR 122.26(b)(14)(ii). Therefore, storm water discharges from such industrial activities must be in compliance with a general or individual storm water permit for industrial storm water discharges other than construction. At a construction site which disturbs less than 5 acres of land (and which is, therefore, not subject to storm water permit application requirements for the construction activity), the operator of the mobile asphalt or concrete plant still would be required to obtain storm water permit coverage for discharges from the plant. Please note that States with approved NPDES permit programs may allow portable asphalt plants and/or cement batch plants to be covered under the State's construction general permit.

V. Group Applications

73. **How will group applicants be permitted?**

A. EPA is currently developing a model permit using information from Part I and Part II group applications, and other sources. This model permit will have sections which address a particular type of industrial activity. When the model permit is completed, the permitting authority (EPA or NPDES States) then has the option to propose and issue final permits to cover group members within their state based upon the model permit.

VI. Sampling

74. **For what parameters does a facility have to sample under the individual or group application?**

A. Applicants are required to obtain quantitative data from samples collected during storm events from all outfalls that discharge storm water associated with industrial activity for the following parameters: (1) any pollutant limited in an effluent guideline to which the facility is subject; (2) Any pollutant listed in the facility's permit for its process wastewater [if the facility is operating under an existing NPDES permit]; (3) Oil and grease, pH, BOD5, COD, TSS, total phosphorous, total Kjeldahl nitrogen, and nitrate plus nitrite nitrogen; (4) certain toxic pollutants listed in Tables II and III of the Appendix D to 40 CFR Part 122 (also listed as Tables 2F-2 and 2F-3 in the instructions for Form 2F) that are expected to be present in the storm water.

75. For an individual or group application, how many aliquots (portions) of storm water are needed to obtain a flow-weighted composite?

A. A flow-weighted composite may be taken as a combination of a minimum of 3 sample aliquots taken in each hour of discharge for the entire event or for the first three hours of the event, with each aliquot collection being separated by a minimum of 15 minutes. If the storm event lasts less than three hours, aliquots should be collected for as long as there is sufficient flow. Large and medium municipalities may use a different protocol with respect to time duration between collection of aliquots with approval of the permitting authority. EPA's *NPDES Storm Water Sampling Guidance Document* discusses several ways to estimate flows. [This manual is available from the Storm Water Hotline (703) 821-4823) and the Office of Water Resource Center (202)260-7786].

76. How does a facility measure flow if there are numerous small outfalls?

A. Applicants may provide either measurements or estimates of storm water flows. One possible method for estimating flow is to create a conveyance that would combine flows from many of the outfalls. Alternatively, where flows are similar, the flow at one outfall may be measured to calculate flows at the other outfalls, provided that the method of measurement is indicated to the permitting authority. EPA's *NPDES Storm Water Sampling Guidance Document* discusses several ways to estimate flows. [This manual is available from the Storm Water Hotline (703) 821-4823) and the Office of Water Resource Center (202)260-7786.]

77. For what parameters is only a grab sample appropriate?

A. When collecting storm water samples, grab samples are required for the following parameters: pH, temperature, cyanide, total phenols, residual

chlorine, oil and grease, fecal coliform and fecal streptococcus. Both grab and composite samples are required for all other pollutants.

78. **Do both a grab and a composite sample have to be taken from a 24-hour holding pond?**

A. No. Only a minimum of one grab sample is required to be taken for effluent from holding ponds or other impoundments with a retention period of greater than 24 hours for the representative event.

79. **Can composite and grab samples be taken from separate events?**

A. Grab and composite samples for a given outfall should be taken from the same storm event to provide a basis for comparing the data. If this is impossible, information describing each storm event used for sample collection should be recorded and submitted with sampling results. However, applicants are advised that the permitting authority may request data to be collected from only one storm event.

80. **Is a facility required to sample all of its outfalls during a single storm event?**

A. No. Unless otherwise specified by the permitting authority, a facility may sample outfalls during different events provided that the storms meet the criteria established in the application regulations or in the applicable permit language. Information describing each storm event used for sample collection should be recorded and submitted with sampling results.

81. **If a facility has two conveyances that join and leave the site as one combined discharge, where should a sample be collected?**

A. If the discharge is composed entirely of storm water, the sampling point should be at the outfall as it leaves the property. If the discharge is a combination of process wastewater and storm water, the storm water component of the discharge should be sampled before it commingles with the process waste water discharges. If sampling at an outfall at the property boundaries is impossible because of safety reasons, inaccessibility, or a poor conveyance, sampling may be done closer to the discharge source.

82. **How long of a 'dry' period does a facility need before sampling?**

A. A 'dry' period needs to be at least 72 hours. More specifically, all samples must be collected from the discharge resulting from a storm event that

occurs at least 72 hours from the previously measurable (greater than 0.1 inches) storm event.

83. **If two or more outfalls at a facility have identical discharges, does each outfall have to be sampled?**

A. Where a facility has outfalls that discharge "substantially identical effluent," the permitting authority may allow the applicant to test only one outfall and report that the quantitative data are representative of the substantially identical outfalls. EPA's *NPDES Storm Water Sampling Guidance Document* (available from the Storm Water Hotline (703-821-4823)) provides information on how to prepare this petition, or the applicant should contact their permitting authority to determine what information is required.

84. **Do analyses for storm water need to be done by a certified lab?**

A. There is no Federal requirement to use a certified lab. However, certain States may require that a certified lab be used. Please note, analyses must comply with the analytical procedures set out in 40 CFR Part 136, as discussed below.

85. **What analytical methods must be used for the pollutants for which sampling is required?**

A. EPA-approved methods must be used where a method for a pollutant has been promulgated. 40 CFR Part 136 discusses required methods. If there is no approved method, the applicant may use any suitable method, but must provide a description of the method in its application. Additional information on general sampling issues can be obtained through the EPA's *NPDES Storm Water Sampling Guidance Document*. The manual is available from the Storm Water Hotline (703-821-4823).

VII. Municipal Permit Applications

86. **Once a municipal separate storm sewer system (MS4) has submitted Part 2 of its storm water permit application, when does the term of the permit actually begin?**

A. The term of the permit begins when a permit is issued by the permitting authority. Pursuant to 40 CFR 122.26(e)(7), storm water permits for discharges from MS4s are to be issued with in one year after submission of a complete application. Since applications for medium and large

municipal separate storm sewer systems were due on May 17, 1993 and November 16, 1992, respectively, this results in permit issuance by November 16, 1993 for large municipalities and by May 17, 1994 for medium municipalities.

87. **How is EPA incorporating 1990 census data into the storm water program?**

A. Most of the municipalities that meet the definition of either a large or medium MS4 based on the results of the 1990 Census have already begun to seek an NPDES permit. Headquarters is working with the Regions and States to determine the best way to incorporate the remaining municipal entities into the program.

88. **How does EPA envision the relationship between large and medium MS4 operators and NPDES permitting authorities in terms of addressing industrial storm water discharges to MS4s?**

A. EPA envisions a partnership between NPDES permitting authorities and operators of large and medium municipal separate storm sewer systems in controlling pollutants in storm water discharges associated with industrial activity through MS4s. In addition, NPDES storm water permits provide a basis for enforcement actions directly against the owner or operator of the storm water discharge associated with industrial activity.

A second NPDES permit will be issued to the operator of the large and medium MS4. This permit will establish the responsibilities of the municipal operators in controlling pollutants from storm water associated with industrial activity which discharges through their municipal system. Under this approach, municipal operators will be able to:

- Assist EPA in identifying priority storm water discharges associated with industrial activity through their system;
- Assist EPA in reviewing and evaluating storm water pollution prevention plans that industrial facilities are required to develop; and
- Assist EPA in compliance efforts regarding storm water discharges associated with industrial activity to their municipal system.

A more complete description of this policy is provided in the August 16, 1991 Federal Register (56 FR 40973).

VIII. The Intermodal Surface Transportation Efficiency Act of 1991 (Transportation Act)

89. **How did the Transportation Act affect permitting requirements for municipalities under 100,000?**

A. Storm water discharges from certain industrial activities owned or operated by municipalities with a population of less than 100,000 people were granted a moratorium from the October 1, 1992 deadline for storm water permit applications. Exceptions to this moratorium include discharges from powerplants, airports and uncontrolled sanitary landfills.

90. **How does the Transportation Act impact privately owned or operated industrial activities located in municipalities under 100,000?**

A. The provisions of the Transportation Act specifically address publicly owned or operated industrial activities. Privately owned facilities that have storm water discharges associated with industrial activity, as defined at 40 CFR 122.26(b)(14), must submit a permit application regardless of the size of the population of the municipality in which they are located.

91. **What is an "uncontrolled sanitary landfill?"**

A. An uncontrolled sanitary landfill (discussed in the 4/2/92 Federal Register, page 11410) is a landfill or open dump, whether in operation or closed, that does not satisfy the runon/runoff requirements established pursuant to subtitle D of the Solid Waste Disposal Act. However, landfills closed prior to October 9, 1991 are not subject to RCRA runon/runoff requirements, and therefore need not submit storm water permit applications if they are located in municipalities of less than 100,000 population. Landfills closed after October 9, 1991 and others that meet the above definition would be subject to the storm water permit application requirements.

92. **If a municipally-owned sewage treatment plant is located in a municipality with a population of less than 100,000 people, but the service population is greater than 100,000 people, is the facility subject to the permitting requirements?**

A. Yes, because service populations are used in determining population for publicly-owned treatment works [POTWs] (April 2, 1992 Federal Register page 11394). Additionally, where one sewer district operates a number of POTWs, the entire service population of the district will be used to determine the applicable population classification of all the POTWs operated by the district. For example, if a district with a cumulative

service population of 160,000 operates two sewage treatment plants, one of which serves 120,000 and the other which serves 40,000, both plants will be considered to be owned or operated by a municipality with a population of 100,000 or more.

93. **If a construction operation disturbing five or more acres is owned by a small municipality (a population of less than 100,000 people)but operated by a private contractor, is the activity regulated?**

A. No. If the construction activity is either owned or operated by a municipality with a population of less than 100,000 it would not be required to obtain a storm water permit during Phase I of the storm water program. Some States, however, may require that an application be submitted.

IX. 9th Circuit U.S. Court of Appeals Decision

94. **What is the current status of light manufacturing facilities without exposure and construction activities under five acres, pursuant to the 9th Circuit Court decision?**

A. The 9th Circuit Court decision remanded two "exemptions" provided in the NPDES storm water permit application regulations for light manufacturing facilities without exposure and construction activities under five acres (11/16/90 Federal Register page 48066). Both exemptions were remanded for further proceedings. In response to these two remands, the Agency intends to conduct further rulemakings on both the light manufacturing and construction activities under five acres. In the December 18, 1992, Federal Register, the Agency stated that it is not requiring permit applications from construction activity under five acres or light industry without exposure until this further rulemaking is completed.

X. Phase II of the Storm Water Program

95. **What is the difference between Phase I and Phase II of the NPDES storm water program?**

A. In the Water Quality Act of 1987, Congress mandated that EPA establish storm water control programs in two phases. While the first Phase I was defined on November 16, 1990, Phase II regulations were to be promulgated by October 1, 1992. However, the Water Resources Development Act (WRDA) of 1992 extended deadlines for Phase II of the

storm water program as follows: 1) EPA must issue Phase II regulations by October 1, 1993; and 2) permits for Phase II sources may not be required by EPA or the State prior to October 1, 1994. EPA is currently developing regulations that will implement Phase II of the storm water program. (See Question #1 for more information on Phase I).

96. **Will all storm water discharges that are not regulated under Phase I be regulated under Phase II of the storm water program (e.g., service stations, retail and wholesale businesses, parking lots, municipalities with populations of less than 100,000)?**

A. Not necessarily. Statutory provisions require that EPA, in consultation with State and local officials, issue regulations that designate additional Phase II sources for regulation to protect water quality. EPA is currently developing approaches to identify and control high risk Phase II sources. EPA requested initial public comments on a variety of Phase II issues on September 9, 1992 (57 FR 41344). As part of this process, EPA is considering all sources of storm water not regulated under Phase I for potential coverage under Phase II.

Regulatory Definitions

Point source means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff. (See §122.3).

Storm Water Associated with Industrial Activity means the discharge from any conveyance which is used for collecting and conveying storm water and which is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program. For the categories of industries identified in paragraphs (i) through (x) of this definition, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at 40 CFR 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the categories of industries identified in paragraph (xi) of this definition, the term includes only storm water discharges from all areas (except access roads and rail lines) listed in the previous sentence where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water. For the purposes of this paragraph, material handling activities include the: storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are Federally, State or municipally owned or operated that meet the description of the facilities listed in this paragraph (i)-(xi) of this definition) include those facilities designated under 122.26(a)(1)(v). The following categories of facilities are considered to be engaging in "industrial activity" for purposes of this subsection:

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category (xi) of this definition);

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373;

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(l) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or

transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; inactive mining operations are mining sites that are not being actively mined, but which have an identifiable owner/operator;

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under Subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under Subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221-25), 43, 44, 45 and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under paragraphs (i)-(vii) or (ix)-(xi) of this subsection are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with 40 CFR 503;

(x) Construction activity including clearing, grading and excavation activities except: operations that result in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221-25, (and which are not otherwise included within categories (i)-(x))[1].

[1] On June 4, 1992, the United States Court of Appeals for the Ninth Circuit remanded the exclusion for manufacturing facilities in category (xi) which do not have materials or activities exposed to storm water to the EPA for further rulemaking. (Nos. 90-70671 and 91-70200).

Industrial Subclassification of Auxiliary Establishment

[From Standard Industrial Classification Manual 1987, Office of Management and Budget, p. 17]

Central Administrative Offices

Auxiliary establishments primarily engaged in performing management and other general administrative functions centrally for other establishments of the same enterprise.

Accounting offices	Financial offices
Advertising offices	Head offices
Buying offices	Legal offices
Central offices	Lobbying offices
Computer operations facilities	
	Marketing research offices
Corporate offices	Public relations offices
Data processing facilities	Purchasing offices
District administrative offices	
	Recordkeeping offices
Executive offices	Regional administrative offices

Research, Development, and Testing Laboratories

Auxiliary establishments primarily engaged in performing laboratory or other physical or biological research, development, and testing for other establishments of the same enterprise.

Biological research facilities	Industrial laboratories
Chemical laboratories	Laboratories, testing of products
Engineering laboratories	Research laboratories
Food research/testing facilities	
	Testing facilities

Warehouses

Auxiliary establishments primarily engaged in storing raw materials, finished goods, and other products to be used or sold by other establishments of the same enterprise.

Storage yards	Warehouses

Auxiliaries, Not Elsewhere Classified

Auxiliary establishments primarily engaged in providing support services, not elsewhere classified, for other establishments of the same enterprise.

Advertising sales offices
Computer maintenance facilities
Garages: maintenance, repair, motor pools
Milk receiving stations
Recreation centers
Repair shops
Security offices
Showrooms, without sales
Stamp redemption centers
Trading stamp stores
Trucking terminals

MEMORANDUM

SUBJECT: Role of Municipalities in the Implementation of State General NPDES Permits for Storm Water Associated with Industrial Activity

FROM: Eugene Bromley EB
EPA, Region 9 (W-5-1)

TO: Maryann Jones, Storm Water Section
California State Water Resources Control Board

This is in response to your request at the last Urban Runoff Task Force meeting for a justification for asking municipalities to assist the State and EPA in the implementation of the storm water program for industrial sources. You had requested this review pursuant to the development of the State storm water compliance strategy which describes the roles of the various parties involved in the storm water program. You had noted that some municipalities have been reluctant to assist the State in activities such as inspections, monitoring and review of SWPPPs for industrial facilities.

EPA's final permit application regulations of November 19, 1990 (55 Fed. Reg. 47990) set forth the permit application requirements for industries and municipalities and also discuss the implementation of the program over the longer term. These regulations envision a cooperative effort on the part of the NPDES permitting authority and permitted municipalities in the implementation of the industrial storm water program (55 Fed. Reg. 47997). The storm water permit application regulations at 40 CFR 122.26(d)(2)(iv)(C) also specifically require that municipalities develop and implement controls on industrial sources which discharge into the municipal separate storm sewer system (MS4). The permit application must include:

> "description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to Section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial

facilities that the municipal permit application determines are contributing a substantial pollutant loading to the municipal storm sewer system."

The regulations are 40 CFR 122.26(d)(2)(iv)(C)(1) also require that the municipality:

"identify priorities and procedures for inspections and establishing and implementing control measures for such discharges"

and include

a monitoring program for storm water discharges associated with industrial activity identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit . . .

(40 CFR 122.26(d)(2)(iv)(C)(2)).

EPA's Part 2 permit application guidance manual (EPA 833-B-92-002, which has already been provided to the State Board) suggests four specific activities to be undertaken by a municipality to assist NPDES permitting authorities with the implementation of the industrial storm water program. These recommendations are found on page 6-17 in Attachment 1 (excerpted from the EPA guidance manual). These recommendations are similar to the activities which will be implemented in accordance with agreements between the San Francisco Bay Regional Board and Santa Clara and Alameda Counties. The guidance manual also notes that municipalities are ultimately responsible for the discharges from their MS4s and thus it is in the best interests of a municipality to assist in the control of pollutants in storm water from industrial sources which is discharged into the MS4.

The State/municipal partnership is also discussed in the preamble to EPA's recent multi-sector general permit (58 Fed. Reg. 61157, Attachment 2). This discussion generally reiterates and supports the above discussion regarding the role of municipalities in assisting the State with the industrial storm water permit.

For the above reasons, we would recommend that the State compliance strategy ask that municipalities provide some assistance to the State with the implementation of the industrial storm water program. However, the strategy should provide flexibility with regards to the extent and timing of the municipal involvement. Factors such as municipal resources, the

number and nature of industrial facilities in a given area, and the presence or absence of water quality impairments would be factors to consider in setting the requirements at the local level.

For the most part, the draft State compliance strategy (version of October 19, 1993) is already consistent with the above recommendations. Page 5 indicates that municipalities must address industrial storm water discharges, including those subject to the State's general permit. In addition, while the strategy (page 10) indicates that municipalities will "focus" on compliance with local ordinances, this would not exclude activities in support of the State. We suggest that the strategy indicate that municipalities should indeed focus on compliance with local requirements but also engage, as resources allow, in the types of activities discussed in the attachments in support of the State. The strategy should also indicate that while the State would focus on compliance with the general permit, the State would also bring to the attention of a municipality any observed non-compliance with local ordinances which may include special requirements beyond those of the general permit.

These above suggested additional activities by the State and municipalities should not constitute an excessive burden for either since pollution prevention is the basic intent of both the local ordinances and the State general permit. Review by a municipality of an industrial facility for compliance with the State's general permit is simultaneously a useful means for a municipality to evaluate the facility from the perspective of the local program and ensure that appropriate controls are implemented for significant sources of pollutants. Awareness of special local requirements by State inspectors would also enhance the effectiveness of the overall program.

Attachments

Characterization data should also be evaluated. Applicants should analyze quantitative data from representative outfalls to establish a monitoring and control program.

An integral part of this requirement is the adequacy of the applicant's legal authority. If a municipality believes that a discharge of storm water associated with industrial activity violates the industrial facility's NPDES permit limits, but the municipality does not have authority over the discharge, the municipality should contact the NPDES permitting authority for appropriate action. Examples of possible actions by the NPDES permitting authority are:

- For a facility that already has a NPDES individual permit, the permit may be reopened and further controls imposed;
- For a facility covered by a NPDES general permit, an individual site-specific permit application may be required; or
- For a facility not covered by a NPDES storm water permit, a permit may be required.

The municipality is ultimately responsible for discharges from their MS4. Consequently, the proposed storm water management program should describe how the municipality will help EPA and authorized NPDES States:

- Identify priority industries discharging to their systems;
- Review and evaluate storm water pollution prevention plans and other procedures that industrial facilities must develop under general or individual permits;
- Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- Inspect and monitor industrial facilities to verify that the industries discharging storm water to the municipal systems are in compliance with their NPDES storm water permit, if required.

6.3.3.1 Identifying Priorities

Proposed management programs must clearly identify priority industrial facilities.

> §122.26(d)(2)(iv)(C)(1). [The applicant must] identify priorities and procedures for inspections and establishing and implementing control measures for such discharges.

This section discusses how applicants might identify priority facilities. Section 6.3.3.2 discusses how municipalities might develop procedures for inspections and implementation of control measures.

At a minimum, priority facilities include:

- Operating and closed municipal landfills;
- Hazardous waste treatment, disposal or recovery facilities; and
- Facilities subject to SARA Title III.

Municipalities must identify these and other priority industrial facilities and describe the criteria used to identify them. For example, information from the Toxics Release Inventory is one source a municipality could use to identify industrial facilities subject to SARA Title III. Other sources may include CWA Section 205 or 208 use-attainability studies, other studies that indicate a site-specific beneficial use impairment immediately downstream of a storm water outfall, or records of industrial pretreatment programs or other permit programs that identify facilities that may be the source of a use impairment or

TABLE 4.—ADVANCED BMP ALTERNATIVES

Prevention	Containment	Mitigation		Waste disposal

Pneumatic and vacuum conveying	Sealing		Ion exchange	Deep well injection.
Vehicle positioning			Chemical oxidation	Discharge to POTW.
Dry cleanup			Biological treatment	Offsite disposal.
			Thermal oxidation	

3. Traditional Storm Water Management Practices

In some situations, traditional storm water management practices such as grass swales, catch basin design and maintenance, infiltration devices, unlined retention or detention basins, water reuse, and oil and grit separators can be applied to an industrial setting. However, care must be taken to evaluate the potential of many of these traditional devices for ground water contamination. In some cases, it is appropriate to limit traditional storm water management practices to those areas of the drainage system that generate storm water discharges with relatively low levels of pollutants (e.g., many rooftops, parking lots, etc.). At facilities located in northern areas of the country, snow removal activities may play an important role in a storm water management program. In addition, other types of controls such as spill prevention measures can be considered to prevent catastrophic events that can lead to surface or ground water contamination.

4. Diversion of Discharge to Sewage Treatment Plant

Where storm water discharges contain significant amounts of pollutants that can be removed by a sewage treatment plant, the storm water discharge can be discharged to the sanitary sewage system. Such diversions must be coordinated with the operators of the sewage treatment plant and the collection system to avoid worsening problems with either combined sewer overflows (CSOs), basement flooding or wet weather operation of the treatment plant. Where CSO discharges, flooding or plant operation problems can result, onsite storage followed by a controlled release during dry weather conditions may be considered.

5. End-of-Pipe Treatment

End-of-pipe treatment requirements are typically imposed through numeric effluent limitations, which provide the discharger with flexibility to design the most cost effective type of treatment for the given facility.

At many types of industrial facilities, it may be appropriate to collect and treat the runoff from targeted areas of the facility. This approach was taken with 10 industrial categories with national effluent guideline limitations for storm water discharges. There are several basic similarities among the national effluent guideline limitations for storm water discharges:

- To meet the numeric effluent limitation, most, if not all, facilities must collect and temporarily store onsite runoff from targeted areas of the plant.
- The effluent guideline limitations do not apply to discharges whenever rainfall events, either chronic or catastrophic, cause an overflow of storage devices designed, constructed, and operated to contain a design storm. The 10-year, 24-hour storm, or the 25-year, 24-hour storm commonly are used as the design storm in the effluent guideline limitations.
- Most technology-based treatment standards are based on relatively simple technologies such as settling of solids, neutralization, and drum filtration. Potential ground water impacts should also be considered by operators when designing storage devices.

V. The Federal/Municipal Partnership: The Role of Municipal Operators of Large and Medium Municipal Separate Storm Sewer Systems

A key issue in developing a workable regulatory program for controlling pollutants in storm water discharges associated with industrial activity is the proper use and coordination of limited regulatory resources. This is especially important when addressing the appropriate role of municipal operators of large and medium municipal separate storm sewer systems in the control of pollutants in storm water associated with industrial activity which discharge through municipal separate storm sewer systems.

Several key policy factors arise when considering the appropriate strategy for regulating storm water discharges associated with industrial activity through municipal separate storm sewer systems. These factors include the following:

- The role and responsibilities of municipalities to control pollutants from nonmunicipal facilities which are discharged through a storm sewer owned or operated by the municipality.
- The large number of storm water discharges through municipal systems (the Agency anticipates that the majority of storm water discharges associated with industrial activity from many industrial classes discharge through municipal separate storm sewer systems).
- The ability of municipalities to recognize and represent local concerns and considerations.
- The ability of municipal operators to assist EPA and authorized NPDES States in identifying local priorities for controlling storm water discharges associated with industrial activity through specific municipal systems.
- The ability of municipal operators to assist EPA and authorized NPDES States to oversee effectively the development of appropriate site-specific controls for storm water discharges associated with industrial activity through municipal systems and to effectively require compliance with such controls.
- The authorities provided by the CWA (including those provided to the public) to review information developed

under the NPDES program and to enforce NPDES permits.

• The requirements of the CWA to develop and implement the NPDES permit program.

On November 16, 1990 (55 FR 47990), EPA promulgated a permitting scheme where controls for storm water discharges associated with industrial activity through large and medium municipal separate storm sewer systems may be addressed by two permits issued in a coordinated manner. This complementary permit approach envisions cooperative efforts by the permit issuing agency and municipal operators of large and medium municipal separate storm sewer systems to develop programs that will result in controls on pollutants in storm water discharges associated with industrial activity which discharge through municipal systems.

Under the complementary permit approach, storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems are required to obtain permit coverage. Permits for these discharges will establish requirements (such as controls or monitoring) for industrial operators of the discharge into the municipal system. In addition, these permits provide a basis for enforcement actions directly against the owner or operator of storm water discharges associated with industrial activity.

A second permit, issued to the operator of the large or medium municipal separate storm sewer, establishes the responsibilities of the municipal operators in controlling pollutants from storm water associated with industrial activity which discharges through their system. The framework for permits for discharges from large and medium municipal separate storm sewer systems has been developed to establish the responsibilities of the municipal operator to control pollutants discharged through these municipal systems. At the heart of the permit program for discharges from municipal separate storm sewer systems serving a population of 100,000 or more are requirements that municipal applicants develop and implement municipal storm water management programs. The municipal storm water management programs that will be incorporated into NPDES permits for discharges from municipal separate storm sewer systems will generally address (in addition to other possible requirements) the following three major components:

• Reducing pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage and disposal facilities; facilities subject to the Emergency Planning and Community Right-to-Know Act (EPCRA), section 313; and other priority industrial facilities through municipal separate storm sewers.

• Reducing pollutants in construction site runoff through municipal separate storm sewers.

• Identifying and controlling non-storm water discharges to municipal separate storm sewer systems.

These components of a municipal program can initiate the role of the municipality in assisting EPA and authorized NPDES States in implementing controls to reduce pollutants in storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems. Municipal programs to reduce pollutants in industrial site runoff and construction site runoff through municipal separate storm sewer systems specifically will address municipal responsibilities in controlling pollutants from industrial facilities. In addition, programs to identify and control non-storm water discharges to municipal separate storm sewer systems will in many cases focus on industrial areas because these areas often have a high potential for illicit connections, spills or improper dumping.

Consistent with the final permit application regulations published on November 16, 1990, (55 FR 47990), the proposed general permit accompanying this fact sheet have been developed to assist in establishing a cooperative approach between EPA and municipal operators of large and medium municipal separate storm sewer systems for controlling pollutants from storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems. These requirements will be coordinated with requirements in permits for discharges from large and medium municipal separate storm sewer systems. Major features of the proposed general permit that establish the framework for this cooperative approach include:

• Operators of storm water discharges associated with industrial activity which discharge through a large or medium municipal separate storm sewer system may be required to submit a copy of the notice of intent to the municipal operators of large or medium municipal system receiving the discharge.

• Requirements to monitor and reduce pollutants in discharges will be established for storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems (as well as other storm water discharges associated with industrial activity). Any records, reports, or information obtained by the Director as part of the permit implementation process, including site-specific storm water pollution prevention programs that are developed pursuant to the proposed general permit, are available to municipalities under section 308(b) of the CWA. This will assist municipalities in reviewing the adequacy of such requirements and developing priorities among industrial storm water sources.

• Industrial permittees with discharges through large and medium municipal systems may be required to submit discharge monitoring reports to municipal operators of these systems (as well as to the permitting issuing agency) or other monitoring results as required by the operator of the municipal separate storm sewer to assist the municipal operator in identifying priorities.

These permit conditions, along with appropriate conditions in permits for discharges from large and medium municipal separate storm sewer systems, will allow municipal operators of these systems to assist EPA in:

• Identifying priority storm water discharges associated with industrial activity to their system

• Reviewing and evaluating storm water pollution prevention plans

• Compliance efforts regarding storm water discharges associated with industrial activity to their municipal systems.

VI. Summary of Common Permit Conditions

The following section describes the permit conditions common to discharges from all the industrial activities covered by today's permit. These conditions reflect the baseline permit requirements established for most regulated industries in EPA's General Permits for Storm Water Discharges Associated with Industrial Activity (57 FR 41344–41358 September 9, 1992, and 57 FR 44438–44470 September 25, 1992). Permit requirements which vary from industry to industry are discussed in part VIII of this fact sheet.

Subject: TRANSMITTAL OF THE FINAL STORM WATER COMPLIANCE STRATEGY

By way of this memorandum, I am transmitting to you the attached final Storm Water Compliance Strategy (Strategy). This final Strategy incorporates many comments submitted by your staff and the regulated community. As a result, this document is a much stronger and cohesive document than the one which was previously transmitted to you on November 5, 1993. The Strategy is viewed as a dynamic document which will change during the coming years as the Storm Water Program matures.

The program priorities and goals laid out in the Strategy are consistent with those of the Urban Runoff Task Force, the U.S. Environmental Protection Agency, and the workplans which have been developed for the Storm Water Program.

Should you have any questions or comments regarding the Strategy or the Storm Water Program in general, please call me at (916) 657-0756 (CALNET 437-0756). You may also contact Bruce Fujimoto, Chief of the Storm Water Unit at (916) 657-0908 (CALNET 437-0908).

CALIFORNIA STORM WATER COMPLIANCE AND ENFORCEMENT STRATEGY (Strategy)

Introduction

This document provides an overview of the State, federal and urban storm water programs and defines the relationship between each of these programs. It outlines the authority, roles, and responsibility of each organization in implementing and enforcing the elements of the storm water program. It also provides guidance to the agencies and to the regulated community regarding each organization's role in compliance and enforcement activities. The goal of the State storm water program is to proactively promote an effective storm water program that maximizes coverage of industrial facilities. The Strategy encourages minimum interference with business activities by coordinating the various agencies activities and by encouraging interagency cooperation to avoid duplication of effort. As with the federal storm water program, the long term goal of this program is full participation and compliance by the entire regulated community.

Background

Storm water runoff has been shown to significantly affect water quality. Rainfall picks up a multitude of pollutants as it falls on and drains off streets and parking lots; construction and industrial sites; and mining, logging, and agricultural areas. The pollutants are carried off by the runoff as it drains from these surfaces. Through natural processes or manmade-systems, the runoff flows through a wide variety of drainage features, scouring accumulated pollutants out of gutters, catch basins, storm sewers, and drainage channels. The runoff, carrying the

pollutants, eventually ends up in surface water bodies such as creeks, rivers, bays and oceans.

To provide a general assessment of the water quality of waters of the United States, the federal Water Pollution Control Act [Clean Water Act (CWA)] requires states to submit biennial reports to the Administrator of U.S. Environmental Protection Agency (USEPA) describing the quality of their waters. These reports list nonpoint sources as significant sources of water quality degradation. One of the sources of pollution shown to significantly affect water quality is urban and industrial storm water runoff. Runoff from urban and industrial areas may exceed water quality criteria and exhibit acute and chronic toxicity. Studies show that the mass loading of specific substances in municipal storm water, such as heavy metals, often exceeds the mass loading of these substances discharged from municipal treatment plants.

In 1972, the CWA was amended to provide that the discharge of pollutants to waters of the United States from point sources, such as a storm water conveyance systems, is effectively prohibited, unless the discharge is permitted through a National Pollutant Discharge Elimination System (NPDES) permit. The 1987 Amendments to the CWA required USEPA to establish final regulations for storm water discharge under the NPDES program using a phased approach. It established phased permit application requirements, permit issuance deadlines, and permit compliance conditions for various categories of storm water discharges associated with municipal and industrial activity.

In 1990 USEPA issued the regulations for permitting of municipal and industrial storm water discharges. California, as a delegated NPDES permit state, issues permits for storm water

through State Water Resources Control Board (State Water Board) and the nine Regional Water Quality Control Boards (Regional Water Board).

Strategy for Compliance

The goal of the storm water program is full compliance by all regulated entities. State and Regional Boards have developed priorities to achieve this goal.

Municipal--The priorities in the municipal program are to:

- Issue permits to all entities requiring municipal permits;
- Work with municipal permittees to develop adequate program elements;
- Evaluate effectiveness of the municipal permittees program elements; and
- Provide outreach and technical support to municipal permittees.

Industrial--The priorities in the industrial program:

- Identify industrial facilities including construction projects that require a permit;
- Issue permits to all industrial facilities and construction projects that require a permit;
- Disseminate information about industrial storm water program compliance;
- Develop forms and procedures to improve the transfer of information; and

- Perform industrial compliance evaluation and inspections as time permits.

Agency Roles and Responsibilities

USEPA--The federal storm water program is under the jurisdiction of USEPA. In states that do not have primacy for NPDES permitting, USEPA is the permitting agency and directly oversees both the municipal and industrial programs. In California, State Water Board administers the storm water program; however, USEPA, through its Region 9 office in San Francisco, retains its authority to ensure compliance with the federal storm water regulations. USEPA participates cooperatively with the Regional Water Board in evaluating the effectiveness of storm water programs and determining whether permittees are in compliance with the storm water regulations. USEPA can initiate enforcement actions and has done so in California in support of the Regional Water Board actions.

USEPA Headquarters in Washington, D.C., has indicated that they believe that urban storm water programs are the heart of the national program. USEPA Headquarters also has indicated that by the expiration date of the first permits in 1995, they will announce plans to independently evaluate the compliance of urban permittees with their permits. USEPA may take enforcement action against urban permittees who are not in compliance with their storm water NPDES permit. This enforcement action may be either administrative or civil and may include corrective action and/or the assessment of penalties up to $25,000 per day.

State Water Board--State and Regional Water Boards are the primary agencies in charge of storm water permitting and compliance in California. State Water Board administers the

program and develops statewide policies and procedures. State Water Board also hears appeals of Regional Water Board actions or inaction.

State Water Board adopted two general storm water permits, one for industrial activities and one for construction activity. State Water Board has the primary administrative responsibility for the two permits. State Water Board processes all Notice of Intents (NOIs) to comply with the permit, issues the permit to facilities, handles permit billing, searches for non-filers, and provides assistance and guidance to Regional Water Boards.

Regional Water Boards--Regional Water Boards directly implement the regulations and enforce the permits. Regional Water Boards adopt urban permits for the municipalities designated by the federal regulations. In addition, they determine if there are other cities or urbanized areas that require permits based on either discharge or receiving water criteria and designate those areas for permit compliance.

Regional Water Boards directly administer the general industrial and construction permits issued by State Water Board and assist State Water Board in the search for nonfilers. They also have the option to develop their own general permits for industry or to issue individual permits for a specific industry. They may require a facility to have an individual permit or incorporate storm water permit requirements into existing NPDES permits as they are renewed.

Regional Water Boards develop their own regional priorities and procedures, as well as coordinating with State Water Board and other Regional Water Boards in the development of statewide policies and procedures. If a permittee is out of compliance

with its permit, Regional Water Board is the first line of enforcement.

State and Regional Water Boards and USEPA coordinate their storm water programs through the Urban Runoff Task Force. This task force provides a forum for discussion of storm water issues and for development of statewide policies and procedures.

Urban Permittees--Urban permittees are responsible for implementation of their municipal permit elements. One of these program elements is the control of industrial storm water discharges to urban storm drain systems. USEPA's final permit application regulations of November 19, 1990 (55 Federal Register 47990) set forth the permit application requirements for industries and municipalities and discuss the implementation of the program over the longer term. These regulations envision a cooperative effort on the part of the NPDES permitting authority and urban permittees in the implementation of the industrial storm water program (55 Federal Register 47997). The storm water permit application regulations at 40 Code of Federal Regulations (CFR) 122.26(d)(2)(iv)(C) also specifically require that municipalities develop and implement controls on industrial sources which discharge into the municipal separate storm sewer system (MS4). The Permit application must include:

> "...description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to Section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit application

determines are contributing a substantial pollutant loading to the municipal storm sewer system."

The regulations 40 CFR 122.26(d)(2)iv)(C)(1) also require that the municipality:

> "...identify priorities and procedures for inspections and establishing and implementing control measures for such discharges"

and include:

> "...a monitoring program for storm water discharges associated with industrial activity identified in paragraph (d)(2)(iv)(C)."

In addition, the USEPA Part 2 Permit Application Guidance Manual (EPA 833-B-92-002) suggests four specific activities to be undertaken by a municipality to assist NPDES permitting authorities with the implementation of the industrial storm water program. These activities are to:

- Identify priority industries discharging to their systems;
- Review and evaluate storm water pollution prevention plans (SWPPP) and other procedures that industrial facilities must develop under general or individual permits;
- Establish and implement Best Management Practices (BMPs) to reduce pollutants from these industrial facilities (or require industry to implement them); and
- Inspect and monitor industrial facilities to verify that the industries discharging storm water to the

municipal systems are in compliance with their NPDES storm water permit, if required.

Urban permittees are also required to have a program to address pollutants from industrial and commercial facilities that do not fall under the State's General Industrial Permit. They are also required to address storm water pollution from residential areas and roads.

Individuals/Special Interest Groups--An important feature of the CWA is Section 505 which allows a concerned individual or a special interest group to enforce compliance with the storm water program through the courts by means of citizens suits. Although they play no role in the State's enforcement of the storm water program, State and Regional Water Boards will cooperate with these groups or individuals when requests are made. All records, information, and data collected by the State, USEPA, and local agencies as part of the storm water program are available to the public.

American Public Works Association, California Storm Water Quality Task Force (Task Force)--The Task Force was formed at the beginning of the storm water program in California by municipal agency representatives through the American Public Works Association. The Task Force was designed to give municipal officials with responsibility for storm water programs a forum for discussion of permit compliance. A major goal of the Task Force, in addition to municipal program compliance, has been to inform industry about the requirements of the storm water program and to promote a proactive approach to compliance with the federal regulations. Task Force meetings have been held monthly beginning in January 1990. Task Force members intend to continue working together in this manner to promote a uniform and

consistent approach to carrying out the State's storm water program. In addition, the Task Force members are available to participate in locally sponsored seminars and workshops and to meet with industrial groups or other interested parties as requested.

The Task Force has conducted many informational workshops and with the State has funded preparation of three BMP manuals for municipal, industrial, and construction activities. Each manual contains suggested procedures, forms, tables, material lists, and descriptions of BMPs to assist permit holders to understand and comply with the storm water general permits. In addition, the industrial and construction BMP manuals explain how to prepare a SWPPP. It is the intention of the State agencies and the Task Force to periodically review and update the manuals to make them more useful.

Municipal Storm Water Permits

Requirement for Municipal Permits--Any municipality owning or operating a MS4 is required to obtain an NPDES permit if the population within the geographic boundaries of the municipality fits the criteria for either a large or medium system. A large MS4 serves a population greater than 250,000. The urbanized population may be in either an incorporated area or an unincorporated area. A medium MS4 serves a population between 100,000 and 250,000. In addition, Regional Water Board can designate other urban areas as requiring a storm water permit. A municipality can be designated because its system is interconnected with other municipal systems, or because of the location of its discharge in relation to the discharges of another municipal system, or because of the quantity and nature of the pollutants being discharged causes or threatens to cause a

violation of water quality standards. In addition, Regional Water Board can also designate a municipality because of the nature of the receiving waters or because of other relevant factors.

The original designation of municipalities as large or medium was based on the 1980 census. Other municipalities, including two in California, were added to the list of cities requiring permits based on the 1990 census. However, the time frame for obtaining those permits has not been established.

The Permitting Process

The Regional Water Board adopts the permit for the municipalities in its region. Urban permittees that serve areas that are in more than one region are required to have a permit from each Regional Water Board that they fall under. Urban areas that require a permit will usually have multiple government agencies that require the permit. In addition to the governing board of the city and the agency which has responsibility for the MS4, any agency that maintains a road system in the permitted area is required to have a permit. This often brings the county and the California Department of Transportation into the permitting process.

The Regional Water Board may also designate cities or counties that have MS4s that discharge into the MS4 that is required to have a permit or that discharge near or into a water body that the MS4 discharges into. Often times, some or all of the government agencies in an area will cooperate and obtain a single areawide permit. The co-permittees are then expected to work cooperatively to develop a coordinated program. One of the permittees, usually either the county or the agency with

responsibility for the MS4, acts as the lead permittee. The other co-permittees submit their reports to the lead permittee who then provides the Regional Water Board with a single report and other materials required to demonstrate compliance with the terms of the NPDES storm water permit.

Early Permits--Recognizing the importance of the impact of storm water discharges on the water quality of receiving waters, many Regional Water Boards began regulating storm water discharges and conducting urban/storm water runoff studies in the 1980s. Anticipating the USEPA regulations for municipal storm water permits, the Regional Water Boards brought the large urban areas in California into the storm water program by adopting NPDES permits in 1990. These so-called "early permits" were issued under the existing NPDES regulations, but they were intended to address all the requirements of the proposed USEPA storm water regulations. In general, because they were issued before the regulations were published, the time frame for compliance with each of the permit elements was longer. The standard for compliance, however, is the federal storm water regulations. If the permit requirements are not as stringent as the federal requirements, the permits must be amended, or the deficiencies must be addressed when the permit is renewed.

Permits under Federal Regulations--USEPA instituted a two part application process. Part I applications from large urban areas were due November 1991; applications from medium urban areas were due May 1992. The Part I application requires information on existing programs and requires the permit applicants to show that they have the legal authority to conduct a storm water program. It also requires the applicants to submit results from field screening of major outfalls to detect illicit connections. Part II applications from large urban areas were due

November 1992; those from medium areas were due May 1993. The Part II application requires a demonstration of adequate legal authority, an additional information on pollutant sources and outfalls, a limited amount of representative quantitative sampling data, a proposed monitoring program, a proposed storm water management program, an estimate of the effectiveness of storm water controls, and a fiscal analysis. The Regional Water Board is required to adopt a permit based on the data submitted in the Part I and Part II applications within 12 months of the submittal of the Part II application.

Medium MS4s under the 1990 Census--USEPA has not given these municipalities dates for compliance. However, both of the affected urban systems in California are preparing permit applications consistent with the federal regulations.

Urban Permit Requirements

The intent of the storm water permitting program is to allow the permittees flexibility to develop and implement a storm water program that is tailored to the needs of the community. The permit requires that the urban permittee implement a program to reduce the pollutants in its storm water to the maximum extent practicable (MEP). MEP is not specifically defined in the CWA or by USEPA in the NPDES regulations. However, in order to achieve compliance with MEP, five program elements must be addressed:

- *Funding* of the program;
- *Legal authority* to carry out the program;
- *Industrial program*, including an illegal discharge and illicit connection program;
- Implementation of a *BMP* program; and
- Implementation of a *monitoring* program.

Funding--Urban permittees must demonstrate that they have a stable source of funding that will allow them to fund the various program activities including a public information program. Regardless of the availability of State or federal funds, urban permittee permittees must fund program activities required by the permits and identified in their annual submittal to the Regional Water Boards. Funding storm water management programs is a major hurdle for local agencies. Failure to adequately fund a local program is a program deficiency subject to enforcement action by the State and Regional Water Boards.

Legal Authority--Urban permittees are required to obtain legal authority including:

- Authority to regulate discharges from industrial sites, including elimination of illicit discharges, controlling discharges form spills, dumping or disposal, pollutant transfer from one area to another, and discharges from construction sites;
- The ability to require compliance with the ordinance; and
- The ability to carry out inspections.

Industrial Program--Urban permittees have a unique role in the storm water program. They must develop a storm water program to reduce the discharge of pollutants from all of their urban areas. This requires them to institute a management plan for residential areas, commercial facilities, roads and parking lots, construction and industrial facilities that are not required to have a NPDES permit, as well as construction projects and industrial facilities that fall under the NPDES storm water permitting requirements. The regulations require that urban permittees take an active role in assuring that regulated

industrial facilities comply with their general permits. The urban permittee must implement a BMP program or require the discharger to implement a BMP program that will control these discharges.

Permittees must also have a program for detection of illegal discharges and illicit connections to the MS4.

BMPs--The BMP program selected by the urban permittee should address the particular needs of their community. The BMP program must include a public education component, as well as measures to control pollution from construction sites, industrial facilities, roads, and parking lots. It must also address pollution from municipal facilities such as corporation yards, maintenance facilities, and municipal parking lots.

However, while the State and Regional Water Boards have not set a standard for BMPs, experience in the municipal programs established under the early permits has led to a selection of BMPs that are reasonable in price and are also effective. The Task Force also put out a manual of information on various BMPs that are suitable for a municipal program.

In selecting BMPs, it is important to remember that municipalities are responsible for reducing the discharge of pollutants in storm water to the MEP. This means choosing effective BMPs. Applicable BMPs should only be rejected when other effective BMPs will serve the same purpose. The BMPs are not to be technically feasible or the cost prohibitive. The following factors may be useful to consider:

- Effectiveness: Will the BMP address a pollutant of concern?

- Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?
- Public Acceptance: Does the BMP have public support?
- Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?

- Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc.?

Monitoring--Finally, permittees are required to conduct a monitoring program to determine whether the storm water discharge meets water quality standards and to evaluate the effectiveness of their industrial and BMP programs.

All urban permittees must submit annual reports to the Regional Water Boards describing and evaluating their storm water management programs and their plans for improving the programs. These reports must demonstrate to the Regional Water Board that the permittees are in compliance with their permits by showing that the permittees' storm water management program is reducing pollutants to MEP through adequate implementation of the five required program elements. If any of the five elements are missing or inadequate, then the permittee has not achieved MEP. The Regional Water Boards will rely on information in the annual submittal from the urban permittees to provide convincing evidence that a permittee is implementing a storm water management program which results in the reduction of the discharge of pollutants to MEP.

Industrial Storm Water Permits

Requirement for industrial permits--USEPA regulations require 11 categories of industrial facilities to obtain permits for the discharge of storm water associated with industrial activity. Industrial activities include the transfer or storage of raw materials, the industrial or manufacturing process, the transfer or storage of the final product, and any transfer, storage or disposal of waste materials. Construction activity that involves five or more acres of land disturbance is one of the 11 industrial categories that must obtain a permit.

A General Industrial Activity Storm Water Permit was adopted on November 19, 1991 and amended on September 17, 1992. This permit is for use by all categories of industry subject to the storm water permit regulations except for construction activities. A second permit, the General Construction Activity Storm Water Permit, was adopted on August 20, 1992. In addition, Regional Water Boards can issue their own general permits or individual permits.

The San Francisco Bay Regional Water Board has developed a General Industrial Permit for the Santa Clara Valley. Industries in Santa Clara County are required to use that permit rather than the State Water Board Permit. Industries can also request an individual permit from the Regional Water Board. The process is time consuming and costly, however, and the Regional Water Board can refuse. Some industrial facilities in California have NPDES permits that are unrelated to storm water discharge. As these permits are reissued, the Regional Water Boards are incorporating the storm water requirements into these existing NPDES permits.

Compliance with the storm water regulations has been required since October 1, 1992. The permits regulate discharges of storm water from industrial activities to MS4, as well as direct discharges to waters of the nation. The State Water Board has adopted two general permits for industrial storm water discharges. To obtain coverage under the State's general permits, an industrial facility submits a NOI to the State Water Board. The NOI notifies the State that the industrial facility intends to comply with the federal regulations by complying with one of the State's general permits. All industrial facilities must do three things: (1) eliminate illicit discharges and illegal connections to the MS4, (2) prepare a SWPPP, and (3) conduct a monitoring program. An annual report, including monitoring program results, must be submitted to the appropriate Regional Water Board each year on July 1. The requirements for construction activities are similar except that sampling, analysis, and annual reports are not required unless directed by a Regional Water Board.

The State Water Board and Regional Water Boards have undertaken activities to make industries aware of the program. This has included mailings to industrial facilities that may need permits, contact with trade organizations, and displays at conferences such as HAZMACON. State and Regional Board staffs have also given talks at meetings and conferences and have set up informational seminars on compliance with the permit. Other Regional Water Board activities include storm water compliance newsletters or other mailings and computer bulletin boards that facilities can access for information. In addition, State and Regional Water Board staffs field phone calls from the public.

The State Water Board is in the process of setting up an electronic storm water bulletin board. The bulletin board will

give information on proposed program revisions, dates for meetings, sources of information and assistance, and generally make it easier to obtain information about the program. The bulletin board is expected to be operational in early 1994. When the bulletin board is operational, the State will notify all permittees, and other interested persons.

A statewide industrial database is being developed by the State Water Board. An early use of the database will be to identify industries that should be covered under the storm water permit and to provide State agencies and other parties with a mailing list to distribute materials regarding the storm water program. After the database becomes available, the information will be shared with the public agencies involved in the program and other interested parties.

Noncomplying Industries

It is important that all industrial facilities that are required by federal regulations to obtain storm water permits do so. Therefore, particular attention will be given to notifying industries of the need to comply and the method for obtaining coverage under the State's general permits. Considerable effort has already been put into conducting outreach activities to inform industry about the storm water program and how best to obtain a permit. At this time, a more aggressive search for industries that have not obtained a permit (nonfilers) has been initiated. The municipalities and USEPA will assist the State and Regional Water Boards in identifying suspected nonfilers through whatever means are available to them.

As the permitting agency, the State Water Board has the primary responsibility for ensuring that all facilities that require a

permit obtain one. The State Water Board maintains a database of industries that have submitted NOIs. A comprehensive statewide industrial database is also being prepared by the State Water Board. Until the statewide database is available, the State will attempt to acquire other databases containing information on industry and compare them to the NOI database to identify nonfilers. The Regional Water Boards will be given the opportunity to verify that the industries identified by this process are subject to regulation under the State's general permits. USEPA and the Regional Water Boards are also independently conducting activities, as time and funding permit, to identify nonfilers.

In addition to the State's efforts to identify nonfilers, the urban permittees are required under the regulations to identify industrial dischargers to their MS4. They can either contact the discharger directly with parallel notification to the Regional Water Board, or they can give the information to the State or Regional Water Board.

Either the State Water Board or the Regional Water Board will then contact the facilities that have not complied and give the facility a time schedule to submit a NOI, prepare a SWPPP, and prepare a monitoring plan. Industries that have not complied with the storm water regulations are subject to enforcement action. Enforcement is usually taken by the Regional Water Boards, but it can also come from the State Water Board or USEPA.

Industrial Compliance Activities

Under the General Permit, a facility is required to develop a SWPPP and a monitoring and reporting program (M&RP). The SWPPP is a plan that the facility will implement to reduce the

discharge of pollutants to its storm water runoff to meet Best Available Technology/Best Conventional Technology (BAT/BCT) standards. The current acceptable technology to achieve the standards is the use of BMPs.

The General Permit prohibits nonstorm water discharges. Nonstorm water discharges can be in the form of illicit connections and/or illegal dumping. Industries regulated by the General Permit are responsible for the inspection and certification of their facilities to ensure the elimination of illicit connections and the prevention of illegal dumping as part of their SWPPP.

Regional Water Boards individually, or cooperatively with local agencies, evaluate an industrial discharger's compliance with the General Permit. Compliance activities include the following activities: review of the SWPPP, M&RP, and annual report; conduct a site inspection; and review other documents pertaining to a facility's storm water program. Regional Water Boards and urban permittees will inspect industrial facilities to review SWPPPs and monitoring programs, to determine whether the SWPPPs and monitoring programs are being implemented, and to evaluate the potential effectiveness of the BMPs that are being used at the site to prevent pollution of storm water.

The State and Regional Water Boards, in cooperation with the Task Force, will develop model SWPPP evaluation checklists and compliance inspection reports to achieve consistent program implementation. Facilities that have filed a NOI but have not prepared a SWPPP and monitoring program are subject to enforcement action.

After an inspection is complete, industries will be provided a copy of the inspection report which will notify them of BMPs

found to be inadequate or areas of industrial activity in which exposure has not been adequately addressed. The discharger will be provided an opportunity to demonstrate or justify the adequacy of its BMPs or SWPPP. If the discharger cannot adequately demonstrate or justify its actions or inaction the discharger will be requested to take action necessary to bring its facility into compliance. If an industry fails to comply, Regional Water Board staff may pursue enforcement action.

Urban Permittees--The federal regulations require that the urban permittees take an active role in the industrial compliance program, including identification of dischargers to their systems, review of SWPPPs, implementation of BMPs, and inspection and monitoring of facilities. Urban permittees and Regional Water Boards should develop a coordinated compliance inspection program strategy which considers known water quality problems, categories of industries, response to incidents, etc. Municipal compliance inspection programs will focus on compliance with local ordinances. The ordinances should be written so that they complement the State's requirements and so that compliance with the ordinance will require compliance with the State's General Permit. Inspections should be conducted as part of, or in coordination with, other regulatory programs including pretreatment, HAZMAT, etc. Violations of the State General Permit will be referred to the Regional Water Board for enforcement. Regional Water Board industrial inspection programs will focus on compliance with the industrial general permit provisions and will be coordinated as closely as possible with municipal inspections. Violations of the Municipal Ordinance will be referred to the municipality for enforcement. In some regions, Regional Water Board staff will focus primarily on those areas outside the jurisdictional boundaries of the municipal permittees.

Failure of regulated industries to eliminate pollutants in their storm water discharges could make it very difficult for urban permittees to comply with their urban system permits because the urban permittees are legally responsible for the discharges along with the industrial facility. Permittees are required to meet all water quality standards.

Enforcement

The enforcement options for the Storm Water Program are the same for both the municipal and the industrial storm water programs. Each of the regulatory agencies has authority to initiate enforcement action at any time there is a violation or threatened violation to a permit, regulation, or statute. Determination that there has been a violation or that there is a threatened violation would be made through the compliance activities discussed in the previous sections.

USEPA authority for enforcement comes from the CWA. The State and Regional Water Boards enforce the Porter-Cologne Water Quality Control Act (Water Code), as well as the NPDES permit, regulations, and statutes. The authority provided in the CWA and Water Code includes the issuance of Administrative Civil Liability (ACL) Orders and provides for injunctive relief. Urban permittees enforce local ordinances.

The first line of enforcement in California is the Regional Water Board. The Regional Water Board can choose from a variety of enforcement options, all of which are also available to the State Water Board. The enforcement options available to the State and Regional Water Boards include: Notice of Violation (NOV), Cease and Desist Order (CDO), Cleanup and Abatement Order (CAO), ACL Orders, and referral to the Attorney General.

Initially, noncompliance will be dealt with by Regional Water Board staff working with the industry to try to obtain compliance or with a NOV. If working cooperatively to achieve compliance fails, the Regional Water Board can pursue other enforcement options including issuing an ACL Order. A Regional Board Executive Officer may issue an ACL complaint. A public hearing with the Regional Water Board will then be scheduled for 60 days after a complaint is issued. The person issued the complaint can waive the right to a hearing (meaning they agree to pay the complaint).

ACL Orders do not included time schedules. If Board staff finds a schedule is necessary, this is typically done through the issuance of an enforcement order which is typically adopted by the Board concurrently with either the payment of the complaint, or the issuance of an ACL Order.

Another enforcement option is the issuance of a CDO. CDOs can be issued to a person or persons that have been issued waste discharge requirements (a permit). CDOs require action and almost always include time schedules for the dischargers to achieve compliance.

In the absence of waste discharge requirements, a CAO may be issued. This would be applicable for enforcement action against an industrial facility or construction site that has not obtained coverage under the storm water general permits.

Cases can be referred to the Attorney General at any point in the enforcement process for resolution in the courts. This may involve enforcement of a CDO or ACL Orders or the issuance of injunctive relief or penalties by the court.

The most immediate enforcement actions that will be taken will be against nonfilers. The State general industrial permit requires industries to submit NOIs by April 1, 1992. Industries that were in existence before April 1, 1992 and that have not filed NOIs may be required to pay a penalty. Because compliance with the Storm Water Industrial Permit has costs associated with it, industries that are currently in compliance are at an economic disadvantage. Some currently permitted industries have requested that fines be imposed on noncomplying industries. Penalties will be based on factors required by statute, including the costs that the facility avoided by not complying. These costs include: the NOI fee, the cost of SWPPP development, the cost of BMPs implementation, and the cost of monitoring. Penalties will be in addition to the requirement of submitting the NOI along with the first year's annual permit fee. Penalties may be assessed by either the State Water Board or the Regional Water Boards.

Urban permittee enforcement authority must be included in local ordinances. Local agencies cannot enforce permits or other orders issued by the State or Regional Water Boards. Local agencies enforce violations of the local urban program. The local ordinance should contain language that is as stringent as the State's requirements. Compliance with the ordinance should lead to compliance with the State's General Permit. If the urban permittee determines that violations of the State's General Permits have occurred, it will refer the violation to the Regional Water Board for action. Violations of local ordinances will be dealt with by local agencies. Local agencies and the Regional Water Boards will coordinate their enforcement efforts so as to avoid more than one agency enforcing against an industrial facility. When local agencies find it necessary to refer permit violations to the Regional Water Board, USEPA will be notified concurrently.

USEPA has the authority to enforce any aspect of the program that derives from the CWA or the federal storm water regulations. This authority will be used by USEPA to implement national enforcement directives issued by USEPA, Washington D.C., and to assist State and local agencies to ensure program compliance.

USEPA can decide to pursue its own enforcement initiative against an industrial facility in the absence of or regardless of any enforcement action being taken by a urban permittee or the Regional Water Board. However, whenever possible, USEPA will work cooperatively with a Regional Water Board or urban permittee when initiating enforcement against an industrial facility.

The sequence of enforcement actions that USEPA uses are:

1. NOV--Includes a Finding of Violation under the CWA, such as failure to comply with NPDES permit provisions. (Examples of violations are: not achieving dates in time schedules to implement a storm water program for an urban permittee or failure to develop or implement a SWPPP for an industry.) The NOV is sent to the municipality or industrial facility in violation with a copy to the Regional Water Board. The Regional Water Board is notified at this time that they have 30 days to take appropriate enforcement action against the discharger receiving the NOV, or USEPA will take action.

2. Administrative Order (AO)--The AO directs the violating facility to come into compliance, usually by setting a time schedule. No penalties are assessed.

3. Administrative Penalty Order (APO)--Class 1 (up to $25,000) and Class 2 (up to $125,000) penalties can be

assessed for past violations or can include a consent order for any action needed to bring the facility into compliance with a permit or the CWA.

4. Civil referral to the U.S. Department of Justice for penalties (up to $25,000 per day per violation of a permit or the CWA) includes a negotiated consent decree for corrective action or a federal court order if the case proceeds to a judicial conclusion.

5. Criminal referral to the US Department of Justice for willful or negligent violations.

An important feature of the federal CWA is the ability of a concerned individual or special interest group to take action independently in the courts to require compliance with the law. Information in State and federal files and databases is available to anyone for use in determining the compliance status of permitted dischargers. If the court rules in favor of the individuals or special interest groups, they may recover the costs they incurred in taking the action.

Future Activities

This document is intended to be an organic document that will evolve as the program develops. While the thrust of the program in the beginning will be to develop the municipal programs and to bring all appropriate industries into the permitting process, this emphasis will change as the program grows. Other topics that may be included in the future are funding of the program and the development of training programs.

GLOSSARY OF TERMS

ACL--ADMINISTRATIVE CIVIL LIABILITY

AO--ADMINISTRATIVE ORDER

BAT/BCT--BEST AVAILABLE TECHNOLOGY/BEST CONVENTIONAL TECHNOLOGY

BMP--BEST MANAGEMENT PRACTICES

CAO--CLEAN UP AND ABATEMENT ORDER

CDO--CEASE AND DESIST ORDER

CFR--CODE OF FEDERAL REGULATIONS

CWA--CLEAN WATER ACT

MEP--MAXIMUM EXTENT PRACTICABLE

M&RP--MONITORING AND REPORTING PROGRAM

MS4--MUNICIPAL SEPARATE STORM SEWER SYSTEM

NOI--NOTICE OF INTENT

NOV--NOTICE OF VIOLATION

NPDES--NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

REGIONAL WATER BOARD--REGIONAL WATER QUALITY CONTROL BOARD

SARA--SUPERFUND AMENDMENTS AND REAUTHORIZATION ACT OF 1986

SWPPP--STORM WATER POLLUTION PREVENTION PLAN

STATE WATER BOARD--STATE WATER RESOURCES CONTROL BOARD

TASK FORCE--AMERICAN PUBLIC WORKS ASSOCIATION CALIFORNIA STORM WATER QUALITY TASK FORCE

MEMORANDUM

SUBJECT: Storm Water Enforcement Strategy

FROM: Michael B. Cook, Director
Office of Wastewater Enforcement and Compliance

Frederick F. Stiehl
Enforcement Counsel for Water

TO: Water Management Division Directors
Regions I-X

Regional Counsels
Regions I-X

Attached is the Storm Water Enforcement Strategy for FY 1994-1995. This strategy incorporates comments received from Regions and States on two draft versions as well as input by an EPA/State Storm Water Workgroup. The Workgroup meeting in February included representatives from Headquarters, three Regions, and two States.

The strategy focuses on getting regulated entities "into the system" by identifying and taking action against Municipal Separate Storm Sewer System (MS4) entities and facilities that have not filed a permit application. While the approach to dealing with the MS4 universe is relatively straightforward, the large remaining number of regulated facilities requires that we utilize different approaches than we have in the past to deal with noncompliance. Some approaches utilize "sweeps" which concentrate activity in a watershed or geographic location. Such activities may be mailings, telephone canvassing or inspections and then publication of these activities in order to give visibility to the program. Regions will also want to review any active judicial cases to determine whether a facility is subject to the storm water regulations, coordinate with municipalities regarding facilities within its jurisdiction, and inquire as to the status of a facility's permit application during routine NPDES inspections. Citizen complaints and contact with local sediment/erosion control programs will also be an important source of information for construction sites.

VOL 23

0845

Three points from the strategy are worth highlighting: 1) Section 308 letters may be used to request the submittal of a NOI/permit application from more than nine addressees nationwide; 2) a storm water discharge need not be observed in order to determine inclusion in the program (but evidence of a conveyance for a discharge must exist), and; 3) failure to apply for a permit is a violation of Section 308, as this section requires reports or other information to carry out Section 402.

Although this strategy was developed for use by EPA Regions, States may want to adopt a similar approach to enforcement. Several Regions have begun compliance/enforcement activities and we need to share information about Regional as well as State activities. The National Storm Water Coordinators' Meeting, scheduled for February 2-4, 1994 in Washington, DC, will be an excellent opportunity to exchange ideas and experiences about the compliance/enforcement issues of the program.

Finally, we want to thank Gerry Levy of Region I for his participation as leader of the Storm Water Workgroup. If you have any questions regarding the strategy, contact David Lyons at (202)-260-8310 or John Lyon at (202)-260-8177.

STORM WATER ENFORCEMENT STRATEGY
FY 1994-1995

Summary

The goal of this enforcement strategy is: Equitable and consistent enforcement against non-complying priority storm water dischargers used in combination with incentive measures to achieve compliance. Full participation and compliance by the entire regulated community is the long term goal of this strategy, as it is for all the Agency's enforcement strategies. Although this strategy was developed for use by EPA Regions, approved NPDES States may want to adopt a similar approach when developing their enforcement strategy.

Outreach has been the primary mechanism used thus far to achieve compliance. To provide for a nationally coordinated effort, starting in FY 1994, we will increase the use of compliance monitoring and enforcement to obtain compliance. The compliance/enforcement priorities for the program in FY 1994-1995 are identification of and action against: 1) municipal separate storm sewer systems (MS4s) entities that have failed to submit a timely and complete permit application; 2) regulated facilities which failed to apply for a permit and are outside the jurisdiction of a regulated MS4; and 3) regulated facilities which failed to apply for a permit and are within jurisdiction of a regulated MS4.

The way the Agency intends to manage its storm water program is based on three principles: 1) integration of storm water compliance/enforcement activities into NPDES and other media inspection activities; 2) use of publicity to maximize the impact of any enforcement actions; and 3) expediting the Administrative Penalty Order/Administrative Order issuance process. The size of the regulated universe far exceeds that of the traditional NPDES program. Therefore, Regions and States are encouraged to make use of new approaches to enforcement and share information with each other about what works and what doesn't.

This strategy discusses the compliance/enforcement activities to identify non-filers, use of local/State sediment/erosion control programs to manage regulated construction sites, and ways to expedite the issuance of the Administrative Penalty Order and Administrative Order.

STORM WATER ENFORCEMENT STRATEGY
FY 1994-1995

I. Storm Water Program Background

A. General

Pollutants in storm water discharges from many sources are largely uncontrolled. The National Water Quality Inventory: 1990 Report to Congress provides a general assessment of water quality based on biennial reports submitted by States as required by Section 305(b) of the Clean Water Act (CWA). The report indicates that approximately 30% of identified cases of water quality impairment are attributable to storm water discharges. States identified a number of major sources of storm water runoff that cause water quality impacts, including separate storm sewer systems, and construction, waste disposal, and resource extraction sites.

The Federal Water Pollution Control Act of 1972 prohibits the discharge of any pollutant to waters of the United States from a point source unless the discharge is authorized by a National Pollutant Discharge Elimination System (NPDES) permit. Efforts to improve water quality under the NPDES program traditionally have focused on reducing pollutants in discharges of industrial process wastewater and from municipal sewage treatment plants. Efforts to address storm water discharges under the NPDES program have generally been limited to certain industrial categories with effluent limits for storm water.

In response to the need for comprehensive NPDES requirements for discharges of storm water, Congress amended the CWA in 1987 to require EPA to establish a two-phased NPDES permitting approach to address storm water discharges. To implement these requirements, on November 16, 1990 EPA published initial permit application requirements for certain categories of storm water discharges associated with industrial activity and discharges from municipal separate storm sewer systems (MS4s) located in municipalities with a population of 100,000 or more. Storm water discharge permits will provide a mechanism for monitoring the discharge of pollutants to waters of the United States and for establishing source controls where needed.

The following storm water discharges are covered under Phase I of the program:

1) A discharge which has been permitted prior to February 4, 1987[1];

2) Storm water discharges associated with industrial activity from 11 industrial categories identified narratively and by Standard Industrial Classification (SIC) codes;

3) Discharges from large MS4s (systems serving a population of 250,000 or more) and

[1] EPA has established effluent guideline limitations for storm water discharges for ten subcategories of industrial dischargers: cement manufacturing, mineral mining and processing, feedlots, fertilizer manufacturing, petroleum refining, phosphate manufacturing, steam electric, coal mining, ore mining and dressing, and asphalt. Most of the existing facilities in these subcategories already have a permit which addresses storm water discharges.

medium MS4s (systems serving a population of 100,000 or more but less than 250,000);

4) Discharges which are designated by the permitting authority because the discharge contributes to a violation of a water quality standard or is a significant polluter of waters of the United States.

All other storm water discharges fall under Phase II of the program. A September 1992 Federal Register Notice was issued requesting comments on what Phase II sources should be selected as priorities, how to control sources, and when the Phase II program should be implemented.

B. Permits for Municipal Separate Storm Sewer Systems (MS4)

A municipal separate storm sewer system (MS4) is defined as any conveyance or system of conveyances that is owned or operated by a State or local government entity designed for collecting and conveying storm water which is not part of a Publically Owned Treatment Works (POTW). As of November 1993, approximately 790 MS4 entities have been identified as having to apply for a permit. Nationwide, there will be approximately 265 permits to address the MS4 universe since some permits will cover more than one permittee. The regulations do not apply to discharges from combined sewer systems or small MS4s[2] (serving a population under 100,000).

Part 2 permit applications for large MS4s were to be submitted by November 16, 1992 and by May 17, 1993 for medium MS4s. Permits are to be issued one year from the Part 2 permit application date. In non-approved NPDES States, Regions process the applications. The statute stipulates that the permits must: 1) effectively prohibit non-storm water discharges into storm sewers; and 2) require controls to reduce the discharge of pollutants to the Maximum Extent Practicable (MEP), including compliance with water quality standards.

MS4 permittees will also have responsibility for establishing and administering storm water management programs to control discharges (including discharges associated with industrial activity from regulated facilities), prohibiting illicit discharges, requiring compliance, and carrying out inspections, surveillance, and monitoring. EPA promulgated regulations on November 16, 1990 requiring MS4 permittees to submit an annual status report by the anniversary of the date of the issuance of the permit to reflect the development of their storm water management program. The reports will be used by the permitting authority to aid in evaluating compliance with permit conditions and where necessary, to modify the permit to address changed conditions. The annual report will contain at least the following information: the status of implementing the components of the program that are established as permit conditions; proposed changes to the program; revisions to the assessment of controls and fiscal analysis; summary of data, including monitoring data, accumulated throughout the year; annual expenditures and budget for the upcoming year; a summary describing the number and nature of enforcement actions, inspections, and public education programs; and identification of water quality improvements or degradation.

[2] Some small MS4 entities have been designated as storm water permittees either individually or as co-permittees.

C. Facility Permits for Storm Water Discharges Associated with Industrial Activity

The term 'storm water discharge associated with industrial activity' is defined as the discharge from any conveyance which is used for collecting and conveying storm water and which is directly related to manufacturing, processing, or raw materials storage areas at an industrial plant. Eleven categories of facilities that have a point source storm water discharge associated with industrial activity discharging to waters of the US must apply for coverage. (Attachment A) The application deadline for most permit applications was October 1, 1992. Facilities that discharge into a small, medium, or large MS4 are considered direct dischargers and are also required to submit signed copies of the permit application to the operator of the MS4. Discharges of storm water to a combined sewer system or POTW are excluded.

The NPDES regulatory scheme provided three potential routes for facilities to apply for permit coverage for storm water discharges associated with industrial activity:

1) Individual Permit- applications for these permits are processed in the Regions for non-approved NPDES States;

2) Group Application- provided an alternative mechanism for groups with a sufficiently similar discharge to apply for permit coverage; to date, 750 group applications have been submitted to Headquarters representing 40,000 facilities in 31 industrial sectors; a separate general permit to cover facilities in the non-approved NPDES States will be issued by EPA.

3) General Permit- intended to initially cover the majority of storm water discharges associated with industrial activity in non-approved NPDES States; approximately 60,000 facilities have submitted a Notice Of Intent (NOI) to be covered under general permits issued by NPDES States and approximately 25,000 facilities have submitted NOIs to be covered in the non-approved NPDES States; facilities submit an NOI to an EPA contractor for processing to obtain coverage under the federal general permit.

General permits, at a minimum, require development of a storm water pollution prevention plan (SWPPP) to reduce pollutant loadings at a facility's site and an annual compliance evaluation of the SWPPP. Facilities were required to prepare their SWPPP by April 1, 1993 and implement it by October 1, 1993. Certain facilities are required to monitor storm water discharges semi-annually and report annually while others are required to monitor annually but not submit a discharge monitoring report (DMR). It is estimated that 3,800 facilities in the 12 non-approved NPDES States and 12,000 facilities in approved NPDES States are required to monitor.

D. Facility Permits for Storm Water Discharges From Construction Sites

A subset of regulated facilities is construction sites for which a separate general permit has been issued. The NOI requires certification that a SWPPP has been prepared for the site, and such plan complies with approved State and/or local sediment and erosion plans or permits and/or storm water management plans or permits.

Owner/Operators of regulated construction sites (disturbances over 5 acres) were required to obtain coverage under an individual or general permit by October 1, 1992 where disturbances

commenced before October 1, 1992. For disturbances commencing after October 1, 1992, an owner/operator is required to apply for general permit coverage at least 48 hours prior to the start of construction activities or 90 days prior to the start of construction activities for coverage under an individual permit.

II. Compliance Activities and Program Priorities

A. General

Fundamental to the storm water program is the filing of a permit application, as failure to do so allows a facility or MS4 entity to escape regulatory scrutiny. Therefore, the compliance/ enforcement priorities in the early stages of the storm water program--through FY 1994-1995--are the identification of:

1) MS4s that have failed to submit a timely or complete Part 2 permit application (or Part 1 application for MS4s that are designated at a future date);

2) regulated facilities that have failed to apply for a permit and are outside of the jurisdiction of a regulated MS4, and;

3) regulated facilities that have failed to apply for a permit and are within the jurisdiction of a regulated MS4.

Review of DMRs, SWPPPs, and other permit requirements for every facility is not a high priority activity for FY 1994 and 1995. However, there may be circumstances under which Regions and States will want to closely monitor a facility's compliance with the storm water permit and to take action for failure to comply with that permit. Usually, this would be a case where non-compliance is contributing to an environmental problem.

Given the level of funding available for storm water enforcement, we will need to be efficient and innovative in our monitoring and enforcement approaches. To that end, every effort should be made to integrate storm water compliance activities into existing programs within and outside of the NPDES program.

The goal for FY 1994 and again in 1995 is that each Region undertake at least one "sweep" in each year to identify and enforce against regulated facilities that have failed to apply for a permit. The goal of this effort is to persuade other non-filers to voluntarily submit permit applications as well as to solve environmental problems. The Regional approach should be described in a Storm Water Work Plan. This Storm Water Work Plan can be incorporated in the Strategic Plan to be submitted by each Region for FY 1994.

The Regional sweep might target high priority watersheds, geographic locations, or a category of facilities to identify non-filers. The decision of which specific areas to target and the type and scope of activity is left to the Regions, although some preference should be given to addressing storm water problems in high priority watersheds. Where all the States in a Region have approved NPDES programs, the Region should work with at least one State to conduct a storm water effort in that Region.

As with other new programs, it is important to look for and widely publicize signature enforcement cases in the early stages of the program. The use of a "sweep"--whether one particular activity or combination of suggested activities--offers an excellent opportunity for publicizing the Agency's and States' enforcement efforts in the area of storm water.

This strategy does not address the issue of data collection and maintenance. However, a long term goal of the enforcement program will be development of an inventory of entities regulated by the program. The Compliance Information and Evaluation Branch has completed a Draft Feasibility Study which will be sent to the Regions for review. The proposed system solution is continued use of PCS to track the storm water inventory.

One final component of the strategy is to provide positive incentives for compliance to compliment the enforcement program. There already exists a National Storm Water Awards Program to recognize MS4 entities and facilities with industrial activity that are responsibly addressing their storm water obligations. The Regions and States might consider adopting such programs at their levels as well. In addition, Regions and States should continue to take every opportunity to explain the requirements of the storm water program to the regulated community.

B. Municipal Storm Sewer Systems

Part 2 applications for large MS4s were required to be submitted by November 16, 1992 and for medium MS4s by May 17, 1993. Regions should be monitoring the MS4s for compliance with the appropriate deadline. Where the entity responsible for submission of an MS4 application has not complied with a deadline, the Region should address this noncompliance as a top enforcement priority in the storm water program. Regions may begin with an informal action but should escalate to formal action if compliance is not achieved within 90 days.

To date, no MS4 permits in non-approved NPDES States have been issued. It is anticipated that compliance monitoring of these permits will be more difficult than traditional NPDES permits due to the newness of the storm water program in general, uniqueness of each MS4 permittee's approach to storm water management and lack of easily evaluated quantitative requirements of the permit. Because of these difficult implementation issues, Regional compliance/enforcement staff are encouraged to work with the permit staff to ensure the enforceability of the MS4 permits.

Annual reports submitted by MS4s should provide the permitting authority information on successes, failures and extent of enforcement activities. It is recognized that some MS4s are in the process--and may be for some time--of developing the legal authority to implement a local enforcement program for storm water discharges from facilities. Assessing compliance with MS4 permits will be left for FY 1995 and beyond. However, it is suggested that where deficiencies are identified in the annual report that will take over one year to correct, a timetable for correction be embodied in an enforceable schedule. Discretion is left to the Regions as to whether to address these problems in FY 1994-1995.

C. Facilities with Storm Water Discharges Associated with Industrial Activity

Outreach activities by the Headquarters Permits Division and Regions have been the primary method of encouraging facilities to comply with the permit application process and permit requirements in the non-approved NPDES States. Examples of ongoing outreach activities, in Regions and States include: Storm Water Workshops conducted in coordination with or conducted

via trade organizations; Mailings of Fact Sheets, General Permit, and/or Guidance Documents followed up with phone calls or visits to the site; and the EPA National Storm Water HOTLINE.

After the first quarter of FY 1994, compliance and enforcement staff should increase their focus on locating regulated facilities that have failed to file a permit application/NOI and that are outside of the jurisdiction of a regulated MS4. To the extent possible, the Regions should integrate these efforts with other NPDES compliance activities and multi-media program operations.

There are several information sources that can be used to develop a list of facilities that are potentially subject to the regulations. Some sources are:

Toxics Release Inventory to identify SARA Title III facilities;
State Department of Labor databases;
State industrial records;
Lists of NPDES or other environmental regulatory program permittees;
Telephone books;
Municipal pretreatment records;
Trade Association membership lists;
Job Service/Employment Service listings; and
Local authorities which issue buildings permits.

EPA Headquarters provides a list of NOI submittals for non-approved NPDES States on a monthly basis to the Regions and has an inclusive list of facilities that participated in the group application process. The group application list identifies both current participants (40,000 facilities), as well as facilities that are no longer using the group application mechanism (25,000 facilities). The group application list will be available when the general permit becomes final. Data from the NOI list and group application list can be compared to that of a compiled list of facilities that potentially are subject to the regulations from the above mentioned information sources.

The Regions should consider for FY 1994 and 1995, the activities below to identify facilities that have failed to comply with the permit application process and should publicize compliance and enforcement actions after they have been concluded to give visibility to the storm water enforcement program.

Mailings: If EPA has reason to believe that a regulated facility has failed to apply for a permit, (for example, a regulated industry's name does not appear on any permit application list) a Section 308 letter can be sent to the facility along with a Fact Sheet and NOI/permit application. The letter should state that the permit application be filled out by a date certain if the regulations apply.[3] If a facility responds indicating that there is no point source discharge and therefore not

[3] A Section 308 letter requesting that more than nine addressees nationwide fill out anything other than a NOI/permit application form may require approval from OMB per requirements of the Paperwork Reduction Act (PRA). For example, EPA cannot request a 'certification of non-applicability' from more that nine addressees nationwide. These

subject to the regulations, that information should be confirmed at a later date in a site inspection.

Judicial Case Review: Municipal[4] and non-municipal judicial cases that are active or are being developed for non-storm water NPDES violations should be reviewed to determine whether or not the facility needs a NPDES permit for storm water discharges and if so, whether or not a permit application has been submitted. If it is determined that the facility failed to file an application then the complaint can be amended to include 'failure to apply for a permit' or 'discharge without a permit'. The decision to amend the existing complaint or issue a separate AO requiring compliance or APO should be made on a case-by-case basis. However, considering these facilities are familiar with EPA regulatory programs, amending an existing complaint may be appropriate action.

Telephone Canvassing: Phone calls to facilities potentially subject to the regulations explaining the storm water program with questions to determine inclusion in the program or as a follow-up to a mailing strategy can be made[5]. Information request letters can then be sent based on the facility's response.

Field Inspections: For purposes of identifying facilities that have failed to apply for a storm water permit, Regions may choose to focus their inspection activity within watersheds, or in areas with water quality-related problems due in part to storm water sources. If a facility has applied for a permit, the inspector should request to see the SWPPP to verify its existence and implementation.

NPDES compliance inspections/Multi-media inspections: To the extent possible, NPDES inspectors or inspectors from other media should complete a storm water screening checklist while in the field to verify whether the facility is covered by storm water requirements. The storm water

---

restrictions do not apply if the PRA enforcement exception applies. Also, the OMB control number for NPDES permit applications is 2040-0086 (expiration date August 31, 1995) and should be displayed on Section 308 letters requesting submittal of a storm water permit application.

[4] Category (ix) of facilities which must submit applications for storm water permits: Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including lands dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1 MGD or more, or required to have an approved pretreatment program under 40 CFR Part 403. Not included are farm lands, domestic gardens, or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with Section 405 of the CWA.

[5] Telephone surveys are subject to the same OMB/PRA approval as Section 308 letters. Questions requiring more than nine surveyees nationwide provide more information than what is necessary to fill out an NOI/permit application may require approval.

checklist in the multi-media screening inspections can be used for this purpose. NPDES program staff may conduct an in-depth storm water evaluation while they are at the facility for other purposes.

Routine Enforcement Contact: When meeting with a facility for other enforcement issues, Compliance Officers can inquire as to the status of the facility's compliance with the storm water regulations. A field inspector can make inquiries without going through a detailed checklist of the need for a permit or compliance with the permit. If it is determined that a facility should obtain storm water coverage or is not complying with a permit (for example, the facility has not developed a SWPPP) enforcement should proceed on a case-by-case basis.

Municipal Coordination: The Part 1 permit application required an MS4 entity to provide the location and NPDES permit number of any known discharge to the storm sewer system (40 CFR 122.26.d.1.iii.B.(4)). Also, the Part 2 permit application required an MS4 entity to provide an inventory, organized by watershed, of the name, address and description (such as SIC code) of the principal products or services provided by each facility which may discharge storm water associated with industrial activity to the system (40 CFR 122.26.d.2.ii).

All facilities with discharges of storm water associated with industrial activity through an MS4 will be subject to local ordinances implementing management programs, as well as to the terms of a federal permit. The list of facilities discharging into an MS4 can be matched with a list of NOIs/permit applications received to verify compliance with the application process. Although the MS4 entity does not have authority to enforce the federal permit application requirements or a federal permit, compliance and enforcement activities of the local program will be done by the MS4 entity. However, it should be noted that the MS4 entity may not be able to enforce its own program for some time because it presently lacks necessary local legal authority or--in the case of medium size municipalities--the permit will not be effective until May 17, 1994.

An MS4 entity can refer a case of a facility that has failed to apply for a federal permit or suspected non-compliance with a federal permit to EPA. Although compliance and enforcement efforts for this group of facilities is not top priority, the Region may want to include them for targeted activities but, should coordinate activities with the municipality to avoid duplication of efforts.

D. Construction Sites

The construction industry in general is regulated at the State and local level. A May 1990 Survey by the Maryland Department of Environmental Resources (Attachment B) indicates that thirteen States have mandatory sediment/erosion control programs or storm water management programs, two States have programs for portions of the State, and an additional nine States have developed guidance for local government use. Most large municipalities, which will eventually include all medium and large MS4s, have some type of sediment/erosion and storm water control program. The general approach, then, for construction sites will be to defer to local or State agencies where there are effective and equivalent programs in place.

Generally, construction sites are highly visible, capital intensive operations that have a high potential for environmental degradation. Because of their high visibility, citizen complaints can be expected more than with other types of industrial activities and are useful as a source for

identifying potential violators. Regions should either refer complaints to local programs or follow up directly. Where State or effective local programs do not exist, Regions should prioritize unpermitted construction sites the same way as other regulated facilities. Again, failure to comply with permit requirements should be addressed at the Regions' discretion during FY 1994-1995.

III. Enforcement Approach

A. Establishment of a Violation

Two criteria must be met for a facility to be subject to the storm water regulations: 1) the industrial activity at a facility must be described (usually by SIC code) in 40 CFR 122.26 of the regulations; and 2) the facility must have a point source discharge to waters of the United States either directly or through a separate storm sewer system. The question of whether a storm water discharge must be observed by an inspector to determine inclusion in the program has been raised. The Office of Enforcement has advised that a facility's inclusion in the program is not dependant on whether a discharge from a point source has been observed. Section 502 of the CWA defines any point source to be 'any discernable, confined, and discrete conveyance . . . . . from which pollutants are or may be discharged'. Therefore, an actual discharge need not be observed but there must be evidence of some conveyance for pollutants when a storm event occurs.

A second question frequently raised is: How to cite 'failure to apply for a permit' as a violation? Section 308 of the CWA requires an owner/operator of a point source to 'make such reports or provide such information' the administrator requires to carry out Section 402 or any requirement established under Section 402. The permit application regulations were promulgated pursuant to both Sections 308 and 402 and thus the permit application is considered information required to implement Section 402 of the Clean Water Act. Since the permit application regulations have been published in the November 16, 1990 Federal Register, any regulated facility that failed to submit a permit application is automatically in violation of Section 308. Wording of any notice of violation, AO, or APO should therefore cite 'failure to apply for a permit' as a violation of Section 308.

As an alternative to a violation of Section 308, a facility can be in violation of Section 301 for 'discharge without a permit' providing there is evidence of a conveyance for pollutants from the industrial activity areas of the facility and an actual discharge (i.e., a precipitation event causing a discharge) has occurred.

B. Overall Strategy

As indicated earlier in this strategy, the enforcement priorities for the storm water program for FY 1994 and 1995 are to address MS4s that have not applied for a storm water permit on a timely basis, and to identify and enforce, as necessary, where facilities with industrial activity have failed to apply for a permit--with priority given to facilities outside the jurisdiction of a regulated MS4. The level of activity with regard to the assessment of compliance with existing permits will be left to the discretion of the Region.

As a strategy for addressing industrial facilities which have failed to apply for a permit as required, each Region is asked to undertake some activity annually in 1994 and again in 1995.

The purpose of any activity is twofold--to address environmental problems and to serve as a vehicle for publicizing EPA's commitment to enforcing storm water requirements, thus creating a deterrent to noncompliance. The design and scope of activities is left to the discretion of the Region. It could be organized on a watershed basis or it might address a category of facilities which is of concern. Whatever the design, it should be significant enough to serve as a vehicle for publicizing Regional activity in the storm water area through such means as a press release, press briefing, trade press publications or other means the Region may choose.

As a general rule, the Enforcement Management System establishes the principle of escalation of enforcement response for continuing, uncorrected noncompliance. This storm water strategy, in fact, recommends beginning with informal enforcement and escalating the severity of the response when an MS4 entity fails to submit complete permit applications on a timely basis. However, because of the limited resources available to address regulated facilities, one of the principles on which this strategy is built is that the maximum possible deterrent effect be achieved with any single enforcement action. For that reason, this strategy recommends, but does not require, the use of penalties as a sanction when a facility has failed to apply for a permit. Of course, any enforcement action that is initiated should take into account the circumstances surrounding the violation, for equitable treatment of violators. During this initial phase of the storm water enforcement program, when any facility submits a permit application voluntarily, without having EPA invest resources to find the facility, the Regions may choose to forego or reduce penalties on a case-by-case basis, thereby providing an incentive to other facilities to comply with permit application requirements.

C. Expedited APOs

Field citations[6] are currently being utilized by other environmental programs on the Federal, State, and local levels and are useful in addressing many prevalent, clear-cut violations that are relatively easy to correct. While the Water Program does not currently have field citation authority, the basic administrative compliance and penalty order authorities can be used in more efficient ways.

There are several ways to make the APO more efficient--to expedite the APO: 1) issue APOs for facilities with the same violation at approximately the same time so that a single 30-day public notice can be used[7]; 2) issue a complaint and a proposed consent order at the same time; and 3) standardize penalty amounts to be assessed, based on the economic benefit for 'failure to submit a permit application', to avoid recalculation for each facility[8]. Existing

---

[6] 'Field citation' as used in this strategy is an APO issued in the field unencumbered by a 30-day public notice period. For this strategy, the term 'Expedited APO' will be used. Reauthorization of the CWA may include Field Citation authority.

[7] When the administrative penalty complaint is first issued, an administrative record should be simultaneously opened at the Regional Office pursuant to proposed 40 CFR Section 28.16.

[8] Headquarters may develop a matrix which could be used to determine the economic benefit and gravity component of the penalty using a small, medium, and large facility. In the interim, no

delegations of authority limit the issuance of APOs to the Branch Chief level. As a result, inspectors cannot be authorized to issue APOs until that delegation is changed. There are, however, other ways to speed up the APO and AO issuance process. These might include: faxing of violation paperwork to the office by the inspector for required signatures or phoning-in of violations by inspectors for immediate penalty issuance from the office. A combination of one or more of the above approaches should result in a less resource intensive, more efficient penalty issuance process.

Attached for your information is a copy of a public notice used by one Region to cover multiple violating facilities, as well as the simultaneous issuance of a complaint and a proposed consent decree. (Attachment C) A letter to the complainant would specify that the consent order will become final after signature by both parties without further agency action, if no public comments are received. The letter would explain the administrative process, the requirement to publish the proposed order for public comment, and the respondent's right within 30 days to either return the signed consent order with payment or request a hearing.

If the respondent agrees to pay the penalty and submits a check before the consent order can be signed by EPA, EPA can hold the respondent's penalty payment check. Where not prohibited by state law, the check should be postdated to 45 days after the date of issuance of the complaint to allow time for publication of the public notice requesting comments within 30 days. If no public comments are received, the proposed order would become final after agency signature and EPA would process the penalty payment. If comments are received, the Regional Administrator or designee would follow established Agency procedures for resolving public comments. If the respondent chooses to contest the initial complaint, EPA would adjudicate the matter under the hearing procedures.

IV. Allocation of Responsibilities

The list below provides a summary of ongoing and future activities to implement this strategy.

Headquarters Permits Division
Continue Storm Water HOTLINE
Continue monthly update of NOI submissions to the Regions (ongoing)
Provide Regions a list of group applicants, current as well as original participants (upon final approval of the general permit)

Headquarters Enforcement Support Branch
Update the storm water component of NPDES inspector guidance and training (ongoing)
Develop guidance on storm water data elements and reporting requirements for Regions and States (mid FY 1994)

---

settlement should normally be less than $500 for failure to submit an application and the proposed assessment should routinely be $1000 or more, taking into account economic benefit and gravity.

Act as a clearinghouse for success/failure of approaches to enforcement/compliance issues of the storm water program (ongoing)
Pursue streamlining efforts of the APO process such as delegation of authority below DD level

Headquarters Compliance Information Branch
Finalize the Storm Water Feasibility Study Mission Needs Analysis to develop a storm water tracking system (mid FY 1994)

Regions
Continue outreach efforts
Review MS4 Permits for enforceability
Follow-up on late or incomplete MS4 permit applications
Investigate local programs that manage storm water discharges from construction sites
Undertake one sweep in FY 1994 and again in FY 1995 to identify regulated facilities that have failed to apply for a permit

VOL 23

0859

Industrial Facilities That Must Submit Applications for Storm Water Permits (Phase I)

40 CFR 122.26(b)(14) Subpart	Description
(i)	Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutants effluent standards under 40 CFR, Subchapter N (except facilities which are exempt under category (xi)).
(ii)	Facilities classified as: SIC 24 (except 2434) . . . . . Lumber and Wood Products SIC 26 (except 265 and 267) . Paper and Allied Products SIC 28 (except 283 and 285) . Chemicals and Allied Products SIC 29 . . . . . Petroleum and Coal Products SIC 311 . . . . . Leather Tanning and Finishing SIC 32 (except 323) . . . . . Stone, Clay and Glass Products SIC 33 . . . . . Primary Metal Industries SIC 3441 . . . . . Fabricated Structural Metal SIC 373 . . . . . Ship and Boat Building and Repairing
(iii)	Facilities classified as SIC 10 through 14, including active or inactive mining operations and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with, or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts, or waste products located on the site of such operations. SIC 10 . . . . . Metal Mining SIC 11 . . . . . Anthracite Mining SIC 12 . . . . . Coal Mining SIC 13 . . . . . Oil and Gas Extraction SIC 14 . . . . . Nonmetallic Minerals, except Fuels
(iv)	Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under Subtitle C of the Resource Conservation and Recovery Act (RCRA).
(v)	Landfills, land application sites, and open dumps that receive or have received any industrial wastes including those that are subject to regulation under subtitle D or RCRA.
(vi)	Facilities involved in the recycling of material, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but not limited to those classified as: SIC 5015 . . . . . Motor Vehicle Parts, Used SIC 5093 . . . . . Scrap and Waste Materials
(vii)	Steam electric power generating facilities, including coal handling sites.
(viii)	Transportation facilities which have vehicle maintenance shops, equipment cleaning operations, or airport de-icing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or airport de-icing operations, or which are otherwise listed in another category, are included. SIC 40 . . . . . Railroad Transportation SIC 41 . . . . . Local and Suburban Transit SIC 42 (except 4221-25) . . . . Motor Freight and Warehousing SIC 43 . . . . . U.S. Postal Service SIC 44 . . . . . Water Transportation SIC 45 . . . . . Transportation by Air SIC 5171 . . . . . Petroleum Bulk Stations and Terminals

VOL 23

0860

Industrial Facilities That Must Submit Applications for Storm Water Permits (Phase I) (continued)

40 CFR 122.26(b)(14) Subpart	Description
(ix)	Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including lands dedicated to the disposal of the sewage sludge that are located within the confines of the facility, with a design flow of 1.0 million gallons per day or more, or required to have an approved pretreatment program under 40 CFR Part 403. Not included are farm lands, domestic gardens, or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with Section 405 of the CWA
(x)	Construction activity including clearing, grading, and excavation activities except operations that result in the disturbance of less than 5 acres of total land area and those that are not part of a larger common plan of development or sale
(xi)	Facilities under the following SICs (which are not otherwise included in categories (ii)-(x)), including only storm water discharges where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, byproducts, or industrial machinery are exposed to storm water. SIC 20 ..... Food and Kindred Products SIC 21 ..... Tobacco Products SIC 22 ..... Textile Mill Products SIC 23 ..... Apparel and Other Textile Products SIC 2434 ..... Wood Kitchen Cabinets SIC 25 ..... Furniture and Fixtures SIC 265 ..... Paperboard Containers and Boxes SIC 267 ..... Converted Paper and Paper Board Products (except containers and boxes) SIC 27 ..... Printing and Publishing SIC 283 ..... Drugs SIC 285 ..... Paints, Varnishes, Lacquer, Enamels SIC 30 ..... Rubber and Misc. Plastics Products SIC 31 (except 311) ..... Leather and Leather Products SIC 323 ..... Products of Purchased Glass SIC 34 (except 3441) ..... Fabricated Metal Products SIC 35 ..... Industrial Machinery and Equipment, except Electrical SIC 36 ..... Electronic and Other Electric Equipment SIC 37 (except 373) ..... Transportation Equipment SIC 38 ..... Instruments and Related Products SIC 39 ..... Miscellaneous Manufacturing Industries SIC 4221 ..... Farm Product Warehousing and Storage SIC 4222 ..... Refrigerated Warehousing and Storage SIC 4225 ..... General Warehousing and Storage

Source: Federal Register, Vol. 55, No. 222, p. 48065, November 16, 1990.

Note: On June 4, 1992, the U.S. Court of Appeals for the Ninth Circuit remanded the exemption for construction sites of less than five acres and for manufacturing facilities in category (xi) which do not have materials or activities exposed to storm water to the EPA for further rulemaking. (Nos. 90-70671 & 91-70200). In response to the remands, the Agency intends to conduct further rulemakings on both the light manufacturing and the construction activities. In the December 18, 1992 Federal Register, EPA stated that it is not requiring permit applications from construction activity under five acres or light industry without exposure until this further rulemaking is completed.

ATTACHMENT B

1990 Survey of State Stormwater (SW) Management and Sediment Control (SC) Programs[1]

State	State Program?	Comments
Alabama	No	Issues handled by local governments.
Alaska	No	2 cities awaiting EPA regulations revisions.
Arizona	No	Issues handled by local governments.
Arkansas	No	May consider after EPA regulations revision.
California	No	Issues handled by local governments.
Colorado	No	Has an optional SW model for local governments.
Connecticut	Yes, SC No, SW	Has statewide SC program, through Soil Water Conservation Council. Has no SW program.
Delaware	Yes, SC No, SW	Has statewide SC program, through SC districts. Also has proposed legislation to adopt state SW program.
District of Columbia	Yes, SC Yes, SW	Has district wide SW/SC programs, implemented by the Department of Consumer and Regulatory Affairs.
Florida	No, SC Yes, SW	Has statewide SW program, implemented by the Department of Environmental Regulation.
Georgia	Yes, SC No, SW	Has statewide SC program implemented by the Department of Natural Resources.
Hawaii	No	No state SW/SC programs.
Idaho	No	No state SW/SC programs, but has statutes on protecting outstanding resource waters.
Illinois	No	Issues handled by local governments.
Indiana	No	Issues handled by local governments.
Iowa	No	No state SW/SC programs.
Kansas	No	State advises local governments when requested.
Kentucky	No	Some counties have SC programs under Soil Conservation Districts. Awaiting EPA regulations revision to strengthen SW program.
Louisiana	No	Some local governments have SW programs. Large scale projects can be funded via Flood Control Program.
Maine	No	Legislation for SC efforts is expected in January 1991. A State SW municipal policy is also being drafted.

[1] Adapted from a May 1990 survey conducted by the Comprehensive Unit of the Maryland Office of Planning. State Stormwater/Sediment Control (SW/SC) programs have been narrowly defined to mean statewide mandatory programs.

State	State Program?	Comments
Maryland	Yes, SC Yes, SW	Has statewide SW/SC programs, implemented by the Department of Environment.
Massachusetts	No	Some local governments have SW programs.
Michigan	Yes, SC No, SW	Has state SC program, implemented by Department of Natural Resources. Awaiting EPA regulations revision to strengthen SW regulations.
Minnesota	No	Has strong SW program for Minneapolis-St. Paul area and some counties. Has optional SC program.
Mississippi	No	No state SW/SC program.
Missouri	No	State encourages local governments to adopt SC ordinances. State is waiting new EPA regulations revision for SW regulations.
Montana	No	Some local governments have SW programs. SC activities are under the State Nonpoint Source Pollution Abatement program.
Nebraska	Yes, SC No, SW	Has statewide SC program implemented by several state agencies. Program essentially applies to agriculture activities but local government adopted program must be in conformance with state.
Nevada	No	No state SW/SC program.
New Hampshire	Yes, SC Yes, SW	Single state program combines both SW/SC. However, law only subject to developments over 100,000 sq. ft.
New Jersey	Yes, SC Yes, SW	Statewide SW program is connected to funding availability. State sets standards for SC programs.
New Mexico	No	No state SW/SC programs.
New York	No	Has a SW/SC Policy Statement. Intervention is triggered only when certain permits (sewerage, industrial plants, etc) are required.
North Carolina	Yes, SC Yes, SW	Has statewide SC program. Has a phased-in SW program which is mandatory for coastal regions and watersheds with water quality standards for water supply. Bill pending for statewide program.
North Dakota	No	No state SW/SC program.
Ohio	No	Has optional state SC program. A state SW program is anticipated after EPA regulations revision.
Oklahoma	No	No state SW/SC program.
Oregon	No	Has a combined state SW/SC program but it only covers a portion of the state.
Pennsylvania	Yes, SW Yes, SC	Has statewide SW/SC programs implemented by the Department of Environmental Resources.

ATTACHMENT B

State	State Program?	Comments
Rhode Island	No	Has optional state SC program. Has no state SW program, but has issued SW manual for guidance.
South Carolina	No	Has optional state SC program. Has no state SW program.
South Dakota	No	No state SW/SC programs.
Tennessee	No	Some local governments have SC programs. State awaiting EPA regulation revision to strengthen SW program.
Texas	No	State provides legislation to form Conservation Districts to handle SC concerns.
Utah	No	No state SW/SC programs.
Vermont	No	Has optional state SW/SC programs.
Virginia	No, SW Yes, SC	Has statewide SC program, implemented by Department of Conservation and Recreation. The state SW program is optional for local governments but mandatory for state projects.
Washington	No	Has state SW/SC program for the Puget Sound area. Aiming for statewide SW/SC legislation after 1991.
West Virginia	No	Has optional state SC program. Some local governments have own SW program. State is seeking mandatory SC legislation.
Wisconsin	No	Has optional state SW/SC programs.
Wyoming	No	No state SW/SC programs.

COMMENT PERIOD OPEN UNTIL: [_____]

ACTION: NOTICE OF PROPOSED ASSESSMENT OF CLEAN WATER ACT SECTION 309(G) CLASS I ADMINISTRATIVE PENALTY AND OPPORTUNITY TO COMMENT

EPA IS AUTHORIZED UNDER SECTION 309(G) OF THE CLEAN WATER ACT, 33 U.S.C. §1319(G), TO ASSESS A CIVIL PENALTY AFTER PROVIDING THE PERSON SUBJECT TO THE PENALTY NOTICE OF THE PROPOSED PENALTY AND THE OPPORTUNITY FOR A HEARING, AND AFTER PROVIDING INTERESTED PERSONS PUBLIC NOTICE OF THE PROPOSED PENALTY AND A REASONABLE OPPORTUNITY TO COMMENT ON ITS ISSUANCE. UNDER SECTION 309(G), ANY PERSON WHO WITHOUT AUTHORIZATION DISCHARGES A POLLUTANT TO A NAVIGABLE WATER, AS THOSE TERMS ARE DEFINED IN SECTION 502 OF THE ACT, 33 U.S.C. §1362, MAY BE ADMINISTRATIVELY ASSESSED A CIVIL PENALTY OF UP TO $25,000 BY EPA. CLASS I PROCEEDINGS FOR SECTION 309(G) OF THE CLEAN WATER ACT ARE CONDUCTED IN ACCORDANCE WITH THE "CONSOLIDATED RULES OF PRACTICE GOVERNING THE ADMINISTRATIVE ASSESSMENT OF CLASS I CIVIL PENALTIES UNDER THE CLEAN WATER ACT" ("PART 28"), WHICH HAS BEEN PUBLISHED IN THE FEDERAL REGISTER, AT 56 FED. REG. 29,996 (JULY 1, 1991). THE FEDERAL REGISTER IS AVAILABLE AT MOST LIBRARIES.

VOL 23

0865

THE PROCEDURES BY WHICH THE PUBLIC MAY SUBMIT WRITTEN COMMENTS ON A PROPOSED CLASS I PENALTY ORDER OR PARTICIPATE IN A CLASS I PENALTY PROCEEDING ARE SET FORTH IN PART 28 AT §28.2(G) AND §28.28(C), AND REQUIRE THE COMMENTER TO (1) DECLARE HIMSELF TO BE A COMMENTER; (2) SUBMIT COMMENTS OR INDICATE THE SUBJECTS UPON WHICH HE WILL COMMENT; AND, (3) PROVIDE EPA WITH A RETURN ADDRESS. THE DEADLINES FOR SUBMITTING PUBLIC COMMENT ON A PROPOSED CLASS I ORDER IS THIRTY (30) DAYS AFTER ISSUANCE OF PUBLIC NOTICE.

IF THE RESPONDENT FAILS TO FILE A TIMELY RESPONSE TO THE AGENCY'S ADMINISTRATIVE COMPLAINT PURSUANT TO §§28.2(U) AND 28.20, THE REGIONAL ADMINISTRATOR MAY ISSUE A DEFAULT ORDER AGAINST THE RESPONDENT.

PURSUANT TO SECTION 309(G)(4) OF THE CLEAN WATER ACT, 33 U.S.C. §1319(G)(4), EPA IS PROVIDING PUBLIC NOTICE OF THE FOLLOWING PROPOSED CLASS I ADMINISTRATIVE PENALTY ASSESSMENTS: NAME AND ADDRESS OF RESPONDENTS:

VOL 23

0866

LOCATIONS OF ALLEGED VIOLATIONS:

BUSINESS OR ACTIVITY OF RESPONDENTS: WASTEWATER TREATMENT

RESPONDENTS' PERMIT NUMBERS:

NATURE OF ALLEGED VIOLATIONS: FAILURE TO SUBMIT A COMPLETE DISCHARGE MONITORING REPORT-QUALITY ASSURANCE REPORT TO EPA

PROPOSED PENALTY: 10,000

DOCKET NUMBERS: EPA-CWA-II-93-109, 116, 118, 125, 126, 127, 132, 134

DATE FILED WITH REGIONAL HEARING CLERK: [_____]

NAME, MAILING ADDRESS, AND TELEPHONE NUMBER OF REGIONAL HEARING CLERK:

FOR FURTHER INFORMATION: PERSONS WISHING TO RECEIVE A COPY OF PART 28, REVIEW THE COMPLAINT OR OTHER DOCUMENTS FILED BY THE PARTIES IN THIS PROCEEDING, COMMENT UPON THE PROPOSED PENALTY ASSESSMENT, OR PARTICIPATE IN ANY HEARING THAT MAY BE HELD, SHOULD CONTACT THE REGIONAL HEARING CLERK IDENTIFIED ABOVE.

UNLESS OTHERWISE NOTED, THE PUBLIC RECORD FOR THE PROCEEDING IS LOCATED IN THE EPA REGIONAL OFFICE SPECIFIED ABOVE, AND FILE WILL BE OPEN FOR PUBLIC INSPECTION DURING BUSINESS HOURS.

EPA HAS PROVIDED EACH RESPONDENT WITH A SETTLEMENT OFFER OF $1,000 IN AN EFFORT TO PROMPTLY SETTLE THIS MATTER. IN ORDER TO PROVIDE OPPORTUNITY FOR PUBLIC COMMENT, EPA WILL NOT TAKE FINAL ACTION IN THIS PROCEEDING PRIOR TO THIRTY (30) DAYS AFTER ISSUANCE OF THIS NOTICE.

Subject: NON-STORM WATER DISCHARGES -- MUNICIPAL PERMITS

Municipal permit language addressing non-storm water discharges is a subject that has come to the forefront of recent discussions. Many of the municipal permittees had anticipated that the State Board's "Limited Threat General NPDES permit" would address many of the non-storm water discharges to a MS4. This is not the case.

Non-storm water discharges to a MS4 may be allowed if the discharge is in accordance with a NPDES permit or the municipality makes a finding that discharge is not a significant source of pollutants if properly managed. In this respect, the municipalities under permit have a real opportunity to exert some control over how best to deal with discharges to their systems.

In drafting the second round of municipal storm water permits, the language used may become an issue. Attached to this memorandum are examples of "non-storm water" language taken from municipal permits adopted or in draft form from both in State and out of state.

Also attached is a copy of a memorandum from Betsy Jennings regarding this issue.

If you have any questions, please call me at (916) 657-0908 (Calnet 437-0908)

VOL 23

008699

R0066850

A. DISCHARGE PROHIBITIONS

1. The Discharger shall effectively prohibit discharge of non-stormwater through its system into waters of the United States. NPDES permitted non-stormwater discharges are exempt from this prohibition. The following non-stormwater discharges need not be prohibited provided such sources are identified and appropriate control measures to minimize the impacts of such sources, are developed under the plan. However, dischargers of such non-stormwater discharges may need to obtain NPDES permits.

   a. water line flushing;
   b. landscape irrigation;
   c. diverted stream flows;
   d. rising ground waters;
   e. uncontaminated groundwater infiltration [as defined at 40 CFR 35.2005(20)] to separate storm sewers;
   f. uncontaminated pumped groundwater;
   g. discharges from potable water sources;
   h. foundation drains;
   i. air conditioning condensate;
   j. irrigation water;
   k. springs;
   l. water from crawl space pumps;
   m. footing drains;
   n. lawn watering;
   o. individual residential car washing;
   p. flows from riparian habitats and wetlands;
   q. dechlorinated swimming pool discharges; and
   r. discharges or flows from emergency fire fighting activities.

2. The discharge of storm water containing pollutants which have not been reduced, through measures identified in the Plan, to the maximum extent practicable is prohibited.

B. RECEIVING WATER LIMITATIONS

1. The discharge of storm water shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:

TULSA OKLAHOMA PERMIT

6. Illicit Discharges and Improper Disposal: Non-storm water discharges to the municipal separate storm sewer system shall be effectively prohibited.

   a. In accordance with 40 CFR 122.26(d)(2)(iv)(B)(1), certain non-storm water discharges to the municipal separate storm sewer system need not be addressed as illicit discharges or improper disposal. The Storm Water Management Program shall identify any non-storm water discharges that the permittee(s) does not prohibit, along with any conditions placed on such non-storm water discharges to the municipal separate storm sewer system. The permittee(s) shall prohibit, on a case-by-case basis, any individual non-storm water discharge (or class of non-storm water discharges) otherwise allowed under this paragraph that is determined to be contributing significant amounts of pollutants to the municipal separate storm sewer system.

VOL 23

0871

CITY OF BALTIMORE

The permittee shall effectively prohibit non-stormwater discharges through its municipal separate storm sewer system. NPDES permitted non-stormwater discharges are exempt from this prohibition. Discharges from the following will not be considered a source of pollutants when properly managed: water line flushing; landscape irrigation; diverted stream flows; rising ground waters; uncontaminated ground water infiltration to separate storm sewers; uncontaminated pumped ground water; discharges from potable water sources; foundation drains; air conditioning condensation; irrigation waters; springs; footing drains; lawn watering; individual residential car washing; flows from riparian habitats and wetlands; dechlorinated swimming pool discharges; street wash water; and fire fighting activities. The discharge of stormwater containing pollutants which have not been reduced to the maximum extent practicable is prohibited.

(3) The permit authorizes the point source discharge of stormwater runoff from the municipal storm sewer system. In addition, discharges of non-stormwater are also authorized through the municipal storm sewer of the City of Charlotte if such discharges are:

(a) Permitted by, and in compliance with, an independent NPDES discharge permit including discharges of process and non-process wastewater, and stormwater associated with industrial activity; or

(b) Determined to be incidental non-stormwater flows that do not significantly impact water quality and may include:

water line flushing;
landscape irrigation;
diverted stream flows;
rising groundwaters;
uncontaminated groundwater infiltration;
uncontaminated pumped groundwater;
discharges from potable water sources;
foundation drains;
air conditioning condensate (commercial/residential);
irrigation waters;
springs;
water from crawl space pumps;
footing drains;
lawn watering;
residential car washing;
flows from riparian habitats and wetlands;
dechlorinated swimming pool discharges;
street wash water;
flows from emergency fire fighting.

The Division may require that non-stormwater flows of this type be controlled by the city's Stormwater Program.

Mail Code G-8

Subject: NON-STORM WATER DISCHARGES TO A MUNICIPAL SEPARATE STORM SEWER SYSTEM

You have asked for legal advice concerning the regulation of non-storm water discharges in permits for municipal separate storm sewer systems (MS4s), and for comments on the "model language" used in several MS4 permits.

The Clean Water Act provides that permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers." Clean Water Act Section 402(p)(3)(B)(ii). The Environmental Protection Agency (EPA) interprets "storm water" to mean "storm water runoff, snow melt runoff, and surface runoff and drainage". 40 CFR Section 122.26(b)(13). Thus, permits for MS4s must "effectively prohibit" all discharges into storm drains which are not comprised of "storm water runoff, snow melt runoff, and surface runoff and drainage".

In the Preamble to EPA's regulations, EPA discusses the requirement to "effectively prohibit non-stormwater discharges". EPA makes clear that while MS4s must develop programs which are effective in prohibiting non-storm water discharges to the sewer system, they are not responsible for completely prohibiting all non-storm water discharges. The Preamble lists specified classes of non-storm water discharges which MS4s generally will not be required to prohibit. 55 Federal Register 47990, at 47996 (Nov. 16, 1990). MS4s also need not prohibit discharges of non-storm water which are subject to a separate NPDES permit. 55 Fed. Reg. at 47995.

In general, the requirement to "effectively prohibit" non-storm water discharges requires either prohibiting the flows from the MS4's system or ensuring that operators of such non-storm water discharges obtain NPDES permits. *Id.* This requirement is effected by requiring MS4s to have a program to detect and remove, or to require the discharger to the system to obtain a

VOL 23

00874

R0066855

separate NPDES permit for, illicit discharges and improper disposal into the storm sewer. 40 CFR Section 122.26(d)(2)(iv)(B). The following classes of discharges must be included in the MS4's program only where the discharges are identified by the MS4 as sources of pollutants of surface waters: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration to separate storm sewers, uncontaminated pumped ground water discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water. 40 CFR Section 122.26 (d)(2)(iv)(B)(1). In addition, programs to control discharges or flows from fire fighting are required only where such discharges or flows are identified as *significant* sources of pollutants to surface waters. *Id.*

In summary, CWA Section 402(p)(3)(B)(ii) requires that permits for MS4's must "include a requirement to effectively prohibit non-stormwater discharges into the storm sewers". The implementing regulations adopted by EPA provide that permits for MS4s must require a program to prohibit flows of non-storm water into their systems, or to ensure that dischargers of such flows are subject to a separate NPDES permit. However, the program need not address the classes of discharges listed above, unless the MS4 determines that the discharge are sources of pollutants in surface water (or, in the cases of flows from fire fighting, that the discharge is a significant source of pollutants).[1]

I have reviewed the language concerning non-storm water discharges from permits you sent me. The permits were for Tulsa, Baltimore, Charlotte, and Fairfield-Suisun Sewer District. These provisions are all generally consistent with the statute and regulations. The language from the permits for Baltimore and Fairfield-Suisun are similar, and both are clearly written. The only language which does not appear fully consistent with the statute and regulations is for Charlotte. Rather than simply stating that the city is not responsible for prohibiting discharges of the listed class of non-storm water

---

[1] *You have stated that many MS4s are reluctant to make a determination regarding the impact of the non-storm water discharges on surface waters. However, the regulations are written to leave this determination to the MS4s. It should be noted that the regulation is written so that unless the MS4 makes the determination that the discharges are sources of pollutant to surface water, then it need not include the discharges in its program to eliminate non-storm water discharges.*

discharges, this permit language states that the class of discharges is specifically authorized by the permit. That language is not fully consistent with EPA's regulations, and I would recommend against using it, unless EPA Region IX states that it would approve such language. If you wish to distribute any of these as "model language", please ensure that it is clearly stated that there is no requirement to use the model language, and that the dischargers and others must be given full opportunity to suggest changes.

If you have any questions regarding this matter, please call me at 657-2421.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

COMPARATIVE COST OF THE LA COUNTY STORM WATER MANAGEMENT PROGRAM

The SMBRP recently conducted a preliminary comparative cost analysis of the proposed Los Angeles County NPDES Storm Water program. SMBRP staff first examined the projected average cost to municipalities in Los Angeles County for implementing the municipal storm water NPDES program, and how the projected cost compare to the amounts that other communities in the state have invested in similar or more advanced programs. The staff examination used a cost survey conducted by the San Gabriel Valley Council of Govemments (SGVCOG) as basis, which was completed by extrapolating cost estimate data from six member cities according to requirements contained in the 12/18/95 permit draft. The examination showed that the program in the San Gabriel Valley area would, on the average, cost a single family parcel $1.68 to $2.25 monthly. When compared with the level of dedicated storm water program funding established by 13 municipalities throughout the State, the local estimate is at the lower range. (Average of the 13 municipalities is $3.34, ranging from $1.51 to $10.46.) See attached tables.

SMBRP staff then examined possible cost reduction associated with permit revisions - between 12/18/95 draft and 5/23/96 tentative. A preliminary comparison indicates that the changes in requirements could result in cost reduction in three program areas:

- Illicit connection: elimination of standardized surveillance, inspection, and monitoring requirements;
- Industrial/commercial Inspection: changed into educational site visits; and,
- Watershed critical source monitoring: deleted.

With regard to the industrial/commercial site program, it indicates that modifications from on-site inspections to educational site visits could reduce cost to municipalities up to fifty-percent for the program area. On the watershed critical source monitoring, cost reduction would be about $700,000 county-wide over the next five years since they are no longer required to conduct critical source/BMP monitoring for each watershed management area.

7/9/96

VOL 23 0871

Table 1
Cost Estimates Provided by the SGVCOG Survey

Category*	San Gabriel Valley cities	Total Cost of Program	Avg $ Person/year	Monthly Avg. $ Rate/SF**
1	Pasadena, Pomona, West Covina	$3,370,939	$8.98	$2.25
2	Alhambra, Arcadia, Baldwin Park, Diamond Bar, El Monte, Glendora Monterey Park, Rosemead, Walnut	$4,183,483	$7.31	$1.79
3	Azusa, Claremont, Covina, Industry, La Verne, Monrovia, San Dimas, San Gabriel	$1,788,133	$6.73	$1.70
4	Bradbury, Duarte, Irwindale, San Marino, Sierra Madre, South Pasadena	$479,317	$6.73	$1.68

*Member cities were categorized based on population size and extent of industrial/commercial activities. In general from category 1 to 4, the cities have smaller populations and fewer industrial/commercial facilities.
**Assume an average of 3.0 persons/single family residence.

Memorandum

To: Storm Water Permit Program Coordinators

Date: September 8, 1994

From: Thomas Mumley
California Regional Water Quality Control Board
San Francisco Bay Region
2101 Webster Street, Suite 500, Oakland, 94612

Subject: MUNICIPAL STORM WATER MANAGEMENT PLAN COMPONENTS

The attached draft Municipal Storm Water Management Plan Components is intended to provide a starting point for establishing a consistent framework for such plans for all municipal programs in the State. I have proposed the categorical program action areas based on experiences with existing programs and existing plans in the San Francisco Bay Region. As proposed, the categorical areas and sub-areas would be essential components of a Municipal Storm Water Management Plan. It would be the responsibility of a municipality to demonstrate that a specific area does not apply to their program or to propose equivalent alternatives with justification.

The categorical areas represent elements integral to the establishment of a storm water management program, as well as specific sources, specific areas of activities, or specific activities that need to managed. The actual management action, such as the type of control measures that would be implemented, or level of implementation of the control measure, would be determined mostly at the discretion of the municipal program. We should also recognize that at this time the appropriate action, in a specific area for a specific municipal program, may be to propose the steps that they will take to scope alternative control measures, prepare for implementation, implement on a reduced or pilot scale, and ultimately select and implement a control measure on a full scale. In such cases the plan would identify milestones and evaluation techniques that will be met and used in the process of progressing through the proposed steps.

Over time we would identify specific control measures that apply in each area and categorize the measure as mandatory, optional, or mandatory under specific conditions. (Mandatory would be interpreted to allow for implementation of equivalently effective alternative measures.) Over time we would also develop information of the effectiveness of specific control measures and develop performance standards for their design, operation, and maintenance. These performance standards would be developed through monitoring programs and serve as the building blocks for defining maximum extent practicable.

By establishing a consistent framework of action areas, we also provide a basis for coordination and collaboration of all municipal programs, and consistent reporting and evaluation standards.

F. DATA MANAGEMENT
1. Data analyses
2. Database system
3. Accessibility
4. Reports
5. Modeling - Use and applicability

c. Describe what the authority of the committee will be and its procedures for decision making.

2. Subcommittees - We expect that programs will have the need to establish focused subcommittees specific to program action areas. List the subcommittees to be formed (or that already exist), tell the focus of the group, the participants, the tasks to be accomplished, the products to come out of the group, and the time frame to be followed. These committees should develop guidelines for program implementation for each of the program areas and a methodology for determining the adequacy of each permittee's program. All of the permittees should participate on at least one of the committees.
   a. Roles/responsibilities - Develop methodology for compliance with the permit elements, and set levels of expected effort. Review the submittals of each permittee for adequacy according to the criteria established for each program element- submit the reviews as part of the annual report.

B. INSTITUTIONAL ARRANGEMENTS - Management of the storm water program will require the cooperation of all of the governmental entities named on the permit. No one agency within a city or county has the authority to assume the responsibility of all activities within the municipality. Consequently, the permit is issued to a city or county, and not to a specific agency within the municipality. (Although, certain agencies, such as flood control agencies, may be cited as a permittee.) It is expected that all of the organizations within each municipality who have programs that have an impact on storm water quality will be educated about the storm water program and actively participate in implementation of it. There must be formal arrangements whereby all municipalities can participate in the same permit program, share costs and work jointly. The agencies within a municipality must also be able to communicate with each other and work jointly.

122.26(d)(2)(i)(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

122.26(d)(2)(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination.

1. Program Participant Arrangements - Describe the relationship and formal arrangements among all permittees.
   a. City-City-County - Identify all of the governmental authorities involved, and who the lead agency will be within each of those authorities for the storm water program. Identify the lead agency for coordination of the permit. The lead agency provides no more than coordination, they do not assume responsibility for the adequacy of any city's program. Identify the responsibilities of each agency, how decisions will be made, and what communication protocols will be used. Identify what method will be used to develop a responsible management committee, or similar mechanism, and vest it with decision making powers.
   b. Format - What institutional arrangements have been used to formalize the agreement between the government entities, what arrangements have been made to allow cost sharing.
      i. Joint Powers Authority
      ii. Memorandum of Agreement/Understanding
2. Area-wide Interagency - Describe the function of each agency as it relates to the storm water program. Tell how each agency will be made aware of their responsibilities under the storm water program, and what they will do to comply with the regulations. Describe any responsibility or activity that impacts or overlaps the storm water program. Describe each activity/responsibility, how it impacts or overlaps the storm water program, how the agency will coordinate their activity with the storm water program, and how pertinent information will be exchanged. Describe the formal institutional arrangements or mechanisms that will be used to oversee or coordinate with each agency.
   a. County Hazmat - Waste regulations, Household hazardous waste program, Industrial Inspections
   b. County Health - Inspections of Restaurants and other food handling establishments.
   c. Flood Control - Operation and maintenance of the storm system
   d. Local Transportation/Congestion Management
   e. County (Regional) Parks
   f. Mosquito Abatement
   g. Fruit Fly Abatement
   h. Water Districts
   i. County Agricultural Agencies

MUNICIPAL STORM WATER MANAGEMENT PLAN COMPONENTS

The Municipal Storm Water Early Permit renewal process requires the submittal of a Storm Water Management Plan for the permitted area covering the entire five year period of the permit. A single plan is expected for each permit, with each of the permittees contributing to the plan. The plan should address all of the following components, including a discussion of how each of the components fit into a single unified program. Every element of the plan must contain compliance schedules with firm dates that will be met. The permittees should suggest schedules for submittals that are realistic for their particular fiscal year. The management plans should emphasize pollution prevention rather than relying solely on pollution control.

This document has been prepared by the staff of the State Water Resources Control Board and the Regional Water Control Boards, in an effort to assist permittees who hold municipal separate storm sewer permitsto comply with those permits. This document has not been adopted by either of the Boards. Its provisions, with the exception of the federal regulations, in italics, are not mandatory, and are provided solely as an aid to permittees.

122.26(d)(1)(i) General information. The applicants' name, address, telephone number of contact person, ownership status and status as a State or local government entity.

122.26(d)(1)(v) Management programs. (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

122.26(d)(2)(iv) Proposed management program. A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls.

I. PROGRAM MANAGEMENT - Area wide permits are permits that are issued to a group of municipal governments. The governments are given a single permit and pay a single fee. It is anticipated that although each governmental entity will have their own program, they will function as a unified entity in their permit responses. The area wide permits require cooperation by a number of government entities including cities, counties, agencies such as flood control districts or water districts, and state agencies such as CALTRANS. Each governmental entity will have, in addition, a variety of agencies that have responsibilities either directly, or indirectly for storm water related activities. The plan must include a discussion of who is involved in the program, how they will function together, what kind of interagency funding arrangements are made. For each permittee, the plan must also outline the funding and funding mechanism to be used, and the legal authority that will be used to enforce the program.

A. PROGRAM STRUCTURE - Each permit will require a structure for the participatory agencies to work together under a unified plan. While each permittee will have an individual program to address the particular needs of their city or agency, a framework must be developed to allow cooperation between them. In addition, cities will have common problems that will be more efficiently addressed as a whole rather than individually. For most area-wide permits, a city or county acts as the lead agency or coordinator for day to day business, setting meetings and preparing submittals. They assume no responsibility for any other city's program, and are not viewed as the responsible agency for the permit. Each area-wide permit will require a mechanism to make decisions for the permittees, develop program guidlines for each of the permit areas, assess the adequacy and consistency of each permittees submittals in each of the program areas, address the inadequate program areas with each of the permitteees, and prepare unified submittals for the Regional Boards. The mechanism can either be a single government entity such as a county, or it can be a Management Committee made up of representatives of the permittees.

1. Management Committee - An overall decision making body that is representative of all of the permittees.
   a. Describe the purpose of the committee, and how its responsibilities fit into the overall program framework.
   b. Descri. the makeup of the committee, how the committee will communicate, and how it will coordinate its activities.

established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:
(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;
(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;
(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;
(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;
(E) Require compliance with conditions in ordinances, permits, contracts or orders; and
(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

1. List of essential authoritics - Describe how the authority already existing in your municipality fills the requirements in the regulations. The ordinances must be adequate and they must be enforced.
2. Ordinance
   a. Exists
   b. Planned
3. Implementation procedures
4. Responsible parties

II. ILLICIT DISCHARGES - The regulations require every permittee to have a plan for fiding and preventing illegal discharges, and a mechanism for enforcing against illegal dischargers.

122.26(d)(1)(iii) Source identification. (A) A description of the historic use of ordinances, guidance or other controls which limited the discharge of non-storm water discharges to any Publicly Owned Treatment Works serving the same area as the municipal separate storm sewer system.

122.26(d)(2)(v)(B) A description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.

122.26(d)(1)(iv)(D) Field screening. Results of a field screening analysis for illicit connections and illegal dumping for either selected field screening points or major outfalls covered in the permit application.

122.26(d)(2)(iv)(B) A description of a program, including a schedule to detect and remove (or require the discharger ... to obtain a ... NPDES permit for) illicit discharges and improper disposal into the storm sewer.

A. ILLICIT CONNECTIONS - The storm drain system should have been surveyed during the first permit period to ensure that all of the connections made to the system are both legal and appropriate. If the system has not yet been surveyed the plan should contain a proposed plan for doing it. The plan should contain a proposal for how the system will be surveyed, who will do the survey and a time table for completion. It should also specify what will be done with the illicit connections that are found. In addition, there should be a plan for ongoing system inspections.
   1. System survey
   2. Ongoing system inspections - The extent of this program would vary widely based on the needs of an individual city.
   3. Reporting

B. ILLEGAL DUMPING - It is important to stop illegal dumping. Unfortunately, it is difficult to detect, because it is usually done both irregularly and covertly. The best method for stopping illegal dumping is educating the public, both to raise the awareness of what is illegal dumping so that people are not doing it, and to encourage the public to contact the authorities if they witness illegal dumping. All city inspectors and police and fire personnel should be trained to recognize and respond to illegal dumping. There should be a clear response mechanism, such as a hotline that anyone can use to report incidence of illegal dumping. In addition there should be ongoing system surveillance. If illegal dumping or spills are reported and responded to, there should be some follow up mechanism.
   1. Outreach

j. Others

3. City-specific Interagency Arrangements - This should reflect the structure in each city.
   a. Public works
      i. Engineering
      ii. Operations & Maintenance
      iii. Streets/roads - by law, these are part of the storm water conveyance system
      iv. Others
   b. Planning - New Construction and Redevelopment, coordination with CEQA and local permitting. Retrofit of existing structures.
   c. Parks and Recreation
   d. POTWs
   e. Others

C. FISCAL RESOURCES - Every permittee must have a mechanism for funding their storm water program. The plan should show what the funding is, the source of the funding, and how it will be distributed. The regulations require a budget for every year of the five year permit period. While it may not be possible for a city to commit to a set budget for future years, it is possible to make estimates about the cost of the program that is proposed. This should include an estimate of the cost of each of the elements, the personnel or contracts that will be required to implement the program, the anticipated funding source, and process and time schedule for establishing detailed annual budgets. Include a detailed budget for the first year.

122.26(d)(1)(vi) Fiscal resources. (A) A description of the financial resources currently available to the municipality to complete part 2 of the permit application. A description of the municipality's budget for existing storm water programs, including an overview of the municipality's financial resources and budget, including overall indebtedness and assets, and sources of funds for storm water programs.

122.26(d)(2)(vi) Fiscal analysis. For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2) (iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

1. Area-wide
   a. Funding source(s)
   b. Staff resources
   c. Contract services
   d. Cost share (funds associated with existing activities/related programs) - if management practices currently in place under another program are to be included as part of the storm water program, the costs associated with those practices should be included as part of the budget. The program should also have a demonstrable water quality perspective.
2. City-specific
   a. Funding source(s)
   b. Staff resources
   c. Contract services
   d. Cost share (funds associated with existing activities/related programs) - if management practices currently in place under another program are to be included as part of the storm water program, the costs associated with those practices should be included as part of the budget. The program should also have a demonstrable water quality perspective.

D. LEGAL AUTHORITY - The regulations require permittees to demonstrate adequate legal authority to carry out the storm water program, including controls on industry and construction. You must cite your legal authority, or where it does not yet exist, give a plan and timetable for developing it.

122.26(d)(1)(ii) Legal authority. A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(ii) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

122.26(d)(2)(ii) Adequate legal authority. A demonstration that the applicant can operate pursuant to legal authority

A. IDENTIFICATION OF SOURCES - Indicate what sources were identified during the first permit period. Tell what measures will be taken to identify other sources, what agency will do the source identification, what methods of source identification will be used, and the time table for completing this investigation. This source identification should allow cities to prioritize industrial and commercial sources and to determine the schedule for inspection. At the minimum all potential sources should be inspected at least once during the permit period. Some facilities will require more frequent inspections.
   1. Categorical list
   2. Ranking
   3. Update procedure

B. CONTROL MEASURES (identification) - For each pollutant source, either by industrial or commercial category or specific activity, determine what measures are applicable for control of the source; which, of these measures, are technically and financially feasible, and which measures will be used. Indicate who will implement the measures, how they will be implemented and the time table for implementation. The plan should include a tiered approach. Describe what measures either have been implemented already, or can be immediately implemented, other measures that can be implemented over the short term and measures that are more costly or difficult that can be used if necessary in the long term. Describe any studies or pilot projects that are contemplated to study these measures.
   1. Pollution prevention measures - Education on source minimization and pollution prevention is an important control measure.
      a. Site design options
      b. Housekeeping/maintenance practices
   2. Structural (treatment) measures
      a. Applicability
      b. Effectiveness
      c. Retrofit opportunities

C. OUTREACH - Indicate the purpose of the outreach, the target audience, the intended messages, who will be responsible for the outreach, how the outreach will be done, and the time table for implementation.
   1. General guidance - All potential industrial and commercial dischargers should be informed of their obligations under the storm water program. Dischargers should also be informed of ways of complying with the storm water program, including general outreach on pollution prevention measures.
   2. Industrial category guidance - Specific outreach should be developed for industrial or commercial categories that permittee identify as high priority industries.
   3. Industrial activity guidance - Specific outreach should be developed for high priority activities such as loading docks or vehicle washing and maintenance.

D. INSPECTIONS - Most municipalities already have programs in which they inspect businesses, these include HAZMAT, Health and Pretreatment Programs among others. Inspections for the storm water program can either be incorporated into these other inspection programs, or they can be done as a stand alone program with separate inspectors. Indicate the purpose of the inspections, the priority for inspections, how the facilities were chosen for inspection, what the inspection will consist of, how the inspection will be carried out, who will be responsible for the inspections, how the inspectors will be trained, when the inspection program will be implemented and a schedule for completion of the inspections. Indicate also how the results will be reported and to whom. If an immediate problem is found how will it be handled? To whom will it be reported? How will follow up to these inspections be handled? Will there be a mechanism for a revisit inspection?
   1. Checklist
   2. Schedule
   3. Reports
   4. Follow-up procedures

E. LOCAL PERMITS / INCENTIVE PROGRAM - While not required by the Regulations, a municipality should consider controlling industrial and commercial sources through the use of local storm water permits, or clean business incentive programs.

F. TRAINING - Implementation of an industrial storm water program will require an informed and aware staff. All

2. System surveillance
3. Spill response - When a spill is identified, it must be cleaned up. The city must have the legal authority to act against the discharger, and the ability to handle the clean up or require the discharger to clean it up. The Regional Water Board and other State agencies can be brought in if a spill occurs that is beyond the ability of the city to the clean up.
4. Complaint response - When a complaint is made, it must be responded to. The city must have the legal authority to act against the discharger, and the ability to handle the clean up or require the discharger to clean it up. The Regional Water Board and other State agencies can be brought in if a spill occurs that is beyond the ability of the city to the clean up.
5. Coordination of alternative disposal - Household hazardous waste recycling programs are mandated for many of the items that are routinely illegally dumped, such as used oil. Describe these programs and any other alternative disposal programs that are available.
6. Reporting - Incidents of illegal dumping and spills should be reported to the Regional Board on a regular basis in writing. All complaint response should be tracked in writing and submitted to the Regional Board.

C. ENFORCEMENT PROCEDURES - Cite your local legal authority and describe your mechanism for enforcing against dischargers who are illegally dumping or who have illicit connections.

D. COORDINATION WITH STATE NON-STORM WATER PERMITS - All other state laws and programs that overlap with or are in conflict with the storm water program must be addressed. Non-storm water discharges are prohibited unless authorized by NPDES permit. Even if the Regional Board issues a permit for a discharge, the city can refuse to accept the discharge into their system. The regulations exclude certain non-storm water discharges from the prohibition unless a municipality identifies them as sources of pollutants. Permittees must identify the discharges they will allow, and the management measures that they will require on these discharges. However, all discharges that are prohibited by a Regional Board must also be prohibited by a municipality. A municipality cannot be less stringent than the state.
1. Identification of permissible/permitable discharges
2. Appropriate management practices
3. Reporting

III. INDUSTRIAL/COMMERCIAL SOURCES - Municipalities are responsible for all discharges from commercial facilities as well as industries and construction sites within their jurisdiction regardless of coverage under the statewide general permits. This includes facilities required to be permitted under the State Industrial Storm Water Program and industries and commercial facilities that are not required to be permitted. Pollution prevention should be emphasized. The Regional Water Board will enforce the General Permits and municipalities are expected to enforce their local ordinances.

122.26(d)(2)(ii) Source identification. The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(1) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

122.26(d)(2)(iv)(A) A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls.

122.26(d)(2)(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:
(1) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;
(2) Describe a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of quantitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7) (iii) and (iv).

d. Follow-up procedures

C. LOCAL PERMITS - Optional
1. Coordination with existing permits
2. New permit issues

D. TRAINING
1. Planning personnel
2. Public Works personnel
3. Inspectors

E. CONTROL MEASURES - Permanent measures to be installed during construction to control runoff from the final development or redevelopment.
1. Pollution prevention measures
   a. Site design - inlet design to allow easy and frequent cleaning.
   b. Education/training
   c. Other
2. Post construction (treatment) measures - grassy swales, extended detention basins, sand filters, constructed wetlands, oil/water separators.
   a. Applicability
   b. Effectiveness
   c. Retrofit opportunities
3. Operation and maintenance - It must be clear who is responsible for the long term maintenance, and who will pay for it.
   a. Requirements
   b. Responsible party
4. Conflicts with other mandates - Regulations from other agencies can conflict with recommended practices in the storm water program. An example of this is the storage of materials. While the storm water program recommends covering materials, fire codes will not allow some materials to be covered. In another area, the minimization of impervious areas and design of landscaping to allow flow to the vegetated areas are recommended practices in storm water. Often local building ordinances dictate the amount of impervious areas and the configuration of the landscaping. These conflicts should be identified and an attempt made to resolve them.
   a. Identification of conflicts
      i. Landscaping
      ii. Pavement/curbs
   b. Conflict resolution

F. OUTREACH
1. Developers
2. Contractors
3. Other parties

G. ENFORCEMENT - Municipalities must enforce their ordinances, including their grading ordinances.

H. COORDINATION WITH STATE CONSTRUCTION STORM WATER PERMIT - It is anticipated that the municipalities will have regulations through ordinance or other legal mechanisms that would be written such that compliance with a municipality's regulations would cause a construction project to be in compliance with the State General Construction Permit. Coordination between the Regional Boards and the municipalities will be necessary. As such, the municipalities should discuss the anticipated relationship or agreement they would have with the Regional Board, and the mechanism they will pursue to enact such an agreement or relationship.

1. Memorandum of Understanding - An MOU can be used to formalize the agreement between municipalities and the Regional Board on the construction compliance program.
2. Reports

public employees should be trained in the storm water regulations, both so that they abide by the regulations in the course of their work day and so that they can tell if an activity that they witness is legal. In addition inspectors who visit commercial or industrial facilities, or who go to construction sites can determine compliance with the storm water regulations and educate the facilities about the requirements of the program.

1. Public employees
2. Inspectors

G. COORDINATION WITH STATE INDUSTRIAL STORM WATER PERMIT - It is anticipated that the municipalities will have regulations through ordinance or other legal mechanisms that would be written such that compliance with a municipality's regulations would cause an industrial discharger to be in compliance with the State General Permit. It is anticipated that coordination between the Regional Boards and the municipalities will be required. As such, the municipalities should discuss the anticipated relationship or agreement they would have with the Regional Board, and the mechanism they will pursue to enact such an agreement or relationship.

1. Memorandum of Understanding - An MOU can be used to formalize the agreement between municipalities and the Regional Board on the industrial compliance program.
2. Reports
3. Other issues

IV. NEW DEVELOPMENT AND RE-DEVELOPMENT - Each permittee must have a plan for managing storm water runoff from new construction and re-development. The plan must cover both construction covered by the State Construction Storm Water General Permit and construction under five acres. The plan should emphasize pollution prevention, especially erosion prevention.

122.26(d)(2)(iv)(A)(2) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed.

122.26(d)(2)(iv)(D) A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include:
(1) A description of procedures for site planning which incorporate consideration of potential water quality impacts;
(2) A description of requirements for nonstructural and structural best management practices;
(3) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and
(4) A description of appropriate educational and training measures for construction site operators.

A. PLANNING PROCESS - The planning process for new development and re-development must address a comprehensive plan to develop, implement and enforce controls to reduce the discharge of pollutants from areas of new development and significant redevelopment. Master planning and other studies regarding flood management must assess the impact on water quality.

1. Watershed protection policies
2. Coordination with CEQA
3. Site planning practices
4. General Plan changes
5. Use of master plans
6. Other policies
7. Planning - public works interface
8. Implementation procedures

B. CONSTRUCTION SITES - Construction site management must consider the requirements of the State Construction Storm Water General Permit. Erosion prevention using vegetation, soil stabilization and timing of grading should be emphasized.

1. Erosion control requirements
2. Chemical and waste management requirements
3. Inspections
   a. Checklist
   b. Schedule
   c. Reports

D. STORM DRAIN SYSTEM OPERATION AND MANAGEMENT - The maintenance and operation of the storm drain system has an impact on storm water quality and must be addressed in the management plan. Material clogging storm drains can not be discharged into drains. It must be removed and disposed of properly.
   1. Inlet maintenance
   2. Drain maintenance
   3. Waste management
   4. New system designs
   5. Retro-fit opportunities

E. STREETS AND ROADS - Construction, operation, and maintenance of roads has an impact on storm water quality and must be addressed in the management plan..
   1. Sweeping - Street sweeping waste cannot be dumped in storm drain.
      a. Storm water quality based operation
      b. Waste management
   2. Street/pavement washing - Wash waters must be managed as non-storm water discharges.
   3. Maintenance
      a. Saw-cut slurry management
      b. Paving practices
      c. Waste management
      d. Medians/Landscaped Right of Way
         i. Irrigation
         ii. Fertilizer/pesticides

F. FLOOD CONTROL - Flood control practices have an impact on storm water quality and must be addressed in the management plan. Flood control managers must be educated about storm water quality requirements. Water quality must be a consideration in moving the water through the system.
   1. Coordination with new projects
   2. Coordination of maintenance activities
      a. Desilting/sediment removal
      b. Vegetation management
      c. Waste management
   3. Operation of facilities
      a. Detention basins - BMPs must be implemented when draining or pumping detention basins. Risers should not be directed into storm drain inlets.
      b. Other
   4. Retrofit opportunities

G. PUBLIC FACILITIES - Storm water runoff and non-storm water discharges from other public facilities must be addressed. Chemical use by these facilities should also be included. Address pressure blasting/cleaning sidewalks and concrete.
   1. Parking facilities
   2. Golf courses
   3. Schools
   4. Hospitals
   5. Parks / Landscapes
   6. Other buildings/plazas/etc.

H. PONDS, FOUNTAINS, AND OTHER PUBLIC WATER BODIES - Maintenance practices used on public water bodies, including waste management and non-storm water discharges, must be addressed in the plan.
   1. Algae control
      a. Use of chemicals
   2. Chlorine management
   3. Maintenance

VI. RESIDENTIAL (Not Elsewhere Covered) - Residential activities including private vehicle washing and maintenance; use of chemicals such as pesticides, herbicides and paints; private swimming pool maintenance; and other household

3. Other issues

V. PUBLIC AGENCY ACTIVITIES - All municipalities perform functions that have an impact on storm water quality. These include among other things, vehicle maintenance, landscape maintenance and weed control, water body maintenance including swimming pool maintenance, construction and maintenance of streets and roads, and construction and maintenance of the flood control system. Since municipalities must address all significant sources of pollutants, all of these activities must be examined and if appropriate, controlled.

122.26(d)(2)(v) Management programs. (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

122.26(d)(2)(iv)(A)(1) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;

122.26(d)(2)(iv)(A)(3) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities;

122.26(d)(2)(iv)(A)(4) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible;

122.26(d)(2)(iv)(A)(5) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage, or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;

122.26(d)(2)(iv)(A)(6) A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

A. SEWAGE SYSTEMS - Sewage spills must not be allowed to go into the storm drain. Sewage must be contained and vacuum pumped. Storm drains must be protected during a sewage spill.

B. CORPORATION YARDS - Corporation yards include any area or facility that is used for vehicle maintenance or washing, other maintenance, chemical storage or use, such as a paint facility, and waste management. Identify all corporation yards and give their locations and describe their functions.

1. Storm Water Pollution Prevention Plans - SWPPP are not required, however, municipalities are required to control any potential source of pollution, and SWPPP are a good vehicle for compliance. Identify what the potential storm water problems are, who is responsible for implementing the storm water measures, what management practices will be used, and how they will be implemented. For measures that are not already in place give a timetable for implementation. Tell how the effectiveness of the BMPs will be judged. If a municipality chooses not to use SWPPP, they must use an equivalent method to handle their corporation yard discharges.

C. PARKS AND RECREATION - Park Departments manage landscaping and swimming pools. Both of these activities involve the use of chemicals, waste management, and non-storm water discharges. Their use of chemicals must be addressed in the storm water management plan. In addition maintenance of swimming pools requires the periodic discharge of large quantities of swimming pool water.

1. Fertilizers/Pesticides
   a. Use / Application management
   b. Storage
2. Facility Management
   a. Wash waters
   b. Maintenance
   c. Swimming pool waters

difficult. Municipalities must develop a process by which they can evaluate the effectiveness of their program, and recommend changes to it.

VIII. PROGRAM EVALUATION - The storm water program developed under this plan must be evaluated for its effectiveness on a regular basis. The plan for this evaluation must include a schedule for evaluation, a methodology for the evaluation, a discussion of who will carry out the evaluation, and what will be evaluated. In addition, there must be a mechanism to follow up on the information generated by the evaluation. The plan should be adjusted based on the program evaluation.

122.26(d)(2)(v) Assessment of controls. Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.

A. PERFORMANCE STANDARDS - The permittees, possibly through management-committee sub-committees, must develop standards to judge the effectiveness of their activities and control measures. As an example, for street sweeping, permittees must devise a way of determining if the street sweeping has an impact on water quality. This could include determining what kind of pollutants are removed by the sweeping, measuring the size of the pollutants and the amount removed. Methodologies should be developed for each, which if followed, will assure that each control measure or action is implemented to the maximum extent practicable. For street sweeping, this would include the frequency of sweeping, the method of sweeping, the equipment used, how the equipment is cleaned and maintained, and the method of disposal for the material collected. Contol measure studies can be coordinated on a larger scale, such as statewide, so that each municipality is studying a different procedure.
   1. Development procedure
   2. Role of subcommittees
   3. Activity/source/action area specific

B. ANNUAL REPORTS - Reports must be submitted after the end of each fiscal year. Permittees should propose a date for submittals that works for them. The reports should be more than a simple compilation of activities. Rather, they should be used to evaluate the program and the effectiveness of the management measures. Each annual report should contain a report on the program implemented during the previous year and a plan that will be implemented during the current year. In addition, the findings of the evaluation of the previous years program should be used to suggest changes that are appropriate for implementation during the next year. Any revisions to the five year plan should be addressed here.
   1. Formal/Structure - Each group of permittees under an area wide permit should develop a format that all the permittees will use for the annual report.
   2. Effectiveness measures - The co-permittees are responsible for developing methods for determining the effectiveness of the BMPs that they implement, for their particular program, and developing a level of effort that will be required in each area.
   3. Content

C. SUB-ANNUAL REPORTS - Each year, before the end of the fiscal year, the permittees should submit a report that contains a draft preliminary report addressing the implementation of that years program, a preliminary budget for the next year program addressing the funding issues for the upcoming budget process, and a preliminary plan for the next year showing what revisions to the five year plan will be required. In some regions, rather than a sub-annual report, the permittees will meet with the Regional Board to discuss these issues.
   1. Purpose
   2. Formal/Structure
   3. Content

D. INTERNAL REPORTING - We suggest the development of a process for interagency - intragency exchange information among themselves and to develop the annual and semiannual reports
   1. Standard forms
   2. Procedures
   3. Record keeping - The Regional Board does not need to see all of the extraneous information, but there should be a mechanism for storage of records in case they are needed.

and landscape maintenance can contribute to storm water pollution. Identify measures that can be taken to improve the quality of the runoff from residential area. Emphasize pollution prevention and the identification and use of safe substitutes.

VII. PUBLIC INFORMATION AND PARTICIPATION - It is necessary to involve the public in the storm water program in order to have an effective municipal program. The outreach program should be focused on the specific needs of individual cities. Tell how the public education needs were determined, who is responsible for developing and implementing the education program, what program and what materials will be developed, give a timetable for implementing the program, and the method to be used to determine its effectiveness.

122.26(d)(2)(iv) Proposed management program. A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate.

122.26(d)(2)(iv)(B)(5) A description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers;

122.26(d)(2)(iv)(B)(6) A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials; and

A. GENERAL OUTREACH - Describe your outreach materials developed for the general public. Tell what the focus of the materials are, and how you arrived at that focus. Tell what materials have already been developed and how they are distributed. Tell what materials are still to be produced, what they address, who is producing them, how they will be distributed, what kind of follow up opportunities are provided, and the timetable for production and distribution.
   1. Written material
   2. Audio material
   3. Video material
   4. Distribution plan

B. FOCUSED OUTREACH - Describe your outreach materials developed for specific groups. Tell how these groups were identified and prioritized. Tell what the focus of the materials are, and how you arrived at that focus. Tell what materials have already been developed and how they are distributed. Tell what materials are still to be produced, what they address, who is producing them, how they will be distributed, what kind of follow up opportunities are provided, and the timetable for production and distribution.
   1. Pollutant specific
   2. Practice/activity specific
   3. Business specific

C. EDUCATION PROGRAMS
   1. Public employees - It is important to educate all of the public employees about the storm water program both so that they do not continue with practices that are counter productive and so that they can participate in its implementation and enforcement. Describe your public employee outreach programs. Tell what the focus of the training is, how it is implemented, who is implementing it, the schedule for training, and the opportunities for continuing education.
   2. K-12 - Describe programs developed for schools. These programs should include storm water awareness, illegal dumping awareness, source minimization and pollution prevention.
   3. Other

D. CITIZENS PARTICIPATION
   1. Volunteer monitoring
   2. Cooperative outreach
   3. Complaint procedures - Describe any mechanism available for citizen reports of illegal discharge illicit connections or potential pollution problems.

E. EFFECTIVENESS EVALUATION - Quantifying the effectiveness of education and outreach efforts may be

e. Other habitat

4. Land use - Characterize the land use in the permitted area. Characterize the storm water discharges from specific land use categories and mixed land use.
   a. General categories
   b. Specific features/sources

B. SOURCE IDENTIFICATION - Do focused monitoring on pollutants of concern.
1. Specific land-use
2. Specific activities

C. CONTROL MEASURE EFFECTIVENESS - Monitor to determine the effectiveness of control measures. Identify what control measure studies will be done and how they will be prioritized. Give a schedule for doing the studies.
1. Specific Sources (e.g., corp yards)
2. Specific Activities (e.g., waste management)
3. Special Studies

D. POLLUTANT LOADING - An initial determination of the pollutant loading, both system wide and specific to land use types should be made through monitoring and modeling. Once the initial determination is made, it is important to continue a minimal long term monitoring program to track trends in the pollutant loading over time.

1. System-wide
2. Land-use specific
3. Long-term stations

E. COMPONENTS OF A MONITORING PROGRAM PLAN - These are the expected elements of a monitoring plan. The elements suggested here do not replace any directions from the regulating Regional Board.
1. Monitoring/sampling points with map
   a. rationale for sampling points
2. Dry weather sampling
   a. frequency
   b. monitored parameters
   c. method for documentation of outfall field inspections
3. Storm sampling plan
   a. number of storm events to be samples
   b. method for determining representative event
   c. worker safety plan
   d. sampling plan
   e. timing of sampling
   f. monitored parameters
      i. how were parameters chose?
   g. method to be used for flow weighted compositing of samples
      i. time duration between samples
      ii. minimum number of samples per hour
4. Manual of field techniques
   a. general field techniques
   b. manual vs automatic sampling
   c. appropriate sampling technique for each pollutant
      i. grab vs composite
   d. appropriate sample size for each pollutant
5. Flow analysis for sampled storm event
   a. method for determining flow
      i. flow rate
      ii. flow volume
6. USEPA Title 40 CFR Part 136 compliance
   a. container type

E. STORM WATER MANAGEMENT PLAN REVISIONS - There should be a review process which will allow you to revise the plan for the next year and for the rest of the permit period.
   1. Process
   2. Reporting

IX. MONITORING - Monitoring serves several purposes. It allows a baseline characterization of storm water/urban runoff from the permitted area, it identifies the problems and their sources and evaluates impacts on receiving waters, it allows the permittee to determine what are appropriate, and it allows a permittee to judge the effectiveness of its control measures. Monitoring is not limited to water sampling. It can include such elements as visual inspections of above and underground systems or compilation of chemical use data.

Characterization of the permitted area, the watershed, the storm drain system, the receiving waters, and the land use was required in the previous permits. The information collected from previous efforts should be used in baseline characterization. This plan should also tell what the future monitoring objectives are, what information will be collected, the purpose of the information, how it will be collected and used, and how the information will be analyzed, reported and stored.

122.26(d)(1)(B) Existing quantitative data describing the volume and quality of discharges from the municipal storm sewer, including a description of the outfalls sampled, sampling procedures and analytical methods used.

122.26(d)(2)(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

122.26(d)(2)(ii) Source identification The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(1) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

122.26(d)(1)(iii)(C) A list of water bodies that receive discharges from the municipal separate storm sewer system, including downstream segments, lakes and estuaries, where pollutants from the system discharges may accumulate and cause water degradation and a brief description of known water quality impacts.

122.26(d)(2)(D) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

122.26(d)(2)(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under Section 122.21(c)(7)) for BOD5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods;

122.26(d)(2)(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(1) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section;

A. SYSTEM CHARACTERIZATION - The previous permit required a complete characterization of the entire system. This included the storm drain system, the receiving waters and the land use activities.
   1. Watershed - Characterize each watershed including the storm drain system, the land uses and the particular problems of the receiving waters.
   2. Storm drain system - Characterize the system including all major outfalls.
      a. Inlets
      b. Outlets
   3. Receiving waters - Identify and evaluate water bodies. Use existing water quality data along with current monitoring efforts to characterize and prioritize the receiving waters. Perform additional monitoring as necessary to characterize the receiving waters.
      a. Streams
      b. Lakes
      c. Bays
      d. Wetlands

Economic Benefits of Runoff Controls

Even though urban runoff management costs money, properly designed runoff systems can provide economic benefits that counterbalance or even outweigh these costs.

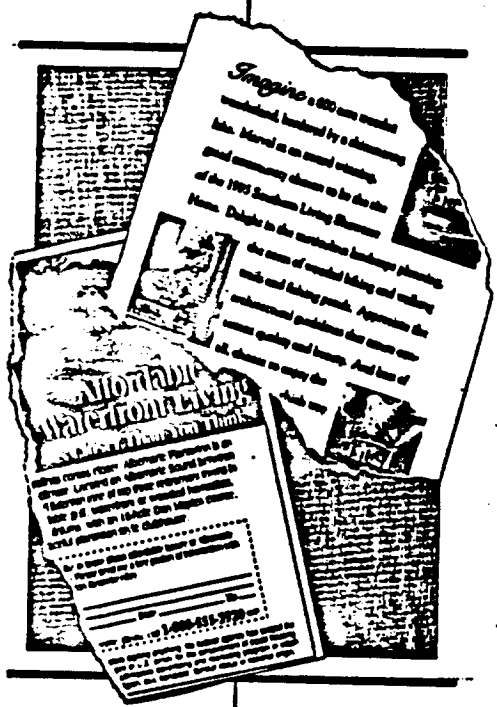
This report describes the economic impacts of various types of urban runoff controls and presents case studies of developments where the implementation of runoff control requirements has provided economic benefits to developers and property owners.

VOL 23

0897

Overview

PEOPLE HAVE a strong emotional attachment to water, arising from its aesthetic qualities—tranquility, coolness, and beauty. As a result, most waterbodies within developments can be used as marketing tools to set the tone for entire projects *(Tourbier and Westmacott, 1992)*. A recent study conducted by the National Association of Home Builders indicates that "whether a beach, pond, or stream, the proximity to water raises the value of a home by up to 28 percent." A 1991 American Housing Survey conducted by the Department of Housing and Urban Development and the Department of Commerce also concurs that "when all else is equal, the price of a home located within 300 feet from a body of water increases by up to 27.8 percent" *(NAHB, 1993)*. Dick Dillingham, President of the National Association of Realtors' Residential Sales Council, declares, "Water makes a difference . . . there is such a very small supply of properties that can claim a water location and it is something you cannot add" *(Lehman, 1994)*.



Although there are a limited number of natural waterfront sites adjacent to lakes, rivers, streams, estuaries, or open ocean, many opportunities exist to create waterfront property. Homes and businesses can be sited along hydroelectric or water supply impoundments or near the banks of artificial lakes created for wildlife, recreational, or aesthetic reasons. A practice becoming more prevalent is to site developments around man-made ponds, lakes, or wetlands created to control flooding and reduce the impacts of urban runoff on neighboring natural streams, lakes, or coastal areas. When designed and sited correctly, artificial lakes or wetlands can help developers reduce negative environmental impacts caused by the development process and increase the value of the property.

The purpose of this report is to show that certain urban runoff management controls can be incorporated into a development in a way that provides aesthetic and economic benefits. Table 1 summarizes the findings of this report. Urban runoff controls that are pleasing to the eye and safe for children can lead to increased property values. Because the beauty of natural surroundings can increase real property values and enhance the quality of life, beautification of land areas adjacent to waterways and detention ponds should be considered an integral part of planning by developers. For existing runoff controls that are unsightly, corrective renovations can be made to increase the property value and quality of life.

People have a strong emotional attachment to water, arising from its aesthetic qualities—tranquility, coolness, and beauty.

Table 1: Examples of real estate premiums charged for property fronting urban runoff controls

Location	Base Costs of Lots/Homes	Estimated Water Premium
Chancery on the Lake, Alexandria, Virginia	Condominium: $129,990 - $139,990	Up to $7,500
Centex Homes at Barkley, Fairfax, Virginia	Home with lot: $330,000 - $368,000	Up to $10,000
Townhomes at Lake Barton, Burke, Virginia	Townhome with lot: $130,000 - $160,000	Up to $10,000
Lake of the Woods, Orange County, Virginia	Varies	Up to $49,000
Dodson Homes, Layton, Fauquier County, Virginia	Home with lot: $289,000 - $305,000	Up to $10,000
Ashburn Village, Loudon County, Virginia	Varies	$7,500 - $10,000
Weston Development, Broward County, Florida	Home with lot: $110,000 - $1,000,000	$6,000 - $60,000 depending on lake size, location, and the percent of lakefront property in the neighborhood
Silver Lakes Development, Broward County, Florida	Varies	$200 - $400 per linear foot of waterfront, depending on lake size and view
Highland Parks, Hybernia, Illinois	Waterfront lot: $299,900 - $374,900	$30,000 - $37,500
Waterside Apartments, Reston, Virginia	Apartment Rental	Up to $10/month
Village Lake Apartments, Waldorf, Maryland	Apartment Rental	$5 - $10/month depending on apartment floor plan
Lake Arbors Towers, Mitchellville, Maryland	Apartment Rental	$10/month
Marymount at Laurel Lakes Apartments, Laurel Lakes, Maryland	Apartment Rental	$10/month
Lynne Lake Arms, St. Petersburg, Florida	Apartment Rental: $336 - $566/month	$5 - $35/month depending on lake size
Sale Lake, Boulder, Colorado	Waterfront lot: $134,000	Up to $35,000
The Landing, Wichita, Kansas	Waterfront lot: $35,000 - $40,000	Up to $20,000
Fairfax County, Virginia	Commercial Office Space Rental	Up to $1/square foot
Laurel Lakes Executive Park, Laurel, Maryland	Commercial Office Space Rental	$1 - $1.50/square foot

Impacts and Controls

URBANIZATION CAUSES changes and impacts to the environment and our communities. Many effects of urbanization are positive, such as new places for people to live and work, increased recreational opportunities, and economic growth. However, some of the impacts might be negative if they are not handled with foresight.

Most local governments require some form of urban runoff management for new development.

Development leads to an increase in the amount of pollutants in an area. Sediment from construction sites can end up in streams and rivers, choking plant and animal life. Oil and gas from vehicles can leak onto roads and parking lots. Fertilizers and pesticides, if not applied properly, can wash off lawns. Pesticides are often found in higher concentrations in urban areas than in agricultural areas (USGS, 1995). Pet waste, if not properly disposed of, can enter storm drains that lead to wetlands, streams, or rivers. Household chemicals, such as paints and cleaning products, can leak if not stored or disposed of properly. All of these pollutants can wash away when it rains and end up in streams, rivers, lakes, estuaries, or ground water. Many pollutants also bind to the sediment, so when sediment washes away it takes the pollutants with it.

Urbanization also leads to loss of pervious areas (porous surfaces) that allow rainwater to soak into the ground. This can increase the amount and velocity of rainwater flowing to streams and rivers, as illustrated in Figures 1 and 2. This increased speed and volume of water can have many impacts, including eroded stream banks, increased turbidity and pollution, increased stream water temperature, and increased water flow. All of these can have an adverse effect on the fish and other organisms living in the stream and the receiving waters. When rainwater cannot soak into the ground, the result can be a loss of drinking water because many areas of the country rely on rainwater soaking into the ground to replenish underground drinking water supplies.

Loss of trees due to urbanization can have negative impacts. Trees are important for controlling the water temperature along the shorelines of waterbodies. Since many aquatic plant and animal species are sensitive to changes in water temperature (trout, for example), it is important to keep stream temperatures as close to natural levels as possible. When the shade of trees is lost, the water temperature can increase.

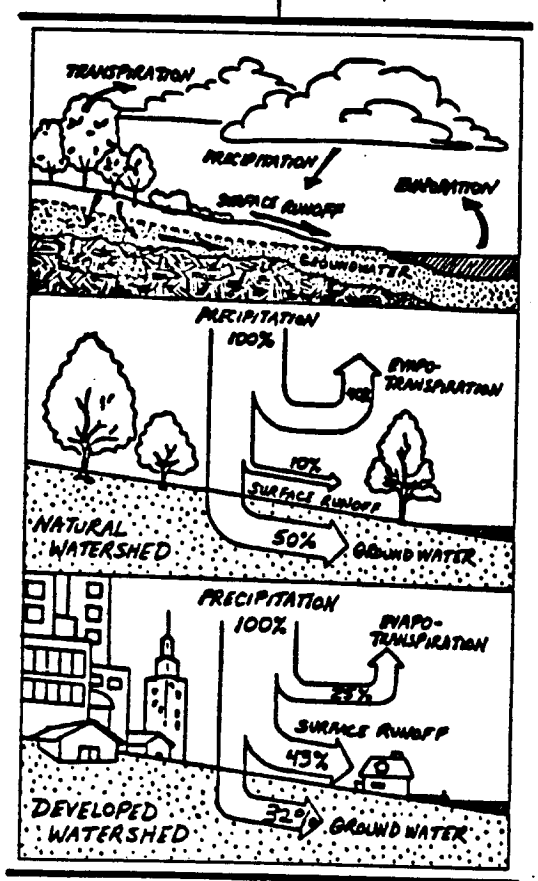


Figure 1: Development decreases the amount of rainwater that can soak into the ground. (L.B. Leopold, USGS Circular 554, 1968, cited in NYSDEC, 1992)

"Best management practices," or BMPs, help address these impacts. BMPs are designed to help reduce the amount of pollution in urban runoff. Some help to control the volume and speed of runoff before it enters receiving waters. Many help to increase the amount of rainwater that soaks into the ground to restore groundwater. There are two general types of BMPs: structural and nonstructural. Structural controls involve building a "facility" for controlling urban runoff. There are a variety of structural controls and most require some level of routine maintenance. This report discusses two types of structural controls that have been documented as providing economic benefits: urban runoff ponds and constructed wetlands. Nonstructural BMPs do not require construction of a facility. For example, planning a development so that there are buffers along stream banks and minimizing the amount of impervious area are types of nonstructural controls. Structural and nonstructural controls can be used in combination to manage runoff.

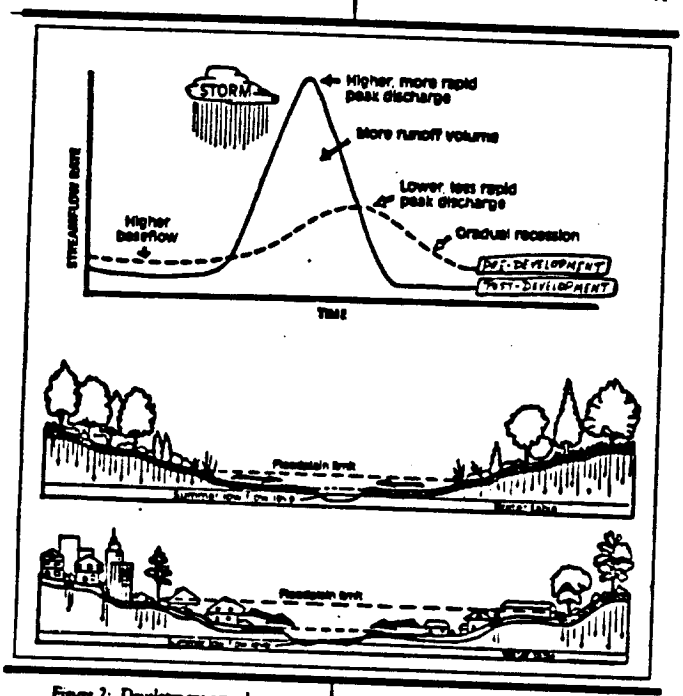

Figure 2: Development can alter an area's hydrology by increasing the amounts of impervious surface. (adapted from Schueler, 1987).

Urban runoff management controls are now widely accepted due to lessons learned from not planning properly for the impacts associated with increased urbanization. Most local governments require some form of urban runoff management for new development. They require such controls for two reasons: to prevent pollution and to prevent flooding caused by increased runoff, mostly from impervious areas. Usually they require structural controls although some local governments give credit for nonstructural controls.

Methodology

A LITERATURE REVIEW was conducted to examine the impacts of urban runoff management ponds on property values. Many experts in the real estate field and experts involved in management of urban BMPs/runoff controls were contacted. Discussions with organizations including the Urban Land Institute, the American Planning Association, and the National Association of Home Builders proved valuable in identifying developments that have incorporated urban runoff management requirements into site development and have realized an economic benefit. Regional personnel of the U.S. Environmental Protection Agency (EPA) were contacted and provided information on their region of the country as well as potential case study examples. Developers and realtors provided comparative values and information on premiums charged for various properties nationwide.

Information regarding case studies was compiled through literature reviews, site visits, and discussions with developers and realtors. After the information-gathering process was completed, case studies were selected. The case studies are

"Why not take an environmental negative and turn it into a positive, into a visual asset?"

(Don Reuble in Tourbier and Westmacott, 1992)

representative examples of positive economic impacts on new development, existing development, and commercial property. Conclusions were made based on information gathered and discussions with experts in the fields of real estate and urban runoff controls.

Ponds and Wetlands for Urban Runoff Control

MOST STRUCTURAL urban runoff BMPs function on the principle that it is best to hold runoff for a period of time. This approach serves two functions. It controls the peak flow rates of water released from a site, thereby controlling downstream flooding, and it allows pollutants to be removed from the water column. There are many different types of urban BMPs, many of which add value to adjacent property. This report focuses on two types of BMPs that are often used: urban runoff "wet ponds" and constructed wetlands, as illustrated in Figure 3.

"Preservation is not a problem for developers; it's a golden opportunity."
(David Hoffman in Tourbier and Weinstein, 1992)

Wet Ponds

Wet ponds, as their name implies, are runoff holding facilities that have water in them all the time. Storm flows are held in the pond temporarily and then released to maintain healthy downstream habitats. Sediment and other pollutants settle out of the water and are not discharged to the receiving waters. Wet ponds are usually vegetated, and the plants' roots hold sediment and use the nutrients that are often contained in urban runoff. The ponds are designed to be big enough to control onsite and offsite flooding in the event of a major storm. This helps to control impacts on downstream habitats.

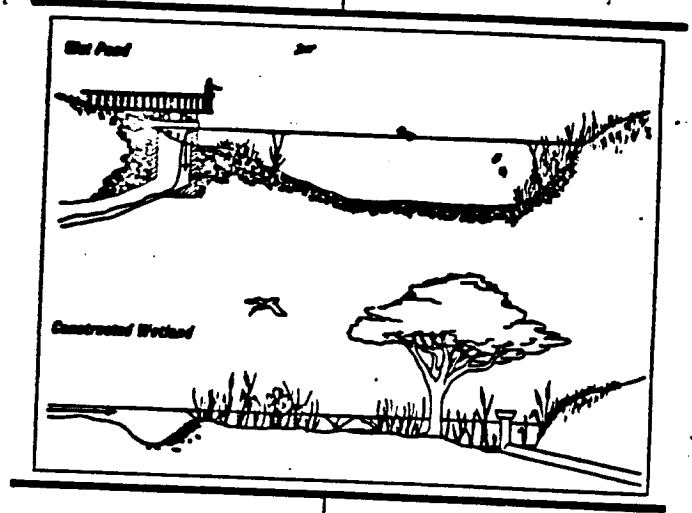

Figure 3: Wet ponds and constructed wetlands are two types of runoff controls.

Many of the "lakes" in developments are actually detention or retention wet ponds. Developers can design the wet ponds to look like natural lakes. Wet ponds can be highly effective in removing sediment and in reducing nutrients if they are properly constructed and maintained. They can usually be used for large drainage areas. Wet ponds can be incorporated into new development site plans and can enhance the value of surrounding property. Old wet ponds can also add value to the surrounding property once they have been aesthetically improved.

Constructed Wetlands

Wetlands serve an important function in controlling the impacts of urban runoff. Because wetlands are heavily vegetated, they serve as a natural filter for urban runoff. They also help to slow the flow of water to the receiving waters and replenish groundwater. When properly designed, constructed wetlands have many

advantages as an urban BMP, including reliable pollutant removal, longevity, adaptability to many development sites, ability to be combined with other BMPs, and excellent wildlife habitat potential (MWCOG, 1992).

Making Urban Runoff Management Work for You

IN MANY CASES, developers are able to realize additional profits (and quicker sales) from units that are adjacent to a wet pond (Harden 1995; MWCOG, 1983). If the urban runoff management control is also developed to allow passive recreation (e.g., a walking path around a lake or pond), the recreational area and the wet pond/constructed wetland can become the feature attraction when advertising the property (Figure 4). Adding walking trails, fitness equipment, gazebos, bird houses, and other facilities to enhance a detention area can be costly, but eventually additional profits are realized (Sala, 1995).

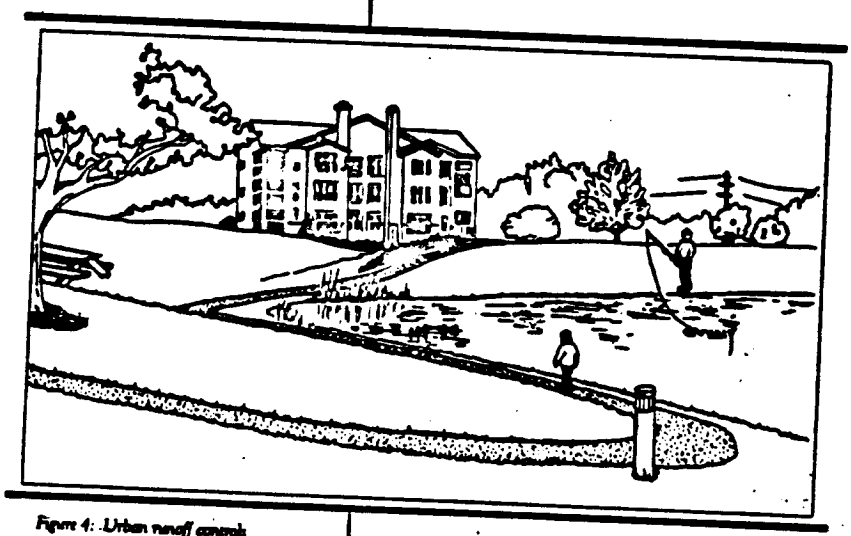

Figure 4: Urban runoff controls can be assets to a development.

The impacts of urban runoff management controls on property values are site-specific (CDM, 1982). Controls can affect property values in one of three ways: increase the value, decrease the value, or have no impact. "Urban runoff controls are greeted with varying degrees of skepticism and acceptance by residential versus commercial property owners," according to Judith Costello Pearson, Manager, Market Research, Fairfax County (Virginia) Economic Development Authority. One must consider the appeal of an attractive urban runoff management control along with the liability of open water. A childless adult might perceive a wet pond as an amenity, but a family might view it as a potential hazard to children.

"Whether a beach, pond, or stream, the proximity to water raises the value of a home by up to 28 percent."
(Lehman, 1994)

Factors That Lead to Increases in Property Value

Urban runoff systems with standing water often appear to be natural systems. A clean lake or pond offers benefits to developers by creating an ideal setting for model units and for the sales office. If located close to the entrance and visible from the road, it will have considerable curb appeal and can repay installation costs through faster sales, in addition to raising the value of adjacent lots (Tourbier and Westmacott, 1992). Developers can charge premiums (extra charges) for property with water views, views of wooded land, or other amenities.

Many ponds planned for urban runoff control are also designed to provide recreational facilities. They are often surrounded by walking trails and picnic areas complete with gazebos and outdoor grills. The ponds also can be used by nonmotorized boats like canoes and are excellent areas for bird-watching. This natural setting creates a home for a variety of birds and animals that homeowners find appealing (Figure 5). Fountains, often included in plans, also add to the aesthetic qualities of the pond.

"Higher sales prices for properties with views of the water have been consistent for 23 years."
(Wade, 1995)

Many developers have capitalized on urban runoff regulations by designing aesthetic wet ponds and marketing them as if they were natural lakes or ponds. A Pennsylvania developer has said, "We are required to build urban runoff management basins. Why not take an environmental negative and turn it into a positive, into a visual asset?" (Tourbier and Westmacott, 1992). In an effort to incorporate landscape design into stormwater management planning to enhance the value and quality of development, General Telephone of Marion, Ohio, created an attractive wet pond ornamented with plantings, stones, and pedestrian paths. Runoff from the Hyatt Regency Ravina hotel complex in Atlanta, Georgia, flows into a series of beautifully designed wet ponds linked together by streams and waterfalls that are kept flowing by recirculating pumps. A carefully designed wet pond at the Woods in Rhinebeck, New York, provides flood control and water quality benefits, and the waterfront created by the impoundment enhances the value of surrounding townhouses (NYSDEC, 1992).

Figure 5: Constructed wetlands provide wildlife habitat and are aesthetically pleasing.

Factors That Lead to Decreases in Property Value

Residential lots located near an urban runoff pond are often a concern to home buyers with young children. Parents fear their children will be attracted by the water or wildlife and drown. Incidents of drowning in urban runoff management areas have occurred in residential as well as commercial areas. Children who fall through frozen ponds or fall into the water without knowing how to swim are usually the victims (Suit filed, 1990; Woellert, 1993). Adults have also drowned in detention ponds. A Chicago man fell into an 18-foot-deep retention pond located on the property of a junkyard and drowned (OSHA probing, 1994). According to one real estate appraiser, safety is the only issue regarding urban runoff management controls that adversely affects property value (Jablonski, 1995).

One solution is to construct a fence surrounding the pond to deter entry and reduce accident potential. Chain-link fencing is often used. Rusting, poorly maintained chain-link fencing reduces any aesthetic qualities of the area, but fencing that has a black or green protective coating is more attractive and can improve the appearance of the runoff control. Prince William County, Virginia, has a fencing ordinance for constructed ponds aimed at preventing entry of children under 4 years of age (Guzman, 1995; MWCOG, 1983). A "protective device" of the developer's choice must be placed around ponds near residential areas with over 2 feet of standing water or more than 2 hours of drainage time. The protective device may be fencing or plantings of bushes and trees (Figure 6); in some cases, flat slopes or shallow beaches extending at least 20 feet from the perimeter of the pond are acceptable. These flat slopes or beaches provide protection for children who could roll down steep slopes directly into the pond. Using flat slopes reduces the amount of land available for development, however, and is the least used option. Fencing is the most inexpensive solution and is used frequently. It has been reported to be an "attractive nuisance," however, because some older children feel challenged to climb fences and enter restricted areas (MWCOG, 1983).

Figure 6: Natural "fencing" can be used as a protective device.

Requirements to construct wet ponds for urban runoff management are a concern for developers, who lose the potential profit from this otherwise buildable land. This unrealized profit, or foregone value, can be substantial if, for example, a builder is no longer able to construct several planned townhomes (Rolband, 1995). Developers often increase the number of homes built in the area available for development and reduce the size of individual homes to recoup the foregone value of the property.

Urban runoff management controls are now widely accepted due to lessons learned from not planning properly for the impacts associated with increased urbanization.

Poorly maintained wet ponds or constructed wetlands are often unsightly due to excessive algal growth or garbage build-up. These conditions are considered detriments by area residents and people passing through the areas. Wet ponds and constructed wetlands can also become mosquito breeding grounds. Mosquito problems usually can be reduced or eliminated by designing the wet pond so that all portions of the basin are connected to open water to allow natural predators to

control the mosquito larvae (Tourbier and Westmacott, 1992). Generally mosquitoes are not a problem in the presence of a good biological community. Organic controls such as mosquito-eating fish or insecticidal bacteria like *Bacillus thuringiensis israelensis* (Bti), however, are also options where mosquitoes need to be controlled.

When designed and sited correctly, artificial lakes or wetlands can help developers reduce negative environmental impacts caused by the development process and increase the value of the property.

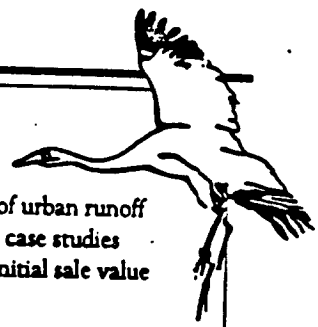
Improving the Acceptance of Urban Runoff Facilities

Effective landscaping can do much to overcome the disadvantages of urban runoff systems and improve the appearance of facilities. Banks of urban runoff storage areas and drainage ditches should be graded smoothly into adjacent areas where feasible. Steep slopes should be protected against erosion by stabilization techniques, such as gabions, rip-rap, or other practices that detract as little as possible from the natural setting. Planting and preservation of trees, shrubs, and other vegetation should also be a part of the improvement plan (Poertner, 1974).

Sediment accumulation and waterlogging of otherwise usable land areas can be avoided by the use of proper design, construction, and operation techniques. Ponds used for urban runoff control can be spared from excessive sediment accumulation by the use of forebays for silt collection. The amount of silt transported can be reduced by directing runoff through vegetated areas or specially designed runoff filters. Waterlogging of land surrounding urban runoff storage areas can be minimized by sloping the ground toward storage areas, eliminating water pockets, and minimizing the frequency and duration of ponding on areas otherwise suitable for multipurpose use (Poertner, 1974).

Operation and Maintenance

Wet ponds and constructed wetlands require periodic maintenance to preserve environmental and monetary benefits of "waterfront" lots. However, the benefits of higher resale value and quality of life typically outweigh the combined costs of the initial lot premium and annual maintenance fees charged by homeowners' associations. In fact, operation and maintenance costs of urban runoff retention ponds can be as low as $62 per year for homeowners (MWCOG, 1983).



Case Studies

THE FOLLOWING CASE studies highlight developments where the incorporation of urban runoff controls resulted in economic benefits to the local homeowners or developers. The case studies detail how the presence of aesthetically designed runoff controls affected both the initial sale value of new developments and the resale values for existing developments.

New Development

Columbia, Maryland *A landmark survey by the National Institute for Urban Wildlife indicated that 75 percent of the residents of Columbia, Maryland, a community planned for a population of 100,000, prefer urban runoff ponds that contain permanent pools of water, wetlands, and wildlife over the dry ponds many municipalities prescribe for their subdivisions. Residents (94 percent) overwhelmingly believed that managing future runoff basins for fish and wildlife as well as for flood and sediment control would be desirable. Residents (92 percent) considered the view of birds and other wildlife to be particularly important and felt that the sight of them outweighed any nuisances they created. Perhaps most importantly, 75 percent of Columbia homeowners felt that permanent bodies of water added to real estate values and 73 percent said they would pay more for property located in a neighborhood with stormwater control basins designed to enhance fish or wildlife use. The study in Columbia covered an area that contained 3 lakes, 22 runoff ponds with a permanent pool of water, and 9 dry detention basins (Adams et al., 1984; Tourbier and Westmacott, 1992).*

For further information contact Charles Rhodeshamel, Columbia Association, Land Management Division, 9450 Gerwig Lane, Columbia, Maryland 21046; phone (410) 381-0288.

Champaign-Urbana, Illinois *Residents of seven Champaign-Urbana, Illinois, subdivisions with urban runoff detention ponds were questioned about the role the pond played in their decision to purchase their home. Sixty-three percent of the respondents living adjacent to a wet pond identified the pond as what they liked most about their neighborhood. Seventy-four percent of homeowners surveyed believed that wet ponds contributed positively to the image of a subdivision as a desirable place to live. Only 3.5 percent felt a wet pond had a negative influence on the image of their neighborhood. Overall, respondents believed that lots adjacent to a wet pond were worth an average of 21.9 percent more than comparable nonadjacent lots in the same subdivision. Eighty-two percent of all respondents said they would, in the future, be willing to pay a premium for a lot adjacent to a wet pond (Emmerling-DiNovo, 1995).*

Boulder, Colorado *Built in 1993, the Sale Lake subdivision of single-family homes surrounds a 4-acre constructed wetland. Sale Lake demonstrates environmental sensitivity in suburban development. Lots located alongside the wetland sold for as much as $134,000, up to a 30 percent premium over lots with no water view (St. Germain, 1995).*

For further information contact Will St. Germain, St. Germain Construction, Inc., 2709 Pine Street, Boulder, Colorado 80302; phone (303) 449-1379.

Highland Parks, Illinois "Preservation is not a problem for developers; it's a golden opportunity," insists the president of the development company for Hybernia, a community of 122 single-family houses on a 133.5-acre site in Highland Parks, Illinois. The site, zoned for 40,000-square-foot lots, was laid out around a constructed pond/stream system and 27 acres of land approved as a state nature preserve. The site includes 16.5 acres of ponds. Forebays at urban runoff inlets catch sediments (Tourbier and Westmacott, 1992).

Hybernia is a an example of ecological landscape planning. Waterfront lots, which now sell for $299,900 to $374,900, draw a 10 percent premium above those with no water view (Margolin, 1995).

For further information contact Peter Margolin, Hybernia Homeowners Association, c/o Red Seal Development Corporation, 425 Huehl Road, Building 18, Northbrook, Illinois 60062; phone (708) 272-5600.

Alexandria, Virginia Chancery on the Lake, a condominium development in Alexandria, Virginia, is a residential project with an attractive 14-acre urban runoff detention area. Realtors are currently promoting the wet pond as the development's feature selling point. The wet pond will be surrounded by a walking trail, and a gazebo and fishing pier will also be built. According to Ginger Harden, Sales Associate of Chancery Associates LP, condominiums are priced between $129,990 and $139,990. Condominiums that front the lake are selling at a $7,500 premium. For the first four buildings on the market, a $5,000 premium was charged for units fronting the lake. The lakefront units were the only units selling, and now the premium has been raised to $7,500 (Harden, 1995).

For further information contact Eric Yakuchev, sales manager, 6540 S. Van Dorn Street, Alexandria, Virginia 22315; phone (703) 922-7171

St. Petersburg, Florida A development consisting of apartments and townhouses in St. Petersburg, Florida, Lynne Lake Arms, has four urban runoff detention ponds on site. Three of the ponds are 3 to 5 acres in size, and the fourth is a 25-acre pond with a large fountain in the center. Apartments or townhouses rent for between $336 and $566 a month. Units facing the three smaller ponds have a $15 per month waterfront premium; units facing the large pond are rented at a $35 per month premium (McInturf, 1995). A small channel connects the large detention pond and one of the smaller ponds. Even apartments fronting this channel have a $5 per month waterfront premium.

For further information contact Mark Mahaffey, leasing agent, 5800 Lynne Lake Drive South, St. Petersburg, Florida 33712; phone (813) 823-3399.

Wichita, Kansas The owner of a 72.3-acre parcel of land had plans to fill deteriorating wetlands before building a subdivision. He was persuaded to enhance them instead and now promotes enhanced and constructed wetlands as the feature selling point of The Landing. A lake with 3,750 feet of shoreline provides aesthetic and recreational value, as well as sensible detention of urban runoff. Waterfront lots currently sell for $18,000 to $40,000, a premium of up to $21,000 (150 percent) above comparable lots with no water view (Baird, 1995).

For further information contact Sally Baird, sales agent, 320 S. Holland Street, Suite 401, Wichita, Kansas 67209; phone (316) 722-0777.

Existing Development

Fairfax County, Virginia *Since their construction in 1971, units facing the constructed pond in the townhouse community of Pinewood Lakes have sold at a premium. Of the 497 units, all with exactly the same square footage according to tax records, only 20 have direct water views in either the front or the rear. Figures show the average 1994 sales price of townhouses lacking the water amenity to be $93,833. The average waterfront sales price is $100,000, a premium of $6,117. Higher sales prices for properties with views of the water have been consistent for 23 years (Wade, 1995).*

Evans Mills is an upscale community of 41 townhouses in the Tysons Corner area built around an existing pond. Fairfax County tax records show Evans Mills waterfront townhouses sell at higher prices. In 1994, waterfront homes sold for an average $17,467 premium above the average $419,200 price of homes not facing the pond (Wade, 1995).

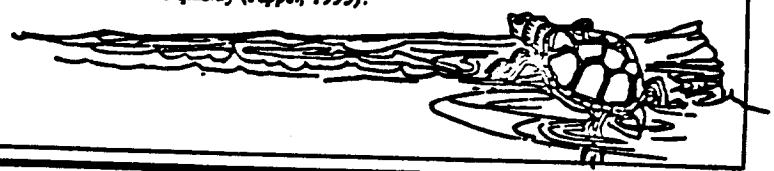
Single-family homes can have higher initial sale values as well as higher resale values when they face urban runoff detention areas. County tax records reveal that land values in Franklin Farms, an established residential neighborhood in northern Virginia, are highest when located in view of its 5-acre urban runoff detention area, which is surrounded by a walking path furnished by the developer. "Waterfront" homes in this neighborhood sold for 10 to 20 percent more initially and again at resale than land with no water view (Dounham, 1995). (These percentages might be slightly higher than actual premiums due to possible additional amenities in the waterfront homes.)

Commercial Property

Prince George's County, Maryland *Laurel Lakes Executive Park, commercial property in Laurel, Maryland, also has created an attractive wet pond system. Office space fronting the water rents at a premium of $100 to $200 per month depending on the size and layout of the office space (Kalish, 1995). On average, first-class office space located in Prince George's County with a lakefront view rents for between $17.50 and $20.00 per square foot, whereas properties without a view rent for between $16.50 and $18.50 per square foot (Duncan, 1995).*

Fairfax County, Virginia *Commercial office space also can be valued higher when it fronts aesthetically designed runoff retention ponds. The lakefront Lakeside at Avion and Tysons Pond, both located in Fairfax County, Virginia, are examples of commercial projects that took advantage of the requirement to implement urban runoff management controls by enhancing a retention pond and then capitalizing on the presence of the pond when naming the project. In Fairfax, Virginia, the average cost of commercial office space without water as an amenity is approximately $15 per square foot. The average leasing rate for commercial waterfront office space is $16 per square foot (Constam, 1995; Goeller, 1995).*

In a soft commerical real estate market, where office space is overabundant, it can be difficult to ask for a premium of any kind. However, real estate brokers agree that, when all else is equal, commercial waterfront property rents considerably faster than space that does not front water (Berman, 1995; Constam, 1995; Goeller, 1995; Pepper, 1995). Although a tenant might not be charged for a water amenity, it can provide a steadier flow of income and fewer vacancies for the realtor (Berman, 1995). Mike Pepper, Vice President of CB Commercial Real Estate Group, Inc., declares that "There is absolutely a premium associated with commercial lakefront property. Anything adding to the aesthetic value is going to raise a property's value." Mr. Pepper concedes that in the saturated market of northern Virginia, property with a water view might or might not rent for a $1-$3 per square foot premium, but will always sell or be rented more quickly (Pepper, 1995).



Conclusion

ENVIRONMENTAL BENEFITS are not the only valid reason for encouraging developers to incorporate urban runoff controls into new residential and commercial developments. Increased property values can result from aesthetically landscaped controls. Both homeowners and developers have realized benefits from beautification of areas adjacent to waterways and detention ponds. Residents find the beauty and tranquility of water, as well as fish, birds, and other wildlife, highly desirable. The beauty of natural surroundings increases real residential property values by up to 28 percent while also enhancing the quality of life. Commercial property owners, too, can benefit when their property is adjacent to an aesthetically designed urban runoff control. They can realize lower vacancies, lower tenant turnover, and high rental prices. Real estate professionals agree that the more amenities a property has, the faster it will sell or rent. Of course, to maintain higher property values, aesthetics must be considered during the operation and maintenance of wet ponds and constructed wetlands over the years. Moreover, for runoff controls to be successful, they must have the support of people in the community as well as developers (Adams et al., 1984). Then, everyone can benefit.

Glossary of Terms

Best management practice (BMP): A practice or combination of practices that are determined to be the most effective and practicable (including technological, economic, and institutional considerations) means of controlling point and nonpoint source pollutants at levels compatible with environmental quality goals.

Constructed wetland: An artificial wetland system designed to mitigate the impacts of urban runoff.

Forebay: An extra storage space provided near an inlet of a wet pond or constructed wetland to trap incoming sediments before they accumulate in the pond.

Gabion: A rectangular basket or mattress made of steel wire in a hexagonal mesh. Gabions are generally subdivided into equal-sized cells that are wired together and filled with stones, forming a large, heavy mass used for shore protection.

Impervious area: A hard surface area (e.g., parking lot) that prevents or retards the entry of water into the soil, thus causing water to run off the surface in greater quantities and at an increased rate of flow.

Nonpoint source pollution: Water pollution caused by rainfall or snowmelt moving over and through the ground which carries pollutants. A nonpoint source is any source of water pollution that does not meet the legal definition of point source in section 502(14) of the Clean Water Act.

Nonstructural control: A practice that does not require construction of a facility to control urban runoff.

Premium: An additional charge for real estate property with an amenity such as a water view or a view of wooded land.

Receiving waters: Lakes, rivers, wetlands, coastal waters, and groundwaters that receive runoff.

Riprap: A protective layer or facing of quarrystone placed to prevent erosion, scour, or sloughing of an embankment or cliff.

Sediment: The product of erosion processes; the solid material, both mineral and organic, that is in suspension, is being transported, or has been moved from its site of origin by air, water, gravity, or ice.

Structural control: A practice that involves design and construction of a facility to mitigate the adverse impact of urban runoff, and often requires maintenance.

Urban runoff: The portion of precipitation, snowmelt, or irrigation water that does not naturally percolate into the ground or evaporate, but runs off the land into streams or other surface water. It can carry pollutants from the air and land into the receiving waters.

Wet pond: Pond for urban runoff management that is designed to detain urban runoff and always contains water.

Subject: MUNICIPAL STORM WATER PERMITS: COMPLIANCE WITH WATER QUALITY OBJECTIVES

VOL 23

0914

ISSUE

Must storm water permits for municipal separate storm sewer systems (MS4s) include requirements necessary to achieve water quality objectives?

CONCLUSION

Storm water permits issued to MS4s must include requirements necessary to achieve water quality objectives.

DISCUSSION

Section 301 of the Clean Water Act prohibits the discharge of any pollutant unless pursuant to a National Pollutant Discharge Elimination System (NPDES) permit. Section 301 also requires compliance with effluent limitations necessary to achieve compliance with technology-based standards (e.g., best practicable control technology currently available or secondary treatment). Finally, Section 301 requires compliance with any more stringent effluent limitation which are necessary to protect water quality standards.

Section 402(p) of the Clean Water Act includes a technology-based standard for storm water permits issued to MS4s. Such permits must require:

> "controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods ...."

Section 402(p) does not discuss water quality-based standards. A question is therefore raised whether permits issued to MS4s

must include only effluent limitations to meet the technology-based standard of "maximum extent practicable" (MEP), or whether they must also include water quality-based effluent limitations.

This question has already been answered by the SWRCB in Order No.WQ 91-03. The answer is that permits issued to MS4s must include effluent limitations which will achieve the MEP standard, and will also achieve compliance with water quality objectives. The SWRCB stated:

> We therefore conclude that permits for municipal separate storm sewer systems issued pursuant to Clean Water Act Section 402(p) must contain effluent limitations based on water quality standards. Order No. WQ 91-03, at slip op. 36.

The specific language in effluent limitations or other permit conditions is left to the discretion of the agency issuing the permit. Thus, for storm water permits for MS4s, it is appropriate to include "best management practices" (BMPs) instead of numeric effluent limitations. See, Order No. WQ 91-03, at slip op. 37-38. These BMPs may be adequate as both technology-based limitations and water quality-based limitations. *Id.* Section 301(b)(1)(C) of the Clean Water Act broadly requires compliance with "any more stringent limitation, including those necessary to meet water quality standards". The legal requirements for determining effluent limitations in permits are listed in 40 Code of Federal Regulations (CFR) Section 122.44. The SWRCB interpreted these provisions in Order No. WQ 91-03, and concluded permits for MS4s may include BMPs as effluent limitations.

In Order No. WQ 91-04, the SWRCB considered a storm water permit issued to a MS4 that included BMPs as effluent limitations, and did not specifically require compliance with water quality objectives. The SWRCB stated that even where a permit does not specifically reference violation of water quality standards, it should be read "so as to require the implementation of practices which will achieve compliance with applicable standards". Slip op. at 15.

In conclusion, the SWRCB has determined storm water permits for MS4s must include requirements necessary to achieve compliance with both MEP and water quality standards. The SWRCB has allowed RWQCBs to determine the specific requirements to place in permits. The SWRCB has approved permits for MS4s which include BMPs rather than numeric effluent limitations. The SWRCB has also approved a permit that did not specifically

prohibit violation of water quality objectives. The permit was approved because it contained BMPs adequate to meet water quality objectives.

National Water Quality Inventory

1994 Report to Congress

Executive Summary

VOL 23

0917

VOL 23

09/18

Executive Summary

The Quality of Our Nation's Water

Introduction

The *National Water Quality Inventory Report to Congress* is the primary vehicle for informing Congress and the public about general water quality conditions in the United States. This document characterizes our water quality, identifies widespread water quality problems of national significance, and describes various programs implemented to restore and protect our waters.

The *National Water Quality Inventory Report to Congress* summarizes the water quality information submitted by 61 States, American Indian Tribes, Territories, Interstate Water Commissions, and the District of Columbia (hereafter referred to as States, Tribes, and other jurisdictions) in their 1994 water quality assessment reports. As such, the report identifies water quality issues of concern to the States, Tribes, and other jurisdictions, not just the issues of concern to EPA. Section 305(b) of the Clean Water Act (CWA) requires that the States and other participating jurisdictions submit water quality assessment reports every 2 years. Most of the survey information in the 1994 Section 305(b) reports is based on water quality information collected and evaluated by the States, Tribes, and other jurisdictions during 1992 and 1993.

It is important to note that this report is based on information submitted by States, Tribes, and other jurisdictions that do not use identical survey methods and criteria to rate their water quality. The States, Tribes, and other jurisdictions favor flexibility in the 305(b) process to accommodate natural variability in their waters, but there is a trade-off between flexibility and consistency. Without known and consistent survey methods in place, EPA must use caution in comparing data or determining the accuracy of data submitted by different States and jurisdictions. Also, EPA must use caution when comparing water quality information submitted during different 305(b) reporting periods because States and other jurisdictions may modify their criteria or survey different waterbodies every 2 years.

Paul Goetz, Cary, NC

For over 10 years, EPA has pursued a balance between flexibility and consistency in the Section 305(b) process. Recent actions by EPA, the States, Tribes, and other jurisdictions include implementing the recommendations of the National 305(b) Consistency Workgroup and the Intergovernmental Task Force on Monitoring Water Quality. These actions will enable States and other jurisdictions to share data across political boundaries as they develop watershed protection strategies.

EPA recognizes that national initiatives alone cannot clean up our waters; water quality protection and restoration must happen at the local watershed level, in conjunction with State, Tribal, and Federal activities. Similarly, this document alone cannot provide the detailed information needed to manage water quality at all levels. This document should be used together with the individual Section 305(b) reports (see the inside back cover for information on obtaining the State and Tribal Section 305(b) reports), watershed management plans, and other local documents to develop integrated water quality management options.

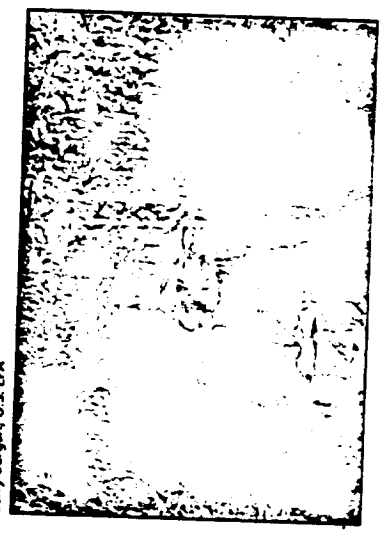
Key Concepts

Measuring Water Quality

The States, participating Tribes, and other jurisdictions survey the quality of their waters by determining if their waters attain the water quality standards they established. Water quality standards consist of beneficial uses, numeric and narrative criteria for supporting each use, and an antidegradation statement:

- **Designated beneficial uses** are the desirable uses that water quality should support. Examples are drinking water supply, primary contact recreation (such as swimming), and aquatic life support. Each designated use has a unique set of water quality requirements or criteria that must be met for the use to be realized. States, Tribes, and other jurisdictions may designate an individual waterbody for multiple beneficial uses.

- **Numeric water quality criteria** establish the minimum physical, chemical, and biological parameters required to support a beneficial use. Physical and chemical numeric criteria may set maximum concentrations of pollutants, acceptable ranges of physical parameters, and minimum concentrations of desirable parameters, such as dissolved oxygen. Numeric biological criteria describe the expected attainable community attributes and establish values based on measures such as species richness, presence or absence of indicator taxa, and distribution of classes of organisms.



Barry Burgan, U.S. EPA

- **Narrative water quality criteria** define, rather than quantify, conditions and attainable goals that must be maintained to support a designated use. Narrative biological criteria establish a positive statement about aquatic community characteristics expected to occur within a waterbody. For example, "Ambient water quality shall be sufficient to support life stages of all native aquatic species." Narrative criteria may also describe conditions that are desired in a waterbody, such as, "Waters must be free of substances that are toxic to humans, aquatic life, and wildlife."

- **Antidegradation statements**, where possible, protect existing uses and prevent waterbodies from deteriorating, even if their water quality is better than the fishable and swimmable water quality goals of the Act.

The CWA allows States, Tribes, and other jurisdictions to set their own standards but requires that all beneficial uses and their criteria comply with the goals of the Act. At a minimum, beneficial uses must provide for "the protection and propagation of fish, shellfish, and wildlife" and provide for "recreation in and on the water" (i.e., the fishable and swimmable goals of the Act), where attainable. The Act prohibits States and other jurisdictions from designating waste transport or waste assimilation as a beneficial use, as some States did prior to 1972.

Section 305(b) of the CWA requires that the States biennially survey their water quality for attainment of the fishable and swimmable goals of the Act and report the results to EPA. The States, participating Tribes, and other jurisdictions measure attainment of the CWA goals by determining how well their waters support their designated beneficial uses. EPA encourages the surveying of waterbodies for support of the following individual beneficial uses:

Aquatic Life Support

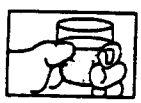
The waterbody provides suitable habitat for protection and propagation of desirable fish, shellfish, and other aquatic organisms.

Fish Consumption

The waterbody supports fish free from contamination that could pose a human health risk to consumers.

Shellfish Harvesting

The waterbody supports a population of shellfish free from toxicants and pathogens that could pose a human health risk to consumers.



Drinking Water Supply

The waterbody can supply safe drinking water with conventional treatment.

Primary Contact Recreation – Swimming

People can swim in the waterbody without risk of adverse human health effects (such as catching waterborne diseases from raw sewage contamination).

Secondary Contact Recreation

People can perform activities on the water (such as boating) without risk of adverse human health effects from ingestion or contact with the water.

Agriculture

The water quality is suitable for irrigating fields or watering livestock.

States, Tribes, and other jurisdictions may also define their own individual uses to address special concerns. For example, many Tribes and States designate their waters for the following beneficial uses:

Ground Water Recharge

The surface waterbody plays a significant role in replenishing ground water, and surface water supply and quality are adequate to protect existing or potential uses of ground water.

Wildlife Habitat

Water quality supports the waterbody's role in providing habitat and resources for land-based wildlife as well as aquatic life.

Tribes may designate their waters for special cultural and ceremonial uses:

Water Quality Monitoring

Water quality monitoring consists of data collection and sample analysis performed using accepted protocols and quality control procedures. Monitoring also includes subsequent analysis of the body of data to support decisionmaking. Federal, Interstate, State, Territorial, Tribal, Regional, and local agencies, industry, and volunteer groups with approved quality assurance programs monitor a combination of chemical, physical, and biological water quality parameters throughout the country.

- Chemical data often measure concentrations of pollutants and other chemical conditions that influence aquatic life, such as pH (i.e., acidity) and dissolved oxygen concentrations. The chemical data may be analyzed in water samples, fish tissue samples, or sediment samples.
- Physical data include measurements of temperature, turbidity (i.e., light penetration through the water column), and solids in the water column.
- Biological data measure the health of aquatic communities. Biological data include counts of aquatic species that indicate healthy ecological conditions.
- Habitat and ancillary data (such as land use data) help interpret the above monitoring information.

Monitoring agencies vary parameters, sampling frequency, and sampling site selection to meet program objectives and funding constraints. Sampling may occur at regular intervals (such as monthly, quarterly, or annually), irregular intervals, or during one-time intensive surveys. Sampling may be conducted at fixed sampling stations, randomly selected stations, stations near suspected water quality problems, or stations in pristine waters.

Culture

Water quality supports the waterbody's role in Tribal culture and preserves the waterbody's religious, ceremonial, or subsistence significance.

The States, Tribes, and other jurisdictions assign one of five levels of use support categories to each of their waterbodies (Table ES-1). If possible, the States, Tribes, and other jurisdictions determine the level of use support by comparing monitoring data with numeric criteria for each use designated for a particular waterbody. If monitoring data are not available, the State, ribe, or other jurisdiction may determine the level of use support with qualitative information. Valid qualitative information includes land use data, fish and game surveys, and predictive model results. Monitored assessments are based on monitoring data. Evaluated assessments are based on qualitative information or monitored information more than 5 years old.

For waterbodies with more than one designated use, the States, Tribes, and other jurisdictions consolidate the individual use support information into a single overall use support determination:

Good/Fully Supporting Overall Use – All designated beneficial uses are fully supported.

Good/Threatened Overall Use – One or more designated beneficial uses are threatened and the remaining uses are fully supported.

Fair/Partially Supporting Overall Use – One or more designated beneficial uses are partially supported and the remaining uses are fully supported or threatened. These waterbodies are considered impaired.

Poor/Not Supporting Overall Use – One or more designated beneficial uses are not supported. These waterbodies are considered impaired.

Poor/Not Attainable – The State, Tribe, or other jurisdiction has performed a use-attainability analysis and demonstrated that use support of one or more designated beneficial uses is not attainable due to one of six biological, chemical, physical, or economic/social conditions specified in the *Code of Federal Regulations* (40 CFR Section 131.10). These conditions include naturally high concentrations of pollutants (such as metals); other natural physical features that create

Table ES-1: Levels of Use Support

Symbol	Use Support Level	Water Quality Condition	Definition
	Fully Supporting	Good	Water quality meets designated use criteria.
	Threatened	Good	Water quality supports beneficial uses now but may not in the future unless action is taken.
	Partially Supporting	Fair (Impaired)	Water quality fails to meet designated use criteria at times.
	Not Supporting	Poor (Impaired)	Water quality frequently fails to meet designated use criteria.
	Not Attainable	Poor	The State, Tribe, or other jurisdiction has performed a use-attainability analysis and demonstrated that use support is not attainable due to one of six biological, chemical, physical, or economic/social conditions specified in the *Code of Federal Regulations*.

unsuitable aquatic life habitat (such as inadequate substrate, riffles, or pools); low flows or water levels; dams and other hydrologic modifications that permanently alter waterbody characteristics; poor water quality resulting from human activities that cannot be reversed without causing further environmental degradation; and poor water quality that cannot be improved without imposing more stringent controls than those required in the CWA that would result in widespread economic and social impacts.

- **Impaired Waters** – The sum of waterbodies partially supporting uses and not supporting uses.

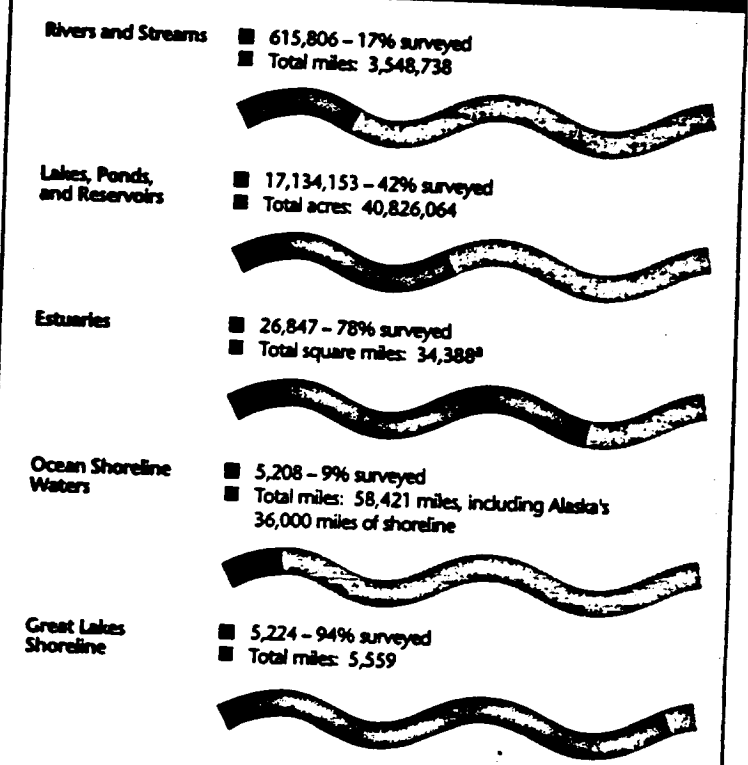
The EPA then aggregates the use support information submitted by the States, Tribes, and other jurisdictions into a national assessment of the Nation's water quality.

How Many of Our Waters Were Surveyed for 1994?

National estimates of the total waters of our country provide the foundation for determining the percentage of waters surveyed by the States, Tribes, and other jurisdictions and the portion impaired by pollution. For the 1992 reporting period, EPA provided the States with estimates of total river miles and lake acres derived from the EPA Reach File, a database containing traces of waterbodies adapted from 1:100,000 scale maps prepared by the U.S. Geological Survey. The States modified these total water estimates where necessary. Based on the 1992 EPA/State figures, the national estimate of total river miles doubled in large part because the EPA/State estimates included nonperennial streams, canals, and ditches that were previously excluded from estimates of total stream miles.

Estimates for the 1994 reporting cycle are a minor refinement of the 1992 figures and indicate that the United States has:

Figure ES-1. Percentage of Total Waters Surveyed for the 1994 Report



Source: 1994 Section 305(b) reports submitted by the States, Tribes, Territories, and Commissions.

[a]Excluding estuarine waters in Alaska because no estimate was available.

- More than 3.5 million miles of rivers and streams, which range in size from the Mississippi River to small streams that flow only when wet weather conditions exist (i.e., nonperennial streams)
- Approximately 40.8 million acres of lakes, ponds, and reservoirs
- About 34,388 square miles of estuaries (excluding Alaska)
- More than 58,000 miles of ocean shoreline, including 36,000 miles in Alaska
- 5,559 miles of Great Lakes shoreline
- More than 277 million acres of wetlands such as marshes, swamps, bogs, and fens, including 170 million acres of wetlands in Alaska.

The Intergovernmental Task Force on Monitoring Water Quality

In 1992, the Intergovernmental Task Force on Monitoring Water Quality (ITFM) convened to prepare a strategy for improving water quality monitoring nationwide. The ITFM is a Federal/State partnership of 10 Federal agencies, 9 State and Interstate agencies, and 1 American Indian Tribe. The EPA chairs the ITFM with the USGS as vice chair and Executive Secretariat as part of their Water Information Coordination Program pursuant to OMB memo 92-01.

The mission of the ITFM is to develop and aid implementation of a national strategic plan to achieve effective collection, interpretation, and presentation of water quality data and to improve the availability of existing information for decisionmaking at all levels of government and the private sector. A permanent successor to the ITFM, the National Monitoring Council will provide guidelines and support for institutional collaboration, comparable field and laboratory methods, quality assurance/quality control, environmental indicators, data management and sharing, ancillary data, interpretation and techniques, and training.

The ITFM and its successor, the National Monitoring Council, are also producing products that can be used by monitoring programs nationwide, such as an outline for a recommended monitoring program, environmental indicator selection criteria, and a matrix of indicators to support assessment of State and Tribal designated uses.

For a copy of the first, second, and final ITFM reports, contact:

The U.S. Geological Survey
417 National Center
Reston, VA 22092
1-800-426-9000

Most States do not survey all of their waterbodies during the 2-year reporting cycle required under CWA Section 305(b). Thus, the surveyed waters reported in Figure ES-1 are a subset of the Nation's total waters. In addition, the summary information based on surveyed waters may not represent general conditions in the Nation's total waters because States, Tribes, and other jurisdictions often focus on surveying major perennial rivers, estuaries, and public lakes with suspected pollution problems in order to direct scarce resources to areas that could pose the greatest risk. Many States, Tribes, and other jurisdictions lack the resources to collect use support information for nonperennial streams, small tributaries, and private ponds. This report does not predict the health of these unassessed waters, which include an unknown ratio of pristine waters to polluted waters.

Pollutants and Processes That Degrade Water Quality

Where possible, States, Tribes, and other jurisdictions identify the pollutants or processes that degrade water quality and indicators that document impacts of water quality degradation. The most widespread pollutants and processes identified in rivers, lakes, and estuaries are presented in Table ES-2. Pollutants include sediment, nutrients, and chemical contaminants (such as dioxins and metals). Processes that

degrade waters include habitat modification (such as destruction of streamside vegetation) and hydrologic modification (such as flow reduction). Indicators of water quality degradation include physical, chemical, and biological parameters. Examples of biological parameters include species diversity and abundance. Examples of physical and chemical parameters include pH, turbidity, and temperature. Following are descriptions of the effects of the pollutants and processes most commonly identified in rivers, lakes, estuaries, coastal waters, wetlands, and ground water.

Low Dissolved Oxygen

Dissolved oxygen is a basic requirement for a healthy aquatic ecosystem. Most fish and beneficial aquatic insects "breathe" oxygen dissolved in the water column. Some fish and aquatic organisms (such as carp and sludge worms) are adapted to low oxygen conditions, but most desirable fish species (such as trout and salmon) suffer if dissolved oxygen concentrations fall below 3 to 4 mg/L (3 to 4 milligrams of oxygen dissolved in 1 liter of water, or 3 to 4 parts of oxygen per million parts of water). Larvae and juvenile fish are more sensitive and require even higher concentrations of dissolved oxygen.

Many fish and other aquatic organisms can recover from short periods of low dissolved oxygen availability. However, prolonged episodes of depressed dissolved oxygen concentrations of 2 mg/L or less can result in "dead" waterbodies. Prolonged exposure to low dissolved oxygen conditions can suffocate adult fish or reduce their reproductive survival by suffocating sensitive eggs and larvae or can starve fish by killing aquatic insect larvae and other prey. Low dissolved oxygen concentrations also favor anaerobic bacterial activity that produces noxious gases or foul odors often associated with polluted waterbodies.

Table ES-2: Five Leading Causes of Water Quality Impairment

Rank	Rivers	Lakes	Estuaries
1	Bacteria	Nutrients	Nutrients
2	Siltation	Siltation	Bacteria
3	Nutrients	Oxygen-Depleting Substances	Oxygen-Depleting Substances
4	Oxygen-Depleting Substances	Metals	Habitat Alterations
5	Metals	Suspended Solids	Oil and Grease

Source: Based on 1994 Section 305(b) reports submitted by States, Tribes, Territories, Commissions, and the District of Columbia.

Fish Kills

Fish kill reporting is a voluntary process; States, Tribes, and other jurisdictions are not required to report on how many fish kills occur, or what might have caused them. In many cases it is the public–anglers, and hunters, recreational boaters, or hikers–who first notice fish kills and report them to game wardens or other State officials. Many fish kills go undetected or unreported, and others may be difficult to investigate, especially if they occur in remote areas. This is because dead fish may be carried quickly downstream or may be difficult to count because of turbid conditions. It is therefore likely that the statistics presented by the States, Tribes, and other jurisdictions underestimate the total number of fish kills that occurred nationwide between 1992 and 1994.

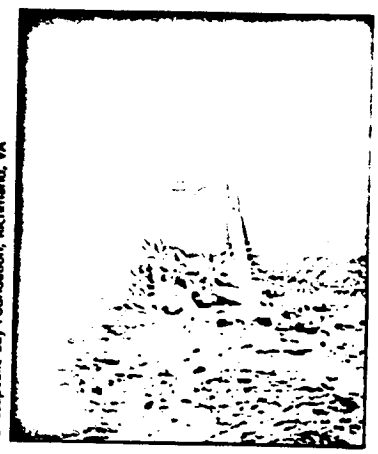
Despite these problems, fish kills are an important consideration in water quality assessments. In 1994, 32 States, Tribes, and other jurisdictions reported a total of 1,454 fish kill incidents. These States attributed 737 of the fish kills to pollution, 257 to unknown causes, 263 to natural conditions (such as low flow and high temperatures), and 229 kills to ambiguous causes. Pollutants most often cited as the cause of kills include oxygen-depleting substances, sewage, pesticides, manure and silage, oil and gas, chlorine, and ammonia. Leading sources of fish kills include agricultural activities, industrial discharges, municipal sewage treatment plant discharges, spills, runoff, and pesticide applications.

Oxygen concentrations in the water column fluctuate under natural conditions, but severe oxygen depletion usually results from human activities that introduce large quantities of biodegradable organic materials into surface waters. Biodegradable organic materials contain plant, fish, or animal matter. Leaves, lawn clippings, sewage, manure, shellfish processing waste, milk solids, and other food processing wastes are examples of oxygen-depleting organic materials that enter our surface waters.

In both pristine and polluted waters, beneficial bacteria use oxygen to break apart (or decompose) organic materials. Pollution-containing organic wastes provide a continuous glut of food for the bacteria, which accelerates bacterial activity and population growth. In polluted waters, bacterial consumption of oxygen can rapidly outpace oxygen replenishment from the atmosphere and photosynthesis performed by algae and aquatic plants. The result is a net decline in oxygen concentrations in the water.

Toxic pollutants can indirectly lower oxygen concentrations by killing algae, aquatic weeds, or fish, which provides an abundance of food for oxygen-consuming bacteria. Oxygen depletion can also result from chemical reactions that do not involve bacteria. Some pollutants trigger chemical reactions that place a chemical oxygen demand on receiving waters.

Other factors (such as temperature and salinity) influence the amount of oxygen dissolved in water. Prolonged hot weather will depress oxygen concentrations and may cause fish kills even in clean



Chesapeake Bay Foundation, Richmond, VA

waters because warm water cannot hold as much oxygen as cold water. Warm conditions further aggravate oxygen depletion by stimulating bacterial activity and respiration in fish, which consumes oxygen. Removal of streamside vegetation eliminates shade, thereby raising water temperatures, and accelerates runoff of organic debris. Under such conditions, minor additions of pollution-containing organic materials can severely deplete oxygen.

Nutrients

Nutrients are essential building blocks for healthy aquatic communities, but excess nutrients (especially nitrogen and phosphorus compounds) overstimulate the growth of aquatic weeds and algae. Excessive growth of these organisms, in turn, can clog navigable waters, interfere with swimming and boating, outcompete native submerged aquatic vegetation (SAV), and lead to oxygen depletion. Oxygen concentrations can fluctuate daily during algal blooms, rising during the day as algae perform photosynthesis, and falling at night as algae continue to respire, which consumes oxygen. Beneficial bacteria also consume oxygen as they decompose the abundant organic food supply in dying algae cells.

Lawn and crop fertilizers, sewage, manure, and detergents contain nitrogen and phosphorus, the nutrients most often responsible for water quality degradation. Rural areas are vulnerable to ground water contamination from nitrates (a compound containing nitrogen) found in fertilizer and manure. Very high concentrations of nitrate (>10 mg/L) in drinking water cause methemoglobinemia, or blue baby syndrome, an inability to fix oxygen in the blood.

Nutrients are difficult to control because lake and estuarine ecosystems recycle nutrients. Rather than leaving the ecosystem, the nutrients cycle among the water column, algae and plant tissues, and the bottom sediments. For example, algae may temporarily remove all the nitrogen from the water column, but the nutrients will return to the water column when the algae die and are decomposed by bacteria. Therefore, gradual inputs of nutrients tend to accumulate over time rather than leave the system.

Sediment and Siltation

In a water quality context, sediment usually refers to soil particles that enter the water column from eroding land. Sediment consists of particles of all sizes, including fine clay particles, silt, sand, and gravel. Water quality managers use the

term "siltation" to describe the suspension and deposition of small sediment particles in waterbodies.

Sediment and siltation can severely alter aquatic communities. Sediment may clog and abrade fish gills, suffocate eggs and aquatic insect larvae on the bottom, and fill in the pore space between bottom cobbles where fish lay eggs. Silt and sediment interfere with recreational activities and aesthetic enjoyment at waterbodies by reducing water clarity and filling in waterbodies. Sediment may also carry other pollutants into waterbodies. Nutrients and toxic chemicals may attach to sediment particles on land and ride the particles into surface waters where the pollutants may settle with the sediment or detach and become soluble in the water column.

Rain washes silt and other soil particles off of plowed fields, construction sites, logging sites, urban areas, and strip-mined lands into waterbodies. Eroding stream banks also deposit silt and sediment in waterbodies. Removal of vegetation on shore can accelerate streambank erosion.

Chesapeake Bay Foundation, Richmond, VA

Bacteria and Pathogens

Some waterborne bacteria, viruses, and protozoa cause human illnesses that range from typhoid and dysentery to minor respiratory and skin diseases. These organisms may enter waters through a number of routes, including inadequately treated sewage, storm water drains, septic systems, runoff from livestock pens, and sewage dumped overboard from recreational boats. Because it is impossible to test waters for every possible disease-causing organism, States and other jurisdictions usually measure indicator bacteria that are found in great numbers in the stomachs and intestines of warm-blooded animals and people. The presence of indicator bacteria suggests that the waterbody may be contaminated with untreated sewage and that other, more dangerous organisms may be present. The States, Tribes, and other jurisdictions use bacterial criteria to determine if waters are safe for recreation and shellfish harvesting.

Toxic Organic Chemicals and Metals

Toxic organic chemicals are synthetic compounds that contain carbon, such as polychlorinated biphenyls (PCBs), dioxins, and the pesticide DDT. These synthesized compounds often persist and accumulate in the environment because they do not readily break down in natural ecosystems. Many of these compounds cause cancer in people and birth defects in other predators near the top of the food chain, such as birds and fish.

Metals occur naturally in the environment, but human activities (such as industrial processes and mining) have altered the distribution of metals in the environment. In most reported cases of metals contamination, high concentrations of metals appear in fish tissues rather than the water column because the metals accumulate in greater concentrations in predators near the top of the food chain.

pH

Acidity, the concentration of hydrogen ions, drives many chemical reactions in living organisms. The standard measure of acidity is

pH, and a pH value of 7 represents a neutral condition. A low pH value (less than 5) indicates acidic conditions; a high pH (greater than 9) indicates alkaline conditions. Many biological processes, such as reproduction, cannot function in acidic or alkaline waters. Acidic conditions also aggravate toxic contamination problems because sediments release toxicants in acidic waters. Common sources of acidity include mine drainage, runoff from mine tailings, and atmospheric deposition.

Habitat Modification/ Hydrologic Modification

Habitat modifications include activities in the landscape, on shore, and in waterbodies that alter the physical structure of aquatic ecosystems and have adverse impacts on aquatic life. Examples of habitat modifications include:

- Removal of streamside vegetation that stabilizes the shoreline and provides shade, which moderates instream temperatures
- Excavation of cobbles from a stream bed that provide nesting habitat for fish
- Stream burial
- Excessive suburban sprawl that alters the natural drainage patterns by increasing the intensity, magnitude, and energy of runoff waters.

Hydrologic modifications alter the flow of water. Examples of hydrologic modifications include channelization, dewatering, damming, and dredging.

Other pollutants include salts and oil and grease. Fresh waters may become unfit for aquatic life and some human uses when they become contaminated by salts. Sources of salinity include irrigation runoff, brine used in oil extraction, road deicing operations, and the intrusion of sea water into ground and surface waters in coastal areas. Crude oil and processed petroleum products may be spilled during extraction, processing, or transport or leaked from underground storage tanks.

Table ES-3. Pollution Source Categories Used In This Report

Category	Examples
Industrial	Pulp and paper mills, chemical manufacturers, steel plants, metal process and product manufacturers, textile manufacturers, food processing plants
Municipal	Publicly owned sewage treatment plants that may receive indirect discharges from industrial facilities or businesses
Combined Sewers	Single facilities that treat both stormwater and sanitary sewage, which may become overloaded during storm events and discharge untreated wastes into surface waters.
Storm Sewers/ Urban Runoff	Runoff from impervious surfaces including streets, parking lots, buildings, lawns, and other paved areas.
Agricultural	Crop production, pastures, rangeland, feedlots, other animal holding areas
Silvicultural	Forest management, tree harvesting, logging road construction
Construction	Land development, road construction
Resource Extraction	Mining, petroleum drilling, runoff from mine tailing sites
Land Disposal	Leachate or discharge from septic tanks, landfills, and hazardous waste sites
Hydrologic Modification	Channelization, dredging, dam construction, streambank modification

Sources of Water Pollution

Sources of impairment generate the pollutants that violate use support criteria (Table ES-3). Point sources discharge pollutants directly into surface waters from a conveyance. Point sources include industrial facilities, municipal sewage treatment plants, and combined sewer overflows. Nonpoint sources deliver pollutants to surface waters from diffuse origins. Nonpoint sources include urban runoff, agricultural runoff, and atmospheric deposition of contaminants in air pollution. Habitat alterations, such as hydromodification, dredging, and streambank destabilization, can also degrade water quality.

Throughout this document, EPA rates the significance of causes and

sources of pollution by the percentage of surveyed waters impaired by each individual cause or source (obtained from the Section 305(b) reports submitted by the States, Tribes, and other jurisdictions). Note that the cause and source rankings do not describe the condition of all waters in the United States because the States identify the causes and sources degrading some of their impaired waters, which are a small subset of surveyed waters, which are a subset of the Nation's total waters. For example, the States identified sources degrading some of the 224,236 impaired river miles, which represent 36% of the surveyed river miles and only 6% of the Nation's total stream miles.

> "The term 'point source' means any discernible, confined, and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged. This term does not include agricultural storm water discharges and return flows from irrigated agriculture."
>
> Clean Water Act Section 502(14)

Table ES-4 lists the leading sources of impairment related to human activities as reported by States, Tribes, and other jurisdictions for their rivers, lakes, and estuaries. Other sources cited include removal of riparian vegetation, forestry activities, land disposal, petroleum extraction and processing activities, and construction. In addition to human activities, the States, Tribes, and other jurisdictions also reported impairments from natural sources. Natural sources refer to an assortment of water quality problems:

- Natural deposits of salts, gypsum, nutrients, and metals in soils that leach into surface and ground waters
- Warm weather and dry conditions that raise water temperatures, depress dissolved oxygen concentrations, and dry up shallow waterbodies
- Low-flow conditions and tannic acids from decaying leaves that lower pH and dissolved oxygen concentrations in swamps draining into streams.

With so many potential sources of pollution, it is difficult and expensive for States, Tribes, and other jurisdictions to identify specific sources responsible for water quality impairments. Many States and other jurisdictions lack funding for monitoring to identify all but the most apparent sources degrading waterbodies. Local management priorities may focus monitoring budgets on other water quality issues, such as identification of contaminated fish populations that pose a human health risk. Management priorities may also direct monitoring efforts to larger waterbodies and overlook sources impairing smaller waterbodies. As a result, the States, Tribes, and other jurisdictions do not associate every impacted waterbody with a source of impairment in their 305(b) reports, and the summary cause and source information presented in this report applies exclusively to a subset of the Nation's impaired waters.

Table ES-4: Five Leading Sources of Water Quality Impairment

Rank	Rivers	Lakes	Estuaries
1	Agriculture	Agriculture	Urban Runoff/ Storm Sewers
2	Municipal Sewage Treatment Plants	Municipal Sewage Treatment Plants	Municipal Sewage Treatment Plants
3	Hydrologic/Habitat Modification	Urban Runoff/ Storm Sewers	Agriculture
4	Urban Runoff/ Storm Sewers	Unspecified Nonpoint Sources	Industrial Point Sources
5	Resource Extraction	Hydrologic/Habitat Modification	Petroleum Activities

Source: Based on 1994 Section 305(b) reports submitted by States, Tribes, Territories, Commissions, and the District of Columbia.

Rivers and Streams

Rivers and streams are characterized by flow. Perennial rivers and streams flow continuously, all year round. Nonperennial rivers and streams stop flowing for some period of time, usually due to dry conditions or upstream withdrawals. Many rivers and streams originate in nonperennial headwaters that flow only during snowmelt or heavy showers. Nonperennial streams provide critical habitats for nonfish species, such as amphibians and dragonflies, as well as safe havens for juvenile fish to escape from predation by larger fish.

The health of rivers and streams is directly linked to habitat integrity in shore and in adjacent wetlands. Stream quality will deteriorate if activities damage shoreline (i.e., riparian) vegetation and wetlands, which filter pollutants from runoff and bind soils. Removal of vegetation also eliminates shade that moderates stream temperature as well as the land temperature that can warm runoff entering surface waters. Stream temperature, in turn, affects the availability of dissolved oxygen in the water column for fish and other aquatic organisms.

Overall Water Quality

For the 1994 Report, 58 States, Territories, Tribes, Commissions, and the District of Columbia surveyed 615,806 miles (17%) of the Nation's total 3.5 million miles of rivers and streams (Figure ES-2). The surveyed rivers and streams represent 48% of the 1.3 million miles of perennial rivers and streams that flow year round in the lower 48 States.

Barry Burgan, U.S. EPA

Altogether, the States and Tribes surveyed 27,075 fewer river miles in 1994 than in 1992. Individually, most States reported that they surveyed more river miles in 1994, but their increases were offset by a decline of 85,000 surveyed river miles reported by Montana, Mississippi, and Maryland. For 1994, these States reported use support status for only those river miles that they surveyed in direct monitoring programs or evaluations rather than using inferences for unsurveyed waters.

The following discussion applies exclusively to surveyed waters and cannot be extrapolated to describe conditions in the Nation's rivers as a whole because the States, Tribes, and other jurisdictions do not consistently use statistical or probabilistic survey methods to characterize all their waters at this time. EPA is working with the States, Tribes, and other jurisdictions to expand survey coverage of the Nation's waters and expects future survey information to cover a greater portion of the Nation's rivers and streams.

Figure ES-2. River Miles Surveyed

Total rivers = 3.5 million miles
Total surveyed = 615,806 miles

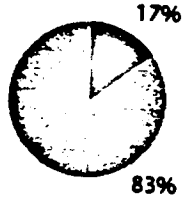


Figure ES-3. Levels of Overall Use Support & Rivers

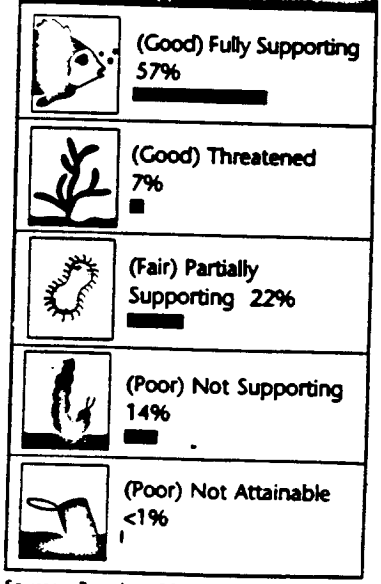


Source: Based on 1994 Section 305(b) reports submitted by States, Tribes, Territories, Commissions, and the District of Columbia.

Of the Nation's 615,806 surveyed river miles, the States, Tribes, and other jurisdictions found that 64% have good water quality. Of these waters, 57% fully support their designated uses, and an additional 7% support uses but are threatened and may become impaired if pollution control actions are not taken (Figure ES-3).

Some form of pollution or habitat degradation prevents the remaining 36% (224,236 miles) of the surveyed river miles from fully supporting a healthy aquatic community or human activities all year round. Twenty-two percent of the surveyed river miles have fair water quality that partially supports designated uses. Most of the time, these waters provide adequate habitat for aquatic organisms and support human activities, but periodic pollution interferes with these activities and/or stresses aquatic life. Fourteen percent of the surveyed river miles have poor water quality that consistently stresses aquatic life and/or prevents people from using the river for activities such as swimming and fishing.

What Is Polluting Our Rivers and Streams?

The States and Tribes report that bacteria pollute 76,397 river miles (which equals 34% of the impaired river miles) (Figure ES-4). Bacteria provide evidence of possible fecal contamination that may cause illness if the public ingests the water.

Siltation, composed of tiny soil particles, remains one of the most widespread pollutants impacting rivers and streams. The States and Tribes reported that siltation impairs 75,792 river miles (which equals 34% of the impaired river miles).

Bacteria and siltation are the most widespread pollutants in rivers and streams, affecting 34% of the impaired river miles.

Siltation alters aquatic habitat and suffocates fish eggs and bottom-dwelling organisms. Excessive siltation can also interfere with drinking water treatment processes and recreational use of a river.

In addition to siltation and bacteria, the States and Tribes also reported that nutrients, oxygen-depleting substances, metals, and habitat alterations impact more miles of rivers and streams than other pollutants and processes. Often, several pollutants and processes impact a single river segment. For example, a process, such as removal of shoreline vegetation, may accelerate erosion of sediment and nutrients into a stream.

Where Does This Pollution Come From?

The States and Tribes reported that agriculture is the most widespread source of pollution in the Nation's surveyed rivers (Figure ES-4). Agriculture generates pollutants that degrade aquatic life or interfere with public use of 134,557 river miles (which equals 60% of the impaired river miles) in 49 States and Tribes.

Twenty-one States reported the size of rivers impacted by specific types of agricultural activities:

- Nonirrigated Crop Production – crop production that relies on rain as the sole source of water.
- Irrigated Crop Production – crop production that uses irrigation systems to supplement rainwater.
- Rangeland – land grazed by animals that is seldom enhanced by the application of fertilizers or pesticides, although managers sometimes modify plant species to a limited extent.
- Pastureland – land upon which a crop (such as alfalfa) is raised to feed animals, either by grazing the animals among the crops or harvesting the crops.
- Feedlots – facilities where animals are fattened and confined at high densities.
- Animal Holding Areas – facilities where animals are confined briefly before slaughter.

The States reported that nonirrigated crop production impaired the most river miles, followed by irrigated crop production, rangeland, feedlots, pastureland, and animal holding areas.

Many States reported declines in pollution from sewage treatment

Agriculture is the leading source of impairment in the Nation's rivers, affecting 60% of the impaired river miles.

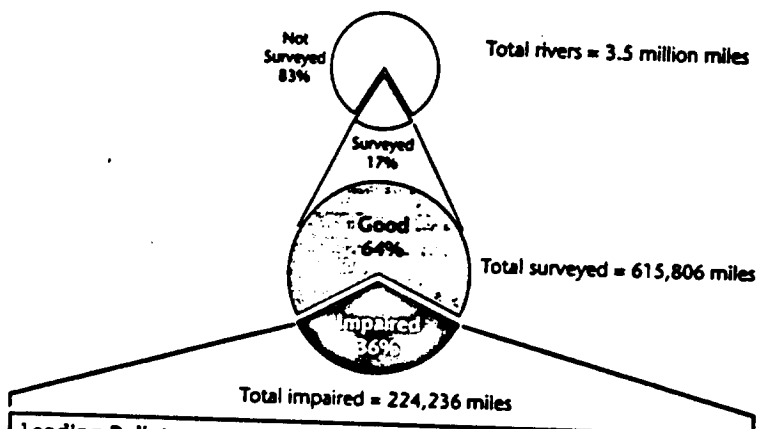
plants and industrial discharges as a result of sewage treatment plant construction and upgrades and permit controls on industrial discharges. Despite the improvements, municipal sewage treatment plants remain the second most common source of pollution in rivers (impairing 37,443 miles) because population growth increases the burden on our municipal facilities.

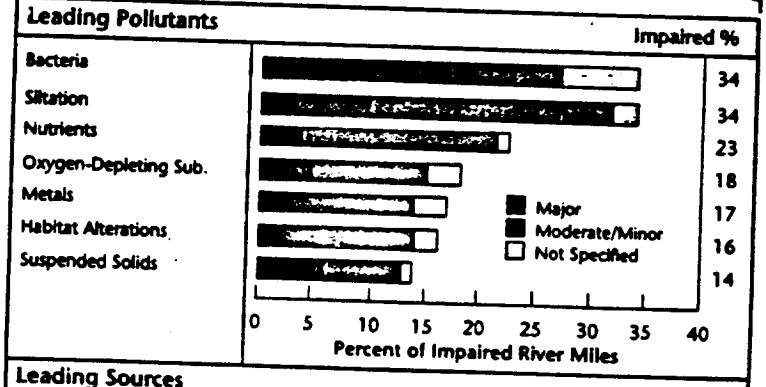
Hydrologic modifications and habitat alterations are a growing concern to the States. Hydrologic modifications include activities that alter the flow of water in a stream, such as channelization, dewatering, and damming of streams. Habitat alterations include removal of streamside vegetation that protects the stream from high temperatures, and scouring of stream bottoms. Additional gains in water quality conditions will be more subtle and require innovative management strategies that go beyond point source controls.

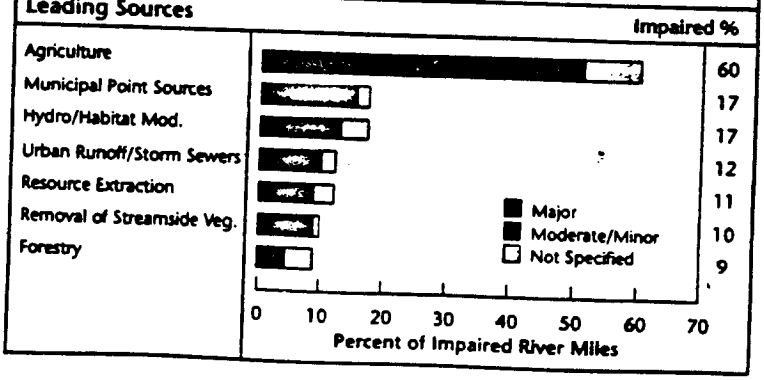
The States, Tribes, and other jurisdictions also reported that urban runoff and storm sewers impair 26,862 river miles (12% of the impaired rivers), resource extraction impairs 24,059 river miles (11% of the impaired rivers), and removal of streamside vegetation impairs 21,706 river miles (10% of the impaired rivers).

The States, Tribes, and other jurisdictions also report that "natural" sources impair significant stretches of rivers and streams. "Natural" sources, such as low flow [illegible] soils with arsenic deposits, can prevent waters from supporting uses in the absence of human activities.

Figure ES-4. Impaired River Miles: Pollutants and Sources







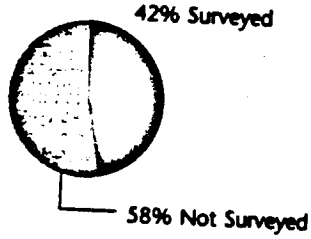
Lakes, Ponds, and Reservoirs

Lakes are sensitive to pollution inputs because lakes flush out their contents relatively slowly. Even under natural conditions, lakes undergo eutrophication, an aging process that slowly fills in the lake with sediment and organic matter (see following sidebar). The eutrophication process alters basic lake characteristics such as depth, biological productivity, oxygen levels, and water clarity. The eutrophication process is commonly defined by a series of trophic states as described in the sidebar.

John Thelgard, Dynum, NC

Figure ES-5. Lake Acres Surveyed

Total lakes = 40.8 million acres
Total surveyed = 17.1 million acres



Overall Water Quality

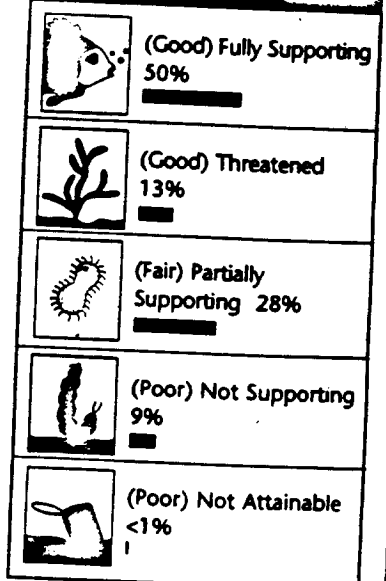
Forty-eight States, Tribes, and other jurisdictions surveyed overall use support in more than 17.1 million lake acres representing 42% of the approximately 40.8 million total acres of lakes, ponds, and reservoirs in the Nation (Figure ES-5). For 1994, the States surveyed about 1 million fewer lake acres than in 1992.

The number of surveyed lake acres declined because several States separated fish tissue data from their survey of overall use support. Some of these States, such as Minnesota, have established massive databases of fish tissue contamination information (which is used to establish fish consumption advisories), but lack other types of water quality data for many of their lakes. In 1994, these States chose not to assess overall use support entirely with fish tissue data alone, which is a very narrow indicator of water quality.

The States and Tribes reported that 63% of their surveyed 17.1 million lake acres have good water quality. Waters with good quality include 50% of the surveyed lake acres fully supporting uses and 13% of the surveyed lake acres that are threatened and might deteriorate if we fail to manage potential sources of pollution (Figure ES-6).

Some form of pollution or habitat degradation impairs the remaining 37% of the surveyed lake acres. Twenty-eight percent of the surveyed lake acres have fair water quality that partially supports designated uses. Most of the time, these waters provide adequate habitat for aquatic organisms and support human activities, but periodic pollution interferes with these activities and/or stresses aquatic life. Nine percent of the surveyed lake acres suffer from poor water quality that consistently stresses aquatic life and/or prevents people from using the lake for activities such as swimming and fishing.

Figure ES-6. Levels of Overall Use Support in Lakes



Source: Based on 1994 Section 305(b) reports submitted by States, Tribes, Territories, Commissions, and the District of Columbia.

What Is Polluting Our Lakes, Ponds, and Reservoirs?

Forty-one States, the District of Columbia, and Puerto Rico reported the number of lake acres impacted by individual pollutants and processes.

Thirty-seven States and Puerto Rico identified more lake acres polluted by nutrients than any other pollutant or process (Figure ES-7). The States and Puerto Rico reported that extra nutrients pollute 2.8 million lake acres (which equals 43% of the impaired lake acres). Healthy lake ecosystems contain nutrients in small quantities, but extra inputs of nutrients from human activities unbalance lake ecosystems.

In addition to nutrients, the States, Puerto Rico, and the District of Columbia report that siltation pollutes 1.8 million lake acres (which equals 28% of the impaired lake acres), enrichment by organic wastes that deplete oxygen impacts 1.6 million lake acres (which equals 24% of the impaired lake acres), and metals pollute 1.4 million acres (which equals 21% of the impaired lake acres).

Metals declined from the most widespread pollutant impairing lakes in the 1992 305(b) reporting cycle

Trophic States

Oligotrophic	Clear waters with little organic matter or sediment and minimum biological activity.
Mesotrophic	Waters with more nutrients and, therefore, more biological productivity.
Eutrophic	Waters extremely rich in nutrients, with high biological productivity. Some species may be choked out.
Hypereutrophic	Murky, highly productive waters, closest to the wetlands status. Many clearwater species cannot survive.
Dystrophic	Low in nutrients, highly colored with dissolved humic organic matter. (Not necessarily a part of the natural trophic progression.)

The Eutrophication Process

Eutrophication is a natural process, but human activities can accelerate eutrophication by increasing the rate at which nutrients and organic substances enter lakes from their surrounding watersheds. Agricultural runoff, urban runoff, leaking septic systems, sewage discharges, eroded streambanks, and similar sources can enhance the flow of nutrients and organic substances into lakes. These substances can overstimulate the growth of algae and aquatic plants, creating conditions that interfere with the recreational use of lakes and the health and diversity of native fish, plant, and animal populations. Enhanced eutrophication from nutrient enrichment due to human activities is one of the leading problems facing our Nation's lakes and reservoirs.

Acid Effects on Lakes

Increases in lake acidity can radically alter the community of fish and plant species in lakes and can increase the solubility of toxic substances and magnify their adverse effects. Twenty-eight States reported the results of lake acidification assessments. These States assessed pH (a measure of acidity) at more than 5,933 lakes and detected acidic conditions in 526 lakes and a threat of acidic conditions in 423 lakes. Most of the States that assessed acidic conditions are located in the Northeast, upper Midwest, and the South.

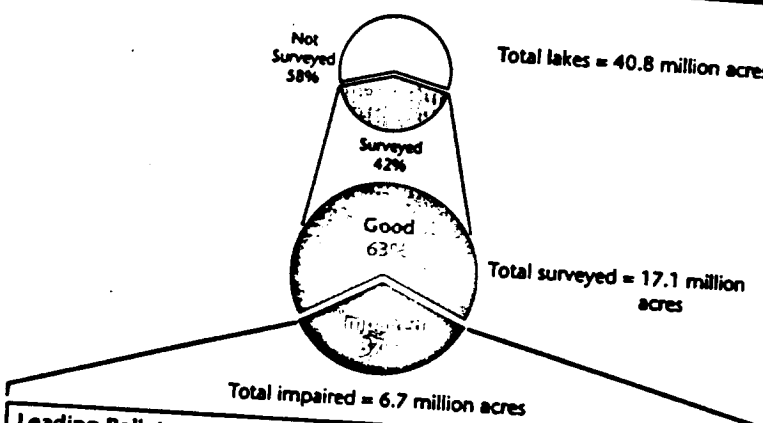
Only 11 States identified sources of acidic conditions. Maine and New Hampshire attributed most of their acid lake conditions to acid deposition from acidic rain, fog, or dry deposition in conjunction with natural conditions that limit a lake's capacity to neutralize acids. Alabama, Kansas, Maryland, Montana, Oklahoma, and Tennessee reported that acid mine drainage resulted in acidic lake conditions or threatened lakes with the potential to generate acidic conditions.

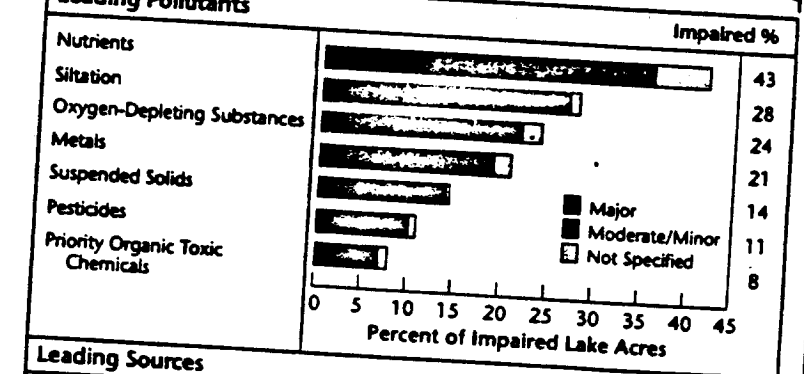
to the fourth leading pollutant impairing lakes in 1994. The decline is due to changes in State reporting and assessment methods rather than a measured decrease in metals contamination. In 1994, several States chose to no longer assess overall use support with fish contamination data alone. Much of that data consisted of measurements of metals in fish tissue. As a result of excluding this fish tissue data, the national estimate of lake acres impaired by metals fell by over 2 million acres in 1994.

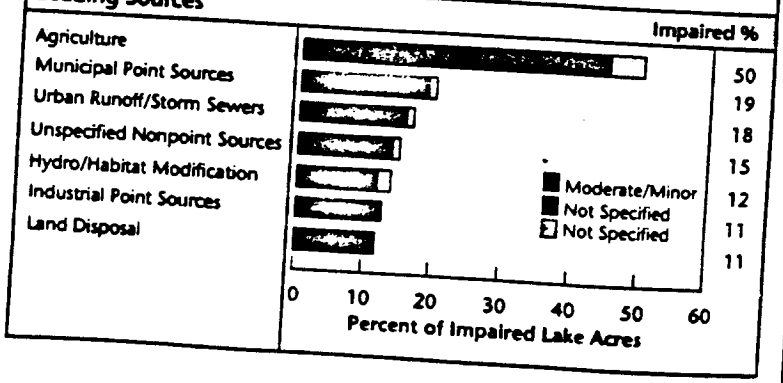
More States reported impairments due to nutrients than any other single pollutant.

Forty-one States also surveyed trophic status, which is associated with nutrient enrichment, in 9,735 of their lakes. Nutrient enrichment tends to increase the proportion of lakes in the eutrophic and hypereutrophic categories. These States reported that 18% of the lakes they surveyed for trophic status were oligotrophic, 32% were mesotrophic, 36% were eutrophic, 6% were hypereutrophic, and 3% were dystrophic. This information may not be representative of national lake conditions because States often assess lakes in response to a problem or public complaint or because of their easy accessibility. It is likely that more remote lakes—which are probably less impaired—are underrepresented in these assessments.

Figure ES-7. Impaired Lake Acres: 4 Pollutants and Sources





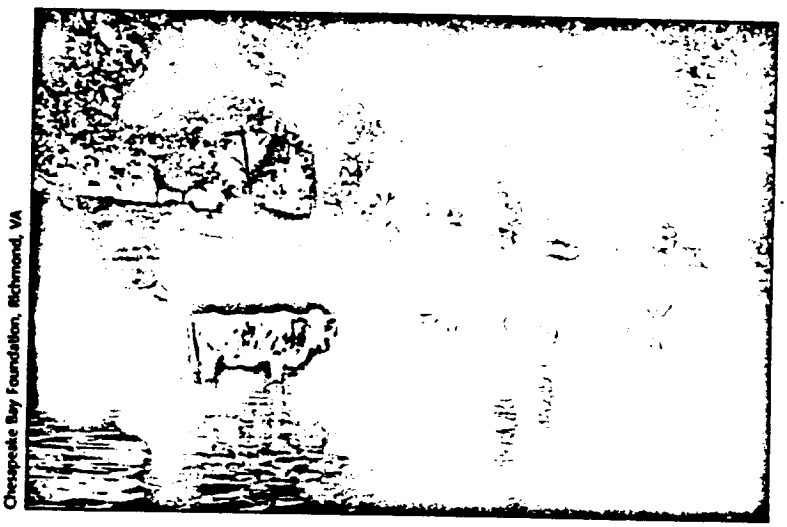


Where Does This Pollution Come From?

Forty-two States and Puerto Rico reported sources of pollution in some of their impacted lakes, ponds, and reservoirs. These States and Puerto Rico reported that agriculture is the most widespread source of pollution in the Nation's surveyed lakes (Figure ES-7). Agriculture generates pollutants that degrade aquatic life or interfere with public use of 3.3 million lake acres (which equals 50% of the impaired lake acres).

Agriculture is the leading source of impairment in lakes, affecting 50% of impaired lake acres.

The States and Puerto Rico also reported that municipal sewage treatment plants pollute 1.3 million lake acres (19% of the impaired lake acres), urban runoff and storm sewers pollute 1.2 million lake acres (18% of the surveyed lake acres), unspecified nonpoint sources impair 989,000 lake acres (15% of the impaired lake acres), hydrologic modifications and habitat alterations degrade 832,000 lake acres (12% of the impaired lake acres), and industrial point sources pollute 759,000 lake acres (11% of the impaired lake acres). Many States prohibit new point source discharges into lakes, but existing municipal sewage treatment plants remain a leading source of pollution entering lakes.



Chesapeake Bay Foundation, Richmond, VA

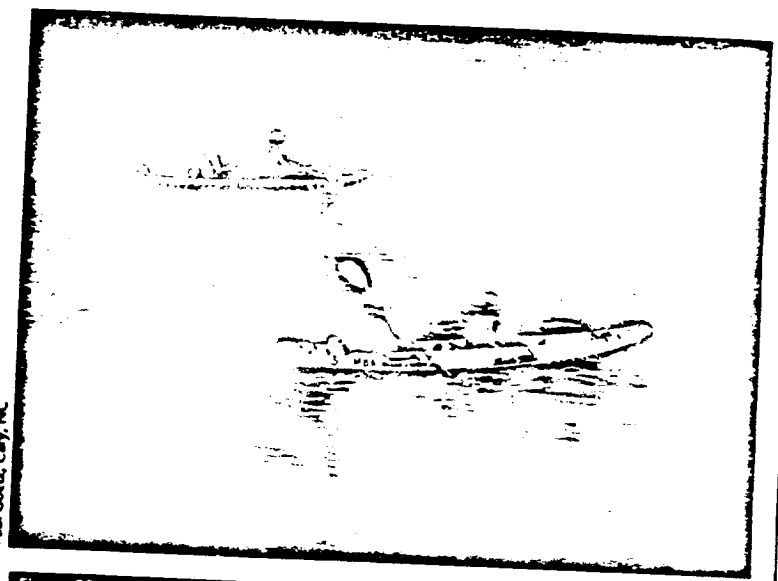
The States and Puerto Rico listed numerous sources that impact several hundred thousand lake acres, including land disposal of wastes, construction, flow regulation, highway maintenance and runoff, contaminated sediments, atmospheric deposition of pollutants, and onsite wastewater systems (including septic tanks).

The Great Lakes

The Great Lakes contain one-fifth of the world's fresh surface water and are stressed by a wide range of pollution sources, including air pollution. Many of the pollutants that reach the Great Lakes remain in the system indefinitely because the Great Lakes are a relatively closed water system with few natural outlets. Despite dramatic declines in the occurrence of algal blooms, fish kills, and localized "dead" zones depleted of oxygen, less visible problems continue to degrade the Great Lakes.

Overall Water Quality

The States surveyed 94% of the Great Lakes shoreline miles for 1994 and reported that fish consumption advisories and aquatic life concerns are the dominant water quality problems, overall, in the Great Lakes (Figure ES-8). The States reported that most of the Great Lakes nearshore waters are safe for swimming and other recreational activities and can be used as a source of drinking water with normal treatment. However, only 2% of the surveyed nearshore waters fully support designated uses, overall, and 1% support uses but are threatened (Figure ES-9). About 97% of the surveyed waters do not fully support designated uses, overall, because fish consumption advisories are posted throughout the nearshore waters of the Great Lakes and water quality conditions are unfavorable for supporting aquatic life in many cases. Aquatic life impacts result from persistent toxic pollutant burdens in birds, habitat degradation and destruction, and competition



Paul Goetz, Cary, NC

and predation by nonnative species such as the zebra mussel and the sea lamprey.

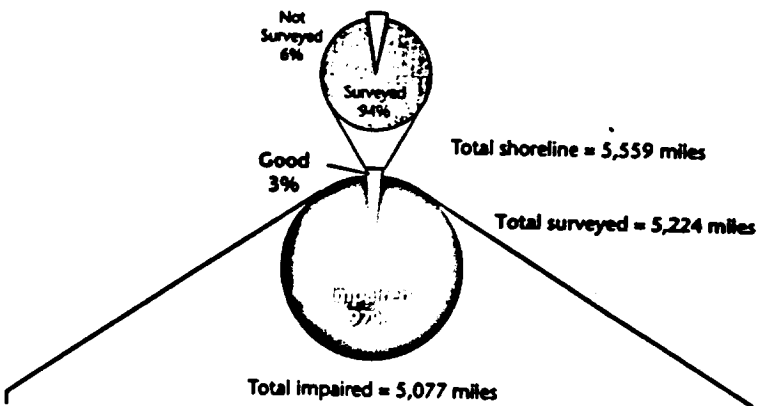
Considerable progress has been made in controlling conventional pollutants, but the Great Lakes are still subject to the effects of toxic pollutants.

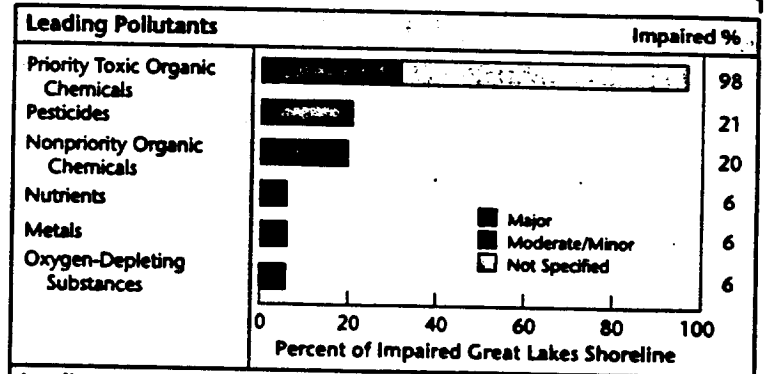
These figures do not address water quality conditions in the deeper, cleaner, central waters of the Lakes.

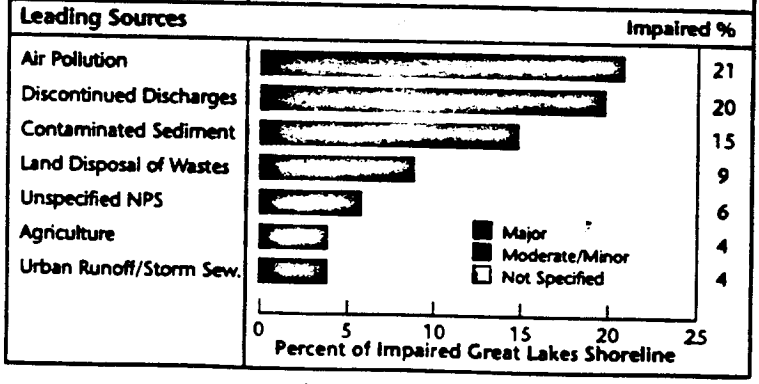
What Is Polluting the Great Lakes?

The States reported that most of the Great Lakes shoreline is polluted by toxic organic chemicals–primarily PCBs–that are often found in fish tissue samples. The Great Lakes States reported that toxic organic chemicals impact 98% of the impaired Great Lakes shoreline miles. Other leading causes of impairment include pesticides, affecting 21%; nonpriority organic chemicals, affecting 20%; nutrients, affecting 6%; and metals, affecting 6% (Figure ES-10).

Figure ES-10. Impaired Great Lakes Shoreline: Pollutants and Sources







Where Does This Pollution Come From?

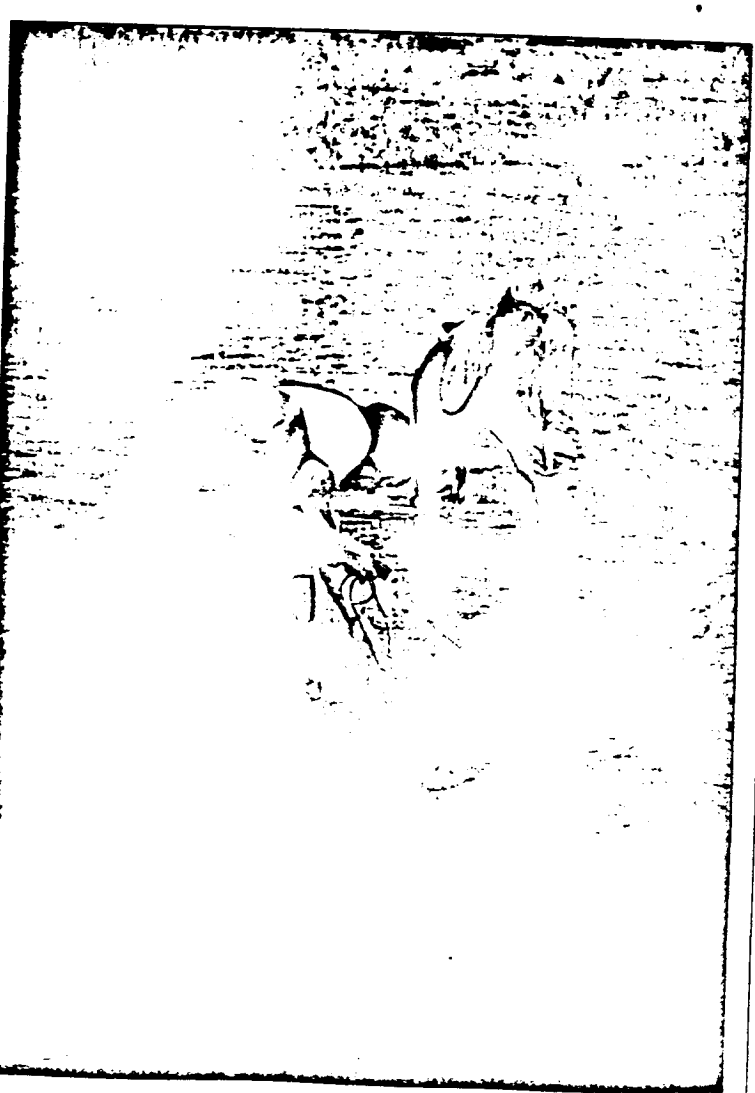
Only four of the eight Great Lakes States measured the size of their Great Lakes shoreline polluted by specific sources. These States have jurisdiction over one-third of the Great Lakes shoreline, so their findings do not necessarily reflect conditions throughout the Great Lakes Basin.

- Wisconsin identifies air pollution and discontinued discharges as a source of pollutants contaminating all 1,017 of their surveyed shoreline miles. Wisconsin also identified smaller areas impacted by contaminated sediments, nonpoint sources, industrial and municipal discharges, agriculture, urban runoff and storm sewers, combined sewer overflows, and land disposal of waste.

- Indiana attributes all of the pollution along its entire 43-mile shoreline to air pollution, urban runoff and storm sewers, industrial and municipal discharges, and agriculture.

- Ohio reports that nonpoint sources pollute 86 miles of its 236 miles of shoreline, in-place contaminants impact 33 miles, and land disposal of waste impacts 24 miles of shoreline.

- New York identifies many sources of pollutants in their Great Lakes waters, but the State attributes the most miles of degradation to contaminated sediments (439 miles) and land disposal of waste (374 miles).



Phil Johnson, U.S. EPA, Region 5

Estuaries

Estuaries are areas partially surrounded by land where rivers meet the sea. They are characterized by varying degrees of salinity, complex water movements affected by ocean tides and river currents, and high turbidity levels. They are also highly productive ecosystems with a range of habitats for many different species of plants, shellfish, fish, and animals.

Many species permanently inhabit the estuarine ecosystem; others, such as shrimp, use the nutrient-rich estuarine waters as nurseries before traveling to the sea.

Estuaries are stressed by the particularly wide range of activities located within their watersheds. They receive pollutants carried by rivers from agricultural lands and cities; they often support marinas, harbors, and commercial fishing fleets; and their surrounding lands are highly prized for development. These stresses pose a continuing threat to the survival of these bountiful waters.

Overall Water Quality

Twenty-five coastal States and jurisdictions surveyed 78% of the Nation's total estuarine waters in 1994 (Figure ES-11). The States and other jurisdictions reported that 63% of the surveyed estuarine waters have good water quality that fully supports designated uses (Figure ES-12). Of these waters, 6% are threatened and might deteriorate if we fail to manage potential sources of pollution.

Brian Murphy, Walnut Creek, CA

Some form of pollution or habitat degradation impairs the remaining 37% of the surveyed estuarine waters. Twenty-seven percent of the surveyed estuarine waters have fair water quality that partially supports designated uses. Most of the time these waters provide adequate habitat for aquatic organisms and support human activities, but periodic pollution interferes with these activities and/or stresses aquatic life. Nine percent of the surveyed estuarine waters suffer from poor water quality that consistently stresses aquatic life and/or prevents people from using the estuarine waters for activities such as swimming and shellfishing.

Figure ES-11: Estuary Square Miles Surveyed

Total estuaries = 34,388 square miles
Total surveyed = 26,847 square miles

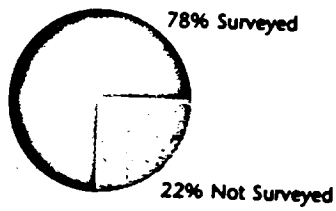


Figure ES-12: Levels of Overall Use Support: Estuaries

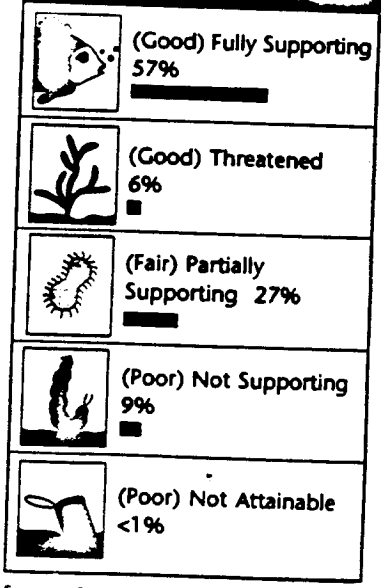


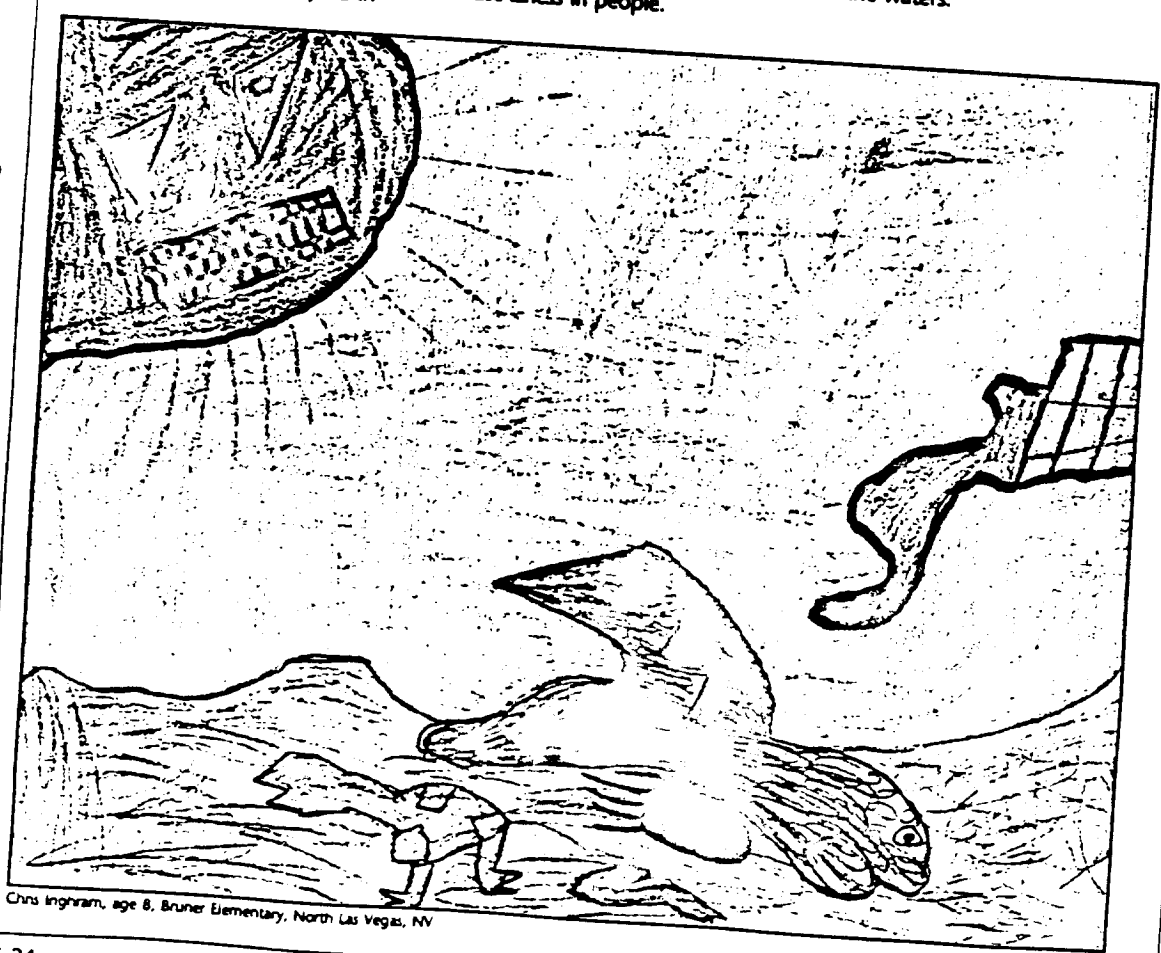
Source: Based on 1994 Section 305(b) reports submitted by States, Tribes, Territories, Commissions, and the District of Columbia.

What Is Polluting Our Estuaries?

The States identified more square miles of estuarine waters polluted by nutrients and bacteria than any other pollutant or process (Figure ES-13). Fifteen States reported that extra nutrients pollute 4,548 square miles of estuarine waters (which equals 47% of the impaired estuarine waters). As in lakes, extra inputs of nutrients from human activities destabilize estuarine ecosystems.

Twenty-five States reported that bacteria pollute 4,479 square miles of estuarine waters (which equals 46% of the impaired estuarine waters). Bacteria provide evidence that an estuary is contaminated with sewage that may contain numerous viruses and bacteria that cause illness in people.

The States also report that oxygen depletion from organic wastes impacts 3,127 square miles (which equals 32% of the impaired estuarine waters), habitat alterations impact 1,564 square miles (which equals 16% of the impaired estuarine waters), and oil and grease pollute 1,344 square miles (which equals 14% of the impaired estuarine waters.

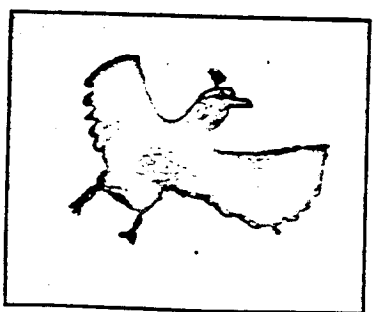


Chris Ingraram, age 8, Bruner Elementary, North Las Vegas, NV

Where Does This Pollution Come From?

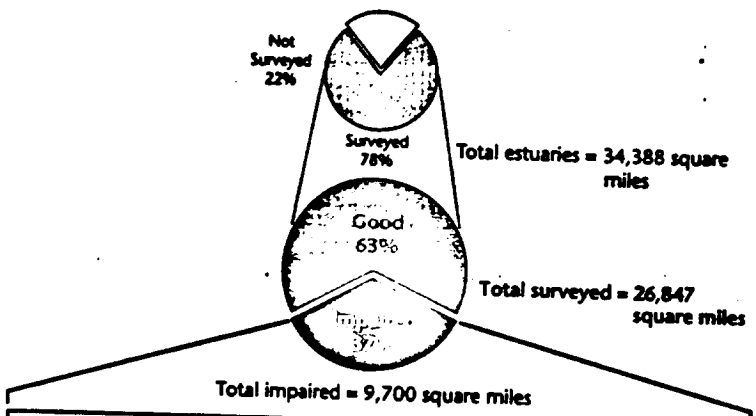
Twenty-three States reported that urban runoff and storm sewers are the most widespread source of pollution in the Nation's surveyed estuarine waters. Pollutants in urban runoff and storm sewer effluent degrade aquatic life or interfere with public use of 4,508 square miles of estuarine waters (which equals 46% of the impaired estuarine waters) (Figure ES-13).

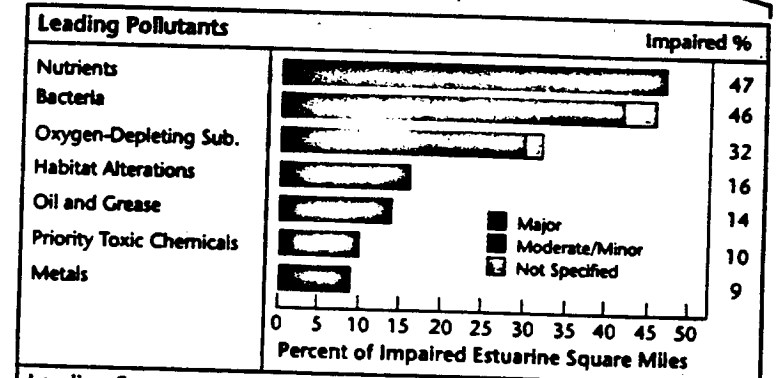
The States also reported that municipal sewage treatment plants pollute 3,827 square miles of estuarine waters (39% of the impaired estuarine waters), agriculture pollutes 3,321 square miles of estuarine waters (34% of the impaired estuarine waters), and industrial discharges pollute 2,609 square miles (27% of the impaired estuarine waters). Urban sources contribute more to the degradation of estuarine waters than agriculture because urban centers are located adjacent to most major estuaries.

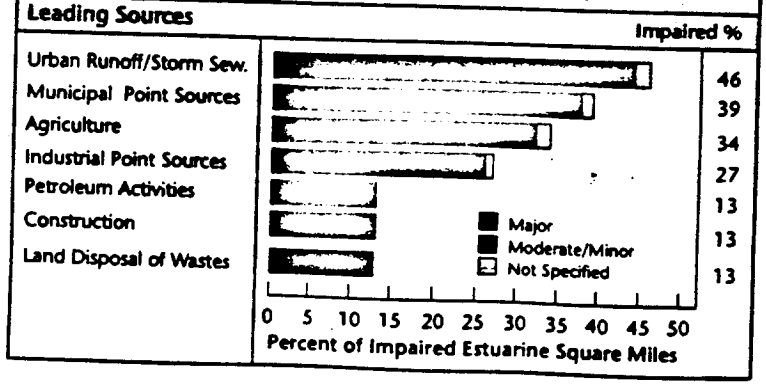


Krista Rose, age 8, Bruner Elementary, North Las Vegas, NV

Figure ES-13. Impaired Estuaries: Pollutants and Sources







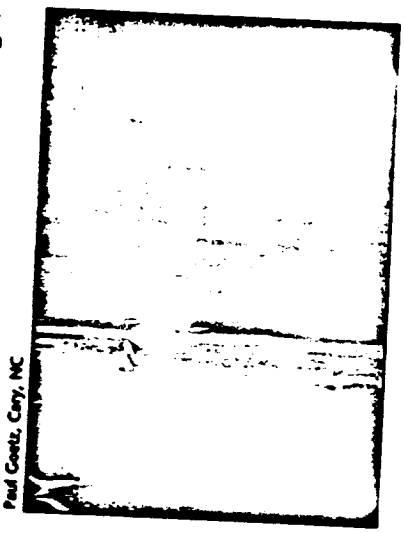
Ocean Shoreline Waters

Although the oceans are expansive, they are vulnerable to pollution from numerous sources, including city storm sewers, ocean outfalls from sewage treatment plants, overboard disposal of debris and sewage, oil spills, and bilge discharges that contain oil and grease. Nearshore ocean waters, in particular, suffer from the same pollution problems that degrade our inland waters.

Overall Water Quality

Thirteen of the 27 coastal States and Territories surveyed only 9% of the Nation's estimated 58,421 miles of ocean coastline (Figure ES-14). Most of the surveyed waters (4,834 miles, or 93%) have good quality that supports a healthy aquatic community and public activities (Figure ES-15). Of these waters, 225 miles (4% of the surveyed shoreline) are threatened and may deteriorate in the future.

Some form of pollution or habitat degradation impairs the remaining 7% of the surveyed shoreline (374 miles). Five percent of the surveyed estuarine waters have fair water quality that partially supports designated uses. Most of the time, these waters provide adequate habitat for aquatic organisms and support human activities, but periodic pollution interferes with these activities and/or stresses aquatic life. Only 2% of the surveyed shoreline suffers from poor water quality that consistently stresses aquatic life and/or prevents people from using the shoreline for activities such as swimming and shellfishing.



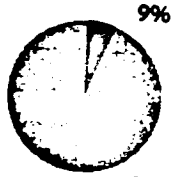
Paul Gantz, Cary, NC

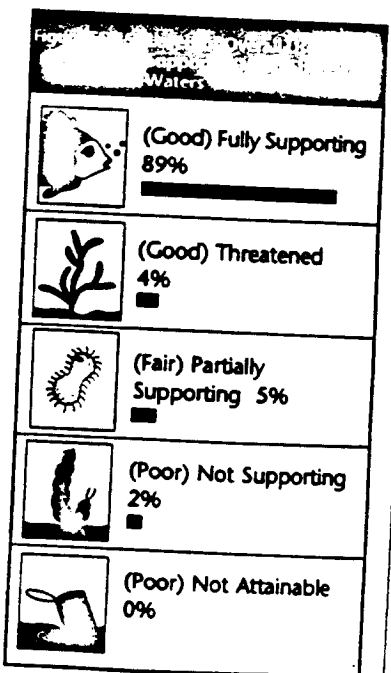
Only six of the 27 coastal States identified pollutants and sources of pollutants degrading ocean shoreline waters. General conclusions cannot be drawn from the information supplied by these States because these States border less than 1% of the shoreline along the contiguous States. The six States identified impacts in their ocean shoreline waters from bacteria, metals, nutrients, turbidity, siltation, and pesticides. The six States reported that urban runoff and storm sewers, industrial discharges, land disposal of wastes, septic systems, agriculture, unspecified nonpoint sources, and combined sewer overflows (CSOs) pollute their coastal shoreline waters.

Figure ES-14: Ocean Shoreline Waters Surveyed

Total ocean shore = 58,421 miles including Alaska's shoreline

Total surveyed = 5,208 miles





Source: Based on 1994 Section 305(b) reports submitted by States and Territories.

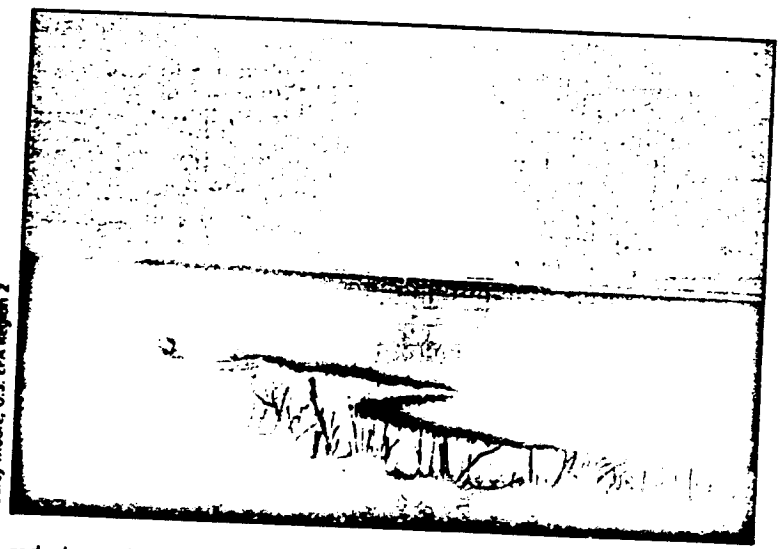
Wetlands

Wetlands are areas that are inundated or saturated by surface water or ground water at a frequency and duration sufficient to support (and that under normal circumstances do support) a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands, which are found throughout the United States, generally include swamps, marshes, bogs, and similar areas.

Wetlands are now recognized as some of the most unique and important natural areas on earth. They vary in type according to differences in local and regional hydrology, vegetation, water chemistry, soils, topography, and climate. Coastal wetlands include estuarine marshes; mangrove swamps found in Puerto Rico, Hawaii, Louisiana, and Florida; and Great Lakes coastal wetlands. Inland wetlands, which may be adjacent to a waterbody or isolated, include marshes and wet meadows, bottomland hardwood forests, Great Plains prairie potholes, cypress-gum swamps, and southwestern playa lakes.

In their natural condition, wetlands provide many benefits, including food and habitat for fish and wildlife, water quality improvement, flood protection, shoreline erosion control, ground water exchange, as well as natural products for human use and opportunities for recreation, education, and research.

Wetlands help maintain and improve water quality by intercepting surface water runoff before it reaches open water, removing or retaining nutrients, processing chemical and organic wastes, and reducing sediment loads to receiving waters. As water moves through a wetland, plants slow the water, allowing sediment and pollutants to settle out. Plant roots trap sediment and are then able to metabolize and detoxify pollutants and remove nutrients such as nitrogen and phosphorus.



Audrey Moore, U.S. EPA Region 2

Wetlands function like natural basins, storing either floodwater that overflows riverbanks or surface water that collects in isolated depressions. By doing so, wetlands help protect adjacent and downstream property from flood damage. Trees and other wetlands vegetation help slow the speed of flood waters. This action, combined with water storage, can lower flood heights and reduce the water's erosive potential. In agricultural areas, wetlands can help reduce the likelihood of flood damage to crops. Wetlands within and upstream of urban areas are especially valuable for flood protection because urban development increases the rate and volume of surface water runoff, thereby increasing the risk of flood damage.

Wetlands produce a wealth of natural products, including fish and shellfish, timber, wildlife, and wild rice. Much of the Nation's fishing and shellfishing industry harvests wetlands-dependent species. A national survey conducted by the Fish and Wildlife Service (FWS) in 1991 illustrates the economic value of some of the wetlands-dependent products. Over 9 billion pounds of fish and shellfish landed in the United States in 1991 had a direct, dockside value of $3.3 billion. This served as the basis of a seafood processing and sales industry that generated total expenditures of $26.8 billion. In addition, 35.6 million anglers spent $24 billion on freshwater and saltwater fishing. It is estimated that 71% of commercially

valuable fish and shellfish depend directly or indirectly on coastal wetlands.

Overall Water Quality

The States, Tribes, and other jurisdictions are making progress in developing specific designated uses and water quality standards for wetlands, but many States and Tribes still lack specific water quality criteria and monitoring programs for wetlands. Without criteria and monitoring data, most States and Tribes cannot evaluate use support. To date, only 9 States and Tribes reported the designated use support status for some of their wetlands. Only one State used quantitative data as a basis for the use support decisions.

EPA cannot derive national conclusions about water quality conditions in all wetlands because the States used different methodologies to survey only 3% of the total wetlands in the Nation. Summarizing State wetlands data would also produce misleading results because two States (North Carolina and Louisiana) contain 91% of the surveyed wetlands acreage.

What Is Polluting Our Wetlands and Where Does This Pollution Come From?

The States have even fewer data to quantify the extent of pollutants degrading wetlands and the sources of these pollutants. Although most States cannot quantify wetlands area impacted by individual causes and sources of degradation, 12 States identified causes and 13 States identified sources known to degrade wetlands integrity to some extent. These States listed sediment as the most widespread cause of degradation impacting wetlands, followed by flow alterations, habitat modifications, and draining (Figure ES-16). Agriculture topped the list of sources degrading wetlands, followed by urban runoff, hydrologic modification, and municipal point sources (Figure ES-17).

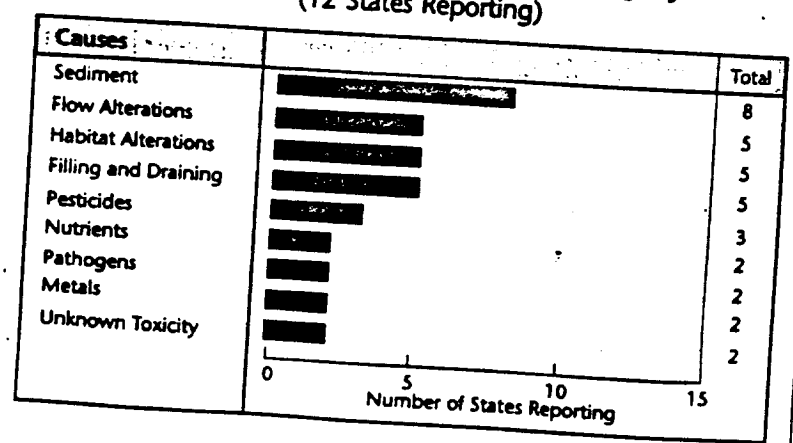
Wetlands Loss: A Continuing Problem

It is estimated that over 200 million acres of wetlands existed in the lower 48 States at the time of European settlement. Since then, extensive wetlands acreage has been lost, with many of the original wetlands drained and converted to farmland and urban development. Today, less than half of our original wetlands remain. The losses amount to an area equal to the size of California. According to the U.S. Fish and Wildlife Service's *Wetlands Losses in the United States 1780's to 1980's*, the three States that have sustained the greatest percentage of wetlands loss are California (91%), Ohio (90%), and Iowa (89%).

According to FWS status and trends reports, the average annual loss of wetlands has decreased over the past 40 years. The average annual loss from the mid-1950s to the mid-1970s was 458,000 acres, and from the mid-1970s to the mid-1980s it was 290,000 acres. Agriculture was responsible for 87% of the loss from the mid-1950s to the mid-1970s and 54% of the loss from the mid-1970s to the mid-1980s.

Figure ES-16

Causes Degrading Wetlands Integrity
(12 States Reporting)



A more recent estimate of wetlands losses from the National Resources Inventory (NRI), conducted by the Natural Resources Conservation Service (NRCS), indicates that 792,000 acres of wetlands were lost on non-Federal lands between 1982 and 1992 for a yearly loss estimate of 70,000 to 90,000 acres. This net loss is the result of gross losses of 1,561,300 acres of wetlands and gross gains of 768,700 acres of wetlands over the 10-year period. The NRI estimates are consistent with the trend of declining wetlands losses reported by FWS. Although losses have decreased, we still have to make progress toward our interim goal of no overall net loss of the Nation's remaining wetlands and the long-term goal of increasing the quantity and quality of the Nation's wetlands resource base.

The decline in wetlands losses is a result of the combined effect of several trends: (1) the decline in profitability in converting wetlands for agricultural production; (2) passage of Swampbuster provisions in the 1985 and 1990 Farm Bills that denied crop subsidy benefits to farm operators who converted wetlands to cropland after 1985; (3) presence of the CWA Section 404 permit programs as well as development of State management programs; (4) greater public interest and support for wetlands protection; and (5) implementation of wetlands restoration programs at the Federal, State, and local level.

Nineteen States listed sources of recent wetlands losses in their 1994 305(b) reports. Residential development and urban growth were cited as the leading sources of current losses. Other losses were due to commercial development; construction of roads, highways, and bridges; agriculture; and industrial development. In addition to human activities, a few States also reported that natural sources, such as rising lake levels, resulted in wetlands losses and degradation.

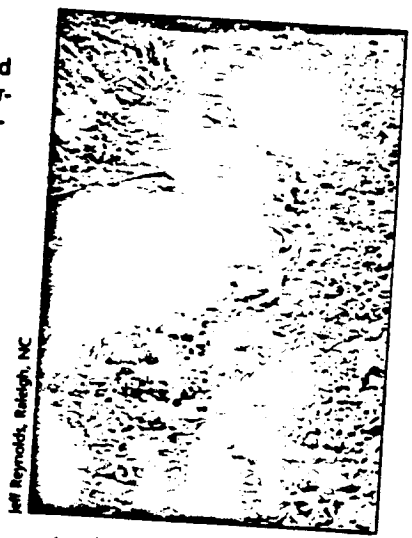
More information on wetlands can be obtained from the EPA Wetlands Hotline at 1-800-832-7828.

Ground Water

Ninety-five percent of all fresh water available on earth (exclusive of icecaps) is ground water. Ground water–water found in natural underground rock formations called aquifers–is a vital natural resource with many uses. The extent of the Nation's ground water resources is enormous. At least 60% of the land area in the conterminous United States overlies aquifers. Usable ground water exists in every State.

Aquifers can range in size from thin surficial formations that yield small quantities of ground water to large systems such as the High Plains aquifer that underlies eight western States and provides water to millions. Although the Nation's ground water is of good quality, it is recognized that ground water is more vulnerable to contamination than previously reported and that an increasing number of pollution events and contamination sources are threatening the integrity of the resource.



Jeff Reynolds, Raleigh, NC

Ground Water Use

Nationally, 51% of the population relies to some extent on ground water as a source of drinking water. This percentage is even higher in rural areas where most residents rely on potable or treatable ground water as an economical source of drinking water. Eighty-one percent of community water systems are dependent on ground water. Seventy-four percent of community water systems are small ground water systems serving 3,300 people or less. Ninety-five percent of the approximately 200,000 noncommunity water systems (serving schools, parks, and other small facilities) are ground water systems.

Ground water provides drinking water for 51% of the population.

Irrigation accounts for approximately 63% of national ground water withdrawals. Public drinking water supplies account for approximately 19% of the Nation's total ground water withdrawals. Domestic, commercial, livestock, industrial, mining, and thermoelectric withdrawals together account for approximately 18% of national ground water withdrawals.

Ground Water Quality

Although the 1994 Section 305(b) State Water Quality Reports indicate that, overall, the Nation's ground water is of good quality, many local areas have experienced significant ground water contamination. The sources and types of ground water contamination vary depending upon the region of the country. Those most frequently reported by States include:

- **Leaking underground storage tanks.** Approximately 1.2 million federally regulated underground storage tanks are buried at over 500,000 sites nationwide. An estimated 139,000 tanks have leaked and impacted ground water quality.
- **Agricultural activities.** Seventy-seven percent of the 1.1 billion pounds of pesticides produced annually in the United States is applied to land in agricultural production, which often overlies aquifers.
- **Superfund sites.** More than 85% of all Superfund sites have some degree of ground water contamination. Most of these sites impact aquifers that are currently used, or potentially may be used, for drinking water purposes.
- **Septic tanks.** Approximately 23 million domestic septic tanks are in operation in the United States. These tanks impact ground water quality through the discharge of fluids into or above aquifers.

The most common contaminants associated with these sources include petroleum compounds, nitrates, metals, volatile organic compounds (VOCs), and pesticides.

States are reporting that ground water quality is most likely to be adversely affected by contamination

in areas of high demand or stress. To combat these problems, States are developing programs designed to evaluate the overall quality and vulnerability of their ground water resources, to identify potential threats to ground water quality, and to identify methods to protect their ground water resources. Thirty-three States indicate that they have implemented statewide ground water monitoring programs.

Ground water monitoring programs vary widely among the States, depending upon the special needs of each of the States. For example, some States choose to monitor ground water quality in specific areas that are especially vulnerable to contamination, whereas other States may choose to monitor ground water quality on a state-wide basis. When it comes to selecting chemicals to test for in the ground water, some States monitor for a large suite of chemicals, whereas other States limit monitoring to one or two specific chemicals that are a definite threat to ground water quality.

Ground water monitoring provides a great deal of information about the nature and quality of our Nation's ground water resources. Still, there is much we do not know about how human activities influence ground water quality. Our continued quest for information about the status of our ground water will help protect and preserve this vast and vulnerable resource. Through a greater understanding of how human activities influence ground water quality, we can better ensure the long-term availability of high-quality water for future generations.

Water Quality Protection Programs

Although significant strides have been made in reducing the impacts of discrete pollutant sources, our aquatic resources remain at risk from a combination of point sources and complex nonpoint sources, including air pollution. Since 1991, EPA has promoted the watershed protection approach as a holistic framework for addressing complex pollution problems.

The watershed protection approach is a place-based strategy that integrates water quality management activities within hydrologically defined drainage basins–watersheds–rather than areas defined by political boundaries. Thus, for a given watershed, the approach encompasses not only the water resource (such as a stream, lake, estuary, or ground water aquifer), but all the land from which water drains to the resource. To protect water resources, it is increasingly important to address the condition of land areas within the watershed because water carries the effects of human activities throughout the watershed as it drains off the land into surface waters or leaches into the ground water.

Mike Steuart, Minnesota Pollution Control Agency

Under the Watershed Protection Approach (WPA), a "watershed" is a hydrogeologic area defined for addressing water quality problems. For example, a WPA watershed may be a river basin, a county-sized watershed, or a small drinking water supply watershed.

EPA's Office of Water envisions the watershed protection approach as the primary mechanism for achieving clean water and healthy, sustainable ecosystems throughout the Nation. The watershed protection approach enables stakeholders to take a comprehensive look at ecosystem issues and tailor corrective actions to local concerns within the coordinated framework of a national water program. The emphasis on public participation also provides an opportunity to incorporate environmental justice issues into watershed restoration and protection solutions.

In May of 1994, the EPA Assistant Administrator for Water, Robert Perciasepe, created the Watershed Management Policy Committee to coordinate the EPA water program's support of the watershed protection approach. During 1995, EPA's water program managers, under the direction of the Watershed Management Policy Committee, evaluated their programs and identified additional activities needed to support the watershed protection approach in an action plan.

EPA's Office of Water will continue to promote and support the watershed protection approach at local, State, Tribal, Territorial, and Federal levels. The Office of Water recognizes that the watershed protection approach relies on active participation by local governments and citizens who have the most direct knowledge of local problems and opportunities in their watersheds. However, the Office of Water will look to the States, Tribes, and Territories to create the framework

for supporting local efforts because most EPA programs are implemented by the States, Tribes, and Territories.

The Clean Water Act

A number of laws provide the authority to develop and implement pollution control programs. The primary statute providing for water quality protection in the Nation's rivers, lakes, wetlands, estuaries, and coastal waters is the Federal Water Pollution Control Act of 1972, commonly known as the Clean Water Act.

The CWA and its amendments are the driving force behind many the water quality improvements we have witnessed in recent years. Key provisions of the CWA provide the following pollution control programs.

Water quality standards and criteria – States, Tribes, and other jurisdictions adopt EPA-approved standards for their waters that define water quality goals for individual waterbodies. Standards consist of designated beneficial uses to be made of the water, criteria to protect those uses, and antidegradation provisions to protect existing water quality.

Effluent guidelines – The EPA develops nationally consistent guidelines limiting pollutants in discharges from industrial facilities and municipal sewage treatment plants. These guidelines are then used in permits issued to dischargers under the

The Watershed Protection Approach (WPA)

Several key principles guide the watershed protection approach:

- **Place-based focus** – Resource management activities are directed within specific geographical areas, usually defined by watershed boundaries, areas overlying or recharging ground water, or a combination of both.
- **Stakeholder involvement and partnerships** – Watershed initiatives involve the people most likely to be affected by management decisions in the decision making process. Stakeholder participation ensures that the objectives of the watershed initiative will include economic stability and that the people who depend on the water resources in the watershed will participate in planning and implementation activities. Watershed initiatives also establish partnerships between Federal, State, and local agencies and nongovernmental organizations with interests in the watershed.
- **Environmental objectives** – The stakeholders and partners identify environmental objectives (such as "populations of striped bass will stabilize or increase") rather than programmatic objectives (such as "the State will eliminate the backlog of discharge permit renewals") to measure the success of the watershed initiative. The environmental objectives are based on the condition of the ecological resource and the needs of people in the watershed.
- **Problem identification and prioritization** – The stakeholders and partners use sound scientific data and methods to identify and prioritize the primary threats to human and ecosystem health within the watershed. Consistent with the Agency's mission, EPA views ecosystems as the interactions of complex communities that include people; thus, healthy ecosystems provide for the health and welfare of humans as well as other living things.
- **Integrated actions** – The stakeholders and partners take corrective actions in a comprehensive and integrated manner, evaluate success, and refine actions if necessary. The watershed protection approach coordinates activities conducted by numerous government agencies and nongovernmental organizations to maximize efficient use of limited resources.

National Pollutant Discharge Elimination System (NPDES) program. Additional controls may be required if receiving waters are still affected by water quality problems after permit limits are met.

Total Maximum Daily Loads – The development of Total Maximum Daily Loads, or TMDLs, establishes the link between water quality standards and point/nonpoint source pollution control actions such as permits or Best Management Practices (BMPs). A TMDL calculates allowable loadings from the contributing point and nonpoint sources to a given waterbody and provides the quantitative basis for pollution reduction necessary to meet water quality standards. States, Tribes, and other jurisdictions develop and implement TMDLs for high-priority impaired or threatened waterbodies.

Permits and enforcement – All industrial and municipal facilities that discharge wastewater must have an NPDES permit and are responsible for monitoring and reporting levels of pollutants in their discharges. EPA issues these permits or can delegate that permitting authority to qualifying States or other jurisdictions. The States, other qualified jurisdictions, and EPA inspect facilities to determine if their discharges comply with permit limits. If dischargers are not in compliance, enforcement action is taken.

Grants – The EPA provides States with financial assistance to help support many of their pollution control programs. These programs include the State Revolving Fund program for construction and upgrading of municipal sewage treatment plants; water quality monitoring, permitting, and enforcement; and developing and implementing nonpoint source pollution controls, combined sewer and stormwater controls, ground water strategies, lake assessment, protection, and restoration activities, estuary and near coastal management programs, and wetlands protection activities.

Nonpoint source control – The EPA provides program guidance, technical support, and funding to help the States, Tribes, and other jurisdictions control nonpoint source pollution. The States, Tribes, and other jurisdictions are responsible for analyzing the extent and severity of their nonpoint source pollution problems and developing and implementing needed water quality management actions.

The CWA also established pollution control and prevention programs for specific waterbody categories, such as the Clean Lakes Program. Other statutes that also guide the development of water quality protection programs include:

- **The Safe Drinking Water Act**, under which States establish standards for drinking water quality, monitor wells and local water supply systems, implement drinking water protection programs, and implement Underground Injection Control (UIC) programs.

- **The Resource Conservation and Recovery Act**, which establishes State and EPA programs for ground water and surface water protection and cleanup and emphasizes prevention of releases through management standards in addition to other waste management activities.

- **The Comprehensive Environmental Response, Compensation, and Liability Act (Superfund Program)**, which provides EPA with the authority to clean up contaminated waters during remediation at contaminated sites.

- **The Pollution Prevention Act** of 1990, which requires EPA to promote pollutant source reduction rather than focus on controlling pollutants after they enter the environment.

Protecting Lakes

Managing lake quality often requires a combination of in-lake restoration measures and pollution controls, including watershed management measures:

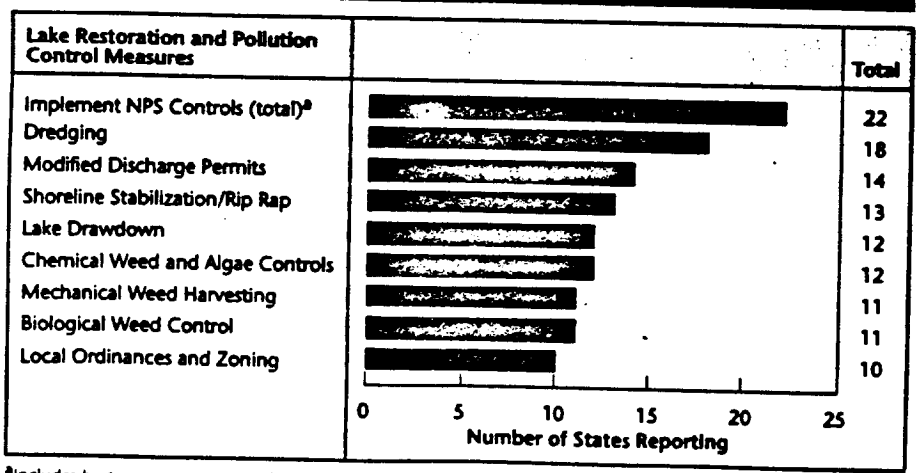
Restoration measures are implemented to reduce existing pollution problems. Examples of in-lake restoration measures include harvesting aquatic weeds, dredging sediment, and adding chemicals to precipitate nutrients out of the water column. Restoration measures focus on restoring uses of a lake and may not address the source of the pollution.

Pollution control measures deal with the sources of pollutants degrading lake water quality or threatening to impair lake water quality. Control measures include planning activities, regulatory actions, and implementation of BMPs to reduce nonpoint sources of pollutants.

During the 1980s, most States implemented chemical and mechanical in-lake restoration measures to control aquatic weeds and algae. In their 1994 Section 305(b) reports, the States and Tribes report a shift toward nonpoint source controls to reduce pollutant loads responsible for aquatic weed growth and algal blooms (Figure ES-18). Twenty-two States reported that they implemented best management practices to control nonpoint source pollution entering more than 171 lakes. The States reported that they implemented agricultural practices to control soil erosion, constructed retention and detention basins to control urban runoff, managed animal waste, revegetated shorelines, and constructed or restored wetlands to remove pollutants from runoff. Although the States reported that they still use in-lake treatments, the States recognize that source controls are needed in addition to in-lake treatments to restore lake water quality.

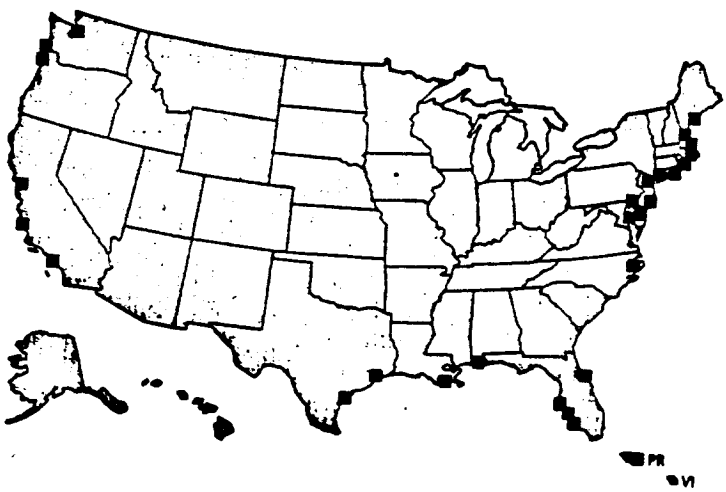
Successful lake programs require strong commitment from local citizens and cooperation from natural resource agencies at the local, State, and Federal levels.

Figure ES-18



[a]Includes best management practices, such as conservation tillage, sediment detention basins, vegetated buffers, and animal waste management.

Figure ES-19.. Locations of National Estuary Program Sites



The National Estuary Program

Section 320 of the Clean Water Act (as amended by the Water Quality Act of 1987) established the National Estuary Program (NEP) to protect and restore water quality and living resources in estuaries. The NEP adopts a geographic or watershed approach by planning and implementing pollution abatement activities for the estuary and its surrounding land area as a whole.

The NEP embodies the ecosystem approach by building coalitions, addressing multiple sources of contamination, pursuing habitat protection as a pollution control mechanism, and investigating cross-media transfer of pollutants from air and soil into specific estuarine waters. Under the NEP, a State governor nominates an estuary in his or her State for participation in the program. The State must demonstrate a likelihood of success in protecting candidate estuaries and provide evidence of institutional, financial, and political commitment to solving estuarine problems.

If an estuary meets the NEP guidelines, the EPA Administrator convenes a management conference of representatives from interested Federal, Regional, State, and local governments; affected industries; scientific and academic institutions; and citizen organizations. The management conference defines program goals and objectives, identifies problems, and designs strategies to control pollution and manage natural resources in the estuarine basin. Each management conference develops and initiates implementation of a Comprehensive Conservation and Management Plan (CCMP) to restore and protect the estuary.

The NEP currently supports 28 estuary projects.

The NEP integrates science and policy by bringing water quality managers, elected officials, and stakeholders together with scientists from government agencies, academic institutions, and the private sector. Because the NEP is not a research program, it relies heavily on past and ongoing research of other agencies and institutions to support development of CCMPs.

With the addition of seven estuary sites in July of 1995, the NEP currently supports 28 estuary projects (see Figure ES-19). These 28 estuaries are nationally significant in their economic value as well as in their ability to support living resources. The project sites also represent a broad range of environmental conditions in estuaries throughout the United States and its Territories so that the lessons learned through the NEP can be applied to other estuaries.

Shortly after coming into office, the Clinton Administration convened an interagency working group to address concerns with Federal wetlands policy. After hearing from States, developers, farmers, environmental interests, members of Congress, and scientists, the working group developed a comprehensive 40-point plan for wetlands protection to make wetlands programs more fair, flexible, and effective. This plan was issued on August 24, 1993.

The Administration's Wetlands Plan emphasizes improving Federal wetlands policy by

- Streamlining wetlands permitting programs
- Increasing cooperation with private landowners to protect and restore wetlands
- Basing wetlands protection on good science and sound judgment
- Increasing participation by States, Tribes, local governments, and the public in wetlands protection.

Protecting Wetlands

A variety of public and private programs protect wetlands. Section 404 of the CWA continues to provide the primary Federal vehicle for regulating certain activities in wetlands. Section 404 establishes a permit program for discharges of dredged or fill material into waters of the United States, including wetlands.

The U.S. Army Corps of Engineers (COE) and EPA jointly implement the Section 404 program. The COE is responsible for reviewing permit applications and making permit decisions. EPA establishes the environmental criteria for making permit decisions and has the authority to review and veto Section 404 permits proposed for issuance by the COE. EPA is also responsible for determining geographic jurisdiction of the Section 404 permit program, interpreting statutory exemptions, and overseeing Section 404 permit programs assumed by individual States. To date, only two States (Michigan and New Jersey) have assumed the Section 404 permit program from the COE. The COE and EPA share responsibility for enforcing Section 404 requirements.

The COE issues individual Section 404 permits for specific projects or general permits (Table ES-5). Applications for individual permits go through a review process that includes opportunities for EPA, other Federal agencies (such as the U.S. Fish and Wildlife Service and the National Marine Fisheries Service), State agencies, and the public to comment. However, the vast majority of activities proposed in wetlands are covered by Section 404 general permits. For example, in FY94, over 48,000 people applied to the COE for a Section 404 permit. Eighty-two percent of these applications were covered by general permits and were processed in an average of 16 days. It is estimated that another 50,000 activities are covered by general permits that do not require notification of the COE at all.

General permits allow the COE to permit certain activities without performing a separate individual

Table ES-5 Federal Section 404 Permits

General Permits (streamlined permit review procedures)				Individual Permits
Nationwide Permits	Regional Permits	Programmatic Permits		
		State Programmatic Permits	Others	
• Cover 36 types of activities that the COE determines to have minimal adverse impacts on the environment	• Developed by COE District Offices to cover activities in a specified region	• COE defers permit decisions to State agency while reserving authority to require an individual permit	• Special Management Agencies • Watershed Planning Commissions	• Required for major projects that have the potential to cause significant adverse impacts • Project must undergo interagency review • Opportunity for public comment • Opportunity for 401 certification review

permit review. Some general permits require notification of the COE before an activity begins. There are three types of general permits:

- Nationwide permits (NWPs) authorize specific activities across the entire Nation that the COE determines will have only minimal individual and cumulative impacts on the environment, including construction of minor road crossings and farm buildings, bank stabilization activities, and the filling of up to 10 acres of isolated or headwater wetlands.

- Regional permits authorize types of activities within a geographic area defined by a COE District Office.

- Programmatic general permits are issued to an entity that the COE determines may regulate activities within its jurisdictional wetlands. Under a programmatic general permit, the COE defers its permit decision to the regulating entity but reserves its authority to require an individual permit.

Currently, the COE and EPA are promoting the development of State programmatic general permits (SPGPs) to increase State involvement in wetlands protection and minimize duplicative State and Federal review of activities proposed in wetlands. Each SPGP is a unique arrangement developed by a State and the COE to take advantage of the strengths of the individual State wetlands program. Several States have adopted comprehensive SPGPs that replace many or all COE-issued nationwide general permits. SPGPs simplify the regulatory process and increase State control over their wetlands resources. Carefully developed SPGPs can improve wetlands protection while reducing regulatory demands on landowners.

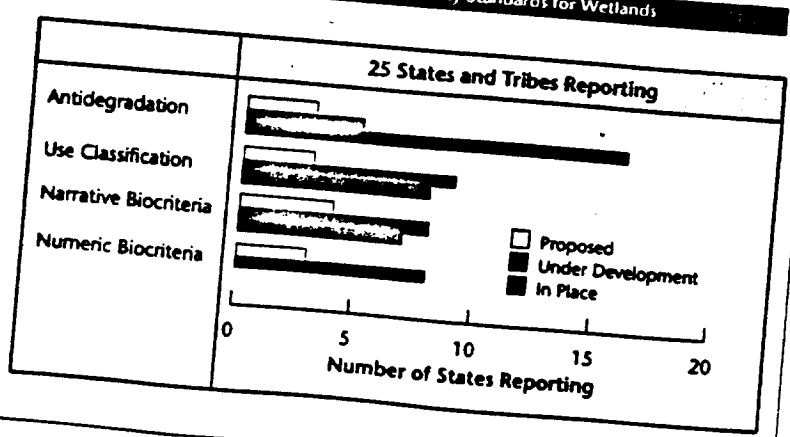
Water quality standards for wetlands ensure that the provisions of CWA Section 303 that apply to other surface waters are also applied to wetlands. In July 1990, EPA issued guidance to States for the development of wetlands water quality standards. Water quality standards consist of designated beneficial uses, numeric criteria, narrative criteria, and antidegradation statements. Figure ES-20 indicates the State's progress in developing these standards.

Standards provide the foundation for a broad range of water quality management activities under the CWA including, but not limited to, monitoring for the Section 305(b) report, permitting under Section 402 and 404, water quality certification under Section 401, and the control of nonpoint source pollution under Section 319.

States, Territories, and Tribes are well positioned between Federal and local government to take the lead in integrating and expanding wetlands protection and management programs. They are experienced in managing federally mandated environmental programs, and they are uniquely equipped to help resolve local and regional conflicts and identify the local economic and geographic factors that may influence wetlands protection.

Section 401 of the CWA gives States and eligible American Indian Tribes the authority to grant, condition, or deny certification of federally permitted or licensed activities that may result in a discharge to U.S. waters, including wetlands. Such activities include discharge of dredged or fill material permitted under CWA Section 404, point source discharges permitted under CWA Section 402, and Federal Energy Regulatory Commission's

Figure ES-20. Development of State Water Quality Standards for Wetlands



hydropower licenses. States review these permits to ensure that they meet State water quality standards.

Section 401 certification can be a powerful tool for protecting wetlands from unacceptable degradation or destruction especially when implemented in conjunction with wetlands-specific water quality standards. If a State or an eligible Tribe denies Section 401 certification, the Federal permitting or licensing agency cannot issue the permit or license.

Until recently, many States waived their right to review and certify Section 404 permits because these States had not defined water quality standards for wetlands or codified regulations for implementing their 401 certification program into State law. Now, most States report that they use the Section 401 certification process to review Section 404 projects and to require mitigation if there is no alternative to degradation of wetlands. Ideally, 401 certification should be used to augment State programs because activities that do not require Federal permits or licenses, such as some ground water withdrawals, are not covered.

State Wetlands Conservation Plans (SWCPs) are strategies that integrate regulatory and cooperative approaches to achieve State wetlands management goals, such as no overall net loss of wetlands. SWCPs are not meant to create a new level of bureaucracy. Instead, SWCPs improve government and private-sector effectiveness and efficiency by identifying gaps in wetlands protection programs and identifying opportunities to improve wetlands programs.

States, Tribes, and other jurisdictions protect their wetlands with a variety of other approaches, including permitting programs, coastal management programs, wetlands acquisition programs, natural heritage programs, and integration with other programs. The following trends emerged from individual State and Tribal reporting:

- Most States have defined wetlands as waters of the State, which offers general protection through antidegradation clauses and designated uses that apply to all waters of a State. However, most States have not developed specific wetlands water quality standards and designated uses that protect wetlands' unique functions, such as flood attenuation and filtration.
- Without specific wetlands uses and standards, the Section 401 certification process relies heavily on antidegradation clauses to prevent significant degradation of wetlands.
- In many cases, the States use the Section 401 certification process to add conditions to Section 404 permits that minimize the size of wetlands destroyed or degraded by proposed activities to the extent practicable. States often add conditions that require compensatory mitigation for destroyed wetlands, but the States do not have the resources to perform enforcement inspections or followup monitoring to ensure that the wetlands are constructed and functioning properly.
- More States are monitoring selected, largely unimpacted wetlands to establish baseline conditions in healthy wetlands. The States will use this information to monitor the relative performance of constructed wetlands and to help establish biocriteria and water quality standards for wetlands.

Although the States, Tribes, and other jurisdictions report that they are making progress in protecting wetlands, they also report that the pressure to develop or destroy wetlands remains high. EPA and the States, Tribes, and other jurisdictions will continue to pursue new mechanisms for protecting wetlands that rely less on regulatory tools.

Protecting the Great Lakes

Restoring and protecting the Great Lakes requires cooperation from numerous organizations because the pollutants that enter the Great Lakes originate in both the United States and Canada, as well as in other countries. The International Joint Commission (IJC), established by the 1909 Boundary Waters Treaty, provides a framework for the cooperative management of the Great Lakes. Representatives from the United States and Canada, the Province of Ontario, and the eight States bordering the Lakes sit on the IJC's Water Quality Board. The Water Quality Board recommends actions for protecting and restoring the Great Lakes and evaluates the environmental policies and actions implemented by the United States and Canada.

The EPA Great Lakes National Program Office (GLNPO) coordinates Great Lakes management

activities conducted by all levels of government within the United States. The GLNPO also works with nongovernmental organizations to protect and restore the Lakes. The GLNPO provides leadership through its annual *Great Lakes Program Priorities and Funding Guidance*. The GLNPO also serves as a liaison to the Canadian members of the IJC and the Canadian environmental agencies.

The 1978 Great Lakes Water Quality Agreement (as amended in 1987) lay the foundation for ongoing efforts to restore and protect the Great Lakes. The Agreement committed the United States and Canada to developing Remedial Action Plans (RAPs) for Areas of Concern and Lakewide Management Plans (LaMPs) for each Lake. Areas of Concern are specially designated waterbodies around the Great Lakes that show symptoms of serious water quality degradation. Most of the 42 Areas of Concern are located in harbors, bays, or river mouths entering the Great Lakes. RAPs identify impaired uses and examine management options for addressing degradation in an Area of Concern. LaMPs use an ecosystem approach to examine water quality issues that have more widespread impacts within each Great Lake. Public involvement is a critical component of both LaMP development and RAP development.

EPA advocates pollution prevention as the most effective approach for achieving the virtual elimination of persistent toxic discharges into the Great Lakes. The GLNPO has funded numerous pollution prevention grants throughout the Great

Julie Fountain, Youngsville, NC

Lakes Basin during the past 3 years. EPA and the States also implemented the 33/50 Program in the Great Lakes Basin, under which EPA received voluntary commitments from industry to reduce the emission of 17 priority pollutants by 50% by the end of 1995. In addition, EPA, the States, and Canada are implementing a virtual elimination initiative for Lake Superior. The first phase of the initiative seeks to eliminate new contributions of mercury.

The Great Lakes Water Quality Initiative is a key element of the environmental protection efforts undertaken by the United States in the Great Lakes Basin. The purpose of the Initiative is to provide a consistent level of protection in the Basin from the effects of toxic pollutants. In 1989, the Initiative was organized by EPA at the request of the Great Lakes States to promote consistency in their environmental programs in the Great Lakes Basin with minimum requirements.

Initiative efforts were well under way when Congress enacted the Great Lakes Critical Programs Act of 1990. The Act requires EPA to publish proposed and final water quality guidance that specifies minimum water quality criteria for the Great Lakes System. The Act also requires the Great Lakes States to adopt provisions that are consistent with the EPA final guidance within 2 years of EPA's publication. In addition, Indian Tribes authorized to administer an NPDES program in the Great Lakes Basin must also adopt provisions consistent with EPA's final guidance.

To carry out the Act, EPA proposed regulations for implementing the guidance on April 16, 1993, and invited the public to comment. The States and EPA conducted public meetings in all of the Great Lakes States during the comment period. As a result, EPA received over 26,500 pages of comments from over 6,000 commenters. EPA reviewed all of the comments and published the final guidance in March of 1995.

The final guidance prioritizes control of long-lasting pollutants that accumulate in the food web—bioaccumulative chemicals of concern (BCCs). The final guidance includes provisions to phase out mixing zones for BCCs (except in limited circumstances), more extensive data requirements to ensure that BCCs are not underregulated due to a lack of data, and water quality criteria to protect wildlife that feed on aquatic prey.

Publication of the final guidance is a milestone in EPA's move toward increasing stakeholder participation in the development of innovative and comprehensive programs for protecting and restoring our natural resources.

The Chesapeake Bay Program

In many areas of the Chesapeake Bay, the quality is not sufficient to support living resources year round. In the warmer months, large portions of the Bay contain little or no dissolved oxygen. Low oxygen conditions may cause fish eggs and larvae to die. The growth and reproduction of oysters, clams, and other bottom-dwelling animals are impaired. Adult fish find their habitat reduced and their feeding inhibited.

Many areas of the Bay also have cloudy water from excess sediment in the water or an overgrowth of algae (stimulated by excessive nutrients in the water). Turbid waters block the sunlight needed to support the growth and survival of Bay grasses, also known as submerged aquatic vegetation (SAV). Without SAV, critical habitat for fish and crabs is lost. Although there has been a recent resurgence of SAV in some areas of the Bay, most areas still do not support abundant populations as they once did.

The main causes of the Bay's poor water quality and aquatic habitat loss are elevated levels of the nutrients nitrogen and phosphorus. Both are natural fertilizers found in animal wastes, soil, and the atmosphere. These nutrients have always existed in the Bay, but not at the present elevated concentrations. When the Bay was surrounded primarily by forests and wetlands, very little nitrogen and phosphorus ran off the land into the water. Most of it was absorbed or held in place by the natural vegetation. As the use of the land has changed and the watershed's population has grown, the amount of nutrients entering the Bay has increased tremendously.

Now in its twelfth year, the Chesapeake Bay Program is a regional partnership of Federal, State, and local participants that has directed and coordinated restoration of the Bay since the signing of the historic 1983 Chesapeake Bay Agreement. Maryland, Pennsylvania, Virginia, the District of Columbia, the Chesapeake Bay Commission, EPA, and advisory groups form the partnership. The Chesapeake Executive Council provides leadership for the Bay Program and establishes program policies to restore and protect the Bay and its living resources. The Council consists of the governors of Maryland, Virginia, and Pennsylvania, the mayor of the District of Columbia, the administrator of EPA, and the chairperson of the Chesapeake Bay Commission.

Considered a national and international model for estuarine restoration and protection programs, the Chesapeake Bay Program is still a "work in progress." Since 1983, milestones in the evolution of the program include the 1987 Chesapeake Bay Agreement and the 1992 amendments to the Agreement. The 1987 Agreement set a goal to reduce the quantity of nutrients entering the Bay by 40% by the year 2000. In the 1992 amendments to the Agreement, the partners reaffirmed the 40% nutrient reduction goal, agreed to cap nutrient loadings beyond the year 2000, and agreed to attack nutrients at their source by applying the 40% reduction goal to the 10 major tributaries of the Bay. The amendments also stressed managing the Bay as a whole ecosystem. The amendments also spell out the importance of reducing atmospheric sources of nutrients and broadening regional interstate cooperation.

Protection and restoration of forests is a critical component of the Chesapeake Bay Program because scientific data clearly show that forests are the most beneficial land cover for maintaining clean water, especially forests alongside waterbodies in the riparian zone. Through the Chesapeake Bay Program, unique partnerships have been formed among the Bay region's forestry agencies, forest managers, and interested citizen groups. Since 1990, the U.S. Forest Service has assigned a Forestry Program Coordinator to the Chesapeake Bay Program to assist both the EPA and Bay Program committees in developing strategies and projects that will contribute to the Bay restoration goals. A Forestry Work Group, formed under the Nonpoint Source Subcommittee, raises and addresses issues related to forests and the practice of forestry in the watershed.

In addition, State foresters and local governments have developed and implemented numerous programs and projects aimed at the protection and restoration of forests.

Forestry incentive programs in all of the Bay States have resulted in the planting of millions of trees, the restoration of nearly 50 miles of riparian forest, the development of stewardship plans, and forest enhancement projects on thousands of acres within the Bay watershed.

On the positive side, the extent of Bay grasses has increased by 75% since 1978. The current extent of SAV attains 64% of the goal established by the Chesapeake Bay Program. Striped bass, or rockfish, have made a remarkable recovery over the past decade due to improved reproduction and better control of the harvest. There has been a modest increase in the number of American shad returning to the Bay to spawn. Controls on the harvest of American shad, creation of fish passages at blockages, stocking programs, and habitat restoration are expected to yield increases in the American shad population and similar fish species that inhabit the Bay during part of their life cycle.

Phosphorus levels continue to decline and, after many years of increasing nitrogen concentrations, most of the Bay's tributaries are showing a leveling off of this trend. Some tributaries are showing declining trends in nitrogen concentrations. These trends indicate that both point and nonpoint source pollution abatement programs are working.

Despite the promising trends in nutrient concentrations, oxygen concentrations are still low enough to cause severe impacts or stressful conditions in the mainstem of the Bay and several larger tributaries. Prospects for the Bay's oyster populations remain poor. Overharvesting, habitat loss, and disease have severely depleted oyster stocks. New management efforts have been developed to improve this situation.

Chesapeake Bay Foundation, Richmond, VA

The blue crab is currently the most important commercial and recreational fishery in the Bay. There is growing concern about the health of the blue crab population due to increasing harvesting pressures and relatively low harvests in recent years. Both Maryland and Virginia have recently implemented new regulations on commercial and recreational crabbers to protect this important resource.

Overall, the Chesapeake Bay still shows symptoms of stress from an expanding population and changes in land use. However, conditions in the Chesapeake Bay have improved since the Chesapeake Bay Program was launched, and continuation of the Program promises an even brighter future for the Bay.

The Gulf of Mexico Program

The Gulf of Mexico Program (GMP) was established in 1988 with EPA as the lead Federal agency in response to signs of long-term environmental damage throughout the Gulf's coastal and marine ecosystem. The main purpose of the GMP is to develop and help implement a strategy to protect, restore, and maintain the health and productivity of the Gulf. The GMP is a grass roots program that serves as a catalyst to promote sharing of information, pooling of resources, and coordination of efforts to restore and reclaim wetlands and wildlife habitat, clean up existing pollution, and prevent future contamination and destruction of the Gulf. The GMP mobilizes State, Federal, and local government; business and industry; academia; and the community at

large through public awareness and information dissemination programs, forum discussions, citizen committees, and technology applications.

A Policy Review Board and the Management Committee determine the scope and focus of GMP activities. The program also receives input from a Technical Advisory Committee and a Citizen's Advisory Committee. The GMP Office, eight technical issue committees, and the operations and support committees coordinate the collection, integration, and reporting of pertinent data and information. The issue committees are composed of individuals from Federal, State, and local agencies and from industry, science, education, business, citizen groups, and private organizations.

The issue committees are responsible for documenting environmental problems and management goals, available resources, and potential solutions for a broad range of issues, including habitat degradation, public health, freshwater inflow, marine debris, shoreline erosion, nutrient enrichment, toxic pollutants, and living aquatic resources. The issue committees publish their findings in Action Agendas.

On December 10, 1992, the Governors of Alabama, Florida, Louisiana, Mississippi, and Texas; EPA; the Chair of the Citizen's Advisory Committee; and representatives of 10 other Federal agencies signed the Gulf of Mexico Program Partnership for Action agreement for protecting, restoring, and enhancing the Gulf of Mexico and adjacent lands. The agreement committed the signatory agencies to pledge their efforts, over 5 years, to obtain the knowledge and resources to:

- Significantly reduce the rate of loss of coastal wetlands
- Achieve an increase in Gulf Coast seagrass beds
- Enhance the sustainability of Gulf commercial and recreational fisheries
- Protect human health and food supply by reducing input of nutrients, toxic substances, and pathogens to the Gulf
- Increase Gulf shellfish beds available for safe harvesting by 10%
- Ensure that all Gulf beaches are safe for swimming and recreational uses
- Reduce by at least 10% the amount of trash on beaches
- Improve and expand coastal habitats that support migratory birds, fish, and other living resources
- Expand public education/outreach tailored for each Gulf Coast county or parish
- Reduce critical coastal and shoreline erosion.

Beginning in 1992, the GMP also launched Take-Action Projects in each of the five Gulf States to demonstrate that program strategies and methods could achieve rapid results. The Take-Action Projects primarily address inadequate sewage treatment, pollution prevention, and habitat protection and restoration. Several projects aim to demonstrate the effectiveness of innovative sewage treatment technologies to control pathogenic contamination of shellfish harvesting areas. Other projects aim to restore wetlands, sea grass beds, and oyster reefs. The Take-Action Projects are designed to have Gulf-wide application.

Take-Action Projects in the five Gulf States primarily address sewage treatment, pollution prevention, and habitat protection and restoration.

Since 1992, EPA has streamlined and restructured its management scheme for the GMP to increase Regional involvement and better meet the needs of the 5-year environmental challenges. The GMP has also expanded efforts to integrate Mexico and the Caribbean Islands into management of the Gulf. These activities include technology transfer and development of international agreements that prohibit the discharge of ship-generated wastes and plastics into waters of the Gulf and Caribbean Sea.

Jeff Reynolds, Raleigh, NC

Ground Water Protection Programs

The sage adage that "An ounce of prevention is worth a pound of cure" is being borne out in the field of ground water protection. Studies evaluating the cost of prevention versus the cost of cleaning up contaminated ground water have found that there are real cost advantages to promoting protection of our Nation's ground water resources.

Numerous laws, regulations, and programs play a vital role in protecting ground water. The following Federal laws and programs enable, or provide incentives for, EPA and/or States to regulate or voluntarily manage and monitor sources of ground water pollution:

- The Resource Conservation and Recovery Act (RCRA) addresses the problem of safe disposal of the huge volumes of solid and hazardous waste generated nationwide each year. RCRA is part of EPA's comprehensive program to protect ground water resources through the development of regulations and methods for handling, storing, and disposing of hazardous material and through the regulation of underground storage tanks—the most frequently cited source of ground water contamination.

- The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) regulates the restoration of contaminated ground water at abandoned hazardous waste sites.

- The Safe Drinking Water Act (SDWA) regulates subsurface injection of fluids that can contaminate ground water.

- The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) controls the use and disposal of pesticides, some of which have been detected in ground water wells in rural communities.

- The Toxic Substances Control Act (TSCA) controls the use and disposal of additional toxic substances, thereby minimizing their entry into ground water. Other Federal laws establish State grants that may be used to protect ground water.

- Clean Water Act Sections 319(h) and (i) and 518 provide funds to State agencies to implement EPA-approved nonpoint source

Comprehensive State Ground Water Protection Programs

A Comprehensive State Ground Water Protection Program (CSGWPP) is composed of six "strategic activities." They are:

- Establishing a prevention-oriented goal
- Establishing priorities, based on the characterization of the resource and identification of sources of contamination
- Defining roles, responsibilities, resources, and coordinating mechanisms
- Implementing all necessary efforts to accomplish the State's ground water protection goal
- Coordinating information collection and management to measure progress and reevaluate priorities
- Improving public education and participation.

management programs that include ground water protection activities. Several States have developed programs that focus on ground water contamination resulting from agriculture and septic tanks.

- The Pollution Prevention Act of 1990 allows grants for research projects to demonstrate agricultural practices that emphasize ground water protection and reduce the excessive use of fertilizers and pesticides.

Comprehensive State Ground Water Protection Programs (CSGWPPs) attempt to combine all of the above efforts and emphasize contamination prevention.

Bruce P. Henningsgaard, Minnesota Pollution Control Agency

Comprehensive State ground water protection programs support State-directed priorities in resource protection.

CSGWPPs improve coordination of Federal, State, Tribal, and local ground water programs and enable distribution of resources to established priorities.

Another means of protecting our Nation's ground water resources is through the implementation of Wellhead Protection Plans. EPA's Office of Ground Water and Drinking Water is supporting the development and implementation of Wellhead Protection Plans at the local level through many efforts. For example, EPA-funded support is provided through the National Rural Water Association Ground Water/Wellhead Protection programs. At the conclusion of the first 4 years of this program, over 2,000 communities in 26 States were actively involved in protecting their water supplies by implementing wellhead protection programs. These 2,000 communities represent almost 4 million people in the rural areas of the United States who will have better-protected water supplies.

Recognizing the importance and cost-effectiveness of protecting our Nation's ground water resources, States are participating in numerous activities to prevent future impairments of the resource. These activities include enacting legislation aimed at the development of comprehensive State ground water protection programs and promulgating protection regulations. More than 80% of the States indicate that they have current or pending legislation geared specifically to ground water protection. Generally, State legislation focuses on the need for program development, increased data collection, and public education programs. In addition, States also may mandate strict technical controls such as discharge permits, underground storage tank registrations, and protection standards.

All of these programs are intended to provide protection to a valuable, and often vulnerable, resource. Through the promotion of ground water protection on both State and Federal levels, our Nation's ground water resources will be safeguarded against contamination, thereby protecting human health and the environment.

What You Can Do

Federal and State programs have helped clean up many waters and slow the degradation of others. But government alone cannot solve the entire problem, and water quality concerns persist. Nonpoint source pollution, in particular, is everybody's problem, and everybody needs to solve it.

Examine your everyday activities and think about how you are contributing to the pollution problem. Here are some suggestions on how you can make a difference.

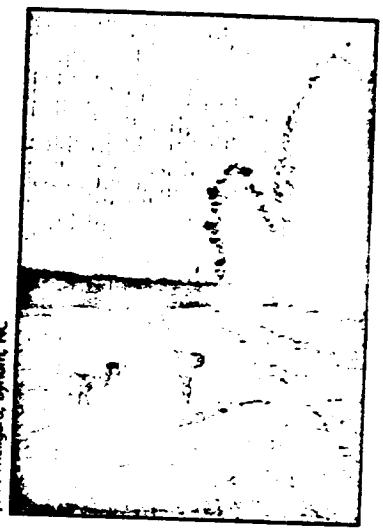
Be Informed

You should learn about water quality issues that affect the communities in which you live and work. Become familiar with your local water resources. Where does your drinking water come from? What activities in your area might affect the water you drink or the rivers, lakes, beaches, or wetlands you use for recreation?

Learn about procedures for disposing of harmful household wastes so they do not end up in sewage treatment plants that cannot handle them or in landfills not designed to receive hazardous materials.

Be Responsible

In your yard, determine whether additional nutrients are needed before you apply fertilizers, and look for alternatives where fertilizers might run off into surface waters. Consider selecting plants and grasses that have low maintenance requirements. Water your lawn conservatively. Preserve existing trees and plant new trees



John Thelgard, Bynum, NC

and shrubs to help prevent erosion and promote infiltration of water into the soil. Restore bare patches in your lawn to prevent erosion. If you own or manage land through which a stream flows, you may wish to consult your local county extension office about methods of restoring stream banks in your area by planting buffer strips of native vegetation.

Around your house, keep litter, pet waste, leaves, and grass clippings out of gutters and storm drains. Use the minimum amount of water needed when you wash your car. Never dispose of any household, automotive, or gardening wastes in a storm drain. Keep your septic tank in good working order.

Within your home, fix any dripping faucets or leaky pipes and install water-saving devices in shower heads and toilets. Always follow directions on labels for use and disposal of household chemicals. Take used motor oil, paints, and other hazardous household materials to proper disposal sites such as approved service stations or designated landfills.

Be Involved

As a citizen and a voter there is much you can do at the community level to help preserve and protect our Nation's water resources. Look around. Is soil erosion being controlled at construction sites? Is the community sewage plant being operated efficiently and correctly? Is the community trash dump in or along a stream? Is road deicing salt being stored properly?

Become involved in your community election processes. Listen and respond to candidates' views on water quality and environmental issues. Many communities have recycling programs; find out about them, learn how to recycle, and volunteer to help out if you can. One of the most important things you can do is find out how your community protects water quality, and speak out if you see problems.

Volunteer Monitoring: You Can Become Part of the Solution

In many areas of the country, citizens are becoming personally involved in monitoring the quality of our Nation's water. As a volunteer monitor, you might be involved in taking ongoing water quality measurements, tracking the progress of protection and restoration projects, or reporting special events, such as fish kills and storm damage.

Volunteer monitoring can be of great benefit to State and local governments. Some States stretch their monitoring budgets by using data collected by volunteers, particularly in remote areas that otherwise might not be monitored at all. Because you are familiar with the water resources in your own neighborhood, you are also more likely to spot unusual occurrences such as fish kills.

The benefits to you of becoming a volunteer are also great. You will learn about your local water resources and have the opportunity to become personally involved in a nationwide campaign to protect a vital, and mutually shared, resource. If you would like to find out more about organizing or joining volunteer monitoring programs in your State, contact your State department of environmental quality, or write to:

Alice Mayio

Fish Consumption Advisories

States issue fish consumption advisories to protect the public from ingesting harmful quantities of toxic pollutants in contaminated fish and shellfish. Fish may accumulate dangerous quantities of pollutants in their tissues by ingesting many smaller organisms, each contaminated with a small quantity of pollutant. This process is called bioaccumulation or biomagnification. Pollutants also enter fish and shellfish tissues through the gills or skin.

Fish consumption advisories recommend that the public limit the quantity and frequency of consumption of fish caught in specific waterbodies. The States tailor individual advisories to minimize health risks based on contaminant data collected in their fish tissue sampling programs. Advisories may completely ban fish consumption in severely polluted waters, or limit fish consumption to several meals per month or year in cases of less severe contamination. Advisories may target a subpopulation at risk (such as children, pregnant women, and nursing mothers), specific fish species, or larger fish that may have accumulated high concentrations of a pollutant over a longer lifetime than a smaller, younger fish.

The EPA fish consumption advisory database tracks advisories issued by each State. For 1994, the database listed 1,531 fish consumption advisories in effect in 49 States. Fish consumption advisories are unevenly distributed among the States because the States use their own criteria to determine if fish tissue concentrations of toxics pose a health risk that justifies an advisory. States also vary the amount of fish tissue monitoring they conduct and the number of pollutants analyzed. States that conduct more monitoring and use strict criteria will issue more advisories than States that conduct less monitoring and use weaker criteria. For example, 62% of the advisories active in 1994 were issued by the States surrounding the Great Lakes, which support extensive fish sampling programs and follow strict criteria for issuing advisories.

Chesapeake Bay Foundation, Richmond, VA

Most of the fish consumption advisories (73%) are due to mercury. The other pollutants most commonly detected in elevated concentrations in fish tissue samples are polychlorinated biphenyls (PCBs), chlordane, dioxins, and DDT (with its byproducts).

Many coastal States report restrictions on shellfish harvesting in estuarine waters. Shellfish–particularly oysters, clams, and mussels–are filter-feeders that extract their food from water. Waterborne bacteria and viruses may also accumulate on their gills and mantles and in their digestive systems. Shellfish contaminated by these microorganisms are a serious human health concern, particularly if consumed raw.

States currently sample water from shellfish harvesting areas to measure indicator bacteria, such as total coliform and fecal coliform bacteria. These bacteria serve as indicators of the presence of potentially pathogenic microorganisms associated with untreated or undertreated sewage. States restrict shellfish harvesting to areas that maintain these bacteria at concentrations in sea water below established health limits.

In 1994, 15 States reported that shellfish harvesting restrictions were in effect for more than 6,052 square miles of estuarine and coastal waters during the 1992-1994 reporting period. Six States reported that urban runoff and storm sewers, municipal wastewater treatment facilities, nonpoint sources, marinas, industrial discharges, CSOs, and septic tanks restricted shellfish harvesting.

Jorge A. León, Senior Staff Counsel

From : STATE WATER RESOURCES CONTROL BOARD

Subject: Legal Issues Raised in Draft Storm Water WDRs/NPDES Permit for LA County, et al.

You have asked for responses to questions raised by the Principal Permittee, CoPermittees, and parties during the development of the current draft of Waste Discharge Requirements/NPDES Permit ("Permit") for LA County and the CoPermittee Cities. Below, I have paraphrased the comments raising each issue, followed by my evaluation of the issue.

1. Under the terms of the current draft, the Executive Advisory Committee ("EAC")could be held legally responsible for compliance with the provisions of the permit.

The previous draft provided that the EAC would implement certain permit requirements. As we discussed previously, the current (December 18, 1995) draft is revised to clarify that the EAC provides direction to the County and the Cities, who are the actual dischargers under the permit. The Regional Board's authority is limited to requiring implementation of the permit by the County and the Cities, as permittees. The EAC members themselves, in their role as members of the EAC, are neither permittees nor dischargers. As such, they cannot personally or as a group be required to do anything under the permit. The legal responsibility for implementation of the permit requirements remains with the County and the Cities. In my view, the individual EAC members are liable only to their respective employers or constituent groups. No new liability is created as a result of serving on the EAC.

2. The draft permit unjustifiably imposes an unnecessary burden by requiring that the cities conduct inspections of industrial/commercial facilities and to determine whether an NOI has been submitted to the State Board, whether a SWPPP is available on-site, and to notify the Regional Board staff of

VOL 23

0966

noncompliance with these and any other requirements as determined appropriate by the Permittee.

This provision is not intended to unreasonably burden Permittees. Rather, the Regional Board staff seeks cooperation of the Permittees in identifying and reporting to the Regional Board staff those facilities that may need additional assistance in complying with storm water requirements. The intent is that -- as part of the inspection and enforcement process which the Permittees are already required to implement pursuant to guidelines issued pursuant to CWA Section 402(p) -- inspection staff merely make additional notes and share appropriate information with the Regional Board staff.

3. The draft permit exceeds State and Federal requirements for storm water programs. Required programs should be limited to those required under the Clean Water Act.

The State of California has been given delegated authority to implement the NPDES Program. The stormwater program is a component of the NPDES Program. Under its own terms, the Clean Water Act sets "bottom line" standards. State law and policy, however, may require more stringent requirements as necessary to implement State Plans. Furthermore, Regional Boards within the State may require more specific requirements as necessary to implement regional water quality control plans. The federal law acknowledges that by accepting delegated authority, the states do not relinquish the ability to impose more stringent requirements than provided pursuant to the Clean Water Act. (CWA Section 510, at 33 USC Section 1370; 40 CFR, Part 123.25.)

The Regional Board staff has endeavored to minimize the burden on the dischargers, and believes that the requirements set forth in the current draft are not in excess of the CWA standards, but rather, are consistent with its requirements. To the extent that such requirements, in fact, exceed federal requirements, as noted above, under State authority, the Regional Board is authorized to adopt requirements that are more stringent.

4. The NRDC and other entities should be required to participate in the Administrative Review process to resolve differences and be bound by the results.

To the extent that the NRDC and other nondischarging observers agree to be so bound, they are free to negotiate a document memorializing that agreement with the dischargers. However, the Regional Board does not possess any authority over nondischarging entities. The Regional Board's authority in issuing the permit is limited to controlling the conduct of dischargers which affects water quality. It does not extend to the conduct of nondischargers. Thus, the Regional Board cannot require that the NRDC or other be bound by the Administrative Review process.

5. Who determines what is the "maximum extent practicable?"

It is up to the Principal Permittee and the CoPermittees to determine initially what actions implement best management practices to reduce pollutants to the maximum extent practicable. The Regional Board will evaluate the proposed programs using appropriate guidance. At present, the most applicable guidance is the Court's decision in NRDC, et al. v. California Department of Transportation, Federal District Court, Central District of California (1994) which provides that a permittee must evaluate and implement best management practices, except where (1) other effective BMPs will achieve greater or substantially similar pollution control benefits; (2) the BMP is not technically feasible; or (3) the cost of BMP implementation greatly outweighs the pollution control benefits.

6. Why are non-storm water discharges exempted from the permit provisions?

Federal regulations promulgated pursuant to CWA Section 402(p) require permittees to "effectively prohibit" all non-storm water discharges to the MS4 except those that have been issued a separate NPDES permit. However, the regulations do not require Permittees to prohibit non-storm water discharges listed under "Exempted Discharges." In order to assist the permittees, the Regional Board staff have included a second category, "Conditionally Exempted Discharges," which Permittees need not prohibit unless information becomes available in the future to indicate that these discharges are sources of pollutants to receiving waters. A "Procedures for Exemption" has been included to allow for the possibility of expanding the list of exempt non-storm water discharges in the future, if permittees deem it necessary.

7. The legal authority requirements are unclear.

The current draft attempts to clarify the requirements. In summary, each permittee must demonstrate to the Regional Board that it possesses the legal authority to implement the required actions provided in 40 CFR 122.26(d)(2)(i)A-F. The Regional Board staff requests that each permittee's municipal attorney provide a statement that he/she has reviewed the City's ordinances and has determined that they provide the necessary authority. If the permittee does not currently have an effective ordinance(s) that provides the required authority, it must provide a schedule setting forth when it will adopt or amend its ordinances to provide the necessary authority.

Once each permittee has so demonstrated, it is required to enforce those ordinances to the extent required to effectively control discharges to and from those portions of the MS4 over which it has jurisdiction, as required by the permit. This is

not to say that it must uncover every violation, regardless of the seriousness, and to seek the maximum punishment in every case. Rather, the responsibility is to demonstrate a good faith effort toward controlling discharges.

8. The stated goals of the Countywide Guidelines would unrealistically and unlawfully target new development to improve existing conditions, rather than preventing water pollution by storm water discharges.

The current draft has been modified to clarify that the requirement is to preserve -- rather than create -- existing beneficial uses. As a practical matter, the opportunities to control pollutants in storm water from land development occur during the following three stages: (1) the siting and design phase, (2) the construction phase, and (3) the post-development phase. The Countywide guidelines in the draft permit promote consideration of water quality protection and pollution prevention strategies during the siting and design phase of development. After development occurs, these options may no longer be practicable or cost-effective. As such, the guidelines are consistent with the requirements of CZARA and CWA.

9. The Regional Board does not have authority to adopt wastershed management plans that effectively preempt local land use control.

It is not the intent to preempt local land use control. Rather, the intent has been to facilitate smooth implementation of applicable provisions of the CWA and the Coastal Zone Act Reauthorization Amendments ("CZARA"). Under CZARA, management measures have been prescribed by the U.S. EPA and National Oceanic and Atmospheric Administration ("NOAA") applicable to construction activity regardless of land size.

10. The Clean Water Act does not regulate "parking lot pollution."

Recent studies have confirmed that facilities connected with automobiles, including parking lots, are a significant source of pollutants. While the CWA does not explicitly require control of parking lots, it does require pollutant control from all significant sources. The permit seeks to address the need to implement BMPs to control pollution from parking lots.

If you have comments or questions, please contact me at (916) 657-2428.

COMPARISON OF LOS ANGELES COUNTY DRAFT STORM WATER PERMIT WITH SIMILAR PERMITS IN ORANGE AND SANTA CLARA COUNTIES EPA, Region 9

The California Regional Water Quality Control Boards (RWQCBs) are in the process of reissuing the "early" municipal storm water permits which were originally issued in 1990. The permits are considered "early" because they were issued prior to the final EPA storm water regulations of November, 1990. "Early" permit were issued in San Diego, Orange, Riverside, San Bernardino, Los Angeles, Santa Clara and Sacramento Counties. Final permits have now been reissued for Santa Clara, Orange, Riverside and San Bernardino Counties. Draft permits have been prepared for Los Angeles, San Diego and Sacramento Counties.

Los Angeles County and many of its 86 co-permittees have argued that the draft permit which has been prepared by the Los Angeles RWQCB is too detailed and contains excessive requirements. To evaluate this claim, EPA, Region 9 has prepared this comparison of the more controversial requirements of the Los Angeles County permit with the corresponding requirements of the Santa Clara County and Orange County permits. The Santa Clara County program is an outstanding program and was the winner of EPA's 1993 national award for excellence in storm water quality management. The Orange County program would be considered at least a representative, if not above average program.

Table 1 summarizes the principal requirements of concern in the Los Angeles County permit in comparison with the permits for Santa Clara County and Orange County. Appendix 1 discusses these requirements in more detail. Appendix 2 highlights principal areas where the Los Angeles County permit appears to be more stringent or more detailed than one or the other of the Santa Clara County or Orange County permits. The differences do not seem to be especially significant in most cases, however.

It should also be noted that the Los Angeles County permit does not reference the storm water program proposals in the permit applications as is done for the permits for Santa Clara County and Orange County. The Los Angeles RWQCB found the Los Angeles County permit application deficient in many respects and elected to write all the requirements into the permit. This factor contributes substantially to the length and detail of the Los Angeles County permit as compared to the other two permits.

TABLE 1 - SUMMARY PERMIT COMPARISON

Permit Requirements	Los Angeles	Santa Clara	Orange County
Receiving Water Limitations	Compliance Via BMPs	Compliance Via BMPs	Compliance Via BMPs[1]
Program Management	Implement Permittee Proposal[2]	Implement Permittee Proposal	Implement Permittee Proposal
Illicit Discharges	Inspection Schedule Developed By Permittees	Inspection Schedule Developed By Permittees	Inspection Schedule Developed By Permittees
	BMPs Required For Street and Sidewalk Washing	BMPs Required For Street and Sidewalk Washing Plus Review of 12 Other Discharges	
Industrial/ Commercial a) Inspections[3]	Specifies Inspection Schedule Plus Types Of Facilities To Be Inspected	Inspection Schedule Proposed By Permittees	Inspection Schedule Based On Other Insp. Programs
b) Specific BMPs	Includes Specific BMPs	Developed By Permittees	Developed By Permittees
New Developments[4]	Storm Water BMPs Required	Storm Water BMPs Required	Storm Water BMPs Required
Monitoring Requirements	Basic Program Plus Critical Source Monitoring	Basic Program Plus Pilot Projects	Basic Program Plus Upgrades To Meet Permit Goals
Street Sweeping	Once/Month Or More	Once/Month Or More	Once/Month Or More

[1] Includes provision that permittees would not be violation of receiving water limitations if they implement required BMPs.

[2] More complicated due to 6 watersheds; an overall Executive Advisory Committee and individual Watershed Management Committees are required. Los Angeles RWQCB would delete proposed membership requirement.

[3] Inspections slightly more frequent in the Los Angeles County permit than in a proposal from the Santa Clara County permittees. For Orange County, the inspection frequency of the other programs (e.g. hazardous wastes) is slightly greater than the requirements of the Los Angeles permit. However, Orange County is still in the process of incorporating storm water into the other inspection programs and no specific schedule is included in the permit for this task.

[4] Slightly differing requirements on applicability and BMPs.

APPENDIX 1 - COMPARISON OF PERMIT CONDITIONS OF PRINCIPAL CONCERN

1) Receiving Water Limitations:

The RWQCBs are attempting to standardize the language in all the State's municipal storm water permits concerning receiving water limitations. A workgroup was formed and model permit language was developed which appears to be close to being acceptable to all municipalities.

The model permit language essentially requires compliance with receiving water limitations via implementation of storm water BMPs. Storm water monitoring is required with additional BMPs as necessary to ensure compliance with the receiving water limitations. The model language also states that permittees will not be in violation of the permit provision requiring compliance with the receiving water limitations as long as they implement the required BMPs.

The model language was incorporated into the final permit for Orange County which was issued on March 8, 1996 by the Santa Ana RWQCB. The Santa Clara County permit and the draft Los Angeles County permit include similar language without, however, the provision that the permittees would be in compliance with the receiving water limitations if they implement the required BMPs. The Orange County permittees appear to be generally comfortable with the language in their permit.

EPA's National Urban Wet Weather Flows Advisory Committee met in March, 1996 to discuss a draft policy developed by EPA that addresses storm water permits and receiving water limitations. Under the draft policy, permittees would be presumed to comply with receiving water limitations as long as they implement required BMPs (provided this appears reasonable to the permitting authority). EPA is redrafting this policy in response to comments received in March from the State of California and others. EPA's Office of Water expects to provide its revised draft to interested persons by April 3, 1996. The redraft will likely include revised statements related to BMPs and presumptions regarding compliance with receiving water limitations. The Advisory Committee will consider the redrafted policy in April and May, after which EPA's Office of Water expects to issue its final policy.

2) Program Management

Several Los Angeles County co-permittees have objected to the permit requirements for program management and coordination. In particular, the draft permit requires the establishment of an

Executive Advisory Committee (EAC) and also specifies the membership. In addition, Watershed Management Committees (WMCs) are mandated by the permit. A couple of co-permittees have argued that the EAC should not be required and that they should be allowed to choose their own organizational structure. A more common complaint pertains to the specification of the membership on the EAC.

The permit application submitted by Los Angeles County on behalf of the co-permittees proposed the same basic program management requirements as in the draft permit, including the establishment of the EAC and the WMCs. As such, it is not clear why any co-permittees would object to this structure, and it would seem likely that this issue would be easily resolvable. The draft permit does require, however, that each WMC's representative on the EAC come from the co-permittee with the largest population. This was not in the County's proposal and co-permittees feel that they should be allowed to select their own representatives. The Los Angeles RWQCB has agreed to this minor change.

Both the Santa Clara County and Orange County co-permittees voluntarily developed suitable implementation agreements to coordinate the individual storm water programs of the various permittees. The permits for these Counties simply require that the permittees follow through with their own proposals. With the above change, the Los Angeles County permit would in effect be comparable to the Santa Clara County and Orange County permits since all co-permittees would basically be implementing their own proposals.

In response to those co-permittees who have argued that the requirement for the EAC is illegal and not mandated by the CWA, we would point to NPDES regulations at 40 CFR 122.26(d)(2)(iv) which require "where necessary intergovernmental coordination" in developing and implementing a storm water management program. The EAC could be considered an appropriate means of ensuring the necessary coordination.

3) Illicit Discharges

The Los Angeles, Santa Clara and Orange County permits all require programs to prevent illicit discharges which are based on the requirements of the EPA regulations. The Santa Clara County permit requires that the co-permittees develop performance standards to set forth the level of activity (e.g., number of inspections) of the program. The Orange County permit requires submittal of a schedule for periodic inspections to be approved

by the Santa Ana RWQCB. The Los Angeles County permit requires the development of a program which presumably would be similar to those developed in Santa Clara County and Orange County.

The Los Angeles County permit does go beyond the Orange County permit in the area of non-storm water discharges. The Los Angeles County permit specifically requires that BMPs must be developed for street and sidewalk washing. The Orange County permit provides that the permittees need not prohibit these discharges unless they are determined to be a source of pollutants.

The Santa Clara County permit also requires that BMPs be developed and implemented to reduce pollutants from street and sidewalk washing operations. In addition, the Santa Clara County permit requires that permittees evaluate a list of 12 other non-storm water discharges and consider the need for additional BMPs. Overall, in the area of illicit discharges, the Los Angeles County permit would seem to be midway in stringency between the Orange County and Santa Clara County permits.

4) Controls for Industrial/Commercial Sources

a) Inspections

The Los Angeles County permit sets forth the specific types of facilities which must be inspected and the inspection frequencies. In this regard the permit goes beyond the requirements of both the Orange County and Santa Clara County permits. The Santa Clara County permit requires that the co-permittees develop a performance standard for the industrial/commercial runoff control program including an appropriate inspection program. The Orange County permit requires that co-permittees incorporate storm water inspections into previously existing inspection programs (e.g., hazardous waste, pretreatment), and thus the inspection frequency and types of facilities which are inspected depend on the nature of these other inspection programs.

The Santa Clara County permittees have submitted their proposal for a performance standard for inspections to the San Francisco Bay RWQCB. The types of facilities which would be inspected are similar to the requirements of the Los Angeles County permit; however, the proposed inspections are slightly less frequent. For example:

Facility Type	Santa Clara	Los Angeles
Vehicle Repair Facility	once/2 years	three/5 years
Restaurants	once/3 years	twice/5 years
Facility with Pretreatment Permit	once/2 years	once/year

As noted above, the types of facilities to be inspected in the Orange County program depend on the types already being inspected under the existing inspection programs. However, these types of facilities are similar to the facilities which would be inspected in the other Counties. The number of inspections conducted annually by the Orange County Health Care Agency is 5,500; another 7,000 inspections are conducted annually by Orange County fire departments. The City of Los Angeles has estimated that 12,000 inspections would be required per year under the proposed permit for the City alone. Given that the population of the City of Los Angeles is about 3.5 million (vs. 2.6 million for Orange County), the inspection frequency in the proposed Los Angeles County permit is slightly less than the Orange County permit. It should also be noted, however, that Orange County is still in process of incorporating storm water into the other inspection programs. No specific schedule is included in the Orange County permit to complete this task.

b) Specific BMPs

Many Los Angeles County co-permittees have objected to the highly specific BMPs which the draft permit requires for industrial and commercial facilities. Examples cited by the City of Long Beach include the requirement for regular sweeping of parking lots with more than 25 spaces, and the prohibition on the repair of machinery or vehicles in areas exposed to storm water, if they are visibly leaking oil or other fluids.

The Santa Clara County program is currently conducting a study of parking lot runoff, and the co-permittees have committed to consider appropriate parking lot BMPs after the study has been completed. The nature of the BMPs and the size of the affected facilities remain to be determined. The Orange County permit requires inspections of commercial and industrial facilities and general pollution prevention would be required (which could include regular sweeping). In addition, for new developments with a property owners association, sweeping of parking lots is required prior to the wet season.

With regards to the other issue involving the repair of machinery or vehicles, the Santa Clara County and Orange County permits are less precise than the Los Angeles County permit. The Santa Clara County permit requires a performance standard for industrial/commercial runoff control. The draft performance standard which has been submitted by the co-permittees would not necessarily prohibit outdoor repairs, but would require appropriate BMPs for such activities. The Orange County permit would essentially require BMPs based on the judgment of the co-permittees. Overall, the Orange County and Santa Clara County permits are less specific than the Los Angeles permit.

5) Controls for New Developments

The Los Angeles County co-permittees have expressed various concerns regarding the proposed requirements for storm water controls for new developments. In particular, co-permittees object to the classification scheme for prioritizing projects. Projects are classified as high priority, priority or limited priority depending on detailed criteria in the permit. In addition, objections have been raised regarding the requirement for a storm water mitigation plan for priority and high priority projects.

The requirement for a storm water mitigation plan does not seem to be excessive considering the requirements of the Santa Clara County and Orange County permits. The Santa Clara County permit requires the development of a performance standard by co-permittees by September 1, 1996. Co-permittees would develop and then require specific BMPs to be included in development projects which are proposed. The equivalent of a storm water mitigation plan would be required to be submitted by a developer for review by the appropriate municipality. The specific BMPs remain to be developed, but would be based on a 1994 guidance memorandum from the San Francisco Bay RWQCB. In as in the proposed Los Angeles County permit, the guidance includes a 3-tier scheme for project prioritization.

The Orange County permit also requires the equivalent of a storm water mitigation plan to be submitted by developers for review. Orange County has also developed detailed guidance for developers regarding appropriate storm water BMPs. BMPs are required "in keeping the size and type of development."

Overall, the Los Angeles County permit requirements do not seem excessive in comparison to the Santa Clara County and Orange County permits.

6) Monitoring Requirements

In most respects, the monitoring requirements of the Los Angeles County permit are similar to the requirements of the Orange County and Santa Clara County permits. Few adverse comments were received. One particular requirement in the Los Angeles County permit which did generated concerns is the requirement for critical source/BMP monitoring. Los Angeles County would be required to monitor runoff from 5 (and possibly 3 more) particular types of sources (industrial, commercial, or construction sites), and subsequently test appropriate BMPs at the sites. Other co-permittees would monitor and evaluate BMPs for 5 more critical sources. Los Angeles County noted that in its recent settlement agreement with NRDC, the County has agreed to implement this type of project; however, the County suggested certain changes to the program set forth in the draft permit. Other co-permittees argued that this type of research is excessive as a permit condition.

The Santa Clara County permit requires the submittal of an annual monitoring program proposal, and also sets forth the general objectives of the monitoring program. Special studies or pilot projects are expected to be part of the proposal in order for the proposal to be approvable, and several such studies are underway or planned by the co-permittees. Examples include a brake pad study and several other metals reductions studies, a parking lot study, a street sweeping study and others.

The Orange County permit establishes various goals for the monitoring program (which include research concerning pollutant sources and BMPs) and requires the submittal of a upgraded monitoring program in 1997. However, the permit also recognizes that the goals may not be achievable in this permit term. It is unclear but probably doubtful that research at the level required by the Los Angeles County permit would be required. Nevertheless, it should also be pointed out that the Orange County program did conduct some pilot projects in the first permit term including monitoring of golf course runoff and runoff from new developments.

Overall, the permit requirements of the Los Angeles County permit related to critical source monitoring would exceed the requirements of the Orange County permit. The source identification and control program required by the Santa Clara County permit, however, would seem comparable to the requirements of the Los Angeles County permit.

7) Street Sweeping

In a cost analysis prepared by the Los Angeles County co-permittees, street sweeping was cited as a particularly high cost item. The cost specifically attributable to the storm water permit was not estimated, however. In comparison with the Santa Clara County and Orange County permits, the requirements of the Los Angeles County permit regarding street sweeping are not excessive.

The Los Angeles County permit requires sweeping of curbed streets at least monthly, and more frequently where feasible for areas which generate high levels of refuse. In Santa Clara County, the sweeping frequency varies among cities, but generally exceeds once/month. Examples are: Palo Alto, once/week or more; Mountain View, once or twice/month; San Jose, weekly to monthly. In addition, a study is required to investigate improved street sweeping methods with revisions in sweeping programs to be implemented based on the results of the study. In Orange County, sweeping frequencies are also on the order of monthly or more frequent.

The street sweeping requirements of the Los Angeles County permit were not among the more controversial aspects of the permit (the City of Los Angeles did recommend that the monthly frequency be considered a target rather than a requirement). However, the costs associated with the Los Angeles County street sweeping should be comparable to the programs of the other Counties.

APPENDIX 2 - KEY LOS ANGELES COUNTY PERMIT REQUIREMENTS WHICH ARE MORE DETAILED OR EXCEED THE REQUIREMENTS OF THE SANTA CLARA COUNTY AND/OR ORANGE COUNTY PERMITS

- *Receiving water limitations* - the Los Angeles County permit omits the provision in the Orange County permit that the permittees would not be in violation of receiving water limitations if they implement the required BMPs.

- *BMPs for street and sidewalk washing* - specifically included in the Santa Clara County permit, but not Orange County. The Santa Clara County permit also requires review of 12 other types of non-storm water discharges for possible BMP requirements.

- *Specific inspection program for industrial/commercial businesses* - inspection program is developed by the Santa Clara and Orange County permittees, rather than specified by the permit. The proposed Los Angeles County inspection frequency is slightly greater than a proposal from Santa Clara County, but slightly less than Orange County's frequency. Orange County plans to incorporate storm water inspections into other inspection programs (e.g., hazardous waste). However, Orange County is still in the process of incorporating storm water into the other inspection programs and no specific schedule is included in the permit to complete this task.

- *Specific BMPs for industrial/commercial businesses* - these requirements are developed by the Santa Clara County and and Orange County permittees rather than specified by the permit. Similar BMPs are likely to be required by Santa Clara and Orange County, but more flexibility is provided.

- *Critical source monitoring* - comparable requirements are found in the Santa Clara County permit, but the Los Angeles County permit generally exceeds Orange County requirements in this area.

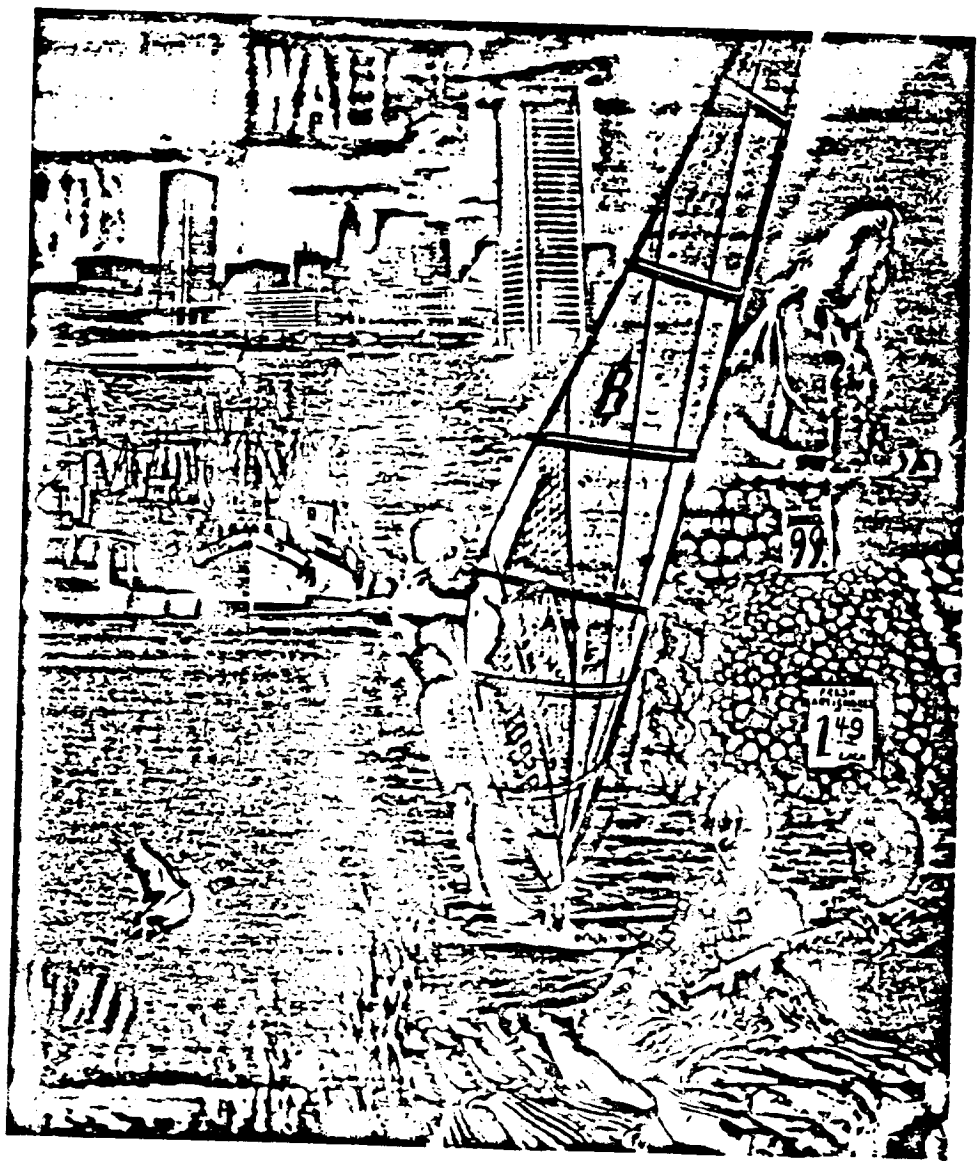
Liquid Assets:

A Summertime Perspective on the Importance of Clean Water to the Nation's Economy



UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

May 24, 1996

Dear Reader:

THE ADMINISTRATOR

As another summer vacation season gets underway this Memorial Day weekend, many American families will be heading for the water. In fact, beaches, rivers and lakes are the number one vacation choice -- every year, Americans take more than 1.8 billion trips to go fishing, swimming, boating or to just relax around a favorite water destination.

But while Americans are seeking the water for recreation, clean water is working for them -- as a vital resource that keeps our communities and our economy healthy and thriving. The attached national report, titled *Liquid Assets: A Summertime Perspective on the Importance of Clean Water to the Nation's Economy*, demonstrates the value of clean water to our nation. The report also underscores the challenges the nation still faces in its efforts to clean up and protect America's lakes, rivers and beaches.

The report highlights how clean water benefits five key industry sectors -- recreation and tourism, agriculture, commercial fishing, real estate and manufacturing -- by boosting jobs, profits and economic growth around the nation. The recreation and tourism sector alone -- which relies on clean water to attract visitors -- is the nation's second largest employer, after health care, providing jobs for over 6 million Americans and generating over $380 billion in sales.

The report also reminds us that clean water is not a resource to be taken for granted. One out of five drinking water systems reports violations of the safety standards. Forty percent of our rivers, lakes and streams are still too polluted for safe fishing or swimming. And in 1994, more than 2,000 beaches were closed to protect public health from bacteria and other pollutants in the water.

The Clinton Administration is at the forefront of efforts to provide safe, clean water for the benefit of all Americans. President Clinton proposed the first-ever state loan fund to ensure that communities have the resources to provide safe, clean drinking water. We issued strong national guidance to keep raw sewage out of rivers and off of beaches. Further, the Clinton Administration has broken the gridlock of previous decades by crafting common-sense, consensus-based plans to control pollution and protect water resources in the San Francisco Bay-Delta, the Everglades and the Great Lakes.

Let us remember that protecting America's water is good for our health, good for our environment, and good for our economy.

Sincerely,

Carol M. Browner

In Memory...

Edmund S. Muskie
1914-1996

This report is dedicated to the memory of Edmund Muskie, an American statesman from Maine who served our nation as a Secretary of State, as a United States Senator, and as a strong advocate for the environment.

The following observation, which captures the central theme of this report, was made by Mr. Muskie during a speech in 1966.

> *"High quality water is more than the dream of conservationists, more than a political slogan; high quality water in the right quantity at the right place at the right time, is essential to health, recreation, and economic growth"*

Thirty years later, it still holds true.

Executive Summary

Each year, the Memorial Day weekend launches a busy season of recreational activity around America's rivers, lakes, and beaches. In addition to providing fun and relaxation, these activities also provide a major boost for our nation's economy. Billions of dollars are spent on food, lodging, gas, special equipment, licenses, and services, all so people can enjoy themselves on and around the water.

But, the dividends from clean water are not limited to just the recreation and tourism industry. From Main Street to Wall Street to the family farm, clean water affects the profits and growth potential of many other economic sectors, including agriculture, commercial fishing, real estate, and manufacturing. This report, *Liquid Assets: A Summertime Perspective on the Importance of Clean Water to the Nation's Economy*, provides a snapshot of these sectors to highlight how and why clean water and a safe, clean environment are so important to economic prosperity and healthy, thriving communities.

Clean water is a vital commodity for major sectors of the U.S. economy.

- **Beaches, rivers, and lakes are the number one vacation choice for Americans**, helping to support a flourishing recreation and tourism industry. Each year, Americans take over 1.8 billion trips to go fishing, swimming, boating, or to just relax around favorite water destinations.

- **About 15 percent of American farm lands use irrigation** to support operations—and maintain our lucrative position as "breadbasket to the world." Crops grown on irrigated lands are valued at nearly $70 billion a year—about 40 percent of the total value of all crops sold.

- **The $45 billion commercial fishing and shellfishing industry needs clean water in order to deliver products safe for us to eat.** Americans now eat 15 pounds of fish and shellfish per person a year.

- **On average, the value of real estate along desirable water areas is nearly 30 percent greater than similar properties located inland.** A *Money* magazine survey found that clean water and clean air are the two most important factors Americans consider in choosing a place to live.

- **Manufacturers use about 13 trillion gallons of water every year—more** than 9 times the volume that flows through the Mississippi River into the Gulf of Mexico every day. The soft drink manufacturing industry alone uses over 12 billion gallons of water a year to produce products valued at more than $50 billion.

Clean water means jobs.

- **The recreation and tourism industry is the second largest employer in the country** after health care, providing jobs for over 6 million Americans.

- **Agriculture, which relies on clean water for livestock and crops, provides jobs for over 3 million people** or 17% of the U.S. labor market. The largest agricultural sector, cattle production, employs over 186,000 people on the farm and over a million more in other areas of the economy.

- **The environmental technology industry is creating jobs at twice the rate of the U.S. economy as a whole,** now employing over one million people.

- **Over a quarter of a million people work to harvest fish and shellfish** from the Great Lakes, the Gulf of Mexico, and other waterbodies that serve as "protein factories" around the country.

Clean water means profits.

- With sales of more than $380 billion, **the recreation and tourism industry provides a $22 billion trade surplus, the highest of all economic sectors.** Annual sales for just three activities—fishing, boating, and viewing and hunting ducks and other birds—**is estimated at nearly $45 billion.**

- Using clean water for irrigation and raising animals, American farmers produce and sell over **$174 billion worth of food and fiber products** every year. The cattle industry, with sales of more than $40 billion, provides one-fourth of the world's beef.

- Our fleet of commercial fishing vessels delivers **fish and shellfish products worth $3.5 billion a year, a value that increases by more than tenfold in the commercial marketplace.** In Puget Sound, an acre of shellfishing beds produces oysters, mussels, and other products worth between $40,000 and $60,000 every three years.

- **The clean water technology industry has sales of over $64 billion a year here in the U.S. and over $170 billion abroad.** With an international environmental market expected to double by the turn of the century, the forecast for future earnings looks promising.

Clean water provides a major stimulus for healthy, thriving local economies.

In communities across the country, clean water is often a critical factor in determining economic conditions.

- In rural West Virginia, white water rivers attract 200,000 people a year for rafting trips, and helps support the State's $2.5 billion recreation and tourism industry.
- In South Florida, the total value of all uses of the Indian River Estuary is estimated at over $700 million a year.
- In the west, recreational activity around Lake Mead National Park generates spending of nearly $940 million a year.

These profiles show that for businesses and communities throughout the country, clean water can mean the difference between economic decline and a bright, prosperous future. They also show just why clean water needs such special care and attention.

The national portfolio of water resources is large and diverse...

3.5 million miles of rivers and streams

41 million acres of lakes

58,000 miles of shoreline

34,400 square miles of estuaries (excludes Alaska)

278 million acres of wetlands

33,000 trillion gallons of ground water

...but so are the challenges of managing it.

While seemingly plentiful, clean water is a resource at risk.

- Our drinking water supply is one of the safest in the world, but one out of every 5 systems reports a violation of a national safety requirement.
- Our rivers, lakes, and coastal waters are cleaner today than 25 years ago, yet nearly 40 percent are still too polluted for safe swimming or fishing.
- Wetland losses have been significantly reduced, but between 70,000 and 90,000 acres are still lost every year.
- Advisories or bans have been issued for more than 1,500 waterbodies to protect the public from eating chemically-contaminated fish.
- One out of every three shellfishing beds is closed for harvest.
- More than 2,000 beaches were closed in 1994 to protect the public from harmful bacteria and other pollutants found in the water.

These problems represent major challenges that defy quick and easy solutions. Firm commitment and strong partnerships involving individuals and organizations from the public and private sectors offer the greatest promise for ensuring clean water in the future.

Under the Clinton Administration, EPA has led and supported multiple partnerships to provide safe, clean water for our communities.

- A national drinking water loan program was proposed to help communities meet their drinking water needs. This program, which establishes a powerful financial partnership between EPA and the States, marks the first time ever that ensuring safe drinking water has been made a federal investment priority.
- National guidance was issued to better control raw sewage spills—spills that can cause beach and shellfishing bed closures—in more than 1,000 communities. This consensus product, developed with State and local governments, industry and environmentalists, provides for sound environmental management at one-fourth the cost of previous proposals.
- An historic, consensus agreement on water allocation was negotiated among multiple parties, including farmers, urban users and environmentalists in California's Bay-Delta region. The common sense agreement broke a ten-year deadlock on one of the area's most difficult issues.
- Following extensive negotiations with the States, industries and other interested parties, national guidance was issued to reduce the flow of toxic pollution into the Great Lakes. By ensuring more consistent standards of performance, the guidance provides for a safer, cleaner environment and a more level economic playing field among competitors.
- One of America's most unique ecosystems—the Florida Everglades— is being restored. A comprehensive approach, including $1.5 billion in federal funding, is helping to speed up the restoration process.

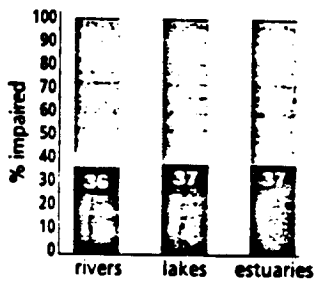
Good News, Bad News

The Current Condition of Our Nation's Water Resources

Our drinking water supply is one of the safest in the world, but...

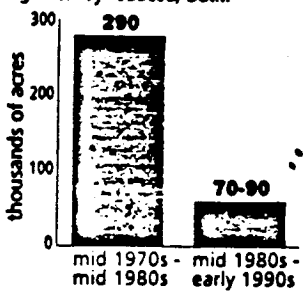
...one out of every five systems reports a violation of a national safety requirement.

Our rivers, lakes and coastal waters are cleaner today than 25 years ago, but...

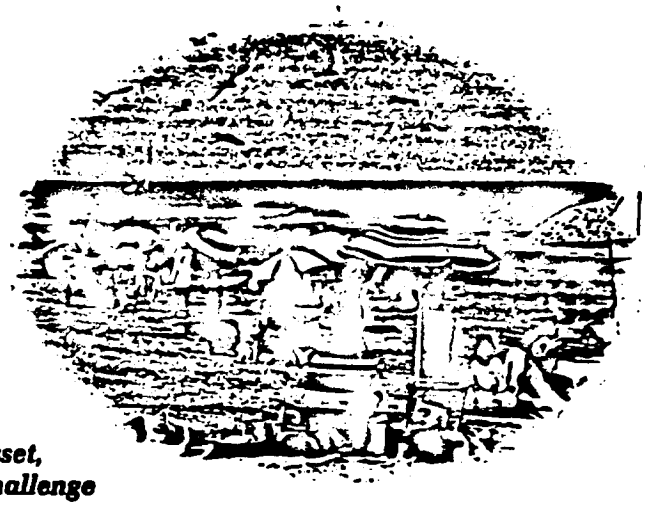


...nearly 40 percent of those surveyed are still too polluted for safe fishing or swimming.

Wetland losses have been significantly reduced, but...



...between 70,000 and 90,000 acres are still lost every year.



Clean Water:

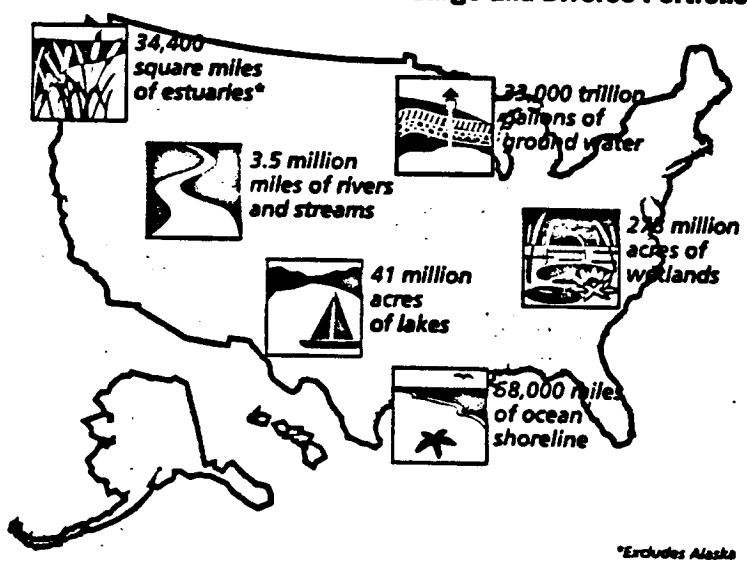
A National Asset, A National Challenge

Each year, the Memorial Day weekend launches a busy season of recreational activity around America's beaches, lakes, and streams. In fact, these areas are our number one vacation choice. In addition to providing relaxation and family fun, travel to these areas also provides a boost to our national economy. Billions of dollars are spent each year for food, lodging, gas, as well as special equipment, licenses, and services, all so people can enjoy themselves on and around the water.

The impact of clean water on the recreation and tourism industry is profound. But, the same is true for many other sectors of our economy. In many ways, clean water is the fuel that powers the nation's economic engine. Commercial fishing, agriculture, real estate, and manufacturing are just a few of the sectors which rely on clean water to operate and ensure productivity.

Despite the many benefits that water provides for society and our economy, some communities are unable to use local water resources to their full advantage. Contaminated drinking water supplies, fish kills, and beach closures are just a few of the problems that communities can face. These problems, which can have far-reaching consequences, call for continued environmental vigilance.

America's Water Resources: A Large and Diverse Portfolio



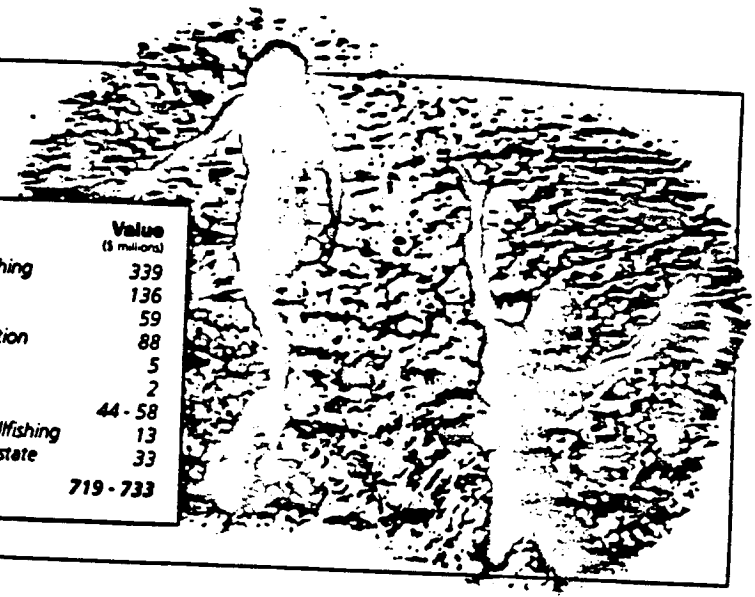
*Excludes Alaska

Profile

What is Water Worth?

The answer is over $700 million a year for the waters of Indian River Lagoon, an estuary along South Florida's Atlantic coast. An economic evaluation was undertaken to support development of a comprehensive plan for managing the estuary. The results, based on a number of uses by those living in the area, show that the people there are wise to invest in its protection.

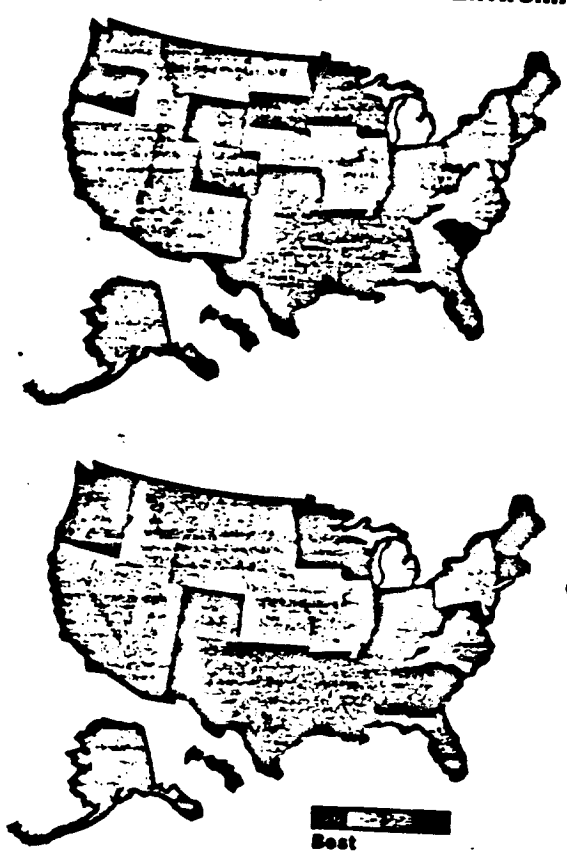
Use	Value ($ millions)
Recreational Fishing	339
Swimming	136
Boating	59
Nature Observation	88
Water Sports	5
Hunting	2
Passive Use	44 - 58
Commercial Shellfishing	13
Riverfront Real Estate	33
Total Value	**719 - 733**



Increasingly, the evidence shows that strong environmental protection and a strong, healthy economy go hand in hand. A study by the Institute for Southern Studies showed that states with the best environmental records also offered the best job opportunities and climate for economic development. Similarly, a study out of the Massachusetts Institute of Technology found that States with stronger environmental standards outperformed those with weaker standards on all economic measures.

This report, *Liquid Assets: A Summertime Perspective on the Importance of Clean Water to the Nation's Economy*, demonstrates the linkage between a strong economy and clean water by focusing on specific sectors. Sector profiles were developed using statistical data from federal agencies, or using appropriate information from other relevant sources, such as trade organizations or individuals working in a particular business. In addition, the report provides information on our nations's clean water laws, on the many efforts underway to help improve water quality in communities throughout the country, and on the many challenges that still lie ahead.

The Economy and the Environment

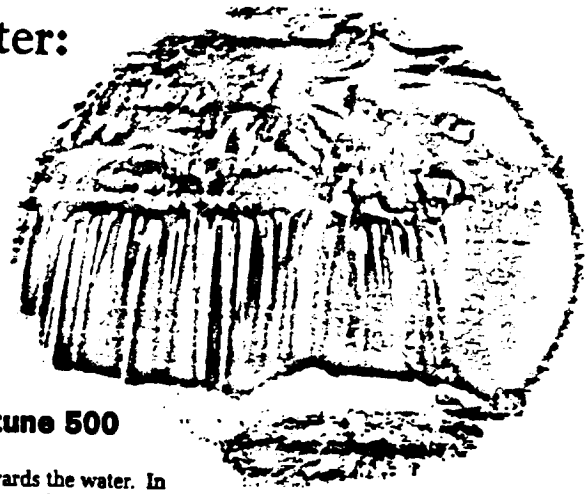


Source: The Institute for Southern Studies

The Business of Clean Water:

A Look at How Water Quality Affects Major Economic Sectors

What do soft drink manufacturing, river rafting companies, and the commercial fishing industry have in common? They all have a basic need for clean water. Day in and day out, these and other sectors of the U.S. economy rely on clean water to grow, process or deliver their products and services. In various ways, water quality can either help or hurt productivity. Take a look at a few sectors for which clean water is a vital commodity.



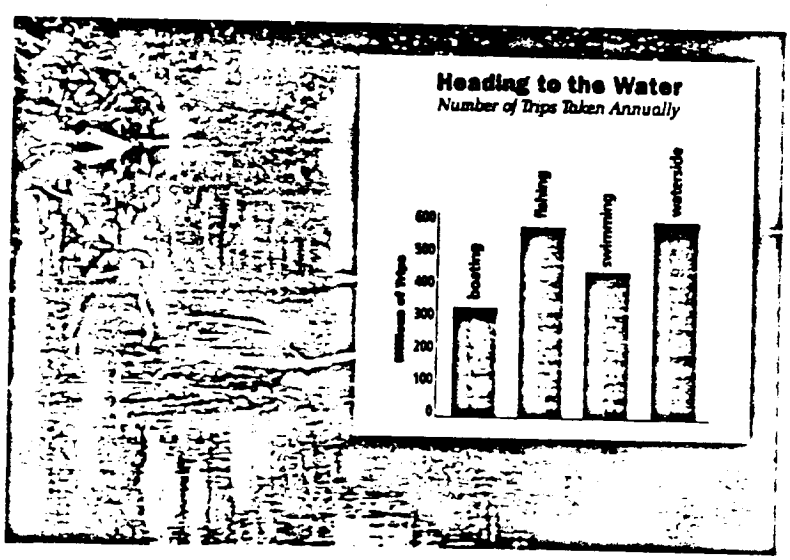
Recreation and Tourism: Rivaling the Fortune 500

An abundance of beautiful beaches, white water rivers, and calm, cool lakes is one of the factors contributing to a flourishing recreation and tourism industry in this country. Water has a powerful attraction for people, one that is translating into jobs and profits for our economy. In 1993, recreation and tourism was the second largest employer in the nation behind only the health care industry. It provided jobs for over 6 million people, and generated sales of over $380 billion, nearly three times the amount of farm products. The industry has a $22 billion trade surplus, the largest of any sector in the U.S. economy.

When people decide to plan vacations and travel for pleasure, there is a strong tendency to head towards the water. In fact, a 1994 Roper Survey found that beaches, rivers, and lakes are Americans' top vacation choices followed by federal and state parks. About a fourth of the population goes swimming every year, making it our second most popular recreational activity behind walking. All total, Americans make an estimated 1.8 billion trips a year to enjoy boating, fishing, swimming or just relaxing around the water.

"beaches, rivers, and lakes are Americans' top vacation choices"

About 300 million trips are made every year to go boating. Over half of these trips involve power boating, but sailing and paddle sports, such as kayaking, canoeing, and rafting are popular, too. Boating sales are estimated at over $14 billion a year, and over 6,000 companies are involved in manufacturing boats, trailers, motors and accessory items. The recreational marine boating industry alone employs about 600,000 people.



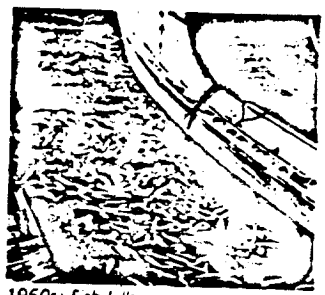
A significant portion of recreational spending is tied to fish and wildlife, both of which require high quality water and habitat, such as wetlands, for survival. Nearly 49 million American anglers spend $24 billion a year pursuing their sport, ultimately generating $69 billion for our economy. If sportfishing were incorporated as a single business, it would rank 27th on the Fortune 500 List of top sales producers, surpassing such giants as Coca-Cola, GTE, and Dow Chemical.

Ducks and other birds that depend on clean water also generate economic activity for the recreation and tourism industry. In 1991, nearly 3 million people spent about $544 million hunting migratory waterfowl. And even more Americans watch and photograph them. Over 19 million people participate every year, spending over $3 billion, and generating nearly $10 billion in total economic activity. When all birds, not just waterfowl, are factored in, the impact is even more significant. The

Profile

The Return of Recreation on the Potomac

The Potomac River, which flows through the nation's capital, provides one of the best examples of how water quality can limit or enhance recreational opportunities for people living or visiting an area. For decades the Potomac suffered from the harmful effects of water pollution. As early as 1894, the U.S. Public Health Service declared, "At certain times of the year, the Potomac River is so loaded with sediments as to be unfit for bathing as well as for drinking and cooking purposes." In 1965, President Lyndon Johnson called the Potomac a "national disgrace" and promised to have "clean water by 1975."



1960s: Fish kills were commonplace.

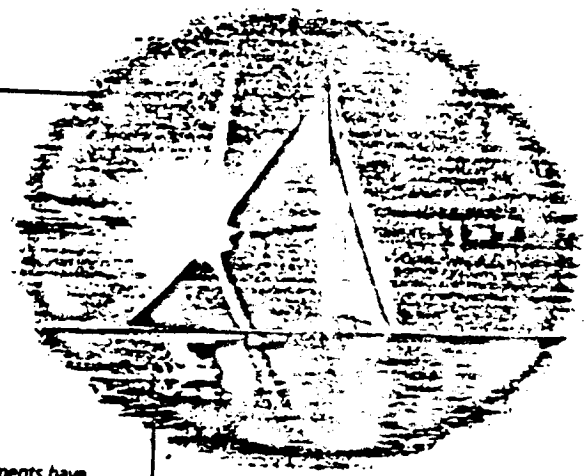
Over time, dramatic improvements have been made, largely as a result of the Clean Water Act of 1972. The legislation was the foundation for stronger environmental performance standards and federal funding. These funds helped to build a state-of-the-art sewage treatment plant which now treats over 70 percent of the region's waste before discharging it into the Potomac. Improved sewage treatment is recognized as the single biggest factor in the Potomac's restoration.

With improvements made in sewage treatment, more recent efforts have focused on reducing another major pollution source—polluted runoff from urban and rural areas. In 1987, a landmark agreement was reached between Federal, State, and local governments in the region which called for reducing nutrient loadings, such as fertilizers, by 40 percent by the year 2000. The agreement focused on the Chesapeake Bay, but as a major bay tributary, it also applies to the Potomac.

Today, the Potomac River is a much cleaner and safer body of water. Restaurants and shops line the river in Georgetown and Old Town Alexandria. A bass fishing industry has been established, and the river has been the sight of national and regional fishing tournaments. In total, the economic benefit of recreation and other uses of the river is estimated at about $120 million a year for Maryland, Virginia, West Virginia, and Washington, D.C.

Nina Wilson, owner of Potomac River Cruises since the late 1970s, offers a glimpse of how water quality has improved over the years, and what these improvements have meant for her business. Speaking of earlier conditions, she said "I was ashamed of the unsightly, filthy, smelly water of the Potomac. In particular, luncheon business suffered as a result of noticeably poor water quality in the light of day." Today, her business thrives, and annual revenues have increased by tens of thousands of dollars. These increases are clearly linked to a cleaner environment. According to Ms. Wilson, "the Potomac is much, much cleaner and more inviting".

1950s: A fishing guide at work.



U.S. Fish and Wildlife Service estimates that nearly 30 million people participate, and the total economic impact is nearly $20 billion. Birdwatching, in particular, is a high growth sport. In just the past 5 years, the American Birding Association has seen its membership nearly triple.

Water-based recreation can have significant impacts for local, State, or regional economies. Tony Fedler of the Sport Fishing Institute commented in *Fisheries Magazine* that, "Many state governments are beginning to recognize the economic payoffs of helping attract more fishers and increasing good fishing opportunities. By investing in boat ramps, fishing piers, aquatic habitat, angler education, fish stocking, and similar programs, communities are helping their economy by attracting more anglers."

West Virginia is just one State that has recognized and moved to capitalize on its ecological riches. With over 29,000 miles of rivers, West Virginia offers some of the country's best white water rafting. In 1994, over 200,000 people enjoyed rafting trips on five commercially regulated rivers. The State now brings in over $2.5 billion a year from all tourism activities, and business continues to grow.

In the western United States, recreational use of the Colorado River is valued at about $100 million a year. Lake Mead National Park provides another major economic stimulus for the region. The park is visited by over 9 million people, and collectively, these visitors spend nearly $940 million.

Given the strong attraction of water as a recreational choice, the future growth and prosperity of the tourism industry is certain to be affected by water quality conditions. Commenting on the medical waste wash-ups that closed New York and New Jersey beaches in 1988, real estate agent Jack McHugh stated, "No one came back in 1989. We are usually completely booked-up by March. That year, we sat around waiting for the phone to ring." Economic losses to the region were estimated at more than $4 billion. In 1994, sewage and health concerns about other pollutants led States to close nearly 2,300 beaches to the public.

Economic losses also result when recreational fisheries are placed off limits. In 1995, States issued fish consumption advisories or bans for over 1,500 rivers and lakes where the fish were too contaminated to eat. Mercury is the toxic pollutant most often causing these advisories. While specific data regarding the impact of these advisories on recreational fishing do not exist, warning signs along a river clearly diminish the joy of the fishing experience—and quite possibly, economic opportunity for the local community.

Reopening of Shellfishing Beds in Puget Sound

Thanks to the effort of scores of people, from public officials to farmers to homeowners to volunteers, clam and oyster harvesting has recently been allowed again in at least four areas of Puget Sound. Although more than 20,000 acres of Washington's commercial shellfish beds still remain closed, there has been success in reducing pollution that had caused some beds to be closed for as long as 12 years. "The oyster industry is more prosperous than ever," says Tim Smith of the Pacific Coast Oyster Growers Association. "It also has a more uncertain future. It's all about the water."

The revival of the half shell trade, coupled with a booming Asian market, has helped turn Washington's $40 million a year oyster industry into the nation's largest. Mussels and clams, produced almost exclusively in Puget Sound, generate an additional $18 million annually. An acre of oyster tidelands can yield about $40,000 to $60,000 every three years, depending on the location and oceanic conditions.

Since 1986, the State has prohibited or restricted oyster harvesting on nearly 45,000 acres of shellfish beds – a quarter of all available grounds in Puget Sound. The culprit is usually poorly treated waste contaminating the waters. A number of steps have helped reduce this contamination. For example, about 100 farmers in the Burley Lagoon watershed have cooperated with the Kitsap Conservation District to cover manure piles, construct fences along streams to keep animals out, and rotate grazing areas to reduce runoff from erosion. Also, a major campaign was launched to identify and upgrade failing septic systems in the watershed.

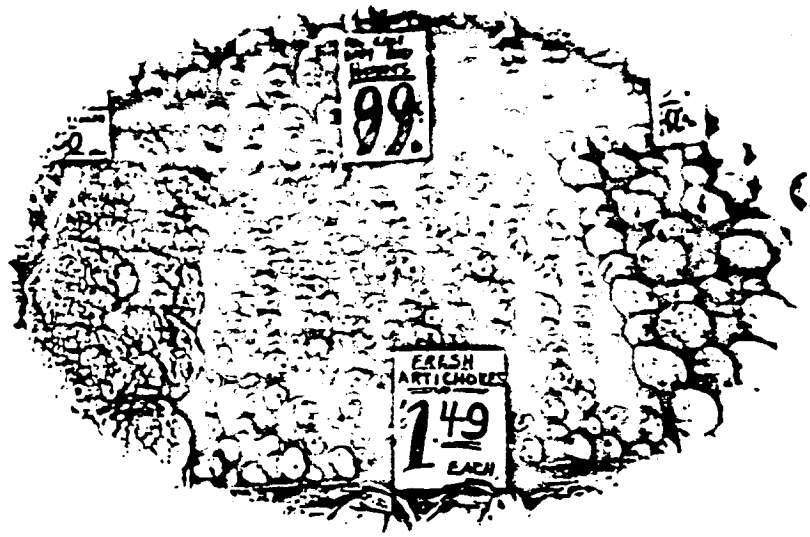
"Homeowners and farmers have worked hard to improve their sewage systems, farm management practices, and to stop the pollution that was damaging Burley Lagoon," stated Eric Slagle, an Assistant Secretary of the State Department of Health. "It's great to see that effort pay off."

Commercial Fishing: What a Catch

H.L. Mencken, an American journalist, once compared the Chesapeake Bay to a giant protein factory. Every year, our nation's protein factories—the Great Lakes, the Gulf of Mexico, and other coastal areas—produce over 10 billion pounds of fish and shellfish. Sold for consumption and industrial uses, these fisheries are valued at $3.5 billion. However, once they enter the retail market, the value increases more than tenfold. Americans now eat an average of 15 pounds of fish a year, collectively spending $35 billion. An additional $7 billion is sold every year to our trading partners.

The vessels and ports which support the commercial fishing industry generate additional revenues for the economy. Our commercial fishing fleet includes nearly 70,000 vessels and boats, and employs 250,000 people. But, there is reason to be worried about this industry's future.

Data from the National Marine Fisheries Service show declining populations for many species, including salmon, bluefin tuna, cod, haddock, and flounder. These declines can be linked to a number of factors, most notably overfishing. But environmental degradation is a key factor, too. Wetlands, for example, provide critical habitat during various life cycle phases for about 70 percent of all commercial fish species. While wetland losses have been significantly reduced in recent years, about 70,000 - 90,000 acres are still lost annually. Polluted runoff from urban and rural areas, and impacts from poorly treated sewage, represent additional stressors. Shellfish, such as oysters, clams, and mussels, extract their food by filtering water over their gills. If these waters are contaminated, the shellfish can become contaminated too. To protect the public from eating unsafe products, States may restrict or close shellfishing beds. The result can be a significant loss of revenue. In 1994, nearly one out of every three shellfish beds were closed or placed under special restrictions by States.



Agriculture: A Bountiful Market

Water is an absolute necessity for ensuring agricultural productivity. Without water, there would be no farming in this country—no fruits, no vegetables, no grain, and no livestock. The loss would be seen on the dinner table—and nationally, in the gross domestic product.

American farmers produce food and fiber products worth $174 billion a year. In 1994, the industry provided jobs for about 3 million people—17 percent of the U.S. labor market. The cattle industry represents the largest sector of the agricultural economy. With sales of over $40 billion a year, this industry supports about 186,000 farm jobs and over a million more jobs in other areas of the economy.

Other products, not always recognized as part of the agricultural industry, contribute, too. For example, those poinsettias purchased by so many Americans during the holidays generate over $170 million a year. Farm-raised fish are another agricultural product, and as an industry, aquaculture continues to grow strongly. The U.S. Department of Agriculture reports the industry has grown by 20 percent per year since 1980.

Agriculture is an important industry in every state. From cranberry bogs in Massachusetts, to corn fields in Kansas, to potato farms in Idaho, agriculture provides jobs and helps boost our economy. All together, American farmers produce over 165 different agricultural products, making this nation the "breadbasket to the world." In 1994, the U.S. exported over $45 billion in products. Record sales of $60 billion are forecast for 1996.

Water, in combination with rich agricultural lands and technological advancements, helps make all this productivity possible. Irrigation for agriculture represents our nation's single largest use of fresh water—about 40 percent. An estimated 136 billion gallons are used daily to irrigate crops. About 4.5 billion gallons are used to raise livestock, including horses and farm-raised fish, as well as other animals raised for meat, eggs, dairy products, wool, and fur.

Having sufficient quantity is the most important water issue for farmers. But quality matters, too. Today many farmers are working hard to manage their operations in a more environmentally sound manner.

Did You Know....

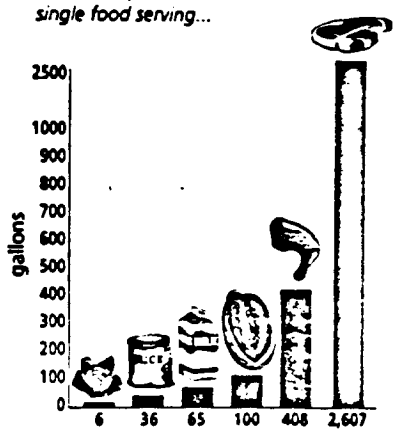
Each year, one American farmer provides food and fiber for 129 people—97 in the U.S. and 32 abroad.

One-fourth of the world's beef and nearly one-fifth of the world's grain, milk, and eggs are produced in the U.S.

About 15 percent of America's 2 million farms use irrigation.

Oh, How Does Your Garden Grow?

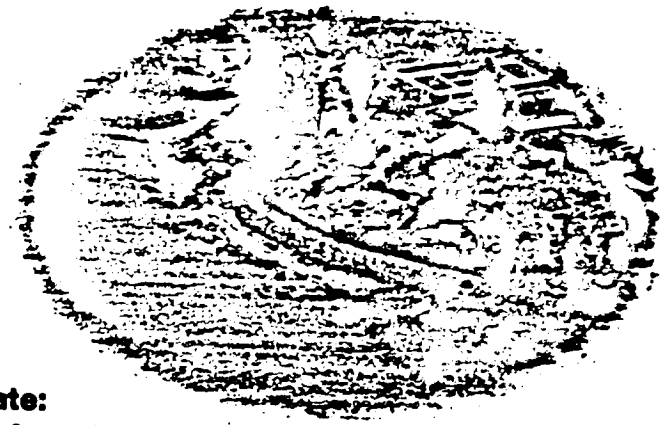
Gallons of water needed to produce a single food serving...



Profile

Wisconsin Farmers Save Money and Protect Water Quality

Farmers all over the country are finding it makes good environmental and economic sense to cut down on the amount of fertilizers and pesticides that are wasted when rain washes them off farmland. Farmers in Wisconsin's Lake Mendota watershed, for example, took the guesswork out of nutrient application, basing their fertilizer rates on soil test results. They reduced phosphorus application by more than 50 percent on more than 30,000 acres and saved $200,000 dollars in the process.



Profile

Real Estate Values Around Lake Champlain

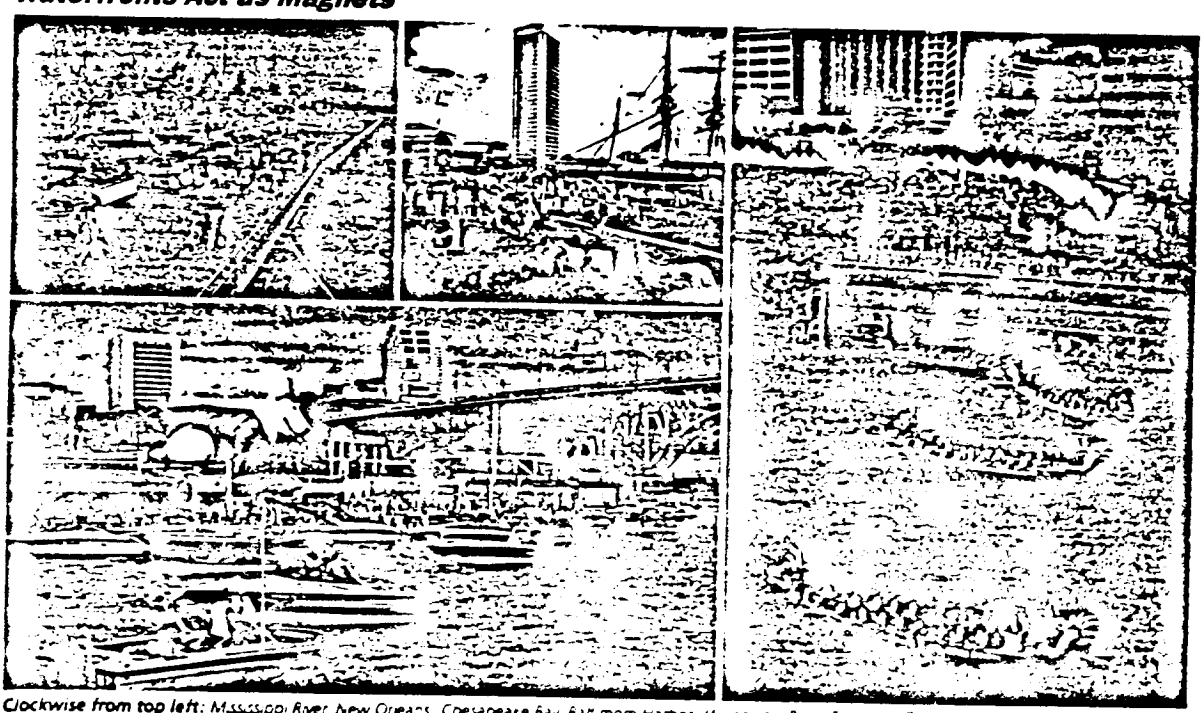
A study of real estate values around Lake Champlain in the mid-80s demonstrated the real world effect that pollution can have in a community and on peoples' pocketbooks. Property values in an area of the lake with good water quality were compared to those in an area of poorer water quality. On average, houses in the better quality areas were worth about 20% more—a $4,500 difference for these homeowners.

Real Estate: Location, Location, Location

When it comes to real estate, a waterfront view is a prime selling feature—as long as the water is clean. Ocean, lake, or riverfront properties often sell or rent for several times the value of similar properties located inland. In fact, according to the National Association of Home Builders, proximity to water raises the value of a home by about 28 percent. Similarly, a 1991 American Housing Survey found that "when all else is equal, the price of a home located within 300 feet from a body of water increases by up to 28 percent."

Community and business leaders also understand the potential value of waterfront locations. Today, waterfronts are often a focal point for urban renewal in many cities. These opportunities are due, in part, to the federal Clean Water Act. Prior to passage, many of our rivers and waterfronts were so polluted that no one wanted to go near them, much less invest in new development. As an example, the Nashua River in New Hampshire was reported to be so degraded that some property along the

Waterfronts Act as Magnets



Clockwise from top left: Mississippi River, New Orleans, Chesapeake Bay, Baltimore Harbor, Willamette River, Portland, Cuyahoga River, Cleveland

river was actually assessed as "worthless" because of the poor conditions. Today, because of cleaner water and revitalization efforts along the Nashua River and in other communities, waterfront areas are often considered "priceless" by those who enjoy them. They act as a strong magnet for business, tourists, and local residents. Restaurants, shops, and aquariums are springing up in areas that were once no more than dilapidated urban wastelands.

Many communities now hold festivals and other special events to celebrate the beauty and bounty of their waters. These events are held because people recognize and value the contribution that a river or lake or beach can have in enhancing their overall quality of life. Clean water consistently ranks as a leading quality of life indicator. Each year, *Money* magazine conducts a "Best Places To Live" survey, and in 1995, clean water and air were the two most important factors for choosing a place to live, over low crime rates, plentiful doctors or hospitals, or low taxes.

Profile

The Change in Chattanooga

What happens when a city receives the title of most polluted city in the country? This label, attached by the U.S. Department of Health, Education, and Welfare in 1970, served as a wake-up call for Chattanooga, Tennessee, a city of 150,000 which sits on a bend of the Tennessee River in the southeastern corner of the State. Chattanooga has transformed itself with a major focus on cleaner water, and today, it receives international recognition as a model of sustainable development. In fact, it was recently chosen as one of 21 areas selected for study by President Clinton's Council on Sustainable Development.

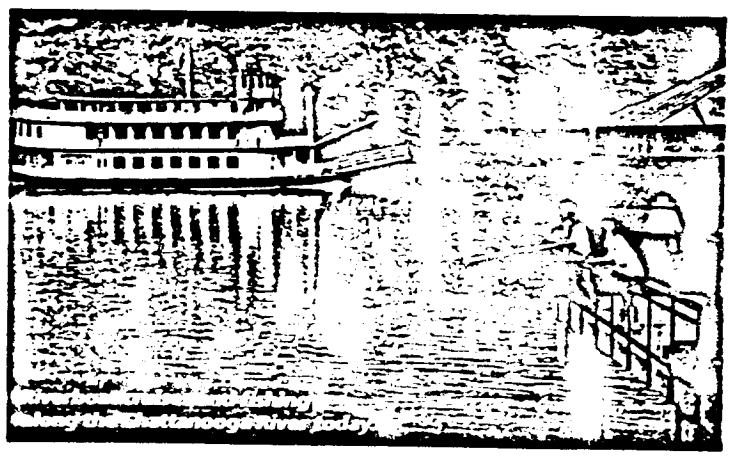
Over the years, easy access to transportation by railway and the river helped Chattanooga grow into a small industrial city. With this growth came pollution, and by the 1960s, the haze in the air was so thick that headlights were sometimes necessary at midday, and the river was unsafe for fishing or swimming.

In 1984, after years of decay, concerned citizens and members of the business community established "Chattanooga Venture" to tackle the city's problems. A group of over 1,700 community members reached consensus on 40 goals that included water quality, air quality, economic development, transportation, education, and housing. Together, they showed a desire for a strong local economy, but also clean air, recreational use of their river, and locally caught fish that were safe to eat.

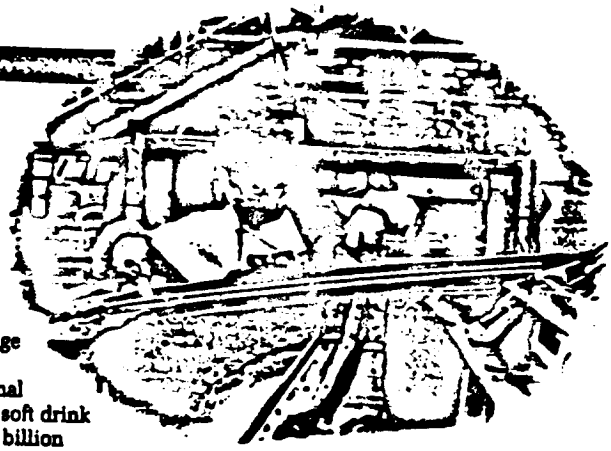
Restoration of the waterfront was a top priority, and over the next 10 years, deteriorating warehouses and piers were removed to open up access and views of the river. In 1992, the Tennessee Aquarium opened with a focus on freshwater fish and their river and lake habitats. Built at a cost of $45 million, it generated $133 million during its first year of operation. About 1.3 million people now visit every year.

Waterfront space was also revitalized for a new four-acre park and plaza area, known as Ross's Landing. Today, the area provides residents and visitors with open space as well as shopping and restaurants. In addition, about 2 miles of a planned 22 mile-long park along the eastern shore have been completed, providing recreational benefits for cyclists, pedestrians, skaters, and anglers. Mixed commercial and residential buildings are also planned along this greenway.

The improvements that have been made to Chattanooga's waterfront led James Yenckel, writer for the Washington Post *Sunday Travel Section to write, "By reinvesting in its river heritage, Chattanooga seems to have restored its faith in itself, and it appears—at least to my eyes—to be well on its way to becoming one of the prettiest cities for its size in America."*



Manufacturing: The Universal Solvent is Also a Key Ingredient



The size and nature of American industries varies widely, and yet, in one way or another, nearly all of them share a common need—a reliable source of water to support operations. In some cases, water is needed primarily for production purposes, such as in the manufacturing of computer chips or steel. In others, clean water is an essential ingredient in the final product, such as soft drinks and pharmaceuticals.

"My company requires high quality water to produce a high quality product."

The most recent data on water used in all manufacturing was last gathered by the Bureau of the Census over a decade ago. At that time, manufacturing companies used over 13 trillion gallons of water a year—more than 9 times the volume that flows from the Mississippi River into the Gulf of Mexico every day. About 84% of total use was attributed to four major industries—chemicals, metals, paper products, and petroleum.

More recent data on water is available from specific industries. For example, water is clearly vital to beverage manufacturers, and according to its national trade association, the soft drink industry uses over 12 billion gallons of water a year. Use is also high for malt beverage producers—it takes about 10 barrels of water to produce a single barrel of beer. These are highly lucrative industries, with each generating about $50 billion a year in sales. Together, they support about 3.5 million jobs and generate $270 billion in total economic activity. In sum, all manufacturing contributes about $1 trillion a year to the U.S. gross domestic product.

Increasingly, companies are choosing to become directly involved in community programs to protect the local water source. The Hershey Foods Corporation is working with its local water company in Pennsylvania to ensure that their water stays clean. And Coors Brewing Company in Colorado is working to prevent pollution of the local aquifer.

"Water is a fundamental input to our production process. My company requires high quality water to produce a high quality product. We must support protection of the community's ground water supply not only to protect our employees, but also to keep production costs down," says Jack Huggins, President and Chief Executive Officer of an ethanol and agricultural feed producing company in Pekin, Illinois. This reliance has not been lost on the local Chamber of Commerce. "We are going to use the Pekin protected water supply as a marketing tool for the community to expand business and attract companies," said Charles Renner, the Chamber of Commerce Executive Director. Indeed, if the water supply can be protected, the water supplier can avoid having to install expensive treatment technology. The result is a lower water bill for manufacturers and other customers in the community, as well as a higher level of confidence in the local drinking water supply.

Clean water often plays a role in corporate marketing campaigns. Several national companies use powerful images of water to convey qualities of freshness and purity. For example, Olympia Brewing Company in Washington has adopted the motto "It's the water" as their marketing slogan. As Samuel Rowse, President of juice manufacturer Veryfine Products, noted, "The integrity of a town's water reflects upon the integrity of the companies within that town."

Latest Estimate:

Manufacturing companies use over 13 trillion gallons of water a year—more than 9 times the volume that flows from the Mississippi River into the Gulf of Mexico every day.

Bringing Products to Market: How Many Gallons of Water are Used...?

To process a quarter pound of hamburger?	*1*
To make one board foot of lumber?	*5*
To process one can of fruit or vegetables?	*9*
To process one chicken?	*12*

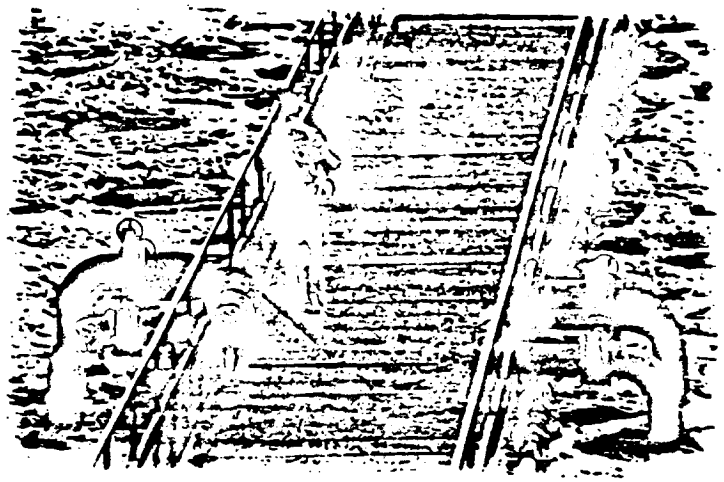
To make four new tires?	*2,072*
To manufacture a new car, including tires?	*39,090*
To produce one ton of steel?	*62,600*



Environmental Technology: New Products, New Markets

The future of the environmental technology industry depends not so much on *using* clean water, but on *delivering* it as a final product. Water companies treat water from local water sources, such as a river, an aquifer, or reservoir, and provide a product safe for drinking. Similarly, sewage plants treat wastewater from our homes and industries before releasing it to local rivers and streams. In 1994, the market for water related equipment, chemicals, and services was over $64 billion here in the United States and over $170 billion worldwide.

Clean Water Technology Keeps Our Communities Healthy

The United States has:

- *nearly **58,000 community water systems** providing drinking water for about 80 million households.*
- *nearly **16,000 public sewage treatment plants** providing service for about 71 million households.*

***Wastewater treatment technology** prevents over 900 million pounds of sewage and 1 billion pounds of toxic chemicals from entering our waterways every year.*

***Drinking water safety standards and technologies** help prevent over 100,000 cases of gastro-intestinal illness and reduce lead exposure for over 50 million people.*

"As we protect our environment, we must invest in the environmental technologies of the future which will create jobs."

President Clinton
State of the Union Address
January 1994

While the U.S. has traditionally represented the world's strongest environmental market because of higher standards, other countries are beginning to invest in environmental infrastructure and technologies. The international environmental market, now estimated at over $400 billion for all media (i.e., water, air, and waste) is expected to double in size by the turn of the century, and foreign shores represent major market development opportunities. In general, water-related investments are likely to be among the first made. Safe drinking water and sewage treatment are essential services that simply do not exist in some areas.

While improving the environment, U.S. and global investments in environmental technologies also create high-skill, high-wage jobs. Nearly 1.3 million Americans are employed by more than 50,000 private environmental technology companies nationwide. Thousands more work for public companies, such as sewage treatment and drinking water plants. In 1995, the Department of Labor identified environmental technology as a key growth sector for the economy, creating jobs at about twice the rate of the economy as a whole.

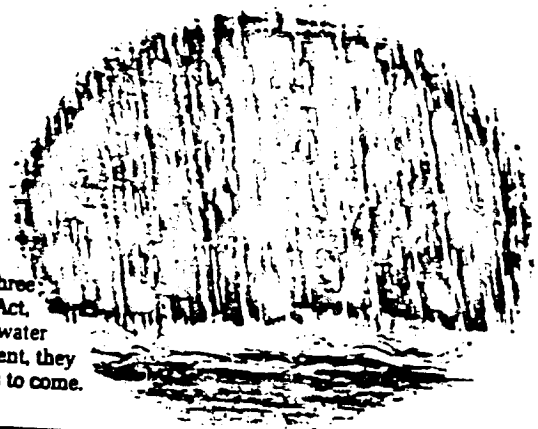
Profile

Creating Jobs *and* a Clean Environment

Environmental technology represents a major growth industry for California's economy. The State's Employment Development Department estimates that about 200,000 people work in the environmental technology sector. Revenues from this industry are expected to reach $27 billion by 1997, up from $19 billion in 1992.

Clean Water Insurance:

Our Three Major Water Laws



Over the years, major legislation has been written, debated, and signed into law to help protect the quality of America's water resources. The three most significant laws are the Clean Water Act, the Safe Drinking Water Act, and the Ocean Dumping Act. Together, they represent a national clean water insurance policy. By providing a framework for protection and investment, they offer the promise of safer, cleaner waters for all of us and for generations to come.

Clean Water Act

The Federal Water Pollution Control Act is the primary Federal legislation that protects surface waters, such as lakes, rivers, and coastal areas. Originally enacted in 1948, the legislation was significantly expanded and strengthened in 1972 in response to growing public concern for serious and widespread water pollution problems. This 1972 legislation, which became known as the Clean Water Act (CWA), provided the foundation for the dramatic progress in reducing water pollution over the past twenty years. Amendments to the 1972 Clean Water Act were made in 1977, 1981, and 1987.

The Clean Water Act focuses on improving water quality by maintaining and restoring the physical, chemical, and biological integrity of the nation's waters. It provides a comprehensive framework of standards, technical tools, and financial assistance to address the many stressors that can cause pollution and adversely affect water quality, including municipal and industrial wastewater discharges, polluted runoff from urban and rural areas, and habitat destruction.

The Clean Water Act requires national performance standards for major industries, such as iron and steel manufacturing and petroleum refining, that provide a minimum level of pollution control based on the best technologies available. These national standards result in the removal of over one billion pounds of toxic pollution from our waters every year.

In addition, the Clean Water Act establishes a framework whereby States and Tribes survey their waters, determine an appropriate use, such as recreation or water supply, and then set specific water quality criteria for various pollutants to protect those uses. These criteria, together with the national industry standards, are the basis for permits that limit the amount of pollution that can be discharged to a water body. Under the National Pollutant Discharge Elimination System, sewage treatment plants and industries that discharge wastewater are required to obtain permits and to meet the specified limits in those permits.

The Clean Water Act also provides Federal funding to help States and communities meet their clean water infrastructure needs. Since 1972, over $66 billion in Federal grants and loans have been provided, primarily for building or upgrading sewage treatment plants. Funding is also provided to address another major water quality problem—polluted runoff from urban and rural areas.

Protecting valuable aquatic habitat, such as wetlands, is another important component of this law. Filling wetlands with dredged or fill material can destroy or degrade these important aquatic areas and have a profound impact on water quality. To minimize impacts, the Clean Water Act establishes a permitting program to ensure that these types of activities are conducted in an environmentally sound manner.

Safe Drinking Water Act

The Safe Drinking Water Act was passed in 1974 following public concern over findings of harmful chemicals in drinking water supplies. The law established the basic Federal-State partnership for drinking water used today. It focuses on ensuring safe water from public water supplies and on protecting the nation's aquifers from contamination.

To ensure the safety of public water supplies, the law requires EPA to set safety standards for drinking water.

Standards are now in place for over 80 different contaminants. EPA sets a maximum level for each contaminant; however, in cases where it is not economically or technologically feasible to make this distinction, EPA specifies an appropriate treatment technology instead. Water suppliers are required to test their drinking water supplies and maintain records to ensure quality and safety. Most States have the responsibility for ensuring that their public water supplies are in compliance with the national safety standards.

Provisions also authorize EPA to conduct basic research on drinking water contamination, to provide technical assistance to States and municipalities, and to provide grants to States to help them manage their drinking water programs.

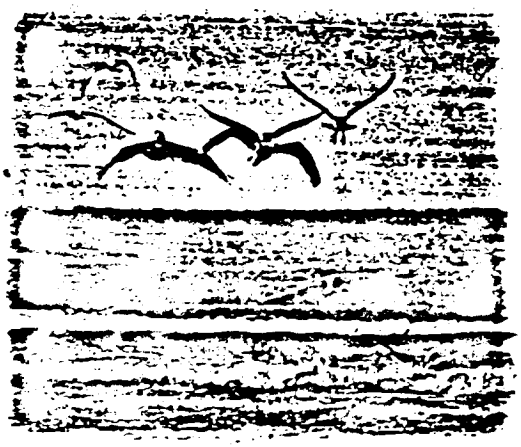
To protect ground water supplies, the law provides a framework for managing underground injection of wastes. EPA has responsibility for issuing permits for these operations and ensuring compliance. EPA also has the authority to prohibit new wells in areas that depend on a single aquifer for their drinking water.

Ocean Dumping Act

Also passed in 1972, the Ocean Dumping Act provides a framework for managing ocean dumping activities and for conducting basic oceanic research. The law bans ocean dumping of radiological, chemical, and biological warfare agents and high-level radioactive waste. Amendments in 1988 extended this ban to sewage sludge, industrial waste, and medical wastes.

The law provides a mechanism for meeting U.S. commitments under the 1972 Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matters, an international ocean dumping treaty signed by 80 countries.

It also authorizes research on the effects of ocean dumping, pollution, over-fishing, and other human-induced stressors, including oil spills. Provisions added in 1992 establish a national coastal water quality monitoring program to evaluate the health and quality of ocean waters and the pollution sources that affect them.



Joint Ventures:

How EPA Works in Partnership to Improve our Waters and Protect Public Health

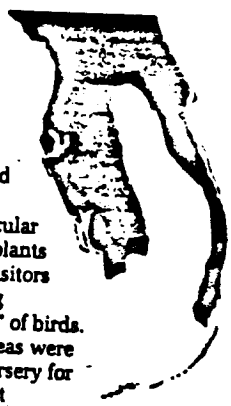
"Waste not, want not," a common American adage, should be considered as a national motto for managing our nation's water resources. Indeed, because our rivers, lakes, and coastal waters are so vital to our economy, our health, and our overall quality of life, they must be treated as a national treasure of the very highest priority.

EPA has a major role in managing this national treasure, acting as the nation's clean water guardian. But, the job of protecting and improving our waters cannot be done by just one government agency. Today, EPA is working hard to build and nurture partnerships with other federal agencies, citizens, industry and business leaders, and State, local and Tribal governments, all of which have important contributions to make in keeping our waters safe and clean. By leveraging resources and targeting actions to those problems in need of attention, EPA and its partners are helping to make safe, clean water and stronger economies a reality for all of us.

Restoring Valuable Ecosystems

EPA and its partners are involved in clean up and protection efforts in hundreds of watersheds throughout the country, but a few areas are getting special attention. Nationally, these areas represent some of our most important waters—ecologically and economically.

The Everglades



One hundred years ago, this unique ecosystem of water and land provided a home to spectacular populations of plants and animals. Visitors described seeing literally "clouds" of birds. Rich wetland areas were the principal nursery for the State's robust commercial and sport fishing industries. Today, while still a major tourist attraction, the Everglades are recognized as being on the verge of collapse. Ninety percent of the wading birds are gone, the estuarine fisheries have declined, and dozens of species are listed as endangered or threatened.

How did this happen? In the 1940s, intense flooding in South Florida took lives and damaged property. A complex system of public canals, levees, pumping stations and other structures was built to control the water and make the land more suitable for farming and urban development. The system worked—too well. Half of the Everglades' wetlands were drained and converted to agriculture or urban developments.

Over time, the impact of these conversions has become obvious, and a series of actions has been taken to restore the natural ecosystem. In 1993, Florida and the U.S. Army Corps of Engineers began the task of converting the Kissimmee River from an "engineered" channel back into its more natural, riverine form. In addition, a special federal task force on South Florida ecosystem restoration was established to improve coordination among the Federal, State, and Tribal interests in the area. A milestone was reached when the State and the sugar industry agreed to work together to reduce phosphorous loadings by 75 percent. This past January, the Clinton Administration announced a comprehensive restoration approach, including a $1.5 billion federal assistance package, to speed up the restoration process. Among other things, the funding is to be used to acquire, in partnership with Florida, enough land to make restoration a reality, including the purchase and reconversion of over 100,000 acres of farm lands. The funding is also to be used to continue work on the Kissimmee River, to construct wetlands to serve as natural filters for phosphorous and other pollutants, and to develop a multi-species recovery plan. Most recently, in April 1996, Congress passed and the President signed into law a new Federal Agriculture Improvement and Reform Act, otherwise known as the Farm Bill, which provides up to $300 million for Everglades restoration.

Together, these and other investments have the potential to make an enormous difference in the health of this great ecosystem, and future generations may very well look back and point to the 1990s as the turning point in Everglades history. A Save Our Everglades campaign has helped to acquire and protect over 326,000 acres of land in the area. Hydrologic improvements have helped rid the ecosystem of exotic species that invade and disrupt the area's natural vegetation and habitat. And, in just the last three years, phosphorous levels in water discharged from farm lands north of the Everglades have been cut by about 30 percent.

But while signs of improvement can be seen, the ecosystem remains in critical condition. The road to recovery will require continued vigilance and commitment to addressing the many stressors that threaten this fragile ecosystem and the many species that live there.

The Great Lakes

Considering that about 95 percent of all fresh water above ground in the U.S. is in the Great Lakes, it is pretty clear why water quality there is so important. Over 23 million people living in the region depend on these magnificent lakes to provide their drinking water and to support other uses. Not surprisingly, a study by the Health Education Research organization found that over 80 percent of those surveyed wanted to see more done to protect the Great Lakes environment.

And more is being done. In just the past two years, toxic pollution from a wide variety of sources, including manufacturing and sewage treatment plants, has been significantly reduced. PCB emissions have been virtually eliminated and levels of mercury, the pollutant most often found in contaminated fish, have been cut by over 60 percent.

The eight States which border the Great Lakes have long recognized the need to work together on common-sense, cost-effective solutions to reduce the harmful effects of toxic pollution. In the late 1980s, the States asked EPA to help develop a consistent approach for achieving these reductions. In 1994, a major milestone was reached. After working closely with the States, industry, and other interested parties, EPA issued guidance that goes a long way towards reducing toxic pollution. Known as the Great Lakes Water Quality Initiative, this guidance will help ensure a consistent level of environmental protection throughout the region. In addition to providing a cleaner, healthier environment, the guidance will also help to level the economic playing field among corporate competitors. Companies in similar industries throughout the region will be held to the same performance standard, eliminating economic advantages that might occur as a result of lower standards in some areas.

Other efforts are also underway to help protect the Great Lakes from toxic pollution. DDT and other pesticides have been banned for use in this country, and yet they can still pose a powerful threat if old supplies are forgotten or disposed of improperly. Several States in the Region now host agricultural "clean sweeps" to gather and arrange proper disposal of these and other pesticides. EPA has helped States and counties sponsor these events, and many individuals have volunteered their time to help organize and manage them. Between 1992 and 1994, community clean sweep events helped remove nearly 20,000 pounds of toxic material from around Lake Superior.

The medical industry is another active partner, helping to reduce one of region's most serious toxic problems – mercury. The majority of mercury pollution in the Great Lakes comes from air pollution generated by coal-burning utilities and incinerators. However, mercury is also found in many medical products, and unless these products are disposed of properly, the very products designed to improve public health can cause serious harm. To reduce this risk, EPA supports a partnership between regional doctors, nurses, hospitals, local governments and the National Wildlife Federation aimed at educating those working in the industry about proper disposal and product alternatives. The goal is to reduce mercury, and if possible, to eliminate the use of mercury-containing products altogether.

"Many hospitals and health care facilities throughout Michigan are already taking steps to eliminate as much of the mercury we use as posssible. In keeping with our mission of providing quality health care and promoting a healthy environment, we're looking forward to spreading this information across the Michigan health care community," said David Seaman, Executive Vice-President of the State Health and Hospital Association.

While the amount of toxic pollution being released into the Great Lakes is being reduced, the problem is not completely solved. Toxic chemicals from the air, from contaminated bottom sediments, from agricultural and urban runoff and from Superfund sites still pose a threat to the environment and the people who live there. These sources present a management challenge, and they call for a continued strong emphasis on pollution prevention and toxics control throughout the region.

Profile

Action by the Auto Industry

The American Automobile Manufacturers Association, on behalf of Chrysler Corporation, Ford Motor Company and General Motors Corporation, worked with the Michigan Department of Natural Resources to establish an automobile pollution prevention project. Launched in 1991, the manufacturers agreed to voluntary actions to help reduce emissions of over 65 toxic chemicals in the Great Lakes area. Since that time, toxic emissions have been cut by 15 percent. If zinc emissions from two plants are excluded, the rate of total toxic reduction is over 50 percent. Because of its success, the program is now being expanded to automobile manufacturers in other parts of the country.

San Francisco Bay-Delta

The San Francisco Bay-Delta is another area getting special attention. Comprising more than 1,650 square miles—an area about the size of Rhode Island—the estuary is a source of drinking water for 20 million people, provides irrigation for over 4.5 million acres of farmland, supports more than 120 species of fish, and is an internationally important waterfowl migration area. It also drains nearly 40 percent of California's land area. Over the years, water diversion, loss of wetlands, and polluted runoff from urban and rural areas have seriously impacted the health of the ecosystem.

Today, multiple government agencies, groups, and individuals are working to stop the pollution and repair the damage. One of the most important efforts to date occurred in 1994. The Clinton Administration worked with

Profile

Volunteers Make a Difference

Increasingly, private citizens are turning their concern for their local environment into action by volunteering to monitor water quality in lakes, rivers, or coastal areas. In the Bay-Delta area, hundreds of people, young and old, have received training and begun to collect and report important water quality information. Mike Rigney, who works at the Coyote Creek Riparian Station, has trained nearly 200 people in the last few years. When asked whether these volunteers really provide reliable data, Mike was quick to answer "yes!". Indeed, these individuals are making a valiant and valuable contribution, doing what they can to help improve conditions in their community.

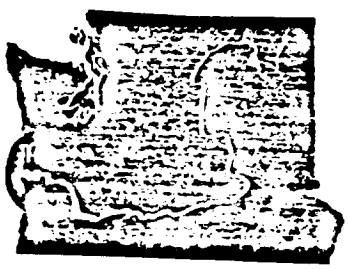
industry, farmers, environmentalists, state officials, and others to craft an historic consensus-based agreement on actions to improve the Bay-Delta environment while providing more certainty in water supplies for the State's future. The common sense strategy allocates water use among the estuary, farmers, and urban users, breaking gridlock on a decade-long water war in the region.

The North Bay Initiative is another important component in the ecosystem's restoration. The North Bay is known for vast ranch lands, rich aquatic habitats, and some of the most productive vineyards in the world. EPA and other Federal, State, and local governments are working together and with landowners in the area to promote common-sense land use management.

The San Francisco Bay National Estuary Program has provided a major platform for planning, coordinating, and managing many restoration activities. The National Estuary Program, which includes 27 other high priority estuaries in addition to the Bay-Delta, brings together multiple stakeholders, including government, business interests, and private citizens to set priorities and find practical solutions for the problems threatening their estuary. Mapping the distribution of native fish species and streamside forests, preserving wetlands, and monitoring water quality are just a few of the activities that have been conducted since the San Francisco Bay Delta program was established in 1987.

Work to restore the Bay-Delta is also being done by the academic community. For example, Professor Robert Twiss of the University of California at Berkeley's Center for Environmental Design and Research is building an extensive geographic information system (GIS), an electronic tool that can map and compare different environmental and land use factors. With more than 50 data sources, the GIS system will be able to show everything from streams and wetlands to urban growth scenarios. To Twiss, GIS and advanced telecommunications have the power to assure wide public access to information. Rather than having one centralized government repository, Twiss envisions a large number of information suppliers (universities, government agencies, volunteer groups) and users (libraries, schools, homes, private firms) connected by a network. "Demystifying and de-professionalizing this kind of information is a very important democratic principle," says Twiss. "It's enormously empowering. It's a way for the estuary project to connect at the grassroots level."

These and other efforts are helping to improve conditions in one of the country's most productive areas. In particular, the Bay-Delta accord addressing water allocation shows that progress can be made on even the most complex and contentious issues. Remaining challenges, as well as emerging ones, such as the rapid introduction and growth of exotic species, will require a similar level of resolve and commitment to finding workable, common-sense solutions.



The Columbia River

As the second largest river in the U.S., the Columbia River is a resource of national and regional significance. This mighty river drains seven states before emptying into the Pacific Ocean, where the mixing of fresh water with salt water provides important estuarine habitat for fish, other aquatic species and wildlife. The river also helps to support agriculture, forestry, commercial and sport fisheries, hydropower generation, and recreation and tourism industries.

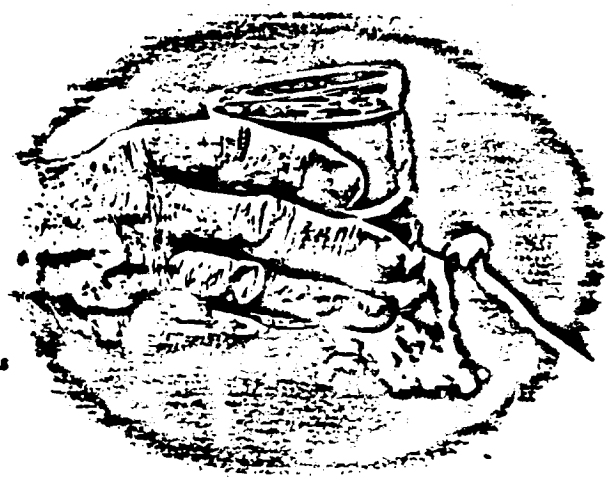
Despite its many uses and benefits for the region, evidence continues to show that this great river is at risk. High concentrations of PCBs, dioxin and other toxic pollutants have been found in sediment and fish tissue in the lower river. Reproductive success for salmon and other species is being affected, and fish consumption advisories are now in place throughout the region. Dam operations, along with habitat loss and pollution, have hurt fisheries. Some salmon species are threatened, endangered, or already extinct. These impacts represent quite a loss in a river that was once passageway for over 15 million salmon a year.

Recognizing the significance of the resource and the need to ensure its protection and restoration, the Lower Columbia River was selected as a site for inclusion in the National Estuary Program in 1995. A team of concerned citizens along with representatives from Federal, State, and local government agencies, environmental groups, and industry is being established to plan and guide priority actions. In addition, in 1994, President Clinton announced a Pacific Northwest Forest Plan to improve management of over 25 million acres of

federally owned forests in the region. Improving forest management will involve protecting streamside areas and reducing polluted runoff from harvest areas, both of which should help to improve water quality and habitat for salmon and other fisheries. One of the largest-scale ecosystem management efforts ever undertaken, the plan will maintain and restore old growth forests, water quality, fish and wildlife habitat, and allow sustainable timber harvests of over 1 billion board feet per year. It calls for over 2.6 million acres to be set aside along streams and wetlands to provide clean water and habitat for fish and wildlife. It provides a stronger scientific basis for managing the area's resources by increasing monitoring and data analyses, and provides funding for education and training to help counter any potential job losses related to timber harvesting restrictions. To date, more than 500 watershed restoration projects have been initiated or completed to improve ecological conditions.

The comprehensive management plan being developed through the National Estuary Program and the Forest Plan provide a strong basis for addressing some of the highest priority problems facing the region. But, they represent only a beginning. Remaining challenges, such as how to best reduce toxic pollution, call for continued action and attention.

Targeting High Priority Problems



As a result of public and private sector investments in infrastructure and technologies and a commitment to preventing pollution and improving overall environmental performance, our waters are much cleaner today compared to twenty five years ago. But, we still have areas where the water is too polluted to safely swim or eat the fish. And Americans are increasingly worried about the safety of their drinking water. The problems that still plague our waters do not have fast and easy fixes. To a great extent, our abilty to find and apply workable solutions will depend on strong, highly commited partnerships involving individuals as well as the public and private sectors.

Drinking Water Contamination

In 1993, a drinking water crisis in Milwaukee sounded a national alarm on drinking water safety. The contaminant, *Cryptosporidium*, shut down the city's water supply, costing businesses and commercial establishments over $50 million in lost economic activity. Even more importantly, it left over 400,000 people sick, and was attributed as the cause of over 100 deaths.

Unlike many microorganisms, *Cryptosporidium* cannot be eliminated with normal disinfection processes, but contamination can be reduced through careful filtration. Recognizing the need to protect people from this and other microbial contaminants, public water suppliers and EPA developed the "Partnership for Safe Water." Under this voluntary program, suppliers that use surface waters carefully survey their filtration systems, operating and maintenance procedures, and other management activities to determine whether action is needed to reduce the risk of contamination occurring. To date, 140 water companies serving more than 74 million Americans have joined up and committed to take action, if needed.

The Groundwater Guardian Program is another voluntary way to improve drinking water safety. Established and managed by a nonprofit organization in the midwest, and strongly promoted by EPA, this program focuses on communities that rely on ground water for their drinking water. It provides special recognition and technical assistance to help communities protect their groundwater from contamination. Since beginning in 1994, Groundwater Guardian programs have been established in nearly 100 communities in 31 States.

These voluntary efforts represent practical approaches to help ensure safe drinking water. But for some risks, stronger safeguards are needed. For example, to better protect the public against *Cryptosporidium*, EPA recently began requiring the nation's largest water suppliers to monitor for signs of contamination. The data will be used to clarify current scientific uncertainties and allow EPA to move forward on setting an appropriate safety standard for all systems in the future.

Profile

Guarding Ground Water in Oklahoma

Ada, Oklahoma is a small town of 15,000 people which relies on a single aquifer for its drinking water. Eight people there have formed a Groundwater Guardian team and are now volunteering their time and energy to keep their ground water clean. To accomplish this goal, the team focuses on education. In the past year, they have developed and widely distributed an information brochure to the local citizens. They have also made numerous presentations to local service clubs and held public meetings to inform local residents about drinking water issues.

Profile

Rochester Takes Action

Rochester, New York is one city that has already acted to address its combined sewer overflow problems. Using an approach similar to the national combined sewer overflow policy, Rochester's sewer system now captures and treats more than 3 billion gallons of combined sewage annually. Automated rainfall monitoring and computerized "smart" controls help the system optimize its response to a variety of rainfall and flow conditions. As a result, combined sewer overflows discharge to the Genesee River only about twice a year, and they have been virtually eliminated as a cause of beach closures on Lake Ontario. An increase in real estate values along Irondequoit Bay has been directly linked to the recent water quality improvements.

Raw Sewage Spills

For the most part, raw sewage is no longer routinely dumped into our nation's waters. Sewage treatment plants are very effective at treating wastewater so that it can be safely discharged to local waterbodies. In fact, the amount of pollution being discharged from these plants has been cut by over one-third during the past twenty years, even as the number of people being served has doubled.

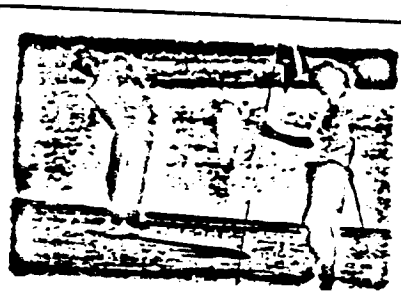
Yet, in some communities, raw sewage spills still occur. Sometimes spills occur because a sewer line is blocked, broken or too small. Spills can also occur during periods of heavy rainfall when the capacity of the sewer line or sewage treatment plant becomes overloaded and overflows into city streets or streams. In many older cities, sewers were designed to carry storm-water runoff along with sewage, and to overflow if a heavy rain exceeded the capacity of the system. These combined sewer overflows or "CSOs" as they are often called, occur in about 1,000 cities around the country.

In addition to spilling raw sewage, CSOs can also release untreated industrial wastewater and street debris. The result can be a real menace to public health, recreational uses, and commercial fishing. In fact, CSOs are a leading cause of beach closures and shellfishing restrictions around the country.

While the local impacts of CSOs can be significant, so is the cost of fixing them. For years, many cities were too daunted by the financial considerations to take action. But in 1994, a breakthrough occurred. Working closely with the States, affected cities, and environmental groups, EPA helped develop a consensus policy to guide action on CSOs. It encourages cities to pursue certain minimum, low-cost controls and to develop a full understanding of local CSO occurrences and impacts before making longer-term investments in additional wastewater treatment, temporary storage capacity, and sewer rehabilitation. The policy balances the need to protect the environment and the public with the need for reasonable cost-effective controls tailored to local environmental and financial conditions. This departure from a one-size-fits-all regulatory approach is expected to provide sound environmental protection at one-fourth the cost of previous proposals.

Profile

Golf Goes Green



For years, the golf industry and the environmental community have been at odds over environmental benefits of golf courses. Golf course architects, superintendents, and owners have always considered themselves stewards of the land. In contrast, the environmental community viewed the use of pesticides and other golf course management practices as damaging to habitat and water quality. With little actual contact, neither constituency had a clear grasp of the other's ideas and the distance between the two camps continued to grow.

In January 1995, however, a new relationship was established. At that time, EPA helped convene the first ever national meeting between the golf industry and the environmental community. A diverse group of 75 participants met to consider, "Is golf as environmentally safe and sensitive as it can be?", and "How can we make it more so?". The conference opened a long-overdue dialogue that has led to an agreed-upon set of principles for managing golf courses in an environmentally sound manner. They are not rules, but rather a set of voluntary guidelines for golf course developers, architects, superintendents, owners, and individual golfers. The principles have been very well received, earning endorsements from the American Society of Golf Course Architects, the Ladies Professional Golf Association, the Southern Environmental Law Center, and the National Wildlife Federation.

Polluted Runoff

Rain, sleet, and snowmelt washes off the land into streams, lakes, and bays or seeps into ground water. Moving across farm fields, city streets, or suburban backyards, this runoff picks up soil particles, pesticides, fertilizers, animal wastes and other pollutants. Because it comes from so many areas and sources, polluted runoff is much more difficult to quantify and to control compared to pollution from industry and municipal wastewater outfalls. Yet, State and Tribal water quality agencies now estimate that it is the leading cause of water pollution.

To deal with the problem, EPA is emphasizing voluntary, cooperative management approaches designed to create greater awareness about how our waters can become polluted from everyday activities or lifestyle choices. Many businesses now understand how their operations can affect water quality, and they are willing to work with EPA to find common-sense, practical solutions.

EPA's Partners in Prevention program has helped bring many of these partners

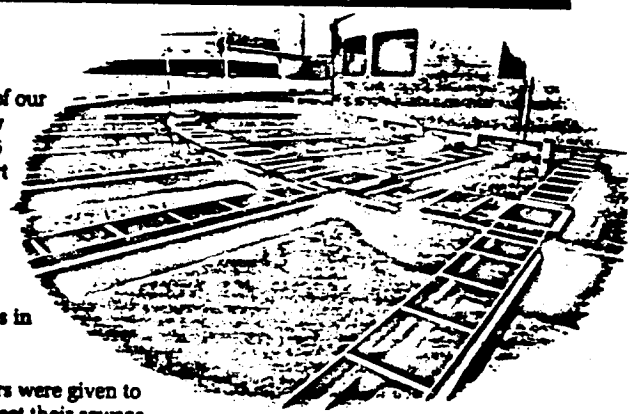
to the table. Through this program, EPA is working with national associations to accelerate voluntary adoption by their members of modern, economical management practices that reduce polluted runoff while maintaining or even enhancing production.

One partner that is very active and providing leadership for the entire livestock industry is the National Pork Producers Council (Pork Council), an organization that represents over 90,000 pork producers in all 50 States. If not managed properly, waste from hog farms can have a devastating impact on water quality. To improve overall environmental performance, the Pork Council produced and distributed to its members a "Guide to Environmental Quality in Pork Production," a "plain-English" handbook describing sound management practices that should be followed. Since publication in 1993, the Pork Council has been working in partnership with EPA, the U.S. Department of Agriculture, and State water quality agencies, to hold workshops designed to deliver hands-on, practical advice for putting these practices into place. Over 65 workshops have been conducted in 14 States. The next step is an Environmental Assurance Program which will promote on-the-farm self-assessments to identify potentially needed environmental improvements. Most recently, the Pork Council held a national summit on environmental issues to continue to improve the industry's commitment and response to ongoing concerns, including proper management and design of hog waste lagoons.

In the summer of 1995, a hog waste spill along the New River in North Carolina killed thousands of fish and resulted in a health warning to protect public health. This incident, which serves as an example of why environmental performance standards are needed, was followed by national guidance from EPA in 1996 which clarifies how large livestock operations should be managed to ensure compliance with national water pollution control requirements.

Investing in Technology and Infrastructure

Since 1972, the Federal government has invested over $66 billion in municipal wastewater treatment. Millions more have been invested by State and local governments to help meet the service needs of a constantly growing population. And these investments have paid off.



The fact that so many of our nation's waters are now cleaner compared to 25 years ago is in large part due to better sewage treatment. Today, the U.S. enjoys what is probably the most advanced network of sewage treatment plants in the world.

For years, Federal dollars were given to communities to help meet their sewage treatment needs through the Clean Water Act Construction Grants Program. However, in 1987, Congress replaced the grants program with a revolving loan program, known as the State Revolving Fund. Under this program, EPA provides grants to the States, and the States then make loans to communities. As the money is paid back, new loans are given to other communities also needing help.

This program represents a powerful financial partnership between EPA and the States, allowing the States to fund their highest priority needs. While traditionally used to build or improve wastewater plants, the State Revolving Fund is also being used to address other water quality problems, such as polluted runoff and sewer overflows.

The program is also a model of efficiency, allowing Federal, State, and local government agencies to leverage limited dollars. Because of the revolving nature, over a twenty year period, an initial federal investment can result in the construction of up to 4 times as many projects compared to a one-time federal grant. And because of new streamlined requirements, State Revolving Fund projects are completed about 30 percent faster compared to those funded with grants. Local governments can benefit by saving a great deal of money. The typical cost of a project funded with a State Revolving Fund loan is about 30 percent to 50 percent less compared to the cost of a project funded through the commercial bond market.

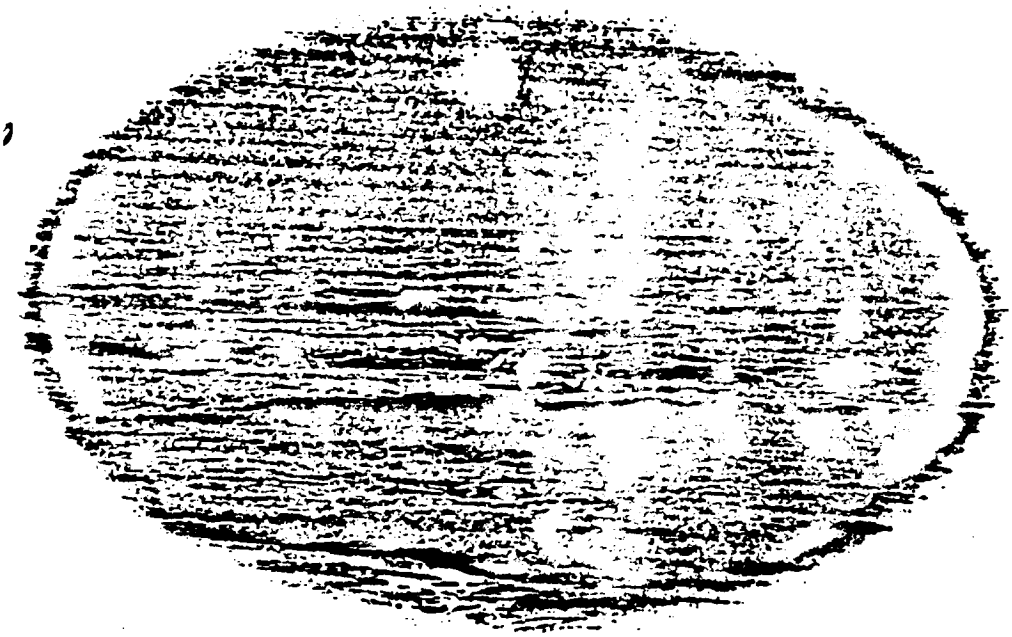
Because of its efficiency and importance in helping communities meet their clean water goals, in 1994, the Clinton Administration recommended a similar program to help communities provide an equally important service—safe drinking water. A total of $1.8 billion has been proposed since then, marking the first time ever that funds to ensure safe drinking water have been made a federal investment priority.

Profile

Sewage Solutions in Indiana

Two small towns in Indiana, Wanatah and Lake of the Woods, received loans from the State Revolving Fund to help replace septic tanks and construct badly needed sewage collection and treatment systems. In both cases, the septic tanks were not functioning properly because of inadequate lot sizes and unsuitable soils. The result was sewage contamination in local streams and lakes. The centralized treatment systems allowed each town to eliminate a major source of water pollution, restoring recreational opportunities for local citizens.

The new sewage systems also helped restore economic opportunity. "In Wanatah, growth was at a standstill due to the septic tank moratorium" said Chuck Mack, the town utility supervisor. The SRF loan allowe dthe community to lift the moratorium, and begin providing service to commercial and private residents. Because of the loan's lower interest rates, these services are provided at a lower monthly cost. According to Mr. Mack, "We see the loan as a real benefit to our community."



Conclusion

Clean water has irreplaceable value and enormous potential for affecting many sectors of the economy. A full spectrum of industries and commercial businesses are at stake as well as the livelihoods of real people. Real estate agents in the northeast, commercial fishermen in the Gulf of Mexico, charterboat captains in the Great Lakes, and hotel owners along Southern California beaches are just a few of the people that depend on clean water to deliver their products and services.

Investing in clean water is a common sense way to protect these businesses and ensure healthy, thriving communities. And many people and organizations are making that investment by joining in partnership with EPA, States, Tribes, and others to help clean up and protect our waters. These partnerships are encouraging as they demonstrate a willingness to invest both time and resources in order to receive the most important of all dividends—the assurance of safe, clean water for use today and tomorrow. In the short-term and long-term, for communities and for the nation, it is hard to imagine a sounder investment opportunity.

OFFICE OF
WATER

MEMORANDUM

SUBJECT: Interpretative Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems

FROM: Robert Perciasepe
Assistant Administrator

TO: EPA Water Management Division Directors

The purpose of this memorandum is to transmit to you a final policy which outlines the reapplication requirements for operators of municipal separate storm sewer systems (MS4s). This policy sets forth a streamlined approach for reapplication for MS4 permits. It allows municipalities to use recommended changes submitted in their fourth annual report as the principal component of their reapplication package. It also encourages changes to monitoring programs to make them appropriate and useful to storm water management decisions. With this policy, the Office of Water is seeking to improve municipal storm water management efforts by allowing municipalities to target their resources for the greatest environmental benefit. We encourage authorized NPDES States to consider this approach.

Numerous parties were involved in preparing this policy. These included State and Regional Water Management Directors, State and Regional Storm Water Coordinators, members of the Urban Wet Weather FACA committee, members of the National Association of Flood and Storm Water Management Agencies, and Tribal Operations Committee members.

If you have questions regarding this policy, please contact William F. Swietlik at (202) 260-9529 or Marilyn Fonseca at (202) 260-0592. I thank you for your assistance.

OFFICE OF
WATER

Dear State Water Program Directors:

The purpose of this letter is to transmit to you a final policy which outlines the reapplication requirements for operators of municipal separate storm sewer systems (MS4s). This policy sets forth a streamlined approach for reapplication for MS4 permits. It allows municipalities to use recommended changes submitted in their fourth annual report as the principal component of their reapplication package. It also encourages changes to monitoring programs to make them appropriate and useful to storm water management decisions. With this policy, the Office of Water is seeking to improve municipal storm water management efforts by allowing municipalities to target their resources for the greatest environmental benefit. We encourage authorized NPDES States to consider this approach.

Numerous parties were involved in preparing this policy. These included State and Regional Water Management Directors, State and Regional Storm Water Coordinators, members of the Urban Wet Weather FACA committee, members of the National Association of Flood and Storm Water Management Agencies, and Tribal Operations Committee members.

If you have questions regarding this policy, please contact William F. Swietlik at (202) 260-9529 or Marilyn Fonseca at (202) 260-0592. I thank you for your assistance.

Sincerely,

Bob Perciasepe

MUNICIPAL SEPARATE STORM SEWER SYSTEM PERMIT REAPPLICATION POLICY

The 1987 amendments to the Clean Water Act added Section 402(p) which directed the Environmental Protection Agency to establish regulations governing storm water discharges under the National Pollutant Discharge Elimination System (NPDES) program. Early in the program, Congress specifically required NPDES permits for municipal separate storm sewer systems (MS4s) serving populations over 100,000. In response, EPA promulgated regulations in 1990 that established permit application requirements for MS4s that serve populations over 100,000. MS4 permits have since been drafted and finalized for many municipal systems. A number of MS4 permits are due to expire and must be reissued.

EPA is providing this policy memorandum to outline permit reapplication requirements for regulated MS4s. There are three components to EPA's reapplication policy. First, EPA is not requiring that the process used for part 1 and 2 of the initial permit application be repeated in full. Second, EPA has identified basic information that should be included in every reapplication package. Finally, EPA is seeking to improve existing MS4 storm water management programs by using information and experience municipalities have gained during the previous permit term.

<u>Is a permit reapplication necessary?</u>

Yes. The requirement that all point source discharges authorized by a NPDES permit must reapply is well established at 40 CFR sections 122.41(b) and 122.46(a):

> " *Duty to reapply*. If the permittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the permittee must apply for and obtain a new permit."
>
> " *Duration of permits*. NPDES permits shall be effective for a fixed term not to exceed 5 years."

The reapplication requirement is also found at 40 CFR Section 122.21(d):

> " *Duty to reapply*. ... All other permittees with currently effective permits shall submit a new application 180 days before the existing permit expires.."

Therefore, all regulated Phase I MS4s need to participate in a permit reapplication process.

Where a complete reapplication package has been submitted as

technical contacts for the municipal permittee(s).

In addition, in the reapplication, municipalities should identify any proposed changes or improvements to the storm water management program and monitoring activities for the upcoming five year term of the permit, if those proposed changes have not already been submitted pursuant to 40 CFR 122.42(c). [A requirement to submit proposed changes to the storm water management program is specified in the annual reporting requirements in 40 CFR Section 122.42(c)(2).] EPA encourages permitting authorities to make use of the fourth year annual report as the basic permit reapplication package.

Changes to the storm water management program may be justified due to the availability of new information on the relative magnitude of a problem or new data on water quality impacts of the storm water discharges. Municipalities may also propose to de-emphasize some program components and strengthen others, based on the experience gained under the first permit. Proposed elimination of a program component might be justified upon permit renewal; for example, when a component is no longer a problem area (i.e., all detention basins have been retrofitted) or when a different water quality program would serve the same goals.

The components of the original storm water management program which are found to be effective should be continued and made an ongoing part of the proposed new storm water management program. Such components may include:

- continued emphasis on public education programs, particularly programs on proper disposal of waste oil and household hazardous waste and pesticide application;
- continued, if not greater, emphasis on addressing impacts of new development/construction;
- proper storm design criteria for all new developments;
- retrofitting and/or upgrading of the existing storm sewer system according to a priority system;
- more frequent maintenance of storm sewer systems and storm water treatment systems;
- coordination with adjacent MS4s on monitoring or other efforts; and
- using a watershed approach to storm water management.

The accumulated annual report information as outlined in 40 CFR 122.42(c) should be evaluated and, to the extent applicable, be incorporated by reference into the reapplication package.

To reiterate, MS4s may use the fourth year annual report,

DRAFT INTERIM PERMITTING APPROACH FOR WATER QUALITY-BASED EFFLUENT LIMITATIONS IN STORM WATER PERMITS

In response to recent questions regarding the type of water quality-based effluent limitations that are most appropriate for National Pollutant Discharge Elimination System (NPDES) storm water permits, the Environmental Protection Agency (EPA) is adopting an interim permitting approach for regulating wet weather storm water discharges. Due to the nature of storm water discharges, and the typical lack of information on which to base numeric water quality-based effluent limitations (expressed as concentration and mass), EPA will use an interim permitting approach for NPDES storm water permits.

The interim permitting approach uses best management practices (BMPs) as water quality-based effluent limitations in first-round storm water permits, and expanded or better-tailored BMPs in subsequent permits, where necessary. In cases where adequate information exists to develop more specific conditions or limitations to meet water quality standards, these conditions or limitations are to be incorporated into storm water permits, as necessary and appropriate. This interim permitting approach is not intended to affect those storm water permits that already include appropriately derived numeric water quality-based effluent limitations or technology-based effluent limitations such as those based on effluent limitations guidelines or developed using best professional judgement (BPJ).

In order to gather necessary information about storm water discharges, storm water permits should include coordinated and cost-effective monitoring programs, such as ambient monitoring, receiving water assessment, discharge monitoring (as needed), or a combination of monitoring procedures designed to gather necessary information.

This interim permitting approach applies only to EPA; however, EPA also encourages authorized States to adopt similar policies for storm water permits. This interim permitting approach provides time, where necessary, to more fully assess the range of issues inherent in the control of storm water discharges for the protection of water quality. This interim permitting approach may be modified as a result of the ongoing Urban Wet Weather Flows Advisory Committee policy dialogue on this subject.

DRAFT Qs & As FOR INTERIM PERMITTING APPROACH FOR WATER QUALITY-BASED EFFLUENT LIMITATIONS IN STORM WATER PERMITS

Question 1: Must EPA require that storm water dischargers, industrial or municipal, be subject to numeric water quality-based effluent limitations (expressed as concentration and mass) in order to attain water quality standards (WQS)?

Answer 1: No, although National Pollutant Discharge Elimination System (NPDES) permits must contain conditions to ensure that water quality standards are met, this does not mandate the use of numeric water quality-based effluent limitations. Under the Clean Water Act (CWA) and NPDES regulations, permitting authorities may employ a variety of controls and limitations in storm water permits, including best management practices, performance objectives, narrative standards, monitoring triggers, action levels (monitoring benchmarks, toxicity reduction evaluation action levels, etc.), etc., as the necessary technology-based or water quality-based controls, where numeric water quality-based effluent limitations are determined to be infeasible.

Analysis:

A. The statute does not require numeric effluent limitations.

Section 301 of the statute requires that dischargers comply with effluent limitations necessary to meet State WQS. Section 502 defines "effluent limitation" to mean any restriction on quantities, rates, and concentrations of constituents discharged from point sources. Nowhere does the CWA say that effluent limitations need be numeric. As a result, EPA has broad flexibility in terms of how to define effluent limitations.

B. EPA's regulations do not require numeric effluent limitations.

EPA has, through regulation, interpreted the statute to allow for non-numeric limitations (e.g., "best management practices" or BMPs, see 40 CFR 122.2) to supplement or replace numeric limitations in specific instances that meet the criteria specified at 40 CFR 122.44(k). This regulation essentially codifies a court case addressing storm water discharges. NRDC v. Costle, 568 F.2d 1369 (D.C. Cir. 1977). In that case, the Court stated that EPA need not establish numeric effluent limitations where such limitations were infeasible.

1015

C. EPA has interpreted the statute and regulations to allow BMPs in lieu of numeric standards.

EPA has defended use of BMPs as a substitute for numeric limitations in litigation involving storm water discharges (CBE v. EPA, 91-70056 (9th Cir.)(brief on merits)) and in correspondence (Letter from Michael Cook, EPA, to Peter Lehner, NRDC, May 31, 1995). EPA has found that numeric limitations for storm water permits can be very difficult to develop at this time because of the existing state of knowledge about the intermittent and variable nature of these types of discharges, their effects on receiving waters, and the effectiveness of control measures in achieving numeric effluent limitations and improving water quality. Some storm water permits, however, currently do contain numeric water quality-based effluent limitations where adequate information exists to derive such limitations.

Question 2: Has EPA provided guidance on a methodology for deriving numeric water quality-based effluent limitations?

Answer 2: Yes, but primarily for continuous wastewater discharges at low flow conditions in the receiving water, not intermittent wet weather discharges during high flow conditions. Regulations at 40 CFR 122.44(d) specify the requirements under which permitting authorities establish water quality-based effluent limitations when a facility has the "reasonable potential" to cause or contribute to an excursion of a numeric or narrative water quality standard. In addition, EPA guidance in the Technical Support Document for Water Quality-Based Toxics Control (TSD) and the NPDES Permit Writers Training Manual, supplemented with total maximum daily load (TMDL) and modeling guidance, supports issuing permits consistent with the regulation and CWA. This guidance was based on crafting numeric water quality-based effluent limitations using TMDLs, or calculations similar to those used in developing TMDLs and wasteload allocations (WLAs), derived through modeling. EPA expects the Urban Wet Weather Flows Advisory Committee (60 FR 21189, May 1, 1995) will review this issue to provide recommendations on how to proceed.

Question 3: Why can numeric water quality-based effluent limitations be difficult to derive for storm water permits?

Answer 3: Storm water discharges are highly variable, and the relationships between discharges, controls and water quality can be complex. The water quality impacts of storm water discharges are related to the uses designated by States and Tribes in their WQS, the quality (e.g., conventional and toxic pollutants conveyed to the receiving water) and quantity (e.g., erosion and loss of habitat caused by increased flows and velocity) of the discharges. Uses may be affected by both water quality and water quantity impacts. Depending on site-specific considerations, some of the water quality impacts of storm water discharges may actually be more related to the physical effects (e.g. stream bank erosion, streambed scouring, extreme temperature variations, sediment smothering) than the pollutants present in the discharge. Although many of the typically used storm water control measures (source controls, traditional structural controls, and other BMPs) will contribute to ensuring that storm water discharges meet WQS, it is currently difficult and resource intensive to accurately quantify the effect of specific BMPs or the cumulative effect of a complex storm water control plan on attaining the numeric pollutant criteria or the designated uses in State or Tribal standards. For municipal storm water permits in particular, the current form of system-wide permits and a variety of jurisdiction-wide BMPs, including programmatic BMPs, does not easily lend itself to the existing procedures for deriving numeric water quality-based effluent limitations. These limitations typically are derived for each specific outfall in consideration of low flows of the receiving water. Because of this, permit writers have not made wide-spread use of existing methodologies and models for municipal storm water discharge permits. Wet weather modeling is technically more difficult and expensive than the simple dilution models generally used in the permitting process. These methodologies were designed primarily for process wastewater (dry weather) discharges which occur at predictable rates with predictable pollutant loadings under low flow conditions in receiving waters.

Question 4: Where has EPA recognized the technical difficulty in deriving numeric water quality-based effluent limitations for wet weather discharges?

Answer 4: EPA recognized the technical difficulty in deriving numeric water quality-based effluent limitations for wet weather discharges in its brief on the merits in Citizens for a Better Environment (CBE) v. United States Environmental Protection Agency, 91-70056 (9th Cir.) and in the Great Lakes Water Quality Guidance (58 FR 20841, April 16, 1993).

In the CBE case, EPA claimed that it was technically infeasible to derive numeric water quality-based effluent limitations for the discharge of metals in storm water into South San Francisco Bay and asserted that a water quality-based effluent limitation could take the form of a narrative statement, such as a BMP, if it was infeasible to derive a numeric limitation. In explaining its arguments in the CBE case, EPA cited 40 CFR 122.44(k)(2), which provides that BMPs may be imposed in NPDES permits "to control or abate the discharge of pollutants when ... (2) [n]umeric effluent limitations are infeasible."

In the Great Lakes Water Quality Guidance, EPA did not extend the method for calculating wasteload allocations, the basis for numeric water quality-based effluent limitations, to storm water or combined sewer overflow (CSO) discharges because the varying nature of these discharges is inconsistent with the assumptions used in developing the guidance. The Great Lakes Water Quality Guidance defers to national guidance and policy on wet weather and does not seek to establish a separate and distinct set of wet weather requirements. EPA expects the Urban Wet Weather Flows Advisory Committee (60 FR 21189, May 1, 1995) to provide recommendations about how to address the broader technical issues involved in achieving compliance with WQS in a wet weather context.

Question 5: What are the potential problems of using standard methodologies to derive numeric water quality-based effluent limitations for storm water permits?

Answer 5: Correctly derived numeric water quality-based effluent limitations provide a greater degree of confidence that a permittee is in compliance with WQS, because numeric water quality-based effluent limitations are derived directly from the numeric component of those standards. In addition, numeric water quality-based effluent limitations can avoid the expense associated with overly protective

treatment technologies, because numeric water quality-based effluent limitations provide a precise quantifiable target for permittees. Potential problems of incorporating numeric water quality-based effluent limitations rather than BMPs in storm water permits at this time are significant in some cases. Deriving numeric water quality-based effluent limitations for any NPDES permit without an adequate effluent characterization, or an adequate receiving water exposure assessment (which could include the use of dynamic modeling or continuous simulations) may result in the imposition of inappropriate numeric limitations on a discharge. Examples of this include the imposition of numeric water quality criteria as limitations without properly accounting for the receiving water assimilation of the pollutant or failure to account for a mixing zone (if allowed by applicable State WQS). This could lead to overly stringent permit requirements, and excessive and expensive controls on storm water discharges, not necessary to achieve compliance with WQS. Conversely, an inadequate effluent characterization could lead to water quality-based effluent limitations that are not stringent enough to protect designated uses in WQS. This could result because effluent characterization and exposure assessments for discharges with high variability of pollutant concentrations, loadings, and flow are more difficult than with process wastewater discharges at low flows.

Question 6: Should numeric water quality-based effluent limitations be developed for combined sewer overflow (CSO) discharges?

Answer 6: Applying numeric water quality-based effluent limitations to CSOs is also difficult, but does not present all of the same challenges as storm water discharges. In general, more information is available to permit writers about CSOs and their impacts.

These concepts are reflected in the CSO Control Policy issued by EPA on April 19, 1994 (59 FR 18688), which provides direction on compliance with the technology-based and water quality-based requirements of the CWA for communities with combined sewer systems. The CSO Policy provides for implementation of technology-based requirements (expressed as "nine minimum controls") by January 1, 1997.

In addition, under the CSO Policy, communities are also expected to develop long-term control plans that will provide for attainment of WQS through either the "presumption approach" or the "demonstration approach." Under the presumption approach, CSO controls would be

presumed to attain WQS if certain performance criteria are met. A program that meets the criteria specified in the CSO policy is presumed to provide an adequate level of control to meet the water quality-based requirements of the CWA, provided the permitting authority determines that such presumption is reasonable based on characterization, monitoring, and modeling of the system, including consideration of sensitive areas. Under the demonstration approach, the permittee would demonstrate that the selected CSO controls, when implemented, will be adequate to meet the water quality-based requirements of the CWA.

The CSO Policy anticipates that it will be difficult in the early stages of permitting to determine whether numeric water quality-based effluent limitations are necessary for CSOs, and, if so, what the limitations should be. For that reason, in the absence of sufficient data to evaluate the need for numeric water quality-based effluent limitations, the Policy recommends that the first phase of CSO permits ("Phase I") contain a narrative limitation to comply with WQS. Further, so-called "Phase II" permits would contain water quality-based effluent limitations, as provided in 40 CFR 122.44(d)(1) and 122.44(k) that may take the form of numeric performance or design standards, such as a certain number of overflow events or a certain percent volume capture. Generally, only after the long-term control plan is in place and after collection of sufficient water quality data (including applicable wasteload allocations developed during a TMDL process) would numeric water quality-based effluent limitations be included in the permit. This would likely occur only after several permitting cycles.

Question 7: If BMPs alone are demonstrated to provide adequate water quality protection, are additional controls necessary?

Answer 7: No. If the permitting authority determines that, through implementation of appropriate BMPs required by the NPDES storm water permit, the discharges have achieved compliance with WQS and technology-based requirements, additional controls need not be included in the permit. Conversely, if a discharger (municipal or industrial) fails to adopt and implement adequate BMPs as intended, the permitting authority may have to consider more traditional permit controls for water quality protection.

If, however, the permitting authority or States conducting 401 certifications have adequate information on which to base more specific controls or limitations, such limitations are to be incorporated into storm water permits, as necessary and appropriate. Such controls or limitations may

include an integrated suite of BMPs, performance objectives, narrative standards, monitoring triggers, numeric water quality-based effluent limitations, action levels, etc.

Question 8: What is EPA doing to develop information about the linkage between BMPs and water quality?

Answer 8: The Agency is currently working with WERF (Water Environment Research Foundation) and ASCE (American Society of Civil Engineers) to research which BMPs are most effective under which circumstances. The results of this research will provide permitting authorities and permittees with information about how to evaluate the effectiveness of different kinds of BMPs in different circumstances and to select the most appropriate controls to achieve water quality objectives. In addition, EPA is sponsoring research being conducted by the Watershed Management Institute and other organizations over the next two to four years to examine the capability of storm water BMPs to improve receiving water quality and restore/protect the biological integrity of those waters.

Question 9: The policy states that permits should incorporate cost-effective monitoring to generate necessary data for the protection of water quality. What types of monitoring should be included and how much monitoring is necessary?

Answer 9: The amount and types of monitoring necessary will vary depending on the individual circumstances of each storm water discharger. EPA encourages dischargers and permitting authorities to carefully evaluate monitoring needs and storm water program objectives so as to select useful and cost-effective monitoring approaches. For most dischargers, storm water monitoring can be conducted for two basic reasons: 1) to identify if problems are present, either in the receiving water or in the discharge, and to characterize the cause(s) of such problems; and 2) to assess the effectiveness of storm water controls in reducing contaminants and making improvements in water quality.

Under the NPDES storm water program, municipal permittees are required to conduct monitoring. EPA recommends that each municipal permittee design the monitoring effort to be supportive of the goals and objectives of its storm water management program when developing such a program for the term of its NPDES permit. To accomplish this, a municipal permittee may use a variety of storm water monitoring tools including receiving water chemistry; receiving water biological assessments (benthic invertebrate surveys, fish

surveys, habitat assessments, etc.) effluent monitoring; including chemical, whole effluent and visual examinations; illicit connections screening; and combinations thereof or other methods. Techniques that assess receiving waters will help to identify the degree to which storm water discharges are contributing to any water quality problems. Techniques that assess storm water discharge characteristics will help to identify potential causes of any identified water quality problems. The municipal permittee, in conjunction with the applicable NPDES permitting authority, should determine which monitoring approaches would be most appropriate given the objectives of the storm water management program. If municipal permittees conduct ambient monitoring, it may be most cost-effective to pool resources with other organizations (including, for example, other municipalities and States) conducting monitoring within the same watershed. This could be best accomplished through a coordinated watershed monitoring strategy.

For industrial storm water dischargers, monitoring may be required under the terms of NPDES permits for storm water discharges. For those industrial storm water permits that do require monitoring, this is typically done to characterize storm water contaminants that might be found in the industrial runoff and/or to assess the effectiveness of the industrial storm water pollution prevention plan in reducing these contaminants. This typically involves end-of-pipe chemical-specific monitoring. End-of-pipe monitoring may be more appropriate for an industrial facility than for a municipal permittee, given the industrial facility's more discrete site characteristics, which make management strategies such as collection and treatment more feasible. Industries for the most part, have readily defined storm water conveyances into which runoff flows from discrete drainage areas. Industries may more readily identify and control existing on-site sources of storm water contamination or provide collection and treatment within these discrete drainage areas to control pollutant concentrations in their storm water discharges.

EPA and other organizations are currently working to improve approaches for monitoring storm water and the potential effects upon water quality. These new approaches are called storm water program "environmental indicators." Environmental indicators are designed to be more meaningful monitoring tools that storm water dischargers can use to conduct storm water monitoring for the purposes described above. A manual describing each of the recommended storm water program environmental indicators is being prepared by the Center for Watershed Protection in Silver Spring, Maryland. That manual is expected to be ready by the end of

July 1996 and should provide useful information for storm water dischargers contemplating the need to develop a cost-effective, meaningful storm water monitoring program. In addition, EPA expects the Urban Wet Weather Flows Advisory Committee (60 FR 21189, May 1, 1995) to provide recommendations on how to better monitor storm water and other wet weather discharges using a watershed approach.

Question 10: Does this policy apply to both storm water discharges associated with industrial activity and storm water discharges from municipal separate storm sewer systems?

Answer 10: Yes. This policy is applicable to both discharges from municipal separate storm sewer systems and storm water discharges associated with industrial activity regulated under CFR 122.26(b)(14). The policy would not apply, however, to industrial storm water discharges regulated under an effluent limitations guideline for which technology-based numeric effluent limitations have already been derived for those discharges. In addition, particularly for some industries, adequate information may already have been collected with which to assess the reasonable potential for a storm water discharge to cause or contribute to an excursion of a WQS, and from which a numeric water quality-based effluent limitation can be (or has been) appropriately derived. An adequate amount of storm water pollutant source information may also exist with which to assess the effectiveness of the industrial storm water control measures in complying with the limitations and in reducing storm water contaminants for protecting water quality.

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. 95-XXX

WASTE DISCHARGE REQUIREMENTS
FOR
STORMWATER MANAGEMENT/URBAN RUNOFF DISCHARGES
WITHIN THE COUNTY OF LOS ANGELES

(NPDES NO. CAS0061654)

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. The Regional Board recognizes that ~~the EAC assumes no responsibility for the adequacy or inadequacy of any individual Permittee's efforts and is not viewed as the responsible agency in this sense.~~ Participation by any Permittee on the EAC is voluntary, and is not an obligation under the permit and shall not increase the responsibility or liability of any Permittee under any portion of the Permit

2. The EAC's main role is to facilitate programs within the six watersheds and to enhance consistency among all of the programs.

3. The Regional Board recognizes that the Principal Permittee assumes no responsibility for insuring the compliance of any individual Permittee with the requirements of this Permit

The Board has notified the interested agencies and persons of its intent to adopt waste discharge requirements for the discharge of municipal stormwater/urban runoff and has provided them with an opportunity to submit their written views and recommendations.

The Board, in a public hearing, heard and considered all comments pertaining to the tentative waste discharge requirements.

This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit pursuant to Section 402 of the federal Clean Water Act, or amendments thereto, and shall take effect at the end of ten (10) days from the date of its adoption provided the Regional Administrator, USEPA, has no objections.

IT IS HEREBY ORDERED that the County of Los Angeles and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Long Beach, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, SanMonica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, WeHollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code, and regulations adopted thereunder, and the provisions of the Federal Clean Water Act, and regulations and guidelines adopted thereunder, shall comply with the following for the areas under their jurisdictions within the drainage area of the County of Los Angeles:

VOL 24

00003

A. Discharge Prohibitions

1. The ~~Dischargers~~ Permittees shall, within their respective jurisdictions, effectively prohibit the discharge of non-storm water ~~(materials other than storm water)~~ into their storm drain systems and watercourses. NPDES permitted discharges are exempt from this prohibition. Compliance with this prohibition shall be demonstrated in accordance with Provisions _____ in this Order.

2. The discharge of stormwater from a facility or activity that causes or contributes to the violation of Receiving Water Limitations is prohibited.

B. Receiving Water Limitations

1. The discharge shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:

   a. Floating, suspended, or deposited macroscopic particulate matter, or foam;
   b. Bottom deposits or aquatic growths;
   c. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;
   d. Visible, floating, suspended, or deposited oil or other products of petroleum origin; and/or
   e. Toxic or deleterious substances present in concentrations or quantities which will cause deleterious effects on aquatic biota, wildlife, or waterfowl, or which render any of these unfit for human consumption either at levels created in the receiving waters or as a result of biological concentration.

2. The discharge shall not cause a violation of any applicable water quality objective for receiving waters. If applicable water quality objectives are adopted and approved by the State Board after the date of the adoption of this Order, the Regional Board may revise and modify this Order as appropriate.

to be discussed at 9/27 Permit negotiating meeting. Present form not acceptable to EAC.

VOL 24

0004

C. PROVISIONS

i. The ~~Discharger~~ Permittees shall demonstrate compliance with Discharge Prohibitions A.1 and A.2, and Receiving Water Limitations B.1, B.2, and B.3 through the timely implementation of control measures and other actions to reduce pollutants in the discharge as proposed in the Plan. The ~~Discharger~~ Permittees shall implement the thirteen baseline BMPs, in addition to all others proposed in the ROWD. As such, the Plan submitted by the Discharger is an integral and enforceable component of this Order. Any subsequent modifications, revisions, or amendments must be approved by the Executive Officer of the Regional Board. Each of the Co-Permittees need only to comply with the permit conditions (including Discharge Prohibitions A.1, A.2, and A.3, and Receiving Water Limitations B.1, B.2, and B.3) applicable to discharges from the municipal separate storm drains for which they are operators.

ii. The Discharger shall implement the Plans as proposed and amended for the Malibu Creek and rural areas, Ballona Creek and urban areas, Santa Clara River, Los Angeles River, San Gabriel River, and the Dominguez Channel Watershed Management Areas:

I. PROGRAM MANAGEMENT

A. Principal Permittee

1. The County of Los Angeles is designated as the Principal Permittee.

2. The Principal Permittee shall:

a. Coordinate permit activities and, by, _____, convene and chair the area-wide Executive Advisory Committee; ~~and the Watershed Management Committees~~;

b. Provide personnel and fiscal resources and by, _____, develop a Baseline Stormwater Management Plan (Plan) for use in developing a watershed management plan (WMP) for each watershed;

c. Provide personnel and fiscal resources for the development of the WMPs;

d. Provide personnel and fiscal resources for the updating and modification of the Plan and the WMPs;

e. Provide technical and administrative support for both the Executive Advisory and Watershed Management Committees;

f. Implement watershed water quality monitoring programs as described in Chapter _____.

g. Provide the personnel and fiscal resources to complete ~~by~~

no need for date here, will be discussed in Program Eval & Reporting Chapter

the annual reports including evaluations of monitoring program data and BMP effectiveness;

h. Coordinate the implementation of stormwater quality management activities of regional significance (this shall mean that the Principal Permittee shall identify BMPs which are applicable for implementation by permittees watershed-wide and area-wide), such as public outreach and education, pollution prevention, waste minimization, and other similar actions;

i. Act as liaison between all Permittees and the Regional Board on Permit issues; and

j. Meet all the responsibilities outlined below for a Permittee.

B. Permittees

1. The other cities and agencies are designated as Permittees.

2. Each Permittee shall:

a. Participate in the development and amendment of the Baseline Stormwater Management Plan (Plan) and by _____, jointly prepare the watershed specific management plans (WMPs) via their WMC;

b. Provide an Implementation Plan describing specific stormwater programs, projects and/or activities which are to be conducted within their jurisdictional boundaries, including the storm drainage system they own and operate, and which demonstrate compliance with the WMP(s) requirements by _____; and

c. Provide in a timely manner all information needed by the Principal Permittee for completing the annual reports.

3. The City Administrator/Public Works Director of each Permittee shall appoint a representative(s) to the WMC.

C. Agency Coordination

Each Permittee shall coordinate implementation of permit requirements and pollution prevention activities among each Permittee's internal departments and agencies (i.e. public works, planning, utilities, water supply, etc...).

D. Executive Advisory Committee

1. The EAC shall consist of a representative of the County of Los Angeles, City of Los Angeles, a representative from the Malibu Creek, Santa Clara, and Dominguez Channel Watershed Management Areas, and two

representatives from each of the San Gabriel River, Los Angeles River, and the Ballona Creek Watershed Management Areas.

a. One representative from the EAC shall chair the Watershed Management Committee for that Permittee's main watershed management area.

2. The City Administrator/Public Works Director for the County of Los Angeles and for the City of Los Angeles shall each appoint a representative to the EAC. Other members will be appointed by the WMCs.

3. The EAC shall be responsible for:

a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

Previously, EAC had primarily responsibility (b.) Assisting the Principal Permittee in the development of the Baseline Storm Water Management Plan; and

c. Reviewing the Watershed Management Plans as developed by each Watershed Management Committee and provide direction and guidance on the plans for consideration by the Watershed Management Committees;

d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

e. Mediating conflict among the Permittees; and

f. Coordinating the implementation of pilot projects to target pollutant sources, evaluate BMP appropriateness, and assess effectiveness.

E. Watershed Management Committee

1. Watershed Management Committees (WMC) shall consist of a representative of each of the Permittees for that particular watershed management area. Regular WMC meetings shall be open to attendance by the public. The WMC may hold closed sessions, at its discretion, to discuss permit related issues.

need to add language allowing the WMC to designate the Principal Permittee as chair, if the WMC so desires (2.) The Malibu Creek, Santa Clara, and Dominguez Channel WMCs shall each appoint one representative to serve on the EAC and to chair the WMC. The San Gabriel River, Los Angeles River, and the Ballona Creek WMCs shall each appoint two representative to serve on the EAC, one of whom will chair the WMC.

3. The WMC shall be responsible for:

   a. Establishing goals and objectives for the watershed;

   b. Prioritizing pollution control efforts;

   c. Participating in the development of a specific watershed management plan (WMP), based on the Baseline Stormwater Management Plan (Plan);

   d. Assessing the effectiveness of, preparing revisions for and making appropriate changes to the Plan and the WMP;

   e. Coordinating and facilitating the preparation of the annual reports on Permit activities within the watershed for submittal to the Regional Board – a draft of the annual report shall be circulated to each Permittee and the Executive Advisory Committee for their review and comments prior to submittal to the Regional Board; and

   f. Facilitating the implementation of this Order among the Permittees in the watershed.

F. Watershed Management Subcommittees

1. Subcommittees will be established where needed as determined by the WMC and/or the EAC.

2. The Subcommittees will be focused on specific program areas and can provide more specific oversight on the development, implementation, and evaluation of selected program areas.

G. Fiscal Resources

Each Permittee shall submit an annual budget for its Implementation Plan within 30 days after the budget adoption. The budget shall be summarized and put into a format which identifies the necessary capital and operation and maintenance expenditures necessary to implement the storm water management program. ~~The budget shall provide information such as funding sources, staff resources, equipment, support capabilities, contract services, and cost sharing arrangements for the storm water management programs.~~ Also included shall be a description of any funding shortfalls.

1. Area-Wide Resources - In implementing this Order and the Plan, the Permittees may elect to jointly fund a single program for certain BMPs, such as Public Education, that are area-wide in nature. ~~Funding agreements, including budgets and cost per agency, shall be developed.~~

repetitive, delete

~~2. City-Specific Resources - As stated above, each Permittee shall develop an annual budget detailing the cost of implementing Permit-related activities~~

~~within its jurisdiction.~~

H. Legal Authority

1. The legal authority that was required of each Permittee under Order No. 90-079 shall continue in effect.

2. The Co-Permittees shall exercise their legal authority and require compliance with this Order and the Plan within its jurisdiction.

What are the Regional Board expectations in complying with this? → (3)

3. Each Permittee shall certify that it has legal authority to control discharges to and from those portions of the storm drainage system over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements between permittees with adequate existing legal authority and shall, at a minimum, accomplish Items a-f below:

   a. Control the contribution of pollutants to the storm drainage system by storm water discharges associate with industrial activity and the quality of storm water discharged from sites of industrial activity;

   b. Prohibit illicit discharges and illicit connections to the storm drainage system and require removal of illicit connections;

   c. Control the discharge of spills and the dumping or disposal of materials other that storm water (e.g. industrial and commercial wastes, trash, debris, motor vehicle fluids, green waste, animal wastes, leaves, dirt, or other landscape debris etc.) to the storm drainage system;

need clarification as to what is intended by this. → (d.)

   d. Control through interagency or inter-jurisdictional agreements among permittees the contribution of pollutants from one portion of the storm drainage system to another;

   e. Require compliance with conditions in ordinances, permits, contracts or orders; and

   f. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the storm drainage system.

4. Each Permittee's legal counsel shall complete a review of its existing legal authority to ensure that its existing legal authority complies with the requirements in this Order.

120 ←

5. Upon its completion of the legal authority review, or within ~~60~~ days of permit adoption, (whichever is sooner) each Permittee shall demonstrate that it has adequate legal authority or provide a schedule for obtaining the

VOL 24

00099

adequate legal authority. Guidance for demonstrating adequate legal authority is included within the EPA document entitled *Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges from Municipal Separate Storm Sewer Systems, (EPA 833-B-92-002, November 1992)*, page 3-4.

I. Administrative Review

The administrative review process formalizes the procedure for review and acceptance of reports and documents submitted to the RWQCB under this Permit. In addition, it provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement actions. A Permittee shall not be in violation of any term or condition of this permit until the following administrative review process has been completed.

need to include RB obligation for timely review of permit submittals (ie: within 45 days)

1. If the Executive Officer finds that a Permittee's stormwater program is insufficient to meet the provisions of the Permit, the Executive Officer shall send a "Notice of Intent to Meet and Confer (NIMC)" to the Permittee. The NIMC shall include a date by which the Permittee must meet with RWQCB staff.

2. Upon receipt of a NIMC, the Permittee shall meet and confer with RWQCB staff to clarify the steps to be taken to completely meet the provisions of this permit. The meet and confer sessions shall be for the purpose of developing additions and enhancements to the jurisdiction's stormwater program. The meet and confer period shall conclude with the submittal to and acceptance by the Executive Officer of a written "Stormwater Program Compliance Amendment (SPCA)" which shall include implementation deadlines. The Executive Officer may terminate the meet and confer period after a reasonable period due to a lack of progress on issues and may order submittal of the ~~SPEP~~ SPCA by a specified date. Failure to submit an acceptable SPCA by the specified date shall constitute a violation of the Permit.

3. The Executive Officer will approve or reject the submitted SPCA within a reasonable amount of time. Rejection of a submitted ~~SPEP~~ by the Executive Officer shall state the reasons for the failure to approve the SPCA. A Permittee that receives a rejection of an SPCA shall have thirty (30) days to remedy the specified deficiency in the SPCA and receive administrative approval from the Executive Officer of the amended SPCA.

4. The Permittee shall comply with the terms of the SPCA. The Permittee shall submit reports to the Executive Officer of progress made under the SPCA. The frequency of progress report submittal shall be as prescribed by the Executive Officer. Failure to comply with the terms and conditions of the SPCA shall constitute a violation of the Permit and shall be cause for immediate Administrative Civil Liability as prescribed by the Executive Officer.

J Regional Board

Programs, including schedules for implementation developed under the terms of the Permit shall be submitted to the Executive Officer for approval. Programs shall be implemented upon approval of the Executive Officer. Within 45 days of program submittal, the Executive Officer shall respond with the results of the review of the program or its approval. Where no written response has been received by the Principal Permittee within 45 days, the program submittal shall be deemed approved.

II. ILLICIT DISCHARGES\DISPOSAL

A. Illicit Connections

By _____, the EAC shall develop a consistent program including investigative standard procedures to eliminate illicit connections to the storm drain system.

By _____, each Permittee shall implement a program to identify and eliminate illicit connections to the maximum extent practicable.

1. The program shall, at a minimum:

   a. standardize per EAC guidelines, storm drain inspection procedures, and illicit connection and identification and elimination procedures;

   b. prioritize ~~major~~ potential problem areas, ~~to include but not be limited to~~ older business areas, and areas with heavy industry such as those listed under subchapter N of 40 CFR Parts 405 - 471

   new wording. vague, open to broad interpretation. remove.

   c. utilize results of field screening activities, and other appropriate information.

   d. contain an industrial/commercial education/outreach component to inform businesses about the problem of illicit discharges/dumping and proper discharge/disposal practices,

   e. schedule storm drains for inspection for illicit connections within its jurisdiction.

   f. maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

   g. establish enforcement procedures to terminate illicit connections.

B. Illegal Discharges\Disposal

1. By _____, the EAC shall develop a consistent program including investigative standard procedures to eliminate illegal discharges/disposal practices to the storm drain system.

2. By _____, the EAC shall develop a standard enforcement procedures, including administrative and judicial, to eliminate illegal discharges/disposal practices.

3. By _____, the EAC shall develop standard procedures for spill response, including a procedure to ensure that, in a spill response, sewage treated

with disinfection agents will not be discharged into the storm drainage system, to the maximum extent practicable. The standard procedures will address investigation, containment, and cleanup activities as appropriate.

4. By _____, each Permittee shall implement a program to identify and eliminate illegal discharges/disposal practices to the maximum extent practicable.

The program shall, at a minimum:

a. Identify and prioritize problem areas of illegal disposal where inspection, clean up, and enforcement are necessary to prevent the discharge of contaminants;

b. Maintain a surveillance program to detect illegal discharges and disposal into the street system, including, but not be limited to, street use inspections and inspections of vacant facilities;

c. Establish procedures to educate inspectors, maintenance workers, and other field staff in their jurisdiction to notice illicit dischargers/disposal practices during the course of their daily activities, and report such occurrences;

d. Maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

e. Establish per EAC guidelines spill response procedures; and

f. Establish, per EAC guidelines, enforcement procedures to eliminate illegal discharges/disposal practices.

C. Non-Storm Water Discharges

1. Exempted Discharges

In carrying out Discharge Prohibition A.1 of this Order, the following non-storm water discharges need not be prohibited unless they are identified by the Dischargers or the Executive Officer as sources of pollutants to receiving waters:

a. flows from riparian habitats or wetlands;
b. diverted stream flows;
c. springs;
d. rising ground waters; and
e. uncontaminated groundwater infiltration.

If the any of the above categories of discharges, or sources of such discharges, are identified as sources of pollutants to receiving waters, then such categories or sources shall be addressed as conditionally exempted discharges, in accordance with Provision C.1.b.

2. Conditionally Exempted Discharges

The following non-storm water discharges need not be prohibited if they are either identified by the ~~Dischargers~~ or the Executive Officer as not being sources of pollutants to receiving waters or if appropriate control measures to minimize the adverse impacts of such sources are developed and implemented under the Storm Water Management Plan, ~~in accordance with Provision C.5.a.~~:

a. Landscape irrigation;
b. ~~Diverted stream flows~~;
c. Foundation ~~drains~~;
d. Air conditioning condensate;
e. Irrigation water;
f. Water from crawl space pumps;
g. ~~Footing~~ drains;
h. Individual residential car washing;
i. Residential and Commercial roof drains;
j. Residential swimming pool discharges;
k. Street washing*
l. Sidewalk washing*
m. Discharges or flows from emergency fire fighting activities;
n. Other types of discharges identified and recommended in annual reports by the Discharger, as approved by the Executive Officer of the Regional Board.

D. Other Prohibited Activities

1. The Permittees shall prohibit any person from:

a. causing or allowing illicit discharges to be made into the storm drain system;

b. ~~establishing, using or maintaining an illicit connection to the storm drain system~~;

c. littering.

d. disposing of leaves, dirt or other landscape debris into a storm drain; and

e. using any pesticide, fungicide, or herbicide which has either been voluntarily discontinued or prohibited by the USEPA.

f. washing down toxic materials from paved or unpaved areas.

g. washing down impervious surfaces in industrial and/or commercial areas is prohibited unless specifically required ~~to under~~ Health and Safety Codes.

more appropriate for Industrial/Commercial source chapter. relocate.

(2.) Storage of Materials, Machinery and Equipment

The Permittees shall require:

a. that objects, such as motor vehicle parts, containing grease, oil, or other hazardous substances, and unsealed receptacles containing hazardous materials, be stored away from areas susceptible to runoff;

b. that machinery or equipment which is to be repaired or maintained in areas susceptible to runoff, be placed on a pad of absorbent material, or an equivalent, to contain leaks, spills or small discharges;

c. that owners of commercial/industrial motor vehicle parking lots ~~and structures~~ (with more than 10 parking spaces) located in areas susceptible to runoff to be swept to remove debris. ~~Lots with more than ten (10) parking spaces and all public parking facilities shall also be vacuum swept, or by equivalent method, to remove chemical residue;~~

d. that all fuel and chemical residue, animal waste, garbage, batteries, or other types of potentially harmful materials which are located in areas susceptible to runoff, be removed immediately and disposed of properly.

e. that hazardous waste be disposed of through the Permittee's hazardous waste program or at any other appropriate disposal site, and not be placed in a trash container for regular trash disposal.

E. Public Reporting

1. By _____, the EAC shall develop a standard program, for Permittees to implement by _____, to promote, publicize, and facilitate public reporting of illicit discharges and illegal disposal practices that may adversely impact water quality.

2. By _____, EAC shall develop a standard program for the reporting of incidents of a hazardous substance entering the storm drain, where the responsible party is not known, to the Regional Board and State of California Office of Emergency Services (OES) at (800)___-____ and the Federal Hazardous Response Number at (800) ___-____. The Permittees shall implement this program by _____.

F. Reporting

(1.) A ~~quarterly~~ summary of illicit connections eliminated shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the investigation; what was being discharged; estimated length of time the practice was on-going; what

New section. As written, summary is far too detailed. Summary should focus on categories of illicit connections # discovered per category, # eliminated, # in process to eliminate, # subject to legal enforcement action.

VOL 24

0014

Pre existing section. However information requested is too detailed. See comments on F2 page 12.

remedial action was taken; and what happened to the discharger.

(2) A ~~quarterly~~ summary illegal discharge/disposal practices reported through the standardized public reporting system shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the incident; what was spilled/dumped; quantity; what remedial action was taken; and what happened to the discharger/dumper.

G. Coordination With State Permits — for use by each Permittee in its illicit connection program to identify

1. The Principal Permittee will be provided an updated list of NPDES Permits on a quarterly basis, through the Regional Board's electronic bulletin board, ~~to verify~~ permitted sources of the existing non-storm water discharges in the storm water drainage system.

2. The Permittees will work with other regulatory agencies and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies. These agencies, include but are not limited to:

   a. California Department of Fish and Game
   b. California Department of Toxic Substances Control
   c. California Coastal Commission
   d. United States Environmental Protection Agency
   e. California Department of Transportation
   f. California Air Resources Board

VOL 24

0015

III. PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES

A. Identification of Sources

1. By _____ the Permittees shall develop a database listing industrial/commercial facilities by four digit SIC codes which shall be updated annually. The database shall include at a minimum:

identified in III.B.1.a. of the

~~a. Facility owner's name, address, and telephone number;~~

b. Site address, ~~telephone number, and contact person;~~

~~c. Closest receiving water and watershed;~~

d. Applicable SIC code(s);

i. For each four digit SIC sector, the Permittees shall identify primary activities that might impact runoff discharges;

ii. For each four digit SIC sector, the Permittees shall identify primary materials that might impact runoff discharges; and

delete. this program to be addressed by the Critical (2) Source monitoring element of the monitoring program.

By _____, ~~the EAC shall develop a pollutant source identification program for the control of storm water pollutant discharges from industrial/commercial facilities. The objective of the source identification program is to gather data on specific and/or interrelated set of pollutant generating activities occurring on very small areas (< 5 acres) of industrial/commercial activity and to provide information for developing and implementing BMPs for specific activities.~~

B. Prioritization of Sources

1. By _____, the Permittees shall prioritize industrial and commercial facilities within their jurisdiction on their relative potential for the contamination of storm water and urban runoff. The prioritized list shall include

a. Categorical List

i. All industries regulated under Phase I of the Federal storm water program (40 CFR 122.26).

ii. All industrial/commercial SIC codes ~~selected by the USEPA for screening under Phase II of the Federal storm water program.~~ → vehicle repair shops, vehicle body shops, vehicle parts + accessory shops, gasoline stations, and restaurants.

iii. Other business sectors considered by both the EAC and/or the

Regional Board to conduct industrial/commercial activity with a high potential for storm water contamination ~~(e.g. restaurants)~~.

The categorical list shall be grouped which Permittees and provide an organized overview of the target facilities based on land use, operation, and activities, could potentially contribute significant amounts of pollutants into storm water runoff.

2. By _____, Permittees shall rank the industrial and commercial facilities, identified as potential pollutant sources of storm water and urban runoff pollutants in III. B.1.a, in order of priority for oversight of implementation of storm water management measures.

C. Source Control Measures

1. By _____, Permittees shall develop ~~a checklist of specific~~ storm water and urban runoff control measures for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutants into storm water runoff. The control measures must

   a. address multiple pollutant sources

   b. initially focus on source control measures such as source minimization, education, good housekeeping, and site design alternatives.

   c. target industrial/commercial source areas and activities with the potential to generate substantial pollutant loadings

new. redundant with III.D. delete (2.) By _____, Permittees shall develop a process to ensure implementation of storm water and urban runoff control measures for industrial/commercial facilities identified in III.C.1.

delete. same reasons as on III.A.2 (3.) By _____, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutants into storm water runoff. The structural control measures must be evaluated as to

   a. effectiveness in reducing toxic pollutants and pollutants of concern

   b. ease of maintenance

   c. current frequency of use

   d. feasibility and cost-effectiveness

VOL 24

0017

e. possible methods to ensure implementation if necessary

By, _____, the Permittees shall, in addition, describe any studies and pilot projects they intend to conduct to assess the feasibility and effectiveness of specific control measures.

4. By _____, Permittees shall require the following:

a. The proper disposal of food wastes by restaurants and food wholesalers.

b. Persons owning or operating a gas station, auto repair garage, or similar structure must clean those facilities in a manner that does not result in discharge of pollutants to the storm drain system; and

c. Machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze must be repaired.

was not agreed to - at Permit negotiating meeting. delete (5)

new provision, its intent is to relieve the Permittees of the need to file for coverage under the General Industrial SW Permit. Only advantage is not having to pay annual $250 fee.

Each Permittee ~~The EAC~~ may seek coverage under this Order, for industrial facilities listed in III.B.1.a.i which are owned and operated by ~~Permittees~~ if it,

a. establishes a procedure for notifying the Regional Board of industrial sites owned and operated by ~~Permittees~~ the

b. prepares a checklist of industrial BMPs using BAT/BCT criteria for implementation ~~by Permittees~~ at these industrial sites

c. standardizes procedures to ensure implementation of industrial BMPs ~~by Permittees,~~

d. ~~requires Permittees to~~ prepare and retain site specific Storm Water Pollution Prevention Plans at ~~Permittee~~ its industrial facilities

e. establishes a procedure ~~for Permittees~~ to report annually on the effectiveness of Storm Water Pollution Plans at each site, and certify compliance with this Order.

D. Source Inspection

1. By _____, each Permittee shall submit a schedule for inspection of those industrial/commercial facilities in III.B.1.a, for adequacy of storm water pollution prevention measures. ~~The schedule shall include, for a five year period,~~ 2

a. for municipalities with a population of less than 250,000, all facilities identified in III.B.1.a.1, and all facilities identified in III.B.1.a.2 and III. B.1.a.3,

(which have been selected by the Permittee for inclusion in an inspection program. 16

{Facilities selected shall be those identified by the Permittee as potentially contributing the most significant pollution impacts to stormwater discharges.

VOL 24

0018

b. for municipalities with a population of greater than 250,000, all facilities identified in III.B.1.a.1, and,
a subset of facilities identified in III.B.1.a.2 and III.B.1.a.3 but not less than ten times the number identified in III.B.1.a.1

Industrial/commercial facilities in III.B.1.~~a.2 and III.B.1.a.3~~ 2 that are not included in the inspection schedule shall be surveyed by phone, mail-out, or a similar method, as to their conformance with good stormwater quality management measures.

2. By _____ each Permittee shall develop and implement a industrial/commercial facilities inspection program. The inspection program shall include, but is not limited to:

   a. procedures for facility inspections

   b. procedures for industrial/commercial sectors outreach on pollution prevention, waste minimization, and storm water quality management

   c. procedures to ensure corrective action is undertaken by non-complying facilities

   d. procedures to follow-up on violations of municipal standards

   e. procedures for enforcement action against non-complying facilities;

   f. an electronic recording system to document the status of facility inspections; and,

   g. appropriate training for program staff.

3. During inspection of facilities included in the program from group III.B.1.a.1, inspectors shall request to see a copy of the SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may deem it necessary to report problematic facilities to the Regional Board.

E. Reporting

Each year, the Permittees shall evaluate the results and progress of their storm water quality management program for industrial/commercial sources. The annual report submitted to the Regional Board shall recommend a strategy for the management of storm water from industrial/commercial sources for the following year based upon:

   a. priority industrial/commercial sources listing
   b. priority on-site inspections
   c. phone/mail-out survey inspections
   d. ~~priority checklists~~ evaluation of stormwater urban runoff control measures implementation.
   e. evaluation of the results from the critical source monitoring program.

delete. to be addressed through the critical source monitoring program.

e. ~~evaluations of structural and treatment control measures~~
f. ~~special studies and pilot projects needs~~
g. ~~specific site and activity monitoring needs~~

The ~~EAC~~ Permittees shall make available to the Regional Board the industrial/commercial database developed in ~~III.B.1.a.1~~ III.A.1 in the appropriate format when so requested.

F. Coordination

The Permittees shall develop a process for the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports shall be developed as required.

new section. ok as modified.

G. Conflicts with Other Mandates

1. The Permittees will work with other regulatory agencies as deemed necessary by the Permittees and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies.

IV. PROGRAM REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT

new section (A.) Regional Policy

1. By _____, the EAC shall develop ~~and adopt~~ a regional ~~policy~~ guidline to ~~promote~~ encourage watershed protection considerations during planning, ~~project review~~, and permitting of new development and redevelopment, to:

   a. preserve to the extent feasible ~~and where possible~~, create or restore areas that provide water quality benefits, such as riparian corridors and wetlands, and promote the design of new development ~~so that~~ to ~~it protects~~ the natural integrity of drainage systems and water bodies.

   b. avoid conversion of areas particularly susceptible to erosion or sediment loss and/or establish development guidance that identifies these areas and protects them from erosion and sediment loss. Such areas include steep slopes, highly erodible soils, ~~periods of intense rainfall~~, and inability to revegetate once disturbed.

   c. ~~require~~ encourage the integration of storm water quality protection into construction and post-construction activities at all development sites, including the minimization of toxic material use and their careful containment on site.

   d. maintain peak runoff rates at pre-development levels, wherever practicable.

2. By _____, the EAC shall ~~establish~~ develop minimum ~~requirements consistent~~ recommendations with the regional ~~policy~~ guidlines for new development and redevelopment, for

   a. site planning practices

   b. construction best management practices

   c. post-construction best management practices

   ~~d. reporting erosion and storm water control strategies~~ not clear. delete

   e. redevelopment and infill

B. Planning Process

In order to integrate storm water management considerations into new development projects at the time that they are first proposed to jurisdictions, and to support other provisions of this permit:

VOL 24

0021

1. By ______, the EAC shall develop ~~guidance~~ guidlines for consideration by the permittees ~~to use~~ in preparing/reviewing EIRs, and in linking EIR mitigation conditions to local permits approvals.

new requirements

2. ~~By ______, permittees shall adopt and use the guidance in their internal procedures.~~

Dictates planning process to city.

3. By ______, the EAC shall develop a model CEQA checklist form that explicitly addresses watershed, water quality, and nonpoint source pollution impacts.

not legal. delete

4. ~~By ______, the permittees shall use the model CEQA checklist.~~

5 Whenever a permittee rewrites either of the following mandated general plan elements - the conservation element or the open space element - watershed and stormwater management/urban runoff considerations shall be incorporated.

6. By ______, permittees shall implement a program to encourage developers to maximize pervious areas and storm water infiltration (in areas where the geology and topography allow), minimize directly connected impervious areas, and include justifiable treatment control measures.

7. Permittees shall require ~~that prior to~~ as part of the submittal of an application for the first planning or building approval for a new development project, ~~an applicant shall submit~~ the inclusion of an Urban Runoff Mitigation Plan.*

a. The Urban Runoff Mitigation Plan shall:

i. Be designed to reduce the runoff volume from the site and the pollutant load contributed by the site through incorporation of design elements and practices that address each of the goals set forth below in subsection ~~(c)~~ (iii). (Applicants should refer to the most recent edition of the Construction Best Management Practices Handbook, produced and published by the Storm Water Quality Task Force, for specific guidance on selecting best management practices for reducing pollutants in stormwater discharges from urbanized areas.)

new section. taken from Heal the Bay's "Municipal Legal Authority" hand out. This section would necessitate that the Permittees develop minimum standards for plan approval.

ii. ~~Discuss compliance with the development requirements set forth by Permittee's legal authority; and~~

iii. Address the following goals in connection with both construction and long term operation of the site:

a. Maximize, to the extent practicable, the percentage of permeable surfaces in order to allow more percolation of runoff into the ground.

* We can only support this concept for very large projects i.e. 100+ dwelling units or 100,000 + sq. ft. of commercial.

VOL 24

0022

R0067025

b. Minimize, to the extent practicable, the amount of runoff directed to impermeable areas ~~to the City's stormwater system~~.

delete. would be too burdensome (c.) ~~Maximize, to the extent practicable, stormwater filtration and storage for reuse through the use of sediment traps, cisterns or other means.~~

d. Minimize, to the extent practicable, parking lot pollution through ~~the use of porous materials to allow percolation of runoff, through~~ the installation of appropriate treatment controls, or through other means.

Source controls such as regular maintenance

iv. Compliance with an approved Urban Runoff Mitigation Plan shall be a condition of any required planning approval.

Do not think this can be dictated by the RB through a Permit. delete. (v.) ~~Failure to comply with an approved Urban Runoff Mitigation Plan after receiving any required planning approval shall be a misdemeanor.~~

C. Identification of Sources

1. By _____, the EAC shall establish a screening criteria for construction sites to be listed in a database. The criteria shall insure that all the selection of

2. By _____, the Permittees shall develop a database listing sites of construction activity within each Permittees' jurisdiction which shall be updated quarterly. The database shall include at a minimum:

a. Facility owner's name, address, and telephone number;

b. Site address, ~~telephone number, and contact person~~, general contractor and telephone #

~~c. Closest receiving water~~ too onerous!

d. Type of construction activity

~~e. Duration of project with start and end dates~~ have no control over this. delete

f. Total size of project in ~~acres~~ or square feet. (cubic yards (grading)

new section. purpose is not apparent. delete. (D.) ~~Prioritization of Sources~~

1. By _____, the Permittees shall prioritize sites of construction activity within their jurisdiction on their relative potential for the contamination of storm water and urban runoff. The categorical list shall include:

~~All~~ construction ~~activity~~ sites regulated under Phase I of the

Federal storm water program (40 CFR 122.26)x are included.

b. All construction activity with sites greater than the size criteria established by the EAC but less than five acres in size.

c. Other construction activity sites considered by the EAC or the Regional Board to have a high potential for the contamination of storm water and urban runoff.

site inspections to be handled through existing inspection programs delete.

(2.) By _____, Permittees shall rank the construction activity sites identified as potential pollutant sources of storm water and urban runoff pollutants in IV. B.1.a. in order of priority for oversight of implementation of storm water management measures.

E. Control Measures

1. By _____, Permittees shall develop ~~a checklist of specific~~ storm water and urban runoff control measures for construction ~~activity~~ sites in IV. ~~B.1.a.~~ C.2. The control measures must

a. address multiple pollutant sources

b. initially focus on source control measures such as source minimization, education, good housekeeping, good waste management and good site planning.

c. target construction activity source areas and activities with the potential to generate substantial pollutant loadings

newly added section. delete. This will be addressed by the critical source monitoring program

(2.) By _____, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for construction sites in IV.B.1.a. The structural control measures must be evaluated as to:

a. effectiveness in reducing sediment, toxic pollutants and pollutants of concern;

b. ease of maintenance;

c. current frequency of use;

d. feasibility and cost-effectiveness; and

e. possible methods to ensure implementation.

By _____, Permittees shall describe any studies and pilot projects that may be conducted to assess the feasibility and effectiveness of specific control measures.

VOL 24

0024

3. By _____, Permittees shall have in place a process to ensure implementation and proper maintenance of storm water and urban runoff control measures for ~~sites associated with~~ construction ~~activity~~ sites in ~~IV.B.1.a.~~, C.2. including

too burdensome for Permittees delete.

~~a. use of qualified personnel to design, install, and maintain BMPs.~~

b. proper maintenance of BMPs incorporated into private developments (e.g., through deed restrictions, covenants, conditions and restrictions (CC&R).

c. proper installation and maintenance of post-construction BMPs.

d. prohibition on grading during the wet season (Oct 15 -Apr 15) except for emergency action unless adequate erosion and sediment control measures are in place and maintained.

newly added section

4. Permittees shall require the following for demolition/construction activity:

a. Sediment, construction waste and other pollutants from construction sites and parking areas shall be retained on the site to the maximum extent practicable. from the time of notification

b. Any sediments or other materials which are not retained on the site shall be removed within 24 hours ~~or where determined necessary~~ by the Director ~~of Department~~ of Public Works, or a designated representative, a temporary sediment barrier shall be installed. In lieu of removal,

c. Excavated soil shall be located on the site in a manner that ~~eliminates~~ minimizes the amount of sediments running into the street or adjoining properties. Soil piles shall be covered until the soil is either used or removed.

d. Drainage controls shall be utilized as needed, depending on the extent of proposed grading and topography of the site, including but not limited to the following:

i. Detention ponds, sediment ponds, or infiltration pits.

ii. Dikes, filter ~~beams~~ berms or ditches.

iii. Downdrains, chutes or flumes.

iv. Silt fences.

e. ~~No washing of construction or other industrial vehicles shall be allowed adjacent to a construction site~~. No water from washing vehicles on a site is allowed to run off ~~into the City's storm drain system~~. maybe construction unless treated to remove sediments and pollutants

VOL 24

0025

f. Roof drainage shall be oriented towards permeable areas on site to maximum extent practicable.

g. Lot drainage shall be oriented towards permeable areas to the maximum extent practicable.

can not be supported with out clear evidence of its effectiveness over good housekeeping measures. delete

h. All parking lots shall be designed to contain one inch of precipitation in a 24 hour period.

i. Runoff from parking lots shall be directed to permeable areas to the Maximum Extent Practicable.

~~5. Permittees shall require the following for construction activity~~:

relocate to E.4.f.

a. All construction sites in hillside areas or in areas adjacent to natural water-ways (soft bottom creeks), lakes or the ocean must develop and implement sedimentation and erosion control plans that incorporate the following elements: timing of construction, BMPs to reduce erosion of cleared hillsides (revegetation, jute netting, etc.), BMPs to reduce the velocity of runoff and sediment from the construction site, and BMPs to detain the flow of sediments from the site;

relocate to E.4.g.

b. As a condition of granting a construction permit, set forth reasonable limits on the clearing of vegetation from construction sites, including, but not limited to, regulating the length of time during which soil may be bare, and, in certain sensitive cases, prohibiting bare soil.

new section see comments under Chapter III.C.5.

6. Each Permittee ~~The EAC~~ may seek coverage under this Order, for construction activity sites listed in III.B.1.a.1 which are owned and operated by Permittees if it:

a. establishes a procedure for notifying the Regional Board of construction activity on sites owned or operated by Permittees ~~the EAC~~;

b. prepares a checklist of construction BMPs using BAT/BCT criteria for implementation ~~by Permittees~~ at these construction sites;

c. standardizes procedures to ensure implementation of construction BMPs ~~by Permittees~~;

d. ~~requires Permittees~~ to prepare and retain site specific Storm Water Pollution Prevention Plans at ~~Permittee~~ construction sites; and

e. establishes a procedure ~~for Permittees~~ to report annually on the effectiveness of Storm Water Pollution Plans at each construction site, and certify compliance with this Order.

newly added section.

F. ~~Source Inspection~~

delete redundant with IV.E.3.

1. By _____, Permittees shall submit a schedule for inspection of construction activity sites in IV.B.1.a. for adequacy of storm water pollution prevention measures and erosion control measures. The schedule shall include, for a five year period,

a. all construction activity identified in IV.B.1.a.1, and all construction activity identified in III.B.1.a.2 and III. B.1.a.3,

2. By _____, Permittees shall develop and implement a construction activity inspection program. The inspection program shall include, but is not limited to:

Include these under IV.E.3.

a. procedures for construction site inspections

b. procedures for construction and building industry outreach on pollution prevention, waste minimization, and storm water quality management

c. procedures to ensure corrective action is undertaken by non-complying sites

d. procedures to follow-up on violations of municipal codes

e. procedures for enforcement action against non-complying construction activity;

~~f. an electronic recording system to document the status of construction activity inspections; and,~~

g. appropriate training for program staff.

3. During inspection of ~~group IV.B.1.a.1~~ construction sites, inspectors shall request to see a copy of the SWPPP ~~during an inspection~~. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee ~~may deem~~ it ~~necessary to~~ shall report problematic construction sites regulated under Phase 1 of the Federal Storm Water Program to the Regional Board.

G. Reporting

1. Each year, the Permittees shall evaluate the results and progress of their storm water quality management program for construction activity sites. The annual report submitted to the Regional Board shall recommend a strategy for the management of storm water from construction ~~activity~~ sites for the following year based on

~~a. priority construction site sources listing~~
~~b. priority site inspections~~
evaluation ~~c. priority checklists~~ of stormwater urban runoff control measures implementation
~~d. evaluations of structural and treatment control measures~~
~~e. special studies and pilot projects needs~~
d evaluation of results from the critical source monitoring program

VOL 24

0027

~~f. specific site and activity monitoring needs~~ a hard copy of

2. The ~~EAC~~ Permittees shall ~~make available~~ transmit to the Regional Board the construction activity database developed in ~~IV.B.1.a.1 in the appropriate format when so requested~~. III.C.2 quarterly.

H. Conflicts with Other Mandates

1. The Permittees shall work with other regulatory agencies as deemed necessary by the Permittees and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies.

This applies to the entire Permit. Therefore, move to Program Management Chapter.

VOL 24

00228

V. PUBLIC AGENCY REQUIREMENTS

A. Examination of Existing Activities

By _____, the Permittees shall develop and begin implementation of a program to examine their existing activities and measures described below to reduce the impact on stormwater quality from their operations.

B. Sewage Systems

1. All reasonable efforts shall be undertaken to keep sewage spills or leaks from entering the storm drain system. The EAC shall develop procedures for spill response by _____.

2. Control procedures for identifying, repairing, and remediating sewer blockages, exfiltration, overflow, and wet weather overflows from the sewers to the storm drain system shall be implemented to protect stormwater quality by _____. These procedures shall include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

3. By _____, the Permittees shall insure that field personnel who operate and/or maintain sewer systems have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to properly investigate any suspect connections or cross connections to the storm drain system.

C. Vehicle Maintenance/Material Storage Facilities

has been revised to when EAC develops standard ppp for use by Permittees

1. By _____, EAC will develop a standard pollution prevention plans for ~~each~~ public vehicle maintenance/material storage facility ~~category~~.. Public vehicle maintenance/material storage facilities include any Permittee-owned and/or operated facility in which any of the following occur: vehicle or equipment maintenance; repair; washing; fueling; and/or any facility at which ~~there is storage of toxic chemicals or hazardous materials.~~ a hazardous materials business plan is required.

2. Best Management Practices (BMPs)

a. By _____, Permittees will have site specific pollutant control measures implemented at all vehicle maintenance/material storage facilities per EAC guidelines, together with an on- site pollution prevention plan.

b. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each public vehicle maintenance/material storage facility. To achieve this goal, the Permittees shall first identify the potential pollution sources and who is responsible for implementing the stormwater

management measures.

c. Based on the facility type, management practices and schedule of implementation shall be developed. BMPs that can be used to improve the quality of runoff include, but are not limited to:

i. Housekeeping practices;

ii. Material storage control;

iii. Vehicle leak and spill control; and

iv. Illegal dumping control.

d. Loading/Unloading of Materials

i. Employees or contractors of the Permittees who handle potentially harmful materials shall be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to stormwater from outdoor loading/unloading of materials.

ii. Applicable BMPs shall be selected based on the following three factors:

1. Eliminating exposure of material to rainfall;

2. Checking equipment regularly for leaks; and

3. Containing spills.

e. Material Storage Control

A program shall be developed to prevent or reduce the discharge of pollutants to stormwater from outdoor container storage areas using measures such as:

i. Installing safeguards against accidental releases;

ii. Secondary containment;

iii. Conducting regular inspections; and

iv. Training employees in standard operating procedures and spill cleanup techniques.

f. Vehicle and Equipment Washing and Maintenance

i.. Washing of vehicles or equipment on-site shall be

performed in a designated area equipped with an oil/water separator.

ii. The sumps and separators shall be maintained/cleaned on a regularly scheduled basis appropriate to the facility.

iii. BMPs to be implemented as appropriate for vehicle and equipment maintenance shall include but not be limited to:

a. Waste reduction;

b. Use of alternate products;

c. Pollution prevention;

d. Recycling; and

e. Spill prevention and clean up.

6. Waste Handling and Disposal

Wastes shall be managed to prevent stormwater pollution.

D. Parks and Recreation

1. Fertilizers/Pesticides

a. Permittees shall develop procedures on the proper application of pesticides, herbicides, and fertilizers by _____. Procedures shall include:

i. List of approved pesticides and selected use;

ii. Product and application information;

iii. Equipment use and maintenance procedures; and

iv. Record keeping.

b. Landscape waste shall not be ~~discharged~~ disposed of into the storm drain system.

c. Storage areas for fertilizers and pesticides shall be designed and maintained to reduce exposure to stormwater. The following BMPs shall be utilized where appropriate:

i. Store materials inside or under cover on paved surfaces;

ii. Use secondary containment;

VOL 24

0031

iii. Minimize storage and handling of hazardous materials;

iv. Inspect storage areas regularly.

2. Facility Management

a. Wash waters cannot be discharged into the storm drain system without appropriate treatment.

b. Landscape maintenance involving the use of pesticides and fertilizers shall ensure the proper use of these materials to minimize loss to storm water.

c. Retention and planting of native vegetation to reduce water, fertilizer, and pesticide needs shall be encouraged.

d. Use of Integrated Pest Management (IPM) shall be encouraged.

e. A schedule for irrigation and fertilization shall be developed by, _____, to minimize:

i. Chemical application during wet season and no chemical application during storms; and,

ii. Over watering that may lead to runoff that contains nutrients and pesticides.

f. The drainage of commercial/municipal swimming pool water shall only be discharged under separate Waste Discharge Requirements.

g. Each Permittee shall develop BMPs to minimize trash, debris, and other pollutants from entering Permittee owned recreational water bodies by _____. These measures shall include:

i. Routine trash collection along, on, and/or in, water bodies, where feasible; and

ii. Public outreach to educate the public about impacts of illegal dumping.

E. Storm Drain System Operation and Management

1. Inlet Maintenance

BMPs to be implemented by each Permittee for effective catch basin cleaning shall include, but not be limited to the following:

a. Basins shall be inspected and cleaned between May 1 and October 15 of each year;

b. Between October 15 and April 15, catch basins shall be maintained as necessary.

c. Records shall be kept of the number of catch basins cleaned; and

d. Track the amount of waste collected.

2. Storm Drain Maintenance

a. Material removed from storm drains and catch basins shall be disposed of properly.

b. Trash and debris from open channel storm drains shall be removed at least annually between May 1 and October 15 of each year.

c. Open channels shall also be monitored during the rainy season for any debris buildup and cleaned where needed.

3. Waste Management

The Permittees shall implement a program by _____, to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

4. Dry weather storm drain diversion

The Permittees shall investigate the feasibility of diverting dry-weather flows from the storm drain system to POTWs where appropriate. The investigation shall be completed by _____.

F. Streets and Roads

1. Sweeping of curbed streets:

a. Sweeping of curbed streets shall occur at least monthly.

b. Where feasible, areas generating excessive refuse shall be swept more frequently.

2. Maintenance

a. Existing saw-cut management and paving practices conducted by the Permittees shall be evaluated and appropriate control measures developed.

b. Paving control measures to be considered that would help reduce the impacts to stormwater include, but are not limited to:

i. Avoid paving during wet weather; and

ii. Store materials away from drainage courses to prevent pollution of stormwater runoff.

c. Refuse collected shall be transported to appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations.

d. Good housekeeping practices shall be implemented to insure proper management of any waste products that may be generated during maintenance activities.

e. To reduce stormwater pollution from concrete materials and wastes:

i. Washout of concrete trucks should be conducted off- or on-site in designated areas. Do not wash out concrete trucks into storm drains, open ditches, streets, or streams;

ii. Store materials under cover, away from drainage areas; and

iii. Avoid mixing excess amounts of concrete or cement on-site.

f. Employees shall be trained in the implementation of good housekeeping measures. Training shall:

i. Promote a clear understanding of the potential for maintenance activities to pollute storm water;

ii. Identify solutions (BMPs selection);

G. Flood Control

1. By, _____, the Permittees shall develop and implement procedures to assess the impact(s) of new flood management projects on the quality of receiving water bodies.

2. The Permittees shall undertake pilot projects/studies to determine the applicability of altered structural flood control system elements to provide pollutant removal in stormwater.

3. During construction, appropriate BMPs shall be utilized to control pollutants.

4. Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed to assure that appropriate management measures are developed to comply with the stormwater regulations.

H. Parking Facilities

Motor vehicle parking lots with 10 or more parking spaces located in areas susceptible to runoff shall be swept to remove debris.

replace with above language

By _____, each Permittee shall develop a program to implement periodic hardscape and catch basin cleaning, in order to reduce concentrations of oil, grease, suspended particulates, and metals, as well as the petroleum byproducts.

VOL 24

00355

Entire chapter to be rewritten by Regional Board to reflect short term needs and long term education strategy.

September 15, 1995

VI. PUBLIC INFORMATION AND PARTICIPATION

To reach as many Los Angeles County residents as possible, a comprehensive educational outreach approach shall be undertaken under this permit. Each Permittee shall choose an appropriate combination of outreach tools and activities to raise public awareness of storm water issues and improve water quality.

Outreach Materials

Outreach programs shall consist of written, audio, and visual materials and, when necessary, translated into appropriate languages or structured for appropriate ages. Permittees shall incorporate interactive methods of distributing outreach materials and provide for public participation in activities developed under this section.

A. Written Material

1. The Permittees shall produce a variety of written materials to convey information regarding storm water management within County watersheds.

2. Written materials shall include, but are not limited to: flyers, brochures, door-hangers, newspaper articles, mail-inserts, and newsletters.

B. Audio Material

1. ~~All~~ Permittees shall singularly or collectively utilize radio broadcast public service announcements to convey information regarding storm water management except in areas where public access radio stations are not available.

2. Examples of audio materials include radio advertisements, public service announcements, and informational recordings.

C. Visual Material

1. ~~All~~ Each Permittees shall implement a catch basin labelling program as well as other strategies such as banners, displays and posters to educate the public on the ultimate destination of storm drain system flows.

2. ~~Each Watershed Management Committee~~ The Permittees shall produce or aquire ~~at least one~~ informational video(s). The video shall be shown on televised public service stations and cable access programs ~~except in areas where cable access programs are not available~~. Further methods of distribution may include workshops, libraries, etc.

regarding stormwater management.

throughout all watersheds on a regular basis

D. Distribution of Materials

Outreach materials shall be made available to the public at appropriate public

VOL 24

0036

counters and distributed at public events. Examples include fairs, festivals, public meetings, community events, school assemblies, etc.

General Education Strategy

A. The EAC shall develop and the Permittees shall implement a 5-year urban runoff education strategy. The intent of the strategy shall be to enhance public awareness of the impact of storm water pollution on receiving waters and to discourage improper waste disposal practices. Outreach efforts shall be conducted throughout the watershed. The public shall be made aware of their responsibility for both the problems and solutions to storm water pollution. A watershed-wide program shall be implemented by _____.

Development and implementation of the education strategy shall be based on the four objectives listed below:

1. Promoting clear identification and understanding of the problem, including activities with the potential to pollute storm water;

2. Identifying solutions or applicable measures (Best Management Practices) that can be taken to prevent storm water pollution;

3. Raising public awareness of the problems and solutions; and

4. Incorporating solutions back into programs, training and BMP implementation.

B. Efforts shall be made to identify land uses and activities that have a higher potential for storm water/urban runoff pollution by focusing on specific pollutants, disposal practices, materials used, etc. To prevent storm water/urban runoff pollution, outreach materials shall be provided on the appropriate selection and implementation of BMPs accordingly. A watershed-wide program shall be developed by _____.

1. Pollutant Specific: The reduction of specific pollutants of concern in a particular watershed shall be addressed in a focused public education and outreach program.

2. Activity-specific: Activity-specific outreach programs shall be developed and implemented throughout the watershed. Written, audio, or visual outreach tools should address three primary topics:

   a. Identification of activities potentially causing storm water pollution;

   b. Implementation of Best Management Practices to prevent storm water pollution.

   c. Recognizing and reporting occurrences of storm water polluting activities.

The Permittees shall continue to develop activity-specific outreach programs that inform residents about the problem of illicit discharges and dumping and that promote, publicize, and facilitate public reporting of these activities. The program shall also include continuing operation, maintenance, and promotion of the county-wide reporting hotline.

Done at discretion of Phone Co's Permittees have no control. delete

C. The Permittees shall ~~list~~ pertinent City phone numbers ~~under the City government directory located in the front section of local area phone books. This shall be updated annually as necessary and shall, at a minimum, include numbers for reporting on clogged catch basin inlets reporting illegal discharges/dumping and a general informational number for storm water. These phone numbers may be~~ city-specific or ~~area-wide~~.

D. All reasonable efforts to coordinate public outreach efforts shall be undertaken. This may include coordinating with environmental groups and public agencies such as the California Coastal Commission, the Department of Beaches and Harbors, Resource Agencies, etc.

Outreach to Target Audiences

Permittees shall develop and implement an educational program that stresses pollution prevention for a variety of audiences, including local residents, school-aged children, businesses and public employees whose job functions and daily lives may impact storm water quality. The program may be developed locally or regionally, ~~and shall include at a minimum~~:

- ~~Education on the proper use and disposal of pesticides, herbicides and fertilizers~~;
- ~~Education on the definition of, identification of, and impacts associated with~~ illicit ~~discharges and procedures for reporting~~.
- ~~Promotion of proper management of and disposal practices for used oil and hazardous substances~~.

A. ~~Local~~ Residents

1. ~~The~~ Permittees shall develop a program to educate local residents on types of household hazardous wastes along with proper management and disposal methods. The program shall at a minimum include:

   a. Information on the availability of collection services, such as location and schedule;

   b. Production of public outreach materials that educate residents on source reduction and proper disposal methods for household hazardous wastes; and

   c. Continue to encourage residents to recycle of oil, antifreeze, glass, plastics, batteries, etc. and to prevent the improper disposal of such

materials to the storm drainage system.

Educational efforts throughout the watershed should also provide residents with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Management Program. Other local programs shall be advertised as appropriate.

2. Permittees shall develop and encourage watershed residents to participate in specific storm water outreach programs. Residents shall be informed of and provided with the opportunity to share ideas and comments about the programs. Permittees shall demonstrate that a good faith effort has been made to outreach to different communities within the watershed. The watershed-wide outreach program shall be implemented by _____. ~~This shall at a minimum include~~:

   a. Where applicable for fire and erosion prevention, mowing shall be encouraged as opposed to disking. An investigation of effectiveness shall be undertaken.

3. Cooperative Public Outreach

   In order to promote public participation, cooperative outreach programs with local residents shall be developed. These cooperative programs should foster awareness and identification of storm water pollution issues among residents in the watershed. ~~Catch basin labelling and other established sign programs are excellent examples of this type of cooperative effort, as are events like the "Storm Water Pollution Awareness Week." One possibility for cooperative outreach is an "Adopt-A-" program. Residents can "adopt" highways, storm drains, catch basins, streams, etc. to monitor, restore and protect~~. The purpose of all cooperative outreach programs created is to inform and involve the public in storm water management.

~~4. Complaint Procedures~~

   ~~Public comments/complaints shall be requested by the Permittees in order to help gauge the success and effectiveness of storm water programs.~~

B. K-12 School Children

~~School children can play an important role in public information and participation programs, as they are generally more easily motivated and any behavior changes they make tend to stay with them through adulthood. School children can also convey storm water pollution prevention messages to other family members.~~ School programs shall include information on storm drain systems, the difference between sewers and storm drains, the importance of preventing storm water pollution, and may also address, illegal discharges/dumping and reporting procedures, source minimization, and general pollution prevention. Written materials (workbooks and coloring books), videos, assemblies, and field trips are examples of effective components of a K-12 educational program.

C. Businesses

A ~~detailed public~~ education and outreach program shall be developed for business operations with greater potential of discharging pollutants into the storm drain system. The program shall ~~include~~ employee training on ~~and the effectiveness of implementing BMPs to reduce nonpoint source pollution.~~ In addition to written, audio, and visual materials, other possible means of focused outreach may include: conducting workshops, mass mailings, submitting informational articles to trade/industry magazines, etc.

D. ~~Public Agencies and~~ Employees

~~Public agency~~ employees shall be trained on storm water management and pollution prevention practices and involve employees on many different levels - from program managers to field personnel. Training programs shall include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forums or committees. Materials developed for other audiences may also be used in these public agency employee training programs. Appropriate public agency employees shall be trained in:

1. Emergency spill cleanup procedures.
2. Environmentally sensitive alternative products.
3. Good housekeeping practices.

Permittees shall provide outreach materials to the general public through business license renewal counters and/or make efforts to outreach through professional and business associations. Additionally, Permittees should consider producing educational materials for professionals and technicians not employed by public agencies.

Outreach Based on Activity-Type

A. Industrial/Commercial

A watershed-wide, general outreach program shall be set up by the WMC for all industrial and commercial facilities potentially discharging to the storm drain system. Furthermore, the WMC shall provide specific guidance objectives to these facilities regarding storm water program compliance by _____, and inform and remind all potential commercial and industrial dischargers of their obligations under the storm water program. The Permittees shall also encourage the proper disposal of all materials from industrial and commercial sites.

Prior to the WMC providing specific guidance objectives, subcommittees shall be established, as needed, to develop specific outreach materials for industrial/ commercial categories and specific "high priority" activities. This shall include at a minimum: metal platers, restaurants, vehicle related facilities, etc...

B. Construction

The Permittees shall ensure that contractors properly install all necessary post-construction, permanent BMPs during initial construction and that any necessary maintenance needed during construction is performed. There shall be specific programs outlining correct practices.

In an effort to prevent concrete waste from entering the storm drain system, contractors shall observe the following guidelines:

1. Washout of concrete trucks should be conducted off-site or on-site in designated area;
2. Excess concrete should not be dumped on site; and
3. Employees and subcontractors should be trained in proper concrete waste management.

Evaluation

The EAC shall develop a process to evaluate the effectiveness of all public outreach programs implemented under this permit. Surveys and focus groups are examples of methods that can be used to gauge a program's effectiveness. They can also be used to provide insight into the program's direction and to help formulate attainable goals. Results of any evaluation method used shall indicate the community's level of awareness of storm water pollution. A watershed-wide program shall be implemented by _____.

VIII. PROGRAM EVALUATION AND REPORTING

~~The program may be modified subject to comments received under the Annual Review.~~

A procedure shall be developed and utilized for program evaluation and reporting by the Principal Permittee and the Permittees during the course of this permit. Under this procedure as outlined below, the EAC shall develop action-specific performance indicators and criteria, perform evaluation of compliance and effectiveness based on the performance criteria, establish schedules and mechanism for internal record keeping and reporting, and submit semi-annual and annual reports to the Regional Board using a standardized format.

The EAC, WMC, and/or each Permittee are responsible for collecting data needed for program evaluation, conducting self-evaluation, and reporting the results of evaluation to the Regional Board. The results reported to the Regional Board shall include both the collected data and analysis of the data. The reports shall include detailed explanation on how the evaluations are conducted, how and why certain provisions of the permits are met or not met, how the effectiveness of certain BMPs is determined or is not, and should a problem arise, how it shall be corrected. The Regional Board will make a compliance determination based on information submitted under this procedure.

A. Demonstration of Compliance

1. Each Permittee is responsible for demonstrating that the required BMPs as prescribed under this permit, as well as other BMPs included in the Watershed Management Plans, are implemented to the "maximum extent practicable." Each Permittee shall implement the required BMPs to the maximum extent practicable.

2. The Watershed Management Committees are responsible for demonstrating the effectiveness of other BMPs through conducting and reporting the results of pilot/demonstration projects for evaluating the effectiveness of BMPs in the watershed.

3. The degree and the effectiveness of BMP implementation shall be evaluated and reported by the Permittees using environmental and/or administrative indicators whenever possible. When environmental indicators are not readily and/or easily available, administrative indicators shall be used. These shall include indicators prescribed under relevant provisions of this permit, and/or other indicators deemed appropriate by the Watershed Management Committee, the Executive Advisory Committee, and/or ultimately the Regional Board. Examples of the quantitative indicators include the number of inspections conducted, number of staff ~~increase~~, number of audience reached through public education, waste recycled, water conserved, hazardous waste collected, oil recycled, catchbasin waste removed, etc. Quantitative indicators of environmental conditions should also be reported if they can be linked to the effects of the BMP implementation.

4. In order to yield comparable results for year to year evaluation on the success, the progress, and/or the failure in BMP implementation, and comparable results from area to area, a uniform data collection methodology shall be established for each of the required BMPs. The uniform data collection methodology shall be developed by the Executive Advisory Committee. Subsequently, each report on BMP implementation shall provide comparison with the implementation status during the previous reporting period and the scheduled implementation timeline for the current and future reporting periods, based on data collected using the uniform collection methodology.

B. Internal Reporting and Record Keeping

1. In order to facilitate the preparation of semi-annual and annual reports, the EAC shall develop standard forms for internal reporting to be used by all Permittees within the watershed. The forms shall collect all the information essential to the preparation of the annual and semi-annual reports and to the needs of other management actions by the Watershed Management Committees, EAC, and/or the Permittees. Reported information shall be quantifiable and specific for each program area and/or BMP. The dates for submitting the internal reports shall allow sufficient time for compilation and analysis by the Watershed Management Committees and/or the EAC for the preparation of semi-annual and annual reports to the Regional Board.

2. All records shall be retained by the Permittees for a period of 5 years ~~or longer as~~ Unless otherwise required by the Regional Board or USEPA.

C. Semi-annual and Annual Reports

1. Semi-annual Report

The requirements under VIII.A shall be met by the submittal of semi-annual and annual reports. Semi-annual reports shall succinctly summarize compliance efforts and may consist of simple compliance checklists. Annual reports shall be comprehensive.

a. The EAC shall submit a semi-annual progress report to the Regional Board by _____ of each year. Semi-annual reports must be submitted to the Regional Board within 30 days after the end of the six-month period. These six month periods are Jan - June, and July - Dec. (TO BE DETERMINED).

b. The semi-annual report shall serve as a status report on the progress of the implementation of the Stormwater Management Plan and other permit provisions. The Watershed Management Committee is responsible for collecting and compiling information from each Permittee prior to preparation of the semi-annual report, and include the compiled information along with the information

analysis into the report.

c. The semi-annual report shall consist of a summary table illustrating the levels of implementation for all requirements by each Permittee. Tables shall be developed for each program element listing the Permittees, describing the status of implementation by each Permittee of the element, and documenting any modifications of the element from the standard program.

2. Annual Report Advisory

a. The Executive Committee shall submit an annual report to the Regional Board not more than 60 days after the end of each permit year (_____). The annual report shall include both a summary of the progress and status of Stormwater Management Plan implementation, a summary on status of compliance with all permit provisions, a report on the evaluation of program effectiveness, and a summary of recommendations for permit provision revisions. The Permittees as a whole (within watershed management areas) shall describe any problems encountered during implementation and discuss the modifications to the program in order to solve these problems.

b. The Principal Permittee shall collect, compile, and analyze information from each Permittee within the watershed prior to preparation of the annual report. The Watershed Management Committee shall include the compiled information and its analysis (instead of raw data or copy of internal reports) in the annual reports.

c. The annual report shall include a summary table illustrating the levels of implementation for all Permittees. Tables shall be developed for each program element listing all the participating Permittees and describing the status of implementation by each Permittee of the element. ~~A table shall also be included to summarize the status of the program elements for which the Watershed Management Committee bears the primary implementation responsibility.~~ Besides summary tables, the report should provide detailed explanation on any modifications made of the program elements (delays, changes, etc.) from the standard provisions and provide an analysis of any problems encountered during the implementation and the proposed solutions.

d. The annual report shall include an assessment of the effectiveness of each program element using the performance evaluation indicators and criteria developed under Section A of this Chapter, and the results of the pilot/demonstration projects conducted within and/or outside the watershed. The findings should be presented graphically for ease of comparison with the established levels of

effort.

e. A fiscal analysis and budget as described under I.I (Fiscal Resources) of this Order shall be submitted annually within 30 days of the Budget adoption date for each Permittee.

D. Storm Water Management Plan Revisions

1. Revisions to provisions of this permit can be made through the order of the Regional Board. The EAC can recommend and request revisions to the Stormwater Management Plan through documentation in the annual reports.

2. Recommended revisions shall be supported by the results of a program evaluation. Recommended revisions to the Stormwater Management Plans may be made if it can be demonstrated that 1) the changes will lead to improvement of the effectiveness of this program, 2) the changes will result in positive impacts of ~~environmental conditions~~ beneficial uses, and 3) that the current measures have been implemented to the "Maximum extent practicable" as defined in Section VIII.A. Any recommended revisions shall not take effect unless approved by the Executive Officer.

3. Revisions may be made to the Storm Water Management Plans by the Executive Officer or the Regional Board based upon public input and/or testimony.

This chapter to be rewritten by Regional Board upon receipt of County / NPDC developed proposal.

IX. MONITORING PROGRAM OUTLINE 01 September 1995

I. GENERAL

1. Revisions of the monitoring and reporting program may be necessary to ensure that the discharger is in compliance with requirements and provisions contained in this Order. Revisions may be made by the Executive Officer at any time during the term of this Order, and may include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring, the location of monitoring sites, the number and/or size of samples collected, and/or any other measures necessary to improve the effectiveness of the program.

2. All sample collection, handling, storage, and analyses shall be in accordance with 40 CFR 136.

3. The Permittees may complement their monitoring data with data from other areas provided the characteristics are similar to characteristics in the Los Angeles County Watershed Management Areas.

4. The Permittees shall implement the monitoring programs submitted under NPDES Permit No. CA0061654 between 1992 and 1995 until acceptable watershed monitoring programs are developed and implemented.

II. OBJECTIVES

The overall goal of this monitoring program is to develop and support effective watershed specific storm water quality management programs.

The following are major objectives:

1. To track water quality status, pollutant trends, pollutant loads, and pollutants of concern.

2. To monitor and assess pollutant loads from specific land uses and watershed areas.

3. To identify, monitor, and assess significant water quality problems related to storm water discharges within the watershed.

4. To identify sources of pollutants in storm water runoff to the maximum extent possible (e.g., atmospheric deposition, contaminated sediments, other nonpoint or point sources, etc.).

5. To identify and eliminate illicit discharges.

6. To evaluate the effectiveness of existing management programs, including scientific estimation of pollutant reductions achieved by structural and nonstructural BMPs.

VOL 24

00466

7. To assess the impacts of storm water runoff on receiving waters. (This may be a coordinated effort among point source dischargers, SCCWRP, etc...)

III. MONITORING PROGRAM REQUIREMENTS

The Permittees shall develop and submit for the approval of the Executive Officer an integrated watershed monitoring program to achieve the above stated objectives. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedule prescribed by the Executive Officer. At a minimum, the program shall include the following:

1. A mechanism for the collection, analysis and interpretation of existing data from monitoring programs within Los Angeles County. These and other data from local, regional or national sources should be utilized to characterize different storm water sources; to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants; to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the watershed management areas in the County of Los Angeles. The Permittees are encouraged to use data from similar studies, if available.

2. Rationale for selection of monitoring locations, parameters, number and frequency, and analytical methods.

3. A description of the monitoring program shall include at a minimum:

   a. The number and location of monitoring stations;

   b. Targeted monitoring indicators (e. g., ecosystem, biological diversity, in stream toxicity, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;

   c. Parameters selected for field screening and for laboratory work and their detection limits;

   d. Total number of samples for statistical significance to be collected from each station, receiving water and major outfall monitoring, frequency of sampling during dry weather and short or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment;

   e. Uniform guidelines for quality control, quality assurance, data collection and data analyses; and

f. Data storage and transfer format, accessibility, etc...

4. A method for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including cost sharing.

6. A description of computer software and modelling programs that will be utilized to assess data, interpret information, etc...

7. A description of how data will be utilized for feedback into the storm water management program.

The Discharger shall comply with the attached Monitoring and Reporting Program, which is part of this Order, and any revisions or modifications thereto, as ordered by the Executive Officer.

It is anticipated that the initial storm water management program, as delineated in the Plan and/or implementation agreement, may need to be modified, revised, or amended from time-to-time to respond to changed conditions and to incorporate more effective approaches to pollutant control. Minor changes may be made at the direction of the Executive Officer. Minor changes requested by the Discharger shall become effective upon written approval of the Executive Officer. If proposed changes imply a major revision in the overall scope of effort of the program, such changes must be approved by the Regional Board as permit amendments.

This Order may be modified, revoked, or reissued, prior to the expiration date as follows:

a. To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;

b. To incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable; or

d. Any other Federal or State Laws or Regulations become effective which necessitate changes.

The issuance of this permit is not intended to, and does not, absolve the Discharger of liability for conduct which may have constituted a violation of the previous Board Order 90-079 (CA0061654, CI 6948) adopted by this Regional Board on June 18, 1990.

This Order expires on _____. The Discharger must submit a complete Report of Waste Discharge including a revised Storm Water Management Plan in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on December __, 1995.

DRAFT

NPDES STORMWATER PERMIT TASK SCHEDULE

Attached is a draft list of the above permit's tasks and flow chart with implementation dates.

This schedule has been generated by my staff. Please note that these lists are strictly a staff level product and have not received any review by either County Public Works administration, or the EAC. Therefore, the schedule should not be viewed as the position of either County Public Works or the EAC regarding acceptable implementation dates.

LOS ANGELES COUNTY

STORMWATER PERMIT

0052

October 12, 1995

LOS ANGELES COUNTY STORMWATER PERMIT

TASK	IMPLEMENTER	COMPLETION DATE (# OF MONTHS AFTER PERMIT ADOPTION)
I PROGRAM MANAGEMENT		
A. Principal Permittee		
2a. Convene EAC	PRINCIPAL PERMITTEE	1 month
G. Fiscal Resources		
Shall submit an annual budget.	EACH PERMITTEE	30 days after Permittee budget adoption
H. Legal Authority		
5. Upon its completion of the legal authority review, or within 6 months of permit adoption, (which ever is sooner), each permittee shall demonstrate that it has adequate legal authority or provide a schedule for obtaining the adequate legal authority.	EACH PERMITTEE	6 months, or upon completion of legal authority review (which ever is sooner).

TASK	IMPLEMENTER	COMPLETION DATE (# OF MONTHS AFTER PERMIT ADOPTION)
II. ILLICIT DISCHARGES/DISPOSAL		
A. Illicit Connections		
Develop a County-wide model plan for investigative standard procedures to eliminate illicit connections.*	EAC	7 months
Approve the County-wide model plan for investigative standard procedures to eliminate illicit connections to the storm drain system.	RWQCB	11 months
Implement the County-wide model plan to identify and eliminate illicit connections to the maximum extent practicable.	EACH PERMITTEE	18 months
B. Illicit Discharges/Disposal		
1. Develop a consistent County-wide model plan for investigative standard procedures to eliminate illicit discharges/disposal practices to the storm drain system.*	EAC	7 months
2. Develop a County-wide model plan for standard enforcement procedures to terminate illicit discharges/disposal.*	EAC	7 months
3. Develop standard procedures for spill response.*	EAC	7 months
Submit plans 1-3 above for approval after EAC completion.	RWQCB	11 months
4. Implement the County-wide model plan to identify and eliminate illegal discharges/disposal practices.	EACH PERMITTEE	17 months
E. Public Reporting		
1. Develop a County-wide model plan for public reporting.*	EAC	7 months
Submit for approval the County-wide model plan for public reporting.	RWQCB	11 months
Implement the County-wide model plan for public reporting.	EACH PERMITTEE	17 months
2. Develop a County-wide model plan for reporting incidents of hazardous substances entering the storm drain.	EAC	7 months
Submit for approval the County-wide model plan for reporting incidents of hazardous substances entering the storm drain.	RWQCB	11 months
Implement the County-wide model plan for reporting incidents of hazardous substances entering the storm drain.	EACH PERMITTEE	17 months

TASKS	IMPLEMENTER	COMPLETION DATE (# OF MONTHS (AFTER PERMIT ADOPTION)
F. REPORTING		
1. A summary of all illicit connections eliminated will be included in the annual report.	PRINCIPAL PERMITTEE	60 days after the end of each Permit year.
2. A summary of illegal discharge/disposal practices reported through the standardized public reporting system shall be submitted with the annual report to the Regional Board.	PRINCIPAL PERMITTEE	60 days after the end of each Permit year.
H. WATERSHED REVIEW		
After RWQCB approval, modify the County-wide model plan requirements for new development and redevelopment as necessary to accommodate each watershed.	WMC	9 months

TASKS	IMPLEMENTER	COMPLETION DATE (# OF MONTHS (AFTER PERMIT ADOPTION)
III. PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES		
A. IDENTIFICATION OF SOURCES		
1. Develop a database listing of the commercial/industrial facilities identified in III.B.1.a. by four digit SIC codes.	EACH PERMITTEE	8 months
B. PRIORITIZATION OF SOURCES		
1. Prioritize industrial and commercial facilities within the Permit area on their relative potential for the contamination of storm water and urban runoff.	EAC	12 months
2. Identify industrial and commerical facilities which potentially contribute significant pollutant impacts to storm water discharges.	EAC	14 months
3. Approve prioritization of sources after completion of Task B.2. above.	RWQCB	18 months
C. SOURCE CONTROL MEASURES		
1. Develop County-wide model plan for stormwater and urban runoff control measures for prioritized facilities.	EAC	18 months
Approve County-wide model plan for stormwater and urban runoff control measures, after completion of Task 1. above.	RWQCB	22 months
2. Begin requiring mandatory source control measures.	EACH PERMITTEE	6 months
D. SOURCE INSPECTION		
Develop County-wide model plan guidelines for conducting source inspections.*	EAC	11 months
Approval of County-wide model plan Guidelines for conducting source inspections upon completion of task above.	RWQCB	15 months
1. Each Permittee shall submit a schedule of inspection of industrial/commercial facilities in III.B.2.	EACH PERMITTEE	21 months
2. Each Permittee shall develop and implement a industrial/commercial facilities inspection program.	EACH PERMITTEE	24 months
E. <u>Watershed Review</u>		
After RWQCB approval, modify the County-wide model plan requirements for new development and redevelopment as necessary to accommodate each watershed.	WMC	29 months

DRAFT

TASK	IMPLEMENTER	COMPLETION DATE (# OF MONTHS AFTER PERMIT ADOPTION)
IV. PROGRAM REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT		
A. Regional Policy		
1. Develop a County-wide model plan to encourage watershed protection considerations.*	EAC	10 months
2. Develop minimum recommended requirements consistent with the County-wide model plan for new development and redevelopment.*	EAC	12 months
3. Upon completion of Task 1 and 2 above, submit the County-wide model plan requirements for new development and redevelopment for approval.	RWQCB	18 months
4. Implement where feasible the County-wide model plan.	EACH PERMITTEE	24 months
B. Planning Process		
1. Develop a County-wide model plan for use in preparing/reviewing EIR's, and in linking EIR mitigation conditions to local permits approvals.*	EAC	14 months
3. Develop a County-wide model plan CEQA checklist form that explicity addresses watershed, water quality, and nonpoint source pollution impacts.*	EAC	14 months
Upon completion of Tasks 1 and 3, submit County-wide model plan for approval.	RWQCB	16 months
Implement B.1. and B.3.	EACH PERMITTEE	24 months
6. Implement a program to encourage developers to maximize pervious areas and stormwater infiltration.	EACH PERMITTEE	24 months
C. Identification of Sources		
1. Establish a screening criteria for the selection of construction sites to be listed in a database.*	EAC	10 months
Upon completion of Task 1 above, submit the County-wide model plan screening criteria for approval.	RWQCB	14 months
2. Develop a database listing construction site activity in each permittees jurisdiction, to be updated quarterly.	EACH PERMITTEE	17 months

DRAFT

TASK	IMPLEMENTER	COMPLETION DATE (# OF MONTHS (AFTER PERMIT ADOPTION)
E. Control Measures		
1. Develop a County-wide model plan for storm water and urban runoff control measures for construction sites in Section IV.C.2.*	SAC	12 months
Upon completion of Task 1 above, submit the County-wide model plan for stormwater and urban runoff control measures for approval.	RWQCB	18 months
3. Develop a process to ensure implementation and proper maintenance of storm water and urban runoff control measures for construction sites identified in Section IV.C.2.	EACH PERMITTEE	20 months
4. Begin to require specific control measures for demolition construction activity.	EACH PERMITTEE	8 months
H. Watershed Review		
After RWQCB approval, modify the County-wide model plan requirements for new development and redevelopment as necessary to accommodate each watershed.	WMC	29 months

DRAFT

TASK	IMPLEMENTER	COMPLETION DATE (# OF MONTHS AFTER PERMIT ADOPTION)
V. PUBLIC AGENCY REQUIREMENTS		
B. SEWAGE SYSTEMS		
1. Develop procedures for spill response control measures and personnel training*	EAC	7 months
a. Review procedures for spill response.	RWQCB	11 months (After Task B.1.)
2. Implement spill response control procedures for indentifying, repairing, and remediating sewer blockages, exfiltration, overflow and wet weather overflows from the sewer to the storm drain system.	EACH PERMITTEE	18 months
3. Insure that all field personnel have procedural training for illegal connection detection.	EACH PERMITTEE	24 months
C. VEHICLE MAINTENANCE/MATERIAL STORAGE FACILITIES		
1. Develop a standard Pollution Prevention Plans (PPP) for vehicle maintenance/material storage facilities.*	EAC	14 months
Review standard pollution prevention plans.	RWQCB	18 months (After Task C.1.)
2. Best Management Practices (BMPs)		
a. Implement site specific pollutant control measures at vehicle maintenance/material storage facilities per EAC guidelines, together with on-site Pollution Prevention Plan.	EACH PERMITTEE	24 months
D. PARKS AND RECREATION		
1. Fertilizer/Pesticides		
a. Develop procedures on the proper application of pesticides, herbicides, and fertilizers.*	EAC	14 months
b. Review procedures for proper application of pesticides, herbicides, and fertilizers.	RWQCB	18 months (After Task D.1.)
c. Implement procedures on the proper application of pesticides, herbicides and fertilizers.	EACH PERMITTEE	24 months
2. Facility Management		
a. A schedule for irrigation and fertilization shall be developed to minimize:	EACH PERMITTEE	24 months
i. Chemical application during wet season and no chemical application during storms.		

TASK	IMPLEMENTER	COMPLETION DATE (# OF MONTHS AFTER PERMIT ADOPTION)
f. Overwatering that may lead to runoff that contains nutrients and pesticides.		
g. Develop BMPs to minimize trash, debris, and other pollutants from entering permittee owned recreational waterbodies.*	EAC	18 months
h. Review BMP's for use on permittee owned recreational waterbodies and revise as necessary to accomodate each watershed.	RWQCB	22 months (After Task 2.g.)
i. Implement BMP's to minimize pollutants from entering recreational waterbodies.	EACH PERMITTEE	28 months
E. Storm Drain System Operation and Management		
3. Waste Management		
a. Develop a program to identify problem areas of illegal dumping.*	EAC	18 months
b. Review the program for problem areas of illegal dumping.	RWQCB	22 months (After Task 3.a.)
c. Implement the program to identify problem areas of illegal dumping.	EACH PERMITTEE	28 months
4. Dry Weather Storm Drain Diversion		
Investigate the feasibility of diverting the dry-weather flows from the storm drain system to POTW's where appropriate.*	EAC	12 months
a. Review results of dry-weather flows diversion feasibility study.	RWQCB	16 months (After Task E.4.)
G. Flood Control		
1. Develop procedures to assure that flood management projects assess the impacts of the project on the quality of receiving waterbodies.*	EAC	18 months
a. Review procedures for Flood Management Projects.	RWQCB	22 months (After Task G.1.)
b. Implement procedures to assess impacts of Flood Management projects on quality of receiving waterbodies.	EACH PERMITTEE	22 months
I. Watershed Review		
After RWQCB approval, modify the County-wide model plan requirements for new development and redevelopment as necessary to accomodate each Watershed.	WMC	28 months

TASK	IMPLEMENTER	COMPLETION DATE (# OF MONTHS AFTER PERMIT ADOPTION)
VI. PUBLIC INFORMATION AND PARTICIPATION		
GENERAL EDUCATION STRATEGY		
A. Develop a County-wide model plan five-year urban runoff education strategy. This shall be done on a watershed-wide basis.*	EAC	14 months
Upon completion of task above, submit the County-wide model plan education strategy for approval.	RWQCB	18 months
Each Permittee shall implement the County-wide model plan for public education strategy.	EACH PERMITTEE	22 months
WMC shall review the County-wide model plan education strategy and alter the plan as necessary to accommodate each specific watershed.	WMC	28 months

TASK	IMPLEMENTER	COMPLETION DATE (# OF MONTHS AFTER PERMIT ADOPTION)
VII. PROGRAM EVALUATION AND REPORTING		
C. Annual Reports		
- Develop a County-wide model plan standard annual report format for program evaluation and reporting.*	EAC	18 months
- Submit the County-wide model plan for annual report format for approval.	RWQCB	22 months
- Implement the report format.	EACH PERMITTEE	24 months
2. Annual Report		
a. Submit an annual report to the Regional Board not more than 60 days after the end of each Permit year.*	EAC	First Annual Report (Due 3/97)
E. Watershed Review	WMC	28 months
After RWQCB approval, modify the County-wide model plan requirements for new development and redevelopment as necessary to accommodate each watershed.		

* Element of County-wide Model Plan.

IN REPLY PLEASE REFER TO FILE: EP-3

Ms. Catherine Tyrrell
California Regional Water Quality
Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Ms. Tyrrell:

COMMENTS ON THE SEPTEMBER 15, 1995 DRAFT NPDES STORMWATER PERMIT

Enclosed are copies of letters received on behalf of 31 cities expressing their comments and concerns regarding the September 15, 1995 Draft Permit.

Please incorporate each of these letters into the Administrative Record of this permit. Copies of the comment letters from the Natural Resources Defense Council and the California Restaurant Association are also included.

Los Angeles County staff has also prepared a version of the September 15, 1995 partial Draft Permit which incorporates the concerns expressed by each city that are directed to specific sections of the Permit. The cities of Los Angeles and El Segundo have extensive specific comments and as part of their submittals have incorporated them directly into the draft Permit. Therefore, their comments have not been included in the enclosed Draft Permit. Please refer to their comment letters for their specific concerns.

Many of the most frequently voiced concerns that addressed the Permit generally (such as scope, complexity, and missing sections) are not reflected in the enclosed draft permit. We urge that each comment letter from the cities be individually given careful review by your staff.

The EAC has not attempted to evaluate these comments. The concerns raised in their previous letter submitted to you dated October 17, 1995 remain and should be addressed by your staff as they review the enclosed material.

We look forward to receiving your complete Draft Permit after you have had the opportunity to review and incorporate these comments.

We trust this information will be helpful to you in completing the Draft permit. If we can be of further assistance, please contact me at (818) 458-4014.

Very truly yours,

Donald L Wolfe

DONALD L. WOLFE

0063

THIS DRAFT CONTAINS COMMENTS ON VARIOUS SPECIFIC ARTICLES OF THE PERMIT AS SUBMITTED BY THE CO-PERMITTEES NOTED. SEE THE COMMENT LETTERS FROM THE CITIES OF EL SEGUNDO AND LOS ANGELES FOR THEIR SPECIFIC COMMENTS.

September 15, 1995

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. 95-XXX

WASTE DISCHARGE REQUIREMENTS
FOR
STORMWATER MANAGEMENT/URBAN RUNOFF DISCHARGES
WITHIN THE COUNTY OF LOS ANGELES

(NPDES NO. CAS0061654)

The California Regional Water Quality Control Board, Los Angeles Region, finds:

(The findings are currently being developed.)

This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit pursuant to Section 402 of the federal Clean Water Act, or amendments thereto, and shall take effect at the end of ten (10) days from the date of its adoption provided the Regional Administrator, USEPA, has no objections.

IT IS HEREBY ORDERED that the County of Los Angeles and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Long Beach, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe

A. Discharge Prohibitions

(Currently under discussion with the negotiation team.)

B. Receiving Water Limitations

(Currently under discussion with the negotiation team.)

C. Provisions

I. The Dischargers shall comply with Discharge Prohibitions (above), and Receiving Water Limitations (above), through the timely implementation of control measures and other actions to reduce pollutants in the discharge as proposed in this Order.

I. PROGRAM MANAGEMENT

A. Principal Permittee

1. The County of Los Angeles is designated as the Principal Permittee.

2. The Principal Permittee shall:

a. Coordinate permit activities and, by _____, convene and chair the area-wide Executive Advisory Committee and the Watershed Management Committees;

[The Principal Permittee will not necessarily be the chair for the Watershed Management Committees according to paragraph E.2 on page 4. Covina & Agoura Hills]

[Another portion of this document, Section I.D.1.a, states that the Watershed Management Committee shall be chaired by the EAC representative for that watershed. - Long Beach]

It is hereby edited that the Permittees shall develop & implement (plans) acceptable to the EO

b. Provide personnel and fiscal resources and by _____, develop a Baseline Stormwater Management Plan (Plan) for use in developing a watershed management plan (WMP) for each watershed;

[Shouldn't the Permit contain the baseline/framework for what is required in the Stormwater Management Plan. Will this Baseline document be reviewed and approved by the RWQCB staff prior to the development of the actual Stormwater Management Plan? - Long Beach]

c. Provide personnel and fiscal resources for the development of the WMPs;

d. Provide personnel and fiscal resources for the updating and modification of the Plan and the WMPs;

[The time frame for providing personnel and fiscal resources still needs to be resolved. San Dimas]

Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code, and regulations adopted thereunder, and the provisions of the Federal Clean Water Act, and regulations and guidelines adopted thereunder, shall comply with the following for the areas under their jurisdictions within the drainage area of the County of Los Angeles:

A. Discharge Prohibitions

(Currently under discussion with the negotiation team.)

B. Receiving Water Limitations

(Currently under discussion with the negotiation team.)

C. Provisions

I. The Dischargers shall comply with Discharge Prohibitions (above), and Receiving Water Limitations (above), through the timely implementation of control measures and other actions to reduce pollutants in the discharge as proposed in this Order.

I. PROGRAM MANAGEMENT

A. Principal Permittee

1. The County of Los Angeles is designated as the Principal Permittee.

2. The Principal Permittee shall:

a. Coordinate permit activities and, by _____, convene and chair the area-wide Executive Advisory Committee and the Watershed Management Committees;

[The Principal Permittee will not necessarily be the chair for the Watershed Management Committees according to paragraph E.2 on page 4. Covina & Agoura Hills]

[Another portion of this document, Section I.D.1.a, states that the Watershed Management Committee shall be chaired by the EAC representative for that watershed. - Long Beach]

b. Provide personnel and fiscal resources and by _____, develop a Baseline Stormwater Management Plan (Plan) for use in developing a watershed management plan (WMP) for each watershed;

[Shouldn't the Permit contain the baseline/framework for what is required in the Stormwater Management Plan. Will this Baseline document be reviewed and approved by the RWQCB staff prior to the development of the actual Stormwater Management Plan? - Long Beach]

c. Provide personnel and fiscal resources for the development of the WMPs;

d. Provide personnel and fiscal resources for the updating and modification of the Plan and the WMPs;

[The time frame for providing personnel and fiscal resources still needs to be resolved. San Dimas]

e. Provide technical and administrative support for both the Executive Advisory and Watershed Management Committees;

f. Implement watershed water quality monitoring programs;

g. Provide the personnel and fiscal resources to complete by _____, the annual reports including evaluations of monitoring program data and BMP effectiveness;

[The Principal Permittee shall provide the resources to complete the annual report. What about the semi-annual reports that are mentioned in section VII.C.? - Long Beach]

h. Coordinate the implementation of stormwater quality management activities of regional significance (this shall mean that the Principal Permittee shall identify BMPs which are applicable for implementation by permittees watershed-wide and area-wide), such as public outreach and education, pollution prevention, waste minimization, and other similar actions;

[Re: "regional significance" - We have already divided permittees by watershed areas. San Dimas]

I. Act as liaison between all Permittees and the Regional Board on Permit issues; and

[This item should be the responsibility of the EAC, not the principal permittee. Recommended Action: Move this section to D. Agoura Hills]

j. Meet all the responsibilities outlined below for a Permittee.

B. Permittees

1. The other cities and agencies are designated as Permittees.

[The term "agencies" used to define permittee needs to be defined. I can think of several agencies that should be part of this permit but to date have not been told to participate, including Las Virgenes Unified School District, Cal. Dept. of Parks and Recreation, Santa Monica Mountains Conservancy, L.A. County Fire Dept., and Conejo Recreation and Parks District to name just a few in the Malibu Creek Watershed. These agencies own large tracts of land within the watershed and are not under the control of the City or County. Agoura Hills]

2. Each Permittee shall:

a. Participate in the development and amendment of the Baseline Stormwater Management Plan (Plan) and by _____, jointly prepare the watershed specific management plans (WMPs) via their WMC;

b. Provide an Implementation Plan describing specific stormwater programs, projects and/or activities which are to be conducted within their jurisdictional boundaries, including the storm drainage system they own and operate, and which demonstrate compliance with the

WMP(s) requirements by _____; and

c. Provide in a timely manner all information needed by the Principal Permittee for completing the annual reports.

3. The City Administrator/Public Works Director of each Permittee shall appoint a representative(s) to the WMC.

C. Agency Coordination

Each Permittee shall coordinate implementation of permit requirements and pollution prevention activities among each Permittee's internal departments and agencies (i.e. public works, planning, utilities, water supply, etc...).

D. Executive Advisory Committee

[Add, in brackets, after the title [EAC] Pomona]
[The EAC should be an advisory and coordinating body, not an implementation or regulatory body. Tasks assigned to the EAC in the Permit should be divided among the Board, the principal permittee, and the co-permittees. San Dimas]
[Same comment: Transfer EAC duties to the watershed management committees. Azusa]

1. The EAC shall consist of a representative of the County of Los Angeles, City of Los Angeles, a representative from the Malibu Creek, Santa Clara, and Dominguez Channel Watershed Management Areas, and two representatives from each of the San Gabriel River, Los Angeles River, and the Ballona Creek Watershed Management Areas.

[Rewrite paragraph to avoid duplication of defining the EAC makeup in two places. To read as follows: "The EAC shall consist of a representative of the County of Los Angeles, City of Los Angeles, Caltrans (unless they are covered by a separate permit) and representatives from the WMC as stated in E2 below." Agoura Hills]

a. One representative from the EAC shall chair the Watershed Management Committee for that Permittee's main watershed management area.

[Los Angeles County shall chair the Watershed M.C. El Monte]
[Paragraph not needed. The subject is covered in E2 and B3. Agoura Hills]

2. The City Administrator/Public Works Director for the County of Los Angeles and for the City of Los Angeles shall each appoint a representative to the EAC. Other members will be appointed by the WMCs.

[Paragraph not needed. The subject is covered in E2 and B3. Agoura Hills]

3. The EAC shall be responsible for:

[How can a permit dictate requirements to an advisory committee? The EAC, as a collective body, will not be a party to this permit nor will the WMC. How can RWQCB hold the committees accountable for not performing a task or fulfilling a requirement? - Long Beach]

a. Making recommendations on area-wide issues to each of the

Watershed Management Committees;

b. Assisting the Principal Permittee in the development of the Baseline Storm Water Management Plan; and

[Delete "and" at the end of the paragraph. Covina]
[3.b. should be the EAC's responsibility. Hermosa Beach]

c. Reviewing the Watershed Management Plans as developed by each Watershed Management Committee and provide direction and guidance on the plans for consideration by the Watershed Management Committees;

d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

[Make "Committee" plural in the third line. Covina]

e. Mediating conflict among the Permittees; and

[It would be a mistake to ask the EAC to mediate conflicts between other permittees. The other permittees are fellow workers so how do you chose sides? The EAC should establish the choices from which the Cities should select and let the City Managers resolve disputes with their neighbors, as they do today. Agoura Hills]

f. Coordinating the implementation of pilot projects to target pollutant sources, evaluate BMP appropriateness, and assess effectiveness.

E. Watershed Management Committee

[Add, in brackets after the title, [WMC]. Pomona]

1. Watershed Management Committees (WMC) shall consist of a representative of each of the Permittees for that particular watershed management area. Regular WMC meetings shall be open to attendance by the public. The WMC may hold closed sessions, at its discretion, to discuss permit related issues.

2. The Malibu Creek, Santa Clara, and Dominguez Channel WMCs shall each appoint one representative to serve on the EAC and to chair the WMC. The San Gabriel River, Los Angeles River, and the Ballona Creek WMCs shall each appoint two representative to serve on the EAC, one of whom will chair the WMC.

[Add new paragraph 3. as follows & change existing 3. to 4.
3. Each WMC shall appoint their own Chairperson and secretary, however in the absence of a volunteer(s) for those positions, the Principal Permittee shall assume those roles in each WMC, until a qualified person is otherwise approved by the WMC.
Pomona and Hermosa Beach]
[The WMC should have the ability to agree on the individual to chair the committee and who represents it on the EAC. They do not need to be the same permittee. Agoura Hills]

3. The WMC shall be responsible for:

[Again how can a permit dictate requirements to a committee? The WMC, as a collective body, will not be a party to this permit. How can RWQCB hold the committee accountable for not performing a task or fulfilling a requirement? - Long Beach]

a. Establishing goals and objectives for the watershed;

b. Prioritizing pollution control efforts;

c. Participating in the development of a specific watershed management plan (WMP), based on the Baseline Stormwater Management Plan (Plan);

d. Assessing the effectiveness of, preparing revisions for and making appropriate changes to the Plan and the WMP;

[How are we to assess the effectiveness of the plan and WMP's? San Dimas]

e. Coordinating and facilitating the preparation of the annual reports on Permit activities within the watershed for submittal to the Regional Board -- a draft of the annual report shall be circulated to each Permittee and the Executive Advisory Committee for their review and comments prior to submittal to the Regional Board; and

[As I read this section the WMC submits a report to the RWQCB. I thought that the Principal Permittee coordinated the submittal of the Annual report to the RWQCB. Recommendation: Revise this paragraph to have the WMC submit to the EAC. Agoura Hills]

f. Facilitating the implementation of this Order among the Permittees in the watershed.

F. Watershed Management Subcommittees

1. Subcommittees will be established where needed as determined by the WMC and/or the EAC.

2. The Subcommittees will be focused on specific program areas and can provide more specific oversight on the development, implementation, and evaluation of selected program areas.

G. Fiscal Resources

[Somewhere within the item the following verbiage should be inserted:
"A sample format for the budget is included as (attachment XX, enclosure xx, or whatever other method), and it is suggested that the budget be done in this format; however, if an agency can provide all of the necessary data in some other format, it will be acceptable to the Board." Pomona]

Each Permittee shall submit an annual budget for its Implementation Plan within 30 days after the budget adoption. The budget shall be summarized and put into a format which identifies the necessary capital and operation and maintenance expenditures necessary to implement the storm water management program. The budget shall

provide information such as funding sources, staff resources, equipment, support capabilities, contract services, and cost sharing arrangements for the storm water management programs. Also included shall be a description of any funding shortfalls.

[The third sentence above should be removed. Hermosa Beach]

[Regarding the budget submittal requirements: Our City uses a line item budget. This detailed budget would place an additional burden on our City and gets us no closer in meeting our objectives. San Dimas]

[Remove the last two sentences. El Monte]

[To whom is the annual budget submitted? Covina]

[This section requires the Permittee to submit an annual budget within 30 days after the budget adoption. After whose budget adoption? - Long Beach]

1. Area-Wide Resources - In implementing this Order and the Plan, the Permittees may elect to jointly fund a single program for certain BMPs, such as Public Education, that are area-wide in nature. Funding agreements, including budgets and cost per agency, shall be developed.

[The language "Funding agreements, including budgets and cost per agency shall be developed" should be deleted. Hermosa Beach and El Monte]

["An agreement and budget is required for jointly funded area-wide program" — Would this apply to our fair display next season, and what benefit would be achieved from having an other agreement or budget? San Dimas]

2. City-Specific Resources - As stated above, each Permittee shall develop an annual budget detailing the cost of implementing Permit-related activities within its jurisdiction.

[2. Should be deleted as repetitive. Hermosa Beach and El Monte]

H. Legal Authority

1. The legal authority that was required of each Permittee under Order No. 90-079 shall continue in effect.

[What is the purpose of this section? Please clarify. - Long Beach]

2. The Co-Permittees shall exercise their legal authority and require compliance with this Order and the Plan within its jurisdiction.

[Change "its jurisdiction" to "their jurisdiction". Covina]

[Here, and in other scattered sections, the terms Co-Permittee or Discharger still appear. This needs to be cleaned up. Agoura Hills]

3. Each Permittee shall certify that it has legal authority to control discharges to and from those portions of the storm drainage system over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements between permittees with adequate existing legal authority and shall, at a minimum, accomplish Items a-f below:

[This Section requires rewriting to clarify the Regional Boards expectations of compliance. Hermosa Beach]

[The words "certify" or "certification" are words which attorneys either love or hate. Since the

permits will be issued to the cities a question should be directed to them on the acceptability of this word. Agoura Hills]

[Each item a. thru f. Should include the clause "to the maximum extent practicable." Also, the intent of items d. and e. need to be clarified. - Long Beach]

a. Control the contribution of pollutants to the storm drainage system by storm water discharges associate with industrial activity and the quality of storm water discharged from sites of industrial activity;

[Change "associate" to "associated". Covina]

b. Prohibit illicit discharges and illicit connections to the storm drainage system and require removal of illicit connections;

c. Control the discharge of spills and the dumping or disposal of materials other that storm water (e.g. industrial and commercial wastes, trash, debris, motor vehicle fluids, green waste, animal wastes, leaves, dirt, or other landscape debris etc.) to the storm drainage system;

[Change "that" to "than" in the second line; add a comma after "e.g.". Covina]

d. Control through interagency or inter-jurisdictional agreements among permittees the contribution of pollutants from one portion of the storm drainage system to another;

[Clarification, as requested by the EAC, is definitely required, especially any differentiation between Charter and General Law Cities (Pomona is a Charter City). Pomona]
[This section requires clarification regarding types of agreements and "the contribution of pollutants from one portion of the storm drainage system to another..." Hermosa Beach]

e. Require compliance with conditions in ordinances, permits, contracts or orders; and

f. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the storm drainage system.

4. Each Permittee's legal counsel shall complete a review of its existing legal authority to ensure that its existing legal authority complies with the requirements in this Order.

[This item is being referred to our City Attorney for review and comment. This may take some additional time that is not available to the Board. Pomona]

[This Section is not necessaria. Legal counsel review is implied in Section I.H.3 where each Permittee is required to certify that it has legal authority. - Long Beach]

5. Upon its completion of the legal authority review, or within 60 days of permit adoption, (whichever is sooner) each Permittee shall demonstrate that it has

adequate legal authority or provide a schedule for obtaining the adequate legal authority. Guidance for demonstrating adequate legal authority is included within the EPA document entitled *Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges from Municipal Separate Storm Sewer Systems, (EPA 833-B-92-002, November 1992)*, page 3-4.

[The time limit should be extended from 60 days to 120 days. Hermosa Beach and Long Beach]
[Is the EPA document current and available to the Permittees? Covina]

I. Administrative Review

[The Administrative Review provisions are a good first step, but all issues must be directed to this process. Nothing in this section requires the NRDC or any other entity who finds reason to sue a City and includes the NPDES permit as a cause of action to first deal with the City to resolve the dispute. Agoura Hills]

The administrative review process formalizes the procedure for review and acceptance of reports and documents submitted to the RWQCB under this Permit. In addition, it provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement actions.

[This section should include language such as "A Permittee shall not be in violation of any term or condition of this permit until the following administrative review process has been completed." Hermosa Beach]

1. If the Executive Officer finds that a Permittee's stormwater program is insufficient to meet the provisions of the Permit, the Executive Officer shall send a "Notice of Intent to Meet and Confer (NIMC)" to the Permittee. The NIMC shall include a date by which the Permittee must meet with RWQCB staff.

[The NIMC shall include a <u>tentative</u> date by which the Permittee must meet with RWQCB staff. El Monte]

2. Upon receipt of a NIMC, the Permittee shall meet and confer with RWQCB staff to clarify the steps to be taken to completely meet the provisions of this permit. The meet and confer sessions shall be for the purpose of developing additions and enhancements to the jurisdiction's stormwater program. The meet and confer period shall conclude with the submittal to and acceptance by the Executive Officer of a written "Stormwater Program Compliance Amendment (SPCA)" which shall include implementation deadlines. The Executive Officer may terminate the meet and confer period after a reasonable period due to a lack of progress on issues and may order submittal of the SPEP by a specified date. Failure to submit an acceptable SPCA by the specified date shall constitute a violation of the Permit.

[Change "SPEP" to "SPCA". Covina and Agoura Hills]

3. The Executive Officer will approve or reject the submitted SPCA within a reasonable amount of time. Rejection of a submitted SPEP by the Executive Officer shall state the reasons for the failure to approve the SPCA. A Permittee that receives a rejection of an SPCA shall have thirty (30) days to

remedy the specified deficiency in the SPCA and receive administrative approval from the Executive Officer of the amended SPCA.

[The time that the Executive Officer has to either reject or accept a SPCA should be more specific --such as the thirty day limit to remedy a deficiency. San Dimas]

[A Permittee that receives a rejection of an SPCA shall have a mutually agreeable date to remedy the specified deficiency in the SPCA. El Monte]

[Change "SPEP" to "SPCA". Also, define or quantify "a reasonable amount of time". Covina and Agoura Hills]

4. The Permittee shall comply with the terms of the SPCA. The Permittee shall submit reports to the Executive Officer of progress made under the SPCA. The frequency of progress report submittal shall be as prescribed by the Executive Officer. Failure to comply with the terms and conditions of the SPCA shall constitute a violation of the Permit and shall be cause for immediate Administrative Civil Liability as prescribed by the Executive Officer.

[The frequency of progress reports for a SPCA needs to be more specific, such as monthly, quarterly, etc. Quarterly reports would seem adequate. San Dimas]

II. ILLICIT DISCHARGES\DISPOSAL

[It would appear that current item III "PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES" should appear ahead of current item II "ILLICIT DISCHARGES/DISPOSAL" for a variety of reasons. Not only it is felt that legal sources should be addressed ahead of illegal ones, but the data base development in III should also include the data required in II; the definitions of sources & prioritizations show up in III - basically you have the cart before the horse. Pomona]

[The punctuation for this section should be cleaned up. - Long Beach]

A. Illicit Connections

[The emphasis should be placed on identifying and eliminating illicit discharges, not connections. Not all unauthorized connections discharge pollutants. Azusa]

By _____, the EAC shall develop a consistent program including investigative standard procedures to eliminate illicit connections to the storm drain system.

[Delete this paragraph. El Monte]

By _____, each Permittee shall implement a program to identify and eliminate illicit connections to the maximum extent practicable.

[Who determines what is "the maximum extent practicable"? This term is used throughout the draft permit. Covina]

1. The program shall, at a minimum:

   a. standardize per EAC guidelines, storm drain inspection procedures, and illicit connection and identification and elimination procedures;

   b. prioritize major problem areas, to include but not be limited to older business areas, and areas with heavy industry such as those listed under subchapter N of 40 CFR Parts 405 - 471

[Amend to read as follows: "prioritize potential problem areas and areas with heavy industry such as those listed under subchapter N of 40 CFR Parts 405-471." The current wording is vague and open to very broad interpretation. Hermosa Beach]

[What does "major problem areas" mean? - Long Beach]

   c. utilize results of field screening activities, and other appropriate information.

   d. contain an industrial/commercial education/outreach component to inform businesses about the problem of illicit discharges/dumping and proper discharge/disposal practices,

[Change "discharges/dumping" to "discharges/disposal" in the second line. Covina]

[This section should be included in Section VI. Public Information and Participation. - Long

Beach]

e. schedule storm drains for inspection for illicit connections within its jurisdiction.

[This inspection requirement will be very expensive for cities. Covina]

[Should read: "include a storm drain inspection schedule for illicit connections. - Long Beach]

f. maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

[Suggest that the standard records keeping system be the same as the data base required in III A.1. Pomona]

[What is the standard for the record keeping system? Covina]

[Revise this statement to refer to illicit connections or delete it because it is already included in section II.B.4.d. - Long Beach]

g. establish enforcement procedures to terminate illicit connections.

B. Illegal Discharges\Disposal

[Change \ to / above. Covina]

1. By _____, the EAC shall develop a consistent program including investigative standard procedures to eliminate illegal discharges/disposal practices to the storm drain system.

2. By _____, the EAC shall develop a standard enforcement procedures, including administrative and judicial, to eliminate illegal discharges/disposal practices.

[Delete "a" in the first line. Covina]

3. By _____, the EAC shall develop standard procedures for spill response, including a procedure to ensure that, in a spill response, sewage treated with disinfection agents will not be discharged into the storm drainage system, to the maximum extent practicable. The standard procedures will address investigation, containment, and cleanup activities as appropriate.

[In 1., 2., and 3., the EAC shall develop GUIDELINES instead of consistent program, standard enforcement, or standard procedures, respectively. El Monte]

4. By ____, each Permittee shall implement a program to identify and eliminate illegal discharges/disposal practices to the maximum extent practicable.

[Please define the "maximum extent practicable". Hermosa Beach]

[This section neglects the to state that the program must first be developed. Or is the intent of the Regional Board that the compilation of procedures developed by the EAC is the program ? This needs to be clarified. - Long Beach]

The program shall, at a minimum:

a. Identify and prioritize problem areas of illegal disposal where inspection, clean up, and enforcement are necessary to prevent the discharge of contaminants;

b. Maintain a surveillance program to detect illegal discharges and disposal into the street system, including, but not be limited to, street use inspections and inspections of vacant facilities;

[The stipulated surveillance programs are costly and beyond the means of many agencies. Azusa]
[This section should be deleted as section "e." serves the same purpose. Hermosa Beach]
["Surveillance program" is too abstract a term upon which to base compliance. Also, how can inspections of vacant facilities detect illegal discharges and disposal into the street system? Covina]
[Delete "including, but not limited to, street use inspections and inspections of vacant facilities. - Long Beach]

c. Establish procedures to educate inspectors, maintenance workers, and other field staff in their jurisdiction to notice illicit dischargers/disposal practices during the course of their daily activities, and report such occurrences;

d. Maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

[What is the standard for the record keeping system? Covina]
[The permit will require the City to maintain an electronic record keeping system for a variety of functions. Unless the State can deal with 88 or more different systems, the EAC or the Principal Permittee should develop a standard format, like dBASE IV, so that all of the data is usable. Agoura Hills]
[To make this statement clear, delete "in their jurisdiction." - Long Beach]

e. Establish per EAC guidelines spill response procedures; and

f. Establish, per EAC guidelines, enforcement procedures to eliminate illegal discharges/disposal practices.

C. Non-Storm Water Discharges

[Cover discharges by water suppliers and utility companies to surface waters. Covina]

1. Exempted Discharges

(Currently under discussion with the negotiation team.)

2. Conditionally Exempted Discharges

(Currently under discussion with the negotiation team.)

[The list of conditionally exempt discharges should include waterline flushing, retaining wall drains, and water from hydraulic graffiti abatement. Diverted stream flows and footing drains should be removed from the list. Hermosa Beach]

[After careful consideration, I cannot support the use of street or sidewalk washing as a permitted discharge. Typically, this would be used by a contractor working for the City who is trying to clean a street tracked with mud and debris from a construction site. This would weaken the BMP contained in the Construction Activity Manual for fifty feet of rock at the exit of a site. Agoura Hills]

D. Other Prohibited Activities

[Delete "Other" in the title. Covina]

[This entire subsection should be deleted and developed as part of the WMP by the Permittees. - Long Beach]

1. The Permittees shall prohibit any person from:

[This section should be deleted entirely. It will lead to confusion, and to many lawyers and dischargers challenging an inexperienced inspector. The question would be "It's not on the list of prohibited activities. Why are you citing me for violating the permit?" The permit in Section A on page 2 prohibits all non-storm water discharges to the storm drain system. Section II C. lists the exceptions. Therefore, if it is not covered by an exception, it is prohibited. Agoura Hills]

a. causing or allowing illicit discharges to be made into the storm drain system;

b. establishing, using or maintaining an illicit connection to the storm drain system;

[Delete this section as being redundant with section 1.a. Hermosa Beach]

c. littering.

d. disposing of leaves, dirt or other landscape debris into a storm drain; and

e. using any pesticide, fungicide, or herbicide which has either been voluntarily discontinued or prohibited by the USEPA.

f. washing down toxic materials from paved or unpaved areas.

[Add "into the storm drain system" to this. Hermosa Beach]

g. washing down impervious surfaces in industrial and/or commercial areas is prohibited unless specifically required to under Health and Safety Codes.

[Add "into the storm drain system" after "washing down impervious surfaces..." Hermosa Beach]

[Delete "is prohibited" in line 2. Covina]

2. Storage of Materials, Machinery and Equipment

[The contents and requirements of this section are more appropriate to the Industrial/Commercial Sources chapter and should be relocated there for clarity. Hermosa Beach]

[I have two comments on this group of five items. First, I do not understand what "susceptible

to runoff" means. I believe that the intent is to include anything "exposed to rainfall or stormwater runoff". If this is accurate then let's say it that way. Second, parking vehicles on absorbent material, or vacuum sweeping every parking lot with 10 of more vehicles is not very practical. Very few parking lots would escape this requirement. If you did a blind survey of 50 property managers, I would think they would say that parking lots below fifty (50) spaces cannot be swept economically. Absorbent material is easily carried or washed away from the parking area and would become useless for the purpose by absorbing moisture from the ground. For these reasons, I recommend that these two requirements be modified to contain practical solutions to a very serious problem. Agoura Hills]

The Permittees shall require:

a. that objects, such as motor vehicle parts, containing grease, oil, or other hazardous substances, and unsealed receptacles containing hazardous materials, be stored away from areas susceptible to runoff;

b. that machinery or equipment which is to be repaired or maintained in areas susceptible to runoff, be placed on a pad of absorbent material, or an equivalent, to contain leaks, spills or small discharges;

c. that owners of commercial/industrial motor vehicle parking lots and structures located in areas susceptible to runoff to be swept to remove debris. Lots with more than ten (10) parking spaces and all public parking facilities shall also be vacuum swept, or by equivalent method, to remove chemical residue;

[Great idea - but how can this be required? New lots can be mandated thru the permitting process, however unless we can PROVE public health and safety, we cannot go back and impose new conditions on old, properly maintained parking lots. Not realistic from an implementation standpoint! Pomona]

[Amend to read as follows: "that owners of commercial/industrial motor vehicle parking lots with more than ten (10) parking spaces located in areas susceptible to runoff begin a regular lot sweeping program to remove debris. Hermosa Beach]

[This requirement is too restrictive. Also, enforcement would not be cost effective. San Dimas and Azusa]

[Delete "owners of" in line 1 and change line 2 to read "structures located in areas susceptible to runoff be swept as necessary to...". Covina]

d. that all fuel and chemical residue, animal waste, garbage, batteries, or other types of potentially harmful materials which are located in areas susceptible to runoff, be removed immediately and disposed of properly.

e. that hazardous waste be disposed of through the Permittee's hazardous waste program or at any other appropriate disposal site, and not be placed in a trash container for regular trash disposal.

E. Public Reporting

[The reporting procedures outlined are too cumbersome and unnecessary. Once a year reporting

should be adequate. Azusa]

1. By _____, the EAC shall develop a standard program, for Permittees to implement by _____, to promote, publicize, and facilitate public reporting of illicit discharges and illegal disposal practices that may adversely impact water quality.

[As stated previously, the EAC as an advisory body, should not be developing elements of the WMP. The Permittees should develop these programs. - Long Beach]

2. By _____, EAC shall develop a standard program for the reporting of incidents of a hazardous substance entering the storm drain, where the responsible party is not known, to the Regional Board and State of California Office of Emergency Services (OES) at (800)___-____ and the Federal Hazardous Response Number at (800) ___-____. The Permittees shall implement this program by _____.

[As stated previously, the EAC as an advisory body, should not be developing elements of the WMP. The Permittees should develop these procedures. - Long Beach]

F. Reporting

[Section 1. should be deleted and 2. should be rewritten. As currently worded, the summaries are far too detailed. The summaries should focus on categories of illicit connections and discharges, the number of connections/discharges discovered per category, the number of each eliminated, the number in process to be eliminated, and the number subject to legal enforcement action. Hermosa Beach]

[The quarterly reporting requirement contained in this section is unacceptable. As important as storm water pollution is for the RWQCB, most cities are not able to dedicate one or more persons to this function. Therefore, with all of the other responsibilities that demand time, quarterly reporting is too great a burden. Agoura Hills]

1. A quarterly summary of illicit connections eliminated shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the investigation; what was being discharged; estimated length of time the practice was on-going; what remedial action was taken; and what happened to the discharger.

[The detailed reporting procedure outlined is too cumbersome. A checklist type of reporting system would accomplish the same results and not be as cumbersome. San Dimas]
[Semi-annually summary instead of quarterly. El Monte]
[Delete "quarterly". Why is a quarterly summary necessary if the information is submitted annually? Covina]

2. A quarterly summary illegal discharge/disposal practices reported through the standardized public reporting system shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the incident; what was spilled/dumped; quantity; what remedial action was taken; and what happened to the discharger/dumper.

[Semi-annually summary instead of quarterly. El Monte]
[Delete "quarterly". Why is a quarterly summary necessary if the information is submitted annually? Also, add "of" between "summary" and "illegal". Covina]

G. Coordination With State Permits

1. The Principal Permittee will be provided an updated list of NPDES Permits on a quarterly basis, through the Regional Board's electronic bulletin board, to verify permitted sources of the existing non-storm water discharges in the storm water drainage system.

[Rewrite as ...electronic bulletin board "for use by each Permittee in its illicit connection program to identify" permitted sources of.... Hermosa Beach]
[With the ease of using an electronic bulletin board, it should be possible for the State to provide us with a monthly updated list of NPDES permits issued. It would be better if they could provide a copy of every permit issued or applied for within our local jurisdiction (i.e., by Zip code identification). San Dimas]

2. The Permittees will work with other regulatory agencies and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies. These agencies, include but are not limited to:

[Delete this section. Hermosa Beach]
[Change "Permittees" to "Principal Permittee" in line 1. Delete the comma in line 4. Covina]

a. California Department of Fish and Game
b. California Department of Toxic Substances Control
c. California Coastal Commission
d. United States Environmental Protection Agency
e. California Department of Transportation
f. California Air Resources Board

III. PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES

[State of California should not delegate its own task of inspecting and monitoring of industrial and commercial facilities to the cities. - Azusa]

A. Identification of Sources

1. By _____ the Permittees shall develop a database listing industrial/commercial facilities by four digit SIC codes which shall be updated annually. The database shall include at a minimum:

[Should be amended to read: "By _____, the Permittees shall develop a database listing of the industrial/commercial facilities identified in III.B.1.a. by four digit SIC codes which shall be updated annually. The database shall include at a minimum:" - Hermosa Beach]

a. Facility owner's name, address, and telephone number;

b. Site address, telephone number, and contact person;

c. Closest receiving water and watershed;

[Section A.1.(a) and © should be deleted as not being required for minimum information. - Hermosa Beach]

d. Applicable SIC code(s);

I. For each four digit SIC sector, the Permittees shall identify primary activities that might impact runoff discharges;

ii. For each four digit SIC sector, the Permittees shall identify primary materials that might impact runoff discharges; and

[Question-has the EPA not made this determination?? It would appear that the Permittees should review businesses within their jurisdiction, based upon SIC, if the industries are conducting activities that might impact runoff discharges. Not just start from ground zero to re-invent the wheel!!! - Pomona]

[Why have each Permittee do these identification procedures? It seems like the SIC codes would be involving the same activities/materials everywhere and this should be standardized. - Covina]

[As I read the requirements of this section, the cities will be required to collect significant data on most businesses in town. Depending on the relationship that already exists this could be difficult. This will be an extensive database even for a city the size of Agoura Hills and will take months to collect and input. The item regarding materials which impact runoff will be difficult to determine without the cooperation of the business. - Agoura Hills]

2. By _____, the EAC shall develop a pollutant source identification program for the control of storm water pollutant discharges from industrial/commercial facilities. The objective of the source identification

program is to gather data on specific and/or interrelated set of pollutant generating activities occurring on very small areas (< 5 acres) of industrial/commercial activity and to provide information for developing and implementing BMPs for specific activities.

[Section A.2 should be deleted. These concerns are to be addressed by the Critical Source Monitoring element of the monitoring program. - Hermosa Beach]

[How can one identify the pollutant sources if the pollutants have not been identified for the LA Basin? If the pollutants are known they should be listed in this permit for each watershed. - Long Beach]

[What is the meaning if interrelated set of pollutant generating activities occurring on very small areas (<5 acres) of industrial/ commercial activity? The indent of this section needs to be clarified. - Long Beach]

B. Prioritization of Sources

1. By _____, the Permittees shall prioritize industrial and commercial facilities within their jurisdiction on their relative potential for the contamination of storm water and urban runoff. The prioritized list shall include

[Clarify the meaning of "relative potential." - Long Beach]

a. Categorical List

I. All industries regulated under Phase I of the Federal storm water program (40 CFR 122.26).

ii. All industrial/commercial SIC codes selected by the USEPA for screening under Phase II of the Federal storm water program.

[Should read as follows: "vehicle repair shops, vehicle body shops, vehicle parts and accessory shops, gasoline stations and restaurants." - Hermosa Beach]

iii. Other business sectors considered by the EAC or the Regional Board to conduct industrial/commercial activity with a high potential for storm water contamination (e.g, restaurants).

[Omit "the EAC" - El Monte]

The categorical list shall be grouped by Permittees and provide an organized overview of the target facilities based on land use, operation, and activities, could potentially contribute significant amounts of pollutants into storm water runoff.

[Clarify the meaning of "significant amounts of pollutants." - Long Beach]

2. By _____, Permittees shall rank the industrial and commercial facilities, identified as potential pollutant sources of storm water and urban runoff pollutants in III. B.1.a, in order of priority for oversight of implementation of

storm water management measures.

["Order of priority" needs to be defined; ie., shall we rank on the degree of pollutant hazard, that the potential quantity of pollutant materials that might be introduced of the qualities of the materials (a million gallons of a 1% soln of "X" or 100,000 gallons of a 15% soln of "X".) - Pomona]

[What is the difference between prioritized and ranking? This item seems to duplicate B1. Why is it needed? - Agoura Hills]

[How does this ranking of industrial/ commercial facilities differ from Section III.B.1 above? - Long Beach]

C. Source Control Measures

1. By _____, Permittees shall develop a checklist of specific storm water and urban runoff control measures for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutants into storm water runoff. The control measures must

[Add "that" after "facilities" in the second line. - Covina]

[The development of checklists should be a Countywide function and should be performed by the EAC, not by individual permittee. - Agoura Hills]

[Is the intent to develop a checklist or control measures? Are control measures the same as best Management Practices? BMPs should be developed as part of the WMP. - Long Beach]

a. address multiple pollutant sources

b. initially focus on source control measures such as source minimization, education, good housekeeping, and site design alternatives.

c. target industrial/commercial source areas and activities with the potential to generate substantial pollutant loadings

2. By _____, Permittees shall develop a process to ensure implementation of storm water and urban runoff control measures for industrial/commercial facilities identified in III.C.1.

[Should be deleted as being redundant with Part III Section D. - Hermosa Beach]

[Rewrite lines 2 and 3 to say "implementation of storm water and urban runoff control measures identified in III.C.1 for industrial/commercial facilities." - Covina]

3. By _____, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutants into storm water runoff. The structural control measures must be evaluated as to

[Should be deleted. These concerns are to be addressed by the Critical Source Monitoring

element of the monitoring program. - Hermosa Beach]

[This evaluation is much too general for Permittees to conduct. Their tasks should focus on circumstances peculiar to their jurisdiction--this is more of the nature of a university study. - Covina]

[This task should be included in the WMP where each control measure can be developed as a pilot project and implemented by the Principal Permittee and supported by all the Permittees. This process could prove to be more cost effective and will provide consistent end results. - Long Beach]

a. effectiveness in reducing toxic pollutants and pollutants of concern

b. ease of maintenance

c. current frequency of use

d. feasibility and cost-effectiveness

e. possible methods to ensure implementation if necessary

By, _____, the Permittees shall, in addition, describe any studies and pilot projects they intend to conduct to assess the feasibility and effectiveness of specific control measures.

4. By _____, Permittees shall require the following:

[This section should be deleted and developed as part of the WMP by the Permittees. - Long Beach]

a. The proper disposal of food wastes by restaurants and food wholesalers.

b. Persons owning or operating a gas station, auto repair garage, or similar structure must clean those facilities in a manner that does not result in discharge of pollutants to the storm drain system; and

c. Machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze must be repaired.

[Should be deleted. - Hermosa Beach]

5. The EAC may seek coverage under this Order, for industrial facilities listed in III.B.1.a.1 which are owned and operated by Permittees if it,

[Change "the EAC" to "the Permittee". - El Monte]

[The intent of this section must be clearly established. - Agoura Hills]

[What is the intent o this section. - Long Beach]

a. establishes a procedure for notifying the Regional Board of industrial sites owned and operated by Permittees

b. prepares a checklist of industrial BMPs using BAT/BCT criteria for implementation by Permittees at these industrial sites

c. standardizes procedures to ensure implementation of industrial BMPs by Permittees,

d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee industrial facilities

e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each site, and certify compliance with this Order.

[Delete entire paragraph. - El Monte]

[Section C.5 suggests that some possible examples be listed to insure compliance - Say your "industrial facilities to most cities & the response will be "Not Applicable, next item!!" - Pomona]

[This Section should be rewritten as follows: "Each permittee may seek coverage under this Order, for industrial facilities listed in II.B.1.a.i. which are owned and operated by the Permittee, if it:

(a) Established as procedure for notifying the Regional Board of industrial sites owned and operated by the Permittee.
(b) Prepare a checklist of industrial BMP's using BAT/BCT criteria for implementation at these industrial sites.
© Standardizes procedures to ensure implementation of industrial BMP's.
(d) Prepare and retain site specific Stormwater Pollution Prevention Plans at its industrial facilities.
(e) Establishes a procedure to report annually on the effectiveness of Stormwater Pollution Plans at each site, and certify compliance with this Order. - Hermosa Beach]

D. Source Inspection

1. By _____, Permittees shall submit a schedule for inspection of industrial/commercial facilities in III.B.1.a. for adequacy of storm water pollution prevention measures. The schedule shall include, for a five year period,

[Should be amended to read: "By _____, each Permittee shall submit a schedule for inspection of those industrial/commercial facilities in III.B.2 which have been selected by the Permittee for inclusion in an inspection program for adequacy of Stormwater pollution prevention measures. Facilities selected shall be those identified by the Permittee as potentially contributing the most significant pollution impacts to Stormwater discharges." The following subsections D.1.a and .b should be deleted as unnecessary. The last paragraph should substitute III.B.2 for III.B.1.a.ii, and delete reference to III.B.1.a.iii. - Hermosa Beach]

[Scheduling inspections 5 years in advance doesn't seem reasonable. - Covina]

[This section seems to be inequitable. I am in a city of less than 250,000, therefore under 1a 1 must inspect all of my industrial/commercial properties. If I was in a city of more than 250,000 with no section B1a1 industries, I am not sure how many of the remainder of my business I would be required to inspect. I believe that we need to put some number to these formulas and see if the results are logical. - Agoura Hills]

a. for municipalities with a population of less than 250,000, all facilities identified in III.B.1.a.1, and all facilities identified in III.B.1.a.2 and III. B.1.a.3,

[Replace "III.B.1.a.1", "III.B.1.a.2", and "III.B.1.a.3" with "III.B.1.a.i, "III.B.1.a.ii", and "III.B.1.a.iii", respectively. - Covina]

b. for municipalities with a population of greater than 250,000, all facilities identified in III.B.1.a.1, and,
a subset of facilities identified in III.B.1.a.2 and III.B.1.a.3 but not less than ten times the number identified in III.B.1.a.1

Industrial/commercial facilities in III.B.1.a.2 and III.B.1.a.3 that are not included in the inspection schedule shall be surveyed by phone, mail-out, or a similar method, as to their conformance with good stormwater quality management measures.

[This paragraph should be moved to Section III.D.2. - Rancho Palos Verdes]

2. By _____, Permittees shall develop and implement a industrial/commercial facilities inspection program. The inspection program shall include, but is not limited to:

[Delete entire paragraph. - El Monte]

[This inspection program will be expensive for cities. - Covina]

a. procedures for facility inspections

b. procedures for industrial/commercial sectors outreach on pollution prevention, waste minimization, and storm water quality management

c. procedures to ensure corrective action is undertaken by non-complying facilities

d. procedures to follow-up on violations of municipal standards

e. procedures for enforcement action against non-complying facilities;

f. an electronic recording system to document the status of facility inspections; and,

[What is meant by "electronic recording system?" - Covina]

g. appropriate training for program staff.

3. During inspection of group III.B.1.a.1, inspectors shall request to see a copy of the SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may deem it necessary to report problematic facilities to the Regional Board.

[Replace "III.B.1.a.1" with "III.B.1.a.i." - Covina]

E. Reporting

Each year, the Permittees shall evaluate the results and progress of their storm water quality management program for industrial/commercial sources. The annual report submitted to the Regional Board shall recommend a strategy for the management of storm water from industrial/commercial sources for the following year based upon:

[Change "Permittees" to "EAC". - El Monte]

a. priority industrial/commercial sources listing
b. priority on-site inspections
c. phone/mail-out survey inspections

[Delete entire line. - El Monte]

d. priority checklists of stormwater urban runoff control measures

[Should be amended to read: "evaluation of stormwater urban runoff control measure implementation." - Hermosa Beach]

e. evaluations of structural and treatment control measures

[Should be amended to read: "evaluation of the results from the critical source monitoring program." - Hermosa Beach]

f. special studies and pilot projects needs
g. specific site and activity monitoring needs

[Sections (f) and (g) should be deleted and addressed in the Critical Source Monitoring program. - Hermosa Beach]

The EAC shall make available to the Regional Board the industrial/commercial database developed in III.B.1.a.1 in the appropriate format when so requested.

[The last paragraph does not appear to make sense. As I read the permit, the Permittees are maintaining databases of inspections made, violations cited, and other permit related work. The EAC does not maintain a database so what information will they make available? Should this have been Permittee? - Agoura Hills]

F. Coordination

The Permittees shall develop a process for the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports shall be developed as required.

[Should be made to read: "The Permittees will work with other regulatory agencies as deemed necessary by the Permittees and report to the Regional Board on recommendations to resolve any

conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies. - Hermosa Beach]

[Change "Permittees" to "Principal Permittee." - El Monte]

[Should the Permittees work directly with the Board? It seems like a better idea to have either the EAC or the Principal Permittee act as the liaison with the Board. This paragraph also leaves open the possibility of many more reports to be required of the already overburdened Permittees. - Covina]

[This paragraph appears to require the Permittee to coordinate submittal of information to the Regional Board. Was under the impression that this should be done by the EAC. If I am correct then this section should be changed. - Agoura Hills]

G. Conflicts with Other Mandates

1. The Permittees will work with other regulatory agencies and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies.

[Both Section (F) and (G) should be deleted as unnecessary. - Hermosa Beach]

[Replace "Permittees" with "Principal Permittee" to be consistent with Section II. - Covina]

IV. PROGRAM REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT

A. Regional Policy

1. By _____, the EAC shall develop and adopt a regional policy to promote watershed protection considerations during planning, project review, and permitting of new development and redevelopment, to:

[I am a firm believer in making sure that Best Management Practices are followed after a development is built out and occupied. The reality is that this will be one more law that will be on the books and will only be enforced on receipt of complaints from citizens. There is not enough money to do this any other way. Then lawyers will have one more charge which cities will have violated. - Agoura Hills]

[Under the law does the EAC have the authority to set policies for all the cities within Los Angeles County? How can a permit dictate such requirements to an advisory committee? - Long Beach]

a. preserve to the extent feasible, and where possible, create or restore areas that provide water quality benefits, such as riparian corridors and wetlands, and promote the design of new development so that it protects the natural integrity of drainage systems and water bodies.

b. avoid conversions of areas particularly susceptible to erosion or sediment loss and/or establish development guidance that identifies these areas and protects them from erosion and sediment loss. Such areas include steep slopes, highly erodible soils, periods of intense rainfall, and inability to revegetate once disturbed.

c. require the integration of storm water quality protection into construction and post-construction activities at all development sites, including the minimization of toxic material use and their careful containment on site.

d. maintain peak runoff rates at pre-development levels, wherever practicable.

2. By _____, the EAC shall establish minimum requirements consistent with the regional policy for new development and redevelopment, for

[Change "minimum requirements" to "recommendations". - El Monte]

a. site planning practices

b. construction best management practices

c. post-construction best management practices

d. reporting erosion and storm water control strategies

e. redevelopment and infill

B. Planning Process

In order to integrate storm water management considerations into new development projects at the time that they are first proposed to jurisdictions, and to support other provisions of this permit:

[We concur totally with the EAC comments-That the planning process cannot be dictated to a City-only recommended. - Pomona]

1. By _____, the EAC shall develop guidance for permittees to use in preparing/reviewing EIRs, and in linking EIR mitigation conditions to local permits approvals.

[Change "guidance" to "guidelines". - El Monte]

[How can a permit dictate such requirements to an advisory committee? - Long Beach]

2. By _____, permittees shall adopt and use the guidance in their internal procedures.

[Should be deleted because it attempts to dictate the planning process to the city. - Hermosa Beach]

[How can an advisory committee dictate such requirements to the Permittees? - Long Beach]

3. By _____, the EAC shall develop a model CEQA checklist form that explicitly addresses watershed, water quality, and nonpoint source pollution impacts.

[How can a permit dictate such requirements to an advisory committee? - Long Beach]

4. By_____, the permittees shall use the model CEQA checklist.

[Should be deleted because it attempts to dictate the planning process to the city. - Hermosa Beach]

[How can an advisory committee dictate such requirements to the Permittees? - Long Beach]

[Should delete B.2, B.3, B.4. - El Monte]

5. Whenever a permittee rewrites either of the following mandated general plan elements - the conservation element or the open space element - watershed and stormwater management/urban runoff considerations shall be incorporated.

6. By _____, permittees shall implement a program to encourage developers to maximize pervious areas and storm water infiltration (in areas where the geology and topography allow), minimize directly connected imperious areas, and include justifiable treatment control measures.

7. Permittees shall require that prior to the submittal of an application for the first planning or building approval for a new development project, an applicant shall submit an Urban Runoff Mitigation Plan.

[Should be amended to read: "Permittees shall require as part of the submittal of an application for the first planning or building approval for a new development project, the inclusion of an Urban Runoff Mitigation Plan." In addition, this plan should only be required of large scale projects (ie. 100+ dwelling units or 100,000 square feet of commercial space). Also, subsections a.ii. and a.iii.c. should be deleted as being too burdensome. - Hermosa Beach]

[Add "for a parcel of over five years". - El Monte]

[The Urban Runoff Mitigation Plan sounds like a good idea that is fifty years too late. If this plan is a good idea it should be a good idea for all properties. I would suggest that the RWQCB or EPA promote this concept to all businesses in the USA. This will provide valuable exposure for the program and will make a significant improvement in the water quality of our nations water bodies. If it is left for new businesses to develop this idea, we may never see a new development. - Agoura Hills]

[What constitutes a new development project? Many of the requirements listed in this section are unreasonable. - Long Beach]

a. The Urban Runoff Mitigation Plan shall:

i. Be designed to reduce the runoff volume from the site and the pollutant load contributed by the site through incorporation of design elements and practices that address each of the goals set forth below in subsection (c). (Applicants should refer to the most recent edition of the Construction Best Management Practices Handbook, produced and published by the Storm Water Quality Task Force, for specific guidance on selecting best management practices for reducing pollutants in stormwater discharges from urbanized areas.)

ii. Discuss compliance with the development requirements set forth by Permittee's legal authority; and

iii. Address the following goals in connection with both construction and long term operation of the site:

a. Maximize, to the extent practicable, the percentage of permeable surfaces in order to allow more percolation of runoff into the ground.

b. Minimize, to the extent practicable, the amount of runoff directed to impermeable areas to the City's stormwater system.

c. Maximize, to the extent practicable, stormwater

filtration and storage for reuse through the use of sediment traps, cisterns or other means.

[As an absolute, I definitely concur with the EAC comments; however, if the phrase "Where economically feasible and practicable by the Permittee," was inserted in front and the phrase, "to the extent practicable" deleted, it would provide a strong suggestion to explore all available options, without unduly burdening anyone. - Pomona]

[Delete these lines. - El Monte]

d. Minimize, to the extent practicable, parking lot pollution through the use of porous materials to allow percolation of runoff, through the installation of appropriate treatment controls, or through other means.

iv. Compliance with an approval Urban Runoff Mitigation Plan shall be a condition of any required planning approval.

[Needs to start with a verb. - Covina]

v. Failure to comply with an approved Urban Runoff Mitigation Plan after receiving any required planning approval shall be a misdemeanor.

[Who does this violation apply to? As a permittee am I exposed to misdemeanor penalties if a business or condo association fails to comply with an Urban Runoff Mitigation Plan? If it is the business or condo association that is guilty are they an agency as defined in this permit? Are they covered? A lawyer should review this question. - Agoura Hills]

[That the determination as to the degree of criminal violation; ie. felony, misdemeanor, infraction, etc. will be a part off each Permittees legal authority and cannot be set by the Regional Board, unless they are ready to get it into the California Penal Code. - Pomona]

[Should be deleted. - Hermosa Beach]

[Needs to start with a verb. - Covina]

[Does the Board have the authority to require this? Permittees should have the opportunity to develop their own enforcement standards. - Long Beach]

C. Identification of Sources

1. By _____, the EAC shall establish a screening criteria for construction sites to be listed in a database.

[Change to "the EAC shall establish guidelines for screening criteria for construction sites to be listed in a database that are over five acres." - El Monte]

[Why establish a new list of criteria for screening construction sites? The federal Regulations are ver clear, sites greater than 5 acres shall ascertain an NPDES permit. - Long Beach]

2. By _____ the Permittees shall develop a database listing sites of construction activity within each Permittees' jurisdiction which shall be

updated quarterly. The database shall include at a minimum:

[Change to "the Permittees shall develop a database listing of construction activity of over five acres within each Permittee's jurisdiction which shall be updated quarterly". - El Monte]

a. Facility owner's name, address, and telephone number;

b. Site address, telephone number, and contact person;

[Should be amended as follows: "Site, address, general contractor and telephone number." The following subsections (c) and (e) should be deleted as either too onerous or not under the control of the Permittee. - Hermosa Beach]

c. Closest receiving water;

d. Type of construction activity

e. Duration of project with start and end dates

[While I concur that the Permittees have no control (EAC comments), the dates could and should be requested as a part of the construction permit process. - Pomona]

[Most construction projects can estimate a completion date at the issuance of permits, but factors beyond anyone's control will delay the proposed completion date. This item should have the end date recognized as an estimate. - Agoura Hills]

f. Total size of project in acres or square feet .

D. Prioritization of Sources

[This Section should be deleted in its entirety. The purpose of this section is not apparent. Site inspections and ranking will be handled through existing inspection programs. - Hermosa Beach]

[Delete this entire section. - El Monte]

[What is the intention of this section? On what basis does one prioritize the relative potential for a construction site to contaminate storm water and urban runoff? - Long Beach]

1. By _____ the Permittees shall prioritize sites of construction activity within their jurisdiction on their relative potential for the contamination of storm water and urban runoff. The categorical list shall include:

   a. All construction activity sites regulated under Phase I of the Federal storm water program (40 CFR 122.26).

   b. All construction activity with sites greater than the size criteria established by the EAC but less than five acres in size.

   c. Other construction activity sites considered by the EAC or the Regional Board to have a high potential for the contamination of storm water and urban runoff.

2. By _____, Permittees shall rank the construction activity sites, identified as potential pollutant sources of storm water and urban runoff pollutants in IV. B.1.a, in order of priority for oversight of implementation of storm water management measures.

[This section refers to section IV.B.1.a, which cannot be found. - Agoura Hills]

E. Control Measures

[In five places, paragraph IV.B.1.a is referenced, but that paragraph does not exist. - Covina]

1. By _____, Permittees shall develop a checklist of specific storm water and urban runoff control measures for construction activity sites in IV. B.1.a. The control measures must

["Permittees shall develop a checklist of specific storm water and urban runoff control measures for construction activity sites of over five acres". - El Monte]

[The Permit asks the permittee to establish a checklist, which should be done by the EAC. - Agoura Hills]

[Is the intent to develop a checklist or control measures? Are control measures the same as Best Management Practices. BMPs should be developed as part of the WMP. - Long Beach]

a. address multiple pollutant sources

b. initially focus on source control measures such as source minimization, education, good housekeeping, good waste management and good site planning.

c. target construction activity source areas and activities with the potential to generate substantial pollutant loadings

2. By _____, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for construction sites in IV.B.1.a. The structural control measures must be evaluated as to:

[Should be deleted. The concerns in this area will be addressed by the Critical Source Monitoring Program. - Hermosa Beach]

[Should be deleted in its entirety. - El Monte]

[This evaluation is much too general for Permittees to conduct. Their tasks should focus on circumstances peculiar to their jurisdiction-this is more of the nature of a university study. - Covina]

[This task should be included in the WMP where each control measure can be developed as a pilot project and implemented by the Principal Permittee and supported by all the Permittees. This process could prove to be more cost effective and will provide consistent end-results. - Long Beach]

a. effectiveness in reducing sediment, toxic pollutants and pollutants of concern;

b. ease of maintenance;

c. current frequency of use;

d. feasibility and cost-effectiveness; and

e. possible methods to ensure implementation.

By _____, Permittees shall describe any studies and pilot projects that may be conducted to assess the feasibility and effectiveness of specific control measures.

3. By ____, Permittees shall have in place a process to ensure implementation and proper maintenance of storm water and urban runoff control measures for sites associated with construction activity in IV.B.1.a., including

["Permittees shall have in place a process to ensure implementation and proper maintenance of storm water and urban runoff control measures for sites associated with construction activity of over five acres including:" - El Monte]

[Delete this entire section. The requirements are unreasonable and exceed the requirements of the Clean Water Act. - Long Beach]

a. use of qualified personnel to design, install, and maintain BMPs.

[Should be deleted as being too cumbersome for the Permittees. - Hermosa Beach]

b. proper maintenance of BMPs incorporated into private developments (e.g., through deed restrictions, covenants, conditions and restrictions (CC&R).

c. proper installation and maintenance of post-construction BMPs.

d. prohibition on grading during the wet season (Oct 15 -Apr 15) except for emergency action unless adequate erosion and sediment control measures are in place and maintained.

[Delete entire paragraph. - El Monte]

4. Permittees shall require the following for demolition/construction activity:

[This section should be deleted and developed as part of the WMP by the Permittees. - Long Beach]

a. Sediment, construction waste and other pollutants from construction sites and parking areas shall be retained on the site to the maximum extent practicable.

b. Any sediments or other materials which are not retained on the site

shall be removed within 24 hours or where determined necessary by the Director of Department of Public Works, or a designated representative, a temporary sediment barrier shall be installed.

[Should be amended to read: "Any sediments or other materials which are not retained on the site shall be removed within 24 hours from the time of notification of the Director of Public Works, or a designated representative. In lieu of removal, a temporary sediment barrier shall be installed." - Hermosa Beach]

c. Excavated soil shall be located on the site in a manner that eliminates the amount of sediments running into the street or adjoining properties. Soil piles shall be covered until the soil is either used or removed.

d. Drainage controls shall be utilized as needed, depending on the extent of proposed grading and topography of the site, including but not limited to the following:

I. Detention ponds, sediment ponds, or infiltration pits.

ii. Dikes, filter beams or ditches.

iii. Down drains, chutes or flumes.

iv. Silt fences.

e. No washing of construction or other industrial vehicles shall be allowed adjacent to a construction site. No water from washing vehicles on a site is allowed to run off into the City's storm drain system.

[Should be amended to read: "No water from washing vehicles on a construction site may be allowed to run off unless treated to remove sediments and pollutants. - Hermosa Beach]

f. Roof drainage shall be oriented towards permeable areas on site to maximum extent practicable.

g. Lot drainage shall be oriented towards permeable areas to the maximum extent practicable.

[It should be noted that it is not good civil engineering practice to allow run-off to infiltrate into graded hillside lots. - Rancho Palos Verdes]

h. All parking lots shall be designed to contain one inch of precipitation in a 24 hour period.

[Should be deleted. These steps cannot be supported without clear evidence that their effectiveness exceeds that of normal good housekeeping practices. - Hermosa Beach]

[This requirement should be thought out more thoroughly. - Rancho Palos Verdes]

[This is an impractical requirement. What will happen to irrigation water? - Azusa and Agoura

Hills]

l. Runoff from parking lots shall be directed to permeable areas to the Maximum Extent Practicable.

[Should be deleted. These steps cannot be supported without clear evidence that their effectiveness exceeds that of normal good housekeeping practices. - Hermosa Beach]

[This requirement should not be deleted. - Rancho Palos Verdes]

[These items should be moved to the planning section, Section 7.a.3. - Rancho Palos Verdes]

5. Permittees shall require the following for construction activity:

[Should be deleted. Subsection (a) should be relocated to IV.E.4.f, and subsection (b) should be relocated to IV.E.4.g. - Hermosa Beach]

[This section should be deleted and developed as part of the WMP.by the Permittees. - Long Beach]

a. All construction sites in hillside areas or in areas adjacent to natural water-ways (soft bottom creeks), lakes or the ocean must develop and implement sedimentation and erosion control plans that incorporate the following elements: timing of construction, BMPs to reduce erosion of cleared hillsides (revegetation, jute netting, etc.), BMPs to reduce the velocity of runoff and sediment from the construction site, and BMPs to detain the flow of sediments from the site;

b. As a condition of granting a construction permit, set forth reasonable limits on the clearing of vegetation from construction sites, including, but not limited to, regulating the length of time during which soil may be bare, and, in certain sensitive cases, prohibiting bare soil.

6. The EAC may seek coverage under this Order, for construction activity sites listed in III.B.1.a.1 which are owned and operated by Permittees if it:

[Should be rewritten as: "Each permittee may seek coverage under this Order, for construction activity sites listed in III.B.1.a.i. which are owned and operated by the Permittee if it:

(a) Establishes as procedure for notifying the Regional Board of construction activity sites owned or operated by the Permittee.

(b) Prepare a checklist of construction BMPs using BAT/BCT criteria for implementation at these construction sites.

© Standardizes procedures to ensure implementation of construction BMPs.

(d) Prepare and retain site specific Stormwater Pollution Prevention Plans (SWPPP) at its construction sites; and

(e) Establishes a procedure to report annually on the effectiveness of Stormwater Pollution Prevention Plans at each construction site, and certify compliance with this Order. - Hermosa Beach]

[Does this section of the permit require the EAC to issue permits for city funded construction activities? Or, does it allow a City that complies with the procedures and checklists established

the EAC to avoid paying fees to the RWQCB? If it is the former; I am opposed to the provision. If it is the latter; I will volunteer for the subcommittee that works on this procedure and checklist. - Agoura Hills]

[What is the intent of this section. - Long Beach]

a. establishes a procedure for notifying the Regional Board of construction activity on sites owned or operated by Permittees;

b. prepares a checklist of construction BMPs using BAT/BCT criteria for implementation by Permittees at these construction sites;

c. standardizes procedures to ensure implementation of construction BMPs by Permittees;

d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee construction sites; and

e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each construction site, and certify compliance with this Order.

F. Source Inspection

1. By _____, Permittees shall submit a schedule for inspection of construction activity sites in IV.B.1.a. for adequacy of storm water pollution prevention measures and erosion control measures. The schedule shall include, for a five year period,

[Section F.1. and F.2 should be deleted in all its entirety as being redundant. The list of typical sites in .2 should be included under Part IV.E.3. - Hermosa Beach]

[Delete F.1 and F.2 - El Monte]

[Paragraph IV.B.1.a and its subparagraphs are referenced but they do not exist. - Covina and Agoura Hills]

[It is not possible to schedule construction inspections five years in advance. - Covina]

[Sections F.1 and F.2 are unacceptable. - Agoura Hills]

a. all construction activity identified in IV.B.1.a.1, and all construction activity identified in III.B.1.a.2 and III. B.1.a.3,

2. By _____, Permittees shall develop and implement a construction activity inspection program. The inspection program shall include, but is not limited to:

a. procedures for construction site inspections

b. procedures for construction and building industry outreach on pollution prevention, waste minimization, and storm water quality management

c. procedures to ensure corrective action is undertaken by non-complying sites

d. procedures to follow-up on violations of municipal codes

e. procedures for enforcement action against non-complying construction activity;

f. an electronic recording system to document the status of construction activity inspections; and,

[Why is it necessary to have an electronic recording system for inspections? - San Dimas, Covina and Azusa]

g. appropriate training for program staff.

3. During inspection of group IV.B.1.a.1 sites, inspectors shall request to see a copy of the SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may deem it necessary to report problematic construction sites to the Regional Board.

[In a program of this magnitude, it is likely that many problem sites will be encountered which will need direct Board involvement for problem resolution. If a problem site is referred to the Board, does that relieve the permittee from the responsibility of taking further actions until a ruling is made by the Board? - Hermosa Beach]

[Should be rewritten as: "During inspection of construction sites regulated under Phase I of the Federal Stormwater Program, inspectors shall request to see a copy of the SWPPP. If no SWPPP is available, the Regional Board shall be notified. In addition , the Permittee shall report problematic construction sites to the Regional Board." - Hermosa Beach]

G. Reporting

1. Each year, the Permittees shall evaluate the results and progress of their storm water quality management program for construction activity sites. The annual report submitted to the Regional Board shall recommend a strategy for the management of storm water from construction activity sites for the following year based on

[Should be amended as: "Each year, the Permittees shall evaluate the results and progress of their stormwater quality management program for construction activity sites. The annual report submitted to the Regional Board shall recommend a strategy for the management o stormwater from construction sites for the following year based on evaluation of stormwater urban runoff control measures implementation and evaluation of results from the critical source monitoring program." In addition G.2 should be amended to read: "The Permittees shall transmit to the Regional Board a hard copy of the construction activity database developed in IV.C.2 on a quarterly basis." - Hermosa Beach]

["Each year, the Permittee shall evaluate the results and progress of their storm water quality management program for construction activity sites of over five acres. - El Monte]

a. priority construction site sources listing
b. priority site inspections
c. priority checklists of stormwater urban runoff control measures
d. evaluations of structural and treatment control measures
e. special studies and pilot projects needs
f. specific site and activity monitoring needs

[Delete entire line. - El Monte]

2. The EAC shall make available to the Regional Board the construction activity database developed in IV.B.1.a.1 in the appropriate format when so requested.

[Delete entire paragraph. - El Monte]

H. Conflicts with Other Mandates

1. The Permittees shall work with other regulatory agencies and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies.

[Replace "Permittees" with "Principal Permittee" to be consistent with sections II and III. - Covina]

[We concur with the EAC comment with regard to placement, but we feel very strongly that the Regional Board should assume the leadership in any conflicts that cannot be readily resolved by the Permittees, especially when the other mandates are at the state and federal level. - Pomona]

[Should be deleted as being redundant. - Hermosa Beach]

VOL 24

0102

V. PUBLIC AGENCY REQUIREMENTS

A. Examination of Existing Activities

By _____, the Permittees shall develop and begin implementation of a program to examine their existing activities and measures described below to reduce the impact on stormwater quality from their operations.

B. Sewage Systems

[This section will have little or no affect on Agoura Hills because we contract with the County for Sewer Maintenance. B2 needs to be clarified to specify who is responsible for establishing control procedures for identifying, repairing and remediating sewer blockages, etc. It would appear to fall to the EAC, but we need to check with those agencies who do sewer maintenance to determine if this is acceptable. - Agoura Hills]

[County Sanitation Districts of Los Angeles County is a major player in operating and maintaining several miles of trunk sewers throughout the Los Angeles Basin. The Permittees have no jurisdiction over the Districts. Who will regulate the Districts operation and maintenance procedures. - Long Beach]

1. All reasonable efforts shall be undertaken to keep sewage spills or leaks from entering the storm drain system. The EAC shall develop procedures for spill response by _____.

2. Control procedures for identifying, repairing, and remediating sewer blockages, exfiltration, overflow, and wet weather overflows from the sewers to the storm drain system shall be implemented to protect stormwater quality by _____. These procedures shall include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

3. By _____, the Permittees shall insure that field personnel who operate and/or maintain sewer systems have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to properly investigate any suspect connections or cross connections to the storm drain system.

C. Vehicle Maintenance/Material Storage Facilities

[This section will have little or no affect on Agoura Hills because we do not have vehicle maintenance/material storage facilities. - Agoura Hills]

1. By ____, EAC will develop pollution prevention plans for each public vehicle maintenance/material storage facility category.. Public vehicle maintenance/material storage facilities include any Permittee-owned and/or operated facility in which any of the following occur: vehicle or equipment maintenance; repair; washing; fueling; and/or any facility at which there is storage of toxic chemicals or hazardous materials.

[Should be amended to read as follows: "By _____, EAC will develop a standard pollution prevention plan for public vehicle maintenance/material storage facilities. Public vehicle maintenance/material storage facilities include any Permittee-owned and/or operated facility in which any of the following occur: vehicle or equipment maintenance; repair, washing; fueling; and/or any facility at which a hazardous materials business plan is required." - Hermosa Beach]

[EAC will develop pollution prevention plan guidelines for each public vehicle maintenance/material storage facility category. - El Monte]

[This task is assigned to the EAC. It does not appear to be the development of a checklist of desirable procedures but rather the development of the SWPPP for an individual property. If this responsibility is left with the EAC it should be modified to be consistent with other similar development projects. - Agoura Hills]

2. Best Management Practices (BMPs)

a. By _____, Permittees will have site specific pollutant control measures implemented at all vehicle maintenance/material storage facilities per EAC guidelines, together with an on- site pollution prevention plan.

b. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each public vehicle maintenance/material storage facility. To achieve this goal, the Permittees shall first identify the potential pollution sources and who is responsible for implementing the stormwater management measures.

c. Based on the facility type, management practices and schedule of implementation shall be developed. BMPs that can be used to improve the quality of runoff include, but are not limited to:

[Change second sentence to: BMP's that can be used to improve the quality of runoff should include, but are not limited to: - Pomona]

i. Housekeeping practices;

ii. Material storage control;

iii. Vehicle leak and spill control; and

iv. Illegal dumping control.

d. Loading/Unloading of Materials

i. Employees or contractors of the Permittees who handle potentially harmful materials shall be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to stormwater from outdoor loading/unloading of materials.

[Delete the words "or Contractors" from the statement as presented and add the following sentence: If feasible, any contractors of the permittees should also receive such training. - Pomona]

ii. Applicable BMPs shall be selected based on the following three factors:

1. Eliminating exposure of material to rainfall;

2. Checking equipment regularly for leaks; and

3. Containing spills.

e. Material Storage Control

[Conventional paragraphing outline procedures need to be followed and the item is very narrow - covering only chemical storage spills/or other similar problems. Needs to be re-written to cover a wider area of materials storage - yes it addresses the most significant potential problem, however it may cause some to pass over the item as not applicable. - Pomona]

[Move paragraph e over to the margin. - Covina]

A program shall be developed to prevent or reduce the discharge of pollutants to stormwater from outdoor container storage areas using measures such as:

I. Installing safeguards against accidental releases;

ii. Secondary containment;

iii. Conducting regular inspections; and

iv. Training employees in standard operating procedures and spill cleanup techniques.

f. Vehicle and Equipment Washing and Maintenance

I. Washing of vehicles or equipment on-site shall be performed in a designated area equipped with an oil/water separator.

ii. The sumps and separators shall be maintained/cleaned on a regularly scheduled basis appropriate to the facility.

iii. BMPs to be implemented as appropriate for vehicle and equipment maintenance shall include but not be limited to:

[This item is redundant - should be incorporated with VC.2.c. - Pomona]

a. Waste reduction;

b. Use of alternate products;

c. Pollution prevention;

d. Recycling; and

e. Spill prevention and clean up.

6. Waste Handling and Disposal

[This should be labeled "g" and the title should not be underscored. - Covina]

[This item appears to be misnumbered and should likely be C3. It is such a non-issue does it even need to be mentioned in the permit? - Agoura Hills]

Wastes shall be managed to prevent stormwater pollution.

D. Parks and Recreation

1. Fertilizers/Pesticides

a. Permittees shall develop procedures on the proper application of pesticides, herbicides, and fertilizers by _____. Procedures shall include:

I. List of approved pesticides and selected use;

[We suggest that this entire line be stricken. - El Monte]

ii. Product and application information;

iii. Equipment use and maintenance procedures; and

iv. Record keeping.

b. Landscape waste shall not be discharged into the storm drain system.

[This paragraph has nothing to do with fertilizers/pesticides. - Covina]

c. Storage areas for fertilizers and pesticides shall be designed and maintained to reduce exposure to stormwater. The following BMPs shall be utilized where appropriate:

I. Store materials inside or under cover on paved surfaces;

ii. Use secondary containment;

iii. Minimize storage and handling of hazardous materials;

iv. Inspect storage areas regularly.

2. Facility Management

[This paragraph should not be underscored. - Covina]

a. Wash waters cannot be discharged into the storm drain system without appropriate treatment.

b. Landscape maintenance involving the use of pesticides and fertilizers shall ensure the proper use of these materials to minimize loss to storm water.

c. Retention and planting of native vegetation to reduce water, fertilizer, and pesticide needs shall be encouraged.

d. Use of Integrated Pest Management (IPM) shall be encouraged.

[The term "Integrated Pest Management" is used as if everyone should know what that is. Is there a document which defines what IPM involves? If not, then this needs to be defined. - Agoura Hills]

e. A schedule for irrigation and fertilization shall be developed by, _____, to minimize:

[Suggest this item be stricken. - El Monte]

I. Chemical application during wet season and no chemical application during storms; and,

ii. Over watering that may lead to runoff that contains nutrients and pesticides.

f. The drainage of commercial/municipal swimming pool water shall only be discharged under separate Waste Discharge Requirements.

[Add words to change sentence to: The drainage of commercial/municipal swimming pool water shall only be discharged to the storm drain system under separate Waste Discharge Requirements. - Pomona]

[Why should commercial/municipal swimming pools be required/subject to have a separate waste discharge requirements? - Azusa and San Dimas]

[Change item to: The discharge of swimming pool water shall only be allowed under a City permit. - El Monte]

g. Each Permittee shall develop BMPs to minimize trash, debris, and other pollutants from entering Permittee owned recreational water bodies by _____. These measures shall include:

[Add words to change sentence to: Each Permittee shall develop BMPs to minimize trash, debris, and other pollutants from entering Permittee owned recreational water bodies if applicable, by _____. - Pomona]

I. Routine trash collection along, on, and/or in, water bodies, where feasible; and

ii. Public outreach to educate the public about impacts of illegal dumping.

E. Storm Drain System Operation and Management

1. Inlet Maintenance

BMPs to be implemented by each Permittee for effective catch basin cleaning shall include, but not be limited to the following:

a. Basins shall be inspected and cleaned between May 1 and October 15 of each year;

b. Between October 15 and April 15, catch basins shall be maintained as necessary.

c. Records shall be kept of the number of catch basins cleaned; and

d. Track the amount of waste collected.

[This item is unclear, it needs to be re-written to define how to track the amount of waste material collected; i.e., tons, loads, cubic yards etc. -Pomona]

[How is it proposed to track the amount of waste collected in inlets. - San Dimas]

[What is it meant by, "Track the amount of waste collected"? What is the purpose of this requirement? - Azusa]

2. Storm Drain Maintenance

a. Material removed from storm drains and catch basins shall be disposed of properly.

b. Trash and debris from open channel storm drains shall be removed at least annually between May 1 and October 15 of each year.

c. Open channels shall also be monitored during the rainy season for any debris buildup and cleaned where needed.

3. Waste Management

The Permittees shall implement a program by _____, to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

4. Dry weather storm drain diversion

The Permittees shall investigate the feasibility of diverting dry-weather flows from the storm drain system to POTWs where appropriate. The investigation shall be

completed by _____.
[Identify a "POTW". - Rancho Palos Verdes]

[The issue raised by this section of the permit is best addressed by the RWQCB as the issuer of NPDES permits for each of the POTWs. If the RWQCB feels that the POTWs should collect and treat dry weather flows in creeks they should require them to perform that service. Only with consistency will any benefit be derived. - Agoura Hills]

F. Streets and Roads

1. Sweeping of curbed streets:

   a. Sweeping of curbed streets shall occur at least monthly.

   b. Where feasible, areas generating excessive refuse shall be swept more frequently.

2. Maintenance

   a. Existing saw-cut management and paving practices conducted by the Permittees shall be evaluated and appropriate control measures developed.

   b. Paving control measures to be considered that would help reduce the impacts to stormwater include, but are not limited to:

      I. Avoid paving during wet weather; and

      ii. Store materials away from drainage courses to prevent pollution of stormwater runoff.

   c. Refuse collected shall be transported to appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations.

   d. Good housekeeping practices shall be implemented to insure proper management of any waste products that may be generated during maintenance activities.

   e. To reduce stormwater pollution from concrete materials and wastes:

      I. Washout of concrete trucks should be conducted off- or on-site in designated areas. Do not wash out concrete trucks into storm drains, open ditches, streets, or streams;

      ii. Store materials under cover, away from drainage areas; and

      iii. Avoid mixing excess amounts of concrete or cement on-site.

f. Employees shall be trained in the implementation of good housekeeping measures. Training shall:

I. Promote a clear understanding of the potential for maintenance activities to pollute storm water;

ii. Identify solutions (BMPs selection);

G. Flood Control

1. By, _____, the Permittees shall develop and implement procedures to assess the impact(s) of new flood management projects on the quality of receiving water bodies.

2. The Permittees shall undertake pilot projects/studies to determine the applicability of altered structural flood control system elements to provide pollutant removal in stormwater.

[Possibly for the principle permittee. This is not a feasible item for the substantive majority of the Co-permittees; either from a staffing level or as a fiscal drain. - Pomona]

3. During construction, appropriate BMPs shall be utilized to control pollutants.

4. Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed to assure that appropriate management measures are developed to comply with the stormwater regulations.

H. Parking Facilities

[This section should be deleted as redundant, it is the same as Part II Section (2)(c).

By _____, each Permittee shall develop a program to implement periodic hard scape and catch basin cleaning, in order to reduce concentrations of oil, grease, suspended particulates, and metals, as well as the petroleum byproducts.

[Periodic hard scape cleaning will be expensive for cities and its value is questionable. - Covina]

[If it is the intent to regulate city-owned parking lots, I do not take exception to this provision. However, if it is the intent to have cities require each business with a parking lot to perform this function, it will not work. Except for gasoline service stations, no one "cleans" parking lots of accumulated grease, oil and petroleum byproducts. - Agoura Hills]

V. PUBLIC INFORMATION AND PARTICIPATION

[The Conventional paragraphing outline procedures need to be followed; i.e., Outreach Materials should be "A", with the Written material being "1." and the 1&2 under "Written Material being a. & b.. - Pomona]

[Part VI should be rewritten in its entirety by the Regional Board to better reflect short term needs and long term education strategy. - Hermosa Beach]

[This section of the permit is totally different from the rest of the permit in language and character. The permit needs to be uniform and direct to the point. - Azusa]

To reach as many Los Angeles County residents as possible, a comprehensive educational outreach approach shall be undertaken under this permit. Each Permittee shall choose an appropriate combination of outreach tools and activities to raise public awareness of storm water issues and improve water quality.

Outreach Materials

Outreach programs shall consist of written, audio, and visual materials and, when necessary, translated into appropriate languages or structured for appropriate ages. Permittees shall incorporate interactive methods of distributing outreach materials and provide for public participation in activities developed under this section.

A. Written Material

[Replace "shall" with "may" in paragraph A.1 and A.2. - Covina]

1. The Permittees shall produce a variety of written materials to convey information regarding storm water management within County watersheds.

2. Written materials shall include, but are not limited to: flyers, brochures, door-hangers, newspaper articles, mail-inserts, and newsletters.

B. Audio Material

1. All Permittees shall singularly or collectively utilize radio broadcast public service announcements to convey information regarding storm water management except in areas where public access radio stations are not available.

[Add "If fiscally feasible," to the beginning of this section. - Pomona]

2. Examples of audio materials include radio advertisements, public service announcements, and informational recordings.

C. Visual Material

1. All Permittees shall implement a catch basin labeling program as well as other

strategies such as banners, displays and posters to educate the public on the ultimate destination of storm drain system flows.

2. Each Watershed Management Committee shall produce at least one informational video. The video shall be shown on televised public service stations and cable access programs except in areas where cable access programs are not available. Further methods of distribution may include workshops, libraries, etc.

[Add to the second sentence to create the following: The video shall be shown on televised public service stations and cable access programs throughout all watersheds on a regular basis, to the maximum extent that the Permittees can request the showings. - Pomona]

[Does anyone believe that the Malibu Creek Watershed will be able to "produce at least one information video"? As desirable as that may be for the watershed, a Countywide video production capability is more productive than trying to set up six different watershed productions. - Agoura Hills]

[Add "if appropriate" to the end of the first sentence. - Covina]

D. Distribution of Materials

Outreach materials shall be made available to the public at appropriate public counters and distributed at public events. Examples include fairs, festivals, public meetings, community events, school assemblies, etc.

General Education Strategy

A. The EAC shall develop and the Permittees shall implement a 5-year urban runoff education strategy. The intent of the strategy shall be to enhance public awareness of the impact of storm water pollution on receiving waters and to discourage improper waste disposal practices. Outreach efforts shall be conducted throughout the watershed. The public shall be made aware of their responsibility for both the problems and solutions to storm water pollution. A watershed-wide program shall be implemented by _____.

[Add the following in the first line of "A": That the EAC & the PIPP Committee shall develop and the permittees shall... - Pomona]

Development and implementation of the education strategy shall be based on the four objectives listed below:

1. Promoting clear identification and understanding of the problem, including activities with the potential to pollute storm water;

2. Identifying solutions or applicable measures (Best Management Practices) that can be taken to prevent storm water pollution;

3. Raising public awareness of the problems and solutions; and

4. Incorporating solutions back into programs, training and BMP implementation.

B. Efforts shall be made to identify land uses and activities that have a higher potential for storm water/urban runoff pollution by focusing on specific pollutants, disposal practices, materials used, etc. To prevent storm water/urban runoff pollution, outreach materials shall be provided on the appropriate selection and implementation of BMPs accordingly. A watershed-wide program shall be developed by _____.

[Who is responsible for this deadline? Will the WMC of the EAC be responsible? It appears that this is an issue that should be addressed at the WMC after the EAC establishes guidelines. - Agoura Hills]

1. Pollutant Specific: The reduction of specific pollutants of concern in a particular watershed shall be addressed in a focused public education and outreach program.

2. Activity-specific: Activity-specific outreach programs shall be developed and implemented throughout the watershed. Written, audio, or visual outreach tools should address three primary topics:

   a. Identification of activities potentially causing storm water pollution;

   b. Implementation of Best Management Practices to prevent storm water pollution.

   c. Recognizing and reporting occurrences of storm water polluting activities.

   The Permittees shall continue to develop activity-specific outreach programs that inform residents about the problem of illicit discharges and dumping and that promote, publicize, and facilitate public reporting of these activities. The program shall also include continuing operation, maintenance, and promotion of the county-wide reporting hotline.

[This item should have the designation "d". - Pomona]

C. The Permittees shall list pertinent City phone numbers under the City government directory located in the front section of local area phone books. This shall be updated annually as necessary and shall, at a minimum, include numbers for reporting on clogged catch basin inlets reporting illegal discharges/dumping and a general informational number for storm water. These phone numbers may be city-specific or area-wide.

[Substitute the following sentence for the first sentence of the above proposed paragraph: That the Permittees shall request a listing of pertinent City phone numbers under the City government directory located in the front section of local area phone books. I feel that the cities should be required to at least make a good faith attempt to have their numbers listed. - Pomona]

[Suggest that the entire paragraph of General Education Strategy-C be stricken. - El Monte]

D. All reasonable efforts to coordinate public outreach efforts shall be undertaken. This may include coordinating with environmental groups and public agencies such as the California Coastal Commission, the Department of Beaches and Harbors, Resource Agencies, etc.

[Add the following to the proposed paragraph in the last line: ...Harbors, Metropolitan Water District of Southern California; Resource Agencies, etc. - Pomona]

Outreach to Target Audiences

[Entire paragraphs of Outreach to Target Audiences: A-1-2-3-4, and B be stricken. - El Monte]

[In paragraphs 1,2,3, and 4 replace "shall" with "may" in all cases.

Permittees shall develop and implement an educational program that stresses pollution prevention for a variety of audiences, including local residents, school-aged children, businesses and public employees whose job functions and daily lives may impact storm water quality. The program may be developed locally or regionally and shall include at a minimum:

[Change the last line of the proposed paragraph to read as follows: That the program may be developed locally or regionally and should include, as a minimum:

- Education on the proper use and disposal of pesticides, herbicides and fertilizers;
- Education on the definition of, identification of, and impacts associated with illicit discharges and procedures for reporting.
- Promotion of proper management of and disposal practices for used oil and hazardous substances.

A. Local Residents

[Outreach to target Audiences A All cities in California who are complying with AB939 are now complying with this portion of the permit. Is this section necessary? Those cities that do not comply face significant penalties under AB939.

1. Permittees shall develop a program to educate local residents on types of household hazardous wastes along with proper management and disposal methods. The program shall at a minimum include:

   a. Information on the availability of collection services, such as location and schedule;

   b. Production of public outreach materials that educate residents on source reduction and proper disposal methods for household hazardous wastes; and

   c. Continue to encourage residents to recycle of oil, antifreeze, glass, plastics, batteries, etc. and to prevent the improper disposal of such materials to the storm drainage system.

[Delete "of" in the above sentence. - Covina]

Educational efforts throughout the watershed should also provide residents with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Management Program. Other local programs shall be advertised as appropriate.

2. Permittees shall develop and encourage watershed residents to participate in specific storm water outreach programs. Residents shall be informed of and provided with the opportunity to share ideas and comments about the programs. Permittees shall demonstrate that a good faith effort has been made to outreach to different communities within the watershed. The watershed-wide outreach program shall be implemented by _____. This shall at a minimum include:

   a. Where applicable for fire and erosion prevention, mowing shall be encouraged as opposed to diking. An investigation of effectiveness shall be undertaken.

[This paragraph does not belong in this section. - Covina]

3. Cooperative Public Outreach

   In order to promote public participation, cooperative outreach programs with local residents shall be developed. These cooperative programs should foster awareness and identification of storm water pollution issues among residents in the watershed. Catch basin labeling and other established sign programs are excellent examples of this type of cooperative effort, as are events like the "Storm water Pollution Awareness Week." One possibility for cooperative outreach is an "Adopt-A- " program. Residents can "adopt" highways, storm drains, catch basins, streams, etc. to monitor, restore and protect. The purpose of all cooperative outreach programs created is to inform and involve the public in storm water management.

4. Complaint Procedures

   Public comments/complaints shall be requested by the Permittees in order to help gauge the success and effectiveness of storm water programs.

B. K-12 School Children

School children can play an important role in public information and participation programs, as they are generally more easily motivated and any behavior changes they make tend to stay with them through adulthood. School children can also convey storm water pollution prevention messages to other family members. School programs shall include information on storm drain systems, the difference between sewers and storm drains, the importance of preventing storm water pollution, and may also address, illegal discharges/dumping and reporting procedures, source minimization, and general pollution prevention. Written materials (workbooks and coloring books), videos, assemblies, and field trips are examples of effective components of a K-12 educational program.

C. **Businesses**

A detailed public education and outreach program shall be developed for business operations with greater potential of discharging pollutants into the storm drain system. The program shall include employee training on and the effectiveness of implementing BMPs to reduce nonpoint source pollution. In addition to written, audio, and visual materials, other possible means of focused outreach may include: conducting workshops, mass mailings, submitting informational articles to trade/industry magazines, etc.

D. Public Agencies and Employees

Public agency employees shall be trained on storm water management and pollution prevention practices and involve employees on many different levels - from program managers to field personnel. Training programs shall include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forums or committees. Materials developed for other audiences may also be used in these public agency employee training programs. Appropriate public agency employees shall be trained in:

1. Emergency spill cleanup procedures.

2. Environmentally sensitive alternative products.

3. Good housekeeping practices.

Permittees shall provide outreach materials to the general public through business license renewal counters and/or make efforts to outreach through professional and business associations. Additionally, Permittees should consider producing educational materials for professionals and technicians not employed by public agencies.

Outreach Based on Activity-Type

A. Industrial/Commercial

A watershed-wide, general outreach program shall be set up by the WMC for all industrial and commercial facilities potentially discharging to the storm drain system. Furthermore, the WMC shall provide specific guidance objectives to these facilities regarding storm water program compliance by _____, and inform and remind all potential commercial and industrial dischargers of their obligations under the storm water program. The Permittees shall also encourage the proper disposal of all materials from industrial and commercial sites.

Prior to the WMC providing specific guidance objectives, subcommittees shall be established, as needed, to develop specific outreach materials for industrial/ commercial categories and specific "high priority" activities. This shall include at a

minimum: metal platers, restaurants, vehicle related facilities, etc...

B. Construction

The Permittees shall ensure that contractors properly install all necessary post-construction, permanent BMPs during initial construction and that any necessary maintenance needed during construction is performed. There shall be specific programs outlining correct practices.

In an effort to prevent concrete waste from entering the storm drain system, contractors shall observe the following guidelines:

1. Washout of concrete trucks should be conducted off-site or on-site in designated area;
2. Excess concrete should not be dumped on site; and

[Items 1 & 2 should be revised. I am a firm believer that concrete waste must be controlled on the construction site. Who will have the strongest desire to cleanup his/her site but the property upon which the concrete is poured? If the concrete is dumped in the street what interest does the contractor have in cleaning up the spoil concrete? Once concrete sets it is no more polluting than sand and gravel. In fact, if a property owner wanted to bury waste concrete on their site would they violate any law? - Agoura Hills]

3. Employees and subcontractors should be trained in proper concrete waste management.

[The above entire line to be stricken. - El Monte]

Evaluation

The EAC shall develop a process to evaluate the effectiveness of all public outreach programs implemented under this permit. Surveys and focus groups are examples of methods that can be used to gauge a program's effectiveness. They can also be used to provide insight into the program's direction and to help formulate attainable goals. Results of any evaluation method used shall indicate the community's level of awareness of storm water pollution. A watershed-wide program shall be implemented by _____.

VIII. PROGRAM EVALUATION AND REPORTING

The program may be modified subject to comments received under the Annual Review.

A procedure shall be developed and utilized for program evaluation and reporting by the Principal Permittee during the course of this permit. Under this procedure as outlined below, the EAC shall develop action-specific performance indicators and criteria, perform evaluation of compliance and effectiveness based on the performance criteria, establish schedules and mechanism for internal record keeping and reporting, and submit semi-annual and annual reports to the Regional Board using a standardized format.
[Delete all requirements for semi-annual reports. The annual reports should be sufficient to monitor the program. City of Covina]

The EAC, WMC, and/or each Permittee are responsible for collecting data needed for program evaluation, conducting self-evaluation, and reporting the results of evaluation to the Regional Board. The results reported to the Regional Board shall include both the collected data and analysis of the data. The reports shall include detailed explanation on how the evaluations are conducted, how and why certain provisions of the permits are met or not met, how the effectiveness of certain BMPs is determined or is not, and should a problem arise, how it shall be corrected. The Regional Board will make a compliance determination based on information submitted under this procedure.
[Change third paragraph to read: "The Permittee is responsible for collecting data needed for program evaluation, conducting self-evaluation, and reporting the results of the evaluation to the Regional Board." City of El Monte]

A. Demonstration of Compliance

1. Each Permittee is responsible for demonstrating that the required BMPs as prescribed under this permit, as well as other BMPs included in the Watershed Management Plans, are implemented to the "maximum extent practicable." Each Permittee shall implement the required BMPs to the maximum extent practicable.

2. The Watershed Management Committees are responsible for demonstrating the effectiveness of other BMPs through conducting and reporting the results of pilot/demonstration projects for evaluating the effectiveness of BMPs in the watershed.

[That the Watershed Management Committees are responsible for demonstrating the effectiveness of other Watershed Specific BMPs through... City of Pomona]

3. The degree and the effectiveness of BMP implementation shall be evaluated and reported by the Permittees using environmental and/or administrative indicators whenever possible. When environmental indicators are not readily and/or easily available, administrative indicators shall be used. These shall include indicators prescribed under relevant provisions of this permit, and/or other indicators deemed appropriate by the Watershed Management Committee, the Executive Advisory Committee, and/or ultimately the

Regional Board. Examples of the quantitative indicators include the number of inspections conducted, number of staff increase, number of audience reached through public education, waste recycled, water conserved, hazardous waste collected, oil recycled, catch basin waste removed, etc. Quantitative indicators of environmental conditions should also be reported if they can be linked to the effects of the BMP implementation.

4. In order to yield comparable results for year to year evaluation on the success, the progress, and/or the failure in BMP implementation, and comparable results from area to area, a uniform data collection methodology shall be established for each of the required BMPs. The uniform data collection methodology shall be developed by the Executive Advisory Committee. Subsequently, each report on BMP implementation shall provide comparison with the implementation status during the previous reporting period and the scheduled implementation time line for the current and future reporting periods, based on data collected using the uniform collection methodology.

B. Internal Reporting and Record Keeping

1. In order to facilitate the preparation of semi-annual and annual reports, the EAC shall develop standard forms for internal reporting to be used by all Permittees within the watershed. The forms shall collect all the information essential to the preparation of the annual and semi-annual reports and to the needs of other management actions by the Watershed Management Committees, EAC, and/or the Permittees. Reported information shall be quantifiable and specific for each program area and/or BMP. The dates for submitting the internal reports shall allow sufficient time for compilation and analysis by the Watershed Management Committees and/or the EAC for the preparation of semi-annual and annual reports to the Regional Board.

[Delete the Italicized words at the end of the first sentence as follows: ...to be used by all Permittees within the watershed City of Pomona]

2. All records shall be retained by the Permittees for a period of 5 years or longer as required by the Regional Board or USEPA.

[Modify the sentence as follows: "All records shall be retained by the Permittees for a period of five years or as otherwise required by competent authority, such as the USEPA or the Regional Board." City of Pomona]

C. Semi-annual and Annual Reports

1. Semi-annual Report

The requirements under VIII.A shall be met by the submittal of semi-annual and annual reports. Semi-annual reports shall succinctly summarize compliance efforts and may consist of simple compliance checklists. Annual reports shall be comprehensive.

[Strongly oppose semi-annual reporting for this permit. The RWQCB has not shown an ability

to gain any information from frequent reports. The staffs time at the RWQCB is as limited, if not more limited, than available to City staffs. Therefore, if semi-annual reports were submitted they would not be read or adequately digested to obtain meaningful information. For this purpose, the annual report will convey the same information while providing time for meaningful review. Changes could then be implemented as outlined in this permit. City of Agoura Hills]

a. The EAC shall submit a semi-annual progress report to the Regional Board by _____ of each year. Semi-annual reports must be submitted to the Regional Board within 30 days after the end of the six-month period. These six month periods are Jan - June, and July - Dec. (TO BE DETERMINED).

[Change from 30 days to a minimum of 45 - preferably 60 days. Larger municipalities take a significantly longer time, not only to acquire and process data but to get the applicable signatures for submission once the reports are completed. City of Pomona]

b. The semi-annual report shall serve as a status report on the progress of the implementation of the Stormwater Management Plan and other permit provisions. The Watershed Management Committee is responsible for collecting and compiling information from each Permittee prior to preparation of the semi-annual report, and include the compiled information along with the information analysis into the report.

c. The semi-annual report shall consist of a summary table illustrating the levels of implementation for all requirements by each Permittee. Tables shall be developed for each program element listing the Permittees, describing the status of implementation by each Permittee of the element, and documenting any modifications of the element from the standard program.

2. Annual Report

a. The Executive Committee shall submit an annual report to the Regional Board not more than 60 days after the end of each permit year (_____). The annual report shall include both a summary of the progress and status of Stormwater Management Plan implementation, a summary on status of compliance with all permit provisions, a report on the evaluation of program effectiveness, and a summary of recommendations for permit provision revisions. The Permittees as a whole (within watershed management areas) shall describe any problems encountered during implementation and discuss the modifications to the program in order to solve these problems.

b. The Principal Permittee shall collect, compile, and analyze information from each Permittee within the watershed prior to preparation of the annual report. The Watershed Management Committee shall include the compiled information and its analysis (instead of raw data or copy of internal reports) in the annual reports.

c. The annual report shall include a summary table illustrating the levels of implementation for all Permittees. Tables shall be developed for each program element listing all the participating Permittees and describing the status of implementation by each Permittee of the element. A table shall also be included to summarize the status of the program elements for which the Watershed Management Committee bears the primary implementation responsibility. Besides summary tables, the report should provide detailed explanation on any modifications made of the program elements (delays, changes, etc.) from the standard provisions and provide an analysis of any problems encountered during the implementation and the proposed solutions.

[Strike the sentence that reads: "A table shall also be included to summarize the status of the program elements for which the watershed management committee bears the primary implementation responsibility." City of El Monte]

d. The annual report shall include an assessment of the effectiveness of each program elements using the performance evaluation indicators and criteria developed under Section A of this Chapter, and the results of the pilot/demonstration projects conducted within and/or outside the watershed. The findings should be presented graphically for ease of comparison with the established levels of effort.

[Make "elements" singular in the second line. City of Covina]

e. A fiscal analysis and budget as described under I.I (Fiscal Resources) of this Order shall be submitted annually within 30 days of the Budget adoption date for each Permittee.

[Change from 30 days to a minimum of 45 - preferably 60 days. Larger municipalities take a significantly longer time, not only to acquire and process data but to get the applicable signatures for submission once the reports are completed. City of Pomona]

D. Storm Water Management Plan Revisions

1. Revisions to provisions of this permit can be made through the order of the Regional Board. The EAC can recommend and request revisions to the Stormwater Management Plan through documentation in the annual reports.

[Add the following words: "That the EAC or Permittees can recommend and request revisions..." City of Pomona]

2. Recommended revisions shall be supported by the results of a program evaluation. Recommended revisions to the Stormwater Management Plans may be made if it can be demonstrated that 1) the changes will lead to improvement of the effectiveness of this program, 2) the changes will result in positive impacts of environmental conditions, and 3) that the current measures have been implemented to the "Maximum extent practicable" as defined in Section VIII.A. Any recommended revisions shall not take effect unless approved by the Executive Officer.

["Maximum extent practicable" is not defined in Section VIII.A, as claimed in lines 6 and 7 of this paragraph. City of Covina]

3. Revisions may be made to the Storm Water Management Plans by the Executive Officer or the Regional Board based upon public input and/or testimony.

VOL 24

0122

The Discharger shall comply with the attached Monitoring and Reporting Program, which is part of this Order, and any revisions or modifications thereto, as ordered by the Executive Officer.

This Order may be modified, revoked, or reissued, prior to the expiration date as follows:

a. To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;

b. To incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable; or

d. Any other Federal or State Laws or Regulations become effective which necessitate changes.

The issuance of this permit is not intended to, and does not, absolve the Discharger of liability for conduct which may have constituted a violation of the previous Board Order 90-079 (CA0061654, CI 6948) adopted by this Regional Board on June 18, 1990.

This Order expires on _____. The Discharger must submit a complete Report of Waste Discharge including a revised Storm Water Management Plan in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on December __, 1995.
[Remove "discharger" and substitute with "Permittees". City of Pomona]

Dear Ms. Tyrrell:

NARRATIVE COMMENT SUMMARY ON THE SEPTEMBER 15, 1995 DRAFT NPDES STORMWATER PERMIT

Enclosed is a summary of the narrative comments received from 31 cities on the September 15, 1995 Draft Permit.

This Narrative Comment Summary is provided as a supplement to the copies of all the documents which have been forwarded to you by the Executive Advisory Committee (EAC). It should be noted that the summary has been prepared by staff as a tool to assist in the review of all comments received. It only reflects information that has been provided by the Co-Permittees in their comments. It does not, in any form, represent any position of the County nor the EAC. It should further be noted that this Narrative Summary does not reflect whether a comment is a majority or minority opinion from the Co-Permittees but is merely a listing of narrative comments submitted. We encourage you to review all comment letters received.

We trust this information is of use to your staff in reviewing the comments.

If any clarification is needed, please contact me at (818) 458-4014 or Mr. Gary Hildebrand at (818) 458-5948 or Mr. Frank Kuo at (818) 458-6989, Monday through Thursday, 7:00 a.m. to 5:30 p.m.

Very truly yours,

HARRY W. STONE
Director of Public Works

WASTE MANAGEMENT DIVISION

VOL 24 0125

The follow is a draft summary of comments received from 31 Co-Permittees on the September 15, 1995 draft Permit.

1 The current draft Permit is too lengthy, complex, and difficult to understand. It needs to be simple, clear, and concise, establishing a framework for a Stormwater Management Plan. The draft contains very specific and seemingly inflexible dictates. It should be more flexible with the ability to reflect local conditions.

2. There is no reason that the Public Information chapter should be different from the rest of the Permit in language and character.

3 The permit should be conditioned to be reviewed and revised in accordance with any Federal Legislation passed in the process of re-authorization of the Clean Water Act or legislation granting relief from unfunded federal mandates.

4. The draft Permit exceeds State and Federal requirements for programs, and doesn't provide flexibility in developing a program appropriate for a watershed. Programs should be implemented only to the extent required by the Clean Water Act. It is suggested that the next draft permit should clearly identify the *specific* section in the Clean Water Act, or a specific provision in the implementing regulations, which provides the basis for each requirement proposed to be included in this permit.

5 Regarding the guidance document being proposed to clarify any ambiguities or problems in the terms of the draft Permit, it is suggested that the Permit should be able to stand alone. However, if the guidance document is necessary, it should be commented upon before the new Permit is adopted.

6. A glossary of terms is needed, as well as a clarification of the relationship between the various Parties of the Permit.

7. The comment period for this draft was too short for an adequate review. It is proposed to reestablish a schedule for the adoption of the permit and thus allowing reasonable time for careful evaluation and meaningful input of further drafts.

8. Comments on the last draft were ignored and some portions which were said to be deleted were actually just moved from one part of the permit to another without explanation. One suggestion is for the Regional Water Quality Control Board (RWQCB) staff to summarize all comments made and respond either in writing or at a public meeting. There were also extensive, detailed corrections, additions, and deletions made to the wording of various portions of the Permit. Reorganization of whole sections were also proposed.

9. A complete draft of the document has not been released, making review even more difficult, as did differing versions of this draft.

10. The Executive Advisory Committee (EAC) has been given too much responsibility for developing programs, with some question as to whether they could be held legally liable for compliance. They should be an advisory and coordinating body, not an implementation or regulatory body. It is also believed that the EAC should not be responsible for mediating conflicts between permittees. In addition, the Watershed Management Committee (WMC) should have the ability to agree on an individual to chair the committee and who represents it on the EAC. They do not have to be the same permittee.

11. For county wide consistency, it was suggested that some tasks be completed by the EAC or done on a county wide level.

12. The State should not relinquish its responsibility for enforcing requirements for industrial and commercial sites to Cities.

13. The transfer of responsibility for the inspection of construction sites from the State to the Cities without the transfer of sufficient funds is not acceptable. In addition, it is suggested that only construction sites greater than five acres be regulated.

14. Some sections are confusing and may lead to implementation problems. The Permit is setting some standards which have already been set by the State (ie, proper removal of disposal wastes from construction sites). In addition, there is the apparent conflict between the State Health Department Requirements and the permit requirements in regard to system flushing of hydrants, wells, and pipelines. Furthermore, both are quoting different parts of Federal EPA.

15. The required detail and frequency of reporting on budgets and programs is excessive. Annual reporting is adequate.

16. The requirements for legal authority are too complex, and unnecessary. The determination as to the degree of criminal violation stated in the draft was also questioned.

17. The RWQCB should make an effort to obtain input regarding the Permit from outside parties, even before the 60-day comment period (especially from the construction, industrial, and commercial sectors).

18. The requirements of the Permit should strive to implement programs which are cost effective and appropriate for a given watershed, toward the goal of reducing storm water pollution. City resources are very limited, and the imposition of mandatory programs, especially those which have not been demonstrated to be more effective than programs already in place, is excessive

19. It should be recognized by the Board that many requirements in the Permit will take time and increased funding on the part of the Permittees. The language of the Permit should be such that municipalities are not held in violation of the Permit during implementation periods, and that good faith efforts to achieve the requirements are recognized. The due dates still to be set should take into account the beginning of the fiscal year and that most cities have already finalized their budgets for the 1995-1996 fiscal years.

20. Administrative Review standards should be established and published. The NRDC and other entities should be required to follow this process to resolve differences.

21. Any required BMP's in addition to the original thirteen should be reviewed by the Watershed Management Committee (WMC) prior to inclusion.

22. The number of inspections required is excessive. Also the number of facilities to be inspected should not be determined by the population of the municipality.

23. There is no clear understanding of how and why non-storm water discharges are exempted.

24. Page 1 or 2 of the Permit should supply a glossary of terms used throughhout the Permit, followed by the abbreviation to be used.

25. The term "agencies" used to define permittee needs to be defined. Agencies which should participate but are not yet involved include school districts, California Dept. of Parks and Recreation, L.A. County Fire Dept., Santa Monica Mountains Conservancy, and other large landowners.

26. Regarding Legal Authority: The terms "Certify" and "Certification" may prove to be legally ambiguous. The Cities should be consulted on the acceptability of these words.

27. The Administrative Review section does not resemble the idea proposed by many Cities previously, and may be one area of responsibility best suited for the EAC. Also, what is SPEP? Should this be SPCA?

28. It is suggested that item **III "Program Requirements for Industrial /Commercial Sources"** should appear ahead of item **II "Illicit Discharges/Disposal"**. Legal sources should be addressed ahead of illegal sources, the data base development in III should include the data required in II, and the definitions of sources & prioritizations show up in III.

29. In Section II, B.3 - Why is sewage specifically mentioned, and not other common spill substances, such as gasoline or oil?

30. Who determines what is the "maximum extent practicable"? The term appears throughout the Permit.

31. The list of conditionally exempted discharges needs to be expanded. (See EAC comment set).

32. The Administrative Review section is too intense for this stage of the program. We are still in the initial implementation stages of many aspects of the program.

33. Comprehensive findings must be included in the next draft. It is impossible to evaluate the effectiveness of proposed programs when the existing draft is nearly devoid of goals and objectives, when it fails to acknowledge existing conditions within its jurisdiction, and it fails to include any baseline monitoring data.

34. The identification and prioritization of pollutants of concern for each watershed (if known) should be listed in this permit.

35. The permit should return to the language of the previous permit which called for the preparation of a plan with proposed control measures based on conditions which are applicable for that watershed instead of specifying all such measures in the permit.

36. Many of the responsibilities assigned to the EAC or Permittees should be those of the Regional Board, such as in the Source Control Measures section (II.C.).

37. The Board's responsibilities to review and approve the WMP should be reinstated.

38. The statement in section I.E. that the "WMC may hold closed sessions at its discretion to discuss permit-related issues" could result in violations of the Ralph M. Brown Act, and it is suggested you confer with your legal counsel on potentail problems created by this wording.

III. PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES

A. Identification of Sources

Identification by means of scanning and sorting currently available databases shall be sufficient for the purposes of this section; accuracy will be dependent upon the accuracy of available electronic data.

1. Each Permittee shall identify the industrial and commercial facilities in the categories listed below that are within its jurisdiction by _________.

   a. All industries regulated under Phase I of the Federal storm water program (40 CFR 122.26) (Phase I facilities).

   b. All ~~industrial/commercial~~ facilities in ~~SIC codes selected by the USEPA for screening under Phase II of the Federal storm water program (Phase II facilities)~~. → Vehicle repair shops, vehicle body shops, vehicle parts + accessory shops, gasoline stations, and restaurants

   c. Other industrial/commercial facilities considered by both the EAC and the Regional Board to conduct industrial/commercial activity with a high potential for storm water contamination. (Potential Problem facilities).

   The EAC shall utilize the following criteria for determining Potential Problem facilities:

   i. extent of exposure of the industrial/commercial activity to stormwater runoff;
   ii. similarity of industrial/commercial activity to industrial activity regulated under Phase I;
   iii. types of chemical contaminants and wastes generated that can become exposed to stormwater and runoff;
   iv. existence of duplicate regulatory programs of other agencies that emphasize waste management and minimize exposure of the industrial/commercial activity to stormwater and runoff;
   v. number of facilities in a given watershed;
   vi. professional understanding of the industrial/commercial waste management practices;

0130

VOL 24 0131

viii. experience of local agency industrial inspection programs;

viii. any other information that indicates a significant potential for contamination of stormwater and runoff.

2. To satisfy provision III.A.1 above, each Permittee shall develop a list of [illegible] industrial facilities in its jurisdiction. Facilities are to be listed by SIC number. The Regional Board will provide the list for the following facilities should be updated annually to include [illegible]

a. For those Phase I facilities which have obtained coverage under the GISP,

i. Facility owner's name, address, and telephone number;

ii. Site address [illegible] and contact person;

iii. Watershed; and

iv. Applicable SIC code(s).

b. For those Phase I facilities which have not obtained coverage under the GISP, Phase II facilities, and Potential Problem facilities,

facilities listed under III.A.1.b

i. Name and address of contact person (e.g., owner/president/site manager), if available;

ii. Site address and telephone number; and

iii. Applicable SIC code(s).

3. By _____, each Permittee shall identify for each SIC industry group identified, primary activities and primary materials that might impact stormwater runoff discharges.

B. Prioritization of Sources

1. Each Permittee shall prioritize the SIC industry groups evaluated in III.A.2.c by _____. Priority shall be based on a groups relative potential for the contamination of storm water and urban runoff.

2. By _____, each Permittee shall rank, based on necessity for

oversight of implementation of storm water management measures, the industrial and commercial facilities within each SIC industry group.

Facility ranking within each SIC industry group should be based on factors such as land use, operations and activities that could potentially contribute significant amounts of pollutants into stormwater runoff, facility size, site history, and geographic location.

C. Source Control Measures

1. By _____, the EAC shall develop for each SIC industry group a checklist of specific storm water and urban runoff control measures for industrial and commercial facilities in III.B.2. The control measures must

   a. address multiple pollutant sources;

   b. initially focus on source control measures such as source minimization, education, good housekeeping, and site design alternatives; and

   c. target source areas and activities with the highest potential to generate substantial pollutant loadings.

2. Each Permittee shall require through its legal authority the following source control measures by _____:

   a. The proper disposal of food wastes by restaurants and food wholesalers;

   b. That persons owning or operating a gas station, auto repair garage, or similar structure, clean the facilities in a manner that does not result in discharge of pollutants to the storm drain system;

   c. That objects, such as motor vehicle parts, containing grease, oil, or other hazardous substances, and unsealed receptacles containing hazardous materials, be stored properly, so that they would not adversely impact discharges to the storm drain system;

   d. That machinery or equipment which is to be repaired or maintained in areas exposed to rainfall and/or susceptible to runoff, be repaired in a manner where leaks, spills and other maintenance related contaminants are not discharged to the storm drain system;

e. That owners of commercial/industrial motor vehicle parking lots with more than twenty-five (25) parking spaces located in areas exposed to rainfall and/or susceptible to runoff be swept regularly to remove debris;

f. That all fuel and chemical residue, animal waste, garbage, batteries, or other types of potentially harmful materials which are located in areas exposed to rainfall and/or susceptible to runoff, be removed and disposed of properly; and

g. That hazardous waste be disposed of at an appropriate disposal site, and not be placed in a trash container for regular trash disposal.

Programs and/or activities to encourage these activities shall be included in the Baseline and Watershed Management Plans.
Countywide & Specific

Source Inspections

1. Each Permittee shall develop and implement an industrial/commercial facilities inspection program by _____. The inspections shall consist of site visits to:

   a. consult with a representative of the facility to explain applicable stormwater regulations;

   b. describe appropriate BMPs and distribute educational materials;

   c. verify that a copy of a SWPPP is available during site visits to all Phase I facilities. If no SWPPP is available, the Regional Board shall be notified; and

   d. identify problematic facilities and report them to the Regional Board, when deemed necessary by the Permittee.

2. Each Permittee shall submit by _____ a schedule for inspection of industrial/commercial facilities. The schedule shall cover a five year period and frequency shall be based on a jurisdictions population.

   a. For municipalities with a population less than 2,500,000, inspections shall be performed as follows:

      i. Phase I facilities in categories [i] through [ix] and [xi],

replace with language from b.iii.

which also have an industrial waste discharge or POTW pre-treatment permit, once a year

ii. ~~all other Phase I facilities, twice during the five year period~~

iii. all vehicle repair shops, vehicle body shops, vehicle parts and accessories (SIC industry groups 753 and 754), and gasoline stations (SIC 5541) once every two years

iv. all restaurant facilities (SIC 5812) twice during the five year period

v. ~~of the remaining Phase II industry groups and~~ Potential Problem facilities, each WMC shall identify up to 5 (five) SIC groups for inspection twice during the five year period.

b. For municipalities with a population greater than 2,500,000, inspections shall be performed as follows:

(2,611 each year for a total of 13,055)

i. Phase I facilities in categories [i] through [ix] and [xi], which also have an industrial waste discharge or POTW pre-treatment permit, once a year

(692)

ii. Phase I facilities in categories [i] through [ix], that do not have an industrial waste permit, but have obtained coverage under the GISP, once during the five year period

(3,505 twice for a total of 7,010)

iii. Phase I facilities in categories [i] through [ix] without an industrial waste permit or GISP coverage, twice during the five year period

Phase I facilities in category [xi] without an industrial waste permit, shall be contacted once during the five year period by phone, mail-out, or similar method, to inform them of notice of intent requirements and to encourage good storm water quality management practices.

(2,156 auto and 767 gas)

iv. all vehicle repair shops, vehicle body shops, vehicle parts and accessories (SIC industry group 753 and 754), and gasoline stations (SIC 5541) once during the five year period

VOL 24

0134

Provided that LA County Health Dept. performs (7,792 twice for 15,584)

v. all restaurant facilities (SIC 5812) twice during the five year period.

(3,000 maximum)

[illegible] facilities, [illegible] inspection [illegible] the five year [illegible]

(Total inspections 42,635)

3. Industrial/commercial facilities that are not [illegible] in the inspection schedule at least [illegible] a site visit inspection [illegible] be conducted once in the five year period by phone, mail-out, or a similar method, to encourage their conformance with good stormwater quality management measures.

4. The EAC shall develop [illegible] a framework and/or guidelines for [illegible] inspection [illegible] inspections will not be performed at all non-complying facilities, [illegible] will be conducted on an as needed basis, as determined by each Permittee. The framework and/or guidelines shall include, but are not limited to:

a. procedures for enhanced facility inspections;

b. procedures for enhanced outreach regarding pollution prevention, waste minimization, and stormwater quality management;

c. procedures to require corrective action be undertaken by non-complying facilities;

d. procedures to follow up on violations of municipal [illegible] and

e. procedures for enforcement action against non-complying facilities.

E. Reporting

Each year, each Permittee shall evaluate the results and progress of their storm water quality management program for industrial/commercial sources. The annual report submitted to the Regional board shall recommend a strategy for the management of storm water from industrial/commercial sources for the following year based upon:

VOL 24

0135

R0067138

a. industrial/commercial sources listing
b. on-site inspections
c. phone/mail-out survey inspections
d. evaluation of stormwater urban runoff control measure implementation
e. evaluations of structural and treatment control measures
f. special studies and pilot projects needs
g. specific site and activity monitoring needs

The Principal Permittee shall make available to the Regional Board a compilation of the industrial/commercial databases developed by each Permittee in III.A.2, in an appropriate format when so requested.

F. Coordination

The Permittees shall develop a process for the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports shall be developed as required.

G. Conflicts with Other Mandates

The Permittees, as they deem necessary, will work with other regulatory agencies and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this Order and the requirements of other regulatory agencies.

Re: Comments on Draft NPDES Permit (NPDES No. CAS0051654) (Draft of September 15, 1995)

Dear Ms. Tyrrell:

The City of Alhambra is most concerned about the Regional Board's process in circulating incomplete drafts of the proposed new Storm Water NPDES permit, and the failure to address comments previously submitted on the drafts. We are further greatly concerned about the breathtaking overreach reflected in the September 15, 1995, RWQCB draft. It has numerous provisions not required by the federal Clean Water Act or any other law. In addition, it appears that some provisions required by the EPA for stormwater permits are missing.

For these reasons, it is absolutely essential that another draft be circulated for comment. The new draft should clearly identify the *specific* section of the Clean Water Act, or a specific provision in the implementing regulations, which provides the basis for each requirement proposed to be included in this permit. In addition, the new draft should address comments submitted to date on all prior drafts. Only then can an informed judgment be made as to the appropriateness of inclusion of permit provisions.

In view of the ominous chilling effects on commercial and industrial development in Los Angeles County should the draft permit be adopted, we believe that each and every requirement in the final permit should be fully justified.

The City has reviewed a *"Substitute Draft" Permit, which provides revisions to be made to the draft.* We adopt the comments in the "Substitute Draft" as our own, and urge their adoption.

In view of the length and complexity of the draft NPDES permit, coupled with the major gaps in previous drafts, we ask that the comment period be extended until the close of business on November 10, 1995.

Thank you for your anticipated cooperation.

Very truly yours,

William A. Vallejos
Assistant City Attorney

RE: COMMENTS ON THE SEPTEMBER 15TH DRAFT PERMIT

Dear Members of the EAC:

Before I address the permit itself, I would like to bring three important issues to your attention:

1. Our comments on the previous draft permit, as well as other cities', were not addressed and wholly ignored. The issues we had raised are not reflected in the new permit and no attempt was made to respond to our comments in the letter which LA County issued about three weeks ago.

As such, I object to the process and the way this draft permit is being finalized. We have not really been given a chance to voice our concerns.

2. The time table which either the Board or the EAC has set up is consistently and routinely being ignored. Specific dates with stipulated review periods were mentioned at the previous general meeting. In practice, the new general meeting was pushed back and the permit review time had shrunk to one week.

Without reasonable amount of time to review the draft permit, adequate comments are impossible.

3. In less than one week's time, two different draft permits were circulated. One was the so-called official version, the other an EAC version.

Either version is confusing enough; two versions make our task doubly difficult. It is hoped that we will only see one version of the draft permit in the future.

VOL 24

0143

R0067146

Specific comments on the permit itself:

1. Item D. EAC

With the latest statements of duties for the EAC, this is not an advisory group any longer. If not all, most of the duties outlined for the EAC should be transferred to the watershed management committees.

2. Item G. Fiscal Resources

The requirements are too burdensome. A simple reporting, as in any city's budget, will have the same end results.

3. Item H. Legal Authority

The requirements are too complex. Many cities have already adopted ordinances addressing storm pollution and have sent copies to the Board. Why is there still a need for the same cities to expend resources and provide the Board with certification?

4. Item I. Administrative Review

This section does not resemble the idea proposed by many cities after the review of the last draft permit. This is one area of responsibility best suited for the EAC.

5. Page 8, Illicit Connections

The emphasis should be placed on identifying and eliminating illicit discharges, not connections. Not all unauthorized connections discharge pollutants.

The stipulated surveillance programs on page 9 are costly and beyond the means of many agencies.

6. Page 10, Storage of Materials...

A requirement that parking lots with more than 10 parking spaces be vacuum swept is too restrictive and costly.

7. Item E. Public Reporting

The reporting procedures outlined are too cumbersome and unnecessary. Once a year reporting should be adequate.

8. Page 12, Program Requirements....

State of California should not delegate its own task of inspecting and monitoring of industrial and commercial facilities to the cities.

9. Page 22, item h...

This is an impractical requirement. What will happen to irrigation water?

10. Page 23, item f...

Why do inspectors need to have "an electronic recording system"? Have the traditional methods of doing inspections been proven ineffective?

11. Page 28, item f...

Why should the commercial/municipal pools be subject to a separate waste discharge requirements?

12. Page 29, item d...

What is it meant by, "Track the amount of waste collected"? What is the purpose of this requirement?

13. Page 32, Public Information...

This section of the permit is totally different from the rest of the permit in language and character. The permit needs to be uniform and direct to the point.

Over all evaluation of the permit:

The permit needs to be much shorter, concise, specific, and to the point. It is too long, unnecessarily complicated, and there are far too many ambiguities.

In its present form, the permit is very long on process and short on results. Finally, We have yet to see clear objectives for the program.

Sincerely,

Nasser Abbaszadeh
City Engineer

Monterey Park, California 91754-2156

SUBJECT: Comments September 15th Draft NPDES Permit CAS0061654

Dear Ms. Tyrrell:

This letter is in response to the Draft NPDES permit dated September 15, 1995. In general, the draft permit is too lengthy and complex for effective implementation. The permit should provide a framework for watershed management and not concentrate on specifics. The specifics should be developed as part of an overall Watershed Management Plan. Other comments are:

1. The draft permit contains many phrases such as:

   "The _____ shall develop by _____."
   "The _____ shall establish by _____."

   Since the new permit has not yet been adopted, it is unlikely that many permittees have budgeted for high cost items such as inspection programs for this fiscal year. All high cost items should be scheduled to begin no earlier than July 1, since that is the beginning of the fiscal year for most permittees.

2. The EAC should be an advisory and coordinating body, not an implementation or regulatory body. The amount of work and responsibility for the members of the Executive Advisory Committee is enormous. This will make membership on the EAC a nearly full-time position (and volunteers for the EAC may become very scarce).

0146

The tasks assigned to the EAC in the draft permit should be divided among the Board, the principle permittee and the co-permittees. This most recent draft appears to have placed many regulatory and semi-regulatory responsibilities on the shoulders of the EAC. These responsibilities should be assigned to the Board.

3. The number of groups required by the permit to develop and implement the many tasks will lead to confusion. There should be only three groups identified by the permit:

   The Board,
   The principle permittee, and
   The co-permittees

   Participation in the Executive Advisory Committee and the Watershed Management Committee should be voluntary (although encouraged).

4. The reporting requirements could be an enormous burden on co-permittee staff. Reports should be required no more than once per year. A simplified check list which demonstrates the permittees compliance with the intent of the permit should be used rather than concentrating on minutiae such as how much debris was collected from catch basins (which have been regularly cleaned since well before the Storm Water Program) and how often streets are swept (which also has been done since well before the Storm Water Program).

   Written descriptions should be required only for anomalies.

5. A specific comment on Section IV.F.3. (Page 23) and similar sections:

   In a program of this magnitude, it is likely that many problem sites will be encountered which will need direct Board involvement for problem resolution. If a problem site is referred to the Board, does that relieve the permittee from the responsibility of taking further actions until a ruling is made by the Board?

6. The amount of work required for implementation of this permit will be considerable. During the first five years, the works should concentrate on realistically achievable goals. The exempted storm water discharges, as proposed by the EAC, should be fully adopted.

7. It has been suggested that the guidance document currently under development be incorporated as part of the permit. We are concerned that this will make any modifications to operating procedures, no matter how minor, difficult to make without prior Board approval.

We appreciate the opportunity to offer our comments to you. Please call if you have any questions.

Sincerely,

Michael J. Egan
Assistant City Administrator
City of Bellflower

RECEIVED
OCT - 4 1995
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION

Mr. Gary Hildebrand
Los Angles County Department of Public Works
Waste Management Division
P.O. Box 1460
Alhambra, CA 91802-1460

Subject: Review of Draft NPDES Permit

Dear Mr. Hildebrand:

Berryman & Henigar has been contracted by the City of Rancho Palos Verdes to conduct the NPDES program administration. Berryman & Henigar has reviewed the 1995-2000 NPDES Draft permit received via mail and the copy of the draft permit as reviewed by the Executive Advisory Committees (EAC) distributed at the general meeting on 9-27-95. Berryman & Henigar agrees with the comments made by the EAC with some exceptions.

Berryman & Henigar makes the following comments as exceptions to or in addition to those written in the EAC review of the draft permit.

Section B Receiving Water Limitations: The draft permit received via mail did not include this section. It simply stated that it was under discussion with the negotiation team. The text included in the EAC review permit is very vague and open to broad interpretation. The limitations would be difficult to enforce should any suspected violators challenge them. Numerical limitations should be set.

Section C Provisions: The text states that permittee shall implement the thirteen baseline BMP's in addition to all others proposed in the Report of Waste Discharge (ROWD.) Any BMPs in addition to the original thirteen should be reviewed by the Watershed Management Committee (WMC) prior to inclusion in the new permit program.

Section II. B.3 Illegal Discharges/Disposal: Spilled sewage treated with disinfection agents is specifically stated. This one example should not be included. There is a wide variety of spills that require spill response ie: gasoline, oil or other chemicals. Either include more examples or do not include any.

Section III. D.b Source Inspection: The paragraph following Section b. should be moved to Section III D.2.

0149

2101 East First Street • Santa Ana CA 92705 tel 714-568-7300 fax: 714-836-5906

R0067152

Section III E.4.g. Control Measures: It should be noted that it is not good civil engineering practice to allow run-off to infiltrate into graded hillside lots.

Section IV E.4.h. Control Measures: In addition to EAC comments we feel 1)the ponding of water in parking lots would be unacceptable to the owners and 2) in order to get an entire parking lot to pond one inch or to obtain an equivalent of one inch of run-off within the parking lot, areas near outlets would probably pond much higher than one inch due to minimum slopes required for proper drainage. This requirement must be thought out more thoroughly.

Section IV E.4.i. Control Measures: This requirement should not be deleted.

Section IV E.4. items f, g, h, i: These items should be moved to the planning section, Section 7.a.3.

Section V E.4. Dry Weather Storm Drain Diversion: Identify a "POTW".

Our main concern is the amount of reports required and the time required to prepare them. Efforts should be made to reduce the detail and frequency of the reports. Although it is important to meet the objectives of this program, it is equally important to consider financial burden placed on permittees, especially during the current economic down turn.

Sincerely,

Mark L. Stowell, R.C.E.
Project Engineer

Re: Proposed Update to NPDES Permit for Stormwater/Urban Runoff Discharge

Dear Catherine:

We appreciate the time you and your staff spent to meet with us on December 7 to discuss the proposed update to the RWQCB's NPDES permit for Stormwater/Urban Runoff Discharge. As we discussed, this letter is to provide recommended language modifications to that portion of the staff proposal that was shared with us at this meeting (pages 44-50 of the December 5, 1995 Pre-release Draft - Program Requirements for Development Planning/Construction).

Due to the very short time provided to submit proposed changes prior to circulation of a draft permit, Attachment A to this letter touches upon significant concerns with that portion of the permit that we have reviewed. We believe that the four areas recommended for modification will go a long ways towards fulfilling the Board's mandates in a constructive manner.

Additionally, it remains unclear how the proposals in the draft permit fit within the overall water quality regulatory scheme for new construction. It would be useful if staff would prepare and circulate a flow chart with the proposed permit that comprehensively provides all the steps an individual must follow to lawfully develop (both for parcels over and under 5 acres) in accordance with federal, state and local water quality and erosion control requirements as envisioned by this updated permit. This flow chart should illustrate, at a minimum, to whom applications will be made, to whom fees will be paid, and who will be making inspections. Further, a comparision of the Board's proposed process against the current process would be helpful.

We would ask that you reexamine the ambitious schedule staff has proposed for Board adoption of this permit. Due to the extensive changes from the currently adopted permit, private industry and interested parties should be provided a minimum of 60 days to

1330 S. Valley Vista Drive
Diamond Bar, CA 91765
(909) 396-9993
Fax (909) 396-9[illegible]

review the proposed permit once it is circulated for public review on December 18. Unlike environmental organizations, we were not accorded a voice in the year long discussions with municipalities that led to the draft permit currently proposed by staff.

For your information, I have included in Attachment B a list of associated trade organizations that should be included on your mail list for dissemination of the draft permit. I would be happy to assist you in further outreach to the construction industry concerning the proposed updated NPDES permit for stormwater. Workshops prior to the Board's hearings would be useful.

We appreciate your consideration and inclusion of our concerns. Should you have any questions, please do not hesitate to contact me at (909) 396-9993.

Sincerely,

Amy L. Glad
Executive Vice President

Enclosures

VOL 24

0152

ATTACHMENT A

Provided below are specific language changes to the proposed permit "December 5, 1995 Pre-release Draft." Language suggested to be deleted is denoted by strikeout. Proposed language additions are provided in italics. Comments follow each suggested change.

1. Page 44, Section IV.A.1 ("Prioritization of Development Projects"):

a. High Priority Projects are development and redevelopment projects with a disturbed area of five acres or more; ~~or~~ *and* projects creating an impervious area 100,000 square feet or more; ~~or~~ *and* projects . . . designated by the Regional Board; or a hillside area where the natural slope exceeds 25 percent. ~~, or redevelopment of projects meeting the above criteria where the value of the improvements exceeds 50 percent of the value of the existing development.~~

Comment: Stormwater runoff impacts to water quality are very location specific. The current staff language is overly expansive in identifying all project ranges (High Priority, Priority, and Limited Priority). It is unreasonable to identify all 5 acre or greater activities or all impervious areas of 100,000 square feet as "High" Priority. The location of the disturbed area should be the controlling factor in determining priorities. Further, the value of a redevelopment project has absolutely nothing to do with water quality impacts -- the criteria should rest purely with physical attributes. Similar changes should be made to subsections "b." and "c."

2. Page 45, Section IV.A.2.a. ("Countywide Guidelines"):

i. Preserve, ~~create or restore,~~ to the extent feasible, areas that provide water quality benefits . . .

ii. *Reduce excessive erosion potential* ~~Avoid development~~ of areas particularly susceptible to erosion or sediment loss *through* ~~and/or establish~~ development guidance . . .

~~iv. Maintain peak runoff rates at predevelopment levels for development projects and reduce peak runoff rates for redevelopment projects, wherever practicable.~~

(or use alternative language:

iv. Minimize increases to peak runoff rates for development and redevelopment projects, wherever practicable.).

Comment: Whereas the goals of the Clean Water Act seek to reduce the impacts of storm water discharges to the quality of our waterways, the stated goals for Countywide Guidelines unrealistically and unlawfully target new development to improve existing conditions. Suggested changes maintain the spirit of the guidelines which will be expanded upon further

in the development of "minimum recommended requirements."

3. Page 45-46, Section IV.A.3. ("Planning Process"):

Delete this entire subsection 3.

Comment: The RWQCB does not have the authority to adopt regulations that act to preempt local land use control under the pretense of adopting watershed management plans. Neither is it necessary for the RWQCB to seek to introduce standards to more easily require a "finding of significant impact" under CEQA. Appendix I of the CEQA Guidelines already includes consideration of impacts to water quality and biological resources. In the event municipalities may voluntarily look to the RWQCB for guidance in the land use and CEQA areas as related to stormwater and urban runoff, such information may be provided in subsequently prepared guidance manuals from the Board. This approach is in keeping with determinations already made on this issue by the State Water Resources Control Board.

4. Page 46, Section IV.A.4.c. ("Planning Control Measures – Priority Project"):

~~iii. Minimize, to the extent practicable, parking lot pollution through the use of appropriate BMPs such as retention, infiltration and treatment;~~

Comment: The Clean Water Act does not regulate "parking lot pollution." This subsection makes absolutely no sense and should be eliminated. Further, it is clear that subsection "c." seeks to require Storm Water Mitigation Plans for projects currently not required to submit such plans (i.e., from 2 to 5 acres of disturbed area). Such new requirements are excessive in light of the fact that these plans are required to be prepared by a licensed Civil Engineer (per Section IV.B.3.b., page 49) and further emphasize the need to redefine the priority levels as we suggested in our comment No. 1.

5. Page 46, Section IV.A.4.d. ("Planning Control Measures – High Priority Project"):

High Priority Project: For projects that meet the criteria . . . that the Storm Water Mitigation Plan also provide for ~~significant~~ permanent controls to reduce storm water discharge . .

Comment: The word "significant" has no specific meaning in this context (since examples are provided) and should be deleted.

Subject: Draft NPDES Permit

Dear Ms. Tyrrell;

It was a pleasure to make your acquaintance at the NPDES hearing. After discussing this issue with other members of the Association, they have asked us to request a meeting with you as soon as possible. They are questioning some the reasoning for naming restaurants in this application.

Under the NPDES Permit, Permittees and Co-Permittees are required to identify and quantify the contributions of pollutants to the storm drainage system. I assume that identification and quantification of potential contributors of pollutants is fact based rather than supposition or perception.

Under Prioritization of Sources (III., B.) you have changed section (1., a., ii.)from SIC Codes selected by the USEPA for screening to a determination without facts that restaurants and vehicle service facilities are major polluters. By singling out restaurants and other food facilities the NPDES permit is unfair and discriminatory. Nowhere are there any facts to support identifying restaurants.

Our members request that any reference to restaurants be removed from the NPDES Permit. Restaurants, though a major source of jobs and sales tax revenues, are not large potential contributors of pollution.

The vast majority of restaurants throughout the water shed are located within structures shared with other businesses. Control over either the parking facility or solid waste disposal is by the lessor. Most free standing restaurants that control their solid waste disposal are required to maintain waste containers in a curbed and fenced facility that drains to the restaurants waste line. Parking lots must be maintained in a clean and safe manner to limit potential liability.

Certainly we all want the least amount of waste in the storm system as these waters either return to a source of fresh water or the ocean. The greatest pollution threat to storm water is from <u>post consumer waste</u> Businesses have little or no control over what consumer's do with a product after purchase. We can only try to educate consumers, restaurants can not be held responsible for the actions.

Attention: Ms. Catherine Tyrrell

Re: Comments on September 15, 1995 Draft Waste Discharge Requirements for Storm Water Management/Urban Runoff Discharges Within the County of Los Angeles (NPDES No. CAS0061654)

Dear Ms. Tyrrell:

At the meeting of the municipal co-permittees on September 27, 1995, the Regional Water Quality Control Board invited comments on the draft "Waste Discharge Requirements For Storm Water Management/Urban Runoff Discharges Within The County of Los Angeles (NPDES No. CAS0061654)", and asked that those comments be submitted in writing to the Board by October 11. While the two week period has not really provided us with a sufficient opportunity to carefully review and evaluate the current draft permit or to obtain outside input, the City of Carson, nevertheless, considers it very important to provide its preliminary comments.

Carson has participated in the permit renewal process as a member of the Executive Advisory Committee ("EAC") and as a member of its watershed committee. We have appreciated the opportunity for involvement in a process which will ultimately lead to a permit that will have a significant impact upon the City's operations and its fiscal resources and, most importantly, upon Carson's residents and businesses.

We also recognize and appreciate all of the hard work which Catherine Tyrrell, Carlos Urrunaga, and the Regional Board's staff have put into the drafting and analysis of a very complex document. Certainly, their efforts, as well as those of the members of the negotiating team representing the principal permittee, Los Angeles County, the co-permittees, and the environmental organizations involved in the negotiations, are commendable, especially considering what a time-consuming and thankless job it has been for all of them. Our comments should not be viewed in any respect as a criticism of any of these dedicated people.

EAST CARSON STREET P.O. BOX 6234 CARSON, CALIFORNIA 9[illegible] • PHONE 31[illegible]

However, as the negotiation of the terms of the proposed permit has proceeded, Carson and other cities have become extremely concerned about both the direction the permit has taken and the scheduling for the renewal of the permit. Before addressing specific portions of the permit, we thought it would be appropriate to first discuss some of our general concerns, which we understand are shared by many of the other co-permittee cities.

In considering our comments, the Board should recognize that, even aside from federal and state statutory and regulatory requirements, the City of Carson is fully committed to and shares the Board staff's objective of implementing a realistic storm water program which is designed to reduce the discharge of pollutants to the maximum extent practicable. However, as acknowledged in the State's own Municipal Storm Water Best Management and Practices Guidebook, "the sources of storm water pollution are extensive, ill-defined and highly variable."

1. The Board Staff's Change In Approach To The Permit

One of the first questions that we had after comparing the draft permit to the existing permit was what factors lead the Board's staff to propose a detailed and comprehensive permit rather than continue to use the more flexible terms and language of the existing permit.

As you may recall, the existing permit was the result of a cooperative effort of the Storm Water Permit Work Group which was established to fulfill part of the objectives of the Santa Monica Bay Restoration Project. That work group assisted in drafting the permit. The permit was approved by the State Water Resources Control Board in 1990. Most importantly, the Board considered a petition from the National Resources Defense Council challenging the terms of the existing permit. The State Board reviewed those challenges in detail and denied the NRDC's petition in its order entitled "In the Matter of Petition of Natural Resources Defense Council, Inc. for Review of Waste Discharge Requirements Order No. 90-079," Order No. WQ 91-04 (May 16, 1991). Among other things, the Board commented favorably on the terms of the existing permit, stating:

> "We find here, as we did in Order No. WQ 91-03, that the permit includes a comprehensive and stringent program for reducing pollutants in storm water discharge, that it will implement the Basin Plan, including the protection of beneficial uses. (See page 22 of Order No. WQ 91-04.)

The Board also stated:

> "We find here also that the approach of the Regional Board requiring the dischargers to implement a program of best management practices which will reduce pollutants and runoff and prohibiting non-storm water discharges, is appropriate and proper. We base our conclusion on the difficulty of establishing numeric effluent limitations which have a rational basis, the lack of technology available to treat storm water discharges at the end of the pipe, the huge expense such treatment would entail, and the level of pollutant reduction which we anticipate from the Board's regulatory program. We feel compelled to note here our agreement with the Regional Board that this permit does truly represent a massive undertaking."

The current draft of the permit reflects a fundamental shift in philosophy towards the permit. Rather than establishing a flexible framework for complying with the Clean Water Act, the current draft contains very specific and seemingly inflexible dictates. This approach is different than the Regional Board's approach to the prior permit and is certainly different than the approach taken by the State Board in the past, as reflected in the State Board's orders.

In its Order No. WQ 91-04, the State Board endorsed the more flexible approach, stating at page 23:

> "[W]e find that the Regional Board's approach of requiring the dischargers to prepare a plan with proposed control measures for approval by the Regional Board is preferable to specifying all such measures in the permit. . . . [A]n effective and cost-effective storm water program requires an analysis of the specific area subject to regulation, and should not involve a simple listing of practices that all municipalities must follow. As EPA stated in its Preamble to the draft storm water regulations:
>
> "A wide variety of control measures to reduce the discharge of pollutants from municipal storm sewer systems are currently available. The performance of appropriate control measures is highly dependent on site-specific factors. It is therefore not practicable to define one standard set of controls which will control all pollutants in all municipalities." (Emphasis added.)

To the best of our knowledge, Carson has complied with the terms of the existing permit. The Regional Board has never informed us of any problems with our current program. These circumstances raise the obvious question of why the Board staff believes that specifically dictated programs set forth in the proposed permit are more effective in controlling storm water pollution than the City of Carson's current programs. It would be helpful for the Board staff to explain what has happened in the last five years that has compelled it to take such a radically different approach to the proposed permit than it took with respect to the present permit.

2. Scheduling of the New Permit

Neither the City's staff, our businesses, our residents, nor other interested parties have been provided sufficient time to carefully evaluate either the specific language of the proposed permit or its impact.

Board staff informs us that they are hoping to complete the negotiation process as soon as possible so that the permit can be considered by the Regional Board at either its December or January meeting. While we appreciate staff's concern that the many months of hard work which they have put into this matter be brought to a conclusion, we do not believe that the current schedule is realistic for a number of reasons.

We have not yet received a full version of the draft permit. Even now, there are numerous versions of the permit which are being discussed. The draft which we have been asked to comment upon has been, we understand, modified significantly. Since the various sections of the permit are intertwined, the piecemeal modifications have created a moving target. This, of course, makes it very difficult to comment intelligently upon the draft permit when the version we are reviewing has most likely been revised two or three times.

Accordingly, we would like to sit down with Board staff and the co-permittee cities and work out a realistic schedule for the renewal of the permit which allows sufficient time for careful evaluation of a complete draft document and for meaningful input from our residents and other interested parties. That objective simply cannot achieved on the time schedule under which the Board staff has been operating.

3. Limitations on Co-Permittee's Efforts

As most cities in California and in Los Angeles County in particular, Carson's fiscal and administrative resources for implementing unfunded mandates are limited. Carson's objective

in the permit renewal process is to develop an effective storm water management program which targets and addresses identifiable, controllable pollutants in a cost-effective manner. Unfortunately, those targets have not yet been identified and we have been provided with no technical or scientific data which demonstrates the effectiveness of many of the programs dictated by the current draft of the permit or any cost justification. To our knowledge, the Board has not yet made any factual findings in connection with the permit that would support or necessitate the new programs which would be required by the permit, assuming it was adopted in a form reasonably approximating the present draft.

Also, a number of sections of the draft permit impose a variety of data gathering requirements. We believe it important to ensure that the data proposed to be gathered at considerable cost to the principal permittee and the co-permittees is meaningful and useful, both for the Board's purposes as well as the permittees'.

Carson needs to be sure that the money it spends on storm water management is utilized in a cost-effective manner. The City simply does not have the administrative or fiscal resources to implement programs that may appear to be good ideas, but are neither mandated nor funded by federal or state law, nor are demonstrably effective in meaningfully reducing storm water pollution.

4. Failure to Incorporate Prior Comments

Over the last three months, the EAC and the permittee and co-permittee members of the negotiation team have commented extensively, both orally and in writing, on the various portions of the permit which have been presented to us. In many cases, we found that our comments were not incorporated or addressed in the draft. In other cases, we found that portions of the draft which we identified as objectionable and were told would be deleted were just moved from one part of the permit to another without any explanation. The failure to incorporate agreed-upon changes in the drafts has been a source of great frustration.

Similarly, many permittees and other interested parties have commented in detail regarding the draft permit at public meetings. While we have presumed that some note has been made of those comments, they are rarely responded to.

In order to ensure that permittee and public participation in the process is meaningful and that comments are seriously considered, we believe that it would be appropriate for the Board staff to collect and summarize all of the comments made

regarding the draft permit and directly respond to them either in writing or at a public meeting.

5. Lack of Involvement By Stakeholders

We are also very concerned that an insufficient opportunity has been provided for involvement in the process by commercial and industrial stakeholders. Currently, a representative of various environmental groups who have a stake in the process sits on the negotiating committee. We think the involvement of the environmental groups is not only appropriate, but highly desirable. By the same token, businesses, industries and developers, which will be significantly affected by the new permit, have not been involved in the process. To our knowledge, little effort has been made to solicit their input.

We believe that, before the draft permit is presented to the Regional Board, all interested parties who have a stake in the process should be given a fair and meaningful opportunity to participate in the process through workshops and public meetings.

6. Complexity and Length of the Draft

As mentioned above, we are also concerned about the length and complexity of the draft permit. We share the concerns previously expressed by the City of Long Beach and many other co-permittees that the permit should be simple, clear and concise, and establish a framework for a Storm Water Management Plan, rather than an attempt to dictate numerous, inflexible management programs. Both the existing permit, as well as other permits currently being issued in other regions, utilize a framework approach which allows the individual co-permittees to select the BMP's which best suit their needs while accomplishing the objectives of the Clean Water Act and state law. The current draft runs over 45 pages, is not even complete, and contains numerous inflexible dictates. To the extent that the draft permit includes requirements or programs which were not included in the existing permit, we ask that an explanation be given as to the reason why such language was added and references to the federal or state law or regulation mandating the requirements or program.

The current approach to the proposed permit seems to run contrary to the objective expressed in the State's Storm Water Municipal Best Practices Handbook, which allows municipal permittees flexibility in selecting effective BMP's themselves, which would (1) adequately address the pollutants of concern; (2) be compatible with storm water regulations, as well as other regulations for air, hazardous waste, and solid waste disposal, (3) have public support, (4) be compatible with land uses and

facilities, (5) be technologically feasible, considering soils, geography and water resources, and (6) balance the cost for implementing specific programs against the pollution control benefits expected to be achieved.

We believe that the permit should be drastically reduced in size and wording to reflect the goals of the State's own objectives of allowing municipal co-permittees and individual watershed the flexibility to select the best and most effective BMP's which fit their circumstances.

7. Required Programs

We are concerned that specific programs are being dictated to the cities in the draft permit without a clear understanding of the water quality goals that the permit aims to achieve and, most importantly, without the benefit of an accurate assessment of existing conditions. With any storm water management program, there is always much more that needs to be achieved than can be practically done in the short term. The specific dictates of the proposed permit do not allow any flexibility for prioritizing the tasks to be performed or the application of cities' limited funds.

Each of the co-permittee cities has very definite local areas of concern and thoughts as to what actions it is willing to take to address those interests. Those interests, however, can only be fully determined through public workshops where citizens and interested parties are informed about storm water pollution problem and are invited to present their views.

8. Failure to Account for Watershed Differences

One single level of control does not have to be applied uniformly across a large metropolitan area such as Los Angeles County. The watershed characteristics of each of the regions in the County have not yet been adequately defined. Also, we have not been presented with any sort of data justifying the proposed programs required of the watersheds in the draft permit.

9. Lack of Consistency With Other Regions' Permits

One other factor that seems to be overlooked in the approach to this permit is its apparent lack of consistency with permits which other regional boards are currently issuing in other areas. For example, when the State Board considered the challenge by the NRDC to their current permit, it issued at the same time an order upholding a permit for the Santa Clara Valley which was substantially the same. Permit consistency helps

ensure a statewide uniformity in the State Board's approach to stormwater pollution.

10. The Proposed Guidance Document

One of our greatest concerns regarding the permit renewal is the issue of the proposed guidance document. It appears that the guidance document is being proposed as a mechanism to clarify any ambiguities or other problems in the terms of the existing permit. Carson strongly believes that the permit should be able to stand on its own. The State has already prepared a Municipal Best Management Practices Handbook which provides specific guidance on selecting BMP's for reducing pollutants in stormwater discharges from urbanized areas. To our knowledge, the scope and extent of the proposed guidance still has not yet been determined. If it is essential that the guidance document be prepared in order to understand or implement the draft permit, that document should be prepared, circulated and commented upon before the new permit is adopted.

11. Comments Regarding Specific Provisions

As noted above, the City has received a succession of draft permits. The following comments address specific provisions included in the draft permit dated September 20, 1995. We understand that the proposed permit has undergone extensive revisions since that date. The City reserves the right to make further, and more extensive, comments on the final draft permit, which is scheduled to be mailed to all cities on October 23, 1995.

a. Best Management Practices. Section C of the permit (p.3) requires permittees to implement "the thirteen baseline BMPs, in addition to all others proposed in the ROWD." The permit does not indicate which BMPs are required as baseline BMPs or ROWD BMPs. The Board previously recommended the implementation of certain BMPs, include the establishment of a catch basin stenciling program and the implementation of facility inspections of auto repair shops, auto body shops, auto parts and accessory shops, gasoline stations and restaurants. These BMPs were never formally adopted as requirements by the Board, and were not part of the prior permit. If the Board wishes to require implementation of these BMPs or any other BMPs at this time, it should enumerate them in the appropriate sections of the permit, so they may be evaluated in conjunction with other requirements of the permit.

b. EAC obligations. The permit includes a number of provisions which state that the EAC "shall" perform a duty, which suggests that the members of the EAC may be subject to

liability for failing to perform mandatory duties. These duties include assisting in the development of a Baseline Storm Water Management Plan (I.D.3.b); reviewing Watershed Management Plans (I.D.3.c); preparing and forwarding Watershed Management Committee submittals to the Regional Board (I.D.3.d); and developing programs to eliminate illegal connections, discharges and disposal practices (II.A, II.B.1-3), to provide and facilitate public reporting of illegal and hazardous discharges (II.E.1, II.E.2), and to identify sources of pollution (III.A.2). If any of the above plans, programs or reports are not prepared or implemented, it appears that the EAC may be liable for a permit violation.

The EAC is a voluntary, unfunded, temporary advisory group. It is unrealistic to expect the members of the EAC to undertake the responsibilities suggested in the draft, particularly since many of the proposed obligations are matters which the Board itself should perform. We believe that the role of the EAC in implementing the permit needs to be completely reconsidered and re-written.

c. Legal authority. Section I.H of the permit requires each permittee to have its legal counsel complete a review of its existing legal authority to ensure that its existing legal authority complies with the requirements of the permit. The legal authority requirements of Section I.H do not appear to have changed from the legal authority requirements of the original permit. Therefore, cities which have already provided evidence of such legal authority to the Board should not have to go to the added expense of reviewing such legal authority a second time.

If this is not the case, and the new permit includes additional legal authority requirements beyond the requirements of the federal regulations, the Board should provide an explanation of why such additional requirements have been included in the proposed permit.

d. Non-storm water discharges. The federal regulations identify eighteen types of illicit discharges which do not have to be addressed by a stormwater management plan unless the discharges are identified by the municipality as sources of pollutants. The proposed permit identifies five of these eighteen types of discharges as "exempted discharges" which need not be prohibited unless they are identified by the permittee or by the Executive Officer as a source of pollutants. This Section allows the Executive Officer to declare a certain type of discharge as a source of pollutants for all permittees, even if the discharge is not a source of pollutants in a

particular municipality. This authority to identify discharges as pollutants should be restricted to the municipality itself.

The proposed permit identifies another nine of the eighteen types of discharges as "conditionally exempted discharges" which need not be prohibited if appropriate control measures are implemented or if they are identified by the permittee or the Executive Officer as not being a source of pollutants. With respect to these categories, the proposed permit shifts the burden of identifying discharges as non-polluting to the municipality. As a practical matter, this provision would result in these discharges being prohibited until the appropriate findings were made or control measures developed. Such a provision is inconsistent with the federal regulations. Moreover, in the case of emergency fire fighting activities, the federal regulations state that they need not be addressed unless they are identified as "significant" sources of pollutants. Therefore, we recommend that all of these categories be listed as exempt, not conditionally exempt.

Finally, four of the eighteen types of federally-exempted discharges, including water line flushing, uncontaminated pumped ground water, discharges from potable water sources, and lawn watering, are neither listed as "exempt" or "conditionally exempt." These types of discharges should also be listed as exempt.

The City of Carson would very much appreciate your careful consideration of our preliminary comments in the permit renewal process and a response to them.

Very truly yours,

John J. Wisz

NOTES: Comments on the September 15 draft of the new NPDES permit.

FROM: Charles Redden

DATE: 9/26/95

VOL 24

CITY OF COVINA

125 East College Street • Covina, California 91723-2199

September 26, 1995

Mr. Frank Kuo
Los Angeles County Department of Public Works
Waste Management Division
Storm Water Discharge Program
P.O. Box 1460
Alhambra, CA 91802-1460

Dear Mr. Kuo:

We have reviewed the September 15, 1995 draft of the new NPDES permit. Generally, the draft is improved over the earlier version, but there are still many requirements that will stress City resources and should not be mandatory. In addition, the tasks assigned to the Executive Advisory Committee are far more than that group will be able to handle. As a Permittee, we have the following specific comments:

1. Page 2, par. I.A.2.a: The Principal Permittee will not necessarily be the chair for the Watershed Management Committees according to paragraph E.2 on page 4.
2. Page 2, par. I.A.2.e: Add "(WMCs)" at the end of the paragraph.
3. Page 4, par. 3.b: Delete "and" at the end of the paragraph.
4. Page 4, par. 3.d: Make "Committee" plural in the third line.
5. Page 5, par. G: To whom is the annual budget submitted?
6. Page 6, par. 2: Change to read "The Permittees shall exercise their legal authority and require compliance with this Order and the Plan within their jurisdiction."
7. Page 6, par. 3.a: Change "associate" to "associated."
8. Page 6, par. 3.c: In the second line, change "that" to "than" and add a comma after "e.g."
9. Page 6, par. 5: Is the EPA document current and available to the Permittees?
10. Page 7, par. 2: Change "SPEP" to "SPCA" in line 10.
11. Page 7, par. 3: Define or quantify "a reasonable amount of time" in the second line. Also, change "SPEP" to "SPCA" in that line.
12. Page 8, par. II: Change "DISCHARGES\DISPOSAL" to "DISCHARGES/DISPOSAL."
13. Page 8, par. A: Who determines what is "the maximum extent practicable"? This term is used throughout the draft permit.

0169

14. Page 8, par. d: Change "discharges/dumping" to "discharges/disposal" in the second line.

15. Page 8, par. e: This inspection requirement will be very expensive for cities.

16. Page 8, par. f: What is the standard for the record keeping system?

17. Page 8, par. B: Change "Discharges\Disposal" to "Discharges/Disposal."

18. Page 8, par. 2: Delete "a" in the first line.

19. Page 9, par. 4.b: "surveillance program" is too abstract a term upon which to base compliance. Also, how can inspections of vacant facilities detect illegal discharges and disposal into the street system?

20. Page 9, par. d: What is the standard for the record keeping system?

21. Page 9, par. C: Is this paragraph the appropriate section to cover discharges by water suppliers and utility companies to surface waters? This topic should be somewhere in the permit.

22. Page 9, par. D: Delete "Other" in the title.

23. Page 10, par. g: Delete "is prohibited" in line 2.

24. Page 10, par. 2.c: Delete "owners of" in line 1 and change line 2 to read "structures located in areas susceptible to runoff be swept as necessary to."

25. Page 11, par. F.1 and F.2: Delete "quarterly" in the first line of both paragraphs. Why is a quarterly summary necessary if the information is submitted annually? In paragraph 2, line 1, add "of" between "summary" and "illegal."

26. Page 11, par. G.2: Change "Permittees" to "Principal Permittee" in line 1. Delete the comma in line 4.

27. Page 12, par. d.I and d.II: Why have each Permittee do these identification procedures? It seems like the SIC codes would be involving the same activities/materials everywhere and this should be standardized.

28. Page 13, second paragraph: Add "that," after "facilities" in the second line.

29. Page 13, par. C.2: Rewrite lines 2 and 3 to say "implementation of storm water and urban runoff control measures identified in III.C.1 for industrial/commercial facilities."

30. Page 13, par. 3: This evaluation is much too general for Permittees to conduct. Their tasks should focus on circumstances peculiar to their jurisdiction--this is more of the nature of a university study.

31. Page 14, par. 1: Scheduling inspections 5 years in advance doesn't seem reasonable.

32. Page 14, par. 1 and subparagraphs: Replace "III.B.1.a.1", "III.B.1.a.2", and "III.B.1.a.3" with "III.B.1.a.I", "III.B.1.a.II", and "III.B.1.a.IIF", respectively.

33. Page 15, par. 2: This inspection program will be expensive for cities.

34. Page 15, par. f: What is meant by "electronic recording system?"

35. Page 15, par. 3: Replace "III.B.1.a.1" with "III.B.1.a.I."

36. Page 16, par. F: Should the Permittees work directly with the Board? It seems like a better idea to have either the EAC or the Principal Permittee act as the liaison with the Board. This paragraph also leaves open the possibility of many more reports to be required of the already overburdened Permittees.

37. Page 16, par. G.1: Replace "Permittees" with "Principal Permittee" to be consistent with section II.

38. Page 19, par. iv and v: These paragraphs need to start with a verb.

39. Pages 20-22, par. E: In five places, paragraph IV.B.1.a is referenced but that paragraph doesn't exist.

40. Page 20, par. E.2: This evaluation is much too general for Permittees to conduct. Their tasks should focus on circumstances peculiar to their jurisdiction--this is more of the nature of a university study.

41. Page 22, par. I: Uncapitalize "Maximum Extent Practicable."

42. Pages 23 and 24: Paragraph IV.B.1.a and its subparagraphs are referenced but they don't exist.

43. Page 23, par. F.1: It is not possible to schedule construction inspections 5 years in advance.

44. Page 23, par. f: What is meant by "electronic recording system?"

45. Page 24, par. H.1: Replace "Permittees" with "Principal Permittee" to be consistent with sections II and III.

46. Page 26, par. e: Move this paragraph over to the margin.

47. Page 27, par. 6: This should be labeled "g" and the title should not be underscored.

48. Page 27, par. b: This paragraph has nothing to do with fertilizers/pesticides.

49. Page 28, par. 2: This paragraph title should not be underscored.

50. Page 31: Periodic hardscape cleaning will be expensive for cities and its value is questionable.

51. Page 32, par. A.1 and A.2: Replace "shall" with "may" in each paragraph.

52. Page 32, par. C.2: Add "if appropriate" to the end of the first sentence.

53. Pages 34 and 35, par. 1, 2, 3, and 4: Replace "shall" with "may" in all cases.

54. Page 34, par. A.1.c: Delete "of" in the first line.

55. Page 35, par. 2.a: This paragraph does not belong in this section.

56. Pages 38-39: Delete all requirements for semi-annual reports. The annual reports should be sufficient to monitor the program.

57. Page 40, par. d: Make "elements" singular in the second line.

58. Page 41, par. 2: "Maximum extent practicable" is not defined in Section VIII.A as claimed in lines 6 and 7 of this paragraph.

If there are any questions about these comments, please contact Charles Redden in our Environmental Services Department at (818) 858-7204.

Sincerely,

Wayne B. Dowdey

Dear Mr. Kuo:

We have reviewed the September 15, 1995 draft of the new NPDES permit. Generally, the draft is improved over the earlier version, but there are still many requirements that will stress City resources and should not be mandatory. In addition, the tasks assigned to the Executive Advisory Committee are far more than that group will be able to handle. As a Permittee, we have the following specific comments:

1. Page 2, par. I.A.2.a: The Principal Permittee will not necessarily be the chair for the Watershed Management Committees according to paragraph E.2 on page 4.
2. Page 2, par. I.A.2.e: Add "(WMCs)" at the end of the paragraph.
3. Page 4, par. 3.b: Delete "and" at the end of the paragraph.
4. Page 4, par. 3.d: Make "Committee" plural in the third line.
5. Page 5, par. G: To whom is the annual budget submitted?
6. Page 6, par. 2: Change to read "The Permittees shall exercise their legal authority and require compliance with this Order and the Plan within their jurisdiction."
7. Page 6, par. 3.a: Change "associate" to "associated."
8. Page 6, par. 3.c: In the second line, change "that" to "than" and add a comma after "e.g."
9. Page 6, par. 5: Is the EPA document current and available to the Permittees?
10. Page 7, par. 2: Change "SPEP" to "SPCA" in line 10.
11. Page 7, par. 3: Define or quantify "a reasonable amount of time" in the second line. Also, change "SPEP" to "SPCA" in that line.
12. Page 8, par. II: Change "DISCHARGES\DISPOSAL" to "DISCHARGES/DISPOSAL"
13. Page 8, par. A: Who determines what is "the maximum extent practicable"? This term is used throughout the draft permit.

0173

14. Page 8, par. d: Change "discharges/dumping" to "discharges/disposal" in the second line.

15. Page 8, par. e: This inspection requirement will be very expensive for cities.

16. Page 8, par. f: What is the standard for the record keeping system?

17. Page 8, par. B: Change "Discharges\Disposal" to "Discharges/Disposal."

18. Page 8, par. 2: Delete "a" in the first line.

19. Page 9, par. 4.b: "surveillance program" is too abstract a term upon which to base compliance. Also, how can inspections of vacant facilities detect illegal discharges and disposal into the street system?

20. Page 9, par. d: What is the standard for the record keeping system?

21. Page 9, par. C: Is this paragraph the appropriate section to cover discharges by water suppliers and utility companies to surface waters? This topic should be somewhere in the permit.

22. Page 9, par. D: Delete "Other" in the title.

23. Page 10, par. g: Delete "is prohibited" in line 2.

24. Page 10, par. 2.c: Delete "owners of" in line 1 and change line 2 to read "structures located in areas susceptible to runoff be swept as necessary to."

25. Page 11, par. F.1 and F.2: Delete "quarterly" in the first line of both paragraphs. Why is a quarterly summary necessary if the information is submitted annually? In paragraph 2, line 1, add "of" between "summary" and "illegal."

26. Page 11, par. G.2: Change "Permittees" to "Principal Permittee" in line 1. Delete the comma in line 4.

27. Page 12, par. d.i and d.ii: Why have each Permittee do these identification procedures? It seems like the SIC codes would be involving the same activities/materials everywhere and this should be standardized.

28. Page 13, second paragraph: Add "that," after "facilities" in the second line.

29. Page 13, par. C.2: Rewrite lines 2 and 3 to say "implementation of storm water and urban runoff control measures identified in III.C.1 for industrial/commercial facilities."

30. Page 13, par. 3: This evaluation is much too general for Permittees to conduct. Their tasks should focus on circumstances peculiar to their jurisdiction--this is more of the nature of a university study.

31. Page 14, par. 1: Scheduling inspections 5 years in advance doesn't seem reasonable.

32. Page 14, par. 1 and subparagraphs: Replace "III.B.1.a.1", "III.B.1.a.2", and "III.B.1.a.3" with "III.B.1.a.i", "III.B.1.a.ii", and "III.B.1.a.iii", respectively.

33. Page 15, par. 2: This inspection program will be expensive for cities.

34. Page 15, par. f: What is meant by "electronic recording system?"

35. Page 15, par. 3: Replace "III.B.1.a.1" with "III.B.1.a.i."

36. Page 16, par. F: Should the Permittees work directly with the Board? It seems like a better idea to have either the EAC or the Principal Permittee act as the liaison with the Board. This paragraph also leaves open the possibility of many more reports to be required of the already overburdened Permittees.

37. Page 16, par. G.1: Replace "Permittees" with "Principal Permittee" to be consistent with section II.

NOTES: Comments on the September 15 draft of the new NPDES permit.

FROM: Charles Redden

DATE: 9/26/95

VOL 24

CITY OF COVINA

125 East College Street • Covina, California 91723-2199

September 26, 1995

Mr. Frank Kuo
Los Angeles County Department of Public Works
Waste Management Division
Storm Water Discharge Program
P.O. Box 1460
Alhambra, CA 91802-1460

Dear Mr. Kuo:

We have reviewed the September 15, 1995 draft of the new NPDES permit. Generally, the draft is improved over the earlier version, but there are still many requirements that will stress City resources and should not be mandatory. In addition, the tasks assigned to the Executive Advisory Committee are far more than that group will be able to handle. As a Permittee, we have the following specific comments:

1. Page 2, par. I.A.2.a: The Principal Permittee will not necessarily be the chair for the Watershed Management Committees according to paragraph E.2 on page 4.

2. Page 2, par. I.A.2.e: Add "(WMCs)" at the end of the paragraph.

3. Page 4, par. 3.b: Delete "and" at the end of the paragraph.

4. Page 4, par. 3.d: Make "Committee" plural in the third line.

5. Page 5, par. G: To whom is the annual budget submitted?

6. Page 6, par. 2: Change to read "The Permittees shall exercise their legal authority and require compliance with this Order and the Plan within their jurisdiction."

7. Page 6, par. 3.a: Change "associate" to "associated."

8. Page 6, par. 3.c: In the second line, change "that" to "than" and add a comma after "e.g."

9. Page 6, par. 5: Is the EPA document current and available to the Permittees?

10. Page 7, par. 2: Change "SPEP" to "SPCA" in line 10.

11. Page 7, par. 3: Define or quantify "a reasonable amount of time" in the second line. Also, change "SPEP" to "SPCA" in that line.

12. Page 8, par. II: Change "DISCHARGES\DISPOSAL" to "DISCHARGES/DISPOSAL."

13. Page 8, par. A: Who determines what is "the maximum extent practicable"? This term is used throughout the draft permit.

0178

14. Page 8, par. d: Change "discharges/dumping" to "discharges/disposal" in the second line.

15. Page 8, par. e: This inspection requirement will be very expensive for cities.

16. Page 8, par. f: What is the standard for the record keeping system?

17. Page 8, par. B: Change "Discharges\Disposal" to "Discharges/Disposal."

18. Page 8, par. 2: Delete "a" in the first line.

19. Page 9, par. 4.b: "surveillance program" is too abstract a term upon which to base compliance. Also, how can inspections of vacant facilities detect illegal discharges and disposal into the street system?

20. Page 9, par. d: What is the standard for the record keeping system?

21. Page 9, par. C: Is this paragraph the appropriate section to cover discharges by water suppliers and utility companies to surface waters? This topic should be somewhere in the permit.

22. Page 9, par. D: Delete "Other" in the title.

23. Page 10, par. g: Delete "is prohibited" in line 2.

24. Page 10, par. 2.c: Delete "owners of" in line 1 and change line 2 to read "structures located in areas susceptible to runoff be swept as necessary to."

25. Page 11, par. F.1 and F.2: Delete "quarterly" in the first line of both paragraphs. Why is a quarterly summary necessary if the information is submitted annually? In paragraph 2, line 1, add "of" between "summary" and "illegal."

26. Page 11, par. G.2: Change "Permittees" to "Principal Permittee" in line 1. Delete the comma in line 4.

27. Page 12, par. d.i and d.ii: Why have each Permittee do these identification procedures? It seems like the SIC codes would be involving the same activities/materials everywhere and this should be standardized.

28. Page 13, second paragraph: Add "that," after "facilities" in the second line.

29. Page 13, par. C.2: Rewrite lines 2 and 3 to say "implementation of storm water and urban runoff control measures identified in III.C.1 for industrial/commercial facilities."

30. Page 13, par. 3: This evaluation is much too general for Permittees to conduct. Their tasks should focus on circumstances peculiar to their jurisdiction--this is more of the nature of a university study.

31. Page 14, par. 1: Scheduling inspections 5 years in advance doesn't seem reasonable.

32. Page 14, par. 1 and subparagraphs: Replace "III.B.1.a.1", "III.B.1.a.2", and "III.B.1.a.3" with "III.B.1.a.I", "III.B.1.a.II", and "III.B.1.a.III", respectively.

33. Page 15, par. 2: This inspection program will be expensive for cities.

34. Page 15, par. f: What is meant by "electronic recording system?"

35. Page 15, par. 3: Replace "III.B.1.a.1" with "III.B.1.a.I."

36. Page 16, par. F: Should the Permittees work directly with the Board? It seems like a better idea to have either the EAC or the Principal Permittee act as the liaison with the Board. This paragraph also leaves open the possibility of many more reports to be required of the already overburdened Permittees.

37. Page 16, par. G.1: Replace "Permittees" with "Principal Permittee" to be consistent with section II.

38. Page 19, par. iv and v: These paragraphs need to start with a verb.

39. Pages 20-22, par. E: In five places, paragraph IV.B.1.a is referenced but that paragraph doesn't exist.

40. Page 20, par. E.2: This evaluation is much too general for Permittees to conduct. Their tasks should focus on circumstances peculiar to their jurisdiction--this is more of the nature of a university study.

41. Page 22, par. I: Uncapitalize "Maximum Extent Practicable."

42. Pages 23 and 24: Paragraph IV.B.1.a and its subparagraphs are referenced but they don't exist.

43. Page 23, par. F.1: It is not possible to schedule construction inspections 5 years in advance.

44. Page 23, par. f: What is meant by "electronic recording system?"

45. Page 24, par. H.1: Replace "Permittees" with "Principal Permittee" to be consistent with sections II and III.

46. Page 26, par. e: Move this paragraph over to the margin.

47. Page 27, par. 6: This should be labeled "g" and the title should not be underscored.

48. Page 27, par. b: This paragraph has nothing to do with fertilizers/pesticides.

49. Page 28, par. 2: This paragraph title should not be underscored.

50. Page 31: Periodic hardscape cleaning will be expensive for cities and its value is questionable.

51. Page 32, par. A.1 and A.2: Replace "shall" with "may" in each paragraph.

52. Page 32, par. C.2: Add "if appropriate" to the end of the first sentence.

53. Pages 34 and 35, par. 1, 2, 3, and 4: Replace "shall" with "may" in all cases.

54. Page 34, par. A.1.c: Delete "of" in the first line.

55. Page 35, par. 2.a: This paragraph does not belong in this section.

56. Pages 38-39: Delete all requirements for semi-annual reports. The annual reports should be sufficient to monitor the program.

57. Page 40, par. d: Make "elements" singular in the second line.

58. Page 41, par. 2: "Maximum extent practicable" is not defined in Section VIII.A as claimed in lines 6 and 7 of this paragraph.

If there are any questions about these comments, please contact Charles Redden in our Environmental Services Department at (818) 858-7204.

Sincerely,

Wayne B. Dowdey

SUBJECT: DRAFT NPDES PERMIT NO. CA S0061654

Dear Ms. Tyrell:

Thank you for the opportunity to provide comments on the draft NPDES permit, dated September 5, 1995. At this time, there are certain concerns which should be considered. They are as follows:

1. The permit needs to provide a framework for watershed management and not concentrate on specifics. The specifics should be developed as part of an overall watershed management plan.

2. The amount of work and fiscal resources required for implementation of this permit will be an enormous burden on co-permittees. The permit needs to concentrate on realistically achievable goals and objectives.

3. The permit should be conditioned to be reviewed and revised in accordance with any Federal Legislation passed in the process of reauthorization of the Clean Water Act or legislation granting relief from unfunded Federal Mandates.

Again, we appreciate the opportunity to offer our comments to you. Please incorporate these concerns in your continuing effort to develop the new permit. Should you have any questions, please call me at (909) 396-5672.

Sincerely,

David G. Liu, P.E.

SUBJECT: Draft L.A. County Municipal Storm Water Discharge Permit

Dear Ms. Tyrrell:

This letter is in response to the most recent copy (September 15, 1995) of the subject NPDES permit. After reviewing the draft, the City of Downey feels that the permit is too lengthy and detailed. The specifics should be included in a watershed management plan, not in the permit. Our other comments are as follows:

1. The financial impact of the new permit, particularly in the first year, will be a real burden on most permittees. The cost of setting up an effective inspection program itself can be extremely high.

2. Quarterly reports are too often. Reports should be generated only once each year. They can be prepared on a pre-approved simplified form that can effectively describe the results and progress of the investigations. These annual forms can save valuable staff time, as well as, provide reports that are easier to work with, and understood by the Regional Board.

3. The program requirements for existing Industrial/Commercial sources, places a considerably large burden on permittees staff with source control measures and source inspections. Why should the permittees be required to continuously monitor, inspect and control these facilities? Where is the involvement of the facilities themselves? The Industrial/Commercial sources should be held personally accountable, and should be required to submit their own reports to the Regional Board. Permittees will continue to do periodic checks and investigate all complaints.

11111 BROOKSHIRE AVENUE POST OFFICE BOX 7016 DOWNEY CALIFORNIA 90241-7016

In general, the draft permit is too lengthy and complex. The permit should only provide the framework for watershed management. Permittees have a need to develop a watershed management plan that will describe the detailed requirements.

Thank you for the opportunity to respond with our comments. We look forward to the development of a more useful and more practical permit.

Sincerely,

Robert Brace
City Engineer

Re: NPDES Permit

Dear Ms. Tyrrell:

After reading the latest revision of the L.A. County NPDES permit, I feel compelled to express my frustration with this entire program. First, let me assure you that I support the cleaning of our waterways and oceans. Being an avid outdoorsman and fisherman I am well aware of the benefits of maintaining our water sources as pure as humanly possible. However, the entire responsibility for performing this vital work has now fallen on local government. While some of the major cities probably have the resources and staff to absorb the multitude of requirements listed in the latest permit, those of us in the smaller municipalities struggle just to keep up with the existing workload.

The reality is that without a continuous funding source, it will be impossible to implement the program as stated. (Of course the pat answer is that we find the money.) Let me give you a short history of the fiscal problems the City of Duarte has encountered during the past 5 years. Four years ago, due to a continuous budgetary shortfall (caused in no small part by the State), the Council implemented a hiring freeze. The result is that the City Hall staff is down 20%. Two years ago I lost my only public works inspector. The rest of the staff, myself and an engineering tech, have picked up the inspectors workload. We're working 48 hours a week just to stay above water.

Late last year the Council voted to implement a 3% utility tax. This additional money was needed to make up a portion of a $1.2 million shortfall. Two recall petitions were generated from this decision. Fortunately, the residents were unable to get enough

signatures. (I'm sure that the Council would love to tackle this type of issue again.) Of course, all the political backlash and animosity generated by the citizens against the Council may have been for nothing. As you are probably aware, this tax is in jeopardy thanks to a recent ruling from the State Supreme Court. What that decision will do to our budget situation is anybody's guess - especially if we're required to rebate the money already collected.

Is there an answer to the dilemma that all of the small municipalities are facing with this permit? I believe there is - the County has the expertise to run a program such as this. Why duplicate a program 80+ times when one agency is capable of handling it? The County controls the majority of the flood control facilities and has a waste management division in place. The fact is that the entire county will benefit from cleaner waterways and beaches.

I respectfully request that the Board consider the impact that this permit is going to have on small cities such as Duarte. Our resources are severely limited. Without an influx of a consistent and substantial sum of funds to support this program complete compliance with the permit, as it is currently written, will present an extreme hardship on what's left of this staff and our available funds.

Sincerely,

Steve Esbenshade

County of Los Angeles
Department of Public Works
Division of Waste Management
900 South Fremont Avenue
Alhambra, CA 91802-1460

Dear Members of the Executive Advisory Committee:

Enclosed please find the City of El Monte's suggested revisions of the "Waste Discharge Requirements for Stormwater Management/Urban Runoff Discharges Within the County of Los Angeles." It is our opinion that a number of the directions and recommendations contained in the Waste Discharge Requirements do not seem realistic and cost effective, and may constitute a hardship and become counterproductive.

We believe that the role of the Executive Advisory Committee is to provide the Permittees with general guidelines and not attempt to dictate their course of action. Requirements for reports on construction sites are numerous and onerous, and should be limited to sites larger than five acres.

If you have any questions, please do not hesitate to call me at (818) 580-2061.

Very truly yours,

Kev Tcharkhoutian

CITY OF EL MONTE'S RESPONSE TO
EXECUTIVE ADVISORY COMMITTEE'S
"WASTE DISCHARGE REQUIREMENTS FOR STORMWATER MANAGEMENT/URBAN RUNOFF DISCHARGES"

We suggest that the following be stricken from:

I–G, last two sentences.
I–G–1, last sentence.
I–G–2, entire paragraph.
II–A, first paragraph
III–C–5–e, entire paragraph.
III–D–2–p, entire paragraph.
III–E–c, entire line.
IV–B–2, 3, 4, entire lines.
IV–B–7–a–iii–c and d, entire lines.
IV–D, entire paragraph.
IV–E–2, entire paragraph.
IV–E–3–d. entire line.
IV–F–1 and 2, entire lines.
IV–G–1–f, entire line.
IV–G–2, entire paragraph.
V–D–1–a–i, entire line.
V–D–2–e
VI General Education Strategy – C, entire paragraph.
VI Outreach to Target Audiences: A–1–2–3–4, and B, entire paragraphs.
VI Outreach Based on Activity-Type–B–3, entire line

We suggest the following changes be done to the following paragraphs:

I-D-1-a	Los Angeles County shall chair Watershed M.C.
I-1-1	The NIMC shall include a tentative date by which the Permittee must meet with RWQCB staff.
I-1-3	A Permittee that receives a rejection of an SPCA shall have a mutual agreeable date to remedy the specified deficiency in the SPCA.
II-B-1, 2, and 3	EAC shall develop GUIDELINES instead of consistent program, standard enforcement, or standard procedures; respectively.
II-F-1 and 2	Semi-annually summary instead of quarterly.
III-B-1-a-iii	Omit "the EAC".
III-C-5	Change "the EAC" to "the Permittee".
III-E	Change "Permittee" to "EAC".
III-F	Change "Permittees" to "Principal Permittee".
IV-A-2	Change "minimum requirements" to "recommendations".
IV-B-1	Change "guidance" to "guidelines".
IV-B-7	Add "for a parcel of over five acres".

VOL 24

01189

IV–C–1	Change to "the EAC shall establish guidelines for screening criteria for construction sites to be listed in a database that are over five acres".
IV–C–2	Change to "the Permittees shall develop a database listing sites of construction activity of over five acres within each Permittee's jurisdiction which shall be updated quarterly".
IV–E–1	"Permittees shall develop a checklist of specific storm water and urban run-off control measures for construction activity sites of over five acres".
IV–E–3	"Permittees shall have in place a process to ensure implementation and proper maintenance of storm water and urban runoff control measures for sites associated with construction activity of over five acres including:"
IV–E–6	"Permittee may seek coverage under this Order for construction activity of over five acres which are owned and operated by them if it:"
IV–G–1	Each year, the Permittee shall evaluate the results and progress of their storm water quality management program for construction activity sites of over five acres.
V–C–1	EAC will develop pollution prevention plan guidelines for each public vehicle maintenance/material storage facility category.
V–D–2–f	"The discharge of swimming pool water shall only be allowed under a City permit.
VIII	Change third paragraph to read, "The Permittee is responsible for collecting data needed for program evaluation, conducting self-evaluation, and reporting the results of the evaluation to the Regional Board."

VOL 24

0190

VIII–C–2–c

Strike the sentence that reads, "A table shall also be included to summarize the status of the program elements for which the watershed management committee bears the primary implementation responsibility."

October 10, 1995

Ms. Catherine Tyrrell
Assistant Executive Officer
California Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Subject: Comments to September 15, 1995 Draft NPDES Permit

Dear Ms. Tyrrell:

Thank you for providing the City of El Segundo an opportunity to comment on the latest Draft NPDES permit. I know it has taken a great amount of effort by the State, County, and Cities to get to this point. However, based on the extensive number of problems we found in the draft, it is obvious we still have a long way to go.

Attached are the City's comments to the draft permit. We have taken the liberty of developing a "substitute permit" showing by red-line/strike-out El Segundo's proposed changes. We felt that, given the numerous comments, that this was the clearest manner in which to relay our concerns.

The City's comments fall into the following three (3) general areas:

1. The draft permit, as presented, far exceeds present Federal and State requirements;

2. The draft permit does not clearly delineate the relationship between the various parties, i.e. the State, the principal permittee, permittees, the EAC, WMC's, etc. and;

3. There are numerous grammatical, typographical, and terminology errors, and inconsistencies which adds to the ambiguity of the draft.

350 Main Street, El Segundo, California 90245-0989
Phone (310) 322-4670   *FAX (310) 322-4167*

R0067200

(continued)

In addition, attached to our red-line/strike-out comments, there are two (2) items which are presently not covered in the draft but we feel warrant inclusion.

I hope that you find our comments helpful. The City is very interested in the State reconciliation of the issues we have raised. We look forward to another opportunity to review and comment on a revised draft before the permit is sent to the Board for consideration.

If you have any questions or wish to discuss our concerns in more detail, please do not hesitate to call me at 310.607.2230.

Sincerely,

Ed Schroder
Director of Public Works

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

INTRODUCTORY NOTE TO "SUBSTITUTE DRAFT" VERSION OF DRAFT ORDER

The September 15, 1995, RWQCB draft is replete with provisions not required by the federal Clean Water Act or any other law. In addition, it appears that some provisions required by the EPA for stormwater permits are missing. For these reasons, the next "official draft" circulated for comment should clearly identify the specific section of the Clean Water Act, or other law, which provides the basis for a requirement proposed to be included in this permit. Only then can an informed judgment be made as to the appropriateness of inclusion of permit provisions.

This Substitute Draft provides revisions which should be made to the draft, in order to link the draft to the underlying legal authority, the Clean Water Act, which itself is under consideration for major revisions. For this reason, the term "to the extent required by the Clean Water Act" has been inserted at numerous places throughout this Substitute Draft. Other cleanup provisions are also included.

Italicized text is intended as commentary on the draft, it is not intended to be included in the text.

September 15, 1995

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. 95-XXX

WASTE DISCHARGE REQUIREMENTS
FOR
STORMWATER MANAGEMENT/URBAN RUNOFF DISCHARGES
WITHIN THE COUNTY OF LOS ANGELES

(NPDES NO. CAS0051654)

The California Regional Water Quality Control Board, Los Angeles Region, finds:

(The findings are currently being developed.)

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

[NOTE: It is essential that the findings be drafted in a manner which does not needlessly implicate the County and the Cities with respect to liability asserted against them by the alleged industrial polluters in the case of United States and State of California v. Montrose Chemical Corporation of California, et al., now pending in the U.S. District Court for the Central District of California. This case is a Natural Resources Damages Claim case filed under the federal Comprehensive Environmental Response, Compensation and Liability Act ("CERCLA" or "Superfund") 42 U.S.C. §§ 9601 et seq. The alleged industrial polluter defendants have filed third party against the County, the Cities and the State. Damages could reach into the hundreds of millions of dollars.]

This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit pursuant to Section 402 of the federal Clean Water Act, ~~or~~ and amendments thereto, and shall take effect at the end of ten (10) days from the date of its adoption provided the Regional Administrator, USEPA, has no objections.

IT IS HEREBY ORDERED that the County of Los Angeles and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardens, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Long Beach, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code, and regulations ~~and guidelines~~ adopted thereunder, and the provisions of the Federal Clean Water Act, and regulations ~~and guidelines~~ adopted thereunder, shall comply with the following for the areas under their respective jurisdictions within the drainage area of the County of Los Angeles:

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

September 15, 1995

A. Discharge Prohibitions

(Currently under discussion with the negotiation team.)

[NOTE: Should conform to, but not exceed, prohibitions required by the Clean Water Act.]

B. Receiving Water Limitations

(Currently under discussion with the negotiation team.)

[NOTE: Should conform to, but not exceed, prohibitions required by the Clean Water Act.]

C. Provisions

i. The Dischargers shall comply with Discharge Prohibitions (above), and Receiving Water Limitations (above), through the timely implementation of control measures ~~and other actions~~ as required by the Clean Water Act, to reduce ~~pollutants in the~~ pollutant discharge as proposed in this Order.

I. PROGRAM MANAGEMENT

A. Principal Permits

1. The County of Los Angeles is designated as the Principal Permittee.

2. The Principal Permittee shall, to the extent required by the Clean Water Act:

a. Coordinate permit activities and, by _____, convene and chair the area-wide Executive Advisory Committee and the Watershed Management Committees;

b. Provide personnel and fiscal resources and by _____, develop a Baseline Stormwater Management Plan (Plan) for use in developing a watershed management plan (WMP) for each watershed;

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

c. Provide personnel and fiscal resources for the development of the WMPs;

d. Provide personnel and fiscal resources for the updating and modification of the Plan and the WMPS;

e. Provide technical and administrative support for both the Executive Advisory and Watershed Management Committees;

f. Implement watershed water quality monitoring programs;

g. Provide the personnel and fiscal resources to complete by _____, the annual reports including evaluations of monitoring program data and BMP effectiveness;

h. Coordinate the implementation of stormwater quality management activities of regional significance (this shall mean that the Principal Permittee shall identify BMPs which are ~~applicable for implementation~~ suitable for adoption by Permittees watershed-wide and area-wide), such as public outreach and education, pollution prevention, waste minimization, and other similar actions;

i. Act as liaison between all Permittees and the Regional Board on Permit issues; and

j. Meet all the responsibilities outlined below for a Permittee.

B. Permittees

1. The ~~other~~ cities and agencies *[Note: What Agencies? If Caltrans, specify.]* are designated as Permittees.

2. Each Permittee shall, to the extent required by the Clean Water Act:

a. Participate in the development and amendment of the Baseline Stormwater Management Plan ~~(Plan)~~("Plan") by advising the Principal Permittee with respect to the Plan and by _____, ~~jointly~~ prepare the portion of the watershed specific management ~~plans (WMPS)~~ plan (WMP) applicable to its jurisdiction via their WMC;

VOL 24

02002

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

b. Provide an Implementation Plan describing specific stormwater programs, projects and/or activities which are to be conducted within ~~their~~ its jurisdictional ~~boundaries~~ boundary, including the storm drainage system ~~they own and operate, and which demonstrate compliance with the WMP(S) requirements~~ it owns and operates, in compliance with those portions of the WMP which are required by the Clean Water Act, by _____; and

c. Provide in a timely manner all information needed by the Principal Permittee for completing ~~the~~ annual reports which comply with the requirements of the Clean Water Act.

3. The City ~~Administrator/Public Director~~ Council of each Permittee shall appoint a ~~representative(s)~~ City representative and alternate(s) to the WMC.

~~C.~~ 4. Agency Coordination. Each Permittee shall coordinate implementation of permit requirements and pollution prevention activities among each Permittee's internal departments and agencies (i.e. public works, planning, utilities, water supply, etc...)~~.~~, to the extent required by the Clean Water Act.

~~D~~ C. Executive Advisory Committee ("EAC")

1. The EAC shall consist of ~~a~~ one representative ~~of~~ from the County of Los Angeles, one representative from the City of Los Angeles, ~~a~~ and one representative each from the Malibu Creek, Santa Clara~~,~~ and Dominguez Channel Watershed Management Areas, and two representatives each from ~~each of~~ the San Gabriel River, Los Angeles River~~,~~ and the Ballona Creek Watershed Management Areas.

   a. ~~One representative from~~ A member of the EAC shall chair the Watershed Management Committee for that Permittee's main watershed management area.

2. The City Administrator/Public Works Director for the County of Los Angeles and for the City of Los Angeles shall each appoint a representative to the EAC. Other members will be appointed by the WMCs.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

3. The EAC shall, to the extent required by the Clean Water Act, be responsible for:

   a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

   b. Assisting the Principal Permittee in the development of the Baseline Storm Water Management Plan; and

   c. Reviewing the Watershed Management Plans as developed by each Watershed Management Committee and provide direction and guidance on the plans for consideration by the Watershed Management Committees;

   d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

   e. Mediating conflict among the ~~Permittee~~ Permittees; and

   f. Coordinating the implementation of pilot projects to target pollutant sources, evaluate BMT appropriateness, and assess effectiveness.

~~E~~ D. Watershed Management Committee

1. A Watershed Management ~~Committees~~ Committee (WMC) shall consist of a representative of each ~~of the Permittees for that~~ Permittee within a particular watershed management area. ~~Regular~~ All WMC meetings shall be open to attendance by the public.

~~The WMC may hold closed sessions, at its discretion, to discuss permit related issues.~~

2. The Malibu Creek, Santa Clara, and Dominguez Channel WMCs shall each appoint one representative to serve on the EAC and to chair the WMC. The San Gabriel River, Los Angeles River, and the Ballona Creek WMCs shall each appoint two representative to serve on the EAC, one of whom will chair the WMC.

3. The WMC shall, to the extent required by the Clean Water Act, be responsible for:

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

a. Establishing goals and objectives for the watershed;

b. Prioritizing pollution control efforts;

c. Participating in the development of a specific watershed management plan (WMP), based on the Baseline Stormwater Management Plan (Plan);

d. Assessing the effectiveness of, preparing revisions for and making appropriate changes to the Plan and the WMP;

e. Coordinating and facilitating the preparation of the annual reports on Permit activities within the watershed for submittal to the Regional Board -- a draft of the annual report shall be circulated to each Permittee and the Executive Advisory Committee for ~~their review and comments~~ review and comment, and the WMC shall respond to each comment, in writing, prior to submittal to the Regional Board; and

f. Facilitating the implementation of this Order among the Permittees in the watershed.

~~START SPELL CHECK~~

~~F~~ E. Watershed Management Subcommittees

1. Subcommittees ~~will~~ may be established ~~where needed~~, to the extent required by the Clean Water Act, as determined by the WMC and/or the EAC.

2. The Subcommittees will be focused on specific program areas and ~~can~~ to provide more specific ~~oversight~~ advice on the development, implementation, and evaluation of selected program areas.

~~G~~ F. Fiscal Resources

Each Permittee shall submit *[NOTE: TO WHOM?]* an annual budget for its Implementation Plan within 30 days after the budget adoption. The budget shall be summarized and put into a format which identifies the necessary capital and operation and maintenance expenditures necessary to implement the storm water management program. The budget shall provide information such as funding

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

sources, staff resources, equipment, support capabilities, contract services, and cost sharing arrangements for the storm water management programs. Also included shall be a description of any funding shortfalls.

1. Area-Wide Resources - In implementing this Order and the Plan, to the extent required by the Clean Water Act, Permittees may elect to jointly fund a single program for certain BMPS, such as Public Education, that are area-wide in nature. Funding agreements, including budgets and cost per agency, shall be developed.

2. City-Specific Resources - As stated above, each Permittee shall develop an annual budget detailing the cost of implementing Permit-related activities within its jurisdiction.

~~H~~ G. Legal Authority

1. The legal authority that was required of each Permittee under Order No. 90-079, to the extent consistent with the Clean Water Act, shall continue in effect.

2. ~~The Co-Permittees shall exercise their~~ Each Co-Permittee *[NOTE: The terminology should be consistent, make it Permittee or Co-Permittee]* shall exercise its legal authority and require compliance with this Order and tile Plan within its jurisdiction, to the extent consistent with the Clean Water Act.

3. Each Permittee shall certify that it has legal authority to control discharges to and from those portions of the drainage system over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements between permittees with adequate existing legal authority and shall, ~~at a minimum,~~ in an effort to accomplish Items a-f below, within its jurisdiction:

   a. Control the contribution of pollutants to the storm drainage system by storm water discharges ~~associate~~ associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

   b. Prohibit illicit discharges and illicit connections to the storm drainage system and require removal of illicit connections;

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

c. Control the intentional discharge of spills and the dumping or disposal of materials other ~~that~~ than storm water (e.g. industrial and commercial wastes, trash, debris, motor vehicle fluids, green waste, animal wastes, leaves, dirt, or other landscape debris etc.) to the storm drainage system;

d. Control, through interagency or inter-jurisdictional agreements among permittees, the contribution of pollutants from one portion *[NOTE: needs definition. What is meant by "one portion?"]* of the storm drainage system to another;

e. Require compliance with conditions in ordinances, permits, contracts or orders; and

f. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the storm drainage system.

4. Each ~~Permittee's~~ Permittee shall direct its legal counsel ~~shall complete a~~ to review of its existing legal authority to ensure that its existing legal authority complies with the requirements in this Order.

5. Upon its completion of the legal authority review, or within 60 days of permit adoption, (whichever is sooner) each Permittee shall demonstrate that it has adequate legal authority or provide a schedule for obtaining the adequate legal authority. Note: Guidance for demonstrating adequate legal authority is included within the EPA document entitled Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges from Municipal Separate Storm Sewer Systems, (EPA 833-B-92-002, November 1992), Section 3-3, page 3-4.

~~I~~ H. Administrative Review

The administrative review process formalizes the procedure for review and acceptance of reports and documents submitted to the RWQCB under this Permit. In addition, it provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement actions. The RWQCB recognizes that the goal of reducing the level of pollutants in stormwater/urban runoff is best accomplished by cooperation and communication between the RWQCB, the permittee, the co-permittees and the

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and L:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

public. The Board further appreciates that cooperation and communication is reduced by enforcement actions and legal suits, which force parties to become defensive and react slowly while wasting scarce local government resources. Los Angeles County is undergoing a severe recession which limits the resources of local governments; to achieve the goal of clean water it is essential to reduce wasteful litigation actions to the greatest extent possible and allow resources to be spent to achieve the goals of this permit. The RWQCB recognizes the following facts: (1) that stormwater programs will vary from jurisdiction to jurisdiction; and (2) that such variation may make it difficult for a permittee to determine whether or not it is in complete conformance with the terms and conditions of this permit; and (3) that the goal of this permit is clean water not lawsuits. Accordingly, for the purposes of this permit, a permittee or co-permittee shall not be in violation of any term or condition of this permit until the following administrative process has been completed:

1. If the Executive Officer ~~finds~~ has reason to believe that a Permittee's stormwater program ~~is~~ may be insufficient to meet the provision of the Permit, the Executive Officer shall send a "Notice of Intent to Meet and Confer (NIMC)" to the Permittee. The NIMC shall include a date by which the Permittee must meet with RWQCB staff. (Failure of the RWQCB to issue a NIMC to any jurisdiction shall constitute evidence that the RWQCB has determined that the jurisdiction in question is in compliance with the terms and conditions of this permit.)

2. Upon receipt of a NIMC, the Permittee shall meet and confer with RWQCB staff to clarify whether the Permittee is in compliance with the permit, and if not, the steps to be taken to ~~completely~~ meet the provisions of this permit. The effect and confer sessions shall be for the purpose of developing additions and enhancements to the jurisdiction's stormwater program, if needed to comply with the legal requirements of the Clean Water Act. The meet and confer period shall conclude with the submittal to and acceptance by the Executive Officer of a written "Stormwater Program Compliance Amendment (SPCA)" which shall include implementation deadlines. The Executive Officer may terminate the meet and confer period after a reasonable period due to a lack of progress on issues and may order submittal of the ~~SPEP~~ SPCA by a specified date. Failure to submit an acceptable SPCA by the specified date shall constitute a violation of the Permit.

3. The Executive Officer will approve or reject the submitted SPCA within a reasonable amount of time. Rejection of a submitted ~~SPEP~~ SPCA by

Thus redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text

the Executive Officer shall state the reasons for the failure to approve the SPCA. A Permittee that receives a rejection of an SPCA shall have thirty (30) days to remedy the specified deficiency in the SPCA and receive administrative approval from the Executive Officer of the amended SPCA. Approval of the SPCA by the RWQCB shall be evidence that the RWQCB has determined that the jurisdiction in question is in full compliance with the permit and that there has been no violation of the permit. Rejection of a submitted SPCA by the RWQCB shall state in writing the reasons for the failure to approve the SPCA. A jurisdiction that receives a rejection of a SPCA shall have fifteen (15) days to cure the specified defects in the SPCA and receive administrative approval from the RWQCB of the amended SPCA. Failure to have a SPCA approved by the RWQCB within thirty (30) days from the conclusion of the meet and confer period shall be a violation of the permit.

4. The Permittee shall comply with the terms of the SPCA. The Permittee shall submit reports to the Executive Officer of progress made under the SPCA. The frequency of progress report submittal shall be as prescribed by the Executive Officer. Failure ~~1,0~~ to comply with the terms and conditions of the SPCA shall constitute a violation of the Permit and shall be cause for immediate Administrative Civil Liability as prescribed by the Executive Officer.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

September 14, 1995

II. ILLICIT DISCHARGES\DISPOSAL

A. Illicit Connections

By _____, the EAC shall develop a consistent program including investigative standard procedures to eliminate illicit connections to the storm drain system.

By _____, each Permittee shall implement a program to identify and eliminate illicit connections to the maximum extent practicable and to the extent required by the Clean Water Act.

1. The program shall, ~~at a minimum~~ to the extent required by the Clean Water Act:

   a. standardize, per EAC guidelines, storm drain inspection procedures, and illicit connection ~~and~~ identification and elimination procedures;

   b. prioritize major problem areas, to include but not be limited to older business areas, and areas with heavy industry such as those listed under subchapter N of 40 CFR Parts 405 - 471

   c. utilize results of field screening activities, and other appropriate information.

   d. contain an industrial/commercial education/outreach component to inform businesses about the problem of illicit discharges/dumping and proper discharge/disposal practices,

   e. schedule inspections of storm drains ~~for inspection~~ for illicit connections within its jurisdiction.

   f. maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

   g. establish enforcement procedures to terminate illicit connections.

B. Illegal Discharges\Disposal

This redlined draft shows the differences between L\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text

1. By _____, the EAC shall develop a consistent program including investigative standard procedure, to eliminate illegal discharges/disposal practices to the storm drain system.

2. By _____, the EAC shall develop a standard enforcement procedures, including administrative and judicial, to eliminate illegal discharges/disposal practices.

3. By _____, the EAC shall develop standard procedures for spill response, including a procedure to ensure hat, in a spill response, sewage treated with disinfection agents will not be discharged into the storm drainage system, to the maximum extent practicable. The standard procedures will address investigation, containment, and cleanup activities as appropriate.

4. By _____, each Permittee shall implement a program to identify and eliminate illegal discharges/disposal practices to the ~~maximum extent practicable~~ extent required by the Clean Water Act.

The program shall, ~~at a minimum~~ to the extent required by the Clean Water Act:

a. Identify and prioritize problem areas of illegal disposal where inspection, clean up, and enforcement are necessary to prevent the discharge of contaminants;

b. Maintain a surveillance program to detect illegal discharges and disposal into the street system, including, but not be limited to, street use inspections and inspections of vacant facilities;

c. Establish procedures to educate inspectors, maintenance workers, and other field staff in their jurisdiction to notice illicit dischargers/disposal practices during the course of their daily activities, and report such occurrences;

d. Maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

e. Establish per EAC guidelines spill response procedures; and

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

f. Establish, per EAC guidelines enforcement procedures to eliminate illegal discharges/disposal practices.

C. Non-Storm Water Discharges

1. Exempted Discharges

(Currently under discussion with the negotiation team.)

2. Conditionally Exempted Discharges

(Currently under discussion with the negotiation team.)

D. Other Prohibited Activities

1. The Permittees shall prohibit any person from:

a. causing or allowing illicit discharges to be made into the storm drain system;

b. establishing, using or maintaining an illicit connection to the storm drain system;

c. littering.

d. disposing of leaves, dirt or other landscape debris into a storm drain; and

e. using any pesticide, fungicide, or herbicide which has either been voluntarily discontinued or prohibited by the USEPA.

f. washing down toxic materials from paved or unpaved areas.

g. washing down impervious surfaces in industrial and/or commercial areas ~~is prohibited~~ unless ~~significantly~~ required ~~to~~ under the Health and Safety ~~Codes~~ Code or other laws.

2. Storage of Materials, Machinery and Equipment

The Permittees shall require:

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

a. that objects, such as motor vehicle parts, containing grease, oil, or other hazardous substances, and unsealed receptacles containing hazardous materials, be stored away *[NOTE: WHAT DOES "AWAY" MEAN]* from areas susceptible to runoff;

b. that machinery or equipment which is to be repaired or maintained in areas susceptible to runoff~~;~~ be placed on a pad of absorbent material, or an equivalent, to contain leaks, spills or small discharges;

c. that owners of commercial/industrial motor vehicle parking lots and structures located in areas susceptible to runoff to be swept to remove debris. *[NOTE: This says that permittees shall require "that owners ... be swept." Illustrates sloppy drafting. Change to:*

> that commercial/industrial motor vehicle parking lots *[NOTE: minimum size?]* and structures located in areas susceptible to runoff be swept to remove debris.

Lots with more than ten (10) parking spaces and all public parking facilities ~~;~~ shall ~~also~~ be vacuum swept, or by equivalent method, to remove chemical ~~residue~~ residues;

d. that all fuel and chemical residue, animal waste, garbage, batteries, or other ~~types of~~ potentially harmful materials which are located in areas susceptible to runoff, be removed immediately *[NOTE: why "immediate" here and not elsewhere? Suggest that "immediate" be deleted.]* and disposed of properly.

e. that hazardous waste be disposed of through the Permittee's hazardous waste program or at any other appropriate disposal site, and not be placed in a trash container for regular trash disposal. *[NOTE: THIS SHOULD BE DELETED AS IT IS REDUNDANT WITH NUMEROUS OTHER LAWS.]*

E. Public Reporting

1. By _____, the EAC shall develop a standard program, for Permittees to implement by _____, to promote, publicize, and facilitate public reporting

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

of illicit discharges and illegal disposal practices that may adversely impact water quality.

2. By _____, EAC shall develop a standard program for the reporting of incidents of a hazardous substance entering the storm drain, where the responsible party is not known, to the Regional Board and State of California Office of Emergency Services (OES) at (800) ___-___ and the Federal Hazardous Response Number at (800) ___-___. *[NOTE: IS THIS INTENDED TO REFER TO THE NATIONAL RESPONSE CENTER? IF SO, THE CORRECT TERM, "National Response Center" SHOULD BE USED.]* The Permittees shall implement this program by _____. *[NOTE: THE CONCEPT OF "REPORTABLE QUANTITY" IS MISSING HERE, BUT IS REQUIRED BY NEARLY ALL OTHER LAWS IMPOSING REPORTING REQUIREMENTS. IT IS SUGGESTED THAT THE OTHER LAWS BE INCORPORATED BY REFERENCE.] [NOTE: what is the purpose of this requirement? Why report incidents where the "responsible party" is not known, but not incidents where the "responsible party" is known?]*

F. Reporting

1. A quarterly summary of illicit connections eliminated shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the investigation; what was being discharged; estimated length of time the practice was on-going; ~~what~~ remedial action ~~was~~ taken; and what happened to the discharger.

2. A quarterly summary of illegal discharge/disposal practices reported through the standardized public reporting system shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the incident; what was spilled/dumped; quantity; ~~what~~ remedial action was taken; and what happened to the discharger/dumper.

G. Coordination With State Permits

1. The Principal Permittee will be provided an updated list of NPDES Permits on a quarterly basis, through the Regional Board's electronic bulletin board, to verify permitted sources of the existing non-storm water discharges in the storm water drainage system.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

2. The Permittees ~~will work~~ may cooperate with other regulatory agencies ~~and~~ may report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies. These agencies, include but are not limited to:

a. California Department of Fish and Game
b. California Department of Toxic Substances Control
c. California Coastal Commission
d. United States Environmental Protection Agency
e. California Department of Transportation
f. California Air Resources Board

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

September 14, 1995

III. PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES

A. Identification of Sources

1. By _____, ~~the Permittees~~ and to the extent required by the Clean Water Act, each Permittee shall develop a database listing industrial/commercial facilities by four digit SIC codes within the Permittee's jurisdiction, which shall be updated annually. The database shall include at a minimum:

   a. Facility owner's name, address, and telephone number;

   b. Site address, telephone number, and contact person;

   c. Closest receiving water and watershed;

   d. Applicable SIC code(s);

      i. For each four digit SIC sector, the Permittees shall identify primary activities that might impact runoff discharges;

      ii. For each four digit SIC sector, the Permittees shall identify primary materials at might impact runoff discharges; and

2. By _____, the EAC shall develop a pollutant source identification program for the control of storm water pollutant discharges from industrial/ commercial facilities. The objective of the source identification program is to gather data on specific and/or interrelated set of pollutant generating activities occurring on very small areas (< 5 acres) of industrial/commercial activity and to provide information for developing and implementing BMPs for specific activities.

B. Prioritization of Sources

1. By _____, ~~the Permittees~~ and to the extent required by the Clean Water Act, each Permittee shall prioritize industrial and commercial facilities, if any, within ~~their~~ its jurisdiction ~~on~~ by their relative potential for ~~the~~ contamination of storm water and urban runoff. The prioritized list shall include

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

a. Categorical List

i. All industries regulated under Phase I of the Federal storm water program (4 CFR 122.26).

ii. All industrial/commercial SIC codes selected by the USEPA for screening under Phase II of the Federal storm water program.

iii. Other business sectors considered by the EAC or the Regional Board conduct industrial/commercial activity with a high potential for storm water contamination (e.g, restaurants).

The categorical list shall be grouped by ~~Permittees and~~ the Permittee. The list shall provide an ~~organized~~ overview of the ~~target~~ facilities based on land use, operation, and activities, ~~could~~ ~~potentially~~ and whether the facilities are likely to contribute significant amounts of pollutants into storm water runoff.

2. By _____, and to the extent required by the Clean Water Act, Permittees shall rank the industrial and commercial facilities, identified as potential pollutant sources of storm water and urban runoff pollutants in ~~III. B.1.a~~ III.B.1.a, in order of priority for oversight of implementation of storm water management measures. *[NOTE: what is meant by the term: "oversight of implementation of storm water management measures?"]*

C. Source Control Measures

1. By, _____, and to the extent required by the Clean Water Act, Permittees shall develop a checklist of specific storm water and urban runoff control measures for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutant; into storm water runoff. The control measures must

a. address multiple pollutant sources

b. initially focus on source control measures such as source minimization, education, good housekeeping, and site design alternatives.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

c. target industrial/source areas and activities with the potential to generate pollutant loadings

2. By _____, and to the extent required by the Clean Water Act, Permittees shall develop a process to ensure implementation of storm water and urban runoff control measures for industrial/commercial facilities identified in III.C.1.

3. By _____, and to the extent required by the Clean Water Act, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutants into storm water runoff. The structural control measures must be evaluated as to

a. effectiveness in reducing toxic pollutants and pollutants of concern

b. ease of maintenance

c. current frequency of use

d. feasibility and cost-effectiveness

e. possible methods to ensure implementation if necessary

By _____, the Permittees shall, in addition, describe any studies and pilot projects they intend to conduct to assess the feasibility and effectiveness of specific control measures.

4. By _____, and to the extent required by the Clean Water Act, Permittees shall require the following:

a. The proper disposal of food wastes by restaurants and food wholesalers.

b. Persons owning or operating a gas station, auto repair garage, or similar structure must clean those facilities in a manner that does not result in discharge of pollutants to the storm drain system; and

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

c. Machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze must be repaired.

5. The EAC may seek coverage under this Order, for industrial facilities listed in III.B.I.a.1 which are owned and operated by Permittees if it,

a. establishes a procedure for notifying the Regional Board of industrial sites owned and operated by Permittees

b. prepares a checklist of industrial BMPs using BAT/BCT criteria for implementation by Permittees at these industrial sites

c. standardizes procedures to ensure implementation of industrial BMPs by Permittees,

d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee industrial facilities

e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each site, and certify compliance with this Order.

~~START SPELL CHECK~~

D. Source Inspection

1. By _____, and to the extent required by the Clean Water Act, Permittees shall submit a schedule for inspection of industrial/commercial facilities in III.B.I.a. for adequacy of storm water pollution prevention measures. The schedule shall include, for a five year period,

a. for municipalities with a population of less than 250,000, all facilities identified in III,B.I.a.1, and all facilities identified in III.B.I.a.2 and III. B.I.a.3,

b. for municipalities with a population of greater than 250,000, all facilities identified in III.E.I.a.1, and, a subset of facilities identified in III.B. I.a.2 and III.B. 1.a.3 but not less than ten times the number identified in III.B.I.a.1

VOL 24

0219

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

Industrial/commercial facilities in III.B.I.a.2 and III.B.I.a.3 that are not included in the inspection schedule shall be surveyed by phone, mail-out, or a similar method, as to their conformance with good stormwater quality management measures.

2. By _____, and to the extent required by the Clean Water Act, Permittees shall develop and implement a industrial/commercial facilities inspection program. The inspection program shall include, but is not limited to:

   a. procedures for facility inspections

   b. procedures for industrial/commercial sectors outreach on pollution prevention, waste minimization, and storm water quality management

   c. procedures to ensure corrective action is undertaken by non complying facilities

   d. procedures to follow-up on violations of municipal standards

   e. procedures for enforcement action against non-complying facilities;

   f. an electronic recording system to document the status of facility inspections; and,

   g. appropriate training for program staff.

3. During inspection of group III.B.1.a.1, inspectors shall request to see a copy of the SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may ~~deem it necessary to~~ report problematic facilities to the Regional Board.

E. Reporting

Each year, ~~the Permittees~~ and to the extent required by the Clean Water Act, each Permittee shall evaluate the results and progress of ~~their~~ its storm water quality management program for industrial/commercial sources, if any. The annual report submitted to the Regional Board ~~shall recommend a strategy~~ may include recommended strategies for the management of storm water from

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

industrial/commercial sources for the following year based upon any or all of the following:

a. priority industrial/commercial sources listing
b. priority on-site inspection
c. phone/mail-out survey inspections
d. priority checklists of stormwater urban runoff control measures
e. evaluations of structural arid treatment control measures
f. special studies and pilot projects needs
g. specific site and activity monitoring needs

The EAC shall make available to the Regional Board the industrial/commercial database developed in III.B.I.a.1 in the appropriate format when so requested.

F. Coordination

The Permittees, to the extent required by the Clean Water Act, shall develop a process for the exchange of information between ~~the~~ Permittees and the Regional Board. Appropriate formats for such reports shall be developed as required.

G. Conflicts with Other Mandates

1. The Permittees ~~will~~ may work with ~~other~~ other regulatory agencies and report to the Regional Board on recommendations to resolve ~~any~~ conflicts ~~which are identified~~, if any, between the provisions of this permit and the requirements of other regulatory agencies.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

September ~~14~~, 1995

IV. PROGRAM REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT

A. Regional Policy

1. By _____, the EAC shall develop and adopt a regional policy to promote watershed protection considerations during planning, project review, and permitting of new development and redevelopment, to:

   a. preserve to the extent feasible, and where possible, create or restore areas that provide water quality benefits, such as riparian corridors and wetlands, and promote the design of new development so that it protects the natural integrity of drainage systems and water bodies.

   b. avoid conversions of areas particularly susceptible to erosion or sediment loss and/or establish development guidance that identifies these areas and protects them from erosion and sediment loss. Such areas include steep slopes, highly erodible soils, periods of intense rainfall, and inability to revegetate once disturbed.

   c. require the integration ~~em~~ of storm water quality protection into construction and post-construction activities at all development sites, including the minimization of toxic material use and their careful containment on site.

   d. maintain peak runoff rates at pre-development levels, wherever practicable.

2. By _____, the EAC shall establish minimum requirements consistent with the regional policy for new development and redevelopment, for

   a. site planning practices

   b. construction best management practices

   c. post-construction best management practices

   d. reporting erosion and storm water control strategies

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

e. redevelopment and infill

B. Planning Process

In order to integrate storm water management considerations into new development projects at the time that ~~th(y~~ they are first proposed to jurisdictions, and to support other provisions of this permit:

1. By _____, the EAC shall develop guidance for permittees to use in preparing/reviewing EIRS, and in linking EIR mitigation conditions to local permits approvals.

2. By _____, ~~permittees~~ and to the extent required by the Clean Water Act, Permittees shall adopt and use the guidance in their internal procedures.

3. By _____, the EAC shall develop a model CEQA checklist form that explicitly addresses watershed, water quality, and nonpoint source pollution impacts.

4. By _____, the permittees ~~shall~~ may use the model CEQA checklist for the review of projects within the matters addressed by this Permit. *[NOTE: Cities, not the RWQCB or other author of the "model CEQA Checklist" are responsible for CEQA compliance, and the adequacy of their checklists.]*

5. Whenever a permittee ~~rewrites either of the following mandated general plan elements the~~ amends its general plan's conservation element or ~~the~~ open space element, watershed and stormwater management/urban runoff considerations shall be incorporated, to the extent required by the Clean Water Act.

6. By _____, to the extent required by the Clean Water Act, permittees shall implement a program to encourage developers to maximize pervious areas and storm water infiltration (in areas where the geology and topography allow), minimize directly connected imperious areas, and include justifiable treatment control measures.

7. Permittees, to the extent required by the Clean Water Act, shall require that prior to the submittal of an application for the first planning or

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

building approval for a new development project, an applicant shall submit an Urban Runoff Mitigation Plan.

a. The Urban Runoff Mitigation Plan, to the extent required by the Clean Water Act, shall:

i. Be designed to reduce the runoff volume from the site and the pollutant load contributed by the site through incorporation of design elements and practices that address each of the goals set forth below in subsection (c). (Applicants should refer to the most recent edition of the Construction Best Management Practices Handbook, produced and published by the Storm Water Quality Task Force, for specific guidance on selecting best management practices for reducing pollutants in stormwater discharges from urbanized arias.)

ii. Discuss compliance with the development requirements set forth by Permittee's legal authority; and

iii. Address the following goals in connection with both construction and long term operation of the site:

(a) Maximize, to the extent practicable, the percentage of permeable surfaces in order to allow more percolation of runoff into the ground.

(b) Minimize, to the extent practicable, the amount of runoff directed to impermeable areas to the City's stormwater system.

(c) Maximize, to the extent practicable, stormwater filtration and storage for reuse through the use of sediment traps, cisterns or other means.

(d) Minimize, to the extent practicable, parking lot pollution through the use of porous materials to allow percolation of runoff, through the installation of appropriate treatment controls, or through other means.

This redlined draft shows the differences between I:\RCYOUNO\PUBL\137989.1 and I:\RCYOUNO\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

iv. Compliance with an approval Urban Runoff Mitigation Plan shall be a condition of any required planning approval.

v. Failure to comply with an approved Urban Runoff Mitigation Plan after receiving any required planning approval shall be a misdemeanor.

C. Identification of Sources

1. By _____, the EAC shall establish a screening criteria for construction sites to be listed in a database.

2. By _____, to the extent required by the Clean Water Act, the Permittees shall develop a database listing sites of construction activity within each Permittees' jurisdiction which shall be updated quarterly. The database shall include at a minimum:

a. Facility owner's name, address, and telephone number;

b. Site address, telephone number, and contact person;

c. Closest receiving water;

d. Type of construction activity

e. Duration of project with start and end dates

f. Total size of project in acres or square feet.

D. Prioritization of Sources

1. By _____, to the extent required by the Clean Water Act, the Permittees shall prioritize sites of construction activity within their jurisdiction on their relative potential for the contamination of storm water and urban runoff. The categorical list shall include:

a. All construction activity sites regulated under Phase I of the Federal storm water program (40 CFR 122.26).

b. All construction activity with sites greater than the size criteria established by the EAC rut less than five acres in size.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

c. Other construction activity sites considered by the EAC or the Regional Board to have high potential for the contamination of storm water and urban off.

2. By _____, to the extent required by the Clean Water Act, Permittees shall rank the construction activity sites, identified as potential pollutant sources of storm water and urban runoff pollutants in IV.B.1.a, in order of priority for oversight of implementation of storm water management measures.

E. Control Measures

1. By _____, to the extent required by the Clean Water Act, Permittees shall develop a checklist of specific storm water and urban runoff control measures for construction activity sites in IV. B.I.a. The control measures must

   a. address multiple pollutant sources

   b. initially focus on source control measures such as source minimization, education, good housekeeping, good waste management and good planning.

   c. target construction activity source areas and activities with the potential to generate substantial pollutant loadings

2. By_____, to the extent, if any, then required by the Clean Water Act, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for construction sites in IV.B.I.a. The structural control measures must be evaluated as to:

   a. effectiveness in reducing sediment, toxic pollutants and pollutants of concern;

   b. ease of maintenance;

   c. current frequency of use;

   d. feasibility and cost-effectiveness; and

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137919.1 and I:\RCYOUNG\PUBL\137919.2. Deletions appear as struck-through text and Additions appear as double underlined text.

e. possible methods to ensure implementation.

By _____, Permittees shall describe any studies and pilot projects that may be conducted to assess e feasibility and effectiveness of specific control measures.

~~3.~~ By _____, to the extent required by the Clean Water Act, Permittees shall have in place a process to ensure implementation and proper maintenance of storm water and urban runoff control measures for sites associated with construction activity in IV.B.I.a., including

a. use of qualified personnel to design, install, and maintain BMPS.

b. proper maintenance of BMPs incorporated into private developments (e.g., through deed restrictions, covenants, conditions and restrictions (CCR).

c. proper installation and maintenance of post-construction BMPS.

d. prohibition on grading daring the wet season (Oct 15 -Apr 15) except for emergency action unless adequate erosion and sediment control measures are in place and maintained.

4. Permittees, to the extent required by the Clean Water Act, shall require the following for demolition/construction activity:

a. Sediment, construction waste and other pollutants from construction sites and parking areas shall be retained on the site to the maximum extent practicable.

b. Any sediments or other materials which are not retained on the site shall be removed within 24 hours or where determined necessary by the Director of Department of Public Works, or a designated representative, a temporary sediment barrier shall be installed.

c. Excavated soil shall be located on the site in a manner that eliminates the amount of sediments running into the street or adjoining properties. Soil piles shall be covered until the soil is either used or removed.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

d. Drainage controls shall be utilized as needed, depending on the extent of proposed grading and topography of the site, including but not limited to the following:

i. Detention ponds, sediment ponds, or infiltration pits.

ii. Dikes, filter beams or ditches.

iii. Downdrains, chutes or flumes.

iv. Silt fences.

e. No washing of construction or other industrial vehicles shall be allowed adjacent to a construction site. No water from washing vehicles on a site is allowed to run off into the City's storm drain system.

f. Roof drainage shall be oriented towards permeable areas on site to maximum extent practicable.

g. Lot drainage shall be oriented towards permeable areas to the maximum extent practicable.

h. All parking lots shall be designed to contain one inch of precipitation in a 24 hour period.

i. Runoff from parking lots shall be directed to permeable areas to the Maximum Extent Practicable.

5. Permittees, to the extent required by the Clean Water Act, shall require the following for construction activity:

a. All construction sites in hillside areas or in areas adjacent to natural water-ways (soft bottom creeks), lakes or the ocean must develop and implement sedimentation and erosion control plans that incorporate the following elements: timing of construction, BMPs to reduce erosion of cleared hillsides (revegetation, jute netting, etc.), BMPs to reduce the velocity of runoff and sediment from the construction site, and BMPs to detain the flow of sediments from the site;

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

b. As a condition of granting a construction permit, set forth reasonable limits on the clearing of vegetation from construction sites, including, but not limited to, regulating the length of time during which soil may be bare, and, in certain sensitive cases, prohibiting bare soil.

6. The EAC may seek coverage under this Order, for construction activity sites listed in III.B.I.(a) 1 which are owned and operated by Permittees if it:

a. establishes a procedure for notifying the Regional Board of construction activity on sites owned or operated by Permittees;

b. prepares a checklist of construction BMPs using BAT/BCT criteria for implementation by Permittees at these construction sites;

c. standardizes procedures to ensure implementation of construction BMPs by Permittees;

d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee construction sites; and

e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each construction site, and certify compliance with this Order.

F. Source Inspection

1. By _____, to the extent required by the Clean Water Act, Permittees shall submit a schedule for inspection of construction activity sites in IV.B.1.a. for adequacy of storm water pollution prevention measures and erosion control measures. The schedule shall include, for a five year period,
   a. all construction activity identified in IV.B.I.a.1, and all construction activity identified in III.B.I.a.2 and III. B.I.a.3,

2. By _____, to the extent required by the Clean Water Act, Permittees shall develop and implement a construction activity inspection program. The inspection program shall include, but is not limited to:

   a. procedures for construction site inspections

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

b. procedures for construction and building industry outreach on pollution prevention, waste minimization, and storm water quality management

c. procedures to ensure corrective action is undertaken by non complying sites

d. procedures to follow-up on violations of municipal codes

e. procedures for enforcement action against non-complying construction activity;

f. an electronic recording system to document the status of construction activity inspections; and,

g. appropriate training for program staff.

3. During inspection of group IV.B.1.a.1 sites, inspectors shall request to see a copy of the SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may deem it necessary to report problematic construction sites to the Regional Board.

G. Reporting

1. Each year, to the extent required by the Clean Water Act, the Permittees shall evaluate the results and progress of their storm water quality management program for construction activity sites. The annual report submitted to the Regional Board shall recommend a strategy for the management of storm water from construction activity sites for the following year based on

a. priority construction site sources listing

b. priority site inspections

c. priority checklists of stormwater urban runoff control measures

d. evaluations of structural and treatment control measures

e. special studies and pilot projects needs

VOL 24

02300

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

f. specific site and activity monitoring needs

2. The EAC shall make available to the Regional Board the construction activity database developed in IV.B.1.a.1 in the appropriate format when so requested.

H. Conflicts with Other Mandates

1. The Permittees ~~shall work~~ may cooperate with ~~other~~ regulatory agencies ~~and report~~ may make recommendations to the Regional Board ~~on recommendations~~ to resolve ~~any~~ conflicts ~~which are identified~~ between the provisions of this permit and the requirements of other regulatory agencies.

VOL 24

0231

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

September 14, 1995

V. PUBLIC AGENCY REQUIREMENTS

A. Examination of Existing Activities

By _____, to the extent required by the Clean Water Act, the Permittees shall develop and begin implementation of a program to examine their existing activities and measures described below to reduce the impact on stormwater quality from their operations.

B. Sewage Systems

1. All reasonable efforts shall be undertaken to keep sewage spills or leaks from entering the storm drain system. The EAC shall develop procedures for spill response by _____.

2. Control procedures for identifying, repairing, and remediating sewer blockages, exfiltration, overflow, and wet weather overflows from the sewers to the storm drain system shall be implemented to protect stormwater quality by _____. These procedures shall include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

3. By _____, ~~the Permittees~~ to the extent required by the Clean Water Act, each Permittee shall insure that its field personnel who operate and/or maintain sewer systems have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to ~~properly~~ investigate properly any suspect connections or cross connections to the storm drain system.

C. Vehicle Maintenance/Material Storage Facilities.

1. By _____, EAC will develop pollution prevention plans for each public vehicle maintenance/material storage facility category. Public vehicle maintenance/material storage facilities include any Permittee-owned and/or operated facility in which any of the following occur: vehicle or equipment maintenance; repair; washing; fueling; and/or any facility at which there is storage of toxic chemicals or hazardous materials.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

2. Best Management Practices (BMPS)

a. By _____, to the extent required by the Clean Water Act, Permittees will have site specific pollutant control measures implemented at all vehicle ~~maintenance/material~~ maintenance/ material storage facilities per EAC guidelines, together with an on-site pollution prevention plan.

b. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each public vehicle maintenance/material storage facility. To achieve this goal, the Permittees shall first identify the potential pollution sources and who is responsible for implementing the stormwater management measures.

c. Based on ~~the~~ facility type, management practices and schedule of implementation shall be developed by the EAC. BMPs that ~~can~~ could be used to improve the quality of runoff include, but are not limited to:

i. Housekeeping practices;

ii. Material storage control;

iii. Vehicle leak and spill control; and

iv. Illegal dumping control.

d. Loading/Unloading of Materials

i. Employees or contractors of the Permittees who handle potentially harmful materials shall be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to stormwater from outdoor loading/unloading of materials.

ii. Applicable BMPs shall be selected based on the following three factors:

(a) Eliminating exposure of material to rainfall;

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

(b) Checking equipment regularly for leaks; and

(c) Containing spills.

e. Material Storage Control

A program shall be developed to prevent or reduce the discharge of pollutants to stormwater from outdoor container storage areas using measures such as:

i. Installing safeguards against accidental releases;

ii. Secondary containment;

iii. Conducting regular inspections; and

iv. Training employees in standard operating procedures and spill cleanup techniques.

f. Vehicle and Equipment Washing and Maintenance

i. Washing of vehicles or equipment on-site shall be performed in a designated area equipped with an oil/water separator.

ii. The sumps and separators shall be maintained/cleaned on a regularly scheduled basis appropriate to the facility.

iii. BMPs to be implemented as appropriate for vehicle and equipment maintenance shall include but not be limited to:

(a) Waste reduction;

(b) Use of alternate product

(c) Pollution prevention;

(d) Recycling; and

(e) Spill prevention and clean up.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

3. Waste Handling and Disposal

Wastes shall be managed to prevent stormwater pollution.

D. Parks and Recreation

1. Fertilizers/Pesticides

a. Permittees, to the extent required by the Clean Water Act, shall develop procedures on the proper application of pesticides, herbicides, and fertilizers by Procedures shall include:

i. List of approved pesticides and selected use;

ii. Product and application information;

iii. Equipment use an(i maintenance procedures; and

iv. Record keeping.

b. Landscape waste shall not be discharged into the storm drain system.

c. Storage areas for fertilizers and pesticides shall be designed and maintained to reduce exposure to stormwater. The following BMPs shall be utilized where appropriate:

i. Store materials inside or under cover on paved surfaces;

ii. Use secondary containment;

iii. Minimize storage and handling of hazardous materials;

iv. Inspect storage areas regularly.

2. Facility Management

a. Wash waters ~~cannot~~ shall not be discharged into the storm drain system without appropriate treatment.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

b. Landscape maintenance involving the use of pesticides and fertilizers shall ensure the proper use of these materials to minimize loss to storm water.

c. Retention and planting of native vegetation to reduce water, fertilizer, and pesticide needs shall be encouraged.

d. Use of Integrated Pest Management (IPM) shall be encouraged.

e. A schedule for irrigation and fertilization shall be developed by _____, to minimize

i. Chemical application during wet season and no chemical application during storms; and,

ii. Over watering that may lead to runoff that contains nutrients and pesticides.

f. The drainage of commercial/municipal swimming pool water shall ~~only~~ be discharged only under separate Waste Discharge Requirements.

g. Each Permittee shall develop BMPs to minimize trash, debris, and other pollutants from entering Permittee owned recreational water bodies by _____. These measures shall include:

i. Routine trash collection along, on, and/or in, water bodies, where feasible; and

ii. Public outreach to educate the public about impacts of illegal dumping.

E. Storm Drain System Operation and Management

1. Inlet Maintenance

BMPs to be implemented by each Permittee, to the extent required by the Clean Water Act, for effective catch basin cleaning shall include, but not be limited to the following:

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

a. Basins shall be inspected and cleaned between May 1 and October 15 of each year;

b. Between October 15 and April 15, catch basins shall be maintained as necessary.

c. Records shall be kept of the number of catch basins cleaned; and

d. Track the amount of waste collected.

2. Storm Drain Maintenance

a. Material removed from storm drains and catch basins shall be disposed of properly.

b. Trash and debris from open channel storm drains shall be removed at least annually between May 1 and October 15 of each year.

c. Open channels shall also be monitored during the rainy season for any debris buildup and cleaned where needed.

3. Waste Management

The Permittees ~~shall implement a program by _____~~, to the extent required by the Clean Water Act, shall, by _____, implement a to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

4. Dry Weather Storm Drain Diversion

The Permittees, to the extent required by the Clean Water Act, shall investigate the feasibility of diverting dry-weather flows from the storm drain system to POTWs where appropriate. The investigation, to the extent required by the Clean Water Act, shall be completed by _____.

VOL 24

02371

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

F. Streets and Roads

1. Sweeping of curbed streets:

a. Sweeping of curbed streets shall occur at least monthly.

b. Where feasible, areas generating excessive refuse shall be swept more frequently.

2. Maintenance

a. Existing saw-cut management and paving practices conducted by the Permittees shall be evaluated and appropriate control measures developed.

b. Paving control measures to be considered that would help reduce the impacts to stormwater include, but are not limited to:

i. Avoid paving during wet weather; and

ii. Store materials away from drainage courses to prevent pollution of stormwater runoff.

c. Refuse collected shall be transported to appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations.

d. Good housekeeping practices shall be implemented to insure proper management of any waste products that may be generated during maintenance activities.

e. To reduce stormwater pollution from concrete materials and wastes:

i. Washout of concrete trucks should be conducted off- or on-site in designated areas. ~~Do not wash out~~ Rinseate from concrete trucks shall not be permitted to flow into storm drains, open ditches, streets, or streams;

ii. Store materials *[NOTE: Please BE SPECIFIC, what materials?]* under cover, away from drainage areas; and

VOL 24

02388

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text

iii. Avoid mixing excess amounts of concrete or cement on-site.

f. Employees shall be trained in the implementation of good housekeeping measures. Training shall:

i. Promote a clear understanding of the potential for maintenance activities to pollute storm water;

ii. Identify solutions (BMPs selection);

G. Flood Control

1. By _____, the Permittees, to the extent required by the Clean Water Act, shall develop and implement procedures to assess the impact(s) of new flood management projects on the quality of receiving water bodies.

2. The Permittees, to the extent required by the Clean Water Act, shall undertake pilot projects/studies to determine the applicability of altered structural flood control system elements to provide pollutant removal in stormwater.

3. ~~During construction~~ To the extent required by the Clean Water Act, appropriate BMPs shall be utilized to control pollutants during construction .

4. Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed, to the extent required by the Clean Water Act, to assure that appropriate management measures are developed to comply with the stormwater regulations.

H. Parking Facilities

By _____, to the extent required by the Clean Water Act, each Permittee shall develop a program to implement periodic hardscape and catch basin cleaning, in order to reduce concentrations of oil, grease, suspended particulates, and metals, as well as the petroleum byproducts.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

September 15, 1995 (To be negotiated)

VI. PUBLIC INFORMATION AND PARTICIPATION

To reach as many Los Angeles County residents as possible, a comprehensive educational outreach approach shall be undertaken under this permit. ~~Each~~ to the extent required by the Clean Water Act. To the extent required by the Clean Water Act, each Permittee shall choose an appropriate combination of outreach tools and activities to raise public awareness of storm water issues and improve water quality.

Outreach Materials

Outreach programs shall consist of written, audio, and visual materials and, when necessary, translated into appropriate languages or structured for appropriate ages. Permittees, to the extent required by the Clean Water Act, shall incorporate interactive methods of distributing outreach materials and provide for public participation in activities developed under this section.

A. Written Material

1. The Permittees, to the extent required by the Clean Water Act, shall produce a variety of written materials to convey information regarding storm waste management within County watersheds.

2. Written materials shall include, but are not limited to: flyers, brochures, door-hangers, newspaper articles, mail-inserts, and newsletters.

B. Audio Material

1. All Permittees ~~shall singularly or collectively~~, to the extent required by the Clean Water Act, shall individually or jointly utilize radio broadcast public service announcements to convey information regarding storm water management except in areas where public access radio stations are not available.

2. Examples of audio materials include radio advertisements, public service announcements, and informational recordings.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

C. Visual Material

1. All Permittees, to the extent required by the Clean Water Act, shall implement a catch basin labelling program as well as other strategies such as banners, displays and posters to educate the public on the ultimate destination of storm drain system flows.

2. Each Watershed Management Committee shall produce at least one informational video. The video shall be shown on televised public service stations and cable access programs except in areas where cable access programs are not available. Further methods of distribution may include workshops, libraries, etc.

D. Distribution of Materials

Outreach materials shall be made available to the public at appropriate public counters and distributed at public events. Examples include fairs, festivals, public meetings, community events, school assemblies, etc.

General Education Strategy

A. The EAC shall develop and the Permittees shall implement a 5-year urban runoff education strategy. The intent of the strategy shall be to enhance public awareness of the impact of storm water pollution on receiving waters and to discourage improper waste disposal practices. Outreach efforts shall be conducted throughout the watershed. The public shall be made aware of their responsibility for both the problems and solutions to storm water pollution. A watershed-wide program shall be implemented by _____.

Development and implementation of the education strategy shall be based on the four objectives listed below:

1. Promoting clear identification and understanding of the problem, including activities with the potential to pollute storm water;

2. Identifying solutions or applicable measures (Best Management Practices) that can be taken to prevent storm water pollution;

3. Raising public awareness of the problems and solutions; and

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

4. Incorporating solutions back into programs, training and BMP implementation.

B. Efforts shall be made to identify land uses and activities that have a higher potential for storm water/urban runoff pollution by focusing on specific pollutants, disposal practices, materials used, etc, To prevent storm water/urban runoff pollution, outreach materials shall be provided on the appropriate selection and implementation of BMPs accordingly A watershed-wide program shall be developed by _____.

1. Pollutant Specific: The reduction of specific pollutants of concern in a particular watershed shall be addressed in a focused public education and outreach program.

2. Activity-specific: Activity-specific outreach programs shall be developed and implemented throughout watershed. Written, audio, or visual outreach tools should address primary topics:

   a. Identification of activities potentially causing storm water pollution;

   b. Implementation of Best Management Practices to prevent storm water pollution.

   c. Recognizing and reporting occurrences of storm water polluting activities.

   The Permittees shall continue to develop activity-specific outreach programs that inform residents about the problem of illicit discharges and dumping and that promote, publicize, and facilitate public reporting of these activities. The program shall also include continuing operation, maintenance, and promotion of the county-wide reporting hotline.

C. The Permittees shall ~~list pertinent~~ submit to telephone directory publishers, City phone numbers to be listed under the City government directory located in the front section of local area phone books. This shall ~~be updated annually as necessary and shall, at a minimum,~~ include numbers for reporting on clogged catch basin inlets, reporting illegal discharges/dumping and a general informational number for storm water. These phone numbers may be city-specific or area-wide.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

D. All efforts deemed to be reasonable ~~efforts~~ by a permittee to coordinate public outreach efforts shall be undertaken. This may include coordinating with environmental groups and public agencies such as the California Coastal Commission, the Department of Beaches and Harbors, Resource Agencies, etc.

Outreach to Target Audiences

Permittees, to the extent required by the Clean Water Act, shall develop and implement an educational program that stresses pollution prevention for a variety of audiences, including local residents, school-aged children, businesses and public employees whose job functions and daily lives may impact storm water quality. The program may be developed locally or regionally and shall include ~~at a minimum~~, to the extent required by the Clean Water Act:

- Education on the proper use and disposal of pesticides, herbicides and fertilizers;
- Education on the definition of, identification of, and impacts associated with illicit discharges and procedures for reporting.
- Promotion of proper management of ad disposal practices for used oil and hazardous substances.

A. Local Residents

1. Permittees, to the extent required by the Clean Water Act, shall develop a program to educate local residents on types of household hazardous wastes along with proper management and disposal methods. The program shall at a minimum include:

   a. Information on the availability of collection services, such as location and schedule;

   b. Production of public outreach materials that educate residents on source reduction and proper disposal methods for household hazardous wastes; and

   c. Continue to encourage residents to recycle oil, antifreeze, glass, plastics, batteries, etc. and to prevent the improper disposal of such materials to the storm drainage system.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

Educational efforts throughout the watershed should also provide residents with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Management Program. Other local programs shall be advertised as appropriate.

2. Permittees, to the extent required by the Clean Water Act, shall develop and encourage watershed residents to participate in specific storm water outreach programs. Residents shall be informed of and provided with the opportunity to share ideas and comments about the programs. Permittees shall demonstrate that a good faith effort has been made to outreach to different communities within the watershed. The watershed-wide outreach program shall be implemented by _____. This shall at a minimum include:

   a. Where applicable for fire and erosion prevention, mowing shall be encouraged as opposed to disking. An investigation of effectiveness shall be undertaken.

3. Cooperative Public Outreach

   In order to promote public participation, cooperative outreach programs with local residents shall be developed. These cooperative programs should foster awareness and identification of storm water pollution issues among residents in the watershed. Catch basin labelling and other established sign programs are excellent examples of this type of cooperative effort, as are events like the "Storm water Pollution Awareness Week." One possibility for cooperative outreach is an "Adopt-A" program. Residents can "adopt" highways, storm drains, catch basins, streams, etc. to monitor, restore and protect. The purpose of all cooperative outreach programs created is to inform and involve the public in storm water management.

4. Complaint Procedures

   Public comments/complaints shall be requested by the Permittees in order to help gauge the success and effectiveness of storm water programs.

B. K-12 School Children

School children can play an important role in public information and participation programs, as they are generally more easily motivated and any behavior changes

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

they make tend to stay with them through adulthood. School children can also convey storm water pollution prevention messages to other family members. School programs shall include information on storm drain systems, the difference between sewers and storm drains, the importance of preventing storm water pollution, and may also address, illegal discharges/dumping and reporting procedures, source minimization, and general pollution prevention. Written materials (workbooks and coloring books), videos, assemblies, and field trips are examples of effective components of a K-12 educational program.

C. Businesses

A detailed public education and outreach program shall be developed for business operations with greater potential of discharging pollutants into the storm drain system. The program shall include employee training on and the effectiveness of implementing BMPs to reduce nonpoint source pollution. In addition to written, audio, and visual materials, other possible means of focused outreach may include: conducting workshops, mass mailing trade/industry magazines, etc.

D. Public Agencies and Employees

~~Public~~ Appropriate public agency employees shall be trained on storm water management and pollution prevention practices and involve employees on many different levels from program managers to field personnel. Training programs shall include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forums or committees. Materials developed for other audiences may also be used in these public agency employee training programs. Appropriate public agency employees shall be trained in:

1. Emergency spill cleanup procedures.

2. Environmentally sensitive alternative products.

3. Good housekeeping practices.

Permittees shall provide outreach materials to the general public through business license renewal counter,; and/or make efforts to outreach through professional and business associations. Additionally, Permittees should consider producing educational materials for professionals and technicians not employed by public agencies.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

Outreach Based on Activity-Type

A. Industrial/Commercial

A watershed-wide, general outreach program shall be set up by the WMC for all industrial and commercial facilities potentially discharging to the storm drain system. Furthermore, the WMC shall provide specific guidance objectives to these facilities regarding storm water program, compliance by _____, and inform and remind all potential commercial and industrial dischargers of their obligations under the storm water program. The Permittees shall also encourage the proper disposal of all materials from industrial and commercial sites.

Prior to the WMC providing specific guidance objectives, subcommittees shall be established, as needed, to develop specific outreach materials for industrial/commercial categories and specific "high priority" activities. This shall include at a minimum: metal ~~platers~~ platters, restaurants, vehicle related facilities, etc...

B. Construction

The Permittees, to the extent required by the Clean Water Act, shall ensure that contractors properly install all necessary post construction, permanent BMPs during initial construction and that any necessary maintenance needed during construction is performed. There shall be specific programs outlining correct practices.

In an effort to prevent concrete waste from entering the storm drain system, contractors shall observe the following guidelines:

1. Washout of concrete trucks should be conducted off-site or on-site in a designated area;

2. Excess concrete should not be dumped on site; and

3. Employees and subcontractors should be trained in proper concrete waste management.

Evaluation

The EAC shall develop a process to evaluate the effectiveness of all public outreach programs implemented under this permit. Surveys and focus groups are examples of

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

methods that can be used to gauge a program's effectiveness. They can also be used to provide insight into the program's direction and to help formulate attainable goals. Results of any evaluation method used shall indicate the community's level of awareness of storm water pollution. A watershed-wide program shall be implemented by _____.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

August 25, 1995 (To be negotiated)

VIII. PROGRAM EVALUATION AND REPORTING

The program may be modified subject to comments received under the Annual Review.

A procedure shall be developed and utilized for program evaluation and reporting by the Principal Permittee during the course of this permit. Under this procedure as outlined below, the EAC shall develop action-specific performance indicators and criteria, perform evaluation of compliance and effectiveness based on the performance criteria, establish schedules and mechanism for initial record keeping and reporting, and submit semi-annual and annual reports to the Regional Board using a standardized format.

The EAC, WMC, and/or each Permittee, to the extent required by the Clean Water Act, are responsible for collecting data needed for program evaluation, conducting self-evaluation, and reporting the results of evaluation to the Regional Board. The results reported to the Regional Board shall include both the collected data and analysis of the data. The reports shall include detailed explanation on how the evaluations are conducted, how and why certain provisions of the permits are met or not met, how the effectiveness of certain BMPs is determined or is not, and should a problem arise, how it shall be corrected. The Regional Board will make a compliance determination based on information submitted under this procedure.

A. Demonstration of Compliance

1. Each Permittee, to the extent required by the Clean Water Act, is responsible for demonstrating that the required BMPs as prescribed under this permit, as well as other BMPs included in the Watershed Management Plans, are implemented to the "maximum extent practicable." Each Permittee shall implement the required BMPs to the maximum extent practicable.

2. The Watershed Management Committees are responsible for demonstrating the effectiveness of other BMPs through conducting and reporting the results of pilot/demonstration projects for evaluating the effectiveness of BMPs in the watershed.

3. The degree and the effectiveness of BMP implementation shall be evaluated and reported by the Permittees, to the extent required by the Clean Water Act, using environmental and/or administrative indicators whenever possible. When environmental indicators are not readily and/or

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and L:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

easily available, administrative indicators shall be used. These shall include indicators prescribed under relevant provisions of this permit, and/or other indicators deemed appropriate by the Watershed Management Committee, the Executive Advisory Committee, and/or ultimately the Regional Board. Examples of the quantitative indicators include the number of inspections conducted, number of staff increase, number of audience reached through public education, waste recycled, water conserved, hazardous waste collected, oil recycled, catchbasin waste removed, etc. Quantitative indicators of environmental conditions should also be reported if they can be linked to the effects of the BMP implementation.

4. In order to yield comparable results for year to year evaluation on the success, the progress, and/or the failure in BMP implementation, and comparable results from area to area, a uniform data collection methodology shall be established for each of the required BMPS. The uniform data collection methodology shall be developed by the Executive Advisory Committee. Subsequently, each report on BMP implementation shall provide comparison with the implementation status during the previous reporting period and the scheduled implementation timeline for the current and future reporting periods, based on data collected using the uniform collection methodology.

B. Internal Reporting and Record Keeping

1. In order to facilitate the preparation of semi-annual and annual reports, the EAC shall develop standard forms for internal reporting to be used by all Permittees within the watershed. The forms shall collect all the information essential to the preparation of the annual and semi-annual reports and to the needs of other management actions by the Watershed Management Committees, EAC, and/or the Permittees. Reported information shall be quantifiable, and specific for each program area and/or BMP. The dates for submitting the internal reports shall allow sufficient time for compilation and analysis by the Watershed Management Committees and/or the EAC for the preparation of semi-annual and annual reports to the Regional Board.

2. All records shall be retained by the Permittees for a period of 5 years or longer as required by the Regional Board or USEPA.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

C. Semi-annual and Annual Reports

1. Semi-annual Report

The requirements under VIII.A shall be met by the submittal of semi annual and annual reports. Semi-annual reports shall succinctly summarize compliance efforts and may consist of simple compliance checklists. Annual reports shall be comprehensive.

a. The EAC shall submit a semi-annual progress report to the Regional Board by _____ of each year. Semi-annual reports must be submitted to the Regional Board within 30 days after the end of the six-month period. These six month periods are Jan - June, and July - Dec. (TO BE DETERMINED).

b. The semi-annual report shall serve as a status report on the progress of the implementation of the Stormwater Management Plan and other permit provisions. The Watershed Management Committee is responsible for collecting and compiling information from each Permittee prior to preparation of the semi-annual report, information along with the information analysis into the report.

c. The semi-annual report shall consist of a summary table illustrating the levels of implementation for all requirements by each Permittee. Tables shall be developed for each program element listing the Permittees, describing the status of implementation by each Permittee of the element, and documenting any modifications of the element from the standard program.

2. Annual Report

a. The Executive Committee shall submit an annual report to the Regional Board not more than 60 days after the end of each permit year (_____). The annual report shall include both a summary of the progress and status of Stormwater Management Plan implementation, a summary on status of compliance with all permit provisions, a report on the evaluation of program effectiveness, and a summary of recommendations for permit provision revisions. The Permittees as a whole (within watershed management areas) shall describe any problems encountered during

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137919.1 and I:\RCYOUNG\PUBL\137969.2. Deletions appear as struck-through text and Additions appear as double underlined text.

implementation and discuss the modifications to the program in order to solve these problems.

b. The Principal Permittee shall collect, compile, and analyze information from each Permittee within the watershed prior to preparation of the annual report. The Watershed Management Committee shall include the compiled information and its analysis (instead of raw data or copy of internal reports) in the annual reports.

c. The semi-annual report shall include a summary table illustrating the levels of implementation for all Permittees. Tables shall be developed for each program element listing all the participating Permittees and describing the status of implementation by each Permittee of the element. A table shall also be included to summarize the status of the program elements for which the Watershed Management Committee bears the primary implementation responsibility. Besides summary tables, the report should provide detailed explanation on any modifications made of the program elements (delays, changes, etc.) from the standard provisions and provide an analysis of any problems encountered during the implementation and the proposed solutions.

d. The annual report shall include an assessment of the effectiveness of each program elements using the performance evaluation indicators and criteria developed under Section A of this Chapter, and the results of the pilot/demonstration projects conducted within and/or outside the watershed. The findings should be presented graphically for ease of comparison with the established levels of effort.

e. A fiscal analysis and budget as described under I.1 (Fiscal Resources) of this Order shall be submitted annually within 30 days of the Budget adoption date for each Permittee.

D. Storm Water Management Plan Revisions

1. Revisions to provisions of this permit ~~can~~ may be made through the order of the Regional Board. The EAC ~~can~~ may recommend and request revisions to the Stormwater Management Plan through documentation in the annual reports.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

2. Recommended revisions shall be supported by the results of a program evaluation. Recommended revisions to the Stormwater Management Plans may be made if it can be demonstrated that 1) the changes will lead to improvement of the effectiveness of this program, 2) the changes will result in positive impacts of environmental conditions, and 3) that the current measures have been implemented to the "Maximum extent practicable" as defined in Section VIII.A. Any recommended revisions shall not take effect unless approved by the Executive Officer.

3. Revisions may be made to the Storm Water Management Plans by the Executive Officer or the Regional Board based upon public input and/or testimony.

The Discharger shall comply with the attached Monitoring and Reporting Program, which is part of this Order, and any revisions or modifications thereto, as ordered by the Executive Officer.

This Order may be modified, revoked, or reissued, prior to the expiration date as follows:

a. To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;

b. To incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain Icy other requirements of the CWA then applicable; or

d. Any other Federal or State Laws or Regulations become effective which necessitate changes.

The issuance of this permit is not intended to, and does not, absolve the Discharger of liability for conduct which may have constituted a violation of the previous Board Order 90-079 (AN, Cl 6948) adopted by this Regional Board on June 18, 1990.

This Order expires on _____. The Discharger must submit a complete Report of Waste Discharge including a revised Storm Water Management Plan in accordance with Title

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

23, California Code of Regulations, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on December __, 1995.

CONFORMITY WITH THE CLEAN WATER ACT

This permit is issued in compliance with the requirements of the Clean Water Act, as amended. In the event of any proceeding in which it is alleged that this permit does not meet the requirements of the Clean Water Act, or that acts or conduct by the permittee in conformity with this permit are not in conformity with the Clean Water Act, then at the request of the permittee through permittee's attorney, the Regional Board shall intervene on behalf of the holder of the permit, and shall protect, defend, indemnify and hold the holder of the permit harmless with respect to allegations that the permit is not in conformity with the requirements of the Clean Water Act, as it may be amended from time to time, and from allegations that acts or conduct by the holder of the permit in conformity with this permit are not in conformity with the Clean Water Act.

OPEN PROCESS: NO EX PARTE MEETINGS HELD [PROPOSED FINDING]

This Order was openly arrived at, developed through an open process, through series of meetings to which all interested entities, including permittees, were invited to participate. There have been no meetings between representatives or Staff of the California Regional Water Quality Control Board - Los Angeles Region and representatives of special interest groups, including regulated industries or environmental groups which were not open to other interested entities, including permittees.

CITY of GARDENA

1700 WEST 162nd STREET / GARDENA, CALIFORNIA 90247-3778 / (310) 217-9500

MAY Y. DOI, City Clerk
LORENZO F. YBARRA, City Treasurer
KENNETH W. LANDAU, City Manager

September 26, 1995

Los Angeles County Department of Public Works
Waste Management Division
P.O. Box 1460
Alhambra, CA 91802-1460

Attn: Frank Kuo
Program Administrator

Subject: Draft NPDES Municipal Permit
September 15, 1995

Dear Mr. Kuo,

The City of Gardena cannot accept the NPDES permit submitted to the City by the Regional Water Quality Board on September 15, 1995. The proposed permit has significant defects and omissions. The City would like to summarize the major problems as follows:

1. In order to fund the many functions to be performed by the City, a fee structure for permits and investigations should be created. A collection mechanism should be established. The budget process must be defined, who is to evaluate the budget and when should it be submitted? Who develops the funding budget for the area-wide programs?

2. The "Municipal Permit" should be considered by itself. All inspection and enforcement of the requirements for "industrial" and "construction" permits should be deleted. The State Board should continue to administer and enforce the requirements of the"industrial" and "construction" permits.

3. Specific and detailed descriptions and instructions are needed for the following sections:

   a. **Programs to be Developed by the EAC and Cities**

      The Board should define the criteria it will use to evaluate the effectiveness of programs and their acceptance by the Board?

   b. **Compliance and Documentation**

      The parameters by which the Board is to judge a permittees compliance should be defined and quantified. Vague and open-ended descriptions in many sections leave room for significant conflict later.

MAILING ADDRESS: P.O. BOX 47003 GARDENA, CALIFORNIA 90247-6803 FAX (310) 217-9684

c. **Authority**

Definitions of the type of ordinances which will be required should be specified. Many existing city codes already cover most tasks specified, therefore, the Board should establish criteria which would permit existing ordinances to cover the required functions.

d. **Administrative Review**

The Board should determine and publish the Board's standards for evaluation of reports and compliance documentation. Specific standards should be established for all permittees.

e. **Database**

The Board maintains this database and should continue to maintain it.

f. **Grading Activities**

The Board has maintained that there really is no "rainy" reason. Therefore, the grading activity restriction should be established by the EAC and enforced by the cities on a project to project basis.

g. **Pumped Stormwater**

This discharge should be exempted.

Please convey the concerns of the City of Gardena to the Regional Water Quality Board. The City requests more intensive and conclusive negotiations between the Board and the Executive Advisory Committee to accomplish a reasonable and enforceable permit.

If there are any questions, please contact me at (310) 217-9529, fax (310) 217-9676.

Yours truly,

Sherwood Nasuhara
City Engineer

SN/jn

City of El Segundo
EDUARD SCHRODER, Director of Public Works

October 10, 1995

Ms. Catherine Tyrrell
Assistant Executive Officer
California Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Subject: Comments to September 15, 1995 Draft NPDES Permit

Dear Ms. Tyrrell:

Thank you for providing the City of El Segundo an opportunity to comment on the latest Draft NPDES permit. I know it has taken a great amount of effort by the State, County, and Cities to get to this point. However, based on the extensive number of problems we found in the draft, it is obvious we still have a long way to go.

Attached are the City's comments to the draft permit. We have taken the liberty of developing a "substitute permit" showing by red-line/strike-out El Segundo's proposed changes. We felt that, given the numerous comments, that this was the clearest manner in which to relay our concerns.

The City's comments fall into the following three (3) general areas:

1. The draft permit, as presented, far exceeds present Federal and State requirements;

2. The draft permit does not clearly delineate the relationship between the various parties, i.e. the State, the principal permittee, permittees, the EAC, WMC's, etc. and;

3. There are numerous grammatical, typographical, and terminology errors, and inconsistencies which adds to the ambiguity of the draft.

350 Main Street, El Segundo, California 90245-0989
Phone (310) 322-4670 FAX (310) 322-4167

(continued)

In addition, attached to our red-line/strike-out comments, there are two (2) items which are presently not covered in the draft but we feel warrant inclusion.

I hope that you find our comments helpful. The City is very interested in the State reconciliation of the issues we have raised. We look forward to another opportunity to review and comment on a revised draft before the permit is sent to the Board for consideration.

If you have any questions or wish to discuss our concerns in more detail, please do not hesitate to call me at 310.607.2230.

Sincerely,

Ed Schroder
Director of Public Works

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~strick-through~~ text and Additions appear as double underlined text.

INTRODUCTORY NOTE TO "SUBSTITUTE DRAFT" VERSION OF DRAFT ORDER

The September 15, 1995, RWQCB draft is replete with provisions not required by the federal Clean Water Act or any other law. In addition, it appears that some provisions required by the EPA for stormwater permits are missing. For these reasons, the next "official draft" circulated for comment should clearly identify the specific section of the Clean Water Act, or other law, which provides the basis for a requirement proposed to be included in this permit. Only then can an informed judgement be made as to the appropriateness of inclusion of permit provisions.

This Substitute Draft provides revisions which should be made to the draft, in order to link the draft to the underlying legal authority, the Clean Water Act, which itself is under consideration for major revisions. For this reason, the term "to the extent required by the Clean Water Act" has been inserted at numerous places throughout this Substitute Draft. Other cleanup provisions are also included.

Italicized text is intended as commentary on the draft, it is not intended to be included in the text.

September 15, 1995

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. 95-XXX

WASTE DISCHARGE REQUIREMENTS
FOR
STORMWATER MANAGEMENT/URBAN RUNOFF DISCHARGES
WITHIN THE COUNTY OF LOS ANGELES

(NPDES NO. CAS0051654)

The California Regional Water Quality Control Board, Los Angeles Region, finds:

(The findings are currently being developed.)

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

[NOTE: It is essential that the findings be drafted in a manner which does not needlessly implicate the County and the Cities with respect to liability asserted against them by the alleged industrial polluters in the case of United States and State of California v. Montrose Chemical Corporation of California, et al., now pending in the U.S. District Court for the Central District of California. This case is a Natural Resources Damages Claim case filed under the federal Comprehensive Environmental Response, Compensation and Liability Act ("CERCLA" or "Superfund") 42 U.S.C. §§ 9601 et seq. The alleged industrial polluter defendants have filed third party against the County, the Cities and the State. Damages could reach into the hundreds of millions of dollars.]

This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit pursuant to Section 402 of the federal Clean Water Act, ~~or~~ and amendments thereto, and shall take effect at the end of ten (10) days from the date of its adoption provided the Regional Administrator, USEPA, has no objections.

IT IS HEREBY ORDERED that the County of Los Angeles and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardens, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Long Beach, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code, and regulations ~~and guidelines~~ adopted thereunder, and the provisions of the Federal Clean Water Act, and regulations ~~and guidelines~~ adopted thereunder, shall comply with the following for the areas under their respective jurisdictions within the drainage area of the County of Los Angeles:

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

September 15, 1995

A. Discharge Prohibitions

(Currently under discussion with the negotiation team.)

[NOTE: Should conform to, but not exceed, prohibitions required by the Clean Water Act.]

B. Receiving Water Limitations

(Currently under discussion with the negotiation team.)

[NOTE: Should conform to, but not exceed, prohibitions required by the Clean Water Act.]

C. Provisions

i. The Dischargers shall comply with Discharge Prohibitions (above), and Receiving Water Limitations (above), through the timely implementation of control measures ~~and other actions~~ as required by the Clean Water Act, to reduce ~~pollutants in the~~ pollutant discharge as proposed in this Order.

I. PROGRAM MANAGEMENT

A. Principal Permits

1. The County of Los Angeles is designated as the Principal Permittee.

2. The Principal Permittee shall, to the extent required by the Clean Water Act:

   a. Coordinate permit activities and, by _____, convene and chair the area-wide Executive Advisory Committee and the Watershed Management Committees;

   b. Provide personnel and fiscal resources and by _____, develop a Baseline Stormwater Management Plan (Plan) for use in developing a watershed management plan (WMP) for each watershed;

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137919.1 and I:\RCYOUNG\PUBL\137919.2. Deletions appear as struck-through text and Additions appear as double underlined text.

c. Provide personnel and fiscal resources for the development of the WMPs;

d. Provide personnel and fiscal resources for the updating and modification of the Plan and the WMPS;

e. Provide technical and administrative support for both the Executive Advisory and Watershed Management Committees;

f. Implement watershed water quality monitoring programs;

g. Provide the personnel and fiscal resources to complete by _____, the annual reports including evaluations of monitoring program data and BMP effectiveness;

h. Coordinate the implementation of stormwater quality management activities of regional significance (this shall mean that the Principal Permittee shall identify BMPs which are ~~applicable for implementation~~ suitable for adoption by Permittees watershed-wide and area-wide), such as public outreach and education, pollution prevention, waste minimization, and other similar actions;

i. Act as liaison between all Permittees and the Regional Board on Permit issues; and

j. Meet all the responsibilities outlined below for a Permittee.

B. Permittees

1. The ~~other~~ cities and agencies *[Note: What Agencies? If Caltrans, specify.]* are designated as Permittees.

2. Each Permittee shall, to the extent required by the Clean Water Act:

a. Participate in the development and amendment of the Baseline Stormwater Management Plan ~~(Plan)~~("Plan") by advising the Principal Permittee with respect to the Plan and by _____, ~~jointly~~ prepare the portion of the watershed specific management ~~plans (WMPS)~~ plan (WMP) applicable to its jurisdiction via their WMC;

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

b. Provide an Implementation Plan describing specific stormwater programs, projects and/or activities which are to be conducted within ~~their~~ its jurisdictional ~~boundaries~~ boundary, including the storm drainage system ~~they own and operate, and which demonstrate compliance with the WMP(S) requirements~~ it owns and operates, in compliance with those portions of the WMP which are required by the Clean Water Act, by _____; and

c. Provide in a timely manner all information needed by the Principal Permittee for completing ~~the~~ annual reports which comply with the requirements of the Clean Water Act.

3. The City ~~Administrator/Public Director~~ Council of each Permittee shall appoint a ~~representative(s)~~ City representative and alternate(s) to the WMC.

~~C.~~ 4. Agency Coordination. Each Permittee shall coordinate implementation of permit requirements and pollution prevention activities among each Permittee's internal departments and agencies (i.e. public works, planning, utilities, water supply, etc...)~~.~~, to the extent required by the Clean Water Act.

~~D~~ C. Executive Advisory Committee ("EAC")

1. The EAC shall consist of ~~a~~ one representative ~~of~~ from the County of Los Angeles, one representative from the City of Los Angeles, ~~a~~ and one representative each from the Malibu Creek, Santa Clara~~,~~ and Dominguez Channel Watershed Management Areas, and two representatives each from ~~each of~~ the San Gabriel River, Los Angeles River~~,~~ and the Ballona Creek Watershed Management Areas.

   a. ~~One representative from~~ A member of the EAC shall chair the Watershed Management Committee for that Permittee's main watershed management area.

2. The City Administrator/Public Works Director for the County of Los Angeles and for the City of Los Angeles shall each appoint a representative to the EAC. Other members will be appointed by the WMCs.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

3. The EAC shall, to the extent required by the Clean Water Act, be responsible for:

   a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

   b. Assisting the Principal Permittee in the development of the Baseline Storm Water Management Plan; and

   c. Reviewing the Watershed Management Plans as developed by each Watershed Management Committee and provide direction and guidance on the plans for consideration by the Watershed Management Committees;

   d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

   e. Mediating conflict among the ~~Permittee~~ Permittees; and

   f. Coordinating the implementation of pilot projects to target pollutant sources, evaluate BMT appropriateness, and assess effectiveness.

~~E~~ D. Watershed Management Committee

1. A Watershed Management ~~Committees~~ Committee (WMC) shall consist of a representative of each ~~of the Permittees for that~~ Permittee within a particular watershed management area. ~~Regular~~ All WMC meetings shall be open to attendance by the public.

~~The WMC may hold closed sessions, at its discretion, to discuss permit related issues.~~

2. The Malibu Creek, Santa Clara, and Dominguez Channel WMCs shall each appoint one representative to serve on the EAC and to chair the WMC. The San Gabriel River, Los Angeles River, and the Ballona Creek WMCs shall each appoint two representative to serve on the EAC, one of whom will chair the WMC.

3. The WMC shall, to the extent required by the Clean Water Act, be responsible for:

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

a. Establishing goals and objectives for the watershed;

b. Prioritizing pollution control efforts;

c. Participating in the development of a specific watershed management plan (WMP), based on the Baseline Stormwater Management Plan (Plan);

d. Assessing the effectiveness of, preparing revisions for and making appropriate changes to the Plan and the WMP;

e. Coordinating and facilitating the preparation of the annual reports on Permit activities within the watershed for submittal to the Regional Board -- a draft of the annual report shall be circulated to each Permittee and the Executive Advisory Committee for ~~their review and comments~~ review and comment, and the WMC shall respond to each comment, in writing, prior to submittal to the Regional Board; and

f. Facilitating the implementation of this Order among the Permittees in the watershed.

~~START SPELL CHECK~~

~~F~~ E. Watershed Management Subcommittees

1. Subcommittees ~~will~~ may be established ~~where needed~~, to the extent required by the Clean Water Act, as determined by the WMC and/or the EAC.

2. The Subcommittees will be focused on specific program areas and ~~can~~ to provide more specific ~~oversight~~ advice on the development, implementation, and evaluation of selected program areas.

~~G~~ F. Fiscal Resources

Each Permittee shall submit *[NOTE: TO WHOM?]* an annual budget for its Implementation Plan within 30 days after the budget adoption. The budget shall be summarized and put into a format which identifies the necessary capital and operation and maintenance expenditures necessary to implement the storm water management program. The budget shall provide information such as funding

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

sources, staff resources, equipment, support capabilities, contract services, and cost sharing arrangements for the storm water management programs. Also included shall be a description of any funding shortfalls.

1. Area-Wide Resources - In implementing this Order and the Plan, to the extent required by the Clean Water Act, Permittees may elect to jointly fund a single program for certain BMPS, such as Public Education, that are area-wide in nature. Funding agreements, including budgets and cost per agency, shall be developed.

2. City-Specific Resources - As stated above, each Permittee shall develop an annual budget detailing the cost of implementing Permit-related activities within its jurisdiction.

~~H~~ G. Legal Authority

1. The legal authority that was required of each Permittee under Order No. 90-079, to the extent consistent with the Clean Water Act, shall continue in effect.

2. ~~The Co-Permittees shall exercise their~~ Each Co-Permittee *[NOTE: The terminology should be consistent, make it Permittee or Co-Permittee]* shall exercise its legal authority and require compliance with this Order and tile Plan within its jurisdiction, to the extent consistent with the Clean Water Act.

3. Each Permittee shall certify that it has legal authority to control discharges to and from those portions of the drainage system over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements between permittees with adequate existing legal authority and shall, ~~at a minimum,~~ in an effort to accomplish Items a-f below, within its jurisdiction:

   a. Control the contribution of pollutants to the storm drainage system by storm water discharges ~~associate~~ associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

   b. Prohibit illicit discharges and illicit connections to the storm drainage system and require removal of illicit connections;

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

c. Control the intentional discharge of spills and the dumping or disposal of materials other ~~that~~ than storm water (e.g. industrial and commercial wastes, trash, debris, motor vehicle fluids, green waste, animal wastes, leaves, dirt, or other landscape debris etc.) to the storm drainage system;

d. Control, through interagency or inter-jurisdictional agreements among permittees, the contribution of pollutants from one portion *[NOTE: needs definition. What is meant by "one portion?"]* of the storm drainage system to another;

e. Require compliance with conditions in ordinances, permits, contracts or orders; and

f. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the storm drainage system.

4. Each ~~Permittee's~~ Permittee shall direct its legal counsel ~~shall complete a~~ to review of its existing legal authority to ensure that its existing legal authority complies with the requirements in this Order.

5. Upon its completion of the legal authority review, or within 60 days of permit adoption, (whichever is sooner) each Permittee shall demonstrate that it has adequate legal authority or provide a schedule for obtaining the adequate legal authority. Note: Guidance for demonstrating adequate legal authority is included within the EPA document entitled Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges from Municipal Separate Storm Sewer Systems, (EPA 833-B-92-002, November 1992), Section 3-3, page 3-4.

H. Administrative Review

The administrative review process formalizes the procedure for review and acceptance of reports and documents submitted to the RWQCB under this Permit. In addition, it provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement actions. The RWQCB recognizes that the goal of reducing the level of pollutants in stormwater/urban runoff is best accomplished by cooperation and communication between the RWQCB, the permittee, the co-permittees and the

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

public. The Board further appreciates that cooperation and communication is reduced by enforcement actions and legal suits, which force parties to become defensive and react slowly while wasting scarce local government resources. Los Angeles County is undergoing a severe recession which limits the resources of local governments; to achieve the goal of clean water it is essential to reduce wasteful litigation actions to the greatest extent possible and allow resources to be spent to achieve the goals of this permit. The RWQCB recognizes the following facts: (1) that stormwater programs will vary from jurisdiction to jurisdiction; and (2) that such variation may make it difficult for a permittee to determine whether or not it is in complete conformance with the terms and conditions of this permit; and (3) that the goal of this permit is clean water not lawsuits. Accordingly, for the purposes of this permit, a permittee or co-permittee shall not be in violation of any term or condition of this permit until the following administrative process has been completed:

1. If the Executive Officer ~~finds~~ has reason to believe that a Permittee's stormwater program ~~is~~ may be insufficient to meet the provision of the Permit, the Executive Officer shall send a "Notice of Intent to Meet and Confer (NIMC)" to the Permittee. The NIMC shall include a date by which the Permittee must meet with RWQCB staff. (Failure of the RWQCB to issue a NIMC to any jurisdiction shall constitute evidence that the RWQCB has determined that the jurisdiction in question is in compliance with the terms and conditions of this permit.)

2. Upon receipt of a NIMC, the Permittee shall meet and confer with RWQCB staff to clarify whether the Permittee is in compliance with the permit, and if not, the steps to be taken to ~~completely~~ meet the provisions of this permit. The effect and confer sessions shall be for the purpose of developing additions and enhancements to the jurisdiction's stormwater program, if needed to comply with the legal requirements of the Clean Water Act. The meet and confer period shall conclude with the submittal to and acceptance by the Executive Officer of a written "Stormwater Program Compliance Amendment (SPCA)" which shall include implementation deadlines. The Executive Officer may terminate the meet and confer period after a reasonable period due to a lack of progress on issues and may order submittal of the ~~SPEP~~ SPCA by a specified date. Failure to submit an acceptable SPCA by the specified date shall constitute a violation of the Permit.

3. The Executive Officer will approve or reject the submitted SPCA within a reasonable amount of time. Rejection of a submitted ~~SPEP~~ SPCA by

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

the Executive Officer shall state the reasons for the failure to approve the SPCA. A Permittee that receives a rejection of an SPCA shall have thirty (30) days to remedy the specified deficiency in the SPCA and receive administrative approval from the Executive Officer of the amended SPCA. Approval of the SPCA by the RWQCB shall be evidence that the RWQCB has determined that the jurisdiction in question is in full compliance with the permit and that there has been no violation of the permit. Rejection of a submitted SPCA by the RWQCB shall state in writing the reasons for the failure to approve the SPCA. A jurisdiction that receives a rejection of a SPCA shall have fifteen (15) days to cure the specified defects in the SPCA and receive administrative approval from the RWQCB of the amended SPCA. Failure to have a SPCA approved by the RWQCB within thirty (30) days from the conclusion of the meet and confer period shall be a violation of the permit.

4. The Permittee shall comply with the terms of the SPCA. The Permittee shall submit reports to the Executive Officer of progress made under the SPCA. The frequency of progress report submittal shall be as prescribed by the Executive Officer. Failure ~~1,0~~ to comply with the terms and conditions of the SPCA shall constitute a violation of the Permit and shall be cause for immediate Administrative Civil Liability as prescribed by the Executive Officer.

II. ILLICIT DISCHARGES\DISPOSAL

A. Illicit Connections

By _____, the EAC shall develop a consistent program including investigative standard procedures to eliminate illicit connections to the storm drain system.

By _____, each Permittee shall implement a program to identify and eliminate illicit connections to the maximum extent practicable and to the extent required by the Clean Water Act.

1. The program shall, ~~at a minimum~~ to the extent required by the Clean Water Act:

   a. standardize, per EAC guidelines, storm drain inspection procedures, and illicit connection ~~and~~ identification and elimination procedures;

   b. prioritize major problem areas, to include but not be limited to older business areas, and areas with heavy industry such as those listed under subchapter N of 40 CFR Parts 405 - 471

   c. utilize results of field screening activities, and other appropriate information.

   d. contain an industrial/commercial education/outreach component to inform businesses about the problem of illicit discharges/dumping and proper discharge/disposal practices,

   e. schedule inspections of storm drains ~~for inspection~~ for illicit connections within its jurisdiction.

   f. maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

   g. establish enforcement procedures to terminate illicit connections.

B. Illegal Discharges\Disposal

0212

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

1. By _____, the EAC shall develop a consistent program including investigative standard procedure, to eliminate illegal discharges/disposal practices to the storm drain system.

2. By _____, the EAC shall develop a standard enforcement procedures, including administrative and judicial, to eliminate illegal discharges/disposal practices.

3. By _____, the EAC shall develop standard procedures for spill response, including a procedure to ensure hat, in a spill response, sewage treated with disinfection agents will not be discharged into the storm drainage system, to the maximum extent practicable. The standard procedures will address investigation, containment, and cleanup activities as appropriate.

4. By _____, each Permittee shall implement a program to identify and eliminate illegal discharges/disposal practices to the ~~maximum extent practicable~~ extent required by the Clean Water Act.

   The program shall, ~~at a minimum~~ to the extent required by the Clean Water Act:

   a. Identify and prioritize problem areas of illegal disposal where inspection, clean up, and enforcement are necessary to prevent the discharge of contaminants;

   b. Maintain a surveillance program to detect illegal discharges and disposal into the street system, including, but not be limited to, street use inspections and inspections of vacant facilities;

   c. Establish procedures to educate inspectors, maintenance workers, and other field staff in their jurisdiction to notice illicit dischargers/disposal practices during the course of their daily activities, and report such occurrences;

   d. Maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

   e. Establish per EAC guidelines spill response procedures; and

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

f. Establish, per EAC guidelines enforcement procedures to eliminate illegal discharges/disposal practices.

C. Non-Storm Water Discharges

1. Exempted Discharges

(Currently under discussion with the negotiation team.)

2. Conditionally Exempted Discharges

(Currently under discussion with the negotiation team.)

D. Other Prohibited Activities

1. The Permittees shall prohibit any person from:

a. causing or allowing illicit discharges to be made into the storm drain system;

b. establishing, using or maintaining an illicit connection to the storm drain system;

c. littering.

d. disposing of leaves, dirt or other landscape debris into a storm drain; and

e. using any pesticide, fungicide, or herbicide which has either been voluntarily discontinued or prohibited by the USEPA.

f. washing down toxic materials from paved or unpaved areas.

g. washing down impervious surfaces in industrial and/or commercial areas ~~is prohibited~~ unless ~~significantly~~ required ~~to~~ under the Health and Safety ~~Codes~~ Code or other laws.

2. Storage of Materials, Machinery and Equipment

The Permittees shall require:

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

a. that objects, such as motor vehicle parts, containing grease, oil, or other hazardous substances, and unsealed receptacles containing hazardous materials, be stored away *[NOTE: WHAT DOES "AWAY" MEAN]* from areas susceptible to runoff;

b. that machinery or equipment which is to be repaired or maintained in areas susceptible to runoff~~;~~ be placed on a pad of absorbent material, or an equivalent, to contain leaks, spills or small discharges;

c. that owners of commercial/industrial motor vehicle parking lots and structures located in areas susceptible to runoff to be swept to remove debris. *[NOTE: This says that permittees shall require "that owners ... be swept." Illustrates sloppy drafting. Change to:*

> that commercial/industrial motor vehicle parking lots *[NOTE: minimum size?]* and structures located in areas susceptible to runoff be swept to remove debris.

Lots with more than ten (10) parking spaces and all public parking facilities ~~:~~ shall ~~also~~ be vacuum swept, or by equivalent method, to remove chemical ~~residue~~ residues;

d. that all fuel and chemical residue, animal waste, garbage, batteries, or other ~~types of~~ potentially harmful materials which are located in areas susceptible to runoff, be removed immediately *[NOTE: why "immediate" here and not elsewhere? Suggest that "immediate" be deleted.]* and disposed of properly.

e. that hazardous waste be disposed of through the Permittee's hazardous waste program or at any other appropriate disposal site, and not be placed in a trash container for regular trash disposal. *[NOTE: THIS SHOULD BE DELETED AS IT IS REDUNDANT WITH NUMEROUS OTHER LAWS.]*

E. Public Reporting

1. By _____, the EAC shall develop a standard program, for Permittees to implement by _____, to promote, publicize, and facilitate public reporting

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as strike-through text and Additions appear as double underlined text.

of illicit discharges and illegal disposal practices that may adversely impact water quality.

2. By _____, EAC shall develop a standard program for the reporting of incidents of a hazardous substance entering the storm drain, where the responsible party is not known, to the Regional Board and State of California Office of Emergency Services (OES) at (800) ___-___ and the Federal Hazardous Response Number at (800) ___-___. *[NOTE: IS THIS INTENDED TO REFER TO THE NATIONAL RESPONSE CENTER? IF SO, THE CORRECT TERM, "National Response Center" SHOULD BE USED.]* The Permittees shall implement this program by _____. *[NOTE: THE CONCEPT OF "REPORTABLE QUANTITY" IS MISSING HERE, BUT IS REQUIRED BY NEARLY ALL OTHER LAWS IMPOSING REPORTING REQUIREMENTS. IT IS SUGGESTED THAT THE OTHER LAWS BE INCORPORATED BY REFERENCE.] [NOTE: what is the purpose of this requirement? Why report incidents where the "responsible party" is not known, but not incidents where the "responsible party" is known?]*

F. Reporting

1. A quarterly summary of illicit connections eliminated shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the investigation; what was being discharged; estimated length of time the practice was on-going; ~~what~~ remedial action ~~was~~ taken; and what happened to the discharger.

2. A quarterly summary of illegal discharge/disposal practices reported through the standardized public reporting system shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the incident; what was spilled/dumped; quantity; ~~what~~ remedial action was taken; and what happened to the discharger/dumper.

G. Coordination With State Permits

1. The Principal Permittee will be provided an updated list of NPDES Permits on a quarterly basis, through the Regional Board's electronic bulletin board, to verify permitted sources of the existing non-storm water discharges in the storm water drainage system.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

2. The Permittees ~~will work~~ may cooperate with other regulatory agencies ~~and~~ may report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies. These agencies, include but are not limited to:

a. California Department of Fish and Game
b. California Department of Toxic Substances Control
c. California Coastal Commission
d. United States Environmental Protection Agency
e. California Department of Transportation
f. California Air Resources Board

VOL 24

VOL 24

September 14, 1995

III. PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES

A. Identification of Sources

1. By _____, ~~the Permittees~~ and to the extent required by the Clean Water Act, each Permittee shall develop a database listing industrial/commercial facilities by four digit SIC codes within the Permittee's jurisdiction, which shall be updated annually. The database shall include at a minimum:

   a. Facility owner's name, address, and telephone number;

   b. Site address, telephone number, and contact person;

   c. Closest receiving water and watershed;

   d. Applicable SIC code(s);

      i. For each four digit SIC sector, the Permittees shall identify primary activities that might impact runoff discharges;

      ii. For each four digit SIC sector, the Permittees shall identify primary materials at might impact runoff discharges; and

2. By _____, the EAC shall develop a pollutant source identification program for the control of storm water pollutant discharges from industrial/ commercial facilities. The objective of the source identification program is to gather data on specific and/or interrelated set of pollutant generating activities occurring on very small areas (< 5 acres) of industrial/commercial activity and to provide information for developing and implementing BMPs for specific activities.

B. Prioritization of Sources

1. By _____, ~~the Permittees~~ and to the extent required by the Clean Water Act, each Permittee shall prioritize industrial and commercial facilities, if any, within ~~their~~ its jurisdiction ~~on~~ by their relative potential for ~~the~~ contamination of storm water and urban runoff. The prioritized list shall include

0278

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

a. Categorical List

i. All industries regulated under Phase I of the Federal storm water program (4 CFR 122.26).

ii. All industrial/commercial SIC codes selected by the USEPA for screening under Phase II of the Federal storm water program.

iii. Other business sectors considered by the EAC or the Regional Board conduct industrial/commercial activity with a high potential for storm water contamination (e.g, restaurants).

The categorical list shall be grouped by ~~Permittees and~~ the Permittee. The list shall provide an ~~organized~~ overview of the ~~target~~ facilities based on land use, operation, and activities, ~~could potentially~~ and whether the facilities are likely to contribute significant amounts of pollutants into storm water runoff.

2. By _____, and to the extent required by the Clean Water Act, Permittees shall rank the industrial and commercial facilities, identified as potential pollutant sources of storm water and urban runoff pollutants in ~~III. B.1.a~~ III.B.1.a, in order of priority for oversight of implementation of storm water management measures. *[NOTE: what is meant by the term: "oversight of implementation of storm water management measures?"]*

C. Source Control Measures

1. By, _____, and to the extent required by the Clean Water Act, Permittees shall develop a checklist of specific storm water and urban runoff control measures for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutant; into storm water runoff. The control measures must

a. address multiple pollutant sources

b. initially focus on source control measures such as source minimization, education, good housekeeping, and site design alternatives.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

c. target industrial/source areas and activities with the potential to generate pollutant loadings

2. By _____, and to the extent required by the Clean Water Act, Permittees shall develop a process to ensure implementation of storm water and urban runoff control measures for industrial/commercial facilities identified in III.C.1.

3. By _____, and to the extent required by the Clean Water Act, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutants into storm water runoff. The structural control measures must be evaluated as to

a. effectiveness in reducing toxic pollutants and pollutants of concern

b. ease of maintenance

c. current frequency of use

d. feasibility and cost-effectiveness

e. possible methods to ensure implementation if necessary

By _____, the Permittees shall, in addition, describe any studies and pilot projects they intend to conduct to assess the feasibility and effectiveness of specific control measures.

4. By _____, and to the extent required by the Clean Water Act, Permittees shall require the following:

a. The proper disposal of food wastes by restaurants and food wholesalers.

b. Persons owning or operating a gas station, auto repair garage, or similar structure must clean those facilities in a manner that does not result in discharge of pollutants to the storm drain system; and

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

c. Machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze must be repaired.

5. The EAC may seek coverage under this Order, for industrial facilities listed in III.B.I.a.1 which are owned and operated by Permittees if it,

a. establishes a procedure for notifying the Regional Board of industrial sites owned and operated by Permittees

b. prepares a checklist of industrial BMPs using BAT/BCT criteria for implementation by Permittees at these industrial sites

c. standardizes procedures to ensure implementation of industrial BMPs by Permittees,

d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee industrial facilities

e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each site, and certify compliance with this Order.

~~START SPELL CHECK~~

D. Source Inspection

1. By _____, and to the extent required by the Clean Water Act, Permittees shall submit a schedule for inspection of industrial/commercial facilities in III.B.I.a. for adequacy of storm water pollution prevention measures. The schedule shall include, for a five year period,

a. for municipalities with a population of less than 250,000, all facilities identified in III,B.I.a.1, and all facilities identified in III.B.I.a.2 and III. B.I.a.3,

b. for municipalities with a population of greater than 250,000, all facilities identified in III.E.I.a.1, and, a subset of facilities identified in III.B. I.a.2 and III.B. I.a.3 but not less than ten times the number identified in III.B.I.a.1

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~strick-through~~ text and Additions appear as double underlined text.

Industrial/commercial facilities in III.B.I.a.2 and III.B.I.a.3 that are not included in the inspection schedule shall be surveyed by phone, mail-out, or a similar method, as to their conformance with good stormwater quality management measures.

2. By _____, and to the extent required by the Clean Water Act, Permittees shall develop and implement a industrial/commercial facilities inspection program. The inspection program shall include, but is not limited to:

   a. procedures for facility inspections

   b. procedures for industrial/commercial sectors outreach on pollution prevention, waste minimization, and storm water quality management

   c. procedures to ensure corrective action is undertaken by non complying facilities

   d. procedures to follow-up on violations of municipal standards

   e. procedures for enforcement action against non-complying facilities;

   f. an electronic recording system to document the status of facility inspections; and,

   g. appropriate training for program staff.

3. During inspection of group III.B.1.a.1, inspectors shall request to see a copy of the SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may ~~deem it necessary to~~ report problematic facilities to the Regional Board.

E. Reporting

Each year, ~~the Permittees~~ and to the extent required by the Clean Water Act, each Permittee shall evaluate the results and progress of ~~their~~ its storm water quality management program for industrial/commercial sources, if any. The annual report submitted to the Regional Board ~~shall recommend a strategy~~ may include recommended strategies for the management of storm water from

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

industrial/commercial sources for the following year based upon any or all of the following:

a. priority industrial/commercial sources listing
b. priority on-site inspection
c. phone/mail-out survey inspections
d. priority checklists of stormwater urban runoff control measures
e. evaluations of structural arid treatment control measures
f. special studies and pilot projects needs
g. specific site and activity monitoring needs

The EAC shall make available to the Regional Board the industrial/commercial database developed in III.B.I.a.1 in the appropriate format when so requested.

F. Coordination

The Permittees, to the extent required by the Clean Water Act, shall develop a process for the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports shall be developed as required.

G. Conflicts with Other Mandates

1. The Permittees ~~will~~ may work with ~~other~~ other regulatory agencies and report to the Regional Board on recommendations to resolve ~~any~~ conflicts ~~which are identified~~, if any, between the provisions of this permit and the requirements of other regulatory agencies.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

September 14, 1995

IV. PROGRAM REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT

A. Regional Policy

1. By _____, the EAC shall develop and adopt a regional policy to promote watershed protection considerations during planning, project review, and permitting of new development and redevelopment, to:

   a. preserve to the extent feasible, and where possible, create or restore areas that provide water quality benefits, such as riparian corridors and wetlands, and promote the design of new development so that it protects the natural integrity of drainage systems and water bodies.

   b. avoid conversions of areas particularly susceptible to erosion or sediment loss and/or establish development guidance that identifies these areas and protects them from erosion and sediment loss. Such areas include steep slopes, highly erodible soils, periods of intense rainfall, and inability to revegetate once disturbed.

   c. require the integration ~~em~~ of storm water quality protection into construction and post-construction activities at all development sites, including the minimization of toxic material use and their careful containment on site.

   d. maintain peak runoff rates at pre-development levels, wherever practicable.

2. By _____, the EAC shall establish minimum requirements consistent with the regional policy for new development and redevelopment, for

   a. site planning practices

   b. construction best management practices

   c. post-construction best management practices

   d. reporting erosion and storm water control strategies

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

e. redevelopment and infill

B. Planning Process

In order to integrate storm water management considerations into new development projects at the time that ~~th(y~~ they are first proposed to jurisdictions, and to support other provisions of this permit:

1. By _____, the EAC shall develop guidance for permittees to use in preparing/reviewing EIRS, and in linking EIR mitigation conditions to local permits approvals.

2. By _____, ~~permittees~~ and to the extent required by the Clean Water Act, Permittees shall adopt and use the guidance in their internal procedures.

3. By _____, the EAC shall develop a model CEQA checklist form that explicitly addresses watershed, water quality, and nonpoint source pollution impacts.

4. By _____, the permittees ~~shall~~ may use the model CEQA checklist for the review of projects within the matters addressed by this Permit. *[NOTE: Cities, not the RWQCB or other author of the "model CEQA Checklist" are responsible for CEQA compliance, and the adequacy of their checklists.]*

5. Whenever a permittee ~~rewrites either of the following mandated general plan elements the~~ amends its general plan's conservation element or ~~the~~ open space element, watershed and stormwater management/urban runoff considerations shall be incorporated, to the extent required by the Clean Water Act.

6. By _____, to the extent required by the Clean Water Act, permittees shall implement a program to encourage developers to maximize pervious areas and storm water infiltration (in areas where the geology and topography allow), minimize directly connected imperious areas, and include justifiable treatment control measures.

7. Permittees, to the extent required by the Clean Water Act, shall require that prior to the submittal of an application for the first planning or

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

building approval for a new development project, an applicant shall submit an Urban Runoff Mitigation Plan.

a. The Urban Runoff Mitigation Plan, to the extent required by the Clean Water Act, shall:

i. Be designed to reduce the runoff volume from the site and the pollutant load contributed by the site through incorporation of design elements and practices that address each of the goals set forth below in subsection (c). (Applicants should refer to the most recent edition of the Construction Best Management Practices Handbook, produced and published by the Storm Water Quality Task Force, for specific guidance on selecting best management practices for reducing pollutants in stormwater discharges from urbanized arias.)

ii. Discuss compliance with the development requirements set forth by Permittee's legal authority; and

iii. Address the following goals in connection with both construction and long term operation of the site:

(a) Maximize, to the extent practicable, the percentage of permeable surfaces in order to allow more percolation of runoff into the ground.

(b) Minimize, to the extent practicable, the amount of runoff directed to impermeable areas to the City's stormwater system.

(c) Maximize, to the extent practicable, stormwater filtration and storage for reuse through the use of sediment traps, cisterns or other means.

(d) Minimize, to the extent practicable, parking lot pollution through the use of porous materials to allow percolation of runoff, through the installation of appropriate treatment controls, or through other means.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137919.1 and L:\RCYOUNG\PUBL\137909.2. Deletions appear as struck-through text and Additions appear as double underlined text.

iv. Compliance with an approval Urban Runoff Mitigation Plan shall be a condition of any required planning approval.

v. Failure to comply with an approved Urban Runoff Mitigation Plan after receiving any required planning approval shall be a misdemeanor.

C. Identification of Sources

1. By _____, the EAC shall establish a screening criteria for construction sites to be listed in a database.

2. By _____, to the extent required by the Clean Water Act, the Permittees shall develop a database listing sites of construction activity within each Permittees' jurisdiction which shall be updated quarterly. The database shall include at a minimum:

a. Facility owner's name, address, and telephone number;

b. Site address, telephone number, and contact person;

c. Closest receiving water;

d. Type of construction activity

e. Duration of project with start and end dates

f. Total size of project in acres or square feet.

D. Prioritization of Sources

1. By _____, to the extent required by the Clean Water Act, the Permittees shall prioritize sites of construction activity within their jurisdiction on their relative potential for the contamination of storm water and urban runoff. The categorical list shall include:

a. All construction activity sites regulated under Phase I of the Federal storm water program (40 CFR 122.26).

b. All construction activity with sites greater than the size criteria established by the EAC rut less than five acres in size.

This redlined draft shows the differences between F:\RCYOUNG\PUBL\137989.1 and F:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

c. Other construction activity sites considered by the EAC or the Regional Board to have high potential for the contamination of storm water and urban off.

2. By _____, to the extent required by the Clean Water Act, Permittees shall rank the construction activity sites, identified as potential pollutant sources of storm water and urban runoff pollutants in IV.B.1.a, in order of priority for oversight of implementation of storm water management measures.

E. Control Measures

1. By _____, to the extent required by the Clean Water Act, Permittees shall develop a checklist of specific storm water and urban runoff control measures for construction activity sites in IV. B.I.a. The control measures must

a. address multiple pollutant sources

b. initially focus on source control measures such as source minimization, education, good housekeeping, good waste management and good planning.

c. target construction activity source areas and activities with the potential to generate substantial pollutant loadings

2. By_____, to the extent, if any, then required by the Clean Water Act, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for construction sites in IV.B.I.a. The structural control measures must be evaluated as to:

a. effectiveness in reducing sediment, toxic pollutants and pollutants of concern;

b. ease of maintenance;

c. current frequency of use;

d. feasibility and cost-effectiveness; and

This redlined draft shows the differences between I:\RCYOUNG\PUBLI\37919.1 and I:\RCYOUNG\PUBLI\37919.2. Deletions appear as struck-through text and Additions appear as double underlined text.

e. possible methods to ensure implementation.

By _____, Permittees shall describe any studies and pilot projects that may be conducted to assess e feasibility and effectiveness of specific control measures.

3. By _____, to the extent required by the Clean Water Act, Permittees shall have in place a process to ensure implementation and proper maintenance of storm water and urban runoff control measures for sites associated with construction activity in IV.B.I.a., including

a. use of qualified personnel to design, install, and maintain BMPS.

b. proper maintenance of BMPs incorporated into private developments (e.g., through deed restrictions, covenants, conditions and restrictions (CCR).

c. proper installation and maintenance of post-construction BMPS.

d. prohibition on grading daring the wet season (Oct 15 -Apr 15) except for emergency action unless adequate erosion and sediment control measures are in place and maintained.

4. Permittees, to the extent required by the Clean Water Act, shall require the following for demolition/construction activity:

a. Sediment, construction waste and other pollutants from construction sites and parking areas shall be retained on the site to the maximum extent practicable.

b. Any sediments or other materials which are not retained on the site shall be removed within 24 hours or where determined necessary by the Director of Department of Public Works, or a designated representative, a temporary sediment barrier shall be installed.

c. Excavated soil shall be located on the site in a manner that eliminates the amount of sediments running into the street or adjoining properties. Soil piles shall be covered until the soil is either used or removed.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as strick-through text and Additions appear as double underlined text.

d. Drainage controls shall be utilized as needed, depending on the extent of proposed grading and topography of the site, including but not limited to the following:

i. Detention ponds, sediment ponds, or infiltration pits.

ii. Dikes, filter beams or ditches.

iii. Downdrains, chutes or flumes.

iv. Silt fences.

e. No washing of construction or other industrial vehicles shall be allowed adjacent to a construction site. No water from washing vehicles on a site is allowed to run off into the City's storm drain system.

f. Roof drainage shall be oriented towards permeable areas on site to maximum extent practicable.

g. Lot drainage shall be oriented towards permeable areas to the maximum extent practicable.

h. All parking lots shall be designed to contain one inch of precipitation in a 24 hour period.

i. Runoff from parking lots shall be directed to permeable areas to the Maximum Extent Practicable.

5. Permittees, to the extent required by the Clean Water Act, shall require the following for construction activity:

a. All construction sites in hillside areas or in areas adjacent to natural water-ways (soft bottom creeks), lakes or the ocean must develop and implement sedimentation and erosion control plans that incorporate the following elements: timing of construction, BMPs to reduce erosion of cleared hillsides (revegetation, jute netting, etc.), BMPs to reduce the velocity of runoff and sediment from the construction site, and BMPs to detain the flow of sediments from the site;

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137919.1 and I:\RCYOUNG\PUBL\137919.2. Deletions appear as strike-through text and Additions appear as double underlined text.

b. As a condition of granting a construction permit, set forth reasonable limits on the clearing of vegetation from construction sites, including, but not limited to, regulating the length of time during which soil may be bare, and, in certain sensitive cases, prohibiting bare soil.

6. The EAC may seek coverage under this Order, for construction activity sites listed in III.B.I.(a) 1 which are owned and operated by Permittees if it:

a. establishes a procedure for notifying the Regional Board of construction activity on sites owned or operated by Permittees;

b. prepares a checklist of construction BMPs using BAT/BCT criteria for implementation by Permittees at these construction sites;

c. standardizes procedures to ensure implementation of construction BMPs by Permittees;

d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee construction sites; and

e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each construction site, and certify compliance with this Order.

F. Source Inspection

1. By _____, to the extent required by the Clean Water Act, Permittees shall submit a schedule for inspection of construction activity sites in IV.B.1.a. for adequacy of storm water pollution prevention measures and erosion control measures. The schedule shall include, for a five year period,
   a. all construction activity identified in IV.B.I.a.1, and all construction activity identified in III.B.I.a.2 and III. B.I.a.3,

2. By _____, to the extent required by the Clean Water Act, Permittees shall develop and implement a construction activity inspection program. The inspection program shall include, but is not limited to:

   a. procedures for construction site inspections

This redlined draft shows the differences between E:\RCYOUNG\PUBL\137919.1 and I:\RCYOUNG\PUBL\137919.2. Deletions appear as strick-through text and Additions appear as double underlined text.

b. procedures for construction and building industry outreach on pollution prevention, waste minimization, and storm water quality management

c. procedures to ensure corrective action is undertaken by non complying sites

d. procedures to follow-up on violations of municipal codes

e. procedures for enforcement action against non-complying construction activity;

f. an electronic recording system to document the status of construction activity inspections; and,

g. appropriate training for program staff.

3. During inspection of group IV.B.I.a.1 sites, inspectors shall request to see a copy of the SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may deem it necessary to report problematic construction sites to the Regional Board.

G. Reporting

1. Each year, to the extent required by the Clean Water Act, the Permittees shall evaluate the results and progress of their storm water quality management program for construction activity sites. The annual report submitted to the Regional Board shall recommend a strategy for the management of storm water from construction activity sites for the following year based on

a. priority construction site sources listing

b. priority site inspections

c. priority checklists of stormwater urban runoff control measures

d. evaluations of structural and treatment control measures

e. special studies and pilot projects needs

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

f. specific site and activity monitoring needs

2. The EAC shall make available to the Regional Board the construction activity database developed in IV.B.1.a.1 in the appropriate format when so requested.

H. Conflicts with Other Mandates

1. The Permittees ~~shall work~~ may cooperate with ~~other~~ regulatory agencies ~~and report~~ may make recommendations to the Regional Board ~~on recommendations~~ to resolve ~~any~~ conflicts ~~which are identified~~ between the provisions of this permit and the requirements of other regulatory agencies.

VOL 24

02993

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

September 14, 1995

V. PUBLIC AGENCY REQUIREMENTS

A. Examination of Existing Activities

By _____, to the extent required by the Clean Water Act, the Permittees shall develop and begin implementation of a program to examine their existing activities and measures described below to reduce the impact on stormwater quality from their operations.

B. Sewage Systems

1. All reasonable efforts shall be undertaken to keep sewage spills or leaks from entering the storm drain system. The EAC shall develop procedures for spill response by _____.

2. Control procedures for identifying, repairing, and remediating sewer blockages, exfiltration, overflow, and wet weather overflows from the sewers to the storm drain system shall be implemented to protect stormwater quality by _____. These procedures shall include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

3. By _____, ~~the Permittees~~ to the extent required by the Clean Water Act, each Permittee shall insure that its field personnel who operate and/or maintain sewer systems have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to ~~properly~~ investigate properly any suspect connections or cross connections to the storm drain system.

C. Vehicle Maintenance/Material Storage Facilities.

1. By _____, EAC will develop pollution prevention plans for each public vehicle maintenance/material storage facility category. Public vehicle maintenance/material storage facilities include any Permittee-owned and/or operated facility in which any of the following occur: vehicle or equipment maintenance; repair; washing; fueling; and/or any facility at which there is storage of toxic chemicals or hazardous materials.

This redlined draft shows the differences between I:\RCYOUNO\PUBL\157989.1 and I:\RCYOUNO\PUBL\157989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

2. Best Management Practices (BMPS)

a. By _____, to the extent required by the Clean Water Act, Permittees will have site specific pollutant control measures implemented at all vehicle ~~maintenance/material~~ maintenance/ material storage facilities per EAC guidelines, together with an on-site pollution prevention plan.

b. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each public vehicle maintenance/material storage facility. To achieve this goal, the Permittees shall first identify the potential pollution sources and who is responsible for implementing the stormwater management measures.

c. Based on ~~the~~ facility type, management practices and schedule of implementation shall be developed by the EAC. BMPs that ~~can~~ could be used to improve the quality of runoff include, but are not limited to:

i. Housekeeping practices;

ii. Material storage control;

iii. Vehicle leak and spill control; and

iv. Illegal dumping control.

d. Loading/Unloading of Materials

i. Employees or contractors of the Permittees who handle potentially harmful materials shall be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to stormwater from outdoor loading/unloading of materials.

ii. Applicable BMPs shall be selected based on the following three factors:

(a) Eliminating exposure of material to rainfall;

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

(b) Checking equipment regularly for leaks; and

(c) Containing spills.

e. Material Storage Control

A program shall be developed to prevent or reduce the discharge of pollutants to stormwater from outdoor container storage areas using measures such as:

i. Installing safeguards against accidental releases;

ii. Secondary containment;

iii. Conducting regular inspections; and

iv. Training employees in standard operating procedures and spill cleanup techniques.

f. Vehicle and Equipment Washing and Maintenance

i. Washing of vehicles or equipment on-site shall be performed in a designated area equipped with an oil/water separator.

ii. The sumps and separators shall be maintained/cleaned on a regularly scheduled basis appropriate to the facility.

iii. BMPs to be implemented as appropriate for vehicle and equipment maintenance shall include but not be limited to:

(a) Waste reduction;

(b) Use of alternate product

(c) Pollution prevention;

(d) Recycling; and

(e) Spill prevention and clean up.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

3. Waste Handling and Disposal

Wastes shall be managed to prevent stormwater pollution.

D. Parks and Recreation

1. Fertilizers/Pesticides

a. Permittees, to the extent required by the Clean Water Act, shall develop procedures on the proper application of pesticides, herbicides, and fertilizers by Procedures shall include:

i. List of approved pesticides and selected use;

ii. Product and application information;

iii. Equipment use an(i maintenance procedures; and

iv. Record keeping.

b. Landscape waste shall not be discharged into the storm drain system.

c. Storage areas for fertilizers and pesticides shall be designed and maintained to reduce exposure to stormwater. The following BMPs shall be utilized where appropriate:

i. Store materials inside or under cover on paved surfaces;

ii. Use secondary containment;

iii. Minimize storage and handling of hazardous materials;

iv. Inspect storage areas regularly.

2. Facility Management

a. Wash waters ~~cannot~~ shall not be discharged into the storm drain system without appropriate treatment.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

b. Landscape maintenance involving the use of pesticides and fertilizers shall ensure the proper use of these materials to minimize loss to storm water.

c. Retention and planting of native vegetation to reduce water, fertilizer, and pesticide needs shall be encouraged.

d. Use of Integrated Pest Management (IPM) shall be encouraged.

e. A schedule for irrigation and fertilization shall be developed by _____, to minimize

i. Chemical application during wet season and no chemical application during storms; and,

ii. Over watering that may lead to runoff that contains nutrients and pesticides.

f. The drainage of commercial/municipal swimming pool water shall ~~only~~ be discharged only under separate Waste Discharge Requirements.

g. Each Permittee shall develop BMPs to minimize trash, debris, and other pollutants from entering Permittee owned recreational water bodies by _____. These measures shall include:

i. Routine trash collection along, on, and/or in, water bodies, where feasible; and

ii. Public outreach to educate the public about impacts of illegal dumping.

E. Storm Drain System Operation and Management

1. Inlet Maintenance

BMPs to be implemented by each Permittee, to the extent required by the Clean Water Act, for effective catch basin cleaning shall include, but not be limited to the following:

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as strunk-through text and Additions appear as double underlined text.

a. Basins shall be inspected and cleaned between May 1 and October 15 of each year;

b. Between October 15 and April 15, catch basins shall be maintained as necessary.

c. Records shall be kept of the number of catch basins cleaned; and

d. Track the amount of waste collected.

2. Storm Drain Maintenance

a. Material removed from storm drains and catch basins shall be disposed of properly.

b. Trash and debris from open channel storm drains shall be removed at least annually between May 1 and October 15 of each year.

c. Open channels shall also be monitored during the rainy season for any debris buildup and cleaned where needed.

3. Waste Management

The Permittees ~~shall implement a program by _____~~, to the extent required by the Clean Water Act, shall, by _____, implement a to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

4. Dry Weather Storm Drain Diversion

The Permittees, to the extent required by the Clean Water Act, shall investigate the feasibility of diverting dry-weather flows from the storm drain system to POTWs where appropriate. The investigation, to the extent required by the Clean Water Act, shall be completed by _____.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and J:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

F. Streets and Roads

1. Sweeping of curbed streets:

a. Sweeping of curbed streets shall occur at least monthly.

b. Where feasible, areas generating excessive refuse shall be swept more frequently.

2. Maintenance

a. Existing saw-cut management and paving practices conducted by the Permittees shall be evaluated and appropriate control measures developed.

b. Paving control measures to be considered that would help reduce the impacts to stormwater include, but are not limited to:

i. Avoid paving during wet weather; and

ii. Store materials away from drainage courses to prevent pollution of stormwater runoff.

c. Refuse collected shall be transported to appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations.

d. Good housekeeping practices shall be implemented to insure proper management of any waste products that may be generated during maintenance activities.

e. To reduce stormwater pollution from concrete materials and wastes:

i. Washout of concrete trucks should be conducted off- or on-site in designated areas. ~~Do not wash out~~ Rinseate from concrete trucks shall not be permitted to flow into storm drains, open ditches, streets, or streams;

ii. Store materials *[NOTE: Please BE SPECIFIC, what materials?]* under cover, away from drainage areas; and

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

iii. Avoid mixing excess amounts of concrete or cement on-site.

f. Employees shall be trained in the implementation of good housekeeping measures. Training shall:

i. Promote a clear understanding of the potential for maintenance activities to pollute storm water;

ii. Identify solutions (BMPs selection);

G. Flood Control

1. By _____, the Permittees, to the extent required by the Clean Water Act, shall develop and implement procedures to assess the impact(s) of new flood management projects on the quality of receiving water bodies.

2. The Permittees, to the extent required by the Clean Water Act, shall undertake pilot projects/studies to determine the applicability of altered structural flood control system elements to provide pollutant removal in stormwater.

3. ~~During construction~~ To the extent required by the Clean Water Act, appropriate BMPs shall be utilized to control pollutants during construction .

4. Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed, to the extent required by the Clean Water Act, to assure that appropriate management measures are developed to comply with the stormwater regulations.

H. Parking Facilities

By _____, to the extent required by the Clean Water Act, each Permittee shall develop a program to implement periodic hardscape and catch basin cleaning, in order to reduce concentrations of oil, grease, suspended particulates, and metals, as well as the petroleum byproducts.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

VI. PUBLIC INFORMATION AND PARTICIPATION

To reach as many Los Angeles County residents as possible, a comprehensive educational outreach approach shall be undertaken under this permit. ~~Each~~ to the extent required by the Clean Water Act. To the extent required by the Clean Water Act, each Permittee shall choose an appropriate combination of outreach tools and activities to raise public awareness of storm water issues and improve water quality.

Outreach Materials

Outreach programs shall consist of written, audio, and visual materials and, when necessary, translated into appropriate languages or structured for appropriate ages. Permittees, to the extent required by the Clean Water Act, shall incorporate interactive methods of distributing outreach materials and provide for public participation in activities developed under this section.

A. Written Material

1. The Permittees, to the extent required by the Clean Water Act, shall produce a variety of written materials to convey information regarding storm waste management within County watersheds.

2. Written materials shall include, but are not limited to: flyers, brochures, door-hangers, newspaper articles, mail-inserts, and newsletters.

B. Audio Material

1. All Permittees ~~shall singularly or collectively~~, to the extent required by the Clean Water Act, shall individually or jointly utilize radio broadcast public service announcements to convey information regarding storm water management except in areas where public access radio stations are not available.

2. Examples of audio materials include radio advertisements, public service announcements, and informational recordings.

. This redlined draft shows the differences between I:\RCYOUNG\PUBL\LJ7989.1 and I:\RCYOUNG\PUBL\LJ7989.2. Deletions appear as strike-through text and Additions appear as double underlined text.

C. Visual Material

1. All Permittees, to the extent required by the Clean Water Act, shall implement a catch basin labelling program as well as other strategies such as banners, displays and posters to educate the public on the ultimate destination of storm drain system flows.

2. Each Watershed Management Committee shall produce at least one informational video. The video shall be shown on televised public service stations and cable access programs except in areas where cable access programs are not available. Further methods of distribution may include workshops, libraries, etc.

D. Distribution of Materials

Outreach materials shall be made available to the public at appropriate public counters and distributed at public events. Examples include fairs, festivals, public meetings, community events, school assemblies, etc.

General Education Strategy

A. The EAC shall develop and the Permittees shall implement a 5-year urban runoff education strategy. The intent of the strategy shall be to enhance public awareness of the impact of storm water pollution on receiving waters and to discourage improper waste disposal practices. Outreach efforts shall be conducted throughout the watershed. The public shall be made aware of their responsibility for both the problems and solutions to storm water pollution. A watershed-wide program shall be implemented by _____.

Development and implementation of the education strategy shall be based on the four objectives listed below:

1. Promoting clear identification and understanding of the problem, including activities with the potential to pollute storm water;

2. Identifying solutions or applicable measures (Best Management Practices) that can be taken to prevent storm water pollution;

3. Raising public awareness of the problems and solutions; and

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

4. Incorporating solutions back into programs, training and BMP implementation.

B. Efforts shall be made to identify land uses and activities that have a higher potential for storm water/urban runoff pollution by focusing on specific pollutants, disposal practices, materials used, etc, To prevent storm water/urban runoff pollution, outreach materials shall be provided on the appropriate selection and implementation of BMPs accordingly A watershed-wide program shall be developed by _____.

1. Pollutant Specific: The reduction of specific pollutants of concern in a particular watershed shall be addressed in a focused public education and outreach program.

2. Activity-specific: Activity-specific outreach programs shall be developed and implemented throughout watershed. Written, audio, or visual outreach tools should address primary topics:

   a. Identification of activities potentially causing storm water pollution;

   b. Implementation of Best Management Practices to prevent storm water pollution.

   c. Recognizing and reporting occurrences of storm water polluting activities.

   The Permittees shall continue to develop activity-specific outreach programs that inform residents about the problem of illicit discharges and dumping and that promote, publicize, and facilitate public reporting of these activities. The program shall also include continuing operation, maintenance, and promotion of the county-wide reporting hotline.

C. The Permittees shall ~~list pertinent~~ submit to telephone directory publishers, City phone numbers to be listed under the City government directory located in the front section of local area phone books. This shall ~~be updated annually as necessary and shall, at a minimum,~~ include numbers for reporting on clogged catch basin inlets, reporting illegal discharges/dumping and a general informational number for storm water. These phone numbers may be city-specific or area-wide.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137919.1 and I:\RCYOUNG\PUBL\137919.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

D. All efforts deemed to be reasonable ~~efforts~~ by a permittee to coordinate public outreach efforts shall be undertaken. This may include coordinating with environmental groups and public agencies such as the California Coastal Commission, the Department of Beaches and Harbors, Resource Agencies, etc.

Outreach to Target Audiences

Permittees, to the extent required by the Clean Water Act, shall develop and implement an educational program that stresses pollution prevention for a variety of audiences, including local residents, school-aged children, businesses and public employees whose job functions and dally lives may impact storm water quality. The program may be developed locally or regionally and shall include ~~at a minimum~~, to the extent required by the Clean Water Act:

- Education on the proper use and disposal of pesticides, herbicides and fertilizers;
- Education on the definition of, identification of, and impacts associated with illicit discharges and procedures for reporting.
- Promotion of proper management of ad disposal practices for used oil and hazardous substances.

A. Local Residents

1. Permittees, to the extent required by the Clean Water Act, shall develop a program to educate local residents on types of household hazardous wastes along with proper management and disposal methods. The program shall at a minimum include:

   a. Information on the availability of collection services, such as location and schedule;

   b. Production of public outreach materials that educate residents on source reduction and proper disposal methods for household hazardous wastes; and

   c. Continue to encourage residents to recycle oil, antifreeze, glass, plastics, batteries, etc. and to prevent the improper disposal of such materials to the storm drainage system.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

Educational efforts throughout the watershed should also provide residents with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Management Program. Other local programs shall be advertised as appropriate.

2. Permittees, to the extent required by the Clean Water Act, shall develop and encourage watershed residents to participate in specific storm water outreach programs. Residents shall be informed of and provided with the opportunity to share ideas and comments about the programs. Permittees shall demonstrate that a good faith effort has been made to outreach to different communities within the watershed. The watershed-wide outreach program shall be implemented by _____. This shall at a minimum include:

   a. Where applicable for fire and erosion prevention, mowing shall be encouraged as opposed to disking. An investigation of effectiveness shall be undertaken.

3. Cooperative Public Outreach

   In order to promote public participation, cooperative outreach programs with local residents shall be developed. These cooperative programs should foster awareness and identification of storm water pollution issues among residents in the watershed. Catch basin labelling and other established sign programs are excellent examples of this type of cooperative effort, as are events like the "Storm water Pollution Awareness Week." One possibility for cooperative outreach is an "Adopt-A" program. Residents can "adopt" highways, storm drains, catch basins, streams, etc. to monitor, restore and protect. The purpose of all cooperative outreach programs created is to inform and involve the public in storm water management.

4. Complaint Procedures

   Public comments/complaints shall be requested by the Permittees in order to help gauge the success and effectiveness of storm water programs.

B. K-12 School Children

School children can play an important role in public information and participation programs, as they are generally more easily motivated and any behavior changes

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137919.1 and I:\RCYOUNG\PUBL\137919.2. Deletions appear as strike-through text and Additions appear as double underlined text.

they make tend to stay with them through adulthood. School children can also convey storm water pollution prevention messages to other family members. School programs shall include information on storm drain systems, the difference between sewers and storm drains, the importance of preventing storm water pollution, and may also address, illegal discharges/dumping and reporting procedures, source minimization, and general pollution prevention. Written materials (workbooks and coloring books), videos, assemblies, and field trips are examples of effective components of a K-12 educational program.

C. Businesses

A detailed public education and outreach program shall be developed for business operations with greater potential of discharging pollutants into the storm drain system. The program shall include employee training on and the effectiveness of implementing BMPs to reduce nonpoint source pollution. In addition to written, audio, and visual materials, other possible means of focused outreach may include: conducting workshops, mass mailing trade/industry magazines, etc.

D. Public Agencies and Employees

~~Public~~ Appropriate public agency employees shall be trained on storm water management and pollution prevention practices and involve employees on many different levels from program managers to field personnel. Training programs shall include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forums or committees. Materials developed for other audiences may also be used in these public agency employee training programs. Appropriate public agency employees shall be trained in:

1. Emergency spill cleanup procedures.

2. Environmentally sensitive alternative products.

3. Good housekeeping practices.

Permittees shall provide outreach materials to the general public through business license renewal counter,; and/or make efforts to outreach through professional and business associations. Additionally, Permittees should consider producing educational materials for professionals and technicians not employed by public agencies.

VOL 24

0307

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through text~~ and Additions appear as double underlined text.

Outreach Based on Activity-Type

A. Industrial/Commercial

A watershed-wide, general outreach program shall be set up by the WMC for all industrial and commercial facilities potentially discharging to the storm drain system. Furthermore, the WMC shall provide specific guidance objectives to these facilities regarding storm water program, compliance by _____, and inform and remind all potential commercial and industrial dischargers of their obligations under the storm water program. The Permittees shall also encourage the proper disposal of all materials from industrial and commercial sites.

Prior to the WMC providing specific guidance objectives, subcommittees shall be established, as needed, to develop specific outreach materials for industrial/commercial categories and specific "high priority" activities. This shall include at a minimum: metal ~~platers~~ platters, restaurants, vehicle related facilities, etc...

B. Construction

The Permittees, to the extent required by the Clean Water Act, shall ensure that contractors properly install all necessary post construction, permanent BMPs during initial construction and that any necessary maintenance needed during construction is performed. There shall be specific programs outlining correct practices.

In an effort to prevent concrete waste from entering the storm drain system, contractors shall observe the following guidelines:

1. Washout of concrete trucks should be conducted off-site or on-site in a designated area;

2. Excess concrete should not be dumped on site; and

3. Employees and subcontractors should be trained in proper concrete waste management.

Evaluation

The EAC shall develop a process to evaluate the effectiveness of all public outreach programs implemented under this permit. Surveys and focus groups are examples of

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

methods that can be used to gauge a program's effectiveness. They can also be used to provide insight into the program's direction and to help formulate attainable goals. Results of any evaluation method used shall indicate the community's level of awareness of storm water pollution. A watershed-wide program shall be implemented by _____.

August 25, 1995 (To be negotiated)

VIII. PROGRAM EVALUATION AND REPORTING

The program may be modified subject to comments received under the Annual Review.

A procedure shall be developed and utilized for program evaluation and reporting by the Principal Permittee during the course of this permit. Under this procedure as outlined below, the EAC shall develop action-specific performance indicators and criteria, perform evaluation of compliance and effectiveness based on the performance criteria, establish schedules and mechanism for initial record keeping and reporting, and submit semi-annual and annual reports to the Regional Board using a standardized format.

The EAC, WMC, and/or each Permittee, to the extent required by the Clean Water Act, are responsible for collecting data needed for program evaluation, conducting self-evaluation, and reporting the results of evaluation to the Regional Board. The results reported to the Regional Board shall include both the collected data and analysis of the data. The reports shall include detailed explanation on how the evaluations are conducted, how and why certain provisions of the permits are met or not met, how the effectiveness of certain BMPs is determined or is not, and should a problem arise, how it shall be corrected. The Regional Board will make a compliance determination based on information submitted under this procedure.

A. Demonstration of Compliance

1. Each Permittee, to the extent required by the Clean Water Act, is responsible for demonstrating that the required BMPs as prescribed under this permit, as well as other BMPs included in the Watershed Management Plans, are implemented to the "maximum extent practicable." Each Permittee shall implement the required BMPs to the maximum extent practicable.

2. The Watershed Management Committees are responsible for demonstrating the effectiveness of other BMPs through conducting and reporting the results of pilot/demonstration projects for evaluating the effectiveness of BMPs in the watershed.

3. The degree and the effectiveness of BMP implementation shall be evaluated and reported by the Permittees, to the extent required by the Clean Water Act, using environmental and/or administrative indicators whenever possible. When environmental indicators are not readily and/or

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

easily available, administrative indicators shall be used. These shall include indicators prescribed under relevant provisions of this permit, and/or other indicators deemed appropriate by the Watershed Management Committee, the Executive Advisory Committee, and/or ultimately the Regional Board. Examples of the quantitative indicators include the number of inspections conducted, number of staff increase, number of audience reached through public education, waste recycled, water conserved, hazardous waste collected, oil recycled, catchbasin waste removed, etc. Quantitative indicators of environmental conditions should also be reported if they can be linked to the effects of the BMP implementation.

4. In order to yield comparable results for year to year evaluation on the success, the progress, and/or the failure in BMP implementation, and comparable results from area to area, a uniform data collection methodology shall be established for each of the required BMPS. The uniform data collection methodology shall be developed by the Executive Advisory Committee. Subsequently, each report on BMP implementation shall provide comparison with the implementation status during the previous reporting period and the scheduled implementation timeline for the current and future reporting periods, based on data collected using the uniform collection methodology.

B. Internal Reporting and Record Keeping

1. In order to facilitate the preparation of semi-annual and annual reports, the EAC shall develop standard forms for internal reporting to be used by all Permittees within the watershed. The forms shall collect all the information essential to the preparation of the annual and semi-annual reports and to the needs of other management actions by the Watershed Management Committees, EAC, and/or the Permittees. Reported information shall be quantifiable, and specific for each program area and/or BMP. The dates for submitting the internal reports shall allow sufficient time for compilation and analysis by the Watershed Management Committees and/or the EAC for the preparation of semi-annual and annual reports to the Regional Board.

2. All records shall be retained by the Permittees for a period of 5 years or longer as required by the Regional Board or USEPA.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

C. Semi-annual and Annual Reports

1. Semi-annual Report

The requirements under VIII.A shall be met by the submittal of semi annual and annual reports. Semi-annual reports shall succinctly summarize compliance efforts and may consist of simple compliance checklists. Annual reports shall be comprehensive.

a. The EAC shall submit a semi-annual progress report to the Regional Board by _____ of each year. Semi-annual reports must be submitted to the Regional Board within 30 days after the end of the six-month period. These six month periods are Jan - June, and July - Dec. (TO BE DETERMINED).

b. The semi-annual report shall serve as a status report on the progress of the implementation of the Stormwater Management Plan and other permit provisions. The Watershed Management Committee is responsible for collecting and compiling information from each Permittee prior to preparation of the semi-annual report, information along with the information analysis into the report.

c. The semi-annual report shall consist of a summary table illustrating the levels of implementation for all requirements by each Permittee. Tables shall be developed for each program element listing the Permittees, describing the status of implementation by each Permittee of the element, and documenting any modifications of the element from the standard program.

2. Annual Report

a. The Executive Committee shall submit an annual report to the Regional Board not more than 60 days after the end of each permit year (_____). The annual report shall include both a summary of the progress and status of Stormwater Management Plan implementation, a summary on status of compliance with all permit provisions, a report on the evaluation of program effectiveness, and a summary of recommendations for permit provision revisions. The Permittees as a whole (within watershed management areas) shall describe any problems encountered during

VOL 24

0312

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

implementation and discuss the modifications to the program in order to solve these problems.

b. The Principal Permittee shall collect, compile, and analyze information from each Permittee within the watershed prior to preparation of the annual report. The Watershed Management Committee shall include the compiled information and its analysis (instead of raw data or copy of internal reports) in the annual reports.

c. The semi-annual report shall include a summary table illustrating the levels of implementation for all Permittees. Tables shall be developed for each program element listing all the participating Permittees and describing the status of implementation by each Permittee of the element. A table shall also be included to summarize the status of the program elements for which the Watershed Management Committee bears the primary implementation responsibility. Besides summary tables, the report should provide detailed explanation on any modifications made of the program elements (delays, changes, etc.) from the standard provisions and provide an analysis of any problems encountered during the implementation and the proposed solutions.

d. The annual report shall include an assessment of the effectiveness of each program elements using the performance evaluation indicators and criteria developed under Section A of this Chapter, and the results of the pilot/demonstration projects conducted within and/or outside the watershed. The findings should be presented graphically for ease of comparison with the established levels of effort.

e. A fiscal analysis and budget as described under I.1 (Fiscal Resources) of this Order shall be submitted annually within 30 days of the Budget adoption date for each Permittee.

D. Storm Water Management Plan Revisions

1. Revisions to provisions of this permit ~~can~~ may be made through the order of the Regional Board. The EAC ~~can~~ may recommend and request revisions to the Stormwater Management Plan through documentation in the annual reports.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

2. Recommended revisions shall be supported by the results of a program evaluation. Recommended revisions to the Stormwater Management Plans may be made if it can be demonstrated that 1) the changes will lead to improvement of the effectiveness of this program, 2) the changes will result in positive impacts of environmental conditions, and 3) that the current measures have been implemented to the "Maximum extent practicable" as defined in Section VIII.A. Any recommended revisions shall not take effect unless approved by the Executive Officer.

3. Revisions may be made to the Storm Water Management Plans by the Executive Officer or the Regional Board based upon public input and/or testimony.

The Discharger shall comply with the attached Monitoring and Reporting Program, which is part of this Order, and any revisions or modifications thereto, as ordered by the Executive Officer.

This Order may be modified, revoked, or reissued, prior to the expiration date as follows:

a. To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;

b. To incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain Icy other requirements of the CWA then applicable; or

d. Any other Federal or State Laws or Regulations become effective which necessitate changes.

The issuance of this permit is not intended to, and does not, absolve the Discharger of liability for conduct which may have constituted a violation of the previous Board Order 90-079 (AN, Cl 6948) adopted by this Regional Board on June 18, 1990.

This Order expires on _____. The Discharger must submit a complete Report of Waste Discharge including a revised Storm Water Management Plan in accordance with Title

RE: Comments on the September 15th Draft Permit

Dear Ms. Tyrell:

This letter is in response to your memo requesting comments regarding the NPDES draft permit dated September 15, 1995.

Before getting to the specifics, I would like to discourage the circulation of more than one draft at a time. Within a few days, two different versions of the draft permit were circulated. This made our reviewing process more difficult given that either version was confusing enough. Also, we must have a reasonable amount of time for review; without it adequate comments are impossible.

0318

Comments/concerns on the draft permit:

- In general, the draft permit is too lengthy, too complex and cumbersome. The details and extensive requirements both in the development of the program and reporting phases would probably make it cost prohibitive to implement. The permit needs to be simple, clear and concise.

- We question the designation of the Executive Advisory Committee (EAC) as an entity responsible for the implementation and regulation of the program. It would seem that only the entities covered by the permit (i.e. the principal permittee and the co-permittees) could be held legally accountable for complying with the different aspects of the permit. The EAC should only be an advisory and coordinating body.

- The amount of work and responsibility put on the EAC and its volunteer members is enormous. Most of the tasks assigned to EAC should be divided between the Board and the principal permittee.

- The reporting requirements would be a substantial burden on the co-permittee staff. We recommend a simple checklist method. This reporting should demonstrate the compliance of the permittee with the intent of the permit. Written justification should only be submitted in the event that compliance is either delayed or not being achieved.

- The draft does not include compliance deadlines. The amount of work for implementation will be considerable; so it is hoped that when the time schedule is considered it will be based on realistically achievable goals.

We appreciate the opportunity to comment on the draft permit. Again, we urge the EAC and the CRWQCB to take into consideration available resources and the need for the permit to be as simple, clear and concise as possible.

Sincerely,

Donald M. Campbell
City Engineer

CC: Donald Wolfe, EAC Chairperson

Subject: Comments September 15th Draft NPDES Permit CAS0061654

Dear Ms. Tyrell:

This letter is in response to the Draft NPDES permit dated September 15, 1995. In general, the draft permit is too lengthy and complex for effective implementation. The permit should provide a framework for watershed management and not concentrate on specifics. The specifics should be developed as part of an overall watershed management plan, and be realistic in relation to the financial resources available to local Cities. Other comments are:

1. The draft permit contains many phrases such as:

   "The_____shall develop by_____"
   "The_____shall establish by_____"

   Since the new permit has not yet been adopted, it is unlikely that many permittees have budgeted for high cost items such as inspection programs for this fiscal year. All high cost items should be scheduled to begin no earlier that July 1, since that is the beginning of the fiscal year for most permittees.

2. The EAC should be an advisory and coordinating body, not an implementation or regulatory body. The amount of work and responsibility for the members of the Executive Advisory Committee is enormous. This will make membership on the EAC a nearly full time position (and volunteers for the EAC may become very scarce).

   The tasks assigned to the EAC in the draft permit should be divided among the Board, the principle permittee and the co-permittees. This most recent draft appears to have placed many regulatory and semi-regulatory responsibilities on the shoulders of the EAC. These responsibilities should be assigned to the Board.

3. The number of groups required by the permit to develop and implement the many tasks will lead to confusion. There should be three groups identified by the permit:

   The Board,
   The principle permittee, and
   The co-permittees

   Participation in the Executive Advisory Committee and the Watershed management committees should be voluntary (although encouraged).

4. The reporting requirements could be an enormous burden on co-permittee staff. Reports should be required no more than once per year. A simplified check list which demonstrates the permittees compliance with the intent of the permit should be used rather than concentrating on minutiae such as how much debris was collected from catch basins (which have been regularly cleaned since well before the stormwater program) and how often streets are swept (which also has been done since well before the stormwater program).

   Written descriptions should be required only for anomalies.

5. A specific comment on Section IV.F.3. (pg 23) and similar sections:

   In a program of this magnitude, it is likely than many problem sites will be encountered which will need direct Board involvement for problem resolution. If a problem site is refereed to the Board, does that relieve the permittee from the responsibility of taking further actions until a ruling is made by the Board?

6. The amount of work required for Implementation of this permit will be considerable. During the first five years. the work should concentrate on realistically achievable goals. The exempted stormwater discharges, as proposed by the EAC, should be fully adopted.

7. It has been suggested that the guidance document currently under development be incorporated as part of the permit. We are concerned that this will make any modifications to operating procedures, no matter how minor, difficult to make without prior board approval.

   Overall this Draft NPDES permit is un-realistic from an implementation point of view. For example, the creation of a Storm Water Utility Tax to fund the proposed activities is virtually impossible. In todays local political climate anything that smacks of additional City intrusion into the daily lives of residents and businesses is strongly resisted. The harsh reality is that reductions in staff and resources will continue to affect the ability of our City to maintain even traditional City services, let alone comply with these proposed additional responsibilities!

VOL 24

0321

We appreciate the opportunity to offer our comments to you. Please call Brad Miller at (818)914-8246 if you have any questions.

Sincerely,

R. Cantwell

Re: Comments on September 15, 1995 Draft Waste Discharge Requirements For Stormwater Management/Urban Runoff Discharges Within The County of Los Angeles (NPDES No. CAS0061654)

Dear Ms. Tyrell:

At the meeting of the municipal co-permittees on September 27, the Regional Water Quality Control Board asked that comments regarding the draft of "Waste Discharge Requirements For Stormwater Management/Urban Runoff Discharges Within The County of Los Angeles (NPDES No. CAS0061654)" be submitted in writing to the Board. The short comment period did not provide us with a sufficient opportunity to carefully review and evaluate the current draft permit or to obtain outside input. The City of Hermosa Beach, nevertheless, considers it very important to provide its initial and preliminary comments.

We have appreciated the opportunity for involvement in a process which will ultimately lead to a permit that will have a significant impact upon the City's operations and its fiscal resources and, most importantly, upon Hermosa Beach's residents and businesses. As a beach city, Hermosa Beach is acutely aware of the problems associated with stormwater pollution. Our residents and businesses which depend upon our coastal resources, as well as visitors, share a common concern regarding the water quality of the Santa Monica Bay. We are committed to doing everything we reasonably can achieve with our limited administrative and physical resources.

However, as the negotiation of the terms of the proposed permit has proceeded, we have become extremely concerned about both the direction the permit has taken and the scheduling for the renewal of the permit. Before addressing specific portions of the

permit, we thought it would be appropriate to first discuss some of our general concerns, which we understand are shared by many of the other co-permittee cities.

I. Scheduling of the New Permit.

One of the biggest concerns which the City of Hermosa Beach has is that neither our staff nor our residents, nor other interested parties, have been provided sufficient time to carefully evaluate either the specific language of the proposed permit or its impact. Board staff informs us that they are hoping to complete the negotiation process as soon as possible so that the permit can be considered by the Regional Board at either its December or January meeting. We do not believe that the current schedule is realistic for a number of reasons.

We have not yet received a full version of the draft permit. Even now, there are numerous versions of the permit which are being discussed. The draft which we have been asked to comment upon has been modified significantly. Since the various sections of the permit are intertwined, the piecemeal modifications have created a moving target. This, of course, makes it very difficult to intelligently comment upon the draft permit when the version we are reviewing has most likely been revised two or three times.

Accordingly, we would like to work with you to develop a realistic schedule for renewal of the permit which allows sufficient time for careful evaluation and meaningful input from our residents and other interested parties. That objective cannot be achieved on the current time schedule.

II. Limitations on Our Efforts.

Hermosa Beach's fiscal and administrative resources for implementing unfunded mandates are limited. Our objective in the permit renewal process is to develop an effective stormwater management program which targets and addresses identifiable, controllable pollutants in a cost-effective manner. Unfortunately, those targets have not yet been identified and we have been provided with no technical or scientific data which have been provided with no technical or scientific data which demonstrates the effectiveness of many of the programs dictated by the current draft of the permit or any cost justification.

To our knowledge, the Board has not yet made any factual findings in connection with the permit that would support or necessitate the many new programs which would be required by the permit if adopted in a form reasonable approximating its present draft.

Also, a number of sections of the draft permit impose a variety of data gathering requirements. We believe it important to ensure that the data proposed to be gathered at considerable cost to the principal permittee and the co-permittees is meaningful and useful, both for the Board's purposes as well as the permittees'.

Hermosa Beach needs to be sure that the money it spends on stormwater management is utilized in a cost-effective manner. The City does not have the resources to implement programs that are neither mandated or funded by federal or state law and are not demonstrably effective in reducing stormwater pollution.

III. Failure To Incorporate Prior Comments.

Over the last three months, the Executive Advisory Committee and the principal permittee and co-permittee members of the negotiation team have commented extensively, both orally and in writing, on the various portions of the permit which have been presented to us. In many cases, we found that our comments were not incorporated or addressed I the draft, nor was any explanation given for not including them. In other cases, we found that portions of the draft which the cities had identified as objectionable, and were told would be deleted, were just moved from one part of the permit to another without any explanation. The failure to incorporate agreed-upon changes in the drafts has been a source of great frustration to Hermosa Beach and other cities.

Similarly, we have commented regarding the draft permit at public meetings. While we have presumed that some note has been made of those comments, they are rarely responded to.

In order to ensure that permittee and public participation in the process is meaningful and that comments are seriously considered, we believe that it would be appropriate for the Board staff to collect and summarize the public comments made regarding the draft permit and directly respond to them either in writing or at a public meeting.

IV. Lack of Involvement By Other Interested Parties.

We are also very concerned that no meaningful opportunity has been provided for involvement in the process by other interested parties. Currently, a representative of various environmental groups who have a stake in the process sits on the negotiating committee. We welcome the involvement of environmental groups, such as Heal The Bay Foundation in the negotiation process. By the same token, local businesses which may be significantly affected by the new permit, have not been involved in the process at all. To our knowledge, no effort has been made by the Board to solicit their input.

We believe that, before the draft permit is presented to the Regional Board, all interested parties who have a stake in the process should be given a fair and meaningful opportunity to participate in the process through workshops and public meetings.

V. Complexity and Length of the Draft.

We are particularly concerned about the length and complexity of the draft permit. We share the concerns previously expressed by the City of Long Beach and the City of

Carson that the permit should establish a framework for a Stormwater Management Plan, rather than an attempt to dictate numerous inflexible management programs. Both the existing permit, as well as other permits currently being issued in other regions, utilize a framework approach that allows the individual co-permittees to select the BMP's which best suit their needs while accomplishing the objectives of the Clean Water Act and state law. The current draft runs over 45 pages and is not even complete and contains numerous inflexible dictates.

The current approach to the proposed permit seems to run contrary to the objective expressed in the State's Stormwater Municipal best Practices Handbook, which allows municipal permittees flexibility in selecting effective BMP's themselves, which would (1) adequately address the pollutants of concern, (2) be compatible with stormwater regulations, as well as other regulations for air, hazardous waste, and solid waste disposal, (3) have public support, (4) be compatible with land uses and facilities, (5) be technologically feasible, considering soils, geography and water resources, and (6) balance the cost for implementing specific programs against the pollution control benefits expected to be achieved.

We believe that the permit needs to be reduced in size to reflect the goal of allowing municipal co-permittees and individual watersheds the flexibility to select the best and most effective BMP's which fit their circumstances.

VI. Specific Dictates of the Permit.

We are concerned that specific programs are being dictated to the cities in the draft permit without a clear understanding of the water quality goals that the permit aims to achieve and, most importantly, without the benefit of an accurate assessment of existing conditions. The specific dictates of the proposed permit do not allow very much flexibility for prioritizing the tasks to be performed or the application of cities' limited funds.

Each of the co-permittee cities has very definite local areas of concern and thoughts as to what actions it can take to address those concerns. These concerns, however, can only be fully determined through public workshops where citizens and interested parties are informed about stormwater pollution problems and are invited to present their views.

VII. Technical Comments.

1. The draft permit contains many phrases such as:

"The_____ shall develop by_____"
"The ____ shall establish by_____"

Since the new permit has not yet been adopted, it is unlikely that many permittees have budgeted for high cost items such as inspection programs for this

fiscal year. All high cost items should be scheduled to begin no earlier than July 1, since that is the beginning of the fiscal year for most permittees.

2. The Executive Advisory Committee (EAC) should be a coordinating body. A consultant can be retained to assist the EAC with all the tasks assigned to them in the draft permit.

3. The number of groups required by the permit to develop and implement the many tasks will lead to confusion. There should be only three groups identified by the permit:

The Board,
The principle permittee, and
The co-permittees

Participation in the Executive Advisory Committee and the Watershed Management Committees should be voluntary (although encouraged).

4. The reporting requirements could be an enormous burden on co-permittee staff. Reports should be required no more than once per year. A simplified check list which demonstrates the permittees compliance with the intent of the permit should be used rather than concentrating on minutiae such as how much debris was collected from catch basins (which have been regularly cleaned since well before the stormwater program) and how often streets are swept (which also has been done since well before the stormwater program).

Written descriptions should be required only for anomalies.

5. A specific comment on Section IV.F.3. (pg. 23) and similar sections:

In a program of this magnitude, it is likely that many problem sites will be encountered which will need direct Board involvement for problem resolution. If a problem site is referred to the Board, does that relieve the permittee from the responsibility of taking further actions until a ruling is made by the Board?

6. The amount of work required for implementation of this permit will be considerable. During the first five years, the work should concentrate on realistically achievable goals. The exempted stormwater discharges, as proposed by the EAC, should be fully adopted.

7. It has been suggested that the guidance document currently under development be incorporated as part of the permit. We are concerned that this will make any modifications to operating procedure, no matter how minor, difficult to make without prior board approval.

VIII. Specific Comments.

1. Part I Section D(3)(b) should be the EAC's responsibility.

2. Part I Section E(2) should include language allowing the Watershed Management Committee to designate the Principal Permittee as chair if the Committee so desires.

3. In Part I Section G the language "The budget shall provide information such as funding sources, staff resources, equipment, support capabilities, contract services, and cost sharing arrangements for the stormwater management programs." should be removed.

4. In Part I Section G(1) the language "Funding agreements, including budgets and cost per agency shall be developed." should be deleted.

5. Part I Section G(2) should be deleted as repetitive.

6. Part I Section H(3) requires rewriting to clarify the Regional Boards expectations of compliance. Subsection H(3)(d) also requires clarification regarding types of agreements and "the contribution of pollutants from one portion of the storm drainage system to another..."

7. The time limit in Part I Section H(5) should be extended from 60 days to 120 days.

8. Part I Section I should include language such as "A Permittee shall not be in violation of any term or condition of this permit until the following administrative review process has been completed."

9. Part I Section J should include an obligation of the Regional Board for timely review of permit submittals (i.e., within 45 days).

10. Part II Section A(1)(b) should be amended to read as follows: "prioritize potential problem areas and areas with heavy industry such as those listed under subchapter N of 40 CFR Parts 405-471." The current wording is vague and open to very broad interpretation.

11. Part II Section B(4), please define maximum extent practicable.

12. Part II Section B(4)(b) should be deleted as Section B(4)(e) serves the same purpose.

13. The list of conditionally exempt discharges in Part II Section C(2) should include waterline flushing, retaining wall drains, and water from hydraulic graffiti abatement. Diverted stream flows and footing drains should be removed from the list.

14. Part II Section D(1)(b) should be deleted as being redundant with Section D(1)(a).

15. Part II Section D(1)(f) should be amended to read "washing down toxic materials from paved or unpaved areas *into the storm drain system*."

16. Part II Section D(1)(g) should be amended to read "washing down impervious surfaces *into the storm drain system* in industrial and/or commercial areas is prohibited unless specifically required *by* Health and Safety Codes."

17. The contents and requirements of Part II Section D(2) are more appropriate to the Industrial/Commercial Sources chapter and should be relocated there for clarity.

18. Part II Section D(2)(c) should be amended to read as follows: "that owners of commercial/industrial motor vehicle parking lots with more than ten (10) parking spaces located in areas susceptible to runoff begin a regular lot sweeping program to remove debris."

19. Part II Section F(1) should be deleted and F(2) should be rewritten. As currently worded, the summaries are far too detailed. The summaries should focus on categories of illicit connection and discharges, the number of connections/discharges discovered per category, the number of each eliminated, the number in process to be eliminated, and the number subject to legal enforcement action.

20. Part II Section G(1) should be amended to read as follows: "The Principal Permittee will be provided an updated list of NPDES Permits on a quarterly basis, through the Regional Board's electronic bulletin board for use by each Permittee in its illicit connection program to identify permitted sources of the existing non-stormwater discharges in the stormwater drainage system. Part II Section G(2) should be deleted.

21. Part III Section A(1) should be amended to read as follows: "By _____, the Permittees shall develop a database listing of the industrial/commercial facilities identified in III.B.1.a. by four digit SIC codes which shall be updated annually. The database shall include at a minimum."

22. Part III Section A(1)(a) and (c) should be deleted as not being required for minimum information.

23. Part III Section A(2) should be deleted. These concerns are to be addressed by the Critical Source Monitoring element of the monitoring program.

24. Part III Section B(1)(a)(ii) should be amended to read as follows: "vehicle repair shops, vehicle body shops, vehicle parts and accessory shops, gasoline stations and restaurants."

25. Part III Section C(2) should be deleted as being redundant with Part III Section D.

26. Part III Section C(3) should be deleted. These concerns are to be addressed by the Critical Source Monitoring element of the monitoring program.

27. Part III Section C(4)(c) should be deleted.

28. Part III Section C(5) should be rewritten as follows: "Each permittee may seek coverage under this Order, for industrial facilities listed in II.B.1.a.i. which are owned and operated by the Permittee, if it:

(a) Established as procedure for notifying the Regional Board of industrial sites owned and operated by the Permittee.
(b) Prepare a checklist of industrial BMP's using BAT/BCT criteria for implementation at these industrial sites.
(c) Standardizes procedures to ensure implementation of industrial BMP's.
(d) Prepare and retain site specific Stormwater Pollution Prevention Plans at its industrial facilities.
(e) Establishes a procedure to report annually on the effectiveness of Stormwater Pollution Plans at each site, and certify compliance with this Order.

29. Part III Section D(1) should be amended to read as follows: "By _____, each Permittee shall submit a schedule for inspection of those industrial/ commercial facilities in III.B.2 which have been selected by the Permittee for inclusion in an inspection program for adequacy of stormwater pollution prevention measures. Facilities selected shall be those identified by the Permittee as potentially contributing the most significant pollution impacts to stormwater discharges." The following subsections D(1)(a) and (b) should be deleted as unnecessary. The last paragraph should substitute III.B.2 for III.B.1.a.ii, and delete reference to III.B.1.a.iii.

30. Part III Section E(d) should be amended to read as follows: "evaluation of stormwater urban runoff control measure implementation." Section E(e) should be changed to read "evaluation of the results from the critical source monitoring

program." Sections E(f) and E(g) should be deleted, and will be addressed in the Critical Source Monitoring Program.

31. Part III Section F(1) should be amended to read as follows: "The Permittees will work with other regulatory agencies as deemed necessary by the Permittees and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies.

32. Part III Section F and G should be deleted as unnecessary.

33. Part IV Section B(2) and B(4) should be deleted. These sections attempt to dictate the planning process to the City, and this is not acceptable.

34. Part IV Section B(7) should be amended to read as follows: "Permittees shall require as part of the submittal of an application for the first planning or building approval for a new development project, the inclusion of an Urban Runoff Mitigation Plan." In addition, this plan should only be required of large scale projects (i.e., 100+ dwelling units or 100,000 square feet of commercial space). Also, subsections (a)(ii) and (a)(iii)(c) should be deleted as being too burdensome.

35. Part IV Section B(7)(a)(v) should be deleted. It is not clear if the Regional Board has the authority to dictate a misdemeanor penalty through this Permit.

36. Part IV Section C(2)(b) should be amended to read as follows: "Site address, general contractor and telephone number." The following subsections (c) and (e) should be deleted as either too onerous or not under the control of the Permittee.

37. Part IV Section D should be deleted in its entirety. The purpose of this section is not apparent. Site inspections and ranking will be handled through existing inspection programs.

38. Part IV Section E(2) should be deleted. The concerns in this area will be addressed by the Critical Source Monitoring Program.

39. Part IV Section E(3)(a) should be deleted as being too burdensome on the Permittees.

40. Part IV Section E(4)(b) should be amended to read as follows: "Any sediments or other materials which are not retained on the site shall be removed within 24 hours from the time of notification of the Director of Public Works, or a designated representative. In lieu of removal, a temporary sediment barrier shall be installed."

41. Part IV Section E94)(e) should be amended to read as follows: "No water from washing vehicles on a construction site may be allowed to run off unless treated to remove sediments and pollutants.

42. Part IV Section E(4)(h) and (I) should be deleted. These steps cannot be supported without clear evidence that their effectiveness exceeds that of normal good housekeeping measure.

43. Part IV Section E(5) should be deleted. Subsection (a) should be relocated to IV.E.4.f., and subsection (b) should be relocated to IV.E.4.g.

44. Part IV Section E(6) should be rewritten as follows: "Each permittee may seek coverage under this Order, for construction activity sites listed in III.B.1.a.i. which are owned and operated by the Permittee, if it:

(a) Establishes as procedure for notifying the Regional Board of construction activity sites owned or operated by the Permittee.
(b) Prepare a checklist of construction BMP's using BAT/BCT criteria for implementation at these construction sites.
(c) Standardizes procedures to ensure implementation of construction BMP's.
(d) Prepare and retain site specific Stormwater Pollution Prevention Plans (SWPPP) at its construction sites; and
(e) Establishes a procedure to report annually on the effectiveness of Stormwater Pollution Prevention Plans at each construction site, and certify compliance with this Order.

45. In Part IV Section F(1) and (2) should be deleted in their entirety as being redundant. The list of typical sites in (2) should be included under Part IV Section E(3). (3) Should be renumbered and rewritten as follows: "During inspection of construction sites regulated under Phase I of the Federal Stormwater Program, inspectors shall request to see a copy of the SWPPP. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee shall report problematic construction sites to the Regional Board."

46. Part IV Section G(1) should be amended as follows: "Each year, the Permittees shall evaluate the results and progress of their stormwater quality management program for construction activity sites. The annual report submitted to the Regional Board shall recommend a strategy for the management of stormwater from construction sites for the following year based on evaluation of stormwater urban runoff control measures implementation and evaluation of results from the critical source monitoring program." In addition, G(2) should be amended to read: "The Permittees shall transmit to the Regional Board a hard copy of the construction activity database developed in IV.C.2 on a quarterly basis."

47. Part IV Section H should be deleted as being redundant.

48. Part V Section C(1) should be amended to read as follows: "By ____, EAC will develop a standard pollution prevention plan for public vehicle maintenance/material storage facilities. Public vehicle maintenance/material storage facilities include any Permittee-owned and/or operated facility in which any of the following occur: vehicle or equipment maintenance; repair; washing; fueling; and/or any facility at which a hazardous materials business plan is required."

49. Part V Section H should be deleted as redundant, it is the same as Part II Section (2)(c).

50. Part VI should be rewritten in its entirety by the Regional Board to better reflect short term needs and long term education strategy.

51. Part IX will need to be rewritten in its entirety by the Regional Board upon receipt of the County/NRDC developed proposal.

The City of Hermosa Beach would appreciate your careful consideration of our preliminary comments in the permit renewal process and a response to them. Please call me at (310) 318-0211 if you have any questions.

Sincerely,

Amy Amirani

Re: Draft NPDES Permit No. CAS0061654

Dear Ms. Terrell:

The purpose of this letter is to inform you that the City of Lawndale, one of the co-permittees under NPDES Per No. CAS0061654, is in the process of reviewing and commenting on the above referenced draft permit.

As you are well aware, the draft permit is quite lengthy and complicated, and we prefer to provide all of our comments to you on the present draft at one time. We intend to have comments on behalf of the City of Lawndale forwarded to you by no later than October 18, 1995.

If you have any questions or need any additional information with respect to the above, please do not hesitate to contact the undersigned.

Thank you for your attention and assistance in this matter.

Sincerely,

Linda Holmes
Interim City Manager

Monterey Park, CA 91754-2156

Dear Ms. Tyrrell:

REVIEW OF DRAFT NPDES PERMIT

The Executive Advisory Committee (EAC) has reviewed all of the chapters and sections we have been given to date, including those in the September 15th partial draft. Furthermore, the negotiating team of the EAC has met and conferred with you on many separate issues over many months and we have reached agreement on many of the issues. From this point forward, the EAC believes it would be most productive to receive a complete draft permit that encompass all the needed elements of an official NPDES Permit. We ask that such a completed draft include:

1. All of the agreed-upon points negotiated to date, without additional modifications by the Regional Board staff.

2. Changes made in response to the comments from the cities or the EAC based on the September 15 draft.

We recognize that it may not be possible to incorporate all of the cities' or EAC's comments into the draft but we ask that, if you choose not to include a proposal, that you respond to each suggestion and explain your decision to not include it. This process will help satisfy the concerns of agencies which believe their comments have not been given due consideration to date. It also allows your agency to demonstrate that it has reviewed and considered the concerns of the commenting agencies. It is essential that the completed draft or its accompanying memorandum make it clear to recipients that the EAC has neither reviewed nor approved the completed document. Upon receipt of the completed draft, we will be pleased to continue the meet and confer process.

Several cities have expressed concern that many of the requirements of the draft Permit are beyond the tasks mandated by the Federal Clean Water Act. Such concern can be avoided, if the draft Permit cites the section of the Federal Clean Water Act which specifically mandates the requirements.

Finally, the schedule you presented at the October 12th EAC meeting projected the following time lines:

October 23	Revised draft mailed
November 6	Meeting of all Permittees to discuss draft
November 22	Permit revised based on comments and mailed as a tentative order
January 5	Revised Permit available for public review
January 22	Permit presented to the Board

We concur that an additional meeting to allow all Permittees to discuss the draft Permit prior to the 60 days public review period is very important. However, the schedule is clearly not achievable, given that a complete draft has not yet been prepared. We recommend that you revise the schedule based on your estimation as to when your staff can generate a complete draft Permit. Also, we recommend that commenting agencies be given a minimum four-week review period from the time a completed draft is distributed to them. Subsequently, Regional Board staff will need time to make further revisions based on comments received. Additional time may be needed for negotiation between the EAC and the Regional Board staff.

We appreciate your efforts in preparing a complete draft Permit and look forward to its receipt. If you wish to discuss the points raised in this letter, please contact me at (818) 458-4014.

Very truly yours,

DONALD L. WOLFE
Chairman, Executive Advisory Committee

DEPARTMENT OF
PUBLIC WORKS
BUREAU OF
ENGINEERING
ROBERT S. HORII
CITY ENGINEER
650 SOUTH SPRING ST., SUITE 200
LOS ANGELES, CA 90014-1911

October 11, 1995

Harry W. Stone, Director
Los Angeles County Department of Public Works
900 South Fremont Avenue
Alhambra, CA 91803
Attn: Gary Hildebrand

Dear Mr. Stone:

CITY OF LOS ANGELES COMMENTS ON DRAFT NEW STORMWATER PERMIT (VERSION MAILED BY RWQCB ON SEPTEMBER 15, 1995)

The Bureau of Engineering has reviewed the draft of the new Stormwater Permit dated September 15, 1995. We want to thank you for the opportunity we have been given to participate in this collaborative process for developing the proposed language for our new County-wide Stormwater Permit. It is an extremely valuable process and hopefully will result in the adoption of a permit that has widespread acceptance. General comments about this version of the new permit are listed below. We have incorporated our more specific comments and/or suggested revisions into a "redline/strikeout" version, which is enclosed in both hard copy and diskette format.

1. Generally, the permit has far too many specific and individual requirements placed on municipalities. It will be difficult for the City to meet all of these, but we think it can be done. However, we are very concerned about the many other cities under the permit, specifically their lack of familiarity with the permit and their ability to comply with all of its detailed and complex provisions.

2. We need to be careful that we have not put in any requirements for municipalities that are to be put into effect immediately but that indeed will take a period of time for implementation. Municipalities will be in violation of the permit for that period of time. An example, noted in more detail later in this letter is that oil/water separators are required for all municipal vehicle washing, but no time period is given for funding and constructing these devices.

3. We have not yet seen any draft language on the reapplication process for the new permit which would be reissued upon expiration of the permit being negotiated currently. It may also be necessary to add language to allow a "reopener".

4. This draft permit calls for a number of specific action items with the assumption that these items are reasonable efforts to improve water quality. As we move into the permit life, it may become apparent that a specified action is indeed not reasonable or cost effective. The permit doesn't seem to allow for any modification.

5. Receiving Water Limitations - The language for this section needs to be carefully crafted so as to not put the municipalities in violation of the permit immediately upon its adoption. The actions called for in the permit should be allowed to take place and an opportunity given to see their level of effectiveness before any efforts are made to add additional requirements necessitated by failure to meet the receiving water limitations specified in this section.

6. Illicit Discharges/Disposal - The language of the version of the permit we have reviewed for these comments calls out street washing and sidewalk washing as not allowed without a finding by the Executive Officer that they are not sources of pollutants to receiving waters. The City of Los Angeles may be in violation of this provision immediately upon adoption of the permit. This language needs to be modified to give us more latitude in arriving at a reasonable solution to this problem.

7. Program Requirements for Industrial/Commercial Sources - We are very concerned about the number of industrial/commercial inspections required by various versions of the language we have seen for this chapter. As background, we have estimated the number of Phase I industries in the City at over 14,000. The number of Phase II industries is estimated to be another 14,000. The number of restaurants is estimated to be over 12,000. The requirement to inspect a major portion of these will be virtually impossible for the City, using any kind of standard inspection protocols. Our Stormwater Management Division staff can perform a maximum of 5,000 inspections over the 5-year term of the permit. Additional inspections can be accomplished through the use of our Bureau of Sanitation inspection staff and the County's Health Department staff, if satisfactory arrangements can be made. However we need to narrow in on a reasonable effort for the City to commit to in this area.

8. Vehicle Maintenance/Material Storage Facilities - The language in this section of the Public Agency Requirements chapter would require all washing of vehicles or equipment onsite to be performed in an area equipped with an oil/water separator or equivalent method. There is no time frame established for the implementation of this requirement and it would therefore be assumed to take effect immediately. Also, there is no restriction on the size of operation falling under this requirement. Many agencies will be in

noncompliance with this provision upon adoption of the permit. A substantial capital investment is required to set up these facilities, and to be effective, they require careful maintenance. We would not recommend an oil/water separator mandate.

9. We have not commented on either the Public Information and Participation or the Monitoring Program chapters since these chapters are scheduled for a significant re-write.

10. Below we have described the way we envision the relationship between the permit and the plans required under the permit:

* Minimum or Baseline BMPs have been incorporated into the appropriate chapters of the permit. The Permittees will begin to implement these minimum BMPs within the timelines specified in the Permit. These BMPs will also be addressed in the Baseline, Watershed, and Implementation Plans.

* The Principal Permittee, utilizing consultant services, will develop the Baseline Stormwater Management Plan.

* The Baseline Plan will be used to create the Watershed Management Plans (WMPs). The WMPs would also be prepared using consultant services.

* Each Permittee will complete its own Implementation Plan, which will provide details and schedules for the activities necessary to comply with each of the above plans within its jurisdiction.

In the attached "redline" version, we have included language which attempts to create the necessary link between the plans and the permit requirements.

If you have any questions please call Michael E. Kantor of my staff at (213) 847-5209.

Sincerely,

ROBERT S. HORII
City Engineer

~~Aug 24, 1995~~ September 27, 1995

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. 95-XXX

WASTE DISCHARGE REQUIREMENTS
FOR
STORMWATER MANAGEMENT/URBAN RUNOFF DISCHARGES
WITHIN THE COUNTY OF LOS ANGELES

(NPDES NO. CAS0061654)

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. The Regional Board recognizes that ~~the EAC assumes no responsibility for the adequacy or inadequacy of any individual Permittee's efforts and is not viewed as the responsible agency in this sense~~ participation by any Permittee on the EAC is voluntary, and is not an obligation under this Order and shall not increase the responsibility or liability of any Permittee under any portion of this Order.

2. The EAC's main role is to facilitate programs within the six watersheds and to enhance consistency among all of the programs.

3. The Regional Board recognizes that the Principal Permittee assumes no responsibility for ensuring the compliance of any individual Permittee with the requirements of this Order.

4. This Order contains specific action items to be executed by Permittees within stated time frames. These items include the development of a Baseline Stormwater Management Plan by the Principal Permittee, the development of six Watershed Management Plans by the Principal Permittee and the Watershed Management Committees, the development of individual stormwater program Implementation Plans by each of the Permittees, and the implementation of the Best Management Practices (BMPs) contained in this Order.

   The programs, activities, and BMPs contained in this Order are early action items that should begin immediately. These actions are viewed as "minimum" or "baseline" efforts. Since they are early actions, these efforts should begin at once and then be further enhanced in the Baseline, Watershed, and Implementation Plans.

   Sections II - IX of this Order are basically the outline for the development of the Baseline Stormwater Management Plan and all subsequent Plans. Every section in this Order should be addressed in all future Plans to be developed under this Order and enhanced as necessary. Each action item listed in this Order is also to be included in all Plans.

VOL 24

0340

5.

The Board has notified the interested agencies and persons of its intent to adopt waste discharge requirements for the discharge of municipal stormwater/urban runoff and has provided them with an opportunity to submit their written views and recommendations.

The Board, in a public hearing, heard and considered all comments pertaining to the tentative waste discharge requirements.

This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit pursuant to Section 402 of the federal Clean Water Act, or amendments thereto, and shall take effect at the end of ten (10) days from the date of its adoption provided the Regional Administrator, USEPA, has no objections.

IT IS HEREBY ORDERED that the County of Los Angeles and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens,Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Long Beach, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code, and regulations adopted thereunder, and the provisions of the Federal Clean Water Act, and regulations and guidelines adopted thereunder, shall comply with the following for the areas under their jurisdictions within the drainage area of the County of Los Angeles:

~~September 15, 1995~~ September 27, 1995

A. Discharge Prohibitions

1. The ~~Dischargers~~ Permittees shall, within their respective jurisdictions, ~~effectively~~ prohibit the discharge of non-storm water ~~(materials other than storm water)~~ into their storm drain systems and watercourses. NPDES permitted discharges are exempt from this prohibition. Compliance with this prohibition shall be ~~demonstrated in accordance~~ accomplished through compliance with Provisions _____ in this Order.

2. The discharge of stormwater from a facility or activity that causes or contributes to the violation of Receiving Water ~~Limitations~~ Goals is prohibited.

B. Receiving Water ~~Limitations~~ Goals

1. The Permittees shall institute comprehensive stormwater management programs as identified in this Order to reduce the discharge of pollutants to the maximum extent practicable. The goal of these stormwater management programs shall be compliance with water quality objectives set forth in the Ocean Plan and Basin Plan. The Regional Board and the Permittees realize that these stormwater management programs may not result in full compliance with identified water quality objectives prior to the expiration of this Order. By complying with the requirements specified

in Sections I - IX of this Order, the Permittee is complying with any "receiving water limitations."

~~12.~~ ~~The discharge shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:~~
Stormwater management programs shall be developed so that the following conditions, where they have been demonstrated to be a condition of nuisance or adversely affect beneficial uses of waters of the State, shall be addressed and minimized to the maximum extent practicable:

a. Floating, suspended, or deposited macroscopic particulate matter, or foam;
b. Bottom deposits or aquatic growths;
c. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;
d. Visible, floating, suspended, or deposited oil or other non-naturally occurring products of petroleum origin; and/or
e. Toxic or deleterious substances present in concentrations or quantities which will cause deleterious effects on aquatic biota, wildlife, or waterfowl, or which render any of these unfit for human consumption either at levels created in the receiving waters or as a result of biological concentration.

~~13.~~ ~~The discharge shall not cause a violation of any applicable water quality objective for receiving waters. If applicable water quality objectives are adopted and approved by the State Board after the date of the adoption of this Order, the Regional Board may revise and modify this Order as appropriate.~~
If different applicable water quality objectives are adopted after the date of adoption of this Order, the Board may revise and modify this Order, as appropriate.

C. ~~PROVISIONS~~ Provisions

i. The ~~Discharger~~Permittees shall demonstrate compliance with Discharge Prohibitions A.1 and A.2, and Receiving Water ~~Limitations~~ Goals B.1, B.2, and B.3, through the timely implementation of control measures and other actions to reduce pollutants in the discharge as required as immediate actions items in this Order and as proposed in the Baseline Stormwater Management Plan. As such, the Baseline Stormwater Management Plan submitted by the ~~Discharger~~Permittees is an integral and enforceable component of this Order. Any subsequent modifications, revisions, or amendments must be approved by the Executive Officer of the Regional Board. Each of the ~~Co-Permittees~~Permittees need only to comply with the ~~permit~~ conditions of this Order (including Discharge Prohibitions A.1, and A.2~~, and A.3,~~ and Receiving Water ~~Limitations~~ Goals B.1, B.2, and B.3) applicable to discharges from the municipal separate storm drains for which they are operators.

ii. The ~~Discharger~~Permittees shall implement the Watershed Management Plans as proposed and amended for the Malibu Creek and rural areas, Ballona Creek and urban areas, Santa Clara River, Los Angeles River, San Gabriel River, and the

Dominguez Channel Watershed Management Areas upon approval by the Executive Officer and in accordance with the schedules therein.

iii. The Permittees shall execute their individual stormwater program Implementation Plans as proposed and amended for their agency upon approval by the Executive Officer and in accordance with the schedules therein.

I. PROGRAM MANAGEMENT

A. Principal Permittee

1. The County of Los Angeles is designated as the Principal Permittee.

2. The Principal Permittee shall:

   a. Coordinate ~~permit~~ activities required under this Order and, by, _____, convene and chair the area-wide Executive Advisory Committee and convene and co-chair the Watershed Management Committees;

   b. Provide personnel and fiscal resources and by _____, develop a Baseline Stormwater Management Plan (Baseline Plan) for use in developing a Wwatershed Mmanagement Pplan (WMP) for each watershed;

      The Plan and the WMPs shall contain, at a minimum, all programs and activities (BMPs) outlined in this Order.

   c. Provide personnel and fiscal resources for the development of the WMPs;

   d. Provide personnel and fiscal resources for the updating and modification of the Plan and the WMPs;

   e. Provide technical and administrative support for both the Executive Advisory and Watershed Management Committees;

   f. Implement watershed water quality monitoring programs as described in Chapter IX(or VII);

   g. Provide the personnel and fiscal resources to complete ~~by~~ _____; the annual reports including evaluations of monitoring program data and BMP effectiveness as described in Chapter VIII(or VII);

   h. Coordinate the implementation of stormwater quality management activities of regional significance ~~(this shall mean that the Principal~~

~~Permittee shall identify BMPs which are applicable for implementation by permitteesPermittees watershed-wide and area-wide);~~ such as public outreach and education, pollution prevention, waste minimization, and other similar actions;

i. Act as liaison between all Permittees and the Regional Board on ~~Permit~~issues regarding this Order; and

j. Meet all the responsibilities outlined below for a Permittee.

B. Permittees

1. The other cities and agencies are designated as Permittees.

2. Each Permittee shall:

a. Participate in the development and amendment of the Baseline Stormwater Management Plan (Baseline Plan) and by _____, jointly prepare the watershed specific management plans (WMPs) via ~~their~~ its Watershed Management Committee (WMC);

b. Provide an Implementation Plan describing specific stormwater programs, projects and/or activities which are to be conducted within ~~their~~its jurisdictional boundaries, including the storm drainage system ~~they own~~it owns and ~~operate~~operates, and which demonstrate compliance with the WMP(s) requirements by _____;

The Implementation Plan shall contain, at a minimum, the baseline programs and activities (BMPs) outlined in this Order.

c. Provide in a timely manner all information needed by the Principal Permittee for completing the annual reports.

3. The City Administrator/Public Works Director of each Permittee shall appoint a representative(s) to the WMC.

C. Agency Coordination

Each Permittee shall coordinate implementation of ~~permit~~ requirements under this Order and pollution prevention activities among ~~each Permittee's~~ its internal departments and agencies (i.e. public works, planning, utilities, water supply, etc...).

D. Executive Advisory Committee

1. The EAC shall consist of a representative of the County of Los Angeles, a representative of the City of Los Angeles, a representative from the Malibu

Creek, Santa Clara, and Dominguez Channel Watershed Management Areas, and two representatives from each of the San Gabriel River, Los Angeles River, and the Ballona Creek Watershed Management Areas.

~~a.~~One representative from the EAC shall ~~chair the~~ co-chair each Watershed Management Committee. ~~for that Permittee's main watershed management area.~~

2. The ~~City Administrator/~~ head of the Department of Public Works ~~Director~~ for the County of Los Angeles and for the City of Los Angeles shall each appoint a representative to the EAC. Other members will be appointed by the WMCs.

3. The EAC shall be responsible for:

   a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

   b. Assisting the Principal Permittee in the development of the Baseline Storm Water Management Plan; ~~and~~

   c. Reviewing the Watershed Management Plans as developed by each Watershed Management Committee and provideing direction and guidance on the plans for consideration by the Watershed Management Committees;

   d. Assisting the Principal Permittee in preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with ~~Permit~~ requirements of this Order;

   e. Mediating conflict among the Permittees; and

   f. Coordinating the implementation of pilot projects to target pollutant sources, evaluate BMP appropriateness, and assess effectiveness.

E. Watershed Management Committee

1. Watershed Management Committees (WMC) shall consist of a representative of each of the Permittees for that particular watershed management area. Regular WMC meetings shall be open to attendance by the public. The WMC may hold closed sessions, at its discretion, to discuss ~~permit related~~ issues related to this Order.

2. The Malibu Creek, Santa Clara, and Dominguez Channel WMCs shall each appoint one representative to serve on the EAC and to co-chair the WMC. The San Gabriel River, Los Angeles River, and the Ballona Creek WMCs shall each appoint two representatives to serve on the EAC, one of whom will

co-chair the WMC.

3. The WMC shall be responsible for:

   a. Establishing goals and objectives for the watershed;

   b. Prioritizing pollution control efforts;

   c. Participating in the development of a specific Wwatershed Mmanagement Pplan (WMP), based on the Baseline Stormwater Management Plan (Baseline Plan);

   d. Assessing the effectiveness of, ~~preparing~~ recommending revisions for and ~~making~~ identifying appropriate changes to the Baseline Plan and the WMP;

   e. Coordinating and facilitating the preparation of the annual reports on ~~Permit~~stormwater activities within the watershed for submittal to the Regional Board -- a draft of the annual report shall be circulated to each Permittee and the Executive Advisory Committee for their review and comments prior to submittal to the Regional Board; and

   f. Facilitating the implementation of this Order among the Permittees in the watershed.

F. Watershed Management Subcommittees

1. Subcommittees will be established where needed as determined by the WMC and/or the EAC.

2. The Subcommittees will be focused on specific program areas and can provide more specific oversight on the development, implementation, and evaluation of selected program areas.

G. Regional Board

It is the responsibility of the Regional Board to fulfill all of the State and Federal requirements for the development of the public policy required for the legal implementation of the CWA and this Order. The Board shall have responsibility for:

1. Issuing and enforcing all State General Stormwater permits;

2. Promulgating standards; and,

3. Reviewing, commenting when appropriate, and adopting necessary findings establishing the following:

a. Pollutants of concern;
b. Targeted activities;
c. Acceptability of proposed actions; and,
d. Allowable non-stormwater discharges.

~~G~~H. Fiscal Resources

Each Permittee shall submit an annual budget for its Implementation Plan within 30 days after the budget adoption. The budget shall be summarized and put into a format which identifies the necessary capital and operation and maintenance expenditures necessary to implement the storm water management program. ~~The budget shall provide information such as funding sources, staff resources, equipment, support capabilities, contract services, and cost sharing arrangements for the storm water management programs.~~ Also included shall be a description of any funding shortfalls.

~~1.~~ Area-Wide Resources - In implementing this Order and the Plan, the Permittees may elect to jointly fund a single program for certain BMPs, such as Public Education, that are area-wide in nature. ~~Funding agreements, including budgets and cost per agency, shall be developed.~~

~~2. City-Specific Resources - As stated above, each Permittee shall develop an annual budget detailing the cost of implementing Permit-related activities within its jurisdiction.~~

~~H~~I. Legal Authority

1. The legal authority that was required of each Permittee under Order No. 90-079 shall continue in effect.

2. ~~The Co-Permittees~~Each Permittee shall exercise ~~their~~its legal authority and require compliance with this Order and the Implementation Plan ~~within~~ for its jurisdiction.

3. Each Permittee shall ~~certify~~ demonstrate that it has legal authority to control discharges to and from those portions of the storm drainage system over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements between ~~permittees~~Permittees with adequate existing legal authority and shall, at a minimum, accomplish Items a-f below:

   a. Control the contribution of pollutants to the storm drainage system by storm water discharges ~~associate~~associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

   b. Prohibit illicit discharges and illicit connections to the storm drainage

system and require removal of illicit connections;

c. Control the discharge of spills and the dumping or disposal of materials other that storm water (e.g. industrial and commercial wastes, trash, debris, motor vehicle fluids, green waste, animal wastes, leaves, dirt, or other landscape debris etc.) to the storm drainage system;

d. ~~Control through~~ Develop interagency or inter-jurisdictional agreements ~~among permittees the contribution of~~ as necessary to establish protocols for the clean up of pollutants that cross from one ~~portion of the~~ agency's storm drainage system to another's;

e. Require compliance with conditions in ordinances, permits, contracts or orders; and

f. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with ~~permit~~ conditions of this Order, including the prohibition on illicit discharges to the storm drainage system.

4. Each Permittee's legal counsel shall complete a review of its existing legal authority to ensure that its existing legal authority complies with the requirements in this Order.

5. Upon its completion of the legal authority review, or within ~~60~~ 180 days ~~of~~ ~~permit~~from the adoption of this Order, (whichever is sooner) each Permittee shall demonstrate that it has adequate legal authority or provide a schedule for obtaining the adequate legal authority. Guidance for demonstrating adequate legal authority is included within the EPA document entitled *Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges from Municipal Separate Storm Sewer Systems, (EPA 833-B-92-002, November 1992)*, page 3-4.

~~H~~J. Administrative Review

The administrative review process formalizes the procedure for review and acceptance of reports and documents submitted to the RWQCB under this ~~Permit~~Order. In addition, it provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement actions. The Regional Board will not take any administrative action against a Permittee until the following review process is followed:

1. Within forty-five (45) days of receiving documents submitted under the terms of this Order, the RWQCB shall respond with the results of the document review. If no written response has been received by the Principal Permittee within 45 days, the submittal shall be deemed approved.

12. If the Executive Officer finds that a Permittee's stormwater program is insufficient to meet the provisions of ~~the Permit~~this Order, the Executive Officer shall send a "Notice of Intent to Meet and Confer (NIMC)" to the Permittee. The NIMC shall include a date by which the Permittee must meet with RWQCB staff.

23. Upon receipt of a NIMC, the Permittee shall meet and confer with RWQCB staff to clarify the steps to be taken to completely meet the provisions of this ~~permit~~Order. The meet and confer sessions shall be for the purpose of developing additions and enhancements to the jurisdiction's stormwater program. The meet and confer period shall conclude with the submittal to and acceptance by the Executive Officer of a written "Stormwater Program Compliance Amendment (SPCA)" which shall include implementation deadlines. The Executive Officer may terminate the meet and confer period after a reasonable period due to a lack of progress on issues and may order submittal of the ~~SPEP~~SPCA by a specified date. Failure to submit an acceptable SPCA by the specified date shall constitute a violation of ~~the Permit~~this Order.

34. The Executive Officer will approve or reject the submitted SPCA within a ~~reasonable amount of time~~ 45 days (see 1 above). Rejection of a submitted ~~SPEP~~SPCA by the Executive Officer shall state the reasons for the failure to approve the SPCA. A Permittee that receives a rejection of an SPCA shall have thirty (30) days to remedy the specified deficiency in the SPCA and receive administrative approval from the Executive Officer of the amended SPCA.

45. The Permittee shall comply with the terms of the SPCA and incorporate such terms into its Stormwater Implementation Plan. The Permittee shall submit reports to the Executive Officer of progress made under the SPCA. The frequency of progress report submittal shall be as prescribed by the Executive Officer. Failure to comply with the terms and conditions of the SPCA shall constitute a violation of ~~the Permit~~this Order and shall be cause for immediate Administrative Civil Liability as prescribed by the Executive Officer.

VOL 24

0349

~~September 14, 1995~~ September 27, 1995

II. ILLICIT DISCHARGES\DISPOSAL

A. Illicit Connections

By _____, the EAC shall develop, ~~for inclusion in the Baseline Stormwater~~ Management Plan, a consistent program, including investigative standard procedures, to eliminate illicit connections to the storm drain system.

By _____, each Permittee shall implement a program to identify and eliminate illicit connections to the maximum extent practicable. Permittees shall develop their program in accordance with the Baseline Stormwater Management Plan. A detailed schedule for implementation shall be included in each Permittees Implementation Plan.

1. The program shall, at a minimum:

   a. standardize, per EAC guidelines, storm drain inspection procedures, and illicit connection and identification and elimination procedures;

   b. prioritize ~~major~~ potential problem areas~~, to include but not be limited to older business areas,~~ and identify areas with heavy industry such as those listed under subchapter N of 40 CFR Parts 405 - 471;

   c. utilize results of field screening activities; and other appropriate information~~.~~;

   d. contain an industrial/commercial education/outreach component to inform businesses about the problem of illicit discharges/dumping and proper discharge/disposal practices;

   e. schedule storm drains in potential problem areas for inspection for illicit connections within ~~their~~ its jurisdiction~~.~~;

   f. maintain a standardized record keeping system to document illicit discharges/disposal in its jurisdiction~~.~~; and

   g. establish enforcement procedures to terminate illicit connections.

B. Illegal Discharges\Disposal

1. By _____, the EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, a consistent program, including investigative standard procedures, to eliminate illegal discharges/disposal practices to the storm drain system.

2. By _____, the EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, ~~a standard~~ model civil, administrative and judicial enforcement procedures ~~including~~ to ~~eliminate~~ control illegal discharges/disposal practices.

3. By _____, the EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, standard procedures for spill response, including a procedure to ensure that, in a spill response, sewage treated with disinfection agents will not be discharged into the storm drainage system, to the maximum extent practicable. The standard procedures will address investigation, containment, and cleanup activities as appropriate.

4. By ____, each Permittee shall implement a program, in accordance with the Baseline Stormwater Management Plan and Watershed Management Plan, to identify and eliminate illegal discharges/disposal practices to the maximum extent practicable. A detailed schedule for implementation shall be included in each Permittees Implementation Plan.

   The program shall, at a minimum:

   a. Identify and prioritize problem areas of illegal disposal where inspection, clean up, and enforcement are necessary to prevent the discharge of contaminants;

   b. Maintain a surveillance program to detect illegal discharges and disposal into the street system~~, including, but not be limited to, street use inspections and inspections of vacant facilities~~;

   c. Establish procedures to educate inspectors, maintenance workers, and other field staff in ~~their~~its jurisdiction to notice ~~illicit~~ illegal dischargers/disposal practices during the course of their daily activities, and report such occurrences;

   d. Maintain a standardized record keeping system to document ~~illicit~~ illegal discharges/disposal in ~~their~~its jurisdiction;

   e. Establish, per EAC guidelines, spill response procedures; and

   f. Establish, per EAC guidelines, enforcement procedures to eliminate illegal discharges/disposal practices.

C. Non-Storm Water Discharges

1. Exempted Discharges

In carrying out Discharge Prohibition A.1 of this Order, the following non-storm water discharges need not be prohibited unless they are identified by the Dischargers

Permittees or the Executive Officer as sources of pollutants to receiving waters:

a. flows from riparian habitats or wetlands;
b. diverted stream flows;
c. springs;
d. rising ground waters; ~~and~~
e. uncontaminated groundwater infiltration~~;~~ ~~and~~
f. discharges or flows from emergency fire fighting activities.

If ~~the~~ any of the above categories of discharges, or sources of such discharges, are identified as sources of pollutants to receiving waters, then such categories or sources shall be addressed as conditionally exempted discharges ~~in accordance with Provision C.5.b~~.

2. Conditionally Exempted Discharges

The following non-storm water discharges need not be prohibited. ~~I~~ if they are either identified by the Dischargers Permittees or the Executive Officer as ~~not~~ being sources of pollutants to receiving waters ~~or if~~ appropriate control measures to minimize the adverse impacts of such sources shall be ~~are~~ developed and implemented under the Baseline Storm Water Management Plan, a Watershed Management Plan, or a Permittees Implementation Plan ~~in accordance with Provision C.5.c.~~:

a. Water line flushing;
b. Landscape irrigation;
~~c. Diverted stream flows;~~
c. Foundation drains;
d. Air conditioning condensate;
e. Irrigation water;
f. Water from crawl space pumps;
g. Retaining wall drains;
h. Individual residential car washing;
i. Residential and ~~Commercial~~ commercial roof drains;
j. Residential swimming pool discharges;
k. Street washing*;
l. Sidewalk washing*;
m. Hydraulic graffiti abatement;
~~o. Other types of discharges identified and recommended in annual reports by the Permittees, as approved by the Executive Officer of the Regional Board.~~

*The Executive Officer is concerned that this discharge may contribute significantly to pollutant loads to receiving waters. Therefore, within 12 months of the adoption of this Order, the Permittees shall either (a) cease the activity; (b) provide evidence that the discharge is not a source of pollutants to receiving waters; or (c) provide appropriate mitigation measures.

3. Procedures for Exemption of Other Non-Storm Water Discharges

The Permittees may identify and describe additional categories of discharges that they wish to exempt from Discharge Prohibition A.1 in the Annual Report to the Executive Officer. The bases for exemption may include,

a. documentation that the discharges are not sources of pollutants to receiving waters
b. special circumstances in which the discharges have been found to be not sources of pollutants to receiving waters
c. prescription of specific control measures to reduce pollutants to the maximum extent practicable and minimize adverse impacts of such sources
d. established procedures to ensure control measures implementation, including performance standards, monitoring and record keeping.

D. Other Prohibited Activities

~~1.~~ The Permittees shall prohibit any person from:

a. causing or allowing illicit discharges to be made into the storm drain system;

b. establishing, using or maintaining an illicit connection to the storm drain system;

c. littering;

d. disposing of leaves, dirt or other landscape debris into a storm drain; ~~and~~

e. using any pesticide, fungicide, or herbicide which has ~~either~~ been ~~voluntarily discontinued or~~ prohibited by the USEPA;

f. washing ~~down~~ toxic materials from paved or unpaved areas which results in a discharge to the storm drain system; and

g. washing ~~down~~ impervious surfaces in industrial and/or commercial areas which results in a discharge to the storm drain system is prohibited unless specifically ~~required to~~ provided for under Health and Safety Codes.

Programs and/or activities to prohibit these activities shall be included in the Baseline, Watershed, and Implementation Plans.

THE FOLLOWING SECTION WAS MOVED TO THE INDUSTRIAL/COMMERCIAL CHAPTER AND THE PUBLIC AGENCY CHAPTER

~~2. Storage of Materials, Machinery and Equipment~~

~~The Permittees shall require:~~

~~a. that objects, such as motor vehicle parts, containing grease, oil, or other hazardous substances, and unsealed receptacles containing hazardous materials, be stored away from areas susceptible to so that they are not in contact with rainfall or runoff;~~

~~b. that machinery or equipment which is to be repaired or maintained in areas exposed to rainfall and/or susceptible to runoff, be placed on repaired in a pad of absorbent material, or an equivalent, to containmanner where leaks, spills or small dischargesand other maintenance related contaminants are managed such that stormwater runoff is not adversely impacted;~~

~~c. that owners of commercial/industrial motor vehicle parking lots and structures located in areas exposed to rainfall and/or susceptible to runoff to be swept to remove debris. Lots with more than tentwenty-five (1025) parking spaces and all public parking facilities shall also be vacuum swept, or by equivalent method, to remove chemical residue;~~

~~d. that all fuel and chemical residue, animal waste, garbage, batteries, or other types of potentially harmful materials which are located in areas exposed to rainfall and/or susceptible to runoff, be removed immediately and disposed of properly.; and~~

~~e. that hazardous waste be disposed of through the Permittee's hazardous waste program or at any other appropriate disposal site. and not be placed in a trash container for regular trash disposal.~~

E. Public Reporting

1. By _____, the EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, a standard program, ~~for Permittees to implement by _____~~ to promote, publicize, and facilitate public reporting of illicit discharges and illegal disposal practices that may adversely impact water quality. Permittees shall implement the program by _____.

2. By _____, EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, a standard program for the reporting of incidents of a hazardous substance entering the storm drain, where the responsible party is not known, to the Regional Board and State of California Office of Emergency Services (OES) at (800)___-____ and the Federal Hazardous Response Number at (800) ___-____. The Permittees shall implement this program by _____.

3. Standard reporting programs shall be included in the Baseline, Watershed, and Implementation Plans.

F. Reporting

1. A ~~quarterly~~ summary of illicit connections eliminated shall be submitted with the Annual Report to the Regional Board. ~~The summary shall include: a brief description of the investigation; what was being discharged; estimated length of time the practice was on-going; what remedial action was taken; and what happened to the discharger.~~ The summary shall be by watershed and include: categories of illicit connections, number discovered per category, number eliminated, number in process of being eliminated, and number subject to legal enforcement action.

2. A ~~quarterly~~ summary of illegal discharge/disposal practices reported through the standardized public reporting system shall be submitted with the Annual Report to the Regional Board. ~~The summary shall include: a brief description of the incident; what was spilled/dumped; quantity; what remedial action was taken; and what happened to the discharger/dumper.~~ The summary shall be by watershed and include: categories of illegal dumping, number discovered per category, and number subject to legal enforcement action.

G. Coordination With State Permits

1. The Principal Permittee will be provided an updated list of all NPDES Permits on a quarterly basis, through the Regional Board's electronic bulletin board, ~~to verify~~ for use by each Permittee in its illicit connection program to identify permitted sources of the existing non-storm water discharges in the storm water drainage system. All point source and general industrial and construction stormwater permits will be included.

2. The Permittees will, as they deem necessary, work with other regulatory agencies and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this ~~permit~~Order and the requirements of other regulatory agencies. These agencies, include but are not limited to:

   a. California Department of Fish and Game
   b. California Department of Toxic Substances Control
   c. California Coastal Commission
   d. United States Environmental Protection Agency
   e. California Department of Transportation
   f. California Air Resources Board

~~September 14, 1995~~ September 27, 1995

III. PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES

A. Identification of Sources

Identification by means of scanning and sorting currently available databases shall be sufficient for the purposes of this section; accuracy will be dependent upon the accuracy of available electronic data.

1. By _____, the Permittees shall identify certain industrial and commercial facilities within their jurisdiction. Facilities should include the following:

   a. All industries regulated under Phase I of the Federal storm water program (40 CFR 122.26) (Phase I facilities).

   b. All industrial/commercial facilities in SIC codes selected by the USEPA for screening under Phase II of the Federal storm water program (Phase II facilities).

   c. Other ~~business sectors~~industrial/commercial facilities considered by both the EAC ~~or~~ and the Regional Board to conduct industrial/commercial activity with a high potential for storm water contamination. ~~(e.g, restaurants)~~ (Potential Problem facilities).

~~1~~2. By _____, the Permittees shall develop a database listing industrial/commercial facilities identified in section III.A.1 by four digit SIC codes ~~which shall be updated annually~~. The Regional Board will provide the basic information for (a) below. The database should be updated annually and shall include at a minimum:

   a. For those Phase I facilities which have obtained coverage under the GISP,

      i. Facility owner's name, address, and telephone number;

      ii. Site address, telephone number, and contact person;

      iii. ~~Closest receiving water and~~ Watershed; and

      iv. Applicable SIC code(s).

   b. For those Phase I facilities which have not obtained coverage under the GISP, Phase II facilities, and Potential Problem facilities,

i. Name and address of contact person (e.g. owner/president/site manager);

ii. Site address and telephone number; and

iii. Applicable SIC code(s).

c. By _____, the Permittees shall identify for each SIC industry group identified, primary activities and primary materials that might impact stormwater runoff discharges.

THE FOLLOWING TEXT WILL BE ADDRESSED IN THE MONITORING PROGRAM

~~23. By _____, the EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, a pollutant source identification program for the control of storm water pollutant discharges from industrial/commercial facilities. The objective of the source identification program is to gather data on specific and/or interrelated set of pollutant generating activities occurring on very small areas (< 5 acres) of industrial/commercial activity and to provide information for developing and implementing BMPs for specific activities.~~

B. Prioritization of Sources

1. By _____, Permittees shall pricritize the SIC industry groups evaluated in III.A.2.c. Priority shall be based on a groups relative potential for the contamination of storm water and urban runoff.

2. By _____, Permittees shall rank, based on necessity for oversight of implementation of storm water management measures, the industrial and commercial facilities within each of the highest priority SICs.

Facility ranking within each priority SIC should be based on factors such as land use, operation, and activities that could potentially contribute significant amounts of pollutants into storm water runoff. Factors such as facility size and site history shall also be considered. All facilities shall be ranked in one of three categories (high, medium and low). [NEED DEFINITION OF HIGH, MEDIUM AND LOW]

3. Detailed implementation schedules for the prioritizing and ranking activities shall be included in each Permittees individual Implementation Plan.

C. Source Control Measures

1. By _____, Permittees shall develop for each SIC group a checklist of specific storm water and urban runoff control measures for industrial and commercial facilities which have been ~~prioritized~~ ranked high in III.B.2. The control measures must

a. address multiple pollutant sources;

b. initially focus on source control measures such as source minimization, education, good housekeeping, and site design alternatives; and

c. target ~~industrial/commercial~~ source areas and activities with the highest potential to generate substantial pollutant loadings;

THE FOLLOWING SECTION IS ALREADY ADDRESSED IN THE INSPECTION SECTION

~~2. By _____, Permittees shall, as an immediate action item and for inclusion in their Implementation Plan, develop a process to ensure implementation of storm water and urban runoff control measures for industrial/commercial facilities identified in III.C.1 for industrial/commercial facilities ranked high in III.B.2. A detailed schedule for developing this process shall be included in each Permittees Implementation Plan.~~

THE FOLLOWING SECTION WILL BE ADDRESSED IN THE MONITORING PROGRAM

~~3. By _____, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for industrial and commercial facilities within III.A.1.a which have been prioritized ranked as having the highest potential to contribute significant amounts of pollutants into storm water runoff. A detailed description of the evaluation process should be included in each Permittees Implementation Plan. The structural control measures must be evaluated as to:~~

~~a. effectiveness in reducing toxic pollutants and pollutants of concern; and~~

~~b. ease of maintenance;~~

~~c. current frequency of use;~~

~~db. feasibility and cost-effectiveness.~~

~~e. possible methods to ensure implementation if necessary.~~

~~By, _____, the Permittees shall, in addition, describe any studies and pilot projects they intend to conduct to assess the feasibility and effectiveness of specific control measures. A description and schedule shall be included in each Permittees Implementation Plan.~~

THE FOLLOWING TEXT WAS MOVED FROM ILLICIT DISCHARGES/DISPOSAL CHAPTER

2. By _____, Permittees shall enact ordinances to require the following:

a. The proper disposal of food wastes by restaurants and food wholesalers;

b. Persons owning or operating a gas station, auto repair garage, or similar structure ~~must~~ to clean those facilities in a manner that does not result in discharge of pollutants to the storm drain system~~; and~~.

~~c. Machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze must be repaired.~~

ac. That objects, such as motor vehicle parts, containing grease, oil, or other hazardous substances, and unsealed receptacles containing hazardous materials, be stored ~~away from areas susceptible to runoff~~ properly, so that they would not adversely impact discharges to the storm drain system;

~~b~~d. That machinery or equipment which is to be repaired or maintained in areas exposed to rainfall and/or susceptible to runoff, be ~~placed on~~repaired in a ~~pad of absorbent material, or an equivalent, to contain~~manner where leaks, spills ~~or small discharges~~and other maintenance related contaminants are not discharged to the storm drain system;

ee. That owners of commercial/industrial motor vehicle parking lots with more than twenty-five (25) parking spaces ~~and structures~~ located in areas exposed to rainfall and/or susceptible to runoff to be swept regularly to remove debris. ~~Lots with more than ten (10) parking spaces and all public parking facilities shall also be vacuum swept to remove chemical residue~~;

df. That all fuel and chemical residue, animal waste, garbage, batteries, or other types of potentially harmful materials which are located in areas exposed to rainfall and/or susceptible to runoff, be removed immediately and disposed of properly; ~~and~~

eg. That hazardous waste be disposed of ~~through the Permittee's hazardous waste program or~~ at ~~any other~~ an appropriate disposal site, and not be placed in a trash container for regular trash disposal.

Programs and/or activities to encourage these activities shall be included in the Baseline, Watershed, and Implementation Plans.

THIS TEXT TO BE DELETED, THE GISP IS TO REMAIN A SEPARATE PERMITTING PROCESS

~~5. The EAC may seek coverage under this Order, for industrial facilities listed in III.B.1.a.i which are owned and operated by Permittees if it;~~

~~a. establishes a procedure for notifying the Regional Board of industrial sites owned and operated by Permittees;~~

~~b. prepares a checklist of industrial BMPs using BAT/BCT criteria for implementation by Permittees at these industrial sites;~~

~~c. standardizes procedures to ensure implementation of industrial BMPs by Permittees;~~

~~d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee industrial facilities; and~~

~~e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each site, and certify compliance with this Order.~~

D. Source Inspection

~~2~~1. By _____, Permittees shall develop and implement an industrial/commercial facilities inspection program. A schedule for the development and implementation of the inspection program should be included in each Permittees Implementation Plan. The inspection program shall include, but is not limited to:

a. procedures for facility inspections;

b. procedures for industrial/commercial sectors outreach on pollution prevention, waste minimization, and storm water quality management;

c. procedures to ~~ensure~~ require corrective action ~~is~~ be undertaken by non-complying facilities;

d. procedures to follow-up on violations of municipal standards;

e. procedures for enforcement action against non-complying facilities; and,

~~f. an electronic recording system to document the status of facility inspections; and;~~

~~g~~f. appropriate training for program staff.

~~1~~2. By _____, each Permittees shall submit a schedule for inspection of Phase I industrial/commercial facilities which is based on the ranking ~~industrial/commercial facilities in III.B.1.a.i~~ in III.B.2, for adequacy of storm water pollution prevention measures. The schedule shall ~~include~~ cover, for

a five year period,

a. for municipalities with a population of less than 2,500,000, all of the facilities regulated under Phase I of the Federal storm water program (40 CFR 122.26).

b. For municipalities with a population of greater than 2,500,000, fifty percent (50%) of the Phase I facilities in categories i through ix and self-certification of Phase I facilities in category xi. Non respondent Phase I facilities in category xi shall be referred to the Regional Board.

3. During the inspections of Phase I facilities in categories i through ix, inspectors shall request to see a copy of ~~the~~ a SWPPP. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may deem it necessary to report problematic facilities to the Regional Board.

4. By _____, each Permittees shall submit a schedule for inspection of Phase II and Potential Problem industrial/commercial facilities in ~~III.B.1.a.i~~ which is based on the ranking in III.B.2, for adequacy of storm water pollution prevention measures. The schedule shall ~~include~~ cover, for a five year period,

   a. for municipalities with a population of less than ~~250,000~~ 2,500,000, ~~all~~ a subset of Phase II and Potential Problem facilities ~~identified in III.B.1.a.ii and III.B.1.a.iii,~~ but not less than fifty percent (50%) of the total number of all Phase II and Potential Problem facilities.

   b. for municipalities with a population of greater than ~~250,000~~ 2,500,000, a subset of Phase II and Potential Problem facilities ~~identified in III.B.1.a.ii and III.B.1.a.iii.~~, but not less than ~~ten times the number identified in III.B.1.a.i~~ ten percent (10%) of the total number of Phase II and Potential Problem facilities.

5. Industrial/commercial facilities ~~in III.B.1.a.ii and III.B.1.a.iii~~ that are not included in the inspection schedule, other than the self-certified Phase I (category xi) facilities, shall be ~~surveyed~~ contacted, at least once during the five year period, by phone, mail-out, or a similar method, ~~as~~ to attempt to determine their conformance with good stormwater quality management measures. A description and schedule for the development of such programs and/or activities shall be included in each Permittees Implementation Plan.

E. Reporting

Each year, the Permittees shall evaluate the results and progress of their storm water quality management program for industrial/commercial sources. The annual report submitted to the Regional Board shall recommend a strategy for the management of

storm water from industrial/commercial sources for the following year based upon:

a. ~~priority~~ industrial/commercial sources listing
b. ~~priority~~ on-site inspections
c. phone/mail-out survey inspections
d. ~~priority checklists~~ evaluation of stormwater urban runoff control measures implementation
e. evaluations of structural and treatment control measures
f. special studies and pilot projects needs
g. specific site and activity monitoring needs

The EAC shall make available to the Regional Board the industrial/commercial database developed in ~~III.B.a.1~~ III.A.2 in ~~the~~ an appropriate format when so requested.

F. Coordination

The Permittees shall develop a process for the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports shall be developed as required.

G. Conflicts with Other Mandates

~~1.~~ The Permittees, as they deem necessary, will work with other regulatory agencies and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this Order and the requirements of other regulatory agencies.

VOL 24

03622

~~September 14, 1995~~ September 27, 1995

IV. PROGRAM REQUIREMENTS FOR NEW DEVELOPMENT AND SIGNIFICANT REDEVELOPMENT

A. ~~Regional Policy~~ Countywide Guidelines

1. By _____, the EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, ~~and adopt a regional policy~~ countywide guidelines to ~~promote~~ encourage watershed protection considerations during planning, ~~project review,~~ and permitting of new development and significant redevelopment, to:

   a. preserve to the extent feasible, and where possible, create or restore areas that provide water quality benefits, such as riparian corridors and wetlands, and promote the design of new development so that it protects the ~~natural~~ biological integrity of drainage systems and water bodies;

   b. avoid conversions of areas particularly susceptible to erosion or sediment loss and/or establish development guidance that identifies these areas and protects them from erosion and sediment loss. Such areas include steep slopes, highly erodible soils, those subject to periods of intense rainfall, and those with the inability to revegetate once disturbed;

   c. ~~require~~ encourage the integration of storm water quality protection into construction and post-construction activities at all development sites ranked high in IV.D, including the minimization of toxic material use and their careful containment on site; and

   d. maintain peak runoff rates at pre-development levels, wherever practicable.

2. By _____, the EAC shall ~~establish~~ develop, for inclusion in the Baseline Stormwater Management Plan, minimum recommended requirements consistent with the ~~regional policy~~ countywide guidelines for new development and significant redevelopment ranked high in IV.D, for

   a. site planning practices

   b. construction best management practices

   c. post-construction best management practices

   d. ~~reporting~~ erosion and ~~storm water~~ sediment control ~~strategies~~

~~e. redevelopment and infill~~

B. Planning Process

In order to integrate storm water management considerations into new development projects at the time that they are first proposed to jurisdictions, and to support other provisions of this ~~permit~~Order:

1. By _____, the EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, ~~guidance~~ guidelines for ~~permittees~~Permittees to use in preparing/reviewing EIRs, and in linking EIR mitigation conditions to local permits approvals.

2. By _____, ~~permittees~~Permittees shall ~~adopt and~~ use the ~~guidance~~ guidelines in their internal procedures.

3. By _____, the EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, a model CEQA checklist form that explicitly addresses watershed, water quality, and nonpoint source pollution impacts.

4. By_____, the ~~permittees~~Permittees shall use the model CEQA checklist or incorporate its provisions into their existing procedures.

5 Whenever a ~~permittee~~ Permittee rewrites either of the following mandated general plan elements - the conservation element or the open space element - watershed and stormwater management/urban runoff considerations shall be incorporated.

6. By _____, ~~permittees~~Permittees shall implement a public education/ outreach program, consistent with the Baseline Stormwater Management Plan and Watershed Management Plan, to encourage developers to maximize pervious areas and storm water infiltration (in areas where the geology and topography allow), minimize directly connected impervious areas, and include ~~justifiable~~ cost effective treatment control measures. A description and schedule for the development of such a program shall be included in each Permittees Implementation Plan.

C. Identification of Sources

1. By _____, the EAC shall, for inclusion in the Baseline Stormwater Management Plan, establish a screening criteria for the selection of construction sites to be listed in a database.

2. By _____, the Permittees shall, in accordance with the Baseline Stormwater Management Plan and the Watershed Management Plan, ~~prioritize~~ identify sites of construction activity within their jurisdiction ~~on~~

~~their relative potential for the contamination of storm water and urban runoff.~~ The ~~categorical~~ list shall be based on the EAC criteria and may include:

a. All construction activity sites regulated under Phase I of the Federal storm water program (40 CFR 122.26).

b. All construction activity with sites greater than the size criteria established by the EAC, but less than five acres, in size.

c. Other construction activity sites considered by both the EAC ~~or~~ and the Regional Board to have a high potential for the contamination of storm water and urban runoff.

~~23.~~ By _____, the Permittees shall develop a database listing sites of construction activity identified in IV.C.2 ~~within each Permittees' jurisdiction.~~ Depending on resources and availability of information, the database ~~which shall~~ should be updated quarterly and ~~The database~~ shall include at a minimum:

a. ~~Facility owner's~~ Developer/Contractor/Site Superintendent name, address, and telephone number;

b. Site address and telephone number~~, and contact person~~;

~~c. Closest receiving water;~~

~~dc.~~ Type of construction activity;

~~e. Duration of project with start and end dates~~

~~fd.~~ Total size of project in acres, cubic yards (grading), or square feet; and

e. Percent impervious area, disturbed area and whether or not the project involves hillside development.

D. Prioritization of Sources

By _____, Permittees shall rank, based on their relative potential for the contamination of storm water and urban runoff, the construction activity sites, identified ~~as potential pollutant sources of storm water and urban runoff pollutants in IV.B.1.a,~~ in IV.C.3 in order of priority for oversight of implementation of storm water management measures. All construction sites shall be ranked in one of three categories (high, medium and low). [NEED DEFINITION OF HIGH, MEDIUM AND LOW] Factors such as the size of the project, site history, and whether or not the project involves hillside development should also be considered. A detailed description and schedule of implementation for ranking activities shall be included

in each Permittees Implementation Plan.

E. Planning Control Measures

By _____, Permittees shall submit a plan and schedule for adopting modifications to their planning processes. The plan should address the development of implementable design standards and the initiation of stormwater requirements for new development and significant redevelopment projects. These plans and schedules shall also be included in the Implementation Plans.

~~Permittees shall require that prior to the submittal of an application for the first planning or building approval for a new development project an applicant shall submit an Urban Runoff Mitigation Plan~~

1. As part of a public education/outreach program, all developers should be made to consider the following issues:

   a. ~~Be designed to reduce the~~ The reduction of runoff volume from the site and the pollutant load contributed by the site through incorporation of design elements and practices that address each of the goals set forth below in subsection (c). (Applicants should refer to the most recent edition of the Construction Best Management Practices Handbook, produced and published by the Storm Water Quality Task Force, for specific guidance on selecting best management practices for reducing pollutants in stormwater discharges from urbanized areas.)

   b. ~~Discuss compliance~~Compliance with the development requirements set forth by Permittee's legal authority; and

   ~~iii~~c. ~~Address the following goals~~Goals in connection with both construction and long term operation of the site are as follows:

      ~~a~~i. Maximize, to the extent practicable, the percentage of permeable surfaces in order to allow more percolation of runoff into the ground.

      ~~b~~ii. Minimize, to the extent practicable, the amount of runoff directed to impermeable areas ~~to the City's~~and to the stormwater system.

      ~~c~~iii. Maximize, to the extent practicable, stormwater filtration and storage for reuse through the use of sediment traps, cisterns or other means.

      ~~d~~iv. Minimize, to the extent practicable, parking lot pollution through the use of porous materials to allow percolation of

runoff, through the installation of appropriate treatment controls, or through other means.

A detailed process for the development of programs and/or activities to increase developer awareness shall be included in each Permittees Implementation Plan.

2. Developers of new projects or significant redevelopment projects that are expected to meet the established screening criteria for a construction site ranked high in IV.D, shall submit an Urban Runoff Mitigation Plan.

   a. The Urban Runoff Mitigation Plan should be submitted for approval prior to the receipt of any grading or building approval.

   b. The Urban Runoff Mitigation Plan should address all of the issues in IV.E.1.a, IV.E.1.b and IV.E.1.c.

~~iv. Compliance with an approval approved Urban Runoff Mitigation Plan shall be a condition of any required planning approval.~~

~~v. Failure to comply with an approval approved Urban Runoff Mitigation Plan after receiving any required planning approval shall be a misdemeanor.~~

3. Permittees shall require that the following planning control measures be incorporated into new development or significant redevelopment projects that are expected to meet the established screening criteria for a construction site ranked high in IV.D:

   a. Roof drainage shall be oriented towards permeable areas on site to the maximum extent practicable.

   b. Lot drainage shall be oriented towards permeable areas to the maximum extent practicable.

   ~~c. All parking lots shall be designed to contain one inch of precipitation in a 24 hour period.~~

   dc. Runoff from parking lots shall be directed to permeable areas to the ~~M~~maximum ~~E~~extent ~~P~~practicable.

A detailed process for the development of programs and/or activities to incorporate control measures into new development and significant re-development shall be included in each Permittees Implementation Plan.

F. Construction Site Control Measures

1. By _____, Permittees shall develop, as part of their Implementation Plan, a checklist of specific source control storm water and urban runoff control measures for construction activity ~~sites in IV. D.1.a.~~ The control measures must

a. address multiple pollutant sources;

b. initially focus on source control measures such as source minimization, education, good housekeeping, good waste management and good site planning; and

c. target ~~construction activity~~ source areas and activities with the ~~highest~~ potential to generate substantial pollutant loadings;

THE FOLLOWING SECTION WILL BE ADDRESSED IN THE MONITORING PROGRAM

~~2. By _____, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for construction sites in IV.B.1.a IV.D. A detailed description of the evaluation process should be included in each Permittees Implementation Plan. The structural control measures must be evaluated as to:~~

~~a. effectiveness in reducing sediment, toxic pollutants and pollutants of concern; and~~

~~b. ease of maintenance;~~

~~c. current frequency of use;~~

~~d. feasibility and cost-effectiveness; and~~

~~e. possible methods to ensure implementation.~~

~~By _____, Permittees shall describe any studies and pilot projects that may be conducted to assess the feasibility and effectiveness of specific control measures. A description and schedule shall be included in each Permittees Implementation Plan.~~

THE INTENT OF THE FOLLOWING SECTION IS INCLUDED IN SOURCE INSPECTION

~~2. By ____, Permittees shall have in place a process to ensure, to the maximum extent practicable, implementation and proper maintenance of storm water and urban runoff control measures identified in IV.F.b for sites associated with construction activity in IV.B.1.a high ranked construction sites in IV.D, including~~

~~a. use of qualified personnel to design, install, and maintain BMPs.;~~

~~ba. proper maintenance of BMPs incorporated into private developments (e.g., through deed restrictions, covenants, conditions and restrictions (CC&R);~~

~~cb. proper installation and maintenance of post-construction BMPs; and~~

42. By _____, Permittees shall require the following for ~~demolition/~~ construction ~~activity~~ sites ranked high in IV.D:

a. Sediment, construction waste and other pollutants from construction sites and parking areas shall be retained on the site to the maximum extent practicable.

b. Any sediments or other materials which are not retained on the site shall be removed within 24 hours from the time of notification, ~~or where determined necessary~~ by the Director of Department of Public Works, or a designated representative. In lieu of removal, a temporary sediment barrier ~~shall~~ may be installed if approved by the Director.

c. Excavated soil shall be located on the site in a manner that ~~eliminates~~ minimizes the amount of sediments running into the street or adjoining properties. Soil piles shall be covered until the soil is either used or removed.

d. Drainage controls shall be utilized as needed, depending on the extent of proposed grading and topography of the site, including but not limited to the following:

i. Detention ponds, sediment ponds, or infiltration pits.

ii. Dikes, filter ~~beams~~ berms or ditches.

iii. Downdrains, chutes or flumes.

iv. Silt fences.

e. ~~No washing of construction or other industrial vehicles shall be allowed adjacent to a construction site.~~ No water from washing construction equipment and/or vehicles ~~on a site~~ is allowed to run off into the ~~City's~~ storm drain system unless treated to remove sediments and pollutants.

~~d~~f. Grading shall be prohibited ~~prohibition on grading~~ during the wet season (Oct 15 -Apr 15) except for emergency action unless adequate erosion and sediment control measures are in place and maintained.

THE FOLLOWING TEXT WAS MOVED TO ANOTHER SUB-SECTION

~~f. Roof drainage shall be oriented towards permeable areas on site to maximum extent practicable.~~

~~g. Lot drainage shall be oriented towards permeable areas to the~~

~~maximum extent practicable.~~

~~h. All parking lots shall be designed to contain one inch of precipitation in a 24 hour period.~~

~~i. Runoff from parking lots shall be directed to permeable areas to the Maximum Extent Practicable.~~

~~5. Permittees shall require the following for construction activity:~~

g. ~~All c~~Construction ~~sites in hillside areas or~~ in areas adjacent to natural water-ways (soft bottom creeks), lakes or the ocean must ~~develop and implement sedimentation~~ include the development and implementation of and erosion control plans that incorporate the following elements: timing of construction, BMPs to reduce erosion of cleared hillsides (revegetation, jute netting, etc.), BMPs to reduce the velocity of runoff and sediment from the construction site, and BMPs to detain the flow of sediments from the site;.

h. ~~As a condition of granting a construction permit, set forth r~~Reasonable limits on the clearing of vegetation from construction sites, including, but not limited to, regulating the length of time during which soil may be bare, and, in certain sensitive cases, prohibiting bare soil.

A detailed process for the development of programs and/or activities to encourage these items shall be included in each Permittees Implementation Plan.

THE FOLLOWING TEXT IS TO BE DELETED, THE GCSP IS TO REMAIN A SEPARATE PERMITTING PROCESS

~~6. The EAC may seek coverage under this Order, for construction activity sites listed in III.B.1.a.1 which are owned and operated by Permittees if it:~~

~~a. establishes a procedure for notifying the Regional Board of construction activity on sites owned or operated by Permittees;~~

~~b. prepares a checklist of construction BMPs using BAT/BCT criteria for implementation by Permittees at these construction sites;~~

~~c. standardizes procedures to ensure implementation of construction BMPs by Permittees;~~

~~d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee construction sites; and~~

~~e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each construction~~

~~site, and certify compliance with this Order.~~

~~F~~G. Source Inspection

~~2~~1. By _____, Permittees shall develop and implement a construction activity inspection program. A schedule for the development and implementation of the inspection program shall be included in each Permittees Implementation Plan. The inspection program shall include, but is not limited to:

a. procedures for construction site inspections;

b. procedures for construction and building industry outreach on pollution prevention, waste minimization, and storm water quality management;

c. procedures to ~~ensure~~ require corrective action is be undertaken by contractors at non-complying sites;

d. procedures to follow-up on violations of municipal codes;

e. procedures for enforcement action against non-complying construction activity; and,

~~f. an electronic recording system to document the status of construction activity inspections; and;~~

~~g~~f. appropriate training for program staff.

~~1~~2. By _____, each Permittees shall submit a schedule for inspection of all construction activity sites in ~~IV.B.1.a.~~ IV.C.2.a, for adequacy of storm water pollution prevention measures and erosion control measures. The schedule shall ~~include;~~ be for a five year period.

3. By _____, each Permittees shall submit a schedule for inspection of construction activity sites ranked high in ~~IV.B.1.a.~~ IV.C.2.b and IV.C.2.c, for adequacy of storm water pollution prevention measures and erosion control measures. The schedule shall ~~include;~~ be for a five year period.

~~a. all construction activity identified in IV.B.1.a.1, and all construction activity identified in III.B.1.a and III. B.1.a~~

~~3~~4. During inspection of group ~~IV.B.1.a.1~~ IV.C.2.a sites, inspectors shall request to see a copy of ~~the~~ a SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may deem it necessary to report problematic construction sites to the Regional Board.

~~G~~H. Reporting

1. Each year, the Permittees shall evaluate the results and progress of their storm water quality management program for construction activity sites. The annual report submitted to the Regional Board shall recommend a strategy for the management of storm water from construction activity sites for the following year based on

   a. ~~priority~~ ranked construction site sources listing
   b. ~~priority~~ site inspections
   c. priority checklists of stormwater urban runoff control measures
   d. evaluations of structural and treatment control measures
   e. special studies and pilot projects needs
   f. specific site and activity monitoring needs

2. The EAC shall make available to the Regional Board the construction activity database developed in ~~IV.B.1.a.1~~ IV.C.3 in ~~the~~ an appropriate format when so requested.

~~H~~I. Conflicts with Other Mandates

~~1.~~ The Permittees, as they deem necessary, shall work with other regulatory agencies and report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this ~~permit~~Order and the requirements of other regulatory agencies.

VOL 24

03712

~~September 14, 1995~~ September 27, 1995

V. PUBLIC AGENCY REQUIREMENTS

A. Examination of Existing Activities

By _____, the Permittees shall develop and begin implementation of a program to examine their existing activities and measures described below to reduce the impact on stormwater quality from their operations. A schedule for the development and implementation of the program shall be included in each Permittees Implementation Plan.

B. Sewage Systems

1. All reasonable efforts shall be undertaken to keep sewage spills or leaks from entering the storm drain system. The EAC shall develop, for inclusion in the Baseline Stormwater Management Plan, procedures for sewage spill response by _____.

2. All reasonable operational control procedures for identifying, repairing, and remediating sewer blockages, exfiltration, overflow, and wet weather overflows from the sewers to the storm drain system shall be implemented to protect stormwater quality by _____ (by whom? EAC or Permittees?). These procedures shall include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

3. By _____, the Permittees shall ~~insure that field personnel who operate and/or maintain sewer systems have procedural training for screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to~~ be able to properly investigate any suspect connections or cross connections from the sewer system to the storm drain system using procedures such as field screening, sampling, smoke/dye testing, and TV inspection, if appropriate. A detailed description of the procedures shall be included in each Permittees Implementation Plan.

C. Construction Activities

By _____, Stormwater management requirements for private development shall be incorporated into the design and construction of all public facilities.

~~C~~D. Vehicle Maintenance/Material Storage Facilities

1. By _____, EAC will develop, for inclusion in the Baseline Stormwater Management Plan, a baseline pollution prevention plans for ~~each~~ all public vehicle maintenance/material storage ~~facility~~ facilities which discharge or have the potential to discharge pollutants into the storm drain system ~~category~~. Public vehicle maintenance/material storage facilities shall be

defined as any "Permittee owned" facility, or portion thereof, that:

a. Conducts activities, operates equipment, handles materials, and provides services equivalent to industries regulated under Phase I of the Federal storm water program (40 CFR 122.26), or

b. Performs fleet vehicle/equipment washing, fueling and maintenance, or

c. Performs maintenance and/or repair of heavy industrial machinery/equipment, or

d. Provides for storage of types of raw and waste materials in significant quantities to require implementation of a hazardous materials business plan or spill prevention, control and countermeasures plan.

Fleet maintenance shall be defined as washing of ten (10) or more vehicles per month, maintaining of ten (10) or more vehicles per month, or fueling of vehicles/equipment in excess of one thousand (1,000) gallons per month.

~~include any Permittee-owned and/or operated facility in which any of the following occur: vehicle or equipment maintenance; repair; washing; fueling; and/or any facility at which there is storage of reportable quantities of toxic chemicals or hazardous materials. (or "at which a hazardous materials business plan is required")~~

2. Best Management Practices (BMPs)

a. By _____, each Permittees will ~~have~~ develop, per EAC guidelines, a schedule for implementing site specific pollutant control measures together with ~~an~~ the baseline on- site pollution prevention plan ~~implemented~~ at ~~all~~ vehicle maintenance/material storage facilities identified in V.D.1. Permittees shall first identify the potential pollution sources and who is responsible for implementing the stormwater management measures. A schedule of implementation shall be developed based on the facility type, management practices, size of facility and site history. A detailed description of the program shall be included in each Permittees Implementation Plan.

~~b. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each public vehicle maintenance/material storage facility. To achieve this goal, the~~

eb. BMPs that can be used to improve the quality of runoff include, but are not limited to:

i. Housekeeping practices;

ii. Material storage control;

iii. Vehicle leak and spill control; and

iv. Illegal dumping control.

~~dc.~~ Loading/Unloading of Materials

~~i.~~Employees or contractors of the Permittees who handle potentially harmful materials shall be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to stormwater from outdoor loading/unloading of materials.

~~ii. Applicable BMPs shall be selected based on the following three factors:~~

~~1. Eliminating exposure of material to rainfall;~~

~~2. Checking equipment regularly for leaks; and~~

~~3. Containing spills.~~

ed. Material Storage Control

A program shall be developed to prevent or reduce the discharge of pollutants to stormwater from outdoor container storage areas using measures such as:

i. Installing safeguards against accidental releases;

ii. Secondary containment;

iii. Conducting regular inspections; and

iv. Training employees in standard operating procedures and spill cleanup techniques.

~~fe.~~ Vehicle and Equipment Washing and Maintenance

i. Washing of vehicles or equipment on-site shall be performed in a ~~designated area equipped with an oil/water separator~~manner that minimizes stormwater pollution or results in no discharge to the storm drain system.

ii. ~~The~~Sumps and separators, where used, shall be maintained/cleaned on a regularly scheduled basis appropriate to the facility.

iii. BMPs to be implemented as appropriate for vehicle and equipment maintenance shall include but not be limited to:

a. Waste reduction;

b. Use of alternate products;

c. Pollution prevention;

d. Recycling; and

e. Spill prevention and clean up.

THE FOLLOWING TEXT WAS MOVED FROM THE ILLICIT DISCHARGE/DISPOSAL CHAPTER

f. Storage of Materials, Machinery and Equipment

Permittees shall require:

~~a~~i. That objects, such as motor vehicle parts, containing grease, oil, or other hazardous substances, and unsealed receptacles containing hazardous materials, be stored ~~away from areas susceptible to~~so that they are not in contact with rainfall or runoff;

~~b~~ii. That machinery or equipment which is to be repaired or maintained in areas exposed to rainfall and/or susceptible to runoff, be ~~placed on~~repaired in a ~~pad of absorbent material, or an equivalent, to contain~~manner where leaks, spills ~~or small discharges~~and other maintenance related contaminants are not discharged to the storm drain system;

~~d~~iii. That all fuel and chemical residue, animal waste, garbage, batteries, or other types of potentially harmful materials which are located in areas exposed to rainfall and/or susceptible to runoff, be removed immediately and disposed of properly~~.~~ and;

~~e~~iv. That hazardous waste be disposed of ~~through the Permittee's hazardous waste program or at any other~~ an appropriate disposal site, and not be placed in a trash container for regular trash disposal.

Programs and/or activities to implement these activities shall be included in the Baseline, Watershed, and Implementation Plans.

6g. Waste Handling and Disposal

Wastes shall be managed to prevent stormwater pollution.

~~D~~E. Parks and Recreation

1. Fertilizers/Pesticides

a. Permittees shall develop, as part of their Implementation Plans, procedures on the proper application of pesticides, herbicides, and fertilizers by _____. Procedures shall include:

i. List of approved pesticides and selected use;

ii. Product and application information;

iii. Equipment use and maintenance procedures; and

iv. Record keeping.

b. Landscape waste shall not be ~~discharged~~ disposed of into the storm drain system.

c. Storage areas for fertilizers and pesticides shall be designed and maintained to reduce exposure to stormwater. The following BMPs shall be utilized where appropriate:

i. Store materials inside or under cover on paved surfaces;

ii. Use secondary containment;

iii. Minimize storage and handling of hazardous materials; and

iv. Inspect storage areas regularly.

2. Facility Management

a. Wash waters that would cause adverse impact cannot be discharged into the storm drain system without appropriate treatment.

b. Landscape maintenance involving the use of pesticides and fertilizers shall ensure the proper use of these materials to minimize ~~loss to storm water~~pollution of stormwater.

c. Retention and planting of native vegetation to reduce water, fertilizer, and pesticide needs shall be encouraged.

d. Use of Integrated Pest Management (IPM) shall be encouraged.

e. ~~A schedule~~ Practices for irrigation and fertilization shall be regularly reviewed ~~developed by, _____ (by whom? EAC or Permittees?)~~, to minimize:

i. Chemical application during wet season and no chemical application during storms; and,

ii. Over watering that may lead to runoff that contains nutrients and pesticides.

f. The drainage of commercial/municipal swimming pool water shall only be discharged into the sanitary sewer under separate Waste Discharge Requirements.

g. As part of its Implementation Plan, each Permittee shall develop BMPs to minimize trash, debris, and other pollutants from entering Permittee owned recreational water bodies by _____. These measures shall include:

i. Routine trash collection along, on, and/or in, water bodies, where feasible; and

ii. Public outreach to educate the public about impacts of illegal dumping.

~~EF.~~ Storm Drain System Operation and Management

1. Inlet Maintenance

BMPs to be implemented by each Permittee for effective catch basin cleaning shall include, but not be limited to the following:

a. All reasonable efforts shall be made to inspect and/or clean catch basins ~~shall be inspected and cleaned~~ between May 1 and October 15 of each year;

b. Between October 15 and April 15, catch basins shall be maintained as necessary~~:~~;

c. Records shall be kept of the number of catch basins cleaned; and

d. Track the amount of waste collected.

These BMPs shall also be incorporated into each Permittees Implementation Plan.

2. Storm Drain Maintenance

a. ~~Material removed from storm drains and catch basins shall be disposed of properly.~~

~~b.~~ Trash and debris from open channel storm drains shall be removed at least annually between May 1 and October 15 of each year.

~~e~~b. Open channels shall also be monitored during the rainy season for any debris buildup and cleaned where needed.

3. Waste Management

a. Under their Implementation Plans, the Permittees shall implement a program by _____, to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

b. Material removed from storm drains and catch basins shall be disposed of properly.

4. Dry Wweather Sstorm Ddrain Ddiversion

The Permittees shall investigate the feasibility of diverting dry-weather flows from the storm drain system to POTWs where appropriate. The initial investigation shall be completed by _____. A detailed description of the feasibility investigation shall be included in each Permittees Implementation Plan.

~~F~~G. Streets and Roads

In their Implementation Plans, Permittees shall describe programs and/or activities to address pollution from public agency activities associated with streets and roads.

1. Sweeping of curbed streets:

a. ~~Sweeping of~~ Curbed streets shall ~~occur at least~~ be targeted for monthly sweeping.

b. Where feasible, areas generating excessive refuse shall be swept more frequently.

2. Maintenance

a. Existing saw-cut management and paving practices conducted by the Permittees shall be evaluated and appropriate, feasible and cost

effective control measures developed.

b. Paving control measures to be considered that would help reduce the impacts to stormwater include, but are not limited to:

i. Avoid paving during wet weather; and

ii. Store materials away from drainage courses to prevent pollution of stormwater runoff.

c. Refuse collected shall be transported to appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations.

d. Good housekeeping practices shall be implemented to insure proper management of any waste products that may be generated during maintenance activities.

e. To reduce stormwater pollution from concrete materials and wastes:

i. Washout of concrete trucks should be conducted off- or on-site in designated areas. Do not wash out concrete trucks into storm drains, open ditches, streets, or streams;

ii. Store materials under cover, and away from drainage areas when feasible; and

iii. Avoid mixing excess amounts of concrete or cement on-site.

f. Employees shall be trained in the implementation of good housekeeping measures. Training shall:

i. Promote a clear understanding of the potential for maintenance activities to pollute storm water; and

ii. Identify solutions (BMPs selection);.

~~G~~H. Flood Control

1. By, _____, the Permittees shall develop and implement procedures to assess the impact(s) of new flood management projects on the quality of receiving water bodies. A schedule for the development and implementation of assessment procedures shall be included in each Permittees Implementation Plan.

2. The Permittees shall undertake pilot projects/studies to determine the applicability of altered structural flood control system elements to provide

pollutant removal in stormwater. (Group effort? WMC?)

3. During construction, appropriate BMPs shall be utilized to control pollutants.

4. Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed to assure that appropriate management measures are developed to comply with the stormwater regulations.

~~H~~I. Parking Facilities

~~That owners of~~ Permittee owned motor vehicle parking lots with more than twenty-five (25) parking spaces ~~and structures~~ located in areas exposed to rainfall and/or susceptible to runoff shall be swept regularly to remove debris. ~~Lots with more than ten (10) parking spaces and all public parking facilities shall also be vacuum swept to remove chemical residue~~ A schedule for the development and implementation of cleaning activities at parking facilities shall be included in each Permittees Implementation Plan.

~~September 15, 1995~~ September 27, 1995

VI. PUBLIC INFORMATION AND PARTICIPATION

CHAPTER TO BE RE-WRITTEN

To reach as many Los Angeles County residents as possible, a comprehensive educational outreach approach shall be undertaken under this Order. Each Permittee shall choose an appropriate combination of outreach tools and activities to raise public awareness of storm water issues and improve water quality.

Outreach Materials

Outreach programs shall consist of written, audio, and visual materials and, when necessary, translated into appropriate languages or structured for appropriate ages. Permittees shall incorporate interactive methods of distributing outreach materials and provide for public participation in activities developed under this section.

A. Written Material

~~1.~~ Each Permittee shall produce a variety of written materials to convey information regarding storm water management within County watersheds.

~~2.~~ Written materials shall include, but are not limited to: flyers, brochures, door-hangers, newspaper articles, mail-inserts, and newsletters.

B. Audio Material

~~1.~~ Each Permittee shall singularly or collectively utilize radio broadcast public service announcements to convey information regarding storm water management except in areas where public access radio stations are not available.

~~2.~~ Examples of audio materials include radio advertisements, public service announcements, and informational recordings.

C. Visual Material

~~1.~~ Each Permittee shall implement a catch basin labeling program as well as other strategies such as banners, displays and posters to educate the public on the ultimate destination of storm drain system flows.

~~2.~~ Each Watershed Management Committee shall produce or acquire at least one informational video regarding stormwater management. The video shall be shown on a regular basis on televised public service stations and cable access programs ~~except in areas where cable access programs are not available.~~ Further methods of distribution may include workshops, libraries, etc.

D. Distribution of Materials

Outreach materials shall be made available to the public at appropriate public counters and distributed at public events. Examples include fairs, festivals, public meetings, community events, school assemblies, etc.

General Education Strategy

A. The EAC shall develop and the Permittees shall implement a 5-year urban runoff education strategy. The intent of the strategy shall be to enhance public awareness of the impact of storm water pollution on receiving waters and to discourage improper waste disposal practices. Outreach efforts shall be conducted throughout the watershed. The public shall be made aware of their responsibility for both the problems and solutions to storm water pollution. A watershed-wide program shall be implemented by _____.

Development and implementation of the education strategy shall be based on the four objectives listed below:

1. Promoting clear identification and understanding of the problem, including activities with the potential to pollute storm water;

2. Identifying solutions or applicable measures (Best Management Practices) that can be taken to prevent storm water pollution;

3. Raising public awareness of the problems and solutions; and

4. Incorporating solutions back into programs, training and BMP implementation.

B. Efforts shall be made to identify land uses and activities that have a higher potential for storm water/urban runoff pollution by focusing on specific pollutants, disposal practices, materials used, etc. To prevent storm water/urban runoff pollution, outreach materials shall be provided on the appropriate selection and implementation of BMPs accordingly. A watershed-wide program shall be developed by _____.

1. Pollutant Specific: The reduction of specific pollutants of concern in a particular watershed shall be addressed in a focused public education and outreach program.

2. Activity-specific: Activity-specific outreach programs shall be developed and implemented throughout the watershed. Written, audio, or visual outreach tools should address three primary topics:

   a. Identification of activities potentially causing storm water pollution;

   b. Implementation of Best Management Practices to prevent storm water pollution.

c. Recognizing and reporting occurrences of storm water polluting activities.

The Permittees shall continue to develop activity-specific outreach programs that inform residents about the problem of illicit discharges and dumping and that promote, publicize, and facilitate public reporting of these activities. The program shall also include continuing operation, maintenance, and promotion of the county-wide reporting hotline.

C. The Permittees shall make an effort to list pertinent City phone numbers under the City government directory located in the front section of local area phone books. This shall be updated annually as necessary and shall, at a minimum, include numbers for reporting on clogged catch basin inlets reporting illegal discharges/dumping and a general informational number for storm water. These phone numbers may be city-specific or area-wide.

D. All reasonable efforts to coordinate public outreach efforts shall be undertaken. This may include coordinating with environmental groups and public agencies such as the California Coastal Commission, the Department of Beaches and Harbors, Resource Agencies, etc.

Outreach to Target Audiences

Permittees shall develop and implement an educational program that stresses pollution prevention for a variety of audiences, including local residents, school-aged children, businesses and public employees whose job functions and daily lives may impact storm water quality. The program may be developed locally or regionally ~~and shall include at a minimum~~:

~~• Education on the proper use and disposal of pesticides, herbicides and fertilizers;~~

~~• Education on the definition of, identification of, and impacts associated with illicit discharges and procedures for reporting~~

~~• Promotion of proper management of and disposal practices for used oil and hazardous substances.~~

A. ~~Local~~ Residents

1. Permittees shall develop a program to educate local residents on types of household hazardous wastes along with proper management and disposal methods. The program shall at a minimum include:

a. Information on the availability of collection services, such as location and schedule;

b. Production of public outreach materials that educate residents on

source reduction and proper disposal methods for household hazardous wastes; and

c. Continue to encourage residents to recycle of oil, antifreeze, glass, plastics, batteries, etc. and to prevent the improper disposal of such materials to the storm drainage system.

d. Where applicable for fire and erosion prevention, mowing shall be encouraged as opposed to disking. An investigation of effectiveness shall be undertaken.

Educational efforts throughout the watershed should also provide residents with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Management Program. Other local programs shall be advertised as appropriate.

2. Permittees shall develop and encourage watershed residents to participate in specific storm water outreach programs. Residents shall be informed of and provided with the opportunity to share ideas and comments about the programs. Permittees shall demonstrate that a good faith effort has been made to outreach to different communities within the watershed. The watershed-wide outreach program shall be implemented by _____. ~~This shall at a minimum include:~~

~~a. Where applicable for fire and erosion prevention, mowing shall be encouraged as opposed to disking. An investigation of effectiveness shall be undertaken.~~

3. Cooperative Public Outreach

In order to promote public participation, cooperative outreach programs with local residents shall be developed. These cooperative programs should foster awareness and identification of storm water pollution issues among residents in the watershed. Catch basin ~~labelling~~labeling and other established sign programs are excellent examples of this type of cooperative effort, as are events like the "Storm water Pollution Awareness Week." One possibility for cooperative outreach is an "Adopt-A- " program. Residents can "adopt" highways, storm drains, catch basins, streams, etc. to monitor, restore and protect. The purpose of all cooperative outreach programs created is to inform and involve the public in storm water management.

4. Complaint Procedures

Public comments/complaints shall be requested by the Permittees in order to help gauge the success and effectiveness of storm water programs.

5. "Do-it-Yourself"ers

B. K-12 School Children

School children can play an important role in public information and participation programs, as they are generally more easily motivated and any behavior changes they make tend to stay with them through adulthood. School children can also convey storm water pollution prevention messages to other family members.

School programs shall include information on storm drain systems, the difference between sewers and storm drains, the importance of preventing storm water pollution, and may also address, illegal discharges/dumping and reporting procedures, source minimization, and general pollution prevention. Written materials (workbooks and coloring books), videos, assemblies, and field trips are examples of effective components of a K-12 educational program.

C. Businesses

A ~~detailed~~ public education and outreach program shall be developed for business operations with greater potential of discharging pollutants into the storm drain system. The program shall ~~include~~encourage employee training on and the effectiveness of implementing BMPs to reduce nonpoint source pollution. In addition to written, audio, and visual materials, other possible means of focused outreach may include: conducting workshops, mass mailings, submitting informational articles to trade/industry magazines, etc.

A watershed-wide, general outreach program shall be set up by the WMC for all industrial and commercial facilities potentially discharging to the storm drain system. Furthermore, the WMC shall provide specific guidance objectives to these facilities regarding storm water program compliance by _____, and inform and remind all potential commercial and industrial dischargers of their obligations under the storm water program. The Permittees shall also encourage the proper disposal of all materials from industrial and commercial sites.

Prior to the WMC providing specific guidance objectives, subcommittees shall be established, as needed, to develop specific outreach materials for industrial/ commercial categories and specific "high priority" activities. This shall include at a minimum: metal platers, restaurants, vehicle related facilities, etc...

D. Public Agencies and Employees

Public agency employees shall be trained on storm water management and pollution prevention practices and involve employees on many different levels - from program managers to field personnel. Training programs shall include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forums or committees. Materials developed for other audiences may also be used in these public agency employee training programs. Appropriate

public agency employees shall be trained in:

1. Emergency spill cleanup procedures.

2. Environmentally sensitive alternative products.

3. Good housekeeping practices.

Permittees shall provide outreach materials to the general public through business license renewal counters and/or make efforts to outreach through professional and business associations. Additionally, Permittees should consider producing educational materials for professionals and technicians not employed by public agencies.

~~Outreach Based on Activity Type~~

~~A.~~ ~~Industrial/Commercial~~

~~A watershed wide, general outreach program shall be set up by the WMC for all industrial and commercial facilities potentially discharging to the storm drain system. Furthermore, the WMC shall provide specific guidance objectives to these facilities regarding storm water program compliance by _____, and inform and remind all potential commercial and industrial dischargers of their obligations under the storm water program. The Permittees shall also encourage the proper disposal of all materials from industrial and commercial sites.~~

~~Prior to the WMC providing specific guidance objectives, subcommittees shall be established, as needed, to develop specific outreach materials for industrial/commercial categories and specific "high priority" activities. This shall include at a minimum: metal platers, restaurants, vehicle related facilities, etc...~~

~~B.~~A. Construction

The Permittees shall ensure that contractors properly install all necessary post - construction, permanent BMPs during initial construction and that any necessary maintenance needed during construction is performed. There shall be specific programs outlining correct practices.

In an effort to prevent concrete waste from entering the storm drain system, contractors shall observe the following guidelines:

1. Washout of concrete trucks should be conducted off-site or on-site in designated area;

2. Excess concrete should not be dumped on site; and

3. Employees and subcontractors should be trained in proper concrete waste

management.

Evaluation

The EAC shall develop a process to evaluate the effectiveness of all public outreach programs implemented under this ~~permit~~Order. Surveys and focus groups are examples of methods that can be used to gauge a program's effectiveness. They can also be used to provide insight into the program's direction and to help formulate attainable goals. Results of any evaluation method used shall indicate the community's level of awareness of storm water pollution. A watershed-wide program shall be implemented by _____.

VOL 24

03888

~~August 25, 1995~~ September 27, 1995

VIII. PROGRAM EVALUATION AND REPORTING

The program may be modified subject to comments received under the Annual Review.

A procedure shall be developed and utilized for program evaluation and reporting by the Principal Permittee during the course of this ~~permit~~Order. Under this procedure as outlined below, the EAC shall develop action-specific performance indicators and criteria, perform evaluation of compliance and effectiveness based on the performance criteria, establish schedules and mechanism for internal record keeping and reporting, and submit ~~semi-annual and~~ annual reports to the Regional Board using a standardized format.

The EAC, WMC, and/or each Permittee are responsible for collecting data needed for program evaluation, conducting self-evaluation, and reporting the results of evaluation to the Regional Board. The results reported to the Regional Board shall include both the collected data and analysis of the data. The annual reports shall include detailed explanation on how the evaluations are conducted, how and why certain provisions of the permits are met or not met, how the effectiveness of certain BMPs is determined or is not, and should a problem arise, how it shall be corrected. The Regional Board will make a compliance determination based on information submitted under this procedure.

A. Demonstration of Compliance

1. Each Permittee is responsible for demonstrating that the required BMPs as prescribed under this ~~permit~~Order, as well as other BMPs included in the Watershed Management Plans, are implemented to the "maximum extent practicable." Each Permittee shall implement the required BMPs to the maximum extent practicable.

2. The Watershed Management Committees are responsible for demonstrating the effectiveness of other BMPs through conducting and reporting the results of pilot/demonstration projects for evaluating the effectiveness of BMPs in the watershed.

3. The degree and the effectiveness of BMP implementation shall be evaluated and reported by the Permittees using environmental and/or administrative indicators whenever possible. When environmental indicators are not readily and/or easily available, administrative indicators shall be used. These shall include indicators prescribed under relevant provisions of this ~~permit~~Order, and/or other indicators deemed appropriate by the Watershed Management Committee, the Executive Advisory Committee, and/or ultimately the Regional Board. Examples of the quantitative indicators include the number of inspections conducted, number of staff increase, number of audience reached through public education, waste recycled, water conserved, hazardous waste collected, oil recycled, ~~catchbasin~~catch basin waste removed, etc. Quantitative indicators of environmental conditions should also be reported if they can be linked to the effects of the BMP

implementation.

4. In order to yield comparable results for year to year evaluation on the success, the progress, and/or the failure in BMP implementation, and comparable results from area to area, a uniform data collection methodology shall be established for each of the required BMPs. The uniform data collection methodology shall be developed by the Executive Advisory Committee. Subsequently, each report on BMP implementation shall provide comparison with the implementation status during the previous reporting period and the scheduled implementation timeline for the current and future reporting periods, based on data collected using the uniform collection methodology.

B. Internal Reporting and Record Keeping

1. In order to facilitate the preparation of ~~semi-annual and~~ annual reports, the EAC shall develop standard forms for internal reporting to be used by all Permittees within the watershed. The forms shall collect all the information essential to the preparation of the annual and semi-annual reports and to the needs of other management actions by the Watershed Management Committees, EAC, and/or the Permittees. Reported information shall be quantifiable and specific for each program area and/or BMP. The dates for submitting the internal reports shall allow sufficient time for compilation and analysis by the Watershed Management Committees and/or the EAC for the preparation of ~~semi-annual and~~ annual reports to the Regional Board.

2. All records shall be retained by the Permittees for a period of 5 years or longer as required by the Regional Board or USEPA.

C. ~~Semi-annual and~~ Annual Reports

The requirements under VIII.A shall be met by the submittal of ~~semi-annual and~~ annual reports. ~~Semi-annual reports shall succinctly summarize compliance efforts and may consist of simple compliance checklists. Annual reports shall be comprehensive.~~

~~1. Semi-annual Report~~

~~a. The EAC shall submit a semi-annual progress report to the Regional Board by _____ of each year. Semi-annual reports must be submitted to the Regional Board within 30 days after the end of the six month period. These six month periods are Jan. - June, and July - Dec. (TO BE DETERMINED).~~

~~b. The semi-annual report shall serve as a status report on the progress of the implementation of the Stormwater Management Plan and other permit provisions of this Order. The Watershed Management~~

~~Committee is responsible for collecting and compiling information from each Permittee prior to preparation of the semi-annual report, and include the compiled information along with the information analysis into the report.~~

~~c. The semi-annual report shall consist of a summary table illustrating the levels of implementation for all requirements by each Permittee. Tables shall be developed for each program element listing the Permittees, describing the status of implementation by each Permittee of the element, and documenting any modifications of the element from the standard program.~~

~~2. Annual Report~~

a. The Executive Committee shall submit an annual report to the Regional Board not more than 60 days after the end of each permit year (_____). The annual report shall include both a summary of the progress and status of Stormwater Management Plan implementation, a summary on status of compliance with all ~~permit provisions~~provisions of this Order, a report on the evaluation of program effectiveness, and a summary of recommendations for ~~permit provision~~ revisions to the provisions of this Order. The Permittees as a whole (within watershed management areas) shall describe any problems encountered during implementation and discuss the modifications to the program in order to solve these problems.

b. The Principal Permittee shall collect, compile, and analyze information from each Permittee within the watershed prior to preparation of the annual report. The Watershed Management Committee shall include the compiled information and its analysis (instead of raw data or copy of internal reports) in the annual reports.

c. The annual report shall include a summary table illustrating the levels of implementation for all Permittees. Tables shall be developed for each program element listing all the participating Permittees and describing the status of implementation by each Permittee of the element. A table shall also be included to summarize the status of the program elements for which the Watershed Management Committee bears the primary implementation responsibility. Besides summary tables, the report should provide detailed explanation on any modifications made of the program elements (delays, changes, etc.) from the standard provisions and provide an analysis of any problems encountered during the implementation and the proposed solutions.

d. The annual report shall include an assessment of the effectiveness of each program elements using the performance evaluation indicators

and criteria developed under Section A of this Chapter, and the results of the pilot/demonstration projects conducted within and/or outside the watershed. The findings should be presented graphically for ease of comparison with the established levels of effort.

e. A fiscal analysis and budget as described under I.I (Fiscal Resources) of this Order shall be submitted annually within 30 days of the Budget adoption date for each Permittee.

D. Baseline Stormwater Management Plan and Watershed Management Plan Revisions

1. Revisions to provisions of this ~~permit~~ Order can be made through the order of the Regional Board. The EAC can recommend and request revisions to the Stormwater Management Plan through documentation in the annual reports.

2. Recommended revisions shall be supported by the results of a program evaluation. Recommended revisions to the Stormwater Management Plans may be made if it can be demonstrated that 1) the changes will lead to improvement of the effectiveness of this program, 2) the changes will result in positive impacts of environmental conditions, and 3) that the current measures have been implemented to the "Maximum extent practicable" as defined in Section VIII.A. Any recommended revisions shall not take effect unless approved by the Executive Officer.

3. Revisions may be made to the Storm Water Management Plans by the Executive Officer or the Regional Board based upon public input and/or testimony.

IX. MONITORING PROGRAM OUTLINE 01 September 1995
TO BE RE-WRITTEN BASED ON COUNTY'S SETTLEMENT WITH NRDC

I. GENERAL

1. Revisions of the monitoring and reporting program may be necessary to ensure that the discharger is in compliance with requirements and provisions contained in this Order. Revisions may be made by the Executive Officer at any time during the term of this Order, and may include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring, the location of monitoring sites, the number and/or size of samples collected, and/or any other measures necessary to improve the effectiveness of the program.

2. All sample collection, handling, storage, and analyses shall be in accordance with 40 CFR 136.

3. The Permittees may complement their monitoring data with data from other areas provided the characteristics are similar to characteristics in the Los Angeles County Watershed Management Areas.

4. The Permittees shall implement the monitoring programs submitted under NPDES Permit No. CA0061654 between 1992 and 1995 until acceptable watershed monitoring programs are developed and implemented.

II. OBJECTIVES

The overall goal of this monitoring program is to develop and support effective watershed specific storm water quality management programs.

The following are major objectives:

1. To track water quality status, pollutant trends, pollutant loads, and pollutants of concern.

2. To monitor and assess pollutant loads from specific land uses and watershed areas.

3. To identify, monitor, and assess significant water quality problems related to storm water discharges within the watershed.

4. To identify sources of pollutants in storm water runoff to the maximum extent possible (e.g., atmospheric deposition, contaminated sediments, other nonpoint or point sources, etc.).

5. To identify and eliminate illicit discharges.

6. To evaluate the effectiveness of existing management programs, including

scientific estimation of pollutant reductions achieved by structural and nonstructural BMPs.

7. To assess the impacts of storm water runoff on receiving waters. (This may be a coordinated effort among point source dischargers, SCCWRP, etc...)

III. MONITORING PROGRAM REQUIREMENTS

The Permittees shall develop and submit for the approval of the Executive Officer an integrated watershed monitoring program to achieve the above stated objectives. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedule prescribed by the Executive Officer. At a minimum, the program shall include the following:

1. A mechanism for the collection, analysis and interpretation of existing data from monitoring programs within Los Angeles County. These and other data from local, regional or national sources should be utilized to characterize different storm water sources; to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants; to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the watershed management areas in the County of Los Angeles. The Permittees are encouraged to use data from similar studies, if available.

2. Rationale for selection of monitoring locations, parameters, number and frequency, and analytical methods.

3. A description of the monitoring program shall include at a minimum:

   a. The number and location of monitoring stations;

   b. Targeted monitoring indicators (e. g., ecosystem, biological diversity, in stream toxicity, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;

   c. Parameters selected for field screening and for laboratory work and their detection limits;

   d. Total number of samples for statistical significance to be collected from each station, receiving water and major outfall monitoring, frequency of sampling during dry weather and short or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment;

   e. Uniform guidelines for quality control, quality assurance, data

collection and data analyses; and

f. Data storage and transfer format, accessibility, etc...

4. A method for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including cost sharing.

6. A description of computer software and ~~modelling~~modeling programs that will be utilized to assess data, interpret information, etc...

7. A description of how data will be utilized for feedback into the storm water management program.

The ~~Discharger~~Permittees shall comply with the attached Monitoring and Reporting Program, which is part of this Order, and any revisions or modifications thereto, as ordered by the Executive Officer.

It is anticipated that the initial storm water management program, as delineated in the Plan and/or implementation agreement, may need to be modified, revised, or amended from time-to-time to respond to changed conditions and to incorporate more effective approaches to pollutant control. Minor changes may be made at the direction of the Executive Officer. Minor changes requested by the ~~Discharger~~Permittees shall become effective upon written approval of the Executive Officer. If proposed changes imply a major revision in the overall scope of effort of the program, such changes must be approved by the Regional Board as permit amendments.

This Order may be modified, revoked, or reissued, prior to the expiration date as follows:

a. To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;

b. To incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable; or

d. Any other Federal or State Laws or Regulations become effective which necessitate changes.

The issuance of this permit is not intended to, and does not, absolve the ~~Discharger~~Permittees of liability for conduct which may have constituted a violation of the previous Board Order 90-079 (CA0061654, CI 6948) adopted by this Regional Board on June 18, 1990.

This Order expires on _____. The ~~Discharger~~Permittees must submit a complete Report of Waste Discharge including a revised Storm Water Management Plan in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on December __, 1995.

ROBERT P. GHIRELLI, D.Env.

Executive Officer

Re: Comments on Draft NPDES Permit (NPDES No. CAS0051654)
Draft of (September 15, 1995)

Dear Ms. Tyrrell:

The City of Manhattan Beach is concerned that the September 15, 1995 RWQCB draft NPDES Permit has numerous provisions not required by the federal Clean Water Act or any other law. In addition, it appears that some provisions required by the EPA for stormwater permits are missing. For these reasons, we ask that another draft be circulated for comment. The new draft should clearly identify the specific section of the Clean Water Act, or implementing regulations, which provides the basis for each requirement proposed to be included in this permit. Only then can an informed judgment be made as to the appropriateness of inclusion of permit provisions.

The City has reviewed a proposed *"Substitute Draft" Permit, which provides revisions to be made to the draft.* We adopt the comments in the "Substitute Draft" as our own.

In view of the length and complexity of the draft NPDES permit, we ask that written responses be prepared to these comments and that the comment period be extended for an additional 30 days following the release of your responses.

Thank you for your anticipated cooperation.

Sincerely,

Neil Miller

INTRODUCTORY NOTE TO "SUBSTITUTE DRAFT" VERSION OF DRAFT ORDER

The September 15, 1995, RWQCB draft is replete with provisions not required by the federal Clean Water Act or any other law. In addition, it appears that some provisions required by the EPA for stormwater permits are missing. For these reasons, the next "official draft" circulated for comment should clearly identify the specific section of the Clean Water Act, or other law, which provides the basis for a requirement proposed to be included in this permit. Only then can an informed judgement be made as to the appropriateness of inclusion of permit provisions.

This Substitute Draft provides revisions which should be made to the draft, in order to link the draft to the underlying legal authority, the Clean Water Act, which itself is under consideration for major revisions. For this reason, the term "to the extent required by the Clean Water Act" has been inserted at numerous places throughout this Substitute Draft. Other cleanup provisions are also included.

Italicized text is intended as commentary on the draft, it is not intended to be included in the text.

September 15, 1995

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. 95-XXX

WASTE DISCHARGE REQUIREMENTS
FOR
STORMWATER MANAGEMENT/URBAN RUNOFF DISCHARGES
WITHIN THE COUNTY OF LOS ANGELES

(NPDES NO. CAS0051654)

The California Regional Water Quality Control Board, Los Angeles Region, finds:

(The findings are currently being developed.)

VOL 24

0401

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

VOL 24

September 15, 1995

A. Discharge Prohibitions

(Currently under discussion with the negotiation team.)

[NOTE: Should conform to, but not exceed, prohibitions required by the Clean Water Act.]

B. Receiving Water Limitations

(Currently under discussion with the negotiation team.)

[NOTE: Should conform to, but not exceed, prohibitions required by the Clean Water Act.]

C. Provisions

i. The Dischargers shall comply with Discharge Prohibitions (above), and Receiving Water Limitations (above), through the timely implementation of control measures ~~and other actions~~ as required by the Clean Water Act, to reduce ~~pollutants in the~~ pollutant discharge as proposed in this Order.

I. PROGRAM MANAGEMENT

A. Principal Permits

1. The County of Los Angeles is designated as the Principal Permittee.

2. The Principal Permittee shall, to the extent required by the Clean Water Act:

a. Coordinate permit activities and, by _____, convene and chair the area-wide Executive Advisory Committee and the Watershed Management Committees;

b. Provide personnel and fiscal resources and by _____, develop a Baseline Stormwater Management Plan (Plan) for use in developing a watershed management plan (WMP) for each watershed;

0402

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

[NOTE: It is essential that the findings be drafted in a manner which does not needlessly implicate the County and the Cities with respect to liability asserted against them by the alleged industrial polluters in the case of United States and State of California v. Montrose Chemical Corporation of California, et al., now pending in the U.S. District Court for the Central District of California. This case is a Natural Resources Damages Claim case filed under the federal Comprehensive Environmental Response, Compensation and Liability Act ("CERCLA" or "Superfund") 42 U.S.C. §§ 9601 et seq. The alleged industrial polluter defendants have filed third party against the County, the Cities and the State. Damages could reach into the hundreds of millions of dollars.]

This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit pursuant to Section 402 of the federal Clean Water Act, ~~or~~ and amendments thereto, and shall take effect at the end of ten (10) days from the date of its adoption provided the Regional Administrator, USEPA, has no objections.

IT IS HEREBY ORDERED that the County of Los Angeles and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardens, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Long Beach, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code, and regulations ~~and guidelines~~ adopted thereunder, and the provisions of the Federal Clean Water Act, and regulations ~~and guidelines~~ adopted thereunder, shall comply with the following for the areas under their respective jurisdictions within the drainage area of the County of Los Angeles:

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through text~~ and Additions appear as double underlined text.

c. Provide personnel and fiscal resources for the development of the WMPs;

d. Provide personnel and fiscal resources for the updating and modification of the Plan and the WMPS;

e. Provide technical and administrative support for both the Executive Advisory and Watershed Management Committees;

f. Implement watershed water quality monitoring programs;

g. Provide the personnel and fiscal resources to complete by _____, the annual reports including evaluations of monitoring program data and BMP effectiveness;

h. Coordinate the implementation of stormwater quality management activities of regional significance (this shall mean that the Principal Permittee shall identify BMPs which are ~~applicable for implementation~~ suitable for adoption by Permittees watershed-wide and area-wide), such as public outreach and education, pollution prevention, waste minimization, and other similar actions;

i. Act as liaison between all Permittees and the Regional Board on Permit issues; and

j. Meet all the responsibilities outlined below for a Permittee.

B. Permittees

1. The ~~other~~ cities and agencies *[Note: What Agencies? If Caltrans, specify.]* are designated as Permittees.

2. Each Permittee shall, to the extent required by the Clean Water Act:

a. Participate in the development and amendment of the Baseline Stormwater Management Plan ~~(Plan)~~("Plan") by advising the Principal Permittee with respect to the Plan and by _____, ~~jointly~~ prepare the portion of the watershed specific management ~~plans (WMPS)~~ plan (WMP) applicable to its jurisdiction via their WMC;

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

b. Provide an Implementation Plan describing specific stormwater programs, projects and/or activities which are to be conducted within ~~their~~ its jurisdictional ~~boundaries~~ boundary, including the storm drainage system ~~they own and operate, and which demonstrate compliance with the WMP(S) requirements~~ it owns and operates, in compliance with those portions of the WMP which are required by the Clean Water Act, by _____; and

c. Provide in a timely manner all information needed by the Principal Permittee for completing ~~the~~ annual reports which comply with the requirements of the Clean Water Act.

3. The City ~~Administrator/Public Director~~ Council of each Permittee shall appoint a ~~representative(s)~~ City representative and alternate(s) to the WMC.

~~C.~~ 4. Agency Coordination. Each Permittee shall coordinate implementation of permit requirements and pollution prevention activities among each Permittee's internal departments and agencies (i.e. public works, planning, utilities, water supply, etc...)~~.~~, to the extent required by the Clean Water Act.

~~D~~ C. Executive Advisory Committee ("EAC")

1. The EAC shall consist of ~~a~~ one representative ~~of~~ from the County of Los Angeles, one representative from the City of Los Angeles, ~~a~~ and one representative each from the Malibu Creek, Santa Clara~~,~~ and Dominguez Channel Watershed Management Areas, and two representatives each from ~~each of~~ the San Gabriel River, Los Angeles River~~,~~ and the Ballona Creek Watershed Management Areas.

a. ~~One representative from~~ A member of the EAC shall chair the Watershed Management Committee for that Permittee's main watershed management area.

2. The City Administrator/Public Works Director for the County of Los Angeles and for the City of Los Angeles shall each appoint a representative to the EAC. Other members will be appointed by the WMCs.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

3. The EAC shall, to the extent required by the Clean Water Act, be responsible for:

   a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

   b. Assisting the Principal Permittee in the development of the Baseline Storm Water Management Plan; and

   c. Reviewing the Watershed Management Plans as developed by each Watershed Management Committee and provide direction and guidance on the plans for consideration by the Watershed Management Committees;

   d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

   e. Mediating conflict among the ~~Permittee~~ Permittees; and

   f. Coordinating the implementation of pilot projects to target pollutant sources, evaluate BMT appropriateness, and assess effectiveness.

~~E~~ D. Watershed Management Committee

1. A Watershed Management ~~Committees~~ Committee (WMC) shall consist of a representative of each ~~of the Permittees for that~~ Permittee within a particular watershed management area. ~~Regular~~ All WMC meetings shall be open to attendance by the public.

~~The WMC may hold closed sessions, at its discretion, to discuss permit related issues.~~

2. The Malibu Creek, Santa Clara, and Dominguez Channel WMCs shall each appoint one representative to serve on the EAC and to chair the WMC. The San Gabriel River, Los Angeles River, and the Ballona Creek WMCs shall each appoint two representative to serve on the EAC, one of whom will chair the WMC.

3. The WMC shall, to the extent required by the Clean Water Act, be responsible for:

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

a. Establishing goals and objectives for the watershed;

b. Prioritizing pollution control efforts;

c. Participating in the development of a specific watershed management plan (WMP), based on the Baseline Stormwater Management Plan (Plan);

d. Assessing the effectiveness of, preparing revisions for and making appropriate changes to the Plan and the WMP;

e. Coordinating and facilitating the preparation of the annual reports on Permit activities within the watershed for submittal to the Regional Board -- a draft of the annual report shall be circulated to each Permittee and the Executive Advisory Committee for ~~their review and comments~~ review and comment, and the WMC shall respond to each comment, in writing, prior to submittal to the Regional Board; and

f. Facilitating the implementation of this Order among the Permittees in the watershed.

~~START SPELL CHECK~~

~~F~~ E. Watershed Management Subcommittees

1. Subcommittees ~~will~~ may be established ~~where needed~~, to the extent required by the Clean Water Act, as determined by the WMC and/or the EAC.

2. The Subcommittees will be focused on specific program areas and ~~can~~ to provide more specific ~~oversight~~ advice on the development, implementation, and evaluation of selected program areas.

~~G~~ F. Fiscal Resources

Each Permittee shall submit *[NOTE: TO WHOM?]* an annual budget for its Implementation Plan within 30 days after the budget adoption. The budget shall be summarized and put into a format which identifies the necessary capital and operation and maintenance expenditures necessary to implement the storm water management program. The budget shall provide information such as funding

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

sources, staff resources, equipment, support capabilities, contract services, and cost sharing arrangements for the storm water management programs. Also included shall be a description of any funding shortfalls.

1. Area-Wide Resources - In implementing this Order and the Plan, to the extent required by the Clean Water Act, Permittees may elect to jointly fund a single program for certain BMPS, such as Public Education, that are area-wide in nature. Funding agreements, including budgets and cost per agency, shall be developed.

2. City-Specific Resources - As stated above, each Permittee shall develop an annual budget detailing the cost of implementing Permit-related activities within its jurisdiction.

~~H~~ G. Legal Authority

1. The legal authority that was required of each Permittee under Order No. 90-079, to the extent consistent with the Clean Water Act, shall continue in effect.

2. ~~The Co-Permittees shall exercise their~~ Each Co-Permittee *[NOTE: The terminology should be consistent, make it Permittee or Co-Permittee]* shall exercise its legal authority and require compliance with this Order and tile Plan within its jurisdiction, to the extent consistent with the Clean Water Act.

3. Each Permittee shall certify that it has legal authority to control discharges to and from those portions of the drainage system over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements between permittees with adequate existing legal authority and shall, ~~at a minimum,~~ in an effort to accomplish Items a-f below, within its jurisdiction:

   a. Control the contribution of pollutants to the storm drainage system by storm water discharges ~~associate~~ associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

   b. Prohibit illicit discharges and illicit connections to the storm drainage system and require removal of illicit connections;

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

c. Control the intentional discharge of spills and the dumping or disposal of materials other ~~that~~ than storm water (e.g. industrial and commercial wastes, trash, debris, motor vehicle fluids, green waste, animal wastes, leaves, dirt, or other landscape debris etc.) to the storm drainage system;

d. Control, through interagency or inter-jurisdictional agreements among permittees, the contribution of pollutants from one portion *[NOTE: needs definition. What is meant by "one portion?"]* of the storm drainage system to another;

e. Require compliance with conditions in ordinances, permits, contracts or orders; and

f. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the storm drainage system.

4. Each ~~Permittee's~~ Permittee shall direct its legal counsel ~~shall complete a~~ to review of its existing legal authority to ensure that its existing legal authority complies with the requirements in this Order.

5. Upon its completion of the legal authority review, or within 60 days of permit adoption, (whichever is sooner) each Permittee shall demonstrate that it has adequate legal authority or provide a schedule for obtaining the adequate legal authority. Note: Guidance for demonstrating adequate legal authority is included within the EPA document entitled Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges from Municipal Separate Storm Sewer Systems, (EPA 833-B-92-002, November 1992), Section 3-3, page 3-4.

~~I~~ H. Administrative Review

The administrative review process formalizes the procedure for review and acceptance of reports and documents submitted to the RWQCB under this Permit. In addition, it provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement actions. The RWQCB recognizes that the goal of reducing the level of pollutants in stormwater/urban runoff is best accomplished by cooperation and communication between the RWQCB, the permittee, the co-permittees and the

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

public. The Board further appreciates that cooperation and communication is reduced by enforcement actions and legal suits, which force parties to become defensive and react slowly while wasting scarce local government resources. Los Angeles County is undergoing a severe recession which limits the resources of local governments; to achieve the goal of clean water it is essential to reduce wasteful litigation actions to the greatest extent possible and allow resources to be spent to achieve the goals of this permit. The RWQCB recognizes the following facts: (1) that stormwater programs will vary from jurisdiction to jurisdiction; and (2) that such variation may make it difficult for a permittee to determine whether or not it is in complete conformance with the terms and conditions of this permit; and (3) that the goal of this permit is clean water not lawsuits. Accordingly, for the purposes of this permit, a permittee or co-permittee shall not be in violation of any term or condition of this permit until the following administrative process has been completed:

1. If the Executive Officer ~~finds~~ has reason to believe that a Permittee's stormwater program ~~is~~ may be insufficient to meet the provision of the Permit, the Executive Officer shall send a "Notice of Intent to Meet and Confer (NIMC)" to the Permittee. The NIMC shall include a date by which the Permittee must meet with RWQCB staff. (Failure of the RWQCB to issue a NIMC to any jurisdiction shall constitute evidence that the RWQCB has determined that the jurisdiction in question is in compliance with the terms and conditions of this permit.)

2. Upon receipt of a NIMC, the Permittee shall meet and confer with RWQCB staff to clarify whether the Permittee is in compliance with the permit, and if not, the steps to be taken to ~~completely~~ meet the provisions of this permit. The effect and confer sessions shall be for the purpose of developing additions and enhancements to the jurisdiction's stormwater program, if needed to comply with the legal requirements of the Clean Water Act. The meet and confer period shall conclude with the submittal to and acceptance by the Executive Officer of a written "Stormwater Program Compliance Amendment (SPCA)" which shall include implementation deadlines. The Executive Officer may terminate the meet and confer period after a reasonable period due to a lack of progress on issues and may order submittal of the ~~SPEP~~ SPCA by a specified date. Failure to submit an acceptable SPCA by the specified date shall constitute a violation of the Permit.

3. The Executive Officer will approve or reject the submitted SPCA within a reasonable amount of time. Rejection of a submitted ~~SPEP~~ SPCA by

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text

the Executive Officer shall state the reasons for the failure to approve the SPCA. A Permittee that receives a rejection of an SPCA shall have thirty (30) days to remedy the specified deficiency in the SPCA and receive administrative approval from the Executive Officer of the amended SPCA. Approval of the SPCA by the RWQCB shall be evidence that the RWQCB has determined that the jurisdiction in question is in full compliance with the permit and that there has been no violation of the permit. Rejection of a submitted SPCA by the RWQCB shall state in writing the reasons for the failure to approve the SPCA. A jurisdiction that receives a rejection of a SPCA shall have fifteen (15) days to cure the specified defects in the SPCA and receive administrative approval from the RWQCB of the amended SPCA. Failure to have a SPCA approved by the RWQCB within thirty (30) days from the conclusion of the meet and confer period shall be a violation of the permit.

4. The Permittee shall comply with the terms of the SPCA. The Permittee shall submit reports to the Executive Officer of progress made under the SPCA. The frequency of progress report submittal shall be as prescribed by the Executive Officer. Failure ~~1,0~~ to comply with the terms and conditions of the SPCA shall constitute a violation of the Permit and shall be cause for immediate Administrative Civil Liability as prescribed by the Executive Officer.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as strike-through text and Additions appear as double underlined text.

September 14, 1995

II. ILLICIT DISCHARGES\DISPOSAL

A. Illicit Connections

By _____, the EAC shall develop a consistent program including investigative standard procedures to eliminate illicit connections to the storm drain system.

By _____, each Permittee shall implement a program to identify and eliminate illicit connections to the maximum extent practicable and to the extent required by the Clean Water Act.

1. The program shall, ~~at a minimum~~ to the extent required by the Clean Water Act:

   a. standardize, per EAC guidelines, storm drain inspection procedures, and illicit connection ~~and~~ identification and elimination procedures;

   b. prioritize major problem areas, to include but not be limited to older business areas, and areas with heavy industry such as those listed under subchapter N of 40 CFR Parts 405 - 471

   c. utilize results of field screening activities, and other appropriate information.

   d. contain an industrial/commercial education/outreach component to inform businesses about the problem of illicit discharges/dumping and proper discharge/disposal practices,

   e. schedule inspections of storm drains ~~for inspection~~ for illicit connections within its jurisdiction.

   f. maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

   g. establish enforcement procedures to terminate illicit connections.

B. Illegal Discharges\Disposal

This redlined draft shows the differences between
I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2
Deletions appear as ~~strick-through~~ text and Additions appear as
double underlined text

1. By _____, the EAC shall develop a consistent program including investigative standard procedure, to eliminate illegal discharges/disposal practices to the storm drain system.

2. By _____, the EAC shall develop a standard enforcement procedures, including administrative and judicial, to eliminate illegal discharges/disposal practices.

3. By _____, the EAC shall develop standard procedures for spill response, including a procedure to ensure hat, in a spill response, sewage treated with disinfection agents will not be discharged into the storm drainage system, to the maximum extent practicable. The standard procedures will address investigation, containment, and cleanup activities as appropriate.

4. By _____, each Permittee shall implement a program to identify and eliminate illegal discharges/disposal practices to the ~~maximum extent practicable~~ extent required by the Clean Water Act.

The program shall, ~~at a minimum~~ to the extent required by the Clean Water Act:

a. Identify and prioritize problem areas of illegal disposal where inspection, clean up, and enforcement are necessary to prevent the discharge of contaminants;

b. Maintain a surveillance program to detect illegal discharges and disposal into the street system, including, but not be limited to, street use inspections and inspections of vacant facilities;

c. Establish procedures to educate inspectors, maintenance workers, and other field staff in their jurisdiction to notice illicit dischargers/disposal practices during the course of their daily activities, and report such occurrences;

d. Maintain a standardized record keeping system to document illicit discharges/disposal in their jurisdiction;

e. Establish per EAC guidelines spill response procedures; and

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

f. Establish, per EAC guidelines enforcement procedures to eliminate illegal discharges/disposal practices.

C. Non-Storm Water Discharges

1. Exempted Discharges

(Currently under discussion with the negotiation team.)

2. Conditionally Exempted Discharges

(Currently under discussion with the negotiation team.)

D. Other Prohibited Activities

1. The Permittees shall prohibit any person from:

a. causing or allowing illicit discharges to be made into the storm drain system;

b. establishing, using or maintaining an illicit connection to the storm drain system;

c. littering.

d. disposing of leaves, dirt or other landscape debris into a storm drain; and

e. using any pesticide, fungicide, or herbicide which has either been voluntarily discontinued or prohibited by the USEPA.

f. washing down toxic materials from paved or unpaved areas.

g. washing down impervious surfaces in industrial and/or commercial areas ~~is prohibited~~ unless ~~significantly~~ required ~~to~~ under the Health and Safety ~~Codes~~ Code or other laws.

2. Storage of Materials, Machinery and Equipment

The Permittees shall require:

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

a. that objects, such as motor vehicle parts, containing grease, oil, or other hazardous substances, and unsealed receptacles containing hazardous materials, be stored away *[NOTE: WHAT DOES "AWAY" MEAN]* from areas susceptible to runoff;

b. that machinery or equipment which is to be repaired or maintained in areas susceptible to runoff~~,~~ be placed on a pad of absorbent material, or an equivalent, to contain leaks, spills or small discharges;

c. that owners of commercial/industrial motor vehicle parking lots and structures located in areas susceptible to runoff to be swept to remove debris. *[NOTE: This says that permittees shall require "that owners ... be swept." Illustrates sloppy drafting. Change to:*

> that commercial/industrial motor vehicle parking lots *[NOTE: minimum size?]* and structures located in areas susceptible to runoff be swept to remove debris.

Lots with more than ten (10) parking spaces and all public parking facilities ~~:~~ shall ~~also~~ be vacuum swept, or by equivalent method, to remove chemical ~~residue~~ residues;

d. that all fuel and chemical residue, animal waste, garbage, batteries, or other ~~types of~~ potentially harmful materials which are located in areas susceptible to runoff, be removed immediately *[NOTE: why "immediate" here and not elsewhere? Suggest that "immediate" be deleted.]* and disposed of properly.

e. that hazardous waste be disposed of through the Permittee's hazardous waste program or at any other appropriate disposal site, and not be placed in a trash container for regular trash disposal. *[NOTE: THIS SHOULD BE DELETED AS IT IS REDUNDANT WITH NUMEROUS OTHER LAWS.]*

E. Public Reporting

1. By _____, the EAC shall develop a standard program, for Permittees to implement by _____, to promote, publicize, and facilitate public reporting

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

of illicit discharges and illegal disposal practices that may adversely impact water quality.

2. By _____, EAC shall develop a standard program for the reporting of incidents of a hazardous substance entering the storm drain, where the responsible party is not known, to the Regional Board and State of California Office of Emergency Services (OES) at (800) ___-___ and the Federal Hazardous Response Number at (800) ___-___. *[NOTE: IS THIS INTENDED TO REFER TO THE NATIONAL RESPONSE CENTER? IF SO, THE CORRECT TERM, "National Response Center" SHOULD BE USED.]* The Permittees shall implement this program by _____. *[NOTE: THE CONCEPT OF "REPORTABLE QUANTITY" IS MISSING HERE, BUT IS REQUIRED BY NEARLY ALL OTHER LAWS IMPOSING REPORTING REQUIREMENTS. IT IS SUGGESTED THAT THE OTHER LAWS BE INCORPORATED BY REFERENCE.] [NOTE: what is the purpose of this requirement? Why report incidents where the "responsible party" is not known, but not incidents where the "responsible party" is known?]*

F. Reporting

1. A quarterly summary of illicit connections eliminated shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the investigation; what was being discharged; estimated length of time the practice was on-going; ~~what~~ remedial action ~~was~~ taken; and what happened to the discharger.

2. A quarterly summary of illegal discharge/disposal practices reported through the standardized public reporting system shall be submitted with the Annual Report to the Regional Board. The summary shall include: a brief description of the incident; what was spilled/dumped; quantity; ~~what~~ remedial action was taken; and what happened to the discharger/dumper.

G. Coordination With State Permits

1. The Principal Permittee will be provided an updated list of NPDES Permits on a quarterly basis, through the Regional Board's electronic bulletin board, to verify permitted sources of the existing non-storm water discharges in the storm water drainage system.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

2. The Permittees ~~will work~~ may cooperate with other regulatory agencies ~~and~~ may report to the Regional Board on recommendations to resolve any conflicts which are identified between the provisions of this permit and the requirements of other regulatory agencies. These agencies, include but are not limited to:

a. California Department of Fish and Game
b. California Department of Toxic Substances Control
c. California Coastal Commission
d. United States Environmental Protection Agency
e. California Department of Transportation
f. California Air Resources Board

September 14, 1995

III. PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES

A. Identification of Sources

1. By _____, ~~the Permittees~~ and to the extent required by the Clean Water Act, each Permittee shall develop a database listing industrial/commercial facilities by four digit SIC codes within the Permittee's jurisdiction, which shall be updated annually. The database shall include at a minimum:

   a. Facility owner's name, address, and telephone number;

   b. Site address, telephone number, and contact person;

   c. Closest receiving water and watershed;

   d. Applicable SIC code(s);

      i. For each four digit SIC sector, the Permittees shall identify primary activities that might impact runoff discharges;

      ii. For each four digit SIC sector, the Permittees shall identify primary materials at might impact runoff discharges; and

2. By _____, the EAC shall develop a pollutant source identification program for the control of storm water pollutant discharges from industrial/ commercial facilities. The objective of the source identification program is to gather data on specific and/or interrelated set of pollutant generating activities occurring on very small areas (< 5 acres) of industrial/commercial activity and to provide information for developing and implementing BMPs for specific activities.

B. Prioritization of Sources

1. By _____, ~~the Permittees~~ and to the extent required by the Clean Water Act, each Permittee shall prioritize industrial and commercial facilities, if any, within ~~their~~ its jurisdiction ~~on~~ by their relative potential for ~~the~~ contamination of storm water and urban runoff. The prioritized list shall include

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

a. Categorical List

i. All industries regulated under Phase I of the Federal storm water program (4 CFR 122.26).

ii. All industrial/commercial SIC codes selected by the USEPA for screening under Phase II of the Federal storm water program.

iii. Other business sectors considered by the EAC or the Regional Board conduct industrial/commercial activity with a high potential for storm water contamination (e.g, restaurants).

The categorical list shall be grouped by ~~Permittees and~~ the Permittee. The list shall provide an ~~organized~~ overview of the ~~target~~ facilities based on land use, operation, and activities, ~~could potentially~~ and whether the facilities are likely to contribute significant amounts of pollutants into storm water runoff.

2. By _____, and to the extent required by the Clean Water Act, Permittees shall rank the industrial and commercial facilities, identified as potential pollutant sources of storm water and urban runoff pollutants in ~~III. B.1.a~~ III.B.1.a, in order of priority for oversight of implementation of storm water management measures. *[NOTE: what is meant by the term: "oversight of implementation of storm water management measures?"]*

C. Source Control Measures

1. By, _____, and to the extent required by the Clean Water Act, Permittees shall develop a checklist of specific storm water and urban runoff control measures for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutant; into storm water runoff. The control measures must

a. address multiple pollutant sources

b. initially focus on source control measures such as source minimization, education, good housekeeping, and site design alternatives.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

c. target industrial/source areas and activities with the potential to generate pollutant loadings

2. By _____, and to the extent required by the Clean Water Act, Permittees shall develop a process to ensure implementation of storm water and urban runoff control measures for industrial/commercial facilities identified in III.C.1.

3. By _____, and to the extent required by the Clean Water Act, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for industrial and commercial facilities which have been prioritized as having the potential to contribute significant amounts of pollutants into storm water runoff. The structural control measures must be evaluated as to

a. effectiveness in reducing toxic pollutants and pollutants of concern

b. ease of maintenance

c. current frequency of use

d. feasibility and cost-effectiveness

e. possible methods to ensure implementation if necessary

By _____, the Permittees shall, in addition, describe any studies and pilot projects they intend to conduct to assess the feasibility and effectiveness of specific control measures.

4. By _____, and to the extent required by the Clean Water Act, Permittees shall require the following:

a. The proper disposal of food wastes by restaurants and food wholesalers.

b. Persons owning or operating a gas station, auto repair garage, or similar structure must clean those facilities in a manner that does not result in discharge of pollutants to the storm drain system; and

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text

c. Machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze must be repaired.

5. The EAC may seek coverage under this Order, for industrial facilities listed in III.B.I.a.1 which are owned and operated by Permittees if it,

a. establishes a procedure for notifying the Regional Board of industrial sites owned and operated by Permittees

b. prepares a checklist of industrial BMPs using BAT/BCT criteria for implementation by Permittees at these industrial sites

c. standardizes procedures to ensure implementation of industrial BMPs by Permittees,

d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee industrial facilities

e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each site, and certify compliance with this Order.

~~START SPELL CHECK~~

D. Source Inspection

1. By _____, and to the extent required by the Clean Water Act, Permittees shall submit a schedule for inspection of industrial/commercial facilities in III.B.I.a. for adequacy of storm water pollution prevention measures. The schedule shall include, for a five year period,

a. for municipalities with a population of less than 250,000, all facilities identified in III,B.I.a.1, and all facilities identified in III.B.I.a.2 and III. B.I.a.3,

b. for municipalities with a population of greater than 250,000, all facilities identified in III.E.I.a.1, and, a subset of facilities identified in III.B. I.a.2 and III.B. I.a.3 but not less than ten times the number identified in III.B.I.a.1

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

Industrial/commercial facilities in III.B.I.a.2 and III.B.I.a.3 that are not included in the inspection schedule shall be surveyed by phone, mail-out, or a similar method, as to their conformance with good stormwater quality management measures.

2. By _____, and to the extent required by the Clean Water Act, Permittees shall develop and implement a industrial/commercial facilities inspection program. The inspection program shall include, but is not limited to:

   a. procedures for facility inspections

   b. procedures for industrial/commercial sectors outreach on pollution prevention, waste minimization, and storm water quality management

   c. procedures to ensure corrective action is undertaken by non complying facilities

   d. procedures to follow-up on violations of municipal standards

   e. procedures for enforcement action against non-complying facilities;

   f. an electronic recording system to document the status of facility inspections; and,

   g. appropriate training for program staff.

3. During inspection of group III.B.1.a.1, inspectors shall request to see a copy of the SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may ~~deem it neeessary to~~ report problematic facilities to the Regional Board.

E. Reporting

Each year, ~~the Permittees~~ and to the extent required by the Clean Water Act, each Permittee shall evaluate the results and progress of ~~their~~ its storm water quality management program for industrial/commercial sources, if any. The annual report submitted to the Regional Board ~~shall recommend a strategy~~ may include recommended strategies for the management of storm water from

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

industrial/commercial sources for the following year based upon any or all of the following:

a. priority industrial/commercial sources listing
b. priority on-site inspection
c. phone/mail-out survey inspections
d. priority checklists of stormwater urban runoff control measures
e. evaluations of structural arid treatment control measures
f. special studies and pilot projects needs
g. specific site and activity monitoring needs

The EAC shall make available to the Regional Board the industrial/commercial database developed in III.B.I.a.1 in the appropriate format when so requested.

F. Coordination

The Permittees, to the extent required by the Clean Water Act, shall develop a process for the exchange of information between ~~the~~ Permittees and the Regional Board. Appropriate formats for such reports shall be developed as required.

G. Conflicts with Other Mandates

1. The Permittees ~~will~~ may work with ~~other~~ other regulatory agencies and report to the Regional Board on recommendations to resolve ~~any~~ conflicts ~~which are identified~~, if any, between the provisions of this permit and the requirements of other regulatory agencies.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

September 14, 1995

IV. PROGRAM REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT

A. Regional Policy

1. By _____, the EAC shall develop and adopt a regional policy to promote watershed protection considerations during planning, project review, and permitting of new development and redevelopment, to:

   a. preserve to the extent feasible, and where possible, create or restore areas that provide water quality benefits, such as riparian corridors and wetlands, and promote the design of new development so that it protects the natural integrity of drainage systems and water bodies.

   b. avoid conversions of areas particularly susceptible to erosion or sediment loss and/or establish development guidance that identifies these areas and protects them from erosion and sediment loss. Such areas include steep slopes, highly erodible soils, periods of intense rainfall, and inability to revegetate once disturbed.

   c. require the integration ~~em~~ of storm water quality protection into construction and post-construction activities at all development sites, including the minimization of toxic material use and their careful containment on site.

   d. maintain peak runoff rates at pre-development levels, wherever practicable.

2. By _____, the EAC shall establish minimum requirements consistent with the regional policy for new development and redevelopment, for

   a. site planning practices

   b. construction best management practices

   c. post-construction best management practices

   d. reporting erosion and storm water control strategies

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

e. redevelopment and infill

B. Planning Process

In order to integrate storm water management considerations into new development projects at the time that ~~th(y~~ they are first proposed to jurisdictions, and to support other provisions of this permit:

1. By _____, the EAC shall develop guidance for permittees to use in preparing/reviewing EIRS, and in linking EIR mitigation conditions to local permits approvals.

2. By _____, ~~permittees~~ and to the extent required by the Clean Water Act, Permittees shall adopt and use the guidance in their internal procedures.

3. By _____, the EAC shall develop a model CEQA checklist form that explicitly addresses watershed, water quality, and nonpoint source pollution impacts.

4. By _____, the permittees ~~shall~~ may use the model CEQA checklist for the review of projects within the matters addressed by this Permit. *[NOTE: Cities, not the RWQCB or other author of the "model CEQA Checklist" are responsible for CEQA compliance, and the adequacy of their checklists.]*

5. Whenever a permittee ~~rewrites either of the following mandated general plan elements the~~ amends its general plan's conservation element or ~~the~~ open space element, watershed and stormwater management/urban runoff considerations shall be incorporated, to the extent required by the Clean Water Act.

6. By _____, to the extent required by the Clean Water Act, permittees shall implement a program to encourage developers to maximize pervious areas and storm water infiltration (in areas where the geology and topography allow), minimize directly connected imperious areas, and include justifiable treatment control measures.

7. Permittees, to the extent required by the Clean Water Act, shall require that prior to the submittal of an application for the first planning or

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

building approval for a new development project, an applicant shall submit an Urban Runoff Mitigation Plan.

a. The Urban Runoff Mitigation Plan, to the extent required by the Clean Water Act, shall:

i. Be designed to reduce the runoff volume from the site and the pollutant load contributed by the site through incorporation of design elements and practices that address each of the goals set forth below in subsection (c). (Applicants should refer to the most recent edition of the Construction Best Management Practices Handbook, produced and published by the Storm Water Quality Task Force, for specific guidance on selecting best management practices for reducing pollutants in stormwater discharges from urbanized arias.)

ii. Discuss compliance with the development requirements set forth by Permittee's legal authority; and

iii. Address the following goals in connection with both construction and long term operation of the site:

(a) Maximize, to the extent practicable, the percentage of permeable surfaces in order to allow more percolation of runoff into the ground.

(b) Minimize, to the extent practicable, the amount of runoff directed to impermeable areas to the City's stormwater system.

(c) Maximize, to the extent practicable, stormwater filtration and storage for reuse through the use of sediment traps, cisterns or other means.

(d) Minimize, to the extent practicable, parking lot pollution through the use of porous materials to allow percolation of runoff, through the installation of appropriate treatment controls, or through other means.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

iv. Compliance with an approved Urban Runoff Mitigation Plan shall be a condition of any required planning approval.

v. Failure to comply with an approved Urban Runoff Mitigation Plan after receiving any required planning approval shall be a misdemeanor.

C. Identification of Sources

1. By _____, the EAC shall establish a screening criteria for construction sites to be listed in a database.

2. By _____, to the extent required by the Clean Water Act, the Permittees shall develop a database listing sites of construction activity within each Permittees' jurisdiction which shall be updated quarterly. The database shall include at a minimum:

a. Facility owner's name, address, and telephone number;

b. Site address, telephone number, and contact person;

c. Closest receiving water;

d. Type of construction activity

e. Duration of project with start and end dates

f. Total size of project in acres or square feet.

D. Prioritization of Sources

1. By _____, to the extent required by the Clean Water Act, the Permittees shall prioritize sites of construction activity within their jurisdiction on their relative potential for the contamination of storm water and urban runoff. The categorical list shall include:

a. All construction activity sites regulated under Phase I of the Federal storm water program (40 CFR 122.26).

b. All construction activity with sites greater than the size criteria established by the EAC rut less than five acres in size.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

c. Other construction activity sites considered by the EAC or the Regional Board to have high potential for the contamination of storm water and urban off.

2. By _____, to the extent required by the Clean Water Act, Permittees shall rank the construction activity sites, identified as potential pollutant sources of storm water and urban runoff pollutants in IV.B.1.a, in order of priority for oversight of implementation of storm water management measures.

E. Control Measures

1. By _____, to the extent required by the Clean Water Act, Permittees shall develop a checklist of specific storm water and urban runoff control measures for construction activity sites in IV. B.I.a. The control measures must

a. address multiple pollutant sources

b. initially focus on source control measures such as source minimization, education, good housekeeping, good waste management and good planning.

c. target construction activity source areas and activities with the potential to generate substantial pollutant loadings

2. By_____, to the extent, if any, then required by the Clean Water Act, Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures such as, oil/water separators, infiltration, detention, biofilters, etc., for construction sites in IV.B.I.a. The structural control measures must be evaluated as to:

a. effectiveness in reducing sediment, toxic pollutants and pollutants of concern;

b. ease of maintenance;

c. current frequency of use;

d. feasibility and cost-effectiveness; and

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

e. possible methods to ensure implementation.

By _____, Permittees shall describe any studies and pilot projects that may be conducted to assess e feasibility and effectiveness of specific control measures.

3. By _____, to the extent required by the Clean Water Act, Permittees shall have in place a process to ensure implementation and proper maintenance of storm water and urban runoff control measures for sites associated with construction activity in IV.B.I.a., including

a. use of qualified personnel to design, install, and maintain BMPS.

b. proper maintenance of BMPs incorporated into private developments (e.g., through deed restrictions, covenants, conditions and restrictions (CCR).

c. proper installation and maintenance of post-construction BMPS..

d. prohibition on grading daring the wet season (Oct 15 -Apr 15) except for emergency action unless adequate erosion and sediment control measures are in place and maintained.

4. Permittees, to the extent required by the Clean Water Act, shall require the following for demolition/construction activity:

a. Sediment, construction waste and other pollutants from construction sites and parking areas shall be retained on the site to the maximum extent practicable.

b. Any sediments or other materials which are not retained on the site shall be removed within 24 hours or where determined necessary by the Director of Department of Public Works, or a designated representative, a temporary sediment barrier shall be installed.

c. Excavated soil shall be located on the site in a manner that eliminates the amount of sediments running into the street or adjoining properties. Soil piles shall be covered until the soil is either used or removed.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

d. Drainage controls shall be utilized as needed, depending on the extent of proposed grading and topography of the site, including but not limited to the following:

i. Detention ponds, sediment ponds, or infiltration pits.

ii. Dikes, filter beams or ditches.

iii. Downdrains, chutes or flumes.

iv. Silt fences.

e. No washing of construction or other industrial vehicles shall be allowed adjacent to a construction site. No water from washing vehicles on a site is allowed to run off into the City's storm drain system.

f. Roof drainage shall be oriented towards permeable areas on site to maximum extent practicable.

g. Lot drainage shall be oriented towards permeable areas to the maximum extent practicable.

h. All parking lots shall be designed to contain one inch of precipitation in a 24 hour period.

i. Runoff from parking lots shall be directed to permeable areas to the Maximum Extent Practicable.

5. Permittees, to the extent required by the Clean Water Act, shall require the following for construction activity:

a. All construction sites in hillside areas or in areas adjacent to natural water-ways (soft bottom creeks), lakes or the ocean must develop and implement sedimentation and erosion control plans that incorporate the following elements: timing of construction, BMPs to reduce erosion of cleared hillsides (revegetation, jute netting, etc.), BMPs to reduce the velocity of runoff and sediment from the construction site, and BMPs to detain the flow of sediments from the site;

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

b. As a condition of granting a construction permit, set forth reasonable limits on the clearing of vegetation from construction sites, including, but not limited to, regulating the length of time during which soil may be bare, and, in certain sensitive cases, prohibiting bare soil.

6. The EAC may seek coverage under this Order, for construction activity sites listed in III.B.I.(a) 1 which are owned and operated by Permittees if it:

a. establishes a procedure for notifying the Regional Board of construction activity on sites owned or operated by Permittees;

b. prepares a checklist of construction BMPs using BAT/BCT criteria for implementation by Permittees at these construction sites;

c. standardizes procedures to ensure implementation of construction BMPs by Permittees;

d. requires Permittees to prepare and retain site specific Storm Water Pollution Prevention Plans at Permittee construction sites; and

e. establishes a procedure for Permittees to report annually on the effectiveness of Storm Water Pollution Plans at each construction site, and certify compliance with this Order.

F. Source Inspection

1. By _____, to the extent required by the Clean Water Act, Permittees shall submit a schedule for inspection of construction activity sites in IV.B.1.a. for adequacy of storm water pollution prevention measures and erosion control measures. The schedule shall include, for a five year period,

a. all construction activity identified in IV.B.I.a.1, and all construction activity identified in III.B.I.a.2 and III. B.I.a.3,

2. By _____, to the extent required by the Clean Water Act, Permittees shall develop and implement a construction activity inspection program. The inspection program shall include, but is not limited to:

a. procedures for construction site inspections

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

b. procedures for construction and building industry outreach on pollution prevention, waste minimization, and storm water quality management

c. procedures to ensure corrective action is undertaken by non complying sites

d. procedures to follow-up on violations of municipal codes

e. procedures for enforcement action against non-complying construction activity;

f. an electronic recording system to document the status of construction activity inspections; and,

g. appropriate training for program staff.

3. During inspection of group IV.B.I.a.1 sites, inspectors shall request to see a copy of the SWPPP during an inspection. If no SWPPP is available, the Regional Board shall be notified. In addition, the Permittee may deem it necessary to report problematic construction sites to the Regional Board.

G. Reporting

1. Each year, to the extent required by the Clean Water Act, the Permittees shall evaluate the results and progress of their storm water quality management program for construction activity sites. The annual report submitted to the Regional Board shall recommend a strategy for the management of storm water from construction activity sites for the following year based on

a. priority construction site sources listing

b. priority site inspections

c. priority checklists of stormwater urban runoff control measures

d. evaluations of structural and treatment control measures

e. special studies and pilot projects needs

This redlined draft shows the differences between I:\RCYOUNO\PUBL\137989.1 and I:\RCYOUNO\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

f. specific site and activity monitoring needs

2. The EAC shall make available to the Regional Board the construction activity database developed in IV.B.1.a.1 in the appropriate format when so requested.

H. Conflicts with Other Mandates

1. The Permittees ~~shall work~~ may cooperate with ~~other~~ regulatory agencies ~~and report~~ may make recommendations to the Regional Board ~~on recommendations~~ to resolve ~~any~~ conflicts ~~which are identified~~ between the provisions of this permit and the requirements of other regulatory agencies.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

September 14, 1995

V. PUBLIC AGENCY REQUIREMENTS

A. Examination of Existing Activities

By _____, to the extent required by the Clean Water Act, the Permittees shall develop and begin implementation of a program to examine their existing activities and measures described below to reduce the impact on stormwater quality from their operations.

B. Sewage Systems

1. All reasonable efforts shall be undertaken to keep sewage spills or leaks from entering the storm drain system. The EAC shall develop procedures for spill response by _____.

2. Control procedures for identifying, repairing, and remediating sewer blockages, exfiltration, overflow, and wet weather overflows from the sewers to the storm drain system shall be implemented to protect stormwater quality by _____. These procedures shall include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

3. By _____, ~~the Permittees~~ to the extent required by the Clean Water Act, each Permittee shall insure that its field personnel who operate and/or maintain sewer systems have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to ~~properly~~ investigate properly any suspect connections or cross connections to the storm drain system.

C. Vehicle Maintenance/Material Storage Facilities.

1. By _____, EAC will develop pollution prevention plans for each public vehicle maintenance/material storage facility category. Public vehicle maintenance/material storage facilities include any Permittee-owned and/or operated facility in which any of the following occur: vehicle or equipment maintenance; repair; washing; fueling; and/or any facility at which there is storage of toxic chemicals or hazardous materials.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

2. Best Management Practices (BMPS)

a. By _____, to the extent required by the Clean Water Act, Permittees will have site specific pollutant control measures implemented at all vehicle ~~maintenance/material~~ maintenance/material storage facilities per EAC guidelines, together with an on-site pollution prevention plan.

b. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each public vehicle maintenance/material storage facility. To achieve this goal, the Permittees shall first identify the potential pollution sources and who is responsible for implementing the stormwater management measures.

c. Based on ~~the~~ facility type, management practices and schedule of implementation shall be developed by the EAC. BMPs that ~~can~~ could be used to improve the quality of runoff include, but are not limited to:

i. Housekeeping practices;

ii. Material storage control;

iii. Vehicle leak and spill control; and

iv. Illegal dumping control.

d. Loading/Unloading of Materials

i. Employees or contractors of the Permittees who handle potentially harmful materials shall be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to stormwater from outdoor loading/unloading of materials.

ii. Applicable BMPs shall be selected based on the following three factors:

(a) Eliminating exposure of material to rainfall;

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through text~~ and Additions appear as double underlined text.

(b) Checking equipment regularly for leaks; and

(c) Containing spills.

e. Material Storage Control

A program shall be developed to prevent or reduce the discharge of pollutants to stormwater from outdoor container storage areas using measures such as:

i. Installing safeguards against accidental releases;

ii. Secondary containment;

iii. Conducting regular inspections; and

iv. Training employees in standard operating procedures and spill cleanup techniques.

f. Vehicle and Equipment Washing and Maintenance

i. Washing of vehicles or equipment on-site shall be performed in a designated area equipped with an oil/water separator.

ii. The sumps and separators shall be maintained/cleaned on a regularly scheduled basis appropriate to the facility.

iii. BMPs to be implemented as appropriate for vehicle and equipment maintenance shall include but not be limited to:

(a) Waste reduction;

(b) Use of alternate product

(c) Pollution prevention;

(d) Recycling; and

(e) Spill prevention and clean up.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

3. Waste Handling and Disposal

Wastes shall be managed to prevent stormwater pollution.

D. Parks and Recreation

1. Fertilizers/Pesticides

a. Permittees, to the extent required by the Clean Water Act, shall develop procedures on the proper application of pesticides, herbicides, and fertilizers by Procedures shall include:

i. List of approved pesticides and selected use;

ii. Product and application information;

iii. Equipment use an(i maintenance procedures; and

iv. Record keeping.

b. Landscape waste shall not be discharged into the storm drain system.

c. Storage areas for fertilizers and pesticides shall be designed and maintained to reduce exposure to stormwater. The following BMPs shall be utilized where appropriate:

i. Store materials inside or under cover on paved surfaces;

ii. Use secondary containment;

iii. Minimize storage and handling of hazardous materials;

iv. Inspect storage areas regularly.

2. Facility Management

a. Wash waters ~~cannot~~ shall not be discharged into the storm drain system without appropriate treatment.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

b. Landscape maintenance involving the use of pesticides and fertilizers shall ensure the proper use of these materials to minimize loss to storm water.

c. Retention and planting of native vegetation to reduce water, fertilizer, and pesticide needs shall be encouraged.

d. Use of Integrated Pest Management (IPM) shall be encouraged.

e. A schedule for irrigation and fertilization shall be developed by _____, to minimize

i. Chemical application during wet season and no chemical application during storms; and,

ii. Over watering that may lead to runoff that contains nutrients and pesticides.

f. The drainage of commercial/municipal swimming pool water shall ~~only~~ be discharged only under separate Waste Discharge Requirements.

g. Each Permittee shall develop BMPs to minimize trash, debris, and other pollutants from entering Permittee owned recreational water bodies by _____. These measures shall include:

i. Routine trash collection along, on, and/or in, water bodies, where feasible; and

ii. Public outreach to educate the public about impacts of illegal dumping.

E. Storm Drain System Operation and Management

1. Inlet Maintenance

BMPs to be implemented by each Permittee, to the extent required by the Clean Water Act, for effective catch basin cleaning shall include, but not be limited to the following:

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

a. Basins shall be inspected and cleaned between May 1 and October 15 of each year;

b. Between October 15 and April 15, catch basins shall be maintained as necessary.

c. Records shall be kept of the number of catch basins cleaned; and

d. Track the amount of waste collected.

2. Storm Drain Maintenance

a. Material removed from storm drains and catch basins shall be disposed of properly.

b. Trash and debris from open channel storm drains shall be removed at least annually between May 1 and October 15 of each year.

c. Open channels shall also be monitored during the rainy season for any debris buildup and cleaned where needed.

3. Waste Management

The Permittees ~~shall implement a program by _____~~, to the extent required by the Clean Water Act, shall, by _____, implement a to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

4. Dry Weather Storm Drain Diversion

The Permittees, to the extent required by the Clean Water Act, shall investigate the feasibility of diverting dry-weather flows from the storm drain system to POTWs where appropriate. The investigation, to the extent required by the Clean Water Act, shall be completed by _____.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~strick-through~~ text and Additions appear as double underlined text.

F. Streets and Roads

1. Sweeping of curbed streets:

   a. Sweeping of curbed streets shall occur at least monthly.

   b. Where feasible, areas generating excessive refuse shall be swept more frequently.

2. Maintenance

   a. Existing saw-cut management and paving practices conducted by the Permittees shall be evaluated and appropriate control measures developed.

   b. Paving control measures to be considered that would help reduce the impacts to stormwater include, but are not limited to:

      i. Avoid paving during wet weather; and

      ii. Store materials away from drainage courses to prevent pollution of stormwater runoff.

   c. Refuse collected shall be transported to appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations.

   d. Good housekeeping practices shall be implemented to insure proper management of any waste products that may be generated during maintenance activities.

   e. To reduce stormwater pollution from concrete materials and wastes:

      i. Washout of concrete trucks should be conducted off- or on-site in designated areas. ~~Do not wash out~~ Rinseate from concrete trucks shall not be permitted to flow into storm drains, open ditches, streets, or streams;

      ii. Store materials *[NOTE: Please BE SPECIFIC, what materials?]* under cover, away from drainage areas; and

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text

iii. Avoid mixing excess amounts of concrete or cement on-site.

f. Employees shall be trained in the implementation of good housekeeping measures. Training shall:

i. Promote a clear understanding of the potential for maintenance activities to pollute storm water;

ii. Identify solutions (BMPs selection);

G. Flood Control

1. By _____, the Permittees, to the extent required by the Clean Water Act, shall develop and implement procedures to assess the impact(s) of new flood management projects on the quality of receiving water bodies.

2. The Permittees, to the extent required by the Clean Water Act, shall undertake pilot projects/studies to determine the applicability of altered structural flood control system elements to provide pollutant removal in stormwater.

3. ~~During construction~~ To the extent required by the Clean Water Act, appropriate BMPs shall be utilized to control pollutants during construction .

4. Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed, to the extent required by the Clean Water Act, to assure that appropriate management measures are developed to comply with the stormwater regulations.

H. Parking Facilities

By _____, to the extent required by the Clean Water Act, each Permittee shall develop a program to implement periodic hardscape and catch basin cleaning, in order to reduce concentrations of oil, grease, suspended particulates, and metals, as well as the petroleum byproducts.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

September 15, 1995 (To be negotiated)

VI. PUBLIC INFORMATION AND PARTICIPATION

To reach as many Los Angeles County residents as possible, a comprehensive educational outreach approach shall be undertaken under this permit. ~~Each~~ to the extent required by the Clean Water Act. To the extent required by the Clean Water Act, each Permittee shall choose an appropriate combination of outreach tools and activities to raise public awareness of storm water issues and improve water quality.

Outreach Materials

Outreach programs shall consist of written, audio, and visual materials and, when necessary, translated into appropriate languages or structured for appropriate ages. Permittees, to the extent required by the Clean Water Act, shall incorporate interactive methods of distributing outreach materials and provide for public participation in activities developed under this section.

A. Written Material

1. The Permittees, to the extent required by the Clean Water Act, shall produce a variety of written materials to convey information regarding storm waste management within County watersheds.

2. Written materials shall include, but are not limited to: flyers, brochures, door-hangers, newspaper articles, mail-inserts, and newsletters.

B. Audio Material

1. All Permittees ~~shall singularly or collectively~~, to the extent required by the Clean Water Act, shall individually or jointly utilize radio broadcast public service announcements to convey information regarding storm water management except in areas where public access radio stations are not available.

2. Examples of audio materials include radio advertisements, public service announcements, and informational recordings.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

C. Visual Material

1. All Permittees, to the extent required by the Clean Water Act, shall implement a catch basin labelling program as well as other strategies such as banners, displays and posters to educate the public on the ultimate destination of storm drain system flows.

2. Each Watershed Management Committee shall produce at least one informational video. The video shall be shown on televised public service stations and cable access programs except in areas where cable access programs are not available. Further methods of distribution may include workshops, libraries, etc.

D. Distribution of Materials

Outreach materials shall be made available to the public at appropriate public counters and distributed at public events. Examples include fairs, festivals, public meetings, community events, school assemblies, etc.

General Education Strategy

A. The EAC shall develop and the Permittees shall implement a 5-year urban runoff education strategy. The intent of the strategy shall be to enhance public awareness of the impact of storm water pollution on receiving waters and to discourage improper waste disposal practices. Outreach efforts shall be conducted throughout the watershed. The public shall be made aware of their responsibility for both the problems and solutions to storm water pollution. A watershed-wide program shall be implemented by _____.

Development and implementation of the education strategy shall be based on the four objectives listed below:

1. Promoting clear identification and understanding of the problem, including activities with the potential to pollute storm water;

2. Identifying solutions or applicable measures (Best Management Practices) that can be taken to prevent storm water pollution;

3. Raising public awareness of the problems and solutions; and

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

4. Incorporating solutions back into programs, training and BMP implementation.

B. Efforts shall be made to identify land uses and activities that have a higher potential for storm water/urban runoff pollution by focusing on specific pollutants, disposal practices, materials used, etc, To prevent storm water/urban runoff pollution, outreach materials shall be provided on the appropriate selection and implementation of BMPs accordingly A watershed-wide program shall be developed by _____.

1. Pollutant Specific: The reduction of specific pollutants of concern in a particular watershed shall be addressed in a focused public education and outreach program.

2. Activity-specific: Activity-specific outreach programs shall be developed and implemented throughout watershed. Written, audio, or visual outreach tools should address primary topics:

   a. Identification of activities potentially causing storm water pollution;

   b. Implementation of Best Management Practices to prevent storm water pollution.

   c. Recognizing and reporting occurrences of storm water polluting activities.

   The Permittees shall continue to develop activity-specific outreach programs that inform residents about the problem of illicit discharges and dumping and that promote, publicize, and facilitate public reporting of these activities. The program shall also include continuing operation, maintenance, and promotion of the county-wide reporting hotline.

C. The Permittees shall ~~list pertinent~~ submit to telephone directory publishers, City phone numbers to be listed under the City government directory located in the front section of local area phone books. This shall ~~be updated annually as necessary and shall, at a minimum,~~ include numbers for reporting on clogged catch basin inlets, reporting illegal discharges/dumping and a general informational number for storm water. These phone numbers may be city-specific or area-wide.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

D. All efforts deemed to be reasonable ~~efforts~~ by a permittee to coordinate public outreach efforts shall be undertaken. This may include coordinating with environmental groups and public agencies such as the California Coastal Commission, the Department of Beaches and Harbors, Resource Agencies, etc.

Outreach to Target Audiences

Permittees, to the extent required by the Clean Water Act, shall develop and implement an educational program that stresses pollution prevention for a variety of audiences, including local residents, school-aged children, businesses and public employees whose job functions and dally lives may impact storm water quality. The program may be developed locally or regionally and shall include ~~at a minimum~~, to the extent required by the Clean Water Act:

- Education on the proper use and disposal of pesticides, herbicides and fertilizers;
- Education on the definition of, identification of, and impacts associated with illicit discharges and procedures for reporting.
- Promotion of proper management of ad disposal practices for used oil and hazardous substances.

A. Local Residents

1. Permittees, to the extent required by the Clean Water Act, shall develop a program to educate local residents on types of household hazardous wastes along with proper management and disposal methods. The program shall at a minimum include:

   a. Information on the availability of collection services, such as location and schedule;

   b. Production of public outreach materials that educate residents on source reduction and proper disposal methods for household hazardous wastes; and

   c. Continue to encourage residents to recycle oil, antifreeze, glass, plastics, batteries, etc. and to prevent the improper disposal of such materials to the storm drainage system.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

Educational efforts throughout the watershed should also provide residents with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Management Program. Other local programs shall be advertised as appropriate.

2. Permittees, to the extent required by the Clean Water Act, shall develop and encourage watershed residents to participate in specific storm water outreach programs. Residents shall be informed of and provided with the opportunity to share ideas and comments about the programs. Permittees shall demonstrate that a good faith effort has been made to outreach to different communities within the watershed. The watershed-wide outreach program shall be implemented by _____. This shall at a minimum include:

   a. Where applicable for fire and erosion prevention, mowing shall be encouraged as opposed to disking. An investigation of effectiveness shall be undertaken.

3. Cooperative Public Outreach

   In order to promote public participation, cooperative outreach programs with local residents shall be developed. These cooperative programs should foster awareness and identification of storm water pollution issues among residents in the watershed. Catch basin labelling and other established sign programs are excellent examples of this type of cooperative effort, as are events like the "Storm water Pollution Awareness Week." One possibility for cooperative outreach is an "Adopt-A" program. Residents can "adopt" highways, storm drains, catch basins, streams, etc. to monitor, restore and protect. The purpose of all cooperative outreach programs created is to inform and involve the public in storm water management.

4. Complaint Procedures

   Public comments/complaints shall be requested by the Permittees in order to help gauge the success and effectiveness of storm water programs.

B. K-12 School Children

School children can play an important role in public information and participation programs, as they are generally more easily motivated and any behavior changes

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

they make tend to stay with them through adulthood. School children can also convey storm water pollution prevention messages to other family members. School programs shall include information on storm drain systems, the difference between sewers and storm drains, the importance of preventing storm water pollution, and may also address, illegal discharges/dumping and reporting procedures, source minimization, and general pollution prevention. Written materials (workbooks and coloring books), videos, assemblies, and field trips are examples of effective components of a K-12 educational program.

C. Businesses

A detailed public education and outreach program shall be developed for business operations with greater potential of discharging pollutants into the storm drain system. The program shall include employee training on and the effectiveness of implementing BMPs to reduce nonpoint source pollution. In addition to written, audio, and visual materials, other possible means of focused outreach may include: conducting workshops, mass mailing trade/industry magazines, etc.

D. Public Agencies and Employees

~~Public~~ Appropriate public agency employees shall be trained on storm water management and pollution prevention practices and involve employees on many different levels from program managers to field personnel. Training programs shall include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forums or committees. Materials developed for other audiences may also be used in these public agency employee training programs. Appropriate public agency employees shall be trained in:

1. Emergency spill cleanup procedures.

2. Environmentally sensitive alternative products.

3. Good housekeeping practices.

Permittees shall provide outreach materials to the general public through business license renewal counter,; and/or make efforts to outreach through professional and business associations. Additionally, Permittees should consider producing educational materials for professionals and technicians not employed by public agencies.

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text

VOL 24

Outreach Based on Activity-Type

A. Industrial/Commercial

A watershed-wide, general outreach program shall be set up by the WMC for all industrial and commercial facilities potentially discharging to the storm drain system. Furthermore, the WMC shall provide specific guidance objectives to these facilities regarding storm water program, compliance by _____, and inform and remind all potential commercial and industrial dischargers of their obligations under the storm water program. The Permittees shall also encourage the proper disposal of all materials from industrial and commercial sites.

Prior to the WMC providing specific guidance objectives, subcommittees shall be established, as needed, to develop specific outreach materials for industrial/commercial categories and specific "high priority" activities. This shall include at a minimum: metal ~~platers~~ platters, restaurants, vehicle related facilities, etc...

B. Construction

The Permittees, to the extent required by the Clean Water Act, shall ensure that contractors properly install all necessary post construction, permanent BMPs during initial construction and that any necessary maintenance needed during construction is performed. There shall be specific programs outlining correct practices.

In an effort to prevent concrete waste from entering the storm drain system, contractors shall observe the following guidelines:

1. Washout of concrete trucks should be conducted off-site or on-site in a designated area;

2. Excess concrete should not be dumped on site; and

3. Employees and subcontractors should be trained in proper concrete waste management.

Evaluation

The EAC shall develop a process to evaluate the effectiveness of all public outreach programs implemented under this permit. Surveys and focus groups are examples of

0448

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2 Deletions appear as struck-through text and Additions appear as double underlined text.

methods that can be used to gauge a program's effectiveness. They can also be used to provide insight into the program's direction and to help formulate attainable goals. Results of any evaluation method used shall indicate the community's level of awareness of storm water pollution. A watershed-wide program shall be implemented by _____.

double underlined text.

August 25, 1995 (To be negotiated)

VIII. PROGRAM EVALUATION AND REPORTING

The program may be modified subject to comments received under the Annual Review.

A procedure shall be developed and utilized for program evaluation and reporting by the Principal Permittee during the course of this permit. Under this procedure as outlined below, the EAC shall develop action-specific performance indicators and criteria, perform evaluation of compliance and effectiveness based on the performance criteria, establish schedules and mechanism for initial record keeping and reporting, and submit semi-annual and annual reports to the Regional Board using a standardized format.

The EAC, WMC, and/or each Permittee, to the extent required by the Clean Water Act, are responsible for collecting data needed for program evaluation, conducting self-evaluation, and reporting the results of evaluation to the Regional Board. The results reported to the Regional Board shall include both the collected data and analysis of the data. The reports shall include detailed explanation on how the evaluations are conducted, how and why certain provisions of the permits are met or not met, how the effectiveness of certain BMPs is determined or is not, and should a problem arise, how it shall be corrected. The Regional Board will make a compliance determination based on information submitted under this procedure.

A. Demonstration of Compliance

1. Each Permittee, to the extent required by the Clean Water Act, is responsible for demonstrating that the required BMPs as prescribed under this permit, as well as other BMPs included in the Watershed Management Plans, are implemented to the "maximum extent practicable." Each Permittee shall implement the required BMPs to the maximum extent practicable.

2. The Watershed Management Committees are responsible for demonstrating the effectiveness of other BMPs through conducting and reporting the results of pilot/demonstration projects for evaluating the effectiveness of BMPs in the watershed.

3. The degree and the effectiveness of BMP implementation shall be evaluated and reported by the Permittees, to the extent required by the Clean Water Act, using environmental and/or administrative indicators whenever possible. When environmental indicators are not readily and/or

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and L:\RCYOUNG\PUBL\137989.2
Deletions appear as struck-through text and Additions appear as double underlined text

easily available, administrative indicators shall be used. These shall include indicators prescribed under relevant provisions of this permit, and/or other indicators deemed appropriate by the Watershed Management Committee, the Executive Advisory Committee, and/or ultimately the Regional Board. Examples of the quantitative indicators include the number of inspections conducted, number of staff increase, number of audience reached through public education, waste recycled, water conserved, hazardous waste collected, oil recycled, catchbasin waste removed, etc. Quantitative indicators of environmental conditions should also be reported if they can be linked to the effects of the BMP implementation.

4. In order to yield comparable results for year to year evaluation on the success, the progress, and/or the failure in BMP implementation, and comparable results from area to area, a uniform data collection methodology shall be established for each of the required BMPS. The uniform data collection methodology shall be developed by the Executive Advisory Committee. Subsequently, each report on BMP implementation shall provide comparison with the implementation status during the previous reporting period and the scheduled implementation timeline for the current and future reporting periods, based on data collected using the uniform collection methodology.

B. Internal Reporting and Record Keeping

1. In order to facilitate the preparation of semi-annual and annual reports, the EAC shall develop standard forms for internal reporting to be used by all Permittees within the watershed. The forms shall collect all the information essential to the preparation of the annual and semi-annual reports and to the needs of other management actions by the Watershed Management Committees, EAC, and/or the Permittees. Reported information shall be quantifiable, and specific for each program area and/or BMP. The dates for submitting the internal reports shall allow sufficient time for compilation and analysis by the Watershed Management Committees and/or the EAC for the preparation of semi-annual and annual reports to the Regional Board.

2. All records shall be retained by the Permittees for a period of 5 years or longer as required by the Regional Board or USEPA.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

C. Semi-annual and Annual Reports

1. Semi-annual Report

The requirements under VIII.A shall be met by the submittal of semi annual and annual reports. Semi-annual reports shall succinctly summarize compliance efforts and may consist of simple compliance checklists. Annual reports shall be comprehensive.

a. The EAC shall submit a semi-annual progress report to the Regional Board by _____ of each year. Semi-annual reports must be submitted to the Regional Board within 30 days after the end of the six-month period. These six month periods are Jan - June, and July - Dec. (TO BE DETERMINED).

b. The semi-annual report shall serve as a status report on the progress of the implementation of the Stormwater Management Plan and other permit provisions. The Watershed Management Committee is responsible for collecting and compiling information from each Permittee prior to preparation of the semi-annual report, information along with the information analysis into the report.

c. The semi-annual report shall consist of a summary table illustrating the levels of implementation for all requirements by each Permittee. Tables shall be developed for each program element listing the Permittees, describing the status of implementation by each Permittee of the element, and documenting any modifications of the element from the standard program.

2. Annual Report

a. The Executive Committee shall submit an annual report to the Regional Board not more than 60 days after the end of each permit year (_____). The annual report shall include both a summary of the progress and status of Stormwater Management Plan implementation, a summary on status of compliance with all permit provisions, a report on the evaluation of program effectiveness, and a summary of recommendations for permit provision revisions. The Permittees as a whole (within watershed management areas) shall describe any problems encountered during

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as struck-through text and Additions appear as double underlined text.

implementation and discuss the modifications to the program in order to solve these problems.

b. The Principal Permittee shall collect, compile, and analyze information from each Permittee within the watershed prior to preparation of the annual report. The Watershed Management Committee shall include the compiled information and its analysis (instead of raw data or copy of internal reports) in the annual reports.

c. The semi-annual report shall include a summary table illustrating the levels of implementation for all Permittees. Tables shall be developed for each program element listing all the participating Permittees and describing the status of implementation by each Permittee of the element. A table shall also be included to summarize the status of the program elements for which the Watershed Management Committee bears the primary implementation responsibility. Besides summary tables, the report should provide detailed explanation on any modifications made of the program elements (delays, changes, etc.) from the standard provisions and provide an analysis of any problems encountered during the implementation and the proposed solutions.

d. The annual report shall include an assessment of the effectiveness of each program elements using the performance evaluation indicators and criteria developed under Section A of this Chapter, and the results of the pilot/demonstration projects conducted within and/or outside the watershed. The findings should be presented graphically for ease of comparison with the established levels of effort.

e. A fiscal analysis and budget as described under I.1 (Fiscal Resources) of this Order shall be submitted annually within 30 days of the Budget adoption date for each Permittee.

D. Storm Water Management Plan Revisions

1. Revisions to provisions of this permit ~~can~~ may be made through the order of the Regional Board. The EAC ~~can~~ may recommend and request revisions to the Stormwater Management Plan through documentation in the annual reports.

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through text~~ and Additions appear as double underlined text.

2. Recommended revisions shall be supported by the results of a program evaluation. Recommended revisions to the Stormwater Management Plans may be made if it can be demonstrated that 1) the changes will lead to improvement of the effectiveness of this program, 2) the changes will result in positive impacts of environmental conditions, and 3) that the current measures have been implemented to the "Maximum extent practicable" as defined in Section VIII.A. Any recommended revisions shall not take effect unless approved by the Executive Officer.

3. Revisions may be made to the Storm Water Management Plans by the Executive Officer or the Regional Board based upon public input and/or testimony.

The Discharger shall comply with the attached Monitoring and Reporting Program, which is part of this Order, and any revisions or modifications thereto, as ordered by the Executive Officer.

This Order may be modified, revoked, or reissued, prior to the expiration date as follows:

a. To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;

b. To incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain Icy other requirements of the CWA then applicable; or

d. Any other Federal or State Laws or Regulations become effective which necessitate changes.

The issuance of this permit is not intended to, and does not, absolve the Discharger of liability for conduct which may have constituted a violation of the previous Board Order 90-079 (AN, Cl 6948) adopted by this Regional Board on June 18, 1990.

This Order expires on _____. The Discharger must submit a complete Report of Waste Discharge including a revised Storm Water Management Plan in accordance with Title

This redlined draft shows the differences between L:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

23, California Code of Regulations, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on December __, 1995.

ROBERT P. GHIRELLI, D.Env.
Executive Officer

This redlined draft shows the differences between I:\RCYOUNG\PUBL\137989.1 and I:\RCYOUNG\PUBL\137989.2. Deletions appear as ~~struck-through~~ text and Additions appear as double underlined text.

VOL 24

October 12, 1995

Harry W. Stone, Director of Pubiic Works
Attn: Gary Hildebrand
County of Los Angeles
Department of Public Works
Waste Management Division
P.O. Box 1460
Alhambra, CA 91803

RE: Draft NPDES Permit/Comments to EAC

Dear Mr. Stone:

This is in reference to the Los Angeles River Watershed Co-Permittee meeting of September 27, 1995. It was very clear to the City of Monrovia Representative and others at the meeting Catherine Tyrell, Assistant Executive Officer Surface Water Program indicated Permit comments on the September 15, 1995 Draft Permit could be submitted up to October 18, 1995. In the meeting of October 12, 1995, we were presented with a letter from Catherine Tyrrell dated October 12, 1995 indicating that the comments deadline is October 11, 1995. We are therefore submitting the following comments and requesting that they be considered in the next Draft Permit that is scheduled for mail out on October 23, 1995.

It is also our understanding that our comment submittal should be to the EAC. We hereby submit our initial comments on the most recent drafts as follows:

- Dated September 15, 1995 - mailed by the California Regional Water Quality Control Board (RWQCB/Board).
- Dated September 26, 1995 - Mailed by the County Public Works Department on Part III rewrite based on Executive Advisory Committee (EAC) comments of September 25, 1995.
- Dated September 27, 1995 - EAC comments on Draft NPDES Permit mailed September 15, 1995 by RWQCB.

0458

415 South Ivy Avenue Monrovia, California 91016-2888 (818) 359-3231

A. General Comments on Process

1. We understood that the process to be used for writing the new five (5) year Permit for years 1995-2000 was that the RWQCB, the Co-Permittees (through their EAC), and the environmental community were to meet on a regular basis and develop the new Permit at those meetings. Drafts of those versions were then to be circulated to all the individual Co-Permittees and other effected parties for comment.

   The initial draft for the first four (4) sections, dated July 5, 1995, apparently followed that process. Comments were then submitted in writing by individual Co-Permittee and Co-Permittee groups and orally at the July 24, 1995 meeting held at the County Public Works Department's Alhambra Facility.

   We received the next draft dated September 15, 1995 with a transmittal letter from Catherine Tyrrell of the RWQCB indicating that the EAC had approved the draft. Because of the tight schedule we immediately started a review of the September 15, 1995 draft. We subsequently received information that the EAC had not approved that draft. Subsequently we received your memo of September 27, 1995 with the EAC's comments on the September 15, 1995 draft. Without the benefit of EAC input, our time spent on reviewing the earlier September 15, 1995 draft was generally wasted time.

   As a Co-Permittee, we are committed to the process, but we are disturbed by the RWQCB sending out a draft stating that it had been reviewed by the EAC when it had not been so reviewed. We think the process needs to be followed even if the time schedule has to be extended into 1996. Our major concern is that, with the EAC becoming a major player in carrying out the terms of the new Permit for the next five (5) years, will the RWQCB "jump the gun" and go on its own way without involving the EAC in all steps of the process whenever the RWQCB decides to do so? We recommend that the previously agreed upon process be followed hereafter.

2. Ms. Tyrrell announced at the beginning of the September 27, 1995 meeting that extension of the time schedule was under consideration. At the end of the meeting, a three (3) week time period was allowed for comments on the several drafts dated September 15, 1995, September

26, 1995, and September 27, 1995. The City of Monrovia supports an orderly process with sufficient time allowed for all affected parties to respond and resolve their differences. It is better to have the details of a five (5) year Permit worked out before it becomes adopted rather than to force through an incomplete document to meet an apparently unrealistic time schedule, and then have to spend the next five (5) years struggling with the Permit.

We recommend that the original schedule that calls for adoption of the Permit by the RWQCB at their December, 1995 meeting be extended into 1996 to allow adequate time to develop a workable Permit that all parties can agree upon.

3. Because virtually all of the time lines are blanks in the current drafts of the new Permit, a Co-Permittee cannot at this time get an understanding of the amount of time and effort that will have to be put forth to comply. Therefore, at this time it is near to impossible for a Co-Permittee to decide whether or not compliance can be accomplished within their known available resources or whether they will have to find additional resources to comply. While we recognize that inserting specific calendar dates cannot be done as the process deadline may change, there needs to be time periods inserted in the draft tied to the Permit adoption date; i.e. "a certain activity is to be done within six (6) months after adoption of the Permit by the RWQCB". A Co-Permittee can then evaluate and plan now for what will have to been done, rather then find out that a number of actions have to be accomplished in a short period of time following Permit adoption by the Board.

B. Comments on Budgeting/Fiscal Resources

We do not see the reason for a Municipal Co-Permittee to develop a separate budget for its NPDES program to submit to the RWQCB. As long as the City carries out the terms of its Permit, the budget amount is not important. The only result of every Co-Permittee submitting a budget is that other parties will be comparing one Co-Permittee's budget to that of another. If one Co-Permittee is able to spend less money to be in compliance than another Co-Permittee spends, is the current test and goal of every municipality in today's world of "doing more for less". A budget becomes meaningful only if the RWQCB or the Federal Government is going to reimburse the Co-Permittee for its cost.

Since the City of Monrovia budget has already been adopted for Fiscal Years 1995-97 (2 years), the available funding levels have essentially already been established for the next two years. Because of the present economy, with its tight budget times, we do not see much chance of increasing funding levels over the next two years.

In that it appears that neither the Board or the Federal Government will be providing financial assistance in the foreseeable future, we recommend deletion of the section on budgetary and fiscal matters.

C. Comments on Procedural Guidance Manual

It appears from information supplied to date to the Co-Permittees regarding the Procedural Guidance Manual that the Procedural Manual should be a part of the new Permit and the new Permit should not be adopted until the Manual has gone through the same review process as the new Permit. As now planned, the Co-Permittees will not know of the final form of the Manual for some months after the new Permit is in effect. Yet the Procedural Manual is to provide definitions for terms in the Permit (some of which do not currently exist in the new Permit) and to explain in detail what is to be done by a Co-Permittee to be in compliance with the Permit.

We therefore recommend completion and approval of the Manual before the new Permit goes into effect.

D. Administrative Review

To make the Administrative Review process complete a provision needs to be added that states that all determinations made by the RWQCB Executive Officer relative to a Co-Permittee's actions being insufficient be taken to the Regional Board for review if the Co-Permittee so requests. The process to be used by the Board in allowing the Co-Permittee an opportunity to make a presentation and seek redress needs to be defined. As the process is currently outlined, the Executive Officer is the investigator, prosecutor, judge and jury all in one body.

We therefore recommend revision of this section to allow Board review.

E. Board's Electronic Bulletin Board

The RWQCB apparently has the capability to dispense/make available data and to receive data through its electronic board. However, many Co-Permittees may not. Wherever the electronic bulletin board feature is referenced in the new Permit there needs to be a provision added that such written information shall be dispensed to all Co-Permittees by the Board and to the Board from the Co-Permittees by current means available to Co-Permittees such as U.S. Mail or Facsimile equipment.

F. Coordinating with State and Other Agency Permits

The present draft Permit states that the parties will work to resolve conflicts between this new Permit and the regulations/requirements of other local, State, and Federal agencies. This is fine. However, what needs to be inserted in the new Permit is that where regulations/requirements of other entities were established before this new Permit goes into effect, the prior regulations/ requirements take precedent until resolution occurs. This will avoid the situation of the Co-Permittee having to respond to two different sets of rules and regulations.

G. Permit Watershed Splitting

While the present plan for the new Permit appears to split the original Permit into six (6) sub-Permits based along the watershed concept rather than the regional area concept of the present Permit, we believe that there definitely needs to be a set of standard conditions of the watershed sub-Permits and plans that are applicable to all six (6) watersheds and cannot be changed without the concurrence of all watersheds. This is because of the underlying organization of the L.A. County Flood Control District (LACFCD) which covers all six (6) watersheds. Because the LACFCD generates a majority of the revenues used to pay its expenses for NDPES as the principal Co-Permittee and for other purposes by the use of a standard Countrywide uniform benefit schedule of assessments, the Permit requirements imposed on the LACFCD need to be somewhat uniform across all watersheds. To do otherwise may create problems in using the LACFCD's uniform assessment schedule to carry the major cost load of the Permit.

H. Reporting

We are concerned that the reporting requirements of the new Permit appear to be of a punitive and burdensome nature. There needs to be a rather simple

check off type compliance list devised for use in reporting. Any complicated narrative type text reporting process will just create a paper monster which will consume a large share of Co-Permittees' resources and reduce the amount of monies available to actually carry out the NPDES Program.

I. Program Evaluation and Reporting - Page 40

The term "maximum extent practicable" as applicable to BMP's being implemented is not defined. The gauging of the results of doing the BMP's should be the criteria, and not that which is "practicable". A Co-Permittee of reasonable economical resource means may believe that following the common standard of street sweeping once a week is practicable and economically reasonable for the results obtained, whereas a Co-Permittee with significant financial resources may say sweeping twice a week, or every weekday is okay. The results of daily versus weekly sweeping in most residential neighborhoods are very comparable, and more frequent sweeping than once a week generally does not make a material change in street debris removal.

It is our recommendation that most reports should be of the compliance check list type rather than quantative numbers. In some cities, because of the species and size of street trees and the trimming frequency schedule, the leaf removal quantities may be considerable. Whereas in other cities the leaf pickup may be rather nominal. The report should simply be "yes or no, streets swept for leaf and debris removal once a week" rather than "xxx tons of leaves and debris removed by once a week sweeping".

The above are our general comments. Depending on time available we may submit additional specific wordage comments. Once all comments have been received from Co-Permittees and other affected parties and acted upon by the EAC, we request that an updated draft new Permit, including all more recent EAC/Board negotiated terminology and wordage, be distributed for review by all Co-Permittees for a reasonable period of time before it goes to the Board for action.

Sincerely,

Robert C. Bammes

MEMORANDUM

TO: Catherine Tyrell, RWQCB, L.A. Region
Gary Hildebrand, L.A. County

FROM: Gail Ruderman Feuer, Maribel Marin, NRDC

DATE: December 7, 1995

RE: **Thresholds for Triggering the Urban Runoff Mitigation Plan Requirement**

We urge that the threshold for requiring an URMP should be based on parcel size rather than floor area. We propose that the cut-off for requiring an URMP or, more generally, the cut-off for a priority site, be set at 10,000 square feet.

Our rational for going with parcel size as opposed to floor area is basically that in commercial/industrial and multi-family residential, the majority of the parcel is developed with impervious surface so it makes sense to target the lot sizes which have the potential to contribute the highest pollutant loads. Since a 10,000 square foot is probably close to the smallest lot size that could be developed as a mini-mall or fast-food type of use, it seemed like a reasonable place to draw the line. Additionally, we felt that at 10,000 square feet, most mom-and-pop style businesses would fall below the threshold. We feel comfortable with this line based on conversations with city planners.

We absolutely cannot accept the 100,000 square foot or the 40,000 square foot alternatives being proposed. Projects of that size are considered major projects that trigger site plan reviews, environmental review, and traffic studies. They also represent a very small percentage of the projects that get permitted. Too many projects that need storm water controls would be exempted.

As discussed at our meeting, we still feel that the following should be categorically exempt from a written plan requirement and/or subject only to "limited" requirements:

- single-family dwellings;
- duplexes; and
- lot sizes greater than 10,000 square feet if they can demonstrate that impervious area on the parcel is less than 10,000 square feet.

Re: Response to the EAC's Comments on the September 15, 1995, Draft Permit

In this letter the Natural Resources Defense Council and the Santa Monica BayKeeper set forth our general response to the EAC's comments on the draft Permit, dated September 15, 1995 (hereinafter the "Draft Permit" or the "Permit") which was distributed at the September 27, 1995 public hearing. In that draft, the EAC proposed changes to numerous provisions and deletion of several other provisions. This letter provides our view on some of the EAC recommendations and thereby supplements our general comments dated September 27, 1995 and our specific comments dated October 13, 1995.

I. PROGRAM MANAGEMENT

In section I.H.5., the EAC recommends that the timeframe for demonstrating adequate legal authority be extended from 60 days to 120 days. We believe that a timeframe of 120 days is unnecessarily long considering that the Permittees are being asked either to demonstrate adequate legal authority or submit a "schedule for obtaining the adequate legal authority." We are opposed to this modification because at the end of 120 days a Permittee could presumably provide a one page schedule that extends the time for demonstrating adequate legal authority indefinitely. We feel strongly that if Permittees are given a choice between a demonstration of adequacy or a schedule for demonstrating adequate legal authority that the timeframe be limited at most to 60 days. We would however, support a timeframe of 120 days if the option was narrowed to requiring a demonstration of adequate legal authority.

IV. PROGRAM REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT

With respect to the Urban Runoff Mitigation Plan provisions, the EAC comments that they "can only support this concept (URMPs) for very large projects i.e. 100+ dwelling units or 100,000+ square feet of commercial." NRDC opposes the EAC's proposed size limit because it is too exclusive and diminishes the effectiveness of this provision by limiting the

VOL 24 0545

projects covered to a very small percentage of those proposed in any jurisdiction. For example, in the City of Los Angeles last year, projects of the recommended size limit numbered less than 20 out of hundreds of projects proposed. We believe that this provision is workable as proposed in the September 15, 1995 draft. In fact, the measures dictated in the URMP provisions are already being put into practice by the Cities of Hermosa Beach, El Segundo, and Beverly Hills with no project size limits.

The EAC proposes to modify section IV.E.4.c. to require only the "minimization" of sediment running into the street from construction sites instead of the "elimination" initially required. Similarly, the EAC proposes to modify section IV.E.4.e. to allow vehicle wash water to run off of construction sites if "treated to remove sediments and pollutants." These provisions imply some allowances which conflict with section A.'s Discharge Prohibitions prohibiting the discharge of non-storm water and section II.C.2.'s Conditionally Exempted Discharges (since they are not on the list of exempted discharges). It is inconsistent to allow "some sediment" and "some wash water" to flow into storm drains because it then becomes difficult to draw a clear line against prohibited materials.

VI. PUBLIC INFORMATION AND PARTICIPATION

Under the **Outreach to Target Audiences** component, the EAC recommends eliminating the minimum tasks identified. These include: education on the proper use/disposal of pesticides, herbicides, and fertilizers; education on illicit discharges and reporting procedures; and promotion of proper management and disposal of used oil and other hazardous substances. We believe that these items are critical and necessary components to any storm water education program and oppose their elimination from this provision.

Under **Outreach Based on Activity-Type**, the EAC proposes deleting section B., Construction, requiring Permittees to "ensure that contractors properly install [and maintain] all necessary post-construction, permanent BMPs during initial construction." This provision further mandated activities to prevent concrete waste from entering the storm drain system by requiring contractors to observe several guidelines. These guidelines required that contractors conduct the washing of concrete trucks off-site or on-site in designated areas, that they abide by the prohibition against excess concrete being dumped on site, and that they train employees and subcontractors on proper concrete waste management. We recommend that this section be placed in section IV., Program Requirements for New Development and Redevelopment under a separate Construction heading (as we recommended earlier in our 10/13/95 comments). However, we also suggest that for purposes of outreach, a "construction sites" brochure be developed listing all guidelines for construction BMPs and describing all of the pertinent construction site inspection and enforcement provisions of the Permittee's program.

Thank you for the opportunity to provide our response to the EAC's comments on the September 15, 1995 draft. If you have any question regarding our comments, please call us.

Sincerely,

Maribel Marin

Re: Comments on the September 15, 1995, Draft Permit

In this letter the Natural Resources Defense Council and the Santa Monica BayKeeper set forth our specific comments on the draft Permit, dated September 15, 1995 (hereinafter the "Draft Permit" or the "Permit"). As we stated in that letter, we appreciate the effort the Permit negotiating committee and the Regional Board have put into this draft of the Permit. This letter supplements our more general comments dated September 27, 1995.

I. PROGRAM MANAGEMENT

Sections A and B -- Principal Permittee; Permittees

This draft requires the Principal Permittee to develop a "Baseline Storm Water Management Plan." The Permit, however, does not specify what this plan should contain. Neither is any definition given to what "Watershed Specific Management Plans" ("WMPs") should contain.

We propose that the Permit contain an outline of the elements that should be included in the Baseline Storm Water Management Plan, the WMPs, and other plans and programs containing BMPs. The Permit also needs to make clear that an evaluation of the technical feasibility and cost/benefit of each potential BMP should be performed under the Maximum Extent Practicable ("MEP") standard. This standard should be defined in clear terms. NRDC recommends that the Permit incorporate the following language that was included in the Federal Court's final order in the NRDC v. CalTrans case (as adapted for this permit):

> Implementation to the "maximum extent practicable" means that BMPs that are effective at reducing stormwater pollution shall be required to be included in the Baseline Plan, the WMPs, and all other plans and programs containing BMPs, except that BMPs identified through this process do not have to be implemented if it is found that: (1) other effective BMPs will achieve greater or substantially the same pollution control benefits; (2) the BMP would not be technically feasible; or (3) the cost of implementation would greatly outweigh the pollution control benefits. The entity responsible for developing each plan shall have the burden of showing that it

has met the "maximum extent practicable" standard in proposing or rejecting BMPs for implementation.

Section E -- Watershed Management Committee

We strongly object to the elimination of the public representative from the Watershed Management Committees ("WMCs") in section I.E. of the Draft Permit. The WMCs will play a major role in development of the WMPs which will be the centerpiece of future storm water activities by the Permittees in each watershed. For example, the "Implementation Plans" that the Permittees are required to develop for their specific storm water control activities are supposed to be developed in compliance with the WMPs.

The goal of the Permit and the Permit process is for the Permittees, environmental groups, and the public generally to work cooperatively in the development of improved basin-wide storm water controls. We believe that the participation by environmental groups in the committee that has helped to draft the Permit has added an important voice in this process. This inclusion of environmental groups and the public should continue. Participation "up front" by the public in development of plans by the WMCs will help create subsequent support for those plans and the Permittees' storm water programs, as well as more successful implementation.

For these reasons, the public should not be shut out of this essential process in development of the WMPs. It is not sufficient that WMC meetings will "generally" be open to the public. All WMC meetings must be open under this State's open meeting laws and good public policy.

Section G -- Fiscal Resources

Sub-section I.G., "Fiscal Resources," no longer contains the essential Permit provision requiring that municipal budgets ensure that there is adequate staff and training to carry out the Permittees' planned storm water management activities. The prior draft provided: "The budgets shall ensure that there is adequate staff/training for storm water management programs."

Absent adequate staffing and training, the Implementation Plans will have no value, and the storm water pollution management goal of the Permit never will be realized.

Section H -- Legal Authority

We urge the Regional Board to include strong legal authority requirements because they are central to adequate storm water control. Our experience has been that the present combination of statutes and ordinances enacted in most municipalities has not been sufficient

to cover all of the necessary elements of storm water regulation. Thus, the general legal authority language in the existing Permit must be strengthened.

We are pleased to note that the Permit has been strengthened by the addition of a number of minimum legal authority requirements that have been added to various sections. However, we continue to have concerns that the new draft Permit does not require either (i) a unifying storm water ordinance or (ii) a single guidance document on legal authority that draws together all legal authority provisions on storm water in one place. As a reference, the cities of Beverly Hills, Hermosa Beach, and El Segundo, in settlement agreements with NRDC, have developed comprehensive stormwater ordinances that provide the requisite legal authority.

A guidance document on legal authority would be simple to develop -- as it would simply recite the various code provisions -- and would serve several important functions. First, it will educate the public and the municipality's staff as to storm water requirements in their jurisdiction. Second, it will make it easier for the Permittees' legal counsel and the Regional Board to evaluate the adequacy of various storm water provisions spread through various government codes.

We are also concerned over the elimination of the provision in the prior draft Permit requiring the use of a checklist for legal authority. This Regional Board-developed checklist was a useful tool both for a Permittee's legal counsel to confirm that a municipality has sufficient legal authority and for the Regional Board to ensure compliance. The checklist should be restored in subsequent drafts, and it should be modified to provide additional detail and to include the legal authority requirements that have been added to this Draft Permit.

Section I.H.3. does not require the adoption of legal authority for the control of storm water discharges from construction sites, an essential element of a municipality's legal authority. Further, this section should require that a Permittee's legal authority include adequate enforcement provisions, including authority for inspections and authorization for imposition of penalties for code violations.

Section I -- Administrative Review

The Administrative Review section is a sound addition to the Permit, particularly in light of the removal of the yearly audit provision. Our understanding of these provisions is that they are intended to provide a process for administrative review by the Regional Board and not to limit the rights of public citizens under the Clean Water Act. Accordingly, the first paragraph of this section should make clear that the proposed administrative process is not intended to modify the citizen review provisions under the Clean Water Act.

In addition, the last sentence of Section I.4. should be revised to read: "Failure to comply with the terms and conditions of the SPCA or to submit an adequate or timely SPCA shall constitute a violation of the Permit and shall be cause for immediate Administrative Civil Liability or a Clean Water Act enforcement action as prescribed by the Executive Officer." (proposed additions underlined).

II. ILLICIT DISCHARGES/DISPOSAL

Sections A and B -- Illicit Connections, Illegal Discharges/Disposal

These sections capably combine flexibility in the development of a program and mandatory minimum requirements. It is essential, however, here -- as in each instance in which a dealine is proposed in the Permit -- that a tight time deadline be placed on the development of the Illicit Connections and Illegal Discharges/Disposal programs by the EAC. In addition, the Permit needs to provide for review and approval by the Regional Board of EAC actions as well as for meaningful public participation. Indeed, public participation is essential here -- and elsewhere where the EAC is given the task of developing the baseline program -- to ensure that adequate programs are developed.

Further, the Permit must require that the baseline programs developed by the EAC, once approved by the Regional Board, establish minimum (and not maximum) requirements for the Permittees. The Permit should make clear that the Permittees are not limited to the minimum program developed by the EAC but, rather, should supplement this program with program elements appropriate for their own jurisdictions.

Section C -- Non-Storm Water Discharges

The exempted or conditionally exempted discharges in section C should specify narrow, if any, exemptions from the discharge requirements.

Section F -- Reporting

This section should also require submittal of a report of the status of inspections and other "investigations" performed pursuant to the Illicit Connections and Illegal Discharges/Disposal programs. By contrast, the Draft Permit's current reporting requirements will provide only a small snapshot of the activities implemented to address illegal connections and illegal disposal (i.e., showing only illicit connections found and illegal discharges or disposal reported).

III. PROGRAM REQUIREMENTS FOR INDUSTRIAL/COMMERCIAL SOURCES

Section III.A.1. from the last draft of the Permit has been removed. This section provided:

> "The Permittees shall develop and implement a program that focuses on the identification and control of storm water pollutant discharges from industrial/commercial facilities within their jurisdiction. This program shall, at a minimum, provide for the inspection of facilities and generally gauge compliance with storm water regulations."

This section provided a useful overview for the sections that followed and required the Permittees to develop an integrated program for dealing with pollution from industrial and commercial sources. We recommend that it be retained. However, it should be moved above the section entitled "Identification of Sources," and inserted in a section that requires development of an overall integrated program for controlling pollution from these sources.

Section A -- Identification of Sources

This section should require the Permittees to perform inspections or to use a questionnaire process to determine actual facility SIC codes and to determine whether the facility is covered under the State Industrial Storm Water Permit. Accordingly, Section III.A.1. should add the following: (e) Whether the facility is covered by the Industrial Activities Storm Water Permit; and (f) Whether the facility has filed a Notice of Intent to comply with the Industrial Activities Storm Water Permit.

Section C -- Source Control Measures

The prior version of section III.C.1. provided for certain minimum source control programs. The September Draft Permit instead calls for the development of a "checklist." This section should be revised to require development of specific source control measures that industries and commercial facilities must follow. These measures should "include but not be limited to" the measures listed in section III.C.1.b. Once these measures are developed, they should be used in a checklist for inspectors and distributed to the relevant industries and commercial facilities so they can incorporate those practices.

The language of section III.C.2. is too vague and unclear. For example, what does it mean to develop "a process to ensure implementation"? Potentially, this language may allow a permittee to argue that any submittal is a "process" since no standard for an adequate "process" is provided. At a minimum, this provision should specify that the "process" require that the checklist be used to check and verify compliance during field inspections and that enforcement action be taken where necessary to ensure compliance.

This section should also be modified to provide that the process should be designed "to ensure implementation of storm water and urban runoff control measures for industrial/commercial facilities identified in III.C.1. and adequate additional measures where necessary to prevent pollutants from flowing from the facility into storm water runoff (proposed additions are underlined). This addition is necessary because, by necessity, source control measures mandated under section C.1.b. will need to be generally applicable to a category of facilities. Each facility should be required, in addition, to implement any necessary control measures appropriate for its unique operations.

Section C.3. of the the prior draft Permit provided that the Permittee's treatment control programs "shall consider" the enumerated control measures in that section. This mandatory language should be maintained in order to provide sufficient enforceability of this section. Accordingly, we recommend that the language read: "...Permittees shall submit an evaluation of specific structural storm water and urban runoff control measures including but not limited to oil/water separators, infiltration, detention, biofilters, and media filtration for industrial and commercial facilities which have been prioritized ..." (proposed additions underlined). Please note that media filtration was specifically listed in the prior draft.

Section D -- Source Inspections

This section does not provide any guidance as to required frequency of inspections, which guidance had been provided to some degree in the prior draft. We are concerned that requiring only a "schedule for a five year period" is insufficient because this could be interpreted to mean that facilities only have to be inspected every five years regardless of need or priority. We assume this was not the intent of this section. Thus, inspection frequencies should, at minimum, be tied to the prioritization process called for in section III.B.1. (as it was in the May draft Permit).
