DISCLAIMER

This report has been reviewed by the U.S. Environmental Protection Agency and approved for release. Approval to publish does not signify that the contents necessarily reflect any policies or decisions of the U.S. Environmental Protection Agency or any of its offices, grantees, contractors, or subcontractors.

ACKNOWLEDGEMENTS

The Nationwide Urban Runoff Program was unusual in its large scale, covering a broad spectrum of technical and planning issues at many geographic locations. Because the program placed such emphasis on tailoring the results to support the planning process, it involved many participants - some from EPA, some from other federal agencies, and many from state, regional, and local planning agencies and other consultants.

The program was developed, implemented, and managed by the Water Planning Division, Office of Water, at EPA Headquarters, Washington, D.C. Principal contributors were: Dennis N. Athayde, Program Manager; and Patrice M. Bubar, Norman A. Whalen, Stuart S. Tuller, and Phillip H. Graham, all of whom served as Project Officers. Additional contributions from EPA personnel came from Rod E. Frederick and Richard P. Healy (Monitoring and Data Support Division), Richard Field (Storm and Combined Sewer Section, EPA Office of Research and Development), and many project staff in the various EPA Regional Offices.

As described elsewhere, much of the field work, water quality analysis, and data analysis was performed by the U.S. Geological Survey (USGS), under a Memorandum of Agreement with EPA. Both District Offices and National Headquarters participated actively. The contributions of Messrs. Ernest Cobb and David Lystrom are especially acknowledged.

Members of the project team which provided essential strategic, technical, and management assistance to the EPA Water Planning Division through a contract with Woodward-Clyde Consultants were: Gail B. Boyd, David Gaboury, Peter Mangarella, and James D. Sartor (Woodward-Clyde Consultants); Eugene D. Driscoll (E. D. Driscoll and Associates); Philip E. Shelley (EG&G Washington Analytical Services Center, Inc.); John L. Mancini (Mancini and DiToro Consultants); Robert E. Pitt (private consultant); Alan Plummer (Alan Plummer and Associates); and James P. Heaney and Wayne C. Huber (University of Florida).

The principal writers of this report were Dennis N. Athayde (EPA), Philip E. Shelley (EG&G Washington Analytical Services Center, Inc.), Eugene D. Driscoll (E. D. Driscoll & Associates), and David Gaboury and Gail B. Boyd (Woodward-Clyde Consultants).

EXECUTIVE SUMMARY

BACKGROUND

The water quality effects of stormwater pollution received little attention prior to 1960. Stormwater concerns were primarily related to drainage problems. As stormwater pollution began to be investigated, the work, reported by EPA and published in professional journals, tended to focus on determining (a) the type and amount of pollutants involved and/or (b) methods to reduce the loads. However, such reports and articles gave limited consideration to either the level of improvement attainable or the need to improve quality of the receiving water body associated with the study. A conclusion common to all such reports was that not enough was known about stormwater, and recommendations for further study and more data were the norm. A tangible result of the uncertain attitude in this area is the fact that stormwater controls for water quality have been implemented in so few places throughout the nation. Thus, there has been a critical need to objectively examine the situation. This need led to the development of the Nationwide Urban Runoff Program (NURP).

The overall goal of NURP was to develop information that would help provide local decision makers, States, EPA, and other interested parties with a rational basis for determining whether or not urban runoff is causing water quality problems and, in the event that it is, for postulating realistic control options and developing water quality management plans, consistent with local needs, that would lead to implementation of least cost solutions. It is also hoped that this information base will be used to help make the best possible policy decision on Federal, State, and local involvement in urban stormwater runoff and its control. Among the many objectives of NURP was the assembly of an appropriate data base and the development of analytical methodologies that would allow us to examine such issues as:

- The quality characteristics of urban runoff, and similarities or differences at different urban locations;
- The extent to which urban runoff is a significant contributor to water quality problems across the nation; and
- The performance characteristics and the overall effectiveness and utility of management practices for the control of pollutant loads from urban runoff.

Water quantity problems are relatively easy to identify and describe. Water quality problems, on the other hand, tend to be more elusive because their definition often involves some subjective considerations, including experiential aspects and expectations of the populace. They are not immediately obvious and are usually less dramatic than, for example, floods. They also

tend to vary markedly with locality and geographic regions within the country. Thus, a methodological approach to the determination of water quality problems is essential if one is to consider the relative role of urban runoff as a contributor. An important finding of the work conducted during NURP was to learn to avoid the following simplistic logic train: (a) water quality problems are caused by pollutants, (b) there are pollutants in urban runoff, therefore, (c) urban runoff causes "problems". The unspoken implication is that a "problem" by definition requires action, and any type of "problem" warrants equally vigorous action. It becomes clear that a more fundamental and more precise definition of a water quality "problem" from urban runoff is necessary. For this purpose, NURP adopted the following three-level definition:

- Impairment or denial of beneficial uses;
- Water quality criterion violation; and
- Local public perception.

The foregoing levels of problem definition provide an essential framework within which to discuss water quality problems associated with urban runoff. However, it is important to understand that when one is dealing at a local level all three elements are typically present. Thus, it is up to the local decision makers, influenced by other levels of support and concern, to carefully weigh each, prior to making a final decision about the existence and extent of a problem and how it is to be defined.

The NURP studies have greatly increased our knowledge of the characteristics of urban runoff, its effects upon designated uses, and of the performance efficiencies of selected control measures. They have also confirmed earlier impressions that some States and local communities have actually begun to develop and implement stormwater management programs incorporating water quality objectives. However, such management initiatives are, at present, scattered and localized. The experience gained from such efforts is both needed and sought after by many other States and localities. Documentation, evaluation, refinement and transfer of management and financing mechanisms/arrangements, of simple and reliable problem assessment methodologies, and of implementation guidance which can be used by planners and officials at the State and local level are urgently needed as is a forum for the sharing of experiences by those already involved, both among themselves and with those who are about to address nonpoint source issues.

CONCLUSIONS

The following summarizes NURP's conclusion relating to its major objectives and is based on the results presented in Chapters 6, 7, and 8 of the report. Conclusions reached by the individual NURP projects are also presented to further support the results of the national level analysis.

URBAN RUNOFF CHARACTERISTICS

General

Field monitoring was conducted to characterize urban runoff flows and pollutant concentrations. This was done for a variety of pollutants at a substantial number of sites distributed throughout the country. The resultant data represent a cross-section of regional climatology, land use types, slopes, and soil conditions and thereby provide a basis for identifying patterns of similarities or differences and testing their significance.

Urban runoff flows and concentrations of contaminants are quite variable. Experience shows that substantial variations occur within a particular event and from one event to the next at a particular site. Due to the high variability of urban runoff, a large number of sites and storm events were monitored, and a statistical approach was used to analyze the data. Procedures are available for characterizing variable data without requiring knowledge of or existence of any underlying probability distribution (nonparametric statistical procedures). However, where a specific type of probability distribution is known to exist, the information content and efficiency of statistical analysis is enhanced. Standard statistical procedures allowed probability distributions or frequency of occurrence to be examined and tested. Since the underlying distributions were determined to be adequately represented by the lognormal distribution, the log (base e) transforms of all urban runoff data were used in developing the statistical characterizations.

The event mean concentration (EMC), defined as the total constituent mass discharge divided by the total runoff volume, was chosen as the primary water quality statistic. Event mean concentrations were based on flow weighted composite samples for each event at each site in the accessible data base. EMCs were chosen as the primary water quality characteristic subjected to detailed analysis, even though it is recognized that mass loading characteristics of urban runoff (e.g., pounds/acre for a specified time interval) is ultimately the relevant factor in many situations. The reason is that, unlike EMCs, mass loadings are very strongly influenced by the amount of precipitation and runoff, and estimates of typical annual mass loads will be biased by the size of monitored storm events. The most reliable basis for characterizing annual or seasonal mass loads is on the basis of EMC and site-specific rainfall/runoff characteristics.

Establishing the fundamental distribution as lognormal and the availability of a sufficiently large population of EMCs to provide reliability to the statistics derived has yielded a number of benefits, including the ability to provide:

- Concise summaries of highly variable data
- Meaningful comparisons of results from different sites, events, etc.
- Statements concerning frequency of occurrence. One can express how often values will be expected to exceed various magnitudes of interest.

- A more useful method of reporting data than the use of ranges; one which is less subject to misinterpretation

- A framework for examining "transferability" of data in a quantitative manner

Conclusions

1. Heavy metals (especially copper, lead and zinc) are by far the most prevalent priority pollutant constituents found in urban runoff. End-of-pipe concentrations exceed EPA ambient water quality criteria and drinking water standards in many instances. Some of the metals are present often enough and in high enough concentrations to be potential threats to beneficial uses.

   All 13 metals on EPA's priority pollutant list were detected in urban runoff samples, and all but three at frequencies of detection greater than 10 percent. Most often detected among the metals were copper, lead, and zinc, all of which were found in at least 91 percent of the samples.

   Metal concentrations in end-of-pipe urban runoff samples (i.e., before dilution by receiving water) exceeded EPA's water quality criteria and drinking water standards numerous times. For example, freshwater acute criteria were exceeded by copper concentrations in 47 percent of the samples and by lead in 23 percent. Freshwater chronic exceedances were common for lead (94 percent), copper (82 percent), zinc (77 percent), and cadmium (48 percent). Regarding human toxicity, the most significant pollutants were lead and nickel, and for human carcinogenesis, arsenic and beryllium. Lead concentrations violated drinking water criteria in 73 percent of the samples.

   It should be stressed that the exceedances noted above do not necessarily imply that an actual violation of standards will exist in the receiving water body in question. Rather, the enumeration of exceedances serves a screening function to identify those heavy metals whose presence in urban runoff warrants high priority for further evaluation.

   Based upon the much more extensive NURP data set for total copper, lead, and zinc, the site median EMC values for the median urban site are: Cu = 34 µg/l, Pb = 144 µg/l, and Zn = 160 µg/l. For the 90th percentile urban site the values are: Cu = 93 µg/l, Pb = 350 µg/l, and Zn = 500 µg/l. These values are suggested to be appropriate for planning level screening analyses where data are not available.

   Some individual NURP project sites (e.g., at DC1, MD1, MH1) found unusually high concentrations of certain heavy metals (especially copper and zinc) in urban runoff. This was attributed by the projects to the effect of acid rain on materials used for gutters, culverts, etc.

2. The organic priority pollutants were detected less frequently and at lower-concentrations than the heavy metals.

Sixty-three of a possible 106 organics were detected in urban runoff samples. The most commonly found organic was the plasticizer bis (2-ethylhexl) phthalate (22 percent), followed by the pesticide α-hexachlorocyclohexane (α-BHC) (20 percent). An additional 11 organic pollutants were reported at frequencies between 10 and 20 percent; 3 pesticides, 3 phenols, 4 polycyclic aromatics, and a single halogenated aliphatic.

Criteria exceedances were less frequently observed among the organics than the heavy metals. One unusually high pentachlorophenol concentration of 115 µg/l resulted in exceedances of the freshwater acute and organoleptic criteria. This observation and one for chlordane also exceeded the freshwater acute criteria. Freshwater chronic criteria exceedances were observed for pentachlorophenol, bis (2-ethylhexyl) phthalate, gamma-BHC, chlordane, and alpha-endosulfan. All other organic exceedances were in the human carcinogen category and were most serious for alpha-hexachlorocyclohexane (alpha-BHC), gamma-hexachlorocyclohexane (gamma-BHC or Lindane), chlordane, phenanthrene, pyrene, and chrysene.

The fact that the NURP priority pollutant monitoring effort was limited to two samples at each site leaves us unable to make many generalizations about those organic pollutants which occurred only rarely. We can speculate that their occurrences tend to be very site specific as opposed to being a generally widespread phenomena, but much more data would be required to conclusively prove this point.

3. Coliform bacteria are present at high levels in urban runoff and can be expected to exceed EPA water quality criteria during and immediately after storm events in many surface waters, even those providing high degrees of dilution.

Fecal coliform counts in urban runoff are typically in the tens to hundreds of thousand per 100 ml during warm weather conditions, with the median for all sites being around 21,000/100 ml. During cold weather, fecal coliform counts are more typically in the 1,000/100 ml range, which is the median for all sites. Thus, violations of fecal coliform standards were reported by a number of NURP projects. High fecal coliform counts may not cause actual use impairments, in some instances, due to the location of the urban runoff discharges relative to swimming areas or shellfish beds and the degree of dilution/dispersal and rate of die off. The same is true of total coliform counts, which were found to exceed EPA water quality criteria in undiluted urban runoff at virtually every site every time it rained.

The substantial seasonal differences noted above do not correspond with comparable variations in urban activities. The NURP analyses as well as current literature suggest that fecal coliform may not be the most appropriate indicator organism for identifying potential health risks when the source is stormwater runoff.

4. Nutrients are generally present in urban runoff, but with a few individual site exceptions, concentrations do not appear to be high in comparison with other possible discharges to receiving water bodies.

NURP data for total phosphorus, soluble phosphorus, total kjeldahl nitrogen, and nitrate plus nitrite as nitrogen were carefully examined. Median site EMC median concentrations in urban runoff were TP = 0.33 mg/l, SP = 0.12 mg/l, TKN = 1.5 mg/l, and NO2+3 - N = 0.68 mg/l. On an annual load basis, comparison with typical monitoring data, literature values, and design objectives for discharges from a well run secondary treatment plant suggests that mean annual nutrient loads from urban runoff are around an order of magnitude less than those from a POTW.

5. Oxygen demanding substances are present in urban runoff at concentrations approximating those in secondary treatment plant discharges. If dissolved oxygen problems are present in receiving waters of interest, consideration of urban runoff controls as well as advanced waste treatment appears to be warranted.

Urban runoff median site EMC median concentrations of 9 mg/l BOD5 and 65 mg/l COD are reflected in the NURP data, with 90th percentile site EMC median values being 15 mg/l BOD5 and 140 mg/l COD. These concentrations suggest that, on an annual load basis, urban runoff is comparable in magnitude to secondary treatment plant discharges.

It can be argued that urban runoff is typically well oxygenated and provides increased stream flow and, hence, in view of relatively long travel times to the critical point, that dissolved oxygen problems attributable solely to urban runoff should not be widespread occurrences. No NURP project specifically identified a low DO condition resulting from urban runoff. Nonetheless, there will be some situations where consideration of urban runoff controls for oxygen demanding substances in an overall water quality management strategy would seem appropriate.

6. Total suspended solids concentrations in urban runoff are fairly high in comparison with treatment plant discharges. Urban runoff control is strongly indicated where water quality problems associated with TSS, including build-up of contaminated sediments, exist.

There are no formal water quality criteria for TSS relating to either human health or aquatic life. The nature of the suspended solids in urban runoff is different from those in treatment plant discharges, being higher in mineral and man-made products (e.g., tire and street surface wear particles) and somewhat lower in organic particulates. Also, the solids in urban runoff are more likely to have other contaminants adsorbed onto them. Thus, they cannot be simply considered as benign, nor do they only pose an aesthetic issue. NURP did not examine the problem of contaminated sediment build-up due to urban runoff, but it undeniably exists, at least at some locations.

The suspended solids in urban runoff can also exert deleterious physical effects by sedimenting over egg deposition sites, smothering juveniles, and altering benthic communities.

On an annual load basis, suspended solids contributions from urban runoff are around an order of magnitude or more greater than those from secondary treatment plants. Control of urban runoff, as opposed to advanced waste treatment, should be considered where TSS-associated water quality problems exist.

7. A summary characterization of urban runoff has been developed and is believed to be appropriate for use in estimating urban runoff pollutant discharges from sites where monitoring data are scant or lacking, at least for planning level purposes.

   As a result of extensive examination, it was concluded that geographic location, land use category (residential, commercial, industrial park, or mixed), or other factors (e.g., slope, population density, precipitation characteristics) appear to be of little utility in consistently explaining overall site-to-site variability in urban runoff EMCs or predicting the characteristics of urban runoff discharges from unmonitored sites. Uncertainty in site urban runoff characteristics caused by high event-to-event variability at most sites eclipsed any site-to-site variability that might have been present. The finding that EMC values are essentially not correlated with storm runoff volumes facilitates the transfer of urban runoff characteristics to unmonitored sites. Although there tend to be exceptions to any generalization, the suggested summary urban runoff characteristics given in Table 6-17 of the report are recommended for planning level purposes as the best estimates, lacking local information to the contrary.

RECEIVING WATER EFFECTS

General

The effects of urban runoff on receiving water quality are highly site-specific. They depend on the type, size, and hydrology of the water body; the urban runoff quantity and quality characteristics; the designated beneficial use; and the concentration levels of the specific pollutants that affect that use.

The conclusions which follow are based on screening analyses performed by NURP, observations and conclusions drawn by individual NURP projects that examined receiving water effects in differing levels of detail and rigor, and NURP's three levels of problem definition. Conclusions are organized on the basis of water body type: rivers and streams, lakes, estuaries and embayments, and groundwater aquifers. Site-specific exceptions should be expected, but the statements presented are believed to provide an accurate perspective on the general tendency of urban runoff to contribute significantly to water quality problems.

Rivers and Streams

1. Frequent exceedances of heavy metals ambient water quality criteria for freshwater aquatic life are produced by urban runoff.

   The Denver NURP project found that in-stream concentrations of copper, lead, zinc, and cadmium exceeded State ambient water quality standards for the South Platte River during essentially all storm events.

NURP screening analyses suggest that frequent exceedances of both EPA 24-hour and maximum water quality criteria for heavy metals should be expected on a relatively general basis.

2. Although a significant number of problem situations could result from heavy metals in urban runoff, levels of freshwater aquatic life use impairment suggested by the magnitude and frequency of ambient criteria exceedances were not observed.

Based upon the magnitude and frequency of freshwater aquatic life ambient criteria exceedances, one would expect to observe impairment of this beneficial use in most streams that receive urban runoff discharges. However, those NURP project studies which examined this issue did not report significant use impairment problems associated with urban runoff.

The Bellevue, Washington NURP project concluded that toxic effects of urban runoff pollutants did not appear to be a significant factor.

The Tampa, Florida NURP project conducted biological studies of the impact of stormwater runoff upon the biological community of the Hillsborough River. They conducted animal bioassay experiments on five sensitive species in two samples of urban runoff from the Arctic Street drainage basin. Thirty-two bioassay experiments were completed including 22 acute tests and 10 chronic tests. Neither sample of stormwater was acutely toxic to test organisms. Long-term chronic experiments were undertaken with two species and resulted in no significant effects attributable to stormwater exposure.

NURP screening analyses suggest that the potential of urban runoff to seriously impair this beneficial use will be strongly influenced by local conditions and the frequency of occurrence of concentration levels which produce toxic effects under the intermittent, short duration exposures typically produced by urban runoff.

While the application of the screening analysis to the Bellevue and Tampa situations supports the absence of a problem situation in these cases, it also suggests that a significant number of problem situations should be expected. Therefore, although not the general, ubiquitous problem situation that criteria exceedances would suggest, there are site-specific situations in which urban runoff could be expected to cause significant impairment of freshwater aquatic life uses.

Because of the inconsistency between criteria exceedances and obeserved use impairments due to urban runoff, adaptation of current ambient quality criteria to better reflect use impacts where pollutant exposures are intermittent and of short duration appears to be a useful area for further investigation.

3. Copper, lead and zinc appear to pose a significant threat to aquatic life uses in some areas of the country. Copper is suggested to be the most significant of the three.

Regional differences in surface water hardness, which has a strong influence on toxicity, in conjunction with regional variations in stream flow

and rainfall result in significant differences in susceptibility to adverse impacts around the nation.

The southern and southeastern regions of the country are the most susceptible to aquatic life effects due to heavy metals, with the northeast also a sensitive area, although somewhat less so.

Copper is the major toxic metal in urban runoff, with lead and zinc also prevalent but a problem in more restricted cases. Copper discharges in urban runoff are, in all but the most favorable cases, a significant threat to aquatic life uses in the southeast and southern regions of the country. In the northeast, problems would be expected only in rather unfavorable conditions (large urban area contribution and high site concentrations). In the remainder of the country (and for the other metals) problems would only be expected under quite unfavorable site conditions. These statements are based on total metal concentrations.

4. Organic priority pollutants in urban runoff do not appear to pose a general threat to freshwater aquatic life.

This conclusion is based on limited data on the frequency with which organics are found in urban runoff discharges and measured end-of-pipe concentrations relative to published toxic criteria. One unusually high pentachlorophenol concentration of 115 µg/l resulted in the only exceedance of the organoleptic criteria. This observation and one for chlordane exceeded the freshwater acute criteria. Freshwater chronic criteria exceedances were observed for pentochlorophenol, bis (2-ethylhexyl) phlhalate, γ-hexachlorocyclohexane (lindane), α-endosulfan, and chlordane.

5. The physical aspects of urban runoff, e.g., erosion and scour, can be a significant cause of habitat disruption and can affect the type of fishery present. However, this area was studied only incidentally by several of the projects under the NURP program and more concentrated study is necessary.

The Metropolitan Washington Council of Governments (MWCOG) NURP project did an analysis of fish diversity in the Seneca Creek Watershed, 20 miles northwest of Washington, D.C. In this study, specific changes in fishery diversity were identified due to urbanization in some of the subwatersheds. Specifically, the number of fish species present are reduced and the types of species present changed dramatically, e.g., environmentally sensitive species were replaced with more tolerant species. For example, the Blacknose Dace replaced the Mottled Sculpin. MWCOG concluded that the changes in fish diversity were due to habitat deterioration caused by the physical aspects of urban runoff.

The Bellevue, Washington NURP project concluded that habitat changes (streambed scour and sedimentation) had a more significant effect than pollutant concentrations, for the changes produced by urbanization.

6. Several projects identified possible problems in the sediments because of the build-up of priority pollutants contributed wholly or in part by urban runoff. However, the NURP studies in this area were few in number

and limited in scope, and the findings must be considered only indicative of the need for further study, particularly as to long-term impacts.

The Denver NURP project found significant quantities of copper, lead, zinc, and cadmium in river sediments. The Denver Regional Council of Governments is concerned that during periods of continuous low flow, lead may reach levels capable of adversely affecting fish.

The Milwaukee NURP project reported the observation of elevated levels of heavy metals, particularly lead, in the sediments of a river receiving urban runoff.

7. Coliform bacteria are present at high levels in urban runoff and can be expected to exceed EPA water quality criteria during and immediately after storm events in most rivers and streams.

Violations of the fecal coliform standard were reported by a number of NURP projects. In some instances, high fecal coliform counts may not cause actual use impairments due to the location of the urban runoff discharge relative to swimming areas and the degree of dilution or dispersal and rate of die off.

Coliform bacteria are generally accepted to be a useful indicator of the possible presence of human pathogens when the source of contamination is sanitary sewage. However, no such relationship has been demonstrated for urban runoff. Therefore, the use of coliforms as an indicator of human health risk when the sole source of contamination is urban runoff, warrants further investigation.

8. Domestic water supply systems with intakes located on streams in close proximity to urban runoff discharges are encouraged to check for priority pollutants which have been detected in urban runoff, particularly those in the organic category.

Sixty-three of a possible 106 organics were detected in urban runoff samples. The most commonly found organic was the plasticizer bis (2-ethylhexl) phthalate (22 percent), followed by the pesticide a-hexachlorocyclohexane (a-BHC) (20 percent). An additional 11 organic pollutants were reported at frequencies between 10 and 20 percent; 3 pesticides, 3 phenols, 4 polycyclic aromatics, and a single halogenated aliphatic.

Lakes

1. Nutrients in urban runoff may accelerate eutrophication problems and severely limit recreational uses, especially in lakes. However, NURP's lake projects indicate that the degree of beneficial use impairment varies widely, as does the significance of the urban runoff component.

The Lake Quinsigamond NURP project in Massachusetts identified eutrophication as a major problem in the lake, with urban runoff being a prime contributor of the critical nutrient phosphorus. Point source discharges

to the lake have been eliminated almost entirely. However, in spite of the abatement of point sources, survey data indicate that the lake has shown little improvement over the abatement period. In particular, the trophic status of the lake has shown no change, i.e., it is still classified as late mesotrophic-early eutrophic. Substantial growth is projected in the basin, and there is concern that Lake Quinsigamond will become more eutrophic. A proposed water quality management plan for the lake includes the objective of reducing urban runoff pollutant loads.

The Lake George NURP project in New York State also identified increasing eutrophication as a potential problem if current development trends continue. Lake George is not classified as eutrophic, but from 1974 to 1978 algae production in the lake increased logarithmically. Lake George is a very long lake, and the limnological differences between the north and south basins provide evidence of human impact. The more developed, southern portion of the lake exhibits lower transparencies, lower hypolimnetic dissolved oxygen concentrations, higher phosphorus and chlorophyll a concentrations, and a trend toward seasonal blooms of blue-green algae. These differences in water quality indicators are associated with higher levels of cultural activities (e.g., increased sources of phosphorus) in the southern portion of the lake's watershed, and continued development will tend to accentuate the differences.

The Lake George NURP project estimated that urban runoff from developed areas currently accounts for only 13.6 percent of the annual phosphorus loadings to Lake George as a whole. In contrast, developed areas contribute 28.9 percent of the annual phosphorus load to the NURP study areas at the south end of the Lake. Since there are no point source discharges, this phosphorus loading is due solely to urban runoff. These data illustrate the significant impact of urbanization on phosphorus loads.

The NURP screening analysis suggests that lakes for which the contributions of urban runoff are significant in relation to other nonpoint sources (even in the absence of point source discharges) are indicated to be highly susceptible to eutrophication and that urban runoff control may be warranted in such situations.

2. Coliform bacteria discharges in urban runoff have a significant negative impact on the recreational uses of lakes.

As was the case with rivers and streams, coliform bacteria in urban runoff can cause violations of criteria for the recreational use of lakes. When unusually high fecal coliform counts are observed, they may be partially attributable to sanitary sewage contamination, in which case significant health risks may be involved.

The Lake Quinsigamond NURP project in Massachusetts found that bacterial pollution was widespread throughout the drainage basin. In all cases where samples were taken, fecal coliforms were in excess of 10,000 counts per 100 ml, with conditions worse in the Belmont street storm drains. This project concluded that the very high fecal coliform counts in their

stormwater are at least partially due to sewage contamination apparently entering the stormwater system throughout the local catchment.

The sources of sewage contamination are leaking septic tanks, infiltration from sanitary sewers into storm sewers, and leakage at manholes. In the northern basin, the high fecal coliform counts are attributed to known sewage contamination sources on Poor Farm Brook. The data from the project suggest that it would be unwise to permit body contact recreation in the northern basin of the lake during or immediately following significant storm events. The project concluded that disinfection at selected storm drains should be considered in the future, especially if the sewage contamination cannot be eliminated.

The Mystic River NURP project in Massachusetts found various areas where fecal coliform counts were extremely high in urban stormwater. Fecal coliform levels of up to one million with an average of 178,000/100 ml were recorded in Sweetwater Brook, a tributary to Mystic River, during wet weather. These high fecal coliform levels were specifically attributed to surcharging in their sanitary sewers, which caused sanitary sewage to overflow into their storm drains via the combined manholes present in this cathcment. Fecal coliform levels above the class B fecal coliform standard of 200 per 100 ml were found in approximately one-third of the samples tested in the upper and lower forebays of the Upper Mystic Lake and occasionally near the lake's outlet. In addition, Sandy Beach, a public swimming area on Upper Mystic Lake, exceeded the State fecal coliform criteria in July of 1982, and warnings that swimming may be hazardous to public health were posted for several days. It is important to note that sewage contamination of surface waters is a major problem in the watershed. The project concluded that urban runoff contributes to the bacteria load during wet weather but, comparatively, is much less significant than the sanitary sources.

Estuaries and Embayments

1. Adverse effects of urban runoff in marine waters will be a highly specific local situation. Though estuaries and embayments were studied to a very limited extent in NURP, they are not believed to be generally threatened by urban runoff, though specific instances where use is impaired or denied can be of significant local and even regional importance. Coliform bacteria present in urban runoff is the primary pollutant of concern, causing direct impacts on shellfish harvesting and beach closures.

The significant impact of urban runoff on shellfish harvesting has been well documented by the Long Island, New York NURP project. In this project, stormwater runoff was identified as the major source of bacterial loading to marine waters and, thus, the indirect cause of the denial of certification by the New York State Department of Conservation for about one-fourth of the shellfishing area. Much of this area is along the south shore, where the annual commercial shellfish harvest is valued at approximately $17.5 million.

The Myrtle Beach, South Carolina NURP project found that stormwater discharges from the City of Myrtle Beach directly onto the beach showed high

bacterial counts for short durations immediately after storm events. In many instances these counts violated EPA water quality criteria for aquatic life and contact recreation. The high bacteria counts, however, were associated with standing pools formed at the end of collectors for brief periods following the cessation of rainfall and before the runoff percolated into the sand. Consequently, the threat to public health was not considered great enough to warrant closure of the beach.

Groundwater Aquifers

1. Groundwater aquifers that receive deliberate recharge of urban runoff do not appear to be imminently threatened by this practice at the two locations where it was investigated.

   Two NURP projects (Long Island and Fresno) are situated over sole source acquifers. They have been practicing recharge with urban runoff for two decades or more at some sites, and extensively investigated the impact of this practice on the quality of their groundwater. They both found that soil processes are efficient in retaining urban runoff pollutants quite close to the land surface, and concluded that no change in the use of recharge basins is warranted.

   Despite the fact that some of these basins have been in service for relatively long periods of time and pollutant breakthrough of the upper soil layers has not occurred, the ability of the soil to continue to retain pollutants is unknown. Further attention to this issue is recommended.

CONTROL EFFECTIVENESS

General

A limited number of techniques for the control of urban runoff quality were evaluated by the NURP program. The set is considerably smaller than previously published lists of potential management practices. Since the control approaches that were investigated were selected at the local level, the choices may be taken as an initial indication of local perceptions regarding practicality and feasibility from the standpoint of implementation.

Conclusions

1. There is a strong preference for detention devices, street sweeping, and recharge devices as reflected by the control measures selected at the local level for detailed investigation. Interest was also shown in grass swales and wetlands.

   Six NURP projects monitored the performance of a total of 14 detention devices. Five separate projects conducted in-depth studies of the effectiveness of street sweeping on the control of urban runoff quality. A total of 17 separate study catchments were involved in this effort. Three NURP projects examined either the potential of recharge devices to reduce discharges of urban runoff to surface waters or the potential of the practice to contaminate groundwaters. A total of 12 separate sites were covered by this effort.

Grass swales were studied by two NURP projects. Two swales in existing residential areas, and one experimental swale constructed to serve a commercial parking lot were studied.

A number of NURP projects indicated interest in wetlands for improving urban runoff quality at early stages of the program. Only one allocated monitoring activity to this control measure, however.

Various other management practices were identified as having local interest by individual NURP projects, but none of them was allocated the necessary resources to be pursued to a point which allowed an evaluation of their ability to control pollution from urban runoff. Management practices in this category included urban housekeeping (e.g., litter programs, catch basin cleaning, pet ordinances) and public information programs.

2. Detention basins are capable of providing very effective removal of pollutants in urban runoff. Both the design concept and the size of the basin in relation to the urban area served have a critical influence on performance capability.

Wet basins (designs which maintain a permanent water pool) have the greatest performance capabilities. Observed pollutant reductions varied from excellent to very poor in the basins which were monitored. However, when basins are adequately sized, particulate removals in excess of 90 percent (TSS, lead) can be obtained. Pollutants with significant soluble fractions in urban runoff show lower reductions; on the order of 65 percent for total P and approximately 50 percent for BOD, COD, TKN, Copper, and Zinc. Results indicate that biological processes which are operative in the permanent pool produce significant reductions (50 percent or more) in soluble nutrients, nitrate and soluble phosphorus. These performance characteristics are indicated by both the NURP analysis results and conclusions reached by individual projects.

Dry basins, (conventional stormwater management basins), which are designed to attenuate peak runoff rates and hence only very briefly detain portions of flow from the larger storms, are indicated by NURP data to be essentially ineffective for reducing pollutant loads.

Dual-purpose basins (conventional dry basins with modified outlet structures which significantly extend detention time) are suggested by limited NURP data to provide effective reductions in urban runoff loads. Performance may approach that of wet ponds; however, the additional processes which reduce soluble nutrient forms do not appear to be operative in these basins. This design concept is particularly promising because it represents a cost effective approach to combining flood control and runoff quality control and because of the potential for converting existing conventional stormwater management ponds.

Approximate costs of wet pond designs are estimated to be in the order of $500 to $1500 per acre of urban area served, for on-site applications serving relatively small urban areas, and about $100 to $250 per acre of urban area for off-site applications serving relatively large urban

areas. The costs reflect present value amounts which include both capital and operating costs. The difference is due to an economy of scale associated with large basin volumes. The range reflects differences in size required to produce particulate removals in the order of 50 percent or 90 percent. Annual costs per acre of urban area served are estimated at $60 to $175, and $10 to $25 respectively.

3. Recharge Devices are capable of providing very effective control of urban runoff pollutant discharges to surface waters. Although continued attention is warranted, present evidence does not indicate that significant groundwater contamination will result from this practice.

Both individual project results and NURP screening analyses indicate that adequately sized recharge devices are capable of providing high levels of reduction in direct discharges of urban runoff to surface waters. The level of performance will depend on both the size of the unit and the soil permeability.

Application will be restricted to areas where conditions are favorable. Soil type, depth to groundwater, land slopes, and proximity of water supply wells will all influence the appropriateness of this control technique.

Surface accumulations which result from the high efficiency of soils to retain pollutants, suggest further attention in applications where dual purpose recharge areas also serve as recreational fields or playground areas.

4. Street sweeping is generally ineffective as a technique for improving the quality of urban runoff.

Five NURP projects evaluated street sweeping as a management practice to control pollutants in urban runoff. Four of these projects concluded that street sweeping was not effective for this purpose. The fifth, which had pronounced wet and dry seasons, believed that sweeping just prior to the rainy season could produce some benefit in terms of reduced pollution in urban runoff.

A large data base on the quality of urban runoff from street sweeping test sites was obtained. At 10 study sites selected for detailed analysis, a total of 381 storm events were monitored under control conditions, and an additional 277 events during periods when street sweeping operations were in effect. Analysis of these data indicated that no significant reductions in pollutant concentrations in urban runoff were produced by street sweeping.

There may be special cases in which street cleaning applied at restricted locations or times of year could provide improvements in urban runoff quality. Some examples that have been suggested, though not demonstrated by the NURP program, include periods following snow melt or leaf fall, or urban neighborhoods where the general level of cleanliness could be significantly improved.

5. Grass swales can provide moderate improvements in urban runoff quality. Design conditions are important. Additional study could significantly enhance the performance capabilities of swales.

Concentration reductions of about 50 percent for heavy metals, and 25 percent for COD, nitrate, and ammonia were observed in one of the swales studied. However the swale was ineffective in reducing concentrations of organic nitrogen, phosphorus, or bacterial species. Two other swales studied failed to demonstrate any quality improvements in the urban runoff passing through them.

Evaluations by the NURP projects involved concluded, however, that this was an attractive control technique whose performance could be improved substantially by application of appropriate design considerations. Additional study to develop such information was recommended.

Design considerations cited included slope, vegetation type and maintenance, control of flow velocity and residence time, and enhancement of infiltration. The latter factor could produce load reductions greater than those inferred from concentration changes and effect reductions in those pollutant species which are not attenuated by flow through the swale.

6. Wetlands are considered to be a promising technique for control of urban runoff quality. However, neither performance characteristics nor design characteristics in relation to performance were developed by NURP.

Although a number of projects indicated interest, only one assigned NURP monitoring activity to a wetland. This was a natural wetland, and flows passing though it were uncontrolled. Results suggest its potential to improve quality, but the investigation was not adequate to associate necessary design factors to performance capability. Additional attention to this control technique would be useful, and should include factors such as the need for maintenance harvesting to prevent constituent recycling.

ISSUES

A number of issues with respect to managing and controlling urban runoff emerge from the conclusions summarized above. In some instances they represent the need for additional data/information or for further study. In others they point to the need for follow-up activity by EPA, State, or local officials to assemble and disseminate what is already known regarding water quality problems caused by urban runoff and solutions.

Sediments

The nature and scope of the potential long-term threat posed by nutrient and toxic pollutant accumulation in the sediments of urban lakes and streams requires further study. A related issue is the safe and environmentally sound disposal of sediments collected in detention basins used to control urban runoff.

Priority Pollutants

NURP clearly demonstrated that many priority pollutants can be found in urban runoff and noted that a serious human health risk could exist when water supply intakes are in close proximity to urban stormwater discharges. However, questions related to the sources, fate, and transport mechanisms of priority pollutants borne by urban runoff and their frequencies of occurrence will require further study.

Rainfall pH Effects

The relationship between pH and heavy metal values in urban runoff has not been established and needs further study. Several NURP projects (mostly in the northeastern states) attributed high heavy metals concentrations in urban runoff to the effects of acid rain. Although it is quite plausible that acid rain increases the level of pollutants in urban runoff and may transform them to more toxic and more easily assimilated forms, further study is required to support this speculation.

Industrial Runoff

No truly industrial sites (as opposed to industrial parks) were included in any of the NURP projects. A very limited body of data suggests, however, that runoff from industrial sites may have significantly higher contaminant levels than runoff from other urban land use sites, and this issue should be investigated further.

Central Business Districts

Data on the characteristics of urban runoff from central business districts are quite limited as opposed to other land use categories investigated by NURP. The data do suggest, however, that some sites may produce pollutant concentrations in runoff that are significantly higher than those from other sites in a given urban area. When combined with their typically high degrees of imperviousness, the pollutant loads from central business districts can be quite high indeed. The opportunities for control in central business districts are quite limited, however. ?? Why ??

Physical Effects

Several projects concluded that the physical impacts of urban runoff upon receiving waters have received too little attention and, in some cases, are more important determinants of beneficial use attainment than chemical pollutants. This contention requires much more detailed documentation.

Synergy

NURP did not evaluate the synergistic effects that might result from pollutant concentrations experienced in stormwater runoff, in association with pH and temperature ranges that occur in the receiving waters. This type of investigation might reveal that control of a specific parameter, such as pH, would adequately reduce an adverse synergistic effect caused by the presence of other pollutants in combination and be the most cost effective solution. Further investigations should include this issue.

Opportunities for Control

Based upon the results of NURP's evaluation of the performance of urban runoff controls, opportunities for significant control of urban runoff quality are much greater for newly developing areas. Institutional considerations and availability of space are the key factors. Guidance on this issue in a form useful to States and urban planning authorities should be prepared and issued.

Wet Weather Water Quality Standards

The NURP experience suggests that EPA should evaluate the possible need to develop "wet weather" standards, criteria, or modifications to ambient criteria to reflect differences in impact due to the intermittent, short duration exposures characteristic of urban runoff and other nonpoint source discharges.

Coliform Bacteria

The appropriateness of using coliform bacteria as indicator organisms for human health risk where the source is exclusively urban runoff warrants further investigation.

Wetlands

The use of wetlands as a control measure is of great interest in many areas, but the necessary information on design performance relationships required before cost effective applications can be considered has not been adequately documented. The environmental impacts of such use upon wetlands is a critical issue which, at present, has been addressed marginally, if at all.

Swales

The use of grass swales was suggested by two NURP projects to represent a very promising control opportunity. However, their performance is very dependent upon design features about which information is lacking. Further work to address this deficiency and appropriate maintenance practices appears warranted.

Illicit Connections

A number of the NURP projects identified what appeared to be illicit connections of sanitary discharges to stormwater sewer systems, resulting in high bacterial counts and dangers to public health. The costs and complications of locating and eliminating such connections may pose a substantial problem in urban areas, but the opportunities for dramatic improvement in the quality of urban stormwater discharges certainly exist where this can be accomplished. Although not emphasized in the NURP effort, other than to assure that the selected monitoring sites were free from sanitary sewage contamination, this BMP is clearly a desirable one to pursue.

Erosion Controls

NURP did not consider conventional erosion control measures because the information base concerning them was considered to be adequate. They are effective, and their use should be encouraged.

Combined Sewer Overflows

In order to address urban runoff from separate storm sewers, NURP avoided any sites where combined sewers existed. However, in view of their relative levels of contamination, priority should be given to control of combined sewer overflows.

Implementation Guidance

The NURP studies have greatly increased our knowledge of the characteristics of urban runoff, its effects upon designated uses, and of the performance efficiencies of selected control measures. They have also confirmed earlier impressions that some States and local communities have actually begun to develop and implement stormwater management programs incorporating water quality objectives. However, such management initiatives are, at present, scattered and localized. The experience gained from such efforts is both needed and sought after by many other States and localities. Documentation, evaluation, refinement and transfer of management and financing mechanisms/ arrangements, of simple and reliable problem assessment methodologies, and of implementation guidance which can be used by planners and officials at the State and local level are urgently needed as is a forum for the sharing of experiences by those already involved, both among themselves and with those who are about to address nonpoint source issues.

APPENDIX
THE NATIONWIDE URBAN RUNOFF PROGRAM

Program Design

NURP was not intended to be a research program, per se, and was not designed as such. Rather, the program was intended to be a support function which would provide information and methodologies for water quality planning efforts. Therefore, wherever possible, the projects selected were ones where the work undertaken would complete the urban runoff elements of formal water quality management plans and the results were likely to be incorporated in future plan updates and lead to implementation of management recommendations. Conduct of the program provided direction and assistance to 28 separate and distinct planning projects, whose locations are shown in Figure 1 and listed in Table 1, but the results will be of value to many other planning efforts. NURP also acted as a clearinghouse and, in that capacity, provided a common communication link to and among the 28 projects.

The NURP effort began with a careful review of what was known about urban runoff mechanisms, problems, and controls, and then built upon this base. The twin objectives of the program were to provide credible information on which Federal, State, and local decision makers could base future urban runoff management decisions and to support both planning and implementation efforts at the 28 project locations.

An early step in implementing the NURP program involved identifying a limited number of locations where intensive data gathering and study could be done. Candidate locations were assessed relative to three basic selection criteria:

- Meeting program objectives;
- Developing implementation plans for those areas; and
- Demonstrating transferability, so that solutions and knowledge gained in the study area could be applied in other areas, without need for intensive, duplicative data gathering efforts.

The program design used for NURP included providing a full range of technical and management assistance to each project as the needs arose. Several forums for the communication of experience and sharing of data were provided through semi-annual meetings involving participants from all projects. The roles and responsibilities of the various State, local, and regional agencies and participating Federal agencies were clearly defined and communicated at the outset. These were reviewed and revised where warranted as the projects progressed.

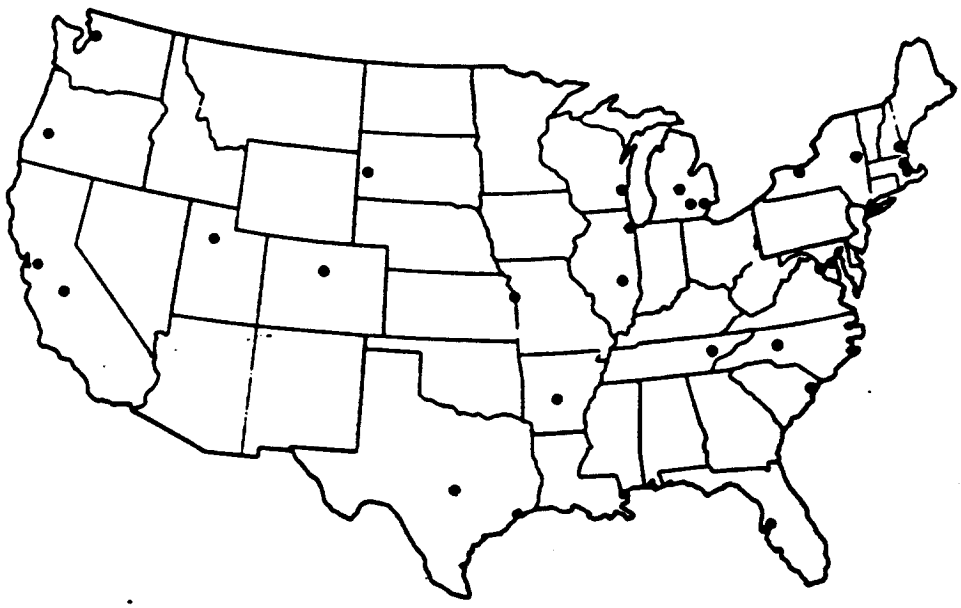

Figure 1. Locations of the 28 NURP Projects

TABLE 1. NURP PROJECT LOCATIONS

EPA Region	NURP Code	Project Name/Location	EPA Region	NURP Code	Project Name/Location
I	MA1	Lake Quinsigamond (Boston Area)	V	IL1	Champaign-Urbana, Illinois
	MA2	Upper Mystic (Boston Area)		IL2	Lake Ellyn (Chicago Area)

	NC1	Winston-Salem, North Carolina	IX	CA1	Coyote Creek (San Francisco Area)
	SC1	Myrtle Beach, South Carolina			
	TN1	Knoxville, Tennessee		CA2	Fresno, California
			X	OR1	Springfield-Eugene, Oregon
				WA1	Bellevue (Seattle Area)

The 28 NURP projects were managed by designated State, county, city, or regional governmental associations. The U.S. Geological Survey (USGS) was involved with EPA as a cooperator, through an inter-agency agreement, on 11 of the NURP projects. The Tennessee Valley Authority was also involved in one project.

Project Selection

Projects were selected from among the 93 Areawide Agencies that had identified urban runoff as one of their significant problems. The intention was to build upon what these agencies had already accomplished in their earlier programs. Also, projects that would be a part of this program were screened to be sure that they represented a broad range of certain characteristics (e.g., hydrologic regimes, land uses, populations, drainage system types). Actual selection of projects was a joint effort among the States, local governments, and Regional EPA offices. The five major criteria used to screen candidate projects were as follows:

1. Problem Identified. Had a problem relative to urban runoff actually been identified? Could that problem be directly related to separate storm sewer discharges? What pollutant or pollutants were thought to be causing the problem? Using the NURP problem identification categories, what was the "problem" (i.e., denying a beneficial use, violating a State water quality standard, or public concern)?

2. Type of Receiving Water. The effects of stormwater runoff on receiving water quality were the NURP program's ultimate concern. Because flowing streams, tidal rivers, estuaries, oceans, impoundments, and lakes all have different hydrologic and water quality responses, the types of receiving waters associated with each candidate project had to be examined to ensure that an appropriately representative mix was included in the overall NURP program.

3. Hydrologic Characteristics. The pattern of rainfall in the study area is perhaps the single most important factor in studying urban runoff phenomena, because it provides the means of conveyance of pollutants from their source to the receiving water. For this reason, projects in locations having different hydrologic regimes were chosen for the program.

4. Urban Characteristics. Characteristics such as population density, age of community, and land use were considered as possible indicators of the waste loads and ultimately the rainfall-runoff water quality relationship. The type of sewerage system was another factor considered (e.g., whether it is combined, separate, or mixed; how severe the infiltration and inflow problems may be). Such factors have different effects on the quantity and quality of storm runoff, and were balanced as well as possible in selecting projects.

5. Beneficial Use of Receiving Water. Because this factor greatly affects the type of control measure that would be appropriate, attempts were made to include a wide range in selecting projects.

Although these were the primary criteria used to identify potential projects, other factors also had to be considered (e.g., the applicant agencies' willingness to participate, the State's acceptance of the project, the experience of the proposed project teams). Because the NURP program used planning grants (not research funds) a major consideration was the anticipated working relationships with local public agencies and the applicants' ability to raise local matching funds.

Program Assistance

Technical expertise and resources available for urban runoff planning varied among the various projects participating in NURP. Therefore, the program strategy called for providing a broad spectrum of technical assistance to each project as needed and for intercommunication of experiences and sharing of data in a timely manner.

Assistance was also provided to the applicants in developing their final work plans. This was done to ensure that there would be consistency among methods, especially in the collection of data. If there were to be differences in data from city to city, they must be due to the characteristics of each city and not a result of how the data were obtained.

Assistance with instrumentation was provided during the program in the form of information on available equipment, installation, calibration, etc. Because one of the more important elements of a data collection program is the "goodness" or quality of the data themselves, questionable data would be of little use. Accordingly, a quality assurance and quality control element was required in the plans for each project.

Periodic visits were made to each project site to ensure that the participants were provided opportunities to discuss any problems, technical or administrative. The visiting team typically included an EPA Regional Office representative, an EPA Headquarters representative, and one or two experienced consultants. All interested parties, including representatives from State or local governments, were requested to attend those visits.

As the projects moved farther into their planned activities and the time for data analysis approached, each project was required to describe how they were going to analyze their data. No single method was recommended for each project, because it was believed that a broad diversity of available methods would be suitable, if used properly. Guidance on proper use was provided as a part of technical assistance through project visits and special workshops for this purpose.

Communication

It was intended that the entire group of NURP participants function as a single team. Accordingly, a communication program was developed. National

meetings were conducted semi-annually so that key personnel from the individual projects would have an opportunity to discuss their experiences and findings.

Reports were required of each project quarterly. EPA Headquarters also provided composite quarterly reports summarizing the status of each project and discussing problems encountered and solutions found.

OUTPUTS TRANSFERABLE TO STATE AND LOCAL GOVERNMENTS

The program has yielded a great deal of information which will be useful for a broad spectrum of planning activities for many years. Furthermore, it has fostered valuable cooperative relationships among planning and regulatory agencies. The most tangible products of the program are this report, the reports of various grantees (available under separate cover), and several technical reports which focus on specialized aspects of the program, its techniques, and its findings. In addition, a considerable number of individual articles drawing on information developed under the NURP program have already appeared in the technical literature and address specific technical or planning aspects of urban runoff.

At the time of publication of this Final Report, the main technical effort of the NURP program is complete; the field studies and the analysis of most of the resultant data are complete enough that the findings reported herein can be taken with confidence. However, there is still some work in progress to make certain details of the program available for future use. The products of this on-going work include:

- A detailed database which has been compiled to make technical information from the 28 projects available for review and use (DECEMBER 1985);
- A technical report which focuses on the program's studies and findings relative to detention and recharge devices (MAY 1984);
- A technical report on urban runoff effects on the water quality of rivers and streams (MARCH 1984); and
- A technical report on the effectiveness of street sweeping as a potential "best management practice" for water pollution control (MAY 1984).

This report supersedes the earlier NURP publication, "Preliminary Results of the Nationwide Urban Runoff Program," March 1982. Information presented there has been expanded, updated, and in some cases revised.

Results of the Nationwide Urban Runoff Program (NURP)

NURP Study - Based on 28 separate and distinct planning projects

Objectives:

- Examine quality characteristics of urban runoff and similarities/differences at different urban areas;
- Examine extent to which urban runoff is a significant contributor to WQ problems across the nation; and,
- Examine performance characteristics and overall effectiveness and utility of management practices for the control of pollutant loads from urban runoff.

NURP definition of WQ "problems" from urban runoff is 3-leveled:

- Impairment or denial of beneficial uses;
- WQ criterion violation; and,
- Local public perception.

NURP Method

Field monitoring was performed at various sites throughout the country. The data represents a cross section of regional climatology, land use types, slopes and soil conditions. Due to the high variability of urban runoff, many sites were monitored and a statistical method was used to analyze the data.

The event mean concentration (EMC), or total constituent mass discharge divided by total runoff volume, was chosen as the primary water quality statistic.

Conclusions

1. Heavy metals, especially copper, lead and zinc were the most prevalent priority pollutant.

2. Organic priority pollutants were detected less frequently and at lower concentrations than heavy metals. The most commonly found pollutant was 2-ethylhexl (22%) and a-BHC (20%).

3. Coliform bacteria are present at high levels in urban runoff. Warm weather typically causes high fecal coliform counts.

4. Nutrients are present in runoffs but the concentration level is not as high as compared to other possible discharges.

VOL 23

00330

5. Oxygen demanding substances are present. Urban runoff is comparable to secondary treatment plant discharges.

6. Compared to treatment plant discharges, total suspended solids concentrations are fairly high.

7. A summary characterization was developed in estimating runoff from sites where monitoring data are scant or lacking.

Receiving Water Effects

The effects of runoff are very site-specific. The effect considerations are based on type, size, and hydrology of the water body, runoff quality and quantity, beneficial uses, and specific pollutants that affect that use. The NURP reports on the basis of the following water body types: rivers and streams, lakes, estuaries and embayments, and groundwater aquifers.

Issues

A number of issues came up during the NURP study. Some issues require additional information or further study.

1. Sediments - Further study is required to determine the long-term effect of nutrients and toxic pollutant accumulation in the sediments of urban lakes and streams.

2. Priority Pollutants - Many are found in runoff and a serious health risk could exist.

3. Rainfall pH Effects - Further study is required. It is speculated that acid rain increases the level of pollutants.

4. Industrial Runoff - Further study is required. It is suggested that industrial runoff might have significantly higher contaminant levels than runoff from other urban land.

5. Central Business Districts - Limited data is available. Some sites may product pollutant concentrations in runoff that are higher than those from a given urban area.

6. Physical Effects - Physical impacts of runoff have received little attention. Further study is required.

7. Synergy - No evaluation performed. It is suggested that control of a certain substance, i.e., pH, would reduce an adverse synergistic effect.

8. Opportunities for Control - Significant control of runoff quality are much greater for newly developing areas.

STATE OF CALIFORNIA, DEPARTMENT OF JUSTICE

ATTORNEY GENERAL'S STATEMENT OF LEGAL AUTHORITY TO IMPLEMENT A STATE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PROGRAM AND A STATE PRETREATMENT PROGRAM

I hereby certify, pursuant to section 402(b) of the Clean Water Act, that in my opinion the laws of the State of California provide adequate authority for the California State Water Resources Control Board (state board) and the nine California Regional Water Quality Control Boards (regional boards) to carry out a state National Pollutant Discharge Elimination System (NPDES) program and a state pretreatment program in the State of California. This authority is provided in lawfully enacted statutes and lawfully adopted regulations in full force and effect on the date of this Attorney General's Statement. Specific authorities provided by these statutes and regulations, as required by 40 C.F.R. part 123, are discussed below.

I. INTRODUCTION

Authority for the State of California to implement an NPDES program and a pretreatment program that complies with federal regulations applicable to state NPDES programs and state pretreatment programs is found in the Porter-Cologne Water Quality Control Act (Porter-Cologne Act), Division 7 (commencing with section 13000) of the California Water Code. (All citations are

to the California Water Code unless otherwise noted.)

A. General Powers of the State and Regional Boards

The Porter-Cologne Act establishes a comprehensive program for the protection of water quality and the beneficial uses of the waters of the state. The act addresses both point and non-point source discharges, to both surface and ground waters. See § 13050(e); 63 Ops.Cal.Atty.Gen. 51, 53-57 (1980); 58 Ops.Cal.Atty.Gen. 531-532 (1975); 58 Ops.Cal.Atty.Gen. 114, 121 (1975). The Porter-Cologne Act also applies to waste discharges to land. See §§ 13172, 13260 et seq.; 23 Cal. Admin. Code § 2510 et seq.

The Porter-Cologne Act is intended to provide a statewide program for water quality control administered regionally, within a framework of statewide coordination and policy. § 13000. The state board and the nine regional boards are the principal state agencies with primary responsibility for water quality control. § 13001. The state board also administers the state's water rights program. See § 174. The state board provides program guidance and oversight to the regional boards though adoption of statewide plans, policies, regulations and administrative procedures, preparation of an annual budget and allocation of funds to the reginnal boards, and providing legal advice to the regional boards. See §§ 186, 1053, 13140, 13164, 13170.

The state board also provides oversight and policy guidance through review of regional board decisions. Most actions

involving planning for basins within the state are initiated by the regional boards, but do not take effect until approved by the state board. See § 13240 et seq. The regional boards also have primary responsibility for individual permitting, inspection, and enforcement actions. See §§ 13260 et seq., 13300 et seq. The state board may review the action or failure to act of any regional board, and take appropriate action, upon petition of any aggrieved person or upon the state board's own motion. § 13320. In addition, for many actions required or authorized under the Clean Water Act, 33 U.S.C. § 1251 et seq., the state board has authority to take action independent of the state board's authority to act upon review of regional board's action or failure to act. See §§ 13160 (certifications); 13170 (standards and implementation plans); 13377 (permits for point source discharges); 13383 (inspection and monitoring); 13386 (enforcement).

The Porter-Cologne Act provides for the adoption of water quality control plans. §§ 13170, 13240 et seq. These plans designate beneficial uses of water, set water quality objectives (criteria) to protect beneficial uses of water, and provide for a program to achieve those objectives. §§ 13050(j), 13241, 13242. Water quality control plans may include prohibitions against the discharge of waste, or certain types of waste, in specified areas or under specified conditions. § 13243.

The principal means of regulating activities which may affect water quality, and the principal means of implementing

water quality control plans, is through issuance of waste discharge requirements. Any person discharging waste or proposing to discharge waste that could affect the quality of waters of the state, other than a discharge into a community sewer system, must submit a report of waste discharge to the board, unless the board waives the requirement for filing a report. § 13260. With certain limited exceptions, no person may initiate any new discharge of waste or make any material change in any discharge prior to issuance of waste discharge requirements by the regional board. § 13264.

A "discharge of waste", as used in the Porter-Cologne Act provisions on waste discharge requirements, includes, but is not limited to, any "discharge or runoff of a pollutant", within the meaning of the Clean Water Act. See Clean Water Act sections 313, 502, 33 U.S.C. § 1323, 1362. The statute enacting the Porter-Cologne Act provides that the statute is intended to implement the legislative recommendations in a report submitted by the state board to the Legislature. 1969 Cal. Stats. c. 482, § 36. The report contains a note that the definition of waste is intended to include all interpretations of the Attorney General of the meaning of "sewage", "industrial waste", and "other waste". Recommended Changes in Water Quality Control, Final Report of the Study Panel to the California State Water Resources Control Board, Study Project--Water Quality Control Program Appendix A at 23 (1969).

Published opinions of the Attorney General had interpreted a discharge of "sewage", "industrial waste", or "other

waste" to include the following:

- o Drainage from inoperative and abandoned mines. 26 Ops.Cal.Atty.Gen. 88 (1955);
- o Drainage, flow or seepage containing debris or eroded earth from logging operations. 27 Ops.Cal.Atty.Gen. 182 (1956);
- o Drainage, flow or seepage containing garbage, ashes, rubbish, mixed refuse, or solid industrial waste from inactive or closed dumps. Id.;
- o Return irrigation or drainage water from agricultural operations. Id.;
- o Liquids containing harmful materials which arise in one stratum intercepted by a water, oil or gas well and flow through the well into other intercepted strata. Id.;
- o Releases from a hydroelectric plant. 43 Ops.Cal.Atty.Gen. 302 (1964);
- o Pesticides improperly applied to waters of the state, or which find their way into waters of the state after application for use. Id.;
- o Changes in the physical or chemical characteristics of receiving waters caused by extraction of minerals from a streambed. 32 Ops.Cal.Atty.Gen. 139 (1958);
- o Dumping of earth moved from construction operations, or drainage of waste water from construction sites. 16 Ops.Cal.Atty.Gen. 125 (1950).

See 63 Ops.Cal.Atty.Gen. 51, 53-57 (1980).

Thus, even as applied to point sources, the Porter-Cologne Act has somewhat broader applicability than the Clean Water Act. Cf. National Wildlife Association v. Gorsuch, 693 F.2d 156 (D.C. Cir. 1982) (excluding from Clean Water Act definition of "pollutant" certain components which are considered "waste" under the Porter-Cologne Act; excluding from Clean Water Act definition of "discharge" certain releases from point sources that are considered "discharges" under the Porter-Cologne Act).

In prescribing waste discharge requirements, the regional board must take into consideration the beneficial uses to be protected, the water quality objectives required to protect those beneficial uses, and the need to prevent nuisance. § 13263. Waste discharge requirements also must implement any applicable water quality control plan. Id.

The Porter-Cologne Act also provides the regional boards with a spectrum of enforcement powers to address violations of waste discharge requirements, violations of reporting or monitoring requirements, and other activities that threaten water quality. §§ 13173, 13261, 13262, 13265, 13268, 13272, 13273, 13300 et seq., 13381, 13385, 13386, 13387.

Other provisions of the Porter-Cologne Act provide for grants and loans for waste treatment facilities, a state water pollution cleanup and abatement account, regulation of use of reclaimed water, sewage treatment plant operator qualifications, regulation of water wells and cathodic protection wells, and

regulation of discharges from houseboats. §§ 13400 et seq.; 13440 et seq.; 13500 et seq.; 13625 et seq.; 13700 et seq.; 13900 et seq.; 13955 et seq.; 13999 et seq.

B. Specific Authority for Clean Water Act Programs

In providing for issuance and enforcement of waste discharge requirements, the Porter-Cologne Act establishes a permit system for both point and non-point sources. To ensure that this program would be adequate to obtain Environmental Protection Agency (EPA) approval of a state NPDES program, the Legislature amended the Porter-Cologne Act in 1972. §13370; San Francisco Civil Service Association Local 400 v. Superior Court, 16 Cal.3d 46, 50, 544 P.2d 1331, 1334, 127 Cal.Rptr. 131, 134 (1976). These amendments added Chapter 5.5 (commencing with section 13370) to the Porter-Cologne Act. 1972 Cal. Stats. c. 1256.

The provisions of Chapter 5.5, patterned after the provisions of the Clean Water Act that apply to the NPDES program (Pacific Water Conditioning Association v. City Council, 73 Cal.App.3d 546, 556, 140 Cal.Rptr. 812, 818 (1977)) include the following authority:

- Permit issuance. Waste discharge requirements for point source discharges must apply and ensure compliance with all applicable provisions of the Clean Water Act. § 13377. They are issued for a fixed term not to exceed five years, and can be terminated or modified for cause.

§§ 13372, 13381. Waste discharge requirements also are required for disposal of pollutants into wells. § 13382.

- Inspection and Monitoring. Waste discharge requirements must incorporate inspection, monitoring, and entry requirements where required under the Clean Water Act. § 13377. The state and regional boards also have inspection, monitoring, and entry powers, independent of any permit conditions, equivalent to EPA's powers under section 308 of the Clean Water Act. § 13383, see 33 U.S.C. § 1318.
- Notice. The state and regional boards must ensure that the public, and any other state the waters of which may be affected, receive notice of any application for waste discharge requirements and are provided with an opportunity for a public hearing before a decision is made on the application. § 13384.
- Notice to EPA. The state board must provide notice to EPA of any application for waste discharge requirements, including a copy of the application. See § 13377; 23 Cal. Admin. Code § 2235.1(c).
- Notice to affected states. The state and regional boards must provide any other state which may be affected by issuance of a permit with an opportunity to submit written recommendations. The other state must be given written notice, and a statement of reasons, if its

recommendations are not accepted. See §§ 13377, 13378, 13384; 23 Cal. Admin. Code § 2235.1(c).

- o Protection of Navigation. The state and regional boards will not issue waste discharge requirements if, in the judgment of the United States Army Corps of Engineers, navigation of navigable waters would be impaired. See § 13377; 23 Cal. Admin. Code § 2235.1(c).
- o Enforcement. The state and regional boards have power to abate violations of the program, including civil and criminal penalties. §§ 13385, 13386, 13387.
- o Pretreatment Program. Waste discharge requirements issued to publicly owned treatment works must include conditions applying the Clean Water Act requirements for identification of pollutants subject to pretreatment requirements and requiring implementation of a pretreatment program. § 13377.
- o Pretreatment Requirements. The state and regional boards have authority to require industrial users of publicly owned treatment works to comply with pretreatment requirements. §§ 13383, 13385, 13386, 13387.

See generally section 402(b) of the Clean Water Act, 33 U.S.C. § 1342(b). Specific authorities provided by Chapter 5.5 of the Porter-Cologne Act and other state statutes and regulations are listed in Part II of this Attorney General's Statement.

Many of the Clean Water Act requirements for an adequate state NPDES program and pretreatment program are provided in

Chapter 5.5 of the Porter-Cologne Act through incorporation by reference of the federal requirements. See, e.g., § 13377. In addition, changes in the Clean Water Act and implementing regulations are incorporated prospectively assure that the state continues to have authority in the face of changing federal regulatory requirements.

Section 13370 states the Legislature's intent as follows: "to authorize the state to implement the provisions of the Federal Water Pollution Control Act and acts amendatory thereof or supplementary thereto, and federal regulations and guidelines issued pursuant thereto". Accordingly, at section 13377, the state and regional boards are directed to issue waste discharge requirements which apply and ensure compliance with the Clean Water Act "and all acts amendatory thereof or supplementary thereto." This statutory language clearly indicates an intent to incorporate prospectively changes in federal law. Similarly, the enforcement provisions of Chapter 5.5, sections 13385, 13386 and 13387, are patterned after section 309 of the Clean Water Act. 33 U.S.C. § 1319. Like section 309 of the Clean Water Act, the enforcement provisions of Chapter 5.5 authorize actions for civil and criminal penalties and injunctive relief to enforce standards and limitations set by EPA regulations promulgated after enactment of the code sections authorizing enforcement.

State statutes and regulations that prospectively incorporate federal statutes and regulations have long been accepted in California. See 64 Ops.Cal.Atty.Gen. 503 (1981);

43 Ops.Cal.Atty.Gen. 275 (1964); 43 Ops.Cal.Atty.Gen. 1 (1964). See generally Kugler v. Yocum, 69 Cal.2d 371, 377-384, 445 P.2d 303, 306-311, 71 Cal.Rptr. 687, 690-695. Issues concerning state incorporation of the Clean Water Act are discussed in detail in Appendix A.

In general, Chapter 5.5 of the Porter-Cologne Act applies only to activities which EPA could regulate under the Clean Water Act if the state did not have a state program, or which the state is required to regulate to obtain program approval. See § 13372. There are some instances where Chapter 5.5 of the Porter-Cologne Act applies to activities the state is not required to regulate in order to obtain program approval. See § 13382 (requiring waste discharge requirements for disposal into wells, or "where pollutants may enter wells from the surrounding groundwater;" Clean Water Act section 402(b)(1)(D) only requires permits to control disposal into wells). Otherwise, activities that are not subject to state programs implementing Clean Water Act requirements, are regulated under Porter-Cologne Act provisions other than Chapter 5.5. See § 13372.

Chapter 5.5 of the Porter-Cologne Act applies to point source discharges to surface waters, introduction of pollutants into public treatment systems, use and disposal of sewage sludge, and disposal of pollutants into wells. See §§ 13373, 13377, 13382, 13383, 13385, 13386, 13387. In 1978, the Legislature amended Chapter 5.5 of the Porter-Cologne Act to authorize a state program to permit discharges of dredged or fill material.

1978 Cal. Stats. c. 746. The provisions of Chapter 5.5 will apply to discharges of dredged or fill material that are not subject to NPDES program requirements only when the state applies for and obtains federal approval of the state dredged or fill permit program under section 404(g) of the Clean Water Act. See § 13370; Clean Water Act section 404(g), 33 U.S.C. § 1344(g). The dredged or fill material permit program established under Chapter 5.5 will apply only to those waters where the Clean Water Act authorizes a state to obtain approval for administration of the Clean Water Act dredged and fill material permit program. See § 13376; Clean Water Act section 404(g), 33 U.S.C. § 1344(g).

Point source discharges and other activities subject to Chapter 5.5 of the Porter-Cologne Act are also subject to the other provisions of the Porter-Cologne Act, to the extent those provisions are consistent with Chapter 5.5. See § 13372. The other provisions of the Porter-Cologne Act serve to supplement the authority provided by Chapter 5.5. They establish procedures for state and regional board operations. See generally § 13260 et seq. They provide additional powers which may be used to enforce requirements set pursuant to Chapter 5.5. See generally § 13300 et seq. They also may provide the basis for establishing stricter requirements than might otherwise be required under Chapter 5.5. See generally § 13000.

In short, the Clean Water Act requirements incorporated into Chapter 5.5 of the Porter-Cologne Act serve as minimum requirements: additional requirements may be imposed to the extent

authorized by other provisions of the Porter-Cologne Act. The Clean Water Act expressly provides that states may adopt and enforce their own standards and requirements, so long as they are not less stringent than the requirements of the Clean Water Act. Clean Water Act section 510; 33 U.S.C. § 1370. Requirements imposed pursuant to other provisions of the Porter-Cologne Act therefore would not be inconsistent with the requirements of Chapter 5.5, and could be adopted and enforced in addition to the requirements of Chapter 5.5. See § 13372.

Indeed, Chapter 5.5 expressly requires that waste discharge requirements for point source discharges, in addition to assuring compliance with all requirements of the Clean Water Act, include "any more stringent effluent standards or limitations necessary to implement water quality control plans, or for the protection of beneficial uses, or to prevent nuisance". § 13377. So long as the state or regional board makes proper findings explaining the basis of its decision, waste discharge requirements may establish more stringent requirements than those required or authorized by the Clean Water Act. See Southern California Edison v. State Water Resources Control Board, 116 Cal.App.3d 751, 758-61, 172 Cal.Rptr. 306, 309-11 (1981) (the Porter-Cologne Act authorizes the state and regional boards to set more stringent controls than those established by the Clean Water Act; the particular waste discharge requirements before the court were remanded because of inadequate findings to support more stringent controls).

Where other provisions of the Porter-Cologne Act are inconsistent with Chapter 5.5, the provisions of Chapter 5.5 prevail to the extent of any inconsistency. § 13372. For example, in State Water Resources Control Board Order No. WQ 80-19, the state board rejected an argument that § 13360, which is not part of Chapter 5.5, limits the authority of the state and regional boards to specify the manner of compliance with an NPDES permit. The state board reasoned:

> "We do not agree that Water Code Section 13360 precludes the State or Regional Boards from specifying the manner of compliance with waste discharge requirements in NPDES permits. The Porter-Cologne Water Quality Control Act, Division 7 of the Water Code, provides that, notwithstanding any other provision of the division, the State and Regional Boards shall issue NPDES permits as required or authorized by the Clean Water Act, 33 U.S.C. §§ 1251 et seq., to ensure compliance with the Federal Act. Water Code § 13377.
>
> "Under the Clean Water Act, effluent limitations, effluent standards and prohibitions, and standards of performance promulgated by EPA are enforced through the issuance of NPDES permits. Prior to the adoption of such limitations, standards, and prohibitions, the Administrator of EPA is authorized by the Act to impose 'such conditions as the Administrator determines are necessary' to carry out the provisions of the Act. 33 U.S.C. § 1342 (a)(1); see NRDC, Inc. v. Costle, 568 F.2d 1369 (D.C. Cir. 1977). In addition, EPA regulations adopted under the Clean Water Act authorize conditions in NPDES permits setting 'best management practices' where numeric effluent limitations are infeasible or where reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the Act. 40 C.F.R. § 122.62(K). 'Best management practices' are defined to include, for NPDES permits, 'treatment requirements, operating procedures, and practices to control...sludge or waste disposal....' 40 C.F.R. § 122.3. (emphasis added).
>
> "Consequently, since the Clean Water Act authorizes the imposition of conditions including best management practices, in NPDES permits where

limitations and standards have not been promulgated, the Porter-Cologne Act gives the State and Regional Boards the same authority. To the extent that this authorization is inconsistent with the provisions of Water Code Section 13360, the authority of the State and Regional Boards to implement the provisions of the Clean Water Act under Water Code Section 13377 must prevail. See Water Code Section 13372." (State Board Order No. WQ 80-19 at pp 19-21 [footnote omitted].)

This decision was upheld in a subsequent proceeding in Los Angeles County Superior Court against a challenge to the state board's order. ABCD v. State Board and Las Virgenes MWD v. State Board, Los Angeles Superior Court Nos. C349722 and C348687, September 10, 1982. In state board Order No. WQ 82-8 the state board concluded, based upon similar reasoning, that section 13360 does not apply to the state's implementation of Clean Water Act pretreatment requirements.

In summary, the provisions of Chapter 5.5 of the Porter-Cologne Act, by incorporating the requirements of the Clean Water Act, provide the basic authority needed for a state NPDES program, including the authority needed for a state pretreatment program. Provisions of the Porter-Cologne Act that are not part of Chapter 5.5 provide supplementary regulatory authority. These provisions, however, do not create exceptions to NPDES and pretreatment program requirements, and do not restrict the State's authority to administer an NPDES program and pretreatment program that complies with all federal requirements. Except where a more stringent requirement is established pursuant to other provisions of the Porter-Cologne Act, Chapter 5.5 requires the state and regional boards to follow all requirements of the Clean Water Act

that apply to state NPDES programs and state pretreatment programs.

II. SPECIFIC AUTHORITY

Specific authority provided by the Porter-Cologne Act and other lawfully enacted state statutes and regulations includes the following:

A. Authority to Issue Permits

1. Existing and New Point Sources

State law provides authority to issue permits for the discharge of pollutants by existing and new point sources to the same extent as required under the permit program administered by EPA pursuant to Sections 318, 402, and 405 of the Clean Water Act.

Federal Authority: Clean Water Act sections 301(a), 318, 402(b)(1)(A), 405(a); 40 C.F.R. § 123.25(a).

State Authority: §§ 1058, 13370, 13374, 13376, 13377, 13378, 13380, 13381, 13382.5; 23 Cal. Admin. Code §§ 2235.1, 2235.2.

Remarks:

Discharger's duties to obtain waste discharge requirements

Section 13376 provides, in relevant part:

"Any person discharging pollutants or proposing to discharge pollutants to the navigable waters of the United States within this state...shall file a

> report of such discharge in accordance with the procedures set forth in section 13260....The discharge of pollutants...by any person except as authorized pursuant to waste discharge requirements...is prohibited...." § 13376.

The terms "discharge," "pollutants," and "navigable waters," as used in section 13376 and other provisions of Chapter 5.5 of the Porter-Cologne Act, have the same meaning as in the Clean Water Act. § 13373. The term "waste discharge requirements," as used in Chapter 5.5 of the Porter-Cologne Act, is the equivalent of the term "permits," as used in the Clean Water Act. § 13374.

The term "person," as used in the Porter-Cologne Act, has the same broad applicability as the term "person" under the Clean Water Act. The term applies to individuals and to both private and governmental entities. "Person" includes any "person, firm, association, organization, partnership, business trust, corporation or company" as well as any "city, county, district, the state or any department thereof" and "the United States, to the extent authorized by federal law". §§ 19, 13050(c); see §§ 5, 13050 Legislative Committee Comment (West 1971); Clean Water Act section 502(5), 33 U.S.C. § 1362(5).

Section 13376 is modeled on the provisions of the Clean Water Act. Compare § 13376, with Clean Water Act sections 301, 402, 33 U.S.C. §§ 1311, 1342. By prohibiting the "discharge of pollutants" except as in accordance with a state permit, in the form of waste discharge requirements, section 13376 requires waste discharge requirements for all discharges for which the Clean Water Act requires an NPDES permit.

Section 13376 also includes provisions requiring a state permit for discharges of dredged or fill material to navigable waters, other than waters used to transport interstate or foreign commerce. See § 13376. But the provisions of Chapter 5.5 of the Porter-Cologne Act requiring a state permit for discharges of dredged or fill material that are not subject to NPDES requirements do not take effect until federal approval of a state dredged and fill material permit program. § 13370.

EPA regulations exclude certain discharges from the requirement for an NPDES permit. 40 C.F.R. § 122.3. Where a California statute is modeled on a federal act, judicial and administrative interpretations of the federal act are persuasive authority in interpreting the California statute. No Oil, Inc. v. City of Los Angeles, 13 Cal.3d 68, 86 n.21, 529 P2d 66, 78 n.21, 118 Cal.Rptr. 34, 46 n.21 (1974). Aside from provisions concerning dredged and fill material permits (see, e.g., § 13370) and control of disposal pollutants into wells (see § 13382) nothing in Chapter 5.5 of the Porter-Cologne Act indicates a legislative intent to require waste discharge requirements for discharges which do not require a permit under sections 318, 402 and 405 of the Clean Water Act. Section 13372 provides, in part, that the "provisions of this chapter [Chapter 5.5 of the Porter-Cologne Act] shall apply only to actions required under the [Clean Water Act]".

Thus, section 13376 does not require waste discharge requirements for discharges which are exempt from NPDES permits

under EPA regulations. 40 C.F.R. § 122.3. Where an NPDES permit may be required at the discretion of the NPDES program director, see, e.g., id. § 122.3(g), waste discharge requirements may be required at the discretion of the state and regional boards.

These conclusions are reinforced by section 13377, which mandates that state and regional boards "shall" issue waste discharge requirements "as required or authorized" under the Clean Water Act. § 13377. Whenever an NPDES permit is required under the Clean Water Act, waste discharge requirements are required under Chapter 5.5 of the Porter-Cologne Act. Where issuance of an NPDES permit is neither required nor authorized under the Clean Water Act and EPA regulations, waste discharge requirements ordinarily are not required under Chapter 5.5 of the Porter-Cologne Act. §§ 13372, 13377.

There are three situations where waste discharge requirements or other permits may be required under Chapter 5.5 of the Porter-Cologne Act, even though an NPDES permit is not required. First, waste discharge requirements are required for disposal of pollutants into wells, or where pollutants may enter wells from surrounding ground water. § 13372. Second, section 13377 provides authority to issue waste discharge requirements for the use or disposal of sludge from treatment works, where permits are required under the Water Quality Act of 1987, even if the treatment works do not require an NPDES Permit. See § 13377; Clean Water Act section 405(f), 33 U.S.C. § 1345(f). Third, state dredged and fill material permits will

be required if California obtains federal approval of a dredged and fill material permit program. §§ 13370, 13377. With these three exceptions, Chapter 5.5 of the Porter-Cologne Act does not require or authorize issuance of waste discharge requirements for activities which are excluded from the NPDES permit program. §§ 13372, 13377; cf. §§ 13383, 13385, 13386, 13387 (providing authority to enforce pretreatment requirements against industrial users of publicly owned treatment works, but not authorizing issuance of waste discharge requirements to those industrial users). Activities that may affect water quality but are not subject to Chapter 5.5 of the Porter-Cologne Act may be regulated under other provisions of the Porter-Cologne Act. See, e.g., § 13260 et seq.; § 13300 et seq.

Procedures for issuing waste discharge requirements

The state and regional boards issue waste discharge requirements in accordance with the procedures set forth in Article 4 (commencing with section 13260) of Chapter 4 of the Porter-Cologne Act and EPA NPDES program regulations. See §§ 13372, 13377; 23 Cal. Admin. Code §§ 2235.1(c); 2235.2.

A regional board may waive waste discharge requirements where such waiver is not against the public interest. § 13269. Where a waiver would be contrary to NPDES program requirements, issuance of a waiver would be contrary to the public interest. See § 13370. In addition, Chapter 5.5 of the Porter-Cologne Act prohibits any discharge for which an NPDES permit is required under the Clean Water Act, except where the discharge is

authorized pursuant to waste discharge requirements. § 13376. If any other provision of the Porter-Cologne Act purported to authorize a waiver of waste discharge requirements for a discharge required to have an NPDES permit under the Clean Water Act, it would be inconsistent with Chapter 5.5 of the Porter-Cologne Act. "The provisions of [Chapter 5.5 of the Porter-Cologne Act] prevail over other provisions of [the Porter-Cologne Act] to the extent of any inconsistency." §13372.

Similarly, certain discharges not subject to the requirement for an NPDES permit may be initiated if the regional board fails to act upon a report of waste discharge within a specified period after a complete report is submitted. §13264(a)(2). This provision, however, does not apply to discharges of pollutants to waters of the United States, which are governed by section 13376 of the Water Code. See § 13372; Pacific Water Conditioning Association v. City Council, 73 Cal.App.3d 546, 556, 140 Cal.Rptr. 812, 818 (1977) (dicta).

State board regulations provide that a report of waste discharge is the equivalent of an NPDES permit application, and that reports of waste discharge for point source discharges to surface waters shall be filed and processed in compliance with EPA's NPDES program regulations. 22 Cal. Admin. Code §§ 2235(b), 2235.1.

Incorporation of NPDES program requirements

When the state and regional boards issue waste discharge

requirements for activities subject to Chapter 5.5 of the Porter-Cologne Act, they must "apply and ensure compliance with all applicable provisions of the [Clean Water] act and acts amendatory thereof or supplementary, thereto". § 13377.

State board regulations for point source discharges to navigable waters require that reports of waste discharge be processed and waste discharge requirements be issued in accordance with the "applicable" EPA NPDES regulations. 23 Cal. Admin. Code §§ 2235.1(c), 2235.2. Thus, the Porter-Cologne Act and state board regulations have incorporated by reference all EPA NPDES regulations which are applicable to the states. Except where the Porter-Cologne Act provides for more stringent requirements, the regional boards follow and apply those EPA regulations in issuing waste discharge requirements for activities subject to Chapter 5.5 of the Porter-Cologne Act. For activities subject to the NPDES permit program, EPA regulations determine both the procedures followed in issuing waste discharge requirements, and the conditions imposed in those waste discharge requirements, unless state law supports a more stringent reouirement.

EPA regulations which are applicable to California's NPDES program include 40 C.F.R. part 123, setting requirements for state NPDES programs, e.g., id. § 123.25, 123.41, and regulations expressly made applicable to state NPDES programs. See, e.g., id. § 122.28 (general permits); id. § 403.1(b)(3).

Specifically, waste discharge requirements for point

source discharges to waters of the United States must, at a minimum, be issued and administered in conformance with each of the sections of title 40 of the Code of Federal Regulations listed below:

"(1) § 122.4--(Prohibitions);
(2) § 122.5(a) and (b)--(Effect of permit);
(3) § 122.7(b) and (c)--(Confidential information);
(4) § 122.21(a)-(b), (e)-(j), and (l)-(o)--(Application for a permit);
(5) § 122.22--(Signatories);
(6) § 122.23--(Concentrated animal feeding operations);
(7) § 122.24--(Concentrated aquatic animal production facilities);
(8) § 122.25--(Aquaculture projects);
(9) § 122.26--(Separate storm sewers);
(10) § 122.27--(Silviculture);
(11) § 122.28--(General permits)...;
(12) § 122.41--(Applicable permit conditions);
(13) § 122.42--(Conditions applicable to specified categories of permits);
(14) § 122.43--(Establishing permit conditions);
(15) § 122.44--(Establishing NPDES permit conditions);
(16) § 122.45--(Calculating permit conditions);
(17) § 122.46--(Duration);
(18) § 122.47(a)--(Schedules of compliance);
(19) § 122.48--(Monitoring requirements);
(20) § 122.50--(Disposal into wells);
(21) § 122.61--(Permit transfer);
(22) § 122.62--(Permit modification);
(23) § 122.64--(Permit termination);
(24) § 124.3(a)--(Application for a permit);
(25) § 124.5 (a), (c), (d), and (f)--(Modification of permits);
(26) § 124.6 (a), (c), (d), and (e)--(Draft permit);
(27) § 124.8--(Fact sheets);
(28) § 124.10 (a)(1)(ii), (a)(1)(iii), (a)(1)(v), (b), (c), (d), and (e)--(Public notice);
(29) § 124.11--(Public comments and requests for hearings);
(30) § 124.12(a)--(Public hearings);
(31) § 124.17 (a) and (c)--(Response to comments);
(32) § 124.56--(Fact sheets);
(33) § 124.57(a)--(Public notice);
(34) § 124.59--(Comments from government agencies);
(35) § 124.62--(Decision on variances);
(36) Subparts A, B, C, D, H, I, J, K, and L of Part 125; and

(37) 40 CFR Parts 129, 133 and Subchapter N."
Id. § 122.25(a).

Of course, a regional board is not required to follow one of the above cited regulations where a more stringent condition is imposed under state law. Id. Note; see, State Water Resources Control Board Order No. WQ 75-16 at 4 (omitting upset clause based in part upon State's authority to set more stringent requirements).

EPA also has adopted regulations which are not expressly made applicable to the states, and apply only to EPA issued permits. See id. § 122.1(c). Many of these regulations deal with procedures followed by EPA. E.g., 40 C.F.R. Part 124, Subpart E (evidentiary hearing procedures). Some of these procedural regulations do not appear to have any bearing on the procedures to be followed by the state and regional boards. Compare id. § 124.16 (automatic stay pending evidentiary hearing), with 23 Cal. Admin. Code § 2053 (regional board action subject to review by the state board may be stayed only after notice and a hearing). See generally 43 Ops.Cal.Atty.Gen. 275, 282 (1964) (suggestion that inapplicable federal procedural or substantive requirements might be adopted inadvertently is not a barrier to prospective incorporation by reference. State statutes and regulations may be construed to avoid giving effect to federal regulations which are clearly irrelevant).

In many cases, however, EPA regulations which are not expressly made applicable to the state and regional boards may

provide valuable guidance. In particular, EPA regulations which do not expressly apply to state programs may provide guidance as to how the regulations which are applicable to state programs should be interpreted. In incorporating applicable provisions of the Clean Water Act and implementing regulations, it is the intent of the Legislature and the state and regional boards to interpret those incorporated provisions consistent with the interpretation they are given by EPA and the federal courts. Regulations which EPA has not made applicable to state programs may show how EPA interprets those regulations that are applicable. In some cases, the effect is the same as if EPA expressly provided that the regulation is applicable to state programs. See, e.g., 40 C.F.R. § 122.2 (definitions; although this provision is not expressly made applicable to state programs, the definitions obviously should be used in interpreting the other regulations which apply).

EPA regulations may also provide guidance in particular instances as to how provisions of Chapter 5.5 of the Porter-Cologne Act may be interpreted. Because Chapter 5.5 of the Porter-Cologne Act is modeled after the Clean Water Act, EPA regulations interpreting the Clean Water Act are persuasive authority in interpreting Chapter 5.5 of the Porter-Cologne Act. See Friends of Mammoth v. Board of Supervisors, 8 Cal.3d 247, 260-261, 502 P.2d 1049, 1057-1058, 104 Cal.Rptr. 761, 769-70 (1972); Pacific Water Conditioning Association v. City Council, 73 Cal.App.3d 546, 556, 140 Cal.Rptr. 812, 818 (1977).

In some cases, where the state and regional boards have discretion under the Porter-Cologne Act and applicable EPA regulations, an EPA regulation that does not apply to state programs may provide guidance as to how that discretion may be exercised to effectuate the purposes of the Clean Water Act and the Porter-Cologne Act. For example, procedures outlined in EPA regulations that do not apply to state programs could be followed by the state and regional boards if those procedures do not conflict with the procedures required under the Porter-Cologne Act. See, e.g., 40 C.F.R. § 124.6(b) (tentative denial of permit application). In some respects, the procedures outlined in EPA regulations that do not apply to the states are essentially the same as procedures followed by the state and regional boards pursuant to state board regulations. E.g., compare id. § 124.12 (recording of hearings) with 23 Cal. Admin. Code § 647.4 (recording of all state and regional board meetings, including those where a hearing is conducted). Otherwise, the state and regional boards may, in the reasonable exercise of their discretion, decide whether or not to follow procedures outlined in those EPA regulations that are neither applicable to state programs nor in conflict with the Porter-Cologne Act.

It is impossible to predict with certainty which of the EPA regulations that do not apply to state programs still might provide guidance to the state and regional boards. Even a regulation which does not appear to have any bearing on the state and regional boards might conceivably provide some guidance in a

particular case. Similarly, it would be impossible to predict all of the situations where the Porter-Cologne Act might require a stricter standard than applicable EPA regulations. California's prospective incorporation by reference of all applicable provisions of the Clean Water Act and implementing regulations does assure, however, that in all cases waste discharge requirements will, at a minimum, apply and ensure compliance with all requirements applicable to state NPDES programs.

2. Disposal into Wells

State law provides authority to issue permits to control the disposal of pollutants into wells.

Federal Authority: Clean Water Act section 402(b)(1)(D); 40 C.F.R. § 123.28.

State Authority: § 13382.

Remarks: Chapter 5.5 of the Porter-Cologne Act requires a state permit, in the form of waste discharge requirements, for disposal of pollutants into wells. § 13382. The state and regional boards may prohibit the disposal, or impose conditions to protect the public health and welfare, including protection of water quality and beneficial uses. See §§ 13243, 13263, 13377. Waste discharge reouirements for disposal of pollutants to wells apply and ensure compliance with all applicable provisions of the Clean Water Act and implementing regulations, as well as any more stringent reouirements of the Porter-Cologne Act. See §§ 13263,

13263.5, 13372, 13377.

B. Authority to Apply Federal Standards

1. Effluent Standards and Limitations and Water Quality Standards

State law provides authority to apply, in terms and conditions of issued permits, applicable federal effluent standards and limitations and water quality standards promulgated or effective under the Clean Water Act, including:

- o Effluent limitations pursuant to sections 301 and 304 of the Clean Water Act;
- o Water quality related effluent limitations pursuant to sections 302 and 303 of the Clean Water Act;
- o National standards of performance pursuant to Section 306 of the Clean Water Act;
- o Toxic and pretreatment effluent standards pursuant to section 307 of the Clean Water Act; and
- o Ocean discharge criteria pursuant to section 403 of the Clean Water Act.

Federal Authority: Clean Water Act sections 208(e), 301(b), 301(e), 302, 303, 304(b), 304(d), 304(f), 306, 307, 402(b)(1)(A), and 403: 40 C.F.R. §§ 122.43, 122.44, 122.45.

State Authority: §§ 1058, 13375, 13376, 13377, 13378, 13380, 13381, 23 Cal. Admin. Code §§ 2233, 2235.1, 2235.2, 2235.3.

Remarks: Because the Porter-Cologne Act and state board regulations incorporate prospectively all applicable Clean Water Act reouirements, the state and regional boards may apply federal effluent standards and limitations. See Appendix A.

Applicable federal effluent limitations which must be applied in waste discharge requirements include any effluent limitations necessary to meet water quality standards, as required under Clean Water Act section 301(b)(1)(C), 33 U.S.C. § 1311(b)(1)(C). See § 13377. Chapter 5.5 of the Porter-Cologne Act also expressly requires that waste discharge requirements ensure compliance with "any more stringent effluent standards or limitations necessary to implement water quality control plans, or for the protection of beneficial uses, or to prevent nuisance." § 13377. In addition, the general provisions of the Porter-Cologne Act require that all waste discharge requirements must implement any applicable state water quality standards. See §§ 13263, 13372.

The authority of the state and regional boards to set more stringent effluent limitations than required under the Clean Water Act and implementing regulations was recognized in Southern California Edison Co. v. State Water Resources Control Board, 116 Cal.App.3d 751, 172 Cal.Rptr. 306 (1981). The Court of Appeal reversed a Superior Court decision that the state and regional boards could not establish requirements more stringent than provided for under federal law. Id. at 757-58, 172 Cal.Rptr. at 309. The Court of Appeal held that in

appropriate cases the state and regional boards may prescribe effluent limitations based upon the gross pollutant levels in the discharge, even where applicable federal requirements would provide for an adjustment to provide credit for pollutants in intake water. Id.; cf. 40 C.F.R. § 122.45(g) (credit for pollutants in intake water).

The provisions of the Clean Water Act and implementing regulations allow for variances in certain situations. See, e.g., Clean Water Act section 301(g), 33 U.S.C. § 1311(g). EPA regulations applicable to the states establish procedures for decisions on variances. These procedures allow the states to grant or deny some types of variances; for other types of variances the state may deny the request, concur in writing, or forward the request without recommendation. 40 C.F.R. § 124.62. The state and regional boards process variance requests in accordance with these regulations, see 23 Cal. Admin. Code §§ 2235.1(c), 2235.2, and any more specific understandings which may be agreed to between the state and EPA. See, e.g., State Water Resources Control Board Order No. WQ 86-17. In issuing waste discharge requirements for a discharge for which a variance has been requested, the state and regional boards also apply all applicable water quality standards, and any other requirements of the Porter-Cologne Act which are more stringent than applicable federal requirements. E.g., id.; see §§ 13272, 13377.

2. Effluent Limitation Requirements of Sections 301 and 307 of

the Clean Water Act

In the absence of formally promulgated effluent standards and limitations under sections 301(b) and 307 of the Clean Water Act, State law provides authority to apply in terms and conditions of issued permits effluent limitations to achieve the purposes of these sections of the Clean Water Act. Such limitations may be based upon an assessment of technology and processes as required under the Clean Water Act with respect to individual point sources, and include authority to apply:

- To existing point sources, other than publicly owned treatment works, effluent limitations based on application of the best practicable control technology currently available, the best available technology economically achievable, or the best conventional pollutant control technology;
- To publicly owned treatment works, effluent limitations based upon the application of secondary treatment or the best practicable waste treatment technology;
- To any point source, effluent limitations and prohibitions for toxic pollutants identified pursuant to section 307(a)(1) of the Clean Water Act, based on application of best available technology economically achievable; and
- To point sources within industrial categories listed in the consent decree in Natural Resources Defense Council v. Train, 8 E.R.C. 2120 (D.D.C. 1976), modified,

12 E.R.C. 1833 (D.D.C. 1970), effluent limitations and compliance schedules which meet the requirements of sections 301(b)(2)(A), (C), (D), (E), and (F) of the Clean Water Act.

Federal Authority: Clean Water Act sections 301, 304(b), 304(d), 307, 402(a)(1), 402(b)(1)(A); 40 C.F.R. §§ 122.43, 122.44.

State Authority: Clean Water Act §§ 1058, 13377; 23 Cal. Admin. Code §§ 2235.1, 2235.2.

Remarks: Chapter 5.5 of the Porter-Cologne Act requires that waste discharge requirements apply and ensure compliance with all applicable provisions of the Clean Water Act. § 13377. This authority includes authority to apply the requirements of the Clean Water Act, on a case-by-case basis, if no effluent limitations or prohibitions have been formally promulgated by EPA.

3. Pretreatment Standards for Industrial Users

State law provides authority to apply to industrial users of publicly owned treatment works pretreatment standards promulgated under sections 307(b) and 307(c) of the Clean Water Act, including the prohibitive discharge standards developed pursuant to 40 C.F.R. § 403.5.

Federal authority. Clean Water Act sections 301(b)(1)(A)(ii), 307(b) and 307(c); 40 C.F.R. § 403.8.

State Authority: Cal. Gov't Code §§ 54739, 54740;

§§ 1058, 13370.5, 13377, 13383, 13385, 13386, 13387; 23 Cal. Admin. Code §§ 2233, 2235.2, 2235.3.

Remarks:

State and regional board authority

State law provides authority for the state and regional boards to apply pretreatment standards to industrial users in two different ways. The state and regional boards may enforce pretreatment standards directly against industrial users. The state and regional boards may also apply pretreatment standards indirectly, by requiring publicly owned treatment works to have and enforce pretreatment programs.

Chapter 5.5 of the Clean Water Act allows the state and regional boards to establish reporting and monitoring requirements for users of public treatment works. § 13383. The state and regional boards may enter and inspect the facilities of any user, and take samples. See §§ 13267, 13383. The state and regional boards may enforce pretreatment standards against users of publicly owned treatment works through actions for civil and criminal penalties and for injunctive relief. §§ 13385, 13386, 13387.

The enforcement provisions of Chapter 5.5 of the Porter-Cologne Act allow the state and regional boards to enforce requirements of the Clean Water Act, including any "effluent limitation" or any "pretreatment...standard". Id. See Appendix A, pp. A-7 - A-8. These enforcement provisions are

patterned after section 309 of the Clean Water Act and, like section 309 of the Clean Water Act, provide for sanctions for certain violations, including violations of sections 301 and 307 of the Clean Water Act. Compare, e.g., § 13377 with Clean Water Act section 309(d), 33 U.S.C. §1319(d). The enforcement provisions of Chapter 5.5 of the Porter-Cologne Act refer to sections of the Clean Water Act by their titles; references to effluent limitations and toxicity and pretreatment standards refer to standards established pursuant to sections 301 and 307 of the Clean Water Act. The obvious intent of these references is to authorize the state and regional boards to take enforcement action in response to violations of sections 301 and 307 of the Clean Water Act.

Effluent limitations are established under section 301 of the Clean Water Act. 33 U.S.C. § 1311. Pretreatment standards are established under section 307 of the Clean Water Act. 33 U.S.C. § 1317. The effluent limitations established under section 301 of the Clean Water Act include a requirement that users of publicly owned treatment works comply with "any applicable pretreatment requirements and any requirements under section 307 of [the Clean Water] Act". Clean Water Act section 301(b)(1)(A)(ii), 33 U.S.C. § 1311(b)(1)(A)(ii). The pretreatment standards established under section 307 of the Clean Water Act include both categorical standards for users in specific industrial subcategories and standards setting prohibited discharges for all users. See 40 C.F.R. §§ 403.5,

403.6. State and regional board authority to apply and enforce any "effluent limitation" or "pretreatment standard" includes authority to apply and enforce any categorical pretreatment standard, prohibited discharge standard, or any other applicable pretreatment standard, directly against a user of a publicly owned treatment works.

EPA regulations establishing pretreatment standards include a prohibition against introduction of pollutants into a publicly owned treatment works in violation of pretreatment requirements established as part of a publicly owned treatment works' pretreatment program. See 40 C.F.R. §§ 403.5, 403.8. This regulation is incorporated into the state program as part of the state and regional boards' authority to enforce pretreatment standards. In addition, the state and regional boards may enforce, as part of their authority to enforce effluent limitations, "any applicable pretreatment requirements," including requirements established as part of a publicly owned treatment works' pretreatment program. See Clean Water Act section 301(b)(1)(A)(ii), 33 U.S.C. § 1311(b)(1)(A)(ii).

It should also be clear that no state regulation, permit or order is required for the state and regional boards to take enforcement action against industrial users for violation of pretreatment standards. The enforcement sections of Chapter 5.5 of the Porter-Cologne Act expressly authorize enforcement for either violations of state and regional board orders or for violations of effluent limitations, pretreatment standards, and

other listed Clean Water Act requirements. See, e.g., § 13385. The enforcement provisions of Chapter 5.5 do not provide sanctions for violations of state boards regulations, except to the extent that those regulations are incorporated into waste discharge requirements or other orders which may be enforced against the discharger. See id. No waste discharge requirements or state and regional board permits or orders are required for discharges into publicly owned treatment works. See §§ 13263, 13372. State regulations which purported to require industrial users of publicly owned treatment works to comply with Clean Water Act pretreatment requirements would add nothing to the state and regional boards' enforcement powers. Nothing in Chapter 5.5 of the Porter-Cologne Act either requires adoption of state pretreatment regulations, or makes the adoption of any regulations a prerequisite to application and enforcement of the statutory requirements of Chapter 5.5. The requirements of sections 301 and 307 of the Clean Water Act, including effluent limitations and pretreatment requirements, are directly incorporated into the enforcement provisions of Chapter 5.5 of the Porter-Cologne Act.

Chapter 5.5 of the Porter-Cologne Act also authorizes the state and regional boards to require, as a condition of waste discharge requirements issued to publicly owned treatment works, that the publicly owned treatment works apply pretreatment standards to industrial users. § 13377; 23 Cal. Admin. Code § 2235.2; see 40 C.F.R. §§ 122.44(j), 123.25(a)(37), 403.8. To

comply with this condition of waste discharge requirements, publicly owned treatment works must apply and enforce pretreatment requirements established pursuant to Clean Water Act sections 307(b) and 307(c). 40 C.F.R. § 403.8. The pretreatment standards that publicly owned treatment works must apply and enforce include a prohibition against introduction of pollutants which pass through or interfere with the operation of the treatment works. Id. § 403.5.

When it enacted Chapter 5.5 of the Porter-Cologne Act, the Legislature made a finding that Chapter 5.5 provided the authority necessary for the state and regional boards to have an approved state NPDES program:

> "The Federal Water Pollution Control Act as amended in 1972 requires the state to have certain powers [to obtain authorization to issue permits for point source discharges]. The powers contained in this act will allow the State Water Resources Control Board and the regional water quality control boards to comply with federal requirements...."

1972 Cal. Stats. c. 1256, § 3. The federal requirements for state NPDES programs, established by the Federal Water Pollution Control Act Amendments of 1972, include a requirement that the state must have authority to issue permits requiring publicly owned treatment works to have pretreatment programs. Clean Water Act section 402(b)(8), 33 U.S.C. § 1342(b)(8). In addition, the Federal Water Pollution Control Act Amendments of 1972 require that the state have authority to require industrial users to comply with pretreatment standards and with inspection, monitoring and

reporting requirements. Clean Water Act sections 402(b)(1)(B), 402(b)(9), 33 U.S.C. §§ 1342(b)(1)(B), 1342(b)(9). When it declared that Chapter 5.5 provided all of the authority necessary to comply with federal requirements, the Legislature must have intended Chapter 5.5 to provide authority to apply pretreatment requirements--both directly against industrial users and indirectly through publicly owned treatment works' pretreatment programs--consistent with the express requirements of section 402(b) of the Clean Water Act.

The state and regional boards have consistently interpreted Chapter 5.5 of the Porter-Cologne Act to provide the authority necessary to enforce pretreatment standards. See, e.g., Memorandum from Sheila K. Vassey to Craig M. Wilson (April 17, 1984). This authority does not depend upon adoption of state regulations, or upon EPA approval of a state pretreatment program:

> "With or without an approved state pretreatment program, the Regional Boards possess statutory authority to enforce national pretreatment standards, including both prohibited discharge standards and categorical standards, against both the owner or operator of a publicly owned treatment works (POTW) and the industrial users. This authority includes the ability to seek civil and criminal penalties against violators of pretreatment standards, as well as injunctive relief. In addition, the Regional Boards are empowered to require industrial users to make reports, monitor, sample effluent, and provide other information as may be reasonably required. The Regional Boards are also authorized to inspect the facilities of industrial users."

Id. at 1. The state and regional boards' construction of the Porter-Cologne Act is entitled to great weight, and will be

followed by the courts unless clearly erroneous. See 63 Ops.Cal.Atty.Gen. 51, 57 (1980). See generally Judson Steel Corp. v. Workers' Compensation Appeals Board, 22 Cal.3d 658, 668, 586 P.2d 564, 570, 150 Cal.Rptr. 250, 256 (1978).

In 1984 the Legislature amended the enforcement provisions of Chapter 5.5 of the Porter-Cologne Act. 1984 Cal. Stats. c. 1541, §§ 7, 8. The amendments increased the amount of liability which may be imposed for violations, and added violation of cleanup and abatement orders to the list of violations for which liability may be imposed. Those portions of the enforcement sections of Chapter 5.5 establishing that penalties may be imposed for violations of effluent limitations and pretreatment standards were re-enacted without change. See id. It is an established rule of statutory construction that when language in a statute has been subject to a particular administrative construction, and the Legislature re-enacts a statute without changing that language, the Legislature is deemed to have adopted that administrative construction. 28 Ops.Cal.Atty.Gen. 250, 252 (1956); see Division of Industrial Safety v. Municipal Court, 61 Cal.App.3d 696, 701, 132 Cal.Rptr. 573, 576 (1976). Before the enforcement sections of Chapter 5.5 were amended, the state and regional boards had construed these sections to authorize direct enforcement of national pretreatment standards against industrial users. See, e.g., Memorandum from Sheila K. Vassey to Craig M. Wilson at 6. The Legislature's re-enactment of these enforcement sections without substantial

change reinforces the conclusion that these enforcement sections provide all of the enforcement powers necessary for the state to have an approved state pretreatment program. This conclusion is consistent with the express language of Chapter 5.5 of the Porter-Cologne Act, and the state and regional boards' consistent interpretation of Chapter 5.5 of the Porter-Cologne Act. See §§ 13370, 13385, 13386, 13387; William R. Attwater, Chief Counsel, State Water Resources Control Board, Statement of Legal Authority to Implement a State Pretreatment Program in Accordance with the Clean Water Act 13 (1985).

Publicly owned treatment works' authority

State law also provides authority for publicly owned treatment works to apply and enforce pretreatment requirements. Cal. Gov't Code §§ 54739, 54740. This authority is in addition to any authority the municipality may have under its charter or enabling act. Id. § 54739(2). Because Government Code sections 54739 and 54740 are requirements of state law, a municipality or other public district which owns or operates a treatment works may apply these provisions of state law to any industrial user of the treatment works, even if the user is located outside the boundaries of the municipality or district.

Government Code section 54739 provides, in part, that the public entity that owns or operates a treatment works may require:

"(a) Pretreatment of any industrial waste which would be detrimental to the treatment works or its proper and efficient operation and maintenance; or

(b) The prevention of the entry of such waste into the collection system and treatment works...."

Cal. Gov't Code § 54739. The authority to require pretreatment or prohibit introduction of waste which would "be detrimental to the treatment works or its proper and efficient operation and maintenance" clearly includes the authority to apply pretreatment standards against pollutants that would otherwise interfere with the operation of the treatment works. The authority provided by Government Code section 54739 also should be interpreted to include authority to apply pretreatment requirements to pollutants which would otherwise pass through the treatment works or cause the treatment works to be in violation of waste discharge requirements.

The provisions determining the coverage of a regulatory statute are construed broadly to accomplish the purpose of the statute. Harvey v. Davis, 69 Cal.2d 362, 370-71, 444 P.2d 705, 710, 71 Cal.Rptr. 129, 134 (1968). Proper operation and maintenance of treatment facilities encompasses much more than avoiding plant breakdowns. Treatment plants should be operated and maintained to protect water quality and achieve compliance with all applicable state and federal regulatory requirements. Cf. 40 C.F.R. § 122.41(e) ("The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control...to achieve compliance with the conditions

of [the NPDES] permit.")

Statutes dealing with the same general subject should be construed together to achieve a uniform and consistent legislative purpose. Isobe v. California Unemployment Insurance Appeals Board, 122 Cal.3d 584, 591-92, 526 P.2d 528, 532, 116 Cal.Rptr. 376, 380 (1974). The Porter-Cologne Act directs the state and regional boards to issue waste discharge requirements which apply and ensure compliance with all applicable provisions of the Clean Water Act. § 13377. The applicable provisions of the Clean Water Act require that, as a condition of an NPDES permit, a publicly owned treatment works shall have a pretreatment program to apply all pretreatment standards promulgated under section 307 of the Clean Water Act. 33 U.S.C. § 1317; see 40 C.F.R. §§ 122.44(j), 403.8. To achieve the common legislative purpose of Government Code section 54739 and sections 13370.5 and 13377, Government Code section 54739 should be construed to provide authority for owners and operators of publicly owned treatment works to apply pretreatment standards to the full extent necessary for the treatment works to comply with waste discharge requirements issued pursuant to section 13377.

Government Code section 54740 provides for civil liability for violations of pretreatment requirements, in an action brought by the public entity which owns or operates the treatment works. Liability may be imposed under this statute for up to $6,000 per day. Cal. Gov't. Code § 54740. Although

Government Code section 54730 does not expressly authorize injunctive relief, injunctive relief is also available as a remedy for violations of pretreatment requirements. Express statutory authorization for damages or penalties, without express authorization of injunctive relief, does not preclude injunctive relief in appropriate cases. See Burks v. Poppy Construction Co., 57 Cal.2d 463, 470, 370 P.2d 313, 317, 20 Cal.Rptr. 609, 613 (1962). As stated in a memorandum by Hugh Barroll of the Office of Regional Counsel for EPA:

> "[T]he superior courts have general authority to grant injunctive and emergency relief 'when it appears...that the plaintiff is entitled to the relief demanded, and such relief, or any part thereof, consists in restraining the commission or continuance of the act complained of...,' or 'when it appears by the complaint or affidavits that the commission of some act during the litigation would produce waste, or great or irreparable injury, to a party to the action.' Code of Civil Procedure § 526. This authority should be sufficient...to halt dangerous discharges and enjoin violations of pretreatment standards and requirements."

(November 20, 1984.) Especially where violation of pretreatment requirements interferes with operation of the treatment works, or results in a condition of pollution or nuisance, the owner or operator of the treatment works will be able to obtain injunctive relief. See generally 7 B. Witkin, Summary of California Law, Equity §§ 94, 99, 102, 103 (8th ed., 1974).

4. Pretreatment Requirements in Permits for Publicly Owned Treatment Works

State law provides authority to apply in terms and

conditions of permits issued to publicly owned treatment works the applicable requirements of 40 CFR part 403 including:

- A compliance schedule for the development of a publicly owned treatment works pretreatment program as required by 40 CFR § 403.8(d);
- The elements of an approved publicly owned treatment works pretreatment program as required by 40 C.F.R. § 403.8(c);
- A modification clause requiring that the publicly owned treatment works' permit be modified or revoked and reissued after the effective date for approval of the state pretreatment program to incorporate into the publicly owned treatment works' permit an approved publicly owned treatment works pretreatment program in accordance with the requirements of 40 C.F.R. §403.10(d);
- Prohibitive discharge limitations applicable to industrial users as required by 40 C.F.R. § 403.5; and
- Demonstrated percentages of removal for those pollutants for which a removal allowance was requested in accordance with the requirements of any applicable regulations.

Federal Authority: Clean Water Act sections 307(b)(1), 402(b)(1)(A); 402(b)(1)(C); 40 C.F.R. §§ 403.5, 403.7, 403.8, 403.10.

State Authority: §§ 1058, 13263, 13370.5, 13376, 13377, 13378, 13383; 23 Cal. Admin. Code §§ 2233, 2235.1, 2235.2, 2235.3.

Remarks: All publicly owned treatment works which discharge to waters of the United States are subject to waste discharge requirements. See §§ 13376, 13377. These waste discharge requirement must apply and ensure compliance with all applicable provisions of the Clean Water Act and EPA regulations, including pretreatment requirements. See § 13377; 23 Cal. Admin. Code § 2235.2.

A federal court has set aside EPA's removal credits regulation. Natural Resources Defense Council, Inc. v. United States Environmental Protection Agency, 790 F.2d 289 (D.C. Cir. 1986). Therefore, there is no currently applicable removal credits regulations to be applied as part of the state program. When EPA adopts a new regulation in response to the court's decision, the new regulation will automatically be incorporated into the state program, and applied as part of the state's permit decisions. See § 13377; 23 Cal.Admin. Code §§ 2235.1, 2235.2.

Publicly owned treatment works which are not subject to NPDES permit requirements because they discharge to land or to ground waters also must have waste discharge requirements under the Porter-Cologne Act. § 13263. Waste discharge requirements may require that the operating entity have and enforce an adequate pretreatment program approved by the regional board, whether or not the treatment works discharge to waters of the

United States. 23 Cal. Admin. Code § 2233. A pretreatment program is required for any publicly owned treatment works with an average dry weather flow of 5 mgd or more; a pretreatment program may be required, at the discretion of the state and regional boards, for smaller treatment works. Id. This requirement is in addition to any applicable pretreatment requirements established pursuant to the Clean Water Act and EPA regulations. Id. § 2235.3; see § 13372.

5. Permit Conditions Required Under 40 C.F.R. §§ 122.41, 122.42

State law provides adequate authority to apply all permit conditions required pursuant to 40 C.F.R. §§ 122.41, 122.42.

Federal Authority: Clean Water Act sections 308(a), 402(a), 402(b); 40 C.F.R. §§ 122.41, 122.42, 123.25(a).

State Authority: §§ 1058, 13370.5, 13376, 13377, 13378, 13380, 13381, 13383; 23 Cal. Admin. Code §§ 2235.1, 2235.2.

Remarks: The Porter-Cologne Act and state board regulations require that waste discharge requirements, at a minimum, apply and ensure compliance with all applicable provisions of the Clean Water Act and EPA regulations. § 13377; 23 Cal. Admin. Code §§ 2235.1, 2235.2. Applicable federal requirements include permit conditions required under 40 C.F.R. §§ 122.41, 122.42. See 40 C.F.R. § 123.25(a). Waste discharge requirements will incorporate these permit conditions, except where the waste discharge requirements set more stringent

conditions pursuant to the requirements of the Porter-Cologne Act. See §§ 13272, 13377.

In some cases, where permit conditions provided for in EPA regulations excuse discharges that would otherwise constitute permit violations, a state may set more stringent requirements by omitting the permit conditions:

> "For example, a State may impose more stringent requirements in an NPDES program by omitting the upset provisions of [40 C.F.R.] § 122.41 or by requiring more prompt notice of an upset."

40 C.F.R. § 123.25(a) Note. Recognizing the rights of the states "to develop more stringent standards than promulgated by EPA", the state board, upon review of the action of a regional board that did not include an upset clause in waste discharge requirements for an oil refinery, concluded that the regional board's action was appropriate and proper. State Water Resources Control Board Order No. WQ 75-16 at 4.

6. Schedules of Compliance

State law provides authority to set and revise schedules of compliance in issued permits which require the achievement of applicable effluent standards and limitations in accordance with compliance dates set by EPA regulations, or, in the absence of any compliance date set by EPA regulations, within the shortest reasonable time consistent with the requirements of the Clean Water Act. This includes authority to set interim compliance dates which are enforceable without otherwise showing a violation

of an effluent limitation or harm to water quality. In no event will more than one year elapse between interim compliance dates.

Federal Authority: Clean Water Act sections 301(b), 303(e), 306, 307, 402(b)(1)(A), 502(11), 502(17), 40 C.F.R. §§ 122.47, 122.62.

State Authority: §§ 1058, 13377, 13381; 23 Cal. Admin. Code §§ 2235.1, 2235.2.

Remarks: Chapter 5.5 of the Porter-Cologne Act incorporates all applicable requirements of the Clean Water Act and implementing regulations concerning schedules of compliance in NPDES permits. See § 13377; 23 Cal. Admin. Code §§ 2235.1, 2235.2. Violation of a schedule of compliance, or any other condition of waste discharge requirements, may be grounds for enforcement, even if there is no discharge. See §§ 13385(a)(3), 13386(b), 13387(a).

Independent of the requirements of Chapter 5.5 of the Porter-Cologne Act, a regional board may establish a schedule of compliance as a condition of waste discharge requirements. § 13263(c). In the exercise of this authority, a regional board may rely on EPA regulations as guidance, and issue alternative schedules of compliance as provided for under 40 C.F.R. § 122.47(b), a regulation not expressly made applicable to state programs. In no event, however, may waste discharge requirements establish a schedule of compliance which is less stringent than required under the provisions of the Clean Water Act and EPA regulations which apply to state NPDES programs. See §§ 13272,

13377.

C. Authority to Deny Permits in Certain Cases

State law provides authority to insure that no permit will be issued in any case where:

- o The permit would authorize the discharge of a radiological, chemical, or biological warfare agent or high-level radioactive waste;
- o The permit would, in the judgment of the Secretary of the Army acting through the Chief of Engineers, result in the substantial impairment of anchorage or navigation of any waters of the United States.
- o The permit it objected to in writing by the Administrator of EPA, or the Administrator's designee, pursuant to any right to object provided to the Administrator under section 402(d) of the Clean Water Act;
- o The permit would not ensure compliance with the applicable water quality requirements of all affected states.
- o The permit would authorize a discharge from a point source which is in conflict with a plan approved under section 208(b) of the Clean Water Act;
- o The permit would authorize a discharge to the territorial sea when insufficient information exists to make a reasonable judgment whether the discharge

complies with guidelines promulgated under Section 403 of the Clean Water Act or, if the permit is issued before promulgation of guidelines under section 403(c) of the Clean Water Act, it is determined that the discharge would not be in the public interest.

- The permit would authorize a discharge from a facility which is a new source or new discharger, the construction or operation of which would cause or contribute to the violation of water quality standards.

Federal Authority: Clean Water Act sections 208(e), 301(b)(1)(c), 301(f), 402(b)(6), 402(d)(2), 40 C.F.R. § 122.4.

State Authority: §§ 1058, 13375, 13377, 13378, 13384; 23 Cal. Admin. Code §§ 2235.1, 2235.2.

Remarks: The requirements of the Clean Water Act and implementing regulations prohibiting issuance of any NPDES permit under specified circumstances have been incorporated into Chapter 5.5 of the Porter-Cologne Act. See § 13377.

D. Authority to Limit Duration of Permits

State law provides authority to limit the duration of permits to a fixed term not exceeding five years.

Federal Authority: Clean Water Act section 402(b)(1)(B); 40 C.F.R. §§ 122.6, 122.46.

State Authority: §§ 1058, 13377, 13378, 23 Cal. Admin. Code §§ 2235.1, 2235.2, 2235.4.

Remarks: Section 13377 and state board regulations incorporate all applicable requirements of the Clean Water Act and EPA regulations, including the requirements of 40 C.F.R. § 122.46, concerning duration of permits.

Chapter 5.5 of the Porter-Cologne Act also expressly provides that waste discharge requirements "shall be adopted for a fixed term not to exceed five years". § 13378. This provision is patterned after section 402(b)(1)(B) of the Clean Water Act. 33 U.S.C. § 1342(b)(1)(B). EPA has construed section 402(b)(1)(B) of the Clean Water Act to allow continuation of expired permits under specified circumstances, including timely submittal of an application for a new permit. 40 C.F.R. § 122.6. Where a state statute is patterned after a federal act, federal regulations interpreting the federal act are persuasive authority as to how the state statute may be interpreted. No Oil, Inc. v. City of Los Angeles, 18 Cal.3d 68, 86 n.21, 529 P.2d 66, 78 n.21, 118 Cal.Rptr. 34, 46 n.21 (1974).

EPA's interpretation of the Clean Water Act to allow continuation of expired permits is based in part upon a provision of the Administrative Procedure Act. See 5 U.S.C. § 558(c). But the rule that a federal agency's interpretation of a federal act is persuasive authority in interpreting a state statute patterned after the federal act is not limited to instances where the federal agency's interpretation is based solely on the language and legislative history of that particular federal act. The rule also may properly be applied where the federal agency's interpretation

is based upon the need to harmonize that particular federal act with other related federal acts. This principle is recognized, at least implicitly, by the Legislature's declared intent, in enacting Chapter 5.5 of the Porter-Cologne Act, to authorize the state to implement the provisions of the Clean Water Act "and acts amendatory thereof or supplementary thereto". § 13370 (emphasis added); see § 13377.

Consistent with EPA's interpretation of the Clean Water Act, the state board has adopted a regulation providing for continuation of expired permits, but only "if all requirements of the federal NPDES regulations on continuation of expired permits are complied with". 23 Cal. Admin. Code § 2235.4. As the agency charged with implimentation of the Porter-Cologne Act, the state board's interpretation of the Act is entitled to great weight. Pacific Legal Foundation v. California Unemployment Insurance Appeals Board 29 Cal.3d 101, 111, 624 P2d 244, 298-99, 172 Cal.Rptr. 194, 198-99 (1981). Thus, waste discharge requirements are for a fixed term not to exceed five years. See 40 C.F.R. § 122.46(a). Waste discharge requirements may not be extended beyond that five year period, except as provided under 40 C.F.R. § 122.6. See id. § 122.46(b).

E. Authority to Allow Transfer of Permits

State law provides authority to allow transfer of permits if the State Director is notified in writing at least thirty days in advance of the proposed transfer date, notice includes a written

agreement between the existing and new permittees containing a specific date for transfer of permit responsibility, coverage, and liability between them, and the Director does not notify the existing permittee and the proposed permittee of the Director's intent to modify, revoke and reissue, or terminate the permit.

Federal Authority: 40 C.F.R. §§ 122.41(l)(3), 122.61(b).

State Authority: § 13377; 23 Cal. Admin. Code § 2235.2.

Remarks: Chapter 5.5 of the Porter-Cologne Act authorizes the state and regional boards to issue permits for point source discharges, in the form of waste discharge requirements, "as required or authorized" by the Clean Water Act. § 13377. State board regulations require that waste discharge requirements for point source discharges be "issued and administered" in accordance with EPA's NPDES program regulations. 23 Cal. Admin. Code § 2235.2. The applicable EPA regulations include provision for automatic transfer of NPDES permits, but only if specified conditions are met. 40 C.F.R. § 122.61(b). Accordingly, the state and regional boards may allow automatic transfer only where the conditions specified in 40 C.F.R. § 122.61(b) are satisfied. Otherwise, waste discharge requirements must be modified or revoked and reissued in order to allow a change in ownership or operational control. See id. § 122.61(a).

Even for non-point discharges, waste discharge requirements ordinarily must be modified, or new waste discharge requirements issued, to allow the discharge from a facility to continue after a change in ownership. Waste discharge requirements

are the personal responsibility of the discharger; they are issued to the discharger, not the facility. See § 13260. In some limited circumstances, however, a transfer may be permissible under the terms of the waste discharge requirements. If waste discharge requirements apply to a category or class of dischargers, as in the case of a general permit, or if the waste discharge requirements expressly allow transfer upon satisfaction of specified conditions, waste discharge requirements may apply to and authorize discharge by a new owner without being modified or reissued.

For point source discharges, waste discharge requirements must include certain permit conditions provided for under applicable EPA regulations. See 40 C.F.R. § 122.41; § 13377; 23 Cal. Admin. Code § 2235.2. These conditions include a provision that transfer may be allowed only after proper notice to the state program director, who may require that the permit be modified or revoked and reissued before the transfer. See 40 C.F.R. §§ 122.41(l)(3), 122.61. Although the regional board may not delegate authority to issue waste discharge requirements, the authority to object to a proposed transfer, and require that the waste discharge requirements be modifed or reissued, may be delegated to the executive officer. See § 13223. In administering the permit condition allowing for permit transfers, the executive officer must follow the requirements of 40 C.F.R. § 122.61. See 23 Cal. Admin. Code § 2235.2.

The Porter-Cologne Act also establishes personal responsibility for persons discharging or proposing to discharge

waste to file a report of waste discharge. §§ 13260, 13376. But this requirement may be waived in appropriate cases. Section 13376 requires that persons discharging or proposing to discharge waste into navigable waters file a report of waste discharge in compliance with section 13260. Section 13260 establishes a parallel requirement for all point and non-point discharges. Section 13260, which applies to point source discharges to the extent that it is consistent with Chapter 5.5 of the Porter-Cologne Act and federal requirements incorporated into Chapter 5.5 of the Porter-Cologne Act, allows the regional board to waive the filing of a report of waste discharge where the waiver is not against the public interest. §§ 13260(b), 13269; see § 13377. In providing that reports of waste discharge be filed in accordance with the procedures set forth in section 13260, which in turn allows for a waiver of the filing requirement in appropriate cases, section 13376 allows for a waiver of the filing requirement where consistent with EPA regulations.

For point source discharges, a report of waste discharge is the equivalent of an NPDES permit application. See 23 Cal. Admin. Code § 2235(b). Accordingly, the state and regional boards cannot waive the filing of a report of waste discharge under circumstances where an NPDES permit application is required under the Clean Water Act and EPA regulations. See §§ 13269, 13370, 13376. Moreover, where EPA regulations require the filing of a complete application before an NPDES permit may be issued, see 40 C.F.R. § 124.3(a)(2), the state and regional boards cannot issue

waste discharge requirements before a complete report of waste discharge is filed. See § 13377; 23 Cal. Admin. Code §§ 2235.1, 2235.2.

In some circumstances, EPA regulations allow the states to issue or modify NPDES permits without requiring that a permit application be filed. For example, no application is required for minor modifications in an NPDES permit. See 40 C.F.R. § 122.63; cf. id. § 124.5(c) (an application may be required for modification for cause). Accordingly, the state board has interpreted the Porter-Cologne Act and state board regulations not to require the filing of a report of waste discharge for minor modifications provided for under 40 C.F.R. § 122.63. State Water Resources Control Board, Office of the Chief Counsel and Division of Technical Services, Guidelines on Application of Fee Schedule R (March 29, 1984).

Similarly, EPA regulations do not require that a report of waste discharge be filed, or that the state program director formally modify the permit, where the conditions for automatic transfer are satisfied. See 40 C.F.R. § 122.61; cf. id. § 122.62(b)(2) (a permit may be modified to reflect an automatic transfer). The state board has interpreted the Porter-Cologne Act and state board regulations to allow for automatic transfers of waste discharge requirements, without filing of a report of waste discharge or formal modification of waste discharge requirements, where automatic transfers are permitted under 40 C.F.R. § 122.61(b). State Water Resources Control Board, Office of the

Chief Counsel and Division of Technical Services, Guidelines on Application of Fee Schedule 10-11. An administrative agency's interpretation of the statutes and regulations it enforces is entitled to great weight unless clearly erroneous. Pacific Legal Foundation v. California Unemployment Insurance Appeals Board, 29 Cal.3d 101, 111, 624 P.2d 244, 298-99, 172 Cal.Rptr. 194, 198-99 (1981).

F. Authority to Issue General Permits

The state has authority to issue general permits in accordance with the Clean Water Act and EPA regulations.

Federal Authority: Clean Water Act section 402;40 C.F.R. § 122.28.

State Authority: § 13377; 23 Cal. Admin. Code § 2235.2.

Remarks: Chapter 5.5 of the Porter-Cologne Act is patterned after the Clean Water Act. Although neither the Porter-Cologne Act nor the Clean Water Act expressly authorize general NPDES permits, the federal courts have construed the Clean Water Act to authorize issuance of general permits. Natural Resources Defense Council v. Costle, 568 F.2d 1369 (1977). Where a state statute is patterned after a federal act, decisions of the federal courts interpreting the federal act are persuasive authority as to how the state statute should be interpreted. Kaplan's Fruit and Produce Co. Superior Court, 26 Cal.3d 60, 65, 603 P.2d 1341, 1343, 160 Cal.Rptr. 745, 747 (1969). The authority to issue waste discharge requirements "as required or authorized" by the Clean

Water Act, § 13377, includes the authority to issue general NPDES permits.

The Porter-Cologne Act has been interpreted to authorize issuance of general waste discharge requirements. See e.g., 23 Cal. Admin. Code § 2524(c). This interpretation applies to point-source discharges subject to the NPDES program to the extent that issuance of general waste discharge requirements for point source discharges would be consistent with the requirements of the Clean Water Act. § 13372.

Waste discharge requirements for point source discharges must apply and ensure compliance with all applicable provisions of the Clean Water Act and EPA regulations. See § 13377; 23 Cal. Admin. Code § 2235.2. EPA has issued general permit regulations. See 40 C.F.R. § 122.28. Accordingly, any waste discharge requirements issued as general permits for point source discharges to waters of the United States must be issued in accordance with 40 C.F.R § 122.28.

The state's authority to issue general permits is not inconsistent with the provisions of the Water Code and state board regulations that require any person discharging or proposing to discharge wastes to file a report of waste discharge. §§ 13260, 13376; 23 Cal. Admin. Code § 2235.1(a). Subdivision (b) of section 13260 specifically provides authority to the regional boards to waive the reporting requirement for a specific discharge or type of discharge. See §§ 13269; 13376 (reports of waste discharge for point source discharges to navigable waters shall be

filed in compliance with the procedures set forth in section 13260.) Under sections 13369 and 13372, a waiver would have to be consistent with the Clean Water Act and regulations promulgated by EPA. For discharges subject to a general permit, such a waiver would be consistent with the NPDES program because the regulations implementing the program specify that a permit application is not required for persons covered by a general permit. 40 CFR §122.21(a).

State board regulations require that "any person discharging or proposing to discharge" from a point source file a report of waste discharge." 23 Cal. Admin. Code § 2235.1(a). This provision must be read in light of another subdivision of the same regulation, which states that "each report of waste discharge...shall be filed...in compliance with the applicable federal regulations governing the NPDES program". Id. § 2235.1(c). The applicable federal regulations provide that no permit application need be filed for discharges which are subject to a general permit. 40 C.F.R. § 122.21(a). It would make little sense to require a permit application from a person who is already permitted to make the discharge. Thus, the state board's NPDES regulations cannot reasonably be interpreted to require a person who already is permitted to make the discharge under a valid general permit to file a new report of waste discharge for the permitted discharge, except where the state board or a regional board requests submission of a report of waste discharge for an individual permit. See 40 C.F.R. § 122.28(b)(2).

G. Authority to Apply Recording, Reporting, Monitoring, Entry, Inspection and Sampling Requirements

1. Monitoring, Recording and Reporting

State law provides authority to require any permit holder or industrial user of a publicly owned treatment works to:

- o Establish and maintain specific records;
- o Make reports;
- o Install, calibrate, use and maintain monitoring equipment or methods including, where appropriate, biological monitoring methods;
- o Take samples of effluents in accordance with the methods mentioned above; and
- o Provide such other information as may reasonably be required.

Federal Authority: Clean Water Act sections 304(i)(2)(A) and (B), 308, 402(b)(2), 402(b)(8); 40 C.F.R. §§ 122.41(h), 122.41(j), 122.41(l), 122.42, 122.44(f), 122.44(g), 122.44(i) 122.44(j), 122.48, 403.7, 403.8, 403.10, 403.12.

State Authority: §§ 1058, 13267, 13377, 13383; 23 Cal. Admin. Code §§ 2230(c), 2235.2, 2235.3.

Remarks: Section 13383 is patterned after section 308(a)(A) of the Clean Water Act. Compare § 13383 with Clean Water Act section 308(a)(A), 33 U.S.C. § 1318(a)(A). Pursuant to section 13383, the state and regional boards may impose

recording, reporting, monitoring, inspection and sampling requirements, to the same extent as these requirements may be imposed by EPA pursuant to section 308 of the Clean Water Act. These requirements may be applied, independent of any conditions imposed in waste discharge requirements, to any person who discharges pollutants to waters of the United States or who introduces pollutants into publicly owned treatment works. See § 13383.

In addition, recording, reporting, monitoring, entry, inspection and sampling requirements may be imposed as a condition of waste discharge requirements. Waste discharge requirements must apply and ensure compliance with all NPDES program requirements. § 13377; 23 Cal. Admin. Code § 2235.2. Applicable NPDES program requirements include requirements for imposition of recording, reporting, monitoring, entry, inspection and sampling requirements as a condition of NPDES permits. See 40 C.F.R. §§ 122.41, 122.42, 122.44, 122.48, 403.7, 403.8, 403.12.

The state and regional boards' authority to apply recording, reporting, monitoring, entry, inspection and sampling requirements pursuant to Chapter 5.5 of the Porter-Cologne Act is supplemented by other provisions. See § 13372. This supplementary authority authorizes the state and regional board to require any state or local agency, or any person discharging or proposing to discharge from a point or non-point source or into a community sewer system, to submit technical or monitoring reports. §§ 13165, 13267. The regional boards may also enter and inspect the

facilities of any persons, including but not limited to, dischargers and industrial users, to determine compliance with the requirements of the Porter-Cologne Act. See § 13267.

2. Entry, Inspection and Sampling

State law provides authority to enable authorized representatives of the state, and publicly owned treatment works with approved pretreatment programs, upon presentation of such credentials as may be required by law, to:

- Have a right of entry to, upon, or through any premises of a permittee or of an industrial user of a publicly-owned treatment works in which premises an effluent source is located or in which any records are required to be maintained.
- At reasonable times to have access to and copy any records required to be maintained;
- To inspect at reasonable times any required monitoring equipment or method;
- To inspect at reasonable times any collection, treatment, pollution management, or discharge facilities required under the permit; and
- Sample or monitor at reasonable times, for the purpose of assuring permit compliance or as otherwise authorized by the Clean Water Act, any substance or parameters at any location.

Federal Authority: Clean Water Act sections 308,

402(b)(2), 402(b)(9); 40 C.F.R. §§ 122.41(i), 403.8, 403.10, 403.12.

State Authority: §§ 183, 186, 1058, 1080, 13221, 13267, 13377, 13383; 23 Cal. Admin. Code § 2235.2.

Remarks: The state and regional boards have the power to conduct investigations. §§ 183, 13267(a); see § 13163. As part of these investigations, the state and regional boards may:

- o Conduct sampling or monitoring;
- o Inspect records, facilities, and monitoring equipment; and
- o Issue subpoenas to require production of evidence. See §§ 183, 186, 1080, 13221, 13267(b), 13267(c); Cal. Gov't Code § 11181.

The state and regional boards have broad powers to conduct investigations of "the quality of any waters of the state". § 13267(a); see § 183; Joseph v. Masonite Corp., 148 Cal.App.3d 6, 9, 195 Cal.Rptr. 629, 630-31 (1983). These investigations may be conducted for any purpose necessary to carry out the power of the boards including "establishing or reviewing any water quality control plan, or waste discharge requirements, or in connection with any action relating to any plan or requirement or authorized by the Porter-Cologne Act". §§ 183, 13267(a). The boards have authority under their investigatory powers to conduct sampling or monitoring, inspect records, facilities, and monitoring equipment and issue subpoenas to require the production of evidence. §§ 183, 186, 1080, 13221, 13267(b), 13267(c); Cal. Gov't Code § 11181.

The power to investigate includes the authority to use

different investigation methods, including inspection, sampling, and other forms of surveillance and monitoring. The plain meaning of the phrases "investigate the quality of any waters of the state," § 13267(a) and "inspect the facilities of any person" includes monitoring and surveillance activities. § 13267(b). The plain meaning of the statute is supported by the legislative history of section 13267.

As originally enacted in 1949, section 13055, the predecessor of section 13267, authorized the regional boards to "investigate" sources of water pollution. 1949 Cal. Stats. c. 1549. The Legislature later amended the statute to authorize the regional boards to require submittal of technical or monitoring reports. 1951 Cal. Stats. c. 1139, § 3.5; 1965 Cal. Stats. c. 1657, § 20.

The report of the state board to the Legislature, upon which the Porter-Cologne Act is based, states:

> "Regional boards are increasing their surveillance and monitoring activities to determine dischargers' compliance with requirements to check on dischargers' self-monitoring programs, and to develop long-term policies....An expanded and improved monitoring and surveillance program is essential to an adequate water quality control program, and should be established."

Recommended Changes in Water Quality Control, Final Report of the Study Panel to the State Water Resources Control Board, Study Project, Water Quality Control Program 17-18 (1969). The Porter-Cologne Act is intended to implement the recommendations made in the report. 1969 Cal. Stats. c. 482, § 36. The state and regional

boards' authority to carry out water quality related investigations should be interpreted consistent with this legislative intent.

The regional boards also have authority to obtain an administrative inspection warrant to enter and inspect the facilities of any direct or indirect discharger to determine if the requirements of the Porter-Cologne Act are being complied with. § 13267(c); see Cal. Civ. Proc. Code § 1822.50, et seq. The constitutional validity of this procedure was upheld in Joseph v. Masonite Corp., 148 Cal.App.3d 6, 196 Cal.Rptr. 629 (1983). The regional board may enter and inspect facilities without an administrative inspection warrant if it obtains the consent of the owner, or in an emergency. § 13267(c).

The term "facilities", as used in Section 13267(c), applies broadly and includes any premises where an effluent source, monitoring equipment, or records required under the Porter-Cologne Act are located. See, e.g., Joseph v. Masonite Corp., 148 Cal.App.3d 6, 195 Cal.Rptr. 629 (unimproved timberland). The facilities that may be inspected include, but are not limited to, the facilities of any person who discharges pollutants from a point source or any industrial user of a publicly owned treatment works. See §§ 13267(b), 13267(c). As used in section 13267 and other provisions of Chapters 4 and 5 of the Porter-Cologne Act, the term "discharge" includes discharges into community sewer systems. See § 13301; cf. § 13263(a) (waste discharge requirements are not required for "discharges into a community sewer system").

Wherever a regional board may exercise powers of entry and

inspection, as provided under section 13267, the state board may also exercise those powers upon review of the regional board's action or failure to act. § 13320(c).

The boards' inspection authority provided in section 13383 also extends to inspection of any effluent source, including the facilities of an industrial user discharging into a publicly owned treatment works. The subject of section 13383, as expressed in the first sentence, is "dischargers of polluters or dredged or fill material to navigable waters or to public treatment systems". In the second sentence, the Legislature provides that the boards may inspect "the facilities of any discharger of pollutants or dredged or fill material". The phrase "discharger of pollutants or dredged or fill material" is used in the second sentence without limitation. Therefore, the reference in the second sentence to "discharger" is at least as extensive as the reference to the first sentence, which specifically includes dischargers to public treatment systems.

Section 13373, which provides that, as used in Chapter 5.5 of the Porter-Cologne Act, the term "discharge" shall have the same meaning as in the Clean Water Act, does not exclude dischargers to public treatment systems from the inspection authority set forth in section 13383. Such interpretation is directly contrary to the express reference to "dischargers...to public treatment systems" and therefore it should be avoided. Moreover, such interpretation would be inconsistent with the legislative intent that the state and regional boards have all powers of entry, inspection,

monitoring and sampling as required under the NPDES program, which encompasses both direct and indirect dischargers. See generally § 13370, 13370.5. In addition, the Clean Water Act also uses the term "discharge" to refer to discharges to public treatment systems. See Clean Water Act sections 301(b)(1)(A)(ii), 307(b)(1), 307(c), 309(a)(6), 33 U.S.C. §§ 1311(b)(1)(A)(ii), 1317(b)(1), 1317(c), 1319(a)(6).

Persons subject to waste discharge requirements for point source discharges are also required to permit entry, access to documents, inspection, sampling and monitoring as a condition of waste discharge requirements. Waste discharge requirements must apply and ensure compliance with all NPDES program requirements. § 13377; 23 Cal. Admin. Code § 2235.2. Applicable NPDES program requirements include a requirement that all NPDES permits include a condition requiring the permittee to allow entry and inspection by the NPDES program director. 40 C.F.R. § 122.41(i).

The Porter-Cologne Act and state board regulations also establish requirements for publicly owned treatment works to prepare and submit pretreatment programs for state or regional board approval. See §§ 13263, 13377; 23 Cal. Admin. Code §§ 2233, 2235.2, 2235.3. For publicly owned treatment works subject to 40 C.F.R. part 403, the state and regional boards may not approve a pretreatment program unless the publicly owned treatment works has adequate legal authority to enter and inspect the premises of any industrial user. See § 13377; 23 Cal. Admin. Code § 2235.2; 40 C.F.R. §§ 122.44(j), 403.8(f).

The authority for a publicly owned treatment works to require industrial users to allow entry and inspection may be provided as a condition of a contract between the public entity and the industrial user. 40 C.F.R. § 403.8(f)(1). California state law expressly authorizes all public entities that own or operate public treatment works to enter into contracts with industrial users. Cal. Gov't Code § 54738. The duration and terms of the contract shall be those which the public entity owning or operating the plant determines to be in its best interest. Id. § 54732. Clearly, this authority to enter contracts with industrial users subject to those terms as are in the best interest of the public entity includes authority to require as a condition of the contract that the industrial user allow entry, inspection, monitoring, sampling, and access to documents. The public entity may also rely on any entry and inspection authority provided by its own charter or enabling act to demonstrate that it has the authority necessary to obtain approval of its pretreatment program. See id. § 54739(2).

3. Compliance Evaluation

State law provides authority to receive, evaluate, retain and investigate for possible enforcement action all notices and reports required of regulated persons, and determine compliance with NPDES program requirements independent of information supplied by regulated persons.

Federal Authority: Clean Water Act sections 308,

402(b)(2), 402(b)(9); 40 C.F.R. § 123.26.

State Authority: §§ 183, 186, 1058, 1080, 13221, 13267, 13383.

Remarks: The state and regional boards have the authority to conduct investigations, as part of which they may receive, evaluate, retain and investigate any notices and reports required of regulated persons. See §§ 183, 186, 1080, 13221, 13267. As part of these investigations, the state and regional boards may also conduct their own monitoring and sampling, or subpoena witness or documents, to obtain information independent of information supplied by regulated persons. See id.

Section 13383 is patterned after section 308 of the Clean Water Act, and gives the state and regional boards powers of inspection, monitoring and entry comparable to EPA's powers under section 308 of the Clean Water Act. Compare § 13383 with Clean Water Act section 308, 33 U.S.C. § 1318. As such, section 13383 provides ample authority, both to receive and evaluate information required to be provided by regulated persons and to obtain information independent of information supplied by regulated persons.

H. Authority to Make Determinations on Request for Pretreatment Program Approval and Removal Allowances

State law provides authority to approve or deny:

- Requests for publicly owned pretreatment program approval, in accordance with the requirements of

40 C.F.R. §§ 403.8 and 403.11;

- Requests for authority to reflect removals achieved by the publicly owned treatment works, in accordance with the requirements of any applicable regulations.

Federal Authority: Clean Water Act sections 307(b), 402(b)(8); 40 C.F.R. §§ 122.44(j); 403.7, 403.8, 403.9, 403.10, 403.11.

State Authority: §§ 1058, 13363, 13370.5, 13377; 23 Cal. Admin. Code §§ 2233, 2235.1, 2235.2, 2235.3.

Remarks: In issuing waste discharge requirements for publicly owned treatment works which discharge from a point source to waters of the United States, the state and regional boards must apply and ensure compliance with all applicable EPA regulations. § 13377; 23 Cal. Admin. Code §§ 2235.1, 2235.2.

Applicable EPA regulations include regulations requiring publicly owned treatment works to prepare pretreatment programs and submit these programs to the "approval authority". 40 C.F.R. §§ 403.8, 403.9, 403.11. Upon EPA approval of a state pretreatment program, the state program director becomes the "approval authority". Id. § 403.3(c). The state program director's actions in reviewing and approving pretreatment programs are part of the state's NPDES program. See Clean Water Act section 402(b)(8); 33 U.S.C. § 1342(b)(8), 40 C.F.R. §§ 122.44(j), 123.25(a)(37), 403.1(b)(3).

Similarly, EPA regulations require that requests for

authority to reflect removals achieved by a publicly owned treatment works must be submitted for approval by the "approval authority". But a federal court has set aside EPA's removal credits regulation. Natural Resources Defense Council, Inc. v. United States Environmental Protection Agency, 790 F.2d 289 (D.C. Cir. 1986). Where the approval authority is EPA, or a state which relies on prospective incorporation by reference to incorporate all currently applicable regulations, there is no currently applicable removal credits regulation to be applied by the approval authority. Thus, even after the state and regional boards become the "approval authority" for purposes of pretreatment program approvals, the state and regional boards will not be authorized to approve revisions of pretreatment standards to reflect removals until EPA promulgates a new removal credits regulation. Once EPA promulgates a new regulation, it will automatically be incorporated into the state program. See § 13377; 23 Cal. Admin. Code § 2235.2. Once the state and regional boards become the "approval authority" and EPA promulgates a new removal credits regulation, the state's NPDES program will include review and approval of revisions of pretreatment standards to reflect removals. See Clean Water Act sections 307(b), 402(b)(8), 33 U.S.C. §§ 1317(b), 1342(b)(8); 40 C.F.R. § 122.44(j), 123.25(a)(37), 403.1(b)(3).

Waste discharge requirements issued pursuant to Chapter 5.5 of the Porter-Cologne Act must be issued and administered in accordance with all currently applicable Clean Water Act NPDES program regulations. § 13377, 23 Cal. Admin. Code

§§ 2235.1(c), 2235.2; see § 13370.5. The authority to approve or deny pretreatment programs is part of the authority to issue and administer waste discharge requirements in accordance with NPDES program requirements. Id. In addition, the Porter-Cologne Act and state board regulations provide authority to require publicly owned treatment works to prepare and submit pretreatment programs, whether or not the treatment works discharge to waters of the United States. See § 13263; 23 Cal. Admin. Code §§ 2233, 2235.2.

I. Authority to Make Determinations Concerning Application of National Pretreatment Standards to Industrial Users

State law provides authority to:

- Make a determination as to whether or not an industrial user falls within a particular industrial subcategory, in accordance with 40 C.F.R. § 403.6; and
- Deny or recommend approval of requests for fundamentally different factor variances for industrial users, in accordance with section 301(n) of the Clean Water Act and applicable EPA regulations.

Federal Authority: Clean Water Act sections 301(n), 402(b)(1)(A), 402(b)(8); 40 C.F.R. §§ 403.6, 403.10, 403.13.

State Authority: §§ 186, 13225, 13370, 13370.5, 13377, 13383, 13385, 13386, 13387.

Remarks: Chapter 5.5 of the Porter-Cologne Act authorizes the state and regional boards to apply and enforce Clean Water Act

pretreatment standards against industrial users of publicly owned treatment works. See §§ 13383, 13385, 13386, 13387. Chapter 5.5 of the Porter-Cologne Act also directs the state board to develop a state pretreatment program for EPA approval. § 13370.5. Included in this authority to apply pretreatment standards to industrial users is the authority to make any decision which must be made as part of state pretreatment program to determine how Clean Water Act pretreatment standards should be applied to any particular industrial user. § 186.

Under California law, an administrative agency's powers are not limited to those expressly granted by statute. Administrative officials may exercise such additional powers as are necessary for the due and efficient administration of those powers expressly granted by statute or which may fairly be implied by the expressly granted powers. Rich Vision Center v. Board of Medical Examiners, 144 Cal.App.3d 110, 114, 192 Cal.Rptr. 455, 457 (1983). The Water Code expressly provides that the state board "shall have such powers...as may be necessary or convenient for the exercise of its duties authorized by law". § 186.

The state and regional boards are authorized to issue waste discharge requirements that require publicly owned treatment works to have and enforce pretreatment programs which implement all applicable Clean Water Act pretreatment standards. See § 13377; 23 Cal. Admin. Code §§ 2233, 2235.1, 2235.2, 2235.3. See generally 40 C.F.R. §§ 122.44(j), 403.8. The state and regional board are also authorized to enforce all applicable Clean Water Act

pretreatment standards directly against industrial users. §§ 13385, 13386, 13387. See Appendix at A-8 - A-9. The authority to make determinations on applicability of specific categorical pretreatment standards to particular industrial users is reasonably necessary to the fair and efficient administration of a program to enforce pretreatment standards. Therefore, the power to make these determinations is implied by the state and regional boards' express powers to apply and enforce Clean Water Act pretreatment standards. In acting upon a request for a determination as to which industrial category applies to an industrial user of a publicly owned treatment works, the state and regional boards will follow the procedures set forth in 40 C.F.R. § 403.6(a). See 23 Cal. Admin. Code § 2235.2.

The authority to make recommendations on variance requests is also reasonably necessary to the efficient administration of the state and regional boards' powers to enforce pretreatment standards. This authority is required to obtain approval of a state pretreatment program, and an approved state pretreatment program is a necessary part of a state NPDES program. See 40 C.F.R. §§ 123.25(a)(37), 403.10(a), 403.10(f). The goal of statutory interpretation is to ascertain the intent of the Legislature so that the purpose of the law can be effectuated. People v. Shirokow, 26 Cal.3d 301, 306-07, 605 P.2d 859, 863-64, 162 Cal.Rptr. 30, 34 (1980). The Legislature has declared its intent that Chapter 5.5 of the Porter-Cologne Act provide the authority for the state to implement a state NPDES program and a

state pretreatment program. §§ 13370, 13370.5. To effectuate this legislative intent, the state and regional boards' express power to enforce pretreatment standards should be construed to include the power to deny or recommend approval of variance requests, as provided for under section 301(n) of the Clean Water Act and 403.1(f)(1). In acting on variance requests, the state and regional boards will apply section 301(n) of the Clean Water Act and, to the extent they have not been superseded by section 301(n) of the Clean Water Act, the criteria and procedures set forth in 40 C.F.R. § 403.13. See § 13377; 23 Cal. Admin. Code § 2235.2.

Other sections of the Porter-Cologne Act provide additional authority to make determinations or recommendations concerning pretreatment standards applicable to particular industrial users. The state board is designated as the state water pollution control agency for all purposes stated in the Clean Water Act, and is authorized to exercise any powers delegated to the state by the Clean Water Act. § 13160. The Legislature provided this authorization in anticipation of the Federal Water Pollution Control Act Amendments of 1972 (now known as the Clean Water Act). 33 U.S.C. § 1251 et seq. The clear intent of section 13160 is to provide authority for the state board to take actions that the Clean Water Act authorizes a state to take as part of the programs established by the Clean Water Act. At a minimum, section 13160 authorizes the state board to make any determination or certification as to the applicability of regulatory standards, and to issue or deny any concurrence in a variance request, that may be

provided for under the Clean Water Act or EPA regulations implementing the Clean Water Act.

J. Authority to Require Notice of Introduction of Pollutants into Publicly Owned Treatment Works

1. New or Substantially Changed Introductions of Pollutants

State law provides authority to require in permits issued to publicly owned treatment works that the permittee give notice to the state permitting authority of any:

- o New introductions into the treatment works of pollutants from any source which would be a new source as defined in section 306 of the Clean Water Act if the source were discharging pollutants directly to waters of the United States;
- o New introductions into the treatment works of pollutants from any source which would be a point source subject to section 301 of the Clean Water Act if it were discharging pollutants directly to waters of the United States;
- o Substantial changes in volume or character of pollutants introduced into the treatment works by a source introducing pollutants into the treatment works at the time of issuance of the permit.

Federal Authority: Clean Water Act sections 304(i)(2)(A) and (B), 308, 402(b)(8); 40 C.F.R. § 122.42(b).

State Authority: Cal. Gov't Code sections 54738, 54739, 54740; §§ 1058, 13267, 13377, 13383; 23 Cal. Admin. Code § 2235.2.

Remarks: The Clean Water Act and EPA regulations require that permits issued to publicly owned treatment works include conditions requiring notice to the state program director if pollutants are introduced from a new industrial source or if there are substantial changes in the pollutants introduced. Clean Water Act section 402(b)(8), 33 U.S.C. § 1342(b)(8); 40 C.F.R. § 122.42(b). The state and regional boards' authority to issue waste discharge requirements which apply and ensure compliance with all applicable provisions of the Clean Water Act encompasses the authority to incorporate the required permit condition. See § 13377; 23 Cal. Admin. Code § 2235.2.

Authority for municipalities that own or operate publicly owned treatment works to comply with the reporting requirements set by section 402(b)(8) of the Clean Water Act and 40 C.F.R. § 122.42(b) is encompassed within the municipalities' authority to set and enforce pretreatment requirements. See Cal. Gov't Code §§ 54738, 54739, 54740.

2. Introductions Subject to Pretreatment Standards

State law provides authority to require in permits issued to publicly owned treatment works that the permittee identify in terms of character and volume of pollutants any significant source introducing pollutants subject to pretreatment standards under section 307(b) of the Clean Water Act.

Federal Authority: Clean Water Act sections 307(b), 402(b)(8); 40 C.F.R. § 122.44(j).

State Authority: Cal. Gov't Code §§ 54738, 54739, 54740; §§ 1058, 13267, 13377, 13383, 23 Cal. Admin. Code § 2235.2.

Remarks: The Clean Water Act and EPA regulations require that permits issued to publicly owned treatment works include conditions requiring the permittee to identify significant introductions of pollutants into the publicly owned treatment works if those introductions are subject to pretreatment standards. Clean Water Act section 402(b)(8), 33 U.S.C. § 1342(b)(8), 40 C.F.R. § 122.44(j). The state and regional boards' authority to issue waste discharge requirements which apply and ensure compliance with all NPDES program requirements encompasses the authority to establish the necessary permit conditions. See § 13387; 23 Cal. Admin. Code § 2235.2.

Authority for municipalities which own or operate publicly owned treatment works to comply with the reporting requirements set by section 402(b)(8) of the Clean Water Act and 40 C.F.R. § 122.44(j) is encompassed within the authority to set and enforce pretreatment requirements. See Cal. Gov't Code §§ 54738, 54739, 54740.

K. Authority to Ensure Compliance by Industrial Users with sections 204(b), 307 and 308 of the Clean Water Act

State law provides authority to ensure that any industrial user of a publicly owned treatment works complies with Clean Water

Act requirements concerning:

- o User charges pursuant to section 204(b);
- o Pretreatment standards pursuant to section 307; and
- o Inspection, monitoring and entry pursuant to section 308.

Federal Authority: Clean Water Act sections 204(b), 307, 308, 402(b)(9); 40 C.F.R. §§ 35.929, 35.935-19, 122.44(j), 122.44(n), 403.8.

State Authority: Cal. Civ. Proc. Code § 1822.50 et seq.; Cal. Gov't Code §§ 54738, 54739, 54740; §§ 13267, 13268, 13370.5, 13377, 13382, 13385, 13386, 13387, 23 Cal. Admin. Code §§ 2233, 2235.2, 2235.3.

Remarks: State law provides authority for the state and regional boards to require industrial users to comply with sections 204(b), 307 and 308 of the Clean Water Act in two different ways. These requirements may be enforced directly against industrial users, or they may be enforced indirectly, through waste discharge requirements issued for publicly owned treatment works.

Chapter 5.5 of the Porter-Cologne Act expressly authorizes the state and regional board to obtain injunctive relief upon failure of an industrial user to comply with any cost or charge adopted by a public agency under section 204(b) of the Clean Water Act. § 13386(b). Chapter 5.5 of the Porter-Cologne Act also provides for civil and criminal penalties, as well as injunctive

relief, against industrial users who violates pretreatment standards established under section 307 of the Clean Water Act. §§ 13385, 13386, 13387.

Section 13383 provides the state and regional boards with powers to impose monitoring requirements, and with powers of entry, inspection and monitoring, equivalent to EPA's powers under section 308 of the Clean Water Act. Compare § 13383 with Clean Water Act section 308, 33 U.S.C. § 1318. These powers apply to industrial users as well as dischargers of pollutants to waters of the United States. § 13383. Failure to comply with recording, reporting, entry, inspection or monitoring requirements may result in civil or criminal liability. See Cal. Civ. Proc. Code § 1822.57; §§ 13267, 13268. The state and regional boards may also obtain injunctive relief to enforce the requirements of section 13383. § 13386(b).

Chapter 5.5 of the Porter-Cologne Act authorizes the state and regional boards to issue waste discharge requirements which "apply and ensure compliance with all applicable provisions" of the Clean Water Act. § 13377. The requirements of sections 204(b), 307, and 308 of the Clean Water Act are applicable provisions of the Clean Water Act; they must be enforced as part of a state NPDES program. See Clean Water Act section 402(b)(9), 33 U.S.C. § 1342(b)(9). Accordingly, the state and regional boards may establish conditions in waste discharge requirements requiring that publicly owned treatment works' apply and enforce the requirements of sections 204(b), 307 and 308 of the Clean Water Act against

industrial users.

Indeed, pretreatment, entry, inspection and monitoring requirements are mandatory permit conditions for waste discharge requirements issued to publicly owned treatment works. EPA regulations require that permits issued to publicly owned treatment works include conditions requiring the public entity to apply and enforce pretreatment, entry, inspection and monitoring requirements against industrial users. 40 C.F.R. §§ 122.44(j), 403.8; cf. id. §§ 35.929 (construction grant regulation requiring user charges), 35.935-19 (construction grant regulation requiring pretreatment programs), 122.44(n) (grant conditions that are reasonably necessary to achieve effluent limitations must also be imposed as permit conditions). Where EPA regulations require that permits include conditions meeting specified requirements, waste discharge requirements issued by the state and regional boards must impose those conditions, unless a stricter requirement is set pursuant to state law. See § 13377; 23 Cal. Admin. Code § 2235.2.

State law provides authority for public entities that own or operate treatment works to establish user charges, and to apply and enforce pretreatment standards and entry, inspection and monitoring requirements to industrial users. Cal. Gov't Code §§ 54738, 54739, 54740.

L. Authority to Issue Notices and Provide Opportunity For Public Hearings

State law provides authority to comply with requirements

of the Clean Water Act and EPA regulations for State NPDES programs and state pretreatment programs to:

- o Notify the public, affected states, and appropriate governmental agencies of proposed actions concerning the issuance or modification of permits, and approval of publicly owned treatment works pretreatment programs;
- o Provide an opportunity for public hearing, with adequate notice, prior to ruling on permit applications and applications for approval of publicly owned pretreatment works pretreatment programs.

Federal Authority: Clean Water Act sections 101(e), 304(i)(2)(B), 402(b)(3), 402(b)(4), 402(b)(5), 402(b)(6); 40 C.F.R. §§ 124.6, 124.8, 124.10, 124.11, 124.12, 403.11.

State Authority: Cal. Gov't Code § 11120 et seq.; §§ 1058, 13167, 13263, 13377, 13378, 13384; 23 Cal. Admin. Code §§ 2235.1, 2235.2.

Remarks: Chapter 5.5 of the Porter-Cologne Act and state board regulations require that waste discharge requirements apply and ensure compliance with all applicable NPDES program requirements. § 13377; 23 Cal. Admin. Code §§ 2235.1(c), 2235.2. This includes a requirement that the procedures for processing reports of waste discharge, issuing waste discharge requirements and approval of publicly owned treatment works pretreatment programs be consistent with public notice and hearing requirements established by the Clean Water Act and EPA

regulations. See id.; §§ 13378, 13384.

Even where NPDES program requirements do not require notice and an opportunity for a hearing, see, e.g., 40 C.F.R. § 122.63, the hearing requirements of the Porter-Cologne Act and the requirements of the Bagley-Keene Open Meeting Act require notice and an opportunity for a hearing before the state board or a regional board may issue or modify waste discharge requirements. See Cal. Gov't Code § 11120 et seq.; § 13263.

M. Authority to Transmit Data and Share Information

State law provides authority to comply with requirements of the Clean Water Act and EPA regulations for state NPDES programs and state pretreatment programs to:

- Transmit necessary information to EPA, and receive information transmitted by EPA; and
- Ensure that any information obtained or used in the administration of the state program is available to EPA without restriction.

Federal Authority: Clean Water Act sections 304(i)(2)(B), 402(b)(4), 402(d); 40 C.F.R. §§ 123.41, 123.42, 123.43, 123.44.

State Authority: Cal. Gov't Code § 6253.1; § 13377; 23 Cal. Admin. Code § 2235.1(c), 2235.2.

Remarks: Chapter 5.5 of the Porter-Cologne Act and state board regulations require that waste discharge requirements

for point source discharges be issued and administered in accordance with NPDES program requirements. § 13377; 23 Cal. Admin. Code § 2235.1(c), 2235.2. Consistent with these requirements, the state and regional boards must comply with all applicable provisions of the Clean Water Act and EPA regulations requiring transmittal of information and information sharing as part of a state NPDES program or state pretreatment program.

The California Public Records Act, Cal. Gov't Code § 6250 et seq., which makes public records available for public inspection but exempts certain documents from disclosure, does not impose any limitation of the ability of the state and regional boards to share information with EPA. The Public Records Act allows agencies to voluntarily disclose records that are exempt from disclosure under the Public Records Act, except where disclosure is prohibited by other laws. Cal. Gov't Code § 6254; see id. § 6254.5.

The Memorandum of Agreement for a state NPDES program must include provisions for sharing information with EPA. 40 C.F.R. § 123.24(b)(3). To the extent that the Memorandum of Agreement provides for disclosure of documents which would otherwise be exempt from disclosure under the Public Records Act, execution of the Memorandum of Agreement by the state board constitutes adoption of requirements that allow greater access to documents than required by the minimum standards set by the Public Records Act. The Public Records Act expressly allows state agencies to adopt such requirements for greater access to

documents:

> "Except as otherwise prohibited by law, a state or local agency may adopt requirements for itself which allow greater access to records than prescribed by the minimum standards set forth in this chapter [the Public Records Act]."

Cal. Gov't Code § 6253.1.

The provision of the Public Records Act which provides that disclosure of a public record to any member of the public constitutes a waiver of any exemption from disclosure otherwise provided by law is not a limitation on the board's authority to make information available to EPA without restriction. See Cal. Gov't Code § 6254.5. The section which provides that disclosure constitutes a waiver of any exemption continues:

> "For the purposes of this section, before a disclosure of an otherwise exempt public document to a federal agency, is made, the federal agency shall agree in writing to comply with [the Public Records Act]."

Id. The apparent intent of this section is to offer a procedure by which state agencies may voluntarily disclose to information to federal agencies without waiving exemptions from disclosure to the general public. Cf. Parrot v. Rogers, 103 Cal.App.3d 377, 383, 163 Cal.Rptr. 75, 78 (1980) (disclosure of information by one official to another who is subject to the same rules governing public disclosure does not constitute public disclosure of an exempt document). It should not be construed to require an agreement by the federal agency if the state agency is willing to waive exemptions from disclosure to the general public. The use

of the term "shall" in a state statute is not necessarily intended to foreclose the exercise of discretion. Cochran v. Herzog Engraving Co., 153 Cal.App.3d 405, 411, 205 Cal.Rptr. 1, 4 (1984) (dicta). Furthermore, section 6254.4 exempts certain disclosures from the requirement that a federal agency agree to comply with the Public Records Act. Section 6254.5(c) provides as follows: "This section [6254.5] however, shall not apply to disclosures...[w]ithin the scope of disclosure of a statute which limits disclosure of specified writings to certain purposes". Id. Information shared with EPA pursuant to NPDES program requirements fall within the scope of a federal statute and federal regulations authorized by that statute. The disclosure required when information is shared with EPA is for certain purposes: information is available for EPA's use, and may not necessarily be available to the general public. See 40 C.F.R. § 123.41. While EPA generally may disclose information to the public, the Clean Water Act and EPA regulations impose limitations on what may be disclosed. See Clean Water Act Section 308(b), 33 U.S.C. § 1318(b)); 40 C.F.R. part 2; id. § 123.41.

EPA regulations require that information obtained as part of the state NPDES program be made available to EPA "without restriction". 40 C.F.R. § 123.41. A requirement that EPA agree to restrict disclosure of information subject to disclosure under the Clean Water Act and EPA regulations would conflict with those regulations. State agencies should construe

state laws so that they may be harmonized with federal statutes and regulations. Regents of the University of California v. Public Employees Relations Board, 139 Cal.App.3d 1037, 1042, 189 Cal.Rptr. 298, 301-03 (1983). To avoid any possible conflict with the Clean Water Act and EPA regulations, the Public Records Act may be construed so that no agreement from EPA is required before the state shares information with EPA. To the extent that the Clean Water Act and EPA regulations require or authorize EPA to restrict public access to information provided by the states, and EPA decides to use the information for EPA's internal purposes only, section 6254.5 of the Government Code obviously is inapplicable. Cal. Gov't Code § 6254.5(c). Where a state agency shares an otherwise exempt document with EPA without restricting EPA's use of the document, and EPA, as required or authorized by the Clean Water Act and EPA regulations, discloses the information to the general public, the state agency's action is authorized under provisions of the Public Records Act which allow voluntary disclosure of otherwise exempt documents. Cal. Gov't Code §§ 6253.1, 6254.

N. Authority to Provide Public Access to Information

State law provides authority to make information available to the public, consistent with the Clean Water Act and EPA regulations. As part of this authority, state law provides:

- o Except insofar as trade secrets would be disclosed, the following information is available to the public for

inspection and copying: (1) Any draft or final fact sheet, permit, permit application, draft permit form or request for publicly owned treatment works pretreatment program approval; (2) Any public comments, testimony or other documentation concerning a permit application or request for publicly owned treatment works pretreatment program approval;

- o The state may hold confidential any information (except effluent data) submitted subject to a claim of confidentiality and shown to be information which, if made public, would divulge methods or processes entitled to protection as trade secrets.
- o The state may make available to the public any information obtained pursuant to any monitoring, recording, reporting, sampling or other investigatory activities of the state.

Federal Authority: Clean Water Act sections 304(i)(2)(B), 308(b), 402(b)(2), 402(j); 40 C.F.R. §§ 122.7(b), 122.7(c), 123.41, 124.3(a), 124.6, 124.8, 403.11, 403.14(b), 403.14(c).

State Authority: Cal. Evid. Code § 1060; Cal. Gov't Code §§ 6253, 6254, 6254.7; §§ 13167, 13267, 13377, 13383; 23 Cal. Admin. Code § 2235.1.

Remarks: Chapter 5.5 of the Porter-Cologne Act and state board regulations require that waste discharge requirements

for point source discharges to waters of the United States be issued and administered in accordance with all NPDES program requirements. § 13377, 23 Cal. Admin. Code § 2235.1(c), 2235.2. Issuance and administration of waste discharge requirements in accordance with NPDES program requirements includes adherence to all requirements for providing public access to information. See Clean Water Act section 402(j); 40 C.F.R. §§ 122.7(b), 122.7(c), 123.41, 124.3(a), 124.6, 124.8, 403.11, 403.14(b), 403.14(c).

The California Public Records Act, Cal. Gov't Code § 6250 et seq., establishes minimum requirements for making records available to the public for inspection and copying. Public records subject to the Public Records Act include any writing prepared by or submitted to the state and regional boards in connection with any report of waste discharge or request for approval of a publicly owned treatment works pretreatment program. See Cal. Gov't Code §§ 6252(d), 6254.7(a).

Certain kinds of documents are exempt from disclosure under the Public Records Act. Id. § 6254. For example, trade secrets are exempt from disclosure under the Public Records Act. See Cal. Evid. Code § 1060; Cal. Gov't Code § 6254(k). The Public Records Act, however, sets only minimum requirements for disclosure. A public agency may disclose information which is exempt from disclosure under the Public Records Act, unless disclosure is prohibited by some other state or federal law. Cal. Gov't Code §§ 6253.1, 6254.

Nothing in Chapter 5.5 of the Porter-Cologne prohibits the disclosure of any information to the public. Trade secret data submitted subject to a claim of confidentiality are protected from disclosure, however, except where disclosure is required under NPDES program requirements.

Provisions of the Porter-Cologne Act outside of Chapter 5.5 apply to actions taken in administering the state NPDES program, except where they are inconsistent with Chapter 5.5 or NPDES program requirements incorporated into Chapter 5.5. § 13372. Section 13267 establishes a procedure by which persons who submit technical or monitoring reports requested by the state and regional boards may request that those portions of the reports which would disclose trade secrets be withheld from the general public. § 13267(b).

Where a state and federal statute addressing the same subject have similar language, interpretations of the federal statute are persuasive authority in interpreting the state statute. See State ex rel. Director of Employment v. General Insurance Co., 13 Cal.App.3d 853, 859 n.3, 96 Cal.Rptr. 744, 747 n.3 (1971). The protection for "trade secrets" provided by the Clean Water Act has been interpreted not to extend to effluent data, permits, permit applications, and information required of all permit applicants. 40 C.F.R. §§ 122.7(b), 122.7(c); see Clean Water Act section 308(b), 33 U.S.C. § 1318(b). Accordingly, the protection of "trade secrets" provided by section 13267(b) may be interpreted not to extend to this

information. Compare § 13267(b) (providing trade secret protection for trade secret information submitted in response to requests for technical and monitoring program reports) with §§ 13260, 13263, 13267(a), 13267(c) (requiring submittal of reports of waste discharge to the regional boards, providing for issuance of waste discharge requirements, and authorizing surveillance and monitoring by the regional boards, without any provision barring disclosure of trade secrets). If the protection for trade secrets set by § 13267(b) were interpreted to extend to information that is not trade secret under the Clean Water Act, the provisions of section 13267(b) protecting trade secrets would not apply to activities carried out pursuant to Chapter 5.5 of the Porter-Cologne Act. See §§ 13272, 13377; 23 Cal. Admin. Code § 2235.2.

Thus, the state and regional boards have authority to make available to the public for inspection and copying any information required to be available under NPDES program requirements, even if disclosure is not required under the Public Records Act. See Cal. Gov't Code §§ 6253.1, 6254; § 13167.

O. Authority to Terminate or Modify Permits

State law provides authority to:

- Modify, revoke and reissue or terminate permits (but not to extend the term of a permit beyond five years from the original date of issuance) for cause including, but not limited to: (1) Violation of any condition of the

permit including, but not limited to, conditions concerning monitoring, entry, and inspection; (2) Obtaining a permit by misrepresentation, or failure to disclose fully all relevant facts; (3) Change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge; (4) Information indicating that the permitted discharge poses a threat to human health or the environment; or (5) Change in ownership or control.

- Where required by 40 C.F.R. §§ 122.44(b), 122.44(c) and 122.62(a)(7), modify, or revoke and reissue permits to incorporate any applicable toxic effluent standard or prohibition that is more stringent than any limitation in the permit.
- Modify, or revoke and reissue permits for such other causes as are set out in 40 C.F.R. § 122.62.

Federal Authority: Clean Water Act section 402(b)(1)(C); 40 C.F.R. §§ 122.41, 122.44, 122.61, 122.62, 122.63, 122.64.

State Authority: §§ 1058, 13377, 13381, 23 Cal. Admin. Code § 2235.2.

Remarks: The provisions of Chapter 5.5 of the Porter-Cologne Act for termination or modification of waste discharge requirements for cause are patterned after the provisions of the Clean Water Act. Compare § 13381 with Clean Water Act

section 402(b)(1)(C), 33 U.S.C. § 1342(b)(1)(C). As such, EPA regulations interpreting what constitutes cause for termination or modification of permits are persuasive authority in interpreting Chapter 5.5 of the Porter-Cologne Act. See generally No Oil, Inc. v. City of Los Angeles, 18 Cal.3d 68, 86 n.21, 629 P.2d 66, 78 n.21, 118 Cal.Rptr. 34, 46 n.21 (1974).

Consistent with 40 C.F.R. §§ 122.41(f), 122.41(l)(3), 122.44(b), 122.44(c), waste discharge requirements must expressly provide that they may be terminated or modified for cause, including promulgation of any effluent standard or prohibition for toxic pollutants which is more stringent than any limitation in the permit, or for which there is no limitation in the permit. See § 13377; 23 Cal. Admin. Code § 2235.2.

The Porter-Cologne Act also provides that all waste discharge requirements, for point and non-point source discharges, may be reviewed and revised upon the regional board's own motion. § 13263. The authority to revise waste discharge requirements includes authority to terminate or revoke and reissue waste discharge requirements in appropriate cases. This authority supplements the express authority set forth in section 13381, and is limited to actions that are not inconsistent with NPDES program requirements. See § 13372.

P. Authority to Abate Violations of Permits or the Permit Program

State law provides authority to:

- Abate violations of: (1) Requirements to obtain permits; (2) Terms and conditions of issued permits; (3) Effluent standards and limitations and water quality standards (including toxic effluent standards); (4) National categorical pretreatment standards; (5) Prohibitive discharge limitations applicable to direct users of publicly owned treatment works; and (6) Requirements for recording, reporting, monitoring, entry, inspection and sampling.
- Immediately and effectively halt or eliminate any imminent or substantial endangerment to the public health or welfare resulting from the discharge of pollutants.
- Apply sanctions against violations described above, and to enforce orders issued to halt or eliminate any imminent or substantial endangerment, including: (1) Injunctive relief, without the necessity of a prior revocation of the permit; (2) Civil penalties; (3) Criminal fines for willful and negligent violations; and (4) Criminal fines against persons who knowingly make any false statement, representation or certification in any form, notice, report, or other document required by the terms or conditions of any permit or otherwise required by the State a part of a recording, reporting or monitoring requirement.
- Assess civil penalties that are appropriate to the

violations. The maximum penalties are comparable to the maximum amounts recoverable under section 309 of the Clean Water Act. Civil and criminal penalties and fines may be obtained for each instance of violation.

Federal Authority: Clean Water Act sections 309, 402(b)(7), 402(h), 504; 40 C.F.R. §§ 123.27, 403.8, 403.10.

State Authority: §§ 13261, 13262, 13264, 13265, 13268, 13300, 13301, 13303, 13304, 13305, 13331, 13340, 13350, 13385, 13386, 13387.

Remarks:

Authority to restrain immediately, by order or by suit in state court, any person from engaging in any unauthorized activity or discharging pollutants that endanger public health or the environment

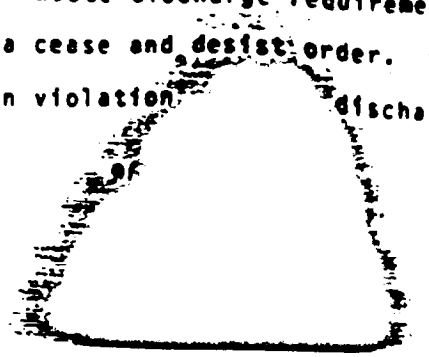
Section 13386 provides authority for the Attorney General, upon request of a regional board or the state board, to petition the appropriate court for issuance of a preliminary or permanent injunction, or both, for violations of state NPDES program requirements.

An injunction may be issued for violation of any "prohibition". § 13386. Prohibitions are established by statute, in Chapter 5.5 of the Porter-Cologne Act, against any discharge of any radiological, chemical, or biological warfare agent, § 13375, and against any point source discharge that is not authorized by waste discharge requirements. § 13376; cf

§ 13264(b) (providing supplementary authority to enjoin unpermitted discharges in specified cases). Prohibitions may also be established in waste discharge requirements and water quality control plans. § 13243.

An injunction may also be issued for any violation of waste discharge requirements, any violations of any "effluent limitation, water quality related effluent limitation, national standard of performance, pretreatment or toxicity standard," and any violation of any inspection, monitoring, or entry requirement. § 13386. An unauthorized point source discharge would constitute a violation of an "effluent limitation" established under section 301 of the Clean Water Act. See Clean Water Act section 301(a), 33 U.S.C. § 1311(a). Introduction of pollutants into a publicly owned treatment works in violation of pretreatment requirements would constitute a violation of a "pretreatment standard" established under section 307 of the Clean Water Act. See id. § 1317. An injunction may also be issued to require compliance with any cost or charge adopted by a public agency pursuant to section 204(b) of the Clean Water Act. § 13386.

Certain activities may also result in administrative orders requiring immediate corrective action. When a regional board finds that a discharge is taking place or threatening to take place in violation of waste discharge requirements, the regional board may issue a cease and desist order. § 13301. When a discharge occurs in violation [redacted] discharge



VOL 23

0132

requirements, the regional board may also issue a cleanup and abatement order. § 13304.

The regional board may also issue a cleanup and abatement order when waste has been discharged or deposited where it enters or threatens to enter waters of the state and create a condition of pollution or nuisance. § 13304. As used in the Porter-Cologne Act, "pollution" and "nuisance" include, but are not limited to, damage to public health or the environment resulting from the discharge of pollutants. See §§ 13050(l): 13304(e). The executive officer may issue a cleanup and abatement order without a prior hearing. See §§ 13223, 13304. "The Legislature specifically set up a process whereby a Regional Board Executive Officer could act expeditiously to correct water quality problems." State Water Resources Control Board Order No. WQ 85-10 at 5. Where a condition of pollution or nuisance is created or is threatened by a discharge or deposit, a cleanup and abatement order may be issued without proof of any violation of waste discharge requirements. See §§ 13263(g), 13304.

The Porter-Cologne Act provides authority for the Attorney General, upon request of a regional board or the state board, to obtain an injunction to enforce a cease and desist order or cleanup and abatement order. §§ 13304, 13331, 13386.

The Porter-Cologne Act also authorizes the Attorney General, upon request of a regional board, to bring an action for an injunction in an emergency requiring immediate action in response to a discharge or threatened discharge that threatens to

create a condition of pollution or nuisance. § 13340. As in the case of a cleanup and abatement order, the authority to obtain an emergency injunction for abatement of pollution or nuisance conditions does not depend upon proof of a violation of waste discharge requirements. See § 13340.

The authority to issue and enforce cease and desist and cleanup and abatement orders, and to obtain an emergency injunction, is not a limitation on the authority of the state and regional boards to obtain an injunction pursuant to section 13386 for violation of NPDES program requirements. § 13377.

The Porter-Cologne Act provides a procedure by which certain regional board decisions, including action or failure to act on waste discharge requirements, cease and desist orders or cleanup and abatement orders, may be appealed to the state board. § 13320. The pendency of an appeal does not stay the effect of a regional board order unless the state board, after notice and a hearing, issues a stay. § 13321. Absent a stay, the regional board may require compliance with an order subject to appeal, and refer any violations to the Attorney General for enforcement. As a matter of policy, the state board does not hear appeals of regional board actions referring matters to the Attorney General for enforcement. State Water Resources Control Board Order No. WQ 80-4 at 37-38.

Thus, the appeal procedures provided by the Porter-Cologne Act do not pose any barrier to the power of the regional boards to restrain immediately any unauthorized activity or any

activity which threatens to create a condition of pollution or nuisance.

In any action brought pursuant to the Porter-Coloone Act for injunctive relief on behalf of the state board or a regional board, it is unnecessary to prove irreparable harm. § 13361. The superior court has no authority to allow violations of the Porter-Cologne Act to continue. People ex rel. California Regional Water Quality Control Board v. F.E. Crites, Inc., 51 Cal.App.3d 961, 965, 124 Cal.Rptr. 664, 666 (1975). In this regard, the Porter-Cologne Act provides more effective enforcement powers than the Clean Water Act. Compare id. (court cannot permit operations to continue pending issuance of waste discharge requirements) with Weinberger v. Romero-Barcelo, 456 U.S. 305, 102 S.Ct. 1798 (1982) (court has equitable discretion to allow unpermitted discharge to continue pending issuance of NPDES permit). See generally Plater, Statutory Violations and Equitable Discretion, 70 Calif.L.Rev. 524 (1982).

The reasonableness and validity of waste discharge requirements cannot be attacked as a defense to enforcement actions brought pursuant to Chapter 5.5 of the Porter-Cologne Act. The provisions of Chapter 5.5 should be construed according to the Legislature's declared purpose in enacting Chapter 5.5 of ensuring that the state has the legal authority necessary to implement a state NPDES program. See § 13370. In particular, it is the intent of the Legislature "to authorize the state to implement the provisions of the [Clean Water Act] and federal

oo.

regulations and guidelines issued pursuant thereto". Id. EPA program guidance for state NPDES programs specifies that "a State could not allow a permittee to challenge its permit limits in an enforcement proceeding and State law that provided such an option would be inconsistent with the federal requirements". Office of Water, United States EPA, National Pollutant Discharge Elimination System State Program Guidance at 3-21 (July 29, 1986). The enforcement provisions of Chapter 5.5 should be construed to be consistent with this program guidance. This construction is consistent with the general rule under California law that failure to challenge the validity of permit conditions at the time a permit is issued bars the permit holder from challenging those permit conditions in a later enforcement action. County of Imperial v. McDougal, 19 Cal.3d 505, 510-11, 564 P.2d 14, 18, 138 Cal.Rptr. 472, 476, appeal dismissed, 434 U.S. 944, 98 S.Ct. 469 (1977).

Section 13330 does not require that challenges to permit conditions be allowed in Chapter 5.5 enforcement actions. Section 13330 provides, in part, that a failure to seek immediate judicial review by petition for writ of mandate after exhausting the administrative appeals available under the Porter-Cologne Act does not preclude a party from challenging the reasonableness and validity of a state or regional board order in a subsequent judicial proceeding brought to enforce that order. Section 13330 does not apply to actions and proceedings under Chapter 5.5, however, to the extent that section 13330 would be inconsistent

with the provisions of Chapter 5.5. § 13372. The enforcement provisions of Chapter 5.5 of the Porter-Cologne Act, as construed to ensure consistency with EPA NPDES program guidance, are not consistent with that portion of section 13330 which would excuse failure to exhaust the judicial remedy of petitioning for writ of mandate. Therefore, that portion of section 13330 does not apply to enforcement proceedings brought pursuant to Chapter 5.5 of the Porter-Cologne Act. Even if it did apply, it would excuse only the failure to exhaust the judicial remedy of filing a petition for writ of mandate; the requirement for exhaustion of administrative remedies would still apply. See generally Hampson v. Superior Court, 67 Cal.App.3d 472, 477, 136 Cal.Rptr. 722, 726 (1977) (doctrine of exhaustion of administrative remedies applies to issues raised as a defense to an enforcement action) (dicta). In particular, failure to exhaust the right to an administrative appeal to the state board precludes a challenge to the terms of waste discharge requirements as a defense to an enforcement action. See Sierra Club v. Union Oil Co., No. 85-2868 ___ F.2d ___, ___ (9th Cir., filed April 3, 1987) (slip opinion at 15-18).

The Attorney General also has authority independent of the Porter-Cologne Act to bring an action, upon request of a state board or a regional board, or upon the Attorney General's own motion, to enjoin any pollution or nuisance. See § 13002(c); People v. New Penn Mines, Inc., 212 Cal.App.2d 667, 28 Cal.Rptr. 337 (1963). See also Cal. Gov't Code § 12607 (authorizing

Attorney General to bring action for equitable relief to protect natural resources).

Authority to sue in courts of competent jurisdiction to enjoin violations of program requirements, including violations of permit conditions, without the necessity of permit revocation

As discussed above, the state boards and regional boards have the authority to obtain an injunction against activities in violation of NPDES program requirements, either through an action filed by the Attorney General to enjoin the activity, or by an action filed by the Attorney General to enforce a cease and desist order or cleanup and abatement order. These actions may be brought without the necessity of prior revocation of waste discharge requirements. See §§ 13263(g), 13301, 13304, 13331, 13340, 13386. Specifically, actions may be brought for violations of conditions of waste discharge requirements. See §§ 13301, 13304, 13386.

Where the state board or a regional board brings an enforcement action agaist an industrial user for violation of pretreatment requirements, and the publicly owned treatment works has failed to bring an enforcment action, the publicly owned treatment works may be joined as a defendent. See Cal.Civ.Proc. Code § 379. See generally §§ 13377, 13386; 23 Cal. Admin. Code §§ 2233, 2235.2, 2235.3; Clean Water Act sections 309(f), 402(b)(8), 33 U.S.C. §§ 1319(f), 1342(b)(8); 40 C.F.R. § 122.44(j). Section 13386(b) is patterned after section 309(b)

of the Clean Water Act, 33 U.S.C. § 1319(b). As such, section 13386 provides authority to enjoin any threatened or continuing violation of NPDES program requirements, to the same extent that EPA is authorized to enjoin violations pursuant to section 309 of the Clean Water Act. See § 13386. See also § 13340 (providing authority comparable to EPA's authority under section 504 of the Clean Water Act, 33 U.S.C. § 1364.

Section 13386 and section 309 of the Clean Water Act provide authority to enjoin threatened violations where no prior violation has occurred. As the purpose of the injunction is to prevent future violations, not to punish previous violations, the availability of relief should depend upon whether future violations are threatened, not on whether previous violations have occurred. Statutes providing administrative power to effectuate a broad regulatory program to protect water quality and other natural resources should be given a liberal construction. Blumfield v. Bay Conservation and Development Commission, 43 Cal.App.3d 50, 56, 117 Cal.Rptr. 327, 330 (1974).

Other provisions of the Porter-Cologne Act provide authority to enjoin threatened or continuing violations in appropriate cases. §§ 13362, 13264(b), 13304, 13331, 13340. By their terms, some of these provisions authorize injunctive relief against threatened violations, without any requirement of a showing of any prior violations. See §§ 13262, 13304, 13340; cf. §§ 13300, 13301 (time schedule orders and cease and desist orders may be issued for threatened violations). These

provisions supplement the authority provided by Chapter 5.5, and may provide authority for an injunction where an injunction could not be obtained under section 13386. They do not limit the availability of injunctive relief under Section 13386. See § 13372. Similarly, the availability of the administrative enforcement orders, see §§ 13300, 13301, 13304, 13305, does not establish a procedure which must be exhausted before the state may seek injunctive relief for violations of NPDES program requirements. See § 13372.

Authority to assess or sue for civil monetary remedies

State law provides for authority to sue in court to recover civil monetary liability comparable to, and in many cases greater than, that provided for in section 309 of the Clean Water Act, 33 U.S.C. § 1319. § 13385. State law establishes liability for violation of any NPDES filing requirement, any NPDES permit condition, any entry, inspection or monitoring requirement, or any state or regional board order issued to abate NPDES program violations. See §§ 13261, 13268(a), 13268(b), 13385. State law also establishes liability for violation of any requirement of section 301, 302, 306, or 307 of the Clean Water Act, including violations of applicable effluent standards and limitations and violations of categorical and prohibitive discharge standards and limitations applicable to industrial users of publicly owned treatment works. § 13385.

Because state law specifically provides for liability

for violation of any effluent limitation, water quality related effluent limitation, national standard or performance, or pretreatment or toxicity standard, and because state law provides for application of federal regulations without the necessity of adopting independent state regulation, see § 13377, providing remedies for violation of state regulations is unnecessary. Indeed, as state regulations merely incorporate federal regulations, see Cal. Admin. Code § 2231.2, providing for civil liability for violation of state regulations would not add to the liability already provided for under section 13385 for violation of NPDES permit requirements and for violations of regulations issued pursuant to sections 301, 302, 306, and 307 of the Clean Water Act.

Section 13385 expressly provides for civil penalties for any discharge of pollutants which is not permitted by waste discharge requirements, or for violation of any waste discharge requirement, cease and desist order, or cleanup and abatement order. Section 13385 does not expressly refer to time schedule orders adopted pursuant to section 13300. The state and regional boards do not use these time schedule orders when they seek to restrain immediately NPDES program violations, and do not use these orders as a basis for obtaining injunctive relief. See § 13300; cf. §§ 13301, 13304, 13386 (providing for immediate restraint of violations and for injunctive relief). But violation of a time schedule order adopted under section 13300 may result in civil penalties. Where violation of the time

schedule order results in violation of any time schedule or other requirement established as part of the waste discharge requirements, civil penalties may be imposed for violation of waste discharge requirements. § 13385. Civil monetary remedies may also be imposed under subdivisions (a) and (b) of section 13268 for failure to comply with any reporting requirements incorporated in a time schedule order. See § 13268.

Inspection, entry and monitoring requirements are imposed as a condition of waste discharge requirements. See § 13377; 23 Cal. Admin. Code § 2235.2; 40 C.F.R. §§ 122.41(i), 122.41(j). Violation of any duty imposed by these conditions would provide a basis for civil penalties pursuant to section 13385. Where inspection, entry and monitoring requirements are established independent of any condition of waste discharge requirements, violations may result in liability pursuant to § 13268. To the extent not inconsistent with NPDES program requirements, the procedures established under section 13267, and the liability for violations provided for under subdivisions (a) and (b) of section 13268, apply to violation of monitoring requirements imposed under section 13283. See §§ 13267, 13268, 13372, 13383.

Section 13261 provides additional authority to impose liability for violation of NPDES permit application filing reuqirements. Where the state board or a regional board requests that a report of waste discharge be filed, any person who fails to comply with the request is subject to liability pursuant to

subdivisions (a) and (b) of section 13261, even when there is no discharge. § 13261. See generally §§ 13372, 13376, 13377.

Liability under subdivision (b) of section 13261, under subdivisions (a) and (b) of section 13268 and under section 13385 is based upon a standard of strict liability. See State Water Resources Control Board Order No. WQ 80-1 at 10 n.6. These provisions do not expressly establish any requirement of knowledge, intent or negligence as a basis for liability. This is in contrast to other nearby liability provisions that expressly require establishment of intent or negligence to establish liability under those other provisions. Cf. § 13261(c) (liability for failure to furnish report of wate discharge, for certain non-point source discharges, if the violations are committed "knowingly"); § 13268(c) (liability for violation of reporting or monitoring requirements, for certain non-point source discharges, if the violations are committed "knowingly"); § 13386 (criminal liability based on violations committed "willfully or negligently"). Where there are no qualifying words concerning intent or negligence, it is appropriate to construe regulatory statutes to provide for strict liability offenses. People v. Chevron Chemical Co., 143 Cal.App.3d 50, 52-54, 191 Cal.Rptr. 537, 538-39 (1983); see, e.g., People v. Travers, 52 Cal.App.3d 111, 115, 124 Cal.Rptr. 728, 730 (1975); Aantex Pest Control v. Structural Pest Control Board, 108 Cal.App.3d 696, 702-03, 166 Cal.Rptr. 763, 767 (1980). But cf. People ex rel. Younger v. Superior Court,

16 Cal.3d 30, 40-41, 544 P.2d 1322, 1328-29, 127 Cal.Rptr. 122, 128-29 (clause basing liability on intent or negligence construed to apply to subsequent clause in the same sentence which does not expressly refer to intent or negligence).

Where a California statute is patterned after a federal act, decisions of the federal courts interpreting the federal act are persuasive authority as to how the state statute should be interpreted. Kaplan's Fruit and Produce Co. v. Superior Court, 26 Cal.3d 60, 65, 603 P.2d 1341, 1343, 160 Cal.Rptr. 745, 747 (1969). Section 13385 is patterned after section 309(d) of the Clean Water Act. Compare § 13385 with Clean Water Act section 309(d), 33 U.S.C. § 1319(d). The federal courts have construed section 309(d) of the Clean Water Act to establish penalties based upon strict liability. See, e.g., United States v. Earth Sciences, Inc., 599 F.2d 1368 (10th Cir. 1979). Accordingly, section 13385 should be construed to establish a standard of strict liability.

Sections 13261, 13268 and 13385 should be construed where possible to effectuate the intent of the Legislature that the state and regional boards have the authority necessary for a state NPDES program. See § 13370. EPA regulations require that a state desiring to administer a state NPDES program have authority to impose penalties based upon a standard of strict liability. See 40 C.F.R. § 123.27(b)(2). As there is nothing in the express language of subdivisions (a) and (b) of section 13261, in the express language of subdivisions (a) and

(b) of section 13286 or in the express language of section 13385 indicating an intent to require proof of intent or negligence, these provisions should be construed to establish monetary remedies based upon a standard of strict liability.

Where reporting or monitoring requirements are established under Chapter 5.5 of the Porter-Cologne Act, and the state board or a regional board sues to impose civil monetrary remedies under section 13268, the maximum liability is $5,000 per day of violation. § 13268(b)(2). Similarly, where the state board or a regional board is authorized to request a report of waste discharge for purposes of Chapter 5.5 of the Porter-Cologne Act, and the board sues to impose civil monetary remedies under section 13261 for failure to file a report of waste discharge, the maximum liaibility is $5,000 per day of violation. § 13261(b)(2).

The amount of liability available under section 13385 is $10,000 or more per day of violation, depending on the type of violation. Where there is a discharge and a cleanup and abatement order is issued, maximum liability under section 13385 is $15,000 per day of discharge plus $15,000 for each day the cleanup and abatement order is violated. § 13385(a)(1). Where there is a discharge and no cleanup and abatement order is issued, liability is based upon the volume discharged. § 13385(a)(2). For large discharges, this may result in liability significantly higher than the $15,000 per day. To ensure that for smaller discharges the amount of liability

available is no less than that provided for under section 309(d) of the Clean Water Act, state board program guidance directs that a cleanup and abatement order shall be issued for any discharge in violation of NPDES program requirements where the amount of liability that would otherwise be available would be less than $10,000 per day of violation. Memorandum from William R. Attwater, Chief Counsel, to State Board Members, Michael A. Campos, and Regional Board Executive Officers, Water Quality Enforcement: Analysis and Implementation of the McCorquodale Bill (SB 2131; Stats. 1984, Chapter 1541) at 8 (November 26, 1984). Where there is a violation of NPDES program requirements but no discharge, the maximum liability available under section 13385 is $10,000 per day of violation.

Once a violation of section 13385 is established, the amount of liability is presumed to be the maximum allowable; the burden of proof is on the violator to establish that liability set at less than the statutory maximum would be appropriate to the violation. State v. City and County of San Francisco, 94 Cal.App.3d 522, 531-32, 156 Cal.Rptr. 542, 547 (1979).

Other provisions of the Porter-Cologne Act may be used to impose civil monetary remedies in appropriate cases. §§ 13265(a), 13265(b), 13350; see § 13372. Where the state board or a regional board sues to impose civil monetary remedies under section 13350, the amount of liability is the same as under section 13385. Compare § 13350 with § 13385. For some violations, the Porter-Cologne Act provides that liability cannot

be imposed under both section 13350 and section 13385. §§ 13350(j), 13386(c). By implication, for any other violation for which liability may be imposed under section 13350, or where liability may be imposed under section 13261, 13265, or 13268, that liability would be in addition to any liability imposed under section 13385. See § 13350(j).

Each of the sections of the Porter-Cologne Act that provides for civil monetary remedies, except for section 13385, provides the option of administrative assessment of civil liability. §§ 13261, 13265, 13268, 13350. The state and regional boards provide for public participation, as required by 40 C.F.R. § 123.27(d)(2), before imposing administrative civil liability for violations of NPDES program requirements. See Memorandum from Betsy Miller Jennings, Staff Counsel, to William R. Attwater, Chief Counsel, Administrative Civil Liability 3 (August 29, 1985).

Civil monetary remedies under Section 13385 and other sections of the Porter-Cologne Act may be imposed on any person, including any state or local agency. See § 13050(c): San Francisco Civil Service Association Local 400 v. Superior Court, 16 Cal.3d 46, 544 P.2d 1331, 127 Cal.Rptr. 122 (1976). But see Clean Water Act section 313, 33 U.S.C. § 1313 (personal liability may not be imposed on federal officers to the extent that the liability constitutes a "penalty").

The availability of administrative enforcement orders under the Porter-Cologne Act does not establish a procedure which

must be exhausted before the state and regional boards may seek civil monetary remedies. See §§ 13261, 13265, 13268, 13350, 13385. Nor are there any circumstances where the state and regional boards are required to seek civil monetary remedies under provisions outside of Chapter 5.5 of the Porter-Cologne Act, instead of seeking civil penalties under section 13385. § 13272.

Authority to impose criminal penalties for willful or negligent violations of applicable standards or limitations, NPDES filing requirements or NPDES permit conditions

The criminal penalty provisions of Chapter 5.5 of the Porter-Cologne Act are patterned after the provisions of the Clean Water Act that provide criminal penalties for violation of NPDES program requirements. Compare § 13387 with Clean Water Act section 309(c), 33 U.S.C. § 1319(c). Under subdivision (a) of section 13387, criminal liability also may be imposed for any unpermitted discharge, or for any discharge in violation of waste discharge requirements. § 13387(a). Criminal liability also may be imposed for violation of a prohibition or cease and desist order, or for violation of any standard or limitation established under section 301, 302, 306, or 307 of the Clean Water Act. Id. Criminal liability may be imposed only if the violation is willful or negligent. Id.

Upon conviction, a fine of not more than $25,000, and not less than $5,000 per day of violation is imposed. A term of

imprisonment, of up to one year, may also be imposed. For second offenders, a maximum fine of up to $50,000 per day of violation, and up to two years imprisonment, may be imposed. Id.

Other provisions of the Porter-Cologne Act may provide for criminal prosecution in appropriate cases. See §§ 13261, 13265, 13268, 13271, and 13272. The possibility of criminal prosecution under these other provisions does not limit the applicability of section 13387. See § 13372.

Authority to impose criminal penalties against any person who knowingly makes any false statement in any document filed or required to be maintained under the state program, or who knowingly renders inaccurate any monitoring device or method required under the state program

Chapter 5.5 of the Porter-Cologne Act establishes criminal penalties for false statements and for tampering with monitoring devices, to the same extent as criminal penalties are established for these actions under section 309 of the Clean Water Act. Compare § 13387(b) with Clean Water Act section 309(c)(2), 33 U.S.C. § 1319(c)(2). Violation may result in a fine of up to $25,000, or up to six months imprisonment, or both. § 13386(b).

Additional enforcement powers

The Porter-Cologne Act provides authority to issue a cease and desist order and obtain injunctive relief to prohibit the introduction of additional pollutants from domestic and industrial sources to a publicly owned treatment works in the event of a

violation or threatened violation of waste discharge requirements. §§ 13301, 13331.

The Porter-Cologne Act also provides authority for a governmental entity to recover its cost of cleanup and abatement of unauthorized discharges or conditions of pollution or nuisance. §§ 13304, 13305.

Public participation

Where the state and regional boards issue administrative orders to restrain unauthorized activities or issue orders assessing civil monetary remedies administratively, concerned citizens have a right to participate in those administrative proceedings. See 23 Cal. Admin. Code § 648.3.

Citizens may seek to intervene in state court proceedings under California Code of Civil Procedures section 387(b), which is patterned after Federal Rules of Civil Procedure Rule 24(a)(2). When the state and regional boards, which are the enforcement authorities for purposes of the Porter-Cologne Act, refer violations to the Attorney General for judicial enforcement proceedings, the boards do not oppose intervention by interested citizens on the ground that the citizens' interests are already adequately represented by the existing parties. The final decision on whether to oppose intervention is a litigation decision made by the Attorney General's Office, not by the client agency. The state and regional boards provide a public comment period of at least thirty days before settlement of any suit

involving NPDES program violations. See generally 23 Cal. Admin. Code § 2235.2; 40 C.F.R. § 123.27(d)(2).

The state board has adopted procedures to provide for investigation and written responses to all citizen complaints. State Water Resources Control Board, Administrative Procedures Manual 21-24 (1985). If a citizen requests enforcement action and the regional board does not take enforcement action, the citizen may petition the state board for review. § 13320. Upon review, the state board may issue an enforcement order or direct the regional board to take enforcement action. See, e.g., State Water Resources Control Board Order No. WQ 85-1. If the state board concludes that the regional board acted properly in not instituting enforcement proceedings, the state board issues a letter or order explaining its reasons for upholding the regional board. See, e.g., State Water Resources Control Board Order No. WQ 85-2.

O. Board Membership

No state board or body which has or shares authority to approve permit applications or portions of permit applications, either initially or on appeal, includes as a member, any person who receives, or during the previous two years has received, a significant portion of his or her income as defined in 40 C.F.R. § 123.25(c)(ii) directly or indirectly from permit holders or applicants for a permit. No state law requires representation on any board which shares authority to issue permits in such a matter

as would violate the disqualification from membership provision in section 304(i)(2)(D) of the Clean Water Act.

Federal Authority: Clean Water Act section 304(i)(2)(D); 40 C.F.R. § 123.25(c).

State Authority: § 13388; 23 Cal. Admin. Code § 644 et seq.

Remarks: Chapter 5.5 of the Clean Water Act and state board regulations follow the conflict of interest requirements set by the Clean Water Act and EPA regulations. See § 13388; 23 Cal. Admin. Code § 644 et seq.

R. Water Quality Planning

The state has authority for a continuing planning process under section 303(e) of the Clean Water Act.

Federal Authority: Clean Water Act section 303(e)(2); 40 C.F.R. § 123.25(b).

State Authority: §§ 1058, 13160, 13164, 13170, 13240 et seq., 13955 et seq., 13970 et seq., 13985 et seq., 13999 et seq.; 23 Cal. Admin. Code § 3618 et seq.

Remarks: The state board has authority to approve or adopt water quality control plans which meet the requirements of section 303 of the Clean Water Act, 33 U.S.C. § 1313. §§ 13170, 13240 et seq. These plans have been submitted to EPA for review, and approved pursuant to section 303(e) of the Clean Water Act. See, e.g., letter from Sheila Prindiville, Acting Regional Administrator, EPA Region IX to Carla Bard, Chairwoman, State

Water Resources Control Board (September 11, 1981) (approving Lake Tahoe Basin Water Quality Plan under sections 303(d) and 303(e) of the Clean Water Act).

The state board also has all powers assigned to the state, or to the governor of the state, under section 208 of the Clean Water Act, 33 U.S.C § 1288. § 13160; letter from George Deukmejian, Governor, to W. Don Maughan, Chairman, State Water Resources Control Board (April 30, 1987) (delegation of authority); letter from Ronald Reagan, Governor, to W. W. Adams, Chairman, State Water Resources Control Board (June 26, 1973) (same).

The state board maintains a priority list, updated annually, of projects eligible for construction grants under the Clean Water Act and state law. 23 Cal. Admin. Code § 3618 et seq.

EPA has approved the state board's continuing planning process. Letter from David B. Jones, Chief, California Branch Water Management Division, EPA Region IX to Edward C. Anton, Chief, Division of Technical Services, State Water Resources Control Board (June 28, 1984).

S. Federal Facilities Requirements

The state has jurisdiction over federal officials and federal facilities.

Federal Authority: Clean Water Act section 313.

State Authority: § 13050(c).

Remarks: There are no barriers, prohibitions or exclusions under state law which limit the state's water pollution control and abatement authority as applied to federal officials or federal facilities. Federal officials and federal agencies are subject to the requirements of the Porter-Cologne Act. See, e.g., Northwest Indian Cemetary Protective Association v. Peterson, 795 F.2d 688 (9th Cir. 1986) (applying state water quality standards to federal agency). Other state and regional board programs which apply to federal officials and federal agencies include regulation of surface impoundments containing hazardous wastes. Cal. Health & Safety Code § 25208 et seq., underground tanks regulations, id. § 25280 et seq., hazardous waste cleanup actions, id. § 25356.1 et seq., and actions taken to protect water quality as part of the state's water rights program. §§ 174, 1242.5, 1243, 1253, 1257, 1258, 2100 et seq; see United States v. State Water Resources Control Board, 182 Cal.App.3d 82, 134-37, 227 Cal.Rptr. 161, 190-92 (1986). Federal officials and federal agencies must also comply with water quality programs administered by other state and local agencies in California. See Clean Water Act section 313, 33 U.S.C. § 1323; § 13002.

When EPA approved of California's state NPDES program in 1973, EPA retained authority to issue permits for federal facilities. After section 313 of the Clean Water Act was amended in 1977 to clarify that states have complete authority to apply state water quality requirements to federal facilities, EPA recognized that California has adequate authority to regulate

federal facilities. EPA therefore approved of California's NPDES program as applied to federal facilities. Letter from Douglas M. Costle, Administrator, Environmental Protection Agency to Edmund G. Brown, Governor, State of California (May 5, 1978).

T. Activities on Indian Lands

The State of California has jurisdiction over certain activities on Indian lands which may affect water quality, including point source discharges resulting from activities by non-Indians, and discharges which demonstrably affect off-reservation water quality. Although the state has authority over certain activities on Indian lands, the state is not requesting NPDES program approval, as applied to activities on Indian lands, at this time. Except where EPA approves a tribal NPDES program, EPA should continue to administer the program, and not suspend the issuance of NPDES permits for activities on Indian lands, unless and until the State of California submits and obtains approval of a supplemental submission requesting approval to administer the NPDES program for discharges from Indian lands. The state will exercise concurrent jurisdiction, issuing its own waste discharge requirements, to the extent deemed necessary to protect the quality of the waters of the state.

Federal Authority: Clean Water Act section 510; federal common law.

State Statutory and Regulatory Authority: §§ 19, 13376.

Remarks: In the absence of any authorization or

preemption of state regulation under applicable federal statues, the state's jurisdiction to regulate activities on Indian reservations depends upon a "particularized inquiry" test, established under federal common law. The following discussion provides a summary of applicable state and federal law, and explains why the "particularized inquiry" test applies. The discussion is intended to provide additional information with respect to the state's program. It is also intended to make clear that the state's decision not to seek, as part of this submission, NPDES program approval for activities on Indian lands is not based upon a conclusion that the state lacks authority. Because the state is not seeking NPDES program approval as applied to activities on Indian lands, and EPA therefore is not required to review the adequacy of the state's authority, this discussion does not go into detail as to how the "participated inquiry" test applies.

Background

There are 102 recognized Indian tribes in the State of California. See Department of the Interior, Bureau of Indian Affairs, Indian Tribal Entities Recognized and Eligible to Receive Services, 50 Fed. Reg. 6055 (February 13, 1985). Reservations or rancherias have been established for all but two of these tribes. See Bureau of Indian Affairs, Sacramento Area Office, Tribal Information and Directory (October 1985). The first of these reservations and rancherias were established by an Act of April 8,

1864, 13 Stat. 39-41, c. 48. The most recent was established on October 18, 1974 by P.L. 93-451, 88 Stat. 1368.

Most of the reservations and rancherias are relatively small. Seventy-one of the reservations and rancherias include less than 1,000 acres; forty-five include less than 100 acres. See Bureau of Indian Affairs, Sacramento Area Office, Tribal Information and Directory (October 1985). Clearly, discharges from lands in these reservations have the potential to affect surface and ground waters outside the reservation. All of the reservations and rancherias that are larger than 1,000 acres are adjacent to or include within their boundaries rivers or streams which flow beyond the reservation boundaries into other areas of California, or lakes which extend beyond the reservation boundaries.

Relatively few Indians live on or adjacent to reservations and rancherias in California. None of the reservations and rancherias has a population of over 5,000. Only six have a population of over 1,000. Half have a population of less than 100. As a consequence, the principal threats to water quality from activities on Indian lands stem from activities by non-Indians, such as mining or solid waste disposal, and discharges from facilities built to serve non-Indians, such as recreational facilities.

State law

Under California law, the laws of the State of California

apply to activities on Indian lands or other lands owned or held in trust by the United States, except to the extent that state jurisdiction is limited by federal law. See Cal. Gov't Code § 110. The California Constitution does not include any provision disclaiming authority over Indians or activities on Indian lands.

As part of the Porter-Cologne Act, the California Legislature has declared that "the state must be prepared to exercise its full power and jurisdiction to protect the quality of waters in the state from degradation originating inside or outside the boundaries of the state". § 13000; cf. § 13376 (requiring submission of report of waste discharge from any person proposing to discharge to surface waters "within the jurisdiction of this state"). It follows that the Porter-Cologne Act applies to activities on Indian lands to the extent that the State may exercise jurisdiction over those activities consistent with federal law. Cf. California State Board of Equalization v. Chemehuevi Indian Tribe, ___ U.S. ___, ___ 106 S.Ct. 289, 290 (1985) (state law need not explicitly state how it applies to activities on Indian lands for the State to enforce its law to the extent that the State's action would not violate federal law).

Federal law

In general, the question whether the State of California may apply its water quality regulatory program to activities on Indian lands will depend upon whether federal common law prohibits the State from exercising jurisdiction. None of the eighteen

treaties entered into by the United States with Indians in California was ever ratified by the United States Senate. Acosta v. San Diego County, 126 Cal.App.2d 455, 463, 272 P.2d 92, 96 (1954). Except under limited circumstances, the Clean Water Act and other federal statutes neither authorize nor prohibit the exercise of state jurisdiction over activities on Indian lands which may affect water quality.

Section 510 of the Clean Water Act, 33 U.S.C.A. § 1370, provides that nothing in the Clean Water Act precludes a State from adopting and enforcing any water pollution control requirement, except where that requirement is less stringent than an applicable Clean Water Act requirement, or where the Clean Water Act expressly preempts state law. Nothing in the Clean Water Act expressly limits state jurisdiction over activities on Indian lands.

Section 518 of the Clean Water Act authorizes EPA to treat an Indian tribe as a State for purposes of several provisions of the Clean Water Act, including section 402 of the Clean Water Act. Clean Water Act section 518(e), 33 U.S.C. § 1378(e). It is unlikely that many of the Indian tribes in California will obtain authorization to issue NPDES permits in the near future. See Clean Water Act section 518(e)(3), 33 U.S.C. § 1378(e)(3). Even where a tribe has an approved NPDES program, that should not preclude state regulation. Where a State does not have an approved NPDES permit program, and permits are issued by EPA, state regulation is not preempted. Clean Water Act section 510,

33 U.S.C. § 1370. Issuance of NPDES permits by an Indian tribe should not have any different effect.

In some circumstances, a State may not adopt or enforce standards that are less stringent than those set by an Indian tribe. If EPA treats an Indian tribe as a state for purposes of section 303 of the Clean Water Act and approves standards set by the tribe, a State apparently could not adopt or enforce a less stringent standard. See Clean Water Act sections 301(b)(1)(C), 303(c), 510, 518(e), 33 U.S.C. §§ 1311(b)(1)(C), 1313(c), 1370, 1378(e). Otherwise, section 518 of the Clean Water Act does not affect state authority over activities on Indian lands which may affect water quality. Section 518 of the Clean Water Act does not expressly preempt state law. Therefore, section 510 of the Clean Water Act dictates that section 518 of the Clean Water Act shall not be construed to impair or in any manner affect the jurisdiction of the State.

It may be anticipated that EPA would not approve a state NPDES program for areas of the state where there is an approved NPDES program administered by an Indian tribe, unless a cooperative agreement between the State and the Indian tribe provides for joint administration of the NPDES program. See Clean Water Act section 518(d), 33 U.S.C. § 1378(d). But EPA's decision not to approve a State's NPDES program as applied to those areas where there is an approved NPDES program administered by an Indian tribe should not preclude approval of the state program as applied to other Indian lands where there is no tribal NPDES program. Nor

would a decision by EPA not to approve a state NPDES program as applied to any Indian lands within the State affect the State's authority to apply and enforce State law: lack of EPA approval simply means that a state permit does not serve as an NPDES permit and a permit issued by EPA or an Indian tribe with an approved program is required. See Clean Water Act sections 402(c), 510, 33 U.S.C. §§ 1342(c), 1370.

The Supreme Court has ruled that the Clean Water Act "preempts state law to the extent that the state law is applied to an out-of-state point source". International Paper Co. v. Ouelette, ___ U.S. ___, ___, 97 S.Ct. 805, 816 (1987). Section 510 of the Clean Water Act preserves state jurisdiction over point source discharges only for those discharges "within the State". See id. at ___, 97 S.Ct. at 812. But the reservations and rancherias in California are "within the State." See 18 U.S.C. § 1162. The reason for preemption of state regulation of out-of-state point source discharges is because of the vagueness and uncertaintly that could result from application of "numerous States' law" to discharges to interstate waterways. International Paper Co. v. Ouelette, ___ U.S. at ___, 97 S.Ct. at 814. This threat of a source "being subject to an indeterminant number of potential regulations" does not arise when only one State, the State within whose boundaries the discharge occurs, applies its regulatory authority. Id. at ___, 97 S.Ct. at 815. Thus, the Supreme Court's ruling has no apparent applicability to discharges from Indian lands within the State seeking to regulate

the discharge.

Although section 510 of the Clean Water Act dictates that nothing in the Clean Water Act shall be construed to preempt state regulation of discharges from Indian lands within the State, section 510 of the Clean Water Act does not grant the States authority to enforce water quality control requirements where state jurisdiction is preempted under other federal laws. See Train v. Colorado Public Interest Group, 420 U.S. 1, 16-17, 96 S.Ct. 1938, 1945 (1976). Under certain circumstances, involving federal facilities and conditions which must be included in EPA issued NPDES permits, the Clean Water Act may provide some basis for requiring that activities on Indian lands comply with state water quality requirements. See Clean Water Act sections 301(b)(1)(C), 313, 401, 402, 502(4), 502(5), 33 U.S.C.A. §§ 1311(b)(1)(C), 1323, 1341, 1342, 1362(4), 1362(5). In general, however, the State's authority to issue NPDES permits for activities on Indian lands does not involve a question of interpretation of the Clean Water Act. Rather, the issue is whether other federal law, including judicial decisions on the extent of state jurisdiction over activities on Indian lands, precludes the State from enforcing its water quality law.

In contrast to the State of Washington's claim, in Washington Department of Ecology v. Environmental Protection Agency, 742 F.2d 1465 (9th Cir. 1975), that the federal Resources Conservation and Recovery Act provided the State with authority to regulate hazardous waste sites on Indian lands, California does

not contend that its authority to issue waste discharge requirements for discharges from Indian lands depends upon an authorization made by the Clean Water Act. Rather, California contends that its authority is not preempted by the Clean Water Act, or any other federal law. California is not currently requesting EPA approval of the state NPDES program as applied to activities on Indian lands, and the State's jurisdiction to issue waste discharge requirements does not depend upon EPA approval. State jurisdiction over activities on Indian lands is permitted, even in the absence of any express congressional consent or any delegation of federal authority, unless state jurisdiction is preempted by federal statutes or common law. See California v. Cabazon Band of Mission Indians, ____ U.S. ____, ____, 107 S.Ct. 1083, 1091-92 (1987).

Since no federal statute preempts California's authority, the extent of permissible state jurisdiction depends on the extent of preemption under federal common law.

The "particularized inquiry" test

The Supreme Court has adopted a federal common law in determining the applicability of state laws on Indian reservations. Under this federal common law, state laws are applicable on Indian reservations unless such application would interfere with tribal self-government or would impair a right granted or reserved by federal law. Mescalero Apache Tribe v. Jones, 411 U.S. 145, 148, 93 S.Ct. 1267, 1270 (1973); Organized

Village of Kake v. Egan, 369 U.S. 60, 74-75, 82 S.Ct. 562, 571 (1962); see California v. Cabazon Band of Mission Indians, ____ U.S. _____, _____, 107 S.Ct. 1083, 1091-92 (1987); White Mountain Apache Tribe v. Bracker, 448 U.S. 136, 142, 100 S.Ct. 2578, 2583 (1980); Eastern Band of Cherokee Indians v. North Carolina Wildlife Comm'n, 588 F.2d 75, 77-78 (4th Cir. 1978); Fort Mojave Tribe v. County of San Bernardino, 543 F.2d 1253, 1256 (9th Cir. 1976). Increasingly, the focus is on preemption rather than tribal self-government. "The trend has been away from the idea of inherent Indian sovereignty as a bar to state jurisdiction and toward reliance on federal preemption." McClanahan v. Arizona State Tax Commission, 411 U.S. 164, 172, 93, S.Ct. 1257, 1262 (1973). The preemption issue ultimately turns on a "particularized inquiry" into "the nature of state, federal, and tribal interests at stake". White Mountain Apache Tribe v. Bracker, 448 U.S. at 145, 100 S.Ct. at 2584.

A complete exposition of the "particular inquiry" test is beyond the scope of this discussion. It should be clear, however, that the balance of state, tribal and federal interests supports state regulation.

The State's interest in controlling the discharge of pollutants from Indian lands is compelling. The impacts of discharges from Indian lands are often not confined to Indian lands, but often affect the quality of waters downstream from the point of discharge. Cf. United States v. Anderson, 736 F.2d 1358, 1365-66 (9th Cir. 1984) (balance weighs heavily in favor of state

regulation of water use where waterway extends beyond reservation boundaries). Discharges from Indian lands may also affect migratory fish and wildlife.

"A State's regulatory interest will be particularly substantial if the State can point to off-reservation effects that necessitate State intervention." New Mexico v. Mescalero Apache Tribe, 462 U.S. 324, 336, 103 S.Ct. 2378, 2388 (1983).

By comparison, the tribal interest in preventing state regulation to protect water quality is relatively weak. State regulation serves to help protect water quality for beneficial uses, including instream beneficial uses, by tribe members. The applicability of state water quality requirements also reduces the ability of non-Indian dischargers to use threats to locate their facilities on other reservations as a means of pressuring an Indian tribe to allow water quality degradation. Cf. Natural Resources Defense Council v. Train, 510 F.2d 692, 709 (D.C. Cir. 1972) (the Clean Water Act is intended to set uniform minimum limitations for dischargers in order to prevent industries from coercing States by threatening to relocate their facilities.)

The interest in tribal self-government is not accorded great weight under the "particularized inquiry" test in areas where there is no historical tradition of tribal self-government. Rice v. Rehner, 463 U.S. at 720, 103 S.Ct. at 3296. There is no established tradition of tribal regulation of point source discharge to navigable waters. Further, the extent of tribal authority to enforce controls over non-members for the protection of instream beneficial uses is uncertain. Cf. Montana v. United

States, 450 U.S. 544, 101 S.Ct. 1245 (1981) (tribe cannot enforce hunting and fishing regulations against non-members on navigable streams within the reservation). The State's interest is strongest, and the tribal interest weakest, where activities of non-Indians on the reservation are concerned. See Rice v. Rehner, 463 U.S. at 720, 103 S.Ct. at 3296.

Application of California's waste discharge regulatory program in no way limits the authority of tribal governments to adopt and enforce their own water quality protection programs, to the extent that the tribes have the necessary authority. The regulatory powers assigned to the state and regional boards under the Porter-Cologne Act do not limit the powers of other governmental entities to set and enforce their own programs to provide additional protection of water quality. See § 13002. Because the state regulatory program allows for concurrent regulation by other governmental bodies, interests in tribal self-government cannot justify exclusion of state regulation.

The federal interest appears to be consistent, or at least is not inconsistent, with the conclusion that the State has the right to regulate point source discharges on Indian reservations. The Supreme Court has recognized federal and tribal interests in encouraging tribal self-sufficiency and economic development through promotion of tribal enterprises. California v. Cabazon Band of Mission Indians, ___ U.S. at ____, 107 S.Ct. at 1092. But the State's application of its water quality laws is not intended to prevent Indian tribes from conducting any type of business on

Indian lands. The State seeks only to assure that activities on Indian lands are conducted in a manner which assures protection of water quality. Where a discharge from a tribal enterprise has a demonstrable impact on off-reservation water quality, and the State seeks to regulate the discharge, the balance of state, tribal and federal interests is far different than where the State seeks to forbid a tribal enterprise supported by the federal government. Cf. California v. Cabazon Band of Mission Indians, supra, ____ U.S. at ____, 107 S.Ct. at 1094 (State's concern about infiltration by organized crime, infiltration which has not in fact occurred, is insufficient basis for prohibiting tribal high stakes bingo enterprises). The federal and tribal interests in promoting tribal enterprises do not override the federal and tribal interests in protecting water quality. See generally EPA Policy for the Administration of Environmental Programs on Indian Reservations ("the fundamental objective of the Environmental Protection Agency is to protect human health and the envionment").

Federal policy encourages the administration of Clean Water Act programs by Indian tribes. See Clean Water Act section 518(b)(2), 33 U.S.C. § 1578(b)(2). The Clean Water Act also establishes an important federal policy of maintaining and protecting the quality of the Nation's waters, a policy which is furthered by preserving and protecting state regulatory authority. See Clean Water Act sections 101(a), 101(b), 33 U.S.C. §§ 1251(a), 1251(b).

In summary, the balance of state, tribal and federal interests appears to permit state regulation of point source discharges from Indian lands, at least under certain circumstances. These circumstances include discharges resulting from activities conducted by non-Indians, and discharges which demonstrably affect off-reservation water quality.

U. Outstanding Permits

Under authorities in effect at the time of this statement, no outstanding permits issued by this State for the discharge of pollutants, other than waste discharge requirements issued in accordance with the State's existing EPA approved state NPDES program, are valid for the purposes of the National Pollutant Discharge Elimination System created by the Clean Water Act. All persons presently in possession of a valid State permit for the discharge pollutants are required to comply with all applicable provisions of the Clean Water Act and EPA regulations, in accordance with EPA's approval of the State's NPDES permit program.

Date: May 11, 1987

Robert H. Connett
Assistant Attorney General
Natural Resources Law Section

APPENDIX A. STATE INCORPORATION OF THE FEDERAL CLEAN WATER ACT

ISSUES

1. Whether the California Legislature in enacting Chapter 5.5 of Division 7 of the California Water Code intended to incorporate by reference into state law future amendments to the federal Clean Water Act and regulations implementing the Clean Water Act.

2. Whether the California State Water Resources Control Board (State Board) was authorized to adopt regulations that incorporate by reference future federal amendments and regulations.

3. Whether the Legislature's incorporation of future federal amendments and regulations is an improper delegation of authority.

4. Whether the Legislature's incorporation of future federal amendments and regulations violates due process requirements for certainty.

RESPONSE

1. The Legislature intended to incorporate by reference current and future federal legislation and regulations.

2. The State Board is authorized to adopt regulations incorporating prospectively the requirements of federal law.

3. The Legislature's enactment of Chapter 5.5 does not constitute an improper delegation of authority. The Legislature has made the fundamental policy decision that the state will implement the Clean Water Act permit system for point source

discharges. Adequate safeguards exist to prevent arbitrary use of the delegated authority.

4. California's incorporation by reference of federal Clean Water Act requirements provides adequate certainty as to what conduct is proscribed.

DISCUSSION

A. Background

The federal Clean Water Act, 33 U.S.C § 1251 et seq., establishes the National Pollutant Discharge Elimination System (NPDES) which requires a permit for point source discharges to surface waters. Id. § 1342. Initially, the Environmental Protection Agency (EPA) issues NPDES permits. A state that wishes to administer its own permit program may submit its program for approval by EPA. Id. § 1342(b). Once the program is approved, EPA suspends its issuance of NPDES permits and the state undertakes the issuance of NPDES permits under the state program. Id. § 1342(c)(1). The California Legislature has determined that the state's interest lies in the state administering the NPDES program in California, thereby avoiding the direct federal regulation of persons already subject to state regulation. Cal. Water Code § 13370. (All section citations are to the California Water Code unless otherwise noted.)

To obtain EPA approval, a state must have adequate authority to implement requirements enumerated in the Clean Water Act. 33 U.S.C. § 1342(b). More specifically, a state must have adequate authority to issue permits that apply and ensure compliance with applicable technology-based effluent limitations,

water quality related effluent limitations, national standards of performance, toxic pollutant effluent limitations, pretreatment standards and ocean discharge criteria (referred to collectively as "limitations and standards"). Id. at § 1342(b)(1)(A). The state also must have adequate authority to require a discharger to maintain certain records, use monitoring equipment and methods and allow inspection. Id. § 1342(b)(2). These limitations, standards and monitoring requirements are set by EPA by regulation. See, e.g., id. §§ 1311(b)(1)(A), 1312(a), 1318(a)(A); 40 C.F.R. Subchapter N.

Because Congress periodically amends the Clean Water Act (see, e.g., Municipal Wastewater Treatment Construction Grant Amendments of 1981, Pub.L. No. 97-117, 95 Stat. 1623) and EPA frequently adopts new or amended regulations (see e.g., EPA, Regulatory Agenda, 50 Fed. Reg. 44644 (Oct. 29, 1985) (identifying 33 current, projected, or recently completed rulemakings)), a state with an EPA approved program must develop a mechanism to adopt these changes into its program. In California, the Legislature decided to adopt automatically these changes as they are enacted or adopted. The Legislature enacted statutes that incorporate by reference current and future federal legislation and regulations. The Legislature thereby avoided the risk that the state program would be inconsistent with the requirements of the Clean Water Act and implementing regulations. The risk lies primarily in the unavoidable delay between the enactment of federal law and the enactment or adoption of state law or regulations that are responsive to the federal changes.

For example, in California, unless the Legislative enacts a statute as urgency legislation by a two-thirds vote, a statute does not take effect until January 1 of the year following a 90-day period after the end of the legislative session. Cal. Const. Art. IV, § 8. Adoption of regulations requires a minimum of 145 days and in practice, between one and four years. See Office of Administrative Law, Regulations Handbook, Appendix 2 (1983).

Incorporation of prospective federal laws and regulations also saves scarce legislative and administrative resources that would otherwise be expended to enact and promulgate state laws and regulations to implement each change at the federal level. The expenditure of resources at the administrative level would be particularly questionable because the Board currently is mandated under state law to apply federal law and regulations.

B. The Legislature Intended To Incorporate Prospective Federal Law and Regulations.

The State Board and the California Regional Water Quality Control Boards (Regional Boards) implement the state NPDES program in California pursuant to the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) found at Division 7 of the California Water Code (§ 13000 et seq.). Several provisions of the Porter-Cologne Act clearly indicate a legislative intent to incorporate prospectively the provisions of federal water quality law in defining the scope of state and regional board authority, and in establishing minimum standards for certain

activities regulated by the State and Regional Boards. See, e.g., §§ 13160, 13170, 13370, 13377, 13385, 13386, 13387.

The most direct expression of legislative intent to incorporate future federal law and regulations is found in Chapter 5.5 of Division 7 (§ 13370 et seq.). Section 13370 states as follows:

> "The Legislature finds and declares that since the Federal Water Pollution Control Act (33 U.S.C. 1251, et seq.), as amended, provides for permit systems to regulate the discharge of pollutants and dredged or fill material to the navigable waters of the United States and provides that permits may be issued by states which are authorized to implement the provisions of such act, it is in the interest of the people of the state, in order to avoid direct regulation by the federal government of persons already subject to regulation under state law pursuant to this division, to enact the provisions of this chapter in order to authorize the state to implement the provisions of the Federal Water Pollution Control Act and acts amendatory thereof or supplementary thereto, and federal regulations and guidelines issued pursuant thereto; provided, however, that the requirements of this chapter relating to the discharge of dredged or fill material shall be applicable only when the state has an approved permit program for the discharge of dredged and fill material in accordance with the provisions of the Federal Water Pollution Control Act; and provided further, that the state board shall request federal funding under the Federal Water Pollution Control Act for the purpose of carrying out its responsibilities under this program." (Emphasis added.)

The verbal declaration to authorize the state to implement acts that amend or supplement existing federal water quality law expresses an intent to incorporate prospective changes in federal law. The phrase "federal regulations and guidelines issued pursuant thereto" refers to regulations issued under the Clean Water Act and "acts amendatory thereof or supplementary thereto." Section 13370 thus refers to future

regulations, expressing the Legislature's intent to implement federal regulations and guidelines promulgated in the future.

The timing of the enactment of Chapter 5.5 also indicates that the Legislature intended to incorporate federal regulations prospectively. Section 13370 specifically refers to federal regulations. EPA regulations for the NPDES program, however, had not yet been promulgated when Chapter 5.5, including section 13370, was enacted as an urgency statute and took effect on December 12, 1972. See 1972 Cal. Stats. Ch. 1256, § 3; EPA, State Program Requirements for Participation in the NPDES System, 37 Fed.Reg. 28391 (Dec. 22, 1972). By referring to regulations that had not yet been issued, the Legislature clearly indicated its intent to authorize the state and regional boards to carry out an NPDES program consistent with EPA regulations to be promulgated in the future.

The legislative intent to incorporate prospective federal law and regulations is also expressed in section 13377 which provides as follows:

> "Notwithstanding any other provision of this division, the state board or the regional boards shall, as required or authorized by the Federal Water Pollution Control Act, as amended, issue waste discharge requirements and dredged or fill material permits which apply and ensure compliance with all applicable provisions of the act and acts amendatory thereof or supplementary thereto, together with any more stringent effluent standards or limitations necessary to implement water quality control plans, or for the protection of beneficial uses, or to prevent nuisance." (Emphasis added.)

The provisions of the Clean Water Act themselves require dischargers to comply with subsequently enacted EPA regulations.

See, e.g., Clean Water Act § 306(b)(1)(13), 33 U.S.C. § 1316(b)(1)(13). Hence, the requirement that waste discharge requirements apply all applicable provisions of the Clean Water Act includes a requirement that waste discharge requirements apply EPA regulations in effect at the time waste discharge requirements are issued, even though the regulations may have been promulgated after the Legislature enacted section 13377.

The legislative history of section 13377 also indicates the Legislature's intent to incorporate future federal requirements automatically. Prior to its amendment in 1978, section 13377 listed the specific types of requirements established under the Clean Water Act and implementing regulations that state-issued permits were required to apply. The Legislature's replacement of the specific list with a general requirement that state-issued permits ensure compliance with "all applicable provisions of the [Clean Water] act and acts amendatory thereof or supplementary thereto" reinforces an intent to incorporate future federal changes automatically without the need for state statutory amendments. Compare 1972 Cal. Stats. Ch. 1256, pp. 2486-2487, § 1, and 1978 Cal. Stats. Ch. 616, p. 2068, § 1.

The enforcement provisions of Chapter 5.5 of the Porter-Cologne Act, sections 13385, 13386, and 13387, also incorporate prospective requirements set by EPA regulations. A comparison of these sections and section 309 of the Clean Water Act discloses the Legislature's intent to incorporate federal regulations, including future regulations. Sections 13385,

13386, and 13387 are patterned generally after Section 309 of the Clean Water Act. Section 309 refers to violations of sections 301, 302, 306, 307, 308, 318 or 405. Section 301 provides for effluent limitations; section 302, for water quality related effluent limitations; section 306, for national standards of performance; section 307, for toxic and pretreatment effluent standards; 308, for records, monitoring and inspections; 318, for discharge of specific pollutants associated with an approved aquaculture project; and 405, for the disposal or use of sewage sludge. The state statutes, sections 13385, 13386, and 13387, each refer to violations of any "effluent limitation[1/], water quality related effluent limitation, national standard of performance, pretreatment or toxicity standard." It must be inferred that the Legislature by its use of these terms intended to incorporate the terms as used in the Clean Water Act. In fact, these terms have no meaning except by reference to the Clean Water Act. The plain meaning of the words of each term do not suggest a clear definition of the term. Also, these terms do not appear in the Porter-Cologne Act except in Chapter 5.5 which, as stated above, was enacted in order to conform state law to the Clean Water Act (§ 13370). Thus, the terms "effluent limitation," "water quality related effluent limitation," "national standard of performance," "pretreatment standard" and "toxicity standard" mean those limitations and standards prescribed in the Clean Water Act and implementing regulations.

---

1. Section 13387 refers to "effluent standard."

The Legislature's intent to include future as well as current federal standards and limitations in effect at the time sections 13385, 13386 and 13387 were enacted is implied by several factors. A settled rule of statutory construction provides that incorporation by reference of law generally on a particular subject includes not only contemporary law but future amendments. See State School Bldg. Finance Comm. v. Betts (1963) 216 Cal.App.2d 685, 692 [31 Cal.Rptr. 258]. The Legislature's reference to the standards and limitations is in broad general terms -- "any effluent limitation, water quality related effluent limitation, national standard of performance, pretreatment or toxicity standard" -- and implies an incorporation of future-promulgated standards and references. In addition, the Legislature in section 13370 states the purpose of chapter 5.5, which includes sections 13385, 13386, and 13387, to authorize the state "to implement" current and future federal regulations. The implementation of regulations includes their enforcement. See 33 U.S.C. § 1342(b)(7). An interpretation of sections 13385, 13386 and 13387 excluding future promulgated federal standards and limitations would be inconsistent with the Legislature's stated purpose and therefore must be rejected. See California Toll Bridge Authority v. Kuchel (1952) 40 Cal.2d 43, 53 [251 P.2d 4].

The Legislature's decision reflected in Chapter 5.5 t ensure that the state permit program conforms to federal requirements by incorporating those requirements into state law is consistent with other provisions of the Porter-Cologne Act that deal with the federal-state relationship in water quality

control. When referring to the Clean Water Act, the Legislature consistently includes reference to future amendments of the Act. Section 13160 designates the State Board "as the state water pollution control agency for all purposes stated in the Federal Water Pollution Control Act and any other federal act, heretofore or hereafter enacted, and is ... authorized to exercise any powers delegated to the state by the Federal Water Pollution Control Act (33 U.S.C. 1251, et seq.) and acts amendatory thereto." (Emphasis added.) Section 13170 authorizes the State Board to adopt water quality control plans for waters for which water quality standards are required by the Federal Water Pollution Control Act and acts "amendatory thereof or supplementary thereto." (Emphasis added.)

The State Board and Regional Boards have consistently interpreted the provisions of Chapter 5.5 of the Porter-Cologne Act to incorporate the Clean Water Act and implementing regulations prospectively. The State and Regional Boards have followed this interpretation both in regulations, see, e.g., 23 Cal. Admin. Code §§ 2235(e), 2235.2, and in individual permit decisions, see, e.g., State Water Resources Control Board Order No. WQ 78-17 (applying EPA pretreatment regulations). As the agencies charged with enforcement of the Porter-Cologne Act, their construction of the law is entitled to great weight and will be upheld by the courts, unless clearly erroneous. See Gay Law Students Assn. v. Pacific Tel. & Tel. Co. (1979) 24 Cal.3d 458, 491 [595 P.2d 592, 156 Cal.Rptr. 14].

A question has arisen whether the Legislature intended that federal law and regulations would be incorporated as state law automatically upon their enactment or only after the promulgation of regulations by the Board incorporating the federal regulations. The language of sections 13377, 13385, 13386 and 13387 indicates that these sections are self-executing and do not require the adoption of implementing regulations to become operable. Federal regulations that fall within the scope of these sections become operable automatically upon their enactment.

Section 13377 directs the State Board and Regional Boards to issue waste discharge requirements that apply and ensure compliance with all applicable provisions of the Act. The mandate is complete and can be implemented directly by the boards. The mechanism for ensuring compliance with applicable federal law, waste discharge requirements, already is in place. There is no need to promulgate regulations to make the directive operable.

Similarly, sections 13385, 13386 and 13387 are complete mandates. The Legislature states that violation of "any" of the listed standards or limitations makes the discharger liable for civil or criminal penalties. As discussed above, the listed standards and limitations include federally-promulgated standards and limitations. The Legislature's express listing of federally-promulgated standards and limitations implies that those standards and limitations become enforceable without the

necessity for administrative rule-making by any California agency.

Section 13371 does not require a different interpretation of sections 13377, 13385, 13386 or 13387. Section 13371 was enacted in 1972 and states as follows:

> The Legislature further finds and declares that it is necessary for the state board to amend its administrative regulations in order to comply with the Federal Water Pollution Control Act and regulations and guidelines adopted thereunder.

Under California law, statutes are to be construed with reference to the entire scheme of which they are a part so that the provisions may be harmonized and retain effectiveness. People v. Kuhn (1963) 216 Cal.App.2d 695, 698 [31 Cal.Rptr. 253]. An interpretation of section 13371 rendering the provisions of sections 13377, 13385, 13386 and 13387 inoperative with respect to federal regulations until the Board adopts regulations implementing the federal regulations is inconsistent with the mandatory self-executing language of these sections. In addition, the legislative history of section 13371 indicates that the provisions of section 13371 are limited to a specific historical context that ceased to exist in 1978.

Section 13377, as enacted in 1972 with section 13371, required the Boards to issue waste discharge requirements that "ensure compliance with all applicable effluent limitations, national standards of performance, toxic and pretreatment

effluent standards, and any ocean discharge criteria." In its 1972 version, section 13377 did not expressly incorporate the procedural requirements established by EPA under section 304(i) of the Clean Water Act. Section 304(i) requires EPA to establish guidelines for "procedural and other elements of any state program", including monitoring requirements, reporting requirements, and enforcement provisions. 33 U.S.C. § 1314(i). Accordingly, in 1972, it was necessary for the State Board to adopt regulations to ensure that the state's permit procedures were consistent with Clean Water Act requirements, as set forth in EPA guidelines adopted pursuant to Clean Water Act Section 304(i). 33 U.S.C. § 1314(i). The Legislature made a finding to that effect in section 13371. The State Board regulations implementing the 1972 legislation set forth in detail the procedural requirements for permitting, while relying on incorporation by reference to apply the substantive requirements of sections 301, 302, 306, 307 and 403 of the Clean Water Act. Register 73, No. 6, filed February 2, 1973, formerly codified at 23 Cal. Admin. Code § 2235 et seq. In 1978, the Legislature amended section 13377 to require the Boards to issue waste discharge requirements that "apply" and ensure compliance with "all applicable" Clean Water Act requirements, not just the requirements of sections 301, 302, 306, 307 and 403 of the Clean Water Act. § 13377; 1978 Cal. Stats. ch. 746, § 3. Section 13377 now incorporates the procedural requirements for permitting, as well as the substantive requirements setting limitations and standards. The need for administrative

regulations to implement the procedural requirements of the Clean Water Act no longer exists and the provisions of section 13371 are subsumed under section 13377.

C. The State Board Is Authorized to Adopt Regulations That Incorporate Prospective Federal Regulations.

The State Board has adopted regulations which incorporate prospectively EPA regulations applicable to the processing of NPDES applications and issuance of NPDES permits. 23 Cal. Admin. Code §§ 2235.1(c), 2235.2; § 2235.4. Section 2235.1(c) states as follows:

> "Each report of waste discharge to navigable water shall be filed and processed in compliance with the applicable federal regulations governing the NPDES permit program promulgated by EPA."

Section 2235.2 states as follows:

> "Waste discharge requirements for discharge from point sources to navigable waters shall be issued and administered in accordance with the currently applicable federal regulations for the National Pollutant Discharge Elimination System (NPDES) program."

By referring to "the applicable" or "the currently applicable" NPDES requirements, these regulations are intended to apply the NPDES regulations in effect when a report of waste discharge is processed and waste discharge requirements are issued.

The State Board is authorized to adopt rules and regulations "as it may from time to time deem advisable in carrying out its powers and duties" under the Water Code. § 1058.

Chapter 5.5 of the Porter-Cologne Act directs the State and Regional Boards to implement the requirements of the Clean Water Act and implementing regulations, including any amendments to the act or implementing regulations promulgated after enactment of Chapter 5.5 of the Porter-Cologne Act. See §§ 13370, 13377. The Board's regulations that direct compliance with EPA regulations, including future amendments, fall within the Board's statutory mandate to implement federal law and regulations, including future amendments. §§ 13377, 13370.

The State Board's regulations implementing Chapter 5.5 of the Clean Water Act have consistently incorporated prospective federal regulations. Former Section 2235.5(b) of Title 23 of the California Administrative Code, as adopted by the State Board on February 1, 1973, provided, in part:

> "(1) All waste discharge requirements shall comply with effluent limits adopted under Sections 301, 302, 306 and 307 of the Federal Water Pollution Control Act and whenever applicable any more stringent limitation necessary to meet any other federal law or regulation.
>
> (2) If a toxic effluent standard is established pursuant to Section 307 of the Federal Water Pollution Control Act for a

toxic pollutant which is present in a discharge and such standard is more stringent than the current waste discharge requirement, the waste discharge requirements shall be revised in accordance with such toxic effluent standard."

Register 73, No. 6. The clear intent of this regulation was to apply EPA regulations setting effluent guidelines and standards, all of which EPA regulations were promulgated after the State Board adopted its regulation. See, e.g., EPA, Effluent Guidelines and Standards, 39 Fed.Reg. 4532 (Feb. 1, 1974).

As stated above, the Board's interpretation of its authority is entitled to great weight. Gay Law Students, supra, 24 Cal.3d 458, 491. Moreover, the Legislature has amended various provisions of Chapter 5.5 from time to time since 1973, without imposing any limitations on the State Board's authority to implement EPA's NPDES program regulations. See, e.g., 1984 Cal. Stats. ch. 1541; 1978 Cal. Stats. ch. 746. Coupled with the Legislature's own use of prospective incorporation by reference (see 1978 Cal. Stats. ch. 746, § 3), the Legislature may be deemed to have accepted the manner in which the Board used prospective incorporation by reference. See California Welfare Rights Organization v. Brian (1974) 11 Cal.3d 237, 241 [520 P.2d 970, 972, 113 Cal.Rptr. 154], cert. denied, 419 U.S. 1022, 95 S.Ct. 497.

The Board's regulations incorporating prospective federal regulations were adopted in compliance with applicable

state rule-making law. The bulk of the current state law prescribing minimum stylistic and procedural requirements for the adoption of administrative regulations (Cal. Gov't. Code, § 11346) became effective after the adoption of the Board's regulations and therefore is not applicable. See 1979 Cal. Stats. ch. 567, §§ 1,3.[2/] The Board's use of incorporation by reference in its regulations, however, is not inconsistent with the statutory requirements or the regulations promulgated by the Office of Administrative Law (OAL) implementing those requirements. See 1 Cal. Admin. Code, § 10 et seq. For example, section 20(c)(4) of Title 1 of the California Administrative Code provides as follows:

> "(c) An agency may 'incorporate by reference' only if the following conditions are met:
>
> . . .
>
> (4) The regulation text states that the document is incorporated by reference and identifies the document by title and date of publication or issuance. Where an

---

2. The Board's use of incorporation by reference in its regulations also is consistent with the current requirements that a state agency must prepare a statement of reasons and information digest for the proposed regulation and, if promulgated, the adopted regulation. See Cal. Gov't. Code § 11346.7. This provision took effect after the Board promulgated the current regulations and therefore did not govern the Board's rulemaking procedure. See Cal. Gov't Code § 11340.2; 1979 Cal. Stats. c. 567, §§ 1, 3. The requirement for a statement of reasons and information digest do not apply to the promulgation of certain regulations that are mandated by federal law or regulations. Cal. Gov't. Code § 11346.7(c). The exception, however, does not apply to the adoption of state regulations that incorporate prospective federal regulations. Thus, the Board could be required to prepare a statement of reasons and an information digest for promulgation of a regulation that adopts future federal regulations.

authorizing California statute or other applicable law requires the adoption or enforcement of the incorporated provisions of the document as well as any subsequent amendments thereto, no specific date is required."

In its reference to a law that requires adoption or enforcement of the incorporated provisions of a document "as well as any subsequent amendments thereto," the drafters of the OAL regulation anticipated a state law that requires adoption or enforcement of present as well as future provisions. Section 13377 is an example of the statute described in subsection 20(c)(4). At section 13377, the Legislature has directed the State Board and Regional Boards to "apply and ensure compliance with all applicable provisions of the [Clean Water] Act and acts amendatory thereof or supplementary thereto...."

D. Prospective Incorporation By Reference Is Not An Impermissible Delegation.

The question has been raised whether the prospective incorporation of federal law and regulations constitutes an impermissible delegation of legislative authority to Congress and EPA. The doctrine against delegation of authority rests upon the premise that the Legislature may not abdicate its responsibility to resolve fundamental policy issues. City of Santa Ana v. City of Garden Grove, (1979) 100 Cal.App.3d 521, 529 [100 Cal.Rptr. 907, 911]; Kugler v. Yocum (1968) 69 Cal.2d 371, 376 [71 Cal.Rptr. 687, 445 P.2d 303]. On the other hand, the courts recognize the practical necessity for delegating legislative authority in light of the ever-increasing multiplicity and

complexity of administrative affairs, and are reluctant to invalidate legislation as an unlawful delegation. Kugler, supra, 69 Cal.2d at 383-384. As stated by the California Supreme Court in Kugler,

> "[o]nly in the event of a total abdication of [legislative] power, through failure either to render basic policy decisions or to assure that they are implemented as made, will this court intrude on legislative enactment because it is an 'unlawful delegation,' and then only to preserve the representative character of the process of reaching legislative decision."

Kugler, supra, 69 Cal.2d at 384; see Clean Air Constituency v. Calif. State Air Resources Board (1974) 11 Cal.3d 801, 817 [523 P. 2d 617]. Accordingly, legislation will be upheld as long as (1) the Legislature has resolved the truly fundamental policy issues and (2) adequate safeguards exist to assure proper implementation of the policy decision. Kugler, supra, 69 Cal.2d at 376; Wilkinson v. Madera Community Hospital (1983) 144 Cal.App.3d 436 [192 Cal.Rptr. 593].

The test pronounced in Kugler applies to incorporation by reference of future as well as contemporary enactments. Prospective incorporation by reference is not per se invalid. Legislative schemes that adopt future enactments by reference have been sustained by state and federal courts. See Arwin v. Board of Medical Examiners (1907) 151 Cal. 499, 503; Ex parte Gerino (1904) 143 Cal. 412, 419; People v. Ovama (1946) 29 Cal.2d 164, 173 [173 P.2d 794]; Kugler, supra, 69 Cal.2d at 379; In re Lasswell (1934) 1 Cal.App.2d 183, 188, 203 [36 P.2d 678]; Manmoros v. State Bd. of Equalization (1948) 87 Cal.App.2d 140,

144 [296 P.2d 857]; Moore v. State Bd. of Equalization (1946) 76 Cal.App.2d 758 [174 P.2d 323]; City of Downey v. Board of Administration (1975) 47 Cal.App.3d 621, 630 [121 Cal.Rptr. 295]; 43 Ops.Cal.Atty.Gen. 1, 3-4 (1964); 43 Ops.Cal.Atty.Gen. 276, 277 (1964); U.S. v. Sharpnack (1957) 355 U.S. 286, 293-294 [78 S.Ct. 291]. In Ex parte Gerino, supra, 143 Cal. at 419, the California Supreme Court upheld a legislative requirement that an applicant for admission to the practice of medicine must have a diploma from a medical school with requirements no less than those prescribed by the Association of American Medical Colleges. The Court stated:

> "Evidently the standard of proficiency in scholarship as a preparation, and the particular studies necessary to secure a fair preparation, must change as the discoveries in natural science open new fields of investigation and suggest or reveal new curative agencies. The legislature cannot successfully prescribe in advance a standard to meet these new and changing conditions. The method adopted appears to be sufficiently definite to enable all colleges to reach the required standard when in good faith they desire to do so. The law is as fixed, definite, and certain in this respect as the nature of the subject and the object to be attained will permit, and we do not think it should be held void because it adopts the standard fixed from time to time by those who, it will be presumed, are the most eminent in the profession which it attempts to regulate, and who should be the most interested in maintaining the highest degree of professional proficiency, skill and training." 143 Cal. 412, at 419.

Sixty-four years later, in Kugler, the Supreme Court confirmed prospective incorporation by reference.

In Kugler, the California Supreme Court upheld proposed legislation setting the minimum wage for the firemen of the City of Alhambra based upon the average of the wages set by the City

of Los Angeles for the City's firemen and the wages set by the County of Los Angeles for the County's firemen. Kugler, supra, 69 Cal.2d at 374. The Court found that the fundamental policy issue - that the Alhambra wages for firemen should be on parity with Los Angeles wages - was being decided by the legislative body. Kugler, supra, 69 Cal.2d at 377. The Court also found that the proposed ordinance contained built-in and automatic safeguards against "exploitive consequences" from the operation of the ordinance. Id. at 382-383.

> "Los Angeles is no more anxious to pay its firemen exorbitant compensation than is Alhambra. Los Angeles as an employer will be motivated to avoid the incurrence of an excessive wage scale; the interplay of competitive economic forces and bargaining power will tend to settle the wages at a realistic level. As we noted in an analogous area involving the establishment of prices: 'the Legislature could reasonably assume that competition . . . coupled with . . . bargaining power. . . would provide a safeguard against excessive prices. In all probability, that safeguard is at least as effective as any which the Legislature could be expected to provide by promulgating explicit standards. . . .' (Wilke & Holzheiser, Inc. v. Dept. of Alcoholic Beverage Control (1966) 65 Cal.2d 349, 367-368 [55 Cal.Rptr. 23, 420 P.2d 735]." Kugler, supra, 69 Cal.2d at 382.

The dangers contemplated by the opponents of the proposed legislation -- that the legislative body will neither know in advance nor control the level of the minimum wage -- were dismissed by the Court. Kugler, supra, 69 Cal.2d at 378-379; see Metropolitan Water District v. Whitsett (1932) 215 Cal. 400, 419 [10 P.2d 781]. Although external bodies would be involved in establishing the minimum wages for Alhambra, the Court found that the City could properly expect these bodies to reasonably discharge their obligations, which were reasonably related to the

fulfillment of the purpose of the ordinance. Hudler, supra, 69 Cal.2d at 382-383.

> "Once Alhambra establishes the policy of parity between the Alhambra and the Los Angeles wages, the fact that the Los Angeles governing bodies participate in setting Los Angeles salaries does not defeat the Alhambra legislation since Alhambra could expect that the authorities would reasonably investigate, negotiate, and finally determine such salaries. Thus the designated method appropriately attains the purposes of the ordinance." Id. at 383.

The validity of prospective incorporation by reference has been questioned in the past in several statements and decisions. See In re Burke (1923) 190 Cal. 326, 328-329 [212 P. 193]; Brock v. Superior Court (1937) 9 Cal.2d 291, 297 [71 P.2d 209]; Palermo v. Stockton Theatre, Inc., (1948) 32 Cal.2d 53, 59-60 [193 P.2d 1]; People v. Kruger (1975) 48 Cal.App.3d Supp. 15, 19 [121 Cal.Rptr. 581]; People v. Williams (1985) 175 Cal.App.3d Supp. 16, 29; 63 Ops.Cal.Atty.Gen. 566 (1980). The statements in Burke, Brock, and Palermo are dicta and therefore not entitled to precedential value. Beking Moving & Storage Co. v. Prudential Ins. Co. (1988) 176 Cal.App.2d 248, 252 [221 Cal.Rptr. 738]. In fact, the statements are dicta relying on other dicta for authority. In Burke, the court expressly reserved the question whether incorporation of future law was valid. 190 Cal. 326 at 328. In Brock, the court cited the Burke opinion and a South Carolina decision to support its dictum. 9 Cal.2d 211, at 297. The Palermo decision cited Brock, Burke and Rancho Santa Anita v. City of Arcadia (1942) 20 Cal.2d 315, 322 [125 P.2d 475]. In Rancho Santa Anita, the court interpreted an ordinance incorporating state law to mean that only the current version of

a state statute and not future versions were incorporated. 20 Cal.2d at 322. The court expressly reserved the question of the validity of future incorporation by reference. 20 Cal.2d at 322. People v. Williams (1985) 175 Cal.App.3d Supp. 16, 24. In addition to lacking precedential value, these statements also lack persuasive value because the statements are made without analysis or explanation of the underlying rationale. Indeed the Kuoler decision disavows the dicta in Burke as not passing on the issue. See Kuoler, supra, 69 Cal.2d at 379-380 n. 6; 64 Ops.Cal.Atty.Gen. at 514 (1981).

In People v. Krueger, the appellate department of the superior court held that the state regulations at issue were invalid because they incorporated by reference future federal regulations setting fishing limits. In California, appellate department decisions are not binding on either the Court of Appeal or the Supreme Court and have been regarded as not controlling even in the appellate department. Worthington v. Unemp. Ins. App. Bd. (1976) 64 Cal.App.3d 384, 389 [134 Cal.Rptr. 867]. The decision in Krueger lacks persuasive value because it relies solely on dicta in Brock without any supporting analysis. The only state authority cited in Brock was Burke which, as discussed above, was impliedly rejected in Kuoler.

In People v. Williams, the court reviewed the validity of state law incorporating federal law setting the maximum speed limit. Williams, supra, 175 Cal.App.3d Supp. at 22-23. As stated above, decisions of the appellate department have limited precedential value. See Worthington, supra, 64 Cal.App.3d at

389. The court in dicta implied that the automatic repeal of the state law based upon the repeal of the federal statute would be an invalid delegation of authority. Williams, supra, 175 Cal.App.3d Supp. at 22. In fact, however, the state law does incorporate a prospective federal repeal. The state law provides that "it shall remain in effect 120 days from the date that the 55-mile-per-hour national maximum speed limit, as specified in . . . the United States Code, is repealed." Id. at 23. Thus, if the Legislature fails to act within the 120-day period, the state law is automatically repealed.

The 1980 opinion from this Office in fact confirms the test enunciated in Eucler. 63 Ops.Cal.Atty.Gen. 566, 571-572. The opinion finds that under the legislative scheme at issue, there are inadequate safeguards to ensure that the Legislature's policy will be carried out. 63 Ops.Cal.Atty.Gen. at 582. The opinion also involved the incorporation of standards adopted by a private entity, a circumstance that perhaps requires greater scrutiny for the adequacy of safeguards than an incorporation of standards adopted by the federal government. See, e.g., Salmon Trollers Marketing Association v. Fullerton (1981) 124 Cal.App.2d 291, 301 [177 Cal.Rptr. 362, 376].

The Legislature's enactment of chapter 5.5 incorporating present and future federal law and regulations satisfies the Eucler test and thus is not an invalid delegation of legislative authority. As stated above, Congress in the Clean Water Act has provided states the opportunity to take over primary responsibility for implementing the provisions of the

Clean Water Act establishing the NPDES permit system to regulate the discharge of pollutants. 33 U.S.C. § 1342(b). States choosing to avail themselves of this opportunity must obtain EPA approval of their program pursuant to the criteria set out by Congress at section 402(b) of the Clean Water Act. These criteria include the requirements that the state has adequate authority to issue permits that "apply and ensure compliance" with federally-promulgated limitations and standards.

The Legislature has made the fundamental policy decision that the interest of the people of the state of California lies in the state's implementation of the NPDES program. The Legislature found that by administering the program in California, the state would "avoid direct regulation by the federal government of persons already subject to regulation under [the Porter-Cologne Act]." § 13370. The Legislature chose to implement this policy decision by incorporating present and future federal law and regulations into state law. The prospective incorporation of federal law and regulations ensures continuing compliance with the criteria for EPA approval of a state program. In fact, the policy of continuing qualification for EPA approval might very well be defeated as a practical matter if an incorporation of federal law and regulations did not provide for future federal law and regulations. See 43 Ops.Cal.Atty.Gen. at 281 (1964).

The Legislature's policy decision to implement the NPDES program is accompanied by adequate safeguards. In fact, the principal safeguard is that Congress and EPA are committed to

the responsible and effective administration of the NPDES program. 33 U.S.C. § 402. The courts have upheld similar delegations to outside agencies when the entity performs a function that is related to the legislative policy and the entity can be expected to perform that function in a reasonable manner. See Kucler, supra, 69 Cal.2d at 382; 43 Ops.Cal.Atty.Gen. 1 (1964); 43 Ops.Cal.Atty.Gen. 275 (1964). It is axiomatic that Congress and EPA perform a function that is related to the State's legislative policy to implement the NPDES program in California. Indeed, the State's policy is to conform to Congress' and EPA's implementation of the NPDES program. § 13370. Also, it is a truism that Congress and EPA can be expected to perform their functions in a reasonable manner. Where a delegation to Congress or a federal agency is at issue, comity would appear to dictate almost automatic recognition that it will reasonably perform its function. The State of California is an inseparable part of the United States of America, Cal. Const., Art. III, Sec. 1, and the Congress of the United States includes senators and representatives from the State of California. Federal agencies are created by statutes enacted by Congress. It may be presumed then that the Legislature can expect the federal government to reasonably perform its function. See Salmon Trollers Marketing Association v. Fullerton, supra, 124 Cal.App.2d at 301.

The presumption that Congress and EPA will act reasonably is bolstered by safeguards built into the NPDES

program that provide ample incentive for Congress and EPA to avoid arbitrary or unreasonable action with respect to the NPDES program. One safeguard is that the requirements of the NPDES program will apply to discharges in the state whether the state or EPA administer the NPDES program. See 33 U.S.C. §§ 1323, 1342, 1365(5). The fact that Congress and EPA will themselves have to enforce requirements provides an incentive to act reasonably. In states that do not have an EPA-approved program, EPA will enforce these requirements directly. 33 U.S.C. § 1342(a). In states such as California that do have an EPA-approved program, EPA enforces these requirements indirectly through its oversight function. See 33 U.S.C. §§ 1342(c) and (d). Another safeguard built into the NPDES program is that Congress and EPA are implementing the NPDES program with full awareness that states with EPA-approved programs will be implementing NPDES requirements. See 33 U.S.C. §§ 1251(b), 1342(b). Congress' and EPA's recognition that the NPDES program is being implemented by the states reduces the likelihood that state incorporation of NPDES requirements could have unanticipated effects.

The Porter-Cologne Act provides additional safeguards. The Legislature authorizes the State Board and Regional Boards to apply effluent standards or limitations that are more stringent than applicable federal limitations and standards where "necessary to implement water quality control plans, or for the protection of beneficial uses, or to prevent nuisance." § 13377. In addition, if federal limitations and standards are relaxed,

existing waste discharge requirements for point source discharge requirements would remain in effect until they were revised by the Regional Boards. See § 13263(c). Additional safeguards lie in the availability of administrative and judicial review of action by the State and Regional Boards regarding waste discharge requirements. §§ 13263(a), 13300 et seq., and 13320 et seq. The administrative appeals provisions of the Porter-Cologne Act provide that any aggrieved person, including regulated parties and interested citizens, may appeal to the State Board from any action or failure to act by a Regional Board, including action or failure to act pursuant to Chapter 5.5. § 13320(c). Appealable action or inaction includes issuance of waste discharge requirements, issuance of enforcement orders or refusal to take enforcement action. The State Board's decision also is subject to judicial review. § 13330.

An example illustrates these administrative review procedures. A discharger who believes that a Regional Board has improperly applied an EPA regulation may petition the State Board for review. The discharger may contest whether the EPA regulation is within the scope of the incorporation by reference established under the Porter-Cologne Act, whether the Regional Board has properly interpreted the regulation, and, if the Regional Board has gone beyond the minimum requirements of the Clean Water Act, whether the Regional Board's action is reasonably necessary to implement the requirements of state law. See, e.g., Southern California Edison Co. v. State Water Resources Control Board, (1981) 116 Cal.App.3d 751, 756-60. [172

Cal.Rptr. 306, 310]. Similarly, if a Regional Board's action satisfies the minimum requirements of the Clean Water Act, but an environmental group believes that more stringent requirements are necessary to promote the purposes of the Porter-Cologne Act, the environmental group may petition the State Board for review.

The state scheme contains adequate safeguards even though it adopts federal law and regulations automatically. In analyzing the adequacy of safeguards the courts consider safeguards that are inherent in the delegation process, including the process for the exercise of the delegated power. See Kugler, supra, 69 Cal.2d at 381-382; 1 Davis, Admin. Law Treatise (1958) § 2.15. The courts do not insist on an external standard or procedural check to validate the actual incorporation of another entity's determinations. See People ex rel. Younger v. County of El Dorado (1971) 5 Cal.3d 480, 507 [487 P.2d 1193, 1210, 96 Cal.Rptr. 553, 570]. While the courts have upheld delegation schemes in which the Legislature directs the agency to adopt regulations incorporating federal regulations (see Salmon Trollers, supra, 124 Cal.App.3d 291, 301), the intermediate administrative act of adopting federal law by regulation is not a mandatory requirement under Kugler.

In Kugler, the City automatically incorporated the average of the adjoining City and County wages as a minimum wage. Kugler, supra, 69 Cal.2d at 373. While the City reserved its discretion to set a higher wage, it did not reserve its discretion to alter the applicable minimum wage set by the Los Angeles wages. Id. at 373-374. See also, People ex rel. Younger

v. County of El Dorado, supra, 5 Cal.3d at 507 (direct incorporation of rules of external body into criminal statute); City of Downey v. Board of Administrators (1975) 47 Cal.App.3d 621, 629-31 & n.6, [121 Cal.Rptr. 295, 301-02 & n.6]; In re Lasswell (1934) 1 Cal.App.2d 183 [36 P.2d 678]; cf. 43 Ops.Cal.Atty.Gen. 275 (1964) (state regulations may prospectively incorporate federal regulations), 43 Ops.Cal.Atty.Gen. 1 (1964) (same). In People ex rel. Younger, the court upheld a statute prospectively incorporating rules to be adopted by an interstate agency, the Tahoe Regional Planning Agency. People ex rel. Younger, supra, 5 Cal.3d at 507. The state statute, adopted before the interstate agency adopted its first ordinance, provided that: "Violation of any ordinance of the [interstate] agency is a misdemeanor." 1968 Cal. Stats. ch. 998, formerly codified at Cal. Gov't Code § 66801. As such the statute is similar to sections 13385 and 13387, which provide civil and criminal penalties for violation of pretreatment standards, national standards of performance, and other specified requirements established by EPA regulations. The interstate agency's rules were automatically incorporated into a California criminal statute, without the necessity of any action by a state or local agency to adopt that interstate ordinance as a rule of that state or local agency. Cf. In re Lasswell, supra, 1 Cal.App.2d at 183 (upholding misdemeanor statute which automatically incorporated rules to be approved by the federal executive). In this respect, California law is the same as

federal law. See United States v. Shermack (1958) 355 U.S. 286 [78 S.Ct. 291].

In sum, the Legislature's decision embodied in Chapter 5.5 to incorporate prospective as well as current federal law and regulations is not an impermissible delegation of legislative authority. The Legislature has made the fundamental policy decision that California will implement the NPDES program in a manner that complies with the federal criteria and requirements for state NPDES programs. See §§ 13370, 13372, 13377. Ample safeguards exist to ensure that the state's acquiescence to NPDES requirements enacted by Congress and implemented by EPA will not result in an unreasonable or arbitrary water quality control program.

E. Chapter 5.5 Is Not Invalid For Vagueness or Uncertainty.

In Ross v. Locke (1975) 423 U.S. 48, 49-50 [96 S.Ct. 283, 299; 46 L.Ed.2d 185], the United States Supreme Court stated the rule proscribing vagueness or uncertainty:

> "The fair-warning requirement embodied in the Due Process Clause prohibits the State from holding an individual 'criminally responsible for conduct which he could not reasonably understand to be proscribed'... [E]ven trained lawyers may find it necessary to consult legal dictionaries, treatises, and judicial opinions before they may say with any certainty what some statutes may compel or forbid. [Citations omitted]. All the Due Process Clause requires is that the law give sufficient warning that men may conduct themselves so as to avoid that which is forbidden." Ross v. Locke, 423 U.S. 48, 49-50.

All presumptions and intendments favor the validity of a statute, and it will be upheld unless its unconstitutionality clearly, positively and unmistakably appears. In re Dennis M. (1969) 70 Cal.2d 444, 453 [75 Cal.Rptr. 1, 450 P.2d 296]; People

v. Medina (1972) 27 Cal.App.3d 473, 479 [103 Cal.Rptr. 721]; People v. Tufts (1979) 97 Cal.App.3d Supp. 37, 46 [159 Cal.Rptr. 163]; People v. Gonda (1982) 138 Cal.App.3d 744, 780 [188 Cal.Rptr. 295, 296].

The "void for vagueness" doctrine has only limited applicability to civil sanctions. It is not likely to present a problem where regulation of speech or expression, or conditions of government employment are not at issue:

> "Although enactments outside the criminal area have occasionally been subjected to scrutiny on grounds of vagueness -- especially in cases involving the right to practice of a recognized profession...we have normally limited such examination to situations where First Amendment rights have been at stake."

Goldin v. Public Utilities Commission (1979) 23 Cal.3d 638, 659, [592 P.2d 289, 302, 153 Cal.Rptr. 802, 815]. See Cranston v. City of Richmond (1985) 40 Cal.3d 755, 763 [710 P.2d 845, 849, 221 Cal.Rptr. 779, 783] (conditions of government employment).

Where a challenge to a statute does not involve First Amendment freedoms, the statute cannot be challenged as vague in the abstract. The challenge must be based upon the facts of the particular case. Cranston v. City of Richmond, supra, 40 Cal.3d at 763-64. Thus, where the state seeks to impose sanctions for violations of water quality laws, it is not necessary to delineate every conceivable situation where sanctions could be imposed in order to avoid a void for vagueness challenge. All that is required is that there be reasonable notice that the particular conduct at issue in the enforcement action is proscribed. See id.

A statute may prospectively incorporate other statutes or administrative regulations in defining criminal conduct. See Braxton v. Municipal Court (1973) 10 Cal.3d 138, 152, [514 P.2d 697, 705, 109 Cal.Rptr. 897, 905]; People v. Rehman (1967) 253 Cal.App.2d 119, 156 [61 Cal.Rptr. 65, 89], cert. denied 390 U.S. 947, 88 S.Ct. 1033 (1968); United States v. Bryant (6th Cir. 1983) 716 F.2d 1091, 1095, cert. denied 104 S.Ct. 1006 (1984). Insofar as void for vagueness issues are concerned, incorporation of federal statutes and regulations does not present any issues that are fundamentally different than those raised when state statutes and regulations are incorporated. Federal statutes and regulations are as readily available to the regulated public as state statutes and regulations. Whether state or federal law is incorporated into a criminal statute, the test is still whether the law provides sufficient warning as to what is forbidden.

Incorporation by reference of other statutes and regulations ordinarily should not present any vagueness problems. See United States v. Bryant, supra, 716 F.2d at 1095, upholding a federal statute incorporating state fish and game laws. In fact, the courts have used incorporation by reference as a means of avoiding vagueness problems. Even statutes and regulations which do not expressly incorporate by reference have been interpreted to do so, so that the standards set by the incorporated document may be used to provide adequate criteria for enforcement. See Associated Home Builders v. City of Livermore (1976) 18 Cal.3d 582, 596-99, [557 P.2d 473, 481-82, 135 Cal.Rptr. 41, 49-50]; Braxton v. Municipal Court, supra, 10 Cal.3d at 152. Further,

the use of prospective incorporation helps avoid vagueness problems that might arise if a statute incorporated only the laws in effect at the time of its enactment. United States v. Francisco (9th Cir. 1976) 536 F.2d 1293, 1295-96 (construing federal criminal statute which incorporates state laws to incorporate those state laws prospectively).

Civil and criminal penalties are established as part of Chapter 5.5 of the Porter-Cologne Act in sections 13385 and 13387. Penalties may be imposed for the following types of violations:

(1) point source discharges which are not permitted by waste discharge requirements;

(2) knowingly making a false statement to the state board or a regional board, or falsifying or tampering with monitoring devices or methods required to be maintained under the Porter-Cologne Act;

(3) violation of waste discharge requirements or other specified state and regional board orders or prohibitions;

(4) violation of the requirements of Sections 301, 302, 306, or 307 of the Clean Water Act.

§§ 13385, 13387. The violations must be willful or negligent for criminal penalties to be imposed. § 13387. In some cases, criminal penalties may not be imposed unless the violations were made knowingly. See § 13387(b).

With respect to the first two categories of violations listed above, unpermitted discharges and specified reporting and monitoring violations, sections 13385 and 13387 on their face provide more than adequate notice and specification of what conduct is proscribed. Where penalties are imposed for violations of the waste discharge requirements and other orders or prohibitions, those waste discharge requirements or other orders or prohibitions should provide adequate warning and certainty as to what is required.

The statutes' authorization of penalties for violation of "any effluent standard, water quality related effluent standard, national standard of performance, [or] toxicity or pretreatment standard" established under Section 301, 302, 306 or 307 of the Clean Water Act also should not present any vagueness problems. § 13387; see § 13385. As discussed earlier, the express language of the provisions of Chapter 5.5, and the similarity of sections 13385 and 13387 to Section 309 of the Clean Water Act, leave little doubt that they are intended to apply the requirements of the Clean Water Act. See pp. 7-9, supra; see also United States v. Phelps Dodge (D.C. Ariz. 1975) 391 F.Supp. 1181 upholding section 309 of the Clean Water Act against a void for vagueness challenge. Further, construing sections 13385 and 13387 to reference the requirements of the Clean Water Act serves to eliminate any potential ambiguity as to what effluent standards, water quality related effluent standards, national standards of performance or toxicity or pretreatment standards are intended to be applied.

The notice provided by sections 13385 and 13387 is in marked contrast with the notice provided by the provisions of the Fish and Game Code considered in People v. Kruger, supra, 48 Cal.App.3d Supp. 15. There, a state regulation, which incorporated federal regulations, prohibited conduct that was expressly authorized by a provision of the Fish and Game Code. The superior court held that the defendant had no notice that his conduct was criminal. Id. at 20, 121 Cal.Rptr. 584 (alternative holding).3/ By contrast, the existence of penalties for violations of effluent limitations, water quality related effluent limitations, national standards of performance of toxicity or pretreatment standards is expressly set forth in the Porter-Cologne Act itself, in sections 13385 and 13387, not in a

---

3. Even as applied to the provisions of the Fish and Game Code before it, People v. Kruger is unpersuasive and internally inconsistent. The court held that federal regulation of the activity involved, fishing between 200 and 1300 miles offshore, is so all-encompassing that any state regulation, even enforcement of the same requirements as those set under federal law, is preempted. 48 Cal.App.3d Supp. at 19. Yet its alternative holding that there was inadequate notice that the defendant's conduct was criminal gave effect to a state statute which was inconsistent with applicable federal regulations. The superior court also failed to consider whether federal law provided adequate notice of the criminal nature of the conduct, independent of the provisions of the California Fish and Game Code. Although the superior court suggests that it is difficult for the regulated public to keep informed of regulations published in the Federal Register, id. at 20, it cannot seriously be contended that the difficulty results in a void for vagueness problem. See Yakus v. United States, 321 U.S. 414, 444, 64 S.Ct. 660, 672 (1944) (constructive notice is given to all persons affected by regulations published in the Federal Register) (dicta). See also id. at 433, 64 S.Ct. at 667 (criminal statute may prospectively incorporate federal regulations without allowing challenge to validity of those regulations as a defense to prosecution).

state board regulation. Moreover, nothing in the Porter-Cologne Act expressly or impliedly permits violation of these standards and limitations. See §§ 13370.5, 13372, 13376, 13385. In many cases, additional notice is provided because compliance with these standards and limitations will also be required pursuant to conditions of waste discharge requirements. See § 13377; 40 C.F.R. §§ 122.41(a), 122.44(b), 122.44(j), 403.8(f).

Independent of sections 13385 and 13387, the federal government may impose criminal penalties for violations of sections 301, 302, 306 and 307 of the Clean Water Act, and for violations of waste discharge requirements issued as part of the state's NPDES program. Clean Water Act section 309(c), 33 U.S.C. § 1319(c). Thus, even if sections 13385 and 13387 were vague or indefinite, they would not be subject to challenge as applied to violations, such as unpermitted discharges and violations of pretreatment standards, for which criminal penalties may also be imposed under section 309 of the Clean Water Act. As the Fifth Circuit reasoned in a decision rejecting a vagueness challenge to a federal statute which prospectively incorporated state criminal laws:

> "[T]he acts performed in violation of [the federal act] are necessarily proscribed by state law. Such violators cannot complain, therefore, of being lulled...into a false sense of security that their behavior stood outside the ambit of criminal prosecution."

United States v. McCoy (5th Cir. 1976) 539 F.2d 1050, 1058.

In sum, the provisions of Chapter 5.5 and State Board

regulations incorporating requirements of the Clean Water Act are not unconstitutionally vague or uncertain.

Cf. 64 Ops.Cal.Atty.Gen. 1 (rejecting similar challenges to state regulation incorporating federal law.)

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 122, 123, 124 and 504

[FRL 3376-8]

National Pollutant Discharge Elimination System Permit Application Regulations for Storm Water Discharges

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: Section 405 of the Water Quality Act of 1987 (WQA) added Section 402(p) of the Clean Water Act (CWA) to require the Environmental Protection Agency (EPA) to establish regulations setting forth National Pollutant Discharge Elimination System (NPDES) permit application requirements for: storm water discharges associated with industrial activity; discharges from a municipal separate storm sewer system serving a population of 250,000 or more; and discharges from a municipal separate storm sewer system serving a population of 100,000 or more, but less than 250,000. Today's notice requests comments on proposed permit application requirements for these discharges and for storm water discharges which are designated on a case-by-case basis for a permit for which the Administrator, or State, as the case may be, determines contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

Section 401 of the WQA amended Section 402(1)(2) to provide that NPDES permits shall not be required for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing, or treatment operations or transmission facilities, which are not contaminated by contact with, or do not come into contact with, any overburden, raw material, intermediate product, finished product, byproduct, or waste product located on the site of such operations. Today's notice requests comments on regulations proposed to clarify and implement this provision.

DATES: Comments on this proposed rule must be received on or before March 7, 1989.

Public meetings are scheduled as follows:

(1) January 13, 1989, 9:00 a.m. to 12:00 p.m. to discuss permit application and notification requirements for storm water discharges associated with industrial activity and 1:00 p.m. to 4:00 p.m. to discuss requirements for municipal separate storm sewer systems, in Washington, DC.

(2) January 24, 1989, 9:00 a.m. to 12:00 p.m. to discuss permit application and notification requirements for storm water discharges associated with industrial activity and 1:00 p.m. to 4:00 p.m. to discuss requirements for municipal separate storm sewer systems, in Chicago, IL.

(3) January 26, 1989, 9:00 a.m. to 12:00 p.m. to discuss permit application and notification requirements for storm water discharges associated with industrial activity and 1:00 p.m. to 4:00 p.m. to discuss requirements for municipal separate storm sewer systems, in Dallas, TX.

(4) January 31, 1989, 9:00 a.m. to 12:00 p.m. to discuss permit application and notification requirements for storm water discharges associated with industrial activity and 1:00 p.m. to 4:00 p.m. to discuss requirements for municipal separate storm sewer systems, in Oakland, CA.

(5) February 7, 1989, 9:00 a.m. to 12:00 p.m. to discuss permit application and notification requirements for storm water discharges associated with industrial activity and 1:00 p.m. to 4:00 p.m. to discuss requirements for municipal separate storm sewer systems, in Jacksonville, FL.

(6) February 9, 1989, 9:00 a.m. to 12:00 p.m. to discuss permit application and notification requirements for storm water discharges associated with industrial activity and 1:00 p.m. to 4:00 p.m. to discuss requirements for municipal separate storm sewer systems, in Boston, MA.

The morning and afternoon sessions may be adjourned earlier if there are no remaining comments.

Persons wishing to make oral presentations must restrict them to 15 minutes and are encouraged to have written copies of their complete comments for inclusion in the official record.

ADDRESSES: The public should send an original and two copies of their comments to Tom Seaton, Permits Division (EN-336), Environmental Protection Agency, 401 M Street SW., Washington, DC 20460. The public record is located at EPA Headquarters, NE-208, and is available for viewing from 9:30 a.m. to 4:00 p.m., Monday through Friday, excluding Federal holidays. Appointments may be made by calling Yvonne Marshall at (202)-475-7460. Copies cost $.15/page.

Public meetings will be held at the following addresses:

(1) Washington—Auditorium of the EPA Education Center at U.S. Environmental Protection Agency Headquarters, 401 M St. SW; Washington, DC 20460.

(2) Chicago—Lakeview Conference Room, Southeast Corner, 16th Floor, U.S. Environmental Protection Agency Region V, 230 South Dearborn St., Chicago, IL 60604.

(3) Dallas—Arkansas Room, 12th Floor, U.S. Environmental Protection Agency Region VI, 1445 Ross Ave., Dallas TX 75270.

(4) Oakland—Hyatt at Oakland International, 455 Hegenberger Rd., Oakland, CA 94621.

(5) Jacksonville—Jacksonville Hilton, 14000 Dixie Clipper Drive, Jacksonville Airport, Jacksonville, FL 32218.

(6) Boston—John F. Kennedy Federal Building, Room 2003, U.S. Environmental Protection Agency Region I, Boston, MA 02203.

FOR FURTHER INFORMATION CONTACT: For further information on the proposed rule contact: James Gallup, Kevin Weiss, or Tom Seaton, Office of Water Enforcement and Permits (EN-336), United States Environmental Protection Agency, 401 M Street SW., Washington, DC 20460, (202)-475-8518.

SUPPLEMENTARY INFORMATION:

I. Background

A. Water Quality Concerns

The 1972 amendments to the Federal Water Pollution Control Act (referred to as the Clean Water Act or CWA), prohibit the discharge of any pollutant to navigable waters from a point source unless the discharge is authorized by a NPDES permit. Efforts to improve water quality under the NPDES program have traditionally focused primarily on reducing pollutants in discharges of industrial process wastewater and municipal sewage. This program emphasis has developed for a number of reasons. At the onset of the program in 1972, many sources of industrial process wastewater and municipal sewage were not adequately controlled, and represented pressing environmental problems. In addition, sewage outfalls and industrial process discharges were easily identified as responsible for poor, often drastically degraded water quality conditions. However, as pollution control measures were initially developed for these discharges, it became evident that more diffuse sources (occurring over a wide area) of water pollution, such as agricultural and urban runoff were also major causes of water quality problems. Some diffuse sources of water pollution, such as agricultural storm water discharges and irrigation return flows, are statutorily exempted from the NPDES program. Controls for other diffuse sources have been slow to develop under the NODES program.

Since enactment of the 1972 amendments to the CWA, considering the rise of economic activity and population, significant progress in cleaning up water pollution has been made, particularly with regard to industrial process wastewater and municipal sewage. Expenditures by EPA, the States, and local governments to construct and upgrade sewage treatment facilities have substantially increased the population serviced by higher levels of treatment. Permitting backlogs for industrial process wastewater discharges have been reduced. Continuing improvements are expected for these discharges as the NPDES program continues to shift to toxic and water quality-based pollution control.

Although assessments of water quality are extremely difficult to perform and verify, several National assessments of water quality are available. For the purpose of these assessments, urban runoff is considered to be a diffuse source or nonpoint source pollution, although legally, most urban runoff is discharged through conveyances such as separate storm sewers or other conveyances which are point sources under the CWA, and are subject to the NPDES program. The "National Water Quality Inventory, 1986 Report to Congress" provides a general assessment of water quality based on biennial reports submitted by the States under Section 305(b) of the CWA. In preparing the Section 305(b) Reports, the States were asked to indicate the fraction of the States' waters that were fully supporting, partly supporting, or not supporting designated uses. The Report indicates that of the rivers, lakes, and estuaries that were assessed by States (approximately one-fifth of stream miles, one-third of lake acres and one-half of esturine waters), roughly 75% are supporting the uses for which they are designated. For waters with use impairments, States were asked to determine impacts due to nonpoint (agricultural and urban runoff and other sources), municipal sewage, industrial (process wastewaters), combined sewer overflows, natural, and other sources, then combine impacts to arrive at estimates of the relative percentage of State waters affected by each source. In this manner, the relative importance of the various sources of pollution causing use impairments was assessed and weighted national averages were calculated. Based on 37 States that provided information of sources of pollution, industrial process wastewaters were cited as the cause of nonsupport for 9% for rivers and streams, 1% lakes, and 8% for estuaries. Municipal sewage was the cause of nonsupport for 17% of rivers and streams, 8% lakes, and 22% estuaries. Nonpoint sources was the cause of nonsupport for 65% of rivers and streams, 76% lakes and 45% estuaries. The Assessment concluded that pollution from diffuse sources such as runoff from agricultural and urban areas is cited by the States as the leading cause of water quality impairment. These sources appear to be increasingly important contributors of use impairment as discharges of industrial process wastewaters and municipal sewage plants come increasingly under

control and intensified data collection efforts provide additional information.

The States conducted a more comprehensive study of diffuse pollution sources under the sponsorship of the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) and EPA. The study resulted in the report "America's Clean Water—The States' Nonpoint Source Assessment, 1985" which indicated that 38 States reported urban runoff as a major cause of beneficial use impairment. In addition, 21 States reported construction site runoff as a major cause of use impairment.

To provide a better understanding of the nature of urban runoff from commercial and residential areas, from 1978 through 1983, EPA provided funding and guidance to the Nationwide Urban Runoff Program (NURP). The NURP program included 28 projects across the Nation, conducted separately at the local level but centrally reviewed, coordinated, and guided.

One focus of the NURP program was to characterize the water quality of discharges from separate storm sewers which drain residential, commercial, and light industrial (industrial parks) sites. The majority of samples collected in the study were analyzed for eight conventional pollutants and three metals. Data collected in NURP indicated that on an annual loading basis, suspended solids in discharges from separate storm sewers draining runoff from residential, commercial and light industrial areas are around an order of magnitude or more greater than effluent from sewage treatment plants receiving secondary treatment. In addition, the study indicated that annual loadings of chemical oxygen demand (COD) is comparable in magnitude to effluent from sewage treatment plants receiving secondary treatment. When analyzing annual loadings associated with urban runoff, it is important to recognize that discharges of urban runoff are highly intermittent, and that the short-term loadings associated with individual events will be high and may have shockloading effects on receiving water such as sag in dissolved oxygen levels. NURP data also showed that fecal coliform counts in urban runoff are typically in the tens to hundreds of thousand per 100 ml of runoff during warm weather conditions, although the study suggested that fecal coliform may not be the most appropriate indicator organism for identifying potential health risks in storm water runoff. Although NURP did not evaluate oil and grease, other studies have demonstrated that urban runoff is an extremely important source of oil pollution to receiving waters, with hydrocarbon levels in urban runoff typically being reported at a range of 2 to 10 mg/1. These hydrocarbons tend to accumulate in bottom sediments where they may persist for long periods of time, and exert adverse impacts on benthic organisms.

A portion of the NURP program involved monitoring 120 priority pollutants in storm water discharges from lands used for residential, commercial and light industrial activities. Seventy-seven priority pollutants were detected in samples of storm water discharges from residential, commercial and light industrial lands taken during the NURP study, including 14 inorganic and 63 organic pollutants. Table A-1 shows the priority pollutants which were detected in at least ten percent of the discharge samples which were sampled for priority pollutants.

Priority Pollutants Detected in at Least 10% of NURP Samples

TABLE A-1

	Frequency of detection (percent)
Metals and inorganics:	
Antimony	13
Arsenic	52
Beryllium	12
Cadmium	48
Chromium	58
Copper	91
Cyanides	23
Lead	94
Nickel	43
Selenium	11
Zinc	94
Pesticides:	
Alpha-hexachlorocyclohexane	20
Alpha-endosulfan	19
Chlordane	17
Lindane	15
Halogenated aliphatics: Methane, dichloro	11
Phenols and cresols:	
Phenol	14
Phenol, pentachloro-	19
Phenol, 4-nitro	10
Phthalate esters: Phthalate, bis(2-ethylhexyl)	22
Polycyclic aromatic hydrocarbons:	
Chrysene	10
Fluoranthene	16
Phenanthrene	12
Pyrene	15

The NURP data also showed a significant number of these samples exceeded various freshwater water quality criteria.

The NURP study provides insight on what can be considered background levels of pollutants for urban runoff, as the study focused primarily on monitoring runoff from residential, commercial and light industrial areas. However, NURP concluded that the quality of urban runoff can be adversely impacted by several sources of pollutants that were not directly evaluated in the study and are generally not reflected in the NURP data, including illicit connections, construction site runoff, industrial site runoff and illegal dumping.

Other studies have shown that many storm sewers contain illicit discharges of non-storm water, and that large amounts of wastes, particularly used oils, are improperly disposed in storm sewers. Removal of these discharges present opportunities for dramatic improvements in the quality of storm water discharges. Storm water discharges from industrial facilities may contain, in addition to illicit connections and improperly disposed wastes, toxics and conventional pollutants when material management practices allow exposure to storm water.

In some municipalities, illicit connections of sanitary, commercial and industrial discharges to storm sewer systems have had a significant impact on the water quality of receiving waters. Although the NURP study did not emphasize identifying illicit connections to storm sewers other than to assure that monitoring sites used in the study were free from sanitary sewage contamination, the study concluded that illicit connections can result in high bacterial counts and dangers to public health. The study also noted that removing such discharges presented opportunities for dramatic improvements in the quality of urban storm water discharges.

Other studies have shown that illicit connections to storm sewers can crate severe, wide-spread contamination problems. For example, the Huron River Pollution Abatement Program inspected 660 businesses, homes and other buildings located in Washtenaw County, Michigan and identified 14% of the buildings as having improper storm drain connections. Illicit discharges were detected at a higher rate of 60% for automobile related businesses, including service stations, automobile dealerships, car washes, body shops and light industrial facilities. While some of the problems discovered in this study were the result of improper plumbing or illegal connections, a majority were approved connections at the time they were built.

Intensive construction activities may result in severe localized impacts on water quality because of high unit loads of pollutants, primarily sediments. Construction sites can also generate other pollutants such as phosphorus and

nitrogen from fertilizer, pesticides, petroleum products, construction chemicals and solid wastes. These materials can be toxic to aquatic organisms and degrade water for drinking and water-contact recreation. Sediment runoff rates from construction sites are typically 10 to 20 times that of agricultural lands, with runoff rates as high as 100 times that of agricultural lands, and typically 1,000 to 2,000 times that of forest lands. Even a small amount of construction may have a significant negative impact on water quality in localized areas. Over a short period of time, construction sites can contribute more sediment to streams than was previously deposited over several decades.

B. Previous Regulatory Approaches

The appropriate means of regulating storm water point sources within the National Pollutant Discharge Elimination System (NPDES) program has been a matter of serious concern since implementation of the NPDES program. Each attempt to devise a workable program has been the focus of substantial controversy, in view of the large number of storm water sources, the nature of storm water runoff and the realities of program priorities and resources. In 1973, EPA promulgated its first storm water regulations exempting from permit requirements those conveyances carrying storm water runoff uncontaminated by industrial or commercial activity unless the particular storm water discharger had been identified by the NPDES Director as a significant contributor of pollution (38 FR 13530 (May 22, 1973)). The Agency maintained that, while these sources fell within the definition of a point source, they were nonetheless ill-suited to the traditional end-of-pipe, technology-based controls that are the basis of the NPDES program for process discharges and discharges from Publicly-Owned Treatment Works (POTWs). Because of the intermittent, variable and unpredictable nature of storm water discharges, EPA reasoned that the problems caused by storm water discharges were better managed at the local level through nonpoint source controls such as the imposition of specific management practices to prevent the pollutants from entering the runoff. The Agency also justified its decision by noting that issuing individual NPDES permits for the hundreds of thousands of storm water point sources in the United States would create an overwhelming administrative burden and would divert resources away from control of industrial process wastewater and municipal sewage, which at the time, were more pressing and identifiable environmental problems.

In the first in a series of challenges to the storm water regulations, the Natural Resources Defense Council (NRDC) brought suit in the U.S. District Court for the District of Columbia, challenging the Agency's authority to selectively exempt categories of point sources from permit requirements. *NRDC v. Train*, 396 F.Supp. 1393 (D.D.C. 1975), *aff'd. NRDC v. Costle*, 568 F.2d 1369 (D.C. Cir. 1977). The District Court held that EPA could not exempt discharges identified as point sources from regulation under the NPDES permit program. However, in acknowledging the administrative burden placed on the Agency by requiring individual permits, the court recognized EPA's discretion to use certain administrative devices, such as area permits, to help manage its workload. In addition, the court recognized some discretion on EPA's part to define what constitutes a point source.

In response to the District Court's decision in *NRDC v. Train*, EPA issued a rule on March 18, 1976, (41 FR 11307) establishing a comprehensive permitting program for all storm water discharges except for rural runoff uncontaminated by industrial or commercial activity. This rule substantially increased the number of storm water discharges subject to the NPDES program. Permits continued to be required for conveyances carrying contaminated storm water runoff from areas used for industrial or commercial activities, as well as storm water discharges designated by the permit-issuing authority as significant contributors of pollution. These sources were required to submit the then-existing individual permit applications required of industrial and commercial process wastewater dischargers. In addition, the 1976 rule brought into the permitting program separate storm sewers which were defined as "conveyance or system of conveyances . . . located in an urbanized area and primarily operated for the purpose of collecting and conveying storm water runoff." Channelized storm water runoff from rural areas continued to be defined as non-point sources unless designated otherwise by the permitting authority. Individual permit applications were not required for separate storm sewers at that point in time. EPA planned to study such discharges and issue "general" or area permits to such sources as these discharges were expected to be less significant than storm water contaminated by industrial wastes.

On June 7, 1979 and May 19, 1980, EPA published comprehensive revisions to the NPDES regulations (44 FR 32854 (June 7, 1979); 45 FR 33290 (May 19, 1980)). With regard to storm water discharges, these rules essentially retained the March 18, 1976 broad definition of storm water discharges subject to NPDES permit requirements, but applied new application requirements to storm water point sources. Under these regulations the same application information required of all industrial and commercial process wastewater dischargers would be required of all storm water point sources. This meant that the new individual permit application requirements of the 1979/1980 rules applicable to process wastewater discharges would also be required for all storm water discharges. These new requirements included testing under certain circumstances for a substantially greater number of pollutants identified in the 1977 amendments to the Clean Water Act (CWA) which stressed the control of toxic pollutants.

This regulation brought suits in several Court of Appeals and District Courts by a number of major trade associations, several of their member companies, NRDC and Citizens for a Better Environment. The suits challenged many aspects of the NPDES regulations, including the storm water provisions. Eventually all petitions for review were consolidated in the D.C. Circuit Court of Appeals (*NRDC v. EPA*, 673 F.2d 392 (D.C. Cir. 1980)).

After two years of intensive settlement negotiations with representatives of most of the petitioners, the Agency and industry petitioners signed a settlement agreement on July 7, 1982, which addressed a number of issues relating to the NPDES program, including storm water. Under the terms of the agreement, EPA agreed to propose changes to the storm water regulations (47 *FR* 52073 (November 18, 1982)). The proposal reflected the Agency's attempt to balance the environmental concerns associated with such discharges with the practical limitations of individual NPDES permits and the reality of limited resources. Thus, the proposal significantly narrowed the definition of storm water point source and reduced the application requirements. The proposal defined storm water point sources as consisting only of conveyances of storm water contaminated by process wastes, raw materials, toxics, hazardous pollutants or oil and grease.

The proposal also reduced application requirements. Storm water discharges were proposed to be divided into two groups based on their potential for significant pollution problems. Group I sources (expected to pose more significant pollution problems) would continue to be required to submit Application Forms 1 and 2C applicable to industrial and commercial process wastewater dischargers except that effluent testing data would be required only for conventional pollutants. For all other pollutants, the applicant would only have to indicate whether they believed any such pollutants were present or absent and explain why. Application requirements were further reduced for Group II. Essentially, the only information that would be required for Group II sources would consist of basic information to identify the type, number and location of Group II discharges. No effluent testing data was proposed to be required at that time from these sources. The Agency also proposed to extend the deadline for submission of storm water permit applications to six months after promulgation of a final rule.

Finally, as also agreed to in the Settlement Agreement, EPA issued a letter stating that while the proposal was pending, EPA would not take enforcement action against storm water dischargers other than those (1) covered by an existing NPDES permit; (2) subject to effluent limitations guidelines or toxic pollutant standards; or (3) designated as a significant contributor of pollutants. This "non-enforcement policy" did not apply to existing enforcement actions, and did not affect the right of an approved NPDES State or citizens group to bring a suit against a storm water discharger.

EPA's 1982 proposal to address the storm water issue again generated considerable reaction and comment from industrial groups and trade associations. They asserted that the proposal did not go far enough in restricting the definition of storm water point sources. They maintained that most storm water discharges were *de minimis* sources of pollution and thus are not appropriately regulated under the NPDES program. States and environmental groups took the position that the CWA requires permits for storm water discharges regardless of the level of pollutants present in such discharges. They contended that the proposal went too far in narrowing the scope of coverage and questioned whether EPA had a legally sufficient or technically supportable basis for the Group I/Group II designations in the proposal. EPA considered these public comments and published final storm water regulations on September 26, 1984 (49 FR 37998).

The 1984 final rule recognized that there are two fundamental issues regarding the NPDES regulation of storm water: (1) which storm water discharges are point sources and therefore within the NPDES program, and (2) what is the best way to regulate these sources.

On the first issue, the Agency was persuaded by commenters that the 1982 proposal had gone too far in narrowing the scope of coverage. Data available to EPA, such as the National Urban Runoff Program (NURP) study, indicated that there are water quality problems associated with storm water runoff in some situations. Thus, the final rule retained the broad coverage of the 1980 rule in mandating the permitting of all storm water point sources that discharge pollutants into waters of the United States. The September 26, 1984 rule defined a storm water point source as a channelized conveyance of storm water runoff that (1) is located in an urbanized area as defined by the Bureau of Census, or (2) discharges from lands of facilities used for industrial or commercial activities, or (3) is designated by the Director.

To address the second issue of how to regulate these sources administratively, the final rule retained the two-tiered classification described in the November 16, 1982 proposal. Thus, the final rule set forth two categories of storm water point sources with different application requirements for each. Group I storm water point sources were defined as those subject to effluent limitations guidelines, located at an industrial plant or plant associated area, or designated by the Director. All other storm water point sources were classified as Group II. Group I dischargers were required to complete both Form 1 and Form 2C, the NPDES Application Form for industrial and commercial process wastewater discharges, including certain sampling and testing data. The application requirements for Group II were significantly reduced from their existing requirements. Group II sources were required to submit only Form 1 plus a narrative description of the drainage area, receiving water, and any treatment applied to the discharge. Since Group II sources were expected to pose less significant pollution problems generally and therefore be a lower priority for permit issuance, additional information could be collected on these sources at a later date when permits were issued to these sources.

The final rule also revoked the non-enforcement letter issued as part of the Settlement Agreement and a new permit application deadline of April 26, 1985 was established.

These storm water regulations generated considerable controversy (through post-promulgation comment) and, once again, suits were filed. With regard to coverage, it was claimed that the new definitions would subject thousands of discharges to the program for the first time. In fact, the EPA's view, the coverage of storm water point sources under the NPDES program was essentially unchanged by the September 26 rulemaking. The 1984 rules deleted the term "contaminated" and relied instead on geographic criteria. However, this change in nomenclature resulted in the same coverage of discharges.

In post-promulgation comments on the 1984 rule, various industries and trade associations claimed that the April 26 application deadline would be impossible for many dischargers to meet. It was argued that many discharges were located in areas where testing during the winter months would not be feasible. It was also pointed out that the intermittent and unpredictable nature of storm water would result in difficult and time-consuming data gathering, and that six months was not enough time to locate, identify, sample and test thousands of storm water point sources. Many comments expressed the view that requiring full samplying from every single Group I discharger was excessive in terms of providing sufficient data for general permits, the preferred means of regulating these sources. They argued that the Agency would be overwhelmed with an unmanageble amount of data that would only be outdated by the time EPA and the States were able to issue permits. Commenters also objected to the expense of the testing when such data might not be utilized in a timely manner.

The environmental groups maintained that, at a minimum, EPA's decisions as reflected in the final rule were supported by the record and should not be changed without strong justification supported by hard data. They expressed concern that any change or delay would only exacerbate what they perceived as EPA's failure to regulate these sources of pollutants.

Upon consideration of these post-promulgation comments, EPA concluded that it was essential to obtain additional data on storm water discharges to assess their significance as an environmental problem, and to identify the best means of control. However, even though the number of dischargers

required to submit quantitative testing data had been reduced by the 1984 rule, tens of thousands of storm water point sources remained to be identified, tested and analyzed. Despite the improvments made in the 1984 regulation, EPA realized it was appropriate to request comment on whether the collection of data from each individual Group I discharger was necessary and efficient. In addition, EPA realized that new deadlines would need to be established. Thus, in an attempt to balance environmental concerns with administrative and practical feasibility, EPA published proposed changes to the storm water regulations on March 7, 1985 at 50 FR 9362.

II. March 7, 1985, Proposed Rule

A. Discussion

Several changes to the application requirements for Group I sources were proposed in the March 7, 1985 proposal. For industrial facilities, the system proposed in the March 7 notice would rely primarily on voluntary, written commitments from trade associations to submit quantitative data from selected representative Group I sources. In this way, EPA could obtain a manageable quantity of data to allow for the establishment of permitting priorities and the development of general permits, thereby reducing the cost to applicants and the administrative burden on EPA and State resources.

EPA proposed that the requirement that Group I dischargers submit Form 2C (sampling and analysis data of effluent) be eliminated. In lieu thereof, Group I dischargers would submit Form 1 and the narrative already required of Group II, with two additions: Group I applicants would also submit any available existing quantitative data for certain pollutants, and would identify (no sampling required) the presence of pollutants listed in the rule: oil and grease, total organic carbon, chemical oxygen demand, and any pollutant listed in Appendix D of 40 CFR Part 122 that the applicant knew or had reason to believe were present in its storm water discharge. The March 7 notice proposed no changes to the Group II application requirements.

As noted above, in proposing to suspend Form 2C, the Agency was relying in part on commitments from industries and trade associations that they would submit representative quantitative effluent testing data during 1985. In December 1984 and February 1985, EPA held meetings with representatives of several industries and trade associations who had raised concerns with the requirements of the September 26 final rule. At those meetings, a number of industry groups indicated a willingness to provide the Agency with representative data on the storm water discharges of their membership.

To follow up on these assurances, the Agency held a meeting on March 7, 1985, in order to clarify the details of this data-gathering initiative. This meeting was attended by representatives of several dozen industry trade associations, a few individual companies and an environmental group. At this meeting, EPA set forth criteria and minimum standards for the voluntary group data submissions. EPA requested that trade associations make a formal commitment to provide representative data and submit these data to EPA by Septembr 1, 1985. The Agency envisioned that these data would supplement existing data available to it and could provide a basis for establishing permitting priorities and setting permit terms and conditions. EPA held a second meeting on March 22 to further refine and explain the data-gathering process. Twenty-nine commitment letters were ultimately received.

With regard to the application deadline, the March 7 proposal suggested a deadline of December 31, 1985, and requested comments on the possibility of extending the deadline still further for Group II storm water point sources. As discussed in greater detail below, this part of the proposal was addressed in a final rule (50 FR 35200 (August 29, 1985)). The August 29 rule extended the deadline to December 31, 1987 for Group I, and June 30, 1989 for Group II.

The March 7 proposal also requested comments on whether, in the event the Form 2C requirement was retained, the regulations should include discretionary authority for the Director of the Office of Water Enforcement and Permits to waive the quantitative data submission requirement for a class or category of Group I storm water point sources.

B. Reaction of Comments

One hundred and thirty-two comments on the March 7 proposal were received from industries, trade associations, States, cities, Federal agencies and environmental groups. All but two commenters supported EPA's proposal as a manageable and environmentally sound approach to the storm water permitting problem. The two environmental groups commenting on the proposal objected to it on a number of grounds. At a minimum, they favored withdrawal of the proposal and retention of the September 26 requirements.

After evaluating the comments received on the March 7 proposal, assessing the commitments received from trade associations, and re-examining the issues, EPA decided to reopen the comment period on the March 7 notice to provide additional information and issues for public comment.

III. August 12, 1985, Reopener Notice

A. Group Application Option, Process and Procedures

On August 12, 1985 (50 FR 32548), EPA reopened the comment period on the March 7 proposal and requested comments on a group application approach for Group I applicants that essentially would codify the plan for submission of representative data detailed in the March 7, 1985 proposal and discussed at the two public meetings held that same month with representatives of trade associations, individual companies, and an environmental group.

Although EPA had received 29 commitment letters from trade associations (and a few individual companies) that indicated a willingness to voluntarily submit representative storm water data from their memberships, the Agency was concerned that such letters might not provide a sufficient basis for suspending the Application Form 2C requirement for all Group I sources. In EPA's view, the voluntary data submissions would not necessarily justify the elimination of testing requirements for those Group I sources that were either not covered by a trade association submission or chose not to participate in the voluntary data submissions. The 29 commitment letters that the Agency received also indicated widespread confusion about the scope of coverage for the data submissions by the trade associations. In addition, there was confusion about the appropriate pollutants to be sampled and analyzed and then submitted to the Agency as representative of the storm water discharges of the members of the group.

Nevertheless, the Agency still regarded the submission of representative data as the most practical and efficient means of determining appropriate permit terms and conditions, as well as permitting priorities, for the multitude of storm water point source discharges requiring NPDES permits. The August 12 proposal attempted to build upon the efforts expended by both the Agency and those

trade associations that cooperated under the March 7 voluntary approach.

The major element of the August 12 proposal was that all Group I storm water point sources would have to submit either an individual NPDES application (Form 1 and Form 2C) or participate in an approved group application. The group application was an optional alternative to the submission of the usual individual NPDES application, with the normal regulatory provisions governing permit application and issuance still applicable.

Under the proposed group application option, representative data on storm water discharges would be compiled by a trade association or similar representative entity for a subcategory or category of dischargers. The group submission would satisfy the application requirements for any storm water discharger falling within the particular subcategory or category.

The group application was to consist of two parts: Part 1 and Part 2. Part 1 would be a commitment by the trade association or representative entity to submit quantitative data from individual representative facilities within the subcategory or category, as well as a complete description of the group's data collection plans. Part 1 would also characterize the facilities covered under the group application and provide an identification of those individual facilities that would do the actual pollutant sampling and analyses. EPA proposed that those individual facilities submitting quantitative data would have to appropriately represent the subcategory or category covered by the group application. Factors proposed to ensure representativeness were a range of operations, sizes and geographic locations, facilities with and without treatment of their storm water discharges, data from facilities connected to sanitary sewers and from facilities discharging storm water directly to waters of the U.S. The Agency also proposed that the group application contain submissions from 10 percent of the subcategory or category, with a minimum of 10 individual facilities. Any historical data on storm water discharges from facilities within the group application were also to be submitted. Other discharges covered by the group application would not be required to submit individual Forms 1 and 2C.

EPA proposed to accept group applications based upon industrial subcategories as defined in 40 CFR Subchapter N. The Agency felt that the submission of a group application covering a subcategory of dischargers would allow for more effective analysis of any quantitative data received, as well as provide a clearer basis for subsequently developed permit terms and conditions. Submission on the basis of subcategories was also considered appropriate to avoid the "blurring of categories" due to the overlap of trade associations' memberships identified in the 29 voluntary commitment letters. However, the Agency did not preclude the submission of data by categories as long as the criteria for representativeness was met. Comments were requested on the acceptance of group applications based upon subcategories.

The August 12 notice also proposed that Part 1 of a group application would be submitted to the Office of Water Enforcement and Permits (OWEP) at EPA Headquarters in Washington, D.C. no later than 90 days after the publication date of any final rule. The Agency also solicited public comments on whether any group application should be accepted after the 90-day deadline. The Agency stated that it preferred the 90-day deadline be mandatory, such that failure to submit a Part 1 within that time would preclude the group application option for those dischargers within the subcategory or category.

Part 1 applications submitted to OWEP would be reviewed for acceptability based on the proposed representative criteria and in accordance with 40 CFR 122.21(e) (completeness of NPDES permit applications). Comments were solicited on the appropriateness of the proposed representative criteria.

The Agency proposed that a notice would be published in the Federal Register if OWEP determined that a Part 1 application was accepted for a particular subcategory or category of storm water dischargers. If a Part 1 application were unacceptable, OWEP could either deny the group application or request changes to the application and then make a final decision on the acceptability of the group application. Even if a group application were accepted, permitting authorities would retain the right to require an individual permit application from any individual storm water discharger.

Any storm water discharger falling within a subcategory or category for which a group application had been accepted would have the option of being covered under the group application or submitting an individual NPDES permit application. If the discharger chose coverage under the group application, no individual information would be required (unless that discharger was identified as one of the individual facilities submitting quantitative data for the group application). The Agency proposed that in lieu of all sources covered by the group application submitting a Form 1, sources would submit a Notice of Intent (NOI) to the permitting authority if the facility wished to be covered under the general permit for that subcategory or category.

Any Group I source that did not fall within a group application (or desiring not to be covered by the group application) would submit an individual NPDES permit application for their storm water discharges. Individual permit applications would be submitted to the applicable permitting authority (i.e., an EPA Regional Office or an NPDES State), the deadline for submittal of individual applications would be the same as that for Part 2 of the group application, December 31, 1987.

The August 12 proposal explained that Part 2 of the group application would consist of the actual quantitative effluent data from the representative facilities within the covered subcategory or category. Those individual facilities selected to perform sampling and analyses under the group application were to test for:

- Any pollutant limited in an effluent limitations guideline for its subcategory or category;
- Any pollutant listed in the individual facility's NPDES permit for its process wastewater;
- Oil and grease, TOC, COD, pH, BOD; and
- Any information on the discharge required under 40 CFR 122.21 (g)(7)(iii) (A) and (B).

The Agency requested public comments on the suitability of the pollutants to be tested, and their sufficiency to determine accurately the characteristics of storm water discharges.

EPA also proposed that those individual facilities selected to provide quantitative data under the group application would sample all of their storm water outfalls. EPA stated that since the individual facilities' data would be considered representative of the subcategory or category, it was appropriate to require information on all storm water outfalls in order to fully characterize the facilities' discharges.

Further, the August 12 proposal requested comment on the possibility of a waiver from testing certain pollutants for group applicants. 40 CFR 122.21(g)(7)(i)(B) of the existing NPDES regulations provides authority to the permitting authority to waive permit application reporting requirements for certain pollutants if the applicant

demonstrates to the satisfaction of the permitting authority that such information is unnecessary. Comment was also solicited on what data should be furnished to support such a waiver request.

Each individual facility submitting actual quantitative data under Part 2 of the group application would complete an NPDES permit Application Form 1 and form 2C. Both Form 1 and Form 2C would be signed by the individual facilities in accordance with the signatory requirements contained in 40 CFR 122.22.

The trade association or representative entity that submitted Part 1 of the group application would compile the individual Form 1s and Forms 2Cs, and would attach a narrative certifying that the Part 2 submission corresponds to the submission described in Part 1. The Agency requested comments on its proposal that the Part 2 narrative would be signed by an association officer (or comparable individual) responsible for policy or decision making functions and to whom authority to sign documents on behalf of the group applicants had been assigned. All Form 1s and Form 2Cs would be signed by the individual facilities in accordance with the general signatory requirements of 40 CFR 122.22.

Like Part 1 of the group application, Part 2 would be submitted to OWEP for review and used to develop permit issuance priorities and model general permit terms and conditions. The group application option and process comported with the Agency's intent to issue general permits in most instances to cover storm water point sources.

The August 12 proposal explained that the group application option, if promulgated as proposed, would only apply to those facilities in States not approved to administer the NPDES permit program (i.e., where EPA is the permit-issuing authority). Facilities within approved NPDES States must follow existing State regulations. Approved NPDES States, of course, would be free to amend their regulations to adopt the group application option for all storm water dischargers or as an alternative to individual storm water permit applications in certain cases. The Agency requested that States, especially NPDES States, comment on the proposed group application process. In addition, EPA strongly recommended in the proposal that NPDES States without general permit authority approved by EPA seek such authority since the ability to issue general permits provide an effective and efficient means of permitting certain storm water point sources and would allow States to make the best use of the results of the group applications.

B. Classification of Publicly-Owned Separate Storm Sewers

The August 12 reopener notice also requested comments on the Agency's clarification of whether publicly-owned separate storm sewers located in urbanized areas were classified as Group I or Group II storm water point sources. The Agency considered the September 26, 1984 final regulations to be ambiguous on this point, as evidenced by the numerous telephone inquiries received immediately after publication of the final rule addressing this issue. The August 12 proposal stated the Agency's view that municipal storm water sewers designed only to convey storm water runoff (a.k.a., publicly-owned separate storm sewers) are Group I storm water point sources based on the data available to the Agency through the National Urban Runoff Program (NURP) study. The NURP study found that in many instances storm water discharged from publicly-owned separate storm sewers was indeed contaminated with conventional pollutants (e.g., suspended solids and fecal coliform) as well as heavy metals (e.g., lead, copper, zinc, and cadmium). Because of the significance such discharges can have for water quality, the Agency felt that it was appropriate to classify publicly-owned separate storm sewers as Group I sources. The Agency requested comments on whether this clarification/classification was appropriate.

C. Discharges into Publicly-Owned Separate Storm Sewers

Under the September 26, 1984 final rule, dischargers into a publicly-owned separate storm sewer must either be covered by an individual NPDES permit or by a permit issued to the municipality or public entity operating the system. This provision, one of the items clarified under the terms of the NPDES Settlement Agreement (June 1982), which EPA proposed in November 1982, allowed the operator of the outfall discharging directly to waters of the U.S. to decline responsibility for discharges into the system while applying for a permit for the outfall.

The "either/or" nature of the September 26 rule allowed a municipality to decline responsibility for non-municipal storm water discharges into the publicly-owned separate storm sewer system. In this case, all non-municipal dischargers into the municipal system would be responsible for applying for and obtaining individual NPDES permits. This approach might conceivably mean that hundreds of thousands of individual NPDES permit applications would be received duplicating the information contained in the municipal storm water permit application(s).

The catch basins, pipes and outfalls that comprise a publicly-owned separate storm sewer system may be owned by a municipality, a flood control district, or various other public service entities. Under the NPDES regulations, such systems are not considered to be a "publicly-owned treatment works" (POTW) because they do not convey discharges to the POTW. For purposes of the NPDES regulations, separate storm sewers are non-POTW point sources and are subject to regulation in a manner that is analogous to privately-owned treatment systems. Under 40 CFR 122.44(m) (privately-owned treatment works), the Agency can require permits for any, some, or all of the contributors to the system.

In the August 12 notice, EPA solicited public comment on the appropriateness of relying on the issuance of permits to the municipality or public entity responsible for the separate storm sewer system, thereby relieving all dischargers of storm water into the system of the need to apply for and obtain individual NPDES permits. The permitting authority would retain the authority to designate operators of such contributing storm water discharges as co-permittees or to require individual permits.

EPA proposed that the municipality or other public entity responsible for the separate storm sewer would be required to identify all those Group I discharges into the system but would not be required to identify those Group II discharges into the system. The Agency stated that this was the most feasible means of covering the hundreds of thousands of discharges into publicly-owned storm water collection systems. Since the public entity (e.g., a municipality) is currently required to obtain an NPDES permit for the separate storm sewer system's individual outfalls, a "single permit" approach would relieve the paperwork burden on both potential permittees and permitting authorities. The Agency also felt that such an approach was likely to be the most environmentally sound, since the ability of permitting authorities to issue quality permits and address the cumulative impacts of storm water discharges would be enhanced.

IV. Water Quality Act of 1987

At the same time that EPA was evaluating the appropriate means to regulate storm water discharges.

Congress was examining the storm water issue in the course of the reauthorization of the Clean Water Act. Both the Senate and the House of Representatives passed bills to amend the Clean Water Act in the summer of 1985 that contained provisions addressing the storm water issue. The separate House and Senate bills were reconciled in Conference Committee in 1986, and on February 4, 1987, Congress passed the Water Quality Act of 1987 (WQA).

The WQA contains three provisions which specifically address storm water discharges. The central provision governing storm water discharges is section 405 which adds section 402(p) to the CWA. Section 402(p)(1) provides that EPA or NPDES States cannot require a permit for certain storm water discharges until October 1, 1992 except for storm water discharges exempted under section 402(p)(2). Section 402(p)(2) lists five types of storm water discharges which are required to obtain a permit prior to October 1, 1992:

(A) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(B) A discharge associated with industrial activity;

(C) A discharge from a municipal separate storm sewer system serving a population of 250,000 or more;

(D) A discharge from a municipal separate storm sewer system serving a population of 100,000 or more, but less than 250,000; or

(E) A discharge for which the Administrator or the State, as the case may be, determines that the storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to the waters of the United States.

Section 402(p)(2) requires EPA to promulgate final regulations governing storm water permit application requirements for storm water discharges associated with industrial activity and discharges from large municipal separate storm sewer systems (systems serving a population of 250,000 or more), by "no later than two years" after the date of enactment (i.e., no later than February 4, 1989). The WQA also requires EPA to promulgate financial regulations governing storm water permit application requirements for discharges from medium municipal separate storm sewer systems (systems serving a population of 100,000 or more but less than 250,000) by "no later than four years" after enactment (i.e., no later than February 4, 1991).

In addition, Section 402(p)(4) provides that permit applications for storm water discharges associated with industrial activity and discharges from large municipal separate storm sewer systems "shall be filed no later than three years" after the date of enactment of the WQA (i.e., no later than February 4, 1990). Permit applications for discharges from medium municipal systems must be filed "no later than five years" after enactment (i.e., no later than February 4, 1992).

NPDES permits for all other storm water discharges cannot be required until October 1, 1992, unless a permit for the discharge was issued prior to the date of enactment of the WQA (i.e., February 4, 1987), or the discharge is determined to be a significant contributor of pollutants to waters of the United States or is contributing to a violation of water quality standards.

The WQA clarified and amended the requirements for permits for storm water discharges in the new CWA section 402(p)(3). The Act clarified that permits for discharges associated with industrial activity must meet all of the applicable provisions of section 402 and section 301 including technology and water quality based standards. However, the new Act makes significant changes to the permit standards for discharges from municipal storm sewers. Section 402(p)(3)(B) provides that permits for such discharges:

(i) May be issued on a system- or jurisdiction-wide basis;

(ii) Shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers; and

(iii) Shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Director determines appropriate for the control of such pollutants.

These changes, including the standard of maximum extent practicable (MEP), are discussed in more detail later in today's notice.

The EPA, in consultation with the States, is required to conduct two studies on storm water discharges that are in the class of discharges for which EPA and NPDES States cannot require permits prior to October 1, 1992. The first study will identify those storm water discharges or classes of storm water discharges for which permits are not required prior to October 1, 1992 and determine, to the maximum extent practicable, the nature and extent of pollutants in such discharges. The second study is for the purpose of establishing procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality. Based on the two studies, the EPA in consultation with State and local officials, is required to issue regulations by no later than October 1, 1992 which designate additional storm water discharges to be regulated to protect water quality and establish a comprehensive program to regulate such designated sources. This program must, at a minimum, (A) establish priorities, (B) establish requirements for State storm water management programs, and (C) establish expeditious deadlines. The program may include performance standards, guidelines, guidance, and management practices and treatment requirements, as appropriate.

Section 401 of the WQA amends section 402(l)(2) of the CWA to provide that the EPA shall not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing, or treatment operations or transmission facilities if the storm water discharge is not contaminated by contact with, or does not come into contact with, any overburden, raw material, intermediate product, finished product, byproduct, or waste product located on the site of such operations.

Section 503 of the WQA amends section 502(14) of the CWA to exclude agricultural storm water discharges from the definition of point source.

V. Remand of 1984 Regulations

On December 4, 1987, the United States Court of Appeals for the District of Columbia Circuit vacated 40 CFR 122.26 (as promulgated on September 26, 1984), and remanded the regulations to EPA for further rulemaking (*NRDC v. EPA*, No. 80-1607). EPA had requested the remand because of significant changes made by the storm water provisions of the WQA. The effect of the decision was to invalidate the storm water discharge regulations then found at § 122.26.

At the time of remand, § 122.26 set forth, among other things, the definitions for "storm water point source", "Group I storm water discharge", and "Group II storm water discharge" and criteria for designating a conveyance or system of conveyances as a storm water point source on a case-by-case basis.

On February 12, 1988 (53 FR 4157), EPA published a notice which deleted § 122.26 pursuant to the Court of Appeals' remand. The February 12, 1988, notice also deleted the deadlines for submittal of Group I and Group II storm water discharge permit applications set forth in § 122.21(c)(2). Section 122.21(c)(2) provided that permit applications must be submitted by

December 31, 1987, for Group I storm water discharges and June 30, 1989, for Group II storm water discharges. The section also required that any discharge that is designated on a case-by-case basis pursuant to § 122.26 must submit a storm water discharge permit application within 6 months of notification.

Storm water discharges which have been issued an NPDES permit prior to February 4, 1987, were not affected by the Court remand or the February 12, 1988, rule. (See section 402(p)(2)(A) of the CWA.) Similarly, the remand and the rulemaking did not affect the authority of EPA or an NPDES State to require a permit for any storm water discharge (except an agricultural storm water discharge) designated under section 402(p)(2)(E) of the CWA. The notice clarified that such designated discharges meet the regulatory definition of point source found at 40 CFR 122.2 and that EPA or an NPDES State can rely on the statutory authority and require the filing of an application (Form 1 and Form 2C) for an NPDES permit with respect to such discharges, on a case-by-case basis.

VI. Codification Rule

In the near future, EPA intends to publish a final rule which will codify numerous provisions of the WQA into EPA regulations. The codification rule will include several provisions dealing with storm water discharges. The codification rule will promulgate the language found at sections 402(p) (1) and (2) of the amended Clean Water Act at 40 CFR 122.26(a)(1). In addition, the codification rule will promulgate Section 503 of the WQA which exempted agricultural storm water discharges from the definition of point source at 40 CFR 122.2. Finally, EPA intends to codify Section 401 of the WQA addressing uncontaminated storm water discharges from mining or oil and gas operations at 40 CFR 122.26(a)(2).

In the codification notice, EPA intends to codify the statutory authority of section 402(p)(2)(E) of the CWA for the Administrator or the State, as the case may be, to designate storm water discharges for a permit on a case-by-case basis at 40 CFR 122.26(a)(1)(v). The provision authorizes such a designation if the Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. The case-by-case designation authority can be used to require a designated storm water discharge associated with industrial activity or a discharge from a municipal separate storm water system serving a population of 100,000 or more to obtain a permit prior to the time frame proposed in today's notice for the particular class of storm water discharges in question. In addition, the designation authority applies to storm water discharges that are not otherwise required to obtain a permit prior to October 1, 1992, under section 402(p)(1), but that are contributing to a violation of a water quality standard or are a significant contributor of pollutants to waters of the United States.

In determining that a storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States for the purpose of a designation under section 402(p)(2)(E), the legislative history for the provision provides that "EPA or the State should use any available water quality or sampling data to determine whether the latter two criteria [contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States] are met, and should require additional sampling as necessary to determine whether or not these criteria are met". Conference Report, *Cong. Rec.* S16443 (daily ed. October 18, 1986). In accordance with this legislative history, EPA intends to require storm water dischargers whose discharges are being considered for designation to submit permit applications in accordance with the requirements of 40 CFR 122.21 to be used to aid in the determination of whether the discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. The agency will consider a number of factors when determining whether a storm water discharge is a significant contributor of pollution to the waters of the United States. These factors include: the location of the discharge with respect to waters of the United States; the size of the discharge; the quantity and nature of the pollutants reaching waters of the United States; and any other relevant factors. Today's notice proposes to incorporate these factors at 40 CFR 122.26(a)(1)(v).

Today's notice proposes to modify the permit application requirements for certain storm water discharges, including discharges designated on a case-by-case basis. Until these requirements are promulgated, operators of storm water discharges considered for designation must submit permit applications in accordance with the requirements of 40 CFR 122.21 (Form 1 and Form 2C). The exemption from certain application requirements given to Group II storm water discharges does not apply to facilities designated on a case-by-case basis. The Group II classification, which was remanded by the Court of Appeals in its December 4, 1987, order, was never intended to apply to storm water discharges which were designated on a case-by-case basis.

Until today's notice is promulgated and becomes effective, case-by-case designations, where appropriate, will be modeled after existing regulatory procedures found at 40 CFR 124.52 for NPDES permits required on a case-by-case basis. The procedures at 124.52 require that whenever the Regional Administrator decides that an individual permit is required, the Regional Administrator shall notify the discharger in writing of the decision that the discharge requires a permit and the reasons for the decision. In addition, an application form is to be sent with the notice. In implementing § 402(p)(2)(E), the Regional Administrator generally will notify the discharger in writing that the discharge is being considered for designation, and the reasons for the consideration. An application form will be sent with the notice. Deadlines for submitting permit applications will also be established on a case-by-case basis. Section 124.52 provides a 60 day period from the date of notice for submitting a permit application. Although this 60 day period may be appropriate for many designated storm water discharges, site specific factors may dictate that the Administrator or NPDES State provide additional time for submitting a permit application. For example, due to the complexities associated with designation of a municipal separate storm sewer system for a system- or jurisdiction-wide permit, the Administrator or NPDES State may provide the applicant with additional time to submit relevant information or may require that information be submitted in several phases.

VII. Today's Notice

Because of the long and complex history of the storm water permit application rulemaking and the subsequent enactment of the WQA, significant changes from the March 7, 1985 proposal and August 12, 1985 reopener have been made in today's notice. Where appropriate, EPA addresses major comments to these earlier proposals in the presentation of today's notice. However, to avoid potential confusion between current and past proposals, EPA requests that comments submitted on today's notice focus on the regulatory proposal

presented in today's notice. EPA intends to promulgate final regulations based on a consideration of comments received on today's notice and will not necessarily address comments received during previous proposals in the final rule. In printing the proposed regulatory changes at the end of today's notice, where existing regulations are modified, this notice may contain the existing regulatory language along with proposed changes. The existing regulatory language that is printed without proposed change is printed for the purpose of clarifying associated proposed changes for commenters. EPA does not request comment on existing regulatory language that is printed without proposed change.

A. Overview

Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT)), but permits for discharges from municipal separate storm sewer systems must require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP) and must include a requirement to effectively prohibit non-storm water discharges into the storm sewers. Furthermore, EPA in consultation with State and local officials must develop a comprehensive program to designate and regulate other storm water discharges to protect water quality.

Section 402(p)(1) of the amended CWA provides that EPA or NPDES States shall not require, with certain exceptions, permits for storm water discharge prior to October 1, 1992. During this grace period, EPA has three tasks.

EPA's first task is to identify storm water discharges which should be designated for immediate permitting because they contribute to a water quality standard violation or are significant contributors of pollutants to waters of the United States. Today's notice proposes to clarify the authority of the Administrator or NPDES State to require a permit for a storm water discharge prior to October 1, 1992, applies to any storm water discharge which the Administrator or NPDES State determines contributes to a water quality violation or is a significant contributor of pollutants to waters of the United States, unless the discharge is explicitly excluded from the NPEDES program (e.g., agricultural storm water discharges).

The second task is to begin to implement the storm water program by establishing permit application requirements and issuing permits for classes of storm water discharge that were specifically identified in section 402(p)(2). These priority storm water discharges include storm water discharges associated with industrial activity and discharges from a municipal separate storm sewer serving a population of 100,000 or more.

During this time, EPA will evaluate appropriate modifications for permit application requirements for storm water discharges which are designated for immediate permitting because they contribute to a water quality violation or are significant contributors of pollutants to waters of the United States.

EPA's third task under section 402(p) of the CWA is to consult with the States and conduct studies for the purpose of identifying storm water dischargers or classes of discharges for which permits are temporarily not required; determining the nature and extent of pollutants in such discharges; and establishing procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality. EPA is then required to issue regulations on or before October 1, 1992 which identify storm water discharges for which permits will be required to protect water quality. Identified storm water discharges are to be regulated under the comprehensive program which, at a minimum, establishes priorities, requirements for State storm water management programs, and expeditious deadlines.

Congress did not intend to limit the scope of the studies authorized by Section 402(p)(5) to the definition of storm water point source that was in EPA's regulations at 40 CFR 122.26(b)(1) on the date of enactment of the WQA. For example, the legislative history accompanying the provision states that after October 1, 1992, "*all* municipal separate storm sewers are subject to the requirements of sections 301 and 402." (emphasis added) (Vol. 132 Cong. Rec. H10576 (daily ed. October 15, 1986) Conference Report). Under the Agency's 1984 regulations, municipal separate storm sewers located outside urban areas were not storm water point sources unless designated on a case-by-case basis. However, Congress clearly did not intend to exclude these discharges from the section 402(p)(5) studies.

Today's notice does not propose to revive the remanded regulatory definition of storm water point source at this time. This action is taken to minimize the confusion between the regulatory program for storm water that was in place before the WQA was enacted and the new program that will be developed in accordance with the manadates of Section 405 of the WQA. In accordance with Congressional intend, EPA will continue to define the scope of the comprehensive program to regulate storm water discharges in rulemaking authorized under section 402(p)(6) of the CWA after completing the CWA section 402(p)(5) studies.

Until the scope of the storm water regulatory program is more completely defined, EPA will define which storm water discharges are required, in accordance with section 402(p)(2), to obtain permits. EPA will rely on the regulatory definition of "point source" at 40 CFR 122.2 to provide authority for requiring permits for those storm water discharges which are to be permitted prior to the completion of the rulemaking authorized under section 402(p)(6).

In addition, EPA does not propose to revive the remanded regulatory definitions of Group I and Group II storm water discharges. EPA is proposing and requesting comments on technical amendments to existing NPDES regulations to remove references to these terms.

B. Definition of Storm Water

Today's notice proposes to clarify the definition of storm water at 122.26(b)(10) as storm water runoff, surface runoff, street wash waters related to street cleaning or maintenance, infiltration (other than infiltration contaminated by seepage from sanitary sewers or by other discharges) and drainage related to storm events or snow melt. This proposed definition is consistent with the regulatory definition of "storm sewer" at 40 CFR 35.2005(b)(47) which is used in the context of grants for construction of treatment works. This definition aids in distinguishing separate storm sewer conveyances from sanitary sewers, combined sewers, process discharges and non-storm water non-process discharges.

In the WQA and other places, the term "storm water" is presented as a single word. The Agency, in preparing this notice, has attempted to consistently use the Government

Printing Office's approved form where storm water appears as two words. The Agency requests comment on the form (one-word or two) of the term perferred by the public.

C. Responsibility for Storm Water Discharges Associated with Industrial Activity into Municipal Separate Storm Sewers

1. Prior Approaches

In past rulemakings concerning permit applications and applicability for storm water discharges, EPA has, within the framework of the CWA, attempted to balance the need for addressing the environmental risk associated with storm water discharges with the administrative burden associated with processing permits and permit applications for the large number of storm water discharges. The regulatory term "storm water point source" was used to define which storm water discharges were subject to the NPDES program. However, under previous regulatory schemes, not all storm water point sources were required to submit an individual permit application. Under regulations promulgated under the September 26, 1984 final rule, one permit could be issued covering all storm water point sources that are discharged to a storm water conveyance system. Under this approach, all "storm water point sources" that discharge into a storm water conveyance system had to be covered either by an individual permit or a permit issued to an operator of the portion of conveyance which discharges directly to waters of the United States. Any permit written to cover more than one operator would have been required to identify the limitations applicable to each discharge. This "either/or" approach in the September 26, 1984 rule allowed the operator of the portion of the conveyance which discharges directly to waters of the United States to decline to assume responsibility for certain discharges into its separate storm sewer system. In that situation, operators of individual storm water point source discharges into the conveyance would have been responsible to file permit applications for their discharges.

In the August 12, 1985 (50 *FR* 32552) reopener notice, EPA requested comments on a proposal that would primarily hold municipalities responsible for obtaining a permit that would cover all the storm water point sources that discharged to a municipal storm water system. Under this approach, all operators of storm water point source discharges into a municipal separate storm sewer were to be relieved of the responsibility of having to obtain individual permits, unless the permitting authority designated such dischargers as a co-permittee with the municipality or required an individual permit from the operator of the discharge into the system. Under the August 12, 1985 proposal, the municipality responsible for the system would be required to identify Group I discharges into the municipal system. Sampling requirements for municipal separate storm sewers that received discharges from non-municipal Group I discharges were not specifically addressed in the August 12, 1985 notice, although the regulations in effect at that time required that applications for discharges from storm sewer systems contain any information regarding discharges into the system that would be required if separate applications were submitted for those discharges.

Fifty-seven (57) commenters addressed the proposal in the August 12 notice that would place the responsibility for applying for and obtaining an NPDES permit for all storm water discharges into the system upon the municipality or public service entity. Twenty-six (26) of the 57 felt that such an approach would relieve many individual operators of discharges from having to obtain permits, which would thereby reduce paperwork, but not reduce EPA's ability to address pollution problems. One municipality felt that under this approach, critical pollution sources could be identified and permitted individually if necessary. One industry representative claimed that individual municipalities are in the best position to determine if individual permits are needed for specific storm water discharges into the municipal system, while another industry representative argued that industrial dischargers into a municipal system should not be singled out for individual permits over discharges from shopping centers, parking lots, etc., which may have significant water quality impacts.

Twenty-one (21) commenters of the 47 were opposed to municipalities being responsible for obtaining a permit covering all discharges of storm water into the system. Eight (8) commenters, a county public service agency, 6 municipalities, and a land development company, cited the substantial costs involved in making a municipality responsible for all storm water discharges into its system, both in terms of identifying all discharges into the system and sampling and analytical costs. Three commenters (a county agency, a municipality, and a State) pointed out that a municipality may lack the authority to regulate non-municipal storm water point source discharges into its system, as well as nonpoint source runoff from many sources that drain into the municipal storm water sewer system. Two municipalities felt that industrial storm water discharges should be controlled by EPA, not the municipalities, while several other municipalities stated that the pollution generator may not be held responsible under the proposed approach.

Several municipalities argued that it is impossible to monitor all storm water inlets to the municipal system since municipalities, stated at least one municipal commenter, do not maintain records identifying dischargers into the system. Another municipality claimed that municipalities have already implemented activities to control storm water discharges (e.g., controls on construction site runoff, spill prevention and abatement ordinances, etc.) in order to improve water quality.

Several commenters objected to the requirement that municipalities identify all industrial storm water discharges into the municipal system since it shifts the burden of the regulatory requirements from the individual facility discharging to the municipal system to the municipality. They argued that there is no benefit to the municipalities under the proposed approach, and that the proposed approach was very complex and counterproductive. A county flood control district commented that a municipal storm water system does not create water pollution or change its ultimate destination. One municipality felt that any municipal group application should not require data on discharges into the municipal system, since that data should be similar to data from direct discharges.

An individual company felt that municipalities should not have the option of excluding non-municipal storm water discharges into the system in the permit covering the system, while on the other hand, two municipalities argued strongly that municipalities should be able to decline to assume responsibility for non-municipal discharges into the municipal system.

2. Today's Proposal Regarding Storm Water Discharges Associated with Industrial Activity into Large and Medium Municipal Separate Storm Sewer Systems

Under the scheme of section 405 of the WQA, operators of large municipal separate storm sewer systems (systems serving a population of 250,000 or more) and medium municipal separate storm sewer systems (systems serving a

population of 100,000 or more but less than 250,000), are required to submit permit applications for discharges from these systems prior to October 1, 1992. However, generally, permits are not required from operators of many storm water discharges (such as storm water discharges from certain commercial and residential facilities) into these large or medium municipal separate storm sewer systems prior to October 1, 1992, unless the Administrator or NPDES State determines that the discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to the waters of the United States. Thus, in enacting the WQA, Congress endorsed a regulatory scheme where municipalities responsible for obtaining NPDES permits for discharges from large and medium municipal separate storm sewer systems are clearly responsible for many storm water discharges which discharge into these municipal systems.

In addition to receiving storm water discharges that are generally not required to obtain a permit prior to October 1, 1992 under section 402(p)(1), large and medium municipal separate storm sewer systems receive storm water discharges that are also excluded from section 402(p)(1), including: storm water discharges which have been issued a permit prior to the enactment of the WQA [section 402(p)(2)(A)]; storm water discharges associated with industrial activity [section 402(p)(2)(B)]; and storm water discharges which the Administrator or NPDES State determines contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States (section 402(p)(2)(E)).

Today's notice requests comments on whether EPA should hold operators of large and medium municipal separate storm sewer systems primarily responsible for obtaining system-wide or area permits which cover storm water discharges associated with industrial activity which discharge into the municipal system, or if non-municipal operators of storm water discharges associated with industrial activity which discharge to large or medium municipal systems should be required to submit individual permit applications (or participate in a group application) for such discharges.

After a consideration of comments on the August 12, 1985 reopener, and reevaluation of the issue in light of the WQA, EPA still favors holding municipal operators of large or medium municipal storm sewer systems primarily responsible for applying for and obtaining an NPDES permit covering system discharges as well as storm water discharges to the system. Holding municipalities primarily responsible for obtaining a permit to cover storm water discharges associated with industrial activity which discharge into the municipal system would reduce the tremendous administrative burden associated with preparing and processing the thousands of permit applications that would be necessary if each storm water discharge associated with industrial activity that goes into a large or medium municipal separate storm sewer system had to apply individually (or as part of a group application). The Agency believes this approach is the most practical option available and holds the most promise for long-term environmental improvements.

The permit application requirements that EPA is proposing for large and medium municipal separate storm sewer systems, discussed in more detail later in today's notice, are intended to begin the development of this approach. EPA is proposing that municipal permit applications include the location of facilities which discharge storm water associated with industrial activity to the municipal system (see § VII.G.6 of the preamble). In addition, EPA is proposing that municipal applicants provide a description of a proposed management program to reduce, to the maximum extent practicable, pollutants from storm water discharges associated with industrial activity which discharge to the municipal system (see § VII.G.6.c of the preamble). The proposed management program will identify priorities and procedures for inspecting industrial facilities and for establishing and implementing measures to reduce the discharge of pollutants in such discharges. The municipal application will be used by permit writers to develop management programs which will be incorporated as permit conditions in the permit issued for discharges from the municipal separate storm sewer system.

Controls developed in management plans for municipal system permits may take a variety of forms. Where necessary, municipal permittees can pursue local remedies to develop measures to reduce pollutants or halt troublesome discharges into the large or medium municipal storm sewer system. This approach is consistent with several comments to the August 12, 1985 proposal, which stated that many local entities have already implemented ordinances or laws that regulate the discharge of pollutants, while other municipalities have developed a variety of techniques to control pollutants in storm water. Alternatively, where appropriate, municipal permittees may develop end-of-pipe controls such as wet detention ponds or diverting flow to Publicly Owned Treatment Works. Finally, municipal applicants will be provided with an opportunity to bring individual storm water discharges which cannot be adequately controlled by the municipal permittees to the attention of the permitting authority who then could, at the Director's discretion, require an individual permit for the storm water discharges into the public system or require such dischargers to be co-permittees to the municipal system permit by establishing conditions applicable to such users.

Some municipal agencies with certain storm water responsibilities have commented on previous rulemakings that they lack legal authority to regulate discharges into their system. The Agency's initial analysis of legal authorities such as ordinances and controls on construction site runoff indicate that such local municipalities have adequate legal authority either to control storm water flows or control pollutant discharges to municipal systems, to the degree necessary to implement the programs envisioned in today's proposal. The Agency requests comments on the legal authority of municipal permittees, including detailed legal analysis of the legal authority of municipalities which contend that they are precluded from exercising adequate authority to implement such controls due to lack of authorization from the State in which the municipality is located. The Agency requests comments on the circumstances when it is not appropriate to hold a municipality responsible for discharges to municipal systems and under what circumstances it is feasible to rely on treatment of storm water discharges in lieu of controls which require legal authority to implement.

Section 402(p)(3) of the CWA establishes different standards for permits for storm water discharges associated with industrial activity and discharges from municipal separate storm sewers. Where individual permits are required for storm water discharges associated with industrial activity, these permits are required to meet all the applicable provisions of sections 402 and 301 of the Clean Water Act, including technology-based and, where necessary, water-quality based requirements. Permits for discharges from municipal separate storm sewers are required to adopt controls to reduce

the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. EPA anticipates that the application of maximum extent practicable controls developed in management programs in municipal system permits will generally result in similar levels of control on industrial discharges to the municipal separate storm sewer system as conditions placed in individual NPDES permits for storm water discharges associated with industrial activity.

In comparing the control mechanisms of individual permits and management plans developed in municipal separate storm sewer permits, it is important to note that currently, EPA has established effluent guideline limitations for storm water discharges for eight subcategories of industrial dischargers (Cement Manufacturing (40 CFR Part 411), Feedlots (40 CFR Part 412), Fertilizer Manufacturing (40 CFR Part 418), Petroleum Refining (40 CFR Part 419), Phosphate Manufacturing (40 CFR Part 422), Steam Electric (40 CFR Part 423), Coal Mining (40 CFR Part 434), and Ore Mining and Dressing (40 CFR Part 440)). Most of the existing facilities in these subcategories already have individual permits for their storm water discharges. Under today's proposal, facilities with existing NPDES permits for storm water discharges to a municipal storm sewer will generally be required to maintain these permits. EPA requests comments on whether storm water discharges associated with industrial activity from industries with promulgated effluent guidelines which discharge to municipal storm sewers should be required to obtain individual permits.

In order to aid municipalities in developing and implementing management programs, EPA is proposing that operators of storm water discharges associated with industrial activity which discharge to a large or medium municipal separate storm sewer system are not required to submit individual permit applications (or participate in a group application) provided:

- The operator of such a storm water discharge submits to the municipality responsible for the municipal separate storm sewer receiving the discharge the name of facility; the location of the discharge; and a certification that the discharge has been tested for the presence of non-storm water discharges;
- Such discharge is composed entirely of storm water;
- Such discharge is in compliance with applicable conditions of the NPDES permit issued for the discharge from the municipal separate storm sewer which receives the storm water discharge associated with industrial activity provided the discharger has been notified of such conditions; and
- Such discharge does not contain a hazardous substance in excess of reporting quantities established at 40 CFR 117.3 or 40 CFR 302.4.

The Agency specifically requests comments on requiring municipal permittees to develop controls to reduce pollutants in storm water discharges associated with industrial activity into municipal systems as an alternative to requiring individual permits (or issuing general permits) for storm water discharges associated with industrial activity.

3. Today's Proposal Regarding Storm Water Discharges Associated with Industrial Activity from Federal Facilities into Large and Medium Municipal Separate Storm Sewer Systems

EPA recognizes that storm water discharges associated with industrial activity from Federal facilities to municipal separate storm sewer systems may pose unique legal and administrative situations. In today's notice, the Agency favors proposing regulations which address storm water discharges from Federal facilities to municipal systems in the same manner as privately-owned storm water discharges to municipal storm sewers. That is, storm water discharges associated with industrial activity from Federal facilities to municipal storm sewers are generally covered by the permit issued for the municipal storm sewer system discharges and are not required to obtain an individual NPDES permit unless the Director of the NPDES program designates the discharge as a co-permittee with the municipality or requires an individual permit. However, the Agency specifically requests comments on applying this approach to Federal facilities, and whether Federal facilities which discharge storm water associated with industrial activity into municipal systems should be required to submit individual applications (or, where appropriate, participate in a group application), and obtain individual permits for such discharges.

4. Today's Proposal Regarding Storm Water Discharges Associated with Industrial Activity into Municipal Separate Storm Sewer Systems Serving a Population of Less than 100,000

Sections 402(p) (1) and (2) of the CWA provides that discharges from municipal separate storm sewer systems serving a population of less than 100,000 are not required to obtain a permit prior to October 1, 1992, unless designated on a case-by-case basis under section 402(p)(2)(E). Such discharges are to be included in the set of storm water discharges to be studied under section 402(p)(5) of the CWA and are subject to regulation under section 402(p)(6) of the Act. However, NPDES permits could be required under section 402(p)(2)(B) for storm water discharges associated with industrial activity which discharge into these municipal systems prior to October 1, 1992. EPA requests comments on whether industrial facilities discharging storm water to these systems should not be required to obtain a permit until after the completion of the studies mandated under section 402(p)(5) of the CWA. Evaluating these discharges under the studies mandated under section 402(p)(5) would provide EPA additional flexibility to evaluate procedures and methods to control these storm water discharges to the extent necessary to mitigate impacts on water quality and to determine whether the municipalities responsible for discharges from municipal separate storm sewer systems serving a population of less than 100,000 or the industrial facility generating the discharge to the municipal system should be responsible for obtaining a NPDES permit. Alternatively, operators of storm water discharges associated with industrial activity to municipal systems serving less than 100,000 would be required to submit permit applications (or participate in group applications) in accordance with the deadlines established for other storm water discharges associated with industrial activity that would be required to obtain a permit under today's proposal.

D. Storm Water Discharge Sampling

Storm water discharges are intermittent by their nature. Pollutant concentrations in storm water discharges will be highly variable. Not only will variability arise between given events, but the flow rate and pollutant concentrations of such discharges will vary with time during an event. This variability raises two technical problems: what is the best way to

characterize the discharge associated with a single storm event; and what is the best way to characterize the variabilty beween discharges of different events that may be caused by seasonal changes, changes in material management practices, and other factors.

The current regulations at 40 CFR 122.21(g)(7) require that applicants for storm water discharges submit quantitative data based on one grab sample taken every hour of the discharge for the first four hours of discharge. In today's notice, EPA is proposing to modify this requirement such that instead of collecting and analyzing four grab samples individually, applicants provide data as indicators of two sets of conditions: first flush pollutant concentrations and flow-weighted average storm event concentrations.

Data describing pollutants in the first flush (i.e., a grab sample taken during the first twenty minutes of the discharge) can often be used as a screen for illicit discharges and illegal dumping to the storm water because pollutants associated with such activities may be flushed out of the system during the initial portion of the discharge. In addition, first flush data is useful because much of the traditional structural technology used to control storm water discharges, including detention and retention devices, may only provide controls for the first flush of the discharge, with relatively little or no treatment for the remainder of the discharge. First flush data will give an indication of the potential usefulness of these techniques to reduce pollutants in storm water discharges. Also, first flush discharges may be primarily responsible for pollutant shocks to the ecosystem in receiving waters.

Studies such as NURP have shown that flow-weighted average concentrations of storm water discharges are useful for estimating pollutant loads and estimating pollutant loads and for evaluating certain concentration-based water quality impacts. The use of flow-weighted composite samples are also consistent with comments raised by various industry representatives during previous Agency rulemakings that continuous monitoring of discharges from storm events is necessary to adequately characterize such discharges.

In order to provide flexibility where it is not feasible to obtain a flow weighted composite sample, EPA is also proposing that applicants may, in lieu of submitting data based on a flow weighted composite, submit quantitive data from individual samples taken during a representative storm event.

EPA requests comment on the feasibility of the proposed modification of sampling procedures at § 122.21(g)(7) and the ability to characterize pollutants in storm water discharges with an average concentration and a first flush concentration compared to collecting and separately analyzing four grab samples. The Agency invites commenters to submit any data that can be used to compare the accuracy and the cost of the proposed changes relative to the existing regulations.

In the proposed regulation, the entire provision at 122.21(g)(7) has been presented to provide ease of review. Today's notice only requests comments on those portions of § 122.21(g)(7) that relate to sampling storm water discharges.

E. Storm Water Discharges Associated with Industrial Activity

1. Permit Applicability

a. Storm Water Discharges to Municipal Storm Sewers. As discussed in more detail in § VII.C of today's notice, EPA is proposing that, in general, the operator of a storm water discharge associated with industrial activity will not be required to individually obtain a permit if their discharge goes to a municipal separate storm sewer serving a population of 250,000 or more, or a population of 100,000 or more, but less than 250,000, but that the operators of these municipal separate storm sewer systems are primarily responsible for obtaining system-wide or area permits which cover storm water discharges associated with industrial activity which discharge into the municipal system. In addition, EPA is proposing that operators of storm discharges associated with industrial activity which discharge to municipal separate storm sewer systems serving a population of less than 100,000 are not required to obtain a permit prior to the completion of studies mandated under section 402(p)(5) of the CWA. In these cases, the Director may still designate such discharges for an individual permit or to be co-permittee.

b. Storm Water Discharges to Non-Municipal Conveyances. Today's notice proposes at § 122.26(a)(5) to require all operators of storm water discharges associated with industrial activity that discharge into a privately or Federally owned storm water conveyance (a storm water conveyance that is not a municipal separate storm sewer) to either be covered by an individual permit or a permit issued to the operator of the portion of the system that directly discharges to waters of the United States. This "either/or" approach, which is similar to the approach taken in the September 26, 1984 final rule, allows a non-municipal operator of a storm water conveyance to decline to assume responsibility for the non-municipal storm water discharges into the non-municipal conveyance.

EPA considers this approach to be appropriate because some of the permit applications requirements proposed in today's notice require the applicant to have access to information regarding the site where the storm water is generated. Operators of non-municipal systems will generally be in a poorer position to gain knowledge of pollutants in storm water discharges and to impose controls water discharges from other facilities than will municipal system operators. In addition, best management practices and other site-specific controls are often most appropriate for reducing pollutants in storm water discharges and operators of non-municipal separate storm sewers may not be able to institute such controls. Also, some non-municipal operators of storm water conveyances which receive storm water runoff from industrial facilities may not be industrial facilities themselves and therefore should generally be excluded from obtaining a permit prior to October 1, 1992, unless specifically designated.

EPA requests comments on the advantages and disadvantages of retaining the "either or" approach for non-municipal storm sewers. Alternatively, EPA could adopt an approach where the operator of the portion of the conveyance which discharges directly to waters of the United States is responsible for obtaining a permit which covers all discharges to the non-municipal storm sewer.

2. Scope of "Associated with Industrial Activitity"

The September 26, 1984 final regulation divided those discharges that met the regulatory definition of storm water point source into two groups. The term Group I storm water discharges was defined in an attempt to identify those storm water discharges which had a higher potential to contribute significantly to environmental impacts. Group I included those discharges that contained storm water from an industrial plant or plant associated areas. Other storm water discharges (such as those from parking lots and administrative buildings) located on lands used for industrial activity were classified as Group II discharges. The regulations defined the term "plant

associated areas" by listing several examples of areas that would be associated with industrial activities. However, the resulting definition led to confusion among the regulated community regarding the distinctions between the Group I and Group II classifications.

When enacting section 405 of the WQA, Congress did not explicitly adopt EPA's regulatory classification of Group I and Group II discharges. Rather, Congress required EPA to develop permit application requirements for storm water "discharges associated with industrial activity" by no later than February 1, 1989. In light of the adoption of the term "associated with industrial activity" in the WQA, and the ongoing confusion surrounding the previous regulatory definition, EPA has eliminated the regulatory terms "Group I storm water discharge" and "Group II storm water discharge" pursuant to the Court remand and does not propose to revive it. In addition, EPA is proposing to define the term "storm water discharge associated with industrial activity" at § 122.26(b)(13) and to clarify the scope of the term.

In describing the scope of the term "associated with industrial activity", several members of Congress explained in the legislative history that the term applied if a discharge was "directly related to manufacturing, processing or raw materials storage areas at an industrial plant." (Vol. 132 Cong. Rec. H10932, H10936 (daily ed. October 15, 1986); Vol. 133 Cong. Rec. H176 (daily ed. January 8, 1987). EPA is proposing to clarify the regulatory definition of "associated with industrial activity" by adopting the language used in the legislative history and supplementing it with a description of various types of areas that are directly related to an industrial process (e.g., industrial plant yard, immediate access roads and rail lines, drainage ponds, material handling sites, sites used for the application or disposal of process waters, sites used for the storage and maintenance of material handling equipment, and sites that are presently or have been used in the past for residual treatment, storage or disposal). Today's proposal would clarify that the term applies to plant areas that are no longer used for such activities as well as areas that are currently being used for industrial processes.

The same comments in the legislative history cited above were careful to state that the term "associated with industrial activity" does not include storm water "discharges associated with parking lots and administrative and employee buildings". To accommodate this legislative intent, EPA is proposing that generally, segregated storm water discharges from these areas will not be required to obtain a permit prior to October 1, 1992. However, if a storm water discharge from a parking lot at an industrial facility is mixed with a storm water discharge associated with industrial activity, the combined discharge is subject to permit application requirements for storm water discharges associated with industrial activity.

Storm water discharges from parking lots and administrative buildings along with other discharges from industrial lands that do not meet the regulatory definition of "associated with industrial activity" and that are segregated from such discharges may be required to obtain a NPDES permit prior to October 1, 1992 under certain conditions. For example, large parking facilities, due to their impervious nature may generate large amounts of runoff which may contain significant amounts of oil and grease and heavy metals which may have adverse impacts on receiving waters. The Administrator or NPDES State has the authority under section 402(p)(2)(e) of the amended CWA to require a permit prior to October 1, 1992 by designating storm water discharges such as those from parking lots that are significant contributors of pollutants or contribute to a water quality standard violation. EPA will address storm water discharges from lands used for industrial activity which do not meet the regulatory definition of "associated with industrial activity" in the section 402(p)(5) study to determine the appropriate manner to regulate such discharges.

EPA requests comments on clarifying the types of facilities that involve industrial activities and generate storm water. EPA prefers basing the clarification, in part, on the use of Standard Industrial Classification (SIC) codes, which have been suggested in comments to prior storm water rulemakings because they are commonly used and accepted and would provide definitions of facilities involved in industrial activity.

EPA requests comments on the scope of the definition (types of facilities addressed) as well as the clarity of regulation. EPA has identified the following types of facilities which it requests comments on with respect to suitability for inclusion in the regulatory definition as facilities which generate and discharge storm water associated with industrial activity:

(i) Facilities subject to effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards;

(ii) Facilities classified as Standard Industrial Classification 20 through 39 (manufacturing industry);

(iii) Facilities classified as Standard Industrial Classification 10 through 14 (mineral industry) including active or inactive mining operations and oil and gas exploration, production, processing, or treatment operations, or transmission facility that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations;

(iv) Hazardous waste treatment, storage, or disposal facilities that are operating under interim status or a permit under Subtitle C or RCRA;

(v) Landfills, land application sites, and open dumps that receive industrial wastes and that are subject to regulation under Subtitle D of RCRA;

(vi) Facilities involved in significant recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards;

(vii) Steam electric power generating facilities, including coal handling sites, and onsite and offsite ancillary transformer storage areas;

(viii) Transportation facilities classified as Standard Industrial Classification 40 through 45, and 47 which have vehicle maintenance shops, material handling facilities, equipment cleaning operations and airport deicing operations. Only those facilities or portions of facilities that are either involved in vehicle maintenance, loading, storage or unloading activities, or equipment cleaning operations or which are subject to another subparagraph under this paragraph are associated with industrial activity;

(ix) POTW lands used for land application treatment technologies, sludge disposal, handling or processing areas, and chemical handling and storage areas;

(x) Facilities classified as Standard Industrial Classification 15 and 16 (General building contractors and heavy construction contractors) including clearing, grading and excavation activities except operations that result in the disturbance of less than 1 acre total land area which are not part of a larger common plan of development or sale; or that are designed to serve single family residential projects, including duplexes, triplexes or quadruplexes, that result in the disturbance of less than 5

acre total land areas which are not part of a larger common plan of development or sale.

(xi) Automotive repair shops classified as Standard Industrial Classification 751 or 753 including general automotive repair shops, paint shops, and body repair shops, and miscellaneous repair shops classified as Standard Industrial Classification 769;

(xii) Gasoline service stations classified as Standard Industrial Code 5541;

(xiii) Lands other than POTW lands (offsite facilities) used for sludge management;

(xiv) Lumber and building materials retail facilities classified as Standard Industrial Classification 5211;

(xv) Landfills, land application sites, and open dumps that do not receive industrial wastes and that are subject to regulation under Subtitle D of RCRA.

(xvi) Facilities classified as Standard Industrial Classification 46 (pipelines, except natural gas), and 492 (gas production and distribution); and

(xvii) Major electrical powerline corridors.

Of the facilities listed above, EPA prefers that storm water discharges from facilities listed in paragraphs (xi) through (xvii) not be classified as storm water discharges associated with industrial activity, but rather be part of the class of discharges for which storm water permits are not required prior to October 1, 1992, unless designated under section 402(p)(2)(E) of the CWA. EPA prefers to study under section 402(p)(5) of the CWA storm water discharges from these and other facilities for appropriate regulation under section 402(p)(6). In addition, storm water discharges from certain facilities listed above that are not associated with industrial activity (such as storm water discharges from parking lots which are not used for material management), and which are segregated from storm water discharges will be studied under section 402(p)(5).

EPA is requesting comments on how the regulatory definition of "associated with industrial activity" can be further clarified and on clarifying the types of facilities that are engaged in industrial activities. Some activities at certain facilities will be listed in more than one category. For example, an inorganic chemical facility with an SIC code of 28 may have an on-site unit which is subject to Subtitle C of RCRA. Although the majority of Subtitle C facilities will be addressed by other classifications listed above, listing Subtitle C facilities separately provides additional clarification. EPA requests comments on further classifications that would serve to clarify the proposed definition of storm water discharge associated with industrial activity (for example, are distinct categories for treatment, storage or disposal facilities for source, special nuclear or by-product material as defined by the Atomic Energy Act of 1954, as amended, 42 U.S.C. 2011 et seq. or sites listed on the National Priority List (other than sites that are Fund-financed pursuant to CERCLA section 106 which are exempt from permitting (see 40 CFR 300.65(f))) necessary to clarify that these are facilities covered by the definition?) Today's proposal is intended to address Department of Defense and Department of Energy facilities which are engaged in the industrial activities listed above, even though SIC codes do not apply to these facilities. EPA requests comments on whether the proposed regulatory language should be clarified with respect to these facilities.

EPA also requests comment on limiting the definition of storm water discharge associated with industrial activity to those discharges which do not discharge into municipal separate storm sewers. This limitation may be useful in clarifying which discharges are required to submit permit applications and obtain an NPDES permit.

If EPA promulgates a final regulatory definition of "storm water discharge associated with industrial activity" that does not include certain facilities that are listed in today's proposal, then those facilities would be studied under Section 402(p)(5) of the CWA for appropriate regulation after October 1, 1992 under Section 402(p)(6) of the Act. Comments which oppose inclusion of proposed facilities to the regulatory definition of "storm water discharge associated with industrial activity" should address the nature and extent of pollutants in the storm water discharge as well as the appropriate procedures and methods to control pollutants in storm water discharges from such facilities to the extent necessary to mitigate impacts on water quality. For facilities which EPA requests comments on in today's notice, but that the Agency does not include in the final definition of "storm water discharge associated with industrial activity", the information received during the rulemaking, along with other information, will constitute a portion of the Section 402(p)(5) study. In such a case, the Agency, where appropriate, will consider today's request for comments as a proposal for regulation under Section 402(p)(6) and establish appropriate regulations (such as delaying the date of permit application submittal) based on today's proposal.

Today's proposed permit application requirements for storm water discharges associated with industrial activity at §122.26(c)(1)(i) include special requirements for storm water discharges originating from mining operations, oil or gas operations (§ 122.26(c)(1)(ii), and from the construction operations listed above (§ 122.26(c)(1)(iii)). These requirements are discussed in more detail in § VII.E.7 and § VII.E.9 of today's notice.

3. Individual Application Requirements

Today's notice addresses whether the requirements for permit applications for discharges which contain storm water associated with industrial activity should be modified from the requirements associated with the Form 1 and Form 2C permit applications. The proposed modifications to the permit application requirements would apply to both storm water discharges associated with industrial activity that are required to submit a permit application (§ VII.E.1 of the preamble discusses permit applicability) and to other discharges from non-municipal separate storm sewers which have been designated by the Administrator or NPDES State as contributing to a violation of a water quality standard or as a significant contributor of pollutants to waters of the United States.

As discussed earlier in today's notice, the September 26, 1984 regulation required operators of Group I storm water discharges to submit the full NPDES Form 1 and Form 2C permit applications. In response to post-regulation comments received on that rule, EPA proposed new permit application requirements (March 7, 1985, (50 FR 9362) and August 12, 1985, (50 FR 32548)) which would have decreased the analytical sampling requirements of the Form 2C and provided procedures for group applications. The passage of the WQA has given the EPA additional time to consider the appropriate permit application requirements for storm water discharges.

Today's notice proposes to modify the permit application requirements found at 122.21 by providing special requirements for storm water discharges associated with industrial activity at § 122.26(c). In response to comments on earlier rulemakings addressing storm water discharges, EPA is proposing to shift the emphasis of the permit application requirements for storm water discharges associated with industrial activity from the existing requirements for collection of quantitative data (sampling data) in Form 2C towards collection of less

quantitative data supplemented by additional information needed for evaluation of the nature of the storm waters discharges. The permit application requirements proposed for storm waters discharges reduce the amount of quantitative data required in the permit application and exempt discharges which contain entirely storm water (and contain no other discharge that, without the storm water component, would require a NPDES permit), from certain reporting requirements of the Form 2C. The proposed modifications also would exempt applicants for discharges which contain entirely storm water from several non-quantitative information collection provisions currently required in the Form 2C. The proposed modifications would rely more on descriptive information for assessing impacts of the storm water discharge.

A proposed application form, Form 2F, for storm water discharges has been included with today's notice. A complete permit application for discharges composed entirely of storm water, will be comprised of Form 2F and Form 1. Operators of discharges which are composed of both storm water and non-storm water will submit a Form 1, an entire Form 2C (or Form 2D) and Form 2F when applying. In this case, the applicant will provide quantitative data describing the discharge during a storm event in Form 2F and quantitative data describing the discharge during non-storm events in Form 2C. Non-quantitative information reported in the Form 2C will not have to be reported again in the Form 2F.

Under today's proposal, Form 2F for storm water discharges associated with industrial activity would not require the submittal of all the quantitative information required in Form 2C, but would require that quantitative data be submitted for:

- Any pollutant limited in an effluent guideline for its subcategory;
- Any pollutant listed in the facility's NPDES permit for its process wastewater;
- Oil and grease, TOC, TSS, COD, pH, BOD_5, total phosphorus, total nitrogen; and
- Any information on the discharge required under 40 CFR 122.21(g)(7) (iii) and (iv).

In order to characterize the discharge(s) sampled, the applicant would be required to submit information regarding the storm event(s) that generated the sampled discharge, including the date(s) the sample was taken, flow measurements or estimates of the duration of the storm event(s) sampled, rainfall measurements or estimates from the storm event(s) which generated the sampled runoff, and the duration between the storm event sampled and the end of the previous storm event. Information regarding the storm event(s) sampled is necessary to evaluate if the discharge(s) sampled was generally representative of other discharges expected to occur during storm events, and to characterize the amount and nature of runoff discharges from the site.

Today's notice proposes that the applicant test for oil and grease, COD, pH, BOD_5, TSS, total nitrogen and total phosphorus. Oil and grease and TSS are a common component of storm water and can have serious impacts on receiving waters. Oxygen demand (COD and BOD_5) will help the permitting authority evaluate the oxygen depletion potential of the discharge. BOD_5 is the most commonly used indicator of oxygen demand. COD is considered a more inclusive indicator of oxygen demand, especially where metals interfere with the BOD_5 test. The pH will provide the permitting authority with important information on the potential availability of metals to the receiving flora, fauna and sediment. Total nitrogen and total phosphorus are measures of nutrients which can impact water quality.

The proposed Form 2F requirements regarding submission of quantitative data are intended to allow tailoring the sampling and reporting of pollutants to site-specific parameters that potentially have an impact on the quality of the storm water discharge. In addition to the conventional pollutants listed above, today's notice proposes to require applicants to, when appropriate, sample other pollutants based on a consideration of site-specific factors. These pollutants account for pollutants associated with materials used for production and maintenance, finished products, waste products and non-process materials such as fertilizers and pesticides associated with the facility. Today's notice proposes that the applicant sample for any pollutant limited in an effluent guideline applicable to the facility or limitation in the facility's NPDES permit. These pollutants will generally be associated with the facility's manufacturing process or wastes. Other process and non-process-related pollutants, will be addressed by complying with the requirements of 40 CFR 122.21(g)(7) (iii) and (iv).

Section 122.21(g)(7)(iii) requires an applicant to indicate whether the applicant knows or has reason to believe that any pollutant listed in Table IV (conventional and nonconventional pollutants) of Appendix D to 40 CFR Part 122 are discharged. If such pollutant is either directly limited or indirectly limited by the expressed terms of the permit through limitations on an indicator, the applicant must report quantitative data. For pollutants that are not limited in an effluent limitations guideline, the applicant must either report quantitative data or describe the reasons the pollutant is expected to be discharged. With regard to pollutants listed in Table II (organic pollutants) or Table III (metals, cyanide and total phenol) of Appendix D, the applicant must indicate whether he knows or has reason to believe such pollutants are discharged from each outfall and, if they are discharged in amounts greater than 10 parts per billion (ppbs), the applicant must report quantitative data. An applicant qualifying as a small business under 40 CFR 122.21(g)(8), (e.g., coal mines with a probable total annual production of less than 100,000 tons per year or, for all other applicants, gross total annual sales averaging less than $100,000 per year (in second quarter 1980 dollars)), is not required to analyze for pollutants listed in Table II of Appendix D (the organic toxic pollutants).

Section 122.21(g)(7)(iv) requires an applicant to indicate whether it knows or has reason to believe that any pollutant in Table V of Appendix D to 40 CFR Part 122 (certain hazardous substances) is discharged. For every pollutant expected to be discharged, the applicant must briefly describe the reasons the pollutant is expected to be discharged, and report any existing quantitative data it has for the pollutant.

When collecting data for permit applications, applicants may make use of 40 CFR 122.21(g)(7), which provides that "when an applicant has two or more outfalls with substantially identical effluents, the Director may allow the applicant to test only one outfall and report that the quantitative data also apply to the substantially identical outfalls." Where the facility has availed itself of this provision, an explanation of why the untested outfalls are "substantially identical" to tested outfalls must be provided in the application. Where the amount of flow associated with the outfalls with substantially identical effluent differs, measurements or estimates of the total flow of each of the outfalls must be provided.

The outfalls are to be sampled in accordance with the requirements of 40 CFR 122.21(g)(7), which are discussed in this section and section VII.D of today's

notice. EPA is proposing that the facility must sample during "representative storm events." EPA request comments on the following definition of a representative storm event. A representative storm event is one that is typical for the area in terms of duration and severity. The event must be greater than 0.1 inch and must be at least 96 hours from previously measurable (greater than 0.1 inch rainfall) storm event. In general, variance of the parameters such as the duration of the event and the total rainfall of the event should not exceed 50 percent from the average rainfall event in that area. EPA also requests comments on addressing snow melt events under this definition.

Today's proposal would also modify the Form 2C requirements by exempting applicants from the requirements at § 122.21(g)(2) (line drawings), (g)(4) (intermittent flows), (g)(7) (i), (ii), and (v) (various sampling requirements to characterize discharges) if the discharge covered by the application is composed entirely of storm water. Permit applications for discharges containing storm water associated with industrial activity would require applicants to provide other non-quantitative information which will aid permit writers to identify which storm water discharges are associated with industrial activity and to characterize the nature of the discharge.

Under existing permit application regulations, 40 CFR 122.21(f)(7) requires all permit applicants to submit as part of Form 1 a topographic map extending one mile beyond the property boundaries of the source, depicting the facility and each intake and discharge structure; each hazardous waste treatment, storage, or disposal facility; each well where fluids from the facility are injected underground; and those wells, springs, other surface water bodies, and drinking water wells listed in the map area in public records or otherwise known to the applicant within one-quarter mile of the facility property boundary. (See 47 *FR* 15604, April 8, 1982). However, the information provided under § 122.21(f)(7) is generally not sufficient by itself for evaluating the nature of storm water discharges associated with industrial activity.

EPA is proposing that application requirements for storm water discharges associated with industrial activity include a drainage map of the site in addition to the topographic map required with the Form 1. A drainage map can provide important site specific information for evaluating the nature of the storm water discharge than the existing requirements, which require a larger map with only general information. The volume of a storm water discharge and the pollutants associated with it will depend on the configuration and activities occurring at the industrial site. The Agency requests comments under what conditions, if any, it would appropriate to submit a site drainage map in lieu of the Form 1 topographic map.

EPA is also proposing that a narrative description be submitted to accompany the drainage map. The proposed narrative will provide a description of on-site features, including existing structures (buildings which cover materials and other material covers, dikes, diversion ditches, etc.) and non-structural controls (employee training, visual inspections, preventive maintenance, and housekeeping measures) that are used to prevent or minimize the potential for release of toxic and hazardous pollutants; a description of significant materials that are currently or in the past have been treated, stored or disposed outside; and the method of treatment, storage or disposal used. The narrative will also include a description of activities at materials loading and unloading areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; a description of the soil; the impact of storm water runoff on production areas; and a description of the areas which are predominantly responsible for first flush runoff.

Today's notice is also proposing that permit applicants for storm water discharges associated with industrial activity certify that all of the outfalls covered in the permit application have been tested for non-storm water discharges which are not covered by a NPDES permit. Section 405 of the WQA added section 402(p)(3)(B)(ii) to the CWA to require that permits for municipal separate storm sewers effectively prohibit non-storm water discharges to the storm sewer system. As discussed in § VII.F.7.b of today's notice, untreated non-storm water discharges to storm sewers can crate severe, wide-spread contamination problems and removing such discharges presents opportunities for dramatic improvements in the quality of such discharges. Although section 402(p)(3)(B)(ii) specifically addresses municipal separate storm sewers, EPA believes that illicit non-storm water discharges are as likely to be mixed with storm water at a facility that discharges directly to the waters of the United States as it is at a facility that discharges to a municipal storm sewer. Accordingly, EPA feels that is appropriate to consider potential non-storm water discharges in permit applications for storm water discharges associated with industrial activity. The certification requirement would not apply to outfalls where storm water is intentionally mixed with process waste water streams which are already identified in and covered by a permit.

EPA is proposing to provide regulatory language that would provide that appropriate tests for non-storm water discharges include smoke tests, fluorometric dye tests and analysis of accurate schematics. EPA requests comment on whether analysis of storm water discharges associated with industrial activity for various parameters (such as fecal coliform, fecal streptococcus, volatile organic carbon (VOC), residual chlorine and detergents) would be an appropriate method for satisfying the certification requirement. EPA requests comments on other technologies and the use of visual observations of flow during dry weather conditions which may be appropriate for this certification requirement. The Agency also requests comments on when a variance from this provision may be appropriate.

Today's proposal would also require applicants to submit known information regarding the history of significant spills at the facility. Such information is necessary to aid in the determination of which drainage areas are likely to generate storm water discharges associated with industrial activity, evaluate pollutants of concern and to develop appropriate permit conditions. Significant spills at a facility would generally include releases of oil or hazardous substances in excess of reportable quantities under section 311 of the Clean Water Act (see 40 CFR 110.20 and 40 CFR 117.21) or section 102 of CERCLA (see 40 CFR 302.4).

Like the regular NPDES permit applications, individual applications are submitted to the State if it is approved to administer the NPDES program, otherwise to the appropriate EPA Regional Office.

In the August 12, 1985 notice, EPA requested comments on the appropriateness of allowing for a waiver from the requirement to submit quantitative data if the applicant can demonstrate that the information is unnecessary for permit issuance. Although overall the commenters supported such a waiver, EPA is not proposing this type of a waiver in this notice. A waiver is inappropriate since EPA is proposing to reduce the number of pollutants that must be sampled and

analyzed from previous regulations. The proposed requirements for quantitative data are limited to pollutants that are appropriate for given site-specific operations, thereby making a waiver unnecessary.

Although the concept of a waiver is attractive because of the perceived potential reduction in burdens for applicants, the Agency believes that because the storm water discharge testing reequirements have already been streamlined, a waiver would not in practice provide significant reductions in burden for either applicants or permitting authorities. Requirements to provide and verify data demonstrating that a waiver is appropriate for a storm water discharge may prove to be more of a burden to the applicant and the permitting authorities. Establishing such a waiver procedure would be administratively complex and time-consuming for both the Agency and the applicants, without any justifiable benefit. Therefore, today's proposal does not include a waiver provision.

4. Group Applications

For two major reasons, EPA continues to support the group application approach. First, group applications will reduce the burden on the regulated community associated with submitting permit applications by requiring the submission of quantitative data from only selected members of the group. Second, the group application process will reduce the burden on the permit issuing authority by forming an appropriate basis and providing adequate information for issuing general permits. Where general permits are not appropriate or cannot be issued, a group application can be used to develop model individual permits, which can significantly reduce the burden of issuing individual permits.

Today's notice refines and clarifies the proposal for the group application approach set forth in the August 12, 1985 Reopener Notice. The proposal would establish a regulatory procedure whereby a representative entity, such as a trade association, may submit a group application to the Office of Water Enforcement and Permits (OWEP) at EPA headquarters, in which quantitative data from certain representative members of a group of industrial facilities is supplied. Information received in the group application will be used by OWEP to develop models for individual permits or general permits. These model permits are not issued permits, but rather they will be used by EPA Regions and the NPDES States to issue individual or general permits for participating facilities in the State. In developing such permits, the Region or NPDES States will, where necessary, adapt the model permits to take into account the hydrological conditions and receiving water quality in their area.

a. Facilities Covered. Today's proposal differs from the August 12 proposal in that the group application is submitted for only the facilities specifically listed in the application, and not necessarily for an entire industry. This is quite different from the August 12 proposal, which proposed that the application was to be submitted for, and be representative of, the industry as a whole, and any facility fitting within the industry subcategory did not have to submit an individual application. Based on comments to the August 12, 1985 proposal, the Agency agrees that submitting an application for an entire industry is simply unworkable. Under the August 12 proposal, it was likely that there would have been only one application for an entire industry, and the one submission would have had to be representative of the industry as a whole. Under today's proposal, a group application will only cover facilities listed in the application, and not the industry as a whole. The facilities in the group application selected to do sampling must be representative of the group, not of the industry. This approach eliminates the problem expressed by some trade associations that because they represented only a portion of the industry, they would be unable to assure representativeness.

Facilities that would be sufficiently similar to members of a group application, but that are not identified in the group application must, if they are required to obtain a permit, submit individual NPDES permit applications in accordance with the deadlines that will be established in the final rule. Storm water discharges that are sufficiently similar to those covered in a general permit that commence discharging after an applicable general permit has been issued must refer to the provisions of that general permit to determine if they are eligible for coverage and the procedures established in the general permit for obtaining coverage. Facilities that have already been issued an individual permit for their storm water discharge would generally not be eligible for participation in a group application.

b. Scope of Group Applications. In the August 12, 1985 notice, EPA proposed that the groups would be based on EPA subcategories for process waste water (as defined by 40 CFR Subchapter N). Over half of the comments which addressed this issue supported the use of subcategories over categories. However, several commenters to the August 12, 1985 proposal noted that this was too restrictive, and would deny the group application option to those industries not defined by one of the Agency's subcategories or to facilities with integrated operations, where processes could fall within several subcategories.

EPA subcategories are functional classifications, breaking down facilities into groups, for purposes of setting effluent limitations guidelines. Thus, they are tighter than the EPA categorical designations and narrow the wide differences among processes within a broad category. The use of EPA subcategories will save time for both applicants and permitting authorities in determining whether a particular group is appropriate for a group application.

EPA recognizes that the subcategory designations may not always be available. Also, there are situations where processes that are subject to different subcategories are combined. The Agency agrees that the group application option should be flexible enough to allow groups to be created where facilities are integrated or overlap into other subcategories. For these reasons, today's proposal does not limit the submission to EPA subcategories alone, but rather allows groups to be formed where facilities are similar enough to be appropriate for general permit coverage.

In determining whether a group is appropriate for general permit coverage, EPA intends that the group applicant use the factors set forth in 40 CFR 122.28(a)(2)(ii), the current general permit regulation, as a guide. If facilities all involve the same or similar types of operations, discharge the same types of wastes, have the same effluent limitation and same or similar monitoring requirements, where applicable, they would probably be appropriate for a group application. The criteria currently used for defining group application coverage are reasonable for defining the scope of a group application in view of the logical assumption that similar types of industrial facilities are likely to have some similar pollutants in their storm water runoff.

C. Group Application Requirements. The group application requirements proposed today will consist of a Part 1 and a Part 2 application which are to be submitted on different dates. In Part 1 of the application, applicants are to provide information to demonstrate that participants in the group application are sufficiently similar to be included in one group and preliminarily identify

representative facilities which will be responsible for collecting and submitting quantitative data on behalf of the entire group. In Part 2 of the application, representative facilities approved by EPA will be responsible for collecting and submitting quantitative data on behalf of the entire group.

Part 1 of the group application will consist of two components, Part 1A and Part 1B. Part 1A of the application will be used to provide an overview of the group. The second component of Part 1, Part 1B, will provide site-specific information which will be used to evaluate whether individual facilities are appropriate for the group application and whether the representative facilities selected in Part 1A will indeed provide representative quantitative data.

Part 1A of the Group Application. Part 1A will consist of four elements: (1) The name and location of all facilities participating in the group application; (2) a narrative description summarizing the major industrial activities of the participants in the group application and why the participants are appropriate for a group application; (3) a list of the significant materials stored outside by members of the group, and a description of the primary materials management practices, if any; and (4) a commitment to provide quantitative sampling data from representative facilities in Part 2 of the permit application, and a list of the facilities which will provide quantitative information.

EPA is proposing that in Part 1A of the group application, the names of facilities participating in the group application be divided into nine subdivisions based on the facility location relative to nine precipitation zones [see attached map, Appendix E]. These nine divisions will enable the data in the permit application to be more easily analyzed and patterns observed on the basis of hydrology and other regional factors. The need to identify precipitation zones arises because the amount of rainfall is likely to have a significant impact on the quality of the receiving water. According to a recent EPA study (Methodology for Analysis of Detention Basins for Control of Urban Runoff Quality; Office of Water, Nonpoint Source Branch, Sept. 1986) the United States can be divided into nine general precipitation zones. These zones are characterized by differences in precipitation volume, precipitation intensity, precipitation duration, and precipitation intervals. Industrial facilities that seek general permits via the group application option may show significantly different loading rates as a result of these regional precipitation differences. As an example, precipitation in Seattle, Washington, located in Zone 7, approaches the mean annual storm intensity of .024 inches/hour with a mean annual storm duration of 20 hours for that Zone. In contrast, precipitation in Atlanta, Georgia, located in Zone 3 approaches the mean annual storm intensity of .102 inches/hour and a mean storm duration 6.2 hours for that Zone. Atlanta, receives on the average four times more precipitation per hour with storms lasting one-third as long. As a result of these differences, if identical facilities within a group application were situated in each of these areas, their storm water discharges would likely exhibit different pollutant characteristics.

As mentioned above, the group application must provide a list of significant materials stored outside by members of the group. Such a list shall include, for example, raw materials (fuels, storage piles); intermediate materials, such as solvents and detergents; finished materials such as metallic products; and waste products such as ashes, slag and sludge. EPA is proposing that materials are significant, for the purpose of preparing a group application, if they are periodically used or stored in quantities that, if released and mixed with storm water, could result in impacts to receiving waters. As an example, materials in quantities sufficient to be stored in a 55-gallon drum generally would be regarded as significant. However, some materials are sufficiently toxic that smaller quantities would be considered significant, such as certain pesticides and solvents. Therefore, any materials consistently used that are known to be highly toxic in small quantities would also be regarded as significant materials.

With regard to the materials identified, the applicant is to discuss the materials management practices employed by members of the group. For example, the applicant should identify whether such materials are commonly covered, contained, or enclosed, whether storm water runoff from materials storage areas is collected in settling ponds prior to discharge, or diverted away from such areas to minimize the likelihood of contamination. Also, the approximate percentage of facilities in the group with no practices in place to minimize materials stored outside is to be identified.

The Agency considers that the processes and materials used at a particular facility may have a bearing on the quality of the storm water. Thus, if there are different processes and materials used by members of the group, the application is to contain data from facilities utilizing the different processes and materials. Accordingly, if the group members are all very similar in their processes and materials, then such distinctions would not be necessary.

The fourth element of Part 1A of the group application is a commitment to submit quantitative data from ten percent of the facilities listed. EPA is proposing that there must be a minimum of ten and a maximum of one hundred facilities within a group that submit data. There must be a sufficient number of facilities submitting data for any patterns and trends to be detectable. However, it is felt that one hundred facilities would in most cases be sufficient to characterize the nature of the runoff. If not, EPA has the authority to request more sampling under section 308 of the CWA.

Because storm water loading rates may differ significantly as a result of regional precipitation differences, it is necessary that each precipitation zone containing representatives of a group application have some of those representatives take samples. Thus, today's proposal would require that Part 2 of the group application contain sampling data from at least two facilities within each precipitation zone in which two or more members of group are located (the application need contain sampling data for only one facility in a precipitation zone if that facility is the only member of the group located in that zone). Several commenters to the August 12, 1985 proposal suggested, and the Agency agrees, that the amount of rainfall will affect the degree of impact a storm water discharge may have on the receiving stream. In addition, facilities selected to do the sampling should be representative of the group as a whole in terms of those characteristics identifying the group which were described in the narrative, i.e., number and range of facilities, types of processes used, and any other relevant factors. If there is some variation in the processes used by the group (40 percent of the group of food processors are canners and 60 percent are canners and freezers, for example), the different processes are to be represented. Also, samples are to be provided from facilities utilizing the materials management practices identified, including those facilities which use no materials management practices. The representation of these different factors, to the extent feasible, is to be roughly equivalent to their proportion in the group.

Part 1B of the Group Application. Under today's proposal, Part 1B of the group application is intended to provide sufficient site specific information to allow EPA to evaluate whether all members of a group are sufficiently similar as to be appropriate for coverage in a group application or general permit, and to ensure that the facilities selected to collect quantitative data are representative of the group.

Each facility in the group application would be required to submit the non-quantitative information that is required in an individual application for storm water discharges associated with industrial activity: a drainage map, a narrative description of material management practices and control measures to control the discharge of pollutants in storm water discharges, and the history of significant spills at the facility.

EPA is requiring this information because the Agency is persuaded by comments on previous proposals suggesting that site-specific practices are likely to have a significant impact on the quality of the runoff. In addition, comparing the results of different control practices will assist in selecting management practices for inclusion in NPDES permits.

In addition, individual members of the group application will be required to certify that their facility has tested all outfalls that should contain entirely storm water discharges and which drain storm water associated with industrial activity for the presence of nonstorm water discharges which are not covered with a NPDES permit. Illicit discharges are by nature site-specific, and hence a representative analysis involving testing of a fraction of the facilities in the group is not appropriate for a group application.

Submittal of Part 1 of the Group Application. Each facility in the group can submit the information required in Part 1B on Form 1 and Form 2F. The entire Form 2F does not need to be completed—only that nonquantitative information for individual applicants described in today's proposal is required. Facilities participating in a group application will not be required to submit quantitative data describing their storm water discharges with Part 1 of the group application.

The Form 1 and Form 2F must be signed by an authorized corporate official of the facility submitting data, in accordance with the requirements of 40 CFR 122.22. This official will make the required certifications that the document was prepared under his supervision, and based on inquiry of the persons responsible for gathering the information, the information is, to the best of their knowledge and belief, true, accurate and complete.

These forms should be collected prior to submission to EPA and submitted at one time along with the information required under Part 1A to the EPA Office of Water Enforcement and Permits (OWEP) in Washington, DC. OWEP will review the Part 1 application for completeness (40 CFR 122.21(e), completeness of NPDES permit applications) and for compliance with the permit application requirements. Factors likely to contribute pollutants to storm water discharges, such as specific material management practices, will be considered in approving the facilities chosen for representative sampling of the group. Then a judgment will be made as to whether the described group, as a whole, is appropriate for a single group application. If a submission is deficient, EPA will either: reject the group application, limit the facilities participating in the group application, or request that corrections be made to the group application prior to a final decision on acceptability. If the application is rejected or if EPA determines that some facilities must be excluded from the group application, facilities no longer covered by the group application would be required to submit additional information such that complete individual applications can be evaluated.

Part 2 of the Group Application. Under today's proposal, groups for which the Part 1 permit application have been accepted will submit Part 2 of the group application within 18 months of the promulgation of a final rule. Part 2 of the application will consist of quantitative data from the representative facilities in the group that were selected in Part 1 of the application. Each facility submitting representative data in Part 2 will submit quantitative sampling data on Form 2F. The individual facilities themselves, in filing out permit applications for their facilities, certify that the data provided are true, accurate, and complete. Individual applications submitted in Part 2 of the group application will contain sampling from each outfall, except that individual applicants may avail themselves of 40 CFR 122.21(g)(7) for multiple outfalls at the same site with substantially identical effluents, as discussed under the proposed requirements for individual applications. These forms are to be submitted to the entity representing the group, which will compile them.

As with Part 1, Part 2 of the Group Application would be submitted to the Permits Division, Office of Water Enforcement and Permits, in Washington, DC. Submission of a Part 2 application which meets Part 1 commitments and the other standard NPDES regulatory requirements satisfies the application requirements for the facilities listed on Part 1. If the information is incomplete, or simply is found to be an inadequate basis for establishing general permit limits, EPA has the authority under section 308 of the Clean Water Act to require that more information be submitted, which may include sampling from facilities that were part of the group application but did not provide data with the initial submission. If the group application is used by a Region or NPDES State to issue a general permit, the general permit should specify procedures for additional coverage under the permit.

If a Part 2 is unacceptable or insufficient, EPA has the option to request additional information or to require that the facilities that participated in the group application submit complete individual applications (e.g., facilities that have submitted Form 1 with the group application would be required to submit Form 2F, and facilities which have submitted complete Form 1 and Form 2F information in the group application would generally not have to submit additional information).

Once the group applications are reviewed and accepted, EPA will use the information to establish draft permit terms and conditions for models for individual and general permits. The information will also allow States and EPA regional offices to estimate the pollutant loads from storm water dischargers associated with the group to assist in identifying groups for which individual permits may be more appropriate. NPDES-approved States and EPA regional offices will continue to be the permit-issuing authority for storm water discharges. The NPDES-approved States accepting the group application approach and the EPA Regions may then take the model permits and adapt them for their particular area, making adjustments for local water quality standards and other localized characteristics, and making determinations as to the need for an individual storm water permit where general permit coverage is felt to be inappropriate. Permits would be proposed by the Region or NPDES-approved State in accordance with current regulations for public comment before becoming final. In NPDES States without general permit authority, or where an individual permit is deemed appropriate, the model permit can serve

as the basis for issuing individual permits.

The group application is an NPDES permit application just like any other, and as such would be handled through normal permitting procedures, subject to the regulatory provisions applicable to permit issuance. Incomplete or otherwise inadequate submissions would be handled in the same manner as any other permit application. The permitting authority would retain the right to require submission of Form 1, Form 2C and Form 2F from any individual discharger it designates.

5. Group Application: Applicability in NPDES States

The relationship between EPA and the States that are authorized to administer the NPDES program (there are 39 such States, called "approved States") that will implement the storm water program is one of the most complicated aspects of today's proposal. Approved States must have requirements that are at least as stringent as the federal program; they may be more stringent if they choose. Authority to issue general permits is opptional with NPDES States. If they choose to issue general permits they may include such authority in their NPDES program and, upon approval of the program by EPA, may then issue general permits. There are currently thirteen approved States that have authority to issue general permits: Arkansas, Colorado, Illinois, Kentucky, Minnesota, Missouri, Montana, New Jersey, Oregon, Rhode Island, Utah, West Virginia and Wisconsin.

Because today's group application option is a relaxation of existing NPDES permit application requirements, the State is free to adopt this option, but is not required to. If the State chooses to adopt the group application and it does not have general permit authority, the group application can be used to issue individual permits. However, EPA recommends that such States consider obtaining general permit authority as a means to efficiently issue permits for storm water discharges. These States should contact the Office of Water Enforcement and Permits at EPA Headquarters (see the **FOR FURTHER INFORMATION** section at the beginning of this notice), as soon as possible.

If an approved State chooses not to adopt the group application, facilities that discharge storm water associated with industrial activity that are located in that State must submit individual applications to the respective State permitting authority. For facilities that discharge storm water associated with industrial activity which are named in a group application, the Director may require an individual facility to submit an individual application where it determines that general permit coverage would be inappropriate for the particular facility.

6. Group Application: Procedural Concerns

Comments received on the August 12, 1985 group application proposal included comments from an environmental group that the proposed group application process and procedures violated federal law. This commenter claimed that EPA was abrogating its responsibility by allowing a trade association to design a data collection plan in lieu of completing an NPDES application form designed by the Agency, thus violating the Federal Advisory Committee Act. The commenter stated that EPA would be improperly influenced by special interests if trade associations were able to design their own storm water data gathering plans. The commenter further asserted that any decisions by EPA on the content of specific group applications would be rulemakings and thus subject to the provisions of the Administrative Procedure Act.

EPA disagrees with the comment that the group application violates the Federal Advisory Committee Act (FACA). FACA governs only those groups that are established or "utilized" by an agency for the purpose of obtaining "advice" or "recommendations". The group application option does not solicit or involve any "advice" or "recommendations". It simply allows submission of data by certain members of a group in accordance with specific regulatory criteria for determining which facilities are "representative" of a group. As such, the group application is merely a submission in accordance and in compliance with specific regulatory requirements and does not contain discretionary uncircumscribed "advice" or "recommendations" as to which facilities are representative of a group.

Thus, the determination of which facilities should submit testing data in accordance with regulatory criteria is little different from many other regulatory requirements where an applicant must submit information in accordance with certain criteria. For example, under 40 CFR 122.21 all outfalls must be tested except where two or more have "substantially identical" effluents. Similarly, quantitative data for certain pollutants is to be provided where the applicant knows or "has reason to believe" such pollutants are discharged. Both of these provisions allow the applicant to exercise discretion in making certain judgments but such action is circumscribed by regulatory standards. EPA further has authority to require these facilities to submit individual applications. In none of these instances are "recommendations" or "advice" involved. EPA also notes that it is questionable whether, in providing for group applications, it is "soliciting" advice or recommendations from groups of that such groups are being "utilized" by the Agency as a "preferred source" of advice. See 48 FR 19328 (April 28, 1983). Furthermore, this data collection effort may be supplemented by EPA if, after review of the data, EPA determines additional data is necessary for permit issuance. Other information gathering may act as a check on the group applications received.

EPA also does not agree with commenters' claims that the group application scheme represents an impermissible delegation of the Administrator's function in violation of the CWA regarding data gathering. The Administrator has the broadest discretion in determining what information is needed for permit development as well as the manner in which such information will be collected. The CWA does not require every discharger required to obtain a permit to file an application. Nor does the CWA require that the Administrator obtain data on which a permit is to be based through a formal application process (see 40 CFR 122.21). For years "applications" have not been required from dischargers covered by general permits. EPA currently obtains much information beyond that provided in applications pursuant to section 308 of the CWA. This is especially true with respect to general permit and effluent limitations guidelines development. The group application option is simply another means of data gathering. The Administrator may always collect more data should he determine it necessary upon review of a groups' data submission. And, he may obtain such additional data by whatever means permissible under the Statue that he deems appropriate. Thus, it can hardly be said that by this initial data gathering effort the Administrator has delegated his data gathering responsibilities. In addition, since groups are required to select "representative" facilities, etc., in accordance with specific regulatory requirements established by the Administrator and because EPA will scrutinize Part 1 of the group applications and either accept or reject the group as appropriate for a group application, no impermissible delegation

has occurred. EPA will make an independent determination of the acceptability of a group application in view of the information required to be submitted by the group applicant, other information available to EPA (such as information on industrial subcategories obtained in developing effluent limitations guidelines as well as individual storm water applications received as a result of today's rule) and any further information EPA may request to supplement Part 1 pursuant to section 308 of the CWA. Moreover, any concerns that a general permit may be based upon biased data can be dealt with in the public permit issuance process.

Finally, EPA also does not agree that the group application option violates the Administrative Procedures Act. Again, the group application scheme is simply a data gathering device. EPA could very well have determined to gather data informally via specific requests pursuant to section 308 of the CWA. In fact, general permit and effluent limitations guideline development proceed along these lines. It would make little sense if the latter informal data gathering process were somehow illegal simply because it is set forth in a rule that allows applicants some relief upon certain showings. In this respect, several of EPA's existing regulations similarly allow an applicant to be relieved from certain data submission requirements upon appropriate demonstrations. For example, testing for certain pollutants and or certain outfalls may be waived under certain circumstances. Most importantly, the operative action of concern that impacts on the public is actual general permit issuance based upon data obtained. As previously stated, ample opportunity for public participation is provided in the permit issuance proceeding.

7. Permit Applicability and Applications for Oil, Gas and Mining Operations

Section 401 of the WQA amended section 402(1)(2) of the CWA to prohibit the Director of the NPDES program from requiring permits for uncontaminated storm water discharges from oil and gas operations and from mining operations. In the near future, EPA intends to issue a notice that will codify this provision into 40 CFR 122.26(a)(2). Today's notice proposes to modify 40 CFR 122.26(a)(2) to clarify the scope of the provision.

As discussed in more detail earlier in today's notice, on March 18, 1976 (41 FR 11307), EPA promulgated permit application requirements for storm water discharges that were located in an urbanized area or that were from lands used for industrial or commercial activities that were contaminated by contact with materials or contaminated soils. The approach to regulating storm water discharges was modified on September 24, 1984 (49 *FR* 37998) which deleted the term "contaminated" and relied instead on geographic criteria which resulted in the same coverage (e.g., discharges meeting the geographic criteria were expected to meet the contaminated criteria).

Congress adopted a similar geographic criterion to generally define the scope of the first phases of the storm water program when enacting Section 405 of the WQA by requiring EPA to develop permit applications for storm water discharges associated with industrial activity and for discharges from municipal separate storm sewer systems serving populations of 250,000 or more or serving populations of 100,000 or more, but less than 250,000.

However, Section 401 of the WQA, amended Section 402(1)(2) of the CWA to provide that the Director shall not require a NPDES permit for storm water runoff from mining or oil and gas operations if the runoff is not contaminated by contact with, or does not come into contact with any overburden, raw material, intermediate product, finished product, byproduct or waste product located on the site. This provision relies on both a geographic criterion and a contamination criterion to define permit applicability.

The legislative history accompanying Section 402(1)(2) clarified that Congress intended that the factors considered in determining if storm water discharges from oil and gas operations are contaminated are different from the factors considered for storm water discharges from mining operations. Congress intended that for these discharges, if the storm water is "not contaminated by contact with such materials, as determined by the Administrator, permits are also not required. With respect to oil or grease or hazardous substances, the determination of whether stormwater is 'contaminated by contact with' such materials, as established by the Administrator, shall take into consideration whether these materials are present in such stormwater runoff in excess of reportable quantities under section 311 of the Clean Water Act or Section 102 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, or in the case of mining operations, above natural background levels." (Vol. 132 Cong. Rec. H10574 (daily ed. October 15, 1986) Conference Report).

a. Gas and Oil Operations. EPA is proposing that contaminated storm water from oil and gas operations includes, but is not limited to, runoff that contains a hazardous substance in excess of reporting quantities (RQs) established at 40 CFR 117.3 or 40 CFR 302.4; or contains oil in excess of the reporting quantity established at 40 CFR 110.3.

In order to implement the storm water permit requirements for oil and gas operations, the Agency is proposing to rely primarily on notification requirements for releases in excess of RQs established under the CWA and CERCLA to trigger the submittal of permit applications for storm water discharges from oil and gas operations. EPA is proposing that oil and gas operations which do not or have not in the past discharged storm water which contains an RQ of a hazardous substance or oil are not required to submit a permit application for such storm water discharges unless the Director requests a permit application on a case-by-base basis.

Oil and gas operations that have been required to notify the release of a RQ of either oil or a hazardous substance via a storm water route will be required to submit a permit application, including quantitative sampling data, in accordance with proposed § 122.26(c)(1)(iii). Oil and gas operations which have had a release via a storm water route in excess of an RQ will be required to obtain a NPDES permit even if the quantitative data submitted in the application does not indicate that the storm water discharge sampled contained a hazardous substance or oil in excess of a reportable quantity.

The proposal also provides the Director authority to require, on a case-by-case basis, operators of oil and gas operations which have certified that its discharge is not contaminated to submit a permit application. In addition, the Director may require an operator of an oil and gas operation to submit information regarding the storm water discharge under Section 308 of the CWA.

Based on a consideration of pollutants in a storm water discharge from an oil or gas facility, the Director may determine that the discharge is contaminated even though the discharge does not contain oil or a hazardous substance in amounts which exceeds an RQ. Also, RQs only serve as one guide in allowing the Director to determine if the discharge is contaminated. RQs have not been developed for some pollutants, such as suspended solids and other various indicator parameters (BOD, COD, pH,

etc.), which are not classified as oil or a hazardous substance.

b. Use of Reportable Quantities to Determine if a Storm Water Discharge from an Oil or Gas Operation Is Contaminated. Section 311(b)(5) of the CWA requires reporting of certain discharges of oil or a hazardous substance into navigable waters (see 44 FR 50766 (August 29, 1979)). Section 304(b)(4) of the Act requires that quantities of oil and hazardous substances that require notification be determined at quantities which may be harmful to the public health or welfare of the United States, including but not limited to fish, shellfish, wildlife, and public or private property, shorelines and beaches. Facilities which discharge oil or a hazardous substance in quantities equal to or in excess of an RQ, with certain exceptions, are required to notify the National Response Center (NRC).

Section 102 of CERCLA extended the reporting requirement for releases equal to or exceeding an RQ of a hazardous substance by adding chemicals to the list of hazardous substances, and by extending the reporting requirement (with certain exceptions) to any releases to the environment, not just those to navigable waters. Releases of oil are not addressed by the reporting requirements under CERCLA.

Pursuant to Section 311 of the CWA, EPA determined reportable quantities for discharges by correlating aquatic animal toxicity ranges with 5 reporting quantities, i.e. 1-, 10-, 100-, 1000-, and 5000-pounds per 24 hour period levels. Reportable quantity adjustments made under CERCLA relied on a different methodology. The strategy for adjusting reportable quantities begins with an evaluation of the intrinsic physical, chemical, and toxicological properties of each designated hazardous substance. The intrinsic properties examined, called "primary criteria", are aquatic toxicity, mammalian toxicity (oral, dermal, and inhalation), ignitability, reactivity, and chronic toxicity. In addition, substances that were identified as potential carcinogens have been evaluated for their relative activity as potential carcinogens. Each intrinsic property is ranked on a five-tier scale, associating a specific range of values on each scale with a particular reportable quantity value. After the primary criteria reportable quantities are assigned, the hazardous substances are further evaluated for their susceptibility to certain extrinsic degradation processes called secondary criteria. Secondary criteria consider whether a substance degrades relatively rapidly to a less harmful compound, and can be used to raise the primary criteria reportable quantity one level.

Also pursuant to § 311, EPA has developed a reportable quantity for oil, and associated reporting requirements at 40 CFR 110. These requirements, known as the oil sheen regulation, defines the RQ for oil to be the amount of oil that violates applicable water quality standards or causes a film or sheen upon or discoloration of the surface of the water or adjoining shorelines or causes a sludge or emulsion to be deposited.

Reportable quantities developed under the CWA and CERCLA were not developed as effluent guideline limitations which establish allowable limits for pollutant discharges to surface waters. Rather, a major purpose of the notification requirements is to alert government officials to releases of hazardous substances that may require rapid response to protect public health and welfare and the environment. Notification based on reportable quantities serves as a trigger for informing the government of a release so that the need for response can be evaluated and any necessary response undertaken in a timely fashion. The reportable quantities do not themselves represent any determination that releases of a particular quantity are actually harmful to public health or welfare or the environment.

In relying in today's proposal on the reporting requirements associated with releases in excess of RQs for oil or hazardous substances to trigger the submittal of permit applications for oil and gas operations, the Agency believes that the use of the reporting requirements for oil will be particularly useful. The Agency believes that the release of oil to a storm water discharge in amounts that cause an oil sheen is a good indicator of the potential for water quality impacts from storm water releases from oil and gas operations. In addition, given the extremely high number of such operations (the Agency estimates that there are over 750,000 oil wells alone in the United States), relying on the oil sheen test to determine if storm water discharges from such sites are "contammated" is more appropriate than sampling. The detection of a sheen does not require sophisticated instrumentation since a sheen is easily perceived by visual observation.

EPA requests comments on the use of reportable quantities for determining whether storm water from mining operations or oil and gas operations is contaminated. EPA is particularly concerned with the use of RQs to define contamination for storm water discharges from oil and gas operations.

c. Mining Operations. Today's notice proposes to clarify that contaminated storm water runoff from mining operations includes runoff which contains pollutants above natural background levels. When evaluating whether a storm water discharge from a mining operation contains contaminates above background levels, EPA will consider both contaminate concentrations and flowrates to estimate total pollutant loads. Concentration values alone are not sufficient to indicate whether a discharge contains contaminates above background levels. Development of land generally causes increased runoff volumes. Thus, even where concentrations of pollutants remain the same as during predevelopment, an increase in runoff volumes will result in increases in pollutant loadings.

EPA is proposing that operators of mining operations will be required to submit permit applications for storm water discharges from active and inactive mining areas (except for areas of coal mining operations meeting the definition of a reclamation area under 40 CFR 434.11[1]) and haul roads where storm water comes into contact with any overburden, raw material, intermediate products, finished product, byproduct or waste products. EPA is proposing at § 122.26(b)(12)(iii) to define storm water discharges from these areas of a mining operation as storm water discharges associated with industrial activity. Accordingly, the permit application requirements proposed at § 122.26(c)(1) will apply to these dischargers. Data in the permit application, and if necessary, other data required by the Director under Section 308 of the CWA, will be used to determine if the discharge contains contaminants above background levels, and therefore a permit is necessary. Mining operations with storm water discharges that are known to be contaminated may participate in appropriate group applications which comply with proposed § 122.26(c)(2).

8. Application Requirements for Construction Activities

As discussed above, EPA is proposing that storm water discharges from facilities classified as Standard Industrial Codes 15 and 16 (General building contractors and heavy construction contractors) (except construction operations that result in the disturbance of less than one acre total land area which are not part of a larger common plan of development or sale; or

operations that are for single family residential projects, including duplexes, triplexes, or quadruplexes, that result in the disturbance of less than five acre total land areas which are not part of a larger common plan of development or sale), be included in the regulatory definition of storm water discharges associated with industrial activity.

The Agency believes that storm water permits are appropriate for the construction industry for two reasons. First, runoff generated while construction activities are occurring have potential for serious water quality impacts. Where construction activities are intensive, the localized impacts of water quality may be severe because of high unit loads of pollutants, primarily sediments. Construction sites can also generate other pollutants such as phosphorus, nitrogen and nutrients from fertilizer, pesticides, petroleum products, construction chemicals and solid wastes. These materials can be toxic to aquatic organisms and degrade water for drinking and water-contact recreation. Sediment runoff rates from construction sites are typically 10 to 20 times that of agricultural lands, with runoff rates as high as 100 times that of agricultural lands, and 1,000 to 2,000 times that of forest lands. Even small construction sites may have a significant negative impact on water quality in localized areas. Over a short period of time, construction sites can contribute more sediment to streams than was previously deposited over several decades.

Techniques to control pollutants in storm water discharges from construction are well developed and understood. A primary control technique is good site planning. A combination of nonstructural and structural best management practices are typically used on construction sites. Relatively inexpensive nonstructural vegetative controls, such as seeding and mulching, are effective control techniques. In some cases, more expensive structural controls may be necessary, such as detention basins or diversions. The most efficient controls result when a comprehensive storm water management system is in place.

The second major reason for addressing storm water discharges from the construction industry at this time is that studies such as NURP indicate that it is much more cost effective to develop measures to reduce pollutants during new development. Many of these controls, which can take the form of grading patterns as well as other controls, generally remain in place after the construction activities are completed.

a. Permit Application Requirements. In today's notice, EPA is proposing distinct permit application requirements for these construction activities, at 122.26(c)(1)(ii). Under the proposal, such facilities will be required to provide a narrative description of:

- The nature of the construction activity;
- The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;
- Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a description of applicable Federal requirements and State or local erosion and sediment control requirements;
- Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a description of applicable State or local requirements;
- An estimate of the runoff coefficient (fraction of total rainfall that will appear as runoff) of the site and the increase in impervious area after the construction addressed in the permit application is completed, a description of the nature of fill material and existing data describing the soil or the quality of the discharge; and
- The name of the receiving water.

EPA is proposing that permit application requirements for the covered construction activities will not include the submission of quantitative data. EPA believes that the changing nature of construction activities at the site to be covered by the permit application requirements generally would not be adequately described by quantitative data.

The Agency specifically requests comments on today's proposed permit application requirements for construction facilities which discharge storm water associated with industrial activity, on appropriate measures to reduce pollutants in construction site runoff, and on appropriate application deadlines.

The application requirements proposed in today's notice are designed to provide flexibility in developing controls to reduce pollutants in storm water discharges from construction sites. The proposed application requirements recognize that many State and local governments have implemented erosion and sediment control programs. The permit application requirements requiring a description of these programs are intended to ensure consistency between NPDES permit requirements and other State and local controls.

b. Administrative Burdens. Ideally, model individual permits and general permits will be issued for storm water discharges for construction activities subject to NPDES requirements to minimize administrative delays associated with permit issuance. EPA requests comment on administrative burdens and delays associated with issuing NPDES permits for storm water discharges from certain construction activities. In addressing the administrative burdens of regulation, commenters should consider the proposed limitation on the definition of storm water discharge associated with industrial activity and the proposed regulatory scheme for storm water discharges associated with industrial activity which discharge to municipal separate storm sewer systems.

Proposed § 122.26(b)(12)(x) limits the definition of "storm water discharge associated with industrial activity" by exempting from the definition construction operations that result in the disturbance of less than one acre total land area which are not part of the larger common plan of development or sale; or operations that are for single family residential projects, including duplexes, triplexes, or quadruplexes, that result in the disturbance of less than five acre total land areas which are not part of a larger common plan of development or sale. In considering the appropriate scope of the definition of storm water discharge associated with industrial activity as it relates to construction activities, EPA recognizes that a wide variety of factors can affect the water quality impacts associated with construction site runoff, including receiving waters, the size of the area disturbed, soil conditions, seasonal rainfall patterns, the slope of area disturbed, and the intensity of construction activities.

EPA favors the one acre/five acre limit primarily because of administrative concerns. EPA recognizes that State and local sediment and erosion controls may address construction activities disturbing less than one acre or five acres for residential development. The one acre/five acre limit proposed in today's notice is not intended to supersede more stringent State or local sediment and erosion controls. For construction facilities that are not included in the definition of storm water discharge associated with industrial activity, EPA will consider the appropriate procedures and methods to

reduce pollutants in construction site runoff under the studies authorized by section 402(p)(5) of the CWA. EPA will also consider under section 402(p)(5) appropriate procedures and methods during post-construction for maintaining structural controls developed pursuant to NPDES permits issued for storm water discharges associated with industrial activity from construction sites.

EPA favors distinguishing between single family residential development and other commercial development because other commercial development is more likely to occur in more densely developed areas. Also, other commercial development provides a more complete opportunity to develop controls that remain in place after the construction activity is completed, as continued maintenance, after the permit has expired, is more feasible.

EPA requests comments on the use of no limit or other limits such as 2, 10 or 20 acres. In addition, limitations could be based on or modified by other factors. Time limitations which consider the length of the construction activity or the season during which the activity occurs may provide a more workable administrative system while still addressing the major water quality impacts associated with construction activities. Other factors, such as steep slopes at the site, which affect the nature of the runoff, may be appropriate for defining special cases which would be addressed in this rulemaking. EPA also requests comments on other factors, such as the intensity of the development within the watershed, which affect the water quality impacts in receiving waters. Such site specific factors may be difficult to define in federal regulations. For example, a definition based on relatively easily interpreted criteria such as Census designated urban areas may not provide adequate protection for rapidly developing areas which are located outside the urban area. EPA requests comments on other factors which can be used to develop a limit on storm water discharges from construction sites which are classified as storm water discharges associated with industrial activity.

Proposed 122.26(a) would specify that storm water discharges, including construction site runoff, that discharge to municipal storm sewers are not required to obtain individual or group permits unless specifically designated by the Director. Under today's proposal, municipal permittees will be responsible for developing a proposed management plan to control pollutants in runoff from construction sites which discharge to large and medium municipal separate storm sewer systems (see § VII.G.8.d of the preamble). The Agency believes that the majority of construction sites do not discharge storm water directly to waters of the United States, but rather discharge to a municipal storm sewer or manage storm water on-site. For example, construction site runoff from a new subdivision which discharges to the drainage system of an existing road or a road that is being built by a developer for a municipality is, under this proposal, discharging to a municipal storm sewer.

9. Application Requirements for New Sources and New Discharges

Today's proposed permit application requirements provide that new sources and new discharges which discharge storm water include estimates of pollutants or parameters for which other storm water discharges are required to submit data. Under the proposal, operators of such discharges are required to provide the quantitative data which is required for other similar existing storm water discharges within two years after the commencement of the discharge, unless the data has already been reported under the monitoring requirements of the NPDES permit for the discharge.

F. Municipal Separate Storm Sewer Systems

1. Municipal Separate Storm Sewers

Today's notice proposes to define "municipal separate storm sewer" at § 122.26(b)(8) as any conveyance or system of conveyances that is owned or operated by a State or local government entity and is used for collecting and conveying storm water which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

It is important to note that the proposed permit application requirements for discharges from municipal reparate storm sewers do not apply to discharges from combined sewers that are designed as both a sanitary sewer and a storm sewer. Discharges from combined sewer systems are not regulated under this proposed rule.

The Agency also wants to clarify that streams, wetlands and other water bodies that are waters of the United States are not storm sewers for the purpose of this rule. This use of the term "storm sewer" differs from the way that the term has often been used in the context of flood control, where natural streams and other water bodies are sometimes considered storm sewers. Activities such as stream channelization, and stream bed stabilization, which occur in waters of the United States would generally not be subject to permits issued under § 402 of the CWA. However, such activities occurring within waters of the United States may be subject to dredge and fill permits required under section 404 of the CWA by the Corps of Engineers. Applicants should consult the regulatory definition of "waters of the United States" at 40 CFR 122.2 to distinguish between storm sewers and waters of the United States.

Some municipalities have maintained in previous comments that difficulties may arise with determining owners or operators of municipal storm sewers as clear title to the storm sewer may not exist. Often, where the ownership of such conveyances is in question, the storm sewer is not maintained and hence an "operator" criteria is not particularly useful. EPA requests comments on different wording for the definition of municipal separate storm sewer to clarify responsibility under the NPDES permit system. Do legal classifications such as storm sewers that are not private (e.g., public, district or joint district sewers) provide a clearer definition than an owner or operator criteria? Does the definition need to be clarified by explicitly stating that municipal streets and roads with drainage systems (curb and gutter, ditches, etc.) are part of the municipal storm sewer system, and the owners or operators of such roads are responsible for such discharges? To what extent should the owner or opesator concept apply to municipal governments with land-use authority over lands which contribute storm water runoff to the municipal storm sewer system, and how should this responsibility be clarified?

2. Effective Prohibition on Non-Storm Water Discharges

Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers.

EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather, an "effective prohibition" would require separate NPDES permits for non-storm water discharges to municipal storm sewers. In many cases in the past, applicants for NPDES permits for process wastewaters and other non-

storm water discharges have been granted approval to discharge into municipal separate storm sewers, provided that the permit conditions for the discharge are met at the point where the discharge enters into the separate storm sewer. Permits for such discharges must meet applicable technology-based and water-quality based requirements of Sections 402 and 301 of the CWA. If the permit for a non-storm water discharge to a municipal separate storm sewer contains water-quality based limitations, then such limitations should generally be based on meeting applicable water quality standards at the boundary of a State mixing zone (for States with mixing zones) located in a water of the United States. Water-quality based limitations would also generally be established during dry weather conditions, when the discharge would not be mixed with storm water in the municipal separate storm sewer (unless receiving water conditions during wet weather dictate more stringent water-quality based limitations).

The legislative history to Section 405 of the WQA supports EPA's interpretation of the non-storm water prohibition. Senator Durenberger stated that the prohibition on non-storm water discharges into municipal separate storm sewers provision applies to non-storm water discharges to municipal separate storm sewers that are currently illegal under the Act (Vol. 133 Cong. Rec. S752 (daily ed. January 14, 1987)). By stating that the provision applies to discharges that are currently illegal, it is clear that Senator Durenberger intended that the effective prohibition apply to non-storm water discharges without NPDES permits, which have been illegal under the CWA since 1972.

The Agency believes that the effective prohibition does not apply to discharges with separate NPDES permits because there would be no additional treatment or environmental benefit from constructing a new sewer line discharging into the same receiving water. If the discharge was not directed into a new discharge line, it might be forced into a Publicly Owned Treatment Works (POTW). However, certain discharges, such as high volumes of non-contact cooling water, may decrease the overall treatment efficiency of the POTW without notable treatment benefits for the cooling water. Overall, the quality of the receiving water is not likely to be improved by installing new discharge lines.

All options will be considered when an applicant applies for a NPDES permit for a non-storm water discharge to a municipal separate storm sewer. In some cases, permits will be denied for discharges to storm sewers that are causing water quality problems in receiving waters. However, not all discharges present such problems, and in these cases EPA or State permit writers may allow such discharges to municipal separate storm sewers within appropriate permit limits.

Today's notice proposes two permit application requirements that are designed to begin to implement the effective prohibition. The first proposed requirement, discussed in § VII.G.6.a, addresses a screening analysis which is intended to provide sufficient information to develop priorities for a program to detect and remove illicit discharges. The second provision, discussed in § VII.G.7.b, requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems.

Conveyances which continue to accept other "non-storm water" discharges (e.g., discharges without an NPDES permit) do not meet the definition of municipal separate storm sewer, and are not subject to section 402(p)(3)(B) of the CWA unless the non-storm water discharges are issued separate NPDES permits. Instead, conveyances which continue to accept non-storm water discharges which have not been issued separate NPDES permits are subject to section 301 and 402 of the CWA. For example, combined sewers which convey storm water and sanitary sewage are not separate storm sewers and must comply with permit application requirements at 40 CFR 122.21 as well as other regulatory criteria for combined sewers.

3. Site-Specific Storm Water Quality Management Programs for Municipal Systems

Today's notice proposes fundamental changes to EPA's approach to control the discharge of pollutants from municipal separate storm sewers. Prior to the enactment of the WQA, NPDES permits for such discharges were required to meet all applicable provisions of section 402 and section 301 of the CWA. The WQA amended this requirement by adding section 402(p)(3)(iii) to the CWA which mandates that permits for discharges from municipal separate storm sewers shall require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP), including management practices, control techniques and systems, design and engineering methods, and such other provisions as the Director determines appropriate for the control of such pollutants.

When enacting this provision, Congress was aware of the difficulties in regulating discharges from municipal separate storm sewers solely through traditional end-of-pipe treatment and intended for EPA and NPDES States to develop permit requirements that were much broader in nature than requirements which are traditionally found in NPDES permits for industrial process discharges or POTWs. As Senator Stafford explained, municipal storm sewer system "permits will not necessarily be like industrial discharge permits. Often, an end-of-the-pipe treatment technology is not appropriate for this type of discharge. As an EPA official explained in a meeting of the conferees:

> These are not permits in the normal sense we expect them to be. These are actual programs. These are permits that go far beyond the normal permits we would issue for an industry because they in effect are programs for stormwater management that we would be writing into these permits." (Vol. 132 Cong. Rec. S16425 (daily ed. Oct. 16, 1986))

A shift towards comprehensive storm water quality management programs to reduce the discharge of pollutants from municipal separate storm sewer systems is appropriate for a number of reasons. First, discharges from municipal storm sewers are highly intermittent, and are usually characterized by very high flow rates occurring over relatively short time intervals. For this reason, municipal storm sewers are usually designed with an extremely high number of outfalls within a given municipality, to reduce potential flooding. Traditional end-of-pipe controls are limited by material management problems that arise with high volume, intermittent flows occurring at a large number of outfalls.

Second, the nature and extent of pollutants in discharges from municipal systems will depend on the activities occurring on the lands which contribute runoff to the system. Municipal separate storm sewers tend to discharge runoff drained from lands used for a wide variety of activities. Given the material management problems associated with end-of-pipe controls, management programs that are directed at pollutant sources are often more practicable than relying solely on end-of-pipe controls.

In past rulemakings, much of the criticism of the concept of subjecting discharges from municipal separate storm sewers to the NPDES permit

program focused on the perception that the rigid regulatory program applied to industrial process waters and effluents from public sewage treatment plants was not appropriate for the site-specific nature of the sources which are responsible for the discharge of pollutants from municipal storm sewers.

The water quality impacts of discharges from municipal separate storm sewer systems depends on a wide range of factors including: the magnitude and duration of rainfall events, the time period between events, soil conditions, the fraction of land that is impervious to rainfall, land use activities, the presence of illicit connections, and the ratio of the storm water discharge to receiving water flow. In enacting Section 405 of the WQA, Congress recognized that permit requirements for municipal separate storm sewer systems should be developed in a flexible manner to allow site-specific permit conditions to reflect the wide range of impacts that can be associated with these discharges. The legislative history accompanying the provision explained that "[p]ermits for discharges from municipal separate stormwater systems * * * must include a requirement to effectively prohibit non-stormwater discharges into storm sewers and controls to reduce the discharge of pollutants to the maximum extent practicable. * * * These controls may be different in different permits. All types of controls listed in subsection [(p)(3)(C)] are not required to be incorporated into each permit" (Vol. 132 Cong. Rec. H10576 (daily ed. October 15, 1986) Conference Report). Consistent with the intent of Congress, EPA intends to develop permit application requirements that are sufficiently flexible to allow the development of site-specific permit conditions.

4. Large and Medium Municipal Storm Sewer Systems

Earlier regulatory efforts addressing NPDES permit requirements for storm water discharges required permits for discharges from municipal separate storm sewers located in urbanized areas that were designated by the Census Bureau. The Census Bureau defines urbanized areas to provide a description of the separation of urbanized and rural population and housing in the vicinity of large cities. A designated urbanized area consists of a central city or cities and surrounding closely settled territory or "urban fringe". Urbanized areas comprise an incorporated place and adjacent densely settled surrounding area that together have a minimum population of 50,000. However, for a number of reasons, the NPDES permit program for municipal separate storm sewers was not successfully implemented.

During the reauthorization of the CWA, Congress intervened by reaffirming its intent to establish a permit program for municipal separate storm sewers and establishing phased deadlines for its implementation. The amended CWA establishes priorities for EPA to develop permit application requirements and issue permits for discharges from three classes of municipal separate storm sewer systems. The WQA requires that NPDES permits be issued for discharges from large municipal separate storm sewer systems (systems serving a population of more than 250,000) by no later than February 4, 1991. Permits for discharges from medium municipal separate storm sewer systems (systems serving a population of more than 100,000, but less than 250,000) must be issued by February 4, 1993. After October 1, 1992, the permit requirements of the CWA are restored for all other discharges from municipal separate storm sewers.

The priorities established in the Act are based on the size of the population served by the system because, in general, discharges from municipal separate storm sewers located in municipalities with higher populations are thought to present a higher potential for contributing to adverse water quality impacts. NURP and other studies have verified that the event mean concentration of pollutants in urban runoff from residential and commercial areas remains relatively constant from one area to another, indicating that pollutant loads from urban runoff strongly depend on the total area of developed land, which in turn is related to population.

The term "municipal separate storm sewer system" is not defined by the Act. By not defining the term, Congress intended to provide EPA discretion to define the scope of municipal systems consistent with the objectives of developing site-specific management programs in permits to reduce pollutants in discharges from municipal separate storm sewer systems.

In evaluating options for defining large and medium municipal separate storm sewer systems, EPA will consider:

- The inter-jurisdiction complexities associated with municipal governments;
- The fact that many municipal storm water management programs have traditionally focused on water quantity concerns, and have not evaluated water quality impacts of system discharges or developed measures to reduce pollutants in such discharges;
- The advantages of developing system-wide storm water management programs for municipal systems;
- The geographic basis necessary for planning of comprehensive management programs to reduce pollutants in discharges from municipal separate storm sewers to the maximum extent practicable;
- The geographic basis necessary to provide flexibility to target controls on areas where water quality impacts associated with discharges from municipal systems are the greatest and to provide an opportunity to develop cost-effective controls;
- Need to establish a reasonable number of permits for municipal systems during the initial phases of program development that will provide an adequate basis for a storm water quality management program for over 13,000 municipalities after the October 1, 1992 general prohibition on storm water permits expires; and
- Congressional intent to allow the development of jurisdiction-wide, comprehensive storm water management programs with priorities given to the most heavily populated areas of the country.

a. Geographic Basis for Developing Storm Water Quality Management Programs for Developed Areas. Municipal storm sewer systems are installed to provide drainage for developed lands. In larger urbanized areas, extensive development continues beyond the boundaries of individual incorporated cities and towns. The concentration of many pollutants in discharges from municipal separate storm sewers are often low relative to many industrial process and POTW discharges. However, where a widespread area supports a high population, the cumulative impact of pollution loads associated with discharges from many municipal separate storm sewers can have significant water quality impacts. Where water quality impacts are associated with discharges from municipal storm sewer systems, the opportunity to develop appropriate controls must be related to the pollution source.

Most larger urbanized areas in the country are comprised of one or more core cities surrounded by urbanized areas outside of the city boundaries. Often, the population which resides outside of the core cities greatly exceeds the population which resides within the core cities' boundaries. Generally, the core areas have experienced development earlier than surrounding areas, with most new development occurring outside of the boundaries of

the core cities. For urbanized areas which follow this model, it may often be practicable to emphasize different aspects of a comprehensive storm water quality management program to reduce pollutants in discharges from separate storm sewers in different parts of the urbanized area.

Problems associated with illicit discharges of non-storm water to municipal separate storm sewers are generally expected to be more severe in areas which have undergone extensive development prior to the enactment and implementation of ordinances and other controls which prohibit illicit discharges to separate storm sewers. In these areas, identification and removal of illicit discharges provides opportunities for dramatic improvements in the quality of discharges from separate storm sewers.

In heavily developed areas, the opportunities for municipalities to implement some types of controls to reduce pollutants in municipal separate storm sewer discharges may be limited by the scarcity of land for controls, the high cost of retrofitting and institutional constraints. Areas of new development offer municipalities a more practicable opportunity to reduce pollutants in storm water discharges for a number of reasons. First, land is more readily available for structural controls such as detention and retention devices, which when incorporated into the design of a developing area can often offer multipurpose amenities to the development and may raise the value of the development. Second, other controls such as grass swales and grading patterns can be more easily implemented during the initial phases of development. Also, programs such as those in Florida and Maryland have focused on controls on new development because the storm water program can be administratively coordinated with other administrative procedures associated with new development such as subdivision, grading or building approvals.

Ideally, storm water quality management controls should be planned, developed, and coordinated on a watershed basis. This is true because pollutants in discharges from municipal storm sewer systems can come from diffuse sources over a wide area and a comprehensive pollutant control program is often needed to adequately protect receiving water quality. This geographical approach to water quality management has been identified as a key element to success in reducing pollutant discharges associated with urban runoff. Also, watershed planning allows priorities to be evaluated as part of a comprehensive assessment of all pollutant sources (all point and non-point sources) to the receiving water and the physical nature of the receiving water. Finally, many storm water pollution controls also control peak flow rates. These measures to control water quality should be coordinated with water quantity control measures. For example, retention basins which discharge into the lower portions of a watershed may create larger peak flows in small or medium-sized rivers and streams by delaying discharges in the lower portion of the watershed to coincide with increased flows caused by runoff in the upper portions of the watershed. The increased peak flows may cause flooding problems or accelerate flow velocities which can accelerate stream-bank and stream-bed erosion. In this manner, situations where controls which affect the rate of flow have adverse impacts on downstream water quality can be avoided.

Unfortunately, several administrative burdens are associated with defining, for the purpose of implementing the WQA, municipal storm sewer systems on a watershed basis. First, it is difficult to accurately estimate the population served by a given watershed. Second, watersheds do not follow political boundaries, thereby creating administrative difficulties in developing basin-wide control programs. Finally, it is difficult to establish an objective definition for the appropriate size of watershed basins, as smaller streams combine to form larger ones. The EPA requests comments on the use of watershed boundaries to define large and medium municipal separate storm sewer systems. Although the Agency does not prefer this option for large and medium systems, the Agency does favor incorporating watershed planning concepts and controls into the permit application requirements proposed in today's notice, and ultimately into permits for municipal separate storm sewer systems. As discussed in more detail later in today's notice, the permit application requirements proposed in today's notice encourage that, where practicable, management plans be developed which are consistent with the nature of the watershed. EPA requests comments on adapting the permit application requirements discussed in today's notice to accommodate the development of management programs based on a watershed basis.

b. Municipal Governments. A wide range of municipal entities may have primary responsibility for municipal storm sewers, including cities, towns, counties, flood control districts, and State Departments of Transportation. These municipalities perform a wide variety of other functions and are delegated a wide variety of legal authority by the State in which they are located. The potential role of various municipalities in reducing pollutants in discharges from municipal separate storm sewers will vary greatly as reflected by the nature of the pollution problem and the legal authority, functions, and administrative and financial capabilities of the municipality.

As discussed above, in larger urbanized areas, water quality impacts associated with diffuse sources contributing pollutants to discharges from municipal separate storm sewers will extend beyond the boundaries of core cities. In these areas, it is possible that a significant number of municipalities may own or operate municipal separate storm sewers.

Section VII.G.2 of this preamble provides a proposed strategy for developing storm water quality management programs for reducing pollutants in discharges from municipal separate storm sewers through NPDES permits. The components of the storm water quality management programs discussed in today's notice can be divided into two general categories. The first category is comprised of measures that do not require the use of police powers to implement. These components include source identification measures associated with mapping, characterizing discharges by estimating flow rates, pollutant concentrations, pollutant loadings, sampling discharges and identifying illicit connections, and implementing certain controls to reduce pollutants such as public education measures to encourage proper oil disposal or recycling or proper pesticide use. This category also includes activities such as maintaining the separate sewers, and design and engineering methods such as designs for new roads to minimize curb and gutter storm water collection systems. Municipal dischargers generally will not lack legal authority to implement these components of the storm water quality management program.

The second category is comprised of measures that generally may require municipal police powers to implement. Examples of these types of controls include reducing pollutants in construction site or industrial site runoff which discharges to municipal separate storm sewers. The police power required to implement these provisions can take a variety of forms including the power to

develop and enforce ordinances, contracts, orders or similar means.

The municipal entity with primary control over a storm sewer may not have sufficient police powers to implement all aspects of a comprehensive storm water quality management plan. In such cases, a combination of municipal entities may be required in order to guarantee sufficient legal authority, financial capability and administrative capability to implement all components of a storm water quality management program. The degree to which municipalities without sufficient police powers are addressed is a major difference between the options presented below for defining large and medium municipal separate storm sewer systems.

C. Options Considered. EPA requests comments on a number of options for defining large and medium municipal separate storm sewer systems. Generally, the options on which EPA is requesting comments can be classified into two categories. The first category of options, listed below as Options 1, 2, 3, and 4 would define municipal systems in terms of the municipal entity which owns or operates storm sewers. The second category of options would define municipal systems on a geographic basis. With Options 5, 6, and 7, all municipal separate storm sewers within the specified geographic area would be part of the municipal system, regardless of which municipal entity owns or operates the storm sewer.

EPA favors those options for defining municipal separate storm sewer systems that rely primarily on the municipal entity which owns or operates or otherwise has jurisdiction over storm sewers. These options are preferred because they will lessen the administrative complexities of initially developing the permit program for discharges from municipal separate storm sewers by decreasing the number of municipal entities which will initially be subject to the permit program.

EPA requests comments on a wide range of options. The Agency will use the comments received on the various options when developing a final regulation defining large and medium municipal separate storm sewer systems. In addition, the Agency believes that in certain circumstances, comments received on the various options will be beneficial when developing strategies for designating municipal separate storm sewers on a system-wide basis under section 402(p)(2)(E) of the CWA for a permit prior to promulgation of final permit application regulations or prior to development of additional regulations under section 402(p)(6) of the CWA.

Also, EPA intends to consider those municipal separate storm sewers which are ultimately not included in the definition of large and medium separate storm sewer systems, along with other municipal storm sewers, in the studies mandated under section 402(p)(5) of the CWA for appropriate regulation after October 1, 1992 under section 402(p)(6) of the Act. Comments received during this rulemaking, along with other information, will constitute a portion of the section 402(p)(5) study. Therefore, EPA requests comments on the appropriateness of all options for study under section 402(p)(5), and on corresponding procedures and methods to reduce pollutant in discharges from municipal separate storm sewer systems described in each option that would be appropriate as regulations under section 402(p)(6). EPA will, where appropriate, consider today's request for comments on the discharges from those municipal separate storm sewers identified in the various options for defining municipal systems as a proposal for regulation under section 402(p)(6) and establish appropriate regulations (for example, the final regulation may define large and medium municipal separate storm sewer system as proposed in Option 1, and also promulgate permit application requirements for counties with a population of 100,000 or more in unincorporated areas (see Option 3) under section 402(p)(6) with a later date for permit application submittal).

It should be noted that discharges from municipal separate storm sewer systems that are not included in the final regulatory definition of large or medium municipal separate storm sewer system may still be required to obtain an NPDES permit if they are determined, under section 402(p)(2)(E) of the CWA, to be a significant contributor of pollutants or to be contributing to a violation of a water quality standard (see § 122.26(a)(1)(v) of the proposed regulation). The Agency is considering the use of the section 402(p)(2)(E) authority to determine the appropriate scope of large or medium municipal separate storm sewer systems on a case-by-case basis (see Option 2 below).

The Agency prefers to use different criteria to determine the appropriate scope of large or medium municipal separate storm sewer systems on a case-by-case basis (see Option 1 below).

The Agency also requests comments on whether non-municipal, non-industrial storm water discharges (e.g., storm water discharges from Federal facilities without industrial activities) that have been determined to be significant under section 402(p)(2)(E) should be addressed as part of a large or medium municipal separate storm sewer system.

In addition, the Agency requests comments on providing municipalities with an opportunity (see proposed § 122.26(f)(3)), to submit a petition to adjust the Census estimates of the population of the municipality to account for storm water discharges to combined sewers. The Agency prefers that storm water discharges to combined sewers be addressed in permits issued for discharges from combined sewer overflows (CSOs) and from publicly owned treatment works (POTWs).

Option 1: Systems Owned or Operated by Incorporated Places Augmented by Potential Inclusion of Interrelated Discharges. EPA proposes that the definition of large and medium municipal separate storm sewer system include those municipal separate storm sewers owned or operated by "incorporated places" with a population which exceeds the appropriate limit. (EPA is proposing to define the term "incorporated place" at 40 CFR 122.26(b)(3) to include the District of Columbia, or a city, town or village that is incorporated under the laws of the State in which it is located. The proposed term "incorporated place" does not include county governments, and certain other municipal entities such as flood control districts, and sewer districts.)

The Agency believes that this approach would provide for the initial development of core storm water management programs in the largest cities in the Nation. The Census Bureau estimates for 1986 indicate that 60 incorporated places have populations of more than 250,000 and that 122 places have populations of more than 100,000 but less than 250,000. The Agency recognizes that many of these cities currently do not have comprehensive programs to address storm water quality. In addition, most of the NPDES States and EPA Regions have limited experience in addressing storm water quality management in the comprehensive manner that is envisioned in this rulemaking. Because of the relative newness of the storm water NPDES program for discharges from municipal systems, the Agency anticipates that, generally, more resources will be needed to begin to implement the initial phases of the program, and therefore, Option 1 provides a reasonable and realistic basis for the initial phases of

development of this program. In addition, this option provides the maximum flexibility for EPA to continue to study the appropriate manner to expand the NPDES program after October 1, 1992 for discharges from municipal separate storm sewers. In this manner, additional flexibility to develop requirements which are tailored to the legal nature and capabilities of various municipalities will be provided.

Option 1 focusses primarily on discharges from municipal separate storm sewer systems that are owned or operated by one municipality, an "incorporated place" with a population of 250,000 or more, or of 100,000 or more. However, in many cases, discharges from municipal separate storm sewers owned or operated by "incorporated places" with a population of 250,00 or more, or of 100,000 or more, will have interrelated impacts and be otherwise interrelated (but not necessarily physically interconnected) to discharges from municipal separate storm sewers owned or operated by municipal entities *other than* an "incorporated place" with a population of 250,000 or more, or 100,000 or more. Wide differences in the physical nature and in water-quality impacts can be expected between drainage systems of various developed areas, as well as differences in the legal authorities and jurisdictions associated with municipalities responsible for storm water discharges.

EPA prefers the Director of the NPDES program make case-by-case decisions on the total scope of each large and medium municipal separate storm sewer system. The Agency is proposing that the definitions of large and medium municipal separate storm sewer system provide for case-by-case designation of interrelated discharges from municipal separate storm sewers that are owned or operated by municipal entities *other than* an "incorporated place" with a population of 250,000 or more, or 100,000 or more based on a discretionary consideration of: the physical interconnections between the municipal separate storm sewers; the location of discharges; the quantity and nature of pollutants discharged; the nature of the receiving waters; or other relevant factors (see proposed § 122.26(b)(4)(ii) and (7)(ii)). For example, discharges from separate storm sewers associated with a State highway running through an "incorporated place" with a population of over 100,000 along with discharges from separate storm sewers owned by the "incorporated place" may adversely impact a stream. In such a case, the Director may consider designating the discharge from the State highway as *part* of the municipal separate storm sewer system serving that "incorporated place".

Accordingly, the proposed definitions of the terms large and medium municipal separate storm sewer system are intended to provide, within the definitions themselves, a flexible and administratively simple way for the Director to decide, on a case-by-case basis, whether and how to include other relevant "interrelated" municipal discharges (for example, discharges from one or more other adjacent smaller municipalities' separate storm sewers systems) into each large or medium municipal separate storm sewer system for NPDES permitting purposes. The approach in the proposed definitions would not require the Director to first determine that the smaller municipality's discharge meets the standard of section 402(p)(2)(E).

Thus, under Option 1, a consideration of location-specific factors would provide flexibility to establish the appropriate total scope of each "municipal separate storm sewer system". In addition, this approach may reduce the burden on some municipalities designated into the "system" when they participate, with the "incorporated place" whose storm sewers are the core of the same system in the development of a single system-wide permit application.

The municipality to be designated into the NPDES-regulated "system" on this basis would not have to meet any criteria for size of population.

EPA requests comments on the appropriate criteria and procedures for designating other municipalities into the large and medium municipal separate storm sewer systems on a case-by-case basis.

Option 2: Systems Owned or Operated by Incorporated Places Augmented by Including Other Municipal Discharges Determined to be Significant Under Section 402(p)(2)(E) Authority. This Option is similar to Option 1, in that it would focus primarily on discharges from municipal separate storm sewer systems that are owned or operated by one municipality, an "incorporated place" with a population of 250,000 or more, or of 100,000 or more. However, this option would differ in the approach to addressing interrelated municipal separate storm sewer discharges from multiple municipalities.

Under Option 2, a discharge from a municipal separate storm sewer that is owned or operated by a municipal entity *other than* an incorporated place with a population of 250,000 or more or a population of 100,000 or more, but less than 250,000, could be designated as *part* of the large or medium municipal separate storm sewer system if the Director of the NPDES program determines that the discharge is contributing to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. Such a determination could be based on the consideration of: the location of the discharge with respect to waters of the United States; the size of the discharge; the quantity and nature of the pollutants discharged to waters of the United States; and other relevant factors (see § 122.26(a)(1)(v)(A)–(D) of the proposed regulation).

This option provides different designation criteria and standards and less administrative flexibility than the designation process described in Option 1. Option 2 would still allow consideration of location specific factors, but would establish a more stringent threshold which must be met before expanding the scope of a large or medium municipal separate storm sewer system on a case-by-case basis.

Municipalities included in the NPDES-regulated "system" on the basis of section 402(p)(2)(E) would not have to meet any specific criteria based on size of population.

As in Option 1, Option 2 may reduce the burden on some municipalities deemed to be part of the large or medium municipal separate storm sewer system when they participate, with the "incorporated place" whose storm sewers are the core of the same "system", in the development of a single system-wide permit application.

EPA request comments on the appropriate criteria and procedures for making case-by-case determinations of the scope of large and medium municipal separate storm sewer systems using the § 402(p)(2)(E) authority.

Option 3: Systems Owned or Operated by Counties. In most States, the primary divisions of the State are counties. In Louisiana, the primary divisions are parishes. In Alaska, the State is divided into organized or unorganized boroughs.

The importance of a county in the government structure of a State varies greatly from State to State. In some western and southern States, counties are divided into townships for limited administrative purposes. In these States, the county is the basic unit of government. In a group of States extending from New York and New Jersey into the Mid-West, the entire county may be divided into townships. In other States, the county is divided

into incorporated and unincorporated areas, with the importance of the county government varying throughout the county. Generally, counties have an important role in highway construction and maintenance (the Census Bureau estimates that, nation-wide, counties are responsible for 32 percent of the expenditures of local governments made for highways), and may assume other responsibilities for drainage.

EPA requests comments on extending the definition of large and medium municipal separate storm sewers to include, in addition to municipal separate storm sewer systems owned or operated by an incorporated place with a population equal to, or exceeding the appropriate limit, storm sewers that are owned or operated by a county government entity in counties with the appropriate population. Under this approach, municipal separate storm sewers owned or operated by cities, towns, townships, boroughs and other municipal entities with a population of less than 100,000 within the county would not be defined as part of the county system.

As discussed above, the legal authority of county governments will vary from State to State, and in many counties may vary throughout the county. To successfully implement this approach with respect to county owned or operated separate storm sewers, permits will have to incorporate storm water quality management programs which would reflect and be compatible with the variations in the county government's legal authority. Thus, the requirements in the management program may vary to reflect the legal authority of the county in a given location. For example, in unincorporated areas of the county, where the county is the primary municipal entity, the storm water quality management program may have all of the appropriate components that are discussed in today's notice. However, in certain areas of the county with incorporated places with a population of less than 100,000, the permit may only address control measures which do not require legal authority to implement (see above).

Census estimates for 1986 indicate that 185 counties have populations of 250,000 or more, while 225 counties have populations of 100,000 or more, but less than 250,000. After considering the number of permits that would be initially required under this option, along with the extensive surface area covered by the combined counties, the Agency believes that this option is not practicable for the initial phases of program development. Rather than addressing all counties with a population of 250,000 or more or between 100,000 and 250,000, many of which encompass extensive rural areas, in the initial phases of program development the Agency will consider various alternatives for establishing the size of the population which is served by the county.

EPA also requests comment on basing the definition of the population served by the municipal storm sewer system on the population of a county which resides within urbanized areas that have been defined by the Census Bureau. This system of measuring populations would provide a means to establish priorities for counties based on the amount of urban developed land in the county. Although all municipal storm sewers owned or operated by an applicable county would be part of the municipal separate storm sewer system, and would be subject to permit requirements, measures to reduce pollutants to the maximum extent practicable would be focused on where water quality improvements are needed, i.e., on the most heavily populated areas of the county and on industrial lands, which are generally expected to cause more water quality impacts.

EPA also requests comment on defining the population served by the county owned or operated municipal storm sewer system as that population of the county which resides outside of incorporated areas of the county. This approach would focus on counties with high populations in unincorporated areas, because these counties would be assumed to generally have greater legal authority, and financial capability for developing and implementing a storm water quality management program. This approach assumes that, in unincorporated areas of a county with a high population, the county government is the functional equivalent of an incorporated government.

Option 4: Systems Owned and Operated by States. Each State has an extensive separate storm sewer system that drains State highways. EPA requests comments on, in addition to other systems of municipal storm sewers, all separate storm sewers associated with State highways should constitute a single system. This approach may simplify the permit application and issuance process for State Departments of Transportation and for the permit issuing agency by consolidating all State highways into one system. In addition, this approach provides a basis for consistent regulation of municipal separate storm sewers associated with State highways which would allow priorities to be established on a consideration of the entire State system. EPA is considering this option in conjunction with other options (for example, EPA could define large municipal separate sewer systems to include municipal storm sewers described in Option 1 and Option 4).

Option 5: Incorporated Place Boundaries. Within the boundaries of an incorporated place, in addition to the storm sewer owned or operated by the incorporated place, some municipal separate storm sewers may be operated by county agencies, State agencies, flood control districts or sewer districts.

Option 5 differs from Option 1 in that all municipal separate storm sewers within an incorporated place with an appropriate population would always be part of the municipal system, instead of beginning with only those municipal storm sewers owned or operated by the incorporated place. Where multiple agencies within a single jurisdiction have storm water management responsibilities, the Agency would consider appropriate interagency agreements to ensure the development of comprehensive control programs and the development of permit conditions which may, for a given discharge, require one municipal entity to implement one set of controls which require police power to implement and another municipal entity to implement a different set of controls which pertain to the operation of the storm sewer.

This approach would create some additional complexity to the initial phases of development of the NPDES storm water program by increasing the scope of the program to include additional municipal permittees. Option 5 would also provide for case-by-case designations as discussed under Option 1 for interrelated discharges from municipal separate storm sewers outside of the incorporated place with a population of 250,000 or more, or of 100,000 or more.

However, the basis of the Option 5 approach would ensure that all discharges from municipal separate storm sewers within the incorporated place were initially addressed under the NPDES program and would provide a mechanism for developing intergovernmental agreements where necessary.

Option 6: County Boundaries. EPA requests comments on defining large and medium municipal separate storm sewer systems to include all municipal separate storm sewers that are located in a county with a population that exceeds the appropriate statutory population limit. Under this approach,

all municipal separate storm sewers that are located within a county with the appropriate population would constitute a large or medium municipal system.

The Agency does not favor defining large and medium municipal systems based on county boundaries at this time because of the extremely large number of municipal entities which would be affected during the initial phases of the storm water program. In addition to the 410 counties with populations of 100,000 or more, several thousand other municipal entities would be affected under this approach. The Agency prefers to develop core programs within the central cities before addressing these municipalities. For this reason, EPA prefers, at this time, to continue to consider this option under the studies mandated under Section 402(p)(5).

In comparing this option to option 1, it should be noted that addressing discharges from separate storm sewers within counties would, in larger urbanized areas, provide a geographic basis necessary for the planning of comprehensive programs to reduce pollutants in discharges from municipal separate storm sewer systems to the maximum extent practicable.

The EPA believes that basing the definition of large and medium municipal storm sewer systems on counties would offer additional flexibility in developing pollution control strategies and targeting controls where water quality improvements are needed and can be achieved in a practicable manner. For example, the NURP study indicated that it is much more feasible and cost-effective to develop controls for areas that are in the process of being developed than it is to develop controls for areas that are more fully developed. This option would allow municipalities flexibility to address storm water concerns associated with many areas of rapid development, rather than relying more heavily on retrofitting controls in older urban core areas defined by city limits.

The water quality impacts of urban runoff are generally more significant for smaller rivers and streams where the ratio of the portion of the drainage basin that is developed to the portion that is undeveloped is relatively high. The county option provides an adequate basis to address existing and future water quality impacts associated with municipal separate storm sewers for many of these water bodies.

Option 7: Unbanized Areas. The storm water permit application regulations that were promulgated in September 26, 1984 established the scope of the requirement to obtain a permit by limiting the definition of storm water point source as it related to municipal separate storm sewers to areas that were located on urbanized areas designated by the Bureau of Census. Prior to the enactment of the WQA, the use of the urbanized area designation to limit the scope of NPDES permit program served as an important tool to establish manageable limits on the large administrative burden associated with preparing and processing permit applications for individual discharges from municipal separate storm sewers. However, the WQA provides several mechanisms which ease this burden, including authorizing the Director to issue permits for municipal storm sewers on a system- or jurisdiction-wide basis, thereby greatly reducing the administrative burden associated with permitting municipal storm sewers. Under this new authority, the advantages of retaining the use of urban area designations to determine initial permit applicability are outweighed by the difficulties associated with defining which discharges are within the urban area and with using urban area boundaries which often do not follow political boundaries. Because the boundaries of urban areas do not follow political boundaries, this option may create additional administrative complexity where some discharges from in a given municipality are addressed initially, and other discharges in other parts of the municipality must be addressed later under regulations developed under section 402(p)(6). Further, the urban areas designated in 1980 do not include many other areas that are undergoing rapid development today. Using more recent estimates of urban areas may create uncertainty in the regulatory definition. Also, areas of new development would not be addressed until after the development had progressed significantly, and therefore, opportunities to limit pollutants from the areas of new development would be limited. Nationwide, urban areas increased by approximately 4% in area annually.

5. System-Wide Permit Applications

Section 402(p)(3)(B)(i) of the amended CWA provides that permits for municipal discharges from municipal storm sewers may be issued on a system-wide or jurisdiction-wide basis. This provision is an important tool towards reaching the goal of developing the comprehensive storm water management programs envisioned by the Act.

The system-wide permit approach represents a drastic change from the regulatory approach taken in the 1984 regulations, which required individual permit applications for each outfall located in a Census designated urban area. The 1984 permit applications were to serve as the basis for developing conditions for individual permits for each discharge. EPA proposes to abandon the individual permit approach for municipal storm sewer outfalls in favor of a program approach that will allow system-wide planning and implementation and appropriate targeting of controls based on an evaluation of priorities.

Under the permit application requirements proposed in today's rule, if the appropriate co-applicants are identified, one permit application may be submitted for a large or medium municipal separate storm sewer system (see § VII.E.4 above). System-wide permit applications can in turn be used to issue system-wide permits which could cover all discharges in the system.

Where several municipal entities are responsible for obtaining a permit for various discharges within a single systems, the Agency will encourage system-wide permit applications involving the several municipal entities for a number of reasons. The system-wide approach not only provides an appropriate basis for planning activities and coordinating development, but also provides municipal entities participating in a system-wide application the means to spread the resource burden of monitoring, evaluating water quality impacts, and developing and implementing controls. The system-wide approach provided in today's notice recognizes differences between individual municipalities with responsibilities for discharges from the municipal system by allowing for different permit conditions to apply to different municipalities. To encourage this flexibility, the permit application requirements proposed in today's notice allow individual municipalities participating in system-wide applications to submit information regarding municipality specific storm water quality management programs to reduce pollutants in system discharges.

In some cases, it may be undesirable for all municipal entities with storm water responsibility within a municipal system to be co-permittees under one system-wide permit. The permit application requirements proposed in today's notice allow individual municipal entities within the system to submit permit applications and obtain a permit for that portion of the storm sewer system for which they are responsible. Thus, several permits may be issued to cover various subdivisions of a single municipal system.

6. Co-Permittees to System-wide Permits

Although several of the proposed options for defining large and medium separate storm sewer systems focus primarily on municipal separate storm sewers that are owned or operated by incorporated cities, towns or villages with the appropriate population (e.g., options 1, 2, or 5), the definition of the "system" could be modified by the Director of the NPDES program on a case-by-case basis to include municipal separate storm sewers owned or operated by other municipal entities.

To accommodate the issuance of permits in which several municipalities are co-permittees, the permit applications for municipal storm sewers described in today's proposal have been designed to facilitate multiple municipal agencies (i.e. flood control districts, local governments, State Departments of Transportation) submitting a joint permit application appropriate for issuing system-wide permits with multiple co-permittees. EPA is requesting comments on this approach, and when it would be appropriate to tailor the permit application requirements to meet the needs of different types of municipal agencies (for example, should distinct permit application requirements be developed for State Departments of Transportation).

G. Permit Application Requirements for Large and Medium Municipal Systems

The August 12, 1985 notice had proposed to clarify that storm water discharges from municipal separate storm sewers would be classified as Group I storm water discharges. The Group I classification, indicating a higher potential for contributing to an adverse environmental impact, was justified on the basis of data from the NURP study of urban runoff which indicate that in many instances BOD loadings in urban runoff were estimated as comparable to that from secondary treatment facilities, while TSS loadings were estimated to be a factor of ten times higher than loadings from secondary treatment plants. The NURP study also found high levels of heavy metals and several organic chemicals in urban runoff.

The Group I classification triggered permit application requirements which included quantitative data sampling for each Group I outfall. In the August 12, 1985 notice, EPA proposed to require that quantitative sampling data for all outfalls from municipal separate storm systems be submitted in permit applications. Eight comments were received on this issue. Six of the commenters objected to the proposal because they felt that such a requirement would create an undue burden on municipalities which have many outfalls. Some municipalities suggested identifying the area drained by the system and then selecting points for representative sampling. Another commenter argued that if three or four outfalls are receiving similar runoff, the participant should only be required to sample one outfall. Other commenters suggested that only outfalls that are suspected of having pollution problems should be tested, although no basis for determining such "problem" outfalls were offered. Two of the eight commenters, both State agencies, felt that all outfalls should be tested.

Today's notice proposes to abandon the Group I classification system and requests comments on replacing the prior permit application system for discharges from municipal systems, based primarily on sampling all outfalls, with a system that involves comprehensive system-wide evaluation of pollutant sources. The permit application requirements for discharges from large and medium municipal separate storm sewer systems proposed in today's notice do not focus on the collection of data at each outfall of the municipal system, but rather require a screening analysis to identify areas of the system affected by illicit non-storm water discharges and some representative sampling.

The permit applications for municipal storm sewer systems proposed in today's notice are applicable to large municipal storm sewer systems (systems serving a population of more than 250,000); medium municipal storm sewer systems (systems serving a population of more than 100,000 but less than 250,000) and any other municipal separate storm sewer system that is required to obtain a permit that the Administrator or NPDES State designates under section 402(p)(2)(E).

1. Strategy for Implementing the Permit Program

Given the differing nature of discharges from municipal separate storm sewer systems in different parts of the country, and the varying water quality impact of municipal storm sewer discharges on receiving waters, EPA intends to develop permit application requirements designed to lead to the development of site-specific storm water management programs. In order to effectively implement this goal, EPA is currently rethinking the appropriate structure and purpose of the NPDES permit program as it applies to municipal separate storm sewers systems. EPA believes that the appropriate permitting strategy (including both the permit application and the permit) for controlling pollutants from municipal separate storm sewers should involve the following components:

- Identifying significant sources of pollutants;
- Characterizing pollutants associated with discharges from the municipal separate storm sewer system;
- Estimating expected changes in the characteristics of pollutants in discharges from the municipal separate storm sewer system associated with population growth and changes in land use activities;
- Initially assessing impacts on the water quality of receiving water bodies;
- Proposing controls to reduce pollutants to the maximum extent practicable;
- Estimating the changes in the characteristics of pollutants in discharges from municipal separate storm sewer systems associated with proposed controls;
- Modifying the proposal of controls to reduce pollutants to reach desired objective (control pollutants to the maximum extent practicable);
- Implementing controls; and
- Evaluating changes in water quality associated with implementing controls.

EPA is proposing to structure the permit application requirements for large- and medium-sized municipal systems to address:

- The development of a municipal storm water management program to control pollutants in municipal storm water discharges. Viable management programs must have adequate legal authority and financial capabilities to ensure compliance with permit conditions;
- A process to identify sources which contribute pollutants to municipal storm water discharges;
- Initial characterization of the discharges from the municipal storm sewer system; and
- Proposed management plans to reduce the discharge of pollutants from municipal storm sewers to the maximum extent practicable.

This information is necessary to allow permits to be based on site-specific best professional judgement evaluations of appropriate pollution control measures. EPA requests comment on the overall strategy for developing a permit program for discharges from municipal separate storm sewers and on which aspects of the strategy should be incorporated into permit applications.

2. Structure of the Permit Application

EPA is proposing a two part permit application that is consistent with the goal of developing site-specific water quality management programs for storm water in NPDES permits

a. Part 1 Application. Part 1 of the permit application is intended to provide an adequate basis for identifying sources of pollutants to the municipal storm sewer system; to preliminarily identify discharges of storm water that are appropriate for individual permits; and to formulate a strategy for characterizing the discharges from municipal separate storm sewer systems.

The components of Part 1 of the permit application include a description of:

- General information regarding the permit applicant or co-applicants (§ 122.26(d)(1)(i));
- A description of the existing legal authority of the applicant(s) to control pollutants in storm water discharges and a plan to augment legal authority where necessary (§ 122.26(d)(1)(ii));
- Source identification information including a description of the historic use of ordinances or other controls which limited the discharge of non-storm water discharges to municipal separate storm sewer systems and the location of known municipal separate storm sewer outfalls (§ 122.26(d)(1)(iii));
- Information characterizing the nature of system discharges including existing quantitative data, the results of a field screening analysis to detect illicit discharges and illegal dumping to the municipal system; an identification of receiving waters with known water quality impacts associated with storm water discharges; a proposed plan to characterize discharges from the municipal storm sewer system by estimating pollutant loads and the concentration of representative discharges, and a plan to obtain representative data (§ 122.26(d)(1)(iv)); and
- A description of existing structural and non-structural controls to reduce the discharge of pollutants from the municipal storm sewer (§ 122.26(d)(1)(v)).
- The submittal of Part 1 of the permit application will allow EPA, or approved NPDES States, to adjust the Part 2 permit application requirements to assure flexibility in developing permit application requirements that are appropriate for the permit applicant given the site specific characteristics of the municipal storm sewer system.

b. Part 2 Application. Part 2 of the proposed permit application is designed to supplement information provided in the Part 1 permit application and to provide municipalities with the opportunity of proposing a comprehensive program of structural and non-structural control measures that will control the discharge of pollutants, to the maximum extent practicable, from municipal storm sewers. The components of the proposed Part 2 permit application include:

- A demonstration that the legal authority of the permit applicant satisfies regulatory criteria (§ 122.26(d)(2)(i));
- Supplementation of the source identification information submitted in the Part 1 application to assure that all major outfalls are identified (§ 122.26(d)(2)(ii));
- Information to characterize discharges from the municipal system including quantitative data from a screening analysis for detecting illicit discharges and illegal dumping, representative data and estimates of pollutant loadings and concentrations of pollutants in discharges (§ 122.26(d)(2)(iii));
- A proposed management program to control the discharge of pollutants to the maximum extent practicable, from municipal storm sewers (§ 122.26(d)(2)(iv));
- Assessment of the performance of proposed controls (§ 122.26(d)(2)(v));
- A financial analysis estimating the cost of implementing the proposed management programs along with identifying sources of revenue (§ 122.26(d)(2)(vi)); and
- A description of the roles and responsibilities of co-applicants (§ 122.26(d)(2)(vii)).

In addition to providing site-specific information, the permit application requirements proposed in today's notice have been designed to allow municipalities an opportunity to propose the set of controls that, in the applicant's opinion, representing the most appropriate means of controlling the discharge of pollutants from municipal storm sewer systems. These proposed plans will be used by the permitting authority to develop permit conditions to control pollutants in the discharges from municipal separate storm sewer systems to the maximum extent practicable. This overall scheme recognizes that local government entities have a critical responsibility for evaluating the nature and sources of pollutant discharges from municipal separate storm sewer systems and for devising appropriate methods of control. Proper development of proposed municipal storm water management programs affords municipalities the opportunity to propose model conditions for their own permits.

3. Major outfalls

In past rulemakings, a controversial issue has been the appropriate sampling requirements for municipal separate storm sewer systems. Earlier storm water rulemakings have been based primarily on the principle that all discharges to waters of the United States from municipal separate storm sewers located in urban areas must be covered by an individual permit. This approach required that individual permit applications contain quantitative data to be submitted for all such discharges. This approach was criticized because of the extremely large number of outfalls in some municipal separate storm sewer systems. Most incorporated cities with a population of 100,000 or more do not know the exact number of outfalls from their municipal systems, but estimates range from 50 to 1,000 or more.

Under the approach taken in earlier rulemakings, the impacts of pollutant loads and impacts on ambient water concentration from municipal storm sewer systems would be analyzed by evaluating samples from all of the discharges from the system. This approach would involve evaluating water quality impacts through the use of models to estimate pollutant loads and to estimate ambient water concentrations during and immediately after storm events, and to calibrate the models using the quantitative data from each outfall. Under this earlier approach, limited information regarding pollutant sources would be available in the permit application to select appropriate models for estimating pollutant loads. Rather, relatively general models would be used which relied on limited quantitative data to assure that the model was calibrated.

In light of the increased flexibility provided by the WQA for regulating municipal separate storm sewer discharges, the approach proposed in today's notice will not require submittal of individual permit applications with quantitative data for each outfall of a municipal system, but rather will encourage systemwide permit applications to provide information suitable for developing effective storm water management programs. Under this approach, not all outfalls of the municipal system will be sampled, but rather more specific and accurate models for estimating pollutant loads and discharge concentrations will be used. The use of these models will require the identification of sources which are responsible for discharging

pollutants into municipal separate storm sewers and will not require as much data to calibrate due to the source-specific nature of the model. A number of standard and localized models have been developed for estimating pollutant loads from storm water discharges. For example, the United States Geological Survey (USGS) has developed four sets of regression equations for 10 pollutants in urban runoff (see "Estimation of the Urban Storm-Runoff Quality and Quantity Data in Metropolitan Areas throughout the United States", 1988). The NURP study provides event mean concentration estimates for 10 pollutants. EPA requests comments on the use of these and other standard and localized models.

By adopting an approach that incorporates source identification measures, the amount of quantitative data required to characterize discharges from the municipal systems will be reduced because of the increased accuracy of site-specific models which can be used. Consistent with a system-wide permit application approach, EPA is proposing to focus source identification measures on "major outfalls". The proposed definition of major outfalls includes any municipal separate storm sewer outfall that discharges from a pipe with a diameter of more than 36 inches or its equivalent (discharges from a drainage area of more than 50 acres); or municipal separate storm sewers that receive storm water from lands zoned for industrial activities, an outfall that discharges from a pipe with a diameter of more than 12 inches or its equivalent (discharges from a drainage area of 2 acres or more). EPA views that it is appropriate to focus source identification and characterization measures conducted as permit application requirements on these outfalls to provide initial screening information that will allow priorities to be set for the system. However, it should be clarified that *all* outfalls from medium and large municipal separate storm sewer systems need to be covered by the permit applications proposed in today's notice and that *all* outfalls from such systems will need to be covered by a permit.

EPA requests comments on the proposed definition of major outfall, and whether outfalls with a diameter of more than 36 inches or its equivalent, or for municipal separate storm sewers that receive storm water from lands zoned for industrial activities, an outfall that discharges from a pipe with a diameter of more than 12 inches or its equivalent provides an appropriate number of outfalls for focusing source identification requirements. Where practicable, comments should include data indicating the distribution of outfall sizes within municipal systems.

4. Viable Program

Perhaps the most important function of the NPDES permit program for municipal separate storm sewers is to ensure that local governments establish viable programs to control pollutants in discharges from municipal separate storm sewers. The proposed permit application requirements address three components of a viable local program for controlling pollutants in discharges from municipal separate storm sewers: legal authority, financial and administrative capability. The ability of a permit applicant or a set of permit applicants to satisfy these criteria will be evaluated in light of the site-specific proposed management plans proposed at 122.26(d)(2)(iv) (discussed in § VII.E.7 of the preamble).

Although pollutants in discharges from municipal separate storm sewers can be controlled by providing end-of-pipe treatment, many representatives from municipalities have expressed concerns that providing treatment for all outfalls from large and medium municipal separate storm systems is technically and economically infeasible. These representatives have expressed a willingness to explore alternative methods, such as developing a variety of preventive source control measures, to control pollutants in such discharges.

However, if source controls are to function in lieu of end-of-pipe treatment, then the permittee, or a set of co-permittees, must have adequate legal authority to ensure that controls on discharges to a municipal storm sewer are implemented and that permit conditions based on source control measures do not become ineffective "paper" requirements.

EPA is proposing that municipal separate storm sewer system permit applicants demonstrate legal authority established by statute, ordinance, or series of contracts which authorizes or enables the applicant at a minimum to:

- Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by each storm water discharge associated with industrial activity;
- Prohibit through ordinance, order or similar means, the discharge of illicit discharges to the municipal separate storm sewer;
- Control through ordinance, order or similar means, the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;
- Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;
- Require compliance with conditions in ordinances, permits, contracts or orders; and
- Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and non-compliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

EPA requests comments on the process by which municipal applicants should demonstrate legal authority and how EPA should evaluate the legal authority of municipal applicants.

In order to ensure that all permit conditions, including both structural and source control measures, are implemented, EPA is proposing to require that permittees demonstrate that they have the fiscal resources and administrative capabilities to carry out the objectives of the permit.

EPA is proposing to require municipal permit applicants to submit a fiscal analysis of expenditures that will be required in order to implement the proposed management plans required in Part 2 of the application. The description of fiscal resources should include a description of the source of the funds.

EPA is requesting comments as to the appropriateness of these criteria for permit applicants for municipal separate storm sewer systems and on what additional criteria should be defined to ensure a viable program to control pollutants in discharges from municipal storm sewers.

5. Source Identification

The identification of sources which contribute pollutants to municipal separate storm sewers is a critical step in characterizing the nature and extent of pollutants in discharges and in developing appropriate control measures. Source identification can be useful for providing an analysis of pollutant source contribution and for identifying the relationship between pollutant sources and receiving water quality problems. In cases where end-of-pipe controls alone are not practicable, it is essential to identify the source of pollutants into the municipal storm sewer systems to support a targeted approach to control pollutant sources.

The relative contribution of pollutants from various sources will be highly site-specific. The first step in developing a

targeted approach for controlling pollutants in discharges from municipal storm sewer systems is identifying the various sources in each drainage basin that will contribute pollutants to the municipal storm sewer system.

Source identification information can serve as the basis for loading estimates (see § VII.E.6.C) and the identification of those discharges to the municipal system with a higher potential to create adverse environmental impacts.

EPA is proposing to phase in the source identification requirements of the permit program by establishing minimum objectives in Part 1 of the application and by requiring applicants to submit a source identification plan in Part 2 of the application to provide additional information during the term of the permit. The minimum source identification requirements of Part 1 have been designed to provide sufficient information to provide an initial characterization of pollutants in the discharges from the municipal storm sewer system. EPA realizes that with many large, complex municipal storm sewer systems, it may be difficult to identify all outfalls during the permit application process. EPA is proposing that known outfalls be reported in Part 1 of the application. Part 1 of the application will also include a description of procedures and a proposed program to identify additional major outfalls. The information required in the proposed Part 1 application also includes identification of the drainage area associated with known outfalls, a description of major land use classifications in each drainage area, descriptions of soils, the location of industrial facilities, open dumps, landfills or RCRA hazardous waste facilities which discharge storm water to the municipal storm sewer system.

Although many municipalities have extensive information regarding the network of conveyances in their municipal separate storm sewer systems, others do not. Municipalities without existing maps would face extreme difficulties in attempting to identify during the permit application process the network of conveyances in their municipal systems. Therefore, applicants are *not* required to identify the conveyance network of the municipal system, but rather need to provide the location of major outfalls (certain points where the municipal system discharges to waters of the United States) and estimates of the area drained by the portion of the system associated with the outfall.

In addition to identifying outfalls from municipal storm sewer systems for the development of a management program to reduce pollutants in storm water discharges, it is also important to identify the location of such outfalls to clarify where the storm sewer system ends and where waters of the United States begin. In many situations, waters of the United States that receive discharges from municipal storm sewers can be mistakenly considered to be part of the storm sewer system. Permit applicants should refer to the regulatory definition of waters of the United States at 40 CFR 122.2 for appropriate guidance. The Director of the NPDES program will be able to make any necessary clarifications during the application process.

The proposed Part 1 application requires applicants to submit ten year projections of population growth and development activities. Population data and development projections will be useful for future predictions of loadings to receiving waters from municipal storm sewer systems, and capacities required for treatment systems. In general, population projections should reflect various scenarios of development (high, medium, low relative to recent trends).

Part 2 of the application will supplement the information reported in the Part 1 application so that, at a minimum, all major outfalls are identified.

Some municipalities, in recognition of the importance of mapping and source identification, have already developed extensive maps of their municipal storm sewer system. In addition, much of the information required in today's proposal will usually have been compiled by other planning agencies in a variety of forms such as land use plans and soil survey maps. Population data are readily available from the Census Bureau, municipal planning departments or public utility records.

Although municipalities or public entities may not keep records identifying dischargers into the storm water collection system, methods usually exist from which such information can be gathered (e.g., water and sewer bills, tax records, zoning permits, etc.). EPA is also proposing that facilities that discharge storm water associated with industrial activity to large or medium municipal separate storm sewer systems submit notifications of the discharge to the municipality (see proposed § 122.26(a)(3)(vii)). Under today's proposal, municipal or public entities responsible for applying for and obtaining an NPDES permit will be required to identify the location of an open dump, sanitary landfill, municipal incinerator or hazardous waste treatment, storage, and disposal facility under RCRA which may discharge storm water to the system as well as all facilities which discharge storm water associated with industrial activity into a large or medium municipal separate storm sewer system.

Requiring these source identification measures is supported by the legislative history of section 405 of the WQA, which instructs that "[i]n writing any permit for a municipal separate storm sewer, EPA or the State should pay particular attention to the nature and uses of the drainage area and the location of *any* industrial facility, open dump, landfill, or hazardous waste treatment, storage, or disposal facility which may contribute pollutants to the discharge." (emphasis added) (Vol 133 Cong. Rec. S752 (daily ed. Jan. 14, 1987)).

EPA is requesting comment on the appropriate elements and level of detail of the source identification process. Comments should address the adequacy of the proposed requirements for preparing initial estimates of pollutant loads and for estimating the concentration of pollutants in discharges from the municipal system based on the minimum source identification requirement in Part 1 of the application and for developing appropriate background information or developing storm water management plans.

8. Characterization of Discharges

The characterization plan proposed in today's notice is comprised of several major components:

- A screening analysis to provide information to develop a program for detecting and controlling illicit connections and illegal dumping to the municipal separate storm sewer system;
- Initial quantitative data to allow the development of a representative sampling program to be incorporated as permit conditions;
- System-wide estimates of annual pollutant loadings and the mean concentration of pollutants in discharges resulting from a representative storm and a program to, during the life of the permit, provide estimates for each major outfall of the seasonal pollutant loadings and the event mean concentration of pollutants in discharges resulting from a representative storm; and
- An identification of receiving waters with known water quality impacts associated with storm water discharges.

a. Screening Analysis for Illicit Discharges. Illicit discharges (non-storm water discharges without a NPDES permit) and illegal dumping to municipal separate storm sewer systems occur in a

relatively haphazard manner. Due to the unpredictability of such discharges, a field analysis is necessary for the developing priorities for detecting and controlling such discharges. As discussed in greater detail in § VII.C.7.b of today's notice, EPA is proposing to require that municipal applicants submit a comprehensive plan to develop a program to detect and control illicit connections and illegal dumping. In order to develop appropriate priorities for these programs, EPA is proposing that applicants submit the results of a two-phased screening analysis to be performed on known major outfalls in the systems to detect the presence of illicit hookups and illegal dumping.

The results of the first phase of the screening analysis, referred to as the field screen, would be reported in Part 1 of the permit application. The information received from the field screen would be used to develop requirements for the second phase of the screening analysis, the results of which would be reported in Part 2 of the application.

Under the proposed requirements for a field screen, the applicant or co-applicants would submit a description of observations of dry weather discharges for all known major outfalls in Part 1 of the application. At a minimum, the field screen would include a description of visual observations made during a dry weather period. If any flow is observed during a dry weather period, two grab samples would be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observation regarding the potential presence of non-storm water discharges or illegal dumping would be provided. In addition, the results of a field screen using on-site methods to estimate pH, total chlorine, total copper, total phenol, total and hexavalant chromium, detergents (or surfactants) and free cyanide would be provided along with an estimate of the flow rate. EPA does not intend to require that analytical methods approved under 40 CFR Part 136 be used exclusively in the field screen. Rather, the use of inexpensive field sampling techniques such as the use of colormetric detection methods is anticipated. Where the field screen does not involve analytical methods approved under 40 CFR Part 136, the applicant would be required to provide a description of the method used which includes the name of the manufacturer of the test method, including the range and accuracy of the test. EPA is requesting comments on appropriate field techniques for a field screen of dry weather discharges. EPA also requests comments on requiring the field screen for all major outfalls, whether the proposed definition of major outfalls is appropriate for this purpose, or whether the number of major outfalls subject to the field screen in the Part 1 application should be limited.

It should be clarified that data from the field screen would generally not be appropriate for comprehensive evaluation of water quality impacts, or estimating pollutant loadings. Rather the Director will use the information from the field screen in Part 1 of the application, along with other information, such as the age of development and degree of industrial activity in the drainage basin, to identify major outfalls which are appropriate for study during the second phase of the screening analysis.

The Second phase of the screening analysis requires that wet-weather and dry-weather samples be collected and analyzed in accordance with analytical methods approved under 40 CFR 136 from designated major outfalls for the following pollutants:

TABLE M-1

pH	lead
fecal coliform	copper
fecal streptococcus	chromium
volatile organic carbon (VOC)	cadmium
surfactants (MBAS)	silver
oil and grease	nickel
TSS	zinc
total organic carbon (TOC)	cyanides
biological oxygen demand (BOD_5)	total phenol
chemical oxygen demand (COD)	total chlorine

These pollutants have been selected as indicators of illegal dumping and illicit connections of process and nonprocess waste waters as well as sanitary wastewaters. Fecal coliform, fecal streptococcus and chlorine were selected as indicators of municipal sanitary wastewater discharges. Oil and grease, surfactants (MBAS), pH, TSS COD BOD_5, and TOC were selected as indicators of illicit connections from commercial and industrial operations. VOC, TOC and total phenol were selected as indicators of illicit connections from facilities that discharge wastewaters contaminated by solvents and other organic materials. The metals selected are metals for which EPA has developed effluent guidelines for industires which are generally expected to be located in an urban setting.

EPA requests comments on the use of these parameters for performing a field screen to detect discharges containing illicit connections, particularly the use of fecal coliform and fecal streptococcus (see 41*FR* 8013 (March 7, 1986)). The Agency also requests comment on the usefulness of additional parameters for use in a field screen. In addition, the Agency requests comment on alternative procedures, such as inspections of separate storm sewers that are suspected to contain illicit connections, that can be relied on in lieu of the field screen procedures proposed as Part 2 application requirements. Also, the Agency requests comments on incorporating a maximum limit on the number of major outfalls that would be subject to field screen procedures of the Part 2 application requirements and what an appropriate limit may be. Under this approach, where information in the Part 1 field screen indicated a high potential for extensive illicit connections within the system, the field sceen requirements of the Part 2 application would be limited to a specified number of major outfalls (for example, 50 major outfalls for large systems, and 25 major outfalls for medium systems). In this case, permit conditions would be developed for studying, during the term of the permit, other major outfall with a high potential for illicit connections.

b. Representative data. The NURP study showed that pollutant concentrations in urban runoff can exhibit significant variation. Pollutant concentrations in such discharges vary during storm events and from storm event to storm event. Given the complex, variable nature of storm water discharges from municipal systems, EPA favors a permit scheme where the

collection of representative data is primarily a task that will be accomplished through monitoring programs during the term of the permit. Permit writers have the necessary flexibility to develop monitoring requirements that more accurately reflect the true nature of highly variable, complex discharges.

In today's notice, EPA is proposing a strategy for performing an initial assessment of water quality impacts of discharges from municipal separate storm sewers based primarily on source identification measures and existing information received in the permit application. This information will be used to characterize system discharges. The analysis developed under this approach will incorporate existing data bases such as the one developed under the NURP study. Under today's proposal, some quantitative data will be collected to ensure the system discharges can be appropriately represented by the various existing data bases and to provide a basis for developing a monitoring plan to be implemented as a permit condition.

EPA is proposing that quantitative data be submitted for representative storm events for between five and ten outfalls. The municipality will recommend and the Director will then designate the outfalls as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system, on the basis of information received in Part 1 of the application. The applicant will be required to collect samples of a storm discharge from a representative storm event for each outfall designated. In addition, for at least one outfall designated by the Director, the applicant will be required to collect samples of storm water discharges from three representative storm events that occur at least one month apart. This requirement will be modified by the Director if the type and frequency of storm events require different sampling. For example, the Director may require samples of discharges be collected during snow melts, or during specified seasons. The Director may also require additional testing during a single event if it is unlikely that there will be three storm events suitable for sampling during the year.

All samples collected will be analyzed for all pollutants listed in Table II (organic pollutants except bis (chlormethyl) ether, dichlorofluoromethane and trichlorofluoromethane) and Table III (toxic metals, cyanide and total phenol) of Appendix D of 40 CFR Part 122, and for:

TABLE M-2

total suspended solids (TSS)	dissolved solids
COD	BOD$_5$
oil and grease	fecal coliform
fecal streptococcus	pH
total nitrogen	dissolved phosphorus
total ammonia plus organic nitrogen	total phosphorus

Table M-2

A portion of the NURP program involved monitoring 120 priority pollutants in storm water discharges from lands used for residential, commercial and light industrial activities. The NURP program excluded testing for asbestos and dioxin. Results for seven other organic priority pollutants were not considered valid due to changes in, or constraints on test methods. Seventy-seven priority pollutants were detected in samples of storm water discharges from lands used for residential, commercial and light industries taken during the NURP study, including 14 inorganic and 63 organic pollutants. Table M-3 shows the priority pollutants which were detected in at least ten percent of the discharge samples which were sampled for priority pollutants.

TABLE M-3.—PRIORITY POLLUTANTS DETECTED IN AT LEAST 10% OF NURP SAMPLES

	Frequency of detection (percent)
Metals and Inorganics:	
Antimony	13
Arsenic	52
Beryllium	12
Cadmium	48
Chromium	58
Copper	91
Cyanides	23
Lead	94
Nickel	43
Selenium	11
Zinc	84
Pesticides:	
Alpha-hexachlorocyclohexane	20
Alpha-endosulfan	19
Chlordane	17
Lindane	15
Halogenated Aliphatics:	
Methane, dichloro-	11
Phenols and Cresols:	
Phenol	14
Phenol, pentachloro-	19
Phenol, 4-nitro	10
Phthalate Esters:	
Phthalate, bis(2-ethylhexyl)	22

TABLE M-3.—PRIORITY POLLUTANTS DETECTED IN AT LEAST 10% OF NURP SAMPLES—Continued

	Frequency of detection (percent)
Polycyclic Aromatic Hydrocarbons:	
Chrysene	10
Fluoranthene	16
Phenanthrene	12
Pyrene	15

The NURP data also showed a significant number of these samples exceeded various freshwater water quality criteria. The exceedence of water quality criteria does not necessarily imply that an actual violation of standards will exist in the receiving water body in question. Rather, the enumeration of exceedences serves as a screening function to identify those constituents whose presence in urban storm water runoff may warrant high priority for further evaluation.

Members of this group represented all of the major organic chemical fractions found in Table II of Appendix D of Part 122 (volatiles, acid compounds, base/neutrals, pesticides). EPA favors requiring testing for all organic constituents in Table II (except bis (chlormethyl) ether, dichlorofluoromethane and trichlorofluoromethane which have been suspended from the list of organic toxic pollutants in the NPDES regulations (see 46 FR 2266, (January 8, 1981), and 46 FR 10723, (February 4, 1981)] rather than limiting the sampling requirements to the 24 toxic constituents found in the NURP study because they will provide a better description of the discharge at essentially the same cost. The NURP study focused on characterizing storm water discharges from lands used for residential, commercial and light industrial activities, and in general, did not focus on other sources of pollutants to municipal separate storm sewer systems, and therefore, does not reflect all potential pollutants that may be present in discharges from municipal separate storm sewer systems.

EPA is requesting comment on appropriate sampling requirements for discharges from large and medium municipal separate storm sewer systems and to what extent such requirements should be included in permit applications or developed as site-specific permit conditions. The option favored in today's proposal includes

sampling requirements to provide screening data for developing a more intensive program to detect illicit connections and illegal dumping. The sampling requirements proposed for the permit application address a limited number of outfalls and storm events, but require analysis of a wide range of pollutants. Sampling for a wide range of pollutants as a permit application requirement may provide permit writers with appropriate data to target more specific pollutants when developing requirements for a monitoring program established as a permit condition. In addition, the favored option requires limited sampling of representative outfalls. The favored option does not require applicants to submit quantitative data for storm water discharges associated with industrial activity as part of the permit application but instead requires applicants to submit a proposed program to monitor and control such discharges to the municipal system (see § VII.E.7.C).

EPA is working with the United States Geological Survey (USGS) to evaluate the availability of USGS technical assistance to municipalities through cooperative funding programs to aid in collecting representative quantitative data of storm water discharges from municipal systems.

USGS data collection programs with municipalities typically include storm water discharge samples obtained at various times during a storm hydrograph event. Various USGS filed procedures can be used to obtain discharge data for pipes, culverts, etc. typically found in urban areas. Pollutant models can be calibrated with data and long-term rainfall records to simulate the quality of system discharges and compared to other storm water models.

In addition, the Agency recognizes that many municipalities have participated in studies, such as NURP, that involve sampling of urban runoff as well as other components of discharges from municipal separate storm sewer systems. All existing storm water sampling data along with relevant water quality data, sediment data, fish tissue data or biosurvey data, taken over the last ten years is considered relevant and under today's proposal must be submitted with Part 1 of the application. Sampling data that is submitted must be accompanied with a narrative description of the drainage area served by the outfall monitored, a description of the sampling and quality control program, and the location of receiving water monitoring.

EPA requests comment on the use of existing data, such as that generated under the NURP study, to satisfy the requirement of providing representative sampling data. The Agency is concerned with establishing criteria that can be used to verify the validity of existing data.

c. Loading and Concentration Estimates. The assessment of the water quality impacts of discharges from municipal separate storm sewer systems on receiving waters requires the analysis of both pollutant loadings and concentrations of pollutants in discharges.

The loading and concentration estimates proposed in today's notice will be used to evaluate two types of water quality impacts: (1) Short-term impacts; and (2) long-term impacts.

Short term impacts from discharges from municipal separate storm sewers involve changes in water quality that occur during and shortly after storm events. Examples of short term impacts that can lead to impairments include periodic dissolved oxygen depression due to the oxidation of contaminants, high bacteria levels, fish kills, acute effects of toxic pollutants, contact recreation impairments and loss of submerged macrophytes. Characterization of instream pollutant concentrations based on estimated pollutant concentration in system discharges are important for evaluating these types of impacts.

Long-term water quality impacts from discharges from municipal separate storm sewers may be caused by contaminants associated with suspended solids that settle in receiving water sediments and by nutrients which enter receiving water systems with long retention times. Pollutant loading data are important for evaluation of impairments such as loss of storage capacity in streams, estuaries, reservoirs, lakes and bays, lake eutrophication caused by high nutrient loading, and destruction of benthic habitat. Other examples of the long-term water quality impacts include depressed dissolved oxygen caused by the oxidation of organics in bottom sediments and biological accumulation of toxics as a result of up-take by organisms in the food chain. An estimate of annual pollutant loading associated with discharges from municipal storm water sewer systems is necessary to evaluate the magnitude and severity of the environmental impacts of such discharges and to evaluate the effectiveness of controls which are imposed at a later time.

Municipal storm water sewer systems generally handle runoff from large drainage areas and the sources of pollution are usually very diffuse. The concentrations of many pollutants in discharges from these systems are often low relative to many industrial process and Publicly Owned Treatment Works discharges. The water quality impacts of low concentration pollution discharges tend to be cumulative and need to be evaluated in terms of aggregate loadings as well as pollutant concentrations. A site-specific loading analysis can be used to evaluate the relative contribution of various pollutant sources.

Physical impacts, such as streambed scour, streambank erosion and low stream flow during dry weather can be caused by urban runoff. Today's proposed regulations do not specifically require that the physical impacts of urban runoff be addressed in the permit application. Although NPDES permits in many jurisdictions may contain controls designed to limit these physical impacts, EPA believes that the most appropriate Federal policy is to encourage jurisdiction-specific decisions regarding the appropriateness of controls designed to lessen the physical impacts of urban runoff.

7. Proposed Storm Water Quality Management Programs

Traditionally, NPDES permits for industrial process waste discharges and for municipal sanitary sewers have relied primarily on end-of-pipe treatment technology. The basic approach for these discharges under the CWA, the application of uniform technology-based controls to classes of discharges, is often not appropriate for municipal separate storm sewer discharges. Instead, flexible site-specific and source-specific decisions on management controls are often appropriate.

A wide variety of control measures to reduce the discharge of pollutants from municipal storm sewer systems are currently available The performance of appropriate control measures is highly dependent on site-specific factors. It is therefore not practicable to define one standard set of controls which will control all pollutants in all municipalities.

In today's notice, EPA is proposing to facilitate the development of site-specific permit conditions by requiring permit applicants to submit, along with other information, a description of existing structural and non-structural control measures on discharges of pollutants from municipal storm sewers in Part 1 of the permit application. Proposed § 122.26(d)(2)(iv) requires the applicant to identify in Part 2 of the application, to the degree necessary to meet the MEP standard, additional

control measures which will be implemented during the life of the permit. Although, in many cases, it will not be possible to identify all control measures that are appropriate as permit conditions, EPA believes that the process of identifying components of a comprehensive control program should begin early and that applicants should be given the opportunity to identify and propose the components of the program that they believe are appropriate for controlling discharges of pollutants.

The permit application requirements in today's notice require the applicant or co-applicant to develop management programs for four types of pollutant sources which discharge to large and medium municipal storm sewer systems. Discharges from large and medium municipal storm sewer systems are usually expected to be composed primarily of (1) runoff from commercial and residential areas, (2) storm water runoff from industrial areas, (3) runoff from construction sites, and (4) non-storm water discharges. Part 2 of the proposed permit application has been designed to allow the applicant the opportunity to propose MEP control measures for each of these components of the discharge. Discharges from some municipal systems may also contain pollutants from other sources, such as runoff from land disposal activities (leaking septic tanks, landfills and land application of sewage sludge). Where other sources, such as land disposal, contribute significant amounts of pollutants to a municipal storm sewer system, appropriate control measures should be included on a site specific basis. Proposed management programs will then be evaluated in the development of permit conditions.

There is some overlap in the manner in which these pollutant sources are classified. Also, some control measures will reduce pollutant loads for multiple components of the municipal storm sewer discharge. These measures should be identified under all appropriate places in the application; as discussed below however, double counting of pollutant removal must be avoided when the total assessment of control measures is performed.

Although many land use programs involve multiple purposes which include measures to reduce pollutants in discharges from municipal separate storm sewer systems, the proposed management program in today's notice is intended to address only those controls which can be implemented by the permit applicant or co-applicants. The Agency cannot abrogate its responsibilities under the CWA to implement the NPDES permit program by relying on pollution control programs that are outside the NPDES program.

The Agency anticipates that storm water management programs will evolve and mature over time. The permits for discharges from municipal separate storm sewer systems will be written to reflect changing conditions that result from program development and implementation and corresponding improvements in water quality. The proposed permit applications will require applicants to provide a description of the range of control measures considered for implementation during the term of the permit. Flexibility in developing permit conditions will be encouraged by providing applicants an opportunity to identify in the permit application priority controls appropriate for the initial implementation of management programs. Applicants will propose priorities based on a consideration of appropriate controls including, but not limited to, consideration of controls that address reducing pollutants to municipal separate storm sewer system discharges that are associated with storm water from commercial and residential areas (§ 122.26(d)(2)(iv)(A)), illicit discharges and illegal disposal (§ 122.26(d)(2)(iv)(B)), storm water from industrial areas (§ 122.26(d)(2)(iv)(C)), and runoff from construction sites (§ 122.26(d)(2)(iv)(D)). Permits for different municipalities will place different emphasis on controlling various components of discharges from municipal storm sewers. For example, the potential for cross-connections (such as municipal sewage or industrial process wastewater discharges to a municipal separate storm sewer) is generally expected to be greater in municipalities with older developed areas. On the other hand, municipalities with larger areas of new development will have a greater opportunity to focus controls to reduce pollutants in storm water generated by the area after it is developed, discharges from construction sites, and other planning activities. EPA requests comments on the process and methods for developing appropriate priorities in management programs proposed in applications and how the development of these priorities can be coordinated with controls on other discharges to ensure the achievement of water quality standards and the goals of the Clean Water Act. In addition, the Agency requests comments on the costs of implementing various components of management programs.

The Agency requests comments on the appropriateness of the individual components of the proposed management programs and whether additional provisions should be added. Comments on various components of the management programs should address the cost of program development and implementation as well as the potential for pollutant removal and water quality benefits.

In addition, the Agency will continue to evaluate procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality in the studies required under Section 402(p)(5) of the CWA (see section IV of today's notice). One purpose of these studies will be to evaluate the costs and water quality benefits associated with implementing these procedures and methods. This evaluation will address a number of factors which impact the implementation costs associated with these programs, such as the extent to which similar municipal ordinances are currently being implemented, the degree to which existing municipal programs (such as flood management programs or construction site inspections) can be expanded to address water quality concerns, the resource intensiveness of the control, and whether the control program will involve public or private expenditures. This information, along with information gained during permit implementation will aid in the dynamic long-term development of municipal storm water management programs. EPA invites the public to submit information that can be used in the development of these studies.

a. Measures to Reduce Pollutants in Runoff from Commercial and Residential Areas. The NURP program evaluated runoff from lands primarily dedicated to residential and commercial activities. The areas evaluated in the study reflect some other activities, such as light industry, which are commonly dispersed among residential and commercial areas. The NURP study selected sampling locations that were thought to be relatively free of illicit discharges and storm water from heavy industrial sites including storm water runoff from heavy construction sites. Of course, in a study such as NURP, it was impossible to totally isolate various contributions to the runoff. In developing the proposed permit application requirements in today's notice, EPA has, in general, relied on the NURP definition of urban runoff, that is, runoff from lands used for residential, commercial and light industrial activities.

NURP and numerous other studies have shown the runoff from residential

and commercial areas washes a number of pollutants into receiving waters. Of equal importance is the volume of storm water runoff leaving urban areas during storm events. Large intermittent volumes of runoff can destroy aquatic habitat.

As the percentage of paved surfaces increases, the volume and rate of runoff and the corresponding pollutant loads also increase. Thus, the amount of storm water from commercial and residential areas and the pollutant loadings associated with storm water runoff increases as development progresses and remains at an elevated level for the lifetime of the development.

Proposed § 122.26(d)(2)(iv)(A) requires municipal storm sewer system applicants to provide in Part 2 of the application a description of a proposed management program that will describe priorities for implementing management programs based on a consideration of appropriate controls including:

- A description of maintenance activities and a maintenance schedule for structural controls;
- A description of planning procedures including a comprehensive master plan to control after construction is completed, the discharge of pollutants from municipal separate storm sewers which receive discharges from new development and significant redevelopment after construction is completed;
- A description of practices for operating and maintaining public highways and procedures for reducing the impact on receiving waters of such discharges from municipal storm sewer system;
- A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies; and
- A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

Water quality problems caused by municipal storm sewer discharges will generally be most acute in heavily developed areas. Usually, the most effective control measures are structural, and opportunities for implementing these measures may be limited in previously developed areas. Commonly used structural technologies include a wide variety of treatment techniques, including first flush diversion systems, detention/infiltration basins, retention basins, extended detention basins, infiltration trenches, porous pavement, oil/grit separators, grass swales, and swirl concentrators. A major problem associated with sound storm water management is the need for operating and maintaining the systems for their expected life.

The unavailability of land in highly developed areas often makes the use of structural controls infeasible for modifying many existing systems. Non-structural practices can play a more important role. Non-structural practices can include erosion control, streambank management techniques, street cleaning operations, vegetation/lawn maintenance controls, debris removal, road salt application management and public awareness programs.

The second component of the proposed program to reduce pollutants in storm water from commercial and residential areas which discharge to municipal storm sewer systems provides that applicants describe the planning procedures and a comprehensive master plan that will assure that increases of pollutant loading associated with newly developed areas are, to the maximum extent practicable, limited. These measures should address storm water from commercial and residential areas which discharge to the municipal storm sewer that occur after the construction phase of development is completed. Controls for construction activities are addressed later in today's notice.

As urban development occurs, the volume of storm water and its rate of discharge increases. These increases are caused when pavement and structures cover soils and destroy vegetation which otherwise would slow and absorb runoff. Development also accelerates erosion through alteration of the land surface. Areas that are in the process of development offer the greatest potential for utilizing the full range of structural and non-structural best management practices. If these measures are to provide controls to reduce pollutant discharges after the area has been developed, comprehensive planning must be used to incorporate these measures as the area is in the process of developing. These measures offer an important opportunity to limit increases in pollutant loads.

The third component of § 122.26(d)(2)(iv)(A) provides a description of practices for operating and maintaining public roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems. General guidelines recommended for managing highway storm water runoff include litter control, pesticide/herbicide use management, reducing direct discharges, reducing runoff velocity, grassed channels, curb elimination, catchbasin maintenance, appropriate streetcleaning, establishing and maintaining vegetation, development of management controls for salt storage facilities, education and calibration practices for deicing application, infiltration practices, and detention/retention practices.

The fourth component of § 122.26(d)(2)(iv)(A) provides that applicants identify procedures that enable flood management agencies to consider the impact of flood management projects on the water quality of receiving streams. A well-developed storm water management program can reduce the amount of pollutants in storm water discharges as well as benefit flood control objectives. As discussed above, increased development can increase both the quantity of runoff from commercial and residential areas and the pollutant load associated with such discharges. Disturbing the land cover, altering natural drainage patterns, and increasing impervious area all increase the quantity and rate of runoff, thereby increasing both erosion and flooding potential. Increases in the quantity of runoff can result in increasing the area of a flood plain. An integrated planning approach helps planners make the best decisions to benefit both flood control and water quality objectives.

The fifth component of § 122.26(d)(2)(iv)(A) would provide that municipal applicants submit a description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer. Such a program may include, as appropriate, controls such as educational activities and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities. Discharges of these materials to municipal storm sewer systems can be controlled by proper application of these materials.

b. Measures for Illicit Discharges and Improper Disposal. The WQA requires that NPDES permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers." In today's proposal, EPA will begin to implement this statutory mandate by focusing on two types of discharges to large and medium

municipal separate storm sewer systems. One type of non-storm water discharges are illicit discharges which are plumbed into the system or that result from leakage of sanitary sewage system. The other class of non-storm water discharges result from the improper disposal of materials such as used oil and other toxic materials.

Illicit Discharges

In some municipalities, illicit connections of sanitary, commercial and industrial discharges to storm sewer systems have had a significant impact on the water quality of receiving waters. Although the NURP study did not emphasize identifying illicit connections to storm sewers other than to assure that monitoring sites used in the study were free from sanitary sewage contamination, the study concluded that illicit connections can result in high bacterial counts and dangers to public health. The study also noted that removing such discharges presented opportunities for dramatic improvements in the quality of urban storm water discharges.

Other studies have shown that illicit connections to storm sewers can create severe, wide-spread contamination problems. For example, the Huron River Pollution Abatement Program inspected 660 businesses, homes and other buildings located in Washtenaw County, Michigan and identified 14% of the buildings as having improper storm drain connections. Illicit discharges were detected at a higher rate of 60% for automobile related businesses, including service stations, automobile dealerships, car washes, body shops and light industrial facilities. While some of the problems discovered in this study were the result of improper plumbing or illegal connections, a majority were approved connections at the time they were built.

A wide variety of technologies exist for detecting illicit discharges. The effectiveness of these measures largely depends upon the site-specific design of the system. Under today's proposal, permit applicants would develop a description of a proposed management program, including priorities for implementing the program and a schedule to implement a program to identify illicit discharges to the municipal storm sewer system. The proposed program will identify initial priorities for analyzing various portions of the system and the appropriate detection techniques to be used.

Improper disposal

The permit application requirements proposed today for municipal storm sewer systems include a requirement that the municipal permit applicant describe a program to assist and facilitate in the proper management of used oil and toxic materials.

Improper management of used oil can lead to discharges to municipal storm sewers that in turn may have a significant impact on receiving water bodies. EPA estimates that annually, 267 million gallons of used oil, including 135 million gallons of used oil from do-it-yourself (DIY) automobile oil changes, are disposed improperly. An additional 70 million gallons of used oil, most coming from service stations and repair shops, are used for road oiling. Most of this oil contains metals, such as lead and chromium, at such high levels that the Agency proposed to list used oil as a hazardous waste (November 29, 1985, (50 *FR* 49258)). This proposal was not made final because the Agency thought that a hazardous waste listing of all used oil may discourage recycling. The Agency is presently considering listing used oil that is not recycled as a hazardous waste (March 10, 1986, (51 *FR* 8206), and November 19, 1986 (51 *FR* 41900). However, even if these rules are promulgated, due to various exclusions many individuals and facilities that generate or handle used oil are not regulated under RCRA.

Although EPA is developing a regulatory program under RCRA for the management of recycled oil, the RCRA regulations will likely only apply to certain facilities that will be classified as used oil marketers and used oil recyclers. DIY oil changers and certain other facilities are generally not subject to regulation under the RCRA program. A recent EPA report, "Revised Baseline Flow Data for Used Oil Modelling" (March 13, 1987) suggests that a large fraction of service stations no longer accept DIY used oil and that as a result DIYs are having increasing difficulty recycling oil, thereby leading to increases in uncontrolled disposal.

EPA is proposing that permit applicants for large and medium municipal storm sewer systems describe a program to facilitate the proper management of used oil. EPA requests comments on when various components of this program may be appropriate, including providing information to handlers of used oil and DIY generators and household toxic waste generators, adopting appropriate controls on road oiling, and establishing and operating oil and household waste recycling/disposal programs.

c. Measures to Reduce Pollutants in Storm Water Discharges Associated with Industrial Activities Into Municipal Systems. As discussed in § VII.B of today's notice, industrial facilities that discharge storm water to a large or medium municipal separate storm sewer system are not required to obtain an individual permit for such discharges unless the Director requires the facility to obtain a permit or to become a co-permittee. EPA is proposing to require the municipal storm sewer permittee to describe control programs for such discharges that are covered under the municipal storm sewer permit. At a minimum, the program would require the municipal applicant to identify such discharges (see source identification requirements at § 122.26(d)(1)(vi)(C)), provide for monitoring certain discharges and where necessary, implement control measures. Should a municipality suspect that an individual discharger into the system is causing a problem, and the municipality or management agency has no authority over the discharge, the municipality should contact the NPDES permitting authority and request that an individual permit be issued, or at a minimum, request that such a discharge be designated a co-permittee.

Although the Agency has not proposed specific regulatory language, EPA is requesting comment on two groups of options for programs to characterize storm water discharges associated with industrial activity that go to municipal separate storm sewers. Under the first group of options, municipal applicants would describe the development of a program to characterize discharges from certain outfalls from the municipal storm sewer system that contain runoff from industrial facilities. Under these options, the municipal applicant would submit a proposed characterization program as part of the permit application. Quantitative data collected under an approved monitoring program would be submitted during the life of the permit and would be used to develop a comprehensive control program. Under the second group of options, certain industrial facilities would be responsible for characterizing storm water discharges into large or medium municipal separate storm sewer systems.

Under the first group of options, several issues arise in the development of an appropriate characterization program for municipal systems. The first issue is identifying which storm water discharges from industrial facilities into municipal systems should be monitored. One approach would be to require data on portions of the municipal system which receives storm water from facilities which are listed in the proposed regulatory definition at § 122.26(b)(13) of "storm water discharge

associated with industrial activity" (with the exception of construction activities and uncontaminated storm water from oil and gas operations) which discharge into the municipal system. However, given the potentially large number of facilities that meet this definition and would discharge into municipal systems, a monitoring program that requires the submission of quantitative data regarding portions of the municipal systems receiving storm water from such facilities may not be practicable. Such a requirement could, for some systems, potentially become the most resource intensive requirements in the municipal permit. Therefore, EPA is considering various ways to develop appropriate targeting for monitoring programs.

EPA requests comments on a requirement that, at a minimum, monitoring programs address discharges from municipal separate storm sewer outfalls that contain storm water discharges from municipal landfills, hazardous waste treatment, disposal and recovery facilities, and runoff from industrial facilities that are subject to Section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA). Section 313 of Title III requires that operators or certain facilities that manufacture, import, process, or otherwise use certain toxic chemicals report annually their releases of those chemicals to any environmental media. Section 313(b) of Title III specifies that a facility is covered for purposes of reporting if it meets all of the following criteria:

- The facility has ten or more full-time employees;
- The facility is in Standard Industrial Classification (SIC) codes 20 through 39;
- The facility manufactured (including quantities imported), processed, or otherwise used a listed chemical in amounts that exceed certain threshold quantities during the calendar year for which reporting is required.

Listed chemicals include 329 toxic chemicals listed at 40 CFR 372.45. After 1989, the threshold quantities of listed chemicals that the facility must manufacture, import or process in order to be required to submit a release report is 25,000 pounds per year. The threshold for a use other than manufacturing, importing or processing of listed toxic chemicals is 10,000 pounds per year. EPA promulgated a final regulation clarifying these reporting requirements on February 16, 1988 (53 FR 4500).

EPA requests comments on whether Section 313 of SARA identifies facilities which provide an appropriate basis for establishing priorities for municipal permittees to develop monitoring and control programs for storm water associated with industrial activity. Several advantages are associated with this approach. First, the potential for toxic materials in discharges from these facilities is relatively high due to the large volume of hazardous substances located at these facilities. Second, some information regarding storm water discharges and material management at these facilities will be available through the Section 313 of SARA reporting process.

The Agency requests comments on monitoring programs for municipal discharges, including the submission of quantitative data on the following constituents:

- Any pollutant limited in an effluent guideline for the industry subcategory, where applicable;
- Any pollutant listed in the facility's NPDES permit for its process wastewater, if it has one;
- Oil and grease, COD, pH, BOD_5, TOC, TSS, total phosphorus, total nitrogen, and
- Any information on the discharge required under 40 CFR 122.21(g)(7) (iii) and (iv).

These are the same constituents that EPA is proposing to require individual permit applicants for storm water discharges associated with industrial activity to provide quantitative data.

A third issue concerning appropriate monitoring programs for runoff from industrial facilities discharging to municipal systems involves the sampling location. Several commenters on earlier storm water proposals asserted that all pollutants discharged to waters of the United States via storm water runoff may not be of concern due to the dilution factor at a specific location. The Agency initially favors establishing monitoring requirements to be applied to those outfalls that directly discharge to waters of the United States. Monitoring of outfalls close to the point of discharge to waters of the United States is generally preferable when attempting to identify priorities for developing pollutant control programs. However, under certain circumstances, it may be preferable to monitor at the point where the runoff from the industrial facility discharges to the municipal system. For example, if many facilities discharge substantially similar storm water to a municipal system (e.g., storm water discharges from general automotive repair shops) it may be more practicable to monitor discharges from representative facilities in order to characterize pollutants in the discharge.

Under the second group of options considered under today's notice, all industrial facilities which discharge storm water into a large or medium municipal storm sewer system would submit information to either the Director of the NPDES program (the EPA or States with approved NPDES programs) or the municipal permit applicant for the municipal storm sewer that receives the discharge. The information that the facility would submit to the permit applicant would be the same information that would be required in an individual permit application for a facility that discharges storm water associated with industrial activity directly to waters of the United States. For example, of facilities that discharge storm water to municipal storm sewer systems, only municipal landfills, hazardous waste treatment, storage and disposal facilities and those facilities subject to Section 313 of Title III of SARA would be required to submit a permit application. Facilities that discharge storm water to a municipal storm sewer would have the option of participating in a group application in lieu of submitting information directly to the municipal applicant. These members of the group application would be required to indicate in the group application the municipal storm sewer to which they are discharging. EPA would forward a summary of the information in the group application to the appropriate municipal applicants for use in developing appropriate controls for the member of the group application.

EPA is also requesting comment on whether facilities that discharge to large and medium municipal storm sewer systems and that are not participating in a group application should submit individual permit applications to EPA regions or NPDES States. Under this option, the permit applications would be used to determine if an individual permit or a co-permittee arrangement is appropriate. Where it is not appropriate to require an individual permit or a co-permittee arrangement, the application would be sent to the appropriate municipal permit applicant (under the authority of Section 402(j) of the CWA), who would use the information to develop appropriate controls for the facility.

This option recognizes that the operator of the facility is in the best position to know which pollutants may be in the storm water discharge and to provide the non-quantitative information that is required in individual permit applications. Further, as with facilities discharging storm water associated with industrial activity directly to waters of the United States, the facility would be responsible for

certifying that it has tested its storm water outfalls for illicit connections. By shifting this burden to the facility discharging storm water associated with industrial activity, the applicant for the municipal storm sewer would be able to concentrate effort on detecting illicit connections from other types of facilities with a high potential for illicit connections.

EPA is requesting comment on these approaches to control pollutants in storm water from industrial facilities which discharge to a large or medium municipal separate storm sewer system. In particular, should municipalities or individual industrial facilities be required to collect sampling data? If high levels of pollutants are detected in samples from a municipal storm water outfall, and storm water from industrial facilities is a suspected contributor, how will municipalities determine which facilities are responsible? Is end-of-pipe treatment generally more appropriate than source controls for storm water from industrial facilities which discharge to municipal systems? If municipalities are responsible for sampling these discharges, are indicator parameters such as VOC more appropriate than the specific constituents that individuals industrial facilities with storm water discharges which do not discharge to municipal systems are required to sample under individual storm water permit application requirements?

d. Measures to Reduce Pollutants in Runoff from Construction Sites Into Municipal Systems. Section VII.D.2 of today's notice discusses EPA's proposal to define the term "storm water discharge associated with industrial activity" to include runoff from construction facilities classified as Standard Industrial Codes 15 and 16 (general building contractors and heavy construction contractors) including preconstruction activities, *except*: (a) operations that result in the disturbance of less than 1 acre total land area which are not part of a larger common plan of development or sale; or (b) that are designed to serve single family residential projects, including duplexes, triplexes, or quadruplexes, that result in the disturbance of less than 5 acre total land areas which are not part of a larger common plan of development or sale. Under today's proposal, facilities that discharge runoff from construction sites that meet this definition will be required to submit permit applications under today's rulemaking unless they are to be covered by another NPDES permit or discharge to a municipal separate storm sewer (see § VII.C.1). Permit application requirements for such discharges are proposed at 40 CFR 122.26(c)(1)(ii).

Section 122.26(d)(2)(iv)(D) of the proposed regulations would require applicants for a permit for large or medium municipal separate storm sewer systems to submit a description of a proposed management program to control pollutants in all construction site runoff that discharges to municipal systems. Under the proposed provision, municipal applicants will submit a proposed program for implementing and maintaining structural and non-structural best management practices for controlling storm water runoff at construction sites. The program will address procedures for site planning; enforceable requirements for nonstructural and structural best management practices; procedures for inspecting sites and enforcing control measures; and educational and training measures.

Generally, construction site ordinances are effective when they are implemented. However, in many areas, even though ordinances exist, they have limited effectiveness because they are not adequately implemented. Maintaining best management practices also presents problems. Retention and infiltration basins fill up and silt fences may break or be overtopped. Weak inspection and enforcement point to the need for more emphasis on training and education to complement regulatory programs.

8. Assessment of Controls

EPA is proposing that municipal applicants provide an initial assessment of the effectiveness of the control method for structural or non-structural controls which have been proposed in the management program. Such an assessment is needed because the performance of appropriate management controls is highly dependent on site-specific factors. The assessment will be used in the development of pollutant loading and concentration estimates (see VII.E.8.C) and the evaluation of water quality benefits associated with implementing controls. Such assessments do not have to be verified with quantitative data, but can be based on accepted engineering design practices.

H. Annual reports

As discussed earlier in today's notice, EPA is proposing flexible permit application requirements to facilitate the development of site-specific programs to control the discharge of pollutants from large and medium municipal separate storm sewer systems. Many municipalities are in early stages of the complex task of developing a program suitable for controlling pollutants in discharges under a NPDES permit, while other municipalities have relatively sophisticated programs in place. In order to ensure that such site-specific programs are developed at the maximum extent practicable rate, EPA is proposing to require permittees of municipal separate storm sewer systems to submit annual status reports which reflect the development of their control programs.

The reports will be used by the permitting authority to aid in evaluating compliance with permit conditions and where necessary, modify permit conditions to address changed conditions. EPA requests comments on the appropriate content of the annual reports.

I. Application Deadlines

The WQA provided a statutory time frame for implementing the storm water permit application requirements. The Act establishes deadlines for EPA to establish permit applications, permit application submittal and permit compliance.

The WQA requires EPA to promulgate permit application requirements for storm water discharges associated with industrial activity and large municipal separate storm sewer systems by "no later than two years" after the date of enactment (i.e., no later than February 4, 1989). In conjunction with this requirement, the Act requires that permit applications for these classes of discharges be submitted within one year after the statutory date by which EPA is to promulgate permit application requirements by providing that such applications "shall be filed no later than three years" after the date of enactment of the WQA (i.e., no later than February 4, 1990).

The WQA also requires EPA to promulgate final regulations governing storm water permit application requirements for discharges from municipal separate storm sewer systems serving a population of 100,000 or more but less than 250,000 by "no later than four years" after enactment (i.e. no later than February 4, 1991). Permit applications for medium municipal separate storm sewer systems "shall be filed no later than five years" after the date of enactment of the WQA (i.e., no later than February 4, 1992). The WQA did not establish the time period between designation and permit application submittal for case-by-case designations under section 402(p)(2)(E).

Comments on earlier rulemakings involving storm water application

deadlines have indicated that applicants need adequate time to obtain "representative" storm water samples, at least one full rain year. This is because many discharges are located in areas where testing during dry seasons or winter would not be feasible. The intermittent and unpredictable nature of storm water discharges can result in difficult and time-consuming data gathering. Moreover, some operators have many storm water discharges associated within industrial activity which can require considerable time to identify, analyze, and submit applications. This creates a tremendous practical problem for the extremely high number of unpermitted storm water discharges. The Agency's and the public's interest in a sound storm water program and the development of a useful data base on these sources is best served by establishing an application deadline which will allow sufficient time to gather, analyze, and submit meaningful applications. Based on a consideration of these factors, EPA favors proposing that individual permit applications for storm water discharges associated with industrial activity which currently are not covered by a permit and that are required to obtain a permit be submitted not later than one year after the final rule is promulgated.

Operators of storm water discharges which are currently covered by a permit, will, of course, not be required to submit a permit application until their existing permit expires. Facilities which must reapply for a permit for a storm water discharge prior to the promulgation of a final rule based on today's proposal are required to submit complete Form 1 and Form 2C applications. In recognition of the time required to collect storm water discharge data, EPA will consider allowing facilities that currently have a NPDES permit for a discharge and which must reapply for permit renewal the option of applying in accordance with existing Form 1 and Form 2C requirements in lieu of applying in accordance with the revised application requirements during the first year following promulgation of the revised permit application requirements.

As discussed in § VII.E.4 and § VII.G.2 of today's notice, EPA favors a two part permit applications for both group applications for sufficiently similar facilities that discharge storm water associated with industrial activity and for operators of large or medium municipal separate storm sewer systems. The deadlines for submitting permit applications that are proposed in today's notice are based on providing adequate time for: applicants to prepare Part 1 of the application, adequate review of Part 1 of the application by EPA or, in the case of permit applications for large and medium municipal storm sewer systems, approved NPDES States, and preparation of the contents of the Part 2 application.

For permit applications for storm water discharges associated with industrial activity, EPA is proposing that Part 1 of the group application be submitted within 120 days from the publication of final permit application regulations. This time is necessary to form groups and for individual members of the group to prepare the non-quantitative information required in Part 1 of the application. Part 1 of the group application will be submitted to EPA Headquarters in Washington, DC and approved or disapproved within 60 days after being received. Part 2 of the application would then be submitted within one year after the Part 1 application is approved.

For large municipal separate storm sewer systems (systems serving a population of more than 250,000), EPA is proposing that Part 1 of the permit applications be submitted within one year of the date of the final rule. The Director will approve or disapprove the provisions of the Part 1 permit application within 90 days after receiving the Part 1 application. The Part 2 portion of the application shall then be submitted within two years of the date of the final rule.

For medium municipal separate storm sewer systems (systems serving a population of more than 100,000, but less than 250,000), EPA is proposing that permit applications will be required on November 4, 1990. The Director will approve or disapprove the provisions of the Part 1 permit application within 90 days after receiving the Part 1 application. The Part 2 portion of the application shall then be submitted no later than February 4, 1992, one year after the Part 1 application has been approved.

Operators of storm water discharges that are not normally required to obtain a permit, may be required to obtain a permit for their discharge on the basis of a case-by-case designation by the Administrator or the NPDES State. EPA is proposing that operators of storm water discharges associated with industrial activity which discharge to municipal separate storm sewers are generally not required to obtain a NPDES permit for their discharge, unless required by the Director on a case-by-case basis. The Administrator or NPDES State may also designate storm water discharges (except agricultural storm water discharges) that contribute to a violation of a water quality standard or that are significant contributors of pollutants to waters of the United States for a permit. Prior to a case-by-case determination that an individual permit is required for a storm water discharge, the Administrator or NPDES State may require the operator of the discharge to submit a permit application. EPA is proposing at § 124.52(c) to require the operator of designated discharges to submit a permit application within 60 days of notice, unless permission for a later date is granted. The 60-day deadline is consistent with the procedures for designating other discharges for a NPDES permit on a case-by-case basis found at § 124.52. The 60-day deadline recognizes that case-by-case designations often require an expedited response, but at the same time, is flexible to allow for case-by-case adjustments.

In recognition of the time required to promulgate rational final regulations which address the complex issues associated with storm water permit application requirements, the Agency realizes that given the date of this proposal, the agency may not be able to promulgate permit application requirements by the statutory deadline of February 4, 1989 for storm water discharges associated with industrial activities and discharges from large municipal separate storm sewer systems. Based on an analysis of the comments received on today's proposal, the Agency will consider promulgating a final rule specifying permit application requirements for storm water discharges associated with industrial activity prior to the date of promulgation of permit application requirements for large and medium municipal storm sewer systems.

EPA requests comments on the relationship between the proposed deadlines and the proposal for a two part permit application for discharges from a large or medium municipal separate storm sewer system. Specifically, EPA requests comments on an alternative approach to a two part permit application where only some of the requirements discussed in today's notice (primarily the Part 1 application requirements) would be established as application requirements and other requirements (primarily the Part 2 application requirements) would be established as permit conditions. Under this approach, applicants would be required to include plans to submit information with the Part 1 application. These plans would be used to develop compliance schedules which would be

incorporated as permit conditions. This option is not favored in today's notice because of the Agency's concerns about the additional complexities associated with the scheme and the additional time that may be required to develop and implement municipal storm water management programs.

J. State Storm Water Management Programs

Today's notice proposes permit application requirements which apply to only the following storm water discharges:

- A discharge with respect to which a permit has been issued prior to February 4, 1987;
- A discharge associated with industrial activity;
- A discharge from a municipal separate storm sewer system serving a population of 250,000 or more;
- A discharge from a municipal separate storm sewer system serving a population of 100,000 or more, but less than 250,000; or
- A discharge for which the Administrator or NPDES State determines that the storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to the waters of the United States.

The EPA, or NPDES approved States cannot require NPDES permits for other discharges composed entirely of storm water prior to October 1, 1992. EPA is required to submit to Congress a report on a study, conducted in consultation with the States, for the purpose of:

- Identifying those storm water discharges or classes of storm water discharges for which permits are not required prior to October 1, 1992; and
- Determining, to the maximum extent practicable, the nature and extent of pollutants in such discharges.

Not later than October 1, 1989, EPA, in consultation with the States, is required to conduct a study for the purpose of establishing procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality.

These studies are to be used by EPA, in consultation with State and local officials, to issue regulations which designate additional storm water discharges to be regulated to protect water quality and to establish a comprehensive storm water quality regulatory program. Section 402(p)(6) of the CWA requires that the comprehensive regulatory program shall, at a minimum, establish priorities, establish requirements for State storm water management programs, and establish expeditious deadlines. The provision provides EPA with broad authority and discretion to fashion the comprehensive regulatory program, which may include performance standards, guidelines, guidance, and management practices and treatment requirements, as appropriate.

As stated earlier in today's notice, one goal in evaluating public comments received in response to today's notice is to gather information for these studies. To facilitate information gathering for the studies, the Agency is proposing an initial framework for State storm water management programs. This initial framework is intended to encourage States to participate in the development of the Section 402(p)(5) studies, and the subsequent development of regulations. EPA will use information collected in this manner, along with other information, such as section 305(b) reports, as guidance in developing storm water programs with the flexibility to target priorities of individual States to the extent necessary to mitigate impacts on water quality associated with storm water discharges.

VIII. Economic Impact

EPA has prepared an Information Collection Request for the purpose of estimating the information collection burden imposed on Federal, State and local governments and industry by proposed revisions to NPDES permit application requirements for storm water discharges codified in 40 CFR Part 122. The Agency is proposing these revisions in response to Section 402(p)(4) of the Clean Water Act, as amended by the Water Quality Act of 1987 (WQA). The proposed revisions would apply to: storm water discharges associated with industrial activity; discharges from municipal separate storm sewer systems serving a population of 250,000 or more and discharges from municipal separate storm sewer systems serving a population of 100,000 or more, but less than 250,000.

The annual cost for applying for NPDES permits for discharges from municipal separate storm sewer systems was estimated to be $5.7 million. EPA estimates that an average application for a permit for all discharges from a municipal separate storm sewer system serving a population of 250,000 or more would cost $131,300 to prepare, or 8,534 hours, while an average application for a permit for all discharges from a municipal separate storm sewer system serving a population of 100,000 or more, but less than 250,000 would cost $83,600 to prepare, or 5,438 hours, annually. The annual respondent cost for NPDES permit applications for storm water discharges for industrial activities was estimated to be $7.6 million or 238,644 hours. EPA estimates that an average application for a permit application for a storm water discharge associated with industrial activity (other than construction activities) would cost $1011.20, or 31.6 hours to prepare. The average cost to prepare a prepare a permit application for a storm water discharge associated with industrial activity from a construction activities would be $144.00 or 4.5 hours. The annual respondent cost for facilities which discharge storm water associated with industrial activity to a municipal separate storm sewer system serving a population of 100,000 or more to notify the operator of the municipal storm sewer is estimated to be $9.4 million. The average cost for facilities which discharge storm water associated with industrial activity to municipal separate storm sewer system serving a populaton of 100,000 or more to notify the operator of the municipal separate storm sewer system would be $185.20 or 6.1 hours. The annual cost to the Federal Government and approved states for administration of the program was estimated to be $0.46 million. In summary, the total burden for municipalities, industry, and state and federal authorities was estimated to equal $23.4 million.

In general, the cost estimates provided in the ICR focus primarily on the costs associated with developing, submitting and reviewing the permit applications associated with today's notice. The Agency will continue to evaluate procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality in the studies required under Section 402(p)(5) of the CWA (see section IV of today's notice). One purpose of these studies will be to evaluate the costs and water quality benefits associated with implementing these procedures and methods. This information, along with information gained during permit implementation will aid in the dynamic long-term development of storm water control efforts. EPA invites the public to submit information regarding the cost of implementing storm water controls to aid in the completion of these studies.

IX. Executive Order 12291

Executive Order 12291 requires EPA and other agencies to perform regulatory analyses of major regulations. Major rules are those which impose a cost on the economy of $100 million or more annually or have certain other economic impacts. Today's proposed amendments

would generally make the NPDES permit application regulations more flexible and less burdensome for the regulated community. These regulations would not, if promulgated satisfy any of the criteria specified in section 1(b) of the Executive Order and, as such, would not constitute a major rule. This regulation was submitted to the Office of Management and Budget (OMB) for review.

X. Paperwork Reduction Act

The information collection requirements in this proposed rule have been submitted for approval to the Office of Management and Budget (OMB) under the *Paperwork Reduction Act*, 44 U.S.C. 3501 *et seq.* An Information Collection Request (ICR) document has been prepared by EPA (ICR No. 0226.04) and a copy may be obtained from: Florice Farmer, Information Policy Branch; EPA; 401 M St., SW. (PM-223); Washington, DC or by calling (202) 382-2740.

Public reporting burden for permit applications for storm water discharges associated with industrial activity (other than from construction facilities) is estimated to average 31.6 hours per response. The public reporting burden for permit applications for storm water discharges associated with industrial activity from a construction activities is estimated to average 4.5 hours per response. The public reporting burden for facilities which discharge storm water associated with industrial activity to municipal separate storm sewers serving a population of 100,000 to notify the operator of the municipal separate storm sewer system is estimated to average 6.1 hours per response.

The reporting burden for system-wide permit applications for discharges from municipal separate storm sewer systems serving a population of 250,000 or more is estimated to average 945.5 hours per response in the Part 1 application and 7589 hours per response in the Part 2 application. The reporting burden for system-wide permit applications for discharges from municipal separate storm sewer systems serving a population of 100,000 or more, but less than 250,000 is estimated to average 515.5 hours per response in the Part 1 application and 4923 hours per response in the Part 2 application. Estimates of reporting burden include time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

Send comments regarding the burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Chief, Information Policy Branch, PM-223, U.S. Environmental Protection Agency, 401 M St., SW., Washington, DC 20490; and to the Office of Information and Regulatory Affairs, Office of Management and Budget; Washington, DC 20503, marked "Attention: Desk Officer for EPA.". The final rule will respond to OMB or public comments on the information collection requirements contained in this proposal.

XI. Regulatory Flexibility Act

Under the Regulatory Flexibility Act, 5 USC 601 *et seq.*, EPA is required to prepare a Regulatory Flexibility Analysis to assess the impact of rules on small entities. No Regulatory Flexibility Analysis is required, however, where the head of the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities.

Today's proposed amendments to the regulations would generally make the NPDES permit applications regulations more flexible and less burdensome for permittees. Accordingly, I hereby certify, pursuant to 5 U.S.C. 605(b), that these amendments would not, if promulgated, have a significant impact on a substantial number of small entities.

List of Subjects in 40 CFR Parts 122, 123, 124 and 504

Administrative practice and procedure, Environmental protection, Reporting and recordkeeping requirements, Water pollution control.

Authority: Clean Water Act, 33 USC 1251 *et seq.*

Lee M. Thomas,
Administrator.

Date: November 23, 1988.

For the reasons stated in the preamble, Parts 122, 123, 124 and 504 of Title 40 of the Code of Federal Regulations are proposed to be amended as follows:

PART 122—EPA ADMINISTERED PERMIT PROGRAMS; THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

Subpart B—Permit Application and Special NPDES Program Requirements

1. The authority citation for Part 122 continues to read as follows:

Authority: Clean Water Act, 33 U.S.C. 1251 et seq.

2. Section 122.1 is amended by revising paragraph (b)(2)(iv) to read as follows:

§ 122.1 Purpose and scope.

* * * * *

(b) * * *

(2) * * *

(iv) Discharges composed entirely of storm water as set forth in § 122.26; and

* * * * *

3. Section 122.21 is amended by revising paragraph (c), removing paragraph (f)(9), amending paragraph (g)(3) by adding the sentence shown below, revising paragraph (g)(7), removing and reserving paragraph (g)(10) and revising the introductory text of paragraph (k) to read as follows:

§ 122.21 Application for a permit (applicable to State programs, see § 123.25).

* * * * *

(c) *Time to apply.* Any person proposing a new discharge, (including new discharges containing storm water associated with industrial activity), shall submit an application at least 180 days before the date on which the discharge is to commence, unless permission for a later date has been granted by the Director. Persons proposing a new discharge are encouraged to submit their applications well in advance of the 180 day requirement to avoid delay. See also paragraph (k) of this section and paragraphs 122.26(c)(1)(i)(G) and 122.26(c)(1)(ii).

* * * * *

(f) * * *

(9) (removed)

* * * * *

(g) * * *

(3) * * * The average flow of point sources composed of storm water may be estimated and the rainfall event and the method of estimation that the estimate is based on must be indicated.

* * * * *

(7) *Effluent characteristics.* Information on the discharge of pollutants specified in this paragraph (except information on storm water discharges which is to be provided as specified in § 122.26). When "quantitative data" for a pollutant are required, the applicant must collect a sample of effluent and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR Part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. When an applicant has two or more outfalls with substantially identical effluents, the Director may allow the applicant to test only one outfall and report that the quantitative data also apply to the substantially identical outfalls. The requirements in paragraphs (g)(7)(iii)

and (iv) of this section that an applicant must provide quantitative data for certain pollutants known or believed to be present do not apply to pollutants present in a discharge solely as the result of their presence in intake water; however, an applicant must report such pollutants as present. Grab samples must be used for pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform and fecal streptococcus. For all other pollutants, 24-hour composite samples must be used. However, a minimum of one grab sample may be taken for effluents from holding ponds or other impoundments with a retention period greater than 24 hours. In addition, for discharges other than storm water discharges, the Director may waive composite sampling for any outfall for which the applicant demonstrates that the use of an automatic sampler is infeasible and that the minimum of four (4) grab samples will be a representative sample of the effluent being discharged. For storm water discharges, all samples shall be collected from the discharge resulting from the first storm event after a minimum period of 96 hours without a measurable (greater than 0.1 inch rainfall) storm event. For storm water discharges, a grab sample shall be taken during the first twenty minutes of the discharge, and a flow-weighted composite shall be taken for either the entire discharge or for the first three hours of the discharge. The flow-weighted composite sample for a storm water discharge may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes. However, a minimum of one grab sample may be taken for storm water discharges from holding ponds or other impoundments with a retention period greater than 24 hours. For a flow-weighted composite sample, only one analysis of the composite of aliquots is required. For storm water discharge samples quantitative data must be reported for the grab sample taken during the first twenty minutes of the discharge for all pollutants specified in § 122.26, and for flow-weighted composites, quantitative data must be reported for all pollutants specified in § 122.26 except pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform and fecal streptococcus. The Director may establish appropriate site-specific sampling requirements, including the location of the outfall to be sampled, the season the sampling takes place, the minimum duration between the previous measurable storm event and the storm event sampled and the form of percipitation sampled (snow melt or rain fall). An applicant is expected to "know or have reason to believe" that a pollutant is present in an effluent based on an evaluation of the expected use, production, or storage of the pollutant, or on any previous analyses for the pollutant. (For example, any pesticide manufactured by a facility may be expected to be present in contaminated storm water runoff from the facility.)

* * * * *

(g)(10) (removed and reserved)

* * * * *

(k) *Application requirements for new sources and new discharges.* New manufacturing, commercial, mining and silvicultural dischargers applying for NPDES permits (except for new discharges of facilities subject to the requirements of § 122.21(h) or new discharges of storm water associated with industrial activity which are subject to the requirements of § 122.26(c)(1) and this section (except as provided by § 122.26(c)(1)(ii)) shall provide the following information to the Director, using the application forms provided by the Director:

* * * * *

4. Section 122.22 is amended by revising paragraph (b) introductory text, to read as follows:

§ 122.22 Signatories to permit applications and reports (applicable to State programs, see § 123.25).

* * * * *

(b) All reports required by permits, and other information requested by the Director shall be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

* * * * *

5. Section 122.26 is revised to read as follows:

§ 122.26 Storm water discharges (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* (1) Prior to October 1, 1992, discharges composed entirely of storm water shall not be required to obtain a NPDES permit except:

(i) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(ii) A discharge associated with industrial activity;

(iii) A discharge from a large municipal separate storm sewer system;

(iv) A discharge from a medium municipal separate storm sewer system;

(v) A discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. This designation may include a discharge from any conveyance or system of conveyances used for collecting and conveying storm water runoff or a system of discharges from municipal separate storm sewers, except for those discharges from conveyances which do not require a permit under paragraph (a)(2) of this section or agricultural storm water runoff which is exempted from the definition of point source at 122.2. The Director or the EPA Regional Administrator may designate discharges from municipal separate storm sewers on a system-wide or jurisdiction-wide basis. In making this determination the Director or the EPA Regional Administrator may consider the following factors:

(A) The location of the discharge with respect to waters of the United States;

(B) The size of the discharge;

(C) The quantity and nature of the pollutants discharged to waters of the United States; and

(D) Other relevant factors.

(2) The Director may not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing or treatment operations or transmission facilities, composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation, runoff and which are not contaminated by contact with or that has not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations. Contaminated storm water runoff from mining operations includes runoff which contain pollutants above natural background levels. Contaminated storm water runoff from oil and gas exploration, production, processing or treatment operations or transmission facilities includes, but is not limited to, runoff which:

(i) Contains a hazardous substance in excess of reporting quantities established at 40 CFR 117.3 or 40 CFR 302.4;

(ii) Contains oil in excess of the reporting quantity established at 40 CFR 110.3; or

(iii) Contributes to a violation of a water quality standard.

(3) *Large and Medium Municipal Separate Storm Sewer Systems.*

(i) Permits must be obtained for all discharges from large and medium municipal separate storm sewer systems.

(ii) The Director may either issue one system-wide permit covering all discharges from municipal separate storm sewers within a large or medium municipal storm sewer system or issue distinct permits for appropriate categories of discharges within a large or medium municipal separate storm sewer system including, but not limited to: all discharges owned or operated by the same municipality; located within the same jurisdiction; all discharges within a system that discharge to the same watershed; discharges within a system that are similar in nature; or for individual discharges from municipal separate storm sewers within the system.

(iii) The operator of a discharge from a municipal separate storm sewer which is part of a large or medium municipal separate storm sewer system must either:

(A) Participate in a permit application (to be a permittee or a co-permittee) with one or more other operators of discharges from the large or medium municipal storm sewer system which covers all, or a portion of all, discharges from the municipal separate storm sewer system; or

(B) Submit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible.

(iv) One permit application may be submitted for all or a portion of all municipal separate storm sewers within adjacent or interconnected large or medium municipal separate storm sewer systems. The Director may issue one system-wide permit covering all, or a portion of all municipal separate storm sewers in adjacent or interconnected large or medium municipal separate storm sewer systems.

(v) Permits for all or a portion of all discharges from large or medium municipal separate storm sewer systems that are issued on a system-wide, jurisdiction-wide, watershed or other basis may specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas which contribute storm water to the system.

(vi) Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators.

(vii) (A) Operators of storm water discharges associated with industrial activity which discharge to a municipal separate storm sewer system are not required to submit an individual NPDES permit application or participate in a group application for such discharge provided:

(*1*) The operator of such a storm water discharge submits, to the municipality responsible for the municipal separate storm sewer receiving the discharge by no later than [*insert 180 days from date of publication of final rule*] or prior to commencing such discharge: the name of the facility; the location of the discharge; a description (such as SIC codes) which best reflects the principal products or services provided by each facility; existing quantitative data (including flow estimates and sampling data) describing the discharge; and a certification that, if feasible, the discharge has been tested for the presence of non-storm water discharges. The certification shall include a description of the results of any test for the presence of non-storm water discharges, the method used, the date of any testing, and the on-site drainage points that were directly observed during a test, or why the test was not feasible;

(*2*) Such discharge is composed entirely of storm water;

(*3*) Such discharge is in compliance with applicable conditions of the NPDES permit issued for the discharge from the municipal separate storm sewer which receives the storm water discharge associated with industrial activity, provided the discharger has been notified of such conditions; and

(*4*) Such discharges do not contain a hazardous substance in excess of reporting quantities established at 40 CFR 117.3 or 40 CFR 302.4.

(B) Notwithstanding paragraph (a)(3)(vii)(A) of this section, for the purpose of appropriate oversight and enforcement, the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, may require an individual permit for a discharge of storm water associated with industrial activity to a municipal separate storm sewer. Cases where an individual permit may be required include, but are not limited to:

(*1*) The discharge is not compliance with the provisions of paragraph (a)(3)(vii)(A) of this Section; or

(*2*) The discharge potentially contains toxic pollutants or hazardous substances in amounts that may interfere with water quality objectives.

(viii) All discharges to a municipal separate storm sewer that are not composed entirely of storm water must obtain a NPDES permit in accordance with the requirements of Part 122.

(4) *Other Municipal Separate Storm Sewers.* The Director may issue permits for municipal separate storm sewers that are designated under paragraph (a)(1)(v) of this section on a system-wide basis, jurisdiction-wide basis, watershed basis or other appropriate basis, or may issue permits for individual discharges.

(5) *Non-Municipal Separate Storm Sewers.* For storm water discharges associated with industrial activity from point sources which do not discharge to a municipal separate storm sewer, the Director, in his discretion, may issue a single NPDES permit covering all storm water discharges associated with industrial activity which discharge into the same set of conveyances which discharge from a single outfall, or multiple permits which cover all storm water discharges associated with industrial activity into such a system.

(i) All storm water discharges associated with industrial activity that discharge into a storm water discharge system that is not a municipal separate storm sewer must either be covered by an individual permit or a permit issued to the operator of the portion of the system that directly discharges to waters of the United States.

(ii) Where there is more than one operator of a single system of such conveyances, all operators of storm water discharges associated with industrial activity must be identified in the application submitted by the operator of the portion of the system that discharges directly to waters of the United States. Any such application shall include all information regarding storm water discharges associated with industrial activity that discharge into the system that would be required if the dischargers submitted separate applications. The operator of a storm water discharge so identified shall not be required to obtain an individual NPDES permit unless the Director specifies otherwise.

(iii) Any permit covering more than one operator shall identify the effluent limitations, or other permit conditions, if any, that apply to each operator.

(6) *Combined Sewer Systems.* Conveyances that discharge storm water runoff combined with municipal sewage are point sources that must

obtain NPDES permits in accordance with the procedures of § 122.21 and are not subject to the provisions of this section.

(7) Whether a discharge from a municipal separate storm sewer is or is not subject to regulation under this section shall have no bearing on whether the owner or operator of the discharge is eligible for funding under Title II, Title III or Title VI of the Clean Water Act. See 40 CFR Part 35, Subpart I, Appendix A(b)H.2.j.

(b) *Definitions.*

(1) "Co-permittee" means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

(2) "illicit discharge" means any discharge to a municipal separate storm sewer that is not composed entirely of storm water, except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer.)

(3) "incorporated place" means the District of Columbia, or a city, town or village that is incorporated under the laws of the State in which it is located.

(4) "Large municipal separate storm sewer system" means all municipal separate storm sewers that are either:

(i) Owned or operated by an incorporated place with a population of 250,000 or more as determined by the most recent Bureau of Census estimates; or

(ii) Owned or operated by a municipality other than an incorporated place with a population of 250,000 or more, and that are designated by the Director as part of the large municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4)(i) of this Section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(4)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

(E) Other relevant factors.

(5) "Major municipal separate storm sewer outfall" (or "major outfall") means a municipal separate storm sewer outfall that discharges from a pipe with a diameter of more than 36 inches or its equivalent (discharges from conveyances other than circular pipe which are associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a pipe with a diameter of 12 inches or more or from its equivalent (discharges from other than a circular pipe associated with a drainage area of 2 acres or more).

(6) "Major outfall" means a major municipal separate storm sewer outfall.

(7) "Medium municipal separate storm sewer system" means all municipal separate storm sewers that are either:

(i) Owned or operated by an incorporated place with a population of 100,000 or more but less than 250,000, as determined by the most recent Bureau of Census estimates; or

(ii) Owned or operated by a municipality other than an incorporated place with a population of 100,000 or more, and that are designated by the Director as part of the medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(7)(i) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(7)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

(E) Other relevant factors.

(6) "Municipal separate storm sewer" means a conveyance or system of conveyances (including roads with drainage systems) that:

(i) Is owned or operated by a city, town, borough, country, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) That is designed solely for collecting or conveying storm water; and

(iii) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

(9) "Outfall" means "point source" as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

(10) "Runoff coefficient" means the fraction of total rainfall that will appear at the conveyance as runoff.

(11) "Significant materials" includes raw materials; fuels; materials such as solvents and detergents; finished materials such as metallic products; and waste products such as ashes, slag and sludge that are used or stored in quantities at an industrial plant that, if released and mixed with storm water, could result in impacts to receiving waters.

(12) "Storm water" means storm water runoff, snow melt runoff, surface runoff, street wash waters related to street cleaning or maintenance, infiltration (other than infiltration contaminated by seepage from sanitary sewers or by other discharges) and drainage.

(13) "Storm water discharge associated with industrial activity" means any "point source" as defined by 40 CFR 122.2 which is used for collecting and conveying storm water and which is located at an industrial plant or directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term includes, but is not limited to, storm water discharges from drainage areas in which are located: industrial plant yards; immediate access roads and rail lines; drainage ponds; material handling sites; refuse sites; sites used for the application or disposal or process waters; sites used for the storage and maintenance of material handling equipment; and sites that are presently or have been used in the past for residual treatment, storage or disposal. Material handling activities include: storage, loading and unloading of any raw material, intermediate product, finished product, byproduct or waste product. The term excludes areas located on plant lands separate from the

plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from lands used for the plant's industrial activities. industrial plants (including industrial plants at Federally owned or operated facilities) include, but are not limited to, the following:

(i) Facilities subject to effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards (see 40 CFR Subchapter N);

(ii) Facilities classified as Standard Indistrial Classifications 20 through 39 (manufacturing industry);

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations meeting the definition of a reclamation area under 40 CFR 434.11(1)) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations;

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under Subtitle C of RCRA;

(v) Active and inactive landfills, land application sites, and open dumps and that have received any industrial wastes, including those that are subject to regulation under Subtitle D of RCRA;

(vi) Facilities involved in significant recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards;

(vii) Steam electric power generating facilities, including coal handling sites, and onsite and offsite ancillary transformer storage areas;

(viii) Transportation facilities classified as Standard Industrial Classifications 40 through 45, and 47 which have vehicle maintenance shops, material handling facilities, equipment cleaning operations or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance, loading, storage and unloading activities or equipment cleaning operations, or which are subject to another subparagraph under this paragraph are associated with industrial activity;

(ix) POTW lands used for land application treatment technologies, sludge disposal, handling or processing areas, and chemical handling and storage areas; and

(x) Facilities classified as Standard Industrial Classifications 15 and 16 (General building contractors and heavy construction contractors) including clearing, grading and excavation activities except: (A) operations that result in the disturbance of less than 1 acre total land area which are not part of a larger common plan of development or sale; or (B) that are designed to serve single family residential projects, including duplexes, triplexes, or guadruplexes, that result in the disturbance of less than 5 acre total land areas which are not part of a larger common plan of development or sale.

(c) *Application requirements for storm water discharges associated with industrial activity*— (1) *Individual application.* Any discharge that contains storm water associated with industrial activity and that an operator is required to obtain a permit for, or any discharge of storm water which the Director is evaluating for designation (see 40 CFR 124.52(c)) under paragraph (a)(1)(v) and is not a municipal separate storm sewer, and which is not part of a group application described under paragraph (c)(2) of this section, shall submit an NPDES application in accordance with the requirement of § 122.21 and shall provide the following information (Applicants for discharges composed entirely of storm water shall submit Form 1 and Form 2F. Applicants for discharges composed of storm water and non-storm water shall submit Form 1, Form 2C, and Form 2F. Applicants for new sources or new discharges (as defined in section 122.2 of this part) composed of storm water and non-storm water shall submit Form 1, Form 2D, and Form 2F):

(i) Except as provided in paragraphs 122.26(c)(1) (ii) and (iii), the operator of a storm water discharge associated with industrial activity subject to this section shall provide:

(A) A site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) depicting the facility including: each of its drainage and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each past or present areas used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied, each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility;

(B) An estimate of the area of impervious surfaces (including paved areas and building roofs) and the total area drained by each outfall and a narrative description of significant materials that are currently or in the past have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal; past and present materials management practices employed to minimize contact by these materials with storm water runoff; materials loading and access areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; the location and a description of existing structural and non-structural control measures to reduce pollutants in storm water runoff; and a description of the treatment the storm water receives, including the ultimate disposal of any solid or fluid wastes other than by discharge.

(C) A certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested for the presence of non-storm water discharges which are not covered by a NPDES permit. tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. The certification shall include a description of the method used, the date of any testing, and the on-site drainage points that were directly observed during a test;

(D) Existing information regarding the history of significant leaks or spills of toxic or hazardous pollutants at the facility;

(E) Representative quantitative data based on samples collected during representative storm events and collected in accordance with section 122.21 of this Part from all outfalls containing a storm water discharge associated with industrial activity for the following parameters:

(*1*) Any pollutant limited in an effluent guideline to which the facility is subject;

(*2*) Any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit);

(3) Oil and grease, pH, TOC, BOD_5, COD, TSS, total phosphorus, total nitrogen;

(4) Any information on the discharge required under § 122.21(g)(7) (iii) and (iv) of this Part;

(5) Flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, and the method of flow measurement or estimation; and

(6) The date and duration of the storm event(s) sampled, rainfall measurements or estimates of the storm event which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event.

(F) Operators of a discharge which is composed entirely of storm water are exempt from the requirements of § 122.21(g)(2), (g)(3), (g)(4), (g)(5), (g)(7)(i), (g)(7)(ii), and (g)(7)(v).

(G) Operators of new sources or new discharges (as defined in section 122.2 of this part) which are composed in part or entirely of storm water must include estimates for the pollutants or parameters listed in paragraph (c)(1)(i)(E) of this paragraph instead of actual sampling data, along with the source of each estimate. Operators of new sources or new discharges composed in part or entirely of storm water must provide quantitative data for the parameters listed in paragraph (c)(1)(i)(E) of this paragraph within two years after commencement of discharge, unless such data has already been reported under the monitoring requirements of the NPDES permit for the discharge. Operators of a new sources or new discharges which is composed entirely of storm water are exempt from the requirements of § 122.21(k)(3)(ii), (k)(3)(iii), and (k)(5).

(ii) The operator of an existing or new storm water discharge that is associated with industrial activity solely under paragraph (b)(13)(x) of this section, is exempt from the requirements of § 122.21(g) and § 122.26(c)(1)(i) of this Part. Such operator shall provide a narrative description of:

(A) The nature of the construction activity;

(B) The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;

(C) Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a brief description of applicable State and local erosion and sediment control requirements; and

(D) Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a brief description of applicable State or local erosion and sediment control requirements;

(E) An estimate of the runoff coefficient of the site and the increase in impervious area after the construction addressed in the permit application is completed, the nature of fill material and existing data describing the soil or the quality of the discharge; and

(F) The name of the receiving water.

(iii) The operator of an existing or new discharge composed entirely of storm water from an oil or gas exploration, production, processing, or treatment operation, or transmission facility:

(A) Is not required to submit a permit application in accordance with paragraph (c)(1)(i) of this section, unless storm water runoff discharged from the facility:

(1) Contains a release of hazardous substance in excess of reporting quantities established at 40 CFR 177.3 or 40 CFR 302.4;

(2) Contains a release of oil in excess of the reporting quantity established at 40 CFR 110.3; or

(3) Contributes to a violation of a water quality standard.

(B) Notwithstanding paragraph (c)(1)(iii)(A) of this section, the Director may require on a case-by-case basis the operator of an existing or new storm water discharge from an oil or gas exploration, production, processing, or treatment operation, or transmission facility to submit a permit application in accordance with paragraph (c)(1)(i) of this section.

(iv) The Director may require additional information under § 122.21(g)(13) of this Part and may require any facility subject to paragraph (c)(1)(ii) of this section to comply with paragraph (c)(1)(i) of this section.

(2) *Group application for discharges associated with industrial activity.* In lieu of individual applications for storm water discharges associated with industrial activity, a group application may be filed by an entity representing a group of applicants that are part of the same subcategory (see 40 CFR Subchapter N) or, where such grouping is inapplicable, are sufficiently similar as to be appropriate for general permit coverage under § 122.28 of this Part. The Part 1 application (Parts 1A and 1B) shall be submitted to the Office of Water Enforcement and Permits, U.S. EPA, 401 M Street, SW., Washington, DC 20460 for approval. Once a Part 1 application is approved, group applicants are to submit Part 2 of the group application to the Office of Water Enforcement and Permits. A group application shall consist of:

(i) *Part 1A.* Part 1A of a group application shall:

(A) Identify the participants in the group application by name and location. Facilities participating in the group application shall be listed in nine subdivisions, based on the facility location relative to the nine precipitation zones indicated in Appendix E to this Part.

(B) Include a narrative description summarizing the industrial activities of participants of the group application and explaining why the participants, as a whole, are sufficiently similar to be covered by a general permit;

(C) Include a list of significant materials stored outside by participants in the group application and materials management practices employed to minimize contact by these materials with storm water runoff;

(D) Identify 10 percent of the dischargers participating in the group application with a minimum of 10 dischargers, and either a minimum of 2 dischargers from each precipitation zone indicated in Appendix E of this Part in which two or more members of the group are located, or one discharger from each precipitation zone indicated in Appendix E of this Part in which only one member of the group is located) from which quantitative data will be submitted in Part 2. If more than 1,000 facilities are identified in a group application, no more than 100 dischargers must submit quantitative data in Part 2. A description of why the facilities selected to perform sampling and analysis are representative of the group as a whole, in terms of the information provided in paragraphs (c)(2)(i)(B) and (i)(C) of this section, shall accompany this section. Different factors impacting the nature of the storm water discharges, such as processes used and material management, shall be represented, to the extent feasible, in a manner roughly equivalent to their proportion in the group.

(ii) *Part 1B.* Part 1B of the group application shall, for each participant in the group application:

(A) Provide the information described under § 122.26(c)(1)(i) (A), (B), (C) and (D) of this Part;

(B) List all constituents that are addressed in a NPDES permit issued to the facility for any non-storm water discharge; and

(C) Include a narrative description of industrial activities at the facility that are different from or that are in addition

to the activities described under paragraph (c)(2)(i)(B) of this section.

(iii) *Part 2.* Part 2 of a group application shall contain quantitative data (NPDES Form 2F) as modified by paragraph (c)(1) of this section so that when Part 1 and Part 2 of the group application are taken together, a complete NPDES application (Form 1, Form 2C and Form 2F) can be evaluated for each discharger identified in paragraph (c)(2)(i)(D) of this section.

(d) *Application requirements for large and medium municipal separate storm sewer discharges.* The operator of a discharge from a large or medium municipal separate storm sewer or a municipal separate storm sewer that is designated by the Director under paragraph (a)(1)(V) of this section, may submit a jurisdiction-wide or system-wide permit application. Where more than one public entity owns or operates a municipal separate storm sewer within a geographic area (including adjacent or interconnected municipal separate storm sewer systems), such operators may be a coapplicant to the same application. Permit applications for discharges from large and medium municipal storm sewers or municipal storm sewers designated under paragraph (a)(1)(v) of this section shall include:

(1) *Part 1.* Part 1 of the application shall consist of:

(i) *General Information.* The applicants' name, address, telephone number, ownership status and status as a Federal, State or local government entity.

(ii) *Legal Authority.* A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(i) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

(iii) *Source Identification.*

(A) A description of the historic use of ordinances, guidance or other controls which limited the discharge of non-storm water discharges to any Publicly Owned Treatment Works serving the same area as the municipal separate storm sewer system.

(B) A USGS 7.5 minute topographic map (or equivalent topographic map with a scale between 1:10,000 and 1:24,000 if cost-effective) extended one mile beyond the service boundaries of the municipal storm sewer system covered by the permit application. The following information shall be provided:

(*1*) The location of known municipal storm sewer system outfalls discharging to waters of the United States;

(*2*) An estimate of the outer perimeter and area of the drainage area associated with each major outfall and a description of the land use activities (e.g. divisions indicating undeveloped, residential, commercial, agricultural and industrial uses) accompanied with estimates of population densities and projected growth for a ten year period within the drainage area. For each land use division, an etimate of a runoff coefficient shall be provided;

(*3*) The name, address, location, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge to the municipal separate storm sewer storm water associated with industrial activity;

(*4*) The location and a description of the activities of the facility of each currently operating or closed municipal landfill or other treatment, storage or disposal facility for municipal waste;

(*5*) The location and the permit number of any known discharge to the municipal storm sewer that has been issued a NPDES permit;

(*6*) The location of major structural controls for storm water discharge (retention basins, detention basins, major infiltration devices, etc.); and

(*7*) The identification of publicly owned lands.

(iv) *Discharge Characterization.*

(A) Monthly mean rain and snow fall estimates and the monthly average number of storm events.

(B) Existing quantitative data describing the volume and quality of discharges from the municipal storm sewer, including a description of the outfall sampled, sampling procedures and analytical methods used.

(C) A list of water bodies that receive discharges from the municipal separate storm sewer system, including downstream segments, lakes and estuaries where pollutants from the system discharges may accumulate and cause water degradation and a brief description of known water quality impacts. At a minimum, the description of impacts shall include a description of whether the water bodies receiving such discharges have been:

(*1*) Assessed and reported in Section 305(b) reports submitted by the State, the basis for the assessment (evaluated or monitored), a summary of designated use support and attainment of Clean Water Act (CWA) goals (fishable and swimmable waters), and causes of nonsupport of designated uses;

(*2*) Listed under section 304(1)(1)(A)(i), 304(1)(1)(A)(ii), or 304(1)(1)(B) of the CWA that is not expected to meet water quality standards or water quality goals;

(*3*) Waterbodies listed in State Nonpoint Source Assessments required by Section 319(a) of the CWA that, without additional action to control nonpoint sources of pollution, cannot reasonably be expected to attain or maintain water quality standards in which storm sewers, construction, highway maintenance and runoff from municipal landfills and municipal sludge adds significant pollution (or contributes to a violation of water quality standards);

(*4*) Identified and classified according to eutrophic condition of publicly owned lakes listed in State reports required under Section 314(a) of the CWA and a description of those publicly owned lakes for which uses are known to be impaired, and a description of procedures, processes and methods relating to pollutants discharges in municipal systems to control sources of pollutants on such lakes and a description of methods and procedures to restore the quality of such lakes;

(*5*) Areas of concern of the Great Lakes that have been identified by the International Joint Commission;

(*6*) Estuaries of national significance that have been designated under the National Estuary Program under § 320 of the CWA;

(*7*) Other water bodies that the applicant recognizes as highly valued or sensitive waters; and

(*8*) Existing data showing pollutants in bottom sediments, fish tissue or biosurvey data.

(D) *Field Screening Analysis.* Results of a field screening analysis for illicit connections and illegal dumping for all major outfalls covered in the permit application. At a minimum, a screening analysis shall include a narrative description for each major outfall of a visual observation made during a dry weather period. If any flow is observed, two grab samples shall be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a narrative description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observation regarding the potential presence of non-storm water discharges or illegal dumping shall be provided. In addition, a narrative description of the results of a field analysis using suitable methods to estimate pH, total chlorine, total copper, total phenol, total and hexavalant chromium, detergents (or surfactants) and free cyanide shall be

provided along with an estimate of the flow rate. Where the field analysis does not involve analytical method approved under 40 CFR Part 136, the applicant shall provide a description of the method used including the name of the manufacturer of the test method along with the range and accuracy of the test.

(E) *Characterization plan.* Information and a proposed program to meet the requirements of paragraph (d)(2)(iii) of this Section. Such description shall include:

(*1*) The identification of major outfalls that, based on information provided in the field screen analysis of paragraph (d)(1)(iv)(D) of this paragraph and other relevant information, are suspected of containing illicit discharges, for sampling under paragraph (d)(2)(iii)(A) of this section; for identified outfalls, a plan to detect and control illicit discharges and improper disposal to the storm sewer may be submitted in lieu of sampling under paragraph (d)(2)(iii)(A) of this section; and

(*2*) The location of outfalls appropriate for representative data collection under paragraph (d)(2)(iii)(B) of this section, a description of why the outfall is representative, the seasons during which sampling is intended, a description of the sampling equipment. The proposed location of outfalls for such sampling should reflect water quality concerns (see paragraph (d)(1)(iv)(C) of this section) to the extent practicable.

(v) *Management Programs.*

(A) A description of the existing management program to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented, accompanied with an estimate of the reduction of pollutant loads. Such controls may include, but are not limited to: procedures to control pollution resulting from construction activities, floodplain management controls, wetland protection measures, best management practices for new subdivisions and emergency spill response programs. The description may address controls established under State law as well as local controls.

(B) A description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.

(*2*) *Part 2.* Part 2 of the application shall consist of:

(i) *Adequate Legal Authority.* A demonstration that the applicant shall operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by each storm water discharge associated with industrial activity or the quantity of storm water discharged from sites of industrial activity;

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;

(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;

(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

(E) Require compliance with conditions in ordinances, permits, contracts or orders; and

(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

(ii) *Source Identification.* The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(*1*) of this section. For any major outfall identified under this paragraph but not identified in Part 1 of the application, the applicant shall submit appropriate information required under paragraph (d)(1)(iv)(D) of this section;

(iii) *Characterization data.* When "quantitative data" for a pollutant are required under paragraphs (d)(2)(iii)(A)(*3*), (B)(*4*) and (B)(*5*) of this section, the applicant must collect a sample of effluent in accordance with 40 CFR 122.21(g)(7) and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR Part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. The applicant must provide information characterizing the quality and quantity of discharges covered in the permit application, including:

(A) Dry weather and storm event sampling requirements established by the Director on the basis of the results of the screening analysis for illicit discharges and illegal dumping submitted under paragraph (d)(1)(ix) of this section. At a minimum, the Director shall require that for appropriate major outfalls:

(*1*) An estimate of the dry weather flow be provided and a 24-hour composite sample be collected during dry weather;

(*2*) Samples be collected of a storm water discharge from a representative storm event and an estimate of the flowrate during the storm event, the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event be provided; and

(*3*) For samples collected under paragraphs (d)(2)(iii) (A)(*1*) and (A)(*2*) of this section, quantitative data shall be provided for:

pH; lead
fecal coliform; copper
fecal streptococcus; chromium
volatile organic carbon (VOC); cadmium
surfactant (MBAS); silver
oil and grease; nickel
TSS; zinc
total organic carbon (TOC); cyanides
biological oxygen demand (BOD_5); total phenol
chemical oxygen demand (COD)

(B) Quantitative data from representative outfalls designate by the Director (based on information received in Part 1 of the application, the Director shall designate between five and ten outfalls as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system or, where there are less than five outfalls covered in the application, the Director shall designate all outfalls) including:

(*1*) For each outfall designated under this subparagraph, the applicant shall collect samples of a storm water discharge from a representative storm event;

(*2*) For a minimum of one outfall designated under this subparagraph, the applicant shall collect samples of storm water discharges from three representative storm events that occur at last one month apart;

(*3*) The applicant shall provide a narrative description of the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(4) For samples collected under paragraphs (d)(2)(iii)(B)(1) and (B)(2) of this section, quantitative data shall be provided for: the organic pollutants listed in Table II (except bis (chlormethyl) ether, dichlorofluoromethane and trichlorofluoremethane); the pollutants listed in Table III (toxic metals, cyanide, and total phenol) of Appendix D of 40 CFR Part 122, and for the following pollutants:

total suspended solids (TSS); dissolved solids
COD; BOD_5
oil and grease; fecal coliform
fecal streptococcus; pH
total nitrogen; dissolved phosphorus
total ammonia plus organic nitrogen; total phosphorus

(5) Additional quantitative data required by the Director (the Director may require that quantitative data shall be provided for additional parameters, and may establish sampling conditions such as the location, season of sample collection, form of precipitation (snow melt, rainfall) and other parameters necessary to insure representativeness);

(C) Estimates of the annual pollutant load of the cumulative discharges from all outfalls (including outfalls that are not classified as major outfalls) represented in the permit application and the event mean concentration of the cumulative discharge from all outfalls (including outfalls that are not classified as major outfalls) represented in the permit application during a representative storm for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including a description of the representative storm, discharge monitoring, modelling, data analysis, and calculation methods;

(D) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(1) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(B) of this section; and

(E) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

(iv) *Proposed management program.* A proposed program covers the duration of the permit including a comprehensive planning process which includes public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a system-wide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls. Such programs shall be based on a consideration of appropriate controls including:

(A) A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls. At a minimum, the description shall include:

(1) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants in discharges from municipal separate storm sewers;

(2) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed. (Controls to reduce pollutants in discharges from municipal separate storm sewers containing construction site runoff are addressed in paragraph (d)(2)(iv)(D) of this section;

(3) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems;

(4) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies;

(5) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section); and

(6) A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

(B) A description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer. The proposed program shall include:

(1) A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system;

(2) A description of sampling requirements during storm events and during non-storm events for the following constituents: fecal coliform, fecal streptococcus, VOC, surfactants (MBAS), and residual chlorine;

(3) A description of other testing programs based on smoke testing, and testing with fluorometric dyes;

(4) A description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer;

(5) A description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewer

(6) A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and

disposal of used oil and toxic materials; and

(7) A description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary.

(C) A description of a program to monitor pollutants in runoff from industrial facilities that discharge to the municipal storm sewer, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges.

(D) A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include:

(1) A description of procedures for site planning which incorporate consideration of potential water quality impacts;

(2) A description of requirements for nonstructural and structural best management practices;

(3) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and

(4) A description of appropriate educational and training measures for construction site operators.

(v) *Assessment of Controls.* Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment will also identify known impacts of storm water controls on ground water.

(vi) *Fiscal Analysis.* For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the proposed programs under paragraphs (d)(2)(iii) and (d)(2)(iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination.

(viii) Where such requirements are not practicable to are not applicable, the Director may exclude any operator of a discharge from a municipal separate storm sewer which is designated under paragraph (a)(1)(v), (b)(4)(ii) or (b)(7)(ii) of this section from the requirements of paragraphs (d)(1)(iv)(E)(7), (d)(2)(ii), (d)(2)(iii)(B) of this section and non-applicable portions of paragraph (d)(2)(iv) of this section. The Director shall not exclude from any permit application requirements under this paragraph, the operator of a discharge from a municipal separate storm sewer that is owned or operated by, or public conveyances within, an incorporated place with a population of 100,000 or more as determined by the most recent Bureau of Census estimates.

(e) *Application deadlines.* Any operator of a point source required to obtain a permit under paragraph (a)(1) of this section that does not have an effective NPDES permit covering its storm water outfalls shall submit an application in accordance with the following deadlines:

(1) For any storm water discharge associated with industrial activity that is not part of a group application as described in paragraph (c)(2), of this section, the application shall be submitted to the Director by [*insert 12 months from date of publication of final rule*];

(2) For any group application:

(i) Part 1 of the application shall be submitted to the Director, Office of Water Enforcement and Permits by [*insert 120 days from the date of publication of final rule*];

(ii) Based on information in the Part 1 application, the Director will approve or deny the members in the group application within 60 days after receiving Part 1 of the group application.

(iii) Part 2 of the application shall be submitted to the Director, Office of Water Enforcement and Permits by [*insert 18 months from the date of publication of final rule*].

(3) For any discharge from a large municipal separate storm sewer:

(i) Part 1 of the application shall be submitted to the Director by [*insert 12 months from date of publication of final rule*];

(ii) Based on information received in the Part 1 application the Director will approve or deny a sampling plan within 90 days after receiving the Part 1 application;

(iii) Part 2 of the application shall be submitted to the Director by [*insert 24 months from date of publication of final rule*].

(4) For any discharge from a medium municipal separate storm sewer:

(i) Part 1 of the application shall be submitted to the Director by November 4, 1990.

(ii) Based on information received in the Part 1 application the Director will approve or deny a sampling plan within 90 days after receiving the Part 1 application.

(iii) Part 2 of the application shall be submitted to the Director by February 4, 1992.

(5) A permit application shall be submitted to the Director within 60 days of notice, unless permission for a later date is granted by the Director (see 40 CFR 124.52(c)), for:

(i) A storm water discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines that the discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States (see paragraph (a)(1)(v) of this section);

(ii) A discharge of storm water associated with industrial activity to a municipal separate storm sewer for which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, requires an individual permit under paragraph 122.26(a)(3)(vii)(B);

(iii) A storm water discharge from an oil or gas exploration, production, processing or treatment operation or transmission facility which is required to submit a permit application on a case-by-case basis under paragraph (c)(1)(iii)(B) of this section; or

(iv) A storm water discharge subject to paragraph (c)(1)(iv) of this section.

(f) *Petitions.* (1) Any operator of a municipal separate storm sewer system may petition the Director to require a separate NPDES permit (or a permit issued under an approved NPDES State program) for any discharge into the municipal separate storm sewer system.

(2) Any person may petition the Director to require an NPDES permit (or a permit issued under an approved NPDES State program) for a discharge which is composed entirely of storm water which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(3) The owner or operator of a municipal separate storm sewer system may petition the Director to reduce the population served by such separate system to account for storm water discharged to combined sewers as defined by 40 CFR 35.2005(b)(11) that is treated in a publicly owned treatment works. In municipalities in which combined sewers are operated, the Census estimates of population may be

reduced proportional to the fraction, based by estimating lengths, of length of combined sewers over the sum of the lengths of combined sewers and municipal separate storm sewers where an applicant has submitted the NPDES permit number associated with each discharge point and a map indicating areas served by combined sewers and the location of any combined sewer overflow discharge point.

(4) The Director shall make a final determination on any petition received under this section within 90 days after receiving the petition.

6. Section 122.28(b)(2)(i)(A) is revised to read as follows:

§ 122.28 General permits (applicable to State NPDES programs, see § 123.25.

* * * * *

(b) * * *

(2) * * *

(i) * * *

(A) The discharge(s) is a significant contributor of pollution. In making this determination, the Director may consider the following factors:

(1) The location of the discharge with respect to waters of the United States;

(2) The size of the discharge;

(3) The quantity and nature of the pollutants discharged to waters of the United States; and

(4) Other relevant factors;

* * * * *

7. Section 122.42 is amended by adding paragraph (c) to read as follows:

§ 122.42 Additional conditions applicable to specified categories of NPDES permits (applicable to State NPDES programs, see § 123.25)

* * ANNUAL REPORT REQUIREMENTS

(c) *Municipal Separate Storm Sewer Systems.* The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the Director under § 122.26(a)(1)(v) of this Part must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report shall include:

(1) The status of implementing the components of the storm water management program that are established as permit conditions;

(2) Proposed changes to the storm water management programs that are established as permit condition. Such proposed changes shall be consistent with § 122.26(d)(2)(iii) of this Part; and

(3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under § 122.26(d)(2)(iv) and (d)(2)(v) of this Part.

7a. Appendix E is added to Part 122 to read as follows:

PART 123—STATE PROGRAM REQUIREMENTS

8. The authority citation for Part 123 continues to read as follows:

Authority: Clean Water Act, 33 U.S.C. 1251 et seq.

9. Section 123.25(a)(9) is revised to read as follows:

§ 123.25 Requirements for permitting.

(a) • • •

(9) Section 122.26—(Storm water discharges);

• • • • •

PART 124—PROCEDURES FOR DECISIONMAKING

10. The authority citation for Part 124 is revised to read as follows:

Authority: Resource Conservation and Recovery Act, 42 U.S.C. 6901 et seq.; Safe Drinking Water Act, 42 U.S.C. 300f et seq.; Clean Water Act, 33 U.S.C. 1251 et seq.; and Clean Air Act, 42 U.S.C. 1857 et seq.

11. Section 124.52 is amended by revising paragraph (b) and adding paragraph (c) to read as follows:

§ 124.52 Permits required on a case-by-case basis.

• • • • •

(b) Whenever the Regional Administrator decides that an individual permit is required under this section, except as provided in paragraph (c) of this section, the Regional Administrator shall notify the discharger in writing of that decision and the reasons for it, and shall send an application form with the notice. The discharger must apply for a permit under § 122.21 within 60 days of notice. The question whether the designation was proper will remain open for consideration during the public comment period under § 124.11 or § 124.118 and in any subsequent hearing.

(c) Prior to a case-by-case determination that an individual permit is required for a storm water discharge under this section (see 40 CFR 122.26(a)(1)(v), (c)(1)(iii) and (c)(1)(iv)), the Regional Administrator may require the discharger to submit a permit application or other information regarding the discharge under section 308 of the CWA. In requiring such information, the Regional Administrator shall notify the discharger in writing and shall send an application form with the notice. The discharger must apply for a permit under § 122.26 within 60 days of notice, unless permission for a later date is granted by the Regional Administrator. The question whether the initial designation was proper will remain open for consideration during the public comment period under § 124.11 or § 124.118 and in any subsequent hearing.

12. Part 504 is added to read as follows:

PART 504—STATE STORM WATER MANAGEMENT PROGRAMS

Sec.

504.0 Program summary and purpose.

504.3 Storm water management plans.

Authority: Clean Water Act, 33 U.S.C. 1251 et seq.

§ 504.0 Program summary and purpose.

(a) This subpart establishes State storm water management programs under section 402(p) of Clean Water Act. State storm water management programs, along with the NPDES requirements for storm water discharges, are to establish comprehensive programs to regulate storm water discharges, including a framework for establishing procedures and methods to control storm water discharges.

(b) State storm water management programs are to include the development of management plans to assist continuing planning necessary to implement comprehensive programs to regulate storm water discharges to mitigate water quality impacts. Initially, State storm water management plans will provide States with a voluntary means of participating in studies of storm water discharges under Section 402(p)(5) of the CWA.

§ 504.3 Storm water management plans

EPA requests that States wishing to participate in studies of storm water discharges under Section 402(p)(5) of the CWA, prepare and submit storm water management plans which include the following plan elements or reference such plan elements contained in separate documents:

(a) Existing State programs, including appropriate Non-Point Source programs, to reduce pollutants in discharges from municipal separate storm sewers and other storm water discharges;

(b) Storm water discharges or classes of storm water discharges in addition to storm water discharges described in 40 CFR 122.26(a). At a minimum, plans should include the identification of municipal agencies which own or operate or are otherwise responsible for discharges from municipal separate storm sewers including State agencies, county agencies associated with cities, towns, villages, townships, with a population of 10,000 or more, or located in whole or in part in urban areas designated by the Bureau of Census. Such identification shall include a description of the limitations under State law of legal authorities of such municipal agencies in developing and implementing measures to reduce pollutants in discharges from municipal separate storm sewers;

(c) To the maximum extent practicable, the nature and extent of pollutants in such discharges;

(d) Procedures and methods to contro' storm water discharges to the extent necessary to mitigate impacts on water quality; and

(e) Priorities for developing a comprehensive program to reduce pollutants in storm water discharges. Priorities should be based on:

(1) The magnitude of water quality impacts associated with storm water discharges on various receiving waters relative to other discharges causing water quality impacts;

(2) The nature of the storm water discharges considering:

(i) The nature of impacts on receiving waters;

(ii) The size of and pollutants in the storm water discharges;

(iii) The nature of the pollution source;

(iv) Available measures to reduce pollutants in storm water discharges; and

(v) Other relevant factors.

Application for Permit To Discharge Stormwater Discharges Associated with Industrial Activity

Paperwork Reduction Act Notice

Public reporting burden for the application is estimated to average 31.6 hours per application, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate, any other aspect of this collection of information, or suggestions for improving this form, including suggestions which may increase or reduce this burden to: Chief, Information Policy Branch, PM-223, U.S. Environmental Protection Agency, 401 M St., SW, Washington, DC 20460, or Director, Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503

I. Outfall Location

For each outfall, list the latitude and longitude of its location to the nearest 15 seconds and the name of the receiving water.

A. Outfall Number (list)	B. Latitude	C. Longitude	D. Receiving Water (name)

II. Improvements

A. Are you now required by any Federal, State, or local authority to meet any implementation schedule for the construction, upgrading or operation of wastewater treatment equipment or practices or any other environmental programs which may affect the discharges described in this application? This includes, but is not limited to, permit conditions, administrative or enforcement orders, enforcement compliance schedule letters, stipulations, court orders, and grant or loan conditions.

1. Identification of Conditions, Agreements, Etc.	2. Affected Outfalls: number	2. Affected Outfalls: source of discharge	3. Brief Description of Project	4. Final Compliance Date: a. req.	4. Final Compliance Date: b. proj.

B. You may attach additional sheets describing any additional water pollution (or other environmental projects which may affect your discharges) you now have under way or which you plan. Indicate whether each program is now under way or planned, and indicate your actual or planned schedules for construction.

III. Site Drainage Map

Attach a site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) depicting the facility including: each of its intake and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall; each past or present areas used for outdoor storage or disposal of significant materials; each existing structural control measure to reduce pollutants in storm water runoff; materials loading and access areas; areas where pesticides, herbicides, soil conditioners and fertilizers are applied; each of its hazardous waste treatment, storage or disposal units (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility.

Continue on Page 2

Continued from the Front

IV. Narrative Description of Pollutant Sources

A. For each outfall, provide an estimate of the area (include units) of impervious surfaces (including paved areas and building roofs) drained to the outfall, and an estimate of the total surface area drained by the outfall.

Outfall Number	Area of Impervious Surface (provide units)	Total Area Drained (provide units)	Outfall Number	Area of Impervious Surface (provide units)	Total Area Drained (provide units)

B. Provide a narrative description of significant materials that are currently or in the past have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage, or disposal; past and present materials management practices employed to minimize contact by these materials with storm water runoff; materials loading and access areas; and the location, manner, and frequency in which pesticides, herbicides, soil conditioners, and fertilizers are applied.

C. For each outfall, provide the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff, and a description of the treatment the storm water receives, including the schedule and type of maintenance for control and treatment measures and the ultimate disposal of any solid or fluid wastes other than by discharge.

Outfall Number	Treatment	List Codes from Table 2F-1

V. Nonstormwater Discharges

A. I certify under penalty of law that the outfall(s) covered by this application have been tested for the presence of nonstormwater discharges, and that all nonstormwater discharges from these outfall(s) are identified in either an accompanying Form 2C or Form 2E application for the outfall.

Name and Official Title (type or print)	Signature	Date Signed

B. Provide a description of the method used, the date of any testing, and the onsite drainage points that were directly observed during a test.

VI. Significant Leaks or Spills

Provide existing information regarding the history of significant leaks or spills of toxic or hazardous pollutants at the facility, including the approximate date and location of the spill or leak, and the type and amount of material released.

Continued from Page 2

EPA ID Number (copy from Item I of Form 1)

VII. Discharge Information

A,B,C, & D: See instructions before proceeding. Complete one set of tables for each outfall. Annotate the outfall number in the space provided. Tables VII-A, VII-B, and VII-C are included on separate sheets numbered VII-1 and VII-2

E. Potential discharges not covered by analyses - Is any pollutant listed in Table 2F-2 a substance or a component of a substance which you currently use or manufacture as an intermediate or final product or byproduct?

☐ Yes (list all such pollutants below) ☐ No (go to Section IX)

VIII. Biological Toxicity Testing Data

Do you have any knowledge or reason to believe that any biological test for acute or chronic toxicity has been made on any of your discharges or on a receiving water in relation to your discharge within the last 3 years?

☐ Yes (list all such pollutants below) ☐ No (go to Section IX)

IX. Contract Analysis Information

Were any of the analyses reported in Item V performed by a contract laboratory or consulting firm?

☐ Yes (list the name, address, and telephone number of, and pollutants analyzed by, each such laboratory or firm below) ☐ No (go to Section X)

A. Name	B. Address	C. Area Code & Phone No.	D. Pollutants Analyzed

X. Certification

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

A. Name & Official Title (type or print)	B. Area Code and Phone No.
C. Signature	D. Date Signed

VOL 23

VII. Discharge Information (*Continued from page 3 of Form 2F*)

Part A - You must provide the results of at least one analysis for every pollutant in this table. Complete one table for each outfall. See instructions for additional details.

Pollutant and CAS Number (*if available*)	Maximum Values (*include units*)		Average Values (*include units*)		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 20 Minutes	Flow-weighted Composite	Grab Sample Taken During First 20 Minutes	Flow-weighted Composite		
Oil and Grease						
Biological Oxygen Demand (BOD5)						
Chemical Oxygen Demand (COD)						
Total Suspended Solids (TSS)						
Total Nitrogen						
Total Phosphorus						
pH	Minimum	Maximum	Minimum	Maximum		

Part B - List each pollutant that is limited in an effluent guideline which the facility is subject to or any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit). Complete one table for each outfall. See the instructions for additional details and requirements.

Pollutant and CAS Number (*if available*)	Maximum Values (*include units*)		Average Values (*include units*)		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 20 Minutes	Flow-weighted Composite	Grab Sample Taken During First 20 Minutes	Flow-weighted Composite

VOL 23

0273

Continued from the Front

Part C - List each pollutant shown in Tables 2F-2, 2F-3, and 2F-4 that you know or have reason to believe is present. See the instructions for additional details and requirements. Complete one table for each outfall.

Pollutant and CAS Number *(if available)*	Maximum Values *(include units)*		Average Values *(include units)*		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 20 Minutes	Flow-weighted Composite	Grab Sample Taken During First 20 Minutes	Flow-weighted Composite		

Part D - Provide data for the storm event(s) which resulted in the maximum values for the flow weighted composite sample.

1. Date of Storm Event	2. Duration of Storm *(in minutes)*	3. Total rainfall during storm event *(in inches)*	4. Number of hours between beginning of storm measured and end of previous measurable rain event	5. Maximum flow rate during rain event *(gallons/minute or specify units)*	6. Total flow from rain event *(gallons or specify units)*

7. Provide a description of the method of flow measurement or estimate.

EPA Form 3510-2F (12-88)

BILLING CODE 6560-50-C

R0066255

Instructions—Form 2F

Application for Permit to Discharge Stormwater Associated with Industrial Activity

Who Must File Form 2F

Form 2F must be completed by operators of facilities which discharge stormwater associated with industrial activity or by operators of stormwater discharges that EPA is evaluating for designation as a significant contributor of pollutants to waters of the United States, or as contributing to a violation of a water quality standard.

Operators of discharges which are composed entirely of stormwater must complete Form 2F (EPA Form 3510-2F) in conjunction with Form 1 (EPA Form 3510-1).

Operators of discharges of stormwater which are combined with process wastewater (process wastewater is water that comes into direct contact with or results from the production or use of any raw material, intermediate product, finished product, byproduct, waste product, or wastewater) must complete and submit Form 2F, Form 1, and Form 2C (EPA Form 3510-2C).

Operators of discharges of stormwater which are combined with nonprocess wastewater (nonprocess wastewater includes noncontact cooling water and sanitary wastes which are not regulated by effluent guidelines or a new source performance standard, except discharges by educational, medical, or commercial chemical laboratories) must complete Form 1, Form 2F, and Form 2E (EPA Form 3510-2E).

Operators of new sources or new discharges of stormwater associated with industrial activity which will be combined with other nonstormwater new sources or new discharges must submit Form 1, Form 2F, and Form 2D (EPA Form 3510-2D).

Where to File Applications

The application forms should be sent to the EPA Regional Office which covers the State in which the facility is located. Form 2F must be used only when applying for permits in States where the NPDES permits program is administered by EPA. For facilities located in States which are approved to administer the NPDES permits program, the State environmental agency should be contacted for proper permit application forms and instructions.

Information on whether a particular program is administered by EPA or by a State agency can be obtained from your EPA Regional Office. Form 1, Table 1 of the "General Instructions" lists the addresses of EPA Regional Offices and the States within the jurisdiction of each Office.

Completeness

Your application will not be considered complete unless you answer every question on this form and on Form 1. If an item does not apply to you, enter "NA" (for not applicable) to show that you considered the question.

Public Availability of Submitted Information

You may not claim as confidential any information required by this form or Form 1, whether the information is reported on the forms or in an attachment. Section 402(j) of the Clean Water Act requires that all permit applications will be available to the public. This information will be made available to the public upon request.

Any information you submit to EPA which goes beyond that required by this form, Form 1, or Form 2C you may claim as confidential, but claims for information which are effluent data will be denied.

If you do not assert a claim of confidentiality at the time of submitting the information, EPA may make the information public without further notice to you. Claims of confidentiality will be handled in accordance with EPA's business confidentiality regulations at 40 CFR Part 2.

Definitions

All significant terms used in these instructions and in the form are defined in the glossary found in the General Instructions which accompany Form 1.

EPA ID Number

Fill in your EPA Identification Number at the top of each odd-numbered page of Form 2F. You may copy this number directly from item I of Form 1.

Item I

You may use the map you provided for item XI of Form 1 to determine the latitude and longitude of each of your outfalls and the name of the receiving water.

Item II-A

If you check "yes" to this question, complete all parts of the chart, or attach a copy of any previous submission you have made to EPA containing the same information.

Item II-B

You are not required to submit a description of future pollution control projects if you do not wish to or if none is planned.

Item III

Attach a site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) depicting the facility including:

- each of its drainage and discharge structures;
- the drainage area of each stormwater outfall;
- paved areas and building within the drainage area of each stormwater outfall, each past or present areas used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in stormwater runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied;
- each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste for less than 90 days under 40 CFR 262.34);
- each well where fluids from the facility are injected underground; and
- springs, and other surface water bodies which receive stormwater discharges from the facility;

Item IV-A

For each outfall, provide an estimate of the area drained by the outfall which is covered by impervious surfaces. For the purpose of this application, impervious surfaces are surfaces where stormwater runs off at rates that are significantly higher than background rates (e.g., predevelopment levels) and include paved areas, building roofs, parking lots, and roadways. Include an estimate of the total area (including all impervious and pervious areas) drained by each outfall. The site map required under item III can be used to estimate the total area drained by each outfall.

Item IV-B

Provide a narrative description of significant materials that are currently or in the past have been treated, stored, or disposed in a manner to allow exposure to stormwater; method of treatment, storage or disposal of these materials; past and present materials management practices employed to minimize contact by these materials with stormwater runoff; materials loading and access areas; and the location, manner, and frequency in which pesticides, herbicides, soil conditioners, and fertilizers are applied.

Significant materials should be identified by chemical name, form (e.g., powder, liquid, etc.), and type of container or treatment unit. Indicate any materials treated, stored, or disposed of together.

Item IV-C

For each outfall, structural controls include structures which enclose material handling or storage areas, covering materials, berms, dikes, or diversion ditches around manufacturing, production, storage or treatment units, retention ponds, etc. Nonstructural controls include practices such as spill prevention plans, employee training, visual inspections, preventive maintenance, and housekeeping measures that are used to prevent or minimize the potential for releases of pollutants.

Item V

Provide a certification that all outfalls that should contain stormwater discharges associated with industrial activity have been tested for the presence of nonstormwater discharges which are not covered by an NPDES permit. Tests for such nonstormwater discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. Part B must include a description of the method used, the date of any testing, and the onsite drainage points that were directly observed during a test. All nonstormwater discharges must be identified in a Form 2C or Form 2E which must accompany this application (see beginning of instructions under section titled "Who Must File Form 2F" for a description of when Form 2C and Form 2E must be submitted).

Item VI

Provide a description of existing information regarding the history of significant leaks or spills of toxic or hazardous pollutants at the facility. Significant spills at a facility include releases of oil or hazardous substances in excess of reportable quantities under section 311 of the Clean Water Act (see 40 CFR 110.10 and 40 CFR 117.21) or section 102 of CERCLA (see 40 CFR 302.4).

Items VII-A, B, and C

These items require you to collect and report data on the pollutants discharged for each of your outfalls. Each part of this item addresses a different set of pollutants and must be completed in accordance with the specific instructions for that part. The following general instructions apply to the entire item.

General Instructions

Part A requires you to report at least one analysis for each pollutant listed. Parts B and C require you to report analytical data in two ways. For some pollutants addressed in Parts B and C, if you know or have reason to know that the pollutant is present in your discharge, you may be required to list the pollutant and test (sample and analyze) and report the levels of the pollutants in your discharge. For all other pollutants addressed in Parts B and C, you must list the pollutant if you know or have reason to know that the pollutant is present in the discharge, and either report quantitative data for the pollutant or briefly describe the reasons the pollutant is expected to be discharged. (See specific instructions on the form and below for Parts A through C.) Base your determination that a pollutant is present in or absent from your discharge on your knowledge of your raw materials, material management practices, maintenance chemicals, history of spills and releases, intermediate and final products and byproducts, and any previous analyses known to you of your effluent or similar effluent.

A. Sampling: The collection of the samples for the reported analyses should be supervised by a person experienced in performing sampling of industrial wastewater or stormwater discharges. You may contact EPA or your State permitting authority for detailed guidance on sampling techniques and for answers to specific questions. Any specific requirements contained in the applicable analytical methods should be followed for sample containers, sample preservation, holding times, the collection of duplicate samples, etc. The time when you sample should be representative, to the extent feasible, of your treatment system operating properly with no system upsets. Samples should be collected from the center of the flow channel, where turbulence is at a maximum, at a site specified in your present permit, or at any site adequate for the collection of a representative sample.

For pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, and fecal coliform, grab samples taken during the first 20 minutes of the discharge must be used (you are not required to analyze a flow-weighted composite for these parameters). For all other pollutants both a grab sample collected during the first 20 minutes of the discharge and a flow-weighted composite sample must be analyzed. However, a minimum of one grab sample may be taken for effluents from holding ponds or other impoundments with a retention period of greater than 24 hours.

All samples shall be collected from a discharge resulting from the first storm event after a minimum period of 96 hours without a measurable (greater than 0.1 inch rainfall) storm event.

A grab sample shall be taken during the first twenty minutes of the discharge, and a flow-weighted composite shall be taken for the entire event or for the first three hours of the event.

Grab and composite samples are defined as follows:

Grab sample: An individual sample of at least 100 milliliters collected during the first twenty minutes of the discharge. This sample is to be analyzed separately from the composite sample.

Flow-Weighted Composite sample: A flow-weighted composite sample may be taken with a continuous sampler that proportions the amount of sample collected with the flow rate or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire event or for the first three hours of the event, with each aliquot being at least 100 milliliters and collected with a minimum period of fifteen minutes between aliquot collections. The composite must be flow proportional; either the time interval between each aliquot or the volume of each aliquot must be proportional to either the stream flow at the time of sampling or the total stream flow since the collection of the previous aliquot. Aliquots may be collected manually or automatically. For GC/MS Volatile Organic Analysis (VOA), aliquots must be combined in the laboratory immediately before analysis. Only one analysis for the composite sample is required.

The Agency is currently reviewing sampling requirements in light of recent research on testing methods. Upon completion of its review, the Agency plans to propose changes to the sampling requirements.

Data from samples taken in the past may be used, provided that:

All data requirements are met;

Sampling was done no more than three years before submission; and

All data are representative of the present discharge.

Among the factors which would cause the data to be unrepresentative are significant changes in production level, changes in raw materials, processes, or final products, and changes in stormwater treatment. When the Agency

promulgates new analytical methods in 40 CFR Part 136. EPA will provide information as to when you should use the new methods to generate data on your discharges. Of course, the Director may request additional information, including current quantitative data, if they determine it to be necessary to assess your discharges.

B. Reporting: All levels must be reported as concentration and as total mass. You may report some or all of the required data by attaching separate sheets of paper instead of filling out pages VII-1 and VII-2 if the separate sheets contain all the required information in a format which is consistent with pages VII-1 and VII-2 in spacing and in identification of pollutants and columns. Use the following abbreviations in the columns headed "Units."

Concentration	Mass
ppm = parts per million	lbs = pounds.
mg/l = milligrams per liter	tons = tons (English tons).
ppb = parts per billion	mg = milligrams.
µg/l = micrograms per liter.	g = grams.
kg = kilograms	T = tonnes (metric tons).

All reporting of values for metals must be in terms of "total recoverable metal," unless:

(1) An applicable, promulgated effluent limitation or standard specifies the limitation for the metal in dissolved, valent, or total form; or

(2) All approved analytical methods for the metal inherently measure only its dissolved form (e.g., hexavalent chromium); or

(3) The permitting authority has determined that in establishing case-by-case limitations it is necessary to express the limitations on the metal in dissolved, valent, or total form to carry out the provisions of the CWA. If you measure only one grab sample and one flow-weighted composite sample for a given outfall, complete only the "Maximum Values" columns and insert "1" into the "Number of Storm Events Sampled" column. The permitting authority may require you to conduct additional analyses to further characterize your discharges.

If you measure more than one value for a grab sample or a flow-weighted composite sample for a given outfall and those values are representative of your discharge, you must report them. You must describe your method of testing and data analysis. You also must determine the average of all values within the last year and report the concentration mass under the "Average Values" columns, and the total number of storm events sampled under the "Number of Storm Events Sampled" columns.

C. Analysis: You must use test methods promulgated in 40 CFR Part 136; however, if none has been promulgated for a particular pollutant, you may use any suitable method for measuring the level of the pollutant in your discharge provided that you submit a description of the method or a reference to a published method. Your description should include the sample holding time, preservation techniques, and the quality control measures which you used. If you have two or more substantially identical outfalls, you may request permission from your permitting authority to sample and analyze only one outfall and submit the results of the analysis for other substantially identical outfalls. If your request is granted by the permitting authority, on a separate sheet attached to the application form, identify which outfall you did test, and describe why the outfalls which you did not test are substantially identical to the outfall which you did test.

Part VII-A

Part VII-A must be completed by all applicants for all outfalls who must complete Form 2F.

Analyze a grab sample collected during the first twenty minutes of the discharge and flow-weighted composite samples for all pollutants in this Part, and report the results except use only grab samples for pH and oil and grease. See discussion in General Instructions to Item VII for definitions of grab sample collected during the first twenty minutes of discharge and flow-weighted composite sample. The "Average Values" column is not compulsory but should be filled out if data are available.

Part VII-B

List all pollutants that are limited in an effluent guideline which the facility is subject to (see 40 CFR Subchapter N to determine which pollutants are limited in effluent guidelines) or any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit). Complete one table for each outfall. See discussion in General Instructions to item VII for definitions of grab sample collected during the first twenty minutes of discharge and flow-weighted composite sample. The "Average Values" column is not compulsory but should be filled out if data are available.

Analyze a grab sample collected during the first twenty minutes of the discharge and flow-weighted composite samples for all pollutants in this Part, and report the results, except as provided in the General Instructions.

Part VII-C

Part VII-C must be completed by all applicants for all outfalls which discharge stormwater associated with industrial activity, or that EPA is evaluating for designation as a significant contributor of pollutants to waters of the United States, or as contributing to a violation of a water quality standard. Use both a grab sample and a composite sample for all pollutants you analyze for in this part except use grab samples for residual chlorine and fecal coliform. The "Average Values" column is not compulsory but should be filled out if data are available. Part C requires you to address the pollutants in Table 2F-2, 2F-3, and 2F-4 for each outfall. Pollutants in each of these Tables are addressed differently.

Table 2F-2: For each outfall, list all pollutants in Table 2F-2 that you know or have reason to believe are discharged (except pollutants previously listed in Part VII-B). If a pollutant is limited in an effluent guideline limitation which the facility is subject to (e.g., use of TSS as an indicator to control the discharge of iron and aluminum), the pollutant should be listed in Part VII-B. If a pollutant in Table 2F-2 is indirectly limited by an effluent guideline limitation through an indicator, you must analyze for it and report data in Part VII-C. For other pollutants listed in Table 2F-2 (those not limited directly or indirectly by an effluent limitation guideline), that you know or have reason to believe are discharged, you must either report quantitative data or briefly describe the reasons the pollutant is expected to be discharged.

Table 2F-3: For each outfall, list all pollutants in Table 2F-3 that you know or have reason to believe are discharged. For every pollutant in Table 2F-3 expected to be discharged in concentrations of 10 ppb or greater, you must submit quantitative data. For acrolein, acrylonitrile, 2,4 dinitrophenol, and 2-methyl-4, 6 dinitrophenol, you must submit quantitative data if any of these four pollutants is expected to be discharged in concentrations of 100 ppb or greater. For every pollutant expected to be discharged in concentrations less than 10 ppb (or 100 ppb for the four pollutants listed above), then you must either submit quantitative data or briefly describe the reasons the pollutant is expected to be discharged.

Small Business Exemption—If you are a "small business," you are exempt from

the reporting requirements for the organic toxic pollutants listed in Table 2F-3. There are two ways in which you can qualify as a "small business". If your facility is a coal mine, and if your probable total annual production is less than 100,000 tons per year, you may submit past production data or estimated future production (such as a schedule of estimated total production under 30 CFR 795.14(c)) instead of conducting analyses for the organic toxic pollutants. If your facility is not a coal mine, and if your gross total annual sales for the most recent three years average less than $100,000 per year (in second quarter 1980 dollars), you may submit sales data for those years instead of conducting analyses for the organic toxic pollutants. The production or sales data must be for the facility which is the source of the discharge. The data should not be limited to production or sales for the process or processes which contribute to the discharge, unless those are the only processes at your facility. For sales data, in situations involving intracorporate transfer of goods and services, the transfer price per unit should approximate market prices for those goods and services as closely as possible. Sales figures for years after 1980 should be indexed to the second quarter of 1980 by using the gross national product price deflator (second quarter of 1980=100). This index is available in National Income and Product Accounts of the United States (Department of Commerce, Bureau of Economic Analysis).

Table 2F-4: For each outfall, list any pollutant in Table 2F-4 that you know or believe to be present in the discharge and explain why you believe it to be present. No analysis is required, but if you have analytical data, you must report them. *NOte:* Under 40 CFR 117.12(a)(2), certain discharges of hazardous substances (listed at 40 CFR 177.21 or 40 CFR 302.4) may be exempted from the requirements of section 311 of CWA, which establishes reporting requirements, civil penalties, and liability for cleanup costs for spills of oil and hazardous substances. A discharge of a particular substance may be exempted if the origin, source, and amount of the discharged substances are identified in the NPDES permit application or in the permit, if the permit contains a requirement for treatment of the discharge, and if the treatment is in place. To apply for an exclusion of the discharge of any hazardous substance from the requirements of section 311, attach additional sheets of paper to your form, setting forth the following information:

1. The substance and the amount of each substance which may be discharged.
2. The origin and source of the discharge of the substance.
3. The treatment which is to be provided for the discharge by:
   a. An onsite treatment system separate from any treatment system treating your normal discharge;
   b. A treatment system designed to treat your normal discharge and which is additionally capable of treating the amount of the substance identified under paragraph 1 above; or
   c. Any combination of the above.

See 40 CFR 117.12 (a)(2) and (c), published on August 29, 1979, in 44 FR 50766, or contact your Regional Office (Table 1 on Form 1, Instructions), for further information on exclusions from section 311.

Part VII-D

If sampling is conducted during more than one storm event, you only need to report the information requested in Part VII-D for the storm event(s) which resulted in any maximum pollutant concentration reported in Part VII-A, VII-B, or VII-C.

Provide flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, the method of flow measurement, or estimation. Provide the data and duration of the storm event(s) sampled, rainfall measurements, or estimates of the storm event which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event.

Part VII-E

List any toxic pollutant listed in Table 2F-2, 2F-3, or 2F-4 which you currently use or manufacture as an intermediate or final product or byproduct. In addition, if you know or have reason to believe that 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) is discharged or if you use or manufacture 2,4,5-trichlorophenoxy acetic acid (2,4,5,-T); 2-(2,4,5-trichlorophenoxy) propanoic acid (Silvex, 2,4,5,-TP); 2-(2,4,5-trichlorophenoxy) ethyl, 2,2-dichloropropionate (Erbon); O,O-dimethyl O-(2,4,5-trichlorphenyl) phosphorothioate (Ronnel); 2,4,5-trichlorophenol (TCP); or hexachlorophene (HCP); then list TCDD. The Director may waive or modify the requirement if you demonstrate that it would be unduly burdensome to identify each toxic pollutant and the Director has adequate information to issue your permit. You may not claim this information as confidential; however, you do not have to distinguish between use or production of the pollutants or list the amounts.

Item VIII

Self explanatory. The permitting authority may ask you to provide additional details after your application is received.

Item X

The Clean Water Act provides for severe penalties for submitting false information on this application form.

Section 309(c)(4) of the Clean Water Act provides that "Any person who knowingly makes any false material statement, representation, or certification in any application, . . . shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction of such person is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both." 40 CFR Part 122.22 requires the certification to be signed as follows:

(A) For a corporation: by a responsible corporate official. For purposes of this section, a responsible corporate official means (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding $25,000,000 (in second-quarter 1980 dollars), if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.

Note: EPA does not require specific assignments or delegation of authority to responsible corporate officers identified in 122.22(a)(1)(i). The Agency will presume that these responsible corporate officers have the requisite authority sign permit applications unless the corporation has notified the Director to the contrary. Corporate procedures governing authority to sign permit applications may provide for assignment or delegation to applicable corporate position under 122.22(a)(1)(ii) rather than to specific individuals.

(B) For a partnership or sole proprietorship: by a general partner or the proprietor, respectively; or

(C) For a municipality, State, Federal, or other public agency: by either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of EPA).

NPDES MEMORANDUM OF AGREEMENT BETWEEN
THE U.S. ENVIRONMENTAL PROTECTION AGENCY AND
THE CALIFORNIA STATE WATER RESOURCES CONTROL BOARD

I. PREFACE

A. Introduction

The State Water Resources Control Board (State Board) is the State water pollution control agency for all purposes of the Clean Water Act pursuant to Section 13160 of the California Water Code. The State Board has been authorized by the U.S. Environmental Protection Agency (EPA), pursuant to Section 402 of the Clean Water Act (CWA), to administer the National Pollutant Discharge Elimination System (NPDES) program in California since 1973.

The Chairman of the State Board and the Regional Administrator of EPA, Region 9 hereby affirm that the State Board and the Regional Boards have primary authority for the issuance, compliance monitoring, and enforcement of all NPDES permits in California including NPDES general permits and permits for federal facilities; and implementation and enforcement of National Pretreatment Program requirements except for NPDES permits incorporating variances granted under Sections 301(h) or 301(m), and permits to dischargers for which EPA has assumed direct responsibility pursuant to 40 CFR 123.44. The State may apply separate requirements to these facilities under its own authority.

This Memorandum of Agreement (MOA) redefines the working relationship between the State and EPA pursuant to the Federal regulatory amendments that have been promulgated since 1973, and supersedes:

1. THE MEMORANDUM OF UNDERSTANDING REGARDING PERMIT AND ENFORCEMENT PROGRAMS BETWEEN THE STATE WATER RESOURCES CONTROL BOARD AND THE REGIONAL ADMINISTRATOR, REGION IX, ENVIRONMENTAL PROTECTION AGENCY, signed March 26, 1973; and

2. The STATE/EPA COMPLIANCE AND ENFORCEMENT AGREEMENT, dated October 31, 1986. The State's standard operating procedures for the NPDES and pretreatment programs are described in the State's Administrative Procedures Manual (APM).

The State shall implement the provision of this MOA through the APM. The State's annual workplan, which is prepared pursuant to Section 106 of the CWA, will establish priorities, activities and outputs for the implementation of specific components of the NPDES and pretreatment programs. The basic requirements of this MOA shall override any other State/EPA agreements as required by 40 CFR 123.24(c). EPA shall implement the provisions of this MOA through written EPA policy guidance and the annual State/EPA 106 agreement.

B. Definitions

The following definitions are provided to clarify the provisions of this MOA.

1. "The APM" means the State's Administrative Procedures Manual. The APM describes standard operating requirements, procedures, and guidance for internal management of the State Board and Regional Boards in the administration of the NPDES and pretreatment programs. The APM is kept current through periodic updates.

2. "Comments" means recommendations made by EPA or another party, either orally or in writing, about a draft permit.

3. "Compliance monitoring" means the review of monitoring reports, progress reports, and other reports furnished by members of the regulated community. It also means the various types of inspection activities conducted at the facilities of the regulated community.

4. "CWA" means the Clean Water Act [33 USC 1251 et. seq.].

5. "Days" mean calendar days unless specified otherwise.

6. "Prenotice draft permit" is the document reviewed by EPA, other agencies, and the applicant prior to public review.

7. "Draft permit" is the document reviewed by EPA and the public.

8. "Enforcement" means all activities that may be undertaken by the Regional Boards, the State Board, or EPA to achieve compliance with NPDES and pretreatment program requirements.

9. "EPA" means the U.S. Environmental Protection Agency (EPA) Region 9, unless otherwise stated.

10. "Formal enforcement action" means an action, order or referral to achieve compliance with NPDES and pretreatment program requirements that: (a) specifies a deadline for compliance; (b) is independently enforceable without having to prove the original violation; and (c) subjects the defendant to adverse legal consequences for failure to obey the order (see footnote #6, p.19, National Guidance for Oversight of NPDES Programs, FFY 1986, dated January 20, 1985). Time Schedule Orders, Administrative Civil Liability Orders, Cease and Desist Orders, Cleanup and Abatement Orders, and referrals to the Attorney General meet these criteria. Effective January 1, 1988, the State and Regional Boards will have authority to impose administrative civil liability, consistent with the requirements of 40 CFR 123.27(a)(3)(i), for all NPDES and pretreatment program violations.

11. "Issuance" means the issuance, reissuance, or modification of NPDES permits through the adoption of an order by a Regional Board or the State Board.

12. "Objections" means EPA objections to applications, prenotice draft permits, draft permits, or proposed permits that are based on federal law or regulation, which are filed as "objections", and which must be resolved before a NPDES permit can be issued, or reissued or modified thereto. "Objection" and "formal objection" mean the same thing.

13. "Proposed permit" means a permit adopted by the State after the close of the public comment period which may then be sent to EPA for review before final issuance by the State. The State's common terminology of "adopted permit" is equivalent to the term "proposed permit" as used at 40 CFR 122.2.

14. Quality Assurance" means all activities undertaken by the State or EPA to determine the accuracy of the sampling data reported on Discharge Monitoring Reports (DMRs), inspection reports, and other reports.

15. "State" means the staff and members of the Regional Boards and the State Board collectively.

16. "106 Workplan" means the annual agreement that is negotiated between the State and EPA.

C. Roles and Responsibilities

1. EPA Responsibilities

EPA is responsible for:

a. Providing financial, technical, and other forms of assistance to the State;

b. Providing the State Board with copies of all proposed, revised, promulgated, remanded, withdrawn, and suspended federal regulations and guidelines;

c. Advising the State Board of new case law pertaining to the NPDES and pretreatment programs;

d. Providing the State Board with draft and final national policy and guidance documents;

e. Monitoring the NPDES and pretreatment programs in California to assure that the program is administered in conformance with federal legislation, regulations, and policy;

f. Intervening as necessary in specific situations (such as development of draft permits, or permit violations) to maintain program consistency throughout all states and over time;

g. Administering the program directly to the following classes of facilities:

(1) Dischargers granted variances under Sections 301(h) or 301(m) of the CWA; and

(2) Dischargers which EPA has assumed direct responsibility for pursuant to 40 CFR 123.44, and

2. State Board Responsibilities

The State Board is responsible for supporting and overseeing the Regional Board's management of the NPDES and pretreatment programs in California. This responsibility includes:

a. Evaluating Regional Board performance in the areas of permit content, procedure, compliance, monitoring and surveillance, quality assurance of sample analyses, and program enforcement;

b. Acting on its own motion as necessary to assure that the program is administered in conformance with Federal and State legislation, regulations, policy, this MOA, and the State annual 106 Workplan;

c. Providing technical assistance to the Regional Boards;

d. Developing and implementing regulations, policies, and guidelines as needed to maintain consistency between State and federal policy and program operations, and to maintain consistency of program implementation throughout all nine regions and over time;

e. Reviewing decisions of the Regional Boards upon petition from aggrieved persons or upon its own motion;

f. Assisting the Regional Boards in the implementation of federal program revisions through the development of policies and procedures; and

g. Performing any of the functions and responsibilities ascribed to the Regional Boards.

(1) Dischargers granted variances under Sections 301(h) or 301(m) of the CWA; and

(2) Dischargers which EPA has assumed direct responsibility for pursuant to 40 CFR 123.44, and

2. State Board Responsibilities

The State Board is responsible for supporting and overseeing the Regional Board's management of the NPDES and pretreatment programs in California. This responsibility includes:

a. Evaluating Regional Board performance in the areas of permit content, procedure, compliance, monitoring and surveillance, quality assurance of sample analyses, and program enforcement;

b. Acting on its own motion as necessary to assure that the program is administered in conformance with Federal and State legislation, regulations, policy, this MOA, and the State annual 106 Workplan;

c. Providing technical assistance to the Regional Boards;

d. Developing and implementing regulations, policies, and guidelines as needed to maintain consistency between State and federal policy and program operations, and to maintain consistency of program implementation throughout all nine regions and over time;

e. Reviewing decisions of the Regional Boards upon petition from aggrieved persons or upon its own motion;

f. Assisting the Regional Boards in the implementation of federal program revisions through the development of policies and procedures; and

g. Performing any of the functions and responsibilities ascribed to the Regional Boards.

h. California Pretreatment Program responsibilities as listed in Section III.B. of this MOA.

3. Regional Board Responsibilities

The following responsibilities for managing the NPDES and pretreatment programs in California have been assigned to the Regional Boards. These responsibilities include:

a. Regulating all discharges subject to the NPDES and pretreatment programs, except those reserved to EPA, in conformance with Federal and State law, regulations, and policy;

b. Maintaining technical expertise, administrative procedures and management control, such that implementation of the NPDES and pretreatment programs consistently conforms to State laws, regulations, and policies;

c. Implementing federal program revisions;

d. Providing technical assistance to the regulated community to encourage voluntary compliance with program requirements;

e. Assuring that no one realizes an economic advantage from noncompliance;

f. Maintaining an adequate public file at the appropriate Regional Board Office for each permittee. Such files must, at a minimum, include copies of: permit application, issued permit, public notice and fact sheet, discharge monitoring reports, all inspection reports, all enforcement actions, and other pertinent information and correspondence;

g. Comprehensively evaluating and assessing compliance with schedules, effluent limitations, and other conditions in permits;

h. Taking timely and appropriate enforcement actions in accordance with the CWA, applicable Federal regulations, and State Law; and

i. California Pretreatment Program responsibilities as listed in Section III. B of this MOA.

D. Program Coordination

In order to reinforce the State Board's program policy and overview roles, EPA will normally arrange its meetings with Regional Board staff through appropriate staff of the State Board. In all cases, the State Board will be notified of any EPA meetings with Regional Boards.

E. Conflict Resolution

Disputes shall be resolved in accordance with the Agreement on a Conflict Resolution Process Between Regional Administrator, EPA, Region 9 and Chairman, State Water Resources Control Board.

II. PERMIT REVIEW, ISSUANCE, AND OBJECTIONS

A. General

The State Board and Regional Boards have primary authority for the issuance of NPDES permits. EPA may comment upon or object to the issuance of a permit or the terms or conditions therein. Neither the State Board nor the Regional Boards shall adopt or issue a NPDES permit until all objections made by EPA have been resolved pursuant to 40 CFR 123.44 and this MOA. The following procedures describe EPA permit review, comment, and objection options that may delay the permit process. These options present the longest periods allowed by 40 CFR 123.44. However, the process should normally require far less time.

The State Board, Regional Boards, and EPA agree to coordinate permit review through frequent telephone contact. Most differences over permit content should be resolved through telephone liaison. Therefore, permit review by the State and EPA should not delay issuing NPDES permits. However, if this review process causes significant delays, the Chief, Division of Water Quality (DWQ) of the State Board (or his or her designee), and the Director, Water Management Division (WMD) of EPA (or his or her designee) agree to review the circumstances of the delays. The State Board and EPA shall determine the reasons for the delays and take corrective action.

To the extent possible, all expiring NPDES permits shall be reissued on or before their expiration. If timely reissuance is not possible, the State Board will notify the Regional Administrator of the reasons for the delay. In no event will permits continued administratively beyond their expiration date be modified or revised.

In the case of the development of a general permit, the Regional Board will collect sufficient data to develop effluent limitations and prepare and draft the general permit. The Regional Board will issue and administer NPDES general permits in accordance with the California Water Code, Division 7 and federal regulations 40 CFR 122.28.

1. EPA Waiver of Review

   a. EPA waives the right to routinely review, object to, or comment upon State-issued permits under Section 402 of the CWA for all categories of discharges except those identified under II.A.2. below.

   b. Notwithstanding this waiver, the State Board and the Regional Boards shall furnish EPA with copies of any file material within 30 days of an EPA request for the material.

   c. The Regional Administrator of EPA, Region 9 may terminate this waiver at any time, in whole or in part, by sending the State Board a written notice of termination.

   d. The State shall supply EPA with copies of final permits.

2. Permits Subject to Review

   a. The Regional Boards shall send EPA copies of applications, prenotice draft permits, draft permits, adopted (proposed) permits, and associated Fact Sheets and Statements of Basis for the following categories of discharges.

      (1) Discharges from a "major" facility as defined by the current major discharger list;

(2) Discharges to territorial seas;

(3) Discharges from facilities within any of the industrial categories described under 40 CFR Part 122, Appendix A;

(4) Discharges which may affect the water quality of another state;

(5) Discharges to be regulated by a General Permit (excludes applications since they are not part of the General Permit process);

(6) Discharges of uncontaminated cooling water with a daily average discharge exceeding 500 million gallons;

(7) Discharges from any other source which exceeds a daily average discharge of 0.5 million gallons; and

(8) Other categories of discharges EPA may designate which may have an environmental impact or public visibility. The Regional Boards or the State Board will consult with EPA regarding other significant discharges.

B. Applications

The provisions for EPA review of applications do not apply to General Permits, because applications are not part of the General Permit Process.

1. Initial Applications

a. The Regional Boards shall forward a complete copy of each NPDES application to EPA and the State Board within 15 days of its receipt.

b. EPA shall have 30 days* from receipt of the application to comment upon or object to its completeness.

(1) EPA shall initially express its comments and objections to the Regional Board through staff telephone liaison.

(2) EPA shall send a copy of comments or objections to an application to the Regional Board, the State Board, and the applicant.

(3) If EPA fails to send written comments or objections to an application within 30 days of receipt, EPA waives its right to comment or object.

c. An EPA objection to an application shall specify in writing:

(1) The nature of the objection;

(2) The sections of the CWA or the NPDES regulations that support the objection; and

(3) The information required to eliminate the objection.

2. State Agreement with EPA Objections and Revised Applications

a. If the State agrees with EPA's objections, the Regional Board shall forward a complete copy of the revised application to EPA within 10 days of its arrival at the Regional Board offices.

---

*COMPUTATION OF TIME: Pursuant to 40 CFR 124.20(d), three(3) days shall be allowed for transit of documents by mail. Therefore, the State must allow at least 36 days, from the postmark date on the application for receipt of an EPA response. If the State Board or a Regional Board delivers a document to EPA within less than three days, the number of days saved by such delivery may be subtracted from the 36 days. All of the timeframes mentioned in this MOA are in calendar days.

b. Another 30-day review period shall begin upon EPA's receipt of the revised application; and

c. This application review process shall be repeated until the application complies with all NPDES regulations.

d. When EPA has no objections pursuant to 40 CFR 123.44, the Regional Board may complete development of a prenotice draft NPDES permit.

e. If an objection is filed, EPA shall advise the State Board and the Regional Board in writing when the application is complete.

f. The Regional Board will be responsible for notifying the applicant.

3. State Disagreement with EPA Objections and Draft Permits

If the Regional Board or the State Board disagrees with EPA's assertion that an application is incomplete, they may issue a prenotice draft permit, provided that:

a. The Regional Board or the State Board states in a transmittal letter that the prenotice draft permit has been issued an EPA objection to the application;

b. EPA may add comments upon or objections to the prenotice draft permit including a reiteration of its objection to the application;

c. Objections to an application will be subject to the same procedures as an EPA objection to the prenotice draft permit, as described below except that the State shall not issue a public notice for a draft permit for which there is an unresolved EPA objection.

C. Prenotice Draft Permits

1. EPA Review of Individual Prenotice Draft Permits

a. It is the intent of the Regional Boards, or the State Board whenever it undertakes the issuance of an NPDES permit, to issue apranotice draft NPDES permit. A copy of

associated Statement of Basis or Fact Sheet shall be sent to EPA. As a matter of urgency the Regional Board or the State Board may decide not to issue a prenotice draft NPDES permit.

b. EPA shall have 30 days from its receipt to send comments upon, or an initial objection to, the prenotice draft permit to the Regional Board and State Board.

(1) If EPA mails an initial objection pursuant to 40 CFR 23.44 within 30 days from its receipt of a prenotice draft permit, EPA shall have 90 days from its receipt of the prenotice draft permit to mail a formal objection.

(2) If EPA requests additional information on a prenotice raft permit, a new 30-day review shall begin upon EPA's receipt of the additional information.

(3) If EPA mails an initial objection pursuant to 40 CFR 123.44 within 30 days from its receipt of additional information, EPA shall have 90 days from its receipt of the additional information to mail a formal objection.

c. If a prenotice draft permit is not issued, the procedures and schedules for EPA review, comment, and objections to a prenotice draft permit, described in Section II.C.4, shall apply to the draft permit.

2. EPA Review of Prenotice Draft General Permits

a. The Regional Boards, or the State Board whenever it undertakes the issuance of an NPDES General Permit, shall mail a copy of each prenotice draft Generalmit and Fact Permit Sheet, except for those for stormwater point sources, to:

(1) Director
Office of Water Enforcement and
Permits (EN 335)
U.S. Environmental Protection Agency
401 M Street S.W.
Washington, D.C. 20460; and

(2) EPA, Region 9.

b. EPA, Region 9, and the Director of the Office of Water Enforcement and Permits, EPA Headquarters, shall have 90 days from their receipt of the prenotice draft General Permit to send comments upon or objections to the State Board and Regional Board.

c. If a prenotice draft general permit is issued, the procedures and schedules for EPA review, comment, and objections to a prenotice draft permit, described in Section II.C.4 shall apply to the draft general permit.

3. EPA Comments

a. The Regional Boards and State Board shall treat any comments made by EPA upon a prenotice draft individual permit or upon a prenotice draft General Permit as they would comments from any authoritative source.

b. The Regional Boards or the State Board shall prepare a written response to each significant comment made by EPA that they do not accommodate by revising the draft permit.

4. EPA Objections

The discussion below describes the procedures the Regional Boards and State Board may pursue if EPA issues an objection to a prenotice draft permit. NPDES regulations restrict the resolution of an EPA objection to three alternatives, or a combination thereof: (a) the Regional Board or the State Board changes the permit, (b) EPA withdraws the objection, or (c) EPA acquires exclusive NPDES jurisdiction over the discharge.

a. Timing of EPA Objections

(1) If the Regional Board or the State Board receives an initial objection from EPA within 36 days of the postmark on the prenotice draft permit sent to EPA, the Regional Board or the State Board shall delay issuance of the public notice until one of the following events occur:

(a) The Regional Board has received EPA's formal objection;

(b) EPA withdraws the initial objection; or

(c) Ninety-six (96) days have passed from the postmark on the prenotice draft (See Section II.C.2 for timing of EPA objections to prenotice general permits).

(2) Whenever EPA files an initial objection to a prenotice draft permit, EPA shall expedite its effort to file the formal objection, in order to avoid undue delay of the permit's final issuance.

(3) EPA may not make an initial objection to the prenotice draft permit once its 30-day review period has lapsed.

(4) EPA may not make a formal objection to the prenotice draft permit, if it failed to make an initial objection within the 30-day period.

(5) EPA may not make a formal objection to the Preenotice draft permit once the 90-day objection period has lapsed.

(6) EPA may not modify the objection, after the 90-day formal objection period, to require more change to the prenotice draft permit than was required under the original objection.

(7) EPA may revise the objection within its allotted 90-day objection period to require additional changes to the prenotice draft permit than were required under its original objection. Such a change to an objection by EPA shall cause the State's allotted 90 day response period to restart upon the State's eceipt of the revised objection.

(8) If the Regional Board receives an EPA formal objection within the 96 days specified above, the State Board or the Regional Board may exercise one of the options described under II.C.4.c. and II.C.4.d. below.

b. Content of EPA Objections

(1) For initial objections that must be filed within 30 days, EPA may simply identify:

(a) The name of the facility and its NPDES umber; and

(b) The general nature of the objection.

(2) For formal objections that must be filed within 90 days, EPA shall specify:

(a) The reasons for the objections;

(b) The section of the CWA, the regulations or the guidelines which support the objection; and

(c) The changes to the permit that are required as a condition to elimination of the objection.

(3) Every EPA objection shall be based upon one or more of the grounds for objection described under 40 CFR 123.44(c). EPA shall:

(a) Cite each of the grounds which applies to the objection; and

(b) Explain how each citation applies to a deficiency of the prenotice draft permit.

(4) Correspondence from EPA which objects to a prenotice draft permit, but which fails to meet the substantive criteria of this part (II.C.4.b) does not constitute an objection and may be treated by the State as comments.

c. State Board Options

(1) If EPA and a Regional Board are unable to resolve a disagreement over provisions of a prenotice draft permit to which EPA has filed a formal objection, the State Board may mediate the disagreement to a resolution that is satisfactory to EPA and to the Regional Board.

(2) If the disagreement proves intractable, the State Board may:

(a) Revise and resubmit the prenotice draft permit in accordance with the required by the EPA objection (The State Board would then be obliged to continue the issuance process and adopt the permit if the Regional Board declines todo so);

(b) Request a public hearing pursuant to 40 CFR 123.44(e); or

(c) Hold a public hearing on the EPA objection.

d. Regional Board Options

(1) If the Regional Board changes the prenotice draft permit to eliminate the basis of the EPA formal objection within 90 days of the Regional Board's receipt of that objection, the permit will remain within the

Regional Board's jurisdiction (see 40 CFR 123.44(h)). The Regional Board may then continue on to the public notice of the permit.

(2) If EPA and a Regional Board are unable to resolve a disagreement over provisions of a prenotice draft permit to which EPA has filed a formal objection, the Regional Board may:

(a) Request that EPA conduct a public hearing, pursuant to 40 CFR 123.44(e); or

(b) Hold a public hearing on the EPA objection.

e. The State Board or a Regional Board Holds a Public Hearing

(1) If either the State Board or a Regional Board decide to hold a public hearing on an EPA objection, that Board shall:

(a) Prepare a written rebuttal describing the legal and environmental reasons why each each provision of the prenotice draft permit should not be changed to accomodate the objection.

(b) Issue a public notice in accordance with 40 CFR 124.10 and 40 CFR 124.57(a) to open the public comment period and announce the public hearing;

(c) Make available for public review:

- The permit application;
- The draft permit;
- The Fact Sheet or Statement of Basis;
- All comments received upon the draft permit;

- The EPA objections; and
- The Regional Board's rebuttal;

(d) Conduct the hearing in accordance with 40 CFR 124.11 and 124.12; and

(e) Decide whether to accommodate the EPA objection.

(2) A representative of EPA shall attend the hearing to explain EPA's objection.

f. State Board and Regional Board Failure to Respond within 90 days (see 40 CFR 123.44(h))

EPA shall acquire exclusive NPDES authority over the discharge pursuant to 40 CFR 123.44(h)(3), if within 90 days of their receipt of an EPA formal objection:

(1) Neither the State Board nor the Regional Board changes the permit to eliminate the basis of the EPA objection;

(2) Neither the State Board nor the Regional Board requests EPA to hold a public hearing pursuant to 40 CFR 123.44(e); and

(3) EPA does not withdraw the objection.

This applies whether or not the State Board or a Regional Board holds a public hearing on the EPA objection.

g. EPA Public Hearing of an EPA Objection

(1) If the State Board or a Regional Board requests a public hearing pursuant to 40 CFR 123.44(e) within the 90-day response period, EPA shall hold a public hearing in accordance with the procedures of 40 CFR Part 124.

(a) If the State Board or Regional Board withdraws its request for

a public hearing before EPA has issued the public notice, EPA shall cancelthe hearing unless third party interest otherwise warrants a hearing pursuant to 40 CFR 123.44(e).

(b) If the State Board or Regional Board withdraws its request for a public hearing after EPA has issued the public notice of the hearing, and EPA determines that there is not sufficient third party interest pursuant to 40 CFR 123.44(e), the State Board or Regional Board shall publish a public notice and send a cancellation to everyone on the EPA mailing list.

(2) Within 30 days after the EPA public hearing, EPA shall:

(a) Reaffirm, withdraw, or modify the original objection; and

(b) Send notice of its action to:

- o The State Board;
- o The Regional Board;
- o The applicant; and
- o Each party who submitted comments at the hearing.

(3) If EPA does not withdraw the objection, the State Board or Regional Board shall have 30 days from its receipt of the EPA notice to change the permit to eliminate the basis of the objection.

(4) If EPA modifies the objection to require less change to the prenotice draft permit than was required under the origiaal objection, the State Board or Regional Board shall have 30 days from its receipt of the EPA notice to change the permit to eliminate the basis of the objection.

VOL 23

0304

(5) EPA may not modify the objection to require more change to the prenotice draft permit than was required by the original objection.

(6) If the State Board or Regional Board fails to send a revised draft permit to EPA within 30 days of its receipt of the EPA notification, EPA acquires exclusive NPDES authority over the discharge pursuant to 40 CFR 123.44(h)(3).

h. Resolved Objections

(1) Whenever EPA has filed a formal objection to a prenotice draft permit and the State Board or Regional Board has changed the permit to eliminate the basis of the objection, or EPA has withdrawn the objection, EPA shall send notice to:

(a) The State Board;

(b) The Regional Board;

(c) The applicant; and

(d) Every other party who has submitted comments upon the EPA objection.

(2) EPA shall send the notice within 30 days of its receipt of the revised State permit, or upon its withdrawal of the objection.

D. Public Notice

1. If the State Board or Regional Board does not receive an EPA initial objection within 36 days of the postmark on the individual prenotice draft permit or within 96 days of the postmark of the prenotice draft general permit, the State Board or Regional Board may proceed with the public notice process.

2. The State Board or Regional Board shall issue the public notice and conduct all public

participation activities for NPDES permits in accordance with the provisions of 40 CFR Part 124 applicable to State Programs.

(a) The Regional Boards and State Board shall make electronic or stenographic recordings of each of the EIR public hearings, pursuant to 23 California Administrative Code Section 847.4(a).

(b) The Regional Board or the State Board shall make a copy of all comments, including tapes or transcripts of oral comments presented at Board Hearings, and the Board's written responses to the comments, available to EPA and the public upon request, pursuant to 40 CFR 124.17(a) and (c).

3. All EPA comments upon and objections to a prenotice draft permit, draft permit or both, and all correspondence, public comments and other documents associated with any EPA objections shall become part of the administrative record/permit file and shall be available for public review.

E. Draft Permits

1. The State Board and Regional Boards shall send a copy of each draft permit and its Statement of Basis or Fact Sheet to EPA as part of the public notice process. A copy of each draft general permit, and accompanying fact sheet except those for stormwater point sources, shall be sent to EPA and:

Director
Office of Water Enforcement
and Permits (EN 335)
U.S. Environmental Protection Agency
401 M Street SW
Washington, DC 20460

2. EPA may not object to a draft permit which it had an opportunity to review as a prenotice draft permit, except to the extent that it includes changes to the prenotice draft permit, or the bases of the objection were not reasonably ascertainable during the prior review period (e.g., because of new facts, new science, or new law).

3. If EPA issues an objection to a draft permit, the procedures described under II.C.4. shall apply.

F. Final Permits

1. Final Permits Become Effective Upon Adoption

NPDES permits other than general permits, adopted by the State Board or Regional Boards shall become effective upon the adoption date only when:

a. EPA has made no objections to the permit;

b. There has been no significant public comment;

c. There have been no changes made to the latest version of the draft permit that was sent to EPA for review (unless the only changes were made to accommodate EPA comments); and

d. The State Board or Regional Board does not specify a different effective date at the time of adoption.

2. Permit Becomes Effective 50 Days after Adoption

NPDES permits, other than general permits, adopted by the State Board or Regional Board shall become effective on the 50th day after the date of adoption, if EPA has made no objection to the permit; if:

a. There has been significant public comment; or

b. Changes have been made to the latest version of the draft permit that was sent to EPA for review (unless the only changes were made to accommodate EPA comments).

3. Permit Becomes Effective 100 days after Adoption

General permits adopted by the State Board or the Regional Boards shall become effective on the 100th day after the date of adoption, if EPA has made no objection to the permit, if:

a. There has been significant public comment; or

b. Changes have been made to the latest version of thet draft permit that was sent to EPA for review (unless the only changes were made to accommodate EPA comments).

4. EPA Review of Adopted Permits

a. Transmittal of Adopted Permits to EPA

The Regional Boards shall send copies of the following documents to EPA and the State Board, upon adoption of each NPDES permit identified under II.A.2:

(1) Each significant comment made upon the draft permit, including a transcript or tape of all comments made at public hearings;

(2) The response to each significant comment made upon the draft permit;

(3) Recommendations of any other affected states, including any written comments prepared by this State te explaining the reasons for rejecting any other states' written recommendations.

(4) The Executive Officer (or State Board Executive Director) summary sheet;

(5) The Fact Sheet or Statement of Basis, if it has been changed; and

(6) The final permit.

For general permits, except those for stormwater point sources, the State Board also shall send copies of these documents to:

Director
Office of Water Enforcement
and Permits (EN 335)
U.S. Environmental Protection Agency
401 M Street SW
Washington, DC 20460

b. EPA Review Period

EPA shall have 30 days from its receipt of these materials to review and comment upon or object to an NPDES permit which becomes effective 50 days after the date of adoption under II.F.2.

EPA shall have 90 days from its receipt of these materials to review and comment upon or object to a general permit which becomes effective 100 days after the date of adoption under II.F.2.

c. EPA Comments upon Adopted Permits

If EPA comments upon an adopted permit pursuant to II.F.3.b. above, the State Board or Regional Board must either change the permit to accommodate the comments, or respond to the comments as follows:

(1) If, the State Board or Regional Board changes the permit, the permit will have to be readopted unless the only changes fall within the definition of minor modifications under 40 CFR 122.63, in which case the permit may take effect as originally scheduled (at least 50 days after the date of adoption); or

(2) If the State Board or Regional Board responds to the EPA comment instead of changing the permit, the permit may take effect as originally scheduled (at least 50 days after the date of adoption).

d. EPA Objection to Adopted Permits

If EPA mails an initial objection to an adopted permit within 30 days of its receipt pursuant to II.F.3.b., the full objection process will have begun, as described under II.C.4. and the permit effective date shall be stayed until the basis of the EPA objection has been eliminated.

e. Restrictions upon EPA Comments and Objections

(1) EPA shall use this review period to make objections which pertain only:

(a) To changes made to the draft permit;

(b) To comments made upon the permit;

(c) To new information that was not reasonably ascertainable during the initial review period; or

(d) To objections made by EPA to the draft permit.

(2) EPA shall not use this review period to file comments or objections which it neglected to file during the prenotice comment period or during the public notice comment period.

G. Permit Modification

1. When a Regional Board or State Board decides to modify an NPDES permit, a prenotice draft permit shall be given public notice and issued in accordance with NPDES regulations.

2. Whenever a Regional Board or State Board decides to modify an NPDES permit, the Regional Board or State Board shall follow the EPA review procedures for prenotice draft permits described under II.C. through II.F.

3. Minor permit modifications (not the same as modifications to minor permits) as described under 40 CFR 122.63 may be accomplished by letter, and are not subject to public review prior to their issuance under NPDES. However, they are subject to notice and review provisions under State law The following protocol shall apply to "minor permit modifications":

a. The Regional Boards or State Board, as appropriate, shall send a copy of each

minor permit modification to EPA and the State Board.

b. If EPA or the State Board notice that a minor modification has been issued (by either a Regional Board or the State Board) which does not conform to the criteria of 40 CFR 122.63, the State Board shall notify the permittee and the Regional Board that the minor modification was improper. The State should initiate promptly any proceedings necessary to void or rescind the modification. The Regional Board or State Board may then initiate a formal permit modification that is subject to public review as specified by NPDES regulations.

4. No NPDES permit shall be modified to extend beyond the maximum term allowed by NPDES regulations. If a Regional Board or State Board decides to extend a permit expiration date to a date more than five years from the date of issuance of the permit, the Board shall revoke and reissue the permit in accordance with NPDES regulations.

H. Administrative or Court Action

If the terms of any permit, including any permit for which review has been waived pursuant to Part II.A.1. above, are affected in any manner by administrative or court action, the Regional Board or State Board shall immediately transmit a copy of the permit, with changes identified, to EPA and shall allow 30 days for EPA to make written objections to the changed permit pursuant to Section 402(d)(2) of the CWA.

I. Variance Requests

1. State Variance Authority

a. The State may approve applications for the following variances, subject to EPA objections under Section C.4 above:

(1) Compliance extension based on delay of a publicly owned treatment works (POTW), under Section 301(i) of the CWA;

(2) Compliance extension based upon the use of innovative technology, under Section 301(k) of the CWA; and

(3) Variances from thermal pollution requirements, under Section 316(a) of the CWA.

b. Unless the State denies the variance application, the State shall adopt approved modifications as either formal modifications to active permits or as provisions of reissued permits.

2. State/EPA Shared Variance Authority

a. The State may deny or forward to EPA, with or without recommendations, applications for the following variances:

(1) Variances based upon the presence of fundamentally different factors (FDF), under Section 301(n) of the CWA;

(2) Variances based upon the economic capabilities of the applicant, under Section 301(c) of the CWA;

(3) Variances based upon water quality factors, under Section 301(g) of the CWA; and

(4) Variances based on economic and social costs or upon the economic capabilities of the applicant for achieving EPA promulgated water quality related effluent limitations, under Section 302(b)(2) of the CWA.

b. Unless the State denies the variance application at the outset, the State will subsequently issue an NPDES permit based upon EPA's final decision.

3. Certification and Concurrence in EPA Variance Decisions under Sections 301(h) and 301(m)

a. The State may deny or forward to EPA, with or without recommendations, applications for the following variances:

(1) Variances based upon the quality of coastal marine waters under Section 301(h) of the CWA (these are addressed by a separate agreement.); and

(2) Variances based upon the energy and environmental costs of meeting requirements for wood processing waste discharged to the marine waters of Humboldt Bay, under Section 301(m) of the CWA.

b. If EPA decides to prepare a draft permit on the application for a variance, the State will issue or deny waste discharge requirements under its own authority as part of the concurrence process.

(1) The State's decision on issuance of waste discharge requirements shall constitute the State's decision on concurrence in the variance. Any amendment or rescission of the waste discharge requirements, and any State Board order finding that a Regional Board's action in issuing the waste discharge requirements was inappropriate or improper, shall constitute a modification of the State's concurrence if the amendment, rescission, or State Board order is issued before EPA issues a final permit authorizing the variance.

(2) Waste discharge requirements issued by the State shall require compliance with any condition EPA imposes in the final permit. Any authorization made by the waste discharge requirements to discharge under a variance will be contingent upon issuance of a permit by EPA authorizing the variance.

(3) EPA will not issue a final permit until the State issues waste discharge requirements. If the waste discharge requirements are issued by a Regional Board, EPA will not issue a final permit until at least 31 days after the Regional Board's decision.

While any timely petition is still pending before the State Board, EPA will not issue a final permit until after 10 months have passed without State Board action on the petition. After 10 months have passed without State Board action on the petition EPA may issue a 301(h) permit provided that the permit includes a reopener clause allowing EPA to revise the permit consistent with the State Board's order on the petition for review. If the State Board initiates action on the petition within 10 months, by notifying the parties involved that the petition is complete, EPA will not issue a 301 (h) permit until after the state Board has issued an order on the petition for review.

(4) A permit issued by EPA shall incorporate any condition of the State's concurrence, including any provisions of the waste discharge requirements issued to the discharge, unless EPA substitutes a more stringent requirement.

III. PRETREATMENT PROGRAM

A. General

This Section defines the State Board, the Regional Boards, and EPA responsibilities for the establishment, implementation, and enforcement of the National Pretreatment Program pursuant to Sections 307 and 402(b) of the CWA, and as described in Section VI of the "NPDES Program Description, January 1988".

B. Roles and Responsibilities

EPA will oversee California Pretreatment Program operations consistent with the requirements of 40 CFR Part 403, this Section of the MOA, and Section VI of the "NPDES Program Description, January 1988".

Consistent with State and federal law, and the State Clean Water Strategy, the State will administer the California Pretreatment Program.

The State Board will have primary responsibility for:

1. Developing, implementing, and overseeing the California Pretreatment Program;

2. Providing technical and legal assistance to the Regional Boards, publicly owned treatment works (POTWs), and industrial users;

3. Developing and maintaining a data management system;

4. Providing information to EPA or other organizations as required and/or requested; and

5. Reviewing and ruling on petitions for review of Regional Board decisions.

The Regional Boards, with the assistance and oversight of the State Board, will have primary responsibility for:

1. Enforcing the National pretreatment standards: prohibited discharges, established in 40 CFR 403.5;

2. Enforcing the National categorical pretreatment standards established by the EPA in accordance with Section 307 (b) and (c) of the CWA, and promulgated in 40 CFR Subchapter N, Effluent Guidelines and Standards;

3. Review, approval, or denial of POTW Pretreatment Programs in accordance with the procedures discussed in 40 CFR 403.8, 403.9, and 403.11;

4. Requiring a Pretreatment Program as an enforceable condition in NPDES permits or waste discharge requirements issued to POTWs as required in 40 CFR 403.8, and as provided in Section 402(b)(8) of the CWA;

5. Requiring POTWs to develop and enforce local limits as set forth in 40 CFR 403.5(c);

6. Review and, as appropriate, approval of POTW requests for authority to modify categorical pretreatment standards to reflect removal of pollutants by a POTW in accordance with 40 CFR

403.7, 403.9, and 403.11, and enforcing related conditions in the POTW's NPDES permit or waste discharge requirements;

7. Overseeing POTW Pretreatment Programs to ensure compliance with requirements specified in 40 CFR 403.8, and in the POTW's NPDES permit or waste discharge requirements;

8. Performing inspection, surveillance, and monitoring activities which will determine, independent of information supplied by the POTW, compliance or noncompliance by the POTW with pretreatment requirements incorporated into the POTW permit;

9. Providing the State Board and EPA, upon request, copies of all notices received from POTWs that relate to a new or changed introduction of pollutants to the POTW; and

10. Applying and enforcing all other pretreatment regulations as required by 40 CFR Part 403.

C. POTW Pretreatment Program and Removal Credits Approval

Each Regional Board shall review and approve POTW applications for POTW pretreatment program authority and POTW applications to revise discharge limits for industrial users who are, or may in the future be, subject to categorical pretreatment standards. It shall submit its findings together with the application and supporting information to the State Board and EPA for review. No POTW Pretreatment Program or request for revised discharge limits shall be approved by the Regional Boards if the State Board or EPA objects in writing to the approval of such submission in accordance with 40 CFR 403.11(d).

Note: No removal credits can be approved until EPA promulgates sludge regulations under Section 405 of the Clean Water Act.

D. Requests for Categorical Determination

Each Regional Board shall review requests for determinations of whether an industrial user does or does not fall within a particular industrial category or subcategory. The Regional Boards will make a written determination for each request

stating the reasons for the determinations. The Regional Board shall then forward its findings, together with a copy of the request and any necessary supporting information, to the State Board and EPA for concurrence. If the State Board or EPA does not modify the Regional Board's decision within 60 days after receipt thereof, the Regional Board finding is final. A copy of the final determination shall be sent to the requestor, the State Board, and EPA Region 9.

E. Variances From Categorical Standards For Fundamentally Different Factors

Each Regional Board shall make an initial finding on all requests from industrial users for fundamentally different factors variances from the applicable categorical pretreatment standard. If the Regional Board determines that the variance request should be denied, the Regional Board will so notify the applicant and provide reasons for its determination in writing. Where the Regional Board's initial finding is to approve the request, the finding, together with the request and supporting information, shall be forwarded to the State Board. If the State Board concurs with the Regional Board's finding, it will submit it to EPA for a final determination. The Regional Board may deny but not approve and implement the fundamentally different factor(s) variance request until written approval has been received from EPA.

If EPA finds that fundamentally different factors do exist, a variance reflecting this determination shall be granted. If EPA determines that fundamentally different factors do not exist, the variance request shall be denied and the Regional Board shall so notify the applicant and provide EPA's reasons for the denial in writing.

F. Net/Gross Adjustments to Categorical Standards

If the Regional Board receives a request for a net/gross adjustment of applicable categorical pretreatment standards in accordance with 40 CFR 403.15, the Regional Board shall forward the application to EPA for a determination. A copy of the application will be provided to the State Board. Once this determination has been made, EPA shall

notify the applicant, the applicant's POTW, the Regional Board, and State Board and provide reasons for the determination and any additional monitoring requirements the EPA deems necessary, in writing.

G. Miscellaneous

The State Board, with the assistance of the Regional Boards, will submit to the EPA a list of POTWs which are required to develop their own pretreatment program or are under investigation by a Regional Board for the possible need for a local pretreatment program. The State will document its reasons for all deletions from this list. Before deleting any POTW with a design flow greater than five-million gallons per day (mgd), the State will obtain an industrial survey from the POTW and determine: (1) that the POTW is not experiencing pass through or interference problems; and (2) that there are no industrial users of the POTW that are subject either to categorical pretreatment standards or specific limits developed pursuant to 40 CFR 403.5(c). The State will document all such determinations and provide copies to EPA. For deletions of POTWs with flows less than 5 mgd, the State will first determine (with appropriate documentation) that the POTW is not experiencing treatment process upsets, violations of POTW effluent limitations, or contamination of municipal sludge due to industrial users. The State will also maintain documentation on the total design flow and the nature and amount of industrial wastes received by the POTW.

The State Board and EPA will communicate, through the Section 106 Workplan process, commitments and priorities for program implementation including commitments for inspection of POTWs and industrial users. The Section 106 Workplan will contain, at a minimum, the following: (1) a list of NPDES permits or waste discharge requirements to be issued by the Regional Boards to POTWs subject to pretreatment requirements; and (2) the number of POTWs to be audited or inspected on a quarterly basis.

H. Other Provisions

Nothing in this agreement is intended to affect any pretreatment requirement, including any standards or prohibitions established by State or local law, as long as the State or local requirements are not less stringent than any set forth in the National Pretreatment Program, or other requirements or

prohibitions established under the CWA or Federal regulations. Nothing in this MOA shall be construed to limit the authority of the EPA to take action pursuant to Sections 204, 208, 301, 304, 306, 307, 308, 309, 311, 402, 404, 405, 501, or other Sections of the CWA (33 U.S.C. Section 1251 et seq).

IV. COMPLIANCE MONITORING AND ENFORCEMENT

This Section constitutes the State/EPA Enforcement Agreement. The State Board and EPA will review this section of the MOA each year.

A. Enforcement Management Systems (EMS)

The State Board will maintain compliance monitoring and enforcement procedures in the APM which are consistent with the seven principles of the EPA Enforcement Management System Guide (listed below), and this MOA. The APM shall constitute the State Enforcement Management System for the NPDES program, and shall describe criteria for:

1. Maintaining a source inventory (of information about discharges subject to NPDES permits) that is complete and accurate;

2. Processing and assessing the flow of information available on a systematic and timely basis;

3. Completing a preenforcement screening (of compliance-related information coming into the inventory) by reviewing the information as soon as possible after it is received;

4. Performing a more formal enforcement evaluation (of the same information) where appropriate;

5. Instituting formal enforcement action and follow-up wherever necessary;

6. Initiating field investigations based upon a systematic plan; and

7. Using internal management controls to provide adequate enforcement information to all levels of the organization.

These compliance and enforcement-related provisions of the APM shall constitute the framework (within which the circumstances of

noncompliance are reviewed) for making NPDES enforcement decisions, and evaluation of those decisions by others.

B. Inspections

1. State Inspections

a. The Regional Boards shall conduct compliance inspections to determine the status of compliance with permit requirements, including sampling and non-sampling inspections.

b. The State Board will maintain up-to-date procedures in the APM for conducting compliance inspections, which conform to NPDES regulations.

c. The State is responsible for inspecting annually all major dischargers. To enable this goal to be accomplished EPA may assist the State by inspecting some dischargers. The 106 workplan will specify the number of sampling inspections and the number of reconnaissance inspections to be conducted by the State each year.

2. EPA Inspections

a. EPA retains the authority to perform compliance inspections of any permittee at any time.

b. For those inspections scheduled more than 15 days in advance, EPA will notify the appropriate Regional Board and the State Board within 15 days in advance. For inspections scheduled less than 15 days in advance, EPA will provide as much advance notice as possible.

c. EPA will send copies of inspection reports to the Regional Board and State Board within 30 days of the inspection if there are no effluent samples to be analyzed. EPA will usually send copies of inspection results to the State within 60 days of the inspection if there are effluent samples to be analyzed.

3. Inspection Assistance

a. EPA and the State Board will provide technical assistance to the Regional Boards in their inspection programs whenever staff are available. This assistance may be requestedat any time by the Regional Boards.

b. If neither EPA nor the State Board are able to provide such assistance when it is requested, the State Board shall schedule the assistance at the earliest possible date, and so notify the Regional Board and EPA.

C. Discharger Reports

1. Review of Reports

The Regional Boards shall require each NPDES permittee to send copies of its Discharge Monitoring Reports (DMRs) to EPA and the Regional Boards for review.

a. Whenever a Regional Board cannot complete the review of DMRs and other compliance reports within 30 days of their arrival, the Regional Board shall follow the "exception procedures" in the APM.

b. For auditing and reporting purposes Regional Boards (or the State Board if it should undertake DMR review) shall track and document the date of receipt, the date of review, and the review results (i.e., compliance status) of each DMR and compliance report.

2. Quality Assurance Reviews

EPA routinely conducts technical studies of the accuracy of the reported effluent data from NPDES permittees. EPA send check samples to selected permittees for analysis as part of these studies. The permittees are required to return the results to EPA.

a. Delinquent Permittees

(1) EPA will send the State Board a list of permittees who declined to return

the analytical results of the check samples.

(2) The State Board shall transmit the list to the Regional Boards and assure that they require the permittee to participate in all subsequent studies.

(3) The State Board or Regional Board shall take other appropriate enforcement action against NPDES permittees that have failed to return the anlytical results of the sample.

b. Unacceptable Quality of Analysis

(1) EPA will send the State Board and Regional Boards a list of permittees who failed the analysis study.

(2) The Regional Boards will determine whether the causes of failure are due to clerical errors in report preparation or procedural errors in sample analysis.

(a) If the problem is due to clerical errors, the Regional Board will clarify the reporting procedures.

(b) If the problem is due to analytical errors,the Regional Board will assure that the problems are corrected immediately or that the permittee begins using another laboratory.

(c) If the permittee is using in-house laboratory facility, the Regional Board staff shall take action to assure compliance with NPDES requirements.

c. EPA Technical Assistance

Within the constraints of available staff time, EPA will provide technical assistance and guidance concerning acceptable analytical procedures.

D. Public Complaints

1. Telephone Complaints

a. Telephone complaints received by EPA or the State Board pertaining to a discharge to water of the United States will be referred to the appropriate Regional Board.

b. The Regional Boards shall maintain written documentation of each telephone complaint and its disposition.

2. Written Complaints

a. Written complaints pertaining toa discharge to waters of the United States may be responded to by telephone or by letter. All telephone responses shall be documented by memo.

b. Copies of each response prepared by EPA or the State Board shall be sent to the appropriate Regional Board.

c. The Regional Boards shall retain documentation of each written complaint and its disposition.

3. Complaint Resolution

a. The Regional Boards will investigate complaints and inform the complainant of the investigation results.

b. The Regional Boards shall place a copy of each NPDES-related complaint and a memo of recorddescribing the investigation results thereof into the permit file or compliance file of the appropriate facility.

E. State Enforcement

1. Basis of EPA/State Relationship

a. The Regional Boards pursue enforcement of NPDES permit requirements, and of all other provisions of the NPDES program under State authority.

b. The State Board shall assure that enforcement of the NPDES program is exercised aggressively, fairly, and consistently by all nine Regional Boards. The staff of the State Board will review enforcement practices and inform the Regional Board is not taking appropriate enforcement actions.

(1) The State Board will assure that Federal facilities are treated the same as other NPDES facilities within the constraints of Section 313 of the Clean Water Act.

(2) The State Board will keep a record of all penalties assessed and all penalties collected in NPDES enforcement cases.

c. EPA shall monitor the State's performance, and may take enforcement action under Section 309 of the CWA, whenever the State does not take timely and appropriate enforcement action.

d. EPA shall coordinate its enforcement actions with the State Board and with the appropriate Regional Board as described below.

e. The State Board and EPA will meet periodically to discuss the status of pending and adopted enforcement actions as well as other issues of concern.

2. State Notice to EPA of Enforcement Actions

The State shall send copies of proposed and final enforcement actions, settlements, and amendments thereto, against NPDES facilities to EPA within five working days after the date of signature.

F. EPA Enforcement

1. EPA Initiation of Enforcement Action

EPA will initiate enforcement action:

a. At the request of the State;

b. If the State response to the violation is not consistent with the APM and EPA policy or is otherwise determined by EPA not to be timely and appropriate; or

c. If there is an overriding federal interest.

2. EPA Deferral of Enforcement Action

EPA shall defer formal enforcement action whenever the State initiates an enforcement action determined by EPA to be timely and appropriate for the violation, except when there is an overriding federal interest.

G. Enforcement Procedures

If circumstnaces require EPA to pursue formal enforcement, EPA, and the State shall observe the following procedures:

1. Enforcement Based on the Quarterly Noncompliance Report

a. EPA shall notify the State Board and the appropriate Regional Boards by letter, of the facilities (the name and NPDES number) for which for which EPA policy requires formal enforcement action.

b. The State Board shall respond to EPA by letter within 30 days of its receipt of the EPA notice.

c. The response shall include:

(1) The name and NPDES number of:

(a) Each facility which has returned to compliance;

(b) Each facility for which the Regional Boards have scheduled formal enforcement actions;

(c) Each facility for which a Regional Board or the State Board has taken a formal enforcement action, if the

enforcement action was not shown on the QNCR as part of the response to the violation; and

(d) Each facility against which the State Board will pursue formal enforcement.

(2) Identification of the type of each formal enforcement action;

(3) A description of how each Regional Board plans to address the violations which have not been corrected by the faciilities, and for which they are not pursuing formal enforcement; and

(4) A description of the enforcement action State Board staff will recommend to take against any facility.

e. EPA shall notify the State Board either that the State response to the violation is sufficient to defer a formal action by EPA, or that EPA will proceed with a formal enforcement action pursuant to Section 309 of the CWA.

2. Enforcement Based on Information Other than the Quarterly Noncompliance Report

a. EPA shall notify the State Board and the appropriate Regional Board of each violation against which EPA intends to pursue formal enforcement. This notice shall include:

(1) The name and NPDES number of the facility;

(2) An identification of the violations which warrant formal enforcement;

(3) The reasons why EPA believes formal enforcement is necessary; and

(4) The reasons why past or pending State responses are insufficient.

b. Within ten working days of the notification by EPA, and after

consultation with the appropriate Regional Boards, the State Board will respond to the EPA notice. The State Board's response will include:

(1) A discussion of the circumstances of the identified violations;

(2) A description of the substance and timing of any past, pending, or planned responses to the violations by the Regional Board or the State Board; including identification of the office and staff responsible for the action;

(3) The amounts of any penalties sought or collected; and

(4) Whether or not the State Board believes the responses are appropriate and why.

c. EPA shall notify the State Board either that the State response to the violation is sufficient to defer a formal action by EPA, or that EPA will proceed with a formal enforcement action pursuant to Section 309 of the CWA.

d. Normal enforcement action until ten working days from the date of the EPA notice have passed.

3. Overriding Federal Interest:

a. For the purposes of this MOA, an overriding federal interest exists when:

(1) EPA enforcement can reasonably be expected to expedite the discharger's return to full compliance;

(2) EPA enforcement can reasonably be expected to increase program credibility; or

(3) The violation has significant implications for the success of the NPDES program beyond the borders of California;

b. EPA shall notify the State Board and the appropriate Regional Board when there is an overriding federal interest;

c. Within ten working days of the EPA notice, the State Board will inform EPA of any coordination between the federal action and a State action that the State believes to be appropriate;

d. EPA shall either:

(1) Contact the Regional Board and the State Board to work out the details of coordinating the State and federal enforcement actions. Usually, such coordination will entail the exchange of draft enforcement actions for review. Comments can usually be exchanged by telephone, or in a staff meeting at the Regional Board depending upon the complexity of the enforcement action; or

(2) Inform the State Board that such coordination is infeasible;

e. EPA shall not proceed with its enforcement action until ten working days after the date of the EPA notice; and

f. In any instance of overriding federal interest and upon request by the State, EPA shall send the State Board and the appropriate Regional Board a brief, written explanation of the reasons for overriding federal interest or the reasons for infeasibility of enforcement coordination.

4. Recovery of Additional Penalties

Nothing in this MOA shall be construed to limit EPA's authority to take direct enforcement action for the recovery of additional penalties, whenever the penalties recovered by the State are less than those prescribed by the EPA penalty policy.

5. EPA Enforcement Without Notice to the State

Not withstanding the provisions above for prior notification to the State of federal enforcement actions, nothing in this MOA limits EPA's authority to take enforcement action without any prior notice to the State. If EPA does take such an action, it shall send copies of its correspondence with the affected facility to the State Board and the appropriate Regional Board.

V. STATE REPORTING

A. The State will submit the following to EPA:

Item	Description	Frequency of Submission
1	A copy of all permit applications except those for which EPA has waived review	Within 5 days of receipt
2	Copies of all draft NPDES permits and permit modifications including fact sheets except those for which EPA has waived review	When placed on public notice
3	Copies of all public notices	As issued
4	A copy of all issued, draft NPDES permits and permit modifications	As issued
5	A copy of settlements and decisions in permit appeals	As issued

Item	Description	Frequency of Submission
6	A list of major facilities of the scheduled for compliance inspections	With submission annual program
7	Proposed revisions to the scheduled compliance inspections	As needed

8	A list of compliance inspections performed during the previous quarter	Quarterly
9	Copies of all compliance inspection reports and data and transmittal letters to major permittees	Within 30 days of inspection
10	Copies of all compliance inspection reports and data transmittal letters to all other permittees	As requested
11	For major dischargers, a quarterly noncompliance report as specified in 40 CFR 123.45(a) and further qualified in EPA guidance	Quarterly, as specified in 40 CFR 123.45(c)
12	For minor dischargers, an annual noncompliance report as specified in 40 CFR 123.45(b)	Within 60 days of the end of the calendar as specified in 40 CFR 123.45(c)
13	Copies of all enforcement actions against NPDES violators (including letters, notices of violation, administrative orders, initial determinations, and referrals to the Attorney General)	As issued
Item	Description	Frequency of Submission
14	Copies of correspondence required to carry out the pretreatment program	As issued or received
15	Copies of Discharge Monitoring Report (DMR) and non-	Within 10 days of receipt

compliance notification from major permittees

B. Major Discharger List

The State annually shall submit to EPA an updated "major dischargers" list. The list shall include those dischargers mutually defined by the State Board and EPA as major dischargers plus any additional dischargers that in the opinion of the State or EPA, have a high potential for violation of water quality standards. The major discharger list for Federal facilities shall be jointly determined by EPA and the State. The schedule for submittal of the major discharger list shall be included in the 106 workplan.

C. Emergency Notification

1. The Regional Board shall telephone, or otherwise contact, EPA and the State Board immediately if it discovers a NPDES permit violation or threatening violation:

   a. That has significantly damaged or is likely to significantly damage the environment or the public health; or

   b. That has or is likely to cause significant public alarm.

2. The Regional Board will describe the circumstances and magnitude of the violation

VI. CONFIDENTIALITY OF INFORMATION

A. All information obtained or used by the State in the administration of the NPDES program shall be available to EPA upon request without restriction, and information in EPA's files which the State needs to implement its program shall be made available to the State upon request without restriction.

B. Whenever either party furnishes information to the other that has been claimed as confidential, the party furnishing the information will also furnish the confidentiality claim and the results of any legal review of the claim.

C. The party receiving the confidential information will treat it in accordance with the provisions of 40 CFR Part 2.

D. The State and EPA will deny all claims of confidentiality for effluent data, permit applications, permits, and the name and address of any permittee.

VII. PROGRAM REVIEW

A. To fulfill its responsibility for assuring the NPDES program requirements are met, EPA shall:

1. Review the information submitted by the State;

2. Meet with State officials from time to time todiscuss and observe the data handling, permit processing, and enforcement procedures, including both manual and automated processes;

3. Examine the files and documents of the State regarding selected facilities to determine: (a) whether permits are processed and issued consistent with federal requirements; (b) whether the State is able to discover permit violations when they occur; (c) whether State reviews are timely; and (d) whether State selection of enforcement actions is appropriate and effective. EPA shall notify the State in advance of any examination under this paragraph so that appropriate State officials may be available to discuss individual circumstances and problems.

   EPA need not reveal to the State in advance the files and documents to be examined. A copy of the examination report shall be transmitted to the State when available;

4. Review, from time to time, the legal authority upon which the State's program is based, including State statutes and regulations;

5. When appropriate, hold public hearings on the State's NPDES program; and

6. Review the State's public participation policies, practices and procedures.

B. Prior to taking any action to propose or effect any substantial amendment, recision, or repeal of any statute, regulations, or form which has been approved by EPA, and prior to the adoption of any statute, regulations, or form, the State shall notify the Regional Administrator and shall transmit the text of any such change or new form to the Regional Administrator (see 40 CFR 123.62 which provides that the change may trigger a program revision, which will not become effective until approved by EPA).

C. If an amendment, recision, or repeal of any statute, regulations, or form described in paragraph (B) above shall occur for any reason, including action by the State legislature or a court, the State shall within ten days of such event, notify the Regional Administrator and shall transmit a copy of the text of such revision to the Regional Administrator.

D. Prior to the approval of any test method as an alternative to those specified as required for NPDES permitting, the State shall obtain the approval of the Regional Administrator.

VIII. TERM OF THE MOA

A. This MOA shall become effective upon the date of signature of the Regional Administrator and of the Chair of the State Water Resources Control Board after State Board approval. If it is signed by the two parties on different days, the latter date shall be the effective date.

B. This MOA shall be reviewed by EPA and the State, and revised as appropriate within five (5) years of its effective date.

C. Either EPA or the State may initiate action to change this MOA at any time.

1. No change to this MOA shall become effective without the concurrence of both agencies.

2. The STATE REPORTING (V) portion may be changed by the written consent of the Chief, Division of Water Quality, SWRCB, and the Director, Water Management Division, EPA, Region 9. The Director of Permits Division (EN-336) must consent to all substantial changes.

3. All other changes to this MOA must be approved by the State Board and approved by the Regional Administrator, with the prior concurrence of the Director of the Office of Water Enforcement and Permits (EN-335)and the Associate General Counsel for Water for all substantial changes. The Director of the Office of Water Enforcement and Permits and Associate General Counsel for Water shall also determine whether changes should be deemed substantial.

4. All changes to this MOA determined by EPA to be substantial shall be subject to public notice and comment in accordance with the requirements of 40 CFR 123.62 before being approved.

D. Either party may terminate this MOA upon notice to other party pursuant to 40 CFR 123.64.

E. In witness thereof, the parties execute this agreement.

Robert Ghirelli
Executive Officer
California Regional Water Quality
Control Board, Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Mr. Ghirelli:

Per your request, we have reviewed the draft NPDES permit prepared by the Board's staff for municipal separate storm sewer discharges within the City and County of Los Angeles.

As I mentioned during the November 3rd meeting in San Francisco, Region 9 concurs with your plans to issue NPDES permits for municipal stormwater discharges in the Los Angeles area. It is Region 9's intent to work with the Board to assist in the development of appropriate permit conditions.

Since this permit will be one of the first in the country for municipal stormwater, we will ensure that EPA Headquarters is kept informed of developments. The role of EPA Headquarters will be limited to monitoring the progress in developing permit conditions and offering suggestions based on experiences elsewhere in the country. However, EPA Headquarters will have no role in either approving or disapproving the final permit.

We generally concur with the approach to municipal stormwater permitting which you have proposed, whereby the application consists of those components described in Part 1 of EPA's draft regulations and the balance of the application requirements along with implementation are incorporated as requirements of the permit.

With regard to the application requirements, the City and County will have completed Tasks 1 through 4 prior to public notice of the draft permit. As such, Tasks 1 through 4 should be described in a finding and the body of the permit need only apply to Tasks 5 and 6.

The draft permit (Tasks 5 and 6) requires development and submittal of several plans during the term of the permit. As you will recall at the November 3rd meeting, we expressed a concern regarding the adequacy of public participation in the approval of the plans. It is also essential that additional conditions be included in Tasks 5 and 6 to ensure implementation of the various plans in accord with schedules which the Board has reviewed and revised/approved. We suggest a condition such as the following:

> "Upon approval/modification of these plans by the Board, subsequent to a public workshop, the permittee shall implement the plans according to the approved schedule."

It is also very important that the area to be permitted be described in detail in the permit application and permit finding. In addition, the schedule for phasing in the various areas needs to be specified in the permit.

Our specific comments on the draft permit are enclosed.

We appreciate your having taken the time to discuss stormwater permitting with us in San Francisco on November 3rd. Additional comments may be forthcoming as a result of the State stormwater permitting meeting in Sacramento on November 16.

Should you have any questions regarding this matter, please call me at (415) 744-2125.

Sincerely,

Harry Seraydarian
Director
Water Management Division

ENCLOSURE - SPECIFIC COMMENTS ON PROPOSED STORMWATER PERMIT

1. FINDINGS

Finding F

We believe the finding could be clarified by replacing "industrial activities" with "industrial facilities which discharge stormwater associated with industrial activity."

2. APPLICATION REQUIREMENTS

Subtask 1(a, f)

We suggest that subtasks a and f be combined. The total area to be permitted should be described as well as the schedule for phasing in each portion of the overall area.

A map showing the drainage areas and outfall locations should also be provided.

Task 2

This task is unclear regarding whether or not the permit requires the source information described in Parts 1 and 2 of EPA's proposed permit application regulations or just Part 1. We suggest that Task 2 require source information comparable to the requirements of Part 1 of EPA's proposed regulations. Submittal of the Part 2 information could be added as an additional subtask of Task 5 or 6.

Subtask 4(d)

Information concerning existing structural controls (such as detention/retention basins, grassy swales, etc.) should be submitted as well as information concerning existing BMP's.

3. PERMIT REQUIREMENTS

Subtask 5(a)

This subtask should specify the parameters to be measured in stormwater or, alternatively, criteria upon which the parameters to be monitored will be determined. We recommend testing for the parameters specified in EPA's proposed permit application regulations; bioassay testing (acute testing initially) is also recommended. The monitoring should be conducted for representative residential, commercial and industrial areas.

VOL 23

0338

Ambient monitoring of the receiving water is also recommended to determine whether or not the discharges are causing violations of water quality standards.

<u>Subtask 5(d)</u>

The list of BMP's identified to be "readily applied" should be accompanied by an implementation schedule which requires implementation as soon as practicable. Also, the permit should require that existing BMP's continue to be implemented.

<u>Subtask 6(b)</u>

This subtask should specify that the monitoring and characterization report would cover only those areas specified by the schedule provided under Subtask 5(a). However, the permit should also require a continuing monitoring program (targeted toward those areas showing the greatest stormwater contamination in the first phase of monitoring) to gather additional stormwater quality data.

<u>Subtask 6(c)</u>

This subtask needs to be clarified. We assume that the intent of the subtask is to require only BMP's which are appropriate on a site-specific basis. We suggest that Subtask 6(c) require a list of BMP's appropriate for each city or watershed with a discussion of the criteria used for the selection.

<u>Subtask 6(d)</u>

The plan for implementation of control measures should include <u>industrial</u> areas as well as commercial and residential areas. An assessment of the expected effectiveness of the controls should also be provided with the stormwater management plan.

Part II

Environmental Protection Agency

40 CFR Parts 122, 123, and 124
National Pollutant Discharge Elimination System Permit Application Regulations for Storm Water Discharges; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 122, 123, and 124

[FRL-3834-7]

RIN 2040-AA79

National Pollutant Discharge Elimination System Permit Application Regulations for Storm Water Discharges

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: Today's final rule begins to implement section 402(p) of the Clean Water Act (CWA) (added by section 405 of the Water Quality Act of 1987 (WQA)), which requires the Environmental Protection Agency (EPA) to establish regulations setting forth National Pollutant Discharge Elimination System (NPDES) permit application requirements for: storm water discharges associated with industrial activity; discharges from a municipal separate storm sewer system serving a population of 250,000 or more; and discharges from municipal separate storm sewer systems serving a population of 100,000 or more, but less than 250,000.

Today's rule also clarifies the requirements of section 401 of the WQA, which amended CWA section 402(1)(2) to provide that NPDES permits shall not be required for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing, or treatment operations or transmission facilities, composed entirely of flows which are from conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with, or do not come into contact with, any overburden, raw material, intermediate product, finished product, byproduct, or waste product located on the site of such operations. This rule sets forth NPDES permit application requirements addressing storm water discharges associated with industrial activity and storm water discharges from large and medium municipal separate storm sewer systems.

DATES: This final rule becomes effective December 17, 1990. In accordance with 40 CFR 23.2, this rule shall be considered final for purposes of judicial review on November 30, 1990, at 1 p.m. eastern daylight time. The public record is located at EPA Headquarters, EPA Public Information Reference Unit, room 2402, 401 M Street SW., Washington DC 20460. A reasonable fee may be charged for copying.

SUPPLEMENTARY INFORMATION:

I. Background and Water Quality Concerns

The 1972 amendments to the Federal Water Pollution Control Act (referred to as the Clean Water Act or CWA), prohibit the discharge of any pollutant to navigable waters from a point source unless the discharge is authorized by an NPDES permit. Efforts to improve water quality under the NPDES program traditionally and primarily focused on reducing pollutants in discharges of industrial process wastewater and municipal sewage. This program emphasis developed for a number of reasons. At the onset of the program in 1972, many sources of industrial process wastewater and municipal sewage were not adequately controlled and represented pressing environmental problems. In addition, sewage outfalls and industrial process discharges were easily identified as responsible for poor, often drastically degraded, water quality conditions. However, as pollution control measures were initially

developed for these discharges, it became evident that more diffuse sources (occurring over a wide area) of water pollution, such as agricultural and urban runoff were also major causes of water quality problems. Some diffuse sources of water pollution, such as agricultural storm water discharges and irrigation return flows, are statutorily exempted from the NPDES program.

Since enactment of the 1972 amendments to the CWA, considering the rise of economic activity and population, significant progress in controlling water pollution has been made, particularly with regard to industrial process wastewater and municipal sewage. Expenditures by EPA, the States, and local governments to construct and upgrade sewage treatment facilities have substantially increased the population served by higher levels of treatment. Backlogs of expired permits for industrial process wastewater discharges have been reduced. Continued improvements are expected for these discharges as the NPDES program continues to place increasing emphasis on water quality-based pollution controls, especially for toxic pollutants.

Although assessments of water quality are difficult to perform and verify, several national assessments of water quality are available. For the purpose of these assessments, urban runoff was considered to be a diffuse source or nonpoint source pollution. From a legal standpoint, however, most urban runoff is discharged through conveyances such as separate storm sewers or other conveyances which are point sources under the CWA. These discharges are subject to the NPDES program. The "National Water Quality Inventory, 1988 Report to Congress" provides a general assessment of water quality based on biennial reports submitted by the States under section 305(b) of the CWA. In preparing the section 305(b) Reports, the States were asked to indicate the fraction of the States' waters that were assessed, as well as the fraction of the States' waters that were fully supporting, partly supporting, or not supporting designated uses. The Report indicates that of the rivers, lakes, and estuaries that were assessed by States (approximately one-fifth of stream miles, one-third of lake acres and one-half of estuarine waters), roughly 70% to 75% are supporting the uses for which they are designated. For waters with use impairments, States were asked to determine impacts due to diffuse sources (agricultural and urban runoff and other sources), municipal sewage, industrial process wastewaters, combined sewer overflows, and natural and other sources, then combine impacts to arrive at estimates of the relative percentage of State waters affected by each source. In this manner, the relative importance of the various sources of pollution that are causing use impairments was assessed and weighted national averages were calculated. Based on 37 States that provided information on sources of pollution, industrial process wastewaters were cited as the cause of non-support for 7.5% of rivers and streams, 10% of lakes, and 6% of estuaries. Municipal sewage was the cause of non-support for 13% of rivers and streams, 5% lakes, 43% estuaries, 41% of the Great Lake shoreline, and 11% of coastal waters. The Assessment concluded that pollution from diffuse sources, such as runoff from agricultural, urban areas, construction sites, land disposal and resource extraction, is cited by the States as the leading cause of water quality impairment. These sources appear to be increasingly important contributors of use impairment as discharges of industrial process wastewaters and municipal sewage plants come under increased control and as intensified data collection efforts provide additional information. Some examples of diffuse sources cited as causing use impairment are: for rivers and streams, 9% from separate storm sewers, 6% from construction and 13% from resource extraction; for lakes, 28% from separate storm sewers and 25% from land disposal; for the Great Lakes shoreline, 10% from separate storm sewers, 34% from resource extraction, and 82% from land disposal; for estuaries, 28% from separate storm sewers and 27% from land disposal; and for coastal areas, 20% from separate storm sewers and 29% from land disposal.

The States conducted a more comprehensive study of diffuse pollution sources under the sponsorship of the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) and EPA. The study resulted in the report "America's Clean Water—The States' Nonpoint Source Assessment, 1985" which indicated that 38 States reported urban runoff as a major cause of beneficial use impairment. In addition, 21 States reported construction site runoff as a major cause of use impairment.

To provide a better understanding of the nature of urban runoff from commercial and residential areas, from 1978 through 1983, EPA provided funding and guidance to the Nationwide Urban Runoff Program (NURP). The NURP included 28 projects across the Nation, conducted separately at the local level but centrally reviewed, coordinated, and guided.

One focus of the NURP was to characterize the water quality of discharges from separate storm sewers which drain residential, commercial, and light industrial (industrial parks) sites. The majority of samples collected in the study were analyzed for eight conventional pollutants and three metals. Data collected under the NURP indicated that on an annual loading basis, suspended solids in discharges from separate storm sewers draining runoff from residential, commercial and light industrial areas are on and an order of magnitude greater than solids in discharges from municipal secondary sewage treatment plants. In addition, the study indicated that annual loadings of chemical oxygen demand (COD) are comparable in magnitude to effluent from secondary sewage treatment plants. When analyzing annual loadings associated with urban runoff, it is important to recognize that discharges of urban runoff are highly intermittent, and that the short-term loadings associated with individual events will be high and may have shock loading effects on receiving water, such as low dissolved oxygen levels. NURP data also showed that fecal coliform counts in urban runoff are typically in the tens to hundreds of thousands per 100 ml of runoff during warm weather conditions, although the study suggested that fecal coliform may not be the most appropriate indicator organism for identifying potential health risks in storm water runoff. Although NURP did not evaluate oil and grease, other studies have demonstrated that urban runoff is an extremely important source of oil pollution to receiving waters, with hydrocarbon levels in urban runoff typically being reported at a range of 2 to 15 mg/L. These hydrocarbons tend to accumulate in bottom sediments where they may persist for long periods of time and exert adverse impacts on benthic organisms.

A portion of the NURP study involved monitoring 120 priority pollutants in storm water discharges from lands used for residential, commercial and light industrial activities. Seventy-seven priority pollutants were detected in samples of storm water discharges from residential, commercial and light industrial lands taken during the NURP study, including 14 inorganic and 63 organic pollutants. Table A-4 shows the priority pollutants which were detected in at least ten percent of the discharge samples which were sampled for priority pollutants.

TABLE A-1.— PRIORITY POLLUTANTS DETECTED IN AT LEAST 10% OF NURP SAMPLES

(In percent)

	Frequency of detection
Metals and inorganics	
Antimony	13
Arsenic	52
Beryllium	12
Cadmium	48
Chromium	58
Copper	91
Cyanides	23
Lead	84
Nickel	43
Selenium	11
Zinc	84
Pesticides:	
Alpha-hexachlorocyclohexane	20
Alpha-endosulfan	19
Chlordane	17
Lindane	15
Halogenated aliphatics:	
Methane, dichloro-	11
Phenols and cresols:	
Phenol	14
Phenol, pentachloro-	19
Phenol, 4-nitro	10
Phthalate esters:	
Phthalate, bis(2-ethylhexyl)	22
Polycyclic aromatic hydrocarbons:	
Chrysene	10
Fluoranthene	16
Phenanthrene	12
Pyrene	15

The NURP data also showed a significant number of these samples exceeded various EPA freshwater water quality criteria.

The NURP study provides insight on what can be considered background levels of pollutants for urban runoff, as the study focused primarily on monitoring runoff from residential, commercial and light industrial areas. However, NURP concluded that the quality of urban runoff can be adversely impacted by several sources of pollutants that were not directly evaluated in the study and are generally not reflected in the NURP data, including illicit connections, construction site runoff, industrial site runoff and illegal dumping.

Other studies have shown that many storm sewers contain illicit discharges of non-storm water and that large amounts of wastes, particularly used oils, are improperly disposed in storm sewers. Removal of these discharges present opportunities for dramatic improvements in the quality of storm water discharges. Storm water discharges from industrial facilities may contain toxics and conventional pollutants when material management practices allow exposure to storm water, in addition to wastes from illicit connections and improperly disposed wastes

In some municipalities, illicit connections of sanitary, commercial and industrial discharges to storm sewer systems have had a significant impact on the water quality of receiving waters. Although the NURP study did not emphasize the identification of illicit connections to storm sewers (other than to assure that monitoring sites used in the study were free from sanitary sewage contamination), the study concluded that illicit connections can result in high bacterial counts and dangers to public health. The study also noted that removing such discharges presented opportunities for dramatic improvements in the quality of urban storm water discharges.

Studies have shown that illicit connections to storm sewers can create severe, wide-spread contamination problems. For example, the Huron River Pollution Abatement Program inspected 660 businesses, homes and other buildings located in Washtenaw County, Michigan and identified 14% of the buildings as having improper storm drain connections. Illicit discharges were detected at a higher rate of 60% for automobile related businesses, including service stations, automobile dealerships, car washes, body shops and light industrial facilities. While some of the problems discovered in this study were the result of improper plumbing or illegal connections, a majority were approved connections at the time they were built.

Intensive construction activities may result in severe localized impacts on water quality because of high unit loads of pollutants, primarily sediments. Construction sites can also generate other pollutants such as phosphorus and nitrogen from fertilizer, pesticides, petroleum products, construction chemicals and solid wastes. These materials can be toxic to aquatic organisms and degrade water for drinking and water-contact recreation. Sediment loadings rates from construction sites are typically 10 to 20 times that of agricultural lands, with runoff rates as high as 100 times that of agricultural lands, and typically 1,000 to 2,000 times that of forest lands. Even a small amount of construction may have a significant negative impact on water quality in localized areas. Over a short period of time, construction sites can contribute more sediment to streams than was previously deposited over several decades.

II. Water Quality Act of 1987

The WQA contains three provisions which specifically address storm water discharges. The central WQA provision governing storm water discharges is section 405, which adds section 402(p) to the CWA. Section 402(p)(1) provides that EPA or NPDES States cannot require a permit for certain storm water discharges until October 1, 1992, except for storm water discharges listed under section 402(p)(2). Section 402(p)(2) lists five types of storm water discharges which are required to obtain a permit prior to October 1, 1992:

(A) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(B) A discharge associated with industrial activity;

(C) A discharge from a municipal separate storm sewer system serving a population of 250,000 or more;

(D) A discharge from a municipal separate storm sewer system serving a population of 100,000 or more, but less than 250,000; or

(E) A discharge for which the Administrator or the State, as the case may be, determines that the storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to the waters of the United States.

Section 402(p)(4)(A) requires EPA to promulgate final regulations governing storm water permit application requirements for storm water discharges associated with industrial activity and discharges from large municipal separate storm sewer systems (systems serving a population of 250,000 or more), "no later than two years" after the date of enactment (*i.e.*, no later than February 4, 1989). Section 402(p)(4)(B) also requires EPA to promulgate final regulations governing storm water permit application requirements for discharges from medium municipal separate storm sewer systems (systems serving a population of 100,000 or more but less than 250,000) "no later than four years" after enactment (*i.e.*, no later than February 4, 1991).

In addition, section 402(p)(4) provides that permit applications for storm water discharges associated with industrial activity and discharges from large municipal separate storm sewer systems "shall be filed no later than three years" after the date of enactment of the WQA (*i.e.*, no later than February 4, 1990). Permit applications for discharges from medium municipal systems must be filed "no later than five years" after enactment (*i.e.*, no later than February 4, 1992).

The WQA clarified and amended the requirements for permits for storm water discharges in the new CWA section 402(p)(3). The Act clarified that permits for discharges associated with industrial activity must meet all of the applicable provisions of section 402 and section 301

including technology and water quality based standards. However, the new Act makes significant changes to the permit standards for discharges from municipal storm sewers. Section 402(p)(3)(B) provides that permits for such discharges:

(i) May be issued on a system- or jurisdiction-wide basis;
(ii) Shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers; and
(iii) Shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

These changes are discussed in more detail later in today's rule.

The EPA, in consultation with the States, is required to conduct two studies on storm water discharges that are in the class of discharges for which EPA and NPDES States cannot require permits prior to October 1, 1992. The first study will identify those storm water discharges or classes of storm water discharges for which permits are not required prior to October 1, 1992, and determine, to the maximum extent practicable, the nature and extent of pollutants in such discharges. The second study is for the purpose of establishing procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality. Based on the two studies the EPA, in consultation with State and local officials, is required to issue regulations no later than October 1, 1992, which designate additional storm water discharges to be regulated to protect water quality and establish a comprehensive program to regulate such designated sources. This program must, at a minimum, (A) Establish priorities, (B) establish requirements for State storm water management programs, and (C) establish expeditious deadlines. The program may include performance standards, guidelines, guidance, and management practices and treatment requirements, as appropriate.

Section 401 of the WQA amends section 402(1)(2) of the CWA to provide that the EPA shall not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing, or treatment operations or transmission facilities if the storm water discharge is not contaminated by contact with, or does not come into contact with, any overburden, raw material, intermediate product, finished product, byproduct, or waste product located on the site of such operations.

Section 503 of the WQA amends section 502(14) of the CWA to exclude agricultural storm water discharges from the definition of point source.

III. Remand of 1984 Regulations

On December 4, 1987, the United States Court of Appeals for the District of Columbia Circuit vacated 40 CFR 122.26, (as promulgated on September 28, 1984, 49 FR 37998, September 26, 1984), and remanded the regulations to EPA for further rulemaking (*NRDC v. EPA*, No. 80-1607). EPA had requested the remand because of significant changes made by the storm water provisions of the WQA. The effect of the decision was to invalidate the storm water discharge regulations then found at § 122.26.

Storm water discharges which had been issued an NPDES permit prior to February 4, 1987, were not affected by the Court remand or the February 12, 1988, rule implementing the court order (53 FR 4157). (*See* section 402(p)(2)(A) of the CWA.) Similarly, the remand did not affect the authority of EPA or an NPDES State to require a permit for any storm water discharge (except an agricultural storm water discharge) designated under section 402(p)(2)(E) of the CWA. The notice of the remand clarified that such designated discharges meet the regulatory definition of point source found at 40 CFR 122.2 and that EPA or an NPDES State can rely on the statutory authority and require the filing of an application (Form 1 and Form 2C) for an NPDES permit with respect to such discharges on a case-by-case basis.

IV. Codification Rule and Case-by-Case Designations

Codification Rule

On January 4, 1989, (54 FR 255), EPA published a final rule which codified numerous provisions of the WQA into EPA regulations. The codification rule included several provisions dealing with storm water discharges. The codification rule promulgated the language found at section 402(p) (1) and (2) of the amended Clean Water Act at 40 CFR 122.26(a)(1). In addition, the codification rule promulgated the language of Section 503 of the WQA which exempted agricultural storm water discharges from the definition of point source at 40 CFR 122.2, and section 401 of the WQA addressing uncontaminated storm water discharges from mining or oil and gas operations at 40 CFR 122.26(a)(2).

EPA also codified the statutory authority of section 402(p)(2)(E) of the CWA for the Administrator or the State Director, as the case may be, to designate storm water discharges for a permit on a case-by-case basis at 40 CFR 122.26(a)(1)(v).

Case by Case Designations

Section 402(p)(2)(E) of the CWA authorizes case-by-case designations of storm water discharges for immediate permitting if the Administrator or the State Director determines that the storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

In determining that a storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States for the purpose of a designation under section 402(p)(2)(E), the legislative history for the provision provides that "EPA or the State should use any available water quality or sampling data to determine whether the latter two criteria (contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States) are met, and should require additional sampling as necessary to determine whether or not these criteria are met." Conference Report, *Cong. Rec.* S16443 (daily ed. October 16, 1986). In accordance with this legislative history, today's rule promulgates permit application requirements for certain storm water discharges, including discharges designated on a case-by-case basis. EPA will consider a number of factors when determining whether a storm water discharge is a significant contributor of pollution to the waters of the United States. These factors include: the location of the discharge with respect to waters of the United States; the size of the discharge; the quantity and nature of the pollutants reaching waters of the United States; and any other relevant factors. Today's rule incorporates these factors at 40 CFR 122.26(a)(1)(v).

Under today's rule, case-by-case designations are made under regulatory procedures found at 40 CFR 124.52. The procedures at 40 CFR 124.52 require that whenever the Director decides that an individual permit is required, the Director shall notify the discharger in writing that the discharge requires a permit and the reasons for the decision. In addition, an application form is sent with the notice. Section 124.52 provides a 60 day period from the date of notice for submitting a permit application. Although this 60 day period may be appropriate for many designated storm water discharges, site specific factors may dictate that the Director provide

additional time for submitting a permit application. For example, due to the complexities associated with designation of a municipal separate storm sewer system for a system- or jurisdiction-wide permit, the Director may provide the applicant with additional time to submit relevant information or may require that information be submitted in several phases.

V. Consent Decree of October 28, 1989

On April 20, 1989, EPA was served notice of intent to sue by Kathy Williams *et al.* because of the Agency's failure to promulgate final storm regulations on February 4, 1989, pursuant to Section 402(p)(4) of the CWA. A suit was filed by the same party on July 20, 1989, alleging the same cause of action, to wit: the Agency's failure to promulgate regulations under section 402(p)(4) of the CWA. On October 20, 1989, EPA entered into a consent decree with Kathy Williams *et al.* wherein the Federal District Court, District of Oregon, Southern Division, decreed that the Agency promulgate final regulations for storm water discharges identified in sections 402(p)(2) (B) and (C) of the CWA no later than July 20, 1990. *Kathy Williams et al.*, v. *William K. Reilly, Administrator, et al.*, No. 89-6265-E (D-Ore.) In July 1990, the consent degree was amended to provide for a promulgation date of October 31. Today's rule is promulgated in compliance with the terms of the consent decree as amended.

VI. Today's Final Rule and Response to Comments

A. Overview

Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT) and the Best Conventional Pollutant Control Technology (BCT) and where necessary, water quality-based controls), but permits for discharges from municipal separate storm sewer systems must require controls to reduce the discharge of pollutants to the maximum extent practicable, and where necessary water quality-based controls, and must include a requirement to effectively prohibit non-storm water discharges into the storm sewers. Furthermore, EPA in consultation with State and local officials must develop a comprehensive program to designate and regulate other storm water discharges to protect water quality.

This final regulation establishes requirements for the storm water permit application process. It also sets forth the required components of municipal storm water quality management plans, as well as a preliminary permitting strategy for industrial activities. In implementing these regulations, EPA and the States will strive to achieve environmental results in a cost effective manner by placing high priority on pollution prevention activities, and by targeting activities based on reducing risk from particularly harmful pollutants and/or from discharges to high value waters. EPA and the States will also work with applicants to avoid cross media transfers of storm water contaminants, especially through injection to shallow wells in the Class V Underground Injection Control Program.

In addition, EPA recognizes that problems associated with storm water, combined sewer overflows (CSOs) and infiltration and inflow (I&I) are all inter-related even though they are treated somewhat differently under the law. EPA believes that it is important to begin linking these programs and activities and, because of the potential cost to local governments, to investigate the use of innovative, non-traditional approaches to reducing or preventing contamination of storm water.

The application process for developing municipal storm water management plans provides an ideal opportunity between steps 1 and 2 for considering the full range of nontraditional, preventive approaches, including municipalities, public awareness/education programs, use of vegetation and/or land conservancy practices, alternative paving materials, creative ways to eliminate I&I and illegal hook-ups, and potentials for water reuse. EPA has already announced its plans to present an award for the best creative, cost effective approaches to storm water and CSOs beginning in 1991.

This rulemaking establishes permit application requirements for classes of storm water discharges that were specifically identified in section 402(p)(2). These priority storm water discharges include storm water discharges associated with industrial activity and discharges from a municipal separate storm sewer serving a population of 100,000 or more.

This rulemaking was developed after careful consideration of 450 sets of comments, comprising over 3200 pages, that were received from a variety of industries, trade associations, municipalities, State and Federal Agencies, environmental groups, and private citizens. These comments were received during a 90-day comment period which extended from December 7, 1988, to March 7, 1989. EPA received several requests for an extension of the comment period from 30-days up to 90-days. Many arguments were advanced for an extension including: the extent and complexity of the proposal, the existence of other concurrent EPA proposals, and the need for technical evaluations of the proposal. EPA considered these comments as they were received, but declined to extend the comment period beyond 90 days. The standard comment period on proposals normally range from 30 to 60 days. In light of the statutory deadline of February 4, 1989, additional time for the comment period beyond what was already a substantially lengthened comment period would have been inappropriate. The number and extent of the comments received on this proposal indicated that interested parties had substantially adequate time to review and comment on the regulation. Furthermore, the public was invited to attend six public meetings in Washington DC, Chicago, Dallas, Oakland, Jacksonville, and Boston to present questions and comments. EPA is convinced that substantial and adequate public participation was sought and received by the Agency.

Numerous commenters have also requested that the rule be reproposed due to the extent of the proposal and the number of options and issues upon which the Agency requested comments. EPA has decided against a reproposal. The December 7, 1988, notice of proposed rulemaking was extremely detailed and thoroughly identified major issues in such a manner as to allow the public clear opportunities to comment. The comments that were received were extensive, and many provided valuable information and ideas that have been incorporated into the regulation. Accordingly, the Agency is confident it has produced a workable and rational approach to the initial regulation of storm water discharges and a regulation that reflects the experience and knowledge of the public as provided in the comments, and which was developed in accordance with the

procedural requirements of the Administrative Procedures Act (APA). EPA believes that while the number of issues raised by the proposal was extensive, the number of detailed comments indicates that the public was able to understand the issues in order to comment adequately. Thus, a reproposal is unnecessary.

B. Definition of Storm Water

The December 7, 1988, notice requested comment on defining storm water as storm water runoff, surface runoff, street wash waters related to street cleaning or maintenance, infiltration (other than infiltration contaminated by seepage from sanitary sewers or by other discharges) and drainage related to storm events or snow melt. This definition is consistent with the regulatory definition of "storm sewer" at 40 CFR 35.2005(b)(47) which is used in the context of grants for construction of treatment works. This definition aids in distinguishing separate storm water sewers from sanitary sewers, combined sewers, process discharge outfalls and non-storm water, non-process discharge outfalls.

The definition of "storm water" has an important bearing on the NPDES permitting scheme under the CWA. The following discusses the interrelationship of NPDES permitting requirements for storm water discharges addressed by this rule and NPDES permitting requirements for other non-storm water discharges which may be discharged via the storm sewer as a storm water discharge. Today's rule addresses permit application requirements for storm water discharges associated with industrial activity and for discharges from municipal separate storm sewer systems serving a population of 100,000 or more. Storm water discharges associated with industrial activity are to be covered by permits which contain technology-based controls based on BAT/BCT considerations or water quality-based controls, if necessary. A permit for storm water discharges from an industrial facility may also cover other non-storm water discharges from the facility. Today's rule establishes individual (Form 1 and Form 2F) and group application requirements for storm water discharges associated with industrial activity. In addition, EPA or authorized NPDES States with authorized general permit programs may issue general permits which establish alternative application or notification requirements for storm water discharges covered by the general permit(s). Where a storm water discharge associated with industrial activity is mixed with a non-storm water discharge, both discharges must be covered by an NPDES permit (this can be in the same permit or with multiple permits). Permit application requirements for these "combination" discharges are discussed later in today's notice.

Today's rule also addresses permit application requirements for discharges from municipal separate storm sewer systems serving a population of 100,000 or more. Under today's rule, appropriate municipal owners or operators of these systems must obtain NPDES permits for discharges from these systems. These permits are to establish controls to the maximum extent practicable (MEP), effectively prohibit non-storm water discharges to the municipal separate storm sewer system and, where necessary, contain applicable water quality-based controls. Where non-storm water discharges or storm water discharges associated with industrial activity discharge through a municipal separate storm sewer system (including systems serving a population of 100,000 or more as well as other systems), which ultimately discharges to a waters of the United States, such discharges through a municipal storm sewer need to be covered by an NPDES permit that is independent of the permit issued for discharges from the municipal separate storm sewer system. Today's rule defines the term "illicit discharge" to describe any discharge through a municipal separate storm sewer that is not composed entirely of storm water and that is not covered by an NPDES permit. Such illicit discharges are not authorized under the CWA. Section 402(p)(3)(B) of the CWA requires that permits for discharges from municipal separate storm sewers require the municipality to "effectively prohibit" non-storm water discharges from the municipal separate storm sewer. As discussed in more detail below, today's rule begins to implement the "effective prohibition" by requiring municipal operators of municipal separate storm sewer systems serving a population of 100,000 or more to submit a description of a program to detect and control certain non-storm water discharges to their municipal system. Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit (other than the permit for the discharge from the municipal separate storm sewer). For reasons discussed in more detail below, in general, municipalities will not be held responsible for prohibiting some specific components of discharges or flows listed below through their municipal separate storm sewer system, even though such components may be considered non-storm water discharges, unless such discharges are specifically identified on a case-by-case basis as needing to be addressed. However, operators of such non-storm water discharges need to obtain NPDES permits for these discharges under the present framework of the CWA (rather than the municipal operator of the municipal separate storm sewer system). (Note that section 516 of the Water Quality Act of 1987 requires EPA to conduct a study of de minimis discharges of pollutants to waters of the United States and to determine the most effective and appropriate methods of regulating any such discharges.)

EPA received numerous comments on the proposed regulatory definition of storm water, many of which proposed exclusions or additions to the definition. Several commenters suggested that the definition should include or not include detention and retention reservoir releases, water line flushing, fire hydrant flushing, runoff from fire fighting, swimming pool drainage and discharge, landscape irrigation, diverted stream flows, uncontaminated pumped ground water, rising ground waters, discharges from potable water sources, uncontaminated waters from cooling towers, foundation drains, non-contact cooling water (such as HVAC or heating, ventilation and air conditioning condensation water that POTWs require to be discharged to separate storm sewers rather than sanitary sewers), irrigation water, springs, roof drains, water from crawl space pumps, footing drains, lawn watering, individual car washing, flows from riparian habitats and wetlands. Most of these comments were made with regard to the concern that these were commonly occurring discharges which did not pose significant environmental problems. It was also noted that, unless these flows are classified as storm water, permits would be required for these discharges.

In response to the comments which requested EPA to define the term "storm water" broadly to include a number of classes of discharges which are not in any way related to precipitation events, EPA believes that this rulemaking is not an appropriate forum for addressing the appropriate regulation under the NPDES program of such non-storm water discharges, even though some classes of non-storm water discharges may typically contain only minimal amounts of pollutants. Congress did not intend that the term storm water be used to describe any discharge that has a de minimis amount of pollutants, nor did it intend for section 402(p) to be used to

provide a moratorium from permitting other non-storm water discharges. Consequently, the final definition of storm water has not been expanded from what was proposed. However, as discussed in more detail later in today's notice, municipal operators of municipal separate storm sewer systems will generally not be held responsible for "effectively prohibiting" limited classes of these discharges through their municipal separate storm sewer systems.

The proposed rule included infiltration in the definition of storm water. In this context one commenter suggested that the term infiltration be defined. Infiltration is defined at 40 CFR 35.2005(b)(20) as water other than wastewater that enters a sewer system (including sewer service connections and foundation drains) from the ground through such means as defective pipes, pipe joints, connections or manholes. Infiltration does not include, and is distinguished from, inflow. Another commenter urged that ground water infiltration not be classified as storm water because the chemical characteristics and contaminants of ground water will differ from surface storm water because of a longer contact period with materials in the soil and because ground water quality will not reflect current practices at the site. In today's rule, the definition of storm water excludes infiltration since pollutants in these flows will depend on a large number of factors, including interactions with soil and past land use practices at a given site. Further infiltration flows can be contaminated by sources that are not related to precipitation events, such as seepage from sanitary sewers. Accordingly the final regulatory language does not include infiltration in the definition of storm water. Such flows may be subject to appropriate permit conditions in industrial permits. As discussed in more detail below, municipal management programs must address infiltration where identified as a source of pollutants to waters of the United States.

One commenter questioned the status of discharges from detention and retention basins used to collect storm water. This regulation covers discharges of storm water associated with industrial activity and discharges from municipal separate storm sewer systems serving a population of 100,000 or more into waters of the United States. Therefore, discharges from basins that are part of a conveyance system for a storm water discharge associated with industrial activity or part of a municipal separate storm sewer system serving a population of 100,000 or more are covered by this regulation. Flows which are channeled into basins and which do not discharge into waters of the United States are not addressed by today's rule.

Several commenters requested that the term illicit connection be replaced with a term that does not connote illegal discharges or activity, because many discharges of non-storm water to municipal separate storm sewer systems occurred prior to the establishment of the NPDES program and in accordance with local or State requirements at the time of the connection. EPA disagrees that there should be a change in this terminology. The fact that these connections were at one time legal does not confer such status now. The CWA prohibits the point source discharge of non-storm water not subject to an NPDES permit through municipal separate storm sewers to waters of the United States. Thus, classifying such discharges as illicit properly identifies such discharges as being illegal.

A commenter wanted clarification of the terms "other discharges" and "drainage" that are used in the definition of "storm water." As noted above, today's rule clarifies that infiltration is not considered storm water. Thus the portion of the definition of storm water that refers to "other discharges" has also been removed. However, the term drainage has been retained. "Drainage" does not take on any meaning other than the flow of runoff into a conveyance, as the word is commonly understood.

One commenter stated that irrigation flows combined with storm water discharges should be excluded from consideration in the storm water program. The Agency would note that irrigation return flows are excluded from regulation under the NPDES program. Section 402(l)(1) states that the Administrator or the State shall not require permits for discharges composed entirely of return flows from irrigated agriculture. The legislative history of the 1977 Clean Water Act, which enacted this language, states that the word "entirely" was intended to limit the exception to only those flows which do not contain additional discharges from activities unrelated to crop production. Congressional Record Vol. 123 (1977), pg. 4360, Senate Report No. 95–370. Accordingly, a storm water discharge component, from an industrial facility for example, included in such "joint" discharges may be regulated pursuant to an NPDES permit either at the point at which the storm water flow enters or joins the irrigation flow, or where the combined flow enters waters of the United States or a municipal separate storm sewer.

Some commenters expressed concern about including street wash waters as storm water. One commenter argued including street wash waters in the definition of storm water should not be construed to eliminate the need for management practices relating to construction activities where sediment may simply wash into storm drains. EPA agrees with these points and the concerns that storm sewers may receive material that pose environmental problems if street wash waters are included in the definition. Accordingly, such discharges are no longer in the definition as proposed, and must be addressed by municipal management programs as part of the prohibition on non-storm water discharges through municipal separate storm sewer systems.

Several commenters requested that the terms discharge and point source, in the context of permits for storm water discharge, be clarified. Several commenters stated that the EPA should clarify that storm water discharge does not include "sheet flow" off of an industrial facility. EPA interprets this as request for clarification on the status of the terms "point source" and "discharge" under these regulations. In response, this rulemaking only covers storm water discharges from point sources. A point source is defined at 40 CFR 122.2 as "any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff." EPA agrees with one commenter that this definition is adequate for defining what discharges of storm water are covered by this rulemaking. EPA notes that this definition would encompass municipal separate storm sewers. In view of this comprehensive definition of point source, EPA need clarify in this rulemaking only that a storm water discharge subject to NPDES regulation does not include storm water that enters the waters of the United States via means other than a "point source." As further discussed below, storm water from an industrial facility which enters and is subsequently discharged through a municipal separate storm sewer is a "discharge associated with industrial

activity" which must be covered by an individual or general permit pursuant to today's rule.

EPA would also note that individual facilities have the burden of determining whether a permit application should be submitted to address a point source discharge. Those unsure of the classification of storm water flow from a facility, should file permit applications addressing the flow, or prior to submitting the application consult permitting authorities for clarification.

One commenter stated that "point source" for this rulemaking should be defined, for the purposes of achieving better water quality, as those areas where "discharges leave the municipal [separate storm sewer] system." EPA notes in response that "point source" as currently defined will address such discharges, while keeping the definition of discharge and point source within the framework of the NPDES program, and without adding potentially confusing and ambiguous additional definitions to the regulation. If this comment is asserting that the term point source should not include discharges from sources through the municipal system, EPA disagrees. As discussed in detail below, discharges through municipal separate storm sewer systems which are not connected to an operable treatment works are discharges subject to NPDES permit requirements at [40 CFR 122.2(c)], and may properly be deemed point sources.

One industry argued that the definition of "point source" should be modified for storm water discharges so as to exclude discharges from land that is not artificially graded and which has a propensity to form channels where precipitation runs off. EPA intends to embrace the broadest possible definition of point source consistent with the legislative intent of the CWA and court interpretations to include any identifiable conveyance from which pollutants might enter the waters of the United States. In most court cases interpreting the term "point source", the term has been interpreted broadly. For example, the holding in *Sierra Club* v. *Abston Construction Co., Inc.*, 620 F.2d 41 (5th Cir. 1980) indicates that changing the surface of land or establishing grading patterns on land will result in a point source where the runoff from the site is ultimately discharged to waters of the United States:

> Simple erosion over the material surface, resulting in the discharge of water and other materials into navigable waters, does not constitute a point source discharge, absent some effort to *change the surface*, to *direct* the water flow or otherwise impede its progress * * * Gravity flow, resulting in a discharge into a navigable body of water, may be part of a point source discharge if the [discharger] at least initially collected or channeled the water and other materials. A point source of pollution may also be present where [dischargers] design spoil piles from discarded overburden such that, during periods of precipitation, erosion of spoil pile walls results in discharges into a navigable body of water by means of ditches, gullies and similar conveyances, even if the [dischargers] have done nothing beyond the mere collection of rock and other materials * * * Nothing in the Act relieves [dischargers] from liability simply because the operators did not actually construct those conveyances, so long as they are reasonably likely to be the means by which pollutants are ultimately deposited into a navigable body of water. Conveyances of pollution formed either as a result of natural erosion or by natural means, and which constitute a component of a * * * drainage system, may fit the statutory definition and thereby subject the operators to liability under the Act." 620 F.2d at 45 (emphasis added).

Under this approach, point source discharges of storm water result from structures which increase the imperviousness of the ground which acts to collect runoff, with runoff being conveyed along the resulting drainage or grading patterns.

The entire thrust of today's regulation is to control pollutants that enter receiving water from storm water conveyances. It is these conveyances that will carry the largest volume of water and higher levels of pollutants. The storm water permit application process and permit conditions will address circumstances and discharges peculiar to individual facilities.

One industry commented that the definition of waters of the State under some State NPDES programs included municipal storm sewer systems. The commenter was concerned that certain industrial facilities discharging through municipal storm sewers in these states would be required to obtain an NPDES permit, despite EPA's proposal not to require permits from such facilities generally. In response, EPA notes that section 510 of the CWA, approved States are able to have stricter requirements in their NPDES program. In approved NPDES States, the definition of waters of the State controls with regard to what constitutes a discharge to a water body. However, EPA believes that this will have little impact, since, as discussed below, all industrial dischargers, including those discharging through municipal separate storm sewer systems, will be subject to general or individual NPDES permits, regardless of any additional State requirements.

One municipality commented that neither the term "point source" nor "discharge" should be used in conjunction with industrial releases into urban storm water systems because that gives the impression that such systems are navigable waters. EPA disagrees that any confusion should result from the use of these terms in this context. In this rulemaking, EPA always addresses such discharges as "discharges through municipal separate storm sewer systems" as opposed to "discharges to waters of the United States." Nonetheless, such industrial discharges through municipal storm sewer systems are subject to the requirements of today's rule, as discussed elsewhere.

One commenter desired clarification with regard to what constituted an outfall, and if an outfall could be a pipe that connected two storm water conveyances. This rulemaking defines outfall as a point of discharge into the waters of the United States, and not a conveyance which connects to Sections of municipal separate storm sewer. In response to another comment, this rulemaking only addresses discharges to waters of United States, consequently discharges to ground waters are not covered by this rulemaking (unless there is a hydrological connection between the ground water and a nearby surface water body. *See, e.g., Exxon Corp.* v. *Train*, 554 F.2d 1310, 1312 n.1 (5th Cir. 1977); *McClellan Ecological Seepage Situation* v. *Weinberger*, 707 F.Supp. 1182, 1195–96 (E.D. Cal. 1988)).

In the WQA and other places, the term "storm water" is presented as a single word. Numerous comments were received by EPA as to the appropriate spelling. Many of these comments recommended that two words for storm water is appropriate. EPA has decided to use an approach consistent with the Government Printing Office's approved form where storm water appears as two words.

C. Responsibility for Storm Water Discharges Associated With Industrial Activity Through Municipal Separate Storm Sewers

The December 7, 1988, notice of proposed rulemaking requested comments on the appropriate permitting scheme for storm water discharges associated with industrial activity through municipal separate storm sewers. EPA proposed a permitting scheme that would define the requirement to obtain coverage under an NPDES permit for a storm water discharge associated with industrial activity through a municipal separate storm sewer in terms of the classification of the municipal separate storm sewer. EPA proposed holding municipal operators of large or medium

municipal separate storm sewer systems primarily responsible for applying for and obtaining an NPDES permit covering system discharges as well as storm water discharges (including storm water discharges associated with industrial activity) through the system. Under the proposed approach, operators of storm water discharges associated with industrial activity which discharge through a large or medium municipal separate storm sewer system would generally not be required to obtain permit coverage for their discharge (unless designated as a significant contributor of pollution pursuant to section 402(p)(2)(E)) provided the municipality was notified of: The name, location and type of facility and a certification that the discharge has been tested (if feasible) for non-storm water (including the results of any testing). The notification procedure also required the operator of the storm water discharge associated with industrial activity to determine that: The discharge is composed entirely of storm water; the discharge does not contain hazardous substances in excess of reporting quantities; and the facility is in compliance with applicable provisions of the NPDES permit issued to the municipality for storm water.

In the proposal, EPA also requested comments on whether a decision on regulatory requirements for storm water discharges associated with industrial activity through other municipal separate storm sewer systems (generally those serving a population of less than 100,000) should be postponed until completion of two studies of storm water discharges required under section 402(p)(5) of the CWA.

EPA favored these approaches because they appeared to reduce the potential administrative burden associated with preparing and processing the thousands of permit applications associated with the rulemaking and provide EPA additional flexibility in developing permitting requirements for storm water discharges associated with industrial activity. EPA also expressed its belief, based upon an analysis of ordinances controlling construction site runoff in place in certain cities, that municipalities generally possessed legal authority sufficient to control contributions of industrial storm water pollutants to their separate storm sewers to the degree necessary to implement the proposed rule. EPA commented that municipal controls on industrial sources implemented to comply with an NPDES permit issued to the municipality would likely result in a level of storm water pollution control very similar to that put directly on the industrial source through its own NPDES permit. This was to be accomplished by requiring municipal permittees, to the maximum extent practicable, to require industrial facilities in the municipality to develop and implement storm water controls based on a consideration of the same or similar factors as those used to make BAT/BCT determinations. (See 40 CFR 125.3 (d)(2) and (d)(3)).

The great majority of commenters on the December 7, 1988, notice addressed this aspect of the proposal. Based on consideration of the comments received on the notice, EPA has decided that it is appropriate to revise the approach in its proposed rule to require direct permit coverage for all storm water discharges associated with industrial activity, including those that discharge through municipal separate storm sewers. In response to this decision, EPA has continued to analyze the appropriate manner to respond to the large number of storm water discharges subject to this rulemaking. The development of EPA's policy regarding permitting these discharges is discussed in more detail in the section VI.D of today's preamble.

EPA notes that the status of discharges associated with industrial activity which pass through a municipal separate storm sewer system under section 402(p) raises difficult legal and policy questions. EPA believes that treating these discharges under permits separate from those issued to the municipality will most fully address both the legal and policy concerns raised in public comment.

Certain commenters supported EPA's proposal. Some commenters claimed that EPA lacked any authority to permit industrial discharges which were not discharged immediately to waters of the U.S. Other commenters agreed with EPA's statements in the proposal that its approach would result in a more manageable administrative burden for EPA and the NPDES states. However, numerous comments also were received which provided various arguments in support of revising the proposed approach. These comments addressed several areas including the definition of discharge under the CWA, the requirements and associated statutory time frames of section 402(p), as well as the resource and enforcement constraints of municipalities. EPA is persuaded by these comments and has modified its approach accordingly. The key comments on this issue are discussed below.

EPA disagrees with commenters who suggested that EPA lacks authority to permit separately industrial discharges through municipal sewers. The CWA prohibits the discharge of a pollutant except pursuant to an NPDES permit. Section 502(12)(A) of the CWA defines the "discharge of a pollutant" as "any addition of any pollutant to navigable waters from any point source." [1] There is no qualification in the statutory language regarding the source of the pollutants being discharged. Thus, pollutants from a remote location which are discharged through a point source conveyance controlled by a different entity (such as a municipal storm sewer) are nonetheless discharges for which a permit is required.

EPA's regulatory definition of the term "discharge" reflects this broad construction. EPA defines the term to include

> additions of pollutants into waters of the United States from: surface runoff which is collected or channelled by man; *discharges through pipes, sewers, or other conveyances owned by a State, municipality, or other person which does not lead to a treatment works;* and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

40 CFR § 122.2 (1989) (emphasis added). The only exception to this general rule is the one contemplated by section 307(b) of the CWA, *i.e.*, the introduction of pollutants into publicly-owned treatment works. EPA treats these as "indirect discharges," subject not to NPDES requirements, but to pretreatment standards under section 307(b).

In light of its construction of the term discharge, EPA has consistently maintained that a person who sends pollutants from a remote location through a point source into a water of the U.S. may be held liable for the unpermitted discharge of that pollutant. Thus, EPA asserts the authority to require a permit either from the operator of the point source conveyance, (such as a municipal storm sewer or a privately-owned treatment works), or from any person causing pollutants to be present in that conveyance and discharged through the point source, or both. *See Decision of the General Counsel (of EPA) No. 43* ("In re Friendswood Development Co.") (June 11, 1976) (operator of privately owned treatment work and dischargers to it are both subject to NPDES permit requirements). *See also*, 40 CFR 122.3(g), 122.44(m)

[1] Indeed, the DC Circuit has held, in the storm water context, that EPA may not exempt any point source discharges of pollutants from the requirement to obtain an NPDES permit. *NRDC v. Costle*, 568 F.2d 1369, 1377 (DC Cir. 1977)

(NPDES permit writer has discretion to permit contributors to a privately owned treatment works as direct dischargers). In other words, where pollutants are added by one person to a conveyance owned/operated by another person, and that conveyance discharges those pollutants through a point source, EPA may permit either person or both to ensure that the discharge is properly controlled. Pollutants from industrial sites discharged through a storm sewer to a point source are appropriately treated in this fashion.

Furthermore, EPA believes that storm water from an industrial plant which is discharged through a municipal storm sewer is a "discharge associated with industrial activity." Today's rule, as in the proposal, defines discharges associated with industrial activity solely in terms of the origin of the storm water runoff. There is no distinction for how the storm water reaches the waters of the U.S. In other words, pollutants in storm water from an industrial plant which are discharged are "associated with industrial activity," regardless of whether the industrial facility operates the conveyance discharging the storm water (or whether the storm water is ultimately discharged through a municipal storm sewer). Indeed, there is no distinction in the "industrial" nature of these two types of discharges. The pollutants of concern in an industrial storm water discharge are present when the storm water leaves the facility, either through an industrial or municipal storm water conveyance. EPA has no data to suggest that the pollutants in industrial storm water entering a municipal storm sewer are any different than those in storm water discharged immediately to a water of the U.S. Thus, industrial storm water in a municipal sewer is properly classified as "associated with industrial activity." Although EPA proposed not to cover these discharges by separate permit, the Agency believes that it is clearly not precluded from doing so.

Many comments also supported the proposed approach, noting that holding municipalities primarily responsible for obtaining a permit which covers industrial storm water discharges through municipal systems would reduce the administrative burden associated with preparing and processing thousands of permit applications—permit applications that would be submitted if each industrial discharger through a large or medium municipal separate storm sewer system had to apply individually (or as part of a group application).

EPA appreciates these concerns. Yet EPA also recognizes that there are also significant problems with putting the burden of controlling these sources on the municipalities (except for designated discharges) which must be balanced with the concerns about the permit application burden on industries. The industrial permitting strategy discussed in section VI.D below attempts to achieve this balance.

EPA also does not believe that the administrative burden will be nearly as significant as originally thought, for several reasons. First, as discussed in section VI.F.2 below and in response to significant public comment, EPA has significantly narrowed the scope of the definition of "associated with industrial activity" to focus in on those facilities which are most commonly considered "industrial" and thought to have the potential for the highest levels of pollutants in their storm water discharges. EPA believes this is a more appropriate way to ensure a manageable scope for the industrial storm water program in light of the statutory language of section 402(p), since it does not attempt to arbitrarily distinguish industrial facilities on the basis of the ownership of the conveyance through which a facility discharges its storm water. Second, EPA's industrial permitting strategy discussed in section VI.D is designed around aggressive use of general permits to cover the vast majority of industrial sources. These general permits will require industrial facilities to develop storm water control plans and practices similar to those that would have been required by the municipality. Yet, general permits will eliminate the need for thousands of individual or group permit applications, greatly reducing the burden on both industry EPA/States. Finally, even under the proposal, EPA believes that a large number of industrial dischargers would have been appropriate for designation for individual permitting under section 402(p)(2)(E), with the attendant individual application requirements. Today's approach will actually decrease the overall burden on these facilities; rather than filing an individual permit application upon designation, these facilities will generally be covered by a general permit.

By contrast, several commenters asserted that not only does EPA have the authority to cover these discharges by separate permit, it is required to by the language of section 402(p). As discussed above, storm water from an industrial plant which passes through a municipal storm sewer to a point source and is discharged to waters of the U.S. is a "discharge associated with industrial activity." Therefore, it is subject to the appropriate requirements of section 402(p). The operator of the discharge (or the industrial facility where the storm water originates) must apply for a permit within three years of the 1987 amendments (*i.e.*, Feb. 4, 1990);[3] EPA must issue a permit by one year later (Feb. 4, 1991); and the permit must require compliance within three years of permit issuance. That permit must ensure that the discharge is in compliance with all appropriate provisions of sections 301 and 402. Commenters asserted that EPA's proposal would violate these two requirements of the law. First, the statute requires all industrial storm water discharges to obtain a permit in the first round of permitting (*i.e.*, February 4, 1990). However, Congress established a different framework to address discharges from small municipal separate storm sewer systems. Section 402(p) requires EPA to complete two studies of storm water discharges, and based on these studies, promulgate additional regulations, including requirements for state storm water management programs by October 1, 1992. EPA is prohibited from issuing permits for storm water discharges from small municipal systems until October 1, 1992 unless the discharge is designated under section 402(p)(2)(E). Thus, industrial storm water discharges from these systems would not be covered by a permit until later than contemplated by statute. Second, permits for municipal storm sewer systems require controls on storm water discharges "to the maximum extent practicable," as opposed to the BAT/BCT requirements of section 301(b)(2). Yet, all industrial storm water discharges must comply with section 301(b)(2). Thus, covering industrial storm water under a municipal storm water permit will not ensure the legally-required level of control of industrial storm water discharges.

In addition to comments on the requirements of section 402(p), EPA received several comments questioning whether EPA's proposal to cover industrial pollutants in municipal separate storm sewers solely in the permit issued to the municipality would ensure adequate control of these pollutants due to both inadequate

[3] It should be noted that EPA did not promulgate the required storm water regulations by February, 1989, as contemplated by section 402(p)(4)(A). As discussed below, today's rule generally requires industrial storm water dischargers to file a permit application in one year.

resources and enforcement. Some municipalities stated that the burdens of this responsibility would be too great with regard to source identification and general administration of the program. These commenters claimed they lacked the necessary technical and regulatory expertise to regulate such sources. Commenters also noted that additional resources to control these sources would be difficult to obtain given the restrictions on local taxation in many states and the fact that EPA will not be providing funding to local governments to implement their storm water programs.

Municipalities also expressed concerns regarding enforcement of EPA's proposed approach. Some municipalities remarked that they did not have appropriate legal authority to address these discharges. Several commenters also stated that requiring municipalities to be responsible for addressing storm water discharges associated with industrial activity through their municipal system would result in unequal treatment of industries nationwide because of different municipal requirements and enforcement procedures. Several municipal entities expressed concern with regard to their responsibility and liability for pollutants discharged to their municipal storm sewer system, and further asserted that it was unfair to require municipalities to bear the full cost of controlling such pollutants. Other municipalities suggested that overall municipal storm water control would be impaired, since municipalities would spend a disproportionate amount of resources trying to control industrial discharges through their sewers, rather than addressing other storm water problems. In a related vein, certain commenters suggested that, where industrial storm water was a significant problem in a municipal sewer, EPA's proposed approach would hamper enforcement at the federal/state level, since all enforcement measures could be directed only at the municipality, rather than at the most direct source of that problem.

In response to all of these concerns, EPA has decided to require storm water discharges associated with industrial activity which discharge through municipal separate storm sewers to obtain separate individual or general NPDES permits. EPA believes that this change will adequately address all of the key concerns raised by commenters.

The Agency was particularly influenced by concerns that many municipalities lacked the authority under state law to address industrial storm water practices. EPA had assumed that since several cities regulate construction site activities, that they could regulate other industrial operations in a similar manner. Several commenters suggested otherwise. In light of these concerns, EPA agrees with certain commenters that municipal controls on industrial facilities, in lieu of federal control, might not comply with section 402(p)(3)(A) for those facilities.[3] This calls into question whether EPA's proposed approach would have reasonably implemented Congressional intent to address industrial storm water early and stringently in the permitting process.

EPA also agrees with those commenters who argued that municipal controls on industrial storm water sources were not directly analogous to the pretreatment program under section 307(b), as EPA suggested in the preamble to the proposal. The authority of cities to control the type and volume of industrial pollutants into a POTW is generally unquestioned under the laws of most states, since sewage and industrial waste treatment is a service provided by the municipality. Thus, EPA has greater confidence that cities can and will adopt effective pretreatment programs. By contrast, many cities are limited in the types of controls they can impose on flows into storm sewers; cities are more often limited to regulations on quantity of industrial flows to prevent flooding the system. So too, the pretreatment program allows for federal enforcement of local pretreatment requirements. Enforcement against direct dischargers (including dischargers through municipal storm sewers) is possible only when the municipal requirements are contained in an NPDES permit.

Although today's rule will require industrial discharges through municipal storm sewers to be covered by separate permit, EPA still believes that municipal operators of large and medium municipal systems have an important role in source identification and the development of pollutant controls for industries that discharge storm water through municipal separate storm sewer systems is appropriate. Under the CWA, large and medium municipalities are responsible for reducing pollutants in discharges from municipal separate storm sewers to the maximum extent practicable. Because storm water from industrial facilities may be a major contributor of pollutants to municipal separate storm sewer systems, municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program. (See section VI.H.7. of today's preamble.) The CWA provides that permits for municipal separate storm sewers shall require municipalities to reduce pollutants to the maximum extent practicable. Permits issued to municipalities for discharges from municipal separate storm sewers will reflect terms, specified controls, and programs that achieve that goal. As with all NPDES permits, responsibility and liability is determined by the discharger's compliance with the terms of the permit. A municipality's responsibility for industrial storm water discharged through their system is governed by the terms of the permit issued. If an industrial source discharges storm water through a municipal separate storm sewer in violation of requirements incorporated into a permit for the industrial facility's discharge, that industrial operator of the discharge may be subject to an enforcement action instituted by the Director of the NPDES program.

Today's rule also requires operators of storm water discharges associated with industrial activity through large and medium municipal systems to provide municipal entities of the name, location, and type of facility that is discharging to the municipal system. This information will provide municipalities with a base of information from which management plans can be devised and implemented. This requirement is in addition to any requirements contained in the industrial facility's permit. As in the proposal, the notification process will assist cities in development of their industrial control programs.

EPA intends for the NPDES program, through requirements in permits for storm water discharges associated with industrial activity, to work in concert with municipalities in the industrial component of their storm water management program efforts. EPA believes that permitting of municipal storm sewer systems and the industrial discharges through them will act in a complementary manner to fully control the pollutants in those sewer systems. This will fully implement the intent of

[3] EPA notes that the legal issue raised by commenters regarding whether industrial storm water would be controlled to BAT if covered by a municipal permit at the MEP level is primarily a theoretical issue. As explained above, the proposal assumed that cities would establish controls on industry very similar to those established in an NPDES permit using best professional judgment. EPA's key concern, rather, is whether cities can, in fact, establish such controls. Thus, today's final rule should not appreciably change the requirements to be imposed on industrial sources, only how those requirements are enforced.

Congress to control industrial as well as large and medium municipal storm water discharges as expeditiously and effectively as possible. This approach will also address the concerns of municipalities that they lack sufficient authority and resources to control all industrial contributions to their storm sewers and will be liable for discharges outside of their control.

The permit application requirements for large and medium municipal separate storm sewer systems, discussed in more detail later in today's preamble, address the responsibilities of the municipal operators of these systems to identify and control pollutants in storm water discharges associated with industrial activity. Permit applications for large and medium municipal separate storm sewer systems are to identify the location of facilities which discharge storm water associated with industrial activity to the municipal system (*see* section VI.H.7. of the preamble). In addition, municipal applicants will provide a description of a proposed management program to reduce, to the maximum extent practicable, pollutants from storm water discharges associated with industrial activity which discharge to the municipal system (*see* section VI.H.7.c of this preamble). EPA notes that each municipal program will be tailored to the conditions in that city. Differences in regional weather patterns, hydrology, water quality standards, and storm sewer systems themselves dictate that storm water management practices will vary to some degree in each municipality. Accordingly, similar industrial storm water discharges may be treated differently in terms of the requirements imposed by the municipality, depending on the municipal program. Nonetheless, any individual or general permit issued to the industrial facility must comply with section 402(p)(3)(A) of the CWA.

EPA intends to provide assistance and guidance to municipalities and permitting authorities for developing storm water management programs that achieve permit requirements. EPA intends to issue a guidance document addressing municipal permit applications in the near term.

Controls developed in management plans for municipal system permits may take a variety of forms. Where necessary, municipal permittees can pursue local remedies to develop measures to reduce pollutants or halt storm water discharges with high levels of pollutants through municipal storm sewer systems. Some local entities have already implemented ordinances or laws that are designed to reduce the discharge of pollutants to municipal separate storm sewers, while other municipalities have developed a variety of techniques to control pollutants in storm water. Alternatively, where appropriate, municipal permittees may develop end-of-pipe controls to control pollutants in these discharges such as regional wet detention ponds or diverting flow to publicly owned treatment works. Finally, municipal applicants may bring individual storm water discharges, which cannot be adequately controlled by the municipal permittees or general permit coverage, to the attention of the permitting authority. Then, at the Director's discretion, appropriate additional controls can be required in the permit for the facility generating the targeted storm water discharge.

One commenter suggested that municipal operators of municipal separate storm sewers should have control over all storm water discharges from a facility that discharges both through the municipal system and to waters of the United States. In response, under this regulatory and statutory scheme, industries that discharge storm water directly into the waters of the United States, through municipal separate storm sewer systems, or both are required to obtain permit coverage for their discharges. However, municipalities are not precluded from exercising control over such facilities through their own municipal authorities.

It is important to note that EPA has established effluent guideline limitations for storm water discharges for nine subcategories of industrial dischargers (Cement Manufacturing (40 CFR part 411), Feedlots (40 CFR part 412), Fertilizer Manufacturing (40 CFR part 418), Petroleum Refining (40 CFR part 419), Phosphate Manufacturing (40 CFR part 422), Steam Electric (40 CFR part 423), Coal Mining (40 CFR part 434), Ore Mining and Dressing (40 CFR part 440) and Asphalt (40 CFR part 441)). Most of the existing facilities in these subcategories already have individual permits for their storm water discharges. Under today's rule, facilities with existing NPDES permits for storm water discharges through a municipal storm sewer will be required to maintain these permits and apply for an individual permit, under § 122.26(c), when existing permits expire. EPA received numerous comments supporting this decision because requiring facilities that have existing permits to comply with today's requirements immediately would be inefficient and not serve improved water quality.

Sections 402(p) (1) and (2) of the CWA provide that discharges from municipal separate storm sewer systems serving a population of less than 100,000 are not required to obtain a permit prior to October 1, 1992, unless designated on a case-by-case basis under section 402(p)(2)(E). However, as discussed above, storm water discharges associated with industrial activity through such municipal systems are not excluded. Thus, under today's rule, all storm water discharges associated with industrial activity that discharge through municipal separate storm sewer systems are required to obtain NPDES permit coverage, including those which discharge through systems serving populations less than 100,000. EPA believes requiring permits will address the legal concerns raised by commenters regarding these sources. In addition, it will allow for control of these significant sources of pollution while EPA continues to study under section 402(p)(6) whether to require the development of municipal storm water management plans in these municipalities. If these municipalities do ultimately obtain NPDES permits for their municipal separate storm sewer systems, early permitting of the industrial contributions may aid those cities in their storm water management efforts.

In the December 7, 1988, proposal, EPA recognized that storm water discharges associated with industrial activity from Federal facilities through municipal separate storm sewer systems may pose unique legal and administrative situations. EPA received numerous comments on this issue, with most of these comments coming from cities and counties. The comments reflected a general concern with respect to a municipality's ability to control Federal storm water discharges through municipal separate storm sewer systems. Most municipalities stated that they do not have the legal authority to adequately enforce against problem storm water discharges from Federal facilities and that these facilities should be required to obtain separate storm water permits. Some commenters stated that they have no Constitutional authority to regulate Federal facilities or establish regulation for such facilities. Some commenters indicated that Federal facilities could not be inspected, monitored, or subjected to enforcement for national security and other jurisdictional reasons. Some commenters argued that without clearly stated legal authority for the municipality, such dischargers should be required to obtain permits. One

municipality pointed out that Federal facilities within city limits are exempted from their Erosion and Sediment Control Act and that permits for these facilities should be required.

Under today's rule, Federal facilities which discharge storm water associated with industrial activity through municipal separate storm sewer systems will be required to obtain NPDES permit coverage under Federal or State law. EPA believes this will cure the legal authority problems at the local level raised by the commenters. EPA notes that this requirement is consistent with section 313(a) of the CWA.

D. Preliminary Permitting Strategy for Storm Water Discharges Associated With Industrial Activity

Many of the comments received on the December 7, 1988, proposal focused on the difficulties that EPA Regions and authorized NPDES States, with their finite resources, will have in implementing an effective permitting program for the large number of storm water discharges associated with industrial activity. Many commenters noted that problems with implementing permit programs are caused not only by the large number of industrial facilities subject to the program, but by the difficulties associated with identifying appropriate technologies for controlling storm water at various sites and the differences in the nature and extent of storm water discharges from different types of industrial facilities.

EPA recognizes these concerns; and based on a consideration of comments from authorized NPDES States, municipalities, industrial facilities and environmental groups on the permitting framework and permit application requirements for storm water discharges associated with industrial activity, EPA is in the process of developing a preliminary strategy for permitting storm water discharges associated with industrial activity. In developing this strategy, EPA recognizes that the CWA provides flexibility in the manner in which NPDES permits are issued.[4] EPA intends to use this flexibility in designing a workable and reasonable permitting system. In accordance with these considerations, EPA intends to publish in the near future a discussion of its preliminary permitting strategy for implementing the NPDES storm water program.

The preliminary strategy is intended to establish a framework for developing permitting priorities, and includes a four tier set of priorities for issuing permits to be implemented over time:

- *Tier I—baseline permitting:* One or more general permits will be developed to initially cover the majority of storm water discharges associated with industrial activity;
- *Tier II—watershed permitting:* Facilities within watersheds shown to be adversely impacted by storm water discharges associated with industrial activity will be targeted for permitting.
- *Tier III—industry specific permitting:* Specific industry categories will be targeted for individual or industry-specific permits; and
- *Tier IV—facility specific permitting:* A variety of factors will be used to target specific facilities for individual permits.

Tier I—Baseline Permitting

EPA intends to issue general permits that initially cover the majority of storm water discharges associated with industrial activity in States without authorized NPDES programs. These permits will also serve as models for States with authorized NPDES programs.

The consolidation of many sources under one permit will greatly reduce the otherwise overwhelming administrative burden associated with permitting storm water discharges associated with industrial activity. This approach has a number of additional advantages, including:

- Requirements will be established for discharges covered by the permit;
- Facilities whose discharges are covered by the permit will have an opportunity for substantial compliance with the CWA;
- The public, including municipal operators of municipal separate storm sewers which may receive storm water discharges associated with industrial activity, will have access under section 308(b) of the CWA to monitoring data and certain other information developed by the permittee;
- EPA will have the opportunity to begin to collect and review data on storm water discharges from priority industries, thereby supporting the development of subsequent permitting activities;
- Applicable requirements of municipal storm water management programs established in permits for discharges from municipal separate storm sewer systems will be enforceable directly against non-complying industrial facilities that generate the discharges;
- The public will be given an opportunity to comment on permitting activities;
- The baseline permits will provide a basis for bringing selected enforcement actions by eliminating many issues which might otherwise arise in an enforcement proceeding; and
- Finally, the baseline permits will provide a focus for public comment on the development of subsequent phases of the permitting strategy for storm water discharges, including the development of priorities for State storm water management programs developed under section 402(p)(6) of the CWA.

Initially, the coverage of the baseline permits will be broad, but the coverage is intended to shrink as other permits are issued for storm water discharges associated with industrial activities pursuant to Tier II through IV activities.

2. Tier II—Watershed Permitting

Facilities within watersheds shown to be adversely impacted by storm water discharges associated with industrial activity will be targeted for individual and general permitting. This process can be initiated by identifying receiving waters (or segments of receiving waters) where storm water discharges associated with industrial activity have been identified as a source of use impairment or are suspected to be contributing to use impairment.

3. Tier III—Industry Specific Permitting

Specific industry categories will be targeted for individual or industry-specific general permits. These permits will allow permitting authorities to focus attention and resources on industry categories of particular concern and/or industry categories where tailored requirements are appropriate. EPA will work with the States to coordinate the development of model permits for selected classes of industrial storm water discharges. EPA is also working to identify priority industrial categories in the two reports to Congress required under section 402(p)(5) of the CWA. In addition, group applications that are received can be used to develop model permits for the appropriate industries

[4] The courts in *NRDC* v. *Train*, 396 F.Supp. 1393 (D.D.C. 1975) *aff'd. NRDC* v. *Costle*, 568 F.2d 1369 (DC Cir. 1977), have acknowledged the administrative burden placed on the Agency by requiring individual permits for a large number of storm water discharges. These courts have recognized EPA's discretion to use certain administrative devices, such as area permits or general permits to help manage its workload. In addition, the courts have recognized flexibility in the type of permit conditions that are established, including requirements for best management practices.

4. Tier IV—Facility Specific Permitting

Individual permits will be appropriate for some storm water discharges in addition to those identified under Tier II and III activities. Individual permits should be issued where warranted by: the pollution potential of the discharge; the need for individual control mechanisms; and in cases where reduced administrative burdens exist. For example, individual NPDES permits for facilities with process discharges should be expanded during the normal process of permit reissuance to cover storm water discharges from the facility.

5. Relationship of Strategy to Permit Applications Requirements

The preliminary long-term permitting strategy described above identifies several permit schemes that EPA anticipates will be used in addressing storm water discharges associated with industrial activity. One issue that arises with this strategy is determining the appropriate information needed to develop and issue permits for these discharges. The NPDES regulatory scheme provides three major options for obtaining permit coverage for storm water discharges associated with industrial activity: (1) Individual permit applications; (2) group applications; and (3) case-by-case requirements developed for general permit coverage.

a. *Individual permit application requirements.* Today's notice establishes requirements for individual permit applications for storm water discharges associated with industrial activity. These application requirements are applicable for all storm water discharges associated with industrial activity, except where the operator of the discharge is participating in a group application or a general permit is issued to cover the discharge and the general permit provides alternative means to obtain permit coverage. Information in individual applications is intended to be used in developing the site-specific conditions generally associated with individual permits.

Individual permit applications are expected to play an important role in all tiers of the Strategy, even where general permits are used. Although general permits may provide for notification requirements that operate in lieu of the requirement to submit individual permit applications, the individual permit applications may be needed under several circumstances. Examples include: where a general permit requires the submission of a permit application as the notice of intent to be covered by the permit; where the owner or operator authorized by a general permit requests to be excluded from the coverage of the general permit by applying for a permit (*see* 40 CFR 122.28(b)(2)(iii) for EPA issued general permits); and where the Director requires an owner or operator authorized by a general permit to apply for an individual permit (*see* 40 CFR 122.28(b)(2)(ii) for EPA issued general permits).

b. *Group applications.* Today's rule also promulgates requirements for group applications for storm water discharges associated with industrial activity. These applications provide participants of groups with sufficiently similar storm water discharges an alternative mechanism for applying for permit coverage.

The group application requirements are primarily intended to provide information for developing industry specific general permits. (Group applications can also be used to issue individual permits in authorized NPDES States without general permit authority or where otherwise appropriate). As such, group application requirements correlate well with the Tier III permitting activities identified in the long-term permitting Strategy.

c. *Case-by-case requirements.* 40 CFR 122.21(a) excludes persons covered by general permits from requirements to submit individual permit applications. Further, the general permit regulations at 40 CFR 122.28 do not address the issue of how a potential permittee is to apply to be covered under a general permit. Rather, conditions for notification of intent (NOI) to be covered by the general permit are established in the permits on a case-by-case basis, and operate in lieu of permit application requirements. Requirements for submitting NOIs to be covered by a general permit can range from full applications (this would be Form 1 and Form 2F for most discharges composed entirely of storm water discharges associated with industrial activity), to no notice. EPA recommends that the NOI requirements established in a general permit for storm water discharges associated with industrial activity be commensurate with the needs of the permit writer in establishing the permit and the permit program. The baseline general permit described in Tier I is intended to support the development of controls for storm water discharges associated with industrial activity that can be supported by the limited resources of the permitting Agency. In this regard, the burdens of receiving and reviewing NOI's from the large number of facilities covered by the permit should also be considered when developing NOI requirements. In addition, NOI requirements should be developed in conjunction with permit conditions establishing reporting requirements during the term of the permit.

NOI requirements in general permits can establish a mechanism which can be used to establish a clear accounting of the number of permittees covered by the general permit, the nature of operations at the facility generating the discharge, their identity and location. The NOI can be used as an initial screening tool to determine discharges where individual permits are appropriate. Also, the NOI can be used to identify classes of discharges appropriate for more specific general permits, as well as provide information needed to notify such dischargers of the issuance of a more specific general permit. In addition, the NOI can provide for the identification of the permittee to provide a basis for enforcement and compliance monitoring strategies. EPA will further address this issue in the context of specific general permits it plans to issue in the near future.

Today's rule requires that individual permit applications for storm water discharges associated with industrial activity be submitted within one year from the date of publication of this notice. EPA is considering issuing general permits for the majority of storm water discharges associated with industrial activity in those States and territories that do not have authorized State NPDES programs (MA, ME, NH, FL, LA, TX, OK, NM, SD, AZ, AK, ID, District of Columbia, the Commonwealth of Puerto Rico, Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, and the Trust Territory of the Pacific Islands) before that date to enable industrial dischargers of storm water to ascertain whether they are eligible for coverage under a general permit (and subject to any alternative notification requirements established by the general permit in lieu of the individual permit application requirements of today's rule) or whether they must submit an individual permit application (or participate in a group application) before the regulatory deadlines for submitting these applications passes. Storm water application deadlines are discussed in further detail below.

E. Storm Water Discharge Sampling

Storm water discharges are intermittent by their nature, and pollutant concentrations in storm water discharges will be highly variable. Not only will variability arise between given events, but the flow and pollutant

concentrations of such discharges will vary with time during an event. This variability raises two technical problems: how best to characterize the discharge associated with a single storm event; and how best to characterize the variability between discharges of different events that may be caused by seasonal changes and changes in material management practices, for example.

Prior to today's rulemaking, 40 CFR 122.21(g)(7) required that applicants for NPDES permits submit quantitative data based on one grab sample taken every hour of the discharge for the first four hours of discharge. EPA has modified this requirement such that, instead of collecting and analyzing four grab samples individually, applicants for permits addressing storm water discharges associated with industrial activity will provide data as indicators of two sets of conditions: data collected during the first 30 minutes of discharge and flow-weighted average storm event concentrations. Large and medium municipalities will provide data on flow-weighted average storm event concentrations only.

Data describing pollutants in a grab sample taken during the first few minutes of the discharge can often be used as a screen for non-storm water discharges to separate storm sewers because such pollutants may be flushed out of the system during the initial portion of the discharge. In addition, data from the first few minutes of a discharge are useful because much of the traditional structural technology used to control storm water discharges, including detention and retention devices, may only provide controls for the first portion of the discharge, with relatively little or no control for the remainder of the discharge. Data from the first portion of the discharge will give an indication of the potential usefulness of these techniques to reduce pollutants in storm water discharges. Also, such discharges may be primarily responsible for pollutant shocks to the ecosystem in receiving waters.

Studies such as NURP have shown that flow-weighted average concentrations of storm water discharges are useful for estimating pollutant loads and for evaluating certain concentration-based water quality impacts. The use of flow-weighted composite samples are also consistent with comments raised by various industry representatives during previous Agency rulemakings that continuous monitoring of discharges from storm events is necessary to adequately characterize such discharges.

EPA requested comment on the feasibility of the proposed modification of sampling procedures at § 122.21(g)(7) and the ability to characterize pollutants in storm water discharges with an average concentration from the first portion of the discharge compared to collecting and separately analyzing four grab samples. It was proposed that an event composite sample be collected, as well as a grab sample collected during the first 20 minutes of runoff. Comments were solicited as to whether or not this sampling method would provide better definition of the storm load for runoff characterization than would the requirement to collect and separately analyze four grab samples.

Many commenters questioned the ability to obtain a 20 minute sample in the absence of automatic samplers. Some believed that pollutants measured by such a sample can be accounted for in the event composite sample. Others argued that this is an unwarranted sampling effort if municipal storm water management plans are to be geared to achieving annual pollutant load reductions. Many commenters advised that problems accessing sampling stations and mobilizing sampling crews, particularly after working hours, made sampling during the first 20 minutes impractical. These comments were made particularly with respect to municipalities, where the geographical areas could encompass several hundred square miles. Several alternatives were suggested including: the collection of a sample in the first hour, and representative grab sampling in the next three hours, one per hour; or perform time proportioned sampling for up to four hours.

Because of the logistical problems associated with collecting samples during the first few minutes of discharge from municipal systems, EPA will only require such sampling from industrial facilities. Municipal systems will be spread out over many square miles with sampling locations potentially several miles from public works departments or other responsible government agencies. Reaching such locations in order to obtain samples during the first few minutes of a storm event may prove impossible. For essentially the same reasons, the requirement has been modified to encompass the first 30 minutes of the discharge, instead of 20 minutes, for industrial discharges. The rule also clarifies that the sample should be taken during the first 30 minutes or as soon thereafter as practicable. Where appropriate, characterization of this portion of the discharge from selected outfalls or sampling points may be a condition to permits issued to municipalities. With regard to protocols for the collection of sample aliquots for flow-weighted composite samples, § 122.21(g)(7) provides that municipal applicants may collect flow-weighted composite samples using different protocols with respect to the time duration between the collection of sample aliquots, subject to the approval of the Director or Regional Administrator. In other words, the period may be extended from 15 minutes to 20 or 25 minutes between sample aliquots, or decreased from 15 to 10 or 5 minutes.

Other comments raised issues that apply both to the impact of runoff characterization and the first discharge representation. These primarily pertained to regions that have well defined wet and dry seasons. Comments questioned whether or not it is fair to assume that the initial storm or two of a wet season, which will have very high pollutant concentrations, are actually representative of the runoff concentrations for the area.

In response, EPA believes that it is important to represent the first part of the discharge either separately or as a part of the event composite samples. This loading is made up primarily of the mass of unattached fine particulates and readily soluble surface load that accumulates between storms. This load washes off of the basin's directly connected paved surfaces when the runoff velocities reach the level required for entrainment of the particulate load into the surface flow. It should be noted that for very fine particulates and solubles, this can occur very soon after the storm begins and much sooner than the peak flow. The first few minutes of discharge represents a shock load to the receiving water, in terms of concentration of pollutants, because for many constituents the highest concentrations of the event will occur during this initial period. Due to the need to properly quantify this load, it is not necessary to represent the first discharge from the upper reaches of the outfall's tributary area. In runoff characterization basins, the assumption is that the land use in the basin is homogeneous, or nearly so, and that the first discharge from the lower reaches for all intents and purposes is representative of the entire basin. If a sample is taken during the first 30 minutes of the runoff, it will be composed primarily of first discharge. If the sample is taken at the outfall an hour into the event, it may contain

discharge from the remote portions of the basin. It will not be representative of the discharge because it will also contain later washoff from the lower reaches of the basin, resulting in a low estimation of the first discharge load of most constituents. Conversely, larger suspended particulates that normally are not present in first discharge due to inadequate velocities will appear in this later sampling scenario because of the influence of higher runoff rates in the lower basin. Many commonly used management practices are designed based on their ability to treat a volume of water defined by the first discharge phenomenon. It is important to characterize the first discharge load because most management practices effectively treat only, or primarily, this load.

It should be noted that first discharge runoff is sometimes contaminated by non-storm water related pollutants. In many urban catchments, contaminants that result from illicit connections and illegal dumping may be stored in the system until "flushed" during the initial storm period. This does not negate the need for information on the characteristic first discharge load, but does indicate that the first phase field screen results for illicit connections should be used to help define those outfalls where this problem might exist.

Several methods can be used to develop an event average concentration. Either automatic or manual sampling techniques can be used that sample the entire hydrograph, or at least the first four hours of it, that will result in several discrete samples and associated flow rates that represent the various flow regimes of an event. These procedures have the potential for providing either an event average concentration, an event mean concentration, or discrete definition of the washoff process. Automatic sampling procedures are also available that collect a single composite sample, either on a time-proportioned or flow proportioned basis.

When discrete samples are collected, an event average composite sample can be produced by the manual composite of the discrete samples in equal volumes. Laboratory analysis of time proportioned composite samples will directly yield the event average concentration. Mathematical averaging of discrete sample analysis results will yield an event average concentration.

When discrete samples are collected, a flow-weighted composite sample can be produced based on the discharge record. This is done by manually flow proportioning the volumes of the individual samples. Laboratory analysis of flow weighted composite samples will directly yield an event mean concentration. Mathematical integration of the change in concentrations and mass flux of the discharge for discrete sample data can produce an event mean concentration. This procedure was used during the NURP program.

EPA wishes to emphasize that the reason for sampling the type of storm event identified in § 122.21(g)(7) is to provide information that represents local conditions that will be used to create sound storm water management plans. Based on the method to be used to generate system-wide estimates of pollutant loads, either method, discrete or event average concentrations, may be preferable to the other. If simulation models will be used to generate loading estimates, analysis of discrete samples will be more valuable so that calibration of water quality and hydrology may be performed. On the other hand, simple estimation methods based on event average or event mean concentrations may not justify the additional cost of discrete sample analysis.

EPA believes that the first discharge loading should be represented in the permit application from industrial facilities and, if appropriate, permitting authorities may require the same in the discharge characterization component of permits issued to municipalities. The first discharge load should also be represented as part of an event composite sample. This requirement will assist industries in the development of effective storm water management plans.

EPA requested comments on the appropriateness of the proposed rules and of proposed amendments to the rules regarding discharge sampling. Comments were received which addressed the appropriateness of imposing uniform national guidelines. Several commenters are concerned that uniform national guidelines may not be appropriate due to the geographic variations in meteorology, topography, and pollutant sources. While some assert that a uniform guideline will provide consistency of the sample results, others prefer a program based on regional or State guidelines that more specifically address their situation.

Several commenters, addressing industrial permit application requirements, preferred that the owner/operator be allowed to set an individual sampling protocol with approval of the permit writer. Some commenters were concerned that one event may not be sufficient to characterize runoff from a basin as this may result in gross over-estimation or underestimation of the pollutant loads. Others indicated confusion with regard to sampling procedures, lab analysis procedures, and the purpose of the program.

In response, today's regulations establish certain minimum requirements. Municipalities and industries may vary from these requirements to the extent that their implementation is at least as stringent as outlined in today's rule. EPA views today's rule as a means to provide assurance as to the quality of the data collected; and to this end, it is important that the minimum level of sampling required be well defined.

In response to EPA's proposal that the first discharge be included in "representative" storm sampling, several commenters made their concerns known about the possible equipment necessary to meet this requirement. Several commenters are concerned that in order to get a first discharge sample, automatic sampling equipment will be required. Concerns related to the need for this equipment surfaced in the comments frequently; most advised that the equipment is expensive and that the demand on sampling equipment will be too large for suppliers and manufacturers to meet. Although equipment can be leased, some commenters maintained that not enough rental equipment is available to make this a viable option in many instances.

EPA is not promoting or requiring the use of automated equipment to satisfy the sampling requirements. A community may find that in the long run it would be more convenient to have such equipment since sampling is required not only during preparation of the application, but also may be required during the term of the permit to assure that the program goals are being met. Discharge measurement is necessary in order for the sample data to have any meaning. If unattended automatic sampling is to be performed, then unattended flow measurement will be required too.

EPA realizes that equipment availability is a legitimate concern. However, there is no practical recommendation that can be made relative to the availability of equipment. If automatic sampling equipment is not available, manual sampling is an appropriate alternative.

F. Storm Water Discharges Associated With Industrial Activity

1. Permit Applicability

a. *Storm water discharges associated with industrial activity to waters of the United States.* Under today's rule dischargers of storm water associated

with industrial activity are required to apply for an NPDES permit. Permits are to be applied for in one of three ways depending on the type of facility: Through the individual permit application process; through the group application process; or through a notice of intent to be covered by general permit.

Storm water discharges associated with the industrial activities identified under § 122.26(b)(14) of today's rule may avail themselves of general permits that EPA intends to propose and promulgate in the near future. The general permit will be available to be promulgated in each non-NPDES State, following State certification, and as a model for use by NPDES States with general permit authority. It is envisioned that these general permits will provide baseline storm water management practices. For certain categories of industries, specific management practices will be prescribed in addition to the baseline management practices. As information on specific types of industrial activities is developed, other, more industry-specific general permits will be developed.

Today's rule requires facilities with existing NPDES permits for storm water discharges to apply for individual permits under the individual permit application requirements found at 122.26(c) 180 days before their current permit expires. Facilities not eligible for coverage under a general permit are required to file an individual or group permit application in accordance with today's rule. The general permits to be proposed and promulgated will indicate what facilities are eligible for coverage by the general permit.

b. *Storm water discharges through municipal storm sewers.* As discussed above, many operators of storm water discharges associated with industrial activity are not required to apply for an individual permit or participate in a group application under § 122.26(c) of today's rule if covered by a general permit. Under the December 7, 1988, proposal, dischargers through large and medium municipal separate storm sewer systems were not required, as a general rule, to apply for an individual permit or as a group applicant. Today's rule is a departure from that proposal. Today's rule requires all dischargers through municipal separate storm sewer systems to apply for an individual permit, apply as part of a group application, or seek coverage under a promulgated general permit for storm water discharges associated with industrial activity.

Municipal operators of large and medium municipal separate storm sewer systems are responsible for obtaining system-wide or area permits for their system's discharges. These permits are expected to require that controls be placed on storm water discharges associated with industrial activity which discharge through the municipal system. It is anticipated that general or individual permits covering industrial storm water dischargers to these municipal separate storm sewer systems will require industries to comply with the terms of the permit issued to the municipality, as well other terms specific to the permittee.

c. *Storm water discharges through non-municipal storm sewers.* Under today's rulemaking all operators of storm water discharges associated with industrial activity that discharge into a privately or Federally owned storm water conveyance (a storm water conveyance that is not a municipal separate storm sewer) will be required to be covered by an NPDES permit (*e.g.* an individual permit, general permit, or as a co-permittee to a permit issued to the operator of the portion of the system that directly discharges to waters of the United States). This is a departure from the "either/or" approach that EPA requested comments on in the December 7, 1988, notice. The "either/or" approach would have allowed either the system discharges to be covered by a permit issued to the owner/operator of the system segment that discharged to waters of the United States, or by an individual permit issued to each contributor to the non-municipal conveyance.

EPA requested comments on the advantages and disadvantages of retaining the "either/or" approach for non-municipal storm sewers. An abundance of comment was received by EPA on this particular part of the program. A number of industrial commenters and a smaller number of municipalities favored retaining the "either/or" approach as proposed, while most municipal entities, one industry, and one trade association favored requiring permits for each discharger.

Two commenters stated that private owners of conveyances may not have the legal authority to implement controls on discharges through their system and would not want to be held responsible for such controls. EPA agrees that this is a potential problem. Therefore, today's rule will require permit coverage for each storm water discharge associated with industrial activity.

One commenter supported the concept of requiring all the facilities that discharge to a non-municipal conveyance to be co-permittees. EPA agrees that this type of permitting scheme, along with other permit schemes such as area or general permits, is appropriate for discharges from non-municipal sewers, as long as each storm water discharge through the system is associated with industrial activity and thus currently subject to NPDES permit coverage.

One State agency commented that in the interest of uniformity, all industries that discharge to non-municipal conveyances should be required to conform to the application requirements. One industry stated that the rules must provide a way for the last discharger before the waters of the U.S. to require permits for facilities discharging into the upper portions of the system. EPA agrees with these comments. Today's rule provides that each discharger may be covered under individual permits, as co-permittees to a single permit, or by general permit rather than holding the last discharger to the waters of the United States solely responsible.

In response to one commenter, the term "non-municipal" has been clarified to explain that the term refers to non-publicly owned or Federally-owned storm sewer systems.

Some commenters supporting the approach as proposed, noted that industrial storm water dischargers into such systems can take advantage of the group application process. EPA agrees that in appropriate circumstances, such as when industrial facilities discharging storm water to the same system are sufficiently similar, group applications can be used for discharges to non-municipal conveyances. However, EPA believes that it would be inappropriate to approve group applications for those facilities whose only similarity is that they discharge storm water into the same private conveyance system. The efficacy of the group application procedures is predicated on the similarity of operations and other factors. The fact that several industries discharge storm water to the same non-municipal sewer system alone may not make these discharges sufficiently similar for group application approval.

One commenter suggested that EPA has not established any deadlines for submission of permit applications for storm water discharges associated with industrial activity through non-municipal separate storm sewer systems. EPA wants to clarify that industrial storm water dischargers into privately owned or Federally owned storm water conveyances are required to apply for permits in the same time frame as individual or group applicants (or as otherwise provided for in a general permit).

One commenter stated that the operator of the conveyance that accepts discharges into its system has control and police power over those that discharge into the system by virtue of the ability to restrict discharges into the system. This commenter stated that these facilities should be the entity required to obtain the permit in all cases. Assuming that this statement is true in all respects, the larger problem is that one's theoretical ability to restrict discharges is not necessarily tied to the reality of enforcing those restrictions or even detecting problem discharges when they exist. In a similar vein one commenter urged that a private operator will not be in any worse a position than a municipal entity to determine who is the source of pollution up-stream. EPA agrees that from a hydrological standpoint this may be true. However, from the standpoint of detection resources, police powers, enforcement remedies, and other facets of municipal power that may be brought to bear upon problem dischargers, private systems are in a far more precarious position with respect to controlling discharges from other private sources.

In light of the comments received, EPA has decided that the either/or approach as proposed is inappropriate. Operators of non-municipal systems will generally be in a poorer position to gain knowledge of pollutants in storm water discharges and to impose controls on storm water discharges from other facilities than will municipal system operators. In addition, best management practices and other site-specific controls are often most appropriate for reducing pollutants in storm water discharges associated with industrial activity and can often only be effectively addressed in a regulatory scheme that holds each industrial facility operator directly responsible. The either/or approach as proposed is not conducive to establishing these types of practices unless each discharger is discharging under a permit. Also, some non-municipal operators of storm water conveyances, which receive storm water runoff from industrial facilities, may not be generating storm water discharges associated with industrial activity themselves and, therefore, they would otherwise not need to obtain a permit prior to October 1, 1992, unless specifically designated under section 402(p)(2)(E). Accordingly, EPA disagrees with comments that dischargers to non-municipal conveyances should have the flexibility to be covered by their permit or covered by the permit issued to the operator of the outfall to waters to the United States.

2. Scope of "Associated with Industrial Activity"

The September 26, 1984, final regulation divided those discharges that met the regulatory definition of storm water point source into two groups. The term Group I storm water discharges was defined in an attempt to identify those storm water discharges which had a higher potential to contribute significantly to environmental impacts. Group I included those discharges that contained storm water drained from an industrial plant or plant associated areas. Other storm water discharges (such as those from parking lots and administrative buildings) located on lands used for industrial activity were classified as Group II discharges. The regulations defined the term "plant associated areas" by listing several examples of areas that would be associated with industrial activities. However, the resulting definition led to confusion among the regulated community regarding the distinctions between the Group I and Group II classifications.

In amending the CWA in 1987, Congress did not explicitly adopt EPA's regulatory classification of Group I and Group II discharges. Rather, Congress required EPA to address "storm water discharges associated with industrial activity" in the first round of storm water permitting. In light of the adoption of the term "associated with industrial activity" in the CWA, and the ongoing confusion surrounding the previous regulatory definition, EPA has eliminated the regulatory terms "Group I storm water discharge" and "Group II storm water discharge" pursuant to the December 7, 1987, Court remand and has not revived it. In addition, today's notice promulgates a definition of the term "storm water discharge associated with industrial activity" at § 122.26(b)(14) and clarifies the scope of the term.

In describing the scope of the term "associated with industrial activity", several members of Congress explained in the legislative history that the term applied if a discharge was "directly related to manufacturing, processing or raw materials storage areas at an industrial plant." (Vol. 132 Cong. Rec. H10932, H10936 (daily ed. October 15, 1986); Vol. 133 Cong. Rec. H176 (daily ed. January 8, 1987)). Several commenters cited this language in arguing for a more expansive or less expansive definition of "associated with industrial activity." EPA believes that the legislative history supports the decision to exclude from the definition of industrial activity, at § 122.26(b)(14) of today's rule, those facilities that are generally classified under the Office of Management and Budget Standard Industrial Classifications (SIC) as wholesale, retail, service, or commercial activities.

Two commenters recommended that all commercial enterprises should be required to obtain a permit under this regulation. Another commenter recommended that all the facilities listed in the December 7, 1988, proposal, including those listed in paragraphs (xi) through (xvi) on page 49122 of the December 7, 1988, proposal, should be included. EPA disagrees since the intent of Congress was to establish a phased and tiered approach to storm water permits, and that only those facilities having discharges associated with industrial activity should be included initially. The studies to be conducted pursuant to section 402(p)(5) will examine sources of pollutants associated with commercial, retail, and other light business activity. If appropriate, additional regulations addressing these sources can be developed under section 402(p)(6) of the CWA. As further discussed below, EPA believes that the facilities identified in paragraphs (xi) through (xvi) are more properly characterized as commercial or retail facilities, rather than industrial facilities.

Today's rule clarifies the regulatory definition of "associated with industrial activity" by adopting the language used in the legislative history and supplementing it with a description of various types of areas that are directly related to an industrial process (e.g., industrial plant yards, immediate access roads and rail lines, drainage ponds, material handling sites, sites used for the application or disposal of process waters, sites used for the storage and maintenance of material handling equipment, and known sites that are presently or have been used in the past for residual treatment, storage or disposal). The agency has also incorporated some of the suggestions offered by the public in comments.

Three commenters suggested that the permit application should focus only on storm water with the potential to come into contact with industrial-related pollutant sources, rather than focusing on how plant areas are utilized. These commenters suggested that facilities that are wholly enclosed or have their operations entirely protected from the elements should not be subject to permit requirements under today's rule. EPA agrees that these comments have merit with regard to certain types of facilities. Today's rule defines the term "storm water discharge associated with

industrial activity" to include storm water discharges from facilities identified in today's rule at 40 CFR 122.21(b)(14)(xi) (facilities classified as Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221–25) only if:

areas where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery at these facilities are exposed to storm water. Such areas include: material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at 40 CFR 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment; storage or disposal; shipping and receiving areas; manufacturing buildings; material storage areas for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water.

The critical distinction between the facilities identified at 40 CFR 122.26(b)(14)(xi) and the facilities identified at 40 CFR 122.26(b)(14)(i)–(x) is that the former are not classified as having "storm water discharges associated with industrial activity" unless certain materials or activities are exposed to storm water. Storm water discharges from the latter set of facilities are considered to be "associated with industrial activity" regardless of the actual exposure of these same materials or activities to storm water.

EPA believes this distinction is appropriate because, when considered as a class, most of the activity at the facilities in § 122.26(b)(14)(xi) is undertaken in buildings; emissions from stacks will be minimal or non-existent; the use of unhoused manufacturing and heavy industrial equipment will be minimal; outside material storage, disposal or handling generally will not be a part of the manufacturing process; and generating significant dust or particulates would be atypical. As such, these industries are more akin or comparable to businesses, such as retail, commercial, or service industries, which Congress did not contemplate regulating before October 1, 1992, and storm water discharges from these facilities are not "associated with industrial activity." Thus, these industries will be required to obtain a permit under today's rule only when the manufacturing processes undertaken at such facilities would result in storm water contact with industrial materials associated with the facility.

Industrial categories in § 122.26(b)(14)(xi) all tend to engage in production activities in the manner described in the paragraph above. Facilities under SIC 20 process foods including meats, dairy food, fruit, and flour. Facilities classified under SIC 21 make cigarettes, cigars, chewing tobacco and related products. Under SIC 22, facilities produce yarn, etc., and/or dye and finish fabrics. Facilities under SIC 23 are in the business of producing clothing by cutting and sewing purchased woven or knitted textile products. Facilities under SIC 2434 and 25 are establishments engaged in furniture making. SIC 265 and 267 address facilities that manufacture paper board products. Facilities under SIC 27 perform services such as bookbinding, plate making, and printing. Facilities under SIC 283 manufacture pharmaceuticals and facilities under 285 manufacture paints, varnishes, lacquers, enamels, and allied products. Under SIC 30 establishments manufacture products from plastics and rubber. Those facilities under SIC 31 (except 311), 323, 34 (except 3441), 35, 36, and 37 (except 373) manufacture industrial and commercial metal products, machinery, equipment, computers, electrical equipment, and transportation equipment, and glass products made of purchased glass. Facilities under SIC 38 manufacture scientific and electrical instruments and optical equipment. Those under SIC 39 manufacture a variety of items such as jewelry, silverware, musical instruments, dolls, toys, and athletic goods. SIC 4221–25 are warehousing and storage activities.

In contrast, the facilities identified by SIC 24 (except and 2434), 26 (except 265 and 267), 28 (except 283 and 285), 29, 311, 32 (except 323), 33, 3441, 373 when taken as a group, are expected to have one or many of the following activities, processes occurring on-site: storing raw materials, intermediate products, final products, by-products, waste products, or chemicals outside; smelting; refining; producing significant emissions from stacks or air exhaust systems; loading or unloading chemical or hazardous substances; the use of unhoused manufacturing and heavy industrial equipment; and generating significant dust or particulates. Accordingly, these are classes of facilities which can be viewed as generating storm water discharges associated with industrial activity requiring a permit. Establishments identified under SIC 24 (except 2434) are engaged in operating sawmills, planing mills and other mills engaged in producing lumber and wood basic materials. SIC 26 facilities are paper mills. Under SIC 28, facilities produce basic chemical products by predominantly chemical processes. SIC 29 describes facilities that are engaged in the petroleum industry. Under SIC 311, facilities are engaged in tanning, currying, and finishing hides and skins. Such processes use chemicals such as sulfuric acid and sodium dichromate, and detergents, and a variety of raw and intermediate materials. SIC 32 manufacture glass, clay, stone and concrete products form raw materials in the form quarried and mined stone, clay, and sand. SIC 33 identifies facilities that smelt, refine ferrous and nonferrous metals from ore, pig or scrap, and manufacturing related products. SIC 3441 identifies facilities manufacturing fabricated structural metal. Facilities under SIC 373 engage in ship building and repairing. The permit application requirements for storm water discharges from facilities in these categories are unchanged from the proposal.

Today's rule clarifies that the requirement to apply for a permit applies to storm water discharges from plant areas that are no longer used for industrial activities (if significant materials remain and are exposed to storm water) as well as areas that are currently being used for industrial activities. EPA would also clarify that all discharges from these areas including those that discharge through municipal separate storm sewers are addressed by this rulemaking.

One commenter questioned the use of the word "or" instead of the word "and" to describe storm water "which is located at an industrial plant 'or' directly related to manufacturing, processing, or raw material storage areas at an industrial plant." The comment expressed the concern that discharges from areas not located at an industrial plant would be subject to permitting by this language and questioned whether this was EPA's intent. EPA agrees that this is a potential source of confusion and has modified this language to reflect the conjunctive instead of the alternative. This change has been made to provide consistency in the rule whereby some areas at industrial plants, such as administrative parking lots which do not have storm water discharges commingled with discharges from manufacturing areas, are not included under this rulemaking.

Two commenters wanted clarification of the term "or process water," in the definition of discharge associated with industrial activity at § 122.26(b)(14). This rulemaking replaces this term with the term "process waste water" which is defined at 40 CFR part 401.

One commenter took issue with the decision to include drainage ponds, refuse sites, sites for residual treatment, storage, or disposal, as areas associated with industrial activity, because it was the commenter's view that such areas are unconnected with industrial activity. EPA disagrees with this comment. If refuse and other sites are used in conjunction with manufacturing or the by-products of manufacturing they are clearly associated with industrial activity. As noted above, Congress intended to include discharges directly related to manufacturing and processing at industrial plants. EPA is convinced that wastes, refuse, and residuals are the direct result or consequence of manufacturing and processing and, when located or stored at the plant that produces them, are directly related to manufacturing and processing at that plant. Storm water drainage from such areas, especially those areas exposed to the elements (*e.g.* rainfall) has a high potential for containing pollutants from materials that were used in the manufacturing process at that facility. One commenter supported the inclusion of these areas since many toxins degrade very slowly and the mere passage of time will not eliminate their effects. EPA agrees and finalizes this part of the definition as proposed. One commenter requested clarification of the term "residual" as used in this context. Residual can generally be defined to include material that is remaining subsequent to completion of an industrial process. One commenter noted that the current owner of a facility may not know what areas or sites at a facility were used in this manner in the past. EPA has clarified the definition of discharge associated with industrial activity to include areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. The Agency believes that the current owner will be in a position to establish these facts.

One commenter suggested including material shipping and receiving areas, waste storage and processing areas, manufacturing buildings, storage areas for raw materials, supplies, intermediates, and finished products, and material handling facilities as additional areas "associated with industrial activity." EPA agrees that this would add clarification to the definition and has incorporated these areas into the definition at § 122.26(b)(14).

One commenter stated that the language "point source located at an industrial plant" would include outfalls located at the facility that are not owned or operated by the facility, but which are municipal storm sewers on easements granted to a municipality for the conveyance of storm water. EPA agrees that if the industry does not operate the point source then that facility is not required to obtain a permit for that discharge. A point source is a conveyance that discharges pollutants into the waters of the United States. If a facility does not operate that point source, then it would be the responsibility of the municipality to cover it under a permit issued to them. However, if contaminated storm water associated with industrial activity were introduced into that conveyance by that facility, the facility would be subject to permit application requirements as is all industrial storm water discharged through municipal sewers.

EPA disagrees with several comments that road drainage or railroad drainage within a facility should not be covered by the definition. Access roads and rail lines (even those not used for loading and unloading) are areas that are likely to accumulate extraneous material from raw materials, intermediate products and finished products that are used or transported within, or to and from, the facility. These areas will also be repositories for pollutants such as oil and grease from machinery or vehicles using these areas. As such they are related to the industrial activity at facilities. However, the language describing these areas of industrial activity has been clarified to include those access roads and rail lines that are "used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility." For the same reasons haul roads (roads dedicated to transportation of industrial products at facilities) and similar extensions are required to be addressed in permit applications. Two industries stated that haul roads and similar extensions should be covered by permits by rule. EPA is not considering the use of a permit by rule mechanism under this regulation, however this issue will be addressed in the section 402(p)(5) reports to Congress and in general permits to be proposed and promulgated in the near future. EPA would note however that facilities with similar operations and storm water concerns that desire to limit administrative burdens associated with permit applications and obtaining permits may want to avail themselves of the group application and/or general permits.

In response to comments, EPA would also like to clarify that it intends the language "immediate access roads" (including haul roads) to refer to roads which are exclusively or primarily dedicated for use by the industrial facility. EPA does not expect facilities to submit permit applications for discharges from public access roads such as state, county, or federal roads such as highways or BLM roads which happen to be used by the facility. Also, some access roads are used to transport bulk samples of raw materials or products (such as prospecting samples from potential mines) in small-scale prior to industrial production. EPA does not intend to require permit applications for access roads to operations which are not yet industrial activities.

EPA does agree with comments made by several industries that undeveloped areas, or areas that do not encompass those described above, should generally not be addressed in the permit application, or a storm water permit, as long as the storm water discharge from these areas is segregated from the storm water discharge associated with the industrial activity at the facility.

Numerous commenters stated that maintenance facilities, if covered, should not be included in the definition. EPA disagrees with this comment. Maintenance facilities will invariably have points of access and egress, and frequently will have outside areas where parts are stored or disposed of. Such areas are locations where oil, grease, solvents and other materials associated with maintenance activities will accumulate. In response to one commenter, such areas are only regulated in the context of those facilities enumerated in the definition at § 122.26(b)(14), and not similar areas of retail or commercial facilities.

Another commenter requested that "storage areas" be more clearly defined. EPA disagrees that this term needs further clarification in the context of this section of the rule. However, in response to one comment, tank farms at industrial facilities are included. Tank farms are in existence to store products and materials created or used by the facility. Accordingly they are directly related to manufacturing processes.

Regarding storage areas, one commenter stated that the regulations should emphasize that only facilities that are not totally enclosed are required to submit permit applications. EPA does not agree with this interpretation since use of the generic term storage area indicates no exceptions for certain physical characteristics. Thus discharges from enclosed storage areas are also covered by today's rule (except as discussed above). EPA also disagrees with one

comment asserting that small outside storage areas of finished products at industrial facilities should be excluded under the definition of associated with industrial activity. EPA believes that such areas are areas associated with industrial activity which Congress intended to be regulated under the CWA. As noted above, the legislative history refers to storage areas, without reference to whether they are covered or uncovered, or of a certain size.

The same language, in the legislative history cited above, was careful to state that the term "associated with industrial activity" does not include storm water "discharges associated with parking lots and administrative and employee buildings." To accommodate legislative intent, segregated storm water discharges from these areas will not be required to obtain a permit prior to October 1, 1992. Many commenters stated that this was an appropriate method in which to limit the scope of "associated with industrial activity." However, if a storm water discharge from a parking lot at an industrial facility is mixed with a storm water discharge "associated with industrial activity," the combined discharge is subject to permit application requirements for storm water discharges associated with industrial activity. EPA disagrees with some commenters who urged that office buildings and administrative parking lots should be covered if they are located at the plant site. EPA agrees with one commenter that inclusion of storm water discharge from these areas would be overstepping Congressional intent unless such are commingled with storm water discharges from the plant site. Several commenters requested that language be incorporated into the rule which establishes that storm water discharges from parking lots and administrative areas not be included in the definition of associated with industrial activity. EPA agrees and has retained language used in the proposal which addresses this distinction.

Storm water discharges from parking lots and administrative buildings along with other discharges from industrial lands that do not meet the regulatory definition of "associated with industrial activity" and that are segregated from such discharges may be required to obtain an NPDES permit prior to October 1, 1992, under certain conditions. For example, large parking facilities, due to their impervious nature may generate large amounts of runoff which may contain significant amounts of oil and grease and heavy metals which may have adverse impacts on receiving waters. The Administrator or NPDES State has the authority under section 402(p)(2)(E) of the amended CWA to require a permit prior to October 1, 1992, by designating storm water discharges such as those from parking lots that are significant contributors of pollutants or contribute to a water quality standard violation. EPA will address storm water discharges from lands used for industrial activity which do not meet the regulatory definition of "associated with industrial activity" in the section 402(p)(5) study to determine the appropriate manner to regulate such discharges.

Several commenters requested clarification that the definition does not include sheet flow or discharged storm water from upstream adjacent facilities that enters the land or comingles with discharge from a facility submitting a permit application. EPA wishes to clarify that operators of facilities are generally responsible for its discharge in its entirety regardless of the initial source of discharge. However, where an upstream source can be identified and permitted, the liability of a downstream facility for other storm water entering that facility may be minimized. Facilities in such circumstances may be required to develop management practices or other run-on/run-off controls, which segregates or otherwise prevents outside runoff from comingling with its storm water discharge. Some commenters expressed concern about other pollutants which may arrive on a facility's premises from rainfall. This comment was made in reference to runoff with a high or low pH. If an applicant has reason to believe that pollutants in its storm water discharge are from such sources, then that needs to be addressed in the permit application and brought to the attention of the permitting authority, which can draft appropriate permit conditions to reflect these circumstances.

EPA requested comments on clarifying the types of facilities that involve industrial activities and generate storm water. EPA preferred basing the clarification, in part, on the use of Standard Industrial Classification (SIC) codes, which have been suggested in comments to prior storm water rulemakings because they are commonly used and accepted and would provide definitions of facilities involved in industrial activity. Several commenters supported the use by EPA of Standard Industrial Classifications for the same reasons identified by EPA as a generally used and understood form of classification. It was also noted that using such a classification would allow targeting for special notification and educational mailings. Three municipalities and three State authorities commented that SICs were appropriate and endorsed their use as a sound basis for determining which industries are covered.

One municipality questioned how SIC classifications will be assigned to particular industries. SICs have descriptions of the type of industrial activity that is engaged in by facilities. Industries will need to assess for themselves whether they are covered by a listed SIC and submit an application accordingly. Another commenter questioned if Federal facilities that do not have an SIC code identification are required to file a permit application. Federal facilities will be required to submit a permit application if they are engaged in an industrial activity that is described under § 122.26(b)(14). The definition of industrial activity incorporates language that requires Federal facilities to submit permit applications in such circumstances. The language has been further clarified to include State and municipal facilities.

EPA requested comments on the scope of the definition (types of facilities addressed) as well as the clarity of regulation. EPA identified the following types of facilities in the proposed regulation as those facilities that would be required to obtain permits for storm water discharges associated with industrial activity:

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are also identified under category (xi) of this paragraph). One commenter (a municipality) agreed with EPA that these industries should be addressed in this rulemaking. No other comments were received on this category. EPA agrees with this comment since these facilities are those that Congress has required EPA to examine and regulate under the CWA with respect to process water discharges. The industries in these categories have generally been identified by EPA as the most significant dischargers of process wastewaters in the country. As such, these facilities are likely to have storm water discharges associated with industrial activity for which permit applications should be required.

One commenter stated that because oil and gas producers are subject to effluent guidelines, EPA is disregarding the intent of Congress to exclude

facilities pursuant to section 402(1). EPA disagrees with this comment. EPA is not prohibited from requiring permit applications from industries with storm water discharge associated with industrial activity. EPA is prohibited only from requiring a permit for oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water that is not contaminated by contact with or has not come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations such discharges. In keeping with this requirement, EPA is requiring permit applications from oil and gas exploration, production, processing, or treatment operations, or transmission facilities that fall into a class of dischargers as described in § 122.26(c)(iii).

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283 and 285), 29, 311, 32 (except 323), 33, 3411, 373 and *(xi). Facilities classified as Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221–25.* One large municipality and one industry agreed with EPA that facilities covered by these SICs should be covered by this rulemaking. Many commenters, however, took exception to including all or some of these industries. However as noted elsewhere these facilities are appropriate for permit applications.

One commenter stated that within certain SICs industries, such as textile manufacturers use few chemicals and that there is little chance of pollutants in their storm water discharge. EPA agrees that some industries in this category are less likely than others to have storm water discharges that pose significant risks to receiving water quality. However, there are many other activities that are undertaken at these facilities that may result in polluted storm water. Further, the CWA is clear in its mandate to require permit applications for discharges associated with industrial activity. Excluding any of the facilities under these categories, except where the facility manufacturing plant more closely resembles a commercial or retail outlet would be contrary to Congressional intent.

One State questioned the inclusion of facilities identified in SIC codes 20–39 because of their temporary and transient nature or ownership. Agency disagrees that simply because a facility may transfer ownership that storm water quality concerns should be ignored. If constant ownership was a condition precedent to applying for and obtaining a permit, few if any facilities would be subject to this rulemaking.

One State estimated that the proposed definition would lead to permits for 18,000 facilities in its State. Consequently this commenter recommended that the facilities under SIC 20–39 should be limited to those facilities that have to report under section 313 of title III, Superfund Amendments and Reauthorization Act. However, as noted by another commenter, limiting permit requirements to these facilities would be contrary to Congressional intent. While use of chemicals at a facility may be a source of pollution in storm water discharges, other every day activities at an industrial site and associated pollutants such as oil and grease, also contribute to the discharge of pollutants that are to be addressed by the CWA and these regulations. While the number of permit applications may number in the thousands, EPA intends for group applications and general permits to be employed to reduce the administrative burdens as greatly as possible.

Two commenters felt the permit applications should be limited to all entities under SIC 20–39. EPA disagrees that all the industrial activities that need to be addressed fall within these SICs. Discharges from facilities under paragraphs (ii) through (xi) such as POTWs, transportation facilities, and hazardous waste facilities, are of an industrial nature and clearly were intended to be addressed before October 1, 1992.

Two commenters stated that SIC 241 should be excluded in that logging is a transitory operation which may occur on a site for only 2–3 weeks once in a 20–30 year period. It was perceived that delays in obtaining permits for such operations could create problems in harvest schedule and mill demand. This commenter stated that runoff from such operations should be controlled by BMPs in effect for such industries and that such a permit would not be practical and would be cost prohibitive.

EPA agrees with the commenter that this provision needs clarification. The existing regulations at 40 CFR 122.27 currently define the scope of the NPDES program with regard to silvicultural activities. 40 CFR 122.27(b)(1) defines the term "silvicultural point source" to mean any discrete conveyance related to rock crushing, gravel washing, log sorting, or log storage facilities which are operated in connection with silvicultural activities and from which pollutants are discharged into waters of the United States. Section 122.27(b)(1) also excludes certain sources. The definition of discharge associated with industrial activity does not include activities or facilities that are currently exempt from permitting under NPDES. EPA does not intend to change the scope of 40 CFR 122.27 in this rulemaking. Accordingly, the definition of "storm water discharge associated with industrial activity" does not include sources that may be included under SIC 24, but which are excluded under 40 CFR 122.27. Further, EPA intends to examine the scope of the NPDES silvicultural regulations at 40 CFR 122.27 as it relates to storm water discharges in the course of two studies of storm water discharges required under section 402(p)(5) of the CWA.

In response to one comment, EPA intends that the list of applicable SICs will define and identify what industrial facilities are required to apply. Facilities that warehouse finished products under the same code at a different facility from the site of manufacturing are not required to file a permit application, unless otherwise covered by this rulemaking.

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(l) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990 and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations. Several commenters urged that Congress intended to require permits or permit applications only for the manufacturing sector of the oil and gas industry (or those activities that designated in SIC 20 through 39). EPA disagrees with this argument. The fact that Congress used the language cited above and not the appropriate the SIC definition explicitly does not indicate that a broader definition or less exclusive definition was contemplated. According to these comments, all storm water discharges from oil and gas

exploration and production facilities would be exempt from regulation. However, EPA is convinced that a facility that is engaged in finding and extracting crude oil and natural gas from subsurface formations, separating the oil and gas from formation water, and preparing that crude oil for transportation to a refinery for manufacturing and processing into refined products, will have discharges directly relating to the processing or raw material storage at an industrial plant and are therefore discharges associated with industrial activity.

For further clarification EPA is intending to focus only on those facilities that are in SIC 10-14. Furthermore, in response to several comments, this rulemaking will require permit applications for storm water discharges from currently inactive petroleum related facilities within SIC codes 10-14, if discharges from such facilities meet the requirements as described in section VI.F.7.a. and § 122.26(c)(1)(iii). Inactive facilities will have storm water associated with industrial activity irrespective of whether the activity is ongoing. Congress drew no distinction between active and inactive facilities in the statute or in the legislative history.

(iv) Hazardous waste treatment, storage, or disposal facilities that are operating under interim status or a permit under Subtitle C of the Resource, Conservation and Recovery Act. One commenter believed that all RCRA and Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) facilities should be specifically identified using SIC codes for further clarification. EPA considers this to be unnecessarily redundant, since the RCRA/CERCLA identification is sufficient.

Several industries asserted that storm water discharge from landfills, dumps, and land application sites, properly closed or otherwise subject to corrective or remedial actions under RCRA, should not be included in the definition. One commenter noted that the runoff from these areas is like runoff from undeveloped areas. One commenter also concluded that landfills, dumps, and land application sites should also be excluded if they are properly maintained under RCRA.

One commenter also rejected the idea of requiring permits from all active and inactive landfills and open dumps that have received any industrial wastes, and subtitle C facilities. This commenter felt that these facilities were already adequately covered under RCRA.

Two industry commenters felt that it would be redundant to have hazardous waste facilities regulated by RCRA and the NPDES storm water program. One felt this was especially so if there are current pretreatment standards.

The Agency disagrees that all activities that may contribute to storm water discharges at RCRA subtitle C facilities are being fully controlled and that requiring NPDES permits for storm water discharges at RCRA subtitle C facilities is redundant. First, the vast majority of permitted hazardous waste management facilities are industrial facilities involved in the manufacture or processing of products for distribution in commerce. Their hazardous waste management activities are incidental to the production-related activities. While RCRA subtitle C regulations impose controls in storm water runoff from hazardous waste management units and require cleanup of releases of hazardous wastes, they generally do not control non-systematic spills or process. These releases, from the process itself or the storage of raw materials or finished products are a potential source of storm water contamination. In addition, RCRA subtitle C (except via corrective action authority) does not address management of "non hazardous" industrial wastes, which nevertheless could also potentially contaminate storm water runoff.

Second, at commercial hazardous waste management facilities, the RCRA subtitle C permitting requirements and management standards do not control all releases of potentially toxic materials. For example, some permitted commercial treatment facilities may store and use chemicals in the treatment of RCRA hazardous wastes. Releases of these treatment chemicals from storage areas are a potential source of storm water contamination.

Finally, many RCRA subtitle C facilities have inactive Solid Waste Management Units (SWMU's) on the facility property. These SWMU's may contain areas on the land surface that are contaminated with hazardous constituents. RCRA requires that hazardous waste management facilities must investigate these areas of potential contamination, and then perform corrective action to remediate any SWMU's that are of concern. However, the corrective action process at these facilities will not be completed for a number of years due to the complexity of the cleanup decisions, and due to the fact that many hazardous waste management facilities do not yet have RCRA permits. Until corrective action has been completed at all such subtitle C facilities, SWMU's are a potential source of storm water contamination that should be addressed under the NPDES program. Finally, under section 1004(27) of RCRA, all point source discharges, including those at RCRA regulated facilities, are to be regulated by the NPDES program. Thus, there is no concern of regulatory overlap, and to the extent that the storm water regulations are effectively implemented, it will help address these units in a way that alleviates the need for expensive corrective action in the future.

(v) Landfills, land application sites, and open dumps that receive or have received industrial wastes and that are subject to regulation under subtitle D of RCRA. EPA received numerous comments supporting the regulation of municipal landfills which receive industrial waste and are subject to regulation under subtitle D of RCRA. EPA agrees with these comments. These industries have significant potential for storm water discharges that can adversely affect receiving water.

Two States argued that landfills should be addressed under the non-point source program. EPA disagrees that the non-point source program is sufficient for addressing these facilities. Further, addressing a class of facilities under the non-point source program does not exempt storm water discharges from these facilities from regulation under NPDES. The CWA requires EPA to promulgate regulations for controlling point source discharges of storm water from industrial facilities. Point sources from landfills consisting of storm water are such discharges requiring an NPDES permit. Several commenters argued that these discharges are adequately addressed by RCRA and that regulating them under this storm water rule would be redundant. However, as discussed above, RCRA expressly does not regulate point source discharges subject to NPDES permits. Given the nature of these facilities and of the material stored or disposed, EPA believes storm water permits are necessary. Similarly EPA rejects the comment that storm water discharges from these facilities are already adequately regulated by State authority. Congress has mandated that storm water discharges associated with industrial activity have an NPDES permit.

One commenter wanted EPA to define by size what landfills are covered. In response, it is the intent of these regulations to require permit applications from all landfills that receive industrial waste. Storm water discharges from such facilities are addressed because of the nature of the material with which the storm water comes in contact. The size of facility

will not dictate what type of waste is exposed to the elements.

One commenter requested that the definition of industrial wastes be clarified. For the purpose of this rule, industrial waste consists of materials delivered to the landfill for disposal and whose origin is any of the facilities described under § 122.26(b)(14) of this regulation.

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classifed as Standard Industrial Classification 5015 and 5093. One commenter suggested that the recycling of materials such as paper, glass, plastics, etc., should not be classified as an industrial activity. EPA disagrees that such facilities should be excluded on that basis. These facilities may be considered industrial, as are facilities that manufacture such products absent recycling.

Other facilities exhibit traits that indicate industrial activity. In junkyards, the condition of materials and junked vehicles and the activities occurring on the yard frequently result in significant losses of fluids, which are sources of toxic metals, oil and grease and polychlorinated aromatic hydrocarbons. Weathering of plated and non-plated metal surfaces may result in contributions of toxic metals to storm water. Clearly such facilities cannot be classified as commercial or retail.

One municipality felt that "significant recycling" should be defined or clarified. EPA agrees that the proposed language is ambiguous. It has been clarified to require permit applications from facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093. These SIC codes describe facilities engaged in dismantling, breaking up, sorting, and wholesale distribution of motor vehicles and parts and a variety of other materials. The Agency believes these SIC codes clarify the term significant recycling.

One municipality stated that regulation of these facilities under NPDES would be duplicative if they are publicly owned facilities. One State expressed the view that automobile junkyards, salvage yards could not legitimately be considered industrial activity. As noted above, EPA disagrees with these comments. Facilities that are actively engaged in the storage and recycling of products including metals, oil, rubber, and synthetics are in the business of storing and recycling materials associated with or once used in industrial activity. These activities are not commercial or retail because they are engaged in the dismantling of motors for distribution in wholesale or retail, and the assembling, breaking up, sorting, and wholesale distribution of scrap and waste materials, which EPA views as industrial activity. Further, being a publicly owned facility does not confer non-industrial status.

(vii) Steam electric power generating facilities, including coal handling sites, and onsite and offsite ancillary transformer storage areas. Most of the comments were against requiring permit applications for onsite and offsite ancillary transformer facilities. One commenter stated that these transformers did not leak in storage and if there were leakage problems in handling transformers, such leaks were subject to Federal and State spill clean-up procedures. The same commenter suggested that if EPA required applications from such facilities that it exclude those that have regular inspections, management practices in place, or those that store 50 transformers at any one time.

EPA agrees that such facilities should not be covered by today's rule. As one commenter noted, the Toxic Substances Control Act (TSCA) addresses pollutants associated with transformers that may enter receiving water through storm water discharges. EPA has examined regulations under TSCA and agrees that regulation of storm water discharges from these facilities should be the subject of the studies being performed under section 402(p)(5), rather than regulations established by today's rule. Under TSCA, transformers are required to be stored in a manner that prevents rain water from reaching the stored PCBs or PCB items. 40 CFR 761.65(b)(1)(i). EPA considers transformer storage to be more akin to retail or other light commercial activities, where items are inventoried in buildings for prolonged periods for use or sale at some point in the future, and where there is no ongoing manufacturing or other industrial activity within the structure.

One commenter stated that this category of industries should be loosened so that all steam electric facilities are addressed—oil fired and nuclear. EPA believes that the language as proposed broadly defines the type of industrial activity addressed without specifying each mode of steam electric production. One commenter noted that the EPA has no authority under the CWA (*Train v. CPIR, Inc.*, 426 U.S. 1 (1976)) to regulate the discharge of source, special nuclear and by-product materials which are regulated under the Atomic Energy Act. EPA agrees permit applications may not address those aspects of such facilities, however the facility in its entirety may not necessarily be exempt. A permit application will be appropriate for discharges from non-exempt categories.

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171 which have vehicle maintenance shops, material handling facilities, equipment cleaning operations or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or which are identified in another subcategory of facilities under EPA's definition of storm water discharges associated with industrial activity. One commenter requested clarification of the terms "vehicle maintenance." Vehicle maintenance refers to the rehabilitation, mechanical repairing, painting, fueling, and lubricating of instrumentalities of transportation located at the described facilities. EPA is declining to write this definition into the regulation however since "vehicle maintenance" should not cause confusion as a descriptive term. One commenter wanted railroad tracks where rail cars are set aside for minor repairs excluded from regulation. In response, if the activity involves any of the above activities then a permit application is required. Train yards where repairs are undertaken are associated with industrial activity. Train yards generally have trains which, in and of themselves, can be classified as heavy industrial equipment. Trains, concentrated in train yards, are diesel fueled, lubricated, and repaired in volumes that connote industrial activity, rather than retail or commercial activity.

One commenter argued that if gasoline stations are not considered for permitting, then all transportation facilities should be exempt. EPA disagrees with the thrust of this comment. Transportation facilities such as bus depots, train yards, taxi stations, and airports are generally larger than individual repair shops, and generally engage in heavier more expansive forms of industrial activity. In keeping with Congressional intent to cover all industrial facilities, permit applications from such facilities are appropriate. In contrast, EPA views gas stations as retail commercial facilities not covered

by this regulation. It should be noted that SIC classifies gas stations as retail.

(ix) POTW lands used for land application treatment technology/ sludge disposal, handling or processing areas, and chemical handling and storage areas. One commenter wanted more clarification of the term POTW lands. Another commenter requested clarification of the terms sludge disposal, sludge handling areas, and sludge processing areas. One State recommended that a broader term than POTW should be used. EPA notes that on May 2, 1989, it promulgated NPDES Sewage Sludge Permit Regulations; State Sludge Management Program Requirements at 40 CFR part 501. This regulation identified those facilities that are subject to section 405(f) of the CWA as "treatment works treating domestic sewage."

In response to the above comments, EPA has decided to use this language to define what facilities are required to apply for a storm water permit. Under this rulemaking "treatment works treating domestic sewage," or any other sewage sludge or wastewater treatment device or system used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge, with a design flow of 1.0 mgd or more, or facilities required to have an approved pretreatment program under 40 CFR part 403, will be required to apply for a storm water permit. However, permit applications will not be required to address land where sludge is beneficially reused such as farm lands and home gardens or lands used for sludge management that are not physically located within the confines (offsite facility) of the facility or where sludge is beneficially reused in compliance with section 405 of the Clean Water Act (proposed rules were published on February 6, 1989, at 54 FR 5746). EPA believes that such activity is not "industrial" since it is agricultural or domestic application (non-industrial) unconnected to the facility generating the material.

EPA received many comments on the necessity and appropriateness of requiring permit applications for storm water discharges from POTW lands. It was anticipated by numerous commenters that the above cited sludge regulations would adequately address storm water discharges from lands where sludge is applied. However, the sewage sludge regulations do not directly address NPDES permit requirements for storm water discharges from POTW lands and related areas to the extent required by today's rulemaking; the regulations cover only permits for use or disposal of sludge. Also, the regulations proposed on February 4, 1989, cover primarily the technical standards for the composition of sewage sludge which is to be used or disposed. They do not include detailed permitting requirements for discharges of storm water from lands where sludge has been applied to the land. To that extent, EPA is not persuaded by these commenters that POTWs and POTW lands should be excluded from these storm water permit application requirements.

Two commenters noted that some States already regulate sludge use or disposal activities substantially and that EPA should refrain from further regulation. EPA disagrees that this is a basis for excluding facilities from Federal requirements. Notwithstanding regulations in existence under State law, EPA is required by the CWA to promulgate regulations for permit application for storm water associated with industrial activity. Under the NPDES program, States are able to promulgate more rigorous requirements. However a minimum level of control is required under Federal law. One commenter also indicated that a State's sludge land application sites must follow a well defined plan to ensure there is no sludge related runoff. Notwithstanding that a State may require storm water controls for sludge land applications, as noted above, EPA is required to promulgate regulations requiring permit applications from appropriate facilities. EPA views facilities such as waste treatment plants that engage in on-site sludge composting, storage of chemicals such as ferric chloride, alum, polymers, and chlorine, and which may experience spills and bubbleovers are suitable candidates for storm water permits. Facilities using such materials are not characteristic of commercial or retail activities. Use and storage of chemicals and the production of material such as sludge, with attendant heavy metals and organics, is activity that is industrial in nature. The size and scope of activities at the facility will determine the extent to which such activities are undertaken and such materials used and produced at the facility. Accordingly, EPA believes limiting the facilities covered under this category to those of 1.0 mgd and those covered under the industrial pretreatment program is appropriate.

To the extent that permit applicants are already required to employ certain management practices regarding storm water, these may be incorporated into permits and permit conditions issued by Federal and State permitting authorities. EPA has selected facilities identified under 40 CFR part 501 (*i.e.* those with a design flow of 1.0 mgd or more or those required to have an approved pretreatment program) since these facilities will have largest contribution of industrial process discharges. Sludge from such facilities will contain higher concentrations of heavy metal and organic pollutants.

One commenter stated that sludge disposal is a public activity that should be addressed in a public facility's storm water management program under a municipal storm water management program. EPA disagrees. Industrial facilities, whether publicly owned or not, are required to apply for and obtain permits when they are designated as industrial activity.

Another comment stated that a permit should not be required for facilities that collect all runoff on site and treat it at the same POTW. EPA believes that a permit application should be required from such facilities. However, the above practice can be incorporated as a permit condition for such a facility. One commenter stated storm water from sludge and chemical handling areas can be routed through the headworks of the POTW. The agency agrees that this may be an appropriate management practice for POTWs as long as other NPDES regulatory requirements are fulfilled with regard to POTWs.

(x) Construction activities, including clearing, grading and excavation activities except operations that result in the disturbance of less than five acre total land area which are not part of a larger common plan of development or sale. EPA addresses whether these facilities should be covered by today's rule in section VI.F.8.

The December 7, 1988, proposal also requested comments on including the following other categories of discharges in the definition of industrial activities: (xii) Automotive repair shops classified as Standard Industrial Classification 751 or 753; (xiii) Gasoline service stations classified as Standard Industrial Code 5541; (xiv) Lands other than POTW lands (offsite facilities) used for sludge management; (xv) Lumber and building materials retail facilities classified as Standard Industrial Classification 5211; (xvi) Landfills, land application sites, and open dumps that do not receive industrial wastes and that are subject to regulation under subtitle D of RCRA; (xvii) Facilities classified as Standard Industrial Classification 46 (pipelines, except natural gas), and 492 (gas production and distribution); (xviii) Major electrical powerline corridors.

EPA received numerous comments on whether to require permit applications for these particular facilities. The December 7, 1988, proposal reflected EPA's intent not to require permits for these facilities, but rather to address these facilities in the two studies required by CWA sections 402(p)(5) and (6). After reviewing the comments on this issue, EPA believes that these facilities should be addressed under these sections of the CWA. Most of these facilities are classified as light commercial and retail business establishments, agricultural, facilities where residential or domestic waste is received, or land use activities where there is no manufacturing. It should be noted that although EPA is not requiring the facilities identified as categories (xii) to (xviii), in the December 7, 1988, proposal to apply for a permit application under this rulemaking, such facilities may be designated under section 402(p)(2)(E) of the CWA.

Three commenters recommended that EPA clarify that non-exempt Department of Energy and Department of Defense facilities should be covered by the storm water regulation. The regulation clearly states that Federal Facilities that are engaged in industrial activity (i.e. those activities in § 122.26(b)(14)(i)–(xi)) are required to submit permit applications. Those applying for permits covering Federal facilities should consult the Standard Industrial Classifications for further clarification.

One commenter questioned how EPA intended to regulate municipal facilities engaged in industrial activities. Municipal facilities that are engaged in the type of industrial activity described above and which discharge into waters of the United States or municipal separate storm sewer systems are required to apply for permits. These facilities will be covered in the same manner as other industrial facilities. The fact that they are municipally owned does not in any way exclude them from needing permit applications under this rulemaking.

One commenter suggested exempting those facilities that have total annual sales less than five million dollars or occupy less than five acres of land. Another commenter thought that all minor permittees should be exempt. EPA believes that the quality of storm water and the extent to which discharges impact receiving water is not necessarily related to the size of the facility or the dollar value of its business. What is important in this regard, is the extent to which steps are taken at facilities to curb the quantity and type of material that may pollute storm water discharges from these facilities. Therefore EPA has not excluded facilities from permitting on such a basis. This same commenter stated that the proposed rules should not address facilities with multiple functions (industrial and retail). EPA disagrees. If a facility engages in activity that is defined in paragraphs (i) through (xi) above, it is required to apply for a permit regardless of the fact that it also has a retail element. Such facilities need only submit a permit application for the industrial portion of the facility (as long as storm water from the non-industrial portion is segregated, as discussed above). This commenter also felt that more studies needed to be undertaken to determine the best way to regulate industries. EPA agrees that storm water problems need further study and for that reason EPA has devoted substantial manpower and resources to complete comprehensive studies under section 402(p)(5), while also addressing industrial sources that need immediate attention under this rulemaking.

One commenter requested that EPA give examples of storm water discharges from each of the facilities that have been designated for submitting permit applications. Agency believes that this is unnecessary and impractical since every facility, regardless of the type of industry, will have different terrain, hydrology, weather patterns, management practices and control techniques. However, EPA intends to issue guidance on filing permit applications for storm water discharges from industrial facilities which details how an industry goes about filing an industrial permit and dealing with storm water discharges.

Today's rulemaking for storm water discharges associated with industrial activity at § 122.26(c)(1)(i) includes special conditions for storm water discharges originating from mining operations, oil or gas operations (§ 122.26(c)(1)(iii)), and from the construction operations listed above (§ 122.26(c)(1)(ii)). These requirements are discussed in more detail in section VI.F.7 and section VI.F.8 of today's notice.

3. Individual Application Requirements

Today's rule establishes individual and group permit application requirements for storm water discharges associated with industrial activity. These requirements will address facilities precluded from coverage under the general permits to be proposed and promulgated by EPA in the near future. EPA considers it necessary to obtain the information required in individual permit applications from certain facilities because of the nature of their industrial activity and because of existing institutional mechanisms for issuing and tracking NPDES permits. Furthermore, some States will not have general permitting authority. Facilities located in such States will be required to submit individual applications or participate in a group application. The following response to comments received on these requirements pertains to these facilities.

Under the September 26, 1984, regulation operators of Group I storm water discharges were required to submit NPDES Form 1 and Form 2C permit applications. In response to post-regulation comments received on that rule, EPA proposed new permit application requirements (March 7, 1985, (50 FR 9362) and August 12, 1985, (50 FR 32548)) which would have decreased the analytical sampling requirements of the Form 2C and provided procedures for group applications. Passage of the WQA in 1987 gave the EPA additional time to consider the appropriate permit application requirements for storm water discharges. On December 7, 1988, application requirements were proposed and numerous comments were received. Based upon these comments, modifications and refinements have been made to the industrial storm water permit application.

Some commenters expressed the view that the permit application requirements are too burdensome, require too much paperwork, are of dubious utility, and focus too greatly on the collection of quantitative data. EPA disagrees. In comparison to prior approaches for permitting storm water discharges and other existing permitting programs, EPA has streamlined the permit application process, limited the quantitative data requirements, and required narrative information that will be used to determine permit conditions that relate to the quality of storm water discharge. To the extent that EPA needs non-quantitative information to develop appropriate permit conditions, EPA disagrees with the view of some commenters that the information required is excessive. In response to comments on earlier rulemakings and a comment received on the December 7, 1988, proposal (stressing that the emphasis should be on site management, rather than monitoring, sampling, and reporting) EPA has shifted the emphasis of the permit application requirements for storm water discharges associated with industrial activity from the existing requirements for collection of

quantitative data (sampling data) in Form 2C towards collection of less quantitative data supplemented by additional information needed for evaluation of the nature of the storm water discharges.

The permit application requirements proposed for storm water discharges reduce the amount of quantitative data required in the permit application and exempt discharges which contain entirely storm water (*i.e.* contain no other discharge that, without the storm water component, would require an NPDES permit), from certain reporting requirements of Form 2C. The proposed modifications also would exempt applicants for discharges which contain entirely storm water from several non-quantitative information collection provisions currently required in the Form 2C. The proposed modifications would rely more on descriptive information for assessing impacts of the storm water discharge. One commenter proposed that information that the applicant has submitted for other permits be incorporated by reference into the storm water permit application. EPA disagrees that incorporation by reference is appropriate. The permitting authority will need to have this information readily available for evaluating permit application and permit conditions. Furthermore, EPA feels that the applicant is in the best position to provide the information and verify its accuracy. However, if the applicant has such information and it accurately reflects current circumstances, then the applicant can rely on the information for meeting the information requirements of the application. Another commenter suggested that EPA should only require the information in § 122.26(c)(1) (A) and (B) (*i.e.*, the requirement for a topographic map indicating drainage areas and estimate of impervious areas and material management practices). As explained in greater detail below, EPA is convinced that some quantitative data and the other narrative requirements are necessary for developing appropriate permit conditions.

Form 2F addressing permit applications for storm water discharges associated with industrial activity is included in today's final rule. A complete permit application for discharges composed entirely of storm water, will be comprised of Form 2F and Form 1. Operators of discharges which are composed of both storm water and non-storm water will submit, where required, a Form 1, an entire Form 2C (or Form 2D) and Form 2F when applying. In this case, the applicant will provide quantitative data describing the discharge during a storm event in Form 2F and quantitative data describing the discharge during non-storm events in Form 2C. Non-quantitative information reported in the Form 2C will not have to be reported again in the Form 2F.

Under today's rule, Form 2F for storm water discharges associated with industrial activity would not require the submittal of all of the quantitative information required in Form 2C, but would require that quantitative data be submitted for:

- Any pollutant limited in an effluent guideline for an industrial applicant's subcategory;
- Any pollutant listed in the facility's NPDES permit for its process wastewater;
- Oil and grease, TSS, COD, pH, BOD5, total phosphorus, total Kjeldahl nitrogen; nitrate plus nitrite nitrogen; and
- Any information on the discharge required under 40 CFR 122.21(g)(7) (iii) and (iv).

In order to characterize the discharge(s) sampled, applicants need to submit information regarding the storm event(s) that generated the sampled discharge, including the date(s) the sample was taken, flow measurements or estimates of the duration of the storm event(s) sampled, rainfall measurements or estimates from the storm event(s) which generated the sampled runoff, and the duration between the storm event sampled and the end of the previous storm event. Information regarding the storm event(s) sampled is necessary to evaluate whether the discharge(s) sampled was generally representative of other discharges expected to occur during storm events and to characterize the amount and nature of runoff discharges from the site.

One commenter stated that the quantitative information should be limited to those pollutants that are expected to be known to the applicant. EPA believes this would be inappropriate since there will be no way of determining initially whether these pollutants are present despite the expectations of the applicant. Once the data is provided, permits can be drafted which address specific pollutants. This rulemaking requires that the applicant test for oil and grease, COD, pH, BOD5, TSS, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen and total phosphorus. Oil and grease and TSS are a common component of storm water and can have serious impacts on receiving waters. Oxygen demand (COD and BOD5) will help the permitting authority evaluate the oxygen depletion potential of the discharge. BOD5 is the most commonly used indicator of potential oxygen demand. COD is considered a more inclusive indicator of oxygen demand, especially where metals interfere with the BOD5 test. The pH will provide the permitting authority with important information on the potential availability of metals to the receiving flora, fauna and sediment. Total Kjeldahl nitrogen, nitrate plus nitrite nitrogen and total phosphorus are measures of nutrients which can impact water quality. Because this data is useful in developing appropriate permit conditions, EPA disagrees with the argument made by one commenter that quantitative data requirements should be a permit condition and not part of the application process.

In the proposed rule, the Agency used total nitrogen as a parameter. This has been changed to total Kjeldahl nitrogen and nitrate plus nitrite nitrogen for clarity.

Today's rule defines sampling at industrial sites in terms of sampling for those parameters that have effluent limits in existing NPDES permits, as well as for any other conventional or nonconventional parameter that might be expected to be found at the outfall. Comments on the appropriateness of the defined parameters were solicited by the proposal. Numerous commenters maintained that either the parameter list be made industry specific, or that pollutant categories not detected in the initial screen be exempted from further testing. Some suggested that only conventional pollutants, inorganics, and metals be sampled unless reason for others is found.

In terms of specific water quality parameters, it was recommended that surfactants not be tested for unless foam is visible. One commenter also suggested that fecal coliform sampling is inappropriate for industrial permits applications. One commenter favored testing for TOC instead of VOC. In response, VOC has been eliminated from the list of parameters because it will not yield specific usable data. VOC is not specifically required in any sampling in today's rule, except where priority pollutant scans are required.

Some recommended that procedures be modified to facilitate quicker, less expensive lab analyses. Concern was also raised that industry might be required to collect its own rainfall data if there is no nearby observation station. Some commenters stated that EPA should not allow automatic sampling for either biological or oil and grease sampling due to the potential for contamination in sampling equipment.

In response, EPA believes that the sampling requirements for industry in today's rule are reasonable and not burdensome. These requirements address parameters that have effluent limits in existing NPDES permits, as well as for any other conventional or nonconventional parameter that might be expected to be found at the applicants outfall. Under this procedure both industry-specific and site-specific contaminants are already identified in the existing permit. Whether all these parameters need to be made a part of any discharge characterization plans, under the terms of the permit, will be a case-by-case determination for the permitting authority. EPA maintains that the test for surfactants (if in effluent guidelines or in the facility's NPDES permit for process water) is justifiable even when a foam is not obvious at the outfall. The presence of detergents in storm water may be indicated by foam, but the absence of foam does not indicate that detergents are not present.

EPA requested comments on fecal coliform as a parameter. Fecal coliform was included on the list as an indicator of the presence of sanitary sewage. In large concentrations, fecal coliform may be an effective indicator of sanitary sewage as opposed to other animal wastes. EPA believes that sanitary cross connections will also be found at industrial facilities. Furthermore, the test for fecal coliform is an inexpensive test and its inclusion or exclusion should make little impact financially on the individual application costs. Sampling for volatile organic carbon shall be accomplished when required, as it is an appropriate indicator of industrial solvents and organic wastes.

In response to comments, EPA acknowledges that there are certain pollutants that are capable of leaving residues in automatic sampling devices that will potentially contaminate subsequent samples. In these cases, such as for biological monitoring, if such a problem is perceived to exist and it is expected that the contaminant will render the subsequent samples unusable, manual grab samples may be needed. This would include grab samples for pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform, and fecal streptococcus. EPA is not disallowing the use of automatic sampling because of possible contamination, as this type of sampling may be the best method for obtaining the necessary samples from a selected storm events.

In addition to the conventional pollutants listed above, this final rule requires applicants, when appropriate, to sample other pollutants based on a consideration of site-specific factors. These parameters account for pollutants associated with materials used for production and maintenance, finished products, waste products and non-process materials such as fertilizers and pesticides that may be present at a facility. Applicants must sample for any pollutant limited in an effluent guideline applicable to the facility or limited in the facility's NPDES permit. These pollutants will generally be associated with the facility's manufacturing process or wastes. Other process and non-process related pollutants, will be addressed by complying with the requirements of 40 CFR 122.21(g)(7) (iii) and (iv).

Section 122.21(g)(7)(iii) requires applicants to indicate whether they know or have reason to believe that any pollutant listed in Table IV (conventional and nonconventional pollutants) of appendix D to 40 CFR part 122 is discharged. If such a pollutant is either directly limited or indirectly limited by the terms of the applicant's existing NPDES permit through limitations on an indicator parameter, the applicant must report quantitative data. For pollutants that are not contained in an effluent limitations guideline, the applicant must either report quantitative data or describe the reasons the pollutant is expected to be discharged. With regard to pollutants listed in Table II (organic pollutants) or Table III (metals, cyanide and total phenol) of appendix D, the applicant must indicate whether they know or have reason to believe such pollutants are discharged from each outfall and, if they are discharged in amounts greater than 10 parts per billion (ppb), the applicant must report quantitative data. An applicant qualifying as a small business under 40 CFR 122.21(g)(8), (e.g., coal mines with a probable total annual production of less than 100,000 tons per year or, for all other applicants, gross total annual sales averaging less than $100,000 per year (in second quarter 1980 dollars)), is not required to analyze for pollutants listed in Table II of appendix D (the organic toxic pollutants).

Section 122.21(g)(7)(iv) requires applicants to indicate whether they know or have reason to believe that any pollutant in Table V of appendix D to 40 CFR part 122 (certain hazardous substances) is discharged. For every pollutant expected to be discharged, the applicant must briefly describe the reasons the pollutant is expected to be discharged and report any existing quantitative data it has for the pollutant.

When collecting data for permit applications, applicants may make use of 40 CFR 122.21(g)(7), which provides that "when an applicant has two or more outfalls with substantially identical effluents, the Director may allow the applicant to test only one outfall and report that the quantitative data also applies to the substantially identical outfalls." Where the facility has availed itself of this provision, an explanation of why the untested outfalls are "substantially identical" to tested outfalls must be provided in the application. Where the amount of flow associated with the outfalls with substantially identical effluent differs, measurements or estimates of the total flow of each of the outfalls must be provided. Several commenters stated that the time and expense associated with sampling and analysis would be saved if the applicant was able to pick substantially identical outfalls without prior approval of the permitting authority. EPA disagrees that this would be an appropriate devolution of authority to the permit applicant. The permitting authority needs to ensure that these outfalls have been grouped according to appropriate criteria (for example do the outfalls serve similar drainage areas at the facility). Furthermore, EPA is not requiring that the permit applicant engage in sampling to demonstrate that the outfalls are indeed substantially identical, because that would of course defeat the purpose of § 122.21(g)(7). The procedure for establishing identical outfalls is not that onerous and provides a means for industry to save substantially on time and resources for sampling.

EPA proposed and requested comment on a requirement that the facility must sample a storm event that is typical for the area in terms of duration and severity. The storm event must be greater than 0.1 inches and must be at least 96 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. In general, variance of the parameters (such as the duration of the event and the total rainfall of the event) should not exceed 50 percent from the parameters of the average rainfall event in that area. EPA also requested comments on addressing snow melt events under this definition.

Commenters stated that: median or average rainfall is not an acceptable approach; the minimum depth and duration of rainfall must be specified; the allowable 50% variation is questionable; the total depth of the storm is irrelevant; and the storm should be viewed based on the average intensity of the storm. One commenter

suggested that using the median rainfall event would be a better approach than the average rainfall event.

Others insisted that "representative" or typical storms do not exist in semi-arid climates and that representative rainfall must be site-specific (regional) and seasonal. Several commenters contended that the requirement for 96 dry hours between events is not acceptable, with 48 and 72 hours identified as possible alternatives.

One commenter believed that a typical standard design storm, such as the 1-year, 24-hour, or 10-year, 1-hour, would be preferable. Another commenter felt that the storm event should be based on the rainfall required to generate a minimum discharge level. One commenter questioned whether the storm is to be sampled at all sites simultaneously.

To clarify its decision on what storm event should be sampled, EPA notes that its selection of the storm event considers both regional and seasonal variation of precipitation. This is evidenced in the rule with regard to sites in the municipal application (three events sampled), and in the requirements for industrial group applications (a minimum of two applicants, or one applicant in groups of less than 10, to be represented in each precipitation zone (*see* section VI.F.4 below).

The definition of a 0.1 inch minimum was determined by NURP and other studies to be the minimum rainfall depth capable of producing the rainfall/runoff characteristics necessary to generate a sufficient volume of runoff for meaningful sample analysis. EPA believes by requiring the average storm to be used as the basis for sampling that depth, duration, and therefore average rainfall intensity are being regionally defined. The Agency has also added the option of using the median rainfall event instead of the average. The potential for monitoring events that may not meet this specification should be minimized by allowing the proposed 50 percent variation in rainfall depth and/or duration from event statistics. However, the 50 percent variation need only be met when possible. Further, there is flexibility in the rule where the Director may allow or establish site specific requirements such as the minimum duration between the previous measurable storm event and the storm event sampled, the amount of precipitation from the storm event to be sampled, and the form of precipitation sampled (snowmelt or rainfall). If data is obtained from a rain event that does not meet the criteria above, the Director has the discretion to accept the data as valid.

The December 7, 1988, proposal called for a 96-hour period between events of measurable rainfall, here defined as 0.1 inch, which provided a four day minimum for the accumulation of pollutants on the surface of the outfalls' tributary areas. The key word in the definition is "measurable", which means that the 96-hour period did not necessarily have to be dry, only that no cleansing rainfall (*i.e.* 0.1 inch rain event) has occurred. However, after reviewing comments on this issue EPA has decided to change the period to 72 hours. Many commenters indicated that 96 hours is too restrictive and that securing a sample under such circumstances would be unnecessarily difficult. EPA agrees that the quality or representativeness of the sample would not be adversely affected by this change.

EPA does not agree with comments that the requirement of a particular "design" storm would be appropriate. Many commenters have expressed concern that they might sample an event not meeting the requirements for industrial group applications as defined. Because there is no way to know with sufficient certainty beforehand that an upcoming event will approximate a one-year, twenty-four hour storm, many events would be unnecessarily sampled before this event is realized.

EPA does not intend that a municipality or industry be required to sample all required outfalls for a single storm. This would represent a unmanageable investment in equipment and manpower. In some areas, it may be necessary to sample multiple sites for a single event due to the irregularity of rainfall, but not all sites.

EPA described parameters for selecting storm events for sampling of municipal and industrial outfalls in the December 7, 1988, proposal. EPA has received several comments regarding the problems that rainfall measurement in general presents. A recurring comment relative to reporting rainfall, and in verifying that the storm itself is representative, deals with the spatial distribution of rainfall. The rainfall measured at an airport does not always represent rainfall at the site, particularly in summer months when thunderstorms are prevalent. One commenter stated that it would be easier to base the selected storm on either a minimum discharge, or on a discharge duration other than on the total precipitation, because these parameters are easily measured at the site and are not dependent on the airport gauges receiving the same rainfall as the site. A few commenters questioned how to determine typical storm characteristics. One commenter advised that NOAA rainfall reporting stations provide data that represent only daily rainfall totals, not storm event data. One commenter pointed out that the time frame of the sampling requirement does not consider that a particular region may be in the midst of a multi-year drought cycle, and that what little rainfall occurs may have uncharacteristically high levels of pollutants.

The type of rain event sampled is an important parameter in any attempt to characterize system-wide loads based on the sampling results. Rainfall gauges that report only event total depth will provide the information necessary to characterize most events, provided that a reasonable estimate of the event duration can be made. If simulation models are to be used in estimating system-wide loads, rainfall measurement based on time and depth of rainfall will be needed. If the recording stations are not believed to accurately reflect this distribution, then the data will need to be collected by the applicant at a location central to the tributary area of the outfall.

The rainfall data collected by NOAA are in most cases available in the form of hourly rainfall depths. This information can be analyzed to develop characteristic storm depths and durations. In some cases, this information has already been analyzed for many long term reporting stations by various municipalities, states, and universities. The results of these investigations should be available to the applicants.

EPA realizes that prolonged rainless periods occur for both semi-arid areas and areas experiencing droughts and that the first storm after a prolonged dry period may well not be representative of "normal" runoff conditions. In order for the appropriate system-wide characterization of loads to be made, data must be collected. With regard to the municipal permit application, today's rule states that runoff characterization data will be collected during three events at from five to ten sites. The rule gives the Director the flexibility of modifying these requirements.

EPA has defined the parameters for selecting the storm event to be sampled such that at the discretion of the Director, seasonal, including winter, sampling might be required. EPA has received several comments regarding the problems that snow melt sampling may present. Several commenters are

opposed to monitoring of snowmelt events. The reasons cited include equipment problems and the unreasonableness of expecting this sampling, because of temperatures and the time required for personnel to be waiting for events. A few comments addressed the issues of snow pack depth, ambient temperature, and solar radiation levels, and that the snow pack may filter suspended solids or refreeze such that final melting is uncharacteristically over-polluted relative to normal conditions. Another commenter contended that it is impossible to manage the melting process and therefore unreasonable to expect controls to be implemented relative to snowmelt. In essence, it is contended that there is no first discharge unless the snow pack depth is low and melts quickly.

A few commenters favor monitoring snowmelt, for precisely the same reason that most oppose it: that the runoff from snowmelt is the most polluted runoff generated in some areas on an annual basis. Where this is the case, sampling snowmelt should be undertaken in order to accurately assess impacts to receiving streams. EPA is confident that in areas where automated sampling cannot be relied upon, grab sampling can probably be performed because the nature of the snowmelt process tends to make the timing of samples less of a problem when compared to typical rainfall events. EPA disagrees that management practices, either at industrial facilities or with regard to municipalities, cannot address snowmelt. Some areas may need to reassess their salt application procedures. In addition retention and detention devices may address snowmelt, as well as erosion controls at construction sites. Thus, obtaining samples of snowmelt is appropriate to allow development of such permit conditions.

Today's rule also modifies the Form 2C requirements by exempting applicants from the requirements at § 122.21(g)(2) (line drawings), (g)(4) (intermittent flows), (g)(7) (i), (ii), and (v) (various sampling requirements to characterize discharges) if the discharge covered by the application is composed entirely of storm water. Permit applications for discharges containing storm water associated with industrial activity would require applicants to provide other non-quantitative information which will aid permit writers to identify which storm water discharges are associated with industrial activity and to characterize the nature of the discharge.

Numerous comments were received regarding the requirement to submit a topographic map and site drainage map. Many of these comments offered alternatives to EPA's proposal. Two commenters suggested that a simple sketch of the site would be sufficient. Two commenters stated that one or the other should be adequate. One commenter believed that the drainage map was a good idea, but that the topographic map should be optional. Several commenters submitted that a topographic map was sufficient and that only SPCC plans or SARA submittals should supplement that. Another commenter argued that information relating to the location of the nearest surface water or drinking wells would be sufficient. Other commenters believed that a drainage map alone would indicate all relevant site specific information. Numerous commenters expressed concern that the drainage area map would be too detailed and that one which depicts the general direction of flow should be sufficient. Clarification was requested on whether the final rule would require the location of any drinking water wells. One commenter stated that a U.S.G.S. 7.5 quadrangle map will not illustrate drainage systems in all cases, and that therefore the requirement should be optional.

Several commenters agreed with EPA's proposal. One commenter maintained that drainage maps should be required from developments greater than three acres and from all individual applicants. Several commenters agreed with EPA's proposal that both maps should be provided, with arrows indicating site drainage and entering and leaving points. It was advised that drainage maps are useful in locating sources of storm water contamination, and it is useful to identify areas and activities which require source controls or remedial action. One commenter recommended that the map should extend far enough offsite to demonstrate how the privately owned system connects to the publicly owned system.

After considering the merits of all the comments and the reasons supporting EPA's proposal, EPA is convinced that a topographic map and a site drainage map are necessary components of the industrial application. Existing permit application regulations at 40 CFR 122.21(f)(7) require all permit applicants to submit as part of Form 1 a topographic map extending one mile beyond the property boundaries of the source depicting: the facility and each intake and discharge structure; each hazardous waste treatment, storage, or disposal facility; each well where fluids from the facility are injected underground; and those wells, springs, other surface water bodies, and drinking water wells listed in the map area in public records or otherwise known to the applicant within one-quarter mile of the facility property boundary. (*See* 47 FR 15304, April 8, 1982.) However, as indicated by the comments the information provided under § 122.21(f)(7) is generally not sufficient by itself for evaluating the nature of storm water discharges associated with industrial activity.

As stated in comments, a drainage map can provide more important site specific information for evaluating the nature of the storm water discharge in comparison to existing requirements, which require a larger map with only general information. The volume of storm water discharge and the pollutants associated with it will depend on the configuration and activities occurring at the industrial site. One commenter suggested that it would be appropriate to submit an aerial photograph of the site with all the topographic and drainage information superimposed on the photograph. EPA agrees that this may be an appropriate method of providing this information. EPA is not requiring a specific format for submitting this information.

EPA is also requiring that a narrative description be submitted to accompany the drainage map. The narrative will provide a description of on-site features including: existing structures (buildings which cover materials and other material covers; dikes; diversion ditches, etc.) and non-structural controls (employee training, visual inspections, preventive maintenance, and housekeeping measures) that are used to prevent or minimize the potential for release of toxic and hazardous pollutants; a description of significant materials that are currently or in the past have been treated, stored or disposed outside; and the method of treatment, storage or disposal used. The narrative will also include: a description of activities at materials loading and unloading areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; a description of the soil; and a description of the areas which are predominately responsible for first flush runoff. This requirement is unchanged from the proposal.

Some commenters believed that information on pesticides, herbicides, and fertilizers and similar products is irrelevant, incidental to the facility's production activities, and should not be

addressed by this rulemaking. EPA disagrees. As these materials are applied outside and hence subject to storm events, they are significant sources of pollutants in storm water discharges whether applied in residential or industrial settings. By providing this information in the permit application the permit writer will be able to determine whether such activity is associated with industrial activity and the subject of appropriate permit conditions. Nominal or incidental application of these materials at industrial facilities and non-detects in sampling of storm water discharges for the permit application will result, in most cases, in these materials not being addressed specifically in storm water permits.

Today's rule also requires that permit applicants for storm water discharges associated with industrial activity certify that all of the outfalls covered in the permit application have been tested or evaluated for non-storm water discharges which are not covered by an NPDES permit. (The applicant need not test for nonstorm water if the certification of the plant storm water discharges can be evaluated through the use of schematics or other adequate method). Section 405 of the WQA added section 402(p)(3)(B)(ii) to the CWA to require that permits for municipal separate storm sewers effectively prohibit non-storm water discharges to the storm sewer system. As discussed in part VI.F.7.b of today's preamble, untreated non-storm water discharges to storm sewers can create severe, widespread contamination problems and removing such discharges presents opportunities for dramatic improvements in the quality of such discharges. Although section 402(p)(3)(B)(ii) specifically addresses municipal separate storm sewers, EPA believes that illicit non-storm water discharges are as likely to be mixed with storm water at a facility that discharges directly to the waters of the United States as it is at a facility that discharges to a municipal storm sewer. Accordingly, EPA feels that it is appropriate to consider potential non-storm water discharges in permit applications for storm water discharges associated with industrial activity. The certification requirement would not apply to outfalls where storm water is intentionally mixed with process waste water streams which are already identified in and covered by a permit.

This rulemaking requires applicants for individual permits to submit known information regarding the history of significant spills at the facility. Several commenters indicated that the extent to which this information is required should be modified. One commenter stated that the requirement should be limited to those spills that resulted in a complaint or enforcement action. EPA disagrees. EPA believes that significant spills at a facility should generally include releases of oil or hazardous substances in excess of reportable quantities under section 311 of the Clean Water Act (see 40 CFR 110.10 and 40 CFR 117.21) or section 102 of CERCLA (see 40 CFR 302.4). Such a requirement is consistent with these regulations and the perception that such spills are significant enough to mandate the reporting of their occurrence. Some commenters stated that industries have already submitted this information in other contexts and should not be required to have to do it again. For the same reason another commenter felt that submittal of this information represents a waste of manpower and resources. EPA disagrees that requiring this information is unduly burdensome. If this information has already been provided for another purpose it follows that it is readily available to the industrial applicant. Thus, the burden of providing this information cannot be considered undue. Furthermore, the permit authority will need to have this available in order to determine which drainage areas are likely to generate storm water discharges associated with industrial activity, evaluate pollutants of concern, and develop appropriate permit conditions. However, to keep this information requirement within reasonable limits and limited to information already available to individual facilities, EPA has declined to expand the reporting requirements to spills of other materials, such as food as one commenter has suggested. However, EPA has decided to add raw materials used in food processing or production to the list of significant materials. Materials such as these may find their way into storm water discharges in such quantities that serious water quality impacts occur. These materials may find there way into storm water from transportation vehicles carrying materials into the facility, loading docks, processing areas, storage areas, and disposal sites.

One commenter urged that any information requested should be limited to a period of three years, which is the general NPDES records retention requirement under 40 CFR 122.21(p) and 40 CFR 112.7(d)(8). EPA agrees with this comment and has limited historical information requirements to the 3 years prior to the date the application is submitted. In this manner this regulation will be consistent with records keeping practices under the NPDES and Oil Spill Prevention programs, except sludge programs.

The December 7, 1988, proposal required the applicant to submit a description of each past or present area used for outdoor storage or disposal of significant materials. One commenter felt that the definition of significant material was too imprecise. EPA disagrees that the language should be made more precise by delineating every conceivable material that may add pollutants to storm water. Rather the definition is broad, to encourage permit applicants to list those materials that have the potential to cause water quality impacts. Stating what materials are addressed in meticulous detail may result in potentially harmful materials remaining unconsidered in permits. However, EPA has decided to add "fertilizers, pesticides, and raw materials used in the production or processing of food" to the definition in response to the comment of one State authority that such materials need to be accounted for due to their potential danger to storm water discharge quality. This same commenter recommended that "hazardous chemicals" should be added. EPA agrees, and will delineate those chemicals as "hazardous substances" which are designated under section 101(14) of CERCLA. Further clarification has been added by requiring the listing of any chemical the facility is required to report pursuant to section 313 of title III of SARA.

Another commenter felt that EPA should not require information of past storage of significant materials. EPA agrees that this proposed requirement is overbroad and has limited the time frame to those materials that were stored in areas 3 years or fewer from the date of the permit application. The 3-year limit is consistent with other Agency reporting requirements as discussed above.

One commenter questioned EPA's proposal not to provide for a waiver from the requirement to submit quantitative data if the applicant can demonstrate that it is unnecessary for permit issuance. Another commenter said that a waiver is inappropriate. EPA believes relevant quantitative data are essential to the process, but in this rulemaking the number of pollutants that must be sampled and analyzed is reduced compared to previous regulations. The proposed requirements for quantitative data are limited to pollutants that are appropriate for given

site-specific operations, thereby making a waiver unnecessary.

Although the concept of a waiver is attractive because of the perceived potential reduction in burdens for applicants, EPA believes that because the storm water discharge testing requirements have already been streamlined, a waiver would not in practice provide significant reductions in burden for either applicants or permit issuing authorities. Requirements to provide and verify data demonstrating that a waiver is appropriate for a storm water discharge may prove to be more of a burden to the applicant and the permitting authorities. Establishing such a waiver procedure would be administratively complex and time-consuming for both EPA and the applicants, without any justifiable benefit. Therefore, this rulemaking does not include a waiver provision.

In response to one commenter, EPA wishes to emphasize that if a facility has zero storm water discharge because it is discharging to a detention pond only, a permit application is not required. Only those discharges to the waters of the United States or municipal systems need submit notifications, individual or group permit applications, or notices of intent where applicable. However, if the detention pond overflows or the discharger anticipates that it may overflow, then a permit application should be submitted.

Two commenters agreed with EPA's proposed requirement to have a description of past and present material management practices and controls. EPA believes that this is important information directly relating to the quality of storm water that can be expected at a particular facility and this requirement is retained in today's rule. However, as with other historical information requirements, EPA is limiting past practices to those that occurred within three years of the date that the application is submitted. One commenter argued that past practices should not be considered unless there is evidence that past practices cause current storm water quality problems. EPA anticipates that the information submitted by the applicant will be used to make this determination and that appropriate permit conditions can be developed accordingly.

One commenter requested clarification on the certification requirement that the data and information in the application is true and complete to the best of the certifying officer's knowledge. This is a fundamental and integral part of all NPDES permit applications. It essentially requires the signatory to assure the permit writer, based upon his or her personal knowledge, that the information has been submitted without a negligent, reckless, or purposeful misrepresentation. EPA intends to interpret this requirement in the same manner for storm water applications as other applications.

4. Group Applications

Today's final rule provides some industries with the option of participating in a group application, in lieu of submitting individual permits. There are several reasons for the group application. First, the group application procedure provides adequate information for issuing permits for certain classes of storm water discharges associated with industrial activity. Second, numerous commenters supported the concept of the group application as a way to reduce the costs and administrative burdens associated with storm water permit applications. Third, group applications will reduce the burden on the regulated community by requiring the submission of quantitative data from only selected members of the group. Fourth, the group application process will reduce the burden on the permit issuing authority by consolidating information for reviewing permit applications and for developing general permits suited to certain industrial groups. Where general permits are not appropriate or cannot be issued, a group application can be used to develop model individual permits, which can significantly reduce the burden of preparing individual permits.

As noted above in today's preamble, EPA intends to promulgate a general permit that will cover many types of industrial activity. Industrial dischargers eligible for such permits will generally be required to seek coverage by submittal of a notice of intent. Facilities that are ineligible for coverage under the general permit will be required to submit an individual permit application or submit a group application. The group application process promulgated today will serve as an important component to implement Tier III of EPA's industrial storm water permitting strategy discussed above. The general permit which EPA intends to promulgate in the near future shall set forth what types of facilities are eligible for coverage.

Some commenters criticized the group application procedure as an abdication of EPA's responsibility to effectively deal with pollutants in storm water discharges. One commenter stated that every facility subject to these regulations should be required to submit quantitative data. In response EPA believes, as do numerous commenters, that the group application procedure is a legitimate and effective way of dealing with a large volume of currently uncontrolled discharges. The only difference between the group application procedure and issuing individual permits based on individual applications is that the quantitative data requirements from individual facilities will be less if certain procedures are followed. EPA is convinced that marked improvements in the process of issuing permits will be achieved when these procedures are followed. Where the storm water discharge from a particular facility is identified as posing a special environmental risk, it can be required to submit individual applications and therefore separate quantitative data. It should also be noted that submittal of a group application does not exempt a facility from submitting quantitative data on its storm water discharge during the term of the permit.

The final rule refines and clarifies some of the requirements of the group application approach set forth in the December 7, 1988 proposal. Several commenters requested that EPA add a provision which would allow a facility that becomes subject to the regulations to "add on" to a group application after that group application has already been submitted. One commenter indicated that some trade associations are prohibited from engaging in an activity which would not apply to all its members, and that an "add on" provision was needed in the event such a prohibition was invoked. Another commenter noted that where a group is particularly large, for example one that consists of several thousand members, that it would be a logistical feat to ensure that all facilities eligible as members of the group are properly identified and listed on the application within the 120 day deadline for submitting part 1A of the application.

EPA believes that a group applicant should have a limited ability to add facilities to the group after part 1A has been submitted and that a provision which allows a group or group representative an unbridled ability to "add on" is impractical for a number of reasons. First, 10% of the facilities must submit quantitative data. Adding facilities after the group has been formed and approved would change the number of facilities that have to submit quantitative data on behalf of the group. This would result in an unwarranted administrative burden on the reviewing authority, which is in the position of having to examine the quantitative data and determine the appropriateness of group members (and those that are

required to submit quantitative data) within 2 months of receiving part 1 of the group application. Further, during the permit application process permitting authorities will be developing permit conditions for an identified and pre-determined group of facilities. Allowing potentially significant numbers of permit applicants to suddenly inject themselves into a group application could unnecessarily hamper or disrupt the timely development of general and model permits. In addition, if a facility were "added on" the number of facilities having to submit quantitative data may drop below 10%. Thus the facility desiring to "add on" may be put in the position of having to submit the quantitative data themselves, which would clearly defeat the purpose of being a part of the group application.

Nevertheless, EPA has added a provision to 122.26(e) which enables facilities to add on to a group application at the discretion of the EPA's Office of Water Enforcement and Permits, and upon a showing of good cause by the group applicant. For the reasons noted above, EPA anticipates this provision will be invoked only in limited cases where good cause is shown. Facilities not properly identified in the group application, and which cannot meet the good cause test will be required to submit individual permit applications. EPA will advise such facilities within 30 days of receiving the request as to whether the facility may add on.

However, the "add on" facility must meet the following requirements: The application for the additional facility is made within 15 months of the final rule; and the addition of the facility does not reduce the percentage of the facilities that are required to submit quantitative data to below 10% unless there are over 100 facilities that are submitting quantitative data. Approval to become part of a group application is obtained from the group or the trade association and is certified by a representative of the group; approval for adding on to a group is obtained from the Office of Water Enforcement and Permits.

Several commenters stated that the application requirements for groups are so burdensome that the advantages of the process are undermined. These concerns are addressed in greater detail below. Among the requirements which commenters objected are the requirements to list every group member's company by name and address. EPA is convinced that a condition precedent to approving a group application is at least identifying the members of the group. Without such information it would be impossible to determine if all the facilities are sufficiently similar. EPA disagrees that industries will be dissuaded from using the group application process because the advantages of the process are undermined. Although commenters perceived many burdens associated with individual permit applications, by far the most significant burden identified by the comments is the requirement for obtaining and submitting quantitative data. The group application significantly reduces this burden by requiring only 10% of the facilities to submit quantitative data if the number in the group is over 100. If the number in the group is over 1000, then only 100 of the facilities need submit quantitative information. If group applicants develop cost sharing procedures to reduce the financial and administrative burdens of submitting quantitative data, it is evident that utilizing the group application could save industries as much as 90% on the most economically burdensome aspect of the application.

Several commenters perceived that the group application procedure did not offer them significant savings because under the proposal their particular industry would only be required to test for COD, BOD5, pH, TSS, oil and grease, nitrogen, and phosphorous. These commenters stated that sampling for these pollutants is not particularly expensive. EPA believes that even if a group is required only to submit minimal quantitative data on particular pollutants, substantial savings can accrue to a particular industry if the group has many members. This is particularly true when the number of outfalls to be sampled, the information on storm events, and flow measurements are factored into the cost analysis. An additional benefit for members of the group as well as for permit issuing agencies is that the process of developing a permit, including drafting and responding to public comments on the permit, is consolidated by the group application process. Accordingly, it is less resource intensive for the group to work with permit issuance authorities to develop well founded permit conditions.

One commenter raised a concern about the situation where one of the facilities that is designated for submitting quantitative data drops out of the group. If this happened, then another facility would have to submit quantitative data. In response, EPA notes that one approach would be for the group to have one or two more facilities submit quantitative data than needed to avoid problems from such a departure or to account for new additions to the group. Certainly this issue goes directly to the facility selection process which is a critical component of the group application; the facilities need to be carefully selected and reviewed by the group to prevent such difficulties.

Several comments indicated a confusion over what facilities are eligible to take advantage of the group application procedure. Any industry or facility that is required to submit a storm water permit application under these regulations is eligible to participate in a group application. However, whether a facility can obtain a storm water permit under a group application procedure will depend upon whether that facility is a member of the same effluent guideline subcategory, or is sufficiently similar to other members of the group to be appropriate for a general permit or individual permit issued pursuant to the group application. Accordingly, group applications are not limited to national trade associations. The agency believes that the language in § 122.26(c)(2) adequately addresses these concerns. The process does not prohibit a particular company with multiple facilities from filing a group application as long as those facilities are sufficiently similar.

One commenter expressed concern that a single company would not be able to take advantage of the group application benefits unless the company had more than ten facilities. Under such circumstances the company would have to become integrated with a larger group of facilities owned by other companies in order to take advantage of the benefits afforded by the group application procedure. In response, the Agency is providing for a group application of between four and ten members, however at least half the facilities must submit data. One commenter stated that the number of facilities required to submit quantitative data should be determined on a case by case basis. EPA believes that 10 percent for groups with over ten members will be easiest to implement for both industry and EPA, and will ensure that adequate representative quantitative data are obtained so that meaningful determinations of facility similarity can be made and appropriate permit conditions in general or model permits can be developed.

Another commenter suggested that one facility with a multitude of storm water discharge points should be able to use the group permit application to reduce the amount of quantitative data

that it is required to submit. This is an accurate observation but only to the extent that the facility combines with several other facilities to form a group, in which case only 10% of the facilities need submit quantitative data. The group application procedure in today's rule is designed for use by multiple facilities only. However, if an individual facility has 10 outfalls with ten substantially identical effluents the discharger may petition the Director to sample only one of the outfalls, with that data applying to the remaining outfalls. See § 122.21(g)(7). Thus, existing authority already allows for a "group-like" process for sampling a subset of storm water outfalls at a single facility.

Concern was expressed that the spill reporting requirement from each facility in part 1B would preclude any group from demonstrating that the facilities sampled are "representative," because the incidence of past spills is very site-specific. EPA notes that since it has dropped the part 1B requirements for other reasons discussed below, this comment is now moot.

Numerous commenters noted that if a facility is part of a group application and is subsequently rejected as a group applicant, such an entity would not have a full year to submit an individual permit application. EPA agrees that this is a significant concern. Accordingly, those facilities that apply as a member of a group application will be afforded a full year from the time they are notified of their rejection as a member of the group to file an individual application. EPA notes that it intends to act on group application requests within 60 days of receipt; thus this approach will only provide facilities that are rejected from a group application a short extension of the deadline for other individual applications.

One commenter complained that the cost of defending a group's choice of representative facilities may exceed the cost of submitting an individual permit application, thereby reducing the incentive to apply as group. The agency anticipates that the selection process will be one open to negotiation between the affected parties and one that will end in a mutually satisfactory group of facilities. It is the intent of EPA to reduce the costs of submitting a permit application as much as possible, while providing adequate information to support permitting activities.

Another commenter argued that the use of model permits will create a disincentive for participating in a group because model permits may be used by the permit issuing authority to issue individual permits for discharges from similar facilities that did not participate in the group application. EPA does not agree. The benefit of applying as a group applicant is to take advantage of reduced representative quantitative data requirements. This incentive will exist regardless of whether or how model permits are used. Further, technology transfer can occur during the development of permits based on individual applications as well as those based on group applications.

One commenter suggested moving some of the facility specific information requirements of part 1 of the group application to part 2 of the group application in order to provide more incentive to apply as a group. EPA has considered this and believes such a change would be inappropriate. Part 1 information will be used to make an informed decision about whether individual facilities are appropriate as group members and appropriate for submitting representative quantitative data. Furthermore, information burdens from providing site specific factors in part 1 is relatively minimal, and the information requirements in the proposed part 1B application have been eliminated.

One commenter suggested that trade associations develop model permits since they have the most knowledge about the characteristics of the industries they represent. As noted above, EPA expects that the industries and trade associations will have input, through the permit application process, as to how permit conditions for storm water discharges are developed. While the applicant can submit proposed permit conditions with any type of application, EPA however cannot delegate the drafting of model permits to the permittees. EPA is developing and publishing guidance in conjunction with this rulemaking for developing permit conditions.

One commenter suggested that new dischargers should be able to take advantage of general permits developed pursuant to group applications. As with other general permits, EPA anticipates that such discharges will be able to fall within the scope of a general permit based on a group application where appropriate.

One commenter stated that the group application does not benefit municipalities since there is no requirement for industrial discharges through municipal sewers to apply for a permit. As noted in a previous discussion, industrial discharges through municipal sewers must be covered by an NPDES permit. Such facilities may avail themselves of the group application procedure. Also, municipalities are not precluded from developing a group application procedure under their management plan for industries that discharge into their municipal system, in order to streamline developing controls for such industries.

One industry wanted clarification that facilities located within a municipality would be eligible to participate in a group application. All industrial activities required to submit an individual permit are entitled to submit as part of group application, except those with existing NPDES permits covering storm water. Those facilities that discharge through a municipal separate storm sewer systems required to submit an individual application (because they do not fall within a general permit) are not precluded from using the group application procedure if appropriate.

Other municipalities expressed confusion over the industrial group application concept. The following responds to these comments. First, municipalities are not eligible for participation in a group application because the group application process is designed for industrial activities. Sampling requirements for municipal permit applications are already limited to a small subset of the outfalls from the system, as discussed below. Furthermore, permits for municipal separate storm sewer systems will be issued on a system-wide or jurisdiction-wide basis, rather than individually for each outfall. Thus, today's regulation already incorporates a "grouplike" permit application process for municipalities. Furthermore, it is highly unlikely that various municipal storm sewer systems would be "substantially similar" enough to justify group treatment in the same way as industrial facilities. In response to another comment, this regulation does not directly give the municipality enforcement power over members of an industrial group who may be discharging through its system. Only the permitting authority and private citizens and organizations (including the municipality acting in such a capacity) will have enforcement power over members of the group once permits are issued to those members.

One commenter believed that the States with authorized NPDES programs rather than EPA should establish permit terms for permits based on group applications. In response to this comment, EPA wishes to clarify its role in the group application process. Group applications will be submitted to EPA headquarters where they will be reviewed and summarized. The

summaries of the group application will be distributed to authorized NPDES States. EPA wishes to emphasize that NPDES States are not bound by draft model permits developed by EPA. States may adopt model permits for use in their particular area, making adjustments for local water quality standards and other regional characteristics. Where general permit coverage is believed to be inappropriate, facilities may be required to apply for individual permits. One commenter objected to the group application procedure because it is not consistent with existing Federal permitting procedures, which will lead to confusion in the regulated community. The agency disagrees with this assessment. The group application is a departure from established NPDES program procedures. However, the comments, when viewed in their entirety, reflect widespread support from the regulated community for a group application procedure. Further, the comments reflect that those affected by this rulemaking understand the components of the group application and the procedures under which permits will be obtained pursuant to the group application.

One commenter expressed concern regarding how BAT limits for groups of similar industries will be developed. Technology based limits will be developed based on the information received from the group applicants. If the group applicants possess similar characteristics in terms of their discharge, BAT/BCT limitations and controls will be developed accordingly for those members of the group. If the discharge characteristics are not similar then applying industries are not appropriate for the group.

One commenter has suggested that the proposed group application is too complex with regard to the part 1A, part 1B, and part 2 group application requirements and that EPA should repropose these provisions. As discussed below, EPA has simplified the industrial group application requirements by eliminating the part 1B application. Thus, reproposal is unnecessary.

One commenter criticized the group application concept as not achieving any type of reduction in administrative burden for NPDES States. EPA disagrees with this assessment. If industries take advantage of the group application procedure, EPA will have an opportunity to review information describing a large number of dischargers in an organized manner. EPA will perform much of the initial review and analysis of the group application, and provide NPDES States with summaries of the applications thereby reducing the burden on the States. Furthermore, the procedure encourages a potentially large number of facilities to be covered by a general permit, which will clearly reduce the administrative burden of issuing individual permits.

The final rule establishes a regulatory procedure whereby a representative entity, such as a trade association, may submit a group application to the Office of Water Enforcement and Permits (OWEP) at EPA headquarters, in which quantitative data from certain representative members of a group of industrial facilities is supplied. Information received in the group application will be used by EPA headquarters to develop models for individual permits or general permits. These model permits are not issued permits, but rather they will be used by EPA Regions and the NPDES States to issue individual or general permits for participating facilities in the State. In developing such permits, the Region or NPDES State will, where necessary, adapt the model permits to take into account the hydrological conditions and receiving water quality in their area. One commenter expressed the view that having this procedure managed by EPA headquarters would cause delays and it should be delegated to the States and Regions. EPA disagrees that delay will ensue using this procedure. Furthermore, consistency in development of model and general permits can be achieved if application review is coordinated at EPA headquarters.

a. Facilities Covered. Under this rule the group application is submitted for only the facilities specifically listed in the application and not necessarily for an entire industry. The facilities in the group application selected to do sampling must be representative of the group, not necessarily of the industry.

Facilities that are sufficiently similar to those covered in a general permit (issued pursuant to a group application) that commence discharging after the general permit has been issued, must refer to the provisions of that general permit to determine if they are eligible for coverage. Facilities that have already been issued an individual permit for storm water discharges will not be eligible for participation in a group application. Several commenters believed that this restriction is inequitable since they have experienced the administrative burden of submitting a permit application. EPA disagrees. Industries that have already obtained a permit for storm water discharges have developed a storm water management program, engaged in the collection of quantitative data, and possess familiarity and experience with submitting storm water permit applications. The Agency sees no point to instituting an entirely new permit application process for facilities that have storm water permits issued individually. It makes little sense for these industries to be involved with submitting another permit application before their current permit expires.

As noted above, once a general permit has been issued to a group of dischargers, a new facility may request that they be covered by the general permit. The permitting authority can then examine the request in light of the general permit applicability requirements and determine whether the facility is suitable or not.

b. Scope of Group Applications. Numerous comments were received on how facilities should be evaluated as members of a group application. Several commenters stated that effluent limitation guideline subcategories are not relevant to pollutants found in storm water, but rather to the facility's everyday activities, and therefore similarity should be based on each facility's discharge or the similarity of pollutants expected to be found in a facility's discharge. Other commenters felt that similarity of operations at facilities should be the criteria. Others, believed that an examination of the facility's impact on storm water quality should be the applied criteria. Other commenters suggested that EPA provide more guidance as to how broadly groups can be defined and that a failure to do so would discourage facilities from going to the trouble and expense of entering into the group application process. Some commenters were concerned that facilities would be rejected as a group because of variations in processes and process wastewater characteristics.

EPA does not agree that effluent limitation guideline subcategories are inappropriate as a method for determining group applications. EPA guideline subcategories are functional classifications, breaking down facilities into groups, for purposes of setting effluent limitations guidelines. The use of EPA subcategories will save time for both applicants and permitting authorities in determining whether a particular group is appropriate for a group application. Furthermore, EPA believes that this method of grouping provides adequate guidance for determining what facilities are grouped together. Establishing groups on the extent to which a facility's discharge

affects storm water quality would not provide applicants with sufficient guidance as to the appropriateness of individual industries for group applications and would not provide information needed to draft appropriate model permit conditions for potentially different types of industries, industrial processes, and material management practices.

However, EPA recognizes that the subcategory designations may not always be available or an effective methodology for grouping applicants. Also, there are situations where processes that are subject to different subcategories are combined. EPA agrees that the group application option should be flexible enough to allow groups to be created where subcategories are too rigid or otherwise inappropriate for developing group applications or where facilities are integrated or overlap into other subcategories. For these reasons, this rulemaking does not limit the submission to EPA subcategories alone, but rather allows groups to be formed where facilities are similar enough to be appropriate for general permit coverage.

In determining whether a group is appropriate for general permit coverage, EPA intends that the group applicant use the factors set forth in 40 CFR 122.26(a)(2)(ii), the current regulations governing general permits, as a guide. If facilities all involve the same or similar types of operations, discharge the same types of wastes, have the same effluent limitation and same or similar monitoring requirements, where applicable, they would probably be appropriate for a group application. To that extent, facilities that attempt to form groups where the constituent makeup of its process wastewater is dissimilar may run the risk of not being accepted for purposes of a group application.

Some commenters expressed the view that categories formed using general permit factors are too broad or that the language is too vague. One commenter expressed the view that the standard is too subjective and that permit writers will be evaluating the similarity of discharge too subjectively, while other commenters felt that the criteria should be broad and flexible. Other commenters stated that the effluent guideline subcategory or general permit coverage factors are not related to storm water discharges, because much of the criteria are based upon what is occurring inside the plant, rather than activities outside of the plant. EPA believes that these criteria are reasonable for defining the scope of a group application. EPA disagrees that the procedure, which is adequate for the issuance of general permits, is inadequate for the development of a group application. EPA believes that the activities inside a facility will generally correspond to activities outside of the plant that are exposed to storm events, including stack emissions, material storage, and waste products. Furthermore, if facilities are able to demonstrate their storm water discharge has similar characteristics, that is one element in the analysis needed for establishing that the group is appropriate. EPA disagrees that the criteria are too vague. If facilities are concerned that general permit criteria is insufficient guidance, then subcategories under 40 CFR subchapter N should be used. EPA believes that the program will function best if flexibility for creating groups is maintained.

If a NPDES approved State feels that a tighter grouping of applicants is appropriate individual permit applications can be requested from those permit applicants. One commenter indicated that it was not clear whether the group application procedure could be used for all NPDES requirements. EPA would clarify that the group application is designed only to cover storm water discharges from the industrial facilities identified in § 122.26(b)(14).

As noted above, EPA wishes to clarify that facilities with existing individual NPDES permits for storm water are not eligible to participate in the group application process. From an administrative standpoint EPA is not prepared to create an entirely different mechanism for permitting industries which already have such permits.

c. *Group Application Requirements.* The group application, as proposed, included the following requirements in three separate parts. Part 1A of a group application included: (A) Identification of the participants in the group application by name and location; (B) a narrative description summarizing the industrial activities of participants; (C) a list of significant materials stored outside by participants; and (D) identification of 10 percent of the dischargers participating in the group application for submitting quantitative data. A proposed part 1B of the group application included the following information from each participant in the group application: (A) A site map showing topography (or indicating the outline of drainage areas served by the outfall(s) and related information; (B) an estimate of the area of impervious surfaces (including paved areas and building roofs) and the total area drained by each outfall and a narrative description of significant materials; (C) a certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested for the presence of non-storm water discharges; (D) existing information regarding significant leaks or spills of toxic or hazardous pollutants at the facility; (E) a narrative description of industrial activities at the facility that are different from or that are in addition to the activities described under part 1A; and (F) a list of all constituents that are addressed in a NPDES permit issued to the facility for any of non-storm water discharge. Part 2 of a group application required quantitative data from 10 percent of the facilities identified.

Some commenters felt that spill histories, drainage maps, material management practices, and information on significant materials stored outside are too burdensome or meaningless for evaluating similarity of discharges among group applicants. Several commenters stated that such requirements where the group may consist of several thousand facilities were impractical and would not assist EPA in developing model permits. Many commenters insisted that the requirements imposed in part 1B would effectively discourage use of the group application procedure. EPA agrees in large part with these comments. After reevaluating the components of part 1B, and the entire rationale for instituting the group application procedure, EPA has decided to excise part 1B from the requirements, and rely on part 1A and part 2 for developing appropriate permit condition. Where appropriate, EPA may require facilities to submit the information formerly in part 1B, during the term of the permit. In other cases, EPA will establish which facilities must submit individual permit applications where more site specific permits are appropriate.

Under the revised part 1 and part 2, EPA will receive information pertaining to the types of industrial activity engaged in by the group, materials used by the facilities, and representative quantitative data. EPA can use such information to develop management practices that address pollutants in storm water discharges from such facilities. For most facilities, general good housekeeping or management practices will eliminate pollutants in storm water. Such requirements can be further refined by determining the nature of a group's industrial activity and by obtaining information on material used at the facility and representative quantitative data from a

percentage of the facilities. Thus, EPA is confident that model permits and general permits can be developed from the information to be submitted under part 1 and part 2.

One commenter felt that more guidance on what makes a facility representative for sampling as part of a group is needed. In response, the Agency believes the rule as currently drafted provides adequate notice.

Another commenter asked how much sampling needed to be done and how much monitoring will transpire over the life of the permit for members of a group. This will vary from permit to permit and will be determined in permit proceedings. This rulemaking only covers the quantitative data that is to be submitted in the context of the group permit application.

One commenter indicated that because of the amount of diversity in the operations of a particular industry, obtaining a sample that could be considered representative would be extremely difficult. EPA recognizes that obtaining representative quantitative data through the group application process will prove to be difficult; however, EPA has sought to minimize these perceived problems. Under the group application concept, industries must be sufficiently similar to qualify. Industries which have significantly different operations from the rest of the group that affects the quality of their storm water discharge may be required to obtain an individual permit. Use of the nine precipitation zones will enable the data in the permit application to be more easily analyzed and patterns observed on the basis of hydrology and other regional factors. How EPA will evaluate the representativeness of the sample is discussed below.

Several commenters asked why the precipitation zone of group members is relevant to the application. The need to identify precipitation zones arises because the amount of rainfall is likely to have a significant impact on the quality of the receiving water. According to an EPA study (Methodology for Analysis of Detention Basins for Control of Urban Runoff Quality; Office of Water, Nonpoint Source Branch, Sept. 1986) the United States can be divided into nine general precipitation zones. These zones are characterized by differences in precipitation volume, precipitation intensity, precipitation duration, and precipitation intervals. Industrial facilities that seek general permits via the group application option may show significantly different loading rates as a result of these regional precipitation differences. As an example, precipitation in Seattle, Washington, located in Zone 7, approaches the mean annual storm intensity of .024 inches/hour with a mean annual storm duration of 20 hours for that Zone. In contrast, precipitation in Atlanta, Georgia, located in Zone 3 approaches the mean annual storm intensity of .102 inches/hour and a mean storm duration of 6.2 hours for that Zone. Atlanta, receives on the average four times more precipitation per hour with storms lasting one-third as long. As a result of these differences, if identical facilities within a group application were situated in each of these areas, their storm water discharges would likely exhibit different pollutant characteristics. Accordingly, data should be submitted from facilities in each zone.

One commenter felt that the EPA should abandon or modify its rainfall zone concept, because storm water quality will depend more on what materials are used at the facility than rainfall. EPA disagrees. Because storm water loading rates may differ significantly as a result of regional precipitation differences, it is necessary that for each precipitation zone containing representatives of a group application, the group must provide samples from some of those representatives. In comments to previous rulemakings it was argued that the amount of rainfall will affect the degree of impact a storm water discharge may have on the receiving stream.

One commenter stated that the precipitation zones illustrated in appendix E of the proposed rulemaking do not adequately reflect regional differences in precipitation and that in some cases the zones cut through cities where there are concentrations of industries without differences in their precipitation patterns. The rainfall zone map is a general guide to determining what areas of the country need to be addressed when determining representative rainfall events and quantitative data. When dealing with rainfall on a national scale, it is near impossible to make generalized statements with a great deal of accuracy. In the case of rainfall zones, rainfall patterns may be similar for facilities in close proximity to each other but none the less in different rainfall zones. In response, EPA has created these zones to reflect regional rainfall patterns as accurately as possible. Because of the variable nature of rainfall such circumstances are sure to arise. However, in order to obtain a degree of representativeness EPA is convinced that the use of these rainfall zones as described is appropriate for the submittal of group applications and the quantitative data therein.

The second and third requirements of part 1 of the group application instruct the applicant to describe the industrial activity (processes) and the significant materials used by the group. For the significant materials listed, the applicant is to discuss the materials management practices employed by members of the group. For example, the applicant should identify whether such materials are commonly covered, contained, or enclosed, and whether storm water runoff from materials storage areas is collected in settling ponds prior to discharge or diverted away from such areas to minimize the likelihood of contamination. Also, the approximate percentage of facilities in the group with no practices in place to minimize materials stored outside is to be identified.

EPA considers that the processes and materials used at a particular facility may have a bearing on the quality of the storm water. Thus, if there are different processes and materials used by members of the group, the application must identify those facilities utilizing the different processes and materials, with an explanation as to why these facilities should still be considered similar.

One commenter felt that a facility should be able to describe in its permit application the possibility of individual materials entering receiving waters. EPA supports the applicant adding site specific information which will assist the permit writer making an informed decision about the nature of the facility, the quality of its storm water discharge, and appropriate permit conditions.

The fourth element of part 1 of the group application is a commitment to submit quantitative data from ten percent of the facilities listed. EPA proposed that there must be a minimum of ten and a maximum of one hundred facilities within a group that submit data. Comments reflected some dissatisfaction with this requirement. Some commenters asserted that ten percent was too high a number and would discourage group applications, while one commenter suggested a lesser percentage would be appropriate where the group can certify that facilities are representative. One commenter suggested that EPA have the discretion to allow for a smaller percentage. Several commenters argued that EPA should be satisfied with fewer than ten percent because EPA often relies on data from less than ten percent of the plants in a subcategory when promulgating effluent guidelines and that EPA should rely on data collection goals

with affected groups as was done in the 1985 storm water proposal. Other commenters pointed out that an anomalous situation could arise where the group was small and facilities were scattered throughout the precipitation zones. For example, if a group consisted of 20 members where a minimum of ten facilities had to submit samples, and two or more members were in each precipitation zone; a total of 18 facilities (90% of the group) would have to submit quantitative data. EPA believes that there must be a sufficient number of facilities submitting data for any patterns and trends to be detectable. However, in light of these comments EPA has decided to modify the language in § 122.26(c) to allow 1 discharger in each precipitation zone to submit quantitative data where 10 or fewer of the group members are located in a particular precipitation zone. EPA believes, however, that one hundred facilities would in most cases be sufficient to characterize the nature of the runoff and thus 100 should remain the maximum. If the data are insufficient, EPA has the authority to request more sampling under section 308 of the CWA.

One commenter suggested that the ten facility cutoff was unreasonable, and that instead of cutting off the group at ten, allow a smaller number in the group and allow the facilities to sample ten percent of their outfalls instead. EPA agrees, in part, and will allow groups of between four and ten to submit a group application. However, the ten percent rule would not be effective in such cases. Therefore, at least half the facilities in a group of four to ten will be required to provide quantitative data from at least one outfall, with each precipitation zone represented by at least one facility.

For any group application, in addition to selecting a sufficient number of facilities from each precipitation zone, facilities selected to do the sampling should be representative of the group as a whole in terms of those characteristics identifying the group which were described in the narrative, i.e., number and range of facilities, types of processes used, and any other relevant factors. If there is some variation in the processes used by the group (40 percent of the group of food processors are canners and 60 percent are canners and freezers, for example), the different processes are to be represented. Also, samples are to be provided from facilities utilizing the materials management practices identified, including those facilities which use no materials management practices. The representation of these different factors, to the extent feasible, is to be roughly equivalent to their proportion in the group.

EPA wishes to emphasize that the provision that ten percent of the facilities need to submit quantitative data only applies to the permit application process. The general or individual permit itself may require quantitative data from each facility.

Submittal of Part 2 of the Group Application. As with part 1, part 2 of the Group Application would be submitted to the Office of Water Enforcement and Permits, in Washington, DC. If the information is incomplete, or simply is found to be an inadequate basis for establishing model permit limits, EPA has the authority under section 308 of the Clean Water Act to require that more information be submitted, which may include sampling from facilities that were part of the group application but did not provide data with the initial submission. If the group application is used by a Region or NPDES State to issue a general permit, the general permit should specify procedures for additional coverage under the permit.

If a part 2 is unacceptable or insufficient, EPA has the option to request additional information or to require that the facilities that participated in the group application submit complete individual applications (e.g. facilities that have submitted Form 1 with the group application may be required to submit Form 2F, or facilities which have submitted complete Form 1 and Form 2F information in the group application generally would not have to submit additional information).

Once the group applications are reviewed and accepted, EPA will use the information to establish draft permit terms and conditions for models for individual and general permits. NPDES approved States and EPA regional offices will continue to be the permit-issuing authority for storm water discharges. The NPDES approved States accepting the group application approach and the EPA Regions may then take the model permits and adapt them for their particular area, making adjustments for local water quality standards and other localized characteristics, and making determinations as to the need for an individual storm water permit where general permit coverage is felt to be inappropriate. Permits would be proposed by the Region or NPDES approved State in accordance with current regulations for public comment before becoming final. In NPDES States without general permit authority, or where an individual permit is deemed appropriate, the model permit can serve as the basis for issuing an individual permit.

The group application is an NPDES permit application just like any other and, as such, would be handled through normal permitting procedures, subject to the regulatory provisions applicable to permit issuance. Incomplete or otherwise inadequate submissions would be handled in the same manner as any other inadequate permit application. The permit issuing authority would retain the right to require submission of Form 1, Form 2C and Form 2F from any individual discharger it designates.

Some commenters offered other procedures for developing a group application procedure; however, these were frequently entirely different approaches or so novel that a reproposal would be required. One commenter suggested that those industries that are identified as being likely to pollute should be required to submit quantitative data. Numerous commenters contended that a generic approach for meeting the required information requirements for group applications would allow EPA to develop adequate general permits. EPA does not view these approaches as appropriate.

5. Group Application: Applicability in NPDES States

Many commenters expressed concern about how the group application procedure will work within the framework of an NPDES approved State. The relationship between EPA and the States that are authorized to administer the NPDES program, including implementation of the storm water program, is a complicated aspect of this rulemaking. Approved States (there are 38 States and one territory so approved) must have requirements that are at least as stringent as the Federal program; they may be more stringent if they choose. Authority to issue general permits is optional with NPDES States.

EPA has determined that ten percent of the facilities must provide quantitative data in the permit application as noted above. Furthermore, these applications are submitted to EPA headquarters. Consequently States, whether NPDES approved or not, are not in a position to reject or modify this requirement. Such States may determine the amount of sampling to be done pursuant to permit conditions. If they choose to issue general permits they may include such authority in their NPDES program and,

upon approval of the program by EPA, may then issue general permits. Within the context of the NPDES provisions of the CWA, if States do not have general permitting authority, then general permits are not available in those States.

In response to one comment, EPA does not have authority to issue general or individual permits to facilities in NPDES approved states. Today's rule provides a means for affected industries to be covered by general permits developed via the group application procedure as well as from general permits developed independently of the group application process. Accordingly, today's rule anticipates that most NPDES States will seek general permit issuance authority to implement the storm water program in the most efficient and economical way. Without general permit issuance authority NPDES States will be required to issue individual permits covering storm water discharges to potentially thousands of industrial facilities.

One commenter recommended that States with approved NPDES programs should be involved in determining what industries are representative for submitting quantitative data. EPA recognizes that States will have an interest in this determination and may possess insight as to the appropriateness of using some facilities. However, EPA may be managing hundreds of group applications and approving or disapproving them as expeditiously as possible. EPA believes that involving the States in this already administratively complex and time consuming undertaking would be counterproductive. In any event, NPDES approved States are not bound by the determinations of EPA as to the appropriateness of groups or the issuance of permits based on model permits or individual permits. However, States will be encouraged to use model permits that are developed by EPA. EPA will endeavor to design general and model permits that are effective while also adaptable to the concerns of different States. Again, States are able to develop more stringent standards where they deem it to be appropriate. There are currently seventeen States that have authority to issue general permits: Arkansas, Colorado, Illinois, Kentucky, Minnesota, Missouri, Montana, New Jersey, North Dakota, Oregon, Rhode Island, Utah, Washington, West Virginia and Wisconsin. As suggested in the comments, EPA is encouraging more States to develop general permit issuing authority in order to facilitate the permitting process.

One commenter advised that the rules should state that a NPDES approved State may accept a group application or require additional information. EPA has decided not to explicitly state this in the rule. However, this comment does raise some points that need to be addressed. Because the group application option is a modification of existing NPDES permit application requirements, the State is free to adopt this option, but is not required to. If the State chooses to adopt the group application and it does not have general permit authority, the group application can be used to issue individual permits. If an approved NPDES State chooses to not issue permits based on the group application, facilities that discharge storm water associated with industrial activity that are located in that State must submit individual applications to the State permitting authority. Before submitting a group application, facilities should ascertain from the State permitting authority whether that State intends to issue permits based upon a group application approved by EPA for the purpose of developing general permits. For facilities that discharge storm water associated with industrial activity which are named in a group application, the Director may require an individual facility to submit an individual application where he or she determines that general permit coverage would be inappropriate for the particular facility.

One commenter stressed that EPA should streamline the procedure for States desiring to obtain general permit coverage. EPA has, over the last year, streamlined this procedure and encourages States to take advantage of this procedure. EPA recommends that States consider obtaining general permit authority as a means to efficiently issue permits for storm water discharges. These States should contact the Office of Water Enforcement and Permits at EPA Headquarters as soon as possible.

6. Group Application: Procedural Concerns

One commenter claimed that the proposed group application process and procedures violated federal law. This commenter claimed that EPA was abrogating its responsibility by allowing a trade association to design a data collection plan in lieu of completing an NPDES application form designed by EPA, thus violating the Federal Advisory Committee Act. The commenter stated that EPA would be improperly influenced by special interests if trade associations were able to design their own storm water data gathering plans. The commenter further asserted that any decisions by EPA on the content of specific group applications would be rulemakings and thus subject to the provisions of the Administrative Procedure Act.

EPA disagrees with the comment that the group application violates the Federal Advisory Committee Act (FACA). FACA governs only those groups that are established or "utilized" by an agency for the purpose of obtaining "advice" or "recommendations." The group application option does not solicit or involve any "advice" or "recommendations." It simply allows submission of data by certain members of a group in accordance with specific regulatory criteria for determining which facilities are "representative" of a group. As such, the group application is merely a submission in accordance and in compliance with specific regulatory requirements and does not contain discretionary uncircumscribed "advice" or "recommendations" as to which facilities are representative of a group.

Thus, the determination of which facilities should submit testing data in accordance with regulatory criteria is little different from many other regulatory requirements where an applicant must submit information in accordance with certain criteria. For example, under 40 CFR 122.21 all outfalls must be tested except where two or more have "substantially identical" effluents. Similarly, quantitative data for certain pollutants are to be provided where the applicant knows or "has reason to believe" such pollutants are discharged. Both of these provisions allow the applicant to exercise discretion in making certain judgments but such action is circumscribed by regulatory standards. EPA further has authority to require these facilities to submit individual applications. In none of these instances are "recommendations" or "advice" involved. EPA also notes that it is questionable whether, in providing for group applications, it is "soliciting" advice or recommendations from groups or that such groups are being "utilized" by EPA as a "preferred source" of advice. See 48 FR 19324 (April 28, 1983). Furthermore, this data collection effort may be supplemented by EPA if, after review of the data, EPA determines additional data is necessary for permit issuance. Other information gathering may act as a check on the group applications received.

EPA also does not agree with this commenter's claim that the group application scheme represents an

impermissible delegation of the Administrator's function in violation of the CWA regarding data gathering. The Administrator has the broadest discretion in determining what information is needed for permit development as well as the manner in which such information will be collected. The CWA does not require every discharger required to obtain a permit to file an application. Nor does the CWA require that the Administrator obtain data on which a permit is to be based through a formal application process (see 40 CFR 122.21). For years "applications" have not been required from dischargers covered by general permits. EPA currently obtains much information beyond that provided in applications pursuant to section 308 of the CWA. This is especially true with respect to general permit and effluent limitations guidelines development. The group application option is simply another means of data gathering. The Administrator may always collect more data should he determine it necessary upon review of a groups' data submission. And, he may obtain such additional data by whatever means permissible under the Statute that he deems appropriate. Thus, it can hardly be said that by this initial data gathering effort the Administrator has delegated his data gathering responsibilities. In addition, since groups are required to select "representative" facilities, etc., in accordance with specific regulatory requirements established by the Administrator and because EPA will scrutinize part 1 of the group applications and either accept or reject the group as appropriate for a group application, no impermissible delegation has occurred. EPA will make an independent determination of the acceptability of a group application in view of the information required to be submitted by the group applicant, other information available to EPA (such as information on industrial subcategories obtained in developing effluent limitations guidelines as well as individual storm water applications received as a result of today's rule) and any further information EPA may request to supplement part 1 pursuant to section 308 of the CWA. Moreover, any concerns that a general permit may be based upon biased data can be dealt with in the public permit issuance process.

Finally, EPA also does not agree that the group application option violates the Administrative Procedures Act. Again, the group application scheme is simply a data gathering device. EPA could very well have determined to gather data informally via specific requests pursuant to section 308 of the CWA. In fact, general permit and effluent limitations guideline development proceed along these lines. It would make little sense if the latter informal data gathering process were somehow illegal simply because it is set forth in a rule that allows applicants some relief upon certain showings. In this respect, several of EPA's existing regulations similarly allow an applicant to be relieved from certain data submission requirements upon appropriate demonstrations. For example, testing for certain pollutants and or certain outfalls may be waived under certain circumstances. Most importantly, the operative action of concern that impacts on the public is individual or general permit issuance based upon data obtained. As previously stated, ample opportunity for public participation is provided in the permit issuance proceeding.

7. Permit Applicability and Applications for Oil and Gas and Mining Operations

Oil, gas and mining facilities are among those industrial sites that are likely to discharge storm water runoff that is contaminated by process wastes, toxic pollutants, hazardous substances, or oil and grease. Such contamination can include disturbed soils and process wastes containing heavy metals or suspended or dissolved solids, salts, surfactants, or solvents used or produced in oil and gas operations. Because they have the potential for serious water quality impacts, Congress recognized, throughout the development of the storm water provisions of the Water Quality Act of 1987, the need to control storm water discharges from oil, gas, and mining operations, as well as those associated with other industrial activities.

However, Congress also recognized that there are numerous situations in the mining and oil and gas industries where storm water is channeled around plants and operations through a series of ditches and other structural devices in order to prevent pollution of the storm water by harmful contaminants. From the standpoint of resource drain on both EPA as the permitting agency and potential permit applicants, the conclusion was that operators that use good management practices and make expenditures to prevent contamination must not be burdened with the requirement to obtain a permit. Hence, section 402(l)(2) creates a statutory exemption from storm water permitting requirements for uncontaminated runoff from these facilities.

To implement section 402(l)(2), EPA intends to require permits for contaminated storm water discharges from oil, gas and mining operations. Storm water discharges that are not contaminated by contact with any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations will not be required to obtain a storm water discharge permit.

The regulated discharge associated with industrial activity is the discharge from any conveyance used for collecting and conveying storm water located at an industrial plant or directly related to manufacturing, processing or raw materials storage areas at an industrial plant. Industrial plants include facilities classified as Standard Industrial Classifications (SIC) 10 through 14 (the mining industry), including oil and gas exploration, production, processing, and treatment operations, as well as transmission facilities. See 40 CFR 122.26(b)(14)(iii). This also includes plant areas that are no longer used for such activities, as well as areas that are currently being used for industrial processes.

a. Oil and Gas Operations. In determining whether storm water discharges from oil and gas facilities are "contaminated", the legislative history reflects that the EPA should consider whether oil, grease, or hazardous materials are present in storm water runoff from the sites described above in excess of reportable quantities (RQs) under section 311 of the Clean Water Act or section 102 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). (Vol. 132 Cong. Rec. H10574 (daily ed. October 15, 1986) Conference Report).

Many of the comments received by EPA regarding this exemption focused on the concern that EPA's test for requiring a permit is and would subject an unnecessarily large number of oil and gas facilities to permit application requirements. Specific comments made in support of this concern are addressed below.

A primary issue raised by commenters centered on how to determine when a storm water discharge from an oil or gas facility is "contaminated", and therefore subject to the permitting program under section 402 of the CWA. Many of the comments received from industry representatives objected to the Agency's intent as expressed in the proposal to use past discharges as a trigger for submitting permit applications.

The proposed rule provided that the notification requirements for releases in excess of RQs established under the CWA and CERCLA would serve as a

basis for triggering the submittal of permit applications for storm water discharges from oil and gas facilities. As described in the proposal, oil and gas operations that have been required to notify authorities of the release of either oil or a hazardous substance via a storm water route would be required to submit a permit application. In other words, any facility required to provide notification of the release of an RQ of oil or a hazardous substance in storm water in the past would be required to apply for a storm water permit under the current rule. In addition, any facility required to provide notification regarding a release occurring from the effective date of today's rule forward would be required to apply for a storm water permit.

Commenters maintained that the use of historical discharges to require permit applications is inconsistent with the language and intent of section 402(1)(2) of the CWA, and relevant legislative history, both of which focus on present contamination. Requiring storm water permits based solely on the occurrence of past contaminated discharges, even where no present contamination is evident, would go beyond the statutory requirement that EPA not issue a permit absent a finding present contamination. Commenters also noted that the proposal did not take into account the fact that past problems leading to such releases may have been corrected, and that requiring an NPDES permit may no longer be necessary. The result of such a requirement, commenters maintained, would be an excessive number of unnecessary permit applications being submitted, at significant cost and minimal benefit to both regulated facilities and regulating authorities.

Commenters also indicated that using the release of reportable quantities of oil, grease or hazardous substances as a permit trigger would identify discharges of an isolated nature, rather than the continuous discharges, which should be the focus of the NPDES permit program under section 402. Such an approach, commenters maintained, is inconsistent with existing regulations under section 311 of the CWA, and would result in permit applications from facilities that are more appropriately regulated under section 311.

Despite these criticisms, many commenters recognized that the Agency is left with the task of determining when discharges from oil and gas facilities are contaminated, in order to regulate them under section 402(1)(2). It was suggested by numerous commenters that the EPA adopt an approach similar to that used under section 311 of the CWA for Spill Prevention Control and Countermeasure (SPCC) Plans. Under SPCC, facilities that are likely to discharge oil into waters of the United States are required to maintain a SPCC plan. In the event the facility has a spill of 1,000 gallons or 2 or more reportable quantities of oil in a 12 month period, the facility is required to submit its SPCC plan to the Agency. The triggering events proposed by the commenters for storm water permits for oil and gas operations are six reportable sheens or discharges of hazardous substances (other than oil) in excess of section 311 or section 102 reportable quantities via a storm water point source route over any thirty-six month period. It was suggested that if this threshold is reached, an operator would then file a permit application (or join a group application) based upon the presumption that its current storm water discharges are contaminated.

In response to these comments, the Agency believes that past releases that are reportable quantities can be a valid indicator of the potential for present contamination of discharges. The legislative history as cited above supports this conclusion. EPA would note that the existence of a RQ release would serve only as a triggering mechanism for a permit application. Under the proposed rule, evidence of past contamination would merely require submission of a permit application and would not be used as conclusive evidence of current contamination. The determination as to whether a permit would be actually required due to current contaminated discharge would be made by the permitting authority after reviewing the permit application. The fact of a past RQ release does not necessarily imply a conclusive finding of contamination, only that sufficient potential for contamination exists to warrant a permit application or the collection of other further information. Today's rule does not change the proposed approach in this respect. Thus, EPA does not believe that today's rule exceeds the authority of section 402(1)(2).

EPA believes that there is no legal impediment to using past RQ discharges as a trigger for requiring a storm water permit application. EPA notes that, as mentioned above, even those commenters who objected to the proposed test on legal authority grounds merely offered an alternate test that requires more releases to have occurred within a shorter period of time before a permit application is required.

Therefore, the only disagreement that remains is over what constitutes a reasonable test that will identify facilities with the potential for storm water contamination. EPA notes that neither the statute nor the legislative history provides any guidance on this question. Furthermore, EPA disagrees with the commenters who suggested that 6 releases in the past 3 years or 2 releases in the past year are necessarily more valid measures of the potential for current contamination than EPA's proposed test. There is no statistical or other basis for preferring one test to the other. However, EPA does agree with those commenters that suggest that a single release in the distant past may not accurately reflect current conditions and the current potential for contamination.

EPA has therefore amended today's rule to provide that only oil and gas facilities which have had a release of an RQ of oil or hazardous substances in storm water in the past three years will be required to submit a permit application. EPA believes that limiting the permit trigger to events of the past three years will address commenters' concerns regarding the use of "stale history" in determining whether an application is required. EPA notes that the three year cutoff is consistent with the requirement for industrial facilities to report significant leaks or spills at the facility in their storm water permit applications. See 40 CFR 122.26(c)(1)(ii)(D).

Commenters asserted that EPA and the States must have some reasonable basis for concluding that a storm water discharge is contaminated before requiring permit applications or permits. Commenters believed that § 122.26(c)(1)(iii)(B) as proposed implied that the Agency's authority in this respect is unrestricted. In response, EPA may collect such data by whatever appropriate means the statute allows, in order to obtain information that a permit is required. Usually, the most practical tool for doing so is the permit application itself. However, if necessary to supplement the information made available to the Agency, EPA has broad authority to obtain information necessary to determine whether or not a permit is required, under section 308 of the Clean Water Act. Given the plain language of the CWA and the Congressional intent as manifested in the legislative history, the Agency is convinced that the approach described above is appropriate. Yet, as further discussed below, EPA has also deleted as redundant § 122.26(c)(1)(iii)(B).

Regarding the types of facilities included in the storm water regulation, a number of commenters suggested that the Agency has misconstrued the meaning of facilities "associated with

industrial activity", and has proposed an overly broad definition of such facilities in the oil and gas industry. Specifically, commenters suggested that only the manufacturing sector of the oil and gas industry should be subject to storm water permit application requirements, and that exploration and production activities, gas stations, terminals, and bulk plants should all be exempted from storm water permitting requirements. Commenters maintain that this broad interpretation would subject many oil and gas facilities to the storm water permit requirements, when these were not intended by Congress to be so regulated. As a second point related to this issue, some commenters felt that transmission facilities were not intended to be regulated under the storm water provisions, and should be exempted from permit requirements. This would be consistent, it was argued, with legislative history which concluded that transmission facilities do not significantly contribute to the contamination of water.

The Agency disagrees that these facilities do not fall under the storm water permitting requirements as envisioned by Congress. SIC 13, which is relied upon by EPA to identify these oil and gas operations, describes oil and gas extraction industries as including facilities related to crude oil and natural gas, natural gas liquids, drilling oil and gas wells, oil and gas exploration and field services. Moreover, legislative history as it applies to industrial activities, and thus to oil and gas (mining) operations, expressly includes exploration, production, processing, transmission, and treatment operations within the purview of storm water permitting requirements and exemptions. EPA's intent is for storm water permit requirements (and the exemption at hand) to apply to the activities listed above (exploration, production, processing, treatment, and transmission) as they relate to the categories listed in SIC 13.

Commenters requested clarification from the Agency that storm water discharges from oil and gas facilities require a permit or the filing of a permit application only when they are contaminated at the point of discharge into waters of the United States. Commenters noted that large amounts of potentially contaminated stormwater may not enter waters of the United States, or may enter at a point once the discharge is no longer "contaminated". In these cases, it should be clear that no permit or permit application is required.

EPA agrees that oil and gas exploration, production, processing, or treatment operations or transmission facilities must only obtain a storm water permit when a discharge to waters of the U.S. (including those discharges through municipal separate storm sewers) is contaminated. A permit application will be required when any discharge in the past three years or henceforth meets the test discussed above.

Under the proposed rule, the Agency stated at § 122.26(c)(1)(iii)(B) that the Director may require on a case-by-case basis the operator of an existing or new storm water discharge from an oil or gas exploration, production, processing, or treatment operation, or transmission facility to submit an individual permit application. The Agency has removed this section since CWA section 402(l)(2), as codified in 122.26(c)(1)(iii)(A), adequately addresses every situation where a permit should be required for these facilities.

b. Use of Reportable Quantities to Determine if a Storm Water Discharge from an Oil or Gas Operation is Contaminated. Section 311(b)(5) of the CWA requires reporting of certain discharges of oil or a hazardous substance into waters of the United States (see 44 FR 50766 (August 29, 1979)). Section 304(b)(4) of the Act requires that notification levels for oil and hazardous substances be set at quantities which may be harmful to the public health or welfare of the United States, including but not limited to fish, shellfish, wildlife, and public or private property, shorelines and beaches. Facilities which discharge oil or a hazardous substance in quantities equal to or in excess of an RQ, with certain exceptions, are required to notify the National Response Center (NRC).

Section 102 of CERCLA extended the reporting requirement for releases equal to or exceeding an RQ of a hazardous substance by adding chemicals to the list of hazardous substances, and by extending the reporting requirement (with certain exceptions) to any releases to the environment, not just those to waters of the United States.

Pursuant to section 311 of the CWA, EPA determined reportable quantities for discharges by correlating aquatic animal toxicity ranges with 5 reporting quantities, i.e., 1-, 10-, 100-, 1000-, and 5000- pounds per 24 hour period levels. Reportable quantity adjustments made under CERCLA rely on a different methodology. The strategy for adjusting reportable quantities begins with an evaluation of the intrinsic physical, chemical, and toxicological properties of each designated hazardous substance. The intrinsic properties examined, called "primary criteria," are aquatic toxicity, mammalian toxicity (oral, dermal, and inhalation), ignitability, reactivity, and chronic toxicity. In addition, substances that were identified as potential carcinogens have been evaluated for their relative activity as potential carcinogens. Each intrinsic property is ranked on a five-tier scale, associating a specific range of values on each scale with a particular reportable quantity value. After the primary criteria reportable quantities are assigned, the hazardous substances are further evaluated for their susceptibility to certain extrinsic degradation processes (secondary criteria). Secondary criteria consider whether a substance degrades relatively rapidly to a less harmful compound, and can be used to raise the primary criteria reportable quantity one level.

Also pursuant to section 311, EPA has developed a reportable quantity for oil and associated reporting requirements at 40 CFR part 110. These requirements, known as the oil sheen regulation, define the RQ for oil to be the amount of oil that violates applicable water quality standards or causes a film or sheen upon or discoloration of the surface of the water or adjoining shorelines or causes a sludge or emulsion to be deposited.

Reportable quantities developed under the CWA and CERCLA were not developed as effluent guideline limitations which establish allowable limits for pollutant discharges to surface waters. Rather, a major purpose of the notification requirements is to alert government officials to releases of hazardous substances that may require rapid response to protect public health, welfare, and the environment. Notification based on reportable quantities serves as a trigger for informing the government of a release so that the need for response can be evaluated and any necessary response undertaken in a timely fashion. The reportable quantities do not themselves represent any determination that releases of a particular quantity are actually harmful to public health, welfare, or the environment.

EPA requested comment on the use of RQs for determining contamination in discharges from oil and gas facilities. As noted above numerous commenters supported the concept of using reportable quantities under certain circumstances. Comments on the measurement of oil sheens for the purpose of triggering a permit application were divided. Some commented that it is much too stringent because the amount of oil creating a

sheen may be a relatively small amount. Others viewed the test as a quick, easy, practical method that has been effective in the past.

In relying on the reporting requirements associated with releases in excess of RQs for oil or hazardous substances to trigger the submittal of permit applications for oil and gas operations, the Agency believes that the use of the reporting requirements for oil will be particularly useful. The Agency believes that the release of oil to a storm water discharge in amounts that cause an oil sheen is a good indicator of the potential for water quality impacts from storm water releases from oil and gas operations. In addition, given the extremely high number of such operations (the Agency estimates that there are over 750,000 oil wells alone in the United States), relying on the oil sheen test to determine if storm water discharges from such sites are "contaminated" will be a far easier test for operators to determine whether to file a storm water permit application than a test based on sampling. The detection of a sheen does not require sophisticated instrumentation since a sheen is easily perceived by visual observation. EPA agrees with those comments calling the oil sheen test an appropriate measure for triggering a storm water permit application. In adopting this approach, EPA recognizes, as pointed out by many commenters that an oil sheen can be created with a relatively small amount of oil.

One commenter suggested that contamination must be caused by contact with on-site material before being subject to permit application requirements. The Agency agrees with this comment. Those facilities that have had releases in excess of reportable quantities will generally have contamination from contact with on-site material as described in the CWA. Thus, use of the RQ test is an appropriate trigger. As discussed above, determination of whether contamination is present to warrant issuance of a permit will be made in the context of the permit proceeding.

One commenter believed that the use of RQs is inappropriate because "the statute intended to exempt only oil and gas runoff that is not contaminated at all." The Agency wishes to clarify that reportable quantities are being used to determine what facilities need to file permit applications and to describe what is meant by the term "contaminated." The Director may require a permit for any discharges of storm water runoff contaminated by contact with any overburden, raw material, intermediate product, finished product, by product or waste product at the site of such operations. The use of RQs is solely a mechanism for identifying the facilities most likely to need a storm water permit consistent with the legislative history of section 402(l)(2).

c. Mining Operations. The December 7, 1988 proposal would establish background levels as the standard used to define when a storm water discharge from a mining operation is contaminated. When a storm water discharge from a mining site was found to contain pollutants at levels that exceed background levels, the owner or operator of the site was required to submit a permit application for that operation. The proposal was founded upon language in the legislative history stating that the determination of whether storm water is contaminated by contact with overburden, raw material, intermediate product, finished product, byproduct, or waste products "shall take into consideration whether these materials are present in such stormwater runoff . . . above natural background levels". [Vol. 132 Cong. Rec. H10574 (daily ed. Oct. 15, 1986) Conference Report].

Comments received on this component of the rule suggested that background levels of pollutants would be very difficult to calculate due to the complex topography frequently encountered in alpine mining regions. For example, if a mine is located in a mountain valley surrounded on all sides by hills, the site will have innumerable slopes feeding flow towards it. Under such circumstances, determining how the background level is set would prove impractical. Commenters indicated that it is very difficult to measure or determine background levels at sites where mining has occurred for prolonged periods. In many instances, data on original background levels may not be available due to long-term site activity. As a result, any background level established will vary based on the type and level of previous activity. In addition, mining sites typically have background levels that are naturally distinct from the surrounding areas. This is due to the geologic characteristics that makes them valuable as mining sites to begin with. This also makes it difficult to establish accurate background levels.

Because of these concerns EPA has decided to drop the use of background levels as a measure for determining whether a permit application is required. Accordingly, a permit application will be required when discharges of storm water runoff from mining operations come into contact with any overburden, raw material, intermediate product, finished product, byproduct, or waste product located on the site. Similar to the RQ test for oil and gas operations, EPA intends to use the "contact" test solely as a permit application trigger. The determination of whether a mining operation's runoff is contaminated will be made in the context of the permit issuance proceedings.

If the owner or operator determines that no storm water runoff comes into contact with overburden, raw material, intermediate product, finished product, byproduct, or waste products, then there is no obligation to file a permit application. This framework is consistent with the statutory provisions of section 402(1)(2) and is intended to encourage each mining site to adopt the best possible management controls to prevent such contact.

Several commenters stated that EPA's use of total pollutant loadings for determining permit applicability is not consistent with the general framework of the NPDES program. Their concern is that such evaluation criteria depart from how the NPDES program has been administered in the past, based on concentration limits. In addition, commenters requested that EPA clarify that information on mass loading will be used for determining the need for a permit only. Since the analysis of natural background levels as a basis for a permit application has been dropped from this rulemaking, these issues are moot.

Commenters noted that the proposed rule did not specify what impact this rulemaking has on the storm water exemptions in 40 CFR 440.131. The commenters recommended not changing any of these provisions. Some commenters indicated that mining facilities that have NPDES permits should not be subject to additional permitting under the storm water rule. EPA does not intend that today's rule have any effect on the conditional exemptions in 40 CFR 440.131. Where a facility has an overflow or excess discharge of process-related effluent due to stormwater runoff, the conditional exemptions in 40 CFR 440.131 remain available.

Several commenters note that the term overburden, as used in the context of the proposed storm water rule, is not defined and recommended that this term should be defined to delineate the scope of the regulation. EPA agrees that the term overburden should be defined to help properly define the scope the storm water rule. In today's rule, the term

overburden has been clarified to mean any material of any nature overlying a mineral deposit that is removed to gain access to that deposit, excluding topsoil or similar naturally-occurring surface materials that are not disturbed by mining operations. This definition is patterned after the overburden definition in SMCRA, and is designed to exclude undisturbed lands from permit coverage as industrial activity. However, the definition provided in this regulation may be revised at a later date, to achieve consistency with the promulgation of RCRA Subtitle D mining waste regulations in the future.

Numerous commenters raised issues pertaining to the inclusion of inactive mining areas as subject to the stormwater rule. Some commenters indicated that including inactive mine operations in the rule would create an unreasonable hardship on the industry. EPA has included inactive mining areas in today's rule because some mining sites represent a significant source of contaminated stormwater runoff. EPA has clarified that inactive mining sites are those that are no longer being actively mined, but which have an identifiable owner/operator. The rule also clarifies that active and inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined materials, nor sites where minimal activities required for the sole purpose of maintaining the mining claim are undertaken. The Agency would clarify that claims on land where there has been past extraction, beneficiation, or processing of mining materials, but there is currently no active mining are considered inactive sites. However, in such cases the exclusion discussed above for uncontaminated discharges will still apply.

EPA's definition of active and inactive mining operations also excludes those areas which have been reclaimed under SMCRA or, for non-coal mining operations, under similar applicable State or Federal laws. EPA believes that, as a general matter, areas which have undergone reclamation pursuant to such laws have concluded all industrial activity in such a way as to minimize contact with overburden, mine products, etc. EPA and NPDES States, of course, retain the authority to designate particular reclaimed areas for permit coverage under section 402(p)(2)(E).

The proposed rule had included an exemption for areas which have been reclaimed under SMCRA, although the language of the proposed rule inadvertently identified the wrong universe of coal mining areas. The final rule language has been revised to clarify that areas which have been reclaimed under SMCRA (and thus are no longer subject to 40 CFR part 434 subpart J) are not subject to today's rule. Today's rule thus is consistent with the coal mining effluent guideline in its treatment of areas reclaimed under SMCRA.

In response to comments, EPA has also expanded this concept to exclude from coverage as industrial activity non-coal mines which are released from similar State or Federal reclamation requirements on or after the effective date of this rule. EPA believes it is appropriate, however, to require permit coverage for contaminated runoff from inactive non-coal mines which may have been subject to reclamation regulations, but which have been released from those requirements prior to today's rule. EPA does not have sufficient evidence to suggest that each State's previous reclamation rules and/or Federal requirements, if applicable, were necessarily effective in controlling future storm water contamination.

6. Application Requirements for Construction Activities

As discussed above, EPA has included storm water discharges from activities involving construction operations that result in the disturbance of five acres total land in the regulatory definition of storm water discharges associated with industrial activity.

This is a departure from the proposed rule which required permit applications for discharges from activities involving construction operations that result in the disturbance of less than one acre total land area and (which are not part of a larger common plan of development or sale; or operations that are for single family residential projects, including duplexes, triplexes, or quadruplexes, that result in the disturbance of less than five acre total land areas and which are not part of a larger common plan of development or sale). The reasons for this change are noted below.

Many commenters representing municipalities, States, and industry requested that clearing, grading, and excavation activities not be included in the definition of storm water discharges associated with industrial activity. It was suggested that EPA delay including construction activities until after the studies mandated in section 402(p)(5) of the CWA are completed. Other commenters felt that NPDES permits are not appropriate for construction discharges due to their short term, intermediate and seasonal nature. Another commenter felt that only the construction activities on the sites of the industrial facilities identified in the other subsections of the definition of "associated with industrial activity" should be included.

EPA believes that storm water permits are appropriate for the construction industry for several reasons. Construction activity at a high level of intensity is comparable to other activity that is traditionally viewed as industrial, such as natural resource extraction. Construction that disturbs large tracts of land will involve the use of heavy equipment such as bulldozers, cranes, and dump trucks. Construction activity frequently employs dynamite and/or other equipment to eliminate trees, bedrock, rockwork, and to fill or level land. Such activities also engage in the installation of haul roads, drainage systems, and holding ponds that are typical of the industrial activity identified in § 122.26(b)(14)(i-x). EPA cannot reasonably place such activity in the same category as light commercial or retail business.

Further, the runoff generated while construction activities are occurring has potential for serious water quality impacts and reflects an activity that is industrial in nature. Where construction activities are intensive, the localized impacts of water quality may be severe because of high unit loads of pollutants, primarily sediments. Construction sites can also generate other pollutants such as phosphorus, nitrogen and nutrients from fertilizer, pesticides, petroleum products, construction chemicals and solid wastes. These materials can be toxic to aquatic organisms and degrade water for drinking and water-contact recreation. Sediment runoff rates from construction sites are typically 10 to 20 times that of agricultural lands, with runoff rates as high as 100 times that of agricultural lands, and 1,000 to 2,000 times that of forest lands. Even small construction sites may have a significant negative impact on water quality in localized areas. Over a short period of time, construction sites can contribute more sediment to streams than was previously deposited over several decades.

EPA is convinced that because of the impacts of construction discharges that are directly to waters of the United States, such discharges should be addressed by permits issued by Federal or NPDES State permitting authorities. It is evident from numerous studies and reports submitted under section 319 of the CWA that discharges from construction sites continue to be a major source of water quality problems and water quality standard violations.

Accordingly EPA is compelled to address these source under these regulations and thereby regulate these sources under a nationally consistent program with an appropriate level of enforcement and oversight.

Techniques to prevent or control pollutants in storm water discharges from construction are well developed and understood. A primary control technique is good site planning. A combination of nonstructural and structural best management practices are typically used on construction sites. Relatively inexpensive nonstructural vegetative controls, such as seeding and mulching, are effective control techniques. In some cases, more expensive structural controls may be necessary, such as detention basins or diversions. The most efficient controls result when a comprehensive storm water management system is in place. Another reason that EPA has decided to address this class of discharges is that it is part of the Agency's recent emphasis on pollution prevention. Studies such as NURP indicate that it is much more cost effective to develop measures to prevent or reduce pollutants in storm water during new development than it is to correct there problems later on. Many of these prevention and control practices, which can take the form of grading patterns as well as other controls, generally remain in place after the construction activities are completed.

a. Permit Application Requirements. In today's rulemaking, EPA has set forth distinct permit application requirements for these construction activities, at § 122.26(c)(1)(ii), to be used where general permits to be developed and promulgated by EPA are inapplicable. Such facilities will be required to provide a map indicating the site's location and the name of the receiving water and a narrative description of:

- The nature of the construction activity;
- The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;
- Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a description of applicable Federal requirements and State or local erosion and sediment control requirements;
- Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a description of applicable State or local requirements, and
- An estimate of the runoff coefficient (fraction of total rainfall that will appear as runoff) of the site and the increase in impervious area after the construction addressed in the permit application is completed, a description of the nature of fill material and existing data describing the soil or the quality of the discharge.

Permit application requirements for construction activities do not include the submission of quantitative data. EPA believes that the changing nature of construction activities at a site to be covered by the permit application requirements generally would not be adequately described by quantitative data. The comments received by EPA support this determination. One State commented that a program they instituted has been based on quantitative data for the past 10 years and has proven to be very awkward, even unworkable.

Twenty commenters responded to the issue of appropriate construction site application deadlines including: Three towns (<100,000 population); one medium municipality; one large municipality; one agency associated with a large municipality; three agencies associated counties; three agencies associated with States; two industries; five industrial associations; and one private organization representing industry. The commenters primarily focused on actual deadlines and permitting authority response time.

Applicants for permits to discharge storm water into the waters of the United States from a construction site would normally be required to submit permits in the same time frame as new sources and new discharges. This rulemaking requires permit applications from such sources to be submitted at least 180 days prior to the date on which the discharge is to commence. Four commenters agreed with the application deadline of 180 days prior to commencement of discharge. Three commenters felt it would be difficult to apply 180 days prior to when the discharge was to begin. Three commenters recommended shortening the time period to 90 days. Numerous other commenters were concerned over delays during the permitting authority's review of the permit application. The commenters requested that a maximum response time be set in the regulation. Suggested maximum response times were 90 and 30 days.

In response to these comments, EPA has changed the application deadline for construction permits from at least 180 days prior to discharge to at least 90 days prior to the date when construction is to commence. This change reflects EPA's recognition of the nature of construction operations in that developers/builders may not be aware of projects 180 days before they are scheduled to begin.

Numerous commenters expressed concern over who should be responsible for applying for the permit. Two commenters felt the owner should be responsible so that construction bid documents can include the storm water management requirements and to avoid confusion among multiple subcontractors. One commenter thought that either the owner/developer, or general contractor should be responsible. Another commenter suggested that the designer should obtain the permit which would allow all necessary erosion controls to be part of the project plan. Several commenters requested that the responsibility simply be more clearly defined.

In response to these comments, EPA would clarify that the operator will generally be responsible for submitting the permit application. Under existing regulations at § 122.21(b), when a facility is owned by one person but operated by another, then it is the duty of the operator to apply for the permit. Due to the temporary nature of construction activities, EPA believes that the operator is the most appropriate person to be responsible for both short and long term best management practices included on the site. EPA considers the term "operator" to include a general contractor, who would generally be familiar enough with the site to prepare the application or to ensure that the site would be in compliance with the permit requirements. General contractors, in many cases, will often be on site coordinating the operation among his/her staff and any subcontractors. Furthermore, the operator/general contractor would be much more familiar with construction site operations than the owner and should be involved in the site planning from its initial stages. The application requirements in today's rule are designed to provide flexibility in developing controls to reduce pollutants in storm water discharges from construction sites. A significant aspect to this is the role of State and local authorities in control of construction storm water discharges. Sixty-three commenters addressed the question of what the role of State and local authorities should be. Most of these commenters supported local government control of construction discharges and that qualified State programs should satisfy Federal requirements.

Many commenters representing municipalities, States, and industry, felt that local government should have full control over construction storm water

discharges, either under existing programs or those required by their municipal permit. EPA agrees with these comments as far as discharges through municipal storm sewers are concerned. EPA is requiring municipalities that are required to submit municipal permit applications under this regulation to describe their program for controlling storm water discharges from construction activities into their separate storm sewers. It is envisioned that municipalities will have primary responsibility over these discharges through NPDES municipal storm water permits. However, EPA also plans to cover such discharges under general permits to be promulgated in the near future.

In response to several comments that the regulation should provide flexibility for qualified State programs to satisfy Federal requirements, the application requirements recognize that many States have implemented erosion and sediment control programs. The permit application requires a brief description of these programs. This is intended to ensure consistency between NPDES permit requirements and other State controls. Permit applicants will be in the best position to pass on this site-specific information to the permitting authority. States or Federal NPDES authorities will have the ability to exercise authority over these discharges as will other State and local authorities responsible for construction. EPA envisions NPDES permitting efforts will be coordinated with any existing programs.

The proposed rule requested comments on appropriate measures to reduce pollutants in construction site runoff. Numerous commenters representing municipalities, States, and industry responded. Some commenters recommended specific best management practices (BMPs) whereas others suggested ways in which the measures should be incorporated into the program. One commenter suggested that EPA establish design and performance standards for appropriate BMPs. One State commenter recommended requiring a schedule or sequence for use of BMPs. A municipality suggested developing guidance on erosion control at construction sites and disseminating the guidance to educate contractors and construction workers in proper erosion control techniques. The Agency is continuing to review these recommendations for the purposes of permit development and issuance.

Another commenter suggested that further research be done to determine the effectiveness of particular BMPs in reducing pollutants in construction site runoff. EPA agrees that more research and studies can be undertaken to develop methodologies for more effective storm water controls and will continue to look at these concerns pursuant to section 402(p)(5) studies. However, EPA is convinced that enough information, technology, and proven BMP's are available to address these discharges in this regulation.

Specific BMPs suggested by the commenters include: wheel washing; locked exit roadways, street cleaning methods which exclude sheet washing; clearing and grading codes; construction standards; riparian corridors; solids retention basins; soil erosion barriers; selected excavation; adequate collection systems; vegetate disturbed areas; proper application of fertilizers; proper equipment storage; use of straw bales and filter fabrics; and use of diversions to reduce effective length of slopes. EPA is continuing to evaluate these suggestions for developing appropriate permit conditions for construction activity.

b. Administrative Burdens. Many commenters representing municipalities, States, and industry commented on the administrative burdens of individually permitting each construction site discharging to waters of the United States. The extensive use of general permits for storm water discharges from construction activities that are subject to NPDES requirements is anticipated to minimize administrative delays associated with permit issuance. Many commenters strongly endorsed extensive use of general permits. In addition the Agency will provide as much assistance as possible for developing appropriate permit conditions.

Many commenters responded to the use of acreage limits in determining which construction sites are required to submit a permit application, including several cities, counties and States. Some commenters generally supported the use of an acre limit. Many commenters suggested increasing the acreage limit. Several suggested using a five acre limit for both residential and nonresidential development. Others suggested greater acreage as the cutoff. Two commenters concurred with the proposed limit of one acre/five acres and one commenter suggested lowering the residential limit to one acre.

Other factors were suggested as a means to create a cutoff for requiring permit applications. Several commenters suggested exempting construction that would be completed with a certain time frame, such as construction of less than 12 months. EPA believes that this is inappropriate because some construction can be intensive and expansive, but nonetheless take place over a short period of time, such as a parking lot. One commenter suggested basing the limit on the quantity of soil moved, i.e., cubic yards. In response, this approach would not be particularly helpful since removal of soil will not necessarily relate to the amount of land surface disturbed and exposed to the elements. Another commenter suggested that where there is single family detached housing construction that should trigger applications as well as the proposed acreage limit. This would not be appropriate since EPA is attempting to focus only on those construction activities that resemble industrial activity. After considering these and similar comments EPA has limited the definition of "storm water discharge associated with industrial activity" by exempting from the definition those construction operations that result in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale. In considering the appropriate scope of the definition of storm water discharge associated with industrial activity as it relates to construction activities, EPA recognized that a wide variety of factors can affect the water quality impacts associated with construction site runoff, including the quality of receiving waters, the size of the area disturbed, soil conditions, seasonal rainfall patterns, the slope of area disturbed, and the intensity of construction activities. These factors will be considered by the permit writer when issuing the permit. However, as noted above, EPA views such site-specific factors to be too difficult to define in a regulatory framework that is national in scope. For example, attempting to adjust permit application triggers based upon a myriad of regional rainfall patterns is not a practical solution. However, permit conditions adjusted for specific geographical areas may be appropriate.

Under the December 7, 1988, proposal the definition of industrial activity exempted: construction operations that resulted in the disturbance of less than one acre total land area which was not part of a larger common plan of development or sale; or operations for single family residential projects, including duplexes, triplexes, or quadruplexes, that result in the disturbance of less than five acre total land areas which were not part of a larger common plan of development or sale. EPA distinguished between single family residential development and

other commercial development because other commercial development is more likely to occur in more densely developed areas. Also, it was reasoned that other commercial development provides a more complete opportunity to develop controls that remain in place after the construction activity is completed, since continued maintenance after the permit has expired, is more feasible.

However, EPA has decided to depart from the proposal and use an unqualified five acre area in today's final rule. This limit has been selected, in part, because of administrative concerns. EPA recognizes that State and local sediment and erosion controls may address construction activities disturbing less five acres for residential development; the five acre limit in today's rule is not intended to supersede more stringent State or local sediment and erosion controls. In light of the comments, EPA is convinced that the acreage limit is appropriate for identifying sites that are amount to industrial activity. Several comments suggested higher acreage limits without giving a supporting rationale except administrative concerns. Several commenters agreed that the five acre limit is suitable, but again without specifying why they agreed. EPA is convinced, however, that the acreage limits as finalized in today's rule reflect an earth disturbance and/or removal effort that is industrial in magnitude. Disturbances on large tracts of land will employ more heavy machinery and industrial equipment for removing vegetation and bedrock.

For construction facilities that are not included in the definition of storm water discharge associated with industrial activity, EPA will consider the appropriate procedures and methods to reduce pollutants in construction site runoff under the studies authorized by section 402(p)(5) of the CWA. EPA will also consider under section 402(p)(5) appropriate procedures and methods during post-construction for maintaining structural controls developed pursuant to NPDES permits issued for storm water discharges associated with industrial activity from construction sites.

Numerous commenters requested clarification as to whether permits for storm water discharges from construction activities at an industrial facility are required. EPA is requiring permits for all storm water discharges from construction activities where the land disturbed meets the requirements established in § 122.26(b)(14)(x) and which discharge into waters of the United States. The location of the construction activity or the ultimate land use at the site does not factor into the analysis.

C. Municipal Separate Storm Sewer Systems

1. Municipal Separate Storm Sewers

Today's rule defines "municipal separate storm sewer" at § 122.26(b)(8) to include any conveyance or system of conveyances that is owned or operated by a State or local government entity and is designed for collecting and conveying storm water which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2. It is important to note that today's permit application requirements for discharges from municipal separate storm sewer systems serving a population of 100,000 or more do not apply to discharges from combined sewers (systems designed as both a sanitary sewer and a storm sewer). For purposes of calculating whether a municipal separate storm sewer system meets the large or medium population criteria, a municipality may petition to have the population served by a combined sewer deducted from the total population. Section 122.26(f) of today's rule describes this procedure.

EPA requested comments on whether different language for the definition of municipal separate storm sewer would clarify responsibility under the NPDES permit system. Comments were also requested on whether the definition needed to be clarified by explicitly stating that municipal streets and roads with drainage systems (curb and gutter, ditches, etc.) are part of the municipal storm sewer system, and that the owners or operators of such roads are responsible for such discharges. Numerous comments were received by EPA on this issue. Some commenters questioned whether road culverts and road ditches were municipal separate storm sewers, while others specifically recommended that further clarifying language should be added so that owners and operators of roads and streets understand that they are covered by this regulation. In light of these comments, EPA has clarified that municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains that discharge into the waters of the United States are municipal separate storm sewers. One commenter asked if "other wastes" in the proposed definition of municipal separate storm sewer (40 CFR 122.26 (b)(8)(i)) included storm water. In response, EPA has added "storm water" to this definition in order to clarify that the rule addresses such systems.

EPA requested comments on whether legal classifications such as "storm sewers that are not private (e.g. public, district or joint district sewers)" would provide a clearer definition of municipal separate storm sewer than an owner or operator criterion, especially for the purpose of determining responsibility under the NPDES program. Most commenters agreed that the owner/operator concept, and the additional language noted above, is sufficient for this purpose. EPA also requested comments on to what extent the owner/operator concept should apply to municipal governments with land-use authority over lands which contribute storm water runoff to the municipal storm sewer system, and how the responsibility should be clarified. In response to comments on this point, EPA has addressed these concerns in the context of clarifying what municipal entities are responsible for applying for a permit covering storm water discharges from municipal systems in section VI.H. below.

One commenter expressed a desire for clarification as to whether conveyances that were once used for the conveyance of storm water, but are no longer used in that manner, are covered by the definition. EPA emphasizes that this rulemaking only addresses conveyances that are part of a separate storm sewer system that discharges storm water into waters of the United States.

One commenter stated that if EPA intends to regulate roadside collection systems then EPA must repropose since these were not considered by the public. EPA disagrees with this comment since one of the options specifically addressed the inclusion of roadside drainage systems and roads in the definition of municipal separate storm sewer system. In addition, the public recognized the issue in comments on the proposal. EPA would note that several commenters specifically endorsed EPA's inclusion of these conveyances.

2. Effective Prohibition on Non-Storm Water Discharges

Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers. Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather,

an "effective prohibition" would require separate NPDES permits for non-storm water discharges to municipal storm sewers. In many cases in the past, applicants for NPDES permits for process wastewaters and other non-storm water discharges have been granted approval to discharge into municipal separate storm sewers, provided that the permit conditions for the discharge are met at the point where the discharge enters into the separate storm sewer. Permits for such discharges must meet applicable technology-based and water-quality based requirements of Sections 402 and 301 of the CWA. If the permit for a non-storm water discharge to a municipal separate storm sewer contains water-quality based limitations, then such limitations should generally be based on meeting applicable water quality standards at the boundary of a State established mixing zone (for States with mixing zones) located in the receiving waters of the United States.

All options will be considered when an applicant applies for a NPDES permit for a non-storm water discharge to a municipal separate storm sewer. In some cases, permits will be denied for discharges to storm sewers that are causing water quality problems in receiving waters. However, not all discharges present such problems; and in these cases EPA or State permit writers may allow such discharges to municipal separate storm sewers within appropriate permit limits.

Today's rule has two permit application requirements that are designed to begin implementation of the effective prohibition. The first requirement discussed in VI.H.6.a., below, addresses a screening analysis which is intended to provide sufficient information to develop priorities for a program to detect and remove illicit discharges. The second provision, discussed in VI.H.7.b., requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems.

Several commenters suggested that either the definition of "storm water" should include some additional classes of nonprecipitation sources, or that municipalities should not be held responsible for "effectively prohibiting" some classes of nonstorm water discharges into their municipal storm sewers. The various types of discharges addressed by these comments include detention and retention reservoir releases, water line flushing, fire hydrant flushing, runoff from fire fighting, swimming pool drainage and discharge, landscape irrigation, diverted stream flows, uncontaminated pumped ground water, rising ground water, discharges from potable water sources, uncontaminated waters from cooling towers, foundation drains, non-contact cooling water (such as heating, ventilation, air conditioning (HVAC) water that POTWs require to be discharged to separate storm sewers rather than sanitary sewers), irrigation water, springs, roofdrains, water from crawl space pumps, footing drains, lawn watering, individual car washing, flows from riparian habitats and wetlands. Most of these comments were made with regard to the concern that these were commonly occurring discharges which did not pose significant environmental problems.

EPA disagrees that the above described flows will not pose, in every case, significant environmental problems. At the same time, it is unlikely Congress intended to require municipalities to effectively prohibit individual car washing or discharges resulting from efforts to extinguish a building fire and other seemingly innocent flows that are characteristic of human existence in urban environments and which discharge to municipal separate storm sewers. It should be noted that the legislative history is essentially silent on this point. Accordingly, EPA is clarifying that section 402(p)(3)(B) of the CWA (which requires permits for municipal separate storm sewers to 'effectively' prohibit non-storm water discharges) does not require permits for municipalities to prohibit certain discharges or flows of nonstorm water to waters of the United States through municipal separate storm sewers in all cases. Accordingly, § 122.26(d)(2)(iv)(B)(1) states that the proposed management program shall include: "A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; the program description shall address the following categories of non-storm water discharges or flows only where such discharges are identified by the municipality as sources of pollutants to waters of the United States: Water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers, uncontaminated pumped ground water discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash waters. Program descriptions shall address discharges from fire fighting only where such discharges or flows are identified as significant sources of pollutants to waters of the United States."

However, the Director may include permit conditions that either require municipalities to prohibit or otherwise control any of these types of discharges where appropriate. In the case of fire fighting it is not the intention of these rules to prohibit in any circumstances the protection of life and public or private property through the use of water or other fire retardants that flow into separate storm sewers. However, there may be instances where specified management practices are appropriate where these flows do occur (controlled blazes are one example).

Conveyances which continue to accept other "non-storm water" discharges (e.g. discharges without an NPDES permit) with the exceptions noted above do not meet the definition of municipal separate storm sewer and are not subject to section 402(p)(3)(B) of the CWA unless the non-storm water discharges are issued separate NPDES permits. Instead, conveyances which continue to accept non-storm water discharges which have not been issued separate NPDES permits are subject to sections 301 and 402 of the CWA. For example, combined sewers which convey storm water and sanitary sewage are not separate storm sewers and must comply with permit application requirements at 40 CFR 122.21 as well as other regulatory criteria for combined sewers.

3. Site-Specific Storm Water Quality Management Programs for Municipal Systems

Section 402(p)(3)(iii) of the CWA mandates that permits for discharges from municipal separate storm sewers shall require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP), including management practices, control techniques and systems, design and engineering methods, and such other provisions as the Director determines appropriate for the control of such pollutants.

When enacting this provision, Congress was aware of the difficulties in regulating discharges from municipal

separate storm sewers solely through traditional end-of-pipe treatment and intended for EPA and NPDES States to develop permit requirements that were much broader in nature than requirements which are traditionally found in NPDES permits for industrial process discharges or POTWs. The legislative history indicates, municipal storm sewer system "permits will not necessarily be like industrial discharge permits. Often, an end-of-the-pipe treatment technology is not appropriate for this type of discharge." [Vol. 132 Cong. Rec. S16425 (daily ed. Oct. 16, 1986)].

A shift towards comprehensive storm water quality management programs to reduce the discharge of pollutants from municipal separate storm sewer systems is appropriate for a number of reasons. First, discharges from municipal storm sewers are highly intermittent, and are usually characterized by very high flows occurring over relatively short time intervals. For this reason, municipal storm sewer systems are usually designed with an extremely high number of outfalls within a given municipality to reduce potential flooding. Traditional end-of-pipe controls are limited by the materials management problems that arise with high volume, intermittent flows occurring at a large number of outfalls. Second, the nature and extent of pollutants in discharges from municipal systems will depend on the activities occurring on the lands which contribute runoff to the system. Municipal separate storm sewers tend to discharge runoff drained from lands used for a wide variety of activities. Given the material management problems associated with end-of-pipe controls, management programs that are directed at pollutant sources are often more practical than relying solely on end-of-pipe controls.

In past rulemakings, much of the criticism of the concept of subjecting discharges from municipal separate storm sewers to the NPDES permit program focused on the perception that the rigid regulatory program applied to industrial process waters and effluents from publicly owned treatment works was not appropriate for the site-specific nature of the sources which are responsible for the discharge of pollutants from municipal storm sewers.

The water quality impacts of discharges from municipal separate storm sewer systems depend on a wide range of factors including. The magnitude and duration of rainfall events, the time period between events, soil conditions, the fraction of land that is impervious to rainfall, land use activities, the presence of illicit connections, and the ratio of the storm water discharge to receiving water flow. In enacting section 405 of the WQA, Congress recognized that permit requirements for municipal separate storm sewer systems should be developed in a flexible manner to allow site-specific permit conditions to reflect the wide range of impacts that can be associated with these discharges. The legislative history accompanying the provision explained that "[p]ermits for discharges from municipal separate stormwater systems * * * must include a requirement to effectively prohibit non-stormwater discharges into storm sewers and controls to reduce the discharge of pollutants to the maximum extent practicable. * * * These controls may be different in different permits. All types of controls listed in subsection [(p)(3)(C)] are not required to be incorporated into each permit" [Vol. 132 Cong. Rec. H10578 (daily ed. October 15, 1986) Conference Report]. Consistent with the intent of Congress, this rule sets out permit application requirements that are sufficiently flexible to allow the development of site-specific permit conditions.

Several commenters agreed with this approach. One municipality recommended that there be as much flexibility as possible so that the permitting authority can work with each municipality in developing meaningful long-term goals with plans for improving storm water quality. This commenter noted that too many specific regulations that apply nationwide do not take into consideration the climatic and governmental differences within the States. EPA agrees that as much flexibility as possible should be incorporated into the program. However, flexibility should not be built into the program to such an extent that all municipalities do not face essentially the same responsibilities and commitment for achieving the goals of the CWA. EPA believes that these final regulations build in substantial flexibility in designing programs that meet particular needs, without abandoning a nationally consistent structure designed to create storm water control programs.

4. Large and Medium Municipal Storm Sewer Systems

During the 1987 reauthorization of the CWA, Congress established a framework for EPA to implement a permit program for municipal separate storm sewers and establishing phased deadlines for its implementation. The amended CWA establishes priorities for EPA to develop permit application requirements and issue permits for discharges from three classes of municipal separate storm sewer systems. The CWA requires that NPDES permits be issued for discharges from large municipal separate storm sewer systems (systems serving a population of more than 250,000) by no later than February 4, 1991. Permits for discharges from medium municipal separate storm sewer systems (systems serving a population of more than 100,000, but less than 250,000) must be issued by February 4, 1992. After October 1, 1992, the requirements of sections 301 and 402 of the CWA are restored for all other discharges from municipal separate storm sewers.

The priorities established in the Act are based on the size of the population served by the system. Municipal operators of these systems are generally thought to be more capable of initiating storm water programs and discharges from municipal separate storm sewers serving larger populations are thought to present a higher potential for contributing to adverse water quality impacts. NURP and other studies have verified that the event mean concentration of pollutants in urban runoff from residential and commercial areas remains relatively constant from one area to another, indicating that pollutant loads from urban runoff strongly depend on the total area and imperviousness of developed land, which in turn is related to population.

The term "municipal separate storm sewer system" is not defined by the Act. By not defining the term, Congress intended to provide EPA discretion to define the scope of municipal systems consistent with the objectives of developing site-specific management programs in NPDES permits. EPA considered two key issues in defining the scope of municipal separate storm sewer system: (1) What is a reasonable definition of the term "system," and (2) how to determine the number of people "served" by a storm sewer system. EPA found these two issues to be intertwined. Different approaches to defining the scope of a system allowed for greater or lesser certainty in deterining the population served by the system.

In the December 7, 1988, proposal, EPA described seven options for defining "municipal separate storm sewer system." In developing these options the EPA considered:

- The inter-jurisdiction complexities associated with municipal governments;
- The fact that many municipal storm water management programs have traditionally focused on water quantity

concerns, and have not evaluated water quality impacts of system discharges or developed measures to reduce pollutants in such discharges;

• The advantages of developing system-wide storm water management programs for municipal systems;

• The geographic basis necessary for planning of comprehensive management programs to reduce pollutants in discharges from municipal separate storm sewers to the maximum extent practicable;

• The geographic basis necessary to provide flexibility to target controls on areas where water quality impacts associated with discharges from municipal systems are the greatest and to provide an opportunity to develop cost effective controls;

• The need to establish a reasonable number of permits for municipal systems during the initial phases of program development that will provide an adequate basis for a storm water quality management program for over 13,000 municipalities after the October 1, 1992 general prohibition on storm water permits expires; and

• Congressional intent to allow the development of jurisdiction-wide, comprehensive storm water management programs with priorities given to the most heavily populated areas of the country.

a. Overview of Proposed Options and Comments. The December 7, 1988, proposal requested comment on seven options for defining large and medium municipal separate storm sewer system. With the addition of a watershed-based approach suggested by certain commenters, eight options or approaches were addressed by the over 200 commenters on this issue: Option 1—systems owned or operated by incorporated places augmented by integrated discharges; Option 2—systems owned or operated by incorporated places augmented with significant other municipal discharges; Option 3—systems owned or operated by counties; Option 4—systems owned and operated by States or State departments of transportation; Option 5—systems within the boundaries of an incorporated place; Option 6—systems within the boundaries of counties; Option 7—systems in census designated urbanized areas; and Option 8—systems defined by watershed boundaries.

Generally, these options can be classified into two categories. The first category of options, Options 1, 2 and 3, define municipal systems in terms of the municipal entity which owns or operates storm sewers within municipal boundaries of the requisite population. The second category of options would define municipal systems on a geographic basis. Under Options 4, 5, 6, 7 and 8 all municipal separate storm sewers within the specified geographic area would be part of the municipal system, regardless of which municipal entity owns or operates the storm sewer. EPA did not propose to define the scope of a municipal separate storm sewer system in engineering terms because of practical problems determining the boundaries of and the populations served by "systems" defined in such a manner. In addition an engineering approach based on physical interconnections of storm sewer pipes by itself does not provide a rational basis for developing a storm water program to improve water quality where a large number of individual storm water catchments are found within a municipality.

In the December 7, 1988, proposal, EPA favored those options that relied primarily on the municipal entity which owns or operates or otherwise has jurisdiction over storm sewers. These options were preferred because it was anticipated that the administrative complexities of developing the permit programs would be reduced by decreasing the number of affected municipal entities. However, most commenters were not satisfied that such an approach would reduce administrative burdens or complexities.

The diversity of arguments and rationales offered in comments justifying the selection of particular option, or combinations thereof, were generally a function of geographic, climatic, and institutional differences around the country. As such, there was little substantive agreement with how this program should be implemented as far as defining large and medium municipal separate storm sewer systems. Of all the options, Option 1 generally received the most favorable comment. However, the overwhelming majority of comments suggested different options or other alternatives. Having reviewed the comments at length, EPA is convinced that the definition of municipal separate storm sewers should possess elements of several of the options enumerated above and a mechanism that enables States or EPA Regions to define a system that best suits their various political and geographical conditions.

The following comments were the most pervasive, and represent those issues and concerns of greatest importance to the public: (1) The approach chosen initially must be realistic and achievable administratively; (2) the definition must be flexible enough to accommodate development of the program on a watershed basis, and incorporate elements of existing programs and frameworks and regional differences in climate, geography, and political institutions; (3) permittees must have legal authority and control over land use; (4) discharges from State highways, identified as a significant source of runoff and pollutants, should be included in the program and combined in some manner with one or more of the other options; (5) the definition should address how the inclusion of interrelated discharges into the municipal separate storm sewer system are timed, decided upon, dealt with, etc.; (6) any approach must address the major sources of pollutants; (7) development of co-permittee management plans must be coordinated or developed on a regional basis and in the same time frame—fragmented or balkanized programs must be avoided; (8) municipalities should be regulated as equitably as possible; (9) flood control districts should be addressed as a system or part of a system; (10) the definition must conform to the legal requirements of the Clean Water Act; and (11) the definition should limit the number of co-permittees as much as possible.

b. Definition of large and medium municipal separate storm sewer system. A combination of the options outlined in the 1988 proposal would address most of these concerns, while achieving a realistic and environmentally beneficial storm water program. Accordingly, EPA has adopted the following definition of large and medium municipal separate storm sewer systems. Large and medium separate storm sewer systems are municipal separate storm sewers that:

(i) Are located in an incorporated place with a population of 100,000 or more or 250,000 or more as determined by the latest Decennial Census by the Bureau of Census (see appendices F and G of part 122 for a list of these places based on the 1980 Census);

(ii) Are located within counties having areas that are designated as urbanized areas by latest decennial Bureau of Census estimates and where the population of such areas exceeds 100,000, after the population in the incorporated places, townships or towns within such counties is excluded (see appendices H and I for a listing of these counties based on the 1980 census) (incorporated places, towns, and townships within these counties are excluded from permit application requirements unless they fall under paragraph (i) or are designated under paragraph (iii)); or (iii) are owned or

operated by a municipality other than those described in paragraph (i) or (ii) that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraphs (i) or (ii). In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in subparagraph (i);

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

(E) Other relevant factors.

(iv) The Director may, upon petition, designate as a system, any municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (i), (ii), and (iii).

Under today's rule at § 122.26(a)(3)(iii) the regional authority shall be responsible for submitting a permit application under the following guidelines: The regional authority together with co-applicants shall have authority over a storm water management program that is in existence, or shall be in existence at the time part 1 of the application is due: the permit applicant or co-applicants shall establish their ability to make a timely submission of part 1 and part 2 of the municipal application; each of the operators of municipal separate storm systems described in paragraphs 122.26(b)(4) (i), (ii), and (iii) and (7)(i), (ii), and (iii), that are under the purview of the designated regional authority, shall comply with the application requirements of § 122.26(d).

As noted above, the finalized definition of large and medium municipal separate storm sewer system is combination of the approaches as proposed. (In the following discussion "paragraph (i)" refers to §§ 122.26 (b)(4)(i) and (b)(7)(i); "paragraph (ii)" refers to §§ 122.26(b)(4)(ii) and (b)(7)(ii); "paragraph (iii)" refers to §§ 122.26 (b)(4)(iii) and (b)(7)(iii); and "paragraph (iv)" refers to §§ 122.26 (b)(4)(iv) and (b)(7)(iv)). Paragraph (i) originates from proposed Option 5 (boundaries of incorporated places); paragraph (ii) originates from Option 6 (boundaries of counties) and Option 7 (urbanized areas); paragraph (iii) originates from Options 1 and 5; and paragraph (iv) is an outgrowth of comments on all options, especially Option 4 (State owned systems/State highways) and Option 8 (watersheds).

This definition creates a system by virtue of the fact that storm sewers within defined geographical and political areas, and the owner/operators of separate storm sewers in those areas, are addressed or required to obtain permits. Although within these systems, different segments and discharges of storm water conveyances may be owned or operated by different public entities. EPA is convinced by comments that discharges from such conveyances are interrelated to such an extent that all of these conveyances may be properly considered a "system." These comments are identified and discussed in greater detail below.

c. Response to comments. Many commenters urged that the approach taken must be administratively achievable. Option 5 of the proposal (boundaries of incorporated places), which can be equated to paragraphs (i) and (iii) above, was identified by several commenters as the most workable of all the options. Many commenters stated that Option 1 (systems owned or operated by incorporated places) was inappropriate because of special districts and other owners of systems within the incorporated area; and although EPA proposed a designation provision for interrelated discharges in Option 1, commenters advised that it would be impossible to identify these systems, account for their discharges, and exclude or include them in a timely manner if Option 1 was selected (Option 1 only addresses those systems owned or operated by the incorporated place). The final rule would obviate these concerns, since all the publicly owned sewers within the boundaries of the municipality will be required to be covered by a permit.

Other commenters noted that cities sometimes have storm water conveyances owned or operated by numerous entities. One municipality commented that these problems could be more easily resolved using a unified permit/district wide approach, which the final approach outlined above can accomplish. One county stated that Option 1 of the proposal would result in a permanent balkanization of stormwater programs and that a regional approach focusing on the entire system should be established. Another municipality recommended that all the systems of conveyances within the incorporated city boundaries be issued a permit. In rejecting Option 1 of the proposal, one municipality stated that program inefficiencies would result from implementing a piecemeal program in a contiguous urban environment with different owners and operators. One State conveyed similar concerns. Using a geographical approach, as described in paragraph (i) of the final definition, will best address all of these concerns.

One commenter criticized proposed Option 1 as being contrary to the legal requirements of the WQA, and a further example of EPA's continuing attempt to minimize the scope of a national storm water program. It was noted that the legislative history regarding requirements for large and medium municipal separate storm sewer systems in section 402(p) of the CWA generally does not reference incorporated cities or towns. As a result, the commenter recommended that the term "municipal" in municipal separate storm sewer system refer to separate storm sewers operated by municipal entities meeting the definition of "municipality" in section 502 of the CWA and that the scope of the term "municipal separate storm sewer system" be defined as broadly as possible. This approach would result in defining large and medium municipal separate storm sewer systems to include all municipal separate storm sewers within the 410 counties with a population of 100,000 or more. EPA has adopted the commenter's recommendation to extend the scope of the program to the extent that today's rule covers all municipal separate storm sewers within certain areas rather than only those operated by an incorporated place. EPA disagrees however that it must define the term "system" to include sewers within any municipal boundary of sufficient population with reference to section 502(4). By not providing explicit definitions, section 402(p)(3)(B) of the CWA gives EPA discretion to define how municipal separate storm sewer systems are defined. There is no indication in the language of the CWA or the legislative history that Congress intended that the scope of "municipality" and the scope of "municipal separate storm sewer system" to be identical, particularly since the latter term is not defined in the statute. Furthermore, for the reasons discussed elsewhere in this section, EPA believes that today's definition is a reasonable accommodation of the many conflicting concerns surrounding the proper way to delineate the extent of a

municipal separate storm sewer system serving over 100,000 people.

Several commenters concluded that EPA should be flexible enough to allow the permitting authority broad discretion to establish system wide permits, with flood control districts and/or counties acting as co-permittees with the various incorporated cities within the district boundaries. Commenters expressed concern that Option 1 would not allow for such flexibility.

Arguments that were advanced by commenters in support of proposed Option 1 are equally applicable to paragraph (i), above. Like proposed Option 1, the approach outlined above targets major cities. However, it also has the advantage of addressing municipal separate storm sewer systems which may be interrelated to those owned by the city, a benefit recognized by one municipality that endorsed the selection of proposed Option 5. This will also give the permitting authority more discretion to establish co-permittee relationships.

Paragraph (ii) of the final definition also uses a geographical approach to the definition of municipal storm sewer systems to include municipal storm sewers within urbanized counties. Thus, it closely resembles Option 7 of the proposal. The counties identified in paragraph (ii) have, based on the 1980 Census, a population of 100,000 or more in urbanized,[5] unincorporated portions of the county. In the unincorporated areas of these counties (or in the 20 States where the Census recognizes minor civil divisions, unincorporated county areas outside of towns or townships), the county is the primary local government entity. In these cases, the county performs many of the same functions as incorporated cities with a population of 100,000, and is generally expected to have the necessary legal and land use authority in these areas to begin to implement storm water management programs. Due to the urbanized nature of their population, discharges from the municipal separate storm sewers in these counties will have many similarities to discharges from municipal systems in incorporated cities with a population of 100,000 or more. Addressing these counties in this fashion will not adversely affect small municipalities (incorporated places, towns and townships) within the county, as municipal separate storm sewers that are located in the small incorporated places, townships or towns within these counties are not automatically included as part of the system.

EPA has focused on the unincorporated areas because permit applications cannot be required from systems that serve a population less than 100,000, unless designated. EPA received the comment that if the sewers in incorporated places within such counties were included as part of the system for that county, there would be the potential for systems serving a population less than 100,000 to be improperly subject to permit requirements. EPA agrees with the comment, except that EPA reserves the authority to designate sewers in small incorporated places as part of the system subject to permitting, pursuant to paragraph (iii) of the final definition. Incorporated areas within the identified counties will be required to file permit applications if the population served by the municipal separate storm sewer system is 100,000 or more.

As one commenter noted, the counties addressed by the definition will generally be areas of high growth with a growing tax base that can finance a storm water management program. Numerous counties affected by paragraph (ii) commented on the proposal. Several of these indicated a preference for the county government as the permittee. Others indicated that their county had the ability to perform the functions of the permit applicant and permittee. One county brought to EPA's attention that the county had laid plans for a storm water utility scheduled to be in operation in 1989. Several of the counties supported the use of watersheds, or flexible regional approaches, as the basis for the definition of municipal separate storm sewer systems. The modified definition should satisfy these concerns.

EPA recognizes that some of the counties addressed by today's rule have, in addition to areas with high unincorporated urbanized populations, areas that are essentially rural or uninhabited and may not be the subject of planned development. While permits issued for these municipal systems will cover municipal system discharges in unincorporated portions of the county, it is the intent of EPA that management plans and other components of the programs focus on the urbanized and developing areas of the county. Undeveloped lands of the county are not expected to have many, if any, municipal separate storm sewers.

Paragraphs (i) and (ii) above will help resolve the problems associated with permittees not having adequate land use controls, the legal authority to implement controls, and the ownership of the conveyances. This factor was mentioned by numerous commenters on the proposed options, especially county governments. Under paragraphs (i) and (ii), all publicly owned separate storm sewers within the appropriate municipal boundaries will be defined as part of the municipal system. In many cases, a number of municipal operators of these storm sewers will be responsible for discharges from these systems. Since a number of co-permittees may be addressed in the permits for these discharges, problems associated with the ability to control pollutants that are contributed from interrelated discharges will be minimized. State highways or flood control districts, which may have no land use authority in incorporated cities, will be co-permittees with the city which does possess land use authority. EPA envisions that permit conditions for these systems will be written to establish duties that are commensurate with the legal authorities of a co-permittee. For example, under a permit, a flood control district may be responsible for the maintenance of drainage channels that they have jurisdiction over, while a city is responsible for implementing a sediment and erosion ordinance for construction sites which relates to discharges to the drainage channel. Confusion over ownership of conveyances or systems, at least for the purposes of determining whether they require a permit, will be minimized since all conveyances will be covered. Similarly, under paragraph (ii), the affected counties are expected to have the necessary legal and land use authority to implement programs and controls in unincorporated, urbanized areas because the county government is the primary political or governing entity in these geographical areas.

Many commenters from all levels of State and local government expressed concern about controlling pollutants from State highways. Paragraphs (i) and (ii) will result in discharges from separate storm sewers serving State highways and other highways through storm sewers that are located within incorporated places with the appropriate population or highways in unincorporated portions of specified counties being included as part of the large or medium municipal separate storm sewer system, since all municipal separate storm sewers within the boundaries of these political entities are included. Paragraph (iv) can facilitate

[5] The Bureau of Census defines urbanized areas to provide a description of high-density development. Urbanized areas are comprised of a central city (or cities) with a surrounding closely settled area. The population of the entire urbanized area must be greater than 50,000 persons, and the closely settled area outside of the city (the urban fringe) must generally have a population density greater than 1,000 persons per square mile (just over 1.5 persons per acre) to be included.

the submission of a permit application for storm sewers operated as part of an entire State highway system. Paragraph (iv) would allow an entire system in a geographical region under the purview of a State agency (such as a State Department of Transportation) to be designated, where all the permit application requirements and requirements established under § 122.26(a)(iii)(C) can be met.

Paragraphs (i) and (ii) can effectively deal with many of the major sources of pollutants. One municipality noted that Option 5 (paragraph (i)) would require all systems in the incorporated boundaries to obtain permits and institute control measures, rather than just the few owned or operated by incorporated cities. Another municipality noted that this approach could deal with many of the regional variations in sources of pollution. Many commenters, including environmental groups, believed that proposed Option 3 (systems owned or operated by counties), Option 6 (systems within the boundaries of counties), and Option 7 (system in urbanized areas) were good approaches because more sources of pollution would be addressed. It was also maintained that Options 3, 6 and 7 could incorporate watershed planning which, in the view of some commenters, is the only effective way to address pollutants in storm water.

Commenters noted that addressing counties and urbanized areas would focus attention on developing areas which would otherwise be left out in the initial phases of permitting. One commenter noted that most new development in large urbanized areas occurs outside of core cities (incorporated cities with a population of 100,000 or more). Newly developing areas provide opportunities for installing pollutant controls cost effectively. EPA agrees with these comments and notes that paragraph (ii) addresses a significant number of counties with highly developed or developing areas.

However, EPA is convinced that addressing all counties or urbanized areas in the initial phases of the storm water program is ill-advised. Commenters noted that some counties have inappropriate or nonexistent governmental structures, and that a program that addressed all counties in the country with a population of 100,000 or more would be unmanageable, because too many municipal entities nationwide would be involved in the program initially. Commenters advised that defining municipal storm sewer systems solely in terms of the boundaries of census urbanized areas (Option 7) would result in systems which did not correspond to jurisdictions that are in a position to implement a storm water programs. Thus, EPA has modified Option 7 and combined it with Option 6 to create paragraph (ii) above.

Paragraph (iii) incorporates a designation authority such that municipalities that own or operate discharges from separate storm sewers systems other than those described in paragraph (i) or (ii) may be designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the other discharges of the designated storm sewer and the discharges from the large or medium municipal separate storm sewers. In making this determination the physical interconnections between the municipal separate storm sewers, the location of discharges from the designated municipal separate storm sewer relative to discharges from large or medium municipal separate storm sewers, the quantity and nature of pollutants discharged to waters of the United States, the nature of the receiving waters, or other relevant factors may be considered.

Comments indicated that the designation authority as proposed and described above should be retained. One State noted that this approach gives the most flexibility in making the case-by-case designations, while also delineating in sufficient detail what criteria are used to make the determination. This commenter was concerned about being able to regulate many of the interrelated discharges from counties surrounding incorporated cities.

Paragraph (iv) of the final definition allows the permitting authority, upon petition, to designate as a medium or large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (i), (ii), (iii).

Paragraph (iv) was added to the final definitions to respond to a variety of concerns of commenters. One of the prime concerns of commenters was that the definition of large and medium municipal separate storm sewer systems must be flexible enough to accommodate: Programs on a watershed basis, existing storm water programs and frameworks and regional differences in climate, geography, and political institutions. Some States were particularly expressive regarding this concern. One State maintained that an inflexible program could totally disrupt ongoing State efforts. Other commenters urged that the regulation encourage the establishment of regional storm water authorities or other mechanisms that can deal with storm water quality on a watershed basis. One State proposed defining the municipal separate storm sewer system to include all municipal separate storm sewers within a core incorporated place of 100,000 or more, and all surrounding incorporated places within the State defined watershed. One of the State water districts advised that the regulations should be flexible enough to allow regional water quality boards to apply the regulations geographically. One national association expressed concern that existing institutional arrangements for flood control and drainage would be ignored, while another warned against fostering a proliferation of inconsistent patchwork programs based on arbitrary definitions and jurisdictions which bear no relationship to water quality.

EPA is convinced that the mechanism described in paragraph (iv) provides a means whereby the mechanisms and concepts identified above can be utilized or created in appropriate circumstances. In addition, § 122.26(f)(4) provides a means for State or local government agencies to petition the Director for the designation of regional authorities responsible for a portion of the storm water program. For example, some States or counties may currently or in the near future have regional storm water management authorities that have the ability to apply for permits under today's rule and carry out the terms of the permit. Some of these authorities may encompass within their jurisdiction large or medium municipal separate storm sewer systems as defined in today's rule. EPA wishes to encourage such entities to assume the role as permittee under today's rule. That is the purpose of paragraph (iv). Such authorities may petition the Director to assume such a role.

Many commenters expressed the view that municipal management plans must be coordinated or developed among co-permittees on a regional basis and in the same timeframe. Paragraphs (i), (iii) and (iv) would bring in all appropriate municipal entities with jurisdiction over a specified geographical area in the same timeframe. Several commenters, including one State, noted proposed Option 1 would lead to fragmented, ill-coordinated programs. Paragraphs (i), (iv), and (iv) do not suffer this drawback

to the same extent since all the municipal separate storm sewers are addressed within the incorporated place, instead of only those owned or operated by the incorporated place.

Equal treatment of municipalities within a watershed or other specified area was a major subject of comment. Many commenters urged that a degree of fairness could be achieved by requiring permit applications, and the concomitant expenditure of municipal dollars and resources, from all municipalities within an entire urban area that contributes to storm water pollution, rather than from a discrete system within an arbitrary political boundary. Paragraph (i), especially when coupled with paragraphs (ii), (iii), and (iv), can best accomplish a more equitable approach, because all owners and operators of municipal separate storm sewers within a system have responsibilities. In addition, some of the areas outside the incorporated city limits which are engaged in expansive urban or suburban development will be brought into the program. Paragraph (xi) will provide a means for State or regional authorities to use existing or emerging mechanisms to set up storm water management programs, and would require multiple agencies either to become regional co-permittees or to be subject to a regional permit.

Paragraphs (i), (ii), (iii), and (iv) could also require flood control districts to be co-permittees, which was a major concern of counties and numerous cities. One municipality stated that the inclusion of flood control districts would greatly reduce the administrative burden required to prepare a single inter-city discharge agreement and would establish a common legal authority to implement the program. Numerous county agencies believed it imperative that flood control districts be brought into a system-wide permit strategy.

Paragraphs (i) and (iii) may not accommodate the concern of several commenters that the number of co-permittees be kept to a minimum. The fact that all the municipal separate storm sewers within the boundaries of the appropriate incorporated places will be addressed dictates that some permits will have several co-permittees. This is a major concern since it goes directly to achieving an effective initial storm water program. There is concern about being able to bring all the co-permittees together under intra-municipal agreements or contracts within regulatory deadlines. This problem would be resolved in the short term by selecting Option 1. However, Option 1 may still require inter-municipal agreements because of the designation authority under § 122.26 (b)(4)(ii) and (b)(7)(ii) of the proposal. In addition, such inter-jurisdictional problems will arise after October 1, 1992 when the moratorium on requiring NPDES permits for discharges from other municipal separate storm sewers ends. Under the permitting goals established by the CWA, multi-jurisdictional storm water programs and agreements cannot be avoided. Despite interest in limiting the number of co-permittees, EPA decided not to adopt Option 1 for the reasons already stated.

Section 402(p)(3)(B)(i) of the amended CWA provides that permits for municipal discharges from municipal storm sewers may be issued on a system-wide or jurisdiction-wide basis. This provision is an important mechanism for developing the comprehensive storm water management programs envisioned by the Act.

Under the permit application requirements of today's rule, if the appropriate co-applicants are identified, one permit application may be submitted for a large or medium municipal separate storm sewer system (see section VI.G.4 above). System-wide permit applications can in turn be used to issue system-wide permits which could cover all discharges in the system.

Where several municipal entities are responsible for obtaining a permit for various discharges within a single system, EPA will encourage system-wide permit applications involving the several municipal entities for a number of reasons. The system-wide approach not only provides an appropriate basis for planning activities and coordinating development, but also provides municipal entities participating in a system-wide application the means to spread the resource burden of monitoring, evaluating water quality impacts, and developing and implementing controls.

The system-wide approach provided in today's rule recognizes differences between individual municipalities with responsibilities for discharges from the municipal system. Today's application rule requires information to be submitted that enables the permit issuing authorities to develop tailored programs for each permittee with responsibility for certain components, segments, or portions of the municipal separate storm sewer system. The permit application requirements allow individual municipal entities, participating in system-wide applications, to submit site specific information regarding storm water quality management programs to reduce pollutants in system discharges as a whole, or from specific points within the system.

In some cases, it may be undesirable for all municipal entities with storm water responsibility within a municipal system to be co-permittees under one system-wide permit. The permit application requirements in today's rule allow individual municipal entities within the system to submit permit applications and obtain a permit for that portion of the storm sewer system for which they are responsible. Thus, several permits may be issued to cover various subdivisions of a single municipal system.

In summary, EPA believes that the definition of municipal storm sewer system adopted in today's rule has several distinct advantages that were identified in comments:

- The definition adopts features of several options;
- The definition targets areas that have the necessary police powers and land use authority to implement the program;
- The definition can utilize watersheds or accommodate existing administrative frameworks and storm water programs;
- The definition provides that all systems within a geographical area including highways and flood control districts will be covered, thereby avoiding fragmented and ill-coordinated programs;
- The definition has flexible designation authority; and
- The definition addresses major sources of pollutants without being overly broad.

H. Permit Application Requirements for Large and Medium Municipal Systems

1. Implementing the Permit Program

Given the differing nature of discharges from municipal separate storm sewer systems in different parts of the country and the varying water quality impacts of municipal storm sewer discharges on receiving waters, today's permit application requirements are designed to lead to the development of site-specific storm water management programs. In order to effectively implement this goal, EPA intends to retain the overall structure of the municipal permit application as proposed in the December 7, 1988, proposal.

2. Structure of the Permit Application

EPA proposed a two-part permit application designed to meet the goal of

developing site-specific storm water quality management programs in NPDES permits. In response to a request for comments on this aspect of the proposal, numerous comments were received. After reviewing these comments, EPA has decided to retain the two-part permit application. Many commenters agreed that the approach as proposed is appropriate for phasing in and developing site specific storm water management programs. One large municipality strongly endorsed the two-part application, stating that it would facilitate the identification of water quality problem areas and the development of priorities for control measures, thereby allowing for more cost-effective program development. Two State agencies expressed the same view, and noted that the two-part approach is reasonable and well structured for efficient development of programs. One large municipality noted it would allow the permit authority and the permit applicant the time needed to gain the knowledge and data to develop site-specific permits. A medium municipality expressed similar views.

Numerous commenters submitted endorsements of a proposal offered by one of the national municipal associations. This approach responded to EPA's request for comments on alternatives to a two-part application process. These comments recommended having permit applicants submit information regarding their existing legal authority, prepare source identification information, describe existing management plans, provide discharge characterization information based on existing data, and prepare a monitoring, characterization and illicit discharge and removal plan in a one-part application. The remaining requirements such as: implementing plans to remove illicit connections, obtaining legal authority, monitoring and characterization, plans for structural controls, preparation of control assessments, preparation of fiscal analysis, and management plan implementation would be part of the permit and take place during the compliance period of the permit. It was argued that this would result in a more orderly development of stormwater management programs while allowing for quick implementation of efforts to eliminate illicit discharges and initiate some BMPs.

After careful review and consideration of these comments, EPA is convinced that this approach would not meet the goals and requirements of section 402 of the Clean Water Act. Section 402(p)(3)(B) of the CWA requires that permits effectively prohibit non-storm water discharges into storm sewers and incorporate controls that reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques, and system design and engineering methods. The above comments suggesting an alternative for achieving this goal are not entirely compatible with these requirements. In light of the language in the statute, permit conditions should do more than plan for controls during the term of the permit. A strong effort to have the necessary police powers and controls based on pollutant data should be undertaken before permits are issued. In short, the one-part application described by these comments would result in permits that would focus too much on preparation and not enough on implementing controls for pollutants.

In comparison, EPA's approach requires municipalities to submit a two-part application over a two year period. Part one of the application would require information regarding existing programs and the means available to the municipality to control pollutants in its storm water discharges. In addition, part one would require field screening of major outfalls to detect illicit connections. Part two of the permit application would require a limited amount of representative quantitative data and a description of proposed storm water management plans. The purpose of the two-part application process is to develop information, in a reasonable time frame, that would build successful municipal storm water management programs and allow the permit writer to make informed decisions with regard to developing permit conditions. This will include initiating efforts to effectively prohibit non-storm water discharges into storm sewers, and initially implementing controls that reduce the discharge of pollutants to the maximum extent practicable, including management practices and control techniques during the term of the permit. Such an approach clearly meets the statutory mandate of section 402(p)(3)(B).

a. Part 1 Application. Part 1 of the permit application is intended to provide an adequate basis for identifying sources of pollutants to the municipal storm sewer system, to preliminarily identify discharges of storm water that are appropriate for individual permits, and to formulate a strategy for characterizing the discharges from municipal separate storm sewer systems. Several commenters supported retaining these components of the application process. The components of part 1 of the permit application include:

- General information regarding the permit applicant or co-applicants (§ 122.26(d)(1)(i));
- A description of the existing legal authority of the applicant(s) to control pollutants in storm water discharges and a plan to augment legal authority where necessary (§ 122.26(d)(1)(ii));
- Source identification information including: a topographic map, description of the historic use of ordinances or other controls which limited the discharge of non-storm water discharges to municipal separate storm sewer systems, the location of known municipal separate storm sewer outfalls, projected growth, location of structural controls, and location of waste disposal facilities (§ 122.26(d)(1)(iii));
- Information characterizing the nature of system discharges including existing quantitative data, the results of a field screening analysis to detect illicit discharges and illegal dumping to the municipal system, an identification of receiving waters with known water quality impacts associated with storm water discharges, a proposed plan to characterize discharges from the municipal storm sewer system by estimating pollutant loads and the concentration of representative discharges, and a plan to obtain representative data (§ 122.26(d)(1)(iv)); and
- A description of existing structural and non-structural controls to reduce the discharge of pollutants from the municipal storm sewer (§ 122.26(d)(1)(v)).

One commenter disagreed that source identification should be made part of the permit application process beyond the identification of major municipal storm sewer outfalls. In reply, EPA is convinced that the other elements of the source identification are critical for identifying sources of pollutants and creating a base of knowledge from which informed decisions about permit conditions and further data requirements can be determined. One county stated that it already had engaged in extensive monitoring and modeling of watersheds and that its programs should be substituted for EPA's. In response, EPA anticipates that information collected under various State, county or city programs that matches the information requirements in this rulemaking may be used by the applicants in submissions under this rulemaking where the requirements of the rule are met. However, because of the divergence in data collection techniques and information collected by

these programs. EPA disagrees that it would be appropriate to accept a substitution in its entirety without tailoring such a program to today's specific information requirements. One municipality noted that municipal systems are not well documented and responsibility for them is in question. In response, EPA notes that the source identification procedure is designed, in part, to address such shortcomings.

Several municipalities suggested that legal authority could be demonstrated by providing EPA with copies of appropriate local ordinances to demonstrate their legal authority and a statement from the city attorney. EPA agrees that these methods are appropriate for making this demonstration.

Several commenters noted that there was adequate existing municipal legal authority to carry out the program requirements or such authority could be obtained by the municipality. Other commenters stated that municipalities possess some authority over certain activities but may not have authority over discharges from roads and construction. Numerous commenters, however, claimed that certain municipalities had no existing legal authority to carry out the permit requirements and that obtaining all the necessary legal authority could take several years due to cumbersome legislative and political processes. In response, part 1 of the permit application will establish a schedule for the development of legal authority that will be needed to accomplish the goals of the permit application and permits. Some municipalities will have more advanced storm water programs with appropriate legal authority or the ability to establish necessary ordinances. Providing an appropriate schedule will not present difficulties in these circumstances. EPA also notes that the definitions of large and medium municipal separate storm sewer systems finalized in today's rule will in many cases result in a number of co-applicants participating in a system wide application. It is anticipated that the development of adequate inter-jurisdictional agreements specifying the various responsibilities of the co-permittees may in some cases be very complex, thereby justifying the development of a schedule to complete the task. For example, clarifying the authority over discharges from roads may present difficulties where a number of municipal entities operate different roads in a given jurisdiction. In other limited cases, the MEP standard for municipal permits may translate into permit conditions that extend the schedule for obtaining necessary legal authority into the term of the permit. These situations will be evaluated on a case-by-case basis by permit issuing authorities.

Numerous commenters supported the field screening analysis as proposed. Comments from three municipalities noted that it would be a cost effective means of identifying problem areas. One municipality noted that illicit connections can be reliably detected by the screening method proposed. In view of these comments EPA has decided to retain this portion of the regulation. However many commenters expressed concern over how the proposed approach would work given the particular circumstances under which some municipal storm water systems are arranged. Several commenters questioned the effectiveness of dry weather monitoring for several reasons, including the shallow depth of some cities' water tables. Accordingly, an alternative approach may be utilized by the municipal permittee, and this is discussed later in section VI.H.3.

Some comments suggested that if any field screening is required that it be done during the term of the permit. EPA believes that field screening should not be done during the term of the permit exclusively. Unless a field screening is accomplished during the permit application phase there will be scant knowledge, if any, upon which illicit connection programs can be established for the term of the permits. EPA views field screening during the application process as an appropriate means of beginning to meet the CWA's requirement of effectively prohibiting non-storm water discharges into municipal separate storm sewers.

The submittal of part 1 of the permit application will allow EPA, or approved NPDES States, to adjust part 2 permit application requirements to assure flexibility for submitting information under part 2, given the site specific characteristics of each municipal storm sewer system.

EPA agrees with the concerns of commenters regarding the estimate of the reduction of pollutant loads from existing management programs. EPA agrees that sufficient data may not be available to establish meaningful estimates. Therefore this component of the proposed part 1 is not a requirement of today's rule.

b. Part 2 Application. Part 2 of the proposed permit application is designed to supplement information found in part 1 and to provide municipalities with the opportunity of proposing a comprehensive program of structural and non-structural control measures that will control the discharge of pollutants, to the maximum extent practicable, from municipal storm sewers. The components of the proposed part 2 of the permit application included:

- A demonstration that the legal authority of the permit applicant satisfies regulatory criteria (§ 122.26(d)(2)(i));
- Supplementation of the source identification information submitted in part 1 of the application to assure the identification of all major outfalls and land use activities (§ 122.26(d)(2)(ii);
- Information to characterize discharges from the municipal system;
- A proposed management program to control the discharge of pollutants to the maximum extent practicable, from municipal storm sewers (§ 122.26(d)(2)(iv));
- Assessment of the performance of proposed controls (§ 122.26(d)(2)(v));
- A financial analysis estimating the cost of implementing the proposed management programs along with identifying sources of revenue § 122.26(d)(2)(vi);
- A description of the roles and responsibilities of co-applicants (§ 122.26(d)(2)(vii)).

One municipality agreed that the assessment of the performance of controls was a critical component of establishing a viable program and one that could be accomplished within the time frame of the permit application deadlines. One commenter suggested that the applicant describe what financial resources are currently available. In response, EPA will require applicants to describe the municipality's existing budget for storm water programs in part 1 of the permit application requirements. This information will be useful to evaluate the municipality's ability to prepare and implement management plans. In response to other comments, this information will also include an overview of the municipality's financial resources and a description of the municipality's budget, including overall indebtedness and assets.

EPA has retained the financial analysis in this portion of the rule on the advice of two municipal commenters, who agreed that this was an important component of establishing a viable program and one that could be accomplished within the time frame of the permit application deadlines. Another commenter noted that this requirement is appropriate to justify a municipality's proposed management plan.

3. Major Outfalls

In past rulemakings, a controversial issue has been the appropriate sampling requirements for municipal separate storm sewer systems. Earlier storm water rulemakings have been based primarily on the principle that all discharges to waters of the United States from municipal separate storm sewers located in urban areas must be covered by an individual permit. This approach requires that individual permit applications contain quantitative data to be submitted for all such discharges. This approach was criticized because of a potentially unmanageable number of outfalls in some municipal separate storm sewer systems. Most incorporated cities with a population of 100,000 or more do not know the exact number of outfalls from their municipal systems; but based on the comments, the number ranges from 500 to 8,000 or more.

In light of the increased flexibility provided by the WQA and the development of EPA's system-wide approach for regulating municipal separate storm sewer discharges, today's rule will not require submittal of individual permit applications with quantitative data for each outfall of a municipal system. Rather today's rule will encourage system-wide permit applications to provide information suitable for developing effective storm water management programs. Under this approach, not all outfalls of the municipal system will be sampled, but rather more specific and accurate models for estimating pollutant loads and discharge concentrations will be used. The use of these models will require the identification of sources which are responsible for discharging pollutants into municipal separate storm sewers and will not require as much data to calibrate due to the source-specific nature of the model. A number of standard and localized models have been developed for estimating pollutant loads from storm water discharges.

Several commenters support the use of models for developing management plans and estimating pollutant loadings and concentrations. EPA encourages their use where applicable to particular systems.

By adopting an approach that incorporates source identification measures, the amount of quantitative data required to characterize discharges from the municipal system will be reduced because of the increased accuracy of the site-specific models which can be used. Consistent with a system wide permit application approach, EPA proposed to focus source identification measures on "major outfalls." The proposed definition of major outfalls includes any municipal separate storm sewer outfall that discharges from a pipe with a diameter of more than 36 inches or its equivalent (discharges from a drainage area of more than 50 acres), or for municipal separate storm sewers that receive storm water from lands zoned for industrial activities, an outfall that discharges from a pipe with a diameter of more than 12 inches or its equivalent (discharges from a drainage area of 2 acres or more).

Numerous entities offered comments on this definition. Several commenters concurred with this proposed definition. One commenter maintained that the data collected at such outfalls would be sufficient to estimate pollutant loads as well as concentrations using well calibrated models. Another municipality stated that 50 acres was an excellent approximation for the average drainage area served by a 36-inch storm sewer. Two States and one county supported the definition as proposed. One large municipal entity supported the definition, stating that screening major outfalls could be accomplished with available staff over a three month period. In light of these comments, EPA has decided to retain, in part, the definition as proposed.

Numerous commenters suggested alternative definitions or otherwise disagreed with the proposed definition. Most of these comments expressed concern about the number of outfalls that would have to be tested or screened if the definition was retained. For this reason EPA has decided to limit the total number of major outfalls or equivalent sampling points that have to be tested to 250 or 500 for medium or large systems respectively. This change is discussed in further detail below.

The following are examples of comments that opposed the definition of a "major outfall" as proposed. Several commenters stated that, in the southwest, 6 to 12 foot outfalls are the norm, and that smaller outfalls should not be addressed unless there is a compelling reason to suspect illicit connections. One commenter suggested a size of 54 inches and 50 acres, while another commenter suggested that 48 inches would be appropriate. One commenter suggested that the diameter for industrial pipes should be 18 inches, while another commenter suggested that 50 acres should be the only criterion.

One commenter noted that pipe size will vary according to rainfall patterns and that a single approach would not work universally. This comment, and other similar points of view as noted herein, convinces that Agency that a more flexible approach is needed to identify field screening and sampling locations. However, EPA is also convinced that a universal standard is necessary for purposes of identifying drainage areas within the municipal system and discrete areas of land use that are drained by certain sized outfalls. This information is critical since these conveyances, and lands they drain, are sources of pollutants to waters of the United States from municipal systems and are properly the subject of appropriate permit conditions.

Many commenters suggested placing a limit on the number of major outfalls addressed during the field screening phase of the permit application. Two municipalities stated that the proposed definition of major outfalls in terms to the pipe diameter was too small and that too many outfalls would be covered. One municipality stated that under the proposed definition, it would have over 4700 "major outfalls," a number viewed as being unacceptably large. Several municipalities argued that they would be penalized for over-design of their storm drain system. One municipality stated field screening of outfalls should be limited to 200 for medium cities and 500 for large cities. Some commenters suggested EPA set a percentage of major outfalls for screening, because all pipes in some municipalities meet the definition of major outfall. One commenter suggested that a sliding scale be used to determine the number of outfalls tested: those with 50 test all, those with 100–200 test 50%, etc. Other commenters suggested a flat percentage of outfalls or flat number such as 100.

4. Field Screening Program

EPA also received several comments in response to the proposed field screening methodology. Among the major concerns were: End of pipe sampling may not be practical and the more appropriate and accessible location is likely to be the nearest upstream manhole; the type of discharge should be the criterion for selecting sampling points as opposed to pipe size; a system wide evaluation is more appropriate than checking each outfall within some systems, major outfalls or pipe size will not reflect discharges from suspect or old land use areas; efforts should be focused on locations where illicit connections are expected; sites should be determined by looking at sites within drainage basin areas based on land use within these basins; land use and hydrology of the watershed should be the criteria for selecting points;

screening should be performed at locations that will allow for the location of upstream discharges; the focus should be exclusively on drainage areas rather than pipe size, since pipe size will vary with slope; a prescribed percentage of total flow may be more appropriate; state water quality standards should be utilized along with focusing on actual quality in the reaches of a stream.

EPA is convinced by these comments that today's rule should allow applicants to either field screen all major outfalls as proposed (first procedure) or use a second procedure to provide for the strategic location of sampling points to pinpoint illicit connections. EPA agrees with comments that the size of the outfall will not always reflect the chance of uncovering illicit connections or discharges, and that field screening points should be easily accessible.

This second procedure is as follows: field screening points and/or outfalls are randomly located throughout the storm sewer system by placing a grid over a drainage system map and identifying those cells of the grid which contain a major outfall or segment of the storm sewer system. The grid shall be established using the following guidelines and criteria:

(1) A grid system consisting of perpendicular north-south and east-west lines spaced 1/4 mile apart shall be overlaid on a map of the municipal storm sewer system, creating a series of cells;

(2) All cells that contain a segment of the storm sewer system shall be identified; one field screening point shall be selected in each cell; major outfalls may be used as field screening points;

(3) Field screening points or major outfalls should be located downstream of any sources of suspected illegal or illicit activity;

(4) Field screening points shall be located to the degree practicable at the farthest manhole or other accessible location downstream in the system within each cell; however, safety of personnel and accessibility of the location should be considered in making this determination;

(5) The assessment and selection of cells shall use the following criteria: Hydrological conditions; total drainage area of the site; population density of the site; traffic density; age of the structures or buildings in the area; history of the area; land use types.

(6) For medium municipal separate storm sewer systems, no more than 250 cells need have identified field screening points; in large municipal separate storm sewer systems, no more than 500 cells need to have identified field screening points for detecting illicit connections; cells established by the grid that contain no storm sewer segments will be eliminated from consideration; if fewer than 250 cells in medium municipal sewers are created, and fewer than 500 in large systems are created by the overlay on the municipal sewer map, then all those cells which contain a segment of the sewer system shall be subject to field screening (unless access to the separate storm sewer system is impossible);

(7) Large or medium municipal separate storm sewer systems which are unable to utilize the procedures described in paragraphs (1) through (6) above, because a sufficiently detailed map of the separate storm sewer systems is unavailable, shall field screen at least 250 or 500 major outfalls respectively using the following method: the applicant shall establish a grid system consisting of north-south and east-west lines spaced 1/4 mile apart overlaid on a map of the boundaries of a large or medium municipal entity described at § 122.26(b), thereby creating a series of cells; major outfalls in as many different cells as possible shall be selected until 500 major outfalls (large municipalities) or 250 major outfalls (medium municipalities) are selected; a field screening analysis shall be undertaken at these major outfalls.

The methodology outlined above is in response to public comments which indicated that the field screening and sampling of major outfalls as proposed would lead to insurmountable logistical problems in some municipal systems. EPA believes that the above is an effective approach to pinpointing suspected problem points along a given trunkline or segment of separate storm sewer system. Jurisdictions with no extensive or previous history of monitoring, or lack of an intensive monitoring program can utilize the methods described in establishing a program. Furthermore, the approach will allow for the prioritization of outfalls, sampling points, or areas within the municipality where there are suspected illicit connections or discharges, or other circumstances creating higher concentrations and loadings of pollutants.

Paragraph (7) enables municipalities to select major outfalls without regard to the municipal sewer system map that is required for using the procedure described in paragraphs (1) through (6). However, the applicant must still select outfalls within the cells created by overlaying a 1/4 mile grid over a map of the boundaries of the large or medium municipal entity defined under § 122.26(b), and select major outfalls within as many of those cells as possible, up to 500 (large municipal systems) or 250 (medium municipal systems). In this manner, as many different areas and land uses within the municipal system will be covered by the field screening component of the municipal application.

In order to keep the costs of the program within the anticipated limits of the proposed regulation, the number of outfalls or sampling locations using the grid system is to be limited to 500 for large municipal separate storm sewer systems and 250 for medium municipal separate storm sewer systems.

In response to several comments, EPA has clarified the definition of major outfalls with regard to the words, "pipe with an inside diameter of 36 inches or more or its equivalent" and "a pipe with an inside diameter of 12 inches or more or its equivalent." This definition has been modified to specify that single pipes or single conveyances with the appropriate diameter or equivalent are covered.

EPA's proposal required municipal permit applicants to submit a fiscal analysis of expenditures that will be required in order to implement the proposed management plans required in part 2 of the application. The description of fiscal resources should include a description of the source of the funds. Some commenters felt that a fiscal analysis should only be required during the term of the permit. In response, EPA believes that during the two years of permit application development, the permit applicant should be in a position to submit information on the ability and means for financing storm water management programs during the term of the permit. EPA views this information as an important means of evaluating the scope of program and whether the permittee will be devoting adequate resources to implementing the program before that program is mapped out in the permit itself.

5. Source Identification

The identification of sources which contribute pollutants to municipal separate storm sewers is a critical step in characterizing the nature and extent of pollutants in discharges and in developing appropriate control measures. Source identification can be useful for providing an analysis of pollutant source contribution and for identifying the relationship between pollutant sources and receiving water quality problems. In cases where end-of-pipe controls alone are not practicable, it is essential to identify the source of pollutants into the municipal storm

sewer systems to support a targeted approach to control pollutant sources.

The relative contribution of pollutants from various sources will be highly area-specific. The first step in developing a targeted approach for controlling pollutants in discharges from municipal storm sewer systems is identifying the various sources in each drainage basin that will contribute pollutants to the municipal storm sewer system.

This rulemaking phases in the source identification requirements of the permit program by establishing minimum objectives in part 1 of the application and by requiring applicants to submit a source identification plan in part 2 of the application to provide additional information during the term of the permit. The minimum source identification requirements of part 1 of the application have been designed to provide sufficient information to provide an initial characterization of pollutants in the discharges from the municipal storm sewer system. EPA realizes that with many large, complex municipal storm sewer systems, it may be difficult to identify all outfalls during the permit application process. Accordingly, EPA is requiring that known outfalls be reported in part 1 of the application. Part 1 of the application will also include: A description of procedures and a proposed program to identify additional major outfalls; the identification of the drainage area associated with known outfalls; a description of major land use classifications in each drainage area, descriptions of soils, the location of industrial facilities, open dumps, landfills or RCRA hazardous waste facilities which discharge storm water to the municipal storm sewer system; and ten year projections of population growth and development activities (population data and development projections will be useful for future predictions of loadings to receiving waters from municipal storm sewer systems, and capacities required for treatment systems). In general, population projections should reflect various scenarios of development (high, medium, low relative to recent trends).

Part 2 of the application will supplement the information reported in part 1 of the application so that, at a minimum, all major outfalls are identified.

Under today's rule, municipal or public entities responsible for applying for and obtaining an NPDES permit will be required to identify the location of an open dump, sanitary landfill, municipal incinerator or hazardous waste treatment, storage, and disposal facility under RCRA which may discharge storm water to the system as well as all facilities which discharge storm water associated with industrial activity into a large or medium municipal separate storm sewer system.

Requiring these source identification measures is supported by the legislative history of section 405 of the WQA, which instructs that "[i]n writing any permit for a municipal separate storm sewer, EPA or the State should pay particular attention to the nature and uses of the drainage area and the location of any industrial facility, open dump, landfill, or hazardous waste treatment, storage, or disposal facility which may contribute pollutants to the discharge." (emphasis added) [Vol 133 Cong. Rec. S752 (daily ed. Jan. 14, 1987].

One municipality questioned the purpose of the topographic map and commented that the scale of the topographic map is too large to indicate any of the required outfall, drainage, industrial or structural control information. In response, the purpose of the topographic map is to identify receiving waters, major storm water sewer lines that contribute discharges to these waters, and potential sources of storm water pollution. EPA disagrees that a USGS 7.5 scale map is inappropriate for identifying these features within a municipal system. The scale afforded by such a map provides sufficient detail to allow specified delineation of outfalls, while not requiring an overly burdensome map in terms of size. Numerous commenters noted the value of source identification information and generally supported submitting this information in the permit application.

Many commenters questioned the value of the source identification information for the purpose of characterizing pollutant loads and concentrations. Conversely, one commenter opined that the requirement would provide sufficient information to estimate pollutant loadings from each outfall using loading models to estimate loadings by watershed. In response, the source identification information serves several purposes. It is the first step for identifying potential sources of pollutants from which more in depth analysis can be accomplished, under the discharge characterization component of the application. Also, where appropriate, it may be used in conjunction with models to estimate loadings and concentrations. EPA has also taken note of the many comments that question or dismiss the concept of determining pollutant loads and concentrations solely from source identification. Accordingly, EPA is convinced that at least some of the sampling requirements as proposed are necessary to facilitate more accurate system specific estimates of pollutant concentrations and loadings. These are discussed below, in the discharge characterization section.

One commenter suggested that aerial photos be submitted in lieu of topographic maps. EPA agrees that an aerial photograph of the appropriate scale that communicates the same information as a topographic map may be substituted. Today's final rule reflects this flexibility.

The source identification component of the municipal application also requires that municipal applicants identify the industrial activity within the drainage area associated with each major outfall. One commenter stated that where multiple storm sewers outfalls discharge to a stream reach, municipalities should be allowed to delineate a single sewer-shed for identifying sources of industrial activity. In response, the rule does not delimit an applicant's ability to identify industries in groups according to a common series of storm sewer outfalls, if that is an easier or more appropriate methodology for that particular applicant. However, EPA would view this as appropriate only where the land use is of one type, such as industrial. Where land use is mixed within the drainage area associated with each major outfall, such differences need to be identified.

In response to comments, to the extent that EPA is requesting that applicants identify the types of industrial facilities operating within the municipality, the municipality is free to use Standard Industrial Classification (SIC) or other systems which identify the principal products or services of the facility. One commenter disagreed with EPA's decision to require a list of water bodies that are listed under CWA sections 304(l), 319(a), 314(a), and 320, because the States already have this information and that requesting it from permittees could result in "omissions, misunderstandings, and mistakes." EPA believes that these waters should be identified in the application so that appropriate permit conditions can be developed that address storm water discharges that are adversely effecting such waters. EPA believes that having this information immediately at the disposal of the municipality and the permit writer will speed the process and alert the municipality of storm water discharges to listed water bodies and potentially polluted storm water discharges to those waters.

6. Characterization of Discharges

The characterization plan and data collection required in today's rule as elements of Part-one and Part-two of the municipal permit application is comprised of several major components:

- A screening analysis to provide information to develop a program for detecting and controlling illicit connections and illegal dumping to the municipal separate storm sewer system;
- Initial quantitative data to allow the development of a representative sampling program to be incorporated as a permit condition;
- System-wide estimates of annual pollutant loadings and the mean concentration of pollutants in storm water discharges, and a schedule to provide estimates during the term of the permit for each major outfall of the seasonal pollutant loadings and the event mean concentration of pollutants in storm water discharges; and
- An identification of receiving waters with known water quality impacts associated with storm water discharges.

Several commenters noted the importance of developing and targeting management programs based on discharge characterization data and monitoring. Numerous other commenters stressed the importance of a program to identify and eliminate illicit connections and improper disposal. EPA agrees that discharge characterization is an important component of developing management programs. Most of the discharge characterization components of the municipal application procedure have been retained as proposed. However some changes and clarifications have been made, and these are noted below.

a. *Screening analysis for illicit discharges (part 1 of application).* Illicit discharges (non-storm water discharges without a NPDES permit), and illegal dumping to municipal separate storm sewer systems occur in a relatively haphazard manner. Due to the unpredictability of such discharges, today's permit applications require a field analysis for the development of priorities for detecting and controlling such discharges. A field screening approach will provide a means of detecting high levels of pollutants in dry weather flows, which is one indicator of illicit connections. Results of a field test of such discharges will provide further information about the nature of the discharge to determine if further investigation is warranted. Visual observation of dry weather flows has been shown to be one the most effective means for tracking down illicit connections and improper disposal.

As discussed in greater detail in section VI.H.7.b of today's preamble, EPA is proposing to require that municipal applicants submit a comprehensive plan to develop a program to detect and control illicit connections and illegal dumping. In order to develop appropriate priorities for these programs, applicants shall submit the results of a screening analysis to be performed on major outfalls or "field screening points" in the systems to detect the presence of illicit hookups and illegal dumping. The results of the screening analysis, referred to as the field screen, would be reported in part 1 of the permit application.

Under the requirements for a field screen, the applicant or co-applicants will submit a description of observations of dry weather discharges from major outfalls or "field screening points" identified in part 1 of the application. At a minimum, the field screen would include a description of visual observations made during a dry weather period. If any flow is observed during a dry weather period, two grab samples will be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observation regarding the potential presence of non-storm water discharges or illegal dumping would be provided. In addition, the applicant should provide the results of a field screen which includes on-site estimates of pH, total chlorine, total copper, total phenol, detergents (or surfacants) along with a description of the flow. EPA is not requiring analytical methods approved under 40 CFR part 136 be used exclusively in the field screen. Rather, the use of inexpensive field sampling techniques such as the use of colorimetric detection methods is anticipated. Where the field screen does not involve analytical methods approved under 40 CFR part 136, the applicant is required to provide a description of the method used which includes the name of the manufacturer of the test method, including the range and accuracy of the test. Appropriate field techniques for a field screen of dry weather discharges are discussed in EPA guidance for municipal storm water discharge permit applications.

It should be clarified that data from the field screen is generally not appropriate for comprehensive evaluation of water quality impacts, or estimating pollutant loadings. Rather, the information from the field screen in part 1 of the application will be used along with other information, such as the age of development and degree of industrial activity in the drainage basin, to identify areas or outfalls which are appropriate targets for management programs and for investigations directed at identifying and controlling non-storm water discharges to separate storm sewers during the term of the permit.

In the December 7, 1988, proposal, EPA proposed a second phase of the screening analysis requiring that wet weather and dry-weather samples be collected and analyzed in accordance with analytical methods approved under 40 CFR part 136 from designated major outfalls for a larger set of pollutants identified with illicit connections. Comments essentially viewed this proposal as too ambitious for the permit application. One commenter recommended that this procedure could best be accomplished during the term of the permit. Some comments maintained that the collection of analytical samples as a follow up to an initial field screen analysis was not the most cost-effective, practicable or efficient method for pinpointing illicit connections. EPA recognizes that several municipal programs to detect and control illicit connections and other non-storm water discharges have been successfully developed and implemented without the use of extensive analytical sampling (for example, programs in Fort Worth, TX and Washtenaw County, MI). After identifying and analyzing the comments on this aspect of the proposal EPA has withdrawn this element of the proposal from today's rule. EPA believes that a follow-up phase to the initial field screening is more appropriate during the term of the permit. Thus, EPA has dropped the field screening requirement proposed for Part 2 of the application.

b. *Representative data (Part 2 of application).* The NURP study showed that pollutant concentrations in urban runoff can exhibit significant variation. Pollutant concentrations in such discharges vary during storm events and from storm event to storm event. Given the complex, variable nature of storm water discharges from municipal systems, EPA favors a permit scheme where the collection of representative data is primarily a task that will be accomplished through monitoring programs during the term of the permit. Permit writers have the necessary flexibility to develop monitoring requirements that more accurately reflect the true nature of highly variable and complex discharges.

Today's rule provides for an initial assessment of the quality of discharges from municipal separate storm sewers based primarily on source identification measures and existing information received in the permit application. This information will be used to begin to characterize system discharges. The analysis developed under this approach will not rely soley on sampling data collected during the application process, but will also incorporate existing data bases such as the one developed under the NURP study. Today's rule requires that some quantitative data will be collected to ensure the system discharges can be appropriately represented by the various existing data bases and to provide a basis for developing a monitoring plan to be implemented as a permit condition.

Today's rule requires that quantitative data be submitted for discharges from selected storm events at between 5 and 10 outfalls or field screening points. The municipality will recommend and the Director will then designate the outfalls or field screening points as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system, on the basis of information received in part 1 of the application. The applicant will be required to collect samples of a storm discharge from three storm events occurring one month apart for each designated outfall or field screening point. This is a modification to the December 7, 1988, proposal wherein only one of the 5 to 10 outfalls was to be sampled during three storm events, and the remaining sampled only once. This requirement may be modified by the Director if the type and frequency of storm events require different sampling. The Director may require samples of discharges to be collected during snow melts or during specified seasons. The Director may also require additional testing during a single event if it is unlikely that there will be three storm events suitable for sampling during the year. Furthermore, the Director may allow exemptions to the three storm event requirement when climatic conditions create good cause for such exemptions; for example, arid regions or areas experiencing drought conditions during the period when applications are developed could be exempted.

EPA has added requirements to sample more storm events in response to comments that the sampling procedure proposed would not necessarily yield representative data. Commenters indicated that: rain events of different intensity may yield different levels and types of pollutants; a rain event after a dry spell of several months will not be representative when compared to rain events occurring closer together, due to the build up of constituents; one sample may reflect short term effects such as improper disposal rather than long term effects; and that rain events are generally too variable to rely on the limited sampling as proposed. Clearly the data collected from sampling storm water discharges has a tendency to vary greatly. The more sampling that is accomplished, the greater extent to which this variability may be accounted for and appropriate management programs developed.

In selecting the amount of data to be collected during the permit application process, EPA has attempted to balance the usefulness of this data against the economic and logistical constraints in actually obtaining it. In some cases the data obtained will support initial loading and concentration estimates obtained using various modeling techniques, from which appropriate permit conditions can be developed. Data obtained may be supplemented with further data collection during the term of the permit.

EPA believes that the requirement that selected major municipal outfalls or "field screening points" be sampled for more than one event will provide verification that the characterization of discharge is valid. Where an ongoing sampling program is defined for the term of the permit, samples taken during the first few years of this period can be used to verify the application results. If a municipality or an industry questions the conclusions drawn from the characterization sampling, it may at its discretion choose to perform additional sampling to either confirm or dispel these concerns.

All samples collected will be analyzed for all pollutants listed in Table II, (organic pollutants), and Table III, (toxic metals, cyanide and total phenol) of appendix D of 40 CFR part 122, and for the pollutants listed in Table M-1 below:

Table M-1

Total suspended solids (TSS).	Total dissolved solids.
COD.	BOD$_5$.
Oil and grease	Fecal coliform.
Fecal streptococcus	pH.
Dissolved phosphorus	
Total ammonia plus organic nitrogen.	Total phosphorus.
Total Kjeldahl nitrogen	Nitrate plus nitrite.

A portion of the NURP program involved monitoring 120 priority pollutants in storm water discharges from lands used for residential, commercial and light industrial activities. The NURP program excluded testing for asbestos and dioxin. Results for seven other organic priority pollutants were not considered valid due to changes in, or constraints on test methods. Seventy-seven priority pollutants were detected in samples of storm water discharges from lands used for residential, commercial and light industries taken during the NURP study, including 14 inorganic and 63 organic pollutants. Table M-2 shows the priority pollutants which were detected in at least ten percent of the discharge samples which were sampled for priority pollutants.

TABLE M-2.—PRIORITY POLLUTANTS DETECTED IN AT LEAST 10% OF NURP SAMPLES

(In percent)

Metals and inorganics	Frequency of detection
Antimony	13
Arsenic	52
Beryllium	12
Cadmium	48
Chromium	58
Copper	91
Cyanides	23
Lead	94
Nickel	43
Selenium	11
Zinc	94
Pesticides:	
Alpha-hexachlorocyclohexane	20
Alpha-endosulfan	19
Chlordane	17
Lindane	15
Halogenated aliphatics:	
Methane, dichloro-	11
Phenols and cresols:	
Phenol	14
Phenol, pentachloro-	19
Phenol, 4-nitro	10
Phthalate esters:	
Phthalate, bis(2-ethylhexyl)	22
Polycyclic aromatic hydrocarbons:	
Chrysene	10
Fluoranthene	18
Phenanthrene	12
Pyrene	15

The NURP data also showed a significant number of these samples exceeded various freshwater water quality criteria. The exceedence of water quality criteria does not necessarily imply that an actual violation of standards will exist in the receiving water body in question. Rather, the enumeration of exceedences serves as a screening function to identify those constituents whose presence in urban storm water runoff may warrant high priority for further evaluation.

Members of this group represent all of the major organic chemical fractions

found in Table II of appendix D of 40 CFR part 122 (volatiles, acid compounds, base/neutrals, pesticides). Today's rule requires testing for all organic constituents in Table II rather than limiting the sampling requirements to the 24 toxic constituents found in the NURP study because they will provide a better description of the discharge at essentially the same cost. (The cost of analyzing samples for organic chemicals strongly depends on the number of major organic chemical fractions tested). The NURP study focused on characterizing storm water discharges from lands used for residential, commercial and light industrial activities. In general, the NURP study did not focus on other sources of pollutants to municipal separate storm sewer systems and, therefore, does not reflect all potential pollutants that may be present in discharges from municipal separate storm sewer systems.

The sampling requirements for the permit application address a limited number of sampling locations but require analysis for a wide range of pollutants. Sampling for a wide range of pollutants as a permit application requirement should provide permit writers with appropriate data to target more specific pollutants when developing requirements for a monitoring program during the term of the permit.

Numerous commenters stated that monitoring for all priority pollutants seemed excessive. However, EPA is convinced that it is more appropriate for permit conditions to focus on and prioritize particular pollutant problems after data covering a broad spectrum of pollutants are developed. As noted above, NURP identified 77 priority pollutants in urban runoff, but only from residential, commercial, and light industrial (e.g. industrial parks) areas. One municipal entity stated that this approach is a reasonable and realistic means of providing some useful baseline data, while others recommended sampling a variety of parameters that are included in Tables M-1 and M-2. Another municipal entity stated that characterization of outfall discharge quality during storm events is necessary as a means of targeting source control activities.

EPA is working with the United States Geological Survey (USGS) to evaluate the availability of USGS technical assistance to municipalities through cooperative funding programs to aid in collecting representative quantitative data of storm water discharges from municipal systems.

USGS data collection programs with municipalities typically include storm water discharge samples obtained at various times during a storm hydrograph event. Various USGS field procedures can be used to obtain discharge data for pipes, culverts, etc., typically found in urban areas. Pollutant models can be calibrated with data and long-term rainfall records to simulate the quality of system discharges and compared to other storm water models.

In addition, EPA recognizes that many municipalities have participated in studies, such as NURP, that involve sampling of urban runoff as well as other components of discharges from municipal separate storm sewer systems. All existing storm water sampling data along with relevant water quality data, sediment data, fish tissue data or biosurvey data taken over the last ten years is considered relevant and, under today's rule, must be submitted with part I of the application. Sampling data that is submitted must be accompanied with a narrative description of the drainage area served by the outfall monitored, a description of the sampling and quality control program, and the location of receiving water monitoring.

EPA requested comments on the use of existing data, such as that generated under the NURP study, to satisfy the requirement of providing representative sampling data. Commenters did not agree on the value of NURP results as an indicator of representative data. Several commenters expressed the view that existing data could be used to satisfy in whole or in part the representative sampling requirements of the storm water permit application. However, commenters generally did not offer suggested criteria that could be used to verify the validity of existing data. One commenter believed that intensive sampling over a period of ten years in 12 basins, when combined with NURP data, would be adequate.

One commenter supported the use of data, such as that obtained from the NURP study, to target sampling programs. EPA supports such a methodology and has retained this portion of the proposed discharge characterization component. EPA received strong support from an environmental group for retaining this information requirement in part 1 of the application.

In light of these comments EPA believes it is appropriate to retain the representative sampling requirements without resorting to the use of existing data exclusively. Because of the inherent variability in reliability and applicability of existing data, EPA is convinced that a nationally consistent methodology for collecting data is appropriate. This data can then be used in conjunction with other existing data and models to develop appropriate site specific management programs and more generalized management program strategies. Where existing data and data collected under today's rule varies or does not match, further sampling under the term of the permit will be accomplished to more accurately assess the discharge of pollutants.

c. Loading and Concentration Estimates (part 2 of application). The assessment of the water quality impacts of discharges from municipal separate storm sewer systems on receiving waters requires the analysis of both pollutant loadings and concentrations of pollutants in discharges.

The loading and concentration estimates in today's rule will be used to evaluate two types of water quality impacts: (1) Short-term impacts; and (2) long-term impacts. Specifically, the regulation requires estimates of the annual pollutant load of the cumulative discharges to waters of the United States from municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States municipal outfalls during a storm event for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods. Municipalities have options in the use of methodologies, including those presented in NURP for calculating loads.

Short term impacts from discharges from municipal separate storm sewers involve changes in water quality that occur during and shortly after storm events. Examples of short-term impacts that can lead to impairments include periodic dissolved oxygen depression due to the oxidation of contaminants, high bacteria levels, fish kills, acute effects of toxic pollutants, contact recreation impairments and loss of submerged macrophytes. Characterization of instream pollutant concentrations based on estimated pollutant concentrations in system discharges are important for evaluating these types of impacts.

Long-term water quality impacts from discharges from municipal separate storm sewers may be caused by contaminants associated with suspended solids that settle in receiving water sediments and by nutrients which enter receiving water systems with long

retention times. Pollutant loading data are important for evaluation of impairments such as loss of storage capacity in streams, estuaries, reservoirs, lakes and bays, lake eutrophication caused by high nutrient loadings, and destruction of benthic habitat. Other examples of the long-term water quality impacts include depressed dissolved oxygen caused by the oxidation of organics in bottom sediments and biological accumulation of toxics as a result of uptake by organisms in the food chain. An estimate of annual pollutant loading associated with discharges from municipal storm water sewer systems is necessary to evaluate the magnitude and severity of the environmental impacts of such discharges and to evaluate the effectiveness of controls which are imposed at a later time.

Municipal storm water sewer systems generally handle runoff from large drainage areas and the sources of pollution are usually very diffuse. The concentrations of many pollutants in discharges from these systems are often low relative to many industrial process and POTW discharges. The water quality impacts of low concentration pollution discharges tend to be cumulative and need to be evaluated in terms of aggregate loadings as well as pollutant concentrations. A site-specific loading analysis can be used to evaluate the relative contribution of various pollutant sources.

7. Storm Water Quality Management Plans

Today's rule facilitates the development of site-specific permit conditions by requiring large and medium municipal permit applicants to submit, along with other information, a description of existing structural and non-structural prevention and control measures on discharges of pollutants from municipal storm sewers in part I of the permit application. Section 122.26(d)(2)(iv) requires the applicant to identify in part 2 of the application, to the degree necessary to meet the MEP standard, additional prevention or control measures which will be implemented during the life of the permit. Although, in many cases, it will not be possible to identify all prevention and control measures that are appropriate as permit conditions, EPA believes that the process of identifying components of a comprehensive prevention and/or control program should begin early and that applicants should be given the opportunity to identify and propose the components of the program that they believe are appropriate for first preventing or controlling discharges of pollutants.

As noted earlier, EPA recognizes that problems associated with storm water, combined sewer overflows (CSOs) and infiltration and inflow (I&I) are all interrelated even though they are treated somewhat differently under the law. EPA believes that it is important to begin linking these programs and activities and, because of the potential cost to local governments, to investigate the use of innovative, nontraditional approaches to reducing or preventing contamination of storm water. The application process for developing municipal storm water management plans provides an ideal opportunity between steps 1 and 2 for considering the full range of nontraditional, preventive approaches.

The permit application requirements in today's rule require the applicant or co-applicants to develop management programs for four types of pollutant sources which discharge to large and medium municipal storm sewer systems. Discharges from large and medium municipal storm sewer systems are usually expected to be composed primarily of: (1) Runoff from commercial and residential areas; (2) storm water runoff from industrial areas; (3) runoff from construction sites; and (4) non-storm water discharges. Part 2 of the permit application has been designed to allow the applicant the opportunity to propose MEP control measures for each of these components of the discharge. Discharges from some municipal systems may also contain pollutants from other sources, such as runoff from land disposal activities (leaking septic tanks, landfills and land application of sewage sludge). Where other sources, such as land disposal, contribute significant amounts of pollutants to a municipal storm sewer system, appropriate control measures should be included on a site-specific basis. Proposed management programs will then be evaluated in the development of permit conditions.

There is some overlap in the manner in which these pollutant sources are characterized and their sources identified. For instance, improper disposal of oil into storm drains is often associated with do-it-yourself automobile oil changes in residential areas, or improper application or overuse of herbicides and pesticides in residential areas can also occur in industrial areas. Also, some control measures will reduce pollutant loads for multiple components of the municipal storm sewer discharge. These measures should be identified under all appropriate places in the application; as discussed below, however, double counting of pollutant removal must be avoided when the total assessment of control measures is performed.

Although many land use programs have multiple purposes, including the reduction of pollutants in discharges from municipal separate storm sewer systems, the proposed management programs in today's rule are intended to address only those controls which can be implemented by the permit applicant or co-applicants. EPA cannot abrogate its responsibilities under the CWA to implement the NPDES permit program by relying on pollution control programs that are outside the NPDES program. For example, municipal permit management programs may not rely exclusively on erosion or sediment control laws for implementing that portion of management programs that address discharges from construction sites, unless such laws implement NPDES permit program requirements entirely and that such implementation is a part of the permit.

EPA anticipates that storm water management programs will evolve and mature over time. The permits for discharges from municipal separate storm sewer systems will be written to reflect changing conditions that result from program development and implementation and corresponding improvements in water quality. The proposed permit applications will require applicants to provide a description of the range of control measures considered for implementation during the term of the permit. Flexibility in developing permit conditions will be encouraged by providing applicants an opportunity to identify in the permit application priority controls appropriate for the initial implementation of management programs. Many commenters endorsed the flexible site-specific storm water program approach as proposed as a method for addressing regional water quality control programs in a cost effective manner. To this extent, EPA agrees with one municipality that management programs should focus on more serious problems and sources of pollutants identified in the municipal system. However, EPA believes that to implement section 402(p)(3), comprehensive storm water management programs which address a number of major sources of pollutants to a system are necessary. Municipal programs should not be focused solely on a single source of pollution, such as illicit connections.

One commenter maintained that management program development

should be flexible enough to allow for consideration of what is attainable based on the area's climate, vegetation, hydrology, and land uses. EPA agrees with this comment. Some strategies for reducing pollutants in the northeast will not be practical in the southwest, such as management programs for deicing activities. The permit application process will determine what strategies are appropriate in different locations.

Several commenters supported addressing storm water pollutant problems through management practices or programs rather than end of pipe controls or treatment. EPA agrees with this comment to the extent that storm water management practices are a general theme of this rulemaking with regard to municipal permits. However, there will be cases where such discharges are best addressed through technology such as retention, detention or infiltration ponds.

One commenter reacted unfavorably to the flexible site-specific management plan approach stating that there is no hard criteria upon which to judge the adequacy of programs. Another commenter felt that there should be a BAT standard for municipal permits. Another commenter stated that the rule should contain specific BMPs that the permittee must comply with. EPA disagrees with these comments. The Clean Water Act requires municipalities to apply for permits that will reduce pollutants in discharges to the maximum extent practicable and sets out the types of controls that are contemplated to deal with storm water discharges from municipalities. The language of CWA section 402(p)(3) contemplates that, because of the fundamentally different characteristics of many municipalities, municipalities will have permits tailored to meet particular geographical, hydrological, and climatic conditions. Management practices and programs may be incorporated into the terms of the permit where appropriate. Permit conditions, which require that storm water management programs be developed and implemented or require specific practices, are enforceable in accordance with the terms of the permit. EPA disagrees with the notion that this regulation, which addressed permit application requirements, should create mandatory permit requirements which may have no legitimate application to a particular municipality. The whole point of the permit scheme for these discharges is to avoid inflexibility in the types and levels of control. Further, to the degree that such mandatory requirements may be appropriate, these requirements should be established under the authority of section 402(p)(6) of the CWA and not in this rulemaking, which addresses permit application requirements.

Some commenters suggested that management programs should be developed as part of the permit conditions and not as part of the permit application. EPA agrees that management programs and their ongoing development should be part of the permit term. However, EPA is convinced, and many commenters agree, that the permit application should contain information on what the permittee has done to date and what it proposes and plans to do during the permit term based upon its discharge characterization and source identification data. This is a reasonable and logical approach and one that meets the intent and letter of section 402(p)(3) of the CWA. As stated above, this would be an appropriate method for implementing storm water management programs that should mature and evolve over time.

Applicants will propose priorities based on a consideration of appropriate controls including, but not limited to, consideration of controls that address: reducing pollutants to municipal separate storm sewer system discharges that are associated with storm water from commercial and residential areas (§ 122.26(d)(2)(iv)(A)); illicit discharges and illegal disposal (§ 122.26(d)(2)(iv)(B)); storm water from industrial areas (§ 122.26(d)(2)(iv)(C)); and runoff from construction sites (§ 122.26(d)(2)(iv)(D)). Permits for different municipalities will place different emphasis on controlling various components of discharges from municipal storm sewers. For example, the potential for cross-connections (such as municipal sewage or industrial process wastewater discharges to a municipal separate storm sewer) is generally expected to be greater in municipalities with older developed areas. On the other hand, municipalities with larger areas of new development will have a greater opportunity to focus controls to reduce pollutants in storm water generated by the area after it is developed, discharges from construction sites, and other planning activities.

EPA requested comments on the process and methods for developing appropriate priorities in management programs proposed in applications and how the development of these priorities can be coordinated with controls on other discharges to ensure the achievement of water quality standards and the goals of the CWA.

Discharges from diffuse sources in residential areas was recognized by several commenters as a significant source of pollutants. Accordingly, these elements of the management plans have been retained. In conjunction with the importance of developing programs for illicit connections, numerous commenters stated that education programs are a priority. Another commenter emphasized that ordinances prohibiting such discharges and their enforcement is a crucial means of a successful program in this regard. EPA agrees with these comments and consequently will retain those portions of management program development that include a description of a program for educational activities such as public information for the proper disposal of oil and toxic materials and the use of herbicides, pesticides and fertilizers.

Some commenters noted that discharge characterization is necessary for development of appropriate management plans. EPA agrees with these comments and has retained the discharge characterization components in this rulemaking. However, EPA disagrees that the results of all discharge characterization procedures (*i.e.*, part 1 and part 2) are necessary to describe and propose a program as required in part 2 of the application. The application of various models is available to permit applicants, where needed, to develop appropriate management programs. All available site specific discharge characterization data should be available to the permit writer to draft appropriate conditions for the term of the permit.

One commenter noted that an important aspect of developing management plans is establishing the necessary legal authority to improve water quality. EPA agrees with this comment and has retained those aspects of the regulation which call for development and attainment of adequate legal authority in both parts of the municipal application.

One commenter stated that programs should address previously identified water quality problems in other programs that are required by section 304(l) of the CWA. EPA agrees that identified water quality problems need to be addressed by management programs, and the municipal permit application will call for an identification of these waters. However, EPA does not endorse addressing these waters to the exclusion of all others within the boundaries of the municipal separate storm sewer system. Some waters may experience substantial degradation after rain events and still not be listed under

section 304(l). Further, water quality impacts in listed waters may not be related to storm water discharges, while other non-listed waters do have water quality impacts from storm water discharges. Similarly, EPA agrees with one commenter that it may be desirable to focus attention and resources on certain problem watersheds within a municipality, and controls may be imposed and programs prioritized on that basis. However, such a focus should not be to the exclusion of other waters and watersheds that have water quality problems (although less troublesome) traceable to storm water discharges. The CWA requires that permits address discharges to waters of the United States, not just waters previously targeted under special programs.

Some commenters expressed concern that the permit application requires the design of management programs before knowing what will be in the permits. EPA disagrees with the thrust of this comment, that is that the order of requirements is inappropriate. The permit applicant will have two years to develop proposed plans which can be considered by permit writers in the development of the permit. Based upon a consideration of the management program proposed by the municipality and other relevant information, permits can be tailored for individual programs. One commenter stated that the cornerstone of management programs are inspection and enforcement programs. EPA agrees that these two elements are important components. Without inspection and enforcement mechanisms the programs will undoubtedly falter. Accordingly these requirements in the description of management programs in the permit application have been retained. In a similar vein, one commenter emphasized the importance of developing legal authority, financial capability, and administrative infrastructure. EPA agrees with this comment and has retained those aspects of the regulation that call for a description of applicants plans and resources in these areas.

One commenter stressed that control of discharges into the municipal system from industries is an important goal of municipal storm water management programs. EPA agrees with this comment and has retained the proposed description of management programs to address discharges from industrial sources. Other commenters identified industries as the principal contributors of pollutants to municipal separate storm sewer systems.

In addition, EPA will continue to evaluate procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality in the studies required under section 402(p)(5) of the CWA. One purpose of these studies will be to evaluate the costs and water quality benefits associated with implementing these procedures and methods. This evaluation will address a number of factors which impact the implementation costs associated with these programs, such as the extent to which similar municipal ordinances are currently being implemented, the degree to which existing municipal programs (such as flood management programs or construction site inspections) can be expanded to address water quality concerns, the resource intensiveness of the control, and whether the control program will involve public or private expenditures. This information, along with information gained during permit implementation will aid in the dynamic long-term development of municipal storm water management programs.

a. *Measures to reduce pollutants in runoff from commercial and residential areas.* The NURP program evaluated runoff from lands primarily dedicated to residential and commercial activities. The areas evaluated in the study reflect some other activities, such as light industry, which are commonly dispersed among residential and commercial areas. The NURP study selected sampling locations that were thought to be relatively free of illicit discharges and storm water from heavy industrial sites including storm water runoff from heavy construction sites. Of course, in a study such as NURP it was impossible to totally isolate various contributions to the runoff. In developing the permit application requirements in today's rule EPA has, in general, relied on the NURP definition of urban runoff—runoff from lands used for residential, commercial and light industrial activities.

NURP and numerous other studies have shown that runoff from residential and commercial areas washes a number of pollutants into receiving waters. Of equal importance is the volume of storm water runoff leaving urban areas during storm events. Large intermittent volumes of runoff can destroy aquatic habitat. As the percentage of paved surfaces increases, the volume and rate of runoff and the corresponding pollutant loads also increase. Thus, the amount of storm water runoff from commercial and residential areas and the pollutant loadings associated with storm water runoff increases as development progresses; and they remain at an elevated level for the lifetime of the development.

Proposed § 122.26(d)(2)(iv)(A) requires municipal storm sewer system applicants to provide in part 2 of the application a description of a proposed management program that will describe priorities for implementing management programs based on a consideration of appropriate controls including:

- A description of maintenance activities and a maintenance schedule for structural controls;
- A description of planning procedures including a comprehensive master plan to control after construction is completed, the discharge of pollutants from municipal separate storm sewers which receive discharges from new development and significant redevelopment after construction is completed (in response to comment this contemplates an engineering policy and procedure strategy with long term planning);
- A description of practices for operating and maintaining public highways and procedures for reducing the impact on receiving waters of such discharges from municipal storm sewer system;
- A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies; and
- A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

Water quality problems caused by municipal storm sewer discharges will generally be most acute in heavily developed areas. Prevention measures may be desirable and cost effective. However, structural control measures may also be effective, although opportunities for implementing these measures may be limited in previously developed areas. Commonly used structural technologies include a wide variety of treatment techniques, including first flush diversion systems, detention/infiltration basins, retention basins, extended detention basins, infiltration trenches, porous pavement, oil/grit separators, grass swales, and swirl concentrators. A major problem associated with sound storm water management is the need for operating

and maintaining the system for its expected life.

The unavailability of land in highly developed areas often makes the use of structural controls infeasible for modifying many existing systems. Non-structural practices can play a more important role. Non-structural practices can include erosion control, streambank management techniques, street cleaning operations, vegetation/lawn maintenance controls, debris removal, road salt application management and public awareness programs.

As noted above, the first component of the proposed program to reduce pollutants in storm water from commercial and residential areas which discharge to municipal storm sewer systems is to describe maintenance activities and schedule. The second component of the proposed program to reduce pollutants in storm water from commercial and residential areas which discharge to municipal storm sewer systems provides that applicants describe the planning procedures and a comprehensive master plan that will assure that increases of pollutant loading associated with newly developed areas are, to the maximum extent practicable, limited. These measures should address storm water from commercial and residential areas which discharge to the municipal storm sewer that occur after the construction phase of development is completed. Controls for construction activities are addressed later in today's rule. One commenter noted the feasibility of developing management plans for newly developing areas. EPA agrees with this comment and has retained that portion of the regulation that deals with a description of controls for areas of new development. Similarly, one municipality stressed the importance and achievability of addressing storm water discharges from construction sites.

As urban development occurs, the volume of storm water and its rate of discharge increases. These increases are caused when pavement and structures cover soils and destroy vegetation which otherwise would slow and absorb runoff. Development also accelerates erosion through alteration of the land surface. Areas that are in the process of development offer the greatest potential for utilizing the full range of structural and non-structural best management practices. If these measures are to provide controls to reduce pollutant discharges after the area has been developed, comprehensive planning must be used to incorporate these measures as the area is in the process of developing. These measures offer an important opportunity to limit increases in pollutant loads.

The third component of § 122.26(d)(2)(iv)(A) provides a description of practices for operating and maintaining public roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems. General guidelines recommended for managing highway storm water runoff include litter control, pesticide/herbicide use management, reducing direct discharges, reducing runoff velocity, grassed channels, curb elimination, catchbasin maintenance, appropriate streetcleaning, establishing and maintaining vegetation, development of management controls for salt storage facilities, education and calibration practices for deicing application, infiltration practices, and detention/retention practices.

The fourth component of § 122.26(d)(2)(iv)(A) provides that applicants identify procedures that enable flood management agencies to consider the impact of flood management projects on the water quality of receiving streams. A well-developed storm water management program can reduce the amount of pollutants in storm water discharges as well as benefit flood control objectives. As discussed above, increased development can increase both the quantity of runoff from commercial and residential areas and the pollutant load associated with such discharges. Disturbing the land cover, altering natural drainage patterns, and increasing impervious area all increase the quantity and rate of runoff, thereby increasing both erosion and flooding potential. An integrated planning approach helps planners make the best decisions to benefit both flood control and water quality objectives.

The fifth component of § 122.26(d)(2)(iv)(A) would provide that municipal applicants submit a description of a program to reduce, to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer. Such a program may include controls such as educational activities and other measures for commercial applicators and distributors and controls for application in public rights-of-way and at municipal facilities. Discharges of these materials to municipal storm sewer systems can be controlled by proper application of these materials. Some commenters noted that insecticides used in residential areas are a probable source of pollutants in storm water discharges from residential areas, as well as salting and other de-icing activities. In response to this comment, part of a community management plan may include controls or education programs to limit the impacts of these sources of pollutants. One commenter noted that many communities already have household toxic disposal programs. Where appropriate these can be incorporated into municipal management programs.

Some commenters suggested substituting the management program description for residential and commercial areas with a simple identification of applicable management practices. EPA agrees that identification of appropriate management practices is a critical component of a program description for these areas. In essence, this is what the program description is designed to achieve. However, for the reasons discussed in greater detail above, EPA is convinced that an appropriate program must address all of the components of the management program for residential and commercial areas that are outlined in today's rule. Further, for the purposes of writing a permit with enforceable conditions, the application should identify a schedule to implement management practices. The applicant should be able to estimate the reduction in pollutant loads as a result of the development of certain management practices and programs (§ 122.26(d)(2)(v). A program may also include public education programs, which are not necessarily viewed as traditional BMPs.

b. *Measures for illicit discharges and improper disposal.* The CWA requires that NPDES permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers." In today's rule, EPA will begin to implement this statutory mandate by focusing on two types of discharges to large and medium municipal separate storm sewer systems. *See* § 122.26(d)(1)(iv)(D) and (d)(2)(iv)(B). One type of non-storm water discharges are illicit discharges which are plumbed into the system or that result from leakage of sanitary sewage system. The other class of non-storm water discharges result from the improper disposal of materials such as used oil and other toxic materials.

Illicit discharges. In some municipalities, illicit connections of sanitary, commercial and industrial discharges to storm sewer systems have had a significant impact on the water quality of receiving waters. Although the

NURP study did not emphasize identifying illicit connections to storm sewers other than to assure that monitoring sites used in the study were free from sanitary sewage contamination, the study concluded that illicit connections can result in high bacterial counts and dangers to public health. The study also noted that removing such discharges presented opportunities for dramatic improvements in the quality of urban storm water discharges.

Other studies have shown that illicit connections to storm sewers can create severe, wide-spread contamination problems. For example, the Huron River Pollution Abatement Program inspected 660 businesses, homes and other buildings located in Washtenaw County, Michigan and identified 14% of the buildings as having improper storm drain connections. Illicit discharges were detected at a higher rate of 60% for automobile related businesses, including service stations, automobile dealerships, car washes, body shops and light industrial facilities. While some of the problems discovered in this study were the result of improper plumbing or illegal connections, a majority were approved connections at the time they were built. Many commenters emphasized the identification and elimination of illicit connections as a priority, including leakage from sanitary sewers. EPA agrees with these comments and intends to retain this portion of the program without modification.

A wide variety of technologies exist for detecting illicit discharges. The effectiveness of these measures largely depends upon the site-specific design of the system. Under today's rule, permit applicants would develop a description of a proposed management program, including priorities for implementing the program and a schedule to implement a program to identify illicit discharges to the municipal storm sewer system. This rulemaking will require the initial priorities for analyzing various portions of the system and the appropriate detection techniques to be used.

Improper disposal. The permit application requirements for municipal storm sewer systems include a requirement that the municipal permit applicant describe a program to assist and facilitate in the proper management of used oil and toxic materials. Improper management of used oil can lead to discharges to municipal storm sewers that in turn may have a significant impact on receiving water bodies. EPA estimates that, annually, 267 million gallons of used oil, including 135 million gallons of used oil from do-it-yourself automobile oil changes, are disposed of improperly. An additional 70 million gallons of used oil, most coming from service stations and repair shops, are used for road oiling. Many commenters emphasized the elimination of discharges composed of improperly disposed of oil and toxic material. One commenter identified motor oil as the major source of oil contamination and that EPA needs to encourage proper disposal of used oil. Several other commenters emphasized the importance of recycling programs for oil. EPA agrees with these comments and intends to retain this portion of the program without modification. One commenter identified public awareness and timely reporting of illegal dumping as critical components of this portion of the program. EPA agrees with this comment and intends for management programs to deal with this problem.

c. *Measures to reduce pollutants in storm water discharges through municipal separate storm sewers from municipal landfills, hazardous waste treatment, disposal and recovery facilities that are subject to section 313 of title III of SARA.* As discussed in section VI.C of today's preamble, industrial facilities that discharge storm water through a large or medium municipal separate storm sewer system are required to apply for a permit under § 122.26(c) or seek coverage under a promulgated general permit. Today's rule also requires the municipal storm sewer permittee to describe a program to address industrial dischargers that are covered under the municipal storm sewer permit. Today's rule requires the municipal applicant to identify such discharges (*see* source identification requirements under § 122.26(d)(2)(iii)), provide a description of a program to monitor pollutants in runoff from certain industrial facilities that discharge to the municipal separate storm sewer system, identify priorities and procedures for inspections, and establish and implement control measures for such discharges. Should a municipality suspect that an individual discharger is discharging pollutants in storm water above acceptable limits, and the owner/operator of the system has no authority over the discharge, the municipality should contact the NPDES permitting authority for appropriate action. Two example of possible action are: if the facility already has an individual permit, the permit may be reopened and further controls imposed; or if the facility is covered by a promulgated general permit, then an individual site specific permit application may be required.

In the December 7, 1988, proposal, EPA requested comments concerning what storm water discharges from industrial facilities through municipal systems should be monitored. One of the proposed approaches was to require data on portions of the municipal system which receive storm water from facilities which are listed in the proposed regulatory definition at § 122.26(b)(14) of "storm water discharge associated with industrial activity" (with the exception of construction activities and uncontaminated storm water from oil and gas operations) which discharge through the municipal system. However, given the large number of facilities meeting this definition that discharge through municipal systems, a monitoring program that requires the submission of quantitative data regarding portions of the municipal systems receiving storm water from such facilities may not be practicable. Such a requirement could, for some systems, potentially become the most resource intensive requirements in the municipal permit. Therefore, EPA proposed various ways to develop appropriate targeting for monitoring programs.

EPA requested comments on a requirement that, at a minimum, monitoring programs address discharges from municipal separate storm sewer outfalls that contain storm water discharges from municipal landfills, hazardous waste treatment, disposal and recovery facilities, and runoff from industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA). Section 313 of title III requires that operators of certain facilities that manufacture, import, process, or otherwise use certain toxic chemicals report annually their releases of those chemicals to any environmental media. Section 313(b) of title III specifies that a facility is covered for the purposes of reporting if it meets all of the following criteria.

- The facility has ten or more full-time employees;
- The facility is in Standard Industrial Classification (SIC) codes 20 through 39;
- The facility manufactured (including quantities imported), processed, or otherwise used a listed chemical in amounts that exceed certain threshold quantities during the calendar year for which reporting is required.

Listed chemicals include 329 toxic chemicals listed at 40 CFR 372.45. After 1989, the threshold quantities of listed chemicals that the facility must manufacture, import or process (in order to trigger the submission of a release

report) is 25,000 pounds per year. The threshold for a use other than manufacturing, importing or processing of listed toxic chemicals is 10,000 pounds per year. EPA promulgated a final regulation clarifying these reporting requirements on February 16, 1988. (53 FR 4500).

EPA received numerous comments regarding limiting the types of facilities that are initially subject to monitoring and municipal management programs. Numerous municipalities agreed that focusing on the above facilities is an appropriate means for setting priorities for the development of control measures to eliminate or reduce pollutants associated with industrial facilities. Commenters agreed that the potential for toxic materials in discharges is high because of the high volume of such materials at these facilities and that information regarding discharges and material management practices will be available through section 313 of SARA. One commenter noted that building on an established program will contribute to establishing an effective storm water program. Accordingly, EPA has specified at § 122.26(d)(2)(ii)(C) that the municipal applicant must describe a program that identifies priorities and procedures for inspections and establishing and implementing control measures for these facilities.

Several commenters suggested that these facilities should not be singled out because the presence of the threshold amounts of SARA 313 chemicals does not indicate that significant quantities of those chemicals are likely to enter the facility's storm water runoff. Instead it was suggested that municipalities should monitor storm sewers as a whole to determine what chemicals are present and therefore what facilities are responsible. EPA disagrees with these comments. The object of these requirements is initially to set priorities for monitoring requirements. Then, if the situation requires, controls can be developed and instituted. If a facility is a member of this class of facilities and does not discharge excessive quantities of SARA 313 chemicals, then it may not be subjected to further monitoring and controls. As noted above, the selection of facilities is only a means of setting priorities for facilities for the development of municipal plans.

EPA agrees, however, that there will be other facilities that are significant sources of pollutants and should be addressed by municipalities as soon as possible under managemen programs. Accordingly, those industrial facilities that the municipal permit applicant determines to be contributing a substantial pollutant loading to the municipal storm sewer system shall be addressed in this portion of the municipal management program.

EPA also requested comments on monitoring programs for municipal dischargers including the submission of quantitative data on the following constituents:

- Any pollutants limited in an effluent guidelines for the industry subcategories, where applicable;
- Any pollutant listed in a discharging facility's NPDES permits for process wastewater, where applicable;
- Oil and grease, pH, BOD5, COD, TSS, total phosphorus, total Kjeldahl nitrogen, and nitrate plus nitrite nitrogen;
- Any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

These are the same constituents that are to be addressed in individual permit applicants for storm water discharges associated with industrial activity.

Several industries and municipalities submitted comments on this issue. Some commenters agreed that these are appropriate parameters. Some commenters advised that the ability of municipalities to implement this aspect of the program depended on industries submitting this data. Several industries provided comments suggesting that the approach should allow the permittee flexibility in determining which parameters are chosen because of the burdens of monitoring and the complexity of materials and flows in municipal systems.

In light of these comments, EPA has retained § 122.26(d)(2)(iv)(C) as proposed requiring municipalities to describe a monitoring program which utilizes the above parameters. Monitoring for these parameters provides consistency with the individual application requirements for industries, provides uniformity in municipal applications, and will narrow the parameters to conform to the types of industries discharging into the municipal systems. Monitoring programs may consist of programs undertaken by the municipality exclusively or requirements imposed on industry by the municipality, or a combination of approaches. Appropriate procedures are discussed in municipal permit application guidance.

EPA requested comments on appropriate means for municipalities to determine what facilities are contributing pollutants to municipal systems. Many commenters responded with numerous methodologies. Some of these have been addressed in guidance. Municipalities will have options in selecting the most appropriate methodology given their circumstances as described in their permit applications.

EPA initially favors establishing monitoring requirements to be applied to those outfalls that directly discharge to waters of the United States. EPA received one comment from a municipality with regard to this issue which agreed that this was the most logical approach. Monitoring of outfalls close to the point of discharge to waters of the United States is generally preferable when attempting to identify priorities for developing pollutant control programs. However, under certain circumstances, it may be preferable to monitor at the point where the runoff from the industrial facility discharges to the municipal system. For example, if many facilities discharge substantially similar storm water to a municipal system it may be more practicable to monitor discharges from representative facilities in order to characterize pollutants in the discharge.

As noted by numerous industries, if municipal characterization plans reveal problems from certain industrial dischargers, then such facilities may be required to provide further data from their own monitoring. As noted above, EPA envisions that this data could then be used to develop appropriate control practices or techniques and/or require individual permit applications if a general permit covering the facility proves inadequate.

Comments were also solicited as to whether end-of-pipe treatment generally was more appropriate than source controls for storm water from industrial facilities which discharge to municipal systems. Many commenters, including both municipalities and industries, stated that source controls are the only practical and feasible means of controlling pollutants in storm water runoff, and specifically opposed the concept of end-of-pipe treatment or other controls. Some commenters maintained that, from an economic and environmental standpoint, end-of-pipe treatment may be the only effective means. One advised that the prompt cleanup of spills, controlled wash down of process areas, covering of material loading areas, storm water runoff diversion, covered storage areas, detention basins or other such mechanisms would prevent storm water from mixing with pollutants and possibly discharging them into receiving waters. Another noted that in the urban areas, there is little potential for treatment; consequently, it would seem

that controls and/or retrofitting existing facilities would be necessary when violations are found and that citizens will be better served by source controls appropriate to the individual problem.

EPA agrees with these comments to the extent that source controls and management programs are the general thrust of these regulations. However, in some situations end-of-pipe treatment, such as holding ponds, may be the only reasonable alternative. EPA disagrees with one industrial commenter that the municipalities should be almost entirely responsible for treating municipal discharges at the end of-the-pipe without reliance on source controls by industrial dischargers. Municipal programs may require controls on industrial sources with demonstrated storm water discharge problems. One industrial association noted that its member companies already have incentive to properly handle their materials and facilities because of other environmental programs with spill and erosion controls.

Numerous commenters stated that the program addressing industrial dischargers through municipal systems needs to be clearly defined in order to eliminate, as much as possible, potential conflicts between the system operator and dischargers. EPA has provided a framework for development of management plans to control pollutants from these particular sources. However, because of the differences in municipal systems and hydrology nationwide, EPA is not convinced that program specificity is an appropriate approach. The concept of the management program is to provide flexibility to the permit applicants to develop regional site specific control programs.

One commenter suggested that required controls should be limited to a facility's proportional contribution (based on concentration) of pollutants. EPA disagrees. Most facilities discharging through a municipal separate storm sewer will need to be covered by a general or individual permit. These permits will control the introduction of pollutants from that facility through the municipal storm sewer to the waters of the U.S. Any additional controls placed on the facility by the municipality will be at the discretion of the municipality. EPA is not requiring municipalities to adopt a particular level of controls on industrial facilities as suggested by the commenter.

One commenter questioned how dischargers that discharged both into the waters of the United States and through a municipal system will be addressed and whether there is a potential for inconsistent requirements. Industries that discharge storm water associated with industrial activity into the waters of the United States are required to be covered by individual permits or general permits for such discharges. Dischargers of storm water associated with industrial activity through municipal separate storm sewer systems will be subject to municipal management programs that address such discharges as well as to an individual or general NPDES permit for those discharges. EPA does not believe there is a significant risk of inconsistent requirements, since each industrial facility must meet BAT/BCT-level controls in its NPDES permit. EPA doubts that municipalities will impose much more stringent controls.

Many commenters stated that if cities and municipalities are to be responsible for industrial storm water discharges through their system, then municipalities should have authority to make determinations as to what industries should be regulated, how they are regulated, and when enforcement actions are undertaken. In response, EPA notes that the proposal has been changed and that municipalities will not be solely responsible for industries discharging through their system. Nonetheless, municipalities will be required to meet the terms of their permits related to industrial dischargers. Municipalities may undertake programs that go beyond the threshold requirements of the permit. Some municipal entities stated that municipal permittees should be able to require permit applications from industries in the same manner that EPA does and also require permits. In response, if operators of large and medium municipal separate storm sewer systems wish to employ such a program, then this portion of the management program may incorporate such practices.

d. *Measures to reduce pollutants in runoff from construction sites into municipal systems.* Section VI.F.8 of today's rule discusses EPA's proposal to define the term "storm water discharge associated with industrial activity" to include runoff from construction sites, including preconstruction activities except operations that result in the disturbance of less than 5 acres total land area which are not part of a larger common plan of development or sale. Under today's rule, facilities that discharge runoff from construction sites that meet this definition will be required to submit permit applications unless they are to be covered by another individual or general NPDES permit. Permit application requirements for such discharges are at 40 CFR 122.26(c)(1)(ii).

Section 122.2o(d)(2)(iv)(D) of today's rule requires applicants for a permit for large or medium municipal separate storm sewer systems to submit a description of a proposed management program to control pollutants in construction site runoff that discharges to municipal systems. Under this provision, municipal applicants will submit a description of a program for implementing and maintaining structural and non-structural best management practices for controlling storm water runoff at construction sites. The program will address procedures for site planning, enforceable requirements for nonstructural and structural best management practices, procedures for inspecting sites and enforcing control measures, and educational and training measures. Generally, construction site ordinances are effective when they are implemented. However, in many areas, even though ordinances exist, they have limited effectiveness because they are not adequately implemented. Maintaining best management practices also presents problems. Retention and infiltration basins fill up and silt fences may break or be overtopped. Weak inspection and enforcement point to the need for more emphasis on training and education to complement regulatory programs. Permits issued to municipalities will address these concerns.

8. Assessment of Controls

EPA proposed that municipal applicants provide an initial assessment of the effectiveness of the control method for structural or non-structural controls which have been proposed in the management program. Some commenters stated that the assessment of controls should be left to the term of the permit because the effectiveness of controls will be hard to establish. EPA believes that an initial estimate or assessment is needed because the performance of appropriate management controls is highly dependent on site-specific factors. The assessment will be used in conjunction with the development of pollutant loading and concentration estimates (*see* VI.H.6.c) and the evaluation of water quality benefits associated with implementing controls. Such assessments do not have to be verified with quantitative data, but can be based on accepted engineering design practices. Further more precise assessments based upon quantitative data can be undertaken during the term of the permit.

I. Annual Reports

As discussed earlier in today's preamble EPA has provided for proposed flexible permit application requirements to facilitate the development of site-specific programs to control the discharge of pollutants from large and medium municipal separate storm sewer systems. Many municipalities are in the early stages of the complex task of developing a program suitable for controlling pollutants in discharges under a NPDES permit, while other municipalities have relatively sophisticated programs in place. In order to ensure that such site-specific programs are developed in a timely manner, EPA proposed to require permittees of municipal separate storm sewer systems to submit status reports every year which reflect the development of their control programs.

The reports will be used by the permitting authority to aid in evaluating compliance with permit conditions and where necessary, modify permit conditions to address changed conditions. EPA requested comments on the appropriate content of the annual reports. Based on these comments EPA has added the following in these reports: an analysis of data, including monitoring data, that is accumulated throughout the year; new outfalls or discharges; annual expenditures; identification of water quality improvements or degradation on watershed basis; budget for year following each annual report; and administrative information including enforcement activities, inspections, and public education programs. EPA views this information as important for evaluating the municipal program. Annual monitoring data and identified water quality improvements are important for evaluating the success of management programs in reducing pollutants. If new outfalls come into existence during the term of the permit, these may be sources of pollutants and appropriate permit conditions will be developed. Annual reports should reflect the level of enforcement activity and inspections undertaken to ensure that the legal authority developed by the municipality is properly exercised. Many of the management programs depend upon an ongoing high level of public education. Accordingly, the undertaking of these programs on an annual basis should be documented.

J. Application Deadlines

The CWA provided a statutory time frame for implementing the storm water permit application process and issuance and compliance with permits.

The CWA requires EPA to promulgate permit application requirements for storm water discharges associated with industrial activity and for large municipal separate storm sewer systems by "no later than two years" after the date of enactment (*i.e.* no later than February 4, 1989). In conjunction with this requirement, the Act requires that permit applications for these classes of discharges be submitted within one year after the statutory date by which EPA is to promulgate permit application requirements by providing that such applications "shall be filed no later than three years" after the date of enactment of the WQA (*i.e.*, no later than February 4, 1990).

The CWA also requires EPA to promulgate final regulations governing storm water permit application requirements for discharges from municipal separate storm sewer systems serving a population of 100,000 or more but less than 250,000 by "no later than four years" after enactment (*i.e.* no later than February 4, 1991). Permit applications for medium municipal separate storm sewer systems "shall be filed no later than five years" after the date of enactment of the CWA (*i.e.*, no later than February 4, 1992). The CWA did not establish the time period between designation and permit application submittal for case-by-case designations under section 402(p)(2)(E).

Comments on earlier rulemakings involving storm water application deadlines have established that applicants need adequate time to obtain "representative" storm water samples. Many commenters have indicated that at least one full year is needed to obtain such samples. This is because many discharges are located in areas where testing during dry seasons or winter would not be feasible. The intermittent and unpredictable nature of storm water discharges can result in difficult and time-consuming data gathering. Moreover, some operators of municipal separate storm sewer systems have many storm water discharges associated with industrial activity, which can require considerable time to identify, analyze, and submit applications. This creates a tremendous practical problem for the extremely high number of unpermitted storm water discharges. The public's interest in a sound storm water program and the development of a useful storm water data base is best served by establishing an application deadline which will allow sufficient time to gather, analyze, and prepare meaningful applications. Based on a consideration of these factors, EPA proposed that individual permit applications for storm water discharges associated with industrial activity which currently are not covered by a permit and that are required to obtain a permit, be submitted one year after the final rule is promulgated.

EPA received numerous comments from industries on the one year requirement for submitting applications. Several commenters supported the proposed deadline as realistic, while others believed more time was needed to meet the information and quantitative requirement.

EPA rejects the assertion by some commenters that a year is too short a period of time to obtain the required quantitative data. Today's rule generally requires applications for storm water discharges associated with industrial activity to be submitted on or before November 18, 1991. Operators of storm water discharges associated with industrial activity which discharge through a municipal separate storm sewer are subject to the same application deadline as other storm water discharges associated with industrial activity. Since final regulation at § 122.21(g)(7) provides considerable latitude for selecting rain events for quantitative data, EPA is convinced that in most cases data can be obtained during the one year time frame. If data cannot be collected during the one year time frame because of anomalous weather (*e.g.* drought conditions), then permitting authorities may grant additional time for submitting that data on a case-by-case basis. *See* § 122.21(g)(7).

Operators of storm water discharges which are currently covered by a permit will not be required to submit a permit application until their existing permit expires. In recognition of the time required to collect storm water discharge data, EPA will allow facilities which currently have a NPDES permit for a storm water discharge and which must reapply for permit renewal during the first year following promulgation of today's permit application requirements the option of applying in accordance with existing Form 1 and Form 2C requirements (in lieu of applying in accordance with the revised application requirements).

As discussed in section VI.D.4 and section VI.F.6 of today's preamble, EPA has established a two part permit application both for both group applications for sufficiently similar facilities that discharge storm water associated with industrial activity and for operators of large or medium municipal separate storm sewer systems. The deadlines for submitting

permit applications in today's rule provide adequate time for: (1) Applicants to prepare Part 1 of the application; (2) EPA or an approved State to adequately review applications; and (3) applicants to prepare the contents of the part 2 application.

Part 1 of the group application for storm water discharges associated with industrial activity must be submitted within 120 days from the publication of these final permit application regulations. This time is necessary to form groups and for individual members of the group to prepare the non-quantitative information required in part 1 of the application. Part 1 of the group application will be submitted to EPA Headquarters in Washington, DC and reviewed within 60 days after being received. Part 2 of the application would then be submitted within one year after the part 1 application is approved. It should be noted that many facilities located in States in which general permits can be issued, will be eligible for coverage by a storm water general permit to be promulgated in the near future. Such facilities may either seek coverage under such general permits or participate in the group application.

Several comments were received by EPA that indicated that a period of 120 days was too short a period for groups to be formed. EPA disagrees with these comments. The information that EPA is requiring to be submitted by the group or group representative is information that is generally available such as the location of the facility, its industrial activity, and material management practices. EPA believes that 120 days is sufficient to gather and submit this information along with an identification of 10% of the facilities which will submit quantitative data. To ameliorate any difficulties for applicants, EPA has provided a means for late facilities to "add on" where appropriate, on a case-by-case basis, as discussed in section VI.F.4. above.

Several comments were received with regard to the requirement that new dischargers submit an application at least 180 days before the date on which the discharge is to commence. One commenter noted that it will be difficult for a facility to know when a storm water discharge is to commence since precipitation and runoff cannot be predicted to any degree of accuracy. In response, new dischargers must apply for a storm water permit application 180 days before that facility commences manufacturing, processing, or raw material storage operations which may result in the discharge of pollutants from storm water runoff, and 90 days for new construction sites.

For large municipal separate storm sewer systems (systems serving a population of more than 250,000), EPA proposed that part 1 of the permit application be submitted within one year of the date of the final regulations, with approval or disapproval by the permit issuing authority of the provisions of the part 1 permit application within 90 days after receiving part 1 of the application. The Part 2 portion of the application was to be submitted within two years of the date of promulgation.

For medium municipal separate storm sewer systems (systems serving a population of more than 100,000, but less than 250,000), EPA proposed that permit applications would be required nine months after the date of the final rule, with approval or disapproval of the provisions of the part 1 permit application within 90 days after receiving the part 1 application. The part 2 portion of the application would then be submitted no later than one year after the part 1 application has been approved.

Numerous comments were received by EPA from municipalities on these proposed deadlines. Many of these comments reflect the sentiment that the deadlines are too tight and that the required information would not be available for submission within the required time frame. Some commenters suggested deadlines that would add over three years to the permit application process. Other commenters suggested a revamped application process and a shorter deadline of 18 months. Some commenters explained that additional time would be needed to obtain adequate legal authority, while another stated that an inventory of outfalls required more time. One commenter maintained that intergovernmental agreements will require more time to prepare, and others expressed the view that more time was needed for the review of part 1 of the application by permitting authorities. Others felt more time was needed for collecting data, or hiring additional staff to accomplish the work. Most of these commenters did not provide specific details regarding what would be an appropriate amount of time and why.

After reviewing these comments EPA has decided to modify some of the deadlines as proposed. EPA is convinced that to properly achieve the goals of the CWA, the permit application requirements as discussed in previous sections are appropriate; but that the deadlines for medium municipal separate storm sewer systems should be adjusted so that the program's goals can be properly accomplished. After reviewing comments, EPA believes that medium municipalities will have fewer resources and existing institutional arrangements than large cities and therefore more time should be granted to these cities for submitting parts 1 and 2 of the application.

Accordingly EPA will require large municipal systems to submit part 1 of the permit application no later than November 18, 1991. Part 1 will be reviewed and approved or disapproved by the Director within 90 days. Part 2 of the application will then be submitted November 16, 1992. Medium municipal systems will submit part 1 of the application on May 18, 1992. Approval or disapproval by the Director will be accomplished within 90 days. Part 2 of the application will be submitted by May 17, 1993. These deadlines will give large systems two years to complete the application process, and medium systems 2 years and 6 months to submit applications. EPA is convinced that the permit application schedule is warranted and should provide adequate time to prepare the application.

In establishing these regulatory deadlines EPA is fully aware that they are not synchronized with the statutory deadlines as established by Congress. One commenter argued that the deadlines as proposed were contrary to the deadlines established by Congress and that EPA had no authority to extend these deadlines. (For large municipal separate storm sewer systems and storm water discharges associated with industrial activity, Congress established a deadline of February 4, 1990, for submission of permit applications; for medium municipal separate storm sewer systems, the deadline is February 4, 1992.) In response, this regulation provides certain deadlines for meeting the substantive requirements of this rulemaking—requirements which EPA is convinced are necessary for the development of enforceable and sound storm water permits. EPA believes it is important to give applicants sufficient time to reasonably comply with the permit application requirements set out today. EPA will therefore accept applications for storm water discharge permits up to the dates specified in today's rule. By establishing these regulatory deadlines, however, EPA is not attempting to waive or revoke the statutory deadlines established in Section 402(p) of the CWA and does not assert the authority to do so. The statutory permit application deadlines

continue to be enforceable requirements.

EPA was not able to promulgate the final application regulations for storm water discharges before the February 4, 1990, deadline for industrial and large municipal dischargers despite its best efforts. Further, as noted above, EPA is not able to waive the statutory deadline. Dischargers concerned with complying with the statutory deadline should submit a permit application as required under this rulemaking as expeditiously as possible.

Operators of storm water discharges that are not specifically required to file a permit application under today's rule may be required to obtain a permit for their discharge on the basis of a case-by-case designation by the Administrator or the NPDES State.

The Administrator or NPDES State may also designate storm water discharges (except agricultural storm water discharges), that contribute to a violation of a water quality standard or that are significant contributors of pollutants to waters of the United States for a permit. Prior to a case-by-case determination that an individual permit is required for a storm water discharge, the Administrator or NPDES State may require the operator of the discharge to submit a permit application. 40 CFR 124.52(c) requires the operator of designated storm water discharges to submit a permit application within 60 days of notice, unless permission for a later date is granted. The 60-day deadline is consistent with the procedures for designating other discharges for a NPDES permit on a case-by-case basis found at 40 CFR 124.52. The 60-day deadline recognizes that case-by-case designations often require an expedited response, however, flexibility exists to allow for case-by-case extensions.

The December 7, 1988, proposal also proposed Part 504 State Storm Water Management Programs. The Agency has not included this component in today's rule. The Agency believes this program element is appropriate for addressing in regulations promulgated under section 402(p)(6) of the CWA.

VII. Economic Impact

EPA has prepared an Information Collection Request for the purpose of estimating the information collection burden imposed on Federal, State and local governments and industry for revisions to NPDES permit application requirements for storm water discharges codified in 40 CFR part 122. EPA is promulgating these revisions in response to Section 402(p)(4) of the Clean Water Act, as amended by the Water Quality Act of 1987 (WQA). The revisions would apply to: Storm water discharges associated with industrial activity; discharges from municipal separate storm sewer systems serving a population of 250,000 or more and discharges from municipal separate storm sewer systems serving a population of 100,000 or more, but less than 250,000.

The estimated annual cost of applying for NPDES permits for discharges from municipal separate storm sewer systems is $4.2 million. EPA estimates that an average permit application for a large municipality will cost $76,681 and require 4,534 hours to prepare. The average application for a medium municipality will cost $49,249 (2,912 hours) to prepare. The annual respondent cost for NPDES permit applications, notices of intent, and notifications for facilities with discharges associated with industrial activity is estimated to be $9.5 million (271,248 hours). EPA estimates that the average preparation cost of an individual industrial permit application would be $1,007 (28.6 hours). Average Group application will cost $74.00 per facility (2.1 hours). The average cost of the notification and notice of intent to be covered by general permit is $17.00 (0.5 hours).

The annual cost to the Federal Government and approved States for administration of the program is estimated to be $588,603. The total cost for municipalities, industry, and State and Federal authorities is estimated to be $14.5 million annually.

In general, the cost estimates provided in the ICR focus primarily on the costs associated with developing, submitting and reviewing the permit applications associated with today's rule. EPA will continue to evaluate procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality in the studies required under section 402(p)(5) of the CWA. Executive Order 12291 requires EPA and other agencies to perform regulatory analyses of major regulations. Major rules are those which impose a cost on the economy of $100 million or more annually or have certain other economic impacts. Today's proposed amendments would generally make the NPDES permit application regulations more flexible and less burdensome for the regulated community. These regulations do not, satisfy any of the criteria specified in section 1(b) of the Executive Order and, as such, do not constitute a major rule. This regulation was submitted to the Office of Management and Budget (OMB) for review.

VIII. Paperwork Reduction Act

The information collection requirements in this rule have been submitted for approval to the Office of Management and Budget (OMB) under provision of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* and have been assigned OMB control number 2040-0086.

Public reporting burden for permit applications for storm water discharges associated with industrial activity (other than from construction facilities) is estimated to average 28.6 hours per individual permit application, 0.5 hours per notice of intent to be covered by general permit, and 2.1 hours per group applicant. The public reporting burden for permit applications for storm water discharges associated with industrial activity from construction activities submitting individual applications is estimated to average 4.5 hours per response. The public reporting burden for facilities which discharge storm water associated with industrial activity to municipal separate storm sewers serving a population over 100,000 to notify the operator of the municipal separate storm sewer system is estimated to average 0.5 hours per response.

The reporting burden for system-wide permit applications for discharges from municipal separate storm sewer systems serving a population of 250,000 or more is estimated to average 4,534 hours per response. The reporting burden for system-wide permit applications for discharges from municipal separate storm sewer systems serving a population of 100,000 or more, but less than 250,000 is estimated to average 2,912 hours per response. Estimates of reporting burden include time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

IX. Regulatory Flexibility Act

Under the Regulatory Flexibility Act, 5 U.S.C. 601 *et seq.*, EPA is required to prepare a Regulatory Flexibility Analysis to assess the impact of rules on small entities. No Regulatory Flexibility Analysis is required, however, where the head of the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities.

Today's amendments to the regulations would generally make the NPDES permit applications regulations more flexible and less burdensome for permittees. Accordingly, I hereby

certify, pursuant to 5 U.S.C. 605(b), that these amendments do not have a significant impact on a substantial number of small entities.

List of Subjects in 40 CFR Parts 122, 123, and 124

Administrative practice and procedure, Environmental protection, Reporting and recordkeeping requirements, Water pollution control.

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

Dated: October 31, 1990.

William K. Reilly,

Administrator.

For the reasons stated in the preamble, parts 122, 123, and 124 of title 40 of the Code of Federal Regulations are amended as follows:

PART 122—EPA ADMINISTERED PERMIT PROGRAMS; THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

Subpart B—Permit Application and Special NPDES Program Requirements

1. The authority citation for part 122 continues to read as follows:

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

2. Section 122.1 is amended by revising paragraph (b)(2)(iv) to read as follows:

§ 122.1 Purpose and scope.

* * * * *

(b) * * *

(2) * * *

(iv) Discharges of storm water as set forth in § 122.26; and

* * * * *

3. Section 122.21 is amended by revising paragraph (c)(1), by removing the last sentence of paragraph (f)(7), by removing paragraph (f)(9), by adding two sentences at the end of paragraph (g)(3), by revising paragraph (g)(7) introductory text, by removing and reserving paragraph (g)(10) and by revising the introductory text of paragraph (k) to read as follows:

§ 122.21 Application for a permit (applicable to State programs, see § 123.25).

* * * * *

(c) *Time to apply.* (1) Any person proposing a new discharge, shall submit an application at least 180 days before the date on which the discharge is to commence, unless permission for a later date has been granted by the Director. Facilities proposing a new discharge of storm water associated with industrial activity shall submit an application 180 days before that facility commences industrial activity which may result in a discharge of storm water associated with that industrial activity. Facilities described under § 122.26(b)(14)(x) shall submit applications at least 90 days before the date on which construction is to commence. Different submittal dates may be required under the terms of applicable general permits. Persons proposing a new discharge are encouraged to submit their applications well in advance of the 90 or 180 day requirements to avoid delay. See also paragraph (k) of this section and § 122.26 (c)(1)(i)(G) and (c)(1)(ii).

* * * * *

(g) * * *

(3) * * * The average flow of point sources composed of storm water may be estimated. The basis for the rainfall event and the method of estimation must be indicated.

* * * * *

(7) *Effluent characteristics.* Information on the discharge of pollutants specified in this paragraph (except information on storm water discharges which is to be provided as specified in § 122.26). When "quantitative data" for a pollutant are required, the applicant must collect a sample of effluent and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. When an applicant has two or more outfalls with substantially identical effluents, the Director may allow the applicant to test only one outfall and report that the quantitative data also apply to the substantially identical outfalls. The requirements in paragraphs (g)(7) (iii) and (iv) of this section that an applicant must provide quantitative data for certain pollutants known or believed to be present do not apply to pollutants present in a discharge solely as the result of their presence in intake water; however, an applicant must report such pollutants as present. Grab samples must be used for pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform and fecal streptococcus. For all other pollutants, 24-hour composite samples must be used. However, a minimum of one grab sample may be taken for effluents from holding ponds or other impoundments with a retention period greater than 24 hours. In addition, for discharges other than storm water discharges, the Director may waive composite sampling for any outfall for which the applicant demonstrates that the use of an automatic sampler is infeasible and that the minimum of four (4) grab samples will be a representative sample of the effluent being discharged. For storm water discharges, all samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inch and at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where feasible, the variance in the duration of the event and the total rainfall of the event should not exceed 50 percent from the average or median rainfall event in that area. For all applicants, a flow-weighted composite shall be taken for either the entire discharge or for the first three hours of the discharge. The flow-weighted composite sample for a storm water discharge may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes (applicants submitting permit applications for storm water discharges under § 122.26(d) may collect flow weighted composite samples using different protocols with respect to the time duration between the collection of sample aliquots, subject to the approval of the Director). However, a minimum of one grab sample may be taken for storm water discharges from holding ponds or other impoundments with a retention period greater than 24 hours. For a flow-weighted composite sample, only one analysis of the composite of aliquots is required. For storm water discharge samples taken from discharges associated with industrial activities, quantitative data must be reported for the grab sample taken during the first thirty minutes (or as soon thereafter as practicable) of the discharge for all pollutants specified in § 122.26(c)(1). For all storm water permit applicants taking flow-weighted composites, quantitative data must be reported for all pollutants specified in § 122.26 except pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform, and fecal streptococcus. The Director may allow or establish appropriate site-specific sampling procedures or requirements, including sampling locations, the season in which the sampling takes place, the minimum duration between the previous measurable storm event and the storm event sampled, the minimum or maximum level of precipitation required for an appropriate storm event, the form of precipitation sampled (snow melt or rain fall), protocols for collecting samples under 40 CFR part 136, and additional time for submitting data on a

case by-case basis. An applicant is expected to "know or have reason to believe" that a pollutant is present in an effluent based on an evaluation of the expected use, production, or storage of the pollutant, or on any previous analyses for the pollutant. (For example, any pesticide manufactured by a facility may be expected to be present in contaminated storm water runoff from the facility.)

* * * * *

(k) *Application requirements for new sources and new discharges.* New manufacturing, commercial, mining and silvicultural dischargers applying for NPDES permits (except for new discharges of facilities subject to the requirements of paragraph (h) of this section or new discharges of storm water associated with industrial activity which are subject to the requirements of § 122.26(c)(1) and this section (except as provided by § 122.26(c)(1)(ii)) shall provide the following information to the Director, using the application forms provided by the Director:

* * * * *

4. Section 122.22(b) introductory text is revised to read as follows:

§ 122.22 Signatories to permit applications and reports (applicable to State programs, see § 123.25).

* * * * *

(b) All reports required by permits, and other information requested by the Director shall be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

* * * * *

5. Section 122.26 is revised to read as follows:

§ 122.26 Storm water discharges (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* (1) Prior to October 1, 1992, discharges composed entirely of storm water shall not be required to obtain a NPDES permit except:

(i) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(ii) A discharge associated with industrial activity (see § 122.26(a)(4));

(iii) A discharge from a large municipal separate storm sewer system;

(iv) A discharge from a medium municipal separate storm sewer system;

(v) A discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. This designation may include a discharge from any conveyance or system of conveyances used for collecting and conveying storm water runoff or a system of discharges from municipal separate storm sewers, except for those discharges from conveyances which do not require a permit under paragraph (a)(2) of this section or agricultural storm water runoff which is exempted from the definition of point source at § 122.2.

The Director may designate discharges from municipal separate storm sewers on a system-wide or jurisdiction-wide basis. In making this determination the Director may consider the following factors:

(A) The location of the discharge with respect to waters of the United States as defined at 40 CFR 122.2.

(B) The size of the discharge;

(C) The quantity and nature of the pollutants discharged to waters of the United States; and

(D) Other relevant factors.

(2) The Director may not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing or treatment operations or transmission facilities, composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with or that has not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(3) *Large and medium municipal separate storm sewer systems.* (i) Permits must be obtained for all discharges from large and medium municipal separate storm sewer systems.

(ii) The Director may either issue one system-wide permit covering all discharges from municipal separate storm sewers within a large or medium municipal storm sewer system; or issue distinct permits for appropriate categories of discharges within a large or medium municipal separate storm sewer system including, but not limited to: all discharges owned or operated by the same municipality; located within the same jurisdiction; all discharges within a system that discharge to the same watershed; discharges within a system that are similar in nature; or for individual discharges from municipal separate storm sewers within the system.

(iii) The operator of a discharge from a municipal separate storm sewer which is part of a large or medium municipal separate storm sewer system must either:

(A) Participate in a permit application (to be a permittee or a co-permittee) with one or more other operators of discharges from the large or medium municipal storm sewer system which covers all, or a portion of all, discharges from the municipal separate storm sewer system;

(B) Submit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible; or

(C) A regional authority may be responsible for submitting a permit application under the following guidelines:

(*1*) The regional authority together with co-applicants shall have authority over a storm water management program that is in existence, or shall be in existence at the time part 1 of the application is due;

(*2*) The permit applicant or co-applicants shall establish their ability to make a timely submission of part 1 and part 2 of the municipal application;

(*3*) Each of the operators of municipal separate storm sewers within the systems described in paragraphs (b)(4)(i), (ii), and (iii) or (b)(7)(i), (ii), and (iii) of this section, that are under the purview of the designated regional authority, shall comply with the application requirements of paragraph (d) of this section.

(iv) One permit application may be submitted for all or a portion of all municipal separate storm sewers within adjacent or interconnected large or medium municipal separate storm sewer systems. The Director may issue one system-wide permit covering all, or a portion of all municipal separate storm sewers in adjacent or interconnected large or medium municipal separate storm sewer systems.

(v) Permits for all or a portion of all discharges from large or medium municipal separate storm sewer systems that are issued on a system-wide, jurisdiction wide, watershed or other basis may specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas which contribute storm water to the system.

(vi) Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators.

(4) *Discharges through large and medium municipal separate storm sewer systems.* In addition to meeting the requirements of paragraph (c) of this section, an operator of a storm water discharge associated with industrial activity which discharges through a large or medium municipal separate storm sewer system shall submit, to the operator of the municipal separate storm sewer system receiving the discharge no later than May 15, 1991, or 180 days prior to commencing such discharge: the name of the facility; a contact person and phone number; the location of the discharge; a description, including Standard Industrial Classification, which best reflects the principal products or services provided by each facility; and any existing NPDES permit number.

(5) *Other municipal separate storm sewers.* The Director may issue permits for municipal separate storm sewers that are designated under paragraph (a)(1)(v) of this section on a system-wide basis, jurisdiction-wide basis, watershed basis or other appropriate basis, or may issue permits for individual discharges.

(6) *Non-municipal separate storm sewers.* For storm water discharges associated with industrial activity from point sources which discharge through a non-municipal or non-publicly owned separate storm sewer system, the Director, in his discretion, may issue: a single NPDES permit, with each discharger a co-permittee to a permit issued to the operator of the portion of the system that discharges into waters of the United States; or, individual permits to each discharger of storm water associated with industrial activity through the non-municipal conveyance system.

(i) All storm water discharges associated with industrial activity that discharge through a storm water discharge system that is not a municipal separate storm sewer must be covered by an individual permit, or a permit issued to the operator of the portion of the system that discharges to waters of the United States, with each discharger to the non-municipal conveyance a co-permittee to that permit.

(ii) Where there is more than one operator of a single system of such conveyances, all operators of storm water discharges associated with industrial activity must submit applications.

(iii) Any permit covering more than one operator shall identify the effluent limitations, or other permit conditions, if any, that apply to each operator.

(7) *Combined sewer systems.* Conveyances that discharge storm water runoff combined with municipal sewage are point sources that must obtain NPDES permits in accordance with the procedures of § 122.21 and are not subject to the provisions of this section.

(8) Whether a discharge from a municipal separate storm sewer is or is not subject to regulation under this section shall have no bearing on whether the owner or operator of the discharge is eligible for funding under title II, title III or title VI of the Clean Water Act. *See* 40 CFR part 35, subpart I, appendix A(b)(1.2.j.

(b) *Definitions.* (1) *Co-permittee* means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

(2) *Illicit discharge* means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

(3) *Incorporated place* means the District of Columbia, or a city, town, township, or village that is incorporated under the laws of the State in which it is located.

(4) *Large municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 250,000 or more as determined by the latest Decennial Census by the Bureau of Census (appendix F); or

(ii) Located in the counties listed in appendix H, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers:

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(4)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; and

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraph (b)(4) (i), (ii), (iii) of this section.

(5) *Major municipal separate storm sewer outfall* (or "major outfall") means a municipal separate storm sewer outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

(6) *Major outfall* means a major municipal separate storm sewer outfall.

(7) *Medium municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 100,000 or more but less than 250,000, as determined by the latest Decennial Census by the Bureau of Census (appendix G); or

(ii) Located in the counties listed in appendix I, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(7)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a medium municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (b)(7) (i), (ii), (iii) of this section.

(8) *Municipal separate storm sewer* means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) Designed or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

(9) *Outfall* means a *point source* as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

(10) *Overburden* means any material of any nature, consolidated or unconsolidated, that overlies a mineral deposit, excluding topsoil or similar naturally-occurring surface materials that are not disturbed by mining operations.

(11) *Runoff coefficient* means the fraction of total rainfall that will appear at a conveyance as runoff.

(12) *Significant materials* includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under section 101(14) of CERCLA; any chemical the facility is required to report pursuant to section 313 of title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

(13) *Storm water* means storm water runoff, snow melt runoff, and surface runoff and drainage.

(14) *Storm water discharge associated with industrial activity* means the discharge from any conveyance which is used for collecting and conveying storm water and which is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program under 40 CFR part 122. For the categories of industries identified in paragraphs (b)(14) (i) through (x) of this section, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at 40 CFR part 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the categories of industries identified in paragraph (b)(14)(xi) of this section, the term includes only storm water discharges from all the areas (except access roads and rail lines) that are listed in the previous sentence where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water. For the purposes of this paragraph, material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are Federally, State, or municipally owned or operated that meet the description of the facilities listed in this paragraph (b)(14)(i)–(xi) of this section) include those facilities designated under the provisions of paragraph (a)(1)(v) of this section. The following categories of facilities are considered to be engaging in "industrial activity" for purposes of this subsection:

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category (xi) in paragraph (b)(14) of this section);

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373;

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(1) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; (inactive mining operations are mining sites that are not being actively mined, but which have an identifiable owner/operator; inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined

materials, nor sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim);

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that receive or have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221–25), 43, 44, 45, and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under paragraphs (b)(14) (i)–(vii) or (ix)–(xi) of this section are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR part 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with section 405 of the CWA;

(x) Construction activity including clearing, grading and excavation activities except: operations that result in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221–25, (and which are not otherwise included within categories (ii)–(x)).

(c) *Application requirements for storm water discharges associated with industrial activity*—(1) *Individual application.* Dischargers of storm water associated with industrial activity are required to apply for an individual permit, apply for a permit through a group application, or seek coverage under a promulgated storm water general permit. Facilities that are required to obtain an individual permit, or any discharge of storm water which the Director is evaluating for designation (see 40 CFR 124.52(c)) under paragraph (a)(1)(v) of this section and is not a municipal separate storm sewer, and which is not part of a group application described under paragraph (c)(2) of this section, shall submit an NPDES application in accordance with the requirements of § 122.21 as modified and supplemented by the provisions of the remainder of this paragraph. Applicants for discharges composed entirely of storm water shall submit Form 1 and Form 2F. Applicants for discharges composed of storm water and non-storm water shall submit Form 1, Form 2C, and Form 2F. Applicants for new sources or new discharges (as defined in § 122.2 of this part) composed of storm water and non-storm water shall submit Form 1, Form 2D, and Form 2F.

(i) Except as provided in § 122.26(c)(1)(ii)–(iv), the operator of a storm water discharge associated with industrial activity subject to this section shall provide:

(A) A site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) of the facility including: each of its drainage and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each past or present area used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied, each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility;

(B) An estimate of the area of impervious surfaces (including paved areas and building roofs) and the total area drained by each outfall (within a mile radius of the facility) and a narrative description of the following: Significant materials that in the three years prior to the submittal of this application have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal of such materials; materials management practices employed, in the three years prior to the submittal of this application, to minimize contact by these materials with storm water runoff; materials loading and access areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; the location and a description of existing structural and non-structural control measures to reduce pollutants in storm water runoff; and a description of the treatment the storm water receives, including the ultimate disposal of any solid or fluid wastes other than by discharge;

(C) A certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested or evaluated for the presence of non-storm water discharges which are not covered by a NPDES permit; tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. The certification shall include a description of the method used, the date of any testing, and the on site drainage points that were directly observed during a test;

(D) Existing information regarding significant leaks or spills of toxic or hazardous pollutants at the facility that have taken place within the three years prior to the submittal of this application;

(E) Quantitative data based on samples collected during storm events and collected in accordance with § 122.21 of this part from all outfalls containing a storm water discharge associated with industrial activity for the following parameters:

(*1*) Any pollutant limited in an effluent guideline to which the facility is subject;

(*2*) Any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit);

(*3*) Oil and grease, pH, BOD5, COD, TSS, total phosphorus, total Kjeldahl nitrogen, and nitrate plus nitrite nitrogen;

(*4*) Any information on the discharge required under paragraph § 122.21(g)(7)(vi) and (ix) of this part;

(5) Flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, and the method of flow measurement or estimation; and

(6) The date and duration (in hours) of the storm event(s) sampled, rainfall measurements or estimates of the storm event (in inches) which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event (in hours);

(F) Operators of a discharge which is composed entirely of storm water are exempt from the requirements of § 122.21 (g)(2), (g)(3), (g)(4), (g)(5), (g)(7)(i), (g)(7)(ii), and (g)(7)(v); and

(G) Operators of new sources or new discharges (as defined in § 122.2 of this part) which are composed in part or entirely of storm water must include estimates for the pollutants or parameters listed in paragraph (c)(1)(i)(E) of this section instead of actual sampling data, along with the source of each estimate. Operators of new sources or new discharges composed in part or entirely of storm water must provide quantitative data for the parameters listed in paragraph (c)(1)(i)(E) of this section within two years after commencement of discharge, unless such data has already been reported under the monitoring requirements of the NPDES permit for the discharge. Operators of a new source or new discharge which is composed entirely of storm water are exempt from the requirements of § 122.21 (k)(3)(ii), (k)(3)(iii), and (k)(5).

(ii) The operator of an existing or new storm water discharge that is associated with industrial activity solely under paragraph (b)(14)(x) of this section, is exempt from the requirements of § 122.21(g) and paragraph (c)(1)(i) of this section. Such operator shall provide a narrative description of:

(A) The location (including a map) and the nature of the construction activity;

(B) The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;

(C) Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a brief description of applicable State and local erosion and sediment control requirements;

(D) Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a brief description of applicable State or local erosion and sediment control requirements;

(E) An estimate of the runoff coefficient of the site and the increase in impervious area after the construction addressed in the permit application is completed, the nature of fill material and existing data describing the soil or the quality of the discharge; and

(F) The name of the receiving water.

(iii) The operator of an existing or new discharge composed entirely of storm water from an oil or gas exploration, production, processing, or treatment operation, or transmission facility is not required to submit a permit application in accordance with paragraph (c)(1)(i) of this section, unless the facility:

(A) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 117.21 or 40 CFR 302.6 at anytime since November 16, 1987; or

(B) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 110.6 at any time since November 16, 1987; or

(C) Contributes to a violation of a water quality standard.

(iv) The operator of an existing or new discharge composed entirely of storm water from a mining operation is not required to submit a permit application unless the discharge has come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(v) Applicants shall provide such other information the Director may reasonably require under § 122.21(g)(13) of this part to determine whether to issue a permit and may require any facility subject to paragraph (c)(1)(ii) of this section to comply with paragraph (c)(1)(i) of this section.

(2) *Group application for discharges associated with industrial activity.* In lieu of individual applications or notice of intent to be covered by a general permit for storm water discharges associated with industrial activity, a group application may be filed by an entity representing a group of applicants (except facilities that have existing individual NPDES permits for storm water) that are part of the same subcategory (*see* 40 CFR subchapter N, part 405 to 471) or, where such grouping is inapplicable, are sufficiently similar as to be appropriate for general permit coverage under § 122.28 of this part. The part 1 application shall be submitted to the Office of Water Enforcement and Permits, U.S. EPA, 401 M Street, SW., Washington, DC 20460 (EN-336) for approval. Once a part 1 application is approved, group applicants are to submit Part 2 of the group application to the Office of Water Enforcement and Permits. A group application shall consist of:

(i) *Part 1.* Part 1 of a group application shall:

(A) Identify the participants in the group application by name and location. Facilities participating in the group application shall be listed in nine subdivisions, based on the facility location relative to the nine precipitation zones indicated in appendix E to this part.

(B) Include a narrative description summarizing the industrial activities of participants of the group application and explaining why the participants, as a whole, are sufficiently similar to be a covered by a general permit;

(C) Include a list of significant materials stored exposed to precipitation by participants in the group application and materials management practices employed to diminish contact by these materials with precipitation and storm water runoff;

(D) Identify ten percent of the dischargers participating in the group application (with a minimum of 10 dischargers, and either a minimum of two dischargers from each precipitation zone indicated in appendix E of this part in which ten or more members of the group are located, or one discharger from each precipitation zone indicated in appendix E of this part in which nine or fewer members of the group are located) from which quantitative data will be submitted in part 2. If more than 1,000 facilities are identified in a group application, no more than 100 dischargers must submit quantitative data in Part 2. Groups of between four and ten dischargers may be formed. However, in groups of between four ano ten, at least half the facilities must submit quantitative data, and at least one facility in each precipitation zone in which members of the group are located must submit data. A description of why the facilities selected to perform sampling and analysis are representative of the group as a whole in terms of the information provided in paragraph (c)(1) (i)(B) and (i)(C) of this section, shall accompany this section. Different factors impacting the nature of the storm water discharges, such as processes used and material management, shall be represented, to the extent feasible, in a manner roughly equivalent to their proportion in the group.

(ii) *Part 2.* Part 2 of a group application shall contain quantitative

data (NPDES Form 2F), as modified by paragraph (c)(1) of this section, so that when part 1 and part 2 of the group application are taken together, a complete NPDES application (Form 1, Form 2C, and Form 2F) can be evaluated for each discharger identified in paragraph (c)(2)(i)(D) of this section.

(d) *Application requirements for large and medium municipal separate storm sewer discharges.* The operator of a discharge from a large or medium municipal separate storm sewer or a municipal separate storm sewer that is designated by the Director under paragraph (a)(1)(v) of this section, may submit a jurisdiction-wide or system-wide permit application. Where more than one public entity owns or operates a municipal separate storm sewer within a geographic area (including adjacent or interconnected municipal separate storm sewer systems), such operators may be a coapplicant to the same application. Permit applications for discharges from large and medium municipal storm sewers or municipal storm sewers designated under paragraph (a)(1)(v) of this section shall include:

(1) *Part 1.* Part 1 of the application shall consist of:

(i) *General information.* The applicants' name, address, telephone number of contact person, ownership status and status as a State or local government entity.

(ii) *Legal authority.* A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(i) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

(iii) *Source identification.* (A) A description of the historic use of ordinances, guidance or other controls which limited the discharge of non-storm water discharges to any Publicly Owned Treatment Works serving the same area as the municipal separate storm sewer system.

(B) A USGS 7.5 minute topographic map (or equivalent topographic map with a scale between 1:10,000 and 1:24,000 if cost effective) extending one mile beyond the service boundaries of the municipal storm sewer system covered by the permit application. The following information shall be provided:

(*1*) The location of known municipal storm sewer system outfalls discharging to waters of the United States;

(*2*) A description of the land use activities (e.g. divisions indicating undeveloped, residential, commercial, agricultural and industrial uses) accompanied with estimates of population densities and projected growth for a ten year period within the drainage area served by the separate storm sewer. For each land use type, an estimate of an average runoff coefficient shall be provided;

(*3*) The location and a description of the activities of the facility of each currently operating or closed municipal landfill or other treatment, storage or disposal facility for municipal waste;

(*4*) The location and the permit number of any known discharge to the municipal storm sewer that has been issued a NPDES permit;

(*5*) The location of major structural controls for storm water discharge (retention basins, detention basins, major infiltration devices, etc.); and

(*6*) The identification of publicly owned parks, recreational areas, and other open lands.

(iv) *Discharge characterization.* (A) Monthly mean rain and snow fall estimates (or summary of weather bureau data) and the monthly average number of storm events.

(B) Existing quantitative data describing the volume and quality of discharges from the municipal storm sewer, including a description of the outfalls sampled, sampling procedures and analytical methods used.

(C) A list of water bodies that receive discharges from the municipal separate storm sewer system, including downstream segments, lakes and estuaries, where pollutants from the system discharges may accumulate and cause water degradation and a brief description of known water quality impacts. At a minimum, the description of impacts shall include a description of whether the water bodies receiving such discharges have been:

(*1*) Assessed and reported in section 305(b) reports submitted by the State, the basis for the assessment (evaluated or monitored), a summary of designated use support and attainment of Clean Water Act (CWA) goals (fishable and swimmable waters), and causes of nonsupport of designated uses;

(*2*) Listed under section 304(l)(1)(A)(i), section 304(l)(1)(A)(ii), or section 304(l)(1)(B) of the CWA that is not expected to meet water quality standards or water quality goals;

(*3*) Listed in State Nonpoint Source Assessments required by section 319(a) of the CWA that, without additional action to control nonpoint sources of pollution, cannot reasonably be expected to attain or maintain water quality standards due to storm sewers, construction, highway maintenance and runoff from municipal landfills and municipal sludge adding significant pollution (or contributing to a violation of water quality standards);

(*4*) Identified and classified according to eutrophic condition of publicly owned lakes listed in State reports required under section 314(a) of the CWA (include the following: A description of those publicly owned lakes for which uses are known to be impaired; a description of procedures, processes and methods to control the discharge of pollutants from municipal separate storm sewers into such lakes; and a description of methods and procedures to restore the quality of such lakes);

(*5*) Areas of concern of the Great Lakes identified by the International Joint Commission;

(*6*) Designated estuaries under the National Estuary Program under section 320 of the CWA;

(*7*) Recognized by the applicant as highly valued or sensitive waters;

(*8*) Defined by the State or U.S. Fish and Wildlife Services's National Wetlands Inventory as wetlands; and

(*9*) Found to have pollutants in bottom sediments, fish tissue or biosurvey data.

(D) *Field screening.* Results of a field screening analysis for illicit connections and illegal dumping for either selected field screening points or major outfalls covered in the permit application. At a minimum, a screening analysis shall include a narrative description, for either each field screening point or major outfall, of visual observations made during dry weather periods. If any flow is observed, two grab samples shall be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a narrative description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observations regarding the potential presence of non-storm water discharges or illegal dumping shall be provided. In addition, a narrative description of the results of a field analysis using suitable methods to estimate pH, total chlorine, total copper, total phenol, and detergents (or surfactants) shall be provided along with a description of the flow rate. Where the field analysis does not involve analytical methods approved under 40 CFR part 136, the applicant shall provide a description of the method used including the name of the manufacturer of the test method along with the range and accuracy of the test. Field screening points shall be either major outfalls or other outfall points (or

any other point of access such as manholes) randomly located throughout the storm sewer system by placing a grid over a drainage system map and identifying those cells of the grid which contain a segment of the storm sewer system or major outfall. The field screening points shall be established using the following guidelines and criteria:

(*1*) A grid system consisting of perpendicular north-south and east-west lines spaced ¼ mile apart shall be overlayed on a map of the municipal storm sewer system, creating a series of cells;

(*2*) All cells that contain a segment of the storm sewer system shall be identified; one field screening point shall be selected in each cell; major outfalls may be used as field screening points;

(*3*) Field screening points should be located downstream of any sources of suspected illegal or illicit activity;

(*4*) Field screening points shall be located to the degree practicable at the farthest manhole or other accessible location downstream in the system, within each cell; however, safety of personnel and accessibility of the location should be considered in making this determination;

(*5*) Hydrological conditions; total drainage area of the site; population density of the site; traffic density; age of the structures or buildings in the area; history of the area; and land use types;

(*6*) For medium municipal separate storm sewer systems, no more than 250 cells need to have identified field screening points; in large municipal separate storm sewer systems, no more than 500 cells need to have identified field screening points; cells established by the grid that contain no storm sewer segments will be eliminated from consideration; if fewer than 250 cells in medium municipal sewers are created, and fewer than 500 in large systems are created by the overlay on the municipal sewer map, then all those cells which contain a segment of the sewer system shall be subject to field screening (unless access to the separate storm sewer system is impossible); and

(*7*) Large or medium municipal separate storm sewer systems which are unable to utilize the procedures described in paragraphs (d)(1)(iv)(D) (*1*) through (*6*) of this section, because a sufficiently detailed map of the separate storm sewer systems is unavailable, shall field screen no more than 500 or 250 major outfalls respectively (or all major outfalls in the system, if less); in such circumstances, the applicant shall establish a grid system consisting of north-south and east-west lines spaced ¼ mile apart as an overlay to the boundaries of the municipal storm sewer system, thereby creating a series of cells; the applicant will then select major outfalls in as many cells as possible until at least 500 major outfalls (large municipalities) or 250 major outfalls (medium municipalities) are selected; a field screening analysis shall be undertaken at these major outfalls.

(E) *Characterization plan.* Information and a proposed program to meet the requirements of paragraph (d)(2)(iii) of this section. Such description shall include: the location of outfalls or field screening points appropriate for representative data collection under paragraph (d)(2)(iii)(A) of this section, a description of why the outfall or field screening point is representative, the seasons during which sampling is intended, a description of the sampling equipment. The proposed location of outfalls or field screening points for such sampling should reflect water quality concerns (*see* paragraph (d)(1)(iv)(C) of this section) to the extent practicable.

(v) *Management programs.* (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

(B) A description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.

(vi) *Fiscal resources.* (A) A description of the financial resources currently available to the municipality to complete part 2 of the permit application. A description of the municipality's budget for existing storm water programs, including an overview of the municipality's financial resources and budget, including overall indebtedness and assets, and sources of funds for storm water programs.

(2) *Part 2.* Part 2 of the application shall consist of:

(i) *Adequate legal authority.* A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;

(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;

(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

(E) Require compliance with conditions in ordinances, permits, contracts or orders; and

(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

(ii) *Source identification.* The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(*1*) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

(iii) *Characterization data.* When "quantitative data" for a pollutant are required under paragraph (d)(a)(iii)(A)(*3*) of this paragraph, the applicant must collect a sample of effluent in accordance with 40 CFR 122.21(g)(7) and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. The applicant must provide information characterizing the quality and quantity of discharges covered in the permit application, including:

(A) Quantitative data from representative outfalls designated by the Director (based on information received

in part 1 of the application, the Director shall designate between five and ten outfalls or field screening points as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system or, where there are less than five outfalls covered in the application, the Director shall designate all outfalls) developed as follows:

(1) For each outfall or field screening point designated under this subparagraph, samples shall be collected of storm water discharges from three storm events occurring at least one month apart in accordance with the requirements at § 122.21(g)(7) (the Director may allow exemptions to sampling three storm events when climatic conditions create good cause for such exemptions);

(2) A narrative description shall be provided of the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(3) For samples collected and described under paragraphs (d)(2)(iii)(A)(1) and (A)(2) of this section, quantitative data shall be provided for: the organic pollutants listed in Table II; the pollutants listed in Table III (toxic metals, cyanide, and total phenols) of appendix D of 40 CFR part 122, and for the following pollutants:

Total suspended solids (TSS)
Total dissolved solids (TDS)
COD
BOD_5
Oil and grease
Fecal coliform
Fecal streptococcus
pH
Total Kjeldahl nitrogen
Nitrate plus nitrite
Dissolved phosphorus
Total ammonia plus organic nitrogen
Total phosphorus

(4) Additional limited quantitative data required by the Director for determining permit conditions (the Director may require that quantitative data shall be provided for additional parameters, and may establish sampling conditions such as the location, season of sample collection, form of precipitation (snow melt, rainfall) and other parameters necessary to insure representativeness);

(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under § 122.21(c)(7)) for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods;

(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(1) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section; and

(D) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

(iv) *Proposed management program.* A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls. Such programs shall be based on:

(A) A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls. At a minimum, the description shall include:

(1) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;

(2) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed. (Controls to reduce pollutants in discharges from municipal separate storm sewers containing construction site runoff are addressed in paragraph (d)(2)(iv)(D) of this section;

(3) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities;

(4) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible;

(5) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section); and

(6) A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

(B) A description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer. The proposed program shall include:

(1) A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers, uncontaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water (program descriptions shall address discharges or flows from fire fighting only where such discharges or flows are identified as significant sources of pollutants to waters of the United States);

(2) A description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens;

(3) A description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water (such procedures may include: sampling procedures for constituents such as fecal coliform, fecal streptococcus, surfactants (MBAS), residual chlorine, fluorides and potassium; testing with fluorometric dyes; or conducting in storm sewer inspections where safety and other considerations allow. Such description shall include the location of storm sewers that have been identified for such evaluation);

(4) A description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer;

(5) A description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers;

(6) A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials; and

(7) A description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary;

(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:

(1) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;

(2) Describe a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of quantitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7) (iii) and (iv).

(D) A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include:

(1) A description of procedures for site planning which incorporate consideration of potential water quality impacts;

(2) A description of requirements for nonstructural and structural best management practices;

(3) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and

(4) A description of appropriate educational and training measures for construction site operators.

(v) *Assessment of controls.* Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.

(vi) *Fiscal analysis.* For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2) (iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination.

(viii) Where requirements under paragraph (d)(1)(iv)(E), (d)(2)(ii), (d)(2)(iii)(B) and (d)(2)(iv) of this section are not practicable or are not applicable, the Director may exclude any operator of a discharge from a municipal separate storm sewer which is designated under paragraph (a)(1)(v), (b)(4)(ii) or (b)(7)(ii) of this section from such requirements. The Director shall not exclude the operator of a discharge from a municipal separate storm sewer identified in appendix F, G, H or I of part 122, from any of the permit application requirements under this paragraph except where authorized under this section.

(e) *Application deadlines.* Any operator of a point source required to obtain a permit under paragraph (a)(1) of this section that does not have an effective NPDES permit covering its storm water outfalls shall submit an application in accordance with the following deadlines:

(1) For any storm water discharge associated with industrial activity identified in paragraph (b)(14) (i)–(xi) of this section, that is not part of a group application as described in paragraph (c)(2) of this section or which is not covered under a promulgated storm water general permit, a permit application made pursuant to paragraph (c) of this section shall be submitted to the Director by November 18, 1991;

(2) For any group application submitted in accordance with paragraph (c)(2) of this section:

(i) Part 1 of the application shall be submitted to the Director, Office of Water Enforcement and Permits by March 18, 1991;

(ii) Based on information in the part 1 application, the Director will approve or deny the members in the group application within 60 days after receiving part 1 of the group application.

(iii) Part 2 of the application shall be submitted to the Director, Office of Water Enforcement and Permits no later than 12 months after the date of approval of the part 1 application.

(iv) Facilities that are rejected as members of a group by the permitting authority shall have 12 months to file an individual permit application from the date they receive notification of their rejection.

(v) A facility listed under paragraph (b)(14) (i)–(xi) of this section may add on to a group application submitted in accordance with paragraph (e)(2)(i) of this section at the discretion of the Office of Water Enforcement and Permits, and only upon a showing of good cause by the facility and the group applicant; the request for the addition of the facility shall be made no later than February 18,1992; the addition of the facility shall not cause the percentage of the facilities that are required to submit quantitative data to be less than 10%, unless there are over 100 facilities in the group that are submitting quantitative data; approval to become part of group application must be obtained from the group or the trade association representing the individual facilities.

(3) For any discharge from a large municipal separate storm sewer system:

(i) Part 1 of the application shall be submitted to the Director by November 18, 1991;

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application;

(iii) Part 2 of the application shall be submitted to the Director by November 16, 1992.

(4) For any discharge from a medium municipal separate storm sewer system:

(i) Part 1 of the application shall be submitted to the Director by May 18, 1992.

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application.

(iii) Part 2 of the application shall be submitted to the Director by May 17, 1993.

(5) A permit application shall be submitted to the Director within 60 days of notice, unless permission for a later date is granted by the Director (*see* 40 CFR 124.52(c)), for:

(i) A storm water discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines that the discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States (see paragraph (a)(1)(v) of this section);

(ii) A storm water discharge subject to paragraph (c)(1)(v) of this section.

(6) Facilities with existing NPDES permits for storm water discharges associated with industrial activity shall maintain existing permits. New applications shall be submitted in accordance with the requirements of 40 CFR 122.21 and 40 CFR 122.26(c) 180 days before the expiration of such permits. Facilities with expired permits or permits due to expire before May 18, 1992, shall submit applications in accordance with the deadline set forth under paragraph (e)(1) of this section.

(f) *Petitions.* (1) Any operator of a municipal separate storm sewer system may petition the Director to require a separate NPDES permit (or a permit issued under an approved NPDES State program) for any discharge into the municipal separate storm sewer system.

(2) Any person may petition the Director to require a NPDES permit for a discharge which is composed entirely of storm water which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(3) The owner or operator of a municipal separate storm sewer system may petition the Director to reduce the Census estimates of the population served by such separate system to account for storm water discharged to combined sewers as defined by 40 CFR 35.2005(b)(11) that is treated in a publicly owned treatment works. In municipalities in which combined sewers are operated, the Census estimates of population may be reduced proportional to the fraction, based on estimated lengths, of the length of combined sewers over the sum of the length of combined sewers and municipal separate storm sewers where an applicant has submitted the NPDES permit number associated with each discharge point and a map indicating areas served by combined sewers and the location of any combined sewer overflow discharge point.

(4) Any person may petition the Director for the designation of a large or medium municipal separate storm sewer system as defined by paragraphs (b)(1)(iv) or (b)(7)(iv) of this section.

(5) The Director shall make a final determination on any petition received under this section within 90 days after receiving the petition.

6. Section 122.28(b)(2)(i) is revised to read as follows:

§ 122.28 General permits (applicable to State NPDES programs, see § 123.25).

* * * * *

(b) * * *

(2) *Requiring an individual permit.* (i) The Director may require any discharger authorized by a general permit to apply for and obtain an individual NPDES permit. Any interested person may petition the Director to take action under this paragraph. Cases where an individual NPDES permit may be required include the following:

(A) The discharger or "treatment works treating domestic sewage" is not in compliance with the conditions of the general NPDES permit;

(B) A change has occurred in the availability of demonstrated technology or practices for the control or abatement of pollutants applicable to the point source or treatment works treating domestic sewage;

(C) Effluent limitation guidelines are promulgated for point sources covered by the general NPDES permit;

(D) A Water Quality Management plan containing requirements applicable to such point sources is approved;

(E) Circumstances have changed since the time of the request to be covered so that the discharger is no longer appropriately controlled under the general permit, or either a temporary or permanent reduction or elimination of the authorized discharge is necessary;

(F) Standards for sewage sludge use or disposal have been promulgated for the sludge use and disposal practice covered by the general NPDES permit; or

(G) The discharge(s) is a significant contributor of pollutants. In making this determination, the Director may consider the following factors:

(*1*) The location of the discharge with respect to waters of the United States;

(*2*) The size of the discharge;

(*3*) The quantity and nature of the pollutants discharged to waters of the United States; and

(*4*) Other relevant factors;

* * * * *

7. Section 122.42 is amended by adding paragraph (c) to read as follows:

§ 122.42 Additional conditions applicable to specified categories of NPDES permits (applicable to State NPDES programs, see § 123.25).

. . . . .

(c) *Municipal separate storm sewer systems.* The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the Director under § 122.26(a)(1)(v) of this part must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report shall include:

(1) The status of implementing the components of the storm water management program that are established as permit conditions;

(2) Proposed changes to the storm water management programs that are established as permit condition. Such proposed changes shall be consistent with § 122.26(d)(2)(iii) of this part; and

(3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under § 122.26(d)(2)(iv) and (d)(2)(v) of this part;

(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year;

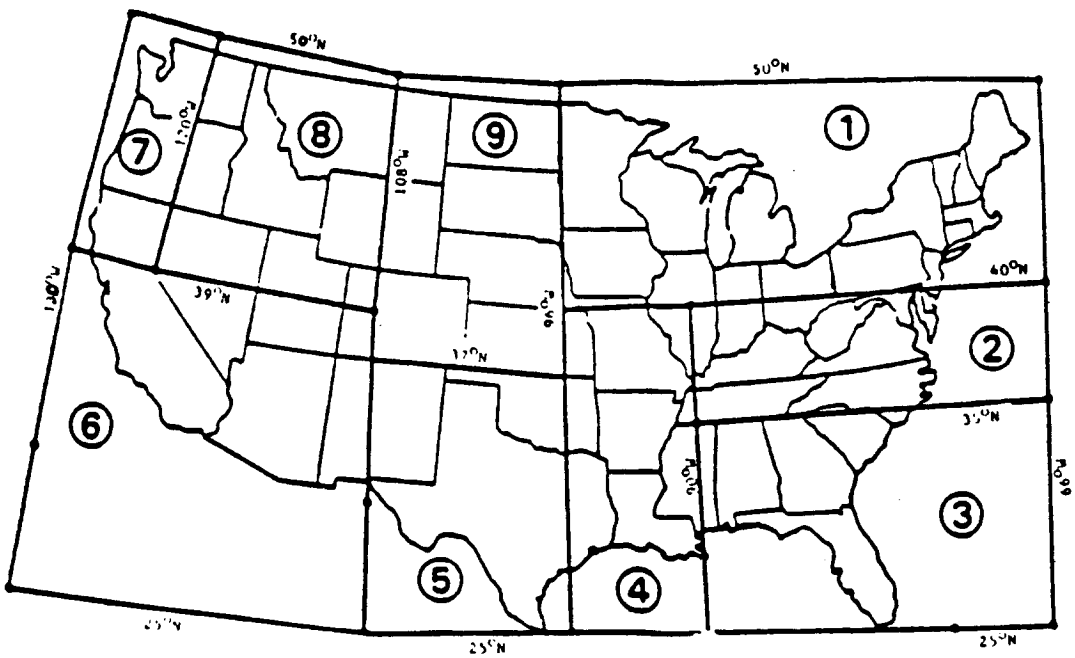
(5) Annual expenditures and budget for year following each annual report;

(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs;

(7) Identification of water quality improvements or degradation;

7a. Part 122 is amended by adding appendices E through I as follows:

Appendix E to Part 122—Rainfall Zones of the United States



Not Shown: Alaska (Zone 7); Hawaii (Zone 7); Northern Mariana Islands (Zone 7); Guam (Zone 7); American Samoa (Zone 7); Trust Territory of the Pacific Islands (Zone 7); Puerto Rico (Zone 3) Virgin Islands (Zone 3).

Source: Methodology for Analysis of Detention Basins for Control of Urban Runoff Quality, prepared for U.S. Environmental Protection Agency, Office of Water, Nonpoint Source Division, Washington, DC, 1986.

PART 123—STATE PROGRAM REQUIREMENTS

8. The authority citation for part 123 continues to read as follows:

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

9. Section 123.25 is amended by revising paragraph (a)(9) to read as follows:

§ 123.25 Requirements for permitting.

(a) * * *

(9) § 122.26—(Storm water discharges);

* * * * *

PART 124—PROCEDURES FOR DECISIONMAKING

10. The authority citation for part 124 continues to read as follows:

Authority: Resource Conservation and Recovery Act, 42 U.S.C. 6901 *et seq.*; Safe Drinking Water Act, 42 U.S.C. 300f *et seq.*; Clean Water Act, 33 U.S.C. 1251 *et seq.*; and Clean Air Act, 42 U.S.C. 1857 *et seq.*

11. Section 124.52 is revised to read as follows:

§ 124.52 Permits required on a case-by-case basis.

(a) Various sections of part 122, subpart B allow the Director to determine, on a case-by-case basis, that certain concentrated animal feeding operations (§ 122.23), concentrated aquatic animal production facilities (§ 122.24), storm water discharges (§ 122.26), and certain other facilities covered by general permits (§ 122.28) that do not generally require an individual permit may be required to obtain an individual permit because of their contributions to water pollution.

(b) Whenever the Regional Administrator decides that an individual permit is required under this section, except as provided in paragraph (c) of this section, the Regional Administrator shall notify the discharger in writing of that decision and the reasons for it, and shall send an application form with the notice. The discharger must apply for a permit under § 122.21 within 60 days of notice, unless permission for a later date is granted by the Regional Administrator. The question whether the designation was proper will remain open for consideration during the public comment period under § 124.11 or § 124.118 and in any subsequent hearing.

(c) Prior to a case-by-case determination that an individual permit is required for a storm water discharge under this section (*see* 40 CFR 122.26 (a)(1)(v) and (c)(1)(v)), the Regional Administrator may require the discharger to submit a permit application or other information regarding the discharge under section 308 of the CWA. In requiring such information, the Regional Administrator shall notify the discharger in writing and shall send an application form with the notice. The discharger must apply for a permit under § 122.26 within 60 days of notice, unless permission for a later date is granted by the Regional Administrator. The question whether the initial designation was proper will remain open for consideration during the public comment period under § 124.11 or § 124.118 and in any subsequent hearing.

Note: The following form will not appear in the Code of Federal Regulations.

BILLING CODE 6560-50-M

Please print or type in the unshaded areas only

EPA

United States Environmental Protection Agency
Washington, DC 20460

Application for Permit To Discharge Stormwater Discharges Associated with Industrial Activity

Paperwork Reduction Act Notice

Public reporting burden for this application is estimated to average 28.6 hours per application, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate, any other aspect of this collection of information, or suggestions for improving this form, including suggestions which may increase or reduce this burden to: Chief, Information Policy Branch, PM 223, U.S. Environmental Protection Agency, 401 M St., SW, Washington, DC 20460, or Director, Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503

I. Outfall Location

For each outfall, list the latitude and longitude of its location to the nearest 15 seconds and the name of the receiving water

A. Outfall Number (list)	B. Latitude	C. Longitude	D. Receiving Water (name)

II. Improvements

A. Are you now required by any Federal, State, or local authority to meet any implementation schedule for the construction, upgrading or operation of wastewater treatment equipment or practices or any other environmental programs which may affect the discharges described in this application? This includes, but is not limited to, permit conditions, administrative or enforcement orders, enforcement compliance schedule letters, stipulations, court orders, and grant or loan conditions

1. Identification of Conditions, Agreements, Etc.	2. Affected Outfalls		3. Brief Description of Project	4. Final Compliance Date	
	number	source of discharge		a. req.	b. proj.

B. You may attach additional sheets describing any additional water pollution (or other environmental projects which may affect your discharges) you now have under way or which you plan. Indicate whether each program is now under way or planned, and indicate your actual or planned schedules for construction.

III. Site Drainage Map

Attach a site map showing topography (or indicating the outline of drainage areas served by the outfalls) covered in the application if a topographic map is unavailable) depicting the facility including: each of its intake and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each known past or present areas used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied, each of its hazardous waste treatment, storage or disposal units (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34), each well where fluids from the facility are injected underground, springs, and other surface water bodies which receive storm water discharges from the facility.

Continue on Page 2

Continued from the Front

IV. Narrative Description of Pollutant Sources

A. For each outfall, provide an estimate of the area (include units) of impervious surfaces (including paved areas and building roofs) drained to the outfall, and an estimate of the total surface area drained by the outfall.

Outfall Number	Area of Impervious Surface (provide units)	Total Area Drained (provide units)	Outfall Number	Area of Impervious Surface (provide units)	Total Area Drained (provide units)

B. Provide a narrative description of significant materials that are currently or in the past three years have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage, or disposal; past and present materials management practices employed, in the last three years, to minimize contact by these materials with storm water runoff; materials loading and access areas; and the location, manner, and frequency in which pesticides, herbicides, soil conditioners, and fertilizers are applied.

C. For each outfall, provide the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff, and a description of the treatment the storm water receives, including the schedule and type of maintenance for control and treatment measures and the ultimate disposal of any solid or fluid wastes other than by discharge.

Outfall Number	Treatment	List Codes from Table 2F-1

V. Nonstormwater Discharges

A. I certify under penalty of law that the outfall(s) covered by this application have been tested or evaluated for the presence of nonstormwater discharges, and that all nonstormwater discharges from these outfall(s) are identified in either an accompanying Form 2C or Form 2E application for the outfall.

Name and Official Title (type or print)	Signature	Date Signed

B. Provide a description of the method used, the date of any testing, and the onsite drainage points that were directly observed during a test.

VI. Significant Leaks or Spills

Provide existing information regarding the history of significant leaks or spills of toxic or hazardous pollutants at the facility in the last three years, including the approximate date and location of the spill or leak, and the type and amount of material released.

Continued from Page 2

EPA ID Number (copy from Item I of Form 1)

VII. Discharge Information

A,B,C, & D. See instructions before proceeding. Complete one set of tables for each outfall. Annotate the outfall number in the space provided. Tables VII-A, VII-B, and VII-C are included on separate sheets numbered VII-1 and VII-2.

E. Potential discharges not covered by analysis - Is any pollutant listed in Table 2F-2 a substance or a component of a substance which you currently use or manufacture as an intermediate or final product or byproduct?

☐ Yes (list all such pollutants below) ☐ No (go to Section VIII)

VIII. Biological Toxicity Testing Data

☐ Yes (list results below) ☐ No (go to Section IX)

IX. Contract Analysis Information

☐ Yes ☐ No (go to Section X)

A. Name	B. Address	C. Area Code & Phone No.	D. Pollutants Analyzed

X. Certification

A. Name & Official Title (type or print)

B. Area Code and Phone No.

C. Signature

D. Date Signed

EPA ID Number (copy from Item I of Form 1)

Form Approved. OMB No. 2040-0086
Approval expires 5/31/92

VII. Discharge Information (Continued from page 3 of Form 2F)

Part A - You must provide the results of at least one analysis for every pollutant in this table. Complete one table for each outfall. See instructions for additional details.

Pollutant and CAS Number (if available)	Maximum Values (include units)		Average Values (include units)		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite		
Oil and Grease						
Biological Oxygen Demand (BOD5)						
Chemical Oxygen Demand (COD)						
Total Suspended Solids (TSS)						
Total Kjeldahl Nitrogen						
Nitrate plus Nitrite Nitrogen						
Total Phosphorus						
pH	Minimum	Maximum	Minimum	Maximum		

Part B - List each pollutant that is limited in an effluent guideline which the facility is subject to or any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit). Complete one table for each outfall. See the instructions for additional details and requirements.

Pollutant and CAS Number (if available)	Maximum Values (include units)		Average Values (include units)		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite		

Continue on Reverse

Continued from the Front

Part C - List each pollutant shown in Tables 2F-2, 2F-3, and 2F-4 that you know or have reason to believe is present. See the instructions for additional details and requirements. Complete one table for each outfall.

Pollutant and CAS Number (if available)	Maximum Values (include units)		Average Values (include units)		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite		

Part D - Provide data for the storm event(s) which resulted in the maximum values for the flow weighted composite sample.

1. Date of Storm Event	2. Duration of Storm (in minutes)	3. Total rainfall during storm event (in inches)	4. Number of hours between beginning of storm measured and end of previous measurable rain event	5. Maximum flow rate during rain event (gallons/minute or specify units	6. Total flow from rain event (gallons or specify units)	7. Season sample was taken	8. Form of Precipitation (rainfall, snowmelt)

9. Provide a description of the method of flow measurement or estimate.

Instructions - Form 2F
Application for Permit to Discharge Storm Water Associated with Industrial Activity

Who Must File Form 2F

Form 2F must be completed by operators of facilities which discharge storm water associated with industrial activity or by operators of storm water discharges that EPA is evaluating for designation as a significant contributor of pollutants to waters of the United States, or as contributing to a violation of a water quality standard.

Operators of discharges which are composed entirely of storm water must complete Form 2F (EPA Form 3510-2F) in conjunction with Form 1 (EPA Form 3510-1).

Operators of discharges of storm water which are combined with process wastewater (process wastewater is water that comes into direct contact with or results from the production or use of any raw material, intermediate product, finished product, byproduct, waste product, or wastewater) must complete and submit Form 2F, Form 1, and Form 2C (EPA Form 3510-2C).

Operators of discharges of storm water which are combined with nonprocess wastewater (nonprocess wastewater includes noncontact cooling water and sanitary wastes which are not regulated by effluent guidelines or a new source performance standard, except discharges by educational, medical, or commercial chemical laboratories) must complete Form 1, Form 2F, and Form 2E (EPA Form 3510-2E).

Operators of new sources or new discharges of storm water associated with industrial activity which will be combined with other nonstormwater new sources or new discharges must submit Form 1, Form 2F, and Form 2D (EPA Form 3510-2D).

Where to File Applications

The application forms should be sent to the EPA Regional Office which covers the State in which the facility is located. Form 2F must be used only when applying for permits in States where the NPDES permits program is administered by EPA. For facilities located in States which are approved to administer the NPDES permits program, the State environmental agency should be contacted for proper permit application forms and instructions.

Information on whether a particular program is administered by EPA or by a State agency can be obtained from your EPA Regional Office. Form 1, Table 1 of the "General Instructions" lists the addresses of EPA Regional Offices and the States within the jurisdiction of each Office.

Completeness

Your application will not be considered complete unless you answer every question on this form and on Form 1. If an item does not apply to you, enter "NA" (for not applicable) to show that you considered the question.

Public Availability of Submitted Information

You may not claim as confidential any information required by this form or Form 1, whether the information is reported on the forms or in an attachment. Section 402(j) of the Clean Water Act requires that all permit applications will be available to the public. This information will be made available to the public upon request.

Any information you submit to EPA which goes beyond that required by this form, Form 1, or Form 2C you may claim as confidential, but claims for information which are effluent data will be denied.

If you do not assert a claim of confidentiality at the time of submitting the information, EPA may make the information public without further notice to you. Claims of confidentiality will be handled in accordance with EPA's business confidentiality regulations at 40 CFR Part 2.

Definitions

All significant terms used in these instructions and in the form are defined in the glossary found in the General Instructions which accompany Form 1.

EPA ID Number

Fill in your EPA Identification Number at the top of each odd-numbered page of Form 2F. You may copy this number directly from item I of Form 1.

Item I

You may use the map you provided for item XI of Form 1 to determine the latitude and longitude of each of your outfalls and the name of the receiving water.

Item II-A

If you check "yes" to this question, complete all parts of the chart, or attach a copy of any previous submission you have made to EPA containing the same information.

Item II-B

You are not required to submit a description of future pollution control projects if you do not wish to or if none is planned.

Item III

Attach a site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) depicting the facility including:

each of its drainage and discharge structures;

the drainage area of each storm water outfall;

paved areas and building within the drainage area of each storm water outfall, each known past or present areas used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied;

each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste for less than 90 days under 40 CFR 262.34);

each well where fluids from the facility are injected underground; and

springs, and other surface water bodies which receive storm water discharges from the facility;

Item IV-A

For each outfall, provide an estimate of the area drained by the outfall which is covered by impervious surfaces. For the purpose of this application, impervious surfaces are surfaces where storm water runs off at rates that are significantly higher than background rates (e.g., predevelopment levels) and include paved areas, building roofs, parking lots, and roadways. Include an estimate of the total area (including all impervious and pervious areas) drained by each outfall. The site map required under item III can be used to estimate the total area drained by each outfall.

Item IV-B

Provide a narrative description of significant materials that are currently or in the past three years have been treated, stored, or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal of these materials; past and present materials management practices employed, in the last three years, to minimize contact by these materials with storm water runoff; materials loading and access areas; and the location, manner, and frequency in which pesticides, herbicides, soil conditioners, and fertilizers are applied. Significant materials should be identified by chemical name, form (e.g., powder, liquid, etc.), and type of container or treatment unit. Indicate any materials treated, stored, or disposed of together. "Significant materials" includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of CERCLA; any chemical the facility is required to report pursuant to Section 313 of Title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

Item IV-C

For each outfall, structural controls include structures which enclose material handling or storage areas, covering materials, berms, dikes, or diversion ditches around manufacturing, production, storage or treatment units, retention ponds, etc. Nonstructural controls include practices such as spill prevention plans, employee training, visual inspections, preventive maintenance, and housekeeping measures that are used to prevent or minimize the potential for releases of pollutants.

Item V

Provide a certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested or evaluated for the presence of non-storm water discharges which are not covered by an NPDES permit. Tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. Part B must include a description of the method used, the date of any testing, and the onsite drainage points that were directly observed during a test. All non-storm water discharges must be identified in a Form 2C or Form 2E which must accompany this application (see beginning of instructions under section titled "Who Must File Form 2F" for a description of when Form 2C and Form 2E must be submitted).

Item VI

Provide a description of existing information regarding the history of significant leaks or spills of toxic or hazardous pollutants at the facility in the last three years.

Item VII-A, B, and C

These items require you to collect and report data on the pollutants discharged for each of your outfalls. Each part of this item addresses a different set of pollutants and must be completed in accordance with the specific instructions for that part. The following general instructions apply to the entire item.

General Instructions

Part A requires you to report at least one analysis for each pollutant listed. Parts B and C require you to report analytical data in two ways. For some pollutants addressed in Parts B and C, if you know or have reason to know that the pollutant is present in your discharge, you may be required to list the pollutant and test (sample and analyze) and report the levels of the pollutants in your discharge. For all other pollutants addressed in Parts B and C, you must list the pollutant if you know or have reason to know that the pollutant is present in the discharge, and either report quantitative data for the pollutant or briefly describe the reasons the pollutant is expected to be discharged. (See specific instructions on the form and below for Parts A through C.) Base your determination that a pollutant is present in or absent from your discharge on your knowledge of your raw materials, material management practices, maintenance chemicals, history of spills and releases, intermediate and final products and byproducts, and any previous analyses known to you of your effluent or similar effluent.

A. **Sampling:** The collection of the samples for the reported analyses should be supervised by a person experienced in performing sampling of industrial wastewater or storm water discharges. You may contact EPA or your State permitting authority for detailed guidance on sampling techniques and for answers to specific questions. Any specific requirements contained in the applicable analytical methods should be followed for sample containers, sample preservation, holding times, the collection of duplicate samples, etc. The time when you sample should be representative, to the extent feasible, of your treatment system operating properly with no system upsets. Samples should be collected from the center of the flow channel, where turbulence is at a maximum, at a site specified in your present permit, or at any site adequate for the collection of a representative sample.

For pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, and fecal coliform, grab samples taken during the first 30 minutes (or as soon thereafter as practicable) of the discharge must be used (you are not required to analyze a flow-weighted composite for these parameters). For all other pollutants both a grab sample collected during the first 30 minutes (or as soon thereafter as practicable) of the discharge and a flow-weighted composite sample must be analyzed. However, a minimum of one grab sample may be taken for effluents from holding ponds or other impoundments with a retention period of greater than 24 hours.

All samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches and at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where feasible, the variance in the duration of the event and the total rainfall of the event should not exceed 50 percent from the average or median rainfall event in that area.

A grab sample shall be taken during the first thirty minutes of the discharge (or as soon thereafter as practicable), and a flow-weighted composite shall be taken for the entire event or for the first three hours of the event.

Grab and composite samples are defined as follows:

Grab sample: An individual sample of at least 100 milliliters collected during the first thirty minutes (or as soon thereafter as practicable) of the discharge. This sample is to be analyzed separately from the composite sample

Flow-Weighted Composite sample: A flow-weighted composite sample may be taken with a continuous sampler that proportions the amount of sample collected with the flow rate or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire event or for the first three hours of the event, with each aliquot being at least 100 milliliters and collected with a minimum period of fifteen minutes between aliquot collections. The composite must be flow proportional; either the time interval between each aliquot or the volume of each aliquot must be proportional to either the stream flow at the time of sampling or the total stream flow since the collection of the previous aliquot. Aliquots may be collected manually or automatically. Where GC/MS Volatile Organic Analysis (VOA) is required, aliquots must be combined in the laboratory immediately before analysis. Only one analysis for the composite sample is required.

Data from samples taken in the past may be used, provided that:

All data requirements are met;

Sampling was done no more than three years before submission; and

All data are representative of the present discharge.

Among the factors which would cause the data to be unrepresentative are significant changes in production level, changes in raw materials, processes, or final products, and changes in storm water treatment. When the Agency promulgates new analytical methods in 40 CFR Part 136, EPA will provide information as to when you should use the new methods to generate data on your discharges. Of course, the Director may request additional information, including current quantitative data, if they determine it to be necessary to assess your discharges. The Director may allow or establish appropriate site-specific sampling procedures or requirements, including sampling locations, the season in which the sampling takes place, the minimum duration between the previous measurable storm event and the storm event sampled, the minimum or maximum level of precipitation required for an appropriate storm event, the form of precipitation sampled (snow melt or rainfall), protocols for collecting samples under 40 CFR Part 136, and additional time for submitting data on a case-by-case basis.

B. **Reporting:** All levels must be reported as concentration and as total mass. You may report some or all of the required data by attaching separate sheets of paper instead of filling out pages VII-1 and VII-2 if the separate sheets contain all the required information in a format which is consistent with pages VII-1 and VII-2 in spacing and in identification of pollutants and columns. Use the following abbreviations in the columns headed "Units."

Concentration		Mass	
ppm	parts per million	lbs	pounds
mg/l	milligrams per liter	ton	tons (English tons)
ppb	parts per billion	mg	milligrams
ug/l	micrograms per liter	g	grams
kg	kilograms	T	tonnes (metric tons)

All reporting of values for metals must be in terms of "total recoverable metal," unless:

(1) An applicable, promulgated effluent limitation or standard specifies the limitation for the metal in dissolved, valent, or total form; or

(2) All approved analytical methods for the metal inherently measure only its dissolved form (e.g., hexavalent chromium); or

(3) The permitting authority has determined that in establishing case-by-case limitations it is necessary to express the limitations on the metal in dissolved, valent, or total form to carry out the provisions of the CWA. If you measure only one grab sample and one flow-weighted composite sample for a given outfall, complete only the "Maximum Values" columns and insert "1" into the "Number of Storm Events Sampled" column. The permitting authority may require you to conduct additional analyses to further characterize your discharges.

If you measure more than one value for a grab sample or a flow-weighted composite sample for a given outfall and those values are representative of your discharge, you must report them. You must describe your method of testing and data analysis. You also must determine the average of all values within the last year and report the concentration mass under the "Average Values" columns, and the total number of storm events sampled under the "Number of Storm Events Sampled" columns.

C. **Analysis:** You must use test methods promulgated in 40 CFR Part 136; however, if none has been promulgated for a particular pollutant, you may use any suitable method for measuring the level of the pollutant in your discharge provided that you submit a description of the method or a reference to a published method. Your description should include the sample holding time, preservation techniques, and the quality control measures which you used. If you have two or more substantially identical outfalls, you may request permission from your permitting authority to sample and analyze only one outfall and submit the results of the analysis for other substantially identical outfalls. If your request is granted by the permitting authority, on a separate sheet attached to the application form, identify which outfall you did test, and describe why the outfalls which you did not test are substantially identical to the outfall which you did test.

Part VII-A

Part VII-A must be completed by all applicants for all outfalls who must complete Form 2F.

Analyze a grab sample collected during the first thirty minutes (or as soon thereafter as practicable) of the discharge and flow-weighted composite samples for all pollutants in this Part, and report the results except use only grab samples for pH and oil and grease. See discussion in General Instructions to Item VII for definitions of grab sample collected during the first thirty minutes of discharge and flow-weighted composite sample. The "Average Values" column is not compulsory but should be filled out if data are available.

Part VII-B

List all pollutants that are limited in an effluent guideline which the facility is subject to (see 40 CFR Subchapter N to determine which pollutants are limited in effluent guidelines) or any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit). Complete one table for each outfall. See discussion in General Instructions to item VII for definitions of grab sample collected during the first thirty minutes (or as soon thereafter as practicable) of discharge and flow-weighted composite sample. The "Average Values" column is not compulsory but should be filled out if data are available.

Analyze a grab sample collected during the first thirty minutes of the discharge and flow-weighted composite samples for all pollutants in this Part, and report the results, except as provided in the General Instructions.

Part VII-C

Part VII-C must be completed by all applicants for all outfalls which discharge storm water associated with industrial activity, or that EPA is evaluating for designation as a significant contributor of pollutants to waters of the United States, or as contributing to a violation of a water quality standard. Use both a grab sample and a composite sample for all pollutants you analyze for in this part except use grab samples for residual chlorine and fecal coliform. The "Average Values" column is not compulsory but should be filled out if data are available. Part C requires you to address the pollutants in Table 2F-2, 2F-3, and 2F-4 for each outfall. Pollutants in each of these Tables are addressed differently.

Table 2F-2: For each outfall, list all pollutants in Table 2F-2 that you know or have reason to believe are discharged (except pollutants previously listed in Part VII-B). If a pollutant is limited in an effluent guideline limitation which the facility is subject to (e.g., use of TSS as an indicator to control the discharge of iron and aluminum), the pollutant should be listed in Part VII-B. If a pollutant in table 2F-2 is indirectly limited by an effluent guideline limitation through an indicator, you must analyze for it and report data in Part VII-C. For other pollutants listed in Table 2F-2 (those not limited directly or indirectly by an effluent limitation guideline), that you know or have reason to believe are discharges, you must either report quantitative data or briefly describe the reasons the pollutant is expected to be discharged.

Table 2F-3: For each outfall, list all pollutants in Table 2F-3 that you know or have reason to believe are discharged. For every pollutant in Table 2F-3 expected to be discharged in concentrations of 10 ppb or greater, you must submit quantitative data. For acrolein, acrylonitrile, 2,4 dinitrophenol, and 2-methyl-4,6 dinitrophenol, you must submit quantitative data if any of these four pollutants is expected to be discharged

in concentrations of 100 ppb or greater. For every pollutant expected to be discharged in concentrations less than 10 ppb (or 100 ppb for the four pollutants listed above), then you must either submit quantitative data or briefly describe the reasons the pollutant is expected to be discharged.

Small Business Exemption - If you are a "small business," you are exempt from the reporting requirements for the organic toxic pollutants listed in Table 2F-3. There are two ways in which you can qualify as a "small business". If your facility is a coal mine, and if your probable total annual production is less than 100,000 tons per year, you may submit past production data or estimated future production (such as a schedule of estimated total production under 30 CFR 795.14(c)) instead of conducting analyses for the organic toxic pollutants. If your facility is not a coal mine, and if your gross total annual sales for the most recent three years average less than $100,000 per year (in second quarter 1980 dollars), you may submit sales data for those years instead of conducting analyses for the organic toxic pollutants. The production or sales data must be for the facility which is the source of the discharge. The data should not be limited to production or sales for the process or processes which contribute to the discharge, unless those are the only processes at your facility. For sales data, in situations involving intracorporate transfer of goods and services, the transfer price per unit should approximate market prices for those goods and services as closely as possible. Sales figures for years after 1980 should be indexed to the second quarter of 1980 by using the gross national product price deflator (second quarter of 1980 = 100). This index is available in National Income and Product Accounts of the United States (Department of Commerce, Bureau of Economic Analysis).

Table 2F-4: For each outfall, list any pollutant in Table 2F-4 that you know or believe to be present in the discharge and explain why you believe it to be present. No analysis is required, but if you have analytical data, you must report them. **Note:** Under 40 CFR 117.12(a)(2), certain discharges of hazardous substances (listed at 40 CFR 177.21 or 40 CFR 302.4) may be exempted from the requirements of section 311 of CWA, which establishes reporting requirements, civil penalties, and liability for cleanup costs for spills of oil and hazardous substances. A discharge of a particular substance may be exempted if the origin, source, and amount of the discharged substances are identified in the NPDES permit application or in the permit, if the permit contains a requirement for treatment of the discharge, and if the treatment is in place. To apply for an exclusion of the discharge of any hazardous substance from the requirements of section 311, attach additional sheets of paper to your form, setting forth the following information:

1. The substance and the amount of each substance which may be discharged.
2. The origin and source of the discharge of the substance.
3. The treatment which is to be provided for the discharge by:
   a. An onsite treatment system separate from any treatment system treating your normal discharge;
   b. A treatment system designed to treat your normal discharge and which is additionally capable of treating the amount of the substance identified under paragraph 1 above; or
   c. Any combination of the above.

See 40 CFR 117.12(a)(2) and (c), published on August 29, 1979, in 44 FR 50766, or contact your Regional Office (Table 1 on Form 1, Instructions), for further information on exclusions from section 311.

Part VII-D

If sampling is conducted during more than one storm event, you only need to report the information requested in Part VII-D for the storm event(s) which resulted in any maximum pollutant concentration reported in Part VII-A, VII-B, or VII-C.

Provide flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, the method of flow measurement, or estimation. Provide the data and duration of the storm event(s) sampled, rainfall measurements, or estimates of the storm event which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event.

Part VII-E

List any toxic pollutant listed in Tables 2F-2, 2F-3, or 2F-4 which you currently use or manufacture as an intermediate or final product or byproduct. In addition, if you know or have reason to believe that 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) is discharged or if you use or manufacture 2,4,5-trichlorophenoxy acetic

acid (2,4,5,-T); 2-(2,4,5-trichlorophenoxy) propanoic acid (Silvex, 2,4,5,-TP); 2-(2,4,5-trichlorophenoxy) ethyl, 2,2-dichloropropionate (Erbon); O,O-dimethyl O-(2,4,5-trichlorphenyl) phosphorothioate (Ronnel); 2,4,5-trichlorophenol (TCP); or hexachlorophene (HCP); then list TCDD. The Director may waive or modify the requirement if you demonstrate that it would be unduly burdensome to identify each toxic pollutant and the Director has adequate information to issue your permit. You may not claim this information as confidential; however, you do not have to distinguish between use or production of the pollutants or list the amounts.

Item VIII

Self explanatory. The permitting authority may ask you to provide additional details after your application is received.

Item X

The Clean Water Act provides for severe penalties for submitting false information on this application form.

Section 309(c)(4) of the Clean Water Act provides that "Any person who knowingly makes any false material statement, representation, or certification in any application, . . . shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction of such person is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both." 40 CFR Part 122.22 requires the certification to be signed as follows:

(A) For a corporation: by a responsible corporate official. For purposes of this section, a responsible corporate official means (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding $25,000,000 (in second-quarter 1980 dollars), if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.

Note: EPA does not require specific assignments or delegation of authority to responsible corporate officers identified in 122.22(a)(1)(i). The Agency will presume that these responsible corporate officers have the requisite authority to sign permit applications unless the corporation has notified the Director to the contrary. Corporate procedures governing authority to sign permit applications may provide for assignment or delegation to applicable corporate position under 122.22(a)(1)(ii) rather than to specific individuals.

(B) For a partnership or sole proprietorship: by a general partner or the proprietor, respectively; or

(C) For a municipality, State, Federal, or other public agency: by either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of EPA).

JAN - 9 1991

OFFICE OF GENERAL COUNSEL

MEMORANDUM

SUBJECT: Compliance With Water Quality Standards in NPDES Permits Issued To Municipal Separate Storm Sewer Systems

FROM: E. Donald Elliott ED Elliott
Assistant Administrator and
General Counsel (LE-130)

TO: Nancy J. Marvel
Regional Counsel
Region IX

In your memorandum of August 9, 1990, you have asked for our views on the following two issues:

ISSUES

1) Must NPDES permits for municipal separate storm sewer systems ("MS4s") issued under Section 402(p)(3)(B) of the Clean Water Act (CWA) include requirements necessary to achieve water quality standards (WQS), as generally required by Section 301(b)(1)(C) for all NPDES permits?

2) If permits issued to MS4s must comply with WQS, by what date must the permit ensure compliance?

SHORT ANSWERS

1) The better reading of Sections 402(p)(3)(B) and 301(b)(1)(C) is that all permits for MS4s must include any requirements necessary to achieve compliance with WQS.

2) Sections 402(p)(4)(A) and (p)(4)(B) give "large" and "medium" MS4s three years to comply with permit conditions from the date of permit issuance. This three year compliance date also applies to WQS-based permit requirements.

0443

DISCUSSION

1. Statutory Background

Section 402(a)(1) requires that all NPDES permits comply with the applicable provisions of section 301. This includes compliance with appropriate technology-based standards and effluent limits (sections 301(b)(1)(B), 301(b)(2)). Permits must include "any more stringent limitation" necessary to meet WQS. Section 301(b)(1)(C). In addition, Section 401 requires that any applicant for a federal permit (including NPDES permits issued by EPA) must provide the permitting agency a certification from the State in which the discharge originates that the discharge will comply with the State's WQS.

As part of the 1987 amendments to the Clean Water Act, Congress added Section 402(p) to the Act, related to storm water discharges. Congress exempted some storm water discharges from the requirement to obtain an NPDES permit until after October 1, 1992. Section 402(p)(1). For certain specific categories of storm water discharges, this permit "moratorium" is not in effect, including discharges "associated with industrial activity," discharges from large and medium municipal separate storm sewer systems (i.e., systems serving a population over 250,000 or systems serving a population between 100,000 and 250,000, respectively). Section 402(p)(2).

For industrial and municipal storm water discharges, EPA was instructed to promulgate new regulations specifying permit application requirements. Congress mandated EPA to issue permits no later than February 4, 1991 (for industrial and large municipal discharges) or February 4, 1993 (for medium municipal discharges). Section 402(p)(4). These permits shall provide for compliance "as expeditiously as practicable, but in no event later than 3 years after the date of issuance of such permit." Id.

Section 402(p) also specified the levels of control to be incorporated into storm water permits. Permits for discharges associated with industrial activity are to require compliance with all applicable provisions of Sections 301 and 402 of the CWA, i.e., all technology-based and water quality-based requirements. Section 402(p)(3)(A). By contrast, permits for discharges from municipal separate storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable" ("MEP"). Section 402(p)(3)(B)(iii).

2. Analysis

A. WQ-based Requirements in Municipal Storm Water Permits

The relationship of Section 402(p)(3)(B)(iii) to Section 301(b)(1)(C) is not clear, either on the face of the statute or in legislative history. Section 402(p)(3) is clearly intended to draw a distinction between the requirements on industrial and municipal storm water discharges. Section 402(p)(3)(A) states that industrial discharges shall comply with the applicable provisions of section 301, i.e., BAT/BCT technology-based requirements as well as any more stringent WQ-based requirements pursuant to 301(b)(1)(C). In the next sub-paragraph, Congress requires municipalities to control storm water to the MEP standard: no mention is made of section 301. The juxtaposition of (p)(3)(A) and (p)(3)(B) gives rise to the argument that Congress may have intended to waive all section 301 requirements for municipal discharges in favor of the MEP standard. On the other hand, one could read (p)(3)(B)(iii) as modifying only technology-based requirements for municipal storm water (i.e., MEP substitutes for BAT/BCT); any WQ-based requirements would still be necessary in a municipal permit, even if those requirements are more stringent than "practicable." The legislative history of Section 402(p) provides no guidance as to how Congress intended the MEP standard to operate.

Where Congressional intent behind a statutory provision is ambiguous in light of the language or legislative history, the Agency charged with administering that statute may adopt any reasonable interpretation consistent with the goals and purposes of the statute. Chevron, U.S.A. v. NRDC, 467 U.S. 837 (1984). Therefore, EPA has a large degree of discretion to choose how it will interpret the applicability of WQS to municipal storm water discharges. The only interpretation by EPA to date, contained in its proposed rulemaking, has been that WQS would continue to apply to permits for municipal storm water discharges. See, e.g., 53 Fed. Reg. 49,457 (Dec. 7, 1988) (priorities for controls in municipal storm water management programs will be developed to ensure achievement of water quality standards and the CWA).[1] There has been no intervening interpretation expressed by EPA on this issue. It is the opinion of the Office of General Counsel that the interpretation adopted by the Agency in the proposal is a reasonable one, for the following reasons.

---

[1] EPA's intent to apply WQS to municipal storm water discharges can also be inferred by the fact that the 1988 proposal did not propose to alter 40 CFR 122.44(d), which provides that all NPDES permits must contain water quality-based requirements more stringent than technology-based requirements, where necessary to achieve WQS.

First, to support the opposite reading (i.e., that WQ-based requirements do not apply to municipal storm water permits), one would have to assert that Congress implicitly waived section 301(b)(1)(C) requirements for municipal storm water. One would further have to assume that Congress impliedly exempted municipal storm water permits from the Section 401 certification requirements. Implied repeals of statutory provisions are generally disfavored. Morton v. Mancari, 417 U.S. 535, 549 (1974). A court generally will find a statute impliedly repealed only if the later enacted provision is in "irreconcilable conflict" with the earlier provision. Kremer v. Chemical Construction Corp., 456 U.S. 461, 468 (1982) (citations omitted). In this case, the statutory provisions are not in irreconcilable conflict; rather, as discussed above, one may read Section 301(b)(1)(C) as requiring "any more stringent limitation" necessary to meet a WQS in every NPDES permit, including permits for discharges from municipal separate storm sewers which are subject to the MEP standard. Such a reading would harmonize the two provisions and give effect to the policy behind Sections 301(b)(1)(C) and 401, i.e., to ensure that WQS are met, regardless of practical considerations (such as the availability of treatment technology or the "practicability" of MS4 permit requirements).

To read Section 402(p)(3)(B) as overriding 301(b)(1)(C) requirements would also cause a conflict between Section 402(p) and the general focus of the provisions in the 1987 Amendments, many of which reflect a Congressional desire to improve compliance with the WQ-based requirements of the Act. The amendments to/additions of sections 303(c)(2)(B), 304(l), 319, 320, 402(o) all reflect Congressionel concern with the improvement of water quality through the NPDES and other CWA programs. It would be particularly difficult to argue that the storm water provisions, a major part of the 1987 Amendments, were intended to create an exemption from the general rule regarding WQ-based requirements without an explicit acknowledgment of that result. We think the approach taken in the proposed rule is preferable.

B. Compliance Date for WQ-Based Limits in Municipal Storm Water Permits

In contrast to the issue of whether WQ-based requirements apply at all to MS4s, Congress had indeed spoken to the compliance date issue. Section 402(p)(4) requires compliance with all permit conditions no later than three years from the date of issuance. In light of the express language, we believe the Agency may reasonably interpret the three-year compliance provisions in Section 402(p)(4) to apply to all permit

conditions, including those imposed under 301(b)(1)(C).[2]

There are arguments which support the reasonableness of this interpretation. First, EPA has issued few, if any storm water permits to MS4s to date. Many of these systems will face NPDES permit conditions for the first time, and I understand immediate compliance for these systems is likely to be unrealistic. The compliance date in Section 402(p)(4) apparently reflects a Congressional realization of that reality. Second, EPA has already construed another very similar provision of the 1987 Amendments in the same manner. Section 304(l) establishes an identical three-year compliance date for achieving water quality standards in Individual Control Strategies issued under that section. EPA has interpreted that provision, while not repealing Section 301(b)(1)(C), to allow for three-year compliance with new effluent limits established to meet WQS on 304(l)-identified streams. 54 Fed. Reg. 23,889 (Jun. 2, 1989). Given that 304(l) deals directly with WQ-based standards and permit requirements, a consistent interpretation with respect to 402(p)(3) and (p)(4) (which, as we have seen, is silent on the role of WQ-based requirements for MS4s) is certainly reasonable.[3]

If you have any questions regarding this memorandum, please contact Randy Hill of my staff, FTS 382-7700.

---

[2] There may be some municipal separate storm sewer systems which are unable to meet even the three-year compliance date in their permits. The Agency retains the discretion to issue an administrative order fixing a schedule for compliance if compliance is not achieved in that three-year period.

[3] The decision of the Administrator in the Star-Kist permit appeal does not affect this analysis. Indeed, the decision itself supports the reading that compliance schedules under Section 304(l) (and, by extension, schedules under Section 402(p)(4)) are unaffected by the holding in that decision. Cf. Order on Petition for Reconsideration, In the Matter of Star-Kist Caribe, Inc., NPDES Appeal No. 88-5, (Apr. 17, 1990), at 6 n.5 (because decision does not prevent all post-1977 compliance schedules, arguments regarding 304(l) are not pertinent); (order stayed Sept. 4 1990).

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD

In the Matter of the Petition of CITIZENS FOR A BETTER ENVIRONMENT, SAVE SAN FRANCISCO BAY ASSOCIATION, AND SANTA CLARA VALLEY AUDUBON SOCIETY For Review of Waste Discharge Requirements Order No. 90-094 of the California Regional Water Quality Control Board, San Francisco Bay Region. Our File No. A-695.	ORDER NO. WQ 91-03

BY THE BOARD:

On July 23, 1990, the State Water Resources Control Board (State Board) received a petition from Citizens for a Better Environment, Save San Francisco Bay Association and Santa Clara Valley Audubon Society (petitioners). The petition sought review of waste discharge requirements adopted by the Regional Water Quality Control Board, San Francisco Bay Region (Regional Board) in Order No. 90-094, regulating discharges of storm water[1] from municipal separate storm sewers throughout the Santa Clara Valley. The storm drains discharge to creeks and streams which are tributary to South San Francisco Bay (South Bay).

The issues raised in the petition are complex, and concern two major federal regulatory programs--storm water

0449

1 *There are variant spellings of 'storm water' and 'stormwater' found in the relevant statutes, regulations, and case law. We will adopt 'storm water', but quoted materials using 'stormwater' will also appear in this Order.*

regulation and regulation of water bodies which do not attain water quality standards. Given the complexity of these issues, we will review the background and requirements of these programs, and the application of these programs to municipal storm water discharges throughout the Santa Clara Valley.

We note that the Regional Water Quality Control Board, Los Angeles Region, issued a separate permit regulating storm water discharges from municipalities in the Los Angeles area, which we have also reviewed. Order No. WQ 91-04, which is also being issued today, explores many of the same issues as this Order. In preparing this Order, we have reviewed the documents submitted by persons interested in the Los Angeles petition.

I. BACKGROUND

A. The Need for a Storm Water Regulatory Program

Through the natural hydrologic cycle, precipitation condenses from clouds and falls on land surfaces where it disperses in several ways. Water may be temporarily captured in the soil so plants may use and then transpire it. Rain or snowfall may also quickly evaporate or may infiltrate the surface soil to replenish ground water. Rain water and snow melt flow over land areas and replenish creeks, streams, rivers and lakes. But this runoff accumulates a variety of pollutants including minerals, nutrients, bacteria, suspended material, heavy metals and debris as it flows through the natural environment. Surface runoff also becomes degraded as plants and animals use it. Though gravitational flow eventually returns water to the ocean

and evaporation again transforms this water on a broad scale, the accumulation of pollutants in runoff water may substantially diminish water quality in a microcosm and thereby alter the balance of important natural cycles.

In addition to the pollutants which accumulate in storm water runoff, pollutants also enter surface waters during dry weather through storm drain systems. Pollutants may be transported by wet weather flows or even by direct discharge to the storm drains, and later released to surface waters, even during times when there is no rainfall or snow melt. Examples of these dry-weather pollutant discharges include water line flushing, landscape irrigation, diverted stream flows, rising ground waters, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, and individual residential car washing.

While there is some confusion in the terminology which is used in the regulatory documents, the former type of discharge, which occurs as a direct result of storm events, is usually referred to as "storm water discharge," while the latter form of dry weather discharge is referred to as "urban runoff." Together, we shall most commonly refer to the phenomenon as "storm water discharge."[2] Storm water discharges may be significant contributors of pollutants to surface waters.

---

2 In regulations, the Environmental Protection Agency (EPA) adopted recently, "storm water" is defined as "storm water runoff, snow melt runoff, and surface runoff and drainage". 40 CFR Section 122.26(a)(13). While "storm water" thus includes urban runoff, it must be noted that discharges which are not composed of "storm water" (such as illicit discharges to the municipal system from industrial facilities) are prohibited by the regulations. Thus, many forms of urban runoff may in fact be prohibited.

B. Municipal Separate Storm Sewer Systems

Municipal separate storm sewer systems essentially act as conduits for pollutants from diffuse sources throughout the urban environment and from discrete point sources associated with industrial activities. The systems to which we shall refer in this Order are owned or operated by public agencies, are designed or used for collecting or conveying storm water, and are not a combined sewer.[3] While separate storm sewer systems are legally characterized as point sources within the meaning of the Clean Water Act, as discussed hereinafter, the waste which they discharge mostly originates as nonpoint, diffuse waste flows from urban development and activities (including residences, streets and commercial establishments). Municipal separate storm sewer systems are somewhat analogous to municipal sanitary sewer systems where those systems convey industrial wastewaters along with domestic sewage. The sanitary sewers simply transport industrial wastes to the treatment facility and then to the receiving water. However, storm water discharges, and the pollutants therein, are also highly variable, being affected greatly by such factors as storm events, land uses and receiving water conditions, and thus present even greater challenges for their regulation and control.

3 *40 CFR Section 122.26(b)(8).*

C. Early Attempts to Regulate Storm Water Discharges

In 1972, Congress adopted the Federal Water Pollution Control Act Amendments of 1972,[4] which created a comprehensive program to protect surface waters. The Clean Water Act emphasizes the control, treatment and elimination of all pollutant sources in order to protect vital uses of the nation's waters. Because scant information about runoff existed in 1972, the Clean Water Act mandated further assessment of runoff, its constituent pollutants, the consequent water quality effects, and applicable control measures. Section 105 of the Act specified that the development and application of "waste management methods" to prevent, reduce, or eliminate pollutants from storm water runoff would be a national priority.[5]

---

4 *Public Law 92-500 (86 Stat. 816, enacted October 18, 1972); 33 USC Section 1151 et seq. Although characterized in the official title as "amendments", the 1972 FWPCA essentially rewrote the pre-1972 Federal Water Pollution Control Act. The 1972 amendments are commonly referred to as the Clean Water Act, and we will follow that practice. We shall use the enumeration of Clean Water Act sections, rather than the comparable United States Code designations.*

5 *The pertinent portions of Section 105 state:*

> *"(a) The Administrator [of the Environmental Protection Agency] is authorized to conduct in the Environmental Protection Agency and to make grants to any state, municipality, or intermunicipal or interstate agency for the purpose of assisting in the development of (1) any project which will demonstrate a new or improved method of preventing, reducing, and eliminating the discharge into any waters of pollutants from sewers which carry storm water or both storm water and pollutants...."*
>
> * * *
>
> *(d) In carrying out the provisions of this section, the Administrator shall conduct, on a priority basis, an accelerated effort to develop, refine, and achieve practical application of:*
> *(1) waste management methods applicable to point and nonpoint sources of pollutants to eliminate the discharge of pollutants, including, but not limited to, elimination of runoff of pollutants and the effects of pollutants from inplace or accumulated sources...."*

The Clean Water Act also included a major new regulatory program intended to implement the Act's stated goal of eliminating the discharge of pollutants into surface waters by 1985. Section 301 of the Act prohibits the discharge of any pollutant to navigable waters from a "point source"[6] unless the discharge is authorized by a national pollutant discharge elimination system (NPDES) permit. The provisions for adoption of NPDES permits are contained in Section 402 of the Clean Water Act.[7]

In 1973, EPA issued regulations which exempted certain categories of point sources of pollution from the permit requirements of Section 402.[8] One of the categories of discharges exempted by the 1973 regulations was separate storm sewers containing only storm runoff uncontaminated by any industrial or commercial activity. In Natural Resources Defense Council v. Costle (D.C.Cir. 1977) 568 F.2d 1369, the court held

---

6 A "point source" is defined in Section 502(14) as "any discernible, confined, and discrete conveyance, including but not limited to any pipe, ditch channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged." It is important to note that, while the discharge of storm water to surface waters is a discharge from a point source from a legal standpoint, these discharges have often been referred to in official documents as "nonpoint" discharges, in recognition of the manner in which they travel over land to the point of discharge.

7 Section 402 authorizes states to administer the NPDES program within their boundaries. EPA has approved California's NPDES program. Pursuant to the provisions of the Porter-Cologne Water Quality Control Act (California Water Code Section 13000 et seq.), NPDES permits are issued by the Regional Water Quality Control Boards in California.

8 See 38 Fed. Reg. 18000 (1973).

that the Clean Water Act required NPDES permits for all discharges of pollutants from point sources, specifically including the discharge of storm water. In that opinion, the court encouraged the use of general permits and "alternative" permit conditions for storm water permits. It was not until 1990, after several aborted attempts, that EPA finally issued regulations for the issuance of storm water permits.[9]

D. Basin Planning Activities by the Regional Board

In 1975, the Regional Board adopted its Water Quality Control Plan for the San Francisco Bay Region (1975 Basin Plan).[10] The 1975 Basin Plan broadly characterized suspected constituents in runoff and roughly estimated pollutant mass loadings from runoff throughout the region. These estimates were derived from several earlier, but limited runoff emission studies. In the 1975 Basin Plan, the Regional Board acknowledged the necessity to obtain further knowledge about storm water runoff and to undertake regulatory actions. Four fundamental control strategies were described for urban runoff: (1) Prevent contaminants from reaching urban land surfaces; (2) Improve street cleaning and cleansing of other public areas;

9 *40 CFR Parts 122, 123, and 124. See 55 Fed. Reg. 47990 (November 16, 1990).*

10 *The 1975 Basin Plan was approved by the State Board in Resolution No. 75-28.*

(3) Treat runoff prior to discharge to receiving waters; and (4) New controls on land use and development.[11]

The 1975 Basin Plan concluded that until more definitive research and study about runoff control strategies was conducted, the prudent regulatory path was to adopt and maintain reasonable source control measures and comprehensive monitoring programs. In approving the 1975 Basin Plan, the State Board stipulated that various actions in the Plan, including the urban runoff strategies, constituted recommendations which the State Board, the Regional Board and other agencies should consider further.[12]

The 1975 Basin Plan identified beneficial uses for specified water bodies and listed water quality objectives to protect such uses. Among the water quality objectives listed in the 1975 Basin Plan was a narrative toxicity objective.[13] Compliance with the narrative toxicity objective was to be determined by bioassays. The Basin Plan further specified "limiting concentrations" for inorganic chemical constituents (primarily heavy metals) in waters used as domestic and municipal supply.[14]

The 1975 Basin Plan did not specify numeric water quality objectives for the South Bay. It instead prohibited

12 State Board Resolution No. 75-28.

13 The objective requires that all waters be maintained free of toxic substances in toxic amounts. 1975 Basin Plan, page 4-11.

14 1975 Basin Plan, at page 4-18.

continued wastewater discharges to the South Bay, with specified exceptions to this prohibition.[15] The Basin Plan also referred to various plans and policies of the State Board, including the "Water Quality Control Policy for the Enclosed Bays and Estuaries of California."[16] However, the 1975 Basin Plan explicitly stated that this policy does not apply to wastes from "land runoff".[17]

After approval of the Basin Plan by the State Board, the beneficial uses and water quality objectives contained therein were approved by EPA as water quality standards within the meaning of the Clean Water Act. Thus, in 1976 there were no numeric water quality objectives for the South Bay, and there was a general prohibition against discharges thereto, which did not apply to storm water discharges.

In 1986, the Regional Board made substantial revisions to the Basin Plan.[18] The 1986 Basin Plan included numeric objectives for specific toxic pollutants (primarily heavy metals) in some of the surface waters in the Region. For surface waters

15 1975 Basin Plan, pages 5-6 through 5-12 and 5-47.

16 The "Bays and Estuaries Policy", as this document is commonly known, was adopted on May 16, 1974.

17 1975 Basin Plan, "Bays and Estuaries Policy", section at page 4-11. In the Bays and Estuaries Policy, the State Board had prohibited continued wstewater discharges to the South Bay, based on limited assimilative capacity, generally shallow depth and hydrodynamic circumstances restricting free movement and wide dispersion.

18 The Regional Board amended the Basin Plan in Resolution No. 86-14, on December 17, 1986. This document will be referred to as "1986 Basin Plan". The State Board approved the revisions on May 21, 1987.

downstream from Carquinez Straits, the Regional Board adopted water quality objectives in Table III-2A, which were to be included in NPDES permits.

The 1986 Basin Plan reiterated the necessity of site-specific, numeric water quality objectives for the South Bay, and did not apply the Table III-2A objectives there. The 1986 Basin Plan explained:

> "The South Bay below the Dumbarton Bridge is a unique, water quality limited, hydrodynamic and biological environment which merits continued special attention by the Board. Site specific water quality objectives are absolutely necessary in this area for two reasons. First, its unique hydrodynamic environment dramatically affects the environmental fate of pollutants. Second, potentially costly nonpoint source pollution control measures must be implemented to attain any objectives in this area. The costs of those measures must be factored into economic impact considerations by the Board in adopting any objectives for this area. Nowhere else in the Region will nonpoint source economic considerations have such an impact on the attainability of objectives. Therefore, for this area, the objectives contained in Tables III-2A and III-2B will be considered guidance only, and should be used as part of the basis for site specific objectives. Programs described in Chapter IV will be used to develop site specific objectives for it. Ambient conditions shall be maintained until site specific objectives are developed."[19]

The 1986 Basin Plan identified existing and potential beneficial uses for the South Bay and its tributary surface waters. Uses for the South Bay include industrial service supply, navigation, body contact and non-contact recreation, commercial and sport fishing, wildlife and rare and endangered species habitat, fish migration and spawning, shellfish

19 *1986 Basin Plan, page III-5.*

harvesting and estuarine habitat.[20] For the numerous surface water bodies tributary to the South Bay, the beneficial uses typically include municipal supply, agricultural supply, ground water recharge, body contact and non-contract recreation, cold and warm freshwater habitat, wildlife habitat, and fish migration and spawning.

In order to protect beneficial uses, the 1986 Basin Plan contained a four-part implementation plan. The plan included point source control measures, nonpoint source control measures, estuarine management actions, and continued planning actions. While the plan for point sources included either specific effluent limitations to be included in NPDES permits or alternative limits based on site-specific water quality objectives, the plan for nonpoint sources did not contain such specific controls. It was noted in the 1986 Basin Plan that wastes from diffuse sources such as agricultural operations, onsite treatment and disposal systems, construction activities, urban runoff, spills and dredging had not been thoroughly investigated.[21]

While the 1986 Basin Plan did not call for the immediate regulation of storm water runoff, the Plan did

---

20 1986 Basin Plan, Table 2-1.

21 As was noted earlier, while storm water runoff is legally a point source and must be regulated as such, many historical documents describe such discharges as nonpoint sources. Regardless of the nomenclature, such documents must be read in context. Where, as here, the Regional Board distinguished between point sources and nonpoint sources including storm water or urban runoff, we must interpret its intent to exclude storm water runoff from the rules for other point sources. In the Basin Plan, it is obvious that the Regional Board considered both storm water and urban runoff as nonpoint sources.

summarize the findings of several local and national studies concerning urban and storm water runoff.[22] Collectively, these studies indicated that runoff varies considerably, but likely contributes significant quantities of pollutants, especially heavy metals, to the surface waters. The 1986 Basin Plan instituted actions to identify more thoroughly local runoff problems, to evaluate existing control measures, and to develop specific additional measures. Local governmental agencies and owners or operators of storm drain systems in the South Bay were required to submit detailed information and to identify and implement runoff control measures.

E. Preliminary Control Activities in the Santa Clara Valley Storm Water System

The information required by the 1986 Basin Plan provided some data regarding operation of the municipal separate storm sewer system in the Santa Clara Valley. Throughout the Valley, a relatively flat region spanning approximately 700 square miles between the Santa Cruz Mountains and the Diablo Range, a complex network of storm sewers and natural drainage courses collect and transport intermittent urban runoff and storm waters from urban, industrial, residential and undeveloped areas. The County of Santa Clara, the Santa Clara Valley Water District, and 13 cities[23] own, operate, or maintain the municipal separate

22 *1986 Basin Plan, pages IV-39 through IV-41.*

23 *The cities and towns are Campbell, Cupertino, Los Altos, Los Altos Hills, Los Gatos, Milpitas, Monte Sereno, Mountain View, Palo Alto, San Jose, Santa Clara, Saratoga and Sunnyvale. They are sometimes referred to in the record as "Santa Clara Valley Nonpoint Source Agencies".*

storm sewers within the system. The collected flows are conveyed and discharged into numerous creeks, streams, rivers and other surface water bodies which comprise the Santa Clara hydrologic unit of the San Francisco hydrologic basin, and which are ultimately tributary to the South Bay.[24]

In response to the 1986 Basin Plan requirements, the local agencies which discharge storm water runoff from their storm drain systems into Santa Clara Valley drainage courses developed an action plan to initiate a storm water runoff control program.[25] The program consisted of three principal phases: (1) Dry- and wet-weather investigation and monitoring of pollutants in runoff flows and in receiving waters; (2) Identification and evaluation of alternative pollutant control measures; and (3) Development of an implementation plan. The local agencies and their consultants prepared and submitted reports when they completed each phase of the program. The "Implementation Program", the final phase, was completed in March 1990. This report described numerous individual and jurisdiction-wide runoff pollutant control measures and the institutional arrangement to implement them.

F. Water Quality Act of 1987

1. Storm Water Provisions

In 1987, the federal Clean Water Act was amended[26] to add provisions specifically requiring a regulatory program for storm water discharges. Section 402 of the Clean Water Act was amended to add subsection 402(p), which establishes NPDES permit application requirements for municipal storm water discharges and for storm water discharges associated with industrial activities.[27]

Section 402(p)(1) provides that prior to October 1, 1992, NPDES permits shall not be required for discharges composed entirely of storm water. Exceptions to this prohibition include discharges from municipal separate storm sewer systems serving a population of 250,000 or more (Section 402(p)(2)(C)) and where the "stormwater discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States". Section 204(p)(2)(E). Regarding municipal discharges, Section 402(p)(3)(B) provides:

> "Permits for discharges from municipal storm sewers--(i) may be issued on a system- or jurisdiction-wide basis; (ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and (iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and

26 *The amendments are entitled Water Quality Act of 1987, Public Law 100-4 (February 4, 1987).*

27 *Section 405(p) of the Water Quality Act of 1987.*

engineering methods, and such other provisions as the [EPA] Administrator or the State determines appropriate for the control of such pollutants." (Emphasis added.)

The issues raised in this petition concern the portions of Section 402(p) addressing municipal discharges, especially the meaning of the requirement that municipalities must control and reduce pollutant discharges to the "maximum extent practicable". These issues will be discussed in detail hereafter.

On December 7, 1988, EPA issued draft regulations intended to implement Section 402(p). However, despite the statutory requirement that EPA promulgate regulations by February 4, 1989, the final regulations were not promulgated until November 16, 1990,[28] after the Regional Board had issued the permit which we are reviewing.

---

28 55 Fed. Reg. 47990.

2. Section 304(l)

The Water Quality Act of 1987 also added Subsection 304(l) to the Clean Water Act.[29] Section 304(l) generally requires states to identify those surface waters which are adversely affected by toxic, conventional, and nonconventional pollutants. The surface waters may be included on any of three lists which must be prepared. The list which we shall discuss herein includes waters which are not expected to meet applicable standards, "due entirely or substantially to discharges from

---

29 Section 308(a) of the Water Quality Act of 1987 added Section 304(l)(1), which states:

"Not later than 2 years after February 4, 1987, each State shall submit to the Administrator for review, approval, and implementation under this subsection--

(A) a list of those waters within the State which after the application of effluent limitations required under section 1311(b)(2) of this title cannot reasonably be anticipated to attain or maintain (i) water quality standards for such waters reviewed, revised, or adopted in accordance with section 1313(c)(2)(b) of the title, due to toxic pollutants, or (ii) that water quality which shall assure protection of public health, public water supplies, agricultural and industrial uses, and the protection and propagation of a balanced population of shellfish, fish and wildlife, and allow recreational activities in and on the water,

(B) a list of all navigable waters in such State for which the State does not expect the applicable standard under section 1313 of this title will be achieved after the requirements of sections 1311(b), 1316, and 1317(b) of this title are met, due entirely or substantially to discharges from point sources of any toxic pollutants listed pursuant to section 1317(a) of this title;

(C) for each segment of the navigable waters included on such lists, a determination of the specific point sources discharging any such toxic pollutant which is believed to be preventing or impairing such water quality and the amount of each such toxic pollutant discharged by each such source; and;

(D) for each such segment, an individual control strategy which the State determines will produce a reduction in the discharge of toxic pollutants from point sources identified by the State under this paragraph through the establishment of effluent limitations under section 1342 of this title and water quality standards under section 1313(c)(2)(B) of this title, which reduction is sufficient, in combination with existing controls on point and nonpoint sources of pollution, to achieve the applicable water quality standard as soon as possible, but not later than 3 years after the date of the establishment of such strategy."

point sources". Section 304(l)(1)(B). The list is commonly known as the "B list".

Section 304(l) also requires states to prepare "individual control strategies" ("ICS") to control toxic pollutant discharges. To implement Section 304(l), EPA promulgated regulations on June 2, 1989.[30] The regulations interpret an "individual control strategy" to mean "a final NPDES permit with supporting documentation showing that effluent limits are consistent with an approved wasteload allocation, or other documentation which shows that the applicable water quality standards will be met not later than three years after an individual control strategy is established."[31]

The ICS or permit must reduce toxic pollutant discharges from identified point sources "in combination with existing controls on point and nonpoint sources of pollutants".[32] The regulations require ICS's for surface waters on the B list, i.e. for waters which do not or are not expected to achieve applicable water quality standards "due

30 *54 Fed. Reg. 23896.*

31 *40 CFR Section 123.46(c).*

32 *40 CFR Section 123.46(a).*

entirely or substantially to discharges from point sources" of toxic pollutants.[33]

On February 3, 1989, the State Board sent EPA its B list of impaired waters and contributing point sources. The South Bay was included on this list because conditions violated the narrative receiving water quality objective for toxicity. Point sources which were identified as contributing to the violation of standards included three municipal wastewater treatment plants,[34] and "stormdrains." The list identified seven toxic pollutants (cadmium, copper, lead, mercury, nickel, selenium and silver) as causing the impairment.

G. Adoption of the Permit

In an attempt to fulfill the numerous requirements of the 1986 Basin Plan amendments, the provisions of state law regarding adoption of waste discharge requirements,[35] the Clean Water Act provisions regarding storm water permits and

---

33 40 CFR Section 130.10(d). The regulations only require ICS's for those surface waters identified on the B list. 40 CFR Section 123.46(a). In a recent court decision, it was held that this interpretation was too narrow, and the regulations were remanded to EPA for reconsideration. Natural Resources Defenses Council v. Environmental Protection Agency (9th Cir. 1990) 915 F.2d 1314. The other lists required under Section 304(l) are the "A(i) list" of surface waters not expected to attain water quality standards due to toxic pollutants (Section 304(l)(1)(A)(i)) and the "A(ii) list" of surface waters which will not attain water quality which "assure[s] protection of public health, public water supplies, agricultural and industrial uses, and the protection and propagation of a balanced population of shellfish, fish and wildlife, and allow recretional activities in and on the water". Section 304(l)(1)(ii).

34 See our earlier order regarding these plants, Order No. WQ 90-5.

35 California Water Code Section 13000 et seq.

Section 304(l), and the federal regulations regarding Section 304(l), the Regional Board issued a draft NPDES permit for the Santa Clara Valley Nonpoint Sources Agencies' (the dischargers) storm water discharges throughout Santa Clara Valley. Public hearings were held by the Regional Board on May 16 and on June 20, 1990, and on the latter date the Regional Board adopted the NPDES permit (NPDES permit CA0029718; Regional Board Order No. 90-094). Subsequently, the petitioners filed a timely petition for review of the NPDES permit. On September 28, 1990, EPA approved the permit as an ICS.[36]

II. CONTENTIONS AND FINDINGS

The petition raises a number of contentions which all address whether the permit must include numeric, water quality-based effluent limitations. The petitioners argue that, both as an NPDES permit regulating storm water discharges and as an ICS, the permit must prescribe numeric effluent limitations for toxic pollutants (specifically cadmium, copper, lead, mercury, nickel, selenium, silver and "toxic organic pollutants") in regulated storm water discharges.

The petitioners' arguments contend that numeric effluent limitations are required both pursuant to the legal

---

36 The document transmitting EPA's approval constituted EPA's final agency action and is entitled, "Decision of the United States Environmental Protection Agency on Listings under Section 304(l) of the Clean Water Act Regarding the State of California." This Decision will be referred to as "304(l) Decision." On page 20, EPA states: "EPA approves NPDES permit CA0029718 as the individual control strategy for the South San Francisco Bay Stormdrains. The permit requires attainment of water quality standards in South San Francisco Bay."

requirements for NPDES permits generally and for ICS's specifically. The petitioners generally contend that the dischargers are causing pollutants to enter the South Bay and to violate water quality standards there, and that the only acceptable means to control this impact is to place numeric limitations on the dischargers' effluent. The petitioners also contend that the permit does not comply with statutory deadlines in the Clean Water Act. Finally, the petitioners seek inclusion of specified measures to reduce pollutants from transportation facilities and practices.

In order to address the various arguments made by the petitioners, we must discuss some of the factual assumptions which the petitioners have made, along with the legal contentions. Our order of presentation varies somewhat from the petitioners', but all of the major points are covered.[37]

A. Location of the Storm Water Discharges in the Santa Clara Valley

The petitioners' arguments are based on the premise that the dischargers' municipal separate storm sewer system discharges pollutants to the South Bay and that these discharges are significantly impairing its beneficial uses. The petitioners contend that these beneficial uses are jeopardized by the failure of the permit to contain numeric effluent limitations. As we shall explain, the petitioners' broad assertions vastly oversimplify the complex nature of the dischargers' flood control

37 Any issue not specifically discussed herein is dismissed for failure to raise substantial issues appropriate for review. 23 Calif. Code of Regulations, Section 2052(a)(1).

and drainage facilities, imply that the storm sewer system discharges only into the South Bay, and misconstrue ambient water quality criteria, receiving water quality standards and effluent limitations.

The storm drains are generally point sources,[38] which discharge upstream from the South Bay.[39] While pollutants may be transported from the storm drains to the South Bay, the process of this transportation and the amounts of pollutants reaching the South Bay are unknown.

The documents and reports required by the 1986 Basin Plan, and which accompanied the permit application, describe the dischargers' municipal separate storm sewer system. This system, a vast network of catchments, street gutters, conduits, pipes and channels, collects urban runoff flows and storm water flows from eleven distinct watersheds and a land area greater than 700 square miles. Numerous outfalls (point sources) exist throughout the entire Santa Clara Valley, which discharge urban runoff and storm water flows into nearby natural surface waters. The permit

---

38 The term "point source" is defined in the Clean Water Act as:

> *"...any discernible, confined, and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged..." Section 502(14).*

39 The documents prepared by the State Board and EPA pursuant to Section 304(1) speak only vaguely of "stormdrains" and do not specify to which specific stormdrains they refer. We do acknowledge that the petitioners may have read these documents to mean that a determination had been made that storm water discharges are known to contribute significant pollutants directly to the South Bay. However, as we will explain infra, the decision to list "stormdrains" as a point source on the B list was based on minimal information and a reading of Section 304(1) requiring listing under the circumstances.

covers the dischargers' entire jurisdiction. Many of the surface waters are separately identified in the Basin Plan, and water quality standards are established, as described above. The surface waters then flow into the South Bay.

While the precise location of each outfall is not apparent in the record (and may not be known at this time), the dischargers' storm sewers generally convey waste to specific, identified receiving waters other than the South Bay. The permit contains a finding regarding the point of discharge:

> "Discharge consists of the surface runoff generated from various land uses in all the hydrologic subbasins in the basin which discharge into watercourses which in turn flow into South San Francisco Bay."[40]

The natural water courses to which the storm sewers discharge are not in themselves part of the dischargers' municipal separate storm sewer system. The EPA regulations define the term "municipal separate storm sewer" as "a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains)...."[41] In the Santa Clara Valley, the storm sewer outfalls discharge to the water courses upstream

---

40 *Permit, Finding Number 3.*

41 *40 CFR Section 122.26(b)(8).*

from the South Bay These water courses are themselves waters of the United States.[42]

Storm water discharge, which originates as a diffuse, nonpoint source flow, becomes a "point source" addition of pollutants at the discrete intersection of the conveyance (outfall) and waters of the United States. While there may be cases where it is difficult to distinguish waters of the United States from the dischargers' conveyance systems, where the outfall leads to a natural stream with designated beneficial uses and water quality objectives, the outfall is the point source. The mouth of the river or creek at the South Bay is not a point source. The dischargers' storm sewer system conveys waste, though numerous point source outfalls, to Santa Clara Valley's creeks, streams and rivers. Few storm sewers discharge directly into South San Francisco Bay.

B. Conditions of the Receiving Waters

Both the South Bay and the water courses which receive the storm water discharges have beneficial uses. However, the uses of the streams, creeks, and rivers in the Santa Clara Valley are not the same as the uses of the South Bay. (This point is obvious since the upstream waters are fresh and the Bay is

---

42 *The EPA regulations provide:*

> *"'Outfall' means a 'point source' as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States." 40 CFR Section 122.26(b)(9).*

estuarine.) The Valley surface waters are chiefly used for municipal supply, agricultural supply, ground water recharge, body contact and non-contact recreation, cold and warm freshwater habitat, wildlife habitat, and fish migration and spawning, and, in some cases, for freshwater replenishment, navigation, and rare and endangered species habitat.[43]

As described above, the objectives contained in Table III-2A of the 1986 Basin Plan are not applicable to the South Bay.[44] Even though the Basin Plan appears to state that these objectives may apply to the Santa Clara Valley surface waters, the marine water criteria which are enumerated in Table III-2A clearly do not. Criteria intended to protect marine or estuarine water uses, especially aquatic habitat, cannot simply be interpolated for freshwater uses such as drinking water supply, since the bases for the criteria are different.

A better reading of the 1986 Basin Plan is that EPA's ambient fresh water criteria, which are also the water quality objectives in Table III-2B, apply to the upstream water courses. Table III-2A states that EPA fresh water criteria[45] "can be applied seasonally, where appropriate."[46] It appears that the Regional Board intended that such fresh water criteria may be

---

43 1986 Basin Plan.

44 In Order No. WQ 90-5, we recently directed the Regional Board to adopt numeric water quality objectives for toxic pollutants in the South Bay.

45 EPA's most recent compilation of water quality criteria is the "Gold Book", entitled Quality Criteria for Water 1986 (EPA 440/5-86-001). These criteria have not been adopted as rules or regulations.

46 1986 Basin Plan, Table III-2A, footnote b.

applied to such water courses as the Santa Clara Valley surface waters. We reach this conclusion because ambient criteria for protection of uses in freshwater are clearly more appropriate than the estuarine or marine water criteria. The record indicates that the water courses upstream of the South Bay may be impaired or threatened by a variety of pollutant sources, including storm drains and nonpoint sources, such as abandoned mines. However, none of the upstream water bodies was included on the Section 304(l) "B" list.

The petitioners argue that by including "stormdrains" as contributors to impairment of the South Bay on the B list, "[t]oxic pollutants and toxicity known to be present in the dischargers' (sic) discharges are known to violate water quality standards and impair uses."[47] We find, instead, that the decision to list storm drains as a point source on the B list was based on the available evidence at the time, and a broad reading of the types of pollutant sources to the South Bay which should be listed. In making the findings for the listing, we stated:

> "Our review of the data, therefore, concerning the relative metals loadings from point and nonpoint sources indicates that impairments of water quality in the South Bay cannot be attributed to one or the other category of source. Rather, any regulatory strategy to improve the water quality and protect beneficial uses in the South Bay must take both categories or sources into account."[48]

---

47 *See Exhibit 2 to Petition, page 11.*

48 *State Board Order No. WQ 90-5 at page 55.*

On April 11, 1991, we adopted the Statewide Water Quality Control Plans for Inland Surface Waters of California (Inland Plan) and for Enclosed Bays and Estuaries of California (Bays and Estuaries Plan), which include numeric water quality objectives which will apply to the surface waters of Santa Clara Valley and to the South Bay. The plans provide five years for the Regional Board to determine what actions are appropriate to ensure that storm water discharges are in compliance with the numeric objectives. The Plans further provide: "All dischargers shall be given a maximum of 10 years from the date of adoption of this plan to come into compliance with the numerical objectives in this plan." See, March 26, 1991 Draft, at page A-28.

C. Storm Water Discharge Characteristics

Pursuant to the 1986 Basin Plan requirements, the dischargers conducted dry- and wet-weather monitoring to characterize urban runoff and storm water flows from the municipal separate storm sewer system. From these investigations, cadmium, chromium, copper, lead, nickel and zinc were found in detectable concentrations in residential, commercial and industrial land use runoff and in the Santa Clara Valley surface waters. Arsenic, mercury, selenium and silver were seldom detected.[49] Further, significant differences were recorded between dry-weather and wet-weather stream concentrations, and runoff pollutant concentrations varied

[49] *Santa Clara Valley Nonpoint Source Study, Volume I: Loads Assessment Report*.

considerably between storms and between locations. The evidence suggests that storm water and urban runoff transport heavy metals which are then deposited with sediments in the Santa Clara Valley creeks and streams. The physical aspects of runoff (that is, the erosion and scour of these sediments in the receiving waters) resuspends pollutants during storm events. Wet weather flow in the natural water courses likely transports resuspended pollutants to the South Bay.

In comparing storm water runoff and receiving water concentrations to EPA's criteria, heavy metals concentrations were typically less than the chronic toxicity criteria during dry-weather periods. Copper and, to a lesser extent, zinc, lead and cadmium, exceeded the acute toxicity criteria values during wet-weather. Laboratory tests were also performed to study toxicity using undiluted, static-renewal effluent samples for both dry-and wet-weather periods. The dry-weather test results were inconsistent and inconclusive. In the dischargers' wet-weather laboratory samples, approximately 75 percent of these samples significantly affected Ceriodaphnia test organisms. Even though a few heavy metals did exceed acute toxicity criteria in the same samples, the lethal effects could not be definitively correlated to the presence of particular heavy metals alone. Test results suggest the presence of other, unmeasured chemical agents or factors.

The results of the characterization studies indicate that the nature and effects of storm water discharges are

complicated. While we are concerned about the effects of the dischargers' storm water discharges on aquatic life and other beneficial uses, we also note that the various point sources and nonpoint sources affect these uses in a complicated and little-understood fashion. In attempting to solve the problems of the South Bay we must ensure that the Regional Board uses its authority to control both point and nonpoint sources in the most effective manner possible.

D. The Regional Board's Pollution Control Strategy

As we have discussed above, the dischargers' municipal separate storm sewer system generally discharges waste into numerous receiving waters, and not directly into the South Bay. The characterization studies which have been performed do suggest that potential threats exist and warrant appropriate control. Following the requirements of the 1986 Basin Plan and Clean Water Act Section 402(P), the Regional Board adopted the NPDES permit as an initial element of its storm water control strategy for protecting the surface waters of the Santa Clara Valley.

The NPDES permit employs a two-fold strategy; it prohibits non-storm water discharges and illicit connections, and it requires a comprehensive series of regulatory, governmental, and educational control measures. The first element effectively prohibits unpermitted industrial discharges into the storm sewer

system, and should also prohibit most dry-weather "urban runoff" discharges.[50]

The second element prescribes area-wide and community-specific source reduction, hydraulic, and treatment-based control measures. For example, some of the regulatory measures include local ordinances to prohibit litter and hazardous waste disposal, regulations governing oil and grease disposal, provisions for construction site drainage, and increased use of permeable landscaping and surfaces. Public agency control measures include intensified street sweeping, bimonthly community cleanup days, illegal dumping investigations, and detention and infiltration projects. As potential contaminants in storm sewer flows substantially originate from human activities, the permit requires extensive educational and outreach programs geared toward residents and small businesses.

The method by which the specific control activities will be implemented is that the dischargers must submit a Management Plan for approval by the Regional Board, and then must implement the Plan. Thus, the permit lists some, but not all of the management practices which will be undertaken. The dischargers have already identified a list of practices from which the individual entities will select. The specific

---

50 "Illicit discharge" is defined in EPA's regulation as "any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for dischages from the municipal separate storm sewer) and discharges resulting from fire fighting activities." 40 CFR Section 122.26(b)(2). While this regulation was adopted subsequent to issuance of the permit, it is assumed that this definition will apply.

practices will be selected over a two-year period starting with adoption of the NPDES permit.

In addition to the basin-wide and community-specific "best management practices" required by the permit and the prohibitions against discharging non-storm water, the permit also prohibits discharges of storm water which cause or contribute to violation of receiving water limitations. The receiving water limitations disallow the creation of conditions of pollution or nuisance in the receiving waters. In addition, the discharge may not cause a violation of "any applicable water quality objective for receiving waters."[51]

The permit does not include specific, numeric effluent limitations which would be measured at the outfalls. This omission is the crux of the petitioners' complaints.

E. Legal Requirements of Clean Water Act Sections 301 and 402(p)

The petitioners contend that the Clean Water Act, and regulations and court decisions interpreting the Act, require the inclusion of numeric effluent limitations in NPDES permits for the discharge of storm water from a municipal separate storm sewer system. We have reviewed these authorities, and also opinions we have received from EPA, and conclude that numeric effluent limitations are not legally required. Further, we have determined that the program of prohibitions, source control

51 *Permit, Receiving Water Limitation B.2.*

measures and "best management practices" set forth in the permit constitutes effluent limitations as required by law.

First and foremost, the petitioners contend that by virtue of the absence of numeric effluent limitations, the permit contains no "effluent limitations" or "water quality-based effluent limitations."[52] The petitioners assert that effluent limitations can only be numeric concentration values for individual constituents. Our review of the relevant law reveals that the permit's scheme of prohibitions, source control measures and best management practices constitutes valid effluent limitations consistent with requirements of "maximum extent practicable" controls and water quality standards.

Before we address the acceptability of practices as "effluent limitations" we shall review the mandate contained in the Clean Water Act that NPDES permits in general must contain effluent limitations, and we shall decide whether that mandate applies to permits regulating municipal discharges of storm water in particular.

Section 301 of the Clean Water Act prohibits the discharge of any pollutant,[53] unless pursuant to a NPDES permit

---

52 Indeed, even among Regional Board staff and the dischargers there appeared to be confusion regarding the term "effluent limitation". See e.g., transcript from May 16, 1990 Regional Board hearing, at page 11. All parties to the permit appeared to be under the impression that the permit did not contain effluent limitations. As we will explain, however, our determination that best management practices may constitute effluent limitations is certainly not novel.

53 "Discharge of a pollutant" is defined to include "any addition of any pollutant to navigable waters from any point source." Clean Water Act Section 502(12).

(or other method in compliance with the Act). Section 301(b) further requires point sources to be in compliance with effluent limitations which require the application of "best practicable control technology currently available," and which are necessary to meet water quality standards established under state law, by July 1, 1977.[54] Section 301 also requires compliance with any more stringent effluent limitations which are necessary to protect water quality standards. The former effluent limitations are generally referred to as technology-based, while the latter are referred to as water quality-based.

Thus, the general rule in Section 301 is that point sources must comply with effluent limitations. These effluent limitations are contained in NPDES permits, for which standards are set out in Clean Water Act Section 402. Section 402(a)(1) provides that permits may allow the discharge of pollutants, so long as the permit requires compliance with applicable requirements including Section 301.

Subsection (p) was added to Section 402 in order to clarify the specific requirements relating to discharges of storm water. Section 402(p)(3) specifies the permit requirements for industrial and municipal discharges:

> "(A) Permits for discharges associated with industrial activity shall meet all applicable provisions of this section and section 1311 [Section 301] of this title.
> "(B) Permits for discharges from municipal storm sewers--

54 *For certain pollutants, effluent limitations which require "best available technology economically achievable" must be met by March 31, 1989. As will be explained infra, the deadlines contained in Section 301(b) are clearly not applicable to municipal dischargers of storm water.*

"(i) may be issued on a system-or jurisdiction-wide basis;

"(ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and

"(iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."55

While the permit requirements for industrial discharges require compliance with all applicable provisions of Section 402 and with Section 301, Section 402(p)(3)(B) is ambiguous as to whether municipal storm water discharges must comply with these general requirements (including effluent limitations). The requirements specified for municipal discharges are only a prohibition against non-storm water discharges and "controls to reduce the discharge of pollutants to the maximum extent practicable."56 Thus, the first issue which arises is whether the requirements of Section 301 and of Section 402, other than subsection 402(p), apply to municipal storm water discharges.

The petitioners claim that Section 402(p) requires the inclusion of effluent limitations in permits, and specifically effluent limitations necessary to meet water quality standards.

---

55 It is clear that the time limitations in Section 301 do not apply to either type of discharge. Industrial and large municipal discharges are given three years after issuance to comply with permit terms. Section 402(p)(4)(A).

56 The third provision in the municipal requirements, issuance on a system- or jurisdiction-wide basis, is couched in permissive rather than mandatory terms.

The dischargers, along with many interested municipalities throughout the State, claim that the only standards which they must meet are the reduction of pollutants to the "maximum extent practicable" ("MEP") and the prohibition against non-storm water discharges.

In reviewing the terms of Section 402(p), we find that the meaning of the statute on its face is not clear. On the one hand, there is nothing in Section 402(p) which states that the general provisions of Sections 301 and 402 do not apply to municipal storm water discharges. This would lead us to conclude that these general provisions do apply. On the other hand, the subsection applying to industrial discharges specifies that those general provisions apply, while the subsection referring to municipal storm water discharges is silent on this point. Because the meaning of the statute is ambiguous, we will look to other sources to determine the legislative intent.[57]

The legislative history is generally silent on the meaning of the MEP standard and the distinction between industrial and municipal discharges.[58] However, we have obtained an interpretation from EPA, and that interpretation must be accepted as a valid interpretation of the federal law, unless

---

57 See Cal. Jur. III, Vol. 58, Statutes, page 453.

58 1987 U.S. Code Cong. and Adm. News, pages 38-39. Senator Durenberger is quoted as saying that MEP includes such controls as "management practices, control techniques and systems, [and] design and engineering methods." Volume 132, No. 143 Congressional Record, S16443 (October 16, 1986).

it is manifestly unreasonable. National Wildlife Federation v. Gorsuch (D.C. Cir. 1982) 693 F.2d 156. In a memorandum from its Assistant Administrator and General Counsel,[59] EPA proceeds to consider two plausible interpretations: (1) Congress intended to waive all Section 301 requirements for municipal discharges in favor of the MEP standard, or (2) the MEP statutory requirement modified only the technology-based requirements contained in Section 301, and left in place the need for water quality-based requirements, even if those requirements would be more stringent than MEP. EPA concluded by adopting the latter interpretation.

EPA gave two reasons for its conclusion that municipal storm water discharges do not need to meet technology-based standards contained in Section 301, but that they must meet water quality-based standards. First, a contrary reading would require the conclusion that Congress implicitly repealed Section 301 as applied to these discharges. Such a conclusion would generally be disfavored by courts. Second, such a reading would interpret the Water Quality Act of 1987 as weakening the standards of the Clean Water Act, whereas the available legislative history indicates a desire to strengthen its provisions.

In reviewing EPA's interpretation, we cannot conclude that it is wholly unreasonable. Further, we have an interest as a state agency in supporting this rationale. It is the state-adopted water quality standards which EPA claims must be met by provisions of the permit. We must conclude that it is in the

---

59 Memorandum from E. Donald Elliot to Nancy J. Marvel, Regional Counsel, EPA Region IX, regarding "Compliance with Water Quality Standards in NPDES Permits Issued to Municipal Separate Storm Sewer Systems", dated January 9, 1991.

interest of the State to be able to enforce its standards in the provisions of NPDES permits. See, Clean Water Act Section 510. Further, since the State has the authority to adopt the water quality standards, we believe that we can incorporate into these standards the necessary flexibility to allow realistic opportunity for compliance.[60] We have used this flexibility in our recently-adopted Inland Plan and Bays and Estuaries Plan. These provide ten years for storm water dischargers to come into compliance with numeric water quality objectives. In addition, the Plans emphasize source reduction of toxic pollutants and development of best management practices before costly end-of-the-pipe treatment is required. See, California Inland Surface Waters Plan, at page A-24.

We therefore conclude that permits for municipal separate storm sewer systems issued pursuant to Clean Water Act Section 402(p) must contain effluent limitations based on water quality standards. As we discussed earlier, the applicable water quality standards in this matter are those established for the creeks and streams which are predominantly the receiving waters of the storm water discharges. These standards appear generally to be EPA's fresh water criteria. The Inland Plan also contains applicable water quality objectives which will be submitted to EPA for approval as water quality standards. Dischargers of storm water are given a maximum of ten years to come into

60 The Regional Board adopts water quality objectives pursuant to its authority in Water Code Section 13240 and following. This Board may also adopt water quality objectives pursuant to Water Code Section 13170.

complaince with the numeric objectives contained in the Inland Plan. We will now consider whether "best management practices" constitute acceptable effluent limitations, or whether numeric effluent limitations based on numeric water quality standards are required.61

While the petitioners have correctly pointed to the absence of numeric effluent limitations, the permit prohibits non-storm water discharges, and includes receiving water limitations and a requirement that the discharge not cause the violation of any water quality objectives. The permit does, therefore require compliance with water quality standards. The major issue is whether numeric effluent limitations are also required.

As we stated above, the Regional Board and the dischargers assumed that the permit did not include effluent limitations. However, in its response to the petition, Region IX of EPA concludes that effluent limitations need not be numeric, and may instead constitute any measures to reduce pollutants in the discharge including "best management practices."62 This response is also consistent with EPA's 304(l) Decision, in which

---

61 A point which is not directly at issue here is what sort of effluent limitations are required to meet the MEP standard set forth in Section 402(p). While the question of what actions are required to achieve MEP may indeed be a source of substantial controversy, it is clear that the inclusion of best management practices in a permit (rather than numeric effluent limitations) is an acceptable means of complying with the MEP requirement. See, Vol. 132, Congressional Record, S16443 (October 16, 1986).

62 See letter from Harry Seraydarian, Director, Water Management Division, to Elizabeth Miller Jennings, Senior Staff Counsel, State Water Resources Control Board, dated October 24, 1990.

it approved the permit as an ICS pursuant to Clean Water Act Section 304(1). Because EPA undertook a final action in the 304(1) Decision, approving the permit with best management practices rather than numeric effluent limitations, we assume that EPA's formal agency position is that expressed in the response from Region IX. Therefore, we shall follow this interpretation unless it is manifestly incorrect.

The statutory definition of "effluent limitation" is broad and supports EPA's contention that a numeric limit is not required:

> "The term 'effluent limitation' means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from point sources into navigable water, the waters of the contiguous zone or the ocean, including schedules of compliance." Clean Water Act Section 502(11).

The definition of "effluent limitation" contained in EPA's regulations is similarly broad:

> "Effluent limitation means any restriction imposed by the Director [or a State] on quantities, discharge rates, and concentrations of 'pollutants' which are 'discharged' from 'point sources' into 'waters of the United States,' the waters of the 'continguous zone,' or the ocean." 40 CFR Section 122.2.

In a decision by a federal court of appeals, the court stated that it did not agree with the premise that effluent limitations must be articulated "in terms of a numeric effluent standard." Natural Resources Defense Council v. Costle (D.C. Cir. 1977) 568 F.2d 1369. Rather, the court stated that

Section 402 "gives EPA considerable flexibility in framing the permit to achieve a desired reduction in pollutant discharges. The permit may proscribe industry practices that aggravate the problem of point source pollution." 586 F.2d at 1380. (Emphasis added.) Costle concerned whether specific discharges, including storm water, must be regulated by NPDES permits. EPA had assumed that numeric effluent limitations were required, and argued that these would be infeasible. Instead, the court clarified that specific practices could be required, especially in cases such as storm water regulations, where numeric permit limitations would be difficult to enforce.

Following the Costle case, and several attempts by EPA to establish a regulatory program for storm water permits, the Clean Water Act was amended to incorporate Subsection 402(p). Given this background in the development of storm water regulations, it appears reasonable to assume that in adopting subsection 402(p), Congress intended to allow EPA to regulate "practices" as suggested by the court.

In a more recent decision by the Ninth Circuit court of appeals, it was held that numeric, technology-based effluent limitations may not always be appropriate, and that EPA must include in permits it adopts whatever effluent limitations are necessary to achieve state water quality standards. Trustees for Alaska v. Environmental Protection Agency (9th Cir. 1984) 749 F.2d 549. Section 302 of the Clean Water Act describes the use of effluent limitations to protect beneficial uses of water where

the application of technology-based standards is inadequate.[63] This section states that water quality-based effluent limitations may include "alternative effluent control strategies." Clean Water Act Section 302(a). Plainly, the term "alternative effluent control strategies" encompasses the types of control measures prescribed in the NPDES permit.[64] Costle, supra, at note 21.

Finally, EPA's storm water regulations, while not specifically addressing the contents of municipal permits, clearly emphasize a "best management practices" approach. The information which municipalities must submit in their applications concerns establishment of a control program with specific structural and non-structural controls. There is nothing in the storm water regulations which would indicate an approach which mandates numeric effluent limitations.

---

63 Section 302(a) provides:

> *"Whenever, in the judgment of the Administrator or as identified under section [304(l)] of this title, discharges of pollutants from a point source or group of point sources, with the application of effluent limitations required under section [301(b)(2)] of this title, would interfere with the attainment or maintenance of that water quality in a specific portion of the navigable waters which shall assure protection of public health, public water supplies, agricultural and industrial uses, and the protection and propagation of a balanced population of shellfish, fish and wildlife, and allow recreational activities in and on the water, effluent limitation (including alternative effluent control strategies) for such point source or sources shall be established which can reasonably be expected to contribute to the attainment or maintenance of such water quality." (Emphasis added.)*

64 EPA has also adopted regulations regarding the establishment of water quality-based effluent limitations. These regulations are discussed in the next section.

In conclusion, we agree with EPA that Sections 301 and 402 must be read to require municipal storm water discharges to meet MEP and also to achieve compliance with water quality standards. The most reasonable way of blending these two sections together is to write permits which seek implementation of water quality standards through the controls which constitute MEP. In other words, Section 402(p) should be read to require permits to include actions which constitute MEP for the first three years, and then an evaluation of further actions which must be taken if water quality standards are not protected. We do not believe this reading is inconsistent with EPA's requirement that standards be met within three years, since MEP will be the most effective method of achieving reductions in pollutants contained in storm water, as discussed below. Region IX of EPA expressed this policy well in their response to the petition:

> "Region 9 believes that it would be premature for a municipal storm water permit to include numerical effluent limitations. Storm drains raise unique problems and differ from other types of point source discharges in that only limited information is currently available concerning the sources and loadings of the pollutants and the effectiveness of many of the control measures. While NPDES permits have been issued since the mid-1970s for industrial dischargers and POTWs, permitting of municipal storm drains is still in its infancy and additional information is necessary to determine the best means for achieving compliance with water quality standards."

As a final point, we note that the provisions contained in the permit also comply with the state law requirements for

adoption of waste discharge requirements. Water Code Section 13263 provides that requirements:

> "...shall implement relevant water quality control plans, if any have been adopted, and shall take into consideration the beneficial uses to be protected, [and] the water quality objectives reasonably required for that purpose...."

We find that the permit includes a comprehensive and stringent program for reducing pollutants in storm water discharge, and that it will implement the Basin Plan, including the protection of beneficial uses.

F. Legal Requirements of Clean Water Act Section 304(l)

The NPDES permit was issued pursuant to both Clean Water Act Sections 402(p) and 304(l). Thus, the permit must be adequate not only as a NPDES permit regulating storm water under Section 402(p), but it must also meet the requirements of Section 304(l) and the regulations adopted thereunder.[65]

Section 304(l)(1)(B) required this Board to compile a list of surface waters for which we do not expect water quality standards will be achieved after requirements of Section 301 and other applicable sections are met, "due entirely or substantially to discharges from point sources" of specified toxic pollutants. In addition, for each segment of waters included on the B list, we were required to determine the "specific point sources

65 The Section 304(l) regulations concerning water quality-based effluent limitations, which we shall discuss in this section, are applicable whenever permits must require compliance with water quality standards, and not just where Section 304(l) is applicable. Therefore, these regulations would also have to be satisfied even if these storm drains had not appeared on the 304(l) B list.

discharging any such toxic pollutant which is believed to be preventing or impairing such water quality and the amount of each such toxic pollutant discharged by each such source." Section 304(l)(1)(C). Then, for each such segment, an individual control strategy [ICS] was required which "will produce a reduction in the discharge of toxic pollutants from point sources" identified on the B list. Section 304(l)(1)(D). In regulations adopted June 2, 1989, EPA set forth the requirements for producing lists and adopting ICS' under Section 304(l).[66]

As we discussed above, the South Bay was included on the B list, and "stormdrains" were named as contributing point sources. The first issue which we will discuss concerning Section 304(l) is what sort of factual determinations were made in the decision to list "stormdrains," and specifically what is meant by the term "entirely or substantially."

The EPA regulations require inclusion on the B list if a water meets either of two conditions:

> "(i) Existing or additional water quality-based limits on one or more point sources would result in the achievement of an applicable water quality standard for a toxic pollutant; or
> "(ii) The discharge of a toxic pollutant from one or more point sources, regardless of any nonpoint source contribution of the same pollutant, is sufficient to cause or is expected to cause an excursion above the applicable water quality standard for the toxic pollutant." 40 CFR Section 130.10(d)(5).

It should be noted that waters must be listed where, notwithstanding the impacts of nonpoint sources, the contribution of the point source "is expected to cause" the water body to

66 *54 Federal Register 23868-23899.*

exceed water quality standards. Section 130.10(d)(5)(ii). This means that waters may be put on the B list even where the nonpoint sources are the more significant contributors to the violation of water quality standards. Moreover, in its preamble to the 304(l) regulations, EPA noted two points especially relevant here. First, EPA noted the difficulty of developing ICS's for storm water outfalls. 54 Federal Register 23884 (1989). Second, EPA discussed the lack of available data to make the determinations required by Section 304(l) and the short time schedule available. Nonetheless, EPA directed the states to "rely on existing and readily available data" and discussed what it considered to be "the minimum existing and readily available water quality data and information that a state and EPA can reasonably attain." 54 Federal Register 23884 (1989).

Taking together 40 CFR 130.10(d)(5)(ii) and EPA's comments concerning storm water outfalls and scant available data, it is clear that there may be situations where point sources are included on the B list where at the time of listing, their proportionate wasteload contribution to the excursion of water quality standards is unknown, where regulation through traditional methods available for point sources is not feasible, and where any provisions requiring a reduction in the discharge of pollutants from these point sources may not be adequate to allow the receiving water to achieve water quality standards (in light of continuing contributions from nonpoint sources).

It appears that the instant matters includes all of these variables. As was discussed above, while the

dischargers' storm drains are point sources, they do not generally discharge directly to the South Bay, and their relative contribution, via riverine transport, to the South Bay's impairment is still unknown.[67] In short, given the available data, we do not believe that any restraints--that is, numeric effluent limitations--which could be imposed on the discharge of pollutants through the storm drain system would alone attain water quality standards in the South Bay.

We do note that EPA's definition of ICS may be read to require that ICS's be set so as to ensure that receiving waters will achieve water quality standards. In 40 CFR Section 123.46, EPA set forth the requirements of ICS. The term ICS is defined as: "a final NPDES permit with supporting documentation showing that effluent limits are consistent with an approved wasteload allocation, or other documentation which shows that applicable water quality standards will be met not later than three years after the [ICS] is established." Section 123.46(c). However, a recent court decision has brought this requirement into question. In Natural Resources Defense Council v. Environmental Protection Agency (9th Cir. 1990) 915 F.2d 1314, the court disapproved of one portion of EPA's Section 304(l) regulations, and remanded the

67 In EPA's response to comments regarding its final decision regarding lists of waters, sources and pollutants under Section 304(l), it conceded the lack of scientific data available concerning South San Francisco Bay. EPA concluded "that narrative standards for toxicity are being exceeded in South San Francisco Bay and that the exceedance is due substantially to POTW and storm drain point source discharges of toxic pollutants." To support this conclusion, EPA pointed to a final Staff Report of the State Board, supporting our Order No. WQ 90-5, wherein it is stated that "the State Board agrees that the relative contribution of point and nonpoint sources to ambient water conditions has not been established." 304(l) Decision.

regulations to EPA for reconsideration. The court determined that EPA must list point sources for all water bodies which appear on any of the Section 304(l) lists, not just the B list.[68] It did not reach the question whether ICS's are required for all listed point sources, or only for those related to B lists. This is the issue which was remanded to EPA. In reading this court decision, it is apparent that it is not expected that all point sources which are designated under Section 304(l) are capable of limiting pollutants to an extent that water quality standards will be met in the receiving water. Further, it is certainly questionable whether an ICS will be able to ensure that the receiving waters will achieve water quality standards.

The regulations themselves raise questions as to whether it will always be feasible to assure compliance with water quality standards simply through adoption of an ICS. The pollutants associated with storm water discharges are apparently bound up in sediments in dry weather periods and are resuspended and transported in storm events. The Preamble to the Section 304(l) regulations states that water quality impairments due to sediments contaminated and deposited by active point sources (such as storm drains) must be included on the B list.

---

68 The other two lists are known as the "(A)(i) list" and the "(A)(ii) list." Section 304(l)(1)(A)(i) requires a list of water bodies in which water quality standards are not expected to be achieved after the application of effluent limitations to point sources. The list required by Section 304(l)(1)(A)(ii) must include waters which, after application of effluent limitations to point sources, are not expected to "assure protection of public health, public water supplies, agricultural and industrial uses, and the protection and propagation of a balanced population of shellfish, fish and wildlife, and allow recreational activities in and on the water."

Nevertheless, NPDES permits do not apply to the sediments. 54 Federal Register 23883. Given the complicated and little understood process of transportation and resuspension of sediments, it is not possible to calculate numeric effluent limitations which would apply to storm drain outfalls and would be based upon water quality standards in downstream waters such as the South Bay.

Notwithstanding the ambiguities raised in interpreting Section 304(l), we must still address whether the effluent limitations contained in the permit are adequate as water quality-based effluent limitations pursuant to EPA's regulations. EPA adopted regulations at 40 CFR 122.44(d) which set forth requirements for water quality-based limitations. These regulations were adopted to comply with Section 304(l). See, 54 Federal Register 23870.

EPA's regulations concerning the establishment of limitations, standards, and other permit conditions, including effluent limitations, appear in 40 CFR 122.44. Section 122.44(d)(1) requires the inclusion of requirements in

NPDES permits necessary to achieve water quality standards.[69] That subsection requires the inclusion of effluent limitations for specific pollutants where those pollutants cause, have the reasonable potential to cause, or contribute to an in-stream excursion above narrative or numeric criteria within an ambient water quality standard.

The petitioners point to Section 122.44(d)(1) in claiming that numeric effluent limitations are required. However, the term "numeric" effluent limitation does not appear in Section 122.44(d)(1). Concededly, in most cases, the easiest and most effective chemical-specific limitation would be numeric.[70] However, there is no legal requirement that effluent limitations be numeric.

---

69 Section 122.44(d)(1) provides, in relevant part, that NPDES permits must include:

> *"any requirements...necessary to...[a]chieve water quality standards....*
>
> *"(i) Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have the reasonable potential to cause, or contribute to an excursion above any State water quality standard....*
>
> * * *
>
> *"(iii) When the permitting authority determines...that a discharge causes, has the reasonable potential to cause, or contributes to an in-stream excursion above the allowable ambient concentration of a State numeric criteria within a State water quality standard for an individual pollutant, the permit must contain effluent limits for that pollutant.*
>
> * * *
>
> *"(v) ...[W]hen the permitting authority determines...that a discharge causes, has the reasonable potential to cause, or contributes to an instream excursion above a narrative criterion within a applicable State water quality standard, the permit must contain effluent limits for whole effluent toxicity."*

70 In fact, in our order regarding discharges from POTW's to the South Bay, we found that numeric effluent limitations were appropriate and feasible.

Even in Section 122.44 there is specific provision for best management practices in lieu of numeric effluent limitations. Section 122.44(k) states that NPDES permits should include "...best management practices to control or abate the discharge of pollutants when: ...(2) Numeric effluent limitations are infeasible...." As we shall describe below, we conclude that numeric effluent limitations are infeasible as a means of reducing pollutants in municipal storm water discharges, at least at this time. EPA Guidance allows further monitoring in lieu of immediate permit limitations. In EPA's Permit Writer's Guide to Water Quality-Based Permitting for Toxic Pollutants, numeric limits are not required.[71] Additionally, the Inland Plan provides up to ten years for storm water discharges to comply with numeric objectives and specifically endorses source reduction and best management practices to reduce pollutants.[72]

Finally, EPA has formally approved the permit as an ICS. In its 304(l) Decision, EPA stated:

> "EPA approves NPDES permit CA0029718 as the individual control strategy for the South San Francisco Bay Stormdrains. The permit requires attainment of water quality standards in South San Francisco Bay." (304(l) Decision, page 20.

This final agency action is entitled to great deference, as it is a determination by the administrative agency authorized to carry

---

71 EPA Office of Water, July 1987 (EPA 440/4-87-005), Section 3.1.

72 We note here that there is certainly a lack of adequate information in the record concerning the specifics of the storm water system and its impacts. We point out, however, that regardless of how Section 122.44 is interpreted, municipal storm water dischargers have three years to come into compliance with permit terms, and the Regional Board incorporated a broad reopener provision into the permit, allowing the inclusion of more stringent effluent limitations as required.

out the program, and which adopted the regulations which we are now attempting to interpret. Clearly, EPA found that the effluent limitations contained in the permit were adequate to protect water quality standards and to comply with 40 CFR Section 122.44.

As a final point, we take note of the broad authority the Regional Board possesses to regulate nonpoint sources which contribute to degradation of the South Bay. While the permit program under the Clean Water Act is limited to point sources, the Porter-Cologne Water Quality Control Act allows the Regional Board to regulate directly all discharges to state waters, including nonpoint sources and impacts from existing sediments. When this broad authority to ensure compliance with water quality standards is considered, it is clear that this permit, along with other actions the Regional Board will take (as contemplated in the 1986 Basin Plan) provides adequate protection of the impaired waters. We conclude that the permit does comply with the requirements of Section 304(l) of the Clean Water Act.

G. The Appropriateness and Propriety of the Permit

Our review of the permit does not end with the conclusion that the permit is legally defensible. Water Code Section 13320 provides that this Board must determine whether the Regional Board's action was appropriate and proper. Even though numeric effluent limitations are not legally required, we will consider whether numeric effluent limitations would result in more effective regulation of the dischargers' storm water

discharges. We note, of course, that the Regional Board clearly left open the possibility of including numeric effluent limitations at a later date. The critical question before us, then, is whether it is appropriate and proper for numeric effluent limitations to be applied at this time at each outfall to receiving waters.

In order to obtain a realistic chance of compliance with numeric effluent limitations, dischargers would have to install some kind of end-of-pipe treatment technology. However, few such technologies have been investigated or developed for discharges of storm water and urban runoff. Available treatment technologies are limited because storm waters involve high volume, intermittent flows from a large number of outfalls. Physical treatment works generally necessitate interception and transport of storm sewer flows to central locations and require extensive land area for gravitational settling basins. The pollutant removal efficiencies of wet- and dry-detention basins were briefly examined in a national study conducted by EPA. For metals (the runoff constituents of most concern here), these physical treatment works varied in effectiveness. In the best cases, wet-detention basins removed 90 percent of the lead but only about 50 percent of the copper and zinc found in influent runoff. Consequently, conventional end-of-pipe treatment technologies have limited effectiveness.

Treatment techniques such as wet-detention basins also require large land areas to contain high volume, variable storm

flows. These techniques therefore result in extremely high costs. The County of Sacramento has submitted evidence to us estimating that its capital costs to build conveyance and wet detention treatment facilities would exceed $2 billion. Clearly, the potential costs for end-of-pipe treatment would be substantial, while the benefit to the receiving water would be difficult to predict accurately and reasonably. The impacts of holding large amounts of storm water for treatment may also pose potential adverse environmental impacts.

The inherent variability of storm water discharges also make numeric effluent limitations and end-of-pipe treatment impractical. The frequency, duration and magnitude of storm events and the constituents, concentrations, mechanisms, persistence and effects of runoff are poorly understood. As the current drought exemplifies, precipitation is highly variable temporally and spatially. The specific pollutants in runoff flows and their concentrations change dramatically from storm to storm and from location to location. The dischargers' monitoring investigation studies illustrate the variability of pollutants in the dischargers' runoff and possible receiving water effects. Similar regional and national studies of storm water and urban runoff discharges also reveal wide variability. The relative contribution and bioavailability of the potentially toxic trace metals in storm water remain uncertain. The mechanisms, nature, and potential threat of pollutant accumulation in sediments must be examined further.

The intermittent, irregular discharges of storm water also make it exceedingly difficult to formulate an appropriate numeric effluent limitation which would bear a reasonable relationship to established ambient water quality standards and criteria. The regulatory authority must minimally know the effluent flow rate (or the volume and duration), the receiving water flow and available dilution in order to establish numeric limitations. Without the necessary technical tools and a fundamental understanding of runoff variability, numeric effluent limitations cannot be legitimately developed or applied at this time.

In considering the anticipated effectiveness of the permit's best management practices approach, we consider that the discharges, while conveyed through point sources, are by nature more comparable to nonpoint sources. They derive from a vast variety of sources, including streets, residences, commercial areas, construction sites and industrial facilities. Source reduction and pollution prevention measures are, presently, the only practical means of controlling the truly nonpoint, diffuse waste flows from urban development. It is therefore apparent to us that a comprehensive and coordinated basin-wide approach, which stresses source reduction and elimination, will be most effective. This strategy focuses on the preventable causes rather than quantifying the tolerable effects of pollutants in runoff discharges.

At least at this preliminary point in the regulatory program for storm water discharges, it appears that an approach which implements "best management practices" to reduce sources and control pollutants is desirable. The Regional Board has taken this approach, but also has not foreclosed adding numeric, water quality-based effluent limits to the permit if it determines such limits are also necessary after receiving further monitoring data or after completion of a wasteload allocation for the South Bay.

We note also the probable impacts on the South Bay of mine drainage and resuspension of sediments. Just as we will rely on practices to reduce pollutants from storm water discharges, impacts from mine drainage and sediment resuspension must also be addressed if the South Bay is to achieve water quality standards and protection of beneficial uses. As we have stated, our interpretation of Section 304(l) of the Clean Water Act implies a coordination of activities intended to reduce impacts from all sources. The activities which the Regional Board has undertaken since 1986 are consistent with that approach. This is also the direction given this Board by the court in United States of America v. State Water Resources Control Board (1986) 182 Cal.App.3d 82, that we must assume a "global perspective" in water quality planning activities. In establishing objectives, we must consider all available remedial activities, and not just those which may be more readily regulated, such as point sources.

In summary, given the lack of clear evidence linking discharges of storm water in the Santa Clara Valley drainage courses to actual impacts in the South Bay, the difficulty of establishing numeric effluent limitations which have a rational basis, the lack of technology available to treat storm water discharges at the end of the pipe, the huge expenses such treatment would entail, and the level of pollutant reduction which we anticipate from the Regional Board's regulatory program, we conclude that the permit is proper and appropriate.

H. Transportation Control Measures

The petitioners contend that the permit must include specified transportation system control measures, or alternatively must name state and federal transportation entities as co-permittees, in order to regulate effectively runoff from streets, roads and highways. In support of these arguments, the petitioners contend that automobiles are the largest source of toxic pollutants in urban runoff and storm water discharges to the surface waters of the Santa Clara Valley. The specific control measures sought include extending regional transit systems, establishing inter-regional rail service, limiting further highway expansion, and enactment of "balanced growth" ordinances.

While runoff from highways and other transportation facilities undoubtedly contributes pollutants to the dischargers' municipal separate storm sewer system, for a number of reasons we decline to comply with the petitioners' requests.

First, while the permit was issued prior to promulgation of EPA's storm water regulations, the Regional Board proceeded in a manner consistent with those regulations in issuing the permit to municipalities with control over the municipal separate sewer system. Permits for municipal systems are to name only those municipal entities. Industrial discharges (and other discharges which contain other than storm water) are to be regulated both through the permits issued to the municipalities and through separate permits issued to industrial facilities.[73] Thus, it was not improper for the Regional Board to fail to name transportation authorities as dischargers.

Regarding the specified transportation measures requested by the petitioners, we find that the Regional Board's approach of requiring the municipalities to prepare a plan with proposed control measures for approval by the Regional Board preferable to specifying all such measures in the permit.[74] The permit does specifically require the dischargers to implement control measures focussing on transportation-related runoff.[75]

73 In Finding 5, the permit states the Regional Board's intent to issue separate NPDES permits to state or federal agencies including the California Department of Transportation.

74 We note that this approach is consistent with EPA's regulations, even though the procedure differs. The regulations require submission of a plan containing control measures as part of the application process. The final permit envisioned in the permit will presumably contain the specified control measures. In contrast, the instant permit was issued long before permits will be issued to large municipal dischargers under EPA's regulations, but development of the control program is a part of the permit's provisions. The result in both cases will be that a mandatory control program will be developed after review of the municipality's proposal. The final program will be developed at an earlier date under the instant permit than under EPA's regulations.

75 See Provision C.9. of the permit.

I. Time Schedule for Compliance

The petitioners contend that the permit violates the Clean Water Act by not requiring timely compliance with water quality standards. Both Clean Water Act Sections 304(l) and 402(p) require compliance with permit conditions within three years of issuance of the permit. We find that the permit contains provisions requiring such compliance.

Clean Water Act Section 304(l)(1)(D) provides that an ICS must "produce a reduction in the discharges of toxic pollutants from point sources identified," in order "to achieve the applicable water quality standard as soon as possible, but not later than 3 years after the date of the establishment of such strategy." EPA has interpreted this provision to mean "that Congress recognized that permittees will need a reasonable amount of time, not to exceed three years, to comply with new effluent limits that are necessary to achieve new water quality standards, or re-interpretations of existing water quality standards."[76]

Similarly, Clean Water Act Section 402(p)(4) requires compliance with all permit conditions by large and medium municipal storm water dischargers no later than three years from the date of issuance. EPA has interpreted this provision similarly to its interpretation of Section 304(l)(1)(D), as applying to all permit conditions, including the requirement of water quality-based effluent limitations.[77]

---

76 *54 Federal Register 23889 (June 2, 1989).*

77 *General Counsel Memorandum.*

In reviewing the permit, we find that its provisions do require compliance with water quality standards and that all practices necessary to achieve such compliance must be in place within three years of adoption of the permit. Therefore, the permit complies with the time schedule requirements of the Clean Water Act. We note further that the permit specifically provides that it may be reopened for the inclusion of more stringent effluent limitations, including numeric effluent limitations if necessary. If it appears within the three-year period after issuance that new permit limitations are required, the Regional Board may proceed under the reopener provisions.[78]

III. CONCLUSIONS

After review of the record and consideration of the contentions of the petitioners, and for the reasons discussed above, we conclude:

1. Impacts of storm water discharges on South San Francisco Bay are complicated and, at this time, it would be infeasible to establish numeric effluent limitations on discharges to storm drains in the Santa Clara Valley which are validly associated with impacts on the South Bay.

2. Pollutants associated with these storm water discharges alone do not substantially impair or threaten the beneficial uses of South San Francisco Bay.

3. The permit adopted by the Regional Board requires implementation of specific source control measures and contains

[78] *See Permit, Finding 17 and Provision 12.*

general prohibitions against discharge of non-storm water and violation of water quality standards.

4. The provisions in the Clean Water Act regulating municipal storm water discharges require effluent limitations and achievement of water quality standards, but the limitations may consist of source control measures, rather than numeric effluent limitations.

5. The provisions in the Clean Water Act concerning impaired water bodies also allow the inclusion of source control measures rather than numeric effluent limitations in permits for point sources.

6. It is appropriate and proper to issue a permit regulating municipal separate storm sewer systems which requires specific practices, rather than containing numeric effluent limitations.

7. The specific transportation control measures requested by petitioners should be considered by the Regional Board when approval of the dischargers' control plan is sought, rather than by this Board.

8. The permit complies with the time schedule requirements of the Clean Water Act.

IV. ORDER

IT IS ORDERED that the petition is denied.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the State Water Resources Control Board held on May 16, 1991.

VOL 23

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD

In the Matter of the Petition of NATURAL RESOURCES DEFENSE COUNCIL, INC. For Review of Waste Discharge Requirements Order No. 90-079 of the California Regional Water Quality Control Board, Los Angeles Region for Los Angeles County and Co-Permittees. NPDES Permit No. CA0061654. Our File No. A-693.	ORDER NO. WQ 91-04

BY THE BOARD:

On July 18, 1990, the State Water Resources Control Board (State Board) received a petition from Natural Resources Defense Council, Inc. (petitioner), seeking review of waste discharge requirements which the California Regional Water Quality Control Board, Los Angeles Region (Regional Board) adopted in Order No. 90-079, regulating discharges of storm water from municipal separate storm sewers throughout Los Angeles County.

Many of the issues raised by the petitioner are discussed in great detail in Order No. WQ 91-03, which we are also issuing today, and which concerns a permit issued by the Regional Water Quality Control Board, San Francisco Bay Region (San Francisco Bay Regional Board) regulating discharges of storm water from municipalities in the Santa Clara Valley. Given the similarity of these issues, we will discuss most of the

0509

petitioner's contentions in only a summary manner, and will refer to our determinations in Order No. WQ 91-03.[1] In adopting that Order, we did consider the petitioner's arguments, and also those of the Regional Board, the dischargers, and interested persons.

I. BACKGROUND

As we discussed in Order No. WQ 91-03, over the last twenty years, the Environmental Protection Agency (EPA), has developed a program to regulate discharges of storm water and urban runoff through the National Pollutant Discharge Elimination System (NPDES) of permits. The requirements for this program are contained in Clean Water Act Section 402(p). In this case, as in the case of the San Francisco Bay Regional Board, the Regional Board adopted its permit regulating discharges from municipal separate storm sewer systems prior to EPA's promulgation of regulations implementing Section 402(p).

As did the San Francisco Bay Regional Board, the Los Angeles Regional Board also proceeded to take earlier steps to study and control storm water discharges while EPA's program development was delayed. In 1975, the Regional Board adopted its Water Quality Control Plan (Basin Plan).[2] The Basin Plan characterized constituents commonly found in runoff and roughly estimated runoff wasteloads through the Los Angeles River and

---

1 A major portion of our other Order involved discussion of Clean Water Act Section 304(l). That section does not apply here. However, the discussion concerning the regulations which EPA adopted to implement Section 304(l), i.e. 40 CFR Section 122.44(d), is also relevant to this matter.

2 Water Quality Plan Report, Santa Clara River Basin (4A) and Los Angeles River Basin (4B) (March 1975). The Basin Plan was approved by the State Board in Resolution No. 75-21.

Santa Clara River sub-basins.[3] The Basin Plan also compared local runoff data with the results of several investigations conducted elsewhere in the nation.

The Basin Plan identified beneficial uses of the surface waters within the region, established water quality objectives to protect and enhance these uses, and described a detailed "Implementation Plan" to achieve those objectives. The beneficial uses of the surfaces waters typically include ground water recharge (replenishment), contact and non-contact recreation and wildlife habitat.[4] A few creeks also support warm and cold water habitat, fish migration and fish spawning uses. Some reservoirs also provide municipal, industrial supply and industrial process water uses.[5] Rare and endangered habitat and agricultural supply were identified as existing beneficial uses of several surface waters also.[6] The Basin Plan listed marine habitat, contact and non-contact recreation, commercial and sport fishing, navigation, and shellfish harvesting as the beneficial uses of the Pacific Ocean.

The Basin Plan also established water quality objectives. First, it referred to several state policies for water quality control and statewide plans. These include the "Water Quality Control Policy for the Enclosed Bays and Estuaries

---

3 *The 1975 Basin Plan divided its region into two sub-basins: the Santa Clara River Basin ("4A") and the Los Angeles River Basin ("4B").*

6 *Id.*

of California"[7] and the "Water Quality Control Plan for Ocean Waters of California".[8] The Basin Plan stated that the Ocean Plan and the Bays and Estuaries Policies established effluent quality requirements for certain discharges. "Land runoff", however, was specifically excluded from the effluent requirements.[9]

The receiving water quality objectives set forth in the Basin Plan included several general requirements and narrative objectives. For inland surface waters, enclosed bays, and estuaries in the Los Angeles River sub-basin, narrative receiving water quality objectives were specified for tastes and odors, floating material, suspended material, settleable material, oil and grease, sediment, turbidity, bacteria, and several other pollutants.[10] The narrative toxicity objective required that all waters be maintained free of "toxic substances in concentrations that are toxic to, or produce detrimental physiological responses in human, plant, animal, or aquatic life."[11] The Basin Plan

---

7 The "Bays and Estuaries Policy", as this document is know, was adopted on May 16, 1974.

8 The State Board first adopted this plan, commonly known as the "Ocean Plan", on July 6, 1972. The State Board approved amendments to the Ocean Plan on March 22, 1990 by Resolution No. 90-27.

9 The 1975 Basin Plan states:

> *"This policy does not apply to wastes from vessels or land runoff except as specifically indicated for siltation and combined sewer flows." See page I-4-5.*

10 1975 Basin Plan, pages I-4-6 through I-4-8.

11 Ibid., at page I-4-8.

further specified "limiting concentrations" for inorganic chemical constituents (primarily heavy metals) in waters used as domestic and municipal supply.[12] It also prescribed "mean mineral quality objectives" for the Los Angeles River, the San Gabriel River and their "tributaries".[13]

The Basin Plan also contained an "Implementation Plan" to reduce wasteloads from various pollutant sources and their effects on the basin's waters. For urban runoff and storm water discharges, the Basin Plan indicated that the pollutants found in runoff discharges varied considerably and exhibited a seasonal nature. More specifically, the Plan stated that the "bulk of these mass emissions is normally experienced in only a few days of wet weather during the rainy season."[14] Although certain beneficial uses, such as groundwater recharge and recreational uses, may be temporarily impaired during storm flow conditions, the Basin Plan noted few traditional "end-of-pipe" controls existed for runoff flows. It explained:

> "...there is little, if anything, that can be done to mitigate the effects of such runoff except for improved air pollution control practices, improved urban housekeeping, and improved environmental levels of performance for automotive equipment."[15]

12 Ibid., at page I-4-9.

13 Ibid., at Table 4-1 and pages I-4-11 and I-4-12.

14 1975 Basin Plan, "Impact of Runoff Waste Loads", page II-15-94.

15 Id.

Although much runoff data was included in the Basin Plan, limited information about the significance or effects of runoff discharges on receiving water quality existed.

The Basin Plan specified requirements and controls for "traditional" point sources,[16] but storm water discharges were not covered, based on the difficulty of their regulation:

> "...no practical and economical means has yet been developed for containment and treatment of urban runoff wastes for reduction of pollutants prior to downstream release, nor are standards for such measures presently in existence or contemplated for the foreseeable future, at least on a widespread basis....There are presently no generally applicable effluent limits nor water pollution control facilities in connection with urban runoff that appear practical or economical. The emphasis for water quality control from this standpoint should be public education, public cooperation in improved (outdoor) housekeeping, and continued search of solutions to the air pollution problems."[17] (Emphasis added)

The Regional Board has not amended the portions of its Basin Plan relating to storm water and urban runoff since 1975. Therefore, we conclude that the Basin Plan does not address controls on such discharges, except for the few practices listed above. Clearly, the effluent limitations listed for other point sources are not meant to apply. In addition, there are no

---

16 As was explained in Order No. WQ 91-03, throughout the years many documents have treated storm water discharge as a nonpoint source, even though it is legally a point source. This has led to some confusion in terminology. However, it is often obvious from statements in the document that decision makers have sought to exclude storm water from requirements otherwise applicable to point sources.

17 Ibid., at pages I-5-87 and I-5-88.

numeric water quality standards which have yet been developed.[18] On April 11, 1991, the State Board adopted the Water Quality Control Plan for Inland Surface Waters (Inland Plan) which is applicable here. The Inland Plan establishes numeric water quality objectives but allows dischargers of storm water a maximum of ten years to achieve compliance.

As was discussed in Order No. WQ 91-03, in 1987 the federal Clean Water Act was amended[19] to add provisions specifically requiring a regulatory program for storm water discharges. Section 402 of the Clean Water Act was amended to add subsection 402(p), which establishes NPDES permit application requirements for municipal storm water discharges and for storm water discharges associated with industrial activities.[20]

Section 402(p) includes the following requirements for municipal discharges of storm water:

> "Permits for discharges from municipal storm sewers--(i) may be issued on a system- or jurisdiction-wide basis; (ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and (iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the [EPA] Administrator or the State determines appropriate for the control of such pollutants." (Emphasis added.)

---

18 The petitioner contends that numerical objectives contained in the Ocean Plan apply to discharges of storm water. We shall discuss that contention infra.

19 The amendments are entitled, Water Quality Act of 1987, Public Law 100-4 (February 4, 1987).

20 Section 405(p) of the Water Quality Act of 1987.

The Water Quality Act of 1987 also added Section 320 to the Clean Water Act. This amendment created the National Estuaries Program, an effort to develop and implement comprehensive conservation and management plans for estuaries of national importance. In December 1987, a federal appropriations act formally included Santa Monica Bay in EPA's National Estuaries Program.[21] The State of California then organized the Santa Monica Bay Restoration Project to coordinate local, state, and federal activities to develop the required plan which would improve the condition of Santa Monica Bay. The nomination document for this project indicated that urban runoff and storm water discharges may contain heavy metals, organic constituents, pathogens, and other pollutants that threaten or may impair the beneficial uses of Santa Monica Bay.[22] As a part of this project, the Los Angeles Regional Board--and the numerous local and regional governments and environmental interest groups that also participate in the project--began a more thorough investigation of runoff discharges to Santa Monica Bay. Because existing runoff data was incomplete or inconsistent, the Santa Monica Bay Restoration Project initiated detailed monitoring studies to identify pollutants in runoff flow, especially pathogens, and to assess their effects on the bay. This monitoring work is now in progress.

---

21 *National Estuary Program, The Nomination of Santa Monica Bay, Environmental Affairs Agency, May 1988.*

22 *Ibid., see "Executive Summary", page viii, and "Storm Drains and Runoff", page 41.*

The permit which we are reviewing here was the result of a cooperative effort of the "Storm Water Permit Work Group," which was established to fulfill part of the objectives of the Santa Monica Bay Restoration Project. The Work Group assisted in drafting the permit.

In order to implement the Basin Plan, the provisions of state law regarding adoption of waste discharge requirements,[23] and the Clean Water Act provisions regarding storm water permits, the Regional Board issued a draft NPDES permit to regulate urban runoff and storm water discharged throughout Los Angeles County. The revised draft permit designated the County of Los Angeles as the "Principal Permittee" and 16 cities as "Co-permittees" (the dischargers). A workshop was held by the Regional Board on April 23, 1990, and a public hearing was held on June 18, 1990, and on the latter date the Regional Board adopted the NPDES permit (NPDES permit CA-0061654; Regional Board Order No. 90-079). Subsequently, the petitioner filed a timely petition for review of the NPDES permit.

II. CONTENTIONS AND FINDINGS

The petition raises a number of contentions which all address whether the permit must include numeric, water quality-based effluent limitations. The petitioner argues that the Clean Water Act requires permits regulating municipal discharges of storm water to prescribe numeric effluent limitations for toxic pollutants. The petitioner also contends that the permit does

23 *California Water Code Section 13000 et seq.*

not require controls which reduce pollutants to the "maximum extent practicable". Finally, the petitioner argues that the permit does not comply with the three-year time schedule required in Clean Water Act Section 402(p).

A. The Need for Numeric Effluent Limitations

The petitioners' arguments are based on the premise that the dischargers' municipal separate storm sewer system discharges pollutants to Santa Monica Bay, and that these discharges violate numeric water quality standards in the bay. The numeric standards which the petitioner relies upon are found in the Ocean Plan. As we shall explain, the petitioner's broad assertions vastly oversimplify the complex nature of the dischargers' flood control and drainage facilities, imply that the storm sewer system discharges only into Santa Monica Bay, and misconstrue ambient water quality criteria, receiving water quality standards and effluent limitations.

The County of Los Angeles, Department of Public Works' municipal separate storm sewer system serves a geographic area greater than 4,000 square miles[24] and includes more than 87 overlapping local governmental jurisdictions. This system, a vast network of catchments, street gutters, conduits, pipes, and channels that were designed for drainage and flood control purposes, collects urban runoff flows and storm water flows from throughout Los Angeles County. The County's Department of Public Works and 87 cities own, operate, or maintain this enormous

24 *See Regional Board's Response to Petition, page 10.*

municipal separate storm sewer system. More than 5,000 outfalls or "point sources" discharge these runoff flows into both constructed works and the natural streams, rivers, and other surface water bodies that comprise the Los Angeles River hydrologic unit.

As we discussed in Order No. WQ 91-03, the specific location at which the storm water outfall intersects receiving waters is where the "point source" discharge occurs. While the precise location of each of the several thousand outfalls in Los Angeles County is understandably omitted from the record, the substantial majority of these outfalls discharge urban runoff and storm water flows to surface waters--such as Ballona Creek, Coyote Creek, and San Antonia Creek, the Los Angeles River and the San Gabriel River, Rio Hondo, and other water bodies--throughout the hydrologic basin.[25]

Obviously, not all of the dischargers' 5,000 municipal separate storm sewer system outfalls actually discharge directly to Santa Monica Bay. Although the numerous natural water courses which receive storm water generally are ultimately tributary to Santa Monica Bay, they are the receiving waters. As such, these natural water courses cannot be considered elements of the dischargers' municipal separate storm sewer system. In fact, many of these surface waters are clearly identified in the Los Angeles Regional Board's Basin Plan.

---

25 The nomination document for the Santa Monica Bay Restoration Project stated that "over 60 storm drains" empty into the Bay.

In the Los Angeles Basin, the storm sewer outfalls generally discharge to the water courses upstream from Santa Monica Bay. Both Santa Monica Bay and the water courses which receive the storm water discharges have beneficial uses. However, the uses of the streams, creeks, reservoirs and rivers in the Los Angeles River Basin are not the same as the uses of Santa Monica Bay. The upstream waters support fresh water uses, while Santa Monica Bay sustains marine water uses.

As was described above, while the Basin Plan does include narrative water quality objectives for the upstream surface waters, the Regional Board has not yet developed numeric objectives for all of the pollutants the petitioner enumerates. Although the Inland Plan does contain numeric objectives, up to ten years is allowed for compliance. The Ocean Plan also includes numeric standards, but these do not apply to discharges of storm water.

The Ocean Plan states that all parts are applicable to point source discharges to the ocean. Narrative water quality objectives and toxic materials limitations (Table B) do apply to nonpoint sources, but compliance is determined by direct measurement in receiving waters. The petitioner requests that the storm water discharges be subject to Table B, and also to Table A (which is meant only to apply to publicly-owned treatment works).

While on its face, Table B may appear to apply to storm water discharges, it is clear from reading the Functional

Equivalent Document,[26] which was adopted by the State Board at the same time as the Ocean Plan, that neither Table A nor Table B are meant to apply to storm water discharges:

> "The attainability analysis did not include stormwater discharges because there are few data available on pollutant concentrations in stormdrains. EPA's proposed regulations for stormwater discharges do not use water quality-based effluent limits for stormdrains.[27] Instead, an approach based on Best Management Practices is proposed, following an initial period of characterization.
>
> "We do not propose to apply water quality-based effluent limits such as Table B to stormdrains at this time. Technology-based standards will not be based on Table A, but on Best Management Practices. Since the Table B objectives represent levels of pollutants that are protective of beneficial uses they may be applied to stormdrains at some future date. We do not anticipate that this would occur until adequate characterization data are available so that attainability can be assessed and implementation measures established."

Following the above statement, the Functional Equivalent Document states that the Plan explains how to apply Table B objectives to nonpoint sources. From this statement, it is clear that in drafting the Ocean Plan the State Board was viewing storm water discharges as nonpoint sources. This characterization is understandable. Storm water discharges,

---

26 Functional Equivalent Document, Amendment of the Water Quality Control Plan for Ocean Waters of California, California Ocean Plan (March 1990), at pages 33 and 34.

27 It appears that the reference here was to numeric water quality-based limitations, since such limitations are required in Table B. As we explained in Order No. WQ 91-03, water quality-based limitations need not always be numeric.

while ultimately flowing through a point source to receiving waters, are by nature more akin to nonpoint sources as they flow from diffuse sources over land surfaces. This point is discussed in the Preamble to EPA's storm water regulations:

> "For the purpose of [national assessments of water quality], urban runoff was considered to be a diffuse source or nonpoint source pollution. From a legal standpoint, however, most urban runoff is discharged through conveyances such as separate storm sewers or other conveyances which are point sources under the [Clean Water Act]." 55 Federal Register 47991.

We therefore conclude that the petitioner has misinterpreted appropriate criteria and the applicability of Ocean Plan provisions to storm water. There are no numeric objectives or numeric effluent limits required at this time, either in the Basin Plan or in any statewide plan that apply to storm water discharges. This absence, however, will not in any way diminish the permit's enforceability or its ability to reduce pollutants in storm water discharges substantially. While numeric objectives are contained in the Inland Plan, these need not be achieved for up to ten years. In addition, the Plan endorses the application of "best management practices" rather than numeric limitations as a means of reducing the level of pollutants in storm water discharges.

The permit which the Regional Board adopted is very similar to that reviewed in Order No. WQ 91-03. The NPDES permit employs a two-fold strategy: It effectively prohibits non-storm

water discharges and illicit connections; and, it requires a comprehensive series of regulatory, governmental, and educational control measures.

As in the case of the permit issued by the San Francisco Bay Regional Board, the method by which the specific control activities will be implemented is that the dischargers must submit an Implementation Plan for approval by the Regional Board's Executive Officer, and then must implement the Plan. Thus, the permit lists some, but certainly not all of the management practices which will be undertaken. The remaining specific practices will be developed over a two-year period starting with adoption of the NPDES permit. In addition, the "co-participant" cities, which have not yet been added to the permit, are also being required to select appropriate control measures.

Although the permit does not make specific reference to violation of water quality standards, the permit will be read so as to require the implementation of practices which will achieve compliance with applicable standards. Such a requirement is implicit in the issuance of an NPDES permit, since that is a minimum requirement of a permit, as we discussed in Order No. WQ 91-03. The requirement is also a part of the California Water Code. Water Code Section 13263. The permit does provide that the Regional Board may, in the future adopt numeric water quality objectives and limitations.[28]

---

28 Permit, Finding 19.

We concluded in Order No. WQ 91-03 that permits for municipal separate storm sewer systems issued pursuant to Clean Water Act Section 402(p) must contain effluent limitations based on water quality standards. In addition, the applicable water quality standards are those established for the receiving waters of the storm water discharges. We further concluded there that even if such effluent limitations are intended to require compliance with water quality standards, "best management practices" constitute legally acceptable effluent limitations. We find here, as we did in Order No. WQ 91-03, that the permit includes a comprehensive and stringent program for reducing pollutants in storm water discharge, and that it will implement the Basin Plan, including the protection of beneficial uses.

We note that the dischargers argued in their response that the fact that the permit was derived from a cooperative effort, prior to the promulgation of regulations by EPA, had relevance to its enforceability. While we are certainly pleased that the dischargers and the Regional Board have been able to work together in a cooperative and positive manner, the permit which was adopted is a lawfully adopted NPDES permit, and is fully enforceable as such. The fact that it was adopted prior to the deadline for adoption of such permits, and prior to promulgation of the regulations, has no relevance to its enforceability. The prohibitions and practices contained in the

permit must be obeyed, and those prohibitions and practices must result in compliance with any applicable water quality standards.

Just as in our review of the San Francisco Bay Regional Board's permit, we have reviewed the appropriateness and propriety of this permit. We find here also that the approach of the Regional Board, requiring the dischargers to implement a program of best management practices which will reduce pollutants in runoff, and prohibiting non-storm water discharges, is appropriate and proper. We base our conclusion on the difficulty of establishing numeric effluent limitations which have a rational basis, the lack of technology available to treat storm water discharges at the end of the pipe, the huge expense such treatment would entail, and the level of pollutant reduction which we anticipate from the Regional Board's regulatory program. We feel compelled to note here our agreement with the Regional Board that this permit does truly represent a massive undertaking. No other permit in the State, and perhaps in the nation, will control the number of outfalls in a metropolitan area as this permit undertakes to regulate.

B. The Maximum Extent Practicable Standard

The petitioners contend that the permit must include specified management practices in order to comply with the requirement in Clean Water Act Section 402(p) of reducing pollutants in municipal separate storm sewer discharges to the maximum extent practicable (MEP). The petitioner states that MEP means, "what can be done now, must be done now." As we stated in

Order No. WQ 91-03, however, we find that the Regional Board's approach of requiring the dischargers to prepare a plan with proposed control measures for approval by the Regional Board is preferable to specifying all such measures in the permit. The petitioner gives as an example a requirement for catch basin cleaning, which it claims would reduce pollutants. However, an effective and cost-effective storm water program requires an analysis of the specific area subject to regulation, and should not involve a simple listing of practices that all municipalities must follow. As EPA stated in its Preamble to the draft storm water regulations:

> "A wide variety of control measures to reduce the discharge of pollutants from municipal storm sewer systems are currently available. The performance of appropriate control measures is highly dependent on site-specific factors. It is therefore not practicable to define one standard set of controls which will control all pollutants in all municipalities." 53 Federal Register 49456[29]

We also note that, while we share the petitioner's goal of rapid achievement of an effective practices program, the Clean Water Act does not require implementation of all measures now, but rather has set forth a three-year time schedule for compliance. We shall discuss this point further in the next section.

---

29 This point was also made in the preamble to EPA's final regulations. 55 Fed. Reg. 48038. There a reference to the legislative history of Clean Water Act Section 402(p) makes clear that Congress' intent was not to dictate specific practices.

C. Time Schedule for Compliance

The petitioner contends that the permit violates the Clean Water Act by not requiring timely compliance with water quality standards. We addressed this point in Order No. WQ 91-03. Here, also, we find that the permit contains provisions requiring such compliance.

The permit includes a very aggressive and comprehensive program of developing and implementing best management practices over a three-year period. The permit does require a program aimed at compliance with applicable water quality standards and all practices necessary to achieve such compliance must be in place within three years of adoption of the permit. Therefore, the permit complies with the time schedule requirements of the Clean Water Act. The permit also specifically provides that the Regional Board may include more stringent effluent limitations, including numeric effluent limitations if necessary.

III. CONCLUSIONS

After review of the record and consideration of the contentions of the petitioners, and for the reasons discussed above, and in Order No. WQ 91-03, we conclude:

1. Impacts of storm water discharges on receiving waters and Santa Monica Bay are complicated, and at this time, it would be infeasible to establish numeric effluent limitations on

discharges to storm drains in the Los Angeles River Basin, which are validly associated with impacts in Santa Monica Bay.

2. The permit adopted by the Regional Board requires implementation of specific source control measures and effectively prohibits discharges of non-storm water and violation of water quality standards.

3. The provisions in the Clean Water Act regulating municipal storm water discharges require effluent limitations and achievement of water quality standards, but the limitations may consist of source control measures, rather than numeric effluent limitations.

4. It is appropriate and proper to issue a permit regulating municipal separate storm sewer systems which requires specific practices, rather than containing numeric effluent limitations.

5. The specific control measures requested by the petitioner should be considered by the Regional Board when approval of the dischargers' control plan is sought, rather than by this Board.

6. The permit complies with the time schedule requirements of the Clean Water Act.

IV. ORDER

IT IS ORDERED that the petition is denied.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the State Water Resources Control Board held on May 16, 1991.

ENVIRONMENTAL IMPACTS OF STORMWATER DISCHARGES

Introduction

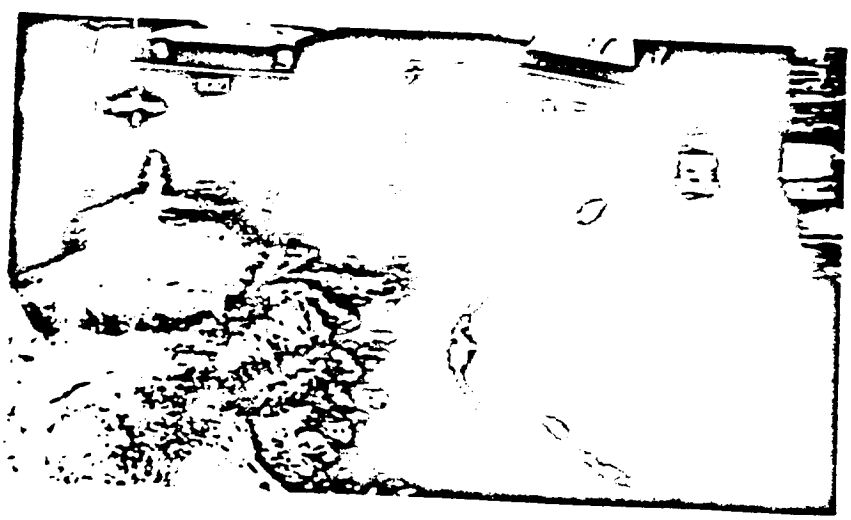
What constitutes stormwater discharges? What pollutants are associated with stormwater and why? In comparison to other pollution sources, how does stormwater affect the Nation's rivers, lakes, and estuaries? What sources of stormwater pollution are not currently regulated under the NPDES program and what are their impacts? What have we learned in our efforts to control and manage sources of stormwater pollution?

These questions and others face al, state, and federal water qual- managers as they struggle to implement cost effective control strategies which target stormwater and other pollutant discharges in areas where the greatest risks to water quality impairment exist. This booklet was prepared based on the best available current information, to assist managers in answering the above questions. It is intended as a capsule summary of national level information on water quality drawn from various EPA program reports (i.e., the Section 305(b) National Water Quality Inventory, the Section 319 Nonpoint Source Program, and the Nationwide Urban Runoff Program – NURP), as well as from more site-specific information and data generated by local agencies and researchers over the last decade.

The remainder of this booklet is in three parts. In the first part, we define the general nature of and impacts from stormwater discharges and compare, on a national scale, stormwater pollution to other point and nonpoint pollution sources. A differentiation is made between stormwater discharges that are currently regulated versus not regulated under the NPDES program. A discussion of the relationship between land use/land disturbance and the magnitude of stormwater pollution is provided.

In the second part we examine in more detail, the pollutant characteristics and impacts of stormwater runoff. This is presented by a series of site specific examples where environmental impacts caused by various types of stormwater sources have been observed and documented.

In the third and last part, we examine lessons learned from recently implemented stormwater control strategies which have shown promise in effectively minimizing impacts in areas of greatest risk.



STORMWATER POLLUTION - A NATIONAL CONCERN

Defining the Problem

As human activities alter the watershed landscape, adverse impacts to receiving waters may result from changes in the quantity and quality of stormwater runoff. Rain (and snow) falling onto the surface of unmanaged urbanizing watersheds results in a predictable increase in the quantity of runoff (and snowmelt) volume flowing to receiving waters. If left unmanaged, the hydraulic impacts (e.g., flooding, erosion, channelization) associated with the increased water volumes may be several orders of magnitude higher than that of the undisturbed watershed. In addition to causing runoff volume impacts, stormwater can also be a major nonpoint pollution source in many watersheds, which is the focus of the remainder of this booklet.

There are six primary nonpoint source activities associated with stormwater runoff pollution. They are (in no particular order):

- Agriculture,
- Silviculture,
- Mining,
- Construction,
- Urban activities, (including storm sewers, industrial and commercial operations, urban growth, land disposal[a], and hydromodification[a]), and
- Atmospheric deposition.

The first five are the traditional nonpoint sources; the sixth, atmospheric deposition, has also been recognized as a major contributor of nitrogen, sulfates, and trace metals to stormwater runoff in highly urbanized areas (Halverson, et al., 1984).

The types and amounts of pollutants carried by stormwater runoff, commonly resulting in nonpoint source pollution of receiving waters, are highly variable (USEPA, 1983a). The pollutant characteristics of stormwater runoff are largely based on land use characteristics (as illustrated in Table 1) and vary with the duration and the intensity of rainfall events (Metropolitan Washington Council of Governments, 1980). Table 1 illustrates the high variability of pollutant loads associated with stormwater runoff. For example, Table 1 shows loads of suspended sediment vary considerably within a land use and among land uses. Pollutant characteristics from stormwater runoff also vary regionally.

Recent regulatory efforts have focused almost exclusively on point sources (e.g., municipal and industrial wastewater discharges). In the early 1970s, however, it was recognized that nonpoint sources, including pollutants originating from agri-

culture, mining, and land disposal activities, as well as stormwater and diffuse urban sources such as construction sites, impervious surfaces, and unsewered residential areas, were contributing significantly to the impairment of the Nation's surface and groundwaters.

A National Ranking

Based in part on national assessments conducted by the U.S. Environmental Protection Agency (EPA) it is now recognized that nonpoint sources and certain diffuse point sources[a] (e.g., stormwater discharges) are responsible for between one-third to two-thirds of existing and threatened impairments of the Nation's waters (USEPA, 1991a). Under Sections 305(b) and 319(a) of the Clean Water Act, states report to the EPA on the quality of their rivers, streams, lakes, estuaries, coastal waters, wetlands, and groundwater. EPA, in turn, prepares summary reports to Congress called the National Water Quality Inventory [for 305(b)], and Managing Nonpoint Source Pollution [for 319(a)]. These reports contain national statistics on the degree of impairment of assessed waters [see Table 2(a)]. Impairment is measured according to the level at which the designated uses of the waterbody are attained or supported [see Table 2(b)]. For example, as shown in Table 2(a), of the waters assessed by the States under 305(b) (approximately one-third of

river miles, one-half of lake acres and three-quarters of estuarine waters), roughly 50 to 60 percent are fully supporting the uses for which they are designated.

Although methodologies used by the states to report and analyze data differ between the 319 and 305(b) reports according to the different requirements of the Clean Water Act, their general conclusions are nonetheless comparable. Both methods, for instance, use similar pollution source categories and pollutant categories (see insets previous page) to track the relative causes of use impairment. Figure 1 compares, for example, the reported pollution sources and pollutants impacting use support in rivers for the two methods. Note that, for rivers, **both the 319 and 305(b) methods show agriculture to be the primary source contributing to use impairment; siltation/suspended solids and nutrients are the pri-**

ary pollutants causing riverine impacts, followed by pathogens, metals, and pesticides. Other nonpoint pollution sources contributing to use impairment in rivers and whose individual levels of contribution are similar for both 305(b) and 319 are construction, land disposal, silviculture, urban runoff/storm sewers, hydromodification, and mining. A major uncertainty is the

[a]*Source: Managing Nonpoint Source Pollution: 1991 Report to Congress*

23% unknown sources identified in the 319 program for rivers.

Table 3 extends the comparison between 319 and 305(b) methods for pollution sources causing impairment of assessed river miles, lake acres (excluding Great Lakes) and estuary square miles, as reported in the most recent 305(b) document (USEPA, 1992), and 319 document (USEPA, 1991a). Pollution source categories are grouped into rural nonpoint sources, urban nonpoint sources, point sources, and other sources. As seen in Table 3, the level of contribution to reported impairment caused by a given 319 or 305(b) source category varies between waterbody types, however, the general trend is similar for both methods. For example, for rivers, rural nonpoint sources represent the largest contribution to impairment under both 319 and 305(b) methods, followed by urban nonpoint sources. For lakes and estuaries, however, the largest contributors to use impairment are reported to be urban nonpoint sources, regardless of which method is used.

Stormwater runoff from agriculture and from urban areas are the two present leading causes of surface water quality impairment nationwide, except for estuaries (where point sources are shown to be the second largest contributor to impairment behind urban nonpoint sources)

Furthermore, while urban population areas (greater than 2500 inhabitants as defined by the Bureau of Census) take up only about 2.5% of the total land surface of the country, stormwater pollution from these urban areas and associated urban activities (i.e., storm sewers/urban runoff, combined sewers, hydromodification, land disposal, construction, urban growth, etc.) accounts for a proportionately high degree of water quality impairment (i.e., 18% of impaired river miles, 34% of impaired lake acres, and 62% of impaired estuary square miles reported under 319) when compared to that (see Table 3) from rural activities (i.e., agriculture, silviculture, and mining) which take up approximately 53% of the total land surface (USDA, 1992).

Explanation of 305(b)/319 Pollution Sources (legend to Table 3)

Agriculture:	Runoff from crop production, pastures, rangeland, feedlots, and irrigated return flows
Silviculture:	Runoff from forest management, harvesting, and road construction
Mining:	Runoff and process fluids from mining, petroleum drilling, and mine tailing sites
Construction:	Runoff from highway building and land development
Urban Runoff:	Runoff from sewered and unsewered urban areas, including industrial and commercial activities; under 319 also includes combined sewers
Combined Sewers:	Storm and sanitary sewers combined, which may discharge untreated wastes during storms
Land Disposal:	Runoff and leachate from landfills, septic tanks, and hazardous waste disposal sites
Hydromodification:	Channelization, dredging, dam construction, and streambank modification
Municipal Point Source:	Discharge from POTW (publicly owned treatment works)
Industrial Point Source:	Discharge from industrial processes
Other:	Includes atmospheric deposition, waste storage/tank leaks, highway runoff, spills, in-place contaminants, natural, and recreational and urban growth
Unknown:	Unknown

This indicates the importance of focusing efforts on the management and control of stormwater discharges from urban areas and associated urban activities (i.e., storm sewers/urban runoff, combined sewers, hydromodification, land disposal, construction, urban growth, etc.) since the potential for future urban growth and cumulative impacts from increased stormwater discharges from expanding urban activities is relatively great.

The above analysis, although an approximation, indicates the relative importance of urban stormwater discharges as a major contributor to the impairment of the Nation's waters. This is consistent with the National Oceanic and Atmospheric Administration (NOAA) findings that urban runoff is a leading cause of impairment to shellfish growing waters (NOAA; 1988; 1989; 1990). This qualitative analysis does not allow, however, for a detailed ranking of all subcategories of stormwater discharges, including industrial and commercial activities occurring in urban areas. Certain source categories included under 319 and 305(b) that do correlate well with industrial activities are land disposal, mining, and construction and these are shown to be important contributors to water quality impairment (see Table 3).

It is not readily apparent as to what degree stormwater discharges are currently regulated in relation to the level of impairment reported. For example, although agriculture is a major nonpoint source contributor to water quality impairment, currently only the largest animal feedlots require stormwater discharge permits. Table 3 shows the status of National Pollutant Discharge Elimination System (NPDES) permit requirements for each pollution source category and we discuss this status in more detail below.

Regulating the Risk

The 1987 amendments to the Clean Water Act require EPA to develop NPDES permit application requirements for the following "Phase I" classes of stormwater discharges:

- discharges from large municipal separate storm sewer systems (systems serving a population of 250,000 or more) and medium municipal separate storm sewer systems (systems serving a population of 100,000 or more, but less than 250,000);
- stormwater discharges associated with industrial activity [identified by Standard Industrial Classification (SIC) codes]; and
- discharges which are designated by EPA or an NPDES approved State as needing an NPDES permit because the discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

Statutorily excluded from the NPDES requirements under the Clean Water Act are general agricultural stormwater, irrigation return flows, and uncontaminated runoff from oil and gas or mining operations.

The CWA creates a temporary moratorium on the general requirement of the CWA that point source discharges of pollutants to waters of the United States must be authorized by an NPDES permit. Under the moratorium, EPA is prohibited from issuing NPDES permits for non-Phase I discharges composed entirely of stormwater prior to October 1, 1992. EPA is required to issue regulations by no later than October 1, 1992 which designate additional "Phase II" stormwater discharges to be regulated to protect water quality and establish a comprehensive program to regulate such designated sources. The program must, at a minimum:

(A) establish priorities,

(B) establish requirements for State stormwater management programs, and

(C) establish expeditious deadlines.

The program may include performance standards, guidelines, guidance, and management practices and treatment requirements, as appropriate.

Phase I Stormwater Discharges. On November 16, 1990, EPA published regulations specifying permit application requirements for industrial activities and large/medium municipal separate storm sewer systems, the two major classes of Phase I stormwater sources (see inset next page).

Municipal - The November 16, 1990 regulations defined a municipal separate storm sewer system serving a population of 100,000 or more to include municipal separate storm sewers within the boundaries of 173 incorporated cities, and within unincorporated portions of 47 counties that were identified as

Defining Stormwater Discharges

As "Phase I" Discharges:

Municipal:

- Separate storm sewers* in incorporated (city) and unincorporated (county) urban areas with population of 100,000 or more
- Combined sewer overflows (subject to NPDES permit requirements prior to Phase I)

Industrial:

- Heavy manufacturing facilities
- Medium manufacturing facilities with materials exposed to rainfall
- Priority oil and gas facilities
- Active and inactive mines
- Construction sites greater than 2ha(5ac)
- Landfills, storage or disposal facilities handling industrial/hazardous wastes
- Scrapyards/salvage yards
- Runoff from sewage treatment plants
- Selected transportation facilities
- Steam electric power plants
- Large animal feedlots (subject to NPDES permit requirements prior to Phase I)

Statutorily Excluded:

- Agricultural stormwater
- Irrigation return flows
- "Uncontaminated" runoff from oil and gas or mining operations

*Separate storm sewers include pipe conveyance as well as ditches, and grass swales in suburban areas

having populations of 100,000 or more in unincorporated, urbanized portions of the county. In addition, the regulations allowed for additional municipal separate storm sewers to be designated by the Director of the NPDES program as being part of a large or medium municipal system. **The inclusion of these 173 cities and 47 urban counties in the Phase I program recognizes that stormwater runoff from high density urbanized areas has a significant potential to impact receiving waters** due to the greater concentration of commercial and industrial activities; the existence of leaks, cross connections and illicit discharges into sewer systems; and the large impervious areas which normally exist.

Industrial - The November 16, 1990 regulations also defined the term "storm water discharges associated with industrial activity" broadly to include 11 categories of industrial facilities (see Phase I inset). EPA estimates that over 100,000 industrial facilities are addressed by this definition. Many of the Phase I industrial facilities (e.g., mining, landfills, construction, etc.) have previously been addressed by the NPDES program as traditional sources.

For example, stormwater discharges from mining sites have long been recognized as having significant impacts on receiving water quality, and national effluent guideline limitations under NPDES have been developed for most types of mining activities to control surface drainage (but not groundwater seepage). A wide variety of waste materials can be exposed to stormwater at waste disposal sites and scrap yards, which now require NPDES permits. Under RCRA Subtitle D, States reported that of the 1,100 municipal solid waste landfills which monitored discharges to surface water, 660 were cited for surface water impacts. Older landfills are of most concern because they may have received large volumes of hazardous waste and, in general, their use of design controls was very limited. Runoff generated from construction activities has the potential for serious water quality impacts from sediments and other land related pollutants. Annually, about 1.6 million acres of land are disturbed by construction activities nationwide. Only construction sites larger than 5 acres are currently required to be permitted under NPDES.

Pollutant concentrations in runoff from industrial facilities located in urban areas can be significantly higher than from residential or commercial areas due to the increased presence and amounts of toxic materials (Roesner, 1978). In general, the level of pollutants from industrial facilities is related to the type of activities occurring at the site, and the degree to which these activities are exposed to precipitation. Illicit connections, cross connections, improper waste disposal, and spills may also contribute sanitary or industrial waste waters directly to municipal storm sewer systems, leading to high metal, nutrient, or bacterial concentrations. A high priority has been set under the Phase I NPDES stormwater permit program to identify and bring these "non-stormwater pollution discharges" under control.

Phase I Implementation - The Phase I stormwater program takes two very different approaches to defining the roles of EPA and authorized NPDES States in controlling pollutants in stormwater discharges. With respect to permits for large and medium municipal systems, the efforts of the NPDES permitting authority (EPA or an authorized NPDES State) are directed to ensuring that municipalities develop and implement stormwater management programs to control pollutants to the maximum extent practicable. Municipal programs address ways to reduce pollutants in stormwater from privately-owned lands (e.g., commercial operations, houses) that discharge to a municipal system, as well as modifying municipal activities (e.g., road deicing and maintenance, flood control efforts, maintenance of municipal lands, etc.) to address stormwater quality concerns. NPDES permit activities can define the role of municipalities under this program in a flexible manner that allows local governments to assist in identifying individual priority pollutant sources (e.g., industrial sources, illicit connections, spills, etc.) within the municipality and to develop and implement appropriate controls for such discharges.

With respect to permits for stormwater discharges associated with specific Phase I industries identified in the November 1990 regulations, the NPDES permitting authority has a more direct role in regulating these facilities. In addition, NPDES permits for discharges from large and medium municipal separate storm sewer systems will establish municipal responsibilities for assisting EPA and authorized NPDES States in implementing controls to reduce pollutants in stormwater discharges associated with Phase I industrial activities which discharge through municipal systems.

Phase II Stormwater Discharges. EPA is currently evaluating a number of options for identifying Phase II stormwater discharges to be regulated to protect water quality. **Of the options being considered, perhaps the most difficult to address is whether to expand the categories of individual facilities (such as commercial or light industrial facilities) requiring permits, or rather to include these within an expansion of municipal separate storm sewer systems requiring permits.** Addressing additional municipal separate storm sewer systems would result in requiring the selected municipalities to:

(A) identify individual priority pollutant sources within the municipality (e.g., industrial sources, illicit connections, spills, etc.), and

(B) develop and implement appropriate controls for such discharges.

On the other hand, individual facilities specifically identified as new categories under Phase II of the NPDES stormwater permit program would primarily be regulated directly through requirements in NPDES permits. These two classes of Phase II sources (i.e., individual and municipal) are discussed in more detail below.

For **individual facilities under Phase II**, EPA could specify new categories of stormwater discharges (in addition to the existing 11 categories) to be regulated separately or under Phase II municipal separate storm sewer systems. Among the discharges that EPA could include for Phase II requirements are the 13 categories of stormwater sources identified in the inset above. The number of individual facilities within these new categories under consideration is currently unknown.

Defining Stormwater Discharges

As "Phase II" Discharges:

Municipal:

- **Separate storm sewers[a] in incorporated (city) and unincorporated (county) urban areas with populations less than 100,000**

Individual facilities:

- **Industrial facilities owned or operated by municipalities with a population less than 100,000**
- **Light industrial facilities**
- **Medium industrial facilities without materials exposed to rainfall**
- **Gas stations and automobile related facilities**
- **Tank farms**
- **Abandoned mine sites**
- **Construction sites less than 2ha(5ac)**
- **Runoff from construction projects for roads used for silviculture**
- **Municipal landfills that do not receive industrial waste**
- **Large parking lots (shopping centers, stadiums, etc)**
- **Military bases**
- **Research centers**
- **Animal feedlots not currently subject to NPDES permit requirements**

[a]Separate storm sewers include pipe conveyance as well as ditches, and grass swale in suburban areas

For municipal separate storm sewer systems under Phase II, EPA is considering expanding NPDES requirements to urban areas having populations less than 100,000. Under Phase I, EPA defined municipal separate storm sewer systems on the basis of political boundaries, including 173 incorporated cities (having a population of 100,000 or more) and 47 of 500 counties having an unincorporated urban population of 100,000 or more. The counties that were addressed by the 11/16/90 regulation were in a handful of States, primarily MD, VA, FL, and CA. **While the current regulations indirectly address suburban growth in these States, in most parts of the country, the regulations only address core cities and exclude suburban or "urban fringe" development.** This is typified in Figure 2 for the Milwaukee, Wisconsin area, where only the incorporated city of Milwaukee and none of the urban fringe area within Washington, Waukesha, Ozaukee, Milwaukee, and Racine Counties is required to apply for a stormwater permit. The 1990 population for the Milwaukee urbanized area is about twice that of Milwaukee City and population densities are similar.

The Bureau of Census has defined 396 "urbanized areas" (UAs) based on the 1990 Census to define large metropolitan population patterns. UAs are comprised of a central "core" city (or cities) with a surrounding closely settled area. The population of the entire urbanized area must be greater than 50,000 people, and the closely settled area outside the city, the urban fringe, must have a population density generally greater than 1,000 persons per square mile (just over 1.5 persons per acre) to be included. **These 396 UAs contain over 158 million people, or over 63% of the Nation's total population. However, UAs only occupy about 1.5-2% of the Nation's land area.** Urban fringe areas surrounding core cities are typically divided into numerous local governments, as defined in Table 4 based on 1990 Census data.

Table 4. Municipalities Associated With Urbanized Areas (UAs)[a]

Size of UA	Number of UAs	Number of Incorporated Places[b]	Number of Minor Civil Divisions[c]	Number of County Equivalents[d]
250,000 or more	172	3,674	880	470
100,000-250,000	121	930	362	200
50,000-100,000	103	829	315	258

[a] Based on 1990 Census data
[b] Incorporated places include incorporated cities, towns, villages, and boroughs
[c] Minor civil divisions include unincorporated towns and townships in 20 States
[d] County equivalents include counties, parishes in LA, and boroughs in Alaska. Some double counting of counties occurred as portions of several UAs may be in one county (for example, the portions of the Washington UA, Baltimore UA, and Annapolis UA are in Anne Arundel County, MD)

The 220 Phase I NPDES municipalities have a combined urban population of 78 million. The remaining 80 million people located in urbanized areas are outside of Phase I municipalities. **Most urban growth occurs in the urban fringe areas outside of core cities.** For example, between 1970 and 1980, the population of incorporated cities with a population of 100,000 or more (Phase I cities) increased by only 0.6 million, with the population of many of these cities decreasing. Between 1970 and 1980, the population of urbanized areas outside of cities with a population of 100,000 or more increased 30 times more (an increase of 18.9 million) than the population of these core cities. This is important from a stormwater perspective as numerous studies (e.g., NURP) have shown that **it is much more cost effective to develop measures to prevent or reduce pollutants in stormwater during new development than it is to correct these problems later on.**

Addressing new development is generally considered to be institutionally feasible as many municipalities already have some form of approval or permit program in place that can be modified to address stormwater concerns. In addition, the economic achievability of implementing stormwater controls is expected to be greater for new development versus established core cities since: (1) structural controls and therefore costs can be minimized; (2) new development often absorbs a significant portion of infrastructure capital costs; and (3) the tax base on a per capita basis in urban fringe areas is likely to be

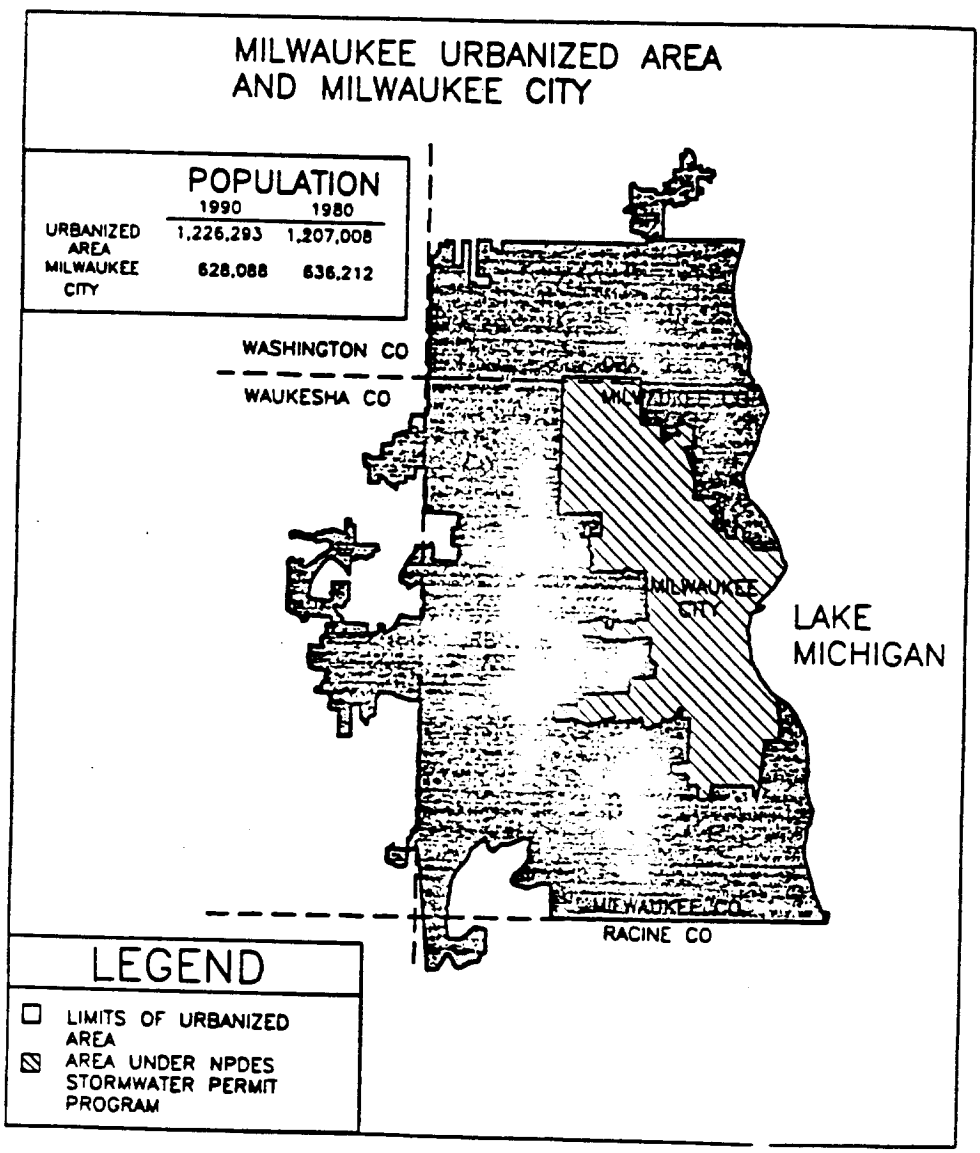

Figure 2. Jurisdiction of Phase I NPDES Stormwater Permit Program in Milwaukee, Wisconsin

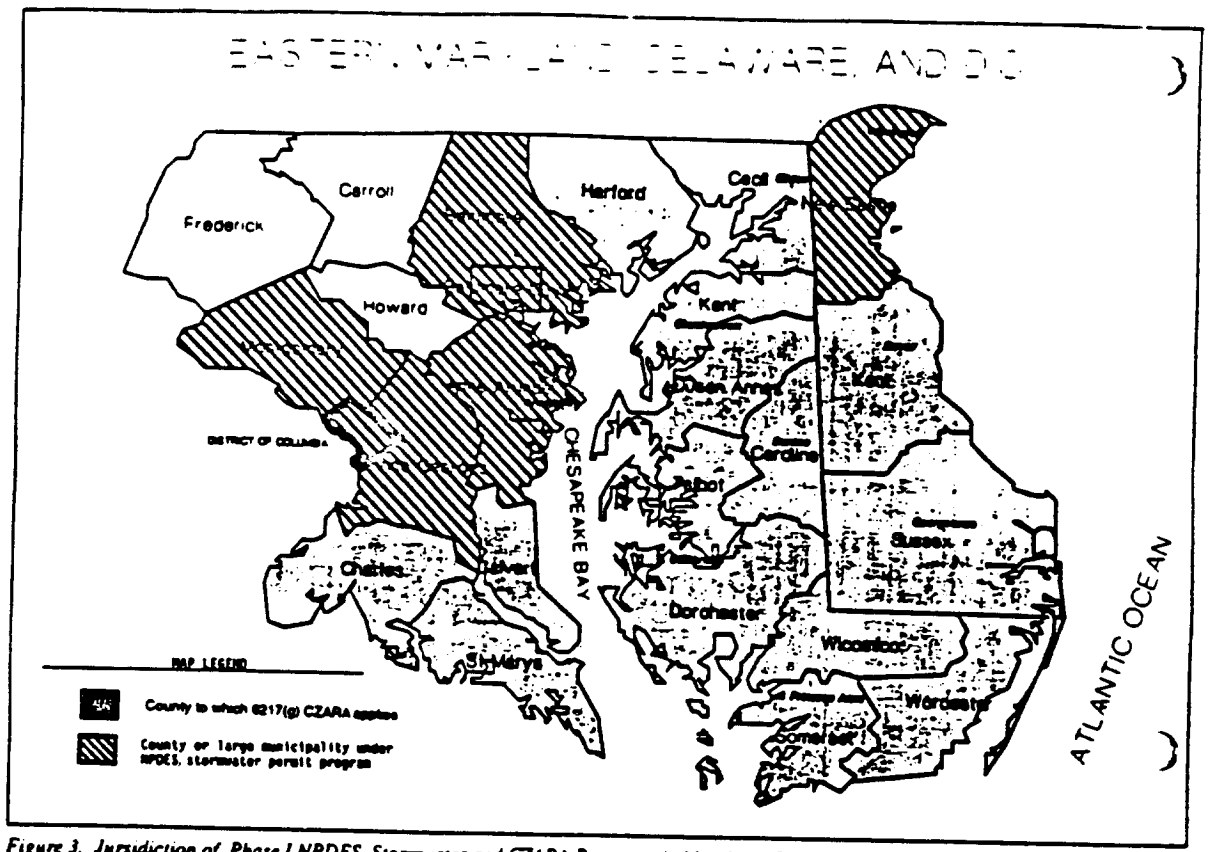

Figure 3. Jurisdiction of Phase I NPDES Stormwater and CZARA Programs in Maryland, Delaware, and Washington, DC

greater (National League of Cities, 1991).

Relationship of NPDES to Other Programs. Figure 3 illustrates the current jurisdiction of the Phase I NPDES stormwater discharge permit program and the Coastal Nonpoint Pollution Control Program under Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA), respectively, in Maryland, Delaware, and Washington, DC. Although not a permit program, the CZARA program is intended to foster the development and implementation of management measures for nonpoint source pollution control to restore and protect coastal waters in conformance with guidance developed by EPA (USEPA, 1991c). "Management measures" are defined under CZARA as economically achievable measures to control the addition of pollutants to coastal waters, which reflect the greatest degree of pollutant reduction achievable through the application of the best available nonpoint pollution control practices, technologies, processes, siting criteria, operating methods, or other alternatives. CZARA management measures include a mix of non-structural and structural control practices in order to optimize costs and pollutant removal effectiveness over a range of land uses and activities.

For the example presented in Figure 3, two cities in close proximity (Washington, DC and Baltimore, MD) and the urbanized counties which surround these cities are addressed by the Phase I NPDES program. **However, incorporated towns or cities with populations less than 100,000 within the NPDES counties are exempt from the NPDES program,** such as the city of Annapolis, MD, as well as 43 other incorporated towns in Anne Arundel, Prince Georges, and Montgomery Counties (MD). Since Maryland is an approved

astal zone State[a], the areas within the coastal zone that are exempt from NPDES requirements will be included in the State's approved Coastal Nonpoint Pollution Control Program under CZARA. Counties and municipalities landward of the coastal zone with populations less than 100,000 are currently not addressed by either the Phase I NPDES or CZARA programs and fall under the jurisdiction of other nonpoint source management programs including Section 319 of the Clean Water Act and US Department of Agriculture conservation programs.

[a] *There are 29 federally approved State and Territorial coastal zone programs, including states bordering the Great Lakes (e.g., Wisconsin). The definition of the approved coastal zone boundary varies substantially by State.*

.ormwater and the Urban- ation Process

As pointed out by Novotny (1992), the extent and nature of **stormwater pollution is characterized not only by meteorologic conditions, type of land surface, and its inherent difficulty to measure or quantify, but perhaps most importantly by its relationship to the level and type of activity, or disturbance, occurring on the land surface in question.**

In the EPA Nationwide Urban Runoff Program (NURP), significant differences in measured pollutant concentrations, reported as event mean concentrations (EMCs), were not detected among the three major urban land use categories (i.e., residential, commercial, and mixed ban). Only open/non-urban lands e significantly different from the previous three land use types (USEPA, 1983b). The NURP data point out the existence of high variability in urban stormwater runoff quality and the need to characterize urban runoff for individual urban areas when conducting site-specific designs for stormwater controls. Data on pollutant loadings given in Table 1 also demonstrate the wide variations in loads associated with traditional land use categories.

In contrast to land use, land disturbance through urbanization, (i.e., cor :truction, deforestation, wetland drainage, channelization) is perhaps more directly correlated to the level of pollutant loadings and impacts caused by stormwater runoff. **Urbanization alters the natural vegetation and natural infiltration characteristics of the watershed, causing runoff from an urban area to have a much higher surface flow, a much smaller interflow, and a somewhat reduced baseflow (see Figure 4).** Urbanization also can create water quality impacts by increasing the amount of sediment, nutrients, metals, and other pollutants associated with land disturbance and alteration activities, as well as with the permanent increase in the impervious urban surfaces created . Thus urbanization tends to increase both runoff volumes and pollutant loadings to the receiving waterbody.

Effects of Urbanization-Developing Areas. The change of land use from natural or agricultural to

Phases of Urbanization

Suburban/Urban Area Development -
Land conversion through deforestation and drainage/filling creates extensive erosion and changes the hydrologic balance of the watershed. Soil loss from uncontrolled construction can reach a magnitude of over 100 ton/ha.yr. Shifts from the natural watershed flow and stream channel conditions greatly reduce the habitat value of the stream.

Suburban/Urban Areas - Post Development-
Once stabilized, pollutants accumulate on impervious surfaces and are washed off. Primary pollutant sources are atmospheric deposition, urban surfaces (roofs, autos on streets), and miscellaneous activities (animals, litter, spills, fertilizer application, street salting, septic system failures, etc.). Loading rates of pollutants are generally correlated with degree of imperviousness, land area size, and type of drainage system.

Fully Developed (Core)Urban Areas -
Sewered watersheds are characterized by extensive impervious areas, large runoff volumes during storms, and increased loadings of pollutants from similar sources (see above). Older urban areas commonly are served by combined sewers which often overflow during wet weather releasing pathogens and industrial toxicants. Increased industrial and commercial activities (land disposal, storage piles, vehicle maintenance, spills, etc.) create opportunities for release of toxic substances into separate and combined sewer systems.

urban occurs in several steps (see inset previous page) that range from developing suburban/urban areas to fully developed cities serviced by extensive sewer networks and transportation corridors.

During the construction phase of suburban/urban land development, the hydrology of a stream changes in response to initial site clearing and grading. Trees that had interrupted rainfall are felled (see Figure 4a). Natural depressions that temporarily ponded water are graded to a uniform slope. The thick humus layer of the forest floor that had absorbed rainfall is scraped off or eroded away. **Having lost much of its natural storage capacity, the cleared and graded construction site can no longer prevent rainfall from being rapidly converted to runoff** (Schueler, 1987).

Pollutant export increases dramatically both during and after development. **Unless adequate erosion controls are installed and maintained at the site, enormous quantities of sediment are delivered to the stream channel, along with attached soil nutrients and organic matter.** Uncontrolled construction site sediment loads have been reported to be on the order of 35 to 45 tons/acre/year (Novotny and Chesters, 1981; Wolman and Schick, 1967; Yorke and Herb, 1976, 1978).

After construction is completed, roof tops, roads, parking lots, sidewalks, and driveways make much of the site impervious to rainfall. Unable to percolate through the soil, rainfall is converted to runoff. The excess runoff becomes too great for the existing drainage system to handle. As a result, the drainage network must be improved to direct and convey the runoff away from the site (Schueler, 1987). **Downstream of the land development activity, impacts in the form of streambank erosion, channelization, and elimination/alteration of habitat occur due to increases in streamflow volumes, flooding frequency, peak flows, and movement of sediment.** The effect of development on stream hydrology in a typical, moderately developed watershed is shown in Figure 4b,c and summarized in the inset (next page) by Scheuler (1987).

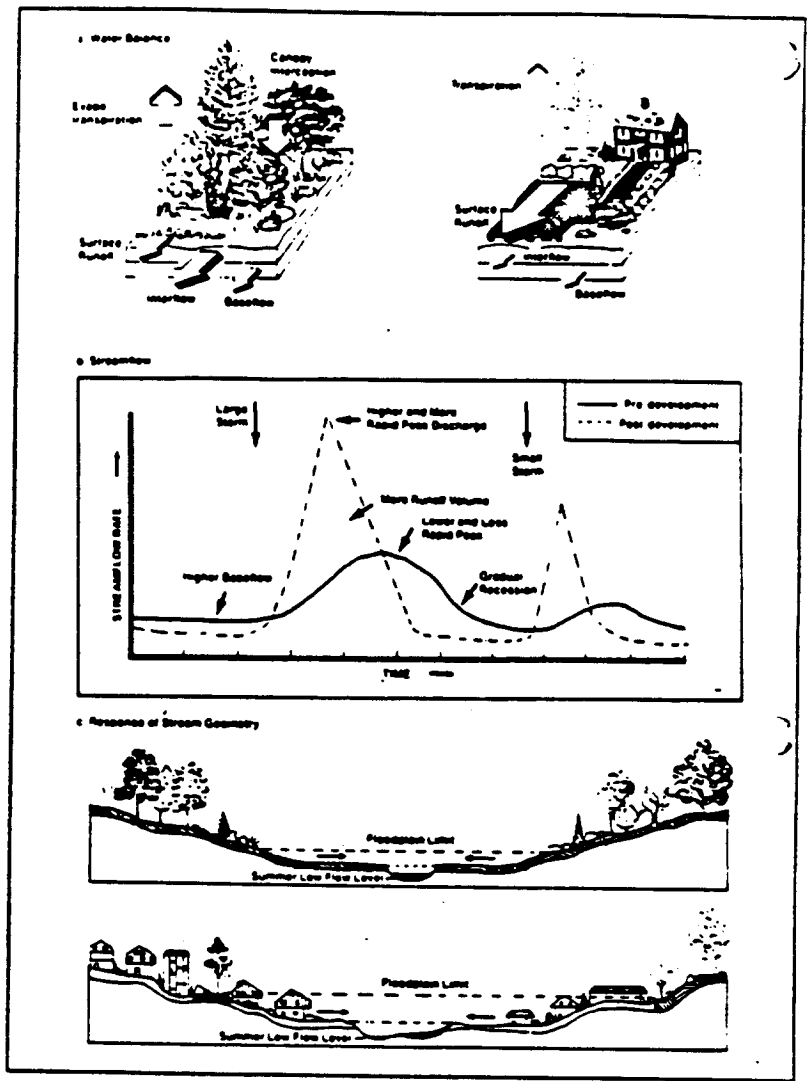

Figure 4. Changes in Watershed Hydrology as a Result of Urbanization (Schueler, 1987)

Construction activities are tempo rary, but the permanent chan

Changes in Stream Hydrology from Urbanization[a]

- Increased peak discharges compared to predevelopment levels (Leopold, 1968; Anderson, 1970);
- Increased volume of storm runoff produced by each storm in comparison to predevelopment conditions;
- Decreased time needed for runoff to reach the stream (Leopold, 1968), particularly if extensive drainage improvements are made;
- Increased frequency and severity of flooding;
- Reduced streamflow during prolonged periods of dry weather due to the reduced level of infiltration in the watershed; and
- Greater runoff velocity during storms, due to the combined effect of higher peak discharges, rapid time of concentration and the smoother hydraulic surfaces that occur as a result of development.

in land use and the hydraulic and pollutant characteristics associated with the transformed urban landscape produce lasting effects. Most of these impacts are caused by the net increase in impervious surfaces. In developed suburban/urban areas, pollutants accumulate rapidly on impervious surfaces and are easily washed off. Measured rates of atmospheric deposition of pollutants in the Washington D.C. area are summarized in Table 5. Halverson et al. (1984) reported that the contribution of precipitation to runoff pollution from paved surfaces was 100% for ammonia and nitrate nitrogen. They also reported values of 28 percent for sulfate and 13 percent for phosphorus. They suggested that nitrogen, sulfate and phosphorus should be considered when assessing urban runoff quality. **The type of surfaces in the urban landscape are also an important source of pollutants in runoff.** Trace metals, for example, are a common component of surfaces such as roofing materials, downspouts, galvanized pipes, metal plating, paints, wood preservatives, catalytic converters, brake linings, and tires. Over time, these surfaces corrode, decay, or leach out, releasing metals into the runoff (Scheuler, 1987). **Other sources of pollutants that accumulate and subsequently wash off impervious surfaces include pet droppings, lawn fertilizer and pesticides, organic matter, litter, used motor oil, and road salt (see Table 6).**

Gwinnett County, Georgia, An Urban Fringe Area. Stormwater runoff characteristics also vary with the age of the development and the rate at which natural and agricultural lands are converted to urban areas. This rate of change depends on the land location and its proximity to other urban areas and core cities. **Urban fringe areas are experiencing the largest land use changes due to rapid growth in population resulting in an excessive net increase in pollution loadings. Many of these fringe areas are not currently covered under the Phase I NPDES stormwater program.** A typical rapidly growing fringe area not initially regulated under the NPDES program, Gwinnett County, GA

Table 6. Sources of Urban Runoff Pollutants

Source	Pollutant of Concern
Erosion	Sediment and attached soil nutrients, organic matter, and other adsorbed pollutants
Atmospheric Deposition	Hydrocarbons emitted from automobiles, dust, aromatic hydrocarbons, metals, and other chemicals released from industrial and commercial activities.
Construction Materials	Metals from flashing and shingles, gutters and downspouts, galvanized pipes and metal plating, paint, and wood preservatives.
Manufactured Products	Heavy metals; halogenated aliphatics; phthalate esthers; PAHs; other volatiles; phenols and oil from automobile-use, zinc and cadmium from tire wear, and pesticides and phenols from other uses including industrial.
Landscape Maintenance	Fertilizer and pesticides. Generally as impervious area increases, nutrients build up on surfaces and runoff transport capacities also rise resulting in high loads. Exceptions include intensively landscaped areas (e.g., golf courses, cemeteries).
Plants and Animals	Plant debris, animal excrement.
Septic Tanks	Coliform bacteria, nitrogen/NO_3
Non-stormwater Connections	Inadvertent or deliberate discharges of sanitary sewage and industrial wastewater to storm drainage systems, including illicit connections, leaking sanitary collection systems, spills, industrial and commercial activities, construction activities, infiltration of contaminated groundwater, and improper disposal.
Accidental Spills	Pollutants of concern depend on the nature of the spill.

[a] *Based in part on Woodward-Clyde Consultants, 1990.*

(see Figure 5) has experienced an increase in population from abo 72,000 to 275,000 during the 1975 to 1986 period, and significant conversion of forest and agricultural lands to urban areas. Urban areas increased from about 50,000 acres in 1975 to over 100,000 acres in 1990 (Atlanta Regional Commission land use database - unpublished). This urban fringe growth rate, although high, was not significantly different from that of all urban areas in the entire country during this same time period, according to Bureau of Census data (USDA, 1992). Based on analysis of Census data, the projected population of Gwinnett County is expected to exceed 700,000 by year 2012 (also county estimate). Consequently, the corresponding increase in urban areas may be expected to exceed 170,000 acres or about 300% of the 1975 values

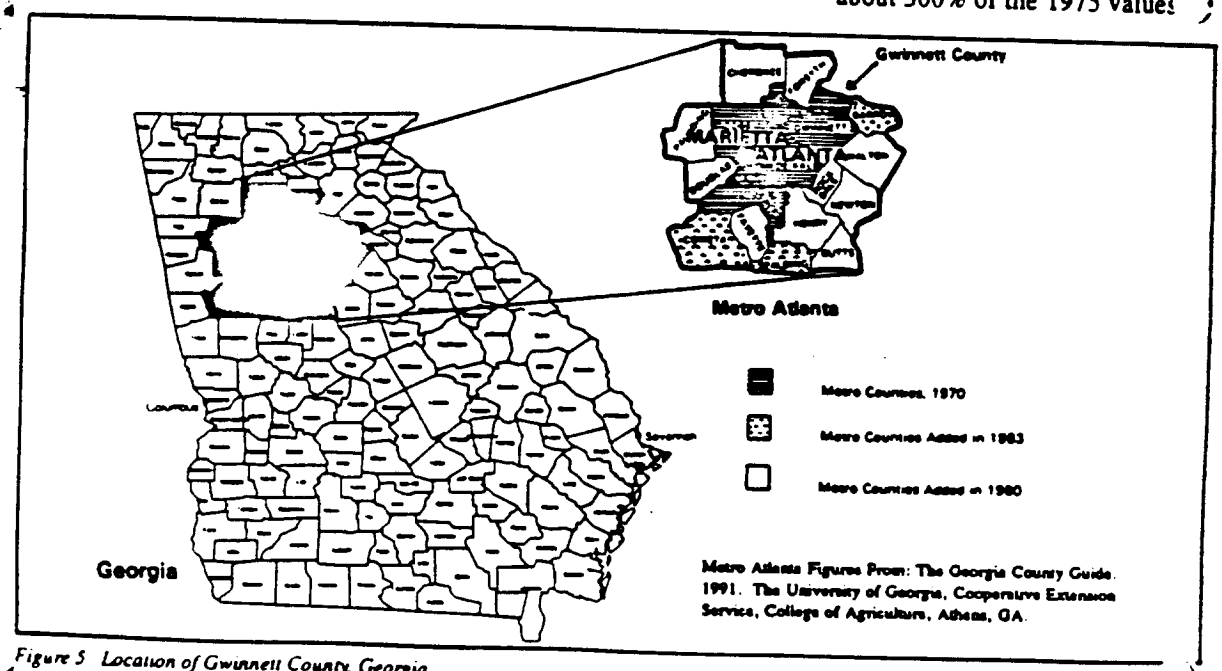

Figure 5 Location of Gwinnett County, Georgia

illustrates the observed (1[illegible] and expected (1985-20[illegible] of change in land use distribution as the population increases.

In the absence of a comprehensive urban planning program addressing stormwater runoff in particular, such rapid land conversion and associated land disturbances due to construction activities will yield high sediment and pollutant loadings. Furthermore, the permanent change in land use activities will result in dramatic changes in hydrologic and pollutant characteristics. Current NPDES regulations address construction activities (>5 acres) but do not address the longer term cumulative effects of urbanization.

The long-term rates of change of nutrient loadings in Gwinnett county were roughly estimated using a generalized loading function model and existing information from the Census and National Resource Inventory files. Nutrient load estimates were derived for the years 1975, 1980, and 1985 based on existing land use and population data, and for the year 2012 based on projected land use distribution (Figure 6b). Projected population and land use distributions for 2012 were estimated based on the mean annual rate of change during the 1975-1985 period. Temporary sediment and nutrient loadings due to construction activities were not considered in these estimates. Currently, construction activities are regulated under Federal or State approved NPDES programs. The 2012 nutrient loading projections indicate a relative increase in nitro-

gen of about 154% and phosphorous of about 79% above the 1975 levels.

The importance of addressing stormwater runoff in the early stages of urban land development is illustrated by the temporal increase in nitrogen load from urban areas under three control scenarios: no control, control beginning in 1975, and control beginning in 1992 (Figure 6c). The nitrogen loadings under the no control condition were derived based on urban development trends in Gwinnett county. The control conditions for each of the treatment scenarios consisted of a 50% reduction goal in nitrogen loading from all new development and 10 to 25% reduction goals from existing and retrofit urban areas. The projection of annual nitrogen loads to year 2012, for controls beginning in 1975 and controls beginning in 1992, shows an overall annual reduction of 734 and 420 tons of nitrogen respectively, corresponding to 45% and 25% of the projected value for the uncontrolled condition. A comparison of the two control programs shows that **if implementation of stormwater controls is delayed, achieving lower levels of nitrogen loadings may require implementation of a retrofit program with limited control options consisting primarily of costly structural practices.**

As discussed earlier, the recent and projected rapid growth rate of the urban fringe area of Gwinnett County is expected to parallel a similar rapid growth rate of urban fringe areas nationwide. **A basic principle of stormwater controls for urban development is that it is much more cost effective and institutionally feasible to develop controls for new development than it is to retrofit old development.** At the time the 319 status on water quality impairment was last reported (1991), stormwater runoff from urban and land development activities representing only about 2% of the Nation's land surface was responsible for 18% to 62% of the reported impairment to surface water bodies (see Table 3). The growth rate of urban land areas for the last 4 decades (based on Bureau of Census data) has been about 20% per decade creating the potential for rapidly increasing impacts if stormwater discharges from new urban fringe growth is not adequately managed.

Fully Developed Core Urban Areas. In fully developed urban areas, the amount of impervious land is extensive, providing further opportunity for pollutants to wash off urban surfaces in even larger amounts. Original stormwater systems were typically constructed for flood control purposes. Water quality programs probably did not address stormwater quality concerns and runoff is typically directed to surface water. Older, more established urban areas are also characterized by greater commercial and industrial activities; the existence of leaks, cross connections and illicit discharges into sewer systems; and often the existence of combined sewer systems. These create opportunities for the release of toxic pollutants and large amounts of pathogens during wet weather overflows of the combined sewers.

Pollutant concentrations in urban runoff vary considerably, both during the course of a storm event and from event to event at a given site, from site to site within a given urban area, and from one urban area to another across the country. This variability is the result of variations in rainfall characteristics, differing watershed features that affect runoff quantity and quality, and variations in urban activities (Woodward-Clyde, 1990). Table 7 presents ranges of urban runoff pollutant concentrations based on re-

Table 8. Strength of Point and Nonpoint Urban Sources[a]

Wastewater type	BOD_5 mg/L	SS mg/L	Total N mg/L	Total P mg/L	Lead mg/L	Total coliforms MPN/100 mL

[a] *Source. Ellis (1986) as reported by Novotny (1992)*

the Nationwide Urban Runoff Program (NURP). Values represent the mean of event mean concentration (EMC) pollutant values for the median, 10th percentile, and 90th percentile sites in the NURP data. Although statistically significant differences in EMCs were not detected amount the three major urban land use categories (i.e., residential, commercial, and mixed urban), or among geographical locations or between runoff events (volumes), nevertheless these data are perhaps the best available for planning purposes in describing the general quality of urban runoff. The NURP data base does not, however, represent pollutant contributions from illicit connections, spills, industrial activities, or dumping, as these sources were not evaluated at the time NURP was conducted.

A comparison of the pollutant strength (i.e., concentrations) of typical point and nonpoint urban sources is presented in Table 8. **The pollution potential of urban runoff carried by separate storm sewers is similar to treated municipal wastewater, while that of combined sewer overflows (CSOs) is greater than treated and less than untreated municipal wastewater (Novotny, 1992). Although the pollution strength of CSOs is somewhat less than that of raw wastewater, an overflow from a large storm may shock the receiving waterbody many times greater than a normal effluent load.** Floatable debris in CSOs and separate storm sewers can further degrade receiving water. This debris represents both an aesthetic problem and a threat to aquatic life.

Impacts on Aquatic Ecosystems. The aquatic ecosystems in urban headwater streams (i.e., streams whose upper reaches lie within urbanizing areas) are particularly susceptible to the impacts of urbanization (Scheuler, 1987). The massive shift from natural flow and channel conditions reduce the habitat value of the stream. As reported by Scheuler (1987), studies of fish diversity and abundance over time in urbanizing streams [Dietemann (1975), Ragan and Dietemann (1976), Klein (1979) and MWCOG (1982)] have shown that fish communities become less diverse and are composed of more tolerant species after the surrounding watershed is developed. Sensitive fish species either disappear or occur **rarely. The total number of fish in urbanizing streams also usually declines.**

Similar trends have been noted among aquatic insects which are a major food resource for some species of fish (Schueler, 1987). These species cling to rocks (or other aquatic substrates) and rely on the passing flow of leaf litter and organic matter for sustenance. Higher post-development sediment and trace metals can interfere in their efforts to gather food. Changes in water temperature, oxygen levels, and substrate composition can further reduce the species diversity and abundance of the aquatic insect community.

No single factor is responsible for the progressive degradation of urban stream ecosystems. Rather, it is probably the cumulative impacts of many individual factors such as sedimentation, scouring, increased flooding, lower summer flows, higher water temperatures, and increased pollutants. A more detailed discussion of the impacts of urban stormwater pollution on receiving waters is presented in the next chapter of this booklet.

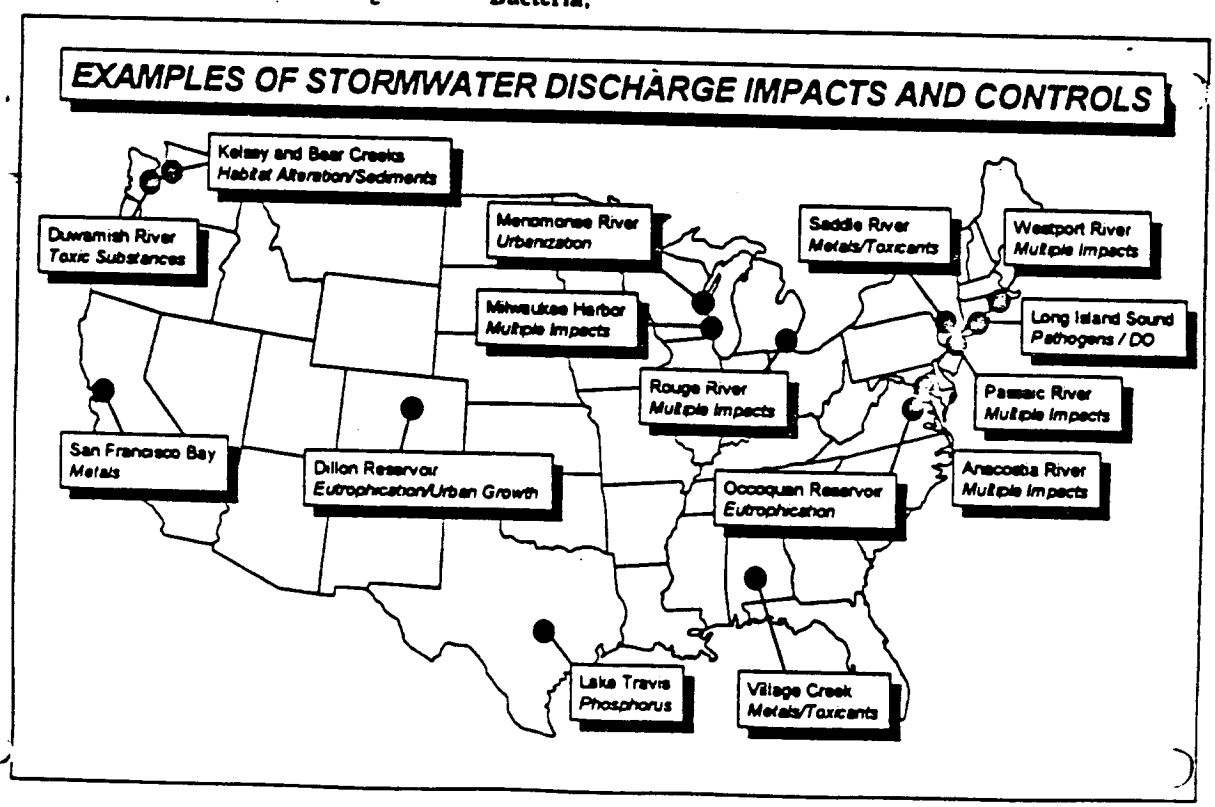
POLLUTANTS IN STORMWATER AND EXAMPLES OF ASSOCIATED IMPACTS

The net effect of urbanization is to increase pollutant export by several orders of magnitude over pre-development levels. The impact of the higher export is felt not only on adjacent streams, but also on downstream receiving waters such as lakes, rivers, and estuaries. The nature of the impacts associated with specific urban stormwater pollutants are reviewed in this chapter. Examples of documented impacts covering the range of pollutants and source types are also presented. The land activities that are likely to result in the most severe receiving water impacts are also identified (after Scheuler, 1987). The following principal types of pollutants found in urban runoff are addressed:

- **Sediment/habitat alteration;**
- **Oxygen-demanding substances** (organic matter);
- **Nutrients**
  - phosphorus
  - nitrogen;
- **Toxic substances**
  - heavy metals
  - oil and grease
  - others;
- **Bacteria;**
- **Floatables;** and

the multiple impacts of several of these pollutants acting in concert.

The locations of the fifteen case examples of documented receiving water impacts caused by stormwater pollution are shown on the map below. Examples which address stormwater control practices are also presented in the last chapter of this booklet.



Sediment/Habitat Alteration

High concentrations of suspended sediment in streams can cause multiple impacts including increased turbidity, reduced light penetration, reduced prey capture for sight feeding predators, clogging of gills/filters of fish and aquatic invertebrates, reduced spawning and juvenile fish survival, and reduced angling success. Additional impacts result after sediment is deposited in slower moving receiving waters, such as smothering of the benthic community, changes in the composition of the bottom substrate, more rapid filling of small impoundments which create the need for costly dredging, and reduction in aesthetic values. Sediment having a high organic or clay content is also an efficient carrier of toxicants and trace metals. Once deposited, pollutants in these enriched sediments can be remobilized under suitable environmental conditions to pose an additional risk to benthic and other aquatic life. A study of Kelsey Creek in Seattle, WA, revealed the impacts of stormwater flows and sedimentation on fish populations (Kelsey and Bear Creeks).

The greatest sediment loads are exported during the construction phase of any development activity. Furthermore, in intensively developed watersheds, increased streamflow can result in channel degradation requiring streambank erosion controls.

Kelsey and Bear Creeks, Seattle, Washington (Habitat Alteration/Sediments)

A comparison of urban Kelsey Creek to rural Bear Creek near Bellevue, Washington (Pitt and Bissonette, 1984); indicated significant interrelationships among the physical, biological, and chemical characteristics. The urban creek, although not grossly polluted, contained a limited and unhealthy salmon fishery where many fish suffered from respiratory anomalies. The most significant impact resulting from the urban area is high flood flows which alter the stream channel, and carry priority pollutants, organics and metals through the stream system. Low dissolved oxygen in the stream bed results in low embryo survival rates.

Monitoring conducted by the City of Bellevue, the U.S. Geological Survey, and the Municipality of Metropolitan Seattle revealed that concentrations of metal and organic priority pollutants are higher near the source areas than in the stream itself. Heavy metals were observed to originate primarily from street dirt.

Evaluations of control practices indicated that detention basins in a residential area did not significantly improve runoff quality although peak flows were reduced by approximately 60%. A specialized street sweeper was needed to obtain effective removal of small dirt normally washed off by rain as regular street cleaning removed only a maximum of 10% of pollutants. Bi-yearly catchbasin cleaning resulted in a maximum effectiveness of 25%.

Urbanization has led to rapid stormwater conveyance to streams. However, these increased flows result in the transport of metals and toxic pollutants through the stream system with little deposition in the stream bed. If the flows are reduced, increased amounts of toxic materials are expected to settle in the stream bed with increased negative effects on aquatic life. However, reducing the flows would allow the retainment of many smaller fish and organisms which are currently washed from the system. The monitoring and stormwater control management of Kelsey Creek demonstrates the importance of balancing the benefits obtainable from reduced flows with the potential impacts resulting from increased deposition of toxic pollutants and organics.

Oxygen Demanding Substances

Decomposition of organic matter by microorganisms depletes dissolved oxygen (DO) levels in receiving waters, especially slower moving streams and lakes and estuaries. There are several measures of the degree of potential DO depletion, the most common of which are the Biochemical Oxygen Demand (BOD) test and the Chemical Oxygen Demand (COD) test. Both of these tests have problems associated with their use in urban runoff, but it has been demonstrated (e.g., Rouge River, Western Long Island Sound—see insets) that urban run-

off can severely depress DO levels after large storms, and that BOD solids can accumulate in bottom sediment causing impacts during periods of dry weather. BOD levels can exceed 10 to 20 mg/l during storm events which can lead to anoxic conditions (zero oxygen) in shallow, slow-moving or poorly-flushed receiving waters. The problem is particularly acute in some older urban areas, where storm runoff BOD mixes with overflows from combined or sanitary sewers.

The greatest export of BOD typically occurs from older highly impervious, highly populated urban areas with outdated combined storm sewers. In contrast, only moderate BOD export has been reported from newer, low density suburban residential development. A study of the Rouge River, Michigan, included an examination of BOD loadings from a highly developed basin, and is presented at right (Rouge River).

Rouge River, Michigan
(Multiple Impacts)

The Rouge Basin, located in Southeast Michigan in the Detroit metropolitan area, is a fan shaped basin with four river branches draining 438 square miles. In addition to the four major river branches, the Basin's surface water system includes numerous tributary streams and over 400 lakes and ponds. The Basin contains all or part of 48 municipalities with a population of 1.5 million people. More than 50 percent of the land in the Basin is developed for residential, commercial or industrial uses with portions intensely urbanized (Newport and Davenport, 1988). The City of Detroit and the older cities adjacent to Detroit have combined sewers. Though the Rouge has been designated as a warm water fishery and suitable for recreational and agricultural use, applicable water quality standards, including dissolved oxyten, are not being met. The Rouge has been designated as an Area of Concern by the International Commission overseeing the Great Lakes, as it contributes some of the greatest pollutant loadings to the Great Lakes. Annual stormwater loadings in 1985 to the Rouge Basin were estimated to be 6,360,000 lb/yr BOD_5 (45% of the total BOD_5 load), 154,000,000 lbs/yr TSS (88% of the total TSS load), and 1,110,000 lb/yr nitrogen (about twice the nitrogen load from CSOs). CSOs contribute 5,489,000 lbs/yr BOD_5 (40%) of the total load), 13,100,000 lbs/yr suspended solids (8%) and 567,000 lbs/yr nitrogen. Loadings are impairing the uses of the Basin.

In July 1985, the Michigan Water Resources Commission passed a resolution requesting the department of Natural Resources to develop a Remedial Action Plan (RAP) addressing the water quality in the Rouge Basin. Of particular concern were the adverse impacts from CSOs, illicit connections to storm drains and storm water runoff. The RAP, published in 1989, recommends a 20 year program of nearly $1 billion to eliminate CSOs, improve separate sanitary sewers, upgrade treatment facilities and fund local stormwater programs.

Nutrients

The levels of phosphorus and nitrogen in urban runoff can lead to accelerated eutrophication in downstream receiving waters. Generally, phosphorus is the controlling nutrient in freshwater systems. The greatest risk of eutrophication is in urban lakes and impoundments with long detention times (two weeks or greater). Surface algal scums, water discoloration, strong odors, depressed oxygen levels (as the bloom decomposes), release of toxins, and reduced palatability to aquatic consumers are among the problems encountered. High nutrient levels can also promote the growth of dense mats of green algae that attach to rocks and cobbles in shallow, unshaded headwater streams. High nutrient loads from urban runoff, in combination with other sources, can contribute to eutrophication in both fresh and tidal waters.

As a general rule of thumb, as impervious area increases, nutrients build-up on surfaces and runoff transport capacities rise as well, leading to high pollution loads. Exceptions include land under development, and land activities that receive unusually high fertilizer inputs, such as golf courses, cemeteries, and other intensively landscaped areas.

Examples of eutrophication caused by nonpoint sources of nutrients include the Dillon Reservoir in Colorado and the Occoquan Reservoir

(/irginia. These are discussed in the following chapter on control practices.

Toxic Substances

Toxic substances are all defined as materials capable of producing an adverse response or effect in a biological system. A large number of potentially toxic compounds are routinely detected in urban stormwater. These include trace metals (lead, zinc, copper, and cadmium) pesticides and herbicides, hydrocarbons (derived from oil and grease, and gasoline runoff). These toxic chemicals tend to accumulate in benthic sediments of urban streams, lakes, and estuaries. Both the San Francisco Bay, and the Duwamish River, Washington have received significant loadings of (ic substances and heavy metals from stormwater runoff, and are presented at right (San Francisco Bay, Duwamish River).

Heavy Metals - Heavy metals are of concern because of their toxic effects on aquatic life and their potential to contaminate drinking water supplies. The heavy metals having the highest concentrations in urban runoff are copper, lead, and zinc with cadmium a distant fourth. However, when inappropriate connections between sanitary and storm sewers are present, other heavy metals such as arsenic, beryllium, chromium, mercury, nickel, selenium, and thallium can be found. A large fraction of the heavy metals in urban runoff are adsorbed to particulates and thus are not readily available for biological ake and subsequent bioaccumulation. Also, the typical periods of exposure are those of urban runoff

San Francisco Bay (Metals)

Southern San Francisco Bay is a highly urbanized estuary in the Santa Clara watershed which encompasses the Silicon Valley (Mulmey, 1988). The Bay is a major navigable waterway for the U.S. Navy and commerce, a valuable fishery for salmon and herring and a recreational resource. Despite significant advances on controlling municipal and industrial point source pollution over the last two decades, water quality impairment due to toxic pollution from urban runoff continues in the southern bay segment. The California Regional Water Quality Control Board adopted water quality standards for copper, lead, nickel and zinc to protect the beneficial uses of the Bay and , with local municipalities, developed a water-quality/technology based program for reducing urban runoff pollutants. Sources of pollution include urban runoff, illicit connections, illegal dumping and construction/development sites.

Duwamish River, Washington (Toxic Substances)

The Duwamish River is vital to Washington State's commerce as a primary navigational route, a major contributor to the State's salmon and steelhead trout industry and a recreational resource (USEPA, 1990). The lower six miles of the river flow through a heavily industrialized area of Seattle including airplane factories, shipyards, metal scrap yards, oil tank farms and port facilities. Though water quality improvements were observed through control of point sources, metals and organic toxicants from industrial and urban nonpoint sources continued to degrade water quality in the river. In the early 1980's copper concentrations in the river water exceeded the USEPA's acute freshwater criterion (18 ug/l), and lead concentrations exceeded the EPA chronic freshwater criterion (3.2 ug/l). The highest concentrations of metals (lead, copper, zinc, mercury and cadmium) were found unevenly distributed in the sediments of the river, suggesting that contaminants came from localized sources (such as storm drains) where zinc concentrations were as high as 3,000 ppm and lead as high as 18,000 ppm. Sediments inside a storm drain near a lead smelter were found to contain 350,000 ppm (or 35%) lead. These sediments were removed and handled as hazardous waste. Sources of pollutants along the river included illegal dumping in storm drains, mismanagement of industrial chemicals and wastes, industrial activities, and storm drain sediments. Storm drain sediments contained significant concentrations of copper, lead, arsenic, zinc, mercury, PCBs and cadmium from historic activities.

The Municipality of Metropolitan Seattle (Metro) received a Clean Water Act Section 205 grant for sampling storm drain sediments to track pollutants and locate sources. Eventually, the sediments themselves were considered a significant source. Removal of sediments from storm drain systems and reductions in contaminant inputs from industrial facilities eliminated major sources of contamination to the Duwam sh River. In 1989, sediments in a storm drain line near a lead smelter contained 85 to 97 percent less lead than 1984 levels. Remedial actions at smelter and electric transformer recycling facilities resulted in reduced PCB, copper and lead concentrations in the stormwater. Reduced activity at shipyards (due to economic factors) and implementation of voluntary and mandatory BMPs in salvage yards reduced zinc loadings by 90 percent from 194 lb/day to 15 lb/day.

events (typically under 8 hours), which are much shorter than the exposure periods used in bioassay tests (typically 24 to 96 hours for toxicity testing). Nonetheless, it is likely that the heavy metals in urban runoff are toxic to aquatic life in certain situations, particularly for the more soluble metals such as copper and zinc. Additionally, resuspension of bottom deposits from high flow events may impact on downstream benthic invertebrates. Compared to risks to aquatic life, human health risks appear to be more remote.

Oil and Grease - Oil and grease contain a wide variety of hydrocarbon compounds, some of which (e.g., polynuclear aromatic hydrocarbons) are known to be toxic to aquatic life at low concentrations. Hydrocarbons are often initially found as a rainbow colored film or sheen on the water's surface. Other hydrocarbons, especially weathered crankcase oil, appear in solution or in emulsion and have no sheen. However, hydrocarbons have a strong affinity for sediment, and much of the hydrocarbon load eventually adsorbs to particles and settles out. Hydrocarbons tend to accumulate rapidly in the bottom sediments of lakes and estuaries, where they may persist for long periods of time and exert adverse impacts on benthic organisms. The precise impacts of hydrocarbons on the aquatic environment are not well understood. Bioassay data which do exist are largely confined to laboratory exposure tests for specific hydrocarbon compounds. Remarkably few toxicity tests have been performed to examine the effect of urban runoff hydrocarbon loads on aquatic communities under the typical exposure conditions found in urban streams.

Other Pollutants - Other toxic compounds that have been detected in urban runoff include pesticides, herbicides, and synthetic organic compounds. Concentrations of these toxic substances in runoff from residential and commercial areas rarely exceed current water quality criteria. However, it should be noted that there has been relatively little sampling of runoff reported from industrial areas, where toxic compounds might be expected to be more prevalent (e.g., Duwamish River).

Examples of Impacts from Toxic Substances. In-stream monitoring of Village Creek in Birmingham, Alabama (Water Quality Engineers, 1981—not an inset) provides a classic example of stream degradation due to intense urban development. At the stream's origin at Roebuck Springs, the creek had excellent physical and chemical characteristics, supporting watercress and other vegetation. By the time the stream passed through the city, it turned grey-green and had an oily sheen and contained significant debris. Further downstream at the western limits of Birmingham, the creek was dark green, had a putrid odor and contained considerable oil and grease. At this point the creek was often anaerobic and contained no fish or other biological life. This study found that, on an annual basis, more than 90 percent of the copper loadings, more than 75 percent of the chromium and zinc loadings, and about 40 percent of the lead loadings originated from urban runoff.

A study (Dong et al., 1979, and Southeastern Wisconsin Plannin Commission, 1976—not an inset) of the Menomonee River near Milwaukee, Wisconsin indicated that the upper, more rural reaches of the river had an average of 40 times more fish than the lower, urbanized reach. The urban segments of the river supported a significantly reduced and scattered fish population and some segments were virtually devoid of even highly pollution tolerant species. These conditions are the combined result of higher concentrations of toxic pollutants and poorer habitat conditions resulting from increased flow velocities and channelization. Further, the watershed benthic community is in poor condition in the urban area. The Menomonee study concluded that a relatively small degree of urbanization, less than 20 percent, was sufficient to cause significant receivir water degradation.

Studies at other locations have produced results similar to those cited above. Interestingly, toxic pollutants or long-term oxygen depletion has been found to cause more serious receiving water problems than short-term, event-related oxygen depletion or other concentration excursions. The long-term affects due to accumulation of toxic compounds in sediments and their subsequent movement through the food chain is especially pronounced in urban receiving waters. Studies on the Saddle River near Lodi, New Jersey (Wilbur and Hunter, 1980) found significant enrichment of heavy metals (two to seven times) in lower Saddle River sediments (affected by urbanization) as compared to upper rural reaches (see also Saddle River case

(udy at right) Similar results were found in a stream near Champaign-Urbana, Illinois (Rolfe and Reinhold, 1977—not an inset), where the upper two inches of sediment in an urban stream reach had much higher lead concentrations (almost 400 ug/g) than sediments in the rural stream reaches. Species diversity of plants and animals were found to be lower in urban streams as compared to streams in rural areas. This impact is likely to be influenced by habitat and temperature changes, as well as pollutant levels.

Bacteria

Bacterial levels in undiluted urban runoff usually will exceed federal public health standards for water contact recreation and shellfish harvesting. Because bacteria multiply faster during warm weather, it is not uncommon to find a twenty-fold difference in bacterial levels between summer and winter. The substantial seasonal differences often found do not correspond with comparable variations in urban activities. This suggests that in addition to temperature effects, many sources of coliform unrelated to those traditionally associated with human health risk (e.g., animal excrement, illicit connections, leaking sanitary collection systems), may be significant. Thus, despite the high numbers of coliforms found in urban runoff, in the absence of contamination from sanitary sewage, the health implications are unclear. The current literature suggests that fecal coliform may not be consistently reliable in identifying human health risks from urban runoff pollution (Moffa, 1990). The impact of bacterial pollution in coastal waters is illustrated in the Western Long Island Sound and Westport River, Massachusetts case studies (see insets next page).

Saddle River, New Jersey
(Metals/Toxicants)

Saddle River drains an area of 59 mi^2 extending from the headwaters in Southern Rockland County, NY to Garfield, NJ where it intercepts the Passaic River. The study was centered around the lower reaches of the Saddle River and encompasses the borough of Lodi, NJ. The area is heavily urbanized with 60% of the area as single-family housing, 6% multi-family residential, 11 % industrial, 12% commercial, 10 % open and 2 % public and municipal (Wilber and Hunter, 1980). Because municipal and industrial wastewater is dispatched to Passaic Valley Sewerage Authority via trunk sewers, the only pollution from Lodi is from nonpoint sources. Eleven individual storm hydrographs were monitored at the storm sewer outfalls during the project period. Samples were collected manually at 5 to 10 minute intervals over the complete hydrograph. Water samples were analyzed for lead, zinc, copper, nickel, and chromium. The major contributors of heavy metals in stormwater were lead and zinc. They accounted for 89% of the total metals observed. Copper, nickel and chromium were usually found in smaller quantities.

Rainfall as a source of metals to the Saddle River was investigated by collection of rainwater samples by local residents. The concentration in precipitation was between 4 and 10 percent of the concentration in runoff. Peak concentrations of heavy metals in runoff were observed within the first half hour after the initiation of runoff, thus giving a first flush effect. In general, metal loadings were correlated with increased percentages of commercial and industrial land-use. An average of 66 percent of the total solids for the three storms studied were removed after four hours of settling. The majority of the lead and zinc were found in the non-settleable solids fractions. Copper was found primarily in the soluble plus colloidal fractions.

Studies conducted by the National Oceanic and Atmospheric Administration (NOAA, 1988, 1989, and 1990) indicate that urban runoff is a major pollutant source which adversely affects shellfish growing waters. The NOAA studies identified urban runoff as affecting over 578,000 acres of shellfish growing waters on the East Coast (39 percent of harvest-limited area); 2,000,000 acres of shellfish growing waters in the Gulf of Mexico (59% of the harvest-limited area); and 130,000 acres of shellfish growing waters on the West Coast (52% of harvest-limited areas).

Although nearly every urban and suburban land use can export bacteria at levels which will violate health standards, older and more intensively developed urban areas typically produce the greatest export. The problem is especially significant in urban areas that experience combined or sanitary sewer overflows that export bacteria derived from human wastes.

Floatables

Floatable debris in stormwater runoff commonly includes plastic and paper products, garden refuse, tires, and metal and glass containers. These pollutants degrade the aesthetic quality of both receiving waters and river banks and shorelines. Vegetation and wildlife may also be impacted. In the tidal Anacostia River, Maryland, floating debris has impaired restoration efforts by hindering the establishment of emergent vegetation (USACOE, 1990). Fish and aquatic wildlife mortality may also be attributed to debris, due to either ingestion or entanglement in the slowly decomposing materials.

Western Long Island Sound (Pathogens/DO)

Long Island Sound is a major marine resource for the state of Connecticut as well as a source of recreation to more than ten million New Yorkers. Water quality of Western Long Island Sound has been degraded by both point and nonpoint discharges which have resulted in low DO concentrations, toxic contamination, and closure of beaches and commercial shellfish beds due to high fecal coliform concentrations. Combined sewer overflows and urban stormwater runoff are two significant pollution sources to Long Island Sound. It is estimated that up to 85% of the sewer lines in New York City are combined. Urban runoff is the largest identified nonpoint pollution source, based on the number of estuaries along the Connecticut shoreline impacted. Stormwater runoff pollution from New York City has been implicated in a New York Harbor Water Quality Survey because of the increase in coliforms and reduction in DO observed after rainstorms. Increases in coliform levels between 3 and 8 times were observed after rainfall events for Jamaica Bay, Upper Harlem River, Gowanns Canal, Hudson River, Lower East River, and Western Long Island Sound. These increases were due to urban stormwater runoff and CSOs (City of New York, 1987).

Westport River, Massachusetts (Multiple Impacts)

Analysis of pollution sources to Buzzards Bay is typified by loads to the Westport River and includes pollution from surface runoff, boat discharges, storm sewers, septic systems, feedlot and pasture runoff. Nonpoint source pollution has been implicated based on the high concentrations of coliform bacteria observed after rainfall events. Bacteria, nutrients, and solids contamination from nonpoint sources has impacted water quality of the East Branch of the Westport River (EBWR), one of the most productive shellfisheries on the south shore of Massachusetts. Violations of Class SA (for tidal, salt water suitable for primary contact recreation) water quality criteria for coliform bacteria have forced the closure of 960 acres of shellfish beds (over 75% of the shellfish producing area) in 1979, including soft-shell clams, quahog and oyster beds. Since between 1983 and 1985, 555 acres of the 960 acres permanently closed in 1979 have been reclassified to allow periodic harvesting. The area between Gunning Island and Cadman's Neck was closed for a minimum of eight days following a rainfall of one inch or more. These standards were not sufficient for the area north of Cadman's Neck (200 areas), which in 1985 showed bacterial levels in excess of the standard for at least 10 to 16 days after rainfall; this area remains permanently closed. It has been estimated that annual losses in commercial shellfishing exceed 1$ million not including losses to recreational diggers.

Westport is primarily a rural community that has experienced a population growth of 25% between 1970 and 1975. Most of the land in the drainage basin is undeveloped, consisting predominantly of forested land with smaller areas of wetlands and lakes. Agricultural land, primarily cropland with some pastureland, is the second largest land use within the region. Residential, commercial and industrial land comprise less than 10 percent of the total watershed. In the past 35 years, significant land use changes have occurred within the southeastern Massachusetts area. From 1951 to 1971, developed land within Westport increased by 96%, while open, forested, and agricultural land decreased by 19%. The conversion of undeveloped land continued with residential land use increasing by 1,500 acres and commercial land increasing by 110 acres between 1971 and 1981. Land use data developed by the Soil Conservation Service and the Environmental Protection Agency showed that between 1983 and 1988 combined residential and urban land use increased by 13%. Agricultural, forested, and open land use decreased by 8% during this same period (Metcalf & Eddy, 1989).

EXAMPLES OF SUCCESSFUL STORMWATER CONTROLS

In this last chapter we examine general stormwater control practices and present examples of successful stormwater programs implemented at various stages of urban development. **A basic principle of stormwater controls for urban development is that it is much more cost effective and institutionally feasible to develop controls for new development than it is to retrofit old development.** Structural practices for stormwater pollution control require not only capital but operation and maintenance costs, and are often constrained by spatial and financial limitations in core urban areas. In addition, some structural controls can destroy the resource it is designed to protect due to disruption of the hydrologic cycle. In contrast, non-structural practices may be included in the development process, for which municipalities usually have pre-existing permitting programs. Combining both types of controls into an integrated stormwater management program can result in effective water quality protection at minimal cost. Before presenting representative case studies, the practices for control of stormwater are first defined.

Examples of Non-Structural Stormwater Practices

- Zoning Ordinances
- Subdivision Regulations
- Capital Improvement Plans
- Site Plan Reviews
- Planned Unit Development Reviews
- Restrictive Covenants
- Environmental Impact Assessment/Statements
- Public Education Programs
- Growth Management
- Buffers and Setbacks
- Environmental Permitting
- Pollution Prevention for All Sources
- Spill Control Programs
- Road Maintenance Programs

Control Practices

Non-Structural Practices. Non-structural practices are those not requiring construction or maintenance. These differ from structural practices in that they are preventative in nature, and have the potential to be more cost effective especially if implemented early in the site planning stages. They include such practices as: regional comprehensive stormwater management programs; planning future development to minimize stormwater runoff; limiting the amount of impervious surface in new and retrofitted development; instituting fertilizer and pesticide management programs; requiring setbacks from surface water and wetlands to protect their environmental integrity; siting infrastructure so as not to encourage development in environmentally sensitive areas that are critical to maintaining water quality; requiring the use of best management practices through land development regulations and site plan approval; and inspecting stormwater management systems and erosion control structures to ensure they are functioning properly.

Examples of Structural Stormwater Practices

Developing Areas

- Extended Detention Ponds
- Stormwater Wetlands
- Multiple Pond Systems
- Infiltration Trenches
- Infiltration Basins
- Filter Strips

Core Urban Areas

- Illicit Connection Controls
- Porous Pavements
- Stormwater Detention/Wetland Retrofits
- Sand Filters

Non-structural practices for controlling stormwater pollution have typically centered around preventing land use disruptions on areas critical to maintaining water quality and reducing the source of pollution.

Structural Practices. Structural management practices are defined as those designed and constructed to mitigate the adverse impact of stormwater runoff. The selection and use of individual practices has typically been based on land use activities, existing structures, hydrology and climate, soil type and other site specific conditions.

In addition to installation costs, structural practices usually require continuing operation and maintenance efforts. Table 9 summarizes the site-specific and maintenance burdens of several selected structural practices.

The lack of adequate maintenance and upkeep may dramatically reduce their effectiveness in removing pollutants from stormwater runoff. For example, a sand filter system in Maryland that had not been maintained for several years appeared to be clogged with sediment and grease to the point that the operation of the system may have been impaired (Shaver, 1991).

Separate storm sewers may also receive materials other than stormwater (e.g., illicit connections from industrial and commercial facilities). Controlling these sources may involve structural practices such as conventional wastewater treatment units, or repairing/retrofitting connections to the storm sewer system.

Integrated Management Programs. The stormwater management practices presented above may be used in conjunction with one another, taking an integrated approach to minimizing stormwater impacts. Structural practices could be targeted at areas already built up, while developing areas utilize a more non-structural approach.

Strategies have been shown to be successful when targeted to land disturbance, not necessarily land use, and should reflect land use/activity changes. Guiding development to areas capable of sustaining growth without excessive impacts to the natural environment, and encouraging the implementation of stormwater practices as development proceeds, can minimize the need for future stormwater control efforts. Many local governments have adopted integrated stormwater management programs to regulate development activities within their jurisdictions. Several states, including Oregon, New Jersey, Delaware, and Florida, have adopted comprehensive plans involving guidance of future growth and avoidance of water quality and quantity impacts associated with uncontrolled development.

Land Disburbance/Activity

The extent of stormwater pollution problems is dependent upon the land disturbance/activity which in turn is a function of the stage of the urbanization process. The range of stormwater management options applied has been based to a certain extent on the stage of land development, each stage representing a unique set of challenges and opportunities. Three land development stages that have been addressed by states and municipalities while developing stormwater management programs are defined below. Within each of these stages a brief description of relevant case studies illustrating different stormwater control approaches is presented.

Undeveloped Areas. Undeveloped areas consist of relatively unurbanized land with low population densities. Although the land use is primarily rural, the proximity and location of these lands presents the potential for eventual development into urban and suburban settings. Stormwater runoff from these areas currently results primarily from agricultural, forestry, and resource extraction activitie

Table 9. Regional, Site Specific, and Maintenance Considerations for Structural Practices to Control Sediments in Stormwater Runoff

BMP Option	Size of Drainage Area	Site Requirement	Regional Restrictions	Maintenance Burdens	Longevity
Infiltration basins	moderate to large	deep permeable soils	arid and cold regions	high	low
Vegetated filter strips	small	low density areas with low slopes	arid and cold regions	low	low if poorly maintained
Filtration basins and sand filters	widely applicable	widely applicable	arid and cold regions	moderate	low to moderate
Extended detention ponds	moderate to large	deep soils	few restrictions	dry ponds have relatively high burdens	high
Wet ponds	moderate to large	deep soils	arid regions	low	high
Constructed stormwater wetlands	moderate to large	poorly drained soils, space may be limiting	arid regions	annual harvesting of vegetation	high

undeveloped areas stormwater management programs may be integrated with local planning and regulatory programs at an early stage of development. These management programs, relying primarily on nonstructural practices, have been aimed at minimizing future degradation of water quality.

Depending on the expected degree and rate of development, integrated management programs have been tailored to address pollution generating activities associated with the various phases of urbanization. Many local governments, aware of the consequences of uncontrolled urbanization, have adopted planning programs in which stormwater pollution considerations were major decision criteria. Two case studies in which stormwater pollution control practices were addressed at an early phase of development are presented. These case studies are the Occoquan Reservoir, Virginia (see inset) which utilized zoning ordinances to achieve stormwater management goals, and Lake Travis, Texas in which point and nonpoint pollution concerns were integrated into a single management program, discussed below.

Lake Travis, Texas (Phosphorus)

The Highland Lakes, a chain of reservoirs in Central Texas, provide hydroelectric power, flood control, and recreational opportunities. Sedimentation, eutrophication, and toxic contamination problems caused by stormwater runoff to these lakes prompted the Lower Colorado River Association (LCRA) to develop the Water Quality Leadership Policy (WQLP) in 1988 (Hartigan and Wilwerding, 1991). Analysis of the monitoring data of the Highland Lakes showed that over 90% of the pollution was from nonpoint sources. LCRA estimates that the NPS loads to the Lake Travis basin could increase by 200 to 600 percent in the future, largely due to the conversion of rangeland into urban and suburban development. The WQLP initiated public education efforts along with a regulatory program to control nonpoint source pollution in its ten county district. The Lake Travis Nonpoint Source Pollution Control Ordinance was adopted by the LCRA Board of Directors in December 1989 and went into effect on February 1, 1990. The ordinance targets new urban and suburban development in the 250 square mile area of western Travis County.

The Lake Travis Ordinance establishes a set of performance standards that require new developments to remove a specified amount of the annual NPS pollution load, depending on the site's proximity to the shoreline and the slope of the property. Sites within 500 feet of the lake and/or those on steep slopes require a higher level of runoff treatment than those inland or on flatter ground. In general, the more intensively a site is developed, the more pollution must be removed. This approach recognizes the link between land use and NPS pollution; however, there are

Occoquan Reservoir, Virginia (Eutrophication)

The Occoquan Reservoir is the major water supply for 600,000 people in the Virginia suburbs of Washington, DC. The 9.8 billion gallon reservoir is located at the mouth of a 580 square mile watershed in Northern Virginia. Between 1976 and 1978 a special planning study carried out by the Northern Virginia Planning District Commission concluded that nonpoint sources of pollution were a significant contributor to water quality problems in the Occoquan Reservoir, and were much higher than originally thought (NVPDC, 1987, NVPDC, 1990). The primary concern for the reservoir was eutrophication resulting from nitrogen and phosphorus loadings.

In response to this study, the Occoquan Basin Nonpoint Pollution Management Program was initiated in February, 1982 to address nonpoint source pollution (NPS) in the Occoquan watershed.

This program is designed to manage nonpoint source pollution loadings from each of the watershed's jurisdictions, with each developing its own NPS program. Most of these local programs utilize Best Management Practices compiled in a BMP Handbook for the Occoquan Watershed. BMPs included in the Handbook include extended detention ponds, dry ponds, infiltration trenches and non-structural practices such as fertilizer application controls, street sweeping, and zoning changes.

The Program maintains a water quality model of the watershed to analyze the effects of land use changes on water quality. In 1982 Fairfax County "downzoned" approximately 27,000 acres in the Occoquan watershed to reduce the future nonpoint source pollution loads entering the reservoir, based on results from the model. Downzoning, the process of reclassifying existing zoning regulations (in this case to lower density residential), is ...ed to reduce development impacts. The validity of basing land use decisions designed to protect water quality on modelling results was recently upheld in Fairfax County Circuit Court.

no land use control stipulations in the ordinance.

The Ordinance requires all land owners proposing to develop land within the Lake Travis watershed to submit an application for review and plans on how the surface runoff from the site will be treated. The plan must include temporary erosion and sediment control plans including a restoration program for all disturbed areas, description of the design and location of structural practices used to meet the performance standards, and establishment of a maintenance organization to ensure that the structural practices are adequately maintained. An ongoing program conducted jointly by LCRA, the US EPA Region 6 and the U.S. Geological Survey will evaluate the Ordinance on a periodic basis to determine whether the standards are adequate to protect the water quality of Lake Travis and whether or not the structural best management practices are adequate to meet the standards of onsite pollutant removal.

Developing Urban Areas. Developing urban areas are those lands currently experiencing new development or redevelopment resulting in significant changes to the landscape. These areas include suburban cities and urban fringes located adjacent to urban areas.

Many of these areas are experiencing a dramatic rise in population compared to well established urban areas. For instance, between the 1970 and the 1980 period, the population of urbanized areas increased 30 times more (an increase of 18.9 million) than core cities with a population exceeding 100,000. One activity affecting stormwater quality in developing areas is land disturbance in and around construction sites where exposed soils results in increased sedimentation, erosion, and nutrient transport. Land disturbance in these areas may result in severe stormwater pollution if adequate control programs are not incorporated into the development process. Yet these areas, where the majority of new growth and land disturbance and conversion are occurring, are not necessarily covered under the Phase I NPDES stormwater program. Moreover, an important characteristic of these areas resulting from land conversion consists of permanent changes to land use patterns. These changes induce a significant disruption to the hydrologic cycle and modification of runoff water quality (modification of natural vegetation and infiltration rates, increase storm peak discharges and transport capacities, and decrease of low flow especially during prolonged dry periods).

Stormwater management efforts have been directed primarily toward controlling construction site stormwater runoff. Stormwater pollution control efforts have been minimized by retaining and treating stormwater onsite rather than by addressing impacts occurring offsite. To address impacts originating from developing areas, several state and local agencies have developed comprehensive programs incorporating both structural and nonstructural practices. Typical comprehensive studies include the Anacostia River study (see inset next page) that involves a sediment control program designed to control stormwater pollution from construction sites, and the Dillon Reservoir study in Colorado, discussed below, which addresses both stormwater and point source discharges.

Dillon Reservoir, Colorado: Eutrophication/Urban Growth

Dillon Reservoir is a large (2970 acre) impoundment of the Blue River in Colorado. The Reservoir supplies drinking water to the Denver metropolitan area and is used for recreation, fish habitat and agriculture. Water quality degradation, primarily eutrophication and sedimentation, has occurred since the Reservoir's construction over 20 years ago. At higher elevations the watershed is primarily undeveloped, while the lower elevations contain three major municipalities, four major treatment plants, housing developments and a large molybdenum mine. A study completed in 1983, supported by the EPA through the Clean Lakes Program of the Clean Water Act, identified phosphorus as the primary contributor to the Reservoir's eutrophication. According to the Clean Lakes study, which evaluated 1982 Reservoir phosphorus levels, human activities were found to account for about 1/2 of the total phosphorus load, and of this, between 1/2 and 2/3 was attributed to urban nonpoint sources including runoff from parking lots, golf courses, and construction sites, as well as leakage from septic tanks.

The Northwest Colorado Council of Governments, cooperating with local and state agencies, developed a strategy for phosphorus control by holding the phosphorus loadings to existing (1982) waste load allocation levels (4609 kg/yr) and allowing no further water quality degradation (USEPA, 1991b). To meet the

osphorus loading while allowing for future growth in the basin, nonpoint source controls were encouraged by allowing point/nonpoint source trading at a ratio of 2:1. For every 2 kg of nonpoint source phosphorus removed, 1 kg of phosphorus credit is added to the point source limit. This system provided for maintenance of existing phosphorus levels in the Reservoir, while accounting for increased loading from growth. In addition to providing environmental benefits, this program provides economic benefits and incentives for nonpoint source reduction. The 2:1 ratio provides a margin of safety in the source trading program, and if further phosphorus reduction in the Reservoir is desired, the ratio can be adjusted.

To date, only one point/nonpoint source trade has been completed. The low volume of trade has caused the program to operate differently than was first envisioned. The low volume of trade occurred because the POTWs were able to achieve some of the highest phosphorus removal efficiencies in the nation using expensive advanced treatment technology. Consequently, point/nonpoint source trading has played only a minor role in the overall basinwide phosphorus mitigation strategy. The major constraint to future development is a limit on nonpoint source phosphorus loading.

Although total phosphorus loading was only 5,559 pounds in 1989, i.e., 54 percent of the total phosphorus allowed, additional reductions phosphorus loadings must result from reductions in nonpoint sources. Nonpoint/nonpoint trades

Anacostia River Case Study, Metropolitan Washington, DC (Mutiple Impacts)

The Anacostia River watershed covers approximately 170 square miles of the metropolitan Washington, DC area. Roughly 145 square miles of the basin are in Maryland with the remaining 25 square miles within the District of Columbia. Nonpoint source pollution associated with storm runoff from construction sites were analyzed based on data collected from 9 subbasins in a 32 square mile area north of Washington, DC in Montgomery County, MD (Yorke and Herb, 1978).

From 1963 to 1974 the study area experienced extensive urbanization, a process that continued beyond the period of the study. Urban land use increased from 3 to 11% from 1966 to 1974 and suburban land increased from 6 to 23% of the total drainage area, resulting in significant increases in impervious areas. Impacts resulting from urbanization during this time included the loss of aquatic habitat and consequent decline in the biological community, increased sediment transport and bank erosion, widening of the stream channel, and increased flooding. Fish species in the Anacostia River declined from an average of 7.2 species per station in 1948 to 3.6 species per station in 1972. The decline of fish species was attributed to loss of habitat and increased stream sedimentation.

Changes in stream sediment yield were correlated to land development which averaged 3% of the basin during the study period. Regression analysis of this relationship indicated that 40% of the changes in sediment yield were due to construction activities. From this analysis sediment yield from construction sites was estimated to range from 7 to 100 tons per acre per year, with an average of 32.7.

In 1971 an existing sedimentation control program from construction/developing areas was enforced, requiring developers to incorporate and maintain control practices at their construction sites. The most commonly used measures were: 1) mulch and/or temporary vegetation to protect exposed slopes; 2) interceptor dikes to reduce erosion on rights of way by temporarily diverting storm runoff to where the water can be transported with minimal erosion; 3) grassed waterways, level spreaders, and grade stabilization structures to convey storm runoff through the construction site without erosion, 4) diversion berms to divert storm runoff from areas with critical slopes, 5) sediment basins to trap and store sediment from construction sites before it can enter the stream system. The program also included a number of non-structural practices, such as keeping the smallest practical area of land exposed for the shortest period of time, and fitting the development plan to the topography and soils so as to create the least erosion possible.

This program resulted in the implementation of control practices in up to 60% of construction sites in four subbasins. The enforcement of these practices resulted in an estimated reduction in suspended sediments from construction sites of 60 to 80%. It was estimated that the suspended sediment load in the Anacostia River basin between 1962 and 1974 would have been reduced by 50% if strictly enforced sediment control had been used throughout the period. At the time of the study, the cost of sediment control practices on 1,900 acres was estimated to be $1,030/acre corresponding to $19 for each ton of sediment control. This study indicated that costs could be reduced if construction were limited to areas with slopes less than 10% and sites immediately adjacent to stream channels were avoided. Those non-structural control practices would have the effect of preventing the problem before it occurred.

are beginning to be used to offset nonpoint sources from new development through the control of existing nonpoint sources. For example, the Frisco Sanitation District built a series of concrete vaults (man holes) to control runoff. Filtering the runoff through perforated pipes resulted in removal efficiencies of 50 to 70 percent for total phosphorus and the alleviation of drainage problems. Encouraged by the results of the first project, the district expanded its program to another section of town with the help of federal funds administered through the Clean Water Act's nonpoint source management program. Since the Frisco Sanitation District did not need all the phosphorus credits it earned, the credits were set aside for the construction of a new town golf course. The result was a nonpoint/nonpoint source trade. The removal capabilities of this project will be monitored to determine the actual phosphorus credits applied to the new golf course.

The county-owned Snake River treatment plant is also involved in a nonpoint source control trading project. The project will offset increased contributions of phosphorus to Dillon Reservoir resulting from a stream diversion plan by reducing loads from another stream that is currently responsible for the highest phosphorus load entering the Reservoir. The diverted stream is expected to load an additional 200 pounds of phosphorus into the Reservoir. The phosphorus reduction will occur on Soda Creek where the treatment plant has constructed a discharge contro. structure using an existing road causeway over the Reservoir to intercept and filter the stream flow. When Reservoir levels are low, phosphorus removal efficiencies of 50%, or 75 pounds, are expected. After modelling studies assess the actual removal achieved by the dam, phosphorus discharge credits will be shared equally by the Snake River Plant and the Denver Water Board.

The Dillon experience illustrates the importance of a comprehensive basin-wide management approach which does not focus on isolated point sources. Modelling studies considered the contributions from point, nonpoint, and background sources of phosphorus to determine the maximum loadings from these categories that would maintain the in-lake phosphorus standard of 0.0074 mg/L. As a result of Dillon's projective planning, 1989 phosphorus loads to the Reservoir totaled only 53 percent of the critical load. Modelling is an essential component of this water quality-based approach to evaluate current control strategies and predict the impact of future development.

Core Urban Areas. Existing urban areas, with typical population densities greater than 100,000, are communities with limited potential for new development. These existing, incorporated urban areas with typical populations greater than 100,000 are currently subject to Phase I NPDES stormwater permit requirements. The Phase I NPDES stormwater program also applies to some highly populated counties.

Original stormwater systems in established urban areas were typically constructed for flood control purposes. Water quality programs probably did not address stormwater quality concerns and runoff is typically directed to surface wat

These urban areas are characterized by high percentages of impervious surfaces, which contribute to increased storm water discharges and pollutant transport capacities. Reduction of infiltration rates and groundwater recharge also results in lower baseflows and higher pollutant concentrations in receiving waters, especially during prolonged dry periods. Other stormwater impacts include increases in temperature and concentrations of toxic chemicals, nutrients, heavy metals, oil, grease, and pesticides.

Core urban areas may also experience stormwater pollution problems resulting from illicit connections, leaking sanitary sewage systems, or ground water infiltration. Illicit connections can often be traced to the initial development of the storm sewer system, or arise during redevelopment where storm sewers are either mistaken for sanitary sewers or intentionally used for wastewater conveyance. In industrial facilities, floor drains or other discharge points which are connected to the separate storm sewer system may receive spills, rinse waters, or process wastewaters that should be sent to a treatment plant. Illicit connection programs are directed at identifying such problems for corrective action.

Stormwater control practices in established urban areas have typically included retrofits of detention ponds and controls on combined sewer systems as well as the construction of wetlands and sand filters. As development proceeds, the range of available non-structural options decreases. The following representa-

These case studies highlight a number of stormwater control programs. The Kelsey/Bear Creeks, Washington, case study below examines stormwater impacts from developed areas, and the effects of street sweeping, catchbasin cleaning, and detention ponds on runoff quality and quantity. Various stormwater control practices in the Milwaukee metropolitan area were evaluated using a computer simulation model (see inset next page). The Anacostia Watershed Retrofit Project (see inset below) illustrates a basin-wide approach to storm sewer retrofitting. Additional examples from core urban areas are also included.

Kelsey/Bear Creeks, Washington
Habitat Alteration/Sediment

Kelsey Creek (see page 22 inset) is located in a highly urbanized suburb of Seattle, Washington. The watershed is 90% developed with residential units and commercial/light industry uses (Pitt and Bissonnettee, 1984). Kelsey Creek, a natural water channel, was developed to convey stormwater from the City of Bellevue to Lake Washington, a major water body in the Puget Sound area. The creek serves as a recreational resource and has a productive, but limited, salmon fishery. Increased peak flows from urban development dramatically altered the stream channel causing severe streambed erosion. The number and diversity of aquatic organisms declined as bed scouring and the resultant deposition of suspended sediment destroyed stream habitat. Reduced dissolved oxygen in the sediments depressed salmon embryo survival. The fish population adapted to the degrading environment by shifting species composition from coho salmon to less sensitive cutthroat trout.

Urban stormwater was monitored for six metals and suspended solids. Dry weight concentrations of pollutants from various nonpoint sources, including atmospheric deposition, street dirt accumulation, and catchbasin and detention basin sediment, were measured. Impervious sources (streets, sidewalks, driveways, parking lots and rooftops) were found to contribute more than 60% of the total runoff flow when precipitation exceeded 0.1 inch. Street surfaces contributed 25% of the total flow in the monitored sites. Most of the total solids in urban runoff originated from residential yards. Nutrients were primarily detected in street dirt samples, originating from vehicle emissions. Only a small fraction of the total particulate loadings on the impervious surfaces were removed by rain (15%). Large particles were not effectively removed, while about one-half of the smallest particles (less than 50 microns) were washed off during rains. These small particles were not very abundant, but contained high heavy metal and nutrient concentrations. Most of the settled particulate material in the storm drainage inlets and sewerage pipes was not removed during observed storms.

Several control practices were instituted as pilot projects to determine their effectiveness: street sweeping, catchbasin cleaning and detention ponds. Intensive street sweeping (3 times per week) resulted in rapid and significant decreases in street surface suspended solids loadings, from 110 g/curb-meter down to 55 g/curb-meter. This 50% reduction in suspended solids loadings resulted in a maximum 10% decrease in metal loadings. The median particle size also decreased signifi-

Anacostia Watershed Retrofit Project, Metropolitan Washington, DC (Multiple Impacts)

Opportunities for urban retrofitting are limited in developed watersheds, but they can be implemented after extensive onsite evaluations. In the 179 square mile Anacostia watershed in Montgomery County, MD, over 125 sites were identified as candidates for retrofitting between 1989 and 1991 (Schueler et al., 1991). Retrofit operations included source reduction, extended detention (ED) marsh ponds or ED ponds to handle the first flush, additional storage capacity in the open channel, routing of stormwater runoff away from sensitive channels, diversion of the first flush to sand-peat filters, and installation of oil/grit separators in the drain network itself. The most commonly used technique in the Anacostia watershed is the retrofit of existing dry stormwater detention or flood control structures to improve their runoff storage and treatment capacity. Existing detention ponds are maintained by excavation, adding to the elevation of the embankment, or by construction of low-flow orifices. The newly created storage is used to provide a permanent pool, extended detention storage, or shallow wetland. Nearly 20 such retrofits are in some stage of design or construction in the Anacostia watershed.

cantly with intensive street cleaning. A regenerative air street cleaner showed substantially higher performance in removing the finer street particles. It appears that conventional street sweeping removes the larger particles and rain removes the smaller particles; however, street sweeping did not reduce loadings of toxic compounds by more than 10%. Cleaning of storm drainage inlets and catch basin sumps twice per year reduced the lead and total solids runoff concentrations by between 10 to 25%. COD, nutrients and zinc were reduced by between five and ten percent. After an initial cleaning, it appeared that almost a full year was required for sediment to reach a 'stable volume' in the storm drain inlet structures. Only 60% of the total available sump volumes in the inlet structures and catchbasins were used for detention of particulates at the 'stable volume.' Small detention basins (detention times of 30 minutes or less) did not have any significant effect on urban runoff quality but did reduce peak flow rates by up to 60 percent. Detention basins should be carefully located so increased flow rates do not disturb critical habitat areas. The final recommendation states that if intensive street sweeping was implemented along with semi-annual catchbasin sediment removal, urban runoff discharges for most pollutants would be reduced by as much as 25%. Though these reductions are small, they may be important in reducing the accumulation of contaminated sediments in smaller creek systems.

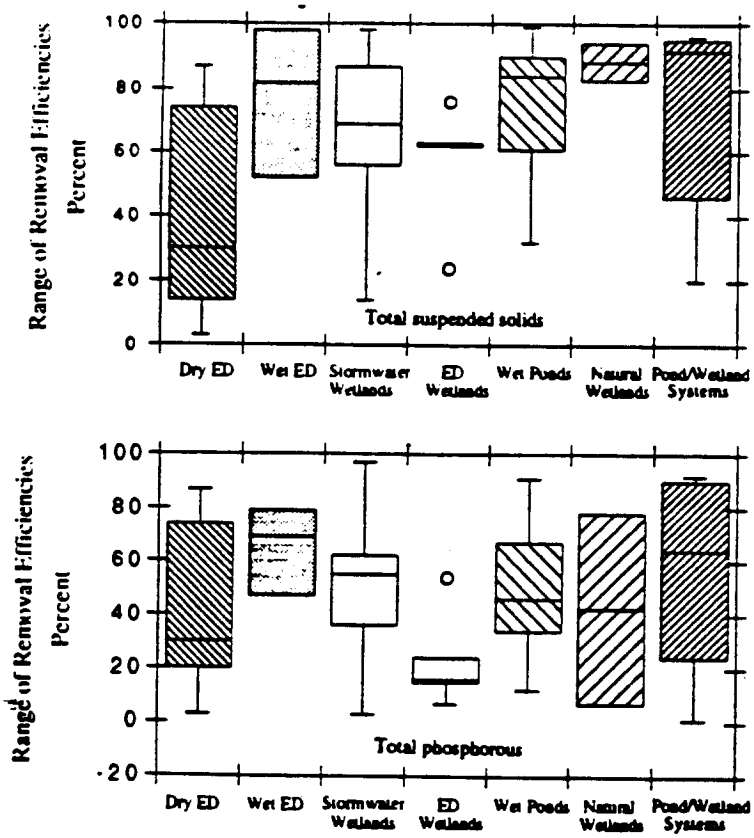
Milwaukee Harbor, Wisconsin
(Multiple Impacts)

Milwaukee Harbor is a freshwater reservoir-embayment of Lake Michigan. The Milwaukee River is productive, and typically oversaturated with oxygen, as it moves through the agricultural and mixed land uses of the upper two-thirds of the watershed (Pitt, 1986). Upon reaching the deeper and slower moving, impounded lower one-third of the watershed which includes the suburban and urban areas of the city of Milwaukee, dissolved oxygen levels plummet 5 to 6 mg/L resulting in periodic septic conditions. Point source sewage treatment plant discharges are not important for this watershed because only 10% of the city's population is served by sewage treatment plants that discharge into the river. Water quality and quantity are monitored at 6 sampling stations along the river by the Milwaukee Sewerage District and the U.S. Geological Survey.

The Ontario Ministry of the Environment, in cooperation with the Wisconsin Department of Natural Resources, funded the application of the Source Loading and Management Model (SLAMM) which was used to predict the effectiveness of various stormwater runoff source area, sewerage, and outfall controls for urban runoff in the Milwaukee metropolitan area. Performance data on control practices for reducing runoff flow volumes and lead discharges were obtained from two study areas in Toronto, including a mixed residential/commercial and a light/medium industrial area. The data from the Toronto study were augmented with extensive literature information on the effectiveness of source area and outfall urban controls. Control options analyzed using SLAMM included: increased street cleaning, catchbasin cleaning, wet detention basins, infiltration of runoff from half of the residential roofs currently draining to pavement, and combinations of these practices. Cost effectiveness of the retrofits was analyzed by examination of the cost per unit removal for suspended solids, phosphorus, fecal coliform bacteria, and lead for each of the control options.

Three cost-effective programs for stormwater runoff particulate control were identified: 1) detention basins and detention basins plus street sweeping at a cost of $2 to $3 per kg with a potential maximum control of 26%; 2) partial infiltration plus large wet basins at $6 per kg with a maximum control potential of 44%; and 3) all practices combined including increased street cleaning and catchbasin cleaning, partial infiltration, and large wet detention basins at $9 per kg with a maximum control level of 47%.

The most highly recommended program combined infiltration and wet detention ponds. However, control program performance varied for different land uses. The modeling effort further revealed that the age of development as well as land use should be considered in the evaluation of water quality and effectiveness of controls.



Legend

Reported removal efficiencies for each management practice are variable. To account for this variability the box and whiskers representation was used to display the range of the reported values and to characterize the distribution by indicating various percentiles. It should be noted that because of the limited data points, no advanced statistical tests were used to evaluate the significance of the reported data. The box encloses 50% of the reported values, with the lower and upper sides of the box representing the 25th and 75th percentiles respectively. The line inside the box represents the median value of the distribution. The horizontal whiskers above and below the box, if any, indicate the 90th and 10th percentiles, respectively. Extreme values, also called outliers, if any, (higher than the 90th or lower than the 10th percentiles) are represented by circles.

Total Suspended Solids and Phosphorus Removal Capabilities of Structural Stormwater Management Practices (MWCOG,1992)

Additional Examples of Successful Urban and Industrial Stormwater Control Practices

This study, prepared as a part of the Technical Guidance to implement Section 6217(g) of the Coastal Zone Act Reauthorization Amendments, provides a comparative assessment of various structural stormwater quality control practices (MWCOG, 1992). It analyzes the capabilities and limitations of eleven practices. The study thoroughly reviewed the existing literature, consulted with numerous local and state experts around the country, and analyzed data from ongoing projects. The results of the literature survey concerning the effectiveness of eleven stormwater management practices in removing total suspended sediment and total phosphorus presented in this study are illustrated in the Figures above.

Although a wide range of removal efficiencies for each practice was observed, high removal rates were achieved in a number of cases. The maximum removal rates for total suspended sediments ranged from 70% to more than 95%. The highest reported removals were achieved by wet ponds, wet extended detention ponds, natural wetlands, and ponds/wetland systems.

Wet Detention Ponds, Charlotte, NC

The performance of existing urban wet detention ponds in the City of Charlotte within the piedmont region of North Carolina, was evaluated based on a comprehensive data collection program (Wu, Holman, and Dorney, 1988). The hydrologic and water quality responses of three wet ponds were characterized during storm water events. The three ponds studied control a combined area of 437 acres. Although initially designed and built for storm runoff control, the results of this study indicate wet ponds have significant capacity to improve water quality.

Differences in removal efficiencies among the three ponds were attributed in part to surface area ratios calculated based on pond surface and subarea acreage. Observed removal of total suspended solids was consistantly high (82-100%) for the pond with the highest area ratio. The two heavy metals monitored in this study, zinc and iron, were also consistently removed with an efficiency rate of about 80% in pond A (high surface area ratio), and 42% in pond B (low surface area ratio). For total phosphorous and nitrogen the removal efficiencies were inconsistent, attributable to the variable input from waterfowl droppings in the ponds. Average removal efficiencies for two of the ponds are shown in the Table below.

Removal Efficiency Achieved by Wet Detention Ponds

Constituent	% Removal Pond 1	Pond 2
TSS	91	54
Nutrients	6-23	20-24
Metals	79-82	42-45

High removal efficiencies for total phosphorus were also observed. Apart from the extended wetlands for which fewer data were obtained from the literature survey, the highest removal efficiencies achieved exceeded 60% for the other ten practices. The highest removals were achieved with wet extended detention ponds, natural wetlands, and pond/wetland systems. The performance of existing urban wet detention ponds was also examined in a case study from Charlotte, North Carolina (see inset above).

Michigan

Recent studies in Michigan have recognized that development occurring while undersized waste water treatment plants are operating can create wide-spread illicit connection problems. For example, the Huron River Pollution Abatement Program in Wastenaw County, Michigan, inspected 660 businesses, homes, and other buildings discharging stormwater to the Allen Creek drain. Of the buildings inspected, 14% were found to have improper storm drain connections, with the highest percentage (60%) for automobile related businesses. Although some of the problems discovered in this study resulted from improper plumbing or illegal connections, the majority were approved connections at the time they were built. Efforts are underway to correct those illicit connections identified during the inspection program (40 CFR parts 122, 123, and 124).

Combined Sewer Pollution Control: Structural Practices. Structural practices for controlling combined sewer overflow pollution usually parallel conventional wastewater treatment practices. They are designed to handle intermittent and random flows which vary in magnitude and quality. These practices include in-line storage, off-line storage, storage sedimentation, swirl concentrators, screens, dissolved air floatation, high rate filtration, treatment lagoons, contact stabilization, rotating biological contactors, and high rate trickling filters. They all differ in costs, efficiencies, suitability, and operation and maintenance. Two case studies concerning in-line storage and an integrated approach follow.

In-line Storage Control, Seattle

In-line storage control is a low capital cost method that uses existing facilities. It is easily integrated with dry-weather collection, treatment, and disposal activities, and is adaptable to future expansion. Metropolitan Seattle implemented an on-line storage control system to mitigate Combined Sewer Overflows (CSO) impacts to receiving waters (Finnemore, 1982). The system performance was evaluated in

...ine reduction of overflow ... overflow frequency, and ... reduction of pollutant loads.

... system was estimated to re... overflow volume by 74%. ... resulting reductions in pollu... loads were estimated to be ... kg/year of suspended solids and 136,000kg/year of BOD. The total costs for this system are summarized as follows:

In-line Storage Control Costs

Regulators	$9,762,000
Computer facilities	$5,717,000
Engineering	$924,000
O&M cost (per year)	$440,000

Integrated Approach, Saginaw, MI

Saginaw, Michigan uses a combination of storage and treatment processes to take advantage of the capabilities of exisiting systems (Finnemore, 1982). This integrated approach reduces the volume of overflows to receiving waters and treats overflows that do occur to near primary treatment levels. This integrated system at the Hancock Street facilities, includes: (1) in-line storage; (2) using existing interceptor capacity controlled by modified regulator stations; (3) a flood protection pumping station, an off-line storage-treatment basin capable of treating and disinfecting all overflows; and (4) a capability to treat all flows retained in storage at the local dry-weather treatment plant. Together this system supports a city-wide plan to eliminate uncontrolled combined sewer discharge to the Saginaw River.

The performance of the Hancock Street storage/treatment facility was characterized using data from the 1978 summer monitoring program. Eleven storms occurred during the monitoring period and an estimated 52,000,000 gallons were pumped to the storage/treatment basin. Forty percent of this volume overflowed, after treatment, during three storms. The overflow frequency was reduced by 73%, and the effectiveness of the basin in treating the overflows ranged between 35% and 75% reduction in concentrations of eight different pollutants.

The total construction cost of the Hancock Street CSO control facilities was $7,280,000, including modifications to the in-line storage system (regulators) and the storage/treatment facilities. Estimated annual operating and maintenance cost for the storage/treatment system is about $50,000/yr.

Detention Ponds and Retention Basins. The ability of wet detention ponds and retention basins to remove pollutants from stormwater has been extensively studied. Numerous case studies have shown that reductions in suspended sediments, nutrients, and heavy metals are possible through the use of either retrofitted stormwater basins or detention ponds designed specifically for water quality improvements. The following case study reported variable reductions in total suspended solids, metals, and nutrients.

... Retention Pond, Orlando, FL

A three pond stormwater retention system receiving stormwater from a highway interchange in Orlando, Florida, was investigated (Youssef, Wanielista, and Harper, 1986). The three ponds were interconnected by way of a large culvert to allow overflow to other ponds when storm runoff exceeds the design level. The first receiving pond has an approximate surface area of 1.3 ha (3.2 acres), an average depth of 1.5m (4.9 feet), and a total drainage area of 10.8 ha (26.7 acres). The ponds maintained a large standing crop of filamentous algae virtually year-round.

Field investigations conducted during 1982-1984 were designed to assess 1) the quantity of pollutants entering the pond, 2) the average water quality parameters in the basin water, 3) the accumulation of nutrients and heavy metals in the sediment of the pond, and 4) the leaching of heavy metals to the groundwater beneath the retention ponds.

The removal efficiencies of particulate metals were found to range from 77% for copper to over 95% for lead and zinc, while the removal of the dissolved fraction was only about 50% for lead and copper and 88% for zinc. The removal of particulate phosphorus and organic nitrogen was, on the other hand, poor and did not exceed 12%. The removal of the dissolved fraction of nutrient loadings ranged from 81.6% for ammonia to 90% for phosphorus.

Accumulation of phosphorus in the bottom sediment of the pond was evaluated at 99% of the total input during a 7 year period. However, 85-90% removal of the total nitrogen load was attributed to nitrification-denitrification processes. The removal of particulate heavy metals from the pond water was also attributed to settling and accumulation in

Constructed Wetlands for Wastewater Treatment
DUST Marsh Trap Efficiencies (percent)

Constituents	System A	System B	System C[a]	Overall[b]
TDS	-9	-20	-50	-49

Nickel (Ni)	34	-30	12	20
Zinc (Zn)	8	-22	51	33

[a]System C inflow = composite of System A and B outflows.
[b]Overall trap efficiencies may be greater than cumulative reductions by individual systems because System C provides secondary treatment for System A and B discharges

the bottom sediment within a relatively short distance from the stormwater inlet.

One common concern of using retention basins is the potential for groundwater contamination. However, monthly groundwater samples revealed no conclusive evidence of heavy metals migration from the pond.

Stormwater Wetlands, Fremont, CA

This study summarizes the results from the Demonstration Urban Stormwater Treatment (DUST) marsh project at Coyote Hills in Fremont, California (Meiorin, 1986). The study analyzes the applicability of artificial wetlands as a means for improving urban stormwater quality. The wetland system and control structures consist of a series of detention basins designed to simulate a secondary wastewater treatment plant, including pretreatment, clarifier, and biological processes. The basins were built in 1983 to receive water from approximately 4.6 square miles including residential, commercial, and open areas as well as urban roads.

A monitoring program during the wet seasons of 1984 and 1985 documented the marsh development and treatment effectiveness. Samples from eleven storms collected from each basin outflow were analyzed and the results, expressed in terms of trap efficiency, are listed in the table above.

The overall trap efficiency for heavy metals (chromium, copper, nickel, lead, and zinc) ranged from 20-88%, due in part to settling of heavy suspended particles. Nitrogen is transported into the marsh primarily as ammonia and organic nitrogen and was moderately trapped due to plant uptake and adsorption into the sediment. However, a higher trap efficiency was seen for phosphorus (orthophosphate and total phosphate).

Heavy metal concentrations in vegetation generally followed a pattern of greatest relative uptake occurring in plant roots with decreasing levels in the leaf and seed tissues. Generally soil-root concentrations were less than half of those found in the surface soil, leaf and seed concentration were one-half to one-fourth of the root amount. Bioaccumulation of chromium, copper, lead and zinc in fish tissue exceeded the 85% Elevated Data Level (EDL^a) in all the basins; however, bioaccumulation of cadmium, nickel and selenium was not significant. Further research was recommended to determine the long-term build-up of heavy metals and toxic hydrocarbons in the foodchain.

It should be noted that the rest of this study were collected from a relatively new wetland system, and the uptake of nutrients and heavy metals could vary as the system matures.

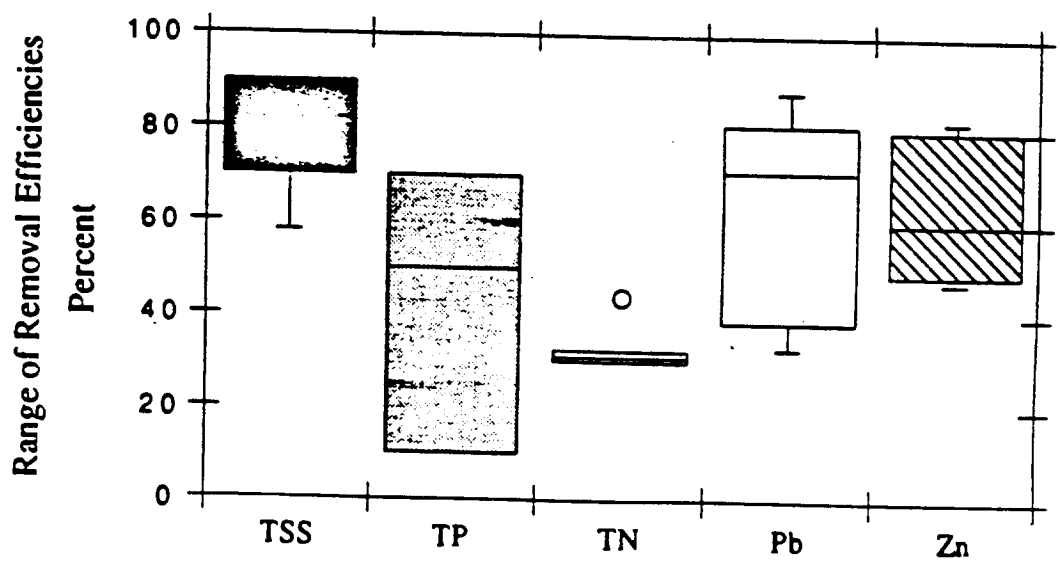
Sand Filters, Delaware

The State of Delaware developed a design approach for implementation of stormwater management water quality control practices targeting urban areas having little or no pervious area (Shaver, 1991). The controls were adopted under the urban stormwater runoff component of the NPDES program. The State of Delaware enacted an urban stormwater control program focussing on new construction. After July 1, 1991 all new development activities require reviews for water quality impacts prior to their approval. The program requires pre-development peak dis-

[a]Statistical values developed by the California Fish and Game from the 1984 Toxic Substances Monitoring program indicating percent of exceedance of a toxic substance in observed fish tissues.

not exceeded and water quality is protected by vegetative and structural control strategies designed to remove 80% of the inflow's suspended solids. Shallow stormwater management ponds that encourage plant growth are preferred because nutrients are a significant source of water quality degradation in Delaware. Often spatial or other engineering considerations limit the use of ponds in urban areas. In heavily urbanized areas, sand filters may be appropriate for both new development and retrofits as they do not limit land usage. The sand filters will be designed to treat runoff from frequent storm events, i.e., the first inch of rainfall. The design procedures for the sand filters are based on equations developed by the City of Austin as well as structural design previously used for a project in the State of Maryland.

Filter efficiency is related to the distribution of pollutants in the various particle size classes. Most of urban particulate matter is of a coarser size fraction; however, most of the other pollutants (except for metals which tend to be more evenly distributed across the size classes) are associated with the smaller particle sizes. For example, approximately 6% of urban particulate matter is in the silt and clay soil size range; but silts and clays contain more than 50% of the phosphorus. The sedimentation chamber of the filtration system is designed to remove the sand and gravel components and the sand filter is designed to remove the finer silt and clay particles. The detention chamber provides a detention time sufficient to remove sand and coarse particles based on their calculated settling velocities. The filter drains the first inch of runoff within a 24 hour period by assuming an average filtration rate of 0.04 gal/min/ft^2 for the sand. The design drainage area, typically a parking lot, must be less than 5 acres. Predicted removal efficiencies are 70% removal of total suspended solids, 33% removal of total phosphorus, 21% removal of total nitrogen, and 45% removal of the metals lead and zinc. Actual removals contained in the Austin report are somewhat higher than expected. Removal efficiencies reported in several sources (Woodward-Clyde, 1991) are illustrated in the following Figure. For example, the 25th and 75th percentile of TSS removal by filtration systems were about 70 and 90 percent, respectively. The median value is about 82 percent.



Removal efficiencies for total suspended solids, total phosphorous, total nitrogen, lead, and zinc by sandfilter basins.

code of federal regulations

Protection of Environment

40

PARTS 100 TO 149

Revised as of July 1, 1992

(i) The size of the animal feeding operation and the amount of wastes reaching waters of the United States;

(ii) The location of the animal feeding operation relative to waters of the United States;

(iii) The means of conveyance of animal wastes and process waste waters into waters of the United States;

(iv) The slope, vegetation, rainfall, and other factors affecting the likelihood or frequency of discharge of animal wastes and process waste waters into waters of the United States; and

(v) Other relevant factors.

(2) No animal feeding operation with less than the numbers of animals set forth in appendix B of this part shall be designated as a concentrated animal feeding operation unless:

(i) Pollutants are discharged into waters of the United States through a manmade ditch, flushing system, or other similar manmade device; or

(ii) Pollutants are discharged directly into waters of the United States which originate outside of the facility and pass over, across, or through the facility or otherwise come into direct contact with the animals confined in the operation.

(3) A permit application shall not be required from a concentrated animal feeding operation designated under this paragraph until the Director has conducted an on-site inspection of the operation and determined that the operation should and could be regulated under the permit program.

§ 122.24 Concentrated aquatic animal production facilities (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* Concentrated aquatic animal production facilities, as defined in this section, are point sources subject to the NPDES permit program.

(b) *Definition. Concentrated aquatic animal production facility* means a hatchery, fish farm, or other facility which meets the criteria in appendix C of this part, or which the Director designates under paragraph (c) of this section.

(c) *Case-by-case designation of concentrated aquatic animal production facilities.* (1) The Director may designate any warm or cold water aquatic animal production facility as a concentrated aquatic animal production facility upon determining that it is a significant contributor of pollution to waters of the United States. In making this designation the Director shall consider the following factors:

(i) The location and quality of the receiving waters of the United States;

(ii) The holding, feeding, and production capacities of the facility;

(iii) The quantity and nature of the pollutants reaching waters of the United States; and

(iv) Other relevant factors.

(2) A permit application shall not be required from a concentrated aquatic animal production facility designated under this paragraph until the Director has conducted on-site inspection of the facility and has determined that the facility should and could be regulated under the permit program.

§ 122.25 Aquaculture projects (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* Discharges into aquaculture projects, as defined in this section, are subject to the NPDES permit program through section 318 of CWA, and in accordance with 40 CFR part 125, subpart B.

(b) *Definitions.* (1) *Aquaculture project* means a defined managed water area which uses discharges of pollutants into that designated area for the maintenance or production of harvestable freshwater, estuarine, or marine plants or animals.

(2) *Designated project area* means the portions of the waters of the United States within which the permittee or permit applicant plans to confine the cultivated species, using a method or plan or operation (including, but not limited to, physical confinement) which, on the basis of reliable scientific evidence, is expected to ensure that specific individual organisms comprising an aquaculture crop will enjoy increased growth attributable to the discharge of pollutants, and be harvested within a defined geographic area.

§ 122.26 Storm water discharges (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* (1) Prior to October 1, 1992, discharges composed entirely of storm water shall not be required to obtain a NPDES permit except:

(i) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(ii) A discharge associated with industrial activity (see § 122.26(a)(4));

(iii) A discharge from a large municipal separate storm sewer system;

(iv) A discharge from a medium municipal separate storm sewer system;

(v) A discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. This designation may include a discharge from any conveyance or system of conveyances used for collecting and conveying storm water runoff or a system of discharges from municipal separate storm sewers, except for those discharges from conveyances which do not require a permit under paragraph (a)(2) of this section or agricultural storm water runoff which is exempted from the definition of point source at § 122.2.

The Director may designate discharges from municipal separate storm sewers on a system-wide or jurisdiction-wide basis. In making this determination the Director may consider the following factors:

(A) The location of the discharge with respect to waters of the United States as defined at 40 CFR 122.2.

(B) The size of the discharge;

(C) The quantity and nature of the pollutants discharged to waters of the United States; and

(D) Other relevant factors.

(2) The Director may not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing or treatment operations or transmission facilities, composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with or that has not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(3) *Large and medium municipal separate storm sewer systems.* (i) Permits must be obtained for all discharges from large and medium municipal separate storm sewer systems.

(ii) The Director may either issue one system-wide permit covering all discharges from municipal separate storm sewers within a large or medium municipal storm sewer system or issue distinct permits for appropriate categories of discharges within a large or medium municipal separate storm sewer system including, but not limited to: all discharges owned or operated by the same municipality; located within the same jurisdiction; all discharges within a system that discharge to the same watershed; discharges within a system that are similar in nature; or for individual discharges from municipal separate storm sewers within the system.

(iii) The operator of a discharge from a municipal separate storm sewer which is part of a large or medium municipal separate storm sewer system must either:

(A) Participate in a permit application (to be a permittee or a co-permittee) with one or more other operators of discharges from the large or medium municipal storm sewer system which covers all, or a portion of all, discharges from the municipal separate storm sewer system;

(B) Submit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible; or

(C) A regional authority may be responsible for submitting a permit application under the following guidelines:

(*1*) The regional authority together with co-applicants shall have authority over a storm water management program that is in existence, or shall

e in existence at the time part 1 of he application is due;

(2) The permit applicant or co-applicants shall establish their ability to make a timely submission of part 1 nd part 2 of the municipal application;

(3) Each of the operators of municipal separate storm sewers within the ystems described in paragraphs (b)(4) i), (ii), and (iii) or (b)(7) (i), (ii), and iii) of this section, that are under the urview of the designated regional authority, shall comply with the application requirements of paragraph (d) of this section.

(iv) One permit application may be ubmitted for all or a portion of all municipal separate storm sewers within adjacent or interconnected large or medium municipal separate storm sewer systems. The Director may issue one system-wide permit covering all, or a portion of all municipal separate storm sewers in adjacent or interconnected large or medium municipal separate storm sewer systems.

(v) Permits for all or a portion of all discharges from large or medium municipal separate storm sewer systems that are issued on a system-wide, jurisdiction-wide, watershed or other basis may specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas which contribute storm water to the system.

(vi) Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators.

(4) *Discharges through large and medium municipal separate storm sewer systems.* In addition to meeting the requirements of paragraph (c) of this section, an operator of a storm water discharge associated with industrial activity which discharges through a large or medium municipal separate storm sewer system shall submit, to the operator of the municipal separate storm sewer system receiving the discharge no later than May 15, 1991, or 180 days prior to commencing such discharge: the name of the facility; a contact person and phone number; the location of the discharge; a description, including Standard Industrial Classification, which best reflects the principal products or services provided by each facility; and any existing NPDES permit number.

(5) *Other municipal separate storm sewers.* The Director may issue permits for municipal separate storm sewers that are designated under paragraph (a)(1)(v) of this section on a system-wide basis, jurisdiction-wide basis, watershed basis or other appropriate basis, or may issue permits for individual discharges.

(6) *Non-municipal separate storm sewers.* For storm water discharges associated with industrial activity from point sources which discharge through a non-municipal or non-publicly owned separate storm sewer system, the Director, in his discretion, may issue: a single NPDES permit, with each discharger a co-permittee to a permit issued to the operator of the portion of the system that discharges into waters of the United States; or, individual permits to each discharger of storm water associated with industrial activity through the non-municipal conveyance system.

(i) All storm water discharges associated with industrial activity that discharge through a storm water discharge system that is not a municipal separate storm sewer must be covered by an individual permit, or a permit issued to the operator of the portion of the system that discharges to waters of the United States, with each discharger to the non-municipal conveyance a co-permittee to that permit.

(ii) Where there is more than one operator of a single system of such conveyances, all operators of storm water discharges associated with industrial activity must submit applications.

(iii) Any permit covering more than one operator shall identify the effluent limitations, or other permit conditions, if any, that apply to each operator.

(7) *Combined sewer systems.* Conveyances that discharge storm water runoff combined with municipal sewage are point sources that must obtain NPDES permits in accordance with the procedures of § 122.21 and

are not subject to the provisions of this section.

(8) Whether a discharge from a municipal separate storm sewer is or is not subject to regulation under this section shall have no bearing on whether the owner or operator of the discharge is eligible for funding under title II, title III or title VI of the Clean Water Act. *See* 40 CFR part 35, subpart I, appendix A(b)H.2.j.

(b) *Definitions.* (1) *Co-permittee* means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

(2) *Illicit discharge* means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

(3) *Incorporated place* means the District of Columbia, or a city, town, township, or village that is incorporated under the laws of the State in which it is located.

(4) *Large municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 250,000 or more as determined by the latest Decennial Census by the Bureau of Census (appendix F); or

(ii) Located in the counties listed in appendix H, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(4)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; and

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraph (b)(4) (i), (ii), (iii) of this section.

(5) *Major municipal separate storm sewer outfall* (or "major outfall") means a municipal separate storm sewer outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

(6) *Major outfall* means a major municipal separate storm sewer outfall.

(7) *Medium municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 100,000 or more but less than 250,000, as determined by the latest Decennial Census by the Bureau of Census (appendix G); or

(ii) Located in the counties listed in appendix I, except municipal separate

311-144 O—92——4

storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(7)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a medium municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (b)(7) (i), (ii), (iii) of this section.

(8) *Municipal separate storm sewer* means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) Designed or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

(9) *Outfall* means a *point source* as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

(10) *Overburden* means any material of any nature, consolidated or unconsolidated, that overlies a mineral deposit, excluding topsoil or similar naturally-occurring surface materials that are not disturbed by mining operations.

(11) *Runoff coefficient* means the fraction of total rainfall that will appear at a conveyance as runoff.

(12) *Significant materials* includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under section 101(14) of CERCLA; any chemical the facility is required to report pursuant to section 313 of title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

(13) *Storm water* means storm water runoff, snow melt runoff, and surface runoff and drainage.

(14) *Storm water discharge associated with industrial activity* means the discharge from any conveyance which is used for collecting and conveying storm water and which is directly related to manufacturing, processing or

raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program under 40 CFR part 122. For the categories of industries identified in paragraphs (b)(14) (i) through (x) of this section, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at 40 CFR part 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the categories of industries identified in paragraph (b)(14)(xi) of this section, the term includes only storm water discharges from all the areas (except access roads and rail lines) that are listed in the previous sentence where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water. For the purposes of this paragraph, material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are Federally, State, or municipally owned or operated that meet the description of the facilities listed in this paragraph (b)(14)(i)-(xi) of this section) include those facilities designated under the provisions of paragraph (a)(1)(v) of this section. The following categories of facilities are considered to be engaging in "industrial activity" for purposes of this subsection:

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category (xi) in paragraph (b)(14) of this section);

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373;

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(l) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; (inactive mining operations are mining sites that are not being actively mined, but which have an identifiable owner/operator; inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined materials, nor sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim);

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim

status or a permit under subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that receive or have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under paragraphs (b)(14)(i)-(vii) or (ix)-(xi) of this section are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR part 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with section 405 of the CWA;

(x) Construction activity including clearing, grading and excavation activities except: operations that result in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221-25, (and which are not otherwise included within categories (ii)-(x));

(15) *Uncontrolled sanitary landfill* means a landill or open dump, whether in operation or closed, that does not meet the requirements for runon or runoff controls established pursuant to subtitle D of the Solid Waste Disposal Act.

(c) *Application requirements for storm water discharges associated with industrial activity*—(1) *Individual application.* Dischargers of storm water associated with industrial activity are required to apply for an individual permit, apply for a permit through a group application, or seek coverage under a promulgated storm water general permit. Facilities that are required to obtain an individual permit, or any discharge of storm water which the Director is evaluating for designation (*see* 40 CFR 124.52(c)) under paragraph (a)(1)(v) of this section and is not a municipal separate storm sewer, and which is not part of a group application described under paragraph (c)(2) of this section, shall submit an NPDES application in accordance with the requirements of § 122.21 as modified and supplemented by the provisions of the remainder of this paragraph. Applicants for discharges composed entirely of storm water shall submit Form 1 and Form 2F. Applicants for discharges composed of storm water and non-storm water shall submit Form 1, Form 2C, and Form 2F. Applicants for new sources or new discharges (as defined in § 122.2 of this part) composed of storm water and non-storm water shall submit Form 1, Form 2D, and Form 2F.

(i) Except as provided in § 122.26(c)(1)(ii)-(iv), the operator of a storm water discharge associated with industrial activity subject to this section shall provide:

(A) A site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic

map is unavailable) of the facility including: each of its drainage and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each past or present area used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied, each of its hazardous weste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility;

(B) An estimate of the area of impervious surfaces (including paved areas and building roofs) and the total area drained by each outfall (within a mile radius of the facility) and a narrative description of the following: Significant materials that in the three years prior to the submittal of this application have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal of such materials; materials management practices employed, in the three years prior to the submittal of this application, to minimize contact by these materials with storm water runoff; materials loading and access areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; the location and a description of existing structural and non-structural control measures to reduce pollutants in storm water runoff; and a description of the treatment the storm water receives, including the ultimate disposal of any solid or fluid wastes other than by discharge;

(C) A certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested or evaluated for the presence of non-storm water discharges which are not covered by a NPDES permit; tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. The certification shall include a description of the method used, the date of any testing, and the on-site drainage points that were directly observed during a test;

(D) Existing information regarding significant leaks or spills of toxic or hazardous pollutants at the facility that have taken place within the three years prior to the submittal of this application;

(E) Quantitative data based on samples collected during storm events and collected in accordance with § 122.21 of this part from all outfalls containing a storm water discharge associated with industrial activity for the following parameters:

(*1*) Any pollutant limited in an effluent guideline to which the facility is subject;

(*2*) Any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit);

(*3*) Oil and grease, pH, BOD5, COD, TSS, total phosphorus, total Kjeldahl nitrogen, and nitrate plus nitrite nitrogen;

(*4*) Any information on the discharge required under paragraph § 122.21(g)(7) (iii) and (iv) of this part;

(*5*) Flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, and the method of flow measurement or estimation; and

(*6*) The date and duration (in hours) of the storm event(s) sampled, rainfall measurements or estimates of the storm event (in inches) which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event (in hours);

(F) Operators of a discharge which is composed entirely of storm water are exempt from the requirements of § 122.21 (g)(2), (g)(3), (g)(4), (g)(5), (g)(7)(i), (g)(7)(ii), and (g)(7)(v); and

(G) Operators of new sources or new discharges (as defined in § 122.2 of this part) which are composed in part or

entirely of storm water must include estimates for the pollutants or parameters listed in paragraph (c)(1)(i)(E) of this section instead of actual sampling data, along with the source of each estimate. Operators of new sources or new discharges composed in part or entirely of storm water must provide quantitative data for the parameters listed in paragraph (c)(1)(i)(E) of this section within two years after commencement of discharge, unless such data has already been reported under the monitoring requirements of the NPDES permit for the discharge. Operators of a new source or new discharge which is composed entirely of storm water are exempt from the requirements of § 122.21 (k)(3)(ii), (k)(3)(iii), and (k)(5).

(ii) The operator of an existing or new storm water discharge that is associated with industrial activity solely under paragraph (b)(14)(x) of this section, is exempt from the requirements of § 122.21(g) and paragraph (c)(1)(i) of this section. Such operator shall provide a narrative description of:

(A) The location (including a map) and the nature of the construction activity;

(B) The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;

(C) Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a brief description of applicable State and local erosion and sediment control requirements;

(D) Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a brief description of applicable State or local erosion and sediment control requirements;

(E) An estimate of the runoff coefficient of the site and the increase in impervious area after the construction addressed in the permit application is completed, the nature of fill material and existing data describing the soil or the quality of the discharge; and

(F) The name of the receiving water.

(iii) The operator of an existing or new discharge composed entirely of storm water from an oil or gas exploration, production, processing, or treatment operation, or transmission facility is not required to submit a permit application in accordance with paragraph (c)(1)(i) of this section, unless the facility:

(A) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 117.21 or 40 CFR 302.6 at anytime since November 16, 1987; or

(B) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 110.6 at any time since November 16, 1987; or

(C) Contributes to a violation of a water quality standard.

(iv) The operator of an existing or new discharge composed entirely of storm water from a mining operation is not required to submit a permit application unless the discharge has come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(v) Applicants shall provide such other information the Director may reasonably require under § 122.21(g)(13) of this part to determine whether to issue a permit and may require any facility subject to paragraph (c)(1)(ii) of this section to comply with paragraph (c)(1)(i) of this section.

(2) *Group application for discharges associated with industrial activity.* In lieu of individual applications or notice of intent to be covered by a general permit for storm water discharges associated with industrial activity, a group application may be filed by an entity representing a group of applicants (except facilities that have existing individual NPDES permits for storm water) that are part of the same subcategory (*see* 40 CFR subchapter N, part 405 to 471) or, where such grouping is inapplicable, are sufficiently similar as to be appropriate for general permit coverage under § 122.28 of this part. The part 1 application shall be submitted to the Office of Water Enforcement and Permits, U.S. EPA,

401 M Street, SW., Washington, DC 20460 (EN-336) for approval. Once a part 1 application is approved, group applicants are to submit Part 2 of the group application to the Office of Water Enforcement and Permits. A group application shall consist of:

(i) *Part 1.* Part 1 of a group application shall:

(A) Identify the participants in the group application by name and location. Facilities participating in the group application shall be listed in nine subdivisions, based on the facility location relative to the nine precipitation zones indicated in appendix E to this part.

(B) Include a narrative description summarizing the industrial activities of participants of the group application and explaining why the participants, as a whole, are sufficiently similar to be a covered by a general permit;

(C) Include a list of significant materials stored exposed to precipitation by participants in the group application and materials management practices employed to diminish contact by these materials with precipitation and storm water runoff;

(D) For groups of more than 1,000 members, identify at least 100 dischargers participating in the group application from which quantitative data will be submitted. For groups of 100 or more members, identify a minimum of ten percent of the dischargers participating in the group application from which quantitative data will be submitted. For groups of between 21 and 99 members identify a minimum of ten dischargers participating in the group application from which quantitative data will be submitted. For groups of 4 to 20 members, identify a minimum of 50 percent of the dischargers participating in the group application from which quantitative data will be submitted. For groups with more than 10 members, either a minimum of two dischargers from each precipitation zone indicated in appendix E of this part in which ten or more members of the group are located, or one discharger from each precipitation zone indicated in appendix E of this part in which nine or fewer members of the group are located, must be identified to submit quantitative data. For groups of 4 to 10 members, at least one facility in each precipitation zone indicated in appendix E of this part in which members of the group are located must be identified to submit quantitative data. A description of why the facilities selected to perform sampling and analysis are representative of the group as a whole in terms of the information provided in paragraphs (c)(1)(i)(B) and (c)(1)(i)(C) of this section, shall accompany this section. Different factors impacting the nature of the storm water discharges, such as the processes used and material management, shall be represented, to the extent feasible, in a manner roughly equivalent to their proportion in the group.

(ii) *Part 2.* Part 2 of a group application shall contain quantitative data (NPDES Form 2F), as modified by paragraph (c)(1) of this section, so that when part 1 and part 2 of the group application are taken together, a complete NPDES application (Form 1, Form 2C, and Form 2F) can be evaluated for each discharger identified in paragraph (c)(2)(i)(D) of this section.

(d) *Application requirements for large and medium municipal separate storm sewer discharges.* The operator of a discharge from a large or medium municipal separate storm sewer or a municipal separate storm sewer that is designated by the Director under paragraph (a)(1)(v) of this section, may submit a jurisdiction-wide or system-wide permit application. Where more than one public entity owns or operates a municipal separate storm sewer within a geographic area (including adjacent or interconnected municipal separate storm sewer systems), such operators may be a coapplicant to the same application. Permit applications for discharges from large and medium municipal storm sewers or municipal storm sewers designated under paragraph (a)(1)(v) of this section shall include:

(1) *Part 1.* Part 1 of the application shall consist of:

(i) *General information.* The applicants' name, address, telephone number of contact person, ownership status and status as a State or local government entity.

(ii) *Legal authority.* A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(i) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

(iii) *Source identification.* (A) A description of the historic use of ordinances, guidance or other controls which limited the discharge of non-storm water discharges to any Publicly Owned Treatment Works serving the same area as the municipal separate storm sewer system.

(B) A USGS 7.5 minute topographic map (or equivalent topographic map with a scale between 1:10,000 and 1:24,000 if cost effective) extending one mile beyond the service boundaries of the municipal storm sewer system covered by the permit application. The following information shall be provided:

(*1*) The location of known municipal storm sewer system outfalls discharging to waters of the United States;

(*2*) A description of the land use activities (e.g. divisions indicating undeveloped, residential, commercial, agricultural and industrial uses) accompanied with estimates of population densities and projected growth for a ten year period within the drainage area served by the separate storm sewer. For each land use type, an estimate of an average runoff coefficient shall be provided;

(*3*) The location and a description of the activities of the facility of each currently operating or closed municipal landfill or other treatment, storage or disposal facility for municipal waste;

(*4*) The location and the permit number of any known discharge to the municipal storm sewer that has been issued a NPDES permit;

(*5*) The location of major structural controls for storm water discharge (retention basins, detention basins, major infiltration devices, etc.); and

(*6*) The identification of publicly owned parks, recreational areas, and other open lands.

(iv) *Discharge characterization.* (A) Monthly mean rain and snow fall estimates (or summary of weather bureau data) and the monthly average number of storm events.

(B) Existing quantitative data describing the volume and quality of discharges from the municipal storm sewer, including a description of the outfalls sampled, sampling procedures and analytical methods used.

(C) A list of water bodies that receive discharges from the municipal separate storm sewer system, including downstream segments, lakes and estuaries, where pollutants from the system discharges may accumulate and cause water degradation and a brief description of known water quality impacts. At a minimum, the description of impacts shall include a description of whether the water bodies receiving such discharges have been:

(*1*) Assessed and reported in section 305(b) reports submitted by the State, the basis for the assessment (evaluated or monitored), a summary of designated use support and attainment of Clean Water Act (CWA) goals (fishable and swimmable waters), and causes of nonsupport of designated uses;

(*2*) Listed under section 304(l)(1)(A)(i), section 304(l)(1)(A)(ii), or section 304(l)(1)(B) of the CWA that is not expected to meet water quality standards or water quality goals;

(*3*) Listed in State Nonpoint Source Assessments required by section 319(a) of the CWA that, without additional action to control nonpoint sources of pollution, cannot reasonably be expected to attain or maintain water quality standards due to storm sewers, construction, highway maintenance and runoff from municipal landfills and municipal sludge adding significant pollution (or contributing to a violation of water quality standards);

(*4*) Identified and classified according to eutrophic condition of publicly owned lakes listed in State reports required under section 314(a) of the CWA (include the following: A description of those publicly owned lakes for

which uses are known to be impaired; a description of procedures, processes and methods to control the discharge of pollutants from municipal separate storm sewers into such lakes; and a description of methods and procedures to restore the quality of such lakes);

(*5*) Areas of concern of the Great Lakes identified by the International Joint Commission;

(*6*) Designated estuaries under the National Estuary Program under section 320 of the CWA;

(*7*) Recognized by the applicant as highly valued or sensitive waters;

(*8*) Defined by the State or U.S. Fish and Wildlife Services's National Wetlands Inventory as wetlands; and

(*9*) Found to have pollutants in bottom sediments, fish tissue or biosurvey data.

(D) *Field screening.* Results of a field screening analysis for illicit connections and illegal dumping for either selected field screening points or major outfalls covered in the permit application. At a minimum, a screening analysis shall include a narrative description, for either each field screening point or major outfall, of visual observations made during dry weather periods. If any flow is observed, two grab samples shall be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a narrative description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observations regarding the potential presence of non-storm water discharges or illegal dumping shall be provided. In addition, a narrative description of the results of a field analysis using suitable methods to estimate pH, total chlorine, total copper, total phenol, and detergents (or surfactants) shall be provided along with a description of the flow rate. Where the field analysis does not involve analytical methods approved under 40 CFR part 136, the applicant shall provide a description of the method used including the name of the manufacturer of the test method along with the range and accuracy of the test. Field screening points shall be either major outfalls or other outfall points (or any other point of access such as manholes) randomly located throughout the storm sewer system by placing a grid over a drainage system map and identifying those cells of the grid which contain a segment of the storm sewer system or major outfall. The field screening points shall be established using the following guidelines and criteria:

(*1*) A grid system consisting of perpendicular north-south and east-west lines spaced ¼ mile apart shall be overlayed on a map of the municipal storm sewer system, creating a series of cells;

(*2*) All cells that contain a segment of the storm sewer system shall be identified; one field screening point shall be selected in each cell; major outfalls may be used as field screening points;

(*3*) Field screening points should be located downstream of any sources of suspected illegal or illicit activity;

(*4*) Field screening points shall be located to the degree practicable at the farthest manhole or other accessible location downstream in the system, within each cell; however, safety of personnel and accessibility of the location should be considered in making this determination;

(*5*) Hydrological conditions; total drainage area of the site; population density of the site; traffic density; age of the structures or buildings in the area; history of the area; and land use types;

(*6*) For medium municipal separate storm sewer systems, no more than 250 cells need to have identified field screening points; in large municipal separate storm sewer systems, no more than 500 cells need to have identified field screening points; cells established by the grid that contain no storm sewer segments will be eliminated from consideration; if fewer than 250 cells in medium municipal sewers are created, and fewer than 500 in large systems are created by the overlay on the municipal sewer map, then all those cells which contain a segment of the sewer system shall be subject to field screening (unless access to the separate storm sewer system is impossible); and

(*7*) Large or medium municipal separate storm sewer systems which are

unable to utilize the procedures described in paragraphs (d)(1)(iv)(D) (*1*) through (*6*) of this section, because a sufficiently detailed map of the separate storm sewer systems is unavailable, shall field screen no more than 500 or 250 major outfalls respectively (or all major outfalls in the system, if less); in such circumstances, the applicant shall establish a grid system consisting of north-south and east-west lines spaced ¼ mile apart as an overlay to the boundaries of the municipal storm sewer system, thereby creating a series of cells; the applicant will then select major outfalls in as many cells as possible until at least 500 major outfalls (large municipalities) or 250 major outfalls (medium municipalities) are selected; a field screening analysis shall be undertaken at these major outfalls.

(E) *Characterization plan.* Information and a proposed program to meet the requirements of paragraph (d)(2)(iii) of this section. Such description shall include: the location of outfalls or field screening points appropriate for representative data collection under paragraph (d)(2)(iii)(A) of this section, a description of why the outfall or field screening point is representative, the seasons during which sampling is intended, a description of the sampling equipment. The proposed location of outfalls or field screening points for such sampling should reflect water quality concerns (*see* paragraph (d)(1)(iv)(C) of this section) to the extent practicable.

(v) *Management programs.* (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

(B) A description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.

(vi) *Fiscal resources.* (A) A description of the financial resources currently available to the municipality to complete part 2 of the permit application. A description of the municipality's budget for existing storm water programs, including an overview of the municipality's financial resources and budget, including overall indebtedness and assets, and sources of funds for storm water programs.

(2) *Part 2.* Part 2 of the application shall consist of:

(i) *Adequate legal authority.* A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;

(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;

(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

(E) Require compliance with conditions in ordinances, permits, contracts or orders; and

(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions

including the prohibition on illicit discharges to the municipal separate storm sewer.

(ii) *Source identification.* The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(*1*) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

(iii) *Characterization data.* When "quantitative data" for a pollutant are required under paragraph (d)(2)(iii)(A)(*3*) of this paragraph, the applicant must collect a sample of effluent in accordance with 40 CFR 122.21(g)(7) and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. The applicant must provide information characterizing the quality and quantity of discharges covered in the permit application, including:

(A) Quantitative data from representative outfalls designated by the Director (based on information received in part 1 of the application, the Director shall designate between five and ten outfalls or field screening points as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system or, where there are less than five outfalls covered in the application, the Director shall designate all outfalls) developed as follows:

(*1*) For each outfall or field screening point designated under this subparagraph, samples shall be collected of storm water discharges from three storm events occurring at least one month apart in accordance with the requirements at § 122.21(g)(7) (the Director may allow exemptions to sampling three storm events when climatic conditions create good cause for such exemptions);

(*2*) A narrative description shall be provided of the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(*3*) For samples collected and described under paragraphs (d)(2)(iii)(A)(*1*) and (A)(*2*) of this section, quantitative data shall be provided for: the organic pollutants listed in Table II; the pollutants listed in Table III (toxic metals, cyanide, and total phenols) of appendix D of 40 CFR part 122, and for the following pollutants:

Total suspended solids (TSS)
Total dissolved solids (TDS)
COD
BOD,
Oil and grease
Fecal coliform
Fecal streptococcus
pH
Total Kjeldahl nitrogen
Nitrate plus nitrite
Dissolved phosphorus
Total ammonia plus organic nitrogen
Total phosphorus

(*4*) Additional limited quantitative data required by the Director for determining permit conditions (the Director may require that quantitative data shall be provided for additional parameters, and may establish sampling conditions such as the location, season of sample collection, form of precipitation (snow melt, rainfall) and other parameters necessary to insure representativeness);

(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under § 122.21(c)(7)) for BOD$_5$, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including

any modelling, data analysis, and calculation methods;

(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(*1*) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section; and

(D) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

(iv) *Proposed management program.* A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls. Such programs shall be based on:

(A) A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls. At a minimum, the description shall include:

(*1*) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;

(*2*) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed. (Controls to reduce pollutants in discharges from municipal separate storm sewers containing construction site runoff are addressed in paragraph (d)(2)(iv)(D) of this section;

(*3*) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities;

(*4*) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible;

(*5*) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section); and

(*6*) A description of a program to reduce to the maximum extent practicable, pollutants in discharges from

municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

(B) A description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer. The proposed program shall include:

(*1*) A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers, uncontaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water (program descriptions shall address discharges or flows from fire fighting only where such discharges or flows are identified as significant sources of pollutants to waters of the United States);

(*2*) A description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens;

(*3*) A description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water (such procedures may include: sampling procedures for constituents such as fecal coliform, fecal streptococcus, surfactants (MBAS), residual chlorine, fluorides and potassium; testing with fluorometric dyes; or conducting in storm sewer inspections where safety and other considerations allow. Such description shall include the location of storm sewers that have been identified for such evaluation);

(*4*) A description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer;

(*5*) A description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers;

(*6*) A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials; and

(*7*) A description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary;

(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:

(*1*) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;

(*2*) Describe a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the

term of the permit, including the submission of quantitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

(D) A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include:

(*1*) A description of procedures for site planning which incorporate consideration of potential water quality impacts;

(*2*) A description of requirements for nonstructural and structural best management practices;

(*3*) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and

(*4*) A description of appropriate educational and training measures for construction site operators.

(v) *Assessment of controls.* Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.

(vi) *Fiscal analysis.* For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2)(iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination.

(viii) Where requirements under paragraph (d)(1)(iv)(E), (d)(2)(ii), (d)(2)(iii)(B) and (d)(2)(iv) of this section are not practicable or are not applicable, the Director may exclude any operator of a discharge from a municipal separate storm sewer which is designated under paragraph (a)(1)(v), (b)(4)(ii) or (b)(7)(ii) of this section from such requirements. The Director shall not exclude the operator of a discharge from a municipal separate storm sewer identified in appendix F, G, H or I of part 122, from any of the permit application requirements under this paragraph except where authorized under this section.

(e) *Application deadlines.* Any operator of a point source required to obtain a permit under paragraph (a)(1) of this section that does not have an effective NPDES permit covering its storm water outfalls shall submit an application in accordance with the following deadlines:

(1) *Individual applications.* (i) Except as provided in paragraph (e)(1)(ii) of this section, for any storm water discharge associated with industrial activity identified in paragraphs (b)(14) (i) through (xi) of this section, that is not part of a group application as described in paragraph (c)(2) of this section or which is not authorized by a storm water general permit, a permit application made pursuant to paragraph (C) of this section shall be submitted to the Director by October 1, 1992;

(ii) For any storm water discharge associated with industrial activity from a facility that is owned or operated by a municipality with a population of less than 100,000 other than an airport, powerplant, or uncontrolled sanitary landfill, permit applications requirements are reserved.

(2) For any group application submitted in accordance with paragraph (c)(2) of this section:

(i) *Part 1.* (A) Except as provided in paragraph (e)(2)(i)(B) of this section, part 1 of the application shall be submitted to the Director, Office of Wastewater Enforcement and Compliance by September 30, 1991;

(B) Any municipality with a population of less than 250,000 shall not be required to submit a part 1 application before May 18, 1992.

(C) For any storm water discharge associated with industrial activity from a facility that is owned or operated by a municipality with a population of less than 100,000 other than an airport, powerplant, or uncontrolled sanitary landfill, permit applications requirements are reserved.

(ii) Based on information in the part 1 application, the Director will approve or deny the members in the group application within 60 days after receiving part 1 of the group application.

(iii) *Part 2.* (A) Except as provided in paragraph (e)(2)(iii)(B) of this section, part 2 of the application shall be submitted to the Director, Office of Wastewater Enforcement and Compliance by October 1, 1992;

(B) Any municipality with a population of less than 250,000 shall not be required to submit a part 1 application before May 17, 1993.

(C) For any storm water discharge associated with industrial activity from a facility that is owned or operated by a municipality with a population of less than 100,000 other than an airport, powerplant, or uncontrolled sanitary landfill, permit applications requirements are reserved.

(iv) *Rejected facilities.* (A) Except as provided in paragraph (e)(2)(iv)(B) of this section, facilities that are rejected as members of the group shall submit an individual application (or obtain coverage under an applicable general permit) no later than 12 months after the date of receipt of the notice of rejection or October 1, 1992, whichever comes first.

(B) Facilities that are owned or operated by a municipality and that are rejected as members of part 1 group application shall submit an individual application no later than 180 days after the date of receipt of the notice of rejection or October 1, 1992, whichever is later.

(v) A facility listed under paragraph (b)(14) (i)-(xi) of this section may add on to a group application submitted in accordance with paragraph (e)(2)(i) of this section at the discretion of the Office of Water Enforcement and Permits, and only upon a showing of good cause by the facility and the group applicant; the request for the addition of the facility shall be made no later than February 18,1992; the addition of the facility shall not cause the percentage of the facilities that are required to submit quantitative data to be less than 10%, unless there are over 100 facilities in the group that are submitting quantitative data; approval to become part of group application must be obtained from the group or the trade association representing the individual facilities.

(3) For any discharge from a large municipal separate storm sewer system;

(i) Part 1 of the application shall be submitted to the Director by November 18, 1991;

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application;

(iii) Part 2 of the application shall be submitted to the Director by November 16, 1992.

(4) For any discharge from a medium municipal separate storm sewer system;

(i) Part 1 of the application shall be submitted to the Director by May 18, 1992.

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application.

(iii) Part 2 of the application shall be submitted to the Director by May 17, 1993.

(5) A permit application shall be submitted to the Director within 60 days of notice, unless permission for a later date is granted by the Director (*see* 40 CFR 124.52(c)), for:

(i) A storm water discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines that the discharge

contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States (see paragraph (a)(1)(v) of this section);

(ii) A storm water discharge subject to paragraph (c)(1)(v) of this section.

(6) Facilities with existing NPDES permits for storm water discharges associated with industrial activity shall maintain existing permits. Facilities with permits for storm water discharges associated with industrial activity which expire on or after May 18, 1992 shall submit a new application in accordance with the requirements of 40 CFR 122.21 and 40 CFR 122.26(c) (Form 1, Form 2F, and other applicable Forms) 180 days before the expiration of such permits.

(f) *Petitions.* (1) Any operator of a municipal separate storm sewer system may petition the Director to require a separate NPDES permit (or a permit issued under an approved NPDES State program) for any discharge into the municipal separate storm sewer system.

(2) Any person may petition the Director to require a NPDES permit for a discharge which is composed entirely of storm water which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(3) The owner or operator of a municipal separate storm sewer system may petition the Director to reduce the Census estimates of the population served by such separate system to account for storm water discharged to combined sewers as defined by 40 CFR 35.2005(b)(11) that is treated in a publicly owned treatment works. In municipalities in which combined sewers are operated, the Census estimates of population may be reduced proportional to the fraction, based on estimated lengths, of the length of combined sewers over the sum of the length of combined sewers and municipal separate storm sewers where an applicant has submitted the NPDES permit number associated with each discharge point and a map indicating areas served by combined sewers and the location of any combined sewer overflow discharge point.

(4) Any person may petition the Director for the designation of a large or medium municipal separate storm sewer system as defined by paragraphs (b)(4)(iv) or (b)(7)(iv) of this section.

(5) The Director shall make a final determination on any petition received under this section within 90 days after receiving the petition.

[55 FR 48063, Nov. 16, 1990, as amended at 56 FR 12100, Mar. 21, 1991; 56 FR 58554, Nov. 5, 1991; 57 FR 11412, Apr. 2, 1992]

§ 122.27 Silvicultural activities (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* Silvicultural point sources, as defined in this section, as point sources subject to the NPDES permit program.

(b) *Definitions.* (1) *Silvicultural point source* means any discernible, confined and discrete conveyance related to rock crushing, gravel washing, log sorting, or log storage facilities which are operated in connection with silvicultural activities and from which pollutants are discharged into waters of the United States. The term does not include non-point source silvicultural activities such as nursery operations, site preparation, reforestation and subsequent cultural treatment, thinning, prescribed burning, pest and fire control, harvesting operations, surface drainage, or road construction and maintenance from which there is natural runoff. However, some of these activities (such as stream crossing for roads) may involve point source discharges of dredged or fill material which may require a CWA section 404 permit (See 33 CFR 209.120 and part 233).

(2) *Rock crushing and gravel washing facilities* means facilities which process crushed and broken stone, gravel, and riprap (See 40 CFR part 436, subpart B, including the effluent limitations guidelines).

(3) *Log sorting and log storage facilities* means facilities whose discharges result from the holding of unprocessed wood, for example, logs or roundwood with bark or after removal of bark held in self-contained bodies of water (mill ponds or log ponds) or stored on land where water is applied intentionally on the logs (wet decking). (See 40 CFR part 429, subpart I, including the effluent limitations guidelines).

§ 122.28 General permits (applicable to State NPDES programs, see § 123.25).

(a) *Coverage.* The Director may issue a general permit in accordance with the following:

(1) *Area.* The general permit shall be written to cover a category of discharges or sludge use or disposal practices or facilities described in the permit under paragraph (a)(2)(ii) of this section, except those covered by individual permits, within a geographic area. The area shall correspond to existing geographic or political boundaries, such as:

(i) Designated planning areas under sections 208 and 303 of CWA;

(ii) Sewer districts or sewer authorities;

(iii) City, county, or State political boundaries;

(iv) State highway systems;

(v) Standard metropolitan statistical areas as defined by the Office of Management and Budget;

(vi) Urbanized areas as designated by the Bureau of the Census according to criteria in 30 FR 15202 (May 1, 1974); or

(vii) Any other appropriate division or combination of boundaries.

(2) *Sources.* The general permit may be written to regulate, within the area described in paragraph (a)(1) of this section, either:

(i) Storm water point sources; or

(ii) A category of point sources other than storm water point sources, or a category of "treatment works treating domestic sewage," if the sources or "treatment works treating domestic sewage" all:

(A) Involve the same or substantially similar types of operations;

(B) Discharge the same types of wastes or engage in the same types of sludge use or disposal practices;

(C) Require the same effluent limitations, operating conditions, or standards for sewage sludge use or disposal;

(D) Require the same or similar monitoring; and

(E) In the opinion of the Director, are more appropriately controlled under a general permit than under individual permits.

(b) *Administration.* (1) *In general.* General permits may be issued, modified, revoked and reissued, or terminated in accordance with applicable requirements of part 124 or corresponding State regulations. Special procedures for issuance are found at § 123.44 for States and § 124.58 for EPA.

(2) *Authorization to discharge, or authorization to engage in sludge use and disposal practices.* (i) Except as provided in paragraphs (b)(2)(v) and (b)(2)(vi) of this section, dischargers (or treatment works treating domestic sewage) seeking coverage under a general permit shall submit to the Director a written notice of intent to be covered by the general permit. A discharger (or treatment works treating domestic sewage) who fails to submit a notice of intent in accordance with the terms of the permit is not authorized to discharge, (or in the case of sludge disposal permit, to engage in a sludge use or disposal practice), under the terms of the general permit unless the general permit, in accordance with paragraph (b)(2)(v) of this section, contains a provision that a notice of intent is not required or the Director notifies a discharger (or treatment works treating domestic sewage) that it is covered by a general permit in accordance with paragraph (b)(2)(vi) of this section. A complete and timely notice of intent (NOI) to be covered in accordance with general permit requirements, fulfills the requirements for permit applications for purposes of §§ 122.6, 122.21 and 122.26.

(ii) The contents of the notice of intent shall be specified in the general permit and shall require the submission of information necessary for adequate program implementation, including at a minimum, the legal name and address of the owner or operator, the facility name and address, type of facility or discharges, and the receiving stream(s). General permits for storm water discharges associated with industrial activity from inactive mining, inactive oil and gas operations, or inactive landfills occurring on Federal lands where an operator cannot be identified may contain alternative

Resource Conservation and Recovery Act (42 U.S.C. 6901 *et seq.*))

[48 FR 14153, Apr. 1, 1983, as amended at 48 FR 39619, Sept. 1, 1983; 49 FR 38048, Sept. 26, 1984; 50 FR 6940, Feb. 19, 1985; 54 FR 18782, May 2, 1989; 55 FR 48072, Nov. 16, 1990; 57 FR 11412 and 11413, Apr. 2, 1992]

§ 122.29 New sources and new dischargers.

(a) *Definitions.* (1) *New source* and *new discharger* are defined in § 122.2. [See Note 2.]

(2) *Source* means any building, structure, facility, or installation from which there is or may be a discharge of pollutants.

(3) *Existing source* means any source which is not a new source or a new discharger.

(4) *Site* is defined in § 122.2;

(5) *Facilities or equipment* means buildings, structures, process or production equipment or machinery which form a permanent part of the new source and which will be used in its operation, if these facilities or equipment are of such value as to represent a substantial commitment to construct. It excludes facilities or equipment used in connection with feasibility, engineering, and design studies regarding the source or water pollution treatment for the source.

(b) *Criteria for new source determination.* (1) Except as otherwise provided in an applicable new source performance standard, a source is a "new source" if it meets the definition of "new source" in § 122.2, and

(i) It is constructed at a site at which no other source is located; or

(ii) It totally replaces the process or production equipment that causes the discharge of pollutants at an existing source; or

(iii) Its processes are substantially independent of an existing source at the same site. In determining whether these processes are substantially independent, the Director shall consider such factors as the extent to which the new facility is integrated with the existing plant; and the extent to which the new facility is engaged in the same general type of activity as the existing source.

(2) A source meeting the requirements of paragraphs (b)(1) (i), (ii), or (iii) of this section is a new source only if a new source performance standard is independently applicable to it. If there is no such independently applicable standard, the source is a new discharger. See § 122.2.

(3) Construction on a site at which an existing source is located results in a modification subject to § 122.62 rather than a new source (or a new discharger) if the construction does not create a new building, structure, facility, or installation meeting the criteria of paragraph (b)(1) (ii) or (iii) of this section but otherwise alters, replaces, or adds to existing process or production equipment.

(4) Construction of a new source as defined under § 122.2 has commenced if the owner or operator has:

(i) Begun, or caused to begin as part of a continuous on-site construction program:

(A) Any placement, assembly, or installation of facilities or equipment; or

(B) Significant site preparation work including clearing, excavation or removal of existing buildings, structures, or facilities which is necessary for the placement, assembly, or installation of new source facilities or equipment; or

(ii) Entered into a binding contractual obligation for the purchase of facilities or equipment which are intended to be used in its operation with a reasonable time. Options to purchase or contracts which can be terminated or modified without substantial loss, and contracts for feasibility engineering, and design studies do not constitute a contractual obligation under the paragraph.

(c) *Requirement for an environmental impact statement.* (1) The issuance of an NPDES permit to new source:

(i) By EPA may be a major Federal action significantly affecting the quality of the human environment within the meaning of the National Environmental Policy Act of 1969 (NEPA), 33 U.S.C. 4321 *et seq.* and is subject to the environmental review provisions of NEPA as set out in 40 CFR part 6, subpart F. EPA will determine whether an Environmental Impact Statement (EIS) is required under § 122.21(k) (special provisions for applications from new sources) and 40 CFR part 6, subpart F;

(ii) By an NPDES approved State is not a Federal action and therefore does not require EPA to conduct an environmental review.

(2) An EIS prepared under this paragraph shall include a recommendation either to issue or deny the permit.

(i) If the recommendation is to deny the permit, the final EIS shall contain the reasons for the recommendation and list those measures, if any, which the applicant could take to cause the recommendation to be changed;

(ii) If the recommendation is to issue the permit, the final EIS shall recommend the actions, if any, which the permittee should take to prevent or minimize any adverse environmental impacts;

(3) The Regional Administrator, to the extent allowed by law, shall issue, condition (other than imposing effluent limitations), or deny the new source NPDES permit following a complete evaluation of any significant beneficial and adverse impacts of the proposed action and a review of the recommendations contained in the EIS or finding of no significant impact.

(d) *Effect of compliance with new source performance standards.* (The provisions of this paragraph do not apply to existing sources which modify their pollution control facilities or construct new pollution control facilities and achieve performance standards, but which are neither new sources or new dischargers or otherwise do not meet the requirements of this paragraph.)

(1) Except as provided in paragraph (d)(2) of this section, any new discharger, the construction of which commenced after October 18, 1972, or new source which meets the applicable promulgated new source performance standards before the commencement of discharge, may not be subject to any more stringent new source performance standards or to any more stringent technology-based standards under section 301(b)(2) of CWA for the soonest ending of the following periods:

(i) Ten years from the date that construction is completed;

(ii) Ten years from the date the source begins to discharge process or other nonconstruction related wastewater; or

(iii) The period of depreciation or amortization of the facility for the purposes of section 167 or 169 (or both) of the Internal Revenue Code of 1954.

(2) The protection from more stringent standards of performance afforded by paragraph (d)(1) of this section does not apply to:

(i) Additional or more stringent permit conditions which are not technology based; for example, conditions based on water quality standards, or toxic effluent standards or prohibitions under section 307(a) of CWA; or

(ii) Additional permit conditions in accordance with § 125.3 controlling toxic pollutants or hazardous substances which are not controlled by new source performance standards. This includes permit conditions controlling pollutants other than those identified as toxic pollutants or hazardous substances when control of these pollutants has been specifically identified as the method to control the toxic pollutants or hazardous substances.

(3) When an NPDES permit issued to a source with a "protection period" under paragraph (d)(1) of this section will expire on or after the expiration of the protection period, that permit shall require the owner or operator of the source to comply with the requirements of section 301 and any other then applicable requirements of CWA immediately upon the expiration of the protection period. No additional period for achieving compliance with these requirements may be allowed except when necessary to achieve compliance with requirements promulgated less than 3 years before the expiration of the protection period.

(4) The owner or operator of a new source, a new discharger which commenced discharge after August 13, 1979, or a recommencing discharger shall install and have in operating condition, and shall "start-up" all pollution control equipment required to meet the conditions of its permits before beginning to discharge. Within the shortest feasible time (not to exceed 90 days), the owner or operator must meet all permit conditions. The requirements of this paragraph do not apply if the owner or operator is

issued a permit containing a compliance schedule under § 122.47(a)(2).

(5) After the effective date of new source performance standards, it shall be unlawful for any owner or operator of any new source to operate the source in violation of those standards applicable to the source.

(Information collection requirements in paragraph (c)(5) were approved by the Office of Management and Budget under control number 2040-0078)

[48 FR 14153, Apr. 1, 1983, as amended at 49 FR 38048, Sept. 26, 1984; 50 FR 4514, Jan. 31, 1985; 50 FR 6941, Feb. 19, 1985; 54 FR 255, Jan. 4, 1989]

EDITORIAL NOTE: At 54 FR 255, Jan. 4, 1989, § 122.29 was amended by removing subparagraphs (c) (4) and (5). At 54 FR 258, Jan. 4, 1989, § 122.29 was further amended by correcting (c)(4)(i). For the convenience of the user, the corrected paragraph follows as it had already been removed.

§ 122.29 New sources and new dischargers.

* * * * *

(c) * * *

(4)(i) No on-site construction of a new source for which an EIS is required shall commence before final Agency action in issuing a final permit incorporating appropriate EIS-related requirements, or before execution by the applicant of a legally binding written agreement which requires compliance with all such requirements, unless such construction is determined by the Regional Administrator not to cause significant or irreversible adverse environmental impact. The provisions of any agreement entered into under this paragraph shall be incorporated as conditions of the NPDES permit when it is issued.

* * * * *

Subpart C—Permit Conditions

§ 122.41 Conditions applicable to all permits (applicable to State programs, see § 123.25).

The following conditions apply to all NPDES permits. Additional conditions applicable to NPDES permits are in § 122.42. All conditions applicable to NPDES permits shall be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to these regulations (or the corresponding approved State regulations) must be given in the permit.

(a) *Duty to comply.* The permittee must comply with all conditions of this permit. Any permit noncompliance constitutes a violation of the Clean Water Act and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application.

(1) The permittee shall comply with effluent standards or prohibitions established under section 307(a) of the Clean Water Act for toxic pollutants and with standards for sewage sludge use or disposal established under section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if the permit has not yet been modified to incorporate the requirement.

(2) The Clean Water Act provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any such sections in a permit issued under section 402, or any requirement imposed in a pretreatment program approved under sections 402(a)(3) or 402(b)(8) of the Act, is subject to a civil penalty not to exceed $25,000 per day for each violation. The Clean Water Act provides that any person who *negligently* violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, or any requirement imposed in a pretreatment program approved under section 402(a)(3) or 402(b)(8) of the Act, is subject to criminal penalties of $2,500 to $25,000 per day of violation, or imprisonment of not more than 1 year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than $50,000 per day of violation, or by imprisonment of not more than 2 years, or both. Any person who *knowingly* violates such sections, or such conditions or limitations is subject to criminal penalties of $5,000 to $50,000 per day of violation, or imprisonment fur not more than 3 years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than $100,000 per day of violation, or imprisonment of not more than 6 years, or both. Any person who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than $250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than $500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than $1,000,000 and can be fined up to $2,000,000 for second or subsequent convictions.

(3) Any person may be assessed an administrative penalty by the Administrator for violating section 301, 302, 306, 307, 308, 318 or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed $10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed $25,000. Penalties for Class II violations are not to exceed $10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed $125,000.

(b) *Duty to reapply.* If the permittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the permittee must apply for and obtain a new permit.

(c) *Need to halt or reduce activity not a defense.* It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

(d) *Duty to mitigate.* The permittee shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

(e) *Proper operation and maintenance.* The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems which are installed by a permittee only when the operation is necessary to achieve compliance with the conditions of the permit.

(f) *Permit actions.* This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

(g) *Property rights.* This permit does not convey any property rights of any sort, or any exclusive privilege.

(h) *Duty to provide information.* The permittee shall furnish to the Director, within a reasonable time, any information which the Director may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit or to determine compliance with this permit. The permittee shall also furnish to the Director upon request, copies of records required to be kept by this permit.

(i) *Inspection and entry.* The permittee shall allow the Director, or an authorized representative (including an authorized contractor acting as a representative of the Administrator), upon presentation of credentials and

other documents as may be required by law, to:

(1) Enter upon the permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit;

(2) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit;

(3) Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; and

(4) Sample or monitor at reasonable times, for the purposes of assuring permit compliance or as otherwise authorized by the Clean Water Act, any substances or parameters at any location.

(j) *Monitoring and records.* (1) Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

(2) Except for records of monitoring information required by this permit related to the permittee's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 CFR part 503), the permittee shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of the sample, measurement, report or application. This period may be extended by request of the Director at any time.

(3) Records of monitoring information shall include:

(i) The date, exact place, and time of sampling or measurements;

(ii) The individual(s) who performed the sampling or measurements;

(iii) The date(s) analyses were performed;

(iv) The individual(s) who performed the analyses;

(v) The analytical techniques or methods used; and

(vi) The results of such analyses.

(4) Monitoring results must be conducted according to test procedures approved under 40 CFR part 136 or, in the case of sludge use or disposal, approved under 40 CFR part 136 unless otherwise specified in 40 CFR part 503, unless other test procedures have been specified in the permit.

(5) The Clean Water Act provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or both.

(k) *Signatory requirement.* (1) All applications, reports, or information submitted to the Director shall be signed and certified. (See § 122.22)

(2) The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than 6 months per violation, or by both.

(l) *Reporting requirements.* (1) *Planned changes.* The permittee shall give notice to the Director as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required only when:

(i) The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in § 122.29(b); or

(ii) The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in the permit, nor to notification requirements under § 122.42(a)(1).

(iii) The alteration or addition results in a significant change in the permittee's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan;

(2) *Anticipated noncompliance.* The permittee shall give advance notice to the Director of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements.

(3) *Transfers.* This permit is not transferable to any person except after notice to the Director. The Director may require modification or revocation and reissuance of the permit to change the name of the permittee and incorporate such other requirements as may be necessary under the Clean Water Act. (See § 122.61; in some cases, modification or revocation and reissuance is mandatory.)

(4) *Monitoring reports.* Monitoring results shall be reported at the intervals specified elsewhere in this permit.

(i) Monitoring results must be reported on a Discharge Monitoring Report (DMR) or forms provided or specified by the Director for reporting results of monitoring of sludge use or disposal practices.

(ii) If the permittee monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR part 136 or, in the case of sludge use or disposal, approved under 40 CFR part 136 unless otherwise specified in 40 CFR part 503, or as specified in the permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Director.

(iii) Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified by the Director in the permit.

(5) *Compliance schedules.* Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit shall be submitted no later than 14 days following each schedule date.

(6) *Twenty-four hour reporting.* (i) The permittee shall report any noncompliance which may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the permittee becames aware of the circumstances. A written submission shall also be provided within 5 days of the time the permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

(ii) The following shall be included as information which must be reported within 24 hours under this paragraph.

(A) Any unanticipated bypass which exceeds any effluent limitation in the permit (See § 122.41(g).

(B) Any upset which exceeds any effluent limitation in the permit.

(C) Violation of a maximum daily discharge limitation for any of the pollutants listed by the Director in the permit to be reported within 24 hours. (See § 122.44(g).)

(iii) The Director may waive the written report on a case-by-case basis for reports under paragraph (l)(6)(ii) of this section if the oral report has been received within 24 hours.

(7) *Other noncompliance.* The permittee shall report all instances of noncompliance not reported under paragraphs (l)(4), (5), and (6) of this section, at the time monitoring reports are submitted. The reports shall contain the information listed in paragraph (l)(6) of this section.

(8) *Other information.* Where the permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Director, it shall promptly submit such facts or information.

(m) *Bypass*—(1) *Definitions.* (i) *Bypass* means the intentional diversion of waste streams from any portion of a treatment facility.

(ii) *Severe property damage* means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

(2) *Bypass not exceeding limitations.* The permittee may allow any bypass to occur which does not cause effluent limitations to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions of paragraphs (m)(3) and (m)(4) of this section.

(3) *Notice*—(i) *Anticipated bypass.* If the permittee knows in advance of the need for a bypass, it shall submit prior notice, if possible at least ten days before the date of the bypass.

(ii) *Unanticipated bypass.* The permittee shall submit notice of an unanticipated bypass as required in paragraph (l)(6) of this section (24-hour notice).

(4) *Prohibition of bypass.* (i) Bypass is prohibited, and the Director may take enforcement action against a permittee for bypass, unless:

(A) Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;

(B) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and

(C) The permittee submitted notices as required under paragraph (m)(3) of this section.

(ii) The Director may approve an anticipated bypass, after considering its adverse effects, if the Director determines that it will meet the three conditions listed above in paragraph (m)(4)(i) of this section.

(n) *Upset*—(1) *Definition. Upset* means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

(2) *Effect of an upset.* An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of paragraph (n)(3) of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review.

(3) *Conditions necessary for a demonstration of upset.* A permittee who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

(i) An upset occurred and that the permittee can identify the cause(s) of the upset;

(ii) The permitted facility was at the time being properly operated; and

(iii) The permittee submitted notice of the upset as required in paragraph (l)(6)(ii)(B) of this section (24 hour notice).

(iv) The permittee complied with any remedial measures required under paragraph (d) of this section.

(4) *Burden of proof.* In any enforcement proceeding the permittee seeking to establish the occurrence of an upset has the burden of proof.

EFFECTIVE DATE NOTE: Information collection requirements in paragraph (l)(1) have not been approved by the Office of Management and Budget, and are not effective, pending OMB approval.

EDITORIAL NOTE: In paragraphs (j)(2), (4) and (l)(4)(ii), there are references to 40 CFR part 503. These references are to a proposed rule which was published at 54 FR 5746, Feb. 6, 1989. There is currently no part 503 in the Code of Federal Regulations.

§ 122.42 Additional conditions applicable to specified categories of NPDES permits (applicable to State NPDES programs, see § 123.25).

The following conditions, in addition to those set forth in § 122.41, apply to all NPDES permits within the categories specified below:

(a) *Existing manufacturing, commercial, mining, and silvicultural dischargers.* In addition to the reporting requirements under § 122.41(l), all existing manufacturing, commercial, mining, and silvicultural dischargers must notify the Director as soon as they know or have reason to believe:

(1) That any activity has occurred or will occur which would result in the discharge, on a routine or frequent basis, of any toxic pollutant which is not limited in the permit, if that discharge will exceed the highest of the following "notification levels":

(i) One hundred micrograms per liter (100 μg/l);

(ii) Two hundred micrograms per liter (200 μg/l) for acrolein and acrylonitrile; five hundred micrograms per liter (500 μg/l) for 2,4-dinitrophenol and for 2-methyl-4,6-dinitrophenol; and one milligram per liter (1 mg/l) for antimony;

(iii) Five (5) times the maximum concentration value reported for that pollutant in the permit application in accordance with § 122.21(g)(7); or

(iv) The level established by the Director in accordance with § 122.44(f).

(2) That any activity has occurred or will occur which would result in any discharge, on a non-routine or infrequent basis, of a toxic pollutant which is not limited in the permit, if that discharge will exceed the highest of the following "notification levels":

(i) Five hundred micrograms per liter (500 μg/l);

(ii) One milligram per liter (1 mg/l) for antimony;

(iii) Ten (10) times the maximum concentration value reported for that pollutant in the permit application in accordance with § 122.21(g)(7).

(iv) The level established by the Director in accordance with § 122.44(f).

(b) *Publicly owned treatment works.* All POTWs must provide adequate notice to the Director of the following:

(1) Any new introduction of pollutants into the POTW from an indirect discharger which would be subject to section 301 or 306 of CWA if it were directly discharging those pollutants; and

(2) Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of issuance of the permit.

(3) For purposes of this paragraph, adequate notice shall include information on (i) the quality and quantity of effluent introduced into the POTW, and (ii) any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW.

(c) *Municipal separate storm sewer systems.* The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the Director under § 122.26(a)(1)(v) of this part must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report shall include:

(1) The status of implementing the components of the storm water management program that are established as permit conditions;

(2) Proposed changes to the storm water management programs that are established as permit condition. Such proposed changes shall be consistent with § 122.26(d)(2)(iii) of this part; and

(3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit appli-

cation under § 122.26(d)(2)(iv) and (d)(2)(v) of this part;

(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year;

(5) Annual expenditures and budget for year following each annual report;

(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs;

(7) Identification of water quality improvements or degradation;

(Information collection requirements in paragraph (a) were approved by the Office of Management and Budget under control number 2040-0045)

[48 FR 14153, Apr. 1, 1983, as amended at 49 FR 38049, Sept. 26, 1984; 50 FR 4514, Jan. 31, 1985; 55 FR 48073, Nov. 16, 1990]

§ 122.43 Establishing permit conditions (applicable to State programs, see § 123.25).

(a) In addition to conditions required in all permits (§§ 122.41 and 122.42), the Director shall establish conditions, as required on a case-by-case basis, to provide for and assure compliance with all applicable requirements of CWA and regulations. These shall include conditions under §§ 122.46 (duration of permits), 122.47(a) (schedules of compliance), 122.48 (monitoring), and for EPA permits only 122.47(b) (alternates schedule of compliance) and 122.49 (considerations under Federal law).

(b)(1) For a State issued permit, an applicable requirement is a State statutory or regulatory requirement which takes effect prior to final administrative disposition of a permit. For a permit issued by EPA, an applicable requirement is a statutory or regulatory requirement (including any interim final regulation) which takes effect prior to the issuance of the permit (except as provided in § 124.86(c) for NPDES permits being processed under subpart E or F of part 124). Section 124.14 (reopening of comment period) provides a means for reopening EPA permit proceedings at the discretion of the Director where new requirements become effective during the permitting process and are of sufficient magnitude to make additional proceedings desirable. For State and EPA administered programs, an applicable requirement is also any requirement which takes effect prior to the modification or revocation and reissuance of a permit, to the extent allowed in § 122.62.

(2) New or reissued permits, and to the extent allowed under § 122.62 modified or revoked and reissued permits, shall incorporate each of the applicable requirements referenced in §§ 122.44 and 122.45.

(c) *Incorporation.* All permit conditions shall be incorporated either expressly or by reference. If incorporated by reference, a specific citation to the applicable regulations or requirements must be given in the permit.

§ 122.44 Establishing limitations, standards, and other permit conditions (applicable to State NPDES programs, see § 123.25).

In addition to the conditions established under § 122.43(a), each NPDES permit shall include conditions meeting the following requirements when applicable.

(a) *Technology-based effluent limitations and standards* based on effluent limitations and standards promulgated under section 301 of CWA or new source performance standards promulgated under section 306 of CWA, on case-by-case effluent limitations determined under section 402(a)(1) of CWA, or on a combination of the two, in accordance with § 125.3. For new sources or new dischargers, these technology based limitations and standards are subject to the provisions of § 122.29(d) (protection period).

(b)(1) *Other effluent limitations and standards* under sections 301, 302, 303, 307, 318 and 405 of CWA. If any applicable toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under section 307(a) of CWA for a toxic pollutant and that standard or prohibition is more stringent than any limitation on the pollutant in the permit, the Director shall institute proceedings under these regulations to modify or revoke and reissue the permit to conform to the toxic effluent standard or prohibition. See also § 122.41(a).

(2) *Standards for sewage sludge use or disposal* under section 405(d) of the CWA unless those standards have been included in a permit issued under the appropriate provisions of subtitle C of the Solid Waste Disposal Act, Part C of Safe Drinking Water Act, the Marine Protection, Research, and Sanctuaries Act of 1972, or the Clean Air Act, or under State permit programs approved by the Administrator. When there are no applicable standards for sewage sludge use or disposal, the permit may include requirements developed on a case-by-case basis to protect public health and the environment from any adverse effects which may occur from toxic pollutants in sewage sludge. If any applicable standard for sewage sludge use or disposal is promulgated under section 405(d) of the CWA and that standard is more stringent than any limitation on the pollutant or practice in the permit, the Director may initiate proceedings under these regulations to modify or revoke and reissue the permit to conform to the standard for sewage sludge use or disposal.

(c) *Reopener clause:* for any discharger within a primary industry category (see appendix A), requirements under section 307(a)(2) of CWA as follows:

(1) On or before June 30, 1981: (i) If applicable standards or limitations have not yet been promulgated, the permit shall include a condition stating that, if an applicable standard or limitation is promulgated under sections 301(b)(2) (C) and (D), 304(b)(2), and 307(a)(2) and that effluent standard or limitation is more stringent than any effluent limitation in the permit or controls a pollutant not limited in the permit, the permit shall be promptly modified or revoked and reissued to conform to that effluent standard or limitation.

(ii) If applicable standards or limitations have been promulgated or approved, the permit shall include those standards or limitations. (If EPA approves existing effluent limitations or decides not to develop new effluent limitations, it will publish a notice in the FEDERAL REGISTER that the limitations are "approved" for the purpose of this regulation.)

(2) On or after the statutory deadline set forth in section 301(b)(2) (A), (C), and (E) of CWA, any permit issued shall include effluent limitations to meet the requirements of section 301(b)(2) (A), (C), (D), (E), (F), whether or not applicable effluent limitations guidelines have been promulgated or approved. These permits need not incorporate the clause required by paragraph (c)(1) of this section.

(3) The Director shall promptly modify or revoke and reissue any permit containing the clause required under paragraph (c)(1) of this section to incorporate an applicable effluent standard or limitation under sections 301(b)(2) (C) and (D), 304(b)(2) and 307(a)(2) which is promulgated or approved after the permit is issued if that effluent standard or limitation is more stringent than any effluent limitation in the permit, or controls a pollutant not limited in the permit.

(4) For any permit issued to a treatment works treating domestic sewage (including "sludge-only facilities"), the Director shall include a reopener clause to incorporate any applicable standard for sewage sludge use or disposal promulgated under section 405(d) of the CWA. The Director may promptly modify or revoke and reissue any permit containing the reopener clause required by this paragraph if the standard for sewage sludge use or disposal is more stringent than any requirements for sludge use or disposal in the permit, or controls a pollutant or practice not limited in the permit.

(d) *Water quality standards and State requirements:* any requirements in addition to or more stringent than promulgated effluent limitations guidelines or standards under sections 301, 304, 306, 307, 318 and 405 of CWA necessary to:

(1) Achieve water quality standards established under section 303 of the CWA, including State narrative criteria for water quality.

(i) Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged

at a level which will cause, have the reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality.

(ii) When determining whether a discharge causes, has the reasonable potential to cause, or contributes to an in-stream excursion above a narrative or numeric criteria within a State water quality standard, the permitting authority shall use procedures which account for existing controls on point and nonpoint sources of pollution, the variability of the pollutant or pollutant parameter in the effluent, the sensitivity of the species to toxicity testing (when evaluating whole effluent toxicity), and where appropriate, the dilution of the effluent in the receiving water.

(iii) When the permitting authority determines, using the procedures in paragraph (d)(1)(ii) of this section, that a discharge causes, has the reasonable potential to cause, or contributes to an in-stream excursion above the allowable ambient concentration of a State numeric criteria within a State water quality standard for an individual pollutant, the permit must contain effluent limits for that pollutant.

(iv) When the permitting authority determines, using the procedures in paragraph (d)(1)(ii) of this section, that a discharge causes, has the reasonable potential to cause, or contributes to an in-stream excursion above the numeric criterion for whole effluent toxicity, the permit must contain effluent limits for whole effluent toxicity.

(v) Except as provided in this subparagraph, when the permitting authority determines, using the procedures in paragraph (d)(1)(ii) of this section, toxicity testing data, or other information, that a discharge causes, has the reasonable potential to cause, or contributes to an in-stream excursion above a narrative criterion within an applicable State water quality standard, the permit must contain effluent limits for whole effluent toxicity. Limits on whole effluent toxicity are not necessary where the permitting authority demonstrates in the fact sheet or statement of basis of the NPDES permit, using the procedures in paragraph (d)(1)(ii) of this section, that chemical-specific limits for the effluent are sufficient to attain and maintain applicable numeric and narrative State water quality standards.

(vi) Where a State has not established a water quality criterion for a specific chemical pollutant that is present in an effluent at a concentration that causes, has the reasonable potential to cause, or contributes to an excursion above a narrative criterion within an applicable State water quality standard, the permitting authority must establish effluent limits using one or more of the following options:

(A) Establish effluent limits using a calculated numeric water quality criterion for the pollutant which the permitting authority demonstrates will attain and maintain applicable narrative water quality criteria and will fully protect the designated use. Such a criterion may be derived using a proposed State criterion, or an explicit State policy or regulation interpreting its narrative water quality criterion, supplemented with other relevant information which may include: EPA's Water Quality Standards Handbook, October 1983, risk assessment data, exposure data, information about the pollutant from the Food and Drug Administration, and current EPA criteria documents; or

(B) Establish effluent limits on a case-by-case basis, using EPA's water quality criteria, published under section 307(a) of the CWA, supplemented where necessary by other relevant information; or

(C) Establish effluent limitations on an indicator parameter for the pollutant of concern, provided:

(*1*) The permit identifies which pollutants are intended to be controlled by the use of the effluent limitation;

(*2*) The fact sheet required by § 124.56 sets forth the basis for the limit, including a finding that compliance with the effluent limit on the indicator parameter will result in controls on the pollutant of concern which are sufficient to attain and maintain applicable water quality standards;

(*3*) The permit requires all effluent and ambient monitoring necessary to show that during the term of the permit the limit on the indicator parameter continues to attain and maintain applicable water quality standards; and

(*4*) The permit contains a reopener clause allowing the permitting authority to modify or revoke and reissue the permit if the limits on the indicator parameter no longer attain and maintain applicable water quality standards.

(vii) When developing water quality-based effluent limits under this paragraph the permitting authority shall ensure that:

(A) The level of water quality to be achieved by limits on point sources established under this paragraph is derived from, and complies with all applicable water quality standards; and

(B) Effluent limits developed to protect a narrative water quality criterion, a numeric water quality criterion, or both, are consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA pursuant to 40 CFR 130.7.

(2) Attain or maintain a specified water quality through water quality related effluent limits established under section 302 of CWA;

(3) Conform to the conditions to a State certification under section 401 of the CWA that meets the requirements of § 124.53 when EPA is the permitting authority. If a State certification is stayed by a court of competent jurisdiction or an appropriate State board or agency, EPA shall notify the State that the Agency will deem certification waived unless a finally effective State certification is received within sixty days from the date of the notice. If the State does not forward a finally effective certification within the sixty day period, EPA shall include conditions in the permit that may be necessary to meet EPA's obligation under section 301(b)(1)(C) of the CWA;

(4) Conform to applicable water quality requirements under section 401(a)(2) of CWA when the discharge affects a State other than the certifying State;

(5) Incorporate any more stringent limitations, treatment standards, or schedule of compliance requirements established under Federal or State law or regulations in accordance with section 301(b)(1)(C) of CWA;

(6) Ensure consistency with the requirements of a Water Quality Management plan approved by EPA under section 208(b) of CWA;

(7) Incorporate section 403(c) criteria under part 125, subpart M, for ocean discharges;

(8) Incorporate alternative effluent limitations or standards where warranted by "fundamentally different factors," under 40 CFR part 125, subpart D;

(9) Incorporate any other appropriate requirements, conditions, or limitations (other than effluent limitations) into a new source permit to the extent allowed by the National Environmental Policy Act, 42 U.S.C. 4321 *et seq.* and section 511 of the CWA, when EPA is the permit issuing authority. (See § 122.29(c)).

(e) *Technology-based controls for toxic pollutants.* Limitations established under paragraphs (a), (b), or (d) of this section, to control pollutants meeting the criteria listed in paragraph (e)(1) of this section. Limitations will be established in accordance with paragraph (e)(2) of this section. An explanation of the development of these limitations shall be included in the fact sheet under § 124.56(b)(1)(i).

(1) Limitations must control all toxic pollutants which the Director determines (based on information reported in a permit application under § 122.21(g)(7) or (10) or in a notification under § 122.42(a)(1) or on other information) are or may be discharged at a level greater than the level which can be achieved by the technology-based treatment requirements appropriate to the permittee under § 125.3(c); or

(2) The requirement that the limitations control the pollutants meeting the criteria of paragraph (e)(1) of this section will be satisfied by:

(i) Limitations on those pollutants; or

(ii) Limitations on other pollutants which, in the judgment of the Director, will provide treatment of the pol-

lutants under paragraph (e)(1) of this section to the levels required by § 125.3(c).

(f) *Notification level.* A "notification level" which exceeds the notification level of § 122.42(a)(1)(i), (ii) or (iii), upon a petition from the permittee or on the Director's initiative. This new notification level may not exceed the level which can be achieved by the technology-based treatment requirements appropriate to the permittee under § 125.3(c)

(g) *Twenty-four hour reporting.* Pollutants for which the permittee must report violations of maximum daily discharge limitations under § 122.41(l)(6)(ii)(C) (24-hour reporting) shall be listed in the permit. This list shall include any toxic pollutant or hazardous substance, or any pollutant specifically identified as the method to control a toxic pollutant or hazardous substance.

(h) *Durations* for permits, as set forth in § 122.46.

(i) *Monitoring requirements.* In addition to § 122.48, the following monitoring requirements:

(1) To assure compliance with permit limitations, requirements to monitor:

(i) The mass (or other measurement specificed in the permit) for each pollutant limited in the permit;

(ii) The volume of effluent discharged from each outfall;

(iii) Other measurements as appropriate including pollutants in internal waste streams under § 122.45(i); pollutants in intake water for net limitations under § 122.45(f); frequency, rate of discharge, etc., for noncontinuous discharges under § 122.45(e); pollutants subject to notification requirements under § 122.42(a); and pollutants in sewage sludge or other monitoring as specified in 40 CFR part 503; or as determined to be necessary on a case-by-case basis pursuant to section 405(d)(4) of the CWA.

(iv) According to test procedures approved under 40 CFR part 136 for the analyses of pollutants having approved methods under that part, and according to a test procedure specified in the permit for pollutants with no approved methods.

(2) Except as provided in paragraphs (i)(4) and (i)(5) of this section, requirements to report monitoring results shall be established on a case-by-case basis with a frequency dependent on the nature and effect of the discharge, but in no case less than once a year. For sewage sludge use or disposal practices, requirements to monitor and report results shall be established on a case-by-case basis with a frequency dependent on the nature and effect of the sewage sludge use or disposal practice; minimally this shall be as specified in 40 CFR part 503 (where applicable), but in no case less than once a year.

(3) Requirements to report monitoring results for storm water discharges associated with industrial activity which are subject to an effluent limitation guideline shall be established on a case-by-case basis with a frequency dependent on the nature and effect of the discharge, but in no case less than once a year.

(4) Requirements to report monitoring results for storm water discharges associated with industrial activity (other than those addressed in paragraph (i)(3) of this section) shall be established on a case-by-case basis with a frequency dependent on the nature and effect of the discharge. At a minimum, a permit for such a discharge must require:

(i) The discharger to conduct an annual inspection of the facility site to identify areas contributing to a storm water discharge associated with industrial activity and evaluate whether measures to reduce pollutant loadings identified in a storm water pollution prevention plan are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed;

(ii) The discharger to maintain for a period of three years a record summarizing the results of the inspection and a certification that the facility is in compliance with the plan and the permit, and identifying any incidents of non-compliance;

(iii) Such report and certification be signed in accordance with § 122.22; and

(iv) Permits for storm water discharges associated with industrial activity from inactive mining operations may, where annual inspections are impracticable, require certification once every three years by a Registered Professional Engineer that the facility is in compliance with the permit, or alternative requirements.

(5) Permits which do not require the submittal of monitoring result reports at least annually shall require that the permittee report all instances of noncompliance not reported under § 122.41(l) (1), (4), (5), and (6) at least annually.

(j) *Pretreatment program for POTWs.* Requirements for POTWs to:

(1) Identify, in terms of character and volume of pollutants, any significant indirect dischargers into the POTW subject to pretreatment standards under section 307(b) of CWA and 40 CFR part 403.

(2) Submit a local program when required by and in accordance with 40 CFR part 403 to assure compliance with pretreatment standards to the extent applicable under section 307(b). The local program shall be incorporated into the permit as described in 40 CFR part 403. The program shall require all indirect dischargers to the POTW to comply with the reporting requirements of 40 CFR part 403.

(3) For POTWs which are "sludge-only facilities," a requirement to develop a pretreatment program under 40 CFR part 403 when the Director determines that a pretreatment program is necessary to assure compliance with Section 405(d) of the CWA.

(k) *Best management practices* to control or abate the discharge of pollutants when:

(1) Authorized under section 304(e) of CWA for the control of toxic pollutants and hazardous substances from ancillary industrial activities;

(2) Numeric effluent limitations are infeasible, or

(3) The practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of CWA.

(l) *Reissued permits.* (1) Except as provided in paragraph (l)(2) of this section when a permit is renewed or reissued, interim effluent limitations, standards or conditions must be at least as stringent as the final effluent limitations, standards, or conditions in the previous permit (unless the circumstances on which the previous permit was based have materially and substantially changed since the time the permit was issued and would constitute cause for permit modification or revocation and reissuance under § 122.62.)

(2) In the case of effluent limitations established on the basis of Section 402(a)(1)(B) of the CWA, a permit may not be renewed, reissued, or modified on the basis of effluent guidelines promulgated under section 304(b) subsequent to the original issuance of such permit, to contain effluent limitations which are less stringent than the comparable effluent limitations in the previous permit.

(i) Exceptions—A permit with respect to which paragraph (l)(2) of this section applies may be renewed, reissued, or modified to contain a less stringent effluent limitation applicable to a pollutant, if—

(A) Material and substantial alterations or additions to the permitted facility occurred after permit issuance which justify the application of a less stringent effluent limitation;

(B)(*I*) Information is available which was not available at the time of permit issuance (other than revised regulations, guidance, or test methods) and which would have justified the application of a less stringent effluent limitation at the time of permit issuance; or

(*2*) The Administrator determines that technical mistakes or mistaken interpretations of law were made in issuing the permit under section 402(a)(1)(b);

(C) A less stringent effluent limitation is necessary because of events over which the permittee has no control and for which there is no reasonably available remedy;

(D) The permittee has received a permit modification under section 301(c), 301(g), 301(h), 301(i), 301(k), 301(n), or 316(a); or

(E) The permittee has installed the treatment facilities required to meet the effluent limitations in the previous permit and has properly operated and maintained the facilities but has nevertheless been unable to achieve

APPENDIX F TO PART 122—INCORPORATED PLACES WITH POPULATIONS GREATER THAN 250,000 ACCORDING TO LATEST DECENNIAL CENSUS BY BUREAU OF CENSUS

State	Incorporated place
Alabama	Birmingham.
Arizona	Phoenix
	Tucson
California	Long Beach.
	Los Angeles.
	Oakland
	Sacramento
	San Diego
	San Francisco
	San Jose
Colorado	Denver
District of Columbia	
Florida	Jacksonville
	Miami
	Tampa
Georgia	Atlanta
Illinois	Chicago
Indiana	Indianapolis.
Kansas	Wichita
Kentucky	Louisville
Louisiana	New Orleans.
Maryland	Baltimore
Massachusetts	Boston
Michigan	Detroit
Minnesota	Minneapolis
	St Paul
Missouri	Kansas City
	St Louis
Nebraska	Omaha
New Jersey	Newark
New Mexico	Albuquerque
New York	Buffalo
	Bronx Borough
	Brooklyn Borough
	Manhattan Borough
	Queens Borough
	Staten Island Borough.
North Carolina	Charlotte
Ohio	Cincinnati
	Cleveland
	Columbus
	Toledo
Oklahoma	Oklahoma City.
	Tulsa
Oregon	Portland
Pennsylvania	Philadelphia
	Pittsburgh
Tennessee	Memphis
	Nashville/Davidson.
Texas	Austin
	Dallas
	El Paso
	Fort Worth
	Houston
	San Antonio
Virginia	Norfolk
	Virginia Beach
Washington	Seattle
Wisconsin	Milwaukee
