Figure 5. Regional Comparison of TSS Removal Performance (2ha)

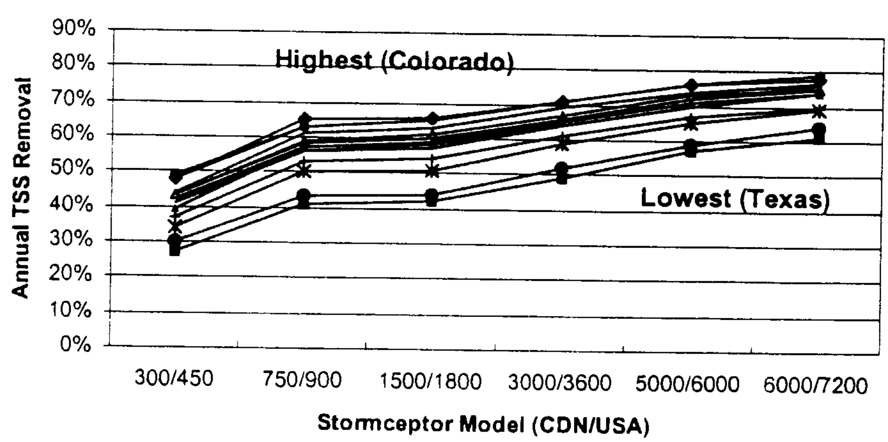

Figure 5. Regional Comparison of TSS Removal Performance

Rainfall Timestep

An analysis was conducted to determine the sensitivity of the model to changes in rainfall resolution. Results based on hourly rainfall data (0.25 mm resolution) were compared to those based on 15 minute rainfall data, to determine the impact of using the hourly data. Hourly data are more readily available than 15 minute data and most large cities have airports that collect rainfall on an hourly basis.

The model reads the hourly data as rainfall that falls during the first fifteen minute timestep of each hour. This will produce higher intensities since the rain is not distributed correctly over the entire hour. The greater intensity is compensated for, however, by the completeness of the hourly records which translates into a greater number of small rainfall values.

Four areas were analyzed (Rockville, Maryland; Boston, Massachusetts; Miami, Florida; and Houston, Texas). The results of this analysis (Figure 6) indicate that the use of hourly data does not significantly alter the TSS removal estimates for units that are designed to remove over 40% of the annual TSS load. Greater discrepancies can be expected at large ratios of drainage area to separator storage.

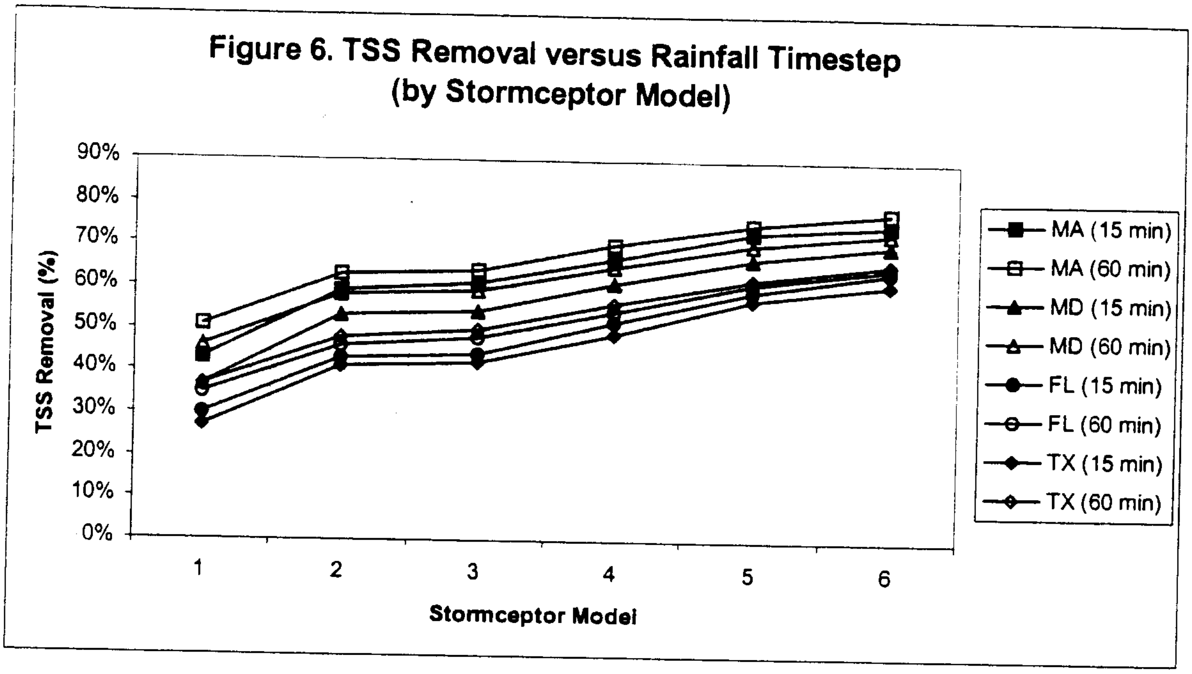

Figure 6. TSS Removal vs. Rainfall Timestep (by Stormceptor Model).

Conclusions

The TSS removal results were sensitive to the selection of settling velocities for the specified particle distribution. Differences in TSS removal of up to 40% were obtained, depending on the settling velocities that were evaluated.

Results were also affected by the TSS loading method. The use of an EMC underestimated TSS removal performance by approximately 15%, when compared to using the build-up and wash-off equations. This difference is expected since the EMC method increases the load that is by-passed and provides higher loads during higher treated flow rates when the detention time, and hence settling effectiveness of the unit, is reduced.

The model indicates that high percentages of the annual runoff can be treated with low-flow treatment devices such as the Stormceptor. The model also predicts that the TSS removal performance is less sensitive to the size of separator than observed from previous field studies.

Regional hydrology affected the TSS removal estimates provided by the model. Although differences of up to 20% were observed, significant hydrological differences between the sites were needed to obtain this variance. Most of the rainfall station locations tested provided TSS removal estimates similar to those of Toronto, where the original sizing guidelines were developed.

Testing the model with different rainfall timesteps (15 minute versus hourly) indicated that hourly rainfall records can provide an adequate estimation of performance if the rainfall is collected at adequate resolution (0.25 mm increments).

The modeling indicated that significant TSS removal rates can be achieved using small infrastructure control measures if the drainage area is limited. The results lend credence to the positive field monitoring results obtained to-date for the Stormceptor, and to the concept of small storm hydrology being the predominant parameter for urban stormwater quality design.

NPDES Phase II Cost Estimates

Andrew J. Reese, P.E.
Ogden Environmental and Energy Services, Inc.
Nashville, TN, 37211

Introduction

The United States Environmental Protection Agency (EPA) has published final rules expanding the existing stormwater NPDES permitting program to smaller cities and other urban areas throughout the United States. Due both to external pressures and directives from the current and past administrations, EPA is conscious of attempting to make the current stormwater NPDES program "cost-effective." For example:

> "EPA believes this rule will cost significantly less than the existing 1995 rule that is currently in place, and will result in significant monetized financial, recreational and health benefits, as well as benefits that EPA has been unable to monetize, including reduced scouring and erosion of streambeds, improved aesthetic quality of waters, reduced eutrophication of aquatic systems, benefit to wildlife and endangered and threatened species, tourism benefits, biodiversity benefits and reduced siting costs of reservoirs." [1]

> "... the Agency recognizes the continuing imperative to assure that environmental regulations accomplish statutory objectives in the least burdensome and most cost-effective fashion. As explained further in this preamble, the form and substance of NPDES permits to address the sources designated in today's proposal would provide greater flexibility for the newly covered sources than the existing "standard" NPDES permit."[2]

While the "benefit" side of the proposed regulations exists in the realm of gross estimates, the "cost" side is also filled with unknowns. What will the mandated and negotiated stormwater program cost a local community? Are there ways to reduce costs? What should a local community be doing now to prepare for this regulatory program? This paper seeks to address these related questions.

The final regulations were published on December 8, 1999 and the changes from the draft regulations are only minor[3]. But it is still not possible to say what the regulations will cost everyone in toto. This is so because:

- there is great flexibility inherent in the regulations to create a stormwater quality program tailored to meet an individual community's needs and situation;
- each permit writer has preferences and "hot buttons" that will color what any particular program will look like; and
- each community setting is different in terms of climate, topography, pollutants of concern, and current condition of local waters.

Basic Approach to Permitting

Under proposed § 123.35(g), an NPDES permitting authority issues a general permit to authorize stormwater discharges from regulated small municipal separate storm sewer systems. The NPDES permitting authority will also provide a menu of regionally appropriate and field-tested Best Management Practices (BMPs) that the permitting authority determines to be "cost-effective." The regulated small municipal separate storm sewer systems could choose to select from this menu or select other BMPs that they feel are appropriate.

Under Phase II each regulated community will need to develop a set of BMPs under each of six specific program minimums. These BMPs can be any combination of programs, structures and other controls that, in the agreed opinion of the permit writer and the regulated community, meet the standard of reducing pollution discharge to waters of the state to the Maximum Extent Practicable (MEP). In this process, permittees and permit writers would evaluate the proposed stormwater management controls to determine whether reduction of pollutants to the MEP could be achieved with the identified BMPs. EPA envisions that this evaluative process would consider such factors as condition of receiving waters, specific local concerns, and other aspects included in a comprehensive watershed plan.

Under the proposed approach, implementation of BMPs consistent with stormwater management program requirements at § 122.34 and permit provisions at § 122.33 would constitute compliance with the standard of "reducing pollutants to the maximum extent practicable." That is, "if you do what you say you will do, you are by definition in compliance." It is important to note that states implementing their own NPDES programs may develop more stringent requirements than those proposed in the Federal Register. In fact, we anticipate that many states will require more specific and rigorous requirements under special circumstances relating to the condition of the receiving water within, and downstream from, the community. For example, if a certain stream is required to have a Total Maximum Daily Load (TMDL) or similar study performed on it (for example, a watershed assessment for the purposes of wastewater treatment plan permitting or expansion), the NPDES stormwater Phase II permit conditions may reflect the allocation of pollutants to that community.

The steps for a community are: (1) review the conditions of the general permit, (2) develop and submit a Notice of Intent (NOI) to comply with the general NPDES permit through description of a BMP-based program under each of the six minimum controls or program areas (see below), (3) negotiate this proposed program with the permit writer, (4) receive approval of the submittal, and (5) begin implementation of the conditions and programs described in the NOI including record keeping and submittal of appropriate reports describing attainment of "measurable goals" for each BMP as described in the NOI.

Current NPDES Phase II Program Cost Estimates

There is naturally much speculation on the actual program elements and costs for a particular stormwater program developed under Phase II. There have been several attempts at estimating Phase II program costs based on current costs of "similar" programs.

In the draft regulations, EPA had provided estimates of the probable cost implications of the NPDES Phase II Permit. These estimates were based on summary information from the permit applications from 21 Phase I cities. Very high and very low figures were thrown out by EPA in developing these estimates. Figure 1 shows the summary table developed by EPA.

The range depicted in Figure 1 is from $1.39 to $7.83 per person per year for the first permit five-year period, and $1.28 to $5.63 for other permit cycles. For a city of 50,000 that is a very wide range of $69,500 to $391,500 annually for the first permit cycle. This is clearly not helpful in attempting to estimate a specific community's costs.

There is question about the vagueness in the regulatory language, and the high degree of potential flexibility inherent in briefly described program elements. For example, for the first of the minimum controls the regulatory language states:

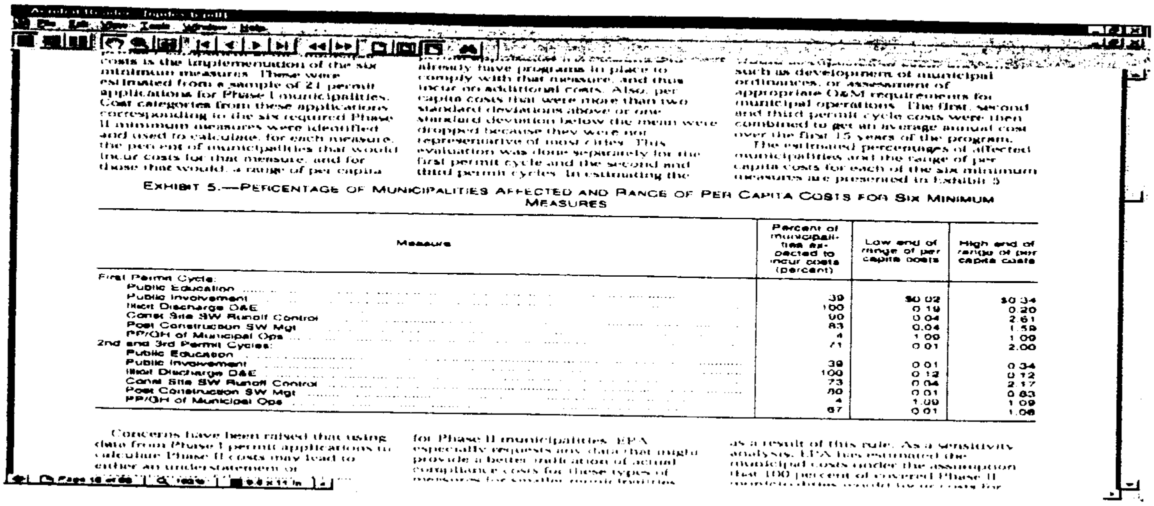

EXHIBIT 5.—PERCENTAGE OF MUNICIPALITIES AFFECTED AND RANGE OF PER CAPITA COSTS FOR SIX MINIMUM MEASURES

Measure	Percent of municipalities expected to incur costs (percent)	Low end of range of per capita costs	High end of range of per capita costs
First Permit Cycle:			
Public Education	39	$0.02	$0.34
Public Involvement	100	0.19	0.20
Illicit Discharge D&E	90	0.04	2.61
Const Site SW Runoff Control	83	0.04	1.59
Post Construction SW Mgt	4	1.00	1.00
PP/GH of Municipal Ops	71	0.01	2.00
2nd and 3rd Permit Cycles:			
Public Education	39	0.01	0.34
Public Involvement	100	0.12	0.12
Illicit Discharge D&E	73	0.04	2.17
Const Site SW Runoff Control	80	0.01	0.83
Post Construction SW Mgt	4	1.09	1.09
PP/GH of Municipal Ops	67	0.01	1.06

Figure 1. EPA Cost Estimates for Phase II NPDES Compliance.

1. Public education and outreach on storm water impacts[4].. You must implement a public education program to distribute educational materials to the community or conduct equivalent outreach activities about the impacts of storm water discharges on water bodies and the steps that can be taken to reduce storm water pollution.

   (You may use stormwater educational materials provided by your State, Tribe, EPA, or, subject to the approval of the local government, environmental or other public interest or trade organizations. The materials or outreach programs should inform individuals and households about the steps they can take, such as ensuring proper septicsystem maintenance, limiting the use and runoff of garden chemicals, becoming involved in local stream restoration activities that are coordinated by youth service and conservation corps and other citizen groups, and participating in storm drain stenciling, to reduce storm water pollution. In addition, some of the materials or outreach programs should be directed toward targeted groups of commercial, industrial, and institutional entities likely to have significant storm water impacts. For example, information to restaurants on the impact of grease clogging storm drains and to garages on the impact of oil discharges. You are encouraged to tailor your outreach program to address the viewpoints and concerns of all communities, particularly minority and disadvantaged communities, as well as children.)

The "regulatory" wording in parentheses is not mandatory but suggested. There is wide room for interpretation of the intensity and detail necessary to accomplish this minimum control. The devil is always in the details, and there will always be great variability in what two different programs intend to do to accomplish the same general goals.

NAFSMA (1999a, 1999b) published a survey on potential Phase II program costs responded to by 121 cities and counties nationally. Ten communities responded with programs that had three or more suggested elements in the first minimum control: Public Education and Outreach. The annual per capita costs for these ten ranged from $0.04 to $1.17 – again a wide range.

Of those responding, only one community stated that it had program activity in each of the six minimum control measure areas and it spent $15.11 per capita annually, well above the EPA estimate (the city has a population of about 25,000). Of the 121 respondents only 26 had programs in at least three (most had only three) of the six mandatory minimum control areas, and these can be considered far from complete. Figure 2 shows the distribution of costs for these 26 programs. The vertical axis is the annual per capita cost for these elements. The median was $1.44 and the average was $4.07. The low value was $0.04 and the high was $26.00.

[4]Federal Register, January 9,1998, p. 1639.

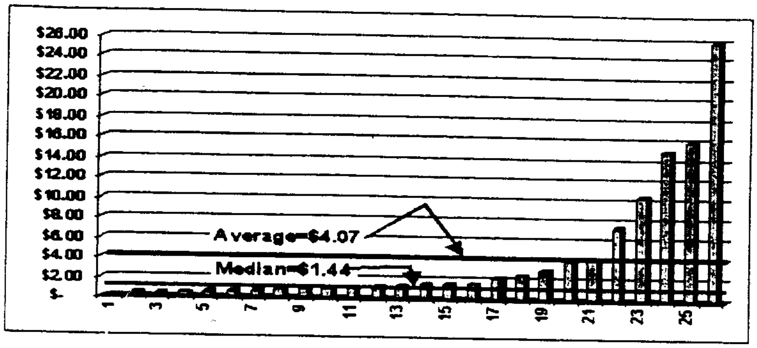

Figure 2. NAFSMA Study Program Costs.

We can speculate that if many of these communities had a fully developed Phase II program, the average costs could more than double, since each community would be adding both new program areas and upgrading their existing programs they had to make them comply with the details of the Phase II permit writers requirements.

In the final regulations, USEPA took a different approach to making estimates of the costs of compliance, using both the NAFSMA information and past experience with Phase I (EPA, 1999). EPA estimated annual costs for the municipal programs based on a fixed cost component and a variable cost component. The fixed cost component included costs for the municipal application, record keeping, and reporting activities. On average, EPA estimated annual costs of $1,525 per municipality. Variable costs include the costs associated with annual operations for the six minimum measures and are calculated at a rate of $8.93 annually per household (assuming 2.62 persons per household). The the cost estimating equation is:

Annual cost = $1,525 + population/2.62*$8.93

Finally, rule of thumb estimates based on the author's experience working in over 100 communities indicate that comprehensive stormwater programs that include advanced stormwater quality programs cost between $7.00 and $20.00 per capita per year – above the EPA estimates. The quality portion is normally between 20 and 30% of the total average program cost.

Estimating Costs from Anticipated Programs[5]

The methods used above do not provide details of the components of the stormwater programs resulting in the costs, and thus are not very helpful in assisting other communities in their thinking about the regulations. An effort was made to develop cost estimate ranges based on a direct interpretation of the stormwater regulations as applied to example communities at each end of the spectrum, in terms of size and intensity of water quality program. This has an advantage in that it deals directly with the stormwater regulatory requirements and illustrates specific program components so that we can control and define all details. The following sub-sections will develop two hypothetical permit applications for the six minimum controls.

The Two Permittees

Permittee one ("Smallville") is a community of 10,000 that is adjacent to a larger city that has obtained a Phase I permit or that can assist Smallville in many of its permit responsibilities. It is a small bedroom community interested in compliance with minimum disruption and cost. It does not really have an engineering or planning component of its city staff, but relies on a city administrator and hired consultants.

[5] Based on a presentation made by Andy Reese of Ogden Environmental at the APWA seminar, "Designing and Implementing an Effective Storm Water Management Program, Denver, 1998.

R0019754

Permittee two ("Midtown") is a larger and more self-contained community with a population of 50,000 located within an urbanizing county whose total population makes it a designated "urbanized area." It is aggressively annexing growth areas, and has a thriving economy. It has a City Engineer/Public Works director, road maintenance staff, and other municipal capabilities and resources. It also has a growing stormwater quantity program and wishes to bring quality together with quantity in a comprehensive and integrated approach. It wants to take advantage of its GIS database and capability.

The Programs

We can assume that contained within. or subsequent to obtaining the general permit, the permit writer will publish a list of regionally appropriate BMPs to be used in permit applications. The general permit will have narrative effluent limitations which describe goals or narrative standards for each of the minimum controls. Each permittee must then develop basic program objectives and measurable standards (not included here) under the goals provided by USEPA for each of the six minimum controls. These measurable standards can be stated in terms of actions taken or results achieved. It is best to state them in terms of things that can be controlled and which do not have uncontrollable and unpredictable results.

It is also smart to schedule the programs (the schedule is not demonstrated here) in terms of phases, pilot programs, demonstration projects, trials, etc., with an evaluation process at some point in the permit. It should then be written into the NOI that this program will be modified, expanded, curtailed or even abandoned if it is not effective.

Smallville sought to obey only the letter of the law, but did not see many ways to proceed. It had no real stormwater program, no known water quality problems, and few current responsibilities. This community sought to take advantage of "big brother" next door in joint programs or education, and to adopt more regionally uniform development regulations enforced locally. Smallville sought to fund any program needs through budget changes and through economies gained by taking advantage of regional programs, free information, and expanding duties of existing staff.

Midtown sought to meet the program minimums in a more proactive way focusing on perceived needs within the community. They took advantage of the strength of existing local programs, a strong economy, a strong environmental awareness, and outside assistance where available in the form of copied resources and shared efforts. Midtown expanded its current program using EPA suggestions to build a more comprehensive and meaningful program in several key areas[6]. Because they did not have the ability to try to work regionally (the adjacent county had no resources for developing a stormwater program, but would cooperate as necessary) it needed to build the program alone and to work extra-territorially as appropriate. Midtown looked at each program to insure the existence of: adequate legal authority, competent technical approach, dedicated financial resources and appropriate administrative procedures and staffing.

Because program funding became an issue, Midtown sought to establish a stormwater user fee system (often called a stormwater utility) to provide stable, adequate and equitable funds. The costs and steps of the utility development are not included here.

Program Objectives

Table 1 develops the basic objectives of each of the programs in each of the six minimum areas. In real life these objectives would be developed through a series of discussions with staff and, perhaps, a citizen's group, and through early coordination with the permit writer.

Table 2, which is attached as an Appendix, gives basic cost-estimate information for the two programs. The costs are approximate and would vary depending on how all costs are accounted for, availability of staff, etc. The intent is to give ballpark estimates and not to quibble over details. In these estimates all personnel time is costed at $50/hr regardless of

[6] NAFSMA has taken an earlier version of the Midtown values, refined them, and developed a minimal and advanced program concept out of this information. That information can be obtained from NAFSMA by calling 202-218-4122.

the source of the labor (in-house or contracted). This corresponds to a fully burdened salary rate plus allocated overhead costs for a mid-level technical person.

Table 1. Basic Program Objectives

Smallville	Midtown
Public Education and Outreach on Storm Water Impacts	
1. Acquire and mail existing public domain informational brochures 2. Encourage and facilitate newspaper articles 3. Educate the few industrial and commercial stakeholders individually	1. Acquire and mail existing and specifically pertinent public domain informational brochures to the general public 2. Develop a stratified database of stakeholder groups and develop and execute targeted education programs 3. Develop and implement elementary school education programs with preexisting curriculum 4. Develop and advertise complaint hotline as a pollution hotline 5. Develop press information and briefings with the objective of having a quarterly news article 6. Develop and make available a slide show and speakers bureau
Public Involvement/Participation	
1. Develop and implement a citizens advisory group appointed by the mayor 2. Encourage citizen participation in the neighboring city's programs for used oil, household hazardous waste, adopt-a-stream, etc. through news articles in local neighborhood newspaper	1. Develop and implement a stratified and diverse citizens advisory group/task force 2. Develop a citizen monitoring and/or adopt-a-stream program -- may be partially federally funded 3. Develop a student storm drain stenciling program and student dry weather screening program (see illicit connections program) 4. Encourage the development of watershed groups for each major watershed within the jurisdiction (see BMP control)
Illicit Discharge Detection and Elimination	
1. Develop a stormwater major outfall map on USGS base map 2. Modify slightly and adopt a generic ordinance available from the state or other organization.	1. Develop a major stormwater system map and inventory on existing GIS topo. Base mapping 2. Cross-reference map with existing databases on NPDES permit holders (available from the state) and SARA Title III database to identify likely source of dry weather pollution 3. Develop an illicit connections and illegal dumping ordinance including hotspot program 4. Perform initial dry weather screening in several key parts of the city by student volunteers 5. Develop inspection and enforcement capabilities and resources, and develop a detection program using city staff and a database of potential specific locations 6. Advertise hotline and write news articles (see public education) 7. Advertise existing private used oil disposal sites (see public education) 8. Educate all public employees to recognize and report problems (see pollution prevention) 9. Develop automotive industry sponsorship of spill prevention, materials management, and inspection and education programs (see public education for part of this)
Construction Site Storm Water Runoff Control	
1. Modify the adjacent city's sediment and erosion control ordinance to meet the regulatory minimums 2. Modify plans review and inspection procedures to include program minimums 3. Train city secretary to collect phone complaints and take appropriate action on erosion complaints 4. Advertise the complaint line as part of the public education program.	1. Modify existing sediment and erosion control ordinance to include all the requirements of the regulations 2. Add a BMP section and clear design steps to the drainage manual 3. Conduct training and familiarization program for developers, contractors and engineers, as well as in-house training for inspectors 4. Insure hotline has a formal and defined ability to receive and properly process erosion complaints 5. Upgrade the erosion control inspection and enforcement program

Post-Construction Storm Water Management in New Development and Redevelopment

1. Modify and adopt the adjacent city's stormwater ordinance regarding stormwater quantity and quality requirements to require similar controls and requirements. Add a maintenance requirement for BMPs and detention designs
2. Transform the inspection process to be able to inspect and enforce the new ordinance
3. Communicate the new requirements

1. Investigate and seek to institute zoning and policy changes to encourage density restrictions, transferable development rights, easier use of PUDs, limitation of impervious areas, conservation easements, mandatory floodplain dedication, etc.
2. Develop design guidance for the use of structural and non-structural BMPs
3. Develop and conduct an ongoing training program in the proper use of BMPs
4. Develop several BMP pilot projects to demonstrate and gain experience in BMP use
5. Overhaul and develop a comprehensive storm water ordinance for both water quantity and quality which includes mandatory use of BMPs and a maintenance requirement
6. Establish inspection program for private BMPs
7. Develop a monitoring program for local surface waters and to monitor their long term changes
8. Develop master plans for areas facing new development and establish and enact policy for regional BMP design and maintenance
9. Develop ways to improve extra-territorial planning and zoning input
10. Identify key environmentally sensitive areas and take steps to protect such areas through ordinance, overlay districts, etc.
11. Seek to establish local watershed organizations and neighborhood adopt-a-stream programs to assist in compliance and build public support

Pollution Prevention/Good Housekeeping for Municipal Operations

1. Review all current municipal procedures and document ways to reduce pollution
2. Make changes and document
3. Obtain and distribute materials on ways to reduce pollution as available and appropriate.

1. Conduct an outside review of all applicable procedures and criteria and make recommendations for change, implement changes
2. Obtain available information and conduct sensitivity and familiarization training for all applicable city employees
3. Seek to control floatables partially through adopt-a-stream program (see public participation)
4. Review existing flood control projects to insure advantage is taken of pollution reduction opportunities in design and operation

Hours are given in most cases. Italicized numbers are one-time costs that are experienced some time in the first permit period, assumed to fill the year in which they initiate. For ongoing programs, the program initiates beginning in the next year. The annual costs are the anticipated costs thereafter. I have assumed that all programs initiate in year one for the total five-year cost estimate. Obviously if a program initiates in a later year there will be savings in annual costs not incurred until the program initiates. The five-year total is four times the annual cost plus the initial cost -- making a total of five years. Some programs are five-year programs only, ending after the first cycle.

A schedule of tasks and of manpower requirements is not developed in this paper. The costs are given as initial costs and as ongoing costs (clear from the context of the table). Because not all program elements will be developed and in-place for the whole permit term, there will be a ramp-up process. Also, most of the program elements will continue to change and evolve over time, and program costs will also change (up or down) in subsequent permit periods. Extraordinary volunteer efforts have not been assumed (e.g. writing news articles, manning a hotline, etc.).

It is important to realize that some per capita costs go down for large cities because they have a large fixed component. For example, it may cost the same to develop a one-page brochure whether the city has 20,000 or 200,000 people in it. Expenses are based on medium levels of effort wherever appropriate. Detailed expenses (e.g. long distance phone costs) have not been estimated.

Measurable goals have also not been provided in this handout. But for each BMP measure or program it will be necessary to develop some measurable standard by which to judge success. The standard may be based on internal activities where it cannot easily be based on external results. For example, sending out brochures three times per year can be measured. But, the effectiveness of those brochures can only be measured through phone surveys of public knowledge before and after the brochure was sent, or based on statistics on increased public participation in whatever program the brochure was about. Neither measure is easy and reliable. And, should a certain percent "effectiveness increase" be stated as the measurable goal, if it is not achieved the city would, technically, be out of compliance. Better to make the goal controllable, especially in the first permit cycles when little is known on the effectiveness of certain (especially non-structural) BMP measures.

In no case have the costs of structural BMPs been estimated or included. Cost estimates are available in several references including the Center for Watershed Protection (1997) and Northern Virginia Planning District Commission (1994). The economic benefits of structural BMPs are discussed in EPA (1995).

Monitoring costs are developed for Midtown based on both receiving stream monitoring and some pilot BMP program monitoring; they are non-existent for Smallville. EPA estimates that about 50% of permittees may incur monitoring costs in subsequent permit cycles. It is also assumed that there are no TMDL or other types of watershed assessment actions going on in the watershed which may radically modify the permit conditions, and that there are no regional or state-wide programs which could simply be adopted by reference for portions of the NPDES minimum requirements.

Summary Results

The summary results of the analysis are presented in Table 3, in terms of cost per capita, for each of the programs in a manner comparable to the EPA estimates.

The range of results is similar to that experienced by EPA in making its original estimates of the cost of the Phase II program. The details of this program development can assist a local community in fashioning its own stormwater program in response to the regulations.

Table 3. Summary Results

Minimum Control	Annual Per-Capita Cost Small	 Midtown
First 5-year Permit Period		
1 - Public Ed.	0.39	1.24
2 - Public Inv.	0.21	0.62
3 - Illicit Connections	0.24	1.77
4 - Construction	0.20	0.96
5 - Post Const.	0.14	5.78
6 - Housekeeping	0.15	0.59
Totals	1.33	10.96
Subsequent 5-year Permit Periods		
1 - Public Ed.	0.36	1.40
2 - Public Inv.	0.24	0.51
3 - Illicit Connections	0.10	1.16
4 - Construction	0.18	1.10
5 - Post Const	0.13	1.26
6 - Housekeeping	0.10	0.20
Totals	1.11	5.63

The Phase II Action Plan

Given the great range in costs for the Phase II program it makes sense to get a jump start on planning for it. Many of the requirements or potential inter-local arrangements that could be developed take time to implement, more time than is available if the community waits until the general permit has been finalized and the NOI is due. There are steps that a local government should take now to prepare itself for the regulations and to position itself to meet compliance in the most cost-effective manner. These steps can be performed as part of a Phase II action plan:

1. Assess your status

Ask yourself if you are "in," "potentially in," or "out." Find out who else is in your category.

2. Get to know the permit writers

Find out what the permit writers are thinking about the permits, what the general permit will look like, when you will know more, how they will evaluate those potentially in, what other actions are going on in the state that may impact the permit, etc. Find out their ideas about what is important in the permit, what their special interests are, do they strongly support the permit, etc. Plan to establish an ongoing dialog.

3. Assess your surface waters

Find out if there are any ongoing actions which might designate surface waters in your jurisdiction as not meeting water quality standards. See if there are any planned watershed assessments or TMDL requirements coming in the future.

4. Assess your own program

How much of your own stormwater program looks like the regulations, even with some minor modifications. Can you get a jump on the requirements through transformation of your current programs?

5. Check out your neighbors

Are there some other programs nearby that might result in savings to you? Can you simply be covered under another program? Can parts of the requirements be waived because they are already being done by someone else? Can you plan to be part of a regional permit? Can you split the permit requirements with an adjacent entity and perform them together at savings to both of you?

6. Get a team together

Once you have answered some of these questions, it is time to pull the action team together. This may include only your own staff, a multi-disciplinary staff within your own jurisdiction, or a multi-jurisdictional or regional team. Get together to brainstorm and come up with a proposal to the permit writer which has mutual benefits. Remember, permit writers are being encouraged to think regionally and on a watershed basis.

7. Develop an action plan

Once you have a team, it is time to have a plan. Begin to formulate what you will need to do to apply for the permit and to carry it out. What might your program minimums look like? Are there some things you can do now, over several years, that you cannot afford to do in any one year, or that will take too long to get going if you wait until the permit is upon you? Can you begin the program transformation process now? What about data collection and mapping? Are there other uses for any data you will collect which will create synergy?

8. Get started

Some things are best started early. But do not jump the gun by committing resources in areas that are not yet anticipated to be firm. Ask the permit writer for his or her opinion.

Appendix

Table 2. Hypothetical Program Detail and Cost Summary

Smallville Program Element	Cost	Midtown Program Element	Cost
Public Education and Outreach on Stormwater Impacts			
Acquisition of available mailers and information from private institutions and other governmental entities - 20 hrs	$1,000	Acquisition of available mailers and information from private institutions and other governmental entities - 40 hrs	$2000
Keep up with available literature - 20 hrs/yr	$1000/yr	Keep up with available literature - 50 hrs/yr	$2500/yr
Coordination with neighborhood or shoppers newspaper to run articles on pollution sources - 4 hrs	$200	Stratified mailing database development for key stakeholder groups - commercial, automotive, minority, etc. - 100 hrs	$5,000
Develop 2 articles per year - 24 hrs/yr	$1,200/yr	Maintenance of database - 1 hr/wk	$2,600/yr
Coordination with the few individual potential sources of pollution about the program and their needs - 10 hrs	$500	Obtaining or developing educational materials for the specific outreach and stakeholders' programs, printing - 30 hr	$4,000
		Updating materials - 100 hrs/yr. Mailing 5,00 brochures per year	$7,500/yr
Series of three mailings - stuffers in utility bill	$3,600	Developing outreach and educational programs - 200 hrs	$10,000
One mailing per year afterward	$1,050/yr	Executing programs - updating, mailing, training, presentations - 200 hrs/yr	$12,000/yr
Responding to information requests - 1/2 hr/wk	$1,300/yr	Develop elementary and middle school education programs - preexisting Material/curriculum - free materials - 100 hrs	$5,000
		Ongoing program maintenance - refresher training, 5 schools - 100 hrs/yr	$5,000/yr
		Advertising of hotline - radio spots developed in-house and on public And other radio service spots and Newspaper ad, 3 times per year - 140 hrs - donated spots	$12,000/yr
		Develop white paper and press package - initial, brief - 32 hrs	$1,600
		Develop quarterly press package/briefing - brief press - 24 hrs per + expenses	$5,000/yr
		Development of a short, scripted stormwater pollution slide show, Presentation and speakers bureau & initial presentation - 60 hrs	$3,000
		Give presentations - 48 hrs/yr + expenses	$2,600/yr
		General informational brochure development and mailing - once/year - 60 hrs/yr - 25,000 inserts @ 0.50 per	$15,500/yr

The Stormwater Utility Concept in the Next Decade (Forget the Millenium)

Hector J. Cyre, President
Water Resource Associates, Inc.
Kirkland, WA

Abstract

In the mid-1970's, the first stormwater utilities were viewed as novel innovations in a few western states. Today, just 25 years later, more than four hundred cities, counties, and special districts throughout the United States have established such utilities. The pace is accelerating, and the stormwater utility concept has moved from a novelty to a well-accepted management and funding approach. What will we see in the next decade?

The stormwater utility has been adapted to fit diverse stormwater management problems and needs across the United States. Program content, priorities, institutional and organizational structures, and rate methodologies have been tailored to fit local needs and municipal authority and practices that vary widely. Courts in several states, and even federal courts, have been engaged in resolving key issues, including but not limited to the legality of utility service fees and the use of other funding mechanisms.

Major changes in the concept are still emerging today. Stormwater quality has become a concern equal to flood control in many communities. The National Pollutant Discharge Elimination System Phase II stormwater permits have spurred a new round of interest in the stormwater utility concept among smaller communities. This is creating a demand for basic utility concepts suitable for small cities and towns, which will need to be less costly and simpler to implement and maintain. Concurrently, more large cities, urban and urbanizing counties, regional service agencies such as metropolitan sewer districts, and consolidated governments are investigating the utility approach. They will require more complex institutional and funding solutions.

Stormwater management itself is also changing rapidly. Interest and involvement in stormwater management have broadened. As combined sewer overflow programs, total maximum daily load (TMDL) negotiations, stormwater quality mandates, coastal zone management measures, and safe drinking water supply issues converge, more wastewater and even water supply utilities are engaging in stormwater management. Regional resource management programs, watershed-based master planning, multi-purpose cooperative efforts involving urban forestry and riparian corridor protection, and use of state revolving loan funds for stormwater quality projects are becoming more common.

Local programs are quickly evolving as well. They have become more comprehensive in scope, more costly, and more demanding of technical and administrative skills while the pool of resources has grown relatively slowly. Local governments are accepting responsibility for more components of the stormwater drainage systems or, in some cases, being forced to take on such responsibilities. Open streams, historic remnants or agricultural ditches and levees, and detention facilities are being included among the system components actively improved, operated, and maintained by local stormwater management agencies. A preventive orientation that minimizes problems is replacing reactive measures. Technology, such as geographical information systems and hydrologic and hydraulic modeling, is more widely available and more productive in support of stormwater management, even in smaller communities. Public involvement in decisions, policies, and even the operation of systems is increasing.

This paper examines these and other emerging trends that characterize where stormwater utilities are heading in the next decade.

Pressures Moving us from Draining the Swamp to Stormwater Management

Historically, local drainage flooding, erosion, and water pollution due to stormwater runoff have not been high priorities for municipal governments. Unless homes, businesses, valuable agricultural land, or public properties have been devastated by flooding or other "drainage" problems, competing priorities have generally garnered more public concern and thus more support from elected officials. As a result, stormwater management operations, regulatory measures, and capital investment were historically ignored or, at best, received inadequate attention and erratic funding. Stormwater management has been a "stepchild" among municipal programs.

Symptoms of this past disregard are evident in many cities and counties.

- Improvements to stormwater systems in many communities have been limited to site-specific facilities installed by subdivision and commercial developers.
- Design practices have traditionally emphasized collecting and discharging runoff from each property as quickly as possible, without regard for downstream consequences.
- Public maintenance of stormwater systems has typically been reactive, and usually limited to road rights-of-way where uncontrolled stormwater might impact traffic safety, degrade the integrity of road surfaces, or threaten valuable adjacent properties.
- Maintenance of stormwater systems located outside of road corridors has commonly been left to private property owners, who are rarely capable of or willing to properly improve, clean, and repair such facilities.
- Municipal governments have usually improved and maintained individual structures or reaches instead of entire drainage systems, creating a patchwork of pieces having widely varying capacity and reliability.
- Failures of substandard components frequently impair the performance of otherwise adequate parts of the systems and damage properties near them.

As described by one municipal public works official, this stepchild is also the "sleeping giant" of unmet municipal infrastructure needs. Long-term stormwater remedial repair costs potentially exceed street and bridge repair needs in many older cities. Learning the high cost of correcting stormwater management deficiencies through master planning may have frightened as many local jurisdictions into inaction as it has spurred others. Perhaps the classic example is the stormwater master plan for Key West, Florida, which (in the early 1990's) identified $78 million in capital needs for that four square mile island community of less than 30,000 people.

Several factors are now changing local governments' traditional orientation to stormwater management.

- Citizens' service expectations are higher than in the past. In many cities and counties the number of citizen complaints about stormwater problems exceeds those about potholes in roads.
- Crumbling inlets and silt clogged ditches along roadsides spawn complaints even though they are on public property.
- Individual citizens or neighborhood associations no longer tolerate minor problems like localized flooding and channel erosion in backyards.

Environmental awareness in general is greater than in the past, and much more attention is being focused on stormwater impacts on receiving water quality in recent years.

- Stormwater management is now recognized as being part of an effective water resource protection strategy.
- Local concerns about acute threats of water pollution from spills and surreptitious dumping of toxic materials into stormwater systems are becoming more common.
- Phase II of the National Pollutant Discharge Elimination System (NPDES) stormwater permitting program is extending the program to smaller communities and those larger urban cities that escaped Phase I due to combined sewer service area exemptions.
- Programs proposed by local governments in NPDES Phase II permit applications will cost many thousands of dollars per year in cities, towns, and urban counties.

An encompassing, umbrella perspective of water resource management is emerging.

- Solutions to combined sewer overflow (CSO) problems will have to balance optimization of wastewater transport and treatment facilities against stormwater quantity and quality concerns.
- Several coastal states have instituted restrictive limitations on stormwater runoff to protect fragile estuaries and offshore waters from stormwater impacts.
- Drinking water supply watershed protection measures have imposed stormwater runoff regulations on developers independent of local stormwater management control practices.
- The point is becoming clear. Drinking water is water. Wastewater is water. Stormwater is water. Ground water is water. It is all WATER!

In the face of these pressures, the inadequacies of traditional stormwater management practices and funding are more widely recognized. More comprehensive and cohesive programs that address both stormwater quantity and quality are emerging. Clearly, however, the diversity of our communities and their problems and priorities means that no single solution is appropriate for every county, city, town, and village. Nor can a single funding method or stormwater utility rate structure fit every situation. Stormwater service fee methodologies can be designed to meet the specific needs of each community and provide equitable, adequate, and stable funding. The key is to tailor the funding to a clear program strategy.

"Stormwater Utility" can have Many Meanings

The fact that the simple term "stormwater utility" obscures the various meanings it may encompass, results in many misunderstandings. The term may imply a funding and accounting method, an organizational approach, a management concept, or a combination of all these. In reality a "utility" provides an umbrella under which the financial, organizational, and management approaches of each local stormwater program can be orchestrated to achieve practical and efficient solutions. Responsibilities may be consolidated and focused. Substantial new funding may be generated. New technology, different management concepts, and upgraded support systems may be adopted. A comprehensive, preventive program may be instituted.

Changes in the Approaching Decade

The spectrum of the stormwater utility concept will broaden more in the next 10 years than it has in the 25 years since the first utilities were established. The definition of "conventional" will change. Smaller towns and even villages will need to employ simpler variations of the concept. Larger cities, urban counties, consolidated governments, and coordinated regional approaches will demand more complex institutional, organizational, and funding solutions. The following are a few of the changes that may occur.

NPDES Phase II Will Impact the Stormwater Utility Concept

The findings of a survey of Phase II cities conducted by the National Association of Stormwater and Flood Management Agencies (NAFSMA) and published in July, 1999 indicate that 17% of all the respondent communities did not know how they would obtain funding to meet the stormwater regulations. Nearly half indicated they were not currently spending money on any of the stormwater program elements mandated by the regulations. Nearly three-quarters did not have a public information or education program as the regulations mandate. The 54% of respondents that currently fund programs or activities that fit the Phase II regulations on average spend upwards of $4,000 per square mile, or about $2.79 per capita. The implication seems clear that the NPDES Phase II program poses demands on local governments that may cause them to look to the stormwater utility concept to meet their stormwater quality program funding requirements.

The typical community that found the stormwater utility concept attractive in the past was a mid-size to larger city undergoing rapid development. Analyses of their stormwater management needs and programs typically revealed initial costs of service ranging from $25,000/sq. mile to $50,000/sq. mile annually. Costs per capita were typically $10 to $30 annually, with smaller cities trending toward the higher end of the range. In this context, the NAFSMA survey data is not alarming. It suggests that the Phase II program costs will likely be in the neighborhood of five (5) to fifteen (15) percent of the typical cost of stormwater management at the outset of utility-based programs.

Given its cost implications, NPDES Phase II makes the stormwater utility concept attractive to a broader variety of cities, counties, towns, and villages. Many communities that do not suffer flooding or other drainage problems will find the revenue potential and flexibility of a utility service fee attractive in the face of NPDES permit requirements. This will result in utility approaches that are outside the current spectrum of our experience. The needs in individual small communities may be less diverse than in large cities and urban counties, but the range will be cumulatively broader among the communities involved in NPDES Phase II than in those that have implemented utilities previously.

New institutional arrangements and relationships will have to be devised. The "utility" concept will take on new forms. Use of interlocal agreements among several local jurisdictions will increase, with responsibilities in some cases concentrated in one entity capable of providing the range of services required or, conversely, allocated among several participants.

The limits of existing authorizing legislation in some states will be tested. Many states will need to adopt new legislation and amendments, giving local governments greater flexibility in dealing with their water resource management responsibilities. Courts in the various states, and perhaps even federal courts, will be challenged to arrive at some sense of continuity among the institutional and financial solutions characterized as "stormwater utilities." Whether the court decisions will enable rather than hinder local governments' efforts to comply with NPDES mandates is a key question.

Organizationally and financially independent stormwater utilities have been common to date. In the next decade more stormwater utilities will be integrated with other water resource programs: organizationally, through formalized working relationships, or through financial arrangements. Other resource management agencies and programs, including but not limited to health departments and growth management authorities, will demand a seat at the stormwater table.

As NPDES permitting is applied to smaller urban areas of less than 100,000 people, more of the regional wastewater and water utilities already serving those communities will assume stormwater management responsibilities. In some cases their involvement will be limited to water quality aspects. In others they will address both quantity and quality. Funding of stormwater management costs will simply be assumed by some of these existing utility agencies without changes in their rate methodologies. Others will establish independent stormwater cost centers and rate components to track spending and allocate costs. Some will even modify existing wastewater and/or water rate methodologies to better reflect the impact of stormwater control on costs of service.

As more small cities and counties seek to establish utilities, stormwater funding strategies and rate methodologies will need to minimize implementation costs, yet be more flexible to accommodate stormwater quality management costs and unique local needs. The urge to use a "cookbook" solution will cause some to adopt approaches that are poorly suited to their circumstances. The desire for more precision in service fee rate algorithms will lead to methodologies that give an illusion of greater refinement without actually achieving it.

The mandated involvement of smaller jurisdictions and more rural communities in stormwater management will spawn "paper utilities" established solely to generate added revenue. Most of these will be initiated without the foundation of a solid program strategy. Accountability will become a key issue in some of these communities within a few years. Political challenges based on accountability issues will cause some of these storm water utilities to be melded into other local agencies or programs or even dissolved entirely before they have geared up to address their program priorities.

Despite NPDES storm water permit mandates, locally perceived needs will still predominate in setting priorities. Flooding will remain a more important local issue than storm water quality. NPDES mandates will influence actual spending priorities only slightly. Few communities will need to institute a utility service fee just to support their NPDES Phase II programs, but many will justify it (at least partially) on that basis because it is easy to blame unfunded federal mandates for new local taxes, assessments, and service fees.

The technological resources and expertise required will change from the traditional engineering emphasis to a multi-disciplinary mix. More natural science and social science skills will be needed. Operational practices will change as new technology and information management systems enable innovative approaches and result in greater efficiency. Greater use will be made of outsourcing because of limited personnel resources and the high cost of specialized equipment.

The Stormwater Utility Concept will Impact NPDES Phase II

Local approaches to stormwater management will influence the content of Phase II permits and attainment of NPDES objectives. Stormwater utilities offer both financial capability and flexibility. Except in rare instances, stormwater utilities will not be established strictly to address stormwater quality and NPDES permit requirements. Rather, they will have a broader stormwater management perspective. For many communities this will mean that water quality management activities to comply with their NPDES permit will be tacked onto other stormwater efforts. NPDES Phase II permitting will, within a few years, adjust to accommodate this reality in terms of permit mandates, technical and scientific standards, and reporting requirements.

Related issues ranging from combined sewer overflow strategies to drinking water protection will be melded with Phase II permit requirements because they have to be. Local stormwater quality management cannot independently meet the entire range of regulatory expectations operating strictly by reference to NPDES Phase II. Conflicts and primacy battles will identify inconsistencies and gaps between the issues and programs, and will ultimately filter down to changes in NPDES Phase II program priorities and the permit requirements imposed on local governments. The unknown is whether this result in responsibility shifting toward bigger agencies with more resources and a broader perspective or toward local entities that have the ability to identify and activate locally acceptable solutions.

Watershed-based regulatory programs will overtake jurisdictional-based regulatory programs like NPDES Phase II. The utility approach will broaden to encompass watersheds through agreements among counties and cities simply because utility funding has the proven capacity to generate sufficient funding in politically acceptable ways. The transition has already begun in some areas. Where TMDLs affecting discharges of all sorts into receiving waters are an issue, they will supercede the six minimum practices identified for NPDES Phase II, making them essentially meaningless. Scientifically based, public health driven measures to protect drinking water supplies, estuaries, lakes, fisheries, and recreational beaches will overwhelm the programmatic approach represented by NPDES Phase II.

You May Need a Program to Identify All the Players

Stormwater utilities were first established because no one wanted responsibility for stormwater management. Those involved were concerned only about the impact of stormwater on their "real" jobs. The utility approach provided a way to focus responsibility and obtain dedicated, if not always adequate, funding for stormwater management. If there had been another option that was working, the stormwater utility concept probably would never have emerged.

A key issue in the next decade will be whether stormwater utilities will be major protagonists or bit players among all those now crowding onto the stage. More established and better-funded water and wastewater utilities now recognize that stormwater influences their operations directly and, in some cases, dramatically. For example, TMDL-based wastewater discharge limitations may severely curtail development in some areas. Will local wastewater utility administrators (and local elected officials) allow independent stormwater management utilities to address stormwater quality when economic vitality is at risk?

Other interests are becoming involved in stormwater management. Water supply utilities face the requirements of federal and state legislation regulating sources of supply and treatment. Coastal zone management has recognized that many priority uses of the shorelines and near-shore areas are dependent on good water quality. Growth management is an emerging concept, and concurrency of infrastructure improvements with development approvals highlights the issue of deficient stormwater systems in many communities. Protection of endangered and threatened species, urban forestry, and riparian corridor protection all have a relationship with stormwater management.

The Walls Will ComeTumbling Down (or at least they better)

The proliferation of federal, state, and local water resource (and related) regulations in recent years has created an environment in which dispersed responsibility for water in various forms and for various purposes is rapidly becoming unworkable. The institutional barriers that have been created over the past hundred years or so to focus attention, energy, and responsibility no longer fit the public needs. As watershed-scale studies, planning efforts, and the concept of TMDLs clearly illustrate, water resources are inextricably bound together regardless of their temporary form, use, and character.

The next decade will see accelerating consolidation of water resource management responsibilities at the local level of government. This is contrary to the control interests of some individuals and entities, and will not happen silently or easily. Will cities, counties, and special districts relinquish a little (or a lot) of their control over water resources through interlocal agreements? Will they accept a regional entity for water supply, wastewater treatment, stormwater management, or even water quality? What will be the effect on stormwater utilities?

What are the organizational implications of the coming changes in storm water management? Realistically, local governments change slowly. Public Works and Street Departments have historically been the lead organizations of storm water programs, but they rarely have had much involvement in water quality issues. If storm water quality begins to influence local priorities, it is more likely that water and wastewater utilities will assume storn water management responsibilities from Public Works and Street Departments than the reverse. Public Works agencies will have to upgrade their engineering and scientific capability or risk losing their storm water management role to water and wastewater utilities that are typically well-established, well-funded, and well-understood by the public.

The Ability to Innovate Will Exceed the Need

Most of the early stormwater utilities programs were rather narrowly focused, and the funding mechanisms supporting them were relatively simple. In recent years, however, there has been a shift toward more sophisticated and complex approaches to all aspects of stormwater management--from master planning to rate methodology design. Much of the credit goes to the explosive growth in information processing capability associated with the computer revolution of the past 20 years. It is not clear, however, that much of the added capability to innovate is necessary to meet stormwater management needs. This is not to suggest that opportunities to improve should be ignored simply because they are based on increasing capability to do so. The following examples demonstrate how the ability to innovate in stormwater through technology can run amok, and suggest how it should be managed to the benefit of people and the environment.

There is no substitute for understanding what is really important. One Southeastern United States city invested over $1 million dollars assembling a highly detailed location inventory of its stormwater systems on a relatively sophisticated data processing platform. Unfortunately, the need for the inventory was not premised on a clear program strategy, nor was adequate funding available or established concurrently to support capital improvements or maintenance enhancements that could be facilitated by the inventory. The local elected officials finally tired of the seemingly mindless spending on the inventory and refused to discuss program improvements. Today, nearly 10 years later, the inventory has not been maintained and is out of date, and few improvements have been made in the stormwater management program.

What is technically possible does not always make common sense, and what makes sense is not always technically possible. A Northeastern city recognized that the stormwater component of its wastewater service fee rate methodology (one that was based on water meter size and internalized within its water/wastewater rates) was not reasonably allocating the cost of stormwater services and facilities across the community. Change to a more rational approach was desired, so a thorough assessment of the range of options was undertaken. A broadly representative advisory committee aided in the selection process. A relatively simple stormwater rate concept was selected that segregates stormwater funding from wastewater and water service. It will allocate a portion of the cost of stormwater service on the basis of gross area and a portion on the basis of impervious area. Once the impact of the change on certain rate payers was recognized, however, the advisory committee decided that phasing in the new rate over three years was a better idea than making the change in one step. While the technical support requirements of the phased approach are not especially demanding, the public information and education challenge is enormous. Not only must the new rate methodology explained to the public; it and the phase-in concept must be explained every year for three years.

Errors by a Few Will Make Life Miserable for Many

As the number of stormwater utilities grows, there is a natural tendency among municipal managers to assume that the process and results have become standardized, and the experiences of another community can simply be transferred. In an effort to save money, some cities and counties have established utilities without sufficient foundation and have even adopted service fee ordinances without the benefit of a cost of service analysis or a rate study. Such misjudgments have led to some monumental errors that have the potential to erode if not destroy the viability of the utility concept in a region, a state, or even nationally.

One city recently established a stormwater utility and adopted rates based on internal analyses that did not define a program, project the cost of service, or estimate the rate base available to generate revenue. As a result, the initial service fee billing was for nearly three times as much total revenue as the administration had indicated it hoped to raise for stormwater management. Furthermore, sufficient public information and education had not been conducted prior to the initial billing, so the public did not understand the purpose of the billing. A lawsuit was filed, and a same judgement on behalf of the plaintiff has resulted in the servie fees being rescinded and revenues returned with interest.

Expectations Will Advance Faster than Programs

One common experience of the cities and counties that have established stormwater utilities is that public expectations for the program have exceeded the utility's ability to perform. This means that creating accurate expectations before a utility is established must be a high priority. One cause for unfulfilled expectations is that stormwater utility revenue streams are usually insufficient to address all the accumulated problems in a relatively short time. Initial stormwater utility service fees have typically been less than $3 month for single-family residences.

Perhaps more significant, however, is the fact that most stormwater utilities inherit programs and systems that are not only deficient, but also do not offer an adequate foundation for a good, more comprehensive, program. Utilities often must invest one to three years creating the foundation for the program before real results begin to emerge in the form of capital improvements, remedial repairs, upgraded maintenance, and more effective regulations. Ratepayers tend to have little patience, however, when they are writing checks regularly to a stormwater utility.

In the context of NPDES Phase II permits, public expectations of improvements in water quality need to reflect the complexity of water quality issues and the limited ability of local government to quickly alter conditions in receiving waters through informational and regulatory programs. Attempting to sell a utility to a community as a response to federal water quality mandates has been unsuccessful in several communities. The public recognizes that stormwater quality, while important, is still a minor part of the total cost of stormwater management. Unless a comprehensive quantity and quality control program strategy is apparent, it is difficult to generate support for a stormwater utility.

Are Green Lots Worth More Than Brown Lots? An Economic Incentive for Erosion Control on Residential Developments[1]

Abstract

Construction sites are major contributors to nonpoint source (NPS) pollution. However, a lack of personnel to enforce erosion control regulations and limited voluntary compliance means that few developers apply effective erosion control. New approaches are needed to increase erosion control on construction sites if this source of NPS pollution is to be significantly reduced. We have tested whether an economic advantage exists for developers who use vegetative cover for erosion control, independent of advantages gained in addressing environmental or regulatory concerns. Improving residential lot appearance from muddy brown to green grass may increase the appeal of the lot to buyers. A market survey shows that homebuyers and Realtors perceive vegetated lots to be worth more than unvegetated lots, and this increased value exceeds the cost of seeding. Thus, developers can now be encouraged to invest in vegetative cover because of the potentially high return on the investment.

Introduction

Sediment Pollution and Construction Sites

Nonpoint source (NPS) pollution, produced from diffuse sources such as runoff from agricultural land, construction sites, and urban surfaces, is now the leading cause of surface water quality degradation in the United States (Novotny and Chesters, 1989; Federal Register, 1990). In developing areas, construction sites are a major source of NPS pollution because soil erosion rates are increased dramatically when land is exposed and disturbed by excavation and vehicular movement (Harbor et al., 1995; Goudie, 1994; Goldman et al., 1986, Fennessey and Jarrett, 1994). In fact, some of the greatest soil erosion rates ever reported are associated with construction activities (Crawford and Lenat, 1989); erosion rates on construction sites are typically 2-40,000 times greater than rates under preconstruction conditions (Wolman and Schick, 1967; Harbor, in press). Sediment contributed to streams by construction sites can exceed that previously

[1] This paper is reprinted from the Journal of Soil and Water Conservation, Spring Issue, 2000. We thank the Soil and Water Conservation Society for their permission to reprint this article.

deposited over many decades under pre-development land uses, radically altering stream geomorphology and ecology (e.g., Wolman and Schick, 1967). The larger-than-normal sediment deposition in waterways frequently exceeds the natural capacity of the receiving water system to assimilate and equilibrate to the sediment influx (Paterson et al., 1993), causing rapid channel changes and increased probability of flooding, erosion, and sedimentation problems (Goldman et al., 1986).

In addition to sediment, construction sites generate other pollutants such as pesticides, nitrogen, and phosphorus from fertilizers, petroleum products such as oil and gas from machinery, soil stabilizers, construction chemicals, and washings from concrete or bituminous mixing and flushing operations (Koehn and Rispoli, 1982; Lemly, 1982). In some cases these pollutants are in particulate form or are adsorbed by soil particles and are transported with the suspended sediment in runoff from construction sites (Paterson et al., 1993; Bhaduri et al., 1997).

Although construction sites generate a wide range of potential pollutants, sediment overshadows all the other construction site pollutants in total ecological and economic impact on receiving waters (Lemly, 1982). It was estimated that 15 million tons of sediment were released from urban construction sites to surface waters in or near heavily populated areas in 1975 (Lemly, 1982). The North Carolina Department of Natural Resources and Community Development has stated, that "sediment and its effects on stream environments" is the "most widespread water quality problem in North Carolina" (Crawford and Lenat, 1989). Because construction activities predominantly occur near existing population centers, the waters that are most seriously degraded are generally those that are most frequently used (Lemly, 1982).

Economic Consequences of Sedimentation

In addition to environmental impacts, enhanced delivery of sediment to off-site areas from construction activities has significant economic effects (Table 1). These economic impacts result from lakes and streams becoming turbid and filling with silt, destruction of commercial aquatic species, the need for additional treatment of turbid water for industrial use, filling of harbors and navigation channels, loss of storage capacity of reservoirs, damage to drainage ditches, increased frequency of flooding, loss of aesthetic value in the environment, and loss of game habitat (Lemly, 1982; Wolman and Schick, 1967; Koehn and Rispoli, 1982). The economic burden of mitigating these environmental impacts is almost always placed upon the taxpayer, rather than on the operator of the construction site that is producing high sediment yields (Harbor, in press). By not paying to prevent the off-site transport of sediment through the use of erosion control measures, the developer allows sediment from the construction site to reach waterways where the economic and environmental costs of any impacts are paid by downstream landowners and the community as a whole, and not the developer.

Overall, annual expenditures for in-stream and off-stream impacts due to sedimentation in the United States exceeds $11.6 billion (Table 1). In-stream effects include impacts while sediment is in a waterway (stream, river, lake, or reservoir). Off-stream effects can occur before or after sediment reaches a waterway, either in floodwater or in water withdrawn from waterways to be used for industries, municipalities, or agriculture (Clark, 1985; Clark et al., 1985; Paterson et al., 1993). Although agricultural areas are far more extensive than construction sites, the mass of sediment per unit volume of runoff from urban and construction areas is 5 to 20 times greater than that of runoff from agricultural lands (Fennessey and Jarrett, 1994). In addition, construction sites are usually located in developing or developed areas, where potential impacts on infrastructure and other water uses are more severe than in rural areas. Estimates of agriculture's contribution to off-site effects range from 1/3 to 2/3 of the total (Clark, 1985; Clark et al., 1985; Colacicco et al., 1989, Pimentel, et al. 1995). Thus, urban off-site environmental impacts are probably on the order of $3.9 to $7.8 billion per year (1/3 to 2/3 of the total off-site effects), and are often borne by off-site landowners and communities. One of the main goals of erosion and sediment control regulations is to avoid these costs. The problem, however, is that developers have to pay to reduce erosion yet do not see any immediate return on this investment. Because there is little economic incentive for developers to control erosion, regulatory and educational approaches have been developed to improve construction site erosion control, and requests to impose impact fees on developers have increased (Trotti, 1997).

Table 1. Off-site damage costs from soil erosion by water in the United States

Type of Damage	Cost (millions in 1997 dollars*)
In-stream damage	
Recreational (fishing, boating, swimming)	3,886.0
Water storage facilities (dredging, excavation, construction of sediment pools)	1,340.7
Navigation (accidents, dredging)	1,088.1
Other in-stream uses (commercial fisheries)	1,748.7
Subtotal in-stream	8,063.5
Off-stream effects	
Flood damages (sediment damage to urban and agricultural areas)	1,496.1
Water conveyance facilities (sediment removal of drainage ditches and irrigation canals)	388.6
Water treatment facilities	194.3
Other-off stream uses (municipal and industrial, steam electric power plants, irrigation)	1,554.4
Subtotal off-stream	3,633.4
Total water erosion costs	11,696.9⁺

(Data based on: Clark et al., 1985)

Vegetation and erosion control

The significant ecological and economic impacts of sedimentation provide strong motivation for erosion control. Soil erosion involves the detachment of soil particles by raindrop impact, wind-blown particle impact, wetting and drying cycles, freezing and thawing, and runoff, and the transport of detached soil particles by rain splash, wind and runoff (Ekwue, 1990; Goldman et al., 1986). Climate, topography, vegetative cover, and soil characteristics are the principal factors that control soil erosion potential. Climate and soil characteristics cannot be readily controlled on a site, and topography is constrained by pre-existing conditions and the grading plan, leaving surface cover as the most easily modified variable that controls oil erosion on a site. Increasing vegetative cover on barren areas such as construction sites is an excellent way to impede soil erosion and decrease sedimentation (Fig. 1).

"Vegetative cover is the most effective form of erosion control...a properly revegetated soil will be protected from erosion indefinitely without any need for human attention" (Goldman et al., 1986, p. 6.23). Vegetation (especially close to the ground surface) protects the surface from raindrop impact and reduces the velocity of water flowing over the surface by increasing surface roughness and disrupting overland flow (Clark et al., 1985; Rogers and Schumm, 1991; Satterlund, 1972). The reduction of water velocity flowing over the surface and the breaking up of soil by plant roots increases the amount of infiltration, thereby reducing the amount of surface water flow (Clark et al., 1985). Vegetation also depletes subsurface water between rainfall events, which reduces the amount of runoff during storm events. In fact, vegetative stabilization on construction sites has been shown to reduce soil loss by 80% (Harbor et al., 1995) to 99% as compared to bare soil (Koehn and Rispoli, 1982). The cost of reducing soil erosion using vegetative cover depends on the materials used, but typical temporary seeding on a one-third acre residential lot in the Midwestern US costs from $250 to $325.

Regulations requiring construction site erosion control

In the US, the biological and physical impacts of off-site sedimentation have prompted local, state, and federal regulations requiring erosion and sediment control for construction sites. The National Pollution Discharge Elimination System (NPDES) is a national program that issues, monitors and enforces permits for stormwater discharges associated

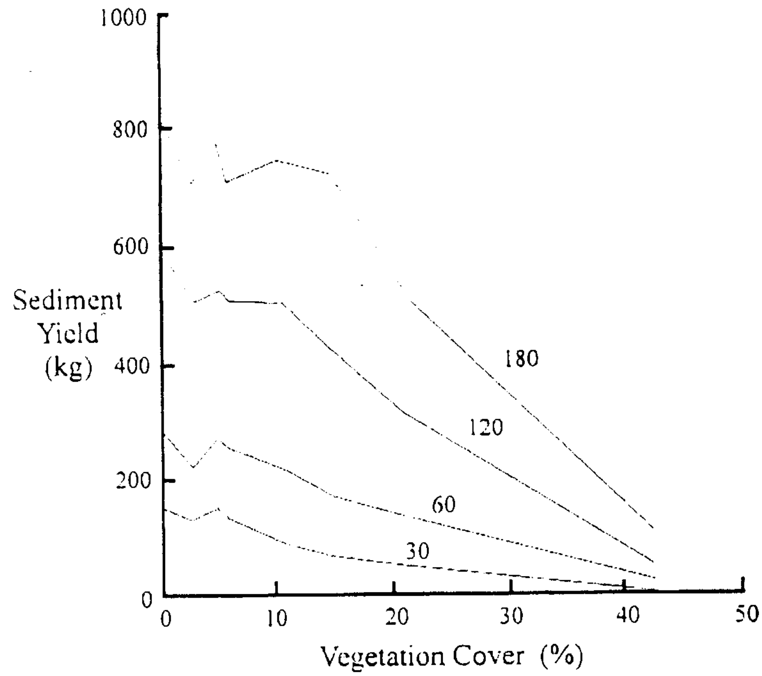

Figure 1. Sediment yields for different vegetative cover densities at 30, 60, 120, and 180 minutes of simulated rainfall on a 10% slope (Rogers and Schumm, 1991).

with industrial activity such as construction under the Clean Water Act (Federal Register, 1990). State and local regulators, under the NPDES program, require erosion and sediment control for construction sites with 5 acres or more of land disturbance (Federal Register, 1990). Because vegetative cover greatly reduces soil erosion, many federal and state regulations, such as Rule 5 in Indiana and the Model Regulations for Urban Soil Sediment Pollution Control in Ohio, encourage the use of surface cover as an important element of erosion control on construction sites.

In Indiana, for example, state regulations mandate that sediment should be contained on the construction site and not, for example, allowed to run onto public or private roadways. Rule 5 requires that if vegetative practices such as seeding and mulching are used, they must be implemented within seven days of the "last land-disturbing activity" at the site and that these actions are the responsibility of the person in charge of the construction activity, which usually is the developer (Indiana Department of Natural Resources, 1992). Similarly, in Ohio, Model Regulations for Urban Soil Sediment Pollution Control (1980) require that the responsible party for the development stabilize denuded areas with permanent or temporary soil stabilization within seven days for any denuded area that has reached its final grade or is to remain dormant for more than 45 days. The permanent vegetation is not "considered established until ground cover is achieved which...provides adequate cover and is mature enough to control soil erosion satisfactorily and to survive adverse weather conditions" (Ohio Department of Natural Resources, 1980).

Enforcement of erosion control regulations varies significantly among states. For example, in Indiana, the Indiana Department of Environmental Management (IDEM) controls permitting and enforcement, but local soil and water conservation districts (SWCD) review and evaluate erosion control plans. At typical staffing levels, SWCDs in developing areas find it very hard to keep up with the large number of developments they are responsible for. The local SWCDs inspect the construction sites to establish whether the developer is implementing the soil erosion control plan correctly and to observe whether the possibility of or the actual transport of sediment off-site exists. The SWCD will provide the developer with written recommendations describing which erosion control measures need to be improved, maintained, or installed. The developer then has two weeks to comply with the recommendations. If the developer is not found in compliance with the requirements after recommendations have been made, the SWCD reports the site to the Urban

Erosion Control Specialist from the Indiana Department of Natural Resources (IDNR), who has been receiving copies of all written warnings to the developer. The Urban Erosion Control Specialist will then visit the site and determine whether the site should be reported to the IDEM. Subsequently, the IDEM determines whether further action, such as levying a fine against the developer, is warranted. This process can lead to delays of many months between identification of a problem and regulatory enforcement.

In reality, it takes a great deal of coercion to get developers to promptly apply erosion control measures on their sites. Developers find applying erosion control measures inconvenient, costly, and time consuming, and are fully aware of the lack of regulatory personnel to enforce local, state, and federal mandated erosion control (Harbor et al., 1995). Therefore, developers often do not comply with the regulations and let their sites remain bare (Harbor, in press; Harbor et al., 1995). When inspected, sites are often either lacking erosion control measures or maintenance of existing control measures is long overdue. The effort (if any) on the developer's part to maintain or implement the erosion control measures is often inadequate and is done to appease the local SWCD, rather than with the goal of achieving 'best management' of the site. Aside from regulation, there is little incentive for a developer to use erosion and sediment control practices. In fact, a developer who uses erosion control may be at a cost disadvantage compared to other developers who do not, thereby making construction less profitable (Harbor, in press).

Origin of this study

In a study evaluating the use of rapid seeding and mulching to reduce NPS pollution from construction sites, one developer commented that he liked seeding because he thought that it made his developments more marketable (Harbor et al., 1995). The developer soon began to include extensive seeding on his other developments to achieve the same neat, green looking result. Even though the developer was interested in seeding because he thought it would give him a competitive edge over other developers, he was voluntarily using vegetative erosion control (Harbor et al., 1995; Harbor, in press). As similar anecdotal evidence accumulated, it seemed possible that a higher market value for a seeded site might provide an incentive for voluntary erosion control. If an economic advantage can be established, then it may be possible to persuade developers to use erosion control on the basis of a profit motive, where regulation and education have proved ineffective. If widespread voluntary application can be achieved by this means of increased profitability, it will make it easier to obtain compliance with erosion control programs and reduce the burden on regulators. Furthermore, and most importantly, the NPS pollution load from construction sites would be reduced.

Methodology

We hypothesize that green, grassed lots are more attractive to buyers and therefore may be valued more highly and sell faster than bare, dirt lots. There are several ways to test this hypothesis, with the most thorough being a detailed tracking of the sales prices and sales timing of a large number of randomly selected treated and untreated control lots on residential constructions sites throughout the US. In the absence of data to perform this type of highly detailed approach, we undertook a pilot study using photos of treated and untreated lots in a market survey questionnaire aimed at establishing whether lots with green vegetative cover are valued higher than barren ones by Realtors, developers, and homebuyers. In the work reported here, however, we do not evaluate whether green, grassed lots sell faster than bare, dirt lots.

Randomly selected lots in three residential housing developments in Ohio and Indiana were seeded and mulched. Photographs of these lots were taken prior to seeding and then when the grass was approximately one inch high (Fig. 2). Lots were photographed from three angles (front left, front center, and front right), and selected photos were used in a lot valuation survey. The market survey was designed as a broad tool to investigate a wide range of factors which homebuyers, Realtors, and developers find important when buying/selling a lot in a residential housing development. The survey included open- and closed-ended questions, and those surveyed were not told the actual purpose of the survey. The survey is reproduced in Herzog (1997). Included within the wide range of questions in the survey were specific questions on the importance of lot appearance, and a lot valuation question in which those surveyed were asked to place prices on lots shown in photographs. Those surveyed were told the lots were in the same neighborhood/subdivision, with the streets and curbs installed and had the samesewer/septic system, water system, and noise level. They were then

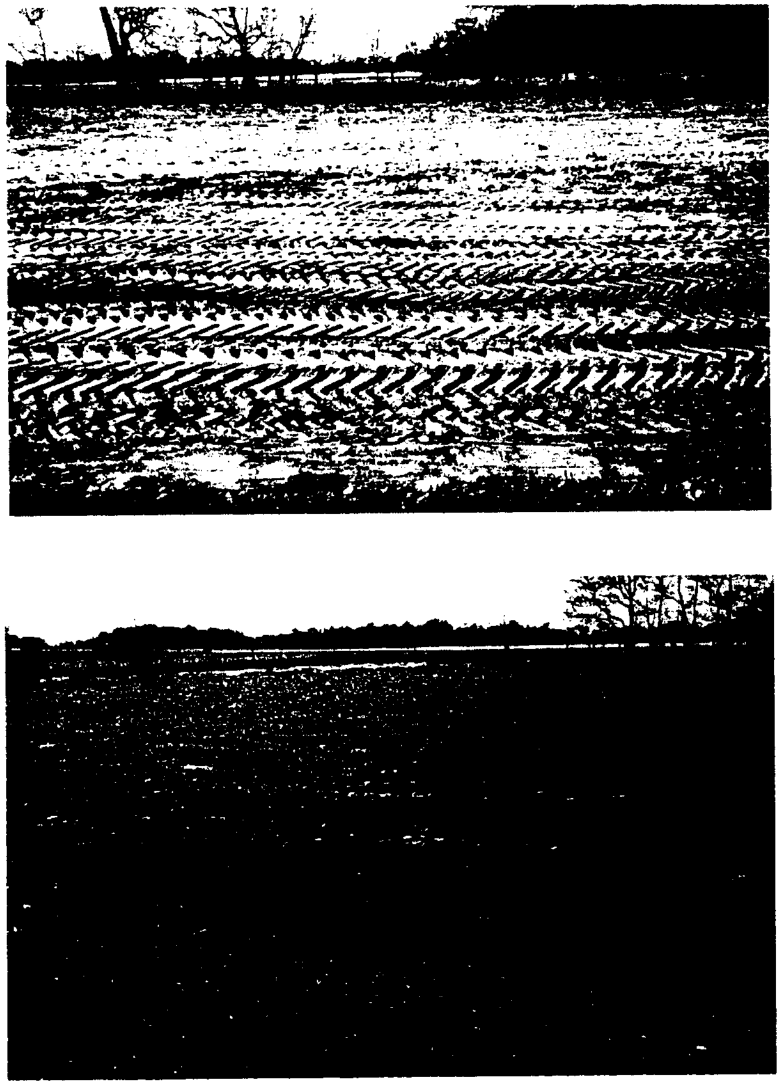

Figure 2. Examples of grassed and bare lot photographs used in the survey.

given 10 lot photos and asked to establish prices for each lot, having been told that the average lot value in the development was $20,000.

Most Realtors and developers were interviewed at their offices in St. Joseph County, Indiana and Geauga County, Ohio. Potential homebuyers were interviewed either at a neutral location or at their place of work, and included residents of St. Joseph County and West Lafayette, Indiana, as well as personnel at a chemical engineering facility in Buffalo, New York which was relocating to Philadelphia, Pennsylvania. The survey typically took 10-20 minutes depending on the responsiveness of the individual.

After completion of the surveys, comparative statistics were used on the lot valuation data to assess whether there was any significant difference between "brown" and "green" lot values for Realtors, developers, and homebuyers. Analysis of variance was initially used to be able to test for the existence of significant interaction between the fixed variables (respondent group and color), while taking into account variation that occurs in the random variables (eg., subjects). The assumptions needed to appropriately apply this method, such as normality of the error terms, were found to be satisfied (Montgomery, 1997).

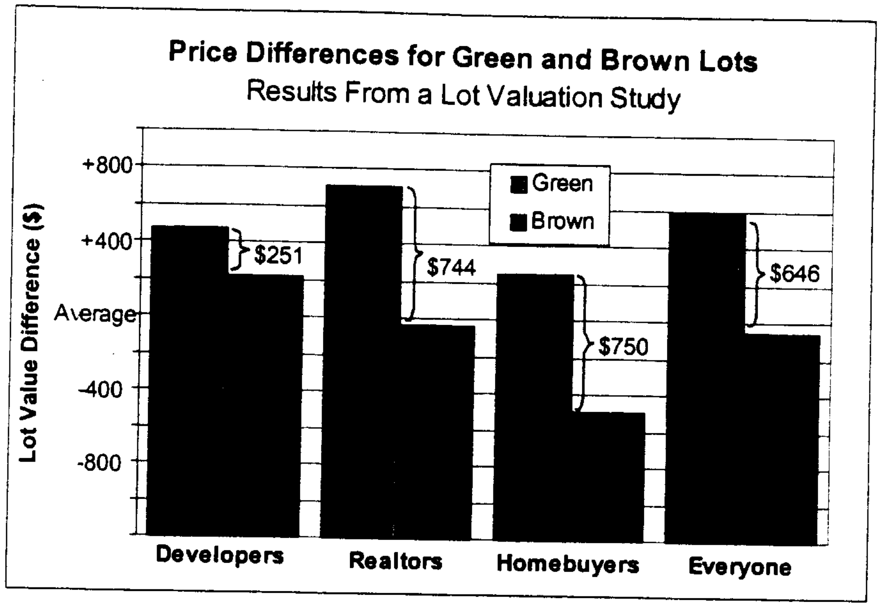

Figure 3. Differences in average prices for green and brown lots between survey groups.

Table 2. Effect of lot treatment on price for three different survey groups

Group	Green Lot Mean Price ($), sample size (n)	Brown Lot Mean Price ($), sample size (n)	Price Difference ($)	Test Statistic	Significance Level (p-value)
Realtors	20,711 (n=155)	19,967 (n=154)	744	t=4.0085	0.0001
Homebuyers	20,250 (n=36)	19,500 (n=36)	750	t= -1.7957	0.0788
Developers	20,469 (n=48)	20,218 (n=48)	251	t= -0.9200	0.3609

An important element of the economic analysis of lot greening is the actual cost involved in applying seed. This can vary widely depending on the method used to apply the seed, and the density of vegetation desired. In this work, we restrict the analysis to an amount and type of cover intended for erosion control, as opposed to grass species and density intended for final lawn cover. For this study we used independent contractors to apply seed, mulch, water and fertilizer by hydroseeding. Other common approaches include use of a hand seeder, and mulching with straw either by hand or using a blower. During dry seasons in some areas, watering may be necessary to produce successful germination and early growth. Thus there is a wide range of possible costs of lot greening. In this study we use the actual cost of hydroseeding for our study sites in Indiana and Ohio, $300 per lot, although we could have applied seed and mulch by hand for about $100 per lot. Readers may want to contact their local Soil and Water Conservation District to get estimates of typical costs for their areas.

Results

A total of 478 lot valuations (310 by Realtors, 96 by developers, and 72 by homebuyers) were made. However, during the survey process, it became apparent that two of the photographed lots were being ranked either highest or lowest based on their specific background (one with a fire hydrant and another with lush tree vegetation behind the lot giving an appearance of more privacy than the other lots). Lot valuations based on these two photos, one green lot and one brown were eliminated prior to the statistical analysis.

Initial statistical evaluation of the entire data set focused on determining if the data fit a model in which price was a function of the overall mean price, effects related to the group, the individual surveyed, the individual lot and the lot color plus interaction and random error terms. In this model we assume that the effect of the particular lot and the particular individual are random variables that are independently and normally distributed with a mean of zero, and also that the error terms are independently and identically distributed as normal random variables with mean of zero and variance σ^2. Analysis of variance followed by a normal probability plot of the residuals, and plotting of the residuals versus the predicted values, demonstrated that the error terms were normally distributed with constant variance (Montgomery, 1997). This analysis also demonstrated that there appeared to be significant differences in the variations of prices between groups, which complicates analysis of the data as a combined group. Thus it was necessary to analyze each group separately, using a t test to evaluate the overall effect of color within each group.

Realtors

The Realtors surveyed gave an average value of $20,711 on the green grassed lots and $19,969 on the brown dirt lots. The distributions of lot values for green and brown lots were statistically significantly different at a 99.99% confidence level (Fig. 3, Table 2). As a simple difference between means, the perceived added value for green lots was $742 per lot.

Narrative questions on the survey revealed additional qualitative insight into Realtors' perceptions of lot value, and reasons for preferring green lots. One Realtor commented: "I don't like these mud lots." Others said the grass was more appealing and "easier on the eye," and that the lots look better because they are green. Other Realtors did not see the importance of seeding and believed that grass should not enter into the decision because it will be destroyed in the house building process. "Grass makes it look better but means nothing for what's coming."

Overall Realtors perceived that homebuyers would prefer the grassed lots ("I think people like grass,") and the green lots would sell first because the green grass will remind homebuyers of a yard and allow them to visualize what a house and yard would look like on the lot. One Realtor stated that the grass/ground cover was more appealing than dirt, and that homebuyers "wouldn't like the bare ones very much." Another noted that buyers would be more willing to walk a grassed lot in inclement weather lot because the grass would absorb the moisture and that buyer would not walk a dirt lot because it would become muddy and puddle. One Realtor stated: the green lots look "lush and fertile;" some people cannot visualize dirt lots as possibly being lush and fertile. This Realtor also brought up the concern that a buyer may ask about the drainage if the lot is wet, and if the dirt lot is dry, caked, and cracked, the buyer will wonder if anything can grow on it.

Homebuyers

The homebuyers surveyed placed an average value of $20,250 for the green lots and $19,500 for the brown lots. The distributions of lot values for green and brown lots were statistically significantly different at a 92% confidence level (Fig. 3, Table 2). As a simple difference between means, the perceived added value for green lots was $750 per lot. The added value of $750 (the greatest added value among the groups surveyed) is particularly significant because homebuyers are the ones who actually pay for the lots.

Homebuyers stated that grass gives a realistic impression of the future appearance of the lot and it is more appealing; and that the final product is more difficult to visualize on dirt lots. In general, the homebuyers acknowledged that the grass looks good and has more appeal, while understanding that the lots would be disturbed during construction. One homebuyer said that the green look was nicer but that it "wouldn't effect my decision to buy," because grass was not a "big deal." Even though comments such as these were made, on average homebuyers valued green lots $750 more than brown lots.

Developers

The developers surveyed placed an average value of $20,469 on the green lots and $20,219 on the brown lots. The distributions of lot values for green and brown lots were statistically significantly different at only a 64% confidence level (Fig. 3, Table 2). Typically this would be viewed as indicating no statistically significant difference. As a simple difference between means, the perceived value of the green lots was $250 greater than the brown lots. Clearly, the small difference between the green and brown lots data sets and the comparatively low significance level indicate that developers perceive little or no difference based on lot color.

During the survey, developers addressed the difference between the grass and dirt lots and stated that it should not be a factor in lot price. They pointed out that the green lots will become brown lots during construction and that the homebuyer will put in a yard anyway. Other developers saw that ground cover was more attractive ("I like the green") and perceived that homebuyers would like the grass. Also, some perceived that the green look made a development more marketable compared to other developments; one developer said he "greens up" his developments to make them look more attractive. Another stated that grass makes a lot look like it has topsoil, and if there are soil concerns, the grass demonstrates that vegetation can be grown and is holding soil. One developer remarked how ground cover may be important to homebuyers for more than just appearance. He stated that grass cover is more significant when there is rolling ground because if there is unseeded soil on an adjacent lot, the soil may erode onto the grassed property to the dismay of the homeowner.

The Economic Incentive

Although green lots may be priced higher than brown lots, this gross value is only significant if the price differential exceeds the cost of seeding. The difference in value between grassed and bare lots compared to the cost of seeding provides a measure of potential net economic benefit to the developer. In terms of a simple net return on investment, seeding a lot provides potentially excellent return. Homebuyers valued grassed lots $750 more than brown lots, and as it cost $300 to seed a lot in this study, the developer stands to profit by $450 per lot, which is a 150% return on the initial investment. The ability to more than double an initial investment should be an attractive and sensible advantage for the developer, if the perceived value difference actually translates into a sale price difference.

Present Limitations and Future Work

This pilot study is an initial step in developing information that can be used to persuade more developers to make widespread use of vegetative cover, and other forms of environmental protection. The results of this pilot study are most relevant in areas where climate conditions allow for relatively easy establishment of temporary vegetative cover, and are not applicable to arid or semi arid areas. In addition, budget restrictions limited the scale of the study. Although we collected 478 lot valuations from 62 respondents, a much larger study with respondents from many areas of the United States would overcome a potential criticism that the current study only represents conditions in a small portion of the Midwest. Developers are also more likely to notice results based on data collected within their region, especially if these are coupled with regional demonstration projects. Thus, the next logical step is to initiate a network of coordinated studies in regions experiencing rapid residential development. This would provide for analysis on a national as well as a regional level, and for comparisons between regions.

An additional limitation of the results presented here is that they consider only <u>perceived</u> increase in lot values. In actual sales transactions, buyers may not actually behave in the way they say they would on a survey. As a linked project, it would be desirable to track actual sales histories (timing and pricing) to provide a more complete picture of the actual economic impact of lot greening. Future research should include analysis of a large number of real-world transactions for which lot condition is known. This could be based on a large-scale, long-term study in which researchers intervene to change lot conditions on selected lots or developments. Alternatively, if some landowners are convinced by the results of this study, the experiment might occur naturally in the marketplace as the findings of our work are disseminated.

Further extension of the basic concept of examining the direct profitability of environmental protection is also possible. We were recently contacted by a consultant who had heard of the lot valuation study, and wanted a similar study performed on the increased value of lots next to ponds on developments. Although ponds are often built for stormwater control, and also aid in reduction of nonpoint source pollution, they can also have considerable aesthetic appeal. Thus, it would be potentially very useful to know what the return on investment on a pond is for a new residential development, both in terms of the increased price of lots adjacent to the pond, as well as the increase in average price in lots for the development as a whole because of the improved appearance of the development.

Conclusions

Showing that erosion control may be profitable provides a new way to reach developers who have failed to act on the logic that erosion control provides environmental protection and is required to comply with local, state or federal erosion control regulations. Evaluating the cost of environmental damage is not only very difficult, but also of little direct relevance to a developer who does not directly pay the cost of the damage. Land development is a business, with profit as a leading motive, so appealing to increased profitability is one potentially effective way to change behavior.

The pilot study described here indicates that vegetated lots are perceived to be more valuable and more desirable by Realtors and homebuyers. Realtors perceived that vegetated lots are worth more than barren lots (by $742). They also perceived that vegetated lots are worth more to homebuyers and that homebuyers would be willing to pay more for grassed lots. Homebuyers also perceived grassed lots to be more valuable and put the largest premium ($750) on the lots for all those surveyed. The added lot value is only significant if the price differential exceeds the cost of seeding ($300), which was the case for Realtors and homebuyers by $417 and $450, respectively. Developers valued the vegetated lots higher than non-vegetated lots by an average of $250, but the difference was not statistically significant. Even if it were significant, this price differential is less than the cost of seeding and indicates that developers perceive that seeding costs are greater than the benefits of vegetation. This perception of a net cost associated with greening a lot is perhaps why the market has largely failed to recognize this simple way to increase a property's value. Some developers did recognize the visual appeal of the grass and believed that a greened development would attract homebuyers more rapidly than a development that appears unkempt. However, the valuation study indicates that developers have not aligned their perception of lot value with that of homebuyers.

An alternative way of interpreting the results is to consider the potential return on the investment in the vegetative cover. For a $300 investment the developer can receive a return of $750, i.e. a 150% return on investment. Such a rate of return is difficult to achieve in most conventional investments. Finally, price differential is not the only economic benefit of lot greening; if lots sell faster because of greening, profits will increase because of lower financing costs for capital invested in the development process. Further research is needed to clearly define the value of this potential economic impact associated with lot greening. However, at this stage it is possible to state that in addition to the environmental benefits, and regulatory requirements associated with using vegetation for erosion control, there may be significant marketing and thus economic returns associated with lot greening.

Education concerning the environmental benefits of erosion control, and enforcement of regulations have not produced widespread, effective use of vegetative cover for erosion control. Because developers generally do not perceive much incentive to vegetate their developments aside from complying with often-ineffective regulations, they typically do not. Typically a developer who is using erosion control practices believes s/he is at a cost disadvantage compared to other developers who are not, thereby making the developer following regulation believe s/he will be less profitable. Furthermore, the developer does not directly pay for the mitigation of the environmental impacts caused by the sediment leaving the site; it is the burden of the taxpayer instead. In this study, we have demonstrated that vegetating a development may be a profitable investment. Appealing to the profit motive will hopefully provide a way to generate widespread use of vegetative cover that also provides erosion prevention on construction sites.

Environmental Protection Agency

Final Reissuance of National Pollutant Discharge Elimination System (NPDES) Storm Water Multi-Sector General Permit for Industrial Activities; Notice

ENVIRONMENTAL PROTECTION AGENCY

[FRL–6880–5]

Final Reissuance of National Pollutant Discharge Elimination System (NPDES) Storm Water Multi-Sector General Permit for Industrial Activities

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of Final NPDES general permit.

SUMMARY: The Regional Administrators of EPA Regions 1, 2, 3, 4, 6, 8, 9 and 10 are today reissuing EPA's NPDES Storm Water Multi-Sector General Permit (MSGP). This general permit was first issued on September 29, 1995 (60 FR 50804), and amended on February 9, 1996 (61 FR 5248), February 20, 1996 (61 FR 6412), September 24, 1996 (61 FR 50020), August 7, 1998 (63 FR 42534) and September 30, 1998 (63 FR 52430). The reissuance of the MSGP was proposed by EPA on March 30, 2000 (65 FR 17010). Today's final MSGP will authorize the discharge of storm water from industrial facilities consistent with the terms of the permit.

DATES: This MSGP shall be effective on October 30, 2000. This effective date is necessary to provide dischargers with the immediate opportunity to comply with Clean Water Act requirements in light of the expiration of the existing MSGP on October 1, 2000. Deadlines for submittal of notices of intent are provided in Section VI.A.2 of this fact sheet and Part 2.1 of the MSGP. Today's MSGP also provides additional dates for compliance with the terms of the permit.

ADDRESSES: The index to the administrative record for the final MSGP is available at the appropriate Regional Office or from the EPA Water Docket Office in Washington, DC. The administrative record, including documents immediately referenced in this reissuance notice and applicable documents used to support the original issuance of the MSGP in 1995, are stored at the EPA Water Docket Office at the following address: Water Docket, MC–4101, U.S. EPA, 401 M Street SW, room EB57, Washington, DC 20460. The records are available for inspection from 9 a.m. to 4 p.m., Monday through Friday, excluding legal holidays. For appointments to examine any portion of the administrative record, please call the Water Docket Office at (202) 260–3027. A reasonable fee may be charged for copying. Specific record information can also be made available at the appropriate Regional Office upon request.

FOR FURTHER INFORMATION CONTACT: For further information on the final MSGP, contact the appropriate EPA Regional Office. The name, address and phone number of the EPA Regional Storm Water Coordinators are provided in Section VI.F of this fact sheet. Information is also available through the Internet on EPA's Office of Wastewater Management website at http://www.epa.gov/owm/sw.

SUPPLEMENTARY INFORMATION: The following fact sheet provides background information and explanation for today's notice of final MSGP reissuance, including a summary Response to Comments regarding the comments which were received on the proposed MSGP. The actual language of the final MSGP appears after this fact sheet.

Fact Sheet

Table of Contents

I. Background

The Regional Administrators of EPA Regions 1, 2, 3, 4, 6, 8, 9 and 10 are today reissuing EPA's NPDES Storm Water Multi-Sector General Permit (MSGP). The MSGP currently authorizes storm water discharges associated with industrial activity for most areas of the United States where the NPDES permit program has not been delegated. The MSGP was originally issued on September 29, 1995 (60 FR 50804), and amended on February 9, 1996 (61 FR 5248), February 20, 1996 (61 FR 6412), September 24, 1996 (61 FR 50020), August 7, 1998 (63 FR 42534) and September 30, 1998 (63 FR 52430). The proposed reissuance of the MSGP appeared in the **Federal Register** on March 30, 2000 (65 FR 17010).

The 1995 MSGP was the culmination of the group permit application process described at 40 CFR 122.26(c)(2). A group permit application was one of three options for obtaining an NPDES industrial storm water permit which were provided by the 1990 storm water permit application regulations (55 FR 48063). The 1990 regulations also provided that industrial facilities could apply for coverage under an existing general NPDES permit or apply for an individual permit. In 1992, EPA issued a baseline general permit (57 FR 41175 and 57 FR 44412) to cover industrial facilities which did not select the group application option or submit an application for an individual permit.

In response to the group application option, EPA received applications from approximately 1,200 groups representing nearly all of the categories of industrial facilities listed in the storm water regulations at 40 CFR 122.26(b)(14). To facilitate permit issuance for the group applications, EPA consolidated the groups into 29 industrial sectors, with subsectors also included in certain sectors as appropriate.

In developing the requirements for the 1995 MSGP, EPA utilized and built upon the storm water pollution control requirements of the 1992 baseline general permit. The baseline permit had required a storm water pollution prevention plan (SWPPP) with generic best management practice (BMP) requirements which applied to all facilities covered by the permit. In addition, certain categories of facilities were required to monitor storm water discharges based on EPA's best professional judgment concerning the risks posed by the facilities.

The group permit applications included information concerning the specific types of operations which are present at the different types of industrial facilities, potential sources of pollutants at the facilities, industry-specific BMPs which are available, and monitoring data from the different types of facilities. Using this information, EPA developed SWPPP requirements for the MSGP which consisted of the generic requirements of the baseline permit plus industry-specific requirements developed from the group application information. Also, the monitoring requirements of the 1995 MSGP were developed using the monitoring data submitted with the group applications rather than EPA's best professional judgment.

On September 30, 1998 (63 FR 52430), EPA terminated the baseline general permit and required facilities which were previously covered by the baseline permit to seek coverage under the MSGP (or submit an individual permit application). EPA believed that the MSGP, with its industry-specific requirements, would provide improved water quality benefits as compared to the baseline permit.

For today's reissuance of the MSGP, EPA has re-evaluated the industry-specific requirements of the MSGP. In a few instances, additional requirements have been included based on new information which has been obtained since the original MSGP issuance in 1995. These changes are discussed in more detail in Section VIII of this fact sheet, and in the Response to Comments. EPA also re-evaluated the monitoring requirements of the existing MSGP. However, after review of the comments received from the public, and the monitoring data received during the term of the 1995 MSGP, EPA has retained the same monitoring requirements for the reissued MSGP as were found in the 1995 MSGP.

A. Pollutants in Storm Water Discharges Associated With Industrial Activities in General

The volume and quality of storm water discharges associated with industrial activity will depend on a number of factors, including the industrial activities occurring at the facility, the nature of the precipitation, and the degree of surface imperviousness. A discussion of these factors was provided in the fact sheet for the original proposed MSGP (58 FR 61146 Nov. 19, 1993), and is not being repeated here.

B. Summary of Options for Controlling Pollutants

Pollutants in storm water discharges from industrial plants may be reduced using the following methods: Eliminating pollution sources, implementing BMPs to prevent pollution, using traditional storm water management practices, and providing end-of-pipe treatment. A general discussion of each of these was included in the original proposed MSGP (58 FR 61146, Nov. 19, 1993), and is not being repeated here.

C. The Federal/Municipal Partnership: The Role of Municipal Operators of Large and Medium Municipal Separate Storm Sewer Systems

A key issue in developing a workable regulatory program for controlling pollutants in storm water discharges associated with industrial activity is the proper use and coordination of limited regulatory resources. This is especially important when addressing the appropriate role of municipal operators of large and medium municipal separate storm sewer systems in the control of pollutants in storm water associated with industrial activity which discharge through municipal separate storm sewer systems. The original proposed MSGP discussed several key policy factors (see 58 FR 61146).

II. Organization of Final MSGP and Summary of Changes From the 1995 MSGP and the March 30, 2000 Proposed MSGP

The organization of today's final MSGP has been revised from the 1995 MSGP to reduce the overall size of the permit. In Part XI of the 1995 MSGP, many requirements such as SWPPP and monitoring requirements which were common to each sector were repeated in each sector, greatly adding to length of the permit. For today's reissuance, such requirements are found only once in expanded sections of the permit (Parts 4 and 5) which include requirements common to each sector. Requirements which are genuinely unique to a given sector or subsector are found in Part 6 in the permit. Similarly, Section VIII of the fact sheet for the 1995 MSGP repeated certain explanatory information in the discussions of sector-specific requirements, and also included considerable descriptive information about the various sectors. To reduce the length of today's notice, most of this information is not being repeated. Section VIII of today's fact sheet focuses on the changes (if any) in the various sectors. The reorganization and reduction of duplication have reduced the size of the permit by approximately 75%.

Also note that the section/paragraph identification scheme of today's final MSGP has been modified from the 1995 MSGP. The original scheme utilized a sometimes lengthy combination of numbers, letters and Roman numerals (in both upper and lower cases) which many permittees found confusing. Today's reissuance identifies sections/ paragraphs, and hence permit conditions, using numbers only, except in Part 6 (which also incorporates the sector letters from the 1995 MSGP for consistency). Under the original permit, only the last digit or letter of the section/paragraph identifier appeared with its accompanying section title/ paragraph, making it difficult to determine where you were in the permit. In today's reissuance, the entire string of identifying numbers is listed at each section/paragraph to facilitate recognizing where you are and in citing and navigating through the permit. For example, paragraph number 1.2.3.5 tells you immediately that you are in Part 1, section 2, paragraph 3, subparagraph 5; whereas under the 1995 MSGP you would only see an "e", thereby forcing you to hunt back through the permit to determine that you were in Part I.B.3.e. The exception to the numbering rule is in Part 6, where the Sector letters from the 1995 MSGP have been retained to correspond to the sectors of industry covered by the permit and make it easy to tell that you are in a section of the permit which has conditions which only apply to a specific industrial sector. For example, paragraph 6.F.3.4 immediately tells you that you are in Part 6 and looking at conditions that only apply to sector "F" facilities. In some cases, requirements which previously appeared in a single paragraph are now found listed out as separate individual items. The final MSGP is also written in EPA's "readable regulations" style using terms like "you" and "your" in referring to permittees, etc.

Following below is a list of the major changes included in the proposed MSGP of March 30, 2000 (as compared to the 1995 MSGP) and retained in today's final MSGP. These changes are discussed in more detail later in this fact sheet.

1. Requirements for co-located activities clarified (Part 1.2.1.1).

2. Incidental cooling tower mist discharges included as an authorized non-storm water discharge, subject to certain requirements (Parts 1.2.2.2.13 and 4.4.2.3).

3. Eligibility provided for coverage of inactive mining activities occurring on Federal Lands where an operator has not been identified (Part 1.2.3).

4. Clarified language for situations where a discharge previously covered by an individual permit can be covered under today's MSGP (Part 1.2.3.3).

5. Clarified/added language for compliance with water quality standards and requirements for follow-up actions if standards are exceeded (Parts 1.2.3.5 and 3.3).

6. ESA and NHPA eligibility requirements modified (Parts 1.2.3.6 and 1.2.3.7).

7. Eligibility requirements for discharges to water quality impaired/limited waterbodies added/clarified (Part 1.2.3.8).

8. Clarified that discharges which do not comply with anti-degradation requirements are not authorized by the permit (Part 1.2.3.9).

9. Deadline of 30 days for submission of an NOT added (Part 1.4.2).

10. Opportunity for termination of permit coverage based on the "no exposure exemption" from the Phase II storm water regulations (64 FR 68722, 12/8/99) added (Parts 1.5 and 11.4).

11. Notice of Intent requirements and modified form (Part 2.2 and Addendum D).

12. Permit will accommodate electronic filing of NOIs, NOTs, or DMRs, should these options become available during the term of the permit (Parts 2.3 and 7.1)

13. Prohibition on discharges of solid materials and floating debris and requirement to minimize off-site tracking of materials and generation of dust added (Part 4.2.7.2.3).

14. Requirement to include a copy of the permit with the storm water pollution prevention plan (SWPPP) was added (Part 4.7).

15. Special conditions for EPCRA 313 facilities were modified (Part 4.12).

16. Monitoring requirements reorganized and additional clarification/revisions on monitoring periods, waivers, default minimum monitoring for limitations added by State 401 certification, and reporting requirements added (Part 5).

17. Manufacturing of fertilizer from leather scraps (SIC 2873) moved from Sector Z—Leather Tanning and Finishing to Sector C—Chemical and Allied Products (Table 1-1 and Part 6.C).

18. New effluent limitations guidelines for landfills in Sectors K and L included; the final guidelines were published in the **Federal Register** on January 19, 2000 (65 FR 3007) (Parts 6.K.5 and 6.L.6).

19. Sector AD (Non-Classified Facilities) language clarified to say that facilities cannot choose coverage under Sector AD, but can only be so assigned by permitting authority (Part 6.AD).

20. Additional BMP requirements in Sectors S, T, and Y added (Parts 6.S, 6.T, and 6.Y).

21. NOI to continue coverage under the permit when it expires (without a replacement permit in place) is not required and the reapplication process has been clarified (Part 9.2).

22. Process for EPA to remove facilities from permit coverage clarified (Part 9.12).

Following below is another list which summarizes the provisions of today's final MSGP which differ from the proposed MSGP of March 30, 2000.

1. Reference to "drinking fountain water" removed from Part 1.2.2.2.3.

2. Part 1.2.3.3.2.1 of the proposed MSGP was deleted. This requirement had not allowed MSGP coverage for facilities previously covered by another permit, unless the other permit only covered storm water and MSGP authorized non-storm water discharges.

3. Part 2.2.3.6 revised to indicate that the NOI must include the name of the MS4 receiving the discharges only if it is different from the permittee.

4. Part 4.9.3 revised to clarify the time frame for implementation of revised SWPPP.

5. Part 4.11 revised to require permittees to provide a copy of their SWPPP to the public when requested in writing to do so.

6. Sector E coverage was modified for consistency with the September 30, 1998 MSGP modification.

7. In Sector G, language was added stating that non-storm water discharges must be tested or evaluated; this change ensures consistency with the 1995 MSGP. Also in Sector G, the definition of "reclamation" was revised.

8. The title for Sector I was changed to include "Refining."

9. Sector T revised for consistency with 40 CFR 122.26(b)(14)(ix) concerning size of POTWs covered.

10. Section V.C. deleted the requirement to consider species proposed for listing as endangered or threatened.

III. Geographic Coverage of Final MSGP

The geographic coverage of today's final MSGP includes the following areas:

EPA Region 1—for the States of Maine, Massachusetts and New Hampshire; for Indian Country lands located in Massachusetts, Connecticut, Rhode Island and Maine; and for Federal facilities in the State of Vermont.

EPA Region 2—for the Commonwealth of Puerto Rico.

EPA Region 3—for the District of Columbia and Federal facilities in the State of Delaware.

EPA Region 4—for Indian Country lands located in the State of Florida.

EPA Region 6—for the State of New Mexico; for Indian Country lands located in the States of Louisiana, New Mexico, Texas and Oklahoma (except Navajo lands and Ute Mountain Reservation lands); for oil and gas facilities under SIC codes 1311, 1381, 1382, and 1389 in the State of Oklahoma not on Indian Country lands; and oil and gas facilities under SIC codes 1311, 1321, 1381, 1382, and 1389 in the State of Texas not on Indian Country lands.

EPA Region 8—for Federal facilities in the State of Colorado; for Indian Country lands in Colorado, North Dakota, South Dakota, Wyoming and Utah (except Goshute and Navajo Reservation lands); for Ute Mountain Reservation lands in Colorado and New Mexico; and for Pine Ridge Reservation lands in South Dakota and Nebraska.

EPA Region 9—for the State of Arizona; for the Territories of Johnston Atoll, American Samoa, Guam, the

Commonwealth of Northern Mariana Islands, Midway and Wake Islands; for Indian Country lands located in Arizona, California, and Nevada; and for the Goshute Reservation in Utah and Nevada, the Navajo Reservation in Utah, New Mexico, and Arizona, the Duck Valley Reservation in Nevada and Idaho, and the Fort McDermitt Reservation in Oregon and Nevada.

EPA Region 10—for the State of Idaho; for Indian Country lands located in Alaska, Oregon (except Fort McDermitt Reservation lands), Idaho (except Duck Valley Reservation lands) and Washington; and for Federal facilities in Washington.

For several reasons, the geographic area of coverage described above differs from the area of coverage of the 1995 MSGP. Indian country in Vermont and New Hampshire has been removed since there are no Federally recognized tribes in these States. Also, state NPDES permit programs have since been authorized in the States of South Dakota, Louisiana, Oklahoma (except for certain oil and gas facilities in Oklahoma) and Texas (again except for oil and gas facilities). In Oklahoma, EPA maintains NPDES permitting authority over oil and gas exploration and production related industries, and pipeline operations regulated by the Oklahoma Corporation Commission (See 61 FR 65049). Oklahoma received NPDES program authorization only for those discharges covered by the authority of the Oklahoma Department of Environmental Quality (ODEQ). In Texas, EPA maintains NPDES permitting authority over oil and gas discharges regulated by the Texas Railroad Commission (See 63 FR 51164). Texas received NPDES program authorization only for those discharges covered by the authority of the Texas Natural Resource Conservation Commission (TNRCC).

Specific additional conditions required in Region 6 as a result of a State or Tribal CWA Section 401 certification have been added for New Mexico, Oklahoma, and the Pueblos of Isleta, Pojoaque, San Juan, and Sandia. Numeric limitations for discharges in Texas contained in the previous permit pursuant to 31 TAC 319.22 and 319.23 have been continued in accordance with 40 CFR 122.44(d) and (l).

Federal facilities in Colorado, and Indian country located in Colorado (including the portion of the Ute Mountain Reservation located in New Mexico), North Dakota, South Dakota (including the portion of the Pine Ridge Reservation located in Nebraska), Utah (except for the Goshute and Navajo Reservation lands) and Wyoming were not included in the 1995 MSGP, but are included in today's MSGP. Indian country lands in Montana are not included at this time due to a recent court order. Prior to today, industrial facilities in these areas were largely covered under an extension of EPA's 1992 baseline general permit for industries (57 FR 41175).

Also, subsequent to the issuance of the MSGP in 1995, coverage was extended to the Island of Guam on September 24, 1996 (61 FR 50020) and the Commonwealth of the Northern Mariana Islands on September 30, 1998 (63 FR 52430). Certification was not received from Arizona in time for that state to be included in this permit.

The 1995 MSGP was issued in the State of Alaska, except Indian Country, on February 9, 1996 (61 FR 5247). Industrial facilities in Alaska outside of Indian Country will continue to be covered under the 1995 MSGP through February 9, 2001. EPA will reissue the permit for Alaska at a later date, and will include any state-specific modifications or additions or additions applicable to parts 1 through 12 of this permit as part of the State's Clean Water Act Section 401 or Coastal Zone Management Act certification processes.

Lastly, today's MSGP reissuance differs from the March 30, 2000 MSGP proposal in that the State of Florida (except for Indian country) is not included. This is a result of the recent NPDES program delegation to the State of Florida.

There are some areas where the NPDES permit program has not been delegated (such as Indian country in states not listed above) where neither the MSGP nor an alternate general permit is available for authorization of storm water discharges associated with industrial activity. However, only a very small number of permittees exist in such areas and individual permits are issued as needed.

IV. Categories of Facilities Covered by the Final MSGP

Today's final MSGP authorizes storm water discharges associated with industrial activity from the categories of facilities shown in Table 1 below:

TABLE 1.—SECTOR/SUBSECTORS COVERED BY THE FINAL MSGP

Subsector	SIC code	Activity represented
		Sector A. Timber Products
1*	2421	General Sawmills and Planning Mills.
2	2491	Wood Preserving
3*	2411	Log Storage and Handling
4*	2426	Hardwood Dimension and Flooring Mills.
	2429	Special Product Sawmills, Not Elsewhere Classified.
	2431–2439 (except 2434)	Millwork, Veneer Plywood, and Structural Wood.
	2448, 2449	Wood Containers
	2451, 2452	Wood Buildings and Mobile Homes.
	2493	Reconstituted Wood Products.
	2499	Wood Products, Not Elsewhere Classified.
		Sector B. Paper and Allied Products Manufacturing
1	2611	Pulp Mills.
2	2621	Paper Mills.
3*	2631	Paperboard Mills.
4	2652–2657	Paperboard Containers and Boxes.
5	2671–2679	Converted Paper and Paperboard Products, Except Containers and Boxes.
		Sector C. Chemical and Allied Products Manufacturing
1*	2812–2819	Industrial Inorganic Chemicals.

TABLE 1.—SECTOR/SUBSECTORS COVERED BY THE FINAL MSGP—Continued

Subsector	SIC code	Activity represented
2*	2821–2824	Plastics Materials and Synthetic Resins, Synthetic Rubber, Cellulosic and Other Man-made Fibers Except Glass.
3	2833–2836	Medicinal chemicals and botanical products; pharmaceutical preparations,; invitro and invivo diagnostic substances; biological products, except diagnostic substances.
4*	2841–2844	Soaps, Detergents, and Cleaning Preparations; Perfumes, Cosmetics, and Other Toilet Preparations.
5	2851	Paints, Varnishes, Lacquers, Enamels, and Allied Products.
6	2861–2869	Industrial Organic Chemicals.
7*	2873–2879	Agricultural Chemicals, including Facilities that Make Fertilizer Solely from Leather Scraps and Leather Dust.
8	2891–2899	Miscellaneous Chemical Products.
9	3952 (limited to list)	Inks and Paints, Including China Painting Enamels, India Ink, Drawing Ink, Platinum Paints for Burnt Wood or Leather Work, Paints for China Painting, Artist's Paints and Artist's Watercolors.
Sector D. Asphalt Paving and Roofing Materials Manufacturers and Lubricant Manufacturers.		
1*	2951, 2952	Asphalt Paving and Roofing Materials.
2	2992, 2999	Miscellaneous Products of Petroleum and Coal.
Sector E. Glass, Clay, Cement, Concrete, and Gypsum Product Manufacturing		
1	3211	Flat Glass.
	3221, 3229	Glass and Glassware, Pressed or Blown.
	3231	Glass Products Made of Purchased Glass.
	3281	Cut Stone and Stone Products.
	3291–3292	Abrasive and Asbestos Products.
	3296	Mineral Wool.
	3299	Nonmetallic Mineral Products, Not Elsewhere Classified.
2	3241	Hydraulic Cement.
3*	3251–3259	Structural Clay Products.
	3261–3269	Pottery and Related Products.
	3297	Non-Clay Refractories.
4*	3271–3275	Concrete, Gypsum and Plaster Products.
	3295	Minerals and Earth's, Ground, or Otherwise Treated.
Sector F. Primary Metals		
1*	3312–3317	Steel Works, Blast Furnaces, and Rolling and Finishing Mills.
2*	3321–3325	Iron and Steel Foundries.
3	3331–3339	Primary Smelting and Refining of Nonferrous Metals.
4	3341	Secondary Smelting and Refining of Nonferrous Metals.
5*	3351–3357	Rolling, Drawing, and Extruding of Nonferrous Metals.
6*	3363–3369	Nonferrous Foundries (Castings).
7	3398, 3399	Miscellaneous Primary Metal Products.
Sector G. Metal Mining (Ore Mining and Dressing)		
1	1011	Iron Ores.

	3571–3579	Computer and Office Equipment.
		Sector AD. Reserved for Facilities Not Covered Under Other Sectors and Designated by the Director

*Denotes subsector with analytical (chemical) monitoring requirements.
NA indicates those industry sectors in which subdivision into subsectors was determined to be not applicable.

The final MSGP modification of September 30, 1998 (63 FR 52430) expanded the coverage of the 1995 MSGP to include a small number of categories of facilities which had been covered by the 1992 baseline industrial general permit but excluded from the MSGP. In Table 1 above, these categories have been included in the appropriate sectors/subsectors of the MSGP as determined by the September 30, 1998 modification.

With the September 30, 1998 modification, EPA believes that the MSGP now covers all of the categories of industrial facilities which may discharge storm water associated with industrial activity as defined at 40 CFR 122.26(b)(14) (except construction activities disturbing five or more acres which are permitted separately). However, the September 30, 1998 modification also added another sector to the MSGP (Sector AD) to cover any inadvertent omissions. EPA has retained Sector AD in today's reissued MSGP.

Sector AD is further intended to provide a readily available means for covering many of the storm water facilities which are designated for permitting in accordance with NPDES regulations at 40 CFR 122.26(g)(1)(i). These regulations provide that permit applications may be required within 180 days of notice for any discharges which contribute to a violation of a water quality standard, or are determined to be significant sources of pollutants.

EPA also recognizes that a new North American Industry Classification System (NAICS) was recently adopted by the Office of Management and Budget (62 FR 17288, April 9, 1997). NAICS replaces the 1987 standard industrial classification (SIC) code

R0019792

system for the collection of statistical economic data. However, the use of the new system for nonstatistical purposes is optional. EPA considered the use of NAICS for the today's MSGP reissuance, but elected to retain the 1987 SIC code system since the storm water regulations (40 CFR 122.26(b)(14)) reference the previous system and this system has generally proven to be adequate for identifying the facilities covered by storm water regulations. EPA will consider transitioning to the new NAICS system in future rule making.

V. Limitations on Coverage

A. Storm Water Discharges Subject to Effluent Guideline Limitations, Including New Source Performance Standards

The general prohibition on coverage of storm water subject to an effluent guideline limitation in the 1995 MSGP has been retained in today's MSGP reissuance. Only those storm water discharges subject to the following effluent guidelines are eligible for coverage (provided they meet all other eligibility requirements):

TABLE 2.—EFFLUENT GUIDELINES APPLICABLE TO DISCHARGES THAT MAY BE ELIGIBLE FOR PERMIT COVERAGE

Effluent guideline	New Source performance standards included in effluent guidelines?	Sectors with affected facilities
Runoff from material storage piles at cement manufacturing facilities [40 CFR Part 411 Subpart C (established February 23, 1977)].	Yes	E
Contaminated runoff from phosphate fertilizer manufacturing facilities [40 CFR Part 418 Subpart A (established April 8, 1974)].	Yes	C
Coal pile runoff at steam electric generating facilities [40 CFR Part 423 (established November 19, 1982)]	Yes	O
Discharges resulting from spray down or intentional wetting of logs at wet deck storage areas [40 CFR Part 429, Subpart I (established January 26, 1981)].	Yes	A
Mine dewatering discharges at crushed stone mines [40 CFR part 436, Subpart B]	No	J
Mine dewatering discharges at construction sand and gravel mines [40 CFR part 436, Subpart C]	No	J
Mine dewatering discharges at industrial sand mines [40 CFR part 436, Subpart D]	No	J
Runoff from asphalt emulsion facilities [40 CFR Part 443 Subpart A (established July 24, 1975)].	Yes	D
Runoff from landfills, [40 CFR Part 445, Subpart A and B (established February 2, 2000.]	Yes	K & L

Section 306 of the Clean Water Act (CWA) requires EPA to develop performance standards for all new sources described in that section. These standards apply to all facilities which go into operation after the date the standards are promulgated. Section 511(c) of the CWA requires the Agency to comply with the National Environmental Policy Act (NEPA) prior to issuance of a permit under the authority of Section 402 of the CWA to facilities defined as a new source under Section 306.

The fact sheet for the 1995 MSGP described a process for ensuring compliance with NEPA for the MSGP (60 FR 50809). This process, which is repeated below, has been retained for the reissued MSGP. Additional guidance is found in a new Addendum C to the final MSGP.

Facilities which are subject to the performance standards for new sources as described in this section of the fact sheet must provide EPA with an Environmental Information Document pursuant to 40 CFR 6.101 prior to seeking coverage under this permit. This information shall be used by the Agency to evaluate the facility under the requirements of NEPA in an Environmental Review. The Agency will make a final decision regarding the direct or indirect impact of the discharge. The Agency will follow all administrative procedures required in this process. The permittee must obtain a copy of the Agency's final finding prior to the submission of a Notice of Intent to be covered by this general permit. In order to maintain eligibility, the permittee must implement any mitigation required of the facility as a result of the NEPA review process. Failure to implement mitigation measures upon which the Agency's NEPA finding is based is grounds for termination of permit coverage. In this way, EPA has established a procedure which allows for the appropriate review procedures to be completed by this Agency prior to the issuance of a permit under Section 402 of the CWA to an operator of a facility subject to the new source performance standards of Section 306 of the CWA. EPA believes that it has fulfilled its requirements under NEPA for this Federal action under Section 402 of the CWA.

B. Historic Preservation

The National Historic Preservation Act (NHPA) requires Federal agencies to take into account the effects of Federal undertakings, including undertakings on historic properties that are either listed on, or eligible for listing on, the National Register of Historic Places. The term "Federal undertaking" is defined in the existing NHPA regulations to include any project, activity, or program under the direct or indirect jurisdiction of a Federal agency that can result in changes in the character or use of historic properties, if any such historic properties are located in the area of potential effects for that project, activity, or program. See 36 CFR 802(o). Historic properties are defined in the NHPA regulations to include prehistoric or historic districts, sites, buildings, structures, or objects that are included in, or are eligible for inclusion in, the National Register of Historic Places. See 36 CFR 802(e).

Federal undertakings include EPA's issuance of general NPDES permits. In light of NHPA requirements, EPA included a provision in the eligibility requirements of the 1995 MSGP for the consideration of the effects to historic properties. That provision provided that an applicant is eligible for permit coverage only if: (1) the applicant's storm water discharges and BMPs to control storm water runoff do not affect a historic property, or (2) the applicant has obtained, and is in compliance with, a written agreement between the applicant and the State Historic Preservation Officer (SHPO) that outlines all measures to be taken by the applicant to mitigate or prevent adverse effects to the historic property. See Part I.B.6, 60 FR 51112 (September 29, 1995). When applying for permit coverage, applicants were required to certify in

R0019793

the NOI that they are in compliance with the Part I.B.6 eligibility requirements. Provided there are no other factors limiting permit eligibility, MSGP coverage was then granted 48 hours after the postmark on the envelope used to mail the NOI.

The September 30, 1998 modification included two revisions of the original MSGP with respect to historic properties. First, EPA amended the original Part I.B.6.(ii) to include a reference to Tribal Historic Preservation Officers (THPOs) because MSGP coverage extends to Tribal lands and in recognition of the central role Tribal governments play in the protection of historic resources. Second, EPA included NHPA guidance and a list of SHPO and THPO addresses in a new Addendum I to the MSGP to assist applicants with the certification process for permit eligibility under this condition.

For today's MSGP reissuance, EPA has modified slightly the requirements of the first option for obtaining permit coverage to enhance the protection of historic properties. Permit coverage is only available if storm water and allowable non-storm water discharges and "discharge-related activities" do not affect historic properties. "Discharge-related activities" are defined to include activities which cause, contribute to, or result in storm water and allowable non-storm water point source discharges, and measures such as the siting, construction and operation of BMPs to control, reduce or prevent pollution in the discharges. Discharge-related activities are included to ensure compliance with NHPA requirements to consider the effects of activities which are related to the activity which is permitted, *i.e.*, the storm water and non-storm water discharges. Because this change was minor, EPA is relying on its 1995 and 1998 consultations with the Advisory Council on Historic Preservation as its basis for reissuance of this permit.

Also, as discussed in Section VI.A.1 below, EPA intends to modify, contingent upon Office of Management and Budget review and approval, the Notice of Intent form to require that operators identify which of the above two options they are using to ensure eligibility for permit coverage under the MSGP. The NHPA guidance has also been modified to reflect the above pending changes, and appears in Addendum B in today's notice rather than Addendum I. Until the revised form is approved and issued, the current form (with minor clarifications) remains in effect.

Facilities seeking coverage under today's MSGP which cannot certify compliance with the NHPA requirements must submit individual permit applications to the permitting authority. For facilities already covered by the existing MSGP, the deadline for the individual applications is the same as that for NOIs requesting coverage under the reissued MSGP (December 29, 2000).

C. Endangered Species

The Endangered Species Act (ESA) of 1973 requires Federal Agencies such as EPA to ensure, in consultation with the U.S. Fish and Wildlife Service (FWS) and the National Marine Fisheries Service (NMFS) (also known collectively as the "Services"), that any actions authorized, funded, or carried out by the Agency (*e.g.*, EPA issued NPDES permits authorizing discharges to waters of the United States) are not likely to jeopardize the continued existence of any Federally-listed endangered or threatened species or adversely modify or destroy critical habitat of such species (see 16 U.S.C. 1536(a)(2), 50 CFR 402 and 40 CFR 122.49(c)).

For the 1995 MSGP, EPA conducted formal consultation with the Services which resulted in a joint Service biological opinion issued by the FWS on March 31, 1995, and by the NMFS on April 5, 1995, which concluded that the issuance and operation of the MSGP was not likely to jeopardize the existence of any listed endangered or threatened species, or result in the adverse modification or destruction of any critical habitat.

The 1995 MSGP contained a number of conditions to protect listed species and critical habitat. Permit coverage was provided only where:

• The storm water discharge(s), and the construction of BMPs to control storm water runoff, were not likely to jeopardize species identified in Addendum H of the permit, or

• The applicant's activity had received previous authorization under the Endangered Species Act and established an environmental baseline that was unchanged; or,

• The applicant was implementing appropriate measures as required by the Director to address jeopardy.

For today's MSGP reissuance, EPA has modified the ESA-related requirements for obtaining permit coverage to enhance the protection of listed species. First, permit coverage is only available if storm water and allowable non-storm water discharges and "discharge-related activities" result in no jeopardy to listed species. "Discharge-related activities" are defined to include activities which cause, contribute to or result in storm water and allowable non-storm water point source discharges, and measures such as the siting, construction and operation of BMPs to control, reduce or prevent pollution in the discharges. Discharge-related activities are included for compliance with ESA requirements to consider the effects of activities which are related to the activity which is permitted, *i.e.*, the storm water and non-storm water discharges.

In addition, operators seeking coverage under the reissued MSGP must certify that they are eligible for coverage under one of the following five options which are provided in Parts 1.2.3.6.3.1 through 5 of the permit:

1. No endangered or threatened species or critical habitat are in proximity to the facility or the point where authorized discharges reach the receiving water; or

2. In the course of a separate federal action involving the facility (*e.g.*, EPA processing request for an individual NPDES permit, issuance of a CWA Section 404 wetlands dredge and fill permit, etc.), formal or informal consultation with the Fish and Wildlife Service and/or the National Marine Fisheries Service under Section 7 of the ESA has been concluded and that consultation:

(a) addressed the effects of the storm water and allowable non-storm water discharges and discharge-related activities on listed species and critical habitat and

(b) the consultation resulted in either a no jeopardy opinion or a written concurrence by the Service(s) on a finding that the storm water and allowable non-storm water discharges and discharge-related activities are not likely to jeopardize listed species or critical habitat; or

3. The activities are authorized under Section 10 of the ESA and that authorization addresses the effects of the storm water and allowable non-storm water discharges and discharge-related activities on listed species and critical habitat; or

4. Using due diligence, the operator has evaluated the effects of the storm water discharges, allowable non-storm water discharges, and discharge-related activities on listed endangered or threatened species and critical habitat and does not have reason to believe listed species or critical habitat would be jeopardized; or

5. The storm water and allowable non-storm water discharges and discharge-related activities were already addressed in another operator's

certification of eligibility under Part 1.2.3.6.3.1 through 1.2.3.6.3.4 which included the facility's activities. By certifying eligibility under this Part, a permittee agrees to comply with any measures or controls upon which the other operator's certification was based.

The first four options listed above are similar to the eligibility provisions of the 1995 MSGP. Option 5 was added to account for situations such as an airport facility where one operator (*e.g.*, the airport authority) may have covered the entire airport through its certification. Option 5 allows other operators to take advantage of such a certification without repeating the reviews conducted by the first operator. Option 1 applies to operators who are not jeopardizing endangered species because listed species simply are not in proximity to their facility. Option 4 applies to operators who have endangered species nearby and must look more closely at potential jeopardy and may need to adopt measures to reduce the risk of jeopardy to listed species or critical habitat. The provision of the two options to determine that a facility is unlikely to jeopardize listed species, coupled with the pending new NOI requirement to indicate whether or not the Service was contacted in making the determination, will also allow for better oversight of the permit. Under the 1995 permit, there was no way to tell from the NOI information whether the decision on eligibility was due to no species in the county, a discussion with the Service, or a simple unilateral decision by the operator.

Addendum H of the 1995 MSGP provided instructions to assist permittees in determining whether they met the permit's ESA-related eligibility requirements. For today's reissued MSGP, this guidance has been updated to reflect the above requirements and appears as Addendum A. As noted in Section VI.A.1 below, EPA intends to modify the Notice of Intent form to conform with new ESA requirements discussed above.

Addendum H of the 1995 MSGP contained a list of proposed and listed endangered and threatened species that could be jeopardized by the discharges and measures to control pollutants in the discharges. EPA reinitiated and completed formal consultation with the Services for the September 30, 1998 modification of the MSGP. As a result of this consultation and in response to public comments on the modification, EPA updated the species list in Addendum H to include species that were listed or proposed for listing since the Addendum H list was originally compiled on March 31, 1995. EPA also decided to expand the list to include all of the terrestrial (*i.e.*, non-aquatic) listed and proposed species in recognition that those species may be impacted by permitted activities such as the construction and operation of the BMPs. The September 30, 1998 MSGP modification included the species list updated as of July 8, 1998 (63 FR 52494). The species list is also being updated on a regular basis and an electronic copy of the list is available at the Office of Wastewater Management website at "http://www.epa.gov/owm/esalst2.htm". The information may also be obtained by contacting the Services. The permittee is responsible for obtaining the updated information.

Based on comments received on the proposed MSGP on March 30, 2000 (65 FR 17010), the final permit requires facility operators to consider only listed endangered or threatened species, and not species proposed to be listed. Further explanation for the change can be found in Section IX of this notice.

On August 10, 2000, EPA initiated informal consultation with FWS and NMFS on EPA's finding of no likelihood of adverse effect on threatened and endangered species and critical habitat resulting from issuance of MSGP–2000. On September 22, 2000 FWS concurred with EPA's finding.

To be eligible for coverage under today's reissued MSGP, facilities must review the updated list of species and their locations in conjunction with the Addendum A instructions for completing the application requirements under this permit. If an applicant determines that none of the species identified in the updated species list is found in the county in which the facility is located, then there is a likelihood of no jeopardy and they are eligible for permit coverage. Applicants must then certify that their storm water and allowable non-storm water discharges, and their discharge-related activities, are not likely to jeopardize species and will be granted MSGP permit coverage 48 hours after the date of the postmark on the envelope used to mail the NOI form, provided there are no other factors limiting permit eligibility.

If listed species are located in the same county as the facility seeking MSGP coverage, then the applicant must determine whether the species are in proximity to the storm water or allowable non-storm water discharges or discharge-related activities at the facility. A species is in proximity to a storm water or allowable non-storm water discharge when the species is located in the path or down gradient area through which or over which the point source discharge flows from industrial activities to the point of discharge into the receiving water, and once discharged into the receiving water, in the immediate vicinity of, or nearby, the discharge point. A species is also in proximity if it is located in the area of a site where discharge-related activities occur. If an applicant determines there are no species in proximity to the storm water or allowable non-storm water discharges, or discharge-related activities, then there is no likelihood of jeopardizing the species and the applicant is eligible for permit coverage.

If species are in proximity to the storm water or allowable non-storm water discharges or discharge-related activities, as long as they have been considered as part of a previous ESA authorization of the applicant's activity, and the environmental baseline established in that authorization is unchanged, the applicant may be covered under the permit. The environmental baseline generally includes the past and present impacts of all Federal, state and private actions that were occurring at the time the initial NPDES authorization and current ESA section 7 action by EPA or any other federal agency was taken. Therefore, if a permit applicant has received previous authorization and nothing has changed or been added to the environmental baseline established in the previous authorization, then coverage under this permit will be provided.

In the absence of such previous authorization, if species identified in the updated species list are in proximity to the discharges or discharge-related activities, then the applicant must determine whether there is any likely jeopardy to the species. This is done by the applicant conducting a further examination or investigation, or an alternative procedure, as described in the instructions in Addendum A of the permit. If the applicant determines that there is no likely jeopardy to the species, then the applicant is eligible for permit coverage. If the applicant determines that there likely is, or will likely be any jeopardy, then the applicant is not eligible for MSGP coverage unless or until he or she can meet one of the other eligibility conditions.

All dischargers applying for coverage under the MSGP must provide in the application information on the Notice of Intent form: (1) A determination as to whether there are any listed species in proximity to the storm water or allowable non-storm water discharges or discharge related activity, and (2) (when

EPA receives approval from the Office of Management and Budget and issues the revised form) an indication of which option under Part 1.2.3.6.3 of the MSGP they claim eligibility for permit coverage, and (3) a certification that their storm water and allowable non-storm water discharges and discharge-related activities are not likely to jeopardize listed species, or are otherwise eligible for coverage due to a previous authorization under the ESA. Coverage is contingent upon the applicant's providing truthful information concerning certification and abiding by any conditions imposed by the permit.

Dischargers who cannot determine if they meet one of the endangered species eligibility criteria cannot sign the certification to gain coverage under the MSGP and must apply to EPA for an individual NPDES storm water permit. For facilities already covered by the 1995 MSGP, the deadline for the individual applications is the same as that for NOIs requesting coverage under the reissued MSGP (December 29, 2000). As appropriate, EPA will conduct ESA section 7 consultation when issuing such individual permits.

Regardless of the above conditions, EPA may require that a permittee apply for an individual NPDES permit on the basis of possible jeopardy to species or critical habitats. Where there are concerns that coverage for a particular discharger is not sufficiently protective of listed species, the Services (as well as any other interested parties) may petition EPA to require that the discharger obtain an individual NPDES permit and conduct an individual section 7 consultation as appropriate.

In addition, the Assistant Administrator for Fisheries for the National Oceanic and Atmospheric Administration, or his/her authorized representative, or the U.S. Fish and Wildlife Service (as well as any other interested parties) may petition EPA to require that a permittee obtain an individual NPDES permit. The permittee is also required to make the SWPPP, annual site compliance inspection report, or other information available upon request to the Assistant Administrator for Fisheries for the National Oceanic and Atmospheric Administration, or his/her authorized representative, or the U.S. Fish and Wildlife Service Regional Director, or his/her authorized representative.

These mechanisms allow for the broadest and most efficient coverage for the permittee while still providing for the most efficient protection of endangered species. They significantly reduce the number of dischargers that must be considered individually and therefore allow the Agency and the Services to focus their resources on those discharges that are indeed likely to jeopardize listed species. Straightforward mechanisms such as these allow applicants more immediate access to permit coverage, and eliminates "permit limbo" for the greatest number of permitted discharges. At the same time it is more protective of endangered species because it allows both agencies to focus on the real problems, and thus, provide endangered species protection in a more expeditious manner.

D. New Storm Water Discharges to Water Quality-Impaired or Water Quality-Limited Receiving Waters

Today's final MSGP includes a new provision (Part 1.2.3.8) which establishes eligibility conditions with regard to discharges to water quality-limited or water quality-impaired waters. For the purposes of this permit, "water quality-impaired" refers to a stream, lake, estuary, etc. that is not currently meeting its assigned water quality standards. These waters are also referred to as "303(d) waters" due to the requirement under that section of the CWA for States to periodically list all state waters that are not meeting their water quality standards. "Water quality-limited waters" refers to waterbodies for which a State had to develop individual Total Maximum Daily Loads (TMDLs), a tool which helps waterbodies meet their water quality standards. A TMDL is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards, and an allocation of that amount to the pollutant's sources. Water quality standards are set by States, Territories, and Tribes. They identify the uses for each waterbody, for example, drinking water supply, contact recreation (swimming), and aquatic life support (fishing), and the scientific criteria to support that use. The CWA, section 303, establishes the water quality standards and TMDL programs.

Prior to submitting a Notice of Intent, any new discharger (see 40 CFR 122.2) to a 303(d) waterbody must be able to demonstrate compliance with 40 CFR 122.4(i). In essence, you are a new discharger if your facility started discharging after August 13, 1979 and your storm water was not previously permitted. Any discharger to a waterbody for which there is an approved TMDL must confirm that the TMDL allocated a portion of the load for storm water point source discharges. These provisions apply only to discharges containing the pollutant(s) for which the waterbody is impaired or the TMDL developed.

Part 1.2.3.8.1 (which applies to new storm water discharges and not to existing discharges) is designed to better ensure compliance with NPDES regulations at 40 CFR 122.4(i), which include certain special requirements for new discharges into impaired waterbodies. Lists of impaired waterbodies (sometimes referred to as 303(d) waterbodies) may be obtained from appropriate State environmental offices or their internet sites. NPDES regulations at 40 CFR 122.4(i) prohibit discharges unless it can be shown that:

1. There are sufficient remaining pollutant load allocations to allow for the discharge; and
2. The existing dischargers into that segment are subject to compliance schedules designed to bring the segments into compliance with applicable water quality standards.

Part 1.2.3.8.2 (which applies to both new and existing storm water discharges) is designed to better ensure compliance with NPDES regulations at 40 CFR 122.4(d), which requires compliance with State water quality standards. The eligibility condition prohibits coverage of new or existing discharges of a particular pollutant where there is a TMDL, unless the discharge is consistent with the TMDL. Lists of waterbodies with TMDLs may be obtained from appropriate State environmental offices or their internet sites and from EPA's TMDL internet site at *http://www.epa.gov/owow/tmdl/index.html.*

E. Storm Water Discharges Subject to Anti-Degradation Provisions of Water Quality Standards

Part 1.2.3.9 of today's final MSGP includes a new provision which clarifies that discharges which do not comply with applicable anti-degradation provisions of State water quality standards are not eligible for coverage under the MSGP. This eligibility condition is designed to better ensure compliance with NPDES regulations at 40 CFR 122.4(d), which requires compliance with State water quality standards. Anti-degradation provisions may be obtained from the appropriate State environmental office or their internet sites.

F. Storm Water Discharges Previously Covered by an Individual Permit

The 1995 MSGP contained general prohibitions on coverage where a discharge was covered by another NPDES permit (Part I.B.3.d) and where a permit had been terminated other than at the request of the permittee (Part

I.B.3.e.). It was therefore possible to obtain coverage by requesting termination of an individual permit and then submitting an NOI for coverage under the MSGP. This could be desirable from both the discharger's and EPA's perspective for a variety of reasons, for example, where a wastewater permit included storm water outfalls, but the wastewater outfalls had been eliminated. Being able to use the general permit would reduce the application cost to the permittee and the administrative burden of permit issuance to the Agency. Today's permit clarifies the conditions under which transfer from an individual permit to this general permit would be acceptable (Part 1.2.3.3.2).

In order to avoid conflict with the anti-backsliding provisions of the CWA, transfer from an individual permit to the MSGP will only be allowed where both of the following conditions are met:

- The individual permit did not contain numeric water quality-based effluent limitations developed for the storm water component of the discharge; and
- The permittee includes any specific BMPs for storm water required under the individual permit in their storm water pollution prevention plan.

Implementation of a comprehensive Storm Water Pollution Prevention Plan for the entire facility (as opposed to selected outfalls in an individual permit) and compliance with all other conditions of the MSGP is deemed to be at least as stringent a technology-based permit limit as the conditions of the individual permit. This assumption is only made where the previous permit did not contain any specific water quality-based effluent limitations on storm water discharges (e.g., storm water contained high levels of zinc and the individual permit contained a zinc limit developed to ensure compliance with the State water quality criteria).

G. Requiring Coverage Under an Individual Permit or an Alternate General Permit

Part 9.12 of today's final MSGP provides that EPA may require an individual permit or coverage under a separate general permit instead of today's MSGP. This is in accord with NPDES regulations at 40 CFR 122.28(b)(3). These regulations also provide that any interested party may petition EPA to take such an action. The issuance of the individual permit or alternate general permit would be in accordance with 40 CFR Part 124 and would provide for public comment and appeal of any final permit decision. The circumstances in which such an action would be taken are set forth at 40 CFR 122.28(b)(3).

VI. Summary of Common Permit Conditions

The following section describes the permit conditions common to discharges from all the industrial activities covered by today's final MSGP. These conditions are largely the same as the conditions of the 1995 MSGP.

A. Notification Requirements

General permits for storm water discharges associated with industrial activity must require the submission of a Notice of Intent (NOI) prior to the authorization of such discharges (see 40 CFR 122.28(b)(2)(i), April 2, 1992 (57 FR 11394)). Consistent with these regulatory requirements, today's final MSGP establishes NOI requirements. These requirements apply to facilities currently covered by the 1995 MSGP, as well as new facilities seeking coverage. EPA made minor modifications to the NOI form to allow the discharger, the Agency and the public to more easily determine sector-specific conditions that will apply to the facility. Further modifications proposed on March 30, 2000 (65 FR 17010) require review and approval by the Office of Management and Budget under the Paperwork Reduction Act. EPA will have all appropriate approvals in place prior to requiring the use of the expanded NOI form. In the interim the NOI form with the minor modifications, contained in this notice, is in effect.

The information requirements of the revised NOI form are described below:

1. Content of NOI

a. An indication of which permit the operator is filing the NOI for (e.g., a facility in New Hampshire would be filing for coverage under permit NHR05*###, a facility located on Navajo Reservation lands in New Mexico under the AZR05*##I permit, a private contractor operating a federal facility in Colorado that is not located on Indian Country lands under the COR05*##F permit, etc.);

b. The name, address, and telephone number of the operator filing the NOI for permit coverage;

c. An indication of whether the owner of the site is a Federal, State, Tribal, private, or other public entity;

d. The name (or other identifier), address, county, and latitude/longitude of the facility for which the NOI is submitted (latitude/longitude will be accepted in either degree-minute-second or decimal format);

e. An indication of whether the facility is located on Indian Country lands;

f. An indication of whether the facility is a federal facility operated by the federal government;

g. The name of the receiving water(s);

h. The name of the municipal operator if the discharge is through a municipal separate storm sewer system prior to discharge to a water of the U.S.;

i. Up to four 4-digit Standard Industrial Classification (SIC) codes that best represent the principal products produced or services rendered, including hazardous waste treatment, storage, or disposal activities, land disposal facilities that receive or have received any industrial waste, steam electric power generating facilities, or treatment works treating domestic sewage;

j. Identification of applicable sector(s) in this permit, as designated in Table 1, for facility discharges associated with industrial activity the operator wishes to have covered under this permit;

k. Certification that a storm water pollution prevention plan (SWPPP) meeting the requirements of Part 4 has been developed (with a copy of the permit language in the SWPPP);

l. Based on the instructions in Addendum A, whether any listed threatened or endangered species, or designated critical habitat, are in proximity to the storm water discharges or storm water discharge-related activities to be covered by this permit;

m. Whether any historic property listed or eligible for listing on the National Register of Historic Places is located on the facility or in proximity to the discharge;

n. A signed and dated certification, signed by a authorized representative of the facility as detailed in Part 9.7 and maintained with the SWPPP that certifies the following:

I certify under penalty of law that I have read and understand the Part 1.2 eligibility requirements for coverage under the multi-sector storm water general permit including those requirements relating to the protection of endangered or threatened species or critical habitat. To the best of my knowledge, the storm water and allowable non-storm discharges authorized by this permit (and discharged related activities), are not likely and will not likely, jeopardize endangered or threatened species or critical habitat, or are otherwise eligible for coverage under Part 1.2.3.6 of the permit. To the best of my knowledge, I further certify that such discharges and discharge related activities do not have an effect on properties listed or eligible for listing on the National Register of Historic Places under the National Historic Preservation Act, or are otherwise eligible for coverage under Part 1.2.3.7 of the permit. I understand that continued coverage under the multi-sector storm water general permit is contingent upon maintaining eligibility as provided for in Part 1.2.

Two additional components of the form pending approval by the Office of Management and Budget are:

a. under which Part(s) of Part 1.2.3.6 (Endangered Species) the applicant is certifying eligibility and whether the FWS or NMFS was involved in making the determination of eligibility;

b. under which Part(s) of Part 1.2.3.7 (Historic Properties) the applicant is certifying eligibility and whether the SHPO or THPO was involved in the determination of eligibility.

The NOI must be signed in accordance with the signatory requirements of 40 CFR 122.22. A complete description of these signatory requirements is provided in the instructions accompanying the NOI. Completed NOI forms must be submitted to the Storm Water Notice of Intent (4203), 1200 Pennsylvania Avenue NW., Washington, DC 20460.

In the future (but not at the present time), EPA may also allow alternate means of NOI submission (such as electronic submission). An alternate means of NOI submission may be used by operators provided EPA has informed the operator of the acceptability of the alternative.

2. Deadlines

For facilities currently covered by the 1995 MSGP, the deadline for submission of an NOI requesting coverage under the reissued MSGP is January 29, 2001 (90 days after expiration of the 1995 MSGP). For these facilities, the requirements of the 1995 MSGP are incorporated into today's MSGP and continue to apply during the interim period subsequent to the expiration of the 1995 MSGP, but prior to submission of the NOI requesting coverage under the reissued MSGP. In response to a question from some permittees, EPA wishes to clarify that there is no need to submit an NOT to rescind coverage under the 1995 MSGP.

Facilities currently covered by the 1995 MSGP who cannot immediately determine if they are eligible for coverage under today's reissued MSGP may nevertheless be covered for up to 270 days provided an application for an alternative permit is submitted within 90 days. This interim coverage allows permit coverage while the permittee assesses his eligibility for the reissued MSGP and, if necessary, still meet the 180 day lead time required for applications for individual permits.

For facilities commencing operations after reissuance of the MSGP, the NOI must be submitted at least two days prior to the commencement of the new industrial activity. New operators of existing facilities must also submit the NOI at least two days prior to assuming operational control at existing facilities.

Dischargers who submit a complete NOI in accordance with the MSGP requirements are authorized to discharge storm water associated with industrial activity two days after the date the NOI is postmarked, unless otherwise notified by EPA. EPA may deny coverage under the MSGP and require submission of an individual NPDES permit application based on a review of the completeness and/or content of the NOI or other information (e.g., Endangered Species Act compliance, National Historic Preservation Act Compliance, water quality information, compliance history, history of spills, etc.). Where EPA requires a discharger authorized under the MSGP to apply for an individual NPDES permit (or an alternative general permit), EPA will notify the discharger in writing that a permit application (or different NOI) is required by an established deadline. Coverage under the MSGP will automatically terminate if the discharger fails to submit the required permit application in a timely manner. Where the discharger does submit a requested permit application, coverage under the MSGP will automatically terminate on the effective date of the issuance or denial of the individual NPDES permit or the alternative general permit as it applies to the individual permittee.

A discharger is not precluded from submitting an NOI at a later date than described above. However, in such instances, EPA may bring appropriate enforcement actions.

3. Municipal Separate Storm Sewer System Operator Notification

Operators of storm water discharges associated with industrial activity that discharge through a large or medium municipal separate storm sewer system (MS4) or a municipal system designated by the Director,[1] must (upon request of the MS4 operator) submit a copy of the NOI to the municipal operator of the system receiving the discharge. This requirement of today's MSGP differs from the 1995 MSGP which had required that a copy of the NOI be sent to the MS4 operator. Today's MSGP has been modified in this regard to reduce paperwork requirements, and in consideration of the fact that most large and medium MS4 operators already have good information concerning the industrial facilities discharging into their MS4s.

EPA wishes to ensure a coordinated program between EPA and operators of MS4s for controlling pollutants in storm water discharges associated with industrial activity which enter an MS4. Such a coordinated program was intended by EPA's original storm water permit application regulations of November 16, 1990 (55 FR 48063). Additional discussion of this matter can be found in the original proposed MSGP (58 FR 61146).

4. Notice of Termination

Where a discharger is able to eliminate the storm water discharges associated with industrial activity from a facility, the discharger may submit a Notice of Termination (NOT) form (or photocopy thereof) provided by the Director. Today's final MSGP also differs from the 1995 MSGP by requiring that an NOT be submitted within 30 days after one or both of the following two conditions having been met:

a. a new owner/operator has assumed responsibility for the facility; or

b. the permittee has ceased operations at the facility and there no longer are discharges of storm water associated with industrial activity from the facility;

A copy of the NOT and instructions for completing the NOT are included in Addendum E. The NOT form requires the following information:

a. Name, mailing address, and location of the facility for which the notification is submitted. Where a street address for the site is not available, the location of the approximate center of the site must be described in terms of the latitude and longitude to the nearest 15 seconds, or the section, township and range to the nearest quarter;

b. The name, address and telephone number of the operator addressed by the Notice of Termination;

c. The NPDES permit number for the storm water discharge associated with industrial activity identified by the NOT;

d. An indication of whether the storm water discharges associated with industrial activity have been eliminated or the operator of the discharges has changed; and

e. The following certification:

I certify under penalty of law that all storm water discharges associated with industrial activity from the identified facility that are

[1] The terms large and medium municipal separate storm sewer systems (systems serving a population of 100,000 or more) are defined at 40 CFR 122.26(b)(4) and (7). Some of the cities and counties in which these systems are found are listed in Appendices F, G, H, and I to 40 CFR Part 122. Other municipal systems have been designated by EPA on a case-by-case basis or have brought into the program based upon the 1990 Census.

authorized by an NPDES general permit have been eliminated or that I am no longer the operator of the industrial activity. I understand that by submitting this Notice of Termination I am no longer authorized to discharge storm water associated with industrial activity under this general permit, and that discharging pollutants in storm water associated with industrial activity to waters of the United States is unlawful under the Clean Water Act where the discharge is not authorized by an NPDES permit. I also understand that the submission of this notice of termination does not release an operator from liability for any violations of this permit or the Clean Water Act.

NOTs are to be sent to the Storm Water Notice of Termination (4203), 1200 Pennsylvania Avenue NW., Washington, DC 20460.

The NOT must be signed in accordance with the signatory requirements of 40 CFR 122.22. A complete description of these signatory requirements is provided in the instructions accompanying the NOT.

5. Conditional Exclusion for No Exposure

Today's final MSGP includes a special provision (Part 1.5 of the permit) which provides that a facility may discontinue permit coverage if the facility determines that it is eligible for the "no exposure" permit exemption which was created by EPA as part of the promulgation of the Phase II storm water regulations (64 FR 68722). A notice of termination is not required to discontinue permit coverage under these circumstances. However, in accordance with the Phase II regulations, a no exposure certification must be filed with the permitting authority.

It should also be noted that facilities operating under the existing MSGP are eligible, as of the effective date of the Phase II regulations, to submit no exposure certifications immediately if they meet the criteria for no exposure. No exposure certification renewals must be submitted five years from the time they are first submitted (assuming the facility still qualifies for the exemption). If conditions change at a facility such that renewed MSGP coverage is needed, the facility may submit an NOI requesting renewed coverage.

In response to comments on this matter, EPA has included a copy of the "No Exposure" form and instructions as Addendum F to today's permit.

EPA has also prepared a new guidance document entitled "Guidance Manual for Conditional Exclusion from Storm Water Permitting Based on "No Exposure" of Industrial Activities to Storm Water" to assist permittees in determining eligibility for the exemption. This guidance document is available on EPA's storm water website. In addition, EPA recently conducted a mass mailing to permittees (as well as other stakeholder groups) alerting them to the no exposure exemption.

B. Special Conditions

The conditions of today's final MSGP have been designed to comply with the technology-based standards of the CWA (BAT/BCT). Based on a consideration of the appropriate factors for BAT and BCT requirements, and a consideration of the factors and options for controlling pollutants in storm water discharges associated with industrial activity, the final MSGP lists a set of tailored requirements for developing and implementing storm water pollution prevention plans (SWPPPs) and, for selected discharges, numeric effluent limitations.[2] This is the same approach as in the 1995 MSGP.

Section VIII of the fact sheet for the 1995 MSGP summarized the industry-specific BMP options for controlling pollutants in storm water discharges associated with industrial activity for the various industrial sectors covered by the MSGP. Section VIII of today's fact sheet does not repeat the information from the 1995 fact sheet; however, updates are provided as appropriate.

Section VI.B.4 of today's fact sheet discusses the storm water discharges which are subject to numeric effluent limitations. For other discharges covered by the final MSGP, the permit conditions reflect EPA's decision to identify a number of BMP and traditional storm water management practices which prevent pollution in storm water discharges as the BAT/BCT level of control for the majority of storm water discharges covered by this permit. The permit conditions applicable to these discharges are not numeric effluent limitations, but rather are flexible requirements for developing and implementing site specific plans to minimize and control pollutants in storm water discharges associated with industrial activity

EPA is authorized under 40 CFR 122.44(k)(2) to impose BMPs in lieu of numeric effluent limitations in NPDES permits when the Agency finds numeric effluent limitations to be infeasible. EPA may also impose BMPs which are "reasonably necessary * * * to carry out the purposes of the Act" under 40 CFR 122.44(k)(3). Both of these standards for imposing BMPs were recognized in *NRDC* v. *Costle*, 568 F.2d 1369, 1380 (D.C. Cir. 1977). The conditions in today's final MSGP are issued under the authority of both of these regulatory provisions. The pollution prevention or BMP requirements in today's final MSGP operate as limitations on effluent discharges that reflect the application of BAT/BCT. This is because the BMPs identified require the use of source control technologies which, in the context of the MSGP, are the best available of the technologies economically achievable (or the equivalent BCT finding). See *NRDC* v. *EPA*, 822 F.2d 104, 122–23 (D.C. Cir. 1987) (EPA has substantial discretion to impose nonquantitative permit requirements pursuant to Section 402(a)(1)). See also EPA's memorandum of August 1, 1996 entitled "Interim Permitting Approach for Water Quality-Based Effluent Limitations for Storm Water Discharges."

1. Prohibition of Non-storm Water Discharges

Today's final MSGP includes basically the same provisions pertaining to non-storm water discharges as the 1995 MSGP. Like the 1995 MSGP, today's MSGP does not authorize non-storm water discharges that are mixed with storm water except as provided below. Today's MSGP does authorize one additional non-storm water discharge: mist discharges which originate from cooling towers and which are deposited at an industrial facility and may be discharged. During the term of the 1995 MSGP, these discharges were brought to the attention of EPA with a request that the discharges be authorized under the reissued MSGP. The mist discharges are authorized under today's MSGP provided:

a. The permittee has evaluated the potential for the discharges to be contaminated by chemicals used in the cooling tower and determined that the levels of such chemicals in the discharges would not cause or contribute to a violation of an applicable water quality standard; and

b. The permittee has addressed this source of pollutants with appropriate BMPs in the SWPPP.

The other non-storm water discharges that are authorized under today's final MSGP are the same as those in the 1995 MSGP and include discharges from fire

[2] Section 9.12.2 of the final MSGP provides that facility operators with storm water discharges associated with industrial activity who, based on an evaluation of site specific conditions, believe that the appropriate conditions of this permit do not adequately represent BAT and BCT requirements for the facility may submit to the Director an individual application (Form 1 and Form 2F). A detailed explanation of the reasons why the conditions of the available general permits do not adequately represent BAT and BCT requirements for the facility as well as any supporting documentation must be included.

fighting activities; fire hydrant flushings; potable water sources, including waterline flushings; irrigation drainage; lawn watering; routine external building washdown without detergents; pavement washwaters where spills or leaks of toxic or hazardous materials have not occurred (unless all spilled material has been removed) and where detergents are not used; air conditioning condensate; compressor condensate; uncontaminated ground water or spring water; and foundation or footing drains where flows are not contaminated with process materials such as solvents that are combined with storm water discharges associated with industrial activity. In response to a comment, the final MSGP includes "potable water sources, including waterline flushings" on the list of authorized non-storm water discharges, but deletes the reference to "drinking fountain water," which a commenter felt could conflict with local ordinances.

To be authorized under today's MSGP, these other sources of non-storm water (except flows from fire fighting activities) must be identified in the SWPPP prepared for the facility. (SWPPP requirements are discussed in more detail below). Where such discharges occur, the SWPPP must also identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

Today's final MSGP does not require pollution prevention measures to be identified and implemented for non-storm water flows from fire-fighting activities because these flows will generally be unplanned emergency situations where it is necessary to take immediate action to protect the public.

The prohibition of unpermitted non-storm water discharges in today's MSGP ensures that non-storm water discharges (except for those classes of non-storm water discharges that are conditionally authorized in Part 1.2.2.2 of the MSGP) are not inadvertently authorized by the permit. Where a storm water discharge is mixed with non-storm water that is not authorized by today's MSGP or another NPDES permit, the discharger should submit the appropriate application forms (Forms 1, 2C, and/or 2E) to gain permit coverage of the non-storm water portion of the discharge.

2. Releases of Reportable Quantities of Hazardous Substances and Oil

As discussed below, today's final MSGP includes the same provisions pertaining to releases of reportable quantities of hazardous substances and oil as the 1995 MSGP.

a. Today's final MSGP provides that the discharge of hazardous substances or oil from a facility must be eliminated or minimized in accordance with the SWPPP developed for the facility. Where a permitted storm water discharge contains a hazardous substance or oil in an amount equal to or in excess of a reporting quantity established under 40 CFR Part 117, or 40 CFR Part 302 during a 24-hour period, the following actions must be taken:

(1) Any person in charge of the facility that discharges hazardous substances or oil is required to notify the National Response Center (NRC) (800–424–8802; in the Washington, DC, metropolitan area, 202–426–2675) in accordance with the requirements of 40 CFR Part 117, and 40 CFR Part 302 as soon as they have knowledge of the discharge.

(2) The SWPPP for the facility must be modified within 14 calendar days of knowledge of the release to provide a description of the release, an account of the circumstances leading to the release, and the date of the release. In addition, the plan must be reviewed to identify measures to prevent the reoccurrence of such releases and to respond to such releases, and it must be modified where appropriate.

(3) The permittee must also submit to EPA within 14 calendar days of knowledge of the release a written description of the release (including the type and estimate of the amount of material released), the date that such release occurred, the circumstances leading to the release, and steps to be taken to modify the SWPPP for the facility.

b. Anticipated discharges containing a hazardous substance in an amount equal to or in excess of reporting quantities are those caused by events occurring within the scope of the relevant operating system. Facilities that have more than one anticipated discharge per year containing a hazardous substance in an amount equal to or in excess of a reportable quantity are required to:

(1) Submit notifications of the first release that occurs during a calendar year (or for the first year of this permit, after submission of an NOI); and

(2) Provide a written description in the SWPPP of the dates on which such releases occurred, the type and estimate of the amount of material released, and the circumstances leading to the releases. In addition, the SWPPP must address measures to minimize such releases.

c. Where a discharge of a hazardous substance or oil in excess of reporting quantities is caused by a non-storm water discharge (e.g., a spill of oil into a separate storm sewer), that discharge is not authorized by the MSGP and the discharger must report the discharge as required under 40 CFR Part 110, 40 CFR Part 117, or 40 CFR Part 302. In the event of a spill, the requirements of Section 311 of the CWA and other applicable provisions of Sections 301 and 402 of the CWA continue to apply. This approach is consistent with the requirements for reporting releases of hazardous substances and oil that make a clear distinction between hazardous substances typically found in storm water discharges and those associated with spills that are not considered part of a normal storm water discharge (see 40 CFR 117.12(d)(2)(i)).

3. Co-located Industrial Facilities

Like the 1995 MSGP, today's MSGP includes requirements pertaining to co-located industrial facilities. However, these requirements have been modified from the requirements of the 1995 MSGP to clarify their applicability. Co-located industrial activities occur when activities being conducted onsite fall into more than one of the categories of the industrial facilities listed in Part 1.2.1 of today's MSGP (e.g., a landfill at a wood treatment facility). Facilities operating under the 1995 MSGP have sometimes been unclear whether certain limited activities (e.g., minor vehicle maintenance activities at an industrial plant) would trigger the MSGP's requirements regarding co-located activities.

If you have co-located industrial activities on-site that are described in a sector(s) other than your primary sector, you must comply with all other applicable sector-specific conditions found in Part 6 for the co-located industrial activities. The extra sector-specific requirements are applied only to those areas of your facility where the extra-sector activities occur. An activity at a facility is not considered co-located if the activity, when considered separately, does not meet the description of a category of industrial activity covered by the storm water regulations, and identified by today's MSGP SIC code list. For example, unless you are actually hauling substantial amounts of freight or materials with your own truck fleet or are providing a trucking service to outsiders, simple maintenance of vehicles used at your facility is unlikely to meet the SIC code group 42 description of a motor freight transportation facility. Even though Sector P may not apply, the runoff from your vehicle maintenance facility would likely still be considered storm water associated with industrial activity. As such, your SWPPP must still address the runoff from the vehicle maintenance facility—although not necessarily with the same degree of detail as required by Sector P—but you would not be required to monitor as per Sector P.

In the event there truly are co-located activities at your facility, today's MSGP authorizes, as does the 1995 MSGP, all storm water discharges provided that your facility complies with all SWPPP and monitoring requirements for each co-located activity. By monitoring the discharges from the different industrial activities, you can better determine the effectiveness of your SWPPP for controlling all major pollutants of concern in your storm water discharges. However, if monitoring for the same parameter is required for more than one sector (and the different industrial activities drain to the same outfall), then only one sample analysis is required for that parameter.

4. Numeric Effluent Limitations

Today's MSGP retains the numeric effluent limitations which were included in the 1995 MSGP, and also includes the effluent limitations guidelines which EPA recently finalized for certain storm water discharges from new and existing hazardous and non-hazardous landfills (65 FR 3007, January 19, 2000). The new effluent limitations guidelines for these landfills are discussed in more detail in the Sections VIII.K and L of this fact sheet (Special Requirements for Discharges Associated with Industry Activities).

Today's MSGP retains the numeric effluent limitations from the 1995 MSGP for the following discharges: coal pile runoff (including runoff from steam electric power plants subject to 40 CFR Part 423 requirements), discharges from phosphate fertilizer manufacturing (40 CFR Part 418), asphalt paving and roofing emulsions (40 CFR Part 443), cement manufacturing materials storage pile runoff (40 CFR Part 411), and discharges resulting from the spray down of lumber and wood products storage yards (wet decking) (40 CFR Part 429). In addition, the final MSGP authorizes mine dewatering discharges from construction sand and gravel, industrial sand, and crushed stone facilities (40 CFR Part 436) in EPA Regions 1, 2, 3, 6, 8, 9, 10. The actual numeric effluent limitations can be found in Part 6 of the final MSGP.

5. Compliance with Water Quality Standards

The 1995 MSGP does not specifically address compliance with water quality standards (WQS), other than to exclude from coverage discharges which may contribute to an exceedance of WQS. Today's final MSGP includes the same restriction on eligibility, and in Part 3.3 also includes certain requirements if exceedances occur for discharges covered by the MSGP. If a discharge authorized under the final MSGP is later discovered to cause, or have the reasonable potential to cause or contribute to, a violation of a WQS, the permitting authority will inform the permittee of the violation. The permittee must then take all necessary actions to ensure future discharges do not cause or contribute to the violation of WQS, and document these actions in the SWPPP. If violations remain or recur, coverage under the MSGP may be terminated by the permitting authority and an alternate permit issued. Today's final MSGP also clarifies that compliance with this requirement does not preclude enforcement actions as provided by the CWA for the underlying violation.

C. Common Storm Water Pollution Prevention Plan (SWPPP) Requirements

Like the 1995 MSGP, today's reissued MSGP requires that all facilities which intend to be covered by the MSGP for storm water discharges associated with industrial activity prepare and implement a SWPPP. The MSGP addresses pollution prevention plan requirements for a number of categories of industries. Following below is a discussion of the common permit requirements for all industries; special requirements for facilities subject to EPCRA Section 313 reporting requirements; and special requirements for facilities with outdoor salt storage piles. These are the permit requirements which apply to discharges associated with any of the industrial activities covered by today's final MSGP. These common requirements may be amended or further clarified in the industry-specific SWPPP requirements which are found in Part 6 of the final MSGP. These industry-specific requirements are additive for facilities where co-located industrial activities occur.

The Storm Water Pollution Prevention Plan (SWPPP) approach in today's final MSGP focuses on two major objectives: (1) to identify sources of pollution potentially affecting the quality of storm water discharges associated with industrial activity from the facility; and (2) ensure implementation of measures to minimize and control pollutants in storm water discharges associated with industrial activity from the facility.

The SWPPP requirements in today's final MSGP are intended to facilitate a process whereby the operator of the industrial facility thoroughly evaluates potential pollution sources at the site and selects and implements appropriate measures designed to prevent or control the discharge of pollutants in storm water runoff. The process involves the following four steps: (1) formation of a team of qualified plant personnel who will be responsible for preparing the plan and assisting the plant manager in its implementation; (2) assessment of potential storm water pollution sources; (3) selection and implementation of appropriate management practices and controls; and (4) periodic evaluation of the effectiveness of the plan to prevent storm water contamination.

EPA believes the pollution prevention approach is the most environmentally sound and cost-effective way to control the discharge of pollutants in storm water runoff from industrial facilities. This position is supported by the results of a comprehensive technical survey EPA completed in 1979.[3] The survey found that two classes of management practices are generally employed at industries to control the nonroutine discharge of pollutants from sources such as storm water runoff, drainage from raw material storage and waste disposal areas, and discharges from places where spills or leaks have occurred. The first class of management practices includes those that are low in cost, applicable to a broad class of industries and substances, and widely considered essential to a good pollution control program. Some examples of practices in this class are good housekeeping, employee training, and spill response and prevention procedures. The second class includes management practices that provide a second line of defense against the release of pollutants. This class addresses containment, mitigation, and cleanup. Since publication of the 1979 survey, EPA has imposed management practices and controls in NPDES permits on a case-by-case basis. The Agency also has continued to review the appropriateness and effectiveness of such practices,[4] as well as the

[3] See "Storm Water Management for Industrial Activities," EPA, September 1992, EPA–832–R–92–006.

[4] For example, see "Best Management Practices: Useful Tools for Cleaning Up," Thron, H. Rogoshewski, P., 1982, Proceedings of the 1982 Hazardous Material Spills Conference; "The Chemical Industries" Approach to Spill Prevention," Thompson, C., Goodier, J. 1980. Proceedings of the 1980 National Conference of Control of Hazardous Materials Spills; a series of EPA memoranda entitled "Best Management Practices in NPDES Permits—Information Memorandum." 1983, 1985, 1986, 1987, 1988; Review of Emergency Systems: Report to Congress," EPA, 1988; and "Analysis of Implementing

Continued

techniques used to prevent and contain oil spills.[5] Experience with these practices and controls has shown that they can be used in permits to reduce pollutants in storm water discharges in a cost-effective manner. In keeping with both the present and previous administration's objective to attain environmental goals through pollution prevention, pollution prevention has been and continues to be the cornerstone of the NPDES permitting program for storm water. EPA has developed guidance entitled "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices," September 1992, to assist permittees in developing and implementing pollution prevention measures.

Note: The discussions of the SWPPP requirements are grouped in subject areas and do not follow the exact order of the permit conditions.

1. Pollution Prevention Team (Part 4.2.1)

As a first step in the process of developing and implementing a SWPPP, permittees are required to identify a qualified individual or team of individuals to be responsible for developing the plan and assisting the facility or plant manager in its implementation. When selecting members of the team, the plant manager should draw on the expertise of all relevant departments within the plant to ensure that all aspects of plant operations are considered when the plan is developed. The plan must clearly describe the responsibilities of each team member as they relate to specific components of the plan. In addition to enhancing the quality of communication between team members and other personnel, clear delineation of responsibilities will ensure that every aspect of the plan is addressed by a specified individual or group of individuals. Pollution Prevention Teams may consist of one individual where appropriate (*e.g.*, in certain small businesses with limited storm water pollution potential).

2. Description of the Facility and Potential Pollution Sources (Part 4.2.2)

Each SWPPP must describe activities, materials, and physical features of the facility that may contribute significant amounts of pollutants to storm water runoff or, during periods of dry weather, result in pollutant discharges through the separate storm sewers or storm water drainage systems that drain the facility. This assessment of storm water pollution risk will support subsequent efforts to identify and set priorities for necessary changes in materials, materials management practices, or site features, as well as aid in the selection of appropriate structural and nonstructural control techniques. Some operators may find that significant amounts of pollutants are running onto the facility property. Such operators should identify and address the contaminated runon in the SWPPP. If the runon cannot be addressed or diverted by the permittee, the permitting authority should be notified. If necessary, the permitting authority may require the operator of the adjacent facility to obtain a permit.

Part 6 of the final MSGP includes industry-specific requirements for the various industry sectors covered by today's permit. All SWPPPs generally must describe the following elements:

a. *Description of the Facility Site and Receiving Waters/Wetlands (Parts 4.2.2 and 4.2.3):* The plan must contain a map of the site that shows the location of outfalls covered by the permit (or by other NPDES permits), the pattern of storm water drainage, an indication of the types of discharges contained in the drainage areas of the outfalls, structural features that control pollutants in runoff,[6] surface water bodies (including wetlands), places where significant materials[7] are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the date of the submission of an NOI to be covered under this permit. The map also must show areas where the following activities take place: fueling, vehicle and equipment maintenance and/or cleaning, loading and unloading, material storage (including tanks or other vessels used for liquid or waste storage), material processing, and waste disposal. For areas of the facility that generate storm water discharges with a reasonable potential to contain significant amounts of pollutants, the map must indicate the probable direction of storm water flow and the pollutants likely to be in the discharge. Flows with a significant potential to cause soil erosion also must be identified. In order to increase the readability of the map, the inventory of the types of discharges contained in each outfall may be kept as an attachment to the site map.

b. *Summary of Potential Pollutant Sources (Part 4.2.4):* The description of potential pollution sources culminates in a narrative assessment of the risk potential that sources of pollution pose to storm water quality. This assessment should clearly point to activities, materials, and physical features of the facility that have a reasonable potential to contribute significant amounts of pollutants to storm water. Any such activities, materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the facility operator must consider the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The assessment must list any significant pollution sources at the site and identify the pollutant parameter or parameters (*i.e.*, biochemical oxygen demand, suspended solids, etc.) associated with each source.

c. *Significant Spills and Leaks (Part 4.2.5):* The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the three years prior to the date of the submission of an NOI to be covered under this permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of CWA (see 40 CFR 110.10 and 40 CFR 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance.

The listing should include a description of the causes of each spill or leak, the actions taken to respond to each release, and the actions taken to prevent similar such spills or leaks in the future. This effort will aid the facility operator as she or he examines existing spill prevention and response procedures and develops any additional

Permitting Activities for Storm Water Discharges Associated with Industrial Activity," EPA, 1991.

[5] See for example, "The Oil Spill Prevention, Control and Countermeasures Program Task Force Report," EPA, 1988; and "Guidance Manual for the Development of an Accidental Spill Prevention Program," prepared by SAIC for EPA, 1986.

[6] Nonstructural features such as grass swales and vegetative buffer strips also should be shown.

[7] Significant materials include, but are not limited to the following: raw materials; fuels; solvents, detergents, and plastic pellets; finished materials, such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA); any chemical the facility is required to report pursuant to EPCRA Section 313; fertilizers; pesticides; and waste products, such as ashes, slag, and sludge that have the potential to be released with storm water discharges. (See 40 CFR 122.26(b)(8)).

procedures necessary to fulfill the requirements set forth in Parts 4 and 6 of the final permit.

d. *Allowable and Prohibited Non-storm Water Discharges (Part 4.4):* Each SWPPP must include a certification, signed by an authorized individual, that discharges from the site have been tested or evaluated for the presence of non-storm water discharges. The certification must describe possible significant sources of non-storm water, the results of any test and/or evaluation conducted to detect such discharges, the test method or evaluation criteria used, the dates on which tests or evaluations were performed, and the onsite drainage points directly observed during the test or evaluation. Acceptable test or evaluation techniques include dye tests, television surveillance, observation of outfalls or other appropriate locations during dry weather, water balance calculations, and analysis of piping and drainage schematics.[8]

Except for flows that originate from fire fighting activities, sources of non-storm water that are specifically identified in the permit as being eligible for authorization under the general permit must be identified in the plan. SWPPPs must identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water discharge.

EPA recognizes that certification may not be feasible where facility personnel do not have access to an outfall, manhole, or other point of access to the conduit that ultimately receives the discharge. In such cases, the plan must describe why certification was not feasible. Permittees who are not able to certify that discharges have been tested or evaluated must notify the Director in accordance with Part 4.4 of the final MSGP.

e. *Sampling Data (Part 4.2.6):* Any existing data on the quality or quantity of storm water discharges from the facility must be described in the plan, including data collected for Part 2 of the group application process. These data may be useful for locating areas that have contributed pollutants to storm water. The description should include a discussion of the methods used to collect and analyze the data. Sample collection points should be identified in the plan and shown on the site map.

[8] In general, smoke tests should not be used for evaluating the discharge of non-storm water to a separate storm sewer as many sources of non-storm water typically pass through a trap that would limit the effectiveness of the smoke test.

3. Selection and Implementation of Storm Water Controls (Part 4.2.7, et al.)

Following completion of the source identification and assessment phase, the permit requires the permittee to evaluate, select, and describe the pollution prevention measures, BMPs, and other controls that will be implemented at the facility. BMPs include processes, procedures, schedules of activities, prohibitions on practices, and other management practices that prevent or reduce the discharge of pollutants in storm water runoff.

EPA emphasizes the implementation of pollution prevention measures and BMPs that reduce possible pollutant discharges at the source. Source reduction measures include, among others, preventive maintenance, chemical substitution, spill prevention, good housekeeping, training, and proper materials management. Where such practices are not appropriate to a particular source or do not effectively reduce pollutant discharges, EPA supports the use of source control measures and BMPs such as material segregation or covering, water diversion, and dust control. Like source reduction measures, source control measures and BMPs are intended to keep pollutants out of storm water. The remaining classes of BMPs, which involve recycling or treatment of storm water, allow the reuse of storm water or attempt to lower pollutant concentrations prior to discharge.

The SWPPP must discuss the reasons each selected control or practice is appropriate for the facility and how each will address one or more of the potential pollution sources identified in the plan. The plan also must include a schedule specifying the time or times during which each control or practice will be implemented. In addition, the plan should discuss ways in which the controls and practices relate to one another and, when taken as a whole, produce an integrated and consistent approach for preventing or controlling potential storm water contamination problems. The permit requirements included for the various industry sectors in Part 6 of today's final MSGP generally require that the portion of the plan that describes the measures and controls address the following minimum components.

When "minimize/reduce" is used relative to SWPPP measures, EPA means to consider and implement BMPs that will result in an improvement over the baseline conditions as it relates to the levels of pollutants identified in storm water discharges with due consideration to economic feasibility and effectiveness.

a. *Nonstructural Controls:*

• Good Housekeeping. Good housekeeping involves using practical, cost-effective methods to identify ways to maintain a clean and orderly facility and keep contaminants out of separate storm sewers. It includes establishing protocols to reduce the possibility of mishandling chemicals or equipment and training employees in good housekeeping techniques. These protocols must be described in the plan and communicated to appropriate plant personnel.

• Minimizing Exposure. Where practicable, protecting potential pollutant sources from exposure to storm water is an important control option. Pollutants that are never allowed to contaminate storm water do not require development of "treatment" type BMPs. Elimination of all exposure to storm water may also make the facility eligible for the "No Exposure Certification" exclusion from permitting at 40 CFR 122.26(g)

• Preventive Maintenance. Permittees must develop a preventive maintenance program that involves regular inspection and maintenance of storm water management devices and other equipment and systems. The program description should identify the devices, equipment, and systems that will be inspected; provide a schedule for inspections and tests; and address appropriate adjustment, cleaning, repair, or replacement of devices, equipment, and systems. For storm water management devices such as catch basins and oil/water separators, the preventive maintenance program should provide for periodic removal of debris to ensure that the devices are operating efficiently. For other equipment and systems, the program should reveal and enable the correction of conditions that could cause breakdowns or failures that may result in the release of pollutants.

• Spill Prevention and Response Procedures. Based on an assessment of possible spill scenarios, permittees must specify appropriate material handling procedures, storage requirements, containment or diversion equipment, and spill cleanup procedures that will minimize the potential for spills and, in the event of a spill, enable proper and timely response. Areas and activities that typically pose a high risk for spills include loading and unloading areas, storage areas, process activities, and waste disposal activities. These activities and areas, and their accompanying drainage points, must be described in the plan. For a spill prevention and response program to be effective, employees should clearly understand the proper procedures and requirements and have the equipment necessary to respond to spills.

• Routine Inspections. In addition to the comprehensive site evaluation, facilities are required to conduct periodic inspections of designated equipment and areas of the facility. Industry-specific requirements for such inspections, if any, are set forth in Part 6 of the final MSGP. When required, qualified personnel must be identified to conduct inspections at appropriate intervals specified in the plan. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections must be maintained. These periodic inspections are different from the comprehensive site evaluation, even though the former may be incorporated into the latter. Equipment, area, or other inspections are typically visual and are normally conducted on a regular basis, *e.g.*, daily inspections of loading areas. Requirements for such periodic inspections are specific to each industrial sector in today's permit, whereas the comprehensive site compliance evaluation is required of all industrial sectors. Area inspections help ensure that storm water pollution prevention measures (*e.g.*, BMPs) are operating and properly maintained on a regular basis. The comprehensive site evaluation is intended to provide an overview of the entire facility's pollution prevention activities. Refer to Part VI.C.3.h. below for more information on the comprehensive site evaluation.

• Employee Training. The SWPPP must describe a program for informing personnel at all levels of responsibility of the components and goals of the SWPPP. The training program should address topics such as good housekeeping, materials management, and spill response procedures. Where appropriate, contractor personnel also must be trained in relevant aspects of storm water pollution prevention. A schedule for conducting training must be provided in the plan. Several sections in Part 6 of today's final MSGP specify a minimum frequency for training of once per year. Others indicate that training is to be conducted at an appropriate interval. EPA recommends that facilities conduct training annually at a minimum. However, more frequent training may be necessary at facilities with high turnover of employees or where employee participation is essential to the storm water pollution prevention plan.

b. *Structural Controls:*

• Sediment and Erosion Control. The SWPPP must identify areas that, due to topography, activities, soils, cover materials, or other factors have a high potential for significant soil erosion. The plan must identify measures that will be implemented to limit erosion in these areas.

• Management of Runoff. The plan must contain a narrative evaluation of the appropriateness of traditional storm water management practices (*i.e.*, practices other than those that control pollutant sources) that divert, infiltrate, reuse, or otherwise manage storm water runoff so as to reduce the discharge of pollutants. Appropriate measures may include, among others, vegetative swales, collection and reuse of storm water, inlet controls, snow management, infiltration devices, and wet detention/retention basins.

c. *Example BMPs:* Part 4.2.7.2.2 includes a list of example BMPs that could be considered for use in a SWPPP, for example: detention structures (including wet ponds); storm water retention structures; flow attenuation by use of open vegetated swales and natural depressions; infiltration of runoff onsite; and sequential systems (which combine several practices). These examples are not intended to limit the creativity of facility operators in developing alternative BMPs or applications for BMPs that increase cost effectiveness.

d. *Selection of Controls:* Based on the results of the evaluation, the plan must identify practices that the permittee determines are reasonable and appropriate for the facility. The plan also should describe the particular pollutant source area or activity to be controlled by each storm water management practice. Reasonable and appropriate practices must be implemented and maintained according to the provisions prescribed in the plan.

In selecting storm water management measures, it is important to consider the potential effects of each method on other water resources, such as ground water. Although storm water pollution prevention plans primarily focus on storm water management, facilities must also consider potential ground water pollution problems and take appropriate steps to avoid adversely affecting ground water quality. For example, if the water table is unusually high in an area, an infiltration pond may contaminate a ground water source unless special preventive measures are taken. Under EPA's July 1991 Ground Water Protection Strategy, States are encouraged to develop Comprehensive State Ground Water Protection Programs (CSGWPP). Efforts to control storm water should be compatible with State ground water objectives as reflected in CSGWPPs.

e. *Other Controls:* Today's final MSGP includes a new requirement that no solid materials, including floating debris may be discharged to waters of the United States, except as authorized by a permit under Section 404 of the Clean Water Act. In addition, off-site tracking of raw, final, or waste materials or sediment, and the generation of dust must be minimized. Tracking or blowing of raw, final, or waste materials from areas of no exposure to exposed areas must be minimized. These requirements are similar to requirements included in EPA's construction general storm water permit (63 FR 7858, February 17, 1998) which EPA believes would be appropriate for industrial facilities as well.

f. *Maintenance (Part 4.3):* All BMPs identified in the SWPPP must be maintained in effective operating condition.

g. *Controls for Allowable Non-Storm Water (Part 4.4.2):* Where an allowable non-storm water has been identified, appropriate controls for that discharge must be included in the permit. In many cases, the same types of controls for contaminated storm water would suffice, but the nature and volume of potential pollutants in the non-storm water discharges must be taken into consideration in selection of controls.

h. *Comprehensive Site Compliance Evaluation (Part 4.9):* Today's final MSGP requires that the SWPPP describe the scope and content of the comprehensive site evaluations that qualified personnel will conduct to (1) confirm the accuracy of the description of potential pollution sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of the permit. Note that the comprehensive site evaluations are not the same as periodic or other inspections described for certain industries in Section VI.C.3.d of this fact sheet. However, in the instances when frequencies of inspections and the comprehensive site compliance evaluation overlap, they may be combined allowing for efficiency as long as the requirements for both types of inspections are met. The plan must indicate the frequency of comprehensive evaluations which must be at least once a year, except where comprehensive site evaluations are shown in the plan to be impractical for inactive mining sites, due to remote location and inaccessibility.[9] The individual or individuals who will conduct the comprehensive site evaluation must be identified in the plan and should be members of the pollution prevention team. Material handling and storage areas and other potential sources of pollution must be visually inspected for evidence of actual or potential pollutant discharges to the drainage system. Inspectors also must observe erosion controls and structural storm water management devices to ensure that each is operating correctly. Equipment needed to implement the SWPPP, such as that used during spill response activities, must be inspected to confirm that it is in proper working order.

The results of each comprehensive site evaluation must be documented in a report signed by an authorized company official. The report must describe the scope of the comprehensive site evaluation, the personnel making the comprehensive site evaluation, the date(s) of the comprehensive site evaluation, and any major observations relating to implementation of the SWPPP. Comprehensive site evaluation reports must be retained for at least three years after the date of the evaluation. Based on the results of each comprehensive site evaluation, the description in the plan of potential pollution sources and measures and controls must be revised as appropriate within two weeks after each comprehensive site evaluation, unless indicated otherwise in Part 6 of the permit. If existing BMPs need to be modified or if additional BMPs are necessary, implementation must be completed before the next anticipated storm, or not more than 12 weeks after completion of the comprehensive site evaluation.

i. *Applicable State, Tribal, or Local Plans (Part 4.8):* The SWPPP must be consistent with any applicable requirements of State, Tribal, or Local storm water, waste disposal, sanitary sewer or septic system regulations to the extent these apply to a facility and are more stringent than the requirements of this permit.

j. *Documentation of Permit Eligibility with Regards to ESA and NHPA Requirements (Parts 4.5 and 4.6):* To better ensure compliance with the requirements of the ESA and NHPA, Parts 4.5 and 4.6 of today's final MSGP require that documentation be included with the SWPPP demonstrating permit eligibility with regards to the requirements of the ESA and NHPA. The following information is required for the ESA:

• Information on whether listed endangered or threatened species, or critical habitat, are found in proximity to the facility;
• Whether such species may be jeopardized by the storm water discharges or storm water discharge-related activities;
• Results of the Addendum A endangered species screening determinations; and
• A description of measures necessary to protect listed endangered or threatened species, or critical habitat, including any terms or conditions that are imposed under the eligibility requirements of Part 1.2.3.6. The final MSGP notes that discharges from facilities which fail to describe and implement such measures are ineligible for coverage under the permit.

The following information is required for the NHPA determination:

• Information on whether the storm water discharges or storm water discharge-related activities would have an effect on a property that is listed or eligible for listing on the National Register of Historic Places;
• Where effects may occur, any written agreements which have been made with the State Historic Preservation Officer, Tribal Historic Preservation Officer, or other Tribal leader to mitigate those effects;
• Results of the Addendum B historic places screening determinations; and
• A description of measures necessary to avoid or minimize adverse impacts on places listed, or eligible for listing, on the National Register of Historic Places, including any terms or conditions that are imposed under the eligibility requirements of Part 1.2.3.7 of this permit. The final MSGP notes that discharges from facilities which fail to describe and implement such measures are ineligible for coverage under the permit.

k. *Keeping a Copy of the Permit with the SWPPP (Part 4.7):* A new requirement to have a copy of the permit language in the SWPPP has been added to today's permit. The "confirmation" letter received from the NOI Processing Center is not the permit; it is essentially only the equivalent of a "receipt" for a facility's "registration" (NOI) to use the general permit. Since determining permit eligibility and preparing a SWPPP is required prior to obtaining permit coverage, a copy of the permit would be needed anyway. Requiring a copy of the permit in the SWPPP ensures that facility operators, and not just whoever prepared the SWPPP, will have ready access to all permit requirements.

l. *Recordkeeping and Keeping the SWPPP Current (Parts 4.9.4, 4.10, et al.):* Records must be kept with the SWPPP documenting the status and effectiveness of plan implementation. At a minimum, records must address results of the annual Comprehensive Site Compliance Evaluations, routine facility inspections, spills, monitoring, and maintenance activities. The plan also must describe a system that enables timely reporting of storm water management-related information to appropriate plant personnel. Inspectors or other enforcement officers will ask for records documenting permit compliance during inspections or facility compliance reviews.

The SWPPP must be updated whenever there is a change at the facility that would significantly affect the discharges authorized under the MSGP. The SWPPP must also be updated whenever monitoring results and/or an inspection by the permittee or by local, state, tribal, or federal officials indicate a portion of the SWPPP is proving to be ineffective in controlling storm water discharge quality.

m. *Signature, Plan Review, and Access to the SWPPP (Part 4.11):* The SWPPP must be signed and certified in accordance with Part 7 of the permit. A copy of the SWPPP must be kept on site at the facility or be locally available for the use of the Director, a State, Tribe, or local agency (*e.g.*, MS4 operator) at the time of an onsite inspection. The SWPPP must also be made available to the U.S. Fish and Wildlife Service or National Marine Fisheries Service upon request. Since SWPPPs are living documents that change over time, access to the current version of the SWPPP is critical in assessing permit compliance. Facilities are also required to provide a copy of the SWPPP to the public when requested in writing to do so.

The Director may notify you at any time that your SWPPP does not meet one or more of the minimum requirements of this permit. The notification will identify provisions of the permit which are not being met, as well as the required modifications. Required changes must be made within thirty (30) calendar days and a written certification submitted to the Director confirming that the changes were made.

EPA does not intend to require public comment on SWPPPs or hold public hearings. As noted above, EPA may require changes to a SWPPP when necessary and may consider concerns from the public in making such judgments. The MSGP also provides

[9] Where annual site inspections are shown in the plan to be impractical for inactive mining sites due to remote location and inaccessibility, site inspections must be conducted at least once every three years.

that individual permits may be required when the MSGP is inappropriate for a given facility. During the issuance of the individual permits, the public would have an opportunity to comment on the requirements of the permits.

4. Deadlines

Today's MSGP requires that permittees previously covered by the 1995 MSGP must update their SWPPPs to comply with any new requirements of today's MSGP by the date they submit their new NOIs. As noted earlier, the new NOIs are due January 29, 2001. However, a permittee may request an extension for the SWPPP update not to exceed 270 days from the expiration date of the 1995 MSGP.

D. Special Requirements

1. Special Requirements for Storm Water Discharges Associated With Industrial Activity From Facilities Subject to EPCRA Section 313 Requirements (Part 4.12)

Today's final MSGP replaces the special requirements of the 1995 MSGP for certain permittees subject to reporting requirements under Section 313 of the EPCRA (also known as Title III of the Superfund Amendments and Reauthorization Act (SARA)) with a requirement to identify areas with these pollutants. EPCRA Section 313 requires operators of certain facilities that manufacture (including import), process, or otherwise use listed toxic chemicals to report annually their releases of those chemicals to any environmental media. Listed toxic chemicals include more than 500 chemicals and chemical classes listed at 40 CFR Part 372 (including the recently added chemicals published November 30, 1994).

By requiring identification of EPCRA 313 chemicals in the summary of potential pollutant sources under the Storm Water Pollution Prevention Plan (Part 4.2.4), the facility operator is then required to develop appropriate storm water controls for such areas (Part 4.2.7). EPA expects that many controls for EPCRA chemicals will continue to be driven by other state and federal environmental regulations such as Spill Prevention Control and Countermeasure (SPCC) plans required under Section 311 of the CWA, etc. as long as such a requirement is incorporated into the SWPPP.

This reduction in permit complexity by eliminating redundant requirements was requested by members of the regulated community.

2. Special Requirements for Storm Water Discharges Associated With Industrial Activity From Salt Storage Facilities

Today's MSGP retains the same special requirements as the 1995 MSGP for storm water discharges associated with industrial activity from salt storage facilities. Storage piles of salt used for deicing or other commercial or industrial purposes must be enclosed or covered to prevent exposure to precipitation, except for exposure resulting from adding or removing materials from the pile. This requirement only applies to runoff from storage piles discharged to waters of the United States. Facilities that collect all the runoff from their salt piles and reuse it in their processes or discharge it subject to a separate NPDES permit do not need to enclose or cover their piles.

These special requirements have been included in today's permit based on human health and aquatic effects resulting from storm water runoff from salt storage piles compounded with the prevalence of salt storage piles across the United States.

3. Consistency With Other Plans

SWPPPs may reference the existence of other plans for Spill Prevention Control and Countermeasure (SPCC) developed for the facility under Section 311 of the CWA or BMP programs otherwise required by an NPDES permit for the facility as long as such requirement is incorporated into the SWPPP.

E. Monitoring and Reporting Requirements

Today's final MSGP retains the same monitoring requirements as the existing MSGP. Numerous comments were submitted on these monitoring requirements. A summary of EPA's responses to these comments and justification for retaining these requirements is contained in this section. A more detailed discussion is found in Section IX of this fact sheet (Summary of Responses to Comments). Responses to individual comments are contained in the Water Docket.

Like the 1995 MSGP, today's final MSGP includes three general types of monitoring: analytical monitoring or chemical monitoring; compliance monitoring for effluent guidelines compliance, and visual examinations of storm water discharges. A general description of each of these types of monitoring which was provided with the 1995 MSGP is repeated below.

1. Analytical Monitoring Requirements

Analytical monitoring requirements involve laboratory chemical analyses of samples collected by the permittee. The results of the analytical monitoring are quantitative concentration values for different pollutants, which can be easily compared to the results from other sampling events, other facilities, or to national benchmarks.

The categories of facilities subject to analytical monitoring in today's final MSGP are noted in Table 1 of this fact sheet. The MSGP requires analytical monitoring for the industry sectors or subsectors that demonstrated in the group application data a potential to discharge pollutants at concentrations of concern or, in certain State-specific cases, to satisfy those States' requirements. The data submitted with the group permit applications were reviewed by EPA to determine the industry sectors and subsectors listed in Table 1 of this fact sheet that are to be subject to analytical monitoring requirements. First, EPA divided the Part 1 and Part 2 application data by the industry sectors listed in Table 1. Where a sector was found to contain a wide range of industrial activities or potential pollutant sources, it was further subdivided into the industry subsectors listed in Table 1. Next, EPA reviewed the information submitted in Part 1 of the group applications regarding the industrial activities, significant materials exposed to storm water, and the material management measures employed. This information helped identify potential pollutants that may be present in the storm water discharges. Then EPA entered into a database the sampling data submitted in Part 2 of the group applications. Those data were arrayed according to industrial sector and subsector for the purposes of determining when analytical monitoring would be appropriate.

To conduct a comparison of the results of the statistical analyses to determine when analytical monitoring would be required, EPA established "benchmark" concentrations for the pollutant parameters on which monitoring results had been received. The "benchmarks" are the pollutant concentrations above which EPA determined represent a level of concern. The level of concern is a concentration at which a storm water discharge could potentially impair, or contribute to impairing, water quality or affect human health from ingestion of water or fish. The benchmarks are also viewed by EPA as a level that, if below, a facility presents little potential for water quality concern. As such, the benchmarks also

R0019806

provide an appropriate level to determine whether a facility's storm water pollution prevention measures are successfully implemented. The benchmark concentrations are not effluent limitations and should not be interpreted or adopted as such. These values are merely levels which EPA has used to determine if a storm water discharge from any given facility merits further monitoring to ensure that the facility has been successful in implementing a SWPPP. As such, these levels represent a target concentration for a facility to achieve through implementation of pollution prevention measures at the facility. Table 3 lists the parameter benchmark values and the sources used for the benchmarks. Two changes from the 1995 MSGP are the addition of benchmark values for total Cyanide and Total Magnesium. Benchmark values for the two parameters were included in the Fact Sheet of the 1995 MSGP at Table K–3, but were inadvertently not included in the general listing of parameter benchmark values (Table 5 of the Fact Sheet for the 1995 MSGP). Additional information explaining the derivation of the benchmarks can be found in the fact sheet for the 1995 MSGP (60 FR 50825).

TABLE 3.—PARAMETER BENCHMARK VALUES

Parameter name	Benchmark level	Source
Biochemical Oxygen Demand (5 day)	30 mg/L	4
Chemical Oxygen Demand	120 mg/L	5
Total Suspended Solids	100 mg/L	7
Oil and Grease	15 mg/L	8
Nitrate + Nitrite Nitrogen	0.68 mg/L	7
Total Phosphorus	2.0 mg/L	6
pH	6.0–9.0 s.u.	4
Acrylonitrile (c)	7.55 mg/L	2
Aluminum, Total (pH 6.5–9)	0.75 mg/L	1
Ammonia	19 mg/L	1
Antimony, Total	0.636 mg/L	9
Arsenic, Total (c)	0.16854 mg/L	9
Benzene	0.01 mg/L	10
Beryllium, Total (c)	0.13 mg/L	2
Butylbenzyl Phthalate	3 mg/L	3
Cadmium, Total (H)	0.0159 mg/L	9
Chloride	860 mg/L	1
Copper, Total (H)	0.0636 mg/L	9
Cyanide, Total	0.0636 mg/l	9
Dimethyl Phthalate	1.0 mg/L	11
Ethylbenzene	3.1 mg/L	3
Fluoranthene	0.042 mg/L	3
Fluoride	1.8 mg/L	6
Iron, Total	1.0 mg/L	12
Lead, Total (H)	0.0816 mg/L	1
Magnesium, Total	0.0636 mg/l	9
Manganese	1.0 mg/L	13
Mercury, Total	0.0024 mg/L	1
Nickel, Total (H)	1.417 mg/L	1
PCB–1016 (c)	0.000127 mg/L	9
PCB–1221 (c)	0.10 mg/L	10
PCB–1232 (c)	0.000318 mg/L	9
PCB–1242 (c)	0.00020 mg/L	10
PCB–1248 (c)	0.002544 mg/L	9
PCB–1254 (c)	0.10 mg/L	10
PCB–1260 (c)	0.000477 mg/L	9
Phenols, Total	1.0 mg/L	11
Pyrene (PAH,c)	0.01 mg/L	10
Selenium, Total (*)	0.2385 mg/L	9
Silver, Total (H)	0.0318 mg/L	9
Toluene	10.0 mg/L	3
Trichloroethylene (c)	0.0027 mg/L	3
Zinc, Total (H)	0.117 mg/L	1

Assumptions:
Receiving water temperature - 20 C.
Receiving water pH - 7.8.
Receiving water hardness CaCO3 100 mg/L.
Receiving water salinity 20 g/kg
Acute to Chronic Ratio (ACR) - 10.

EPA prepared a statistical analysis of the sampling data for each pollutant parameter reported within each sector or subsector. (Only where EPA did not subdivide an industry sector into subsectors was an analysis of the entire sector's data performed.) The statistical analysis was performed assuming a delta log normal distribution of the sampling data within each sector/subsector. The analyses calculated median, mean, maximum, minimum, 95th, and 99th percentile concentrations for each parameter. The results of the analyses can be found in the appropriate section of Section VIII of the fact sheet accompanying the 1995 MSGP. From this analysis, EPA was able to identify pollutants for further evaluation within each sector or subsector.

EPA next compared the median concentration of each pollutant for each sector or subsector to the benchmark concentrations listed in Table 3. EPA also compared the other statistical results to the benchmarks to better ascertain the magnitude and range of the discharge concentrations to help identify the pollutants of concern. EPA did not conduct this analysis if a sector had data for a pollutant from less than three individual facilities. Under these circumstances, the sector or subsector would not have this pollutant identified as a pollutant of concern. This was done to ensure that a reasonable number of facilities represented the industry sector or subsector as a whole and that the analysis did not rely on data from only one facility.

For each industry sector or subsector, parameters with a median concentration higher than the benchmark level were considered pollutants of concern for the industry and identified as potential pollutants for analytical monitoring under today's permit. EPA then analyzed the list of potential pollutants to be monitored against the lists of significant materials exposed and industrial activities which occur within each industry sector or subsector as described in the Part I application information. Where EPA could identify a source of a potential pollutant which is directly related to industrial activities of the industry sector or subsector, the permit identifies that parameter for analytical monitoring. If EPA could not identify a source of a potential pollutant which was associated with the sector/subsector's industrial activity, the permit does not require monitoring for the pollutant in that sector/subsector. Industries with no pollutants for which the median concentrations are higher than the benchmark levels are not required to perform analytical monitoring under this permit, with the exceptions explained below.

In addition to the sectors and subsectors identified for analytical monitoring using the methods described above, EPA determined, based upon a review of the degree of exposure, types of materials exposed, special studies and in some cases inadequate sampling data in the group applications, that the following industries also warrant analytical monitoring notwithstanding the absence of data on the presence or absence of certain pollutants in the group applications: Sector K (hazardous waste treatment storage and disposal facilities), and Sector S (airports which use more than 100,000 gallons per year of glycol-based fluids or 100 tons of urea for deicing). Today's final MSGP retains the monitoring requirements of the 1995 MSGP due to the high potential for contamination of storm water discharge which EPA believes was not adequately characterized by group applicants in the information they provided in the group application process. Like the 1995 MSGP, exemptions for today's MSGP would be on a pollutant-by-pollutant and outfall-by-outfall basis.

As part of the reissuance process for today's MSGP, EPA evaluated Discharge Monitoring Reports (DMRs) submitted by facilities for analytical monitoring conducted during the second and fourth year of the 1995 MSGP. The purpose of the evaluation was to evaluate any trends in the monitoring results. One factor common to almost all industrial sectors, however, was that the number of DMRs submitted for the year-four monitoring period far exceeded the number of DMRs submitted for the year-two monitoring period. For the second-year monitoring period, EPA received 380 DMRs, whereas 1377 DMRs were received for the fourth-year monitoring period. For example, the number of Sector M (Auto Salvage Yards) facilities that submitted monitoring results for total suspended solids from the second year monitoring period was roughly 26; the number of DMRs submitted for the fourth year monitoring for the same industrial sector and parameter was 240. As a result, EPA could not conduct the trends analysis it intended to perform.

While the exact reason for the significant increase in the number of DMRs received in year 4 of the permit (as compared to year 2) is unknown, EPA suspects it is related to the administrative extension of EPA's 1992 baseline general permit. Although the 1992 general permit expired in September 1997, the permit was administratively extended. It was not until December 28, 1998 that facilities previously covered under EPA's baseline industrial permit were required to obtain coverage under the MSGP. As a result, facilities previously covered under the baseline industrial permit were not required to conduct analytical monitoring (as required in the second year of the 1995 MSGP). In essence, the fourth-year monitoring data set EPA received represents the baseline of pollutant discharge information under the sector-specific industrial general storm water permit.

Based on the information received during the public comment period and the DMRs received, EPA believes it is premature to make any final conclusions regarding the value of the Agency's acquisition of the monitoring data or to consider dropping the monitoring. EPA is retaining quarterly analytic monitoring requirements for storm water discharges as per the 1995 MSGP for all sectors previously identified. Comparison of pollutant levels against benchmark levels is still regarded as one of the important tools operators must use to evaluate their facilities' storm water pollution prevention plans (SWPPPs) and best management practices (BMPs). Facilities' discharge monitoring reports (DMRs) are also vital to the Agency for use in characterizing an industrial sector's discharges. EPA has not, and does not, intend for pollutant levels above the benchmark values to mean a facility is out of compliance with the MSGP–2000.

While today's permit retains the analytical monitoring requirements of the 1995 MSGP, the Agency continues to support the position that any analytical monitoring program required under the MSGP needs to be structured so that it provides useful information to facility operators, EPA and the general public on the effectiveness of Storm Water Pollution Prevention Plans. EPA commits to using data from the 1995 and 2000 permits to evaluate the effectiveness of management practices on an industry sector basis and to evaluate the need for changes in monitoring protocols for the next permit. The Agency will work with program stakeholders in conducting the evaluation and may seek to implement certain changes possibly on a pilot basis.

Like the 1995 MSGP, today's MSGP requires that all facilities, save for Sector G, within an industry sector or subsector identified for analytical monitoring must, at a minimum, monitor their storm water discharges quarterly during the second year of permit coverage, unless the facility exercises the Alternative Certification described in Section VI.E.3 of this fact sheet. At the end of the second year of coverage under the current permit, a facility is required to calculate the average concentration for each parameter for which the facility is required to monitor. If the average concentration for a pollutant parameter is less than or equal to the benchmark value, then the permittee is not required to conduct analytical monitoring for that pollutant during the fourth year of the permit. If, however, the average concentration for a pollutant is greater than the benchmark value, then the permittee is required to conduct quarterly monitoring for that pollutant during the fourth year of permit coverage. Analytical monitoring is not required during the first, third, and fifth year of the permit. When average concentrations exceed benchmark levels, facilities are encouraged to conduct more monitoring if appropriate to identify additional management practices which may be necessary to include in their SWPPP. The exclusion from analytical monitoring in the fourth year of the permit was conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit. For purposes of the above monitoring, year 2 runs from October 1, 2001 to September 30, 2002; year 4 runs from October 1, 2003 to September 30, 2004.

EPA acknowledges that, considering the small number of samples required per monitoring year (four), and the vagaries of storm water discharges, it may be difficult to determine or confirm the existence of a discharge problem as a commenter claimed. When viewed as an indicator, analytic levels considerably above benchmark values can serve as a flag to the operator that his SWPPP needs to be reevaluated and that pollutant loads may need to be reduced. Conversely, analytic levels below or near benchmarks can confirm to the operator that his SWPPP is doing its intended job. EPA believes there is presently no alternative that provides stakeholders with an equivalent indicator of program effectiveness.

Commenters also had concerns that only four samples and variability in conditions severely reduce the utility of monitoring results for judging BMP effectiveness. While not practicable for EPA to require an increase in monitoring, operators are encouraged to sample more frequently to improve the statistical validity of their results. Unless the proper data acquisition protocol for making a valid BMP effectiveness determination is rigorously followed, any other method used to assess BMP effectiveness would be qualitative, and therefore less reliable. The least subjective approach, and most beneficial to operators and stakeholders, EPA believes, remains a combination of visual and analytic monitoring, using analyte benchmark levels to target potential problems. Statistical uncertainties inherent in the monitoring results will necessitate both operators and EPA exercising best professional judgement in interpreting the results. As stated above, when viewed as an indicator, analytic levels considerably above benchmark values can serve as a flag to the operator that his SWPPP needs to be reevaluated and that pollutant loads may need to be reduced. Conversely, analytic levels below or near benchmarks can confirm to the operator that his SWPPP is doing its intended job.

Commenters had additional concerns regarding impacts of storm water on water quality standards and that monitoring has marginal value in assessing and protecting water quality. In the absence of establishing discharge pollutant levels that correlate directly to water quality standards, as would be done for an individual permit, EPA settled on benchmark levels which would, under nearly all scenarios, be protective of water quality standards. Recognizing the shortcomings of these generic pollutant levels, EPA only intends for them to be used as indicators of possible problems and as a flag to reevaluate the SWPPP and possibly the operation of the facility—not as a trigger to begin mandatory SWPPP or operational revisions (unless, after employing BPJ, the operator deems such revisions are necessary).

Monitoring results also serve as an oversight tool for EPA to prioritize sites which may benefit from a site inspection. A requirement to submit test results serves as an incentive for the facility operator to perform the monitoring and take any necessary action based on the results.

Some commenters felt the validity of benchmark values need to be reevaluated. Universal WQ-based discharge levels for storm water cannot be established; the next best thing would be to determine water segment-specific total maximum daily loads (TMDLs) for these discharges. But when benchmarks are employed merely as indicators, without requiring specific corrective actions beyond using best professional judgement to reassess present conditions and make any changes deemed necessary, the present benchmarks are adequate. In many cases operators can, upon receipt of analytic monitoring results above benchmarks, still conclude their present SWPPPs/BMPs are adequately protective of water quality, or that other situations such as discharging to low-quality, ephemeral streams may obviate the need for SWPPP/BMP revisions.

The fact that storm water discharge pollutant levels could be affected by atmospheric/dry deposition, run on and fate in transport, as well as structural sources, was a concern of a few commenters. EPA acknowledges the potential for adding pollutants to a facility's discharges from external or structural sources. Permittees are, nonetheless, still legally responsible for the quality of all discharges from their sites (or any runoff that comes into contact with their structures, industrial activities or materials, regardless of where these are located)—but not from pollutants that may be introduced into their discharges outside the boundaries of their properties. Pollutant levels, whether elevated from air deposition, run-on from nearby sites, or leachate from on-site structures, remain the responsibility of permittees. This was affirmed in the ruling by the Environmental Appeals Board against the General Motors Corporation CPC-Pontiac Fiero Plant in December 1997.

a. *Other Monitoring Options:* There were various comments for and against various alternatives to quarterly analytic monitoring submitted. The other non-analytic monitoring options are summarized in the following paragraphs, along with EPA responses.

b. *Visual Monitoring:* Numerous commenters supported dropping analytic monitoring from the MSGP–

2000 in favor of just requiring quarterly visual monitoring. Commenters claimed visual monitoring is adequate to ensure compliance and environmental protection (especially coupled with training), and is least burdensome.

Quarterly visual monitoring of storm water discharges has always been a permit requirement, for many of the same reasons why commenters favor it, and will continue to be so. EPA will also be retaining analytic monitoring because we believe the best way to ensure SWPPP effectiveness and protection of water quality is through a combination of visual and analytic monitoring. The reasons for not adopting visual monitoring only are explained further in the rationale for justifying quarterly analytic monitoring.

c. *Annual Reporting:* One option suggested by commenters was for an annual report, possibly using a standardized form, to be submitted to EPA detailing the permittee's SWPPP highlights and revisions/additions, inspections, compliance evaluations, visual monitoring results, etc. This information is already required to be documented in a facility's SWPPP, which, if deemed necessary, must be provided to EPA on demand. One comment against this option stated that the volume of data submitted would be too great for the Agency to evaluate. Other opponents to this option indicated that the reports would not contain enough information to evaluate SWPPP effectiveness, ensure water quality protection, or provide the information necessary to make long-term management plans. Commenters in support of the annual report concept held that it would provide a record of the permittee's commitment to storm water control, was better for evaluating SWPPP effectiveness, and would provide information to EPA to determine if sampling or a site inspection is needed.

If no monitoring data were available, an annual report could be used to ensure that a facility is implementing its SWPPP. The reports could also be used to prioritize sites for inspection. However, EPA agrees that it would be very burdensome to review all the reports and very difficult to assess the effectiveness of a facility's SWPPP based on that review alone. The subjectivity inherent in annual reporting makes it a undesirable substitute for analytic monitoring. Documenting the kind of information in the annual report is already a SWPPP requirement, and is therefore available to operators for assessing and improving their storm water programs. For these reasons, EPA will not require reports containing essentially the same information required in SWPPPs to be submitted in lieu of analytic monitoring.

d. *Group Monitoring:* Commenters also suggested group monitoring. In this option a consortium of like permittees would do sampling at one facility, possibly on a rotating basis. The sample results would represent all the facilities in the consortium. A variation of group monitoring is for the consortium to retain a consultant to do representative sampling and provide storm water program guidance and evaluations. Supporters of this concept said it may allow for comparisons of effectiveness of different SWPPP practices (e.g., sweeping vs. catchment basin for solids control). One commenter pointed out that the feasibility of the group concept is suspect due to the fact that individual facilities may have different topography, soil and other natural conditions. EPA believes that technically valid BMP comparisons could be done under this type of program. However, it would be difficult and very resource-intensive for EPA to establish criteria for group eligibility and then monitor to ensure that groups met these criteria.

e. *Watershed Monitoring:* This option involves replacing the monitoring of discrete storm water discharges with ambient receiving water monitoring on a watershed basis. Watershed monitoring is invaluable to making real conclusions regarding storm water impacts of water quality, and will be employed in making total maximum daily load (TMDL). However, watershed monitoring cannot replace facility-specific storm water discharge monitoring to determine the loads contributed by the facilities and to evaluate the effectiveness of the SWPPP.

f. *Monitoring Only in Impaired Waters:* Several commenters supported requiring monitoring only in impaired water bodies and for pollutants that cause the impairment. Although this option would focus attention on the problem water bodies and possible pollutant sources. EPA and a commenter point out that not all impaired water bodies and their impairments have been determined. The goal of EPA's storm water program is also to protect and maintain water quality, not just remediate impaired waters, so focusing on impaired waters only does not fulfill all the program's responsibilities.

2. Compliance Monitoring

Today's final MSGP retains the same compliance monitoring requirements as the 1995 MSGP, and also includes compliance monitoring requirements for certain storm water discharges from new and existing hazardous and non-hazardous landfills. As noted earlier, EPA has recently finalized effluent limitations guidelines for these landfills (65 FR 3007, January 19, 2000) and the compliance monitoring is required to ensure compliance with the guidelines. These discharges must generally be sampled annually (in some cases quarterly) and tested for the parameters which are limited by the permit. Discharges subject to compliance monitoring include (in addition to the landfills discharges): coal pile runoff, contaminated runoff from phosphate fertilizer manufacturing facilities, runoff from asphalt paving and roofing emulsion production areas, material storage pile runoff from cement manufacturing facilities, and mine dewatering discharges from crushed stone, construction sand and gravel, and industrial sand mines located in EPA Regions 1, 2, 3, 6, 8, 9, 10. All samples are to be grabs taken within the first 30 minutes of discharge where practicable, but in no case later than the first hour of discharge. Where practicable, the samples shall be taken from the discharges subject to the numeric effluent limitations prior to mixing with other discharges.

Monitoring for these discharges is required to determine compliance with numeric effluent limitations. Discharges covered under today's final MSGP which are subject to numeric effluent limitations are not eligible for the alternative certification described in Section VI.E.3 of this fact sheet.

Where a State or Tribe has imposed a numeric effluent limitation as a condition for certification under CWA § 401, a default minimum monitoring frequency of once per year has been included in the final permit. This default monitoring frequency would only apply if a State failed to provided a monitoring frequency along with their conditional § 401 certification.

3. Alternate Certification

Today's final MSGP retains the provision in the 1995 MSGP for an alternative certification in lieu of analytical monitoring. The MSGP includes monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative certification described below is included in the permit to ensure that monitoring requirements are only imposed on those facilities which do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if there are no sources of a pollutant exposed to storm water at the site then the potential for that pollutant to contaminate storm water discharges does not warrant monitoring.

A discharger is not subject to the analytical monitoring requirements provided the discharger makes a certification for a given outfall, on a pollutant-by-pollutant basis, that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the SWPPP, and submitted to EPA in lieu of monitoring reports required under Part 7 of the permit. The permittee is required to complete any and all sampling until the exposure is eliminated. If the facility is reporting for a partial year, the permittee must specify the date exposure was eliminated. If the permittee is certifying that a pollutant was present for part of the reporting period, nothing relieves the permittee from the responsibility to sample that parameter up until the exposure was eliminated and it was determined that no significant materials remained. This certification is not to be confused with the low concentration sampling waiver. The test for the application of this certification is whether the pollutant is exposed, or can be expected to be present in the storm water discharge. If the facility does not and has not used a parameter, or if exposure is eliminated and no significant materials remain, then the facility can exercise this certification.

As noted above, the MSGP does not allow facilities with discharges subject to numeric effluent limitations guidelines to submit alternative certification in lieu of compliance monitoring requirements. The permit also does not allow air transportation facilities or hard rock mines subject to the analytical monitoring requirements in Part 6 of the final MSGP to exercise an alternative certification.

A facility is not precluded from exercising the alternative certification in lieu of analytical monitoring requirements in the second or fourth year of the reissued MSGP, even if that facility has failed to qualify for a low concentration waiver thus far. EPA encourages facilities to eliminate exposure of industrial activities and significant materials where practicable.

4. Reporting and Retention Requirements

Like the 1995 MSGP, today's final MSGP requires that permittees submit all analytical monitoring results obtained during the second and fourth year of permit coverage. As noted earlier, year 2 runs from October 1, 2001 to September 30, 2002; year 4 runs from October 1, 2003 to September 30, 2004. Monitoring results must be submitted by January 28, 2003 for year 2 monitoring and January 28, 2005 for year 4 monitoring.

For each outfall, one Discharge Monitoring Report (DMR) form must be submitted per storm event sampled. For facilities conducting monitoring beyond the minimum requirements, an additional DMR form must be filed for each analysis. The permittee must include a measurement or estimate of the total precipitation, volume of runoff, and peak flow rate of runoff for each storm event sampled. Permittees subject to compliance monitoring requirements are required to submit all compliance monitoring results annually by October 28 following each annual sampling period (which run from October 1 of each year to September 30 of the following year). Compliance monitoring results must be submitted on signed DMR forms. For each outfall, one DMR form must be submitted for each storm event sampled.

Permittees are not required to submit records of the visual examinations of storm water discharges unless specifically asked to do so by the Director. Records of the visual examinations must be maintained at the facility. Records of visual examination of storm water discharge need not be lengthy. Permittees may prepare typed or hand written reports using forms or tables which they may develop for their facility. The report need only document: the date and time of the examination; the name of the individual making the examination; and any observations of color, odor, clarity, floating solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution.

The address for submission of DMR forms for today's final MSGP is as follows: MSGP DMR (4203), U.S. EPA, 1200 Pennsylvania Avenue, NW., Washington, DC 20460.

Under the 1995 MSGP, DMRs had been sent to the EPA Regional Offices. However, to facilitate review of all DMRs from facilities operating under the MSGP, the final MSGP requires that they be sent to the one location specified above.

Today's final MSGP also retains the requirement in the 1995 MSGP that permittees submit signed copies of DMRs to the operator of a large or medium MS4 (those which serve a population of 100,000 or more), if there are discharges of storm water associated with industrial activity through the MS4.

The location for submission of all reports (other than DMRs) for today's final MSGP remains the EPA Regional Offices as found in Part 8.3 of the final permit. Consistent with Office of Management and Budget Circular A-105, facilities located on the following Federal Indian Reservations, which cross EPA Regional boundaries, should note that permitting authority for such lands is consolidated in one single EPA Region.

a. Duck Valley Reservations lands, located in Regions 9 and 10, are handled by Region 9.

b. Fort McDermitt Reservation lands, located in Regions 9 and 10, are handled by Region 9.

c. Goshute Reservation lands, located in Regions 8 and 9, are handled by Region 9.

d. Navajo Reservation lands, located in Regions 6, 8, and 9, are handled by Region 9.

e. Ute Mountain Reservation lands, located in Regions 6 and 8, are handled Region 8.

Pursuant to the requirements of 40 CFR 122.41(j), today's MSGP (like the 1995 MSGP) requires permittees to retain all records for a minimum of three years from the date of the sampling, examination, or other activity that generated the data.

5. Sample Type

Today's final MSGP retains the same requirements regarding the type of sampling as the 1995 MSGP. A general description is provided below. Certain industries have different requirements. Permittees should check the industry-specific requirements in Part 6 of the final permit to confirm these requirements. Grab samples may be used for all monitoring unless otherwise stated. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval may be waived by the permittee where the preceding measurable storm event did not result in a measurable discharge from the facility. The 72-hour requirement may also be waived by the permittee where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample must be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger must submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. A minimum of one grab is required. Where the discharge to be sampled contains both storm water and non-storm water, the facility shall sample the storm water component of the discharge at a point upstream of the location where the non-storm water mixes with the storm water, if practicable.

6. Representative Discharge

Today's MSGP retains the same provision as the 1995 MSGP regarding substantially identical outfalls which allows a facility to reduce its overall monitoring burden. This representative discharge provision provides facilities with multiple storm water outfalls, a means for reducing the number of outfalls that must be sampled and analyzed. This may result in a substantial reduction of the resources required for a facility to comply with analytical monitoring requirements. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one such outfall and report that the quantitative data also apply to the substantially identical outfalls provided that the permittee includes in the SWPPP a description of the location of the outfalls and detailed explanation why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (*e.g.*, low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan. Facilities that select and sample a representative discharge are prohibited from changing the selected discharge in future monitoring periods unless the selected discharge ceases to be representative or is eliminated. Permittees do not need EPA approval to claim discharges are representative, provided they have documented their rationale within the SWPPP. However, the Director may determine the discharges are not representative and require sampling of all non-identical outfalls.

The representative discharge provision in the permit is available to almost all facilities subject to the analytical monitoring requirements (not including compliance monitoring for effluent guideline limit compliance purposes) and to facilities subject to visual examination requirements.

The representative discharge provisions described above are consistent with Section 5.2 of NPDES Storm Water Sampling Guidance Document (EPA 833–B–92–001, July 1992).

7. Sampling Waiver

Today's final MSGP retains the same provisions for sampling waivers (as discussed below) which are found in the 1995 MSGP:

a. Adverse Weather Conditions. Today's final MSGP allows for temporary waivers from sampling based on adverse climatic conditions. This temporary sampling waiver is only intended to apply to insurmountable weather conditions such as drought or dangerous conditions such as lightning, flash flooding, or hurricanes. These events tend to be isolated incidents and should not be used as an excuse for not conducting sampling under more favorable conditions associated with other storm events. The sampling waiver is not intended to apply to difficult logistical conditions, such as remote facilities with few employees or discharge locations which are difficult to access. When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next sampling period as well as a sample for the routine monitoring required in that period. Both samples should be analyzed separately and the results of that analysis submitted to EPA. Permittees are not required to obtain advance approval for sampling waivers.

b. *Unstaffed and Inactive Sites—Chemical Sampling Waiver.* Today's final MSGP allows for a waiver from sampling for facilities that are both inactive and unstaffed. This waiver is only intended to apply to these facilities where lack of personnel and locational impediments hinder the ability to conduct sampling (i.e., the ability to meet the time and representative rainfall sampling specifications). This waiver is not intended to apply to remote facilities that are active and staffed, or to facilities with just difficult logistical conditions. When a discharger is unable to collect samples as specified in this permit, the discharger shall certify to the Director in the DMR that the facility is unstaffed and inactive and the ability to conduct samples within the specifications is not possible. Permittees are not required to obtain advance approval for this waiver.

c. *Unstaffed and Inactive Sites—Visual Monitoring Waiver.* Today's final MSGP allows for a waiver from sampling for facilities that are both inactive and unstaffed. This waiver is only intended to apply to these facilities where lack of personnel and locational impediments hinder the ability to conduct visual examinations (i.e., the ability to meet the time and representative rainfall sampling specifications). This monitoring waiver is not intended to apply to remote facilities that are active and staffed, or to facilities with just difficult logistical conditions. When a discharger is unable to perform visual examinations as specified in this permit, the discharger shall maintain on site with the pollution prevention plan a certification stating that the facility is unstaffed and inactive and the ability to perform visual examinations within the specifications is not possible. Permittees are not required to obtain advance approval for visual examination waivers.

8. Quarterly Visual Examination of Storm Water Quality

Today's final MSGP retains the requirements of the 1995 MSGP for quarterly visual examinations of storm water discharges which EPA continues to believe provide a useful and inexpensive means for permittees to evaluate the effectiveness of their SWPPPs (with immediate feedback) and make any necessary modifications to address the results of the visual examinations. All sectors of today's final MSGP are required to conduct these examinations. In the 1995 MSGP all sectors except Sector S (which covers air transportation) were required to conduct the examinations.

Basically, the MSGP requires that grab samples of storm water discharges be taken and examined visually for the presence of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen or other obvious indicators of storm water pollution. The grab samples must be taken within the first 30 minutes after storm water discharges begin, or as soon as practicable, but not longer than 1 hour after discharges begin. The sampling must be conducted quarterly during the following time periods: January–March, April–June, July–September and October–December of each year. The reports summarizing these quarterly visual storm water examinations must be maintained on-site with the SWPPP.

The examination of the sample must be made in well lit areas. The visual examination is not required if there is insufficient rainfall or snow-melt to run off or if hazardous conditions prevent sampling. Whenever practicable the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible in recording observations.

When conducting a storm water visual examination, the pollution prevention team, or team member, should attempt to relate the results of the examination to potential sources of storm water contamination on the site. For example, if the visual examination reveals an oil sheen, the facility personnel (preferably members of the pollution prevention team) should conduct an inspection of the area of the site draining to the examined discharge to look for obvious sources of spilled oil, leaks, etc. If a source can be located, then this information allows the facility operator to immediately conduct a clean-up of the pollutant source, and/or to design a change to the SWPPP to eliminate or minimize the contaminant source from occurring in the future.

Other examples include: if the visual examination results in an observation of floating solids, the personnel should carefully examine the solids to see if they are raw materials, waste materials or other known products stored or used at the site. If an unusual color or odor is sensed, the personnel should attempt to compare the color or odor to the colors or odors of known chemicals and other materials used at the facility. If the examination reveals a large amount of settled solids, the personnel may check for unpaved, unstabilized areas or areas of erosion. If the examination results in a cloudy sample that is very slow to settle out, the personnel should evaluate the site draining to the discharge point for fine particulate material, such as dust, ash, or other pulverized, ground, or powdered chemicals.

To be most effective, the personnel conducting the visual examination should be fully knowledgeable about the SWPPP, the sources of contaminants on the site, the industrial activities conducted exposed to storm water and the day to day operations that may cause unexpected pollutant releases.

If the visual examination results in a clean and clear sample of the storm water discharge, this may indicate that no pollutants are present. This would be an indication of a high quality result. However, the visual examination will not provide information about dissolved contamination. If the facility is in a sector or subsector required to conduct analytical (chemical) monitoring, the results of the chemical monitoring, if conducted on the same sample, would help to identify the presence of any dissolved pollutants and the ultimate effectiveness of the Storm Water Pollution Prevention Plan. If the facility is not required to conduct analytical monitoring, it may do so if it chooses to confirm the cleanliness of the sample.

While conducting the visual examinations, personnel should constantly be attempting to relate any contamination that is observed in the samples to the sources of pollutants on site. When contamination is observed, the personnel should be evaluating whether or not additional BMPs should be implemented in the SWPPP to address the observed contaminant and, if BMPs have already been implemented, evaluating whether or not these are working correctly or need maintenance. Permittees may also conduct more frequent visual examinations than the minimum quarterly requirement, if they so choose. By doing so, they may improve their ability to ascertain the effectiveness of their plan. Using this guidance, and employing a strong knowledge of the facility operations, EPA believes that permittees should be able to maximize the effectiveness of their storm water pollution prevention efforts through conducting visual examinations which give direct, frequent feedback to the facility operator or pollution prevention team on the quality of the storm water discharge.

EPA believes that this quick and simple assessment will help the permittee to determine the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. EPA recommends that the visual examination be conducted at different times than the chemical monitoring, but is not requiring this. In addition, more frequent visual examinations can be conducted if the permittee so chooses. In this way, better assessments of the effectiveness of the Storm Water Pollution Prevention Plan can be achieved. The frequency of this visual examination will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or followup procedures must be used to ensure that appropriate actions are taken in response to the examinations. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on examination will enhance the staff's understanding of the site's storm water problems and the effects of the management practices that are included in the plan.

F. Regional Offices

1. Notice of Intent Address

Notices of Intent to be authorized to discharge under the MSGP should be sent to: Storm Water Notice of Intent (4203), USEPA, 401 M Street, SW., Washington, DC 20460.

2. EPA Regional Office Addresses and Contacts

For further information, please call the appropriate EPA Regional storm water contacts listed below:

• ME, MA, NH, Indian country in CT, MA, ME, RI, and Federal Facilities in VT

EPA Region 1, Office of Ecosystem Protection, JFK Federal Building (CMU), Boston, MA 02203, Contact: Thelma Murphy (617) 918–1615.

• PR

U.S. EPA, Region 2, Caribbean Environmental Protection Division, Centro Europa Building, 1492 Ponce de Leon Avenue, Suite 417, San Juan, Puerto Rico 00907–4127, Contact: Sergio Bosques (787) 729–6951.

• DC and Federal Facilities in DE

EPA Region 3, Water Protection Division, (3WP13), Storm Water Staff, 841 Chestnut Building, Philadelphia, PA 19107, Contact: Cheryl Atkinson (215) 814–3392.

• Indian country in FL

VII. Cost Estimates for Common Permit Requirements

Cost estimates for the MSGP were included with the final fact sheet accompanying the issuance of the MSGP on September 29, 1995 and are not being repeated here. However, additional costs for facilities seeking coverage under the reissued MSGP should be minor since the new MSGP includes few changes from the 1995 MSGP.

VIII. Special Requirements for Discharges Associated With Specific Industrial Activities

Section VIII of the fact sheet accompanying the 1995 MSGP included a detailed description of the industrial sectors covered by the permit, sources of pollutants from the different types of industries, available industry-specific BMPs, and a description of the industrial-specific permit requirements. As noted previously, EPA is not repeating all this information due to its considerable length. Table 1 in Section IV of this fact sheet listed the industrial sectors and subsectors covered by today's final MSGP. For today's MSGP, EPA reviewed the various sectors and subsectors to determine whether additional BMP opportunities have been identified subsequent to the issuance of the 1995 MSGP which would be appropriate to include in the reissued MSGP.

To update the various sectors and subsectors, EPA reviewed a variety of sources of information. As noted in Section VI.C of this fact sheet, pollution prevention is the cornerstone of the NPDES storm water permit program and, as such, EPA focused on new pollution prevention opportunities in updating the sectors. EPA has several ongoing programs directed toward identifying additional pollution prevention opportunities for different industrial sectors. One example is the "sector notebooks" which EPA's Office of Compliance has published covering 28 different industries, including many of those covered by the MSGP. EPA's Design for the Environment Program and Common Sense Initiative are additional examples. States, municipalities, industry trade associations and individual companies have also been active in recent years in trying to identify additional pollution prevention opportunities for different types of industries.

In reviewing the new information, however, EPA has identified only a few sectors where there appear to be additional storm water BMPs which would be appropriate for the reissued MSGP. For many industries, while considerable work has been conducted to reduce the environmental effects of these industries, little of the work has focused specifically on storm water. Rather, the efforts have focused more in areas such as manufacturing process changes to reduce hazardous waste generation or to reduce pollutant discharges in process wastewater. Where additional storm water BMPs have been identified and incorporated into the reissued MSGP, these new requirements are discussed below by sector. In some sectors, additional language clarifying the permit requirements has been added and these changes are also discussed below.

A. Sectors C—Chemical and Allied Products Facilities

Industry-specific requirements for the manufacture of fertilizer from leather scraps (SIC 2873) was moved from Sector Z (Leather Tanning and Finishing) to Sector C. This change places the requirements for SIC 2873 in the same sector as other manufacturers of fertilizers.

B. Sector G—Metal Mining (Ore Dressing and Mining)

To clarify the applicability of the MSGP regarding construction activity at metal mining sites and to make metal mining requirements consistent with mineral mining provisions (Sector J), Sector G has been modified to indicate that earth-disturbing activities occurring in the "exploration and construction phase" of a mining operation must be covered under EPA's Construction General Permit (63 FR 7858, February 17, 1998) if the area disturbed is one acre or more. All mining exploration/construction operations of less than one acre must be covered under the MSGP–2000.

Today's MSGP also incorporates the MSGP modifications of August 7, 1998 (63 FR 42534) regarding storm water discharges from waste rock and overburden piles. On October 10, 1995, the National Mining Association challenged the interpretation set forth in Table G–4 of the 1995 MSGP that runoff from waste rock and overburden piles would categorically be considered mine drainage subject to effluent limitations guidelines (ELGs) at 40 CFR Part 440. The litigation was settled on August 7, 1998 with a revised interpretation by EPA of the applicability of the ELGs which is incorporated into today's MSGP. Under the revised interpretation, runoff from waste rock and overburden piles is not subject to ELGs unless it naturally drains (or is intentionally diverted) to a point source and combines with "mine drainage" that is otherwise subject to the ELGs.

The August 7, 1998 modification of the MSGP provided permit coverage for storm water discharges from waste rock and overburden piles which are not subject to ELGs. However, due to concerns regarding potential pollutants in the discharges, additional monitoring requirements were included in the permit to determine the pollutant concentrations in the discharges. These monitoring requirements are also included in today's MSGP. The monitoring results which have been submitted to EPA pursuant to these requirements were also considered in determining the monitoring requirements for today's permit for this sector.

Concerns were expressed by some commenters over the use of the term "Numeric limitation" in the headings in the tables in Sector G in the proposed MSGP. However, since there are no actual numeric limitations in the tables, EPA believes this concern is not justified and the final MSGP has not been modified in response to these comments. In response to other comments, the revised Table G–4 from the August 7, 1998 MSGP modification has been added to the permit in Part 6.G.

In response to comments received on the proposed MSGP, the language in Part 6.G.1.6.6 of the final MSGP was modified to indicate that a permittee may test "or evaluate" mining-related discharges for non-storm water discharges to make today's MSGP consistent with the 1995 MSGP.

Also in response to comments, the permit language in the final MSGP which defines the reclamation phase was modified to reflect post-mining land uses other than "pre-mining state" which had been in the proposed MSGP. In addition, the final MSGP has been clarified to indicate that sampling waivers in Part 5.3.1 of the MSGP do apply to Sector G.

C. Sector I—Oil and Gas Extraction and Refining

In response to a comment, the title for Sector I was changed to include "Refining" to clarify that runoff from refineries (except runoff subject to effluent limitations guidelines) is eligible for coverage under today's MSGP.

D. Sector J—Mineral Mining and Processing

EPA has re-evaluated the provisions of the 1995 MSGP for industrial facilities in Sector J to determine whether these provisions need to be updated for the reissued MSGP. To clarify the applicability of the MSGP regarding construction activity at mineral mining sites and to make mineral mining requirements consistent with metal mining provisions (Sector G), Sector J has been modified to indicate that earth-disturbing activities occurring in the "exploration and construction phase" of a mining operation must be covered under EPA's Construction General Permit (63 FR 7858, February 17, 1998) if the area disturbed is one acre or more. All mining exploration/construction operations of less than one acre must be covered under the MSGP–2000.

E. Sector K—Hazardous Waste Treatment, Storage or Disposal Facilities

EPA has re-evaluated the provisions of the 1995 MSGP for industrial facilities in Sector K to determine whether these provisions need to be updated for the reissued MSGP. On January 19, 2000 (65 FR 3008), EPA promulgated final effluent limitations guidelines (ELGs) for "contaminated storm water discharges" from new and existing hazardous landfill facilities regulated under RCRA Subtitle C at 40 CFR Parts 264 (Subpart N) and 265 (Subpart N), except for the following "captive" landfills:

(a) Landfills operated in conjunction with other industrial or commercial operations when the landfill only receives wastes generated by the industrial or commercial operation directly associated with the landfill;

(b) Landfills operated in conjunction with other industrial or commercial operations when the landfill receives wastes generated by the industrial or commercial operation directly associated with the landfill and also receives other wastes provided the other wastes received for disposal are generated by a facility that is subject to the same provisions in 40 CFR Subchapter N as the industrial or commercial operation or the other wastes received are of similar nature to the wastes generated by the industrial or commercial operation;

(c) Landfills operated in conjunction with Centralized Waste Treatment (CWT) facilities subject to 40 CFR Part 437 so long as the CWT facility commingles the landfill wastewater with other non-landfill wastewater for discharge. A landfill directly associated with a CWT facility is subject to this part if the CWT facility discharges landfill wastewater separately from other CWT wastewater or commingles the wastewater from its landfill only with wastewater from other landfills; or

(d) Landfills operated in conjunction with other industrial or commercial operations when the landfill receives wastes from public service activities so long as the company owning the landfill does not receive a fee or other remuneration for the disposal service.

For Sector K of the new MSGP, EPA has included the new ELGs (40 CFR Part 445 Subpart A) for hazardous landfill facilities.

The term "contaminated storm water" is defined in the ELGs as "storm water which comes in direct contact with landfill wastes, the waste handling and treatment areas, or landfill wastewater." [40 CFR 445.2]. Contaminated storm water may originate from areas at a landfill including (but not limited to): "the open face of an active landfill with exposed waste (no cover added); the areas around wastewater treatment operations; trucks, equipment or machinery that has been in direct contact with the waste; and waste dumping areas." [40 CFR 445.2].

The term "non-contaminated storm water" is defined in the ELGs as "storm water which does not come in direct contact with landfill wastes, the waste handling and treatment areas, or landfill wastewater." [40 CFR 445.2]. Non-contaminated storm water includes storm water which "flows off the cap, cover, intermediate cover, daily cover, and/or final cover of the landfill." [40 CFR 445.2].

The term "landfill wastewater" is defined in the ELGs as "all wastewater associated with, or produced by, landfilling activities except for sanitary wastewater, non-contaminated storm water, contaminated groundwater, and wastewater from recovery pumping wells. Landfill wastewater includes, but is not limited to, leachate, gas collection condensate, drained free liquids, laboratory derived wastewater, contaminated storm water and contact washwater from washing truck, equipment, and railcar exteriors and surface areas which have come in direct contact with solid waste at the landfill facility."

The 1995 MSGP authorized discharges of storm water associated with industrial activity which includes contaminated storm water discharges (as defined above) as well as other non-contaminated storm water discharges (also defined above). Today's final MSGP continues to authorize storm water associated with industrial activity; however, for contaminated storm water discharges as defined above, the reissued MSGP requires compliance with the promulgated ELGs for such discharges (with monitoring once/year during each year of the term of the final MSGP). The ELGs for the new and existing hazardous landfills are found in Table K–1 below:

TABLE K–1—EFFLUENT LIMITATIONS GUIDELINES FOR CONTAMINATED STORM WATER DISCHARGES (MG/L)

Pollutant	Maximum for 1 day	Monthly average maximum
BOD5	220	56

R0019815

TABLE K–1—EFFLUENT LIMITATIONS GUIDELINES FOR CONTAMINATED STORM WATER DISCHARGES (MG/L)—Continued

Pollutant	Maximum for 1 day	Monthly average maximum
TSS	88	27
Ammonia	10	4.9
Alpha Terpineol	0.042	0.019
Aniline	0.024	0.015
Benzoic Acid	0.119	0.073
Naphthalene	0.059	0.022
p-Cresol	0.024	0.015
Phenol	0.048	0.029
Pyridine	0.072	0.025
Arsenic (Total)	1.1	0.54
Chromium (Total)	1.1	0.46
Zinc (Total)	0.535	0.296
pH	Within the range of 6–9 pH units.	

Today's final MSGP (like the 1995 MSGP) does not authorize non-storm water discharges such as leachate and vehicle and equipment washwater. These and other landfill-generated wastewaters are subject to the ELGs. Today's final MSGP does, however, continue to authorize certain minor non-storm water discharges (listed in Part 1.2.2.2) which are very similar to the 1995 MSGP.

F. Sector L—Landfills, Land Application Sites and Open Dumps

EPA has re-evaluated the provisions of the 1995 MSGP for industrial facilities in Sector L to determine whether these provisions need to be updated for the reissued MSGP. The SWPPP requirements of the 1995 MSGP already include several special BMPs for this industry in addition to the MSGP's basic BMP requirements.

On January 19, 2000 (65 FR 3008), EPA promulgated final effluent limitations guidelines (ELGs) for "contaminated storm water discharges" from new and existing non-hazardous landfill facilities regulated under RCRA Subtitle D (40 CFR Part 445 Subpart B). For Sector L of today's MSGP, EPA has included the ELGs as they apply to facilities covered by this sector. For Sector L facilities, the ELGs apply to:

Municipal solid waste landfills regulated under RCRA Subtitle D at 40 CFR Part 258 and those landfills which are subject to the provisions of 40 CFR Part 257, except for any of the following "captive" landfills:

(a) Landfills operated in conjunction with other industrial or commercial operations when the landfill only receives wastes generated by the industrial or commercial operation directly associated with the landfill;

(b) Landfills operated in conjunction with other industrial or commercial operations when the landfill receives wastes generated by the industrial or commercial operation directly associated with the landfill and also receives other wastes provided the other wastes received for disposal are generated by a facility that is subject to the same provisions in 40 CFR Subchapter N as the industrial or commercial operation or the other wastes received are of similar nature to the wastes generated by the industrial or commercial operation;

(c) Landfills operated in conjunction with Centralized Waste Treatment (CWT) facilities subject to 40 CFR Part 437 so long as the CWT facility commingles the landfill wastewater with other non-landfill wastewater for discharge. A landfill directly associated with a CWT facility is subject to this part if the CWT facility discharges landfill wastewater separately from other CWT wastewater or commingles the wastewater from its landfill only with wastewater from other landfills; or

(d) Landfills operated in conjunction with other industrial or commercial operations when the landfill receives wastes from public service activities so long as the company owning the landfill does not receive a fee or other remuneration for the disposal service.

EPA has not modified Sector L for the discharges which are not subject to the ELGs. In addition, EPA would like to call attention to a new EPA publication entitled "Guide for Industrial Waste Management" (EPA 530–R–99–001, June, 1999) which provides a useful information resource for permittees in complying with the MSGP, and in minimizing the impact of landfills to the environment overall.

The term "contaminated storm water" is defined in the ELGs as "storm water which comes in direct contact with landfill wastes, the waste handling and treatment areas, or landfill wastewater." [40 CFR 445.2]. Contaminated storm water may originate from areas at a landfill including (but not limited to): "the open face of an active landfill with exposed waste (no cover added); the areas around wastewater treatment operations; trucks, equipment or machinery that has been in direct contact with the waste; and waste dumping areas." [40 CFR 445.2].

The term "non-contaminated storm water" is defined in the ELGs as "storm water which does not come in direct contact with landfill wastes, the waste handling and treatment areas, or landfill wastewater." [40 CFR 445.2]. Non-contaminated storm water includes storm water which "flows off the cap, cover, intermediate cover, daily cover, and/or final cover of the landfill." [40 CFR 445.2].

The term "landfill wastewater" is defined in the ELGs as "all wastewater associated with, or produced by, landfilling activities except for sanitary wastewater, non-contaminated storm water, contaminated groundwater, and wastewater from recovery pumping wells. Landfill wastewater includes, but is not limited to, leachate, gas collection condensate, drained free liquids, laboratory derived wastewater, contaminated storm water and contact washwater from washing truck, equipment, and railcar exteriors and surface areas which have come in direct contact with solid waste at the landfill facility." [40 CFR 445.2].

The 1995 MSGP authorized discharges of storm water associated with industrial activity from landfills including contaminated storm water discharges as defined in the ELGs as well as non-contaminated storm water. Today's final MSGP continues to authorize storm water associated with industrial activity; however, for contaminated storm water discharges as defined above, today's MSGP requires compliance with the promulgated ELGs for such discharges (with monitoring once/year during each year of the term of the final MSGP). The ELGs are found in Table L–1 below:

TABLE L–1—EFFLUENT LIMITATIONS GUIDELINES FOR CONTAMINATED STORM WATER DISCHARGES (MG/L)

Pollutant	Maximum for 1 Day	Monthly average maximum
BOD5	140	37
TSS	88	27
Ammonia	10	4.9
Alpha Terpineol	0.033	0.016
Benzoic Acid	0.12	0.071
p-Cresol	0.025	0.014
Phenol	0.026	0.015
Zinc (Total)	0.20	0.11
pH	within the range of 6–9 pH units.	

Today's final MSGP (like the 1995 MSGP) does not authorize non-storm water discharges such as leachate and vehicle and equipment washwater. These and other landfill-generated wastewaters are subject to the ELGs. Today's MSGP does, however, continue to authorize the same minor non-storm water discharges (listed in Part 1.2.2.2) as the 1995 MSGP.

R0019816

G. Sector S—Air Transportation Facilities

EPA has re-evaluated the provisions of the 1995 MSGP for industrial facilities in Sector S to determine whether these provisions need to be updated for the reissued MSGP. The SWPPP requirements of the 1995 MSGP included several special BMP requirements for airports in addition to the MSGP's basic BMP requirements. Additional technologies have been developed since the original MSGP issuance for deicing operations which have been included in today's MSGP. A lengthy (but not comprehensive) list of new deicing chemical and BMP options is provided in Parts 6.S.5.3.6.2 and 6.S.5.3.7. More information on these options is found in the EPA publication "Preliminary Data Summary, Airport Deicing Operations" *(http://www.epa.gov/ost/guide/airport/index.html).*

The MSGP-2000 has been clarified such that compliance evaluations (Part 6.S.5.5) shall be conducted during a period when deicing activities are likely to occur (vs. a month when deicing activities would be atypical or during an extended heat wave), not necessarily during an actual storm or when intense deicing activities are occurring. This requirement is not seen as onerous, as EPA believes that most weather conditions can be reasonably anticipated and the evaluation can be planned for.

In addition, EPA has revised Part 6.S.5.4 to reflect that monthly inspections of deicing areas during the deicing season (e.g., October through April) are now allowed at airports with highly effective, rigorously implemented SWPPPs. This requirement is a reduction from the previous MSGP's weekly requirement. However, if unusually large amounts of deicing fluids are being applied, spilled or discharged, weekly inspections should be conducted and the Director may specifically require such weekly inspections. In addition, personnel who participate in deicing activities or work in these areas should, as the need arises, inform the monthly inspectors of any conditions or incidents constituting an environmental threat, especially those needing immediate attention.

H. Sector T—Treatment Works

EPA has re-evaluated the provisions of the 1995 MSGP for industrial facilities in Sector T to determine whether these provisions need to be updated for the reissued MSGP. The SWPPP requirements of the 1995 MSGP already include a few special BMP requirements for this industry in addition to the MSGP's basic BMP requirements. In reviewing the information which EPA has available on this industry, EPA has identified several additional areas at treatment works facilities which we believe should be considered more closely for potential storm water controls. As a result, EPA has included additional or modified permit requirements which we believe are appropriate to include in Sector T.

Today's MSGP requires that operators of Sector T treatment works include the following additional areas or activities, where they are exposed to precipitation, in their SWPPP site map, summary of potential pollutant sources, and inspections: grit, screenings and other solids handling, storage or disposal areas; sludge drying beds; dried sludge piles; compost piles; septage and/or hauled waste receiving stations. An additional BMP that permittees must consider is routing storm water into the treatment works, or covering exposed materials from these additional areas or activities.

I. Sector Y—Rubber, Miscellaneous Plastic Products and Miscellaneous Manufacturing Industries

EPA has re-evaluated the provisions of the 1995 MSGP for industrial facilities in Sector Y. The 1995 MSGP included several special BMP requirements for rubber manufacturers to control zinc in storm water discharges. However, no special BMPs beyond the MSGP's basic SWPPP requirements were included in the 1995 MSGP for manufacturers of miscellaneous plastic products or miscellaneous manufacturing industries.

EPA has several ongoing programs directed toward identifying additional pollution prevention opportunities for different industrial sectors. For example, EPA's Office of Compliance has published "sector notebooks" for a number of industries, including the rubber and miscellaneous plastics industry (EPA 310-R-95-016). The sector notebooks are intended to facilitate a multi-media analysis of environmental issues associated with different industries and include a review of pollution prevention opportunities for the industries. As discussed below, EPA's sector notebook for the rubber and plastic products industry identifies a number of additional BMPs (beyond those in the 1995 MSGP) which could further reduce pollutants in storm water discharges from these facilities, and which have been included in the reissued MSGP.

1. Rubber Manufacturing Facilities

Today's MSGP requires that rubber manufacturing facility permittees consider the following additional BMPs (which were selected from those in the sector notebook) for the rubber product compounding and mixing area:

(1) consider the use of chemicals which are purchased in pre-weighed, sealed polyethylene bags. The sector notebook points out that some facilities place such bags directly into the banbury mixer, thereby eliminating a formerly dusty operation which could result in pollutants in storm water discharges.

(2) consider the use of containers which can be sealed for materials which are in use; also consider ensuring an airspace between the container and the cover to minimize "puffing" losses when the container is opened.

(3) consider the use of automatic dispensing and weighing equipment. The sector notebook observes that such equipment minimizes the chances for chemical losses due to spills.

2. Plastic Products Manufacturing Facilities

For plastic products manufacturing facilities, today's final MSGP requires that permittees consider and include (as appropriate) specific measures in the SWPPP to minimize loss of plastic resin pellets to the environment. These measures include (at a minimum) spill minimization, prompt and thorough cleanup of spills, employee education, thorough sweeping, pellet capture and disposal precautions. Additional specific guidance on minimizing loss can be found in the EPA publication entitled "Plastic Pellets in the Aquatic Environment: Sources and Recommendations" (EPA 842-B-92-010, December, 1992) and at the website of the Society of the Plastics Industry (www.socplas.org).

3. Industry-Sponsored Efforts

Both the rubber manufacturing and plastic products industries are also active in sponsoring studies designed to reduce the environmental impacts associated with the production, use and ultimate disposal of their products. However, in reviewing recent work in this regard, EPA has not identified any additional BMPs for storm water discharges which would be appropriate for the reissued MSGP. Therefore, only the additional BMPs noted above are included in the reissued MSGP for these industries.

IX. Summary of Responses to Comments on the Proposed MSGP

EPA received comments from 45 individuals in response to the proposed permit. A summary of the Agency's responses to those comments appears below. Responses to each comment is available from the Water Docket, whose address and hours of operation are listed in the introduction to this notice.

Section 1.2 Eligibility

Comment a: One commenter requested clarification on the responsibilities military bases, which resemble small municipalities, have with regard to non-industrial areas of the base. The commenter expressed concern that examples of co-located industrial activities in Section VI.B.3 of the fact sheet and Part 1.2.1.1 of the proposed permit could be interpreted to require coverage for all vehicle maintenance activities at a base, even those unrelated to an industrial activity. The commenter further noted that bases in urbanized areas would require base-wide storm water management programs anyway as Small Municipal Separate Storm Sewer Systems under Phase II of the Storm Water Program.

Response a: EPA agrees that municipalities and military or other governmental installations are only responsible for obtaining permits for storm water associated with industrial activity for those portions of their municipality or installations where they have a storm water discharge that is covered under the definition of "storm water associated with industrial activity." Under this interpretation, even though a military base may choose to submit a single NOI for all industrial activities on the base, the SWPPP would only need to identify facilities/areas associated or not associated with industrial activities and that have a SWPPP covering the industrial activity areas. The SWPPP required under the MSGP would not need to address storm water controls for the non-industrial areas of the base. A note has been added to Part 4.1 (Storm Water Pollution Prevention Plans) of the permit to clarify the scope of the SWPPP.

Comment b: The proposed limitations on transfer of storm water discharges from a previous permit to the MSGP could result in undue restrictions. The commenter felt that there could be reasons, e.g., for consistent management of storm water across a site, etc. that either the permittee or the permitting authority would want to address all storm water at a facility under a general permit.

Response b: EPA has reconsidered the Part 1.2.3.3.2 restrictions and Part 1.2.3.3.2.1 of the proposed permit has been eliminated. Part 1.2.3.3.2.1 would only have allowed permittees to seek MSGP coverage for storm water discharges previously covered by another permit if that previous permit contained only storm water and eligible non-storm water (i.e., an individual permit for wastewater, etc. would no longer be required if coverage under the MSGP was allowed). EPA's review did identify some unintended consequences and unresolved issues that could result from this restriction.

A facility (including new facilities) that never had storm water discharges covered by an individual permit, or which was located where access to a municipal wastewater treatment plant for wastewater discharges was available, would have an opportunity for burden reduction that would not be available to a facility with even cleaner storm water that happened to have storm water discharges covered in a previous permit and could not eliminate their wastewater discharges. There could be cases were a smaller and "cleaner" facility would not be able to take advantage of the savings (e.g., individual permit application sampling is not required) the MSGP offered their competitors simply because they had a minor wastewater discharge that could not be eliminated.

While the main purpose of the proposed Part 1.2.3.3.2.1 restriction was to discourage dual permits at a facility, there are already many facilities that have permit coverage split between an individual permit and the MSGP and dual permit coverage would still be available in many cases anyway. Currently, some of these "dual permit" facilities have only wastewater under an individual permit and all their storm water discharges under the MSGP, while at others, the individual wastewater permit includes some of the storm water discharges, with the remaining storm water discharges covered by the MSGP. This ability to have split coverage in at least some situations is necessary to address situations where at least interim coverage under a general permit for a new storm water discharge is necessary or desirable from either the permittee's or the permitting authority's standpoint.

EPA has determined that the proposed restrictions in Part 1.2.3.3.2 relating to discharges for which a water quality-based limit had been developed and discharges at a facility for which a permit had been (or was in the process of being) either denied or revoked by the permitting authority were necessary to address the anti-backsliding requirements of the Clean Water Act or to ensure that discharges from a facility requiring the additional scrutiny of an individual permit application were not inadvertently allowed under the general permit. In any event, only those storm water discharges under the previous permit that met all other eligibility conditions of the MSGP could even be considered for transfer.

EPA periodically promulgates new effluent limitation guidelines, some of which, such as the those for landfills published February 2, 2000, contain storm water effluent limitation guidelines. Under Part 1.2.2.1.3 of the MSGP, a storm water discharge subject to a promulgated effluent limitation guideline is only eligible for coverage if that guideline is listed in Table 1–2. A new guideline promulgated during the term of the permit would thus alter the eligibility for the permit not only for new dischargers, but also for discharges already covered by the permit. In order to avoid the situation where a discharge would suddenly become ineligible upon promulgation of a new guideline, Part 1.2.2.1.3 has been modified to allow interim coverage under the permit where a storm water effluent guideline has been promulgated after the effective date of the permit, but the permit has not yet been modified to include the new guideline. This will allow continued coverage until the new storm water guideline could be added to the permit. Where the new guideline includes new source performance standards, "new sources" would need to comply with Part 1.2.4 prior to seeking permit coverage.

Section 1.4 Terminating Coverage

Comment: (Comment also addresses Section 11.1 Transfer of Permit Coverage) Several commenters viewed the submittal of an NOT by the old operator and the submittal of an NOI by the new operator in order to transfer permit coverage after a change in ownership as a new and overly burdensome requirement (Parts 1.4 and 11.1). An alternative suggested was a simple notice to the permit file of the ownership change.

Response: EPA has determined that the most effective method for accommodating and tracking a change in the owner/operator at a facility covered by the general permit is to have the old operator submit a Notice of Termination certifying that they are no longer the operator of the facility, and for the new operator to submit a Notice of Intent certifying their desire and eligibility to be covered by the general permit. In fact, this is not a new

R0019818

requirement since the same process was required under the 1995 MSGP (see Part II.A.4 and Part XI.A at 60 FR 51113 and 51122, respectively). The only "new" aspect of the process is the 30 day timeframe for submittal of the NOT by the old operator and a clarification that simple name changes in a particular company (e.g., Jones Industrial Manufacturing, Co. changing to JIMCO) can be made with a simple update to the company's NOI and a NOT would not be required. Submittal of the NOT by the old operator documents that the old operator believes he no longer needs coverage under the MSGP for any storm water discharges. In addition, EPA is more able to maintain a cleaner database of facilities actually covered by the permit both currently and in the past. The NOI/NOT process for transfers under the general permit is thus essentially a streamlined parallel process to what would otherwise be required under 40 CFR 122.61.

The permit transfer procedures at 40 CFR 122.61 are designed to avoid the time delays and resource burdens associated with issuance of a new permit for a facility just because there is a new owner/operator. Under this process, transfer of the permit to the new owner/operator cannot be made without an actual permit modification (a lengthy process especially for general permits), unless the old operator submits a thirty day advance notice and a written agreement between the parties containing a specific date for transfer of permit responsibility, coverage, and liability between them.

The nature of a general permit is such that there is no actual permit issued to any individual facility, but rather that multiple dischargers are in effect "registering" their intent to use the discharge authority offered by the general permit to anyone who is eligible. This "registration" is accomplished by an operator's submittal of the Notice of Intent to be covered by the general permit as little as two days before they need permit coverage. In fact, regulations at 40 CFR 122.28(b)(2) specifically require submittal of an NOI in order for an operator to be authorized under a general permit for discharges of storm water associated with industrial activity. EPA thus views the requirements for the new operator to file an NOI as little as two days prior to the transfer and for the old operator to file an NOT within thirty days after the transfer to be less burdensome than the thirty day advance notice and written agreements that would otherwise be required under the permit transfer requirements of 40 CFR 122.61.

Section 1.5 Conditional Exclusion for No Exposure

Comment: EPA should insert the No Exposure Certification form and guidance within the permit since many facility operators are unaware of its existence.

Response: EPA has generated a document, "Guidance Manual for Conditional Exclusion from Storm Water Permitting Based on "No Exposure" of Industrial Activities to Storm Water," and a separate no exposure announcement to help operators understand and apply for the conditional permitting exclusion. The guidance is available in hard copy from EPA's Water Resource Center. In addition, EPA also sent a mass mailing alerting all EPA permittees as well as stakeholder groups to the MSGP–2000 and the no exposure exclusion. To provide the No Exposure Certification in as many possible places, EPA is publishing the form and instructions as an addendum to the MSGP–2000.

Section 2.1 Notice of Intent (NOI) Deadlines

Comment: Commenters requested an extension of the 90 day timeframe for submission of their NOI to 270 days. Commenters said they needed the additional time to complete their Storm Water Pollution Prevention Plan (SWPPP), application for an alternate permit, or their endangered species consultation or adverse impact investigation. A commenter also requested clarification of coverage during the 90 days between this publication and their submission of their NOI.

Response: The fact sheet clarifies that SWPPPs are to be prepared at the time the NOI is submitted. Since most permittees are already covered under the current MSGP and have a requirement to update their SWPPP as the need arises, there is no basis for an automatic extension to 270 days. However, facilities may seek an extension up to 270 days to develop their SWPPP, or to obtain an alternate permit, on a case-by-case basis. Similarly, facilities can request an extension up to 270 days if they need to conduct an endangered species consultation or adverse impact investigation. Permittees covered under the current MSGP will continue to be covered during the next 90 days as long as they meet the conditions set forth in the 1995 MSGP.

Section 2.2 Contents of Notice of Intent (NOI)

Comment a: Clarify how to complete the NOI form in situations where an MS4 has industrial activities and is conveying the pollutants to its own storm drainage system.

Response a: The intent of Section 2.2.2.5 was to identify the municipal separate storm sewer system under the assumption that it would be under different ownership. If there is not a separate owner, this requirement is unnecessary. This section has been revised to clarify "the name of the municipal operator if the discharge is through a municipal separate storm sewer system under separate ownership."

Comment b: A commenter questioned whether EPA was requiring or encouraging permittees to consult FWS and NMFS in making its endangered species finding.

Response b: The facility is responsible for obtaining the threatened or endangered species list to make sure that listed specie or critical habitat is not located in or around the vicinity of your facility. That list may be obtained by phoning or mailing the FWS or NMFS, visiting EPA's website, or by some other means. Thus, the permittee is not required to contact the two agencies if he can meet his obligation in another manner.

Comment c: Do not include latitude/longitude information on the NOI.

Response c: EPA requires all regulated facilities to submit latitude and longitude information. The information is critical in overseeing compliance with endangered species assessments and coordinating compliance assistance and enforcement activities across media programs.

Section 2.3 Use of NOI Form

Comment a: Do not add check boxes related to NHPA and ESA compliance.

Response a: EPA believes the additional information improves the Agency's ability to oversee implementation of the permit and compliance with ESA and NHPA requirements. Because the permittee is already responsible for conducting the analysis, there is minimal additional burden associated with indicating on the NOI form how the analysis was conducted. Therefore, EPA intends to retain this requirement. The NOI form requires review by the Office of Management and Budget. Until the new form is approved, permittees should use the current form. EPA's ability to issue today's permit is contingent upon its compliance with ESA and NHPA; thus, provisions related to those statutes is part and parcel of today's permitting action.

Comment b: Commenters supported EPA's proposal to allow facilities to

R0019819

submit NOIs, notices of termination, and discharge monitoring reports electronically. However, they cautioned that EPA continue to allow hard copy filing since not all permittees have internet access.

Response b: The final permit retains the requirement of paper filing for NOIs, NOTs, and DMRs. While EPA believes that electronic filing will be incorporated as an option in the future, it is currently not available.

Section 3.3 Compliance with Water Quality Standards

NPDES regulations at 40 CFR 122.44(d)(1)(i) require that the MSGP ensure compliance with State water quality standards for all discharges which "will cause, have the reasonable potential to cause, or contribute" to an exceedance of a State standard. With the wide variety of facilities to be permitted under the MSGP, EPA believes that reasonable potential to cause or contribute to exceedances of water quality standards is likely to exist at least for some facilities. Therefore the MSGP must include appropriate provisions to ensure compliance with State standards. For general permits, EPA's guidance document entitled "General Permit Program Guidance" (February, 1988) suggests an overall narrative statement requiring compliance with State standards to address the fact that the permit will cover a wide variety of facilities subject to different standards depending on their location. Part 3.3 of the proposed MSGP included a narrative statement in accordance with this guidance to ensure compliance with 40 CFR 122.44(d)(1)(i). Part 1.2.3.5 of the proposed MSGP also included an exclusion from permit coverage for facilities which EPA has determined may cause or contribute to violations of State standards. Commenters raised a number of concerns regarding the provisions of the proposed MSGP related to compliance with State standards. However, after review of the comments, EPA believes that the provisions of the proposed MSGP were appropriate and these provisions have been retained in the final MSGP. Following below are EPA responses to the specific issues raised by the commenters:

Lack of Coverage for Facilities With Reasonable Potential

Comment a: A commenter was puzzled by the exclusion from coverage in Part 1.2.3.5 of the proposed MSGP and requested additional explanation.

Response a: EPA believes that facilities which are shown to cause, or have the reasonable potential to cause or contribute to exceedances of State standards may be more appropriately permitted under individual permits or a separate general permit with alternate permit requirements designed to ensure compliance with State standards. This is the basis for the exclusion. Part 1.2.3.5 also provides, however, that MSGP coverage may be available if the control measures in the storm water pollution prevention plan (SWPPP) are sufficient to ensure compliance with State standards.

Comment b: Part 1.2.3.5 of the proposed MSGP could prove burdensome and could lead to permit backlogs depending on the extent of its use.

Response b: Given the large number of facilities covered by the MSGP, it is not practical for EPA to individually review the status of all facilities covered by the MSGP prior to submittal of the NOI. EPA has developed eligibility criteria for coverage under the MSGP–2000 which should, if applied appropriately by the facility operator, screen out facilities which have "reasonable potential" to exceed a state standard. In addition, where EPA determines there is a "reasonable potential," the Director will require the facility to submit an individual permit or take other appropriate action.

Comment c: MSGP coverage should not be allowed until the absence of reasonable potential had been demonstrated by the discharger.

Response c: As noted above, EPA does not believe this is practical for all facilities given the large number of dischargers covered by the permit. Moreover, as discussed in EPA's "Interim Permitting Policy for Water Quality-Based Effluent Limitations in Storm Water Permits" (61 FR 43761, November 26, 1996), there will likely be circumstances where inadequate information is available to perform the reasonable potential analysis.

Are Discharges with Reasonable Potential a Permit Violation?

Comment d: Several commenters objected to Part 3.3 of the proposed MSGP which indicated that discharges which have occurred would be violations of the MSGP if they are later shown to have the reasonable potential to cause or contribute to exceedances of State standards.

Response d: EPA believes that such discharges are appropriately characterized by the MSGP as violations. The narrative statement in the MSGP requiring compliance with water quality standards in effect incorporates into the permit all numeric effluent limitations which are necessary to ensure compliance with State standards. When a discharge is shown to have reasonable potential, this implies that discharges are occurring which would exceed the permit limits needed to ensure compliance with State standards. Since the narrative statement incorporates all limits needed to ensure compliance with State standards, the discharges are appropriately characterized as violations of the permit.

Process for Terminating Coverage Under the MSGP

Comment e: Several commenters expressed concern regarding the process for terminating coverage under the MSGP and ensuring due process for dischargers to contest such actions by EPA.

Response e: EPA believes that the MSGP does ensure due process for dischargers. Part 9.12 of the MSGP provides that EPA may require an individual permit application from a discharger, or require the discharger to seek coverage under an alternate general permit. If an individual permit application were required, a draft permit would be prepared and a full opportunity would be provided to the discharger in accordance with 40 CFR Part 124 to comment on the draft permit and contest any final determination. Further, any alternate general permit would provide (in accordance with 40 CFR 122.28(b)(3)(iii)) that the discharger could seek coverage under an individual permit rather than the alternate general permit. Such a request would also be processed in accordance with the procedures at 40 CFR Part 124.

Comment f: A number of commenters also asked whether a notice of violation of Part 3.3 of the MSGP for violations of State water quality standards would be in writing.

Response f: Dischargers would be notified in writing by EPA of any violation of Part 3.3.

Permit as a Shield Concerns

Comment g: Section 402(k) of the Clean Water Act shields permittees from the requirements of Part 3.3 of the MSGP to comply with water quality standards.

Response g: EPA disagrees with the commenters on this matter. Section 402(k) provides that compliance with an NPDES permit is considered to be compliance, for purposes of section 309 and 505 enforcement, with sections 301, 302, 306, 307 and 403 of the Clean Water Act. However, the violations which are envisioned by Part 3.3 of the MSGP would be violations of an NPDES permit itself, *i.e.*, the water quality-based effluent limitations which are incorporated into the MSGP by virtue of the narrative statement. Section 402(k) does not provide a shield for such violations.

Concerns about Applying State Water Quality Standards to Storm Water

Comment h: Water quality standards cannot apply to storm water discharges since special wet weather standards have not been developed to address episodic events.

Response h: EPA disagrees that State water quality standards cannot apply in the absence of special wet weather standards. Section 402(p)(3)(A) of the Clean Water Act specifically requires that industrial storm water dischargers comply with State water quality standards. EPA has recognized, however, the difficulties in developing appropriate water quality-based effluent limitations for storm water discharges. In response to concerns such as those raised by the commenter, EPA has developed an "Interim Permitting Policy for Water Quality-Based Effluent Limitations in Storm Water Permits' (61 FR 43761, November 26, 1996). Where numeric water quality-based effluent limitations are infeasible (due for example to inadequate information on which to base the limitations), best management practices (BMPs) such as those in the SWPPP would serve as the water quality-based effluent limitations.

Comment i: Clarify whether mixing zones would apply to the storm water discharges.

Response i: Mixing zones would apply to the extent that State water quality standards provide for their use.

Required Actions if Violations of Standards Occur

Comment j: A commenter was unclear concerning the modifications of the SWPPP that would be required by Part 3.3 of the MSGP if violations of State water quality standards occur.

Response j: The SWPPP must be modified to include additional BMPs to the extent necessary to prevent future violations.

Comment k: Clarify who would determine the additional control measures that would be required by Part 3.3 of the MSGP.

Response k: The discharger would at least initially be responsible for determining the additional control measures. However, Part 4.10 of the MSGP also provides that EPA may require modifications of the SWPPP if it proves to be inadequate.

Can a Reasonable Potential Analysis Occur at Any Time During the Permit Term?

Comment l: Part 3.3 of the MSGP should not require a reasonable potential analysis at any time during the term of the permit.

Response l: The information to support a reasonable potential determination would be based on additional information that becomes available concerning a particular discharge (from monitoring results, for example). As such, the permit appropriately provides that a reasonable potential analysis (possibly leading to an individual permit or separate general permit) may be required at such a time.

Comment m: Discharges of a pollutant which increase during the term of the permit should not be considered a permit violation.

Response m: EPA disagrees with the commenter on this issue. The narrative statement in Part 3.3 of the MSGP requires that dischargers comply with all State water quality standards throughout the term of the permit. Dischargers must ensure that, if there are increases in the discharges of a particular pollutant, the increases are not sufficient to cause or contribute to exceedances of water quality standards.

Questions Regarding the Benchmark Concentrations

Comment n: Part 3.3 of the proposed MSGP would undermine EPA's use of the benchmark values in the MSGP.

Response n: EPA disagrees with the commenters in this regard. The benchmark values are concentrations which are used to evaluate whether a generally effective SWPPP is being implemented. The SWPPP is required to ensure compliance with the technology-based discharge requirements of the Clean Water Act. Exceedance of a benchmark value is not a permit violation. However, if a permittee complies with the benchmarks, the permittee is eligible for the monitoring waiver in year 4 of the term of the permit and this provides an incentive to implement an effective SWPPP. Part 3.3 of the MSGP is required to ensure compliance with the water quality-based requirements of the Clean Water Act, which are in addition to the technology-based requirements. Part 3.3 of the MSGP does not undermine the benchmarks. Part 3.3 is simply a separate requirement of the Clean Water Act which must be included in the permit in addition to the technology-based requirements.

General Comment on Water Quality Standards Requirements

Comment o: One commenter lodged a general objection to Part 3.3 of the proposed MSGP, but did not elaborate on specific concerns.

Response o: As discussed above, EPA believes that Part 3.3 is appropriate and necessary to ensure compliance with State water quality standards. As such, Part 3.3 was retained in the final MSGP.

Section 4.1 Storm Water Pollution Prevention Plan (SWPPP) Requirements

Comment a: EPA should not measure progress solely on the number of BMPs applied.

Response a: As stated, EPA's intention in requiring the comprehensive site compliance evaluation is to determine the effectiveness of BMPs in use at the site, and to assess compliance with the terms and conditions of the permit. Additional new BMPs are not prescribed as part of this requirement; the options to include BMPs to replace those which are not working appropriately, or to augment existing BMPs to ensure better performance, rests solely with the facility operator, based on the findings of the compliance evaluation.

Comment b: Clarify the frequency of training required.

Response b: Some industrial sectors covered by this permit are required to provide training at least once per year. In other sectors, it is left to the discretion of the operator. EPA's fact sheet recommends that facilities conduct employee training annually at a minimum, and acknowledges that, for some facilities, a more frequent training schedule may be appropriate to ensure that personnel at all levels of responsibility are informed of the components and goals of the site's SWPPP.

Comment c: Clarify the term "locally available."

Response c: EPA intends the term "locally available" to mean a facility office which need not actually be located on-site, but co-located with other facility operations. It is not necessary for a permittee to maintain a local presence near an unstaffed site for the purposes of maintaining availability of the SWPPP.

Comment d: Fourteen days is an unrealistic timeframe for modifying a SWPPP in response to a discharge of a reportable quantity of oil.

Response d: EPA does not consider the requirement to revise the SWPPP within 14 days after a discharge of a reportable quantity of oil to be unrealistic. Changes to accommodate a description of the release, date and circumstances of the release, as well as a description of the actions taken to address the problem and any necessary changes to the BMPs to prevent future releases are inherently necessary to prevent water quality degradation.

Comment e: It is standard practice to keep a copy of their SWPPPs with their permit and, therefore, there is no objection to this requirement.

Response e: EPA acknowledges that many industrial facilities already keep a copy of the storm water permit with their SWPPP, and the Agency is formalizing that practice as a requirement of the permit for all facilities.

Section 4.2 Contents of Plan

Comment a: A commenter believed EPA was requiring velocity dissipation devices to minimize erosion due to flow velocity.

Response a: EPA's intention is to require facilities to evaluate the need for velocity dissipation devices where it is necessary to minimize erosion due to flow velocity. Facilities should use their best judgment when considering if velocity dissipation devices are needed. The language in the permit has been clarified.

Comment b: Specify a set of minimum management practices for coverage under the permit.

Response b: Due to the variety of industries covered by the Multi-Sector General Permit, there is no "minimum" list of best management practices that would suitably address the multiple situations found at different industrial sites. EPA considers it sufficient to outline minimum criteria that each facility operator must consider to minimize discharges from their property, and allow facility operators to identify and implement BMPs that are appropriate for their site.

Comment c: Do not require the SWPPP to identify oil spills or leaks below reportable quantities. Only those sites that have not been cleaned up to appropriate levels should be included in the site description and shown on the site map.

Comment d: EPA has not changed the basic intent of this permit requirement: a facility must keep a record of significant spills or leaks of both hazardous substances or oil and, for releases in excess of reportable quantities under 40 CFR Parts 117 or 302, revise its pollution prevention plan as necessary to prevent the reoccurrence of such releases. A spill or leak may not meet the threshold of a "reportable quantity" but may still be sufficiently significant to cause water quality impairment, and therefore should be acknowledged and mitigated by the permittee. EPA does not intend that "reportable quantity" defines the minimum amount of a substance which should be appropriately managed. In regards to including previous spill and/or leak areas in the site map and associated descriptions, the Agency views the inclusion of all areas where spills have occurred over the last three years from the date of NOI submittal as important information which may be useful in assessing future risks.

Comment d: The provision prohibiting discharge of "solid materials" is too broad and should be eliminated.

Response d: EPA intends the reference to "solid materials, including floating debris" and "Off-site tracking of raw, final, or waste materials or sediment, and the generation of dust" as having the generally accepted plain language meanings, and that facility operators should use their best professional judgment in applying this requirement to their discharge. The reference is not necessarily meant to apply in particular to suspended soil. EPA has purposefully allowed for reasonable flexibility in allowing each facility to determine whether "solid materials," "floating debris" and/or "dust" are a component of their storm water discharge. The Agency acknowledges that many areas have state or local ordinances prohibiting the off-site tracking and generation of dust; therefore, this requirement does not pose a hardship on facility operators. While not prohibiting the discharge of waters containing soils, the permit still requires that discharges must comply with state/local water quality standards.

Comment e: The requirement for "routine inspections" and "records of inspections" are too broad.

Response e: EPA acknowledges that most industrial facilities conduct regular inspections of plant conditions. As discussed in Part 4.2.7.1.5 of the permit, facility operators must explicitly outline in the SWPPP the frequency of regular inspections at their facility which will incorporate inspections of industrial activities or materials that are exposed to storm water. Records of these specific storm water inspections, along with records of any followup actions taken as a result of these inspections, must be kept with the SWPPP. This facility-specific schedule of periodic inspections is what EPA is referring to as "routine facility inspections."

Comment f: An evaluation of groundwater impacts or concerns is beyond the scope of a stormwater pollution prevention plan.

Response f: In some cases, groundwater beneath a facility may be hydrologically connected to surface waters. EPA's intent for including an evaluation of impacts to groundwater when considering appropriate BMPs is to ensure that facility operators are fully cognizant of the hydrology of their area, and have evaluated any appropriate BMPs in the event that such a situation exists for their property. If there are no possible impacts to groundwater, this fact should be acknowledged in the SWPPP.

Section 4.4 Non-Storm Water Discharges

Comment a: Include swimming pool discharges as an allowable storm water discharge.

Response a: EPA does not include swimming pool discharge as an allowable non-storm water discharge in the Multi-Sector General Permit, as this is a general permit to cover storm water discharges from industrial activity. The Agency is unclear as to how many industrial facilities have swimming pools that would necessitate this specific exemption. The inclusion of nonchlorinated swimming pool discharges as an allowable non-storm water discharge will be better suited to the upcoming EPA Small Multiple Separate Storm Sewer General Permit, which will be available by December 2002.

Comment b: The permit should allow for case-by-case determinations for inclusion of de minimus non stormwater sources.

Response b: By its very nature, a general permit is meant to cover many similar discharges from a variety of similar sources. Case-by-case determinations for de minimus non-stormwater discharges would be extremely time-intensive, and it is not possible to provide for such individual determinations in the context of a general permit. Specific examples of de minimus discharges were not provided by the commenter; therefore, the Agency is not inclined to include such a provision at this time.

Comment c: Delete "drinking fountain water:" from Section 1.2.2.2.3 and cite only "potable water including water line flushings."

Response c: EPA agrees with the issues presented by the commenter, and that the term "drinking fountain water," in itself, is imprecise. Both the draft MSGP fact sheet and permit specifically authorize potable water as an allowable non-storm water discharge. The "drinking fountain water" language has been deleted.

Section 4.7 Copy of Permit Requirements

Comment: Recommend electronic website access in lieu of paper copy of permit.

Response: The new requirement that a hard copy of the Multi-Sector General Permit be kept with a facility's Storm Water Pollution Prevention Plan is intended to ensure that the permit requirements are easily and readily available to all facility staff who are or may be responsible for implementing the provisions of the permit. Internet access may not be available to staff in all situations; therefore, for ease of reference, EPA is requiring that at least one copy of the permit be retained along with the SWPPP. The sections referring to EPA's acceptance of the electronic medium is contingent, in both cases cited by the commenter, upon the future viability of electronic submittal of NOIs and DMRs to the Agency.

Section 4.9 Timeline

Comment a: The fact sheet and permit need to provide consistent timeframes for SWPPP revisions.

Response a: The fact sheet and permit language were consistent on revising the SWPPP within 14 days of the site evaluation, but were somewhat confusing on how long the permittee had to implement the revisions. To clarify this time period, EPA has revised Part 4.9.3 of the permit to state: "If existing BMPs need to be modified or if additional BMPs are necessary, implementation must be completed before the next anticipated storm event, or not more than 12 weeks after completion of the comprehensive site evaluation."

Comment b: Thirty days to correct deficiencies in the SWPPP following notification by the Director is insufficient.

Response b: EPA intends for corrections to the Storm Water Pollution Prevention Plan to be accomplished in a timely manner, particularly when deficiencies are identified formally by the Director. The Agency feels that thirty days, as outlined in the existing permit language, is a reasonable amount of time for such changes to be made; if revisions are significant, the permittee may request, and the Director can provide, additional time for revisions to be accomplished.

Comment c: Fourteen days to modify a SWPPP is insufficient.

Response c: The Agency feels that revising the Storm Water Pollution Prevention Plan appropriately to address deficiencies within 14 days is a reasonable timeframe in which to address changes administratively; additional time is provided to actually put those revisions into place.

Comment d: The SWPPP must be completed and in place prior to issuance of the permit.

Response d: Part 4.1 of the permit states that a SWPPP must be prepared for the facility before submitting a Notice of Intent for permit coverage. EPA's issuance of the MSGP–2000 does not automatically confer coverage to permittees; therefore, EPA feels the requirement that a site-specific SWPPP be in place for the facility operations prior to seeking coverage by way of the submittal of a NOI is sufficient to prevent environmental degradation.

Section 4.12 Additional Requirement: EPCRA Section 313 Reporting

Comment: Many commenters supported removal of EPCRA Section 313 reporting requirements from the permit. Two commenters objected to identifying areas with pollutants that must be reported under EPCRA Section 313 and to develop appropriate storm water controls for these areas.

Response: EPA acknowledges the general support for revisions to this section. The intent of these modifications is to eliminate the redundant requirements of the existing MSGP for permittees subject to reporting requirements under Section 313 of EPCRA, which includes the 20+ categories of Toxic Release Inventory chemicals. The Agency believes that the MSGP–2000 places no additional burden on facility operators with TRI chemicals. Identification of EPCRA 313 chemicals in the SWPPP acknowledges that these chemicals are pollutants of concern. Facilities with any of these pollutants need to develop appropriate storm water controls to contain them. As noted in the fact sheet, EPA believes these concerns have been addressed through existing state and federal requirements which can be referenced in the SWPPP.

Section 4.13 Public Availability for Review

Comment a: The public should be able to obtain access to and comment upon a SWPPP and "no exposure" claim before they are finalized.

Response a: EPA has, in response to this comment, included a provision in the final permit requiring facility operators to make a hard copy of their SWPPP available to the public when requested in writing. EPA believes this requirement is an acceptable compromise between the facility operator's concerns about having members of the public at their site and the need of the public to understand potential impacts on their environment. EPA does not receive SWPPPs routinely, and, therefore, cannot make them available at its offices or provide them to local government offices. As with the previous MSGP, members of the public have the option of contacting the NOI Center or the Regional EPA Storm Water Coordinators directly to inquire about a facility's permit status.

EPA does not intend to require public comment on SWPPPs, nor require public hearings, because SWPPPs are intended to be modified as necessary to address changes at the facility or when periodic inspections indicate that a portion of the SWPPP is proving to be ineffective. Requirements for public comment and public hearings would delay needed modifications to, not to mention development of, the SWPPP, be burdensome and serve as disincentives to plan updates.

At any time the Agency can conclude that a facility is no longer eligible for coverage under a general permit and require the facility to apply for a general permit. In that event, there would be significant opportunity for public input in the decision-making process.

Comment b: The following should be available in paper copy and on the web: NOI, SWPPP, and "no exposure" certification.

Response b: EPA has found that having a central location for processing NOIs is an efficient and effective way of managing the tremendous amount of data which the Storm Water program generates. Very shortly, members of the public will be able to access information from the NOI database online. The NOI database contains facility information, including the type of industrial activity taking place, facility contact information, and receiving water body information. Also available online will be information on facilities that have submitted "no exposure certifications." Regarding SWPPPs, EPA does not receive them routinely and, therefore, cannot make them available on-line. EPA has, in response to this comment, included a provision in the final permit requiring facility operators to make a hard copy of their SWPPP available to the public when requested in writing. EPA believes this requirement is an acceptable compromise between the facility operator's concerns about having members of the public at their site and the need of the public to understand potential impacts on their environment.

R0019823

Section 5.1 Types of Monitoring Requirements and Limitations

Comment a: A commenter requested language clarification for the first paragraph under Part 5.1, Quarterly Visual Monitoring.

Response a: Quarterly visual monitoring is required for all permittees covered under the MSGP. The visual inspection must cover all outfalls at the facility from which there are storm water discharges associated with industrial activity.

Comment b: A commenter indicated that Part 5.1.1.4 was clear regarding the visual monitoring waiver for inactive and unstaffed sites. However, it was unclear if a similar waiver for benchmark monitoring applies to inactive and unstaffed sites.

Response b: EPA has clarified in Part 5 that a permittee may exercise a waiver for benchmark monitoring at unstaffed and inactive sites.

Section 5.3 General Monitoring Waivers

Comment a: Commenters supported the adverse sampling condition waiver, as long as the permittee doubles sampling during the next event or eliminates the substitute sampling requirement for areas with extended frozen conditions.

Response a: EPA has decided to keep this temporary waiver, since the main purpose of this specific waiver is to allow the permittees the opportunity to take samples under no adverse nor threatening weather conditions.

Comment b: Allow permittees to waive benchmark monitoring in years 2 and 4 of the MSGP–2000 with the result of the 1995–MSGP; waive difficult logistical conditions or location access similar to those for unstaffed/inactive facilities; and impractical sample collection at large facilities.

Response b: Under Section 402 of the CWA, EPA is required to issue permits which apply and ensure compliance with any applicable requirements of sections 301, 302, 306, 307, and 403. Since these permits are issued with fixed terms not exceeding five (5) years, EPA needs to ensure that permittees continue to comply with applicable requirements. EPA believes that benchmark monitoring is not overly burdensome and provides useful information to the permittee and the Agency. Therefore, EPA will require permittees covered under the reissued MSGP to ensure continued compliance with permit conditions and requirements. In addition, EPA has determined that the general monitoring waivers provided in the previous permit are adequate, and that additional waivers are not needed. With regard to problems facilities encounter when monitoring their storm water discharges, such as difficult logistical conditions, access to discharge locations or impractical sample collection at large facilities, EPA recommends permittees review the "NPDES Storm Water Sampling Guidance Document" which suggest solutions to these sampling problems.

Section 6.E Sector E—Glass, Clay, Cement, Concrete and Gypsum Products

Comment a: Separate the concrete pipe manufacturing from the cement, ready mixed and concrete block manufacturing sector.

Response a: Based on the characterization of the concrete pipe manufacturing industry and the cement, ready mixed and concrete block manufacturing industry, EPA has determined that the two industries are similar and, thus, has retained the industrial sectors as described in the 1995 permit.

Comment b: Section 6.E.3.1 of the draft permit was not reflective of the September 30, 1998 modification.

Response b: The commenter is correct. The final permit has been changed to reflect the September 30, 1998 modification which removed the limitations of coverage for various industries. Paragraph 6.E.3 has been removed and the remaining paragraphs have been renumbered accordingly.

Section 6.F Sector F—Primary Metals

Comment a: Do not propose any new BMPs for the steel industry in the MSGP–2000.

Response a: Similarly to the 1995 MSGP, the MSGP–2000 prefers the implementation of structural and non-structural BMPs for stormwater management from Primary Metals facilities. It is up to the individual operators to decide which BMPs most effectively meet their needs. This does not preclude the use of additional or new technologies should they be found to be more effective in any given application.

Comment b: The BMPs provided at Parts 6.F.3.2 and 6.F.3.3 omit the most obvious qualifier, which is that inventories of exposed material and housekeeping should be mandated by the MSGP only where the exposed materials have a potential to contact storm water that is discharged from a point source to a water of the United States. In many cases, the types of materials and activities discussed in the above referenced parts occur in areas where precipitation is collected and contained, and is not discharged. Thus, site inventories and BAT practices discussed in these parts are not relevant except in areas where they affect storm water discharges authorized by the MSGP. Parts 6.F.3.2 and 6.F.3.3 should be clarified (similarly to Part 6.F.3.1) with a statement that these activities are required only in areas where such activities could result in a discharge of pollutants to waters of the United States.

Response b: One of the underlying premises of the MSGP is that if there is a potential for contact between storm water and environmental contaminants, then the facility should apply for coverage under the MSGP. If there is no potential for contact, the facility may be able to submit a "no exposure" certification form, and not be required to obtain permit coverage. Where there is a potential for contact between storm water and industrial activities and/or materials, then the operator needs to obtain permit coverage and take appropriate measures to mitigate the discharge of pollutants.

Comment c: Part 6.F.3.4 includes a requirement for inspections performed under the 2000–MSGP to, among other things, evaluate air pollution control equipment. This activity does not belong under the MSGP. It is a Clean Air Act requirement and an activity performed under each facility's Clean Air Act permit. Such inspections under the MSGP are redundant, inappropriate and extend EPA's CWA authority into the CAA. Inspections of air pollution control equipment should not be a component of any SWPPP or compliance certification under the CWA.

Response c: EPA understands why inspection requirements which routinely fall under the purview of one environmental program (in this case the Air Program) would appear inappropriate under another environmental program (in this case the Water Program). However, if one looks at the potential sources of pollution at primary metals facilities, one will soon discover that one of the principal sources of contamination is from the air pollution control devices. The purpose of the storm water regulations is to keep storm water from coming into contact with any contaminants, regardless of the environmental media from which it arose. If inspections are routinely conducted at a facility pursuant to one environmental statute, that same inspection will generally be accepted by another program. For example, if the facility routinely inspects its air pollution control devices as a requirement of its CAA permit, that

R0019824

same inspection, with the possibility of a few additional observations, *e.g.*, to see if there is any evidence of run off, should also be accepted as part of the SWPPP. The SWPPP can cross reference inspection protocols for the CAA permit. Thus, EPA does not agree with the commenter that these requirements are either redundant, inappropriate or extend EPA authority.

Section 6.G. Sector G —Metal Mining (Ore Mining and Dressing)

Comment a: Include Table G–4, published in the August 7, 1998 modifications, in MSGP–2000. Also, table titles in this section are confusing since they appear to imply that effluent guideline limitations apply to waste rock and overburden piles.

Response a: We have included the revised table G–4 from the August 7, 1998 modification in the fact sheet for today's permit. The titles of tables G–1 and G–2 are consistent with the titles in the other sectors of the final permit. All monitoring tables in Part 6 of the permit are titled "SECTOR–SPECIFIC NUMERIC LIMITATIONS AND BENCHMARK MONITORING." The Agency doesn't not believe that this title is misleading because each table contains a column labeled "Numeric Limitation" which either contains a numerical value or is blank. For those Sectors where there are no values listed in the numeric limitation column it is clear that numeric limitations do not apply. EPA recognizes that benchmark concentrations are not effluent limitations and is provided specific language in the permit to that effect.

Comment b: The commenter opposes EPA's disallowance of sampling waivers from monitoring requirements for waste rock and overburden piles. Another commenter argued that another waiver based on "not present or no exposure" had also been deleted. A third commenter noted that monitoring requirements were also inconsistent with the 1998 permit modifications.

Response b: The restriction on sampling waivers was not intended to exclude the "Adverse Climatic Conditions Waiver" in Part 5.3.1 of the permit. The final permit has been revised to correct this error. Also, Part 6.G.7.2 has been modified to reflect that the monitoring requirements only apply to discharges from active ore mining and dressing facilities and that these requirements remain unchanged from the 1998 permit modification. The second waiver in Part 5.3 which is based on "not present or no exposure" was not part of the August 1998 notice, and was not intended for sector G facilities.

Comment c: The limitation on coverage for adit drainage and contaminated springs or seeps should be modified to exclude only those that do not result from precipitation events. The proposed Certification of Discharge language is confusing since it implies an obligation for testing or evaluation of mining-related discharges that are composed entirely of non-storm water covered by an NPDES permit.

Response c: Adit drainage and contaminated springs and seeps are discharges that originate below the surface of the ground. Often they discharge during dry periods and, while in some instances these flows may increase in response to a storm event, they may continue to flow well after the precipitation has ended. Therefore, EPA has determined that the restriction (*i.e.*, prohibition) for MSGP coverage of discharges from adit drainage, contaminated springs and seeps should remain as proposed.

The "Certification of Discharge Testing" language has been modified to clarify that certification must be provided to show that any mining-related discharge has been "tested or evaluated for the presence of non-storm water discharges." Additional wording has been added to Part 6.G.6.1.6.6 to make it consistent with the language in the 1995 MSGP.

Comment d: Provide guidance in Section 6.G.6.1.6.6 on what type of test should be performed.

Response d: The language has been modified to allow for a certification based on "tested or evaluated" information. Additional wording has been added to Part 6.G.6.1.6.6 to make it consistent with the language in the 1995 MSGP.

Comment e: The definition of "reclamation phase" is inconsistent with most state programs.

Response e: The definition of the three general phases of mining was taken from the fact sheet to the 1995 MSGP. The intent was to recognize that "mining" is comprised of several distinct activities, not to set a standard for each phase. EPA acknowledges that reclamation requirements are typically set by state programs, and therefore the permit language defining the reclamation phase has been modified to reflect other post-mining land uses.

Comment f: In reformatting the permit language, EPA introduced new requirements which are inconsistent with the settlement EPA reached with NMA in 1998.

Response f: The draft MSGP–2000 intended to incorporate all the requirements from the 1998 notice resulting from the settlement with NMA. However, in making the changes and converting to a more "readable" format some unintended errors occurred. The revisions to the monitoring requirements have been made so the final permit language is consistent with the 1998 **Federal Register** publication (63 FR 42534, Aug 7, 1998).

Comment g: Delete the phrase "directly or indirectly" from coverage of "storm water discharges that have come into contact (directly or indirectly) with any overburden, raw material, intermediate product* * *" since it is inconsistent with prior versions of the permit.

Response g: The storm water regulations (Section 122.25(b)(14)(iii)) require permit coverage for "facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products* * *" When revisions were made to the draft MSGP 2000 language to make the permit more "readable," some of the words were changed. In order to be consistent with the storm water regulations, the permit language has been revised. The words "come into contact (directly or indirectly)" have been deleted and replaced with "contaminated by contact or that has come into contact."

Comment h: EPA was incorrect in stating that all facilities permitted in this sector are "no discharge" facilities.

Response h: The monitoring discussion in the Fact Sheet to the permit is a summary of the data available at the time the draft permit was published for public comment. The main focus of the summary was on data from the second year of permit coverage. Of those sector G facilities that submitted information in year 2 of the permit none of them reported a discharge. The 1998 MSGP modification which reflected the settlement with NMA and added monitoring requirements for sector G was much later in the permit term. The final fact sheet language has been changed to recognize the later data and discharge status of sector G facilities covered by the permit.

Comment i: Water technically qualifying as mine drainage but which meets all applicable surface water quality standards should be approved for use in lieu of fresh water for dust control on roads at mine sites.

Response i: The quality of the mine drainage can change from source to source and over time within the same mine. The MSGP would need to specify a process (*e.g.*, monitoring frequency) to ensure that the quality of the mine drainage is protective of water quality. This type of facility specific considerations and potential monitoring requirements would be better addressed under an individual permit issued to the facility.

Sections 6.G and 6.J Construction Requirements for Sector G—Metal Mining and Sector J—Mineral Mining

Comment a: Commenters questioned why EPA was requiring coverage under a construction general permit for earth disturbing activities during the "exploration and construction phase" of a mining operation.

Response a: This requirement was originally contained in the 1995 MSGP Fact Sheet for Sector J (it was inadvertently not duplicated in the metal and coal mining [Sector G] sectors). It therefore represents a clarification or technical correction to the original MSGP. To clarify the applicability of the MSGP regarding construction activity at metal mining sites and to make metal mining requirements consistent with mineral mining provisions (Sector J), Sector G has been modified to indicate that earth-disturbing activities occurring in the "exploration and construction phase" of a mining operation must be covered under EPA's Construction General Permit (63 FR 7858, February 17, 1998) or under an individual permit if the area disturbed is one acre or more. Earth-disturbing activities during exploration/construction affecting less than one acre must be covered under the MSGP–2000. If permittees then opt to actively mine the site they are required to transition to the MSGP–2000 (they should terminate their coverage under the CGP, but there is no requirement to do so). This procedure removes commenters' "dual-permit requirement" fear. Once in the active phase, any subsequent mine enlargement would be covered under the MSGP–2000. All phases of a mining operation must be covered which includes the "reclamation phase." EPA believes the appropriate level of environmental protection for initial land-disturbing mining activities is a construction permit. SWPPP requirements under a construction permit are more effective for the often temporary conditions found during the initial phase versus that which would be appropriate for a more permanent mining operation. Many of the BMPs and other SWPPP requirements of the Construction General Permit could be incorporated in the MSGP–2000 SWPPP, thereby minimizing any duplicative efforts.

Comment b: For Sector J for Region 9, the proposed MSGP only authorized mine dewatering discharges from crushed stone, construction sand and gravel, and industrial sand mines in Arizona. For Regions 1, 2, 6, and 10, coverage was proposed throughout the areas of these regions covered by the MSGP. Expressions of interest in MSGP coverage for these discharges have been received for other areas, such as Indian country in Nevada and California.

Response b: For consistency with the other regions, coverage for the discharges has been extended throughout the areas of Regions 3, 8 and 9 covered by the permit, provided the dischargers meet all other permit eligibility requirements.

Section 6.I Sector I—Oil and Gas Extraction

Comment: One commenter expressed concern that while refineries were covered under Sector I—Oil and Gas Extraction, refining was not usually considered "oil and gas extraction" and the title of Sector I could thus cause refinery operators to overlook permit conditions that could apply to them.

Response: EPA welcomes this suggestion to make the permit easier to use and the title for Sector I has been changed to "Oil and Gas Extraction and Refining" in Table 1–1 and in Part 6.I. Note however, that any storm water at a refinery that is subject to storm water effluent limitation guidelines at 40 CFR 419 is not eligible for permit coverage.

Section 6.R Sector R—Ship and Boat Building or Repair Yards

Comment: One commenter requested that the provisions of part 6.R.4.3.1. be clarified to note that pressure washing to remove paint would require a separate NPDES permit.

Response: EPA agrees that if pressure washing occurs to remove paint, the discharge of that wash water would require separate NPDES permit coverage. EPA also intends for the discharge of wash waters removing marine growth to be permitted separately. The source of the discharge is not storm water and, as a general rule, the MSGP only authorizes the discharge of storm water. The non-storm water discharges that are authorized by the MSGP are a specific list found in Part 1.2.2.2. of the permit and the list does not include pressure wash waters.

Section 6.S Sector S—Air Transportation

Comment: Commenters had concerns regarding the execution of site compliance evaluations and inspections of deicing areas. They also requested EPA to limit the inspection obligation to once per month during periods of deicing operations.

Response: The MSGP–2000 has been clarified to state that compliance evaluations shall be conducted during a period when deicing activities are likely to occur (vs. a month when deicing activities would be atypical or during an extended heat wave), not necessarily during an actual storm or when intense deicing activities are occurring. This requirement is not seen as onerous, as EPA believes that most weather conditions can be reasonably anticipated and the evaluation can be planned for. EPA generally agrees that regularly scheduled, monthly inspections of deicing areas during the deicing season (*e.g.*, October through April) are sufficient at airports with highly effective, rigorously implemented SWPPPs. However, if unusually large amounts of deicing fluids are being applied, spilled or discharged, weekly inspections should be conducted and the Director may specifically require such weekly inspections. In addition, personnel who participate in deicing activities or work in these areas should, as the need arises, inform the monthly inspectors of any conditions or incidents constituting an environmental threat, especially those needing immediate attention. EPA requires permittees to record, to the best of their ability, the quantity of all deicing chemicals applied on a monthly basis (not just glycols and urea, *e.g.*, potassium acetate), as discharges of large quantities of these chemicals can have an adverse impact on receiving waters. The capability to record usage of chemicals should not depend on the type of chemical used. EPA never intended to provide a comprehensive list of technologies and BMP options for airport operators to consider, nor to provide a discussion of the relative merits of each. EPA's discussion was simply an introduction of the many options available and was intended to stimulate thought on the variety of BMPs available. EPA intends that storm water personnel use their best professional judgment to select site-appropriate measures for inclusion in their SWPPPs. For a more thorough source of information on deicing fluid control and airport deicing operations in general, stakeholders can check the EPA publication "Preliminary Data Summary, Airport Deicing Operations" at http://www.epa.gov/ost/guide/airport/index.html.

Section 6.T Sector T—Treatment Works

Comment: Clarify that treatment works smaller than 1.0 MGD are not

R0019826

defined as industrial activities and, therefore, are not subject to the permit.

Response: The final permit language has been modified to be consistent with the industrial definition of § 122.26(b)(14)(ix). The requirements of Sector T are intended to apply only to those treatment works with a design flow of 1.0 MGD or more, or required to have an approved pretreatment program.

Section 8 Retention of Records

Comment: Clarify the Retention of Records language.

Response: EPA has clarified the Retention of Records language used in this permit. Part 8.1 states that the permittee will retain, for three (3) years after the permit expires or is terminated, the SWPPP and all documents/reports needed to complete their Notice of Intent form. In addition, Part 9.16.2.1 addresses the retention of records for the permit monitoring requirements for three (3) years from the date of sample, measurement, evaluation or inspection, or report. Permittees are required to submit Discharge Monitoring Reports for compliance and/or analytical monitoring.

Section 9 Standard Permit Conditions

Comment a: Several comments were received on Part 9.12.1 for requiring coverage under an individual permit or an alternative general permit. Commenters suggest that the permittee be allowed to appeal a Director's decision; provide for determination of non eligibility and semblance of surety available by a permittee who demonstrates eligibility and compliance with the MSGP; and authorize automatic transfer provided all storm water permitting conditions and obligations are met.

Response a: EPA may modify, revoke and reissue, or terminate a permit during its term. Causes for modification, revocation and reissuance, and termination are set forth in 40 CFR § 122.62 and 122.64. Specific causes may include: noncompliance by the permittee with any condition of the permit; failure in the application or during the permit issuance process to disclose fully all relevant facts; determination that the permitted discharge endangers human health or the environment and can only be regulated to acceptable levels by permit modification or termination; or there is a change in any condition that requires either a temporary or a permanent reduction or elimination of any discharges controlled by the permit. In addition, EPA recently published a final rule which revises certain regulations pertaining to the NPDES program, including the procedures for appealing an EPA determination on NPDES permits. See *Amendments to Streamline the National Pollutant Discharge Elimination System Program Regulations; Round II,* 65 Fed. Reg. 30886 (May 15, 2000). Included in the rule are revisions to the permit appeals process that replace evidentiary hearing procedures with direct appeal to the Environmental Appeals Board (EAB). The website for the EAB is "http://www.epa.gov/eab/". The webpage has a frequently asked question section, "http://www.epa.gov/eab/eabfaq.htm". Questions 1 through 9 deal with filing issues, which the commenter can refer to for instructions on how to proceed in filing an appeal with EAB. EPA does not allow automatic transfer from individual permits into other individual or general permits since EPA needs to maintain adequate records of permittees and make periodic evaluations of the adequacy of their measures to comply with permit requirements.

Comment b: EPA should extend coverage to facilities wishing to apply after the expiration date of the MSGP until the permit is reissued.

Response b: Where EPA fails to reissue a permit prior to the expiration of a previous permit, EPA has the authority to administratively extend the permit for facilities already covered. However, EPA does not have the authority to provide coverage to "new" facilities seeking coverage under an expired permit. This concern is not applicable in this instance to the MSGP since the MSGP–2000 was issued before the MSGP–1995 expired.

Section 13 Permit Conditions Applicable to Specific States, Indian Country Lands

Comment: The Agency should not require compliance with provisions of state rules that it cannot specifically identify. For example, EPA requires compliance with state anti-degradation provisions. The Agency provides no assistance with regard to how a small business might somehow ascertain what those provisions are, who has them, and how they might apply to the facility's discharge. See 65 Fed. Reg. at 17021. The Agency must specify precisely how a company would obtain appropriate data and how it should apply that data to its operations. Without this necessary guidance, this new provision should be removed from the final permit.

Response: The permit states that discharges are not covered if they violate, or contribute to the violation of, a state water quality standard. An anti-degradation policy is one component of a state's water quality standards program. The permittee is responsible for checking to ensure compliance with these provisions. Facility operators can check with the EPA official listed in this permit to obtain the name of the appropriate state contact.

Section I.A General Opposition to Proposed Changes

Comment: A commenter objected to several of the proposed modifications to the "Limitations on Coverage" provisions in the Proposed MSGP–2000, including the proposed revisions to the Endangered Species Act requirements (Section 1.2.3.6), the addition of the antidegradation provision (Section 1.2.3.9), the addition of the impaired waters and TMDL provisions (Section 1.2.3.8), and the addition of the compliance with water quality standards provisions in Section 3.3.

Response: The Agency acknowledges the comment. Justifications for each of the positions cited by the commenter are provided in the fact sheet accompanying the permit. Specific objections to these provisions are addressed elsewhere in the comment response document.

Section I.B General Support to Proposed Changes

Comment a: Several commenters supported EPA's continued use of a general NPDES permit for regulating storm water discharges associated with industrial activity. The commenters indicated that this was an efficient and effective means for achieving the goals of the Clean Water Act.

Response a: EPA agrees with the commenters regarding the appropriateness of general permits for the majority of industrial storm water discharges. The issuance of the final MSGP is consistent with these comments.

Comment b: A commenter supported the proposal to authorize incidental windblown mist discharges from cooling towers as an authorized non-storm water discharge under the MSGP.

Response b: These discharges are included in the final MSGP consistent with the recommendation of the commenter.

Comment c: A commenter supported the provision in the proposed MSGP to allow termination of permit coverage based on the "no exposure exemption" (40 CFR 122.26(g)) provided under EPA's Phase II storm water regulations of December 8, 1999 (64 *Fed. Reg.* 68722).

Response c: Although the no exposure exemption would be available whether or not it is specifically included in the

MSGP, EPA has retained the provision in the final MSGP to highlight its availability for those facilities which qualify.

Section I.C Fact Sheet

Comment a: It is imperative that EPA conduct an environmental justice analysis for the MSGP to ensure that the permit is consistent with the goals of EPA's Environmental Justice Strategy of April 3, 1995, the President's 1994 Executive Order on Environmental Justice and Title VI of the Civil Rights Act. The notice of intent (NOI) must include demographic information. EPA must seek comments of minority and low-income communities regarding the MSGP.

Response a: EPA disagrees with the commenter that an environmental justice analysis is necessary prior to the reissuance of the MSGP. Regarding Title VI requirements, EPA has recently proposed guidance (65 *Fed. Reg.* 39649, June 27, 2000) for assisting recipients of Federal funding which administer environmental programs (such as state environmental agencies), as well as guidance for investigating alleged disparate environmental impacts stemming from permitting programs administered by these agencies. The guidance is also appropriate for EPA permits, such as the MSGP.

The Title VI guidance encourages permitting authorities to integrate environmental justice into their permitting programs. However, an environmental justice analysis is not required for every permit issued by a state permitting authority or by EPA. No information was provided by the commenter that a disparate impact on minorities would exist as a result of the MSGP. The MSGP includes numerous effluent limitations and other conditions which should be protective of water quality for all neighborhoods in which permitted facilities are present. EPA does intend to integrate environmental justice considerations explicitly into its permitting programs as outlined in the Title VI guidance. However, this will likely be a longer term process (extending beyond the time frame for reissuance of the MSGP) given the many complexities of the issue.

EPA's Environmental Justice Strategy of April 3, 1995 (developed pursuant to the President's 1994 Executive Order) has similar goals as Title VI of the Civil Rights Act. Again, however, an environmental justice analysis is not required for every permit issuance. The integration of the goals of the Environmental Justice Strategy into the NPDES permit program will also take time given the many complexities of the environmental justice issue.

EPA is committed to implementing the Executive Order on Environmental Justice. As a practical matter, environmental justice concerns are community specific. EPA will work with a specific community that may express concerns related to a specific source or other environmental burdens. If and when a community raises such issues, EPA can then consider a proper course of action. In the case of the MSGP which will largely permit existing facilities, EPA will engage the community that has raised the issue and, if appropriate, work with the State and local agencies to address their concerns. If violations of any applicable standards are identified, EPA can pursue possible enforcement actions. The MSGP also provides that an alternate general permit could be issued for any geographic area which may be identified in the future as subject to disparate environmental impacts.

EPA has public noticed its intent to reissue the MSGP and has requested comments throughout the areas potentially affected by the permit, including areas where minority and low-income communities are present. EPA believes that its outreach activities have been sufficient for the permitting action which was proposed. However, EPA's Environmental Justice Strategy also provides for additional outreach activities in the future which may include outreach to minority and low-income communities specifically regarding the MSGP.

EPA disagrees that demographic information should be required with the NOI. The NOI does include location information for industrial facilities seeking coverage under the permit. Using this information it is possible to locate facilities covered by the permit relative to the locations of different demographic groups. As such, it is not necessary for the NOI to include demographic information.

Comment b: A commenter expressed concern that some non-storm water discharges may be improperly characterized as storm water by certain facilities. The commenter recommended that EPA carefully review permit applications and conduct inspections to ensure that such discharges are treated as point source discharges and not covered by the MSGP.

Response b: Point source discharges would violate the Clean Water Act unless they are authorized by a separate NPDES permit. The MSGP also requires that operators review their facilities for the presence of unpermitted non-storm water discharges which are not authorized by the MSGP. When such discharges are located, the MSGP requires that the discharges be permitted or terminated. This requirement should minimize the possibility that inappropriate non-storm water discharges are discharged under the MSGP. As recommended by the commenter, EPA does conduct periodic inspections of facilities permitted under the NPDES permit program to evaluate the compliance status of a facility with the requirements of the Clean Water Act, including the presence of any unpermitted discharges. Although the permit application for the MSGP (the notice of intent) does not specifically address the issue of non-storm water discharges, EPA believes that the other requirements of the MSGP, along with EPA's inspection program, adequately address the commenter's concern.

Section II.A Organization and Clarity

Comment a: Virtually all commenters supported EPA's effort to make the MSGP smaller and easier to understand. Several comments did express concern that the reorganization and clarification of the permit may have resulted in some substantial changes in permit requirements that may not have been identified and explained in the preamble to the proposed permit. The issue of whether or not explanation and guidance contained in the 1995 MSGP preamble could still be relied upon was also raised.

Response a: EPA went to great lengths to make the permit shorter and easier to understand and believes all substantive changes were identified and discussed in the preamble to the proposed permit. Responses to specific comments on areas where a commenter felt that adequate explanation for changes was not included in the proposal are provided in responses to that comment. With regard to the more specific explanation of sector-specific activities, etc. in the preamble to the 1995 MSGP, this information was incorporated by reference into the proposal of today's permit and may still be relied upon to the extent it does not conflict with the MSGP–2000 documents or is superceded by later guidance. Commenters noted several instances where EPA unintentionally changed requirements through the reformatting. EPA has corrected the permit and identified these instances throughout the comment response document.

Comment b: Based on EPA's use of incorporation by reference in the proposed permit's preamble to avoid reprinting material from the 1995 MSGP's preamble, one commenter expressed concern that the requirement in Part 4.7 to have a copy of the final permit with the Storm Water Pollution Prevention Plan would be difficult if the entire permit was not in a single package. This commenter also was concerned that references to multiple Internet sites for more information would further compound this problem. The commenter further suggested that a copy of the permit and relevant guidance be included with the NOI "confirmation" letter sent by EPA in response to a complete NOI. Another commenter supported making all relevant information available in a single document.

Response b: The entire permit, appropriate addendums, the preamble "fact sheet," and comment response summary are being published today in the **Federal Register** and will, therefore, be easily available from several Internet sites and from Federal Depository Libraries. The information not repeated in the proposed permit notice was primarily background and fact sheet information from the preamble to the 1995 MSGP. While the preamble and response to comments sections of the final permit notice will undoubtedly be valuable to many permittees, the Part 4.7 requirement to have a copy of the permit language with the Storm Water Pollution Prevention Plan refers only to the permit language itself, including addendums. Based on experience with the previous permit, EPA believes the benefits of keeping the size and complexity of the permit to manageable (*i.e.*, less intimidating, easier to use) level far outweigh the benefit of making all supporting and guidance information, much of which will apply to only a small portion of potential permittees, available in a single document. EPA does expect that for convenience, many permittees will simply attach a copy of the entire **Federal Register** notice of the final permit to comply with Part 4.7.

EPA believes the references throughout the permit and preamble to various Internet sites is a sensible alternative to publishing information, only a small part of which may apply to any one facility or which will be changing over time and quickly become outdated. For example, due to periodic updates that must be made to the endangered species list based on new species being listed or old ones delisted, the county-species list was not published with the final permit. This omission saves tax dollars on publication, keeps the size of the permit package down (the current list would double the size of the permit while any one facility only needs to look at a page or so of information), and avoids the inadvertent use of an outdated species list that could result not only in failure to consider potential adverse effects on an endangered species, but also negate a discharger's permit coverage. EPA relies heavily on electronic distribution of documents and guidance, but will be able to provide hard copy or telephone-based information to those who have no access to the Internet or Federal Depository Libraries.

As noted above, the complete permit has been printed and EPA intends to make guidance available, primarily through the Internet. The suggestion to include a copy of the permit and guidance with the NOI "confirmation" letter is impractical since most of this information would have been necessary to develop the Storm Water Pollution Prevention Plan that must be developed before the NOI can be submitted.

Section III Geographic Coverage of Proposed MSGP

Comment: Several commenters and attendees of meetings on the proposed permit identified an inconsistency between Part 6.J.3 of the permit, where mine dewatering discharges from construction sand and gravel, industrial sand, and crushed stone mines were apparently eligible only in Arizona and both the previous permit and the preamble to the proposed MSGP–2000 where such discharges were also eligible in all of the permits for Region 1, 2, 6, and 10. One commenter referred to pages 17025 and 17034 of the preamble to the proposed permit in support of their belief that the proposed permit had been intended to provide coverage in Regions 1, 2, 6, and 10 and in Arizona.

Response: The typographical error in Part 6.J.3 has been corrected. As supported by item 4 on page 17025 and item 2 on page 17034 of the **Federal Register** notice of the proposed permit (65 FR 17025 and 17034), coverage for mine dewatering discharges from construction sand and gravel, industrial sand, and crushed stone mines in not only Arizona, but also Regions 1, 2, 6, and 10 was intended.

Section V.A Historic Preservation

Comment a: It would be more in keeping with balancing the agency's CWA mandate and NHPA obligation to not preclude general permit coverage for those discharges that may affect historic properties. Instead, require the general permittee to notify the agency of the existence of a listed historic property that will be affected along with any preventive or mitigation measures, if necessary, that it plans to implement. EPA could then decide if any further consideration or action is warranted, including any comment by the Council. The obligations established under § 106 are placed upon the agency, not on the permittee.

Response a: EPA agrees and acknowledges that NHPA Section 106 imposes obligations only on federal agencies and not on third parties. EPA's action in issuing permits, however, triggers NHPA Section 106. In order to issue a general permit, EPA included historic preservation-related application and eligibility provisions in order to ensure that it could "filter" out permitting activities that might otherwise trigger advanced procedures under NHPA Section 106. Section 110(k) of the Act prohibits a Federal agency from granting a loan, loan guarantee, permit, license or other assistance to an applicant who intends to avoid requirements of section 106 (64 FR 95 May 18, 1999). To meet this responsibility, EPA requires the applicant to do one of the following: (1) Determine that historic properties are not in the path of permit activities, (2) determine that permit activities have no impact on historic properties, or (3) the permittee reaches agreement with appropriate authorities on measures to mitigate or prevent adverse effects. Thus, it is quite possible for facilities having an impact on historic properties to be covered by the MSGP. Authorization to discharge under the MSGP is a privilege, not a right, which carries with it certain procedural and timing advantages for the permittee. Therefore, it is incumbent upon the permittee, not EPA, to conduct whatever investigations and consultations are necessary consistent with EPA's obligation to satisfy NHPA provisions.

Comment b: The notice states that the provisions in Part 1.2.3.7, are "likely to change as a result of consultations" under the NHPA. The procedures set forth in Addendum B are described as being "models" of what the NHPA guidance "may look like." These provisions are critical for permittees to determine their eligibility for coverage under MSGP–2000, and any substantive changes in these areas should be subject to review and comment by the regulated community before they are adopted.

Response b: There are no changes to these provisions as a result of NHPA consultations.

Comment c: Part 2.1.2.2, which deals with discharges that are authorized under the 1995 MSGP, but not clearly eligible for coverage under this permit, does not allow adequate transition time for those permittees who do not have up-to-date determinations pursuant to the NHPA.

Response c: Within 90 days the permittee must apply for MSGP coverage and certify his compliance with other permit provisions. He then has up to 180 additional days of interim coverage under the MSGP while he conducts the consultation and determines whether he meets the criteria for coverage under the MSGP. EPA believes that 270 days is a sufficient period to conduct and conclude this consultation and take whatever action is necessary to ensure continued permit coverage.

Comment d: EPA states that, "For existing dischargers * * * a simple visual inspection may be sufficient * * * " (emphasis added). This statement is somewhat disingenuous because a "simple visual inspection" is rarely sufficient to determine historic eligibility of an area because many historic resources are often located underground. EPA should provide reasonable guidance worded specifically to shield permittees from liability.

Response d: EPA believes that, for existing dischargers who do not need to construct BMPs for permit coverage, a simple visual inspection may be sufficient to determine whether historic properties are affected. However, for facilities which are new industrial storm water dischargers and for existing facilities which are planning to construct BMPs for permit eligibility, applicants should conduct further inquiry to determine whether historic properties may be affected by the storm water discharge or BMPs to control the discharge. In such instances, applicants should first determine whether there are any historic properties or places listed on the National Register or if any are eligible for listing on the register (*e.g.*, they are "eligible for listing"). Thus, the Agency does not imply that a visual inspection is always sufficient. In instances of uncertainty, the permittee is encouraged to consult with authorities who can advise on the likelihood of historic properties above or below ground.

Given the Agency's obligation to comply with the NHPA and its efforts to coordinate that obligation with the implementation of general permits, the historic preservation-related eligibility restrictions cannot provide an ironclad shield from liability. The permit guidance provides a common sense approach to an historic property assessment. Facility operators are encouraged to consult with local authorities who can advise on the likelihood of historic properties at the facility.

Comment e: Portions of the text are reproduced and other portions not reproduced in columns 1 and 2 of page 17018 of the notice. See 65 F.R. at 17018. Due to this problem, the commenter is unable to provide any comments on EPA's proposed new changes to the MSGP since he is uncertain what EPA intends or proposes. The commenter suggests that EPA fix the language related to the proposed MSGP and re-issue that correction for public review and comment.

Response e: EPA apologizes for the typing error which resulted in a number of sentences being listed twice on p. 1018. Despite this confusion, EPA believes the intent of the section is clear and does not require reproposal.

Section V.B Endangered Species

Comment a: The term "unacceptable effects" is used almost interchangeably with "likely to adversely affect" (See 65 Fed. Reg. 17051), which is similarly undefined in the permit and in pertinent regulation. The correct term for purposes of ESA compliance is the "no jeopardy" standard set forth in Section 7 of the ESA (17 U.S.C § 1536(a)(2)).

Response a: EPA agrees with the commenter regarding the term "avoid unacceptable effects." Therefore, EPA has deleted the term and uses the "no jeopardy" language as stated in part 1.2.3.6.6.

Comment b: The definition of "discharge-related activities" is so all-encompassing that it could include virtually all activities at a mine, from drilling and blasting to loading, hauling and dumping and equipment maintenance, in addition to any activities that are part of a Storm Water Pollution Prevention Plan (SWPPP). There is no justification for a requirement to certify ESA compliance for all of these activities in order to obtain coverage under the MSGP. This requirement clearly exceeds EPA's authority under the Clean Water Act.

Response b: The endangered species provision covers only those activities that are associated with storm water industrial activity. The phrase "discharge-related activities" is intended to clarify that EPA considers a broad range of activities related to storm water discharges to be covered by the permit and, therefore, subject to ESA and NHPA provisions. This broader list of activities could result in environmental impairment if not addressed through a SWPPP. Since the permit covers this broad range, and EPA's permit authority is subject to ESA provisions, then this broader range of activities is subject to the "no jeopardy" finding. BMPs, whether already in place or added, which serve to satisfy the criteria for coverage under the MSGP, are thus subject to the endangered species provisions.

Comment c: While transitional discharge authorization is available for up to 270 days from the date of publication of the permit in the **Federal Register**, that transitional coverage is only available if the permittee submits an application for an alternative permit (most likely an individual permit) within 90 days after publication. Since formal Section 7 consultation is nominally a 135-day process (as stated in the Construction General Permit, see 63 Fed. Reg. 7872), permittees, in order to ensure continuous coverage, would be required to prepare and submit an application for an individual permit before they knew whether they were eligible for coverage under MSGP–2000. This is an unnecessary burden, on both the permittee and the agency. EPA should extend these time limits—for submission of an application for an alternative permit to 180 days, and for transitional coverage to one year.

Response c: EPA will retain the requirement that all applicants must submit their Notice of Intent (NOI) in 90 days. Those applicants who are entering into endangered species consultations or adverse impact investigations could apply for extensions up to 180 days and be covered by an interim permit until their application is completed. EPA believes that 270 days is a sufficient period to conduct and conclude this consultation and take whatever action is necessary to ensure continued permit coverage. The County Species list is available on EPA's web site or by contacting a local official. EPA will update its web site list every 90 days.

Comment d: EPA indicates that the proposed species-related requirements could change, before final issuance, based on consultation with the Fish and Wildlife Service. The public will not have an opportunity to participate in that process, including through commenting on any additional requirements suggested by the Service. If the Service does suggest any substantial changes in MSGP–2000, the public should have an opportunity to review and comment on those changes before EPA makes a decision as to whether to incorporate them into the final permit.

Response d: There are no changes to these provisions as a result of NHPA and ESA consultations, except that, based on comments to the proposed permit, EPA has deleted the inclusion of proposed species on the endangered species list.

Comment e: The duty triggered by the section of the Endangered Species Act (ESA) upon which EPA relies falls not upon the discharger but upon EPA. Thus under EPA's proposal, it would be EPA's duty to assess the impact of each discharger applying for coverage, and if this provision is not removed, EPA loses the benefit of the general permit. The action of adopting the general permit itself triggers EPA's duty, and so EPA, not the discharger, must assess ESA impacts now, not after the fact of the permit.

Response e: EPA is bound by the ESA and attempted to coordinate general permit implementation with its ESA obligations. Authorization to discharge under the MSGP is a privilege which carries with it certain procedural and timing advantages for the permittee. Therefore, it is incumbent upon the permittee, not EPA, to conduct whatever investigations and consultations are necessary to satisfy the ESA-related eligibility provisions. Since EPA cannot predetermine which facilities will apply for coverage under the MSGP, it is impossible for EPA to conduct the site-specific assessments required under the ESA at the time of general permit issuance.

Comment f: Despite previous consultation on the problems of earlier MSGP drafts, certain problems persist, including the gray area language that has fueled citizen suits against permittees. Not only has the agency failed to adequately address this issue, it has increased the liability potential by increasing the requirements for permittees to comply with other agency rules. EPA should clarify language to eliminate the potential for liability for permittees and should reduce the cost and paperwork burdens for compliance with ESA and NHPA.

Response f: Given the operation of the regulatory innovation, the "general permit," EPA cannot provide an ironclad shield from liability in the way the commenter proposes. The permit guidance provides a common sense approach to endangered species and historic property assessments. Facility operators are encouraged to consult with local authorities who can advise on the likelihood of endangered or threatened species, critical habitat, or historic properties at the facility. EPA believes the additional burden associated with the expanded NOI form is minimal because permittees are required to make the findings which are reflected on the form. The additional information provides greater assurance that the assessment has been conducted, but does not in itself constitute the requirement for the assessment. EPA acknowledges that, until such time as the revised form has been cleared by OMB, permittees will continue to use the current NOI form (as modified slightly to conform to changes made elsewhere to the permit).

Comment g: The endangered species section of the permit relating to endangered species is cumbersome and appears to go beyond the intent of the Clean Water Act and beyond the EPA's authority set in the CWA.

Response g: EPA acknowledges the comment, but disagrees. EPA believes these provisions are essential to carry out its responsibility not to issue a permit which could jeopardize an endangered or threatened species, or critical habitat. EPA has consulted with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service to ensure compliance with the Endangered Species Act. The "discharge-related activities" restriction on eligibility also implements the Agency's obligations under NHPA Section 106.

Comment h: The permit should clarify that coverage of the MSGP, and certification by the permittee, need address only new impacts resulting from new changes in operations for which discharges are covered and authorized by the MSGP. In other words, the "baseline" for assessment of effects or impacts should be the date of reissuance of the MSGP or, if later, initiation of new activities to be covered by the MSGP.

Response h: All activities covered by the permit, whether new or existing, are subject to the provisions. It is inappropriate to interpret that these provisions apply only to new activities.

Comment i: The endangered species section suggests that a potential permittee utilize "due diligence" in determining whether or not a potential impact to an endangered or threatened species may exist. This language is too vague and subjective—differing interpretations what constitutes due diligence exist. This is particularly true when dealing with an issue as complex as impact to endangered species or their habitats, where the expertise necessary to make this determination is usually beyond the reach of most industrial operators. It is likely that this could become the focal point of efforts to block permit issuance by those with differing agendas. Further clarification of what is required under "due diligence" is required.

Response i: EPA believes that the language must provide flexibility to reflect the case-by-case decisions which must be made. In response to the commenter's concern, EPA has replaced the "due diligence" phrase with "best judgment." Consultations with local endangered species officials is advised if the permittee is uncertain how to apply these provisions to his facility.

Comment j: Only those species that have been listed should be identified on this list and used in the determination of permit coverage; not those that have not gone through the entire listing process.

Response j: EPA acknowledges the comment and has revised the language to exclude proposed listing requirements.

Comment k: In this section, an applicant is expected to determine whether endangered species are "in proximity" to the stormwater discharges or discharge-related activities at the facility. In proximity is described as being "in the path or down gradient" or in the "immediate vicinity of or nearby," the facility. These definitions are far too vague, and could refer to the presence of species located a considerable distance from a facility, not merely those located close enough to a facility to be affected by that facility's stormwater discharge. This section requires clanfication.

Response k: EPA has retained this language from the 1995 MSGP. EPA believes that the language must provide flexibility to reflect the case-by-case decisions which must be made. Consultations with local endangered species officials is advised if the permittee is uncertain how to apply these provisions to his facility.

Comment l: This section provides that "where there are concerns that coverage for a particular discharger is not sufficiently protective of listed species (and presumably those proposed for listing as well) the Services (as well as any other interested parties) may petition EPA to require that the discharger obtain an individual NPDES permit and conduct an individual section 7 consultation as appropriate." It is clear that this will provide ample opportunity to those who would seek to delay or deny permit issuance, even in those circumstances where an actual impact to species or habitat does not exist. This procedure should be a formal one in which the permit remains in force until EPA, after careful and rigorous scientific evaluation of the potential impact, determines whether or not an impact exists and, if so, whether or not an alternative permit is warranted.

Response l: Opportunity for public input is an essential component of any government regulatory program. As the commenter suggests, the permit would remain in effect until such time as EPA concludes that the activity is no longer eligible for coverage under the permit.

Section V.C 303(d)

Comment a: Several commenters challenged Parts 1.2.3.8. of the permit because they believe it inaccurately applies 40 CFR 122.4(i) regarding compliance with water quality standards to discharges covered by a general permit. Several commenters believe that one doesn't have to consider 40 CFR 122.4(i) if they only add an outfall and similarly one commenter believes that new dischargers under Phase 2 do not have to consider 40 CFR 122.4(i). Commenters stated that any provisions added to the reissued MSGP regarding impaired waters or TMDLs are premature until the new TMDL rule is final. It seems that the major concern is that previously unpermitted discharges would be disallowed coverage under this Part.

Response a: EPA, in Sections 1.2.3.8.1 and 1.2.3.8.2, was merely conditioning a discharger's eligibility for coverage under the MSGP upon meeting certain existing conditions and requirements in EPA's NPDES regulations which apply in all applicable circumstances involving both individual and general permits. In doing so, EPA intended to merely restate those existing conditions and requirements as eligibility requirements under the MSGP. Specifically, EPA's intention in section 1.2.3.8.1 was to condition a new discharger's eligibility for coverage under the MSGP upon meeting the existing regulatory conditions under 40 CFR 122.4(i). A new discharger, therefore would not be eligible for coverage under the MSGP if its discharge would "cause or contribute to a violation of a water quality standard." As mentioned, this regulation is applicable to all new dischargers irrespective of the type of permit they are seeking coverage under; there is no language in this regulation that exempts new dischargers seeking coverage under a general permit. EPA, in section 1.2.3.8.1 of the MSGP, did not intend to create any confusion or change any existing interpretation of the current regulatory language referred to in that section. To avoid confusion EPA is therefore amending the language in section 1.2.3.8.1 to state that "you are not authorized to discharge if your discharge is prohibited under 40 CFR 122.4(i)."

EPA's intention in section 1.2.3.8.2 was to condition a discharger's eligibility for coverage under the MSGP upon meeting the existing regulatory requirements under existing 40 CFR 122.44(d)(1)(vii)(B). This section of EPA's regulations requires permitting authorities to develop effluent limits in permits that are "consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA pursuant to 40 CFR 130.7" (EPA's existing TMDL regulations). This requirement applies to all NPDES permits both individual and general permits.

Comment b: One commenter expressed confusion about what is meant by "new discharges" as this term is not defined in 40 CFR 122.2.

Response b: The final permit will omit the term "new discharge" since it is not necessary for the requirement and it has caused confusion. Today's permit will change the term "new discharge" to simply "discharge" in the first sentence of Part 1.2.3.8.1.

Comment c: Eligibility restrictions of the permit should be limited to those discharges of pollutants actually listed in a TMDL.

Response c: Section 1.2.3.8.2 of the MSGP contains the eligibility requirement that discharges be consistent with an EPA established or approved TMDL. EPA agrees with the commenter's suggestion that Section 1.2.3.8.2 should clearly state that such requirement is only applicable to facilities discharging the pollutant for which the TMDL is established. EPA is therefore, adding this language to Section 1.2.3.8.2.

Comment d: Discharges to 303(d) listed or 303(e) listed waters should be monitored for contaminants that impair or threaten water quality; however, monitoring requirements should be relaxed for other contaminants that do not impair or threaten receiving water quality. Several commenters wanted either exclusive or additional monitoring of discharges to impaired waters for pollutants of concern in lieu of the eligibility requirements based on whether or not a facility causes or contributes to the impairment.

Response d: EPA acknowledges that the MSGP may not contain monitoring requirements for a pollutant for which a waterbody is listed as impaired. This does not eliminate the burden of the discharger in determining that its effluent does not cause or contribute to a violation of water quality standards. Section 1.2.3.8.1 in the MSGP is an eligibility provision which restates existing regulatory requirements, it does not create new restrictions on any dischargers. If a discharger cannot meet the eligibility requirements, then that discharger is not authorized to discharge under the MSGP. Under existing regulations, EPA has the discretion to establish whatever eligibility requirements that it believes are appropriate. Section 1.2.3.8.1 is an eligibility provision that does no more than restate existing regulatory requirements as a condition of being authorized to discharge under the permit. It does not dictate, establish or restrict the use of any particular framework, effluent limits or permit conditions within the permit itself or describe or restate any new interpretation of the underlying regulations which it refers to.

Comment e: Several commenters were not clear how to determine or implement loadings imposed by TMDLs. Further they requested that loadings based on the TMDL be excluded from the MSGP and addressed separately so that the regulated community could have an opportunity to comment on them. One commenter stated that the eligibility requirement of Part 1.2.3.8. is not appropriate because there was no opportunity to comment on the TMDL.

Response e: It is not necessary that all dischargers receive individual wasteload allocations. EPA's regulations at 40 CFR 130.2 define a wasteload allocation as the portion of the receiving water's loading capacity that is allocated to one of its existing or future point sources of pollution. EPA has interpreted this regulation to mean that each point source must be given an individual wasteload allocation when it is feasible to calculate such a wasteload allocation. EPA believes that states may find it infeasible to calculate individual wasteload allocations for all point sources covered by a specific general permit. In that case, the TMDL would establish individual wasteload allocations for dischargers subject to individual permits whereas dischargers subject to a general permit would be accounted for in the aggregate under a single wasteload allocation specific to the general permit under which they are authorized to discharge.

In addition, wasteload allocations can be expressed in different ways, including, percent loading reductions. See 40 CFR 130.2(i) "* * * TMDLs can be expressed in terms of either mass per time, toxicity, or other appropriate measures. * * *" Effluent limitations must be consistent with (but not identical to) the wasteload allocations in TMDLs. See 40 CFR 122.44(d)(1)(vii)(B). Effluent limitations for point source discharges of storm water may be narrative limitations that are expressed in terms of best management practices (BMPs). This policy is consistent with EPA's approach in its Interim Permitting

Approach For Water Quality-Based Effluent Limitations in Storm Water Permits (September 1996, EPA 833–D–96–001). This interim approach allows limits to be expressed in the form of BMPs as a means of satisfying the requirement that limits derive from and comply with water quality standards and are consistent with an EPA approved or established TMDL.

All dischargers who discharge the pollutant for which the waterbody is impaired must be accounted for in the TMDL. Every point source discharger located on the impaired waterbody and discharging the pollutant for which the waterbody is impaired must be accounted for under a wasteload allocation. The State may choose, however, to give a discharger a wasteload allocation that would not require any reduction in loading. In other words, all facilities discharging the pollutant for which the waterbody is impaired must be subject to a wasteload allocation but all facilities subject to a wasteload allocation may not be required to reduce their loads.

Comment f: Several commenters requested guidance on how to adequately evaluate a discharge's eligibility under Part 1.2.3.8 and 1.2.3.9 of the permit.

Response f: EPA intends the analysis to be similar to what a permittee under the previous MSGP had to do in accordance with Part I.B.3.f. of that permit. The applicant must avail himself of all discharge characterization data or estimation of discharge character and determine compliance. If the permittee is able to evaluate eligibility on his own because he has access to State Water Quality Standards, 303(d) lists, TMDLs etc. (all of which are available either from the permit issuing authority or in some cases, online) then he can make his determination, document the determination process in his pollution prevention plan, and sign the NOI. In other cases, the Director may notify him that he is not eligible for coverage if such a determination is made independently, and may require an application for an individual permit.

Comment g: One commenter requested confirmation that Part 1.2.3.8.1 applies to facilities constructed after August 13, 1979 that have not yet been issued an NPDES permit.

Response g: Part 1.2.3.8.1 applies to discharges, not facilities, that have begun after August 13, 1979 that have not yet been authorized by an NPDES permit.

Section V.D—Antidegradation

Comment a: The proposed requirements do not accurately reflect States' anti-degradation policy. Commenters stated that anti-degradation does not hold a permittee accountable until a State's policy is interpreted into a permit. The State's review of the general permit under the CWA 401 is the extent of applicable anti-degradation review. Therefore, delete Part 1.2.3.9. since an individual discharger applying for general permit coverage cannot determine how the State's anti-degradation policy, especially regarding the Tier 2 "high quality water" provisions, will be implemented at a particular facility.

Response a: EPA, in Sections 1.2.3.8.1 and 1.2.3.8.2, was merely conditioning a discharger's eligibility for coverage under the MSGP upon meeting certain existing conditions and requirements in EPA's NPDES regulations which apply in all applicable circumstances involving both individual and general permits. In doing so, EPA intended to merely restate those existing conditions and requirements as eligibility requirements under the MSGP. Specifically, EPA's intention in section 1.2.3.8.1 was to condition a new discharger's eligibility for coverage under the MSGP upon meeting the existing regulatory conditions under 40 CFR 122.4(i). A new discharger, therefore would not be eligible for coverage under the MSGP if its discharge would "cause or contribute to a violation of a water quality standard." As mentioned, this regulation is applicable to all new dischargers irrespective of the type of permit they are seeking coverage under; there is no language in this regulation that exempts new dischargers seeking coverage under a general permit. EPA, in section 1.2.3.8.1 of the MSGP, did not intend to create any confusion or change any existing interpretation of the current regulatory language referred to in that section. To avoid confusion EPA is therefore amending the language in section 1.2.3.8.1 to state that "you are not authorized to discharge if your discharge is prohibited under 40 CFR 122.4(i)."

EPA acknowledges that the MSGP may not contain monitoring requirements for a pollutant for which a waterbody is listed as impaired. This does not eliminate the burden of the discharger in determining that its effluent does not cause or contribute to a violation of water quality standards. Section 1.2.3.8.1 in the MSGP is an eligibility provision which restates existing regulatory requirements, it does not create new restrictions on any dischargers. If a discharger cannot meet the eligibility requirements, then that discharger is not authorized to discharge under the MSGP. Under existing regulations, EPA has the discretion to establish whatever eligibility requirements that it believes are appropriate. Again, section 1.2.3.8.1 is an eligibility provision that does no more than restate existing regulatory requirements as a condition of being authorized to discharge under the permit. It does not dictate, establish or restrict the use of any particular framework, effluent limits or permit conditions within the permit itself or describe or restate any new interpretation of the underlying regulations which it refers to.

EPA's intention in section 1.2.3.8.2 was to condition a discharger's eligibility for coverage under the MSGP upon meeting the existing regulatory requirements under existing 40 CFR 122.44(d)(1)(vii)(B). This section of EPA's regulations requires permitting authorities to develop effluent limits in permits that are "consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA pursuant to 40 CFR 130.7" (EPA's existing TMDL regulations). This requirement applies to all NPDES permits both individual and general permits.

Wasteload allocations can be expressed in different ways, including, percent loading reductions. See 40 CFR 130.2(i) "* * *TMDLs can be expressed in terms of either mass per time, toxicity, or other appropriate measures * * *." Effluent limitations must be consistent with (but not identical to) the wasteload allocations in TMDLs. See 40 CFR 122.44(d)(1)(vii)(B). Effluent limitations for point source discharges of storm water may be narrative limitations that are expressed in terms of best management practices (BMPs). This policy is consistent with EPA's approach in its Interim Permitting Approach For Water Quality-Based Effluent Limitations in Storm Water Permits (September 1996, EPA 833–D–96–001). This interim approach allows limits to be expressed in the form of BMPs as a means of satisfying the requirement that limits derive from and comply with water quality standards and are consistent with an EPA approved or established TMDL.

The commenter correctly recognizes the difficulty in determining what defines "necessary to accommodate important economic or social development" in accordance with 40 CFR Section 131.12(a)(2). By statute, this determination involves public participation, the assurance that water quality will be protected, and several other factors. EPA would have to modify the permit for each discharge in question in order to comply with 40 CFR Section 131.12(a)(2). Individual considerations such as these are contrary to the concept of a general permit. In addition, public participation would be impossible since the permit issuing authority would not know about the particular discharge to tier 2 waters before a NOI was submitted. Therefore, a facility operator must seek coverage under an individual permit to discharge to tier 2 waters under 40 CFR Section 131.12(a)(2)'s allowable degradation provisions to satisfy the requirements for public participation and protection of water quality. The only discharges allowed coverage under today's permit are those which do not degrade the use of a tier 2 water below its existing levels, even though those existing levels exceed levels necessary to support propagation of fish, shellfish and wildlife and recreation in and on the water.

Comment b: While the eligibility requirements disallow the discharge to cause and contribute to the impaired water, the permit doesn't require monitoring for the pollutant of concern. This presents the potential for the permit issuing authority to determine that a discharge causes or contributes at a later date than the submittal of the NOI, effectively creating a violation of the permit without the permittee being able to know of it or prevent it.

Response b: There will be situations where an NOI is accepted by the permit issuing authority and coverage provided to a facility that did not meet the eligibility requirements. Other situations include changes, such as the approval of a TMDL, which may cause a discharge to no longer be eligible. Upon learning of these types of situations, the Director may either require the permittee to submit an application for an individual NPDES permit, take an enforcement action, allow the facility to eliminate the concern, or any combination of these actions.

Comment c: The eligibility requirements require the permittees to predict the final requirements of the TMDL rule and the final loadings of TMDLs approved in the future. Part 1.2.3.8.1 shouldn't be included in the permit because it inaccurately applies 122.4(i) to general permittees.

Response c: EPA, in Sections 1.2.3.8.1 and 1.2.3.8.2, was merely conditioning a discharger's eligibility for coverage under the MSGP upon meeting certain existing conditions and requirements in EPA's NPDES regulations which apply in all applicable circumstances involving both individual and general permits. In doing so, EPA intended to merely restate those existing conditions and requirements as eligibility requirements under the MSGP. Specifically, EPA's intention in section 1.2.3.8.1 was to condition a new discharger's eligibility for coverage under the MSGP upon meeting the existing regulatory conditions under 40 CFR 122.4(i). A new discharger, therefore would not be eligible for coverage under the MSGP if its discharge would "cause or contribute to a violation of a water quality standard." As mentioned, this regulation is applicable to all new dischargers irrespective of the type of permit they are seeking coverage under; there is no language in this regulation that exempts new dischargers seeking coverage under a general permit. EPA, in section 1.2.3.8.1 of the MSGP, did not intend to create any confusion or change any existing interpretation of the current regulatory language referred to in that section. To avoid confusion EPA is therefore amending the language in section 1.2.3.8.1 to state that "you are not authorized to discharge if your discharge is prohibited under 40 CFR 122.4(i)."

EPA's intention in section 1.2.3.8.2 was to condition a discharger's eligibility for coverage under the MSGP upon meeting the existing regulatory requirements under existing 40 CFR 122.44(d)(1)(vii)(B). This section of EPA's regulations requires permitting authorities to develop effluent limits in permits that are "consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA pursuant to 40 CFR 130.7" (EPA's existing TMDL regulations). This requirement applies to all NPDES permits both individual and general permits.

Comment d: The final permit needs to be clear that the requirements of Part 1.2.3.8.2 only apply to the pollutant of concern in the TMDL actually being discharged by the facility. This idea is in Part 1.2.3.8.1. and should be included in 1.2.3.8.2 as well. Similarly, EPA should lift the new source and new discharger restrictions if there is not a storm water component of the approved TMDL. The final permit should clarify that a facility may not have a specific allocation in an approved TMDL and as such may still be eligible for the general permit.

Response d: Section 1.2.3.8.2 of the MSGP contains the eligibility requirement that discharges be consistent with an EPA established or approved TMDL. EPA agrees with the commenter's suggestion that Section 1.2.3.8.2 should clearly state that such requirement is only applicable to facilities discharging the pollutant for which the TMDL is established. EPA is therefore, adding this language to Section 1.2.3.8.2.

Comment e: The eligibility requirements in Part 1.2.3.9 defeat the concept of efficiency of a general permit and should be removed. EPA does not have the authority to require the applicant to assess if they support the use classification of the receiving water because it increases the cost of applying for general permit coverage which has not been evaluated by EPA under the Unfunded Mandates Reform Act. Furthermore, the duty to determine whether or not a discharge supports the use classification of a receiving water is the permit issuing authority's responsibility.

Response e: The concept of the general permit is to reduce the administrative burden on EPA and the regulated community by issuing one permit for many facilities that would otherwise all have exactly the same conditions in their individual permits. If a facility is not like other ones where it would have different permit conditions it should not apply for the general permit in question. This general permit only applies to facilities that support the use classification of the receiving waters. If they do not, EPA is not obligated to change the general permit to include them. The applicant must seek alternate permit coverage. It is the permit issuing authority's responsibility to ensure that the conditions of the general permit support use classifications. It is not their responsibility to ensure that each individual discharge authorized by the permit supports the use. The eligibility requirements are there to indicate the type of facility that can be covered under the permit. The efficiency intended by a general permit is to reduce the number of individual permits and to make application for NPDES permit easier for those who qualify for the coverage under the general permit.

Comment f: The final permit needs to be clear that a facility may not have a specific allocation in an approved TMDL and as such may still be eligible for the general permit.

Response f: EPA agrees in part with the commenter that there may be circumstances under which it is not necessary that all dischargers receive individual wasteload allocations. EPA's regulations at 40 CFR 130.2 define a wasteload allocation as the portion of the receiving water's loading capacity that is allocated to one of its existing or future point sources of pollution. EPA has interpreted this regulation to mean that each point source must be given an individual wasteload allocation when it is feasible to calculate such a wasteload allocation. EPA believes that states may find it infeasible to calculate individual wasteload allocations for all point sources covered by a specific general permit. In that case, the TMDL would establish individual wasteload allocations for dischargers subject to individual permits, whereas dischargers subject to a general permits would be accounted for in the aggregate under a single wasteload allocation specific to the general permit under which they are authorized to discharge.

Comment g: Lift the new source/new discharger restriction if there is not a storm water component of the approved TMDL.

Response g: EPA, in Sections 1.2.3.8.1 and 1.2.3.8.2, was merely conditioning a discharger's eligibility for coverage under the MSGP upon meeting certain existing conditions and requirements in EPA's NPDES regulations which apply in all applicable circumstances involving both individual and general permits. In doing so, EPA intended to merely restate those existing conditions and requirements as eligibility requirements under the MSGP. Specifically, EPA's intention in section 1.2.3.8.1 was to condition a new discharger's eligibility for coverage under the MSGP upon meeting the existing regulatory conditions under 40 CFR 122.4(i). A new discharger, therefore would not be eligible for coverage under the MSGP if its discharge would "cause or contribute to a violation of a water quality standard." As mentioned, this regulation is applicable to all new dischargers irrespective of the type of permit they are seeking coverage under; there is no language in this regulation that exempts new dischargers seeking coverage under a general permit. EPA, in section 1.2.3.8.1 of the MSGP, did not intend to create any confusion or change any existing interpretation of the current regulatory language referred to in that section. To avoid confusion EPA is therefore amending the language in section 1.2.3.8.1 to state that "you are not authorized to discharge if your discharge is prohibited under 40 CFR 122.4(i)."

Section V.E Discharges Not Previously Covered by an Individual Permit

Comment: One commenter requested clarification of the permit requirement at Part 1.2.3.3.2.3 to include any specific storm water BMPs from the old individual permit in the Storm Water Pollution Prevention Plan when transferring from an individual permit to the MSGP. The commenter interpreted this condition to mean that only those specific storm water BMPs from the old individual permit (and areas associated with outfalls from the old permit) needed to be included in the Plan, and noted an apparent inconsistency on page 17021, Item F, of the preamble which states that the Plan must address the entire facility.

Response: When transferring from an individual permit to the MSGP, the requirement at Part 1.2.3.3.2.3 to include any specific storm water BMPs from the old individual permit in the Storm Water Pollution Prevention Plan is in addition to and not in lieu of the basic requirements in Part 4. However, the BMPs brought over from the old individual permit may satisfy one or more of the "basic" Storm Water Pollution Prevention Plan requirements under Part 4 and/or the sector-specific requirements under Part 6. There could be areas at a facility (*e.g.*, employee parking lots) that do not need to be addressed under the permit (and SWPPP) unless the runoff from such areas commingles with storm water associated with industrial activity (or was previously permitted).

Section VI.A Notification Requirements

Comment a: The commenter supported the use of electronic filing of NOIs, but expressed concern that facilities without Internet access would be at a disadvantage.

Response a: It is not the intention of EPA to only accept electronic submittals. Electronic submittal is another alternative which, hopefully, will be available to the regulated community in the near future.

Comment b: The commenter does not support any changes to the NOI form, and expects any changes to comply with the Paperwork Reduction Act.

Response b: Any changes to the NOI form that result in an increase in burden for the applicant must first be reviewed and approved by the Office of Management and Budget. Part of this review includes compliance with the requirements of the Paperwork Reduction Act. Changes to the NOI form published in today's permit were limited to those that provide clarification in information, as well as those changes that reflect changes in the storm water permits issued by EPA. EPA has determined that these changes do not represent an increase in burden for completing the NOI form. As noted in Section 2.2, the more extensive changes listed in the March 30, 2000 proposal need to complete their OMB review before they can be included in the NOI form.

Comment c: A commenter supported inclusion of the no exposure certification form as an addendum to the MSGP–2000.

Response c: EPA agrees that providing the form with the permit is a convenience for facilities qualifying for the no exposure exemption. The certification form is an addendum to the permit.

Section VI.B Special Conditions

Comment a: The Agency is shifting its responsibility regarding meeting minimum technology standards in NPDES permits to the discharger.

Response a: EPA expects that when a facility submits an NOI they are familiar with both the permit and their facility. They should be able to determine their eligibility. The permitting authority may concur with the facility's assessment, or not. EPA does not believe that it has shifted its responsibility on this matter.

Comment b: There was a request to clarify the requirements in the MSGP–2000 regarding co-located facilities.

Response b: A facility is considered co-located if there is a second industrial activity occurring which meets the definition of storm water discharge associated with industrial activity. For example, a facility operates an auto salvage yard and also has an area onsite for scrap recycling. The facility as a whole would meet the requirements for Sector M—Auto salvage. The area where scrap recycling occurs would meet the requirements for Sector N—Scrap Recycling. Any storm water discharges from the scrap recycling area needs to meet the requirements for both sectors. The second activity may or may not be related to the primary industrial activity. The determination as to whether something is co-located rests in the definition of storm water discharges associated with industrial activity. If a second activity exists at a facility which meets one of the categories in the definition, then the facility has co-located industrial activities.

Section VI.C Common Pollution Prevention Plan Requirements

Comment a: A commenter expressed concern about various interpretations and implementation of the storm water program, including incorporation of effluent limits, and stressed "* * * It is imperative that the Agency maintains that SWPPP requirements be interpreted and implemented in a practicable and economically feasible manner."

Response a: EPA believes that proper implementation of storm water BMPS will achieve compliance with water quality standards. EPA is responsible for implementation of the storm water program in eight states, various territories, including Puerto Rico and District of Columbia; and various Indian Country lands throughout the country. For the remaining 42 states, the state agency is responsible for program implementation. They have the authority to interpret and implement the program as appropriate for their state. It continues to be EPA's policy not to include effluent limitations in storm water permits. However, a state may choose to follow a different policy than EPA's.

Comment b: There is not a specific mention of catch basin inserts or fillers on the listing of BMPs.

Response b: In discussions concerning BMPs, EPA attempted to provide some examples of various types of BMPs. By no means is the listing intended to be all inclusive. EPA acknowledges that there are other BMPs, such as catch basin inserts or fillers, that were not mentioned in discussions but may be appropriate in various circumstances.

Section VI.E Monitoring and Reporting Requirements

Comment a: Monitoring results are an unreliable indicator of a discharge problem and they do not provide confirmation of a problem. Permittees cannot use results to support facility management.

Response a: EPA believes that since analytic monitoring has been performed by substantial numbers of permittees only during the fourth year of the 1995 MSGP (many facilities complying with monitoring requirements in the fourth year were covered under the earlier baseline general permit during the second monitoring year and, consequently, had no equivalent monitoring requirement), it is premature to make any final conclusions regarding the value of the Agency's acquisition of the monitoring data or to consider dropping the monitoring. In essence, the fourth-year monitoring data set EPA received represents the baseline of pollutant discharge information under the sector-specific industrial general storm water permit. Several rounds of monitoring significantly enhances the utility of the results for evaluating the effectiveness of management practices at the site as well as for the industry sector as a whole. EPA commits to using data from the 1995 and 2000 permits to evaluate the effectiveness of management practices on an industry sector basis and to evaluate the need for changes in monitoring protocols for the next permit.

EPA acknowledges that, considering the small number of samples required per monitoring year (four), and the vagaries of storm water discharges, it may be difficult to determine or confirm the existence of a discharge problem as a commenter claimed. When viewed as an indicator, analytic levels considerably above benchmark values can serve as a flag to the operator that his SWPPP needs to be reevaluated and that pollutant loads may need to be reduced. Conversely, analytic levels below or near benchmarks can confirm to the operator that his SWPPP is doing its intended job. EPA believes there is presently no alternative that provides stakeholders with an equivalent indicator of program effectiveness.

Comment b: Monitoring results are not necessarily an indicator of BMP effectiveness and EPA never justified that they are.

Response b: While not practicable for EPA to require an increase in monitoring, operators are encouraged to sample more frequently to improve the statistical validity of their results. Unless the proper data acquisition protocol for making a valid BMP effectiveness determination is rigorously followed, any other method used to assess BMP effectiveness would be qualitative, and therefore less reliable. The least subjective approach, and most beneficial to operators and stakeholders, EPA believes, remains a combination of visual and analytic monitoring, using analyte benchmark levels to target potential problems. Statistical uncertainties inherent in the monitoring results will necessitate both operators and EPA exercising best professional judgment in interpreting the results. When viewed as an indicator, analytic levels considerably above benchmark values can serve as a flag to the operator that his SWPPP needs to be reevaluated and that pollutant loads may need to be reduced. Conversely, analytic levels below or near benchmarks can confirm to the operator that his SWPPP is doing its intended job.

Comment c: Alternate test methods can be used for determining effectiveness of BMPs at a facility, and benchmarks will need modifying to account for variability in test methods.

Response c: A technically valid, deterministic investigation of BMP effectiveness would necessarily involve collecting discharge pollutant load data before and after the BMP. The constraints inherent in monitoring preclude requiring this kind of investigation. All other methods used to make an assessment of SWPPP/BMP effectiveness are qualitative. The least subjective approach, and most beneficial to operators and stakeholders, EPA believes, is a combination of visual and analytic monitoring, using analyte benchmark levels (or "targets") as an indicator of potential problems. Vagaries of storm discharges and statistical concerns will necessitate operators and EPA exercising best professional judgment in interpreting the results of any monitoring. When viewed as an indicator, analytic levels considerably above benchmark values can serve as a flag to the operator that his SWPPP needs to be reevaluated and that pollutant loads may need to be reduced. Conversely, analytic levels below or near benchmarks can confirm to the operator that his SWPPP is doing its intended job.

Comment d: (a) The presumption of an impact on water quality standards by storm water is inappropriate given the episodic nature of storms. (b) EPA recognizes that during a storm, water quality standards will not always be met, so EPA shouldn't rely on water quality standards at a discharge point to determine if a facility is in compliance. (c) Monitoring has marginal value in assessing and protecting water quality.

Response d: (a) It is true that many impacts of storm water are short-term and that many pollutants are not really toxic or bioaccumulative. A short term water quality standard violation is not necessarily going to persist long enough to be toxic. (b) In the absence of establishing discharge pollutant loads that correlate directly to a receiving water, as would be done for an individual permit, EPA settled on benchmark levels which would, under nearly all scenarios, be protective of water quality standards. Recognizing the shortcomings of these generic pollutant levels, EPA only intends for them to be used as indicators of possible problems and as a flag to reevaluate the SWPPP—not as a trigger to begin mandatory SWPPP or operational revisions unless, after employing BPJ, the operator deems such revisions are necessary. (c) While end-of-pipe/end-of-property analytic monitoring for storm water may not reflect potential impacts to water quality, EPA does not intend to use the data for that purpose.

Comment e: EPA needs to reevaluate the validity of benchmark values.

Response e: Universal benchmark levels cannot be established; the next best thing would be storm water pollutant loadings vis-a-vis water segment-specific TMDLs. But when used as a target or indicator, without requiring specific corrective actions beyond using BPJ to reassess present conditions and make any changes deemed necessary, the present benchmarks are adequate. In specific situations operators may reasonably conclude, after analyzing monitoring results above benchmarks, their present SWPPPs/BMPs are adequately protective of water quality, or that other conditions such as discharging to low-quality, ephemeral streams may obviate the need for SWPPP/BMP revisions.

Comment f: Monitoring diverts resources from more effective implementation of SWPPPs. EPA should focus on pollution prevention, instead.

Response f: In developing the monitoring requirements, *i.e.*, pollutants of concern, monitoring waivers, etc., along with providing sampling and monitoring guidances, EPA endeavored to make the financial burden as minimal as possible. Four quarterly samples is a minimal data set for evaluating the effectiveness of SWPPPs. Those least able to afford expansive monitoring programs, *i.e.*, small businesses, likely have few outfalls to begin with. EPA believes that if monitoring is required at a facility, it should be planned for and budgeted as a cost of doing business.

Comment g: Permittees fear benchmark limits would be viewed as effluent limitations.

Response g: EPA agrees that benchmark limits are not effluent limitations and should not be used, in and of themselves, as the basis for issuing an enforcement violation.

Comment h: Storm water discharge variability can be caused by atmospheric/dry deposition, run on and fate in transport; facilities with structural leachate are at a disadvantage vis-a-vis those without the problem.

Response h: EPA acknowledges the potential for adding pollutants to a facility's discharges from external or structural sources. A permittee is, nonetheless, still legally responsible for the quality of all discharges from his/her site—but not from pollutants that may be introduced outside the boundaries of his/her property or the areas where his/hers structures, industrial activities or materials are located. Anything that increases the pollutant load in the runoff prior to leaving the site, whether originating from air deposition, run-on from nearby sites, or leachate from on-site structures, remains the responsibility of the permittee. This was affirmed in the ruling by the Environmental Appeals Board against the General Motors Corp. CPC-Pontiac Fiero Plant in December 1997.

Comment i: Allow pollutant credits for background sources of pollution.

Response i: Pollutant credits for background sources of pollution is unfeasible for storm water. Either EPA or the permittee would have to determine the pollutant loads of both the run-on and runoff to calculate pollutant credits. Resources are insufficient to implement this practice.

Comment j: Differences in monitoring results may result from changes in business conditions; changes in personnel doing monitoring can make observations/discharge examinations unreliable.

Response j: EPA published guidance on both monitoring and sampling procedures (available from EPA's Office of Water Resource Center) to standardize data collection practices.

Comment k: The same person cannot always do monitoring. Having to rely on different people is bad for consistency in recording observations and making discharge examinations.

Response k: EPA requires that personnel implementing the SWPPP be provided training as an element of the SWPPP. This training must cover program elements to ensure the quality and validity of all information collected.

Comment l: Sampling can be dangerous.

Response l: EPA provides waivers and options such that extreme weather or perilous conditions are accounted for.

Comment m: Determining whether a storm qualifies to be monitored is difficult.

Response m: EPA has always defined what constitutes a storm event worthy of monitoring. Modern weather forecasting is making it easier to anticipate and plan for qualifying storms.

Comment n: Monitoring in remote west or arid/semi-arid areas is difficult and burdensome.

Response n: EPA has always had accommodations and waivers for lack of qualifying storm events. See EPA Response o below.

Comment o: EPA should reduce analytic monitoring and visual monitoring based on average rainfall (similar to Phase II regulations).

Response o: EPA already allows permittees to skip monitoring in any quarter in which no qualifying storm events occur.

Comment p: Some discharges (in the west) occur only infrequently and sometimes only to isolated, ephemeral streams (which may have no indigenous biota).

Response p: Ephemeral streams may still eventually flow into permanent waters of the U.S.; hence, protective measures may still be needed to protect water quality. If there are truly no water quality standards established for an ephemeral stream and the outflow does not feed another water body, then it's likely there would not be a "point source discharge" and no permit would be required. Only those point source discharges to waters of the U.S. need to be included in a SWPPP.

Comment q: Continuation of monitoring is not justified, especially for mining sectors.

Response q: EPA believes that since analytic monitoring has been performed by substantial numbers of permittees only during the fourth year of the 1995 MSGP (many facilities complying with monitoring requirements in the fourth year were covered under the earlier baseline general permit during the second monitoring year and, consequently, had no equivalent monitoring requirement), it is premature to make any final conclusions regarding the value of the Agency's acquisition of the monitoring data or to consider dropping the monitoring. In essence, the fourth-year monitoring data set EPA received represents the baseline of pollutant discharge information under the sector-specific industrial general storm water permit. Several rounds of monitoring significantly enhance the utility of the results for evaluating the effectiveness of management practices at the site as well as for the industry sector as a whole. EPA commits to using data from the 1995 and 2000 permits to evaluate the effectiveness of management practices on an industry sector basis and to evaluate the need for changes in monitoring protocols for the next permit.

EPA acknowledges that, considering the small number of samples required per monitoring year (four), and the vagaries of storm water discharges, it may be difficult to determine or confirm the existence of a discharge problem as a commenter claimed. When viewed as an indicator, analytic levels considerably above benchmark values can serve as a flag to the operator that his SWPPP needs to be reevaluated and that pollutant loads may need to be reduced. Conversely, analytic levels below or near benchmarks can confirm to the operator that his SWPPP is doing its intended job. EPA believes there is presently no alternative that provides stakeholders with an equivalent indicator of program effectiveness.

Comment r: EPA has not provided guidance on monitoring snow melt events.

Response r: EPA does not have any specific guidance on this matter at the present time. Guidance may be developed in the future. In the interim, however, EPA believes that facilities should be able to obtain reasonably representative samples using their best judgment. Two important points must be considered to ensure the snow melt

R0019837

sample is representative: (1) The melted runoff must come in contact with any pollutants of concern present and not be overly "contaminated" with concentrated surficial deposits of hydrocarbons, dirt, salt, etc., and (2) the melted runoff must have characteristics that approximate those of a monitor-qualifying rain storm (0.1 inch runoff volume, sampled within the first ½ up to 1 hour).

Comment s: (a) In addition to monitoring results, EPA should also require submission of a description of storm water controls being implemented. (b) EPA should require facilities to monitor for pollutants similar to what would be done under an individual permit (to ensure BMPs are being implemented). (c) Monitoring will aid the permittee, permitting authority and the public in understanding the sources and toxicity of storm water at a site.

Response s: (a) EPA already requires that all BMPs and other controls be described in the SWPPP, including inspections, maintenance, etc. Any BMP changes or additions must be added to an updated SWPPP, so EPA will not require this information be formally submitted. If EPA needs to inspect a facility or determine an enforcement issue, the facility's SWPPP will be reviewed for BMP information. (b) Customizing a facility's monitoring requirements is tantamount to writing an individual permit for the facility, which would require the same application package as for an individual permit. This is an option for those facilities where discharges or receiving waters are a concern but, otherwise, EPA believes the requirements of the present general permit with the identified pollutants of concern is sufficient for a large majority of facilities. (c) EPA agrees that monitoring can be used as an indicator of potential problems or toxicity concerns.

Comment t: Submit Discharge Monitoring Reports (DMRs) along with NOIs to prove compliance. If no DMRs were submitted under the current MSGP, require quarterly monitoring for all five years of MSGP–2000.

Response t: DMR and NOI submission deadlines have not coincided in the past and, from a regulatory perspective, it is not feasible to link them. Past instances of non-compliance are an enforcement issue with established penalties in the CFRs, but these instances do not automatically preclude future permit coverage nor can EPA include separate "penalties" such as 5-year monitoring in the permit for them.

Comment u: Analytic monitoring may be good for general info, which may be of use to the facility and regulatory agency, but it should not be required under the permit. Only visual monitoring should be required. One commenter indicated that analytic monitoring may be good for watershed-wide indications of general trends.

Response u: EPA believes that since analytic monitoring has been performed by substantial numbers of permittees only during the fourth year of the 1995 MSGP (many facilities complying with monitoring requirements in the fourth year were covered under the earlier baseline general permit during the second monitoring year and, consequently, had no equivalent monitoring requirement), it is premature to make any final conclusions regarding the value of the Agency's acquisition of the monitoring data or to consider dropping the monitoring. In essence, the fourth-year monitoring data set EPA received represents the baseline of pollutant discharge information under the sector-specific industrial general storm water permit. Several rounds of monitoring significantly enhance the utility of the results for evaluating the effectiveness of management practices at the site as well as for the industry sector as a whole. EPA commits to using data from the 1995 and 2000 permits to evaluate the effectiveness of management practices on an industry sector basis and to evaluate the need for changes in monitoring protocols for the next permit.

EPA acknowledges that, considering the small number of samples required per monitoring year (four), and the vagaries of storm water discharges, it may be difficult to determine or confirm the existence of a discharge problem. When viewed as an indicator, analytic levels considerably above benchmark values can serve as a flag to the operator that his SWPPP needs to be reevaluated and that pollutant loads may need to be reduced. Conversely, analytic levels below or near benchmarks can confirm to the operator that his SWPPP is doing its intended job. EPA believes there is presently no alternative that provides stakeholders with an equivalent indicator of program effectiveness. A technically valid, deterministic investigation of BMP effectiveness would necessarily involve collecting discharge pollutant load data before and after the BMP. The constraints inherent in monitoring preclude requiring this kind of investigation. All other methods used to make an assessment of SWPPP/BMP effectiveness are qualitative. Quarterly visual monitoring of storm water discharges has always been a permit requirement, for many of the same reasons why commenters favor it, and will continue to be so. The least subjective approach, and most beneficial to operators and stakeholders, EPA believes, is a combination of visual and analytic monitoring, using analyte benchmark levels (or "targets") as an indicator of potential problems. Variability of storm discharges and statistical concerns will necessitate operators and EPA exercising best professional judgement in interpreting the results of any monitoring.

Monitoring in impaired water bodies would focus attention on the problem water bodies and possible pollutant sources. However, not all impaired water bodies and their impairments have been determined. The goal of EPA's storm water program is also to protect and maintain water quality, not just remediate impaired waters, so focusing on impaired waters only does not fulfill all the program's responsibilities.

Comment v: If monitoring results are below the benchmark, facilities should not be required to monitor unless there are major changes to the facility.

Response v: Several rounds of monitoring significantly enhances the utility of the results for evaluating the effectiveness of management practices at the site as well as for the industry sector as a whole. EPA is keeping the monitoring requirement for all specified sectors at least one more time to provide stakeholders with continued assurance that SWPPPs are being implemented, concerted efforts to protect water quality are ongoing, and a mechanism is in place to indicate potential problems. The previous second year monitoring waiver for facilities with pollutant levels below the benchmark level is being retained.

Comment w: Substantially identical outfalls reduces burden and is beneficial to SWPPP implementation.

Response w: Noted.

Visual Monitoring

Comment x: Numerous commenters supported dropping analytic monitoring from the MSGP–2000 in favor of just requiring quarterly visual monitoring. Commenters claimed visual monitoring is adequate to ensure compliance and environmental protection (especially coupled with training), and is least burdensome.

Response x: Quarterly visual monitoring of storm water discharges has always been a permit requirement, for many of the same reasons why commenters favor it, and will continue to be so. EPA will also be retaining analytic monitoring because we believe the best way to ensure SWPPP effectiveness and protection of water quality is through a combination of visual and analytic monitoring. The reasons for not adopting visual monitoring only are explained further in the rationale for justifying quarterly analytic monitoring.

Comment y: Operators need flexibility to collect representative samples for visual monitoring.

Response y: EPA believes the same representative sample reduction provided for analytic monitoring is inappropriate for the quarterly visual monitoring. A visual examination of all discharges is the least that operators can do to ensure all discharges are clean and would provide greater confirmation to themselves and other stakeholders that the representative discharge sample reduction claimed for analytic monitoring is, in fact, justified.

Comment z: Support visual monitoring with use of field test kits, which are cheaper and easier than 40 CFR 136.

Response z: Field test kits have not yet been confirmed as being as reliable as currently required analytical methods. Therefore, EPA is not allowing the use of kits in place of currently required analytical methods at this time.

Comment aa: Make visual evaluations standard.

Response aa: EPA has standard protocols for storm water sampling (the storm water sampling guidance can be obtained from EPA's Office of Water Resource Center at 202–260–7786) and the permit describes the examination procedures, parameters to be examined, meaning of results, etc.

Comment bb: Visual monitoring should be reduced commensurately in arid climates.

Response bb: EPA already allows permittees to document in their monitoring records that no discharge occurred during a monitoring quarter.

Annual Reporting

Comment cc: One option suggested by commenters was for an annual report, possibly using a standardized form, to be submitted to EPA detailing the permittee's SWPPP highlights and revisions/additions, inspections, compliance evaluations, visual monitoring results, etc. One comment against this option stated that the volume of data submitted would be too great for the Agency to evaluate. Other opponents to this option indicated that the reports would not contain enough information to evaluate SWPPP effectiveness, ensure water quality protection, or provide the information necessary to make long-term management plans. Commenters in support of the annual report concept held that it would provide a record of the permittee's commitment to storm water control, was better for evaluating SWPPP effectiveness, and would provide information to EPA to determine if sampling or a site inspection is needed.

Response cc: Information on SWPPP highlights and revisions/additions, inspections, compliance evaluations, visual monitoring results, etc. is already required to be documented in a facility's SWPPP, which, if deemed necessary, must be provided to EPA on demand. If no monitoring data were available, an annual report could be used to ensure that a facility is implementing its SWPPP. The reports could also be used to prioritize sites for inspection. However, EPA agrees that it would be very burdensome to review all the reports and very difficult to assess the effectiveness of a facility's SWPPP based on that review alone. The subjectivity inherent in annual reporting makes it an undesirable substitute for analytic monitoring. Documenting the kind of information in the annual report is already a SWPPP requirement and is, therefore, available to operators for assessing and improving their storm water programs. For these reasons, EPA will not require reports containing essentially the same information required in SWPPPs to be submitted in lieu of analytic monitoring.

Group Monitoring

Comment dd: Commenters also suggested group monitoring. In this option a consortium of like permittees would do sampling at one facility, possibly on a rotating basis. The sample results would represent all the facilities in the consortium. A variation of group monitoring is for the consortium to retain a consultant to do representative sampling and provide storm water program guidance and evaluations. Supporters of this concept said it may allow for comparisons of effectiveness of different SWPPP practices (*e.g.*, sweeping vs. catchment basin for solids control). One commenter pointed out that the feasibility of the group concept is suspect due to the fact that individual facilities may have different topography, soil and other natural conditions.

Response dd: EPA believes that technically valid BMP comparisons could be done under this type of program. However, it would be difficult and very resource-intensive for EPA to establish criteria for group eligibility and then monitor to ensure that groups met these criteria.

Watershed Monitoring

Comment ee: Commenters suggested conducting watershed monitoring rather than monitoring at the facility. This option involves replacing the monitoring of discrete storm water discharges with ambient receiving water monitoring on a watershed basis.

Response ee: Watershed monitoring is invaluable to making real conclusions regarding storm water impacts of water quality, and will be employed in making total maximum daily load (TMDL) determinations. However, watershed monitoring cannot replace facility-specific storm water discharge monitoring to determine the loads contributed by the facilities and to evaluate the effectiveness of the SWPPP.

Monitoring Only in Impaired Waters

Comment ff: Several commenters supported requiring monitoring only in impaired water bodies and for pollutants that cause the impairment.

Response ff: Although this option would focus attention on the problem water bodies and possible pollutant sources, EPA and a commenter point out that not all impaired water bodies and their impairments have been determined. The goal of EPA's storm water program is also to protect and maintain water quality, not just remediate impaired waters, so focusing on impaired waters only does not fulfill all the program's responsibilities.

Section VII Cost Estimates for Common Permit Requirements

Comment: EPA incorrectly estimated costs associated with the original MSGP. The new permit imposes even more costs. EPA must better estimate these costs, especially for small businesses. EPA should conduct a Regulatory Flexibility Analysis as well as perform a Small Business Regulatory Enforcement Fairness Act (SBREFA) consultation.

Response: The Regulatory Flexibility Act (RFA), as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA) generally requires an agency to prepare a regulatory flexibility analysis for any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute. Under section 605(b) of the RFA, however, if the head of an agency certifies that a rule will not have a significant economic impact on a substantial number of small entities, the statute does not require the agency to prepare a regulatory flexibility analysis.

The MSGP–2000 provides facilities the option of obtaining a general permit rather than applying for individual permits; it does not extend coverage of the existing NPDES regulations. Therefore, the costs associated with obtaining a permit were already addressed when the NPDES regulations were issued. Furthermore, the MSGP–2000 is intended to reduce costs by providing a streamlined procedure for obtaining permit coverage. For these reasons, there was no requirement on EPA to conduct a separate analysis to support the MSGP–2000.

X. Economic Impact (Executive Order 12866)

Under Executive Order 12866 [58 FR 51735 (October 4, 1993)], the Agency must determine whether the regulatory action is "significant" and therefore subject to OMB review and the requirements of the Executive Order. The Order defines "significant regulatory action" as one that is likely to result in a rule that may have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; create a serious inconsistency or otherwise interfere with an action taken or planned by another agency; materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

EPA has determined that the reissued MSGP is not a "significant regulatory action" under the terms of Executive Order 12866 and is therefore not subject to formal OMB review prior to proposal.

XI. Unfunded Mandates Reform Act

Section 201 of the Unfunded Mandates Reform Act (UMRA), Public Law 104–4, generally requires Federal agencies to assess the effects of their "regulatory actions" on State, local, and tribal governments and the private sector. UMRA uses the term "regulatory actions" to refer to regulations. (See, *e.g.*, UMRA section 201, "Each agency shall * * * assess the effects of Federal regulatory actions * * * (other than to the extent that such regulations incorporate requirements specifically set forth in law)" (emphasis added)). UMRA section 102 defines "regulation" by reference to 2 U.S.C. 658 which in turn defines "regulation" and "rule" by reference to section 601(2) of the Regulatory Flexibility Act (RFA). That section of the RFA defines "rule" as "any rule for which the agency publishes a notice of proposed rulemaking pursuant to section 553(b) of [the Administrative Procedure Act (APA)], or any other law * * *"

As discussed in the RFA section of this notice, NPDES general permits are not "rules" under the APA and thus not subject to the APA requirement to publish a notice of proposed rulemaking. NPDES general permits are also not subject to such a requirement under the CWA. While EPA publishes a notice to solicit public comment on draft general permits, it does so pursuant to the CWA section 402(a) requirement to provide "an opportunity for a hearing." Thus, NPDES general permits are not "rules" for RFA or UMRA purposes.

EPA has determined that today's MSGP reissuance does not result in expenditures of $100 million or more for State, local and Tribal governments, in the aggregate, or the private sector in any one year.

The Agency also believes that the final MSGP will not significantly nor uniquely affect small governments. For UMRA purposes, "small governments" is defined by reference to the definition of "small governmental jurisdiction" under the RFA. (See UMRA section 102(1), referencing 2 U.S.C. 658, which references section 601(5) of the RFA.) "Small governmental jurisdiction" means governments of cities, counties, towns, etc., with a population of less than 50,000, unless the agency establishes an alternative definition.

Today's final MSGP also will not uniquely affect small governments because compliance with the final permit conditions affects small governments in the same manner as any other entities seeking coverage under the final permit.

XII. Paperwork Reduction Act

EPA has reviewed the requirements imposed on regulated facilities resulting from the final MSGP under the Paperwork Reduction Act of 1980, 44 U.S.C. 3501 *et seq.* The information collection requirements of the MSGP have already been approved in previous submissions made for the NPDES permit program under the provisions of the CWA.

XIII. Regulatory Flexibility Act

The Agency has determined that the final MSGP being published today is not subject to the Regulatory Flexibility Act ("RFA"), which generally requires an agency to conduct a regulatory flexibility analysis of any significant impact the rule will have on a substantial number of small entities. By its terms, the RFA only applies to rules subject to notice-and-comment rulemaking requirements under the Administrative Procedure Act ("APA") or any other statute. Today's final MSGP is not subject to notice and comment requirements under the APA or any other statute because the APA defines "rules" in a manner that excludes permits. See APA section 551(4), (6), and (8).

APA section 553 does not require public notice and opportunity for comment for interpretative rules or general statements of policy. In addition to finalizing the new MSGP, today's notice repeats for the convenience of the reader an interpretation of existing regulations promulgated almost twenty years ago. The action would impose no new or additional requirements.

Authorization to Discharge Under the National Pollutant Discharge Elimination System

In compliance with the provisions of the Clean Water Act, as amended, (33 U.S.C. 1251 *et seq.*), operators of discharges associated with industrial activities that submit a complete Notice of Intent in accordance with Part 2.2 for a discharge that is located in an area specified in Part 1.1 and eligible for permit coverage under Part 1.2 are authorized to discharge pollutants to waters of the United States in accordance with the conditions and requirements set forth herein.

This permit becomes effective on October 30, 2000.

This permit and the authorization to discharge expire at midnight, October 30, 2005.

Signed and issued this 15th day of September, 2000.

Linda M. Murphy,

Director, Office of Ecosystem Protection, Region 1.

Signed and issued this 15th day of September, 2000.

Kathleen C. Callahan,

Director, Division of Environmental Planning and Protection, Region 2.

Signed and issued this 15th day of September, 2000.

Joseph T. Piotrowski,

Acting Director, Water Protection Division, Region 3.

Signed and issued this 12th day of September, 2000.

Douglas Mundrick,

Acting Deputy Division Director, Water Management Division, Region 4.

Signed and issued this 27th day of September, 2000.

Sam Becker,

Acting Director, Water Quality Protection Division, Region 6.

Signed and issued this 2d day of October, 2000.

Stephen S. Tuber,

Acting Assistant Regional Administrator, Office of Partnerships and Regulatory Assistance, Region 8.

Signed and issued this 28th day of September, 2000.

Alexis Strauss,

Director, Water Division, Region 9.

Signed and issued this 14th day of September, 2000.

Michael A. Bussell,

Deputy Director, Office of Water, Region 10.

NPDES Multi-Sector General Permits for Storm Water Discharges Associated With Industrial Activities

Table of Contents

Note: In the Spirit of the Agency's "Readable Regulations" policy, this permit was written as much as practicable in a more reader-friendly, plain language format that should make it easier for people less familiar with traditional EPA permits and regulations to read and understand the permit requirements. Terms like "you" and "your" are used to refer to the party(ies) that are operators of a discharge, applicants, permittees, etc. Terms like "must" are used instead of "shall." Phrasing such as "If you. * * * " is used to identify conditions that may not apply to all permittees.

1. Coverage Under This Permit

1.1 Permit Area

The permit language is structured as if it were a single permit, with State, Indian country land or other area-specific conditions contained in Part 13. Permit coverage is actually provided by legally separate and distinctly numbered permits, all of which are contained herein, and which cover each of the areas listed in Parts 1.1.1 through 1.1.10.

Note: EPA can only provide permit coverage for areas and classes of discharges not within the scope of a State's NPDES authorization. For discharges not described in an area of coverage below, please contact the appropriate State NPDES permitting authority to obtain a permit.

1.1.1 EPA Region 1: CT, MA, ME, NH, RI, VT

The states of Connecticut, Rhode Island, and Vermont are the NPDES Permitting Authority for the majority of discharges within their respective states.

Permit No.	Areas of coverage/where EPA is permitting authority
CTR05*##I	Indian country lands within the State of Connecticut.
MAR05*###	Commonwealth of Massachusetts, except Indian country lands.
MAR05*##I	Indian country lands within the Commonwealth of Massachusetts.
MER05*###	State of Maine, except Indian country lands.
MER05*##I	Indian country lands within the State of Maine.
NHR05*###	State of New Hampshire.
RIR05*##I	Indian country lands within the State of Rhode Island.
VTR05*##F	Federal Facilities in the State of Vermont.

1.1.2 EPA Region 2: NJ, NY, PR, VI

The state of New York is the NPDES Permitting Authority for the majority of discharges within that state. New Jersey and the Virgin Islands are the NPDES Permitting Authority for all discharges within their respective states.

Permit No.	Areas of coverage/where EPA is permitting authority
PRR05*###	The Commonwealth of Puerto Rico.

1.1.3 EPA REGION 3: DE, DC, MD, PA, VA, WV

The state of Delaware is the NPDES Permitting Authority for the majority of discharges within that state. Maryland, Pennsylvania, and Virginia, West Virginia are the NPDES Permitting Authority for all discharges within these states.

Permit No.	Areas of coverage/where EPA is permitting authority
DCR05*###	The District of Columbia.
DER05*##F	Federal Facilities in the State of Delaware.

1.1.4 EPA Region 4: AL, FL, GA, KY, MS, NC, SC, TN

The states of Alabama, Florida, Mississippi, and North Carolina are the NPDES Permitting Authority for the majority of discharges within their respective states. Georgia, Kentucky, South Carolina and Tennessee are the NPDES Permitting Authority for all discharges within their respective states.

Permit No.	Areas of coverage/where EPA is permitting authority
ALR05*##I	Indian country lands within the State of Alabama.
FLR05*##I	Indian country lands within the State of Florida.
MSR05*##I	Indian country lands within the State of Mississippi.
NCR05*##I	Indian country lands within the State of North Carolina.

1.1.5 EPA Region 5: IL, IN, MI, MN, OH, WI

Coverage Not Available.

1.1.6 EPA Region 6: AR, LA, OK, TX, NM (Except See Region 9 for Navajo Lands, and See Region 8 for Ute Mountain Reservation Lands)

The states of Louisiana, Oklahoma, and Texas are the NPDES Permitting Authority for the majority of discharges within their respective states. Arkansas is the NPDES Permitting Authority for all discharges within that state.

Permit No.	Areas of coverage/where EPA is permitting authority
LAR05*##I	Indian country lands within the State of Louisiana.
NMR05*###	The State of New Mexico, except Indian country lands.
NMR05*##I	Indian country lands within the State of New Mexico, except Navajo Reservation Lands that are covered under Arizona permit AZR05*##I listed in Part 1.1.9 and Ute Mountain Reservation Lands that are covered under Colorado permit COR05*##I listed in Part 1.1.8.
OKR05*##I	Indian country lands within the State of Oklahoma.
OKR05*##F	Facilities in the State of Oklahoma not under the jurisdiction of the Oklahoma Department of Environmental Quality, except those on Indian country lands. EPA-jurisdiction facilities include SIC codes 1311, 1381, 1382, 1389 and 5171 and point source (but not non-point source) discharges associated with agricultural production, services, and silviculture.

Permit No.	Areas of coverage/where EPA is permitting authority
TXR05*##F	Facilities in the State of Texas not under the jurisdiction of the Texas Natural Resource Conservation Commission, except those on Indian country lands. EPA-jurisdiction facilities include SIC codes 1311, 1321, 1381, 1382, and 1389 (other than oil field service company "home base" facilities).
TXR05*##I	Indian country lands within the State of Texas.

1.1.7 EPA Region 7: IA, KS, MO, NE

Coverage Not Available.

1.1.8 EPA Region 8: CO, MT, ND, SD, WY, UT (Except See Region 9 for Goshute Reservation and Navajo Reservation Lands), the Ute Mountain Reservation in NM, and the Pine Ridge Reservation in NE

The states of Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming are the NPDES Permitting Authority for the majority of discharges within their respective states.

Permit No.	Areas of coverage/where EPA is permitting authority
COR05*##F	Federal Facilities in the State of Colorado, except those located on Indian country lands which are covered under Colorado permit CORO5*##I below.
COR05*##I	Indian country lands within the State of Colorado, including the portion of the Ute Mountain Reservation located in New Mexico.
MTR05*##I	Reserved.
NDR05*##I	Indian country lands within the State of North Dakota, including that portion of the Standing Rock Reservation located in South Dakota except Indian country within the former boundaries of the Lake Traverse Reservation that is covered under South Dakota permit SDR05*##I listed below.
SDR05*##I	Indian country lands within the State of South Dakota, including the portion of the Pine Ridge Reservation located in Nebraska and the portion of Indian country within the former boundaries of the Lake Traverse Reservation located in North Dakota except for the Standing Rock Reservation that is covered under North Dakota permit NDR05*##I listed above.
UTR05*##I	Indian country lands within the State of Utah, except Goshute and Navajo Reservation lands that are covered under Arizona permit AZR05*##I (Goshute) listed in Part 1.1.9 and Nevada permit NVR05*##I (Navajo) listed in Part 1.1.9.
WYR05*##I	Indian country lands within the State of Wyoming.

1.1.9 EPA Region 9: CA, HI, NV, Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, the Goshute Reservation in UT and NV, the Navajo Reservation in UT, NM, and AZ, the Duck Valley Reservation in ID, and the Fort McDermitt Reservation in OR

The states of California and Nevada are the NPDES Permitting Authority for the majority of discharges within their respective states. Hawaii is the NPDES Permitting Authority for all discharges within that state.

Permit No.	Areas of coverage/where EPA is permitting authority
ASR05*###	The Island of American Samoa.
AZR05*###	The State of Arizona, except Indian country lands.
AZR05*##I	Indian country lands within the State of Arizona, including Navajo Reservation lands in New Mexico and Utah.
CAR05*##I	Indian country lands within the State of California.
GUR05*###	The Island of Guam.
JAR05*###	Johnston Atoll.
MWR05*###	Midway Island and Wake Island.
NIR05*###	Commonwealth of the Northern Mariana Islands.
NVR05*##I	Indian country lands within the State of Nevada, including the Duck Valley Reservation in Idaho, the Fort McDermitt Reservation in Oregon and the Goshute Reservation in Utah.

1.1.10 Region 10: AK, ID (Except See Region 9 for Duck Valley Reservation Lands), OR (Except See Region 9 for Fort McDermitt Reservation), WA

The states of Oregon and Washington are the NPDES Permitting Authority for the majority of discharges within their respective states. The 1995 Multi-Sector General Permit was issued in the State of Alaska on February 9, 1996 (61 FR 5247) and the terms and conditions of the 1995 permit are effective for facilities in Alaska through February 9, 2001. EPA will reissue this permit for the State of Alaska at a future date.

Permit No.	Areas of coverage/where EPA is permitting authority
AKR05*##I	Indian country lands within Alaska.
IDR05*###	The State of Idaho, except Indian country lands.
IDR05*##I	Indian country lands within the State of Idaho, except Duck Valley Reservation lands which are covered under Nevada permit NVR05*##I listed in Part 1.1.9.
ORR05*##I	Indian country lands within the State of Oregon except Fort McDermitt Reservation lands that are covered under Nevada permit NVR05*##I listed in Part 1.1.9.
WAR05*##I	Indian country lands within the State of Washington.
WAR05*##F	Federal Facilities in the State of Washington, except those located on Indian country lands.

1.2 Eligibility

You must maintain permit eligibility to discharge under this permit. Any discharges that are not compliant with the eligibility conditions of this permit are not authorized by the permit and you must either apply for a separate permit to cover those ineligible discharges or take necessary steps to make the discharges eligible for coverage.

1.2.1 Facilities Covered

Your permit eligibility is limited to discharges from facilities in the "sectors" of industrial activity based on Standard Industrial Classification (SIC) codes and Industrial Activity Codes summarized in Table 1–1. References to "sectors" in this permit (*e.g.*, sector-specific monitoring requirements, *etc.*) refer to these sectors.

TABLE 1–1.—SECTORS OF INDUSTRIAL ACTIVITY COVERED BY THIS PERMIT

SIC code or activity code [1]	Activity represented
	Sector A: Timber Products
2411	Log Storage and Handling (Wet deck storage areas only authorized if no chemical additives are used in the spray water or applied to the logs).
2421	General Sawmills and Planning Mills.
2426	Hardwood Dimension and Flooring Mills.
2429	Special Product Sawmills, Not Elsewhere Classified.
2431–2439 (except 2434)	Millwork, Veneer, Plywood, and Structural Wood (see Sector W).
2448, 2449	Wood Containers.
2451, 2452	Wood Buildings and Mobile Homes.
2491	Wood Preserving.
2493	Reconstituted Wood Products.
2499	Wood Products, Not Elsewhere Classified.
	Sector B: Paper and Allied Products
2611	Pulp Mills.
2621	Paper Mills.
2631	Paperboard Mills.
2652–2657	Paperboard Containers and Boxes.
2671–2679	Converted Paper and Paperboard Products, Except Containers and Boxes.
	Sector C: Chemical and Allied Products
2812–2819	Industrial Inorganic Chemicals.
2821–2824	Plastics Materials and Synthetic Resins, Synthetic Rubber, Cellulosic and Other Manmade Fibers Except Glass.
2833–2836	Medicinal chemicals and botanical products; pharmaceutical preparations; in vitro and in vivo diagnostic substances; biological products, except diagnostic substances.
2841–2844	Soaps, Detergents, and Cleaning Preparations; Perfumes, Cosmetics, and Other Toilet Preparations.
2851	Paints, Varnishes, Lacquers, Enamels, and Allied Products.
2861–2869	Industrial Organic Chemicals.
2873–2879	Agricultural Chemicals.
2873	Facilities that Make Fertilizer Solely from Leather Scraps and Leather Dust.
2891–2899	Miscellaneous Chemical Products.
3952 (limited to list)	Inks and Paints, Including China Painting Enamels, India Ink, Drawing Ink, Platinum Paints for Burnt Wood or Leather Work, Paints for China Painting, Artist's Paints and Artist's Watercolors.
	Sector D: Asphalt Paving and Roofing Materials and Lubricants
2951, 2952	Asphalt Paving and Roofing Materials.
2992, 2999	Miscellaneous Products of Petroleum and Coal.
	Sector E: Glass Clay, Cement, Concrete, and Gypsum Products
3211	Flat Glass.
3221, 3229	Glass and Glassware, Pressed or Blown.
3231	Glass Products Made of Purchased Glass.
3241	Hydraulic Cement.
3251–3259	Structural Clay Products.
3261–3269	Pottery and Related Products.
3271–3275	Concrete, Gypsum and Plaster Products.
3291–3299	Abrasive, Asbestos, and Miscellaneous Nonmetallic Mineral Products.
	Sector F: Primary Metals
3312–3317	Steel Works, Blast Furnaces, and Rolling and Finishing Mills.
3321–3325	Iron and Steel Foundries.
3331–3339	Primary Smelting and Refining of Nonferrous Metals.
3341	Secondary Smelting and Refining of Nonferrous Metals.
3351–3357	Rolling, Drawing, and Extruding of Nonferrous Metals.

TABLE 1–1.—SECTORS OF INDUSTRIAL ACTIVITY COVERED BY THIS PERMIT—Continued

SIC code or activity code [1]	Activity represented
3363–3369	Nonferrous Foundries (Castings).
3398, 3399	Miscellaneous Primary Metal Products.
Sector G: Metal Mining (Ore Mining and Dressing)	
1011	Iron Ores.
1021	Copper Ores.
1031	Lead and Zinc Ores.
1041, 1044	Gold and Silver Ores.
1061	Ferroalloy Ores, Except Vanadium.
1081	Metal Mining Services.
1094, 1099	Miscellaneous Metal Ores.
Sector H: Coal Mines and Coal Mining Related Facilities	
1221–1241	Coal Mines and Coal Mining-Related Facilities.
Sector I: Oil and Gas Extraction and Refining	
1311	Crude Petroleum and Natural Gas.
1321	Natural Gas Liquids.
1381–1389	Oil and Gas Field Services.
2911	Petroleum Refineries.
Sector J: Mineral Mining and Dressing	
1411	Dimension Stone.
1422–1429	Crushed and Broken Stone, Including Rip Rap.
1442, 1446	Sand and Gravel
1455, 1459	Clay, Ceramic, and Refractory Materials.
1474–1479	Chemical and Fertilizer Mineral Mining.
1481	Nonmetallic Minerals Services, Except Fuels.
1499	Miscellaneous Nonmetallic Minerals, Except Fuels.
Sector K: Hazardous Waste Treatment, Storage, or Disposal Facilities	
HZ	Hazardous Waste Treatment Storage or Disposal.
Sector L: Landfills and Land Application Sites	
LF	Landfills, Land Application Sites, and Open Dumps.
Sector M: Automobile Salvage Yards	
5015	Automobile Salvage Yards.
Sector N: Scrap Recycling Facilities	
5093	Scrap Recycling Facilities.
Sector O: Steam Electric Generating Facilities	
SE	Steam Electric Generating Facilities.
Sector P: Land Transportation and Warehousing	
4011, 4013	Railroad Transportation.
4111–4173	Local and Highway Passenger Transportation.
4212–4231	Motor Freight Transportation and Warehousing.
4311	United States Postal Service.
5171	Petroleum Bulk Stations and Terminals.
Sector Q: Water Transportation	
4412–4499	Water Transportation.
Sector R: Ship and Boat Building or Repairing Yards	
3731,3732	Ship and Boat Building or Repairing Yards.
Sector S: Air Transportation	
4512–4581	Air Transportation Facilities.

R0019845

TABLE 1–1.—SECTORS OF INDUSTRIAL ACTIVITY COVERED BY THIS PERMIT—Continued

SIC code or activity code [1]	Activity represented
Sector T: Treatment Works	
TW	Treatment Works.
Sector U: Food and Kindred Products	
2011–2015	Meat Products.
2021–2026	Dairy Products.
2032	Canned, Frozen and Preserved Fruits, Vegetables and Food Specialties.
2041–2048	Grain Mill Products.
2051–2053	Bakery Products.
2061–2068	Sugar and Confectionery Products.
2074–2079	Fats and Oils.
2082–2087	Beverages.
2091–2099	Miscellaneous Food Preparations and Kindred Products.
2111–2141	Tobacco Products.
Sector V: Textile Mills, Apparel, and Other Fabric Product Manufacturing, Leather and Leather Products	
2211–2299	Textile Mill Products.
2311–2399	Apparel and Other Finished Products Made From Fabrics and Similar Materials.
3131–3199 (except 3111)	Leather and Leather Products, except Leather Tanning and Finishing (see Sector Z).
Sector W: Furniture and Fixtures	
2434	Wood Kitchen Cabinets.
2511–2599	Furniture and Fixtures.
Sector X: Printing and Publishing	
2711–2796	Printing, Publishing, and Allied Industries.
Sector Y: Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries.	
3011	Tires and Inner Tubes.
3021	Rubber and Plastics Footwear.
3052, 3053	Gaskets, Packing, and Sealing Devices and Rubber and Plastics Hose and Belting.
3061, 3069	Fabricated Rubber Products, Not Elsewhere Classified.
3081–3089	Miscellaneous Plastics Products.
3931	Musical Instruments.
3942–3949	Dolls, Toys, Games and Sporting and Athletic Goods.
3951–3955 (except 3952 facilities as specified in Sector C).	Pens, Pencils,and Other Artists' Materials.
3961, 3965	Costume Jewelry, Costume Novelties, Buttons, and Miscellaneous Notions, Except Precious Metal.
3991–3999	Miscellaneous Manufacturing Industries.
3411–3499	Fabricated Metal Products, Except Machinery and Transportation Equipment.
3911–3915	Jewelry, Silverware, and Plated Ware.
Sector AB: Transportation Equipment, Industrial or Commercial Machinery	
3511–3599 (except 3571–3579)	Industrial and Commercial Machinery (except Computer and Office Equipment) (see Sector AC).
3711–3799 (except 3731, 3732)	Transportation Equipment (except Ship and Boat Building and Repairing) (see Sector R).
Sector AC: Electronic, Electrical, Photographic, and Optical Goods	
3571–3579	Computer and Office Equipment.
3612–3699	Electronic, Electrical Equipment and Components, except Computer Equipment.
3812	Measuring, Analyzing and Controlling Instrument; Photographic and Optical Goods.
Sector AD: Non-Classified Facilities	
N/A	Other storm water discharges designated by the Director as needing a permit (see 40 CFR 122.26(g)(1)(I)) or any facility discharging storm water associated with industrial activity not described by any of Sectors A–AC. **Note:** Facilities may not elect to be covered under Sector AD. Only the Director may assign a facility to Sector AD.

[1] A complete list of SIC codes (and conversions from the newer North American Industry Classification System (NAICS)) can be obtained from the Internet at *http://www.census.gov/epcd/www/naics.html* or in paper form from various locations in the document entitled "Handbook of Standard Industrial Classifications," Office of Management and Budget, 1987. Industrial activity codes are provided on the Multi-Sector General Permit Notice of Intent (NOI) application form (EPA Form Number 3510–6).

R0019846

1.2.1.1 *Co-located Activities.* If you have co-located industrial activities on-site that are described in a sector(s) other than your primary sector, you must comply with all other applicable sector-specific conditions found in Part 6 for the co-located industrial activities. The extra sector-specific requirements are applied only to those areas of your facility where the extra-sector activities occur. An activity at a facility is not considered co-located if the activity, when considered separately, does not meet the description of a category of industrial activity covered by the storm water regulations, and identified by the MSGP–2000 SIC code list. For example, unless you are actually hauling substantial amounts of freight or materials with your own truck fleet or are providing a trucking service to outsiders, simple maintenance of vehicles used at your facility is unlikely to meet the SIC code group 42 description of a motor freight transportation facility. Even though Sector P may not apply, the runoff from your vehicle maintenance facility would likely still be considered storm water associated with industrial activity. As such, your SWPPP must still address the runoff from the vehicle maintenance facility—although not necessarily with the same degree of detail as required by Sector P—but you would not be required to monitor as per Sector P.

If runoff from co-located activities commingles, you must monitor the discharge as per the requirements of all applicable sectors (regardless of the actual location of the discharge). If you comply with all applicable requirements from all applicable sections of Part 6 for the co-located industrial activities, the discharges from these co-located activities are authorized by this permit.

1.2.2 Discharges Covered

1.2.2.1 *Allowable Storm Water Discharges.* Subject to compliance with the terms and conditions of this permit, you are authorized to discharge pollutants in:

1.2.2.1.1 Discharges of storm water runoff associated with industrial activities as defined in 40 CFR 122.26 (b)(14)(i–ix and xi) from the sectors of industry described in Table 1–1, and that are specifically identified by outfall or discharge location in the Storm Water Pollution Prevention Plan (see Part 4.2.2.3.7);

1.2.2.1.2 Non-storm water discharges as noted in Part 1.2.2.2 or otherwise specifically allowed by the permit;

1.2.2.1.3 Discharges subject to an effluent guideline listed in Table 1–2 that also meet all other eligibility requirements of the permit. Interim coverage is also available for discharges subject to a new storm water effluent limitation guideline promulgated after the effective date of this permit. Discharges subject to a New Source Performance Standard (NSPS) effluent guideline must also meet the requirements of Part 1.2.4.;

1.2.2.1.4 Discharges designated by the Director as needing a storm water permit under 40 CFR 122.26(a)(1)(v) or under 122.26(a)(9) and 122.26(g)(1)(i); and

1.2.2.1.5 Discharges comprised of a discharge listed in Parts 1.2.2.1.1 to 1.2.2.1.4 above commingled with a discharge authorized by a different NPDES permit and/or a discharge that does not require NPDES permit authorization.

TABLE 1–2.—EFFLUENT GUIDELINES APPLICABLE TO DISCHARGES THAT MAY BE ELIGIBLE FOR PERMIT COVERAGE

Effluent guideline	New source performance standards included in effluent guidelines?	Sectors with affected facilities
Runoff from material storage piles at cement manufacturing facilities [40 CFR Part 411 Subpart C (established February 23, 1977)].	Yes	E
Contaminated runoff from phosphate fertilizer manufacturing facilities [40 CFR Part 418 Subpart A (established April 8, 1974)].	Yes	C
Coal pile runoff at steam electric generating facilities [40 CFR Part 423 (established November 19, 1982)]	Yes	O
Discharges resulting from spray down or intentional wetting of logs at wet deck storage areas [40 CFR Part 429, Subpart I (established January 26, 1981)].	Yes	A
Mine dewatering discharges at crushed stone mines [40 CFR part 436, Subpart B]	No	J
Mine dewatering discharges at construction sand and gravel mines [40 CFR part 436, Subpart C]	No	J
Mine dewatering discharges at industrial sand mines [40 CFR part 436, Subpart D]	No	J
Runoff from asphalt emulsion facilities [40 CFR Part 443 Subpart A (established July 24, 1975)]	Yes	D
Runoff from landfills, [40 CFR Part 445, Subpart A and B (established February 2, 2000]	Yes	K & L

1.2.2.2 *Allowable Non-Storm Water Discharges.* You are also authorized for the following non-storm water discharges, provided the non-storm water component of your discharge is in compliance with Part 4.4.2 (non-storm water discharges):

1.2.2.2.1 Discharges from fire fighting activities;

1.2.2.2.2 Fire hydrant flushings;

1.2.2.2.3 Potable water including water line flushings;

1.2.2.2.4 Uncontaminated air conditioning or compressor condensate;

1.2.2.2.5 Irrigation drainage;

1.2.2.2.6 Landscape watering provided all pesticides, herbicides, and fertilizer have been applied in accordance with manufacturer's instructions;

1.2.2.2.7 Pavement wash waters where no detergents are used and no spills or leaks of toxic or hazardous materials have occurred (unless all spilled material has been removed);

1.2.2.2.8 Routine external building wash down which does not use detergents;

1.2.2.2.9 Uncontaminated ground water or spring water;

1.2.2.2.10 Foundation or footing drains where flows are not contaminated with process materials such as solvents;

1.2.2.2.11 Incidental windblown mist from cooling towers that collects on rooftops or adjacent portions of your facility, but NOT intentional discharges from the cooling tower (*e.g.*, "piped" cooling tower blowdown or drains).

1.2.3 Limitations on Coverage

1.2.3.1 *Prohibition on Discharges Mixed with Non-Storm Water.* You are not authorized for discharges that are mixed with sources of non-storm water. This exclusion does not apply to discharges identified in Part 1.2.2.2, provided the discharges are in compliance with Part 4.4.2 (Storm

Water Pollution Prevention Plan requirements for authorized non-storm water discharges), and to any discharge explicitly authorized by the permit.

1.2.3.2 *Storm Water Discharges Associated with Construction Activity.* You are not authorized for storm water discharges associated with construction activity as defined in 40 CFR 122.26(b)(14)(x) or 40 CFR 122.26(b)(15).

1.2.3.3 *Discharges Currently or Previously Covered by Another Permit.* You are not authorized for the following:

1.2.3.3.1 Storm water discharges associated with industrial activity that are currently covered under an individual permit or an alternative general permit.

1.2.3.3.2 Discharges previously covered by an individual permit or alternative general permit (except the 1992 "Baseline" or the 1995 Multi-Sector NPDES General Permits for Storm Water Discharges Associated With Industrial Activity) that has expired, or been terminated at the request of the permittee unless:

1.2.3.3.2.1 The individual permit did not contain numeric water quality-based limitations developed for the storm water component of the discharge; and

1.2.3.3.2.2 The permittee includes any specific BMPs for storm water required under the individual permit in the SWPPP required under Part 4 of this permit.

1.2.3.3.3 Storm water discharges associated with industrial activity from facilities where any NPDES permit has been or is in the process of being denied, terminated, or revoked by the Director (other than in a replacement permit issuance process). Upon request, the Director may waive this exclusion if operator of the facility has since passed to a different owner/operator and new circumstances at the facility justify a waiver.

1.2.3.4 *Discharges Subject to Effluent Limitations Guidelines.* You are not authorized for discharges subject to any effluent limitation guideline that is not included in Table 1–2. For discharges subject to a New Source Performance Standard (NSPS) effluent guideline identified in Table 1–2, you must comply with Part 1.2.4 prior to being eligible for permit coverage.

1.2.3.5 *Discharge Compliance with Water Quality Standards.* You are not authorized for storm water discharges that the Director determines will cause, or have reasonable potential to cause or contribute to, violations of water quality standards. Where such determinations have been made, the Director may notify you that an individual permit application is necessary in accordance with Part 9.12. However, the Director may authorize your coverage under this permit after you have included appropriate controls and implementation procedures designed to bring your discharges into compliance with water quality standards in your Storm Water Pollution Prevention Plan.

1.2.3.6 *Endangered and Threatened Species or Critical Habitat Protection.* You are not authorized for discharges that do not avoid unacceptable effects on Federally listed endangered and threatened ("listed") species or designated critical habitat ("critical habitat").

Caution: Additional endangered and threatened species have been listed and critical habit designated since the 1995 MSGP was issued. Even if you were previously covered by the 1995 MSGP, you must determine eligibility for this permit through the processes described below and in Addendum A. Where applicable, you may incorporate information from your previous endangered species analysis in your documentation of eligibility for this permit.

1.2.3.6.1 Coverage under this permit is available only if your storm water discharges, allowable non-storm water discharges, and discharge-related activities are not likely to jeopardize the continued existence of any species that are listed as endangered or threatened ("listed") under the ESA or result in the adverse modification or destruction of habitat that is designated or proposed to be designated as critical under the ESA ("critical habitat"). Submission of a signed NOI will be deemed to also constitute your certification of eligibility.

1.2.3.6.2 "Discharge-related activities" include: activities which cause, contribute to, or result in storm water point source pollutant discharges; and measures to control storm water discharges including the siting, construction and operation of best management practices (BMPs) to control, reduce or prevent storm water pollution.

1.2.3.6.3 *Determining Eligibility:* You must use the most recent Endangered and Threatened Species County-Species List available from EPA and the process in Addendum A (ESA Screening Process) to determine your eligibility *PRIOR* to submittal of your NOI. As of the effective date of this permit, the most current version of the List is located on the EPA Office of Water Web site at *http://www.epa.gov/owm/esalst2.htm.* You must meet one or more of the criteria in 1.2.3.6.3.1 through 1.2.3.6.3.5 below for the entire term of coverage under the permit. You must include a certification of eligibility and supporting documentation on the eligibility determination in your Storm Water Pollution Prevention Plan.

1.2.3.6.3.1 *Criteria A:* No endangered or threatened species or critical habitat are in proximity to your facility or the point where authorized discharges reach the receiving water; or

1.2.3.6.3.2 *Criteria B:* In the course of a separate federal action involving your facility (*e.g.*, EPA processing request for an individual NPDES permit, issuance of a CWA § 404 wetlands dredge and fill permit, *etc.*), formal or informal consultation with the Fish and Wildlife Service and/or the National Marine Fisheries Service (the "Services") under section 7 of the Endangered Species Act (ESA) has been concluded and that consultation:

(a) Addressed the effects of your storm water discharges, allowable non-storm water discharges, and discharge-related activities on listed species and critical habitat and

(b) The consultation resulted in either a no jeopardy opinion or a written concurrence by the Service on a finding that your storm water discharges, allowable non-storm water discharges, and discharge-related activities are not likely to adversely affect listed species or critical habitat; or

1.2.3.6.3.3 *Criteria C:* Your activities are authorized under section 10 of the ESA and that authorization addresses the effects of your storm water discharges, allowable non-storm water discharges, and discharge-related activities on listed species and critical habitat; or

1.2.3.6.3.4 *Criteria D:* Using best judgement, you have evaluated the effects of your storm water discharges, allowable non-storm water discharges, and discharge-related activities on listed endangered or threatened species and critical habitat and do not have reason to believe listed species or critical habitat would be adversely affected.

1.2.3.6.3.5 *Criteria E:* Your storm water discharges, allowable non-storm water discharges, and discharge-related activities were already addressed in another operator's certification of eligibility under Part 1.2.3.6.3.1 through 1.2.3.6.3.4 which included your facility's activities. By certifying eligibility under this Part, you agree to comply with any measures or controls upon which the other operator's certification was based;

1.2.3.6.4 The Director may require any permittee or applicant to provide documentation of the permittee or applicant's determination of eligibility for this permit using the procedures in Addendum A where EPA or the Fish and Wildlife and/or National Marine Fisheries Services determine that there is a potential impact on endangered or threatened species or a critical habitat.

1.2.3.6.5 You are not authorized to discharge if the discharges or discharge-related activities cause a prohibited "take" of endangered or threatened species (as defined under section 3 of the Endangered Species Act and 50 CFR 17.3), unless such takes are authorized under sections 7 or 10 of the Endangered Species Act.

1.2.3.6.6 You are not authorized for any discharges where the discharges or discharge-related activities are likely to jeopardize the continued existence of any species that are listed as endangered or threatened under the ESA or result in the adverse modification or destruction of habitat that is designated or proposed to be designated as critical under the ESA.

1.2.3.6.7 The Endangered Species Act (ESA) provisions upon which part 1.2.3.6 is based do not apply to state-issued permits. Should administration of all or a portion of this permit be transfer to a State as a result of that State assuming the NPDES program pursuant to Clean Water Act § 402(b), Part 1.2.3.6 will not apply to any new NOIs submitted to the State after the State assumes administration of the permit (unless otherwise provided in the state program authorization agreement). Likewise, any other permit conditions based on Part 1.2.3.6 will no longer apply to new NOIs accepted by the NPDES-authorized state.

1.2.3.7 *Storm water Discharges and Storm Water Discharge-Related Activities with Unconsidered Adverse Effects on Historic Properties.*

1.2.3.7.1 *Determining Eligibility:* In order to be eligible for coverage under this permit, you must be in compliance with the National Historic Preservation Act. Your discharges may be authorized under this permit only if:

1.2.3.7.1.1 *Criteria A:* Your storm water discharges, allowable non-storm water discharges, and discharge-related activities do not affect a property that is listed or is eligible for listing on the National Register of Historic Places as maintained by the Secretary of the Interior; or

1.2.3.7.1.2 *Criteria B:* You have obtained and are in compliance with a written agreement with the State Historic Preservation Officer (SHPO) or Tribal Historic Preservation Officer (THPO) that outlines all measures you will undertake to mitigate or prevent adverse effect to the historic property.

1.2.3.7.2 Addendum B of this permit provides guidance and references to assist you with determining your permit eligibility concerning this provision.

1.2.3.8 *Discharges to Water Quality-Impaired or Water Quality-Limited Receiving Waters.*

1.2.3.8.1 You are not authorized to discharge if your discharge is prohibited under 40 CFR 122.4(i).

1.2.3.8.2 You are not authorized to discharge any pollutant into any water for which a Total Maximum Daily Load (TMDL) has been either established or approved by the EPA unless your discharge is consistent with that TMDL.

1.2.3.9 *Storm Water Discharges Subject to Anti-degradation Water Quality Standards.* You are not authorized for discharges that do not comply with your State or Tribe's anti-degradation policy for water quality standards. State and Tribal anti-degradation policies can be obtained from the appropriate State or Tribal environmental office or their Internet sites.

1.2.4 Discharges Subject to New Source Performance Standards (NSPS)[1] [2]

1.2.4.1 *Documentation of New Source Review.* If you have a discharge(s) subject to a NSPS effluent guideline, you must obtain and retain the following on site prior to the submittal of your Notice of Intent:

1.2.4.1.1 Documentation from EPA of "No Significant Impact" or

1.2.4.1.2 A completed Environmental Impact Statement in accordance with an environmental review conducted by EPA pursuant to 40 CFR 6.102(a)(6).

1.2.4.2 *Initiating a New Source Review.* If the Agency's decision has not been obtained, you may use the format and procedures specified in Addendum C to submit information to EPA to initiate the process of the environmental review.

To maintain eligibility, you must implement any mitigation required of the facility as a result of the National Environmental Policy Act (NEPA) review process. Failure to implement mitigation measures upon which the Agency's NEPA finding is based is grounds for termination of permit coverage.

1.2.4.3 *NEPA Requirements after State Assumption of this Permit.* The National Environmental Policy Act (NEPA) provisions upon which part 1.2.4 is based do not apply to state-issued permits. Should administration of all or a portion of this permit be transfer to a State as a result of that State assuming the NPDES program pursuant to Clean Water Act § 402(b), Part 1.2.4 will not apply to any new NOIs submitted to the State after the State assumes administration of the permit. Likewise, any other permit conditions based on Part 1.2.4 will no longer apply to new NOIs accepted by the NPDES-authorized state.

1.3 How To Obtain Authorization Under This Permit

1.3.1 Basic Eligibility

You may be authorized under this permit only if you have a discharge of storm water associated with industrial activity from your facility. In order to obtain authorization under this permit, you must:

1.3.1.1 Meet the Part 1.2 eligibility requirements; and

1.3.1.2 Develop and implement a Storm Water Pollution Prevention Plan (SWPPP) (see definition in Part 12) according to the requirements in Part 4 of this permit.

1.3.1.3 Submit a complete Notice of Intent (NOI) in accordance with the requirements of Part 2 of this permit. Any new operator at a facility, including those who replace an operator who has previously obtained permit coverage, must submit an NOI to be covered for discharges for which they are the operator.

1.3.2 Effective Date of Permit Coverage

Unless notified by the Director to the contrary, if you submit a correctly completed NOI in accordance with the requirements of this permit, you are authorized to discharge under the terms and conditions of this permit two (2) days after the date the NOI is postmarked (but in no event, earlier than the effective date of the permit). The Director may deny coverage under this permit and require submission of an application for an individual NPDES permit based on a review of your NOI or other information (see Part 9.12). Authorization to discharge is not automatically granted two days after the NOI is mailed if your NOI is materially incomplete (*e.g.*, critical information left off, NOI unsigned, *etc.*) or if your discharge(s) is not eligible for coverage by the permit.

[1] NSPS apply only to discharges from those facilities or installations that were constructed after the promulgation of NSPS. For example, storm water discharges from areas where the production of asphalt paving and roofing emulsions occurs are subject to NSPS only if the asphalt emulsion facility was constructed after July 24, 1975.

[2] The provisions specified in Part 1.2.2.3 and Part 1.2.4 related to documenting New Source reviews are requirements of Federal programs under the National Environmental Policy Act of 1969 and will not apply to such facilities in the event that authority for the NPDES program has been assumed by the State/Tribe agency and administration of this permit has been transferred to the State/Tribe.

1.4 Terminating Coverage

1.4.1 Submitting a Notice of Termination

If you wish to terminate coverage under this permit, you must submit a Notice of Termination (NOT) in accordance with Part 11 of this permit. You must continue to comply with this permit until you submit an NOT. Your authorization to discharge under the permit terminates at midnight of the day the NOT is signed.

1.4.2 When to Submit an NOT

You must submit an NOT within thirty (30) days after one or more of the following conditions have been met:

1.4.2.1 A new owner/operator has assumed responsibility for the facility

1.4.2.2 You have ceased operations at the facility and there no longer are discharges of storm water associated with industrial activity from the facility and you have already implemented necessary sediment and erosion controls as required by Part 4.2.7.2.2.1

1.4.3 Discharges After the NOT Is Submitted

Enforcement actions may be taken if you submit an NOT without meeting one or more of these conditions, unless you have obtained coverage under an alternate permit or have satisfied the requirements of Part 1.5.

1.5 Conditional Exclusion for No Exposure

If you are covered by this permit, but later are able to file a "no exposure" certification to be excluded from permitting under 40 CFR 122.26(g), you are no longer authorized by nor required to comply with this permit. If you are no longer required to have permit coverage due to a "no exposure" exclusion, you are not required to submit a Notice of Termination.

2. Notice of Intent Requirements

2.1 Notice of Intent (NOI) Deadlines

Your NOI must be submitted in accordance with the deadlines in Table 2–1. You must meet all applicable eligibility conditions of Part 1.2 before you submit your NOI.

TABLE 2.–1—DEADLINES FOR NOI SUBMITTAL

Category	Deadline
1. Existing discharges covered under the 1995 MSGP (see also Part 2.1.2—Interim Coverage).	December 29, 2000.
2. New discharges	Two (2) days prior to commencing operation of the facility with discharges of storm water associated with industrial activity.
3. New owner/operator of existing discharges.	Two (2) days prior to taking operational control of the facility.
4. Continued coverage when the permit expires in 2005.	See Part 9.2

Only one NOI need be submitted to cover all of your activities at the facility (*e.g.*, you do not need to submit a separate NOI for each separate type of industrial activity located at a facility or industrial complex, provided your SWPPP covers each area for which you are an operator).

2.1.1 Submitting a Late NOI

You are not prohibited from submitting an NOI after the dates provided in Table 2–1. If a late NOI is submitted, your authorization is only for discharges that occur after permit coverage is granted. The Agency reserves the right to take appropriate enforcement actions for any unpermitted discharges.

2.1.2 Interim Permit Coverage for 1995 MSGP Permittees

If you had coverage for your facility under the 1995 MSGP, you may be eligible for continued coverage under this permit on an interim basis.

2.1.2.1 *Discharges Authorized Under the 1995 MSGP.* If permit coverage for your facility under the 1995 MSGP was effective as of the date the 1995 MSGP expired (or the date this permit replaced the 1995 MSGP if earlier), your authorization is automatically continued into this replacement permit on an interim basis for up to ninety (90) days from the effective date of the permit. Interim coverage will terminate earlier than the 90 days when an NOI has been submitted and coverage either granted or denied; or after submittal of an NOT.

2.1.2.2 *Discharges Authorized Under the 1995 MSGP, But Not Clearly Eligible for Coverage Under This Permit.* If you were previously covered by the 1995 MSGP, but cannot meet (or cannot immediately determine if you meet) the eligibility requirements of this permit, you may nonetheless be authorized under this permit for a period not to exceed 270 days from the date this permit is published in the **Federal Register**, provided you submit an application for an alternative permit within 90 days from the permit publication date.

2.1.2.3 *Interim Coverage Permit Requirements.* While you are operating under interim coverage status, you must:

2.1.2.3.1 Submit a complete NOI (see Part 2.2) by the deadlines listed in Table 2–1 or Part 2.1.2.2 above.

2.1.2.3.2 Comply with the terms and conditions of the 1995 MSGP.

2.1.2.3.3 Update your Storm Water Pollution Prevention Plan to comply with the requirements of this permit within 90 days after the effective date of this permit.

2.2 Contents of Notice of Intent (NOI)

Your NOI for coverage under this permit must include the following information:

2.2.1 Permit Selection

2.2.1.1 If you were covered under the previous MSGP, provide the permit number assigned to your facility.

2.2.2 Owner/Operator Information

2.2.2.1 The name, address, and telephone number of the operator (*e.g.*, your company, etc.) filing the NOI for permit coverage;

2.2.3 Facility Information

2.2.3.1 The name (or other identifier), address, county, and latitude/longitude of the facility for which the NOI is submitted;

2.2.3.2 An indication of whether you are a Federal, State, Tribal, private, or other public entity;

2.2.3.3 An indication of whether the facility is located on Indian country lands;

2.2.3.4 Certification that a Storm Water Pollution Prevention Plan (SWPPP) meeting the requirements of Part 4 has been developed (including attaching a copy of this permit to the plan;

2.2.3.5 The name of the receiving water(s);

2.2.3.6 The name of the municipal operator if the discharge is through a municipal separate storm sewer system, unless you are the owner/operator of that municipal separate storm sewer system;

2.2.3.7 Identification of applicable sector(s) in this permit, as designated in Table 1–1, that cover the discharges associated with industrial activity you wish to cover under this permit;

2.2.3.8 Up to four 4-digit Standard Industrial Classification (SIC) codes or the 2-letter Activity Codes for hazardous waste treatment, storage, or disposal activities (HZ); land/disposal facilities that receive or have received any industrial waste (LF); steam electric power generating facilities (SE); or treatment works treating domestic sewage (TW) that best represent the principal products produced or services rendered by your facility and major co-located activities;

2.2.4 Eligibility Screening

2.2.4.1 Based on the instructions in Addendum A, whether any listed or proposed threatened or endangered species, or designated critical habitat, are in proximity to the storm water discharges or storm water discharge-related activities to be covered by this permit;

2.2.4.2 Whether any historic property listed or eligible for listing on the National Register of Historic Places is located on the facility or in proximity to the discharge;

2.2.4.3 A signed and dated certification, signed by a authorized representative of your facility and maintained with your SWPPP, as detailed in Part 9.7 that certifies the following:

"I certify under penalty of law that I have read and understand the Part 1.2 eligibility requirements for coverage under the multi-sector storm water general permit including those requirements relating to the protection of endangered or threatened species or critical habitat. To the best of my knowledge, the storm water and allowable non-storm discharges authorized by this permit (and discharged related activities), pose no jeopardy to endangered or threatened species or critical habitat, or are otherwise eligible for coverage under Part 1.2.3.6 of the permit. To the best of my knowledge, I further certify that such discharges and discharge related activities do not have an effect on properties listed or eligible for listing on the National Register or Historic Places under the National Historic Preservation Act, or are otherwise eligible for coverage under Part 1.2.3.7 of the permit. I understand that continued coverage under the multi-sector storm water general permit is contingent upon maintaining eligibility as provided for in Part 1.2"

2.3 Use of NOI Form

You must submit the information required under Part 2.2 on the latest version of the NOI form (or photocopy thereof) contained in Addendum D. Your NOI must be signed and dated in accordance with Part 9.7 of this permit.

Note: If EPA notifies dischargers (either directly, by public notice, or by making information available on the Internet) of other NOI form options that become available at a later date (*e.g.*, electronic submission of forms), you may take advantage of those options to satisfy the NOI use and submittal requirements of Part 2.

2.4 Where To Submit

Your NOI must be signed in accordance with Part 9.7 of this permit and submitted to the Director of the NPDES Permitting Program at the following address: Storm Water Notice of Intent (4203), US EPA, 1200 Pennsylvania Avenue NW, Washington, DC 20460.

2.5 Additional Notification

If your facility discharges through a large or medium municipal separate storm sewer system (MS4), or into a MS4 that has been designated by the permitting authority, you must also submit a signed copy of the NOI to the operator of that MS4 upon request by the MS4 operator.

3. Special Conditions

3.1 Hazardous Substances or Oil

You must prevent or minimize the discharge of hazardous substances or oil in your discharge(s) in accordance with the Storm Water Pollution Prevention Plan for your facility. This permit does not relieve you of the reporting requirements of 40 CFR 110, 40 CFR 117 and 40 CFR 302 relating to spills or other releases of oils or hazardous substances.

3.1.1 Single Releases and Spills

Where a release containing a hazardous substance or oil in an amount equal to or in excess of a reportable quantity established under either 40 CFR 110, 40 CFR 117 or 40 CFR 302, occurs during a 24 hour period:

3.1.1.1 You must notify the National Response Center (NRC) (800–424–8802; in the Washington, DC, metropolitan area call 202–426–2675) in accordance with the requirements of 40 CFR 110, 40 CFR 117 and 40 CFR 302 as soon as he or she has knowledge of the discharge;

3.1.1.2 You must modify your Storm Water Pollution Prevention Plan required under Part 4 within 14 calendar days of knowledge of the release to: provide a description of the release, the circumstances leading to the release, and the date of the release. In addition, you must review your plan to identify measures to prevent the reoccurrence of such releases and to respond to such releases, and you must modify your plan where appropriate.

3.1.2 Anticipated Discharges

Anticipated discharges containing a hazardous substance in an amount equal to or in excess of reporting quantities are those caused by events occurring within the scope of the relevant operating system. If your facilities has (or will have) more than one anticipated discharge per year containing a hazardous substance in an amount equal to or in excess of a reportable quantity, you must:

3.1.2.1 Submit notifications of the first release that occurs during a calendar year (or for the first year of this permit, after submittal of an NOI); and

3.1.2.2 Provide a written description in the SWPPP of the dates on which such releases occurred, the type and estimate of the amount of material released, and the circumstances leading to the releases. In addition, your SWPPP must address measures to minimize such releases.

3.1.2.3 Where a discharge of a hazardous substance or oil in excess of reporting quantities is caused by a non-storm water discharge (*e.g.*, a spill of oil into a separate storm sewer), that discharge is not authorized by the MSGP and you must report the discharge as required under 40 CFR Part 110, 40 CFR Part 117, or 40 CFR Part 302 (see Part 3.1.1. above). In the event of a spill, the requirements of Section 311 of the CWA and other applicable provisions of Sections 301 and 402 of the CWA continue to apply.

3.2 Additional Requirements for Salt Storage

If you have storage piles of salt used for deicing or other commercial or industrial purposes, they must be enclosed or covered to prevent exposure to precipitation (except for exposure resulting from adding or removing materials from the pile). Piles do not need to be enclosed or covered where storm water from the pile is not discharged to waters of the United States or the discharges from the piles are authorized under another permit.

3.3 Discharge Compliance With Water Quality Standards

Your discharges must not be causing or have the reasonable potential to cause or contribute to a violation of a water quality standard. Where a discharge is already authorized under this permit and is later determined to cause or have the reasonable potential to cause or contribute to the violation of an applicable water quality standard, the Director will notify you of such violation(s). You must take all necessary actions to ensure future discharges do not cause or contribute to the violation of a water quality standard and document these actions in the Storm Water Pollution Prevention Plan. If violations remain or re-occur, then coverage under this permit may be terminated by the Director, and an alternative general permit or individual permit may be issued. Compliance with this requirement does not preclude any enforcement activity as provided by the Clean Water Act for the underlying violation.

4. Storm Water Pollution Prevention Plans

4.1 Storm Water Pollution Prevention Plan Requirements

You must prepare a Storm Water Pollution Prevention Plan (SWPPP) for your facility before submitting your Notice of Intent for permit coverage. Your SWPPP must be prepared in accordance with good engineering practices. Use of a registered professional engineer for SWPPP preparation is not required by the permit, but may be independently required under state law and/or local ordinance. Your SWPPP must:

4.1.1 Identify potential sources of pollution which may reasonably be expected to affect the quality of storm water discharges from your facility;

4.1.2 Describe and ensure implementation of practices which you will use to reduce the pollutants in storm water discharges from the facility; and

4.1.3 assure compliance with the terms and conditions of this permit.

Note: At larger installations such as military bases where there are well-defined industrial versus non-industrial areas, the SWPPP required under this Part need only address those areas with discharges of storm water associated with industrial activity. (*e.g.*, under this permit, a U.S. Air Force Base would need to address the vehicle maintenance areas associated with the "airport" portion of the base in the SWPPP, but would not need to address a car wash that served only the on-base housing areas.)

4.2 Contents of Plan

4.24.2.1 Pollution Prevention Team

You must identify the staff individual(s) (by name or title) that comprise the facility's storm water Pollution Prevention Team. Your Pollution Prevention Team is responsible for assisting the facility/plant manager in developing, implementing, maintaining and revising the facility's SWPPP. Responsibilities of each staff individual on the team must be listed.

4.2.2 Site Description

Your SWPPP must include the following:

4.2.2.1 *Activities at Facility.* description of the nature of the industrial activity(ies) at your facility;

4.2.2.2 *General Location Map.* a general location map (*e.g.*, U.S.G.S. quadrangle, or other map) with enough detail to identify the location of your facility and the receiving waters within one mile of the facility;

4.2.2.3 *A legible site map identifying the following:*

4.2.2.3.1 Directions of storm water flow (*e.g*, use arrows to show which ways storm water will flow);

4.2.2.3.2 Locations of all existing structural BMPs;

4.2.2.3.3 Locations of all surface water bodies;

4.2.2.3.4 Locations of potential pollutant sources identified under 4.2.4 and where significant materials are exposed to precipitation;

4.2.2.3.5 Locations where major spills or leaks identified under 4.2.5 have occurred;

4.2.2.3.6 Locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, and liquid storage tanks;

4.2.2.3.7 Locations of storm water outfalls and an approximate outline of the area draining to each outfall;

4.2.2.3.8 Location and description of non-storm water discharges;

4.2.2.3.9 Locations of the following activities where such activities are exposed to precipitation: processing and storage areas; access roads, rail cars and tracks; the location of transfer of substance in bulk; and machinery;

4.2.2.3.10 Location and source of runoff from adjacent property containing significant quantities of pollutants of concern to the facility (an evaluation of how the quality of the storm water running onto your facility impacts your storm water discharges may be included).

4.2.3 Receiving Waters and Wetlands

You must provide the name of the nearest receiving water(s), including intermittent streams, dry sloughs, arroyos and the areal extent and description of wetland or other "special aquatic sites " (see Part 12 for definition) that may receive discharges from your facility.

4.2.4 Summary of Potential Pollutant Sources

You must identify each separate area at your facility where industrial materials or activities are exposed to storm water. Industrial materials or activities include, but are not limited to, material handling equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products. Material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product or waste product. For each, separate area identified, the description must include:

4.2.4.1 *Activities in Area.* A list of the activities (*e.g.*, material storage, equipment fueling and cleaning, cutting steel beams); and

4.2.4.2 *Pollutants.* A list of the associated pollutant(s) or pollutant parameter(s) (*e.g.*, crankcase oil, iron, biochemical oxygen demand, pH, *etc.*) for each activity. The pollutant list must include all significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of three (3) years before being covered under this permit and the present.

4.2.5 Spills and Leaks

You must clearly identify areas where potential spills and leaks, which can contribute pollutants to storm water discharges, can occur, and their accompanying drainage points. For areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility to be covered under this permit, you must provide a list of significant spills and leaks of toxic or hazardous pollutants that occurred during the three (3) year period prior to the date of the submission of a Notice of Intent (NOI) . Your list must be updated if significant spills or leaks occur in exposed areas of your facility during the time you are covered by the permit.

Significant spills and leaks include, but are not limited to releases of oil or hazardous substances in excess of quantities that are reportable under CWA § 311 (see 40 CFR 110.10 and 40 CFR 117.21) or section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements.

4.2.6 Sampling Data

You must provide a summary of existing storm water discharge sampling data taken at your facility. All storm water sampling data collected during the term of this permit must also be summarized and included in this part of the SWPPP.

4.2.7 Storm Water Controls

4.2.7.1 *Description of Existing and Planned BMPs.* Describe the type and location of existing non-structural and structural best management practices (BMPs) selected for each of the areas where industrial materials or activities are exposed to storm water. All the areas identified in Part 4.2.4 should have a BMP(s) identified for the area's discharges. For areas where BMPs are not currently in place, describe appropriate BMPs that you will use to control pollutants in storm water discharges. Selection of BMPs should take into consideration:

4.2.7.1.1 The quantity and nature of the pollutants, and their potential to impact the water quality of receiving waters;

4.2.7.1.2 Opportunities to combine the dual purposes of water quality protection and local flood control benefits (including physical impacts of high flows on streams—*e.g.*, bank erosion, impairment of aquatic habitat, etc.);

4.2.7.1.3 Opportunities to offset the impact of impervious areas of the facility on ground water recharge and base flows in local streams (taking into account the potential for ground water contamination—See "User's Guide to the MSGP–2000" section on groundwater considerations).

4.2.7.2 *BMP Types to be Considered.* The following types of structural, non-structural and other BMPs must be considered for implementation at your facility. Describe how each is, or will be, implemented. This requirement may have been fulfilled with the area-specific BMPs identified under Part 4.2.7.2, in which case the previous description is sufficient. However, many of the following BMPs may be more generalized or non site-specific and therefore not previously considered. If you determine that any of these BMPs are not appropriate for your facility, you must include an explanation of why they are not appropriate. The BMP examples listed below are not intended to be an exclusive list of BMPs that you may use. You are encouraged to keep abreast of new BMPs or new applications of existing BMPs to find the most cost effective means of permit compliance for your facility. If BMPs are being used or planned at the facility which are not listed here (*e.g.*, replacing a chemical with a less toxic alternative, adopting a new or innovative BMP, etc.), include descriptions of them in this section of the SWPPP.

4.2.7.2.1 *Non-Structural BMPs.*

4.2.7.2.1.1 *Good Housekeeping:* You must keep all exposed areas of the facility in a clean, orderly manner where such exposed areas could contribute pollutants to storm water discharges. Common problem areas include: around trash containers, storage areas and loading docks. Measures must also include: a schedule for regular pickup and disposal of garbage and waste materials; routine inspections for leaks and conditions of drums, tanks and containers.

4.2.7.2.1.2 *Minimizing Exposure:* Where practicable, industrial materials and activities should be protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, or runoff.

Note: Eliminating exposure at all industrial areas may make the facility eligible for the 40 CFR 122.26(g) "No Exposure" exclusion from needing to have a permit.

4.2.7.2.1.3 *Preventive Maintenance:* You must have a preventive maintenance program which includes timely inspection and maintenance of storm water management devices, (*e.g.*, cleaning oil/water separators, catch basins) as well as inspecting, testing, maintaining and repairing facility equipment and systems to avoid breakdowns or failures that may result in discharges of pollutants to surface waters.

4.2.7.2.1.4 *Spill Prevention and Response Procedures:* You must describe the procedures which will be followed for cleaning up spills or leaks. Those procedures, and necessary spill response equipment, must be made available to those employees that may cause or detect a spill or leak. Where appropriate, you must explain existing or planned material handling procedures, storage requirements, secondary containment, and equipment (*e.g.*, diversion valves), which are intended to minimize spills or leaks at the facility. Measures for cleaning up hazardous material spills or leaks must be consistent with applicable RCRA regulations at 40 CFR Part 264 and 40 CFR Part 265.

4.2.7.2.1.5 *Routine Facility Inspections:* In addition to or as part of the comprehensive site evaluation required under Part 4.9, you must have qualified facility personnel inspect all areas of the facility where industrial materials or activities are exposed to storm water. The inspections must include an evaluation of existing storm water BMPs. Your SWPPP must identify how often these inspections will be conducted. You must correct any deficiencies in implementation of your SWP3 you find as soon as practicable, but not later than within 14 days of the inspection. You must document in your SWPPP the results of your inspections and the corrective actions you took in response to any deficiencies or opportunities for improvement that you identify.

4.2.7.2.1.6 *Employee Training:* You must describe the storm water employee training program for the facility. The description should include the topics to be covered, such as spill response, good housekeeping and material management practices, and must identify periodic dates (*e.g.*, every 6 months during the months of July and January) for such training. You must provide employee training for all employees that work in areas where industrial materials or activities are exposed to storm water, and for employees that are responsible for implementing activities identified in the SWPPP (*e.g.*, inspectors, maintenance people). The employee training should inform them of the components and goals of your SWPPP.

4.2.7.2.2 *Structural BMPs.*

4.2.7.2.2.1 *Sediment and Erosion Control:* You must identify the areas at your facility which, due to topography, land disturbance (*e.g.*, construction), or other factors, have a potential for significant soil erosion. You must describe the structural, vegetative, and/or stabilization BMPs that you will be implementing to limit erosion.

4.2.7.2.2.2 *Management of Runoff:* You must describe the traditional storm water management practices (permanent structural BMPs other than those which control the generation or source(s) of pollutants) that currently exist or that are planned for your facility. These types of BMPs typically are used to divert, infiltrate, reuse, or otherwise reduce pollutants in storm water discharges from the site. All BMPs that you determine are reasonable and appropriate, or are required by a State or local authority; or are necessary to maintain eligibility for the permit (see Part 1.2.3—Limitations on Coverage) must be implemented and maintained. Factors to consider when you are selecting appropriate BMPs should include: (1) The industrial materials and activities that are exposed to storm water, and the associated pollutant potential of those materials and activities; and (2) the beneficial and potential detrimental effects on surface water quality, ground water quality, receiving water base flow (dry weather stream flow), and physical integrity of receiving waters. (See "User's Guide to the MSGP–2000" for Considerations in Selection of BMPs) Structural measures should be placed on upland soils, avoiding wetlands and floodplains, if possible. Structural BMPs may require a separate permit under section 404 of the CWA before installation begins.

4.2.7.2.2.3 *Example BMPs:* BMPs you could use include but are not limited to: storm water detention structures (including wet ponds); storm water retention structures; flow attenuation by use of open vegetated swales and natural depressions;

R0019853

infiltration of runoff onsite; and sequential systems (which combine several practices).

4.2.7.2.3 *Other Controls.* No solid materials, including floatable debris, may be discharged to waters of the United States, except as authorized by a permit issued under section 404 of the CWA. Off-site vehicle tracking of raw, final, or waste materials or sediments, and the generation of dust must be minimized. Tracking or blowing of raw, final, or waste materials from areas of no exposure to exposed areas must be minimized. Velocity dissipation devices must be placed at discharge locations and along the length of any outfall channel if they are necessary to provide a non-erosive flow velocity from the structure to a water course.

4.3 Maintenance

All BMPs you identify in your SWPPP must be maintained in effective operating condition. If site inspections required by Part 4.9 identify BMPs that are not operating effectively, maintenance must be performed before the next anticipated storm event, or as necessary to maintain the continued effectiveness of storm water controls. If maintenance prior to the next anticipated storm event is impracticable, maintenance must be scheduled and accomplished as soon as practicable. In the case of non-structural BMPs, the effectiveness of the BMP must be maintained by appropriate means (*e.g.*, spill response supplies available and personnel trained, *etc.*).

4.4 Non-Storm Water Discharges

4.4.1 Certification of Non-Storm Water Discharges

4.4.1.1 Your SWPPP must include a certification that all discharges (*i.e.*, outfalls) have been tested or evaluated for the presence of non-storm water. The certification must be signed in accordance with Part 9.7 of this permit, and include:

4.4.1.1.1 The date of any testing and/or evaluation;

4.4.1.1.2 Identification of potential significant sources of non-storm water at the site;

4.4.1.1.3 A description of the results of any test and/or evaluation for the presence of non-storm water discharges;

4.4.1.1.4 A description of the evaluation criteria or testing method used; and

4.4.1.1.5 A list of the outfalls or onsite drainage points that were directly observed during the test.

4.4.1.2 You do not need to sign a new certification if one was already completed for either the 1992 baseline Industrial General Permit or the 1995 Multi-sector General Permit and you have no reason to believe conditions at the facility have changed.

4.4.1.3 If you are unable to provide the certification required (testing for non-storm water discharges), you must notify the Director 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification must describe:

4.4.1.3.1 Reason(s) why certification was not possible;

4.4.1.3.2 The procedure of any test attempted;

4.4.1.3.3 The results of such test or other relevant observations; and

4.4.1.3.4 Potential sources of non-storm water discharges to the storm sewer.

4.4.1.4 A Copy of the notification must be included in the SWPPP at the facility. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

4.4.2 Allowable Non-Storm Water Discharges

4.4.2.1 Certain sources of non-storm water are allowable under this permit (see 1.2.2.2—Allowable Non-Storm Water Discharges). In order for these discharges to be allowed, your SWPPP must include:

4.4.2.1.1 Identification of each allowable non-storm water source;

4.4.2.1.2 The location where it is likely to be discharged; and

4.4.2.1.3 Descriptions of appropriate BMPs for each source.

4.4.2.2 Except for flows from fire fighting activities, you must identify in your SWPPP all sources of allowable non-storm water that are discharged under the authority of this permit.

4.4.2.3 If you include mist blown from cooling towers amongst your allowable non-storm water discharges, you must specifically evaluate the potential for the discharges to be contaminated by chemicals used in the cooling tower and determined that the levels of such chemicals in the discharges would not cause or contribute to a violation of an applicable water quality standard after implementation of the BMPs you have selected to control such discharges.

4.5 Documentation of Permit Eligibility Related to Endangered Species

Your SWPPP must include documentation supporting your determination of permit eligibility with regard to Part 1.2.3.6 (Endangered Species), including:

4.5.1 Information on whether listed endangered or threatened species, or critical habitat, are found in proximity to your facility;

4.5.2 Whether such species may be affected by your storm water discharges or storm water discharge-related activities;

4.5.3 Results of your Addendum A endangered species screening determinations; and

4.5.4 A description of measures necessary to protect listed endangered or threatened species, or critical habitat, including any terms or conditions that are imposed under the eligibility requirements of Part 1.2.3.6. If you fail to describe and implement such measures, your discharges are ineligible for coverage under this permit.

4.6 Documentation of Permit Eligibility Related to Historic Places

Your SWPPP must include documentation supporting your determination of permit eligibility with regard to Part 1.2.3.7 (Historic Places), including:

4.6.1 Information on whether your storm water discharges or storm water discharge-related activities would have an effect on a property that is listed or eligible for listing on the National Register of Historic Places;

4.6.2 Where effects may occur, any written agreements you have made with the State Historic Preservation Officer, Tribal Historic Preservation Officer, or other Tribal leader to mitigate those effects;

4.6.3 Results of your Addendum B historic places screening determinations; and

4.6.4 Description of measures necessary to avoid or minimize adverse impacts on places listed, or eligible for listing, on the National Register of Historic Places, including any terms or conditions that are imposed under the eligibility requirements of Part 1.2.3.7 of this permit. If you fail to describe and implement such measures, your discharges are ineligible for coverage under this permit.

4.7 Copy of Permit Requirements

You must include a copy of this permit in your SWPPP.

Note: The confirmation of coverage letter you receive from the NOI Processing Center assigning your permit number IS NOT your permit—it merely acknowledges that your NOI has been accepted and you have been authorized to discharge subject to the terms and conditions of today's permit.

4.8 Applicable State, Tribal or Local Plans

Your SWPPP must be consistent (and updated as necessary to remain consistent) with applicable State, Tribal and/or local storm water, waste disposal, sanitary sewer or septic system regulations to the extent these apply to your facility and are more stringent than the requirements of this permit.

4.9 Comprehensive Site Compliance Evaluation

4.9.1 Frequency and Inspectors

You must conduct facility inspections at least once a year. The inspections must be done by qualified personnel provided by you. The qualified personnel you use may be either your own employees or outside consultants that you have hired, provided they are knowledgeable and possess the skills to assess conditions at your facility that could impact storm water quality and assess the effectiveness of the BMPs you have chosen to use to control the quality of your storm water discharges. If you decide to conduct more frequent inspections, your SWPPP must specify the frequency of inspections.

4.9.2 Scope of the Compliance Evaluation

Your inspections must include all areas where industrial materials or activities are exposed to storm water, as identified in 4.2.4, and areas where spills and leaks have occurred within the past 3 years. Inspectors should look for: (a) Industrial materials, residue or trash on the ground that could contaminate or be washed away in storm water; (b) leaks or spills from industrial equipment, drums, barrels, tanks or similar containers; (c) offsite tracking of industrial materials or sediment where vehicles enter or exit the site; (d) tracking or blowing of raw, final, or waste materials from areas of no exposure to exposed areas and (e) for evidence of, or the potential for, pollutants entering the drainage system. Results of both visual and any analytical monitoring done during the year must be taken into consideration during the evaluation. Storm water BMPs identified in your SWPPP must be observed to ensure that they are operating correctly. Where discharge locations or points are accessible, they must be inspected to see whether BMPs are effective in preventing significant impacts to receiving waters. Where discharge locations are inaccessible, nearby downstream locations must be inspected if possible.

4.9.3 Follow-Up Actions

Based on the results of the inspection, you must modify your SWPPP as necessary (*e.g.*, show additional controls on map required by Part 4.2.2.3; revise description of controls required by Part 4.2.7 to include additional or modified BMPs designed to correct problems identified. You must complete revisions to the SWPPP within 14 calendar days following the inspection. If existing BMPs need to be modified or if additional BMPs are necessary, implementation must be completed before the next anticipated storm event, if practicable, but not more than twelve (12) weeks after completion of the comprehensive site evaluation.

4.9.4 Compliance Evaluation Report

You must insure a report summarizing the scope of the inspection, name(s) of personnel making the inspection, the date(s) of the inspection, and major observations relating to the implementation of the SWPPP is completed and retained as part of the SWPPP for at least three years from the date permit coverage expires or is terminated. Major observations should include: the location(s) of discharges of pollutants from the site; location(s) of BMPs that need to be maintained; location(s) of BMPs that failed to operate as designed or proved inadequate for a particular location; and location(s) where additional BMPs are needed that did not exist at the time of inspection. You must retain a record of actions taken in accordance with Part 4.9 of this permit as part of the Storm Water Pollution Prevention Plan for at least three years from the date that permit coverage expires or is terminated. The inspection reports must identify any incidents of non-compliance. Where an inspection report does not identify any incidents of non-compliance, the report must contain a certification that the facility is in compliance with the Storm Water Pollution Prevention Plan and this permit. Both the inspection report and any reports of follow-up actions must be signed in accordance with Part 9.7 (reporting) of this permit.

4.9.5 Credit As a Routine Facility Inspection

Where compliance evaluation schedules overlap with inspections required under Part 4.2.7.2.1.5, your annual compliance evaluation may also be used as one of the Part 4.2.7.5 routine inspections.

4.10 Maintaining Updated SWPPP

You must amend the Storm Water Pollution Prevention Plan whenever:

4.10.1 there is a change in design, construction, operation, or maintenance at your facility which has a significant effect on the discharge, or potential for discharge, of pollutants from your facility;

4.10.2 During inspections, monitoring, or investigations by you or by local, State, Tribal or Federal officials it is determined the SWPPP is ineffective in eliminating or significantly minimizing pollutants from sources identified under 4.2.4, or is otherwise not achieving the general objectives of controlling pollutants in discharges from your facility.

4.11 Signature, Plan Review and Making Plans Available

4.11.1 You must sign your SWPPP in accordance with Part 9.7, and retain the plan on-site at the facility covered by this permit (see Part 8 for records retention requirements).

4.11.2 You must keep a copy of the SWPPP on-site or locally available to the Director for review at the time of an on-site inspection. You must make your SWPPP available upon request to the Director, a State, Tribal or local agency approving storm water management plans, or the operator of a municipal separate storm sewer receiving discharge from the site. Also, in the interest of the public's right to know, you must provide a copy of your SWPPP to the public if requested in writing to do so.

4.11.3 The Director may notify you at any time that your SWPPP does not meet one or more of the minimum requirements of this permit. The notification will identify provisions of this permit which are not being met, as well as the required modifications. Within thirty (30) calendar days of receipt of such notification, you must make the required changes to the SWPPP and submit to the Director a written certification that the requested changes have been made.

4.11.4 You must make the SWPPP available to the USFWS or NMFS upon request.

4.12 Additional Requirements for Storm Water Discharges Associated With Industrial Activity From Facilities Subject to EPCRA Section 313 Reporting Requirements

Potential pollutant sources for which you have reporting requirements under EPCRA 313 must be identified in your summary of potential pollutant sources as per Part 4.2.4. Note this additional requirement only applies to you if you are subject to reporting requirements under EPCRA 313.

5. Monitoring Requirements and Numeric Limitations

There are five individual and separate categories of monitoring requirements and numeric limitations that your facility may be subject to under this permit. The monitoring requirements and numeric limitations applicable to your facility depend on a number of factors, including: (1) The types of industrial activities generating storm water runoff from your facility, and (2) the state or tribe where your facility is located. Part 6 identifies monitoring requirements applicable to specific sectors of industrial activity. Part 13 contains additional requirements that apply only to facilities located in a particular State or Indian country land. You must review Parts 5, 6 and 13 of the permit to determine which monitoring requirements and numeric limitations apply to your facility. Unless otherwise specified, limitations and monitoring requirements under Parts 5, 6, and 13 are additive.

Sector-specific monitoring requirements and limitations are applied discharge by discharge at facilities with co-located activities. Where storm water from the co-located activities are co-mingled, the monitoring requirements and limitations are additive. Where more than one numeric limitation for a specific parameter applies to a discharge, compliance with the more restrictive limitation is required. Where monitoring requirements for a monitoring quarter overlap (*e.g.*, need to monitor TSS 1/year for a limit and also 1/quarter for benchmark monitoring), you may use a single sample to satisfy both monitoring requirements.

5.1 Types of Monitoring Requirements and Limitations

5.1.1 Quarterly Visual Monitoring

The requirements and procedures for quarterly visual monitoring are applicable to all facilities covered under this permit, regardless of your facility's sector of industrial activity.

5.1.1.1 You must perform and document a quarterly visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The visual examination must be made during daylight hours (*e.g.*, normal working hours). If no storm event resulted in runoff from the facility during a monitoring quarter, you are excused from visual monitoring for that quarter provided you document in your monitoring records that no runoff occurred. You must sign and certify the documentation in accordance with Part 9.7.

5.1.1.2 Your visual examinations must be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging from your facility. The examination must document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples must be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The 72-hour storm interval is waived when the preceding measurable storm did not yield a measurable discharge, or if you are able to document that less than a 72-hour interval is representative for local storm events during the sampling period. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term. If no qualifying storm event resulted in runoff from the facility during a monitoring quarter, you are excused from visual monitoring for that quarter provided you document in your monitoring records that no qualifying storm event occurred that resulted in storm water runoff during that quarter. You must sign and certify the documentation in accordance with Part 9.7.

5.1.1.3 You must maintain your visual examination reports onsite with the Storm Water Pollution Prevention Plan. The report must include the examination date and time, examination personnel, the nature of the discharge (*i.e.*, runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

5.1.1.4 Inactive and Unstaffed Sites: When you are unable to conduct visual storm water examinations at an inactive and unstaffed site, you may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. If you exercise this waiver, you must maintain a certification with the Storm Water Pollution Prevention Plan stating that the site is inactive and unstaffed and that performing visual examinations during a qualifying event is not feasible. You must sign and certify the waiver in accordance with Part 9.7.

5.1.2 Benchmark Monitoring of Discharges Associated With Specific Industrial Activities

Table 5–1 identifies the specific industrial sectors subject to the Benchmark Monitoring requirements of this permit and the industry-specific pollutants of concern. You must refer to the tables found in the individual Sectors in Part 6 for Benchmark Monitoring Cut-Off Concentrations. If your facility has co-located activities (see Part 1.2.1.1) described in more than one sector in Part 6, you must comply with all applicable benchmark monitoring requirements from each sector.

The results of benchmark monitoring are primarily for your use to determine the overall effectiveness of your SWPPP in controlling the discharge of pollutants to receiving waters. Benchmark values, included in Part 6 of this permit, are not viewed as effluent limitations. An exceedance of a benchmark value does not, in and of itself, constitute a violation of this permit. While exceedance of a benchmark value does not automatically indicate that violation of a water quality standard has occurred, it does signal that modifications to the SWPPP may be necessary. In addition, exceedance of benchmark values may identify facilities that would be more appropriately covered under an individual, or alternative general permit where more specific pollution prevention controls could be required.

TABLE 5–1.—INDUSTRY SECTORS/SUB-SECTORS SUBJECT TO BENCHMARK MONITORING

MSGP sector [1]	Industry sub-sector	Required parameters for benchmark monitoring
A	General Sawmills and Planing Mills	COD, TSS, Zinc.
	Wood Preserving Facilities	Arsenic, Copper.
	Log Storage and Handling	TSS.
	Hardwood Dimension and Flooring Mills	COD, TSS.
B	Paperboard Mills	COD.

R0019856

TABLE 5–1.—INDUSTRY SECTORS/SUB-SECTORS SUBJECT TO BENCHMARK MONITORING—Continued

MSGP sector [1]	Industry sub-sector	Required parameters for benchmark monitoring
C	Industrial Inorganic Chemicals	Aluminum, Iron, Nitrate + Nitrite N.
	Plastics, Synthetic Resins, etc.	Zinc.
	Soaps, Detergents, Cosmetics, Perfumes	Nitrate + Nitrite N, Zinc.
	Agricultural Chemicals	Nitrate + Nitrite N, Lead, Iron, Zinc, Phosphorus.
D	Asphalt Paving and Roofing Materials	TSS.
E	Clay Products	Aluminum.
	Concrete Products	TSS, Iron.
F	Steel Works, Blast Furnaces, and Rolling and Finishing Mills.	Aluminum, Zinc.
	Iron and Steel Foundries	Aluminum, TSS, Copper, Iron, Zinc.
	Non-Ferrous Rolling and Drawing	Copper, Zinc.
	Non-Ferrous Foundries (Castings)	Copper, Zinc.
G [2]	Copper Ore Mining and Dressing	COD, TSS, Nitrate + Nitrite N
H	Coal Mines and Coal-Mining Related Facilities	TSS, Aluminum, Iron
J	Dimension Stone, Crushed Stone, and Nonmetallic Minerals (except fuels).	TSS.
	Sand and Gravel Mining	Nitrate + Nitrite N, TSS.
K	Hazardous Waste Treatment Storage or Disposal	Ammonia, Magnesium, COD, Arsenic, Cadmium, Cyanide, Lead, Mercury, Selenium, Silver.
L	Landfills, Land Application Sites, and Open Dumps	Iron, TSS.
M	Automobile Salvage Yards	TSS, Aluminum, Iron, Lead.
N	Scrap Recycling	Copper, Aluminum, Iron, Lead, Zinc, TSS, COD.
O	Steam Electric Generating Facilities	Iron.
Q	Water Transportation Facilities	Aluminum, Iron, Lead, Zinc.
S	Airports with deicing activities [3]	BOD, COD, Ammonia, pH.
U	Grain Mill Products	TSS.
	Fats and Oils	BOD, COD, Nitrate + Nitrite N, TSS.
Y	Rubber Products	Zinc.
AA	Fabricated Metal Products Except Coating	Iron, Aluminum, Zinc, Nitrate + Nitrite N.
	Fabricated Metal Coating and Engraving	Zinc, Nitrate + Nitrite N.

[1] Table does not include parameters for compliance monitoring under effluent limitations guidelines.
[2] See Sector G (Part 6.G) for additional monitoring discharges from waste rock and overburden piles from active ore mining or dressing facilities.
[3] Monitoring requirement is for airports with deicing activities that utilize more than 100 tons of urea or more than 100,000 gallons of ethylene glycol per year.

5.1.2.1 *Monitoring Periods for Benchmark Monitoring.* Unless otherwise specified in Part 6, benchmark monitoring periods are October 1, 2001 to September 30, 2002 (year two of the permit) and October 1, 2003 to September 30, 2004 (year four of the permit). If your facility falls within a Sector(s) required to conduct benchmark monitoring, you must monitor quarterly (4 times a year) during at least one, and potentially both, monitoring periods; unless otherwise specified in the sector-specific requirements of Part 6. Depending on the results of the 2001–2002 monitoring year, you may not be required to conduct benchmark monitoring in the 2003–2004 monitoring year (see Part 5.1.2.2).

5.1.2.2 *Benchmark Monitoring Year 2003–2004 Waivers for Facilities Testing Below Benchmark Values.* All of the provisions of Part 5.1.2.2 are available to permittees except as noted in Part 6. Waivers from benchmark monitoring are available to facilities whose discharges are below benchmark values, thus there is an incentive for facilities to improve the effectiveness of their SWPPPs in eliminating discharges of pollutants and avoid the cost of monitoring.

On both a parameter by parameter and outfall by outfall basis, you are not required to conduct sector-specific benchmark monitoring in the 2003–2004 monitoring year provided:

• You collected samples for all four quarters of the 2001–2002 monitoring year and the average concentration was below the benchmark value in Part 6; and

• You are not subject to a numeric limitation or State/Tribal-specific monitoring requirement for that parameter established in Part 5.2 or Part 13; and

• You include a certification in the SWPPP that based on current potential pollutant sources and BMPs used, discharges from the facility are reasonably expected to be essentially the same (or cleaner) compared to when the benchmark monitoring for the 2001–2002 monitoring year was done.

5.1.2.3 *Inactive and Unstaffed Sites.* If you are unable to conduct benchmark monitoring at an inactive and unstaffed site, you may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. If you exercise this waiver, you must maintain a certification with your Storm Water Pollution Prevention Plan stating that the site is inactive and unstaffed and that performing benchmark monitoring during a qualifying storm event is not feasible. You must sign and certify the waiver in accordance with Part 9.7.

5.1.3 Coal Pile Runoff

5.1.3.1 If your facility has discharges of storm water from coal storage piles, you must comply with the limitations and monitoring requirements of Table 5–2 for all discharges containing the coal pile runoff, regardless of your facility's sector of industrial activity.

R0019857

TABLE 5–2.—NUMERIC LIMITATIONS FOR COAL PILE RUNOFF

Parameter	Limit	Monitoring frequency	Sample type
Total Suspended Solids (TSS)	50 mg/L, max	1/year	Grab.
pH	6.0–9.0 min. and max	1/year	Grab.

5.1.3.2 You must not dilute coal pile runoff with storm water or other flows in order to meet this limitation.

5.1.3.3 If your facility is designed, constructed and operated to treat the volume of coal pile runoff that is associated with a 10-year, 24-hour rainfall event, any untreated overflow of coal pile runoff from the treatment unit is not subject to the 50 mg/L limitation for total suspended solids.

5.1.3.4 You must collect and analyze your samples in accordance with Part 5.2.2. Results of the testing must be retained and reported in accordance with Part 8 and 9.16.

5.1.4 Compliance Monitoring for Discharges Subject to Numerical Effluent Limitation Guidelines

Table 1–2 of Part 1.2.2.1.3 of the permit identifies storm water discharges subject to effluent limitation guidelines that are authorized for coverage under the permit. Facilities subject to storm water effluent limitation guidelines are required to monitor such discharges to evaluate compliance with numerical effluent limitations. Industry-specific numerical limitations and compliance monitoring requirements are described in Part 6 of the permit.

5.1.5 Monitoring for Limitations Required by a State or Tribe

Unless otherwise specified in Part 13 (state/tribal-specific permit conditions), you must sample once per year for any permit limit established as a result of a state or tribe's conditions for certification of this permit under CWA § 401.

5.2 Monitoring Instructions

5.2.1 Monitoring Periods

If you are required to conduct monitoring on an annual or quarterly basis, you must collect your samples within the following time periods (unless otherwise specified in Part 6):

• The monitoring year is from October 1 to September 30

• If your permit coverage was effective less than one month from the end of a quarterly or yearly monitoring period, your first monitoring period starts with the next respective monitoring period. (*e.g.*, if permit coverage begins June 5th, you would not need to start quarterly sampling until the July—September quarter, but you would only have from June 5th to September 30th to complete that year's annual monitoring)

5.2.2 Collection and Analysis of Samples

You must assess your sampling requirements on an outfall by outfall basis. You must collect and analyze your samples in accordance with the requirements of Part 9.16.

5.2.2.1 *When and How to Sample.* Take a minimum of one grab sample from the discharge associated with industrial activity resulting from a storm event with at least 0.1 inch of precipitation (defined as a "measurable" event), providing the interval from the preceding measurable storm is at least 72 hours. The 72-hour storm interval is waived when the preceding measurable storm did not yield a measurable discharge, or if you are able to document that less than a 72-hour interval is representative for local storm events during the sampling period.

Take the grab sample during the first 30 minutes of the discharge. If it is not practicable to take the sample during the first 30 minutes, sample during the first hour of discharge and describe why a grab sample during the first 30 minutes was impracticable. Submit this information on or with the discharge monitoring report (see Part 7.1). If the sampled discharge commingles with process or non-process water, attempt to sample the storm water discharge before it mixes with the non-storm water.

To get help with monitoring, consult the *Guidance Manual for the Monitoring and Reporting Requirements of the NPDES Storm Water Multi-Sector General Permit* which can be down loaded from the EPA Web Site at *www.epa.gov/OWM/sw/industry/index.htm.* It can also be ordered from the Office of Water Resource Center by calling 202–260–7786.

5.2.3 Storm Event Data

Along with the results of your monitoring, you must provide the date and duration (in hours) of the storm event(s) samples; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event samples and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge samples.

5.2.4 Representative Outfalls—Essential Identical Discharges

If your facility has two (2) or more outfalls that you believe discharge substantially identical effluents, based on similarities of the industrial activities, significant materials or storm water management practices occurring within the outfalls' drainage areas, you may test the effluent of just one of the outfalls and report that the quantitative data also applies to the substantially identical outfall(s). For this to be permissible, you must describe in the Storm Water Pollution Prevention Plan and include in the Discharge Monitoring Report the following: locations of the outfalls; why the outfalls are expected to discharge substantially identical effluents; estimates of the size of the drainage area (in square feet) for each of the outfalls; and an estimate of the runoff coefficient of the drainage areas (low: under 40 percent; medium: 40 to 65 percent; high: above 65 percent). Note: Page 107 of the *NPDES Storm Water Sampling Guidance Document* (EPA 800/B–92–001) lists criteria for substantially identical outfalls (available on EPA's web site at *http://www.epa.gov/owm/sw/industry/).*

5.3 General Monitoring Waivers

Unless specifically stated otherwise, the following waivers may be applied to any monitoring required under this permit.

5.3.1 Adverse Climatic Conditions Waiver

When adverse weather conditions prevent the collection of samples, take a substitute sample during a qualifying storm event in the next monitoring period, or four samples per monitoring year when weather conditions do not allow for samples to be spaced evenly during the year. Adverse conditions (*i.e.*, those which are dangerous or create inaccessibility for personnel) may include such things as local flooding, high winds, electrical storms, or situations which otherwise make sampling impracticable such as drought or extended frozen conditions.

5.3.2 Alternative Certification of "Not Present or No Exposure"

You are not subject to the analytical monitoring requirements of Part 5.1.2 provided:

5.3.2.1 You make a certification for a given outfall, or on a pollutant-by-pollutant basis in lieu of monitoring required under Part 5.1.2, that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period; and

5.3.2.2 Your certification is signed in accordance with Part 9.7, retained in the Storm Water Pollution Prevention Plan, and submitted to EPA in accordance with Part 7. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required Part 7; and

5.3.2.3 If you cannot certify for an entire period, you must submit the date exposure was eliminated and any monitoring required up until that date; and

5.3.2.4 No numeric limitation or State-specific monitoring requirement for that parameter is established in Part 5 or Part 13.

5.4 Monitoring Required by the Director

The Director may provide written notice to any facility, including those otherwise exempt from the sampling requirements of Parts 5, 6 and 12, requiring discharge sampling for a specific monitoring frequency for specific parameters. Any such notice will briefly state the reasons for the monitoring, parameters to be monitored, frequency and period of monitoring, sample types, and reporting requirements.

5.5 Reporting Monitoring Results

Deadlines and procedures for submitting monitoring reports are contained in Part 7.

6. Sector-Specific Requirements for Industrial Activity

You only need to comply with the additional requirements of Part 6 that apply to the sector(s) of industrial activity at your facility. These sector-specific requirements are in addition to the "basic" requirements specified in Parts 1–5 and 7–13 of this permit.

6.A Sector A—Timber Products

6.A.1 Covered Storm Water Discharges

The requirements in Part 6.A apply to storm water discharges associated with industrial activity from Timber Products facilities as identified by the SIC Codes specified under Sector A in Table 1–1 of Part 1.2.1.

6.A.2 Industrial Activities Covered by Sector A

The types of activities that permittees under Sector A are primarily engaged in are:

6.A.2.1 Cutting timber and pulpwood (those that have log storage or handling areas);

6.A.2.2 Mills, including merchant, lath, shingle, cooperage stock, planing, plywood and veneer;

6.A.2.3 Producing lumber and wood basic materials;

6.A.2.4 Wood preserving;

6.A.2.5 Manufacturing finished articles made entirely of wood or related materials except wood kitchen cabinet manufacturers (covered under Part 6.23);

6.A.2.6 Manufacturing wood buildings or mobile homes.

6.A.3 Special Coverage Conditions

6.A.3.1 *Prohibition of Discharges.* (See also Part 1.2.3.1) Not covered by this permit: storm water discharges from areas where there may be contact with the chemical formulations sprayed to provide surface protection. These discharges must be covered by a separate NPDES permit.

6.A.3.2 *Authorized Non-Storm Water Discharges.* (See also Part 1.2.3.1) Also authorized by this permit, provided the non-storm water component of the discharge is in compliance with SWPPP requirements in Part 4.2.7 (Controls): discharges from the spray down of lumber and wood product storage yards where no chemical additives are used in the spray down waters and no chemicals are applied to the wood during storage.

6.A.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.A.4.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Also identify where any of the following may be exposed to precipitation/surface runoff: processing areas; treatment chemical storage areas; treated wood and residue storage areas; wet decking areas; dry decking areas; untreated wood and residue storage areas; and treatment equipment storage areas.

6.A.4.2 *Inventory of Exposed Materials.* (See also Part 4.2.4) Where such information exists, if your facility has used chlorophenolic, creosote or chromium-copper-arsenic formulations for wood surface protection or preserving, identify the following: areas where contaminated soils, treatment equipment and stored materials still remain, and the management practices employed to minimize the contact of these materials with storm water runoff.

6.A.4.3 *Description of Storm Water Management Controls.* (See also Part 4.2.7). Describe and implement measures to address the following activities/sources: log, lumber and wood product storage areas; residue storage areas; loading and unloading areas; material handling areas; chemical storage areas; and equipment/vehicle maintenance, storage and repair areas. If your facility performs wood surface protection/preservation activities, address the specific BMPs for these activities.

6.A.4.4 *Good Housekeeping.* (See also Part 4.2.7.2.1.1). In areas where storage, loading/unloading and material handling occur, perform good housekeeping to limit the discharge of wood debris; minimize the leachate generated from decaying wood materials; and minimize the generation of dust.

6.A.4.5 *Inspections.* (See also Part 4.2.7.2.1.5). If your facility performs wood surface protection/preservation activities, inspect processing areas, transport areas and treated wood storage areas monthly to assess the usefulness of practices to minimize the deposit of treatment chemicals on unprotected soils and in areas that will come in contact with storm water discharges.

6.A.5 Monitoring and Reporting Requirements (See also Part 5)

TABLE A–1.—SECTOR-SPECIFIC NUMERIC LIMITATIONS AND BENCHMARK MONITORING

[Sector of permit affected/supplemental requirements]

Subsector (Discharge may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric limitation [2]
General Sawmills and Planning Mills (SIC 2421)	Chemical Oxygen Demand (COD).	120.0 mg/L.	
	Total Suspended Solids (TSS).	100 mg/L.	
	Total Zinc	0.117 mg/L.	
Wood Preserving (SIC 2491)	Total Arsenic	0.16854 mg/L.	
	Total Copper	0.0636 mg/L.	
Log Storage and Handling (SIC 2411)	Total Suspended Solids (TSS).	100 mg/L.	
Wet Decking Discharges at Log Storage and Handling Areas (SIC 2411).	pH		6.0–9.0 s.u.
	Debris (woody material such as bark, twigs, branches, heartwood, or sapwood).		No Discharge of debris that will not pass through a 2.54 cm (1″) diameter round opening.
Hardwood Dimension and Flooring Mills; Special Products Sawmills, not elsewhere classified; Millwork, Veneer, Plywood and Structural Wood; Wood Containers; Wood Buildings and Mobile Homes; Reconstituted Wood Products; and Wood Products Facilities not elsewhere classified (SIC Codes 2426, 2429, 2431–2439 (except 2434), 2448, 2449, 2451, 2452, 2593, and 2499).	Chemical Oxygen Demand (COD).	120.0 mg/L.	
	Total Suspended Solids (TSS).	100.0 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 monitoring years.
[2] Monitor once per year for each monitoring year.

6.B Sector B—Paper and Allied Products Manufacturing

6.B.1 Covered Storm Water Discharges

The requirements in Part 6.B apply to storm water discharges associated with industrial activity from Paper and Allied Products Manufacturing facilities as identified by the SIC Codes specified under Sector B in Table 1–1 of Part 1.2.1.

6.B.2 Industrial Activities Covered by Sector B

The types of activities that permittees under Sector B are primarily engaged in are:

6.B.2.1 Manufacture of pulps from wood and other cellulose fibers and from rags;

6.B.2.2 Manufacture of paper and paperboard into converted products, *i.e.* paper coated off the paper machine, paper bags, paper boxes and envelopes;

6.B.2.3 Manufacture of bags of plastic film and sheet.

6.B.3 Monitoring and Reporting Requirements (See also Part 5)

TABLE B–1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring and cutoff concentration [1]	Numeric limitation
Part of Permit Affected/Supplemental Requirements			
Paperboard Mills (SIC Code 2631)	COD	120.0 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 monitoring years

6.C Sector C—Chemical and Allied Products Manufacturing

6.C.1 Covered Storm Water Discharges

The requirements in Part 6.C apply to storm water discharges associated with industrial activity from Chemical and Allied Products Manufacturing facilities as identified by the SIC Codes specified under Sector C in Table 1–1 of Part 1.2.1.

6.C.2 Industrial Activities Covered by Sector C

The requirements listed under this Part apply to storm water discharges associated with industrial activity from a facility engaged in manufacturing the following products:

6.C.2.1 basic industrial inorganic chemicals;

6.C.2.2 plastic materials and synthetic resins, synthetic rubbers, and cellulosic and other human made fibers, except glass;

6.C.2.3 soap and other detergents, including facilities producing glycerin from vegetable and animal fats and oils; speciality cleaning, polishing and sanitation preparations; surface active preparations used as emulsifiers, wetting agents and finishing agents, including sulfonated oils; and perfumes, cosmetics and other toilet preparations;

6.C.2.4 paints (in paste and ready mixed form); varnishes; lacquers; enamels and shellac; putties, wood fillers, and sealers; paint and varnish removers; paint brush cleaners; and allied paint producers;

6.C.2.5 industrial organic chemicals;

6.C.2.6 industrial and household adhesives, glues, caulking compounds, sealants, and linoleum, tile and rubber cements from vegetable, animal or synthetic plastic materials; explosives; printing ink, including gravure, screen process and lithographic inks; miscellaneous chemical preparations such as fatty acids, essential oils, gelatin (except vegetable), sizes, bluing, laundry sours, writing and stamp pad ink, industrial compounds such as boiler and heat insulating compounds, and chemical supplies for foundries;

6.C.2.7 ink and paints, including china painting enamels, indian ink, drawing ink, platinum paints for burnt wood or leather work, paints for china painting, artists' paints and artists' water colors;

6.C.2.8 nitrogenous and phosphatic basic fertilizers, mixed fertilizers, pesticides and other agricultural chemicals.

6.C.3 Limitations on Coverage

6.C.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.3.3) Not covered by this permit: non-storm water discharges containing inks, paints or substances (hazardous, nonhazardous, *etc.*) resulting from an onsite spill, including materials collected in drip pans; washwater from material handling and processing areas; and washwater from drum, tank or container rinsing and cleaning.

6.C.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.C.4.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Also identify where any of the following may be exposed to precipitation/surface runoff: processing and storage areas; access roads, rail cars and tracks; areas where substances are transferred in bulk; and operating machinery.

6.C.4.2 *Potential Pollutant Sources.* (See also Part 4.2.4) Describe the following sources and activities that have potential pollutants associated with them: loading, unloading and transfer of chemicals; outdoor storage of salt, pallets, coal, drums, containers, fuels, fueling stations; vehicle and equipment maintenance/cleaning areas; areas where the treatment, storage or disposal (on- or off-site) of waste/wastewater occur; storage tanks and other containers; processing and storage areas; access roads, rail cars and tracks; areas where the transfer of substances in bulk occurs; and areas where machinery operates.

6.C.4.3 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1) As part of your good housekeeping program, include a schedule for regular pickup and disposal of garbage and waste materials, or adopt other appropriate measures to reduce the potential for discharging storm water that has contacted garbage or waste materials. Routinely inspect the condition of drums, tanks and containers for potential leaks.

6.C.5 Monitoring and Reporting Requirements (See also Part 5)

TABLE C–1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration[1]	Numeric limitation[2]
Part of Permit Affected/Supplemental Requirements			
Phosphate Subcategory of the Fertilizer Manufacturing Point Source Category (40 CFR § 418.10)—applies to precipitation runoff, that during manufacturing or processing, comes into contact with any raw materials, intermediate product, finished product, by-products or waste product (SIC 2874).	Total Phosphorus (as P)		105.0 mg/L, daily max. 35 mg/L, 30-day avg.
	Fluoride		75.0 mg/L, daily max. 25.0 mg/L, 30-day avg.
Agricultural Chemicals (2873–2879)	Nitrate plus Nitrite Nitrogen	0.68 mg/L.	
	Total Recoverable Lead	0.0816 mg/L.	
	Total Recoverable Iron	1.0 mg/L.	
	Total Recoverable Zinc	0.117 mg/L.	
	Phosphorus	2.0 mg/L.	
Industrial Inorganic Chemicals (2812–2819)	Total Recoverable Aluminum	0.75 mg/L	Nitrate plus Nitrite Nitrogen
		1.0 mg/L	
	Total Recoverable Iron	0.68 mg/L	
Soaps, Detergents, Cosmetics, and Perfumes (SIC 2841–2844).	Nitrate plus Nitrite Nitrogen	0.68 mg/L.	
	Total Recoverable Zinc	0.117 mg/L..	
Plastics, Synthetics, and Resins (SIC 2821–2824)	Total Recoverable Zinc	0.117 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.
[2] Monitor once/year for each Monitoring Year.

6.D Sector D—Asphalt Paving and Roofing Materials and Lubricant Manufacturers

6.D.1 Covered Storm Water Discharges

The requirements in Part 6.D apply to storm water discharges associated with industrial activity from Asphalt Paving and Roofing Materials and Lubricant Manufacturers facilities as identified by the SIC Codes specified under Sector D in Table 1–1 of Part 1.2.1.

6.D.2 Industrial Activities Covered by Sector D

The types of activities that permittees under Sector D are primarily engaged in are:

6.D.2.1 manufacturing asphalt paving and roofing materials;

R0019861

6.D.2.2 portable asphalt plant facilities;
6.D.2.3 manufacturing lubricating oils and greases.

6.D.3 Limitations on Coverage

The following storm water discharges associated with industrial activity are not authorized by this permit:
6.D.3.1 discharges from petroleum refining facilities, including those that manufacture asphalt or asphalt products that are classified as SIC code 2911;
6.D.3.2 discharges from oil recycling facilities;
6.D.3.3 discharges associated with fats and oils rendering.

6.D.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.
6.D.4.1 *Inspections.* (See also Part 4.2.7.2.1.5) Inspect at least once per month, as part of the maintenance program, the following areas: Material storage and handling areas, liquid storage tanks, hoppers/silos, vehicle and equipment maintenance, cleaning and fueling areas, material handling vehicles, equipment and processing areas. Ensure appropriate action is taken in response to the inspection by implementing tracking or follow up procedures.

6.D.5 Monitoring and Reporting Requirements. (See also part 5)

TABLE D–1.—SECTOR-SPECIFIC NUMERIC LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric Limitation [2]
Sector of Permit Affected/Supplemental Requirements			
Asphalt Paving and Roofing Materials (SIC 2951, 2952)	Total Suspended Solids (TSS).	100mg/L.	
Discharges from areas where production of asphalt paving and roofing emulsions occurs (SIC 2951, 2952).	TSS		23.0 mg/L, daily max 15.0 mg/L 30-day avg.
	Oil and Grease		15.0 mg/L daily max. 10mg/L, 30-day avg.
	pH		6.0–9.0

[1] Monitor once/quarter for the year 2 and year 4 monitoring years.
[2] Monitor once per year for each monitoring year.

6.E Sector E—Glass, Clay, Cement, Concrete, and Gypsum Products

6.E.1 Covered Storm Water Discharges

The requirements in Part 6.E apply to storm water discharges associated with industrial activity from Glass, Clay, Cement, Concrete, and Gypsum Products facilities as identified by the SIC Codes specified under Sector E in Table 1–1 of part 1.2.1.

6.E.2 Industrial Activities Covered by Sector E

The requirements listed under this permit apply to storm water discharges associated with industrial activity from a facility engaged in either manufacturing the following products or performing the following activities:
6.E.2.1 flat, pressed, or blown glass or glass containers;
6.E.2.2 hydraulic cement;
6.E.2.3 clay products including tile and brick;
6.E.2.4 pottery and porcelain electrical supplies;
6.E.2.5 concrete products;
6.E.2.6 gypsum products;
6.E.2.7 minerals and earths, ground or otherwise treated;
6.E.2.8 non-clay refractories:
6.E.2.9. lime manufacturing
6.E.2.10 cut stone and stone products
6.E.2.11 asbestos products
6.E.2.12 mineral wool and mineral wool insulation products.

6.E.3 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.
6.E.3.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify the locations of the following, as applicable: bag house or other dust control device; recycle/sedimentation pond, clarifier or other device used for the treatment of process wastewater, and the areas that drain to the treatment device.
6.E.3.2 *Good Housekeeping Measures.* (See also Part 4.2.2.3) With good housekeeping prevent or minimize the discharge of: spilled cement; aggregate (including sand or gravel); kiln dust; fly ash; settled dust; or other significant material in storm water from paved portions of the site that are exposed to storm water. Consider using regular sweeping or other equivalent measures to minimize the presence of these materials. Indicate in your SWPPP the frequency of sweeping or equivalent measures. Determine the frequency from the amount of industrial activity occurring in the area and the frequency of precipitation, but it must be performed at least once a week if cement, aggregate, kiln dust, fly ash or settled dust are being handled/processed. You must also prevent the exposure of fine granular solids (cement, fly ash, kiln dust, *etc.*) to storm water where practicable, by storing these materials in enclosed silos/hoppers, buildings or under other covering.
6.E.3.3 *Inspections.* (See also Part 4.2.7.2.1.5) Perform inspections while the facility is in operation and include all of the following areas exposed to storm water: material handling areas, above ground storage tanks, hoppers or silos, dust collection/containment systems, truck wash down/equipment cleaning areas.
6.E.3.4 *Certification.* (See also Part 4.4.1) For facilities producing ready-mix concrete, concrete block, brick or similar products, include in the non-storm water discharge certification a description of measures that insure that process waste water resulting from truck washing, mixers, transport buckets, forms or other equipment are discharged in accordance with NPDES requirements or are recycled.

6.E.4 Monitoring and Reporting Requirements. (See also Part 5)

TABLE E-1.—SECTOR-SPECIFIC NUMERIC LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric limitaiton [2]
Sector of Permit Affected/Supplemental Requirements			
Clay Product Manufacturers (SIC 3245–3259,3261–3269) Concrete and Gypsum Product Manufacturers (SIC 3271–3275).	Total Recoverable Aluminum.	0.75 mg/L	
	TSS	100 mg/L	
	Total Recoverable Iron	1.0 mg/L	
Cement Manufacturing Facility, Material Storage Runoff: Any discharge composed of runoff that derives from the storage of materials including raw materials, intermediate products, finished products, and waste materials that are used in or derived from the manufacture of cement.	Total Suspended Solids (TTS≤.	50 mg/L daily max..	
	pH		6.0–9.0 S.U.

[1] Monitor once/quarter for the year 2 and year 4 monitoring years.
[2] Monitor once per year for each monitoring year.

6.F Sector F—Primary Metals

6.F.1 Covered Storm Water Discharges

The requirements in Part 6.F apply to storm water discharges associated with industrial activity from Primary Metals facilities as identified by the SIC Codes specified under Sector F in Table 1–1 of Part 1.2.1.

6.F.2 Industrial Activities Covered by Sector F

The types of activities under this Part are facilities primarily engaged in are:

6.F.2.1 Steel works, blast furnaces, and rolling and finishing mills including: steel wire drawing and steel nails and spikes; cold-rolled steel sheet, strip, and bars; and steel pipes and tubes;

6.F.2.2 Iron and steel foundries, including: gray and ductile iron, malleable iron, steel investment, and steel foundries not elsewhere classified;

6.F.2.3 Primary smelting and refining of nonferrous metals, including: primary smelting and refining of copper, and primary production of aluminum;

6.F.2.4 Secondary smelting and refining of nonferrous metals;

6.F.2.5 Rolling, drawing, and extruding of nonferrous metals, including: rolling, drawing, and extruding of copper; rolling, drawing and extruding of nonferrous metals except copper and aluminum; and drawing and insulating of nonferrous wire;

6.F.2.6 Nonferrous foundries (castings), including: aluminum die-casting, nonferrous die-casting, except aluminum, aluminum foundries, copper foundries, and nonferrous foundries, except copper and aluminum;

6.F.2.7 Miscellaneous primary metal products, not elsewhere classified, including: metal heat treating, and primary metal products not elsewhere classified;

Activities covered include but are not limited to storm water discharges associated with cooking operations, sintering plants, blast furnaces, smelting operations, rolling mills, casting operations, heat treating, extruding, drawing, or forging all types of ferrous and nonferrous metals, scrap and ore.

6.F.3 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.F.3.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Also identify where any of the following activities may be exposed to precipitation/surface runoff: storage or disposal of wastes such as spent solvents/baths, sand, slag/dross; liquid storage tanks/drums; processing areas including pollution control equipment (*e.g.*, baghouses); and storage areas of raw material such as coal, coke, scrap, sand, fluxes, refractories or metal in any form. In addition, indicate where an accumulation of significant amounts of particulate matter could occur from such sources as furnace or oven emissions, losses from coal/coke handling operations, etc., and which could result in a discharge of pollutants to waters of the United States.

6.F.3.2 *Inventory of Exposed Material.* (See also Part 4.2.4) Include in the inventory of materials handled at the site that potentially may be exposed to precipitation/runoff, areas where deposition of particulate matter from process air emissions or losses during material handling activities are possible.

6.F.3.3 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1) As part of your good housekeeping program, include: a cleaning/maintenance program for all impervious areas of the facility where particulate matter, dust or debris may accumulate, especially areas where material loading/unloading, storage, handling and processing occur; the paving of areas where vehicle traffic or material storage occur but where vegetative or other stabilization methods are not practicable (institute a sweeping program in these areas too). For unstabilized areas where sweeping is not practicable, consider using storm water management devices such as sediment traps, vegetative buffer strips, filter fabric fence, sediment filtering boom, gravel outlet protection or other equivalent measures that effectively trap or remove sediment.

6.F.3.4 *Inspections.* (See also Part 4.2.7.2.1.5) Conduct inspections routinely, or at least on a quarterly basis, and address all potential sources of pollutants, including (if applicable): air pollution control equipment (*e.g.*, baghouses, electrostatic precipitators, scrubbers and cyclones) for any signs of degradation (*e.g.*, leaks, corrosion or improper operation) that could limit their efficiency and lead to excessive emissions. Consider monitoring air flow at inlets/outlets (or use equivalent measures) to check for leaks (*e.g.*, particulate deposition) or blockage in ducts. Also inspect all process and material handling equipment (*e.g.*, conveyors, cranes and vehicles) for leaks, drips or the potential loss of material; and material storage areas (*e.g.*, piles, bins or hoppers for storing coke, coal, scrap or slag, as well as chemicals stored in tanks/drums) for signs of material losses due to wind or storm water runoff.

6.F.4 Monitoring and Reporting Requirements. (See also Part 5)

TABLE F-1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Sector of permit affected/supplemental requirements—

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cutoff concentration [1]	Numeric limitation
Steel Works, Blast Furnaces, and Rolling and Finishing Mills (SIC 3312–3317).	Total Recoverable Aluminum	0.75 mg/L	
	Total Recoverable Zinc	0.117 mg/L.	
Iron and Steel Foundries (SIC 3321–3325)	Total Recoverable Aluminum	0.75 mg/L.	
	Total Suspended Solids	100 mg/L	
	Total Recoverable Copper	0.0636 mg/L	
	Total Recoverable Iron	1.0 mg/L	
	Total Recoverable Zinc	0.117 mg/L.	
Rolling, Drawing, and Extruding of Non-Ferrous Metals (SIC 3351–3357).	Total Recoverable Copper	0.0636 mg/L	
	Total Recoverable Zinc	0.117 mg/L.	
Non-Ferrous Foundries (SIC 3363–3369)	Total Recoverable Copper	0.636 mg/L.	
	Total Recoverable Zinc	0.117 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.

6.G Sector G—Metal Mining (Ore Mining and Dressing)

6.G.1 Covered Storm Water Discharges

The requirements in Part 6.G apply to storm water discharges associated with industrial activity from active, temporarily inactive and inactive metal mining and ore dressing facilities, including mines abandoned on Federal Lands, as identified by the SIC Codes specified under Sector G in Table 1–1 of Part 1.2.1. Coverage is required for facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate product, finished product, byproduct, or waste product located on the site of the operation.

6.G.1.1 *Covered Discharges from Inactive Facilities:* All storm water discharges.

6.G.1.2 *Covered Discharges from Active and Temporarily Inactive Facilities:* Only the storm water discharges from the following areas are covered: waste rock/overburden piles if composed entirely of storm water and not combining with mine drainage; topsoil piles; offsite haul/access roads; onsite haul/access roads constructed of waste rock/overburden/spent ore if composed entirely of storm water and not combining with mine drainage; onsite haul/access roads not constructed of waste rock/overburden/spent ore except if mine drainage is used for dust control; runoff from tailings dams/dikes when not constructed of waste rock/tailings and no process fluids are present; runoff from tailings dams/dikes when constructed of waste rock/tailings if and no process fluids are present if composed entirely of storm water and not combining with mine drainage; concentration building if no contact with material piles; mill site if no contact with material piles; office/administrative building and housing if mixed with storm water from industrial area; chemical storage area; docking facility if no excessive contact with waste product that would otherwise constitute mine drainage; explosive storage; fuel storage; vehicle/equipment maintenance area/building; parking areas (if necessary); power plant; truck wash areas if no excessive contact with waste product that would otherwise constitute mine drainage; unreclaimed, disturbed areas outside of active mining area; reclaimed areas released from reclamation bonds prior to December 17, 1990; and partially/inadequately reclaimed areas or areas not released from reclamation bonds.

6.G.2 Industrial Activities Covered by Sector G

Note: "metal mining" will connote any of the separate activities listed in Part 6.G.2. The types of activities that permittees under Sector G are primarily engaged in are:

6.G.2.1 exploring for metallic minerals (ores), developing mines and the mining of ores;

6.G.2.2 ore dressing and beneficiating, whether performed at co-located, dedicated mills or separate (*i.e.*, custom) mills.

6.G.3 Limitations on Coverage

6.G.3.1 *Prohibition of Storm Water Discharges.*

Storm water discharges not authorized by this permit: discharges from active metal mining facilities which are subject to effluent limitation guidelines for the Ore Mining and Dressing Point Source Category (40 CFR Part 440).

Note: discharges that come in contact with overburden/waste rock are subject to 40 CFR Part 440, providing: the discharges drain to a point source (either naturally or as a result of intentional diversion) and they combine with "mine drainage" that is otherwise regulated under the Part 440 regulations. Discharges from overburden/waste rock can be covered under this permit if they are composed entirely of storm water, do not combine with sources of mine drainage that are subject to 40 CFR Part 440, and meet other eligibility criteria contained in Part 1.2.2.1.

6.G.3.2 *Prohibition of Non-Storm Water Discharges.*

Not authorized by this permit: adit drainage and contaminated springs or seeps (see also the standard Limitations on Coverage in Part 1.2.3).

6.G.4 Definitions

6.G.4.1 *Mining Operation*—typically consists of three phases, any one of which individually qualifies as a "mining activity." The phases are the exploration and construction phase, the active phase, and the reclamation phase.

6.G.4.2 *Exploration and Construction Phase*—entails exploration and land disturbance activities to determine the financial viability of a site. Construction includes the building of site access roads and removal of overburden and waste rock to expose mineable minerals.

6.G.4.3 *Active Phase*—activities including each step from extraction through production of a salable product.

6.G.4.4 *Reclamation Phase*—activities intended to return the land to its pre-mining use

The following definitions are not intended to supercede the definitions of active and inactive mining facilities established by 40 CFR 122.26(b)(14)(iii).

6.G.4.5 *Active Metal Mining Facility*—a place where work or other activity related to the extraction, removal or recovery of metal ore is being conducted. For surface mines, this definition does not include any land where grading has returned the earth to a desired contour and reclamation has begun.

R0019864

6.G.4.6 *Inactive Metal Mining Facility*—a site or portion of a site where metal mining and/or milling occurred in the past but is not an active facility as defined above, and where the inactive portion is not covered by an active mining permit issued by the applicable State or Federal government agency.

6.G.4.7 *Temporarily Inactive Metal Mining Facility*—a site or portion of a site where metal mining and/or milling occurred in the past but currently are not being actively undertaken, and the facility is covered by an active mining permit issued by the applicable State or Federal government agency.

6.G.5 Clearing, Grading and Excavation Activities

Clearing, grading and excavation activities being conducted as part of the exploration and construction phase of a mining operation cannot be covered under this permit if these activities will disturb one or more acre of land. Instead, coverage for these activities must be under the latest version of EPA's General Permit for Storm Water Discharges from Construction Activities (the "Construction General Permit;" **Federal Register**, Vol. 63, p. 7858 and for Region 6, **Federal Register**, Vol. 63, p. 36490), or an individual construction permit. If the area of disturbance during the initial phase is less than one acre, you must continue to comply with the requirements of the MSGP–2000.

6.G.5.1 *Requirements for Activities Disturbing 5 or More Acres of Earth.* If the one-acre limit as defined in Part 6.G.5 is attained, coverage for these activities must be under the latest version of EPA's Construction General Permit (or individual permit). You must first obtain and comply with the Construction General Permit's requirements before submitting the separate Construction General Permit Notice of Intent (NOI) form (EPA Form 3510–9). The February 17, 1998 version of the permit can be downloaded from the EPA's Web Site at *www.epa.gov/owm/sw/construction/cgp/cgp-nat.pdf* and Region 6's July 6, 1998 version of the permit at *www.epa.gov/owm/sw/construction/cgp/cgp-reg6.pdf* or obtained from the Office of Water Resource Center at (202) 260–7786. The NOI form is also available from the Web Site at *www.epa.gov/owm/sw/construction/connoi.pdf* or from your EPA Regional office at the address listed under Part 8.3. Discharges in compliance with the provisions of the Construction General Permit are also authorized under the MSGP.

6.G.5.2 *Cessation of Earth Disturbing Activities.* If exploration phase clearing, grading and excavation activities are completed and no further mining activities will occur at the site, you must comply with the requirements for terminating the Construction General Permit, *i.e.*, stabilize and revegetate the disturbed land, submit a Notice of Termination, etc. If active mining activities will ensue, you must apply for coverage under the MSGP–2000 for your storm water discharges and be prepared to implement any new requirements prior to beginning the active phase. It is recommended you terminate your coverage under the Construction General Permit, but it is not mandatory that you do so. If you choose not to terminate your construction General Permit, you will be responsible for complying with all permit conditions of the construction permit in addition to those of the MSGP–2000. The Notice of Termination form is Addendum E to this permit and is available at http://www.epa.gov/owm/sw/industry/msgp/notform.pdf.

6.G.6 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.G.6.1 *SWPPP Requirements for Active and Temporarily Inactive Metal Mining Facilities.*

6.G.6.1.1 *Nature of Industrial Activities.* (See also Part 4.2.2.1) Briefly describe the mining and associated activities that can potentially affect the storm water discharges covered by this permit, including: the total acreage within the mine site; the estimated acreage of disturbed land; the estimated acreage of land proposed to be disturbed throughout the life of the mine; and a general description of the location of the site relative to major transportation routes and communities.

6.G.6.1.2 *Site Map.* (See also Part 4.2.2.3) Also identify the locations of the following (as appropriate): mining/milling site boundaries; access and haul roads; outline of the drainage areas of each storm water outfall within the facility and indicate the types of discharges from the drainage areas; equipment storage, fueling and maintenance areas; materials handling areas; outdoor manufacturing, storage or material disposal areas; chemicals and explosives storage areas; overburden, materials, soils or waste storage areas; location of mine drainage (where water leaves mine) or other process water; tailings piles/ponds (including proposed ones); heap leach pads; off-site points of discharge for mine drainage/process water; surface waters; and boundary of tributary areas that are subject to effluent limitations guidelines.

6.G.6.1.3 *Potential Pollutant Sources.* (See also Part 4.2.4) For each area of the mine/mill site where storm water discharges associated with industrial activities occur, identify the types of pollutants (e.g., heavy metals, sediment) likely to be present in significant amounts. Consider these factors: the mineralogy of the ore and waste rock (*e.g.*, acid forming); toxicity and quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; vegetation of site (if any); history of significant leaks/spills of toxic or hazardous pollutants. Also include a summary of any existing ore or waste rock/overburden characterization data and test results for potential generation of acid rock. If any new data is acquired due to changes in ore type being mined, update your SWPPP with this information.

6.G.6.1.4 *Site Inspections.* (See also Part 4.2.7.2.1.5) Inspect active mining sites at least monthly. Inspect temporarily inactive sites at least quarterly unless adverse weather conditions make the site inaccessible.

6.G.6.1.5 *Employee Training.* (See also Part 4.2.7.2.1.6) Conduct employee training at least annually at active mining and temporarily inactive sites.

6.G.6.1.6 *Controls.* (See also Part 4.2.7) Consider each of the following BMPs. The potential pollutants identified in Part 6.G.6.1.3 shall determine the priority and appropriateness of the BMPs selected. If you determine that one or more of these BMPs are not appropriate for your facility, explain why it is not appropriate. If BMPs are implemented or planned but are not listed here (*e.g.*, substituting a less toxic chemical for a more toxic one), include descriptions of them in your SWPPP.

6.G.6.1.6.1 *Storm Water Diversions.* Consider diverting storm water away from potential pollutant sources. BMP options: interceptor/diversion controls (*e.g.*, dikes, swales, curbs or berms); pipe slope drains; subsurface drains; conveyance systems (*e.g.*, channels or gutters, open top box culverts and waterbars; rolling dips and road sloping; roadway surface water deflector, and culverts); or their equivalents.

6.G.6.1.6.2 *Sediment and Erosion Control.* (See also Part 4.2.7.2.2.1) At active and temporarily inactive sites consider a range of erosion controls within the broad categories of: flow diversion (*e.g.*, swales); stabilization (*e.g.*, temporary or permanent seeding); and structural controls (*e.g.*, sediment traps, dikes, silt fences).

6.G.6.1.6.3 *Management of Runoff.* (See also Part 4.2.7.2.2.2) Consider the potential pollutant sources given in Part 6.G.6.1.3 when determining reasonable and appropriate measures for managing runoff.

6.G.6.1.6.4 *Capping.* When capping is necessary to minimize pollutant discharges in storm water, identify the source being capped and the material used to construct the cap.

6.G.6.1.6.5 *Treatment.* If treatment of storm water (*e.g.*, chemical or physical systems, oil/water separators, artificial wetlands, etc.) from active and temporarily inactive sites is necessary to protect water quality, describe the type and location of treatment used.

6.G.6.1.6.6 *Certification of Discharge Testing.* (See also Part 4.4.1) Test or evaluate for the presence of specific mining-related non-storm water discharges such as seeps or adit discharges or discharges subject to effluent limitations guidelines (*e.g.*, 40 CFR Part 440), such as mine drainage or process water. Alternatively (if applicable), you may certify in your SWPPP that a particular discharge comprised of commingled storm water and non-storm water is covered under a separate NPDES permit; and that permit subjects the non-storm water portion to effluent limitations prior to any commingling. This certification shall identify the non-storm water discharges, the applicable NPDES permit(s), the effluent limitations placed on the non-storm water discharge by the permit(s), and the points at which the limitations are applied.

6.G.6.2 *SWPPP Requirements for Inactive Metal Mining Facilities.*

6.G.6.2.1 *Nature of Industrial Activities.* (See also Part 4.2.2.1) Briefly describe the mining and associated activities that took place at the site that can potentially affect the storm water discharges covered by this permit. Include: approximate dates of operation; total acreage within the mine and/or processing site; estimate of acres of disturbed earth; activities currently occurring onsite (*e.g.*, reclamation); a general description of site location with respect to transportation routes and communities.

6.G.6.2.2 *Site Map.* (See also Part 4.2.2.3) See Part 6.G.6.1.2 for requirements.

6.G.6.2.3 *Potential Pollutant Sources.* (See also Part 4.2.4) See Part 6.G.6.1.3 for requirements.

6.G.6.2.4 *Controls.* (See also Part 4.2.7) Consider each of the following BMPs. The potential pollutants identified in Part 6.G.6.2.3 shall determine the priority and appropriateness of the BMPs selected. If you determine that one or more of these BMPs are not appropriate for your facility, explain why it is not appropriate. If BMPs are implemented or planned but are not listed here (*e.g.*, substituting a less toxic chemical for a more toxic one), include descriptions of them in your SWPPP. The non-structural controls in the general requirements at Part 4.2.7.2.1 are not required for inactive facilities.

6.G.6.2.4.1 *Storm Water Diversions.* See Part 6.G.6.1.6.2 for requirements.

6.G.6.2.4.2 *Sediment and Erosion Control.* (See also Part 4.2.7.2.2.1) See Part 6.G.6.1.6 for requirements.

6.G.6.2.4.3 *Management of Runoff.* (See also Part 4.2.7.2.2.2)

Also consider the potential pollutant sources as described in Part 6.G.6.2.3 (Summary of Potential Pollutant Sources) when determining reasonable and appropriate measures for managing runoff.

6.G.6.2.4.4 *Capping.* See Part 6.G.6.1.7 for requirements.

6.G.6.2.4.5 *Treatment.* See Part 6.G.6.1.8 for requirements.

6.G.6.2.5 *Comprehensive Site Compliance Evaluation.* (See also Part 4.9)

Annual site compliance evaluations may be impractical for inactive mining sites due to remote location/ inaccessibility of the site; in which case conduct the evaluation at least once every 3 years. Document in the SWPPP why annual compliance evaluations are not possible. If the evaluations will be conducted more often than every 3 years, specify the frequency of evaluations.

6.G.7 Monitoring and Reporting Requirements. (See also Part 5)

6.G.7.1 *Analytic Monitoring for Copper Ore Mining and Dressing Facilities.* Active copper ore mining and dressing facilities must sample and analyze storm water discharges for the pollutants listed in Table G–1.

TABLE G–1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING FOR COPPER ORE MINING AND DRESSING FACILITIES

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric limitation
Part of Permit Affected/Supplemental Requirements			
Copper Ore Mining and Dressing Facilities (SIC 1021)	Total Suspended Solids (TSS).	100 mg/L.	
	Nitrate plus Nitrite Nitrogen	0.68 mg/L.	
	Chemical Oxygen Demand (COD).	120 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.

6.G.7.2 *Analytic Monitoring Requirements for Discharges From Waste Rock and Overburden Piles at Active Ore Mining and Dressing Facilities.* For discharges from waste rock and overburden piles, perform analytic monitoring at least once within the first year of permit coverage for the parameters listed in Table G–2, and twice annually thereafter for any parameters measured above the benchmark value (based on the initial sampling event) listed in Table G–2. Permittees must also conduct analytic monitoring twice annually for the parameters listed in Table G–3. The twice annual samples must be collected once between January 1 and June 30 and once between July 1 and December 31, with at least 3 months separating the storm events. The director may, however, notify you that you must perform additional monitoring to accurately characterize the quality and quantity of pollutants discharged from your waste rock/overburden piles. Monitoring requirements for discharges from waste rock and overburden piles are not eligible for the waivers in Part 5.3.2.

TABLE G–2.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING FOR DISCHARGES FROM WASTE ROCK AND OVERBURDEN PILES FROM ACTIVE ORE MINING OR DRESSING FACILITIES

Part of permit affected/supplemental requirements—			
Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cutoff concentration [1]	Numeric limitation
Iron Ores; Copper Ores; Lead and Zinc Ores; Gold and Silver Ores; Ferroalloy Ores Except Vanadium; Miscellaneous Metal Ores (SIC Codes 1011, 1021, 1031, 1041, 1044, 1061, 1081, 1094, 1099).	Total Suspended Solids (TSS)	100 mg/L.	
	Turbidity (NTUs)	5 NTUs above background.	
	pH	6.0–9.0 standard units.	
	Hardness (as $CaCO_3$)	no benchmark value.	
See above, as applicable	Antimony, Total	0.636 mg/L.	
	Arsenic, Total	0.16854 mg/L.	
	Beryllium, Total	0.13 mg/L.	
	Cadmium, Total (hardness dependent)	0.0159 mg/L.	
	Copper, Total (hardness dependent)	0.0636 mg/L.	
	Iron, Total	1.0 mg/L.	
	Lead, Total (hardness dependent)	0.0816 mg/L.	
	Manganese, Total	1.0 mg/L.	
	Mercury, Total	0.0024 mg/L.	
	Nickel, Total (hardness dependent)	1.417 mg/L.	
	Selenium, Total	0.2385 mg/L.	
	Silver, Total (hardness dependent)	0.318 mg/L.	
	Zinc, Total (hardness dependent)	0.117 mg/L.	

[1] Monitor at least once during the first year of permit coverage, and twice annually thereafter for any parameter that exceeds the benchmark value. Facilities that monitored for the full list of Table G–2 parameters during the previous permit need not sample the entire list again, however they must continue twice annual monitoring for parameters that exceeded the benchmark values in the initial sampling event.

6.G.7.2.1 Additional Analytic Monitoring Requirements for Discharges From Waste Rock and Overburden Piles. Table G–3 contains additional monitoring requirements for specific ore mine categories. Perform the monitoring twice annually using the schedule established in Part 6.G.7.2. The initial sampling event for a pollutant parameter required in Table G–2 satisfies the requirement for the first sample of any pollutant measurement in Table G–3.

TABLE G–3.—ADDITIONAL MONOTORING REQUIREMENTS FOR DISCHARGES FROM WASTE ROCK AND OVERBURDEN PILES FROM ACTIVE ORE MINING OR DRESSING FACILITIES

Supplemental requirements—			
Type of Ore mined	Pollutants of concern		
	Total suspended solids (TSS)	pH	Metals, total
Tungsten Ore	X	X	Arsenic, Cadmium (H), Copper (H), Lead (H), Zinc (H).
Nickel Ore	X	X	Arsenic, Cadmium (H), Copper (H), Lead (H), Zinc (H).
Aluminum Ore	X	X	Iron.
Mercury Ore	X	X	Nickel (H).
Iron Ore	X	X	Iron (Dissolved).
Platinum Ore			Cadmium (H), Copper (H), Mercury, Lead (H), Zinc (H).
Titanium Ore	X	X	Iron, Nickel (H), Zinc (H).
Vanadium Ore	X	X	Arsenic, Cadmium (H), Copper (H), Zinc (H).
Copper, Lead, Zinc, Gold, Silver and Molybdenum	X	X	Arsenic, Cadmium (H), Copper (H), Lead, Mercury, Zinc (H).
Uranium, Radium and Vanadium	X	X	Chemical Oxygen Demand, Arsenic, Radium (Dissolved and Total), Uranium, Zinc (H).

Note: (H) indicates that hardness must also be measured when this pollutant is measured.

6.G.7.2.2 *Reporting Requirements Storm Water Discharges From Waste Rock And Overburden Piles From Active Ore Mining or Dressing Facilities.* From active ore mining and dressing facilities, submit monitoring results for each outfall discharging storm water from waste rock and overburden piles, or certifications in accordance with Part 7. Submit monitoring reports on discharge monitoring report (DMR) forms postmarked no later than January 28 of the next year after the samples were collected.

TABLE G–4.—APPLICABILITY OF THE MULTI-SECTOR GENERAL PERMIT TO STORM WATER RUNOFF FROM ACTIVE ORE (METAL) MINING AND DRESSING SITES

Discharge/source of discharge	Note/comment
Piles	
Waste rock/overburden	If composed entirely of storm water and not combining with mine drainage. See Note below.
Topsoil	
Roads constructed of waste rock or spent ore	
Onsite haul roads	If composed entirely of storm water and not combining with mine drainage. See Note below.
Offsite haul/access roads	
Roads not constructed of waste rock or spent ore	
Onsite haul roads	Except if "mine drainage" is used for dust control.
Offsite haul/access roads	
Milling/concentrating	
Runoff from tailings dams/dikes when constructed of waste rock/tailings	Except if process fluids are present and only if composed entirely of storm water and not combining with mine drainage. See Note below.
Runoff from tailings dams/dikes when not constructed of waste rock/tailings	Except if process fluids are present.
Concentration building	If storm water only and no contact with piles.
Mill site	If storm water only and no contact with piles.
Ancillary areas	
Office/administrative building and housing	If mixed with storm water from the industrial area.
Chemical storage area	
Docking facility	Except if excessive contact with waste product that would otherwise constitute "mine drainage".
Explosive storage	
Fuel storage (oil tanks/coal piles)	
Vehicle/equipment maintenance area/building	
Parking areas	But coverage unnecessary if only employee and visitor-type parking.
Power plant	
Truck wash area	Except when excessive contact with waste product that would otherwise constitute "mine drainage".
Reclamation-related areas	
Any disturbed area (unreclaimed)	Only if not in active mining area.
Reclaimed areas released from reclamation bonds prior to Dec. 17 1990.	
Partially/inadequately reclaimed areas or areas not released from reclamation bond.	

Note: Storm water runoff from these sources are subject to the NPDES program for storm water unless mixed with discharges subject to the 40 CFR Part 440 that are not regulated by another permit prior to mixing. Non-storm water discharges from these sources are subject to NPDES permitting and may be subject to the effluent limitation guidelines under 40 CFR Part 440.

Discharges from overburden/waste rock and overburden/waste rock-related areas are not subject to 40 CFR Part 440 unless: (1) it drains naturally (or is intentionally diverted) to a point source; and (2) combines with "mine drainage" that is otherwise regulated under the Part 440 regulations. For such sources, coverage under this permit would be available if the discharge composed entirely of storm water does not combine with other sources of mine drainage that are not subject to 40 CFR Part 440, as well as meeting other eligibility criteria contained in Part I.B. of the permit. Permit applicants bear the initial responsibility for determining the applicable technology-based standard for such discharges. EPA recommends that permit applicants contact the relevant NPDES permit issuance authority for assistance to determine the nature and scope of the "active mining area" on a mine-by-mine basis, as well as to determine the appropriate permitting mechanism for authorizing such discharges.

6.H Sector H—Coal Mines and Coal Mining Related Facilities

6.H.1 Covered Storm Water Discharges

The requirements in Part 6.H apply to storm water discharges associated with industrial activity from Coal Mines and Coal Mining Related facilities as identified by the SIC Codes specified under Sector H in Table 1-1 of Part 1.2.1.

6.H.2 Industrial Activities Covered by Sector H

Storm water discharges from the following portions of coal mines may be eligible for this permit:

6.H.2.1 Haul roads (nonpublic roads on which coal or coal refuse is conveyed);

6.H.2.2 Access roads (nonpublic roads providing light vehicular traffic within the facility property and to public roadways);

6.H.2.3 Railroad spurs, siding and internal haulage lines (rail lines used for hauling coal within the facility property and to offsite commercial railroad lines or loading areas);

6.H.2.4 Conveyor belts, chutes and aerial tramway haulage areas (areas under and around coal or refuse conveyer areas, including transfer stations); and

6.H.2.5 Equipment storage and maintenance yards, coal handling buildings and structures, and inactive coal mines and related areas (abandoned and other inactive mines, refuse disposal sites and other mining-related areas).

6.H.3 Limitation on Coverage

6.H.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.2.2) Not covered by this permit: discharges from pollutant seeps or underground drainage from inactive coal mines and refuse disposal areas that do not result from precipitation events; and discharges from floor drains in maintenance buildings and other similar drains in mining and preparation plant areas.

6.H.3.2 *Discharges Subject to Storm Water Effluent Guidelines.* (See also Part 1.2.3.4) Not authorized by this permit: storm water discharges subject to an existing effluent limitation guideline at 40 CFR Part 434.

6.H.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4 of the MSGP.

6.H.4.1 *Other Applicable Regulations.* Most active coal mining-related areas (SIC Codes 1221–1241) are subject to sediment and erosion control regulations of the U.S. Office of Surface Mining (OSM) that enforces the Surface Mining Control and Reclamation Act (SMCRA). OSM has granted authority to most coal producing states to implement SMCRA through State SMCRA regulations. All SMCRA requirements regarding control of storm water-related pollutant discharges must be addressed in the SWPPP (directly or by reference).

6.H.4.2 *Drainage Area Site Map.* (See also Part 4.2.2.3) Also identify where any of the following may be exposed to precipitation/surface runoff: all applicable mining related areas described in Part 6.H.2; acidic spoil, refuse or unreclaimed disturbed areas, and liquid storage tanks containing pollutants such as caustics, hydraulic fluids and lubricants.

6.H.4.3 *Potential Pollutant Sources.* (See also Part 4.2.4) Describe the following sources and activities that have potential pollutants associated with them: truck traffic on haul roads and resulting generation of sediment subject to runoff and dust generation; fuel or other liquid storage; pressure lines containing slurry, hydraulic fluid or other potential harmful liquids; and loading or temporary storage of acidic refuse/spoil.

6.H.4.4 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1) As part of your good housekeeping program, consider: using sweepers; covered storage; watering haul roads to minimize dust generation; and conserving vegetation (where possible) to minimize erosion.

6.H.4.5 *Preventive Maintenance.* (See also Part 4.2.7.2.1.3) Also perform inspections of storage tanks and pressure lines of fuels, lubricants, hydraulic fluid or slurry to prevent leaks due to deterioration or faulty connections; or other equivalent measures.

6.H.4.6 *Inspections of Active Mining-Related Areas and Inactive Areas Under SMCRA Bond Authority.* (See also Part 4.2.7.2.1.5) Perform quarterly inspections of areas covered by this permit, corresponding with the inspections, as performed by SMCRA inspectors, of all mining-related areas required by SMCRA. Also maintain the records of the SMCRA authority representative.

6.H.4.7 *Sediment and Erosion Control.* (See also Part 4.2.7.2.2.1) As indicated in Part 6.H.4.1 above, SMCRA requirements regarding sediment and erosion control measures are primary requirements of the SWPPP for mining-related areas subject to SMCRA authority.

6.H.4.8 *Comprehensive Site Compliance Evaluation.* (See also Part 4.9.2) Include in your evaluation program, inspections for pollutants entering the drainage system from activities located on or near coal mining-related areas. Among the areas to be inspected: haul and access roads; railroad spurs, sliding and internal hauling lines; conveyor belts, chutes and aerial tramways; equipment storage and maintenance yards; coal handling buildings/structures; and inactive mines and related areas.

6.H.6 Monitoring and Reporting Requirements. (See also Part 5)

TABLE H-1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cutoff concentration [1]	Numeric limitation
Part of Permit Affected/Supplemental Requirements			
Coal Mines and Related Areas (SIC 1221–1241)	Total Recoverable Aluminum	0.75 mg/L.	
	Total Recoverable Iron	1.0 mg/L.	
	Total Suspended Solids	100 mg/L..	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.

6.I Sector I—Oil and Gas Extraction and Refining

6.I.1 Covered Storm Water Discharges

The requirements in Part 6.I apply to storm water discharges associated with industrial activity from Oil and Gas Extraction and Refining facilities as identified by the SIC Codes specified under Sector I in Table 1–1 of Part 1.2.1.

6.I.2 Industrial Activities Covered By Sector I

The types of activities that permittees under Sector I are primarily engaged in are:

6.I.2.1 Oil and gas exploration, production, processing or treatment operations, or transmission facilities;

6.I.2.2 Extraction and production of crude oil, natural gas, oil sands and shale; the production of hydrocarbon liquids and natural gas from coal; and associated oil field service, supply and repair industries.

6.I.3 Limitations On Coverage

6.I.3.1 *Prohibition of Storm Water Discharges.* This permit does not authorize contaminated storm water discharges from petroleum refining or drilling operations that are subject to nationally established BAT or BPT guidelines found at 40 CFR Parts 419 and 435, respectively. Note: most contaminated discharges at petroleum refining and drilling facilities are subject to these effluent guidelines and are not eligible for coverage by this permit.

6.I.3.2 *Prohibition of Non-Storm Water Discharges.* Not authorized by this permit: discharges of vehicle and equipment washwater, including tank cleaning operations.

Alternatively, washwater discharges must be authorized under a separate NPDES permit, or be discharged to a sanitary sewer in accordance with applicable industrial pretreatment requirements.

6.I.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.I.4.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify where any of the following may be exposed to precipitation/surface runoff: Reportable Quantity (RQ) releases; locations used for the treatment, storage or disposal of wastes; processing areas and storage areas; chemical mixing areas; construction and drilling areas; all areas subject to the effluent guidelines requirements for "No Discharge" in accordance with 40 CFR 435.32; and the structural controls to achieve compliance with the "No Discharge" requirements.

6.I.4.2 *Potential Pollutant Sources.* (See also Part 4.2.4)

Also describe the following sources and activities that have potential pollutants associated with them: chemical, cement, mud or gel mixing activities; drilling or mining activities; and equipment cleaning and rehabilitation activities. In addition, include information about the RQ release that triggered the permit application requirements; the nature of release (*e.g.*, spill of oil from a drum storage area); the amount of oil or hazardous substance released; amount of substance recovered; date of the release; cause of the release (*e.g.*, poor handling techniques and lack of containment in the area); areas affected by the release (i.e., land and water); procedure to clean up release; actions or procedures implemented to prevent or improve response to a release; and remaining potential contamination of storm water from release (taking into account human health risks, the control of drinking water intakes and the designated uses of the receiving water).

6.I.4.3 *Inspections.* (See also Part 4.2.7.2.1.5)

6.I.4.3.1 *Inspection Frequency.* Inspect all equipment and areas addressed in the SWPPP at a minimum of 6-month intervals. Routinely (but not less than quarterly) inspect equipment and vehicles which store, mix (including all on and offsite mixing tanks) or transport chemicals/hazardous materials (including those transporting supplies to oil field activities).

6.I.4.3.2 *Temporarily or Permanently Inactive Oil and Gas Extraction Facilities.* For these facilities that are remotely located and unstaffed, perform the inspections at least annually.

6.I.4.4 *Sediment and Erosion Control.* (See also Part 4.2.7.2.2.1) Unless covered by the General Permit for Construction Activity, the additional sediment and erosion control requirements for well drillings, and sand/shale mining areas include the following:

6.I.4.4.1 *Site Description:* Also include: a description of the nature of the exploration activity; estimates of the total area of site and area disturbed due to exploration activity; an estimate of runoff coefficient of the site; site drainage map, including approximate slopes; and the name of all receiving waters. All sediment and erosion control measures must be inspected once every seven days.

6.I.4.4.2 *Vegetative Controls:* Describe and implement vegetative practices designed to preserve existing vegetation where attainable and re-vegetate open areas as soon as practicable after grade drilling. Consider the following (or equivalent measures): temporary or permanent seeding, mulching, sod stabilization, vegetative buffer strips, tree protection practices. Begin implementing appropriate vegetative practices on all disturbed areas within 14 days following the last activity in that area.

6.I.4.5 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

6.I.4.5.1 *Vehicle and Equipment Storage Areas.* Confine vehicles/equipment awaiting or having undergone maintenance to designated areas (as marked on site map). Describe and implement measures to minimize contaminants from these areas (*e.g.*, drip pans under equipment, indoor storage, use of berms or dikes, or other equivalent measures).

6.I.4.5.2 *Material and Chemical Storage Areas.* Maintain these areas in good conditions to prevent contamination of storm water. Plainly label all hazardous materials.

6.I.4.5.3 *Chemical Mixing Areas.* (See also Part 4.4)

Describe and implement measures that prevent or minimize contamination of storm water runoff from chemical mixing areas.

6.J Sector J—Mineral Mining and Dressing

6.J.1 Covered Storm Water Discharges

The requirements in Part 6.J apply to storm water discharges associated with industrial activity from active and inactive mineral mining and dressing facilities as identified by the SIC Codes specified under Sector J in Table 1–1 of Part 1.2.1.

6.J.2 Industrial Activities Covered by Sector J

The types of activities that permittees under Sector J are primarily engaged in are:

6.J.2.1 exploring for minerals (*e.g.*, stone, sand, clay, chemical and fertilizer minerals, non-metallic minerals, etc.), developing mines and the mining of minerals; and

6.J.2.2 mineral dressing, and non-metallic mineral services.

6.J.3 Limitations on Coverage

Not authorized by this permit: most storm water discharges subject to an existing effluent limitation guideline at 40 CFR part 436. The exceptions to this limitation and which are therefore covered by the MSGP–2000 are mine dewatering discharges composed entirely of storm water or ground water seepage from: construction sand and gravel, industrial sand, and crushed stone mining facilities in Regions 1, 2, 3, 6, 8, 9, and 10.

6.J.4 Definitions

6.J.4.1 *Mining Operation*—typically consists of three-phases, any one of which individually qualifies as a "mining activity." The phases are the exploration and construction phase, the active phase and the reclamation phase.

6.J.4.2 *Exploration and Construction Phase*—entails exploration and land disturbance activities to determine the financial viability of a site. Construction includes the building of site access roads and removal of overburden and waste rock to expose mineable minerals.

6.J.4.3 *Active Phase*—activities including each step from extraction through production of a salable product.

6.J.4.4 *Reclamation phase*—activities intended to return the land to its pre-mining state.

Note: The following definitions are not intended to supercede the definitions of active and inactive mining facilities established by 40 CFR 122.26(b)(14)(iii).

6.J.4.5 *Active Mineral Mining Facility*—a place where work or other activity related to the extraction, removal or recovery of minerals is being conducted. This definition does not include any land where grading has returned the earth to a desired contour and reclamation has begun.

6.J.4.6 *Inactive Mineral Mining Facility*—a site or portion of a site where mineral mining and/or dressing occurred in the past but is not an active facility as defined above, and where the inactive portion is not covered by an active permit issued by the applicable State or Federal government agency.

6.J.4.7 *Temporarily Inactive Mineral Mining Facility*—a site or portion of a site where mineral mining and/or dressing occurred in the past but currently are not being actively undertaken, and the facility is covered by an active mining permit issued by the applicable State or Federal government agency.

6.J.5 Clearing, Grading and Excavation Activities

Clearing, grading and excavation activities being conducted as part of the exploration and construction phase of a mineral mining operation cannot be covered under this permit if these activities will disturb one or more acre of land. Instead, coverage for these activities must be under the latest version of EPA's General Permit for Storm Water Discharges from Construction Activities (the "Construction General Permit;" **Federal Register**, Vol. 63, p. 7858) and, for Region 6, **Federal Register**, Vol. 63, p. 36490), or an individual construction permit. If the area of disturbance during the initial phase is less than one acre, you must continue to comply with the requirements of the MSGP–2000.

6.J.5.1 *Obtaining Coverage Under the Construction General Permit.* If the one-acre limit as described in Part 6.J.5 is attained, coverage for these activities must be under the latest version of EPA's Construction General Permit (or individual permit). You must first obtain and comply with the Construction General Permit's requirements before submitting the separate Construction General Permit Notice of Intent (NOI) form (EPA Form 3510–9). The February 17, 1998 version of the permit can be downloaded from the EPA's Web Site at *http://www.epa.gov/owm/sw/construction/cgp/cgp-nat.pdf* or obtained from the Office of Water Resource Center at (202) 260–7786. The NOI form is also available from the Web Site at *http://www.epa.gov/owm/sw/construction/connoi.pdf* or from your EPA Regional office at the address listed under Part 8.3. Discharges in compliance with the provisions of the Construction General Permit are also authorized under the MSGP.

6.J.5.2 *Cessation of Exploration and Construction Activities.* If exploration phase clearing, grading and excavation activities are completed and no further mining activities will occur at the site, you must comply with the requirements for terminating the Construction General Permit, *i.e.*, stabilize and revegetate the disturbed land, submit a Notice of Termination, etc. If active mining operations will ensue, you must apply for coverage under the MSGP–2000 for your storm water discharges and be prepared to implement any new requirements prior to beginning the active phase. It is recommended you terminate your coverage under the construction general permit, but you are not required to do so. If you choose to not terminate, you will be responsible for complying with all permit conditions of the construction permit in addition to those of the MSGP–2000. The Notice of Termination form is available in Addendum F to this permit and at *http://www.epa.gov/owm/sw/industry/msgp/notform.pdf.*

6.J.6 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4 of the MSGP.

6.J.6.1 *Inspections.* (See also Part 4.2.7.2.1.5) Conduct quarterly visual inspections of all BMPs at active mining facilities. At temporarily or permanently inactive facilities, perform annual inspections. Include in your inspection program: assessment of the integrity of storm water discharge diversions, conveyance systems, sediment control and collection systems and containment structures; inspections to determine if soil erosion has occurred at, or as a result of vegetative BMPs, serrated slopes and benched slopes; inspections of material handling and storage areas and other potential sources of pollution for evidence of actual or potential discharges of contaminated storm water.

6.J.7 Monitoring and Reporting Requirements. (See also Part 5)

TABLE J–1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric limitation [2]
Part of Permit Affected/Supplemental Requirements			
Mine Dewatering Activities at Construction Sand and Gravel; Industrial Sand; and Crushed Stone Mining Facilities (SIC 1422–1429, 1442, 1446).	Total Suspended Solids		25 mg/L, monthly avg. 45 mg/L, daily max
	pH		6.0–9.0
Sand and Gravel Mining (SIC 1442, 1446)	Nitrate plus Nitrogen	0.68 mg/L.	
	Total Suspended Solids	100 mg/L.

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric limitation [2]
Dimension and Crushed Stone and Nonmetallic Minerals (except fuels) (SIC 1411, 1422–1429, 1481, 1499).	Total Suspended Solids	100 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.
[2] Monitor once/year for Each Monitoring Year.

6.K Sector K—Hazardous Waste Treatment, Storage or Disposal Facilities

6.K.1 Covered Storm Water Discharges

The requirements in Part 6.K apply to storm water discharges associated with industrial activity from Hazardous Waste Treatment, Storage or Disposal facilities as identified by the Activity Code specified under Sector K in Table 1–1 of Part 1.2.1.

6.K.2 Industrial Activities Covered by Sector K

This permit authorizes storm water discharges associated with industrial activity from facilities that treat, store or dispose of hazardous wastes, including those that are operating under interim status or a permit under subtitle C of RCRA.

6.K.3 Limitations on Coverage

For facilities located in Region 6, coverage is limited to Hazardous Waste Treatment Storage or Disposal Facilities (TSDF's) that are self-generating or handle residential wastes only and to those facilities that only store hazardous wastes and do not treat or dispose. Those permits are issued by EPA Region 6 for Louisiana (LAR05*###), New Mexico (NMR05*###), Oklahoma (OKR05*###), and Federal Indian Reservations in these States (LAR05*##F, NMR05*##F, OKR05*##F, or TXR05*##F). Coverage under this permit is not available to commercial hazardous waste disposal/treatment facilities located in Region 6 that dispose and treat on a commercial basis any produced hazardous wastes (not their own) as a service to generators.

6.K.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.3.1) Not authorized by this permit: leachate, gas collection condensate, drained free liquids, contaminated ground water, laboratory-derived wastewater and contact washwater from washing truck and railcar exteriors and surface areas which have come in direct contact with solid waste at the landfill facility.

6.K.4 Definitions

6.K.4.1 *Contaminated storm water*—storm water which comes in direct contact with landfill wastes, the waste handling and treatment areas, or landfill wastewater as defined in Part 6.K.4.5. Some specific areas of a landfill that may produce contaminated storm water include (but are not limited to): the open face of an active landfill with exposed waste (no cover added); the areas around wastewater treatment operations; trucks, equipment or machinery that has been in direct contact with the waste; and waste dumping areas.

6.K.4.2 *Drained free liquids*—aqueous wastes drained from waste containers (*e.g.*, drums, etc.) prior to landfilling.

6.K.4.3 *Land treatment facility*—a facility or part of a facility at which hazardous waste is applied onto or incorporated into the soil surface; such facilities are disposal facilities if the waste will remain after closure.

6.K.4.4 *Landfill*—an area of land or an excavation in which wastes are placed for permanent disposal, that is not a land application or land treatment unit, surface impoundment, underground injection well, waste pile, salt dome formation, a salt bed formation, an underground mine or a cave as these terms are defined in 40 CFR 257.2, 258.2 and 260.10.

6.K.4.5 *Landfill wastewater*—as defined in 40 CFR Part 445 (Landfills Point Source Category) all wastewater associated with, or produced by, landfilling activities except for sanitary wastewater, non-contaminated storm water, contaminated groundwater, and wastewater from recovery pumping wells. Landfill wastewater includes, but is not limited to, leachate, gas collection condensate, drained free liquids, laboratory derived wastewater, contaminated storm water and contact washwater from washing truck, equipment, and railcar exteriors and surface areas which have come in direct contact with solid waste at the landfill facility.

6.K.4.6 *Leachate*—liquid that has passed through or emerged from solid waste and contains soluble, suspended, or miscible materials removed from such waste.

6.K.4.7 *Non-contaminated storm water*—storm water which does not come into direct contact with landfill wastes, the waste handling and treatment areas, or landfill wastewater as defined in Part 6.K.4.5. Non-contaminated storm water includes storm water which flows off the cap, cover, intermediate cover, daily cover, and/or final cover of the landfill.

6.K.4.8 *Pile*—any non-containerized accumulation of solid, nonflowing hazardous waste that is used for treatment or storage and that is not a containment building.

6.K.4.9 *Surface impoundment*—a facility or part of a facility which is a natural topographic depression, man-made excavation or diked area formed primarily of earthen materials (although it may be lined with man-made materials), which is designed to hold an accumulation of liquid wastes or wastes containing free liquids, and which is not an injection well. Examples of surface impoundments are holding, storage, settling, and aeration pits, ponds and lagoons.

6.K.5 Numeric Limitations, Monitoring and Reporting Requirements. (See also Part 5)

TABLE K–1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK AND COMPLIANCE MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric limitation [2]
Part of Permit Affected/Supplemental Requirements			
ALL—Industrial Activity Code "HZ" (Note: permit coverage limited in some States)	Ammonia	19.0 mg/L	
	Total Recoverable Magnesium.	0.0636 mg/L	
	Chemical Oxygen Demand (COD).	120.0 mg/L	
	Total Recoverable Arsenic	0.16854 mg/L	
	Total Recoverable Cadmium.	0.0159 mg/L	
	Total Cyanide	0.0636 mg/L	
	Total Recoverable Lead	0.0816 mg/L	
	Total Recoverable Mercury	0.0024 mg/L	
	Total Recoverable Selenium.	0.2385 mg/L	
	Total Recoverable Silver	0.0318 mg/L	
ALL—Industrial Activity Code "HZ" Subject to the Provisions of 40 CFR Part 445 Subpart A.	BOD5		220 mg/l, daily max. 56 mg/l, monthly avg. maximum.
	TSS		88 mg/l, daily max. 27 mg/l, monthly avg. maximum.
	Ammonia		10 mg/l, daily maximum. 4.9 mg/l, monthly avg. maximum.
	Alpha Terpineol		0.042 mg/l, daily max. 0.019 mg/l, monthly avg. maximum.
	Aniline		0.024 mg/l, daily max. 0.015 mg/l, monthly avg. maximum.
	Benzoic Acid		0.119 mg/l, daily max. 0.073 mg/l, monthly avg. maximum.
	Naphthalene		0.059 mg/l, daily max. 0.022 mg/l, monthly avg. maximum.
	p-Cresol		0.024 mg/l, daily max. 0.015 mg/l, monthly avg. maximum.
	Phenol		0.048 mg/l, daily max. 0.029 mg/l, monthly avg. maximum.
	Pyridine		0.072 mg/l, daily max. 0.025 mg/l, monthly avg. maximum.
	Arsenic (Total)		1.1 mg/l, daily maximum. 0.54 mg/l, monthly avg. maximum.
	Chromium (Total)		1.1 mg/l, daily maximum. 0.46 mg/l, monthly avg. maximum.
	Zinc (Total)		0.535 mg/l, daily max. 0.296 mg/l, monthly avg. maximum.
	pH		Within the range of 6–9 pH units.

[1] These benchmark monitoring cutoff concentrations apply to storm water discharges associated with industrial activity other than contaminated storm water discharges from landfills subject to the numeric effluent limitations set forth in Table K–1. Monitor once/quarter for the year 2 and year 4 monitoring years.

[2] As set forth at 40 CFR Part 445 Subpart A, these numeric limitations apply to contaminated storm water discharges from hazardous waste landfills subject to the provisions of RCRA Subtitle C at 40 CFR Parts 264 (Subpart N) and 265 (Subpart N) except for any of the facilities described below:

(a) Landfills operated in conjunction with other industrial or commercial operations when the landfill only receives wastes generated by the industrial or commercial operation directly associated with the landfill;

(b) Landfills operated in conjunction with other industrial or commercial operations when the landfill receives wastes generated by the industrial or commercial operation directly associated with the landfill and also receives other wastes provided the other wastes received for disposal are generated by a facility that is subject to the same provisions in 40 CFR Subchapter N as the industrial or commercial operation or the other wastes received are of similar nature to the wastes generated by the industrial or commercial operation;

R0019873

(c) Landfills operated in conjunction with Centralized Waste Treatment (CWT) facilities subject to 40 CFR Part 437 so long as the CWT facility commingles the landfill wastewater with other non-landfill wastewater for discharge. A landfill directly associated with a CWT facility is subject to this part if the CWT facility discharges landfill wastewater separately from other CWT wastewater or commingles the wastewater from its landfill only with wastewater from other landfills; or

(d) Landfills operated in conjunction with other industrial or commercial operations when the landfill receives wastes from public service activities so long as the company owning the landfill does not receive a fee or other remuneration for the disposal service.

For the discharges subject to the numeric effluent limitations, monitoring for the specified parameters is required once/year during each year of the term of the permit.

6.L Sector L—Landfills, Land Application Sites and Open Dumps

6.L.1 Covered Storm Water Discharges

The requirements in Part 6.L apply to storm water discharges associated with industrial activity from Landfills and Land Application Sites and Open Dumps as identified by the Activity Codes specified under Sector L in Table 1–1 of Part 1.2.1.

6.L.2 Industrial Activities Covered by Sector L

This permit may authorize storm water discharges for Sector L facilities associated with waste disposal at landfills, land application sites and open dumps that receive or have received industrial waste, including sites subject to regulation under Subtitle D of RCRA.

6.L.3 Limitations on Coverage

6.L.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.3.1)

Not authorized by this permit: leachate, gas collection condensate, drained free liquids, contaminated ground water, laboratory wastewater, and contact washwater from washing truck and railcar exteriors and surface areas which have come in direct contact with solid waste at the landfill facility.

6.L.4 Definitions

6.L.4.1 *Contaminated storm water*—storm water which comes in direct contact with landfill wastes, the waste handling and treatment areas, or landfill wastewater. Some specific areas of a landfill that may produce contaminated storm water include (but are not limited to): the open face of an active landfill with exposed waste (no cover added); the areas around wastewater treatment operations; trucks, equipment or machinery that has been in direct contact with the waste; and waste dumping areas.

6.L.4.2 *Drained free liquids*—aqueous wastes drained from waste containers (*e.g.*, drums, etc.) prior to landfilling.

6.L.4.3 *Landfill wastewater*—as defined in 40 CFR Part 445 (Landfills Point Source Category) all wastewater associated with, or produced by, landfilling activities except for sanitary wastewater, non-contaminated storm water, contaminated groundwater, and wastewater from recovery pumping wells. Landfill process wastewater includes, but is not limited to, leachate, gas collection condensate, drained free liquids, laboratory derived wastewater, contaminated storm water and contact washwater from washing truck, equipment and railcar exteriors and surface areas which have come in direct contact with solid waste at the landfill facility.

6.L.4.4 *Leachate*—liquid that has passed through or emerged from solid waste and contains soluble, suspended or miscible materials removed from such waste.

6.L.4.5 *Non-contaminated storm water*—storm water which does not come in direct contact with landfill wastes, the waste handling and treatment areas, or landfill wastewater. Non-contaminated storm water includes storm water which flows off the cap, cover, intermediate cover, daily cover, and/or final cover of the landfill.

6.L.5 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.L.5.1 *Drainage Area Site Map.* (See also Part 4.2.2.3)

Identify where any of the following may be exposed to precipitation/surface runoff: Active and closed landfill cells or trenches, active and closed land application areas, locations where open dumping is occurring or has occurred, locations of any known leachate springs or other areas where uncontrolled leachate may commingle with runoff, leachate collection and handling systems.

6.L.5.2 *Summary of Potential Pollutant Sources.* (See also Part 4.2.4)

Describe the following sources and activities that have potential pollutants associated with them: fertilizer, herbicide and pesticide application; earth/soil moving; waste hauling and loading/unloading; outdoor storage of significant materials including daily, interim and final cover material stockpiles as well as temporary waste storage areas; exposure of active and inactive landfill and land application areas; uncontrolled leachate flows; failure or leaks from leachate collection and treatment systems.

6.L.5.3 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

As part of your good housekeeping program, consider providing protected storage areas for pesticides, herbicides, fertilizer and other significant materials.

6.L.5.4 *Preventative Maintenance Program.* (See also Part 4.2.7.1)

As part of your preventive maintenance program, maintain: all containers used for outdoor chemical/significant materials storage to prevent leaking; all elements of leachate collection and treatment systems to prevent commingling of leachate with storm water; the integrity and effectiveness of any intermediate or final cover (including repairing the cover as necessary to minimize the effects of settlement, sinking and erosion).

6.L.5.5 *Inspections.*

6.L.5.5.1 *Inspections of Active Sites.* (See also Part 4.2.7.2.1.5) Inspect operating landfills, open dumps and land application sites at least once every 7 days. Focus on areas of landfills that have not yet been finally stabilized, active land application areas, areas used for storage of material/wastes that are exposed to precipitation, stabilization and structural control measures, leachate collection and treatment systems, and locations where equipment and waste trucks enter/exit the site. Ensure that sediment and erosion control measures are operating properly. For stabilized sites and areas where land application has been completed, or where the climate is seasonally arid (annual rainfall averages from 0 to 10 inches) or semi-arid (annual rainfall averages from 10 to 20 inches), conduct inspections at least once every month.

6.L.5.5.2 *Inspections of Inactive Sites.* (See also Part 4.2.7.2.1.5) Inspect inactive landfills, open dumps and land application sites at least quarterly. Qualified personnel must inspect landfill (or open dump) stabilization and structural erosion control measures and leachate collection and treatment systems, and all closed land application areas.

6.L.5.6 *Recordkeeping and Internal Reporting.* Implement a tracking system for the types of wastes disposed of in each cell or trench of a landfill or open dump. For land application sites, track the types and quantities of wastes applied in specific areas.

6.L.5.7 *Non-Storm Water Discharge Test Certification.* (See also Part 4.) The discharge test and certification must also be conducted for the presence of leachate and vehicle washwater.

6.L.5.8 *Sediment and Erosion Control Plan.* (See also Part 4.2.7.2.2.1) Provide temporary stabilization (e.g., consider temporary seeding, mulching and placing geotextiles on the inactive portions of stockpiles): for materials stockpiled for daily, intermediate and final cover; for inactive areas of the landfill or open dump; for any landfill or open dump area that have gotten final covers but where vegetation has yet to established itself; and where waste application has been completed at land application sites but final vegetation has not yet been established.

6.L.5.9 *Comprehensive Site Compliance Evaluation.* (See also Part 4.9.2) Evaluate areas contributing to a storm water discharge associated with industrial activities at landfills, open dumps and land application sites for evidence of, or the potential for, pollutants entering the drainage system.

6.L.6 Numeric Limitations, Monitoring and Reporting Requirements. (See also Part 5)

TABLE L–1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK AND COMPLIANCE MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric limitation [2]
Section of Permit Affected/Supplemental Requirements			
All Landfill, Land Application Sites and Open Dumps (Industrial Activity Code "LF").	Total Suspended Solids (TSS).	100 mg/L.	
All Landfill, Land Application Sites and Open Dumps, Except Municipal Solid Waste Landfill (MSWLF) Areas Closed in Accordance with 40 CFR 258.60 (Industrial Activity Code "LF").	Total Recoverable Iron	1.0mg/L.	
All Landfills Which are Subject to the Requirements of 40 CFR Part 445 Subpart B (Industrial Activity Code "LF").	BOD5		140 mg/1, daily max. 37 mg/1, monthly ave maximum
	TSS		88 mg/l, daily max. 27 mg/1, monthly ave maximum.
	Ammonia		10 mg/1, daily max. 4.9 mg/1, monthly ave maximum.
	Alpha Terpineol		0.033 mg/1, daily max. 0.016 mg/1, monthly ave maximum.
	Benzoic Acid		0.12 mg/1, daily max. 0.071 mg/1, monthly ave maximum.
	p-Cresol		0.025 mg/1, daily max. 0.014 mg/1, monthly ave maximum.
	Phenol		0.026 mg/1, daily max. 0.015 mg/1, monthly ave maximum.
	Zinc (Total)		0.20 mg/1, daily max. 0.11 mg/1, monthly ave maximum.
	pH		Within the range of 6–9 pH units.

[1] These benchmark monitoring cutoff concentrations apply to storm water discharges associated with industrial activity other than contaminated storm water discharges from landfills subject to the numeric effluent limitations set forth in Table L–1. Monitor once/quarter for the year 2 and year 4 monitoring years.

[2] As set forth at 40 CFR Part 445 Subpart B, these numeric limitations apply to contaminated storm water discharges from MSWLFs which have not been closed in accordance with 40 CFR 258.60, and contaminated storm water discharges from those landfills which are subject to the provisions of 40 CFR Part 257 except for discharges from any of facilities described in (a) through (d) below:

(a) landfills operated in conjunction with other industrial or commercial operations when the landfill only receives wastes generated by the industrial or commercial operation directly associated with the landfill;

(b) landfills operated in conjunction with other industrial or commercial operations when the landfill receives wastes generated by the industrial or commercial operation directly associated with the landfill and also receives other wastes provided the other wastes received for disposal are generated by a facility that is subject to the same provisions in 40 CFR Subchapter N as the industrial or commercial operation or the other wastes received are of similar nature to the wastes generated by the industrial or commercial operation;

(c) landfills operated in conjunction with Centralized Waste Treatment (CWT) facilities subject to 40 CFR Part 437 so long as the CWT facility commingles the landfill wastewater with other non-landfill wastewater for discharge. A landfill directly associated with a CWT facility is subject to this part if the CWT facility discharges landfill wastewater separately from other CWT wastewater or commingles the wastewater from its landfill only with wastewater from other landfills; or

(d) landfills operated in conjunction with other industrial or commercial operations when the landfill receives wastes from public service activities so long as the company owning the landfill does not receive a fee or other remuneration for the disposal service.

For the discharges subject to the numeric effluent limitations, monitoring for the specified parameters is required once/year during each year of the term of the permit.

6.M Sector M—Automobile Salvage Yards

6.M.1 Covered Storm Water Discharges

The requirements in Part 6.M apply to storm water discharges associated with industrial activity from Automobile Salvage Yards as identified by the Activity Code specified under Sector M in Table 1-1 of Part 1.2.1.

6.M.2 Industrial Activities Covered by Sector M

The types of activities that permittees under Sector M are primarily engaged in are dismantling or wrecking used motor vehicles for parts recycling/resale and for scrap.

6.M.3 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.M.3.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Indicate the location of each monitoring point, and estimate the total acreage used for industrial activity including, but not limited to, dismantling, storage and maintenance of used motor vehicle parts. Also identify where any of the following may be exposed to precipitation/surface runoff: Dismantling areas; parts (*e.g.*, engine blocks, tires, hub caps, batteries, hoods, mufflers) storage areas; liquid storage tanks and drums for fuel and other fluids.

6.M.3.2 *Potential Pollutant Sources.* (See also Part 4.2.4) Assess the potential for the following to contribute pollutants to storm water discharges: Vehicle storage areas; dismantling areas; parts storage area (*e.g.*, engine blocks, tires, hub caps, batteries, hoods, mufflers); fueling stations.

6.M.3.3 *Spill and Leak Prevention Procedures.* (See also Part 4.2.7.2.1.4) Drain vehicles intended to be dismantled of all fluids upon arrival at the site (or as soon thereafter as feasible); or employ some other equivalent means to prevent spills/ leaks.

6.M.3.4 *Inspections.* (See also Part 4.2.7.2.1.5) Immediately (or as soon thereafter as feasible) inspect vehicles arriving at the site for leaks. Inspect quarterly for signs of leakage, all equipment containing oily parts, hydraulic fluids or any other types of fluids. Also inspect quarterly for signs of leakage, all vessels and areas where fluids are stored, including, but not limited to, brake fluid, transmission fluid, radiator water and antifreeze.

6.M.3.5 *Employee Training.* (See also Part 4.2.7.2.1.6) If applicable to your facility, address the following areas (at a minimum) in your employee training program: Proper handling (collection, storage, and disposal) of oil, used mineral spirits, anti-freeze and solvents.

6.M.3.6 *Management of Runoff.* (See also Part 4.2.7.2.2.2) Consider the following management practices: Berms or drainage ditches on the property line (to help prevent run-on from neighboring properties); berms for uncovered outdoor storage of oily parts, engine blocks and above-ground liquid storage; installation of detention ponds; and the installation of filtering devices and oil/water separators.

6.M.4 Monitoring and Reporting Requirements. (See also Part 5)

TABLE M-1.—SECTOR-SPECIFIC NUMERIC LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration[1]	Numeric limitation
Sector of Permit Affected/Supplemental Requirements			
Automobile Salvage Yards (SIC 5015)	Total Suspended Solids (TSS).	100.0 mg/L.	
	Total Recoverable Aluminum.	0.75 mg/L.	
	Total Recoverable Iron	1.0 mg/L.	
	Total Recoverable Lead	0.0816 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 monitoring years.

6.N Sector N—Scrap Recycling and Waste Recycling Facilities

6.N.1 Covered Storm Water Discharges

The requirements in Part N apply to storm water discharges associated with industrial activity from Scrap Recycling and Waste Recycling facilities as identified by the SIC Codes specified under Sector N in Table 1-1 of Part 1.2.1.

6.N.2 Industrial Activities Covered by Sector N

The types of activities that permittees under Sector N are primarily engaged in are:

6.N.2.1 processing, reclaiming and wholesale distribution of scrap and waste materials such as ferrous and nonferrous metals, paper, plastic, cardboard, glass, animal hides;

6.N.2.2 reclaiming and recycling liquid wastes such as used oil, antifreeze, mineral spirits and industrial solvents.

6.N.3 Coverage Under This Permit

Separate permit requirements have been established for recycling facilities that only receive source-separated recyclable materials primarily from non-industrial and residential sources (*i.e.*, common consumer products including paper, newspaper, glass, cardboard, plastic containers, aluminum and tin cans). This includes recycling facilities commonly referred to as material recovery facilities (MRF).

6.N.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.2.2) Not covered by this permit: non-storm water discharges from turnings containment areas (see also Part 6.N.5.1.3). Discharges from containment areas in the absence of a storm event are prohibited unless covered by a separate NPDES permit.

6.N.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4 of the MSGP. Part 6.N.4.1 contains a requirement that applies to all recycling facilities and is followed by Parts 6.N.4.2 to 6.N.4.4.4, which have requirements for specific types of recycling facilities. Implement and describe in your SWPPP a program to address those items that apply. Included are lists of BMP options which, along with any functional equivalents, should be considered for implementation. Selection or deselection of a particular BMP or approach is up to the best professional judgement of the operator, as long as the objective of the requirement is met.

6.N.4.1 *Drainage Area Site Map.* (See also Part 4.2.2.3)

Identify the locations of any of the following activities or sources which may be exposed to precipitation/surface runoff: scrap and waste material storage, outdoor scrap and waste processing equipment, and containment areas for turnings exposed to cutting fluids.

6.N.4.2 *Scrap and Waste Recycling Facilities (Non-Source Separated, Non-Liquid Recyclable Materials).* Requirements for facilities that receive, process and do wholesale distribution of non-liquid recyclable wastes (*e.g.*, ferrous and nonferrous metals, plastics, glass, cardboard and paper). These facilities may receive both non recyclable and recyclable materials. This section is not intended for those facilities that only accept recyclables from primarily non-industrial and residential sources.

6.N.4.2.1 *Inbound Recyclable and Waste Material Control Program.* Minimize the chance of accepting materials that could be significant sources of pollutants by conducting inspections of inbound recyclables and waste materials. BMP options: (a) Provide information/education to suppliers of scrap and recyclable waste materials on draining and properly disposing of residual fluids (*e.g.*, from vehicles and equipment engines, radiators and transmissions, oil filled transformers and individual containers or drums), prior to delivery to your facility; (b) procedures to minimize the potential of any residual fluids from coming into contact with precipitation/runoff; (c) procedures for accepting scrap lead-acid batteries (additional requirements for the handling, storage and disposal or recycling of batteries are contained in the scrap lead-acid battery program provisions in N.5.1.6); (d) training targeted for those personnel engaged in the inspection and acceptance of inbound recyclable materials. In addition, (e) liquid wastes, including used oil, must be stored in materially compatible and non-leaking containers and disposed or recycled in accordance with RCRA.

6.N.4.2.2 *Scrap and Waste Material Stockpiles/Storage (Outdoor).* Minimize contact of storm water runoff with stockpiled materials, processed materials and non-recyclable wastes. BMP options: (a) Permanent or semi-permanent covers; (b) to facilitate settling or filtering of pollutants: sediment traps, vegetated swales and strips, catch basin filters and sand filters; (c) divert runoff away from storage areas via dikes, berms, containment trenches, culverts and surface grading; (d) silt fencing; (e) oil/water separators, sumps and dry absorbents for areas where potential sources of residual fluids are stockpiled (*e.g.*, automobile engine storage areas).

6.N.4.2.3 *Stockpiling of Turnings Exposed to Cutting Fluids (Outdoor).* Minimize contact of surface runoff with residual cutting fluids. BMP options (use singularly or in combination): (a) Store all turnings exposed to cutting fluids under some form of permanent or semi-permanent cover. Storm water discharges from these areas are permitted provided the runoff is first treated by an oil/water separator or its equivalent. Identify procedures to collect, handle and dispose/recycle residual fluids which may be present; (b) establish dedicated containment areas for all turnings that have been exposed to cutting fluids. Storm water runoff from these areas can be discharged provided: The containment areas are constructed of either concrete, asphalt or other equivalent types of impermeable material; there is a barrier around the perimeter of the containment areas (*e.g.*, berms, curbing, elevated pads, etc.) to prevent contact with storm water run-on; there is a drainage collection system for runoff generated from containment areas; you have a schedule to maintain the oil/water separator (or its equivalent); and you identify procedures for properly disposing or recycling collected residual fluids.

6.N.4.2.4 *Scrap and Waste Material Stockpiles/Storage (Covered or Indoor Storage).* Minimize contact of residual liquids and particulate matter from materials stored indoors or under cover with surface runoff. BMP options: (a) Good housekeeping measures including the use of dry absorbent or wet vacuuming to contain or dispose/recycle residual liquids originating from recyclable containers; (b) not allowing washwater from tipping floors or other processing areas to discharge to the storm sewer system; (c) disconnect or seal off all floor drains connected to the storm sewer system.

6.N.4.2.5 *Scrap and Recyclable Waste Processing Areas.* Minimize surface runoff from coming in contact with scrap processing equipment. Pay attention to operations that generate visible amounts of particulate residue (*e.g.*, shredding) to minimize the contact of accumulated particulate matter and residual fluids with runoff (*i.e.*, through good housekeeping, preventive maintenance, etc.). BMP options: (a) Regularly inspect equipment for spills/leaks, and malfunctioning/worn/corroded parts or equipment; (b) a preventive maintenance program for processing equipment; (c) use of dry-absorbents or other cleanup practices to collect and dispose/recycle spilled/leaking fluids; (e) on unattended hydraulic reservoirs over 150 gallons in capacity, install such protection devices as low-level alarms or other equivalent devices, or, alternatively, secondary containment that can hold the entire volume of the reservoir; (f) containment or diversion structures such as dikes, berms, culverts, trenches, elevated concrete pads, grading to minimize contact of storm water runoff with outdoor processing equipment or stored materials; (g) oil/water separators or sumps; (h) permanent or semi-permanent covers in processing areas where there are residual fluids and grease; (i) retention/detention ponds or basins; sediment traps, vegetated swales or strips (for pollutant settling/filtration); (j) catch basin filters or sand filters.

6.N.4.2.6 *Scrap Lead-Acid Battery Program.* Properly handle, store and dispose of scrap lead-acid batteries. BMP options: (a) Segregate scrap lead-acid batteries from other scrap materials; (b) proper handling, storage and disposal of cracked or broken batteries; (c) collect and dispose leaking lead-acid battery fluid; (d) minimize/eliminate (if possible) exposure of scrap lead-acid batteries to precipitation or runoff; (e) employee training for the management of scrap batteries.

6.N.4.2.7 *Spill Prevention and Response Procedures.* (See also Part 4.2.7.2.1.4) Minimize storm water contamination at loading/unloading areas, and from equipment or container failures. BMP options: (a) Prevention and response measures for areas that are potential sources of fluid leaks/spills; (b) immediate containment and clean up of spills/leaks. If malfunctioning equipment is responsible for the spill/leak, repairs should also be conducted as soon as possible; (c) cleanup measures including the use of dry absorbents. If this method is employed, there should be an adequate supply of dry absorbent materials kept onsite and used absorbent must be properly disposed of; (d) store drums containing liquids—especially oil and lubricants—either: Indoors, in a bermed area, in overpack containers or spill pallets, or in other containment devices; (e) install overfill prevention devices on fuel pumps or tanks; (f) place drip pans or equivalent measures under leaking stationary equipment until the leak is repaired. The drip pans should be inspected for leaks and potential overflow and all liquids must be properly disposed of (as per RCRA); (g) install alarms and/or pump shut off systems on outdoor equipment with hydraulic reservoirs exceeding 150 gallons in the event of a line break. Alternatively, a secondary containment system capable of holding the entire contents of the reservoir plus room for precipitation can be used.

6.N.4.2.8 *Quarterly Inspection Program*. (See also Part 4.2.7.2.1.5) Inspect all designated areas of the facility and equipment identified in the plan quarterly.

6.N.4.2.9 *Supplier Notification Program*. As appropriate, notify major suppliers which scrap materials will not be accepted at the facility or are only accepted under certain conditions.

6.N.4.3 *Waste Recycling Facilities (Liquid Recyclable Materials)*.

6.N.4.3.1 *Waste Material Storage (Indoor)*. Minimize/eliminate contact between residual liquids from waste materials stored indoors and surface runoff. The plan may refer to applicable portions of other existing plans such as SPCC plans required under 40 CFR Part 112. BMP options: (a) procedures for material handling (including labeling and marking); (b) clean up spills/leaks with dry-absorbent materials or a wet vacuum system; (c) appropriate containment structures (trenching, curbing, gutters, etc.); (d) a drainage system, including appurtenances (*e.g.*, pumps or ejectors, manually operated valves), to handle discharges from diked or bermed areas. Drainage should be discharged to an appropriate treatment facility, sanitary sewer system, or otherwise disposed of properly. These discharges may require coverage under a separate NPDES wastewater permit or industrial user permit under the pretreatment program.

6.N.4.3.2 *Waste Material Storage (Outdoor)*. Minimize contact between stored residual liquids and precipitation or runoff. The plan may refer to applicable portions of other existing plans such as SPCC plans required under 40 CFR Part 112. Discharges of precipitation from containment areas containing used oil must also be in accordance with applicable sections of 40 CFR Part 112. BMP options: (a) appropriate containment structures (*e.g.*, dikes, berms, curbing, pits) to store the volume of the largest tank with sufficient extra capacity for precipitation; (b) drainage control and other diversionary structures; (c) for storage tanks, provide corrosion protection and/or leak detection systems; (d) use dry-absorbent materials or a wet vacuum system to collect spills.

6.N.4.3.3 *Trucks and Rail Car Waste Transfer Areas*. Minimize pollutants in discharges from truck and rail car loading/unloading areas. Include measures to clean up minor spills/leaks resulting from the transfer of liquid wastes. BMP options: (a) containment and diversionary structures to minimize contact with precipitation or runoff; (b) use dry-clean up methods, wet vacuuming, roof coverings, or runoff controls.

6.N.4.3.4 *Quarterly Inspections*. (See also Part 4.2.7.2.1.5) At a minimum, the inspections must also include all areas where waste is generated, received, stored, treated or disposed and that are exposed to either precipitation or storm water runoff.

6.N.4.4 *Recycling Facilities (Source Separated Materials)*. The following identifies considerations for facilities that receive only source-separated recyclables, primarily from non-industrial and residential sources.

6.N.4.4.1 *Inbound Recyclable Material Control*. Minimize the chance of accepting non-recyclables (*e.g.*, hazardous materials) which could be a significant source of pollutants by conducting inspections of inbound materials. BMP options: (a) information/education measures to inform suppliers of recyclables which materials are acceptable and which are not; (b) training drivers responsible for pickup of recycled material; (c) clearly marking public drop-off containers regarding which materials can be accepted; (d) reject non-recyclable wastes or household hazardous wastes at the source; (e) procedures for handling and disposal of non-recyclable material.

6.N.4.4.2 *Outdoor Storage*. Minimize exposure of recyclables to precipitation and runoff. Use good housekeeping measures to prevent accumulation of particulate matter and fluids, particularly in high traffic areas. Other BMP options: (a) provide totally-enclosed drop-off containers for the public; (b) install a sump/pump with each container pit and treat or discharge collected fluids to a sanitary sewer system; (c) provide dikes and curbs for secondary containment (*e.g.*, around bales of recyclable waste paper); (d) divert surface water runoff away from outside material storage areas; (e) provide covers over containment bins, dumpsters, roll-off boxes; (f) store the equivalent one days's volume of recyclable material indoors.

6.N.4.4.3 *Indoor Storage and Material Processing*. Minimize the release of pollutants from indoor storage and processing areas. BMP options: (a) schedule routine good housekeeping measures for all storage and processing areas; (b) prohibit tipping floor washwater from draining to the storm sewer system; (c) provide employee training on pollution prevention practices.

6.N.4.4.4 *Vehicle and Equipment Maintenance*. BMP options for those areas where vehicle and equipment maintenance are occurring outdoors: (a) prohibit vehicle and equipment washwater from discharging to the storm sewer system; (b) minimize or eliminate outdoor maintenance areas whenever possible; (c) establish spill prevention and clean-up procedures in fueling areas; (d) avoid topping off fuel tanks; (e) divert runoff from fueling areas; (f) store lubricants and hydraulic fluids indoors; (g) provide employee training on proper handling, storage of hydraulic fluids and lubricants.

6.N.5 Monitoring and Reporting Requirements. (See also Part 5)

TABLE N-1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration[1]	Numeric limitation
Part of Permit Affected/Supplemental Requirements			
Scrap Recycling Facility (SIC 5093)	Chemical Oxygen Demand (COD).	120 mg/L.	
	Total Suspended Solids (TSS).	100 mg/L.	
	Total Recoverable Aluminum.	0.75 mg/L.	
	Total Recoverable Copper	0.0636 mg/L.	
	Total Recoverable Iron	1.0 mg/L.	
	Total Recoverable Lead	0.0816 mg/L.	
	Total Recoverable Zinc	0.117 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.

6.O Sector O—Steam Electric Generating Facilities

6.O.1 Covered Storm Water Discharges

The requirements in Part 6.O apply to storm water discharges associated with industrial activity from Steam Electric Power Generating Facilities as identified by the Activity Code specified under Sector O in Table 1–1 of Part 1.2.1.

6.O.2 Industrial Activities Covered by Sector O

This permit authorizes storm water discharges from the following industrial activities at Sector O facilities:

6.O.2.1 Steam electric power generation using coal, natural gas, oil, nuclear energy, etc. to produce a steam source, including coal handling areas;

6.O.2.2 Coal pile runoff, including effluent limitations established by 40 CFR Part 423;

6.O.2.3 Dual fuel co-generation facilities.

6.O.3 Limitations on Coverage

6.O.3.1 *Prohibition of Non-Storm Water Discharges.* Not covered by this permit: non-storm water discharges subject to effluent limitations guidelines.

6.O.3.2 *Prohibition of Storm Water Discharges.* Not covered by this permit: storm water discharges from ancillary facilities (*e.g.*, fleet centers, gas turbine stations and substations) that are not contiguous to a stream electric power generating facility; and heat capture co-generation facilities.

6.O.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.O.4.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify the locations of any of the following activities or sources which may be exposed to precipitation / surface runoff: storage tanks, scrap yards, general refuse areas; short and long term storage of general materials (including but not limited to: supplies, construction materials, paint equipment, oils, fuels, used and unused solvents, cleaning materials, paint, water treatment chemicals, fertilizer and pesticides); landfills, construction sites; stock piles areas (*e.g.*, coal or limestone piles).

6.O.4.2 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

6.O.4.2.1 *Fugitive Dust Emissions.* Describe and implement measures that prevent or minimize fugitive dust emissions from coal handling areas. Consider such procedures to minimize the tracking of coal dust offsite as installing specially designed tires, or washing vehicles in a designated area before they leave the site and controlling the wash water.

6.O.4.2.2 *Delivery Vehicles.* Describe and implement measures that prevent or minimize contamination of storm water runoff from delivery vehicles arriving at the plant site. Consider the following: procedures to inspect delivery vehicles arriving at the plant site and ensure overall integrity of the body or container; and procedures to deal with leakage / spillage from vehicles or containers.

6.O.4.2.3 *Fuel Oil Unloading Areas.* Describe and implement measures that prevent or minimize contamination of precipitation / surface runoff from fuel oil unloading areas. Consider, at a minimum (or their equivalents): using containment curbs in unloading areas; having personnel familiar with spill prevention and response procedures present during deliveries to ensure that any leaks / spills are immediately contained and cleaned up; using spill and overflow protection (*e.g.*, drip pans, drip diapers or other containment devices placed beneath fuel oil connectors to contain potential spillage during deliveries or from leaks at the connectors).

6.O.4.2.4 *Chemical Loading / Unloading.* Describe and implement measures that prevent or minimize contamination of precipitation / surface runoff from chemical loading / unloading areas. Consider, at a minimum (or their equivalents): using containment curbs at chemical loading / unloading areas to contain spill; having personnel familiar with spill prevention and response procedures present during deliveries to ensure that any leaks / spills are immediately contained and cleaned up; and load / unload in covered areas and store chemicals indoors.

6.O.4.2.5 *Miscellaneous Loading / Unloading Areas.* Describe and implement measures that prevent or minimize contamination of precipitation / surface runoff from loading / unloading areas. Consider, at a minimum (or their equivalents): covering the loading area; grading, berming, or curbing around the loading area to divert run-on; or locating the loading / unloading equipment and vehicles so leaks are contained in existing containment and flow diversion systems.

6.O.4.2.6 *Liquid Storage Tanks.* Describe and implement measures that prevent or minimize contamination of surface runoff from above ground liquid storage tanks. Consider using, at a minimum (or their equivalents): protective guards around tank; containment curbs; spill and overflow protection; and dry cleanup methods.

6.O.4.2.7 *Large Bulk Fuel Storage Tanks.* Describe and implement measures that prevent or minimize contamination of surface runoff from large bulk fuel storage tanks. Consider, at a minimum, using containment berms (or its equivalent). You must also comply with applicable State and Federal laws, including Spill Prevention Control and Countermeasures (SPCC).

6.O.4.2.8 *Spill Reduction Measures.* Describe and implement measures to reduce the potential for an oil / chemical spill or reference the appropriate Part of your SPCC plan. At a minimum, visually inspect on a weekly basis, the structural integrity of all above ground tanks, pipelines, pumps and other related equipment, and effect any necessary repairs immediately.

6.O.4.2.9 *Oil Bearing Equipment in Switchyards.* Describe and implement measures that prevent or minimize contamination of surface runoff from oil bearing equipment in switchyard areas. Consider using level grades and gravel surfaces to retard flows and limit the spread of spills or collecting runoff in perimeter ditches.

6.O.4.2.10 *Residue Hauling Vehicles.* Inspect all residue hauling vehicles for proper covering over the load, adequate gate sealing and overall integrity of the container body. Repair as soon as practicable, vehicles without load covering or adequate gate sealing, or with leaking containers or beds.

6.O.4.2.11 *Ash Loading Areas.* Describe and implement procedures to reduce or control the tracking of ash/residue from ash loading areas. Where practicable, clear the ash building floor and immediately adjacent roadways of spillage, debris and excess water before departure of each loaded vehicle.

6.O.4.2.12 *Areas Adjacent to Disposal Ponds or Landfills.* Describe and implement measures that prevent or minimize contamination of surface runoff from areas adjacent to disposal ponds or landfills. Develop procedures to reduce ash residue that may be tracked on to access roads traveled by residue handling vehicles, and reduce ash residue on exit roads leading into and out of residue handling areas.

6.O.4.2.13 *Landfills, Scrap Yards, Surface Impoundments, Open Dumps, General Refuse Sites.*

Address these areas in your SWPPP and include appropriate BMPs as referred to in Part 4.

6.O.4.2.14 *Vehicle Maintenance Activities.* For vehicle maintenance activities performed on the plant site, use the applicable BMPs outlined in Part 6.P.

6.O.4.2.15 *Material Storage Areas.* Describe and implement measures that prevent or minimize contamination of storm water runoff from material storage areas (including areas used for temporary storage of miscellaneous products and construction materials stored in lay-down areas). Consider using (or their equivalents): Flat yard grades; collecting runoff in graded swales or ditches; erosion protection measures at steep outfall sites (*e.g.*, concrete chutes, riprap, stilling basins); covering lay-down areas; storing materials indoors; and covering materials temporarily with polyethylene, polyurethane, polypropylene or hypalon. Storm water run-on may be minimized by constructing an enclosure or building a berm around the area.

6.O.4.3 *Comprehensive Site Compliance Evaluation.* (See also Part 4.9.3) As part of your evaluation, inspect the following areas on a monthly basis: Coal handling areas, loading/unloading areas, switchyards, fueling areas, bulk storage areas, ash handling areas, areas adjacent to disposal ponds and landfills, maintenance areas, liquid storage tanks, and long term and short term material storage areas.

6.O.5 Monitoring and Reporting Requirements. (See also Part 5)

TABLE O–1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric Limitation [2]
Part of Permit Affected/Supplemental Requirements			
Steam Electric Generating Facilities (Industrial Activity Code "SE").	Total Recoverable Iron	1.0 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.
[2] Note that the numeric effluent limitation guidelines for coal pile runoff at steam electric generating facilities have been adopted as a standard numeric limits for all coal pile runoff. See Part 5.1.3.

6.P Sector P—Land Transportation and Warehousing

6.P.1 Covered Storm Water Discharges

The requirements in Part 6.P apply to storm water discharges associated with industrial activity from Land Transportation and Warehousing facilities as identified by the Activity Code specified under Sector P in Table 1–1 of Part 1.2.1.

6.P.2 Industrial Activities Covered by Sector P

The types of activities that permittees under Sector P are primarily engaged in are:

6.P.2.1 vehicle and equipment maintenance (vehicle and equipment rehabilitation, mechanical repairs, painting, fueling and lubrication);

6.P.2.2 equipment cleaning.

6.P.3 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.P.3.1 *Drainage Site Map.* (See also Part 4.2.2.3) Identify the locations of any of the following activities or sources: Fueling stations; vehicle/equipment maintenance or cleaning areas; storage areas for vehicle/equipment with actual or potential fluid leaks; loading/unloading areas; areas where treatment, storage or disposal of wastes occur; liquid storage tanks; processing areas; storage areas; and all monitoring areas.

6.P.3.2 *Potential Pollutant Sources.* (See also Part 4.2.4) Describe and assess the potential for the following to contribute pollutants to storm water discharges: Onsite waste storage or disposal; dirt/gravel parking areas for vehicles awaiting maintenance; and fueling areas.

6.P.3.3 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

6.P.3.3.1 *Vehicle and Equipment Storage Areas.* Confine the storage of leaky or leak-prone vehicles/equipment awaiting maintenance to designated areas. Consider the following (or other equivalent measures): The use of drip pans under vehicles/equipment, indoor storage of vehicles and equipment, installation of berms or dikes, use of absorbents, roofing or covering storage areas, and cleaning pavement surfaces to remove oil and grease.

6.P.3.3.2 *Fueling Areas.* Implement and describe measures that prevent or minimize contamination of storm water runoff from fueling areas. Consider the following (or other equivalent measures): Covering the fueling area; using spill/overflow protection and cleanup equipment; minimizing storm water runon/runoff to the fueling area; using dry cleanup methods; and treating and/or recycling collected storm water runoff.

6.P.3.3.3 *Material Storage Areas.* Maintain all material storage vessels (*e.g.*, for used oil/oil filters, spent solvents, paint wastes, hydraulic fluids) to prevent contamination of storm water and plainly label them (*e.g.*, "Used Oil," "Spent Solvents," etc.). Consider the following (or other equivalent measures): storing the materials indoors; installing berms/dikes around the areas; minimizing runoff of storm water to the areas; using dry cleanup methods; and treating and/or recycling collected storm water runoff.

6.P.3.3.4 *Vehicle and Equipment Cleaning Areas.* Implement and describe measures that prevent or minimize contamination of storm water runoff from all areas used for vehicle/equipment cleaning. Consider the following (or other equivalent measures): performing all cleaning operations indoors; covering the cleaning operation, ensuring that all washwater drains to a proper collection system (*i.e.*, not the storm water drainage system unless NPDES permitted); treating and/or recycling collected storm water runoff, or other equivalent measures. Note: the discharge of vehicle/equipment washwater, including tank cleaning operations, are not authorized by this permit and must be covered under a separate NPDES permit or discharged to a sanitary sewer in accordance with applicable industrial pretreatment requirements.

6.P.3.3.5 *Vehicle and Equipment Maintenance Areas.* Implement and describe measures that prevent or minimize contamination of storm water runoff from all areas used for vehicle/equipment maintenance. Consider the following (or other equivalent measures): performing maintenance activities indoors; using drip pans; keeping an organized inventory of materials used in the shop; draining all parts of fluid prior to disposal; prohibiting wet clean up practices if these practices would result in the discharge of pollutants to storm water drainage systems; using dry cleanup methods; treating and/or recycling collected storm water runoff, minimizing run on/runoff of storm water to maintenance areas.

6.P.3.3.6 *Locomotive Sanding (Loading Sand for Traction) Areas.* Consider the following (or other equivalent measures): covering sanding areas; minimizing storm water run on/runoff; or appropriate sediment removal practices to minimize the offsite transport of sanding material by storm water.

6.P.3.4 *Inspections.* (See also Part 4.2.7.2.1.5) Inspect all the following areas/activities: storage areas for vehicles/equipment awaiting maintenance, fueling areas, indoor and outdoor vehicle/equipment maintenance areas, material storage areas, vehicle/equipment cleaning areas and loading/unloading areas.

6.P.3.5 *Employee Training.* (See also Part 4.2.7.2.1.6) Train personnel at least once a year and address the following, as applicable: used oil and spent solvent management; fueling procedures; general good housekeeping practices; proper painting procedures; and used battery management.

6.P.3.6 *Vehicle and Equipment Washwater Requirements.* (See also Part 4.4) Attach to or reference in your SWPPP, a copy of the NPDES permit issued for vehicle/equipment washwater or, if an NPDES permit has not been issued, a copy of the pending application. If an industrial user permit is issued under a pretreatment program, attach a copy to your SWPPP. In any case, address all non-storm water permit conditions or pretreatment conditions in your SWPPP. If washwater is handled in another manner (*e.g.*, hauled offsite), describe the disposal method and attach all pertinent documentation/information (*e.g.*, frequency, volume, destination, etc.) in the plan.

6.Q Sector Q—Water Transportation

6.Q.1 Covered Storm Water Discharges

The requirements in Part 6.Q apply to storm water discharges associated with industrial activity from Water Transportation facilities as identified by the Activity Code specified under Sector Q in Table 1–1 of Part 1.2.1.

6.Q.2 Industrial Activities Covered by Sector Q

The requirements listed under this Part apply to storm water discharges associated with the following activities:

6.Q.2.1 Water transportation facilities classified in SIC Code major group 44 that have vehicle (vessel) maintenance shops and/or equipment cleaning operations including:

6.Q.2.1.1 Water transportation industry includes facilities engaged in foreign or domestic transport of freight or passengers in deep sea or inland waters;

6.Q.2.1.2 Marine cargo handling operations;

6.Q.2.1.3 Ferry operations;

6.Q.2.1.4 Towing and tugboat services;

6.Q.2.1.5 Marinas.

6.Q.3 Limitations on Coverage

6.Q.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.3.1) Not covered by this permit: bilge and ballast water, sanitary wastes, pressure wash water and cooling water originating from vessels.

6.Q.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.Q.4.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify where any of the following may be exposed to precipitation/surface runoff: fueling; engine maintenance/repair; vessel maintenance/repair; pressure washing; painting; sanding; blasting; welding; metal fabrication; loading/unloading areas; locations used for the treatment, storage or disposal of wastes; liquid storage tanks; liquid storage areas (*e.g.*, paint, solvents, resins); and material storage areas (*e.g.*, blasting media, aluminum, steel, scrap iron).

6.Q.4.2 *Summary of Potential Pollutant Sources.* (See also Part 4.2.4) Describe the following additional sources and activities that have potential pollutants associated with them: outdoor manufacturing or processing activities (*i.e.*, welding, metal fabricating); and significant dust or particulate generating processes (*e.g.*, abrasive blasting, sanding, painting).

6.Q.4.3 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

6.Q.4.3.1 *Pressure Washing Area.* If pressure washing is used to remove marine growth from vessels, the discharge water must be permitted by a separate NPDES permit. Describe in the SWPPP: the measures to collect or contain the discharges from the pressures washing area; the method for the removal of the visible solids; the methods of disposal of the collected solids; and where the discharge will be released.

6.Q.4.3.2 *Blasting and Painting Area.* Implement and describe measures to prevent spent abrasives, paint chips and over spray from discharging into the receiving water or the storm sewer systems. Consider containing all blasting/painting activities or use other measures to prevent or minimize the discharge the contaminants (*e.g.*, hanging plastic barriers or tarpaulins during blasting or painting operations to contain debris). Where necessary, regularly clean storm water conveyances of deposits of abrasive blasting debris and paint chips. Detail in the SWPPP any standard operating practices relating to blasting/painting (*e.g.*, prohibiting uncontained blasting/ painting over open water, or prohibiting blasting/painting during windy conditions which can render containment ineffective).

6.Q.4.3.3 *Material Storage Areas.* Store and plainly label all containerized materials (*e.g.*, fuels, paints, solvents, waste oil, antifreeze, batteries) in a protected, secure location away from drains. Implement and describe measures to prevent or minimize the contamination of precipitation/surface runoff from the storage areas. Specify which materials are stored indoors and consider containment or enclosure for those stored outdoors. If abrasive blasting is performed, discus the storage and disposal of spent abrasive materials generated at the facility. Consider implementing an inventory control plan to limit the presence of potentially hazardous materials onsite.

6.Q.4.3.4 *Engine Maintenance and Repair Areas.* Implement and describe measures to prevent or minimize the contamination of precipitation/surface runoff from all areas used for engine maintenance and repair. Consider the following (or their equivalents): performing all maintenance activities indoors; maintaining an organized inventory of materials used in the shop; draining all parts of fluid prior to disposal; prohibiting the practice of hosing down the shop floor; using dry cleanup methods; and treating and/or recycling storm water runoff collected from the maintenance area.

6.Q.4.3.5 *Material Handling Area.* Implement and describe measures to prevent or minimize the contamination of precipitation/surface runoff from material handling operations and areas (*e.g.*, fueling, paint and solvent mixing, disposal of process wastewater streams from vessels). Consider the following (or their equivalents): covering fueling areas; using spill/overflow protection; mixing paints and solvents in a designated area (preferably indoors or under a shed); and minimize runoff of storm water to material handling areas.

6.Q.4.3.6 *Drydock Activities.* Describe your procedures for routinely maintaining/cleaning the drydock to prevent or minimize pollutants in storm water runoff. Address the cleaning of accessible areas of the drydock prior to flooding, and final cleanup following removal of the vessel and raising the dock. Include procedures for cleaning up oil, grease or fuel spills occurring on the drydock. Consider the following (or their equivalents): sweeping rather than hosing off debris/spent blasting material from accessible areas of the drydock prior to flooding, and having absorbent materials and oil containment booms readily available to contain/cleanup any spills.

6.Q.4.3.7 *General Yard Area.* Implement and describe a schedule for routine yard maintenance and cleanup. Regularly remove from the general yard area: scrap metal, wood, plastic, miscellaneous trash, paper, glass, industrial scrap, insulation, welding rods, packaging, etc.

6.Q.4.4 *Preventative Maintenance.* (See also Part 4.2.7.2.1.4) As part of your preventive maintenance program, perform timely inspection and maintenance of storm water management devices (*e.g.*, cleaning oil/ water separators and sediment traps to ensure that spent abrasives, paint chips and solids will be intercepted and retained prior to entering the storm drainage system) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters.

6.Q.4.5 *Inspections.* (See also Part 4.2.7.2.1.5) Include the following areas in all monthly inspections: pressure washing area; blasting, sanding and painting areas; material storage areas; engine maintenance/repair areas; material handling areas; drydock area; and general yard area.

6.Q.4.6 *Employee Training.* (See also Part 4.2.7.2.1.6) As part of your employee training program, address, at a minimum, the following activities (as applicable): used oil management; spent solvent management; disposal of spent abrasives; disposal of vessel wastewaters; spill prevention and control; fueling procedures; general good housekeeping practices; painting and blasting procedures; and used battery management.

6.Q.4.7 *Comprehensive Site Compliance Evaluation.* (See also Part 4.9) Conduct regularly scheduled evaluations at least once a year and address those areas contributing to a storm water discharge associated with industrial activity (*e.g.*, pressure washing area, blasting/sanding areas, painting areas, material storage areas, engine maintenance/repair areas, material handling areas, and drydock area). Inspect these sources for evidence of, or the potential for, pollutants entering the drainage system.

6.Q.5 Monitoring and Reporting Requirements. (See also Part 5)

TABLE Q–1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration [1]	Numeric limitation
Part of Permit Affected/Supplemental Requirements			
Water Transportation Facilities (SIC 4412–4499)	Total Recoverable Aluminum..	0.75 mg/L	
	Total Recoverable Iron.	1.0 mg/L	
	Total Recoverable Lead.	0.0816 mg/L	
	Total Recoverable Zinc.	0.117 mg/L	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.

R0019882

6.R Sector R—Ship and Boat Building or Repair Yards

6.R.1 Covered Storm Water Discharges

The requirements in Part 6.R apply to storm water discharges associated with industrial activity from Ship and Boat Building or Repair Yards as identified by the Activity Codes specified under Sector R in Table 1–1 of Part 1.2.1.

6.R.2 Industrial Activities Covered by Sector R

The types of activities that permittees under Sector R are primarily engaged in are:

6.R.2.1 Ship building and repairing and boat building and repairing [3]

6.R.3 Limitations on Coverage

6.R.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.3.1) Not covered by this permit: discharges containing bilge and ballast water, sanitary wastes, pressure wash water and cooling water originating from vessels.

6.R.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.R.4.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify where any of the following may be exposed to precipitation/surface runoff: fueling; engine maintenance/repair; vessel maintenance/repair; pressure washing; painting; sanding; blasting; welding; metal fabrication; loading/unloading areas; locations used for the treatment, storage or disposal of wastes; liquid storage tanks; liquid storage areas (*e.g.*, paint, solvents, resins); and material storage areas (*e.g.*, blasting media, aluminum, steel, scrap iron).

6.R.4.2 *Potential Pollutant Sources.* (See also Part 4.2.4) Describe the following additional sources and activities that have potential pollutants associated with them (if applicable): outdoor manufacturing/processing activities (*e.g.*, welding, metal fabricating); and significant dust/particulate generating processes (*e.g.*, abrasive blasting, sanding, painting).

6.R.4.3 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

6.R.4.3.1 *Pressure Washing Area.* If pressure washing is used to remove marine growth from vessels, the discharge water must be permitted as a process wastewater by a separate NPDES permit.

6.R.4.3.2 *Blasting and Painting Area.* Implement and describe measures to prevent spent abrasives, paint chips and over spray from discharging into the receiving water or the storm sewer systems. Consider containing all blasting/painting activities or use other measures to prevent the discharge of the contaminants (*e.g.*, hanging plastic barriers or tarpaulins during blasting or painting operations to contain debris). Where necessary, regularly clean storm water conveyances of deposits of abrasive blasting debris and paint chips. Detail in the SWPPP any standard operating practices relating to blasting/painting (*e.g.*, prohibiting uncontained blasting/painting over open water, or prohibiting blasting/painting during windy conditions which can render containment ineffective).

6.R.4.3.3 *Material Storage Areas.* Store and plainly label all containerized materials (*e.g.*, fuels, paints, solvents, waste oil, antifreeze, batteries) in a protected, secure location away from drains. Implement and describe measures to prevent or minimize the contamination of precipitation/surface runoff from the storage areas. Specify which materials are stored indoors and consider containment or enclosure for those stored outdoors. If abrasive blasting is performed, discuss the storage and disposal of spent abrasive materials generated at the facility. Consider implementing an inventory control plan to limit the presence of potentially hazardous materials onsite.

6.R.4.3.4 *Engine Maintenance and Repair Areas.* Implement and describe measures to prevent or minimize the contamination of precipitation/surface runoff from all areas used for engine maintenance and repair. Consider the following (or their equivalents): performing all maintenance activities indoors; maintaining an organized inventory of materials used in the shop; draining all parts of fluid prior to disposal; prohibiting the practice of hosing down the shop floor; using dry cleanup methods; and treating and/or recycling storm water runoff collected from the maintenance area.

6.R.4.3.5 *Material Handling Area.* Implement and describe measures to prevent or minimize the contamination of precipitation/surface runoff from material handling operations and areas (*e.g.*, fueling, paint and solvent mixing, disposal of process wastewater streams from vessels). Consider the following (or their equivalents): covering fueling areas; using spill/overflow protection; mixing paints and solvents in a designated area (preferably indoors or under a shed); and minimize runon of storm water to material handling areas.

6.R.4.3.6 *Drydock Activities.* Describe your procedures for routinely maintaining/cleaning the drydock to prevent or minimize pollutants in storm water runoff. Address the cleaning of accessible areas of the drydock prior to flooding, and final cleanup following removal of the vessel and raising the dock. Include procedures for cleaning up oil, grease or fuel spills occurring on the drydock. Consider the following (or their equivalents): sweeping rather than hosing off debris/spent blasting material from accessible areas of the drydock prior to flooding, and having absorbent materials and oil containment booms readily available to contain/cleanup any spills.

6.R.4.3.7 *General Yard Area.* Implement and describe a schedule for routine yard maintenance and cleanup. Regularly remove from the general yard area: scrap metal, wood, plastic, miscellaneous trash, paper, glass, industrial scrap, insulation, welding rods, packaging, etc.

6.R.4.4 *Preventative Maintenance.* (See also Part 4.2.7.2.1.4) As part of your preventive maintenance program, perform timely inspection and maintenance of storm water management devices (*e.g.*, cleaning oil/water separators and sediment traps to ensure that spent abrasives, paint chips and solids will be intercepted and retained prior to entering the storm drainage system) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters.

6.R.4.5 *Inspections.* (See also Part 4.2.7.2.1.5) Include the following areas in all monthly inspections: pressure washing area; blasting, sanding and painting areas; material storage areas; engine maintenance/repair areas; material handling areas; drydock area; and general yard area.

6.R.4.6 *Employee Training.* (See also Part 4.2.7.2.1.6) As part of your employee training program, address, at a minimum, the following activities (as applicable): used oil management; spent solvent management; disposal of spent abrasives; disposal of vessel wastewaters; spill prevention and control; fueling procedures; general good housekeeping practices; painting and blasting procedures; and used battery management.

6.R.4.7 *Comprehensive Site Compliance Evaluation.* (See also Part 4.9) Conduct regularly scheduled evaluations at least once a year and address those areas contributing to a storm water discharge associated with industrial activity (*e.g.*, pressure

[3] According to the U.S. Coast Guard, a vessel 65 feet or greater in length is referred to as a ship, and a vessel smaller than 65 feet is a boat.

R0019883

washing area, blasting/sanding areas, painting areas, material storage areas, engine maintenance/repair areas, material handling areas, and drydock area). They must be visually inspected for evidence of, or the potential for, pollutants entering the drainage system.

6.S Sector S—Air Transportation

6.S.1 Covered Storm Water Discharges

The requirements in Part 6.S apply to storm water discharges associated with industrial activity from Air Transportation facilities as identified by the SIC Codes specified under Sector S in Table 1–1 of Part 1.2.1.

6.S.2 Industrial Activities Covered by Sector S

The types of activities that permittees under Sector S are primarily engaged in are:

6.S.2.1 Air transportation, scheduled, and air courier;

6.S.2.2 Air transportation, non scheduled;

6.S.2.3 Airports; flying fields, except those maintained by aviation clubs; and airport terminal services including: air traffic control, except government; aircraft storage at airports; aircraft upholstery repair; airfreight handling at airports; airport hangar rental; airport leasing, if operating airport; airport terminal services; and hangar operations.

6.S.2.4 Airport and aircraft service and maintenance including: aircraft cleaning and janitorial service; aircraft servicing/repairing, except on a factory basis; vehicle maintenance shops; material handling facilities; equipment clearing operations; and airport and aircraft deicing/anti-icing.

Note: "deicing" will generally be used to imply both deicing (removing frost, snow or ice) and anti-icing (preventing accumulation of frost, snow or ice) activities, unless specific mention is made regarding anti-icing and/or deicing activities.

6.S.3 Limitations on Coverage

Only those portions of the facility that are involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling and lubrication), equipment cleaning operations or deicing operations are addressed in Part 6.S.

6.S.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.3.1) Not covered by this permit: aircraft, ground vehicle, runway and equipment washwaters; and dry weather discharges of deicing chemicals. These discharges must be covered by a separate NPDES permit.

6.S.4 Special Conditions

6.S.4.1 *Hazardous Substances or Oil.* (See also Part 3.1) Each individual permittee is required to report spills equal to or exceeding the reportable quantity (RQ) levels specified at 40 CFR 110, 117 and 302 as described at Part 3.2. If an airport authority is the sole permittee, then the sum total of all spills at the airport must be assessed against the RQ. If the airport authority is a co-permittee with other deicing operators at the airport, such as numerous different airlines, the assessed amount must be the summation of spills by each co-permittee. If separate, distinct individual permittees exist at the airport, then the amount spilled by each separate permittee must be the assessed amount for the RQ determination.

6.S.5 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4 of the MSGP.

(See also Part 4.1) If an airport's tenant has a SWPPP for discharges from their own areas of the airport, that SWPPP must be integrated with the plan for the entire airport. Tenants of the airport facility include air passenger or cargo companies, fixed based operators and other parties who have contracts with the airport authority to conduct business operations on airport property and whose operations result in storm water discharges associated with industrial activity.

6.S.5.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify where any of the following may be exposed to precipitation/surface runoff: aircraft and runway deicing operations; fueling stations; aircraft, ground vehicle and equipment maintenance/cleaning areas; storage areas for aircraft, ground vehicles and equipment awaiting maintenance.

6.S.5.2 *Potential Pollutant Sources.* (See also Part 4.2.4) Include in your inventory of exposed materials a description of the potential pollutant sources from the following activities: aircraft, runway, ground vehicle and equipment maintenance and cleaning; aircraft and runway deicing operations (including apron and centralized aircraft deicing stations, runways, taxiways and ramps). If you use deicing chemicals, you must maintain a record of the types (including the Material Safety Data Sheets [MSDS]) used and the monthly quantities, either as measured or, in the absence of metering, as estimated to the best of your knowledge. This includes all deicing chemicals, not just glycols and urea (*e.g.*, potassium acetate), because large quantities of these other chemicals can still have an adverse impact on receiving waters. Tenants or other fixed-based operations that conduct deicing operations must provide the above information to the airport authority for inclusion in any comprehensive airport SWPPPs.

6.S.5.3 *Good Housekeeping Measures.* (See also 4.2.7)

6.S.5.3.1 *Aircraft, Ground Vehicle and Equipment Maintenance Areas.* Describe and implement measures that prevent or minimize the contamination of storm water runoff from all areas used for aircraft, ground vehicle and equipment maintenance (including the maintenance conducted on the terminal apron and in dedicated hangers). Consider the following practices (or their equivalents): performing maintenance activities indoors; maintaining an organized inventory of material used in the maintenance areas; draining all parts of fluids prior to disposal; preventing the practice of hosing down the apron or hanger floor; using dry cleanup methods; and collecting the storm water runoff from the maintenance area and providing treatment or recycling.

6.S.5.3.2 *Aircraft, Ground Vehicle and Equipment Cleaning Areas.* Clean equipment only in the areas identified in the SWPPP and site map and clearly demarcate these areas on the ground. Describe and implement measures that prevent or minimize the contamination of storm water runoff from cleaning areas.

6.S.5.3.3 *Aircraft, Ground Vehicle and Equipment Storage Areas.* Store all aircraft, ground vehicles and equipment awaiting maintenance in designated areas only. Consider the following BMPs (or their equivalents): storing aircraft and ground vehicles indoors; using drip pans for the collection of fluid leaks; and perimeter drains, dikes or berms surrounding the storage areas.

6.S.5.3.4 *Material Storage Areas.* Maintain the vessels of stored materials (*e.g.*, used oils, hydraulic fluids, spent solvents, and waste aircraft fuel) in good condition, to prevent or minimize contamination of storm water. Also plainly label the vessels (e.g., "used oil," "Contaminated Jet A," etc.). Describe and implement measures that prevent or minimize contamination of precipitation/runoff from these areas. Consider the following BMPs (or their equivalents): storing materials indoors; storing waste materials in a centralized location; and installing berms/dikes around storage areas.

6.S.5.3.5 *Airport Fuel System and Fueling Areas.* Describe and implement measures that prevent or minimize the discharge of fuel to the storm sewer/ surface waters resulting from fuel servicing activities or other operations conducted in support of the airport fuel system. Consider the following BMPs (or their equivalents): implementing spill and overflow practices (*e.g.*, placing absorptive materials beneath aircraft during fueling operations); using dry cleanup methods; and collecting storm water runoff.

6.S.5.3.6 *Source Reduction.* Consider alternatives to the use of urea and glycol-based deicing chemicals to reduce the aggregate amount of deicing chemicals used and/or lessen the environmental impact. Chemical options to replace ethylene glycol, propylene glycol and urea include: potassium acetate; magnesium acetate; calcium acetate; anhydrous sodium acetate.

6.S.5.3.6.1 *Runway Deicing Operation:* Evaluate, at a minimum, whether over-application of deicing chemicals occurs by analyzing application rates and adjusting as necessary, consistent with considerations of flight safety. Also consider these BMP options (or their equivalents): metered application of chemicals; pre-wetting dry chemical constituents prior to application; installing a runway ice detection system; implementing anti-icing operations as a preventive measure against ice buildup.

6.S.5.3.6.2 *Aircraft Deicing Operations:* As in Part 6.S.5.3.6.1, determine whether excessive application of deicing chemicals occurs and adjust as necessary, consistent with considerations of flight safety. EPA intends for this evaluation to be carried out by the personnel most familiar with the particular aircraft and flight operations in question (vice an outside entity such as the airport authority). Consider using alternative deicing/anti-icing agents as well as containment measures for all applied chemicals. Also consider these BMP options (or their equivalents) for reducing deicing fluid use: forced-air deicing systems, computer-controlled fixed-gantry systems, infrared technology, hot water, varying glycol content to air temperature, enclosed-basket deicing trucks, mechanical methods, solar radiation, hangar storage, aircraft covers, thermal blankets for MD–80s and DC–9s. Also consider using ice-detection systems and airport traffic flow strategies and departure slot allocation systems.

6.S.5.3.7 Management of Runoff. Where deicing operations occur, describe and implement a program to control or manage contaminated runoff to reduce the amount of pollutants being discharged from the site. Consider these BMP options (or their equivalents): a dedicated deicing facility with a runoff collection/recovery system; using vacuum/collection trucks; storing contaminated storm water/deicing fluids in tanks and releasing controlled amounts to a publicly owned treatment works; collecting contaminated runoff in a wet pond for biochemical decomposition (be aware of attracting wildlife that may prove hazardous to flight operations); and directing runoff into vegetative swales or other infiltration measures. Also consider recovering deicing materials when these materials are applied during non-precipitation events (*e.g.*, covering storm sewer inlets, using booms, installing absorptive interceptors in the drains, etc.) to prevent these materials from later becoming a source of storm water contamination. Used deicing fluid should be recycled whenever possible.

6.S.5.4 *Inspections.* (See also Part 4.2.7.2.1.5) Specify the frequency of inspections in your SWPPP. At a minimum they must be conducted monthly during the deicing season (*e.g.*, October through April for most mid-latitude airports). If your facility needs to deice before or after this period, expand the monthly inspections to include all months during which deicing chemicals may be used. Also, if significantly or deleteriously large quantities of deicing chemicals are being spilled or discharged, or if water quality impacts have been reported, increase the frequency of your inspections to weekly until such time as the chemical spills/discharges or impacts are reduced to acceptable levels. The Director may specifically require you to increase inspections and SWPPP reevaluations as necessary.

6.S.5.5 *Comprehensive Site Compliance Evaluation.* (See also 4.9) (See also Part 4.9)

Using only qualified personnel, conduct your annual site compliance evaluations during periods of actual deicing operations, if possible. If not practicable during active deicing or the weather is too inclement, conduct the evaluations when deicing operations are likely to occur and the materials and equipment for deicing are in place.

6.S.6 Monitoring and Reporting Requirements. (See also Part 5)

TABLE S–1.—SECTOR-SPECIFIC NUMBERIC LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark monitoring cut-off concentration[1]	Numeric limitation
Sector of Permit Affected/Supplemental Requirements			
Facilities at airports that use more than 100,000 gallons of glycol-based deicing/anti-icing chemicals and/or 100 tons or more of urea on an average annual basis: monitor ONLY those outfalls from the airport facility that collect runoff from areas where deicing/ anti-icing activities occur (SIC 45XX).	Biochemical Oxygen Demand (BOD_5).	30 mg/L .... Chemical Oxygen Demand COD).	120.0mg/L. Ammonia 19 mg/L. pH 6/0 to 9 s.u

[1] Monitor once/quarter for the year 2 and year 4 monitoring years.

6.T Sector T—Treatment Works

6.T.1 Covered Storm Water Discharges

The requirements in Part 6.T apply to storm water discharges associated with industrial activity from Treatment Works as identified by the Activity Code specified under Sector T in Table 1–1 of Part 1.2.1.

6.T.2 Industrial Activities Covered by Sector T

The requirements listed under this Part apply to all existing point source storm water discharges associated with the following activities:

6.T.2.1 treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system used in the storage, treatment, recycling and reclamation of municipal or domestic sewage; including land dedicated to the disposal of sewage sludge; that are located within the confines of the facility with a design flow of 1.0 MGD or more; or required to have an approved pretreatment program under 40 CFR Part 403.

6.T.2.2 Not required to have permit coverage: farm lands; domestic gardens or lands used for sludge management where sludge is beneficially reused and which are not physically located within the facility; or areas that are in compliance with Section 405 of the CWA.

6.T.3 Limitations on Coverage

6.T.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.3.1) Not authorized by this permit: sanitary and industrial wastewater; and equipment/vehicle washwater.

6.T.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.T.4.1 *Site Map.* (See also Part 4.2.2.3.6) Identify where any of the following may be exposed to precipitation/surface runoff: grit, screenings and other solids handling, storage or disposal areas; sludge drying beds; dried sludge piles; compost piles; septage or hauled waste receiving station; and storage areas for process chemicals, petroleum products, solvents, fertilizers, herbicides and pesticides.

6.T.4.2 *Potential Pollutant Sources.* (See also Part 4.2.4) Describe the following additional sources and activities that have potential pollutants associated with them, as applicable: grit, screenings and other solids handling, storage or disposal areas; sludge drying beds; dried sludge piles; compost piles; septage or hauled waste receiving station; and access roads/rail lines.

6.T.4.3 *Best Management Practices (BMPs).* (See also Part 4.2.7.2) In addition to the other BMPs considered, consider the following: routing storm water to the treatment works; or covering exposed materials (*i.e.*, from the following areas: grit, screenings and other solids handling, storage or disposal areas; sludge drying beds; dried sludge piles; compost piles; septage or hauled waste receiving station).

6.T.4.4 *Inspections.* (See also Part 4.2.7.2.1.5) Include the following areas in all inspections: access roads/rail lines; grit, screenings and other solids handling, storage or disposal areas; sludge drying beds; dried sludge piles; compost piles; septage or hauled waste receiving station areas.

6.T.4.5 *Employee Training.* (See also Part 4.2.7.2.1.6) At a minimum, must address the following areas when applicable to a facility: petroleum product management; process chemical management; spill prevention and controls; fueling procedures; general good housekeeping practices; proper procedures for using fertilizer, herbicides and pesticides.

6.T.4.6 *Wastewater and Washwater Requirements.* (See also Part 4.4) Attach to your SWPPP a copy of all your current NPDES permits issued for wastewater, industrial, vehicle and equipment washwater discharges or, if an NPDES permit has not yet been issued, a copy of the pending applications. Address any requirements/conditions from the other permits, as appropriate, in the SWPPP. If the washwater is handled in another manner, the disposal method must be described and all pertinent documentation must be attached to the plan.

6.U Sector U—Food and Kindred Products

6.U.1 Covered Storm Water Discharges

The requirements in Part 6.U apply to storm water discharges associated with industrial activity from Food and Kindred Products facilities as identified by the SIC Codes specified in Table 1-1 of Part 1.2.1.

6.U.2 Industrial Activities Covered by Sector U

The types of activities that permittees under Sector U are primarily engaged in are:

6.U.2.1 meat products;
6.U.2.2 dairy products;
6.U.2.3 canned, frozen and preserved fruits, vegetables, and food specialties;
6.U.2.4 grain mill products;
6.U.2.5 bakery products;
6.U.2.6 sugar and confectionery products;
6.U.2.7 fats and oils;
6.U.2.8 beverages;
6.U.2.9 miscellaneous food preparations and kindred products and tobacco products manufacturing.

6.U.3 Limitations on Coverage

Not covered by this permit: storm water discharges identified under Part 1.2.3 from industrial plant yards, material handling sites; refuse sites; sites used for application or disposal of process wastewaters; sites used for storage and maintenance of material handling equipment; sites used for residential wastewater treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; and storage areas for raw material and intermediate and finished products. This includes areas where industrial activity has taken place in the past and significant materials remain. "Material handling activities" include the storage, loading/unloading, transportation or conveyance of any raw material, intermediate product, finished product, by-product or waste product.

6.U.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.2.2) Not authorized by this permit: discharges subject to Part 1.2.2.2 include discharges containing: boiler blowdown, cooling tower overflow and blowdown, ammonia refrigeration purging and vehicle washing/clean-out operations.

6.U.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.U.4.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify the locations of the following activities if they are exposed to precipitation/runoff: vents/stacks from cooking, drying and similar operations; dry product vacuum transfer lines; animal holding pens; spoiled product; and broken product container storage areas.

6.U.4.2 *Potential Pollutant Sources.*(See also Part 4.2.4) Describe, in addition to food and kindred products processing-related industrial activities, application and storage of pest control chemicals (*e.g.*, rodenticides, insecticides, fungicides, etc.) used on plant grounds.

6.U.4.3 *Inspections.*(See also Part 4.2.7.2.1.5) Inspect on a regular basis, at a minimum, the following areas where the potential for exposure to storm water exists: loading and unloading areas for all significant materials; storage areas including associated containment areas; waste management units; vents and stacks emanating from industrial activities; spoiled product and broken product container holding areas; animal holding pens; staging areas; and air pollution control equipment.

6.U.4.4 *Employee Training.*(See also Part 4.2.7.2.1.6) Address pest control in the training program.

6.U.5 Monitoring and Reporting Requirements. (See also Part 5)

TABLE U–1. SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one Sector/Subsector)	Parameter	Benchmark monitoring cut-off concentration[1]	Numeric limitation
Part or Permit Affected/Supplemental Requirements			
Grain Mill Products (SIC 2041–2048)	Total Suspended Solids (TSS).	100 mg/L.	
Fats and Oils Products (SIC 2074–2079)	Biochemical Oxygen Demand (BOD_5).	30 mg/L.	
	Chemical Oxygen Demand (COD).	120 mg/L.	
	Nitrate plus Nitrate Nitrogen.	0.68 mg/L.	
	Total Suspended Solids (TSS).	100 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.

6.V Sector V—Textile Mills, Apparel and Other Fabric Products

6.V.1 Covered Storm Water Discharges

The requirements in Part 6.V apply to storm water discharges associated with industrial activity from Textile Mills, Apparel, and Other Fabric Product Manufacturing as identified by the Activity Code specified under Sector V in Table 1–1 of Part 1.2.1.

6.V.2 Industrial Activities Covered by Sector V

The types of activities that permittees under Sector V are primarily engaged in are:

6.V.2.1 textile mill products, of and regarding facilities and establishments engaged in the preparation of fiber and subsequent manufacturing of yarn, thread, braids, twine, and cordage, the manufacturing of broadwoven fabrics, narrow woven fabrics, knit fabrics, and carpets and rugs from yarn;

6.V.2.2 processes involved in the dyeing and finishing of fibers, yarn fabrics, and knit apparel;

6.V.2.3 the integrated manufacturing of knit apparel and other finished articles of yarn;

6.V.2.4 the manufacturing of felt goods (wool), lace goods, non-woven fabrics, miscellaneous textiles, and other apparel products.

6.V.3 Limitations on Coverage

6.V.3.1 *Prohibition of Non-Storm Water Discharges.* (See also Part 1.2.3.1) Not authorized by this permit: discharges of wastewater (*e.g.*, wastewater resulting from wet processing or from any processes relating to the production process); reused/recycled water; and waters used in cooling towers. If you have these types of discharges from your facility, you must cover them under a separate NPDES permit.

6.V.4 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.V.4.1 *Potential Pollutant Sources.* (See also Part 4.2.4) Describe the following additional sources and activities that have potential pollutants associated with them: industrial-specific significant materials and industrial activities (*e.g.*, backwinding, beaming, bleaching, backing bonding, carbonizing, carding, cut and sew operations, desizing , drawing, dyeing locking, fulling, knitting, mercerizing, opening, packing, plying, scouring, slashing, spinning, synthetic-felt processing, textile waste processing, tufting, turning, weaving, web forming, winging, yarn spinning, and yarn texturing).

6.V.4.2 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

6.V.4.2.1 *Material Storage Area.* Plainly label and store all containerized materials (*e.g.*, fuels, petroleum products, solvents, dyes, etc.) in a protected area, away from drains. Describe and implement measures that prevent or minimize contamination of the storm water runoff from such storage areas, including a description of the containment area or enclosure for those materials stored outdoors. Also consider an inventory control plan to prevent excessive purchasing of potentially hazardous substances. For storing empty chemical drums/containers, ensure the drums/containers are clean (consider triple-rinsing) and there is no contact of residuals with precipitation/runoff. Collect and dispose of washwater from these cleanings properly.

6.V.4.2.2 *Material Handling Area.* Describe and implement measures that prevent or minimize contamination of storm water runoff from material handling operations and areas. Consider the following (or their equivalents): use of spill/overflow protection; covering fueling areas; and covering/enclosing areas where the transfer of material may occur. Where applicable address the replacement or repair of leaking connections, valves, transfer lines and pipes that may carry chemicals, dyes or wastewater.

6.V.4.2.3 *Fueling Areas.* Describe and implement measures that prevent or minimize contamination of storm water runoff from fueling areas. Consider the following (or their equivalents): covering the fueling area, using spill and overflow protection, minimizing runon of storm water to the fueling areas, using dry cleanup methods, and treating and/or recycling storm water runoff collected from the fueling area.

6.V.4.2.4 *Above Ground Storage Tank Area.* Describe and implement measures that prevent or minimize contamination of the storm water runoff from above ground storage tank areas, including the associated piping and valves. Consider the following (or their equivalents): regular cleanup of these areas; preparation of the spill prevention control and countermeasure program, provide spill and overflow protection; minimizing runoff of storm water from adjacent areas; restricting access to the area; insertion of filters in adjacent catch basins; providing absorbent booms in unbermed fueling areas; using dry cleanup methods; and permanently sealing drains within critical areas that may discharge to a storm drain.

6.V.4.3 *Inspections.* (See also Part 4.2.7.2.1.5) Inspect, at least on a monthly basis, the following activities and areas (at a minimum): transfer and transmission lines; spill prevention; good housekeeping practices; management of process waste products; all structural and non structural management practices.

6.V.4.4 *Employee Training.* (See also Part 4.2.7.2.1.6) As part of your employee training program, address, at a minimum, the following activities (as applicable): use of reused/recycling waters; solvents management; proper disposal of dyes; proper disposal of petroleum products and spent lubricants; spill prevention and control; fueling procedures; and general good housekeeping practices.

6.V.4.5 *Comprehensive Site Compliance Evaluation.* (See also Part 4.9) Conduct regularly scheduled evaluations at least once a year and address those areas contributing to a storm water discharge associated with industrial activity for evidence of, or the potential for, pollutants entering the drainage system. Inspect, at a minimum, as appropriate: storage tank areas; waste disposal and storage areas; dumpsters and open containers stored outside; materials storage areas; engine maintenance and repair areas; material handing areas and loading dock areas.

6.W Sector W—Furniture and Fixtures

6.W.1 Covered Storm Water Discharges

The requirements in Part 6.W apply to storm water discharges associated with industrial activity from Furniture and Fixtures facilities as identified by the Activity Code specified under Sector W in Table 1–1 of Part 1.2.1.

6.W.2 Industrial Activities Covered by Sector W

The types of activities that permittees under Sector W are primarily engaged in the manufacturing of:

6.W.2.1 wood kitchen cabinets;
6.W.2.2 household furniture;
6.W.2.3 office furniture;
6.W.2.4 public buildings and related furniture;
6.W.2.5 partitions, shelving, lockers, and office and store fixtures;
6.W.2.6 miscellaneous furniture and fixtures.

6.W.3 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.W.3.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify where any of the following may be exposed to precipitation/surface runoff: material storage (including tanks or other vessels used for liquid or waste storage) areas; outdoor material processing areas; areas where wastes are treated, stored or disposed; access roads; and rail spurs.

6.X Sector X—Printing and Publishing

6.X.1 Covered Storm Water Discharges

The requirements in Part 6.X apply to storm water discharges associated with industrial activity from Printing and Publishing facilities as identified by the Activity Code specified under Sector X in Table 1.1 of Part 1.2.1.

6.X.2 Industrial Activities Covered by Sector X

The types of activities that permittees under Sector X are primarily engaged in are:

6.X.2.1 book printing;
6.X.2.2 commercial printing and lithographics;
6.X.2.3 plate making and related services;
6.X.2.4 commercial printing, gravure;
6.X.2.5 commercial printing not elsewhere classified.

6.X.3 Storm Water Pollution Prevention Plan Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.X.3.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify where any of the following may be exposed to precipitation/surface runoff: above ground storage tanks, drums and barrel permanently stored outside.

6.X.3.2 *Potential Pollutant Sources.* (See also Part 4.2.4) Describe the following additional sources and activities that have potential pollutants associated with them, as applicable: loading and unloading operations; outdoor storage activities; significant dust or particulate generating processes; and onsite waste disposal practices (*e.g.*, blanket wash). Also identify the pollutant or pollutant parameter (*e.g.*, oil and grease, scrap metal, etc.) associated with each pollutant source.

6.X.3.3 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

6.X.3.3.1 *Material Storage Areas.* Plainly label and store all containerized materials (*e.g.*, skids, pallets, solvents, bulk inks, and hazardous waste, empty drums, portable/mobile containers of plant debris, wood crates, steel racks, fuel oil, etc.) in a protected area, away from drains. Describe and implement measures that prevent or minimize contamination of the storm water runoff from such storage areas, including a description of the containment area or enclosure for those materials stored outdoors. Also consider an inventory control plan to prevent excessive purchasing of potentially hazardous substances.

6.X.3.3.2 *Material Handling Area.* Describe and implement measures that prevent or minimize contamination of storm water runoff from material handling operations and areas (*e.g.*, blanket wash, mixing solvents, loading/unloading materials). Consider the following (or their equivalents): use of spill/overflow protection; covering fueling areas; and covering/enclosing areas where the transfer of materials may occur. Where applicable address the replacement or repair of leaking connections, valves, transfer lines and pipes that may carry chemicals or wastewater.

6.X.3.3.3 *Fueling Areas.* Describe and implement measures that prevent or minimize contamination of storm water runoff from fueling areas. Consider the following (or their equivalents): covering the fueling area, using spill and overflow protection, minimizing runoff of storm water to the fueling areas, using dry cleanup methods, and treating and/or recycling storm water runoff collected from the fueling area.

6.X.3.3.4 *Above Ground Storage Tank Area.* Describe and implement measures that prevent or minimize contamination of the storm water runoff from above ground storage tank areas, including the associated piping and valves. Consider the following (or their equivalents): regular cleanup of these areas; preparation of the spill prevention control and countermeasure program, provide spill and overflow protection; minimizing runoff of storm water from adjacent areas; restricting access to the area; insertion of filters in adjacent catch basins; providing absorbent booms in unbermed fueling areas; using dry cleanup methods; and permanently sealing drains within critical areas that may discharge to a storm drain.

6.X.3.4 *Employee Training.* (See also Part 4.2.7.2.1.6) As part of your employee training program, address, at a minimum, the following activities (as applicable): spent solvent management; spill prevention and control; used oil management; fueling procedures; and general good housekeeping practices.

6.Y Sector Y—Rubber, Miscellaneous Plastic Products and Miscellaneous Manufacturing Industries

6.Y.1 Covered Storm Water Discharges

The requirements in Part 6.Y apply to storm water discharges associated with industrial activity from Rubber, Miscellaneous Plastic Products and Miscellaneous Manufacturing Industries facilities as identified by the Activity

Code specified under Sector Y in Table 1–1 of Part 1.2.1.

6.Y.2 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.Y.2.1 *Potential Pollutant Sources.* (See also Part 4.2.4) Review the use of zinc at your facility and the possible pathways through which zinc may be discharged in storm water runoff.

6.Y.2.2 *Controls for Rubber Manufacturers.* (See also Part 4.2.7) Describe and implement specific controls to minimize the discharge of zinc in your storm water discharges. Parts 6.Y.2.2.1 to 6.Y.2.2.5 give possible sources of zinc to be reviewed and list some specific BMPs to be considered for implementation (or their equivalents). Some general BMP options to consider: using chemicals which are purchased in pre-weighed, sealed polyethylene bags; storing materials which are in use in sealable containers; ensuring an airspace between the container and the cover to minimize "puffing" losses when the container is opened; and using automatic dispensing and weighing equipment.

6.Y.2.2.1 Inadequate Housekeeping. Review the handling and storage of zinc bags at your facility. BMP options: employee training on the handling/storage of zinc bags; indoor storage of zinc bags; cleanup zinc spills without washing the zinc into the storm drain, and the use of 2,500-pound sacks of zinc rather than 50- to 100-pound sacks;

6.Y.2.2.2 Dumpsters. Reduce discharges of zinc from dumpsters. BMP options: covering the dumpster; moving the dumpster indoors; or provide a lining for the dumpster.

6.Y.2.2.3 Malfunctioning Dust Collectors or Baghouses: Review dust collectors/baghouses as possible sources in zinc in storm water runoff. Replace or repair, as appropriate, improperly operating dust collectors/baghouses.

6.Y.2.2.4 *Grinding Operations.*

Review dust generation from rubber grinding operations and, as appropriate, install a dust collection system.

6.Y.2.2.5 Zinc Stearate Coating Operations. Detail appropriate measures to prevent or clean up drips/spills of zinc stearate slurry that may be released to the storm drain. BMP option: using alternate compounds to zinc stearate.

6.Y.2.3 *Controls for Plastic Products Manufacturers.* Describe and implement specific controls to minimize the discharge of plastic resin pellets in your storm water discharges. BMPs to be considered for implementation (or their equivalents): minimizing spills; cleaning up of spills promptly and thoroughly; sweeping thoroughly; pellet capturing; employee education and disposal precautions.

6.Y.3 Monitoring and Reporting Requirements. (See also Part 5)

TABLE Y–1.—SECTOR-SPECIFIC NUMERIC EFFLUENT LIMITATIONS AND BENCHMARK MONITORING

Subsector	Parameter	Benchmark monitoring cut-off concentration	Numeric limitations
Part of Permit Affected/Supplemental Requirements			
Tires and Inner Tubes; Rubber Footwear; Gaskets, Packing and Sealing Devices; Rubber Hose and Belting; and Fabricated Rubber Products, Not Elsewhere Classified (SIC 3011–3069, rubber.	Total Recoverable Zinc	0.117 mg/L	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years.

6.Z Sector Z—Leather Tanning and Finishing

6.Z.1 Covered Storm Water Discharges

The requirements in Part 6.Z apply to storm water discharges associated with industrial activity from Leather Tanning and Finishing facilities as identified by the Activity Code specified under Sector Z in Table 1–1 of Part 1.2.1.

6.Z.2 Industrial Activities Covered by Sector Z

The types of activities that permittees under Sector Z are primarily engaged are leather tanning, curry and finishing; dry finishing operations; and haul roads, access roads and rail spurs.

6.Z.3 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.Z.3.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify where any of the following may be exposed to precipitation/surface runoff: processing and storage areas of the beamhouse, tanyard, and re-tan wet finishing and

6.Z.3.2 *Potential Pollutant Sources.* (See also Part 4.2.4) At a minimum, describe the following additional sources and activities that have potential pollutants associated with them (as appropriate): temporary or permanent storage of fresh and brine cured hides; extraneous hide substances and hair; leather dust, scraps, trimmings and shavings; chemical drums, bags, containers and above ground tanks; empty chemical containers and bags; spent solvents; floor sweepings/washings; refuse, waste piles and sludge; and significant dust/particulate generating processes (*e.g.*, buffing).

6.Z.3.3 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

6.Z.3.3.1 *Storage Areas for Raw, Semiprocessed or Finished Tannery Byproducts.* Pallets/bales of raw, semiprocessed or finished tannery byproducts (*e.g.*, splits, trimmings, shavings, etc.) should be stored indoors or protected by polyethylene wrapping, tarpaulins, roofed storage, etc. Consider placing materials on an impermeable surface, and enclosing or putting berms (or equivalent measures) around the area to prevent storm water runon/runoff.

6.Z.3.3.2 *Material Storage Areas.* Label storage containers of all materials (*e.g.*, specific chemicals, hazardous materials, spent solvents, waste materials). Describe and implement measures that prevent/minimize contact with storm water.

6.Z.3.3.3 *Buffing and Shaving Areas.* Describe and implement measures that prevent or minimize contamination of storm water runoff with leather dust from buffing/shaving areas. Consider dust collection enclosures, preventive inspection/maintenance programs or other appropriate preventive measures.

6.Z.3.3.4 *Receiving, Unloading, and Storage Areas.* Describe and implement measures that prevent or minimize contamination of storm water runoff from receiving, unloading, and storage areas. If these areas are exposed, consider (or their equivalent): Covering all hides and chemical supplies; diverting drainage to the process sewer;

or grade berming/curbing area to prevent runoff of storm water.

6.Z.3.3.5 *Outdoor Storage of Contaminated Equipment.* Describe and implement measures that prevent or minimize contact of storm water with contaminated equipment. Consider (or their equivalent): Covering equipment; diverting drainage to the process sewer; and cleaning thoroughly prior to storage.

6.Z.3.3.6 *Waste Management.* Describe and implement measures that prevent or minimize contamination of storm water runoff from waste storage areas. Consider (or their equivalent): Inspection/maintenance programs for leaking containers or spills; covering dumpsters; moving waste management activities indoors; covering waste piles with temporary covering material such as tarpaulins or polyethylene; and minimizing storm water runoff by enclosing the area or building berms around the area.

6.AA Sector AA—Fabricated Metal Products

6.AA.1 Covered Storm Water Discharges

The requirements in Part 6.AA apply to storm water discharges associated with industrial activity from Fabricated Metal Products facilities as identified by the Activity Code specified under Sector AA in Table 1–1 of Part 1.2.1.

6.AA.2 Industrial Activities Covered by Sector AA

The types of activities that permittees under Sector AA are primarily engaged in are:

6.AA.2.1 Fabricated metal products; except for electrical related industries;

6.AA.2.2 Fabricated metal products; except machinery and transportation equipment;

6.AA.2.3 Jewelry, silverware, and plated ware.

6.AA.3 Storm Water Pollution Prevention Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.AA.3.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify where any of the following may be exposed to precipitation/surface runoff: Raw metal storage areas; finished metal storage areas; scrap disposal collection sites; equipment storage areas; retention and detention basins; temporary/permanent diversion dikes or berms; right-of-way or perimeter diversion devices; sediment traps/barriers; processing areas including outside painting areas; wood preparation; recycling; and raw material storage.

6.AA.3.2 *Spills and Leaks.* (See also Part 4.2.5) When listing significant spills/leaks, pay attention to the following materials at a minimum: Chromium, toluene, pickle liquor, sulfuric acid, zinc and other water priority chemicals and hazardous chemicals and wastes.

6.AA.3.3 *Potential Pollutant Sources.* (See also Part 4.2.4) Describe the following additional sources and activities that have potential pollutants associated with them: Loading and unloading operations for paints, chemicals and raw materials; outdoor storage activities for raw materials, paints, empty containers, corn cob, chemicals, and scrap metals; outdoor manufacturing or processing activities such as grinding, cutting, degreasing, buffing, brazing, etc; onsite waste disposal practices for spent solvents, sludge, pickling baths, shavings, ingots pieces, refuse and waste piles.

6.AA.3.4 *Good Housekeeping Measures.* (See also Part 4.2.7.2.1.1)

6.AA.3.4.1 *Raw Steel Handling Storage.* Describe and implement measures controlling or recovering scrap metals, fines and iron dust. Include measures for containing materials within storage handling areas.

6.AA.3.4.2 *Paints and Painting Equipment.* Describe and implement measures to prevent or minimize exposure of paint and painting equipment to storm water.

6.AA.3.5 *Spill Prevention and Response Procedures.* (See also Part 4.2.7.2.1.4) Ensure the necessary equipment to implement a clean up is available to personnel. The following areas should be addressed:

6.AA.3.5.1 *Metal Fabricating Areas.* Describe and implement measures for maintaining clean, dry, orderly conditions in these areas. Consider the use of dry clean-up techniques.

6.AA.3.5.2 *Storage Areas for Raw Metal.* Describe and implement measures to keep these areas free of condition that could cause spills or leakage of materials. Consider the following (or their equivalents): maintaining storage areas such that there is easy access in the event of a spill; and labeling stored materials to aid in identifying spill contents.

6.AA.3.5.3 *Receiving, Unloading, and Storage Areas.* Describe and implement measures to prevent spills and leaks; plan for quick remedial clean up; and instruct employees on clean-up techniques and procedures.

6.AA.3.5.4 *Storage of Equipment.* Describe and implement measures for preparing equipment for storage and the proper storage of equipment. Consider the following (or their equivalents): protecting with covers; storing indoors; and cleaning potential pollutants from equipment to be stored outdoors.

6.AA.3.5.5 *Metal Working Fluid Storage Areas.* Describe and implement measures for storage of metal working fluids.

6.AA.3.5.6 *Cleaners and Rinse Water.* Describe and implement measures: to control/cleanup spills of solvents and other liquid cleaners; control sand buildup and disbursement from sand-blasting operations; and prevent exposure of recyclable wastes. Substitute environmentally-benign cleaners when possible.

6.AA.3.5.7 *Lubricating Oil and Hydraulic Fluid Operations.* Consider using monitoring equipment or other devices to detect and control leaks/overflows. Consider installing perimeter controls such as dikes, curbs, grass filter strips or other equivalent measures.

6.AA.3.5.8 *Chemical Storage Areas.* Describe and implement proper storage methods that prevent storm water contamination and accidental spillage. Include a program to inspect containers and identify proper disposal methods.

6.AA.3.6 *Inspections.* (See also Part 4.2.7.2.1.5) Include, at a minimum, the following areas in all inspections: raw metal storage areas; finished product storage areas; material and chemical storage areas; recycling areas; loading and unloading areas; equipment storage areas; paint areas; vehicle fueling and maintenance areas.

6.AA.3.7 *Comprehensive Site Compliance Evaluation.* (See also Part 4.9.2) As part of your evaluation, also inspect: areas associated with the storage of raw metals; storage of spent solvents and chemicals; outdoor paint areas; and drainage from roof. Potential pollutants include chromium, zinc, lubricating oil, solvents, aluminum, oil and grease, methyl ethyl ketone, steel and other related materials.

6.AA.4 Monitoring and Reporting Requirements

(See also Part 5)

TABLE AA–1.—SECTOR-SPECIFIC NUMERIC LIMITATIONS AND BENCHMARK MONITORING

Subsector (Discharges may be subject to requirements for more than one sector/subsector)	Parameter	Benchmark, monitoring, cutoff, concentration[1]	Numeric limitation
Part of Permit Affected/Supplemental Requirements			
Fabricated Metal Products Except Coating (SIC 3411–3471, 3482–3499, 3911–3915).	Total Recoverable Aluminum.	0.75 mg/L.	
	Total Recoverable Iron	1.0 mg/L.	
	Total Recoverable Zinc	0.117 mg/L.	
	Nitrate plus Nitrite Nitrogen	0.68 mg/L.	
Fabricated Metal Coating and Engraving (SIC 3479)	Total Recoverable Zinc	0.117 mg/L.	
	Nitrate plus Nitrite Nitrogen	0.68 mg/L.	

[1] Monitor once/quarter for the year 2 and year 4 Monitoring Years

6.AB Sector AB—Transportation Equipment, Industrial or Commercial Machinery

6.AB.1 Covered Storm Water Discharges

The requirements in Part 6.AB apply to storm water discharges associated with industrial activity from Transportation Equipment, Industrial or Commercial Machinery facilities as identified by the Activity Code specified under Sector AB in Table 1–1 of Part 1.2.1.

6.AB.2 Industrial Activities Covered by Sector AB

The types of activities that permittees under Sector AB are primarily engaged in are:

6.AB.2.1 Industrial and Commercial Machinery (except Computer and Office Equipment) (see Sector AC); and

6.AB.2.2 Transportation Equipment (except Ship and Boat Building and Repairing) (see Sector R).

6.AB.3 Storm Water Pollution Plan (SWPPP) Requirements

In addition to the following requirements, you must also comply with the requirements listed in Part 4.

6.AB.3.1 *Drainage Area Site Map.* (See also Part 4.2.2.3) Identify where any of the following may be exposed to precipitation/surface runoff: vents and stacks from metal processing and similar operations.

6.AB.3.2 *Non-Storm Water Discharges.* (See also Part 4.4) If your facility has a separate NPDES permit (or has applied for a permit) authorizing discharges of wastewater, attach a copy of the permit (or the application) to your SWPPP. Any new wastewater permits issued/reissued to you must then replace the old one in your SWPPP. If you discharge wastewater, other than solely domestic wastewater, to a Publicly Owned Treatment Works (POTW), you must notify the POTW of the discharge (identify the types of wastewater discharged, including any storm water). As proof of this notification, attach to your SWPPP a copy of the permit issued to your facility by the POTW or a copy of your notification to the POTW.

6.AC Sector AC—Electronic, Electrical Equipment and Components, Photographic and Optical Goods

6.AC.1 Covered Storm Water Discharges

The requirements in Part 6.AC apply to storm water discharges associated with industrial activity from facilities that manufacture Electronic, Electrical Equipment and Components, Photographic and Optical Goods as identified by the SIC Codes specified in Table 1–1 of Part 1.2.1.

6.AC.2 Industrial Activities Covered by Sector AC

The types of manufacturing activities that permittees under Sector AC are primarily engaged in are:

6.AC.2.1 Measuring, analyzing, and controlling instruments;

6.AC.2.2 Photographic, medical and optical goods;

6.AC.2.3 Watches and clocks; and

6.AC.2.4 Computer and office equipment.

6.AC.3 Additional Requirements

No additional sector-specific requirements apply to this sector.

6.AD Storm Water Discharges Designated by the Director as Requiring Permits

6.AD.1 Covered Storm Water Discharges

Sector AD is used to provide permit coverage for facilities designated by the Director as needing a storm water permit, or any discharges of industrial activity that do not meet the description of an industrial activity covered by Sectors A–AC. Therefore, almost any type of storm water discharge could be covered under this sector. You must be assigned to Sector AD by the Director and may NOT choose sector AD as the sector describing your activities on your own.

6.AD.1.1 *Eligibility for Permit Coverage.* Because this Sector only covers discharges designated by the Director as needing a storm water permit (which is an atypical circumstance) or your facility's industrial activities were inadvertently left out of Sectors A–AC, and your facility may or may not normally be discharging storm water associated with industrial activity, you must obtain the Director's written permission to use this permit prior to submitting a Notice of Intent. If you are authorized to use this permit, you will be required to ensure your discharges meet the basic eligibility provisions of this permit at Part 1.2.

6.AD.2 Storm Water Pollution Prevention Plan (SWPPP) Requirements

The Director will establish any additional Storm Water Pollution Prevention Plan requirements for your facility at the time of accepting your Notice of Intent to be covered by this permit. Additional requirements would be based on the nature of activities at your facility and your storm water discharges.

6.AD.3 Monitoring and Reporting Requirements

The Director will establish any additional monitoring and reporting requirements for your facility at the time of accepting your Notice of Intent to be covered by this permit. Additional requirements would be based on the nature of activities at your facility and your storm water discharges.

7. Reporting

7.1 Reporting Results of Monitoring

Depending on the types of monitoring required for your facility, you may have to submit the results of your monitoring or you may only have to keep the results with your Storm Water Pollution Prevention Plan. You must follow the reporting requirements and deadlines in Table 7–1 that apply to the types of monitoring that apply to your facility.

If required by the conditions of the permit that apply to your facility, you must submit analytical monitoring results obtained from each outfall associated with industrial activity (or a certification as per 5.3.1) on a Discharge Monitoring Report (DMR) form (one form must be submitted for each storm event sampled). An example of a form is found in the Guidance Manual for the Monitoring and Reporting Requirements of the NPDES Storm Water Multi-Sector General Permit. A copy of the DMR is also available on the Internet at *http://www.epa.gov/owm/sw/permits-and-forms/index.htm*. The signed DMR must be sent to: MSGP DMR (4203), US EPA, 1200 Pennsylvania Avenue NW., Washington, DC 20460.

Note: If EPA notifies dischargers (either directly, by public notice or by making information available on the Internet) of other DMR form options that become available at a later date (*e.g.*, electronic submission of forms), you may take advantage of those options to satisfy the DMR use and submission requirements of Part 7.

TABLE 7–1.—DMR/ALTERNATIVE CERTIFICATION SUBMISSION DEADLINES

Type of monitoring	Reporting deadline (postmark)
Monitoring for Numeric Limitation	Submit results by the 28th day of the month following the monitoring period.
Benchmark Monitoring:	
Monitoring Year 2001–2002	Save and submit all results for year in one package by January 28, 2003.
Monitoring Year 2003–2004	Save and submit all results for year in one package by January 28, 2005.
Biannual Monitoring for Metal Mining Facilities (see Part 6.G).	Save and submit all results for year in one package by January 28 of the year following the monitoring year.
Visual Monitoring	Retain results with SWPPP—do not submit unless requested to do so by Permitting Authority.
State/Tribal/Territory—Specific Monitoring	See Part 13 (conditions for specific States, Indian country, and Territories).

7.2 Additional Reporting for Dischargers to a Large or Medium Municipal Separate Storm Sewer System

If you discharge storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more), you must also submit signed copies of your discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in Table 7–1.

7.3 Miscellaneous Reports

You must submit any other reports required by this permit to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part 8.3.

8. Retention of Records

8.1 Documents

In addition to the requirements of Part 9.16.2, you must retain copies of Storm Water Pollution Prevention Plans and all reports and certifications required by this permit, and records of all data used to complete the Notice of Intent to be covered by this permit, for a period of at least three years from the date that the facility's coverage under this permit expires or is terminated. This period may be extended by request of the Director at any time.

8.2 Accessibility

You must retain a copy of the Storm Water Pollution Prevention Plan required by this permit (including a copy of the permit language) at the facility (or other local location accessible to the Director, a State, Tribal or Territorial agency with jurisdiction over water quality protection; local government officials; or the operator of a municipal separate storm sewer receiving discharges from the site) from the date of permit coverage to the date of permit coverage ceases. You must make a copy of your Storm Water Pollution Prevention Plan available to the public if requested to do so in writing.

8.3 Addresses

Except for the submittal of NOIs and NOTs (see Parts 2.1 and 11.2, respectively), all written correspondence concerning discharges in any State, Indian country land, Territory, or from any Federal facility covered under this permit and directed to the EPA, including the submittal of individual permit applications, must be sent to the address of the appropriate EPA Regional Office listed below:

8.3.1 Region 1: CT, MA, ME, NH, RI, VT

EPA Region 1, Office of Ecosystem Protection, One Congress Street—CMU, Boston, MA 02114.

8.3.2 Region 2: NJ, NY, PR, VI

United States EPA, Region 2, Caribbean Environmental Protection Division, Environmental Management Branch, Centro Europa Building, 1492 Ponce de Leon Ave., Suite 417, San Juan, PR 00907–4127.

8.3.3 Region 3: DE, DC, MD, PA, VA, WV

EPA Region 3, Water Protection Division (3WP13), Storm Water Coordinator, 1650 Arch Street, Philadelphia, PA 19103.

8.3.4 Region 4: AL, FL, GA, KY, MS, NC, SC, TN

Environmental Protection Agency, Region 4, Clean Water Act Enforcement Section, Water Programs Enforcement Branch, Water Management Division, Atlanta Federal Center, 61 Forsyth Street, SW., Atlanta, GA 30303.

8.3.5 Region 5: IL, IN, MI, MN, OH, WI

(Coverage Not Available Under This Permit.)

8.3.6 Region 6: AR, LA, OK, TX, NM

(Except see Region 9 for Navajo lands, and see Region 8 for Ute Mountain Reservation lands)

United States EPA, Region 6, Storm Water Staff, Enforcement and Compliance Assurance Division (GEN–WC), EPA SW MSGP, P.O. Box 50625, Dallas, TX 75205.

8.3.7 Region 7:

(Coverage Not Available Under This Permit.)

8.3.8 Region 8: CO, MT, ND, SD, WY, UT

(Except see Region 9 for Goshute Reservation and Navajo Reservation lands), the Ute Mountain Reservation in NM, and the Pine Ridge Reservation in NE

United States EPA, Region 8, Ecosystems Protection Program (8EPR–

EP), Storm Water Staff, 999 18th Street, Suite 300, Denver, CO 80202–2466.

8.3.9 Region 9: AZ, CA, HI, NV, Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, the Goshute Reservation in UT and NV, the Navajo Reservation in UT, NM, and AZ, the Duck Valley Reservation in ID, Fort McDermitt Reservation in OR

United States EPA, Region 9, Water Management Division, WTR–5, Storm Water Staff, 75 Hawthorne Street, San Francisco, CA 94105.

8.3.10 Region 10: ID, WA, OR

(Except see Region 9 for Fort McDermitt Reservation.)

United States EPA, Region 10, Office of Water OW–130, 1200 6th Avenue, Seattle, WA 98101.

8.4 State, Tribal, and Other Agencies

See Part 13 for addresses of States or Tribes that require submission of information to their agencies.

9. Standard Permit Conditions

9.1 Duty To Comply

9.1.1 You must comply with all conditions of this permit. Any permit noncompliance constitutes a violation of CWA and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

9.1.2 *Penalties for Violations of Permit Conditions:* The Director will adjust the civil and administrative penalties listed below in accordance with the Civil Monetary Penalty Inflation Adjustment Rule (**Federal Register**: December 31, 1996, Volume 61, Number 252, pages 69359–69366, as corrected, March 20, 1997, Volume 62, Number 54, pages 13514–13517) as mandated by the Debt Collection Improvement Act of 1996 for inflation on a periodic basis. This rule allows EPA's penalties to keep pace with inflation. The Agency is required to review its penalties at least once every four years thereafter and to adjust them as necessary for inflation according to a specified formula. The civil and administrative penalties listed below were adjusted for inflation starting in 1996.

9.1.2.1 *Criminal Penalties.*

9.1.2.1.1 *Negligent Violations.* The CWA provides that any person who negligently violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

9.1.2.1.2 *Knowing Violations.* The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

9.1.2.1.3 *Knowing Endangerment.* The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

9.1.2.1.4 *False Statement.* The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both. (See section 309(c)(4) of the Clean Water Act.)

9.1.2.2 *Civil Penalties.* The CWA provides that any person who violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $27,500 per day for each violation.

9.1.2.3 *Administrative Penalties.* The CWA provides that any person who violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to an administrative penalty, as follows:

9.1.2.3.1 *Class I Penalty.* Not to exceed $11,000 per violation nor shall the maximum amount exceed $27,500.

9.1.2.3.2 *Class II Penalty.* Not to exceed $11,000 per day for each day during which the violation continues nor shall the maximum amount exceed $137,500.

9.2 Continuation of the Expired General Permit

If this permit is not reissued or replaced prior to the expiration date, it will be administratively continued in accordance with the Administrative Procedures Act and remain in force and effect. Any permittee who was granted permit coverage prior to the expiration date will automatically remain covered by the continued permit until the earlier of:

9.2.1 Reissuance or replacement of this permit, at which time you must comply with the Notice of Intent conditions of the new permit to maintain authorization to discharge; or

9.2.2 Your submittal of a Notice of Termination; or

9.2.3 Issuance of an individual permit for your discharges; or

9.2.4 A formal permit decision by the Director not to reissue this general permit, at which time you must seek coverage under an alternative general permit or an individual permit.

9.3 Need To Halt or Reduce Activity Not a Defense

It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

9.4 Duty To Mitigate

You must take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

9.5 Duty To Provide Information

You must furnish to the Director or an authorized representative of the Director any information which is requested to determine compliance with this permit or other information.

9.6 Other Information

If you become aware that you have failed to submit any relevant facts or submitted incorrect information in the Notice of Intent or in any other report to the Director, you must promptly submit such facts or information.

9.7 Signatory Requirements

All Notices of Intent, Notices of Termination, Storm Water Pollution Prevention Plans, reports, certifications or information either submitted to the Director or the operator of a large or medium municipal separate storm sewer system, or that this permit requires be maintained by you, must be signed as follows:

9.7.1 All notices of intent and notices of termination must be signed as follows:

9.7.1.1 *For a corporation:* By a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation; or the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

9.7.1.2 *For a partnership or sole proprietorship:* By a general partner or the proprietor, respectively; or

9.7.1.3 *For a municipality, State, Federal, or other public agency:* By either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes: (1) The chief executive officer of the agency, or (2) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (*e.g.*, Regional Administrators of EPA).

9.7.2 All reports required by this permit and other information must be signed as follows:

9.7.2.1 All reports required by this permit and other information requested by the Director or authorized representative of the Director must be signed by a person described in Part 9.7.1 or by a duly authorized representative of that person.

9.7.2.2 A person is a duly authorized representative only if the authorization is made in writing by a person described Part 9.7.1 and submitted to the Director.

9.7.2.3 The authorization must specify either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position).

9.7.3 *Changes to Authorization.* If the information on the NOI filed for permit coverage is no longer accurate because a different operator has responsibility for the overall operation of the facility, a new Notice of Intent satisfying the requirements of Part 2 must be submitted to the Director prior to or together with any reports, information, or applications to be signed by an authorized representative. The change in authorization must be submitted within the time frame specified in Part 2.1, and sent to the address specified in Part 2.4.

9.7.4 *Certification.* Any person signing documents under Part 9.7 must make the following certification:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

9.8 Penalties for Falsification of Reports

Section 309(c)(4) of the Clean Water Act provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or by both.

9.9 Oil and Hazardous Substance Liability

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve you from any responsibilities, liabilities, or penalties to which you are or may be subject under section 311 of the CWA or section 106 of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA).

9.10 Property Rights

The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State or local laws or regulations.

9.11 Severability

The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

9.12 Requiring Coverage Under an Individual Permit or an Alternative General Permit

9.12.1 Eligibility for this permit does not confer a vested right to coverage under the permit.

The Director may require any person authorized by this permit to apply for and/or obtain either an individual NPDES permit or an alternative NPDES general permit. Any interested person may petition the Director to take action under this paragraph. Where the Director requires a permittee authorized to discharge under this permit to apply for an individual NPDES permit, the Director will notify you in writing that a permit application is required. This notification will include a brief statement of the reasons for this decision, an application form, a statement setting a deadline for you to file the application, and a statement that on the effective date of issuance or denial of the individual NPDES permit or the alternative general permit as it applies to the individual permittee, coverage under this general permit will automatically terminate. Applications must be submitted to the appropriate Regional Office indicated in Part 8.3 of this permit. The Director may grant additional time to submit the application upon request of the applicant. If a permittee fails to submit in a timely manner an individual NPDES permit application as required by the Director under this paragraph, then the applicability of this permit to the individual NPDES permittee is automatically terminated at the end of the day specified by the Director for application submittal.

9.12.2 Any permittee authorized by this permit may request to be excluded from the coverage of this permit by applying for an individual permit. In such cases, you must submit an individual application in accordance with the requirements of 40 CFR 122.26(c)(1)(ii), with reasons supporting the request, to the Director at the address for the appropriate Regional

R0019894

Office indicated in Part 8.3 of this permit. The request may be granted by issuance of any individual permit or an alternative general permit if the reasons cited by you are adequate to support the request.

9.12.3 When an individual NPDES permit is issued to a permittee otherwise subject to this permit, or the permittee is authorized to discharge under an alternative NPDES general permit, the applicability of this permit to the individual NPDES permittee is automatically terminated on the effective date of the individual permit or the date of authorization of coverage under the alternative general permit, whichever the case may be. When an individual NPDES permit is denied to an owner or operator otherwise subject to this permit, or the owner or operator is denied for coverage under an alternative NPDES general permit, the applicability of this permit to the individual NPDES permittee is automatically terminated on the date of such denial, unless otherwise specified by the Director.

9.12.4 The Director's notification that coverage under an alternative permit is required does not imply that any discharge that did not or does not meet the eligibility requirements of Part 1.2 is or has been covered by this permit.

9.13 State/Tribal Environmental Laws

9.13.1 Nothing in this permit will be construed to preclude the institution of any legal action or relieve you from any responsibilities, liabilities, or penalties established pursuant to any applicable State/Tribal law or regulation under authority preserved by section 510 of the Act.

9.13.2 No condition of this permit releases you from any responsibility or requirements under other environmental statutes or regulations.

9.14 Proper Operation and Maintenance

You must at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by you to achieve compliance with the conditions of this permit and with the requirements of Storm Water Pollution Prevention Plans. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee only when necessary to achieve compliance with the conditions of this permit.

9.15 Inspection and Entry

You must allow the Director or an authorized representative of EPA, the State/Tribe, or, in the case of a facility which discharges through a municipal separate storm sewer, an authorized representative of the municipal owner/operator or the separate storm sewer receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to:

9.15.1 Enter upon the your premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit;

9.15.2 Have access to and copy at reasonable times, any records that must be kept under the conditions of this permit; and

9.15.3 Inspect at reasonable times any facilities or equipment (including monitoring and control equipment).

9.16 Monitoring and Records

9.16.1 *Representative Samples/Measurements.* Samples and measurements taken for the purpose of monitoring must be representative of the monitored activity.

9.16.2 *Retention of Records.*

9.16.2.1 You must retain records of all monitoring information, and copies of all monitoring reports required by this permit for at least three (3) years from the date of sample, measurement, evaluation or inspection, or report. This period may be extended by request of the Director at any time. Permittees must submit any such records to the Director upon request.

9.16.2.2 You must retain the Storm Water Pollution Prevention Plan developed in accordance with Part 4 of this permit, including the certification required under Section 2.2.4.3 of this permit, for at least 3 years after the last modification or amendment is made to the plan.

9.16.3 *Records Contents.* Records of monitoring information must include:

9.16.3.1 The date, exact place, and time of sampling or measurements;

9.16.3.2 The initials or name(s) of the individual(s) who performed the sampling or measurements;

9.16.3.3 The date(s) analyses were performed;

9.16.3.4 The time(s) analyses were initiated;

9.16.3.5 The initials or name(s) of the individual(s) who performed the analyses;

9.16.3.6 References and written procedures, when available, for the analytical techniques or methods used; and

9.16.3.7 The results of such analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc., used to determine these results.

9.16.4 *Approved Monitoring Methods.* Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit.

9.17 Permit Actions

This permit may be modified; revoked and reissued; or terminated for cause. Your filing of a request for a permit modification; revocation and reissuance; or your submittal of a notification of planned changes or anticipated non-compliance does not automatically stay any permit condition.

10. Reopener Clause

10.1 Water Quality Protection

If there is evidence indicating that the storm water discharges authorized by this permit cause, have the reasonable potential to cause, or contribute to a violation of a water quality standard, you may be required to obtain an individual permit or an alternative general permit in accordance with Part 3.3 of this permit, or the permit may be modified to include different limitations and/or requirements.

10.2 Procedures for Modification or Revocation

Permit modification or revocation will be conducted according to 40 CFR 122.62, 122.63, 122.64 and 124.5.

11. Transfer or Termination of Coverage

11.1 Transfer of Permit Coverage

Automatic transfers of permit coverage under 40 CFR 122.61(b) are not allowed for this general permit.

11.1.1 Transfer of coverage from one operator to a different operator (*e.g.,* facility sold to a new company): the new owner/operator must complete and file an NOI in accordance with Part 1.3 at least 2 days prior to taking over operational control of the facility. The old owner/operator must file an NOT (Notice of Termination) within thirty (30) days after the new owner/operator has assumed responsibility for the facility.

11.1.2 Simple name changes of the permittee (*e.g.,* Company "A" changes name to "ABC, Inc." or Company "B" buys out Company "A") may be done by filing an amended NOI referencing the facility's assigned permit number and requesting a simple name change.

R0019895

11.2 Notice of Termination (NOT)

You must submit a completed Notice of Termination (NOT) that is signed in accordance with Part 9.7 when one or more of the conditions contained in Part 1.4 (Terminating Coverage) have been met. The NOT form found in Addendum E will be used unless it has been replaced by a revised version by the Director. The Notice of Termination must include the following information:

11.2.1 The NPDES permit number for the storm water discharge identified by the Notice of Termination;

11.2.2 An indication of whether the storm water discharges associated with industrial activity have been eliminated (*i.e.*, regulated discharges of storm water are being terminated); you are no longer an operator of the facility; or you have obtained coverage under an alternative permit;

11.2.3 The name, address and telephone number of the permittee submitting the Notice of Termination;

11.2.4 The name and the street address (or a description of location if no street address is available) of the facility for which the notification is submitted;

11.2.5 The latitude and longitude of the facility; and

11.2.6 The following certification, signed in accordance with Part 9.7 (signatory requirements) of this permit. For facilities with more than one permittee and/or operator, you need only make this certification for those portions of the facility where the you were authorized under this permit and not for areas where the you were not an operator:

I certify under penalty of law that all storm water discharges associated with industrial activity from the identified facility that authorized by a general permit have been eliminated or that I am no longer the operator of the facility or construction site. I understand that by submitting this notice of termination, I am no longer authorized to discharge storm water associated with industrial activity under this general permit, and that discharging pollutants in storm water associated with industrial activity to waters of the United States is unlawful under the Clean Water Act where the discharge is not authorized by a NPDES permit. I also understand that the submittal of this Notice of Termination does not release an operator from liability for any violations of this permit or the Clean Water Act.

11.3 Addresses

All Notices of Termination must be submitted using the form provided by the Director (or a photocopy thereof) to the address specified on the NOT form.

11.4 Facilities Eligible for "No Exposure" Exemption for Storm Water Permitting

By filing a certification of "No Exposure" under 40 CFR 122.26(g), you are automatically removed from permit coverage and a NOT to terminate permit coverage is not required.

12. Definitions

Best Management Practices (BMPs) means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the discharge of pollutants to waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

Commencement of Construction the initial disturbance of soils associated with clearing, grading, or excavating activities or other construction activities.

Control Measure as used in this permit, refers to any Best Management Practice or other method (including effluent limitations) used to prevent or reduce the discharge of pollutants to waters of the United States.

CWA means the Clean Water Act or the Federal Water Pollution Control Act, 33 U.S.C. 1251 *et seq.*

Director means the Regional Administrator of the Environmental Protection Agency or an authorized representative.

Discharge when used without qualification means the "discharge of a pollutant."

Discharge of Storm Water Associated with Construction Activity as used in this permit, refers to a discharge of pollutants in storm water runoff from areas where soil disturbing activities (*e.g.*, clearing, grading, or excavation), construction materials or equipment storage or maintenance (*e.g.*, fill piles, borrow areas, concrete truck washout, fueling), or other industrial storm water directly related to the construction process (*e.g.*, concrete or asphalt batch plants) are located. (See 40 CFR 122.26(b)(14)(x) and 40 CFR 122.26(b)(15) for the two regulatory definitions on regulated storm water associated with construction sites).

Discharge of Storm Water Associated with Industrial Activity is defined at 40 CFR 122.26(b)(14).

Facility or Activity means any NPDES "point source" or any other facility or activity (including land or appurtenances thereto) that is subject to regulation under the NPDES program.

Flow-Weighted Composite Sample means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge.

Indian country, as defined in 18 USC 1151, means: (a) All land within the limits of any Indian reservation under the jurisdiction of the United States Government, notwithstanding the issuance of any patent, and including rights-of-way running through the reservation; (b) all dependent Indian communities within the borders of the United States whether within the original or subsequently acquired territory thereof, and whether within or without the limits of a state; and (c) all Indian allotments, the Indian titles to which have not been extinguished, including rights-of-way running through the same. This definition includes all land held in trust for an Indian tribe.

Industrial Activity as used in this permit refers to the eleven categories of industrial activities included in the definition of "discharges of storm water associated with industrial activity".

Industrial Storm Water as used in this permit refers to storm water runoff associated with the definition of "discharges of storm water associated with industrial activity".

Large and Medium Municipal Separate Storm Sewer Systems are defined at 40 CFR 122.26(b)(4) and (7), respectively and means all municipal separate storm sewers that are either:

1. Located in an incorporated place (city) with a population of 100,000 or more as determined by the 1990 Census by the Bureau of Census (these cities are listed in Appendices F and G of 40 CFR 122); or
2. Located in the counties with unincorporated urbanized populations of 100,000 or more, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties (these counties are listed in Appendices H and I of 40 CFR 122); or
3. Owned or operated by a municipality other than those described in paragraph (i) or (ii) and that are designated by the Director as part of the large or medium

municipal separate storm sewer system.

Municipal Separate Storm Sewer is defined at 40 CFR 122.26.

No exposure means that all industrial materials or activities are protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt and/or runoff.

NOI means Notice of Intent to be covered by this permit (see Part 2 of this permit.)

NOT means Notice of Termination (see Part 11.2 of this permit).

Owner or operator means the owner or operator of any "facility or activity" subject to regulation under the NPDES program.

Point source means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

Pollutant is defined at 40 CFR 122.2. A partial listing from this definition includes: dredged spoil, solid waste, sewage, garbage, sewage sludge, chemical wastes, biological materials, heat, wrecked or discarded equipment, rock, sand, cellar dirt, and industrial or municipal waste.

Runoff coefficient means the fraction of total rainfall that will appear at the conveyance as runoff.

Special Aquatic Sites, as defined at 40 CFR 230.3(q–1), means those sites identified in 40 CFR 230 Subpart E. They are geographic areas, large or small, possessing special ecological characteristics of productivity, habitat, wildlife protection, or other important and easily disrupted ecological values. These areas are generally recognized as significantly influencing or positively contributing to the general overall environmental health or vitality of the entire ecosystem of a region. (See 40 CFR 230.10(a)(3)).

Storm Water means storm water runoff, snow melt runoff, and surface runoff and drainage.

Storm Water Associated with Industrial Activity refers to storm water, that if allowed to discharge, would constitute a "discharge of storm water associated with industrial activity" as defined at 40 CFR 122.26(b)(14) and incorporated here by reference.

Waters of the United States means:

1. All waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
2. All interstate waters, including interstate "wetlands";
3. All other waters such as interstate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:

a. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
b. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
c. Which are used or could be used for industrial purposes by industries in interstate commerce;

4. All impoundments of waters otherwise defined as waters of the United States under this definition;
5. Tributaries of waters identified in paragraphs (1) through (4) of this definition;
6. The territorial sea; and
7. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs 1. through 6. of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of the CWA (other than cooling ponds for steam electric generation stations per 40 CFR 423) which also meet the criteria of this definition) are not waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with EPA.

You and *Your* as used in this permit is intended to refer to the permittee, the operator, or the discharger as the context indicates and that party's facility or responsibilities. The use of "you" and "your" refers to a particular facility and not to all facilities operated by a particular entity. For example, "you must submit" means the permittee must submit something for that particular facility. Likewise, "all your discharges" would refer only to discharges at that one facility.

13. Permit Conditions Applicable to Specific States, Indian Country Lands, or Territories

The provisions of Part 13 provide modifications or additions to the applicable conditions of Parts 1 through 12 of this permit to reflect specific additional conditions required as part of the State or Tribal CWA Section 401 certification process, or Coastal Zone Management Act certification process, or as otherwise established by the permitting authority. The additional revisions and requirements listed below are set forth in connection with, and only apply to, the following States, Indian country lands and Federal facilities.

13.1 Region 1

13.1.1 *CTR05*##I:* Indian country lands within the State of Connecticut.

13.1.2 *MAR05*###:* Commonwealth of Massachusetts, except Indian country lands.

13.1.2.1 Discharges covered by the general permit must comply with the provisions of 314 CMR 3.00; 314 CMR 4.00; 314 CMR 9.00; and 310 CMR 10.00 and any other related policies adopted under the authority of the Massachusetts Clean Waters Act, M.G.L. c.21, ss. 26–53 and Wetlands Protection Act, M.G.L., s.40. Specifically, new facilities or the redevelopment of existing facilities subject to this permit must comply with applicable storm water performance standards prescribed by state regulation or policy. A permit under 314 CMR 3.04 is not required for existing facilities which meet state storm water performance standards. An application for a permit under 314 CMR 3.00 is required only when required under 314 CMR 3.04(2)(b) (designation of a discharge on a case-by-case basis) or is otherwise identified in 314 CMR 3.00 or Department policy as a discharge requiring a permit application. Department regulations and policies may be obtained through the State House Bookstore or online at *www.magnet.state.ma.us/dep.*

13.1.2.2 The department may request a copy of the Storm Water Pollution Prevention Plan (SWPPP) or conduct an inspection of any facility covered by this permit to ensure compliance with state law requirements, including state water quality standards. The Department may enforce its certification conditions.

13.1.2.3 The results of any quarterly monitoring required by this permit must be sent to the appropriate Regional

Office of the Department where the monitoring identifies violations of effluent limits or benchmarks for any parameter for which monitoring is required under this permit.

13.1.3 *MAR05*##I:* Indian country lands within the Commonwealth of Massachusetts.

13.1.4 *MER05*###:* State of Maine, except Indian country lands.

13.1.5 *MER05*##I:* Indian country lands within the State of Maine.

13.1.6 *NHR05*###:* State of New Hampshire.

13.1.7 *RIR05*##I:* Indian country lands within the State of Rhode Island.

13.1.8 *VTR05*##F:* Federal Facilities in the State of Vermont.

13.2. Region 2

13.2.1 *PRR05*###:* The Commonwealth of Puerto Rico. No additional requirements

13.3 Region 3

13.3.1 *DCR05*###:* The District of Columbia.

13.3.2 *DER05*##F:* Federal Facilities in the State of Delaware.

13.4 Region 4

13.4.1 *ALR05*##I:* Indian country lands within the State of Alabama.

13.4.2 *FLR05*##I:* Indian country lands within the State of Florida.

13.4.3 *MSR05*##I:* Indian country lands within the State of Mississippi.

13.4.4 *NCR05*##I:* Indian country lands within the State of North Carolina.

13.5 Region 5

Permit coverage not available.

13.6 Region 6

13.6.1 *LAR05*##I:* Indian Country lands within the State of Louisiana. No additional requirements.

13.6.2 *NMR05*###:* The State of New Mexico, except Indian Country lands.

13.6.2.1 *Discharges to Water Quality Impaired/Water Quality Limited Waters:* Any operator who intends to obtain authorization under the MSGP for all new and existing storm water discharges to water quality-impaired (303(d)) waters (see *http://www.nmenv.state.nm.us/*) from facilities where there is a reasonable potential to contain pollutants for which the receiving water is impaired must satisfy the following conditions prior to the authorization. Signature of the NOI (which includes certifying eligibility for permit coverage) will be deemed the operator's certification that this eligibility requirement has been satisfied.

13.6.2.1.1 Prior to submitting a Notice of Intent (NOI) for coverage under the MSGP, provide an estimate of pollutant loads in storm water discharges from the facility to the New Mexico Environment Department, Surface Water Quality Bureau (SWQB). This estimate must include the documentation upon which the estimate is based (*e.g.*, sampling data from the facility, sampling data from substantially identical outfalls at similar facilities, modeling, etc.). Existing facilities must base this estimate on actual analytical data, if available.

13.6.2.1.2 Eligibility Requirements for New Discharges.

13.6.2.1.2.1 If a Total Maximum Daily Load (TMDL) has been developed, permit coverage is available only if the operator has received notice from the SWQB confirming eligibility.

Note: Following receipt of the information required under Part 13.6.2.1.1, SWQB anticipates using the following process in making eligibility determinations for new discharges into 303(d) waters where a TMDL has been developed:

- SWQB will notify the facility operator and EPA that the estimated pollutant load is consistent with the TMDL and that the proposed storm water discharges meet the eligibility requirements of Part 1.2.3.8 of the MSGP and may be authorized under this NPDES permit; or
- SWQB will notify the facility operator and EPA that the estimated pollutant load is not consistent with the TMDL and that the proposed storm water discharges do not meet the eligibility requirements of Part 1.2.3.8 of the MSGP and can not be authorized under this NPDES permit.

13.6.2.1.2.2 If a Total Maximum Daily Load (TMDL) has not been developed, permit coverage is not available under this permit for discharges to 303(d) waters and the operator must seek coverage under a separate permit.

Note: Following receipt of the information required under Part 13.6.2.1.1, SWQB anticipates using the following process in making eligibility determinations for new discharges into 303(d) waters where a TMDL has not yet been developed: SWQB will notify the facility operator and EPA that the proposed storm water discharges do not meet the eligibility requirements of Part 1.2.3.8 of the MSGP and can not be authorized under this NPDES permit.

13.6.2.1.3 *Eligibility Requirements for Existing Discharges:*

13.6.2.1.3.1 If a Total Maximum Daily Load (TMDL) has been developed, permit coverage is available only if the operator has received notice from the SWQB confirming eligibility.

Note: Following receipt of the information required under Part 13.6.2.1.1, SWQB anticipates using the following process in making eligibility determinations for existing discharges into 303(d) waters where a TMDL has been developed:

- SWQB will notify the facility operator and EPA that the estimated pollutant load is consistent with the TMDL and that the proposed storm water discharges meet the eligibility requirements of Part 1.2.3.8 of the MSGP and may be authorized under this NPDES permit; or
- SWQB will notify the facility operator and EPA that the estimated pollutant load is not consistent with the TMDL and that the proposed storm water discharges do not meet the eligibility requirements of Part 1.2.3.8 of the MSGP and can not be authorized under this NPDES permit.

13.6.2.1.3.2 If a Total Maximum Daily Load (TMDL) has not been developed at the time of permit authorization, but is later developed during the term of this permit and identifies existing permitted discharges as having a reasonable potential to contain pollutants for which the receiving water is impaired, these discharges shall no longer be authorized by this permit unless, following notification by the SWQP:

- The operator completes revisions to his/her Storm Water Pollution Prevention Plan (SWPPP) to include additional and/or modified Best Management Practices (BMPs) designed to comply with any applicable Waste Load Allocation (WLA) established his/her discharges within 14 calendar days following notification by SWQB; and
- The operator implements the additional and/or modified BMPs before the next anticipated discharge following revision of the SWPPP; and
- A report is submitted to SWQB which documents actions taken to comply with this condition, including estimated pollutant loads, within 30 calendar days following implementation of the additional and/or modified BMPs.

13.6.2.1.4 Additional Monitoring—perform analytical monitoring for each outfall at least annually for any pollutant(s) for which the 303(d) water is impaired where there is a reasonable potential for discharges to contain any or all of these pollutants. Submit monitoring results to SWQB within 45 calendar days following sample collection. These monitoring requirements are not eligible for any waivers listed elsewhere in the permit.

13.6.2.2 Permit Eligibility Regarding Protection of Water Quality Standards and Compliance with State Anti-degradation Requirements: Storm water discharges associated with industrial activity to 303(d) waters as well as all other "waters of the State" that SWQB has determined to be or may reasonably be expected to be contributing to a violation of a water quality standard

R0019898

and/or that do not comply with the applicable anti-degradation provisions of the State's WQS are not authorized by this permit.

Note: Upon receipt of this determination, NMED anticipates that, within a reasonable period of time, EPA will notify the general permittee to apply for and obtain an individual NPDES permit for these discharges per 40 CFR 122.28(b)(3).

13.6.2.3 Signed Copies of discharge monitoring reports, individual permit applications, the data and reports addressed in Part 13.6.2.1, and all other reports required herein, shall be submitted to the appropriate state office address: New Mexico—Program Manager, Point Source Regulation Section, Surface Water Quality Bureau, New Mexico Environment Department, P.O. Box 26110, Santa Fe, New Mexico 87502.

13.6.3. NMR05*##I: Indian Country lands in the State of New Mexico, except Navajo Reservation lands (see Region 9) and Ute Mountain Reservation lands (see Region 8).

13.6.3.1 *Pueblo of Isleta* The following conditions apply only to discharges on the Pueblo of Isleta.

13.6.3.1.1 Copies of "Certification of Eligibility of Coverage" under Part 1.2.3.6.3 (Endangered Species) and Part 1.2.3.7 (Historical Properties), and their justifications, must be provided to the Tribe 10 days prior to filing the Notice of Intent (NOI).

13.6.3.1.2 A copy of the Storm Water Pollution Prevention Plan (SWPPP) must be provided to the Tribe 5 days prior to filing the NOI.

13.6.3.1.3 A copy of the NOI must be provided to the Tribe at the same time it is sent to the Environmental Protection Agency.

13.6.3.1.4 A copy of the Notice of Termination (NOT) must be provided to the Tribe at the same time it is sent to the Environmental Protection Agency.

13.6.3.1.5 Any notice of release of hazardous substances (Part 3.1.2) shall also be sent to the Tribe at the same time it is sent to the Environmental Protection Agency. Notification of a release of hazardous substances shall also be made to the Pueblo's Police Department (505–869–3030) or Governor's Office (505–869–3111) or Environment Department (505–869–5748).

13.6.3.1.6 Copies of all "Routine Inspection Reports: (Part 4.2.7.2.1.5) and "Comprehensive Inspection Reports" (Part 4.9) shall be sent to the Tribe within 5 days of completion.

13.6.3.1.7 All analytical data (*e.g.*, Discharge Monitoring Reports, etc.) shall be provided to the Tribe at the same time it is provided to the EPA.

13.6.3.1.8 Exceedance of any EPA-established "Benchmark Value" for any pollutant will require quarterly monitoring for that pollutant until such time as analytical results from 4 consecutive quarters are below the "Benchmark."

13.6.3.1.9 Any permittee in Sector F shall monitor for all Clean Water Act Section 307(a) priority pollutants used in any of their processes. Monitoring shall be on a quarterly basis.

13.6.3.1.10 Any permittee in Sector M shall monitor for total oil & grease, glycols, and those solvents regulated under Safe Drinking Water Act mandates at 40 CFR 141.61(a) in addition to those parameters identified in Table M–1. Monitoring shall be on a quarterly basis.

13.6.3.1.11 Any permittee in Sector N shall monitor for PCBs in addition to those parameters identified in Table N–1. Monitoring shall be on a quarterly basis.

13.6.3.1.12 All written reports shall be sent to: Director, Environment Department, Pueblo of Isleta, Isleta, NM 87022.

13.6.3.2 *Pueblo of Nambe.* The following conditions apply only to discharges on the Pueblo of Nambe.

No additional requirements.

13.6.3.3 *Pueblo of Picuris.* The following conditions apply only to discharges on the Pueblo of Picuris.

13.6.3.4 *Pueblo of Pojoaque.* The following conditions apply only to discharges on the Pueblo of Pojoaque.

13.6.3.4.1 Notices of Intent (NOI) and notices of Termination (NOT) shall be submitted to the Pueblo of Pojoaque Environment Department at the same time they are submitted to EPA.

13.6.3.4.2 Storm Water Pollution Prevention Plans (SWPPP) shall be submitted to the Pueblo of Pojoaque Environment Department 30 days before commencement of the project.

13.6.3.4.3 If requested by the Pueblo of Pojoaque Environment Department (PPED), the permittee shall provide additional information necessary for a "case by case" eligibility determination to assure compliance with Pojoaque Pueblo Water Quality Standards.

Note: Upon receipt of an determination by the Pueblo of Pojoaque that discharges from a facility have the reasonable potential to be causing or contributing to a violation of Pojoaque Pueblo Water Quality Standards, EPA would notify the general permittee to either improve their Storm Water Pollution Prevention Plan to achieve compliance with Pojoaque Pueblo Water Quality Standards or apply for and obtain an individual NPDES permit for these discharges per 40 CFR 122.28(b)(3).

13.6.3.4.4 All written reports shall be sent to: Pueblo of Pojoaque Environment Department, 2 W. Gutierrez, Santa Fe, NM 87501; Phone (505) 455–2087; FAX (505) 455–2177.

13.6.3.5 *Pueblo of San Juan.* The following conditions apply only to discharges on the Pueblo of San Juan.

13.6.3.5.1 Copies of the Notice of Intent (NOI) and Notice of Termination (NOT) shall be provided to the Pueblo five (5) days prior to the time it is provided to the Environmental Protection Agency. A copy of the Storm Water Pollution Prevention Plan shall be provided to the Pueblo five (5) days prior to the time the NOI is submitted to the Environmental Protection Agency.

13.6.3.5.2 All analytical data (*e.g.*, Discharge Monitoring Reports, etc.) shall be provided to the Pueblo at the same time it is provided to the Environmental Protection Agency. Monitoring activities must be coordinated with the Director of the Environment Department to insure consistency with the Pueblo of San Juan Surface Water Quality Monitoring Program.

13.6.3.5.3 Copies of all written reports required under the permit shall be sent to: Director, Environment Department, San Juan Pueblo, P.O. Box 717, San Juan Pueblo, NM 87566. For questions or coordination, you may contact the Director at (505) 852–4212.

13.6.3.6 *Pueblo of Sandia.* The following conditions apply only to discharges on the Pueblo of Sandia.

13.6.3.6.1 Copies of the Notice of Intent (NOI) and Notice of Termination (NOT) shall be provided to the Pueblo at the same time it is provided to the Environmental Protection Agency. A copy of the Storm Water Pollution Prevention Plan must also be provided to the Pueblo at the time the NOI is submitted.

13.6.3.6.2 All analytical data (e.g., Discharge Monitoring Reports, etc) shall be provided to the Pueblo at the same time it is provided to the Environmental Protection Agency.

13.6.3.6.3 All written reports shall be sent to: Director, Environment Department, Pueblo of Sandia, Box 6008, Bernalillo, NM 87004.

13.6.3.7 *Pueblo of Tesuque.* The following conditions apply only to discharges on the Pueblo of Tesuque. No additional requirements.

13.6.3.8 Santa Clara Pueblo. The following conditions apply only to discharges on the Santa Clara Pueblo. No additional requirements.

13.6.3.9 *All Other Indian Country lands in New Mexico.* No additional requirements.

13.6.4. OKR05*##I: Indian Country lands within the State of Oklahoma. No additional requirements.

13.6.5. OKR05*##F: Facilities in the State of Oklahoma not under the jurisdiction of the Oklahoma Department of Environmental Quality, except those on Indian Country lands.

13.6.5.1 Ineligible Discharges to the Oklahoma Scenic Rivers System and Outstanding Resource Waters—New or proposed discharges to the Oklahoma Scenic Rivers System, including the Illinois River, Flint Creek, Barren Fork Creek, Mountain Fork, Little Lee Creek, and Big Lee Creek or to any water designated an "Outstanding Resource Water" (ORW) in Oklahoma's Water Quality Standards are not eligible for coverage under the MSGP. Existing discharges of storm water in these watersheds may be permitted under the MSGP only from point sources existing as of June 25, 1992, whether or not such storm water discharges were permitted as point sources prior to June 25, 1992.

13.6.6. TXR05*###: The State of Texas, except Indian Country lands.

13.6.6.1 The following limitations, independently required under the Texas Water Quality Standards (31 TAC 319.22 and 319.23), apply to discharges authorized by the permit:

13.6.6.1.1 *All Discharges to Inland Waters:* The maximum allowable concentrations of each of the hazardous metals, stated in terms of milligrams per liter (mg/l), for discharges to inland waters are as follows:

Total metal	Monthly average	Daily composite	Single grab
Arsenic	0.1	0.2	0.3
Barium	1.0	2.0	4.0
Cadmium	0.05	0.1	0.2
Chromium	0.5	1.0	5.0
Copper	0.5	1.0	2.0
Lead	0.5	1.0	1.5
Manganese	1.0	2.0	3.0
Mercury	0.005	0.005	0.01
Nickel	1.0	2.0	3.0
Selenium	0.05	0.1	0.2
Silver	0.05	0.1	0.2
Zinc	1.0	2.0	6.0

13.6.6.1.2*All Discharges to Tidal Waters:* The maximum allowable concentrations of each of the hazardous metals, stated in terms of milligrams per liter (mg/l), for discharges to tidal waters are as follows:

Total metal	Monthly average	Daily composite	Single grab
Arsenic	0.1	0.2	0.3
Barium	1.0	2.0	4.0
Cadmium	0.1	0.2	0.3
Chromium	0.5	1.0	5.0
Copper	0.5	1.0	2.0
Lead	0.5	1.0	1.5
Manganese	1.0	2.0	3.0
Mercury	0.005	0.005	0.01
Nickel	1.0	2.0	3.0
Selenium	0.10	0.2	0.3
Silver	0.05	0.1	0.2
Zinc	1.0	2.0	6.0

13.6.6.1.3 Definitions:

Inland Waters—all surface waters in the State other than "tidal waters" as defined below.

Tidal Waters—those waters of the Gulf of Mexico within the jurisdiction of the State of Texas, bays and estuaries thereto, and those portions of the river systems which are subject to the ebb and flow of the tides, and to the intrusion of marine waters.

13.6.7. TXR05*##I: Indian Country lands within the State of Texas. No additional requirements.

13.7. *Region 7. Permit Coverage Not Available.*

13.8. *Region 8.*

13.8.1. COR05*##F: Federal Facilities in the State of Colorado, except those located on Indian country lands.

13.8.2. COR05*##I: Indian country lands within the State of Colorado, including the portion of the Ute Mountain Reservation located in New Mexico.

13.8.3. MTR05*##I: Reserved

13.8.4. NDR05*##I: Indian country lands within the State of North Dakota, including that portion of the Standing Rock Reservation located in South Dakota except for the Lake Traverse Reservation which is covered under South Dakota permit SDR05*##I listed below.

13.8.5. SDR05*##I: Indian country lands within the State of South Dakota, including the portion of the Pine Ridge Reservation located in Nebraska and the portion of the Lake Traverse Reservation located in North Dakota except for the Standing Rock Reservation which is covered under North Dakota permit NDR05*##I listed above.

13.8.6. UTR05*##I: Indian country lands in the State of Utah, except Goshute and Navajo reservation lands (see Region 9).

13.8.7. WYR05*##I: Indian country lands in the State of Wyoming.

13.9. *Region 9.*

13.9.1. ASR05*###: The Island of American Samoa.

13.9.1.1. Copies of NOIs shall also be submitted to the American Samoa Environmental Protection Agency at the following address concurrently with NOI submittal to EPA: American Samoa Environmental Protection Agency, Executive Office Building, Pago Pago, American Samoa 96799.

13.9.1.2. Updated storm water pollution prevention plans must be submitted to the American Samoa Environmental Protection Agency at the following address for review and approval as soon as they are completed: American Samoa Environmental Protection Agency, Executive Office Building, Pago Pago, American Samoa 96799.

13.9.2. AZR05*###: The State of Arizona, except Indian country lands.

13.9.2.1. Discharges authorized by this permit shall not cause or contribute to a violation of any applicable water quality standard of the State of Arizona (Arizona Administrative Code, Title 18, Chapter 11).

13.9.2.2. Notices of Intent (NOIs) shall also be submitted to the State of Arizona Department of Environmental Quality at the following address: Storm Water Coordinator, Arizona Department of Environmental Quality, 3033 N. Central Avenue, Phoenix, Arizona 85012. NOIs submitted to the State of Arizona shall include the well registration number if storm water associated with industrial activity is discharged to a dry well or an injection well.

13.9.2.3. Notices of Termination (NOTs) shall also be submitted to the State of Arizona Department of Environmental Quality at the following address: Storm Water Coordinator, Arizona Department of Environmental Quality, 3033 N. Central Avenue, Phoenix, Arizona 85012.

13.9.2.4. For facilities which submit a no exposure certification in accordance with Part 1.5 of the permit, the operator shall submit a copy of the no exposure certification to the State of Arizona Department of Environmental Quality at the following address: Storm Water Coordinator, Arizona Department of Environmental Quality, 3033 N. Central Avenue, Phoenix, Arizona 85012.

13.9.2.5. SARA Section 313 (Community Right to Know) facilities shall have the following requirement: Liquid storage areas for Section 313 water priority chemicals shall be operated to minimize discharges of such chemicals. Appropriate measures to minimize discharges of Section 313 chemicals shall include: provision of secondary containment for at least the entire contents of the largest tank plus sufficient freeboard to allow for the 25-year, 24-hour precipitation event; a strong spill contingency and integrity testing plan, and/or other equivalent measures.

13.9.2.6. Delineation of Facility Areas Within the 100-Year Floodplain. All facilities or any portion of a facility that is located at or within the 100-year floodplain shall be delineated on the site map. The base flood elevation, if known, shall also be reported.

13.9.2.7. Facilities subject to monitoring and reporting requirements shall also submit Discharge Monitoring Report Form(s) (DMR) and other required monitoring information to the State of Arizona Department of Environmental Quality at the following address: Storm Water DMR Coordinator, Arizona Department of Environmental Quality, 3033 N. Central Avenue Phoenix, Arizona 85012.

13.9.2.8. The term "Significant Sources of Non-Storm Water" includes, but is not limited to discharges which could cause or contribute to violations of water quality standards of the State of Arizona, and discharges which could include releases of oil or hazardous substances in excess of reportable quantities under Section 311 of the Clean Water Act (see 40 CFR 110.10 and CFR 117.21) or Section 102 of CERCLA (see CFR 302.4).

13.9.2.9. The term "Base Flood Elevation" as defined by Federal Emergency Management Agency (FEMA) is the height of the base (100-year) flood in relation to a specified datum, usually the National Geodetic Vertical Datum of 1929 of North American Vertical Datum of 1988. This is the elevation of the 100-year flood waters relative to "mean sea level."

13.9.2.10. The term "100-year flood" means the flood having a one percent chance of being equaled or exceeded in magnitude in any given year.

13.9.2.11. The term "100-year floodplain" means that area adjoining a river, stream, or watercourse covered by water in the event of a 100-year flood.

13.9.3. AZR05*##I: Indian country lands within the State of Arizona, including Navajo Reservation lands in New Mexico and Utah.

13.9.3.1. White Mountain Apache Tribe. The following condition applies only on the White Mountain Apache Tribe: All NOIs for proposed storm water discharge coverage shall be provided to the following address: Tribal Environmental Planning Office, Attn: Brenda Pusher-Begay, P.O. Box 1000, Whiteriver, AZ 85941.

13.9.4. CAR05*##I: Indian country lands within the State of California No additional requirements.

13.9.5. GUR05*###: The Island of Guam.

13.9.5.1. Facilities ineligible for Multi-Sector General Permit coverage which are required to submit an individual NPDES permit application must send a copy to the following address at the time of submittal to EPA: Guam Environmental Protection Agency, P.O. Box 22439 GMF, Barrigada, Guam 96921.

13.9.5.2. Copies of NOIs shall also be submitted to the following address concurrently with NOI submittal to EPA: Guam Environmental Protection Agency, P.O. Box 22439 GMF, Barrigada, Guam 96921.

13.9.5.3. Permittees required by the Director to submit an individual NPDES permit application or alternative general NPDES permit application must send a copy to the following address at the time of submittal to EPA: Guam Environmental Protection Agency, P.O. Box 22439 GMF, Barrigada, Guam 96921.

13.9.6. JAR05*###: Johnston Atoll. No additional requirements.

13.9.7. MWR05*###: Midway Island and Wake Island. No additional requirements.

13.9.8. NIR05*###: Commonwealth of the Northern Mariana Islands (CNMI)

13.9.8.1. All conditions and requirements set forth in the USEPA final NPDES MSGP must be complied with.

13.9.8.2. A storm water pollution prevention plan (SWPPP) for storm water discharges associated with industrial activity must be approved by the Director of the CNMI DEQ prior to the submission of the NOI to USEPA. The CNMI address for the submittal of the SWPPP for approval is: Commonwealth of the Northern Mariana Islands, Office of the Governor, Director, Division of Environmental Quality (DEQ), P.O. Box 501304 C.K., Saipan, MP 96950–1304.

13.9.8.3. An NOI to be covered by the storm water MSGP for discharges associated with industrial activity must be submitted to CNMI DEQ (use above address) and USEPA, Region 9, in the form prescribed by USEPA, accompanied by a SWPPP approval letter from CNMI DEQ.

13.9.8.4. The NOI must be postmarked seven (7) calendar days prior to any stormwater discharges and a copy must be submitted to the Director of CNMI DEQ (use above address) no later than seven (7) calendar days prior to any stormwater discharges.

13.9.8.5. All monitoring reports required by the MSGP must be submitted to CNMI DEQ (use above address).

13.9.8.6. In accordance with section 10.3(h) and (i) of CNMI water quality standards, CNMI DEQ reserves the right to deny coverage under the MSGP and to require submittal of an application for an individual NPDES permit based on a review of the NOI or other information made available to the Director.

13.9.9. NVR05*##I: Indian country lands within the State of Nevada, including the Duck Valley Reservation in Idaho, the Fort McDermitt Reservation in Oregon and the Goshute Reservation in Utah. No additional requirements.

13.10. *Region 10.*

13.10.1. (The terms and conditions of the 1995 Multi-Sector General Permit are effective for facilities in the State of Alaska through February 9, 2001.)

13.10.2. AKR05*##I: Indian country Lands within the State of Alaska.

13.10.3. IDR05*### The State of Idaho, except Indian country lands.

13.10.4. IDR05*##I: Indian country lands within the State of Idaho, except Duck Valley Reservation lands (see Region 9).

13.10.5. ORR05*##I: Indian country lands in the State of Oregon except Fort McDermitt Reservation lands (see Region 9).

13.10.6. WAR05*##I: Indian country lands within the State of Washington

13.10.6.1 Permittees on Chehalis Reservation lands must also meet the following conditions:

1. The permittee shall be responsible for achieving compliance with Confederated Tribes of Chehalis Reservation's Water Quality Standards, and

2. The permittee shall be responsible for submitting all Storm Water Pollution Prevention Plans to the Chehalis Tribal Department of Natural Resources at the following address for review and approval prior to the beginning of any discharge activities taking place: Confederated Tribes of Chehalis Reservation, Department of Natural Resources, 420 Howanut Road, Oakville, WA 98568.

13.10.6.2 Permittees on Puyallup Reservation lands must also meet the following conditions:

1. The permittee shall be responsible for achieving compliance with Puyallup Tribe's Water Quality Standards;

2. The permittee shall submit a copy of the Notice of Intent to be covered by the general permit to the Puyallup Tribe Environmental Department at the address listed below at the same time it is submitted to U.S. EPA;

3. The permittee shall be responsible for submitting all Storm Water Pollution Prevention Plans to the Puyallup Tribe Environmental Department at the following address for review and approval prior to the beginning of any discharge activities taking place: Puyallup Tribe Environmental Department, 2002 East 28th Street, Tacoma, WA 98404.

13.10.7. WAR05*##F: Federal Facilities in the State of Washington, except those located on Indian country lands.

13.10.7.1 Discharges authorized by this permit shall not cause or contribute to a violation of any applicable water quality standard of the State of Washington. These standards are found at Chapter 173–201A WAC (Water Quality Standards for Surface Waters), Chapter 173–204 WAC (Sediment Management Standards) and the National Toxics Rule for human health standards (57 FR 60848–60923).

13.10.7.2 Any operator of a facility in Sectors A, D, E, F, G, H, J, L, M, N, or U who intends to obtain authorization under the MSGP–2000 for all new and existing storm water discharges must conduct and report benchmark monitoring for turbidity with a cutoff concentration of 50 NTU.

Addendum A—Endangered Species Guidance

I. Assessing Permit Eligibility Regarding Endangered Species

A. Background

To meet its obligations under the Clean Water Act and the Endangered Species Act (ESA) and to promote those Acts' goals, the Environmental Protection Agency (EPA) is seeking to ensure the activities regulated by this Multi-Sector General Permit (MSGP) pose no jeopardy to endangered and threatened species and critical habitat. To ensure that those goals are met, applicants for MSGP coverage are required under Part 1.2.3.6 to assess the impacts of their storm water discharges, allowable non-storm water discharges, and discharge-related activities on Federally listed endangered and threatened species ("listed species") and designated critical habitat ("critical habitat") by following the process listed below. EPA strongly recommends that you follow these steps at the earliest possible stage to ensure that measures to protect listed species and critical habitat are incorporated early in your planning process.

You also have an independent ESA obligation to ensure that your activities do not result in any prohibited "takes" of listed species.[1] Many of the measures required in the MSGP and in these instructions to protect species may also assist you in ensuring that your activities do not result in a prohibited take of species in violation of section 9 of the ESA. If you have or plan activities in areas that harbor endangered and threatened species, you may wish to ensure that you are protected from potential takings liability under ESA section 9 by obtaining an ESA section 10 permit or, if there is a separate federal action regarding the facility, by requesting formal consultation under ESA section 7 regarding that action. If you are not sure whether to pursue a section 10 permit or a section 7 consultation for takings protection, you should confer with the appropriate Fish and Wildlife Service (FWS) and/or National Marine Fisheries Service (NMFS) (collectively the "Services") office.

[1] Section 9 of the ESA prohibits any person from "taking" a listed species (*e.g.*, harassing or harming it) unless: (1) the taking is authorized through a "incidental take statement" as part of undergoing ESA section 7 formal consultation; (2) where an incidental take permit is obtained under ESA section 10 (which requires the development of a habitat conservation plan); or (3) where otherwise authorized or exempted under the ESA. This prohibition applies to all entities including private individuals, businesses, and governments.

B. How Does The Basic Eligibility Assessment Process Work?

In order to determine if you are eligible to use the permit, you need to go through a series of steps to determine:

1. Are there any listed endangered or threatened species or critical habitat in proximity to your facility or the point where your discharges reach a receiving water?

2. If there are listed species in proximity, are your discharges or discharge-related activities going to adversely affect them?

3. If adverse effects on listed species or critical habitat are likely, what can you do to eliminate or reduce these effects?

4. Have any adverse effects already been addressed under the Endangered Species Act?

5. Which, if any, of the eligibility criteria make you eligible for permit coverage?

C. What Are the Eligibility Criteria?

The Part 1.2.3.6 eligibility requirement may be satisfied by documenting that one or more of the following criteria has been met:

Criteria A. No Listed Species or Critical Habitat Are in Proximity to Your Facility or the Point Where Authorized Discharges Reach a Water of the United States (See Part 1.2.3.6.3.1)

Using the latest County Species List available from EPA and any other relevant information sources, you have determined that no listed species or critical habitat are in proximity to your facility. Listed species and critical habitat are in proximity to a facility when they are:

- Located in the path or immediate area through which or over which contaminated point source storm water flows from industrial activities to the point of discharge into the receiving water. This may also include areas where storm water from your facility enters groundwater that has a direct hydrological connection to a receiving water (*e.g.*, groundwater infiltrates at your facility and re-emerges to enter a surface waterbody within a short period of time.)
- Located in the immediate vicinity of, or nearby, the point of discharge into receiving waters.
- Located in the area of a facility where storm water BMPs are planned or are to be constructed.

Please be aware that no protection from incidental takings liability is provided under this criteria.

Criteria B. An ESA Section 7 Consultation Has Been Performed for a Separate Federal Action Regarding Your Facility (See Part 1.2.3.6.3.2)

A formal or informal ESA § 7 consultation on a separate federal action (*e.g.*, New Source review under NEPA, application for a dredge and fill permit under CWA § 404, application for an individual NPDES permit, etc.) addressed the effects of your discharges and discharge-related activities on listed species and critical habitat. If your facility was the subject of a formal consultation, it must have resulted in either a "no jeopardy opinion" or a "jeopardy opinion" and you agree to implement any reasonable and prudent alternatives or other conditions upon which the consultation was based. If your facility was the subject of an informal consultation, it must have resulted in a written concurrence by the Service(s) on a finding that the applicant's activities are not likely to adversely affect listed species or critical habitat (for informal consultation, see 50 CFR 402.13).

Criteria C. An Incidental Taking Permit Under Section 10 of the ESA was Issued for Your Facility (See Part 1.2.3.6.3.3)

You have a permit under section 10 of the ESA and that authorization addresses the effects of your wastewater and storm water discharges and discharge-related activities on listed species and critical habitat. Note: You must follow FWS/NMFS procedures when applying for an ESA section 10 permit (see 50 CFR 17.22(b)(1)).

Criteria D. You Have Determined Adverse Effects Are Not Likely (See Part 1.2.3.6.3.4)

Using best judgment, you have investigated potential effects your discharges and discharges-related activities may have on listed species and critical habitat and have no reason to believe there would be adverse effects. Any terms and/or conditions to protect listed species and critical habitat you relied on in order to determine adverse effects would be unlikely must be incorporated into your Storm Water Pollution Prevention Plan (required by the permit) and implemented in order to maintain permit eligibility.

Please be aware that no protection from incidental takings liability is provided under this criteria.

Criteria E. Your Facility Was Covered Under the Eligibility Certification of Another Operator for the Facility Area (See Part 1.2.3.6.3.5)

Your storm water discharges, allowable non-storm water discharges, and discharge-related activities were already addressed in another operator's certification of eligibility under Part 1.2.3.6.3 which covered your facility. By certifying eligibility under Part 1.2.3.6.3.4, you agree to comply with any measures or controls upon which the other operator's certification under Part 1.2.3.6.3 was based.

Please be aware that in order to meet the permit eligibility requirements by relying on another operator's certification of eligibility, the other operator's certification must apply to the location of your facility and must address the effects from your storm water discharges, allowable non-storm water discharges, and discharge-related activities on listed species and critical habitat. This situation will typically occur where an ownership of a facility covered by this permit changes or when there are multiple operators within an industrial park or an airport. However, before you rely on another operator's certification, you should carefully review that certification along with any supporting information. You also need to confirm that no additional species have been listed or critical habitat designated in the area of your facility since the other operator's endangered species assessment was done. If you do not believe that the other operator's certification provides adequate coverage for your facility, you should provide your own independent endangered species assessment and certification.

Please be aware that no protection from incidental takings liability is provided under this criteria.

D. What Procedures Do I Use To Determine if the Eligibility Criteria Can Be Satisfied?

Caution: Additional endangered and threatened species have been listed and critical habit designated since the 1995 MSGP was issued and will continue to be added after the effective date of this permit. You must verify any earlier determination of eligibility is still valid before relying on that assessment to certify eligibility for this permit. Where applicable, you may incorporate information from your previous endangered species analysis in your documentation of eligibility for this permit.

To determine eligibility, you must assess (or have previously assessed) the potential effects of your storm water discharges, allowable non-storm water discharges and discharge-related activities on listed species and critical habitat. PRIOR to completing and submitting a Notice of Intent (NOI) form, you must follow the steps outlined below and document the results of your eligibility determination.

Step One: Are There Any Endangered Species or Critical Habitat in Your County (or Other Area) and, if so, Are They in Proximity to Your Facility or Discharge Locations?

1–A. *Check for Listed Species* Look in the latest county species list to see if any listed species are found where your facility and discharge point(s) are located. If you are located close to the border of a county or your facility is located in one county and your discharge points are located in another, you must look under both counties. Since species are listed and de-listed periodically, you will need the most current list at the time you are doing your endangered species assessment. EPA's most current county-species list is on the Internet at *http://www.epa.gov/owm/esalst2.htm.*

=>Proceed to 1–B.

1–B. *Check for Critical Habitat* Some (but not all) listed species have designated critical habitat. Exact locations of such habitat is provided in the endangered species regulations at 50 CFR part 17 and part 226. To determine if facility or discharge locations are within designated critical habitat, you should either:

- Review those regulations (which can be found in many larger libraries); or
- Contact the nearest Fish and Wildlife Service (FWS) and National Marine Fisheries Service (NMFS) Office. A list of FWS and NMFS offices is found at section II of this Addendum.; or
- Contact the State Natural Heritage centers. These centers compile and disseminate information on Federally listed and other protected species. They frequently have the most current information on listed species and critical habitat. A list of these centers is provided in section III of the Addendum.

=>Proceed to 1–C.

1–C. *Check for Proximity* If there are listed species in your county, are they in proximity to your facility or discharge locations? You will need to use the proximity criteria in Eligibility Criteria A to determine if the listed species are in your part of the county. The area in proximity to be searched/surveyed for listed species will vary with the size of the facility, the nature and quantity of the storm water discharges, and the type of receiving waters. Given the number of facilities potentially covered by the MSGP, no specific method to determine whether species are in proximity is required for permit coverage under the MSGP. Instead, you should use the method or methods which best allow you to determine to the best of your knowledge whether species are in proximity to your particular facility. These methods may include:

- Conducting visual inspections. This method may be particularly suitable for facilities that are smaller in size, facilities located in non-natural settings such as highly urbanized areas or industrial parks where there is little or no nature habitat; and facilities that discharge directly into municipal storm water collection systems. For other facilities, a visual survey of the facility site and storm water drainage areas may be insufficient to determine whether species are likely to be located in proximity to the discharge.
- Contacting the nearest State Wildlife Agency or U.S. Fish and Wildlife Service (FWS) or National Marine Fisheries Service (NMFS) offices. Many endangered and threatened species are found in well-defined areas or habitats. That information is frequently known to state or federal wildlife agencies. FWS has offices in every state. NMFS has regional offices in: Gloucester, Massachusetts; St. Petersburg, Florida; Long Beach, California; Portland, Oregon; and Juneau, Alaska.
- Contacting local/regional conservation groups. These groups inventory species and their locations and maintain lists of sightings and habitats.
- Conducting a formal biological survey. Larger facilities with extensive storm water discharges may choose to conduct biological surveys as the most effective way to assess whether species are located in proximity and whether there are likely adverse effects.

If neither your facility nor discharge locations are located in designated critical habitat, then you need not consider impacts to critical habitat when following Steps Two through Five below. If your facility or discharge locations are located within critical habitat, then you must look at impacts to critical habitat when following Steps Two through Five. EPA notes that many measures imposed to protect listed species under these

R0019903

steps will also protect critical habitat. However, obligations to protect habitat under this permit are separate from those to protect listed species. Thus, meeting the eligibility requirements of this permit may require measures to protect critical habitat that are separate from those to protect listed species.

=> Proceed to 1–D

1–D. *Check for Criteria "A" Eligibility* IF NO SPECIES WERE LISTED FOR YOUR COUNTY OR THE SPECIES THAT WERE LISTED WERE NOT IN PROXIMITY TO YOUR DISCHARGE *AND* YOUR FACILITY AND DISCHARGE LOCATIONS WERE NOT IN PROXIMITY TO CRITICAL HABITAT, YOU ARE ELIGIBLE UNDER CRITERIA "A". Document your endangered species assessment and certify eligibility under Part 1.2.3.6.3.1 of the permit. Congratulations, go to Step Five!

=> If there were listed species or critical habitat, proceed to Step Two

Step Two: Can You Meet Eligibility Criteria "B", "C", or "E"?

2–A *Check for Criteria "B", "C", or "E" Basis* Do one of the following apply:

- There was a completed consultation under ESA § 7 for your facility (Criteria B) => proceed to 2–B
- There is a previously issued ESA § 10 permit for your facility (Criteria C) => proceed to 2–C
- Another operator previously certified eligibility for the area where your facility is located (Criteria E) => proceed to 2–D

=> If no, proceed to Step Three

2–B *Check for Criteria "B" Eligibility* Did the previously completed ESA § 7 consultation consider all currently listed species and critical habitat and address your storm water, allowable non-storm water, and discharge related activities?

=> If no, proceed to Step Three

2-B–1 Did the ESA § 7 consultation result in either a "no jeopardy" opinion by the Service (for formal consultations) or a concurrence by the service that your activities would be "unlikely to adversely affect" listed species or critical habitat?

=> If no, proceed to Step Three

2–B–2 IF YOU AGREE TO IMPLEMENT ANY MEASURES UPON WHICH THE CONSULTATION WAS CONDITIONED, YOU ARE ELIGIBLE UNDER CRITERIA "B". Incorporate any necessary measures into your Storm Water Pollution Prevention Plan, document your endangered species assessment, and certify eligibility under Part 1.2.3.6.3.2. Congratulations, go to Step Five!

=> If you do not agree to implement conditions upon which the consultation was based, proceed to Step Three

2–C *Check for Criteria "C" Eligibility* IF YOUR ESA § 10 PERMIT CONSIDERED ALL CURRENTLY LISTED SPECIES AND CRITICAL HABITAT AND ADDRESSES YOUR STORM WATER, ALLOWABLE NON-STORM WATER, AND DISCHARGE RELATED ACTIVITIES, YOU ARE ELIGIBLE UNDER CRITERIA "C". Incorporate any necessary measures into your Storm Water Pollution Prevention Plan, document your endangered species assessment, and certify eligibility under Part 1.2.3.6.3.3 of the permit. Congratulations, go to Step Five!

=> If your ESA § 10 permit did not meet these criteria, proceed to Step Three

2–D Check for Criteria "E" Eligibility Did the other operator's certification of eligibility consider all currently listed species and critical habitat and address your storm water, allowable non-storm water, and discharge related activities?

=> If no, proceed to Step Three

2–D–1 IF YOU AGREE TO IMPLEMENT ANY MEASURES UPON WHICH THE OTHER OPERATOR'S CERTIFICATION WAS BASED, YOU ARE ELIGIBLE UNDER CRITERIA "E". Incorporate any necessary measures into your Storm Water Pollution Prevention Plan, document your endangered species assessment, and certify eligibility under Part 1.2.3.6.3.5 of the Permit. Congratulations, go to Step Five!

=> If you do not agree to implement conditions upon which another operator's certification was based, proceed to Step Three

Step Three: Are Listed Species or Critical Habitat Likely To Be Adversely Affected by Your Facility's Storm Water Discharges, Allowable Non-storm Water Discharges, or Discharge-related Activities?

If you are unable to certify eligibility under Criteria A, B, C, or E, you must assess whether your storm water discharges, allowable non-storm water discharges, and discharge-related activities are likely to pose jeopardy to listed species or critical habitat. "Storm water discharge-related activities" include:

Activities which cause, contribute to, or result in point source storm water pollutant discharges; and

Measures to control storm water discharges and allowable non-storm water discharges including the siting, construction, operation of best management practices (BMPs) to control, reduce or prevent water pollution.

Effects from storm water discharges, allowable non-storm water discharges, and discharge-related activities which could pose jeopardy include:

Hydrological. Wastewater or storm water discharges may cause siltation, sedimentation or induce other changes in receiving waters such as temperature, salinity or pH. These effects will vary with the amount of wastewater or storm water discharged and the volume and condition of the receiving water. Where a discharge constitutes a minute portion of the total volume of the receiving water, adverse hydrological effects are less likely.

Habitat. Excavation, site development, grading, and other surface disturbance activities, including the installation or placement of wastewater or storm water ponds or BMPs, may adversely affect listed species or their habitat. Wastewater or storm water associated with facility operation may drain or inundate listed species habitat.

Toxicity. In some cases, pollutants in wastewater or storm water may have toxic effects on listed species.

The scope of effects to consider will vary with each facility. If you are having difficulty in determining whether your facility is likely to pose jeopardy to a listed specie or critical habitat, then the appropriate office of the FWS, NMFS, or Natural Heritage Center listed in Sections II and III of this Addendum should be contacted for assistance.

Document the results of your assessment and make a preliminary determination on whether or not there would likely be any jeopardy to listed species or critical habitat. You will need to determine that your activities are either "unlikely to adversely affect" or "may adversely affect". Your determination may be based on measures that you implement to avoid, eliminate, or minimize adverse affects.

=> Proceed to Step Four

Step Four: Can You Meet Eligibility Criteria "D"?

Using best judgment, can you determine your facility's storm water discharges, allowable non-storm water discharges, and discharge-related activities are unlikely to pose jeopardy to listed species or critical habitat?

4–A IF STEP THREE DETERMINATION IS "UNLIKELY TO ADVERSELY AFFECT", YOU ARE ELIGIBLE UNDER CRITERIA "D". Incorporate appropriate measures upon which your eligibility was based into your Storm Water Pollution Prevention Plan and certify eligibility under Part 1.2.3.6.3.4 of the permit. Congratulations, go to Step Five.

=> If there may be adverse effects, proceed to Step 4–B

4–B *Step Three (or Step 4–A–1) Determination is "May Adversely Affect"* You must contact the Service(s) to discuss your findings and measures you could implement to avoid, eliminate, or minimize adverse affects.

4–B–1 IF YOU AND THE SERVICE(S) REACH AGREEMENT ON MEASURES TO AVOID ADVERSE EFFECTS, YOU ARE ELIGIBLE UNDER CRITERIA "D". Incorporate appropriate measures upon which your eligibility was based into your Storm Water Pollution Prevention Plan and certify eligibility under Part 1.2.3.6.3.4 of the permit. Congratulations, go to Step Five.

4–C *Endangered Species Issues Cannot be Resolved* If you cannot reach agreement with the Service(s) on measures to avoid, eliminate, or reduce adverse effects to an acceptable level; and if any likely adverse effects cannot otherwise be addressed through meeting the other criteria of Part 1.2.3.6; then you are not eligible for coverage under the MSGP at this time and must seek coverage under an individual permit. Proceed to 40 CFR 122.26(c) for individual permit application requirements.

Step Five: Submit Notice of Intent and Document Results of the Eligibility Determination

Once all other Part 1.2 eligibility requirements have been met, you may submit the Notice of Intent (NOI). Signature and submittal of the NOI is also deemed to constitute your certification, under penalty of law, of your eligibility for permit coverage.

You must include documentation of Part 1.2.3.6 eligibility in the pollution prevention plan required for the facility. Documentation required for the various eligibility criteria are as follows:

Criteria A—A copy of the County-Species List pages with the county(ies) where your facility and discharges are located and a statement on how you determined that no listed species or critical habitat was in proximity to your discharge.

Criteria B—A copy of the Service(s)'s Biological Opinion or concurrence on a finding of "unlikely to adversely effect" regarding the ESA § 7 consultation.

Criteria C—A copy of the Service(s)'s letter transmitting the ESA § 10 authorization.

Criteria D—Documentation on how you determined adverse effects on listed species and critical habitat were unlikely.

Criteria E—A copy of the documents originally used by the other operator of your facility (or area including your facility) to satisfy the documentation requirement of Criteria A, B, C or D.

E. Duty To Implement Terms and Conditions Upon Which Eligibility Was Determined

You must comply with any terms and conditions imposed under the eligibility requirements of Part 1.2.3.6.3 to ensure that your storm water discharges, allowable non-storm water discharges, and discharge-related activities do not pose jeopardy to listed species and/or critical habitat. You must incorporate such terms and conditions in your facility's Storm Water Pollution Prevention Plan as required by the permit. If the eligibility requirements of Part 1.2.3.6 cannot be met, then you may not receive coverage under this permit. You should then consider applying to the permitting authority for an individual permit.

Region Six—Regional Office

Division Chief, Endangered Species, U.S. Fish and Wildlife Service, ARD-Ecological Services, P.O. Box 25486, DFC, Denver, CO 80225

State, Field, and Project Offices (Region Six)

Field Supervisor, U.S. Fish and Wildlife Service, Montana Field Office, 100 N. Park, Suite 320, Helena, MT 59601
Sub-Office Supervisor, U.S. Fish and Wildlife Service, Billings Sub-Office, 2900 4th Ave. North-Rm 301, Billings, MT 59101
Sub-Office Supervisor, U.S. Fish and Wildlife Service, Kalispell Sub-Office, 780 Creston Hatchery Road, Kalispell, MT 59901
Grizzly Bear Recovery Coordinator, U.S. Fish and Wildlife Service, Forestry Sciences Lab, University of Montana, Missoula, MT 59812
Field Supervisor, U.S. Fish and Wildlife Service, North Dakota Field Office, 1500 Capitol Avenue, Bismarck, ND 58501
Field Supervisor, U.S. Fish and Wildlife Service, Nebraska Field Office, 203 W. 2nd Street; Federal Bldg., 2nd Floor, Grand Island, NE 68801
Field Supervisor, U.S. Fish and Wildlife Service, Kansas Field Office, 315 Houston, Suite E, Manhattan, KS 66502
Field Supervisor, U.S. Fish and Wildlife Service, South Dakota Field Office, 420 S. Garfield Ave., Suite 400, Pierre, SD 57501–5408
Field Supervisor, U.S. Fish and Wildlife Service, Salt Lake City Field Office, Lincoln Plaza, 145 East 1300 South—Suite 404, Salt Lake City, UT 84115
Field Supervisor, U.S. Fish and Wildlife Service, Colorado Field Office, 730 Simms, Suite 290, Golden, CO 80401–4798
Field Supervisor, U.S. Fish and Wildlife Service, Western Colorado Field Office, 764 Horizon Drive South, Annex A, Grand Junction, CO 81506–3946
Field Supervisor, U.S. Fish and Wildlife Service, Wyoming Field Office, 4000 Morrie Avenue, Cheyenne, WY 82001
E.S. Coordinator, U.S. Fish and Wildlife Service, Rocky Mountain Arsenal, National Wildlife Area, Building 111, Commerce City, CO 80022–1748
Colorado River Recovery Coordinator, U.S. Fish and Wildlife Service, P.O. Box 25486, DFC, Denver, CO 80225
U.S. Fish and Wildlife Service, Laramie Black Footed Ferret Office, 410 Grand Ave., Suite 315, Laramie, WY 80270

Region Seven—Regional Office

Division Chief, Endangered Species, U.S. Fish and Wildlife Service, ARD Ecological Services, 1011 E. Tudor Road, Anchorage, AK 99503

State, Field, and Project Offices (Region Seven)

Field Supervisor, U.S. Fish and Wildlife Service, Ecological Services, 605 West 4th Avenue, Room G–62, Anchorage, AK 99501
Field Supervisor, U.S. Fish and Wildlife Service, Ecological Services, 101 12th Avenue, Box 19 (Room 232), Fairbanks, AK 99701
Field Supervisor, U.S. Fish and Wildlife Service, Ketchikan Sub-office, 103 Main Street, P.O. Box 3193, Ketchikan, AK 99901
Field Supervisor, U.S. Fish and Wildlife Service, Ecological Services, 300 Vintage Blvd., Suite 201, Juneau, AK 99801
Region Eight—Has not yet been created out of the other FWS Regions at the time of this posting.

Region Nine

Janet Ady—Outreach, U.S. Fish and Wildlife Service, National Conservation Training Center, Route 3, Box 49, Kearneysville, WV 25430
Dan Benfield—Training, U.S. Fish and Wildlife Service, National Conservation Training Center, Route 3, Box 49, Kearneysville, WV 25430

III. National Marine Fisheries Service Offices

The National Marine Fisheries Service is developing a database to provide county and territorial water (up to three miles offshore) information on the presence of endangered and threatened species and critical habitat. The database should be found at the "Office of Protected Resources" site on the NMFS Homepage at http://www.nmfs.gov.

Regional and Field Offices—Northeast Region

Protected Resources Program, National Marine Fisheries Service, Northeast Region, One Blackburn Drive, Gloucester, Massachusetts 01930
Milford Field Office, National Marine Fisheries Service, 212 Rogers Avenue, Milford, Connecticut 06460
Oxford Field Office, National Marine Fisheries Service, 904 So. Morris Street, Oxford, Maryland 21654
Sandy Hook Field Office, James J. Howard Marine Sciences Laboratory, National Marine Fisheries Service, 74 Magruder Road, Highlands, New Jersey 07732
Protected Species Branch, National Marine Fisheries Service, Northeast Fisheries Science Center, 166 Water Street, Woods Hole, Massachusetts 02543

Southeast Region

Protective Species Management Branch, National Marine Fisheries Service, Southeast Region, 9721 Executive Center Drive, St. Petersburg, Florida 33702–2432

Northwest Region

Protected Species Division, National Marine Fisheries Service, Northwest Region, 525 NE Oregon, Suite 500, Portland, Oregon 97232–2737
Boise Field Office, National Marine Fisheries Service, 1387 S. Vinnel Way, Suite 377, Boise, Idaho 83709
Olympia Field Office, National Marine Fisheries Service, 510 Desmond Drive, SE, Suite 103, Lacey, Washington 98503

Roseburg Field Office, National Marine Fisheries Service, 2900 Stewart Parkway NW, Roseburg, Oregon 97470

Rufus Field Office, National Marine Fisheries Service, P.O. Box 67, 704 "E" 1st, Rufus, Oregon 97050

Southwest Region

Protected Species Management Division, Southwest Region, National Marine Fisheries Service, 501 West Ocean Blvd., Suite 4200, Long Beach, California 90802-4213

Arcata Field Office, National Marine Fisheries Service, 1125 16th Street, Room 209, Arcata, California 95521

Eureka Field Office, National Marine Fisheries Service, 1330 Bayshore Way, Eureka, California 95501

Pacific Islands Area Field Office, National Marine Fisheries Service, 2570 Dole Street, Room 106, Honolulu, Hawaii 96822-2396

Santa Rosa Field Office, Protected Resources Program, National Marine Fisheries Service, 777 Sonoma Avenue, Room 325, Santa Rosa, California 95404

Alaska Region

Protected Resources Management, Division, Alaska Region, National Marine Fisheries Service, 709 West 9th Street, Federal Building 461, P.O. Box 21767, Juneau, Alaska 99802

Anchorage Office, 222 West 7th Avenue, Box 10, Anchorage, Alaska 99513-7577

IV. Natural Heritage Centers

The Natural Heritage Network comprises 85 biodiversity data centers throughout the Western Hemisphere. These centers collect, organize, and share data relating to endangered and threatened species and habitat. The network was developed to inform land-use decisions for developers, corporations, conservationists, and government agencies and is also consulted for research and educational purposes. The centers maintain a Natural Heritage Network Control Server Website (http://www.heritage.tnc.org) which provides website and other access to a large number of specific biodiversity centers. Some of these centers are listed below:

Alabama Natural Heritage Program, Huntingdon College, Massey Hall, 1500 East Fairview Avenue, Montgomery, AL 36106-2148, (334) 834-4519 Fax: (334) 834-5439, Internet: alnhp@wsnet.com

Alaska Natural Heritage Program, University of Alaska Anchorage, 707 A Street, Anchorage, AK 99501, 907/257-2702 Fax: 907/258-9139, Program Director: David Duffy, 257-2707, Internet: afdcd1@orion.alaska.edu

Arizona Heritage Data Management System, Arizona Game & Fish Department, WM-H, 2221 W. Greenway Road, Phoenix, AZ 85023, 602/789-3612 Fax: 602/789-3928, Internet: hdms@gf.state.az.us Internet: hdms1@gf.state.az.us

Arkansas Natural Heritage Commission, Suite 1500, Tower Building, 323 Center Street, Little Rock, AR 72201, 501/324-9150 Fax: 501/324-9618, Director: Harold K. Grimmett, -9614

California Natural Heritage Division, Department of Fish & Game, 1220 S Street, Sacramento, CA 95814, 916/322-2493 Fax: 916/324-0475

Addendum B—Historic Properties Guidance

Applicants must determine whether their facility's storm water discharges, allowable non-storm water discharges, or construction of best management practices (BMPs) to control such discharges, has potential to affect a property that is either listed or eligible for listing on the National Register of Historic Places.

For existing dischargers who do not need to construct BMPs for permit coverage, a simple visual inspection may be sufficient to determine whether historic properties are affected. However, for facilities which are new industrial storm water dischargers and for existing facilities which are planning to construct BMPs for permit eligibility, applicants should conduct further inquiry to determine whether historic properties may be affected by the storm water discharge or BMPs to control the discharge. In such instances, applicants should first determine whether there are any historic properties or places listed on the National Register or if any are eligible for listing on the register (*e.g.*, they are "eligible for listing").

Due to the large number of entities seeking coverage under this permit and the limited number of personnel available to State and Tribal Historic Preservation Officers nationwide to respond to inquiries concerning the location of historic properties, EPA suggests that applicants first access the "National Register of Historic Places" information listed on the National Park Service's web page (see Part I of this addendum). Addresses for State Historic Preservation Officers and Tribal Historic Preservation Officers are listed in Parts II and III of this addendum, respectively. In instances where a Tribe does not have a Tribal Historic Preservation Officer, applicants should contact the appropriate Tribal government office when responding to this permit eligibility condition. Applicants may also contact city, county or other local historical societies for assistance, especially when determining if a place or property is eligible for listing on the register.

The following three scenarios describe how applicants can meet the permit eligibility criteria for protection of historic properties under this permit:

(1) If historic properties are not identified in the path of a facility's storm water and allowable non-storm water discharges or where construction activities are planned to install BMPs to control such discharges (*e.g.*, diversion channels or retention ponds), then the applicant has met the permit eligibility criteria under Part 1.2.3.7.1.

(2) If historic properties are identified but it is determined that they will not be affected by the discharges or construction of BMPs to control the discharge, the applicant has met the permit eligibility criteria under Part 1.2.3.7.1.

(3) If historic properties are identified in the path of a facility's storm water and allowable non-storm water discharges or where construction activities are planned to install BMPs to control such discharges, and it is determined that there is the potential to adversely affect the property, the applicant can still meet the permit eligibility criteria under Part 1.2.3.7.2 if he/she obtains and complies with a written agreement with the appropriate State or Tribal Historic Preservation Officer which outlines measures the applicant will follow to mitigate or prevent those adverse effects. The contents of such a written agreement must be included in the facility's Storm Water Pollution Prevention Plan. The NOI form is being amended to include which option was selected to demonstrate compliance with NHPA provisions. EPA will notify applicants when the new NOI form takes effect.

In situations where an agreement cannot be reached between an applicant and the State or Tribal Historic Preservation Officer, applicants should contact the Advisory Council on Historic Preservation listed in Part IV of this addendum for assistance.

The term "adverse effects" includes but is not limited to damage, deterioration, alteration or destruction of the historic property or place. EPA encourages applicants to contact the appropriate State or Tribal Historic Preservation Officer as soon as possible in the event of a potential adverse effect to a historic property.

Applicants are reminded that they must comply with applicable State, Tribal and local laws concerning the protection of historic properties and places.

I. Internet Information on the National Register of Historic Places

An electronic listing of the "National Register of Historic Places," as maintained by the National Park Service on its National Register Information System (NRIS), can be accessed on the Internet at "http://www.nr.nps.gov/nrishome.htm". Remember to use small case letters when accessing Internet addresses.

II. State Historic Preservation Officers (SHPO)

SHPO and Deputy SHPO List:

Alabama

Dr. Lee Warner, SHPO, Alabama Historical Commission, 468 South Perry Street, Montgomery, AL 36130–0900, 334–242–3184 FAX: 334–240–3477, E-Mail: *lwarner@mail.preserveala.org/*

Deputy: Ms. Elizabeth Ann Brown, E-Mail: *ebrown@mail.preserveala.orgwww.preserveala.org*

Alaska

Ms. Judith Bittner, SHPO, Alaska Department of Natural Resources, Office of History & Archeology, 550 West 7th Avenue, Suite 1310, Anchorage, AK 99501–3565, 907–269–8721 FAX: 907–269–8908, E-Mail: *judyb@dnr.state.ak.us*

Deputy: Joan Antonson, *www.dnr.state.ak.us/parks/oha_web*

American Samoa

Mr. John Enright, HPO, Executive Offices of the Governor, American Samoa Historic Preservation Office, American Samoa Government, Pago Pago, American Samoa 96799, 011–684–633–2384 FAX: 684–633–2367, E-Mail: *enright@samoatelco.com*

Deputy: Mr. David J. Herdrich, E-Mail: *herdrich@samoatelco.com*

Arizona

Mr. James W. Garrison, SHPO, Arizona State Parks, 1300 West Washington, Phoenix, AZ 85007, 602–542–4174 FAX: 602–542–4180, E-Mail: *jgarrison@pr.state.az.us*

Addendum C—New Source Environmental Assessments

Basic Format for Environmental Assessment

This is the basic format for the Environmental Assessment prepared by EPA from the review of the applicant's Environmental Information Document (EID) required for new source NPDES permits. Comprehensive information should be provided for those items or issues that are affected; the greater the impact, the more detailed information needed. The EID should contain a brief statement addressing each item listed below, even if the item is not applicable. The statement should at least explain why the item is not applicable.

A. General Information
1. Name of applicant
2. Type of facility
3. Location of facility
4. Product manufactured

B. Description Summaries
1. Describe the proposed facility and construction activity
2. Describe all ancillary construction not directly involved with the production processes
3. Describe briefly the manufacturing processes and procedures
4. Describe the plant site, its history, and the general area

C. Environmental Concerns
1. Historical and Archeological (include a statement from the State Historical Preservation Officer)
2. Wetlands Protection and 100-year Floodplain Management (the Army Corps of Engineers must be contacted if any wetland area or floodplain is affected)
3. Agricultural Lands (a prime farmland statement from the Soil Conservation Service must be included)
4. Coastal Zone Management and Wild and Scenic Rivers
5. Endangered Species Protection and Fish and Wildlife Protection (a statement from the U.S. Fish and Wildlife Service must be included)
6. Air, Water and Land Issues: quality, effects, usage levels, municipal services used, discharges and emissions, runoff and wastewater control, geology and soils involved, land-use compatibility, solid and hazardous waste disposal, natural and man-made hazards involved.
7. Biota concerns: floral, faunal, aquatic resources, inventories and effects
8. Community Infrastructures available and resulting effects: social, economic, health, safety, educational, recreational, housing, transportation and road resources.

BILLING CODE 6560–50–P

Addendum D—Notice of Intent Form

NPDES Form 3510-6

United States Environmental Protection Agency
Washington, DC 20460

Form Approved
OMB No. 2040-0086

Notice of Intent for Storm Water Discharges Associated with INDUSTRIAL ACTIVITY Under the Multi-sector NPDES General Permit

Submission of this completed Notice of Intent (NOI) constitutes notice that the entitiy in Section B intends to be authorized to discharge pollutants to waters of the United States, from the facility or site identified in Section C, undar EPA's Storm Water Multi-sector General Permit (MSGP). Submission of the NOI also constitutes notice that the party identified in Section B of this form has read, understands, and meets the eligibility conditions of Part I of the MSGP; agrees to comply with all applicable terms and conditions of the MSGP; understands that continued authorization under the MSGP is contigent on maintaining eligibility for coverage, and that implementation of the permittee's pollution prevention plan is required two days after a complete NOI is mailed. In order to be granted coverage, all information required on this form must be completed. Please read and make sure you comply with all permit requirements, including the requirement to prepare and implement a storm water pollution prevention plan.

A. Permit Selection

Permit number assigned to your facility under the previous permit: ☐☐☐☐☐☐☐☐☐

New Permit Number (EPA Use Only) ☐☐R05☐☐☐☐

B. Facility Operator Information

1. Name: ☐ 2. Phone: ☐
3. Mailing Address: a. Street or P.O. Box: ☐
b. City: ☐ c. State: ☐☐ d. Zip Code: ☐☐☐☐☐-☐☐☐☐

C. Facility/Site Information

1. Facility/Site Name: ☐
2. Location Address: a. Street: ☐
b. City: ☐ c. County: ☐
d. State: ☐☐ e. Zip Code: ☐☐☐☐☐-☐☐☐☐
3. a. Latitude: ☐☐° ☐☐' ☐☐" b. Longitude: ☐☐° ☐☐' ☐☐"
4. a. Permit Applicant: ☐ Federal ☐ State ☐ Tribal ☐ Private ☐ Other public entity
b. Is the facility located on Indian Country Lands? ☐ Yes ☐ No
5. Does the facility discharge storm water into:
a. Receiving water(s)? ☐ Yes ☐ No If yes, name(s) of receiving water(s): ☐
b. A municipal separate storm sewer system (MS4)? ☐ Yes ☐ No
If yes, name of the MS4 operator: ☐
6. The 4-digit Standard Industrial Classification (SIC) codes or the 2-letter Activity Codes that best represent the principal products produced or services rendered by your facility and major co-located activities:
Primary: ☐☐☐☐ Secondary (if applicable): ☐☐☐☐
7. Applicable sector(s) of industrial activity, as designated in Part 1.2.1 of the MSGP, that include associated discharges that you seek to have covered under this permit (choose up to three):

☐ Sector A	☐ Sector F	☐ Sector K	☐ Sector P	☐ Sector U	☐ Sector Z
☐ Sector B	☐ Sector G	☐ Sector L	☐ Sector Q	☐ Sector V	☐ Sector AA
☐ Sector C	☐ Sector H	☐ Sector M	☐ Sector R	☐ Sector W	☐ Sector AB
☐ Sector D	☐ Sector I	☐ Sector N	☐ Sector S	☐ Sector X	☐ Sector AC
☐ Sector E	☐ Sector J	☐ Sector O	☐ Sector T	☐ Sector Y	☐ Sector AD

8. Additional Facility/Site Requirements:
a. Based on the instructions provided in Addendum A of the MSGP, have the eligibility criteria for "listed species" and critical habitat been met? ☐ Yes ☐ No
b. Based on the instructions provided in Addendum B of the MSGP, have the eligibility criteria for protection of historic properties been met? ☐ Yes ☐ No

D. Certification

Do you certify under penalty of law that this document and all attachments were prepared under your direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted? Based on your inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, do you certify that the information submitted is, to the best of your knowledge and belief, true, accurate, and complete? Do you certify that you are aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations?

EPA Form 3510-6 (Revised 08-2000, Expires 04-2003)

R0019913

Instructions for Completing the Notice of Intent for Storm Water Discharges Associated with INDUSTRIAL ACTIVITY Under the Multi-sector General Permit

Who Must File a Notice of Intent?

Under the provisions of section 402(p) of the Clean Water Act (CWA) and regulations at 40 CFR Part 122, Federal law prohibits "point source" discharges of storm water associated with industrial activity to waters of the U.S. without a National Pollutant Discharge Elimination System (NPDES) permit. If you operate a facility which is described in Part 1.2.1. of the Multi-sector General Permit (MSGP) or if you have been designated as needing permit coverage for your storm water discharges by your NPDES permitting authority, and you meet the eligibility requirements in Part 1 of the permit, you may satisfy your CWA obligation for permit coverage by submitting a completed NOI to obtain coverage under the MSGP. If you have questions about whether you need a permit under the NPDES Storm Water Program, contact your NPDES permitting authority (i.e., your EPA Regional storm water coordinator or your State water pollution control agency).

One NOI must be submitted for each facility or site for which you are seeking permit coverage. Only one NOI need be submitted to apply for coverage for all of your activities at each facility (e.g., you do not need to submit a separate NOI for each type of industrial activity located at a facility or industrial complex, provided your storm water pollution prevention plan covers each area for which you are an operator). Finally, the NOI must be submitted in accordance with the deadlines established in Part 2.1 of the MSGP.

When to File the NOI Form

DO NOT FILE THE NOI UNTIL YOU HAVE OBTAINED A COPY OF THE MULTI-SECTOR GENERAL PERMIT. You will need it to determine your eligibility, prepare your storm water pollution prevention plan, and correctly answer all questions on the NOI form — all of which must be done before you can sign the certification statement on the NOI in good faith (and without risk of committing perjury).

If you have a new facility or are the new operator of an existing facility, this form must be postmarked at least 48 hours before you need permit coverage. If your facility was covered under the 1995 Multi-sector General Permit or if you are currently operating without a permit, see Part 2.1 of the MSGP for your deadlines. CAUTION: You must allow enough lead time to gather the information necessary to complete the NOI (especially that related to determining eligibility with regards to endangered species and historic properties) and prepare the pollution prevention plan required by Part 4 of the MSGP <u>prior</u> to submitting your NOI.

Where to File the NOI Form

NOIs must be sent to the following address (do not send Storm Water Pollution Prevention Plans (SWPPPs) to this address):

Storm Water Notice of Intent (4203)
U.S. EPA
1200 Pennsylvania Avenue, NW
Washington, DC 20460

(For overnight/express delivery of NOIs, add the phone number (202) 260-9541)

NOTE: While not currently available, EPA is exploring the possibility of offering the option to complete the NOI form electronically online via the Internet. If this option does become available, directions will be posted on EPA's web site. To check on the availability of the alternative Online NOI, please visit <u>http://www.epa.gov/ow/sw</u>. If the Online NOI is not available, you must file the NOI at the above address.

If your facility discharges through a municipal separate storm sewer system (MS4) that is permitted as a medium or large MS4 under the NPDES Storm Water Program, you must also submit a signed copy of the NOI to the operator of that MS4, in accordance with the deadlines established in Part 2.1 of the permit.

Completing the NOI Form

To complete this form, type or print, using uppercase letters, in the appropriate areas only. Please place each character between the marks (abbreviate if necessary to stay within the number of characters allowed for each item). Use one space for breaks between words. Please make sure you have addressed all applicable questions and have made a photocopy for your records before sending the completed form to the address above.

Section A. Permit Selection

You must indicate the NPDES storm water general permit under which you are applying for coverage. Find the generic permit "number" in Part 1.1 of the permit that covers the area where your facility is located. For example, if you are located in New Mexico (except Indian Country lands), the generic number would be NMR05*###. If you are located on Navajo lands in New Mexico, the generic permit number would be AZR05*##1. CAUTION: You <u>must</u> use the correct permit number or your permit coverage will be invalid since you are not located within the coverage area for that permit.

Section B. Facility Operator Information

1. Provide the legal name of the person, partnership, co-partnership, firm, company, corboration, association, joint stock company, trust, estate, governmental entity, or other legal entity that operates the facility or site described in this application. The name of the operator may or may not be the same as the name of the facility. The responsible party is the legal entity that controls the facility's operation, rather than the plant or site manager.
2. Provide the telephone number of the facility operator.
3. Provide the mailing address of the facility operator. Include the street address or P.O. Box, city, state, and zip code. All correspondence regarding the permit will be sent to this address, not the facility address in Section C.
4. Indicate the legal status of the facility operator as a Federal, State, Tribal private, or other public entity (other than Federal or State). This refers only to the operator, not the owner or the land the facility or site is located upon.

Section C. Facility/Site Information

1. Enter the official or legal name of the facility or site.
2. Enter the complete street address (If no street address exists, provide a geographic description [e.g., Intersection of Routes 9 and 55]), city county, state, and zip code. Do not use a P.O. Box.
3. Enter the latitude and longitude of the approximate center of the facility or site in degrees/minutes/seconds. Latitude and longitude can be obtained from U.S. Geological Survey (USGS quadrangle or topographic maps, by using a GPS unit, by calling 1-(888) ASK-USGS, by searching for your facility's address on several commercial "map" sites on the Internet, or by accessing EPA's web site at http://www.epa.gov/owm/sw/industry/index.htm and selecting Latitude and Longitude Finders under the Resources/Permit section.
4. Indicate whether the facility is located on Indian Country lands (e.g., a federally recognized reservation, etc,).
5. Indicate whether the facility or site discharges storm water into a receiving water(s) and/or a municipal separate storm sewer system (MS4). Enter the name(s) of the closest receiving water(s) and/or the MS4 (An MS4 is defined as a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains) that is owned or operated by a state, city, town, borough, county, parish, district, association, or other public body and is designed or used for collecting or conveying storm water.)
6. List your primary and secondary four 4-digit Standard Industrial Classification (SIC) codes or 2-character Activity Codes that best describe the principal products or services provided at the facility or site identified in Section C of this application. For industrial activities defined in 40 CFR 122.26(b)(14)(i)-(ix) and (xi) that do not have SIC codes that accurately describe the principal products produced or services provided, use the following 2-character Activity Codes:
   HZ = Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under subtitle C of RCRA [40 CFR 122.26(b)(14)(iv)];
   LF = Landfills, land application sites, and open dumps that receive or have received any industrial wastes, including those that are subject to regulation under subtitle D of RCRA [40 CFR 122.26(b)(14)(v)];
   SE = Steam electric power generating facilities, including coal handling sites [40 CFR 122.26(b)(14)(vii)];
   TW = Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage [40 CFR 122.26(b)(14)(ix)]; or
   Alternatively, if your facility or site was specifically designated by your NPDES permitting authority (EPA), enter "AD."

Section D. Certification

Certification statement and signature. (CAUTION: An unsigned or undated NOI form will prevent the granting of permit coverage.) Federal statutes provide for severe penalties for submitting false information on this application form. Federal regulations require this application to be signed as follows:

For a corporation: by a responsible corporate officer, which means:

(i) president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision making functions for the corporation, or

(ii) the manager of one or more manufacturing, production, or operating facilities, provided the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

For a partnership or sole proprietorship: by a general partner or the proprietor; or

For a municipal, State, Federal, or other public facility: by either a principal executive or ranking elected official.

Paperwork Reduction Act Notice

Public reporting burden for this certification is estimated to average 3.7 hours per certification, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose to provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. Send comments regarding the burden estimate, any other aspect of the collection of information, or suggestions for improving this form, including any suggestions which may increase or reduce this burden to: Director, Office of Environmental Information Services, Collection Services Division (2823), USEPA, 1200 Pennsylvania Avenue, NW, Washington, DC 20460. Include the OMB control number of this form on any correspondence. Do not send the completed NOI form to this address.

Addendum E—Notice of Termination Form

THIS FORM REPLACES PREVIOUS FORM 3510-7 (8-92)
Please See Instructions Before Completing This Form

Form Approved. OMB No. 2040-0086
Approval expires: 8-31-98

NPDES FORM

EPA

United States Environmental Protection Agency
Washington, DC 20460

Notice of Termination (NOT) of Coverage Under a NPDES General Permit for Storm Water Discharges Associated with Industrial Activity

Submission of this Notice of Termination constitutes notice that the party identified in Section II of this form is no longer authorized to discharge storm water associated with industrial activity under the NPDES program. ALL NECESSARY INFORMATION MUST BE PROVIDED ON THIS FORM.

I. Permit Information

NPDES Storm Water General Permit Number:

Check Here if You are No Longer the Operator of the Facility: ☐

Check Here if the Storm Water Discharge is Being Terminated: ☐

II. Facility Operator Information

Name: Phone:

Address:

City: State: ZIP Code:

III. Facility/Site Location Information

Name:

Address:

City: State: ZIP Code:

Latitude: Longitude: Quarter: Section: Township: Range:

IV. Certification: I certify under penalty of law that all storm water discharges associated with industrial activity from the identified facility that are authorized by a NPDES general permit have been eliminated or that I am no longer the operator of the facility or construction site. I understand that by submitting this Notice of Termination, I am no longer authorized to discharge storm water associated with industrial activity under this general permit, and that discharging pollutants in storm water associated with industrial activity to waters of the United States is unlawful under the Clean Water Act where the discharge is not authorized by a NPDES permit. I also understand that the submittal of this Notice of Termination does not release an operator from liability for any violations of this permit or the Clean Water Act.

Print Name: Date:

Signature:

Instructions for Completing Notice of Termination (NOT) Form

Who May File a Notice of Termination (NOT) Form

Permittees who are presently covered under an EPA-issued National Pollutant Discharge Elimination System (NPDES) General Permit (including the 1995 Multi-Sector Permit) for Storm Water Dicharges Associated with Industrial Activity may submit a Notice of Termination (NOT) form when their facilities no longer have any storm water discharges associated with industrial activity as defined in the storm water regulations at 40 CFR 122.26(b)(14), or when they are no longer the operator of the facilities.

For construction activities, elimination of all storm water discharges associated with industrial activity occurs when disturbed soils at the construction site have been finally stabilized and temporary erosion and sediment control measures have been removed or will be removed at an appropriate time, or that all storm water discharges associated with industrial activity from the construction site that are authorized by a NPDES general permit have otherwise been eliminated. Final stabilization means that all soil-disturbing activities at the site have been completed, and that a uniform perennial vegetative cover with a density of 70% of the cover for unpaved areas and areas not covered by permanent structures has been established, or equivalent permanent stabilization measures (such as the use of riprap, gabions, or geotextiles) have been employed.

Where to File NOT Form

Send this form to the the following address:

Storm Water Notice of Termination (4203)
401 M Street, S.W.
Washington, DC 20460

Completing the Form

Type or print, using upper-case letters, in the appropriate areas only. Please place each character between the marks. Abbreviate if necessary to stay within the number of characters allowed for each item. Use only one space for breaks between words, but not for punctuation marks unless they are needed to clarify your response. If you have any questions about this form, telephone or write the Notice of Intent Processing Center at (703) 931-3230.

EPA Form 3510-7 (8-98)

R0019915

Instructions - EPA Form 3510-7
Notice of Termination (NOT) of Coverage Under The NPDES General Permit for Storm Water Discharges Associated With Industrial Activity

Section I Permit Information

Enter the existing NPDES Storm Water General Permit number assigned to the facility or site identified in Section III. If you do not know the permit number, telephone or write your EPA Regional storm water contact person.

Indicate your reason for submitting this Notice of Termination by checking the appropriate box:

If there has been a change of operator and you are no longer the operator of the facility or site identified in Section III, check the corresponding box.

If all storm water discharges at the facility or site identified in Section III have been terminated, check the corresponding box.

Section II Facility Operator Information

Give the legal name of the person, firm, public organization, or any other entity that operates the facility or site described in this application. The name of the operator may or may not be the same name as the facility. The operator of the facility is the legal entity which controls the facility's operation, rather than the plant or site manager. Do not use a colloquial name. Enter the complete address and telephone number of the operator.

Section III Facility/Site Location Information

Enter the facility's or site's official or legal name and complete address, including city, state and ZIP code. If the facility lacks a street address, indicate the state, the latitude and longitude of the facility to the nearest 15 seconds, or the quarter, section, township, and range (to the nearest quarter section) of the approximate center of the site.

Section IV Certification

Federal statutes provide for severe penalties for submitting false information on this application form. Federal regulations require this application to be signed as follows:

For a corporation: by a responsible corporate officer, which means: (i) president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision making functions, or (ii) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding $25 million (in second-quarter 1980 dollars), if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

For a partnership or sole proprietorship: by a general partner or the proprietor; or

For a municipality, State, Federal, or other public facility: by either a principal executive officer or ranking elected official.

Paperwork Reduction Act Notice

Public reporting burden for this application is estimated to average 0.5 hours per application, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate, any other aspect of the collection of information, or suggestions for improving this form, including any suggestions which may increase or reduce this burden to: Chief, Information Policy Branch, 2136, U.S. Environmental Protection Agency, 401 M Street, SW, Washington, DC 20460, or Director, Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503.

Addendum F—No Exposure Certification Form

NPDES FORM 3510-11

EPA

United States Environmental Protection Agency
Washington, DC 20460

Form Approved OMB No. 2040-0211

NO EXPOSURE CERTIFICATION for Exclusion from NPDES Storm Water Permitting

Submission of this No Exposure Certification constitutes notice that the entity identified in Section A does not require permit authorization for its storm water discharges associated with industrial activity in the State identified in Section B under EPA's Storm Water Multi-Sector General Permit due to the existence of a condition of no exposure.

A condition of no exposure exists at an industrial facility when all industrial materials and activities are protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, and/or runoff. Industrial materials or activities include, but are not limited to, material handling equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products. Material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product or waste product. A storm resistant shelter is not required for the following industrial materials and activities:

- drums, barrels, tanks, and similar containers that are tightly sealed, provided those containers are not deteriorated and do not leak. "Sealed" means banded or otherwise secured and without operational taps or valves;
- adequately maintained vehicles used in material handling; and
- final products, other than products that would be mobilized in storm water discharges (e.g., rock salt).

A No Exposure Certification must be provided for each facility qualifying for the no exposure exclusion. In addition, the exclusion from NPDES permitting is available on a facility-wide basis only, not for individual outfalls. If any industrial activities or materials are or will be exposed to precipitation, the facility is not eligible for the no exposure exclusion.

By signing and submitting this No Exposure Certification form, the entity in Section A is certifying that a condition of no exposure exists at its facility or site, and is obligated to comply with the terms and conditions of 40 CFR 122.26(g).

ALL INFORMATION MUST BE PROVIDED ON THIS FORM.

Detailed instructions for completing this form and obtaining the no exposure exclusion are provided on pages 3 and 4.

A. Facility Operator Information

1. Name: ______________________ 2. Phone: ____________
3. Mailing Address: a. Street: ______________________
   b. City: ______________ c. State: __ d. Zip Code: _____-____

B. Facility/Site Location Information

1. Facility Name: ______________________
2. a. Street Address: ______________________
   b. City: ______________ c. County: ____________
   d. State: __ e. Zip Code: _____-____
3. Is the facility located on Indian Lands? Yes ☐ No ☐
4. Is this a Federal facility? Yes ☐ No ☐
5. a. Latitude: ___° ___' ___" b. Longitude: ___° ___' ___"
6. a. Was the facility or site previously covered under an NPDES storm water permit? Yes ☐ No ☐
   b. If yes, enter NPDES permit number: ________________
7. SIC/Activity Codes: Primary: ____ Secondary (if applicable): ____
8. Total size of site associated with industrial activity: ______________ acres
9. a. Have you paved or roofed over a formerly exposed, pervious area in order to qualify for the no exposure exclusion? Yes ☐ No ☐
   b. If yes, please indicate approximately how much area was paved or roofed over. Completing this question does not disqualify you for the no exposure exclusion. However, your permitting authority may use this information in considering whether storm water discharges from your site are likely to have an adverse impact on water quality, in which case you could be required to obtain permit coverage.

   Less than one acre ☐ One to five acres ☐ More than five acres ☐

NPDES FORM 3510-11 | EPA | **NO EXPOSURE CERTIFICATION for Exclusion from NPDES Storm Water Permitting** | Form Approved OMB No. 2040-0211

C. Exposure Checklist

Are any of the following materials or activities exposed to precipitation, now or in the foreseeable future? (Please check either "Yes" or "No" in the appropriate box.) **If you answer "Yes" to any of these questions (1) through (11), you are not eligible for the no exposure exclusion.**

	Yes	No
1. Using, storing or cleaning industrial machinery or equipment, and areas where residuals from using, storing or cleaning industrial machinery or equipment remain and are exposed to storm water	☐	☐
2. Materials or residuals on the ground or in storm water inlets from spills/leaks	☐	☐
3. Materials or products from past industrial activity	☐	☐
4 Material handling equipment (except adequately maintained vehicles)	☐	☐
5. Materials or products during loading/unloading or transporting activities	☐	☐
6. Materials or products stored outdoors (except final products intended for outside use [e.g., new cars] where exposure to storm water does not result in the discharge of pollutants)	☐	☐
7. Materials contained in open, deteriorated or leaking storage drums, barrels, tanks, and similar containers	☐	☐
8. Materials or products handled/stored on roads or railways owned or maintained by the discharger	☐	☐
9. Waste material (except waste in covered, non-leaking containers [e.g., dumpsters])	☐	☐
10. Application or disposal of process wastewater (unless otherwise permitted)	☐	☐
11. Particulate matter or visible deposits of residuals from roof stacks and/or vents not otherwise regulated (i.e., under an air quality control permit) and evident in the storm water outflow	☐	☐

D. Certification Statement

I certify under penalty of law that I have read and understand the eligibility requirements for claiming a condition of "no exposure" and obtaining an exclusion from NPDES storm water permitting.

I certify under penalty of law that there are no discharges of storm water contaminated by exposure to industrial activities or materials from the industrial facility or site identified in this document (except as allowed under 40 CFR 122.26(g)(2)).

I understand that I am obligated to submit a no exposure certification form once every five years to the NPDES permitting authority and, if requested, to the operator of the local municipal separate storm sewer system (MS4) into which the facility discharges (where applicable). I understand that I must allow the NPDES permitting authority, or MS4 operator where the discharge is into the local MS4, to perform inspections to confirm the condition of no exposure and to make such inspection reports publicly available upon request. I understand that I must obtain coverage under an NPDES permit prior to any point source discharge of storm water from the facility.

Additionally, I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is to the best of my knowledge and belief true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

R0019918

NPDES FORM 3510-11 | EPA | **Instructions for the NO EXPOSURE CERTIFICATION for Exclusion from NPDES Storm Water Permitting** | Form Approved OMB No. 2040-0211

Who May File a No Exposure Certification

Federal law at 40 CFR Part 122.26 prohibits point source discharges of storm water associated with industrial activity to waters of the U.S. without a National Pollutant Discharge Elimination System (NPDES) permit. However, NPDES permit coverage is not required for discharges of storm water associated with industrial activities identified at 40 CFR 122.26(b)(14)(i)-(ix) and (xi) if the discharger can certify that a condition of "no exposure" exists at the industrial facility or site.

Storm water discharges from construction activities identified in 40 CFR 122.26(b)(14)(x) and (b)(15) are not eligible for the no exposure exclusion.

Obtaining and Maintaining the No Exposure Exclusion

This form is used to certify that a condition of no exposure exists at the industrial facility or site described herein. This certification is only applicable in jurisdictions where EPA is the NPDES permitting authority and must be re-submitted at least once every five years.

The industrial facility operator must maintain a condition of no exposure at its facility or site in order for the no exposure exclusion to remain applicable. If conditions change resulting in the exposure of materials and activities to storm water, the facility operator must obtain coverage under an NPDES storm water permit immediately.

Where to File the No Exposure Certification Form

Mail the completed no exposure certification form to:

Storm Water No Exposure Certification (4203)
USEPA
401 M Street, SW
Washington, D.C. 20460

Completing the Form

You <u>must</u> type or print, using uppercase letters, in appropriate areas only. Enter only one character per space (i.e., between the marks). Abbreviate if necessary to stay within the number of characters allowed for each item. Use one space for breaks between words. One form must be completed for each facility or site for which you are seeking to certify a condition of no exposure. Additional guidance on completing this form can be accessed through EPA's web site at www.epa.gov/owm/sw. Please make sure you have addressed all applicable questions and have made a photocopy for your records before sending the completed form to the above address.

Section A. Facility Operator Information

1. Provide the legal name of the person, firm, public organization, or any other entity that operates the facility or site described in this certification. The name of the operator may or may not be the same as the name of the facility. The operator is the legal entity that controls the facility's operation, rather than the plant or site manager.

2. Provide the telephone number of the facility operator.

3. Provide the mailing address of the operator (P.O. Box numbers may be used). Include the city, state, and zip code. All correspondence will be sent to this address.

Section B. Facility/Site Location Information

1. Enter the official or legal name of the facility or site.

2. Enter the complete street address (if no street address exists, provide a geographic description [e.g., Intersection of Routes 9 and 55]), city, county, state, and zip code. Do not use a P.O. Box number.

3. Indicate whether the facility is located on Indian Lands.

4. Indicate whether the industrial facility is operated by a department or agency of the Federal Government (see also Section 313 of the Clean Water Act).

5. Enter the latitude and longitude of the approximate center of the facility or site in degrees/minutes/seconds. Latitude and longitude can be obtained from United States Geological Survey (USGS) quadrangle or topographic maps, by calling 1-(888) ASK-USGS, or by accessing EPA's web site at <u>http://www.epa.gov/owm/sw/industry/index.htm</u> and selecting Latitude and Longitude Finders under the Resources/Permit section.

   Latitude and longitude for a facility in decimal form must be converted to degrees (°), minutes ('), and seconds (") for proper entry on the certification form. To convert decimal latitude or longitude to degrees/minutes/seconds, follow the steps in the following example.

   <u>Example</u>: Convert decimal latitude 45.1234567 to degrees (°), minutes ('), and seconds (").

   a) The numbers to the left of the decimal point are the degrees: 45°.

   b) To obtain minutes, multiply the first four numbers to the right of the decimal point by 0.006: 1234 x 0.006 = 7.404.

   c) The numbers to the left of the decimal point in the result obtained in (b) are the minutes: 7'.

   d) To obtain seconds, multiply the remaining three numbers to the right of the decimal from the result obtained in (b) by 0.06: 404 x 0.06 = 24.24. Since the numbers to the right of the decimal point are not used, the result is 24".

   e) The conversion for 45.1234567 = 45° 7' 24".

6. Indicate whether the facility was previously covered under an NPDES storm water permit. If so, include the permit number.

7. Enter the 4-digit SIC code which identifies the facility's primary activity, and second 4-digit SIC code identifying the facility's secondary activity, if applicable. SIC codes can be obtained from the <u>Standard Industrial Classification Manual, 1987</u>.

8. Enter the total size of the site associated with industrial activity in acres. Acreage may be determined by dividing square footage by 43,560, as demonstrated in the following example.

   <u>Example</u>: Convert 54,450 ft^2 to acres

   Divide 54,450 ft^2 by 43,560 square feet per acre:
   54,450 ft^2 ÷ 43,560 ft^2/acre = 1.25 acres.

9. Check "Yes" or "No" as appropriate to indicate whether you have paved or roofed over a formerly exposed, pervious area (i.e., lawn, meadow, dirt or gravel road/parking lot) in order to qualify for no exposure. If yes, also indicate approximately how much area was paved or roofed over and is now impervious area.

R0019919

NPDES FORM 3510-11

EPA

Instructions for the NO EXPOSURE CERTIFICATION for Exclusion from NPDES Storm Water Permitting

Form Approved OMB No. 2040-0211

Section C. Exposure Checklist

Check "Yes" or "No" as appropriate to describe the exposure conditions at your facility. If you answer "Yes" to ANY of the questions (1) through (11) in this section, a potential for exposure exists at your site and you cannot certify to a condition of no exposure. You must obtain (or already have) coverage under an NPDES storm water permit. After obtaining permit coverage, you can institute modifications to eliminate the potential for a discharge of storm water exposed to industrial activity, and then certify to a condition of no exposure.

Section D. Certification Statement

Federal statutes provide for severe penalties for submitting false information on this application form. Federal regulations require this application to be signed as follows:

For a corporation: by a responsible corporate officer, which means:

(i) president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision making functions for the corporation, or

(ii) the manager of one or more manufacturing, production, or operating facilities, provided the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

For a partnership or sole proprietorship: by a general partner or the proprietor; or

For a municipal, State, Federal, or other public facility: by either a principal executive or ranking elected official.

Paperwork Reduction Act Notice

Public reporting burden for this certification is estimatedto average 1.0 hour per certification, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose to provide information to or for a Federal agency This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. Send comments regarding the burden estimate, any other aspect of the collection of information, or suggestions for improving this form, including any suggestions which may increase or reduce this burden to: Director, Office of Environmental Services, Collection Services Division (2823), USEPA, 1200 Pennsylvania Avenue, NW, Washington, D.C. 20460. Include the OMB control number of this form on any correspondence. Do not send the completed No Exposure Certification form to this address.

BILLING CODE 6560-50-C

Second Preliminary Draft

Proposed Municipal Stormwater NPDES General Permit

December 6, 2000

ADMINISTRATIVE RECORD INDEX-
DOCUMENTS - STORM WATER
MANAGEMENT -
FOLDER: 3, ITEM#: 19

Permit No.____________
Coverage Date__________

Issuance Date:
Effective Date:
Expiration Date:

National Pollutant Discharge Elimination System and State Waste Discharge General Permit for Discharges from Municipal Separate Storm Sewers

STATE OF WASHINGTON
DEPARTMENT OF ECOLOGY
OLYMPIA, WASHINGTON 98504-7600

In compliance with the provisions of
The State of Washington Water Pollution Control Law
Chapter 90.48 Revised Code of Washington
and
The Federal Water Pollution Control Act
(The Clean Water Act)
Title 33 United States Code, Section 1251 et seq.

Until this permit expires, is modified, or revoked, permittees that have properly obtained coverage under this permit are authorized to discharge to waters of the state in accordance with the special and general conditions which follow.

____

Megan White
Water Quality Program Manager
Department of Ecology

TABLE OF CONTENTS

SPECIAL CONDITIONS

S1. AUTHORIZED DISCHARGES.

A. This permit authorizes the discharge of stormwater to waters of the state from the municipal separate storm sewers owned or operated by permittees identified in Special Condition S2 as follows:

1. New and existing discharges from existing outfalls.
2. Discharges from new stormwater outfalls constructed after the issuance date of this permit that have received all applicable state and local permits and use authorizations, including compliance with Ch. 43.21C RCW (the State Environmental Policy Act), and that are in compliance with Special Condition S6.E.

B. This permit authorizes discharges of stormwater associated with industrial activity and non-stormwater flows (e.g., industrial process wastewater or non-process wastewater) from municipal separate storm sewers owned or operated by the permittee to waters of the state only under the following conditions:

1. Non-stormwater discharges must be authorized by another NPDES permit or identified by and in compliance with Special Condition S7.C.9; or
2. Stormwater associated with industrial activity must be authorized by a separate individual or general NPDES permit.

> Ecology is considering covering construction and industrial stormwater activities conducted by the municipal permittees under this permit, instead of the construction and industrial stormwater permits. We would like some feedback on this proposal.

C. This permit does not authorize illicit discharges except as allowed in Special Condition S7.C.9., nor does it relieve entities responsible for illicit discharges, including spills of oil or hazardous substances, from responsibilities and liabilities under state and federal laws and regulations pertaining to those discharges.

S2. PERMITTEES.

A. The following entities are covered under this permit as full permittees:

The City of Seattle

The City of Tacoma

King County

Snohomish County

Pierce County

Clark County

Washington State Department of Transportation

In regard to the Washington State Department of Transportation (WSDOT), this permit only covers municipal separate storm sewers owned or operated by WSDOT that are located in municipalities that are also listed as permittees in Special Condition S2.A.

B. Upon application and coverage in accordance with Special Condition S3.B, the following entities are covered under this permit as co-permittees with the municipality they are located in:

King-County through its Department of Metropolitan Services for municipal separate storm sewers it operates in the City of Seattle
Port of Seattle, not including Sea-Tac Airport
Port of Tacoma
Drainage districts located in the Counties listed above, which own or operate drainage systems serving non-agricultural land uses.

C. Any other owners or operators of municipal separate storm sewers required by Ecology or U.S. EPA to obtain a permit. The requirement to obtain a permit will be through an administrative order issued in accordance with RCW 90.48, Title 40 CFR Section 122.26, and Section 309 of the Clean Water Act.

D. Any other owners or operators of municipal separate storm sewers that apply for and are granted coverage in accordance with Special Condition S3.

S3. PERMIT COVERAGE

A. This permit covers all areas located in, served by, or otherwise contributing to discharges from municipal separate storm sewers owned or operated by permittees and co-permittees listed in Special Condition S2.

B. In order to obtain coverage under this permit, each entity identified under Special Condition S2.B. shall submit a Notice of Intent (NOI) (Appendix 5).

C. Each entity desiring coverage under this permit as allowed under Special Condition S2.D., shall submit an NOI and provide public notice of the application for coverage in accordance with WAC 173-226-130. The NOI shall constitute the application for coverage. Ecology will notify applicants in writing of their status concerning coverage under this permit within 90 days of Ecology's receipt of the NOI and demonstration that the public notice requirements have been met. If the applicant is granted coverage, the implementation schedule for the Stormwater Management Program is established in Special Condition S10, and the schedule for Stormwater Planning is in Special Condition S8.

S4. RESPONSIBILITIES OF PERMITTEES AND CO-PERMITTEES

A. Each permittee is responsible for full compliance with the terms of this permit for the municipal separate storm sewers it owns or operates.

B. Full compliance with the terms of the permit for the municipal separate storm sewers owned or operated by co-permittees shall be achievable through the combined authorities of the co-permittee and the municipality it is located in. Each co-permittee, through an agreement with the municipality it is located in, shall meet its responsibilities for permit conditions as described in Special Condition S9, Stormwater Management Program for Co-permittees.

S5. TOTAL MAXIMUM DAILY LOAD ALLOCATIONS

A. If a Total Maximum Daily Load (TMDL) is approved that includes requirements for control of stormwater discharges from municipal separate storm sewers owned or operated by the permittee, then the permittee must incorporate implementation of the TMDL into the Stormwater Planning required pursuant to Special Condition S8.

B. If a Total Maximum Daily Load (TMDL) is approved after the Stormwater plan is completed, then the permittee shall review the stormwater plan. If implementation of the stormwater will not result in meeting the TMDL implementation requirments, then the stormwater plan and it's implementation schedule must be modified to incorporate the TMDL implementation strategy into the stormwater plan within 12 months of the TMDL's approval.

S6. COMPLIANCE WITH STANDARDS

A. This permit authorizes discharges of stormwater to surface waters and to ground waters of the state.

B. Compliance with the requirements of this permit shall constitute reduction of the discharge of pollutants to the maximum extent practicable (MEP) during the term of this permit.

C. This permit does not authorize any alteration of physical, chemical or biological properties of waters of the state as will or is likely to create a nuisance or render such waters harmful, detrimental or injurious to the public health, safety or welfare or to domestic, commercial, industrial, agricultural, recreational or other legitimate beneficial uses, or to livestock, wild animals, birds, fish or other aquatic life.

D. Ecology recognizes that for discharges from existing stormwater outfalls a compliance schedule is necessary to meet water quality standards in cases where municipal stormwater discharges do not comply with those standards. For the purposes of this permit, development and implementation of a stormwater management program (S7 and S9), compliance with stormwater planning requirements (S8), and compliance with schedules for compliance with stormwater management program components (S10) represent ongoing efforts towards meeting those standards on an approved compliance schedule as allowed in those standards.

E. Discharges from a new stormwater outfall, constructed after the issuance date of this permit, shall not cause a violation of any applicable ground water quality, surface water quality, or sediment management standards.

1. For the purpose of this permit a new stormwater outfall means an outfall that is constructed at a location where a municipal separate stormwater discharge did not previously exist.
2. For the purpose of this permit the point of compliance for discharges from a new stormwater outfall is in the naturally-occurring or man-altered surface water body or ground water at the point of discharge.
3. To determine compliance with this provision Ecology will presume that a discharge is not causing a violation of applicable standards if all sources contributing to the discharge are controlled in accordance with the technical standards in Appendix 1 (or approved equivalent technical standards) unless additional information indicates otherwise.

F. Discharges associated with areas of new development shall not cause a violation of any applicable ground water quality, surface water quality or sediment management standards. Permittees and co-permittees covered under this permit shall use best available science in land use planning and the regulation of development to protect watersheds and portions of watersheds within their jurisdiction from further impacts to and loss of beneficial uses due to increased disruptions in the natural hydrologic cycle. Permittees and co-permittees covered under this permit are to use other actions as necessary (such as land use regulation and protection of forest cover), in addition to the site-by-site application of a Stormwater Management Manual, to prevent cumulative impacts to beneficial uses.

For the purpose of this permit areas of new development shall mean contiguous areas or sub-basins of less than 25% total impervious surface that receive multiple residential, commercial and/or industrial development projects, or multiple development sites within a single project, during the term of the permit.

Ecology is committed to addressing the cumulative impact of development on a regional scale, and ensuring that areas of new development do not cause a violation of standards. It is very difficult, however, to define the appropriate scale for application of this provision and we are requesting comments on this issue.

S7. STORMWATER MANAGEMENT PROGRAM

A. Each permittee shall implement a stormwater management program during the term of this permit. For the purpose of this permit a stormwater management program is a plan for the term of the permit to:

1. Ensure that new development does not cause a violation of applicable standards or increase degradation of already impaired waters;
2. Reduce the discharge of pollutants;

3. Reduce impacts to receiving waters;
4. Eliminate illicit discharges as described in S7.C10 (below); and
5. Make progress toward compliance with surface water, ground water and sediment standards, including protection and restoration of beneficial uses of Waters of the State

B. The stormwater management program shall be developed and implemented in accordance with the conditions of this permit. Permittees are to continue implementation of existing stormwater management programs prior to implementation of the updated stormwater management program for the term of this permit.

C. The stormwater management program shall consist of the components listed below, and Stormwater Planning in accordance with Special Condition S8, as referenced in S7C.6 and 7. All components are mandatory and must be fully implemented by each primary permittee. Co-permittees are responsible for implementation of Stormwater Management Programs as indicated in Special Condition S9.

In regard to WSDOT, compliance with this condition is required for pollution sources originating within the state right-of-way. Measures to control pollution sources originating outside of the state right-of-way are subject to the memorandums of agreement required by component 1.

1. Legal Authority

a. Each permittee shall establish or maintain adequate legal authority to control discharges to and from municipal separate storm sewers owned or operated by the permittee.

b. This legal authority, which may be a combination of statute, ordinance, permit, contract, order, or inter-jurisdictional agreements with other permittees that have existing legal authority, shall include the ability to:

i. Control the contribution of pollutants to municipal separate storm sewers owned or operated by the permittee from stormwater discharges associated with industrial activity, and control the quality of stormwater discharged from sites of industrial activity.

ii. Prohibit illicit discharges to the municipal separate storm sewer owned or operated by the permittee.

iii. Control the discharge of spills and the dumping or disposal of materials other than stormwater into the municipal separate storm sewers owned or operated by the permittee.

iv. Control, through interagency agreements or inter-jurisdictional agreements among permittees, the contribution of pollutants from one municipal separate storm sewer to another.

v. Require compliance with conditions in ordinances, permits, contracts, or orders.

vi. Within the limitations of state law, carry out all inspection, surveillance, and monitoring procedures necessary to determine compliance with local ordinances.

c. WSDOT shall comply with this condition for all discharges originating within the state right-of-way. For discharges originating outside of the state right-of-way, WSDOT shall enter into memorandums of understanding with Ecology and the local jurisdiction that has enforcement authority, establishing the terms of enforcement.. WSDOT and the appropriate entities shall sign the memorandums of understanding no later than 18 months after the effective date of this permit.

2. Monitoring Program

> Ecology is working on a proposal for this program component. The CWA goals of protection and restoration of designated uses will drive the monitoring requirements. Data generated must be useful to both permittees and Ecology to guide their stormwater programs and to determine their progress towards meeting the CWA goals i.e., "Are municipal stormwater influenced or dominated receiving waters improving or declining?" To achieve this, the permit requires that data be collected, analyzed, and reported in a standardized manner across jurisdictions and that the sampling parameters, locations, and frequencies are sufficient to answer this fundamental question reasonably and objectively.

3. Gathering, Maintaining, and Using Adequate Information

The SWMP shall include an ongoing program for gathering, maintaining, and using adequate information to conduct planning, priority setting, and program evaluation activities. The information and its form of retention shall include but not be limited to:

a. Mapping of known municipal separate storm sewer outfalls.

b. Mapping of tributary conveyances, and the associated drainage areas of major municipal separate storm sewer outfalls. Mapping of tributary conveyances for other outfalls shall be conducted through the Stormwater Planning process in accordance with Special condition S8. In lieu of 3.a. and b. above, WSDOT may retain as-built drawings of storm drainage systems and areas.

c. Map(s) depicting existing land use. In lieu of land use maps, WSDOT shall map existing highways, existing and predicted average daily traffic volumes for each of those highways, and future possible or planned highway expansions.

d. Map(s) depicting zoning.

e. A data base, including at least the following information.

i. Precipitation records.

ii. Stormwater quality and quantity records.

iii. Water quality and physical characteristics of receiving water that may be impacted by stormwater.

We will need to reassess this provision when developing the monitoring requirements.

iv. A description and location of major structural Best Management Practices (BMPs) and other structural controls for stormwater discharges.

4. Coordination

a. The SWMP shall include coordination mechanisms to ensure intergovernmental and intragovernmental coordination of stormwater-related policies, programs and projects among permittees within a watershed, and coordination among departments within each jurisdiction.

b. Minimum Performance Measures:

i. Establish a program ensuring intergovernmental and intragovernmental coordination will occur as follows:

(1) Intragovernmental coordination will include maximizing benefits and leveraging resources, minimizing duplication of efforts, and avoiding programmatic gaps.

(2) Coordinate on comprehensive land use plans, monitoring, data management, and BMP testing.

(3) Participation in Stormwater Planning in accordance with Special Condition S8 for shared waterbodies among permittees, including WSDOT.

ii. Each permittee shall participate in Stormwater Planning in accordance with Special Condition S8 for shared waterbodies among permittees. WSDOT shall participate in Stormwater Planning in all applicable basins where WSDOT has stormwater discharges.

iii. Each municipality is to enter into a memorandum of agreement with WSDOT establishing terms of enforcement for controlling discharges into WSDOT-owned storm drains, no later than 18 months after the effective date of this permit.

iv. Each municipality is to enter into an agreement with co-permittees located within their boundaries to control the contribution of pollutants into the system owned or operated by the co-permittee.

5. Public Involvement

a. The SWMP shall include ongoing programs that provide opportunities for public involvement through advisory councils, watershed committees, participation in developing rate structures, stewardship programs, environmental activities, or other similar activities.

b. Minimum performance measures:

   i. Adoption of a program or policy directive to create opportunities for the public to participate in the decision making process involving stormwater management programs, priorities, and Stormwater Planning.

   2. Implement a public involvement program, including public involvement in the Stormwater Planning process.

6. Controlling Runoff from New Development, Redevelopment and Construction Sites

   a. The SWMP shall include a program to control runoff from areas of new development and redevelopment, and from construction sites. The program must address site-specific development impacts and the cumulative effects of changes to watershed hydrology and increases in pollutant loads resulting from development throughout a basin.

   b. Minimum performance measures:

      i. The program must include ordinances (except WSDOT's program) and technical standards that include minimum requirements, definitions, and thresholds equivalent to those found in Appendix 1. The program must also include a BMP selection process and site planning guidance equivalent to those found in Volume 1 of the Stormwater Management Manual for Western Washington. The program must also include implementation of a manual that includes BMPs equivalent to those contained in Volumes II – V of Ecology's Stormwater Management Manual (2000 edition). The ordinance(s), technical standards, and manual must be adopted within 12 months of the effective date of this permit. The ordinances, technical standards, and manual shall apply to private and public development, including roads.

      ii. All development activities, except those identified in iii, below, which have not yet received all permits, approvals or authorizations from the permittee necessary to begin construction prior to (a date 12 months from the effective date of this permit) shall either comply with the provisions of the ordinance(s) and manual required under this permit condition or the municipal entity shall provide additional controls to ensure the technical standards in Appendix 1 are met. For WSDOT, all construction projects that have not been advertised for bid prior to (a date 12 months from the effective date of this permit) shall comply with the provisions of the technical standards and manual required under this permit condition.

      iii. After (date 12 months from the effective date of the permit), all new development on an undeveloped parcel must meet all the applicable technical standards in Appendix 1 at the time they are constructed.

      iv. The following criteria shall be used for determining if the local ordinance(s), technical standards, and manual are technically equivalent to Appendix 1 and the Stormwater Management Manual for Western Washington:

(1) The Minimum Requirements (in Appendix 1) for new development and redevelopment or their equivalents must be included in the ordinance adopted by the local government. More stringent requirements may be used, and/or the Minimum Requirements may be tailored to local circumstances through the use of basin plans.

(2) The thresholds for and definitions of new development, redevelopment, land disturbing activities, impervious surfaces, and pollution-generating surfaces should provide equivalent protection of receiving waters or equivalent levels of pollution treatment as those in Appendix 1.

(3) The substantially equivalent technical standards must include BMP selection and site planning processes that have outcomes that provide equivalent or greater protection to those in Volume 1 of the Stormwater Management Manual for Western Washington.

(4) The types of BMPs and design criteria for those BMPs specified by local governments must provide equivalent or greater protection than those contained in Volumes II through V of Ecology's manual.

(5) An exceptions and variance process similar in content to Section 2.8 of Volume 1 of the Stormwater Management Manual for Western Washington, must be included.

v. The program must establish legal authority through approval of new development to inspect private stormwater facilities and enforce maintenance standards.

vi. The program must include a uniform process of permits, plan review, inspections, and enforcement capability to meet the following standards for both private and public projects:

(1) Review, with qualified staff or consultants, all stormwater site plans required to be submitted for proposed development activities.

(2) Inspect, with qualified staff or consultants prior to clearing and construction, all development sites that are hydraulically near[1] a sediment/erosion-sensitive feature[2] or have a high potential for sediment transport as determined through plan review based on definitions and guidance in Appendix 2. The intent of this inspection is to promote proper installation of erosion and sediment controls.

---

[1] Hydraulically near means runoff from the site discharges to the sensitive feature without significant natural attenuation of flows that allows for suspended solids removal. See Appendix 2 for a more detailed definition.

[2] Sediment/erosion-sensitive feature means an area subject to significant degradation due to the effect of construction runoff or areas requiring special protection to prevent erosion. See Appendix 2 for a more detailed definition.

(3) Inspect, with qualified staff or consultants, all permitted development sites during construction to ensure proper installation and maintenance of required erosion and sediment controls. Enforce as necessary based on the inspection. Note: this inspection may be combined with other inspections provided it is still performed by certified staff or consultants.

(4) Inspect, with qualified staff or consultants, all development sites upon completion of construction and prior to final approval/occupancy to ensure proper installation of permanent erosion controls and stormwater facilities/BMPs. Enforce as necessary based on the inspection. Note: this inspection may be combined with other inspections provided it is still performed by qualified staff or consultants.

vii. The program must require that proposed clearing and grading activities be reviewed and approved under or in conjunction with a permit approval or other approval as outlined in Appendix 3 so that appropriate standards and BMPs can be applied to mitigate the impacts of clearing and grading activities.

viii. The program must also include a process to make available copies of the "Notice of Intent for Construction Activity" and/or copies of the "Notice of Intent for Industrial Activity" to representatives of proposed new development and redevelopment. Permittees will continue to enforce local ordinances controlling runoff from construction sites that also require coverage under the Baseline General Permit for Discharges Associated with Industrial Stormwater and/or the General Permit for Stormwater Discharges Associated with Construction Activities.

ix.. The program must include Stormwater Planning to assess and evaluate the estimated cumulative impacts from projected new development, and recommend actions to prevent alteration of the physical, chemical or biological properties of any waters of the state as will or is likely to be harmful, detrimental or injurious to beneficial uses. Planning must be conducted in accordance with Special condition S8. In addition to adoption and implementation of the Stormwater Management Manual and control of stormwater discharges on a site-specific basis, the program must include actions as necessary based on stormwater planning recommendations (such as land use regulation, protection of forest cover and riparian buffers), to ensure that stormwater discharges associated with areas of new development do not cause or contribute to a violation of any applicable ground water quality, surface water quality or sediment management standards in accordance with Special Condition S6.F.

7. Stormwater Controls for Existing Developed Areas

a. The SWMP shall include a program, implemented through the Stormwater Planning requirement in Special condition S8, to address impacts to beneficial uses resulting from disturbances to watershed hydrology and stormwater pollutant discharges caused by stormwater discharges from areas of existing development. The program shall include Capital Improvement Projects (CIP) for the construction of projects such as regional flow control facilities, water quality treatment facilities, and retrofitting of existing flood control facilities. Permittees should also consider other means to address impacts from existing development, such as reduction of hydrologic changes through the use of on-site stormwater management BMPs and site design techniques, habitat acquisition or restoration of forest cover and riparian buffers, for compliance with this requirement. Permittees may not cite in-stream culvert replacement projects for compliance with this requirement.

b. Minimum Performance Measures:

   i. The program must include Stormwater Planning to evaluate the types of controls that are appropriate and necessary to mitigate impacts to basin hydrology and beneficial uses, and reduce pollutant loads, caused by stormwater discharges from existing development. The stormwater plans shall also recommend specific actions, including capital improvement projects, to prevent and reduce impacts from stormwater discharges, in accordance with Special condition S8.

   ii. The WSDOT program to control stormwater impacts from existing development shall identify treatment and flow control deficiencies for each discharge covered under this permit. WSDOT shall develop a prioritization for correction of those deficiencies. In accordance with requirements for Stormwater Planning in special condition S8, the prioritization must include a consideration of the needs, priorities, and strategies identified by local governments in their stormwater planning. The prioritization should also take into account transportation planning conducted by WSDOT, and construction schedules for transportation projects. The WSDOT CIP program schedule shall also be predicated on achieving correction of all identified deficiencies within 20 years from the issuance of this permit.

8. Source Control Program

   a. The SWMP shall include a program to reduce pollutants in runoff from existing developed areas that discharge to municipal separate storm sewers owned or operated by the permittee. The program shall include:

      i. Requiring application of source control BMPs (equivalent to Volume IV of the Ecology Stormwater Management Manual) on existing facilities and activities.

      ii. Inspections of commercial, industrial and multifamily properties to ensure implementation of BMPs to control pollution discharging into municipal separate storm sewers owned or operated by the permittee.

      iii. Unless otherwise agreed to by the permittee, a permittee will not be expected to enforce an industrial NPDES permit issued by Ecology, however, the permittee is expected to enforce local ordinances at all sites, including those with industrial NPDES permits. Municipalities may refer stormwater discharge problems associated with industrial (non-construction) NPDES permittees to Ecology unless the permittee has local ordinances that impose stricter stormwater standards than imposed through the permit issued by Ecology. Permittees will not be held liable by Ecology for water quality standard violations caused by industries covered under an NPDES permit issued by Ecology.

iv. Reduction of pollutants associated with the application of pesticides, herbicides, and fertilizer discharging into municipal separate storm sewers owned or operated by the permittee.

b. Minimum Performance Measures for Source Control Program:

i. Adoption of an ordinance requiring the application of source control BMPs (equivalent to Volume IV of the Ecology Stormwater Management Manual) for existing facilities and activities. Enforcement of source control requirements may be done through education and technical assistance programs, provided that regulatory authority is available to the permittee and is used for flagrant violations.

ii. Compile a list of existing commercial, multifamily, industrial and government sites which are potentially pollution generating (see Appendix 4 for guidance). The list shall be updated at least once every 5 years.

iii. An inspection program for all the listed sites, with adequate enforcement capability to ensure implementation of source control BMPs, including elimination of sanitary sewer or interior floor drain connections. The inspection program will perform inspections of at least 15% of the listed sites annually. 80% of the total of these properties will be inspected during the term of the permit. Adjust the inspection program as needed to incorporate new sites added to the list and reflect sites already inspected. Note: those sites where the property owner denies entry/inspection and there is no legal authority to enter/inspect may be excluded from onsite inspection, however, the permittee is still responsible for enforcement of the source control ordinance if evidence of a violation can be seen without entering the property.

iv. Adopt and implement policies and procedures to reduce pollutants associated with the application of pesticides, herbicides, and fertilizer on all public property owned or managed by the permittee, including parks and road right-of-ways.

v. Provide a minimum of two training sessions for inspection and other field staff to ensure adequate implementation of the source control program.

9. Illicit Discharge Reduction

a. The SWMP shall include an ongoing program to detect, remove and prevent illicit discharges and improper disposal, including spills, into the municipal separate storm sewers owned or operated by the permittee. The program shall include:

i. Effectively prohibiting illicit discharges to the municipal separate storm sewers owned or operated by the permittee other than those authorized under a separate NPDES permit. Unless identified by either the permittee or Ecology as significant sources of pollution to waters of the state, the illicit discharges listed in 40 CFR Section 122.26(d)(iv)(B)(1) need not be prohibited from entering the municipal separate storm sewers owned or operated by the permittee. As necessary, the permittee(s) shall incorporate appropriate control measures in the stormwater management program to ensure these discharges are not significant sources of pollutants to waters of the state.

ii. Detecting and removing sanitary sewer or interior floor drain connections to municipal separate storm sewers owned or operated by the permittee.

iii. On-going identification of illicit discharges, spills and improper disposal into the municipal separate storm sewer system, through inspections, monitoring and complaint response.

iv. Preventing, responding to, and cleaning up spills and improper disposal into the municipal separate storm sewers owned or operated by the permittee.

b. Minimum Performance Measures:

i. An on-going program to prevent, identify and respond to illicit discharges including illicit connections, spills and improper disposal through complaints/reports, construction inspections, maintenance inspections, source control inspections, and monitoring information.

ii. Provide appropriate training for municipal field staff to recognize and report illicit discharges, including spills, improper disposal and illicit connections.

iii. Adopt procedures for reporting and correcting or removing illicit connections, spills and other illicit discharges when they are suspected or identified.

iv. A well-publicized citizen complaints/reports telephone number.

v. Investigate or refer to the appropriate agency, within 7 days on average, any complaints/reports or monitoring information that indicates a potential illicit discharge, spill, or illegal dumping. Investigate or refer as soon as possible within 24 hours, those problems/violations judged to be urgent or severe.

10. Operation and Maintenance Program

a. The SWMP shall include a program to conduct maintenance activities that prevent or reduce stormwater impacts. The program shall include:

i. Maintenance standards and programs to ensure proper and timely maintenance of public and private stormwater facilities.

ii. Practices for operating and maintaining public streets, roads, and highways to reduce stormwater impacts.

iii. Policies and procedures to reduce pollutants associated with the application of pesticides, herbicides, and fertilizer.

iv. Practices for operating and maintaining fleet vehicles and maintenance yards to reduce stormwater impacts.

b. Minimum Performance Measures:

i. Adopt facility-specific maintenance standards that are as protective or more protective than those specified in Appendix 10A of Volume V of the Stormwater Management Manual for Western Washington.

ii. Adopt policies and procedures to establish a program to ensure proper and timely maintenance of public and private stormwater facilities.

iii. Adopt and implement an ordinance requiring maintenance of all privately owned permanent stormwater BMPs in accordance with adopted maintenance standards.

iv. Develop and implement an initial inspection schedule for all private stormwater facilities that ensures inspection of each facility at least once during the term of this permit to enforce compliance with adopted maintenance standards as needed based on the inspection. Note: those sites where the property owner denies entry/inspection and there is no legal authority to enter/inspect may be excluded from onsite inspection. In addition, jurisdictions shall not be held responsible for lack of compliance by the property owner if appropriate enforcement action has been taken in accordance with the policies and procedures established in ii and iii above.

v. Develop an on-going schedule for implementation after the initial schedule to ensure inspection of all private stormwater facilities annually. The annual inspection schedule may be changed to a lesser or greater frequency of inspection as appropriate to ensure compliance with maintenance standards based on maintenance records of double the number of years of the proposed inspction frequency.

vi. Manage maintenance activities to inspect all new flow control and water quality treatment facilities in subdivisions every 6 months during the period of heaviest house construction (i.e., 1 to 2 years following subdivision approval) to identify maintenance needs and enforce compliance with maintenance standards as needed.

vii. Manage maintenance activities to inspect all public stormwater facilities annually and take appropriate maintenance action in accordance with adopted maintenance standards. The annual inspection schedule may be changed to a lesser or greater frequency of inspection as appropriate to ensure compliance with maintenance standards based on maintenance records of double the number of years of the proposed inspction frequency.

viii. Manage maintenance activities to inspect all public stormwater facilities after major storm events if spot checks of some facilities indicate widespread damage/maintenance needs. Conduct repairs or take appropriate maintenance action in accordance with adopted maintenance standards based on the results of the inspections.

ix. Annually inspect public catchbasins and inlets on a "circuit basis" whereby a sampling of catchbasins and inlets within each circuit is inspected to identify maintenance needs. Include in the sampling an inspection of the catchbasin immediately upstream of any system outfall. Clean all catchbasins within a given circuit at one time if the inspection sampling indicates cleaning is needed to comply with adopted maintenance standards.

x. Require cleaning of private catchbasins and inlets whenever they are found to be out of compliance with adopted maintenance standards.

xi. Records of inspections and maintenance activities shall be maintained.

xii. Adopt practices to reduce stormwater impacts associated with runoff from public streets, roads, and highways within 12 months of the effective date of this permit. Ecology guidance for street waste disposal, the Municipal Stormwater Toolbox for Maintenance Practices (June 1998), developed by Oregon Association of Clean Water Agencies, (and consider adding the guidance on ditch maintenance being developed by the Center for Urban Water Resources management at UW), shall be used as guidance for developing this program. Implementation of practices shall begin no later than 18 months after the effective date of this permit, and continue on an ongoing basis throughout the term of the permit. The following activities must be addressed:

(1) Pipe cleaning

(2) Cleaning of culverts that convey stormwater in ditch systems

(3) Ditch maintenance

(4) Street cleaning

(5) Road repair and resurfacing, including pavement grinding

(6) Snow and ice control

(7) Bridge repair and maintenance

(8) Utility installation

(9) Maintaining roadside areas, including vegetation management .

(10) Dust control

(11) Pavement striping maintenance

xiii. Adopt and implement policies and procedures to reduce pollutants associated with the application of pesticides, herbicides, and fertilizer no later than 12 months after the effective date of this permit.

xiv. Conduct a minimum of 2 training sessions for employees of the permittee whose O&M job functions may impact stormwater quality. Training shall address the importance of protecting water quality, ways to perform their job activities to prevent or minimize impacts to water quality, and procedures for reporting water quality concerns, including potential illicit discharges.

xv. Develop and implement a Stormwater Pollution Prevention Plan (SWPPP) for all maintenance yards and vehicle maintenance facilities owned or operated by the permittee. The SWPPP is a documented plan to implement measures to identify, prevent, and control the contamination of discharges of stormwater to surface or ground water. The SWPPPs must be developed within 18 months of the effective date of this permit. Implementation of non-structural BMPs shall begin immediately after the pollution prevention plan is developed. A schedule for implementation of structural BMPs shall be included in the pollution prevention plan.

11. Education Program

a. The SWMP shall include an education program aimed at residents, businesses, industries, elected officials, policy makers, planning staff and other employees of the permittee. The goal of the education program is to change behaviors and practices that cause or contribute to adverse stormwater impacts so as to minimize and eventually eliminate such impacts. An education program may be developed locally or regionally.

b. Minimum Performance Measures:

i. Begin informal distribution of available materials as a first step towards achieving public education goals.

ii. Permittees shall implement or participate in an education program that uses different types of media (brochures alone are not adequate), and targets a wide range of interest groups to provide education on the topics listed in ii, below.

iii. The education program shall address the following areas:

(1) Provide education for all audiences about the importance of improving water quality, reducing impervious surfaces and protecting beneficial uses of waters of the state, about potential impacts caused by stormwater discharges, and methods for avoiding, minimizing, reducing and/or eliminating the adverse impacts of stormwater runoff.

(2) Provide and encourage participation in environmental stewardship activities.

(3) Provide information to the general public about actions individuals can take to improve water quality and reduce impervious surfaces (e.g., lawn care with less fertilizer and pesticides, more use of native vegetation for landscaping, proper disposal of pet wastes, etc.).

(4) Education on proper use and disposal of pesticides, herbicides, and fertilizers.

(5) Provide training for engineers, construction contractors, developers, development review staff, and land use planners on technical standards, the development of stormwater site plans and erosion control plans, and BMPs for mitigating contaminated runoff and the quantity of runoff from development sites.

(6) Provide education for engineers, contractors, developers, and the public on land development practices and non-structural BMPs that eliminate, avoid, or minimize adverse stormwater impacts.

(7) Provide education to explain the definition and impacts, and promote removal of illicit discharges.

(8) Provide education to promote proper management and disposal of toxic materials (e.g. used oil, batteries, vehicle fluids, home chemicals.)

S8 STORMWATER PLANNING

A. The SWMP shall include stormwater planning to assess and evaluate impacts to physical, chemical and biological properties of waters of the state caused by stormwater discharges from existing development and from projected new development. The stormwater plans will identify actions to prevent future impacts and mitigate existing impacts. Stormwater planning shall address impacts caused by changes in stormwater hydrology and pollutant loads affecting surface water, ground water and sediment quality.

B. The objectives of stormwater planning under the SWMP shall be:

1. To determine the need, opportunity, best alternative, priority, and funding for projects to reduce the stormwater impacts from existing development.

2. To encourage redevelopment and infill, and provide more efficient, effective runoff controls instead of requiring stormwater facilities through individual redevelopment projects.

3. To assess baseline conditions, including but not limited to biota, habitat, beneficial uses, water quality conditions, hydrologic conditions, current and projected land use.

4. To evaluate the need for basin specific stormwater control standards, and implement changes to standards if appropriate.

5. To site and fund projects to ensure flow control and water quality treatment to meet the technical standards in Appendix 1 where local governments allow projects to

continue being built to the old standards beyond the deadline established in Special Condition S7C.6. Notwithstanding the above, permittees are required to comply with the provisions of S7C.6.b.ii and iii.

6. To assess and evaluate the estimated cumulative impacts of stormwater discharges from projected new development, including impacts to summer low flows, and to recommend actions to prevent alteration of the physical, chemical, or biological properties of any waters of the state as will or is likely to be harmful, detrimental or injurious to beneficial uses.

7. To ensure that changes to stormwater quality and hydrology and resulting impacts to physical, chemical, and biological properties of waters of the state are assessed and that appropriate mitigation[3] will be provided when comprehensive land use planning, zoning, and other land use decisions are made.

8. To assess and evaluate stormwater impacts to receiving waters that are in non-attainment of water quality standards, and included on the State of Washington 303(d) list. To provide input into the development of Total Maximum Daily Loads (TMDLs) for those water bodies. Also, to develop implementation strategies for completed TMDLs.

C. The stormwater planning objectives may be accomplished through stormwater-specific basin planning, or other planning processes. The stormwater planning objectives must be considered in all basins, however, detailed planning efforts should focus on objectives most appropriate or necessary for individual basins.

D. Stormwater plans must include a recommended schedule for implementation and recommendations regarding funding of implementation. Stormwater plans must include a commitment to begin implementation according to the implementation schedule contained in the completed stormwater plan upon adoption by the participating entities. Adoption of the stormwater plan shall mean a legislative action (or an administrative action for WSDOT) accepting the plan and a financial commitment to begin funding plan implementation.

E. Stormwater planning must address all basins or portions thereof where the jurisdiction has authority within the urban growth boundaries established under the Growth Management Act, and outside the urban growth boundaries where land uses other than forestry and agriculture could cause stormwater impacts to receiving waters.

Note – The intention here is to address areas outside the UGB where existing platted densities are high or there are non-conforming uses that could cause stormwater impacts. We would appreciate suggestions on language on how best to describe these areas.

[3] Mitigate means, in the following order of preference, to eliminate, avoid, minimize, rectify, reduce, compensate, monitor and correct.

F. Ecology will develop guidance on how to meet the stormwater planning objectives in this condition. Any stormwater plans that have been completed or are near completion, and that adequately address stormwater impacts to salmonids and CWA objectives, are sufficient to meet the planning objectives in this condition. It is expected that stormwater planning will be integrated into existing planning efforts.

G. The Cities and Counties named as permittees under Special Condition S2.A. shall coordinate stormwater planning activities among WSDOT and co-permittees where those entities are located in basins subject to the planning requirement, and shall provide technical and administrative support for plan preparation.

H. WSDOT and co-permittees shall participate in Stormwater Planning and plan implementation when appropriate geographically and environmentally.

I. Minimum Performance Measures:

1. Within 18 months of the effective date of this permit, establish a schedule (or schedules for parallel processes) for conducting stormwater planning required under this condition. This schedule may be prioritized consistent with Clean Water Act objectives, including protection of beneficial uses and achieving proper functioning conditions for salmonids, or other factors as determined by the permittees.
2. By the end of the permit term, complete stormwater planning for at least 50% of the geographic area subject to the planning requirement.
3. By the end of the permit term, adopt and begin implementation of stormwater plans that cover 25% of the geographic area subject to the planning requirement, including implementation of action items that address stormwater discharges from both existing and new development.
4. For each plan establish an implementation schedule and funding strategy for both near term and long term capital improvement, regulatory, programmatic actions and land use. Short term actions are actions that must be taken to prevent additional stormwater impacts and to address critical existing impacts. Short term actions shall be implemented within 5 years. Long term actions are actions to achieve the water quality goals for the basin. Long term actions are to be implemented within 10 years. Short term land use actions are intended to prevent stormwater impacts. Long term land use actions are to address existing impacts. The implementation schedule for each stormwater plan may be adjusted upon completion of additional stormwater plans to accommodate newly identified high priority short term actions, provided that the long term schedule for implementation of actions for all the stormwater plans is 20 years.

S9. STORMWATER MANAGEMENT PROGRAM FOR CO-PERMITTEES

A. Each co-permittee shall implement a stormwater management program during the term of this permit. For the purpose of this permit a stormwater management program is a plan for the term of the permit to:

1. Ensure that new development does not cause a violation of applicable standards or increase degradation of already impaired waters;

5. Reduce the discharge of pollutants;

6. Reduce impacts to receiving waters;

3. Eliminate illicit discharges as described in S7.C10; and

4. Make progress toward compliance with surface water, ground water and sediment standards, including protection and restoration of beneficial uses.

C. **Port Districts** shall develop and implement the following Stormwater Management Program:

1. **Legal Authority**. Port districts shall enter into an agreement with the permitted entity they are located in to control the contribution of pollutants to the municipal separate storm sewers owned or operated by the Port. The agreement shall include the following provisions:

   a. Roles and Responsibilities. The agreement between the City and the County shall clarify roles and responsibilities for public involvement, public education, controlling runoff from new development and redevelopment, inspection, enforcement, monitoring, maintenance, planning, and capital improvements to ensure compliance with the terms of this permit.

   b. Spills. Immediately upon becoming aware of a spill into the drainage system owned or operated by the Port, the Port shall notify the City or County it is located in. The City/County shall respond immediately by taking direct action and notifying Ecology.

   c. Illicit Discharges. If the Port suspects an illicit discharge into the drainage system owned or operated by the Port, the Port shall notify the City or County it is located in within 24 hours. The City/County shall investigate within 7 days, on average.

   d. Other pollution sources and hydrologic impacts. The Port shall participate in the City/County stormwater planning process.

2. **Monitoring Program**. The Port shall participate in the City or County's monitoring program.

3. **Gathering, Maintaining, and Using Adequate Information**. The Port shall comply with S7.D.4.a.i., ii, and iii. This mapping information shall be provided to the City or County.

4. **Coordination**. The Port shall coordinate monitoring, and source control and illicit discharge control efforts with the City or County. The port shall also participate in stormwater planning, when appropriate geographically and environmentally.

5. **Public Involvement**. The Port shall participate in the City or County's public involvement program.

6. **Controlling Runoff from New Development, Redevelopment and Construction sites**. Through compliance with City or County ordinances and rules, the Port shall

ensure that all new development and re-development meets the technical standards in Appendix 1.

7. **Existing Developed Areas**. The port shall prepare Stormwater Pollution Prevention Plans (SWPPPs) for all port owned lands not covered under the Industrial Stormwater General Permit. The SWPPP is a documented plan to implement measures to identify, prevent and control the contamination of discharges of stormwater to surface or ground water. The SWPPPs must be developed within 18 months of the effective date of this permit. Implementation of non-structural BMPs shall begin immediately after the SWPPP is developed. A schedule for implementation of structural BMPs shall be included in the SWPPP. In addition, the Port shall participate in the City's stormwater planning program.
8. **Stormwater Planning**. The Port shall participate in stormwater planning in accordance with Special Condition S8, and implement plan actions as appropriate.
9. **Source Control Program**. The Port shall compile a list of sites that are potentially pollution generating (see Appendix 4 for guidance). The port will inspect all listed sites annually, and implement source control BMPs to prevent or reduce the discharge of pollutants. The port shall adopt and implement policies and procedures to reduce pollutants associated with the application of pesticides, herbicides and fertilizer on all port-owned property. Provide adequate training for inspection and other field staff to ensure adequate implementation of the source control program.
10. **Illicit Discharges**. The Port shall ensure that all sanitary sewer connections and floor drains in buildings on port owned property are not connected to municipal separate storm sewers. The port shall develop a program to prevent, identify, and respond to illicit discharges, including illicit connections, spills and improper disposal, through complaints/reports, maintenance inspections, and source control inspections. The port shall provide appropriate training for field staff to recognize and report illicit discharges, and adopt procedures for responding to and reporting illicit discharges.
11. **Operation and Maintenance Program**. The Port shall adopt facility-specific maintenance standards that are as protective or more protective than those specified in Appendix 10A of Volume V of the Stormwater Management Manual for Western Washington, and comply with the inspection frequencies for public stormwater facilities. The Port shall annually inspect and maintain catchbasins in accordance with S7.D.12.b.ix. Records of inspections and maintenance activities shall be maintained. The port shall provide appropriate training for maintenance staff.
12. **Education Program**. The Port shall participate in the City's public education program.

C. King County as a co-permittee with the City of Seattle shall develop and implement the following Stormwater Program:

1. **Legal Authority.** King County and Seattle shall enter into an agreement to control the contribution of pollutants to the municipal separate storm sewers operated by King County. The agreement shall include the following provisions:

a. Roles and Responsibilities. The agreement between the City and the County shall clarify roles and responsibilities for public involvement, public education, controlling runoff from new development and redevelopment, inspection, enforcement, monitoring, maintenance, planning, and capital improvements to ensure compliance with the terms of this permit.

b. Spills. Immediately upon becoming aware of a spill into the drainage system operated by King County, the County shall notify the City it is located in. The City shall respond immediately by taking direct action and notifying Ecology.

c. Illicit Discharges. If the King County suspects an illicit discharge into the drainage system operated by the County, the County shall first investigate the source and try to eliminate the problem. If the County cannot resolve the problem through education or voluntary actions it shall notify the City. The City shall investigate within 7 days, on average.

d. Other pollution sources and hydrologic impacts. The County shall participate in the City stormwater planning process.

e. Maps of the drainage system. The City shall provide the County with maps of the drainage system draining into the system operated by the County no later than 6 months after the effective date of this permit.

2. **Monitoring Program**. The County shall participate in the City's monitoring program.

3. **Coordination**. The County shall coordinate monitoring, and source control and illicit discharge control efforts with the City. The County shall also participate in stormwater planning, when appropriate geographically and environmentally.

4. **Public Involvement**. The County shall participate in the City's public involvement program.

5. **Stormwater Planning**. The County shall participate in stormwater planning in accordance with Special Condition S8 and implement recommended plan actions as appropriate, including construction of capital facilities where needed.

6. **Source Control Program**. The County and City shall jointly compile a list of sites that are potentially pollution generating (see Appendix 5 for guidance). The County will inspect all listed sites annually, and provide technical assistance and recommended source control BMPs to prevent or reduce the discharge of pollutants. Sites where enforcement is needed to correct urgent or persistent problems shall be referred to the City. The County shall provide adequate training for inspection and other field staff to ensure adequate implementation of the source control program.

7. **Illicit Discharges**. The County shall develop a program to prevent, identify, and respond to illicit discharges, including illicit connections, spills and improper disposal, through complaints/reports, and source control inspections. The County shall provide appropriate training for field staff to recognize and report illicit discharges, and adopt procedures for responding to and reporting illicit discharges.

8. **Operation and Maintenance Program**. The County shall adopt facility-specific maintenance standards that are as protective or more protective than those specified

in Appendix 10A of Volume V of the Stormwater Management Manual for Western Washington, and comply with the inspection frequencies for public stormwater facilities. The County shall ensure that catchbasins are annually inspected and maintained in accordance with S7.D.12.b.ix. Records of inspections and maintenance activities shall be maintained. The County shall provide appropriate training for maintenance staff.

9. **Education Program**. The County shall participate in the City's public education program, and conduct education activities in the areas served by the County's storm drainage system.

C. **Drainage Districts and all other Co-Permittees not otherwise identified** shall develop and implement the following Stormwater Management Program.

1. **Legal Authority**. Co-permittees shall enter into an agreement with the permitted entity they are located in to control the contribution of pollutants to the municipal separate storm sewers owned or operated by the co-permittee. The agreement shall include the following provisions:

   a. Roles and Responsibilities. The agreement between the co-permittee and the permittee shall clarify roles and responsibilities for public involvement, public education, controlling runoff from new development and redevelopment, inspection, enforcement, monitoring, maintenance, planning, and capital improvements to ensure compliance with the terms of this permit.

   b. Spills. Immediately upon becoming aware of a spill into the drainage system owned or operated by the co-permittee, the co-permittee shall notify the City or County it is located in. The City/County shall respond immediately by taking direct action and notifying Ecology.

   c. Illicit Discharges. If the co-permittee suspects an illicit discharge into the drainage system owned or operated by the co-permittee, the co-permittee shall notify the City or County it is located in within 24 hours. The City/County shall investigate within 7 days, on average.

   d. Other pollution sources and hydrologic impacts. The co-permittee shall participate in the City/County stormwater planning process.

2. **Gathering, Maintaining, and Using Adequate Information**. The co-permittee shall provide a map of the district's drainage system to the City/County, if they don't already have such a map. The co-permittee shall ensure the map is updated when any system changes occur.

3. **Stormwater Planning**. The Co-permittee shall participate in stormwater planning and implement plan actions as appropriate, when appropriate geographically and environmentally.

4. **Operation and Maintenance Program**. The co-permittee shall adopt facility-specific maintenance standards that are as protective or more protective than those specified in Appendix 10A of Volume V of the Stormwater Management Manual for Western Washington, and comply with the inspection frequencies for public stormwater facilities. The co-permittee shall ensure that catchbasins are annually

inspected and maintained in accordance with S7.D.12.b.ix. Records of inspections and maintenance activities shall be maintained. The co-permittee shall provide appropriate training for maintenance staff.

S10. SCHEDULES FOR COMPLIANCE WITH STORMWATER MANAGEMENT PROGRAM COMPONENTS

A. Each permittee shall continue all current activities that meet specific permit requirements in Special Condition S7. Whenever permittees must take actions to meet the program components in Special Condition S7, the actions shall be completed by the dates specified in the following implementation schedule. For permittees identified under Special Condition S2C. and D., the following implementation schedule shall apply unless an implementation schedule is issued through an administrative order at the time of permit coverage.

STORMWATER PROGRAM REQUIREMENT	IMPLEMENTATION SCHEUDLE[4] FOR PERMITTEES SPECIAL CONDITION S7	IMPLEMENTATION SCHEDULE[5] FOR PERMITTEES IDENTIFIED UNDER S2 C. AND D.
1. Legal Authority		
a. Maintain adequate legal authority	effective date of permit	12 months
c. WSDOT MOUs	18 months	Not applicable
2. Monitoring Program		
3. Gathering, Maintaining and Using Adequate Information	Effective date of permit, and in accordance with Stormwater Planning, S8.	12 months, and in accordance with Stormwater Planning, S8.
4. Coordination		
b. i. Establish coordination program	3 months	3 months
b. ii. Participate in Stormwater Planning	In accordance with S8	In accordance with S8

[4] All deadlines are measured from the effective date of the permit, unless otherwise noted.

[5] All deadlines are measured from the date of coverage under the permit.

STORMWATER PROGRAM REQUIREMENT	IMPLEMENTATION SCHEUDLE[4] FOR PERMITTEES SPECIAL CONDITION S7	IMPLEMENTATION SCHEDULE[5] FOR PERMITTEES IDENTIFIED UNDER S2 C. AND D.
b. iii. MOU with WSDOT	18 months	Not applicable
b. iv. Agreements with co-permittees	12 months	Not applicable
5. Public Involvement		
b.i. Adopt program or policy directive	6 months	6 months
b. ii. Implement public involvement program	18 months	18 months
6. Controlling Runoff from New Development, Redevelopment and Construction Sites		
b.i. Adopt ordinances, technical standards and manual	12 months	12 months
b. ii. Implement ordinances, technical standards and manual	12 months	12 months
b. iii. All new development on an undeveloped parcel must meet technical standards	12 months	12 months
b.v. Authority to inspect private stormwater facilities	12 months	12 months
b. vi. Permits, plan review, inspections and enforcement	24 months, provided that permittees must continue at least existing level of effort until full implementation is achieved.	[Need to develop appropriate implementation schedule]
b. vii. Clearing and grading in conjunction with a permit or approval	12 months	12 months
b. viii. Coordination with Ecology-administered construction and industrial stormwater permits	effective date of permit	3 months

STORMWATER PROGRAM REQUIREMENT	IMPLEMENTATION SCHEUDLE[4] FOR PERMITTEES SPECIAL CONDITION S7	IMPLEMENTATION SCHEDULE[5] FOR PERMITTEES IDENTIFIED UNDER S2 C. AND D.
b. ix. Stormwater Planning	In accordance with S8	In accordance with S8
7. Stormwater Controls for Existing Developed Areas		
b. i. Stormwater Planning	In accordance with S8	In accordance with S8
b. ii WSDOT prioritization for correction of deficiencies	12 months	Not applicable
8. Source Control Program		
b.i. Adopt ordinance	12 months	12 months
b.ii. Compile list of sites for inspection	12 months	12 months
b.iii. Inspection program	begin implementation no later than 24 months	begin implementation no later than 24 months
b.iv. reduce pollutants associated with pesticides, herbicides and fertilizer	12 months	12 months
b.v. Two training sessions	by the end of the permit term	by the end of the permit term
9. Illicit Discharge Reduction		
b.i. on-going illicit discharge program	effective date of permit	24 months
b.ii. training	12 months	18 months
b. iii. reporting and correction procedures	effective date of permit	24 months
b. iv. complaints/reports telephone number	effective date of permit	24 months
b.v. investigate complaints/reports	effective date of permit	24 months
10. Operation and Maintenance Program		
b.i. Adopt maintenance standards	12 months	12 months
b.ii. Adopt policies and procedures	18 months	18 months

STORMWATER PROGRAM REQUIREMENT	IMPLEMENTATION SCHEUDLE[4] FOR PERMITTEES SPECIAL CONDITION S7	IMPLEMENTATION SCHEDULE[5] FOR PERMITTEES IDENTIFIED UNDER S2 C. AND D.
b.iii. Adopt ordinance for maintenance of private facilities	12 months	12 months
b.iv. inspection of private facilities	18 months to develop inspection schedule complete initial inspections by end of permit term	18 months to develop inspection schedule [Need to develop appropriate schedule for completing initial inspections]
b.v. develop on-going inspection schedule for private facilities	by the end of the permit term	by the end of the permit term
b.vi. inspect new stormwater facilities	24 months	24 months
b.vii. inspect and maintain public facilities	24 months, provided that permittees must continue at least existing level of effort until full implementation is achieved.	[Need to develop appropriate schedule]
b.viii. inspect facilities after storms	24 months	24 months
b.ix. inspect and maintain public catch basins	24 months	24 months
b.x. cleaning of private catch basins as needed	12 months	12 months
b.xi. records maintenance	effective date of permit	[Need to develop appropriate schedule]
b.xii. adopt practices for roads and highways	12 months to adopt practices 18 months to begin on-going implementation	12 months to adopt practices 18 months to begin on-going implementation
b. xiii. reduce pollutants associated with pesticides, herbicides and fertilizer	12 months	12 months
b. xiv. training	by the end of the permit term	by the end of the permit term
b.xv. SWPPs for maintenance yards	• develop SWPP within 18	• develop SWPP within 18

STORMWATER PROGRAM REQUIREMENT	IMPLEMENTATION SCHEUDLE[4] FOR PERMITTEES SPECIAL CONDITION S7	IMPLEMENTATION SCHEDULE[5] FOR PERMITTEES IDENTIFIED UNDER S2 C. AND D.
	months • begin implementation of non-structural BMPs immediately after SWPP is complete • schedule for structural BMPs in the SWPP	months • begin implementation of non-structural BMPs immediately after SWPP is complete • schedule for structural BMPs in the SWPP
11. Education Program		
b.i. informal education program	effective date of permit	6 months
b.ii. implement comprehensive education program	18 months	18 months

B. Each Co-permittee shall continue all current activities that meet the specific permit requirements of Special Condition S9. Whenever co-permittees must take actions to meet the program components in Special Condition S9, the actions shall be completed by the dates specified in the following implementation schedule:

This implementation schedule has not been written yet.

S11. REPORTING REQUIRMENTS

Reporting requirements have not been written yet. We are intending to address the following:

- Ecology is planning to minimize the up front review and approval of programs, therefore, annual reports will be used to determine permit compliance.
- Simplified reports for years 1,2, 3, and 5, with standard formatting provided for reporting on performance measures.
- Status of stormwater planning and implementation in all reports.
- Detailed 4th year reports that include implementation actions for stormwater plans that will be implemented under the next permit.
- The timing for report submittal needs to be determined, suggestions would be appreciated.

GENERAL CONDITIONS

The only general condition I'm currently planning to change is:

G10. REMOVED SUBSTANCES. REMOVED SUBSTANCES

With the exception of decant from street waste vehicles, the permittee shall not allow collected screenings, grit, solids, sludges, filter backwash, or other pollutants removed in the course of treatment or control of stormwater to be resuspended or reintroduced to the storm sewer system or to waters of the state. Decant from street waste vehicles resulting from cleaning stormwater facilities may be reintroduced only when other practical means are not available and only to catch basins remote from the discharge point to waters of the state.

G1. DISCHARGE VIOLATIONS

All discharges and activities authorized by this permit shall be consistent with the terms and conditions of this permit.

G2. PROPER OPERATION AND MAINTENANCE

The permittee shall at all times properly operate and maintain all facilities and systems of collection, treatment, and control (and related appurtenances) which are installed or used by the Permittee for pollution control to achieve compliance with the terms and conditions of this permit.

G3. NOTIFICATION OF SPILL

If a permittee has knowledge of a spill into a municipal storm sewer which could constitute a threat to human health, welfare, or the environment, the permittee shall notify the Ecology regional office and other appropriate spill response authorities immediately but in no case later than within 24 hours of obtaining that knowledge.

G4. BYPASS PROHIBITED

The intentional bypass of stormwater from all or any portion of a stormwater treatment BMP whenever the design capacity of the treatment BMP is not exceeded, is prohibited unless the following conditions are met:

A. Bypass is: (1) unavoidable to prevent loss of life, personal injury, or severe property damage; or (2) necessary to perform construction or maintenance-related activities essential to meet the requirements of the Clean Water Act (CWA); and

B. There are no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated stormwater, or maintenance during normal dry periods.

"Severe property damage" means substantial physical damage to property, damage to the treatment facilities which would cause them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss.

G5. RIGHT OF ENTRY

The permittee shall allow an authorized representative of Ecology, upon the presentation of credentials and such other documents as may be required by law at reasonable times:

A. To enter upon the permittee's premises where a discharge is located or where any records must be kept under the terms and conditions of this permit;

B. To have access to, and copy at reasonable cost and at reasonable times, any records that must be kept under the terms of the permit;

C. To inspect at reasonable times any monitoring equipment or method of monitoring required in the permit;

D. To inspect at reasonable times any collection, treatment, pollution management, or discharge facilities; and

E. To sample at reasonable times any discharge of pollutants.

G6. DUTY TO MITIGATE.

The permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

G7. PROPERTY RIGHTS

This permit does not convey any property rights of any sort, or any exclusive privilege.

G8. COMPLIANCE WITH OTHER LAWS AND STATUTES

Nothing in the permit shall be construed as excusing the permittee from compliance with any other applicable federal, state, or local statutes, ordinances, or regulations.

G9. MONITORING.MONITORING

A. Representative Sampling:

Samples and measurements taken to meet the requirements of this permit shall be representative of the volume and nature of the monitored discharge, including representative sampling of any unusual discharge or discharge condition, including bypasses, upsets, and maintenance-related conditions affecting effluent quality.

B. Records Retention:

The permittee shall retain records of all monitoring information, including all calibration and maintenance records and all original recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least five years. This period of retention shall be extended during the course of any unresolved litigation regarding the discharge of pollutants by the permittee or when requested by the Director. On request, monitoring data and analysis shall be provided to Ecology.

C. Recording of Results:

For each measurement or sample taken, the permittee shall record the following information: (1) the date, exact place and time of sampling; (2) the individual who performed the sampling or measurement; (3) the dates the analyses were performed; (4) who performed the analyses; (5) the analytical techniques or methods used; and (6) the results of all analyses.

D. Test Procedures:

All sampling and analytical methods used to meet the monitoring requirements specified in the approved stormwater management program shall conform to the Guidelines Establishing Test Procedures for the Analysis of Pollutants contained in 40 CFR Part 136, unless otherwise specified in this permit or approved in writing by Ecology.

E. Flow Measurement:

Appropriate flow measurement devices and methods consistent with accepted scientific practices shall be selected and used to ensure the accuracy and reliability of measurements of the volume of monitored discharges. The devices shall be installed, calibrated, and maintained to ensure that the accuracy of the measurements are consistent with the accepted industry standard for that type of device. Frequency of calibration shall be in conformance with manufacturer's recommendations or at a minimum frequency of at least one calibration per year. Calibration records should be maintained for a minimum of three years.

F. Lab Accreditation:

All monitoring data, except for flow, temperature, conductivity, pH, total residual chlorine, and other exceptions approved by Ecology, shall be prepared by a laboratory registered or accredited under the provisions of, Accreditation of Environmental Laboratories, Chapter 173-50 WAC. Soils and hazardous waste data are exempted from this requirement pending accreditation of laboratories for analysis of these media by Ecology.

G. Additional Monitoring:

Ecology may establish specific monitoring requirements in addition to those contained in this permit by administrative order or permit modification.

G10. REMOVED SUBSTANCES

With the exception of decant from street waste vehicles, the permittee shall not allow collected screenings, grit, solids, sludges, filter backwash, or other pollutants removed in the course of treatment or control of stormwater to be resuspended or reintroduced to the storm sewer system or to waters of the state. Decant from street waste vehicles resulting from cleaning stormwater facilities may be reintroduced only when other practical means are not available and only to catch basins remote from the discharge point to waters of the state.

G11. SEVERABILITY

The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

G12. REVOCATION OF COVERAGE

The director may terminate coverage under this General Permit in accordance with Chapter 43.21B RCW and Chapter 173-226 WAC. Cases where coverage may be terminated include, but are not limited to the following:

A. Violation of any term or condition of this general permit;

B. Obtaining coverage under this general permit by misrepresentation or failure to disclose fully all relevant facts;

C. A change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge;

D. A determination that the permitted activity endangers human health or the environment, or contributes significantly to water quality standards violations;

E. Failure or refusal of the permittee to allow entry as required in rcw 90.48.090;

F. Nonpayment of permit fees assessed pursuant to rcw 90.48.465;

Revocation of coverage under this general permit may be initiated by Ecology or requested by any interested person.

G13. TRANSFER OF COVERAGE

The director may require any discharger authorized by this general permit to apply for and obtain an individual permit in accordance with Chapter 43.21B RCW and Chapter 173-226 WAC.

G14. GENERAL PERMIT MODIFICATION AND REVOCATION

This general permit may be modified, revoked and reissued, or terminated in accordance with the provisions of WAC 173-226-230. Grounds for modification, revocation and reissuance, or termination include, but are not limited to the following:

A. A change occurs in the technology or practices for control or abatement of pollutants applicable to the category of dischargers covered under this general permit;

B. Effluent limitation guidelines or standards are promulgated pursuant to the cwa or chapter 90.48 rcw, for the category of dischargers covered under this general permit;

C. A water quality management plan containing requirements applicable to the category of dischargers covered under this general permit is approved; or

D. Information is obtained which indicates that cumulative effects on the environment from dischargers covered under this general permit are unacceptable.

G15. REPORTING A CAUSE FOR MODIFICATION OR REVOCATION

A permittee who knows or has reason to believe that any activity has occurred or will occur which would constitute cause for modification or revocation and reissuance under Condition G12, G14, or 40 CFR 122.62 must report such plans, or such information, to Ecology so that a decision can be made on whether action to modify, or revoke and reissue this permit will be required. Ecology may then require submission of a new or amended application. Submission of such application does not relieve the permittee of the duty to comply with this permit until it is modified or reissued.

G16. APPEALS

A. The terms and conditions of this general permit, as they apply to the appropriate class of dischargers, are subject to appeal within thirty days of issuance of this general permit, in accordance with Chapter 43.21B RCW, and Chapter 173-226 WAC.

B. The terms and conditions of this general permit, as they apply to an individual discharger, are appealable in accordance with chapter 43.21b rcw within thirty days of the effective date of coverage of that discharger. Consideration of an appeal of general permit coverage of an individual discharger is limited to the general permit's applicability or nonapplicability to that individual discharger.

C. The appeal of general permit coverage of an individual discharger does not affect any other dischargers covered under this general permit. If the terms and conditions of this general permit are found to be inapplicable to any individual discharger(s), the matter shall be remanded to ecology for consideration of issuance of an individual permit or permits.

D. Modifications of this permit are appealable in accordance with chapter 43.21B RCW and chapter 173-226 WAC.

G17. PENALTIES

40 CFR 122.41(a)(2) and (3), 40 CFR 122.41(j)(5), and 40 CFR 122.41(k)(2) are hereby incorporated into this permit by reference.

DEFINITIONS AND ACRONYMS

"Best Management Practices" ("BMPs") means the schedules of activities, prohibitions of practices, maintenance procedures, and structural and/or managerial practices that when used singly or in combination, prevent or reduce the release of pollutants and other adverse impacts to waters of Washington State.

Bypass means the diversion of stormwater from any portion of a stormwater treatment facility.

"CWA" means Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972) Pub.L. 92-500, as amended Pub. L. 95-217, Pub. L. 95-576, Pub. L. (6-483 and Pub. L. 97-117, 33 U.S.C. 1251 et.seq.

"Component" or "Program Component" means the elements of the stormwater management program listed in Special Condition S7.

"Co-permittee" means an owner or operator of a municipal separate storm sewer (other than an incorporated city) located within a large or medium muncipality, and that is only responsible for permit conditions relating to the discharge for which it is operator.

"Director" means the Director of the Washington State Department of Ecology, or an authorized representative.

"Discharge" for the purpose of this permit, unless indicated otherwise, refers to discharges from Municipal Separate Storm Sewers of the permittees.

"40 CFR" means Title 40 of the Code of Federal Regulations, which is the codification of the general and permanent rules published in the Federal Register by the executive departments and agencies of the federal government.

"General Permit" means a permit which covers multiple dischargers of a point source category within a designated geographical area, in lieu of individual permits being issued to each discharger.

"Illicit discharge" means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

"Large Municipality" means an incorporated place with a population of 250,000 or more, a County with unincorporated urbanized areas with a population of 250,000 or more according to the 1990 decennial census by the Bureau of Census.

"Major Municipal Separate Storm Sewer Outfall" means a municipal separate storm sewer outfall from a single pipe with an inside diameter of 36 inches or more, or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive stormwater from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 12 acres or more).

"Medium Municipality" means an incorporated place with a population of more than 100,000 but less than 250,000, or a county with unincorporated urbanized areas of more than 100,000 but less than 250,000 according to the 1990 decennial census by the Bureau of Census.

"Municipal Separate Storm Sewer" means a conveyance, or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains): (i) owned or operated by a state, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State Law) having jurisdiction over disposal of wastes, storm water, or other wastes, including special districts under State Law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States; (ii) designed or used for collecting or conveying stormwater; (iii) which is not a combined sewer; and (iv) which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

"National Pollutant Discharge Elimination System" (NPDES) means the national program for issuing, modifying, revoking, and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under sections 307, 402, 318, and 405 of the Federal Clean Water Act, for the discharge of pollutants to surface waters of the state from point sources. These permits are referred to as NPDES permits and, in Washington State, are administered by the Washington Department of Ecology.

"Notice of Intent" (NOI) means the application for, or a request for coverage under this General Permit pursuant to WAC 173-226-200.

"Notice of Intent for Construction Activity," and "Notice of Intent for Industrial Activity" mean the application forms for coverage under the "Baseline General Permit for Stormwater Discharges Assoicated with Industrial Activities."

"Outfall" means point source as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the State and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels, or other conveyances which connect segments of the same stream or other waters of the State and are used to convey waters of the State.

"Runoff" see Stormwater.

"Shared Waterbodies" means waterbodies, including downstream segments, lakes and estuaries, that receive discharges from more than one permittee.

"Stormwater," for the purpose of this permit, means rainfall or snow melt runoff.

"Stormwater Associated with Industrial Activity" means the discharge from any conveyance which is used for collecting and conveying stormwater, which is directly related to manufacturing, processing or raw materials storage areas at an industrial plant, and is required to have an NPDES permit in accordance with 40 CFR 122.26.

"Storm Water Management Manual for Western Washington" means the 5-volume technical manual (Publication Nos. 99-11 through 15) prepared by Ecology for use by local governments that contains BMPs to prevent, control, or treat pollution in storm water.

"Waters of the State" includes those waters as defined as "waters of the United States" in 40 CFR Subpart 122.2 within the geographic boundaries of Washington State and "waters of the state" as defined in Chapter 90.48 RCW which includes lakes, rivers, ponds, streams, inland waters, underground waters, salt waters and all other surface waters and water courses within the jurisdiction of the State of Washington.

"Water Quality Standards" means Surface Water Quality Standards, Chapter 173-201A WAC, Ground Water Quality Standards, Chapter 173-200 WAC, and Sediment Management Standards, Chapter 173-204 WAC.

APPENDIX 1 – Minimum Technical Requirements for All New Development and Re-Development

This Appendix is an excerpt from the August 2000 (final draft) Stormwater Management Manual for Western Washington. After the final manual is published, this appendix will be revised to reflect the final language in the manual.

Definitions

Effective surface Those surfaces, pervious or impervious, that are connected via sheet flow or discrete conveyance to a drainage system.

Impervious surface. A hard surface area that either prevents or retards the entry of water into the soil mantle as under natural conditions prior to development. A hard surface area which causes water to run off the surface in greater quantities or at an increased rate of flow from the flow present under natural conditions prior to development. Common impervious surfaces include, but are not limited to, roof tops, walkways, patios, driveways, parking lots or storage areas, concrete or asphalt paving, gravel roads, packed earthen materials, and oiled, macadam or other surfaces which similarly impede the natural infiltration of stormwater. Open, uncovered retention/detention facilities shall not be considered as impervious surfaces.

Land disturbing activity Any activity that results in a change in the existing soil cover (both vegetative and nonvegetative) and/or the existing soil topography. Land disturbing activities include, but are not limited to demolition, construction, clearing, grading, filling, excavation, and compaction.

Major Receiving Water A surface waterbody of sufficient size such that adequate background water is available for dilution of treated stormwater discharges, and such that, within specified limits, stormwater may be discharged undetained without risk of significantly increasing the natural erosional forces on downgradient stream channels. An initial listing of major receiving waters is included in Appendix C. Local governments may petition for additions to or subtractions from the list.

New development Land disturbing activities, including Class IV -general forest practices that are conversions from timber land to other uses; structural development, including construction or installation of a building or other structure; creation of impervious surfaces; subdivision, short subdivision and binding site plans, as defined and applied in Chapter 58.17 RCW. All other forest practices and commercial agriculture are not considered new development.

Pollution-generating impervious surface (PGIS)

Those impervious surfaces considered to be a significant source of pollutants in stormwater runoff. Such surfaces include those which are subject to: vehicular use; industrial activities; or storage of erodible or leachable materials, wastes, or chemicals, and which receive direct rainfall or the run-on or blow-in of rainfall. Erodible or leachable materials, wastes, or chemicals are those substances which, when exposed to rainfall, measurably alter the physical or chemical characteristics of the rainfall runoff. Examples include erodible soils, uncovered process wastes, manure, fertilizers, oily substances, ashes, kiln dust, and garbage dumpster leakage. Metal roofs are also considered to be PGIS unless they are treated to prevent leaching.

A surface, whether paved or not, shall be considered subject to vehicular use if it is regularly used by motor vehicles. The following are considered regularly-used surfaces: roads, unvegetated road shoulders, bike lanes within the traveled lane of a roadway, driveways, parking lots, unfenced fire lanes, vehicular equipment storage yards, and airport runways.

The following are not considered regularly-used surfaces: road shoulders primarily used for emergency parking, paved bicycle pathways, bicycle lanes adjacent to unpaved or paved road shoulders primarily used for emergency parking, fenced firelanes, and infrequently used maintenance access roads.

Pollution-generating pervious surfaces (PGPS)

Any non-impervious surface subject to use of pesticides and fertilizers or loss of soil. Typical PGPS include lawns, landscaped areas, golf courses, parks, cemeteries, and sports fields.

Project site

That portion of a property or properties subject to proposed project improvements including those required by this manual.

Redevelopment

On an already developed site, the creation or addition of impervious surfaces; the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; land disturbing activities associated with structural or impervious redevelopment

Underground utility projects that replace the ground surface with in-kind material or materials with similar runoff characteristics are not considered redevelopment.

Replaced impervious surface — For structures, the removal and replacement of any exterior surfaces or foundation. For other impervious surfaces, the removal down to bare soil or base course and replacement, excluding impervious surfaces removed for the sole purpose of installing underground utilities.

Site — The legal boundaries of a parcel or parcels of land that is (are) subject to new or redevelopment.

Source control BMP — A BMP that is intended to prevent pollutants from entering stormwater. This manual separates source control BMPs into two types. *Structural Source Control BMPs* are physical, structural, or mechanical devices that are intended to prevent pollutants from entering stormwater. *Operational BMPs* are schedules of activities, prohibition of practices, and other managerial practices to prevent or reduce pollutants from entering stormwater. See Volume IV for details.

Threshold Discharge Area — An onsite area draining to a single natural discharge location or multiple natural discharge locations that combine within one-quarter mile downstream (as determined by the shortest flowpath). The examples in Figure 2.1 below illustrate this definition.

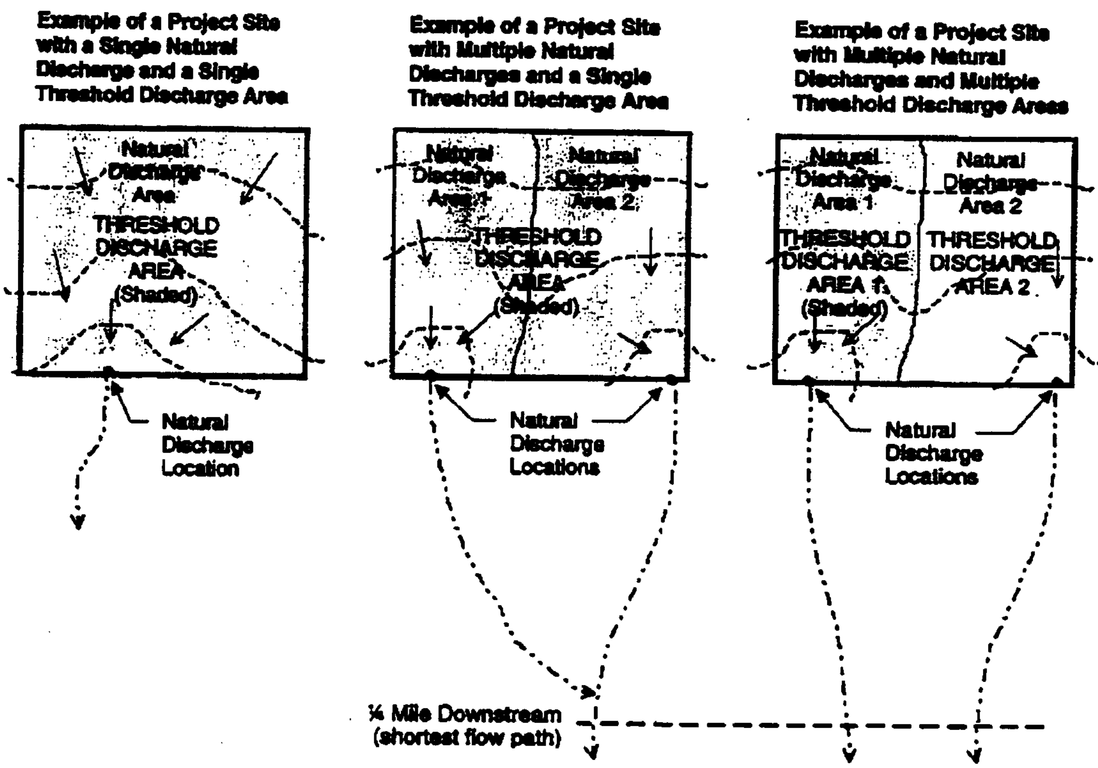

Figure 2.1. Threshold Discharge Areas

Exemptions

Forest practices regulated under Title 222 WAC, except for Class IV General forest practices that are conversions from timber land to other uses, are exempt from the provisions of the minimum requirements.

Commercial agriculture practices involving working the land for production are generally exempt. However, the conversion from timberland to agriculture, and the construction of impervious surfaces are not exempt.

All other new development is subject to the minimum requirements.

Thresholds for Application of Minimum Requirements to New Development and Redevelopment

New Development

All new development that includes the creation or addition of 2,000 square feet or greater, of new impervious surface area, and/or land disturbing activity of 7,000 square feet or greater, shall comply with Minimum Requirements #1 through #5. Projects not exceeding those thresholds shall apply Minimum Requirement #2.

All new development that:

- Creates or adds 5,000 square feet, or greater, of new impervious surface area, or
- Converts ¾ acres of pervious surfaces to lawn or landscaped areas, or
- Converts 2.5 acres of forested area to pasture,

shall comply with Minimum Requirements #1 through # 10

Redevelopment

All redevelopment projects in which the new, replaced, or total of *new plus replaced* impervious surfaces is 2,000 square feet or more, or that disturb 7,000 square feet or more of land, must comply with Minimum Requirements #1 through #5 for the new and replaced impervious surfaces and the land disturbed. Projects not exceeding those thresholds shall apply Minimum Requirement #2.

Redevelopment projects that:

- Add 5,000 square feet or more of *new* impervious surfaces, or

- Convert ¾ acres of pervious surfaces to lawn or landscaped areas, or
- Convert 2.5 acres of forested area to pasture,

must comply with Minimum Requirements #1 through #10 for the new impervious surfaces and the converted pervious surfaces. If the runoff quantity from the new surfaces is not separated from runoff from other surfaces prior to treatment or flow control, the stormwater facilities must be sized for the entire flow. Alternatively, the local government may allow the Minimum Requirements to be met for an equivalent (flow and pollution characteristics) area within the same site. For public roads' projects, the equivalent area must drain to the same receiving water.

Application of stormwater requirements to the entire site:

Local governments shall adopt a threshold(s) for redevelopment projects which, if exceeded, shall cause an entire site undergoing redevelopment to comply with Minimum Requirements #1 through #10. This includes the new, replaced, and existing pervious and impervious surfaces. Ecology will use the following as the standards against which to judge alternative requirements:

- For public transportation projects, runoff from the existing, replaced, and new impervious surfaces (including pavement, shoulders, curbs, and sidewalks) shall meet all the Minimum Requirements if the new impervious surfaces total 5,000 square feet or more and total 50% or more of the existing impervious area within the project limits.
- Other types of redevelopment projects, in which the total of new plus replaced impervious surfaces is 5,000 square feet or more, and whose valuation of proposed improvements – including interior improvements – exceeds 50% of the assessed value of the existing site improvements (or, exceeds 50% of the replacement value as determined by the Marshall Valuation System, or some similar replacement value system), shall comply with all the Minimum Requirements for the entire site.

A local government may exempt redevelopment projects from compliance with Minimum Requirements for treatment, flow control, and wetlands protection if the local government has adopted a plan that fulfills those requirements in regional facilities that will discharge to the same receiving water, AND if they have an implementation plan and a schedule for completing construction of those facilities within five years. Redevelopment projects for public roads may be exempted from Minimum Requirements for treatment, flow control, and wetlands protection for the entire site (i.e., the exemption does not extend to new surfaces that add impervious area) if the local government constructs stormwater facilities for an equivalent amount of existing road surface within two years.

Minimum Requirements

Minimum Requirement #1 Preparation of Stormwater Site Plans

All projects shall prepare a stormwater site plan for local government review.

Minimum Requirement #2: Construction Stormwater Pollution Prevention (SWPP)

All new development and redevelopment shall comply with Construction SWPP Elements #1 through #12 below.

Projects that add or replace 2,000 square feet or more of impervious surface or clear more than 7,000 square feet must prepare a Construction SWPPP that is reviewed by the Plan Approval Authority of the local government. Each of the twelve elements must be considered and included in the Construction SWPPP unless site conditions render the element unnecessary and the exemption from that element is clearly justified in the narrative of the SWPPP.

Projects that add or replace less than 2,000 square feet of impervious surface or clearing projects of less than 7,000 square feet are not required to prepare a Construction SWPPP, but must consider all of the twelve Elements of Construction Stormwater Pollution Prevention and develop controls for all elements that pertain to the project site.

Element 1: Mark Clearing Limits

- Prior to beginning earth disturbing activities, including clearing and grading, all clearing limits, , sensitive areas and their buffers, and trees that are to be preserved within the construction area should be clearly marked, both in the field and on the plans, to prevent damage and offsite impacts.
    - Plastic, metal, or stake wire fence may be used to mark the clearing limits.

Element 2: Establish Construction Access

- Construction vehicle access and exit shall be limited to one route if possible.
  - Access points shall be stabilized with quarry spall or crushed rock to minimize the tracking of sediment onto public roads.
  - Wheel wash or tire baths should be located on-site, if applicable.
  - Public roads shall be cleaned thoroughly at the end of each day. Sediment shall be removed from roads by shoveling or pickup sweeping and shall be transported to a controlled sediment disposal area. Street washing will be allowed only after sediment is removed in this manner.
  - Street wash wastewater shall be controlled by pumping back on-site, or otherwise be prevented from discharging into systems tributary to state surface waters.

Element 3: Control Flow Rates

- Properties and waterways downstream from development sites shall be protected from erosion due to increases in the volume, velocity, and peak flow rate of stormwater runoff from the project site, as required by local plan approval authority.
  - Downstream analysis is necessary if changes in offsite flows could impair or alter conveyance systems, streambanks, bed sediment or aquatic habitat. See Volume 1, Chapter 3 for offsite analysis
  - Stormwater detention facilities shall be constructed as one of the first steps in grading. Detention facilities shall be functional prior to construction of site improvements (e.g. impervious surfaces).
  - The local permitting agency may require pond designs that provide additional or different stormwater flow control if necessary to address local conditions or to protect properties and waterways downstream from erosion due to increases in the volume, velocity, and peak flow rate of stormwater runoff from the project site.
  - If permanent infiltration ponds ar used for flow control during construction, these facilities should be protected from siltation during the construction phase.

Element 4: Install Sediment Controls

- The duff layer, native top soil, and natural vegetation shall be retained in an undisturbed state to the maximum extent practicable.
    - Prior to leaving a construction site, or prior to discharge to an infiltration facility, stormwater runoff from disturbed areas shall pass through a sediment pond or other appropriate sediment removal BMP. Runoff from fully stabilized areas may be discharged without a sediment removal BMP, but must meet the flow control performance standard of Element #3, bullet #1. Full stabilization means concrete or asphalt paving; quarry spalls used as ditch lining; or the use of rolled erosion products, a bonded fiber matrix product, or vegetative cover in a manner that will fully prevent soil erosion. The Local Permitting Authority shall inspect and approve areas stabilized by means other than pavement or quarry spalls.
    - Sediment ponds vegetated buffer strips, sediment barriers or filters, dikes, and other BMPs intended to trap sediment on-site shall be constructed as one of the first steps in grading. These BMPs shall be functional before other land disturbing activities take place.
    - Earthen structures such as dams, dikes, and diversions shall be seeded and mulched according to the timing indicated in Element #5.

Element 5: Stabilize Soils

- All exposed and unworked soils shall be stabilized by application of effective BMPs, that protect the soil from the erosive forces of raindrop impact and flowing water, and wind erosion.
    - From October 1 through April 30, no soils shall remain exposed and unworked for more than 2 days. From May 1 to September 30, no soils shall remain exposed and unworked for more than 7 days. This condition applies to all soils on site, whether at final grade or not. These time limits may be adjusted by the local permitting authority if it can be shown that the average time between storm events justifies a different standard.
    - Applicable practices include, but are not limited to, temporary and permanent seeding, sodding, mulching, plastic covering, soil application of polyacrylamide

(PAM), and the early application of gravel base on areas to be paved and dust control.

- Soil stabilization measures selected should be appropriate for the time of year, site conditions, estimated duration of use, and potential water quality impacts that stabilization agents may have on downstream waters or ground water.
- Soil stockpiles must be stabilized and protected with sediment trapping measures.
- Work on linear construction sites and activities, including right-of-way and easement clearing, roadway development, pipelines, and trenching for utilities, shall not exceed the capability of the individual contractor for his portion of the project to install the bedding materials, roadbeds, structures, pipelines, and/or utilities, and to re-stabilize the disturbed soils, meeting the timing conditions (From October 1 through April 30, no soils shall remain exposed and unworked for more than 2 days. From May 1 to September 30, no soils shall remain exposed and unworked for more than 7 days).

Element 6: Protect Slopes

- Cut and fill slopes shall be designed and constructed in a manner that will minimize erosion.
  - Consider soil type and its potential for erosion.
  - Reduce slope runoff velocities by reducing the continuous length of slope with terracing and diversions, reduce slope steepness, and roughen slope surface.
  - Divert upslope drainage and run-on waters from off-site with interceptors at top of slope. Off-site stormwater should be handled separately from stormwater generated on the site. Diversion of off-site stormwater around the site may be a viable option. Diverted flows shall be redirected to the natural drainage location at or before the property boundary.
  - Contain downslope collected flows in pipes, slope drains, or protected channels.
  - Provide drainage to remove ground water intersecting the slope surface of exposed soil areas.
  - Excavated material shall be placed on the uphill side of trenches, consistent with safety and space considerations.
  - Check dams shall be placed at regular intervals within trenches, which are cut down a slope.
  - Stabilize soils on slopes, as specified in Element #5.

Element 7: Protect Drain Inlets

- All storm drain inlets made operable during construction shall be protected so that stormwater runoff shall not enter the conveyance system without first being filtered or treated to remove sediment.
    - All approach roads shall be kept clean, and all sediment and street wash water shall not be allowed to enter storm drains without prior and adequate treatment unless treatment is provided before the storm drain discharges to a water of the State.

Element 8: Stabilize Channels and Outlets

- All temporary on-site conveyance channels shall be designed, constructed and stabilized to prevent erosion from the expected velocity of flow from a 2 year, 24-hour frequency storm for the developed condition.
    - Stabilization, including armoring material, adequate to prevent erosion of outlets, adjacent streambanks, slopes and downstream reaches shall be provided at the outlets of all conveyance systems.

Element 9: Control Pollutants

- All pollutants, including waste materials and demolition debris, that occur on-site during construction shall be handled and disposed of in a manner that does not cause contamination of stormwater.
    - Cover, containment, and protection from vandalism shall be provided for all chemicals, liquid products, petroleum products, and non-inert wastes present on the site (see Chapter 173-304 WAC for the definition of inert waste).
    - Maintenance and repair of heavy equipment and vehicles involving oil changes, hydraulic system drain down, solvent and de-greasing cleaning operations, fuel tank drain down and removal, and other activities which may result in discharge or spillage of pollutants to the ground or into stormwater runoff must be conducted using spill prevention measures, such as drip pans. Contaminated surfaces shall be cleaned immediately following any discharge or spill incident. Emergency repairs may be performed on-site using temporary plastic placed beneath and, if raining, over the vehicle.
    - Wheel wash, or tire bath wastewater, shall be discharged to a separate on-site treatment system or to the sanitary sewer.
    - Application of agricultural chemicals, including fertilizers and pesticides, shall be conducted in a manner and at application rates that will not result in loss of

chemical to stormwater runoff. Manufacturers' recommendations shall be followed for application rates and procedures.

- Management of pH-modifying sources shall prevent contamination of runoff and stormwater collected on the site. These sources include, but are not limited to, bulk cement, cement kiln dust, fly ash, new concrete washing and curing waters, waste streams generated from concrete grinding and sawing, exposed aggregate processes, and concrete pumping and mixer washout waters.

Element 10: Control De-Watering

- All foundation, vault, and trench de-watering water, which has similar characteristics to stormwater runoff at the site, shall be discharged into a controlled conveyance system, prior to discharge to a sediment trap or sediment pond. Channels must be stabilized, as specified in Element #8.
  - Clean, non-turbid de-watering water, such as well-point ground water, can be discharged to systems tributary to state surface waters, as specified in Element #8, provided the de-watering flow does not cause erosion or flooding of the receiving waters. These clean waters should not be routed through sediment ponds with stormwater.
  - Highly turbid or otherwise contaminated dewatering water, such as from construction equipment operation, clamshell digging, concrete tremie pour, or work inside a cofferdam, shall be handled separately from stormwater at the site.
  - Other disposal options, depending on site constraints, may include: 1) infiltration, 2) transport off-site in vehicle, such as a vacuum flush truck, for legal disposal in a manner that does not pollute state waters, 3) on-site treatment using chemical treatment or other suitable treatment technologies, or 4) sanitary sewer discharge with local sewer district aproval if there is no other option.

Element 11: Maintain BMPs

- All temporary and permanent erosion and sediment control BMPs shall be maintained and repaired as needed to assure continued performance of their intended function. All maintenance and repair shall be conducted in accordance with BMPs.
  - Sediment control BMPs shall be inspected weekly or after a runoff-producing storm event during the dry season and daily during the wet season.

- All temporary erosion and sediment control BMPs shall be removed within 30 days after final site stabilization is achieved or after the temporary BMPs are no longer needed. Trapped sediment shall be removed or stabilized on site. Disturbed soil areas resulting from removal of BMPs or vegetation shall be permanently stabilized.

Element 12: Manage The Project

- Phasing of construction

  Development projects shall be phased where feasible in order to prevent, to the maximum extent practicable, the transport of sediment from the development site during construction. Revegetation of exposed areas and maintenance of that vegetation shall be an integral part of the clearing activities for any phase.

  Clearing and grading activities for developments shall be permitted only if conducted pursuant to an approved site development plan (e.g., subdivision approval) that establishes permitted areas of clearing, grading, cutting, and filling. When establishing these permitted clearing and grading areas, consideration should be given to minimizing removal of existing trees and minimizing disturbance/compaction of native soils except as needed for building purposes. These permitted clearing and grading areas and any other areas required to preserve critical or sensitive areas, buffers, native growth protection easements, or tree retention areas as may be required by local jurisdictions, shall be delineated on the site plans and the development site.

- Seasonal work Limitations

  From October 1 through April 30, clearing, grading, and other soil disturbing activities shall only be permitted if shown to the satisfaction of the local permitting authority that silt-laden runoff will be prevented from leaving the construction site through a combination of the following:

  1. Site conditions including existing vegetative coverage, slope, soil type and proximity to receiving waters; and
  2. Limitations on activities and the extent of disturbed areas; and
  3. Proposed erosion and sediment control measures.

  Based on the information provided, and/or local weather conditions, the local permitting authority may expand or restrict the seasonal limitation on site disturbance. If, during the course of any construction activity or soil disturbance during the seasonal limitation period, silt-laden runoff leaving the construction site causes a violation of the surface water quality standard or if clearing and grading limits or erosion and sediment control measures shown in the approved plan are not maintained, the local permitting authority shall take enforcement action, including, but not limited to a notice of violation, administrative order, penalty, or stop-work order.

The following activities are exempt from the seasonal clearing and grading limitations:

1. Routine maintenance and necessary repair of erosion and sediment control BMPs;

2. Routine maintenance of public facilities or existing utility structures that do not expose the soil or result in the removal of the vegetative cover to soil; and

3. Activities where there is one hundred percent infiltration of surface water runoff within the site in approved and installed erosion and sediment control facilities

- Coordination with utilities and other contractors

  The primary project proponent shall evaluate, with input from utilities and other contractors, the stormwater management requirements for the entire project, including the utilities, when preparing the Construction SWPPP.

- Inspection and Monitoring

  All BMPs shall be inspected, maintained, and repaired as needed to assure continued performance of their intended function.

  A Certified Professional in Erosion and Sediment Control shall be identified in the Construction SWPPP and shall be on-site or on-call at all times. Certification may be through the WSDOT/AGC Construction Site Erosion and Sediment Control Certification Program or any equivalent local or national certification and/or training program.

  Sampling and analysis of the stormwater discharges from a construction site may be necessary on a case-by-case basis to ensure compliance with standards. Monitoring and reporting requirements may be established by the local permitting authority when necessary.

Whenever inspection and/or monitoring reveals that the BMPs identified in the Construction SWPPP are inadequate, due to the actual discharge of or potential to discharge a significant amount of any pollutant, the SWPPP shall be modified, as appropriate, in a timely manner.

- Maintenance of the Construction SWPPP

  The Construction SWPPP shall be retained on-site or within reasonable access to the site. The Construction SWPPP shall be modified whenever there is a significant change in the design, construction, operation, or maintenance of any BMP.

Minimum Requirement #3: Source Control Of Pollution

All known, available and reasonable source control BMPs shall be applied to all projects. Source control BMPs shall be selected, designed, and maintained according to this manual.

Minimum Requirement #4: Preservation of Natural Drainage Systems and Outfalls

Natural drainage patterns shall be maintained, and discharges from the site shall occur at the natural location, to the maximum extent practicable. The manner by which runoff is discharged from the project site must not cause a significant adverse impact to downstream receiving waters and downgradient properties. All outfalls require energy dissipation.

Minimum Requirement #5: On-site Stormwater Management

Projects shall employ Onsite Stormwater Management BMPs to infiltrate, disperse, and retain stormwater runoff onsite to the maximum extent practicable without causing flooding or erosion impacts.

Minimum Requirement #6: Runoff Treatment

Thresholds. The following require construction of stormwater treatment facilities that are sized to treat runoff from the water quality design storm:

- Projects in which the total of effective, pollution-generating impervious surface (PGIS) is 5,000 square feet or more in a threshold discharge area of the project, or
- Projects in which the total of effective, pollution-generating pervious surfaces (PGPS) is three-quarters (3/4) of an acre or more in a threshold discharge area, and from which there is a surface discharge in a natural or man-made conveyance system from the site.

Treatment Facility Sizing. Treatment facilities shall be sized to treat runoff from the water quality design storm, defined as the 24-hour rainfall amount with a 6-month return frequency. Approved single event hydrograph methods identified in Volume III shall be used to identify runoff volumes and peak flow rates for design purposes. Alternative methods can be used if they identify volumes and flow rates that are at least equivalent.

That portion of any development project in which the above PGIS or PGPS thresholds are not exceeded in a threshold discharge area shall apply On-site Stormwater Management BMPs in accordance with Minimum Requirement #5.

Table 2.1 Treatment Requirements by Threshold Discharge Area

	< ¾ acres of PGPS	≥ ¾ acres PGPS	< 5,000 sf PGIS	≥ 5,000 sf PGIS
Treatment Facilities		✔		✔
Onsite Stormwater BMPs	✔	✔	✔	✔

PGPS = pollution-generating pervious surfaces

PGIS = pollution-generating impervious surfaces

sf = square feet

Required Treatment Levels

Basic Treatment. Stormwater discharges to major receiving waters and waters not otherwise designated below shall provide facilities that meet the Basic Treatment Performance Goal of 80% removal of total suspended solids for storms up through the water quality design storm event. The Basic Treatment Menu in Volume V identifies treatment options to achieve the goal.

Enhanced Treatment. Stormwater discharges from industrial, commercial, and multi-family sites, and from arterials and highways to fish-bearing streams, to waters tributary to fish-bearing streams, and to small lakes shall provide facilities that meet the Enhanced Treatment Performance Goal of increased capacity for dissolved metals removal for storms up through the water quality design storm event. The Enhanced Treatment Menu in Volume V identifies treatment options to achieve the goal.

Phosphorus Treatment. Stormwater discharges to waters that drain to lakes where eutrophication concerns have been identified by local governments shall provide facilities that meet the Phosphorus

Treatment Performance Goal of 50% total phosphorus removal for storms up through the water quality design storm event. The Phosphorus Treatment Menu in Volume V identifies treatment options to achieve the goal.

Oil Control. Stormwater discharges from High-Use Sites shall provide facilities that meet the Oil Control Performance Goals of no visible sheen and 10 mg/l of Total Petroleum Hydrocarbons (TPH). The Oil Control Menu in Volume V identifies treatment options.

Additional Requirements. Direct discharge of untreated stormwater from pollution-generating impervious surfaces to ground water is prohibited, except for that achieved by infiltration or dispersion of runoff through use of Onsite Stormwater BMPs. All treatment facilities shall be selected, designed, and maintained according to a local government manual deemed equivalent to this manual.

Minimum Requirement #7: Flow Control

Applicability. Projects must provide flow control to reduce the impacts of increased stormwater runoff from new impervious surfaces and land cover conversions._The requirement below applies wherever stormwater runoff is discharged to surface waters unless the discharge qualifies for a direct discharge exemption to a major receiving water, or the discharge is to a wetland. This requirement must be met in addition to meeting Minimum Requirement #6, Runoff Treatment.

Thresholds. The following require construction of flow control facilities and/or land use management BMPs that will achieve the standard requirement for Western Washington:

- Projects in which the total of effective impervious surfaces is 10,000 square feet or more in a threshold discharge area, or
- Projects that convert ¾ acres or more of pervious surfaces to lawn or landscape, or convert 2.5 acres or more of forested area to pasture in a threshold discharge area, and from which there is a surface discharge in a natural or man-made conveyance system from the site.

That portion of any development project in which the above thresholds are not exceeded in a threshold discharge area shall apply Onsite Stormwater Management BMPs in accordance with Minimum Requirement #5 .

Table 2.2 Flow Control Requirements by Threshold Discharge Area

	< ¾ acres conversion to lawn/land-	≥ ¾ acres conversion to lawn/land-	< 10,000 square feet of effective	≥ 10,000 square feet of effective

	scape, or < 2.5 acres of forest to pasture	scape, or ≥ 2.5 acres of forest to pasture	impervious area	impervious area
Flow Control Facilities		✔		✔
Onsite Stormwater Management BMPs	✔	✔	✔	✔

Western Washington Standard Requirement: Applies to the geographic areas designated as regions 3 and 4 in NOAA Atlas #2 (Miller et al, 1973)(9).

Stormwater discharges shall match developed discharge durations to predeveloped durations for the range of predeveloped discharge rates from 50% of the 2-year peak flow up to the full 50-year peak flow. In addition, the developed peak discharge rates shall not exceed the pre-developed peak discharge rates for 2-,10-, and 50-year return periods.

Unless reasonable, historic, site-specific information is provided to the contrary, the applicant shall use the historic vegetation map in the Ecology Hydrology Model to determine the pre-developed condition.

This standard requirement is waived for sites that will reliably infitrate all the runoff from impervious surfaces and converted pervious surfaces.

Western Washington Alternative Requirement. An alternative requirement may be established through application of watershed-scale hydrological modeling and supporting field observations. Possible reasons for an alternative flow control requirement include:

- Establishment of a stream–specific threshold of significant bedload movement other than the assumed 50% of the 2-year peak flow;
- Zoning and Land Clearing Ordinance restrictions that, in combination with an alternative flow control standard, maintain or reduce the naturally occurring erosive forces on the stream channel; or

- A duration control standard is not necessary for protection, maintenance, or restoration of designated beneficial uses or Clean Water Act compliance.

Additional Requirement. Flow Control BMPs shall be selected, designed, and maintained according to a local government manual deemed equivalent to this manual.

Direct Discharge Exemption. A threshold discharge area is exempt from Minimum Requirement #7 if it drains to one of the major receiving waters listed in the glossary, AND meets all of the following criteria for direct discharge (i.e., undetained discharge) to that receiving water:

1. The area must be drained by a conveyance system that is comprised entirely of manmade conveyance elements (e.g., pipes, ditches, outfall protection, etc.) and extends to the ordinary high water line of the major receiving water. If such a system does not currently exist, one may be provided subject to the following conditions:
   - The new conveyance system (entirely man-made) must not divert flow from or increase flows to an existing wetland, stream, or near-shore habitat sufficient to cause a significant adverse impact, AND
   - If the new conveyance system drains to a river designated as a major receiving water and some or all of the new portion of the system is within one-quarter mile of the 100-year floodplain for that river, the area qualifying for the exemption must be limited to existing parcels that discharge to the system within the on-quarter mile distance.
2. Any erodible elements of the manmade conveyance system for the area must be adequately stabilized to prevent erosion.
3. Surface water from the area must not be diverted from or increased to an existing wetland, stream, or near-shore habitat sufficient to cause a significant adverse impact.

Minimum Requirement #8: Wetlands Protection

Applicability. The requirements below apply only to situations where stormwater discharges directly or indirectly through a conveyance system into a wetland, and must be met in addition to meeting Minimum Requirement #6, Runoff Treatment.

Thresholds. The thresholds identified in Minimum Requirement #6 – Runoff Treatment, and Minimum Requirement #7 – Flow Control shall also be applied for discharges to wetlands.

Standard Requirement. Discharges to wetlands shall maintain the hydrologic conditions, hydrophytic vegetation, and substrate characteristics necessary to support existing and designated uses unless an assessment is completed consistent with the criteria listed in "Wetlands and Stormwater Management Guidelines" of the publication, "Wetlands and Urbanization, Implications for the Future", the final report of the Puget Sound Wetland and Stormwater Management Research Program, 1997. Those guidelines (see Appendix D) shall be used for discharges to natural wetlands and wetlands constructed as mitigation.

Additional Requirements. The standard requirement does not excuse any discharge from the obligation to apply whatever technology is necessary to comply with state water quality standards, Chapter 173-201A WAC, or state ground water standards, Chapter 173-200 WAC. Additional treatment requirements to meet those standards may be required by federal, state, or local governments.
Stormwater treatment and flow control facilities shall not be built within a natural vegetated buffer, except for necessary conveyance systems as approved by the local government.

An adopted and implemented basin plan (Minimum Requirement #9), or a Total Maximum Daily Load (TMDL, also known as a Water Clean-up Plan) may be used to develop requirements for wetlands that are tailored to a specific basin.

Minimum Requirement #9: Basin/Watershed Planning

Projects may be subject to equivalent or more stringent minimum requirements for erosion control, source control, treatment, wetlands protection, and operation and maintenance, and alternative requirements for flow control as identified in Basin/Watershed Plans. Basin/Watershed plans shall evaluate and include, as necessary, retrofitting urban stormwater BMPs into existing development and/or redevelopment in order to achieve watershed-wide pollutant reduction and flow control goals that are consistent with requirements of the federal Clean Water Act. Standards developed from basin plans shall not modify any of the above minimum requirements until the basin plan is formally adopted and implemented by the local governments within the basin, and approved or concurred with by the Department of Ecology.

Minimum Requirement #9: Operation and Maintenance

An operation and maintenance manual that is consistent with the local government standards shall be provided for all proposed stormwater facilities and BMPs, and the party (or parties) responsible for maintenance and operation shall be identified. At private facilities, a copy of the manual shall be retained onsite or within reasonable access to the site, and shall be transferred with the property to the new owner. For public facilities, a copy of the manual shall be retained in the appropriate department. A log of maintenance activity that indicates what actions were taken and where waste was disposed of shall be kept and be available for inspection by the local government.

APPENDIX 2

GUIDANCE FOR DETERMINING CONSTRUCTION SITE SEDIMENT TRANSPORT POTENTIAL

The following rating system allows objective evaluation of a particular development site's potential to discharge sediment.

1. Using the rating system below, determine the total points for each development site. The definitions and soil categorization information to be used in the rating system are listed in items #2 and #3.

CONSTRUCTION SITE SEDIMENT TRANSPORT POTENTIAL

	Points
A. Existing slope of site (average, weighted by areal extent):	
2% or less	0
>2-5%	5
>5-10%	15
>10-15%	30
>15%	50
B. Site Area to be cleared and/or graded:	
<5,000 sq. ft.	0
5,000 sq. ft. – 2 acre	30
>2 acres	50
C. Quantity of cut and/or fill on site:	
<500 cubic yards	0
500 – 5,000 cubic yards	5
>5,000 – 10,000 cubic yards	10
>10,000 – 20,000 cubic yards	25
>20,000 cubic yards	40
D. Runoff potential of predominant soils (Soil Conservation Service):	
Hydrologic soil group A	0
Hydrologic soil group B	10
Hydrologic soil group C	20
Hydrologic soil group D	40
E. Erosion Potential of predominant soils (Unified Classification System):	
GW, GP, SW, SP soils	0
Dual classifications (GW-GM, GP-GM, GW-GC, GP-GC, SW-SM, SW-SC, SP-SM, SP-SC)	10
GM, GC, SM, SC soils	20
ML, CL, MH, CH soils	40
F. Depth of cut or height of fill >10 feet	25
G. Clearing and grading will occur in the wet season (October 1 – May 1)	50
TOTAL	________

2. Definitions Used in the Rating System

A. Hydraulic nearness – runoff from the site discharges to the sensitive feature without significant natural attenuation of flows that allows for suspended solids removal. The conditions that render a site hydraulically near to a sensitive feature include, but are not limited to, the following:

   i. the site is 200 feet or less uphill from the sensitive feature or its buffer; or
   ii. runoff from the site is tightlined to the sensitive feature or flows to the sensitive feature through a channel or ditch; or
   iii. one of the following does not occur before runoff from the site enters the sensitive feature: sheet flow through a vegetated area with dense ground cover; flow through a wetland not included as a sensitive feature; or a significant shallow or adverse slope, not in a conveyance channel, between the site and the sensitive feature.

B. Sediment/erosion sensitive feature – areas subject to significant degradation due to the effect of construction runoff or areas requiring special protection to prevent erosion. These areas include, but are not limited to, the following:

   i. Salmonid bearing fresh water streams and their tributaries or freshwater streams that would be Salmonid bearing if not for anthropogenic barriers;
   ii. Lakes;
   iii. Category I, II, and III wetlands;
   iv. Marine near-shore habitat;
   v. Sites containing contaminated soils where erosion could cause dispersal of contaminants; and
   vi. Steep slopes (25% or greater) associated with one of the above features.

3. Soil Categorization for Use in Rating System

If soil testing has been performed on site, the results should be used to determine the predominant soil type on the site. Otherwise, soil information should be obtained from the county soil survey for the classification and runoff potential of the site's predominant soils.

When using the Soil Survey, the dominant soil type may be in question, particularly when the site falls on a boundary between two soil types or when one of two soil types may be present on a site. In this case, the soil type resulting in the most points on the rating system will be assumed unless site soil tests indicate that another soil type dominates the site.

4. Use the point score from Step #1 to determine whether the development site has a high potential for sediment transport.

Total Score	Erosion Potential
<80	Low
≥80	High

R0019983

Appendix 3

CLEARING & GRADING APPROVAL

All proposed clearing and grading activities must be reviewed and approved by the local jurisdiction.

Suggested activities to be exempted include:

(a) Agricultural crop management;

(b) Cemetery graves;

(c) Routine landscape management;

(d) Road maintenance or other public infrastructure maintenance consistent with the 4(d) rule;

(e) Minor landscape installation;

(f) Emergency and/or hazard situations;

(g) Minor excavation work (e.g., less than 100 cubic yards/5 foot cut);

(h) Minor fill work (e.g., less than 100 cubic yards/3 foot fill); and

(i) Clearing less than one thousand square feet where the existing zoning is single-family residential within the urban growth boundary.

The jurisdiction may review and approve clearing and grading activities through one or more of the following mechanisms:

1. Building permit.
2. Clearing and/or grading permit.
3. Conditional use permit.
4. Approval of a forest management plan.
5. Approval of utility extension plans.
6. Approval of a property access road to an existing developed property.
7. Approval of street, water, storm and sanitary sewer capital improvement projects.
8. Approval of street, water, storm and sanitary sewer construction drawings for a preliminary plat, approved short plat, or other approved development.
9. Approval of a shorelines substantial development permit or shorelines management exemption for the subject property by the local permitting authority and after expiration of all appeal periods pursuant to WAC 173-14-180.
10. Special permission of the permit authority for site work under 500 cubic yards based on a demonstration that extenuating circumstances are present and that the project is consistent with the intent and purposes of the 4(d) rule, in conjunction with a clearing, grading, and drainage plan with erosion and sedimentation control, landscaping, soil stabilization and surface groundcover elements including continuing maintenance.
11. Other permits or approvals as approved by the 4(d) rule certifying agency.

Appendix 4

GUIDANCE FOR IDENTIFYING SITES REQUIRING SOURCE CONTROL INSPECTIONS

Use this attachment to identify sites with potential outdoor pollutant-generating sources that should be inspected to identify and enforce applicable source control standards (*note: see last page for additions, deletions, and qualifiers*). The following types of land uses/businesses (manufacturing, transportation, communication, wholesale, retail, service - based on the 1987 Standard Industrial Classification codes, and public agencies) should be included on the jurisdiction's inspection list and 5-year inspection schedule/plan.

Manufacturing Businesses

Cement
SIC: 3241 **
Description: These businesses produce Portland cement, the binder used in concrete for paving, buildings, pipe and other structural products. The three basic steps in cement manufacturing are 1) proportioning, grinding, and blending raw materials; 2) heating raw materials to produce a hard, stony substance known as clinker; and 3) combining the clinker with other materials and grinding the mixture into a fine powdery form. The raw materials include limestone, silica, alumina, iron, chalk, oyster shell marl, or shale. Waste materials from other industries are often used such as slag, fly ash and spent blasting sand. Raw materials are crushed, mixed and heated in a kiln to produce the correct chemical composition. Kilns typically are coal, gas, or oil fired. The output of the kiln is a clinker that is ground to produce the final product.

The basic process may be wet or dry. In the wet process water is mixed with the raw ingredients in the initial crushing operation and in some cases is used to wash the material prior to use. Water may also be used in the air pollution control scrubber. The most significant waste material from cement production is the kiln dust. Concrete products may also be produced at ready-mix concrete facilities. Refer to "Concrete Products" for a description of the BMPs appropriate to these activities.

Potential Pollutant Generating Sources: Stormwater may be contaminated during the crushing, grinding, storage, and handling of kiln dust, limestone, shale, clay, coal, clinker, gypsum, anhydrite, slag, sand and product and at the vehicle and equipment maintenance, fueling, and cleaning areas. Total suspended solids, aluminum, iron and other heavy metals, pH, COD, potassium, sulfate, and oil and grease are some of the potential pollutants. The following mean concentrations in stormwater discharges have been reported EPA's multi-sector permit fact sheet (7) : TSS=1067, COD=107.5, aluminum=72.6, iron=7.5, all in mg/L, and pH=2-12. These values may be useful in characterizing stormwater contaminants at cement manufacturing facilities.

Chemicals Manufacturing
SIC: 2800 **, 3861 **
Description: This group is engaged in the manufacture of chemicals, or products based on chemicals such as acids, alkalis, inks (2893) ** , chlorine, industrial gases, pigments, chemicals used in the production of synthetic resins (2869 **), fibers and plastics, synthetic rubber, soaps and cleaners (2840) ** , pharmaceuticals (2834) * , cosmetics, paints (2850) * , varnishes, resins (2861) * , photographic materials, chemicals (3861), organic chemicals (2869) ** , agricultural chemicals (2879) ** , adhesives, sealants (2891) ** , and ink (2893) ** .

Potential Pollutant Generating Sources: Activities that can contaminate stormwater include bagging, blending, packaging, crushing, milling, shredding, granulation, grinding, storage, distribution, loading/unloading, and processing of materials; equipment storage; application of fertilizers; foundries; lime application; use of machinery; material handling and warehousing; cooling towers; fueling; boilers; hazardous waste treatment, storage and disposal; wastewater treatment; plant yard areas of past industrial activity; access roads and tracks; drum washing, and maintenance and repair.

Chemical businesses in the Seattle area surveyed for Dangerous Wastes have been found to produce waste caustic solutions, soaps, heavy metal solutions, inorganic and organic chemicals, solvents, acids, alkalis, paints, varnishes, pharmaceuticals, and inks. The potential pollutants include BOD, TSS, COD, oil and grease, pH, total phosphorus, nitrates, nitrites, total Kjeldahl nitrogen, ammonia, specific organics, and heavy metals. EPA stormwater multi-sector permit fact sheet data (7) includes the following mean values in mg/L except pH: BOD, 4.4-143.2; TSS, 35-493; COD, 42.36-245.3; Oil and Grease, 0.3-6.0; NO2+NO3, 0.3-35.9; TKN, 1.3-108.9; tot. P, 0.1-65.7; ammonia, 40.45-73.22; Al, 1.20-1.78; Cu, .12-19; Mn, .56-. 71; Zn, 1.74-2.11; Fe, 2.24-3.52 and pH, 3.5- 10.4. This data could be helpful in characterizing stormwater pollutants at the facility.

Concrete Products
SIC: 3270 **
Description: Businesses that manufacture ready-mix concrete, gypsum products, concrete blocks and bricks, concrete sewer or drainage pipe, septic tanks, and prestressed concrete building components. Concrete is prepared on-site and poured into molds or forms to produce the desired product. The basic ingredients of concrete are sand, gravel, Portland cement, crushed stone, clay, and reinforcing steel for some products. Admixtures including fly ash, calcium chloride, triethanolamine, lignosulfonic acid, sulfonated hydrocarbon, fatty acid glyceride, vinyl acetate, may be added to obtain desired characteristics, such as slower or more rapid curing times.

The first stage in the manufacturing process is proportioning cement, aggregate, admixtures and water, and then transporting the product to a rotary drum, or pan mixer. The mixture is then fed into an automatic block-molding machine that rams, presses, or vibrates the mixture into its final form. The final product is then stacked on iron framework cars where it cures in four hours. After being mixed in a central mixer, concrete is molded in the same manner as concrete block. The concrete cures in the forms for a number of hours. Forms are washed for reuse, and the concrete products are stored until they can be shipped.

Potential Pollutant Generating Sources: *Pollutant* generating activities/sources include stockpiles; washing of waste concrete from trucks, forms, equipment, and the general work area; and water from the curing of concrete products. Besides the basic ingredients for making concrete products, chemicals used in the curing of concrete and the removal of forms may end up in stormwater. These chemicals can include latex sealants, bitumastic coatings and release agents. Trucks and equipment maintained on-site may generate waste oil and solvents, and other waste materials. Potential pollutants include TSS, COD, BOD, pH, lead, iron, zinc, and oil and grease.

Electrical Products
SIC: 3600 *, 3800 *
Description: A variety of products are produced including electrical transformers and switchgear (3610) *, motors, generators, relays, and industrial controls (3620)*; communications equipment for radio and TV stations and systems (3660) * ; electronic components and accessories including semiconductors (3670) * ; printed board circuits; electromedical and electrotherapeutic apparatus (3690) * ; and electrical instrumentation (3800) * . Manufacturing processes include electroplating, machining, fabricating, etching, sawing, grinding, welding, and parts cleaning. Materials used include metals, ceramics, quartz, silicon, inorganic oxides, acids, alkaline solutions, arsenides, phosphides, cyanides, oils, fuels, solvents, and other chemicals.

Potential Pollutant Generating Sources: Pollutant generating activities/sources include bulk storage of raw materials, by-products or finished products; loading and unloading of liquid materials from truck or rail;

temporary storage of waste oil and solvents from cleaning manufacturing equipment; used equipment temporarily stored on site that could drip oil and residual process materials; maintenance and repair of vehicles and equipment; and temporary storage of Dangerous Wastes.

Waste liquids which are sometimes stored outside include spent acetone and solvents, ferric chloride solutions, soldering fluxes mixed with thinner or alcohol, spent acids, and oily waste. Several of these liquid wastes contain chlorinated hydrocarbons, ammonium salts, and metals such as chromium, copper, lead, silver, zinc, nickel, and tin. Waste solids include soiled rags and sanding materials.

Wastewater consists of solutions and rinses from electroplating operations, and the wastewaters from cleaning operations. Water may also be used to cool saws and grinding machines. Sludges are produced by the wastewater treatment process. Potential pollutants include TSS, oil and grease, organics, pH, BOD, COD, Total Kjeldahl Nitrogen, Nitrate and Nitrite Nitrogen, copper, zinc, lead and silver.

Food Products
SIC: 2000 *
Description: Businesses in this category include meat packing plants, poultry slaughtering and processing, sausage and prepared meats, dairy products, preserved fruits and vegetables, flour, bakery products, sugar and confectioneries, vegetable and animal oils, beverages, canned, frozen or fresh fish, pasta products, snack foods, and manufactured ice. Food processing typically occurs inside buildings. Exceptions are meat packing plants where live animals may be kept outside, and fruit and vegetable plants where the raw material may be temporarily stored outside. Meat production facilities include stockyards, slaughtering, cutting and deboning, meat processing, rendering, and materials recovery. Dairy production facilities include receiving stations, clarification, separation, and pasteurization followed by culturing, churning, pressing, curing, blending, condensing, sweetening, drying, milling, and packaging. Canned frozen and preserved fruits and vegetables are typically produced by washing, cutting, blanching, and cooking followed by drying, dehydrating, and freezing.

Grain mill products are processed during washing, milling, debranning, heat treatment, screening, shaping, and vitamin and mineral supplementing. Bakery products processing includes mixing, shaping, of dough, cooling, and decorating. Operations at an edible oil manufacturer include refining, bleaching, hydrogenation, fractionation, emulsification, deodorization, filtration, and blending. Beverage production includes brewing, distilling, fermentation, blending, and packaging. Wine processors often crush grapes outside the process building and/or store equipment outside when not in use. Some wine producers use juice from grapes crushed elsewhere. Some vegetable and fruit processing plants use caustic solutions.

Pollutant Generating Sources: The following are potential stormwater pollutant causing activities/sources: loading/unloading of materials, equipment/vehicle maintenance, liquid storage in tanks and drums, air emissions (ovens, vents), solid wastes handling and storage, wastewater treatment, pest control, animal containment and transit, and vegetable storage. Materials exposed to stormwater include acids, ammonia, activated carbon, bleach, blood, bone meal, brewing residuals, caustic soda, chlorine, coke oven tar, detergents, eggs, feathers, feed, ferric chloride, fruits, vegetables, coffee beans, gel bone, grain, hides, lard, manure, milk, salts, skim powder, starch, sugar, tallow, ethyl alcohol, oils, fats, whey, yeast, and wastes. The following are the pollutants typically expected from this industry segment: BOD, TSS, Oil and Grease, pH, Kjeldahl Nitrogen, copper, manganese, fecal coliform, and pesticides.

Glass Products
SIC: 3210**, 3220**, 3230**
Description: The glass form produced may be flat or window glass, safety glass, or container glass, tubing, glass wool or fibers. The raw materials are sand mixed with a variety of oxides such as aluminum, antimony, arsenic, lead, copper, cobalt oxide, and barium. The raw materials are mixed and heated in a furnace. Processes that vary with the intended product shape the resulting molten material. The cooled glass may be edged, ground, polished,

annealed and/or heat-treated to produce the final product. Air emissions from the manufacturing buildings are scrubbed to remove particulates.

Pollutant Generating Sources: Raw materials are generally stored in silos except for crushed recycled glass and materials washed off recycled glass. Contamination of stormwater and/or ground water can be caused by raw materials lost during unloading operations, errant flue dust, equipment/vehicle maintenance and engine fluids from mobile lifting equipment that is stored outside. The maintenance of the manufacturing equipment will produce waste lubricants and cleaning solvents. The flue dust is likely to contain heavy metals such as arsenic, cadmium, chromium, mercury, and lead. Potential pollutants include suspended solids, oil and grease, high/low pH, and heavy metals such as arsenic, cadmium, chromium, mercury, and lead.

Industrial Machinery and Equipment, Trucks and Trailers, Aircraft, Aerospace, and Railroad
SIC: 3500, 3713/14 *, 3720 *, 3740 *, 3760 *, 3800 *
Description: This category includes the manufacture of a variety of equipment including engines and turbines, farm and garden equipment, construction and mining machinery, metal working machinery, pumps, computers and office equipment, automatic vending machines, refrigeration and heating equipment, and equipment for the manufacturing industries. This group also includes many small machine shops, and the manufacturing of trucks, trailers and parts, airplanes and parts, missiles, spacecraft, and railroad equipment and instruments.

Manufacturing processes include various forms of metal working and finishing, such as electroplating, anodizing, chemical conversion coating, etching, chemical milling, cleaning, machining, grinding, polishing, sand blasting, laminating, hot dip coating, descaling, degreasing, paint stripping, painting, and the production of plastic and fiberglass parts. Raw materials include ferrous and non-ferrous metals, such as aluminum, copper, iron, steel, and their alloys, paints, solvents, acids, alkalis, fuels, lubricating and cutting oils, and plastics.

Potential Pollutant Generating Sources: Potential pollutant sources include fuel islands, maintenance shops, loading/unloading of materials, and outside storage of gasoline, diesel, cleaning fluids, equipment, solvents, paints, wastes, detergents, acids, other chemicals, oils, metals, and scrap materials. Air emissions from stacks and ventilation systems are potential areas for exposure of materials to rain water.

Metal Products
SIC: 2514, 2522 *, 2542 *, 3312 **, 3314- 17 **, 3320 **, 3350 **, 3360 **, 3400 *, 3590 *
Description: This group includes mills that produce basic metals and primary products, as well as foundries, electroplaters, and fabricators of final metal products. Basic metal production includes steel, copper, and aluminum. Mills that transform metal billets, either ferrous or nonferrous such as aluminum, to primary metal products are included. Primary metal forms include sheets, flat bar, building components such as columns, beams and concrete reinforcing bar, and large pipe.

Steel mills in the Pacific Northwest use recycled metal and electric furnaces. The molten steel is cast into billets or ingots that may be reformed on site or taken to rolling mills that produce primary products. As iron and steel billets may sit outside before reforming, surface treatment to remove scale may occur prior to reforming. Foundries pour or inject molten metal into a mold to produce a shape that cannot be readily formed by other processes. The metal is first melted in a furnace. The mold is made of sand or metal die blocks that are locked together to make a complete cavity. The molten metal is ladled in and the mold is cooled. The rough product is finished by quenching, cleaning and chemical treatment. Quenching involves immersion in a plain water bath or water with an additive.

Businesses that fabricate metal products from metal stock provide a wide range of products. The raw stock is manipulated in a variety of ways including machining of various types, grinding, heating, shearing, deformation, cutting and welding, soldering, sand blasting, brazing, and laminating. Fabricators may first clean the metal by sand blasting, descaling, or solvent degreasing. Final finishing may involve electroplating, painting, or direct plating by fusing or vacuum metalizing. Raw materials, in particular recycled metal, are stored outside prior to use, as are billets before reforming. The descaling process may use salt baths, sodium hydroxide, or acid (pickling).

Primary products often receive a surface coating treatment. Prior to the coating the product surface may be prepared by acid pickling to remove scale or alkaline cleaning to remove oils and greases. The two major classes of metallic coating operations are hot and cold coating. Zinc, tin and aluminum coatings are applied in molten metal baths. Tin and chromium are usually applied electrolytically from plating solutions.

Potential Pollutant Generating Sources: Potential pollutant generating sources include outside storage of chemicals, metal feedstock, byproducts (fluxes), finished products, fuels, lubricants, waste oil, sludge, waste solvents, Dangerous Wastes, piles of coal, coke, dusts, fly ash, baghouse waste, slag, dross, sludges, sand refractory rubble, and machining waste; unloading of chemical feedstock and loading of waste liquids such as spent pickle liquor by truck or rail; material handling equipment such as cranes, conveyors, trucks, and forklifts; particulate emissions from scrubbers, baghouses or electrostatic precipitators; fugitive emissions; maintenance shops; erosion of soil from plant yards; and floor, sink, and process wastewater drains.

Based on EPA's multi-sector industrial stormwater permit/fact sheet (7) the following are ranges of mean composite/grab pollutant concentrations from this industrial group (values are in mg/L except pH): BOD at 34.1/32.2; COD at 109.8/221.3; NO2+NO3 N at 1.38/1.17; TKN at 3.05/3.56; Oil and grease at 8.88 (grab); pH at 2.6-10.3 (range-grab); total phosphorus at .52/1.25; TSS at 162/368; copper at 2.28/3.53; lead at .19/. 79; zinc at 6.60/8.90; aluminum at 2.6/4.8; iron at 32.30/45.97; cadmium at 0.015/0.074; chromium at 2.2/5.053; nickel at 0.75/0.7; manganese at .59/.68; ammonia at .55/.85; and pyrene at .01/.06.

Paper and Pulp
SIC: 2610 **, 2620 **, 2630 **

Description: Large industrial complexes in which pulp and/or paper, and/or paperboard are produced. Products also include newsprint, bleached paper, glassine, tissue paper, vegetable parchment, and industrial papers. Raw materials include; wood logs, chips, wastepaper, jute, hemp, rags, cotton linters, bagasse, and esparto. The chips for pulping may be produced on-site from logs, and/or imported.

The following manufacturing processes are typically used: raw material preparation, pulping, bleaching, and papermaking. All of these operations use a wide variety of chemicals including caustic soda, sodium and ammonium sulfites, chlorine, titanium oxide, starches, solvents, adhesives, biocides, hydraulic oils, lubricants, dyes, and many chemical additives.

Potential Pollutant Sources: The large process equipment used for pulping is not enclosed. Thus, precipitation falling over these areas may become contaminated. Maintenance of the process equipment produces waste products similar to that produced from vehicle and mobile equipment maintenance. Logs may be stored, debarked and chipped on site. Large quantities of chips are stored outside. Although this can be a source of pollution, the volume of stormwater flow is relatively small because the chip pile retains the majority of the precipitation. Mobile equipment such as forklifts, log stackers, and chip dozers are sources of leaks/spills of hydraulic fluids. Vehicles and equipment are fueled and maintained on site.

Paper Products
SIC: 2650 *, 2670 *

Description: Included are businesses that take paper stock and produce basic paper products such as cardboard boxes and other containers, and stationery products such as envelopes and bond paper. Wood chips, pulp, and paper can be used as feedstock.

Potential Pollutant Generating Sources: The following are potential pollutant sources:
1. Outside loading/unloading of solid and liquid materials.
2. Outside storage and handling of dangerous wastes, and other liquid and solid materials.
3. Maintenance and fueling activities.
4. Outside processing activities comparable to Pulp and Paper
5. processing in preceding section.

Petroleum Products
SIC: 2911 **, 2950 **
Description: The petroleum refining industry manufactures gasoline, kerosene, distillate and residual oils, lubricants and related products from crude petroleum, and asphalt paving and roofing materials. Although petroleum is the primary raw material, petroleum refineries also use other materials such as natural gas, benzene, toluene, chemical catalysts, caustic soda and sulfuric acid. Wastes may include filter clays, spent catalysts, sludges, and oily water.

Asphalt paving products consist of sand, gravel and petroleum-based asphalt that serves as the binder. Raw materials include stockpiles of sand and gravel and asphalt emulsions stored in aboveground tanks. Waste products may include small dumps of unused asphalt and the usual materials from vehicle maintenance.

Potential Pollutant Generating Sources:

1. Outside processing such as distillation, fractionation, catalytic cracking, solvent extraction, coking, desulfuring, reforming, and desalting.
2. Petrochemical and fuel storage and handling.
3. Outside liquid chemical piping and tankage,
4. Mobile liquid handling equipment such as tank trucks, fork lifts, etc.
5. Maintenance and parking of trucks and other equipment.
6. Waste Piles.
7. Waste treatment and conveyance systems.

The following are potential pollutants at oil refineries: oil and grease, BOD5, COD, TOC, phenolic compounds, PAH, ammonia nitrogen, TKN, sulfides, TSS, low and high pH, and chromium (total and hexavalent).

Printing
SIC: 2700 *
Description: This industrial category includes the production of newspapers, periodicals, commercial printing materials and businesses that do their own printing and those that perform services for the printing industry, for example bookbinding. Processes include typesetting, engraving, photoengraving, and electrotyping.

Potential Pollutant Generating Sources: Various materials used in modifying the paper stock include inorganic and organic acids, resins, solvents, polyester film, developers, alcohol, vinyl lacquer, dyes, acetates, and polymers. Waste products may include waste inks and ink sludge, resins, photographic chemicals, solvents, acid and alkaline solutions, chlorides, chromium, zinc, lead, spent formaldehyde, silver, plasticizers, and used lubricating oils. As the printing operations occur indoors, the only likely points of potential contact with stormwater are the outside temporary storage of waste materials, offloading of chemicals at external unloading bays, and vehicle/equipment repair and maintenance. Pollutants of concern include TSS, pH, heavy metals, oil and grease, and COD.

Rubber and Plastic Products
SIC: 3000

Description: Although different in basic feedstock and processes used, businesses that produce rubber, fiberglass and plastic products belong to the same SIC group. Products in this category include rubber tires, hoses, belts, gaskets, seals; and plastic sheet, film, tubes, pipes, bottles, cups, ice chests, packaging materials, and plumbing fixtures. The rubber and plastics industries use a variety of processes ranging from polymerization to extrusion using natural or synthetic raw materials. These industries use natural or synthetic rubber, plastics components, pigments, adhesives, resins, acids, caustic soda, zinc, paints, fillers and curing agents.

Potential Pollutant Generating Sources: Pollutant generating sources/activities include storage of liquids, other raw materials or by-products, scrap materials, oils, solvents, inks and paints; unloading of liquid materials from trucks or rail cars; washing of equipment; waste oil and solvents produced by cleaning manufacturing equipment; used equipment that could drip oil and residual process materials; and maintenance shops.

Based on data in EPA's multi-sector permit fact sheet (7) the following are mean pollutant concentrations in mg/L, except for pH (unitless) and 1,1,1 trichloroethane, methylene chloride, toluene, zinc, oil/grease which are min.-max. grab sample values: BOD at 11.21-13.92, COD at 72.08-100.0, NO3 + NO2 Nitrogen at 86-1.26, TKN at 1.55-2.34, total phosphorus at .34-.41, TSS at 119.32-188.55, pH range of 2.56-10.1, trichloroethane at 0.00-0.38, methylene chloride at 0.00-13.0, toluene at 0.00-3.8, zinc at .011-7.60 and oil and grease at 0.0-91.0. These data may be helpful in characterizing potential stormwater pollutants.

Ship and Boat Building and Repair Yards
SIC: 3730 **

Description: Businesses that build or repair ships and boats. Typical activities include hull scraping, sandblasting, finishing, metal fabrication, electrical repairs, engine overhaul, and welding, fiberglass repairs, hydroblasting and steam cleaning.

Potential Pollutant Generating Sources: *Outside* boatyard activities that can be sources of stormwater pollution include pressure washing, surface preparation, paint removal, sanding, painting, engine/vessel maintenance and repairs, and material handling and storage. Secondary sources of stormwater contaminants are cooling water, pump testing, gray water, sanitary waste, washing down the work area, and engine bilge water. Engine room bilge water and oily wastes are typically collected and disposed of through a licensed contracted disposal company. Two prime sources of copper are leaching of copper from anti-fouling paint and wastes from hull maintenance. Wastes generated by boatyard activities include spent abrasive grits, spent solvent, spent oils, fuel, ethylene glycol, washwater, paint over spray, various cleaners/detergents and anti-corrosive compounds, paint chips, scrap metal, welding rods, wood, plastic, resins, glass fibers, dust, and miscellaneous trash such as paper and glass. WDOE, local shipyards and METRO have sampled pressure wash wastewater. The effluent quality has been variable and frequently exceeds water quality criteria for copper, lead, tin, and zinc. From monitoring results received to date, metal concentrations typically range from 5 to 10 mg/L, but have gone as high as 190 mg/L copper with an average 55 mg/L copper.

Wood
SIC 2420 **, 2450 **, 2434 *, 2490 **, 2511/12 *, 2517 *, 2519 *, 2521 *, 2541 *

Description: This group includes sawmills, and all businesses that make wood products using cut wood, with the exception of wood treatment businesses. Wood treatment as well as log storage and sorting yards are covered in other sections of this chapter. Included in this group are planing mills, millworks, and businesses that make wooden containers and prefab building components, mobile homes, and glued-wood products like laminated beams, as well as office and home furniture, partitions, and cabinets. All businesses employ cutting equipment whose by-products are chips and sawdust. Finishing is conducted in many operations.

Potential Pollutant Generating Sources: Businesses may have operations that use paints, solvents, wax emulsions, melamine formaldehyde and other thermosetting resins, and produce waste paints and paint thinners, turpentine, shellac, varnishes and other waste liquids. Outside storage, trucking, and handling of these materials can also be pollutant sources.

Potential pollutants reported in EPA's draft multi-sector permit/ fact sheet (7) include the following (all are grab/composite mean values, in mg/L, except for oil and grease and pH): BOD at 39.6/45.4, COD at 297.6/242.5, NO3 + NO2-N at 0.95/0.75, TKN at 2.57/2.32, Tot. Phosphorus at 23.91/6.29; TSS at 1108/575, arsenic at .025/.028, copper at .047/.041, total phenols at .02/.007, oil and grease at 15.2, and pH at 3.6. These data may help in characterizing the potential stormwater pollutants at the facility.

Wood Treatment
SIC: 2491 **
Description: This group includes both anti-staining and wood preserving. The wood stock must be brought to the proper moisture content prior to treatment, which is achieved by either air-drying or kiln drying. Some wood trimming may occur. After treatment, the lumber is typically stored outside. Forklifts are used to move both the raw and finished product. Wood treatment consists of a pressure process using the chemicals described below. Anti-staining treatment is conducted using dip tanks or by spraying. Wood preservatives include creosote, creosote/coal tar, pentachlorophenol, copper naphthenate or inorganic arsenicals such as chromated copper arsenate dissolved in water. The use of pentachlorophenol is declining in the Puget Sound region.

Potential Pollutant Generating Sources: Potential pollutant generating sources/activities include the retort area, handling of the treated wood, outside storage of treated materials/products, equipment/vehicle storage and maintenance, and the unloading, handling, and use of the preservative chemicals. Based on EPA's multi-sector permit/fact sheet (7) the following stormwater contaminants have been reported: COD, TSS, BOD, and the specific pesticide(s) used for the wood preservation.

Other Manufacturing Businesses
SIC: 2200 *, 2300 *, 2873/74 **, 3100 *, 3200 **, 3250-69 **, 3280 **, 3290 **
Description: Includes manufacturing of textiles and apparel, agricultural fertilizers, leather products, clay products such as bricks, pottery, bathroom fixtures; and nonmetallic mineral products.

Potential Pollutant Generating Sources: Pollutant generating sources at facilities in these categories include fueling, loading & unloading, material storage and handling (especially fertilizers), and vehicle and equipment cleaning and maintenance. Potential pollutants include TSS, BOD, COD, Oil and Grease, heavy metals and fertilizer components including nitrates, nitrites, ammonia nitrogen, Kjeldahl Nitrogen and phosphorous compounds.

Transportation and Communication

Airfields and Aircraft Maintenance
SIC: 4513 **, 4515 **
Description: Industrial activities include vehicle and equipment fueling, maintenance and cleaning, and aircraft/runway deicing.

Potential Pollutant Generating Sources: Fueling is accomplished by tank trucks at the aircraft and is a source of spills. Dripping of fuel and engine fluids from the aircraft and at vehicle/equipment maintenance/cleaning areas application of deicing materials to the aircraft and the runways are potential sources of stormwater contamination. Aircraft maintenance and cleaning produces a wide variety of waste products, similar to those found with any vehicle or equipment maintenance, including: used oil and cleaning solvents, paints, oil filters, soiled rags, and soapy wastewater. Deicing materials used on aircraft and/or runways include ethylene and propylene glycol, and urea. Other chemicals currently considered for ice control are sodium and potassium acetates, isopropyl alcohol, and sodium fluoride. Pollutant constituents include oil and grease, TSS, BOD, COD, TKN, pH and specific deicing components such as glycol and urea.

Fleet Vehicle Yards
SIC: 4100 **, 4210 **, 4230 **, 7381/2, 7510
Description: Includes all businesses which own, operate and maintain or repair large vehicle fleets, including cars, buses, trucks and taxis, as well as the renting or leasing of cars, trucks, and trailers.

Potential Pollutant Generating Sources:
1. Spills/leaks of fuels, used oils, oil filters, antifreeze, solvents, brake fluid, and batteries, sulfuric acid, battery acid sludge, and leaching from empty contaminated containers and soiled rags.
2. Leaking underground storage tanks that can cause ground water contamination and is a safety hazard.
3. Dirt, oils and greases from outside steam cleaning and vehicle washing.
4. Dripping of liquids from parked vehicles.
5. Solid and liquid wastes (noted above) that are not properly stored while awaiting disposal or recycling.
6. Loading and unloading area.

Research by the Municipality of Metropolitan Seattle (Metro) of its bus bases indicates that mean concentrations of oil and grease typically range from 10 to 20 mg/l with individual samples commonly exceeding 50 mg/l. This level greatly exceeds Ecology's guideline of no more than 10 mg/l (24 hour average) and indicates need for conscientious source control measures. Potential pollutants can include Oil and grease, TSS, BOD, and heavy metals.

Railroads
SIC: 4011 ** /13 **
Description: Railroad activities are spread over a large geographic area: along railroad lines, in switching yards, and in maintenance yards. Railroad activity occurs on both property owned or leased by the railroad and at the loading or unloading facilities of its customers. Employing BMPs at commercial or public loading and unloading areas is the responsibility of the particular property owner.

Potential Pollutant Generating Sources: The following are potential sources of pollutants: dripping of vehicle fluids onto the road bed, leaching of wood preservatives from the railroad ties, human waste disposal, litter, locomotive sanding areas, locomotive/railcar/equipment cleaning areas, fueling areas, outside material storage areas, the erosion and loss of soil particles from the bed, and herbicides used for vegetation management. Maintenance activities include maintenance shops for vehicles and equipment, track maintenance, and ditch cleaning. In addition to the railroad stock, the maintenance shops service highway vehicles and other types of equipment. Waste materials can include waste oil, solvents, degreasers, antifreeze, radiator flush, acid solutions, brake fluids, soiled rags, oil filters, sulfuric acid and battery sludge, and machine chips with residual machining oil and any toxic fluids or solids lost during transit. The following are potential pollutants at railyards: Oil and grease, TSS, BOD, organics, pesticides, and heavy metals.

Warehouses and Mini-Warehouses
SIC: 4220 **
Description: Businesses that store goods in buildings and other structures.

Potential Pollutant Generating Sources: The following are potential pollutant sources from warehousing operations: Loading and unloading areas, outside storage of materials and equipment, fueling and maintenance areas. Potential pollutants include oil and grease and TSS.

Other Transportation and Communication
SIC: 4700-4900
Description: This group includes travel agencies, communication services such as TV and radio stations, cable companies, and electric and gas services. It does not include railroads, airplane transport services, airlines, pipeline companies, and airfields.

Potential Pollutant Generating Sources: Gas and electric services are likely to own vehicles that are washed, fueled and maintained on site. Communication service companies can generate used oils and Dangerous Wastes. The following are the potential pollutants: Oil and grease, TSS, BOD, and heavy metals.

Retail and Wholesale Businesses

Gas Stations
SIC: 5540
Refer to BMP S1.10-Fueling Stations in Chapter 2 to select applicable BMPs.

Recyclers and Scrap Yards
SIC: 5093 **, 5015 **
Description: Businesses that reclaim various materials for resale or for scrap, such as vehicles and vehicle/equipment parts, construction materials, metals, beverage containers and papers.

Potential Pollutant Generating Sources: *Potential* sources of pollutants include paper/plastic/metal scrap debris, engines, transmissions, radiators, batteries, and other materials that contain fluids or are contaminated with fluids. Other pollutant sources include leachate from metal components and contaminated soil and the erosion of soil. Activities that can generate pollutants include:

1. Transferring/dismantling/crushing of vehicles, and scrap metal.
2. Transferring and removing fluids.
3. Maintenance & cleaning of vehicles, parts, and equipment.
4. Storage of fluids, parts for resale, solid wastes, scrap parts, and materials/equipment/vehicles that contain fluids, generally in uncovered areas.

Potential pollutants typically found at vehicle recycle and scrap yards include oil and grease, ethylene and propylene glycol, total suspended solids, BOD, heavy metals, and acidic pH.

Applicable Best Management Practices: For *facilities subject to Ecology's Industrial Stormwater General Permit refer to BMP Guidance Document #94-146, "Best Management Practices to Prevent Stormwater Pollution at Vehicle Recycler Facilities", Washington Department of Ecology, September 1994 for selection of operational and structural source control, and treatment BMPs for vehicle recycler facilities. The BMPs in that guidance document can also be applied to scrap material recycling facilities depending on the pollutant sources existing at those facilities.*

Commercial Composting
SIC 2875
Description: This typically applies to businesses that have numerous compost piles that require large open areas to break down the wastes. Composting can contribute nutrients, organics, coliform bacteria, low pH, color, and suspended solids to stormwater runoff.

Restaurants/Fast Food
SIC: 5800
Description: Businesses that provide food service to the general public, including drive through facilities.
Potential Pollutant Generating Sources: *Potential* pollutant sources include high-use customer parking lots and garbage dumpsters. The cleaning of roofs and other outside areas of restaurant and cooking vent filters in the parking lot can cause cooking grease to be discharged to the storm drains. The discharge of washwater or grease to storm drains or surface water is not allowed.

Retail/General Merchandise SIC: 5300, 5600, 5700, 5900, and 5990
Description: This group includes general merchandising stores such as department stores, shopping malls, variety stores, 24-hour convenience stores, and general retail stores that focus on a few product types such as clothing and shoes. It also includes furniture and appliance stores.

Potential Pollutant Generating Sources: Of particular concern are the high-use parking lots of shopping malls and 24-hour convenience stores. Furniture and appliance stores may provide repair services in which Dangerous Wastes may be produced.

Retail/Wholesale Vehicle and Equipment Dealers
SIC: 5010, 5080, and 5500 excluding fueling stations (5540)
Description: This group includes all retail and wholesale businesses that sell cars, trucks, boats, trailers, mobile homes, motorcycles and recreational vehicles. It includes both new and used vehicle dealers. It also includes sellers of heavy equipment for construction, farming, and industry. With the exception of motorcycle dealers, these businesses have large parking lots. Most retail dealers that sell new vehicles and large equipment also provide repair and maintenance services.

Potential Pollutant Generating Sources: *Oil* and other materials that have dripped from parked vehicles can contaminate stormwater at high-use parking areas. Vehicles are washed regularly generating vehicle grime and detergent pollutants. The storm or washwater runoff will contain oils and various organics, metals, and phosphorus. Repair and maintenance services generate a variety of waste liquids and solids including used oils and engine fluids, solvents, waste paint, soiled rags, and dirty used engine parts. Many of these materials are Dangerous Wastes.

Retail/Wholesale Nurseries and Building Materials
SIC: 5030, 5198, 5210, 5230, and 5260
Description: These businesses are placed in a separate group because they are likely to store much of their merchandise outside of the main building. They include nurseries, and businesses that sell building and construction materials and equipment, paint (5198, 5230) and hardware.

Potential Pollutant Generating Sources: *Some* businesses may have small fueling capabilities for forklifts and may also maintain and repair their vehicles and equipment. Some businesses may have unpaved areas, with the potential to contaminate stormwater by leaching of nutrients, pesticides, and herbicides. Businesses in this group surveyed in the Puget Sound area for Dangerous Wastes were found to produce waste solvents, paints and used oil. Storm runoff from exposed storage areas can contain suspended solids, and oil and grease from vehicles and forklifts and high-use customer parking lots, and other pollutants. Runoff from nurseries may contain nutrients, pesticides and/or herbicides.

Retail/Wholesale Chemicals and Petroleum
SIC: 5160, 5170
Description: These businesses sell plastic materials, chemicals and related products. This group also includes the bulk storage and selling of petroleum products such as diesel oil, automotive fuels, etc.

Potential Pollutant Generating Sources: The general areas of concern are the spillage of chemicals or petroleum during loading and unloading, and the washing and maintenance of tanker trucks and other vehicles. Also, the fire code requires that vegetation be controlled within a tank farm to avoid a fire hazard. Herbicides are typically used. The concentration of oil in untreated stormwater is known to exceed the water quality effluent guideline for oil and grease. Runoff is also likely to contain significant concentrations of benzene, phenol, chloroform, lead, and zinc.

Retail/Wholesale Foods and Beverages
SIC 5140, 5180
Description: Included are businesses that provide retail food stores including general groceries, fish and seafood, meats and meat products, dairy products, poultry, soft drinks, and alcoholic beverages.

Potential Pollutant Generating Sources: Vehicles may be fueled, washed and maintained at the business. Spillage of food and beverages may occur. Waste food and broken contaminated glass may be temporarily stored in containers located outside. High-use customer parking lots may be sources of oil and other contaminants.

Other Retail/Wholesale Business
SIC: 5010 (not 5012), 5040, 5060, 5070, 5090
Description: Businesses in this group include sellers of vehicle parts, tires, furniture and home furnishings, photographic and office equipment, electrical goods, sporting goods and toys, paper products, drugs and apparel.

Potential Pollutant Generating Sources: Pollutant sources include high-use parking lots, and delivery vehicles that may be fueled, washed and maintained on premises.

Service Businesses

Animal Care Services
SIC: 0740, 0750
Description: This group includes racetracks, kennels, fenced pens, veterinarians and businesses that provide boarding services for animals including horses, dogs and cats.

Potential Pollutant Generating Sources: *The* primary sources of pollution include animal manure, waste products from animal treatment, runoff from pastures where larger livestock are allowed to roam, and vehicle maintenance and repair shops. Pastures may border streams and direct access to the stream may occur. Both surface water and ground water may be contaminated. Potential stormwater contaminants include fecal coliform, oil and grease, suspended solids, BOD, and nutrients.

Commercial Car and Truck Washes
SIC: 7542
Description: Facilities include automatic systems found at individual businesses or at gas stations and 24-hour convenience stores, as well as self-service. There are three main types: tunnels, rollovers and hand-held wands. The tunnel wash, the largest, is housed in a long building through which the vehicle is pulled. At a rollover wash the vehicle remains stationary while the equipment passes over. Wands are used at self-serve car washes. Some car washing businesses also sell gasoline.

Potential Pollutant Generating Sources: *Wash* wastewater may contain detergents and waxes. Wastewater should be discharged to sanitary sewers. In self-service operations a drain is located inside each car bay. Although these businesses discharge the wastewater to the sanitary sewer, some washwater can find its way to the storm drain, particularly with the rollover and wand systems. Rollover systems often do not have air-drying. Consequently, as it leaves the enclosure the car sheds water to the pavement. With the self-service system, washwater with detergents can spray outside the building and drain to storm sewer. Users of self-serve operations may also clean engines and change oil, dumping the used oil into the storm drain. Potential pollutants include oil and grease, detergents, soaps, BOD, and TSS.

Equipment Repair
SIC: 7353, 7600
Description: This group includes several businesses that specialize in repairing different equipment including communications equipment, radio, TV, household appliances, and refrigeration systems. Also included are businesses that rent or lease heavy construction equipment (7353) as miscellaneous repair and maintenance may occur on site.

Potential Pollutant Generating Sources: *Potential* pollutant sources include storage and handling of fuels, waste oils and solvents, and loading/unloading areas. Potential pollutants include oil and grease, low/high pH, and suspended solids.

Laundries and Other Cleaning Services
SIC: 7211 through 7217
Description: This category includes all types of cleaning services such as laundries, linen suppliers, diaper services, coin-operated laundries and dry cleaners, and carpet and upholstery services. Wet washing may involve the use of acids, bleaches and/or multiple organic solvents. Dry cleaners use an organic-based solvent, although small amounts of water and detergent are sometimes used. Solvents may be recovered and filtered for further use. Carpets and upholstery may be cleaned with dry materials, hot water extraction process, or in-plant processes using solvents followed by a detergent wash.

Potential Pollutant Generating Sources: Wash liquids are discharged to sanitary sewers. Stormwater pollutant sources include: loading and unloading of liquid materials, particularly at large commercial operations, disposal of spent solvents and solvent cans, high-use customer parking lots, and outside storage and handling of solvents and waste materials. Potential stormwater contaminants include oil and grease, chlorinated and other solvents, soaps and detergents, low/high pH, and suspended solids.

Marinas and Boat Clubs
SIC: 7999
Description: Marinas and yacht clubs provide moorage for recreational boats. Marinas may also provide fueling and maintenance services. Other activities include cleaning and painting of boat surfaces, minor boat repair, and pumping of bilges and sanitary holding tanks. Not all marinas have a system to receive pumped bilge water.

Potential Pollutant Generating Sources: *Both* solid and liquid wastes are produced as well as stormwater runoff from high-use customer parking lots. Waste materials include sewage and bilge water. Maintenance by the tenants will produce used oils, oil filters, solvents, waste paints and varnishes, used batteries, and empty contaminated containers and soiled rags. Potential stormwater contaminants include oil and grease, suspended solids, heavy metals, and low/high pH.

Golf and Country Clubs
SIC: 7992, 7997
Description: Public and private golf courses and parks are included.

Potential Pollutant Generating Sources: Maintenance of grassed areas and landscaped vegetation has historically required the use of fertilizers and pesticides. Golf courses contain small lakes that are sometimes treated with algaecides and/or mosquito larvicides. The fertilizer and pesticide application process can lead to inadvertent contamination of nearby surface waters by overuse, misapplication, or the occurrence of storms shortly after application. Heavy watering of surface greens in golf courses may cause pesticides or fertilizers to migrate to surface and shallow ground water resources. The use of pesticides and fertilizers generates waste containers. Equipment must be cleaned and maintained.

Miscellaneous Services
SIC: 4959, 7260, 7312, 7332, 7333, 7340, 7395, 7641, 7990, 8411
Description: This group includes photographic studios, commercial photography, funeral services, amusement parks, furniture and upholstery repair and pest control services, and other professional offices. Pollutants from these activities can include pesticides, waste solvents, heavy metals, pH, and suspended solids, soaps and detergents, and oil and grease.

Potential Pollutant Generating Sources: *Leaks* and spills of materials from the following businesses can be sources of stormwater pollutants:

1. Building maintenance produces wash and rinse solutions, oils, and solvents.
2. Pest control produces rinsewater with residual pesticides from washing application equipment and empty containers.
3. Outdoor advertising produces photographic chemicals, inks, waste paints, organic paint sludges containing metals.
4. Funeral services produce formalin, formaldehyde, and ammonia.
5. Upholstery and furniture repair businesses produce oil, stripping compounds, wood preservatives and solvents.

Professional Services
SIC: 6000, 7000 and 8000, not listed elsewhere
Description: The remaining service businesses include theaters, hotels/motels, finance, banking, hospitals, medical services, nursing homes, schools/universities, and legal, financial and engineering services. Stormwater from parking lots will contain undesirable concentrations of oil and grease, suspended particulates, and metals such as lead, cadmium and zinc. Dangerous wastes might be generated at hospitals, nursing homes and other medical services.

Potential Pollutant Generating Sources: *The* primary concern is runoff from high use parking areas, maintenance shops, and storage and handling of dangerous wastes.

Vehicle Maintenance and Repair
SIC: 4000 **, 7530, 7600
Description: This category includes businesses that paint, repair and maintain automobiles, motorcycles, trucks, and buses and battery, radiator, muffler, lube, tune-up and tire shops, excluding those businesses listed elsewhere in this manual.

Potential Pollutant Generating Sources: Pollutant sources include storage and handling of vehicles, solvents, cleaning chemicals, waste materials, vehicle liquids, batteries, and washing and steam cleaning of vehicles, parts, and equipment. Potential pollutants include waste oil, solvents, degreasers, antifreeze, radiator flush, acid solutions with chromium, zinc, copper, lead and cadmium, brake fluid, soiled rags, oil filters, sulfuric acid and battery sludge, and machine chips in residual machining oil.

Multi-Family Residences
SIC: NA
Description: Multifamily residential buildings such as apartments and condominiums. The activities of concern are vehicle parking, vehicle washing and oil changing, minor repairs, and temporary storage of garbage.

Potential Pollutant Generating Sources: *Stormwater* contamination can occur at vehicle parking lots and from washing of vehicles. Runoff from parking lots may contain undesirable concentrations of oil and grease, suspended particulates, and metals such as lead, cadmium and zinc.

Construction Businesses
SIC: 1500, 1600, 1700
Description: This category includes builders of homes, commercial and industrial buildings, and heavy equipment as well as plumbing, painting and paper hanging, carpentry, electrical, roofing and sheet metal, wrecking and demolition, stonework, drywall and masonry contractors. It does not include construction sites.

Potential Pollutant Generating Sources: Potential pollutant sources include leaks/spills of used oils, solvents, paints, batteries, acids, strong acid/alkaline wastes, paint/varnish removers, tars, soaps, coatings, asbestos, lubricants, anti-freeze compounds, litter, and fuels at the headquarters, operation, staging, and maintenance/ repair locations of the businesses.

Demolition contractors may store reclaimed material before resale. Roofing contractors generate residual tars and sealing compounds, spent solvents, kerosene, and soap cleaners, as well as non-hazardous waste roofing materials. Sheet metal contractors produce small quantities of acids and solvent cleaners such as kerosene, metal shavings, adhesive residues and enamel coatings, and asbestos residues that have been removed from buildings. Asphalt paving contractors are likely to store application equipment such as dump trucks, pavers, tack coat tankers and pavement rollers at their businesses. Stormwater passing through this equipment may be contaminated by the petroleum residuals. Potential pollutants include oil and grease, suspended solids, BOD, heavy metals, pH, COD, organic compounds, etc.

ADDITIONS, QUALIFIERS, AND EXCEPTIONS

Additions:
Food Stores: Industry Groups: 541, 542, 543
Wholesale Trade – Nondurable Goods: Industry Group 515
Hospitals: 806
Medical and Dental Laboratories: Industry Group 807
Automotive Rental and Leasing: Industry Group 751

Qualifiers: Only for proper solid waste handling:
Food Stores: Industry Groups 544, 545, 546, 549,
Miscellaneous Retail: Industry Groups: 591, 592
Wholesale Trade – Nondurable Goods: Industry Groups: 511, 512, 514, 518
Equipment Repair: Major Group 76 (except businesses in 7623, 7692, and (some, not all) 7699 can have other source control needs)

Exceptions: (i.e., no onsite inspections required)
Retail/General Merchandise: Major Groups 53, 56, 57
Miscellaneous Retail: Industry Groups: 593, 594, 596, 599
Wholesale Trade-Nondurable Goods: Industry Groups: 513
Other Retail/Wholesale Businesses: Industry Groups 502, 504, 506, 507, 509 (not including 5093).
Professional Services not listed elsewhere in Appendix 1: Major Groups: 6000, 7000 and 8000

Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California

(Phase 1 of the Inland Surface Waters Plan and the Enclosed Bays and Estuaries Plan)

2000

STATE WATER RESOURCES CONTROL BOARD

California Environmental Protection Agency

STATE WATER RESOURCES CONTROL BOARD
RESOLUTION NO. 2000 - 015

ADOPTION OF THE POLICY FOR THE IMPLEMENTATION OF TOXICS STANDARDS FOR INLAND SURFACE WATERS, ENCLOSED BAYS, AND ESTUARIES OF CALIFORNIA (PROPOSED POLICY)

WHEREAS:

1. Section 303(c)(2)(B) of the Federal Clean Water Act (CWA) requires that states adopt numeric criteria for priority pollutants as part of the states' water quality standards.

2. In 1991, the State Water Resources Control Board (SWRCB) adopted the Inland Surface Waters Plan (ISWP) and the Enclosed Bays and Estuaries Plan (EBEP); in part, to comply with CWA section 303(c)(2)(B). The SWRCB amended the plans in 1993.

3. In 1994, the SWRCB rescinded the ISWP and the EBEP in response to a court ruling invalidating the plans. Since then, California has been without statewide water quality standards for the majority of priority pollutants for the State's non-ocean surface waters.

4. After rescission of the plans, the SWRCB and the U.S. Environmental Protection Agency (U.S. EPA) agreed to pursue a collaborative approach to reestablish the regulatory framework of the rescinded ISWP and EBEP and to bring California into compliance with CWA section 303(c)(2)(B). This approach consists of two phases. In Phase 1, the U.S. EPA will promulgate numeric water quality criteria for priority pollutants for California in accordance with CWA section 303(c)(2)(B), and the SWRCB will adopt statewide measures to implement those criteria in a statewide policy. In Phase 2, the SWRCB will consider the adoption of appropriate statewide water quality objectives for toxic pollutants.

5. The U.S. EPA is scheduled to promulgate the final California Toxics Rule (CTR) (proposed at 62 Federal Register 42160-42208, August 5, 1997) to be codified at 40 Code of Federal Regulations section 131.38 in March or April 2000. The CTR will establish statewide water quality criteria for priority toxic pollutants for California.

6. The SWRCB may formulate and adopt State policy for water quality control in accordance with California Water Code sections 13140-13147.

7. The SWRCB prepared and circulated drafts of the Functional Equivalent Document (FED) for a proposed Policy to implement the draft CTR in accordance with the provisions of the California Environmental Quality Act (CEQA) and California Code of Regulations, title 14, section 15251(g), and title 23, sections 3775-3782, as follows:

a. The First Public Draft of the proposed Policy and FED was released for public review on September 11, 1997; a Supplement to the FED was released on October 16, 1997; and an Addendum to the Supplement was released on October 28, 1997.

b. The Second Public Draft of the proposed Policy and FED was released for public review on November 12, 1999; Appendix G to the 1999 FED (responses to public comments on the first draft Policy) was released on December 7, 1999.

c. The Third Public Draft of the proposed Policy was released for public review on January 24, 2000; the third draft of the FED was released for public review on January 31, 2000; Appendix G to the 2000 FED (responses to public comments on the second draft Policy) was released on February 11, 2000.

d. Supplement 1 to Appendix G to the November 12, 1999 FED and Appendix G to the January 31, 2000 FED were released on February 11, 2000.

e. Supplement 2 to Appendix G to the November 12, 1999 FED and Supplement to Appendix G to the January 31, 2000 FED will be released at the March 2, 2000 SWRCB Meeting.

8. The SWRCB has conducted public hearings in Sacramento on November 17, 1997 and in Newport Beach on December 3, 1997 and a public workshop in Sacramento on December 6, 1999 to solicit comments regarding the proposed Policy. The SWRCB has reviewed and carefully considered all comments received on the first, second, and third drafts of the proposed Policy and FED. The SWRCB considered the information contained in the FED prior to approval of the proposed Policy.

9. The SWRCB submitted the first and second drafts of the proposed Policy and FED for external scientific peer review of the scientific basis for the proposed Policy under the requirements of Health and Safety Code section 57004.

10. By letter dated January 21, 2000 from Alexis Strauss, Director of the Water Division at U.S. EPA, Region 9, to Walt Pettit, SWRCB Executive Director (January 21 letter), the U.S. EPA notified the SWRCB of the more important changes that U.S. EPA staff has proposed to the U.S. EPA Administrator for the final CTR. The SWRCB has reviewed the proposed CTR changes, and it finds that they do not require revisions to the proposed Policy or FED.

11. Further, the SWRCB does not anticipate that any additional changes to the final CTR will require the SWRCB to revise the adopted Policy (Policy) or final FED. If, however, the final CTR is substantially changed from the CTR as proposed and with the changes referenced in the January 21 letter, and if these changes will require revisions in the Policy or major revisions in the final FED, the SWRCB will reconsider the Policy.

12. In order to expedite the effective date of the Policy, the SWRCB has decided to adopt the Policy now, but to delay its effective date until the effective date of the CTR.

13. In addition, the regulatory provisions of the Policy will not become effective until they are approved by the Office of Administrative Law (OAL) in accordance with Government Code section 11349.3(a).

14. The SWRCB makes the following specific findings regarding its CEQA responsibilities:

    a. The Third Public Draft FED has been completed in compliance with CEQA (Public Resources Code section 21000 et seq.), the CEQA guidelines, and the procedures of the State of California for Certified Regulatory Programs (Public Resources Code section 21080.5, California Code of Regulations, title 14, sections 15250-15253, and title 23, sections 3775-3782); the SWRCB has reviewed and considered the Third Public Draft FED prior to its decision to approve the proposed Policy; and the Third Public Draft FED reflects the independent judgment of the SWRCB.

    b. The Third Public Draft FED identified potentially significant adverse environmental effects related to only one Policy provision. These potential effects stem from Policy provisions allowing RWQCB authorization of a longer compliance schedule where necessary to develop and implement a Total Maximum Daily Load (TMDL) and accompanying wasteload allocations and load allocations. As compared to the CTR, under the Policy dischargers could be allowed up to ten additional years to accommodate development of TMDLs. Adverse environmental effects could occur during this period because water quality standards for priority pollutants established to protect human health and aquatic life may not be met. Such potential adverse effects could occur to surface and ground water quality; endangered, threatened, or rare species; locally designated species or natural communities; wetland or other fish and wildlife habitat; human health; or recreational opportunities.

    c. The Policy contains provisions to lessen or avoid potentially significant adverse effects on the environment stemming from the TMDL compliance schedule provisions. These provisions include the following:

(1) The compliance schedule provisions are narrowly written to apply only to those situations where the discharger demonstrates that it is infeasible to achieve immediate compliance with the CTR criteria;

(2) The compliance schedule provisions do not apply to new discharges;

(3) The discharger must submit the following justification before compliance schedules may be authorized in a permit:

   (a) Documentation that diligent efforts have been made to quantify pollutant levels in the discharge and the sources of the pollutant in the waste stream, and the results of those efforts,

   (b) Documentation of source control and/or pollution minimization efforts currently underway or completed,

   (c) A proposed schedule for additional source control measures, pollutant minimization actions, or waste treatment (i.e., facility upgrades), and

   (d) A demonstration that the proposed schedule is as short as practicable;

(4) The schedule of compliance must be as short as practicable and must include specified required actions that demonstrate progress toward attainment of the CTR criterion or effluent limitation;

(5) Longer compliance schedules for TMDL development will be authorized only if the discharger has made appropriate commitments to support and expedite the development of the TMDL;

(6) If a compliance schedule is granted, the Policy requires that the Regional Water Quality Control Board (RWQCB) establish interim requirements and dates for their achievement in the National Pollutant Discharge Elimination System (NPDES) permit;

(7) If the compliance schedule exceeds one year, the RWQCB must establish limitations for the priority pollutant in the NPDES permit and may also impose interim requirements to control the pollutant, such as pollutant minimization and source control measures;

(8) Numeric limitations must be based on current treatment facility performance or existing NPDES permit limitations, whichever is more stringent; and

(9) The Policy requires each discharger to report, in writing, its compliance or noncompliance with the interim requirements. Both the interim requirements and reporting requirements are fully enforceable NPDES permit conditions.

d. Alternatives to the Policy provisions for TMDL-based compliance schedules for implementing the CTR identified in the FED are infeasible. These alternatives are discussed below:

Alternative 1. No Action. If the SWRCB does not adopt Policy provisions for compliance schedules for implementation of the CTR, compliance schedules for discharges which receive effluent limitations that are not based on TMDLs are substantially the same. Both the CTR and the Policy would allow compliance schedules of up to five years from NPDES permit issuance, reissuance, or modification with a maximum deadline of ten years from the effective date of the CTR or Policy, respectively. (It is anticipated that the Policy and CTR effective dates will differ only by a few weeks.) There is no significant difference in these time frames; therefore, no significant impacts to the environment would result.

Under this alternative, longer compliance schedules to coincide with TMDL schedules could not be authorized by the RWQCBs. The SWRCB finds that this is not a feasible alternative because eliminating these compliance schedules for TMDLs is unrealistic. Currently, over 500 water bodies are listed as impaired on the CWA section 303(d) list. More than 1400 impairments are cited for these waters. Existing U.S. EPA policy requires that the states develop schedules for TMDL development of up to 13 years, beginning with the 1998 lists. U.S. EPA has proposed, however, in draft TMDL regulations published in August 1999, that the states develop schedules for establishing TMDLs as expeditiously as practicable, but no later than 15 years from the date of the initial listing. The draft regulations also contemplate that each TMDL include an implementation plan containing a timeline, including interim milestones, for implementing control actions and management measures necessary to achieve the wasteload allocations and load allocations. The implementation plan also must include an estimate of the time required to achieve water quality standards. In the draft rule, U.S. EPA recognizes that relatively longer time frames may be necessary for problems that are extremely difficult to solve. The Policy's TMDL compliance schedule provisions are consistent with U.S. EPA's direction.

Alternatives 2-5. Adopt a compliance schedule of: up to 3 years from the effective date of the proposed Policy (Alternative 2); up to 10 years from the effective date of the proposed Policy (Alternative 3); up to 15 years from the effective date of the proposed Policy (Alternative 4); or up to 5 years from the date of permit issuance, reissuance, or modification (Alternative 5).

The SWRCB finds that these are not feasible alternatives for TMDL-based compliance schedules for the reasons explained under Alternative 1.

e. The SWRCB finds that there are no feasible alternatives or additional feasible mitigation measures available to the SWRCB that would substantially lessen any potentially significant adverse environmental effects associated with the Policy provisions authorizing longer compliance schedules for TMDLs.

f. The SWRCB has eliminated or substantially lessened all significant adverse effects on the environment associated with the Policy provisions authorizing longer compliance schedules for TMDLs. The remaining Policy provisions will not have a significant effect on the environment.

g. To the extent that the potential for any impacts remains associated with longer compliance schedules for TMDLs, the SWRCB finds that there are overriding considerations that outweigh any adverse environmental effects that may potentially occur due to the TMDL-based compliance schedules provisions of the Policy.

Implementing TMDLs for priority pollutants may result in greater overall improvements to water quality because all significant sources of a pollutant will be addressed. If a TMDL is under development, the discharger must still immediately comply with CTR-based effluent limitations if it is feasible to do so. If it is infeasible, the discharger must comply with RWQCB interim requirements that demonstrate progress toward meeting the CTR criterion or effluent limitation. The Policy provides that the RWQCB can impose requirements for source control and pollution minimization/prevention during the compliance schedule period. However, to require the discharger to install expensive treatment controls to comply with a CTR-based effluent limitation while the TMDL is under development could result in unnecessary costs and unnecessary secondary environmental effects due to construction of the treatment controls.

THEREFORE BE IT RESOLVED THAT:

The SWRCB:

1. Approves the FED for the proposed Policy.

2. Adopts the proposed Policy, provided that the Policy shall not go into effect unless and until the final CTR is effective and the regulatory provisions of the Policy have been approved by OAL in compliance with the Administrative Procedure Act.

3. Intends to reconsider the Policy if the final CTR is substantially changed from the CTR, as proposed and with the changes referenced in the January 21 letter, and if these changes require revisions in the Policy or major revisions in the final FED.

4. Authorizes the Executive Director or his designee to transmit the Policy to OAL for review and approval in compliance with the Administrative Procedure Act and subsequently to transmit the OAL-approved Policy to the U.S. EPA for review and approval in compliance with section 303(c) of the CWA.

5. Intends to reassess and modify, as appropriate, the Minimum Level values in Appendix 4 of the Policy during triennial reviews to consider and reflect the availability and use of more sensitive analytical methods. Prior to adoption of new a Minimum Level, the SWRCB will consider its environmental and economic effects.

6. Intends to reassess and modify, as appropriate, applicable water quality standards for water bodies that may depend on the discharge of wastewater to support its beneficial uses, including an evaluation of the appropriateness of priority pollutant criteria established by the CTR during Phase 2 of the development of the ISWP and the EBEP.

7. Requires the RWQCBs to report annually to the SWRCB on progress in implementing priority pollutant standards in accordance with the Policy.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on March 2, 2000.

Administrative Assistant to the Board

STATE WATER RESOURCES CONTROL BOARD
RESOLUTION NO. 2000 - 030

AMENDING RESOLUTION NO. 2000-15 REGARDING ADOPTION OF THE POLICY FOR THE IMPLEMENTATION OF TOXICS STANDARDS FOR INLAND SURFACE WATERS, ENCLOSED BAYS, AND ESTUARIES OF CALIFORNIA (PROPOSED POLICY)

WHEREAS:

1. On March 2, 2000, the State Water Resources Control Board (SWRCB), in Resolution No. 2000-15, adopted a Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (Policy).

2. The Policy establishes implementation procedures for three categories of priority pollutant criteria or water quality objectives. These are priority pollutant: (1) criteria promulgated by the U.S. Environmental Protection Agency (U.S. EPA) in the National Toxics Rule that apply in California; (2) criteria proposed by U.S. EPA in the California Toxics Rule; and (3) water quality objectives contained in Regional Water Quality Control Board (RWQCB) water quality control plans (basin plans).

3. Under Resolution No. 2000-015, the Policy is effective when the Policy is approved by the Office of Administrative Law and the California Toxics Rule becomes effective.

4. U.S. EPA has experienced delays in promulgating the California Toxics Rule as a final rule.

5. Priority pollutant criteria in the National Toxics Rule and water quality objectives in RWQCB basin plans are currently in effect.

6. The SWRCB does not wish to delay implementation of the Policy with respect to applicable National Toxics Rule criteria and water quality objectives for priority pollutants.

THEREFORE BE IT RESOLVED THAT:

The SWRCB amends Resolution No. 2000-015 as follows:

1. Resolved No. 2 is deleted and replaced with:

   "2. Adopts the proposed Policy."

2. New Resolved Nos. 3 and 4 are added and existing Resolved Nos. 3 through 7 are renumbered accordingly:

"3. Provides that the Policy shall go into effect with respect to National Toxics Rule priority pollutant criteria that are applicable in California and priority pollutant water quality objectives in RWQCB basin plans upon approval by the Office of Administrative Law."

"4. Provides that the Policy shall go into effect with respect to California Toxics Rule criteria when the Policy is approved by the Office of Administrative Law and the California Toxics Rule becomes effective."

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on April 26, 2000.

R0020011

POLICY FOR IMPLEMENTATION OF TOXICS STANDARDS FOR INLAND SURFACE WATERS, ENCLOSED BAYS, AND ESTUARIES OF CALIFORNIA

INTRODUCTION

This state policy for water quality control (Policy), adopted by the State Water Resources Control Board (SWRCB) on March 2, 2000 and effective by May 22, 2000 (See "Note" below), applies to discharges of toxic pollutants into the *inland surface waters, *enclosed bays, and *estuaries of California subject to regulation under the State's Porter-Cologne Water Quality Control Act (Division 7 of the Water Code) and the federal Clean Water Act (CWA). Such regulation may occur through the issuance of National Pollutant Discharge Elimination System (NPDES) permits, the issuance or waiver of waste discharge requirements (WDRs), or other relevant regulatory approaches.[1] The goal of this Policy is to establish a standardized approach for permitting discharges of toxic pollutants to non-*ocean surface waters in a manner that promotes statewide consistency. As such, this Policy is a tool to be used in conjunction with watershed management approaches and, where appropriate, the development of Total Maximum Daily Loads (TMDLs) to ensure achievement of water quality standards (i.e., water quality criteria or objectives, and the beneficial uses they are intended to protect, as well as the State and federal antidegradation policies).

This Policy establishes: (1) implementation provisions for priority pollutant criteria promulgated by the U.S. Environmental Protection Agency (U.S. EPA) through the National Toxics Rule (NTR)[2] (promulgated on December 22, 1992 and amended on May 4, 1995) and through the California Toxics Rule (CTR)[3], and for priority pollutant objectives established by Regional Water Quality Control Boards (RWQCBs) in their water quality control plans (basin plans)[4]; (2) monitoring requirements for 2,3,7,8-TCDD equivalents; and (3) chronic toxicity control provisions. In addition, this Policy includes special provisions for certain types of discharges and factors that could affect the application of other provisions in this Policy. With respect to nonpoint source discharges, only section 5.1 applies.

Note: This Policy was effective on April 28, 2000 with respect to the priority pollutant criteria promulgated for California by the U.S. EPA through the National Toxics Rule and to the priority pollutant objectives established by Regional Water Quality Control Boards in their water quality control plans (basin plans), with the exception of the provision on alternate test procedures in section 2.3., item (1). The alternate test procedures provision was effective on May 22, 2000. This Policy was effective on May 18, 2000 with respect to the priority pollutant criteria promulgated by the U.S. EPA through the California Toxics Rule.

1 This Policy does not apply to discharges of toxic pollutants from combined sewer overflows. These discharges will continue to be regulated in accordance with the federal "Combined Sewer Overflow (CSO) Control Policy," published April 19, 1994 (59 Fed. Register 18688-18698). This Policy does not apply to regulation of storm water discharges. The SWRCB has adopted precedential decisions addressing regulation of municipal storm water discharges in Orders WQ 91-03, 91-04, 96-13, 98-01, and 99-05. The SWRCB has also adopted two statewide general permits regulating the discharge of pollutants contained in storm water from industrial and construction activities. See SWRCB Orders 99-08-DWQ and 97-03-DWQ.

2 40 CFR 131.36

3 65 Fed. Register 31682-31719 (May 18, 2000), adding Section 131.38 to 40 CFR.

4 If a water quality objective and a CTR criterion are in effect for the same priority pollutant, the more stringent of the two applies.

With the exception of Appendix 5 (Special Studies) and Appendix 6 (Watershed Management and TMDLs), the provisions of this Policy have full regulatory effect. Appendix 5 is provided as guidance that may be followed in planning and conducting special studies that may be needed to implement the provisions of this Policy. Appendix 6 is provided as information on the role of watershed management approaches and TMDL development in achieving water quality standards.

Except as provided in section 4, this Policy supersedes basin plan provisions to the extent that (1) they apply to implementation of water quality standards for priority pollutants, and (2) they regard the same subject matter as that addressed in this Policy with respect to priority pollutant standards. For example, the Policy supersedes basin plan mixing zone provisions to the extent that they apply to implementation of water quality standards for priority pollutants.

Reference to a RWQCB also refers to SWRCB, where appropriate. Terms indicated with an asterisk (*) are defined in Appendix 1.

1. ESTABLISHING WATER QUALITY-BASED EFFLUENT LIMITATIONS FOR PRIORITY POLLUTANT CRITERIA/OBJECTIVES

The following sections address the issues of: (1) applicable priority pollutant criteria and objectives (section 1.1); (2) data requirements and adjustments (section 1.2); (3) determining priority pollutants requiring water quality-based effluent limitations (section 1.3); (4) calculating effluent limitations (section 1.4); (5) translators for metals and selenium (section 1.4.1); (6) mixing zones and dilution credits (section 1.4.2); (7) ambient background concentrations (section 1.4.3); and (8) intake water credits (section 1.4.4). Notwithstanding the provisions of these sections, effluent limitations must protect beneficial uses and comply with the State and federal antidegradation policies[5], federal antibacksliding requirements[6], and other applicable provisions of law.

1.1 Applicable Priority Pollutant Criteria and Objectives

Federal water quality criteria and State water quality objectives for priority pollutants have been established for non-ocean surface waters of California by the U.S. EPA and some RWQCBs, respectively. Federal priority pollutant criteria have been promulgated by the U.S. EPA in the 1992 NTR (amended in 1995) and in the 2000 CTR. For California, the criteria in the CTR supplement the criteria in the NTR (i.e., the CTR does not change or supersede any criteria previously promulgated for California in the NTR, but it does include them in the table of criteria for convenience). State priority pollutant objectives are contained in RWQCB basin plans.[4]

The RWQCB basin plans designate the beneficial uses that apply to the surface water bodies within their respective regions. Priority pollutant criteria/objectives are specifically established for the protection of aquatic life and human health beneficial uses designated in basin plans. Aquatic life criteria/objectives are established for fresh and salt waters. The CTR specifies the salinities to which the freshwater and saltwater criteria apply. The CTR also states that, except as specified in the CTR, the federal criteria apply to all waters assigned any aquatic life or human health use

---

5 SWRCB Resolution No. 68-16 (Statement of Policy with Respect to Maintaining High Quality of Waters in California), and 40 CFR 131.12 (revised as of July 1, 1996), respectively.

6 CWA Sections 402(o)(1) and 303(d)(4), and 40 CFR 122.44(l) and 40 CFR 122.62 (revised as of July 1, 1996).

designated in basin plans. It further states that the application of the criteria are based on the presence in all waters of some aquatic life designation and the presence or absence of the municipal and domestic supply (MUN) designation (i.e., the aquatic life criteria and the human health criteria for consuming water and organisms apply to MUN-designated water bodies; the aquatic life criteria and the human health criteria for consuming organisms only apply to non-MUN water bodies).

Designated beneficial uses to which aquatic life criteria or objectives would apply include, but are not necessarily limited to, warm freshwater habitat (WARM), cold freshwater habitat (COLD), and estuarine habitat (EST). Designated beneficial uses to which human health criteria/objectives would apply include, but are not necessarily limited to, municipal and domestic supply (MUN) and water contact recreation (REC1). Human health criteria/objectives are differentiated by whether organisms alone from the water body are consumed compared to whether both organisms and water from the water body are consumed. Where MUN is designated, the latter situation applies.

1.2 Data Requirements and Adjustments

The RWQCB shall issue Water Code Section 13267 or 13383 letters to all NPDES dischargers within their respective regions requiring the submittal of data sufficient to conduct the determination based on the analysis in section 1.3 and to calculate water quality-based effluent limitations in accordance with section 1.4 (excluding the development of a translator in accordance with section 1.4.1). The letter shall specify a time schedule for providing the data to the RWQCB that is as short as practicable but <u>not to exceed three years from the effective date of this Policy</u>. If the NPDES permit is reissued prior to completing the requirements, the schedule shall be included in the permit as interim requirements (in accordance with section 2.2.2). The permit shall be reopened to establish water quality-based effluent limitations, if necessary.

It is the discharger's responsibility to provide all data and other information requested by the RWQCB before the issuance, reissuance, or modification of a permit to the extent feasible. When implementing the provisions of this Policy, the RWQCB shall use all available, valid, relevant, representative data and information, as determined by the RWQCB. The RWQCB shall have discretion to consider if any data are inappropriate or insufficient for use in implementing this Policy. Instances where such consideration is warranted include, but are not limited to, the following: evidence that a sample has been erroneously reported or is not representative of effluent or ambient receiving water quality; questionable quality control/quality assurance practices; and varying seasonal conditions. The lack of a site-specific objective for a priority pollutant shall not be considered insufficient data.

When implementing the provisions of this Policy, the RWQCB shall ensure that criteria/objectives are properly adjusted for hardness or pH, if applicable, using the hardness or pH values for the receiving water, and that translators are appropriately applied (in accordance with section 1.4.1), if applicable. The RWQCB shall also ensure that pollutant and flow data are expressed in the appropriate forms and units for purposes of comparability and calculations.

1.3 Determination of Priority Pollutants Requiring Water Quality-Based Effluent Limitations

The RWQCB shall conduct the analysis in this section for each priority pollutant with an applicable criterion or objective, excluding priority pollutants for which a Total Maximum Daily Load (TMDL) has been developed, to determine if a water quality-based effluent limitation is required in the discharger's permit. It is the discharger's responsibility to provide all information requested by the RWQCB for use in the analysis. The RWQCB shall use all available, valid, relevant, representative information, as described in section 1.2, to determine whether a discharge may: (1) cause, (2) have a reasonable potential to cause, or (3) contribute to an excursion above any applicable priority pollutant criterion or objective. If the following analysis (which is depicted as a flowchart in Appendix 2) indicates that a limitation for a pollutant is required, the RWQCB shall establish the limitation in accordance with section 1.4.

Step 1: Identify applicable water quality criteria and objectives for priority pollutants as described in section 1.1. Determine the lowest (most stringent) water quality criterion or objective for the pollutant applicable to the receiving water (C). Adjust the criterion or objective, if applicable, as described in section 1.2. If it is necessary to express a dissolved metal or selenium criterion/objective as total recoverable and a site-specific translator has not yet been developed, as described in section 1.4.1, the RWQCB shall use the applicable U.S. EPA conversion factor (Appendix 3).

Step 2: Identify all effluent data for the pollutant as described in section 1.2 and proceed with *Step 3*. If effluent data are unavailable or insufficient, proceed with *Step 5*.

Step 3: Determine the observed maximum pollutant concentration for the effluent (MEC). If the pollutant was **not** detected in any of the effluent samples **and** any of the reported detection limits are below the C, use the lowest detection limit as the MEC and proceed with *Step 4*. If the pollutant was **not** detected in any of the effluent samples **and** all of the reported detection limits are greater than or equal to the C value, proceed with *Step 5*.

Step 4: Adjust the MEC from *Step 3*, if applicable, as described in section 1.2. Compare the MEC from *Step 3* or the adjusted MEC to the C from *Step 1*. If the MEC is greater than or equal to the C, an effluent limitation is required and the analysis for the subject pollutant is complete. If the MEC is less than the C, proceed with *Step 5*.

Step 5: Determine the observed maximum ambient background concentration for the pollutant (B) as described in section 1.4.3.1 and proceed with *Step 6*. If B data are unavailable or insufficient, proceed with *Step 7*.

Step 6: Adjust the B from *Step 5*, if applicable, as described in section 1.2. Compare the B from *Step 5* or the adjusted B to the C from *Step 1*. If the B is greater than the C, an effluent limitation is required and the analysis for the subject pollutant is complete. If the B is less than or equal to the C, proceed with *Step 7*.

Step 7: Review other information available to determine if a water quality-based effluent limitation is required, notwithstanding the above analysis in *Steps 1* through *6*, to protect beneficial uses.

Information that may be used includes: the facility type, the discharge type, solids loading analysis, lack of dilution, history of compliance problems, potential toxic impact of discharge, fish tissue residue data, water quality and beneficial uses of the receiving water, CWA 303(d) listing for the pollutant, the presence of endangered or threatened species or critical habitat, and other information. If data or other information is unavailable or insufficient to determine if a water quality-based effluent limitation is required, proceed with *Step 8*.

Step 8: If data are unavailable or insufficient to conduct the above analysis for the pollutant, or if all reported detection limits of the pollutant in the effluent are greater than or equal to the C value, the RWQCB shall establish interim requirements, in accordance with section 2.2.2, that require additional monitoring for the pollutant in place of a water quality-based effluent limitation. Upon completion of the required monitoring, the RWQCB shall use the gathered data to conduct the analysis in *Steps 1* through *7* above and determine if a water quality-based effluent limitation is required.

The RWQCB shall require periodic monitoring (at least once prior to the issuance and reissuance of a permit) for pollutants for which criteria or objectives apply and for which no effluent limitations have been established; however, the RWQCB may choose to exempt low volume discharges, determined to have no significant adverse impact on water quality, from this monitoring requirement.

1.4 Calculation of Effluent Limitations

When a RWQCB determines, using the procedures described in section 1.3, that water quality-based effluent limitations are necessary to control a priority pollutant in a discharge, the permit shall contain effluent limitations developed using one or more of the following methods:

A. If a TMDL is in effect, assign a portion of the loading capacity of the receiving water to each identified priority pollutant source of waste, point and nonpoint, based on the TMDL (see Appendix 6);

B. Use the following procedure based on a steady-state model:

Step 1: For each priority pollutant identified in section 1.3, identify the applicable water quality criteria/objectives for the pollutant as described in section 1.1. Adjust the criterion or objective, if applicable, as described in section 1.2. If it is necessary to express a dissolved metal or selenium criterion/objective as total recoverable and a site-specific translator has not yet been developed, as described in section 1.4.1, the RWQCB shall use the applicable U.S. EPA conversion factor (Appendix 3). If data are insufficient to calculate the effluent limitation, the RWQCB shall establish interim requirements in accordance with section 2.2.2.

Step 2: For each water quality criterion/objective, calculate the effluent concentration allowance (ECA) using the following steady-state mass balance equation:

$ECA = C + D(C - B)$ when $C > B$, and
$ECA = C$ when $C \leq B$,

where C = the priority pollutant criterion/objective, adjusted (as described in section 1.2), if necessary, for hardness, pH, and translators (as described in section 1.4.1);
D = the dilution credit (as determined in section 1.4.2); and
B = the ambient background concentration. The ambient background concentration shall be the observed maximum as determined in accordance with section 1.4.3.1 with the exception that an ECA calculated from a priority pollutant criterion/objective that is intended to protect human health from carcinogenic effects shall use the ambient background concentration as an arithmetic mean determined in accordance with section 1.4.3.2.

The concentration units for C and B must be identical. Both C and B shall be expressed as total recoverable, unless inappropriate. The dilution credit is unitless.

Step 3: For each ECA based on an aquatic life criterion/objective, determine the long-term average discharge condition (LTA) by multiplying the ECA with a factor (multiplier) that adjusts for effluent variability. The multiplier shall be calculated as described below, or shall be found in Table 1. To use Table 1, the *coefficient of variation (CV) for the effluent pollutant concentration data must first be calculated. If (a) the number of effluent data points is less than ten, or (b) at least 80 percent of the data are reported as not detected, the CV shall be set equal to 0.6. When calculating CV in this procedure, if an effluent data point is below the detection limit for the pollutant in that sample, one-half of the detection limit shall be used as a value in the calculations. Multipliers for acute and chronic criteria/objectives that correspond to the CV can then be found in Table 1.

ECA Multipliers

$$\text{ECA multiplier}_{\text{acute99}} = e^{(0.5\sigma^2 - z\sigma)}$$

$$\text{ECA multiplier}_{\text{chronic99}} = e^{(0.5\sigma_4^2 - z\sigma_4)}$$

Where
σ = *standard deviation
σ = $[ln(CV^2 + 1)]^{0.5}$
σ^2 = $ln(CV^2 + 1)$
σ_4 = $[ln(CV^2/4 + 1)]^{0.5}$
σ_4^2 = $ln(CV^2/4 + 1)$
z = 2.326 for 99th percentile probability basis

Table 1. Effluent Concentration Allowance (ECA) Multipliers for Calculating Long-Term Averages (LTAs)

3.7	0.085	0.123
3.8	0.084	0.121
3.9	0.083	0.119
4.0	0.082	0.117

LTA Equations

LTA_{acute} = ECA_{acute} * ECA $multiplier_{acute99}$ (from Table 1 or as calculated above)

$LTA_{chronic}$ = $ECA_{chronic}$ * ECA $multiplier_{chronic99}$ (from Table 1 or as calculated above)

Step 4: Select the lowest (most limiting) of the *LTA*s for the pollutant derived in *Step 3*.

Step 5: Calculate water quality-based effluent limitations (an *average monthly effluent limitation, AMEL, and a *maximum daily effluent limitation, MDEL) by multiplying the most limiting *LTA* (as selected in *Step 4*) with a factor (multiplier) that adjusts for the averaging periods and exceedance frequencies of the criteria/objectives and the effluent limitations, and the effluent monitoring frequency as follows:

$AMEL_{aquatic\ life}$ = *LTA* * AMEL $multiplier_{95}$ (from Table 2 or as calculated below)
$MDEL_{aquatic\ life}$ = *LTA* * MDEL $multiplier_{99}$ (from Table 2 or as calculated below)

The AMEL and MDEL multipliers shall be calculated as described below, or shall be found in Table 2 using the previously calculated *CV* and the monthly sampling frequency (*n*) of the pollutant in the effluent. If the sampling frequency is four times a month or less, *n* shall be set equal to 4. For this method only, maximum daily effluent limitations shall be used for publicly-owned treatment works (POTWs) in place of average weekly limitations.

AMEL and MDEL Multipliers

$$AMEL\ multiplier_{95} = e^{(z\sigma_n - 0.5\sigma_n^2)}$$

Where
$\sigma_n = [ln(CV^2/n + 1)]^{0.5}$
$\sigma_n^2 = ln(CV^2/n + 1)$
z = 1.645 for 95th percentile probability basis
n = number of samples per month

$$MDEL\ multiplier_{99} = e^{(z\sigma - 0.5\sigma^2)}$$

Where
$\sigma = [ln(CV^2 + 1)]^{0.5}$
$\sigma^2 = ln(CV^2 + 1)$
z = 2.326 for 99th percentile probability basis

Step 6: For the applicable human health criterion/objective, set the AMEL equal to the *ECA* (from *Step 2*).

$AMEL_{human\ health}$ = ECA

To calculate the MDEL for a human health criterion/objective, multiply the *ECA* by the ratio of the MDEL multiplier to the AMEL multiplier.

Table 2. Long-Term Average (LTA) Multipliers for Calculating Effluent Limitations

Coefficient of Variation	MDEL Multiplier	AMEL Multiplier			MDEL/AMEL Multiplier

4.0	12.16	3.60	3.24	2.37	3.37	3.76	5.14

Notes:
n = monthly sampling frequency of the effluent concentration data.

$$\text{MDEL/AMEL multiplier} = \text{MDEL multiplier}_{99} \div \text{AMEL multiplier}_{95}$$

$$\text{MDEL}_{\text{human health}} = \text{ECA} * \text{MDEL/AMEL multiplier}$$

Step 7: Identify the lower of (1) the AMEL and MDEL calculated based on the aquatic life criteria/objectives, and (2) the AMEL and MDEL calculated based on the human health criterion/objective.

C. Apply a *dynamic model, approved by the RWQCB, where sufficient effluent and receiving water data exist; or

D. Establish effluent limitations that consider intake water pollutants according to section 1.4.4.

The RWQCB shall impose more restrictive water quality-based effluent limitations (e.g., discharge prohibitions established in accordance with Water Code Section 13243) where necessary for the protection of beneficial uses or where otherwise required by law.[7] Seasonal effluent limitations may be established, where appropriate (such as in applying translators and mixing zones/dilution credits). Any significant change in effluent quantity or quality shall be cause for reevaluation of effluent limitations.

Regardless of which method is used for deriving water quality-based effluent limitations, the calculated water quality-based effluent limitations shall be compared to the technology-based effluent limitations for the pollutant, and the most protective of the two types of limitations shall be included in the permit.

Effluent limitations shall apply to the total effluent of a waste discharge at the end-of-pipe, except in the rare situations where it is impractical or infeasible (e.g., where the final discharge point is inaccessible, or the pollutants are so diluted by cooling water as to make monitoring impractical, or interferences among pollutants make analysis infeasible). In these cases, some effluent limitations and monitoring requirements for the discharge may be modified to apply to internal waste streams instead, provided that the permit fact sheet fully states the circumstances for allowing this to occur and the permit also contains the unmodified effluent limitations (see 40 CFR 122.45(h), revised as of July 1, 1996).

For pollutants that are so diluted by cooling water as to make monitoring impractical, effluent limitations for internal waste streams shall be based on the same averaging periods as the unmodified effluent limitations and shall be calculated as follows:

[7] For example, to implement the State and federal antidegradation policies, and the federal antibacksliding requirements.

$$IL = EL + (EL - CC) * CF/IF$$
$$IL = EL + (EL - CC) * (EF - IF)/IF$$

where IL = the limitation for the internal waste stream;
EL = the unmodified effluent limitation;
CC = the concentration of the pollutant in the cooling water;
CF = the cooling water flow, which is equal to the effluent flow minus the internal waste stream flow;
IF = the internal waste stream flow; and
EF = the effluent flow.

These equations do not apply when intake water credits (as described in section 1.4.4) are being provided.

1.4.1 Translators for Metals and Selenium

To derive total recoverable effluent limitations for aquatic life metals and selenium criteria/objectives that are expressed in the dissolved form, a translator first must be applied to the criterion/objective to express it as total recoverable. The translator shall be the U.S. EPA conversion factor (see Appendix 3) that applies to the dissolved aquatic life metals criterion as specified in the CTR (i.e., the dissolved criterion/objective would be divided by the applicable U.S. EPA conversion factor to calculate a total recoverable criterion) unless:

A. the discharger, in the permit application, (1) commits to (a) completing a defensible site-specific translator study and (b) proposing a dissolved to total recoverable translator to the RWQCB, and (2) describes the method(s) to be used in developing the translator; and

B. the discharger, within a time period specified by the RWQCB not exceeding two years from the date of issuance/reissuance of the permit, submits to the RWQCB (1) the proposed translator, and (2) all data and calculations related to its derivation.

Site-specific translators can be developed from field data by either direct determination of the fraction dissolved, or by development of a site-specific partition coefficient that relates the fraction dissolved to ambient background conditions such as pH, suspended load, or organic carbon. The fraction of metal that is dissolved in a water body can vary depending on when and where measurements are taken. A site-specific translator must (1) account for spatial and/or seasonal variability in areas of the water body that are affected by the discharger's effluent and (2) protect against toxic effects during critical conditions. The translator shall be derived using the *median of data for translation of chronic criteria and the *90^{th} percentile of observed data for translation of acute criteria. If systematic seasonal variation in the translator is demonstrated, seasonal effluent limitations may be justified. If a spatial gradient in the translator is demonstrated, the highest translator value should be used unless the permit allows for a mixing zone (in accordance with section 1.4.2), in which case measurements should be taken outside the mixing zone. The site-specific study plan (including sampling design) must be approved by the RWQCB, after consultation with the California Department of Fish and Game, prior to conducting the study. Translator studies may be conducted by one or more dischargers discharging to the same receiving water body, as described in the permit application, subject to approval by the RWQCB. The planning and undertaking of the study may follow the guidelines presented in Appendix 5, as applicable.

Alternatively, the RWQCB may consider applying a previously approved site-specific translator or translator based on a study completed prior to the adoption of this Policy if the RWQCB believes the translator adequately reflects existing conditions (including spatial and/or seasonal variability) in the areas of the water body affected by the discharger's effluent.

While a translator study is being conducted, a final effluent limitation based on the applicable U.S. EPA conversion factor shall be included in the provisions of the permit and interim requirements shall be established (in accordance with section 2.2.2). An interim deadline to submit the results of the study shall be specified by the RWQCB, and shall not exceed two years from the date of issuance/reissuance of the permit. Once the translator is developed by the discharger(s) and approved by the RWQCB, the RWQCB shall reopen the permit and a new effluent limitation shall be calculated using a method described in section 1.4 after adjusting the dissolved metal or selenium criterion/objective by dividing it by the translator. In the event a translator study is not completed within the specified time, the U.S. EPA conversion factor-based effluent limitation in the provisions of the permit shall become effective as a default limitation.

1.4.2 Mixing Zones and Dilution Credits

With the exception of effluent limitations derived from TMDLs, in establishing and determining compliance with effluent limitations for applicable human health, acute aquatic life, or chronic aquatic life priority pollutant criteria/objectives or the toxicity objective for aquatic life protection in a RWQCB basin plan, the RWQCB may grant *mixing zones and *dilution credits to dischargers in accordance with the provisions of this section. To the extent permitted by applicable law, mixing zones may be considered for TMDL-derived effluent limitations. Effluent limitations based on a TMDL shall meet the mixing zone conditions specified in section 1.4.2.2.A.

The applicable priority pollutant criteria and objectives are to be met throughout a water body except within any mixing zone granted by a RWQCB. The allowance of mixing zones is discretionary and shall be determined on a discharge-by-discharge basis. A RWQCB may consider allowing mixing zones and dilution credits only for discharges with a physically identifiable point of discharge that are regulated through an NPDES permit issued by the RWQCB.

1.4.2.1 <u>Dilution Credits</u>

The dilution credit, D, is a numerical value associated with the mixing zone that accounts for the receiving water entrained into the discharge. The dilution credit is a value used in the calculation of effluent limitations (described in section 1.4). Dilution credits may be limited or denied on a pollutant-by-pollutant basis, which may result in a dilution credit for all, some, or no priority pollutants in a discharge.

Before establishing a mixing zone and a dilution credit for a discharge, it must first be determined if, and how much (if any), receiving water is available to dilute the discharge. In determining the appropriate available receiving water flow, the RWQCBs may take into account actual and seasonal variations of the receiving water and the effluent. For example, a RWQCB may prohibit mixing zones during seasonal low flows and allow them during seasonal high flows. However, for year-round mixing zones, the mixing zone and dilution credit shall be determined using the parameters specified in Table 3.

Table 3. Effluent and Receiving Water Flows for Calculating Dilution Ratios

In calculating a dilution ratio for:	Use the critical receiving water flow[8] of:	Use the discharged effluent flow of:
Acute aquatic life criteria/objectives	*1Q10	*maximum daily flow during period of discharge
Chronic aquatic life criteria/objectives Chronic toxicity objective for aquatic life[9]	*7Q10	*four-day average of daily maximum flows during period of discharge
Human health criteria/objectives	*harmonic mean	*long-term arithmetic mean flow during period of discharge

The approach to making a mixing zone determination also depends on whether a discharge is *completely-mixed or *incompletely-mixed with the receiving water as discussed below.

Completely-Mixed Discharges

For completely-mixed discharges, as determined by the RWQCB and based on information provided by the discharger, the amount of receiving water available to dilute the effluent shall be determined by calculating the *dilution ratio (i.e., the critical receiving water flow divided by the effluent flow) using the appropriate flows in Table 3. In no case shall the RWQCB grant a dilution credit that is greater than the calculated dilution ratio. The dilution credit may be set equal to the dilution ratio only if the site-specific conditions concerning the discharge and the receiving water do not indicate that a smaller dilution credit is necessary to protect beneficial uses and meet the conditions of this Policy. If, however, dilution ratios that are calculated using the Table 3 parameters are inappropriate for use due to site-specific issues, the mixing zone and dilution credit shall be determined using site-specific information and procedures detailed for incompletely-mixed discharges.

[8] U.S. EPA's *biologically-based receiving water flows may be used in place of these critical receiving water flows where sufficient data are available.

[9] These objectives are included in RWQCB basin plans and may address both chronic and acute toxicity to aquatic life. The flows in Table 3 apply to the chronic component of the objective.

Incompletely-Mixed Discharges

Dilution credits and mixing zones for incompletely-mixed discharges shall be considered by the RWQCB only after the discharger has completed an independent mixing zone study and demonstrated to the satisfaction of the RWQCB that a dilution credit is appropriate. Mixing zone studies may include, but are not limited to, tracer studies, dye studies, modelling studies, and monitoring upstream and downstream of the discharge that characterize the extent of actual dilution. These studies may be conducted in accordance with the procedures outlined in Appendix 5.

1.4.2.2 Mixing Zone Conditions

A mixing zone shall be as small as practicable. The following conditions must be met in allowing a mixing zone:

A. A mixing zone shall not:

(1) compromise the integrity of the entire water body;
(2) cause *acutely toxic conditions to aquatic life passing through the mixing zone;
(3) restrict the passage of aquatic life;
(4) adversely impact biologically sensitive or critical habitats, including, but not limited to, habitat of species listed under federal or State endangered species laws;
(5) produce undesirable or nuisance aquatic life;
(6) result in floating debris, oil, or scum;
(7) produce objectionable color, odor, taste, or turbidity;
(8) cause *objectionable bottom deposits;
(9) cause nuisance;
(10) dominate the receiving water body or overlap a mixing zone from different outfalls; or
(11) be allowed at or near any drinking water intake. A mixing zone is not a *source of drinking water. To the extent of any conflict between this determination and the Sources of Drinking Water Policy (SWRCB Resolution No. 88-63), this determination supersedes the provisions of that policy.

B. The RWQCB shall deny or significantly limit a mixing zone and dilution credit as necessary to protect beneficial uses, meet the conditions of this Policy, or comply with other regulatory requirements. Such situations may exist based upon the quality of the discharge, hydraulics of the water body, or the overall discharge environment (including water column chemistry, organism health, and potential for bioaccumulation). For example, in determining the extent of or whether to allow a mixing zone and dilution credit, the RWQCB shall consider the presence of pollutants in the discharge that are *carcinogenic, *mutagenic, *teratogenic, *persistent, *bioaccumulative, or attractive to aquatic organisms. In another example, the RWQCB also shall consider, if necessary to protect the beneficial uses, the level of flushing in water bodies such as lakes, reservoirs, enclosed bays, estuaries, or other water body types where pollutants may not be readily flushed through the system. In the case of multiple mixing zones, proximity to other outfalls shall be carefully considered to protect the beneficial uses.

If a RWQCB allows a mixing zone and dilution credit, the permit shall specify the method by which the mixing zone was derived, the dilution credit granted, and the point(s) in the receiving water where the applicable criteria/objectives must be met. The application for the permit shall include, to the extent feasible, the information needed by the RWQCB to make a determination on allowing a mixing zone, including the calculations for deriving the appropriate receiving water and effluent flows, and/or the results of a mixing zone study. If the results of the mixing zone study are unavailable by the time of permit issuance/reissuance, the RWQCB may establish interim requirements in accordance with section 2.2.2.

1.4.3 Ambient Background Concentrations

Ambient background concentration, B, of a priority pollutant in the receiving water body shall be calculated on a pollutant-by-pollutant basis and on a discharge-by-discharge or water body-by-water body basis at the RWQCB's discretion. The ambient background concentration shall be the observed maximum ambient water column concentration in accordance with section 1.4.3.1 or the *arithmetic mean of observed ambient water concentrations in accordance with section 1.4.3.2 where these sections are specifically referenced in this Policy (i.e., sections 1.3 and 1.4).

1.4.3.1 Ambient Background Concentration as an Observed Maximum

Step 1: Identify all available, applicable ambient background data for the pollutant in accordance with section 1.2. If possible, preference should be given to ambient water column concentrations measured immediately upstream or near the discharge, but not within an allowed mixing zone for the discharge. The RWQCB shall have discretion to consider if any samples are invalid for use as applicable data due to evidence that the sample has been erroneously reported or the sample is not representative of the ambient receiving water column that will mix with the discharge. For example, the RWQCB shall have discretion to consider samples to be invalid that have been taken during peak flows of significant storm events.

Step 2: If all samples are below the reported detection limits, the ambient background concentration shall be set equal to the lowest of the individual reported detection limits. If any sample is reported with a detected concentration, as either measured or estimated by the laboratory, the ambient background concentration shall be set equal to the maximum of the individual reported measured or estimated concentrations.

1.4.3.2 Ambient Background Concentration as an Arithmetic Mean

Step 1: Identify all available, applicable ambient background data for the pollutant in accordance with section 1.2. If possible, preference should be given to ambient water column concentrations measured immediately upstream or near the discharge, but not within an allowed mixing zone for the discharge. The RWQCB shall have discretion to consider if any samples are invalid for use as applicable data due to evidence that the sample has been erroneously reported or the sample is not representative of the ambient receiving water column that will mix with the discharge.

Step 2: If all samples are below the reported detection limits, the ambient background concentration shall be set equal to the lowest of the individual reported detection limits. If any sample is reported with a detected concentration, as either measured or estimated by the laboratory, the ambient background concentration shall be set equal to the arithmetic mean of the individual reported measured or estimated concentrations. The arithmetic mean shall be calculated using the reported detection limits for samples that are reported below detection limits.

1.4.4 Intake Water Credits

A RWQCB may consider priority pollutants in intake water on a pollutant-by-pollutant and discharge-by-discharge basis when establishing water quality-based effluent limitations, provided that the discharger has demonstrated to the satisfaction of the RWQCB that the following conditions are met:

(1) The observed maximum ambient background concentration, as determined in section 1.4.3.1, and the intake water concentration of the pollutant exceed the most stringent applicable criterion/objective for that pollutant;

(2) The intake water credits provided are consistent with any TMDL applicable to the discharge that has been approved by the RWQCB, SWRCB, and U.S. EPA;

(3) The intake water is from the same water body as the receiving water body. The discharger may demonstrate this condition by showing that:

(a) the ambient background concentration of the pollutant in the receiving water, excluding any amount of the pollutant in the facility's discharge, is similar to that of the intake water;

(b) there is a direct hydrological connection between the intake and discharge points;

(c) the water quality characteristics are similar in the intake and receiving waters; and

(d) the intake water pollutant would have reached the vicinity of the discharge point in the receiving water within a reasonable period of time and with the same effect had it not been diverted by the discharger.

The RWQCB may also consider other factors when determining whether the intake water is from the same water body as the receiving water body;

(4) The facility does not alter the intake water pollutant chemically or physically in a manner that adversely affects water quality and beneficial uses; and

(5) The timing and location of the discharge does not cause adverse effects on water quality and beneficial uses that would not occur if the intake water pollutant had been left in the receiving water body.

Where the above conditions are met, the RWQCB may establish effluent limitations allowing the facility to discharge a mass and concentration of the intake water pollutant that is no greater than the mass and concentration found in the facility's intake water. A discharger may add mass of the pollutant to its waste stream if an equal or greater mass is removed prior to discharge, so there is no net addition of the pollutant in the discharge compared to the intake water. Where proper operation and maintenance of a facility's treatment system results in the removal of an intake water pollutant, the RWQCB may establish limitations that reflect the lower mass and concentration of the pollutant achieved by such treatment.

Where intake water for a facility is provided by a municipal water supply system and the supplier provides treatment of the raw water that removes an intake water pollutant, the concentration of the intake water pollutant shall be determined at the point where the water enters the water supplier's distribution system.

Where a facility discharges pollutants from multiple sources that originate from the receiving water body and from other water bodies, the RWQCB may derive an effluent limitation reflecting the flow-weighted amount of each source of the pollutant provided that adequate monitoring to determine compliance can be established and is included in the permit. When calculating the flow-weighted effluent limitation, the pollutant from the receiving water body shall be assumed to have a concentration that is no greater than the concentration in the facility's intake water; the same pollutant from other sources shall be assumed to have a concentration that is no greater than the most stringent applicable criterion/objective.

The permit shall specify how compliance with mass- and concentration-based limitations for the intake water pollutant will be assessed. This may be done by basing the effluent limitation on ambient background concentration data. Alternatively, the RWQCB may determine compliance by simultaneously monitoring the pollutant concentrations in the intake water and in the effluent. This monitoring may be supplemented by monitoring internal waste streams or by a RWQCB evaluation of the use of *best management practices.

2. DETERMINING COMPLIANCE WITH PRIORITY POLLUTANT CRITERIA/OBJECTIVES AND WATER QUALITY-BASED EFFLUENT LIMITATIONS FOR PRIORITY POLLUTANT CRITERIA/OBJECTIVES

Compliance with priority pollutant criteria/objectives and water quality-based effluent limitations established pursuant to section 1 shall be determined according to the following provisions for (1) compliance schedules (section 2.1), (2) interim requirements (section 2.2), (3) monitoring requirements (section 2.3), and (4) reporting requirements including compliance determinations (section 2.4). In determining compliance with effluent limitations based on intake water credits, only the monitoring requirements (section 2.3) and the reporting requirements (section 2.4) apply. In determining compliance with effluent limitations derived from TMDLs, only the compliance schedule provisions (section 2.1) apply.

2.1 Compliance Schedules

Based on an *existing discharger's request and demonstration that it is *infeasible for the discharger to achieve immediate compliance with a CTR criterion[10], or with an effluent limitation based on a CTR criterion, the RWQCB may establish a compliance schedule in an NPDES permit. Compliance schedules shall not be allowed in permits for *new dischargers.

A schedule of compliance shall include a series of required actions to be undertaken for the purpose of achieving a CTR criterion and/or effluent limitations based on a CTR criterion. These actions shall demonstrate reasonable progress toward the attainment of a CTR criterion and/or effluent limitations. The compliance schedule shall include a schedule for completion that reflects a realistic assessment of the shortest practicable time required to perform each task. The compliance schedule shall contain a final compliance date based on the shortest practicable time required to achieve compliance. The deadlines to complete each action in the compliance schedule shall be specified in the NPDES permit and shall be accompanied by interim requirements as described in section 2.2.1. When a compliance schedule exceeds one year from the date of permit issuance, interim limitations with specific compliance dates (as described in section 2.2.1) shall be included in the NPDES permit. If the final compliance date extends beyond the permit term, the final compliance date and supporting explanation shall be included in the permit findings.

The discharger shall submit to the RWQCB the following justification before compliance schedules may be authorized in a permit: (a) documentation that diligent efforts have been made to quantify pollutant levels in the discharge and the sources of the pollutant in the waste stream, and the results of those efforts; (b) documentation of source control and/or pollution minimization efforts currently underway or completed; (c) a proposed schedule for additional or future source control measures, *pollutant minimization actions, or waste treatment (i.e., facility upgrades); and (d) a demonstration that the proposed schedule is as short as practicable.

The schedule of compliance for point source dischargers in an NPDES permit shall be as short as practicable but in no case exceed the following:

A. Up to <u>five</u> years <u>from the date of permit issuance, reissuance, or modification</u> to complete actions (such as pollutant minimization or facility upgrades) necessary to comply with CTR criterion-based effluent limitations that are derived with or without a TMDL. Such actions shall include the development and adoption of a site-specific objective, if appropriate, as provided in section 5.2.

B. Up to <u>15</u> years <u>from the effective date of this Policy</u> to develop and adopt a TMDL, and accompanying Waste Load Allocations (WLAs) and Load Allocations (LAs), as described in section 2.1.1, below.

In no case (unless an exception has been granted in accordance with section 5.3) shall a compliance schedule for these dischargers exceed, from the effective date of this Policy: (a) 10 years to establish and comply with CTR criterion-based effluent limitations; or (b) 20 years

---

[10] CTR criteria, for purposes of this section, exclude NTR criteria.

to develop and adopt a TMDL, and to establish and comply with WLAs derived from a TMDL for a CTR criterion (i.e., up to 15 years to complete the TMDL and up to five years to comply with a TMDL-derived effluent limitation).

2.1.1 TMDL-Based Compliance Schedule

The compliance schedule provisions for the development and adoption of a TMDL only apply when: (a) the discharger requests and demonstrates that it is *infeasible for the discharger to achieve immediate compliance with a CTR criterion, or with an effluent limitation based on a CTR criterion; and (b) the discharger has made appropriate commitments to support and expedite the development of the TMDL. In determining appropriate commitments, the RWQCB should consider the discharge's contribution to current loadings and the discharger's ability to participate in TMDL development.

For *bioaccumulative priority pollutants for which the receiving water has been included on the CWA Section 303(d) list, the RWQCB should consider whether the mass loading of the bioaccumulative pollutant(s) should be limited to representative, current levels pending TMDL development in order to implement the applicable water quality standard.

2.2 Interim Requirements

If a compliance schedule is allowed (in accordance with section 2.1) or a schedule is allowed to collect and provide data needed to establish water quality-based effluent limitations for a CTR criterion (in accordance with provisions in section 1), interim requirements shall be included in an NPDES permit.

2.2.1 Interim Requirements Under a Compliance Schedule

If a compliance schedule is granted (in accordance with section 2.1), the RWQCB shall establish interim requirements and dates for their achievement in the NPDES permit. If the compliance schedule exceeds one year, the RWQCB shall establish interim numeric limitations for the priority pollutant in the permit and may also impose interim requirements to control the pollutant, such as *pollutant minimization and source control measures. Numeric interim limitations for the pollutant must be based on current treatment facility performance or on existing permit limitations, whichever is more stringent. If the existing permit limitations are more stringent, and the discharger is not in compliance with those limitations, the noncompliance under the existing permit must be addressed through appropriate enforcement action before the permit can be reissued, unless antibacksliding provisions are met.

There shall be no more than one year between interim dates. The interim requirements shall state that the discharger must notify the RWQCB, in writing, no later than 14 days following each interim date, of its compliance or noncompliance with the interim requirements.

If the compliance schedule is within the term of the permit, the final effluent limitations shall be included in the permit provisions. If the compliance schedule exceeds the length of the permit, the final effluent limitations shall be included in the permit findings. In the latter case, the findings shall include: (1) the water quality to be achieved; (2) the reason that a final water quality-based effluent limitation is not being incorporated into the permit as an enforceable limitation at this time; (3) a statement that it is the intent of the RWQCB to include, in a subsequent permit revision, the final water quality-based effluent limitation as an enforceable limitation (based either on the CTR criterion directly or on future regulatory developments, such as TMDL or site-specific objective development). The permit findings shall also state the appropriate enforcement actions that may be taken by the RWQCB if interim limitations and requirements are not met.

2.2.2 Interim Requirements for Providing Data

The RWQCB may determine, based on a discharger's request and/or a demonstration of necessity, that it is appropriate to establish a schedule of interim requirements regarding the implementation of a CTR criterion. Such interim schedules may be established based on a consideration of time needed to collect sufficient data to: (1) determine whether effluent limitations are needed (as described in section 1.3); and (2) calculate effluent limitations (as described in section 1.4), including developing a site-specific translator (as described in section 1.4.1) and conducting a mixing zone study (as described in section 1.4.2).

If a discharger makes a successful demonstration, as determined by the RWQCB, that available data are insufficient, the permit provisions shall specify a schedule <u>not to exceed three years from the effective date of this Policy</u>[11] that contains interim requirements and dates for their achievement. There shall be no more than one year between interim dates. The interim requirements shall state that the discharger must notify the RWQCB, in writing, no later than 14 days following each interim date, of its compliance or noncompliance with the interim requirements (or must submit a progress report, if applicable). Additional requirements that are specific to two situations follow:

A. Insufficient Data to Determine if an Effluent Limitation for a CTR Criterion is Needed

The RWQCB shall <u>not</u> establish in the NPDES permit numeric interim limitations, and source control or *pollutant minimization measures, for the pollutant, but shall instead require the discharger to collect the needed data. These data requirements should be sufficient to contribute to the data needs for both sections 1.3 and 1.4. When the needed data have been provided in accordance with the interim requirements, the RWQCB shall determine, based on the data and the section 1.3 procedure, if water quality-based effluent limitations are necessary for the pollutant. If the RWQCB determines that effluent limitations are needed, the RWQCB shall calculate them, reopen the permit, and include the calculated effluent limitations in the permit provisions.

B. Insufficient Data to Calculate a Final Effluent Limitation for a CTR Criterion

The RWQCB shall establish in the NPDES permit numeric interim limitations, and may also establish other interim requirements such as requiring the discharger to implement *pollutant minimization and/or source control measures and participate in the activities necessary to develop final effluent limitations. Numeric interim limitations for the pollutant must be based on current treatment facility performance or on existing permit limitations, whichever is more

---

[11] Note that the schedule to submit a translator for approval by the RWQCB is up to two years from the date of issuance/reissuance of the permit (as described in section 1.4.1).

stringent. If the existing permit limitations are more stringent, and the discharger is not in compliance with those limitations, the noncompliance under the existing permit must be addressed through appropriate enforcement action before the permit can be reissued, unless antibacksliding provisions are met.

Permit findings shall also state the appropriate enforcement actions that may be taken by the RWQCB if interim limitations and requirements are not met. Except as provided in section 1.4.1 (for a translator study), the permit provisions shall not include a final effluent limitation, but the permit findings shall include: (1) the water quality to be achieved; (2) the reason that a final water quality-based effluent limitation is not being incorporated into the permit as an enforceable limitation at this time; (3) a statement that it is the intent of the RWQCB to include the final water quality-based effluent limitation as an enforceable limitation in a subsequent permit revision, and that the final water quality-based effluent limitation will be based either on the water quality criterion or on future regulatory developments; and (4) a schedule for development of a final water quality-based effluent limitation. When interim requirements have been completed, the RWQCB shall calculate final water quality-based effluent limitations for that pollutant based on the collected data, reopen the permit, and include the final effluent limitations in the permit provisions. Once final limitations become effective, the interim limitations will no longer apply.

2.3 Monitoring Requirements

The RWQCB shall require dischargers to conduct self-monitoring programs and shall clearly state in all permits the objective and purpose of the monitoring. Furthermore, the RWQCB shall determine, and specify under the monitoring and reporting requirements, the sampling parameters, monitoring frequencies, locations, and analytical methods to be used. To evaluate compliance with effluent limitations, effluent and ambient monitoring should occur within a brief enough period to be able to evaluate the effect of the effluent on the ambient water quality. All data shall be reported in accordance with section 2.4. Options for analytical methods are:

(1) those methods listed in Appendix 4 and described in Tables 1A, 1B, 1C, 1D, and 1E of 40 CFR 136.3 (revised as of May 14, 1999); or alternate test procedures for individual discharges that have been approved by the U.S. EPA Regional Administrator pursuant to 40 CFR 136.4 (a) through (c), inclusive, and 40 CFR 136.5 (a) through (d), inclusive (revised as of May 14, 1999); or

(2) where no methods are specified for a given pollutant in the tables described in (1) above, methods approved by the SWRCB or RWQCB.

Laboratories analyzing monitoring samples shall be certified by the Department of Health Services, in accordance with the provision of Water Code Section 13176, and must include quality assurance/quality control data with their reports.

Dischargers are also encouraged to submit monitoring data in electronic formats approved by the SWRCB or RWQCB.

Furthermore, it is the policy of the SWRCB that individual permit monitoring complement and be coordinated with water body, watershed, and regional monitoring programs to the extent practicable.

2.4 Reporting Requirements

The discharger shall submit to the RWQCB reports necessary to determine compliance with effluent limitations for priority pollutants in permits. The reports shall comply with the requirements of sections 2.4.1 through 2.4.4.

2.4.1 Reporting Levels

The RWQCB shall require in the permit that the discharger shall report with each sample result:

1. The applicable *Minimum Level (ML) (selected from Appendix 4 in accordance with section 2.4.2 or established in accordance with section 2.4.3); this ML is the "reported ML"; and

2. The laboratory's current *Method Detection Limit (MDL), as determined by the procedure found in 40 CFR 136 (revised as of May 14, 1999).

2.4.2 Selection and Use of Appropriate ML Value

<u>ML Selection</u>: When there is more than one ML value for a given substance, the RWQCB shall cite for inclusion in the permit all ML values, and their associated analytical methods, listed in Appendix 4 that are below the calculated effluent limitation. The discharger may select any one of those cited analytical methods for compliance determination. If no ML value is below the effluent limitation, then the RWQCB shall select the lowest ML value, and its associated analytical method, listed in Appendix 4 for inclusion in the permit.

<u>ML Usage</u>: The ML value in Appendix 4 represents the lowest quantifiable concentration in a sample based on the proper application of all method-based analytical procedures and the absence of any matrix interferences. Assuming that all method-specific analytical steps are followed, the ML value will also represent, after the appropriate application of method-specific factors, the lowest standard in the calibration curve for that specific analytical technique. Common analytical practices sometimes require different treatment of the sample relative to calibration standards. Some examples are given below:

Substance or Grouping	Method-Specified Treatment	Most Common Method-Specific Factor(s)
Volatile organic	No differential treatment	1
Semi-Volatile organic	Samples concentrated by extraction	1000
Metals	Samples diluted or concentrated	½, 2, and 4
Pesticides	Samples concentrated by extraction	100

Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied in the computation of the reporting limit. Application of such factors will alter the reported ML (as described in section 2.4.1).

Dischargers are to instruct laboratories to establish calibration standards so that the ML value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the discharger to use analytical data derived from *extrapolation* beyond the lowest point of the calibration curve. The discharger's laboratory(ies) may, as allowed for by the rules governing alterations to ML values in section 2.4.3 below, employ a calibration standard lower than the ML value in Appendix 4.

2.4.3 Deviation from MLs Listed in Appendix 4

The RWQCB, in consultation with the SWRCB's Quality Assurance Program, shall establish an ML that is not contained in Appendix 4 to be included in the discharger's permit in any of the following situations:

1. When the pollutant under consideration is not included in Appendix 4.

2. When the discharger and the RWQCB agree to include in the permit a test method that is more sensitive than those specified in 40 CFR 136 (revised as of May 14, 1999).

3. When a discharger agrees to use an ML that is lower than those listed in Appendix 4.

4. When a discharger demonstrates that the calibration standard matrix is sufficiently different from that used to establish the ML in Appendix 4 and proposes an appropriate ML for their matrix.

5. When the discharger uses a method whose quantification practices are not consistent with the definition of an ML. Examples of such methods are the U.S. EPA-approved method 1613 for dioxins and furans, method 1624 for volatile organic substances, and method 1625 for semi-volatile organic substances. In such cases, the discharger, the RWQCB, and the SWRCB shall agree on a lowest quantifiable limit and that limit will substitute for the ML for reporting and compliance determination purposes.

2.4.4 Reporting Protocols

The discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

1. Sample results greater than or equal to the reported ML shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

2. Sample results less than the reported ML, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The *estimated chemical concentration of the sample shall also be reported.

For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words "Estimated Concentration" (may be shortened to "Est. Conc."). The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (± a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

3. Sample results less than the laboratory's MDL shall be reported as "Not Detected," or ND.

2.4.5 Compliance Determination

Compliance with effluent limitations shall be determined as follows:

1. Dischargers shall be deemed out of compliance with an effluent limitation if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reported ML.

2. Dischargers shall be required to conduct a Pollutant Minimization Program (PMP) in accordance with section 2.4.5.1 when there is evidence (e.g., sample results reported as DNQ when the effluent limitation is less than the MDL, sample results from analytical methods more sensitive than those methods included in the permit in accordance with sections 2.4.2 or 2.4.3 above, presence of whole effluent toxicity, health advisories for fish consumption, results of benthic or aquatic organism tissue sampling) that the priority pollutant is present in the effluent above an effluent limitation and either:

   a. A sample result is reported as DNQ and the effluent limitation is less than the reported ML; or

   b. A sample result is reported as ND and the effluent limitation is less than the MDL.

   RWQCBs may include special provisions in the permit to require the gathering of evidence to determine whether the constituent of concern is present in the effluent at levels above a calculated effluent limitation.

When determining compliance with an AMEL and more than one sample result is available in a month, the discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of DNQ or ND. In those cases, the discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

1. The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both

of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

If a sample result, or the arithmetic mean or median of multiple sample results, is below the reported ML, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation <u>and</u> the discharger conducts a PMP (as described in section 2.4.5.1), the discharger shall <u>not</u> be deemed out of compliance.

2.4.5.1 <u>Pollutant Minimization Program</u>

The goal of the PMP shall be to reduce all potential sources of a priority pollutant(s) through *pollutant minimization (control) strategies, including *pollution prevention measures as appropriate[12], to maintain the effluent concentration at or below the water quality-based effluent limitation. The RWQCB may consider cost-effectiveness when establishing the requirements of a PMP. The program shall include, but not be limited to, the following actions and submittals acceptable to the RWQCB:

1. An annual review and semi-annual monitoring of potential sources of the reportable priority pollutant(s), which may include fish tissue monitoring and other bio-uptake sampling;

2. Quarterly monitoring for the reportable priority pollutant(s) in the influent to the wastewater treatment system;

3. Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable priority pollutant(s) in the effluent at or below the effluent limitation;

4. Implementation of appropriate cost-effective control measures for the reportable priority pollutant(s), consistent with the control strategy; and

5. An annual status report that shall be sent to the RWQCB including:

    a. All PMP monitoring results for the previous year;

    b. A list of potential sources of the reportable priority pollutant(s);

    c. A summary of all actions undertaken pursuant to the control strategy; and

    d. A description of actions to be taken in the following year.

The permit shall contain a reopener clause authorizing modifications, or revocation and reissuance of the permit, as a result of the detection of a reportable priority pollutant generated by special conditions included in the permit. These special conditions in the permit may be, but are

---

[12] Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted.

not limited to, fish tissue sampling, whole effluent toxicity tests, monitoring requirements on internal waste stream(s), and monitoring for surrogate parameters. Additional requirements may be included in the permit as a result of the special condition monitoring data.

The completion and implementation of a pollution prevention plan, required pursuant to Water Code Section 13263.3(d), shall be considered to fulfill the PMP requirements of this section.

3. 2,3,7,8-TCDD EQUIVALENTS

The CTR includes criteria for 2,3,7,8-tetrachlorodibenzo-p-dioxin (2,3,7,8-TCDD). In addition to this compound, there are many congeners of chlorinated dibenzodioxins (2,3,7,8-CDDs) and chlorinated dibenzofurans (2,3,7,8-CDFs) that exhibit toxic effects similar to those of 2,3,7,8-TCDD. The U.S. EPA has published toxic equivalency factors (TEFs) for 17 of the congeners. The TEFs express the relative toxicities of the congeners compared to 2,3,7,8-TCDD (whose TEF equals 1.0). In June 1997, participants in a World Health Organization (WHO) expert meeting revised TEF values for 1,2,3,7,8-PentaCDD, OctaCDD, and OctaCDF. The current TEFs for the 17 congeners, which include the three revised values, are shown in Table 4:

Table 4. Toxic Equivalency Factors (TEFs) for 2,3,7,8-TCDD Equivalents

Congener	TEF
2,3,7,8-TetraCDD	1
1,2,3,7,8-PentaCDD	1.0
1,2,3,4,7,8-HexaCDD	0.1
1,2,3,6,7,8-HexaCDD	0.1
1,2,3,7,8,9-HexaCDD	0.1
1,2,3,4,6,7,8-HeptaCDD	0.01
OctaCDD	0.0001
2,3,7,8-TetraCDF	0.1
1,2,3,7,8-PentaCDF	0.05
2,3,4,7,8-PentaCDF	0.5
1,2,3,4,7,8-HexaCDF	0.1
1,2,3,6,7,8-HexaCDF	0.1
1,2,3,7,8,9-HexaCDF	0.1
2,3,4,6,7,8-HexaCDF	0.1
1,2,3,4,6,7,8-HeptaCDF	0.01
1,2,3,4,7,8,9-HeptaCDF	0.01
OctaCDF	0.0001

TEF Reference: Van den Berg, M., et al. (22 additional authors). 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs, for humans and wildlife. Environmental Health Perspectives 106(12):775-792.

Whether or not an effluent limitation is required for 2,3,7,8-TCDD in accordance with section 1.3 of this Policy, each RWQCB shall require (as described below) major and minor POTW and industrial dischargers in its region to conduct effluent monitoring for the 2,3,7,8-TCDD congeners listed above. The purpose of the monitoring is to assess the presence and amounts of the congeners being discharged to inland surface waters, enclosed bays, and estuaries for the development of a strategy to control these chemicals in a future multi-media approach.

Within one year of the effective date of this Policy, each RWQCB shall either (1) amend the NPDES permits, or (2) send a written request for the information pursuant to California Water Code Section 13267 or 13383, for NPDES permittees in their respective regions, requiring, for a period of three consecutive years from the date the permit is amended or the request is sent, that: (1) each major POTW and major industrial discharger monitor its effluent for the presence of the 17 congeners once during dry weather and once during wet weather each of the three years; and (2) each minor POTW and minor industrial discharger monitor its effluent for the presence of the 17 congeners once during dry weather and once during wet weather for one year during the three-year period.

The RWQCB should coordinate this region-wide monitoring to provide data that are consistent with the purpose of the provisions of this section to the extent possible. The RWQCB shall encourage public and private dischargers, and local governments, to develop a coordinated, cooperative regional monitoring program to gather this information.

The RWQCB shall require the discharger to report for each congener the analytical results of the effluent monitoring, including the quantifiable limit[13] and the MDL, and the measured or estimated concentration. In addition, the RWQCB shall require the discharger to multiply each measured or estimated congener concentration by its respective TEF value (presented above) and report the sum of these values. This information shall be submitted to the RWQCB as part of the discharger's self-monitoring reports, in accordance with section 2.3. The RWQCB shall, subsequently, submit the information to the SWRCB.

Based on the monitoring results, the RWQCB may, at its discretion, increase the monitoring requirement (e.g., increase sampling frequency) to further investigate frequent or significant detections of any congener. At the conclusion of the three-year monitoring period, the SWRCB and RWQCBs will assess the data (a total of six samples each from major POTWs and industrial dischargers, and a total of two samples each from minor POTWs and industrial dischargers), and determine whether further monitoring is necessary.

4. TOXICITY CONTROL PROVISIONS

This section establishes minimum toxicity control requirements for implementing the narrative toxicity objectives for aquatic life protection in RWQCB basin plans. These provisions are intended to supplement basin plan requirements and do not supersede existing RWQCB toxicity requirements.

[13] As determined by the procedure found in section 2.4.3, number 5.

Water Quality-Based Toxicity Control

A chronic toxicity effluent limitation is required in permits for all discharges that will cause, have reasonable potential to cause, or contribute to chronic toxicity in receiving waters.

To determine compliance with the chronic aquatic life toxicity objective in a RWQCB basin plan, or an effluent limitation based on the objective, the RWQCB shall require, in a permit or other appropriate order, the use of short-term chronic toxicity tests. At least three test species with approved test protocols shall be used to measure compliance with the toxicity objective. If possible, the test species shall include a vertebrate, an invertebrate, and an aquatic plant. After a screening period, monitoring may be reduced to the most sensitive species. Dilution and control waters should be obtained from an area unaffected by the discharge in the receiving waters. For rivers and streams, dilution water should be obtained immediately upstream of the wastewater outfall. Standard dilution water can be used if the above sources exhibit toxicity or if approved by the RWQCB. The sensitivity of the test organisms to a reference toxicant shall be determined concurrently with each bioassay and reported with the test results.

The tests contained in Appendix II, "Chapter IV. Compliance With Toxicity Limitations and Objectives", of the California Ocean Plan (amended March 20, 1997 and effective July 23, 1997) are incorporated by reference and one or more of these tests shall be used to measure toxicity in salt water. This incorporation-by-reference is prospective, including future changes to the incorporated provisions as the changes take effect. One or more of the tests in Table 5 shall be used to measure chronic toxicity in fresh water.

Table 5. Short-term Methods for Estimating Chronic Toxicity–Fresh Water

Species	Effect	Test duration (days)
fathead minnow (Pimephales promelas)	larval survival; growth	7
water flea (Ceriodaphnia dubia)	survival; number of young	6 to 8
alga (Selenastrum capricornutum)	growth rate	4

Toxicity Test Reference: U.S. EPA. 1994. Short-term methods for estimating the chronic toxicity of effluents and receiving waters to freshwater organisms. Third edition. U.S. EPA Environmental Monitoring Systems Laboratory, Cincinnati, Ohio. EPA/600/4-91-002.

Toxicity Reduction Requirements

If a discharge causes or contributes to chronic toxicity in a receiving water body, a *toxicity reduction evaluation (TRE) is required. Where multiple dischargers to the same water body are required to conduct TREs, the TREs may be coordinated with the approval of the RWQCB. The TRE shall include all reasonable steps to identify the source(s) of toxicity. Once the source of toxicity is identified, the discharger shall take all reasonable steps necessary to eliminate toxicity.

The following shall be incorporated into permits: (1) a requirement to conduct a TRE if repeated tests reveal toxicity as a result of the waste discharge; (2) a provision requiring a discharger to take all reasonable steps to control toxicity once the source of toxicity is identified; and (3) a statement that failure to conduct required toxicity tests or a TRE within a designated period shall result in the establishment of effluent limitations for chronic toxicity in a permit or appropriate enforcement action.

5. SPECIAL PROVISIONS

The following sections include provisions that address certain discharges and factors that could affect the application of other provisions in this Policy. They include: (1) nonpoint source discharges (section 5.1); (2) site-specific objectives (section 5.2); and (3) exceptions to the Policy provisions (section 5.3).

5.1 Nonpoint Source Discharges

It is the intent of the SWRCB, in adopting this Policy, that the implementation of the priority pollutant criteria/objectives and other requirements of this Policy for nonpoint source discharges shall be consistent with the State's "three-tiered approach" for nonpoint sources. The three tiers, listed in order of increasing stringency, are:

Tier 1. Self-determined implementation of management practices (such as BMPs).

Tier 2. Regulatory-based encouragement of BMPs (through, e.g., WDR waivers conditioned on BMP implementation or management agency agreements between the SWRCB and/or RWQCBs and other agencies with authority to enforce BMPs).

Tier 3. Effluent limitations and enforcement (through, e.g., WDRs, time schedule orders, cease and desist orders, and cleanup and abatement orders).

The RWQCBs may select the appropriate tier, or combination of tiers, to address nonpoint source discharges of priority pollutants. The SWRCB, in adopting this Policy, understands that nonpoint source pollution control can best be achieved through the cooperative efforts of the dischargers, other interested persons, and the SWRCB and RWQCBs.

5.2 Site-Specific Objectives

If a priority pollutant criterion or objective is inappropriate for a particular water body (i.e., it does not protect the beneficial uses or, based on site-specific conditions, a less stringent standard may be warranted), a water quality objective that differs from the applicable criterion or objective may be developed for the site. A RWQCB may develop site-specific objectives whenever it determines, in the exercise of its professional judgement, that it is appropriate to do so. Where a priority pollutant criterion or objective is not being attained in the water body, under certain circumstances, it may be more appropriate to pursue other approaches to achieve the applicable criterion or objective rather than develop a site-specific objective. These approaches include, but are not limited to, watershed management and development of TMDLs (see Appendix 5 and Appendix 6). The RWQCB may investigate, facilitate, or implement such approaches as appropriate.

Regardless of an action taken by the RWQCB as described above, the RWQCB shall, at a public meeting, consider initiating the development of a site-specific objective under the following conditions:

(1) A written request for a site-specific study, accompanied by a preliminary commitment to fund the study, subject to development of a workplan[14], is filed with the RWQCB; and

(2) Either:

(a) a priority pollutant criterion or objective is not achieved in the receiving water; or
(b) a holder of an NPDES permit demonstrates that they do not, or may not in the future, meet an existing or potential effluent limitation based on the priority pollutant criterion or objective; and

(3) A demonstration that the discharger cannot be assured of achieving the criterion or objective and/or effluent limitation through reasonable treatment, source control, and *pollution prevention measures. This demonstration may include, but is not limited to, as determined by the RWQCB:

(a) an analysis of compliance and consistency with all relevant federal and State plans, policies, laws, and regulations;
(b) a thorough review of historical limits and compliance with those limits;
(c) a thorough review of current technology and technology-based limits; and
(d) an economic analysis of compliance with the priority pollutant criterion or objective of concern.

During the period when site-specific objectives studies are being conducted, the RWQCB shall place effluent limitations based upon the applicable priority pollutant criteria or objectives into permits only in conjunction with an appropriate compliance schedule and interim requirements, as described in sections 2.1 and 2.2.

A discharger subject to a schedule for compliance with a CTR criterion or CTR criterion-based effluent limitations, as described in section 2.1, may choose to, concurrently with the actions necessary to achieve compliance, conduct the studies necessary to support the development and adoption of a site-specific objective.[15]

Following adoption of a site-specific objective by the RWQCB, existing effluent limitations shall be replaced with effluent limitations (calculated as described in section 1.4) based on the adopted site-specific objective if the analysis in section 1.3 indicates that a limitation for the pollutant is

---

14 The elements presented under the "Special Studies Process" in Appendix 5 should be considered in developing the site-specific objectives workplan.

15 A RWQCB may include a compliance schedule in a water quality standard based on a site-specific objective. Such a compliance schedule is separate and distinct from the compliance schedules established by this Policy.

required. In the event that, for reasons beyond the control of the discharger, a decision whether or not to adopt site-specific objectives has not been made by the RWQCB before the end of the compliance schedule, the compliance schedule shall be extended for an additional period to allow time for a decision whether or not to adopt the objective. However, in no event may a compliance schedule exceed the maximum time period allowed for compliance with the CTR criteria (as described in section 2.1) or priority pollutant objectives (as described in the basin plan, if applicable), unless an exception has been granted (in accordance with section 5.3).

Development of Site-Specific Objectives

Water quality objectives shall be developed in a manner consistent with State and federal law and regulations. In accordance with the State's Porter-Cologne Water Quality Control Act (Division 7 of the Water Code), objectives must provide for the reasonable protection of beneficial uses based on consideration of the factors listed in Water Code Section 13241. In accordance with federal law (CWA) and regulations (40 CFR 131.11, revised as of July 1, 1997), the objectives must be based on sound scientific rationale and protect the designated beneficial uses of the receiving water.

The RWQCB shall use scientifically defensible methods appropriate to the situation to derive the objectives. Such methods may include U.S. EPA-approved methods (e.g., Water Effects Ratio [WER] procedure, recalculation procedure, a combination of recalculation and WER procedures, Resident Species Procedure), and/or other methods specified in the workplan.

A site-specific objective adopted by the RWQCB may include a compliance schedule. However, if attainment of the potential objective(s) developed under the study is anticipated to be infeasible (as defined in 40 CFR 131.10(g), revised as of July 1, 1997), or if the RWQCB otherwise determines it is appropriate, a *use attainability analysis (UAA) may be conducted. The RWQCB shall conduct, with the participation of interested persons, as appropriate, the UAA in accordance with 40 CFR 131.10(j) (revised as of July 1, 1997). If the UAA shows that attainment of the designated beneficial use(s) is not feasible (pursuant to 40 CFR 131.10(g), revised as of July 1, 1997), the RWQCB shall designate an alternative beneficial use or subcategory of use, and develop appropriate water quality objectives to protect the new use(s). Both the use(s) and the objective(s) established to protect it would be reevaluated during the triennial reviews of the State's water quality standards.

5.3 Exceptions

Categorical and case-by-case exceptions to this Policy may be granted pursuant to the provisions below.

Categorical Exceptions

The RWQCB may, after compliance with the California Environmental Quality Act (CEQA), allow short-term or seasonal exceptions from meeting the priority pollutant criteria/objectives if determined to be necessary to implement control measures either:

1. for resource or pest management (i.e., vector or weed control, pest eradication, or fishery management) conducted by *public entities to fulfill statutory requirements, including, but not limited to, those in the California Fish and Game, Food and Agriculture, Health and Safety, and Harbors and Navigation codes; or

2. regarding drinking water conducted to fulfill statutory requirements under the federal Safe Drinking Water Act or the California Health and Safety Code. Such categorical exceptions may also be granted for draining water supply reservoirs, canals, and pipelines for maintenance, for draining municipal storm water conveyances for cleaning or maintenance, or for draining water treatment facilities for cleaning or maintenance.

For each project, the discharger shall notify potentially affected public and governmental agencies. Also, the discharger shall submit to the Executive Officer of the appropriate RWQCB, for approval:

(1) A detailed description of the proposed action, including the proposed method of completing the action;

(2) A time schedule;

(3) A discharge and receiving water quality monitoring plan (before project initiation, during the project, and after project completion, with the appropriate quality assurance and quality control procedures);

(4) CEQA documentation;

(5) Contingency plans;

(6) Identification of alternate water supply (if needed); and

(7) Residual waste disposal plans.

Additionally, upon completion of the project, the discharger shall provide certification by a qualified biologist that the receiving water beneficial uses have been restored.

To prevent unnecessary delays in taking emergency actions or to expedite the approval process for expected or routine activities that fall under categorical exceptions, the discharger is advised to file with the appropriate RWQCB, in advance of seeking RWQCB approval, the information required in items (1)-(7) above, to the extent possible.

Case-by-Case Exceptions

Where site-specific conditions in individual water bodies or watersheds differ sufficiently from statewide conditions and those differences cannot be addressed through other provisions of this

Policy, the SWRCB may, in compliance with the CEQA, subsequent to a public hearing, and with the concurrence of the U.S. EPA, grant an exception to meeting a priority pollutant criterion/objective or any other provision of this Policy where the SWRCB determines:

1. The exception will not compromise protection of enclosed bay, estuarine, and inland surface waters for beneficial uses; and

2. The public interest will be served.

An example of where a case-by-case exception would be appropriate is where it is necessary to accommodate wastewater reclamation or water conservation.

APPENDIX 1

Definition of Terms

ACUTELY TOXIC CONDITIONS, as used in the context of mixing zones, refers to lethality that occurs to mobile aquatic organisms that move or drift through the mixing zone.

ARITHMETIC MEAN (μ), also called the average, is the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean = $\mu = \Sigma x / n$ where:

- Σx is the sum of the measured ambient water concentrations, and
- n is the number of samples.

AVERAGE MONTHLY EFFLUENT LIMITATION (AMEL) means the highest allowable average of daily pollutant discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of measurements.

BEST MANAGEMENT PRACTICES (BMPs) are methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and non-structural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

BIOACCUMULATIVE pollutants are those substances taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

BIOLOGICALLY-BASED RECEIVING WATER FLOW refers to the method for determining receiving water flows developed by the U.S. EPA Office of Research and Development which directly uses the averaging periods and exceedance frequencies specified in the acute and chronic aquatic life criteria for individual pollutants (e.g., 1 day and 3 years for acute criteria, and 4 days and 3 years for the chronic criteria). Biologically-based flows can be calculated using the program DFLOW.

CARCINOGENIC pollutants are substances that are known to cause cancer in living organisms.

COEFFICIENT OF VARIATION (*CV*) is a measure of the data variability and is calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

COMPLETELY-MIXED DISCHARGE condition means not more than a 5 percent difference, accounting for analytical variability, in the concentration of a pollutant exists across a transect of the water body at a point within two stream/river widths from the discharge point.

DILUTION CREDIT is the amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio or determined through conducting a mixing zone study or modelling of the discharge and receiving water.

DILUTION RATIO is the critical low flow of the upstream receiving water divided by the flow of the effluent discharged.

DYNAMIC MODELS used for calculating effluent limitations predict the effects of receiving water and effluent flow and of concentration variability. The outputs of dynamic models can be used to base effluent limitations on probability estimates of receiving water concentrations rather than critical conditions (which are used in the steady-state model). The three dynamic modeling techniques recommended by the U.S. EPA for calculating effluent limitations are continuous simulation, Monte Carlo simulation, and lognormal probability modeling.

EFFLUENT CONCENTRATION ALLOWANCE (ECA) is a value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the coefficient of variation for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in U.S. EPA guidance (Technical Support Document For Water Quality-based Toxics Control, March 1991, second printing, EPA/505/2-90-001).

ENCLOSED BAYS means indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

ESTIMATED CHEMICAL CONCENTRATION is the estimated chemical concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

ESTUARIES means waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and sea water. Estuarine waters include, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code Section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

EXISTING DISCHARGER means any discharger that is not a new discharger. An existing discharger includes an "increasing discharger" (i.e., an existing facility with treatment systems in place for its current discharge that is or will be expanding, upgrading, or modifying its existing permitted discharge after the effective date of this Policy).

FOUR-DAY AVERAGE OF DAILY MAXIMUM FLOWS is the average of daily maximums taken from the data set in four-day intervals.

HARMONIC MEAN flows are expressed as $Q_{hm} = (n)/(\Sigma^{n}_{i=1} 1/x_i)$, where x_i = specific data values and n = number of data values.

INCOMPLETELY-MIXED DISCHARGE is a discharge that contributes to a condition that does not meet the meaning of a completely-mixed discharge condition.

INFEASIBLE means not capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.

INLAND SURFACE WATERS are all surface waters of the State that do not include the ocean, enclosed bays, or estuaries.

LOAD ALLOCATION (LA) is the portion of a receiving water's total maximum daily load that is allocated to one of its nonpoint sources of pollution or to natural background sources.

LONG-TERM ARITHMETIC MEAN FLOW is at least two years of flow data used in calculating an arithmetic mean as defined in this appendix.

MAXIMUM DAILY FLOW is the maximum flow sample of all samples collected in a calendar day.

MAXIMUM DAILY EFFLUENT LIMITATION (MDEL) means the highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

MEDIAN is the middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between the $n/2$ and $n/2+1$).

METHOD DETECTION LIMIT (MDL) is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 CFR 136, Appendix B, revised as of May 14, 1999.

MINIMUM LEVEL (ML) is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

MIXING ZONE is a limited volume of receiving water that is allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

MUTAGENIC pollutants are substances that are known to cause a mutation (i.e., change in a gene or chromosome) in living organisms.

NEW DISCHARGER includes any building, structure, facility, or installation from which there is, or may be, a discharge of pollutants, the construction of which commenced after the effective date of this Policy.

OBJECTIONABLE BOTTOM DEPOSITS are an accumulation of materials or substances on or near the bottom of a water body which creates conditions that adversely impact aquatic life, human health, beneficial uses, or aesthetics. These conditions include, but are not limited to, the accumulation of pollutants in the sediments and other conditions that result in harm to benthic organisms, production of food chain organisms, or fish egg development. The presence of such deposits shall be determined by RWQCB(s) on a case-by-case basis.

OCEAN WATERS are the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the SWRCB's California Ocean Plan.

PERSISTENT pollutants are substances for which degradation or decomposition in the environment is nonexistent or very slow.

POLLUTANT MINIMIZATION means waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses.

POLLUTION PREVENTION means any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code Section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the SWRCB or RWQCB.

PROCESS OPTIMIZATION means minor changes to the existing facility and treatment plant operations that optimize the effectiveness of the existing treatment processes.

PUBLIC ENTITY includes the federal government or a state, county, city and county, city, district, public authority, or public agency.

SOURCE OF DRINKING WATER is any water designated as municipal or domestic supply (MUN) in a RWQCB basin plan.

STANDARD DEVIATION (σ) is a measure of variability that is calculated as follows:

$$\sigma = (\Sigma[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;

μ is the arithmetic mean of the observed values; and

n is the number of samples.

TERATOGENIC pollutants are substances that are known to cause structural abnormalities or birth defects in living organisms.

TOXICITY REDUCTION EVALUATION (TRE) is a study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases [characterization, identification, and confirmation] using aquatic organism toxicity tests.)

USE ATTAINABILITY ANALYSIS is a structured scientific assessment of the factors affecting the attainment of the use which may include physical, chemical, biological, and economic factors as described in 40 CFR 131.10(g) (40 CFR 131.3, revised as of July 1, 1997).

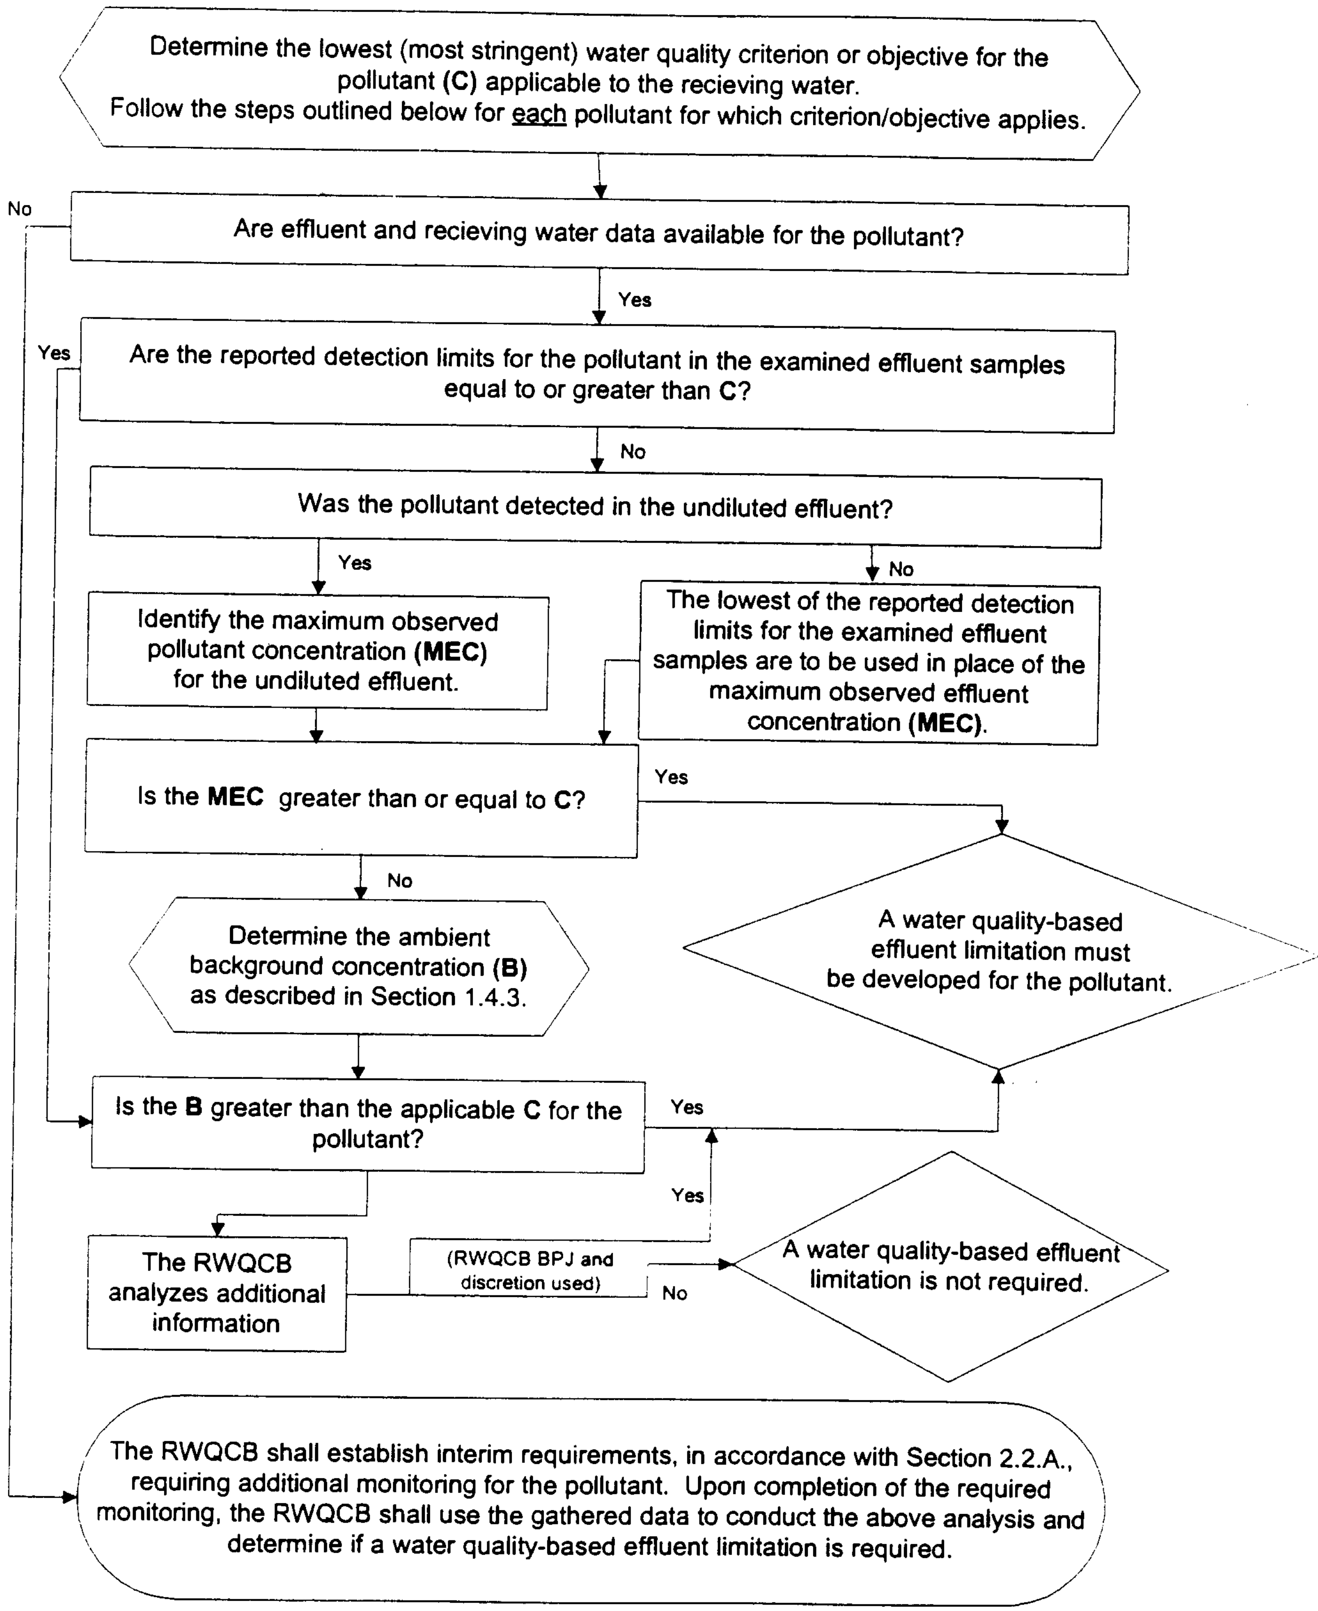
1Q10 is the lowest flow that occurs for one day with a statistical frequency of once every 10 years.

7Q10 is the average low flow that occurs for seven consecutive days with a statistical frequency of once every 10 years.

90th PERCENTILE OF OBSERVED DATA is the measurement in the ordered set of data (lowest to highest) where 90 percent of the reported measurements are less than or equal to that value.

APPENDIX 2

Determination of Pollutants Requiring Water Quality-Based Effluent Limitations



APPENDIX 3

U.S. Environmental Protection Agency Conversion Factors

Metal	Conversion Factor (CF) for Freshwater Acute Criteria	CF for Freshwater Chronic Criteria	CF for Saltwater Acute Criteria	CF(a) for Saltwater Chronic Criteria
Antimony	(d)	(d)	(d)	(d)
Arsenic	1.000	1.000	1.000	1.000
Beryllium	(d)	(d)	(d)	(d)
Cadmium (b)	0.944	0.909	0.994	0.994
Chromium (III)	0.316	0.860	(d)	(d)
Chromium (VI)	0.982	0.962	0.993	0.993
Copper	0.960	0.960	0.83	0.83
Lead (b)	0.791	0.791	0.951	0.951
Mercury	0.85	0.85	0.85	0.85
Nickel	0.998	0.997	0.990	0.990
Selenium	(c)	(c)	0.998	0.998
Silver	0.85	(d)	0.85	(d)
Thallium	(d)	(d)	(d)	(d)
Zinc	0.978	0.986	0.946	0.946

Footnotes:

(a) Conversion Factors for chronic marine criteria are not currently available. Conversion Factors for acute marine criteria have been used for both acute and chronic marine criteria.

(b) Conversion Factors for these pollutants are hardness dependent. CFs are based on a hardness of 100 mg/L as calcium carbonate ($CaCO_3$). Other hardness can be used; CFs should be recalculated using the following equations:
Cadmium: Acute: CF = 1.136672 - [(ln {hardness})(0.041838)]
Cadmium: Chronic: CF = 1.101672 - [(ln {hardness})(0.041838)]
Lead: Acute and Chronic: CF = 1.46203 - [ln {hardness})(0.145712)]

(c) Bioaccumulative compound and inappropriate to adjust to percent dissolved.

(d) U.S. EPA has not published an aquatic life criterion value.

NOTE: The term "Conversion Factor" represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column. See "Office of Water Policy and Technical Guidance on Interpretation and Implementation of Aquatic Life Metals Criteria," October 1, 1993, by Martha G. Prothro, Acting Assistant Administrator for Water, available from the Water Resource Center, USEPA, 401 M St. SW., mail code RC 4100, Washington, DC 20460; and 40 CFR §131.36(b)(1).

Source: CTR (65 Fed. Register 31682-31719, May 18, 2000), adding Section 131.38 to 40 CFR).

APPENDIX 4

SWRCB Minimum Levels in ppb (μg/L)

The Minimum Levels (MLs) in this appendix are for use in reporting and compliance determination purposes in accordance with section 2.4 of this Policy. These MLs were derived from data for priority pollutants provided by State certified analytical laboratories in 1997 and 1998. These MLs shall be used until new values are adopted by the SWRCB and become effective. The following tables (Tables 2a - 2d) present MLs for four major chemical groupings: volatile substances, semi-volatile substances, inorganics, and pesticides & PCBs.

Table 2a - VOLATILE SUBSTANCES*	GC	GCMS
1,1 Dichloroethane	0.5	1
1,1 Dichloroethene	0.5	2
1,1,1 Trichloroethane	0.5	2
1,1,2 Trichloroethane	0.5	2
1,1,2,2 Tetrachloroethane	0.5	1
1,2 Dichlorobenzene (volatile)	0.5	2
1,2 Dichloroethane	0.5	2
1,2 Dichloropropane	0.5	1
1,3 Dichlorobenzene (volatile)	0.5	2
1,3 Dichloropropene (volatile)	0.5	2
1,4 Dichlorobenzene (volatile)	0.5	2
Acrolein	2.0	5
Acrylonitrile	2.0	2
Benzene	0.5	2
Bromoform	0.5	2
Bromomethane	1.0	2
Carbon Tetrachloride	0.5	2
Chlorobenzene	0.5	2
Chlorodibromo-methane	0.5	2
Chloroethane	0.5	2
Chloroform	0.5	2
Chloromethane	0.5	2
Dichlorobromo-methane	0.5	2
Dichloromethane	0.5	2
Ethylbenzene	0.5	2
Tetrachloroethene	0.5	2
Toluene	0.5	2
trans-1,2 Dichloroethylene	0.5	1
Trichloroethene	0.5	2
Vinyl Chloride	0.5	2

*The normal method-specific factor for these substances is 1, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance.

Table 2b - SEMI-VOLATILE SUBSTANCES*	GC	GCMS	LC	COLOR
1,2 Benzanthracene	10	5		
1,2 Dichlorobenzene (semivolatile)	2	2		
1,2 Diphenylhydrazine		1

PCB 1232	0.5
PCB 1242	0.5
PCB 1248	0.5
PCB 1254	0.5
PCB 1260	0.5
Toxaphene	0.5

* The normal method-specific factor for these substances is 100, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance multiplied by 100.

Techniques:

GC - Gas Chromatography
GCMS - Gas Chromatography/Mass Spectrometry
HRGCMS - High Resolution Gas Chromatography/Mass Spectrometry (i.e., EPA 1613, 1624, or 1625)
LC - High Pressure Liquid Chromatography
FAA - Flame Atomic Absorption
GFAA - Graphite Furnace Atomic Absorption
HYDRIDE - Gaseous Hydride Atomic Absorption
CVAA - Cold Vapor Atomic Absorption
ICP - Inductively Coupled Plasma
ICPMS - Inductively Coupled Plasma/Mass Spectrometry
SPGFAA - Stabilized Platform Graphite Furnace Atomic Absorption (i.e., EPA 200.9)
DCP - Direct Current Plasma
COLOR - Colorimetric

APPENDIX 5

Special Studies

Pre-Evaluation for Special Studies
Decision Tree with Attached Narrative Discussion

A special study is sometimes conducted as part of a regulatory process (standard setting and permit writing) and may be conducted as part of a collaborative watershed planning effort. Special studies can provide site-specific data that can assist in decision-making regarding water quality and beneficial use issues.

Many water quality problems may be best addressed on a watershed or water body basis. The SWRCB believes that stakeholders should be able to develop flexible and innovative solutions for water quality problems in their watershed. For special studies conducted as part of a watershed management plan, the watershed management group should be involved in the design of the study, and study information should be provided back to the committee. Watershed or water body studies may gather data regarding topics such as:

- TMDLs, WLAs, and LAs (see Appendix 6);
- Regional ambient monitoring (regional ambient monitoring is the collection of scientific information regarding water quality and impacts to beneficial uses for a specified portion of, or an entire, watershed or water body); and
- Contaminant fate and transport monitoring (contaminant fate and transport monitoring is the gathering of scientific information regarding how a specific pollutant[s] moves through the environment and how the pollutant[s] degrades or is otherwise transformed in the environment).

These types of studies are useful to collect integrated, comprehensive, and systematic data regarding:

- Baseline concentrations of toxic pollutants in the water and sediment;
- Seasonal, annual, and long-term trends in water quality;
- Causes and effects of water quality problems;
- Effectiveness of a water quality control effort;
- Greater certainty regarding existing monitoring data; etc.

Any of the studies discussed below may be undertaken as part of a watershed approach to addressing regional water quality issues. Information collected as part of a watershed or water body study can be used as a way to define parameters (e.g., ambient background concentrations, mixing zones, etc.) related to the development of effluent limitations as part of the permitting process or to evaluate whether changes in water quality standards are appropriate. A watershed or water body approach is also useful to dischargers because information collected as a part of one effluent limitation or standard-setting study can be shared with other stakeholders in the same water body.

Studies for Setting Effluent Limitations

Studies regarding establishing effluent limitations can be done as part of the permitting process. Such studies may be simpler and there may be fewer interested stakeholders than studies involving more than one discharger, or an entire water body or watershed. However, when such studies are undertaken individually, the discharger, the RWQCB, and other stakeholders do not gain the benefit of data collected from others in the watershed.

Special studies may address topics such as the following:

- Determining pollutants requiring effluent limitations (see section 1.3);
- Metals translators (see section 1.4.1); or
- Mixing zones (see section 1.4.2).

Studies For Changes to Water Quality Standards

Establishing or modifying water quality standards (i.e., beneficial uses and water quality criteria/objectives) may involve complex and resource intensive studies. A detailed workplan will normally be needed because early planning and coordination with the RWQCB and U.S. EPA is critical to the development of a successful study. In addition, a workplan will normally be appropriate because there will be more stakeholder interest and involvement of other public agencies (e.g., Department of Fish and Game, U.S. Fish and Wildlife Service, etc.). Involvement in a watershed management planning effort would facilitate the sharing of information among stakeholders in the watershed, both in gathering information for the study and in sharing the results. Studies related to changes in water quality standards may address topics such as the following:

- Site-specific objective studies (see section 5.2), and
- Use attainability analysis (UAA) (see section 5.2).

Pre-Evaluation

As a first step in determining whether and how to conduct a special study, the RWQCB or other stakeholders may want to evaluate whether it would be appropriate to address a water quality issue through a watershed management approach. To do that, the factors in the following flowchart may be considered:

1. Is there a watershed management group?[a]

↓ Yes

2. Has a watershed management approach been developed?[b] →→→→→ No → GO TO start of Decision Tree[d] if water issue involves toxics.

↓ Yes

3. Are toxic pollutants part of the reason beneficial uses are impaired or water quality objectives are exceeded?[c] →→→→→ No → Issue is outside scope of this Policy.

↓ Yes

GO TO #9 in Decision Tree[d], or other point in Decision Tree as determined by stakeholders.

The decision tree and associated narrative discussion in Appendix 5 are provided to assist RWQCBs and stakeholders in identifying whether there is a current or potential water quality issue requiring attention [Compliance Status], the nature of the identified water quality issue [Screening-level Evaluation], and possible action to address the issue [Potential Options].

Based on this information, the RWQCB and stakeholders can determine whether a special study is needed and the scope of the study. This approach can help avoid initiation of costly and time-consuming studies which are not appropriately designed to resolve the specific issue in question. The decision tree is not meant to preclude the exploration of any other creative solutions; it is meant to encourage constructive dialogue among stakeholders.

Two specific considerations should be kept in mind when conducting the pre-evaluation suggested by this decision tree. First, users must be familiar with the quality of the data under review and the potential need to augment data which are not of adequate quality. Second, users should know what the existing beneficial uses are (i.e., uses attained since 1975).

---

[a] Is there a committee of local interests in both the public and private sectors that are actively involved in the management of the watershed area?

[b] Has a watershed management approach that identifies key issues, boundaries, objectives, and early actions been developed?

[c] A study may be necessary to determine whether toxics are part of the cause of the impairment of beneficial uses. This Policy applies only to the CTR and NTR criteria, and applicable chemical-specific basin plan objectives for priority toxic pollutants.

[d] The decision tree is on page APPENDIX 5 - 6.

Special Studies Process

A. Workplan

If appropriate, the RWQCB may participate in developing a detailed workplan with interested persons (which can include, but are not limited to, U.S. EPA, the RWQCB, the SWRCB, and affected dischargers) prior to proceeding with a special study. The workplan may include the following elements:

(1) Formation of a project team for the workplan, which may include the Department of Fish and Game, the U.S. Fish and Wildlife Service, and other stakeholders;

(2) Purpose of the workplan;

(3) Responsibilities of the persons associated with the workplan;

(4) Budget and cost-sharing plan. This plan must be determined on a case-by-case basis; however, the SWRCB encourages sharing of costs (based on availability of funding), where there are multiple persons who wish to support the goals of the study;

(5) Development of the following elements:

(a) Identification of tasks(s),
(b) Purpose of tasks(s),
(c) Method by which task(s) will be implemented,
(d) Products of the tasks(s),
(e) Schedule for the task(s),
(f) Responsibility for implementing the task(s), and
(g) Budget and funding for the task(s);

(6) Administrative policies and procedures to govern oversight of the special studies process (e.g., amending the workplan, conflict resolution, etc.); and

(7) Project schedule.

B. Scientific Review Panel

If, during the data interpretation phase of a special study, the RWQCB, SWRCB, U.S. EPA, or other stakeholders have differing opinions with regard to the interpretation of data, the RWQCB and stakeholders may want to seek the advice of an independent scientific review panel. The method of selecting the panel, cost reimbursement, and other details regarding the conflict resolution process could be included in the workplan.

C. Compliance Schedule

A permit compliance schedule (as described in section 2.1) may allow sufficient time for collection of data, completion of a study, and determination of compliance measures. While special studies are being conducted, interim requirements may be established by the RWQCB (as described in section 2.2). However, in no event may a compliance schedule exceed the time period allowed in this Policy, unless an exception has been granted.

D. Environmental and Economic Impacts

To ensure that environmental and economic impacts are adequately addressed, the RWQCB staff shall, as part of the special study workplan:

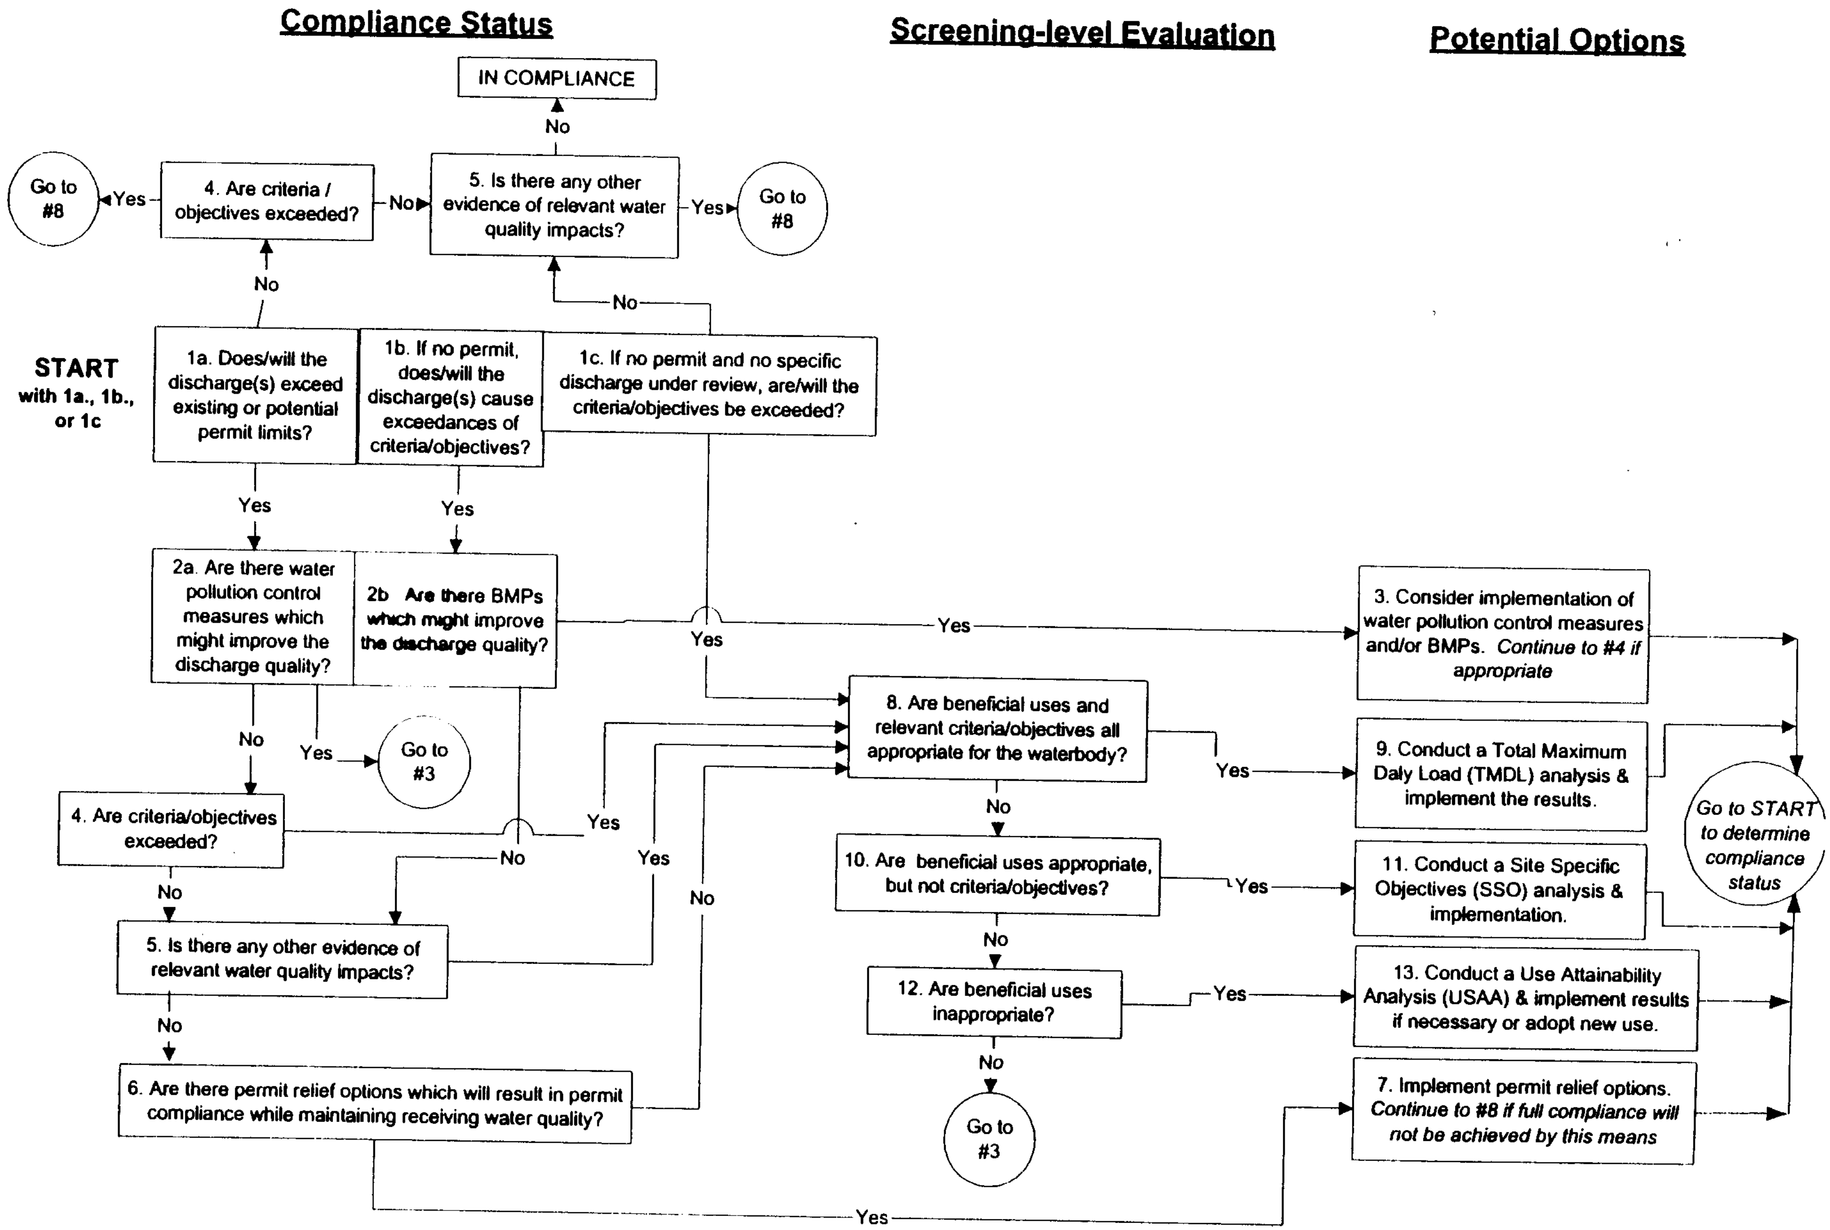
(1) Comply with CEQA, if applicable; and

(2) Direct the preparation of an analysis documenting economic impacts if site-specific objectives or a change in designated beneficial uses is being considered under 40 CFR 131.10(g)(6), revised as of July 1, 1997.

E. Antidegradation and Other Legal Requirements

RWQCB staff shall, as part of the special study workplan, ensure compliance with SWRCB Resolution No. 68-16 (Statement of Policy with Respect to Maintaining High Quality of Waters in California) and any other applicable legal requirements.

Pre-Evaluation for Special Studies
Decision Tree with Attached Narrative Discussion



APPENDIX 5 - 6

R0020064

Narrative Discussion of Decision Tree:

1a. Does/will a discharge exceed existing or potential permit limits for toxic pollutants? This question applies to discharges regulated by a National Pollutant Discharge Elimination System (NPDES) permit or Waste Discharge Requirements (WDRs). If the discharge(s) in question is not regulated by a discharge permit, proceed to #1b. It is assumed that data used to answer this question are reliable.

1b. If no permit, does the discharge(s) cause exceedances of criteria/objectives? This question primarily applies to nonpoint discharges, though it could conceivably apply to point source discharges which are not currently permitted. It is assumed that data used to answer this question are reliable.

1c. If no permit and no specific discharge(s) are under review, are criteria/objectives exceeded? It is assumed that data used to answer this question are reliable.

2a. Are there water pollution control measures which might improve the water quality? A water pollution control program may include, as appropriate: pollution control technologies; pretreatment requirements; and pollution prevention, waste minimization, and source control measures. This question is meant to elicit consideration of effluent quality control measures which could be implemented as a full or partial solution to the identified permit noncompliance issue. It is not intended as a barrier to the exploration of other potential forms of regulatory adjustment.

2b. Are there Best Management Practices (BMPs) which might improve water quality? BMPs are pollution management measures designed to reduce the water quality impacts, where they exist, associated primarily with non-point source discharges. As with #2a above, this question is meant to elicit consideration of discharge control measures which could be implemented as a full or partial solution to the identified noncompliance issue. It is not intended as a barrier to the exploration of other potential forms of regulatory adjustment.

3. Consider whether implementation of water pollution control measures and/or BMPs will lead to compliance. Simultaneously, continue to #4 if deemed appropriate, considering such questions as whether or not full compliance will be achieved by these means, or whether it would be cost effective. As stated, the simple determination that implementation of pollution control measures and/or BMPs might improve the discharge or water quality should not preclude the exploration of other potential regulatory adjustment options, as well. For clarity, the reviewer should proceed not to box four prime, but to box four.

4. Are criteria/objectives exceeded? It is assumed that data used to answer this question are reliable and appropriate hardness adjustments have been made.

5. Is there any other evidence of relevant water quality impacts? This question is meant to capture those situations where the criteria/objective for the pollutant of concern do not exist

or appear to be under protective. "Other evidence" might include: bioconcentration or biocriteria data, population studies, food web analyses, etc. Impacts to wildlife should be considered as should impacts to threatened and endangered species. The potential for impacts to be of a seasonal nature should also be considered in this pre-evaluation. "Relevant water quality impacts" are those impacts which have a demonstrable relationship to the pollutant(s) of concern.

6. Are there permit relief options which will result in permit compliance while maintaining receiving water quality? Permit relief options might include, where appropriate: development of a mixing zone, modification of the averaging periods, adoption of a variance, etc. For unpermitted discharges or pre-evaluations involving no specific discharges, the user should continue to box #8.

7. Implement permit relief options. Continue to #8 if full compliance will not be achieved by these means. The development of permit relief options would occur through a request to the RWQCB.

8. Are beneficial uses and criteria/objectives both appropriate for the water body? To answer this question, a screening-level evaluation may be necessary, including an evaluation of the associated regulatory history, the site-specific conditions, and the status of current, applicable scientific understanding. It is assumed that data used to answer this question are reliable.

   This question is best answered when a watershed stakeholder group has formed and collectively either: 1) evaluated the condition of the watershed through a watershed management plan, 2) evaluated the condition of the watershed through less formal means, or 3) convened discussions regarding the condition of the watershed. If one does not currently exist, a watershed stakeholder group should be formed if it appears to be a useful forum for discussion and review. The following more specific questions may apply:

- Is the water effluent dominated, agricultural drainage water dominated, etc.? These water bodies may be likely candidates for the appropriate application of regulatory adjustments (e.g., SSO or UAA).

- Were the current beneficial uses applied on a national, state-wide, or region-wide basis or have they been specifically designated for the water body in question? While not the only candidates, water bodies for which beneficial uses have been applied on a national, state-wide, or region-wide basis may be candidates for the appropriate application of regulatory adjustments (e.g., SSO).

- Are there rare, threatened, or endangered species, or ecological conditions which the currently applied beneficial uses do not adequately describe or the water quality objectives do not fully protect?

- Has the beneficial use and the water quality necessary to maintain the beneficial use been attained since 1975?

- How do anti-degradation requirements apply?

- Are elevated constituents the result of 1) natural phenomena or 2) anthropogenic activities that ceased prior to 1975?

- Do the currently designated beneficial uses protect all existing and appropriate potential uses?

- Are natural, ephemeral, intermittent, or low flow conditions or water levels preventing the attainment of the designated non-existing uses?

- Are there human-caused conditions or sources of pollution which prevent attainment of the uses but either cannot be remedied or would cause greater environmental damage if corrected?

- Does the presence of dams, diversions, or other types of hydrologic modifications preclude the attainment of designated non-existing beneficial uses?

- Do the physical conditions of the water body preclude attainment of aquatic life protection uses (i.e., lack of proper substrate, cover, flow, depth, pools, riffles, and the like)?

- Does attainment of designated beneficial uses require the application of controls which would result in substantial and widespread economic and social impact?

- Have the appropriate water characteristics (e.g., hardness, pH) been accounted for in the CTR criteria?

- Has an appropriate set of species been evaluated in setting the CTR criteria and toxicity objective?

9. Conduct a total maximum daily load analysis and implement the results. Conducting a TMDL could result in, among other things, waste load allocations, BMP implementation for non-point dischargers, and/or effluent trading options for point and non-point source dischargers. (See Appendix 6 regarding TMDLs.)

10. Are beneficial uses appropriate but not criteria/objectives for toxic pollutants? See #8 above.

11. Conduct a site-specific objectives analysis. An SSO study will include one or more of the following activities:

    - Recalculation of objective;
    - Water effects ratio or other similar method; or
    - Any scientifically defensible process.

U.S. EPA's "Guidelines for Deriving Numerical Aquatic Site Specific Water Quality Criteria by Modifying National Criteria," dated 1984 (EPA-600/3-84-099), provides guidance for conducting an SSO study.

U.S. EPA's "Water Quality Standards Handbook," dated 1994, also provides general guidance in this area.

12. Are beneficial uses inappropriate? See #8 above.

13. Conduct a use attainability analysis (UAA) and implement the results. When a use is proposed for dedesignation, i.e., removed or replaced with a subcategory requiring less stringent standards, a UAA is necessary. In a case where a use is proposed to be added, a UAA is not necessary. A new use designation can be added for a water body following the normal public review process. A UAA will determine if physical, chemical, and/or biological factors affect the attainability of a designated use via a water body survey and assessment. An analysis of economic factors can also be included to determine whether substantial and widespread economic and social impacts would be caused by stringent pollution control requirements.

    U.S. EPA's "Technical Support Manual: Water body Survey and Assessment for Conducting Use Attainability Analyses," dated 1983, provides guidance for conducting a UAA as does Region 9's Interim Final "Guidance for Modifying Water Quality Standards and Protecting Effluent-Dependent Ecosystems," dated 1992. U.S. EPA's "Water Quality Standards Handbook," dated 1994, also provides general guidance in this area.

APPENDIX 6

Watershed Management and TMDLs

Watershed Management

The SWRCB will utilize and promote, to the extent feasible, a watershed approach to address water quality issues involving toxic pollutants. Compared to the more traditional, programmatic approach to water management, the watershed approach can look at all types of pollution and all sources of pollution. One consequence of the more global perspective is that attention can be trained on the most effective strategies for management (rather than the most programmatically expedient). Another consequence is that a much larger universe of interested persons becomes important to the management of water quality, and the ability to work with these people creates added value for water management. In utilizing the watershed approach, the SWRCB will work to marshall the expertise and resources of other agencies and the private sector to collaboratively manage water quality.

In a collaborative, stewardship effort, local interests are engaged with State and federal interests, and land managers, to work with water managers to solve complex resource management problems. A watershed perspective can also enhance interagency coordination by focusing programs on resource needs throughout the watershed.

Watershed management is an integrated holistic approach for restoring and protecting aquatic ecosystems and protecting human health in a geographic area. Watershed management may include diverse issues as defined by the watershed's stakeholders (persons with some interest in the watershed) to ensure comprehensive solutions. It reflects a growing consensus that many of the existing water quality problems can be best addressed by a more integrated, basin-wide approach. The purpose of watershed management is variously viewed as (1) a method for increasing participation at the local level in water quality protection, (2) an approach to reducing the impact of nonpoint sources, (3) a strategy for integrating management of all components of aquatic ecosystems, and (4) a process for optimizing the cost effectiveness of a blend of point and nonpoint source control efforts.

Whichever purpose or blend of purposes predominates, watershed management is not a new centralized program that competes with or replaces existing programs. The significant advantage of the watershed management approach is that it encourages a collaborative, stewardship-driven process where diverse interests (individuals, landowners, farmers, POTWs, industries, environmentalists, and agencies) can work in conjunction with SWRCB and RWQCB staff to develop a consensus on, and share responsibility for, addressing water quality problems. The watershed approach assumes all stakeholders are brought to the table; therefore, there should be one watershed group that can develop a plan for the watershed that addresses the interests of stakeholders in the watershed. Furthermore, watershed management provides a mechanism for considering social and economic interests, in the context of resolving water quality issues. The SWRCB and RWQCBs will work to preserve the integrity of the watershed process and facilitate an open and timely resolution of issues.

In some cases, there is no active watershed management group that has evolved far enough to have identified key issues, boundaries, objectives, and early actions. In these instances, a group of government agencies may work together to define the conditions in a water body and to identify the specific parameters contributing to beneficial use impairments. In any event, the RWQCBs may have to act more or less independently to meet legal requirements using primarily in-house staff. Participation from other interested persons, under these circumstances, is accomplished through the SWRCB and RWQCB public hearing processes.

Watershed management planning and implementation actions will occur primarily at the RWQCB and local level. However, the SWRCB will provide training in stewardship and watershed management, and support educational efforts involving K through 12 programs as well as land owners/managers.

TMDLs and Watershed Management

TMDLs are required for all waters listed pursuant to CWA Section 303(d)(1)(A). The SWRCB is committed to expeditiously addressing these water quality problems.

A TMDL establishes the amount of a pollutant that may be discharged into a water body and still maintain water quality standards with seasonal variations and a margin of safety that takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality. The TMDL process is defined in federal regulations (40 CFR 130.7, revised as of July 1, 1996) and generally consists of five steps:

(1) Identification by each state of water quality-limited waters that do not now, or are not expected to, attain state water quality standards after implementation of technology-based effluent limitations, more stringent effluent limitations required by federal, State, or local authority, and other pollution control requirements (e.g., best management practices) required by local, State, or federal authority, and identification of impairment;

(2) Establishment of priority rankings for the development of TMDLs;

(3) Development of waste load allocations (WLAs), load allocations (LAs), and TMDLs;

(4) Incorporation of the loadings in the RWQCB basin plans; and

(5) Submittal of segments identified, priority ranking, and loads established to U.S. EPA for approval.

Development of TMDLs can utilize the watershed approach to assess and identify water quality-limited segments and pollutants causing impairment, identify sources, and allocate pollutant loads. The watershed approach may address a broader range of issues than the TMDLs, but the approach can: (1) result in achieving or maintaining water quality standards so that waters are not added to the 303(d) list; (2) result in attainment of water quality standards, through means other than the TMDL process, so that waters can be removed from the 303(d) list; or (3) be used to develop TMDLs. A watershed group can develop a TMDL if the TMDL complies with applicable federal requirements.

BEST MANAGEMENT PRACTICES
FOR
STORM WATER DISCHARGES ASSOCIATED WITH INDUSTRIAL ACTIVITIES

DEQ

State of Oregon
Department of Environmental Quality

Guidance for Reducing or Eliminating
Pollutants in Storm Water Discharges
Associated with Industrial Activities

DEQ Northwest Region Document

Revised – January 2001

R0020071

Background: In 1998 a Total Maximum Daily Load (TMDL) was developed and approved by the U.S. Environmental Protection Agency for the Columbia Slough. This TMDL indicated that additional and more effective environmental pollution prevention practices were required to meet water quality standards and the basin beneficial uses criteria and that more commercial and industrial businesses would be required to participate in the permitting process in order to achieve water quality standards and restore those beneficial uses within the Slough. This lead to the development of the Best Management Practices (BMPs) addressed in this document and the concept of treating the potential point sources that may contribute to the non-point storm water discharges.

Best Management Practices: BMPs are practices or procedures that include methods to prevent toxic and hazardous substances from reaching receiving waters. They are designed to address the quality of a facility's practices with respect to storm water leaving the site, and may ultimately affect the ability of the facility to meet environmental control standards or benchmarks. They are most effective when organized into a comprehensive Storm Water Pollution Control Plan. Many different practices can be used to achieve similar environmentally protective results. With facility-specific or activity-specific pollutant(s) of concern as the major consideration(s) in selecting appropriate BMPs, this flexibility allows a facility to tailor a Storm Water Pollution Control Plan to meet its needs using the capabilities and resources available.

The BMPs included in this document, for the most part, address activities and operations that take place outdoors or have a direct impact on the areas outside of the buildings. These BMPs are to be considered a work-in-process and are by no means to be considered a complete list of appropriate pollution control measures. Additional BMPs will be added periodically to this document.

Contributing Agencies: Assistance in developing these BMPs was provided by the Columbia Slough Technical Advisory Committee. This document was compiled by Dennis Jurries, Environmental Engineer with the Department of Environmental Quality, and formatted by Carolyn Sharp, an intern also with DEQ.

Best Usage: The best way to use this guide is to assess your site and your storm water discharge(s). Determine the pollutants in the storm water discharge(s) and the potential sources of those pollutants on site, then determine which potential sources have the most significant impact on the discharge(s). Select BMP(s) that will be most effective in controlling pollution in the storm water discharges for the resources and costs that will be required to implement those BMPs. Implement the BMPs selected and sample the storm water discharges to check the results of the BMP implementation and determine if more BMPs will be required in order to meet the benchmarks for the various pollutants of concern.

Caution: The efficiencies provided in this document should be used as indicators of the potential effects the implementation of any particular BMP may provide. The efficiencies can be variable depending on a number of factors including flow, maintenance of BMP, loading, and other factors.

Acknowledgment: Partial funding for the writing, initial publishing, and revision of this document came from a Pollution Prevention Grant provided by EPA.

BMP Selection Table			
Pollutant	**Activity**	**BMP №**	**Page №**
Heavy Metals, BOD_5, Bacteria, Fungicides Oil, Corrosion Inhibitors, Emulsifiers, Biocides, pH	Mechanical metal removal	CS1	1
Oily air emissions, Metal Particles, Gaseous Metal, Vaporized Flux	Cutting and welding of metal	CS2	2
Oil, Hydraulic Fluid, Antifreeze, Paint, Solvent, Cleaners, Petroleum Hydrocarbons, Toluene, Ethylene Glycol	Oil (& Other Fluids) Dispensing & Outside Storage	CS3	3
Oils, Diesel, Gasoline(Petroleum Hydrocarbons), Antifreeze(Ethylene Glycol), and Solvents(Toluene, Mineral Oil)	Storage of liquids in bulk containers or tanks.	CS4	5
Zinc	Galvanized corrugated sheet metal roof and/or outside walls on buildings	CS5	6
Petroleum Hydrocarbons	Parts & equipment cleaning in Parts Cleaners containing mineral spirits/oil or petroleum products	CS6	6
Grease (Petroleum Hydrocarbons with heavy metal additives)	Vehicle maintenance, equipment maintenance, involving grease	CS7	7
Degreasers, Soap, Heavy Metals, Oil, Grease	Pressure washing/steam cleaning of equipment and/or vehicles.	CS8	8
Oil, Grease, Suspended Solids	Steel, equipment, or vehicles stored outside	CS9	15
Oil	Use of compressed air at the site.	CS10	16
Oil & Grease, Suspended Solids	Retrofiting standard catch basins and drains with sediment and oil retention catch basins	CS11	17
Metal Fines, Suspended Solids	Arc furnace or mechanical removal operations creating dust that is collected in baghouses.	CS12	18
Biocides, Algaecides, Fungicides, Corrosion Inhibitors(BOD_5, COD), Suspended Solids, Zinc, Copper, pH	The use of cooling towers with the associated water treatment chemicals & blowdown discharges.	CS13	19
Copper, Zinc, Total Suspended Solids	Exposed copper/galvanized piping, galvanized siding /roofing, or exposed copper, brass, or zinc coated materials exposed to storm water, heavy vehicle traffic.	CS14	20

BMP Selection Table			
Pollutant	**Activity**	**BMP №**	**Page №**
Total Suspended Solids, Copper, Zinc	Exposed copper/galvanized piping, galvanized siding/roofing, other copper, brass, and/or zinc coated materials exposed; heavy vehicle traffic; particulate discharge from vehicular traffic.	CS15	22
Oils, Suspended Solids, Heavy Metals, Organics	Disposal of waste water from street and floor scrubbing	CS16	24
Lead, Nickel, Cadmium, Sulfuric Acid	Replacement or storage of lead/acid or nickel/cadmium batteries or long time storage of vehicles or powered equipment outside.	CS17	24
Antifreeze (ethylene glycol), gasoline, oil, grease, brake fluid, diesel	Wrecked or damaged vehicle storage.	CS18	25
Hazardous stripping chemicals, lead from old lead based paints, zinc chromate from old paint preparations, metal particulate, low pH, and increased suspended solids	Stripping metal or wood surfaces outdoors.	CS19	26
Asbestos, Copper, Total Suspended Solids	Vehicle repair/brake shoe replacement.	CS20	27
Any and all	Employee environmental education and training.	CS21	28
Total Suspended Solids	Any site that stores material outside.	CS22	29
Fertilizers, Pesticides, Herbicides, Fungicides, Phosphorus, Nitrogen, Zinc, Copper, pH	Facilities with lawns or vegetated areas.	CS23	31
Suspended Solids, Nutrients, Bacteria, Dioxin, Chemicals	Storage of general rubbish or food rubbish outside in dumpsters.	CS24	35
Petroleum Hydrocarbons, Antifreeze, Other Potentially Toxic or Hazardous Liquids	Pumping liquids from storage tanks into site buildings or into vehicles.	CS25	33
Oil and Grease	Trucking firms or other operations where semi-trailers are parked on site and dollies are used to attach to the trailers to move the trailers around the site or operations in which fifth wheel tractors are used on site.	CS26	36
Gasoline and Diesel Fuels (Petroleum Hydrocarbons)	Fueling operations performed by employees on-site or through restricted access systems such as Cardlock sites.	CS27	37
Sediment(TSS), Metals, BOD, Phosphorus, Hydrocarbons(Oil & Grease)	Vegetated filter (buffer).	CS28	38
Sediment(TSS), Metals, BOD, Phosphorus, Hydrocarbons(Oil & Grease)	Catch Basin Filter System.	CS29	39
Sediment(TSS), Metals, BOD, Phosphorus, Hydrocarbons(Oil & Grease)	Constructed Wetland.	CS30	41

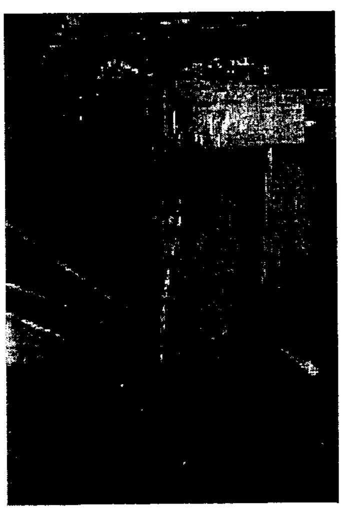
BMP Selection Table			
Pollutant	**Activity**	**BMP №**	**Page №**
Sediment(TSS), Metals, BOD, Phosphorus, Hydrocarbons(Oil & Grease)	Grassy Bioswale.	CS31	44
Heavy Metals	Sand Filter.	CS32	45
Sediment(TSS), Metals, BOD, Phosphorus, Hydrocarbons(Oil & Grease)	Storm Treat System.	CS33	47
Sediment(TSS), Metals, BOD, Phosphorus, Hydrocarbons(Oil & Grease)	Multi-Chambered Treatment Train (MCTT).	CS34	48
Sediment(TSS), Metals, BOD, Phosphorus, Hydrocarbons(Oil & Grease)	Flocculation System.	CS35	50
TSS and Heavy Metals	ElectroFloc..	CS36	54

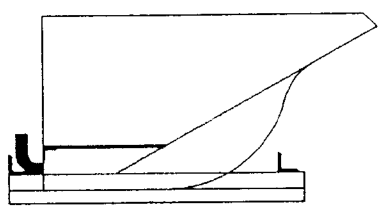
BMP Nº CS1 (Reference #2 &7)

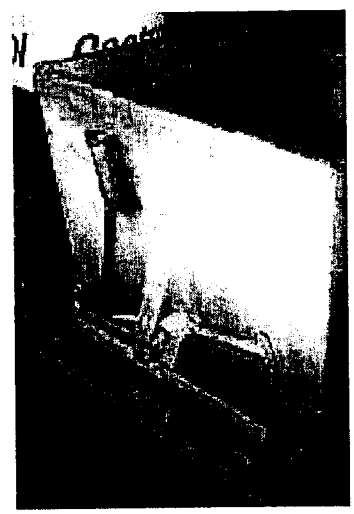
Activity: Mechanical metal removal through the use of high-speed equipment and the associated discharge of metal fines in the form of swarf, grindings, chips, etc.

Typical Pollutants: Heavy metals, i.e. chromium, copper, manganese, lead, zinc; Dissolved Oxygen consuming organisms, i.e. bacteria, fungi; Chemicals in the coolant, i.e. corrosion inhibitors, emulsifiers, biocides, and etc.; Tramp oil; and Decreased pH

Typical Problem: Swarf and turnings are discharged into a hopper along with varying amounts of coolant and tramp oil. The hopper is transported outside and dumped into a dumpster or special portable scrap bin supplied by a scrap dealer. Typically the outside bin or dumpster is not liquid proof nor is it covered. The coolants, metal fines, and tramp oil leak out of the outside bin or are spilled in the process of loading onto a transport vehicle. Quite often the discharge continues as the truck carries the scrap down the highway.







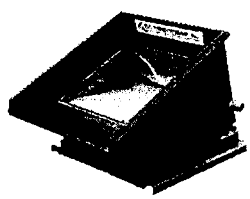
BMP: Locating the outside scrap bin on a concrete pad that drains into a dead-end containment sump and is bermed to prevent storm water run-on may resolve the potential source providing that the sump is emptied periodically. The sump should either be double contained or be coated on the inside with a flexible epoxy to minimize any seepage from any small cracks that may develop in the concrete sump.

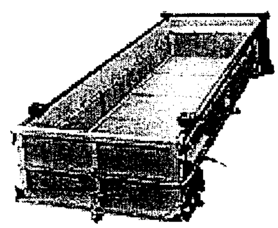
Another approach that works is to modify the scrap hopper located at the metal removing machinery for coolant/oil separation from the swarf while the coolant/oil is warm and less viscous. This approach would minimize or eliminate leakage outdoors by removing most of the potential contaminants at the source.
A removable plate, either solid or with small perforations, either screened or unscreened,

can be added to the bottom of the swarf/chip hopper. This creates a sump for the coolant and oils to drain into while the liquid is very hot and thus less viscous. A piping connection should be made into the lower chamber sized to fit the hose end on your sump sucker. If holes are made in the bottom plate, the number of holes will be determined with experimentation. They should be sufficient to provide the air draw of the sump sucker and should be located to encourage the best flow out of the lower chamber when the liquid is sucked out.

Coolant should be of the synthetic type and should be recycled on site. Small package recycling units are available from several manufacturers.

A few manufacturers will modify existing hoppers or sell new hoppers that have a filtering screen and filter material separating the scrap from the liquid chamber.





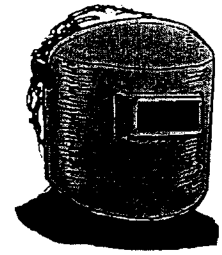
Two commercially available bins with built in screening.

As the scrap bins are moved outside, pause at the outside door where someone should use a sump sucker to draw the liquid/fines out of the lower chamber for either proper disposal or recycling of the coolant.

Efficiency/Impact: Virtually all liquid and metal fines from this activity are eliminated by implementation of this BMP provided the outside scrap dumpster/bin is covered when scrap from inside bins are not being discharged in to it. This point source should no longer be a significant contributor of pollutants to the storm water discharge.

BMP Nº CS2

Activity: Metal cutting with gas burners, oxygen/acetylene torches, and welding of metal with stick, wire, or gas welders.



Typical Pollutants: Oily air emissions;
Metal particles;
Gaseous metal; and
Vaporized flux

Typical Problem: The fume from the metal cutting/welding operation is

R0020077

exhausted to the outside where it comes in contact with rain and precipitates out into the storm water. Indoor air quality is also of concern.

BMP: Welding creates an oily soot type smoke. The amount of smoke produced from the welding process can be estimated using the table below.

Fume Ratio:

MIG (Wire Feed)	**0.005-0.01 lb. of smoke/lb. of rod**
TIG	**0.004 lb. of smoke/lb. of rod**
Oxy-acetylene torch	**0.004 lb. of smoke/lb. of rod**
Stick	**0.015 lb. of smoke/lb. of rod**
Flux core	**0.02 lb. of smoke/lb. of rod**

This fume has products that can be very small, submicron in size. There are two methods to control this fume. If it is properly maintained, the use of a self-washing electrostatic precipitator mounted near the room ceiling is the most efficient and cost effective. Air extraction units with HEPA and charcoal filters can also be used.

Efficiency/Impact: Implementation of one of these BMPs will mostly eliminate this source of pollutants, not only to storm water but also to air, and significantly improve indoor air quality. As an added benefit, if the air inside of a building is heated, it may be possible to recycle the air and provide a significant energy cost savings in the winter months. This point source should no longer be a significant contributor to the storm water discharge concerns.

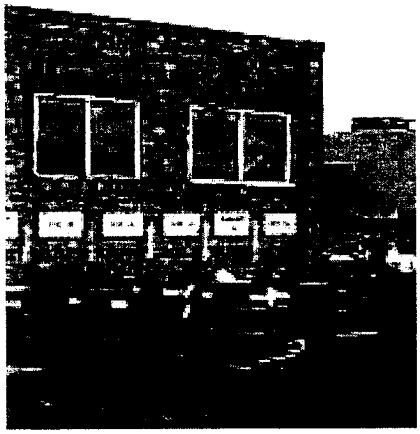
BMP № CS3 (Reverence # 43 & 44)

Activity: Oil (& other fluids) dispensing and outside storage

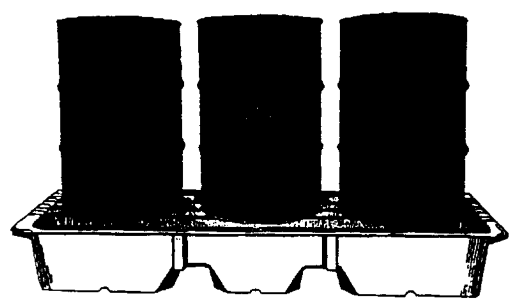
Typical Pollutants: Oil, hydraulic fluid, antifreeze, paint, solvent, cleaners, etc.
i.e. petroleum hydrocarbons, toluene, ethylene glycol, etc.

Typical Problem: Drums, pails, and small containers of liquids are stored outside in unbermed, noncontained areas, which through expansion and contraction of the container, can damage the container, or the container bungs casing leaks, or filling/dispensing operations can discharge pollutants to the ground in the vicinity. Rain and snow contact this material and transport it off site or into the ground water.

R0020078



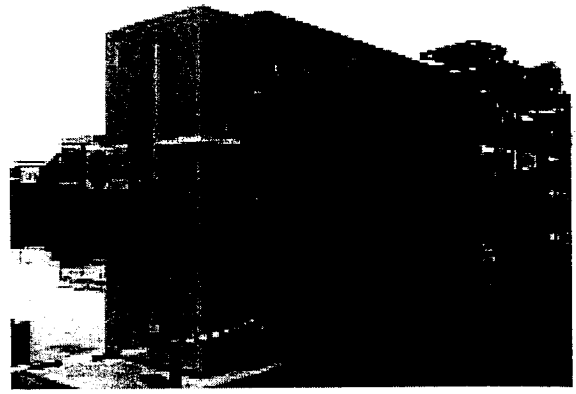
Dispensing oil, antifreeze, and other potentially hazardous liquids usually results in spills and leaks around the dispensing area. This leaked liquid can be tracked to other locations, or can seep through cracks and floor joints into the soil and groundwater beneath the floor. Rain and snow melt transport these pollutants off site. Containment pallets made from steel or plastic will contain the liquid.



For large numbers of drums a portable containment building will keep containers protected from the elements and provide containment in the event of leaks.

R0020079

Oil & Flammable Storage:



Outdoor storage of oil and flammable liquids such as paint, usually results in leakage and spillage of the liquids into the environment. The purchase and placing of portable metal storage buildings with built-in containment reduces this risk and better protects the liquid containers from damage and possible contamination. Environmental controls, i.e. heating and air conditioning, and fire protection are usually available in these preconstructed units.

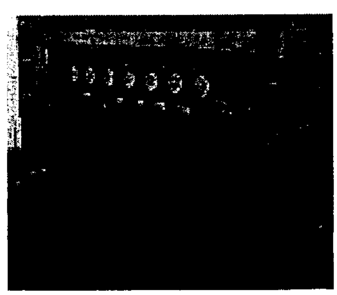
Efficiency/Impact: The use of containment pallets or portable containment/storage buildings will greatly reduce or eliminate storm water contamination from these sources. Some risk of contamination will still exist from the material handling activities associated with moving containers of these liquids to and from the pallets or storage buildings.

BMP Nº CS4

Activity: Storage of liquids in bulk containers or tanks.

Typical Pollutants: Oils, diesel, gasoline (petroleum hydrocarbons); antifreeze (ethylene glycol); and solvents (toluene, mineral oil)

Typical Problem: Leakage or spillage occurs around tanks from filling, dispensing, deterioration of pipe connections or failure of secondary containment



BMP: Bulk storage tanks should have secondary containment in the form of a curbed enclosure with a liner to prevent migration of the liquids through the enclosure walls and floor. The liner can be in the form of a compatible flexible epoxy or a liner membrane compatible with the fluids being contained. If a roof is not provided to keep out rain and snow, then the volume of the enclosure should be 110% of the volume of the largest bulk tank inside of the enclosure. Fill locations should have drip trays that drain into a drum or other container. Dispensing areas should have their own containment. When dispensing into secondary containers, the containment should drain into a drum or other container. Hoses on dispensing stations should not be able to extend beyond the containment area. For dispensing area containment, the volume of the containment area should be equal to the tank being dispensed from. Dispensing areas should be under roof or some other protection from storm water. Caution should be used to ensure that incompatible materials are not contained within the same enclosure.

Double-walled, aboveground storage tanks maybe used instead of single walled storage tanks with containment structures. Filling and dispensing areas associated with double-walled tanks should have containment and protection from storm water.

Efficiency/Impact: Implementation of this BMP will reduce the risk of exposure to storm water of the contaminants associated with the delivery, dispensing, and storage of the materials in bulk tanks.

BMP Nº CS5

Activity: Runoff from buildings with corrugated galvanized sheet metal roofs and/or siding.

Typical Pollutants: Zinc

Typical Problem: As the sheet metal ages zinc from the galvanized coating is released to storm water runoff.

BMP: Avoid using galvanized sheeting on new construction. Clean and paint the exposed galvanized sheet with a good enamel paint. Be sure to contain and collect any liquids used in cleaning for proper disposal. Instigate a regular inspection and maintenance program concerning the building painting.

Efficiency/Impact: With proper maintenance of the painted surface the zinc runoff can be decreased from this source to the non-detect level.

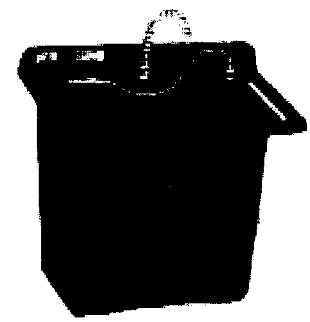
BMP Nº CS6 (Reference #14 & 42)

Activity: Cleaning of parts and equipment in Parts Cleaners containing mineral spirits/oil or petroleum products.

Typical Pollutants: Petroleum hydrocarbons

Typical Problem: The use of petroleum based cleaners leads to the requirement for either storage of the spent cleaner or recycling companies periodically removing old cleaner solution/sludge and adding new solution. This results in spent cleaner storage on site and/or frequent handling of both the clean and contaminated cleaner. This increases the risk of spills and leakage getting into storm water. The spent cleaning solution/sludge must be treated as a hazardous waste and be properly handled and disposed.

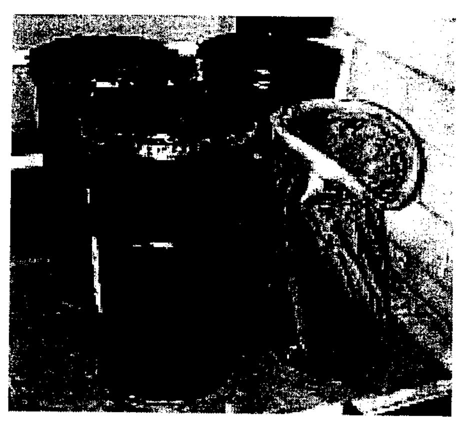
BMP: Large parts and frames are generally cleaned in a shot blast machine. Smaller parts should be cleaned in an aqueous based solution (caustic or other) or in a biological solution. These units typically are heated and may involve agitation. Parts cleaners other than these typically have a sludge residue or the solution has to be replaced periodically. The sludge or removed solution is usually considered a hazardous waste somewhere in its cycle. The sludge from an aqueous based or biological parts washer is not typically hazardous and solutions are only added, never removed. The SmartWasher shown to the right is an example of a biological unit.



Efficiency/Impact: Use of water based or biological parts cleaning solutions could potentially result in no hazardous waste generation, improved health for employees, and overall cost savings in material, labor, and waste disposal. Generally, cleaning with these solutions takes employee involvement in the acceptance of the use of the material and usually takes a little bit longer to perform the cleaning operation.

BMP № CS7

Activity: Vehicle maintenance, equipment maintenance, and construction involving the addition of grease to joints, couplings, bearings, etc.



Typical Pollutants: Grease (Petroleum Hydrocarbons with heavy metal additives)

Typical Problem: Grease containers when emptied still contain fair amounts of grease residue in them. Should water mix with this grease, potential adverse impact to the environment in the form of oil/water spillage may occur.

BMP: Some suppliers provide returnable containers (bulk) that, when sealed after use, minimize the potential adverse impact. Another environment friendly option is a container that is lined. After emptying, the liners can be removed and more of the grease squeezed out. The liners can then be placed in a drum for accumulation and properly disposed.

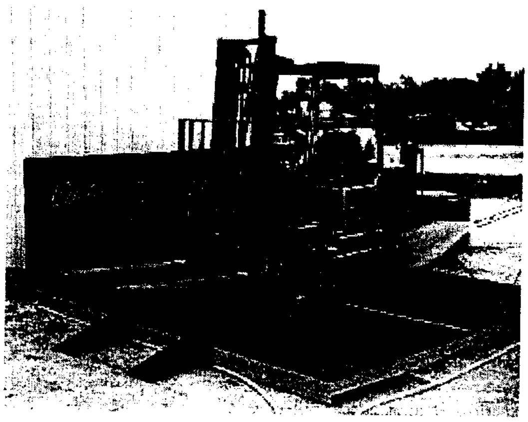
Efficiency/Impact: An increase in the amount of grease available at very little increase in labor cost will result from implementation of this BMP. If the lined containers are used, properly accumulated and disposed of after use or bulk returnable containers are used, very little risk of environmental contamination through storm water discharges will be present from this source.

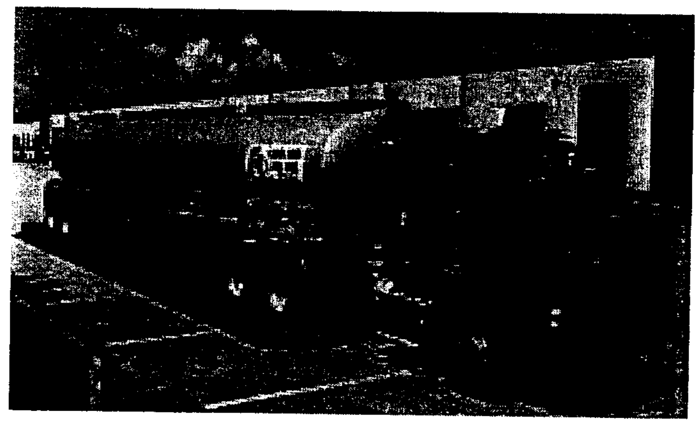
BMP Nº CS8 (Reference #14, 50, & 51)

Activity: Pressure washing or steam cleaning of equipment and/or vehicles. Equipment includes forklifts, backhoes, graders, tractors, and similar commercial implements. Equipment does not include motors, engines, generators, compressors, and similar commercial machinery.

Typical Pollutants: Degreasers, soap, heavy metals, oil and grease

Typical Problem: When equipment and/or vehicles are washed outside, contaminants in the washwater and the overspray mix with the storm water runoff.





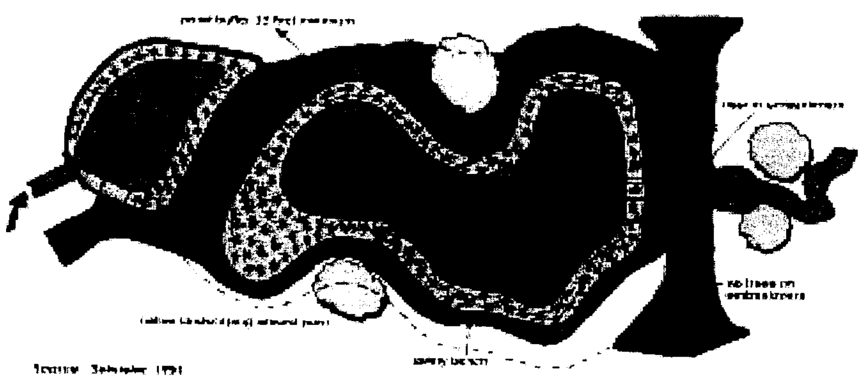
BMP: Normally wash areas should be located on well-constructed and maintained, impervious surfaces with drains piped to the sanitary sewer. The wash area should extend at least 4 feet in every direction from the perimeter of the vehicle or equipment being washed. When sanitary sewer is not available there are several different approaches to this concern that can be taken depending on the size of the site and the resources available, such as:

- discharging the storm water to a properly sized grassy swale,
- discharging the washwater and storm water to a collection sump for later disposal,
- discharging the storm water through an oil/water separator,
- relocating the washing operations to a commercial washing facility, and/or
- discharging the storm water to a constructed wetland.

Selection of the cleaning detergent to be used is critical to good oil/water separation and retention in control devices. Ensure that the detergents used do not emulsify oils as this would allow the oils and grease to flow though the oil/water separator instead of being separated from the effluent. The detergent should be a low sudsing, low phosphate,

R0020083

biodegradable type. Design the cleaning area with walls to keep the dirty overspray from leaving the wash area. Place an oil/water interceptor or separator in the wash area's drain to separate out the oil and grease before the effluent is sent to the sanitary sewer. Should sanitary sewer not be available, discharge should be through an oil/water separator into a bioswale or pond and thus to storm water conveyances provided a permit is applied for and granted. Should the site not be large enough for a bioswale or pond, collection of the washwater can be made by using a portable containment enclosure. The wastewater can then be extracted and placed in a suitable holding tank for later oil/water separation and discharge into a sanitary sewer, or other disposal method such as collection and transportation or the waste to a sewage treatment plant. Discharge of wash water and pad rinse water may require a vehicle wash water discharge permit from DEQ. Typically the discharge of washwater from washing activities is not allowed to the Slough. Pressure washing without chemical usage and with treatment BMPs may be eligible for a permit.



Washing systems are available that will recycle the washwater for reuse in washing operations.

General BMPs for Vehicle and Equipment Washing Activities - Site and Activity Conditions

1. Vehicle/equipment washing that occurs on an impermeable surface (i.e. concrete, plastic, or other) should utilize an impervious area which extends to minimum of four (4) feet on all sides of the vehicle/equipment to trap all overspray. Washing areas should be properly graded so that all washwater can be collected from the impermeable surface.

2. Impervious surfaces used for cleaning operations should be marked to indicate the boundaries of the washing area and the area draining to the designated collection point; exceptions include wash areas covered by a roof or wash areas that use portable impervious material with boom collection.

3. Vehicles should not be washed near uncovered repair areas or chemical storage facilities such that chemicals could be transported in washwater runoff. All washwater runoff

should be drained away from a shop area or chemical storage facility.

4. For washing operations that use detergents, soaps, cleaners, hot water or steam, and other chemicals, the washwater should be collected in a manner which prevents the mixture or wash-down of pollutants with storm water runoff. Preventative measures may include:
   a) designating a wash area in an area under a roof,
   b) in open areas, draining to a dead-end sump or grit trap and pump or siphon washwater to sanitary sewer, recycling equipment, or treatment equipment,
   c) a catch basin may be used as a sump provided a positive control valve can close the outlet to the storm drainage system while washing occurs,
   d) as a temporary condition, an existing catch basin may be used as a sump provided the outlet pipe is sealed by a plug (plumber's balloon) to prevent washwater from entering the storm drainage system, or
   e) collecting washwater with a portable vacuum recovery unit.

5. For washing operations that use detergents, soaps, cleaners, hot water or steam, and other chemicals that drain to a catch basin with separate outlets to storm and sanitary sewer, the basin should contain a positive control valve. The positive control valve is open during washing so that washwater discharges to sanitary sewer, and closed during non-washing periods so that storm water runoff discharges to storm sewer. The designated wash area should be thoroughly rinsed after washing activities.

6. At all permanent washwater facilities and catch basins with a valved sanitary sewer outlet, the owner should post a "warning" to customers, employees and others not to dump vehicle fluids, pesticides, herbicides, solvents, fertilizers, organic chemicals, or toxic chemicals; a sign or stenciled note on pavement next to the grit trap or catch basin should be in a visible location and maintained for readability.

7. Washing operations at train yards that use detergents, soaps, cleaners, hot water, steam, solvents, or other chemicals should occur in common area such that all washwater is collected, treated, and discharged properly as approved of in writing by DEQ. Wash areas in train yards should employ an impermeable surface to collect washwater. The impermeable surface may be a concrete pad or a double-lined geotextile material under the railroad ballast. The wash area should be properly graded to direct washwater into a grit trap.

8. All parking lots/stalls of dealerships, vehicle rental agencies, and government/company fleets that wash exterior vehicle surfaces with cold water should furnish or retrofit catch basins with sediment traps and an inverted elbow outlet to trap floating oil. Design guidelines for this type of catch basin are described in Section 4.4 of the Oregon DEQ washing document. Catch basins should be cleaned of solids and oil when the basin becomes 30% full with solids, or at least once a year. Catch basins should be cleaned during dry weather to prevent discharge of pollutants into the storm sewer. Solids and oil must be disposed of in a manner that complies with all State administrative rules.

9. Paved areas where washing will occur (i.e., roads, parking lots, driveways, sidewalks,

and other surfaces) should be cleaned of excessive debris. If excessive debris lies on the pavement surface, the surface should be dry swept or blown and debris collected and disposed of properly.

10. In washing operations involving the washing of buildings and pavement areas and that use detergents, soaps, or cleaners, the washwater should be collected and discharged to sanitary sewer or a treatment system, or discharged to the ground surface provided a minimum buffer of 20 feet exists to the nearest surface water or pavement area that drains directly to storm sewer. A buffer should consist of vegetated ground with a relatively level slope, and soil with adequate permeability to prevent runoff.

11. Washing exterior surfaces of buildings with water only may drain to a catch basin with sediment trap and inverted elbow outlet. Catch basins should be cleaned of solids and oil when the basin becomes 30% full with solids, or at least once a year. Catch basins should be cleaned during dry-weather to prevent discharge of pollutants into the storm sewer. Solids and oil must be disposed of in a manner that complies with all State administrative rules.

12. Wash down of construction vehicles and equipment should prevent soil erosion and runoff from the construction rite. Silt ponds may be used to control erosion.

13. Cleaning operations should be modified to minimize paint residues (chips), heavy metals, or any other potentially hazardous materials that detach from surfaces. Modifications may include a change of cleaning agent or reduction in water pressure. Detached metals should not enter storm sewers or surface waters.

14. The use of acids and/or solvents as cleaning agents for building exteriors and pavement areas should be avoided if possible. Dry or semi-dry methods may be used to clean these surfaces (i.e., sand or other particle blasting, grind-off and vacuum technology, and ice blast technology). If blasting is used as an alternative, all solids should be swept or vacuumed and disposed of properly.

15. For washing operations on painted or metal surfaces, detergents should not possess abrasive properties. Cleaned surfaces should not leave paint residues (chips) or detach heavy metals such that these particles can enter storm sewers or surface waters.

16. Detergents and soaps used in washing activities should be phosphate-free and possess the ability to rapidly biodegrade.

17. At all designated washing areas, spill prevention, control, and management should be planned and designed to prevent any spills of pollutants from entering a publicly- or privately-owned treatment works or surface waters.

18. A chemical management plan should be implemented for cleaning operations that utilize metal brighteners, caustics/acids, halogenated hydrocarbons, or solvents; the plan should include as a minimum:

a) lists of chemicals used,
b) the method of disposal used, such as reclamation or contract hauling, and
c) procedures for assuring that *toxic* chemicals are not discharged into the waters of the State.

Sanitary Sewer Discharge

19. Prior to disposal of washwater to sanitary sewer, minimum pretreatment requirements must be met as required by the local Sewer Authority. Pretreatment may consist of grit removal, followed by free oil removal. Solids can be removed by a grit trap and/or a properly-sized detention tank. Free oil can be removed by a coalescing-type oil/water separator or comparable treatment unit. Grit traps used for pretreatment should be inspected daily. Sludge, grit, and other solids in a grit trap and/or detention tank should be removed by a certified waste hauler and disposed of in a manner that complies with all State administrative rules. Design guidelines for such treatment are described in Section 4.4 of the Oregon DEQ washing document.

20. Pretreatment units should be operated and maintained in accordance with manufacturer specifications and as required by the local Sewer Authority.

Recycling Treatment

21. Recycling treatment equipment should be properly operated and maintained to achieve compliance with all conditions of the permit. Backwash water or concentrate water should be properly discharged to sanitary sewer. Liquid concentrate discharged to the sanitary sewer should meet all pretreatment standards and other requirements of the local Sewer Authority. Solids, grit, or sludge should be disposed in a manner that complies with State administrative rules.

Equipment Treatment - Discharge to Surface Waters, Ground Surface, or Vegetated Swale

22. For cleaning operations that use metal brighteners, caustics/acids, halogenated hydrocarbons, or solvents, washwater should be treated and effluent disposed of either by no discharge methods or by discharge to surface waters not exceeding permit limitations. Treatment may consist of a combination of various process units (e.g., a grit trap can be used to remove suspended solids, an oil/water separator can be used to remove floating oil, a pH adjustment unit can be used to neutralize acids or caustics, an air stripper can be used to remove volatile organics, a dissolved air flotation unit can be used to remove fine solids, polymer chemical mixing and flocculation units, and a sand filtration unit can be used to remove dissolved solids and metals, an ultrafiltration unit can be used to remove solids, a carbon column can be used to remove organics and metals, and a reverse osmosis unit can be used to remove metals).

23. For cleaning operations that use detergents, soaps, cleaners, hot-water, or steam, washwater should be treated and effluent disposed of either by no discharge methods or by discharge to surface waters not exceeding permit limitations.

The following treatment alternatives may be developed:

24a. Washwater may be treated with, in sequence, a grit trap, an oil/water separator, a dosing tank with siphons or pumps, and a multi-media filter bed with underdrains. Discharge from underdrains must meet effluent limitations set forth by the DEQ. Design guidelines for the treatment system units are described in Section 4.4 of the Oregon DEQ washing document. Maintenance of a multi-media filter should consist of cleaning, removing the top inch of sand once every six months; when the total depth of filter sand fall below 18-inches, the sand should be replaced; if clogging and/or short circuiting occurs as observed by uneven infiltration in the filter or formation of surface cracks, the sand should be replaced.

24b. Washwater may be treated with adequately-sized units of grit trap and oil-water separator, or comparable units such as a water quality inlet to remove sediments and floating oils; pH adjustment may be needed as additional treatment. Effluent may be applied on vegetated land by irrigation equipment. Design guidelines for the grit trap and coalescing oil/water separator, and water quality inlet are described in Section 4.4 of the Oregon DEQ washing document. Land irrigation should occur on nonagricultural vegetation with a 20-foot buffer. Treated washwater should not result in surface runoff. All criteria set forth in OAR 340-40 must be met for groundwater quality protection.

24c. Washwater may be treated with adequately-sized units of: grit trap and oil/water separator, or comparable units such as a water quality inlet to remove sediments and floating oils. Effluent may be disposed of to an evaporative storage lagoon or constructed wetlands. The lagoon or constructed wetlands should be designed with no discharge and thus should be designed with sufficient storage. Design guidelines for treatment units are described in Section 4.4 of the Oregon DEQ washing document. An impermeable fabric liner may be needed for the lagoons or constructed wetlands to protect groundwater. All criteria set forth in OAR 340-40 must be met for groundwater quality protection.

On-site disposal (septic tank and drainfield) was evaluated for treatment of washwater that contain detergents, soaps, or cleaners. Lack of data on treatment performance data prohibited its use currently. Groundwater must be protected according to OAR 340-40.

25. If an oil/water separator is used as a treatment component, detergents used as cleaning agents must meet emulsion stability requirements to improve the efficiency of the treatment unit; emulsion stability should meet the fats, oil, and grease (FOG) test, which involves testing a 1,000 ml detergent mixture at an one percent (1%) working concentration of the detergent; one liter of a 50:50 mixture of//2 diesel fuel and 30-weight motor oil is added to the detergent mixture, shaken for 20 seconds and allowed to stand for 30 minutes; an acceptable test performance is less than 20 mg/L total fats, oil, and grease remaining in emulsion.

26. The treatment system must be, at all times, properly operated and maintained to achieve compliance with all conditions of the permit. Records of maintenance activities should be

maintained on-site for DEQ inspection.

27. A Spill Prevention, Control and Countermeasure (SPCC) Plan, in accordance with 40 CFR 112, should be prepared and implemented to prevent the entry of pollutant loads beyond the capabilities of the treatment system.

28. For small cleaning operations that use detergents, soaps, cleaners (i.e., private and nonprofit vehicle/equipment washing, and building and pavement washing, or commercial facilities which wash less than eight of their own vehicles, trailers, or pieces of equipment during any week), washwater can be disposed of onto the ground surface.

Disposal alternatives to ensure contaminated water does not enter surface waters are as follow:

29a. Washwater may be collected in a sump, grit trap, or containment structure to be pumped or siphoned to a vegetated area so that complete percolation into the ground occurs.

29b. Disposal of washwater should occur on ground surfaces with vegetated cover, preferably grasses.

29c. Washwater may be disposed to a dry grassy swale, a minimum of 250 feet in length before a surface water body. Complete percolation in the swale should occur with no direct discharge to the surface water. Discharge into a grassy swale for treatment should not occur within 24 hours after a rainfall event or if water remains ponded in the swale. Guidelines for design of a grassy swale or use of an existing grassy swale to reduce pollutants are in Section 4.4 of the Oregon DEQ washing document. A distance of 250 feet was based on a hydraulic conductivity of 0.2 gal/ft/day, volume per day of 150 gallons, and a swale with a width of 3 feet.

29d. Washwater runoff may be disposed of into an infiltration basin/trench. Guidelines for design of an infiltration basin/trench to reduce pollutants are described in Section 4.4 of the Oregon DEQ washing document.

29e. Commercial mobile washers that use detergents, soaps, or other chemicals should use a portable impervious surface material when washing on a porous surface. A portable wash pit, vacuum recovery unit, or comparable device must be used on location to collect washwater for proper disposal.

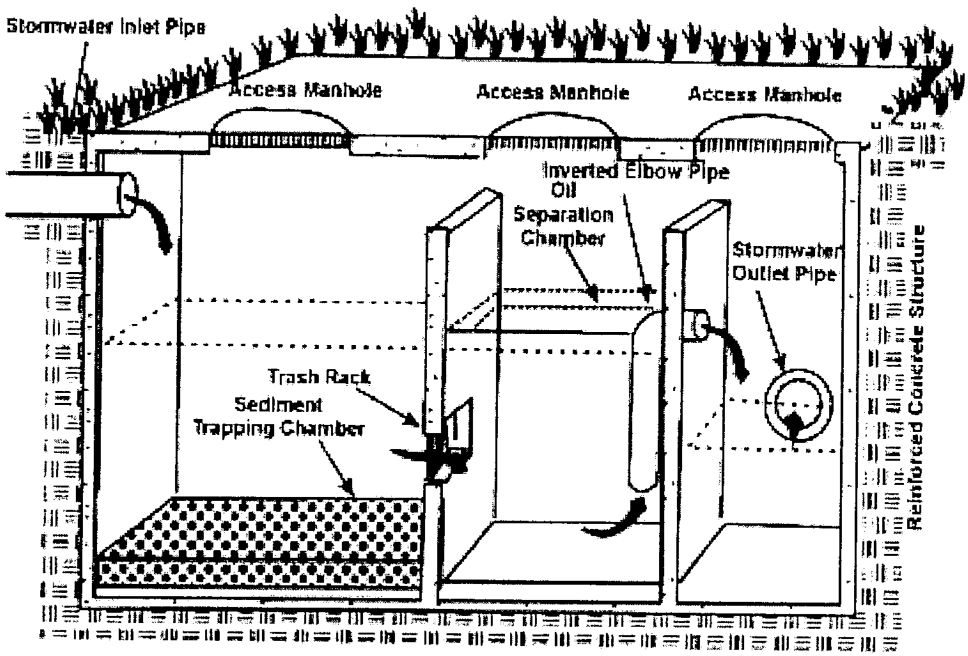
Efficiency/Impact: The use of a recycling system will not only reduce or eliminate the contaminant discharge to storm water or sanitary sewer but it will greatly reduce the amount of water used in the process. The use of a bioswale with an oil/water separator will likewise virtually eliminate the total suspended solids, oil and grease, and heavy metals discharged provided both are properly sized. A portable collection system will provide the collection of the contaminants provided the collection system is large enough to capture significant amounts of the overspray.

BMP Nº CS9 (Reference # 21 & 41)

Activity: Any site that has steel, equipment, or vehicles stored outside and has a potential for oily storm water discharges.

Typical Pollutants: Oil and grease and suspended solids

Typical Problem: Structural steel and plate arrives on the site from the supplier coated with oil to inhibit corrosion. As storm water comes in contact with the steel the oil disperses and runs off. Equipment stored outside has grease and oil on it that washes off when contacted by storm water. Vehicles not only have the normal oil and grease associated with them but they also have road film which contains oil.



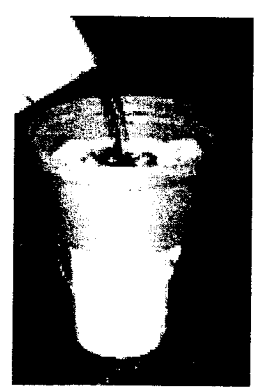
BMP: Installation of a properly sized oil/water separator can reduce the amount of both Total Suspended Solids and Oil and Grease in the storm water run-off. Several types of oil/water separators are available (Gravity, Coalescing, Centrifugal, Carbon Absorption, Ultrafiltration, etc.). Gravity Oil/Water Separators are generally the most economical provided emulsifying chemicals have not been used upstream of the separator, dirt is not a major contaminant, and high shear centrifugal pumps are not used to pump the water to the separator.

There are three basic types of oil/water separators, spill control (SC), API (longer retaining time), and coalescing plate (CPS) recommended for use in all pipe drainage systems conveying runoff from paved areas, subject to vehicular use or storage of chemicals, prior to discharge from the project site or into an open drainage feature. All three types have the following basic application/selection criteria:

- Urban residential runoff usually low flows
- Suitable for smaller sites, draining 5 or less acres
- Land uses associated with include: industrial, transportation, log storage, airports, fleet yard, railroad, gas station, vehicle/equipment dealers and repair, construction and petroleum
- SC can be effective at retaining small spills but does not remove dispersed oil droplets because they have a short residence
- SC type should be required when the site stores petroleum based products and spills are
- API used where there is a relatively high likelihood of dispersed oil contamination.
- API/CPS should be used in areas with high traffic volumes (2,500 vehicles per day), at sites that are used for petroleum storage/transfer, scrap and wrecking yards, or at sites where heavy equipment is stored and/or maintained.
- Oil/water separators cannot deal well with heavy sediment
- Should be used in conjunction with detention, biofiltration, or water quality treatment system to protect groundwater.
- CPS consist of a bundle of plates made of fiberglass or polypropylene installed in a concrete vault. The plates improve the removal of oil and fine suspended sediments and assist in concentrating the pollutants for
- CPS requires frequent inspection and maintenance to operate as
- A mechanism should exist for the system to be bypassed, so the system can be taken off line for maintenance.
- Oil and sediment removed from devices may qualify as hazardous waste and should be tested prior to
- Oil separators should be sized for a local six-month reoccurring 24-hour design storm. Larger storms should be diverted from the separators.

Efficiency/Impact: The use of gravity oil/water separators in the storm water outflow can greatly reduce the free oil droplets larger than 0.015cm (150 microns). Ultrafiltration can virtually eliminate oil in the storm water outflow. Fouling of membranes may become a concern with Ultrafiltration although some newer vibrating membranes show great promise for keeping the membranes clear during backflushing.

BMP № CS10

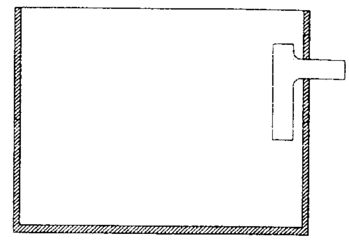


Activity: The use of compressed air.

Typical Pollutants: Oil

Typical Problem: Compressed air systems typically absorb or condense moisture from the ambient air. Fine oil is released to the compressed air in the compression cycle. The condensed water is either manually drained out of the compressor, filters, and/or the air receiver tank or is automatically drained by a timed valve system. This condensate may be discharged to the ground or to a location that can leak or be spilled into the outside environment. Storm water then flushes this oil to the storm water outfall.

BMP: Install an oil/water separator especially made for compressors and receiver tanks or manufacture a simple separator similar to the one shown on the following page and siphon off the oil. Discharge the remaining water to the sanitary sewer if it is available on-site.



Efficiency/Impact: Oil from this source can be greatly reduced or eliminated and loading to the storm water conveyances will be reduced.

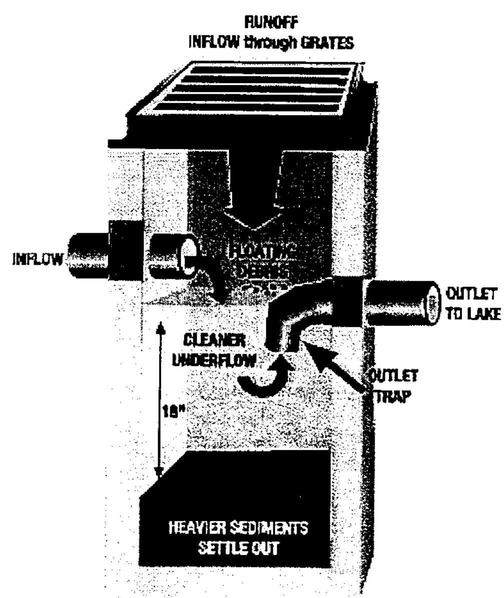
BMP Nº CS11

Activity: Storm water runoff from commercial or industrial sites to standard catch basins or drains.

Typical Pollutants: Oil and sediment

Typical Problem: On sites that use standard catch basins or drains there is no retention of any oils or sediments. This could result in excessive discharges to storm water of these pollutants.

BMP: Retrofitting drains to standard sediment and oil trap catch basins properly designed for the flow-through rate and properly maintained can reduce oil and grease levels in the storm water discharge.



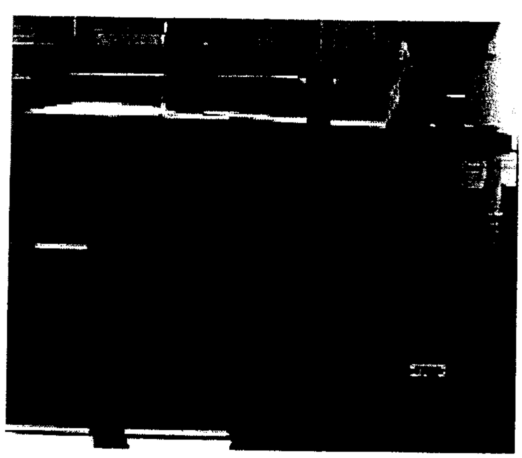
Efficiency/Impact: Proper sizing and maintenance can reduce the discharge concentrations of oil and grease to below 10mg/l and settleable solids to some degree.

BMP Nº CS12

Activity: Arc furnace or mechanical removal operations (grinding, sanding, shot blasting, etc.) that create dust which is collected in baghouses.

Typical Pollutants: Metal fines, suspended solids in storm water

Typical Problem: Mechanical removal operations involving the removal of metal, paint, wood, and other materials generate dust that is collected in bag filter houses. Arc furnaces will generate a metallic fume that condenses out as a dust on the way to the baghouse. The baghouses must discharge the dust collected to a dumpster, drum, or bin. If the connection between the baghouse and the collection container is not airtight then, dust leaks out into the environment. Storm water will contact this dust and convey it off-site, typically causing a TSS discharge problem.

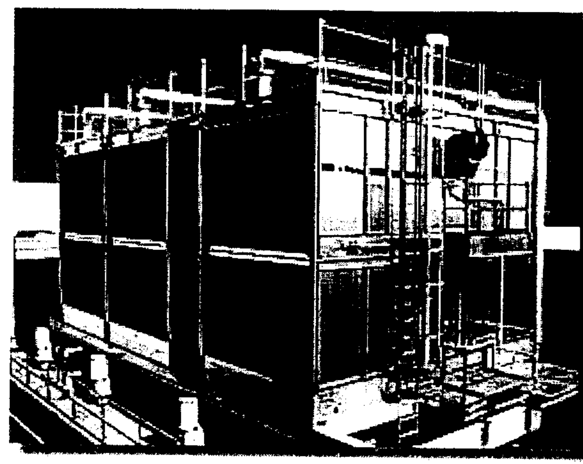


BMP: If a drum is being used for collection of the dust, manufacture from a removable drum top a flange or sleeve that a flexible boot can be clamped to and attach the sleeve to both the discharge point on the baghouse and to the drum sleeve. Use quick release clamps to attach the removable drum top to the drum. If a dumpster or other large container is used to collect the dust, manufacture a solid reinforced cover for the container using rubber sealing strips and clamps or bolts to hold the cover in place. The cover should have a sleeve or flange that attaches to a flexible boot which is attached to the discharge point on the baghouse. It may be necessary to also include a vent line from the dust receiving container back into the dust collector in order to relieve the air pressure resulting from the dust dropping down in to the collection container.

Spillage that occurs from connecting and disconnecting to the flexible boot should be immediately cleaned up using a vacuum. A fixed vacuum duct may be plumbed into the inlet of the dust collector with a valve so that the spillage can be reintroduced into the dust collector. Also, frequent vacuum sweeping of the area around the dust collector should be performed.

Efficiency/Impact: Through the use and proper maintenance of the container covers most of the dust can be contained significantly reducing the amount of dust that could leak out to the environment. This would, in turn, greatly reduce the impact from this source of suspended solids and metals to the storm water discharge.

BMP № CS13 (Reference #29)



Activity: The use of cooling towers with the associated water treatment chemicals and blowdown discharges.

Typical Pollutants: Biocides, algaecides, fungicides, and corrosion inhibitors (BOD, COD); suspended solids; zinc; and copper

Typical Problem: Chemicals such as Biocides, Algaecides, and Corrosion Inhibitors are added to cooling towers to prevent biological growth, and to reduce scaling and corrosion. Periodically cooling tower water must be blown down in order to remove sediment and particulate buildup in the cooling tower sump. This water should be discharged to sanitary sewer but may not be in areas where a sanitary sewer is not available. Even when the water is discharged to a sanitary sewer an upset can occur in which the cooling tower sump water is discharged to outside areas and comes in contact with storm water. This water can contain elevated levels of copper, zinc, and chemicals with high BOD_5 and COD.

BMP: Use ozone instead of chemicals to control biological growth and scaling. Ozone is a powerful oxidizing agent. It has one and one-half times the oxidizing potential of chlorine. A properly operated and controlled ozone treatment system will not allow microorganisms that secrete the glue-like substance called mucilage to survive and will break down existing mucilage. Microbiological induced corrosion(MIC) can be controlled through the use of ozone. The pH of the water when using ozone is around 8 in comparison to levels typically below 7 when using chemical treatment. Cooling tower sumps can be vacuumed out using a swimming pool type vacuum. With little or no biological growth, the absence of chemical additives, and the absence of scaling sediment, particulate accumulation can be restricted to airborne particulates for the most part which should reduce the frequency for the need to remove sediments and particulates by blowing down the sump. Use of a swimming pool vacuum cleaner could eliminate almost all blowdown.

An alternative to introducing ozone is the use of ultraviolet light disinfection to control microbial growth in cooling tower water. In this case the cooling tower is recirculated through the UV unit which kills organisms attempting to grow in the water. Blowdown will still have to occur but will probably be required at a reduced frequency over that necessary when chemicals are used. The computer chip industry has used this method for their ultrapure water processes for years and the machinery coolant recycling equipment industry has also been using UV treatment units to eliminated biological growth in their coolant recycling equipment.

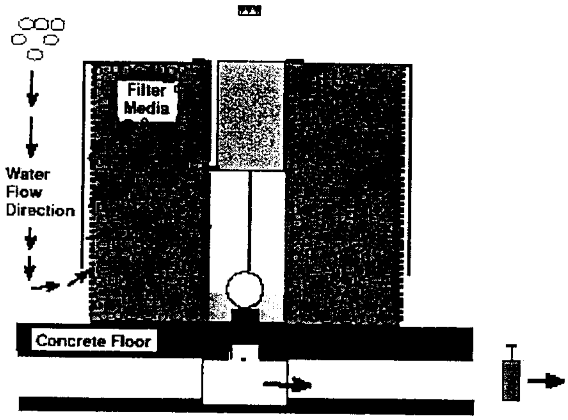
Efficiency/Impact: By replacing chemical additives with ozone or UV treatment and using a swimming pool vacuum cleaner for sediment removal, potential pollutants from this source to the storm water conveyances can be reduced or eliminated.

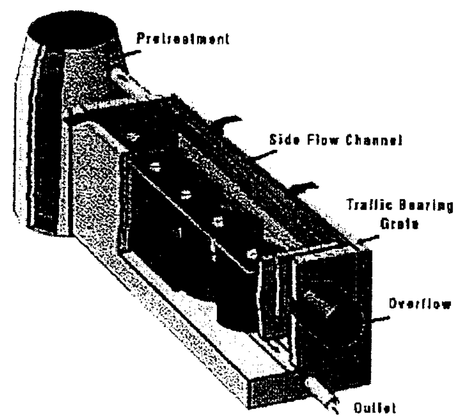
BMP Nº CS14 (Reference # 34)

Activity: Operations with exposed copper and/or galvanized piping, galvanized siding and/or roofing materials, cathodic protection coatings of copper such as may be found on boats, or other exposed copper, brass, and/or zinc coated materials that are exposed to storm water may have significant levels of these metals present in their storm water discharge. Operations involving heavy vehicle traffic may also have metals in their storm water discharge such as copper from brake shoes and clutches or zinc from tire wear.

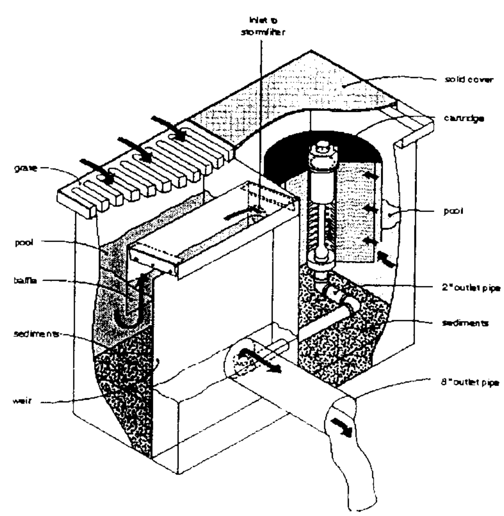
Typical Pollutants: Copper, zinc, and Total Suspended Solids

Typical Problem: Dust from tires (1% Zinc wear rate = 90mg/km/tire) and clutch/brake mechanisms, deterioration from galvanized building materials or corrosion and/or oxidation of copper piping and fixtures cause discharges of particulate and dissolved chemical forms of copper and zinc to the environment when contacted by storm water. Copper based cathodic protection on boats and other equipment generates chemical and particulate forms of copper that becomes combined with storm water.





BMP: The installation of properly sized compost filtration units can remove significant amounts of both chemical and particulate forms of some heavy metals, including copper and zinc, and reduce TSS levels in the storm water discharge. Colloidal particulate levels from clay soils should also be reduced effectively.

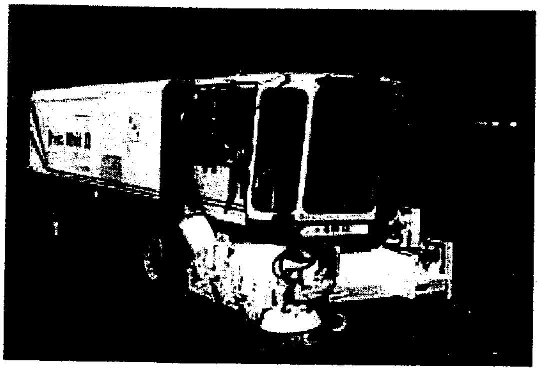


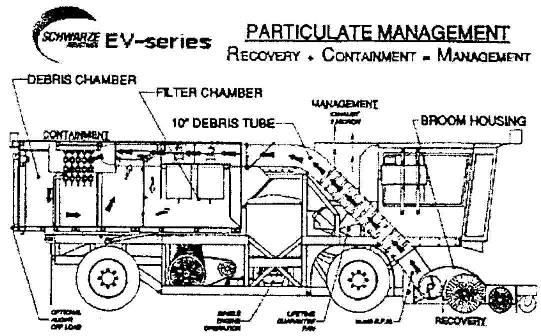
Effectiveness/Impact: Evaluation of existing sites over a three-year period show that the mean reductions of pollutants in storm water for the following were achieved:

TDS	**22.4%**	**Turbidity**	**91.8%**
COD	**70.4%**	**Total Phosphorus**	**44.9%**
Lead	**44.9%**	**Zinc**	**83.2%**
Copper	**65.3%**	**Oil & Grease**	**80.9%**

In general, reductions for Heavy Metals can be expected to be in the range of 65 to 95% and for Oil & Grease up to 85% for a properly designed and sized system.

BMP № CS15 (Reference #32 & 45)





Activity: Operations that have exposed copper and/or galvanized piping, galvanized siding and/or roofing materials, or other exposed copper, brass, and/or zinc coated materials exposed to storm water can have significant levels of these metals present in the storm water discharge. Operations involving heavy vehicle traffic also produce elevated metal levels in storm water from vehicle brake shoes or clutches (copper) and tire particles (1% zinc wear rate = 90mg/km/tire).

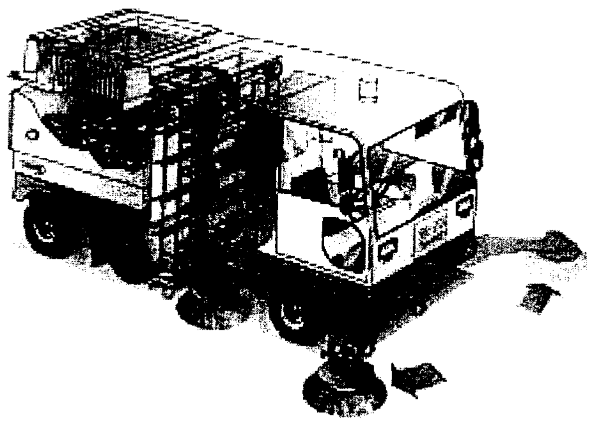
Typical Pollutants: Total Suspended Solids, copper, zinc.

Typical Problem: Dust from tires and clutch or brake mechanisms, deterioration from galvanized building materials, or corrosion and/or oxidation of copper piping and fixtures cause discharges of particulate and dissolved chemical forms of copper and zinc to the environment when contacted by storm water. Copper based cathodic protection on boats and other equipment also generate dissolved chemical and particulate forms of copper that can become combined with storm water.

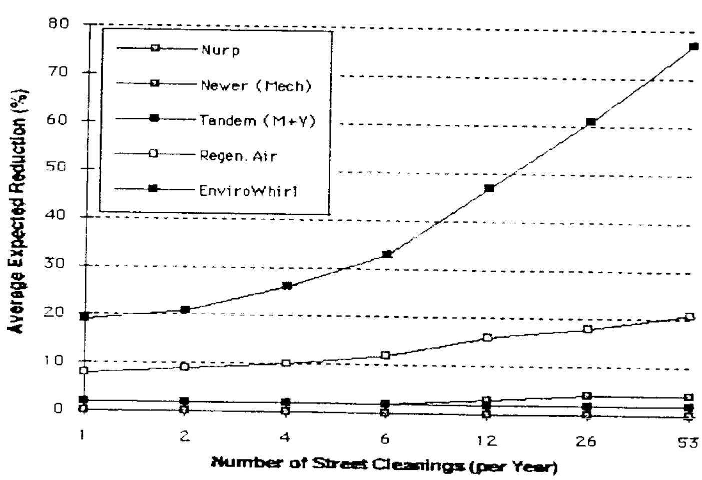
BMP: Sweeping of paved roads, parking lots, and storage areas with a type of vacuum sweeper that incorporates HEPA filtration or other high efficiency method of filtration of the exhaust air from the sweeper to trap the very fine metallic particles found in road or parking lot dust can reduce these discharges to storm water.

Ensure that good control measures are implemented when dumping the contents of the sweeper and practice proper disposal methods for the emptied contents to ensure that there is no adverse environmental impact after spending so much effort in the initial clean-up.

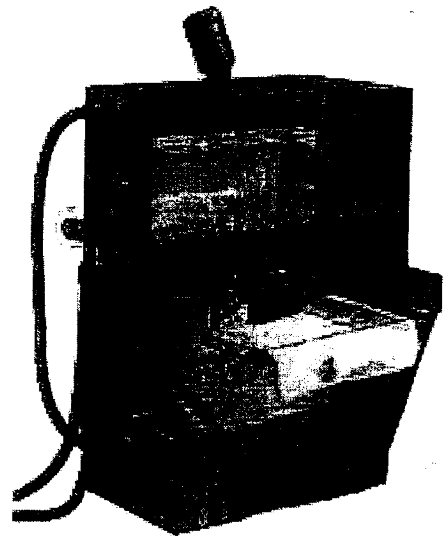
Efficiency/Impact: This type of Sweeper is capable of collecting and containing up to 99.6% of particles as small as 2.5 microns in size. The elimination of particulates in storm water is related to the frequency of sweeping as is shown comparisons of various types of sweepers in the following graph.



Tennant Company also produces a series of sweepers, ranging from a small, walk-behind model to as large as municipal street sized sweepers. The unique feature of Tennant's products is a stainless steel hopper built in to the sweeper to collect dust and debris as it is picked up from the floor and passed through a polyester filter. When the hopper is full, it can be emptied directly into a dumpster or dump truck, minimizing the chance of particulate matter being re-released into the air. Information from the manufacturer reports that the sweepers will retain particles 10 microns, or 0.001 mm, or larger. The smaller size of the model and four-wheel steering makes it easy to maneuver in small spaces that traditional sweepers would not fit.



BMP № CS16



Activity: The disposal of wastewater associated with street or floor scrubbing activities.

Typical Pollutants: Oil emulsions, heavy metals, organics and suspended solids

Typical Problem: When floors, streets and other paved surfaces are cleaned with scrubbing or wet-vacuum type machines, the resulting waste water is frequently disposed of over a catch basin that runs into the storm water system.

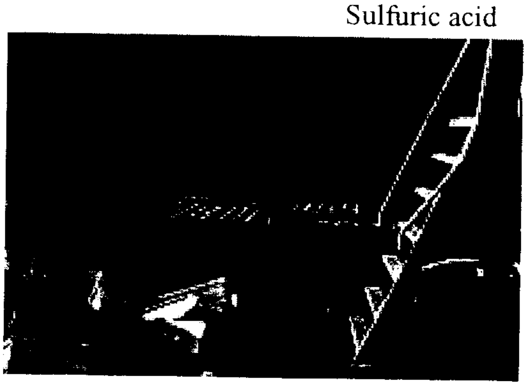
BMP: One option is to make sure that all waste water is disposed of into the sanitary system where it can be treated and cleaned. A solution reclaimer system can also be used to separate contaminants from dirty scrubber solution. Dirty water is pumped into the top of the reservoir, and a chemical compound added to separate out the contaminants. The chemicals encapsulate and separate metals, oils, solids, dust and oils in approximately 20 minutes. The clarified solution is drained out of the reservoir, through a filter, and can then be reused. The remaining solids contain only 10% of the original volume, and dry waste disposal is less costly and has fewer environmental issues associate with it.

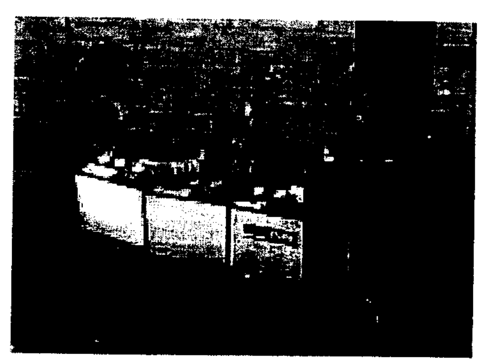
Efficiency/Impact: With appropriate solid waste disposal, a solution reclaimer system can minimize or eliminate the adverse storm water impact from this potential source of contamination.

BMP № CS17

Activity: The outdoor replacement or storage of lead/acid or nickel/cadmium batteries and the long time storage of vehicles or battery powered equipment outside.

Typical Pollutants: Soluble metals such as lead, nickel, or cadmium
Sulfuric acid





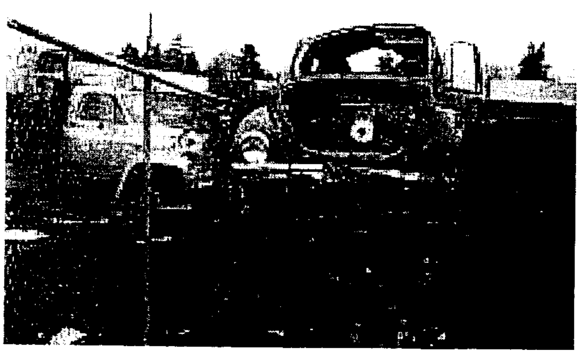
R0020099

Typical Problem: When batteries are replaced, the used batteries are generally stored around a site until enough have been collected to make it feasible to either have them picked up or shipped out to a battery recycler. These batteries are usually stored on the shop floor or outside without containment and with no thought of exposure to storm water. Sometimes electric lift trucks, pallet jacks, welders, portable powered pumps, etc. are stored outside with the batteries used for starting or for operation left in place and poorly protected from storm water contact. Lead sulfate usually present on lead/acid batteries or in the spillage of the lead/acid or nickel-cadmium/acid solution can create soil contamination and a storm water run-off problem.

BMP: Batteries should be stored in a contained area protected from the weather. Containment pallets can be used to collect any acid spillage. The pallets should be placed inside of buildings to keep storm water from coming into contact with the batteries.

Efficiency/Impact: Containment, protection from the weather, and frequent shipment to the recycler can minimize or eliminate the adverse storm water impact from this potential source of contamination.

BMP Nº CS18



Activity: Wrecked or Damaged Vehicle Storage

Typical Pollutants: Antifreeze (ethylene glycol), gasoline, oil, grease, brake fluid, diesel

Typical Problem: Depending on the damage to the vehicle, fluids may leak due to the damage incurred and/or the damage may expose oily components of the vehicle that would normally be protected from the weather. Storm water will contact these contaminants and infiltrate the ground, contaminating the soil and groundwater at the site and combining with storm water runoff, depending on the rainfall and soil conditions, to waters of the State.

BMP: Provide containment of wrecked vehicles on impervious surfaces. If wrecked vehicles are stored on impervious surfaces, the drainage from those surfaces should pass through an oil/water separator prior to discharging to a storm water drainage system or to a storm water sewer. Insure that all fluids are completely drained from wrecked vehicles. If possible, provide a roofed storage area to prevent storm water contact with wrecked or damaged vehicles.

Remove engine oil, transmission oil, rear-end oil, antifreeze, freon, and any other fluids before storing the vehicles on the site.

Efficiency/Impact: Storage of all vehicles under a roof with a storm water divergence berm should, by eliminating storm water contact and allowing collection of potential contaminants, eliminate storm water concerns. Providing an impervious surface for the vehicles should eliminate the concern for groundwater contamination. Draining of the vehicle fluids would minimize but not eliminate the contaminant(s) concern.

BMP Nº CS19

Activity: Stripping coatings (paint, plastic, etc.) from metal and wood surfaces outdoors.

Typical Pollutants: Hazardous stripping chemicals, lead from old lead based paints, zinc chromate from old paint preparations, metal particulate, low pH, and increased suspended solids

Typical Problem: Stripping of wood and metal parts is usually accomplished with the use of chemicals that have health and environmental hazards. High pressure water blasting can cause increased runoff and can, in the case of blasting wood, damage the surface. Sand blasting creates a large amount of solids to dispose, i.e. the sand plus the paint removed which may be considered hazardous waste.

BMP: Consider using dry ice or baking soda abrasion type removal of old surface coatings instead of chemical or sand blasting. The dry ice system removes the surface coating and leaves only the material removed on the ground, which can be vacuumed or swept up. Using baking soda as the blasting agent leaves the material removed plus baking soda which is not typically harmful and can be fairly easily separated from the paint removed with it by using reclamation equipment or through dissolving the baking soda in water and separating the paint by sedimentation and then evaporating the water. Use a removable ground cover before blasting to ease the cleanup efforts at job completion.

Efficiency/Impact: By placing a removable ground cover such as a plastic tarp down prior to conducting the work and using one of the blasting methods mentioned, virtually all of the removed material can easily be cleaned up with minimal volumes of material involved. Disposal will be less costly when less volume of combined materials are involved over the conventional sand blasting methods. The overall impact to the environment and especially to storm water discharges will be minimized or eliminated.

BMP № CS20

Activity: Vehicle repair/brake shoe replacement including materials handling vehicles.

Typical Pollutants: Asbestos, copper, total suspended solids

Typical Problem: Dust in the brake shoe/wheel housing is typically disturbed and can be released into the environment when brake shoes are replaced. This dust will migrate from inside buildings to outside areas creating an asbestos and/or increased copper discharge when contacted by storm water.

BMP: Use the Low Pressure/Wet Cleaning Method described below for dust removal in brake shoe housings. Some older brake shoes may still be present which contain asbestos. Some new brake shoes on mobile equipment still contain asbestos. Brake shoes contain copper compounds in addition to other materials. The dust in the brake shoe housing can, because of its micron and submicron size, escape the shop area and contaminate the site to a level that, when contacted by storm water, may exceed the copper discharge benchmark. If a vacuum is used, ensure that it is of a type that has a HEPA filtration system that can retain the micron sized particles.

Low Pressure/Wet Cleaning Method

- A drip pan shall be placed under the brake assembly, positioned to avoid splashes and spills.

- The reservoir shall contain water containing an organic solvent or wetting agent. The flow of liquid shall be controlled such that the brake assembly is gently flooded to prevent the asbestos-containing brake dust from becoming airborne.

- The aqueous solution shall be allowed to flow between the brake drum and brake support before the drum is removed.

- After removing the brake drum, the wheel hub and back of the brake assembly shall be thoroughly wetted to suppress dust.

- The brake support plate, brake shoes and brake components used to attach the brake shoes shall be thoroughly washed before removing the old shoes.

- In systems using filters, the filters, when full, shall be first wetted with a fine mist of water, then removed and placed immediately in an impermeable container, properly labeled and disposed.

- Any spills of asbestos-containing aqueous solution or any asbestos-containing waste material shall be cleaned up immediately and properly disposed.

- The use of dry brushing during low pressure/wet cleaning operations is prohibited.

Efficiency/Impact: Use of the wet method for removing the dust in the wheel/brake housing or the use of a HEPA vacuum will significantly reduce or eliminate this practice as a source for copper or asbestos in storm water. It will also significantly reduce the potential health hazard associated with asbestos exposure to employees.

BMP Nº CS21

Activity: Employee environmental education and training.

Typical Pollutants: All

Typical Problem: Many employees are not aware of the potential adverse impact the company's business may have on the environment or how they personally can effect those impacts. They may not have even thought about environmental impacts and can not recognize bad practices. Some may not know whom to inform of upsets or potential problems.

BMP: Provide periodic training that describes the potential adverse environmental impacts of the business and methods for preventing those impacts. The training should:

- Describe how the company is being environmentally responsible.
- Encourage employees to bring forth suggestions for improving the environmental performance of the business.
- Describe how and to whom the employee should report potential environmentally relate concerns.
- Inform the employee of what to do.
- Providc incentives to employees to offer ideas for improvement.

Record attendance of the training. Show graphics in the presentation such as pictures of the various parts of the site under discussion during the presentation. Schedule regular inspections of the site looking for possible conditions or operations that could produce potential adverse environmental impacts. Use a team approach to this inspection, as it is too easy, even for professionals, to acquire tunnel vision during the inspection. During the site inspections, write up every questionable item or practice for later thought or resolution. To resolve or dismiss a suggestion or question during the inspection may distract from the process of the inspection or discourage employees from providing their input. Do not associate biodegradable with environmentally safe. Verify that the company is not moving wastes from one media to another, i.e. water to air, storm water to groundwater, etc.

Before the training takes place, analyze the potential problem areas of the site and the potential for how the site's manufacturing process can adversely impact the environment. Develop the training program presentation around these areas. Ask the question "what message am I trying to present?" and thoroughly provide the information necessary to answer the question. How and to whom should it be reported? Involve employees in the presentation through discussion items. Don't over look providing this training to temporary employees.

Efficiency/Impact: By making employees aware of the potential adverse impacts of the business and encouraging employees to offer ideas and suggestions, employers will see, not only a decrease in pollutants in their storm water discharge but, potentially in air, hazardous waste, and other media.

BMP № CS22

Activity: Any site that stores material outside.

Typical Pollutants: Total suspended solids from erosion, oil and grease, BOD_5, heavy metals.

Typical Problem: Poor housekeeping inside and outside on a site provide a possible indicator of the degree of the site's compliance with environmental, health and safety regulations. In addition, poor outside housekeeping tends to discharge paper, cardboard, wood, pallet and box strapping, and other wastes to the storm water conveyance system. These wastes can plug the storm water conveyances, and divert storm water flows causing increased erosion and localized flooding.

BMP: Good housekeeping includes:

- Orderly storage of bags, drums, and piles of materials and chemicals; prompt cleanup of spilled liquids;
- Frequent sweeping, vacuuming, or other cleanup methods for accumulated dry chemicals and materials can cut down on possible storm water contamination;
- Proper disposal of toxic and hazardous wastes, and
- Removal of accumulated scrap and spare parts.

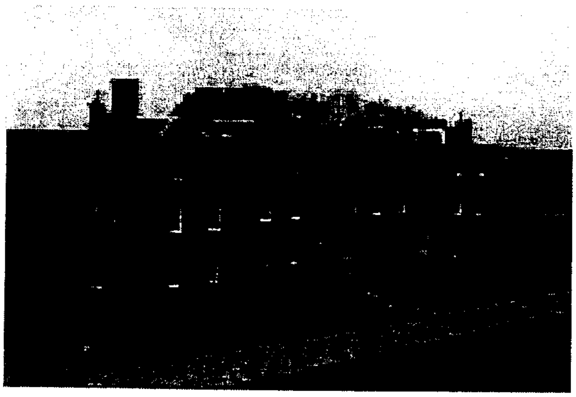
Good housekeeping doesn't just happen. It occurs when it is well planned, scheduled, and when upper management demonstrates its importance by participating in regular inspections. Set aside time in the work schedule for cleanup activities.

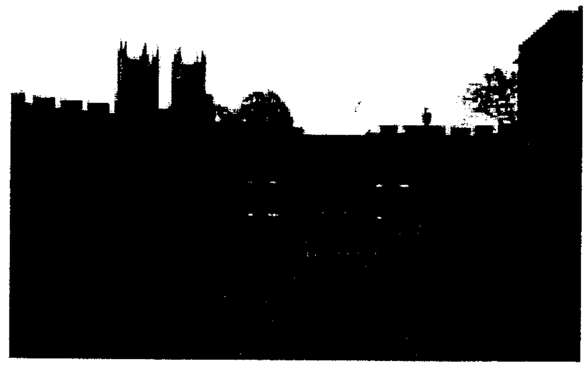
- Schedule personnel to be responsible for the cleanup and rotate every employee through the schedule.
- Periodic inspections and regular site clean up can prevent problems from occurring. The frequency of outside inspections should be increased during the October through May rainy period.
- Encourage employees to pick up trash when it is seen and to report when more intensive clean up is needed.

Every site that is environmentally responsible has good housekeeping activities. Most sites with environmental problems do not have good housekeeping activities.

Efficiency/Impact: The implementation of a formal housekeeping program with education and encouragement of employees can reduce or eliminate pollution by bringing the importance of how materials are stored and how trash can effect the storm water discharges to their attention along with the importance that management places on the issue. A regular maintenance schedule for storm water conveyances minimizes erosion and visually verifies the condition of the storm water discharges. Several typical pollutants in storm water can readily be identified by visual observance.

BMP № CS23 (References #15, 22, 31, 52)





Activity: Facilities having lawns or vegetated areas.

Typical Pollutants: Fertilizers, pesticides, herbicides, fungicides, phosphorus, nitrogen, zinc, copper, and pH.

Typical Problem: Lawn care entails the application of fertilizers, herbicides, pesticides, and water in order to achieve a rich vibrant lawn. Weeds are quite often controlled through the application of chemicals. Over fertilizing and the over-application of pesticides and herbicides can contaminate storm water. Too much irrigation can wash these chemicals off the site into storm water conveyances, streams, rivers, and lakes. The nutrients, phosphorus, nitrogen, and pH can be detrimental to slow moving water bodies by encouraging algae growth. Herbicides and pesticides can adversely impact human health, fish and other wildlife. All of these pollutants can significantly effect the beneficial uses of water bodies.

BMP: If a landscape contractor is hired to take care of the lawn and other vegetated areas of the site, ensure that they do their part to protect the environment by applying the appropriate amount of chemicals. Encourage them to investigate more environmentally friendly alternatives to the use of chemicals.

A few simple precautions can minimize adverse environmental impacts from lawn care. No matter what chemicals are used, over-watering can move the chemicals in to the storm water conveyance system. Use rain measuring equipment to automatically prevent automatic lawn sprinklers from turning on. In the Northwest, watering to a depth of six inches a couple of times a week is sufficient for a lush green growth. Always water in the morning, between 6 a.m. and noon.

R0020106

Fertilization:

For lawn fertilization, 1,000 square feet of lawn requires 0.5 pound of nitrogen per month of active growth(~8 months in Portland area ~ 4 pounds). A good ratio for fertilizer is 3 parts nitrogen to 1 part phosphorus to 2 parts potassium to 1 part sulfur(3:1:2:1). Use a slow release fertilizer such as one containing water insoluble nitrogen(WIN). After determining the amount of fertilizer to use per year based upon the growing season, apply the fertilizer in four equal applications of approximately one pound per 1,000 square feet each application, i.e. 1/4 in early spring, 1/4 in late spring, 1/4 in late summer, and 1/4 in the fall.

Have your site's soil tested to determine if other materials such as iron(for low pH soil < 6.8), boron, chlorine, copper, manganese, molybdenum, nickel, and zinc should be added for a healthy lawn. If soil testing indicates that one or more of the additives above is needed, contact your county Extension Agent, a lawn and garden center, or a master gardener for advise on how much of the additives to apply for optimum growing conditions.

Fertilizer over-use, over watering, and watering at the wrong time of the day set up a good environment for many grass diseases and for invasion by weeds that are very competitive with the grasses in the lawn.

Pest Management:

Pest management can be conducted in an environmentally friendly manner through:

- **Knowledge**
  1. knowing the variety of grass in your lawn;
  2. knowing its growth characteristics; and

- **Identification**
  1. identifying the weeds present;
  2. identifying the grass disease present; and/or
  3. identifying the insect pests present
    a). Note where the pest is located on the lawn
    b). Draw a picture of the pest or collect a sample
      i. Research in books for a match of the pest found to a photograph;
      ii. Contact local County Extension office for assistance and advice; or
      iii. Take sample to local home and garden center for identification.

Weed removal is best accomplished by hand-pulling.

Maintain a buffer strip next to waterways. Do not apply fertilizer or pesticides to this strip. It is used to absorb excess fertilizer from the care of the rest of the lawn.

It will also retain excess nutrients and sediments.

Healthy Lawn

Step 1: Lawn conversion	Convert lawn areas into groundcover, trees, shrubs, or meadow plantings. For a low input approach, replace the grass underneath mature trees with groundcover. For an even lower input approach, examine your lawn for potential conversion areas and plant groundcovers, trees, shrubs, or perennials in all areas where grass is hard to grow. For the lowest input approach, use turf only where it is the best plant to fulfill a particular function, such as providing a children's sports area.
Step 2: Soil building	Provide a strong foundation for the lawn. For a low input lawn, get a soil test to determine the soil's pH and fertility. You may not need to add any lime or fertilizer to your lawn. For a lower input lawn, test for soil compaction. Can you sink a screwdriver into the ground without pounding or is the soil compacted? If the soil is compacted, aerate with a hand corer or mechanical aerator. For the lowest input lawn, examine the soil's texture- neither extremely sandy soils nor extremely heavy clay soils make for good lawns. Next count earthworms-if none can be found in a square foot of soil, there's a problem. A healthy soil community has over 10 per square foot. With this basic understanding of soil acidity, fertility, compaction, texture, and earth-worms, one can build soil that supports dense, healthy turf.
Step 3: Grass selection	Choose the type of grass that will be easiest to grow. For a low input lawn, select hardy grass species adapted your the region's climate. For a lower input lawn, select named grass varieties to meet your specific needs. For the lowest input lawn, try the new low-input slow-growing or dwarf grass mixes.
Step 4: Mowing and thatch management	Mow to the right height at the right time and recycle clippings. For a low input lawn, leave clippings on the lawn to provide nutrients and moisture. For a lower input lawn, set mowing height as high as possible. For the lowest input lawn, adjust mowing height and frequency during the growing season and monitor thatch levels.
Step 5: Minimal fertilization	Give the lawn what it needs but don't overfeed. For a low input lawn, recycle clippings and (in the right season) apply commercial fertilizer at half the recommended rate; avoid

weed and feed formulations and don't fertilize if rain is imminent. For a lower input lawn, fertilize as above but use encapsulated nitrogen or an organic product instead-and fertilize only if soil tests show it's needed. For the lowest input lawn, substitute home generated compost for commercial organic or encapsulated products.

Step 6: Weed control and tolerance

Establish a realistic tolerance level for weeds and use least toxic control methods to maintain it. For a low input lawn use least toxic weed control methods such as: cultivation, solarization, flaming, mowing, or herbicidal soap. For a lower input lawn, grow strong healthy grass and it will crowd out weeds. For the lowest input lawn, broaden your definition of "lawn" to include weeds that perform desirable functions.

Step 7: Integrated pest management

Establish a realistic tolerance level for pests and use least toxic control methods to maintain it. For a low input lawn, use least toxic control methods such as removing or trapping pests, introducing biological control agents, or apply least toxic chemical controls such as insecticidal soaps. For a lower input lawn, grow strong, healthy grass that can resist attack. For the lowest input lawn, use cultural controls to prevent infestation, protect natural predators, and add beneficial soil microbes.

Step 8: Sensible irrigation

Practice water conserving landscaping techniques. For a low input lawn, water infrequently, in the early morning, but soak the lawn well. For a lower input lawn, water only when the lawn definitely needs it, and calibrate sprinklers. For the lowest input lawn, accept that the grass may not be green year round.

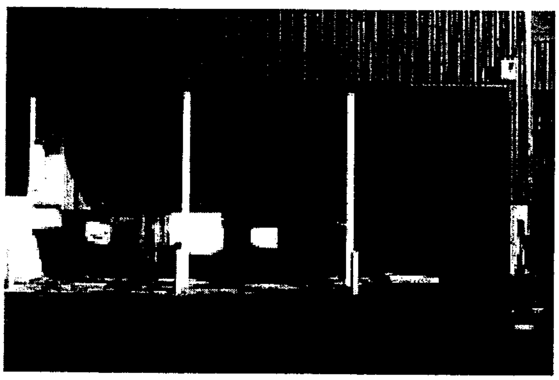
Efficiency/Impact: Proper maintenance of lawns and vegetative strips can be pleasing to the eye and provide environmental benefits such as reduced pollution to streams, rivers, and lakes, cooler runoff, reduce sediments in the runoff, and in some cases reduce other pollutants from the site. The degree that this BMP will be effective is directly proportional to the degree of involvement in the care of the lawn or the degree of caution exercised in selecting a lawn care contractor and the degree that the watering system is in tune with the lawn and the weather.

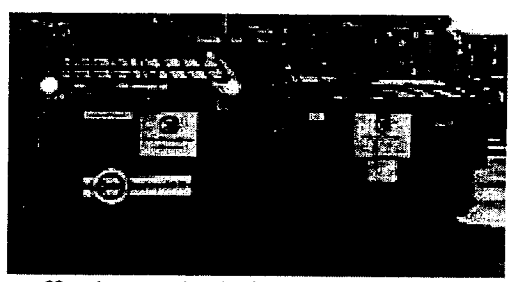
BMP Nº CS24

Activity: Storage of general rubbish or food rubbish outside in dumpsters.

Typical Pollutants: Suspended solids, nutrients, bacteria, dioxin, chemicals

Typical Problem: Waste materials are typically removed from inside the site buildings to a collection container(dumpster) outside of the buildings. If these dumpsters have an open top or the top is left open at times when materials are not being dumped into them, storm water makes contact and will mix with the wastes and leak out to the storm water discharge conveyances for the site.





BMP: There are two effective methods for addressing this concern. At the end of a building, extend the roof over the area where the dumpsters will be placed to keep storm water out. Slope the floor that the dumpsters are sitting on to a drain where the contaminated storm water/dumpster drainage can be collected and discharged to a sanitary sewer, if necessary.

The other method is to ensure that covers are on all of the dumpsters and that the covers are lowered when wastes are not being discharged into them. The second method has the most risk in that this method relies on employees always performing the proper procedure and many different situations can arise that may interrupt the procedure and prevent it from occurring. No matter which method is used, ensure that no storm water catch basin is located close by.

Efficiency/Impact: Either method for protecting wastes from storm water exposure will minimize or eliminate storm water pollution from this source. The method that relies on the least effort from employees is usually the most reliable.

BMP № CS25

Activity: Pumping liquids from storage tanks into the site buildings or into vehicles.

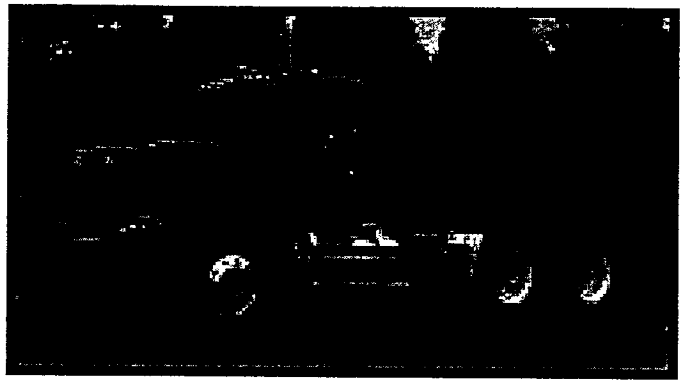
Typical Pollutants: Petroleum hydrocarbons, antifreeze, other potentially toxic or hazardous liquids

Typical Problem: Pumps and piping can leak the liquids being pumped. Pumps located inside of buildings without containment can leak fluids that may contaminate storm water runoff.

BMP: Spill or leak containment should be constructed around the pumps. Place a curb across door openings and seal the floor and wall/curb with an epoxy compatible with the liquid being pumped. This measure will contain liquids within the enclosure and, unless a catastrophic failure of the discharge piping occurs, the liquid will not escape the building to adversely impact storm water runoff. Periodic inspections of the containment should be made to ensure that a build up of the leakage does not eventually rise to the point that it will pass over the containment berm. The contained liquids should be periodically removed and properly disposed.

Efficiency/Impact: Ensuring that pump houses can provide containment and frequent inspections of the containment within the pump house will minimize or eliminated storm water runoff contamination from this source.

BMP № CS26



Activity: Trucking firms or other operations in which semi trailers are parked on site and dollies are used to attach to the trailers to move the trailers around the site or operations in which semi tractors are used on site.

Typical Pollutants: Oil and grease

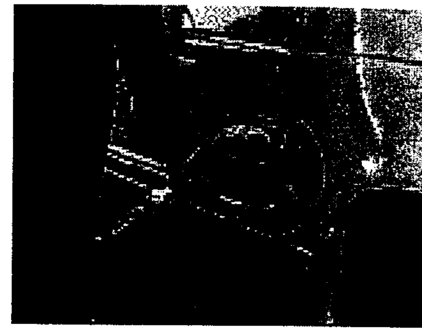
Typical Problem: Fifth wheel hitching mechanisms used to attach semi-tractors or tow dollies to semi-trailers have a thick coating of grease on them to minimize the friction encountered and to ease the attachment process during connection of tractors or dollies to the trailers. When the dollies or semi-tractors are parked and not attached to trailers the grease on the fifth wheel is exposed to storm water. This allows the storm water runoff to pick up the oil and grease.

BMP: Manufacture or purchase a quick install cover to slip over the hitch. A simple lightweight inexpensive cylindrical slip-on cover could be made out of fiberglass. Ensure that all operators of the equipment are instructed to place the cover over the hitches when they are not being used. Changing from the lubricated type fifth wheel hitch to a teflon non-lubricated type is a better approach but, if rental or transit trailers are in use frequently this may not be a viable option due to the requirement that both the trailer and the tractor fifth wheel slider plates need to be coated with the teflon.

Efficiency/Impact: While there will always be some exposure especially at the times the covers are removed for making the connections and the moving of the trailers, this method should minimize the adverse impact that the practice has on the storm water runoff.

R0020112

BMP Nº CS27



Activity: Fueling operations performed by employees on-site or through restricted access systems such as Cardlock sites in various locals across the State.

Typical Pollutants: Gasoline and diesel fuels (Petroleum Hydrocarbon)

Typical Problem: Fueling nozzles can stick in the open or on position when fueling vehicles. Employees some times are not instructed in the correct methods for spill clean-up. Frequently, spill clean-up materials are not available at the dispensing pumps. Fueling stations may not have roofed areas or properly sloped or contained areas for collecting spilled fuel. All of these situations and conditions can result in fuel contacting storm water and entering the site runoff.

BMP: The fueling area should be designed and operated to minimize contact between spilled fuel and leaked fluids and storm water.

- Use a damp cloth on the pumps and a damp mop on the pavement for area clean up.
- Clean up spills immediately:
  - ➢ Spread absorbent material and sweep it up with a broom.
  - ➢ Perform a hazardous waste determination on the absorbed material.
  - ➢ Dispose of the absorbed material properly.
- Ensure that the overfill nozzle protection is in working order.
- Remove any nozzle locking mechanism which allows the fuel to stay on with the operator absent. The operator should be present at all times to ensure that overfilling and spillage does not occur.
- Cover fueling areas and berm/slope the pavement under the roof to a drain system that is connected to a holding tank or contains the spillage at the surface for easy clean up.
- Provide an easily accessible and well-marked emergency shutoff for pumps with plainly written instructions on how to operate the shutoff.
- Never hose down the fueling area.
- Don't drain spills to the sanitary or the storm water sewers.
- Ensure that the fueling area has an undamaged continuous paved or otherwise impervious surface.
- Ensure that spill clean up materials are readily available.
- For areas where multiple customers or operators from multiple companies have access, provide highly visible, simple instructions on how to clean up spills and report the incidence.
- Provide well placed, understandable instructions on the proper procedures to

follow in the event of an emergency, including reporting information.

Efficiency/Impact: Implementation of this BMP can virtually eliminate this potential source of storm water contamination provided site inspection is frequently performed.

BMP № CS28

Activity: Sites with surface water runoff contamination that have implemented specific non-point source BMPs for pollution prevention but have been unable to reduce the pollutant discharges in their storm water runoff to levels below the benchmarks. Unused excess land may be necessary to implement these BMPs.

Typical Pollutants: Sediment(TSS), metals, BOD, phosphorus, and hydrocarbons(Oil & Grease)

Typical Problem: When the implementation of specific point source BMPs has not eliminated or reduced the contaminants in the storm water to the specific benchmarks, end of the pipe or final discharge BMPs may be necessary.

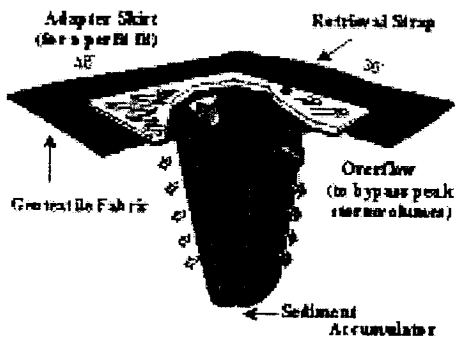
BMP: Install a grassy filter strip and ensure that the storm water passes through the strip in sheet flow. Vegetated filter (buffer) strips are best used on sites with sheet runoff, such as parking lots.

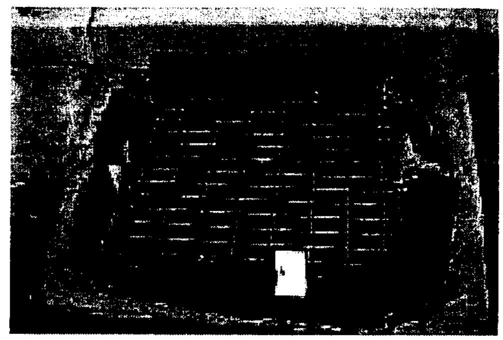
- Effective filter strip widths range from a minimum of 50 feet to a maximum of 200 feet.
- Best for smaller drainage basins, five acres or less.
- Not suitable on slopes or sites with shallow depth to bedrock .
- Best for sheet flow. Do not use on slopes over 10%.
- Good for conventional pollutants.
- Cannot be used to convey larger storms, or concentrated flow discharges as their effectiveness will be destroyed plus they could become sources of pollution through erosion.
- Best grasses is tall fescue, followed by western wheatgrass, annual or Italian Ryegrass, Kentucky Bluegrass.
- Rectangular and V shaped cross sections are the least desirable.
- Design to create a low velocity flow, bent grass is not as good a filter.
- Curbing for impervious areas draining to the filter strips should have a one-foot gap every five feet.

Efficiency/Impact: Properly sized and maintained vegetated filter strips can have a removal efficiency of up to 80 percent for suspended solids.

BMP № CS29 (References # 9, 21)

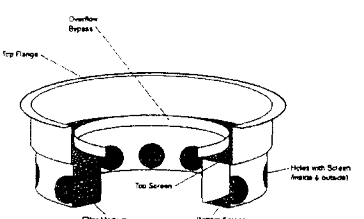
Activity: Sites with surface water runoff contamination that have implemented specific non-point source BMPs for pollution prevention but have been unable to reduce the pollutant discharges in their storm water runoff to levels below the benchmarks. Unused excess land may be necessary to implement these BMPs.

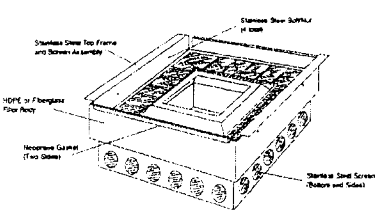




Typical Pollutants: Sediment(TSS), metals, BOD, phosphorus, and hydrocarbons(Oil & Grease)

Typical Problem: When the implementation of specific point source BMPs has not eliminated or reduced the contaminants in the storm water to the specific benchmarks, end of the pipe or final discharge BMPs may be necessary.





BMP: Install a catch basin filter system: a catch basin coupled with a sump and sediment traps. May also be used with an inlet device, prefiltering insert and screens (see other facilities and retrofit). The inserts consist of several filtering trays suspended from the inlet grate. Common filters are charcoal, wood fibers or fiberglass.

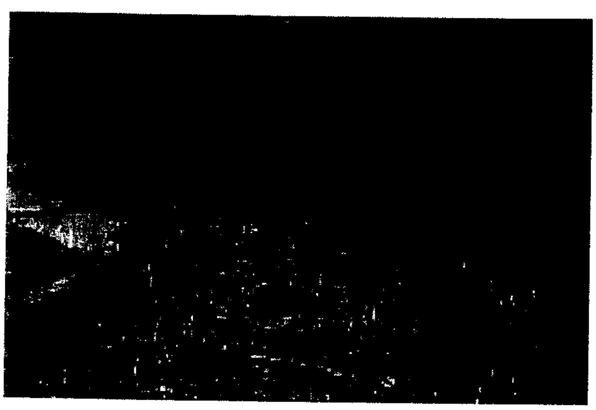
- Retains small particles, partially effective with high levels of particulate heavy metals, oil/grease, and TSS. Moderate reduction in TSS and turbidity. However, few pollutants are associated with these coarser solids.
- Disadvantage: When 60% full, the suspended solid deposition is in equilibrium with scour, and the capture efficiency is reduced to zero.
- Best in small basins and with treatment of highly turbid runoff prior to

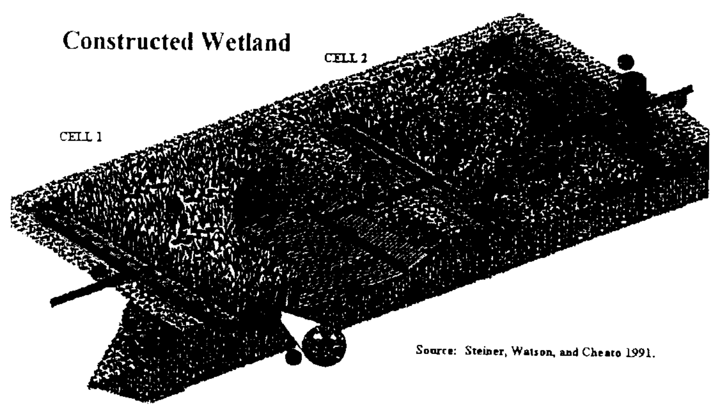
discharge to catch basin.

- Do not use on unstable or steep slopes.
- Usually used with vaults, tanks, sumps or inverted (hood) inlet. Inlet can be coupled with a filtration system (see retrofit).
- Maintenance is critical and must be at least semiannual. Require a maintenance schedule and plan for disposal of material removed by the catch basin.
- Insert maintenance is required quarterly and should be inspected more frequently during wet periods.
- Catch basins with a restrictor device (multiple orifice and weir/riser section) for controlling outflow provide minimal control for floatables and petroleum based products.
- Design the size of catch basin sump to handle the site runoff rate, TSS concentration in runoff and how often it will be cleaned out.
- To minimize groundwater pollution problems, be careful where infiltrating catch basins are used (residential areas) and pre-treat the infiltration water.

Efficiency/Impact: Catch Basin Filter System Efficiency: TSS up to 22%, and Turbidity up to 38%

BMP № CS30 (Reference #21 & 46)





Activity: Sites with surface water runoff contamination that have implemented specific non-point source BMPs for pollution prevention but have been unable to reduce the pollutant discharges in their storm water runoff to levels below the benchmarks. Unused excess land may be necessary to implement these BMPs.

Typical Pollutants: Sediment(TSS), metals, BOD, phosphorus, and hydrocarbons(Oil & Grease)

Typical Problem: When the implementation of specific point source BMPs has not eliminated or reduced the contaminants in the storm water to the specific benchmarks, end of the pipe or final discharge BMPs may be necessary.

BMP: Install a constructed wetland. Constructed wetlands are constructed by a combination of excavation and/or berming. The basic types of constructed wetlands are: shallow marsh, a 2 or 3 celled pond/marsh, extended-detention wetland and pocket wetland.

Storm water treatment facilities are not considered waters of the State, however, their discharge is regulated in the same way as any treatment system. Created wetlands built as mitigation for loss of wetlands under the Clean Water Act Section 404, are considered waters of the State. Created wetlands are protected as natural wetlands and cannot be used for conveyance or treatment of wastewater, unlike constructed wetlands.

- Extended-detention wetland and pocket wetlands are less effective in removal of some types of pollution than other types of wetlands.
- The constructed wetland should be lined when located over permeable soils for permanent pool maintenance. This is to prevent potential groundwater and soil contamination. Use a Bentonite clay (12" thick) or commercial heavy plastic pond liner (minimum 40 ml). Place a minimum of 18" thick compacted soil over the liner prior to seeding.
- The permanent pool depth should be between three to six feet in depth, plus one foot of dead storage for sediment. Six feet is the minimum depth or the pond will stratify in summer and create low oxygen conditions which result in the re-release of phosphorus and other pollutants. In addition, if the pond is deeper than six feet, it will likely pollute the groundwater.
- Suitable for larger sites up to 100 acres.
- Soils should be tested to determine suitability. Best when located in clay loams, silty clay loams, sandy clays, silty clays and clays.
- Cannot be used in areas with shallow depth to bedrock or unstable slopes.
- Good for removal of nutrients and conventional pollutants such as oil and grease and some heavy metals.
- Needs to have a shallow marsh system in association to deal with nutrients.
- Should be multi-celled, preferably three of equal sizes. The first cell should be three feet deep to trap coarse sediments and slow turbulence. They need to be designed as a flow through facility, and the pond bottom should be flat to facilitate sedimentation.
- Need to be designed with periodic maintenance in mind by using an overhead scooping device.
- Side slopes should be 2:1, not steeper than 3:1, and 10 to 20 feet in width. A length to width ratio of 5:1 is preferred, with a minimum ratio of 2:1 to enhance water quality benefits. The longer length allows more travel time and opportunity for infiltration, biofiltration and sedimentation.
- Pond berm embankments over six feet should be designed by a registered

engineer. Berm tops should be 15 feet wide for maintenance access and should be fenced for public safety.

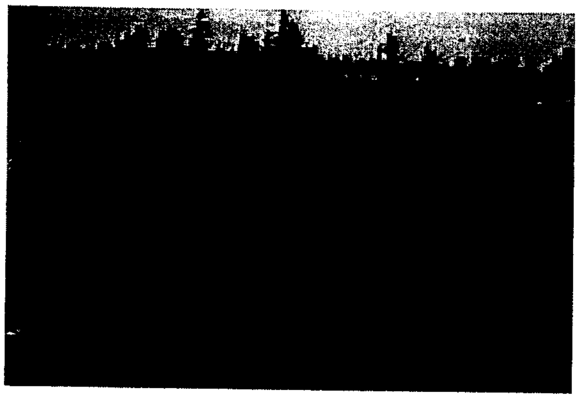
- Shape should be long, narrow, and irregular since these are less prone to short circuiting, are more effective, and maximize the treatment area.
- Baffles can be used to increase the flow path and water residence time.
- Should have an overflow system/emergency spillway to accommodate a 100 year, 24 hour flood and a gravity drain.
- Maintenance is of primary importance. The site must be responsibly selected. A maintenance plan needs to address removal of dead vegetation (that release nutrients) prior to the winter wet season, debris removal from trash racks, sediment monitoring in forbays and in basin are likely to contain significant amounts of heavy metals and organics (regular testing is advised).
- Access to the wet pond is to be restricted with a gate and posted signs.
- For mosquito control, either stock the pond with fish or allow it to be drained for short periods of time (do not kill the marsh vegetation).
- Constructed wetland is more complex, with more vegetation, and shallower with greater surface area, hydrologic factors (flow) play a larger part in siting.
- Selection of vegetation should be done by a wetland specialist.
- Oil/water separators can be used prior to the constructed wetland, depending upon the surrounding land uses.
- Relatively low maintenance costs.
- Fence off for safety (children), to protect plants/wildlife.
- Disadvantages/constructed wetlands:
  a.) Constructed wetlands have a larger land requirement for equivalent service compared to a wet pond.
  b.) Relatively high construction costs.
  c.) Delayed efficiency until plants are well established (1–2 seasons).
- Buffer width 25 to 50 feet.
- Limit water level fluctuations, as they kill plants.

Efficiency/Impact: Wet pond/wetland removal efficiencies:*

a) Heavy metals = 40 to 80%;
b) Total Phosphorus = 40 to 80%
c) Total Nitrogen = 40 to 60%
d) TSS = 70%
e) Soluble reactive phosphorus 75%
f) Nitrate = 65%
g) Ammonia = -43
h) COD = 2
i) Total copper, lead and zinc = 80 to 95%

* Higher efficiencies are associated with use of O/G trap, larger pond/marsh area and volume. These efficiencies assume that the intensity of the storm water inflow does not exceed the capacity of the wetlands and that the pollutants are not in a concentrated form from a large spill or discharge.

BMP Nº CS31 (Reference #21 & 46)



Activity: Sites with surface water runoff contamination that have implemented specific non-point source BMPs for pollution prevention but have been unable to reduce the pollutant discharges in their storm water runoff to levels below the benchmarks. Unused excess land may be necessary to implement these BMPs.

Typical Pollutants: Sediment(TSS), metals, BOD, phosphorus, and hydrocarbons(Oil & Grease)

Typical Problem: When the implementation of specific point source BMPs has not eliminated or reduced the contaminants in the storm water to the specific benchmarks, end of the pipe or final discharge BMPs may be necessary.

BMP: Install a grassy bioswale. Swales basically act as filters for runoff from frequent storms. The principle form of treatment is the settling out of pollutants and the use of vegetation to take up the dissolved fraction. For best results a swale should be designed to deal with the peak runoff for a two year, 24 hour storm event.

- Does well with first flush runoff, economically feasible, improves aesthetics and has minimal environmental impacts. Best in median strips and parking lot islands.
- The organic topsoil layer is good for degrading petroleum solvents, heavy metals, nutrients and hydrocarbons.
- Critical design elements: size of drainage area to be treated, location of bioretention areas, sizing guidelines, calculate water budget.
- Biofiltration is suitable for smaller sites 10 or less acres.
- Needs a minimum width of 20 feet.

- Must be graded to create sheet flow, not a concentrated stream. Sheet flow decreases the chance of producing gully erosion and distributes contaminants over a wider area. Level spreaders (i.e. slotted curbs) can be used to facilitate sheet flow.
- Can be placed anywhere with careful site design.
- Do not use on steep, unstable slopes or landslides.
- Can reduce peak flow rates.
- Best when used for treatment and conveyance of storm water after a settling pond.
- Good for nutrient removal and conventional pollutants such as suspended solids and some heavy metals.
- Best at 200 feet in length, in tight spaces obtain more length by using a curved path. Should have a maximum bottom width of 50 feet. One foot high check dams should be installed every 50 feet starting 20 feet downstream from the inflow point.
- Good when used at a storm water outfall, commercial development or roadside.

Efficiency/Impact: Bioswales can, when sized correctly and when incorporated with an upstream settling pond, provide similar pollutant removal efficiencies to those achieved by a biopond or constructed wetland.

Removal efficiencies:

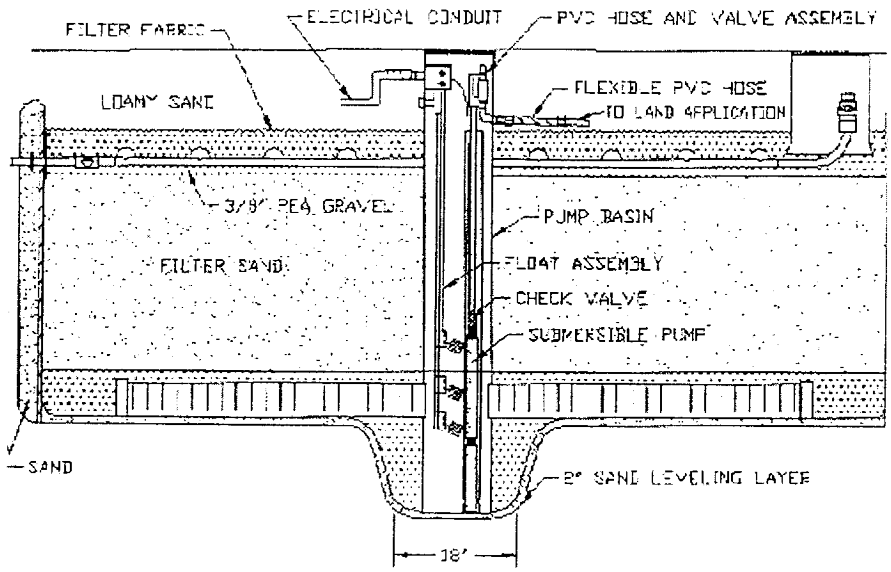
a) TSS = 83 to 92%
b) Lead = 67%
c) Copper = 46%
d) Total phosphorus = 29 to 80%
e) Total zinc and aluminum = 63%
g) Oil/grease/TPH = 75%
h) Nitrate-N = 39 to 89%

BMP № CS32 (Reference 38, 39, & 40)

Activity: Sites with surface water runoff contamination that have implemented specific non-point source BMPs for pollution prevention but have been unable to reduce the pollutant discharges in their storm water runoff to levels below the benchmarks.

Typical Pollutants: Phosphorus, Heavy metals.

Typical Problem: When the implementation of specific point source BMPs has not eliminated or reduced the contaminants in the storm water to the specific benchmarks, end of the pipe or final discharge BMPs may be necessary.

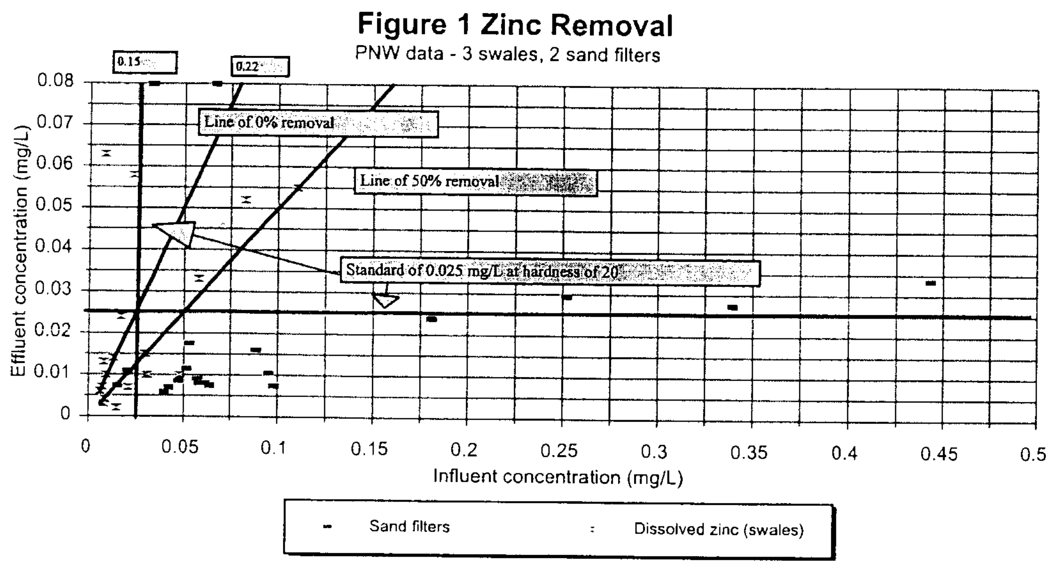


BMP: Installation of a sand filter has shown to reduce some heavy metals.

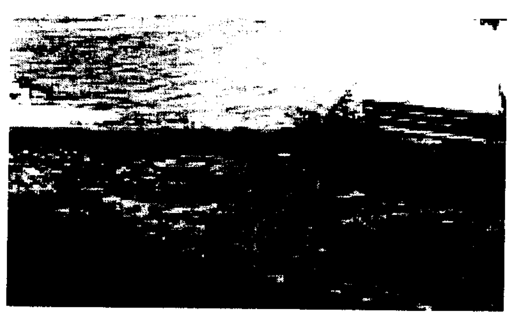
Efficiency/Impact: Research has shown zinc to be reduced to as little as 8% of the original concentration. More research is needed to determine the effect a sand filter will have on other metals. The mechanism for the removal of the metals is not completely understood at this time. Due to the particle size, this method should have negligible effect on the dissolved metals.

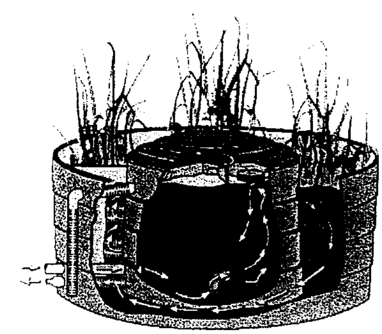
Typical Pollutant Removal Efficiency

Pollutant	Percent Removal	Pollutant	Percent Removal
Biochemical Oxygen Demand (BOD)	70	Total Kjeldahl Nitrogen (TKN)	46
Total Suspended Solids (TSS)	70	Total Phosphorus (TP)	33
Total Organic Carbon (TOC)	48	Iron (Fe)	45
Total Nitrogen (TN)	21	Lead (Pb)	45
Zinc (Zn)	45		



BMP Nº CS33 (Reference #47 & 48)





Activity: Sites with surface water runoff contamination that have implemented specific non-point source BMPs for pollution prevention but have been unable to reduce the pollutant discharges in their storm water runoff to levels below the benchmarks. Unused excess land may be necessary to implement these BMPs.

Typical Pollutants: Sediment(TSS), metals, BOD, phosphorus, and hydrocarbons(Oil & Grease)

Typical Problem: When the implementation of specific point source BMPs has not eliminated or reduced the contaminants in the storm water to the specific benchmarks, end of the pipe or final discharge BMPs may be necessary.

BMP: Storm Treat System uses a 4 x 9 chambered treatment tank (sedimentation and filtration) that discharges to a small constructed wetland, catch basin, swale or sump near the pollution source. The system can capture and treat the first flush runoff when located high in the watershed and near the source of pollution. The number of units used depends upon the design storm, size of sub-drainage area and needed detention volume.

- Significantly smaller (5-10%) than other systems. Good for constrained sites, such as roadside wetlands.
- Discharge is slow enough for discharge to a constructed wetland or groundwater, so it can be located in low permeability soils with a high water table (self-anchored).
- Closed system with no standing water (public health/safety issue) and can be shut off in case of a local spill.
- Requires sediment removal every three to five years by suction pump and annual inspection of skimmers and screens.
- Can connect to existing drainage structure, usually a catch basin, swale or sump to provide treatment.

Efficiency/Impact: Storm Treat System removal efficiency:
a) Fecal coliform = 97%
b) TSS = 99%
c) COD = 82%
d) Total dissolved nitrogen = 44%
e) Total petroleum hydrocarbons = 90%
f) Lead = 77%
g) Chromium = 98%
h) Phosphorus = 90%; and
i) Zinc = 90%

BMP Nº CS34

Activity: Sites with surface water runoff contamination that have implemented specific non-point source BMPs for pollution prevention but have been unable to reduce the pollutant discharges in their storm water runoff to levels below the benchmarks. Unused excess land may be necessary to implement these BMPs.

Typical Pollutants: Sediment(TSS), metals, BOD, phosphorus, and hydrocarbons(Oil & Grease)

Typical Problem: When the implementation of specific point source BMPs has not eliminated or reduced the contaminants in the storm water to the specific benchmarks, end of the pipe or final discharge BMPs may be necessary.

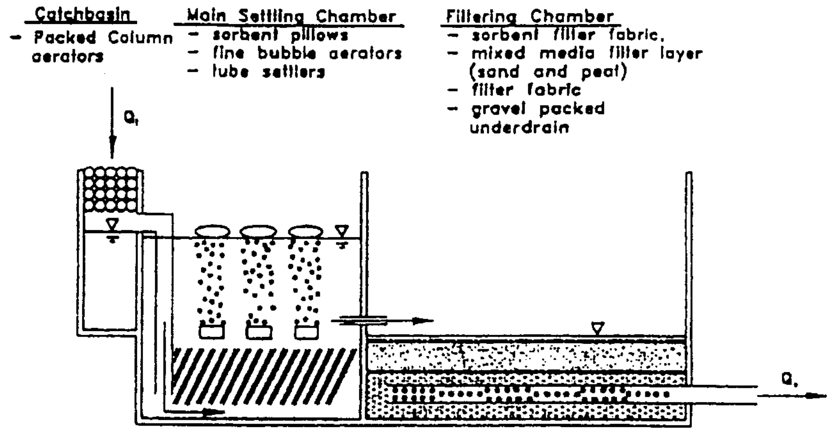


Figure 9. General Schematic of MCTT

BMP: Multi-Chambered Treatment Train (MCTT) uses a catch basin/sump and two chambers: initial grit catch basin for large sedimentation and volatiles, main settling chamber (aeration and sorbent pillows) for the removal of fine sediment, associated toxicants, and floating hydrocarbons (settling time 1-3 days); and a sand/peat filter/ion exchange unit to remove filterable toxicants.

- Best in small, isolated, paved critical source areas (0.25 to 2.5 acres).
- Suggested for the following land uses: vehicle service facilities, convenience store parking areas, equipment storage areas and salvage yards.
- Uses 1/3 the area of a wet detention pond.
- Very effective removal rates for both filtered and particulate storm water toxicants and suspended solids.
- Very new technology, so costs are currently high, but are expected to drop with pre-fabrication. Can be used in retrofitting; preliminary experimental costs at a gas station were $54,000
- Design is very site specific and highly dependent upon local rains (depth, intensity and inter-event time). The size of the main chamber increases as the annual rain volume increases. The inter-event period and rain volume determines the specific runoff treatment volume requirements. Seattle requires a small MCTT because of the small rain depths for each rain.

Efficiency/Impact: Multi-Chambered Treatment Train removal efficiencies:

a) Total toxicity = 96%
b) Filtered toxicity = 98%
c) Suspended solids = 83 to 95%
d) COD = 60 to 90%
e) Turbidity = 40 to 90%

f) Lead = 95%
g) Zinc = 85 to 90%
h) Cadmium = 90%
i) Copper = 65 to 90%
j) Pyrene = 75 to 85%
k) Phosphorus = 80 to 90%
l) Ammonia = 50%
m) n-Nitro-di-n-proplamine = 100%, and
n) pH decreased by 25 to 50%

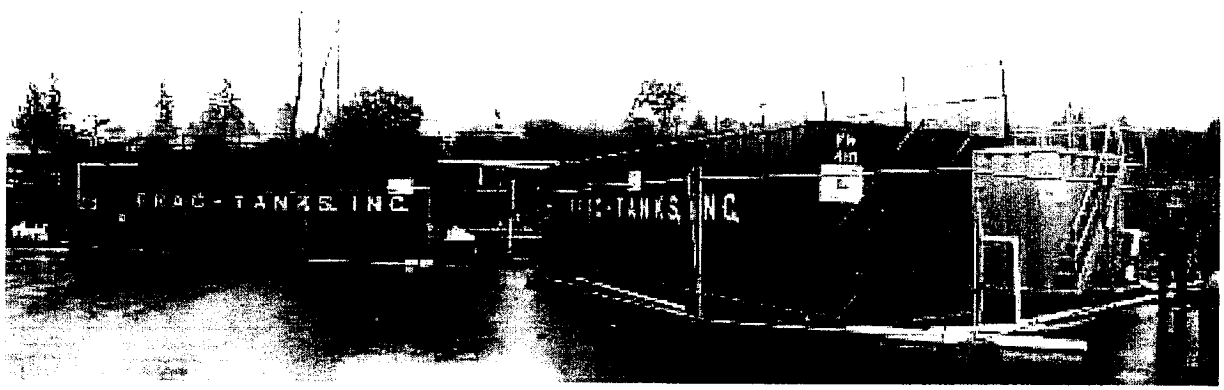
Color increased by 25 to 50% and nitrate nitrogen had low removal rates.

BMP № CS35 (Reference #30)

Activity: Sites with surface water runoff contamination that have implemented specific non-point source BMPs for pollution prevention but have been unable to reduce the pollutant discharges in their storm water runoff to levels below the benchmarks. Unused excess land may be necessary to implement these BMPs.

Typical Pollutants: Sediment (TSS), metals, BOD, phosphorus, and hydrocarbons (Oil & Grease)

Typical Problem: When implementation of specific point source BMPs have not managed or eliminated the contaminants in the storm water to the benchmarks or below or where potential point sources for the contaminants can not be identified, end of the pipe or final discharge BMPs may be necessary.

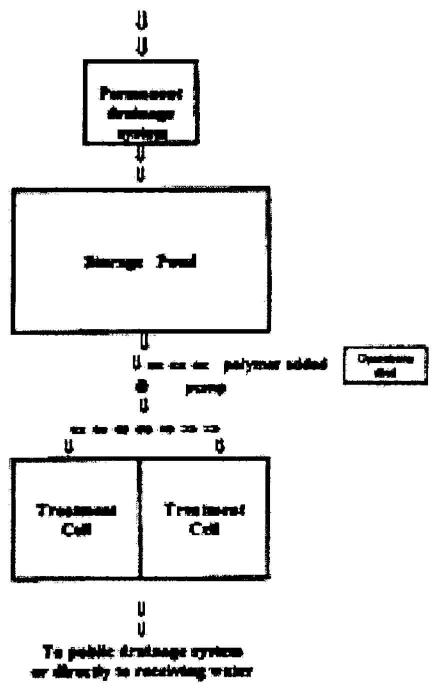


BMP: Install a flocculation system using a flocculent such as Calgon Cat Floc 2953 or a Polyaluminum Chloride such as Sumalchlor-50 or other.

Fine particles suspended in water give it a milky appearance, usually measured as turbidity or total suspended solids. Their small size, often much less than 0.001 mm in diameter, give them a very large surface area relative to their volume. These fine particles typically carry a negative surface charge. Largely because of these two factors, small size and negative charge, these particles tend to stay in suspension for extended periods of time. Because of this, removal is not practical by settling alone. Polymers and inorganic chemicals speed the process of clarification. The added chemical destabilizes the suspension and causes the smaller particles to agglomerate. The process consists of three steps: coagulation, flocculation, and settling or clarification.

The conditions under which clarification is achieved can affect performance.

Currents can reduce settling efficiency. Currents can be produced by wind, by differences between the temperature of the incoming water and the water in the clarifier, and by flow conditions near the inlets and outlets. Calm water such as that which occurs during batch clarification provides a good environment for effective performance, as many of these factors become less important in comparison to flow-through clarification basins. One source of currents that is likely important in batch systems is movement of the water leaving the clarifier unit. Given that flocs are relatively small and light the exit velocity of the water must be as low as possible. Sediment on the bottom of the basin can be resuspended and removed by fairly modest velocities.



Coagulants and flocculant-aids:

Polymers are large organic molecules that are made up of subunits linked together in a chain-like structure. Polymers that carry groups with positive charges are called cationic. Cationic polymers can be used as primary coagulants to destabilize negatively-charged turbidity particles present in storm water. Inorganic chemicals such as aluminum or ferric sulfate and aluminum or ferric chloride can also be used, as these chemicals become positively charged when dispersed in water.

In practice, the only way to determine whether a polymer is effective for a specific application is to perform preliminary or on-site testing. Polymer effectiveness can degrade with time and also from other influences. Thus, manufacturers' recommendations for storage should be followed.

Application of coagulants and flocculent-aids at the appropriate concentration or

dosage rate for optimum turbidity removal is important for management of chemical cost, as well as for effective performance. The optimum dose in a given application depends on several site-specific features. The turbidity of untreated water is a primary determinant. The surface charge of particles to be removed is also important, as previously noted. Environmental factors that can influence dosage rate are water temperature, pH, and the presence of constituents that consume or otherwise affect polymer effectiveness (for example, color, oils). Preparation of working solutions and thorough dispersal of polymers in water to be treated is also important to establish the appropriate dosage rate.
Design engineers wishing to review more detailed presentations on this subject are referred to the following textbooks:

- Fair, G., J. Geyer and D. Okun, *Water and Wastewater Engineering*, Wiley and Sons, NY, 1968.
- American Water Works Association, *Water Quality and Treatment*, McGraw-Hill, NY, 1990.
- Weber, W.J, *Physiochemical Processes for Water Quality Control*, Wiley and Sons, NY, 1972.

Comparisons

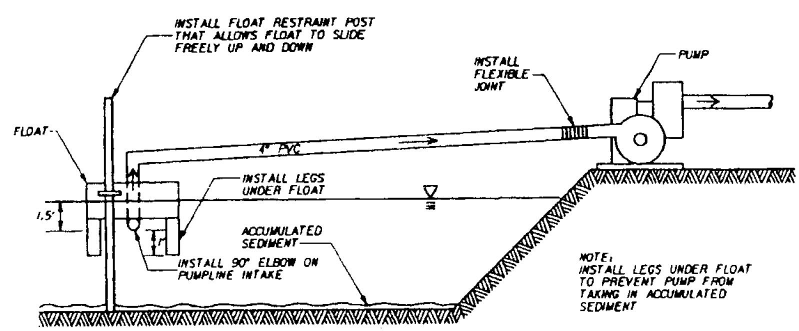
The above discussion indicates that the design and operation of a polymer system should take into consideration the factors that determine optimum, cost-effective performance. It may not be possible to fully incorporate all of the classic concepts into the design because of practical limitations at construction sites. Nonetheless it is important to recognize the following:

- The right polymer must be used at the right dosage. A dosage that is either too low or too high will not produce the lowest turbidity. There is an optimum dosage rate. This is a situation where the adage "more is always better" does not apply.
- The coagulant must be mixed rapidly into the water to ensure proper dispersion.
- A flocculation step is important to increase the rate of settling, to produce the lowest turbidity and to keep the dosage rate as low as possible.
- Too little energy input into the water during the flocculation stage results in flocs that are too small and/or insufficiently dense. Too much energy can rapidly destroy floc as it is formed.
- Since the volume of the basin is a determinant in the amount of energy per unit volume, a basin can be too big relative to the size of the energy input system.
- Care must be taken in the design of the withdrawal system to minimize outflow velocities.

Number and volume of treatment cells

There are three reasons for having two rather than one treatment cell. First, if something goes wrong with the treatment of a particular batch, the contractor can continue treatment in the second cell while dealing with the problem in the first cell. The second reason is the uncertainty over the time required to achieve satisfactory clarification. If one had confidence that satisfactory settling could be achieved consistently within 30 to 60 minutes, it might be reasonable to conclude that only one cell is needed since turnover could occur rapidly. The third reason is the time to empty the cell after treatment. It therefore seems appropriate to use two cells.

The second consideration is the volume of the individual treatment cell. There are two opposing considerations in sizing the treatment cells. There is a desire to have a large cell- so as to be able to treat a large volume of water each time a batch is processed. However, the larger the cell the longer the time required to empty the cell. It is also possible that the larger the cell the less effective the flocculation process, and therefore the settling. The simplest approach to sizing the treatment cell is to multiply the allowable discharge rate by the desired draw-down time. The desired draw-down time is about four hours.
A four-hour draw-down time allows one batch per cell per eight hour work period. A batch can be prepared in the morning including an hour or so of flocculation followed by about two hours of settling followed by discharge, although discharge could occur after hours. Or a batch can be prepared in the afternoon, followed by settling overnight, with discharge the following morning. The main point is that it appears to be most logical to size the cell to fit the desired drawdown time, constrained by the allowable release rate.



FLOATING PUMPLINE INTAKE (TYP.)

Configuration of the outlet device

The withdrawal device used for removing the liquid from the settling pond should be designed so that pulling settled sediments from the bottom of the treatment cell in the vicinity of the device does not occur. Whether this is a problem is not known but it should be evaluated. One approach is to place the discharge outlet near the area where treated water enters the cell. At this location there will be relatively little accumulation of solid because of the turbulence created by the incoming water.

A second approach is to use the float configuration as in the diagram shown above. The use of four rather than one inlet pipe reduces the inlet velocity. Reduced inlet velocity reduces the possibility that sediments will be picked up and discharged from the settling pond.

A third approach is to modify the float to include a square circular weir that the water enters before reaching the outlet pipe. A circular weir with, say, 10 feet of circumference would significantly reduce the overflow rates(velocity) over the weir. As an example, examine how exit velocities are kept as low as possible in water and wastewater clarifiers. These clarifiers include what is known as effluent launders. They are long troughs, placed at the outlet end the clarifier or around the outside circumference in the case of circular clarifiers, into which the water flows. Actually weirs, they reduce the exit velocity of the water leaving the clarification area of the clarifier.

The weir may provide at least one and possibly two benefits with the treatment of storm water. First, it may reduce the carry-out of floc that is still settling while the cell is being drawn down, could result in lower final effluent turbidities and/or allow a reduction in the settling time to achieve the same effluent turbidity. Secondly, the weir could reduce if not eliminate the tendency for the withdrawal pipe to suck-up previously settled sediment.

FLOCCULATION SYSTEMS SHOULD BE DESIGNED BY KNOWLEDGEABLE PERSONNEL. A CONSULTANT SHOULD BE CONTRACTED WITH TO DEVELOP AND IMPLEMENT A SYSTEM. OPERATING PERSONNEL NEED TO BE SPECIFICALLY TRAINED TO OPERATE THESE SYSTEMS.

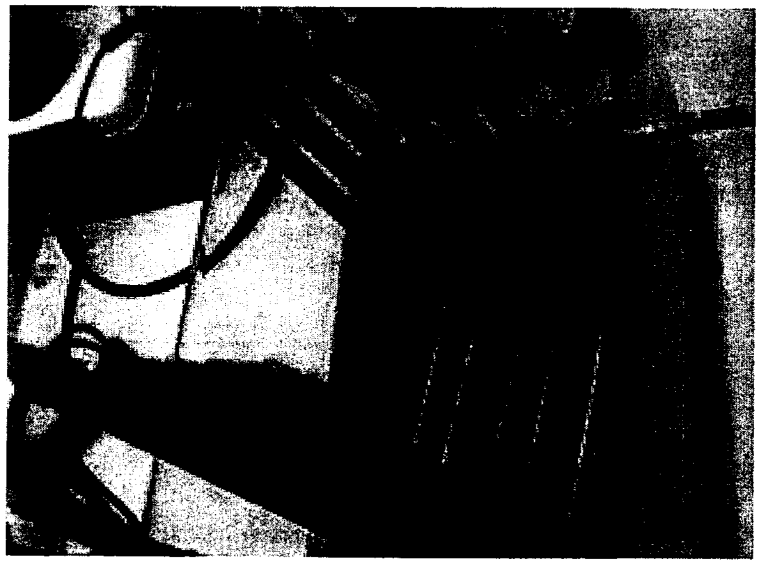
Efficiency/Impact: Mean turbidity reductions can be achieved in the 95.5% to 99.4% range.

BMP № CS36

Activity: Sites with surface water runoff contamination that have implemented specific non-point source BMPs for pollution prevention but have been unable to reduce the pollutant discharges in their storm water runoff to levels below the benchmarks.

Typical Pollutants: Sediment (TSS), metals, BOD, phosphorus, and turbidity

Typical Problem: When implementation of specific point source BMPs have not managed or eliminated the contaminants in the storm water to the benchmarks or below or where potential point sources for the contaminants can not be identified, end of the pipe or final discharge treatment BMPs may be necessary.



BMP: Experiments with a process tentatively called ElectroFloc indicates that it may be possible to use electricity to floc dissolved metals, TSS, and turbidity from storm water runoff. By charging aluminum plates with about 40 volts DC in a batch process, it has been shown to create an approximately equal number of charged particles in suspension. These dissimilar charged particles attract each other and due to aluminum ions present remain in contact with each other in as little as five minutes per liter. This works for TSS and turbidity in the lab and should work for dissolved metals as the metals usually are not really dissolved but submicron in size particles. Dissolved oxygen is increased in the water due to the splitting of the water molecule into hydrogen and oxygen in which the hydrogen leaves the water and the oxygen saturates the volume.

Efficiency/Impact: Lab tests have repeatedly show that TSS and turbidity can be reduced by 98% and the dissolved oxygen content can be increased to around 16 mg/l. To date, no tests have been performed on heavy metals.

ASCE American Society of Civil Engineers

Urban Watershed Best Management Practices

An ASCE Continuing Education Seminar

Presented by Dan O'Leary

February 16, 2001
Los Angeles

New Advances in Urban BMP's

- Stormwater Ponds
- Stormwater Wetlands
- Infiltration
- Filtering Systems
- Open Channel Designs
- Updated Pollutant Removal Data and Costs
- New Design Variations

R0020135

BMP Definitions

DA	=	Drainage Area
Re_v	=	Recharge Capability
WQ_v	=	Pollutant Removal Capability (80% TSS)
Cp_v	=	Channel Protection Capability
Q_p	=	Overbank Flood Protection
TSS	=	Total Suspended Solids
TP	=	Total Phosphorus
TN	=	Total Nitrogen

BMP Definitions (continued)

Maintenance	=	**maintenance score**
Comm. Accept.	=	**community acceptance score**
Cost	=	**construction cost score**

Score ranked from 1 to 5, with a lower score indicating either a high benefit or low drawback, and a higher score indicating either low benefit or high drawback.

First Generation SWM Ponds

Generally Detention (Dry) Ponds

Added as Afterthought to Completed Site Plans

Minimal Water Quality Benefits

Out of Sight...Out of Mind

Maintenance?

New Advances in Stormwater Ponds

P-1 Micropool Extended Detention Pond
P-2 Wet Pond
P-3 Wet Extended Detention Pond
P-4 Multiple Pond System Pond
P-5 "Pocket" Pond

P-1 Micropool ED Pond: Design Notes

- Micropool and forebay prevent resuspension and clogging
- Useful for "fingerprinting" = limited clearing
- Low community acceptance
- Inundation may harm trees
- Cost effective urban retrofit option

Release time = 24 hours

R0020140

[BMP score sheet]

P -1 Micropool ED Pond

DA = > 10 acres

Maintenance = 3.5

Comm. Accept.= 4.0

Cost = 1.0

Treatment

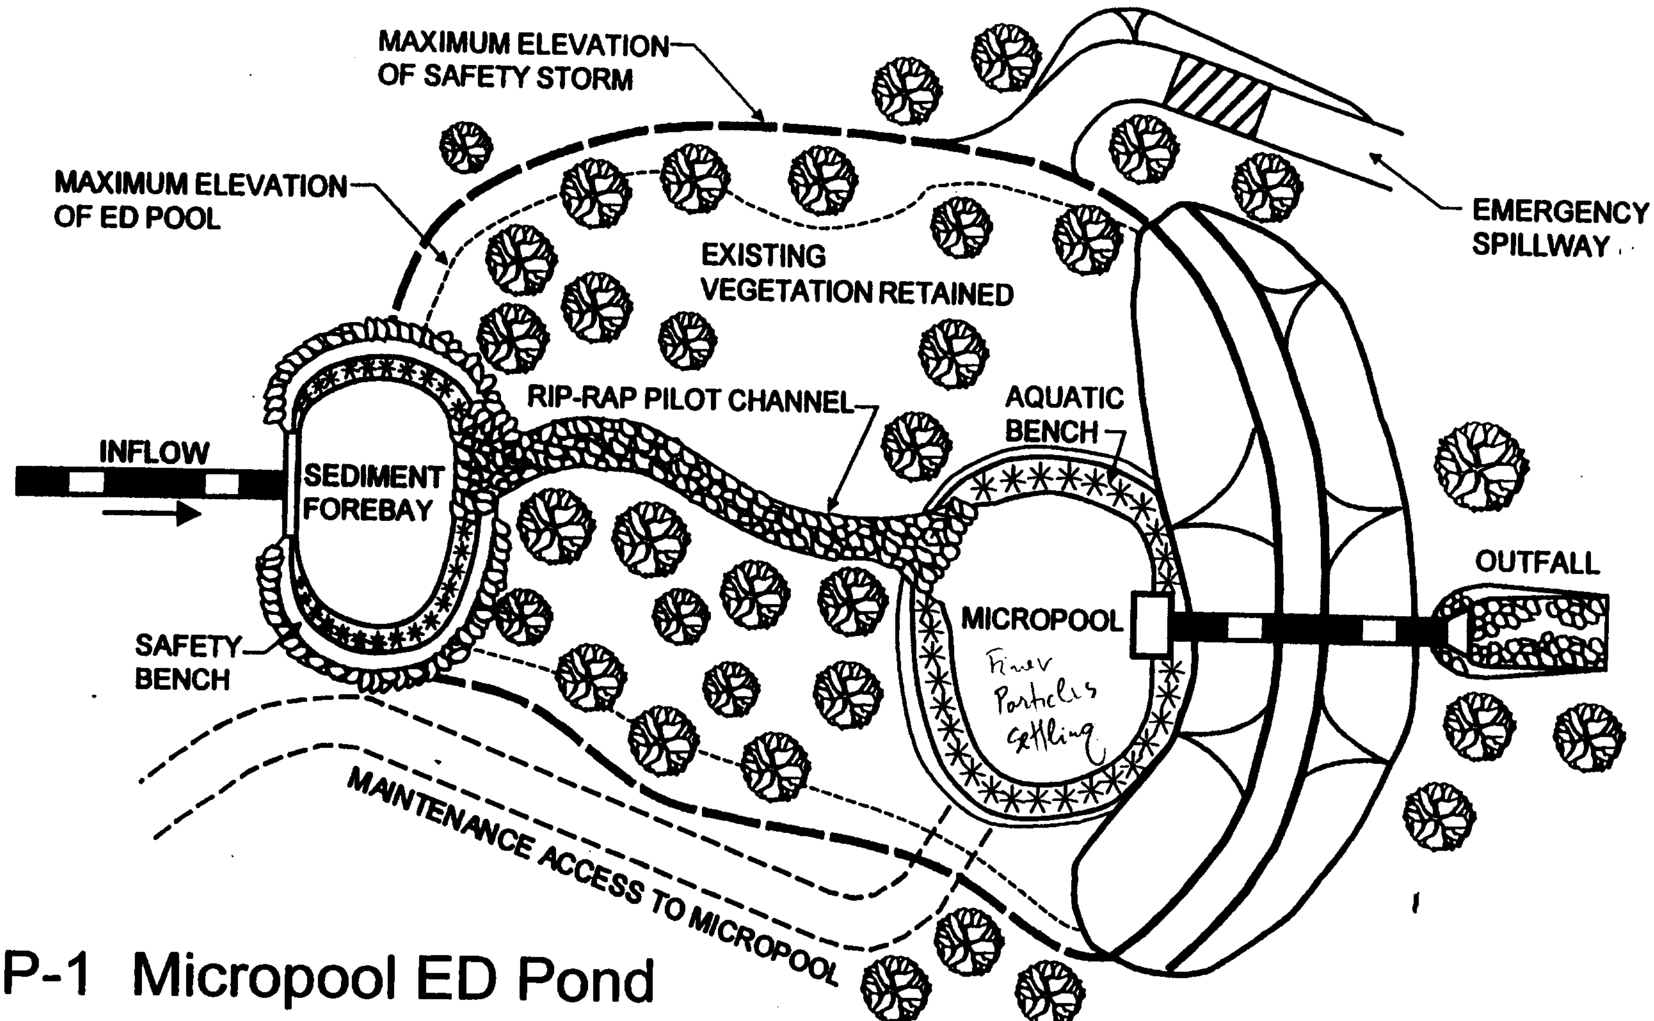
Re_v	
Cp_v	x
WQ_v	?
Q_{p2}	x

Pollutant Removal

TSS = 50%

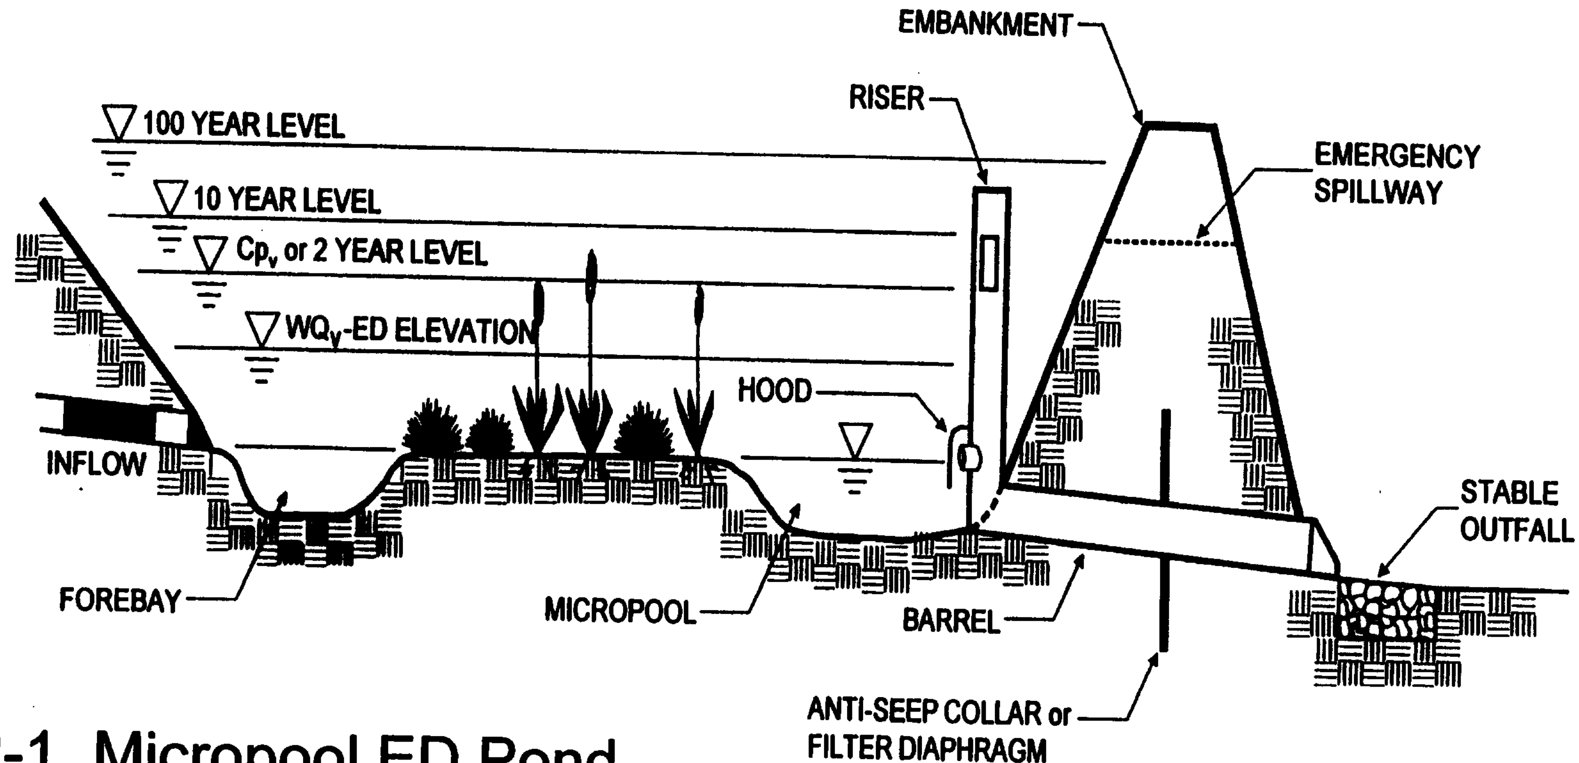
TP = 30%

TN = 30%



P-1 Micropool ED Pond Plan

R0020142



P-1 Micropool ED Pond Profile

R0020143

P-2 Wet Pond: Design Notes

- Algal uptake/settling increases nutrient removal
- Documented improvement in adjacent property values
- Careful location to prevent environmental impacts
- Stream warming limits use in trout streams (Use III & IV)
- Benches create fringe wetlands

P-2 Wet Pond

!! Careful with the water budget - so it does not dry out

DA = > 25 acres *

* unless groundwater intercepted

Maintenance = 1.5

Comm. Accept.= 1.5

Cost = 2.0

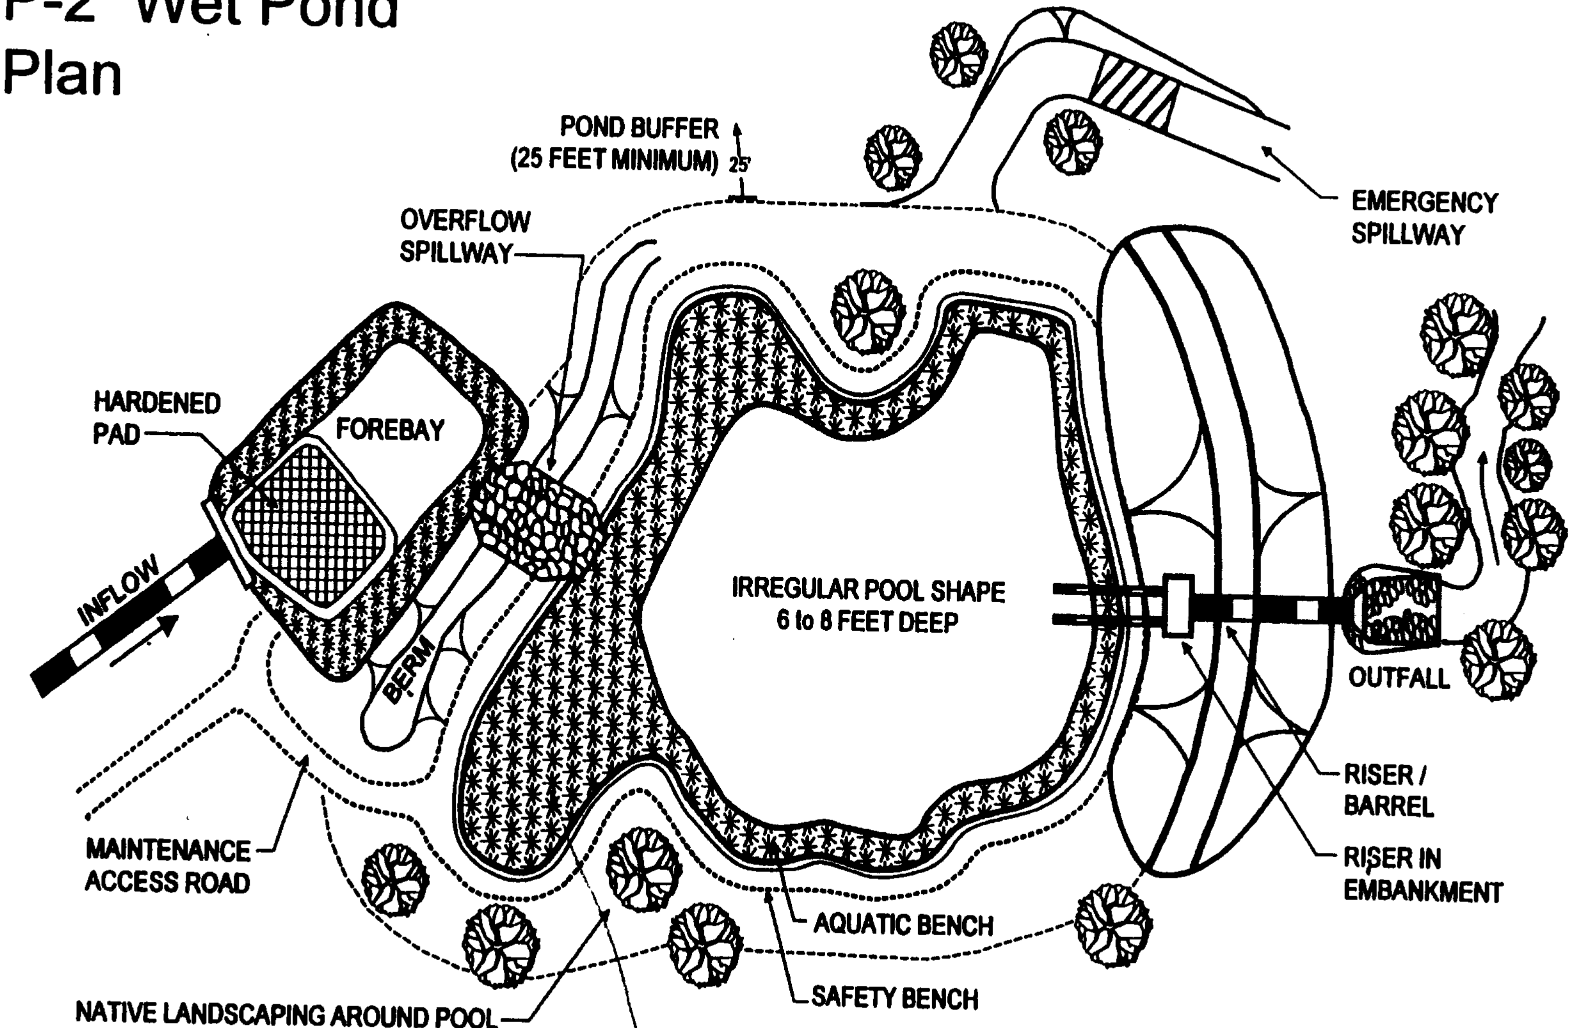
Treatment

Re_v	
Cp_v	x
WQ_v	x
Q_{p2}	x

Pollutant Removal

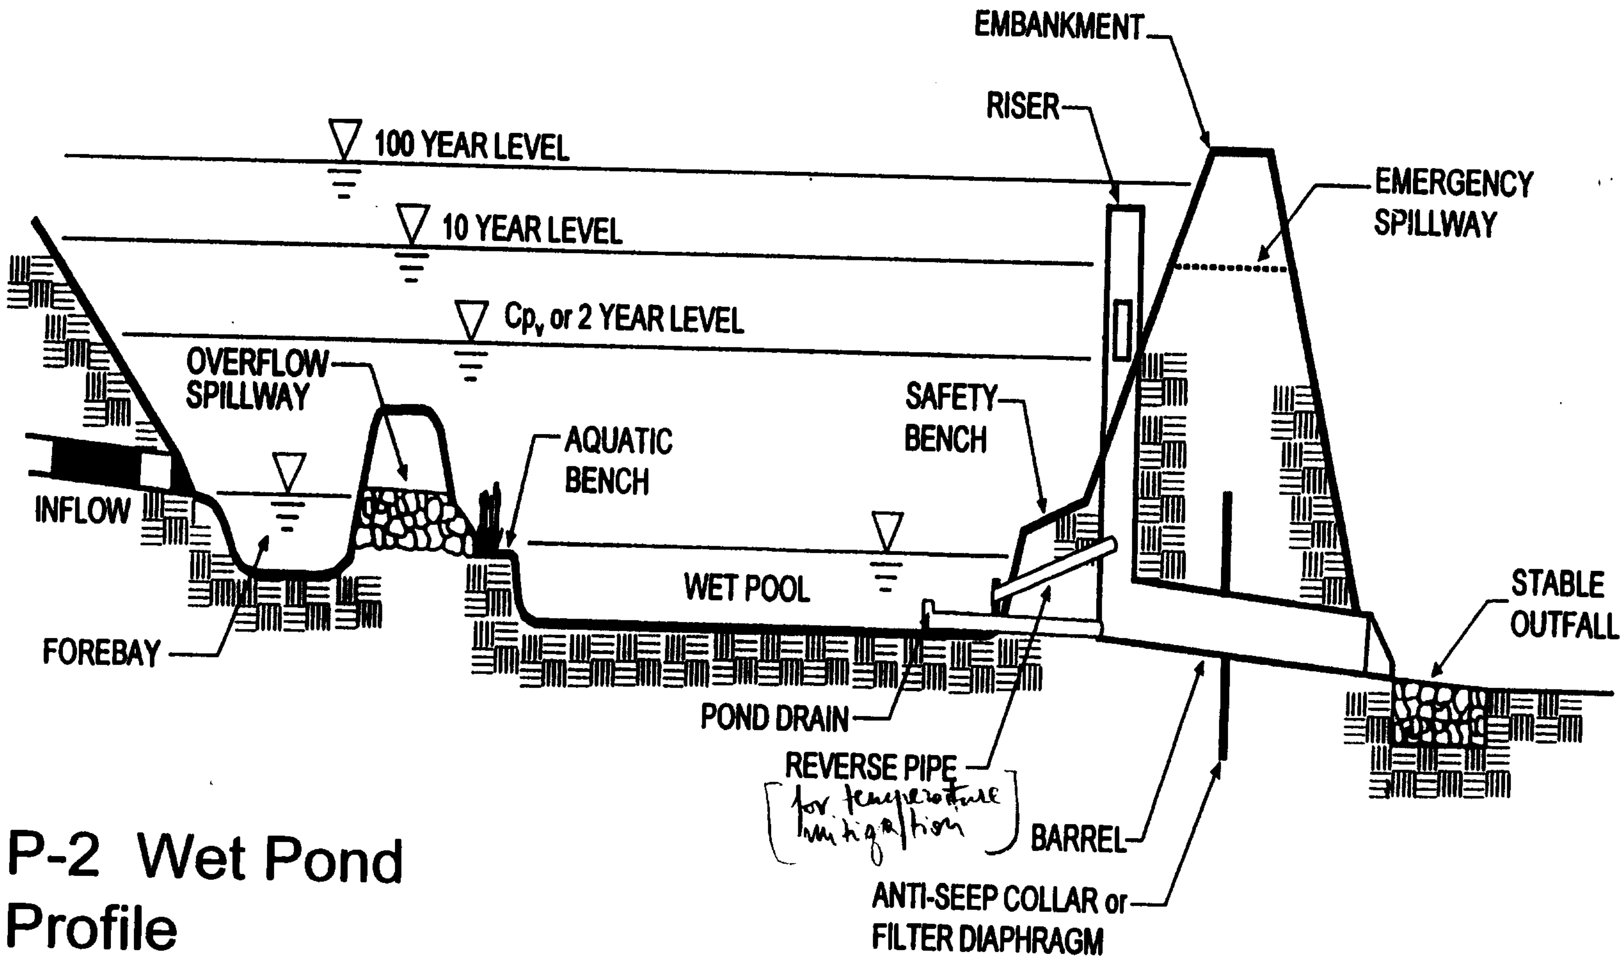
- TSS = 80%
- TP = 50%
- TN = 40%

P-2 Wet Pond Plan



[illegible]

R0020146



P-2 Wet Pond Profile

R0020147

P-3 Wet ED Pond: Design Notes

- Features Similar to Wet Ponds
- Added Benefit of Extended Draw Down Time
  - Downstream Channel Protection
  - Increased Residence Time
- Enhances Wetland Component of Fringe Areas
- Reduces Resuspension

R0020148

P-3 Wet extended detention pond

DA = > 25 acres

Maintenance = 2.0

Comm. Accept.= 2.0

Cost = 2.0

Treatment

Re_v

Features of the Standard Pond System.
(revised 1/5/95)

Source: Design of Stormwater Pond Systems (Available, 1995).

#1. Adequate Water Quality Treatment Volume.

Provide water quality treatment storage of at least one-inch per contributing impervious acre through any combination of permanent pool, extended detention or marsh.

An additional 0.25 inch per contributing impervious acre should be reserved for pretreatment in the form of a forebay or micropool, or both.

Water quality storage can be provided in multiple cells

It is generally desirable to provide water quality treatment off-line when topography, head and space permit. (i.e, apart from stormwater quantity storage)

2. Multiple Treatment Pathways.

Performance is enhanced when multiple or redundant treatment is provided. either using multiple cells, longer flowpaths, high surface area to volume ratios. complex microtopography, and/or treatment methods (pool, ED, marsh)

Features of the Standard Pond Systems

1 Adequate Water Quality Treatment Volume 3/4 inch as per SUSMP
2 Multiple Treatment Pathways
3 Minimum Pond Geometry
4 Sediment Forebay
5 Non-clogging Low Flow Orifice
6 Riser in Embankment
7 Adjustable Gate Valve
8 Pond Drain

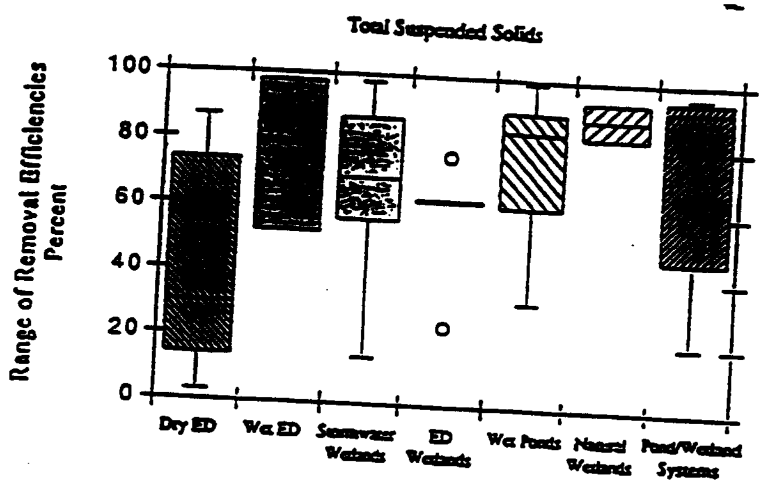
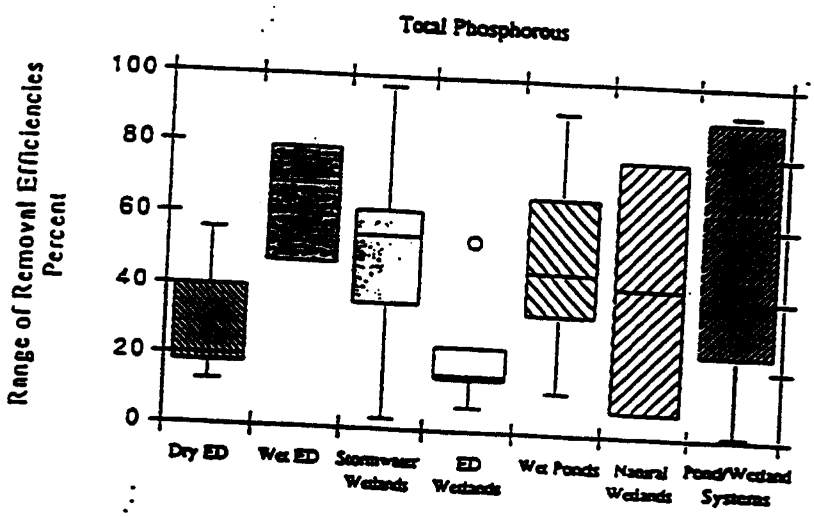
10. Pond/March Systems	25+	1.5	Climate, Baseflow	LO	Pool (10-15 yrs)	Yes	HI	HI

Notes: (A) maximum acreage of 400 acres in most cases.

(B) space consumption index (1 = space required for wet pond).

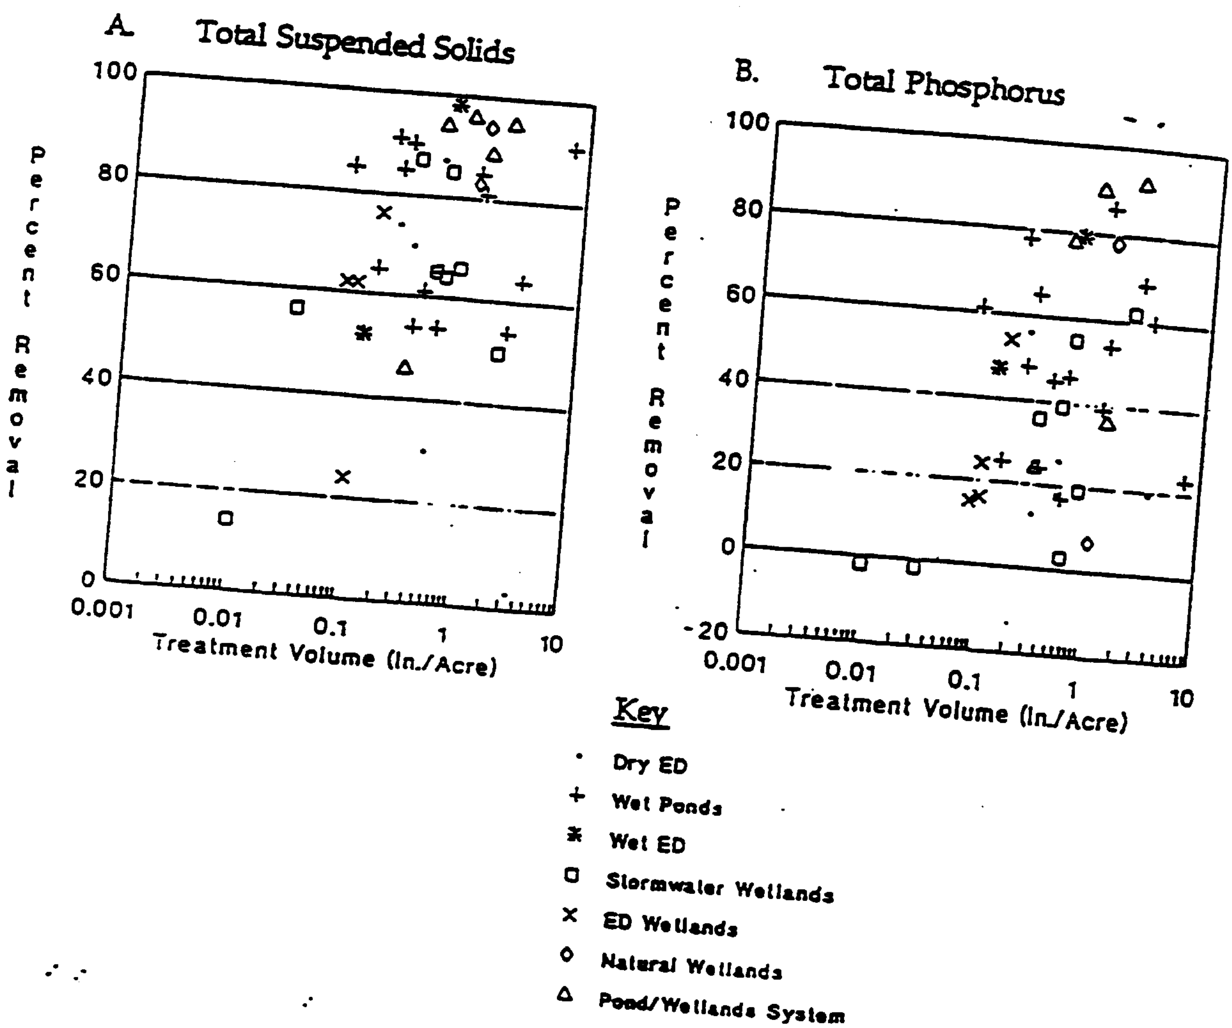
Pollutant Removal Performance of Stormwater Ponds and Wetlands: By Pond Type





"Box and whiskers" plots are used to illustrate the difference in removal rates for seven different kinds of stormwater pond and wetland systems. The "whiskers" show the range of reported values, whereas the lines within the box define the 25th, 50th and 75th percentile values (from top to bottom). Plots were adapted from a program developed by Pagenkoff, and the full data for each study can be found in Appendix A of Schueler et al, 1991.

Pollutant Removal Performance of Stormwater Ponds and Wetlands: By Treatment Volume



Pollutant removal rates for nearly 50 stormwater pond and wetland designs are reported for (a) totoal suspended solids and (b) totoal phosphorus. Additional data on each wetland performance study can be found in Appendix A. Note that pollutant removal is only loosely related to total treatment volume. (i.e., other design factors appear to be equally important in defining removal rate).

Selecting the Right Pond Design

- Pollutant Removal Target
- Downstream Channel Protection
- Wetland Creation
- Wildlife Habitat
- Safety Risk
- Community Acceptance
- Delta-T
- Land Consumption
- Required Catchment Area
- Environmental Restrictions
- Maintenance Burden
- Construction Cost

Pollutant Removal of Ponds

Only partially related to treatment volume (Vt).
Internal geometry very important (length to width ratio).
Removal increases when multiple treatment mechanisms are combined or multiple cells are used.
Wet ED ponds are more effective than Dry ED ponds.
Dry ED subject to resuspension and failure to meet target ED times.
Most other pond/wetland options provide comparable removal.
Large waterfowl populations reduce nutrient/bacteria removal.
Declines during ice cover and/or snowmelt.
Off-line ponds appear to be more retentive than on-line ponds.

STORMWATER POND DESIGN PRINCIPLES

20 ELEMENTS OF AN EFFECTIVE DESIGN

16. Pondscaping Plan

A pondscaping plan shall be prepared that indicates how aquatic and terrestrial areas will be vegetatively stabilized.

Specific pondscaping guidance is provided in Design of Stormwater Wetland Systems (Schueler, 1992).

17. Wetland Elements.

Wherever possible, wetland plants should be encouraged in the pond design, either along the aquatic bench (fringe wetlands), the safety bench and sideslopes (ED wetlands) or within shallow areas of the pool itself.

The best elevations for establishment of wetland plants, either through transplantation or volunteer colonization, are within six inches (plus or minus) of the normal pool.

18 Pond Buffers and Setbacks.

A pond buffer shall be provided that extends 25 feet outward from the maximum water surface elevation of the pond. The pond buffer should be contiguous with other buffer areas, as are required by local regulation (e.g., stream buffers).

An additional 15 foot setback shall be provided to permanent structures.

Trees should be preserved in the buffer area during construction, should they exist.

Trees, shrubs and native ground covers should be planted in the buffer if they do not presently exist.

The only mowing required within the buffer is along maintenance right of ways and the embankment. The remaining buffer can be managed as a meadow (mowing twice a year) or forest.

19 Maintenance Measures.

Maintenance responsibility for the pond and the pondscape shall be vested with a responsible authority by means of legally binding and enforceable maintenance agreement.

The pond shall be inspected annually in wet-weather conditions.

Sediment removal in the forebay should occur every 5 to 7 years, or after one foot of sediment deposition has been recorded in the forebay.

Suitable on-site sediment disposal area should be reserved.

20 Maintenance Access.

A 25 foot wide maintenance right of way easement shall extend to the pond from a public or private road.

Maintenance access shall have a maximum slope of no more than 15% and shall be stabilized to withstand heavy equipment

The maintenance access shall extend to the forebay, safety bench and riser, and be designed to allow vehicles to turnaround.

Access within the riser is to be provided by lockable manhole covers, and manhole steps within easy reach of valves and other controls.

12. Inlet Protection.

Inlet pipes to the pond can be partially submerged in warmer climates.

A forebay must be provided at each inlet, unless it provides less than 10% of the total design storm inflow rate to the pond.

13. Adequate Outfall Protection.

Flared end pipe sections that discharge at or near the stream invert are preferred.

The channel immediately below the pond outfall shall be modified to conform to natural dimensions, and lined with large rip-rap placed over filter cloth.

A stilling basin shall be used to reduce flow velocities from the primary spillway to non-erosive velocities.

If the pond daylights to a channel with dry weather flow, care should be taken to minimize tree clearing along the downstream channel, and to reestablish a forested riparian zone in the shortest possible distance. Excessive use of rip-rap should be avoided to reduce stream warming.

If the pond has a dry pilot channel, a PVC underdrain pipe shall be located 2 to 3 feet below the riprap to prevent excessive warming of dry weather flows. The pilot channel can also be protected by shade trees.

14. Pond Benches.

The perimeter of all deep pool areas (four feet or greater in depth) shall be surrounded by two benches:

A safety bench that extends 15 feet outward from the shoreline to the toe of the pond sideslope. The maximum slope of the safety bench shall be 3%.

An aquatic bench that extends 15 feet inward from the normal shoreline, that has a maximum depth of eighteen inches below the normal pool water surface elevation.

15. Safety Features.

Fencing of ponds is not generally desirable.

Safety is provided by managing the contours of the pond to eliminate dropoffs and other hazards.

Sideslopes to the pond shall not exceed 3:1 (h:v), and shall terminate on a safety bench.

Both the safety bench and the aquatic bench may be landscaped to prevent access to the pool.

The primary spillway opening shall not permit access by small children.

Outfall pipes above 48 inches in diameter should be fenced.

Warning signs prohibiting swimming and skating may be posted

8. Pond Drain.

Each pond shall have a ductile iron drain pipe that can completely or partially drain the pond.

The drain pipe shall have an inverted elbow within the pond to prevent sediment deposition.

The diameter of the pipe shall be sufficient to drain the pond within 24 hours.

Care shall be exercised during pond drawdowns to prevent downstream discharge of sediments or anoxic water.

9. Principal Spillway.

The principal spillway shall be designed in accordance with SCS Pond Specifications Code 378 (revised).

The principal spillway shall have the capacity to accommodate the design stormwater storm for the given drainage area and height to emergency spillway crest (usually the five and/or ten year storm event) (Note: applies only to online ponds)

The crest elevation of the primary spillway shall be no less than one foot below the emergency spillway crest.

The inlet or riser size for pipe drops shall be such that the flow through the structure goes from weir flow control to pipe flow control without going into orifice control in the riser.

The use of reinforced concrete pipe and cast-in-place reinforced concrete box culverts are recommended for the primary spillway to increase its longevity.

The primary spillway should be equipped with a removable trash rack.

10. Emergency Spillway.

The emergency spillway is provided to convey large flood flows safely past the earthen embankment, and should be designed in accordance in SCS Pond Code 378, National Engineering Handbook, or local equivalent.

Excavated earthen spillways shall be trapezoidal and located in undisturbed earth. (up to the 100 year depth)

Side-slopes should be no greater than 2:1 (h:v).

The emergency spillway shall have an inlet channel, level section and an exit channel. The spillway shall have a minimum width of 8 feet, and be designed for non-erosive velocities through the control section and exit channel.

11. Embankment Specifications

The embankment shall be designed and constructed in a manner to prevent dam breach or seepage, and the exact criteria depend on the NEH dam safety criteria. Some of the key requirements include:

minimum top width of 10 feet (or 16 to 26' if it is a roadway embankment)

the dam height shall be increased to account for settlement (often 5 to 10%)

combined upstream and downstream side slopes of embankment shall not be steeper than 5:1 (h:v), with neither slope exceeding 2:1

provision of freeboard, depending on dam classification (usually 1 to 2 feet)

Cutoff trench and impervious core located along centerline of dam.

Anti-seep collars or seepage diapraghms shall be provided for all conduit pipes through the embankment greater than six inches in diameter.

3 Minimum Pond Geometry

Ponds should be wedge-shaped, narrowest at the inlet and widest at the outlet.

The minimum length to width ratio for the pond is 1.0 (i.e., length equal to width). Greater flowpaths are recommended.

Maximum depth of the permanent pool should not exceed eight feet, with an average of 4 to 6 feet.

4. Sediment Forebay

Each pond shall have a sediment forebay. The forebay shall consist of a separate cell, formed by an earthen berm, gabion or rip-rap wall.

The forebay shall be sized to contain 0.25 inches per impervious acre of contributing drainage (with a minimum of 0.1 inches per impervious acre), and shall be 4 to 6 feet deep.

Exit velocities from the forebay shall not be erosive during for the two year design storm.

Direct maintenance access by heavy equipment should be provided to the forebay.

The bottom of the forebay may be hardened to make sediment removal easier.

A fixed vertical sediment depth marker shall be installed in the forebay to measure sediment deposition over time.

5. Non-clogging Low Flow Orifice.

The preferred method is a submerged reverse-slope pipe that extends downward from the riser to a release point one foot below the normal pool elevation.

The low flow orifice shall have a minimum internal diameter of 3 inches.

An alternative method is to employ a broad crested weir that is protected by a half-round CMP that extends at least 18 inches below the normal pool.

The use of horizontal perforated pipes protected by gravel are not recommended as means to provide extended detention. Vertical pipes may be used as an alternative if at least one foot of standing water is present..

6. Riser in Embankment.

The riser shall be located within the embankment for purposes of maintenance access, safety and aesthetics.

Access to the riser will be by manholes with lockable nuts.

The riser can be "fenced" with pipe or rebar at 8 inch intervals for safety purposes.

7. Adjustable Gate Valve.

Both the ED pipe and the pond drain shall be equipped with an adjustable gate valve (typically a handwheel activated knife gate valve)

Both the ED pipe and the pond drain shall be sized one pipe schedule higher than the calculated design diameter.

Valves shall be located inside of the riser at a point where they (a) will remain dry and (b) can be operated in a safe and convenient manner.

To prevent vandalism, the handwheel shall be chained to a ringbolt, manhole step or other fixed object.

Pond Design Example

Design Assumptions

- Pond serves a townhouse development project
- Located in Mid-Atlantic Piedmont (Frederick Co. MD)
- Receiving water is a warm-water fishery (MD CL. I)
- Low hazard pond (SCS Class a, minimal property damage, no loss of life potential)
- Water quality storage volume (WQV) based on 90% rule — corrected
- Soils adequate for embankment & wet pond
- No disturbance to non-tidal wetlands
- No forest removal or re-forestation required

Pond Design Example

Design Steps - I

1. Assemble necessary background information
2. Confirm design criteria
3. Establish hazard classification
4. Conduct site visit/confirm facility location
5. Perform Hydrologic computations
   - D.A., land use, soils, t_c
   - Compute peak discharges for pre- and post-developed conditions
6. Determine storage requirements
   - Compute required water quality storage (WQV)
   - Estimate required quantity storage (TR-55 short cut method)

Pond Design Example

Design Steps - II

7. Perform pond grading
8. Compute provided storage (elevation- storage relationship)
9. Determine permanent pool, forebay, and ED volume elevations
10. Perform hydraulic calculations
    - Extended detention outlet
    - 2 year storm outlet
    - 10 year storm outlet
    - Riser and barrel sizing & capacity
    - Emergency spillway
11. Prepare storage-elevation-discharge table
12. Conduct pond routing
13. Perform additional computations (as applicable)
14. Draw profiles and details

spillway

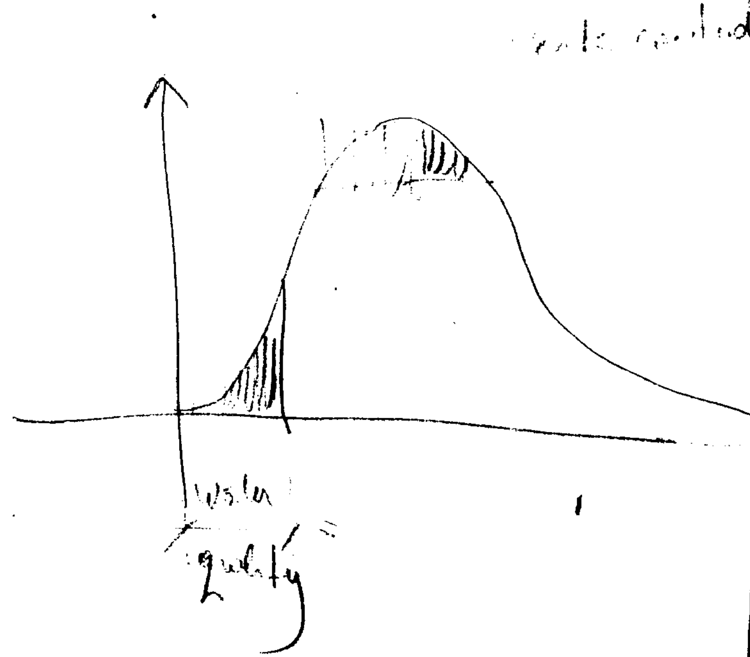
Frequent storm control is an issue when introducing storm water control.

R0020197

Pond Design Example

Storage Requirements

- Water Quality
  - Permanent pool
  - Forebay
  - Extended detention
- Water Quantity
  - 2 year storm
  - 10 year storm



Permanent Pool and Extended Detention

Water Quality Volume (WQV) TOTAL

DA=72.4 ac
(for 50% Impervious)
$WQV = 1.25" \times R_v \times DA$
$R_v = 0.05 + 0.009(I) = 0.5$

$WQV = 1.25"(0.5)(72.4\ ac)/12"/ft = 3.77\ ac\text{-}ft$

Water Quality Storage - II

(PAGE 23 IN BOOKLET)

Permanent Pool Volume

50% of WQV = 0.5(3.77 ac-ft) = 1.89 ac-ft
Minimum length to width ratio = 2:1
Max depth = 8ft, 4ft to 6ft avg.
70% of shoreline in shallow aquatic shelves

Sediment Forebay

tenth of an inch

Minimum Vol. required: 0.1"(0.5)(72.4 ac)/(12"/ft) = <u>0.3 ac-ft</u>

Extended Detention

Vol. required: ½ * (WQV) = ½ * (3.77 ac-ft) = <u>1.89 ac-ft</u>

Water Quantity Storage - I

(*PAGE 24 IN BOOKLET*)

Preliminary Storage for 2 Year Storm Event

2 year pre-developed runoff = 16.0 cfs
2 year post-developed discharge = 89.3 cfs

From TR-55 Figure 6.1 [short cut method for routing]

$Q_o/Q_i = 16.0/89.3 = 0.18$

$V_s/V_R = 0.47$: for CN = 76, and 3.1" rainfall; $V_r = 1.08"$

Storage Volume: $V_s = 0.47(1.08")(72.4 \text{ ac}/12 \text{ "/ft}) = 3.06$ ac-ft.

Add 10% due to E.D. below — for ease of calculations (conservative we do not do iteration)

3.06(1.1) = 3.37 ac-ft

Water Quantity Storage - II

(PAGE 24 IN BOOKLET)

Preliminary Storage for 10 Year Storm Event

10 year pre-developed runoff = 78.4 cfs
10 year post-developed runoff = 212.2 cfs ← Dimensionless Value

$Q_o/Q_i = 78.4/212.2 = 0.37$
$V_s/V_r = 0.34$: for CN = 76, and 5.0" rainfall; $V_r = 2.54"$
Storage Volume: $V_s = 0.34(2.54)(72.4/12) = 5.21$ ac-ft

add 10% due to E.D. below
5.21(1.1) = 5.73 ac-ft

Pond Design Example

Pond Grading

- Storage provided
  - Permanent pool
  - Stormwater management

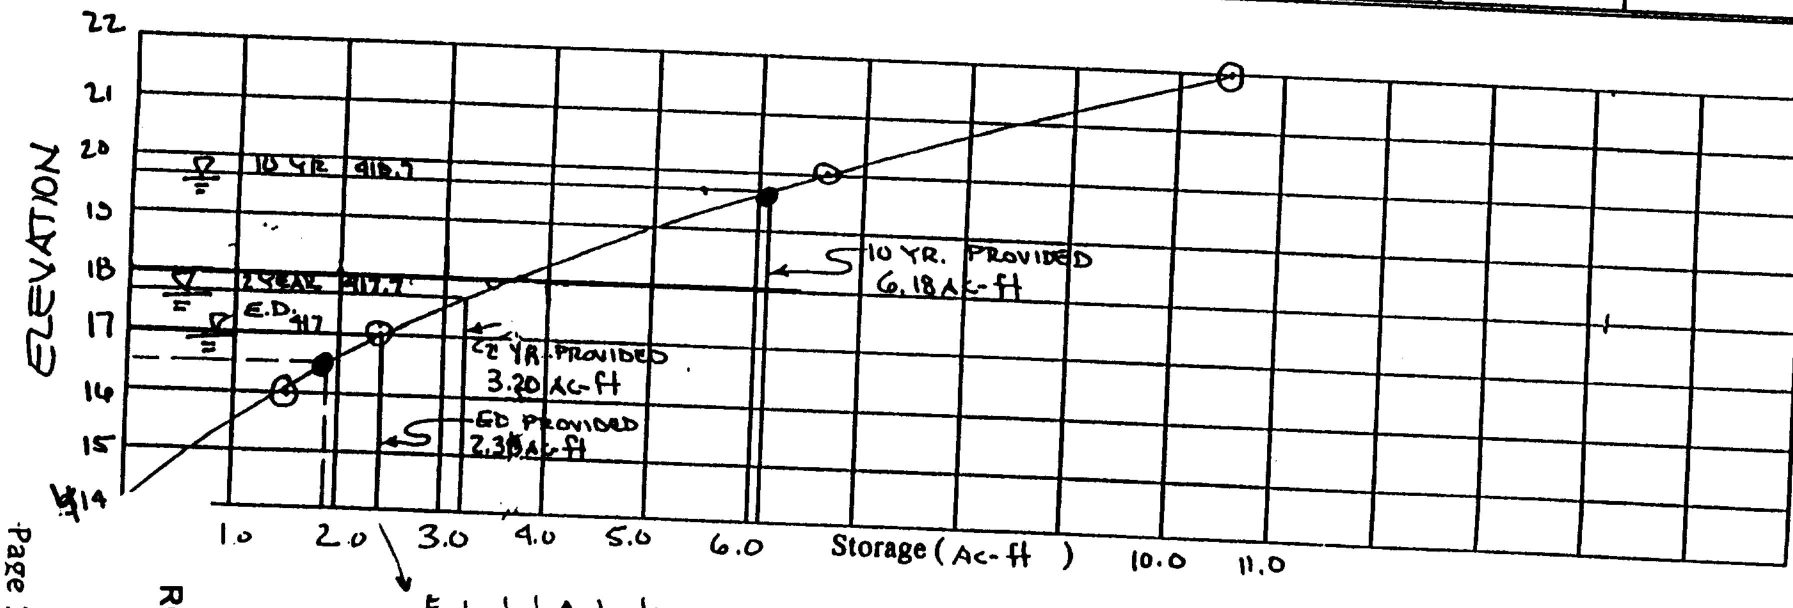
ELEVATION-STORAGE DATA AND CURVE ABOVE PERMANENT POOL



Extended Detention

R0020206

Pond Design Example

Hydraulic Computations

- Extended detention
- 2 year storm
- 10 year storm
- Riser
- Barrel
- Emergency spillway
- Storage-elevation-discharge table
- TR-20 input data
- TR-20 results data

(PAGE 27 IN BOOKLET)

(1) Extended Detention

For extended detention of 1.89 ac-ft

Using the elevation-storage table and curve
Read elev. 416.6, use 417.0 ✓

Average release rate:

Q_{avg} = (1.89 ac-ft(43,560 ft²/ac))/ (24hr(3600 sec/hr)) = 0.95 cfs
maximum release rate ~~is assumed~~ to be $Q_{max} = 2 * (Q_{avg})$
$Q_{max} = 2 * (0.95) = 1.9$ cfs @ elev.. 417.0

$Q = C * A * (2gh)^{1/2}$ H to center of orifice => $\boxed{h\text{-WSEL} - (\text{INV} + \frac{d}{2})}$

Try 6" diameter orifice Use oriffice equation

$Q = 0.6 * (.196\ ft^2) * [(64.4\ ft/sec^2)(2.75\ ft)]^{1/2} = 1.56\ ft^3/sec$, 1.56 < 1.90 OK

Result: Use 6" diameter orifice, invert elevation, 414.0

assumes free outfall

Hydraulic Computations - II

(PAGE 27 IN BOOKLET)

(2.0) 2 Year Stormwater Management

Set invert elevation at ED water surface elevation (417.0)
Allowable release rate = 16.0 cfs existing Q_{in}

For storage of 3.37 ac-ft, read elevation = 417.8 (Figure 3)
At elevation 417.8, $Q_{ED\ orifice}$ = 1.8 cfs $417.8 - 414.0 + \frac{6''}{2(12)} = 1.8$
2 year slot maximum release rate = 16.0 cfs - 1.8 cfs = 14.2 cfs. $H_{ED} = 3.8' - \frac{1}{2}$ Diam (OR
$H_{2YR} = 0.8'$ WEIR

$$Q_o = C * A * (2gh)^{1/2} \text{ or } Q_w = C * L * H^{3/2}$$

Try 4' x 1' horizontal slot, with invert set at 417.0 Weir or orifice the more restrictive will control?

orifice $Q_o = 0.6 * (4.0\ ft^2) * [(64.4\ ft/sec^2)(0.3\ ft)]^{1/2}$ = 10.5 cfs + 1.8 cfs = 12.3 cfs
cfs (which is < 16.0 cfs). usable head

weir $Q_w = 3.1(4\ ft)(0.8)^{3/2}$ = 8.9 cfs + 1.8 cfs = 10.7 cfs (which is < 16.0 cfs) Weir Controls Who controls

Result: Use 4 ft x 1 ft slot, invert elevation, 417.0 $H_{Max} = 0.8'$ (9.6")

Page 28

R0020209

(PAGE 28 IN BOOKLET)

(2.1) 10 Year Stormwater Management

Set invert elevation above 2 year elevation at 418.0
Allowable 10 year release rate = 78.3 cfs

For storage = 5.73 ac-ft, read elevation 419.5 (Figure 3)
At elev. 419.5 $Q_{ED\ orifice}$ = 2.2 cfs and $Q_{2yr\ slot}$ = 27.2 cfs
Q_{10} Release = 78.3 cfs - (2.2 cfs + 27.2 cfs) = 48.9 cfs

$H_{ED} = 5.5'$ (Minus 0.25') ORIFICE
$H_{2YR} = 2.5'$ (MINUS 0.5') ORIFICE
$H_{10YR} = 1.5'$ WEIR

Try 10' x 2' slot (actually, 2 - 5' x 2' slots) → Design detail

Weir: $Q_w = 3.1(10\text{ ft})(1.5\text{ ft})^{3/2} = 57.0$ cfs > 48.9 cfs
(may be too large, but want the barrel to control flow)

who controls

Orifice: $Q_o = 0.6 * (20\text{ ft}) * [(64.4\text{ ft/sec}^2)(0.5\text{ ft})]^{1/2} = 68.1$ cfs > 57.0 cfs
from weir equation

So WEIR CONTROLS

Result: Use two 5 ft x 2 ft slots, invert elevation, 418.0

(PAGE 28 IN BOOKLET)

(3.0) Riser

Size riser to accommodate all flow through control openings
- 6" ED Orifice
- 4' x 1' 2-Year Slot
- Two 5' x 2' 10-Year Slots
- 27" RCP Barrel (see following computations)

<u>Try 8' x 5' Reinforced Concrete Box</u>

Check orifice control at elevation 419.5 (this condition is rarely a limiting factor)

$Q_{\text{base orifice}} = 0.6 * (40\ ft^2) * [(64.4\ ft/sec^2)(1.5)]^{1/2} = 236$ cfs
which is >> slot orifice

Result: **<u>Use 8' x 5' Reinforced Concrete Box Riser</u>**

Hydraulic Computations - V

(PAGE 29 IN BOOKLET)

(3.1) Barrel

Upstream invert = 405.0
Downstream invert = 403.65

At elevation 419.5 the barrel should control flow and release less than 78.3 cfs.

Try 27" RCP Barrel

Inlet Control Condition

Use Culvert Charts

For 27" RCP, $H_w/d = (419.5 - 405.0)/2.25\ \text{ft} = 6.44$ ft

Read Q = 70 cfs ±

70 cfs < 78.3 cfs

Outlet Control Condition

Use SCS pipe flow equation FHA orifice method,

$Q = A * [2gh/(1 + k_m + k_pL)]^{1/2}$

$Q = 3.98\ \text{ft}^2 * [(\cancel{64.4\ \text{ft/sec}^2})(14.73)/2 + .01016(81)]^{1/2} = 73.0\ \text{cfs} > 70$ cfs so barrel is in inlet control

Result: **Use 27" RCP Barrel**

(PAGE 29 IN BOOKLET)

(4) Emergency Spillway

Set invert elevation above 10 year water surface elevation (419.7)
Set crest elevation = 419.8

Size spillway to pass ultimate 100 year discharge with at least 1 foot of freeboard to top of embankment (Q_{100} inflow = 392.0 cfs).

<u>Try 40' wide, vegetated, emergency spillway with 3:1 side slopes</u>

Using SCS, Design Data for Earth Spillways
$H = 421.5 - 419.8 = 1.7$ ft
$Q_{ES} = 222.0$ cfs
$Q_{Principal\ Spillway} = 77$ cfs.
$Q_{ES} + Q_{PS} = 299$ cfs, less than 392cfs, however pond storage attenuation will ensure passage of ultimate 100 year flow

due to routing effect of the pond

(PAGE 31 IN BOOKLET)

(1) **Extended Detention - 6" orifice**

$Q = C * A * (2gh)^{1/2}$ $h = w.s.e. - 414.25$

$\underline{Q = 0.943 * h^{1/2}}$

(2.0) **2 Year Slot - 4' x 1' slot**

Orifice:

$h = w.s.e. - 417.5$

$\underline{Q = 19.25 * h^{1/2}}$

Weir:

$H = w.s.e. - 417.0$

$\underline{Q_w = 12.4 * H^{3/2}}$

(2.1) **10 Year Slot - two 5' x 2' slots**

Weir:

$H = w.s.e. - 418.0$

$\underline{Q_w = 31.0 * H^{3/2}}$

Orifice:

$h = w.s.e. - 419.0$

$\underline{Q = 96.25 * h^{1/2}}$

(PAGE 31 IN BOOKLET)

(3.0) **Riser - 8' x 5' box**

Orifice:

h = w.s.e. - 418.0

$\underline{Q_{base\ orifice} = 192.61 * h^{1/2}}$

(note: slot orifice more restrictive than base, use slot orifice in storage-elevation-discharge data table)

(3.1) **Barrel - 27" RCP**

Inlet control:

Use FHA Culvert Chart No. 2 where, H_w/D = (w.s.e. - 405.0)/2.25

Outlet control:

$Q = A* [(2gh/1 + k_m + k_pL)]^{1/2}$

h = w.s.e. - 404.78

$\underline{Q = 19.00 * h^{1/2}}$

(4) **Emergency Spillway**

Use Engineering Field Manual, Design Data for Earth Spillways

where H_p = w.s.e.) - 419.8

XEQ 9/21/95

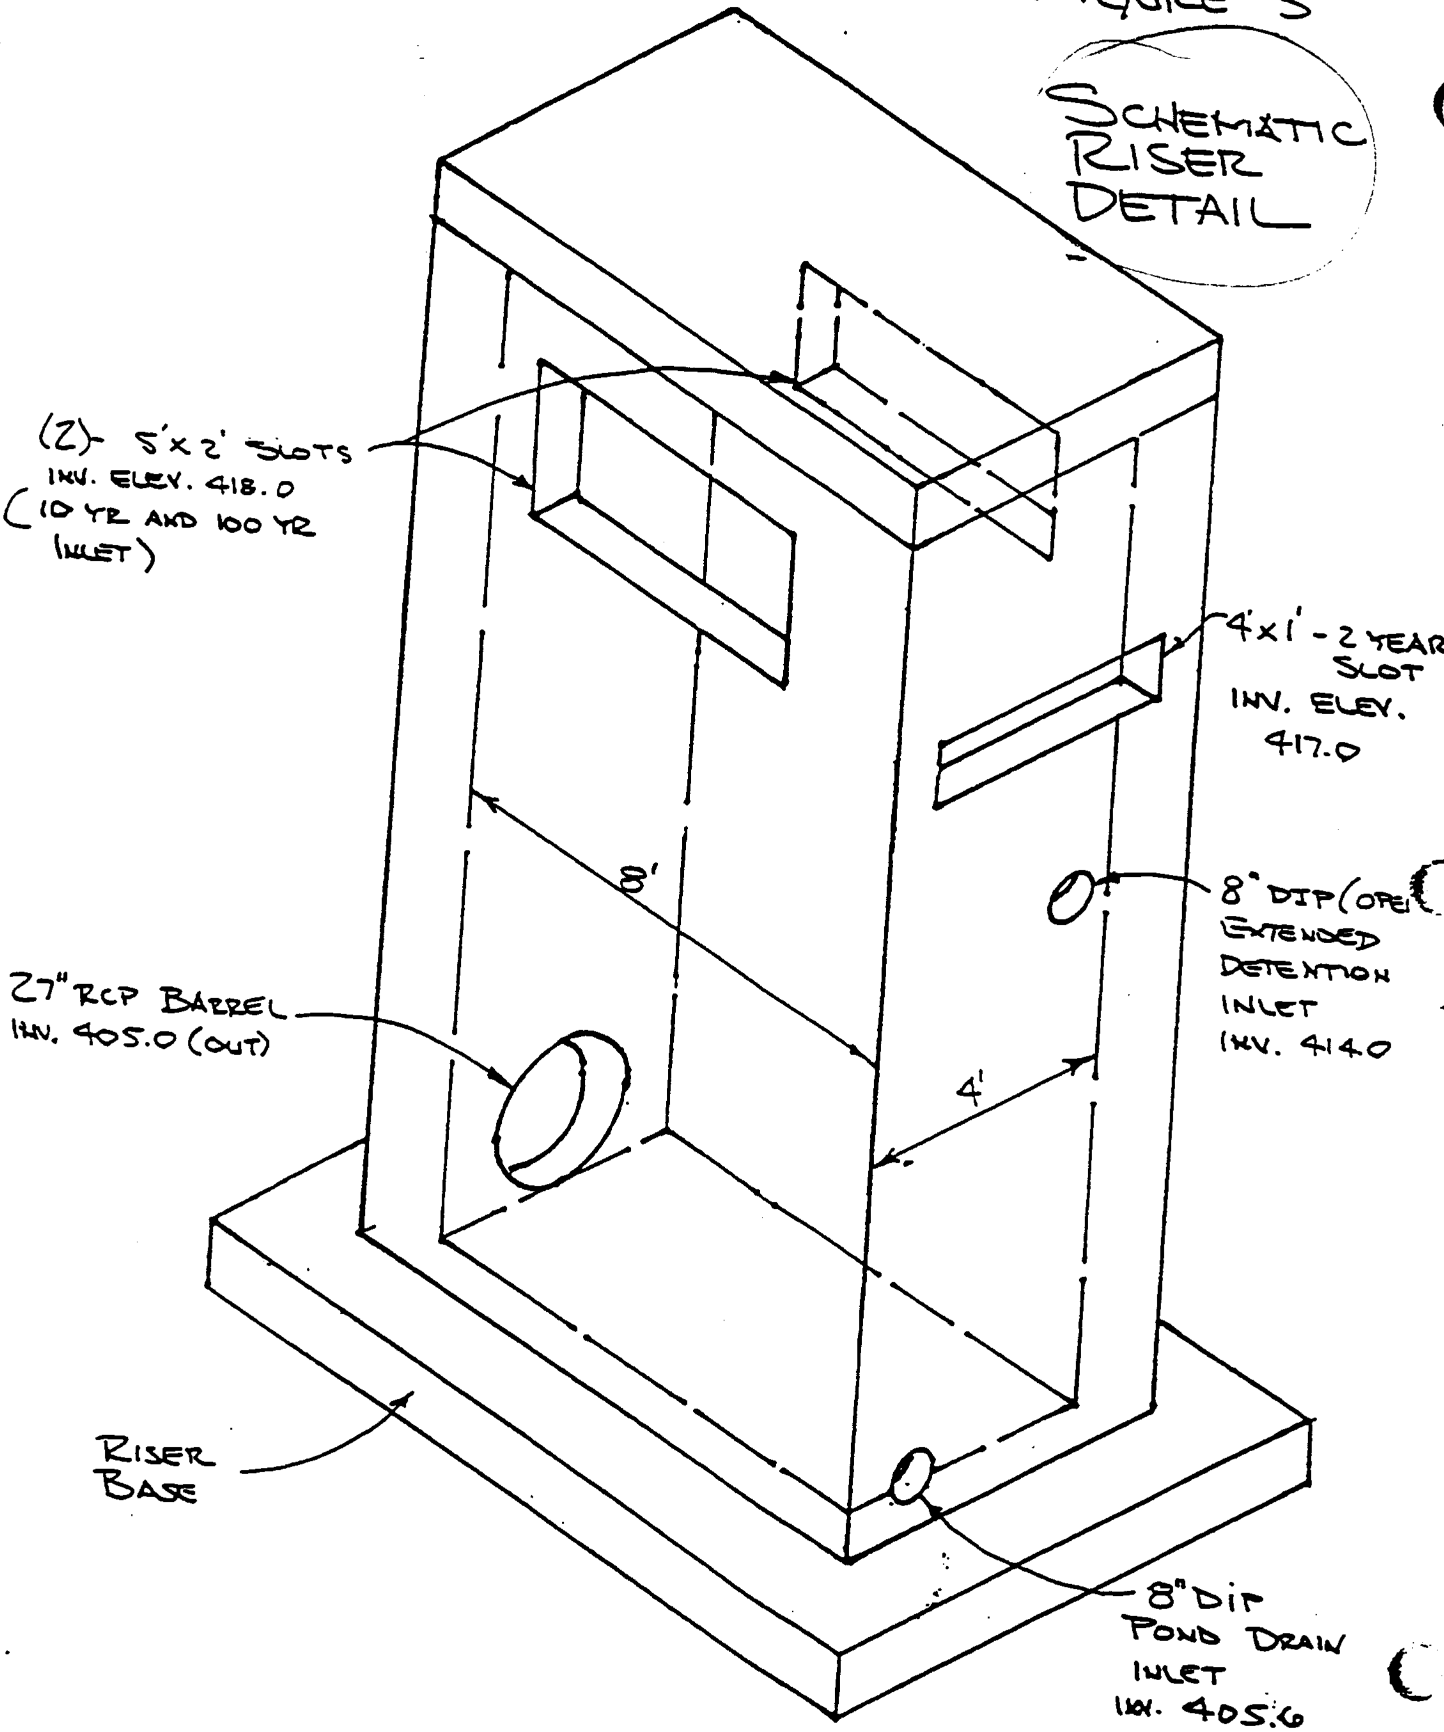
SCHEMATIC RISER DETAIL



R0020223

Pond Design Example

Miscellaneous Computations

- Barrel outlet channel
- Water balance
- Pond drain
- Seepage control
- Anti-floatation → assuming orifices of the riser clogged + drain check
- Slope stability
- Structural concrete
- Inflow channels
- Geotechnical
- Cost estimate
- Spillway between forebay and pond

12. Inlet Protection.

Inlet pipes to the pond can be partially submerged in warmer climates.

A forebay must be provided at each inlet, unless it provides less than 10% of the total design storm inflow rate to the pond.

13. Adequate Outfall Protection.

Flared end pipe sections that discharge at or near the stream invert are preferred.

The channel immediately below the pond outfall shall be modified to conform to natural dimensions, and lined with large rip-rap placed over filter cloth.

A stilling basin shall be used to reduce flow velocities from the primary spillway to non-erosive velocities.

If the pond daylights to a channel with dry weather flow, care should be taken to minimize tree clearing along the downstream channel, and to reestablish a forested riparian zone in the shortest possible distance. Excessive use of rip-rap should be avoided to reduce stream warming.

If the pond has a dry pilot channel, a PVC underdrain pipe shall be located 2 to 3 feet below the riprap to prevent excessive warming of dry weather flows. The pilot channel can also be protected by shade trees.

14. Pond Benches.

The perimeter of all deep pool areas (four feet or greater in depth) shall be surrounded by two benches:

A safety bench that extends 15 feet outward from the shoreline to the toe of the pond sideslope. The maximum slope of the safety bench shall be 3%.

An aquatic bench that extends 15 feet inward from the normal shoreline, that has a maximum depth of eighteen inches below the normal pool water surface elevation.

15. Safety Features.

Fencing of ponds is not generally desirable.

Safety is provided by managing the contours of the pond to eliminate dropoffs and other hazards.

Sideslopes to the pond shall not exceed 3:1 (h:v), and shall terminate on a safety bench.

Both the safety bench and the aquatic bench may be landscaped to prevent access to the pool.

The primary spillway opening shall not permit access by small children.

Outfall pipes above 48 inches in diameter should be fenced.

Warning signs prohibiting swimming and skating may be posted

16. Pondscaping Plan

A pondscaping plan shall be prepared that indicates how aquatic and terrestrial areas will be vegetatively stabilized.

Specific pondscaping guidance is provided in Design of Stormwater Wetland Systems (Schueler, 1992).

17. Wetland Elements.

Wherever possible, wetland plants should be encouraged in the pond design, either along the aquatic bench (fringe wetlands), the safety bench and sideslopes (ED wetlands) or within shallow areas of the pool itself.

The best elevations for establishment of wetland plants, either through transplantation or volunteer colonization, are within six inches (plus or minus) of the normal pool.

18 Pond Buffers and Setbacks.

A pond buffer shall be provided that extends 25 feet outward from the maximum water surface elevation of the pond. The pond buffer should be contiguous with other buffer areas, as are required by local regulation (e.g., stream buffers).

An additional 15 foot setback shall be provided to permanent structures.

Trees should be preserved in the buffer area during construction, should they exist.

Trees, shrubs and native ground covers should be planted in the buffer if they do not presently exist.

The only mowing required within the buffer is along maintenance right of ways and the embankment. The remaining buffer can be managed as a meadow (mowing twice a year) or forest.

19 Maintenance Measures.

Maintenance responsibility for the pond and the pondscape shall be vested with a responsible authority by means of legally binding and enforceable maintenance agreement.

The pond shall be inspected annually in wet-weather conditions.

Sediment removal in the forebay should occur every 5 to 7 years, or after one foot of sediment deposition has been recorded in the forebay.

Suitable on-site sediment disposal area should be reserved.

20 Maintenance Access.

A 25 foot wide maintenance right of way easement shall extend to the pond from a public or private road.

Maintenance access shall have a maximum slope of no more than 15% and shall be stabilized to withstand heavy equipment

The maintenance access shall extend to the forebay, safety bench and riser, and be designed to allow vehicles to turnaround.

Access within the riser is to be provided by lockable manhole covers, and manhole steps within easy reach of valves and other controls.

Stormwater Wetlands

W-1	Shallow Marsh
W-2	ED Shallow Wetland
W-3	Pond/Wetland System
W-4	"Pocket" Marsh
W-5	Submerged Gravel Wetland

W-1 Shallow Marsh: Design Notes

- Deeper forebay and micropool are essential
- Shallow depths over remaining surface area
- High Surface Area to Volume Ration
- Complex internal microtopography
- Potential Wildlife Habitat Creation
- Consumes most land of any pond/wetland option

Stormwater vs. Natural Wetlands

Factor	Stormwater wetlands	Natural wetlands
diversity	low,most emergent	high,many forms
dominants	exotic/invasive	few dominants
maintenance	active management	self-maintaining
sediments	enriched	not enriched
habitat quality	low	high

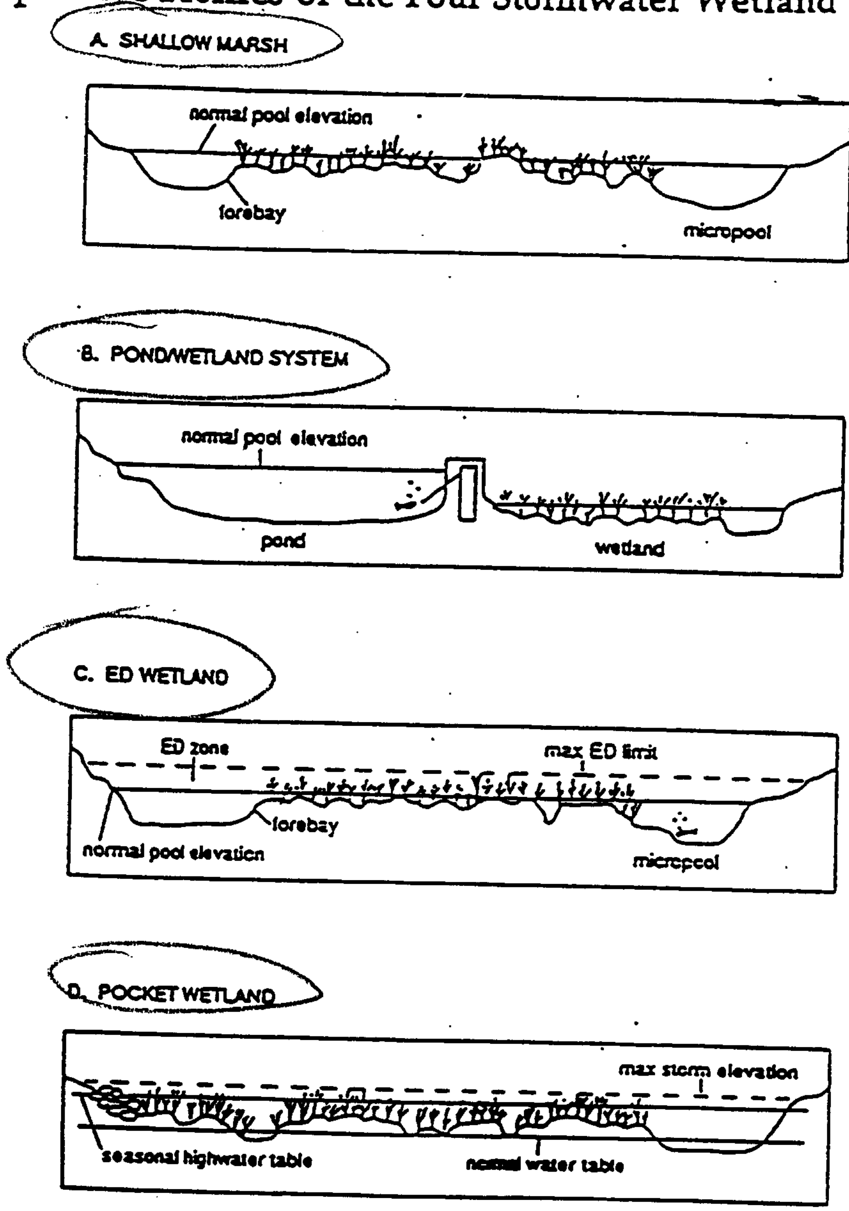
Center for Watershed Protection

Stormwater vs. Natural Wetlands

Factor	Stormwater wetlands	Natural wetlands
water balance	surface Runoff	groundwater
hydroperiod	"semi-tidal"	gradual/seasonal
standing water	year round	seasonal
establishment	by planting	by seedbank
structure	simple	complex

Center for Watershed Protection

Comparative Profiles of the Four Stormwater Wetland Designs



Not to scale

Cross-sectional profiles of the four stormwater wetlands are not drawn to scale. In Panel A, the majority of the shallow marsh is devoted to shallow depths that support emergent wetland plants. The pond/wetland system (Panel B) is composed of deep and a shallow pool. In ED wetlands (Panel C), the runoff storage of the wetland is augmented by temporary, vertical ED storage. Pocket wetlands (Panel D) are excavated to the groundwater table to provide a more or less constant water elevation.

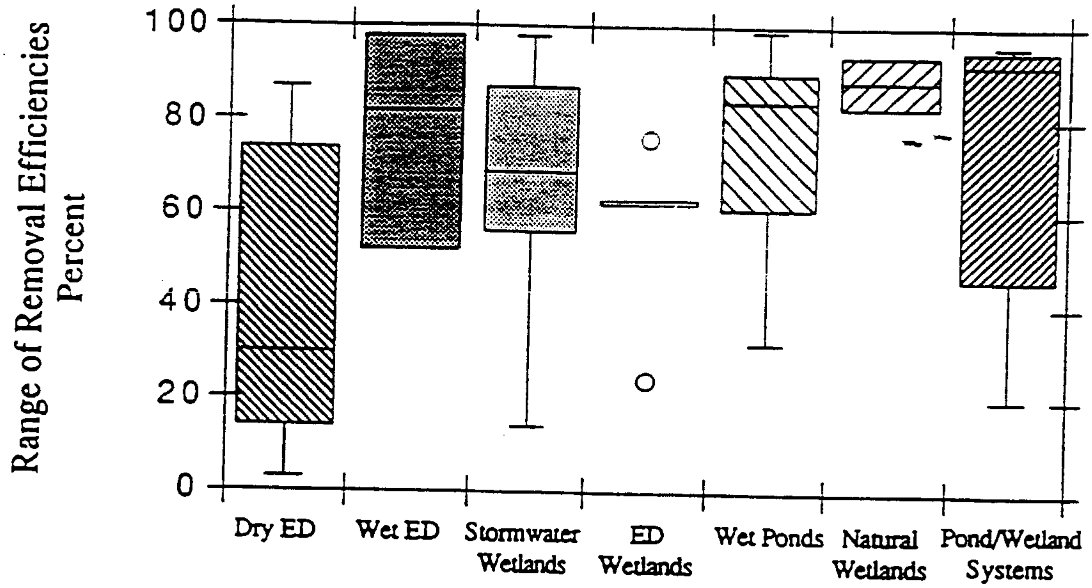
Total Suspended Solids



Total Phosphorous

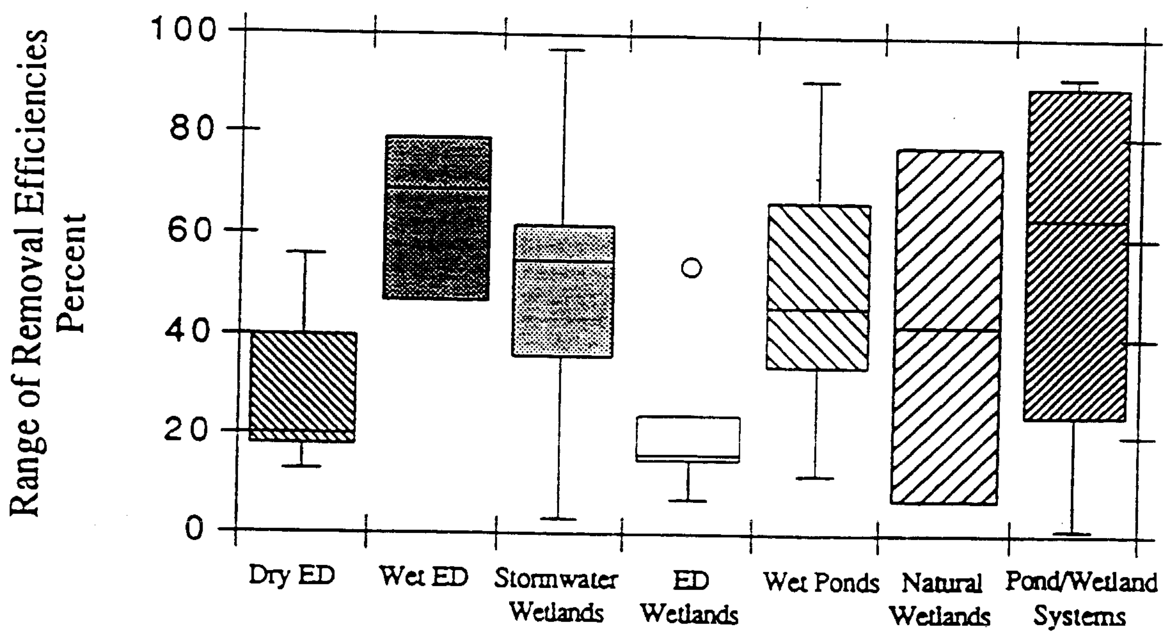


Table 7

Design Techniques to Enhance Pollutant Removal Performance of Stormwater Wetland Systems

1. **Increase the Volume of Runoff Treatment**
   - Capture greater percentage of annual runoff volume
   - provide for longer residence time in wetland for most storm events

2. **Increase the Surface Area to Volume Ratio**
   - increase the total area of the wetland, or
   - increase the internal structural complexity of the wetland, by adding complex microtopography, establishing extensive and dense wetland plant cover

3. **Increase the Effective Flow Path Through the Wetland**
   - extend distance between the inlet and outlet (berms)
   - maximize sinousity of dry weather flow path with hi marsh wedges
   - create some areas with extremely shallow flow path (i.e., hi marsh)
   - use multiple cells within the wetland system

4. **Provide Runoff Pre-Treatment and Energy Dissipation**
   - use forebay or pond cell near inlet, with broad crested weirs to spread flow between cells

5. **Utilize Redundant Pollutant Removal Pathways**
   - provide extended detention to keep removal rates reliable during non-growing season, or
   - utilize permanent pool to increase algal uptake and sedimentation

R0020256

Suggested Sizing Criteria for Stormwater Wetlands

1. Treat 90% of Annual Runoff Volume (V_T)
2. Minimum Wetland/Watershed Area Ratio
3. Allocate Depth Zones, by Surface Area
4. Allocate Depth Zones, by Treatment Volumes
5. Minimum Effective Flow Path
6. Adequate Water Balance to Sustain Pool
7. Small Storm ED, If Needed

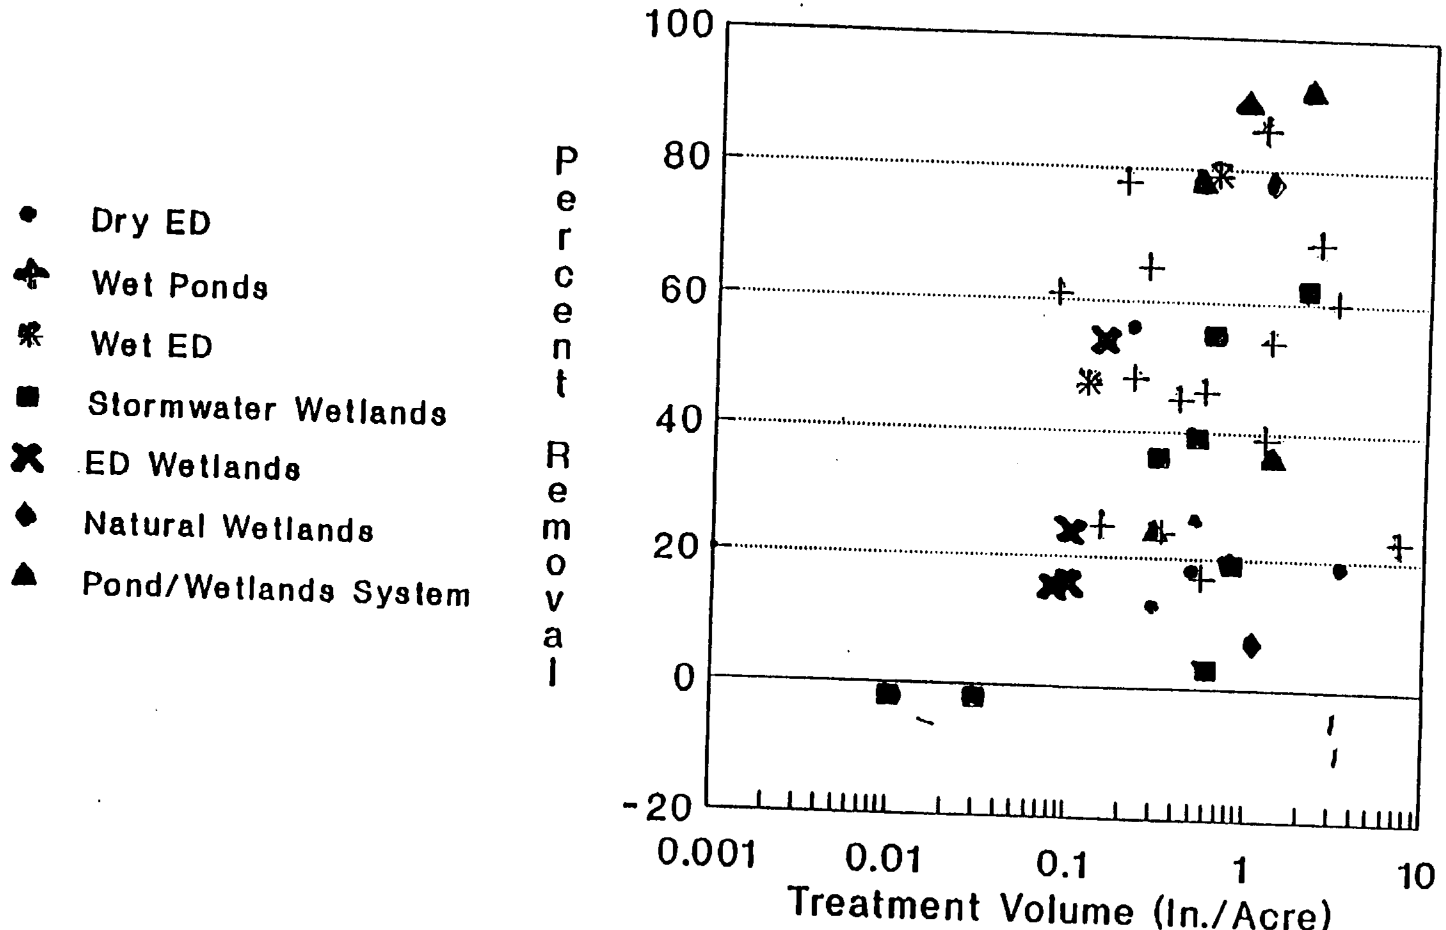
Criteria No. 1: 90% V_T

- Derived from Regional RFS Analysis
- 90% Runoff Producing Event = 1.25 Inches
- $V_T = (1.25)(Rv)(A)$
- V_T Increases with I
- Minimum V_T of 0.25 Inches/Acre
- 50% Storms Are 1/3 of V_T
- RFS Criteria Generally Comparable to Other Criteria

R0020258

Pollutant Removal Efficiency

Total Phosphorus, Rain



11/15/91--Revision

R0020259

Criteria No. 2: Surface Area Requirements

- o Wetland to Watershed Area Ratio (WWAR)
- o Gross Measure of SA/V Ratio
- o Removal Rates Increases If Ratio Exceeds 2%
- o Minimum WWAR's (general target)
  - Shallow Marsh = 2.0
  - ED and Pond/Wetlands = 1.0
  - Pocket Wetlands = 1.0

R0020260

Criteria No. 3: Area Allocations for Depth Zones

Percentage of Total Surface Area

	Deepwater	Low Marsh	High Marsh
Design 1	20	40	40
Design 2	45	25	30
Design 3	20	35	45
Design 4	10	40	50

R0020261

Maximum Water Depths For Emergent Wetland Plant Species

Emergent Wetland Species	Maximum Depth
A. Primary Species	
Sagittaria latifolia (duck potato)	12 inches
Scirpus pungens (common three square)	6 inches
Scirpus validus (softstem bulbrush)	12 inches
B. Secondary Species	
(Acorus Calamus (sweet flag)	3 inches
Cephalanthus occidentalis (button bush)	2 feet
Hisbiscus Moscheutos (rose mallow)	3 inches
Hibiscus Laevis (Halbered-leaved r. mallow)	3 inches
Leersia oryzoides (rice cutgrass)	3 inches
Nuphar luteum (spatterdock)	5 feet (2ft. min.)
Peltandra virginica (arrow-arum)	12 inches
Pondederia cordata (pickerel weed)	12 inches
Saururus Cernuus (lizards tail)	6 inches
C. Exotic or Invasive Species (not recommended)	
Phramities australus (common reed)	3 inches
Typha Latifolia (common cattail)	12 - 18 inches
Typha angustifolia (narrow-leaved cattail)	12 inches

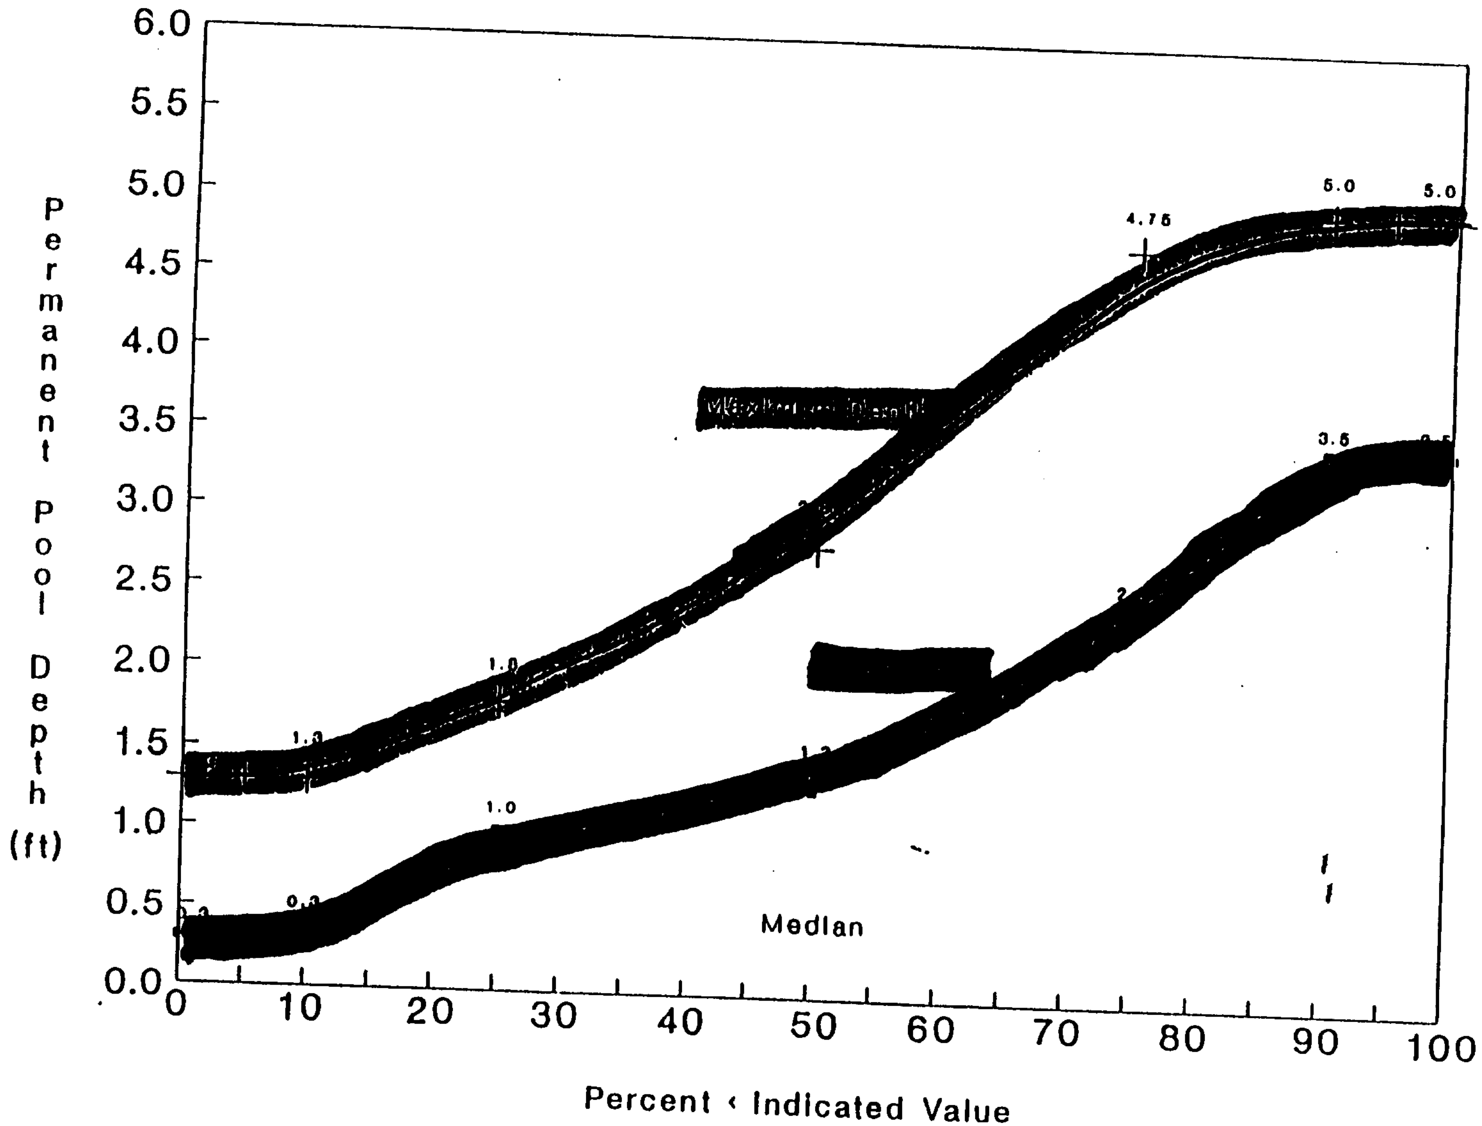
Note: These depths can be tolerated, but plant growth and survival may decline under permanent inundation at these depths.

Primary species are rapid colonizers; secondary species do not spread as rapidly.

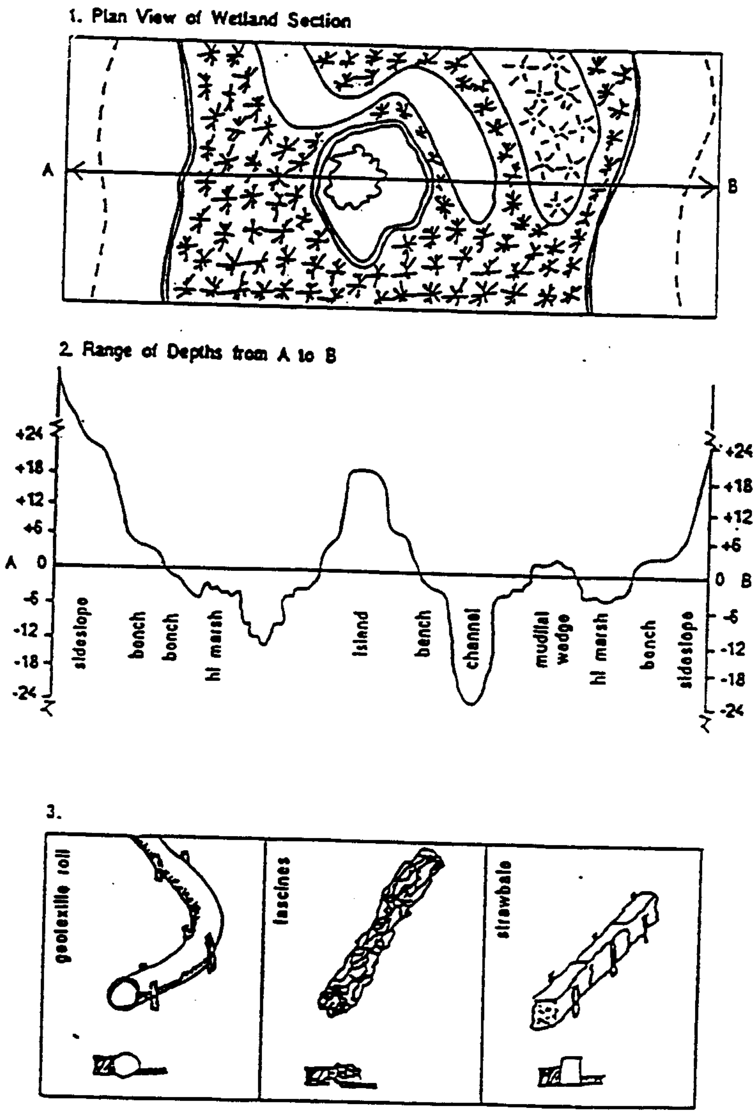
Table adapted from Athanas (1986).

R0020262

Figure X. Artificial Marshes: Maximum and Mean Permanent Pool Depths (N=9)



Complex Microtopography Across a Stormwater Wetland Enhances Removal Performance



Complex microtopography across a stormwater wetland (panel A) creates a range of depth zones (panel B) that increases total surface area available for adsorption and microbial activity, and creates better conditions for sedimentation and filtration. Panel C illustrates some techniques for maintaining microtopographic elevations in high energy or soupy substrate environments.

R0020264

Criteria No. 4: Volume Allocations for Depth Zones

Percentage of Total Treatment Volume (V_T)

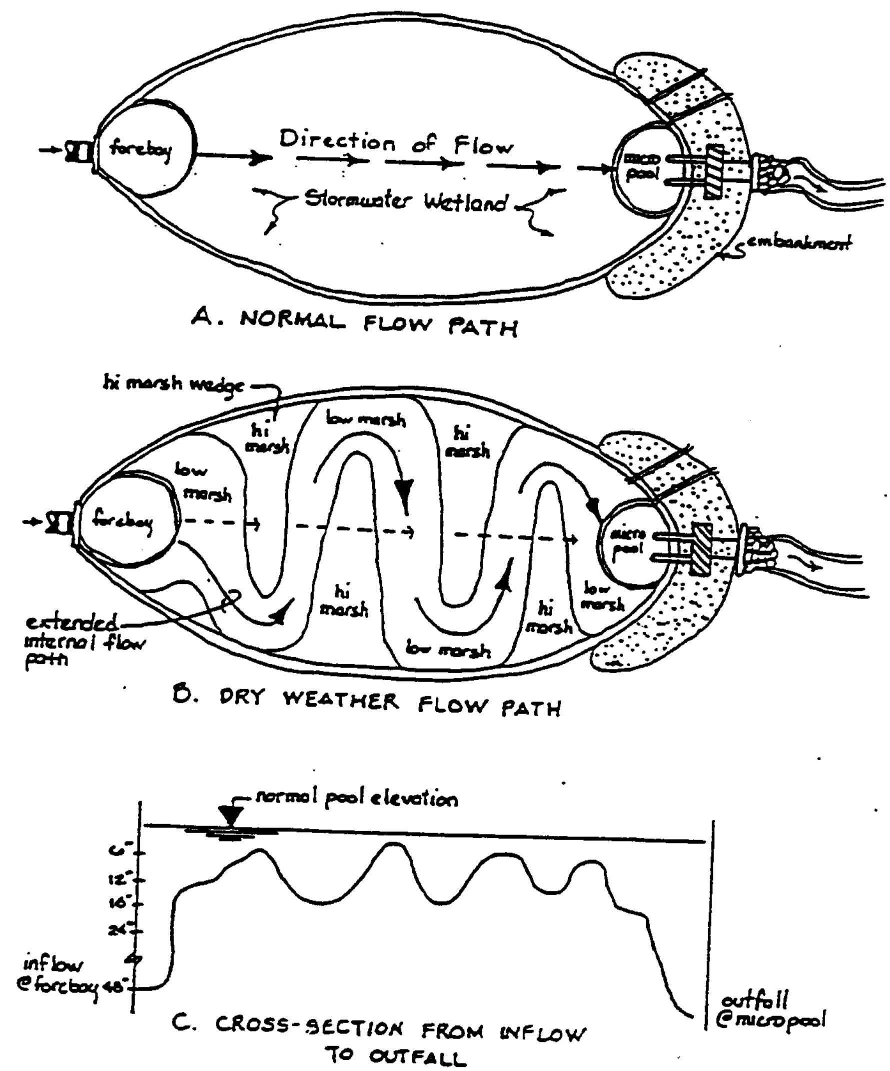
	Deepwater	Marsh	ED
Design 1	40	60	0
Design 2	70	30	0
Design 3	20	30	50 ✓
Design 4	10	100	0

R0020265

Criteria No. 5: Minimum Effective Flow Path

- Minimum Length to Width Ratio of 1 (1 + O/W)
- Preferred Ratio Is 2:1 or 3:1 (Berms)
- Minimum Dry Weather Flow Path of 2:1
- Use of Hi Marsh Wedges for Sinuosity
- No Minimum for Pocket Wetlands

Use of Hi Marsh Wedges to Extend the Internal Flow Path Through a Stormwater Wetland



Although the flow path of runoff during storms is governed by the distance between the inlet and outlet of the pond, the effective flow path during dry weather can be much greater if wedges of hi marsh (1 to 6 inches deep) are placed at right angles to the normal direction of flow.

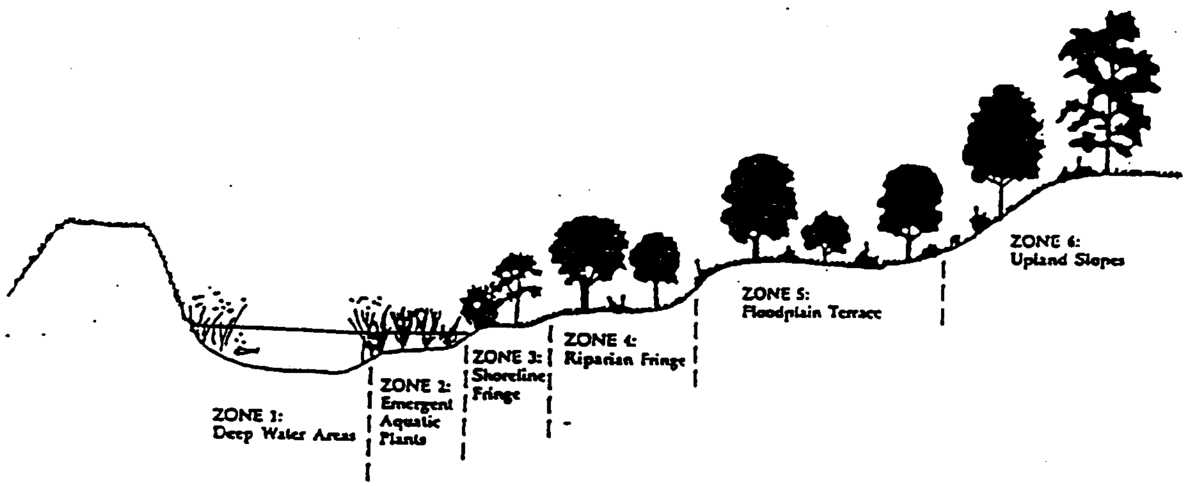
Criteria No. 6: Adequate Water Balance

- Field Confirmation of Baseflow
- 0.10 CFS / 50 Acres ROT
- Wetland Sealing Reduces Exfiltration
- Karst, Fractured Bedrock, Gravel Sands Cause Problems
- In Most Cases, Drawdown = Evaporation
- Pocket Wetlands - Excavate to Groundwater

Criteria No. 7: Extended Detention (Where Applicable)

- ED Volume No More Than 1/2 V_T
- ED Time 12 to 24 Hours
- Max Vertical ED Zone: 2 Feet
- Adjustable Gate Valve Adds Flexibility
- Protected ED: Reverse Pipe or Proportional Weir

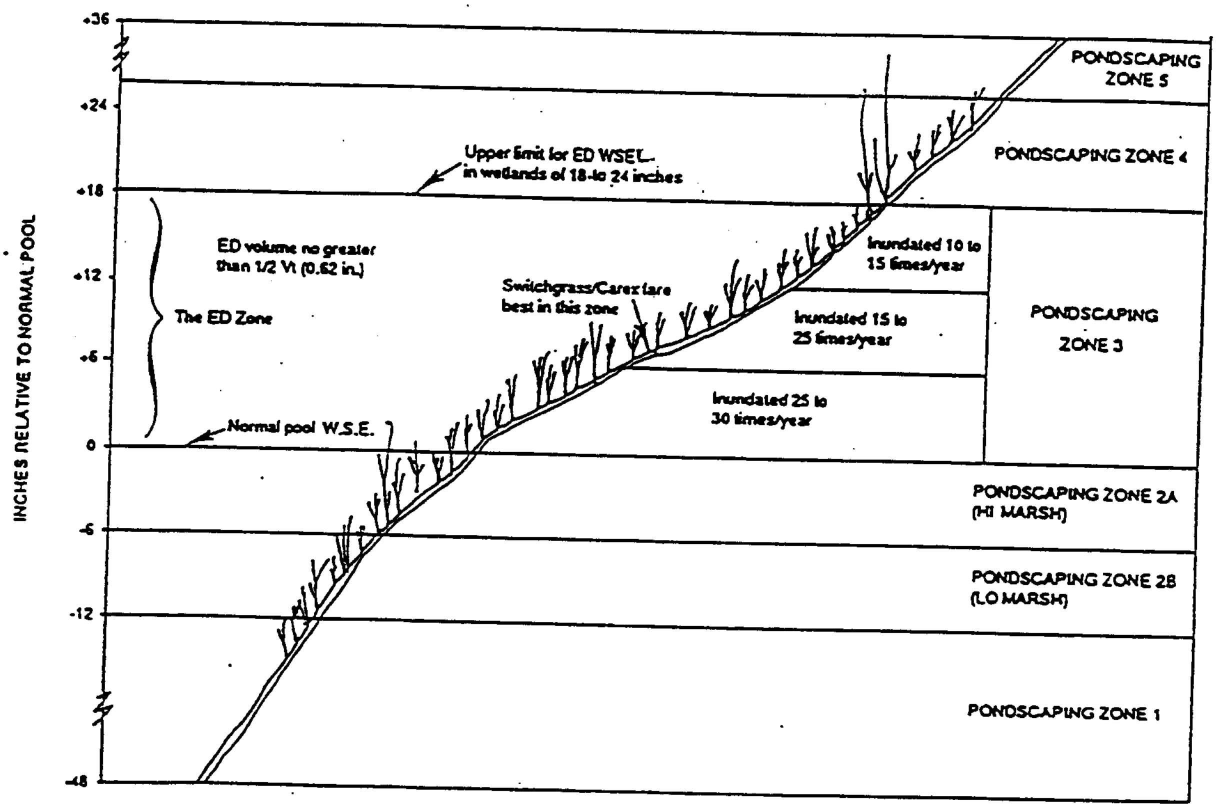
Pondscaping Zones in a Stormwater Wetland
(Cross-sectional view)



The pondscaping zones as they appear in cross-section. Note that the width of the pondscaping zones is related to the side-slope angle, i.e, the steeper the slope; the narrower the width of the pondscaping zones.

R0020270

The ED Zone in a Stormwater Wetland



The effort of extended detention (ED) in stormwater wetlands is to create a unique pondscaping zone (No.3) that is subject to frequent but brief periods of inundation. The frequent change in water levels imposes severe physiological stress on the plant community in this zone. The increased frequency of inundation can also have an impact on the lo marsh zone (2B). Therefore, a maximum upper limit of 2 to 3 feet of ED is recommended.

R0020271

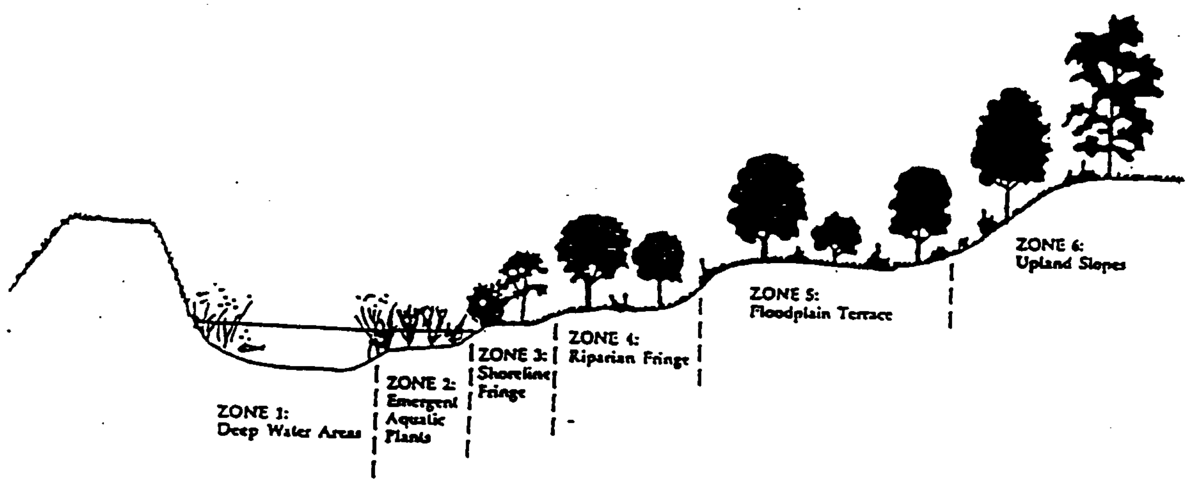
The ED Zone in Stormwater Wetlands

- Inundation Frequency: 5 to 40 Times / Yr
- Sharp Gradient in Inundation Frequency
- 2-3 Foot Vertical Limit to ED Zone
- Severe Physiological Constraints on Plants
- Difficult to Establish a Vigorous Ground Cover

Stages of Stormwater Wetland Design and Construction

1. Evaluate the Feasibility of a Stormwater Wetland at the Site.
2. Develop the Initial Concept Design.
3. Size the Stormwater Wetland for Maximum Pollutant Removal.
4. Incorporate Standard Design Features into the Stormwater Wetland.
5. Develop a Pondscaping Plan for the Wetland and Its Buffer
6. Prepare the Wetland Bed for Planting
7. Establish and Maintain the Pondscape
8. Inspect and Manage the Wetland After Construction

Pondscaping Zones in a Stormwater Wetland
(Cross-sectional view)



The pondscaping zones as they appear in cross-section. Note that the width of the pondscaping zones is related to the side-slope angle, i.e, the steeper the slope; the narrower the width of the pondscaping zones.

R0020274

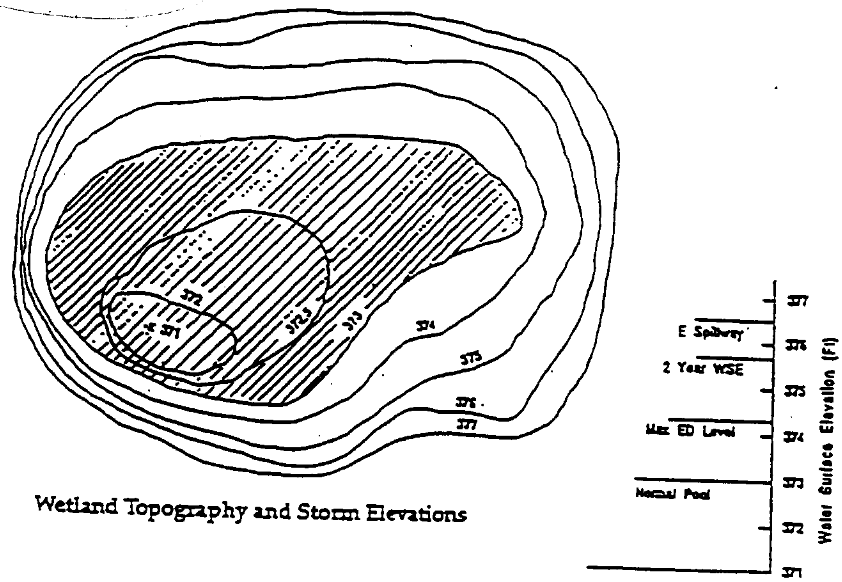
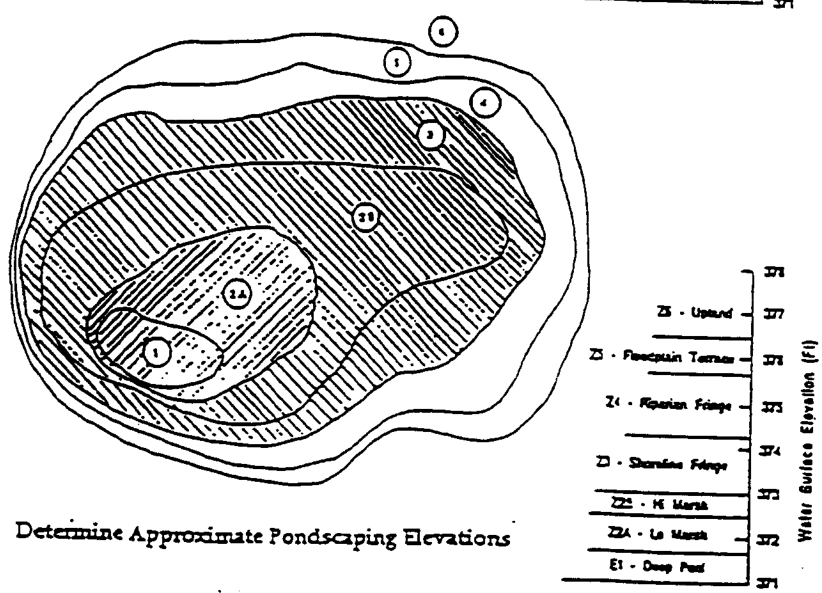
Pondscaping Zones in a Stormwater Wetland (Plan view)



Wetland Topography and Storm Elevations



Determine Approximate Pondscaping Elevations

The pondscaping zones of a stormwater wetland can be estimated by examining the water surface elevations for the various design storms that the wetland has been engineered to control. The next step is to define the inundation frequencies that correspond to the storm elevations, and thereby set the appropriate pondscaping zones.

R0020277

Creating Effective and Diverse Stormwater Wetlands

- If possible, let basin sit for a few months to establish actual planting depths
- Select 2-3 dense growing, aggressive species
- Bulrush, Dickerweed, Arrow Arum, Three-Square or Rice Cutgrass
- Plant in clumps, 18" OC, over 50% SA of wetland
- Add 5 other wetland species to promote diversity
- Avoid Cattails, Phragmites and Loose Strite
- Measure depths, stake and flag
- Followup after first growing season with reinforcement planting
- Transplanting window and post-nursery care is very important

Center for Watershed Protection

PONDSCAPING SEQUENCE

1. Temporary stabilization of all disturbed areas within 72 hours of final grade.
2. Aquatic planting window 4/1 - 6/15.
3. Reconfirm planting elevations one week prior to planting.
4. Revise plan, stake and flag.
5. De-water wetland 24 hrs before planting.
6. Plant wetland, remaining trees/shrubs.
7. Mulch, water stock, as needed.
8. Inspect pondscape twice/yr.
9. Reinforce planting at end of 1st and 2nd growing season.
10. Restrict mowing to designated areas.
11. Suppress weeds/vines on trees/shrubs during years 2 and 3.

PONDSCAPING NOTES

1. No trees in embankment or along mowed maintenance access area.
2. Tree-save line denotes limit of disturbance during wetland excavation.
3. Pondscaping zones and marsh planting zones to be confined in field after excavation.
4. Existing topsoil to be stockpiled and used to dress pondscaping zones 4,5,6.
5. Reinforcement planting after first growing season based on field inspection of marsh plant survival / colonization rates.
6. Three soil pit tests taken to confirm general soil properties.
7. Switchgrass overseeded on Red Fescue in Pondscaping Zone 3, Tall Fescue and Wildlife grass mix used in Zones 4,5,6 within three days of final grading for erosion control.
8. Six inches of wood mulch around all trees and shrubs, planting holes to be threetimes rootball diameter.

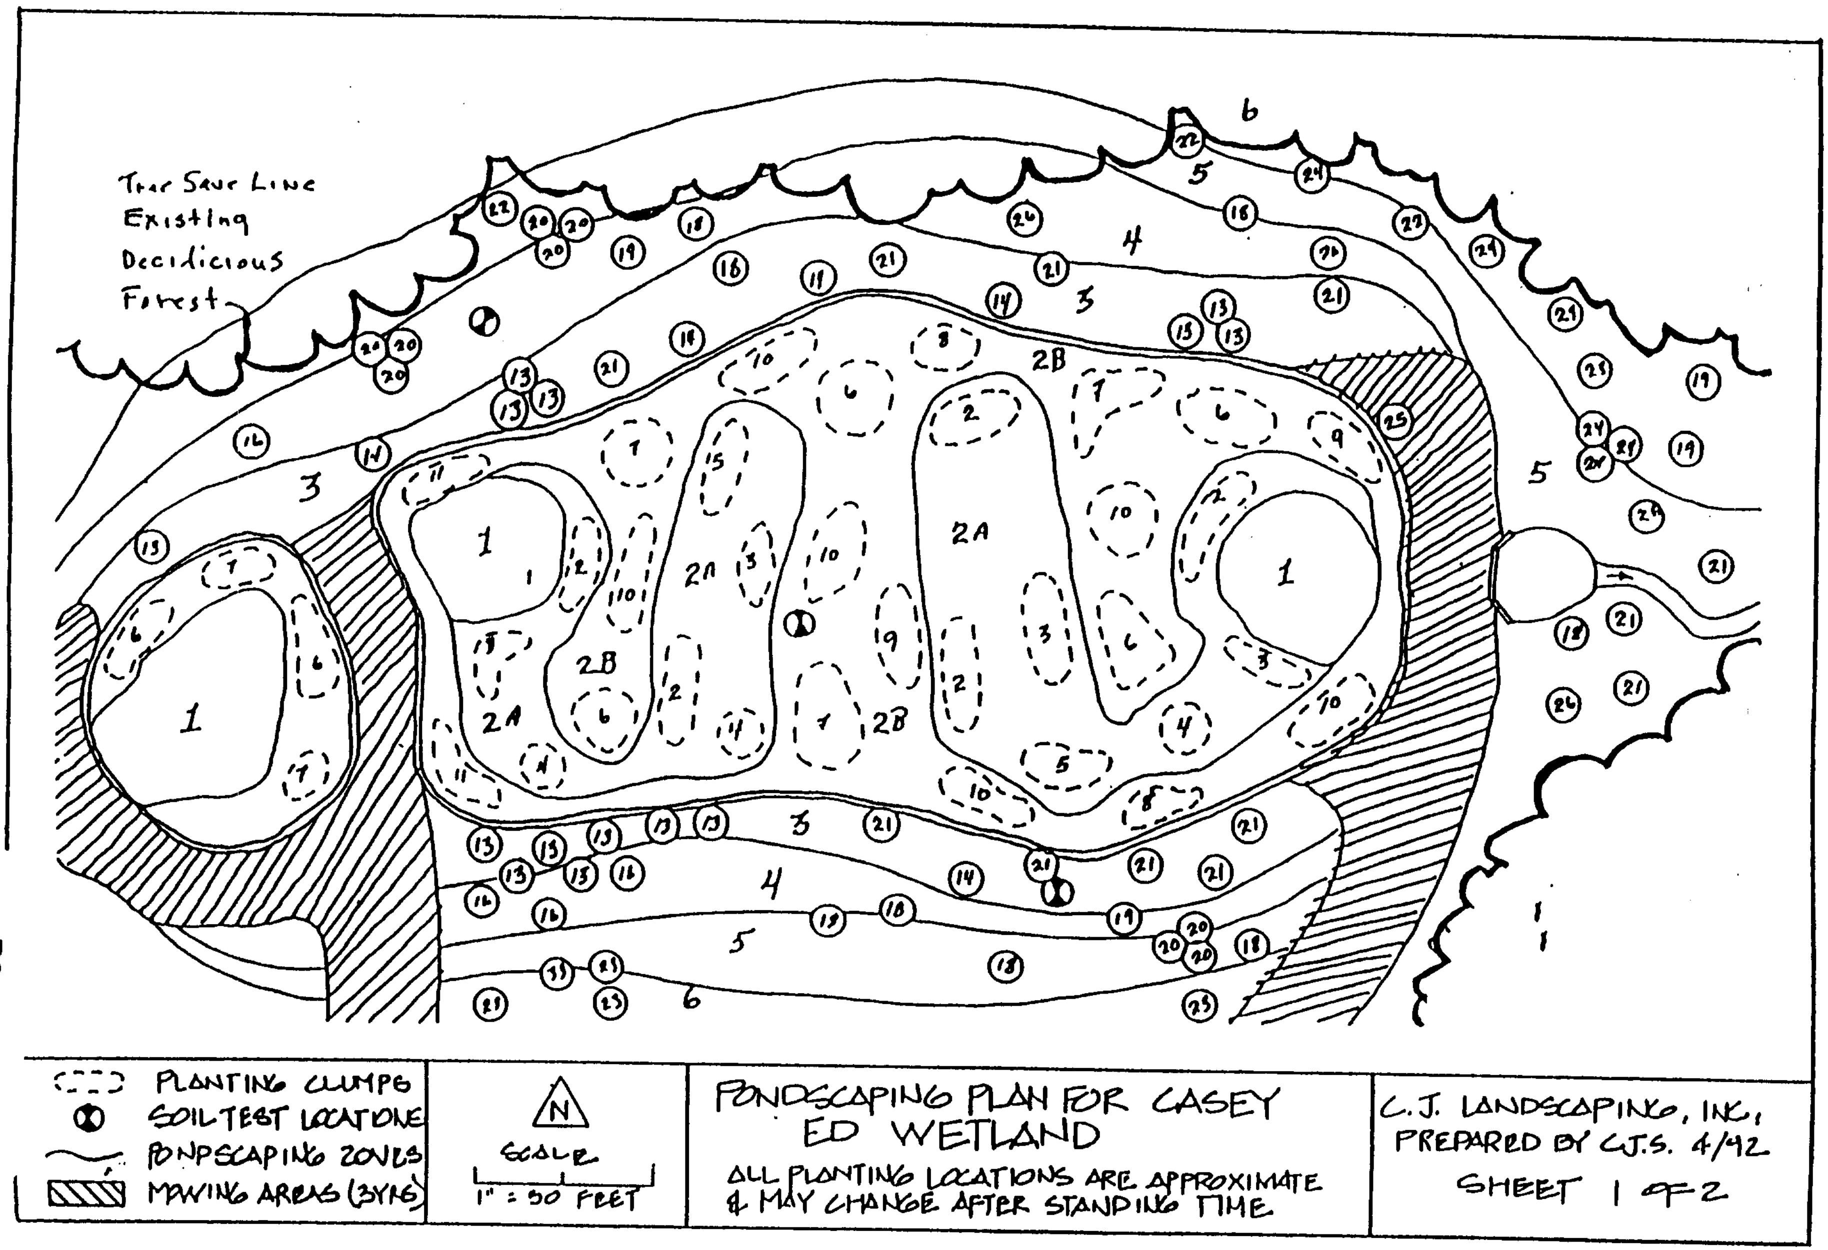
Figure 16: Sample Pondscaping Plan



Establishing a Diverse Wetland Plant Community

1. Preparing the Wetland Bed
2. Establishing the Plant Community
   - -planting nursery stock
   - -wetland mulch
   - -broadcasting wetland seeds
   - -allowing volunteer

Center for Watershed Protection

Transplanting Wetland Nursery Stock

- Spring planting window
- Plant 5 to 7 species of emergents
- Plant in single-species clumps (18" O.C.)
- Initial plantings: 50% of Surface Area
- Reinforcement plantings: second growing season

Center for Watershed Protection

Seedbanks for Wetland Establishment

- Wetland mulch - Upper six inches of wetland soils
- Up to 20 species can emerge from Seedbank
  - composed of native sedges?, rushes, and grasses
- Donor sites are highly restricted
- Spread mulch 3-6 inches in Hi Marsh
- Uncertainty about ultimate community

Center for Watershed Protection

Stormwater Wetland Buffers

- o Minimum 25 Feet from Max WSE
- o Additional 15 Foot Setback to Structures
- o Wider Buffer Helpful for Habitat
- o 75% Buffer Perimeter as Forest

  Preserve Existing Trees, if Practicable

R0020282

Maintenance of the Pondscape

- Reinforcement plantings
- Control of exotic or invasive species
- Harvesting of the wetland
- Reducing mowing of the pondscape
- Intensive maintenance of pondscape (0 to 2 years)

Center for Watershed Protection

Preparing the Wetland Bed - Seven Steps

1. Prepare Grading Plan
2. Grade to Interim Elevations
3. Add Topsoil and/or Mulch Amendments
4. Grade to Final Elevations (Micro-T)
5. Allow 6 to 9 Months Standing Time
6. Measure and Stake Planting Depths
7. De-Water Wetland

Center for Watershed Protection

Stormwater Management

R0020284

Wetland Design Example

Design Assumptions

- Wetland example serves same area as pond design example
  - Townhouse development project
  - Located in Mid-Atlantic Piedmont
  - Receiving water is warm-water fishery
  - Low hazard facility
  - 2 and 10 year management
  - soils adequate for wetland pool and embankment
  - No wetlands/forest disturbance
- Water quality volume (WQV) based on 90% rule
- Wetland design example is Design 3: ED Wetland

Center for Watershed Protection

R0020285

Wetland Design Example

Design Steps - I

1. Same first 6 as pond design example
   - assemble background information
   - confirm design criteria
   - establish hazard classification
   - conduct site visit
   - perform hydrologic computations
   - determine storage requirements (quantity controls)
2. Calculate target permanent pool volumes and surface areas
3. Perform wetland pond grading
4. Compute provided storage and surface areas

Center for Watershed Protection

R0020286

Wetland Design Example

Design Steps - II

5. Perform hydraulic calculations
   - extended detention outlet
   - 2 year storm outlet
   - 10 year storm outlet
   - riser and barrel sizing & capacity
   - emergency spillway
6. Prepare storage-elevation-discharge table
7. Conduct wetland pond routing
8. Perform additional calculations
9. Draw profile and details
10. Pondscaping design

Center for Watershed Protection

R0020287

Wetland Design Example

Given: D.A. = 72.4 ac

WQV = 3.77 ac-ft

2 year management volume = 3.20 ac-ft

10 year management volume = 6.18 ac-ft

Allowable release rates:

2 year = 16.0cfs

10 year = 78.4 cfs

Inflow rates:

2 year = 89 cfs

10 year = 212 cfs

100 year = 392 cfs

Center for Watershed Protection

R0020288

Wetland Design Example

Surface Area & Storage Requirements - I

Extended Detention:

- 50% of WQV = 1.89 ac-ft
- Maximum depth = 2 ft
- Minimum surface area = 1.89/2 = 0.95 ac-ft

Permanent Pool:

- Target minimum surface area: Between 1% & 2% of watershed area: 72.4(.01) = 0.72 ac
  72.4(.02) = 1.45 AC

Center for Watershed Protection

R0020289

Wetland Design Example

Surface Area & Storage Requirements - II

Target Permanent Pool Depth Zones:

3 Depth zones:	Volume (% of WQV)	Area (% of total)
Deep water	25% - 40%	20% - 30%
High marsh	*5% - 10%	*30% - 40%
Low marsh	*15% - 20%	*30% - 40%

(* Target minimum)

Center for Watershed Protection

R0020290

Wetland Design Example

Surface Area & Storage Requirements-III

Permanent Pool Depth Zone Goals:

D.A. = 72.4 ac, WQV = 3.77 ac-ft, ED Vol. = 1.89 ac-ft

3 Depth Zones	Volume (ac-ft)	Area (ac)
High marsh (<6")	.05(3.77) = 0.19 ac-ft	0.38 ac
Low marsh (16" avg.)	.15(3.77) = 0.57 ac-ft	0.42 ac
Deep pool (4' avg.)	.35(3.77) = 1.32 ac-ft	0.33 ac

Definition

Porous pavement is an alternative to conventional pavement whereby runoff is diverted through a porous asphalt layer and into an underground stone reservoir. The stored runoff then gradually infiltrates into the subsoil.

Schematic Design of a Porous Pavement System

BMP Selection and Location

Six Step Screening Process

1. Watershed Management Objectives
2. Terrain Factors
3. Stormwater Treatment Suitability
4. Physical Feasibility
5. Community and Environmental Benefits
6. Locational/Permitting Factors

Center for Watershed Protection

Step 1. Watershed Management Objective

- Maryland Critical Area (IDA's)
- Coldwater Streams (Maryland Use III and IV)
- Sensitive (Maryland Use I, IV, and Ic less than 15%)
- Wellhead Protection
- Reservoir Protection
- Shellfish/Beach Protection (Maryland Use II)

Center for Watershed Protection

BMP SELECTION MATRIX No. 1:
SPECIAL WATERSHED DESIGN REQUIREMENTS

BMPs	Critical Area	Cold-water	Sensitive	Ground. Protection	Reservoir Protect.	Shellfish Beach
Ponds	Drainage area may limit except for P5. P1 has low removal rate	P2, P3, and P4 restricted, limit ED to 12 hrs offline design shading	Require Control of Cpv, usually 1year 24 ED	May require liner if A soils are present pretreat hotspots 2 to 4 ft SD	Require Cpv Control	Moderate bacteria removal, but design to prevent geese. permanent pool
Wetlands	Drainage area may limit, W-4 excepted	W1, W2 and W3 restricted	Same as above			Provide 48 hr ED for max coliform dieoff
Infiltration	are often infeasible due to soils or water table in tidal area	Useful, if site has right soil	may be difficult to infiltrate the Cpv	SD from wells and water table. No hotspot runoff infiltrate rooftop runoff	SD from bedrock and water table. Pretreat runoff	OK, but a min 4 ft SD is required
Filtering Systems	OK	OK, but evaluate for stream warming	Must be combined another ED basin to provide Cpv	yes, if designed w/ no exfilter	Filtering may be required for pretreat.	mod. to high coliform removal
Open Channels	OK	OK	Must be linked w/ ED basin to provide Cpv	OK, but hotspot runoff must be adequately treated		poor coliform removal for O-2 and O-3

SD = Separation Distance

Step 2. Terrain Factors

- Low Relief
- Karst
- Mountainous

Center for Watershed Protection

BMP SELECTION MATRIX No. 2:
TERRAIN FACTORS

BMPs	Low Relief	Karst	Mountainous
Ponds	Maximum ponding depth of 4 feet	Require poly or clay liner max ponding depth geotechnical tests	Maximum pool depth 8 ft
Wetlands	OK	require polyliner geotechnical testing	Maximum pool depth 8 ft Embankment heights restricted
Infiltration	NOT Recommended. Minimum distance to water table of 2 feet	NOT ALLOWED	Max slope 8% trenches must have flat bottom
Filtering Systems	Several designs limited by low head (F1 and F2)	Use poly-liner or impermeable membrane to seal bottom	OK
Open Channels	Not generally feasible due to low slopes	OK	Often infeasible if slopes are 4% or greater

Note: SD = separation distance to seasonally high water table or bedrock

Step 3. Stormwater Treatment Suitability

- Recharge (Re_v)
- WQ_v
- Cp_v
- Qp
- Ability to accept hotspot runoff

Center for Watershed Protection

R0020354

Step 4. Physical Feasibility

- Soils
- Water Table
- Drainage Area
- Slope
- Head
- Bedrock

Step 5. Other Factors

- Maintenance Burden
- Community Acceptance
- Construction Cost
- Habitat Creation
- Others

Step 6. Locational/Permitting Considerations

- Wetlands
- Streams
- Stream and Shoreline Buffers
- Floodplains
- Forest Conservation Areas
- Steep Slopes
- Existing/Proposed Utilities
- Residential Setbacks

F-6 Bioretention	2.0	1.5	2.5	4.0	Landscaping
O-1 Dry Swale	2.0	1.5	2.5	4.5	
O-2 Wet Swale	2.0	1.5	1.5	4.0	Possible mosquitos
O-3 Bioretention Cell	2.0	1.5	1.5	4.0	

BMP Selection Example

Treatment Suitability

(Matrix No. 3

Recharge and Channel protection controls (Re_v and Cp_v)

- Ponds: limited Re_v, Cp_v OK
- Wetlands: limited Re_v, Cp_v OK
- Infiltration: Re_v good, Cp_v unlikely
- Filters: limited Re_v, no Cp_v
- Bioretention: Re_v good, Cp_v depends
- Open channels: limited Re_v, no Cp_v

BMP Selection Example

- 50 acre single family subdivision
- 15,000 sq ft lot sizes
- Karst topography
- Cold-water receiving stream (Maryland Use IV)
- Drains to headwater stream (approx. 150 acre DA)

BMP Selection Example

Preferred Alternatives

(multiple practices)

- Micro-pool ED for Cp_v & some WQ_v
  - minimizes thermal impacts (provide shading & off line design)
  - provide 12 hr ED for Cp_v
  - drainage area appropriate
  - provides some water quality control
  - provide liner, if necessary
  - appropriate for land use
- Bioretention for Re_v & WQ_v
  - provides recharge
  - provides water quality
  - ok for karst (no infiltration, limited open channel applications)
  - appropriate for land use
  - 5 to 10 locations necessary
  - pretreat with filter strips

R0020363

BMP Selection Example

Terrain Consideration

(Matrix No. 2)

Karst Topography

- Ponds: Poly- or clay liner recommended: (geotech. to confirm)
- Wetlands: same
- Infiltration: Not allowed
- Filters: Liners or concrete shell
- Open channels: OK, but consider increased infiltration (geotech. to confirm)

preclude a BMP. At the end of this step, the designer can screen the BMP options down to a manageable number, and determine if a single BMP or multiple BMP system is needed to meet the four stormwater sizing criteria for the site.

Step No. 4 Physical Feasibility

Are there any physical constraints at the project site that might restrict or preclude the use of a particular BMP? In this step, the designer screens the BMP list using Matrix No. 4 to determine if the soils, water table, drainage area, slope or head conditions present at a particular development site that might limit the use of a BMP. In many cases, the designer can use the matrix to identify geotechnical or other tests to confirm physical feasibility.

Step No. 5 Community and Environmental Benefits/Drawbacks

Do the remaining BMPs have any important community or environmental benefits or drawbacks that would influence the selection process? In this step, a matrix is used to compare the 22 BMPs on the list in regard to maintenance, habitat, community acceptance, cost and other environmental factors

Step No. 6 Locational Considerations

What environmental features must be avoided or considered when locating the BMP system at my development site, so as to fully comply with State and Federal laws and permits? In this step, the designer follows an environmental features checklist that asks whether any of the following are present at the site: wetlands, waters of the US, stream or shoreline buffers, forest conservation areas, etc. Brief guidance is then provided on "fingerprinting techniques" to locate the BMP so as to avoid impacts to sensitive resources. If the BMP is located within sensitive environmental features, a brief summary of State and federal permitting requirements will be provided.

Summary. The six step approach is intended to compactly present comparative information for the 22 BMPs on the list in a condensed format. Some of the comparative information in the matrices reflects our recent interviews with engineers across the State, and general research into the physiographic differences in the State.

The advantage of the six step approach is that it allows manual readers to use whatever matrices they need for design, and also provides a step-wise approach for the novice designer or plan reviewer. A more user-friendly and attractive format will be developed for the final manual.

BMP Selection Example

Physical Feasibility

(Matrix No. 4)

Drainage area

- Ponds: 10-25 acre min. (except pocket)
- Wetlands: 25 acre min. (except pocket)
- Infiltration: 10 ac max.
- Filters: 10 ac max.
- Bioretention: 5-10 ac max.
- Open channels: 5 max.

Shellfish/Bacteria. Watersheds that drain to specific shellfish harvesting areas or public swimming beaches require a higher level of BMP treatment to prevent closings due to bacterial contamination from stormwater runoff. In these watersheds, BMPs are explicitly designed to maximize bacteria removal.

Section 4.0 A Guide to BMP Selection and Location in the State of Maryland

Section 4.1 Introduction

This section outlines a process for selecting the best BMP or group of BMPs at a development site, and provides guidance on factors to consider on where to put the BMP ~~on~~ the site. The process is used to screen the 22 designs on the BMP list that could meet the pollutant removal targets for the WQ_v. The process asks the designer to go through a six step screening process, that progressively examines:

- Watershed Factors
- Terrain Factors
- Stormwater Treatment Suitability
- Physical Feasibility Factors
- Community and Environmental Benefits
- Locational Considerations

More detail on the step-wise screening process is provided below:

Step No. 1 Watershed Factors

Is the project located in a watershed that has special watershed design objectives or constraints that must be met? Matrix No.1 outlines BMP restrictions or additional design requirements that must be considered if the project lies within the Maryland Critical Area, Cold-water watersheds, Sensitive Watersheds, Aquifer Protection Areas, Water Supply Reservoirs, and Shellfish/Beach Protection Zones.

Step No. 2 Terrain Factors

Is the project located in a portion of the State that has particular constraints imposed by local terrain and or underlying geology? Matrix No. 2 details BMP restrictions for karst regions (portions of Carrol, Frederick and Washington Counties) and low relief areas of the lower Eastern Shore.

Step No. 3 Stormwater Treatment Suitability

Can the BMP meet all of my stormwater treatment requirements for my site, or will a combination of BMPs be needed? In this step, the designer can screen the BMP list using Matrix No. 3 to determine if a particular BMP can meet the Re_v, C_{pv} and/or Q_p storage requirements, In addition, this third matrix allows the designer to determine if the BMP is capable of treating hotspot runoff, and provides relative indexes for land consumption and safety risk that might

Each of the 22 BMPs on the list are presumed capable of achieving a long-term removal rate of 80% for total suspended solids, which has been identified as a base criterion for BMP performance under the recently issued CZARA 6217 guidance (see Section 3).

Section 4.3 Terrain Factors

Three key factors to consider are low-relief, karst and mountainous terrain. In the state of Maryland, *Low Relief Areas* can be defined as the Eastern Shore Counties, particularly below Choptank River, while most of the *Karst* and major carbonaceous rock areas are found in portions of Carrol County, Frederick County and Washington County. Mountainous areas are found in the Western part of the State.

BMP SELECTION MATRIX No. 2: TERRAIN FACTORS

BMPs	Low Relief	Karst	Mountainous
Ponds	Maximum ponding depth of 4 feet	Require poly or clay liner max ponding depth geotechnical tests	Maximum pool depth 8 ft
Wetlands	OK	require polyliner geotechnical testing	Maximum pool depth 8 ft Embankment heights restricted
Infiltration	NOT Recommended. Minimum distance to water table of 2 feet	NOT ALLOWED	Max slope 8% trenches must have flat bottom
Filtering Systems	Several designs limited by low head (F1 and F2)	Use poly-liner or impermeable membrane to seal bottom	OK
Open Channels	Not generally feasible due to low slopes	OK	Often infeasible if slopes are 4% or greater

Note: SD = separation distance to seasonally high water table or bedrock

Section 4.2 Watershed Factors

In some cases, higher pollutant removal or environmental performance is needed to fully protect aquatic resources and human health and safety within a particular watershed. Therefore, a shorter list of BMPs may need to be considered for selection within these watersheds or zones. They include:

Maryland Critical Area Intensively Developed Areas (IDAs). BMPs located within the Intensively Developed Area (IDA) of the Maryland Critical Area (a zone extending 1000 feet landward from mean high tide) must demonstrate compliance with the "10% Rule" The rule mandates that post development stormwater phosphorus loads must be reduced to 10% below pre-development loads, using the methodology developed by Herson et al, 1994. Updated estimates of long term keystone pollutant removal rates can be found in Section 3.5.

Coldwater Streams (Maryland Use III). These cold and cool water streams have habitat qualities capable of supporting trout and other sensitive aquatic organisms. Therefore, the design objective is to maintain habitat quality by preventing stream warming, maintaining natural recharge, preventing bank and channel erosion, and preserving the natural riparian corridor. Some BMPs can have adverse downstream impacts on cold-water streams, and their use is highly restricted.

Sensitive Streams (Maryland Use IV, or Impervious Cover less than 15%). These streams also possess high quality warm-water aquatic resources. The design objectives are to maintain habitat quality through the same techniques used for cold-water streams, with the exception that stream warming is not as severe of a design constraint. Designers may need to provide Cp_v to protect stream channels from erosion. These streams are specially designated by local authorities (e.g., Piney Branch Special Protection Area in Montgomery County), or may be designated if a project triggers the 401 or 404 permit process.

Wellhead Protection. Areas that recharge existing public water supply wells present a unique management challenge. The key design constraint is to prevent possible groundwater contamination by preventing infiltration of hotspot runoff. At the same time, recharge of unpolluted stormwater is encouraged to maintain flow in streams and wells during dry weather.

Reservoir Protection. Watersheds that deliver surface runoff to a public water supply reservoir or impoundment are a special concern. Depending on the treatment available at the water intake, it may be necessary to control several pollutants of concern to a higher level, such as bacteria, nutrients, sediment or metals. One particular management concern is enhanced treatment for pollutant hotspots that pose a greater risk to drinking water safety.

BMP Selection Matrix No. 3 STORMWATER TREATMENT SUITABILITY

GENERAL BMP LIST	Rev Ability	Cpv Control	Qp2 Control	safety index	space index	accept hotspot runoff
P-1 Micropool ED	no	yes	yes	1.5	1.5	yes *
P-2 Wet Pond	no	yes	yes	4.0	3.0	yes*

O-2 Wet Swale	NR	below WT	5 max		1 ft	
O-3 Bioretention Cell	Made Soil	2 feet	2 max		1 ft	

Notes: NR = not restricted, WT = water table, PT = pretreatment * unless adequate water balance and anti-clogging device installed ** drainage area can be larger in some instances.

Section 4.4 Stormwater Treatment Suitability

The third matrix examines the capability of each BMP to meet the stormwater treatment sizing criteria outlined in Technical Memo No. 3. Thus, it shows whether a BMP has the:

Ability to Provide Recharge Requirement (Re_v). It should be noted that other practices, not on the BMP list, are capable of meeting the Re_v requirement (e.g. grass channel, filter strip, disconnection of rooftop runoff and other practices outlined in Technical Memo No. 1). Thus, if a BMP on the matrix cannot meet the Re_v requirement, it informs the designer that supplemental recharge practices may be needed in the overall BMP design.

Ability to Provide Channel Protection (Cp_v). The matrix indicates whether the BMP can typically provide the Cp_v that may be needed in some watersheds. The finding that a particular BMP cannot meet the requirement does not necessarily mean that it should be eliminated from consideration, but rather is a reminder that more than one practice may be needed at the site to meet requirements (e.g., a bioretention area and a downstream ED pond).

Ability to Provide Quantity Control (Q_{p2} and/or Q_{10}) The matrix shows whether a BMP can typically meet the over-bank flooding criteria for the site. Again, the finding that a particular BMP cannot meet the requirement does not necessarily mean that it should be eliminated from consideration, but rather is a reminder that more than one practice may be needed at the site to meet requirements (e.g., a bioretention area and a downstream stormwater detention pond)

Safety Index– A comparative rating from 1 to 5 that expresses the potential safety risk of a BMP, The lower score indicates a safe BMP, while a higher score indicates that there may be potential safety risks to children associated with deep pools. The safety factor is included at this stage of the screening process since liability and safety are a paramount concern in many residential settings.

Space Consumption Index. A comparative rating from 1 to 5 that expresses how much space a BMP typically consumes at a site. A lower score indicates that the BMP consumes a relatively small amount of land, whereas a high score indicates the BMP may consume a relatively high fraction of land. Again, this factor is included in this early screening stage since many BMPs are severely constrained by land consumption.

Ability to Accept Hotspot Runoff. This last column examines the capability of a BMP to treat runoff from designated hotspots, as defined in Section 2.7. A BMP may be capable of accepting hotspot runoff, or may have some design restrictions as noted.

BMP SELECTION MATRIX No. 5: COMMUNITY AND ENVIRONMENTAL FACTORS

GENERAL BMP LIST	Main. Burden	Comm. Accept	Const. Cost	Habitat	Other Factors
P-1 Micropool ED	3.5	4.0	1.0	3.5	trash/debris
P-2 Wet Pond	1.5	1.5	2.0	2.5	High pond premium
P-3 Wet ED Pond	2.0	2.0	2.0	3.0	
P-4 Multiple Pond	2.0	1.5	3.0	1.5	
P-5 Pocket Pond	4.0	3.0	1.5	4.0	drawdowns
W-1 Shallow Marsh	3.5	2.0	3.5	1.5	
W-2 ED Wetland	3.0	2.5	2.5	2.0	Limit ED depth
W-3 Pond/Wetland	2.0	1.5	3.0	1.0	
W-4 Pocket Marsh	4.0	3.0	2.0	3.5	drawdowns
W-5 Gravel Wetland	4.0	4.0	3.0	4.5	Possible odors
I-1 Infil. Trench	5.0	2.0	3.5	5.0	Avoid large stone
I-2 Shallow I-Basin	5.0	4.0	3.0	4.5	Frequent pooling
I-3 Porous Pavement	5.0	1.0	3.0	5.0	
F-1 Surface SF	3.5	2.5	4.0	5.0	Minimize concrete
F-2 Underground SF	4.0	1.0	4.5	5.0	Out of sight
F-3 Perimeter SF	3.5	1.0	4.0	5.0	Traffic bearing
F-4 Organic SF	3.5	2.5	4.0	5.0	Change compost
F-5 Pocket Sand Filter	4.0	2.5	3.0	5.0	
F-6 Bioretention	2.0	1.5	2.5	4.0	Landscaping
O-1 Dry Swale	2.0	1.5	2.5	4.5	
O-2 Wet Swale	2.0	1.5	1.5	4.0	Possible mosquitos
O-3 Bioretention Cell	2.0	1.5	1.5	4.0	

Section 4.5 Physical Feasibility

At this point, the designer has whittled down the BMP list to a manageable number and can evaluate the remaining options given the actual physical conditions present on the site. This matrix will ultimately cross-reference the testing protocols needed to confirm physical conditions at the site. The six primary factors are:

Soils. The key evaluation factors are based on an initial investigation of the NRCS hydrologic soils groups at the site, followed by subsequent geotechnical tests to confirm permeability and other factors.

Water Table. Depth to the seasonally high water table from the bottom or floor of the practice

Drainage Area. Indicates the minimum or maximum drainage area that is considered suitable for the practice. If the drainage area present at the site is slightly greater than the maximum allowable drainage area needed for a practice, more than one practice can be installed. The minimum drainage areas indicated for ponds and wetlands should not be considered hard and fast limits, and may be increased or decreased depending on water availability (baseflow or groundwater) or the anti-clogging mechanisms employed.

Slope. This column evaluates the effect of slope on the practice. Specifically, the slope restrictions refer to local slope (how flat the area of practice installation must be) and up-gradient slopes (i.e., how steep can the contributing drainage area or flow length be)

Head. This column provides a typical estimate of the elevation difference needed from the inflow to the outflow to allow for gravity operation within the practice.

Other Factors. This column includes other physical restrictions such as depth to bedrock, proximity to wells and foundations, water balance, etc.

Section 4.6 Community and Environmental Factors

The fifth step involves an assessment of community and environmental factors that the BMP can provide. Again an index approach is used, where the given BMP is ranked from 1 to 5, with the lower score indicating that the practice has either a high benefit (or low drawbacks), and a higher score indicating that the particular practice has a low benefit or a major drawback for that factor.

Maintenance. This column assesses the maintenance burden for the practice, in terms of three criteria: frequency of scheduled maintenance, chronic maintenance problems (such as clogging) and reported failure rates.

Community acceptance. This column assesses community acceptance, as measured by three factors: market and preference surveys, reported nuisance problems, and visual orientation (i.e., is it prominently located or is it in an out of the way or underground location). It should be noted that a low rank may merely indicate the need for a better landscaping plan.

Construction Cost. The BMPs are ranked according to their relative construction cost per impervious acre treated. Please note that these rankings are preliminary, and await completion of the Center's ongoing BMP Cost Study.

Habitat. The BMPs are evaluated on their ability to provide wildlife or wetland habitat, assuming that an effort is made to landscape them appropriately. Objective criteria include: size, water features, wetland features and vegetation coverage in BMP and buffer.

Other Factors. This column indicates other factors that should be considered in BMP selection.

BMP SELECTION AND LOCATION

SELECTING THE RIGHT BMP
BMP SELECTION EXAMPLE

EXCERPT FROM MARYLAND'S DRAFT TECHNICAL SUPPORT DOCUMENT FOR THE STATE BMP MANUAL- CHAPTER 4: A GUIDE TO BMP SELECTION & LOCATION IN THE STATE OF MARYLAND

Section 4.7 Locational Considerations

In the last step, the designer follows a checklist to determine where the selected BMP or BMPs can be located at the site, given the environmental features that are present. The checklist also indicates what, if any, permits must be secured to construct the BMP. The checklist will be modeled after the MDE Stormwater Management Assessment and Flow Chart Documents, already developed by Comstock (1995). Some of the locational factors would include:

Wetlands. Including the limited conditions under which a degraded wetland can be modified to accept stormwater (e.g., retrofits), and forested wetlands, and requirements for State and Federal CWA Sec. 401 and 404 permits.

Streams: Outline the general restrictions for placing ponds and wetlands within waters of the US, and outlining the permit process to follow if they are located in the uppermost 300 feet of a perennial stream. Guidance on dealing with intermittent channels, agricultural drainage, ditches and other situations. Additional guidance on location of detention or Cp_v facilities in and near streams.

Stream and Shoreline Buffers. Restrictions or conditions for locating BMPs within the Critical Area Buffer Zone and local stream buffer zones will be highlighted.

Forest Conservation Area. Discussion of BMP location within the context of the Forest Conservation Act, including prohibition from locating BMPs in Priority 1 Forest Retention Areas, or within 100 feet of specimen trees. Opportunities for reforestation in stormwater buffer areas will be noted.

Steep Slopes: Construction of BMPs are generally restricted on slopes greater than 15%.

Floodplains. BMP restrictions if located within the 100 year floodplain may require approval under the MDE Waterway Construction Regulations (COMAR 26.17.05).

Existing and Proposed Utilities. Restrictions and setbacks from sewer lines, roads, cables and other utilities at the site.

Residential Setbacks. Required setback distances from residential structures.

NOTE: THE CENTER WILL DRAFT THIS SECTION IN THE SUMMER OF 1997 FOR STATE AND LOCAL REVIEW.

BMP Selection and Location

Six Step Screening Process

1. Watershed Management Objectives
2. Terrain Factors
3. Stormwater Treatment Suitability
4. Physical Feasibility
5. Community and Environmental Benefits
6. Locational/Permitting Factors

Step 1. Watershed Management Objective

- Maryland Critical Area (IDA's)
- Coldwater Streams (Maryland Use III and IV)
- Sensitive (Maryland Use I, IV, and Ic less than 15%)
- Wellhead Protection
- Reservoir Protection
- Shellfish/Beach Protection (Maryland Use II)

BMP Selection and Location

Selecting the right BMP
BMP selection example

Excerpt from Maryland's draft technical support document for the state BMP manual- Chapter 4: A guide to BMP selection & Location in the state of Maryland

BMP Selection and Location

Six Step Screening Process

1. Watershed Management Objectives
2. Terrain Factors
3. Stormwater Treatment Suitability
4. Physical Feasibility
5. Community and Environmental Benefits
6. Locational/Permitting Factors

Step 1. Watershed Management Objective

- Maryland Critical Area (IDA's)
- Coldwater Streams (Maryland Use III and IV)
- Sensitive (Maryland Use I, IV, and Ic less than 15%)
- Wellhead Protection
- Reservoir Protection
- Shellfish/Beach Protection (Maryland Use II)

BMP SELECTION MATRIX No. 1:
SPECIAL WATERSHED DESIGN REQUIREMENTS

BMPs	Critical Area	Cold-water	Sensitive	Ground. Protection	Reservoir Protect	Shellfish Beach
Ponds	Drainage area may limit except for P5. P1 has low removal rate	P2, P3, and P4 restricted, limit ED to 12 hrs offline design shading	Require Control of Cpv, usually 1year 24 ED	May require liner if A soils are present pretreat hotspots 2 to 4 ft SD	Require Cpv Control	Moderate bacteria removal, but design to prevent geese. permanent pool
Wetlands	Drainage area may limit, W-4 excepted	W1, W2 and W3 restricted	Same as above			Provide 48 hr ED for max coliform dieoff
Infiltration	are often infeasible due to soils or water table in tidal area	Useful, if site has right soil	may be difficult to infiltrate the Cpv	SD from wells and water table. No hotspot runoff infiltrate rooftop runoff	SD from bedrock and water table. Pretreat runoff	OK, but a min 4 ft SD is required
Filtering Systems	OK	OK, but evaluate for stream warming	Must be combined another ED basin to provide Cpv	yes, if designed w/ no exfilter	Filtering may be required for pretreat.	mod. to high coliform removal
Open Channels	OK	OK	Must be linked w/ ED basin to provide Cpv	OK, but hotspot runoff must be adequately treated		poor coliform removal for O-2 and O-3

SD = Separation Distance

R0020383

Step 2. Terrain Factors

- Low Relief
- Karst
- Mountainous

BMP SELECTION MATRIX No. 2:
TERRAIN FACTORS

BMPs	Low Relief	Karst	Mountainous
Ponds	Maximum ponding depth of 4 feet	Require poly or clay liner max ponding depth geotechnical tests	Maximum pool depth 8 ft
Wetlands	OK	require polyliner geotechnical testing	Maximum pool depth 8 ft Embankment heights. restricted
Infiltration	NOT Recommended. Minimum distance to water table of 2 feet	NOT ALLOWED	Max slope 8% trenches must have flat bottom
Filtering Systems	Several designs limited by low head (F1 and F2)	Use poly-liner or impermeable membrane to seal bottom	OK
Open Channels	Not generally feasible due to low slopes	OK	Often infeasible if slopes are 4% or greater

Note: SD = separation distance to seasonally high water table or bedrock

R0020385

Step 3. Stormwater Treatment Suitability

- Recharge (Re_v)
- WQ_v
- Cp_v
- Qp
- Ability to accept hotspot runoff

BMP Selection Matrix No. 3
STORMWATER TREATMENT SUITABILITY

GENERAL BMP LIST	Rev Ability	Cpv Control	Qp2 Control	safety index	space index	accept hotspot runoff
P-1 Micropool ED	no	yes	yes	1.5	1.5	yes *

W-2 ED Wetland	3.0	2.5	2.5	2.0	Limit ED depth
W-3 Pond/Wetland	2.0	1.5	3.0	1.0	
W-4 Pocket Marsh	4.0	3.0	2.0	3.5	drawdowns
W-5 Gravel Wetland	4.0	4.0	3.0	4.5	Possible odors
I-1 Infil. Trench	5.0	2.0	3.5	5.0	Avoid large stone
I-2 Shallow I-Basin	5.0	4.0	3.0	4.5	Frequent pooling
I-3 Porous Pavement	5.0	1.0	3.0	5.0	
F-1 Surface SF	3.5	2.5	4.0	5.0	Minimize concrete
F-2 Underground SF	4.0	1.0	4.5	5.0	Out of sight
F-3 Perimeter SF	3.5	1.0	4.0	5.0	Traffic bearing
F-4 Organic SF	3.5	2.5	4.0	5.0	Change compost
F-5 Pocket Sand Filter	4.0	2.5	3.0	5.0	
F-6 Bioretention	2.0	1.5	2.5	4.0	Landscaping
O-1 Dry Swale	2.0	1.5	2.5	4.5	
O-2 Wet Swale	2.0	1.5	1.5	4.0	Possible mosquitos
O-3 Bioretention Cell	2.0	1.5	1.5	4.0	

R0020392

Step 6. Locational/Permitting Considerations

- Wetlands
- Streams
- Stream and Shoreline Buffers
- Floodplains
- Forest Conservation Areas
- Steep Slopes
- Existing/Proposed Utilities
- Residential Setbacks

Center for Watershed Protection

BMP Selection Example

- 50 acre single family subdivision
- 15,000 sq ft lot sizes
- Karst topography
- Cold-water receiving stream (Maryland Use IV)
- Drains to headwater stream (approx. 150 acre DA)

R0020394

BMP Selection Example

Watershed Considerations

(Matrix No. 1)

Cold-water receiving stream

- Ponds: ED with micro-pool, 12 hour detention, off line design, shading, others restricted
- Wetlands: Most are restricted
- Infiltration: OK
- Filters: OK
- Open Channels: OK

R0020395

BMP Selection Example

Terrain Consideration

(Matrix No. 2)

Karst Topography

- Ponds: Poly- or clay liner recommended: (geotech. to confirm)
- Wetlands: same
- Infiltration: Not allowed
- Filters: Liners or concrete shell
- Open channels: OK, but consider increased infiltration (geotech. to confirm)

R0020396

BMP Selection Example

Treatment Suitability

(Matrix No. 3

Recharge and Channel protection controls (Re_v and Cp_v)

- Ponds: limited Re_v, Cp_v OK
- Wetlands: limited Re_v, Cp_v OK
- Infiltration: Re_v good, Cp_v unlikely
- Filters: limited Re_v, no Cp_v
- Bioretention: Re_v good, Cp_v depends
- Open channels: limited Re_v, no Cp_v

R0020397

BMP Selection Example

Physical Feasibility

(Matrix No. 4)

Drainage area

- Ponds: 10-25 acre min. (except pocket)
- Wetlands: 25 acre min. (except pocket)
- Infiltration: 10 ac max.
- Filters: 10 ac max.
- Bioretention: 5-10 ac max.
- Open channels: 5 max.

R0020398

BMP Selection Example

Preferred Alternatives

(multiple practices)

- Micro-pool ED for Cp_v & some WQ_v
  - minimizes thermal impacts (provide shading & off line design)
  - provide 12 hr ED for Cp_v
  - drainage area appropriate
  - provides some water quality control
  - provide liner, if necessary
  - appropriate for land use
- Bioretention for Re_v & WQ_v
  - provides recharge
  - provides water quality
  - ok for karst (no infiltration, limited open channel applications)
  - appropriate for land use
  - 5 to 10 locations necessary
  - pretreat with filter strips

R0020399

Section 4.0 A Guide to BMP Selection and Location in the State of Maryland

Section 4.1 Introduction

This section outlines a process for selecting the best BMP or group of BMPs at a development site, and provides guidance on factors to consider on where to put the BMP on the site. The process is used to screen the 22 designs on the BMP list that could meet the pollutant removal targets for the WQ_v. The process asks the designer to go through a six step screening process, that progressively examines:

- Watershed Factors
- Terrain Factors
- Stormwater Treatment Suitability
- Physical Feasibility Factors
- Community and Environmental Benefits
- Locational Considerations

More detail on the step-wise screening process is provided below:

Step No. 1 Watershed Factors

Is the project located in a watershed that has special watershed design objectives or constraints that must be met? Matrix No.1 outlines BMP restrictions or additional design requirements that must be considered if the project lies within the Maryland Critical Area, Cold-water watersheds, Sensitive Watersheds, Aquifer Protection Areas, Water Supply Reservoirs, and Shellfish/Beach Protection Zones.

Step No. 2 Terrain Factors

Is the project located in a portion of the State that has particular constraints imposed by local terrain and or underlying geology? Matrix No. 2 details BMP restrictions for karst regions (portions of Carrol, Frederick and Washington Counties) and low relief areas of the lower Eastern Shore.

Step No. 3 Stormwater Treatment Suitability

Can the BMP meet all of my stormwater treatment requirements for my site, or will a combination of BMPs be needed? In this step, the designer can screen the BMP list using Matrix No. 3 to determine if a particular BMP can meet the Re_v, C_{pv} and/or Q_p storage requirements, In addition, this third matrix allows the designer to determine if the BMP is capable of treating hotspot runoff, and provides relative indexes for land consumption and safety risk that might

R0020400

preclude a BMP. At the end of this step, the designer can screen the BMP options down to a manageable number, and determine if a single BMP or multiple BMP system is needed to meet the four stormwater sizing criteria for the site.

Step No. 4 Physical Feasibility

Are there any physical constraints at the project site that might restrict or preclude the use of a particular BMP? In this step, the designer screens the BMP list using Matrix No. 4 to determine if the soils, water table, drainage area, slope or head conditions present at a particular development site that might limit the use of a BMP. In many cases, the designer can use the matrix to identify geotechnical or other tests to confirm physical feasibility.

Step No. 5 Community and Environmental Benefits/Drawbacks

Do the remaining BMPs have any important community or environmental benefits or drawbacks that would influence the selection process? In this step, a matrix is used to compare the 22 BMPs on the list in regard to maintenance, habitat, community acceptance, cost and other environmental factors

Step No. 6 Locational Considerations

What environmental features must be avoided or considered when locating the BMP system at my development site, so as to fully comply with State and Federal laws and permits? In this step, the designer follows an environmental features checklist that asks whether any of the following are present at the site: wetlands, waters of the US, stream or shoreline buffers, forest conservation areas, etc. Brief guidance is then provided on "fingerprinting techniques" to locate the BMP so as to avoid impacts to sensitive resources. If the BMP is located within sensitive environmental features, a brief summary of State and federal permitting requirements will be provided.

Summary. The six step approach is intended to compactly present comparative information for the 22 BMPs on the list in a condensed format. Some of the comparative information in the matrices reflects our recent interviews with engineers across the State, and general research into the physiographic differences in the State.

The advantage of the six step approach is that it allows manual readers to use whatever matrices they need for design, and also provides a step-wise approach for the novice designer or plan reviewer. **A more user-friendly and attractive format will be developed for the final manual.**

Section 4.2 Watershed Factors

In some cases, higher pollutant removal or environmental performance is needed to fully protect aquatic resources and human health and safety within a particular watershed. Therefore, a shorter list of BMPs may need to be considered for selection within these watersheds or zones. They include:

Maryland Critical Area Intensively Developed Areas (IDAs). BMPs located within the Intensively Developed Area (IDA) of the Maryland Critical Area (a zone extending 1000 feet landward from mean high tide) must demonstrate compliance with the "10% Rule" The rule mandates that post development stormwater phosphorus loads must be reduced to 10% below pre-development loads, using the methodology developed by Herson et al, 1994. Updated estimates of long term keystone pollutant removal rates can be found in Section 3.5.

Coldwater Streams (Maryland Use III). These cold and cool water streams have habitat qualities capable of supporting trout and other sensitive aquatic organisms. Therefore, the design objective is to maintain habitat quality by preventing stream warming, maintaining natural recharge, preventing bank and channel erosion, and preserving the natural riparian corridor. Some BMPs can have adverse downstream impacts on cold-water streams, and their use is highly restricted.

Sensitive Streams (Maryland Use IV, or Impervious Cover less than 15%). These streams also possess high quality warm-water aquatic resources. The design objectives are to maintain habitat quality through the same techniques used for cold-water streams, with the exception that stream warming is not as severe of a design constraint. Designers may need to provide Cp_v to protect stream channels from erosion. These streams are specially designated by local authorities (e.g., Piney Branch Special Protection Area in Montgomery County), or may be designated if a project triggers the 401 or 404 permit process.

Wellhead Protection. Areas that recharge existing public water supply wells present a unique management challenge. The key design constraint is to prevent possible groundwater contamination by preventing infiltration of hotspot runoff. At the same time, recharge of unpolluted stormwater is encouraged to maintain flow in streams and wells during dry weather.

Reservoir Protection. Watersheds that deliver surface runoff to a public water supply reservoir or impoundment are a special concern. Depending on the treatment available at the water intake, it may be necessary to control several pollutants of concern to a higher level, such as bacteria, nutrients, sediment or metals. One particular management concern is enhanced treatment for pollutant hotspots that pose a greater risk to drinking water safety.

Shellfish/Bacteria. Watersheds that drain to specific shellfish harvesting areas or public swimming beaches require a higher level of BMP treatment to prevent closings due to bacterial contamination from stormwater runoff. In these watersheds, BMPs are explicitly designed to maximize bacteria removal.

BMP SELECTION MATRIX No. 1: SPECIAL WATERSHED DESIGN REQUIREMENTS

BMPs	Critical Area	Cold-water	Sensitive	Ground Protection	Reservoir Protect	Shellfish Beach
Ponds	Drainage area may limit except for P5. P1 has low removal rate	P2, P3, and P4 restricted, limit ED to 12 hrs offline design shading	Require Control of Cpv, usually 1year 24 ED	May require liner if A soils are present pretreat hotspots 2 to 4 ft SD	Require Cpv Control	Moderate bacteria removal, but design to prevent geese. permanent pool
Wetlands	Drainage area may limit, W-4 excepted	W1, W2 and W3 restricted	Same as above			Provide 48 hr ED for max coliform dieoff
Infiltration	are often infeasible due to soils or water table in tidal area	Useful, if site has right soil	may be difficult to infiltrate the Cpv	SD from wells and water table. No hotspot runoff infiltrate rooftop runoff	SD from bedrock and water table. Pretreat runoff	OK, but a min 4 ft SD is required
Filtering Systems	OK	OK, but evaluate for stream warming	Must be combined another ED basin to provide Cpv	yes, if designed w/ no exfilter	Filtering may be required for pretreat.	mod. to high coliform removal
Open Channels	OK	OK	Must be linked w/ ED basin to provide Cpv	OK, but hotspot runoff must be adequately treated		poor coliform removal for O-2 and O-3

SD = Separation Distance

R0020404

Each of the 22 BMPs on the list are presumed capable of achieving a long-term removal rate of 80% for total suspended solids, which has been identified as a base criterion for BMP performance under the recently issued CZARA 6217 guidance (see Section 3).

Section 4.3 Terrain Factors

Three key factors to consider are low-relief, karst and mountainous terrain. In the state of Maryland, *Low Relief Areas* can be defined as the Eastern Shore Counties, particularly below Choptank River, while most of the *Karst* and major carbonaceous rock areas are found in portions of Carrol County, Frederick County and Washington County. Mountainous areas are found in the Western part of the State.

BMP SELECTION MATRIX No. 2: TERRAIN FACTORS

BMPs	Low Relief	Karst	Mountainous
Ponds	Maximum ponding depth of 4 feet	Require poly or clay liner max ponding depth geotechnical tests	Maximum pool depth 8 ft
Wetlands	OK	require polyliner geotechnical testing	Maximum pool depth 8 ft Embankment heights restricted
Infiltration	NOT Recommended. Minimum distance to water table of 2 feet	NOT ALLOWED	Max slope 8% trenches must have flat bottom
Filtering Systems	Several designs limited by low head (F1 and F2)	Use poly-liner or impermeable membrane to seal bottom	OK
Open Channels	Not generally feasible due to low slopes	OK	Often infeasible if slopes are 4% or greater

Note: SD = separation distance to seasonally high water table or bedrock

R0020405

Section 4.4 Stormwater Treatment Suitability

The third matrix examines the capability of each BMP to meet the stormwater treatment sizing criteria outlined in Technical Memo No. 3. Thus, it shows whether a BMP has the:

Ability to Provide Recharge Requirement (Re_v). It should be noted that other practices, not on the BMP list, are capable of meeting the Re_v requirement (e.g. grass channel, filter strip, disconnection of rooftop runoff and other practices outlined in Technical Memo No. 1). Thus, if a BMP on the matrix cannot meet the Re_v requirement, it informs the designer that supplemental recharge practices may be needed in the overall BMP design.

Ability to Provide Channel Protection (Cp_v). The matrix indicates whether the BMP can typically provide the Cp_v that may be needed in some watersheds. The finding that a particular BMP cannot meet the requirement does not necessarily mean that it should be eliminated from consideration, but rather is a reminder that more than one practice may be needed at the site to meet requirements (e.g., a bioretention area and a downstream ED pond).

Ability to Provide Quantity Control (Q_{p2} and/or Q_{p10}) The matrix shows whether a BMP can typically meet the over-bank flooding criteria for the site. Again, the finding that a particular BMP cannot meet the requirement does not necessarily mean that it should be eliminated from consideration, but rather is a reminder that more than one practice may be needed at the site to meet requirements (e.g., a bioretention area and a downstream stormwater detention pond)

Safety Index-- A comparative rating from 1 to 5 that expresses the potential safety risk of a BMP, The lower score indicates a safe BMP, while a higher score indicates that there may be potential safety risks to children associated with deep pools. The safety factor is included at this stage of the screening process since liability and safety are a paramount concern in many residential settings.

Space Consumption Index. A comparative rating from 1 to 5 that expresses how much space a BMP typically consumes at a site. A lower score indicates that the BMP consumes a relatively small amount of land, whereas a high score indicates the BMP may consume a relatively high fraction of land. Again, this factor is included in this early screening stage since many BMPs are severely constrained by land consumption.

Ability to Accept Hotspot Runoff. This last column examines the capability of a BMP to treat runoff from designated hotspots, as defined in Section 2.7. A BMP may be capable of accepting hotspot runoff, or may have some design restrictions as noted.

BMP Selection Matrix No. 3 STORMWATER TREATMENT SUITABILITY

GENERAL BMP LIST	Rev Ability	Cpv Control	Qp2 Control	safety index	space index	accept hotspot runoff
P-1 Micropool ED	no	yes	yes	1.5	1.5	yes *
P-2 Wet Pond	no	yes	yes	4.0	3.0	yes*
P-3 Wet ED Pond	no	yes	yes	4.5	2.0	yes*
P-4 Multiple Pond	no	yes	yes	4.0	3.5	yes*
P-5 Pocket Pond	no	yes	yes	3.0	1.5	yes*
W-1 Shallow Marsh	no	yes	yes	2.0	5.0	yes*
W-2 ED Wetland	no	yes	yes	2.5	3.0	yes*
W-3 Pond/Wetland	no	yes	yes	3.5	4.0	yes*
W-4 Pocket Marsh	no	yes	depends	2.0	2.5	yes*
W-5 Gravel Wetland	no	yes	depends	1.5	3.0	yes
I-1 Infil. Trench	yes	depends	depends	1.0	2.0	NO
I-2 Shallow I-Basin	yes	depends	depends	1.0	3.5	NO
I-3 Porous Pavement	yes	depends	depends	1.0	1.0	NO
F-1 Surface Sand Filter	no, unless exfilter	depends	no	2.0	2.0	yes **
F-2 Underground SF	no	no	no	3.0	1.0	yes
F-3 Perimeter SF	no	no	no	1.0	1.5	yes

F-5 Pocket Sand Filter	no, unless exfilter	no	no	1.5	2.0	yes**
F-6 Bioretention	yes	depends	no	1.0	3.5	yes**
O-1 Dry Swale	yes	no	no	1.0	3.0	yes**
O-2 Wet Swale	no	no	no	1.5	3.0	NO
O-3 Off-line Swale	yes	no	no	1.5	3.5	yes **

* only if four foot separation distance is maintained from the floor of the pond to the seasonally high water table (2 feet on Lower Eastern Shore)

** only if bottom of facility is lined with impermeable filter fabric that prevents leachate infiltration

R0020407

Section 4.5 Physical Feasibility

At this point, the designer has whittled down the BMP list to a manageable number and can evaluate the remaining options given the actual physical conditions present on the site. This matrix will ultimately cross-reference the testing protocols needed to confirm physical conditions at the site. The six primary factors are:

Soils. The key evaluation factors are based on an initial investigation of the NRCS hydrologic soils groups at the site, followed by subsequent geotechnical tests to confirm permeability and other factors.

Water Table. Depth to the seasonally high water table from the bottom or floor of the practice

Drainage Area. Indicates the minimum or maximum drainage area that is considered suitable for the practice. If the drainage area present at the site is slightly greater than the maximum allowable drainage area needed for a practice, more than one practice can be installed. The minimum drainage areas indicated for ponds and wetlands should not be considered hard and fast limits, and may be increased or decreased depending on water availability (baseflow or groundwater) or the anti-clogging mechanisms employed.

Slope. This column evaluates the effect of slope on the practice. Specifically, the slope restrictions refer to local slope (how flat the area of practice installation must be) and up-gradient slopes (i.e., how steep can the contributing drainage area or flow length be)

Head. This column provides a typical estimate of the elevation difference needed from the inflow to the outflow to allow for gravity operation within the practice.

Other Factors. This column includes other physical restrictions such as depth to bedrock, proximity to wells and foundations, water balance, etc.

BMP SELECTION MATRIX No. 4: PHYSICAL FEASIBILITY

GENERAL BMP LIST	SOILS	WATER TABLE	DRAIN AREA (acres)	SLOPE	HEAD	Other
P-1 Micropool ED	A soils may require pond liner B soils may require testing	2 feet If hotspot or aquifer	10 min*	no more than 15%	6 to 8 ft	baseflow bedrock
P-2 Wet Pond			25 min*			
P-3 Wet ED Pond						
P-4 Multiple Pond						
P-5 Pocket Pond	NR	below WT	5 max		4 ft	
W-1 Shallow Marsh	A soils may require liner	2 feet if hotspot or aquifer	25 min	no more than 8%	3 to 5 ft	baseflow bedrock
W-2 ED Wetland						
W-3 Pond/Wetland						
W-4 Pocket Marsh	NR	below WT	5 max		2 to 3 ft	
W-5 Gravel Wetland	NR	2 feet			2 to 4 ft	
I-1 Infil. Trench	Fc > 0.52 inch/hr PT if Fc < 2.00 in/hr	4 feet		flat as possible	1 ft	Bedrock
I-2 Shallow I-Basin			10 max		3 ft	
I-3 Porous Pavement			5 max**		1 ft	
F-1 Surface Sand Filter	NR	2 feet	10 max **	no more than 6%	5 ft	
F-2 Underground SF			2 max **		5 to 7ft	
F-3 Perimeter SF			2 max **		2 to 3 ft	
F-4 Organic SF			5 max**		2 to 4 ft	
F-5 Pocket Sand Filter			2 max **		2 to 5 ft	
F-6 Bioretention	Made Soil				5 ft	
O-1 Dry Swale			5 max	usually 1 to 4% max	3 to 5 ft	
O-2 Wet Swale	NR	below WT	5 max		1 ft	
O-3 Bioretention Cell	Made Soil	2 feet	2 max		1 ft	

Notes: NR = not restricted, WT = water table, PT = pretreatment * unless adequate water balance and anti-clogging device installed ** drainage area can be larger in some instances.

R0020409

Section 4.6 Community and Environmental Factors

The fifth step involves an assessment of community and environmental factors that the BMP can provide. Again an index approach is used, where the given BMP is ranked from 1 to 5, with the lower score indicating that the practice has either a high benefit (or low drawbacks), and a higher score indicating that the particular practice has a low benefit or a major drawback for that factor.

Maintenance. This column assesses the maintenance burden for the practice, in terms of three criteria: frequency of scheduled maintenance, chronic maintenance problems (such as clogging) and reported failure rates.

Community acceptance. This column assesses community acceptance, as measured by three factors: market and preference surveys, reported nuisance problems, and visual orientation (i.e., is it prominently located or is it in an out of the way or underground location). It should be noted that a low rank may merely indicate the need for a better landscaping plan.

Construction Cost. The BMPs are ranked according to their relative construction cost per impervious acre treated. Please note that these rankings are preliminary, and await completion of the Center's ongoing BMP Cost Study.

Habitat. The BMPs are evaluated on their ability to provide wildlife or wetland habitat, assuming that an effort is made to landscape them appropriately. Objective criteria include: size, water features, wetland features and vegetation coverage in BMP and buffer.

Other Factors. This column indicates other factors that should be considered in BMP selection.

BMP SELECTION MATRIX No. 5: COMMUNITY AND ENVIRONMENTAL FACTORS

GENERAL BMP LIST	Main. Burden	Comm. Accept	Const. Cost	Habitat	Other Factors
P-1 Micropool ED	3.5	4.0	1.0	3.5	trash/debris
P-2 Wet Pond	1.5	1.5	2.0	2.5	High pond premium
P-3 Wet ED Pond	2.0	2.0	2.0	3.0	
P-4 Multiple Pond	2.0	1.5	3.0	1.5	
P-5 Pocket Pond	4.0	3.0	1.5	4.0	drawdowns
W-1 Shallow Marsh	3.5	2.0	3.5	1.5	
W-2 ED Wetland	3.0	2.5	2.5	2.0	Limit ED depth
W-3 Pond/Wetland	2.0	1.5	3.0	1.0	
W-4 Pocket Marsh	4.0	3.0	2.0	3.5	drawdowns
W-5 Gravel Wetland	4.0	4.0	3.0	4.5	Possible odors
I-1 Infil. Trench	5.0	2.0	3.5	5.0	Avoid large stone
I-2 Shallow I-Basin	5.0	4.0	3.0	4.5	Frequent pooling
I-3 Porous Pavement	5.0	1.0	3.0	5.0	
F-1 Surface SF	3.5	2.5	4.0	5.0	Minimize concrete
F-2 Underground SF	4.0	1.0	4.5	5.0	Out of sight
F-3 Perimeter SF	3.5	1.0	4.0	5.0	Traffic bearing
F-4 Organic SF	3.5	2.5	4.0	5.0	Change compost
F-5 Pocket Sand Filter	4.0	2.5	3.0	5.0	
F-6 Bioretention	2.0	1.5	2.5	4.0	Landscaping
O-1 Dry Swale	2.0	1.5	2.5	4.5	
O-2 Wet Swale	2.0	1.5	1.5	4.0	Possible mosquitos
O-3 Bioretention Cell	2.0	1.5	1.5	4.0	

R0020411

Section 4.7 Locational Considerations

In the last step, the designer follows a checklist to determine where the selected BMP or BMPs can be located at the site, given the environmental features that are present. The checklist also indicates what, if any, permits must be secured to construct the BMP. The checklist will be modeled after the MDE Stormwater Management Assessment and Flow Chart Documents, already developed by Comstock (1995). Some of the locational factors would include:

Wetlands. Including the limited conditions under which a degraded wetland can be modified to accept stormwater (e.g., retrofits), and forested wetlands, and requirements for State and Federal CWA Sec. 401 and 404 permits.

Streams: Outline the general restrictions for placing ponds and wetlands within waters of the US, and outlining the permit process to follow if they are located in the uppermost 300 feet of a perennial stream. Guidance on dealing with intermittent channels, agricultural drainage, ditches and other situations. Additional guidance on location of detention or Cp_v facilities in and near streams.

Stream and Shoreline Buffers. Restrictions or conditions for locating BMPs within the Critical Area Buffer Zone and local stream buffer zones will be highlighted.

Forest Conservation Area. Discussion of BMP location within the context of the Forest Conservation Act, including prohibition from locating BMPs in Priority 1 Forest Retention Areas, or within 100 feet of specimen trees. Opportunities for reforestation in stormwater buffer areas will be noted.

Steep Slopes: Construction of BMPs are generally restricted on slopes greater than 15%.

Floodplains. BMP restrictions if located within the 100 year floodplain may require approval under the MDE Waterway Construction Regulations (COMAR 26.17.05).

Existing and Proposed Utilities. Restrictions and setbacks from sewer lines, roads, cables and other utilities at the site.

Residential Setbacks. Required setback distances from residential structures.

NOTE: THE CENTER WILL DRAFT THIS SECTION IN THE SUMMER OF 1997 FOR STATE AND LOCAL REVIEW.

BMP Selection and Location

Six Step Screening Process

1. Watershed Management Objectives
2. Terrain Factors
3. Stormwater Treatment Suitability
4. Physical Feasibility
5. Community and Environmental Benefits
6. Locational/Permitting Factors

Center for Watershed Protection

Step 1. Watershed Management Objective

- Maryland Critical Area (IDA's)
- Coldwater Streams (Maryland Use III and IV)
- Sensitive (Maryland Use I, IV, and Ic less than 15%)
- Wellhead Protection
- Reservoir Protection
- Shellfish/Beach Protection (Maryland Use II)

Center for Watershed Protection

R0020414

BMP SELECTION MATRIX No. 1:
SPECIAL WATERSHED DESIGN REQUIREMENTS

BMPs	Critical Area	Cold-water	Sensitive	Ground Protection	Reservoir Protect	Shellfish Beach
Ponds	Drainage area may limit except for P5. P1 has low removal rate	P2, P3, and P4 restricted, limit ED to 12 hrs offline design shading	Require Control of Cpv, usually 1year 24 ED	May require liner if A soils are present pretreat hotspots 2 to 4 ft SD	Require Cpv Control	Moderate bacteria removal, but design to prevent geese. permanent pool
Wetlands	Drainage area may limit, W-4 excepted	W1, W2 and W3 restricted	Same as above			Provide 48 hr ED for max coliform dieoff
Infiltration	are often infeasible due to soils or water table in tidal area	Useful, if site has right soil	may be difficult to infiltrate the Cpv	SD from wells and water table. No hotspot runoff infiltrate rooftop runoff	SD from bedrock and water table. Pretreat runoff	OK, but a min 4 ft SD is required
Filtering Systems	OK	OK, but evaluate for stream warming	Must be combined another ED basin to provide Cpv	yes, if designed w/ no exfilter	Filtering may be required for pretreat.	mod. to high coliform removal
Open Channels	OK	OK	Must be linked w/ ED basin to provide Cpv	OK, but hotspot runoff must be adequately treated		poor coliform removal for O-2 and O-3

SD = Separation Distance

R0020415

Step 2. Terrain Factors

- Low Relief
- Karst
- Mountainous

Center for Watershed Protection

BMP SELECTION MATRIX No. 2:
TERRAIN FACTORS

BMPs	Low Relief	Karst	Mountainous
Ponds	Maximum ponding depth of 4 feet	Require poly or clay liner max ponding depth geotechnical tests	Maximum pool depth 8 ft
Wetlands	OK	require polyliner geotechnical testing	Maximum pool depth 8 ft Embankment heights. restricted
Infiltration	NOT Recommended. Minimum distance to water table of 2 feet	NOT ALLOWED	Max slope 8% trenches must have flat bottom
Filtering Systems	Several designs limited by low head (F1 and F2)	Use poly-liner or impermeable membrane to seal bottom	OK
Open Channels	Not generally feasible due to low slopes	OK	Often infeasible if slopes are 4% or greater

Note: SD = separation distance to seasonally high water table or bedrock

R0020417

Step 3. Stormwater Treatment Suitability

- Recharge (Re_v)
- WQ_v
- Cp_v
- Qp
- Ability to accept hotspot runoff

Step 6. Locational/PermittingConsiderations

- Wetlands
- Streams
- Stream and Shoreline Buffers
- Floodplains
- Forest Conservation Areas
- Steep Slopes
- Existing/Proposed Utilities
- Residential Setbacks

Center for Watershed Protection

R0020425

BMP Selection Example

- 50 acre single family subdivision
- 15,000 sq ft lot sizes
- Karst topography
- Cold-water receiving stream (Maryland Use IV)
- Drains to headwater stream (approx. 150 acre DA)

R0020426

BMP Selection Example

Watershed Considerations

(Matrix No. 1)

Cold-water receiving stream

- Ponds: ED with micro-pool, 12 hour detention, off line design, shading, others restricted
- Wetlands: Most are restricted
- Infiltration: OK
- Filters: OK
- Open Channels: OK

R0020427

BMP Selection Example

Terrain Consideration

(Matrix No. 2)

Karst Topography

- Ponds: Poly- or clay liner recommended: (geotech. to confirm)
- Wetlands: same
- Infiltration: Not allowed
- Filters: Liners or concrete shell
- Open channels: OK, but consider increased infiltration (geotech. to confirm)

R0020428

BMP Selection Example

Treatment Suitability

(Matrix No. 3

Recharge and Channel protection controls (Re_v and Cp_v)

- Ponds: limited Re_v, Cp_v OK
- Wetlands: limited Re_v, Cp_v OK
- Infiltration: Re_v good, Cp_v unlikely
- Filters: limited Re_v, no Cp_v
- Bioretention: Re_v good, Cp_v depends
- Open channels: limited Re_v, no Cp_v

R0020429

BMP Selection Example

Physical Feasibility

(Matrix No. 4)

Drainage area

- Ponds: 10-25 acre min. (except pocket)
- Wetlands: 25 acre min. (except pocket)
- Infiltration: 10 ac max.
- Filters: 10 ac max.
- Bioretention: 5-10 ac max.
- Open channels: 5 max.

R0020430

BMP Selection Example

Preferred Alternatives

(multiple practices)

- Micro-pool ED for Cp_v & some WQ_v
  - minimizes thermal impacts (provide shading & off line design)
  - provide 12 hr ED for Cp_v
  - drainage area appropriate
  - provides some water quality control
  - provide liner, if necessary
  - appropriate for land use
- Bioretention for Re_v & WQ_v
  - provides recharge
  - provides water quality
  - ok for karst (no infiltration, limited open channel applications)
  - appropriate for land use
  - 5 to 10 locations necessary
  - pretreat with filter strips

R0020431

Section 4.0 A Guide to BMP Selection and Location in the State of Maryland

Section 4.1 Introduction

This section outlines a process for selecting the best BMP or group of BMPs at a development site, and provides guidance on factors to consider on where to put the BMP on the site. The process is used to screen the 22 designs on the BMP list that could meet the pollutant removal targets for the WQ_v. The process asks the designer to go through a six step screening process, that progressively examines:

- Watershed Factors
- Terrain Factors
- Stormwater Treatment Suitability
- Physical Feasibility Factors
- Community and Environmental Benefits
- Locational Considerations

More detail on the step-wise screening process is provided below:

Step No. 1 Watershed Factors

Is the project located in a watershed that has special watershed design objectives or constraints that must be met? Matrix No.1 outlines BMP restrictions or additional design requirements that must be considered if the project lies within the Maryland Critical Area, Cold-water watersheds, Sensitive Watersheds, Aquifer Protection Areas, Water Supply Reservoirs, and Shellfish/Beach Protection Zones.

Step No. 2 Terrain Factors

Is the project located in a portion of the State that has particular constraints imposed by local terrain and or underlying geology? Matrix No. 2 details BMP restrictions for karst regions (portions of Carrol, Frederick and Washington Counties) and low relief areas of the lower Eastern Shore.

Step No. 3 Stormwater Treatment Suitability

Can the BMP meet all of my stormwater treatment requirements for my site, or will a combination of BMPs be needed? In this step, the designer can screen the BMP list using Matrix No. 3 to determine if a particular BMP can meet the Re_v, C_{pv} and/or Q_p storage requirements, In addition, this third matrix allows the designer to determine if the BMP is capable of treating hotspot runoff, and provides relative indexes for land consumption and safety risk that might

R0020432

preclude a BMP. At the end of this step, the designer can screen the BMP options down to a manageable number, and determine if a single BMP or multiple BMP system is needed to meet the four stormwater sizing criteria for the site.

Step No. 4 **Physical Feasibility**

Are there any physical constraints at the project site that might restrict or preclude the use of a particular BMP? In this step, the designer screens the BMP list using Matrix No. 4 to determine if the soils, water table, drainage area, slope or head conditions present at a particular development site that might limit the use of a BMP. In many cases, the designer can use the matrix to identify geotechnical or other tests to confirm physical feasibility.

Step No. 5 **Community and Environmental Benefits/Drawbacks**

Do the remaining BMPs have any important community or environmental benefits or drawbacks that would influence the selection process? In this step, a matrix is used to compare the 22 BMPs on the list in regard to maintenance, habitat, community acceptance, cost and other environmental factors

Step No. 6 **Locational Considerations**

What environmental features must be avoided or considered when locating the BMP system at my development site, so as to fully comply with State and Federal laws and permits? In this step, the designer follows an environmental features checklist that asks whether any of the following are present at the site: wetlands, waters of the US, stream or shoreline buffers, forest conservation areas, etc. Brief guidance is then provided on "fingerprinting techniques" to locate the BMP so as to avoid impacts to sensitive resources. If the BMP is located within sensitive environmental features, a brief summary of State and federal permitting requirements will be provided.

Summary. The six step approach is intended to compactly present comparative information for the 22 BMPs on the list in a condensed format. Some of the comparative information in the matrices reflects our recent interviews with engineers across the State, and general research into the physiographic differences in the State.

The advantage of the six step approach is that it allows manual readers to use whatever matrices they need for design, and also provides a step-wise approach for the novice designer or plan reviewer. **A more user-friendly and attractive format will be developed for the final manual.**

Section 4.2 Watershed Factors

In some cases, higher pollutant removal or environmental performance is needed to fully protect aquatic resources and human health and safety within a particular watershed. Therefore, a shorter list of BMPs may need to be considered for selection within these watersheds or zones. They include:

Maryland Critical Area Intensively Developed Areas (IDAs). BMPs located within the Intensively Developed Area (IDA) of the Maryland Critical Area (a zone extending 1000 feet landward from mean high tide) must demonstrate compliance with the "10% Rule" The rule mandates that post development stormwater phosphorus loads must be reduced to 10% below pre-development loads, using the methodology developed by Herson et al, 1994. Updated estimates of long term keystone pollutant removal rates can be found in Section 3.5.

Coldwater Streams (Maryland Use III). These cold and cool water streams have habitat qualities capable of supporting trout and other sensitive aquatic organisms. Therefore, the design objective is to maintain habitat quality by preventing stream warming, maintaining natural recharge, preventing bank and channel erosion, and preserving the natural riparian corridor. Some BMPs can have adverse downstream impacts on cold-water streams, and their use is highly restricted.

Sensitive Streams (Maryland Use IV, or Impervious Cover less than 15%). These streams also possess high quality warm-water aquatic resources. The design objectives are to maintain habitat quality through the same techniques used for cold-water streams, with the exception that stream warming is not as severe of a design constraint. Designers may need to provide Cp_v to protect stream channels from erosion. These streams are specially designated by local authorities (e.g., Piney Branch Special Protection Area in Montgomery County), or may be designated if a project triggers the 401 or 404 permit process.

Wellhead Protection. Areas that recharge existing public water supply wells present a unique management challenge. The key design constraint is to prevent possible groundwater contamination by preventing infiltration of hotspot runoff. At the same time, recharge of unpolluted stormwater is encouraged to maintain flow in streams and wells during dry weather.

Reservoir Protection. Watersheds that deliver surface runoff to a public water supply reservoir or impoundment are a special concern. Depending on the treatment available at the water intake, it may be necessary to control several pollutants of concern to a higher level, such as bacteria, nutrients, sediment or metals. One particular management concern is enhanced treatment for pollutant hotspots that pose a greater risk to drinking water safety.

Shellfish/Bacteria. Watersheds that drain to specific shellfish harvesting areas or public swimming beaches require a higher level of BMP treatment to prevent closings due to bacterial contamination from stormwater runoff. In these watersheds, BMPs are explicitly designed to maximize bacteria removal.

BMP SELECTION MATRIX No. 1: SPECIAL WATERSHED DESIGN REQUIREMENTS

BMPs	Critical Area	Cold-water	Sensitive	Ground Protection	Reservoir Protect	Shellfish Beach
Ponds	Drainage area may limit except for P5. P1 has low removal rate	P2, P3, and P4 restricted, limit ED to 12 hrs offline design shading	Require Control of Cpv, usually 1year 24 ED	May require liner if A soils are present pretreat hotspots 2 to 4 ft SD	Require Cpv Control	Moderate bacteria removal, but design to prevent geese. permanent pool
Wetlands	Drainage area may limit, W-4 excepted	W1, W2 and W3 restricted	Same as above			Provide 48 hr ED for max coliform dieoff
Infiltration	are often infeasible due to soils or water table in tidal area	Useful, if site has right soil	may be difficult to infiltrate the Cpv	SD from wells and water table. No hotspot runoff infiltrate rooftop runoff	SD from bedrock and water table. Pretreat runoff	OK, but a min 4 ft SD is required
Filtering Systems	OK	OK, but evaluate for stream warming	Must be combined another ED basin to provide Cpv	yes, if designed w/ no exfilter	Filtering may be required for pretreat.	mod. to high coliform removal
Open Channels	OK	OK	Must be linked w/ ED basin to provide Cpv	OK, but hotspot runoff must be adequately treated		poor coliform removal for O-2 and O-3

SD = Separation Distance

R0020436

Each of the 22 BMPs on the list are presumed capable of achieving a long-term removal rate of 80% for total suspended solids, which has been identified as a base criterion for BMP performance under the recently issued CZARA 6217 guidance (see Section 3).

Section 4.3 Terrain Factors

Three key factors to consider are low-relief, karst and mountainous terrain. In the state of Maryland, *Low Relief Areas* can be defined as the Eastern Shore Counties, particularly below Choptank River, while most of the *Karst* and major carbonaceous rock areas are found in portions of Carrol County, Frederick County and Washington County. Mountainous areas are found in the Western part of the State.

BMP SELECTION MATRIX No. 2: TERRAIN FACTORS

BMPs	Low Relief	Karst	Mountainous
Ponds	Maximum ponding depth of 4 feet	Require poly or clay liner max ponding depth geotechnical tests	Maximum pool depth 8 ft
Wetlands	OK	require polyliner geotechnical testing	Maximum pool depth 8 ft Embankment heights restricted
Infiltration	NOT Recommended. Minimum distance to water table of 2 feet	NOT ALLOWED	Max slope 8% trenches must have flat bottom
Filtering Systems	Several designs limited by low head (F1 and F2)	Use poly-liner or impermeable membrane to seal bottom	OK
Open Channels	Not generally feasible due to low slopes	OK	Often infeasible if slopes are 4% or greater

Note: SD = separation distance to seasonally high water table or bedrock

R0020437

Section 4.4 Stormwater Treatment Suitability

The third matrix examines the capability of each BMP to meet the stormwater treatment sizing criteria outlined in Technical Memo No. 3. Thus, it shows whether a BMP has the:

Ability to Provide Recharge Requirement (Re_v). It should be noted that other practices, not on the BMP list, are capable of meeting the Re_v requirement (e.g. grass channel, filter strip, disconnection of rooftop runoff and other practices outlined in Technical Memo No. 1). Thus, if a BMP on the matrix cannot meet the Re_v requirement, it informs the designer that supplemental recharge practices may be needed in the overall BMP design.

Ability to Provide Channel Protection (Cp_v). The matrix indicates whether the BMP can typically provide the Cp_v that may be needed in some watersheds. The finding that a particular BMP cannot meet the requirement does not necessarily mean that it should be eliminated from consideration, but rather is a reminder that more than one practice may be needed at the site to meet requirements (e.g., a bioretention area and a downstream ED pond).

Ability to Provide Quantity Control (Q_{p2} and/or Q_{p10}) The matrix shows whether a BMP can typically meet the over-bank flooding criteria for the site. Again, the finding that a particular BMP cannot meet the requirement does not necessarily mean that it should be eliminated from consideration, but rather is a reminder that more than one practice may be needed at the site to meet requirements (e.g., a bioretention area and a downstream stormwater detention pond)

Safety Index– A comparative rating from 1 to 5 that expresses the potential safety risk of a BMP, The lower score indicates a safe BMP, while a higher score indicates that there may be potential safety risks to children associated with deep pools. The safety factor is included at this stage of the screening process since liability and safety are a paramount concern in many residential settings.

Space Consumption Index. A comparative rating from 1 to 5 that expresses how much space a BMP typically consumes at a site. A lower score indicates that the BMP consumes a relatively small amount of land, whereas a high score indicates the BMP may consume a relatively high fraction of land. Again, this factor is included in this early screening stage since many BMPs are severely constrained by land consumption.

Ability to Accept Hotspot Runoff. This last column examines the capability of a BMP to treat runoff from designated hotspots, as defined in Section 2.7. A BMP may be capable of accepting hotspot runoff, or may have some design restrictions as noted.

R0020438

BMP Selection Matrix No. 3 STORMWATER TREATMENT SUITABILITY

GENERAL BMP LIST	Rev Ability	Cpv Control	Qp2 Control	safety index	space index	accept hotspot runoff
P-1 Micropool ED	no	yes	yes	1.5	1.5	yes *
P-2 Wet Pond	no	yes	yes	4.0	3.0	yes*
P-3 Wet ED Pond	no	yes	yes	4.5	2.0	yes*
P-4 Multiple Pond	no	yes	yes	4.0	3.5	yes*
P-5 Pocket Pond	no	yes	yes	3.0	1.5	yes*
W-1 Shallow Marsh	no	yes	yes	2.0	5.0	yes*

W-4 Pocket Marsh	no	yes	depends	2.0	2.5	yes*
W-5 Gravel Wetland	no	yes	depends	1.5	3.0	yes
I-1 Infil. Trench	yes	depends	depends	1.0	2.0	NO
I-2 Shallow I-Basin	yes	depends	depends	1.0	3.5	NO
I-3 Porous Pavement	yes	depends	depends	1.0	1.0	NO
F-1 Surface Sand Filter	no, unless exfilter	depends	no	2.0	2.0	yes **
F-2 Underground SF	no	no	no	3.0	1.0	yes
F-3 Perimeter SF	no	no	no	1.0	1.5	yes
F-4 Organic SF	no	no	no	1.5	2.0	yes**
F-5 Pocket Sand Filter	no, unless exfilter	no	no	1.5	2.0	yes**
F-6 Bioretention	yes	depends	no	1.0	3.5	yes**
O-1 Dry Swale	yes	no	no	1.0	3.0	yes**
O-2 Wet Swale	no	no	no	1.5	3.0	NO
O-3 Off-line Swale	yes	no	no	1.5	3.5	yes **

* only if four foot separation distance is maintained from the floor of the pond to the seasonally high water table (2 feet on Lower Eastern Shore)
** only if bottom of facility is lined with impermeable filter fabric that prevents leachate infiltration

R0020439

Section 4.5 Physical Feasibility

At this point, the designer has whittled down the BMP list to a manageable number and can evaluate the remaining options given the actual physical conditions present on the site. This matrix will ultimately cross-reference the testing protocols needed to confirm physical conditions at the site. The six primary factors are:

Soils. The key evaluation factors are based on an initial investigation of the NRCS hydrologic soils groups at the site, followed by subsequent geotechnical tests to confirm permeability and other factors.

Water Table. Depth to the seasonally high water table from the bottom or floor of the practice

Drainage Area. Indicates the minimum or maximum drainage area that is considered suitable for the practice. If the drainage area present at the site is slightly greater than the maximum allowable drainage area needed for a practice, more than one practice can be installed. The minimum drainage areas indicated for ponds and wetlands should not be considered hard and fast limits, and may be increased or decreased depending on water availability (baseflow or groundwater) or the anti-clogging mechanisms employed.

Slope. This column evaluates the effect of slope on the practice. Specifically, the slope restrictions refer to local slope (how flat the area of practice installation must be) and up-gradient slopes (i.e., how steep can the contributing drainage area or flow length be)

Head. This column provides a typical estimate of the elevation difference needed from the inflow to the outflow to allow for gravity operation within the practice.

Other Factors. This column includes other physical restrictions such as depth to bedrock, proximity to wells and foundations, water balance, etc.

BMP SELECTION MATRIX No. 4: PHYSICAL FEASIBILITY

GENERAL BMP LIST	SOILS	WATER TABLE	DRAIN AREA (acres)	SLOPE	HEAD	Other
P-1 Micropool ED	A soils may require pond liner B soils may require testing	2 feet If hotspot or aquifer	10 min*	no more than 15%	6 to 8 ft	baseflow bedrock
P-2 Wet Pond			25 min*			
P-3 Wet ED Pond						
P-4 Multiple Pond						
P-5 Pocket Pond	NR	below WT	5 max		4 ft	
W-1 Shallow Marsh	A soils may require liner	2 feet if hotspot or aquifer	25 min	no more than 8%	3 to 5 ft	baseflow bedrock
W-2 ED Wetland						
W-3 Pond/Wetland						
W-4 Pocket Marsh	NR	below WT	5 max		2 to 3 ft	
W-5 Gravel Wetland	NR	2 feet			2 to 4 ft	
I-1 Infil. Trench	Fc > 0.52 inch/hr PT if Fc < 2.00 in/hr	4 feet		flat as possible	1 ft	Bedrock
I-2 Shallow I-Basin			10 max		3 ft	
I-3 Porous Pavement			5 max**		1 ft	
F-1 Surface Sand Filter	NR	2 feet	10 max **	no more than 6%	5 ft	
F-2 Underground SF			2 max **		5 to 7ft	
F-3 Perimeter SF			2 max **		2 to 3 ft	
F-4 Organic SF			5 max**		2 to 4 ft	
F-5 Pocket Sand Filter			2 max **		2 to 5 ft	
F-6 Bioretention	Made Soil				5 ft	
O-1 Dry Swale			5 max	usually 1 to 4% max	3 to 5 ft	
O-2 Wet Swale	NR	below WT	5 max		1 ft	
O-3 Bioretention Cell	Made Soil	2 feet	2 max		1 ft	

Notes: NR = not restricted, WT = water table, PT = pretreatment * unless adequate water balance and anti-clogging device installed ** drainage area can be larger in some instances.

R0020441

Section 4.6 Community and Environmental Factors

The fifth step involves an assessment of community and environmental factors that the BMP can provide. Again an index approach is used, where the given BMP is ranked from 1 to 5, with the lower score indicating that the practice has either a high benefit (or low drawbacks), and a higher score indicating that the particular practice has a low benefit or a major drawback for that factor.

Maintenance. This column assesses the maintenance burden for the practice, in terms of three criteria: frequency of scheduled maintenance, chronic maintenance problems (such as clogging) and reported failure rates.

Community acceptance. This column assesses community acceptance, as measured by three factors: market and preference surveys, reported nuisance problems, and visual orientation (i.e., is it prominently located or is it in an out of the way or underground location). It should be noted that a low rank may merely indicate the need for a better landscaping plan.

Construction Cost. The BMPs are ranked according to their relative construction cost per impervious acre treated. Please note that these rankings are preliminary, and await completion of the Center's ongoing BMP Cost Study.

Habitat. The BMPs are evaluated on their ability to provide wildlife or wetland habitat, assuming that an effort is made to landscape them appropriately. Objective criteria include: size, water features, wetland features and vegetation coverage in BMP and buffer.

Other Factors. This column indicates other factors that should be considered in BMP selection.

BMP SELECTION MATRIX No. 5: COMMUNITY AND ENVIRONMENTAL FACTORS

GENERAL BMP LIST	Main. Burden	Comm. Accept	Const. Cost	Habitat	Other Factors
P-1 Micropool ED	3.5	4.0	1.0	3.5	trash/debris
P-2 Wet Pond	1.5	1.5	2.0	2.5	High pond premium
P-3 Wet ED Pond	2.0	2.0	2.0	3.0	
P-4 Multiple Pond	2.0	1.5	3.0	1.5	
P-5 Pocket Pond	4.0	3.0	1.5	4.0	drawdowns
W-1 Shallow Marsh	3.5	2.0	3.5	1.5	
W-2 ED Wetland	3.0	2.5	2.5	2.0	Limit ED depth
W-3 Pond/Wetland	2.0	1.5	3.0	1.0	
W-4 Pocket Marsh	4.0	3.0	2.0	3.5	drawdowns
W-5 Gravel Wetland	4.0	4.0	3.0	4.5	Possible odors
I-1 Infil. Trench	5.0	2.0	3.5	5.0	Avoid large stone
I-2 Shallow I-Basin	5.0	4.0	3.0	4.5	Frequent pooling
I-3 Porous Pavement	5.0	1.0	3.0	5.0	
F-1 Surface SF	3.5	2.5	4.0	5.0	Minimize concrete
F-2 Underground SF	4.0	1.0	4.5	5.0	Out of sight
F-3 Perimeter SF	3.5	1.0	4.0	5.0	Traffic bearing
F-4 Organic SF	3.5	2.5	4.0	5.0	Change compost
F-5 Pocket Sand Filter	4.0	2.5	3.0	5.0	
F-6 Bioretention	2.0	1.5	2.5	4.0	Landscaping
O-1 Dry Swale	2.0	1.5	2.5	4.5	
O-2 Wet Swale	2.0	1.5	1.5	4.0	Possible mosquitos
O-3 Bioretention Cell	2.0	1.5	1.5	4.0	

Section 4.7 Locational Considerations

In the last step, the designer follows a checklist to determine where the selected BMP or BMPs can be located at the site, given the environmental features that are present. The checklist also indicates what, if any, permits must be secured to construct the BMP. The checklist will be modeled after the MDE Stormwater Management Assessment and Flow Chart Documents, already developed by Comstock (1995). Some of the locational factors would include:

Wetlands. Including the limited conditions under which a degraded wetland can be modified to accept stormwater (e.g., retrofits), and forested wetlands, and requirements for State and Federal CWA Sec. 401 and 404 permits.

Streams: Outline the general restrictions for placing ponds and wetlands within waters of the US, and outlining the permit process to follow if they are located in the uppermost 300 feet of a perennial stream. Guidance on dealing with intermittent channels, agricultural drainage, ditches and other situations. Additional guidance on location of detention or Cp_v facilities in and near streams.

Stream and Shoreline Buffers. Restrictions or conditions for locating BMPs within the Critical Area Buffer Zone and local stream buffer zones will be highlighted.

Forest Conservation Area. Discussion of BMP location within the context of the Forest Conservation Act, including prohibition from locating BMPs in Priority 1 Forest Retention Areas, or within 100 feet of specimen trees. Opportunities for reforestation in stormwater buffer areas will be noted.

Steep Slopes: Construction of BMPs are generally restricted on slopes greater than 15%.

Floodplains. BMP restrictions if located within the 100 year floodplain may require approval under the MDE Waterway Construction Regulations (COMAR 26.17.05).

Existing and Proposed Utilities. Restrictions and setbacks from sewer lines, roads, cables and other utilities at the site.

Residential Setbacks. Required setback distances from residential structures.

NOTE: THE CENTER WILL DRAFT THIS SECTION IN THE SUMMER OF 1997 FOR STATE AND LOCAL REVIEW.

Draft Data Summary for the Construction and Development Industry

Introduction

This document summarizes selected economic data for the construction and development (C&D) industry. EPA is providing preliminary data about the industry as part of its outreach activities in the early stages of rulemaking. These businesses may be covered under a proposed C&D effluent guidelines regulation being developed by the Agency.

EPA chose to develop effluent guidelines for the construction and development industry due to the large impacts some of these activities are causing to receiving waters across the United States. Sediment loadings from construction sites can be orders of magnitude higher than those associated with undisturbed areas. In addition, construction site runoff can contribute high loadings of nutrients and metals to receiving streams and can contribute significantly to receiving water impairments. In addition to contributing pollutants, the increased runoff volumes and flow rates produced following development can cause significant degradation of receiving stream quality. Impacts include stream bed scouring and habitat degradation, shoreline erosion and stream bank widening, loss of fish populations and loss of sensitive aquatic species, increased frequency of downstream flooding and aesthetic degradation. These impacts will be addressed in other documents being prepared by the Agency to support the proposed rule.

The purpose of this document is three-fold:

- Identify the industry sectors that may be covered by the proposed rules
- Quantify the size and magnitude of the potentially covered sectors
- Provide current information about economic conditions in these sectors.

EPA developed the data in this profile from several sources, including the 1997 Census of Construction Industries and the National Association of Home Builders.

1. Industry Definition

The proposed rules may cover establishments within the construction industry (NAICS 23) that disturb the land at construction sites of one acre or more.[1] These land-disturbing activities may include site preparation and site clearing tasks such as tree removal, excavation, blasting, scraping, and grading. Most establishments in NAICS 233 (Building, developing, and general contracting) and

[1] The Bureau of the Census classifies industries according to the North American Industrial Classification System, or NAICS. Under the NAICS, economic activity is first divided into twenty broad 2-digit industry codes. One of these is Construction (NAICS 23). Each 2-digit industry is further subdivided into 3-, 4-, and 5-digit levels.

NAICS 234 (Heavy construction) are likely to engage in such activities on a regular basis. Establishments within selected 5-digit industries that are part of NAICS 235 (Special trade contractors) are also likely to engage in land disturbing activities. The latter include NAICS 23593 (Excavation contractors) and 23594 (Wrecking and demolition contractors). Table 1 identifies the industry sectors that may be covered by the proposed regulations. While the focus of the effluent guidelines rulemaking is on land disturbing activities in the C&D industry, the data sources cited do not separately tabulate these activities.

Table 1. Construction and development industries

233 Building, developing, and general contracting		*234 Heavy Construction (cont.)*	
23311	Land subdivision and development	23491	Water, sewer, and pipeline construction
23321	Single-family housing construction	23492	Power and communication transmission line construction
23322	Multifamily housing construction	23493	Industrial nonbuilding structure construction
23331	Manufacturing and industrial building construction	23499	All other heavy construction
23332	Commercial and institutional building construction		
234 Heavy construction		*235 Special trades contractors*	
23411	Highway and street construction	23593	Excavation contractors
23412	Bridge and tunnel construction	23594	Wrecking and demolition contractors

Source: *North American Industry Classification System - United States*, Office of Management and Budget, 1999.

2. Number of Establishments

In 1997, these industries encompassed 261,614 establishments having at least one paid employee. The National Association of Home Builders estimates that among these establishments are 45,952 building contractors that perform only remodeling work (Ahluwalia and Chapman, 2000). Since most remodeling work does not result in land disturbance, these establishments may not be covered by the proposed regulations. In addition, builders that disturb one acre or less may not be subject to the proposed regulations. EPA believes that the number of such establishments may be substantial but no estimates are available. For purposes of this profile, the number of covered establishments with payroll is approximately 216,000 (i.e., 261,614 minus 45,952). Figure 1 shows the distribution of establishments by industry, as well as changes in the number of establishments between 1992 and 1997. Of note is the increase in the number of establishments in the building, heavy construction, and special trades sectors, but a decline in the land development sector.

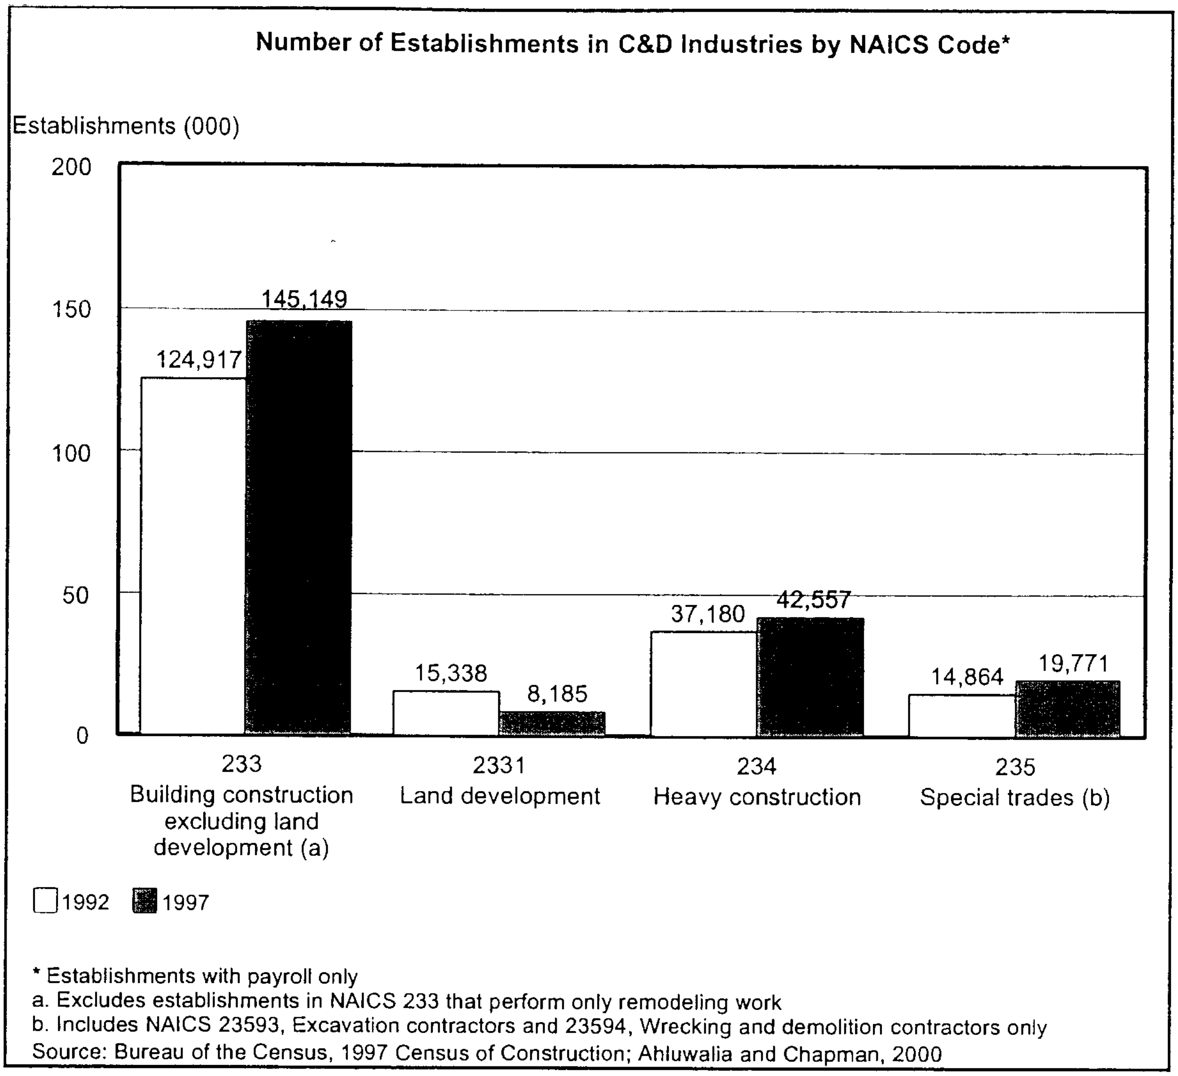

Figure 1. Number of Establishments with payroll in the C&D industries, 1992 and 1997.

In addition to establishments with payroll, Census estimates indicate that at least 448,387 establishments in the C&D industries had no paid employees in 1997.[2] EPA is seeking additional information about these establishments, but believes that many are either inactive or operate on a part-time basis only. Furthermore, a high percentage of those classified in building construction are probably remodelers (Baker, 2001).

[2] The number of non-employer establishments in NAICS 23593 and 23594 was not reported, hence the figure of 448,387 non-employer establishments is an underestimate.

3. Size of Establishments

Figure 2 shows the distribution of establishments by employment size class for 1997. Overall, 67 percent of establishments with payroll in the C&D industries have 4 or fewer employees, 83 percent have 9 or fewer employees, and 92 percent have fewer than 20 employees. Only one percent of C&D establishments with payroll have 100 or more employees. The *average* number of employees per establishment is 6.6 for building construction, 20.1 for heavy construction, and 5.6 for special trades.

From a revenue standpoint, in 1997, 20 percent of establishments with payroll reported annual revenues below $250,000, 35 percent reported revenues below $500,000 and 49 percent reported revenues below $1.0 million. Only 9,118 establishments, representing 3.5 percent of the total, reported annual revenues in excess of $10.0 million.[3]

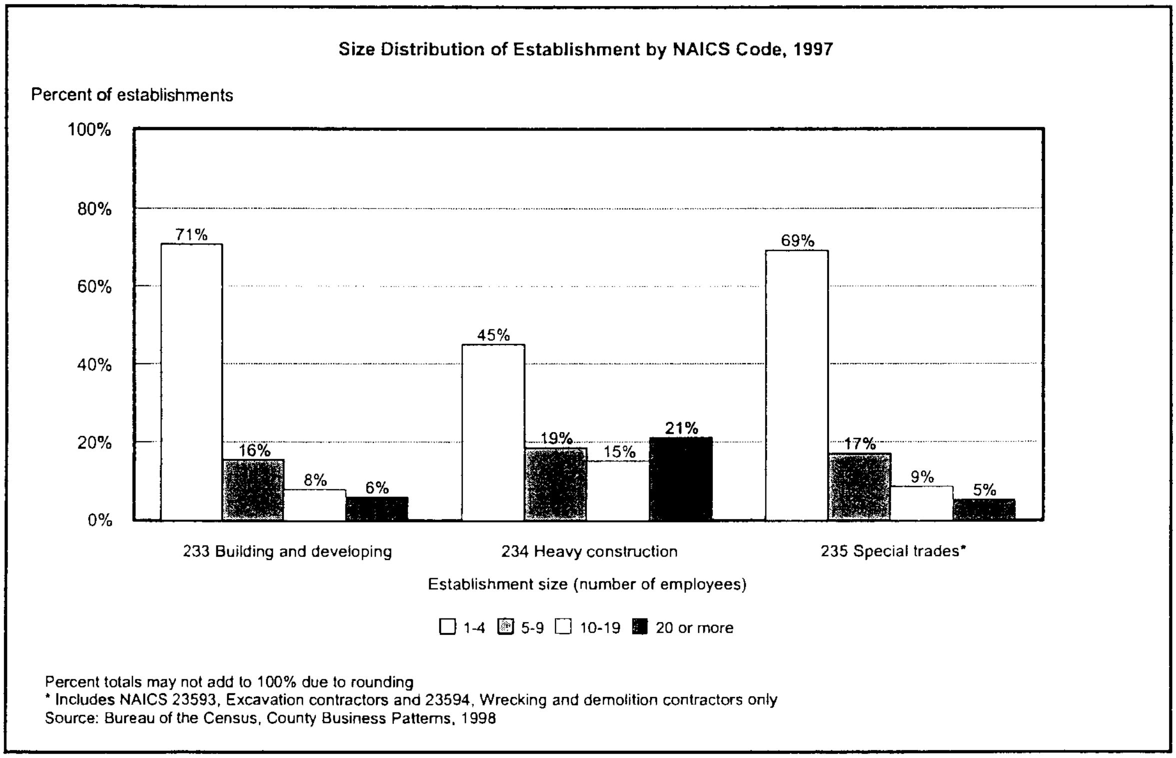

Figure 2. Size distribution of establishments in construction and development industries, 1997.

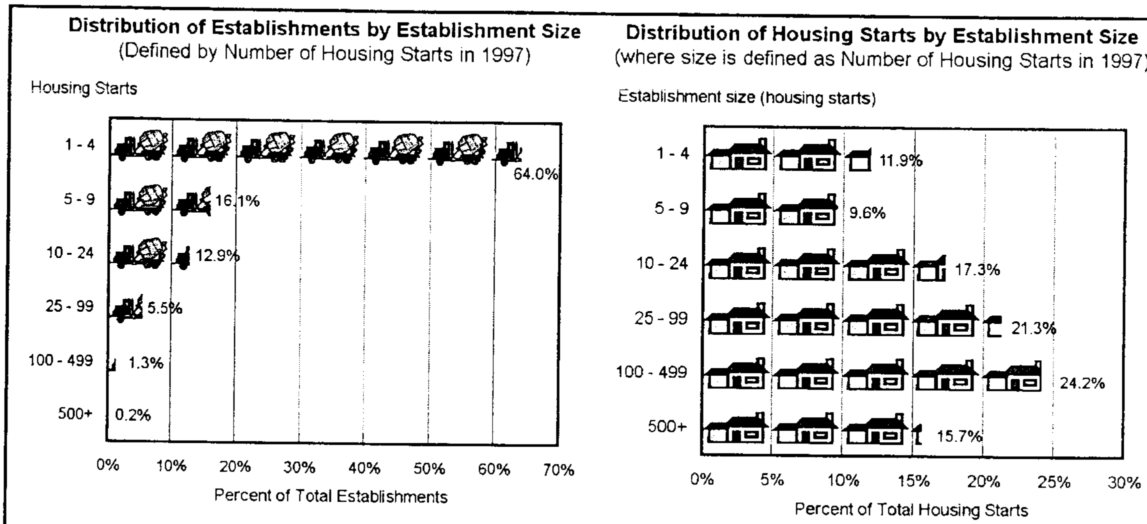
[3] The Small Business Administration (SBA) has established a small business size standard of $27.5 million for the building construction and heavy construction industries (except NAICS 23311, Land subdivision and development, which has a size standard of $5.0 million), and $11.5 million for special trades contractors. These size standards determine the eligibility of businesses for SBA assistance programs and Federal procurement preferences. In addition, the standards are used to define the number of small businesses affected by regulatory actions under the Small Business Regulatory Enforcement Fairness Act (SBREFA).

Figure 3 and Table 2 provide charts on single family residential construction activity based on the number of new homes started in 1997. A total of 50,661 establishments, representing 64 percent of the total, started constructing between one and four housing units. These units represented 12 percent of the total. Sixteen percent of establishments had between five and nine starts, 13 percent between 10 and 24 starts, and 5.5 percent between 25 and 99 starts. Only 1,200 establishments (1.5 percent of the total) had more than 100 housing starts, but these represented 39.9 percent of all housing units started in 1997.



Explanation:
Read across to compare the population of a particular firm size group to the number of houses produced by that group.
Example:
Firms (establishments) that started 1 to 4 houses in 1997 comprised 64 percent of all firms, and were responsible for 11.9 percent of all houses started in 1997.

Figure 3. Number of establishments in single-family housing construction by number of housing starts, 1997.

Table 2. Number of Housing Starts in 1997	Establishments		Housing Starts	
	Number	Percent	Number	Percent
1-4	50,661	64.0%	102,033	11.9%
5-9	12,708	16.1%	81,900	9.6%
10-24	10,183	12.9%	148,037	17.3%
25-99	4,338	5.5%	182,812	21.3%
100-499	1,060	1.3%	207,687	24.2%
500+	152	0.2%	134,154	15.7%
Total	79,102	100.0%	856,623	100.0%

R0020452

4. Geographic Distribution

Figure 4 shows a geographic distribution of establishments by state. The largest distribution of establishments are located in California, New York, Texas, Florida, and Pennsylvania. Combined, these account for approximately 25 percent of all C&D establishments nationwide.

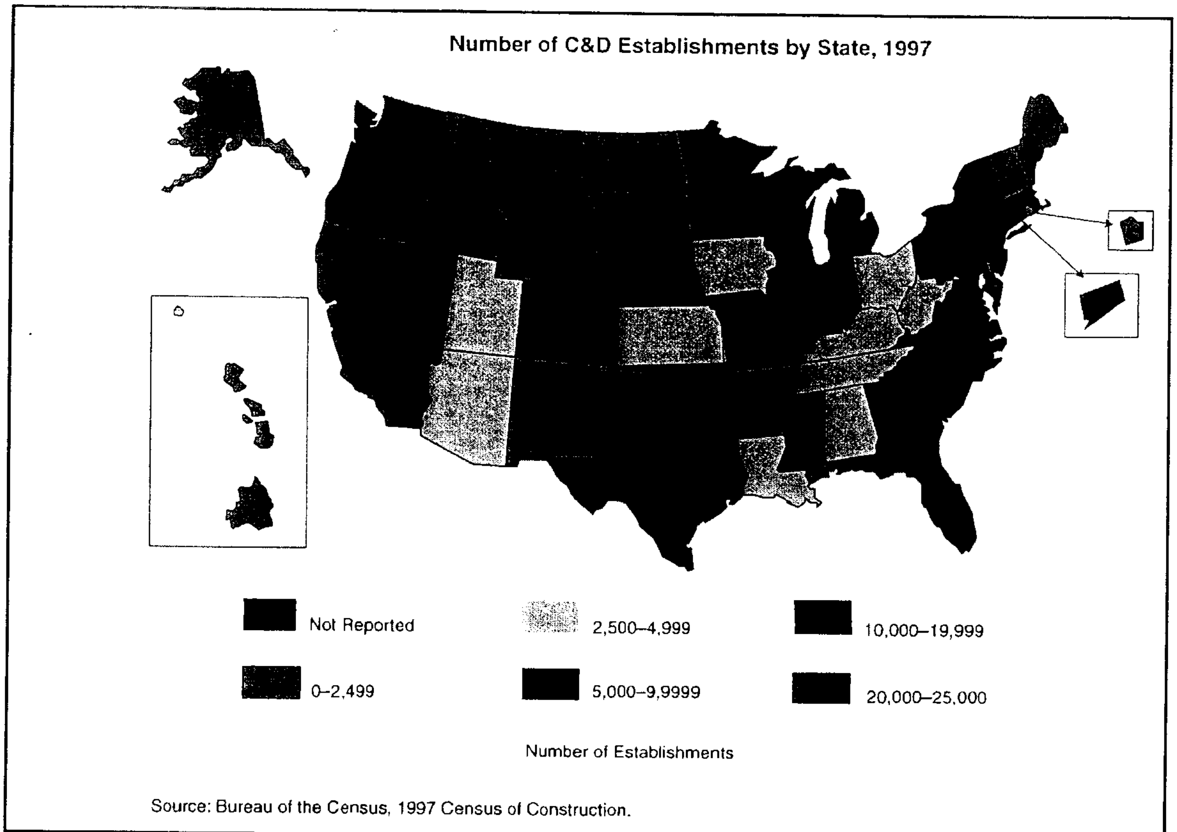


Figure 4. Number of establishments in the C&D industry, by state, 1997.

5. Employment

In 1997, the C&D industries employed 2.4 million workers. As shown in Table 3, land subdividers and developers accounted for 41,827 employees (1.8 percent of the total) while builders and general contractors (the remainder of NAICS 233) accounted for 1.3 million employees, or 55.2 percent of the total. Some 880,400 workers, or 37.3 percent of the total, were employed in heavy construction, and the special trades contractors (excavation contractors and wrecking/demolition contractors) together employed 135,057 (5.7 percent of the total). EPA has not estimated the proportion of these workers that are involved in land disturbing activities.

R0020453

Table 3. Employment in the C&D Industries, 1997

NAICS	Description	Employees	Percent of total
233, except 2331	Building, developing, and general contracting, except land development and subdivision	1,301,126	55.2%
2331	Land subdivision and land development	41,827	1.8%
234	Heavy construction	880,400	37.3%
235[a]	Special trade contractors	135,057	5.7%
TOTAL		2,358,410	100.0%

[a] Includes NAICS 23593 (Excavation contractors) and 23594 (Wrecking/demolition contractors)
Source: Bureau of the Census, 1997 Census of Construction.

Construction is a seasonal activity in many parts of the country, and employment data from the industry confirm this trend. Figure 5 shows quarterly employment data for building construction and heavy construction industries in 1997. Overall, employment of construction workers reached its lowest in March at 1.53 million and its highest in August at 1.83 million during that year.

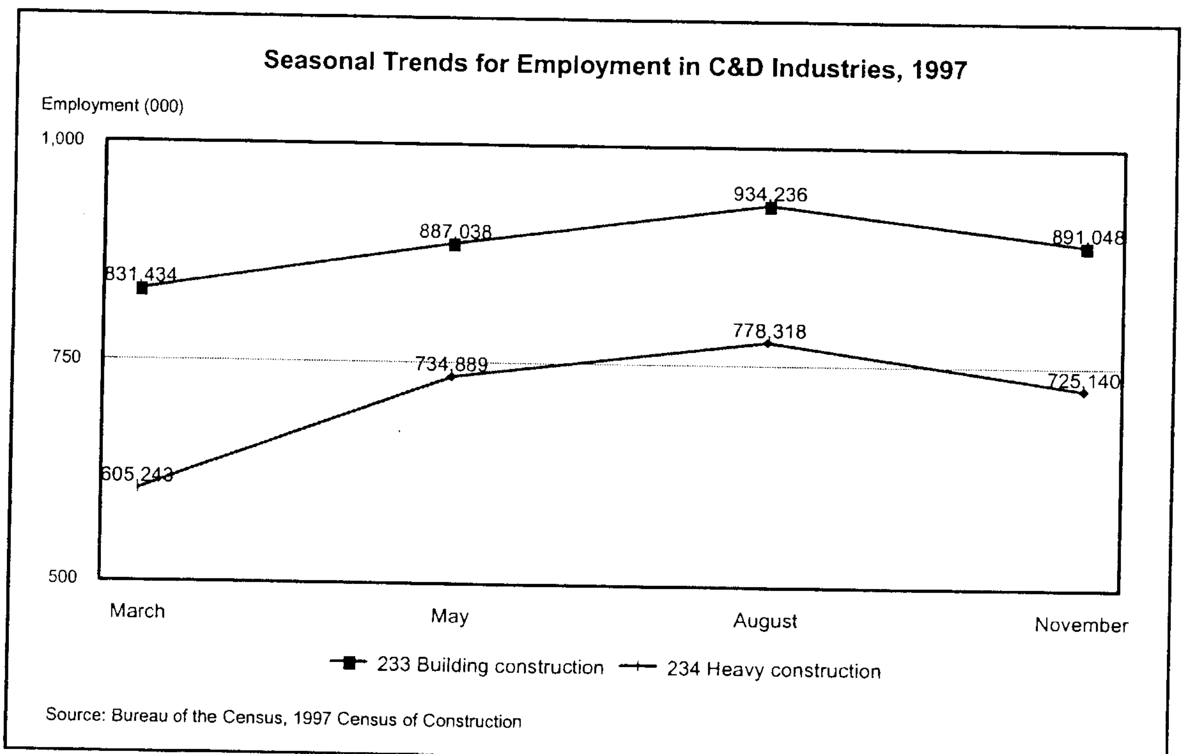

Figure 5. Seasonal trends for employment in the C&D industries, 1997.

6. Payroll and Benefits

In 1997, the total payroll in the C&D industries was $76.8 million. Of this, construction workers earned $48.3 million (62.9 percent) and other workers not directly engaged in construction activity earned $28.5 million (37.1 percent). In addition, the C&D industries incurred $11.2 million in legally required fringe benefit expenditures and $6.5 million in voluntary fringe benefits, for a total of $17.7 million in fringe benefits. This total represents 23.0 percent of the combined payroll for all workers.

7. Revenue Indicators

Table 4 shows revenue indicators for the C&D industries. Overall, the total value of business done in the C&D industries was $534.2 billion in 1997. Builders and developers accounted for $386.9 billion or 72.4 percent of the total in 1997. Revenues of heavy construction contractors were $130.8 billion and represented 24.5 percent of the total, while special trade contractors (excavation contractors and wrecking/demolition contractors) earned $16.5 billion, representing 3.1 percent of total C&D industry revenues. On average, establishments in special trades generate $834,000 in business compared with $1.8 million for land developers, $1.9 million for building construction contractors, and $3.1 million for heavy construction contractors. The value of business done per employee is highest among land developers at $344,514, followed by housing contractors at $286,303, heavy construction contractors at $148,563 and special trades contractors at $122,156.

Table 4. Revenue in the C&D Industries, 1997

NAICS	Description	Value of business done ($millions)[a]	No. of estabs.	Value of business done per estab.	Employees	Value of business done per employee

8. Value of Construction Work

Table 5 shows that approximately $845 billion in construction work was completed in the U.S. in 1997. Of this, roughly 80 percent was for building construction and 20 percent was for nonbuilding construction. The building construction component includes residential construction (41 percent of building construction), commercial and industrial construction (40 percent), institutional construction (15 percent), and other (4 percent). The nonbuilding construction component includes highways, streets and related work (29 percent of nonbuilding construction), sewers, water mains and related work (14 percent), power and communication lines and towers (8 percent), bridges, tunnels, and elevated highways (7 percent), and a large number of miscellaneous categories (42 percent).

Table 5. Value of construction work completed, by type of construction (1997 $billions)

Type of Construction	Value of Construction Work	Percent of Total
Building construction	*$667.9*	*79.0%*
Residential	$275.7	32.6%
Single family houses	$238.3	28.2%

8.1. Value of Construction Work Done, by State

Figure 6 shows the value of construction work done in the C&D industries, by state. On an individual state level, the total value of construction work ranged from $1.4 billion (0.2 percent of the total U.S. value) in the District of Columbia to $93.1 billion (11.0 percent of the U.S. total) in California.

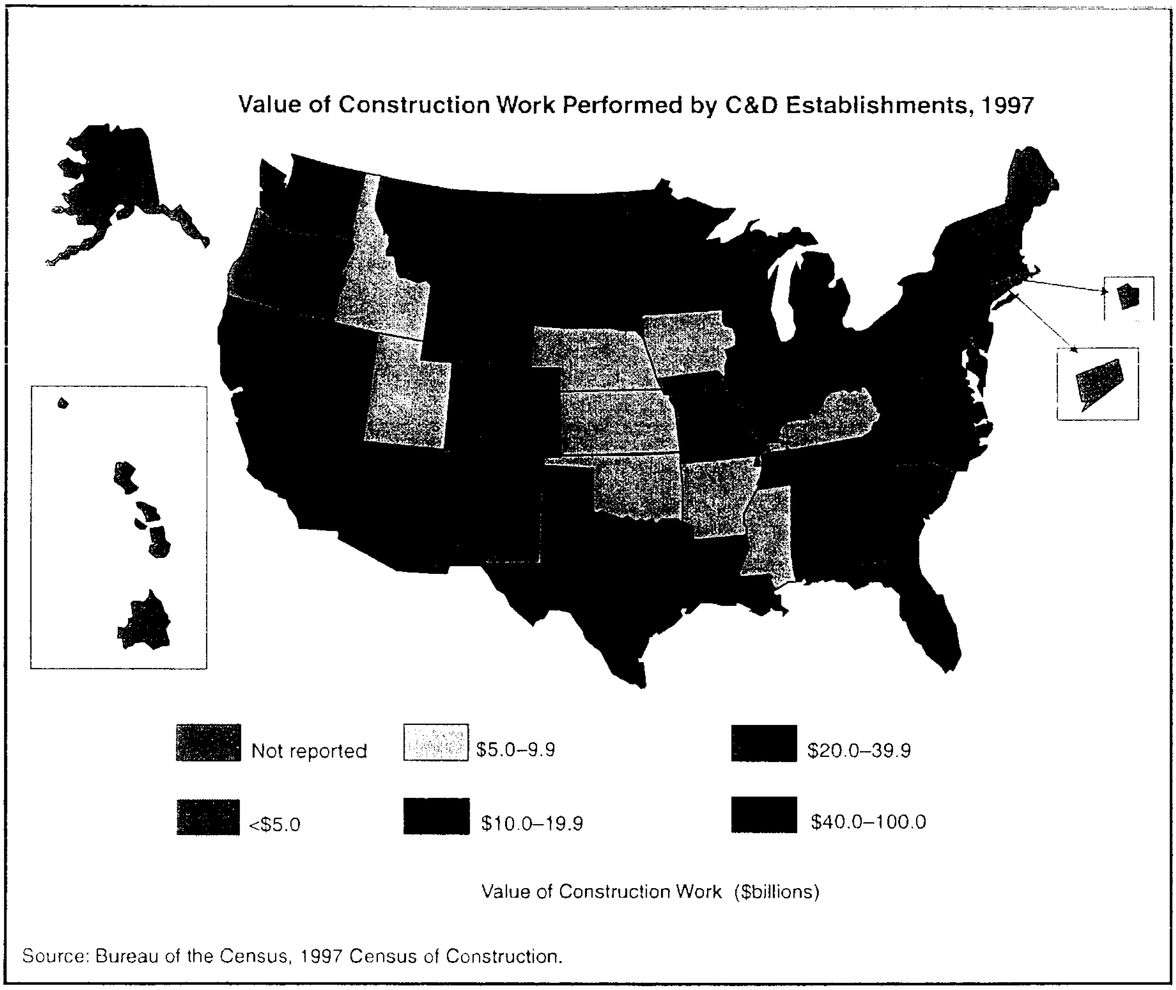

Figure 6. Value of construction work done by state, 1997.

8.2. Value of Construction Work Done, by Type of Ownership

Figure 7 shows the value of construction work, by project ownership. Privately owned projects totaled $501.7 billion in 1997, representing 76.4 percent of the total. Projects owned by State and local governments accounted for $140.8 billion, or 21.4 percent of the total, while Federal government projects totaled $14.1 billion, or 2.1 percent of the total. In general, government projects account for a greater share of heavy construction work, with the Federal government accounting for 6.9 percent and state government accounting for 47.2 percent of the heavy construction total.

R0020457

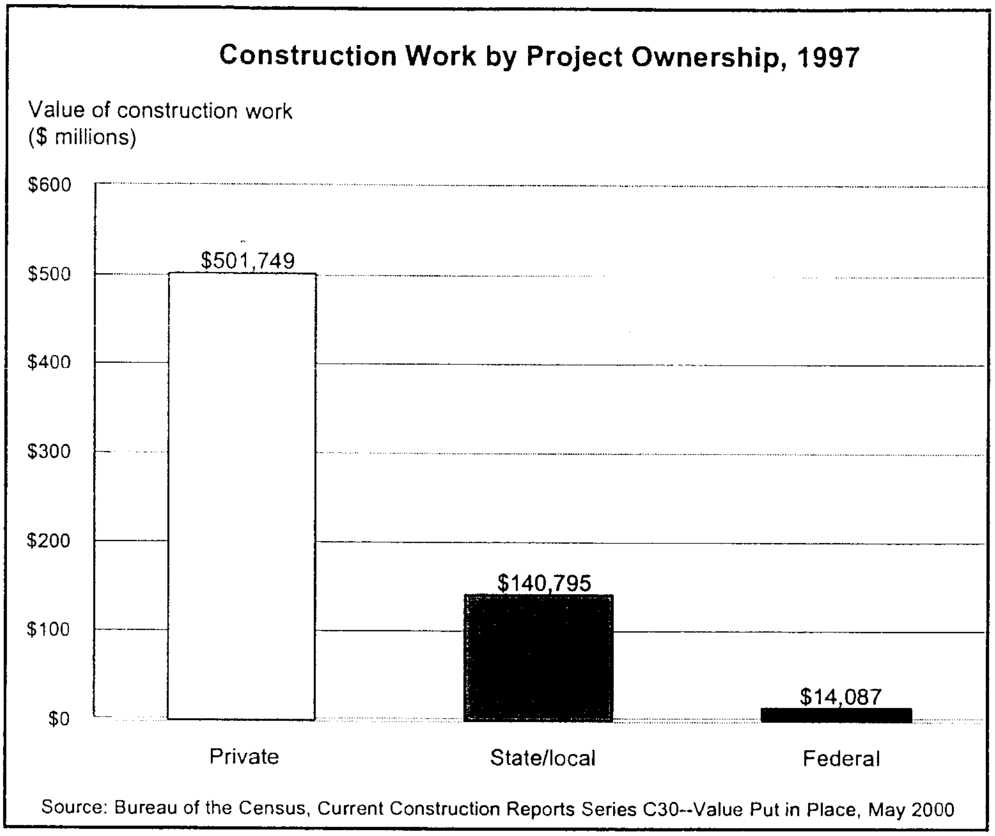

Figure 7. Value of construction work, by project ownership, 1997.

9. Construction Activity Indicators

The primary indicator of construction activity in the U.S. is the number of new housing units authorized for construction. Figure 8 tracks the seasonally adjusted annual number of units authorized on a month-to-month basis. As seen, the number of units authorized shows a steady rise over the recent period. From an average of between 1.3 and 1.5 million units per year over the 1994 to 1997 period, the number rises through the 1998 to 2000 period. The rate appears to have reached a peak in February 2000 when it hit 1.8 million units, and has since fallen steadily back to the 1.5 million units-per-year mark.

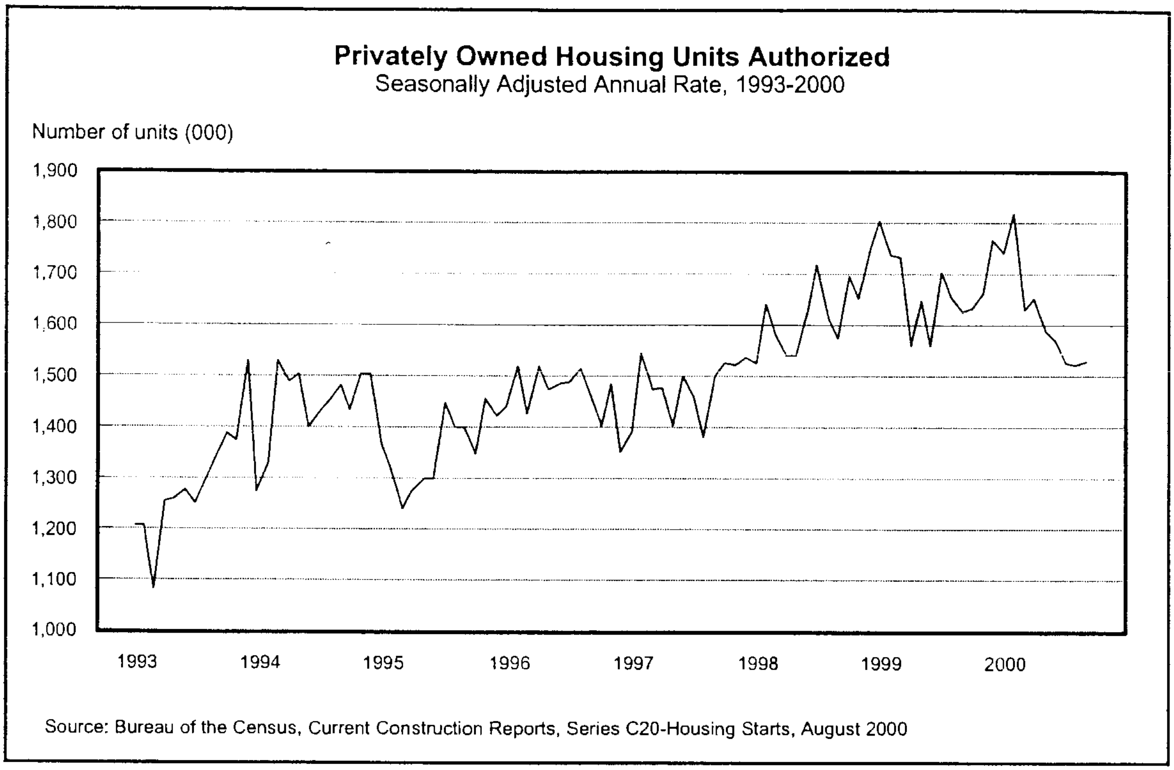

Figure 8. Number of housing units authorized by building permit, 1993 to 2000.

Figure 9 shows actual year-end data on the number of new housing units authorized by building permit in 1997, by state. The states with the greatest number of housing units authorized, and number of units, included Florida (133,990), Texas (125,974), California (109,589), North Carolina (73,015), and Georgia (75,123). States with the fewest housing units authorized, and number of units, included Alaska (2,560), Montana (2,472), Vermont (1,831), Wyoming (1,669), and the District of Columbia (15). The total number of new housing units authorized in 1997 was 1,441,136, with single-family housing units accounting for 1,062,396 or 73.7 percent.

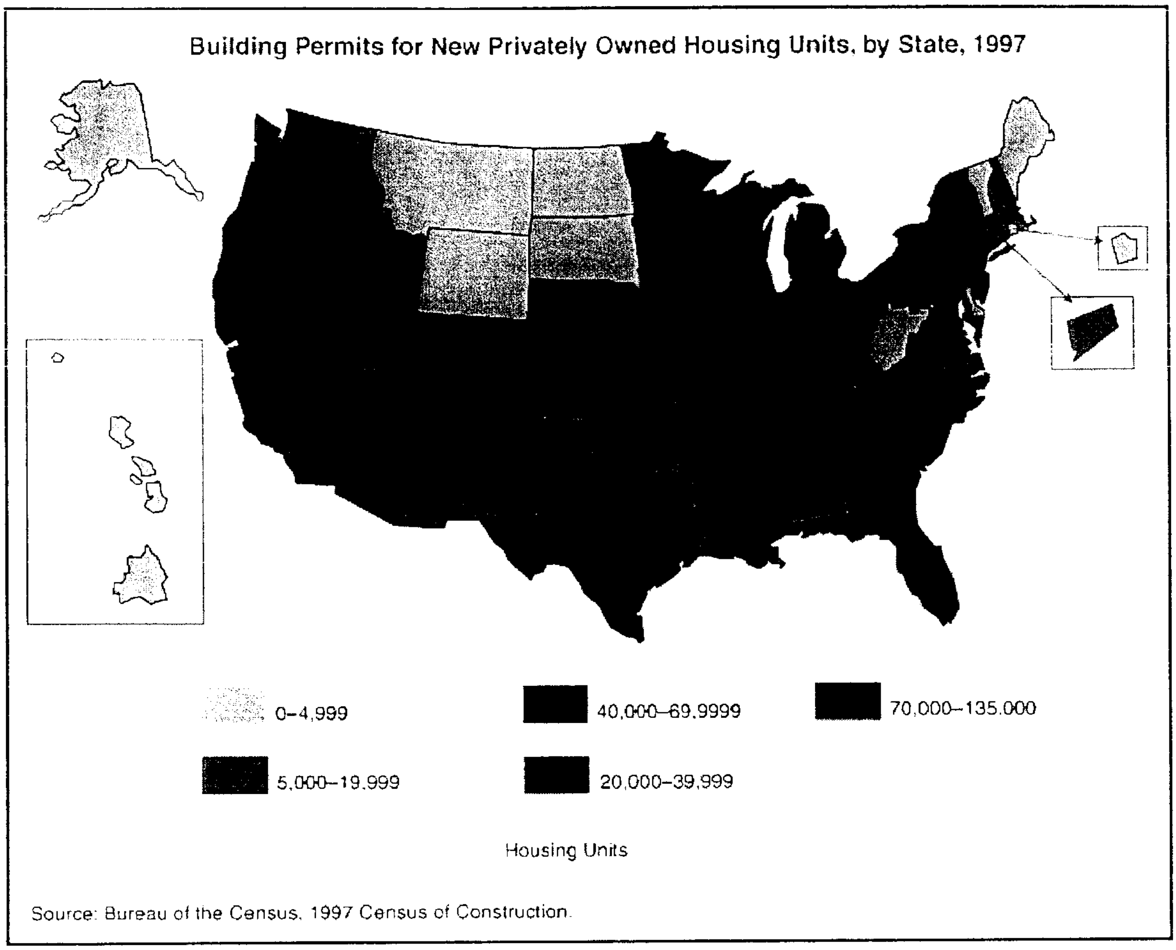

Figure 9. Number of building permits issued, by state, 1997.

Figure 10 demonstrates the annual cycle of building activity, using monthly data on housing units authorized by building permits for 1997. The monthly average for all of 1997 was 120,100 units. This fluctuated from a low of 88,100 units in January to a high of 137,200 units in April.

R0020460

R0020466

Driveways: Reducing Impacts

Driveways ARE a big deal! They can contribute 15% to the total impervious surface area in a residential subdivision. Research shows that they are also hot spots for pollutant (auto and household hazardous wastes) accumulation too. In addition, moat driveways concentrate runoff and direct it to off-site municipal storm water systems.

Follow the planning guide below for some of the most effective means to reduce impacts fror new driveways. For more information, View NEMO Technical Paper #6 (Adobe Acrobat forma 36k) now or browse the information available in the NEMO Store.

1. Limit the size and number of driveways in your town.
Review your towns zoning and subdivision regulations and road ordinances. Are shared driveways permitted? Allow shared driveways to serve commercial areas and up to four single-family lots. What do your lot setbacks generate? (Photo1) Establish maximum limits on paved driveway lengths. Are driveway standards asking for a minimum width that can be easily exceeded? (Photo 2) Establish *maximum* limits on paved driveway widths. Allow single lane straight drives to be 8' or 9' wide and double lane drives to be 18'. Driveway curb cuts should be limited to one per site.

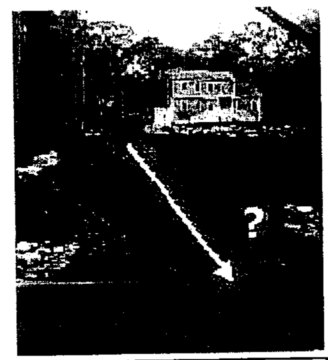

Photo 1

Middlesex County
Extension Center
1066 Saybrook Road
Box 70
Haddam, CT 06438-0070
860-345-4511
FAX 860-345-3357

2. Reduce their imperviousness

Many local driveway regulations stipulate they be constructed with impervious surfaces. There are numerous porous surfaces that work well on driveways and local regulations should permit their use. Examples of porous driveway surfaces include; porous concrete and asphalt mixtures, paver blocks and brick set in sand, grass pavers, grid pavers, crushed stone and gravel. The key to the use of porous driveway surfaces is the installation of a sub-base specifically designed for the surface material used. The sub base must also be capable of promoting infiltration and runoff cleansing.

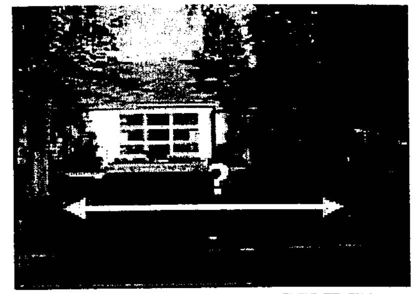

Photo 2

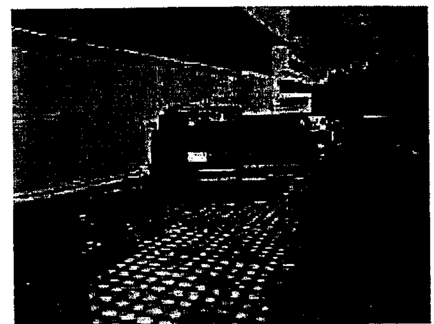

Photo 3 – gravel drive with concrete grid pavers for extra width and emergency vehicle support.

Design shorter and narrower drives. Design wide turnaround areas only where needed. Allow various driveway designs, including ribbon drives that contain less impervious surface than the more common full width, single slab, drive. Where porous driveway surfaces are used, insure that a proper sub base, capable of infiltrating and cleansing storm water runoff is installed

3. Direct runoff to allow for infiltration.

- Design drives to follow contours Do not allow roof gutters and downspouts to drain ov impervious driveways.
- Allow and promote the use of porous driveway surfaces, including; porous asphalt anc concrete mixtures, paver blocks and bricks laid in sand, concrete and grass grid pave crushed stone and gravel.
- Where impervious driveway surfaces are installed they should be crowned and pitche to direct runoff to adjacent porous areas.
- Where impervious driveway surfaces are installed, disrupt their connection to roads, curbs and curtain drains with porous materials in the area where the drive intersects tl road.
- Whatever type of driveway is installed, it should never obstruct existing storm water flows along the road or through drainage facilities.

Got an experience to share? Drop us a note.

Revised: February 09, 2001 .

Maintaining Urban Ponds and Other Stormwater Facilities

Urban Stormwater Facilities or Best Management Practices (BMPs), structures for managing stormwater, have become common in Maryland during the past twenty years. These facilities will cease to function as designed if not properly maintained. The purpose of this Guidebook is to describe the four primary types of BMPs found in the County and to outline some basic maintenance tasks that will keep them functioning properly.The audience for this Guidebook is primarily homeowners associations and residential or commercial property managers.

R0020470

Introduction

Over the past twenty years, the impacts of watershed urbanization have become apparent in our streams and rivers. Watershed drainage patterns altered by development that had no control for stormwater runoff often resulted in downstream flooding on residential and commercial properties or at road crossings. Uncontrolled stormwater volume increases streambank erosion and produces major detrimental changes in the physical characteristics of receiving streams. Residential, commercial, and industrial land uses result in polluted stormwater runoff, known as non-point source pollution, which can reach streams and rivers unless control mechanisms are in place. Pollutants include sediment, nutrients such as phosphorus and nitrogen, oil and grease, lawn and garden chemicals, heavy metals, and anything else that may wash off from streets and developed properties.

For many years, stormwater management focused on reducing the risks of downstream flooding. During this time, detention basins were frequently used to control quantity impacts by temporarily storing runoff from large storms and then releasing it slowly so that peakflows were reduced. During the mid 1980's, the commonly-used facility designs were modified to reduce pollutants in basin discharges to help protect downstream aquatic life and drinking water quality. These dual purpose (quantity and quality) basins are generally referred to as urban Best Management Practices or BMPs. Federal, state, and local laws and regulations require stormwater management and the control of non-point source pollution. At the local level, these requirements are addressed in Chapter 19 of the Montgomery County Code.

Home Owner Associations and facility managers can perform simple maintenance and contract with knowledgeable consultants for detailed, complex maintenance and repair. The goals of an effective maintenance program would be to prolong the life of stormwater facilities, avert expensive repair costs and prevent adverse downstream impacts.

Under Montgomery County Code and Executive Regulation 5-90, business and homeowners are responsible for routine maintenance and repair of on-site stormwater management facilities. It is the goal of this manual to assist responsible parties in complying with the regulations, to help make stormwater facilities an asset to our communities and to protectlocal streams and the Chesapeake Bay.

This manual is designed to help responsible parties understand basic maintenance needs and associated costs for the facilities being managed. Just as no two natural ponds or lakes are the same, no two urban ponds are the same and therefore maintenance needs will differ from BMP to BMP.

Back to Top

Types of BMPs

R0020471

The following information describes the four most common types of BMPs found in Montgomery County, including Ponds, Infiltration Trenches, Underground Storage Structures, and Oil Grit Separators.

In general, infiltration trenches and oil grit separators manage runoff quality while underground storage structures manage runoff quantity. Stormwater management ponds may be designed to control runoff quantity only or to control both quantity and quality.

Quantity management attempts to prevent downstream flooding and erosion while quality management attempts to control "first flush" effects in which the highest concentration of pollutants are carried during th first stages of runoff from developed sites.

It is not unusual, however, for multiple types of BMPs to be used at one site. For example, a site may includ several oil grit separators at the edge of paved areas to treat the quality of runoff from that area prior to its entering a large detention basin which controls quantity impacts due to runoff from the rest of the site. Owners and operators must therefore conduct a holistic maintenance program which addresses every component in the entire system or the facility will lose its intended capability for quality and/or quantity management.

Storm Water Management Ponds

Dry Ponds

In Montgomery County, most dry ponds provide quantity control through man-made basins which temporarily hold stormwater after a storm. There are a few dry ponds in the County which provide quality control through extended detention of stormwater. Prior to the mid-1980's, dry ponds represented the most common type of stormwater management facility in the County. To meet more recent quality control requirements, dry ponds are built in conjunction with quality control structures such as infiltration trenches. See figure 1.

Wet Ponds

Wet ponds are man-made retention basins which contain permanent pools of water that function much like natural ponds.The wet pond is designed to hold a certain amount of water permanently. Runoff from storm events is stored above the permanent pool with excess water being discharged at a controlled rate via outlet devices similar to those used in dry ponds. Over time, this permanent pool develops into an aquatic ecosystem. See figure 2.

R0020472

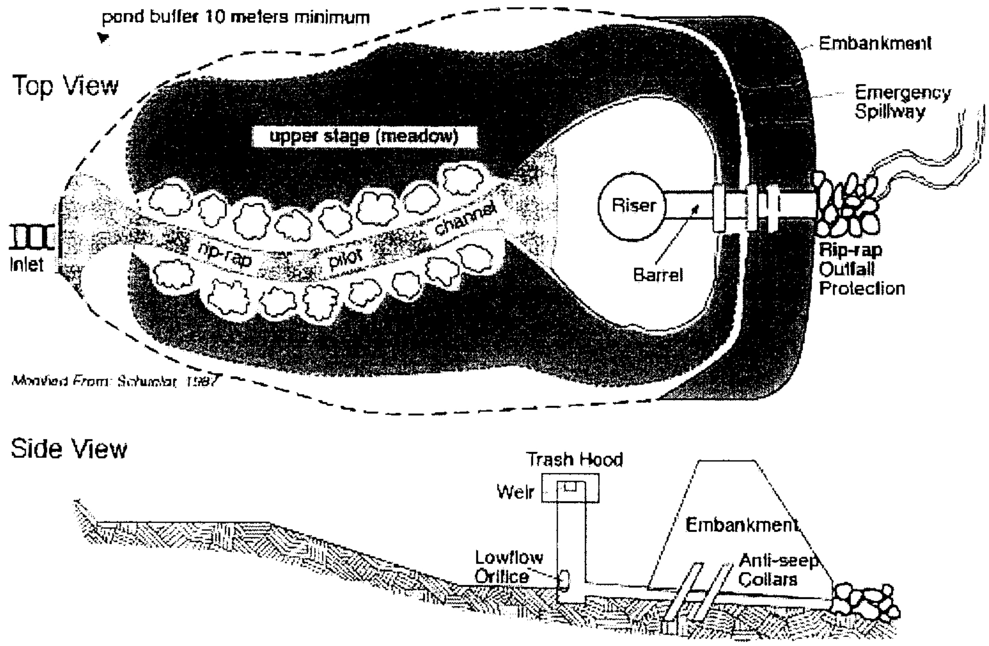

Figure 1. Typical Dry Pond

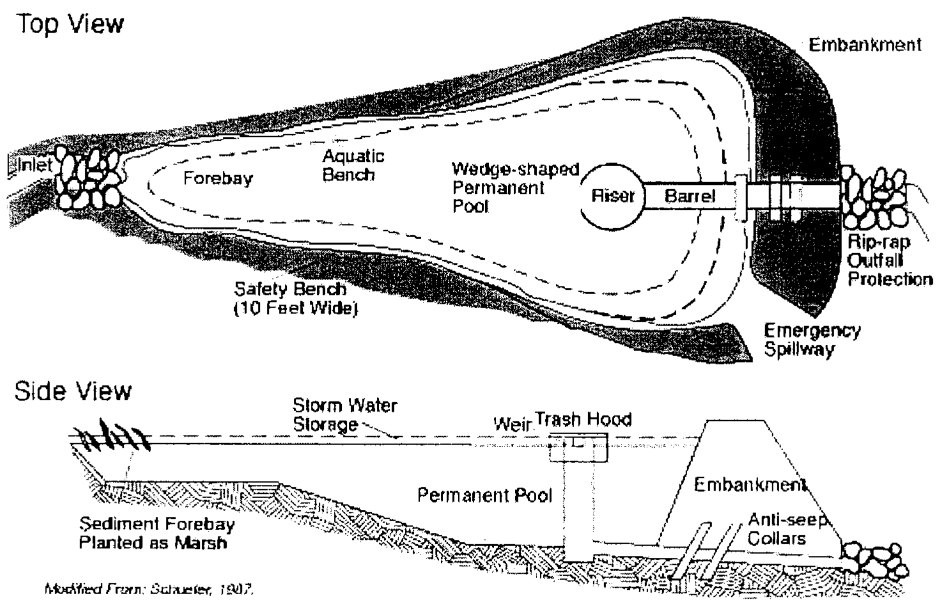

Figure 2. Typical Wet Pond

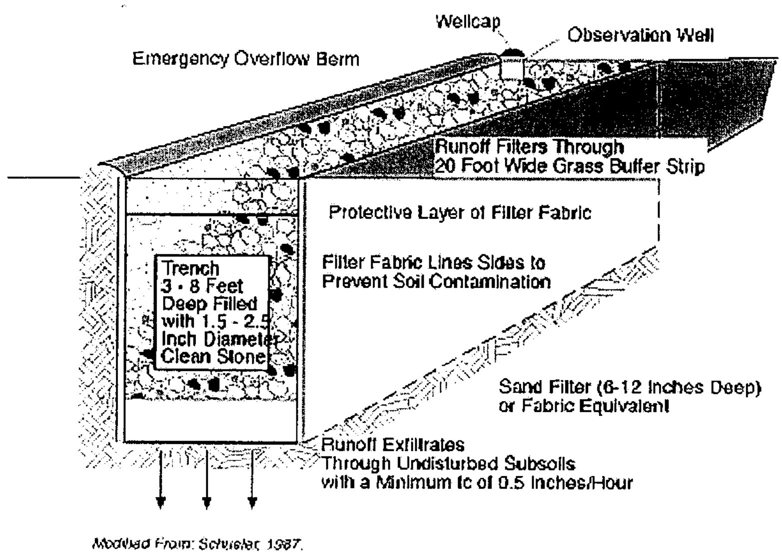
R0020473

Infiltration Trenches

Infiltration trenches are gravel-filled excavations that temporarily store stormwater and allow it to soak into the soil beneath the trench, filtering out pollutants as the water moves through the soil. In Montgomery County, infiltration trenches are generally used for water quality control only. An example is shown in Figure 3.



The two basic types of infiltration trenches are distinguished by how stormwater enters the facility. Dispersed input facilities allow stormwater to enter the top of the trench as overland runoff. Concentrated input facilities receive stormwater from curb inlets, gutters, and pipes. All underground BMPs are complex in structure and function, and a professional should be consulted to determine a particular facility's maintenance needs.

Figure 3. Typical Infiltration Trench.

R0020474

Oil Grit Separators

Oil Grit separators (also known as water quality inlets) are multiple stage, underground concrete storage structures that are designed to remove hydrocarbons (oil) and particulates (grit) from stormwater. Typically associated with parking lots and other paved areas, these structures are common on commercial sites. These structures require routine removal of the materials accumulated in the storage chambers or their pollutant removal ability will be severely compromised.

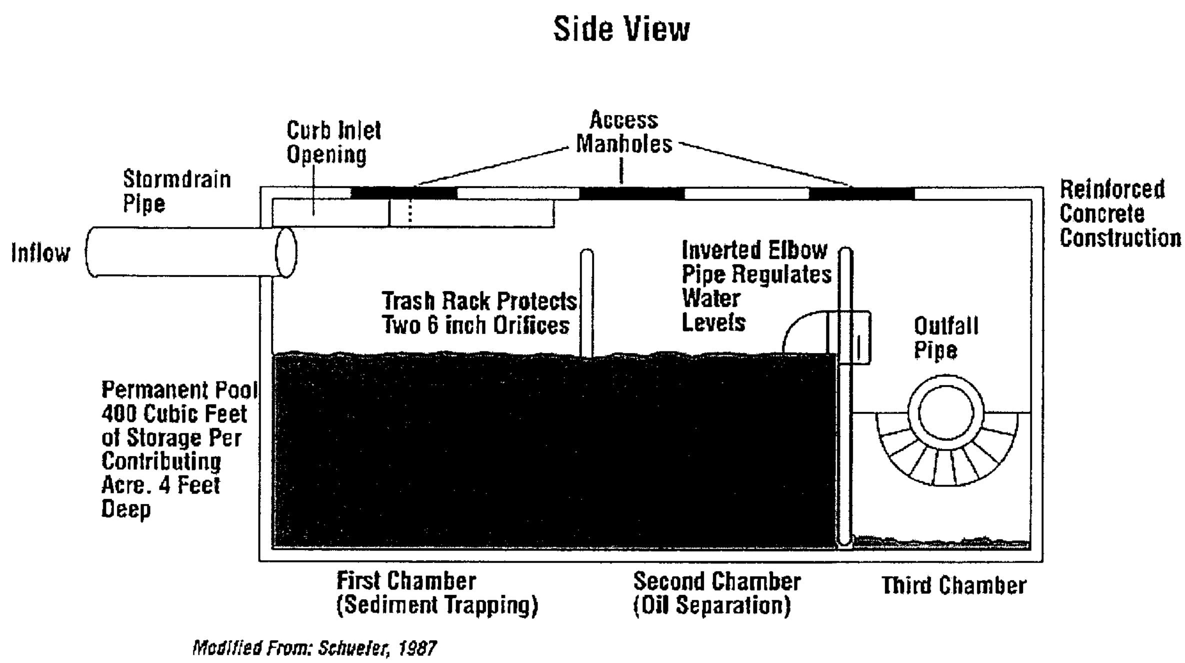


Figure 4. Typical Oil Grit Separator at a Commercial Site

R0020475

Underground Storage Structures

Underground storage structures manage runoff quality similar to ponds. Their advantage is that they do not take up valuable property and are located below parking gargages in large buildings. Specialized certification and training are required for inspecting and maintaining these structures. An example is shown in figure 5.

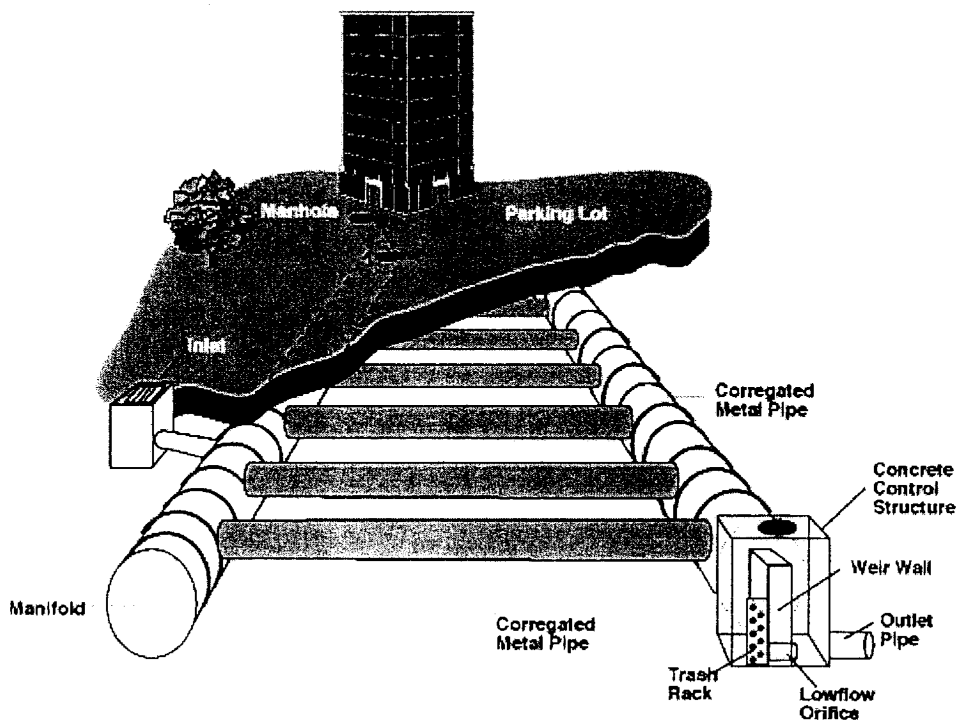

Figure 5. Typical Underground Storage Structure

Back to Top

Elements of a Maintenance Program

Overview

BMPs cannot perform their two functions, stormwater storage and stormwater quality improvement, unless they are maintained over time. If a facility loses its storage capacity, downstream flooding may occur. There may be no visible indicator, however, if a facility is not removing pollutants like nutrients and heavy metals as originally designed. A consistent maintenance program is the best way to ensure that a BMP will continu to perform its water quality improvement functions.

R0020476

Routine Visual	Non-Routine
Visual Inspection	Bank Stabilization
Vegetation Management	Sediment Removal
Debris/Litter Control	Outlet Structure Maintenance/ Replacement
Maintaining undisturbed areas above infiltrating trenches/basins	Mechanical Components Maintenance (dependenton age of BMP)
Cleaning of Oil/Grit Separators	

Table 1. Components of a Maintenance Program.

This section outlines the maintenance needs for the most common BMPs found in Montgomery County. I is important to note that while general maintenance tasks can be outlined, actual maintenance needs will vary according to specific site conditions.

Table 1 shows the tasks that need to be considered as part of a general maintenance program. Other factors which need to be considered include:

Visibility of the Facility. Community needs and preferences determine to a large extent the type and amount of necessary maintenance for aesthetic purposes.

Landscaping. Maintenance needs vary greatly depending upon the type of vegetation.

Watershed conditions above the facility will largely determine type and amount of sediment and other pollutants that are entering that facility. For example, erosion problems upstream can dramatically increase the amount of sediment entering a basin.

A BMP maintenance program should also consider the following:

Safety. Some tasks can be carried out by non-technical staff or residents quite effectively; however, all programs should carefully ensure the safety of anyone carrying out maintenance tasks, and often a professional should be hired to conduct the work. Confined spaces should never be entered without proper training and permits from occupational and safety regulatory agencies.

Need for professional judgement. Professional judgement should be solicited regularly to ensure that all needs of the facility are met. Even though some maintenance tasks can be routinely performed by non-professionals, there are many problems that are not obvious to the untrained eye.

The County is required to insure that a maintenance inspection of all stormwater management facilities are conducted once every three years.

Financing. A fund should be established to provide for the costs of long-term maintenance needs, such as sediment removal, which can be considerable. (See page 11 for further discussion of estimated costs.)

Routine Maintenance Needs

Inspections

Montgomery County's Stormwater Management Regulations require that the County insure that routine maintenance inspections occur at all privately-owned facilities. The County has developed "checklists" for

R0020477

use during routine inspections at facilities. A minimum checklist for ponds is shown in Table 2.

-
- Obstructions of the inlet or outlet devices by trash and debris
- Excessive erosion or sedimentation in the basin
- Cracking or settling of the dam
- Low spots in the bottom of a dry pond
- Deterioration of pipes
- Condition of the emergency spillway
- Stability of the side-slopes
- Upstream and downstream channel conditions
- Signs of vandalism

Table 2. Minimum Inspection Checklist for Ponds.

Infiltration Trenches

Infiltration facilities have been shown to become dysfunctional due to clogging by sediments more frequently than either detention or retention basins. Therefore, it is recommended to inspect these facilities on the order of two to four times a year. The purpose of regular inspection is to determine if the sediment removal structures require routine maintenance. Most infiltration trenches have a grassed and/or gravel filter to remove some sediment before the stormwater enters the trench. Keeping this sediment filter clean is vital to ensuring the long-term performance of the infiltration trench. Although these operations must be undertaken more often than with surface facilities, the costs are significantly less.

The performance of an infiltration trench should be monitored as part of the routine inspection. The observation well installed in most trenches can be used to determine how long it takes the water to infiltrate into the soil after a storm event. This determination can be made in two ways. Several water level readings can be made over a period of days after a large storm. The rate the water level falls can be directly determined by two or more readings. The alternative method is a "one stop" method where a single water level reading is taken and compared to the local rainfall record. Although less accurate than the multiple reading method, the "one stop" method does provide enough information to approximate the emptying time and will identify trenches which are severely clogged.

Debris and Litter Removal

The regular removal of debris and litter provides a variety of benefits as shown in Table 3. Special attention should be given to the removal of floating debris which can clog the outlet device or riser.

- Reduce the chance of clogging in outlet structures, trash rocks, and other facility components
- Prevent possible damage to vegetated areas
- Reduce potential mosquito breeding habitats
- Maintain facility appearance
- Reduce conditions for excessive surface algae

Table 3. Benefits of Regular Debris and Litter Removal

Back to Top

R0020478

Mechanical Components Maintenance

Each type of BMP may have mechanical components that need periodic attention to ensure their continued performance. Valves, sluice gates, fence gates, locks and access hatches should be functional at all times. The specific BMP design used will determine how maintenance intensive the facility will be.

Vegetation Management

Vegetative cover filters sediment from runoff as it flows into the BMP and prevents erosion of the banks and in the bottom of the facility. Grass is generally used in and around detention basins and around retention basins and infiltration trenches. There should be at least a 10' buffer strip around ponds and streams which is mowed no more than four times a year.

Mowing requirements can be tailored to the specific needs of a site and the neighboring residents or office building tenants.The grass in a BMP may be hardiest if maintained as an upland meadow, cutting no shorter than 6 to 8 inches. If a more manicured lawn setting is desired, more mowing and special attention to turf health will be needed. Some communities consider the tall wetlands-type vegetation (typically, cattails or rushes) that may spring up in dry ponds as unaesthetic. Some of this vegetation is actually beneficial as it provides water quality benefits and wildlife habitat.

Surrounding vegetation should not be overfertilized or excess nutrients will be washed off into the stormwater management facility and contribute to algae growth problems. Nutrient needs of surrounding vegetation should be evaluated by testing the pH and nutrient content of the soil prior to fertilization. Fertilization of all turf areas should be done in the fall of the year. Local soil conservation service or extension service offices can provide testing as well as interpretation of the results.

Vegetation planted around infiltration trenches, known as a buffer strip, often serves the specific purpose of removing some sediment before the storm water enters the facility. The health of buffer strips should be closely monitored and the turf replaced if necessary. If the buffer strip becomes laden with sediment and is damaged, bare spots will emerge and contribute excessive sediment loads into the trench.

Insect Control

Mosquitoes are not as big a problem as is often perceived and there are proven control strategies that can be used. While ponded water can create mosquito and other insect breeding habitat, it also provides habitat for insect predators to keep the nuisance populations in check.

The best mosquito control technique in retention basins is to prevent stagnant areas from forming in the permanent pool. Prompt removal of floating debris helps to eliminate still or standing surface waters that provide breeding habitat. In larger basins, it may also be possible to maintain stocks of fish which feed on mosquito larvae.

Pond Habitat Maintenance

An important, yet often overlooked aspect of non-routine retention basin maintenance is the need to ensure a healthy aquatic environment. Suitable habitat and a healthy aquatic ecosystem can be ensured with a regular monitoring program and should require little maintenance. For example, a common problem in wet ponds is excessive algae growth (blooms) resulting from excess nutrients in stormwater runoff entering the facility. In many cases, excess nutrients will be taken up by more desirable aquatic and semi-aquatic vegetation encouraged to grow in and around the permanent pool of a retention facility. The presence of submerged and emergent plants will help reduce the amount of algal growth and will provide desirable pond habitat for aquatic and terrestrial creatures. Pond management experts can provide algae management plans that might include aeration fountains, and, in extreme cases, herbicides.

Bank Stabilization

It is very important to ensure the integrity of the banks, slopes, and bottom of a dry pond and the visible banks of a wet pond. A healthy ground cover must be routinely maintained on the embankments and bottoms of basins. Bare areas should be re-seeded and stabilized as quickly as possible to avoid soil erosion and clogging of the facility.

The roots of woody growth, such as young trees and bushes, tend to be destabilizing on embankments. Impoundments over a certain size must comply with state and local dam safety standards. Consistent mowing will control any stray seedlings that take root on an embankment. Woody growth away from the embankment does not generally pose a threat to the stability of the embankment and can play an important role in maintaining a healthy pond ecosystem. Trees and bushes should, however, be planted outside maintenance and access areas.

Beavers have been known to take up residence in facilities with ponded water. These animals can cut down small trees in the BMP area and may cause an increase in the amount of ponding. Should excessive tree damage or ponding be observed, it is suggested that the local Cooperative Extension Services or Maryland Department of Natural Resources be contacted.

Other animals, such as muskrats and groundhogs, may dig out burrows that could deteriorate the structural integrity of an embankment. Muskrats in particular will burrow tunnels up to 6 inches in diameter. Existing burrows should be filled as soon as possible to minimize animal burrowing.

Sediment Removal

Dry and Wet Ponds

Since one of the purposes of BMPs is to remove sediment from stormwater, sediment will accumulate in a BMP and eventually need to be removed. Facilities vary so dramatically that there are no "rules of thumb" to guide responsible parties on the frequency for sediment removal from a surface basin. Upstream conditions, including land use, type of land cover (vegetated vs. paved), and soil types are important factors in determining how rapidly sediment accumulates in a basin. For planning purposes, sediment removal should be considered on intervals shown in Table 4.

POND TYPE	INTERVAL
DRY	2 to 10 years
WET	5 to 20 years

Table 4. Sediment Removal Intervals for Basins

R0020480

Sediment removal is usually the largest single cost of maintaining a BMP facility. Responsible parties should therefore plan ahead and set aside the necessary funds in advance. The sediment removed from a basin will need to be disposed. The best solution is to have an on-site area or a site adjacent to the facility, but outside of the floodplain, set aside for the sediment. If such a disposal area is not set aside, transportation and landfill tipping fees can greatly increase the cost. Once the sediment is removed, the bottom of the basin and any disturbed areas need to be immediately stabilized and re-vegetated or the facility will quickly clog and require sediment removal again.

Wet sediment is more difficult and expensive to remove than dry sediment. In some cases the entire facility can be drained and allowed to dry so that heavy equipment can remove sediment from the bottom. In other cases, where this is not practical, it may be necessary to remove sediment from the shoreline or by hydraulic dredging from the surface. This additional cost of sediment removal for a retention facility is partially offset by the longer interval between dredging cycles. Disposal of wet sediment is not allowed in many landfills, so the material often must be dried (dewatered) prior to disposal. This extra step adds to the cost and requires a place where wet material can be temporarily placed to dry.

Infiltration Trenches

If an overflow condition is observed at an infiltration trench, its observation well should be checked to determine the cause.This is especially critical for concentrated input facilities which use sediment traps, because if the sediment trap is full, sediment laden water will be conveyed into the trench. With dispersed input (surface-fed) facilities, a clogged sediment barrier is indicated when water cannot flow into the trench and goes through the overflow channel prematurely. If an infiltration trench is found to stay filled with water after a rain and cause regular overflow, the aggregate stone must be excavated and the facility rebuilt.

The specific sediment removal procedure will depend on the manner in which stormwater enters the facility. Concentrated input facilities will have an in-line filter system or sediment trap. Clean-out procedures are described in the maintenance checklists for those specific facilities. If there is any question on how routine sediment removal is to be performed for a given facility, contact the County for instructions.

For "typical" trenches using dispersed input, routine sediment removal usually means removing the top 6 to 12 inches of

R0020481

filter gravel and replacing the filter cloth sediment barrier covering the aggregate reservoir beneath. A layer of clean filter gravel replaces the gravel removed. Any bare spots or damaged areas in the grassfilter strip should be sodded upon completion of the sediment removal procedure.

Who Should Carry Out the Maintenance

In designing a maintenance program, safety, cost and effectiveness of the maintenance activities need to be balanced. Some activities can be cost effectively undertaken by facility owners, if desired. Manageable landscaping tasks, litter removal, and even some mowing, are tasks appropriate for owners to handle themselves.

However, it is usually worth the cost to have a professional do the more difficult work. Mowing and handling a wheelbarrow can be dangerous on the sloping embankments of a detention basin. Filling eroded areas and soil disturbing activities, such as resodding or replanting vegetation, are also items that a professional landscaping firm might best manage. If not performed properly the first time, not only will the effort have been wasted, but damage may be done to the facility by creating excessive erosion. Grading and sediment removal are best left to professional contractors.

In addition, trained personnel will be able to identify potential problems early on when it is most cost-effective to make repairs or alterations. The maintenance needs of BMPs are somewhat site specific and the total costs for conducting needed maintenance will vary greatly. However, it is possible to estimate cost for some general BMP maintenance tasks. The costs for routine and non-routine tasks should be evaluated separately since they vary dramatically.

Back to Top

Estimating Routine Costs

Routine costs for maintaining a BMP are highly site-specific and dependent on factors like type of development and landscaping on the site. Routine maintenance includes inspections, debris and litter control, mechanical components maintenance, vegetation management, and other routine tasks as determined for the specific facility.

A survey of Washington Metropolitan area lawn and grounds maintenance services showed that grounds keeping maintenance costs ranged between $100 per acre per year for mowing and fertilizing only, to $550 per acre per year for mowing, fertilizing, litter control, resodding and insect control.

Estimating Dredging and Sediment Removal Costs

R0020482

Costs for dredging and sediment removal of BMPs are highly site specific and vary greatly depending upon the size and depth of the facility, the volume of sediment trapped in the BMP, ease of access to the BMP, and whether or not on-site disposal of the dredged sediments is possible. In general, both wet and dry pond maintenance costs are similar unless otherwise noted. Table 5 shows the ranges of costs associated with sediment removal for various sized BMPs. The last column is blank and can be used with the data below to estimate the costs of a particular facility.The costs shown here are based on an informal survey of firms that provide such services in Northern Virginia and Montgomery County.

Mobilization and Demobilization

One of the larger fixed costs in dredging a BMP facility is the mobilization and demobilization of the required machinery and personnel. Large wet ponds will often require a waterborne operation during which an excavator or a crane must be mounted to a floating barge and moved into position. The cost associated with such an operation is usually around $30,000.

For dry ponds and smaller wet ponds which can be drained or dredged from shore, a perimeter or dry operation will usually suffice. In this case, a backhoe or crane can scoop out the sediment without a floating barge. The costs of mobilizing and demobilizing for this type of operation will range between $5,000 to $7,000.

Dredging

The costs of physically dredging sediment from a BMP once mobilization has occurred depend on the total volume (in cubic yards) of sediment removed. The cost per cubic yard is largely influenced by the depth of the water and the distance between the excavation area and the "staging area" where sediment is transferred to trucks for removal. A further consideration is whether the equipment can easily access the BMP bottom. Dredging costs range from $6 to $15 per cubic yard.

R0020483

	Surface Area in Acres						ES
	.25	0.5	1	2	10		
Mobilization and Demobilization Low High	5,000 7,000	5,000 7,000	5,000 7,000	5,000 7,000	5,000 7,000		
Dredging (Low ($6/cy) (High ($15/cy)	1,210 3,025	2,420 6,050	4,840 12,100	9,680 24,200	48,400 121,000		
Disposal Onsite ($3/cy) Offsite ($29/cy)	605 5,848	1,210 11,697	2,420 23,303	4,480 46,787	24,200 233,933		
TOTAL							

Table 5. Sample Cost Estimates for Sediment Removal from BMPs

---

The equation shown in Table 6 can be used to estimate the volume of sediment that needs to be removed. The depth of accumulated sediment and the surface area (depends on shape) of the pond must be determined. The surface area in acres is used as an approximation of the area of the bottom of the pond. This figure is multiplied by 43,560 (to convert to square feet) and by the depth of the sediment to be removed. The product is divided by 27 to give the volume of sediment in cubic yards.

-
- surface area (in acres)
- x depth of sediment (in feet)
- x 43,560 = cubic feet/27 = cubic yards

Table 2. Minimum Inspection Checklist for Ponds.

Disposal

R0020484

The primary factor in disposal costs is whether an on-site disposal area is available. The largest cost is that of transporting the material, which can be upwards of $40 an hour per truck. Costs may range from $3 per cubic yard, where a single truck is used to dispose of the material on-site, to $29 per cubic yard for a larger site requiring 20 trucks to haul the material to an off-site location.

Total Costs for Dredging and Disposal

By adding the costs of the previous three steps, one can establish a range in which a BMP owner can expect to pay for the non-routine maintenance of a BMP. The estimates shown in Table 5 assume a sediment accumulation of 6 inches. Based on those estimates, total non-routine costs range from $ 6,815 for a small pond of 0.25 acres to $ 384,933 for a larger facility of 10 acres.

Planning Ahead

The costs of maintaining a BMP over the long run can therefore be considerable, particularly when dredging or other non-routine maintenance is needed. To lessen the immediate financial impact of non-routine costs, responsible parties should consider creating a fund for this eventuality. For dry ponds, which need to have sediment removed every 2 to 10 years, 10% to 50% of the anticipated dredging costs should be collected per year. For wet ponds, which need to be dredged every 5 to 20 years, approximately 5% to 20% of the anticipated costs should be accrued per year. The rate of assessment can include anticipated interest over the collection interval.

Recomended Inspection Frequency For Facilities
Ponds - Annually
Oil/Grit Seperator - 6 Months
Infiltration trenches - Annually
Underground Storage Structures - Annually

Back to Top

Community Involvement

Stormwater facilities, particularly pond BMPs, can provide unique opportunities for fostering stewardship and involvement in community based activities. There are many ongoing school and community-based outreach programs that homeowners' associations can take advantage of which will enhance the BMPs in their communities and make for cleaner local streams and help restore the Chesapeake Bay. A good reference on how individuals can help control pollution is the Baybook: A Guide to Reducing Water Pollutionat Home; copies are available from the Alliance for the Chesapeake Bay in Baltimore.

How does your community affect BMPs?
You and your neighbors can adversely affect the functioning of BMPs by:

R0020485

- allowing trash to accumulate in and around BMPs
- dumping grass clippings or leaves on or into BMPs
- using excess or in appropriately applied fertilizers that can then run off into the BMP
- disturbing vegetated areas and leaving bare areas which produce sediment laden runoff to the BMP
- introducing swimming pool discharges or allowing toxic substances (oil or antifreeze, e.g.,) to run off into the BMPs or into stormdrains that lead to BMPs

In most residential areas, the most common type of stormwater control is some form of pond. The following list includes activities that can be organized and performed by homeowners, schools or other volunteer groups to help maintain and improve the pond environment. Some of these activities may need to involve environmental or engineering professionals.

Organizations that assist with some of these projects include Montgomery County Department of Environmental Protection (grasscycling,composting, Stream Teams), Cooperative Extension Office (fertilizer use, planting tips, Master Gardeners), U.S. Fish and Wildlife Annapolis Office-Bayscape Program (native plantings, butterfly gardens), Audubon Naturalist Society (native plantings, workshops on pond ecology). Many private companies focus on proper plantings around ponds and can be found in the phone book under landscaping or gardening.

Some of the best texts available for an HOA or town to use for stormwater facility maintenance are Lake Smarts-The First Lake Maintenance Handbook and Fundamentals of Urban Runoff Management by the Terrene Institute which can be ordered from the Terrene Institute of Washington D.C. by calling (202) 833-8317. It contains field tested, easy and affordable projects to help you clean up, improve, and maintain ponds, such as stormwater ponds.(See Table 7 for community activities to maintain and improve BMPs)

R0020486

PROBLEM	EVIDENCE	SOLUTION
Trash accumulation in and around the BMP	Trash and debris settled in basin bottom or floating in wet pond or collected on trash rack	Organize neighborhood trash pickup; contact local school or scout troop and offer prizes for largest item found or most trash collected
Using excess or incorrectly applied fertilizers	Excessive algal growth and fish kills	Find or create a factsheet on proper fertilizer use and distribute it in your neighborhood; encourage your neighbors to closely follow manufacturer's instructions on concentration and application rates for fertilizers and follow recommended application periods (contact the County Cooperative Extension Office)
Oil or other toxic substances	Oily sheen on basin bottom or on surface of pool area; presence of dead fish or other aquatic organisms	Find or create a factsheet on proper disposal of hazardous household waste; encourage your neighbors to follow manufacturer's directions for concentrations and application of pesticides
Bare, exposed areas in or around pond or in areas draining to facility	Water in pond is cloudy	Spread hay on temporarily disturbed areas; reseed and stabilize disturbed areas as soon as possible; organize planting of grass or shrubs in disturbed areas; plant water loving shrubs if disturbed areas are adjacent to pond
Animal activity	Burrows (holes) in pond sides or embankment; small trees cut down around pond or in nearby yards; increase in wet pond area	Coordinate with the County's Cooperative Extension Office

9TH INTERNATIONAL CONFERENCE ON URBAN DRAINAGE

PLAN TO PARTICIPATE IN THE CONFERENCE.
SUBMIT YOUR ABSTRACT TODAY!

Use the reply form inside.

About the Conference

Plan to participate in and attend the ninth triennial International Conference on Urban Storm Drainage — one of the foremost international meetings where engineers, scientists and managers of urban water resources exchange ideas about the urban water environment. The ninth ICUD continues the tradition begun in 1978 in Southampton, UK, exploring state-of-the-art technology and bringing together colleagues from around the world to address critical issues in the practice of urban storm drainage. No other meeting on urban water issues attracts such a diverse group of participants. Don't miss this opportunity to exchange ideas with colleagues and leaders in the field worldwide!

Conference Topics

- Urban hydrologic processes, including precipitation and runoff
- Hydraulics of urban drainage, including combined and separate storm sewer systems
- Highway runoff impacts and management
- Infiltration/inflow and sanitary sewer overflows
- Water quality and environmental issues
- Sediment in sewers
- Sewer system design and rehabilitation
- Impact mitigation and best management practices (BMPs)
- Low impact development techniques

Pictured left, Mount Hood, Mount Hood National Forest

- Monitoring and data collection
- State-of-the-art computer modeling of water quantity and quality in urban areas
- Geographical information systems and decision support systems applications in urban stormwater management
- Receiving water impacts, including effects on migratory fish
- Urban wetlands
- Water reuse
- Real time control
- Integrated stormwater management approaches and stormwater master planning
- Storm system asset management
- Educational initiatives for urban stormwater management
- Urban runoff management and regulatory programs
- Urban streams
- Emerging urban runoff issues of the 21st Century
- Integrated urban water system management
- Other

Conference Format

Proceedings will be prepared in a printed format. Authors are expected to present their papers orally or at poster sessions during the five-day meeting. There will be technical tours and a trade exhibition. All published materials and spoken presentations will be in English.

Key Dates

- **One-page abstract due:** July 31, 2001
- **Author notification:** October 31, 2001
- **Final paper due:** January 31, 2002

Organizing Committee

Dr. Wayne C. Huber (*wayne.huber@orst.edu*) and Mr. Eric W. Strecker (*estrecker@geosyntec.com*) serve as co-chairs for the 9ICUD. Members of the ASCE/EWRI Urban Water Resources Research Council and Portland and regional civil and environmental engineers will lead the conference and serve as its organizing committee, with additional assistance and guidance from the international membership of the IAHR and IWA. The 2002 conference builds on the experience of eight, highly successful past conferences on urban drainage.

Accompanying Persons

Portland, Oregon, ranks 5th in "100 fabulous places to visit in 2001" by Travel & Leisure magazine. While trees and city parks continue to dominate Portland's landscape, trendy restaurants, clothing shops, and art galleries are popping up all over this pedestrian-friendly city, making it one of the world's most interesting destinations.

In addition, the city's nearby ocean beaches, mountains and the high desert of the Pacific Northwest, make it an ideal setting for recreation and touring for the entire family. A selection of activities will be available both during and after the conference. Portland is also an excellent gateway for travel elsewhere in the region.

Trade Exhibition

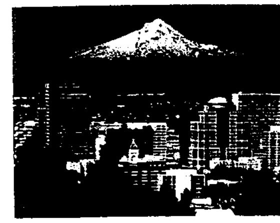
A trade exhibition will run concurrently with the conference. Please contact the conference manager, Ms. Cindy Gold, to reserve a location.

Conference Website

A Web site has been established for up-to-date information about the 9ICUD. The address is:

www.asce.org/conferences/9icud2002

Destination Portland, Oregon, USA



The Pacific Northwest is one of the leaders in efforts to control combined sewer overflows and resolve stormwater management problems — while at the same time addressing special ecological concerns such as endangered salmon populations. As a result, the 9ICUD should receive wide regional as well as international attention. Field trips will take advantage of several large urban water resources construction and planning projects underway in the area, smaller watershed BMP-implementation projects, and a tour of on-site BMPs being employed in the Portland area. Technical tour opportunities will also be available at major dams nearby on the Columbia River.

The greater Portland metropolitan area has a population of approximately 1.6 million and is the third largest city in the Pacific Northwest. The city is situated on the Willamette River near its confluence with the Columbia River, 125 km upstream from the Pacific Ocean. Portland is also just 100 km west of beautiful 3,400-meter Mount Hood, between the Cascade Mountains to the east and the Coast Range to the west, an area boasting every imaginable urban and natural recreational amenity.

Portland's international airport has connections to every part of the world, and public transportation within the city is excellent. The average maximum temperature in September is 24°C, with typically sunny weather. For additional information about the city, visit the Portland Oregon Visitors Association Web site at *www.pova.com*.

The conference will be held at the DoubleTree Hotel at Portland's Lloyd Center. The hotel is near downtown Portland, adjacent to shopping and restaurants, and is served by light rail, city buses and airport vans. More information is available at *www.hilton.com/doubletree/hotels/RLLC-DT*.

Mailing List Reply Form

☐ **YES!** *I'd like to be added to the mailing list! Please send me the full conference program when it becomes available.*

Meeting New Requirements for Stormwater Controls in New and Redevelopment Projects

R0020499

Are you involved in site design, plan development or review, landscape design, permitting, construction inspection, or other development activities??
If so, this workshop is for you!!

Come learn about:

The proposed new development and redevelopment requirements for municipal storm water discharge permits in the Bay Area;

Proposed design standards for storm water treatment controls at development sites;

Current efforts to reduce impacts of new and redevelopment on water quality;

Experiences of municipal agencies, developers, and engineers in the Los Angeles area in meeting similar requirements;

Case studies of how to apply the new requirements to actual development projects.

A G E N D A

KEY: First speaker(s) in Berkeley
Second speakers(s) in Cupertino
Single speaker at both workshops

8:30 Registration/Refreshments

9:00 Welcome/Introduction

Jim Scanlin, ACCWP

Jill Bicknell, SCVURPPP
Lavenia Millar, City of Cupertino

9:05 Regulatory Perspective

Lawrence P. Kolb, Assistant Executive Officer, RWQCB (invited)

9:20 "Start at the Source" Video

9:35 Panel I - Current Efforts to Reduce Impacts of New and Redevelopment

Liz Lewis, MCSTOPPP
Ed Boscacci, BKF Engineers
Danny Akagi, City of Berkeley

Pankti Shah, City of San Jose
Ed Boscacci, BKF Engineers
Kathy Cote, City of Fremont

10:30 Break

10:45 Panel II - The Southern California Experience

Development of the "Standard Urban Stormwater Mitigation Plan" (SUSMP)

Xavier Swamikannu, L.A. RWQCB

Implementation of the SUSMP Requirements in the City of Los Angeles

Gary Moore, City of Los Angeles

R0020500

Implementation of the SUSMP Requirements in the County of Los Angeles

Phil Doudar, Los Angeles County (invited)

Engineer's Perspective

John Olivier, Fuscoe Engineering

Developer's Perspective

Tim Piasky, Building Industry Assoc.

12:15 Lunch

1:00 What We Can Expect in the Bay Area:

- SCVURPPP Permit Requirements
- Update of Regional Board's Staff Recommendations
- SCVURPPP/BASMAA Projects
- Implications for Municipalities

Keith Lichten, Dale Bowyer, and/or Jan O'Hara, SF RWQCB
Jill Bicknell, SCVURPPP

2:30 Break

2:45 Panel III - Applying the New Requirements to Project Designs

Jeff Endicott, CDM
Eric Strecker, GeoSyntec
John Olivier, Fuscoe Engineering

4:00 Adjourn

Continental breakfast and lunch will be served.

REGISTRATION

Registration is FREE.

But you need to RSVP with the following information to Bonnie Hulkower by Friday, August 3, 2001 at:

Mail: 1410 Jackson Street
Oakland, CA 94612
Phone: (510) 832-2852 ext. 119
Email: bonnie@eoainc.com
Fax: (510) 832-2856

Please complete the following and check off the date that you will attend.

Name __________

Affiliation __________

Address __________

City __________

State and Zip __________

Telephone __________

Fax __________

Workshop Dates and Locations:

☐ Thursday, August 9, 2001
Radisson Hotel Berkeley Marina
200 Marina Blvd., Berkeley, CA

☐ Friday, August 10, 2001
Quinlan Community Center
10185 N. Stelling Road
Cupertino, CA

8:30 a.m. - 4:00 p.m.

Questions? Contact Bonnie at EOA, Inc.

Can't attend? Please pass this brochure on to appropriate staff within your organization.

R0020501

Directions to the
Radisson Hotel Berkeley Marina

From the North
Take I-80 West.
Take the University Ave. exit towards Berkeley.
Keep Right in the fork in the ramp.
Keep Left in the fork in the ramp.
Turn Left onto University Ave.
Turn slight Right onto Marina Blvd.

From the South
Take I-80 East.
Take the University Ave. exit towards Berkeley.
Keep Left at the fork in the ramp.
Turn Left onto University Ave.
Turn slight Right onto Marina Blvd.

Directions to the
Quinlan Community Center (Cupertino)

From the North
Take 101 or 280 South.
Take CA-85 South Ramp toward Cupertino/
Santa Cruz/Gilroy onto CA-85.
Take the Stevens Creek Blvd. exit.
Turn Left onto Stevens Creek Blvd.
Turn Left onto North Stelling Rd.

From the South
Take CA-85 North.
Take Stevens Creek Blvd. exit.
Turn Right onto Stevens Creek Blvd.
Turn Left onto North Stelling Rd.

Take 80 S, get to Left lanes (not carpool) lanes toward S.F. Take the Oakland/San Jose 880 Exit. Take 880 South. In Hayward take the San Mateo Bridge (HWY 92) West. Continue on 92 past 101. Go South on 280

Sponsored by Bay Area Stormwater Management Agencies:

Standard Urban Storm Water Mitigation Plan

Bay Area Storm Water Management Agencies

August 9 and 10, 200
Berkeley and Cupertino

Xavier Swamikannu
CalEPA - California Regional Water Quality Control Board, Los Angeles Region

Regulation of Storm Water

- Clean Water Act Amendments - 1987
- USEPA Phase 1 - Large/ Medium Municipalities and Industrial Permits
- USEPA Phase 2 - Small Municipalities and Construction
- California Implementation - Areawide MS4 Permits; Statewide General Storm Water Permits

Statutory Standard

Standard of Compliance in Statute

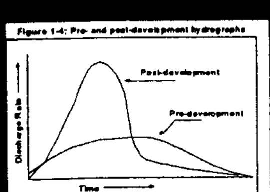
- For MS4 Permits -
  - reduce pollutants to the Maximum Extent Practicable (MEP);
  - meet water quality standards where required by the Permitting Authority

Regulatory Authority

- Regional Board may "require controls to reduce the discharge of pollutants ..and such other provisions ..determines appropriate." [33 U.S.C. 342(p)(3)(B)(iii)]
- EPA's Interim Permitting Policy authorizes "more specific conditions or limitations to be incorporated into storm water permits as necessary and appropriate" [61 Fed. Register 43761]
- Administering agency accorded high degree of deference in areas of law they regulate.

[Chevron v. NRDC (1984) 467 U.S. 837]

Urbanization : Storm Water Problems



- Changes to hydrology
- Changes to water quality
- Ultimate impacts to aquatic life and humans

Standard Urban Storm Water Mitigation Plans

- Definition - Model guidance document for the selection of post-construction BMPs
- Purpose - To ensure that potential adverse water quality impacts are addressed during project planning
- Method - Affirmative review and approval by a municipality of a written plan

Development Categories

SUSMP categories:

- 10 or more home sub-division
- 100,000 square feet commercial development
- stand alone restaurant
- automotive repair
- single family hillside dwelling
- commercial parking lots [5000 sq. ft. or more]
  - » retail gasoline outlets
  - » projects in environmentally sensitive areas

Numerical Storm Water Mitigation Standard

Four different and equivalent volumetric methods to determine BMP sizing criteria (Water Quality Volume - WQV)

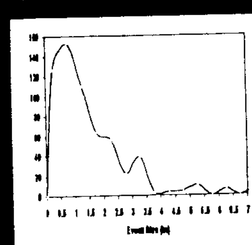
- Maximized volume capture (ASCE Method)
- Percent volume treatment (CA Handbook)
- All events up to 0.75 inch 24-hr precipitation
- Historical record 85th percentile rainfall event

Numerical Storm Water Mitigation Standard

Three different and equivalent flow based methods to determine BMP sizing criteria (Water Quality Flow - WQF)

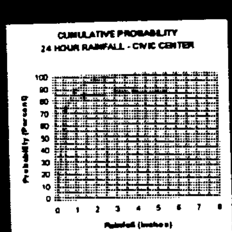
- 0.2 inch per hour or more rainfall intensity
- 2 x the 85th percentile hourly rainfall intensity
- Flow criterion equivalent to the volumetric portion treated

Principle



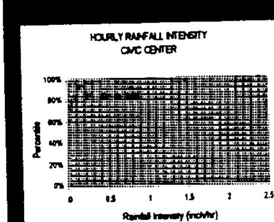
- Largest volumes of runoff are produced by smaller storms
- Criteria promotes BMP application to smaller more frequent storms

Principle



- 85th Percentile 24 hour rainfall event (0 75 inch)
- Representative rainfall station for Los Angeles County
- 100 + Years Records

Principle



- 85th Percentile hourly rainfall intensity (0 08 inch/ hr) x 2
- Margin to account for variability
- 100 + Years Records
- Consider cost benefit
  - 90th = 0.11 in per hr
  - 95th = 0.18 in. per hr
  - 99th = 0.36 in. per hr

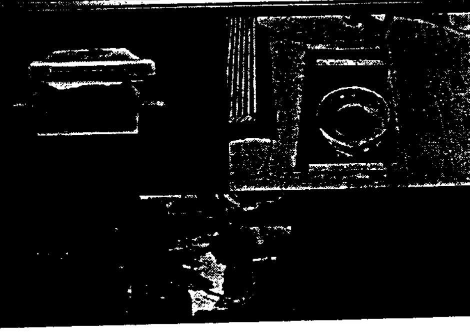
R0020504

Criteria Application

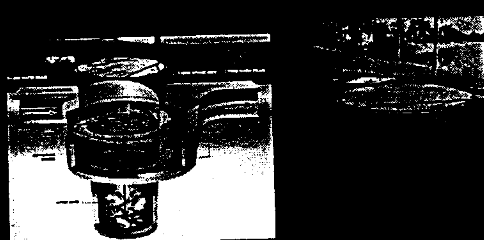
Example - A 100 square feet commercial development

- Select source control and structural BMPs from guidance in SUSMP
- Select a set of "treatment" control BMPs from guidance to remove pollutants in total runoff using WQF or WQV design criteria.
- Size BMPs for respective drainage area
- Submit Plan to municipality for approval.

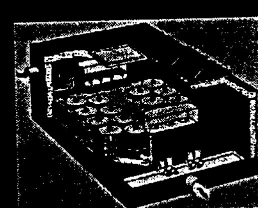
Catch Basin Filter



Full Capture System



Serial Flow Through System



Peak Discharge Flow Criteria

Objective

"Control post-development peak storm water discharge rate to maintain or reduce pre-development peak discharge rate [illegible]"

Peak Discharge Flow Criteria

Examples

- Pennsylvania - detain or infiltrate two year 24 hour storm (2 5 in) on site
- Texas - 24 hour detention storage for 1 year 3 hour frequency event
- Maryland - 12-24 hrs detention storage for one year frequency, and post-development peak discharge not to exceed pre development for 10 year storm frequency
- Washington - post-development discharge to match pre development discharge duration for range 50% of the 2 year peak flow up to 50 year peak flow, and post development discharge rate not to exceed predevelopment discharge rate for 2 year and ten year storms

R0020505

Redevelopment Criteria

- creation or addition or replacement of 5,000 square feet of impervious area or more
- if creation or addition or replacement of impervious surfaces is 50 percent or more of the existing impervious surface area, storm water from the entire site will have to be mitigated, where the original development was not subject to SUSMP requirements.

Next and New

Changes to SUSMP Categories

- All projects (non CEQA included)
- 10 or more home units (replaces sub-divisions)
- Single family hill side developments of 1 acre or more (new threshold)
- Retail gasoline outlets [5,000 sq. ft. and 100 ADT)
- Projects in environmentally sensitive areas (2,500 sq. ft. or more of impervious surface or changes natural condition to 20 percent or more of impervious surface)
- Commercial/ industrial development that disturbs one acre or more [effective March 9, 2003)

Summary

Storm water and urban runoff impair the beneficial uses of receiving waters.

Federal and State Permitting Authorities are moving towards establishing objective criteria for permit compliance.

SUSMPs and BMP water quality design criteria are steps in that direction.

R0020506

STANDARD URBAN STORMWATER MITIGATION PLAN:
City of Los Angeles' Approach

John H. Dorsey
Assistant Program Manager

SUSMP BACKGROUND FOR LOS ANGELES

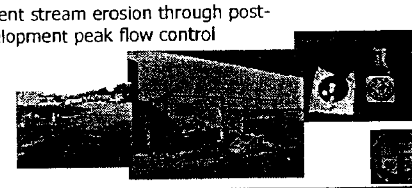
- Adopted by SWRCB on October 5, 2000
- Effective on February 15, 2001

DEVELOPMENT CATEGORIES

- Single-family hillside dwellings
- 100,000 sq ft commercial developments
- Automotive repair shops
- Retail gasoline outlets
- Restaurants
- Home subdivisions with 10 to 99 housing units
- Home subdivisions with 100 or more housing units
- Parking lots (≥5,000 sq ft, or ≥ 25 parking spaces)

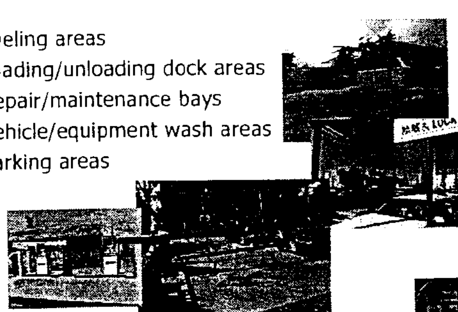
GENERAL REQUIREMENTS

- Conserve natural areas
- Protect slopes and channels
- Provide storm drain stenciling and signage
- Properly design outdoor material storage areas
- Properly design trash storage areas
- Provide for ongoing BMP maintenance
- Prevent stream erosion through post-development peak flow control



SPECIFIC DESIGN REQUIREMENTS

- Fueling areas
- Loading/unloading dock areas
- Repair/maintenance bays
- Vehicle/equipment wash areas
- Parking areas



NUMERICAL DESIGN STANDARDSTO SIZE BMPs

- Flow base methods
  (ex. 0.2 in/hr rainfall intensity)
- Volumetric methods
  (ex. first 0.75 inch of rainfall, 24hr)
- Exclude restaurants & retail gasoline outlets categories

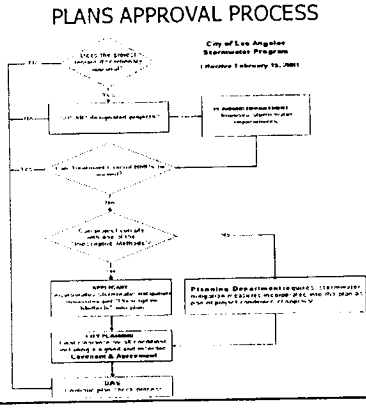
CITY ORDINANCE
No. 173494

- Generic, not detailed
- Refers to handbooks
- Provides Dept of Public Works authority to
  - update handbooks without Council approval
  - grant waivers
  - collect waiver monies
- Gives Public Works' inspectors authority to enter private properties for BMP inspections
- Requires Covenant & Agreement

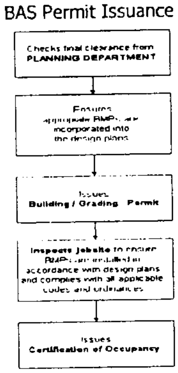
DEPARTMENT RESPONSIBILITIES

- Department of Public Works/Stormwater Management Division (DPW/SMD)
  - developed implementation plan
  - coordinated the implementation
  - acts as technical consultant
- Planning Department -- imposes SUSMP requirements for discretionary projects
- Department of Building and Safety (BAS) -- verifies requirements

PLANS APPROVAL PROCESS



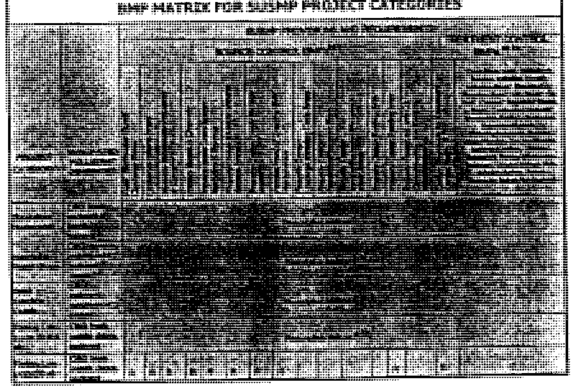
PLANS APPROVAL PROCESS
BAS Permit Issuance



DEVELOPMENT BMP HANDBOOK

- Project Review and Permitting Process
- SUSMP Project Categories and Required Mitigation Measures
- Additional Planning Priority Projects and Recommended Mitigation Measures
- Prescriptive Methods
- BMP Matrixes
- Sample Design Calculations
- Covenant and Agreement Form
- BMP References and Vendor List

TABLE 3-1 FROM HANDBOOK: BMP MATRIX FOR SUSMP PROJECT CATEGORIES



R0020508

TABLE 3-3 FROM HANDBOOK:
BMP MATRIX FOR ADDITIONAL PLANNING PRIORITY PROJECT CATEGORIES

[illegible]	[illegible]

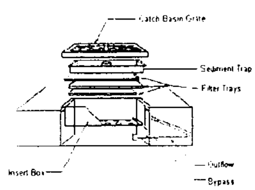
PRESCRIPTIVE METHODS

Definition: Specific stormwater BMPs and requirements designated as standard mitigation measures for certain project categories

- Retail Gasoline Outlets
- Automotive Repair Shops
- Parking Lots (5,000 - 20,000 sq-ft or 25-50 parking spaces)
- Restaurants

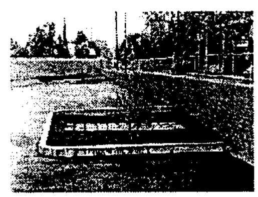
PRESCRIPTIVE METHODS
PARKING LOT BMP EXAMPLES

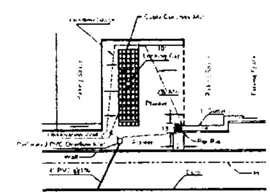
- Catch basin inserts
  - 1 catch basin insert per 5,000 sq-ft area
  - use for areas up to 10,000 sq-ft
  - size of catch basin 24" x 36"
  - minimum depth of catch basin insert shall be 24 inches
  - Aqua-Guard™, Ultra-Urban™, DrainPac™, Enviro-Drain(R)
- Hydrodynamic system
  - use for areas up to 20,000 sq-ft
  - StormCeptor(R) 450i
    4ft ϕ, 5ft-8in depth
    Vortechnics™ 1000
    3.67ft ϕ, 6ft depth
    Jensen(R) Interceptor JPHV-750
    4' x 8'-1" x 6'-3"
    V2B1™ V2-3
    4ft ϕ, 6ft depth



PRESCRIPTIVE METHODS
PARKING LOT BMP EXAMPLES

- Infiltration trench
  - use for areas up to 20,000 sq-ft
  - trench shall be 5'4" wide x 4'6" deep x 15' in length
  - bottom infiltration layer shall be 18" thick & consist of fine sand
  - site consideration to include geology and soil characteristics, presence of water supply wells, groundwater depth





PROGRAM HIGHLIGHTS

- Integration of requirements into existing City process
- Development of prescriptive methods
- Preparation of Development Planning BMP Handbook
- Mitigation of additional priority projects
- Covenant & Agreement for BMPs maintenance

FINAL THOUGHTS

- Developers are willing to work with you to install the required BMPs
- Availability of Handbook at Stormwater Program website (www.lastormwater.org/Pages/partb.htm)
- Anticipate the following 190 development projects will require SUSMP for this year:

[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]

R0020509

Presentation by:
Phil K. Doudar, P.E.
Assistant Division Engineer
Land Development Division
Los Angeles County Department of Public Works
(626)458-4995
pdoudar@dpw.co.la.ca.us

THE LOS ANGELES COUNTY EXPERIENCE

- Los Angeles County principal permittee with 88 co-permittees
- Los Angeles County started the program prior to the RWQCB order
- Have made water quality an element of an integrated watershed management approach
- Contracted with responsive environmental advocacy groups for our outreach efforts
- Developed criteria with input from industry, RWQCB, other agencies, and environmental advocacy groups
- Criteria is continually "refined" to reflect new information, new products, and maintenance issues
- Have an ongoing "BMP" task force
- Pollutants of concern: Trash, O&G, TSS
- Moving towards public maintenance of regional facilities
- Moving towards central units and away from individual filters/inserts
- Experimenting with catch basin excluders
- Moving away from percolation/bio filtration basins
- Subdivisions
  - Part of the conditions of approval
  - Feasibility established at tentative map stage
- Building Permits - Commercial/Industrial
  - Same pollutants of concern
  - Additional pollutants to address case specific
  - SUSMP review is tied to Industrial Waste Permit Review
  - Avoid depressed truck docks and direct connections to storm drains
  - Renewable permits for maintenance accountability
- Did not relax flood control standards
- Did not relax zoning and infrastructure standards
  - Still require garages
  - Did not reduce street widths or eliminate sidewalks

R0020510

MAKING THE RWQCB ORDER WORKABLE

- Private and Public partnership essential
  - You are both regulated
- Identify what is appropriate for the region
  - Geology, hydrology, land use, pollutants of concern
- Balancing the act
  - Make it simple and cost effective
- Maintaining future facilities/ accountability
  - Private, public, volunteers
- Paying for the maintenance
  - Private, public
- Looking ahead
  - More to come
  - Monitoring/sampling
  - TMDL
- Industry
  - Be familiar with the new regulation and simplify it to Do's and Don'ts
  - Train staff to be familiar with basic lingo and the Do's and Don'ts
  - Designate a key person for all SUSMP/SWPPP, and RWQCB contacts
  - Where applicable, make your contractors/subcontractors contractually obligated
  - Keep up - attend workshops and seminars
- Do not lose site of the big picture.
  - The intent is less pollution to receiving waters.

COMMUNICATING WITH THE REGIONAL BOARD

- Be proactive in shaping new regulations
- Stress the uniqueness of the region
  - What is good for Bellflower may not work in San Jose
- Establish credibility on reporting noncompliance
  - Do it before someone else does it
- Record keeping
  - Private – photos, training
  - Public -- statistics

Standard Urban Storm Water Mitigation Plan Requirements: The Southern California Experience

Developers Perspective

Presentation to BASMAA Workshop
by
Richard Watson
Richard Watson & Associates, Inc.
9 August 2001 Berkeley, California
10 August 2001 Cupertino, California

What are SUSMPs?

- SUSMPs are Development Standards.
- SUSMPs define priority projects, include BMP requirements, and generally require application of numeric design criteria.
- SUSMPs target post-development conditions in new development and redevelopment projects.

History of SUSMPs

- Standard Urban Storm Water Mitigation Plans started in Los Angeles.
- The San Diego Regional Board staff (with encouragement) picked them up.
- Included by LARWQCB (under a different name) in the Ventura Permit
- Added to the Long Beach Permit by LARWQCB
- The Santa Clara Valley Permit was delayed and is now being amended to add SUSMPs.

Continued ...

History of SUSMPs
(Continued)

- In the draft CVRWQCB Bakersfield, Modesto, Sacramento, and Stockton Permits
- In the draft SARWQCB Orange County Permit
- Will be included in new SARWQCB Riverside County and San Bernardino County permits
- In the draft Los Angeles Permit
- In new SDRWQCB Orange County Permit
- Will be added to other SFBRWQCB permits

Evolution of SUSMP Content

- Original SUSMPs were developed by permittees as a permit requirement.
- Executive Officer's substitute SUSMPs were very prescriptive.
- Los Angeles SUSMPs were modified by State Board Order 2000-11, which corrected most blatant problems, but retained numeric design criteria.
- San Diego Permit added to Los Angeles permit as modified by SWRCB.

Continued ...

Evolution of SUSMP Content
(Continued)

- April 13 Draft Los Angeles Permit borrowed from San Diego permit and added other onerous requirements.
- June 29 Draft of Los Angeles permit is improved.
- San Diego copermittees finding some elements of their permit are not workable.
- Workshops on both Orange County permits, the Los Angeles permit, and the Santa Clara permit

Typical Priority Projects

- Hillside development > 5,000 sq. ft.
- Home subdivisions > 10 units
- Commercial developments > 100,000 sq. ft.
- Automotive repair shops
- Restaurants
- Parking lots > 5,000 sq. ft.
- Retail gasoline outlets

- Projects adjacent to environmentally sensitive areas
- Streets, roads, highways, freeways

SUSMP Provisions Typically Applicable to All Categories

- Control peak storm water discharge rates
- Conserve natural areas
- Minimize storm water pollutants of concern
- Protect slopes and channels
- Provide storm drain stenciling and signage
- Properly design outdoor material storage areas

Consequences of Not Implementing SUSMPs

Results of LA SUSMP Appeal

- Changes in redevelopment definitions made in-fill projects more feasible.
- "Non-discretionary projects" eliminated
- Retail gasoline stations added to Limited Exclusion
- "Locations within or directly adjacent to or discharging directly to an environmentally sensitive area" eliminated
- Storm water mitigation funding was eliminated.

Continued ...

Results of LA SUSMP Appeal

(Continued)

- Numerical design criteria and procedural arguments were discounted.
- State Board noted that there could be further cost savings for developers if permittees develop a regional solution.
- State Board recommended that the cities and the county, along with other interested agencies, work to develop regional solutions.
- State Board encouraged innovative regional solutions.

The Craig Wilson Memo

- On December 26, 2000, the Chief Council of the SWRCB sent a memo to all RWQCB Executive Officers summarizing State Board Order WQ 2000-11.
- Attempted to make SUSMP order a precedent
- Triggered (or used to justify) a wave of SUSMPs across the State
- Concluded that "the Order finds that the provisions in the SUSMPs as revised by the Order, constitute MEP"

San Diego SUSMP Requirements

- Requires municipalities to assess General Plans (was "revise" in draft) and to modify development approval process
- Requires SUSMPs for new development and significant redevelopment
- Specifies numeric design criteria for post-construction BMPs (added flow-based criteria)
- Expands priority development definition to include streets, highways, and freeways as well as smaller parking lots

Continued ...

San Diego SUSMP Requirements
(Continued)

- Includes a new attempt to define Environmentally Sensitive Areas
- Includes a new attempt to create a waiver provision
- Includes rigid conditions for infiltration and ground water protection
- Requires that pre-development peak storm water runoff discharge rates and velocities be maintained

Draft Los Angeles Permit Requires Expanded SUSMPs

- Adds back what the State Board removed
- Maintains the 0.75 inch volumetric storm event numerical design criterion, but adds a set of flow-based numerical design criteria
- Contains unrealistic implementation schedules for municipal compliance
- Mandates implementation of SUSMP and post-construction requirements on one acre commercial and industrial development projects by March 9, 2003

Draft SARWQCB Orange County Permit

- Less prescriptive than Los Angeles and San Diego permits
- Recognizes significant progress made by permittees during first and second term permits
- Incorporates SUSMPs in a more flexible and realistic manner (incentive and hammer)
- Permittees/Project proponents may propose BMPs based on a watershed approach, establish a storm water pollution fund for such BMPs, or any other innovative and proven alternative to address storm water pollution

SUSMPs in the Draft Orange County Permit

- Requires review of General Plan and CEQA processes and modification of project approval processes, if necessary
- Requires incorporation of SUSMP-related watershed protection principles and policies into General Plan by July 1, 2004
- If stated goals are not properly addressed in WQMP requirements by January 1, 2004, numerical design criteria similar to San Diego's will be required.

Major SUSMP Issues

- Prescriptive Nature
- Discretionary/Ministerial projects
- Significant redevelopment definitions
- Environmentally Sensitive Areas
- Waivers and regional solutions
- Maintenance
- Numeric Sizing Criteria

Other Permit Issues

- Micromanagement
- Shifting of inspection responsibilities
- General plan/CEQA checklist requirements
- Peak discharge requirements
- Shifting reliance on CWA and Porter-Cologne
- Lack of economic and housing considerations
- Invitations for third party lawsuits

Emerging Strategy for Regulated Community

- Comply with laws and regulations
- Promote science-based regulation
- Avoid oppressive regulation
- Prepare for potential litigation
- Separate storm water section in CWA

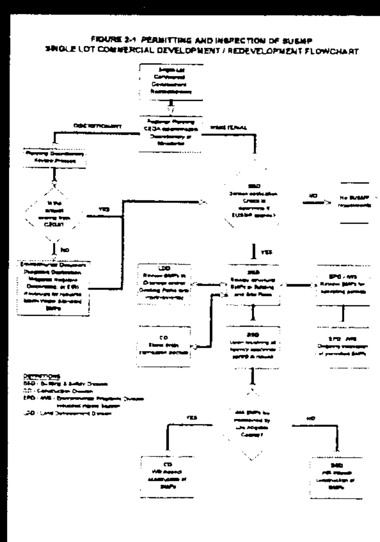
FUSCOE ENGINEERING



APPENDIX A **VOLUME & FLOW RATE CALCULATIONS**

TABLE FOR ITERATIONS:

Iteration No.	Initial T_c (min)	I_x (in/hr)	C_P	C_D	C_D*I_x (in/hr)	Calculated T_c (min)	Difference (min)
1	15	0.267	0.1	0.828	0.221076	28.26	13.26
2	28.26	0.198	0.1	0.828	0.163944	33.01	4.75
3	33.01	n/a					
4							
5							
6							
7							
8							
9							
10							

Acceptable T_c value ___30___ minutes

I Calculate the Peak Mitigation Flow Rate
$Q_{PM} = C_D * I_X * A_{Total} * (1.008333\ ft^3\text{-hour / acre-inches-seconds})$

Q_{PM} ___0.89___ cfs

$\boxed{Q_{PM} = 0.89\ cfs}$ ← USE FLOW RATE IN CFS FOR BMP DESIGN IN APPENDIX "B" WHICH REQUIRES "RATE".

$C_D = 0.828$
$I_{30} = 0.193$
$A_{Total} = 5.51$ acres

Use I_{30} since T_c is greater than 30 minutes.

TIM PIASKY

Construction Industry Coalition for Water Quality

History of SUSMP

- Seven development categories included in 1996 LA Permit requiring SUSMP development
- Development planning permittee workgroup responsible for developing initial SUSMP
- LA County negotiating planning program with NRDC at same time
- Workgroup submitted SUSMP to regional board that did not include design standard
- LA County agreed to ¾" design standard
- LA regional board added ¾" requirement and ESA and parking lots as priority development categories

SUSMP APPEAL

- Appeal brought by WSPA, BIA and coalition of cities
- Main points argued by BIA and cities were:
  - Administrative procedures
  - Validity of treatment standard
  - Inclusion of ESA and Parking Lots
  - Redevelopment definition
- The inclusion of the original seven development categories was not argued since they were already in Permit

CURRENT SUSMP CONCERNS

- RWQCB's not using existing local science as foundation for policy decisions
  - Water quality monitoring
    - Pollutants of concern
    - Land use
    - BMP effectiveness at addressing pollutants of concern
- Environmentally Sensitive Area (ESA) inclusion
- One size fits all mentality

BIA "CLEAN" WATER PLAN

- C – Create practical regulations and work for good solutions
- L - Lead industry-wide change in approach to water quality
- E - Educate industry on water quality regulation compliance
- A - Advance technological and design innovations
- N - Nurture comprehensive regional solutions

CREATE PRACTICAL REGULATIONS

- Promote and support sound environmental policies
- Participate proactively in water quality regulation process (workshops, hearings, meetings, boards, etc.)
- Provide presentations to interested agencies and groups
- When necessary, challenge unreasonable proposals both legislatively and legally

LEAD INDUSTRY-WIDE CHANGE IN APPROACH TO WATER QUALITY

- Change the way we do business
- Transition builder/contractor philosophy of fighting all water quality regulations to becoming part of the solution

EDUCATE INDUSTRY ON WATER QUALITY

- Increase member education programs on water quality compliance issues
  - Workshops, seminars, trade magazine, newsletters and e-mail updates
  - Provide certification programs
- Involve the broader construction industry (AGC, ECA, SCCA) in our education programs through a coalition approach
- Consumer/public education
  - New homeowner's brochure

ADVANCE TECHNOLOGICAL AND DESIGN INNOVATIONS

- Determine innovative technologies which can be used in building designs
  - Irrigation controllers, building products, etc.
  - Conduct research and monitoring
  - Apply for grants
- Pursue demonstration projects to showcase the use of innovative technologies by the building/construction industries

NURTURE COMPREHENSIVE REGIONAL SOLUTIONS

- Work for inclusion of regional solution option in water quality regulations
- Promote the involvement of other stakeholders in developing regional solutions
- Advantages
  - Creates teamwork "buy-in"
  - Grants may be available to fund capital costs
  - Economies-of-scale provide opportunity to cost effectively address pollutants of concern
  - Ability to establish maintenance districts
  - Large-scale solutions can be planned and modified to address future regulations (i.e. TMDLs)

CONCLUSION

- 2001 and beyond: water quality and supply issues offer many challenges and opportunities
- The building and construction industries will be actively responding to these challenges and searching for opportunities to participate in the movement toward better water quality and supply
- The "CLEAN" water plan is the framework for participating in this movement

Start at the Source

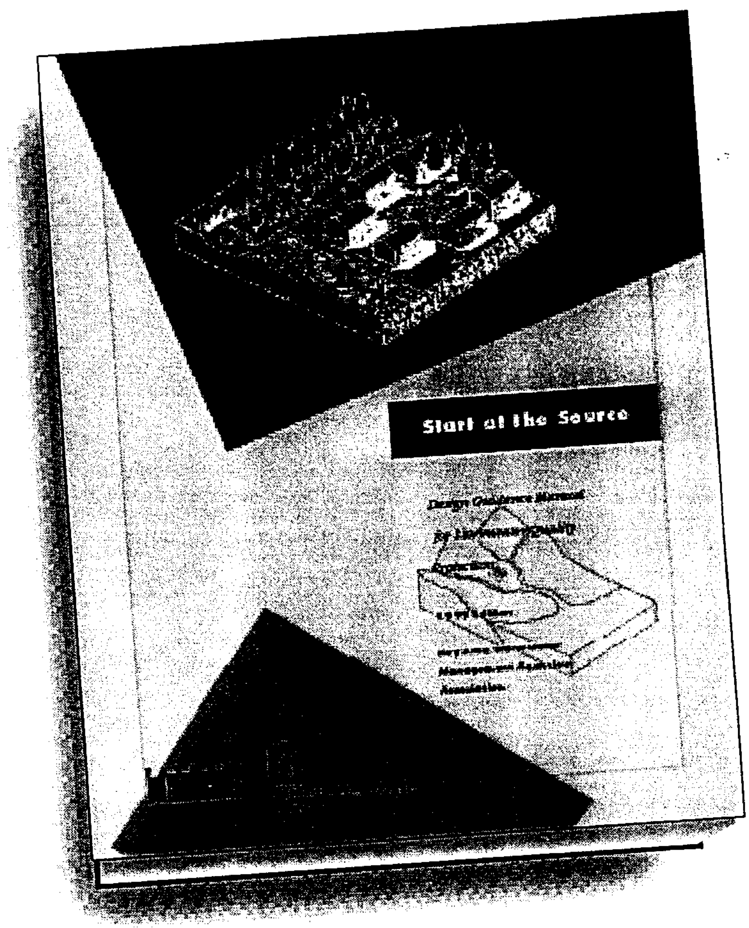
A Design Guidance Manual for Stormwater Quality Protection

by the Bay Area Stormwater Management Agencies Association

BASMAA's second edition of ***Start at the Source*** focuses on the importance of considering stormwater quality in the early stage of planning and designing land development and redevelopment projects.

This current edition has been updated and expanded to include commercial, industrial, and institutional development, as well as a technical section to provide more detailed information on the characteristics, applications, design criteria, maintenance, and economics of the details that are discussed in this document. Examples of case studies, frequently asked questions, and a complete glossary are also included.

This manual was developed under the guidance of a Review Committee comprised of representatives from the public and private sector. The principles and techniques described in this book are valuable and worthwhile to all regulatory agencies, planning and public works departments, developers, builders, engineers, landscape architects, EIR/EIS consultants, and members of the academic community.



Price: $35.00 plus tax, shipping and handling.

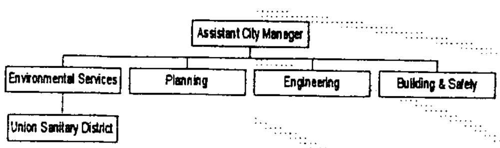
Current Efforts to Reduce Impacts of New and Redevelopment

Kathy Cote
Environmental Services Manager
City of Fremont

City of Fremont

- population 203,413
- 92 square miles
- 1.4 million square feet commercial industrial construction in 2000
- over 1,000 undeveloped acres available for commercial development

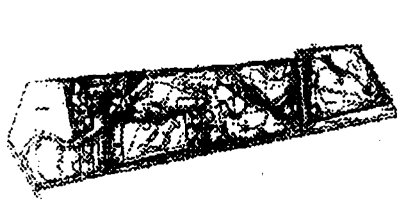
Development and Environmental Services



New Development Examples

- Central Park Golf Course
  - 9 hole executive golf course/driving range
- Jack in the Box
  - fast food restaurant
- Pacific Commons
  - 305 acre office park
  - 8.3 million square feet of office space

Central Park Golf Course



Central Park Golf Course

Conditional Use Permit Requirements

- Dust and Construction Emission Control
  - dust control measures
  - earth moving or travel restrictions
  - soil management provisions
  - roadway & work areas management
- Wetlands
  - wet season survey
  - wetland avoidance or mitigation
  - Streambed Alteration Permit

Central Park Golf Course

Other CUP Requirements

- excavation and grading restrictions
- Notice of Intent requirement
- prerequisite for ground disturbance or grading permit
- erosion control & grading plan

Jack in the Box

CUP Requirements

- Construction/Site Development
  - developer responsibility re: construction BMPs
  - construction mitigation activities
  - storm drain stenciling
  - trash/recycling enclosure
  - outdoor storage requirement

Jack in the Box

CUP Requirements Cont.

- Construction/Site Development (Cont.)
  - structural controls for spill interception, stormwater pretreatment
  - ongoing erosion control
  - drainage study
  - NPDES conformance
  - adequate site drainage

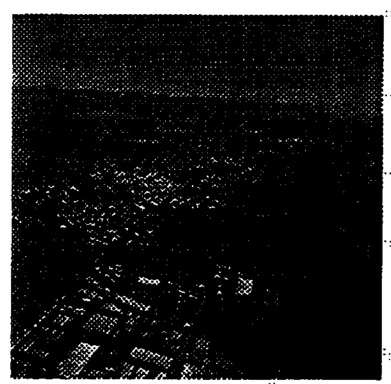
Jack in the Box

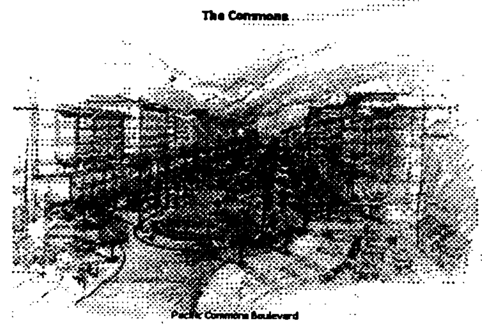
Conditional Use Permit Requirements

- Operational maintenance
  - litter control / sweeping
  - landscaping design and maintenance
  - cleaning facilities and employee training
  - storm water measures and operational BMP's
  - sweeping requirement
  - washwater discharge

Pacific Commons

- 768 total acres
- 305 acre office park
- 391 acres dedicated to Preserve as mitigation
- 49 acre City sports park/stormwater detention basin
- 11 acres for Cushing Parkway and other roads
- 12 acres for N-1 flood control channel

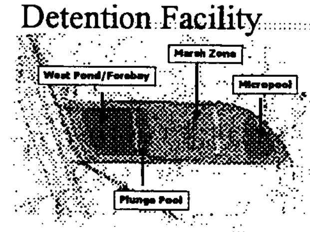




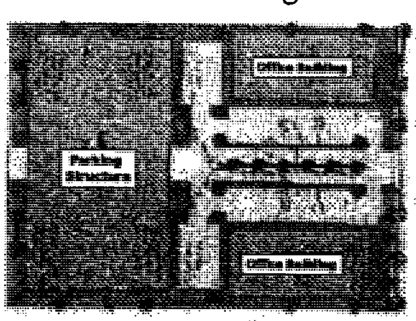
Planned Stormwater Features
for Pacific Commons

- Regional Water Quality Detention Facility
- Vegetated Bioswales
- Depressed Inlets
- Extended Wet Detention Ponds

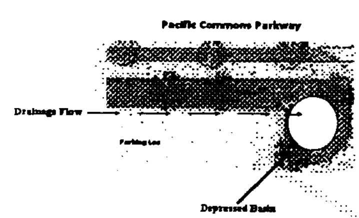
Regional Water Quality Detention Facility



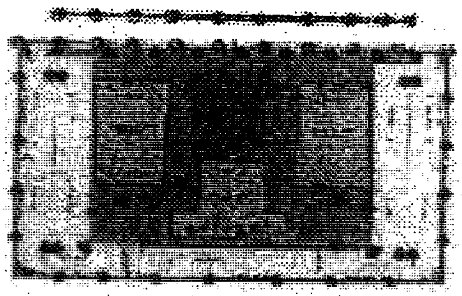
Office Park Design



Depressed Basin



Extended Wet Detention Ponds



Current Efforts to Reduce Impacts of New and Redevelopment in Marin County

Liz Lewis, MCSTOPPP Program Manager

Presentation Overview

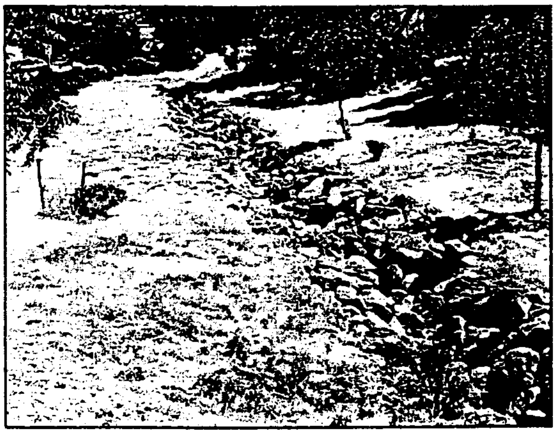
- Program Background
- Stormwater Mgmt Plan- *Action Plan 2005* view @ *www.mcstoppp.org*
- Introduction to Marin County
- Local Measures

Marin County Stormwater Pollution Prevention Program (MCSTOPPP)

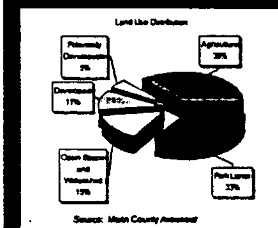
- Drivers
  - *San Francisco Bay Water Quality Control Plan* (*Basin Plan*) required a Baseline Program
    - Good creek habitat within urban setting
    - Concentrated urban corridor which flows to SF Bay
  - Locally popular efforts to preserve and enhance creek and wetland habitat
  - Public Works Directors
  - Phase II permit in 2003

Marin's rural character maximizes infiltration of stormwater

R0020552



Marin Land Use



How Municipalities are Implementing Stormwater Controls

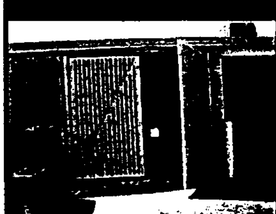
- Interdepartmental Review Teams
- Updating General Plans
- Revising Development Codes

City of San Rafael

Development Coordinating Committee

- Staff from Public Works, Planning, Building Inspection, Fire and Police meet monthly to discuss new development projects
- Public Works recommends appropriate ***Start at the Source*** post-construction controls for every project.

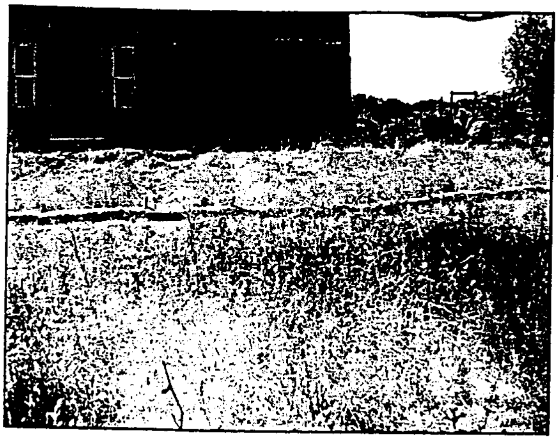
City of San Rafael



City of Novato

- Design Review Committee
  Staff prepares a list of recommended post construction controls and works with applicants to establish conditions.
- Waterway Ordinance-
  - *50 ft laterally outward from top of each bank.*
  - *Can include habitat areas /riparian vegetation.*
  - *Native plants are encouraged*
  - *Non-native, invasive vegetation discouraged*

R0020553



Effects of County Land Use Policies and Management Practices on Salmonids and Their Habitats

UC Berkeley Extension for *FishNet 4C*
Fishery Network of the Central California Coastal Counties

R0020554

Efforts to Reduce Storm Water Impacts of Development

Meeting New Requirements for Storm Water Controls in New and Redevelopment Workshop

Presented By
Pankti Shah

August 10, 2001

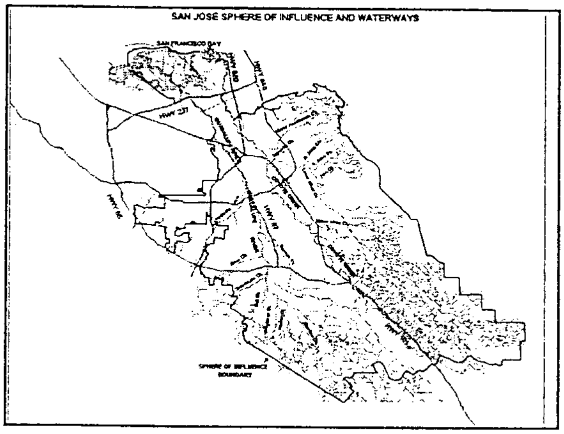
City of San Jose
Department of Planning, Building and Code Enforcement

Control of Pollutants from New Development

- Background
- Local Policies and Planning Tools
- Application of Storm Water Controls
- Educational Resources/References
- Conclusion

Context of San Jose

- San Jose Growth:17 square miles to 136 square miles between 1950-1970 (800%)
- Population Growth: Increased from 95,000 to 446,000 people between 1950-1970 (469%)
- Unplanned expansion resulted in sprawl until the 70's
- Planning policies in 70's began to curb sprawl
- Now: USA is approx. 177 square miles; Sphere of Influence is 104 square miles



Background

- Four main phases of application and management of controls:
  - Planning
  - Design
  - Construction
  - Maintenance
- San Jose is implementing all four phases

Local Policies and Planning Tools

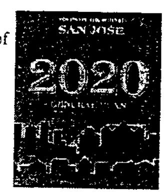
- General Plan Policies
- City Council Policy on Post-Construction Runoff Management
- Guidance Manual on Selection of Stormwater Quality Control Measures
- Riparian Corridor Policy Study
- Riparian Restoration Action Plan
- Zoning Code Provisions

General Plan Policies

- Smart Growth Policies:
  - Higher Density Housing
  - Compact Development near Transit
  - Growth Management
  - Urban Growth Boundary

General Plan Policies

- Water resource policies serve to:
  - regulate development in watershed areas
  - protect groundwater recharge, particularly creeks and riparian corridors
  - establish guidelines to control discharge of storm runoff into storm drains
  - control quantity and improve quality of urban runoff



City Council Policy on Post-Construction Runoff

- Acknowledges NPDES permit requirement to control post-construction runoff
- Establishes framework for incorporating minimum levels of Best Management Practices into new development
- Requires maintenance of all control measures
- Lists various types of land uses and required BMPs

City Council Policy on Post-Construction Runoff

- Example- Auto Wrecking Yards:
  - All new auto wrecking yards or *major expansion* of such uses should include the following:
    - 1) install and maintain a treatment control measure;
    - 2) pave all outside vehicle storage areas;
    - 3) cover fluids drainage areas;
    - 4) pave fluids drainage areas with impermeable materials;

SAN JOSE

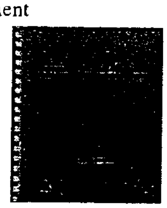
City Council Policy on Post-Construction Runoff

- Example- Auto Wrecking Yards:
  - 5) construct a berm around fluids drainage areas and grade the site to prevent water draining toward this working area;
  - 6) remove and store batteries in conformance with the City Fire Code;
  - 7) drain and store fluids in conformance with the City Fire Code; and
  - 8) prepare and execute the spill prevention plan in conformance with the City Fire Code.

SAN JOSE

Guidance Manual on the Selection of Stormwater Quality Control Measures

- Summarizes development impacts and pollutants of concern
- Contains guidelines for selecting control measures for major land use development categories
- Recommends treatment measures for various types of development
- Describes BMPs in detail



SAN JOSE

RECOMMENDED TREATMENT MEASURES FOR VARIOUS TYPES OF DEVELOPMENT

Type of Development and Impervious Area (acres)	Inlet Filters [1,2]	Porous Pavers	Oil/Sediment Separators [1]	Grassy Swales	Extended Detention (dry) Ponds	Wet Ponds	Filter Strips
Single Family Residential Projects (approx. # of homes)							
< 1 acre (<5 homes)		●					●
1-5 acres (5-30 homes)		●		●			●
> 5 acres (>30 homes)		●		⇨	●	●	●
Commercial/Industrial/... Impervious Area (acres)							
very small (single business)	●	●		●			●
<1.0 acres		●		●			●
1-5 acres		⇨		●			●
> 5 acres		⇨		⇨	●	●	⇨
Other Activities/Sources							
gas stations, equipment fueling facilities [3]			●				
auto wrecking yards [3]	●		●				
limited available space	●	●					

Symbols:
● = appropriate
⇨ = can be used but may require several units or additional measures

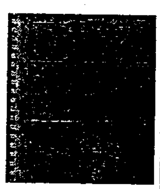
Footnotes:
1. Requires additional inspection and/or maintenance following major rainfall events.
2. Cannot be used where vegetation (leaves, grass clippings, pine needles, etc.), trash, debris or coarse sediment occur in the runoff and would cause blockage.
3. See City's Post construction Urban Runoff Management Policy

Note: This table is intended to provide general guidance. Final Selection should carefully consider site specific conditions and appropriateness.

SAN JOSE

Riparian Corridor Policy Study

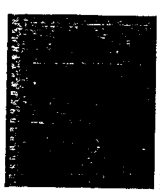
- Addresses several issues relating to the identification, management and the protection of riparian resources
- Inventories riparian corridors
- Contains development guidelines



SAN JOSE

Riparian Corridor Policy Study

- Contains development guidelines:
  - Site Design
  - Building and Fixture Design
  - Landscaping
  - Public Recreation Facilities
  - Fire Management
  - Vegetative Removal
  - Erosion Control, Flood Control, Water Quality and Protection from Construction

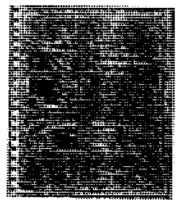


SAN JOSE

R0020559

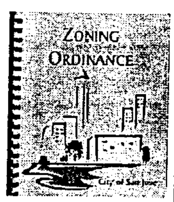
Riparian Restoration Action Plan

- Identifies impacts of past development to restore damaged corridors
- Suggests mitigation measures for new projects
- Provides basis for deciding how and when to restore, and who should be responsible
- Menu of techniques for different circumstances



City of San Jose Zoning Code

- Tool to Implement Planning Policies
- Update Effective February 19, 2001
- Bicycle and Motorcycle Parking Provisions
- Reductions in Minimum Required Parking
- Parking Maximums/Caps Placed
- Includes Storm Water Conditions of Approval

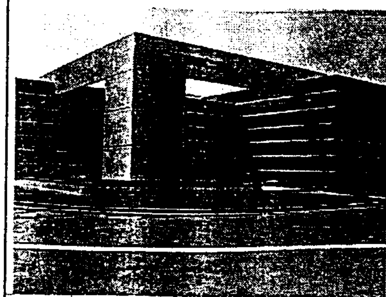


Example of Storm Water Quality Controls

Grassy Swale

- Approx. 30' x 300' swale within setback area
- Ionics Project (at Silver Creek Valley Rd. by Hellyer Av.)
- 66,700 sq. ft. Office/Industrial Use
- Approx. 4.5 acre site

Examples of Storm Water Quality Controls



Brick Pavers

- 2,800 sq. ft. of pavers
- Ionics Project (at Silver Creek Valley Rd. by Hellyer Av.)
- 66,700 sq. ft. Office/Industrial Use
- Approx. 4.5 acre site

Examples of Storm Water Quality Controls

Brick Pavers

- Front entrance driveway area

Educational Resources/References

- Website: www.ci.san-jose.ca.us/planning/sjplan/ ('counter', 'general information', 'Storm Water Management')
- Controlling Storm Water Pollution from Construction Sites (Brochure)
- *Clean Bay Blueprint/Blueprint for a Clean Bay*: handed out and referred to in permit conditions
- In-house training

Conclusion

- Strong policy foundation directs the implementation of storm water controls
- Political will to stand by policies and their implementation
- The policy and implementation tools can be used as a model by community of any size
- Continuously improving tools to implementing storm water controls

SAN JOSE

Challenges to Implementing Post-Construction BMP Measures

Ed Boscacci, Jr. PE
BKF Engineers
Redwood City

Challenges

Close Proximity to Adjacent Projects.

Typically Discharge to Storm Drainage Systems.

Little Room Available for Land Intensive Facilities.

Existing City Drainage Requirements.

Percolation to Shrink/Swell Soils Could Cause Problems.

Site Design Water Quality Measures

- Vegetated Swales
- Infiltration Trenches
- Disconnected Impervious Area
- Storm Water Detention
- Outfall Protection

BIOSWALE

- Summer
  - No Irrigation
- Winter

BIOSWALE

- On-line or Off-line
- Meet Constraints

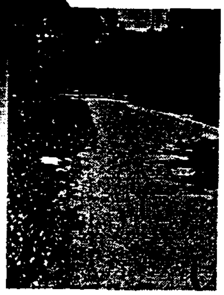
BIOSWALE

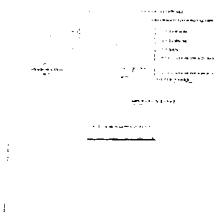
- Flow Enters Swale through Curb Openings

R0020563

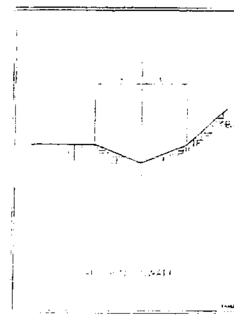
BIOSWALE

- Where Percolation not Allowed
- Near Asphalt
- In Shrink/Swell Soils



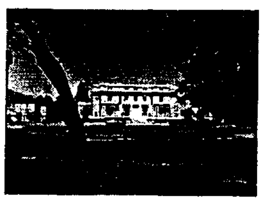


BIOSWALE

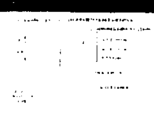


- Plant in Swale
- Analyze Swale for Erosion. Use Geofabric if Erosion Potential.
- Where Percolation Allowed

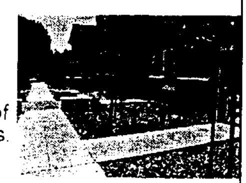
INFILTRATION TRENCH



- Where Percolation Allowed
- Plant in Swale
- Analyze Swale for Erosion. Use Geofabric if Erosion Potential.



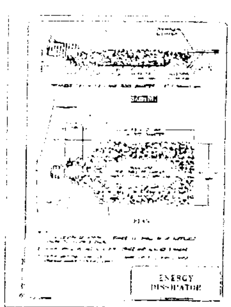
Disconnected Impervious Area



- ed Areas and Roof Landscape Areas.
- Flow Crosses Landscape Area Prior to Discharge to Area Drains
- Cannot be Used near Shrink/Swell Soils.
- Make sure Outlet is Lower than Building and Discharge

Energy Dissipation, Outfalls

- ABAG has Standard Shape, Where Space Available.
- Rock Outfalls Preferred, but Space Intensive.
- Concrete can be more Compact.



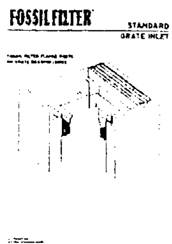
Structural Solutions

- Require Maintenance.
- After Solids Settle Out, Heavy Metals may Dissolve and be Discharged in Later Storms.
- Two Common Methods, Filters and Settling Units.

R0020564

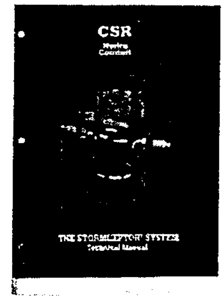
Structural Solutions

- Filtering Unit.

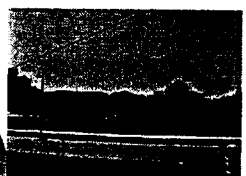


Structural Solutions

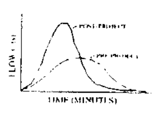
- Settling Unit



Stormwater Detention



- Stormwater Detention Reduces Peak Flows to Downstream System.
- Stormwater Detention Area can be Used for Long-Duration Storage to Provide Water Treatment.



CONCLUSIONS

- Grass Swales
- Infiltration Trenches
- Disconnected Impervious Area
- Covered Trash Area

- Include:

- Treatment Devices
- Street Sweeping
- Landscape Controls
- Where Practical Use:

New & Re-Development Stormwater Permit Amendment

Santa Clara Valley Urban Runoff Pollution Prevention Program Permit*

SF Bay RWQCB Staff
Janet B. O'Hara
Dale C. Bowyer
Keith H. Lichten

*plus RB Staff Recommendations

Municipal Stormwater Permit Components

- Monitoring
- Public Information/Participation
- Municipal Maintenance Activities
- Industrial/Commercial Discharge
- Illicit Discharge
- Construction Activities
- New Development/ Redevelopment
  - Treatment measures
  - Peak runoff changes

Presentation Overview

- Process for Amendment adoption
- New development treatment measures – Brief background
- Permit Amendment – Major issues and proposed revisions

Proposed Amendment Adoption Process

- Last 2 weeks: 2 stakeholder meetings.
- August 15: Revised T.O. and Response to Comments out.
- Five week comment period with more stakeholder meetings
  - Tentative Dates: 8/30/1 & 9/5/1
- October Board action on Final Revised T.O.
- Ample opportunity for further comment on and revision of the T.O.

New Development Treatment Measures – Regulatory Background

- EPA regulations require "a description of planning procedures...to develop, implement and enforce controls to reduce the discharge of pollutants from MS4s which receive discharges from areas of new development and significant redevelopment"
- Best Management Practices implemented to the Maximum Extent Practicable

Where are we now?
How did we get here?

- Bay Area: Existing guidance & implementation.
- What's happening elsewhere?
- Project Examples.

Existing Guidance & Implementation - Bay Area

- 1993: California State BMP Handbooks
- 1994: Regional Board - "Staff Recommendations"
- 1994: Bay Area Preamble to CA State BMP Handbooks
- 1997: BASMAA - "Start at the Source"

Elsewhere -
Other States and Regions Requiring New Dev. Measures

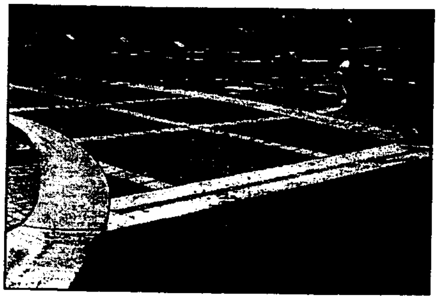
- Washington, Texas, Florida, Virginia, Maryland
- California Region 4 (L.A.), Region 9 (San Diego), Bellflower
- New L.A. Draft Permit

Detention Basin

Vegetated Swale - 1997

Vegetated Swale - 2001

Pervious Pavement



The evolving process

Amendment Goal - Add specific language to existing performance standard

- Include more projects with treatment measures
- Address redevelopment
- Design treatment measures adequately
- Maintain treatment measures
- Address increased peak runoff

New Development / Redevelopment Tentative Order – Major Elements

- Hydraulic sizing criteria for treatment measures
- New development project size
- Significant redevelopment projects
- Exemption for impracticality
- Peak runoff management

Hydraulic Design Criteria for Treatment Measures

- Volume Basis
  - 85^{th} percentile 24 hr Runoff Event
  - Unit Basin Storage Method for 80% Treatment – CA BMP Handbook - 1993
- Flow Basis
  - 2 X 85^{th} percentile of hourly rainfall intensity
  - 0.2 inch per hour intensity
  - 10% of 50 year flow

New Development Project Size

- Group 1 - Commercial, industrial, roads or residential projects of one acre new impervious surface or greater (Significant re-development of same size)
- Group 2 - 5000 ft^2 of new impervious surface creation *Revise to 2004 from 2003*
- Program can propose alternate equivalent approach

Significant Redevelopment Category

- Significant redevelopment emphasized in EPA regulations
- Addition vs. replacement, land disturbance
- Routine pavement and roof replacement, maintenance excluded
- *Interior remodel excluded*
- *50% standard for partial work*

Exemption or Waiver for Impracticality

- Impracticability established, or Regional treatment planned
- Transfer equivalent treatment of water volume or pollutant load basis to near watershed
- *Request Program to Propose Language for Board Approval*

Peak Runoff Change

- New roofs and pavement can increase peak runoff flows and durations
  - Impact example: Damage to downstream structures and habitat through excess erosion & deposition.
- Degree of impact depends on local watershed and stream conditions
- Hydrograph Modification Management Plan development over next 2 years
- ***Interim standard – Revised to limit peak runoff where excessive downstream erosion may occur (L.A. SUSMP Language)***

New Development / Redevelopment Tentative Order – Minor Elements

- Review of site design standards.
- Inclusion in CEQA review, General Plans, etc.
- Source controls.
- Reporting.

Summary

- Process Extended
  - Revised T.O. with response to comments – August 15
  - Revised T.O. will be renoticed for five weeks
  - Revised T.O. can be further revised before October Board Meeting action
- Increased degree of implementation of existing concepts

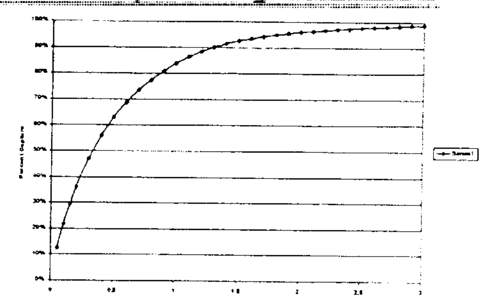
Areas of Revision for New T.O.

- Interim Peak Runoff standard
- Project size categories
- Significant Redevelopment
- Exemption criteria
- Schedule for implementation

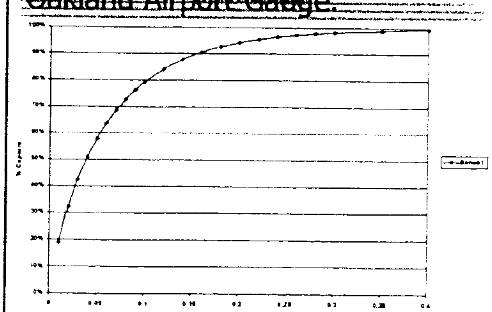
Conclusion

- Ample opportunity for review, discussion, & further changes to the Amendment T.O.
- Consistent approach will follow for other stormwater programs in the Region.
- Back to Water Board in October.

Technical Analysis (Volume): Oakland Airport Gauge:



Technical Analysis (Intensity): Oakland Airport Gauge:



Proposed Permit Requirements for Development Projects: Implications for Municipalities

Jill Bicknell, EOA, Inc.
Assistant Program Manager,
Santa Clara Valley Urban Runoff
Pollution Prevention Program (SCVURPPP)

Overview of Presentation

- Key changes in municipal approvals and responsibilities for development projects (based on May 18th Tentative Order)
- SCVURPPP's approach to implementation of permit requirements
- Expected guidance from SCVURPPP and BASMAA

Key Changes in Development Project Approval Process (May T.O.)

- **Conditions of approval:**
  - Develop additional conditions
  - Include in project requirements
  - Review and condition more projects, down to minimum size threshold

Key Changes in Development Project Approval Process, continued

- **New conditions include:**
  - Site design/landscape measures
  - Source control measures
  - Numeric sizing criteria
  - Peak runoff control measures
  - Pesticide reduction measures
  - Operation & maintenance responsibility

Key Changes in Development Project Approval Process, continued

- **Legal authority** – May need expanded authority to review/require controls at small sites and allow exemptions
- **Environmental reviews** – Must address water quality impacts and mitigation
- **Waiver/Compensation Provision** – Must evaluate/document impracticability & cost
- **Data management** -- More documentation and record keeping required

Key Changes – Ongoing Responsibilities

- **Treatment Controls Operation and Maintenance Verification Program**
  - Establish public/private responsibility
  - Maintain list of properties with controls
  - Conduct inspection and enforcement
- **Management of Compensatory Fees**
  - Accounting and transfer of funds to identified projects

Key Changes -- Implications for Municipalities

- **Major increases in staff time and resources will be needed to:**
  - Review/revise ordinances & procedures
  - Develop new conditions/standards
  - Train planning department staff
  - **Review more projects**

Key Changes -- Implications for Municipalities, cont.

- **Major increases in staff time and resources will also be needed to:**
  - Document site conditions and controls by project
  - Develop and implement O&M verification program
  - Hire and train staff to conduct inspections

Additional Implementation Challenges

- High density, infill, and/or urban redevelopment projects
- Sites with infiltration limitations
- Limiting peak flow discharges to pre-developed conditions
- **Using site design measures to meet numeric sizing criteria**

Additional Implementation Challenges, continued

- Selecting from untested/evolving treatment system technologies
- Selecting controls that cost-effectively reduce pollutants of concern
- Determining equitable and legal ways of collecting mitigation fees
- Meeting permit implementation schedule

SCVURPPP Approach: Update Performance Standards

- Have adequate legal authority
- Provide guidance to developers up front
- Address stormwater quality in CEQA reviews
- *Require developers of significant projects to minimize stormwater quality impacts to MEP, through site planning & permanent controls*

SCVURPPP Approach: Update Performance Standards

- Require coverage under General Permit
- Require effective erosion/sediment controls prior to and during wet season
- *Require O&M methods for permanent BMPs*
- Include control measures in municipal capital improvement projects
- Provide staff training annually

SCVURPPP Approach: Develop Guidance

- Translate numeric sizing criteria to local climate conditions
- Site design measures and design standards
- Source control measures/conditions
- Treatment control selection, design, and maintenance

SCVURPPP Approach: Develop Guidance, continued

- Peak flow limitations (develop Hydromodification Management Plan, protocols and BMPs)
- Pesticide reduction measures/conditions
- Evaluating and documenting impracticability and alternate measures
- Regional approach to guidance

BASMAA Projects (FY 01-02)

- **"Treatment Control Position Paper"**
  - Evaluate cost-effective levels of treatment for various land uses
- **"Using Start at the Source to Comply with Development Standards"**
  - Use site design techniques to comply with flow/volume control standards
- **Workshops**

Using Good Science and Process for BMP Selection and Requirements

Eric Strecker
Portland, OR
GeoSyntec Consultants

Overview of Presentation

- Setting and Implementing Design Standards
- Future Trends
  - The Effectiveness of BMPs
  - BMPs – Emerging Trends
- Project Examples
  - Playa Vista
  - Irvine Company

Effectively Implementing Design Standards

- **Need to target both existing and potential future problems**
- **Dischargers should develop requirements rather than regulators (or if developed, adapt more relevant approaches)**
- **Technical Approaches should be based upon good science and process**

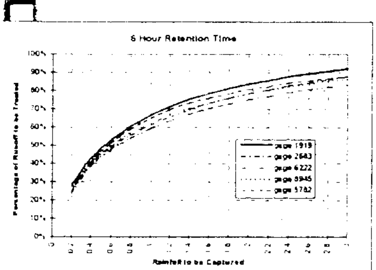
Technical Approaches

- **Setting water quality facility sizing requirements**
  - **Assess rainfall, runoff, and BMP functioning to ascertain what will be achieved**
  - **Volume vs. flow-through BMPs need separate approaches**
  - **Make requirements simple**
  - **Encourage "treatment trains"**
  - **Recognize that standards will need to evolve as we learn more**

City and County of Honolulu-Factors Considered in Selecting Standards

- **Reduce pollutants to "Maximum Extent Practicable"**
- **Pollutants of concern - NPDES Sampling**
- **Water Quality Limited water bodies**
- **Rainfall - Point of diminishing return**
- **Rainfall/runoff/BMP function analysis to ascertain what proposed requirements would achieve for different BMP types**
- **First flush for small sites**
- **We have a lot more to learn about stormwater BMP effectiveness**
- **Hawaii development site conditions**
- **This is an initial start**

Storm Event Rainfall Analysis to Select Storm Sizes for Evaluation for Detention Based BMPs



Honolulu Airport 1919
Kailua Fire 2683
Maunawili 6222
Wahiawa Dam 8945
Makaha Pump 5782

Selected Storm Sizes
1.0 (60 to 67%)
1.4 (67 to 75%)
2.2 (76 to 85%)

R0020578

Example Site Analyses - Simulation of the Results of Requirements Performed

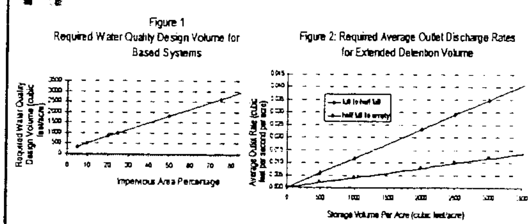
- Selected Actual Site Examples
- Developed Site Re-designs for each sizing requirement
- Predicted Results - Hydrologic, Hydraulic and Pollutant Removal Performance
- Developed Cost Implications/Evaluation
- Assessed Land use/aesthetics

COMPARISON OF ON-SITE WATER QUALITY DESIGN STORMS FOR TYPICAL COMMERCIAL OFFICE BUILDING DEVELOPMENT

Water Quality Design Storm	Water Quality Site Design					Estimated Annual Pollutant Load of Total Suspended Solids (TSS)[2]			Estimated Reduction in Annual Pollutant Load of Total Copper (Cu)
	Potential Water Quality BMP	Estimated Percentage of Annual Runoff Volume Treated		Cost Implications[1]		Site With			
		Rainfall Analysis	SWMM Modeling	Capital	Maintenance	Traditional Site Design	Water Quality Facilities	Percent Reduction	
0.30 in/hr	vegetated swales (2' - 4.5' bottom width)	65%	na	$23,000 Annual Cost	$3,000	710 lbs per year	327 lbs per year	54%	45%
0.40 in/hr	vegetated swales (2' - 6.5' bottom width)	70%	na	$15,000 Annual Cost	$3,000	710 lbs per year	300 lbs per year	58%	50%
0.55 in/hr	vegetated swales (2' - 9' bottom width)	80%	na	$22,000 Annual Cost	$3,000	710 lbs per year	240 lbs per year	66%	56%

NOTES
1. "Cost Implications" based on comparison to construction and maintenance of conventional storm drainage system.
2. Pollutant loads based on stormwater quality data collected on Oahu between 1992 and 1994.
3. Pollutant removal based on performance data reported in Portland Stormwater Quality Facilities Design Guidance Manual.

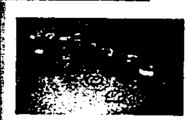
Detention Based Water Quality Control - Design Sizing/Detention Time



Approach -Provided simple charts for sizing of facilities

EPA's and ASCE's Standardized Best Management Practices Data Base -

DETERMINING URBAN STORMWATER BMP EFFECTIVENESS



ASCE UWRRC Team:
Eric W. Strecker and Marcus Quigley
GeoSyntec Consultants;

Ben Urbonas,
Urban Drainage and Flood Control District; and

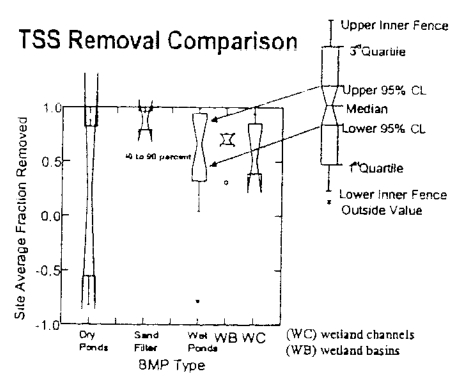
Jonathon Jones and Jane Clary,
Wright Water Engineers

Urban Water Resources Research Council

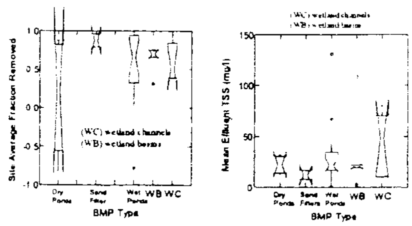
Problem: BMP Studies inconsistencies make it difficult to transfer what is learned to overall knowledge of specific BMP types and factors that affect their effectiveness (examples):

- constituents
- sample collection techniques
- sampling approaches
- data reporting
- effectiveness estimation
- statistical validation of results

TSS Removal Comparison

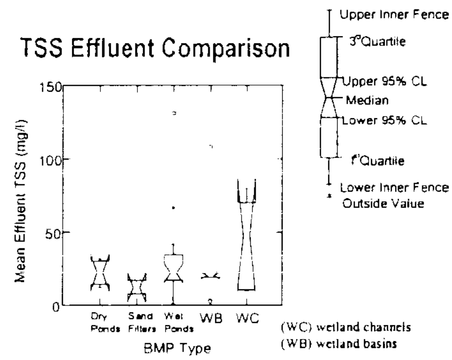


BMP Performance Characterization –Lessons from ASCE Database



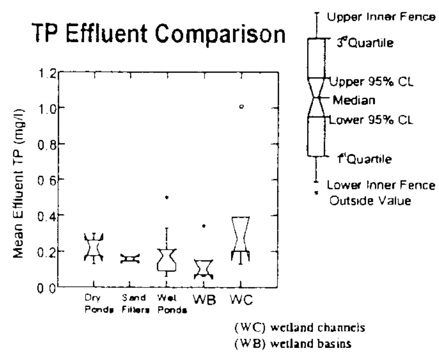
- Percent Removal (-70 to 99% on average) vs. Effluent Quality (Range of 20 to 30 mg/l average TSS) (Note: Only three wetland channels in database)
- So What?
  - BMPs are best described by how much they treat and to what effluent quality.
  - Important for assessing effectiveness for BMP selection (commercial and public domain BMPs)

TSS Effluent Comparison

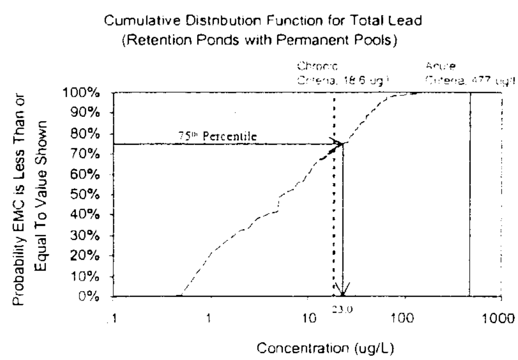


Average effluent of 20 to 40 mg/l common achievement

TP Effluent Comparison



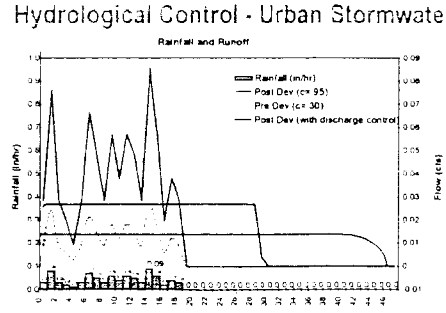
Average effluent of 100 to 200 ug/l common achievement



Effluent CDF Results

	25th Percentile	50th Percentile (median)	75th Percentile	90th Percentile
Total Suspended Solids (mg/l)	6.0	14.6	36.0	79.3
Total Cadmium (ug/l)	0.3	0.7	1.5	200.0
Total Copper (ug/l)	4.0	5.9	10.0	13.4
Lead (ug/l)	2.0	6.0	23.0	44.1
Zinc (ug/l)	12.0	29.0	68.5	153.8

Hydrological Control - Urban Stormwater



Pre=Post peak flows for 1 to 2 year storms is likely to worsen stream impacts!

Addressing Stream Stability by Working with the Stream

Timber Stepdown (front)

Boulder Bed Control Structure (back)

Solving the Problems: BMP Preferences

1. Tied:
   - Hydrological source control
   - Pollution source control
   - On-site "lower impact" stormwater management techniques for treatment and flow control
2. In-stream stabilization measures
3. On-site treatment via end of pipe "structural" facilities
4. Regional water quality/flow management facilities

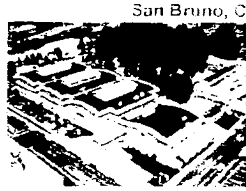
Gap World Headquarters, San Bruno, CA



Traditional vs. Integrated Landscape Stormwater Design Approaches

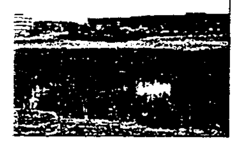
Project	Integrated Approach	Cost: Traditional vs. Integrated Approach	Savings
OMSI (commercial)	"Naturescaped" bioswales in parking lots	$273K vs. $195K	$78,000
Walnut Park Police Station (commercial)	Bioswale and infiltration area in parking lot	$10K vs. $1K	$9,000
Flex Alloy (industrial)	Flow-through grass filters and swale	$[illegible]K vs. $68K	$11,000
[illegible] Village (31-home subdivision, including streets)	Open channel bioswales and soakage trenches	$[illegible]K vs. $58K	$[illegible]

R0020582

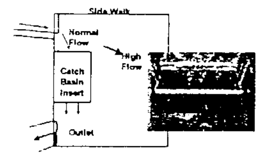
Parking Lot Swales

- Parking Loss Minimized
- Meets Landscaping Requirements
- Can Reduce Costs
- Access Issues
- Look Attractive

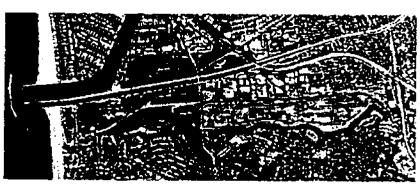
Are All BMPs the Same?



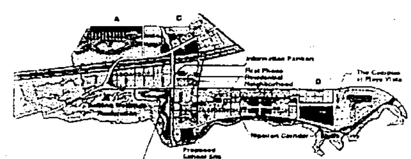
Vs.



Playa Vista – Stormwater Management



Playa Vista's Plan for Ecologically Based Restoration and Development

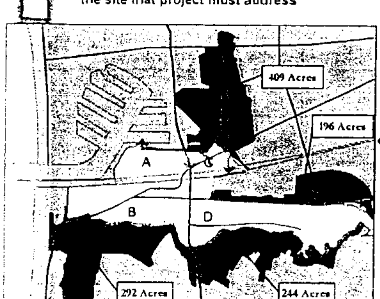


Freshwater Marsh

- The Playa Vista Water Resources Plan was developed to be ecologically driven both internal and external to the project
- One of the first systems in Southern California designed to address water quality from a natural systems perspective
- Is often cited as an example of comprehensive urban water resources management in other Cities (including Portland!)

Playa Vista Water Quality and Quantity "Opportunities"

- Significant off-site flows draining directly onto the site that project must address

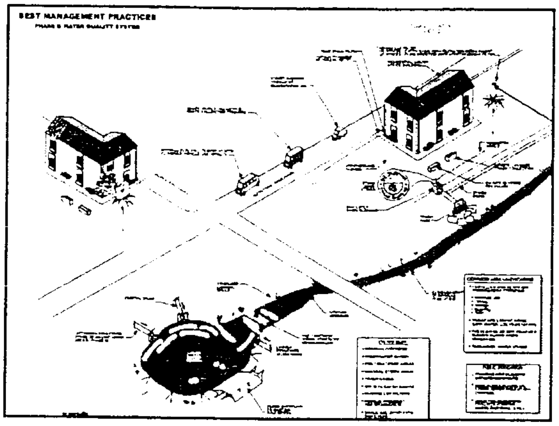


78,000+ acres of greater Los Angeles

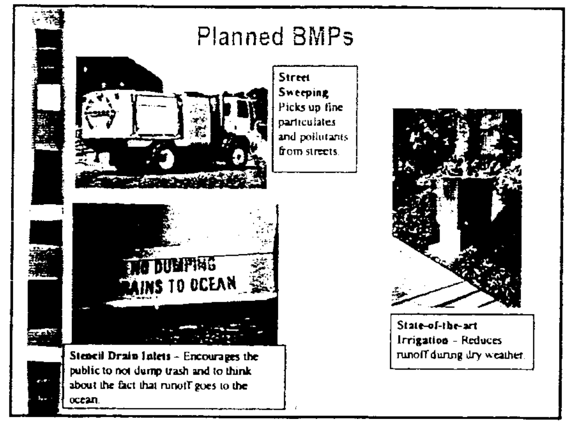
1,087 Acres
A, B, C, & D

Stormwater Management System -Treatment Train BMPs

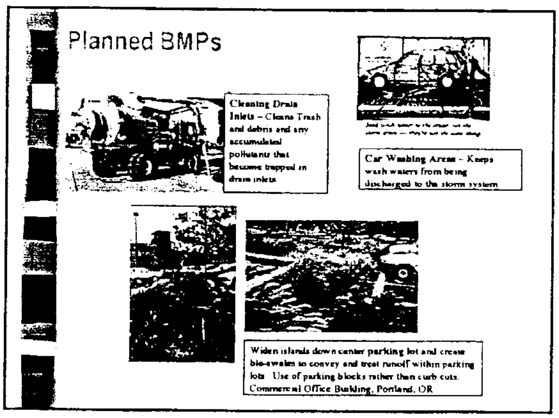
- Community education and amenities
- Off-site BMPs to improve water quality in stormwater that enters project area
- Bio-swales, catch basin inserts and other in-project features in tributary watersheds to minimize runoff amounts and provide primary treatment
- Riparian corridor habitat, water quality, aesthetics
- Water quality wetlands and habitat
- Fresh water flow management



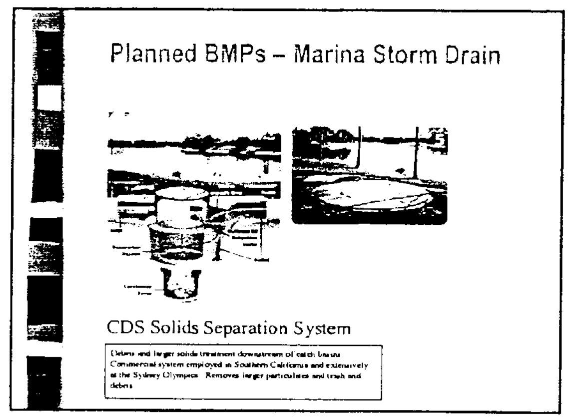
BEST MANAGEMENT PRACTICES



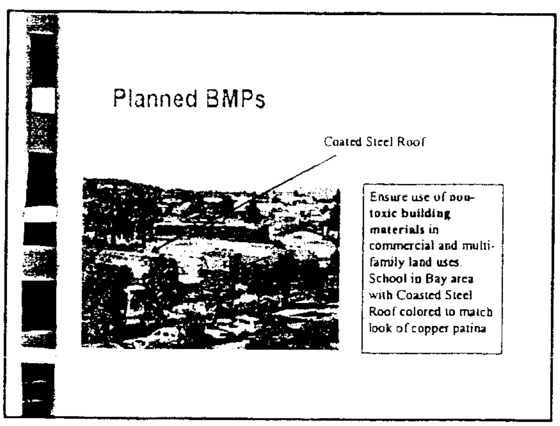
Planned BMPs
Street Sweeping Picks up fine particulates and pollutants from streets.
NO DUMPING
DRAINS TO OCEAN
Stencil Drain Inlets - Encourages the public to not dump trash and to think about the fact that runoff goes to the ocean.
State-of-the-art Irrigation - Reduces runoff during dry weather



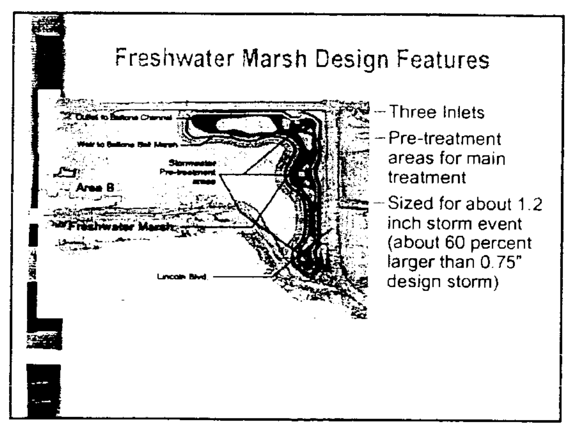
Planned BMPs
Cleaning Drain Inlets – Cleans Trash and debris and any accumulated pollutants that become trapped in drain inlets
Car Washing Areas - Keeps wash waters from being discharged to the storm system
Widen islands down center parking lot and create bio-swales to convey and treat runoff within parking lots. Use of parking blocks rather than curb cuts. Commercial Office Building, Portland, OR



Planned BMPs – Marina Storm Drain
CDS Solids Separation System
Debris and larger solids treatment downstream of catch basins. Commercial system employed in Southern California and extensively at the Sydney Olympics. Removes larger particulates and trash and debris.



Planned BMPs
Coated Steel Roof
Ensure use of non-toxic building materials in commercial and multi-family land uses. School in Bay area with Coasted Steel Roof colored to match look of copper patina



Freshwater Marsh Design Features
Outlet to Ballona Channel
Area B
Stormwater Pre-treatment areas
Freshwater Marsh
Lincoln Blvd
– Three Inlets
– Pre-treatment areas for main treatment
– Sized for about 1.2 inch storm event (about 60 percent larger than 0.75" design storm)

Freshwater Marsh

- Under construction now

Irvine Company Stormwater Management

- Developed a company-wide approach for stormwater management
- Focused on both project and regional solutions
- Selected Natural Treatment Systems options, with other structural approaches as appropriate
- Program includes both regional and on-site solutions to meet water quality goals

Stormwater Controls in New Development Projects

Understanding Numeric BMP Sizing Criteria

Presented by

Jeffrey D. Endicott, P.E.

CDM Camp Dresser & McKee Inc.

Wednesday, August 08, 2001

Presentation Objectives

- Discuss advantages of uniform BMP design criteria – a.k.a. Numeric Sizing Criteria
- Identify areas where BMP design criteria have or will be implemented
- Review BMP design criteria in proposed Santa Clara Valley permit amendment
- Make sense of the proposed BMP design criteria

Advantages of Uniform BMP Design Criteria

- Establishes a basis for compliance
- Provides a measure of equity in BMP implementation
- Allows for consistent evaluation and improvement of
  - Individual BMPs
  - Overall BMP program

CA Migration of BMP Design Criteria – In Place

- Tahoe Basin
- SUSMPs
  - Los Angeles County (Unincorporated)
  - Los Angeles County (Municipalities)
  - City of Long Beach
- Ventura County County-wide Permit
- San Diego County-wide Permit

CA Migration of BMP Design Criteria – Being Considered

- Santa Clara Valley
- L.A. County (Round 2)
- And who knows where else?
  - Orange County Permit, San Diego Regional Board jurisdiction?
  - Others?

Proposed Design Criteria Santa Clara Valley

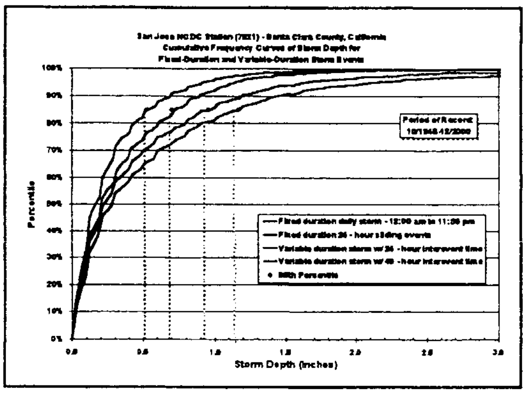
- Volumetric design basis for
  - Detention, Wet and Dry
  - Retention
  - Infiltration
  - Wetlands
- Flow design basis for
  - Biofilters
  - Media filters
- Some BMPs require consideration of both
  - Diversion to off-line detention, retention, etc.

Proposed Design Criteria Santa Clara Valley

- Volumetric Design Basis
  - Each runoff event up to the 85th percentile 24-hour storm runoff event – The URQM Approach
  - Volume of annual runoff to achieve 80 percent capture – The CA BMP Handbook Approach

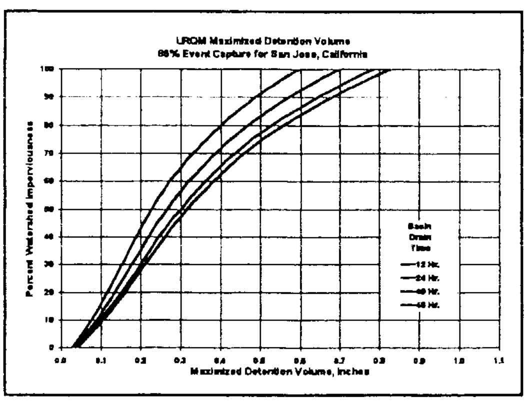
Volumetric Design Basis

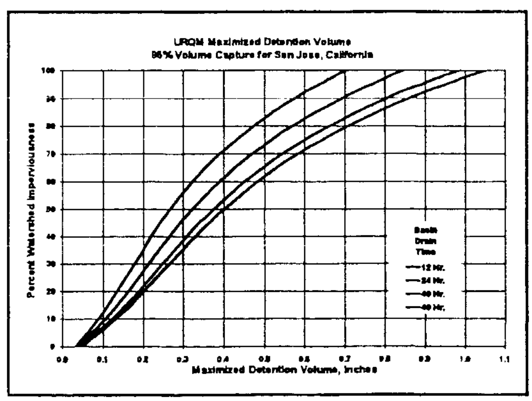
- Current language is ambiguous
  - 24 hr storm Vs 24 hr runoff event?
    - Not part of URQM approach
    - Not recognized by Mother Nature
- Language can be clarified, yielding a sound approach
- CA BMP Handbook Vs URQM
  - Same underlying approach

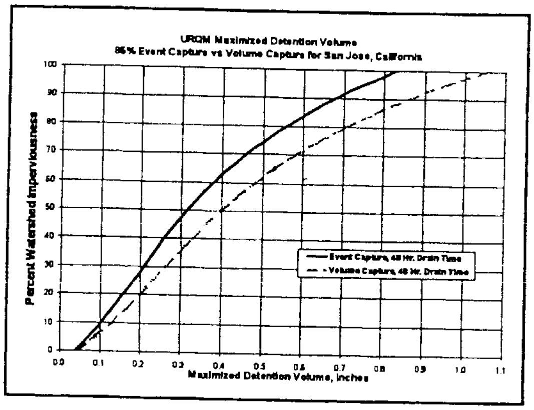


URQM Approach

- Current language allows multiple interpretations

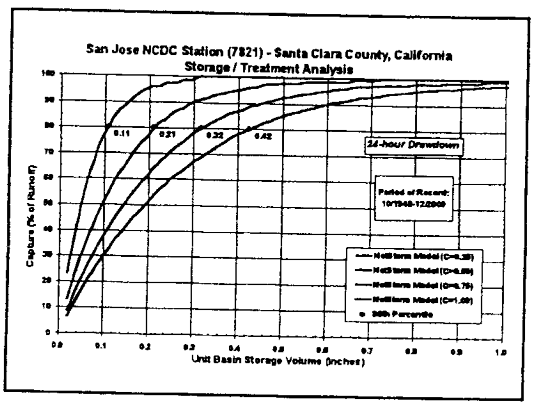


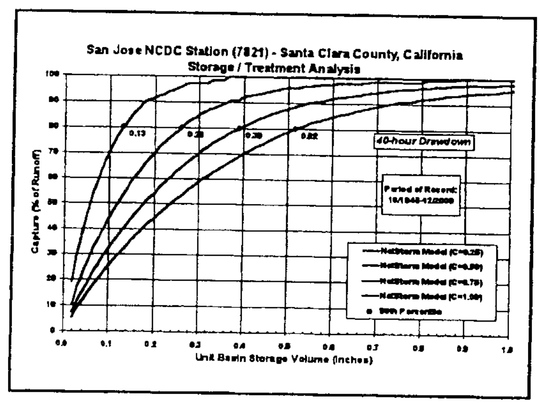




CA BMP Handbook Approach

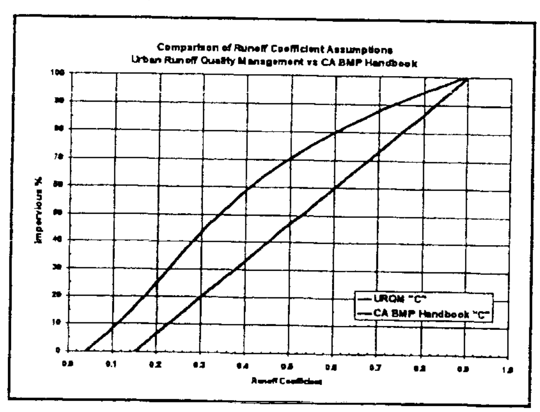
- Current language is sufficiently clear to implement





Important to Keep in Mind

- CA BMP Handbook and URQM use different runoff coefficient assumptions
- Don't co-mingle!



Volume Approach Comparison

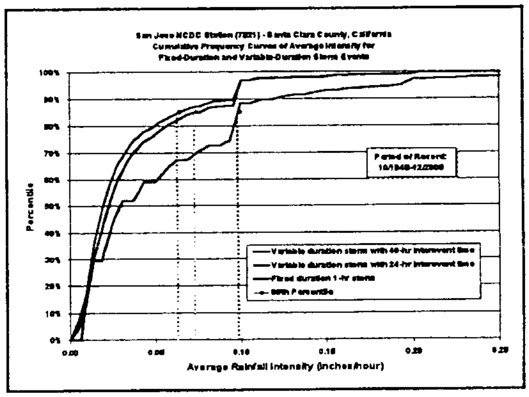
	CA BMP Handbook		URQM		
Impervious Area %	"C"	80% Runoff Volume (inches)	"C"	85% Events Volume (inches)	85% Runoff Volume (inches)
100	[illegible]	0.43	[illegible]	0.70	[illegible]
75	0.71	0.33	0.54	0.42	0.52
50	0.52	0.23	0.36	0.28	0.32
25	0.34	0.11	0.20	0.15	0.19

Proposed Design Criteria Santa Clara Valley

- Flow Design Basis
  - 10% of the 50 yr design flow
    - Straight forward, easy to determine
  - Flow that treats same portion of runoff treated using volumetric standards
    - Difficult to determine, has significant absolute compliance issues - Not Recommended

Proposed Design Criteria Santa Clara Valley

- Flow Design Basis
  - Flow produced by a 0.2 in/hr storm
    - Straight forward, easy to determine
  - Flow produced by 2X the 85th percentile hourly intensity
    - Current language is ambiguous – similar to previous reasons



Flow Approach Comparison

- Intensity approaches
  - Calculated intensities, ~0.06 ~ 0.10 in/hr
  - Doubling yields ~0.12 ~ 0.20 in/hr
  - Doubled figures are similar to the 0.2 in/hr option
  - Doubling intensity for design makes some sense – it factors out numerous "trace" events that do not produce runoff

Summary

- Design criteria
  - Provide equity in BMP implementation
  - Allow long-term assessment
    - BMPs
    - Changes in water quality
- Proposed criteria
  - Generally heading in the right direction
  - Relatively minor changes will make important improvements

R0020589

Summary

- Volumetric design criteria
  - URQM
    - Simple to use
    - Yields somewhat higher volumes for Santa Clara Valley
  - CA BMP Handbook
  - Simple to use once complex hydrologic analysis is completed and curves developed
  - Yields volumes specific to Santa Clara Valley

Summary

- Flow design criteria
  - 10% of Q_{50}
    - Simple to use
    - Yields site-specific results
  - Intensity approach
    - Simple to use
    - ~0.2 in/hr seems to be a reasonable target

Recommended Reading

- Urban Runoff Quality Management (1998) - Water Environment Federation and American Society of Civil Engineers

Marin Countywide Plan Update 2000-2004

Future Marin

Designing a Sustainable County

www.future-marin.org Summer 2001

Hindsite: A Word From the Agency Director...

Dear Marin Community Member,

As we move forward in the new millennium, we welcome your participation in the Countywide Plan Update. We need your ideas to help launch the plan for the 21st century. Your participation will determine the quality of the plan.

Those of us who live or work in Marin County treasure its natural beauty and its emphasis on conservation. We also recognize that housing costs have sky-rocketed and that commuting during rush hour on Highway 101 erodes the quality of our lives.

If you are interested in participating in the planning process, please register on our website (www.future-marin.org) to receive e-mail updates and related information.

Sincerely,

Alex Hinds

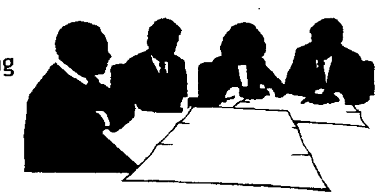
Alex Hinds
Director,
Marin County
Community Development Agency

Marin Countywide Plan (CWP) Update Progress Report

CWP UPDATE FRAMEWORK

Marin's Countywide Plan (CWP) serves as the county's land use and policy blueprint. First adopted in 1973, Marin's plan remains a visionary land use guide. Updated in 1982 and again in 1994, most of the document has withstood the test of time, and its policies continue to reflect widespread community values. Nevertheless, many elements will be updated to address current issues such as traffic congestion, erratic and costly energy supplies, and the need for well-designed and affordable housing. In response to a recommendation of the Marin Economic Commission, the Board of Supervisors in 1999 decided that sustainability would be the overarching theme for the updated plan. See page 4 for the Interim Guiding Principles as prepared by the Sustainability Working Group and staff.

WORKSHOPS



To launch the CWP process, the Community Development Agency held six workshops in various locations throughout Marin beginning in October 2000. About 75 people attended each workshop where they heard presentations and gave input about what they envision for Marin's future. Local and regional experts presented topics addressing planning for sustainable communities such as green business, food and agricultural, social equity, green building, transportation, and economics. Videotapes of the workshops are available through the Marin County Free Library. For availability call the Reference Desk at (415) 499-6058 or visit www.countylibrary.marin.org.

(continued from page 2)

SUSTAINABILITY WORKING GROUP

The Sustainability Working Group (SWG), the first of four working groups to support the CWP process, met from February through May. Members from different sectors of our community worked with staff to prepare a set of ten sustainability principles to guide the CWP (page 4). SWG members include: Meg Amaral (student liaison), Sue Beittel, Clark Blasdell, Nona Dennis, Nancy Ducos, Jeff Ehlenback, Jim Goodwin, Grace Hughes, Arie Kurtzig, Luke McCann, Charles McGlashan, Linda Novy, Larry Rosenberger, and Sim Van der Ryn. Biographies of members furthur information about the the SWG can be viewed at www.future-marin.org.

The Sustainability Working Group members

WEBSITE

In addition to the workshops and preparation of the guiding principles, several other efforts have begun recently to support the CWP Update process. A logo to help with public awareness and name recognition has been developed for use on all CWP publications. A website (www.future-marin.org) advertises upcoming events, supplements information presented at workshops, provides summaries of workshops, and reports on the working groups including biographies of members and minutes of meetings.

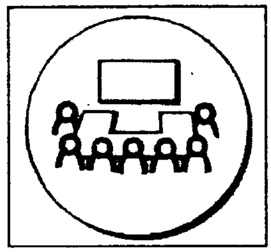
CHILDREN'S ARTWORK KICKOFF

See Marin's Future Through the Eyes of Children

This exhibit of children's artwork looks at Marin's future through the eyes of six to eleven year olds. The Community Development Agency with the help of Art Specialist Barbara Marino gathered input from the very people our long-range plans will most affect - our children. This show of wondrous drawings and accompanying verbatim explanations is part of the Countywide Plan Update process.

This exhibit is on display through August 1, 2001 at the Marin County Civic Center Administrative Wing in the foyer outside of the Board of Supervisors Chambers, 3501 Civic Center Drive, Third Floor, San Rafael.
For more information visit www.future-marin.org or call (415) 499-6269.

WORKING GROUPS



Three working groups are being formed to assist staff in preparing the major sections of the plan: Natural Systems, the Built Environment, and Economy, Equity and Culture. Working groups will begin meeting in late July 2001, and will continue to meet approximately once monthly for the next year to identify trends, challenges, visions and strategies. The product of each working group will then be turned over to a Board-appointed Steering Committee to help blend and balance this input into an integrated and comprehensive plan. A variety of public agencies responsible for transportation, health and human services, and housing twill also assist the working groups by identifying key trends and provide technical information.

No Cost, Easy Energy Conservation Quick Tips

- Turn off anything you're not using: all equipment and appliances, such as lights, TV's, VCRs, computers and monitors.
- Full loads ONLY for dishwasher, clothes washer & dryer. Clean dryer lint trap after each use and line dry clothes whenever possible.
- Water heater: Lower the temperature to 140 degrees (or normal).
- Plan meals so you'll cook and bake several items at once. Preheat as little as possible.
- Turn off lights when they are not needed.
- Air conditioners: Set thermostat at 78 degrees or higher when you're at home, and 85 degrees or higher when you are not home. Inspect filters monthly during operation and clean regularly.
- Heaters: Set at 68 degrees during the day and 55 degrees at night.
- When going on vacation, shut off or turn down automatic appliances, such as your water heater and furnace.

R0020592

Growth and Traffic Congestion in Marin:

Our Solutions Must Match Our Problems

By Dean R. Powell, AICP, Principal Transportation Planner

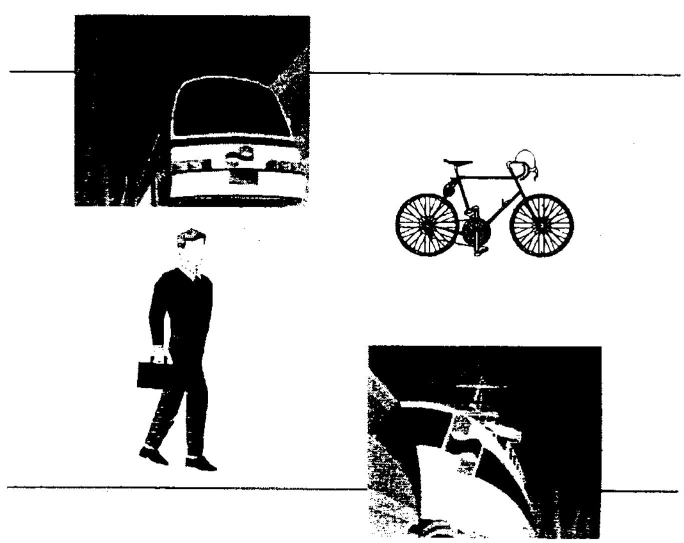
There are many popular myths circulating about the causes of traffic congestion in Marin, such as explosive growth in Sonoma County coupled with jobs in San Francisco, making Highway 101 in Marin a stepping stone for residents to the north. Looking for the true cause of Marin's traffic problems? Try looking into a mirror, if you are a resident of Marin.

Earlier this year the County of Marin and Marin County Congestion Management Agency released a study on growth and traffic congestion in Marin. This cornerstone study is part of a larger, ongoing effort to develop an integrated, multi-modal solution to Marin's traffic congestion by first defining the traffic problems and causes. Multi-modal means various modes of transportation, such as cars, buses, ferries, trains, bicycles, and walking.

The study, which focused on the peak commute hours in the morning and investigated where traffic in Marin comes from and goes to, provided several surprising findings:

- From 1990 to 1998, Marin's population has grown very little, approximately half a percent per year, which is the lowest growth rate in the nine Bay Area counties. The population growth rate is projected to be even less over the next 20 years.
- The number of vehicles registered in Marin has grown almost three times faster (1.4% per year) than the population growth rate over the last 20 years (0.5% per year).
- People are taking more trips per day. As a result, the number of total trips per household has increased by approximately 0.4% per year over the last 10 years. This trend is projected to continue over the next 20 years.
- Over 77% of all daily trips generated in Marin are destined for locations within Marin.
- Over 63% of all daily commute (work) trips generated from all possible sources within and outside Marin are destined for locations within Marin.
- During the morning commute hours, over half (52%) of the trips made from the north that cross the Sonoma/Marin County line via Highway 101 are destined for Marin, about 24% travel through Marin bound for San Francisco, and about 20% travel through Marin bound for the East Bay.
- During the morning commute hours, over three-quarters (76%) of the trips made from the East Bay that cross the Contra Costa/Marin County line via Interstate 580 are destined for Marin and the remaining 24% travel through Marin bound for Sonoma County. Only a negligible percent of these trips are bound for San Francisco.
- Only 8% of the total morning commute hour trips generated from all areas outside of Marin pass through Marin.
- School trips account for 21% of all trips during the morning commute hours.

These findings demonstrate that increased traffic in Marin is primarily due to Marin residents relying more on their private cars, taking more trips per day, commuting within Marin to work, and taking their children to school by private vehicle during the morning commute hours. Our traffic problems are our own. Any solution to traffic congestion in Marin must involve a range of integrated, targeted solutions, such as rail, bus, paratransit, ferry, highway, bike and pedestrian solutions, that respond to these specific problems, which will improve mode choice, manage traffic flow and operations better, and change the behavior of people who rely so much on their private automobile. By improving modal choice and convenience in Marin, mobility will be improved and congestion will be reduced. There is no one solution to Marin's traffic problems.



Marin Countywide Plan Update 2001
Interim Guiding Principles

Preamble

Meeting the needs of the present without compromising the future is the overarching theme of the Marin Countywide Plan. Marin County government is committed to lead by example, support public participation, and work in community partnerships to improve quality of life and use key indicators to measure progress. To design a sustainable future, we will:

Guiding Principles

1. Link equity, economy, and the environment locally, regionally and globally.

We will improve the vitality of our community, economy, and environment. We will seek innovations that provide multiple benefits to Marin County.

Examples of Community Indicators: Social, economic and environmental indicators listed below; GPI (Genuine Progress Indicator: comprehensive, aggregate measure of general well being and sustainability including economic, social and ecological costs).

2. Use finite and renewable resources efficiently and effectively.

We will reduce consumption and reuse and recycle resources. We will reduce waste by optimizing the full life cycle of products and processes.

Examples of Community Indicators: Per capita waste produced and recycled; per capita use of energy, natural gas, and water; ecological footprint (measures per capita consumption of natural resources).

3. Reduce the release of hazardous materials.

We will make continual progress toward eliminating the release of substances that cause damage to living systems. We will strive to prevent environmentally-caused diseases.

Examples of Community Indicators: Water and air quality; measurements of toxic levels; childhood cancer rates.

4. Steward our natural and agricultural assets.

We will continue to protect open space and wilderness, and enhance habitats and bio-diversity. We will protect and support agricultural lands and activities and provide markets for fresh, locally grown food.

Examples of Community Indicators: Acres of wilderness; acres of protected land; level of fish populations; track special status plants and animals; quantity of topsoil; active farmland by crop; productivity of acreage and crop value of agricultural land; acres of organic farmland.

5. Provide efficient and effective transportation.

We will expand our public transportation systems to better connect jobs, housing, schools, shopping and recreational facilities. We will provide affordable and convenient transportation alternatives that reduce our dependence on single occupancy vehicles, conserve resources, improve air quality and reduce traffic congestion.

Examples of Community Indicators: Vehicle miles traveled; bus and ferry ridership and fares; person miles traveled; community walkability; miles and use of bike paths.

6. Supply housing affordable to the full range of our workforce and community.

We will provide and maintain well designed, energy efficient, diverse housing close to job centers, shopping and transportation links. We will pursue innovative opportunities to finance workforce housing, promote infill development and reuse and redevelop underutilized sites.

Examples of Community Indicators: Jobs-housing balance; Housing affordability; Number of new housing units within walking distance to jobs or transit.

7. Foster businesses that provide a balance of economic, environmental and social benefits.

We will retain, expand and attract a diversity of businesses that meet the needs of our residents and strengthen our economic base. We will partner with local employers to address transportation and housing needs.

Examples of Community Indicators: Taxable sales; retention and attraction of targeted businesses; job growth; unemployment rate; number of businesses with environmental management systems; hospitality revenues.

8. Educate and prepare our workforce and residents.

We will make high quality education, workforce preparation and lifelong learning opportunities available to all sectors of our community. We will help all children succeed in schools, participate in civic affairs, acquire and retain well-paying jobs, and achieve economic independence.

Examples of Community Indicators: Education level of Marin residents; per-pupil expenditures; percentage of eligible voters who voted; high school dropout rate; percent of high school graduates going to college or post secondary training.

9. Cultivate ethnic, cultural and socio-economic diversity.

We will honor our past, celebrate our cultural diversity, and respect human dignity. We will build vibrant communities, enact programs to maintain, share and appreciate our cultural differences and similarities.

Examples of Community Indicators: Racial diversity; diversity of community and corporate leadership; number of hate crimes; number and use of cultural resources such as museums and theaters.

10. Support public health, safety, and social justice.

We will live in healthy, safe communities and provide equal access to amenities and services. We will particularly protect and nurture our children, our elders, and the more vulnerable members of our community.

Examples of Community Indicators: Income statistics; health statistics; Percent of uninsured (medical) population; longevity after retirement; volunteerism; crime rate; percent of philanthropic contributions.

> *"Probably the most challenging task facing humanity today is the creation of a shared vision of a sustainable and desirable society, one that can provide permanent prosperity within the biophysical constraints of the real world in a way that is fair and equitable to all of humanity, to other species, and to future generations."*
>
> Robert Costanza

R0020595

Balance in Our Community

By Nancy Rubin, Director of the Marin County Department of Health and Human Services

A doorbell rings, telling a fragile senior that his main meal of the day has arrived. A pregnant woman with diabetes finds out how to maintain her health and that of her unborn baby during her pregnancy. A woman with breast cancer gets counseling and encouragement with the difficult decisions that she faces. A laid off tech worker finds a new job with a local employer who has been looking for well-trained staff. What do these people have in common? They all live in Marin County and they all require and receive valuable services from the County Department of Health and Human Services (H&HS) in order to maintain their life quality, health and independence.

Our agency provides an infrastructure which is sometimes invisible (trauma systems, etc.) but fragile. Our goal at H&HS of providing critical health and social services in Marin County is threatened when we cannot attract and retain staff due to the high cost of housing. It is becoming more and more difficult for job candidates to see Marin County as a viable choice economically and for their personal and family lifestyle satisfaction. Our applicant pool has been reduced by two thirds in the last five years before we even begin to screen for quality. A community cannot thrive without health and social services.

Of the over 2,000 full time employees that work for the County of Marin, the average salary is $54,691. Given the generally accepted standard that no more than one-third of a person's income should go toward housing, that works out to $1,367 a month for housing related expenses, an impossible figure in the local real estate market. As a result, slightly more than 48% of Marin County employees currently live in neighboring counties and commute to work in Marin, adding hours to their days and gridlock to our highways. There is little reason to believe that this trend will reverse itself in the near future without a dramatic shift in public policy.

It is an issue of balance. A vibrant community reflects a diversity in economics, ethnicity and ages. It is supported by the wisdom of seniors, the vitality of families, and the interests of the business community. In Marin County that balance is threatened, creating a level of urgency that can no longer be ignored. All citizens count on the safety net that the County provides and it is up to all of us to make sure that it remains intact.

Marin County is at a crossroad where decisions can still be made to improve the situation if we are willing to see beyond our personal needs in the short run, and commit to providing for all sectors in our community, including those who work to maintain public health and sustainability. It is time to take a serious look at preserving and protecting the workers who are the asset that provides balance and life quality in Marin County. Some communities within the state are exploring subsidized housing for professionals such as teachers, law and fire personnel. A recent article in the Marin Independent Journal outlined the use of recruitment tools like housing loans to lure physicians here. Within the Marin County employment structure we have begun to talk about benefits that will attract workers, such as carpooling, satellite offices, and flexible working conditions, as well as creating affordable housing so that they can live in the community in which they work.

It is time to tell our elected officials that we want affordable housing in our community and that we need to take a look at the kinds of housing projects that are approved. One way to do that is by becoming involved in the update of the County's General Plan Housing Element, a task just getting underway. The process will include an analysis of projected housing needs, as well as a new statement of goals, policies, quantified objectives, and any scheduled programs that will help to preserve, improve and develop housing. This process is being managed by the Marin County Community Development Agency. Additional information about this process and how you can participate in helping to shape Marin's future can obtained by calling the Community Development Agency at (415) 507-2801.

It is a community's responsibility to balance the needs of all of its citizens and one way of doing that is to attract and maintain a vibrant workforce. This is an urgent priority on a business level, on a service level, and on a humane level.

The Year in Review

By Barbara Collins

Barbara Collins is the Affordable Housing Strategist for Marin County. In January 2000, the strategist position was created by the Board of Supervisors and she began work in April 2000. The position coordinates affordable housing efforts among the Marin County Housing Authority, Marin County Department of Health and Human Services and the Marin County Community Development Agency.

In the past year, I have focused my attentions on working with others to determine how we as a community can accommodate the housing needs of our residents and workforce. I am fortunate to be able to work with all the cities, county, and interested groups to help shape the Housing Elements and the Housing Workbook that will help shape how we address this critical need for the next five years.

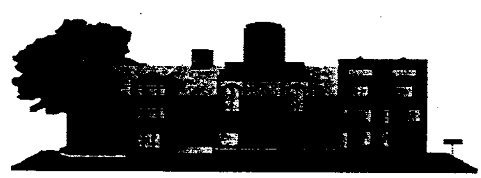
Policy evaluation that addresses unnecessary barriers to developing affordable housing is being conducted and where possible changes are being made in order to increase the number of affordable housing units. It will ultimately be the responsibility of the residents in each jurisdiction to determine what type of housing, for whom, where, and how much housing will be developed in their communities. Although individuals may often appear to be on opposite sides of the issue of affordable housing, in my experience most people share in the desire to solve this challenge.

For example, many housing units are used as income property and are vacant most of the year in the rural communities of West Marin. Existing rental housing is being converted to market-rate rentals and Bed and Breakfast facilities, making it difficult for long time low-income residents to remain. Thus, there is not so much a lack of housing as underutilization of existing units. We have taken steps with the Bolinas Community Land Trust to establish the "Gibson House" project for low income residents.

Financial resources critical to the community are in constant flux and I have worked to increase resources as well as plan for new ways to more effectively use existing resources. Affordable housing development is extremely complicated. It often takes five to ten different sources of financing to develop a project. This requires a great deal of coordination between many different agencies and organizations to achieve the results we want. In the past year, I have worked with several non-profit developers and communities to determine what steps can be taken to gain project support and create ways to address the need for housing.

Employers, including the county, are struggling to recruit and retain employees due to the high cost of housing. Working with other dedicated people, we have been examining ways to bring the community together around this issue to try to develop an effective way for non-profit developers to acquire appropriate sites before they are lost to develop for other purposes. We have also been working on trying to identify a permanent source of revenue to develop affordable housing.

The next year will be extremely exciting for affordable housing. In December 2001, the Housing Element process will be finished and early next year implementation will begin. Everyone will have the opportunity to provide input to the process. I can predict that the open space will remain open and that any housing we build will fit into the existing communities. We will integrate more green building principals into our housing so it uses less energy. Perhaps we can build smaller starter homes, combine more business uses with housing so people don't always have to get in their automobiles to get to work. The possibilities are endless if we use our imagination and work together.



The Marin Community Foundation (MCF) has announced a five year, $10 million commitment to the development, rehabilitation, and construction of affordable housing for low- and moderate-income families in Marin County. The MCF has also provided partial funding for the Affordable Housing Strategist position the County of Marin, the Sustainability Workshops for the CWP Update, and the Housing Element Workbook that will be published in August 2001.

What Is Your Ecological Footprint?

The Ecological Footprint measures people's use of nature. A population's Footprint is the biologically productive area required to produce the resources and to absorb the waste of that population. Since people use resources from all over the world, Footprints add up the extent of these areas, wherever they may be located on the planet.

Footprints can be compared to the biological capacity of a region or the planet. If we are taking more from nature than nature can renew, we erode the very natural capital that current and future generations depend on. This liquidation of our ecological assets is called "overshoot".

Sustainability within this context means achieving satisfying lives for all within the limited capacity of the planet. Tools like the Ecological Footprint track our use of nature, helping us to reduce human pressure on the planet and to move out of overshoot.

THE FOOTPRINT

Redefining Progress has developed a method to calculate the Footprints of cities, towns and regions, using local data on car use, housing, energy consumption, income, and spending on food, goods and services. This makes local Footprints directly comparable to national and global averages.

Take about 5 minutes to calculate your footprint by answering 13 multiple choice questions at www.lead.org/leadnet/footprint.

STANDARD URBAN STORM WATER MITIGATION PLANS

Abstract

On January 26, 2000, the Regional Board approved a Standard Urban Storm Water Mitigation Plan (SUSMP) for Los Angeles County, which imposes storm water pollution controls on new development and significant redevelopment. The SUSMP incorporates numerical water quality design standards to ensure adequate sizing of treatment control best management practices to reduce pollutants in storm water runoff.

Several cities, the building industry, and a petroleum industry trade-group petitioned the Regional Board's action to the State Water Resources Control Board (State Board). On June 7th and June 8th 2000, the State Board conducted a two-day hearing on the matter in Torrance. In its final decision on the Petition, the State Board upheld the Regional Board action and the SUSMP, although a few subsidiary elements of the SUSMP were set aside for procedural deficiencies or additional technical justification. The Regional Board will review these areas when the Los Angeles County municipal storm water permit is revisited for reissuance in November 2001.

The Regional Board's action to establish numerical design criteria for storm water pollution mitigation was precedent setting in the State. Other Regional Boards are expected to develop similar proposals.

STORMWATER RETENTION BEST MANAGEMENT PRACTICES

"2ND WAVE" BMPS

First wave stormwater management BMPs dealt with preventing the type of pollution that contaminates runoff. These BMPs did not affect the traditional collection and conveyance system of stormwater management. Second wave BMPs involve planning and design that reduce runoff and manage stormwater as a resource.

"AT THE SOURCE" VS "END OF PIPE" SOLUTIONS

Traditional stormwater management involves "end of the pipe" design. In this process, stormwater picks up ever increasing amounts of pollutants, greater volume and speed of flow. This "end of pipe" solution results in large volumes of fast moving, contaminated water being discharged through small channels or pipes into the nearest receiving waters (streams, lakes, or oceans).

"At the source" design strives to allow stormwater to remain onsite by infiltrating permeable surfaces. By treating rain water as a resource and allowing it to infiltrate the soil, it greatly reduces the volume, flow and toxicity of any remaining water that does enter the "end of pipe" system.

CONVEYANCE VS INFILTRATION STRATEGIES

The conveyance approach to stormwater management seeks to "get rid of the water." This system collects and concentrates runoff through a network of impervious gutters, structures, and underground pipes. A conveyance system must be continually increased in size as it reaches its final outfall because of the constant addition of tributary stormdrain systems. Because of its impervious nature, the pollutants in the water it contains become more concentrated. When it reaches its outfall, large volumes of highly polluted water are emptied, untreated into natural water bodies.

The infiltration approach to stormwater management seeks to emulate and preserve the natural hydrologic cycle. This system seeks to move stormwater slowly over large permeable surfaces to allow it to percolate into the ground. These permeable surfaces can double as recreational areas during dry weather. Because these systems allow stormwater to infiltrate the soil, overall runoff volumes are reduced and groundwater supplies are more quickly replenished. The slow, natural infiltration process enables the soil to naturally mitigate many of the pollutants found in stormwater. In addition, as it takes longer for water to enter and make its way through the traditional stormdrain system, it reduces the speed, volume and pollutant load of the remaining water when it reaches the outfall.

THINK SMALL—80% OF RUNOFF COMES FROM SMALL STORMS OF .5" TO 1.25" OF RAIN

Our current stormdrain systems are sized to accommodate the flows from the largest storm cycles. However, 80% of runoff is generated from storms producing only .5" to 1.25" of rain. Infiltration based stormwater systems are ideal for these smaller, more frequent events. Infiltration systems can incorporate overflow design components that direct the flows from the infrequent, larger storm events to the current "end of pipe" system.

SITE DESIGN CONSIDERATIONS

In order to maximize the effectiveness of infiltration type stormwater systems, and to minimize the runoff of rain water, the following site design considerations must be kept in mind.

A. DEFINE DEVELOPMENT ENVELOPE & PROTECTED AREAS — Protect existing site features (trees, creeks, and slopes), keep development compact to minimize environmental impact and reduce costs, and retain desirable landscape features.

B. MINIMIZE DIRECTLY CONNECTED IMPERVIOUS AREAS — Avoid the design of impermeable areas that are directly linked to the stormdrain system. Design impermeable areas to drain to permeable soil, shallow retention basins, or soil depressions that can hold the first 1/3" to 1" of rain.

C. MAXIMIZE PERMEABILITY — Maximize the use of landscaped areas or permeable surfacing materials.

D. MAXIMIZE CHOICES FOR MOBILITY — Incorporate design elements that encourage pedestrian use and support existing mass transit options.

E. USE DRAINAGE AS A DESIGN ELEMENT — Design for the use of water as a site amenity. Properly designed retention or wet ponds can be used as a component of the drainage system while creating a valuable and sought after development amenity.

Stormwater Impact and Regulatory Requirements

The runoff caused by storms is the single largest source of non-point water pollution in the US. Past pollution prevention educational efforts have focused on businesses and the public. While these activities remain important, a new area of stormwater pollution prevention is emerging: designing new developments to allow for the retention and infiltration of stormwater runoff.

The Los Angeles Regional Water Quality Control Board recently passed the Standard Urban Stormwater Management Program (SUSMP) regulation which requires all new developments built in the Los Angeles area to be designed to retain on site the first 3/4" of rain that falls in a 24-hour period.

Through the implementation of some new design approaches and the use, where possible, of permeable paving materials, the quantity of stormwater runoff and its resulting quality can be improved. And the new SUSMP regulations can be met.

Viewing rain water as a resource to be captured and conserved rather than a nuisance to be channeled off site, may require a fundamental change in our thought processes. However, the resulting savings in immediate and long term costs plus the environmental benefit to the Southern California coastal areas is worth the effort.

A

[illegible]
to[illegible] stormwater while [illegible] load-bearing surface. While maintaining a surface suitable for walking and driving, permeable pavements contain sufficient void space to allow water to infiltrate into the underlying soil.

Types of Permeable Pavement:

1. Pervious asphalt and concrete.
2. Unit pavers on sand.
3. Granular materials such as gravel, cobbles, and wood mulch.

B

[illegible] impact on stormwater quality. As currently designed most streets are directly connected to an underground conveyance system.

Stormwater quality is improved through the following design options:

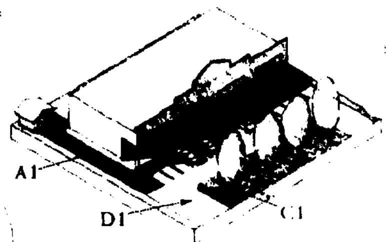
1. Reduced street width.
2. Limited on-street parking.
3. Reduced sidewalk width and placement.
4. Landscaped parkways.
5. Swale drainage systems.
6. Concave medians.
7. Cul-de-sac planting.

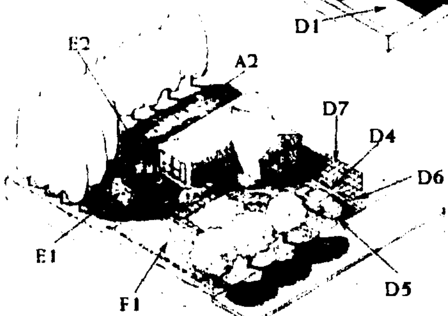
C

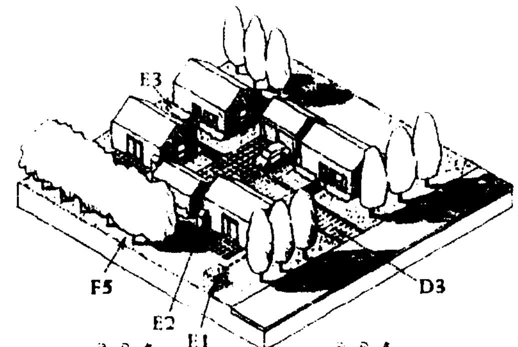
[illegible] (1[illegible]=1 acre). All this paved area has an adverse impact on stormwater.

Ideas to help reduce this stormwater impact include:

1. Hybrid parking lots.
2. Parking groves.
3. Permeable pavement overflow parking.







D

[illegible]

2. [illegible]
3. Unit pavers on sand.
4. Turf block driveways.
5. Paving under wheels only.
6. Flared driveway aprons for 2 or 3 car garages.
7. Temporary RV parking on turf block.

E

[illegible] that can be incorporated into a variety of developments, effectively allow for the retention and infiltration of stormwater.

1. Dry-well.
2. Cistern.
3. Foundation planting.

F

[illegible] infiltration of stormwater [illegible] underlying soils.

1. Concave lawn areas.
2. Vegetated swales.
3. Dry ponds.
4. Wet ponds.
5. Plant selection to maximize infiltration.

G

Manufactured Treatment Devic

Where stormwater cannot be treated by on-site infiltration, devices should be used to clean or filter stormwater before it reaches the existing underground conveyance system.

1. Catch basin or inlet inserts/filters.
2. Oil/Water Separators.
3. Media Filters.

BMPs Design Details Matrix

The matrix summarizes their initial construction cost, maintenance cost, relative effectiveness at meeting stormwater quality goals, and their suitability for use on expansive, clay soils. Conventional approaches are also evaluated for comparison.

R0020602

STANDARD URBAN STORM WATER MITIGATION PLAN

FOR LOS ANGELES COUNTY AND CITIES IN LOS ANGELES COUNTY

Final
Approved – Regional Board Executive Officer
March 8, 2000.

R0020603

STANDARD URBAN STORM WATER MITIGATION PLAN

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Los Angeles County Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, requires the development and implementation of a program addressing storm water pollution issues in development planning for private projects. The same requirements are applicable to the City of Long Beach under its separate municipal storm water permit (City of Long Beach MS4 Permit), which was issued on June 30, 1999.

The requirement to implement a program for development planning is based on, federal and state statutes including: Section 402 (p) of the Clean Water Act, Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 ("CZARA"), and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. The primary objectives of the municipal storm water program requirements are to:

1. Effectively prohibit non-storm water discharges, and
2. Reduce the discharge of pollutants from storm water conveyance systems to the Maximum Extent Practicable (MEP statutory standard).

The Standard Urban Storm Water Mitigation Plan (SUSMP) was developed as part of the municipal storm water program to address storm water pollution from new Development and Redevelopment by the private sector. This SUSMP contains a list of the minimum required Best Management Practices (BMPs) that must be used for a designated project. Additional BMPs may be required by ordinance or code adopted by the Permittee and applied generally or on a case by case basis. The Permittees are required to adopt the requirements set herein in their own SUSMP. Developers must incorporate appropriate SUSMP requirements into their project plans. Each Permittee will approve the project plan as part of the development plan approval process and prior to issuing building and grading permits for the projects covered by the SUSMP requirements.

All projects that fall into one of seven categories are identified in the Los Angeles County MS4 Permit as requiring SUSMPs. These categories are:

- Single-Family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units

The Regional Board Executive Officer has designated two additional categories subject to SUSMP requirements for the Los Angeles County MS4 Permit. These categories are:

- Location within or directly adjacent to or discharging directly to an environmentally sensitive area, and
- Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff

The City of Long Beach permit requires SUSMP for the following categories only: (i) 10-99 home subdivisions; (ii) 100 or more subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) Projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Plan.

Permittees shall amend codes and promulgate ordinances not later than September 8, 2000, to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect not later than October 8, 2000.

DEFINITIONS

"100,000 Square Foot Commercial Development" means any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas."Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

"Best Management Practice (BMP)" means any program, technology, process, siting criteria, operational methods or measures, or engineered systems, which when implemented prevent, control, remove, or reduce pollution.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Directly Connected Impervious Area (DCIA)" means the area covered by a building, impermeable pavement, and/ or other impervious surfaces, which drains directly into the storm drain without first flowing across permeable land area (e.g. lawns).

"Discretionary Project" means a project which requires the exercise of judgement or deliberation when the public agency or public body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.

"Environmentally Sensitive Area" means an area designated as an Area of Special Biological Significance by the State Water Resources Control Board (*Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties* (1994) and amendments) or an area designated as an Area of Ecological Significance by the County of Los *Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments) or an area designated as a significant natural area by the California Resources Agency. Refer to Table 3 for a listing.

"Greater than (>) 9 unit home subdivision" means any subdivision being developed for 10 or more 10 single-family or multi-family dwelling units.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent or greater.

"Infiltration" means the downward entry of water into the surface of the soil.

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Parking Lot" means land area or facility for the temporary parking or storage of motor vehicles used personally, for business or for commerce with a lot size of 5,000 square feet or more, or with 25 or more parking spaces.

"Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/ or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces.

"Restaurant" means a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"Storm Event" means a rainfall event that produces more than 0.1 inch of precipitation and that, which is separated from the previous storm event by at least 72 hours of dry weather.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological, or chemical process.

CONFLICTS WITH LOCAL PRACTICES

Where provisions of the SUSMP requirements conflict with established local codes, (e.g., specific language of signage used on storm drain stenciling), the Permittee may continue the local practice and modify the SUSMP to be consistent with the code, except that to the extent that the standards in the SUSMP are more stringent than those under local codes, such more stringent standards shall apply.

SUSMP PROVISIONS APPLICABLE TO ALL CATEGORIES

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Post-development peak storm water runoff discharge rates shall not exceed the estimated pre-development rate for developments where the increased peak storm water discharge rate will result in increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. MINIMIZE STORM WATER POLLUTANTS OF CONCERN

Storm water runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the storm water conveyance system. The development must be designed so as to minimize, to the maximum extent practicable, the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official. Pollutants of concern, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a concentrations or loads considered potentially toxic to humans and/or flora and fauna.

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the Maximum Extent Practicable. Those BMPs best suited for that purpose are those listed in the *California Storm Water Best Management Practices Handbooks*; *Caltrans Storm Water Quality Handbook: Planning and Design Staff Guide*; *Manual for Storm Water Management in Washington State*;

The Maryland Stormwater Design Manual; *Florida Development Manual: A Guide to Sound Land and Water Management*; Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices* and *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* , USEPA Report No. EPA-840-B-92-002, as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated, may in a particular circumstance, be better suited to maximize the reduction of the pollutants.

Examples of BMPs that can be used for minimizing the introduction of pollutants of concern generated from site runoff are identified in Table 2. Any BMP not specifically approved by the Regional Board in Resolution No. 99-03, "Approving Best Management Practices for Municipal Storm Water and Urban Runoff Programs in Los Angeles County", for development planning may be used if they have been recommended in one of the above references.

4. PROTECT SLOPES AND CHANNELS

Project plans must include BMPs consistent with local codes and ordinances and the SUSMP to decrease the potential of slopes and/or channels from eroding and impacting storm water runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Utilize natural drainage systems to the maximum extent practicable
- Control or reduce or eliminate flow to natural drainage systems to the maximum extent practicable
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion, with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers and the California Department of Fish and Game

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the storm water conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins within the project area must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons, which prohibit illegal dumping, must be posted at public access points along channels and creeks within the project area.
- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials. Improper storage of materials outdoors may provide an opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the storm water conveyance system. Where proposed project plans include outdoor areas for storage of materials that may contribute pollutants to the storm water conveyance system, the following Structural or Treatment BMPs are required:

- Materials with the potential to contaminate storm water must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.
- The storage area must be paved and sufficiently impervious to contain leaks and spills.
- The storage area must have a roof or awning to minimize collection of storm water within the secondary containment area.

7. PROPERLY DESIGN TRASH STORAGE AREAS

A trash storage area refers to an area where a trash receptacle or receptacles are located for use as a repository for solid wastes.

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following Structural or Treatment Control BMP requirements (individual single family residences are exempt from these requirements):

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons why water quality controls will not function as designed or which may cause the system to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included or is required to include, Structural or Treatment Control BMPs in project plans, the Permittee shall require that the applicant provide verification of maintenance provisions through such means as may be appropriate, including, but not limited to legal agreements, covenants, CEQA mitigation requirements and/or Conditional Use Permits.

For all properties, the verification will include the developer's signed statement, as part of the project application, accepting responsibility for all structural and treatment control BMP maintenance until the time the property is transferred and, where applicable, a signed agreement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance. The transfer of property to a private or public owner must have conditions requiring the recipient to assume responsibility for maintenance of any Structural or Treatment Control BMP to be included in the sales or lease agreement for that property, and will be the owner's responsibility. The condition of transfer shall include a provision that the property owners conduct maintenance inspection of all Structural or Treatment Control BMPs at least once a year and retain proof of inspection. For residential properties where the Structural or Treatment Control BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what storm water management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. The transfer of this information shall also be required with any subsequent sale of the property.

If Structural or Treatment Control BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. Structural or Treatment Control BMPs proposed for transfer must meet design standards adopted by the public entity for the BMP installed and should be approved by the County or other appropriate public agency prior to its installation.

9. DESIGN STANDARDS FOR STRUCTURAL OR TREATMENT CONTROL BMPs

Structural or Treatment control BMPs selected for use at any project covered by this

SUSMP shall meet the design standards of this Section unless specifically exempted.

Post-construction Structural or Treatment Control BMPs shall be designed to:

A. mitigate (infiltrate or treat) storm water runoff from either:

1. the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

2. the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial*, (1993), or

3. the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

4. the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,

AND

B. control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.

Limited Exclusion

Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical Structural or Treatment Control BMP design standard requirement only.

10. PROVISIONS APPLICABLE TO INDIVIDUAL PRIORITY PROJECT CATEGORIES

REQUIREMENTS

A. 100,000 SQUARE FOOT COMMERCIAL DEVELOPMENTS

1. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water runon or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. The area in the site design must be:

- Self-contained and/ or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

B. RESTAURANTS

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

The activity of outdoor equipment/accessory washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for the washing/steam cleaning of equipment and accessories. This area must be:

- Self-contained, equipped with a grease trap, and properly connected to a sanitary sewer.
- If the wash area is to be located outdoors, it must be covered, paved, have secondary containment, and be connected to the sanitary sewer.

C. RETAIL GASOLINE OUTLETS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. The project plans must include the following BMPs:

- The fuel dispensing area must be covered with an overhanging roof structure or canopy. The canopy's minimum dimensions must be equal to or greater than the area within the grade break. The canopy must not drain onto the fuel dispensing area, and the canopy downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing area must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

D. AUTOMOTIVE REPAIR SHOPS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. Therefore, design plans, which include fueling areas, must contain the following:

- The fuel dispensing area should be covered with an overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing areas must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water run-on or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all wash-water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. This area must be:

- Self-contained and/or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer or to a permitted disposal facility.

4. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

E. <u>PARKING LOTS</u>

1. PROPERLY DESIGN PARKING AREA

Parking lots contain pollutants such as heavy metals, oil and grease, and polycyclic aromatic hydrocarbons that are deposited on parking lot surfaces by motor-vehicles. These pollutants are directly transported to surface waters. To minimize the offsite transport of pollutants, the following design criteria are required:

- Reduce impervious land coverage of parking areas
- Infiltrate runoff before it reaches storm drain system.
- Treat runoff before it reaches storm drain system

2. PROPERLY DESIGN TO LIMIT OIL CONTAMINATION AND PERFORM MAINTENANCE

Parking lots may accumulate oil, grease, and water insoluble hydrocarbons from vehicle drippings and engine system leaks.

- Treat to remove oil and petroleum hydrocarbons at parking lots that are heavily used (e.g. fast food outlets, lots with 25 or more parking spaces , sports event parking lots, shopping malls, grocery stores, discount warehouse stores)
- Ensure adequate operation and maintenance of treatment systems particularly sludge and oil removal, and system fouling and plugging prevention control

11. WAIVER

A Permittee may, through adoption of an ordinance or code incorporating the treatment requirements of the SUSMP, provide for a waiver from the requirement if impracticability for a specific property can be established. A waiver of impracticability shall be granted only when all other Structural or Treatment Control BMPs have been considered and rejected as infeasible. Recognized situations of impracticability include, (i) extreme limitations of space for treatment on a redevelopment project, (ii) unfavorable or unstable soil conditions at a site to attempt infiltration, and (iii) risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than 10 feet from the soil surface. Any other justification for impracticability must be separately petitioned by the Permittee and submitted to the Regional Board for consideration. The Regional Board may consider approval of the waiver justification or may delegate the authority to approve a class of waiver justifications to the Regional Board Executive Officer. The supplementary waiver justification becomes recognized and effective only after approval by the Regional Board or the Regional Board Executive Officer. A waiver granted by a Permittee to any development or redevelopment project may be revoked by the Regional Board Executive Officer for cause and with proper notice upon petition.

If a waiver is granted for impracticability, the Permittee must require the project proponent to transfer the savings in cost, as determined by the Permittee, to a storm water mitigation fund to be used to promote regional or alternative solutions for storm water pollution in the storm watershed and operated by a public agency or a non-profit entity.

12. LIMITATION ON USE OF INFILTRATION BMPs

Three factors significantly influence the potential for storm water to contaminate ground water. They are (i) pollutant mobility, (ii) pollutant abundance in storm water, (iii) and soluble fraction of pollutant. The risk of contamination of groundwater may be reduced by pretreatment of storm water. A discussion of limitations and guidance for infiltration practices is contained in, *Potential Groundwater Contamination from Intentional and Non-Intentional Stormwater Infiltration, Report No. EPA/600/R-94/051, USEPA (1994).*

In addition, the distance of the groundwater table from the infiltration BMP may also be a factor determining the risk of contamination. A water table distance separation of ten feet depth in California presumptively poses negligible risk for storm water not associated with industrial activity or high vehicular traffic.

Infiltration BMPs are not recommended for areas of industrial activity or areas subject to high vehicular traffic (25,000 or greater average daily traffic (ADT) on main roadway or 15,000 or more ADT on any intersecting roadway) unless appropriate pretreatment is provided to ensure groundwater is protected and the infiltration BMP is not rendered ineffective by overload.

13. ALTERNATIVE CERTIFICATION FOR STORM WATER TREATMENT MITIGATION

In lieu of conducting detailed BMP review to verify Structural or Treatment Control BMPs adequacy, a Permittee may elect to accept a signed certification from a Civil Engineer or a Licensed Architect registered in the State of California, that the plan meets the criteria established herein. The Permittee is encouraged to verify that certifying person(s) have been trained on BMP design for water quality, not more than two years prior to the signature date. Training conducted by an organization with storm water BMP design expertise (e.g., a University, American Society of Civil Engineers, American Society of Landscape Architects, American Public Works Association, or the California Water Environment Association) may be considered qualifying.

TABLE 2

EXAMPLE BEST MANAGEMENT PRACTICES (BMPs)

The following are examples of BMPs that can be used for minimizing the introduction of pollutants of concern that may result in significant impacts, generated from site runoff to the storm water conveyance system. (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.
- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes; on-street parking; emergency, maintenance, and service vehicle access; sidewalks; and vegetated open channels.
- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.
- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).
- Use open space development that incorporates smaller lot sizes.
- Reduce building density.
- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.
- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.
- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the storm water conveyance system.
- Vegetated swales and strips
- Extended/dry detention basins
- Infiltration basin
- Infiltration trenches
- Wet ponds
- Constructed wetlands
- Oil/Water separators
- Catch basin inserts
- Continuous flow deflection/ separation systems
- Storm drain inserts
- Media filtration
- Bioretention facility
- Dry-wells
- Cisterns
- Foundation planting
- Catch basin screens
- Normal flow storage/ separation systems
- Clarifiers
- Filtration systems
- Primary waste water treatment systems

TABLE 3

HABITAT PROTECTION IN THE LOS ANGELES COUNTY AREA

Agency:
State Water Resources Control Board

Designation:
Areas of Significant Biological Significance (ASBS)

Definition:
Areas designated by the State Water Resources Control Board as requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable.

Affected Area:
(See Table 1 & Figure 2)

Agency:
Los Angeles County Department of Regional Planning

Designation:
Significant Ecological Areas (SEA)

Definitions:
Significant Ecological Areas (SEAs) are areas that have been identified by the Los Angeles County General Plan as containing unique or unusual species assemblages, or areas of habitat that are rapidly declining in the Los Angeles County. The SEAs were established to protect a special or sometimes unique collection of habitats and species from loss due to encroachment and human disturbances. However, SEAs are not intended to function as isolated preservation areas.

Affected Areas:
(See Table A & Figure 1)

Agency:
California Department of Fish & Game

Designation:
Natural Communities Conservation Plan Region (NCCP)

Definition:
Identifies and provides for the regional or area wide protection and perpetuation of natural wildlife diversity, while allowing compatible and appropriate development and growth. The goal of the program is to protect sufficient resources in regional preserves to assure the survival of the ecosystem and, at the same time, permit compatible uses of less sensitive land.

Affected Area:
(See Table 1 & Figure 3)

STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

STAFF SUMMARY REPORT (Janet O'Hara)
MEETING DATE: July 18, 2001

ITEM: 11

SUBJECT: **Workshop Regarding Amendment of Santa Clara Municipal Stormwater NPDES Permit Provision on New Development Treatment Measures** – Opening of Public Hearing

CHRONOLOGY: Permit Reissued February 2001

DISCUSSION: The NPDES permit for the Santa Clara Valley Urban Runoff Pollution Prevention Program (Program) was reissued at the February 21, 2001, Board meeting, with the previous permit's new and re-development performance standard, Provision C 3, retained as an enforceable placeholder. Update of Provision C 3 was deferred with the Program Co-permittees' consent at that time. This deferral has allowed time for further meetings and discussions with the Co-permittees and other interested parties, and subsequent circulation on May 18 of the Tentative Order for NPDES Permit Amendment (Appendix A) for a 30-day public comment period.

The Tentative Order is intended to amend the permit to update the new and redevelopment performance standard to more effectively address impacts of new and re-development projects to downstream beneficial uses from both pollutants in stormwater runoff and changes in the amount and timing of stormwater runoff. The Tentative Order is also intended to address the "Cities of Bellflower, et. al." decision by the State Board in October 2000. As such, the Tentative Order would amend the permit to include requirements that certain sizes of new and re-development projects include stormwater treatment measures, that those measures be properly maintained for the life of the project, that they be designed to treat an optimal volume or flow of stormwater runoff from the project site, and that significant changes in the way runoff occurs due to any increase in impervious surface created by the project not adversely erode creekbeds and banks downstream from the project.

The Tentative Order will be revised as appropriate, based on comments received during the workshop and the now-closed public comment period. A revised Tentative Order and a formal

Response to Comments will be distributed prior to the August Board Meeting, when a recommendation will be made for Board action.

RECOMMENDATION: No action is required at this time.

File No. 1538.08 (JBO)

Appendices:

- A: Tentative Order for Permit Amendment and Fact Sheet

APPENDIX A

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

TENTATIVE ORDER
NPDES PERMIT NO. CAS029718

AMENDMENT REVISING PROVISIONS C.3 AND C.14 OF ORDER NO. 01-024 FOR:

SANTA CLARA VALLEY WATER DISTRICT, COUNTY OF SANTA CLARA, CITY OF CAMPBELL, CITY OF CUPERTINO, CITY OF LOS ALTOS, TOWN OF LOS ALTOS HILLS, TOWN OF LOS GATOS, CITY OF MILPITAS, CITY OF MONTE SERENO, CITY OF MOUNTAIN VIEW, CITY OF PALO ALTO, CITY OF SAN JOSE, CITY OF SANTA CLARA, CITY OF SARATOGA, AND CITY OF SUNNYVALE, which have joined together to form the SANTA CLARA VALLEY URBAN RUNOFF POLLUTION PREVENTION PROGRAM

The California Regional Water Quality Control Board, San Francisco Bay Region, hereinafter referred to as the Regional Board, finds that:

<u>**Existing Permit and Amendment of Provisions C.3 and C.14**</u>

1. The Regional Board adopted Order 01-024 reissuing waste discharge requirements under the National Pollutant Discharge Elimination System (NPDES) for the Santa Clara Valley Urban Runoff Pollution Prevention Program for the discharge of stormwater to the South San Francisco Bay and its Tributaries.

2. As outlined in Finding 17 of Order 01-024, Provision C.3 of Order 01-024 is to be revised in response to the "Cities of Bellflower, et. al." decision by the State Water Resources Control Board (State Board Order No. 2000-11). Provision C.14 is hereby revised to extend the permit expiration date by approximately three months, as agreed to by the Dischargers, in order to allow adequate time for implementation of the revised Provision C.3.

3. Order 01-024 recognizes the Santa Clara Valley Urban Runoff Management Plan (Management Plan) as the Dischargers' Comprehensive Control Program and requires implementation of the Management Plan, which describes a framework for management of stormwater discharges. The 1997 Management Plan describes the Program's goals and objectives and contains Performance Standards, which represent the baseline level of effort required of each of the Dischargers. The Management Plan contains Performance Standards for seven different stormwater management activities. The Performance Standard and Supporting Documents for Planning Procedures for new development are contained in Attachment 1.

<u>**Nature of Discharges and Sources of Pollutants**</u>

4. Urban Development Increases Pollutant Load, Volume, and Velocity of Runoff: During urban development two important changes occur. First, natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops, and parking lots. Natural vegetated soil can both absorb rainwater and remove pollutants

providing a very effective natural purification process. Because pavement and concrete can neither absorb water nor remove pollutants, the natural purification characteristics of the land are lost. Secondly, urban development creates new pollution sources as human population density increases and brings with it proportionately higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, trash, etc., which can be washed into the municipal separate storm sewer system (MS4). As a result of these two changes, the runoff leaving the developed urban area is significantly greater in volume, velocity and pollutant load than the pre-development runoff from the same area.

5. Certain pollutants present in storm water and/or urban runoff may be derived from extraneous sources that Dischargers have limited or no direct jurisdiction over. Examples of such pollutants and their respective sources are: PAHs which are products of internal combustion engine operation and other sources; heavy metals, such as copper from brake pad wear and zinc from tire wear; dioxins as products of combustion; mercury resulting from atmospheric deposition; and natural-occurring minerals from local geology. However, Dischargers can implement control measures, or require developers to implement control measures, to reduce entry of these pollutants into storm water and their discharge to receiving waters.

6. These pollutants can have damaging effects on both human health and aquatic ecosystems. In addition, the increased flows and volumes of stormwater discharged from new impervious surfaces resulting from new and redevelopment can significantly impact beneficial uses of aquatic ecosystems due to physical modifications of watercourses, such as bank erosion and widening of channels.

7. Water Quality Degradation Increases with Percent Imperviousness: The increased volume and velocity of runoff from developed urban areas greatly accelerates the erosion of downstream natural channels. Numerous studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving water quality. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as a 10% conversion from natural to impervious surfaces. (Developments of medium density single family homes range between 25 to 60% impervious).

Implementation

8. The revised Provision C.3 is intended to enhance the Dischargers' existing Performance Standard for new development, through addition of provisions to more effectively incorporate source control measures, site design principles, and structural stormwater treatment controls in new development and redevelopment projects in order to reduce water quality impacts of stormwater runoff for the life of these projects. The consistent application of such measures is intended to greatly reduce the adverse impacts of new and redevelopment on water quality and beneficial uses by reducing stormwater pollutant impacts and increases in peak runoff rate and duration, which can affect the stability of waterbodies, both up and downstream of projects.

9. Because land use planning is where urban development begins, it is the phase in which the greatest and most cost-effective opportunities to protect water quality in new and redevelopment exist. When a Discharger incorporates policies and principles designed to safeguard water resources into the General Plan and development project approval processes, it has taken a far-reaching step towards the preservation of local water resources for future generations.

10. The revised Provision C.3 is written with the assumption that Dischargers are responsible for considering potential stormwater impacts when making planning and land use decisions. Neither Provision C.3 nor any of its requirements are intended to restrict or control local land use decision-making authority.

Public Process

11. The action to modify an NPDES Permit is exempt from the provisions of Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code [California Environmental Quality Act (CEQA)] pursuant to Section 13389 of the California Water Code.

12. The Dischargers and interested agencies and persons have been notified of the Board's intent to modify waste discharge requirements for the existing discharge and have been provided opportunities for public meetings and the opportunity to submit their written views and recommendations.

13. The Regional Board has conducted public meetings to discuss the draft revised Provisions C.3 and C.14.

14. The Board, in a public meeting, heard and considered all comments pertaining to the draft revision of Provisions C.3 and C.14.

IT IS HEREBY ORDERED that the Dischargers, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted hereunder and the provisions of the Clean Water Act as amended and regulations and guidelines adopted hereunder, shall comply with the following:

Provision C.3. New and Redevelopment Performance Standard Enhancement of Order No. 01-024 is hereby revised to read as follows:

The Management Plan contains performance standards and supporting documents to address the post-construction and construction phase impacts of new and redevelopment projects on stormwater quality (Planning Procedures and Construction Inspection Performance Standards). The Dischargers shall continue to implement these performance standards and continuously improve them to the maximum extent practicable in accordance with the following sections.

a. **Performance Standard Implementation:** The Dischargers shall continue to implement and continually improve the following performance standards for planning procedures:

i. Each Discharger shall have adequate legal authority to implement new development control measures as part of its development plan review and approval procedures;

ii. Each Discharger shall provide developers with information and guidance materials on site design guidelines, building permit requirements, and BMPs for stormwater pollution prevention early in the application process, as appropriate for the type of project;

iii. Each Discharger shall require developers of projects that disturb a land area of five acres or more to demonstrate coverage under the State General Construction Activity Stormwater Permit;

iv. Each Discharger shall require developers of projects with potential for significant erosion and planned construction activity during the wet season (as defined by local ordinance) to prepare and implement an effective erosion and/or sediment control plan or similar document prior to the start of the wet season;

v. Each Discharger shall ensure that municipal capital improvement projects include stormwater quality control measures during and after construction, as appropriate for each project, and that contractors comply with stormwater quality control requirements during construction and maintenance activities; and

vi. Each Discharger shall provide training at least annually to its planning, building, and public works staffs on planning procedures, policies, design guidelines, and BMPs for stormwater pollution prevention.

b. **Development Project Approval Process:** Dischargers shall modify their project review processes as needed to incorporate the requirements of Provision C.3. Each Discharger shall include conditions of approval in permits for applicable projects to ensure that pollutant discharges and runoff flows are reduced to the maximum extent practicable

The goal of the conditions of approval should be that pollutant discharges and changes in runoff flows where they can cause damage to downstream waterbodies, are reduced to the maximum extent practicable, and that contributions to exceedance of receiving water quality standards do not occur for the life of the project, through implementation of control measures to the maximum extent practicable. Such conditions shall, at a minimum, address the following goals:

i. Require project proponent to implement site design/landscape characteristics where feasible which maximize infiltration (where appropriate), provide retention, slow runoff, and minimize impervious land coverage, so that post-development pollutant loads from a site have been reduced to the maximum extent practicable; and

ii. For new and redevelopment projects that discharge directly to water bodies listed as impaired by a pollutant(s) pursuant to Clean Water Act Section 303(d), ensure that post-development runoff does not exceed pre-development levels for such pollutant(s), through implementation of the control measures addressed in this provision, to the maximum extent practicable, in conformance with Provision C.1.

c. **New and Redevelopment Project Categories – Size of Projects Addressed by this Provision:** New and redevelopment projects are grouped into two categories, based on project type and size. Stormwater runoff from Group 1 Projects is considered to have greater potential impacts on the beneficial uses of water bodies in the Santa Clara basin; thus, Group 1 Projects are subject to all the requirements of this Provision upon implementation. Group 2 Projects, which at this time are considered to have lesser potential impacts on the beneficial uses of water bodies in the Santa Clara Basin, are exempt from the Numeric Sizing Criteria of Provision C.3.d, Operation and Maintenance requirements of C.3.e, and the Limitation on Increase of Peak Stormwater Runoff Discharge Rates of C.3.f. until July 15, 2003, at which time they will have the same status as Group 1.

   i. **Group 1 Projects:** Group 1 Projects consist of all projects for which a development application has not been deemed complete as of the effective date of Provision C.3.b and which are in the following categories:

   Commercial, industrial, or residential developments that create one acre (43,560 square feet) or more of impervious surface, including roof area, streets and sidewalks. This category includes any development of any type on public or private land, which falls under the planning and building authority of the Dischargers, where one acre or more of impervious surface, collectively over the entire project site, will be created.

   Significant redevelopment projects. This category is defined as the creation or addition or structural replacement or significant reconstruction of at least one acre (43,560 square feet) of impervious surfaces on an already developed site, or significant redevelopment that encompasses one acre of impervious surface, including roof area. Significant redevelopment includes: the expansion of a building footprint and/or floor area, or addition to an existing structure; significant reconstruction of an existing structure; or replacement of a structure. Significant redevelopment also includes replacement of impervious surface that is not part of a routine maintenance activity.

   Redevelopment projects that, when complete, would result in reductions in site imperviousness by twenty percent (20%) or more from the existing site condition are excluded (exempted) from the category of Significant Redevelopment Projects.

   Streets, roads, highways, and freeways that are under the Dischargers' jurisdiction and that create one acre (43,560 square feet) or more of impervious surface. This category includes any paved surface used for the transportation of automobiles, trucks, motorcycles, and other vehicles.

   ii. **Group 2 Projects:** Group 2 Projects consist of all other (i.e., not in Group 1) new and significant redevelopment projects that create 5,000 square feet or more of additional impervious surface. Group 2 Projects must be designed and operated to comply with all of Provision C.3 except the Numeric Sizing Criteria of Provision C.3.d, Operation and Maintenance requirements of C.3.e, and the Limitation on Increase of Peak Stormwater Runoff Discharge Rates of C.3.f.

iii. **Alternative Project Size Proposal:** All Dischargers shall review the statistics and pattern of new development and significant redevelopment within their jurisdictions, for all Group 1 and 2 Projects, both in the recent past, and going forward. In the Annual Reports due September 15, 2002, each Discharger shall report a summary of these statistics (numbers, types, and sizes of new and redevelopment projects) showing the ranges of impervious surface creation.

Using this information, each Discharger may propose, for approval by the Executive Officer, an alternative Group 1 Project size, in amount of impervious surface addition, that would encompass approximately 80% of new impervious surface creation in a typical recent year. In the event that a Discharger makes no such proposal, the Group 2 Project definition shall be included in the Group 1 Project definition, making both Group 1 and 2 Projects subject to all the requirements of Provision C.3.

d. **Numeric Sizing Criteria:** All Dischargers shall require that treatment Best Management Practices (BMPs) be implemented at all Group 1 and 2 development projects within their jurisdictions. To ensure their effectiveness, all treatment BMPs for a Group 1 project shall be sized to meet one of the following sizing criteria:

i. **Volume Hydraulic Design Basis:** Treatment BMPs whose primary mode of action depends on volume capacity, such as detention/retention units or infiltration structures, shall be designed to mitigate (infiltrate or treat) stormwater runoff from:

- each runoff event up to and including the 85th percentile 24-hour storm runoff event determined as the maximized capture storm water volume for the area, based on historical rainfall records, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or
- the volume of annual runoff based on unit basin storage volume, to achieve 80 percent or more volume treatment by a method such as that recommended in Appendix D of the *California Stormwater Best Management Practices Handbook*, (1993).

ii. **Flow Hydraulic Design Basis:** Treatment BMPs whose primary mode of action depends on flow capacity, such as swales, sand filters, or wetlands, shall be sized to handle:

- 10% of the 50-year design flow rate, or
- a flow that will result in treatment of the same portion of runoff as treated using volumetric standards above, or
- the flow of runoff produced by a rain event equal to at least two times the 85th percentile hourly rainfall intensity for the applicable area, or
- a rain event equal to at least 0.2 inches pr hour intensity.

e. **Operation and Maintenance of Treatment Measures:** The Dischargers shall develop and implement a phased program to verify on a recurring basis that treatment BMPs are adequately operated and maintained. The operation and maintenance (O&M) verification program shall outline the conditions and procedures that will apply when the public agency is responsible and when a private entity is responsible for long-term O&M. At a minimum, the O&M verification program shall include maintenance of a listing of properties (public and private) and responsible operators, a plan for local agency inspection (e.g., random inspection of a subset of the listed properties), inspector training, follow-up procedures, and a commitment to periodic program evaluation. The schedule for phasing in the O&M verification program is based on the type of treatment BMP and is given in Provision C.3.o, Implementation Schedule.

For all properties where a private entity is responsible for O&M, the verification shall include the owner or developer's signed statement, as part of the project application, accepting responsibility for all treatment BMP maintenance until the time the property is transferred and ensuring that the initial and all subsequent transfers of the property to a successor private or public owner will include conditions in the sales or lease agreement requiring the recipient to (1) assume responsibility for inspection and maintenance of all treatment BMPs at least once each year and (2) retain proof of such inspections.

For Group 1 residential properties where a private entity is responsible for O&M, the verification shall include the owner or developer's signed statement, as part of the project application, accepting responsibility for ensuring that printed educational materials accompany the initial and all subsequent deed transfers. The printed materials must:

- provide information on what storm water management facilities are present;
- explain the treatment BMP operation and maintenance requirements;
- clearly illustrate signs that indicate maintenance is needed;
- tell how the necessary maintenance can be performed; and
- indicate what assistance the Discharger can provide.

Where treatment BMPs are located within a common area that will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the project's conditions, covenants and restrictions.

Reporting: The Dischargers shall report on their Treatment BMPs Operation and Maintenance verification programs in each Annual Report. Information to be reported should include the organizational structure of the program, its successes, and any problems along with possible solutions.

f. **Limitation on Increase of Peak Stormwater Runoff Discharge Rates:** New development and redevelopment can impact water quality and beneficial uses of waters by altering a watershed's patterns of runoff and particularly by increasing the rates, durations, and frequencies of peak flows. These impacts can result from individual projects and can occur cumulatively as the result of increasing urbanization of a watershed. It is the goal of this permit requirement to appropriately limit these changes where there is a potential for adverse impacts.

Therefore, post-development peak stormwater runoff discharge rates and durations shall not exceed estimated pre-development rates and durations for new development and/or redevelopment projects, where the increased peak storm water discharge rates and/or durations will result in increased potential for erosion or other adverse impacts to beneficial uses.

This limitation applies to all Group 1 Projects of Provision C.3.c, for all rain events which generate peak or near-peak flow rates and velocities less than or equal to a pre-development rainfall event or events, or within a pre-development rainfall event range, to be determined by the Dischargers. This requirement does not apply to new development and redevelopment projects where the project discharges storm water runoff into creeks or storm drains where the potential for erosion is minimal. Such situations may include discharges into creeks that are concrete-lined or significantly hardened (e.g., with rip-rap, sackrete, etc.) to their outfall in San Francisco Bay, underground storm drains discharging to the Bay, and construction of infill projects in highly developed watersheds, where the potential for single-project and/or cumulative impacts is minimal. Guidelines for identification of such situations shall be included as a part of the Hydromodification Management Plan (HMP) required in this section.

In addition, the HMP may identify conditions under which some increases in runoff may not have a potential for increased erosion or other impacts to beneficial uses. Reduced controls or no controls on peak storm water runoff discharge rates and/or durations may be appropriate in those cases, subject to the conditions in the HMP. In the absence of information demonstrating that changes in post-development runoff discharge rates and durations will not result in increased potential for erosion or other adverse impacts to beneficial uses, it is assumed that such impacts will occur.

The Dischargers shall complete a review of the literature and develop an HMP. The HMP shall include:

- the literature review;
- a protocol to evaluate impacts;
- identification of the rainfall event below which this limitation applies, or range of rainfall events to which this limitation applies;
- a description of how the Dischargers will incorporate this requirement into their local approval processes; and
- guidance on management practices and measures to address identified impacts.

The identified rainfall event or rainfall event range may be different for specific watersheds, streams, or stream reaches. Individual Dischargers may utilize the protocol to determine a site- or area-specific rainfall event standard.

Interim standard: Prior to the Executive Officer's acceptance of the HMP and a proposed standard, post-development peak storm water discharge rates and durations shall not exceed estimated pre-development rates and durations for new development and/or redevelopment projects for discharge from the 2-year storm up to the 10-year, 6-hour storm.

Equivalent limitation of peak flow impacts: The Dischargers may develop an equivalent limitation protocol, as part of the HMP, to address impacts from changes in the volumes, velocities, and durations of peak flows through measures other than control of those volumes and durations. The protocol may allow increases in peak and near-peak flows and durations, subject to the implementation of specified BMPs and land planning practices that take into account expected stream change (e.g., increases in the cross-sectional area of stream channel) resulting from changes in discharge rates and durations.

The evaluation protocols, management measures, and other information in the HMP may include the following measures:

- Evaluation of the cumulative impacts of urbanization of a watershed on storm water discharge and stream morphology in the watershed;
- Evaluation of stream form and condition, including slope, discharge, vegetation, underlying geology, and other information, as appropriate;
- Implementation of measures to minimize impervious surfaces and directly connected impervious area in new development and redevelopment projects;
- Implementation of measures including storm water detention, retention, and infiltration;
- Implementation of land use planning measures (e.g., stream buffers and stream restoration activities, including restoration-in-advance of floodplains, revegetation, etc.) to allow expected changes in stream channel cross sections, stream vegetation, and discharge rates, velocities, and durations without adverse impacts to stream beneficial uses;
- A mechanism for pre- vs. post-project assessment to determine the effectiveness of the HMP and to allow amendment of the HMP, as appropriate; and,
- Other measures, as appropriate.

The HMP shall be completed as follows. All required documents shall be submitted acceptable to the Executive Officer. Development and implementation status shall be reported in the Dischargers' Annual Reports, which shall also provide a summary of projects incorporating measures to address this section, and the measures used.

- No later than March 1, 2002: Submit a detailed workplan and schedule for completion of the literature review, development of a protocol to identify an appropriate limiting storm, development of guidance materials, and other required information;

- No later than September 15, 2002: Submit the required literature review;

- No later than March 1, 2003: Submit a draft HMP, including the analysis that identifies the appropriate limiting storm and the identified limiting storm event(s) or event range(s); and,

- No later than July 15, 2003: Submit and fully implement the HMP, which shall include the requirements of this measure.

g. **Exemption or Waiver Based on Impracticability and Compensatory Mitigation:** A Discharger may, through adoption of an ordinance or code incorporating the treatment requirements of this Provision, or by other formal administrative means, provide for a waiver from the requirement for treatment BMPs if impracticability for a specific project can be established. A waiver of impracticability shall be granted only when all treatment BMPs have been considered and rejected as infeasible. Grounds for impracticability may include: (i) extreme limitations of space for treatment on a redevelopment project, and lack of below surface options, (ii) unfavorable or unstable soil conditions to attempt infiltration, and (iii) risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than ten (10) feet from the soil surface. Grounds (ii) and (iii) apply only to infiltration-based treatment measures, which are a subset of the range of treatment measure options, so do not in and of themselves establish impracticality.

The Regional Board may consider amendment of Provision C.3.g submitted by a Discharger to authorize additional grounds of impracticability. The supplementary waiver justification becomes recognized and effective only after approval by the Regional Board or the Executive Officer.

If a Discharger grants a waiver for impracticability, the Discharger must require the project proponent to transfer the savings in cost to a stormwater mitigation project to be used to promote regional or alternative solutions for stormwater pollution in the watershed of the development and operated by a public agency or a non-profit entity. The Discharger shall determine the amount of savings by any method that considers the costs of constructing and maintaining treatment BMPs in similar projects.

Each year, each Discharger shall provide a list of the waivers it granted in its Annual Report. For each project granted a waiver, the following information shall be provided:

- Name and location of the project for which the waiver was granted;
- Project type (e.g., restaurant, residence, shopping center) and size;
- Percent impervious surface in final design;
- Reason for granting the waiver;
- Amount of dollar savings incurred by obtaining the waiver, with brief explanation of calculation method; and
- The stormwater mitigation project to which the savings was transferred.

h. **Alternative Certification of Adherence to Design Criteria for Stormwater Treatment Measures:** In lieu of conducting detailed review to verify the adequacy of measures required pursuant to this Provision C.3.b-C.3.h, a Discharger may elect to accept a signed certification from a Civil Engineer or a Licensed Architect or Landscape Architect registered in the State of California, that the plan meets the criteria established herein. The Discharger should verify that each certifying person has been trained on BMP design for water quality not more than three years prior to the signature date, and that each certifying person understands the groundwater protection principles applicable to the project site (*see Provision C.3.h Limitations on Use of Infiltration Treatment Measures*). Training conducted by an organization with storm water BMP design expertise (e.g., a university, American Society of Civil Engineers, American Society of Landscape Architects, American Public Works Association, or the California Water Environment Association) may be considered qualifying.

i. **Limitations on Use of Infiltration Treatment Measures - Infiltration and Groundwater Protection:** In order to protect groundwater from pollutants that may be present in urban runoff, the Dischargers shall ensure that treatment BMPs that function primarily as infiltration devices (such as infiltration trenches and infiltration basins) meet, at a minimum, the following conditions:[1]

  i. Pollution prevention and source control BMPs shall be implemented at a level appropriate to protect groundwater quality at sites where infiltration devices are to be used.

  ii. Use of infiltration devices shall not cause or contribute to an exceedance of groundwater water quality objectives.

  iii. Infiltration devices shall be adequately maintained to maximize pollutant removal capabilities.

  iv. The vertical distance from the base of any infiltration device to the seasonal high groundwater mark shall be at least 10 feet. Note that some locations within the Dischargers' jurisdiction are characterized by highly porous soils and/or a high groundwater table; in these areas BMP approvals should be subject to a higher level of analysis (e.g., considering the potential for pollutants such as on-site chemical use, the level of pretreatment to be achieved, and similar factors).[2]

  v. Unless stormwater is first pretreated, infiltration devices shall not be recommended for areas of industrial or light industrial activity; areas subject to high vehicular traffic (25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway); automotive repair shops; car washes; fleet storage areas (bus, truck, etc.); nurseries; and other high threat to water quality land uses and activities as designated by each Discharger.

  vi. Infiltration devices shall be located a minimum of 100 feet horizontally from any water supply wells.

j. **Site Design Measures Guidance and Standards Development:** Opportunities to address stormwater pollution and hydromodification can be limited by current local design standards and guidance. For example, such standards and guidance may reduce or prohibit opportunities to minimize impervious surfaces, minimize directly connected impervious area, provide for small-scale detention, and implement other management measures. Revision of current standards and guidance can result in a significantly increased ability for project designers to minimize project impacts and can also increase local property values, neighborhood character, and overall quality of life. Further, revision of standards and guidance can allow implementation of site design measures in projects to meet or help meet the numeric sizing criteria in Provision C.3.d and/or the hydromodification limitation in Provision C.3.f.

---

[1] These conditions do not apply to structural treatment BMPs which allow incidental infiltration and are not designed to primarily function as infiltration devices (such as grassy swales, detention basins, vegetated buffer strips, constructed wetlands, etc.).

[2] See the June 1999 memo from Dan Cloak and Wendy Edde (SCVURPPP) to Municipal Planning Department Personnel, *Additional Considerations for Incorporating BASMAA's **Start at the Source** Techniques in Development Projects* for further information on the risks to groundwater and steps to take to minimize such risks from infiltration of stormwater runoff.

Therefore, this measure requires that the Dischargers review their applicable local design standards and guidance to identify opportunities to revise those standards, where revision would result in reduced impacts to water quality and beneficial uses of waters, and that identified opportunities for revision be implemented.

The following are examples of areas it may be appropriate to address in the review of design standards and guidance:

- Minimize land disturbance;
- Minimize impervious surfaces (e.g., roadway width, driveway area, and parking lot area), especially directly connected impervious areas;
  - Minimum-impact street design standards for new development and redevelopment, including typical specifications (e.g., neo-traditional street design standards and/or street standards recently revised in other cities, including Portland, Oregon, and Vancouver, British Columbia);
  - Minimum-impact parking lot design standards, including parking space maximization within a given area, use of landscaping as a storm water drainage feature, use of pervious pavements, and parking maxima;
- Clustering of structures and pavement;
- Typical specifications or "acceptable design" guidelines for lot-level design measures, including:
  - Disconnected roof downspouts to splash blocks or "bubble-ups;"
  - Alternate driveway standards (e.g., wheelways, unit pavers, or other pervious pavements);
  - Microdetention, including landscape detention and use of cisterns.
- Preservation of high-quality open space;
- Maintenance and/or restoration of riparian areas and wetlands as project amenities, including establishing vegetated buffer zones to reduce runoff into waterways, allow for stream channel change as a stream's contributing watershed urbanizes, and otherwise mitigate the effects of urban runoff on waters and beneficial uses of waters; and,
- Incorporation of supplemental controls to minimize changes in the volume, flow rate, timing, and duration of runoff, for a given precipitation event or events. These changes include cumulative hydromodification caused by site development. Measures may include landscape-based measures or other features to reduce the velocity of, detain, and/or infiltrate stormwater runoff.

The standards and guidance review shall be completed as follows. All required documents shall be submitted acceptable to the Executive Officer. A summary of review, revision, and implementation status shall be reported in the Dischargers' Annual Reports.

- No later than March 1, 2002: The Dischargers shall submit a detailed workplan and schedule for completion of the review, revision, and implementation of revised standards and guidance;

- No later than September 15, 2003: The Dischargers shall submit a draft document that includes the review and analysis of local standards and guidance, opportunities for revision, and proposed revised standards and guidance;
- No later than September 15, 2004: The Dischargers shall incorporate any revised standards and guidance into their local approval processes and shall be fully implementing the revised standards and guidance.

k. **Source Control Measures Guidance Development:** The Dischargers shall complete a document providing draft conditions of approval for all Dischargers to use and to be incorporated into the enhanced New and Redevelopment Performance Standards. The document shall summarize source control requirements for new and redevelopment projects to limit pollutant generation, discharge, and runoff.

Examples of conditions to be included and areas to be addressed include, but are not limited to:

- Indoor mat/equipment wash racks for restaurants, or covered outdoor wash racks plumbed to the sanitary sewer;
- Covered trash and food compactor enclosures with a sanitary sewer connection for dumpster drips and designed such that run-on to trash enclosure areas is avoided;
- Sanitary sewer drains for swimming pools;
- Sanitary drained outdoor covered wash areas for vehicles, equipment, and accessories;
- Sanitary sewer drain connections to take fire sprinkler test water;
- Storm drain system stenciling;
- Landscaping that minimizes irrigation and runoff, promotes surface infiltration where appropriate, minimizes the use of pesticides and fertilizers, and where feasible removes pollutants from storm water runoff; and,
- Appropriate covers, drains, and storage precautions for outdoor material storage areas, loading docks, repair/maintenance bays, and fueling areas.

The draft conditions of approval document and enhanced Performance Standard shall be submitted by September 15, 2002, acceptable to the Executive Officer. The Dischargers shall have incorporated the conditions of approval document into their local approval processes and shall be fully implementing it by March 1, 2003. Implementation status shall be reported in the Dischargers' Annual Reports, which shall also provide appropriate detail on projects incorporating the required conditions of approval.

l. **Revise General Plans:** At the next scheduled revision of its General Plan or by July 1, 2005, whichever is sooner, each Discharger shall incorporate water quality and watershed protection principles and policies into its General Plan or equivalent plan (e.g., Comprehensive, Master, or Community Plan) as necessary to direct land-use decisions and require implementation of consistent water quality protection measures for all development projects. These principles and policies shall be designed to protect natural water bodies, reduce impervious land coverage, slow runoff, and where feasible, maximize opportunities for infiltration of rainwater into soil. Such water quality and watershed protection principles and policies may include the following, which are offered as examples:

i. Minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment and where feasible maximize on-site infiltration of runoff;

ii. Implement pollution prevention methods supplemented by pollutant source controls and treatment. Use small collection strategies located at, or as close as possible to, the source (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants offsite and into a Municipal Separate Storm Sewer System;

iii. Preserve, and where possible, create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands, and buffer zones. Encourage land acquisition of such areas;

iv. Limit disturbances of natural water bodies and natural drainage systems caused by development including roads, highways, and bridges;

v. Prior to making land use decisions, utilize methods available to estimate increases in pollutant loads and flows resulting from projected future development. Require incorporation of structural and non-structural BMPs to mitigate the projected increases in pollutant loads and flows;

vi. Avoid development of areas that are particularly susceptible to erosion and sediment loss; or establish development guidance that identifies these areas and protects them from erosion and sediment loss; and

vii. Reduce pollutants associated with vehicles and increasing traffic resulting from development.

m. **Water Quality Review Processes:** When Dischargers conduct environmental review of projects in their jurisdictions, the Dischargers shall conduct evaluations of water quality effects and identification of appropriate mitigation measures. The review shall address increased pollutants and flows from the proposed project through such questions as:

i. Would the proposed project result in an increase in pollutant discharges to receiving waters? Consider water quality parameters such as temperature, dissolved oxygen, turbidity and other typical storm water pollutants (e.g., heavy metals, pathogens, petroleum derivatives, synthetic organics, sediment, nutrients, oxygen-demanding substances, and trash).

ii. Would the proposed project result in significant alteration of receiving water quality during or following construction?

iii. Would the proposed project result in increased impervious surfaces and associated increased runoff?

iv. Would the proposed project create a significant adverse environmental impact to drainage patterns due to changes in runoff flow rates or volumes?

v. Would the proposed project result in increased erosion in its watershed?

vi. Is the project tributary to an already impaired water body, as listed on the Clean Water Act Section 303(d) list? If so, will it result in an increase in any pollutant for which the water body is already impaired?

vii. Would the proposed project have a potentially significant environmental impact on surface water quality, to marine, fresh, or wetland waters?

viii. Would the proposed project have a potentially significant adverse impact on ground water quality?

ix. Will the proposed project cause or contribute to an exceedance of applicable surface or groundwater receiving water quality objectives or degradation of beneficial uses?

x. Will the project impact aquatic, wetland, or riparian habitat?

n. **Reporting, including Pesticide Reduction Measures:** The Dischargers shall demonstrate compliance with Provision C.3 by providing the following information in their Annual Reports for Group 1 and 2 Projects:

- Project name, type of project (using the categories in Provision C.3.c), site acreage or square footage, square footage of new impervious surface.
- Treatment BMPs and numeric sizing criteria used, O&M responsibility mechanism, site design measures used, and source control measures required.
- A summary of the types of pesticide reduction measures required (such as by conditions of approval) for new development and significant redevelopment projects, and the percentage of new development and significant redevelopment projects for which pesticide reduction measures were required. These measures are required under Provision C.9.d.ii, and relate directly to Provision C.3 requirements.
- In the September 2002 Annual Report only: A proposal for enhanced reporting to track the implementation of Provision C.3 requirements. The reporting shall include the above components at a minimum. Enhanced reporting for pesticide reduction measures may also be included.

o. **Implementation Schedule:** The Dischargers shall implement the requirements of this Provision according to the following schedule:

Provision	Action	Implementation Date
C.3.b	Modify development project approval process as needed	July 15, 2002
C.3.c.iii	Report findings of new development and significant redevelopment project numbers, and sizes	September 15, 2002
	Propose an alternative minimum project size proposal	January 15, 2003
	In absence of a proposed alternative minimum project size, Group 2 Projecf definition becomes Group 1 Project definition	July 15, 2003
C.3.e	Implement an O&M verification program for structural in-ground BMPs such as sand filters, filter inlets, detention/ retention basins	July 15, 2002
	Implement an O&M verification program for landscape and all other BMPs, such as vegetated swales, dry or wet ponds	July 15, 2003
	Begin reporting on O&M verification program in Annual Report	September 15, 2003
C.3.f	Submit a detailed workplan and schedule	March 1, 2002
	Submit literature review	September 15, 2002
	Submit draft Hydromodification Management Plan (HMP)	March 1, 2003
	Submit and implement final HMP	July 15, 2003
C.3.g	Report on any waiver(s) granted by the Discharger in Annual Report, due September 15 of each year	Begin the year a waiver is granted
C.3.j	Submit workplan and schedule for completion of review, revision, and implementation of design standards and guidance	March 1, 2002
	Submit draft proposal of revised standards and guidance	September 15, 2003
	Incorporate revisions into local process and fully implement site design standards and guidance	September 15, 2004
C.3.k	Submit draft conditions of approval document for source control measures.	September 15, 2002
	Implement source control measures guidance document	March 1, 2003
C.3.l	Revise General Plans as necessary to direct land-use decisions and require implementation of consistent water quality protection measures for all development projects	July 1, 2005 or at next scheduled revision, whichever is first
C.3.m	Revise Environmental Review Processes	March 1, 2003
C.3.n	Begin reporting Group 1 and 2 Project information in Annual Reports, and propose enhanced reporting method	September 15, 2002

Provision C.14 of Order No. 01-024 is hereby revised to read as follows:

14. This Order expires on June 1, 2006. The Dischargers must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, not later than 360 days in advance of such date as application for reissuance of waste discharge requirements.

Fact Sheet

SANTA CLARA VALLEY URBAN RUNOFF POLLUTION PREVENTION PROGRAM
NPDES PERMIT NO. CAS 029718
AMENDMENT OF PROVISIONS C.3 and C.14 OF ORDER NO. 01-024: NEW AND REDEVELOPMENT PERFORMANCE STANDARD ENHANCEMENT

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION
1515 CLAY STREET, 14TH FLOOR
OAKLAND, CA 94612

I. Reason for Amendment of Provision C.3 and Provision C.14

The Santa Clara Valley Water District (hereinafter District), County of Santa Clara, City of Campbell, City of Cupertino, City of Los Altos, Town of Los Altos Hills, Town of Los Gatos, City of Milpitas, City of Monte Sereno, City of Mountain View, City of Palo Alto, City of San Jose, City of Santa Clara, City of Saratoga, and City of Sunnyvale (hereinafter referred to as the Dischargers) have joined together to form the Santa Clara Valley Urban Runoff Pollution Prevention Program (hereinafter referred to as the Program). On February 21, 2001 the California Regional Water Quality Control Board San Francisco Bay Region (hereinafter referred to as the Regional Board) re-issued waste discharge requirements (Order 01-024) under the National Pollutant Discharge Elimination System (NPDES) to the Program to discharge stormwater run off from storm drains and watercourses within the Dischargers' jurisdictions by implementing a Storm Water Management Plan (hereinafter Management Plan).

Prior to the issuance of Order 01-024, the Dischargers gave their written consent to allow Provision C.3, concerning new and redevelopment performance standards, to be considered for amendment to address the "Cities of Bellflower, et. al." decision by the State Board (State Board Order No. 2000-11). The Dischargers also expressed their desire to extend the permit expiration date in Provision C.14 by approximately three months to allow adequate time for implementation of all the permit's Provisions.

A Tentative Order has been prepared which would amend Order No. 01-024. The Regional Board intends to consider adoption of the Tentative Order at a public hearing that will be held on July 18, 2001 at 9:00 AM in the first floor auditorium at the State Building located at 1515 Clay Street in Oakland, CA. The Tentative Order, comments received, and related documents may be inspected and copied at the Regional Board's office. For further information contact Janet O'Hara at (510) 622-5681 or jbo@rb2.swrcb.ca.gov.

II. Discharge Description and Location

The Dischargers each have jurisdiction over and/or maintenance responsibility for their respective municipal separate storm drain systems and/or watercourses in the Santa Clara basin. Discharge consists of the surface runoff generated from various land uses in all the hydrologic sub basins in the basin which discharge into watercourses, which in turn flow into South San Francisco Bay.

The quality and quantity of these discharges varies considerably and is affected by hydrology, geology, land use, season, and sequence and duration of hydrologic event. Pollutants of concern in these discharges are certain heavy metals, excessive sediment production from erosion due to anthropogenic activities, petroleum hydrocarbons from sources such as used motor oil, microbial pathogens of domestic sewage origin from illicit discharges, certain pesticides associated with the risk of acute aquatic toxicity, excessive nutrient loads which may cause or contribute to the depletion of dissolved oxygen and/or toxic concentrations and dissolved ammonia, and other pollutants which may cause aquatic toxicity in the receiving waters.

III. General Rationale

6. Water Quality Control Plan, San Francisco Bay Basin, June 21, 1995 (Basin Plan).

7. The Urban Runoff Management, Comprehensive Control Program section of the Basin Plan requires the Dischargers to address existing water quality problems and prevent new problems associated with urban runoff through the development and implementation of a comprehensive control program focused on reducing current levels of pollutant loading to storm drains to the maximum extent practicable. The Basin Plan comprehensive program requirements are designed to be consistent with federal regulations (40 CFR 122-124) and are implemented through issuance of NPDES permits to owners and operators of storm drain systems. The Dischargers, having jurisdiction over and/or maintenance responsibility for storm drains and water courses within their boundaries, have assumed responsibility for complying with the Basin Plan's requirements. The permit recognizes submittal of the Programs' Urban Runoff Management Plan (Management Plan) as the Dischargers' Comprehensive Control Program and requires implementation of the Management Plan.

   The Management Plan describes a framework for management of stormwater discharges. The 1997 Management Plan describes the Program's goals and objectives and contains Performance Standards, which represent the baseline level of effort required of each of the Dischargers. The Performance Standard and Supporting Documents for Planning Procedures for new development are contained in Attachment 1.

6. The Basin Plan identifies the beneficial uses of waters and establishes water quality objectives necessary to protect these beneficial uses that apply to certain receiving waters within the Dischargers' boundaries. These water quality objectives serve as receiving water limitations for waters that receive discharges of pollutants.

7. Several sections of the Clean Water Act (CWA) and implementing federal regulations pertain to requirements that MS4 dischargers control stormwater discharges from new development and redevelopment:

   8. **CWA 402(p)(3)(B)(ii) – Prohibit Non-Storm Water:** The CWA requires in section 402(p)(3)(B)(ii) that a stormwater program "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."

   9. **CWA 402(p)(3)(B)(iii) – Require Controls:** The CWA requires in section 402(p)(3)(B)(iii) that a stormwater program "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

   10. **40 CFR 122.26(d)(2)(iv)(A)(2) – Enforce Controls on New Development and Significant Redevelopment:** Federal NPDES regulations have required since 1990 that Dischargers utilize "planning procedures including a master plan to develop, implement and enforce controls to reduce the discharge of pollutants from Municipal Separate Storm Sewer Systems (MS4s) which receive discharges from areas of new development and significant redevelopment."

IV. Specific Rationale

Provision C.3 calls for the enhancement of the Dischargers' existing Performance Standard for Planning Procedures (Attachment 1) to address the post-construction and some construction phase impacts of new and redevelopment projects on storm water quality. The Performance Standard enhancement is intended to address impacts of these projects to downstream beneficial uses from both pollutants and changes in amount and timing of storm water runoff, such as increases in peak runoff flow and duration that can cause increased erosion of streams banks and channel.

Provision C.3 calls for enhancement of this existing performance standard to increase the effectiveness of existing implementation, primarily by: (1) setting volume and flow based hydraulic sizing criteria for stormwater treatment measures, (2) setting minimum sizes of new development and redevelopment projects which must employ the treatment measures, (3) creation of a program to assure the adequate operation and maintenance of treatment measures occurs, (4) creation of standards for source control measures (such as covered dumpster areas) and site design measures which can lead to reduced impervious surface for a given equivalent land use, and (5) a requirement that the Dischargers develop a process and criteria to limit changes in the runoff hydrograph for new and redevelopment, where those changes could have a harmful effect on downstream beneficial uses by excessive erosion of the bed and bank of downstream watercourses.

6. **Development Project Approval Process**: Incorporating post-construction Best Management Practices (BMPs) into new development and redevelopment during project planning and approval is an effective means for controlling pollutants in urban runoff. The United States Environmental Protection Agency (US EPA) finds review of development plans during the project approval process necessary, stating: "Proposed stormwater management programs should include planning procedures for both during and after construction to implement control measures to ensure that pollution is reduced to the maximum extent practicable in areas of new development and redevelopment. Design criteria and performance standards may be used to assist in meeting this objective. A municipality should describe how it plans to implement the proposed standards (e.g., through an ordinance requiring approval of storm water management programs, a review and approval process, and adequate enforcement)." For these reasons, the draft revised Provision C.3 includes a requirement for the development project approval process to implement the stormwater management requirements of Provision C.3.

7. **New and Redevelopment Project Categories:** The definition of Group 1 Projects is intended to include an area of additional impervious surface from new and redevelopment that will have a potential to introduce significant additional pollutants to receiving waters and/or cause a significant change in the runoff hydrograph, which has potential to impact downstream watercourse beneficial uses by significant increased erosion of bed and banks of the watercourse. The definition of significant redevelopment is intended to include projects in which the magnitude of the rework of an existing built project is such that the cost of the addition of structural treatment measures, site design measures, and source control measures would be a reasonably small percentage of the overall project cost. In addition, significant redevelopment may include removal and replacement of structures that would present a practical opportunity for overall improvements to the long-term stormwater pollutant runoff condition of the site.

8. **Numeric Sizing Criteria – Volume & Flow Basis:** The American Society of Civil Engineers (ASCE) and the Water Environment Federation (WEF) have recommended a numerical BMP design standard for stormwater that is derived from a mathematical equation to maximize treatment of runoff volume for water quality based on rainfall/ runoff statistics and which is economically sound

(ASCE/ WEF 1998).[1] The maximized treatment volume is cut-off at the point of diminishing returns for rainfall/ runoff frequency. On the basis of this equation the maximized runoff volume for 85 percent treatment of annual runoff volumes in California can range from 0.08 to 0.86 inch depending on the imperviousness of the watershed area and the mean rainfall.[2]

Other methods of establishing numerical BMP design standards include:
(i) Percent treatment of the annual runoff; (ii) Full treatment of runoff from rainfall event equal to or less than a predetermined size; and (iii) Percent reduction in runoff based on a rainfall event of standard size.[3] These numerical design standards have been applied to development planning in Puget Sound, WA; Alexandria, VA; Montgomery County, MD; Denver, CO, Orlando, FL Portland, OR; and Austin, TX. The City of Seattle requires that where new development coverage is 750 square feet or more, storm water detention be provided based on a 25 year storm return frequency and a peak discharge rate not to exceed 0.2 cubic foot per second.[4] Additionally, for projects that add more than 9,000 square feet in developmental coverage, the peak drainage water discharge rate is limited to 0.15 cubic feet per second per acre for a two-year storm. The City of Denver requires new residential, commercial, and industrial developments to capture and treat the 80th percentile runoff event. This capture and proper treatment is estimated to remove 80 to 90 percent of the annual TSS load, which is a surrogate measure for heavy metal and petroleum hydrocarbon pollutants.[5]

Some States have established numerical standards for sizing stormwater treatment BMPs for new development and significant redevelopment. The State of Maryland has established stormwater numerical criteria for water quality of 0.9 to 1 inch and BMP design standards in a unified approach combining water quality, stream erosion potential reduction, groundwater recharge, and flood control objectives.[6] The State of Florida has used numerical criteria to require treatment of storm water from new development since 1982 including BMPs sized for 80 percent (95 percent for impaired waters) reduction in annual total suspended solids load derived from the 90 percent (or greater for impaired waters) annual

The manual describes structural and non-structural construction and post construction BMPs design criteria.

runoff treatment volume method for water quality.[7] The State of Washington has proposed at least six different approaches of establishing stormwater numerical mitigation criteria for new development that adds 10,000 square feet of impervious surface or more for residential development and 5,000 square feet of impervious surface or more for other types of development.[8] The mitigation criteria options include the 90th percentile 24-hour rainfall event and the six month 24-hour rainfall event.

On a national lèvel, the USEPA is planning to standardize minimum BMP design and performance criteria for stormwater treatment BMPs under Title III of the Clean Water Act and will likely build from the experience of effective state and local programs to establish national criteria.[9] The USEPA, based on the National Urban Runoff Program, supports the first half-inch of rainfall as generating first flush runoff. First flush runoff is associated with the highest pollutant concentrations, and not pollutant load. The USEPA considers the first flush treatment method, the rainfall volume method, and the runoff capture volume method as common approaches for sizing of water quality BMPs.

9. **Operation and Maintenance of Treatment Measures:** All treatment BMPs require some degree of maintenance in order to remain effective for pollutant removal long term. It is the duty of the Dischargers to ensure that adequate and appropriate maintenance and operation occurs, whether the systems are maintained by a public or private entity. This assurance may take the form of an inspection of a random subset of treatment measures in a given year, with effective follow-up.

10. **Limitation on Increase of Peak Storm Water Runoff Discharge Rates:** New development and redevelopment can impact water quality and beneficial uses of waters by altering a watershed's patterns of runoff and particularly by increasing the rates, durations, and frequencies of peak flows. These alterations to runoff patterns, or "hydromodification," result from the addition of impervious surfaces such as rooftops, roads, parking lots, and sidewalks, and the construction of an efficient storm drain system, replacing previously undeveloped land in a watershed. The land use changes associated with urbanization increase the total volume of runoff and increase the speed with which runoff is conveyed to receiving waters.

See USEPA's discussion on construction and post-construction BMP requirements for Phase II. 3 A Watershed Approach to Urban Runoff: Handbook for Decisionmakers, Terene Institute and USEPA Region 5 (1996). See discussion on sizing rules for water quality purposes, p 36.

Increases in flows from impervious surfaces associated with urbanization can result in:[10]

6. Increases in the number of bankfull events and increased peak flow rates;
7. Sedimentation and increased sediment transport;
8. More frequent flooding;
9. Stream bed scouring and habitat degradation;
10. Stream channel widening and shoreline erosion, including threats to infrastructure (e.g., bridges, utility line crossings, and adjacent roads) and existing structures (e.g., homes, businesses, fences, etc.);
11. Decreased stream baseflow;
12. Aesthetic degradation; and,
13. Changes in stream morphology.

This section requires appropriate control of both changes in peak discharge rates and durations. Efforts to mitigate these impacts in other areas, including Ontario and British Columbia, Canada, and Maryland, initially focused on reducing the increases only in peak flows. However, this approach was often ineffective, and sometimes exacerbated the problems it attempted to solve, by reducing the peak flow, but increasing the duration of erosive flows.[11] To appropriately address hydromodification impacts, it is necessary to address changes to both peak flows and the duration of erosive flows. Thus, this section requires, under certain circumstances, limits on urban runoff flows from new and redevelopment projects. Further, this section recognizes that while the impacts it describes are accepted, the exact runoff control requirements necessary to address those impacts may vary by creek location, condition, and other factors, and therefore requires development of a Hydromodification Management Plan to better address appropriate management of these changes.

6. **Exemption or Waiver Based on Impracticability and Compensatory Mitigation:** In certain circumstances, after all reasonable options have been

examined by a project proponent and the Discharger, it may be determined that key aspects of this Provision, primarily structural post-construction, treatment measures designed to operate for the life of the project, are infeasible to integrate into the project. This section allows the Discharger to make this determination under criteria described. It also provides that the Discharger may petition to expand the allowable criteria. If such a determination is made by the Discharger, the project proponent's cost savings, arrived at by comparison to similar projects, must be applied to the removal of stormwater pollutants through treatment measures elsewhere, preferably in the same catchment or watershed.

7. **Alternative Certification of Adherence to Design Criteria for Stormwater Treatment Measures:** This mechanism for review of designs by a competent party is intended to assist Dischargers in the period when they are developing in-house expertise on review of these project elements.

8. **Limitations on Use of Infiltration Treatment Measures - Infiltration and Groundwater Protection:** The use of infiltration, where feasible and safe from the standpoint of structural integrity, must also pose no significant threat to beneficial uses of groundwater.

9. **Site Design Measures Guidance and Standards Development:** The Dischargers have previously participated, through the Bay Area Stormwater Managers Agencies Association, in the preparation of the "Start at the Source" site design guidance. This section seeks to more fully incorporate these site design principles into the Dischargers' local site design guidance and standards.

10. **Source Control Measures Guidance Development:** Many of the Dischargers have already developed planning guidance for this element, but review and augmentation of these efforts is appropriate.

11. **Revise General Plans:** The US EPA finds that the Discharger "must thoroughly describe how the municipality's comprehensive plan is compatible with the storm water regulations" (1992). To achieve this, the Dischargers shall incorporate water quality and watershed protection principles and policies into their General Plans (or equivalent plans). US EPA supports addressing urban runoff problems in General Plans (or equivalent plans) when it states "Runoff problems can be addressed efficiently with sound planning procedures. Master Plans, Comprehensive Plans, and zoning ordinances can promote improved water quality by guiding the growth of a community away from sensitive areas and by restricting certain types of growth (industrial, for example) to areas that can support it without compromising water quality" (2000).

    The principles included in the revised Provision C.3 item 11 incorporate basic measures that have been found to minimize pollutants in urban runoff from new development and redevelopment.

12. **Revise Environmental Review Processes:** Consideration of the effects of new development and redevelopment on water quality during project approval processes will help ensure that potential water quality problems resulting from the development are identified and addressed. The US EPA finds that "Proposed storm water management programs should include planning procedures for both during and after construction to implement control measures to ensure that pollution is reduced to the maximum extent practicable in areas of new development and redevelopment. Design criteria and performance standards may be used to assist in meeting this objective" (1992). The US EPA further finds that "The municipality should consider storm water controls and structural controls in planning, zoning, and site or subdivision plan approval" (1992). Provision C.3 requires the Dischargers' CEQA initial study checklists be revised to include consideration of water quality effects from new development or redevelopment.

13. **Annual Reporting including New Development Pesticide Reduction Measures:** Federal NPDES regulations 40 CFR 122.26(d)(2)(iv) require each Discharger to develop and implement an urban runoff management program. The SFRWQCB must assess the urban runoff management program (URMP) to ensure that it is adequate to prohibit non-storm water discharges and reduce pollutant discharges to and from the MS4 to the maximum extent practicable. In order to assess the urban runoff management program, each Discharger must submit an annual report describing the activities it undertook to meet the requirements of this Provision. The Annual Reports can also be useful tools for the Dischargers. Annual Reports provide a focus to review, update, or revise the URMP on an annual basis. Successful and unsuccessful measures can be identified, helping to focus efforts on areas or issues that provide the greatest results. Areas or issues that have received insufficient efforts can also be identified and improved.

14. **Implementation Schedule:** All of the implementation dates for this provision are presented in this table.

15. **Provision C.14 Expiration Date:** The expiration date is extended by approximately three months to allow adequate time for implementation of the Tentative Order.

V. Written Comments

The formal written comment period for this Tentative Order will close at **5 PM on June 18, 2001**. The Regional Board intends to consider the Tentative Order and any revisions made in response to comments at its July 18, 2001 meeting.

Dale Bowyer
Watershed Management Division

File No. 2182.05 (JBO, KHL, DCB)

SUBJECT: Workshop on Tentative Order Amending the New and Redevelopment Performance Standard in Provision C 3 of the Santa Clara Valley Urban Runoff Pollution Prevention Program NPDES Permit.

Executive Summary

The NPDES permit for the Santa Clara Valley Urban Runoff Pollution Prevention Program (Program) was reissued at the Board's February 2001 meeting, with the previous permit's new and redevelopment performance standard, Provision C 3, retained as an enforceable placeholder. Update of Provision C 3 was deferred with the Program Co-permittees' consent at that time. This deferral has allowed time for further meetings and discussions with the Co-permittees and other interested parties, and subsequent circulation for public comment on May 18, 2001, of the Tentative Order for NPDES Permit Amendment to update Provision C 3 of the Program's permit.

As indicated in Finding 17 of the reissued permit, the Program Co-permittees consented to reopening the permit to address revisions to Provision C 3. As such, the Tentative Order would amend the permit to update the new and redevelopment performance standard to more effectively address impacts of new and re-development projects to downstream beneficial uses from both pollutants in stormwater runoff and sediment erosion in streams caused by changes in the amount and timing of stormwater runoff. The Tentative Order is also intended to address the "Cities of Bellflower, et. al." decision by the State Board in October 2000. The Tentative Order would amend Provision C 3 to include requirements that certain sizes of new and re-development projects include stormwater treatment measures, that those measures be properly maintained for the life of the project, that the measures be designed to treat an optimal volume or flow of stormwater runoff from the project site, and that significant changes in the way runoff occurs due to any increase in impervious surface created by the project not adversely erode creekbeds and banks downstream from the project.

The workshop at the Board's July meeting will allow Board staff to further describe the amendment of Provision C 3 to the Board and interested public, and will open the public hearing on the amendment. Staff intend to revise the Tentative Order as appropriate based on comments received to date and those made in the public hearing, respond to comments made on Provision C 3 in response to the public notices of October 2000 and May 2001, and prepare a Revised Tentative Order for Board consideration at its August 2001 meeting.

Introduction

New and re-development projects present opportunities to efficiently implement measures to reduce the pollutant impacts of stormwater runoff for the life of the newly built projects. Such measures can be and have been completed at a reasonable cost, and can be integrated into the urban and suburban landscape in an aesthetic and unobtrusive manner. The concept of reducing stormwater impacts for the life of a project, including its more technical aspects of design criteria, has been known and widely discussed and implemented for years. The countywide municipal stormwater permitted programs in this Region, including the Program, have worked with Board staff since at least 1993 to develop appropriate technical and conceptual guidance for clean stormwater runoff from new and re-development projects. The challenge remains to ensure consistent and cost-effective implementation of measures that control stormwater pollution and flow to the maximum extent practicable – that is the intent of amending Provision C 3.

We have worked with the Program Co-permittees and other interested parties to develop this amendment through the wide circulation of draft versions of the amendment and through meetings with interested stakeholders on several occasions. While the Co-permittees have stated that the proposed amendment has been improved in some respects as a result of these meetings, the Tentative Order containing the amendment has still drawn significant concern and comment among the Co-permittees and from environmental groups. The Co-permittees' primary comments are that the costs and complexity of implementation will discourage development and redevelopment, the modern life-blood of cities. In addition, the environmental group commenters are not yet satisfied with the Tentative Order; their concerns include that too much time is allowed for implementation of the requirements in the amendment and that the amendment covers fewer types of projects than previous versions, in its first years of implementation. We anticipate further revision of the Tentative Order will help create language that is as clear and workable as possible.

In this report, we summarize the development of the technical and regulatory approaches of addressing the stormwater runoff pollutant impacts of new development, and make it clear that the Co-permittees have been involved in the development and consideration of these approaches for nearly a decade. Besides the years of work in this Region, we mention similar efforts in other California regions and other states in the nation. We discuss the nature of the water quality problem and how the amendment will use the opportunities presented by new development and significant redevelopment to reduce adverse water quality impacts from stormwater runoff. We also describe the major comments received and revisions to the Tentative Order that staff are currently considering to address them.

History and Background of New and Redevelopment Urban Runoff Regulation

In writing the Clean Water Act (CWA), Congress stated, "...the objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters" (86

Stat. 816 §101). Congress' goal is commonly referred to as making all waters fishable, swimmable, and drinkable.

The CWA initially focused on achieving this objective through control of point sources of polluted water (e.g., oil refineries, sewage treatment plants, and other large wastewater sources). Water quality was significantly improved throughout the 1970s and 1980s by controlling these point source, or "large pipe", discharges. However, large percentages of the nation's waters remained impaired—impairment due primarily to non-point sources, such as urban storm water runoff. As a result, when Congress amended the CWA in 1987, it included a much stronger focus on non-point source pollution, including urban runoff. In fact, urban runoff was declared a "point source" and brought into the federal NPDES permit regulatory sphere. In California, the regional boards are mandated to issue federal NPDES permits. The municipal stormwater programs in this Region, including the sections on new and redevelopment, are a result of the 1987 CWA amendments.

As described below, detailed Best Management Practice (BMP) guidance and design materials for new and redevelopment runoff treatment have been available for a number of years. Since the early 1990s, Board staff, working with the Bay Area urban runoff programs and their consultants, have prepared guidance materials to help address the impacts of new and re-development projects. These guidance materials substantially covered the requirements and issues addressed in the proposed amendment to Provision C 3.

1987

The CWA was amended, with particular focus placed on urban runoff, including runoff from new and redevelopment projects. The 1987 CWA amendments require a municipal stormwater program to "require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP)." [CWA 402(p)(3)(B)(iii)]

Regulations issued by U.S. EPA in 1990 in response to the 1987 CWA amendments require that municipal urban runoff programs include:

- "...[a] description of **planning procedures...to develop, implement and enforce controls** to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges **from areas of new development and significant redevelopment..**" [40 CFR 122.26(d)(2)(iv)(A)(2)] and,

- "...[a] description of **maintenance activities and a maintenance schedule** for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers." [40 CFR 122.26(d)(2)(iv)(A)(1)]

1993

- U.S. EPA publishes the "Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters," a guide that identifies BMPs like those addressed in the present permit, includes information on urban runoff impacts, BMP pollutant removal efficiency, and BMP cost. The Guidance identifies both chemical pollutants and runoff hydrograph changes leading to excess creek erosion as significant urban runoff impacts.

- The State Stormwater Quality Task Force, an association of urban runoff programs in California, publishes the "California Storm Water Best Management Practice Handbooks." These *BMP Handbooks* are funded in part by entities including the Bay Area municipal urban runoff programs, the Santa Clara Valley Water District, and the State Board. The *BMP Handbooks* include:
  - A discussion on the impacts of urban runoff pollutants and erosion caused by changes in runoff associated with development;
  - Detailed information on source control BMPs;
  - Detailed design information for treatment controls like extended detention ponds and vegetated swales; and,
  - Notice that maintenance of controls is "very important."

1994

- Regional Board staff release the "Staff Recommendations for New and Redevelopment Controls for Storm Water Programs." These *Staff Recommendations:*
  - Were prepared through a public stakeholder process that included the Bay Area municipal urban runoff programs and other interested parties, working through the Bay Area Storm Water Management Agencies Association (BASMAA) New Development Subcommittee;
  - Describe the key components that should be included in an effective new and redevelopment performance standard of a municipal storm water management plan;
  - Include components that are included in the proposed amendment to Provision C 3, and form the basis for the Program's new and redevelopment permit standards, including:
    - Use of source controls, site planning and design BMPs, and treatment controls;
    - Use of regional treatment facilities to address treatment more efficiently than on a project-by-project basis;
    - Establishment of an inspection, operation, and maintenance program for BMPs;
    - Minimizing hydromodification resulting from urbanization, and specifically maintaining the pre-development peak flow and average volumes at pre-development levels;
    - Lists of BMPs, including source controls, treatment controls, etc.; and,
    - Incorporation of BMP recommendations by cities into their local planning processes, including addressing impacts in CEQA; and,
  - Specify a recommended schedule for municipalities to update their planning and building ordinances to implement the *Staff Recommendations*.

- The Alameda and Contra Costa Urban Runoff Programs publish the "Final Bay Area Preamble to the California Storm Water Best Management Practice Handbooks and New Development Recommendations." This *Preamble*:
  - Provides a step-by-step procedure for using the Board's *Staff Recommendations* and the state *BMP Handbooks*;
  - Provides straightforward guidance regarding the BMP selection process;

- Defines the applicability of individual BMPs to the Bay Area, and includes some sizing information, including detention basin sizing curves for Alameda and Contra Costa counties, based on local rainfall; and,
- Directs the user to appropriate local agencies for further information.

1995-1997

The Program's NPDES permit, as reissued in 1995, required a Performance Standard for New Development Planning Procedures be developed by September 1, 1996, and submitted to the Executive Officer. The final "model" Performance Standard, dated November 12, 1996, "defined the level of implementation that municipal agencies must attain in order to demonstrate that their land use planning and development plan review and approval processes control stormwater quality impacts to the maximum extent practicable." Using the "model" Performance Standard, each Program Co-permittee developed and certified compliance with its own performance standard by mid-1997. The Performance Standard states that:

- The Co-permittee has adequate legal authority to implement new development control measures as part of its development plan review and approval procedures;
- Developers are provided information on site design guidelines and BMPs for stormwater pollution prevention early in the application process;
- The CEQA and NEPA review processes will address stormwater quality impacts during the life of the project;
- Developers of projects with significant stormwater pollution potential are required to mitigate impacts through proper site planning and design techniques and/or addition of permanent stormwater quality control measures;
- Developers of projects with permanent structural stormwater controls are required by the Co-permittee to establish and provide for operation and maintenance of such controls; and,
- The Co-permittee provides annual training to its planning, building, and public works staffs on planning procedures, design guidelines, and BMPs for stormwater pollution prevention.

Annual Reports prepared by the Co-permittees show that permanent stormwater control measures are implemented at some development projects, indicating at least some acceptance of feasibility. However, the number of new development projects implementing such controls is relatively small overall, and where controls are implemented, often the least effective systems are installed with no serious consideration of treatment capacity and maintenance, and some Co-permittees have required very few projects to implement stormwater control measures.

1997 and 1999

BASMAA publishes "*Start at the Source,*" a site planning and design guidance manual for stormwater quality protection. The manual is developed in a public stakeholder process that includes the local urban runoff programs, Board staff, and other interested parties. The revised 1999 edition includes:

- Detailed information on BMPs, including source controls, site design measures, and treatment controls;
- Information on planning and zoning measures to help address urban runoff impacts;
- A discussion of numerical sizing criteria for treatment controls. The stakeholder group cannot agree on a criterion, so while there is a discussion of the issue, no number or agreed-upon sizing method appears in the published book; and,

- Other information, including a discussion of hydromodification as an impact of urban runoff.

Water Quality Impacts of Urban Runoff from New Development

The water quality impacts of urbanization and stormwater discharges have been summarized by several recent U.S. EPA reports.[1] Urbanization causes changes in hydrology and increases pollutant loads, which adversely impact water quality and impair the beneficial uses of receiving waters. Specifically, urbanization affects stormwater runoff by increasing the following:

- The concentrations and types of pollutants found in stormwater;
- The loads of pollutants carried and their transfer rates into receiving waters; and,
- The volumes and rates of surface runoff.[2]

Nationwide and Bay Area monitoring of stormwater, some of it accomplished through years of effort and expense by Program Co-permittees, has indicated that stormwater contributes to exceedance of state and federal water quality criteria for such pollutants as pathogen indicators (e.g., fecal coliform and streptococcus), heavy metals (e.g., lead, copper, and zinc), and pesticides (e.g., diazinon). Further, stormwater discharges can exhibit both acute and chronic toxicity to aquatic life, and can chronically impair aquatic life. Other impacts include: human health impacts from coming into contact with polluted water while swimming, surfing, or wading, or eating contaminated fish and other seafood; creation of a visual nuisance by trash, oil and grease, and other pollutants accumulating in waters; and smothering of aquatic habitat from the discharge of sediment from construction sites or poorly designed and constructed storm water conveyances.[3]

Increases in population density and imperviousness result in changes to stream hydrology.[4] These changes can result in impacts including:

[2] *Urban Drainage Criteria Manual* (Denver Urban Drainage and Flood Control District 1999), vol. 3.
[3] Summaries of pollutant loading and impact data can be found in, for example, *Fundamentals of Urban Runoff Management: Technical and Institutional Issues*, Horner et al. (1994), Terrene Institute, Washington, D.C.
More detailed local and national data may be found in:
Loads Assessment Summary Report, Alameda Cty. Urban Runoff Clean Water Program (1991), ACFCWD, Hayward;
Water Pollution Aspects of Street Surface Contaminants, USEPA (1972), Doc. No. EPA-R2-72-081;
Water Quality and Biological Effects of Urban Runoff on Coyote Creek, Phase I, USEPA (1980), Doc No. EPA-600/2-80-104; and,
Report to San Francisco District Corps of Engineers on determination of Urban Runoff Water Quality at Castro Valley Creek, Alameda County, California, November 1978-April 1979, Metcalf & Eddy Engineers (1979), Palo Alto.
[4] Examples of changes to hydrology include:
1. Increased peak discharges compared to predevelopment levels;
2. Increased volume of storm water runoff with each storm compared to predevelopment levels;
3. Decreased travel time to reach a receiving water;
4. Increased frequency and severity of floods;
5. Reduced stream low flows due to reduced level of infiltration;
6. Increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from channelization; and,
7. Decreased infiltration and diminished groundwater recharge.

1. Changes in erosion and sedimentation and increased sediment transport;
2. Increases in the number of stream bankfull flow events and increased peak flow rates;
3. More frequent flooding;
4. Stream bed scouring and habitat degradation;
5. Stream channel widening and shoreline erosion, including threats to infrastructure (e.g., bridges, utility line crossings, and adjacent roads) and existing structures (e.g., homes, businesses, fences, etc.);
6. Decreased stream base flow during dry weather;
7. Aesthetic degradation; and,
8. Changes in stream morphology.

The measures proposed in the Tentative Order can be expected to reduce the discharge of pollutants to waters of the State. Water bodies within Santa Clara County or to which Santa Clara County is tributary are listed as impaired for pollutants on the CWA Section 303(d) list. Impairing pollutants include those for which urban runoff is a significant contributor, including sediment, copper, nickel, PCBs and diazinon. Total maximum daily load (TMDL) estimates are being prepared for listed pollutants and water bodies, and the measures required in this Tentative Order will be significant measures to manage loadings to waters, when waste load allocations are developed to implement the TMDLs.

In summary, urban runoff has been identified as a significant contributor to degradation of beneficial uses and water quality criteria exceedance. The measures proposed in this Tentative Order will help reduce detrimental impacts to waters of the State caused by urban runoff from new development and significant redevelopment projects.

<u>Implementation in Other California Regions and Other States</u>

A number of municipalities across the country are presently implementing the BMPs, planning practices, and other practices similar to those proposed by the Tentative Order. In addition, projects with measures for site design, source control, or treatment control, and/or limitations on changes in the runoff hydrograph, like those included in the Tentative Order, have been constructed throughout the Bay Area and in at least 25 states.[5] Letters from programs in Maryland, Florida, and Washington, written to the Los Angeles Regional Board staff during the development of the Los Angeles Standard Urban Stormwater Mitigation Plans (L.A. SUSMP), and discussing implementation of numerical standards in those states, are attached (see Attachment A).

Outside of California, numerical design standards similar in approach to those in the Tentative Order apply to development projects in, among other places:

- Puget Sound, Washington
- Alexandria, Virginia

[5] "*Stormwater Strategies: Community Responses to Runoff Pollution*," Natural Resources Defense Council (May 1999), National Storm Water BMP Database, ASCE/USEPA (revised 2000). Projects recently permitted by the Board, including residential projects such as the Gale Ranch project in Contra Costa County and the Blue Rock Country Club in Alameda County, and commercial/industrial projects such as Catellus' Pacific Commons project in Fremont and Pacific Shores in Redwood City, include such measures.

- Montgomery County, Maryland
- Denver, Colorado
- Orlando, Florida, and
- Austin, Texas.

Examples of implementation include:

- **State of Florida:** Since 1979, Florida has used numerical sizing criteria (the method for specifying the runoff rate used to design the proper-sized BMP) for stormwater BMPs, including BMPs sized to treat 90 percent or greater of average annual runoff with the goal of reducing the total suspended solids loadings to waters by 80 percent (95 percent for impaired waters).
- **State of Maryland:** Since 1982, Maryland has required treatment of 0.9 – 1.0 inch of rainfall runoff for water quality, and included BMP design standards in a unified approach combining water quality, stream erosion potential reduction, groundwater recharge, and flood management.
- **State of Washington, Puget Sound catchment:** Since 1992, Washington has required use of numerical sizing criteria for stormwater BMPs and hydromodification impacts. The criteria are presently being revised and, when released this summer, are expected to become more stringent, and to apply to the entirety of western Washington.[6] The 1992 standards, while allowing for differing approaches, required use of numerical hydraulic design standards for new development and redevelopment projects of 5,000 square feet or larger. Sizing options included the 90th percentile 24-hour rainfall event and the six-month, 24-hour rainfall event.[7]
- **Seattle, Washington:** Where new development coverage is 750 square feet or more, stormwater detention must be provided based on a 25-year storm and a peak discharge rate not to exceed 0.2 cubic feet per second per acre. For projects that add more than 9,000 square feet in development coverage, the peak drainage discharge rate is limited to 0.15 cubic feet per second per acre for a 2-year storm.
- **Denver, Colorado:** New residential, commercial, and industrial projects greater than one acre must capture and treat the 80th percentile runoff event.[8] This capture and proper treatment are estimated to remove 80 – 90 percent of the annual total suspended solids (TSS) load. TSS is viewed as a surrogate measure for heavy metal and petroleum hydrocarbon pollutants.

The L.A. SUSMP was affirmed by the State Board in the precedential "Cities of Bellflower, et. al." appeal decision (State Board Order 2000-011). Following this decision, other California stormwater permits, e.g., the County of Ventura, the City of Long Beach, and the City and County of San Diego, contain similar provisions appropriate for local conditions. In addition, draft tentative orders for Municipal Stormwater Permits containing similar provisions are out for public comment for Orange County, and for the reissuance of the L.A. County permit. The L.A. County draft tentative order for permit reissuance, and other adopted orders summarized in Attachment B, include some more comprehensive elements than the first L.A. SUSMP.

---

[8] "Stormwater Quality Control Plans: An Information Guide," Denver Department of Public Works (2000).

In summary, numerical design capacity standards and other BMPs similar to those in the Tentative Order are being successfully implemented in a number of jurisdictions inside and outside of our State.

Key Components of the Tentative Order for NPDES Permit Amendment Revising Provision C 3, including a discussion of Major Comments and Potential Tentative Order Revisions

Major Stakeholder Comments on the Tentative Order

Comments were received from 39 entities during the May 18 through June 18, 2001, public comment period, including fifteen entities representing the Co-permittees, two environmental advocacy groups, fifteen representatives of industry, five other Bay Area public entities, and two consulting firms. Through the stakeholder process and from the comments received, staff has attempted to incorporate in this report discussion, in advance of formal response to comments and revision of the Tentative Order, some of the major issues stated in those comments, and recommended or potential revisions of the Tentative Order which may be made in response to some of the major comments. The most frequent comments could be grouped under the following subjects:

- Project size categories and definition of significant redevelopment
- Cost of implementation
- Implementation schedule
- Limitations in changes to runoff peak flow and duration
- Linkage between Tentative Order requirements and water quality benefits. (This topic is addressed in previous sections of this Staff Report.)

New Development and Redevelopment Project Size Categories

The Tentative Order describes the categories of new and redevelopment projects that would be subject to the new requirements at the proposed date of implementation, July 15, 2002. The Co-permittees expressed concern that implementing numerically sized treatment BMPs for small projects would initially be difficult, because of a lack of design resources and consulting help needed for smaller projects. As a result of this discussion, we included a phased approach, based on project size, to implementing the numerical sizing criteria, so that experience could be gained with larger projects before implementing stormwater BMPs at smaller projects. The larger projects, referred to as Group 1, consist of all new projects that create one acre (43,560 square feet) or more of impervious area including roof area, and all significant redevelopment projects that encompass the same area of impervious surface. For this category, stormwater treatment BMPs must be required during the development approval process by July 15, 2002.

The smaller projects, referred to as Group 2, range from one acre down to 5000 square feet of impervious area for new development and significant redevelopment projects. Initially, this group would be subject to all requirements of the amended Provision C 3 *except* the numeric sizing criteria, the operation and maintenance verification, and the limitations on hydrograph change. Then, in July, 2003, Group 2 merges with Group 1, becoming subject to all the requirements of Provision C 3. Provision C 3 does not apply to any project below these sizes.

The Co-permittees can propose an alternate minimum size for Group 2, which includes 80% of new impervious surface built within a typical year, in order to tailor the requirements to the sizes of new development in their municipalities.

The size categories in the Tentative Order differ from those in the precedential L.A. SUSMP Order. The L.A. SUSMP contains more specific categories that are artifacts of a previous permit. Projects included in the L.A. SUSMP are commercial developments of 100,000 ft^2 or greater; 10 unit or more residential developments; 5000 ft^2 or 25 space parking lots; single family homes on hillsides; and restaurants and automotive facilities of 5000 ft^2 or greater. However, L.A. SUSMP project sizes are being revised downward. The new draft tentative order to reissue the L.A. permit includes one-acre sites by March 2003. The current L.A. SUSMP project categories cover fewer new development projects than would be covered by those specified in our Tentative Order.

The Program has commented that the L.A. SUSMP categories are preferable to the currently proposed categories. However, WaterKeepers has commented that the phasing approach represents a significant reduction of implementation of the requirements from previous drafts of the amendment, and the Group 2 projects should be included immediately upon implementation of this Tentative Order, particularly given the delay in updating Provision C 3.

Significant Redevelopment Definition

The proposed requirements apply to new development projects and to projects that meet the specifications for "significant redevelopment." The definition of significant redevelopment, which involves enough capital investment and physical change in an existing developed site so that stormwater treatment improvements would be a reasonable requirement, has been difficult to specify. Co-permittees are concerned that urban redevelopment is not impeded by permit requirements. We share the Co-permittees' concern that redevelopment limited to simple maintenance of structures and pavement should not be included. All parties are interested in ensuring that these requirements have at least a neutral or positive effect on the sprawl versus smart growth/urban infill dynamic.

The Program has commented that it prefers the L.A. SUSMP redevelopment definition, that we consider very similar to our own. In addition, we anticipate revising the Tentative Order to clarify that strictly interior remodels are excluded.

Numeric Sizing Criteria – Volume and Flow

The Tentative Order includes several equivalent methods to determine the optimum volume or flow rate of stormwater to be treated by stormwater BMPs. This volume or flow rate is used to design proper-sized treatment controls. The volume or flow rate is calculated using local rainfall data and the runoff characteristics of an individual development site. Numeric sizing methods are intended to assist in the design of stormwater treatment controls by answering the question: "How much stormwater treatment capacity is enough?" In so doing, they provide a level of predictability needed by the builders and engineers tasked to incorporate these controls into their projects. The numeric sizing criteria do not appear to be controversial. Throughout the stakeholder process, there has been very little comment focused on the numeric sizing criteria.

The sizing calculations are based on the concept of optimal treatment capacity. With these methods, the capacity of the treatment devices is as large as it can be before additional capacity is more expensive than is reasonable. The table and discussion in Attachment C describe this point in more detail.

The approach in the Tentative Order does not specify use of a particular type of treatment control system or physical principle. For example, the use of infiltration measures, detention basins, and/or grassy swales is not required. Rather, the approach directs the appropriate design capacity or hydraulic sizing of whichever treatment control or controls are selected by a builder. The builder then applies a sizing method from the appropriate category (e.g., volume-based for detention basins, flow-based for grassy swales, etc.) to the project.

The options will result in treatment of about 80-90% of average annual runoff from a site. This volume has been determined based on analyses of rainfall patterns to maximize the amount of runoff treated while minimizing total cost per amount of runoff treated.[9] Under the proposed criteria, 80-90% of average annual runoff is treated without the substantial increase in size and cost of treatment controls that would be necessary to treat the largest storms that comprise the remaining 10 – 20% of average runoff.

The American Society of Civil Engineers (ASCE) and the Water Environment Federation (WEF) have recommended a numerical BMP design standard for storm water. Their recommended standard is derived from a mathematical equation to maximize treatment of runoff volume for water quality based on rainfall/runoff statistics and is economically sound (ASCE/WEF 1998).[10] The standard is based on analyses of hourly rainfall data in cities across the United States, including San Francisco, and is reflected in the criteria listed in the proposed amendment.

In summary, the listed numerical criteria provide an important even playing field for those who will design and build these treatment systems. These technical approaches have been calculated to provide the most treatment for the least cost.

Operation and Maintenance

In order for the installed treatment systems to function adequately, appropriate long-term operation and maintenance must occur. For some of the treatment approaches based on landscape

---

[9] Analysis of 13 years of daily rainfall data for Palo Alto and Livermore found that about 90% of average annual runoff-generating precipitation was in storms of 1.2 inches in depth or less. On average, only about one storm per year was more than 1.2 inches in depth. Thus, sizing controls to treat the largest storm events would result in a significant increase in cost without a concomitant increase in pollutant removal. *Adapting Engineered Vegetated Swales to the San Francisco Bay Area's Mediterranean Climate: Law, Design, and Pollutant Removal Effectiveness. Master's Thesis.* Keith Lichten, University of California, Berkeley (1997).

[10] In Urban Runoff Quality Management, WEF Manual of Practice No. 23, ASCE Manual and Report on Engineering Practice No. 87. WEF, Alexandria, VA; ASCE, Reston, VA (1998).

elements, such as vegetated swales and detention basins, maintenance can be relatively simple. For many of the measures that are more mechanical and exist in below ground vaults, inspection and maintenance can become more resource intensive. Lack of timely maintenance of such measures may result in greater water quality impacts than if the measures were never installed.

The Co-permittees are reluctant to take on new municipal maintenance burdens. However, in some instances, no private entity will be available to assume maintenance responsibility. The language in the Tentative Order follows an approach very similar to that used in the L.A. SUSMP Order, with some improvements. The approach for operation and maintenance assurance in the Tentative Order also gives the Co-permittees responsibility for an effective inspection program, checking a subset of installed systems each year, with follow up and enforcement, if necessary, to assure adequate results. Such an approach is similar to that currently required for the construction and industrial/commercial components of the Program's permit.

The Co-permittees have expressed reluctance to approach this issue using the L.A. SUSMP approach, which directs the creation of deed restrictions and CCRs in property transfers to require appropriate maintenance, because it may be difficult to apply these deed restriction on small, ministerial projects, which do not receive much city review. ***The Tentative Order may be revised to exempt these smaller projects from the deed restriction requirement.***

Economics of Implementing the Tentative Order's Requirements

Among the greatest concerns stakeholders have about the Tentative Order is its potential costs. However, source control, site design, and treatment control BMP requirements for new development offer a cost-effective strategy to reduce urban runoff pollutant loads to surface waters. Studies on the economic impacts of watershed protection indicate that stormwater quality management has a positive or at least neutral economic effect while reducing stormwater pollutant impacts to the quality of surface waters.[11]

Costs of implementation of the Tentative Order requirements are expected to fall in the range of 1 – 2% of overall project costs for new or significant redevelopment. This percentage will vary depending on project type, site design constraints, and the extent to which the Tentative Order's requirements are combined with other parts of a project, such as required landscaping. A simplified example cost estimate is provided in Attachment D.

Innovative project designs that utilize site design and treatment control requirements to reduce other costs—for example, draining stormwater in surface swales rather than excavating for and building an underground storm drain system—may even have lower costs than a so-called "standard" development. Village Homes, constructed in the mid-1970s in Davis, California, is an example of a single-family residential subdivision project that saved money by constructing surface swales and detention basins instead of underground storm drains. Village Homes' use of those

[11] *The Economics of Watershed Protection*, Tom Schueler (1999), Center for Watershed Protection, Endicott, Maryland. The article summarizes nationwide studies to support the statement that watershed planning and stormwater management provide positive economic benefits.
Economic Benefits of Runoff Controls, USEPA (1995), Doc. No. EPA 841-S-95-002, discusses the economic benefits of including stormwater treatment wetlands and wet ponds in projects.

measures also resulted in improved flood control, higher property values, and increased quality of life as compared to similarly situated single-family subdivisions.

Some Co-permittees have asserted that the Tentative Order will lead to costs of as much as 10% of the new and redevelopment capital expense. ***While staff does not agree that costs will be so high, part of this high cost estimate may be based on an interpretation of the interim limitation on changes to the runoff hydrograph from new development. Staff anticipates modifying this limitation to conform to L.A. SUSMP in the Revised Tentative Order. Please see the section below on limitations of hydrograph change.***

Stakeholders also assert that the Tentative Order could have a detrimental effect on downtown urban redevelopment projects, infill, low-cost housing, and "smart growth" initiatives. However, as shown in the Davis, California, example above, and in much of the literature quoted in earlier sections of this Staff Report, the requirements of the Tentative Order are compatible with smart growth concepts and are likely to have positive effects on flood control and property values.

We recognize that Co-permittees may incur some additional staffing costs, depending on their current level of implementation of the existing performance standard. Most will need to augment their existing development review processes, and there will be some initial guidance development and training costs. Information provided in their Annual Reports shows that few Co-permittees consistently require new developments to implement storm water treatment BMPs, despite existing permit requirements.

Based on the results of the Survey of Southern California Stormwater Programs[12], some permitted entities have used existing staff to fulfill requirements, while others have added staff. The Tentative Order includes a measure to reduce cities' potential need for additional staff to review project designs to ensure compliance with the amendment's requirements. Specifically, it allows "alternative certification" of compliance. That is, rather than completing review in-house, cities may defer technical review to a third party, and accept a signed certification from an appropriately trained and licensed professional that a project design meets the established requirements.

The Co-permittees have asked that the "exemption or waiver based on impractibility" process, with compensatory mitigation, such as regional treatment facilities, be made more available than currently written at C 3 g. For very difficult, high-density developments, with high cost of treatment, some additional waiver criteria may be appropriate, and may reduce some "worst case" costs.

The revision of the Tentative Order with the addition of a waiver provision that allows off-site storm water treatment under certain specific conditions, should ease potential conflicts between the requirements of the Tentative Order and in-fill or redevelopment, and may also address some difficult cost issues.

<u>Implementation Schedule</u>

---

[12] Letter from Donald P. Freitas, Program Manager, Contra Costa Clean Water Program, to Loretta Barsamian, Executive Officer; Appendix A of the letter: Survey of Southern California Stormwater Programs, June 18, 2001.

The Co-permittees comment that the amount of time allowed to implement requirements is too short in general, and does not recognize the many time consuming steps, including often lengthy internal review, public participation, CEQA, and other statutory processes that may be required to implement the Tentative Order requirements. However, WaterKeepers comments that too much time will pass before implementation occurs.

More time is provided for implementation in this Tentative Order than in previous drafts, and nearly a year has transpired since the update of the new and redevelopment performance standard was first raised in the permit reissuance process. While it appears that much of the concern about the need for a longer implementation schedule is related to the time needed to adopt ordinances to establish the agencies' legal authority to implement the measures, much of that legal authority should already have been secured in ordinances adopted in response to their existing permit and performance standards. Co-permittees certified as early as November 1996 that they have legal authority to implement new development control measures as part of their development plan review and approval processes.

The schedule in the Tentative Order allows more time for the tasks that are difficult to complete. For example, a two-year period is provided to complete the Hydromodification Management Plan to minimize changes to the hydrograph of local creeks and rivers where erosion impacts can occur. Three years is given to fully implement site design standards and guidance, and two years are allowed before the smaller projects defined under Group 2 are included under the broader requirements for Group 1.

The L.A. SUSMP Order allowed six months for any necessary ordinance modifications, with one additional month to implement requirements. Our Tentative Order allows one year to implement similar requirements. Los Angeles Regional Board staff reports that the municipalities did have adequate time to accomplish the required work. Indeed, survey results provided with stakeholder comments describe that the City of Los Angeles, Los Angeles County, San Diego County and the City of San Diego did not require extra time to fulfill requirements[13]. Los Angeles Co-permittees, who completed all necessary ordinance revisions in six months, did not require CEQA. In many cases, unlike the Program Co-permittees, the Los Angeles Co-permittees had never previously established ordinances for broad implementation of their stormwater pollution control programs.

Many of the requirements in the Tentative Order are similar to requirements and performance standards based on the Program's 1995 permit. In addition to certifying that they have had adequate legal authority to implement new development control measures, the Co-permittees, to some extent, have also required developers of projects with significant stormwater pollution potential to mitigate impacts through proper site planning and design techniques and/or addition of permanent stormwater quality control measures. The existing performance standard also states that Co-permittees will require developers of projects with permanent structural stormwater controls to provide for operation and maintenance of such controls. It further requires annual training to planning, building, and public works staffs on planning procedures, design guidelines, and BMPs for stormwater pollution prevention. While already required, this is a set of tasks that the Co-

[13] Letter from Donald P. Freitas, Program Manager, Contra Costa Clean Water Program, to Loretta Barsamian, Executive Officer; Appendix A: Survey of Southern California Stormwater Programs, June 18, 2001.

permittees comment will now take time and resources to accomplish, as these tasks apparently have not yet been fully implemented.

Regarding requests for additional time to study the impacts of development on local creeks and rivers, the large body of studies quoted in previous sections of this Staff Report provide adequate support that development has detrimental impacts on beneficial uses and water quality, and that the approach which is already a part of the Program's Stormwater Management Plan and existing permit will reduce those impacts.

Regarding requests for more time to comment on the Tentative Order, Board staff believes the stakeholder process, while not perfect, has been adequate. The public dialogue concerning the new development provisions began in 1999 with the NPDES permit reapplication process. A summary of the steps in the public process is included as Attachment E.

An option for consideration is extension by one year of the date when smaller Group 2 projects would be subject to the stricter requirements of Group 1, from the current July 15, 2003 until July 15, 2004. In addition, we will clarify the language on which projects in the plan approval pipeline are subject to implementation. We will also examine whether, upon adequate proof of need, extra time for CEQA review and adoption of ordinance enhancement should be added.

<u>Limitation on Change in Runoff Peak Flow, and Duration of High Energy Flows</u>

Many comments were received on this provision, which limits changes in the peak rate and duration of high energy, scouring flows in runoff from new development. Changes in the peak rate and duration of flows have been shown to cause erosion damage to streams. The language initially used for this provision was not clear enough, and caused serious concern among the Co-permittees.

We currently anticipate revising the Tentative Order so that the interim standard of this provision is very similar to the L.A. SUSMP peak runoff discharge limitation, which is less stringent than the current language that requires no change in peak or duration of runoff after development.

The present standard requires strict controls on increases to peak flows and durations for a certain range of storms for new and redevelopment projects, while a more comprehensive approach to appropriately deal with this impact of new development is required to be developed over two years. This approach is termed the "Hydromodification Management Plan" (HMP) in the Tentative Order.

The impacts of peak flow and duration increases have long been recognized. This provision requires, in part, development of HMPs. A significant advantage of developing these plans, as opposed to specifying a single countywide standard, is that municipalities can look at site- and creek-specific conditions to determine the flexibility in how much flows can change without significant impacts *to their waterbodies*. In addition, the HMP process will determine where it makes sense to impose stormwater flow BMPs, because many creeks in the County have been so hardened by previous flood control work that significant changes due to upstream projects will have little or no impact on sediment erosion. Staff believes there will be significant flexibility, which will be identified as the HMPs are developed. Meanwhile, the interim approach will be revised to be more flexible.

Summary of Other Tentative Order Items

The tentative order includes a variety of measures intended to assist implementation of the amendment's requirements by revising Co-permittees' project planning and approval processes. These measures include development of source control BMP guidance, revising general plans, ensuring that urban runoff water quality impacts are appropriately addressed in environmental review processes such as CEQA, and reviewing and revising local site design standards and guidance to help address urban runoff impacts.

Some of these measures, such as the source control BMP guidance, have already been developed by Bay Area urban runoff programs. Others will require a more detailed review of existing city policies. The amendment includes guidance for each of these areas, to help direct the Co-permittees in completing them. The guidance provides suggestions of areas to address and questions to consider when completing the reviews and revisions. The guidance items listed in the tentative order (e.g., examples of particular source controls, questions that could be incorporated into a city's environmental review process, etc.) are not required, but are strongly recommended as starting points for the review process. Staff anticipates that the Co-permittees will be able to use work that has been completed by other Bay Area stormwater programs, and, further, that the Program may work together with other stormwater programs to address these issues. This would help to reduce the amount of work needed to complete these reviews.

Summary and Conclusions

The Tentative Order is the result of many hours of discussion and consideration with Co-permittees and other interested parties, and is largely patterned on the Orders adopted in other regions of California, and guidance created with the Co-permittees' involvement over the last two 5-year permit cycles. Staff recognize that some careful revision of the Tentative Order will be necessary prior to final Board consideration, and we have attempted to present some recommendations and options for such revisions in this report. Future generations will inherit the built environment we create today, including both its positive and negative aspects. There is much we can do, working together, to reduce the impacts to our waters from necessary development.

Storm Water Program
California Regional Water Quality Control Board – LA Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Dear Ms. Jennings and Mr. Swamikannu:

Enclosed are several items that may help you understand the goals attributed to Maryland's stormwater management program. The Maryland Department of the Environment is nearing 20 years worth of experience in administering an urban runoff program. Some basic tenets of the program and the successes and failures are described in the three reports provided.

Additionally, a brief background summary is provided in order to explain the transition we are making from current requirements to those proposed in the "2000 Maryland Stormwater Design Manual." This summary also helped to better answer the design and performance standards questions that you posed regarding stormwater management in our State. We hope this material will be of some use to you.

If you have any questions or need any more information, please call me at 410-631-3543.

Sincerely,

Brian S. Clevenger

MARYLAND'S STORMWATER MANAGEMENT PROGRAM
SUMMARY

Introduction

The State of Maryland has recently completed the development of the "*2000 Maryland Stormwater Design Manual*" (Manual). This document took nearly 5 years to compose and is intended to improve the State's stormwater management program that has been in existence since 1982. The Maryland Department of the Environment, Water Management Administration (MDE/WMA) provides here a synopsis of Maryland's program's evolution over the last 18 years. This summary will provide the perspective needed to answer questions regarding programmatic goals, performance standards, and strengths and weaknesses. Apologies for the lack of brevity.

Background

Maryland's stormwater management program was a logical progression from its erosion and sediment control efforts. The Attorney General of the State declared "sediment" a pollutant in 1969. The next year a statute was passed that required sediment control practices to be implemented for any earth disturbing activities over 5,000 square feet. Maryland's erosion and sediment control program was implemented statewide by local government beginning in 1970.

The next step from controlling runoff from grading and construction would obviously be controlling runoff after development has been completed. This progression then, is stormwater management. Recognizing that urban runoff was a contributing factor to water quality degradation, the Maryland legislature passed the Stormwater Management Act in 1982. This law, and commensurate regulations adopted the following year, sought to ensure that pre-development runoff characteristics were maintained after development.

During the mid 1980s when Maryland's program was first conceived and implemented, the prevailing attitude was that if peak discharge increases caused by urbanization were controlled, the receiving waters would be protected from excess volume, increased velocities, channel erosion, sedimentation, flooding, etc. Therefore, Maryland's program was, and is currently, based on this flood control perspective. Current State regulations require that all new development project designs include provisions for reducing peak discharge increases for the 2 and 10 year frequency storm events back to pre-development conditions. Clearly, this requires a best management practice (BMP) approach and typically, the BMP of choice is a pond.

Because of the prevailing attitudes regarding how best to control stormwater (e.g., flood management), very little specific design criteria were included in Maryland's stormwater management program. The approach taken, and the one we work under currently, was a "preferred practices" list. State regulations require that infiltration be considered first and, if not feasible, the designer would then progress through a list of BMPs each with lesser water quality efficiency than the one previous. In latter years, rules-of-thumb for water quality design were implemented sporadically throughout the State (e.g., one half inch times total site imperviousness). However, Maryland still operates under its original design criteria (e.g., 2 and 10 year management and the preferred practices list).

Chesapeake Bay Protection and Environmental Awareness

Given the above historical explanation, several points need to be made that will provide other factors affecting program implementation and help explain why a major change of philosophy has been contemplated with the Manual. First, it cannot be overemphasized how much Chesapeake Bay restoration efforts play on bringing to the forefront environmental concerns, especially those related to water quality. Chesapeake Bay garners much attention in the State, region, and, arguably, the world for protection and restoration. This was the case in 1983 when the Six Bay states and Washington, D.C signed the original "Chesapeake Bay Agreement." Therefore, the protection of this valuable resource was very much a factor for implementing an urban runoff program.

Another factor contributing to Maryland's stormwater management program development was the groundswell of environmental awareness caused primarily by nutrient enrichment of the Chesapeake Bay. Nutrient reduction goals, wetland protection, and sediment control all served as catalysts for grass roots organizations to bring to light the importance of environmental issues. This public and sometimes political support cannot be overlooked.

Technical Program Improvements Needed

Finally, because of over 12 years of program oversight and experience, changes with our program were clearly needed in the mid 1990s. Some issues have been mentioned above (e.g., no specific water quality design standards; too much flood control emphasis). However, explaining a couple of technical issues related to our program will address questions regarding stormwater management program goals and specific issues such as redevelopment.

As originally conceived, the State program makes no mention of where new development takes place. Nor does it specify what land use types are affected. If 5,000 square feet of earth is disturbed with new development, you must address stormwater runoff. This would presumably include redevelopment or in-fill situations. However, as with most regulatory programs, Maryland's stormwater regulations contain exemptions and allow for waivers provided certain conditions are met. Since 1982, certain projects have been waived depending on hydrological circumstances. Three major waiver categories have been allowed and these demonstrate the flood management program emphasis on which the program was founded. These categories are:

1) Less than a ten percent increase in the pre-development 2 year storm event,
2) Direct discharges to tidewater, and
3) Projects completely surrounded by an existing storm drain system of sufficient capacity to convey the increase in discharge caused by the new development.

The emphasis on peak management and flood control is quite obvious. It was MDE's want to change this emphasis when regulatory changes were proposed and the Manual was conceived in

1995. Beginning with the Manual's composition, the issue of stormwater control for redevelopment projects was debated vigorously.

The above waiver provisions that local jurisdictions applied to certain "new development" caused most redevelopment and in-fill work to avoid BMP implementation. A fast food restaurant built in the corner of a shopping mall parking lot would surely not change hydrologic characteristics, especially peak discharge. Additionally, this and similar urban "redevelopment" would most likely be surrounded by an existing storm drain system of adequate capacity. Therefore, most redevelopment is waived under Maryland's original and current stormwater regulations. This was an additional reason why MDE felt improvements were warranted.

__Summary__

Under increased environmental awareness caused by Chesapeake Bay protection concerns, Maryland instituted a stormwater management program that emphasized peak flood management for new development projects disturbing 5,000 square feet of earth. Relatively little specific water quality control design criteria were included in original regulations as a "preferred practices" list was used. With an obvious flood control emphasis, most redevelopment projects were waived because pre-development hydrologic conditions remained after construction completion.

With over 12 years of program implementation experience, a recognition that improved water quality management was needed, and a need to eliminate many waivers of stormwater management requirements for such things as redevelopment, MDE developed the "*2000 Maryland Stormwater Design Manual*." This document, along with major regulatory modifications, is intended to address many of Maryland's stormwater management program weaknesses. When adopted later this year, major improvement to controlling urban runoff is expected.

POLICY STATEMENT ON CONTROLS AND REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT IN THE STATE OF MARYLAND

i) Why did your state elect to have requirements on new development and redevelopment?

In 1982, restoration and protection of Chesapeake Bay was one of the most important factors contributing to the development of Maryland's stormwater management program. Heightened environmental awareness and a recognition that urban runoff contributed to water quality degradation combined to produce a program that emphasized peak flood control. Because of this emphasis on peak management, typical redevelopment projects were often waived from stormwater controls.

To address various program shortcomings, MDE development the "*2000 Maryland Stormwater Design Manual*" (Manual). This document is intended to provide better water quality control, an area not specifically addressed currently. Relative to redevelopment, the choice to impose requirements was based primarily on "everyone contributes runoff, everyone ought contribute management." However, a balance between management contributions for environmental purposes, and, practical requirements that make economic sense must be struck. Everyone should contribute management. However, conventional BMPs (e.g., ponds) are not feasible in major metropolitan areas where land values prevent typical management strategies. Flexibility is key.

ii) Does your state have design standards and performance standards for treatment control BMPs for new development/redevelopment?

Currently, there are no performance standards for BMPs only design standards. Maryland requires that BMPs be designed to maintain pre-development peak discharges for the 2 and 10 year storm events in most of the State.

Maryland's proposed Manual contains both design standards and performance standards. A suite of design volumes has been developed to address recharge (Re_v), water quality (WQ_v), channel protection (Cp_v), and overbank flood protection (Q_p). All of these volumes need to be included in new development designs. Additionally, BMP performance standards are implicit in Maryland's proposed Manual. Based on pollutant removal efficiency studies, all BMPs in the Manual have been equated in terms of efficiency. If a BMP is designed according to the criteria specified in the Manual, an 80% total suspended solids (TSS) and a 40% total phosphorus (P) reduction will both be realized. In fact, this 80:40 criteria is used to judge whether new technology is allowed to be used to address the required suite of volumes above. If the proverbial "new mousetrap" can meet 80% TSS and 40% P removal, it can be used as a stand alone BMP.

iii) Do you have thresholds for new development and or redevelopment (impervious area; size; etc.) for requirements to apply?

If a project disturbs 5,000 square feet of earth in Maryland, the site design must address stormwater management.

iv) What development categories do the requirements apply to [i.e. commercial; parking lots; residential, etc.]?

There are no specific development categories. If you disturb 5,000 square feet with any new development, you automatically are included. State regulations, however, do "exempt" agricultural land management activities.

v) How long have such requirements been in place? Are they statewide or region specific?

Stormwater management has been on the books since 1982. This is a statewide program that does have design variations based on hydrologic areas of the State (e.g., no 10 year management requirements in the Coastal Plain on our "Eastern Shore."

vi) Have the design standards and performance standards unduly burdened cities and builders with unsupportable costs? Has compliance been difficult? Has change been for the better or have you seen none? Any noticeable improvements in water quality?

All of these questions have been, are, and will not doubt continue to be debated. Volumes could be written to explain perspectives for burdens, costs, compliance, or noticeable improvements. To avoid this, some very random thoughts about these issues.

Generally, the answer to all of these questions could be "it depends on whom you ask" or "it depends on where you ask it." Maryland has three distinct geographic areas. These are a "Western" section; a central, "Urban" area; and our "Eastern Shore." The Urban area houses most of the State's population; can be defined in terms of the corridor between Washington, D.C., Baltimore, and toward Philadelphia, PA; and, not coincidentally, contains the most sophisticated stormwater programs in our State. It is not uncommon for a central Maryland county to have 8 or 10 plan reviewers and as many field staff dedicated solely to stormwater functions. The burden on these places currently is minimal.

As you travel west or east from this Urban region, the stormwater programs locally tend to become more burdensome. There is less sophistication technically, less resources, and obviously less compliance. In Western Maryland and on our Eastern Shore, localities may only have a single staff person to perform both review and inspection. The burden associated with changing to the proposed Manual in these regions will increase dramatically. However, again, it depends on whom you ask.

Environmental groups have told us we are not doing enough and have actually demanded "zero discharge" from new development. Developers and builders believe we are making them do too much now and are severely questioning our proposed changes and the Manual requirements. Frankly, and with tongue only partially in cheek, we believe we are close to where we need to be with the Manual because we have aggravated an equal number of people on both sides of this regulatory fence.

Some really random thoughts:

- In the beginning of the program (circa 1982), the design standards were very burdensome. Localities had to hire staff and purchase vehicles and equipment. Developers endured the added cost of BMP construction.
- Currently, stormwater management on both sides is a routine part of the development process.
- Compliance varies with the level of resources and the distance from Urban Maryland as described above. One difficulty we do have is the interpretation of the same requirement differently from locality to locality.
- We have seen only modest water quality improvement. This is expected to change dramatically with our Manual.

vii) Typically, what is your estimate of the range in additional cost (in percent of project cost) that the requirements have imposed on builders?

Obviously, this depends on that real estate saying "location, location, location." However, currently, stormwater management for 2 and 10 year control ranges from 0% to 20%. We have proposed to make optional the control of the 10 year storm. Because "lots are money" and "more stormwater means less lots," costs are anticipated to decrease about 20% of current costs without 10 year management. Costs will increase commensurately with 10 year management under the Manual.

viii) How have municipalities ensured that the post construction BMPs O & M has been provided and/or BMPs are properly maintained?

Operation and Maintenance Agreements are required as a condition of plan approval and permit issuance. Localities are required by State regulation to inspect and cause to be maintained BMPs every three years. Some jurisdictions assume ownership of BMPs. This is best for ensuring future maintenance. Other localities require private ownership, which makes it difficult for requiring maintenance due to the limited resources of entities such as homeowners' associations.

ix) What are the policy goals that the standards are intended to achieve (reverse impairment; hold the line; etc.)?

Basically, the best way to describe our proposed program's goal is to minimize damage caused by urban runoff. For us, this boils down to basic hydrology. When you change natural conditions to developed conditions, bad things happen to water quality. We also know that all soils have some recharge value, sustained bankfull discharges create severe channel erosion, and minimizing impervious surfaces is the best way to mimic pre-development hydrology. Therefore, we are hoping to change how development occurs. Hopefully, we can incorporate water management early in the site design process rather than having a BMP placed at the bottom discharge point of a site as an afterthought.

Individual volume goals and design criteria:

1) Recharge (Re_v) – mimic existing annual groundwater recharge rates.
2) Water quality volume (WQ_v) – 80% TSS removal (a Coastal Zone Management Act requirement), 40% P removal (a Chesapeake Bay Program goal), and treatment of 90% of the average annual rainfall.
3) Channel protection volume (Cp_v) – the 2 year storm control policy has actually created more channel erosion in some cases. This method sustains bankfull discharges over a longer period of time. Therefore, more frequent storm event control is essential. We are choosing the 1 year storm using extended detention. This is delaying the 1 year storm's inflow hydrograph by 24 hours.
4) Overbank flood protection (Q_p) – 10 year storm control is optional provided no additional downstream flooding occurs.

5) Redevelopment – the goal is to reduce by 20% the total site imperviousness. If not feasible, BMPs elsewhere in the watershed, stream restoration, fees paid are all acceptable but subject to local approval.

Mr. Xavier Swamikannu
Stormwater Program
Water Quality Control Board
320 W. 4th Street, Suite 200
Los Angeles, California 90013

Dear Ms. Jennings and Mr. Swamikannu:

This letter is sent in response to the email that I received from Mr. Swamikannu on May 19 requesting information about the State of Florida's stormwater treatment requirements. Where appropriate I also have included information that may be helpful about stormwater treatment programs in other states. This information was collected and published in the books *Institutional Aspects of Urban Runoff Programs: A Guide for Program Development* and *Implementation and Operation, Maintenance, and Management of Stormwater Management Systems.* I also have enclosed a paper that I use in teaching stormwater classes that I think will be helpful.

You specifically requested a response to the following questions:

1. Why did your state elect to have requirements on new development and redevelopment?

Studies conducted in the mid to late 1970s as part of the Section 208 Areawide Water Quality Management Program demonstrated that stormwater was a significant source of water pollution, especially from urban development. These studies also demonstrated that it was much easier and cheaper to prevent stormwater pollution using BMPs than to restore degrade water bodies and retrofit already developed areas. Accordingly, given the rapid urban growth Florida was experiencing in the late 1970s and the project growth in the 1980s, the Department of Environmental Protection determined that stormwater was a pollution source that needed treating. Consequently, the Environmental Regulation Commission adopted an interim stormwater rule requiring treatment in 1979 until further studies could be done on BMP effectiveness. On February 1, 1982, the final state stormwater rule was adopted requiring all new development and redevelopment activities to treat their runoff.

Today, six states in the country (Florida, Maryland, Delaware, Virginia, South Carolina, and Massachusetts) have adopted laws or rules that require the treatment of runoff from new developments. In addition, there are numerous regional (i.e., Puget Sound) and local governments that have implemented requirements for stormwater treatment.

2. **Does your state have design standards and performance standards for treatment control BMPs for new development/ redevelopment?**

Under the Federal Clean Water Act, water pollution control programs can be either water quality effluent based or technology based. Every stormwater treatment program in the United States is a technology based program. The key components of a technology based program are a performance standard (desired level of stormwater treatment) and design criteria for BMPs that assure they will provide that level of treatment. To develop design criteria, a number of analyses must be conducted including rainfall characteristics (annual volume, number of storms, interevent time, etc), runoff characteristics (i.e., stormwater volume, pollutant loadings, drainage area), whether BMPs are on-line or off-line, and BMP effectiveness.

Like all stormwater treatment programs in the United States, Florida's performance standard for stormwater treatment is to reduce the average annual loading of TSS by 80% (note that this is postdevelopment loading, so even with treatment, pollutant loads almost always increase). We adopted design criteria for various stormwater treatment BMPs (ie, retention, wet detention, detention with filtration) in our first rule. These criteria have been revised periodically as we gained additional information to assure that they meet the desired level of treatment. I have included a copy of Rule 40C-42 from the St. Johns River Water Management District which is the most current of our state stormwater rules with respect to design criteria. Also please remember that, during construction, erosion and sediment control BMPs must be used to retain sediment on site.

3. **Do you have thresholds for new development and or redevelopment (impervious area; size etc) for requirements to apply.**

The threshold varies depending on the stormwater/environmental resource permitting rule. Florida's stormwater program is cooperatively implemented by DEP and our regional water management districts. Therefore, we have five sets of rules in the state. The typical threshold is the creation of 4000 square feet of impervious area.

4. **What development categories do the requirements apply to [i.e. commercial; parking lots; residential etc]?**

Our rule applies to all urban development (and many agricultural activities as well).

5. **How long have such requirements been in place. Are they statewide or region specific?**

As previously stated, the statewide stormwater rule was first adopted in 1979 with a revised comprehensive rule in place on February 1, 1982. Florida's stormwater program is cooperatively implemented by DEP and our regional water management districts. Therefore, we have five sets of rules in the state. The WMD rules combine stormwater quantity, stormwater quality, and wetlands protection into a single permit called an environmental resource permit.

6. **Have the design standards and performance standards unduly burdened cities and builders with unsupportable costs? Has compliance been difficult? Has change been for the better or have you seen none. Any noticeable improvements in water quality?**

Complying with Florida's stormwater rule is a way of life that does not impose unduly burdens on local governments or the private sector. It also has provided many jobs for the engineering profession. The only part of compliance that is difficult is assuring long term operation and maintenance of the stormwater BMPs. They need to be inspected at least annually. Unfortunately, the public sector will never have enough inspectors which is why Delaware and Florida have implemented training and certification programs for inspectors. We have no doubts that the implementation of Florida's stormwater treatment program has greatly reduced the effects of growth in Florida on water quality and is a major reason why the state has so few truly impaired waters. We also have seen improvements in water quality as a result of retrofitting older stormwater drainage systems.

7. **Typically, what is your estimate of the range in additional cost (in percent of project cost) that the requirements have imposed on builders.**

This question is very site specific since the major cost is the land cost and that varies with every site. We estimate that complying with our stormwater rules requires about 5-10 percent of the land area of a development, although much of this is related to flood protection.

8. **How have municipalities ensured that the post construction BMPs O & M has been provided and/or BMPs are properly maintained.**

As part of our permitting process, the developer must identify the responsible maintenance entity. Typically, this is a homeowner or property owners association for residential development or the property owner for commercial development. The DEP and WMDs require recertification that the stormwater system is functioning on a regular basis (every 1 to 2 years). Additionally, since stormwater systems are part of the local infrastructure, many local governments conduct inspections annually and several have implemented stormwater operating permit systems that require annual inspections. Some of the 100+ local stormwater utilities in the state provide credits for functioning onsite stormwater systems providing an economic incentive to land owners to maintain their stormwater systems.

9. What are the policy goals that the standards are intended to achieve [reverse impairment; hold the line etc.]

Florida statutes and rules establishes the goals for the state's stormwater management program. These include:

- Effective stormwater management for existing and new systems to protect, preserve and restore the functions of natural systems and the beneficial uses of waters;
- Preventing stormwater problems from new land use changes and restoring degraded water bodies by reducing the pollution contributions from older stormwater systems;
- Preserving freshwater resources by encouraging stormwater infiltration and reuse;
- Trying to assure that the stormwater peak discharge rate, volume and pollutant loading are no greater after a site is developed than before; and
- Eliminating the discharge of inadequately managed stormwater into waters and to minimize other adverse impacts on natural systems, property and the health, safety and welfare caused by improperly managed stormwater.

9. Also discuss standards and requirements in other states that you are familiar with because of you special role and expertise.

As previously stated, nearly all of the stormwater treatment programs in the United States are similar. All of the above information for 32 stormwater programs around the country are summarized in books *Institutional Aspects of Urban Runoff Programs: A Guide for Program Development.*

I hope that this information is helpful. It is truly unfortunate that the development industry is still denying that urban runoff is a major source of degradation of our aquatic ecosystems. However, don't be discouraged. When we first adopted our rule, we went through 29 official rule drafts and over 100 TAC meetings before the final rule was adopted. Given the knowledge about stormwater pollution and the effects of urbanization on aquatic ecosystems, it should be much easier to fight any challenges that arise. Please let me know if I can be of further assistance.

Sincerely,

Eric H. Livingston

Mr. Swamikannu and Ms. Jennings:

This is in response to Mr. Swamikannu's e-mail correspondence to me dated May 19, 2000. In that correspondence, Mr. Swamikannu asked for responses to nine questions. Enclosure #1 provides responses from Ann Wessel and me to those questions. Ms. Wessel and I work on stormwater management issues for the Washington Department of Ecology (Ecology) in the Program Development Services Section of the Water Quality Program.

Because our time is limited, we have not elaborated in detail but have tried to give you enough information to satisfy your needs. In addition, I have enclosed a summary of the thresholds and minimum requirements for new development and redevelopment (Enclosure #2) from Ecology's 1992 *Stormwater Management Manual for the Puget Sound Basin*. I have also referenced other documents that are available to you, if you prefer.

Finally, Mr. Swamikannu should have received a draft of Volume 1 of the 1999 Dept. of Ecology Stormwater Manual for Washington State as an attachment to an e-mail message. Please note that the draft has no legal standing, as it has not been formally promulgated by the state. It could significantly change prior to its publication.

If you need a clarification of these responses or any additional information, please feel welcome to contact us. You have my e-mail address. My telephone number is 360/407-6438. Ann Wessel's e-mail address is awes461@ecy.wa.gov; her telephone number is 360/407-6457.

Sincerely,

Ed O'Brien

Response to Questions Posed by Xavier Swamikannu

1) Why did your state elect to have requirements on new development and redevelopment?

Response:

The state first became involved in developing requirements for new development and redevelopment as a result of the 1987 Puget Sound Water Quality Management Plan (The Plan). The Plan was developed as a comprehensive conservation and management plan under section 320 of the federal Clean Water Act. The Plan recognized that urban stormwater was a major contributor to the degradation of Puget Sound water and sediments, and its biological health. Consequently, The Plan specified a number of "program elements," or actions, to manage urban stormwater. One of the actions called for the Washington Department of Ecology (Ecology) to develop a manual to be used by local jurisdictions in stormwater management.

The Plan requires the manual to include: BMP's for controlling erosion from construction sites; hydrologic analysis procedures, including selection of design storms and runoff estimates; design, operation and maintenance standards for public and private structural facilities; and techniques for reducing or eliminating pollutants in runoff from problem land uses.

Subsequently, Ecology published its first *Stormwater Management Manual for the Puget Sound Basin* in February 1992. The Plan requires local governments to adopt requirements that are substantially equivalent to those in Ecology's manual.

In 1995, Ecology issued its first NPDES municipal stormwater permits. Because the permittees were all in the Puget Sound Basin, and so were already required by The Plan to have a "Comprehensive Stormwater Management Program," including a manual equivalent to Ecology's, Ecology issued permits that required permittees to develop and implement (Special Condition S.7.B.8.a.):

> A program to control runoff from new development, redevelopment and construction sites that discharge to the municipal separate storm sewers owned or operated by the permittee. The program must include: ordinances, minimum requirements, and best management practices (BMP's) equivalent to those found in Volumes I-IV of Ecology's Stormwater Management Manual for the Puget Sound Basin (1992 edition, and as amended by its replacement), permits, inspections, and enforcement capability. The program must also include a process to make available copies of the "Notice of Intent for Construction Activity" and/or copies of the "Notice of Intent for Industrial Activity" to representatives of proposed new development and redevelopment."

2) Does your state have design standards and performance standards for treatment control BMPs for new development/redevelopment?

Response:

A) 1992 Stormwater Manual
Washington State has design standards in its stormwater manual that are applicable to the Puget Sound Basin

and NPDES Phase I municipal permittees. The standards are not adopted into a state regulation. They are required by the Puget Sound Plan and by NPDES Phase I municipal stormwater permits.

The treatment design standard is the following:

> All projects shall provide treatment of stormwater. Treatment BMP's shall be sized to capture and treat the water quality design storm, defined as the 6-month, 24-hour return period storm. The first priority for treatment shall be to infiltrate as much as possible of the water quality design storm, only if site conditions are appropriate and ground water quality will not be impaired. Direct discharge of untreated stormwater to ground water is prohibited. All treatment BMP's shall be selected, designed, and maintained according to an approved manual.
>
> Stormwater treatment BMP's shall not be built within a natural vegetated buffer, except for necessary conveyance systems as approved by the local government. An adopted and implemented basin plan (Minimum Requirement #9) may be used to develop runoff treatment requirements that are tailored to a specific basin.

The following statements are offered for clarification:

The manual allows residential roof runoff to be infiltrated without having received treatment.

For most areas of the Puget Sound Basin, the 6-month, 24-hour storm is greater than the 90th percentile, 24-hour rainfall amount.

Volume I of the manual provides a BMP selection process to determine which BMP is most appropriate for the development site. Volume II of the manual specifies hydrologic procedures for determining the runoff flow rates and volumes for the water quality design storm. Volume III specifies design criteria for each treatment BMP listed in the manual.

B) The Draft 1999 Stormwater Manual

The draft of the 1999 manual lists the same water quality design storm as described in the 1992 manual. However, the draft also includes a list of options for defining a new water quality design storm event and asks for recommendations. Volume I of the draft manual is available upon request.

The 1999 draft also distinguishes between pollution-generating surfaces and non-pollution generating surfaces. Runoff from non-pollution generating surfaces does not have to receive treatment if it is discharged without mixing with runoff from pollution-generating surfaces. The draft manual includes definitions for pollution-generating impervious surfaces and pollution-generating pervious surfaces. Non-pollution generating surfaces would include: residential roofs, commercial roofs that do not accumulate pollutants from vents and fugitive emissions, isolated bicycle lanes, other ground surfaces that are not subject to vehicular use.

The draft manual also suggests that Ecology establish performance criteria for treatment BMP's. A performance criterion for basic water quality treatment BMP's is likely to be established in the manual. The criterion is likely to be a specified percent removal of total suspended solids given certain conditions (e.g., influent TSS, flow rate or volume). The criterion will likely not be used to determine site-by-site compliance, but will be used as the standard against which to judge whether new BMP designs will be accepted for use in new and redevelopments.

The draft 1999 also includes:

- A proposal to have discharges into receiving waters that have a phosphorus related water quality problem, to use treatment BMP's that are more able to remove phosphorus.
- A proposal to have discharges from high volume traffic intersections (25,000/15,000 ADT) and "high use sites" (Average daily trips of 15 vehicles per parking space per day; or, commerical or industrial sites subject to petroleum storage and transfer in excess of 1,500 gallons/year; or, commercial/industrial sites subject to use, storage or maintenance of a fleet of 25 or more diesel vehicles that are over 10 tons gross weight) to use an oil removal BMP in addition to applying a "basic" or "enhanced" treatment BMP.
- A proposal to require "enhanced" treatment BMP's for discharges that are likely to violate water quality standards, despite the application of a "basic" treatment BMP, because of a lack of available dilution in the receiving water. The pollutants in question are dissolved copper, zinc, and lead.

3) Do you have thresholds for new development and or redevelopment (impervious area; size, etc) for requirements to apply?

Response:

A) 1992 Stormwater Manual
We have established thresholds that determine the set of requirements that apply to projects. I will fax a summary of the thresholds and corresponding minimum requirements. In brief:

Large Parcels:
Projects that disturb 1 acre or more of land have to meet all eleven of the Large Parcel Minimum Requirements.

Medium Parcels:
Development that disturbs less than 1 acre of land but adds or creates 5,000 ft2 or more of impervious surface, are subject to Large Parcel Minimum Requirements #2 through #11, and the Small Parcel Minimum Requirements for erosion control.

Small Parcels:
Construction of an individual single family residence or duplex; or, construction that adds or creates less than 5,000 ft2 of impervious area and disturbs less than 1 acre are only subject to the small parcel minimum requirements.

Redevelopment projects have some additional thresholds. I will fax a summary of the redevelopment requirement also.

B) The Draft 1999 Stormwater Manual
The draft 1999 manual has similar requirements to the 1992 manual, but there are some significant proposed changes:

- Single family residential projects could be subject to large parcel requirements if they exceed certain thresholds.

- The Small Parcel Requirements may be expanded to include onsite design requirements to maximize infiltration and flow dispersion and treatment without construction of structural facilities.

- All projects, regardless of size, will have to comply with all of the erosion and sediment control requirements or explain why a requirement is not necessary for the site (e.g., no silt fence around a site that is flat or is a closed depression).

- The Large Parcel Requirements allow use of Small Site Requirements for small isolated drainage areas of larger projects.

- The proposed Redevelopment thresholds are significantly changed. They are:

  All redevelopment projects in which the total of *new plus replaced* impervious surfaces is 5,000 square feet or more must comply with Large Parcel Minimum Requirements #1 and #3 for the project site.

  Redevelopment projects that add 5,000 square feet or more of *new* impervious surface must comply with all the Large Parcel Minimum Requirements for the new impervious surfaces. If the runoff quantity from the new surfaces is not separated from runoff from other surfaces prior to treatment or flow control, the stormwater facilities must be sized for the entire flow. Alternatively, the local government may allow the Large Parcel Minimum Requirements to be met for an equivalent (flow and pollution characteristics) area within the same site.

  All redevelopment projects in which the total of new plus replaced impervious surfaces is 5,000 square feet or more, and whose valuation of proposed improvements – including interior improvements - exceeds 50% of the assessed value of the existing site improvements shall comply with all the Large Parcel Minimum Requirements for the entire site.

  Local governments may exempt redevelopment projects from compliance with Large Parcel Minimum Requirements #4, #5, and/or #6 if they have adopted a plan that fulfills those requirements in regional facilities that will discharge to the same receiving water, AND if they have an implementation plan and a schedule for construction of those facilities. Redevelopment projects for public roads may be exempted from meeting Large Parcel Minimum Requirements #4, #5, and/or #6 for the entire site (i.e., the exemption does not extend to new surfaces that add impervious area) if there is an adopted Capital Improvement Program for retrofitting existing road surfaces.

4) What development categories do the requirements apply to (i.e., commercial; parking lots; residential, etc.)?

Response:

Washington's requirements for water quality treatment and flow control apply to impervious surface and to land disturbance (clearing and grading) regardless of the type of land use. Generally, the source control requirements specified in our Volume IV of the manual apply only to commercial and industrial operations.

5) How long have such requirements been in place? Are they statewide or region-specific?

Response:

In 1992 we adopted the Stormwater Management Manual for the Puget Sound Basin. The manual was guidance for the approximately 115 municipalities in the Puget Sound Basin that are required to adopt either the Ecology manual or a manual containing substantially equivalent technical standards. The requirement to adopt the manual was contained in a statute establishing the Puget Sound Water Quality Authority, and development of the Puget Sound Plan. The statute stated that local governments "*must evaluate, and incorporate as applicable, <u>subject to the availability of appropriated funds or other funding sources</u>, the provisions of the plan, including any guidelines, standards and timetables contained in the plan.*" The deadline in the plan for adopting the manual was 1994, however, given the weak statutory requirement and lack of consequences for failing to adopt a manual, few municipalities met the deadline. Regardless, many municipalities began amending and adopting ordinances to incorporate at least part of the requirements, and stormwater controls for new development are accepted practice.

Outside of Puget Sound, the 1992 Stormwater Management Manual was applied as best available science in permitting decisions made by Ecology and other State Agencies.

In 1995 we issued our first municipal stormwater NPDES permits covering the five largest municipalities and Washington State Department of Transportation (WSDOT). This permit established a requirement for adoption and implementation of technical standards and BMPs equivalent to those in the Ecology manual during the term of the permit.

We are currently updating the Ecology manual, and expanding it to a statewide manual. As soon as possible after completion of the new manual, we will reissue the municipal stormwater permit requiring updating of local ordinances and manuals. When we issue phase 2 permits we will also require adoption of the new manual.

6) Have the design standards and performance standards unduly burdened cities and builders with unsupportable costs? Has compliance been difficult? Has change been for the better or have you seen none? Any noticeable improvements in water quality?

Response:

There are substantial costs to implementing stormwater controls for new development and redevelopment, but they are incremental to existing development and permit review costs. The single largest cost driver for developers is land value, so vaults and other underground BMPs tend to prevail in the downtown core areas. Local governments struggle with adequate enforcement, but seem to manage costs through combinations of general fund, permit fee, and stormwater utility revenues. Given the pace of development in Puget Sound, even in the municipalities where stormwater controls for new development are more stringent than what is in the Ecology manual, stormwater controls have not proven to be an obstacle to development.

As for noticeable improvements in water quality, we have not been monitoring to specifically address this question. We are in the process now of developing monitoring requirements for the next permit term that will address the question of effectiveness of programs to control both quantity and quality of runoff from new development. We have anecdotal evidence of reduced sediment loads from erosion and sediment control programs at construction sites (our requirements go beyond the federal 5-acre minimum to require erosion control for all land disturbing activities). Also, data on sediment contamination in urban bays is showing some improvement that could be attributed to stormwater controls.

7) Typically, what is your estimate of the range in additional cost (in percent of project cost) that the requirements have imposed on builders?

Response:

A) 1992 Stormwater Manual
We have not run cost estimates as a percentage of construction. We developed cost estimates for compliance with our 1992 manual using three different types of development (residential, small and large commercial), and assuming infiltration was possible and not possible. For each instance, we developed cost estimates for erosion and sediment control during construction, for the permanent water quality treatment and flow control facilities, and for operation and maintenance.

Ecology did not consider the costs as unreasonable. Let me know if you want a copy of the cost analyses.

One of our Phase I NPDES municipal permittees developed a cost factor for determining whether it was reasonable to make a redevelopment site retrofit treatment BMP's to the entire site (even though only part of the site may be redeveloped). If the treatment BMP retrofit would increase total project costs by 10% or more, the county would allow a reduction in the area being treated in order to stay below the 10% threshold. But in any case, the runoff from the redeveloping portion of the site has to receive treatment. The state accepted this redevelopment requirement.

B) The Draft 1999 Stormwater Manual
We have not done cost estimates on our proposed treatment, flow control, source control, and other minimum requirements. Where those requirements do not substantially change from our 1992 manual, we do not think it is necessary to re-justify them. Through the previous cost analyses and because they have been implemented for eight years throughout Puget Sound, they are considered reasonable requirements.

We have two areas in which our updated requirements could impose significant new costs: 1) the proposed flow duration standard for discharges to streams; and 2) the possible requirement for BMP's to remove significant amounts of dissolved metals in discharges to small receiving waters. We intend to develop costs for these instances. However, costs may not be a factor in these decisions. Both of these proposed requirements are water-quality based. That is, they will be required in those situations where they are determined necessary to maintain beneficial uses and not violate water quality standards. Water-quality based requirements are not subject to cost reasonableness analyses. In addition, both of these requirements are already in effect in significant areas of King County (i.e., the Seattle metropolitan area) for almost two years. The application of these requirements to ongoing development projects could also speak to their cost reasonableness.

8) How have municipalities ensured that the post-construction BMP's operation and maintenance has been provided and/or BMP's are properly maintained?

Response:

The municipal stormwater NPDES permit requires adoption of an ordinance that requires maintenance of privately owned stormwater facilities that discharge into municipal separate storm sewers (ms4) owned or operated by the permittee. The permit also requires the permittee to inspect facilities draining to the ms4 for proper operation and maintenance, and to have enforcement capability.

9) What are the policy goals that the standards are intended to achieve (reverse impairment; hold the line, etc)?

Response:
The goal of the technical standards for new development is to hold the line. The goal of the standards applied to redevelopment is to begin to reverse impairment.

STORMWATER TREATMENT BEST MANAGEMENT PRACTICES

Numerical Sizing Criteria for Development Planning

Sample Calculations

Sample calculations for using the numerical sizing criteria under consideration by the Board were performed for a hypothetical commercial development. The case examples illustrate that the three different numerical sizing criteria for calculating best management practice (BMP) sizing dimensions produce values that are within 10 - 15 percent of one another, when local rainfall data are used.

Requirement: capture of 85th percentile rainfall event
Project: Light industrial warehouse/office with parking lot (assume the site is entirely impervious)
Project site size: 240,000 sq. ft = 5.51 acres

Treatment BMP: 48-hour Detention Basin: Sample calculation demonstrates the water quality treatment volume required to size a detention basin using (a) the maximized water quality treatment volume method; (b) the 85th percentile rainfall event treatment volume for the site using local rainfall data; and (c) the 90 percent annual runoff volume capture method.

(a) Maximized Water Quality Treatment Method – WEF Manual of Practice #23 (Chap 5)

Maximized Detention Volume, $P_o = a\,C\,P_6$ [WEF, p.175]

For 85th percentile event capture for 24 hours

Regression constant, a = 1.963 [WEF, Tbl 5.4, p.177]
Mean Storm Depth, P_6 = 0.64 in. [WEF, Fig 5.3, p.176]
(Note: Local precipitation record can be used to calculate more accurate P_6 for the site)
Runoff Coefficient, C = 0.9 [Dunne, p.300]
(Assume the entire site is paved)

⇨ P_o = 1.963 x 0.9 x 0.64 = 1.13 inch
⇨ Required storage volume = P_o x area of site
⇨ = (1.13 in/12) x 240,000 sq. ft.
⇨ 22,600 cu. ft.

Basin Size ~ 55'L x 40'W x 10.3'D

(b) Using treatment volume from all events up to and including 1.1" rainfall (85% treatment based on local rainfall data)

P_o = 1.1 in.

⇨ Required storage volume = (1.1 in/12) x 240,000 sq. ft
⇨ 22,000 cu. ft

Basin Size ~ 55'L x 40'W x 10'D

(c) California Stormwater Handbook

90 percent annual runoff volume capture for 40 hours [Indus. Handbook, p. D1]

Unit basin storage volume = 0.060 ac-ft/ac [Indus. Handbook, p. D9]

⇨ Required storage volume = Unit basin storage x area of site
⇨ = 0.060 ac-ft/ac x 5.51 ac
⇨ = 0.331 ac-ft
⇨ = 14,400 cu. ft

Basin Size ~ 36'L x 40'W x 10'D
(Note: This calculation was performed using available data from the Oakland Airport rather than the Palo Alto data used in example (b). The Oakland data appears to significantly understate the need for storage, and this example demonstrates the importance of using local rainfall data in stormwater calculations).

Technical Concept

- **Over a year, the largest volumes of runoff are produced by smaller storms**
- **Using the Tentative Order sizing criteria, BMPs would be sized, using local rainfall data, to treat these smaller, more frequent storms.**

ATTACHMENT D

STORMWATER TREATMENT BEST MANAGEMENT PRACTICES

Numerical Sizing Criteria for Development Planning

BMP Cost Estimates

A cost estimate has been developed for post-construction BMPs for a commercial development project using the numerical sizing criteria under consideration by the Board. The cost estimate calculations are based on cost estimates developed by the Los Angeles Regional Board Water Quality Control Board and City of Los Angeles staff. Staff realizes costs in the Los Angeles Region will not be identical to those in the San Francisco Bay Region. However, the cost estimates should be similar, providing adequate information for analysis at the planning level.

The cost estimate is conservative and designed to maximize the cost of the BMP relative to overall project costs (see *Note*, below). The estimate indicates that the capital and maintenance costs associated with a treatment BMP sized to meet the numerical sizing criteria are reasonable and amount to about 1.1 percent of the project cost. The total cost of the project was estimated to be $6.5 million and includes the land acquisition for a 5.5 acre site, engineering and design, any clean-ups, construction, permits, etc.

A single estimate has been prepared for a 48-hour detention basin. Because of the land area and excavation they require, detention basins are usually viewed as the most costly treatment control BMP in terms of up-front capital investment. Other BMPs, such as vegetated swales or in-ground treatment controls, would be expected to have a lower capital cost. The operation and maintenance costs for BMPs vary depending on BMP, and could be relatively higher or lower than those shown here. For example, vegetated swales are usually placed into a site's landscape area, and are often maintained as landscaping would be (e.g., regularly mowed). Thus, while there is a cost that can be attributed to the swale, the presence of the swale does not necessarily incur an increased maintenance cost for the project compared to not having it there.

Note: A land cost of $1.1 million per acre was used in this calculation. This is an estimated land cost based on anecdotal discussions with local developers. However, even a significantly increased land cost would not change the results of the calculation. This is because BMP costs are calculated relative to the overall project costs. If estimated land costs were to almost triple, for example, to $3 million per acre ($75 per square foot), the cost of the detention basin as a percentage of project costs would actually fall, to less than 1 percent.

The below example is simplified. It likely understates project costs by estimating total project costs other than land (e.g., design, permitting, construction, local fees, etc.) at about $500,000. "Other project costs" are likely significantly above that amount, perhaps by more than an order of magnitude (i.e., for a total of at least $5.5 million). Detention basin costs have also been simplified. For example, costs including planting, orifice design, etc., have not been included. However, based on construction costs of $25,000 –50,000 per acre for constructed wetlands with similar features (excavation, planting, installed tide gates, etc.), the overall conclusion of the example remains the same—that BMP costs relative to overall project costs are around 1-2% or less. In general, the example has been estimated conservatively to attempt to maximize the costs of the BMP as a percentage of the overall project costs.

Case Example 1 – 48-hour Detention Basin

Excavation and haul away - $22 per cubic yard [1]

⇨ Warehouse Project: 22,600 cubic foot = 837 cu. yd = $18,414

Land Cost - $25 per square foot (~$1.1 million per acre) [2]

⇨ Warehouse Project: 55' x 40' = 2200 sq. ft = $55,000

Maintenance cost – 1 clean out per year

Event mean TSS concentration for Commercial Area = 91 mg/L [3]

Total rainfall volume captured by basin ~ 85% of 13.2 in. per year
= (11.22 in./12) x 240,000 square feet
= 224,400 cubic feet of water
= 6,350,000 L

TSS collected = 80% (91 mg/L x 6,350,000) = 463 kg/yr
If sediment density = 1.5 tons/ cu. yd, total TSS removed = 0.31 cu. yd/yr
⇨ Clean Out Cost: 1 cu. yd / 3 years = $99/3 yrs = $33 / yr

Total Capital Cost = $73,414
Annual Maintenance = $ 33
About 1.1% of total project cost.

ATTACHMENT E

AMENDMENT OF THE NEW DEVELOPMENT PROVISION: STAKEHOLDER PROCESS

1999-2000: Discussions and submittals from Co-permittees regarding reissuance of the entire municipal storm water NPDES permit, including new development provisions as well as all other permit provisions

Oct. 13 - Nov. 13 2001: Formal public comment period on the Tentative Order for the entire NPDES permit reissuance. Comments were received from Co-permittees, environmental advocacy groups, and industry, and included comments on new development provisions.

Nov. 7, 2000: Held a stakeholder meeting during the formal public comment period to discuss permit issues. Significant comments remained on the new development provisions.

Dec. 13, 2000: Held a stakeholder meeting on the new development provision only. Regional Board staff and stakeholders agreed that the new development provision needed further work, while the remainder of the permit should be reissued. Co-permittees gave their permission to reopen the storm water permit after its reissuance for purposes of adopting a revised new development provision.

Jan. 10, 2001: Held a stakeholder meeting to discuss the new development provisions. Regional Board staff considered comments from this and previous meetings to draft new language.

Feb. 21, 2001: Santa Clara Basin municipal storm water NPDES permit is reissued.

Early May, 2001: Draft new development provisions issued for discussion with stakeholders.

May 14, 2001: Held a stakeholder meeting on the new development provisions. Verbal comments from the meeting and written comments received after the meeting were used to make additional changes in the provisions.

May 18-June 18, 2001: Formal public comment period for the Tentative Order containing the new development provisions.

June 5, 2001: Held final stakeholder meeting on the new development provisions to discuss the changes made following the meeting in May.

STORMWATER RESEARCH NEEDS IN SOUTHERN CALIFORNIA:

2001-2005 Research Agenda

Brock Bernstein and Kenneth Schiff

November 29, 2001

R0020703

Acknowledgements

This document represents a remarkable first step towards regional cooperation in stormwater science and management for southern California. The culmination of this research agenda was, for the most part, a voluntary activity initiated by both stormwater management agencies and regulators in a spirit of mutual collaboration.

The authors wish to thank the workshop panelists who gave freely of their time and talents. The wonderful mix of local and national experts across a wide variety of disciplines and backgrounds provided a unique opportunity for us.

Table Of Contents

R0020705

Introduction

Watersheds in southern California are among the most modified systems in the world (Brownlie and Taylor 1981). Stormwater conveyance systems have been built primarily to reduce flooding, but the infrastructure has not designed to improve water quality. Water quality issues are compounded by the high degree of urbanization of watersheds in southern California. More than 17 million people inhabit the six coastal counties of southern California making it among the most densely populated coastal region in the country (Culliton et al. 1990). The large degree of urbanization, coupled with infrequent rainfall that enables build-up of non-point sources of pollutants, results in sporadic but tremendous loads to receiving waters. Current estimates of pollutant mass emissions for the southern California region indicate loads to the coastal ocean from stormwater discharges rival, and often exceed, those from point sources (Schiff et al. 2001). Based upon the increasing population of southern California and the lack of storm water quality infrastructure, it is likely that stormwater loads will continue to increase.

There is some evidence that stormwater discharges impact receiving water quality. For example, regional monitoring of southern California beaches has shown that shorelines which receive dry weather flows are 10 times more likely to exceed water contact standards than those that are distant from storm drains (Noble et al. 2000). Moreover, more than 60% of the shoreline exceeds water contact standards following wet weather events. This has led to the permanent posting of warning signs near drain outlets and blanket warnings against body contact recreation at any beach for 72 hr following rain events. In addition, large loadings of nutrients have been measured from urban creeks and these have ultimately contributed to the over-enrichment of estuaries at the mouths of urban watersheds, as indicated in part by large blooms of macroalgae. As another example, storm drain discharges have been shown to be toxic to marine and freshwater organisms and this toxicity persists over large areas as discharge plumes spread through coastal receiving waters. After these plumes settle to the bottom of the ocean, the pollutants have been measured in nearshore sediments. Where these sediments must be dredged to maintain navigable harbors or marinas, the associated contamination increases the cost of dredging by orders of magnitude.

Although pollutant loads from stormwater are as large as those from municipal wastewater discharges (POTWs, or publicly owned treatment works), there has been no long-term and sophisticated effort, as there has been for POTWs, to reduce these loads. A primary reason for this lack of coordinated effort is the absence of an equivalent base of scientific knowledge on which to base sound management decisions. For example, knowledge about reference, or expected, conditions is insufficient to enable managers to identify when impacts occur, which beneficial uses are most severely impaired, or clarify target endpoints for remediation. Similarly, we are often unable to differentiate between natural (e.g., storms) and anthropogenic (e.g., contamination, flow modification) impacts on biological communities. Moreover, when water quality impacts from specific constituents do occur, we are too often incapable of identifying, targeting, and reducing their specific contributions.

In parallel with the relatively poor level of scientific understanding of stormwater impacts, there is a lack of technical knowledge on how best to control stormwater discharges. Technical data gaps include source identification in urban watersheds where many small, diffuse sources may commingle. Further, assessments of the most effective and efficient treatment or management strategies for resolving stormwater impairments are typically absent or not well validated. For example, there is a lack of substantive and long-term data about how well best management practices (BMPs) work, which ones work best under a range of conditions, or which BMPs are most appropriate in specific applications for improving receiving water quality.

Finally, available stormwater management tools are typically inadequate to deal with existing needs for proper stewardship and decision making. The tools that do exist are often inadequate because they are either not specific enough (i.e., are based on inappropriate point source analogs) or have not been developed or tested in southern California. For example, managers do not have a tool for assessing the health of physical habitats and biological communities in freshwater environments. Although this tool has been effective at addressing physical and water quality impacts elsewhere around the nation, it has not been developed or applied successfully in southern California. An index or metric of physical and/or biological health would be an invaluable tool for environmental decision making.

Despite such information gaps, management actions (from both the regulated and regulator communities) are being mandated by regulatory frameworks such as National Pollutant Discharge Elimination System (NPDES) Permit requirements and Total Maximum Daily Loads (TMDLs). In the absence of adequate information about stormwater impacts, regulatory requirements derived through such frameworks are likely to be questioned from a variety of perspectives and may not achieve their intended benefits.

Formation of the Stormwater Monitoring Coalition

As a result of the increasing regulatory focus and the lack of scientific knowledge base, both stormwater regulators and municipal stormwater management agencies throughout southern California have developed a collaborative working relationship. The goal of the relationship is to develop the technical information necessary to better understand stormwater mechanisms and impacts, and then develop the tools that will effectively and efficiently improve stormwater decision making. As individuals and agency representatives, there was early recognition that these issues are most often not localized, but oftentimes cross watershed and jurisdictional boundaries. The relationship culminated in a formal letter of agreement signed by all of the Phase I municipal stormwater NPDES lead permittees and the NPDES regulatory agencies in southern California to create the Stormwater Monitoring Coalition (SMC) (Appendix 1).

The SMC member agencies have developed a clear vision of regional cooperation. The vision includes combining resources to cost effectively address the data gaps. The vision includes improved effectiveness of existing monitoring programs by promoting standardization and coordination and reducing duplication of effort across individual programs. In addition, this will lead to improving the basic infrastructure for exchanging, combining, and analyzing data from across the region. The multi-agency collaboration hopes to trade off redundant or ineffective monitoring program elements in order to allocate resources to the research projects necessary for improving stormwater management. The findings from these applied research projects can then be easily and quickly integrated into the existing stormwater management programs.

Once the agreement to work collaboratively was signed, the next step was to determine which research projects should be undertaken. The SMC developed a three step process to identify these projects. The process included: (1) creation of a white paper outlining the technical issues and management questions of interest; (2) conduct a workshop to develop an agenda of research projects using experts in a variety of scientific disciplines; and (3) establish a five-year research plan to implement based upon the workshop proceedings. This document represents step three in the process. The white paper and workshop details can be found in appendices to this document.

Research Themes

The experts who participated in the research agenda workshop generated more than 50 project ideas in less than four hours. This plethora of ideas were combined, clarified, and prioritized over the next day ultimately leading to 15 research projects. Each project was then developed in terms of a problem statement, desired outcome (products), tasks, schedule, and necessary resources (expertise, costs, and potential collaborators).

The 15 research projects developed by the workshop experts naturally fell into one of three categories. These categories included: (1) developing a regional stormwater monitoring infrastructure; (2) improving the fundamental understanding of stormwater mechanisms and process; and (3) identifying stormwater impacts in receiving waters. Monitoring infrastructure includes projects that find ways to integrate, standardize or maintain comparability among programs throughout southern California. These projects include mining existing data, sampling and analysis, data management and sharing, and testing BMPs.

Research projects that improve our fundamental understanding of stormwater mechanisms and processes begin with creating a conceptual model of our existing understanding of these processes. This will help us to identify our knowledge gaps. *A priori* we expect that there will be at least three gaps in the conceptual model. These include an evaluation of reference condition, an evaluation of beneficial uses, and identifying relative contributions of nonpoint sources to stormwater discharges.

Identifying stormwater impacts in receiving waters is the research theme with the greatest number of projects, reflecting how little we know about this subject. Five research projects are geared specifically towards developing tools for assessing conditions in receiving waters. These tools include freshwater bioassessments, toxicity testing, faster and more specific methods for identifying microbial contamination, and identifying indicators of impacts resulting from increased peak flows.

Although the projects are written as individual projects, many of the projects are inter-related. The final chapter of this document provides an overview of these relationships showing where the results from one project may feed into another project.

Developing a Stormwater Monitoring Infrastructure

The following four projects focus on improving the basic knowledge and tools available for addressing questions on a regional scale. They are intended to increase the efficiency of monitoring and improve data integration and interpretation.

Project 1. Integrate and evaluate available data

To date, historical stormwater monitoring data have not been used to their full potential, with the result that important questions at both the local and regional scale have not been addressed and significant opportunities for improving the effectiveness and efficiency of monitoring have not been taken advantage of. This project will address these issues by identifying, integrating, and evaluating available monitoring data from the region. This project would depend to some extent on the regional data infrastructure (Project 3) and would contribute to the definition of regional reference conditions (Project 6) and assessing beneficial uses (Project 7).

Problem statement

While stormwater monitoring programs in southern California have collected large amounts of data, there has been no systematic effort to integrate and analyze these data from a regional perspective. An estimated 1,700 wet weather site-events have been monitored by southern California monitoring programs between 1992 and 1999, which are more than most nationwide data sets. In addition, analysis efforts carried out by individual stormwater programs have not examined a consistent set of questions across the region. As a result, there is little information about the following questions, among others:

- what is the spatial extent of stormwater monitoring?
- what percentage of the total estimated flow of stormwater is monitored on an annual basis?
- what kinds of data types are being sampled throughout the region, and to what extent?
- what is the regional distribution and variability among runoff coefficients from specific land uses?
- what is the regional distribution and variability in contaminant loadings from specific land uses?
- what is the regional distribution and variability in impacts on receiving waters?
- are there specific watersheds or sources that contribute disproportionately to mass emissions on a regional basis?

Thus, available data have not been fully utilized, on a regional basis, to characterize monitoring effort, identify significant sources, describe impacts on receiving waters, and improve the effectiveness and efficiency of monitoring efforts by, for example, removing redundancies among programs.

Desired outcome

This project would take advantage of available monitoring data to help lay the groundwork for important aspects of a regional stormwater monitoring program. It will fully describe monitoring efforts in terms of the parameters sampled and their spatial and temporal coverage. By integrating available information on sources and impacts, it will also take the first steps toward a regional assessment of impacts and beneficial uses (Project 7) and toward a regional definition of background or reference conditions (Project 6). Together, these results will help improve the effectiveness and efficiency of monitoring, on both the local and the regional levels, focus management attention on areas and problems of greater significance, and improve understanding of where and how impacts on receiving waters occur.

Tasks

The major challenges facing this project involve collecting and integrating available data and defining and agreeing on key questions and the analysis approaches appropriate for addressing them.

This project would collaborate with or make use of information from other ongoing or planned studies. For example, the Contaminated Sediment Task Force in Los Angeles has already allocated funds for an analysis of contaminant sources in stormwater to the sediments in Marina del Rey and Los Angeles/Long Beach Harbors. In addition, SCCWRP has committed to a regional analysis of stormwater monitoring data from industrial discharges. Finally, SCCWRP has already compiled a portion of the regional stormwater monitoring data that would be needed for this project and this experience could provide a firm basis for planning and costing out the remainder of the data collection and integration effort. Datasets produced in this project would be formatted to the standards developed in Project 3 and would become part of the regional data infrastructure developed in that same project.

The specific tasks involved in this project include:

- identify existing relevant data
- develop list of specific questions and analyses needed to answer them
- develop a formal data management and analysis plan
- acquire or otherwise confirm access to needed data
- perform quality and consistency checks on data
- standardize and/or normalize data as needed
- conduct analyses
- prepare report(s).

This is a low risk / high benefit project. The probability of success is high because techniques for data integration, synthesis, and analysis are well established. The benefits are likely to be substantial because region-wide analyses have not been performed in the past. In such a situation, the marginal benefit of initial investments in synthesis and analysis are typically very high.

Schedule

This project could begin immediately and could be completed within 12 months.

Resources

Needed expertise includes data managers and data analysts with direct experience with a range of environmental data types. Expected costs are in the range of $100,000 to $250,000. Examples of similar projects include the regional assessments performed as part of the Bight '98 project and watershed assessments performed at a variety of locations throughout the country. Potential partners include the Contaminated Sediments Task Force in Los Angeles and an analogous effort being conducted by San Diego County.

Project 2. Standardize sampling and analysis protocols

At present, the wide array of monitoring approaches used throughout southern California makes it difficult to readily compare findings across stormwater programs and address questions of regional importance. This project would address this problem by developing a standardized set of monitoring protocols for use throughout the region, guided in part by insights gained from Project 1's regional assessment. Senate Bill 72 (SB72) has allocated funds that could support this effort.

Problem statement

Monitoring programs throughout southern California often approach the same question in different ways, sample different sets of parameters, and use a range of field and laboratory methods to collect and analyze samples. This inconsistency makes it difficult, if not impossible, to address questions on a broader spatial scale, to compare monitoring results across programs, and to improve efficiency by taking advantage of opportunities for exchanging data and coordinating monitoring responsibilities across the region.

There are several significant issues involved in any attempt to establish regional standards. Standardization can be approached at four distinct levels. The highest level involves the issue of what to monitor (e.g., should loads be monitored?). The next level involves the approach to use once a decision has been made to monitor a particular parameter (e.g., should time weighted or flow weighted sampling be used?). The third level is procedural and focuses on what specific instrumentation and/or techniques to apply (e.g., should the Mark IV or Mark V Tricorder be used?). Finally, the lowest level of detail involves sampling design issues (e.g., how many samples should be collected? How long should monitoring continue for?). In addition, any attempt at regional standardization must balance the benefits of standardization against the costs in lost flexibility at the local level. Finally, robust sampling approaches for many stormwater related issues have not yet been fully developed, making it difficult to readily select a common standard.

Despite the fact that these issues are often difficult to resolve, the benefits of appropriate regional standardization have been amply demonstrated in numerous instances around the country and in many different types of programs.

Desired outcome

This project would produce a regionally consistent set of standardized monitoring protocols. These would provide the technical basis for addressing questions of regional importance while at the same time maintaining local flexibility where it is essential. Standardization efforts could move in succession through each of the four levels identified above.

Tasks

The major challenges facing this project involve obtaining agreement among a diverse set of participants on, first, the set of priorities for standardization and, second, the standards themselves. The multiyear efforts involved in standardizing monitoring protocols for the marine coastal environment in southern California provide a useful template for this project.

This project could make use of efforts elsewhere in the country to develop uniform approaches to stormwater monitoring. However, the unique features of climate and geography in southern California often make it difficult to apply such approaches directly and without modification. The specific tasks involved in this project include:

- identify a list of management and technical questions that require regionally standardized data to answer
- review and compare relevant monitoring protocols from southern California and from other areas
- determine which protocols can be applied regionally in southern California
- determine which management questions and/or technical issues require further methods development
- develop detailed recommendations to guide implementation by appropriate working groups
- develop regional field operations manual
- conduct laboratory intercalibrations for bacteria, metals, nutrients, and organics.

This is a low to medium risk / high benefit project. The potential risks stem, not from technical problems, but from institutional issues that may make it difficult to achieve regional consensus about sampling methods. However, the potential benefits, in terms of improved efficiency and coordination, along with the ability to integrate data from across the entire region, are large.

Schedule

This project could begin immediately and be completed in 12 months.

Resources

Needed expertise includes a facilitator and in-kind time of one field operations staff person from each participating agency, as well as in-kind time of agency staff knowledgeable about chemical analyses. Expected costs are in the range of $50,000 to $150,000 to produce the field operations manual and another $100,000 to $500,000 to complete the laboratory intercalibrations for chemical analyses. Intercalibrations for bacteria, metals, and nutrients are relatively inexpensive compared to those for organics. Where in the range the costs actually fall depends largely on the constituents chosen. The Bight project undertook similar standardization efforts and these costs are based on that experience. Besides the stormwater agencies in the region, potential partners include the USGS, the SWQTF, and WERF.

Project 3. Develop a regional data infrastructure

The lack of a common data infrastructure in the region makes it extremely difficult to combine data from different programs to assess impacts and problems, quantify trends, evaluate the effectiveness of different solutions, and establish reference conditions on a regional scale. As a result of this situation, it is impossible both to make the best use of available historical data and to realistically consider developing a coordinated regional monitoring program that reduces duplication of effort. This project addresses this problem by creating a set of agreements and standards that will streamline data integration, along with a distributed data management system that will expedite finding and acquiring needed data.

Problem statement

At present, scientists and managers do not have the ability to examine data from across the region to search for patterns or trends, compare impacts and BMP effectiveness across locations, assess local conditions against regional background or reference conditions, or ensure regionally consistent quality control of raw and processed data. In addition, the inability to combine and integrate data from throughout the region leads to duplication of effort and other inefficiencies in individual monitoring programs. Thus, because there is no central data clearing house or network, based on common standards, to make data readily and broadly available, stormwater monitoring and research are less cost effective than they otherwise could be.

Desired outcome

Ultimately, this project would produce a distributed online system, with a centralized catalogue to facilitate search and retrieval, which would provide a wide range of users access to stormwater data from throughout the region. The system could be developed in stages, as follows:

- a simple catalogue of datasets, their locations, and descriptions
- a catalogue with search functions and links to permit users to access and/or retrieve specific datasets
- the addition of data summaries, analysis results, and other data products
- the implementation of regional data quality control and formatting standards to aid data integration
- the addition of modeling, mapping, and other analysis tools to support regional investigations.

Tasks

The major challenges involved in addressing this problem include deciding what data types the system should accommodate, what design the system should be based on, what specific needs it should focus on, and establishing the necessary agreement and coordination among participants. However, the availability of modern distributed database technology will help any such effort avoid the problems inherent in older, centralized systems such as STORET and ODES.

In addition, there are several examples of the successful development of regional information management systems that can provide guidance for this effort, including efforts by the Chesapeake Bay Program and the Gulf Ecosystem Monitoring Program in Alaska. The steps involved are relatively generic and include the following:

- identify data users (e.g., managers, regulators, environmental interests), how they use data now, and how they would like to use the data if they were more readily accessible
- reach agreement on users' needs and desires
- identify existing data generators and the nature of their data
- define an appropriate architecture that describes core functions and how they will be fulfilled
- develop a working prototype, including the user interface, as a focus for more obtaining more detailed user input and defining the system more clearly
- finalize the system design
- select hardware and software components to support the system design
- determine housing and administration needs and how these will be met
- implement system
- maintain and enhance the system over time.

While the development steps are relatively clear, there will nevertheless be significant challenges to be met. These will be primarily institutional, not technical, and will involve issues of funding, coordination, standard setting, access to data that is considered proprietary to some extent, and making provision for orphan datasets.

This is a low risk / high benefit project. The probability of success is high because of the lessons provided by other similar effort and the benefits to be obtained from wider access to regionally standardized data are substantial.

Schedule

With adequate funding, this project could be completed in two to three years. Major milestones include:

- system design
- final cost estimate and funding decision
- completion of the prototype
- implementation
- ongoing maintenance and enhancements.

The only significant rate limiting factors would be the availability of funding and speed with which the participants reach agreement on the system's major design features.

Resources

Needed expertise includes specialists in data management, database design, system architecture, and distributed networks. Expected costs are in the range of $50,000 to $150,000 to establish a data sharing format and an online catalog of existing datasets. This would require no new hardware or software. Developing the full distributed system that permits users to remotely access data over the Internet could cost between $1,000,000 and $1,500,000 and would require new hardware and software. The recent effort to standardize data sharing protocols for regional participants in ocean monitoring in southern California is a good model for the first phase of this project, while the two larger systems mentioned in the Tasks section are models for the second phase. Potential partners are other agencies with needs to acquire and integrate data from a range of sources in order to perform larger-scale analyses and assessments. These may include the SWRCB, Caltrans, and the U.S. EPA, among others.

Project 4. Measure BMP effectiveness

At present, the lack of reliable information on the performance of a range of BMPs hampers decision making about how best to invest available resources to reduce loads. This project would address this problem by systematically evaluating stormwater BMPs using a standardized, regional protocol.

Problem statement

Best management practices (BMPs) are being applied without the benefit of systematic and neutral evaluations of their effectiveness in reducing loads. Available studies of whether BMPs meet manufacturers' claims are often not performed by neutral third parties and are difficult to compare because of inconsistencies in their methods, settings, and timeframes. In addition, the absence of a coordinated regional evaluation strategy means that individual stormwater programs engage in studies that, from a regional perspective, are inefficient and insufficiently comparable. The need for systematic, neutral, and regionally coordinated evaluations is pressing because the ongoing implementation of TMDLs for stormwater contaminants is raising both the regulatory and economic stakes involved in reducing loads and their impacts. Many proposed BMPs (e.g., large settling basins, treatment plants) are expensive and smaller-scale ones are often ineffective (e.g., storm drain filters). As a result of the lack of reliable evaluation studies, decisions involving substantial investments of time, effort, and money are being made based on incomplete and/or faulty information.

Desired outcome

This project will produce a regionally consistent, standardized framework for evaluating stormwater BMPs and will apply this to a priority set of BMPs. The evaluation will focus not only on the performance of individual, or stand-alone, BMPs but also on how alternative networks of BMPS (e.g., fewer, larger BMPs vs. more, smaller BMPs) perform. The project will also take advantage of efficiencies to be gained from using the entire region as a study area.

Tasks

The major challenge involved in this project will be designing a series of evaluation studies that address decision makers' current and future information needs. In addition to examining the performance of individual BMPs, the project should also consider the performance of alternative combinations of BMPs configured in networks relevant to circumstances in southern California.

This project should take advantage of, and integrate if possible, ongoing BMP evaluation efforts by academic researchers and individual stormwater programs. Specific tasks involved in this project include:

- define key management questions
- define primary technical questions and issues
- identify priority list of BMPs
- describe possible alternative BMP networks for evaluation
- incorporate and/or coordinate with ongoing studies
- develop detailed study designs
- develop and/or adapt hydrological and water quality network models as needed
- implement studies of individual BMPs
- implement studies of prototype alternative networks
- apply results to ongoing decision making.

This is a medium risk / high benefit project. The probability of success at the site-specific scale is good because techniques for evaluating the performance of some individual BMPs are relatively well developed. At the larger spatial scale of BMP networks, new modeling approaches may have to be developed or adapted from other applications. Because of the potential aggregate cost of stormwater BMPs in southern California, the potential benefits from improving the effectiveness of this investment are extremely high.

Schedule

This project could begin immediately. Its duration will depend on the number and complexity of BMPs selected for study.

Resources

Needed expertise includes in-kind time of decision makers and of agency staff with direct experience in implementing BMPs, as well as additional expertise in engineering, hydrology, modeling, and statistics. Expected costs are in the range of $50,000 to $150,000 to identify decision makers' priorities and develop the assessment design and $200,000 to $500,000 for the network modeling, depending on the size and complexity of networks considered. Costs for evaluating individual BMPs are difficult to estimate at this time because they are dependent on the number and types of BMPs considered and on the constituents measured. Potential partners include stormwater agencies that are currently implementing BMPs, Caltrans, the Building Industry Association, and XXX (underwriter).

Improving Fundamental Understanding of Stormwater Mechanisms and Processes

The following four projects focus on filling crucial gaps in the understanding of basic mechanisms and processes in the stormwater system. They are intended to bolster the conceptual and empirical foundation for developing improved indicators, assessing conditions, and better targeting management strategies where opportunities are greatest.

Project 5. Develop a systemwide conceptual model

Stormwater management and monitoring efforts in southern California are often planned and undertaken on a case by case basis, without the benefit of a comprehensive regional framework that describes the generation, transport, and fate of contaminants in both wet and dry weather, as well as the operation of important causes of disturbance such as increased flow. This project would address this problem by creating a regional conceptual model of the processes linking sources of impact and endpoints of concern to managers and the public. This model would lay important groundwork for all the subsequent projects in this research plan.

Problem Statement

The stormwater system is a complex combination of natural processes and engineered components, all characterized by poorly understood interactions and a high degree of variability. A basic conceptual model is widely accepted – rainfall causes runoff that mobilizes a variety of contaminants as well as sediment and these cause physical, chemical, and biological impacts in receiving waters. However, the details of the mechanisms and processes that control each step in this causal chain are poorly understood. In addition, currently used conceptual models do not adequately represent the ocean and there are serious knowledge gaps in conceptual models of biological processes.

As a result, it is often difficult to choose appropriate indicators, i.e., where along the causal chain to gather information. It is also difficult to decide where the best leverage points for management action might be, that is, where to intervene to improve conditions and how to determine if such interventions are working as intended. This requires enough knowledge about the system's behavior to make reasonably accurate predictions about what will happen under a range of different conditions. At present, the lack of such knowledge is a serious impediment to the development, implementation, and evaluation of improved management and monitoring strategies.

Desired outcome

This project would produce a conceptual model of stormwater processes that included both wet and dry weather; the full geographical range of the hydrological system (from headwaters to the ocean); and all key system components including hydrology, aerial deposition, chemistry, biology, and human land use decisions. This model would begin as a qualitative summary of knowledge, with quantitative aspects (up to and including mathematical models) where knowledge is more advanced. Its ability to identify linkages between different parts of the system would provide the basis for prioritizing and coordinating management, research, and monitoring on a common set of problems. The ultimate product could range from a linked set of flow charts and system diagrams to a computerized decision support tool.

Tasks

There are two major challenges involved in this project. The first will be the collection and integration of available knowledge about the complete stormwater system in southern California. The second will be the development of a conceptual framework that adequately prioritizes and structures this knowledge.

Major tasks in this project include the following:

- identify all potential processes
- prioritize important pathways

- summarize existing knowledge
- evaluate the need for analytical, quantitative and predictive capability to 'reverse engineer' the impacts to the sources to resolve causation from correlation. For example:
  - attributing the cause of eutrophication to sources (e.g. land use) to receiving waters,
  - identifying locations for monitoring and testing to confirm or refute sources,
  - prioritizing sources on the basis of relative contributions to receiving water impacts to help separate biological impacts from physical and chemical impacts.
- develop framework conceptual model
- flesh out the conceptual model as needed with existing information
- develop an approach to applying the conceptual model to the decision support needs of managers and to structuring the research and monitoring agenda.

This is a low risk / high reward project. There is substantial knowledge available about many aspects of the stormwater system and conceptual modeling techniques are well established. The presence of a systemwide conceptual model will improve a wide range of research, monitoring, and management efforts, in part by providing a systematic and widely accepted framework for planning and decision making.

Schedule
This project could begin immediately and could be completed in 6 – 12 months.

Resources
Needed expertise includes modeling, hydrology, ecology, chemistry, engineering, and systems analysis. Expected costs are in the range of $100,000 to $250,000, with the exact amount depending on the degree of sophistication of the product (e.g., flow charts vs. a computerized decision support tool). Potential partners are stormwater agencies in the region and other agencies responsible for carrying out region-wide assessments of water-related issues.

Project 6. Determine appropriate reference conditions

Assessing impacts, setting management targets, and measuring progress toward these all require clear definitions of reference conditions in order to be maximally effective. While some reference conditions are, in effect, defined by regulatory water quality criteria, there are significant gaps in the systemwide identification of reference conditions throughout the region. This project would address this problem through a comprehensive effort to establish a regionally consistent set of reference definitions for physical, chemical, and biological components of the environment. This effort would depend to some extent on the conceptual model developed in Project 5 and would integrate closely with the following project to stratify beneficial use definitions (Project 7), as well as with all of the indicator research projects described below (Projects 10 – 12).

Problem statement

Quantifying impacts on beneficial uses and tracking progress in improving these requires a definition of reference conditions. These can be numerical regulatory criteria, a description of the natural or unimpacted condition, or a more abstract definition of what might be theoretically possible at a particular site. Whatever form they take, definitions of reference conditions are essential for providing needed context to monitoring and management. Despite the use of numerical water quality criteria, the overall definition of reference conditions in southern California is spotty. Numerical criteria, by themselves, do not take into account broader system hydrology and network linkages. In addition, there is no common agreement about reference for biological conditions or for important physical disturbances such as flow and structural modifications. Nor is there an explicit understanding of how water quality, physical disturbances, and biological processes should be related in a more comprehensive definition of reference conditions.

Desired outcome

This project would produce a regional description of reference conditions that includes water quality, physical processes, biology, and human uses such as recreation and water supply. It would describe functional links between these to ensure that management focuses as much on the functionality of the entire system as on its individual parts. Reference conditions would be defined quantitatively wherever possible and qualitatively where this is not possible.

Tasks

The major challenges involved in this project are the collection and organization of a wide array of data types from across the region, followed by analyses needed to develop appropriate reference frameworks for a variety of habitats. Two recent efforts in the region provide insight into the kinds of analyses that may be required. The Benthic Response Index (BRI) defines a reference condition for marine infaunal communities and a method for measuring how far any particular site is from reference. It is based on regional analyses of data from sites along the entire gradient of conditions from undisturbed to highly impacted. In the second example, the development of the iron normalization technique for sediment samples provided a quantitative method for measuring the increase of metals concentrations above the natural background. Iron normalization essentially calibrates each sample with respect to reference conditions.

Major tasks in this project involve the following:

- examine and evaluate the relevance to southern California of methodologies developed elsewhere
- tailor these methodologies to southern California as appropriate
- use existing data and region-wide data collection, as needed, to identify reference locations and broadly characterize reference conditions for a variety of habitats and environmental components
- define potential indicators for each habitat and/or component, including multivariate indicators that include physical, chemical, and biological features
- analyze indicators in terms of spatial and temporal pattern and resolution
- refine list of potential indicators
- apply metrics (quantitative or qualitative) from Project 7 that define a measurable gradient from reference to highly impacted conditions

- conduct additional field surveys as needed to further refine indicators and/or identify and evaluate new ones
- field test indicators in ongoing monitoring programs.

This project will use the tools developed in Project 1 (Evaluate Available Data) and Project 3 (Develop Regional Data Infrastructure) to improve the efficiency of the characterization and analysis steps. In addition, the conceptual model developed in Project 5 will help ensure that the initial characterization of reference conditions captures important functional relationships. This project will also of necessity be closely integrated with all the indicator projects (Projects 10 – 12) described below. The regional survey that is an integral part of this task will, in an iterative fashion, both depend on and help to define appropriate indicators that can capture the full range of conditions from reference to severely impacted. Finally, the definitions of reference conditions will provide the basis for the next project, which aims to stratify the degree of relative attainment of beneficial uses with respect to reference conditions.

This is a medium risk / high benefit project. The level of risk and difficulty will be low for some environmental components that have been well studied and higher for others that have been less well studied. The benefits to monitoring and management from a regionally consistent definition of reference conditions are substantial.

Schedule

This project could begin immediately and be completed in 5 years.

Resources

Needed expertise includes hydrology, geomorphology, ecology, water quality, and study design. Expected costs are in the range of $XXX to $XXXX, per site, inclusive of project planning, data management, and laboratory and data analysis costs. The total number of sites that might be required is in the range of XXX to XXX. Examples of similar projects include the Bight Project, U.S. EPA's EMAP, and the California Department of Fish and Game's effort to develop bioassessment protocols. Potential partners include U.S. EPA's EMAP, the Statewide Ambient Monitoring Program, the California Department of Fish and Game, and the offshore marine regional monitoring consortium, which is increasingly interested in linkages between land and ocean in the coastal zone.

Project 7. Stratify beneficial uses

The protection of beneficial uses is the fundamental motivation for stormwater monitoring and management. Despite existing frameworks for defining such uses and determining where they have been degraded, there is no regionally consistent system for quantifying how far a particular situation is from reference conditions or how it relates to conditions at other sites. This project addresses this problem by developing a regional scheme for stratifying beneficial use conditions in terms of a set of benchmarks that describe how far from reference a particular site is.

Problem statement

The assessment of receiving water conditions is fundamental to the regulation, management, and mitigation of stormwater impacts. While there are frameworks for this assessment in the Basin Plans and Section 305b of the Clean Water Act, the lack of regionally based reference conditions (see Project 6) and of more sophisticated indicators of both water quality and ecosystem condition (see Projects 10 – 12) has made such assessment more difficult. In addition, there is no regionally consistent definition of benchmarks along the gradient from extremely degraded to reference conditions. Without such benchmarks, it is not possible to quantify just how far from reference conditions a particular location is, to then describe and compare the status of beneficial uses across the region, and to more efficiently manage the application of BMPs. For example, the U.S. EPA's Rouge River Wet Weather Demonstration Project developed quantitative benchmarks for five indicators of river quality (dissolved oxygen, flow, bacteria, Index of Biotic Integrity, and habitat) and used these to rate the status of key beneficial uses along different segments of the river.

Desired outcome

This project will produce a region-wide system for quantifying the status of key beneficial uses and relating their status to a set of benchmarks that rate their relative distance from ideal or reference conditions. This system will then be integrated with existing monitoring and assessment programs in order to begin producing regionally consistent information on the status of beneficial uses. The system could be developed to the point where metrics are converted to colors that visually indicate the status of beneficial uses on maps.

Tasks

The major challenges involved in this task are related to producing a consistent regional framework for inventorying beneficial uses, developing improved indicators of their status (Projects 10 – 12, 15), and achieving region-wide agreement on a set of benchmarks of status.

The major tasks in this project involve the following:

- develop inventory and framework for existing designated uses
- assess stratification schemes used elsewhere
- review range of conditions in southern California (Project 1)
- relate current conditions to regional reference conditions established in Project 6
- develop prototype stratification scheme, with benchmarks
- apply to selected water bodies as test cases using relevant indicators, including those developed in Projects 10 – 12 and 15
- refine stratification scheme as needed
- integrate stratification scheme into ongoing monitoring and assessment programs.

This is a medium risk / high benefit project. The successful development of stratification schemes elsewhere should provide a useful model for a similar effort in southern California. However, the actual benchmarks developed elsewhere will not necessarily be applicable in southern California because of significant differences in rainfall, flow regimes, and habitats. In addition, this project depends on the successful completion of other research projects (Projects 1, 6, 10 – 12, and 15). Despite these risks, the benefits of a regionally consistent set of strata and benchmarks for evaluating the status of beneficial uses will pay substantial dividends in management's ability to inform the public about the condition of beneficial uses and to prioritize monitoring and mitigation efforts.

Schedule

This project must await the completion of the region-wide assessment in Project 1 but could begin before the completion of Projects 6, 10 – 12, and 15. The first two tasks could be completed in six months and the remainder in an additional 12 months, assuming results from other projects are readily available, as shown in the task list above.

Resources

Needed expertise includes data analysts and GIS support, in-kind participation of managers and technical staff from participating agencies, and a facilitator. Expected costs are in the range of $50,000 to $75,000 for a test case and an additional $150,000 to apply the stratification scheme to the entire region. Examples of similar projects include the Bight Project's development of the Benthic Response Index and U.S. EPA's Rouge River Wet Weather Demonstration Project. Potential partners include both regulatory and stormwater management agencies in the region.

Project 8. Identify relative contributions of nonpoint sources to urban runoff loads

Stormwater monitoring and management has focused on a subset of sources that are either presumed to contribute the most to overall loads or are the most tractable to address. What has been missing to date is a comprehensive assessment of the relative contributions to total runoff loads of the full range of potential sources. These include the urban land uses traditionally monitored, as well as aerial deposition, agricultural runoff, and forestry activities. This project addresses this problem in two steps. First, it will use available information to prepare an assessment of how much individual sources may be contributing to overall runoff loads. Using this assessment, it will then design a regional nonpoint source monitoring program to fill data gaps and monitor trends over time.

Problem Statement

With minor exceptions, urban stormwater monitoring and assessment in southern California measures the concentration and loads of a suite of contaminants to receiving waters, along with the contribution to these loads from a range of land uses. As management moves from an earlier emphasis on characterization to a greater concern with reducing impacts (with TMDLs as a primary tool), it will become increasingly important to quantify the contributions to runoff loads of the full range of potential sources. While treated discharges are relatively well characterized, there remain gaps in our understanding of runoff from nonpoint sources. Thus, there is no monitoring program in southern California that looks at all nonpoint sources and quantifies loads and impacts related to these.

Desired Outcome

This project would produce a design for a regional nonpoint source monitoring program that addresses the full range of potential nonpoint sources. This design would be based in part on a best estimate, using currently available data, of the relative contribution to urban runoff loads of these nonpoint sources. This would necessarily use information developed in Project 1 (Integrate Available Data) and Project 5 (Develop Conceptual Model). Data from such a monitoring program would allow stormwater and wastewater managers and regulatory agencies to carry out improved water quality assessments, develop more appropriate TMDLs, and better prioritize pollution prevention efforts.

Tasks

The major challenges involved in this project are the integration of existing data (see Projects 1 and 3) and the development of robust sampling designs for all relevant nonpoint sources, especially those that are not part of traditional stormwater monitoring programs. Further, special attention must be given to developing an approach to sampling on private agricultural lands.

Major tasks involved in this project include:

- identify significant known and potential nonpoint sources (overlap with Project 5, Develop Conceptual Model)
- acquire and integrate available data on these sources (overlap with Projects 1, Integrate Available Data, and 3, Develop Regional Data Infrastructure)
- using available data, estimate relative contribution of significant sources at several spatial scales (overlap with Project 1)
- develop framework of regional nonpoint monitoring design, taking account of the requirements of loading models
- identify relevant monitoring approaches to accomplish the design
- organize information on existing monitoring efforts that could constitute portions of the regional design
- develop detailed program design, including sampling methods and spatial and temporal replication.

These tasks should be carried out in coordination with, or at least with full knowledge of, related efforts by the State Board's SWAMP, U.S. EPA's EMAP, and others to assess loadings and effects.

This is a low risk / high reward project. The monitoring and modeling involved will use readily available techniques. A more complete picture of how all nonpoint sources contribute to regional loadings will greatly assist decision making about how to best allocate monitoring and source reduction efforts.

Schedule

This project could begin as soon as input from the other research projects is available and could be completed in one year.

Resources

Needed expertise includes in-kind support from participating agencies' staff, statisticians, interdisciplinary scientists, air deposition and agricultural runoff specialists, and a facilitator/project manager. Expected costs are in the range of $75,000 to $125,000.

Projects Related to Identifying Receiving Water Impacts

The following seven projects focus on enhancing the tools available for identifying and quantifying stormwater impacts on receiving waters. They are intended to increase the breadth, specificity, and timeliness of methods currently in use and to bring new methods to the level of development where they can be used routinely.

Project 9. Identify the causes of impacts in receiving waters

While there is information available on impacts in receiving waters, monitoring studies, with few exceptions, have yet to identify the specific causes of such impacts. This is because the upstream tracking and identification of sources can be difficult and the causal mechanisms by which sources lead to impacts are not always clearly understood. This project will address this problem by performing detailed field studies to link impacts and sources in one or more pilot watersheds.

Problem Statement

Past stormwater monitoring has successfully identified important sources of contamination and disturbance, although there are some data gaps and remaining questions about the relative contribution of different sources (see Project 8, Identify Relative Contributions). At the "downstream" end of the system, monitoring has also documented specific impacts, such as elevated levels of contaminants in water and sediment, instream toxicity, habitat damage, and eutrophication. What is missing in most cases, however, is accurate knowledge about which sources are related to which impacts and the specific mechanisms causing these impacts. For example, the sources of persistently elevated levels of bacteria in Aliso Creek in Orange County and of organophosphate pesticides in Chollas Creek in San Diego County have been clearly identified.

Desired outcome

This project would produce a catalogue of important impacts in receiving waters, along with the specific kinds of sources that cause each. It would identify the mechanisms that link impacts and sources, as well as procedures for establishing causation from correlative monitoring data.

Tasks

The major challenges involved in this project are identifying and then documenting the particular intermediate mechanisms that lead from sources to impacts. While the systemwide conceptual model (Project 5) will provide a starting point, this project will depend on field investigations to validate presumed relationships and search for currently undefined causal linkages. An additional challenge may involve unraveling the relative contribution of multiple sources to cumulative impacts. This project will also depend on the results of the regional synthesis of existing data (Project 1), as well as improved indicators from Projects 11 (Toxicity Testing), 13 (Microbial Source Tracking), and 15 (Peak Flow).

Major tasks involved in this project include:

- develop list of impacts
- develop list of candidate causes
- develop hypotheses for investigating correlation and causality between them
- assess information available to test specific mechanisms
- identify additional information needed to validate causal relationships
- select pilot watershed(s) suitable for field studies, i.e., where clear impacts exist and upstream tracking of sources is feasible
- design and implement a research plan to test hypothesized mechanisms. This might involve using relatively inexpensive screening techniques throughout the watershed(s), followed by more sophisticated tools focused on specific problem areas.
- update conceptual model with new understanding.

This is a medium to high risk / high benefit project. Assuming that results from Projects 11 (Toxicity Testing) and 13 (Microbial Source Tracking) are available, it should be relatively straightforward to identify the sources of most impacts. Cumulative impacts may present more problems. However, the benefits of an improved ability to reliably link impacts and sources will pay important dividends for source reduction programs.

Schedule

This project could begin when needed information from other projects is available and could be completed in two to five years.

Resources

Needed expertise includes in-kind participation from agency managers who are knowledgeable about the pilot watershed(s) and can help provide needed access for sampling, as well as a hydrologist, scientists skilled in relevant impact identification techniques (e.g., microbiology, toxicity, chemistry), field staff, laboratory facilities, data analysts, GIS support, and data managers. Expected costs are in the range of $250,000 for a single watershed and a single constituent and would scale up from there depending on the number of watersheds and constituents. Similar projects have been conducted elsewhere in the country focusing on individual constituents of concern, such as bacteria. Potential partners include local agencies and the Los Angeles Contaminated Sediment Task Force.

Project 10. Develop bioassessment indicators and protocols

The ultimate concern for both managers and the public is not the levels of contaminants in a waterbody but the status of beneficial uses and trends in these over time. However, indicators do not yet exist for those beneficial uses that are related to ecological conditions. This project would address this problem by developing a regionally consistent set of bioassessment indicators and protocols for a range of important habitat types and ecological assemblages in southern California.

Problem statement

Stormwater monitoring and management have focused primarily on the measurement of levels of contamination and other water quality conditions. However, a focus on contamination and its direct effects can miss other significant sources of impact and do not capture the ecological impacts of stormwater. Adequate or excellent water quality can coexist with serious impairments to biological conditions. Increased flow volume and velocity change sediment budgets, erode banks and streambeds, and damage instream habitat. Channelization removes riparian vegetation and increases water temperatures, creating a lethal barrier to fish migration. Maintenance practices designed to preserve channels' ability to convey stormwater efficiently also remove instream habitat for fish and invertebrates. Development that spreads to the very edge of creeks, streams, and other waterbodies can remove important riparian habitat and damage or destroy a waterbody's ability to respond to natural perturbations by expanding/contracting its extent or changing course.

Bioassessment methods, as developed by U.S. EPA, the U.S. Forest Service, and the California Department of Fish and Game, among others, provide a means of reflecting overall ecosystem health, as well as measuring the status of specific biological conditions, independent of a focus on chemical contamination. Such bioassessment methods can integrate both episodic and long-term exposure to perturbation and can also be used in concert with chemical and other monitoring, as a screening tool, to focus attention on areas of particular concern. While these methods can help to rank sites in relative terms, incomplete understanding of relationships between stressors and biological indicators, along with the lack of accepted biocriteria for assessment, make it impossible to say with any certainty (except in more extreme situations) whether conditions meet minimum levels of acceptability.

Desired outcome

This project would produce a set of regionally standardized bioassessment protocols for macroinvertebrates, fish, algae, and macrophyte assemblages in fresh waters of southern California. The protocols will define procedures for routinely measuring and interpreting appropriate indicators of ecosystem health. In combination with the regional reference framework (Project 6) and the stratification of beneficial uses (Project 7), these protocols would help determine whether and to what degree a system is being ecologically degraded by stormwater inputs.

Tasks

The major challenges involved in this project are those related to identifying sensitive measures of biological response for each assemblage and then developing appropriate indicators that capture that response. Bioassessment protocols are currently under development for fresh waters in southern California, primarily by the California Department of Fish and Game and U. S. EPA's EMAP. These efforts will provide an important framework for this project and mean that, for many habitat types, new techniques will not be needed.

Major tasks in this project will include:

- evaluate existing efforts being conducted by U.S. EPA EMAP, California Department of Fish and Game, U.S. Geological Survey, U.S. Forest Service, and others
- define the degree to which each effort is applicable to specific habitats in southern California
- define baseline and reference conditions of each habitat, including defining subhabitats as needed, within the framework established in Project 6 (Determine Reference Conditions)
- test candidate methods and prospective indicators

- determine biological response signatures of indicator organisms to stormwater. This may require integrating information from toxicity testing. Simultaneously, measure potential physical and chemical confounding factors and the relationship of habitat type to ecosystem health.
- validate the protocols.
- develop QA/QC procedures.

This is a low risk / high benefit project. The fact that current research on bioassessment protocols is underway in southern California, combined with relevant knowledge from similar successful efforts elsewhere in the country, increase the likelihood of success. The benefits of an improved ability to relate stormwater to ecological conditions would be substantial.

Schedule

Each habitat type may have a different schedule, depending on the availability of existing methods and associated data. The project should begin with freshwater systems, on the following schedule:

- Year 1 – literature search on potential indicators and methods; evaluate and select candidate protocols; exploratory analyses on available data to assess stormwater effects (may be a pilot study in one or more test areas)
- Year 2 – prepare study design for additional data collection (e.g., quantify spatial and temporal patterns and variability); field test protocols and indicators; identify indicators' response signatures
- Year 3 – validate procedures and indicators; conduct peer review; report results; identify strengths, weaknesses, recommendations

Resources

Needed expertise includes bioassessment in freshwater systems, indicator and protocol development for biological assemblages, familiarity with methods used in other key programs, field sampling, data analysis, and data management. Expected costs are in the range of $400,000 per year for three years, of which $150,000 would be required for filling data gaps. Similar projects have been carried out at several places throughout the country, most notably in Ohio under the auspices of U. S. EPA. Potential partners are the California Department of Fish and Game, U. S. EPA's EMAP, California State Water Resources Control Board (SWAMP), and volunteer monitoring networks such as those supported by Heal the Bay and the Stream Team in San Diego.

Project 11. Develop improved toxicity testing procedures

Despite their wide use, significant limitations constrain the application and interpretation of toxicity tests. There remain unresolved questions about the choice of indicator organisms, the interpretation of test results, and the identification of sources of toxicity with TIEs. This project will address these problems by developing and field testing a set of improved toxicity testing and TIE protocols.

Problem statement

Toxicity tests are widely used to measure stormwater impacts directly, especially where information on individual chemical contaminants is inconclusive or incomplete. However, there are several important unresolved issues with toxicity testing, including selecting appropriate test organisms, interpreting conflicting and variable test results, and better defining and expanding the scope of toxicity evaluations (TIE). Because of these shortcomings, current toxicity testing procedures are often limited to use in specific environments and their results are often not well integrated into a complete understanding of the ecosystem. In addition, integrating toxicity tests into a regional reference framework (see Project 6) would improve the assessment of stormwater impacts.

Desired outcome

This project will evaluate available methods of toxicity testing (including TIEs), identify the method(s) most applicable in specific types of systems (estuarine, marine, freshwater), and propose improvements to existing methods where needed.

Tasks

The major challenges involved in this project relate to the complex responses of test organisms and the complex chemical characteristics of toxic compounds, both singly and in combination.

This project will utilize results of Project 6 (Determine Reference Conditions) and Project 7 (Stratify Beneficial Uses) to help define the range of conditions toxicity testing should address. Major tasks in this project will include:

- establish prioritized list of problems and issues with toxicity testing approaches currently used in southern California
- develop set of criteria for ideal toxicity tests, e.g., ability to define spatial extent of toxicity, measure spatial and temporal variability of toxicity in relation to hydrology
- evaluate existing toxicity testing protocols in relation to problems and issues
- define areas where further research and development are most needed
- design needed laboratory studies
- design and implement field case studies (see detail below) focused on key habitats
- improve and/or develop ancillary TIE procedures
- develop regional toxicity testing protocols based on field test results and incorporating EPA standards.

Field tests for improved methods could follow the following format:

1. Identify a receiving water of interest
2. Design case study
   - 2.1. consider temporal variability (intra- and inter-storm)
   - 2.2. consider spatial variability
3. Conduct toxicity tests along gradient of exposure
4. Assess results along gradient relative to predefined criteria
   - 4.1. Relative sensitivity (stormwater, ambient water, and reference toxicants)
   - 4.2. Control response / reference site response
   - 4.3. Correlations with contaminants
   - 4.4. Correlations with bioassessment metrics (macroinvertebrates, phytoplankton, fish)
   - 4.5. Correlations with chemical and physical factors, and possible confounding factors
   - 4.6. Use in TIEs
   - 4.7. Ecological relevance

5. Conduct dose-response experiments with key indigenous species identified in bioassessment
6. Conduct in-situ tests to assess ecological linkages, temporal variability in response signal, and response to simultaneous multiple stressors
7. Identify causes of toxicity.

This is a low to medium risk / high benefit project. The responses of different test organisms to the suite of stormwater contaminants are complex and it may be difficult to make clear-cut decisions about which test organisms are the most appropriate in different circumstances. Similarly, the chemistry of toxic compounds is also complex, complicating the development of enhanced TIE procedures. However, if these difficulties can be overcome, the ability to more precisely quantify the level of toxicity and to link it to one or more specific contaminants would substantially improve monitoring and source tracking efforts.

Schedule

This project could begin immediately and be completed in three to five years, assuming results from Projects 6 and 7 were available as needed. Tasks preparatory to the field studies would take six to 12 months. Tasks 1 – 3 in the field tests could be completed in the second year, tasks 4 and 7 in the third year, and tasks 5 – 7 in the fourth year. Writing a protocols and standards document would take up the fifth year.

Resources

Needed expertise includes toxicity specialists, chemists, field teams, specialized laboratories, and in-kind support from agencies for field collection. Expected costs would be $300,000 to $350,000 at a minimum and could be as high as $1 million, depending on the number of sites and test organisms, and on the number and complexity of toxicants of concern. Potential partners include regional stormwater and regulatory agencies, academic researchers, and SCCWRP.

Project 12. Develop rapid response indicator(s) for microbial contamination

The absence of a real-time ability to detect microbial contamination in receiving waters prevents managers in some cases from reliably closing recreational waters when they are contaminated, but also causes a loss in economic revenue when sites are not reopened for public use as quickly as possible. This project addresses this problem by developing improved indicators that would quickly (within two hours) provide reliable measures of the presence of pathogens of concern.

Problem statement

The rapid detection of fecal contamination in receiving waters would improve public health managers' ability to protect the health of those using receiving waters for recreation. This is important in southern California, where beach visitation in the millions coincides with the large-scale stormwater inputs that can carry a variety of human pathogens into waters designated for recreational use. However, current methods for fecal indicator bacteria have a lag time of 24 – 48 hours, which means that it is impossible to provide real-time information to the public about the relative risk of water contact recreation. This not only makes it impossible in some instances to reliably close or post recreational sites when they are contaminated, but also causes a loss in economic revenue when sites are not reopened for public use as quickly as they might be. In addition to their lack of timeliness, current indicators are not necessarily reliable indicators either of animal and/or human waste products or of the presence of pathogens that may cause illness in humans. Improved indicators would provide a speedier and more reliable link to human health risk and do a better job of identifying sewage sources.

Desired outcome

This project would develop a rapid pathogen screening tool that would provide a result within two hours of sampling and would be applicable in marine, brackish, and freshwater environments. This rapid detection method would be accurate, reliable, require little technical training, and might include viruses, bacteria, protozoans, and chemical indicators of sewage (e.g., caffeine). Optimally, the method could be used either in the lab or in the field to provide a quick determination of whether the stormwater from a particular storm event presents a hazard to public health.

Tasks

The major challenge involved in this project is the development of methods that can directly detect pathogens themselves or reliable indicators of their presence. This may require a shift away from standard culture approaches and toward more modern techniques such as biosensors or DNA probes.

The major tasks involved in this project include:

- establish criteria for ideal indicator(s)
- evaluate the full range of existing technologies
- identify directly applicable technologies (if any)
- define development and testing procedure for directly applicable technologies
- carry out further development on directly applicable technologies as needed
- define and conduct needed research if no directly applicable technologies exist
- evaluate new technologies in system(s) of interest, including receiving waters, sources
- refine methods, to improve measurement capabilities and definition of endpoints
- integrate with current epidemiology studies to evaluate how new methods relate to actual human health risk
- conduct further testing and validation
- develop protocols for routine use.

This is a high risk / high benefit project. There are no off-the-shelf technologies that are directly applicable to this problem and also ready for routine use. The direct detection of pathogens, as opposed to indirect indicators such as fecal coliforms, has proved difficulty, and the two-hour goal is a challenging one. However, the ability to reliably and quickly measure the presence of pathogens of relevant to human health concerns would provide substantial economic benefits because it would dramatically improve managers' ability to target closures where they are actually needed.

Schedule

This project could begin immediately and would take five years to complete, as follows:

- Year 1 – identify and select methods to be evaluated
- Year 2 – evaluate methods with regard to rapidity, sensitivity, and specificity. If technology is not available, develop new methods that meet above requirements.
- Year 3 – refine evaluated methods to optimize their capabilities with regard to measuring appropriate analytes in water environments or continue development of new methods.
- Year 4 – use method to measure water quality during the conduct of an epidemiology study. Analyze epidemiology study data to determine how well water quality data relates to health data.
- Year 5 – verify that the method works under a broad range of conditions and develop QA/QC protocols for routine use.

Resources

Needed expertise includes bacteriologists and epidemiologists, as well as in-kind support from regional agencies for field sampling. Expected costs are in the range of $300,000 to $500,000, assuming that the project can collaborate with at least one epidemiology study planned in the region. Potential partners include SCCWRP, U. S. EPA, the California State Water Resources Control Board, county health departments, and the NPDES ocean dischargers who conduct beach monitoring.

Project 13. Develop microbial source tracking protocol

At present, it is not possible to accurately and quickly identify the sources of microbial contamination in stormwater. This prevents the timely application of source controls and results in costs due to closures and other impacts on receiving waters. This project will address this problem by developing standard protocols for tracking the specific sources of contamination in local watersheds.

Problem statement

Fecal contamination in stormwater can derive from agricultural activities, livestock, wastewater, urban runoff, leaking septic systems, and soils, among others. The ability to determine which sources are most important in any particular situation can not only provide a basis for cost-effective source reduction efforts, but can also help determine relative public health risk associated with poor water quality in receiving waters. In addition, successful source tracking techniques are vital to implementing coliform TMDLs, because partitioning of fecal contamination will permit waste load allocation of tributaries or upstream sources in a watershed. However, current approaches to partitioning fecal sources are not successful due to the inability to reliably differentiate among the several possible sources of contamination. In addition, current approaches do not provide results in a timely manner. As a result, it is nearly impossible to follow a "hot spot" or contaminated parcel of water upstream.

Desired outcome

This project would develop standardized protocols for microbial source tracking that will allow stormwater managers to quickly identify the relative contribution of different sources of fecal contamination in any particular situation. The method developed will be accurate and reliable, capable of consistently providing correct classification of sources of fecal contamination, and should be applicable for use in different water body types (i.e., marine, brackish, and freshwater). This project will also provide guidance on the use of this method, including implementation, interpretation of results, its degree of geographic specificity (i.e., whether it is equally applicable in watersheds of different types). The research project would also identify strengths and limitations of the method developed, especially in the context of other available methods, and make suggestions for improved applicability in other systems.

Tasks

The major challenges involved in this project are related to the difficulty in establishing a broadly usable database of microbial fingerprints. Currently used microbial source tracking techniques depend on the development of a watershed-specific database of genetic fingerprints of existing sources of fecal contamination. For example, if the watershed is dominated by residential homes and ranches, and contains very little area where wildlife reside, a typical database might be created that is based upon fingerprints of collected fecal samples from horses, cows, dogs, cats, and humans. Not only are the necessary databases for different systems inherently different, but microbial populations can also vary within individual populations within a system and among systems. Given this, it is often difficult or impossible to use an available database from one watershed for identifying sources of fecal contamination in another watershed. Developing these libraries, or databases, can be time consuming and tedious, especially because the size of the database required increases exponentially with the size of the watershed. This is because scat samples must be collected from a representative portion of the animal and human populations in the watershed. Therefore, this project will identify the technique(s) that are most appropriate for the southern California region, test them in one or more pilot watersheds, and develop standardized protocols for their application throughout the region.

Major tasks in this project include:

- identify possible methods (e.g. ribotyping, Terminal Restriction Fragment Length Polymorphism, antibiotic resistance patterns, nutrition patterns, coliphage serotyping and genotyping, virus detection, Pulse field gel electrophoresis, Rep-PCR, Quantitative PCR)
- evaluate alternative methods in terms of applicability to southern California watersheds and the balance between statistical rigor, cost, and size of watershed
- develop a standardized protocol and relevant databases, with attention to the size of database necessary for statistical rigor and accurately classifying sources

- develop tracking strategy, assessing both top down (evaluate relative contribution of known sources) and bottom up (tracking upstream from a contaminated waterbody or end of a pipe) approaches for use in different situations, and defining the other types of data that should be collected (e.g., flow, pH, salinity, TSS, nutrients)
- test and validate methods both in the laboratory and in the field
- develop QA/QC protocols for routine use.

This is a medium risk / high benefit project. Even given the limitations described above, currently available techniques have been used successfully to identify and mitigate sources of fecal contamination. These methods will undoubtedly improve with time and the likelihood of success is high, given time and funding enough to develop needed databases. As long as the source tracking goal is a general differentiation between sources, for example, differentiating between human and animal fecal contamination, or livestock and dog fecal contamination, available methods provide a suitably high level of correct source classification. However, in a watershed with many confounding factors, and high variability in sources and stormwater inputs, a relatively quick and clear differentiation between sources may not be possible with genetic tracking alone. Despite this, the benefits heavily outweigh the risks because the method will be useful in the large majority of situations, thus greatly improving the efficiency of source tracking and mitigation efforts.

Schedule

This project could be accomplished in three to four years, depending upon the complexity and size of the pilot watersheds. The following milestones could be used to track progress:

- Milestone 1: Identify and evaluate methods. This can be accomplished in six months, given a group that is already familiar with microbial source tracking techniques. First, the available methods must be narrowed to those that are applicable to the system. Second, many small projects using some of these methods have already been undertaken in southern California, so methods that are in existing use should be actively identified and evaluated.
- Milestone 2: Once a method or set of methods is identified that will work for a given system or watershed, it will take approximately 6 months to 1 year to develop a suitable database of existing possible sources, collect scat samples with representative viral or bacterial populations, and design a tracking strategy suitable for the particular watershed of interest. Other important components of this will be to successfully GIS map the system, identify all tributaries and inputs, study hydrological characteristics, and create a conceptual model of the system.
- Milestone 3: Implement microbial source tracking strategy and sampling. This will take approximately 1 year. Microbial source tracking samples will be taken given the tracking strategy outlined, in addition characteristics of the water body of interest will be incorporated to better understand the entire system, namely nutrients, flow, TSS, temperature, pH, etc.
- Milestone 4: Statistical analysis, and data reporting, and data visualization will be followed by transfer of knowledge to parties responsible for decision making and future legislative action. This will take approximately 6 months to 1 year.

Resources

Needed expertise includes microbiologists, molecular biologists, hydrological engineers, statisticians, and data managers. Specialized equipment specific to microbial techniques will also be necessary. Some of the techniques available (e.g., antibiotic resistance) require less large equipment. However, any laboratory using these approaches will need to be outfitted with a laminar flow hood, centrifuges, filter apparatus, incubators, water baths, and other equipment. Other larger cost items that may be needed include hybridization ovens, quantitative PCR machines, gel electrophoresis equipment, power supplies, among others. Expected costs are in the range of $200,000 to $800,000 for pilot studies in one or two smaller watersheds with one or two dominant sources each. The wide range of costs reflects in part the differences among the methods that might be used. Similar projects have been conducted at several places throughout the country. Potential partners include SCCWRP, U. S. EPA, the California State Water Resources Control Board, county health departments, and the NPDES ocean dischargers who conduct beach monitoring.

Project 14. Evaluate BMP effects on receiving water impacts

The large regional investment in BMPs has been based on the assumption that BMPs, by reducing loads of various kinds, will ultimately result in significant improvements in the condition of receiving waters. This assumption has not been systematically and rigorously tested and the ongoing implementation of TMDLs is raising the level of risk associated with the attendant increased investment in BMPs. This project addresses this problem by developing a method, based on conceptual and numerical modeling and on field monitoring, to evaluate the degree to which BMPs actually improve receiving water conditions.

Problem statement

As Projects 9 – 13 (which focus on developing a variety of improved indicators) make clear, our current understanding of causal linkages between a variety of sources and impacts is limited. Such limitations extend to our understanding of linkages between BMPs and their potential reductions of impacts in receiving waters. It is possible to measure the immediate effect of a BMP in terms of reductions in loading of contaminants at a particular point in the drainage system (see Project 4, Measure BMP Effectiveness). However, it is much more difficult to estimate the cumulative effect of a network of BMPs on loadings in an entire watershed and even more difficult to determine if such reductions have improved conditions in the receiving waters. Thus, stormwater programs have made significant commitments to activities such as street sweeping and catch basin cleaning, but there have as yet been no rigorous studies of whether these and other actions actually improve water quality.

Desired outcome

This project will produce a method for determining whether and to what extent BMPs improve conditions in their ultimate receiving waters. This will be extremely valuable in deciding which BMPs to use to achieve the goals of the TMDLs being implemented in the region.

Tasks

The major challenges involved in this project are related to understanding the causal relationships among the different components of the stormwater system. Thus, answering the question whether BMPs have improved receiving water conditions depends on the results of several other projects in this research program. It will require a comprehensive framework that describes the operation of the hydrological system and how sources create impacts (Project 5, Conceptual Model), an estimate of the relative contribution of different kinds of sources to regional loadings (Project 8, Relative Contribution of Nonpoint Sources), improved knowledge about the causes of specific impacts (Project 9, Identify Causes of Impacts), and better indicators of ecological condition (Project 10, Develop Bioassessment Indicators). It will also require improved estimates about the ability of individual BMPs to reduce loads of contaminants in their immediate receiving waters (Project 4, Measure BMP Effectiveness).

Because of the large variability in ambient conditions, and length of time needed to detect changes in these, this project should consider focusing on small pilot watersheds that can be easily manipulated and monitored.

The major tasks involved in this project include:

- enhance the systemwide conceptual model to include specific BMPs and their links to potential receiving water improvements
- select and prioritize BMP / receiving water relationships to examine
- identify one or more pilot watersheds for study
- conduct numerical modeling of the cumulative effects of BMP network(s) to guide design of the field study
- design field study, based on BACI (before-after-control-impact) design if possible
- begin monitoring
- implement BMPs, if necessary
- complete monitoring.

This is a high risk / high reward project. It depends on the successful completion of a number of other research projects. In addition, such an evaluation of BMPs effects on ultimate receiving water conditions has not previously been carried out and there is therefore no prior body of experience to draw on. However, the potential benefits of this project are substantial. Large investments in BMPs have been made and even larger ones are being contemplated in order to meet the requirements of TMDLs. It is therefore crucially important to better understand whether BMPs will produce hoped-for improvements in receiving water conditions.

Schedule

The initial steps of this project through development of the field study design will take at least one year. Monitoring both before and after the implementation of specific BMPs could require an additional five to ten years, depending on the kinds of receiving water conditions targeted. In addition, results can be achieved more quickly for constituents with short residence times (e.g., diazinon, TSS) or that can be more readily controlled. Monitoring would have to continue for a longer period to detect changes related to constituents with reservoirs in the system (e.g., nutrients, metals, bioaccumulative compounds).

Resources

Needed expertise includes in-kind support from stormwater agencies for BMP implementation and field monitoring, as well as engineers, statisticians, hydrologists, scientists knowledgeable in the specific constituents and impacts of concern, data analysts, and data managers. The initial steps of this project through development of the field study design could require up to $1 million. Expected costs for monitoring are in the range of $250,000 - $500,000 per year for ten years. It is not possible at present to scope the BMP implementation and it would be prudent to link monitoring to implementation that is already planned. Potential partners include Caltrans, the State Water Resources Control Board, Water Environment Research Foundation, BMP manufacturers, and stormwater agencies throughout the region, particularly the agency in whose jurisdiction the study will be done.

Project 15. Develop improved indicators of peak flow impacts

Land use changes that increase impervious area lead to increased flows. While this increases the flood potential during major storms, it also increases flows during periods of low to moderate rainfall. These increased flows can cause downstream impacts on water quality and habitat through increased erosion and sedimentation. However, there are no well-established relationships between various levels of increased flow and downstream impacts. This project addresses this problem through an integrated modeling, experimental, and monitoring program in pilot watersheds.

Problem statement

Land development and consequent increases in impervious area increase runoff volumes and peak flows and can lead to downstream erosion and flooding. Traditionally, concerns about increased peak flows have focused on the 50 – 100 year storm event and the potential for destructive flooding. A variety of methods have therefore been developed to shave, retard, and/or channel peak flows and reduce flooding potential. However, development changes the hydrograph and increases runoff volume and velocity even for much smaller flows. Concern is therefore growing that such smaller changes, when they occur on a persistent basis, can create more subtle yet long-term and potentially important impacts on water quality and habitat and the beneficial uses related to them. Such impacts would occur primarily through changes in water quality and through sediment movement and redeposition and streambed scouring. Despite these concerns, there are no regulatory criteria that establish limits on increases in peak flow, nor is there sufficient knowledge about peak flow impacts on which to base such criteria.

Desired outcome

This project would produce indicators that quantitatively link a range of downstream impacts, primarily those related to stream bank and stream bed erosion, to increased peak flows due to land development and increases in impervious area. These indicators could help provide the basis for eventually establishing regulatory criteria for peak flows from smaller and more frequent storms.

Tasks

The major challenges involved in this project stem from the relative lack of quantitative information in the region about the effects of sustained increases in peak flows. Information available from other regions is only partly applicable because of the semi-arid nature of the southern California environment and the highly episodic nature of flows. This project will necessarily depend on the results of several other projects in this research program. It will require a comprehensive framework that describes the operation of the hydrological system and how increased flows might create impacts (Project 5, Conceptual Model), an assessment of historic and current conditions (Project 1, Integrate Available Data), an estimate of the relative contribution of different kinds of sources to regional loadings (Project 8, Relative Contribution of Nonpoint Sources), improved knowledge about the causes of specific impacts (Project 9, Identify Causes of Impacts), and better indicators of ecological condition (Project 10, Develop Bioassessment Indicators).

The major tasks involved in this project include:

- refine or expand the portion of the conceptual model dealing with peak flows
- analyze available data to build a picture of likely changes over time due to increased peak flows
- select pilot watersheds
- design field and modeling study to quantify changes in peak flows and relate these to impacts
- implement field study, including manipulative experiments involving, for example, controlled increases in flow
- develop recommendations for establishing management or regulatory criteria related to peak flows.

This is a medium to high risk / high benefit project. The highly variable nature of rainfall and flows in southern California makes it extremely difficult, in a short period of time, to develop reliable relationships between peak flows and downstream impacts. In addition, the lack of prior attention to this issue means that historical data are not likely to provide a useful database for establishing such relationships.

Schedule

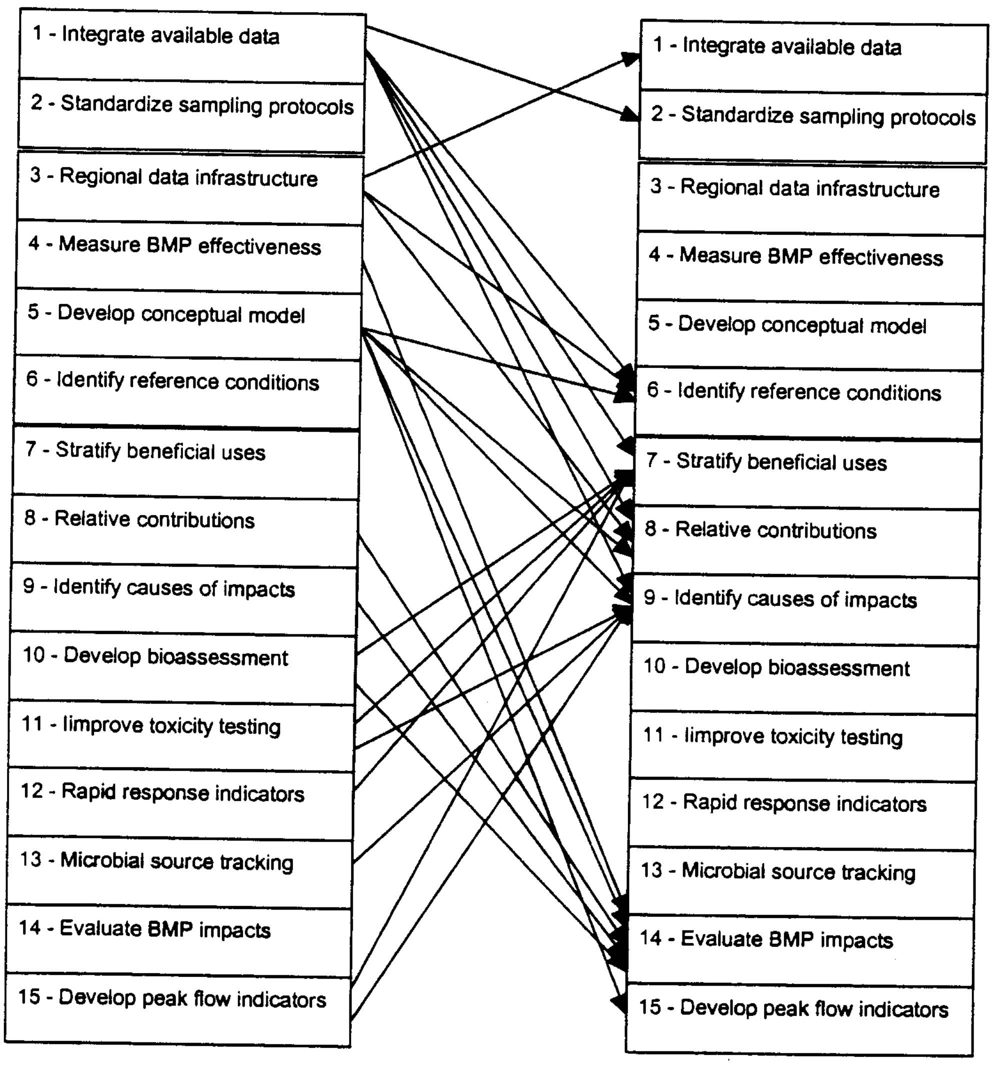
This project could begin in concert with development of the conceptual model in Project 5 and could produce results within three years.

Resources

Needed expertise includes in-kind support from agencies with field monitoring staff, as well as hydrologists, engineers, and modelers. Expected costs for gaging stations, field manipulations, and monitoring range from $75,000 to $250,000 per year, depending on the number of sites and the complexity of field experiments. Modeling would require an additional $200,000. Potential partners include the State Water Resources Control Board, regional stormwater agencies, SCCWRP, the U. S. Army Corps of Engineers, and the U. S. Geological Survey.

Research Plan Overview

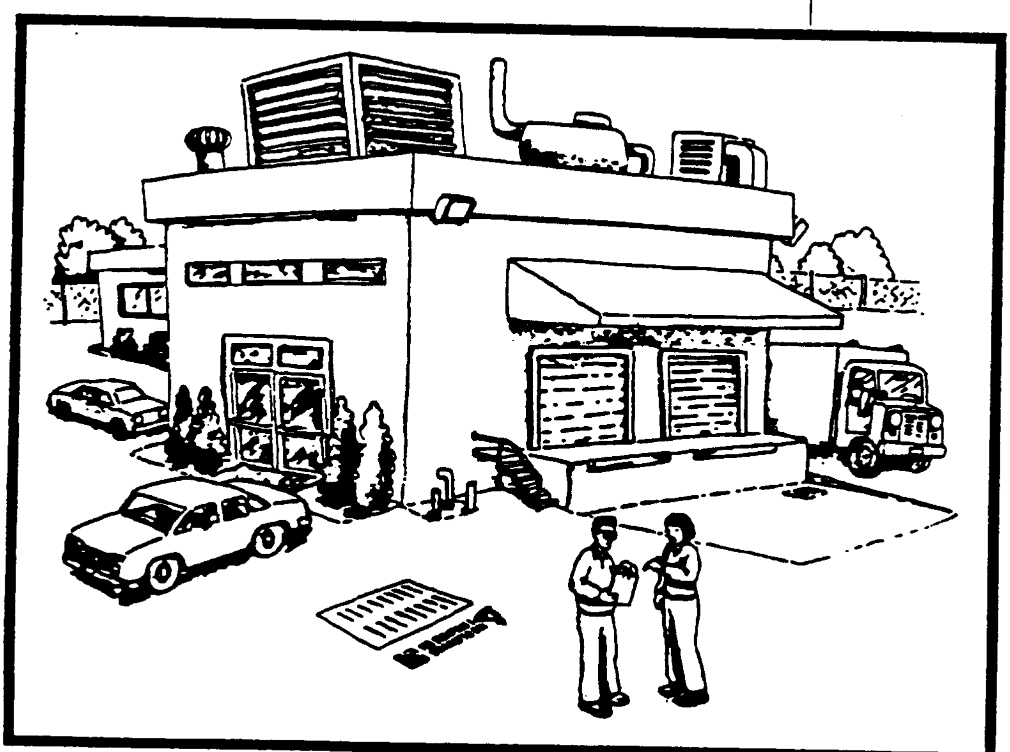
The preceding sections describe 15 distinct research projects that address key gaps in the knowledge base and the monitoring and management tools needed to adequately address stormwater impacts in southern California. While they are presented individually, they have two important features, as a group, that are important to emphasize. First, as the individual descriptions make clear, many of the projects are directly related, with some depending on the output of other projects for their success. The following figure illustrates the major groupings and relationships among the 15 projects. The projects on the left with several arrows emanating from them are projects that should be attempted first. These include integrating available data, creating a regional data infrastructure, developing a conceptual model, and developing or improving assessment tools for identifying receiving water impacts. Similalry, there are projects on the left with several arrows pointing towards them that should be left until the initial work is completed. These include stratifying beneficial uses, identifying causes of impacts, and evaluating the effect of BMPs on receiving wate quality. Ultimately, the interconnectedness among projects demonstrates that the workshop panelists have devised not just a list of individual wish-list projects, but a comprehensive research program.



Second, they lay the necessary groundwork for a comprehensive and region-wide stormwater monitoring program that focuses on high-priority problems and takes advantage of opportunities for regional coordination. In this sense, the information and tools the research program produces will not only improve individual stormwater programs, but will improve all of the stormwater programs in the region. The research projects will identify where there is uneven levels of effort and help to bring parity to monitoring programs throughout southern California. They will identify enhance the efficiency of individual programs and regional programs by ensuring comparability and quality. Finally, the research projects will improve effectiveness by identifying areas where all agencies can use commonly generated information thereby reducing redundancies or repetitive effort.

Finally, the workshop experts set an expectation that the research plan will eventually lead to a model stormwater monitoring program at the end of five years. The expectation included at least three levels of monitoring effort including: (1) an ongoing regional monitoring program where agencies interact at large spatial scales; (2) local monitoring focused on their individual discharges of concern; and (3) an ongoing research component consisting of specific projects, not unlike those described herein, where there is a defined beginning, middle and end, whose results feed directly back into the monitoring and management deciosn-making framework.

Best Management Practices for Industrial Storm Water Pollution Control



Alameda County
Urban Runoff
Clean Water Program
A Consortium of Local Agencies

R0020741

Contents

INTRODUCTION:
Storm Water Pollution Control for Industrial Facilities

Storm water pollution is the major source of contamination affecting local creeks and the San Francisco Bay. Storm drains carry excess water from streets, urban centers, industrial sites, and open spaces. In Alameda County, contamination of storm water is largely due to urban runoff pollution, which occurs when contaminants from industrial, commercial, and residental areas are picked up by runoff water and carried into the storm drain. In Alameda County alone, more than 85 billion gallons of untreated water and debris pass through the storm drain systems each year and flow into the bay.

Industrial operations constitute only partly responsible for urban runoff pollution, but they are known to be a source of heavy metals, oily wastes, and other contaminants. Manufacturing, shipping, and storage operations that are exposed to storm water runoff are common contributors to storm water pollution.

Federal and state storm water regulations now require most industrial facilities to take steps to prevent such contamination. Your facility might need to be covered by the Regional Board's October 1992 Industrial Storm Water General Permit. If so, you must prepare a Storm Water Pollution Prevention Plan (SWPP) that incorporates a variety of Best Management Practices (BMPs) like the ones described in this manual. If your facility is not covered by the General Permit, you might still need to implement BMPs to comply with local pollution prevention requirements.

Unlike some pollution problems, storm water pollution cannot be covered by a single set of rules that applies to all industrial facilities. Regulated industrial facilities in Alameda County range from manufacturing facilities that occupy several square miles to storefront distributors. As a result, plants can have very different storm water quantities, flow patterns, and potential pollutants. Even different facilities within the same general industry might have to adopt different approaches to the prevention of storm water pollution.

The BMPs in this manual are recommended by the Alameda County Urban Runoff Clean Water Program to help you:

- *Prevent storm water pollution;*
- *Protect water quality in local creeks, groundwater basin and the bay; and*
- *Comply with storm water regulations.*

This manual is intended to help you identify and implement the BMPs that are necessary and economically feasible for your facility to prevent storm water pollution. The BMPs include both operating practices and structural controls designed to reduce the amount of pollutants entering the storm drain system. You will need to evaluate which apply to your facility and implement them as necessary. Specific regulations can vary from one municipality to another, so you should become familiar with local storm water ordinances in the communities in which you do business.

This manual consists of two parts. The recommended BMPs in Part 1 are basic everyday operational practices that can be very effective in preventing pollution and reducing potential pollutants at the source, with relatively minimal structural or equipment requirements.

In many industrial facilities, storm water pollution can be prevented with common-sense precautions and modest changes in routine operations or maintenance practices. The numbered sections are keyed to industrial operations that are common to many kinds of facility. For some industrial facilities, these practices alone might be sufficient to control storm water pollution.

In other cases, it will be necessary to establish new practices or build physical controls to prevent storm water pollution. Part 2 of this manual consists of "advanced management practices." The advanced BMPs require more costly or more intensive efforts to address pollutants that are not adequately controlled by the simpler operational BMPs.

PART 1

Recommended BMPs for Storm Water Pollution Prevention

Part 1 of this manual contains BMPs that are recommended to control storm water pollution from particular industrial activities. It is divided into numbered sections, describing activities common to many kinds of industrial facilities, and it contains BMPs tailored to each kind of industrial activity or operation.

The recommended BMPs are to be implemented on an ongoing basis for the indefinite future. Operators of commercial and industrial facilities in Alameda County should implement these BMPs or similar controls wherever they would be effective in preventing pollutants at the site from entering storm water runoff.

PREVENT WATER FROM CONTACTING WORKING AREAS.

Shipping areas, outdoor equipment, material storage areas, vehicle maintenance spaces, and working areas of all sorts are subject to contamination by raw material, process liquids, grease, oily wastes, heavy metals, and miscellaneous potential pollutants. If you prevent storm water, wash water, or water from other sources from contacting areas exposed to pollutants, you won't discharge pollutants into your storm drains. Following are measures you should take to prevent water from contacting exposed areas:

- Keep rainfall from directly contacting working areas by installing roofs or moving industrial operations indoors where possible.
- Prevent storm water *runoff* from flowing across industrial areas by using properly designed berms or grading.
- Avoid practices in which you use water that later enters the storm drains — for instance, washing in outdoor areas. Most of those practices, including many that were acceptable in the past, are now considered to be "illicit discharges" of nonstorm water to the storm drain.

KEEP POLLUTANTS OFF SURFACES THAT COME INTO CONTACT WITH WATER.

Evaluate your site carefully to identify all areas that are contacted by storm water, wash water, or other water that is discharged into the storm drain. Then take special care to keep pollutants off those surfaces. That means controlling minor leaks and spills you might otherwise overlook, and taking a close look at your operating routines and equipment to determine whether any substances are unnecessarily exposed to storm water.

MANAGE STORM WATER BEFORE IT IS DISCHARGED INTO THE STORM DRAIN.

If you cannot avoid adding pollutants to storm water, you might have to remove them before they are discharged. Storm water control regulations, and this manual, consider treatment to be a last resort and emphasize source control options, because they are usually less costly, and more effective in the long run. In this manual, treatment measures appear only under Advanced Management Practices.

1 TRAINING AND EDUCATION FOR EMPLOYEES AND CUSTOMERS

Successful storm water pollution control relies mostly on the proper training and education of employees. Many of the recommended BMPs in this part of the manual identify specific training needs for employees who conduct the activities.

Train employees in the BMPs, because an employee's mistake can lead to a costly pollution incident. Assign experienced workers to train new employees. Review procedures as a group at least once a year.

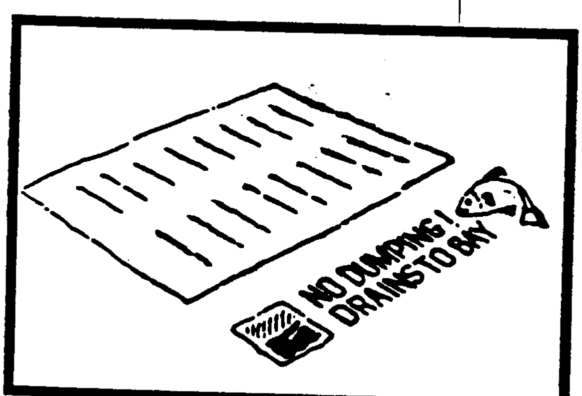
Periodically check employees' work practices to be sure the BMPs are implemented properly. Post informational signs, such as proper equipment washing procedures, at designated washing areas, and "Close the cover" signs at dumpsters and other storage areas. Stencil "NO DUMPING! — DRAINS TO BAY" messages at storm drains. (Stencils might be available from the Clean Water Program.)

Provide general information as well, because employees often respond best if they understand *why* they are being asked to conduct a new procedure. Employees' suggestions in return can help identify cost-effective storm water controls for your facility.

If you subcontract for small construction jobs or other work on your premises, include BMPs as conditions when writing contracts. Provide contractors with proper disposal options for wastes. Monitor contractors to be sure they comply with your BMPs.

If you serve customers at your facility, be aware of customer activities on-site. If they dispose of material improperly, *you* will be responsible for the violation. Ask your customers not to discard liquids into your trash cans or storm drains. If you have persistent problems, you might need to monitor your customers more carefully at trash cans, storm drains, and other potential disposal areas, on your property.

Let your customers know how you are minimizing wastes and recycling fluids to show that you are a "good neighbor," and encourage your customers to do the same. Showing clients what you are doing to protect the Bay is good public relations. Some businesses make the customer aware of their environmental requirements by including a modest environmental compliance fee, itemized on customers' billing statements, to cover handling and disposal costs for hazardous material.



Label storm drain inlets, so that employees do not dispose of waste there.

2 ELIMINATING IMPROPER DISCHARGES INTO STORM DRAINS

Local ordinances generally prohibit discharging *anything but storm water* into the storm drains. There are many ways in which nonstorm water from industrial plants can enter the storm drainage system. In most cases, those discharges are now illegal, even though they might have been permissible in the past. Industrial process water, building wastewater, and water from other sources are prohibited, with a few exceptions described in Table 1. Inspect your facility and yard to be sure no unauthorized discharges enter your storm drains.

Unauthorized discharges take two forms:

Illicit connections are improper permanent connections that allow wastewater to enter storm drains. Connections that allow sanitary or process wastewater to enter the storm drain are prohibited, including all storm drain connections from indoor drains or sinks. More information on identifying and removing illicit connections is available from your sanitary sewer district or municipality.

An illicit discharge is any nonstorm water discharged into the storm drainage system. Pollutants can be introduced into storm drains inadvertently by routine practices that discharge water outdoors or by routinely discharging wastes, wash water, and other material into storm drains, catch basins, and other conveyance facilities either on your property or in the street. A large part of this improper discharge results from employees' lack of understanding, coupled with a lack of readily available proper routes for the discharge.

You need to make a long-term ongoing effort to assure that no illegal discharges will occur. That requires continuing observation to identify potential sources of intentional or

R0020745

TABLE 1. PREFERRED DISPOSAL OPTIONS FOR WATER DISCHARGES			
WATER SOURCE	**PREFERRED DISPOSAL OPTION**	**RESTRICTIONS OR PERMIT NEEDED**	**POSSIBLE OPTIONS FOR REUSE OR RECYCLING**
Industrial process	**Sanitary sewer whenever possible**	**POTW permit**	**Reuse in-plant wastewater**
Noncontact cooling water	**On-site reuse**		**Reuse in closed-loop cooling system** ***(cooling tower)***
• Uncontaminated*	• Storm drain if reuse is impossible	• Storm water NPDES permit	
• Contaminated	• Sanitary sewer	• POTW permit	• Treat and reuse
Industrial cooling equipment condensation		**Storm water NPDES permit**	**Hold and apply to landscape**
• Uncontaminated*	• Storm drain	• Must be tested and shown to be uncontaminated.	
• Contaminated	• Sanitary sewer	• POTW permit	
Building air conditioner condensation	**Storm drain (if city allows)**	**Some localities require discharge to POTW with permit**	
Building air conditioner coolant			**Reuse in-plant whenever possible**
• Uncontaminated*	• Storm drain	• Storm water NPDES permit	
• Contaminated	• Sanitary sewer	• POTW permit	
Storm water in outdoor secondary containment			
• Uncontaminated*	• Storm drain	• Test to determine contamination.	• Pump and apply to landscaping. (See Section 5)
• Contaminated	• Sanitary sewer	• POTW permit	
Storm water from outdoor material storage			
• Covered	• No discharge	• Zero contact with storm water.	
• Open	• Storm drain	• Water quality inlet or similar treatment. (See Section 20) Storm water NPDES permit	
Roof drain water	**Storm drain if no pollutants**	**Roof vents may be source of pollutants. See BAAQMD air emissions regulations and Section 4.**	
Industrial equipment wash water	**Sanitary sewer**	**POTW permit**	**Reuse in-plant whenever possible**
Vehicle maintenance wash water	**Sanitary sewer**	**POTW permit**	**Capture and reuse for washing**
Vehicle one-time wash water	**Storm drain (See Section 7)**	**Water only (no soap or solvents)**	**Minimize water; prevent flow across paved area**
Wash water from paved walkways in commercial and business districts	**Storm drain**	**Sweep sidewalks before washing. No cleaning chemicals may be used.**	**Minimize water use and direct to landscape.****
Commercial building exterior wash water	**Storm drain**	**Filter before it enters catch basin**	**Minimize water use and direct to landscape****
Landscape irrigation	**Storm drain**		**Minimize water so none runs off****
Potable water and potable line flushing	**Storm drain**	**Must be dechlorinated*****	
Fire-fighting flows	**Storm drain**	**Block downstream channels to detain for testing as hazardous waste**	

R0020746

inadvertent improper discharges. Discontinue or reroute the water from those activities. Measures to help prevent illegal discharges include:

- Providing well-marked proper disposal or collection methods for wastewater wherever you frequently use wash water, discharge cooling water, or produce a liquid waste that might otherwise reach the storm drain.
- Employee training that especially emphasizes proper disposal of nonstorm water (see Section 1). Educate employees to understand that storm drains connect directly to streams and the bay without treatment.
- Labeling all storm drain inlets and catch basins "NO DUMPING! — DRAINS TO BAY," so that employees will know which inlets are part of the storm drain system.
- Periodically inspecting and maintaining storm drain inlets. Clean out catch basins so that accumulated pollutants do not wash down the storm drains.

Source: Storm Water Industrial General Permit for the Santa Clara Valley, Regional Water Quality Control Board/S.F. Bay Region, January 1992.
POTW (Publicly Owned Treatment Works) permit: Permit to pretreat and discharge is required from your wastewater authority.
BAAQMD: Bay Area Air Quality Management District.
* Biocides, corrosion inhibitors, or other additives are contaminants from a storm water point of view.
** Must comply with local water use restrictions during drought conditions.
*** Potable water, swimming pool water, and other chlorinated sources must be dechlorinated by aeration, retention, or chemical additives to a "no measurable chlorine" standard before reaching receiving water. If the water is not dechlorinated, it must be discharged to the sanitary sewer under a POTW permit.

Table 1 identifies some common sources in industrial plants of water that can enter storm drains. For each source, the table lists the preferred disposal option. For water that is allowable for discharge into the storm drain, Table 1 lists conditions or restrictions placed on the discharge.

Following are conditions or restrictions placed on a few categories of special interest:

- **Cooling tower condensate** for industrial process water must be discharged into the sanitary sewer. Permits are required.
- **Internal coolant** for refrigeration or building air conditioning must not be discharged into storm drains.
- **Building air conditioner condensate** may be discharged into the storm drain *only* if it is not treated with algae inhibitors, corrosion, control chemicals, or other additives.

Wipe up spills immediately with shop rags.

3 SPILL PREVENTION, CONTROL, AND CLEANUP

Small spills can have cumulative effects that add up to a significant source of potential pollutants in your storm water discharge. The best approach by far is to prevent spills and leaks. Maintain a regular inspection and repair schedule, and correct potential spill situations. Some prevention techniques are described in Sections 4, 5, and 6.

When a spill does occur, quick and effective response is the best way to prevent pollutants from reaching storm water. Prepare a set of well-defined procedures for responding to a spill of any liquids in an area that might be exposed to storm water. The procedures can be specific for your facility. They should take into consideration all circumstances, from small and minor releases that can be easily handled to a large emergency spill, and they should identify whom to call to respond to the situation before it gets out of hand. Train employees in the procedures (Section 1).

The basic procedures should emphasize that spills be cleaned up promptly and not allowed to evaporate. Otherwise, pollutants remain on the pavement and might be washed to the storm drains with the next rain, or they remain in the soil and become a possible groundwater pollutant. If the spill is on an unpaved surface, determine whether you need to remove the contaminated soil to prevent it from becoming a source of future storm water pollutants.

Also the standard procedures should specify cleaning up leaks, drips and other spills without water whenever possible. Do not use a hose or wet mop to clean up a spill area. Hosing might remove the spill from the immediate area, but does not keep the pollutant out of the environment. On the contrary, it

R0020747

adds to the volume of the spill and spreads the spilled material around a larger area.

If you handle hazardous material, spill prevention and response procedures are described in your hazardous material management plan filed with your fire department or other hazardous material ("HazMat") authority (see Section 6). If a spill occurs, notify the authorities as required in your emergency response plan. Contain and collect the spilled substance, then dispose of the substances and any contaminated soil in compliance with hazardous materials regulations.

Small spills are those which can be wiped up with a shop rag. Do not put wet rags in the dumpster with the shop trash. Store them in a covered rag bin of the kind used at auto service stations. Avoid paper towels. You can avoid making this a waste stream by sending used rags to a professional cleaning service. (You must inform your cleaning service of what the shop rags have been used for.) Do not saturate rags with gasoline, solvents, or other volatile liquids.

Medium sized spills are too large to wipe up with a rag and require more attention. Contain and soak up the liquid, using dry absorbent material, such as vermiculite, specially prepared sawdust, or cat litter. Absorbent "snakes" may be used as temporary booms to contain and soak up the liquid. Sweep up the used absorbent material and snakes, and dispose of them appropriately, with the shop trash if nonhazardous, with the hazardous wastes if necessary. Another convenient option is to use a wet/dry shop vacuum cleaner to collect spills and dispose of the liquid with your liquid or hazardous wastes. *Do not* use vacuums for gasoline, solvents, or other volatile fluids because the enclosed vacuum could become an explosion hazard.

Larger spills must be contained then cleaned up. For spills of food waste or other nonhazardous liquid, take steps to contain and clean up the liquid and minimize the wash water used in cleanup. Shut off or plug storm drain inlets or sewer inlets where the spill can enter. If necessary, keep temporary plugs on hand to fit your inlets and train employees regarding when and how to use them. For hazardous material spills, implement your emergency procedures and alert your HazMat authority.

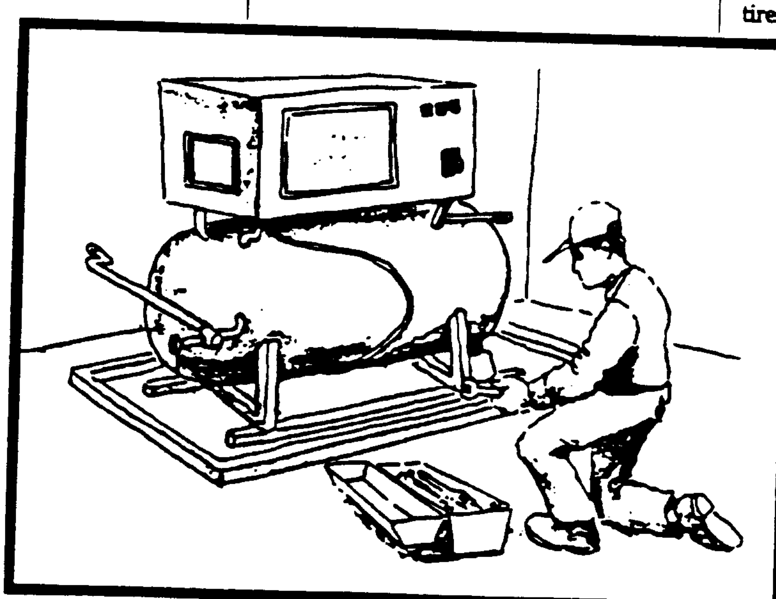
4 OUTDOOR EQUIPMENT OPERATIONS AND MAINTENANCE

Storm water from your site can accumulate pollutants by exposure to numerous small leaks, spills, and other discharges from outdoor equipment. Large equipment might require specially designed structural or advanced BMPs to reduce the potential for storm water to contact pollutants. Ordinary precautions, such as those described below, might suffice for smaller equipment.

As a first step, identify all equipment at your site that might be exposed to storm water or could discharge potential pollutants that could be exposed to storm water. Identify the kinds of pollutants each piece of equipment might generate—lubricants, coolants, and other leaks or discharges.

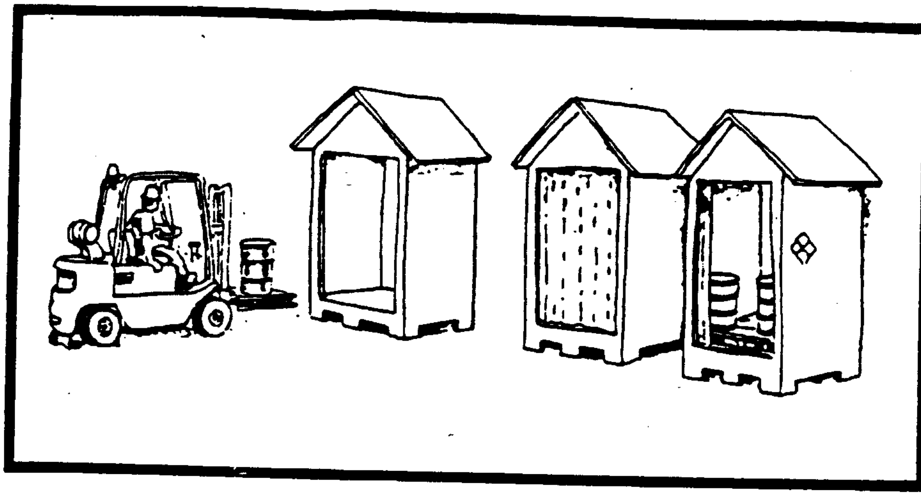
Be creative and thorough in developing your list. The inventory should include rooftop cooling towers or air conditioners; rooftop air vents for industrial equipment; outdoor air compressors and other service equipment; indoor wet processes where leaks or discharges might reach outdoor areas; and material transfer areas, such as loading areas where forklifts or trucks can carry pollutants outdoors on their tires.

Keep drip pans under outdoor equipment to contain drips and leaks, especially during maintenance.



Using the equipment inventory, assign an employee to inspect each piece of equipment on a regular basis to see that it is functioning properly. The employee might be the person responsible for operating the equipment if it is used regularly, or a maintenance staff member for equipment on the roof or in seldom-seen places. Inspect for leaks, malfunctions, and staining on and around the equipment and other evidence of leaks and discharges. Assign to the inspecting person responsibility for reporting a spill.

R0020748



A "Doghouse" shed is one way to keep storm water away from barrels and materials kept outdoors, and at the same time it provides spill control.

Develop a routine for taking actions on the report—cleaning up the spill and repairing the leak to prevent future spills.

Where possible, take the next step toward full pollution prevention and make modifications to prevent storm water from contacting the equipment or its discharges. Place equipment on an impermeable surface, or install a drip pan beneath potential leak points. To minimize the amount of rainwater that contacts the equipment, you might construct a simple roof and install a berm to prevent run-on and runoff. If the equipment requires a "wet" process—that is, if operation inevitably releases wash water or process liquids—place it on a paved surface and install a connection to the sanitary sewer. Check with your municipality or wastewater authority to identify appropriate permits.

Air compressors and other equipment sometimes produce small quantities of automatic blowdown water, which usually contains lubricating oil or other potential pollutants. The water may not be discharged into the storm drain. Connect the blowdown to the sanitary sewer with proper approval. Or if the compressor has a frequent small bleed, place a drip pan or catchment to collect the water—do not let it soak into unpaved surfaces or run off paved surfaces.

Condensate on exterior surfaces of compressors, building cooling equipment, and other machinery may be directed to the storm drain system or, preferably, to a landscaped area.

5 OUTDOOR MATERIALS STORAGE AND HANDLING

If you handle **bulk solid material** outdoors, keep them covered in appropriate containments and protected from storm water. Apply this policy to raw material, products, by-products, and construction materials or supplies.

Store the material in one of these ways:

- The preferred method is storage on a paved surface, with a roof or covering, so that no direct rainfall contacts them, and with appropriate berms or mounding to prevent run-on of storm water. Roofs are recommended by most municipalities for new facilities.
- Where a roof is not feasible, place the material on a paved surface and cover it with plastic sheeting or tarp secured with weighted tires or sand bags. If possible, choose a mounded or bermed area that will prevent run-on of storm water through the material.

Parking lots or other surfaces near bulk material storage facilities should be swept periodically to remove fines that wash out of the material and would otherwise wash away with storm water. Larger bulk material storage facilities need more extensive structural controls for the specific facility and material.

Hazardous material must be stored in accordance with federal, state, and local HazMat requirements. The requirements are generally more than adequate to prevent storm water pollution—for instance, a HazMat secondary containment might have no drain.

If you store **liquid containers**, implement a plan and a design to control unexpected leaks and spills so that the liquid does not reach storm drains or surfaces that will be exposed to storm water. If you store hazardous material, the spill prevention plans required by your HazMat authority are adequate to ensure storm water protection. Nonhazardous material storage should also incorporate spill control designs and procedures.

Select a storage method appropriate for the type of material. Keep liquid tanks in a designated area on a paved impermeable surface and within a berm or other secondary containment. Inspect containers regularly for damage or leaks, as described in Section 4. Clean up any leaks or spills immediately (using dry methods described in Section 3), and repair the leaks promptly.

For smaller storage tanks, storage in roofed areas can prevent all contact with storm water (in combination with well-designed spill control procedures). A possible option is the "doghouse" design used by some firms (see illustration). The roof and flooring prevent contact with direct rain or run-on storm water. Contact your local HazMat and fire authorities for specific requirements.

R0020749

Storm water often accumulates in **secondary containment areas**. If this water is contaminated, it may not be discharged into the storm drain system.

You might wish to roof the containment to avoid this problem. If that is not possible, the liquids that accumulate in the containment *might*, with approval, be acceptable for discharge into the sanitary sewer. However, the area itself should have no direct connection, in case of spills. One common solution is a portable pumping system that can be moved to accommodate separate containment structures on your site. The equipment can pump water into a truck or portable temporary holding tank. The water then can be tested and disposed of according to whether any pollutants are present. Following are some disposal options:

- If the water meets criteria for hazardous waste, employ a certified hazardous waste hauler for disposal at a permitted hazardous waste facility.
- If it has constituents similar to process wastewater for which your on-site wastewater pretreatment facilities are designed, pretreat the water and discharge into the sanitary sewer.
- If it meets standards for your industrial discharge permit, discharge it into the sanitary sewer without pretreatment (if permitted by your wastewater authority).
- Reuse it on your site in an appropriate manner as industrial process water, equipment wash water, steam cleaning makeup, or another use where the water will eventually be discharged as industrial or sanitary wastewater. You might have to invest in a truck or plumbing to convey the water to its reuse location.
- If it is free of hazardous constituents, use it on your facility grounds for landscape watering. Do not apply the water to landscaping if hazardous pollutants are present—even if not concentrated enough to be hazardous waste—because the pollutants might accumulate in the soil or vegetation and eventually create a health hazard.

6 WASTE HANDLING AND DISPOSAL

Table 2 summarizes the preferred storage and disposal practices for some common industrial facility wastes. For many wastes, reusing or recycling is the most cost effective means to prevent potential pollution. Fluids that you hold for recycling are special categories of hazardous waste. You may store them on your site only for short periods in accordance with hazardous waste requirements, but they may be transported under somewhat less stringent requirements than other hazardous wastes. Many recycling services have special variances or permits, which reduce your paperwork requirements and allow shipping at reduced cost.

Keep general shop trash in a dumpster with the lid closed. Put the dumpster in a paved area, not on unpaved soil or your lawn. Keep the area clean by picking up dropped trash and sweeping the area regularly (perhaps once a week), but do not use a hose to clean up—keep water off the area. Nearly all dumpsters and trash compactors leak; keep liquid wastes out of them, and keep them closed to keep out storm water.

If you cannot prevent leakage from trash containers, install a roof or lean-to that keeps direct rainfall off them, and place asphalt curbing or berms around the dumpster to contain the leaks. (Check with your local agencies, and comply with fire codes and building permits.)

If you store **scrap metal** or other such material outdoors, keep it under a roof, cover, or tarpaulin. Keep scrap, parts or other used metals indoors. Oils and other potential pollutants can wash off long after you think the parts have been washed clean. Collect waste metal, such as used parts and metal lathe filings, for delivery to a scrap metal dealer.

If you store **empty drums** outdoors, do not hold them longer than necessary. Ship them to a drum reconditioner or another facility. Before shipping:

- Drain them completely to avoid spills.
- Seal them properly so that they are watertight, to keep storm water from entering; otherwise the water would become a process wastewater, and could not be dumped into the storm drain.

Store and handle **hazardous wastes** properly. Hazardous material or waste is not a storm water problem if they are handled in accord with state and federal regulations, and the requirements of your local HazMat control authority.

Keep hazardous waste and material indoors or under cover in a locked area, to keep nighttime trespassers away from them. Store them before disposal in special hazardous waste containers or in closed drums within a secondary containment that is approved by your HazMat authority.

In some cities of Alameda County, the municipal fire department is the HazMat authority that controls hazardous material storage, handling, and response. Other locales contract with the County Health Department. For information about handling solid wastes that might be controlled under hazardous waste regulations, contact the County's Environmental Health Department or Cal-EPA's Toxic Substances Control Division. (See the back cover for a list of regulatory agencies.)

Empty containers, such as storage barrels, oil cans, paint buckets, and aerosol cans are hazardous wastes if they once held hazardous material. You may not discard these with the regular trash. They must be stored properly so that they do not leak outdoors. Some drum suppliers accept empty drums for reuse under less stringent hazardous material recycling regulations.

TABLE 2. PREFERRED WASTE HANDLING & DISPOSAL METHODS

		RECOMMENDED STORAGE	PREFERRED DISPOSAL	HAZARDOUS WASTE?
General Plant Wastes	• Used parts—clean metal scrap	• Bin (covered or indoors)	• Scrap collector	No
	• Used oily parts—contaminated	• Drum	• Hazardous waste hauler	**Yes**
	• Metal shavings	• Bin (covered or indoors)	• Scrap collector	No
	• Used rags	• Rag bin with lid	• Rag laundry	***Possibly***
	• Soiled cleanup absorbent	• Drum	• Hazardous waste hauler	**Yes**
	• Coolant from air conditioner or refrigeration equipment	• Recycling machine	• Reuse in-house (HVAC service company)	No
Liquid Wastes	• Paints*	• Original container, with lid	• Hazardous waste hauler	**Yes**
	• Waste lubricating oil	• Drum (segregated)	• Oil recycler	*Special***
	• Solvents, thinners, and miscellaneous fluids*	• Tank ("hot" waste) *Segregate different fluids to make recycling possible*	• Solvent recycler (where possible) or waste hauler	***Possibly***
Liquid Containers	• Empty drums	• Indoors or under cover	• Drum reconditioner	
	• Empty cans, bottles, aerosol cans, etc.	• Drum	• Municipal trash or hazardous waste hauler	***Possibly***
Vehicle Wastes	• Waste motor oil	• Drum (segregated)	• Recycler	*Special***
	• Brake fluid, gear oil, hydraulic fluids, etc.*	• Bottle or tank ("hot" waste)		**Yes**
	• Antifreeze	• Tank (segregated)		*Special***
	• Batteries	• Open rack	• Battery supplier	*Special***
	• Tires	• Covered or indoors	• Tire hauler	No
	• Oil filters	• Drum (drain first)	• Oil recycler	*Special**

*Unused pure product may sometimes be returned to the vendor rather than disposed of as waste.

**Recyclable under special hazardous-materials restrictions.

Vehicle maintenance waste material often deserves special attention. Waste oil, antifreeze, spent solvents, and some other liquids can be recycled. Spent batteries may not be discarded with trash, but must be either disposed of as hazardous waste or returned for reclamation and reuse to the dealer from whom you purchased them. Guidance on handling vehicle wastes can be found in the Automotive Industries BMP manual which is available from your municipality.

7 EQUIPMENT WASHING AND STEAM CLEANING

Wash water for industrial equipment in most cases must be discharged as process wastewater into the sanitary sewer, and it is not allowed in storm drains. To clean dirty and/or greasy field equipment or trucks, you must install equipment to capture and pretreat the wash water for discharge into the sanitary sewer as industrial process waste. It may be less costly in the long run to locate a commercial car wash that has all the appropriate equipment and municipal permits, and to contract with them for washing services offsite.

If you wash vehicles or equipment on your site, you may do so only in a designated area, which must be designed and equipped as follows:

- Pave the area.
- Mark the area clearly as a wash area, and be sure all employees know that they may wash in this area only. Post instructional signs that prohibit changing vehicle oil, washing with solvents, and other such activities.
- Install sumps or drain lines to collect wash water for treatment and discharge into the sanitary sewer; reuse (for repeated washings); or recycle (for use elsewhere on-site).

R0020751

- If the equipment is a continuing source of grease or heavy dirt, cover the area to prevent contact with rain water when not in use.
- Grade or berm the area to prevent storm water from running onto it.
- Wash inside a building designed for maintenance or equipment storage if possible. Ensure that all drains connect to the sanitary sewers.

Steam cleaning should be done on your site *only* if you are equipped to capture all the water and other wastes. All the washing requirements above apply to steam cleaning as well. Steam cleaning wash water is not allowed in storm drains unless you have a permit from your wastewater authority. Permit requirements include pretreatment with equipment such as an oil/water separator, which might have to be a hazardous waste unit. If you steam clean, do it indoors or in a specially prepared outdoor working area where you collect the wash water and treat it for discharge.

Storm water runoff from industrial roofs, trucks, parking lots, and yards flows into storm drains and directly into streams and the Bay. It never receives treatment that would remove pollutants.

8

TRUCKING AND SHIPPING/ RECEIVING

Truck loading and unloading are potential sources of pollutants when rainfall and run-on contact spilled raw material, dust, and motor fluids that accumulate in this heavy traffic area.

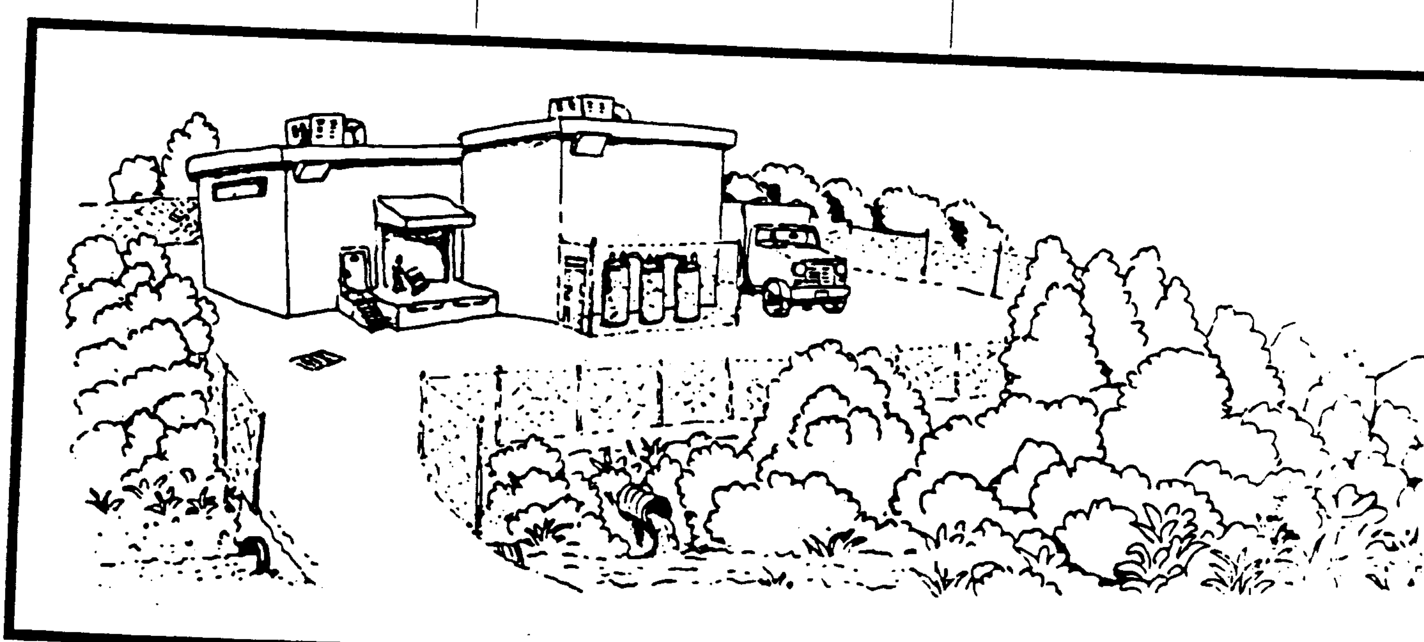
Load and unload raw material, products, and other material only at designated loading areas. In that way, you can isolate the potential source in areas that you can control, instead of in unspecified areas throughout your site. The best areas from a storm water point of view are indoor bays. For facilities that must use an outdoor loading dock, some operational BMPs and simple design features can control storm water pollution:

- Cover the loading dock area with a roof overhang, or use a door skirt that snugly fits both the building door and the truck door.
- Install curbs or berms around the loading area to prevent storm water from running onto it and any spilled material from running off it.
- Instruct the person who accepts the shipment, the truck driver, or someone else to check under the truck for leaked motor fluids, spilled matter, debris, and other foreign material.
- Develop a procedure requiring a maintenance crew to clean up spilled material promptly.

If you load or unload liquids, you need further operational precautions, and the loading dock should have additional design features. If you handle hazardous material, all the features you need are probably in place as part of a spill control and response plan. If they are not, you should select structural BMPs like those described in Section 13.

Parking lots and access roads are sources of potential pollutants from the trucks themselves and from possible spills or leaks of the material being transported. If you are regrading roads and parking lots, or if you transport materials that you expect to be significant sources of potential storm water pollutants, follow the structural BMPs recommended in Section 16. For existing facilities, especially smaller parking lots and short driveways where no hazardous material are transported, you can effectively prevent storm water pollution by implementing routine maintenance activities, such as:

- Regular visual inspection of your access roads and parking lots to identify and clean up spills.
- Removal of debris as soon as operations permit.



R0020752

Conduct street sweeping style cleanups periodically to remove loose debris, small amounts of spilled raw material, road dust, and other potential pollutants:

- Smaller spaces can easily be swept by hand.
- Do not hose off paved surfaces.
- For larger spaces, use a vacuum truck or mechanical sweeper (one that collects solids, not just brushes them aside). Whenever possible, do not use a wet washing street sweeper unless you can collect the polluted wash water.
- Private companies can perform the work on a contract basis so that you need not purchase the truck.

During the dry weather season, the appropriate frequency of sweeping for your facility depends on how heavily the road is used and the kinds of material you transport. Following are signs that you need to sweep more frequently:

- Your trucks commonly spill or drip bulk material.
- Debris or other material accumulates on the access roads. The correct frequency is one that prevents unwanted material from accumulating.

During the wet weather season, emphasize sweeping at times that will best prevent storm water from contacting potential pollutants:

- Clean the area once thoroughly before the wet weather season begins.
- After that, you may stay close to your dry season needs for debris removal, but add an additional thorough cleaning before a major rainfall (when half an inch or more is forecast).

Dispose of the cleaned-up material with your regular facility trash if there is no hazardous material. If you suspect it is hazardous — if you handle hazardous material, or if you know of a significant motor oil leak, for example — you should test the material or dispose of it with your facility's hazardous waste. You could face substantial penalties if you improperly dispose of hazardous waste.

If you **park trucks or heavy equipment** on-site, inspect the parking area for leaks of oil and motor fluids and design a procedure to report them, clean them up, and repair the leaking vehicle. Following are some practical techniques:

- Design consistent parking spots for each vehicle, so that if a leak is indicated on the ground the truck can be identified and repaired.
- Designate a person to be responsible for checking under a vehicle for leaks or spills. If you employ drivers, the driver could have the responsibility as part of a vehicle check conducted before driving.
  - Clean up spills promptly, using dry cleanup procedures described in Section 3. Conduct the preferred cleanup procedures for unpaved, as well as paved, areas.
  - Develop a reasonable procedure for identifying, reporting, repairing, and cleaning up leaking motor fluids and spilled material. Make sure employees are fully trained in the procedures and know who is responsible for checking each truck, who should be notified if there is a problem, and who should respond.

9 MAINTENANCE OF FLEET VEHICLES

The Automotive BMP manual prepared by the Alameda County Urban Runoff Clean Water Program addresses automotive and vehicle repair facilities. You should implement the BMPs in that manual if vehicle maintenance is a potentially significant source of pollutants on your site. Sections 9 and 10 of this manual summarize some of the appropriate BMPs for fleet maintenance at an industrial facility.

Whenever possible, perform vehicle maintenance in an indoor garage, not in outdoor parking areas. If you change oil and do other routine engine work outdoors, you should create a designated area for vehicle maintenance. Keep the area clean, as if it were part of your shop floor, and use dry cleanup practices. The area should incorporate some specific design features, such as those described in Sections 14 and 15. Some operational methods also can be successful in preventing storm water pollution at vehicle maintenance areas. A few suggestions:

- Keep equipment clean; do not allow buildup of grease and oil, which will wash away when the equipment is exposed to rain.
- If you work on vehicles outdoors, keep drip pans or containers under the vehicles at all times while you work on them — leaks and spills can occur unexpectedly. Place drip pans under vehicles as soon as you detect a leak.
- Drain fluids from any retired vehicles kept on-site for scrap or parts. Out-of-service vehicles you intend to restore and vehicles being held for resale should be checked periodically for leakage.

R0020753

- Do not change motor oil or perform vehicle or equipment maintenance in the parking lot or storage yard; use the vehicle maintenance area. Do not allow customers or employees to change their personal vehicles' oil in your vehicle service areas.

Vehicle parking or storage yards need to be operated with similar precautions:

- Inspect equipment in the yard for fluid leaks regularly — perhaps with a walk-by inspection for ground staining every day, and a closer visual inspection once a week.
- Keep the equipment yard clean and clear of debris, using dry sweeping methods described in Section 8. Do not hose off the area or wash with water, because any runoff becomes an illegal discharge into the storm drain.
- Maintain the yard's storm drain inlet(s) with special care. Clean them on a regular schedule and also after large storms. Pay attention to the kinds of potential pollutants that accumulate, so that you can identify the sources and take measures to control the sources.

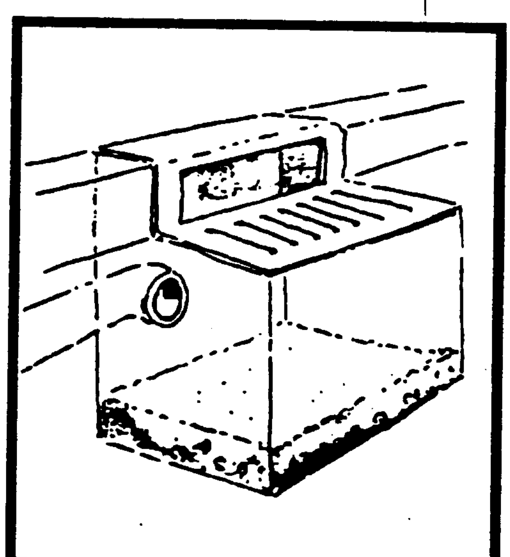
10 FUELING FLEET VEHICLES AND EQUIPMENT

If you have a vehicle fueling area, it should be designed and operated to minimize the contact of spilled fuel and leaked fluids with rain water. This section describes general principles, but simple operational controls might not be adequate for an industrial fueling facility. You might have to redesign your fueling area or install structural controls. Section 14 describes some general design approaches that can be useful in your eventual complete Storm Water Pollution Prevention Plan. Following are steps you can take for proper operation of a fueling area:

- Use a paved area or provide a concrete slab for the fueling area — never locate the area on open ground. Concrete is preferred because fuel and oils cause asphalt to deteriorate.
- Clean up gasoline overflows and spills, using dry methods described in Section 3. Do not allow spills to run off or evaporate, and do not flush the spill away with a hose. Spread absorbent material, sweep it up with a broom, and dispose of it as hazardous waste.
- Post signs that instruct pump operators not to "top off" or overfill gas tanks. Keep dry cleanup material in the fueling area, and instruct employees in the dry cleanup methods described in Section 3. Assign someone the responsibility of checking the area every day for gasoline, motor oil, or other fluids that have leaked.
- When you do routine cleaning, use a damp cloth on the pumps and a damp mop on the pavement, instead of spraying with a hose, to minimize the flow of cleaning water to the sump.

The main concept is to respond properly to fluid leaks in this spill-prone area. Even very small spills, when they happen every day, add up to a lot of fuel in the drainage system. This is an improper discharge that is illegal under the General Permit. Small spills do not present a problem if the fueling area is designed to handle spills — that is, if no storm water contacts it, and if it drains to a sump. But if the area drains to a valved-off storm drain or sewer connection, it must be pumped out before the valve may be opened during a rainfall.

A permit from the HazMat Authority is required for fuel tanks, including temporary ones. The authority will specify design features, such as the size of containments. Keep temporary fuel tanks in a bermed area that has an impervious lining, such as concrete or heavy-gauge plastic.



A catch basin helps keep debris and sediments out of the storm drain, but must be cleaned out periodically.

R0020754

11 BUILDING AND GROUNDS MAINTENANCE

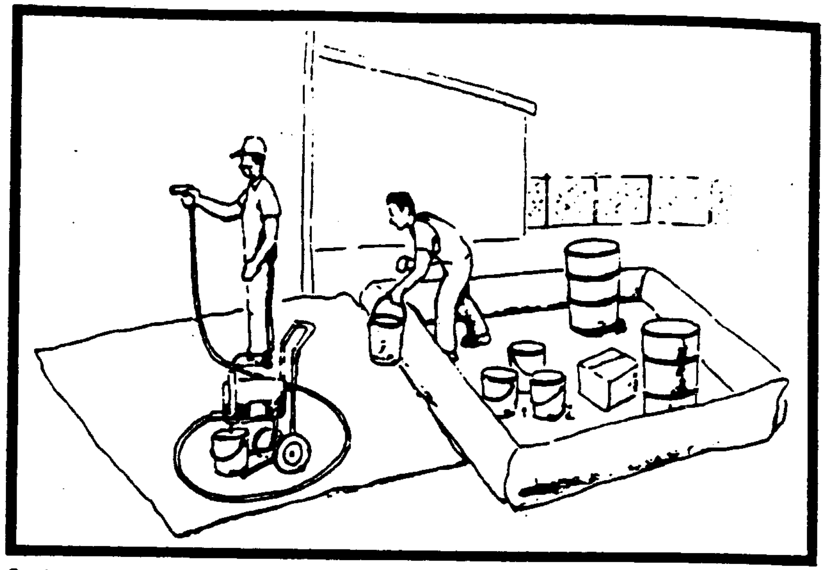
Building maintenance and general outdoor cleanup should be based on the same principles as parking lot cleanup and spill prevention: clean up without water, whenever possible, by sweeping or wiping; wash with as little water as possible; prevent and clean up spills; and clean up debris and solids, so that they do not reach the storm drains.

Maintain the storm water conveyance system on your property. The "conveyance system" might be as simple as roof downspouts and a gutter in your driveway or might be an extensive system of inlets, ditches, drainage channels, and underground lines. Keep all parts of the system clear of debris to avoid blockage that can cause storm water to back up. Remove from the system any spilled or leaked material that can be transported by storm water.

Clean the storm drain inlets to remove sediment and debris at least twice a year — late in the dry weather season before the first storm, and after the first major storm of the wet weather season. After each large storm, inspect the inlet; remove debris; and determine whether you need to remove sediment or do other maintenance.

The storm drain inlet might have a catch basin—a below-grade chamber where the storm drain pipe connects. Catch basins are intended to collect debris and sediment to prevent clogging the lines. Therefore the catch basins themselves must be cleaned out periodically to prevent flooding. If you clean catch basins annually, shortly before the wet weather season, you can keep them flowing freely and remove leaves, sediment, and other material that would otherwise be washed down the storm drain. Do not flush the catch basin with water; use a shovel or vacuum device to remove the material.

Other useful design features, such as vegetated ditches and water quality improvement inlets, are described in Sections 19, 20, and 21 as advanced BMPs.



Outdoor painting requires practices to prevent paint and dust from becoming storm water pollutants.

12 BUILDING REPAIR, REMODELING, AND CONSTRUCTION

This section describes some relatively simple BMPs that apply to minor building repairs, remodeling, and minor construction projects that involve "industrial activity exposed to storm water."

Large-scale projects, such as construction of new facilities, are covered under a separate General Permit for construction. They require more extensive storm water pollution prevention measures than described here. A manual developed by the state is available through the Clean Water Program. (See the back cover of this manual.)

The same practices are *recommended* for construction activities on industrial sites. Before you begin a construction or repair project, review the Construction BMP Manual to identify and implement the appropriate practices. If those BMPs do not apply, or are unduly elaborate for a simple construction activity that will be completed in a short time, consider the BMPs described in this section.

Store building materials under cover or in contained areas, using BMPs discussed in Section 5. For outdoor storage at a construction site, select a pollution prevention method such as:

- Putting an impermeable tarp over piles of wood, gravel or other material. Do not wait for forecasts of rain — do this every day, to avoid being caught unawares. Also it will keep material from blowing off the pile and contributing pollutants to runoff later.
- Keeping the working area clean every day for the same reason. Sweep up wood splinters, paint chips, and other residue every day, as well as thoroughly cleaning up at the end of the project.

Painting requires some basic procedures:

- Before you scrape to remove old paint, spread a ground cloth or tarpaulin to collect dust and paint chips. If the paint contains lead or tributyl tin, dispose of the paint chips as hazardous waste.
- Use impermeable ground cloths, such as plastic sheeting, while you paint. Place in-use paint buckets in a pan or on plastic sheets.

R0020755

- At the end of the work day, store paint buckets and barrels of material away from contact with storm water.
- Treat a paint spill as a chemical spill. Capture it before it flows to the storm drain, and clean it up promptly using dry methods.

During painting cleanup, the following are important procedures:

- If you use water-based paint, clean brushes and equipment in a sink connected to the sanitary sewer.
- Clean up oil-based paint where you can collect the waste paint and solvents for handling as small-quantity hazardous waste — do not pour it into the sink or a storm drain.
- Keep leftover paint, solvents, and other supplies for a later use, or deliver them to a solvent recycler with other plant wastes when you ship a batch.
- Handle empty paint cans and other containers as described in Section 6. Containers might be small-quantity hazardous waste. Latex paint cans are not hazardous waste if the paint is dry.

Do not fall back on old cleanup practices from days when storm water pollution was not known to be a problem. Do not pour leftover paint down the storm drain or onto the ground. Do not clean brushes into the storm drain or pour buckets of cleanup water into the drain, or wash spilled paint down the storm drain with a hose. Those practices are now categorized as "illegal dumping." Do not wipe brushes onto old newspapers or pour leftover paint supplies into newspapers and discard the paper in the trash.

Spray painting requires a few extra precautions:

- Use temporary scaffolding to hang drop cloths or draperies to shield you from the wind and to collect overspray.
- Arrange the draperies to minimize the spreading of windblown materials.
- Be aware of air-quality restrictions on spray paints that use volatile chemicals. Consider a water-based spray paint for better air quality compliance.

Sand blasting can be controlled to keep particles off paved surfaces and out of storm drains. Ask your municipality whether building and construction codes place requirements on the size and type of blasting medium that is allowed. More complete instructions are available in the Construction BMP manual for full-sized jobs, but some basics should be applied for smaller projects as well:

- Place a tarpaulin or ground cloth beneath your work to capture the blasting medium and particles from the surface being cleaned.
- Hang tarps or drop cloths to enclose the area, using temporary scaffolding if necessary. Arrange the drop cloths to protect the work area from wind and to capture airborne particles.
- Curtail operations on a windy day.
- Clean up frequently; collect dust and particles from the drop cloths before you produce a pile that is too large to handle easily.

Wood preservatives, pavement seal coating, and other outdoor surface treatments commonly contain metals, pesticides, solvents, or polymers that are hazardous materials. Handle and dispose of them properly in the following ways:

- Apply only as much of the chemical as the wood can absorb or as needed to cover the paved area.
- Soak up excess chemicals with absorbent material or rags, instead of allowing them to flow to the storm drains or soak into the soil.
- If the chemicals spill, clean them up promptly using dry techniques (See Section 3).
- When sealing a sidewalk, prevent the sealant from reaching the gutters or drains.
- When treating a roof with wood preservative or sealant, line the gutters with rags. Dispose of the rags properly—with your hazardous waste if the substances you are using are hazardous.
- If you clean a roof or sidewalk before applying preservative, sweep thoroughly to remove loose particles, then wash with water if necessary.
- Collect wash water from down spouts or drains where possible, and remove particles.
- Avoid applying surface treatment chemicals during the wet weather season.

R0020756

Advanced BMPs and Structural Controls

Some industrial operations and plant situations require more extensive measures to control storm water pollution. Depending on your facility, and your success at eliminating potential sources of storm water pollution, your long-term implementation plan might need to contain some advanced BMPs. The BMPs include structural controls — storm water management measures that require the construction of new facilities or installation of new equipment.

You will need to evaluate your own plant to determine which BMPs are applicable to your operations and which combination will be most effective at controlling the storm water pollutants that might run off from your site. You could find that you have a choice in selecting structural BMPs. Evaluate and select controls that are adequate and most cost-effective for your site.

The BMP descriptions in this section are not complete design standards, but describe the principles you need to consider in identifying and controlling storm water pollution. Design standards, performance specifications, and further discussion of the design and application of structural and treatment BMPs are contained in the State BMP Manual (available from the Clean Water Program).

Advanced pollution control practices take a number of forms, and might include solutions that are not listed here. If you conduct activities that are unavoidably exposed to storm water, you will need to develop more intensive source control and storm water management BMPs.

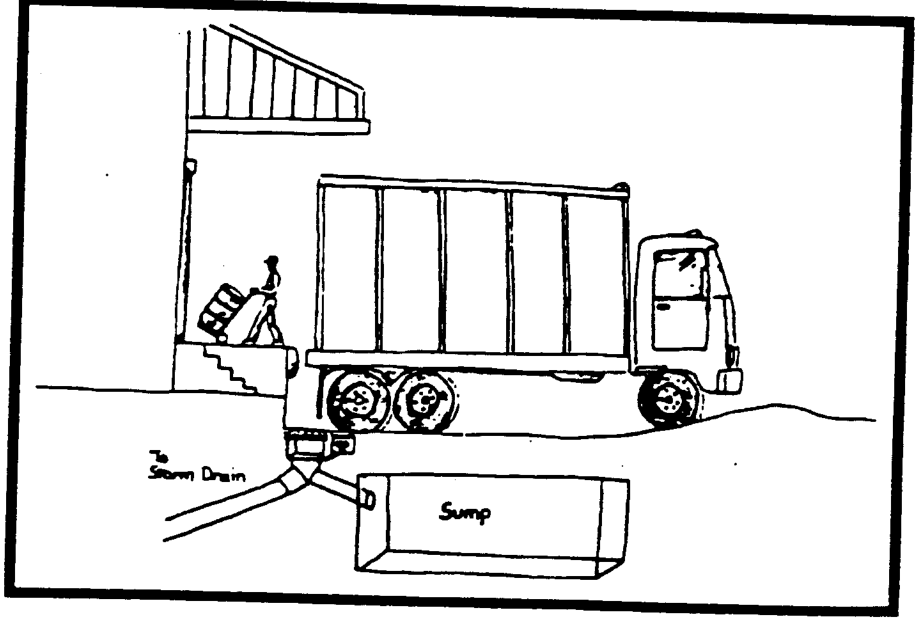
If you are renovating your shop or building a new facility, you should consider installing some of these structural controls. For example, if you regrade an equipment parking area, you should consider storm water design criteria. If you put off implementing the measures, more stringent requirements in the future could oblige you to retrofit the new or upgraded facility, which could be more costly than if you include the work in the construction or renovation.

13 LOADING DOCK DESIGN FEATURES

Loading docks sometimes require more intensive pollution controls than the operational BMPs described in Section 8. That is especially true of areas where you load or unload liquids in containers. Bulk liquid transfers are a more intensive industrial operation that require specific control designs, and are not addressed in this manual.

Additional features of a properly designed loading dock including grading the loading area so that it is sloped or recessed to direct flow toward an inlet with a shutoff valve or toward a dead-end sump. Make sure the inlet includes a sump with enough capacity to hold a spill while the valve is closed. Keep the valve closed at all times, except when you need to release storm water or other liquids that are acceptable for discharge.

A dead-end sump provides secure spill control, but any accumulated liquids need to be pumped out, tested, and properly disposed. Use berms or slopes to prevent run-on so storm water is not added to waste in the sump.



R0020757

Preferably, the inlet should connect to a sanitary sewer instead of a storm drain. Check with your wastewater treatment authority for permit requirements. Consider completely preventing contact with storm water by using a roof and berms, as described in Section 8. This will avoid both washing potential pollutants into the drain and discharging clean storm water into the sanitary sewer.

If the inlet connects to a *storm drain*, accumulated liquid must be tested and found to contain no pollutants before the valve may be opened for discharge. If the liquid does contain pollutants, you must pump it from the sump and discharge it into your sanitary sewer, providing that the wastewater treatment authority agrees to accept it. (See the recommendation below.)

If the inlet connects to a *sanitary sewer*, accumulated liquid must be tested and found to be within the parameters specified in your wastewater discharge permit before the valve may be opened for discharge. If you cannot discharge into the sanitary sewer, you need to convey the liquid to a hazardous waste disposal facility.

14

EQUIPMENT YARD DESIGN FEATURES

Parking and storage yards for large vehicles and heavy equipment generally require site-specific structural and operational controls. Follow the operational BMPs for vehicles recommended in Sections 7, 8, 9, and 10. Also assess your equipment yard to determine if there are possible sources of pollutants, and install appropriate controls to keep potential pollutants out of the storm water. Following are some measures that might be included in the design:

- Grade the area to slope toward a longitudinal drain, or install curbs to direct all storm water to a storm drain in the yard. If your yard is not too large and is properly designed, it should drain to a single storm drain. Even a small yard should include a storm drain on your property and not rely on a city-operating drain in the street.
- If you determine that the equipment yard is a significant source of oily material in your storm water, consider fitting the inlet(s) with a sand filter (see Section 20) or removing oily pollutants (see Section 21).

Segregate the area where you service vehicles, and install special structural controls:

- If possible, perform all work indoors, or construct a roof over the specified area. That will require a building permit and compliance with appropriate fire codes.
- Pave the surface with concrete, not asphalt. Vehicle fluids can dissolve asphalt or be absorbed into the blacktop and released later.
- Drain the surface to a single drain, preferably one connected to a sanitary sewer. The drain will require an oil/water separator or oil/grease trap, and must be approved by your wastewater treatment authority.
- Grade the working area to be higher than the parking lot, or surround it with a berm, to prevent storm water run-on.
- Construct a special area in which to segregate your "dirtiest" equipment (roof tar equipment, asphalt paving equipment, etc.) Handle its discharges, leaks, and runoff separately. This approach could save you from the need to treat all the runoff from the equipment yard.

15 FLEET OR EQUIPMENT FUELING AREA DESIGN FEATURES

If your facility's vehicle fueling area is one of the significant sources you identify in your SWPP Plan, you might need more intensive BMPs than the operational efforts described in Section 10. Following are some design features to consider:

- Cover the fueling area to prevent rain from falling directly on the area. Install a roof over the fueling island, the area where vehicles park while fueling, and as much of the approach as practical. Leaked engine fluids and spilled fuel inevitably accumulate on the pavement in those heavy traffic areas.
- Storm drain and sewer inlets that drain the fueling area must be equipped with shutoff valves to keep fuel out of the drain in the event of a spill from the pumps. The valves should be kept closed at all times except during a rainfall.
- Curtail fueling activities when the valves must be open, or use extra precautions to capture any spilled fuel, such as a large drip pan under the vehicle.

A number of different approaches can serve as effective drainage design. The fueling area must be separated from the rest of the yard, both to contain any fuel spill and to prevent storm water from running onto the area. Select or adapt one of the following schemes:

- Grade the fueling area to be "mounded" or elevated. The Automotive Industries BMP manual includes a suggested mounded grading scheme.
- Install around the area berms that are high enough to redirect water from a large storm.
- Grade the entire fueling area to drain to a single inlet. You can accomplish this with longitudinal drains at the perimeter along the "downhill" side of the fueling area, or with a depression in the middle of the fueling area. Either way, be sure to design the grading to avoid run-on.
- Install at the inlet a sump from which you will pump any accumulated liquids. The sump or connection should be operated as suggested for a loading dock area in Section 13.

16 ACCESS ROADS AND RAIL CORRIDORS

Access roads and rail corridors can be significant sources of pollutants. In the General Permit, access roads and rail corridors are defined as "industrial activities exposed to storm water," which you must include when identifying potential sources and selecting BMPs for your SWPP Plan.

Maintenance and operational BMPs for access roads are the same as those described for vehicle access and parking areas under Section 9. Some structural BMPs are described below.

Proper drainage design is a good place to start. Generally, this means that the roads should be crowned and sloped outward and that storm water should not be allowed to drain across the road but be carried in ditches or culverts alongside the road. Grass lining the roadside ditches, can be an effective way to remove storm water pollutants — see Section 20. Maintain the ditch to make sure it does not clog or fill with sediments and cause storm water to overflow. Plant vegetation by the roadside to control erosion and promote rainwater infiltration.

If your site includes railroad access, preservatives on wooden railroad ties can become important pollutants. Use a less-toxic preservative. Avoid organic toxics, such as creosote and pentachlorophenol. Or use concrete ties or other nonwood ties.

Control spills and dust from railroad unloading. If your rail line delivers or picks up liquids in bulk or in containers, you might have to add spill control loading docks with shutoff valves. (See Section 3 for spill controls, and Section 13 for loading dock design features.) If parked railroad cars drip, install a drip pan at the loading dock between the rails.

17 ON-SITE STORM WATER MANAGEMENT

Some industrial facilities will have potential pollutants exposed to storm water even after implementing source control measures like the operational BMPs described in the first part of the manual and the structural source controls discussed in this part. Further structural controls can be used to manage the storm water itself, either to control the flow of the runoff (described in Section 19), to remove some of the pollutants in passive devices (Section 20), or to remove pollutants using specially designed equipment (Section 21).

The best way to avoid the need for storm water management or treatment is to use source controls, most likely in combination. The right combination for your facility will probably include conscientious implementation of BMPs such as those recommended in Sections 1 through 12 of this manual, attention to the sources of waste at your facility, and careful reduction of process wastes.

If you need to manage storm water on-site, the most important consideration is to minimize the quantity of storm water that contacts potential pollutants. For example, keep the area of industrial activities as small as possible, separate the area from parking lots to prevent run-on, and roof or enclose the area if possible.

Design your storm water conveyance system to *isolate* the areas where storm water contacts potential pollutants, and convey water from those areas separately from water that runs off of "clean" and nonindustrial parts of the site. That will allow you to control storm water with smaller and less costly hydraulic or water quality controls. Or, if you plan to discharge to your wastewater treatment authority (see Section 18), reducing the volume will reduce the discharge cost and increase the willingness of your wastewater authority to accept the discharge.

18 REDIRECT STORM WATER DISCHARGE FROM STORM DRAIN INTO SANITARY SEWER

If source control BMPs are not adequate to prevent discharging pollutants in storm water from your facility, you might have to cease discharging storm water that contacts those pollutants. One way to avoid discharging potential pollutants with storm water is to isolate runoff from that part of your facility where the pollutants are contacted and discharge the storm water into the sanitary sewer instead of a storm drain.

Installation of new connections and new piping can be quite costly, and the necessary permits could be a barrier. Also, a permit from your local wastewater authority will be required. The permit will specify the volume of water you may discharge, the kind of pretreatment equipment you might need to install and operate, and requirements for monitoring your discharge.

Redirecting discharge to the sanitary sewer might not be allowed in all localities — some wastewater authorities have sections in their local ordinances that prohibit the discharge of storm water into the sanitary sewer. Requirements might differ from one municipality to another, so contact the authority that serves your area for information. (See the list on the back cover.)

As a rule, your wastewater treatment authority would prefer to minimize the volume of storm water that passes through the treatment system. You should reduce the quantity of storm water you redirect, using techniques like those described in Section 17.

The wastewater authority might require temporary storage of your storm water on-site, to avoid overloading its facilities during a storm. Your authority is more likely to accept discharge of storm water that has contacted pollutants if you can store it temporarily and deliver it *after* the high flows from a storm.

19 STORM WATER MANAGEMENT: HYDRAULIC CONTROLS

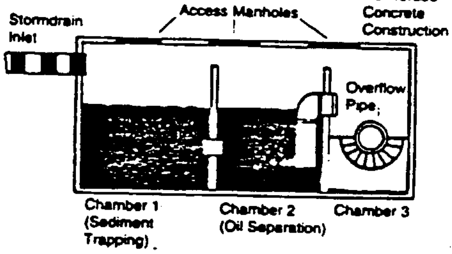
Hydraulic controls are intended to control the *quantity* of storm water discharge, but can be useful for water *quality* as well by removing potential pollutants from storm water. BMPs of this type are widely used to control erosion of hillsides and to remove sediments from storm water runoff. Also hydraulic control BMPs can help to remove oils and heavy metals that adsorb to sediment particles in storm water.

Design standards and operating information for hydraulic controls are available in a number of reference works. Design specifications for hydraulic controls are addressed in the State Industrial BMP manual. Many local and regional regulations that target erosion control provide specifications for hydraulic BMPs.

Hydraulic controls are designed for one of two purposes. One category controls the **rate of peak flow**, slowing the flow of water at the height of the storm to reduce its potential for carrying away soils and other contaminants. The other type reduces **volume** of runoff, generally by causing some storm water to *infiltrate* (or soak into the soil) instead of running off into storm drains, streets, or streams. Some approaches control both peak rate and volume.

R0020760

Hydraulic controls for a site are most effective if the overall site design is considered. The first step generally is to modify the site layout to increase the water-permeable surface, thereby increasing infiltration and reducing runoff volume. If greater flow control is needed, the second step might be to strategically place *infiltration trenches* to intercept runoff and promote infiltration. (Infiltration is not permitted in some areas — see Section 20.) For large quantities of flow, on-site ponds can be designed either to slow the peak flow of storm water or to hold water on-site until it infiltrates or evaporates. They are known as *detention ponds* or *retention ponds*. A variation is the *storm water wetland*, which similarly controls flow while wetland vegetation helps remove pollutants.



An API separator is only partly effective in removing oily wastes, but is more effective than an ordinary catch basin in removing sediments.

20

STORM WATER MANAGEMENT: WATER QUALITY CONTROLS

A number of specific storm water management controls are better suited to water-quality control than hydraulic control. These features might be added to various parts of the storm water conveyance system on an industrial site to help control potential pollutants in the storm water before it leaves the site. They are, for the most part, passive design features instead of treatment devices in the usual sense. Information in existing references gives design parameters for those water-quality controls, so this section merely summarizes a few types of controls.

A simple technique is a **vegetated swale or channel**, a ditch that carries storm water in which plants are permitted to grow. The plants provide some peak flow control by slowing the water. They also remove some pollutants by encouraging the deposit of sediments and minor oily wastes. This control can be retrofitted to some existing storm water conveyance ditches simply by allowing grasses to grow, if it does not interfere with storm water drainage and cause water to back up onto the site.

A **water quality inlet** is a simple multi-purpose device. A storm drain inlet is fitted with an enlarged catch basin or grit chamber where solids and sediments settle out of the water. A baffle restricts the flow of surface-floating oil, which can be removed by hand later. Floatable debris also collects at the baffle. This type of inlet has, in the past, been used to help remove oily wastes, but is of limited effectiveness. Section 21 describes the inlet further, including maintenance requirements.

A **sand filter inlet** is a storm drain inlet that contains sand or another filter medium. The sand removes particulates and oily wastes from storm water as it enters the storm drain. An extension of the same concept is a **sand filter**, where storm water quality can be improved before discharge. Sand filters appear to be particularly effective if used in combination with detention or retention ponds because they divert the first-flush of runoff (often carrying the most pollutants) to the filter and route the remainder of the water to the pond.

R0020761

21

STORM WATER MANAGEMENT: REMOVING OILY POLLUTANTS

A simple technique for removing oils and grease from storm water uses **oil-absorbent materials** (or oleophilic materials), such as the booms used to contain oil spills. The absorbent material preferentially absorbs oil and does not fill with water, so it can be used on storm water with small concentrations of oily materials.

Some facilities that have a storm water conveyance ditch where water flows throughout the rainy season have found it convenient to install a permanent floating boom to control an occasional light surface sheen. When the boom is spent, it is full of oil and is visibly heavier, floating lower in the water. The booms are inexpensive enough to be easily replaced whenever the absorbent is saturated. Disposal is more costly, since they might be hazardous waste, unless an oil recycler can accept the material.

Oil/water separators comprise a broad category of devices that are intended to remove oily constituents. There are many varieties of oil/water separators, and the term is not used in the same way by all equipment vendors or design specifications.

For most applications, oil/water separators are *not recommended* as a storm water management strategy. Source control BMPs are strongly preferred. Oil/water separators are fairly costly, and most designs do not operate well at the low concentrations commonly present in storm water. A sand filter inlet is typically more effective, and less costly, for the small quantities and low concentrations of oils in routine storm water runoff — that is, runoff that has not directly contacted oily industrial activities.

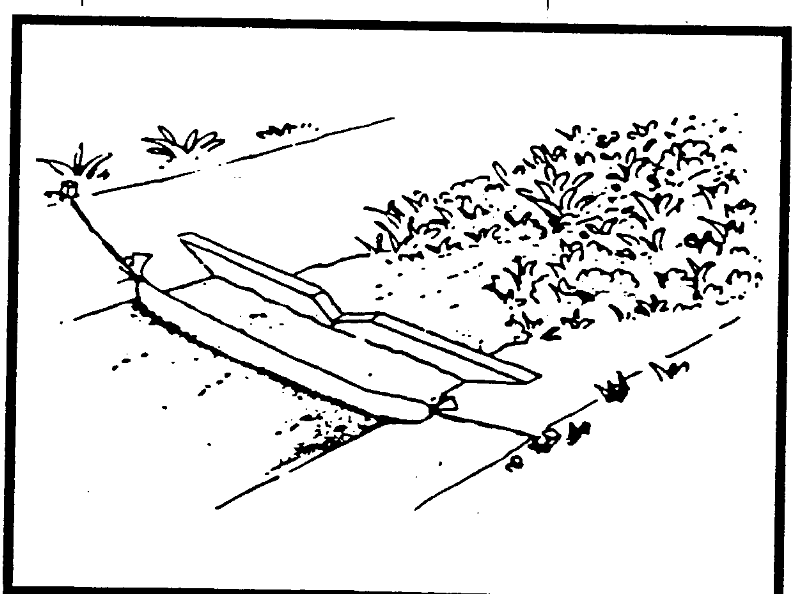
Separators can be useful in limited applications, such as for retrofitting to temporarily help a facility comply while it installs more effective source control BMPs. Another use is in spill control sumps, upstream of a treatment process. The advanced designs are sometimes used as treatment devices, discharging into a sanitary sewer storm water that contacts industrial activities in isolated areas where contact cannot be avoided.

The API (American Petroleum Institute) oil/water separator is a simple design. It is sometimes called an "oil and grease trap," to distinguish it from a true oil/water separator used for industrial wastewater. An API separator usually is a long basin with multiple chambers or vaults, typically installed below grade. It can be fitted to storm drains or storm water inlets in a variety of configurations — the water-quality inlet described in Section 20 is one form. The intent is to slow water and stratify the flow so that oil rises. The floating oil is then retained by one or more baffles in the chambers.

An API separator removes the bulk of floating oily wastes, especially if the oil is not well mixed but floats on top of the water. However, it is not very efficient, so storm water can still be polluted unacceptably even after it flows through the inlet. The separator works by concentrating oily wastes within the chamber, so some of the collected wastes are inevitably carried away during heavy storms. It can be made somewhat more effective at oil removal if it includes pads or pillows of oleophilic material at the water surface level.

If you install an API separator, *it must be maintained* regularly. It requires a standing pool of water, which should be pumped out periodically and replaced with clean water. To clean, remove oil floating on the standing pool and greasy matter collected at the baffle. Some commercial oil recyclers accept this material for recycling; otherwise, it must be handled as hazardous waste. If you install oil-absorbent pillows, they must be closely monitored and replaced when they are saturated, and must be disposed of either as hazardous waste or sent to a recycler. If the inlet includes a sediment trap, as in the water-quality inlet shown in Section 20, remove solids with a shovel between storms.

Develop a regular cleaning schedule. For inlets that don't carry much flow, three cleanings a year are sufficient—once before the rainy reason (mid-September) to remove materials that have accumulated; once after the first major storm; and then at the end of the rainy season to prevent slow loss or



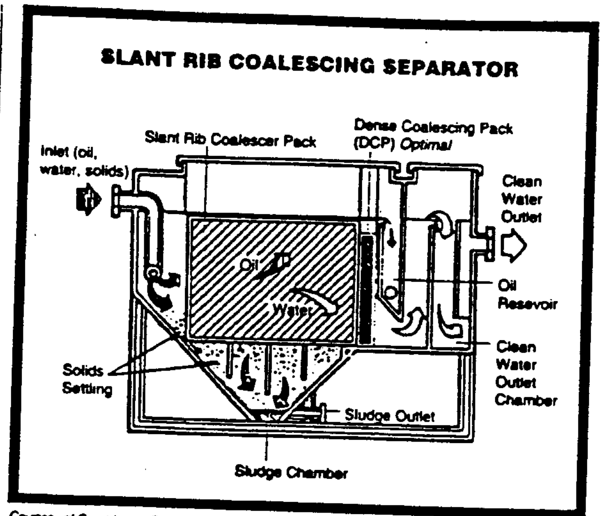
Oil-absorbent berms can remove oily sheen from storm water. Vegetation in an open ditch can slow the flow, helping sediments settle.

R0020762

evaporation of the collected oily wastes. If storm water flow is greater, the API separator might have to be cleaned monthly or periodically between storms. As another guideline, clean the separator before three inches of oil accumulate in the entry chamber.

The CPI, or coalescing plate interceptor oil/water separator, is a more advanced design. It is commonly used for treatment of oil-bearing industrial wastewater, but is less often cost-effective for storm water. The CPI separator generally achieves greater removal efficiency than an API type, but is more costly to purchase and operate. A CPI separator can attain a high removal efficiency and accommodate a fairly high flow rate, but at ever-increasing capital costs for the equipment because of the addition of more separator plates. Cost-effectiveness is generally optimal for relatively high concentrations of oil at low and constant flow rates.

A few design features can improve the effectiveness of an oil/water separator. Pollution removal is most effective if the concentration is high when the storm water enters the unit. Avoid diluting the water to be treated with water from other parts of the site where it does not contact the potential pollutants, both to save on the capital investment and to increase treatment effectiveness. For industrial process applications, an evaporator can be used to reduce the volume of water treated.



Courtesy of Great Lakes Environmental, Inc.

A CPI separator can be very effective in removing oil, but requires upstream sediment control and can be costly to maintain.

An oil/water separator works best if sediment is not present in the water — limit the water to be treated to isolated areas free of mud and soils if possible. Efficiency is highest with a fairly steady flow, so you might require upstream detention. Also, do not site the separator downstream of a pump, because the pump mixes the oil and water and partially emulsifies the oil, with the result that separators are less effective.

Storm water treatment generally is *not recommended* as a BMP. The State or your local wastewater authority might consider as treatment some of the devices described in Section 21, but that could open the door to some burdensome regulatory restrictions and permit requirements.

For most industrial facilities, the best advice about on-site storm water treatment is to avoid it, for a number of reasons. Most of the available treatment equipment is costly to purchase and to obtain permits for. Operational costs can also be significant — you must monitor the equipment to ensure continued effectiveness, and you might need to prepare and submit chemical analyses to demonstrate compliance.

The most troublesome permit procedures are for hazardous materials. Before installing any treatment equipment, determine whether your wastewater is hazardous. Cal-EPA/Toxics or the County Environmental Health Department will describe the necessary testing and approval procedures. If the wastewater that would enter the pretreatment equipment is considered to be hazardous you must obtain a permit from Cal-EPA/Toxics to operate a hazardous waste treatment facility. At present this might be true even for a simple water-quality inlet. If you determine that the waste stream is not hazardous, and do not apply for a hazardous waste treatment permit, keep your testing documentation on hand to show regulators.

Inventory of Ocean Monitoring in the Southern California Bight

Kenneth C. Schiff
Stephen B. Weisberg
Valerie Raco-Rands

ABSTRACT

Monitoring of the ocean environment in southern California has been conducted by a diverse array of public and private organizations with different motivations, working on a variety of spatial and temporal scales. To create a basis from which to integrate information from these diverse programs, we conducted an inventory of ocean monitoring activities in the Southern California Bight to address the following questions: (1) How many dollars are being expended annually on marine monitoring programs? (2) Which organizations are conducting the most monitoring effort? and (3) How are resources allocated among the different types of monitoring programs? This inventory focused on existing programs, or expected to be in existence, for at least 10 years and that were active at any time between 1994 and 1997. For each program identified for inclusion in this study, information was collected on the number of sites, sampling intensity, parameters measured, and methods used. Levels of effort were translated into cost estimates based upon a market survey of local consulting firms. One hundred and fourteen marine monitoring programs, conducted by 65 organizations and costing $31 million annually, were identified. Most of the effort (81 programs, 65% of samples, 70% of costs) was expended by ocean dischargers as part of their compliance with National Pollutant Discharge Elimination System (NPDES) permit requirements. Federal programs (11 programs, 25% of samples, 10% of total expenditures) expended more than state or local government programs. More than one-quarter of monitoring expenditures were conducted to measure concentrations and mass of effluent inputs to the ocean. The largest effort expended on receiving water monitoring was for measuring bacteria, followed by sediments, fish/shellfish, water quality, and intertidal habitats.

INTRODUCTION

Monitoring provides the foundation upon which managers base their decisions about the marine environment (NRC 1990a). Effluent monitoring is used to evaluate potential effects on the marine environment, with discharge concentrations compared to the water quality thresholds that trigger impacts to human health or aquatic life. Mass emission estimates are also derived from effluent monitoring to determine the largest contributors of contaminants to the marine habitat. Ambient monitoring is used to define the magnitude or extent of ecological impacts, such as habitat degradation or impairments to natural biotic communities. Additionally, each of these monitoring types are used to evaluate trends, allowing managers to assess whether environmental conditions are declining or whether previous management actions have been effective in improving conditions.

Numerous organizations conduct monitoring, but often on different spatial and temporal scales. State and federal government programs typically monitor environmental conditions to assess the overall health of large regions. In contrast, most municipal and industrial dischargers monitor to understand the effects their individual facility has on the local environment. Universities often monitor for yet a third goal, to understand the temporal cycles of natural phenomenon, such as oceanographic temperature or biological recruitment processes. These different types of monitoring programs are rarely coordinated.

Several national reviews of monitoring activities in the United States have called for the integration of monitoring programs to enhance their cost effectiveness (NRC 1990a; NSTC 1995, 1997). The first step in coordinating programs is to inventory the existing effort and identify areas that can achieve synergy through combined resources or shared data. The National Science and Technology Council (NSTC 1997) conducted such an inventory for that purpose, but it was limited to the effort expended by federal programs. An inventory that incorporates federal, state, local university, and private programs has not been conducted previously.

The Southern California Bight (SCB), a 500 km section of coastline from Point Conception, California, to the United States-Mexico international border, has one of highest coastal population densities in the country, and also has numerous coastal monitoring programs to assess the effects of this large population. The NRC (1990b) evaluated the monitoring programs being conducted in this area and found that few groups collaborated to enhance the effectiveness of their individual program, nor were data routinely shared among programs. The investigators found that, as a result, environmental managers were unable to develop an integrated assessment of the health of the southern California marine ecosystem or to produce the integrated information required to make informed decisions.

In this article, we present an inventory of monitoring activities in the SCB and address the following questions: (1) How many dollars are being spent annually on marine monitoring programs? (2) Which organizations are conducting the most monitoring effort? and (3) How are resources allocated among the different types of monitoring programs? The objective of this inventory and assessment is to quantify and define the monitoring programs of multiple organizations so that the information generated by each can be integrated into a sustainable monitoring program that is needed by local, regional, and national-level environmental managers.

METHODS

The inventory focused on long-term monitoring programs that met all of the following criteria: (1) programs that had been in existence (or expected to be in existence) for at least 10 years, (2) programs that collected samples at any time between 1994 and 1997, and (3) programs with data or reports that were publicly accessible. In addition, only those monitoring efforts within a selected program that were conducted in the following geographical areas were included in the inventory: (1) south of Pt. Conception, California, and north of the U.S./Mexico international border; and (2) no farther inland than the head of tide and no farther offshore than the continental shelf (ca. 200 m depth).

Both effluent and receiving water monitoring programs were included in the inventory. Effluent monitoring included quantity and quality measures of discharges from municipal wastewater, industrial wastewater, power generating station wastewater, and municipal stormwater. Receiving water monitoring elements included water quality (primarily nutrients and plankton), physical water column structure (primarily conductivity temperature depth [CTD] casts), bacteria, sediments (chemistry and biota), rocky subtidal biota and kelp beds, intertidal habitats, and fish/shellfish programs (fish assemblage and bioaccumulation). Bird, mammal, and wetland monitoring programs were not included.

For each program, the number of stations sampled, frequency of sampling, number of replicates, analytical parameters and media, sampling methods, and analytical methods were documented. Information about discharger monitoring programs was obtained from the Regional Water Quality Control Board that issued the permit to the permittee, or from the permittee directly. Information about other programs was gathered through the examination of data sets and/or project reports, and was often augmented with interviews of the project managers.

Each program was classified according to whether it was conducted by a federal agency, state agency, local agency, university, or private sector or non-profit environmental organization. Some programs were difficult to categorize, particularly when a government agency funded the effort and a university or private contractor conducted the work. In these cases, the effort was classified based upon which organization was the final repository for the data obtained from the program.

Program effort was translated into annual cost estimates by multiplying the number of samples of each type by their unit cost for sample collection and analysis. Unit costs were obtained as the median value of at least three price quotes for each parameter obtained from local contractors. The field/laboratory costs were then doubled to account for program planning, database activities, data analysis, and report preparation. This approach compared costs across organizations and considered the large discrepancies in the ways that different organizations, particularly public organizations, accounted for their costs. For programs in which the number of sites, number of replicates, or frequency of sampling were not evenly distributed over multiple years, the effort expended in the years between 1994 and 1997 was averaged to obtain a representative single-year estimate. To assess the accuracy of the study methods, these cost estimates were compared with a few public agencies that use private contractors to implement their programs. In each case, the study cost estimate was within +/- 20% of the actual costs.

RESULTS

The study identified 114 marine monitoring programs conducted by 65 organizations in the SCB. These numbers included 81 programs conducted by ocean dischargers as part of their NPDES permit requirements, 11 federal programs, 4 state programs, 5 local government programs, 12 university programs, and 1 private program. These programs collect 244,917 samples annually (Table 1). More than 65% of these samples were collected by NPDES permittees while nearly 25% of the samples were collected by federal programs. State, local, university, and private programs combined collected 10% of the samples.

The largest number of samples (36%) was collected to assess bacteria concentrations, particularly along the shoreline (Table 1). Effluent (26%) and kelp bed/rocky subtidal (22%) samples were the next most frequent measurement types surveyed. None of the remaining types of monitoring programs accounted for as much as 5% of the total sampling effort.

There was an estimated $31.3 million spent annually on monitoring in the SCB (Table 2). The differences in cost among program types were even more disproportionate than differences in sampling effort. Nearly 70% of the cumulative annual budget allotted for monitoring was expended by NPDES permittees. Federal agencies contributed 10% and universities contributed 6% of the cumulative annual budget. Local and state governmental agencies combined spent less than 6% of the estimated total SCB monitoring budget.

Although NPDES programs spent the most money on monitoring in the SCB, large differences were found in expenditures between the different types of NPDES programs (Table 3). For example, $17.1 million was spent on monitoring by publicly owned treatment works (POTWs), with 60% of these monies spent by the four largest POTWs. Thermal dischargers were the only other group that accounted for more than 10% of the NPDES monitoring expenditures.

The amount of money expended on monitoring in the SCB differed among monitoring types (Table 2). The most money (28%) was spent on monitoring effluent. The second and third largest expenditures were for bacteria (24%) and sediment chemistry and infauna (13%) monitoring, respectively. Fish and shellfish monitoring accounted for 12% of the annual monitoring expenditures. All other monitoring types accounted for $\leq$ 6% of the annual budget.

Monitoring agencies invested their dollars differently among monitoring types (Table 2). For example, NPDES programs, which expended an estimated $24 million annually, invested most of their funds in monitoring effluents, bacteria, and sediments (37, 27, and 16% of total NPDES expenditures, respectively). The federal government, which expended \$3.1 million annually, invested most of its funds in monitoring water quality, intertidal habitats, and kelp bed/rocky subtidal habitats (40, 23, and 22% of total federal expenditures, respectively). Universities and state governmental agencies invested the bulk (69%) of their combined \$1.2 million in fish and shellfish monitoring. Local government invested the majority (78%) of their \$0.6 million in bacteria monitoring.

DISCUSSION

Although the amount of marine monitoring conducted in southern California is large, the estimates should be placed in perspective. Southern California is the most densely populated coastal area in the country, with 17 million people living within 50 miles of the ocean; thus, the \$31 million annual monitoring expenditures estimated in the present study equates to less than \$2 per person/year. Moreover, the annual estimate of monitoring costs is small in context of the operating budgets of the dischargers and of the regulatory agencies that oversee the dischargers. The annual operating budget of wastewater dischargers alone in southern California exceeds \$1 billion.

The amount of ocean monitoring conducted in the SCB was split almost equally between two types of endpoints: public health and ecological health. However, the expenditures were not evenly apportioned among the indicators for these endpoints. For example, approximately four times more money was spent to address the management question, "Is it safe to swim?" compared to the management question, "Is it safe to eat the seafood?" Similarly, the money allocated to addressing the management question, "Is the ecosystem adequately protected?" was not evenly distributed among habitats or indicators. More than five times the expenditures were spent addressing contaminant levels in sediment compared toeutrophication measures in the water column. Perhaps this level of expenditure is appropriate in the SCB, where historical deposits of threatening pollutants are a greater risk to ecosystem integrity than plankton blooms (Schiff 2000, Conversi and McGowan 1994).

Most of the monitoring in the SCB was conducted by dischargers as requirements of their NPDES permits, but not all dischargers shared equally in the monitoring activity. The POTWs incurred nearly 80% of the ocean monitoring costs expended by NPDES permittees. This finding is consistent with the historical pattern of discharge, in which sewage treatment plants discharged 90% of mass emissions (Raco-Rands 1999). However, increased treatment, pretreatment, reclamation, and source control have considerably reduced the mass emissions from POTWs over the last three decades. Currently, stormwater mass emissions are larger than the mass emissions from POTWs for many constituents (Schiff et *al.* 1999). Despite this trend, NPDES permittees for urban stormwater discharges conducted little or no ocean monitoring for either public health or ecosystem impacts.

In its review of federal programs, the National Science and Technology Council (NSTC 1995) found that more than \$200 million is spent annually on marine monitoring and research nationally. In contrast, we found that federal programs spent only an estimated \$3.1 million annually on monitoring in the SCB. This low percentage partially reflects our definition of monitoring, which included only sustained programs and precluded many shorter term research activities included in the NSTC estimate. Still, federal expenditures in the SCB were small in comparison to the economic and environmental importance of the southern California coast; 25% of the U.S. population living within 50 miles of the coast resides in southern California (Culliton *et al.* 1990) and more than 50% of the beachgoer-days in the country take place in this area (Schiff *et al.* 2000). Some of this disparity may reflect differences in national versus regional priorities. For example, recent national ecosystem initiatives at the federal level focus on harmful algal blooms (Turgeon *et al.* 1998) and coral reefs, which are not important issues along the southern California coast. In contrast, federal agencies do not participate in bacteria monitoring, which is a high priority at the local level.

The much larger investment of resources in marine monitoring by local agencies suggests the desirability for federal programs to leverage their effort through integration with local programs, a strategy endorsed by the federal Clean Water Action Plan (Coastal Research and Monitoring Strategy Workgroup 2000). In some cases, this goal can be accomplished through cost sharing, although the exchange of funds is not the only means of integration. For example, the National Oceanic and Atmospheric Administration's (NOAA's) Status and Trends Program has developed a national laboratory intercalibration program that has enhanced consistency in sediment and fish tissue chemistry measurements (Cantillo and Lauenstein 1993). The Environmental Protection Agency's (EPA's) Environmental Monitoring and Assessment Program has provided assistance in developing local sampling designs that can be integrated with its national design (Stevens 1997). Neither of these efforts requires a great degree of coordination, but both approaches facilitate integration of data sets for larger scale assessments.

The most significant barrier to the integration of federal and local programs is the difference in their overall missions; local programs are typically conducted on a smaller spatial scale to address site-specific issues. However, significant precedents have been established that could break down this barrier as federal compliance programs are increasingly being redirected towards regional assessment. For example, funding for the Chesapeake Bay Benthic Monitoring Program in Maryland is derived from the integration of the federal baywide program with a state program to monitor the effects of power plants. Another example is the Southern California Bight 1998 Regional Monitoring Program, in which 62 organizations pooled their efforts to achieve a $7 million regional assessment of fish, sediment, and water quality, funded almost entirely through redirection of local compliance monitoring (Hashimoto and Weisberg 1998). Moreover, almost all compliance monitoring programs measure trends at unimpacted reference sites for comparison with potentially impacted sites. Some of the most comprehensive long-term data records in this country, such as those for Hudson River fisheries (Barnthouse *et al.* 1988) and California continental shelf benthos (Zmarzly *et al.* 1994, Stull 1995) have resulted from the integration of such compliance-based programs.

What is Low Impact Development (LID)?

Ever wish you could simultaneously lower your site infrastructure costs, protect the environment, and increase your project's marketability? With LID techniques, you can. LID is an ecologically friendly approach to site development and storm water management that aims to mitigate development impacts to land, water, and air. The approach emphasizes the integration of site design and planning techniques that conserve the natural systems and hydrologic functions of a site.

Residential Lot with Bioretention

Somerset Development
Prince George's County, MD

LID Benefits

In addition to the practice just making good sense, LID techniques can offer many benefits to a variety of stakeholders.

Developers
- Reduce land clearing and grading costs
- Potentially reduce infrastructure costs (streets, curbs, gutters, sidewalks)
- Reduce storm water management costs
- Potentially reduce impact fees and increase lot yield
- Increase lot and community marketability

Municipalities
- Protect regional flora and fauna
- Balance growth needs with environmental protection
- Reduces municipal infrastructure and utility maintenance costs (streets, curbs, gutters, sidewalks, storm sewer)
- Increase collaborative public/private partnerships

Environment
- Preserve integrity of ecological and biological systems
- Protect site and regional water quality by reducing sediment, nutrient, and toxic loads to water bodies
- Reduce impacts to local terrestrial and aquatic plants and animals
- Preserve trees and natural vegetation

Builder's Guide to Low Impact Development

Would you be interested in saving upwards of $70,000* per mile in street infrastructure costs by eliminating one lane of on-street parking on residential streets?

Did you know that communities designed to maximize open space and preserve mature vegetation are highly marketable and command higher lot prices?

Are you aware that most homeowners perceive Low Impact Development practices, such as bioretention, as favorable since such practices are viewed as additional builder landscaping?

Did you know that by reducing impervious surfaces, disconnecting runoff pathways, and using on-site infiltration techniques, you can reduce or eliminate the need for costly storm water ponds?

LID Site Planning and Design Concepts

Successful LID projects simultaneously reduce land development and infrastructure costs while protecting a property's natural resources and functions. During the development process, the designer, developer, and reviewing agency should work together to identify solutions that integrate the following concepts:

- Preserve Open Space and Minimize Land Disturbance;
- Protect and Incorporate Natural Systems (wetlands, stream/wildlife corridors, mature forests) as Design Elements;
- Utilize Neo-Traditional Street and Lot Layouts and Designs; and
- Decentralize and Micromanage Storm Water at its Source Using LID Storm Water Management Practices.

LID and Storm Water Management

LID aims to mimic natural hydrology and processes by using small-scale, decentralized practices that infiltrate, evaporate, and transpire rainwater. Specifically, LID aims to:

- Minimize impervious surfaces;
- Disconnect hydrologic elements (roofs, downspouts, parking areas);
- Maintain/increase flow paths and times; and
- Utilize decentralized treatment practices.

Bioretention Areas
Storm water directed to these shallow topographic depressions in the landscape is filtered, stored, and infiltrated into the ground using specialized vegetation and engineered soils.

Grassed Swales
Water moving through these systems is slowed, filtered, and percolated into the ground. These systems can act as low cost alternatives to curbs, gutters, and pipes.

What is Low Impact Development (LID)?

LID is an ecologically friendly approach to site development and storm water management that aims to mitigate development impacts to land, water, and air. The approach emphasizes the integration of site design and planning techniques that conserve natural systems and hydrologic functions on a site. The practice has been successfully integrated into many municipal development codes and storm water management ordinances throughout the United States. Specifically, LID aims to:

- Preserve Open Space and Minimize Land Disturbance;
- Protect Natural Systems and Processes (drainage ways, vegetation, soils, sensitive areas);
- Reexamine the Use and Sizing of Traditional Site Infrastructure (lots, streets, curbs, gutters, sidewalks) and Customize Site Design to Each Site;
- Incorporate Natural Site Elements (wetlands, stream corridors, mature forests) as Design Elements; and
- Decentralize and Micromanage Storm Water at its Source.

Case Study

Somerset is an 80-acre development in Prince George's County, Maryland consisting of 199 homes on 10,000-square-foot lots. During its creation, the developer used LID practices to reduce the storm water management burden. By using LID, the developer:

- Eliminated the need for storm water ponds by using bioretention techniques saving approximately $300,000;
- Gained six additional lots and their associated revenues; and
- Reduced finished lot cost by approximately $4,000.

Ocean Pollution Prevention It's Up to *Us*

Los Angeles has two drainage systems–the sewers and the ***storm drains.*** The storm drain system was designed to prevent flooding by carrying excess rainwater away from city streets out to the ocean.

Because the system contains no filters, it now serves the *unintended* function of carrying urban pollution straight to the ocean.

This pamphlet tells you how to prevent ocean pollution from "stormwater" or "urban runoff."

Rain, industrial and household water mixed with urban pollutants creates stormwater pollution. The pollutants include: oil and other automotive fluids, paint and construction debris, yard and pet wastes, pesticides and litter.

Urban runoff pollution flows to the ocean through the storm drain system–1,500 miles of pipes that take water and debris straight from Los Angeles streets to the ocean. Each day, 100 million gallons of polluted urban runoff enter the ocean untreated, leaving toxic chemicals in our surf and over 4,300 *tons* of trash on our beaches annually.

Urban runoff pollution contaminates the ocean, closes beaches, harms aquatic life and increases the risk of inland flooding by clogging gutters and catch basins.

These Best Management Practices (BMPs) will ensure a cleaner ocean and city.

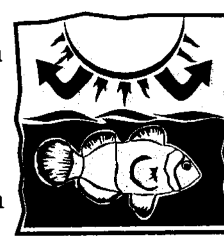
Food Industry Problems

The by-products of food-related businesses can harm the ocean and sea life if they enter the storm drain system.

Food businesses can cause harm by putting food waste in leaky dumpsters, not cleaning up outdoor food or chemical spills, or by washing outdoor spills into the storm drain system.

Other routine activities such as cleaning oily vents and operating and maintaining delivery trucks are sources of pollution, unless proper precautions are taken. When it rains, motor oil that has dripped onto parking lots from business and customer vehicles is washed into the ocean via the storm drain system.

Oil and grease can clog fish gills and block oxygen from entering the water. Also, toxics found in oven and floor cleaners can, in high concentrations, harm aquatic life.



Solutions

Best Management Practices that include the proper handling, storage and disposal of materials can prevent pollutants from entering the ocean through the storm drain system.

❶ Minimize Wastes

Use non-disposable products. Serve food on ceramic dishware rather than paper, plastic or styrofoam and use cloth napkins rather than paper ones. If you must use disposable products, use paper instead of styrofoam.

Buy the least toxic products available.

- Look for "non-toxic," "non-petroleum based," "free of ammonia, phosphates, dye or perfume," or "readily biodegradable" on the label.
- Avoid chlorinated compounds, petroleum distillates, phenols and formaldehyde.
- Use water-based products.
- Look for and use "recycled" and "recyclable" containers.

❷ Keep Work Sites Clean

Cover, repair or replace leaky dumpsters and compactors, and/or drain the pavement beneath them to the sewer. Rain can wash oil, grease and substances into storm drains.

Wash greasy equipment such as vents and vehicles in designated wash areas with an appropriate oil/water separator before storing outside. Ensure that designated wash areas are properly connected to the sewer system.

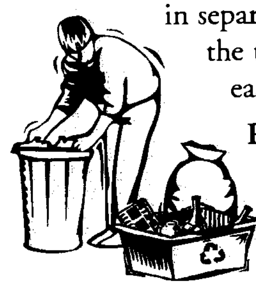
❸ Recycle Wastes

Purchase recycled products. By doing so, you help ensure a use for recyclable materials.

Recycle the following materials:

- Food waste (non-greasy, non-animal food waste can be composted)
- Paper and cardboard
- Glass, aluminum and tin containers
- Pallets and drums
- Oil and grease

Separate wastes. Keep your recyclable wastes in separate containers according to the type of material. They are easier to recycle if separated.



Recycle oil and grease wastes. Never dump them down storm drains or on the ground. Look in the yellow pages for "Renderers" or call one of the disposal numbers listed in this pamphlet.

❹ Toxic Disposal

Toxic waste includes used cleaners, rags (soaked with solvents, floor cleaners and detergents) and automotive products (such as anti freeze, brake fluid, radiator flush and used batteries).

For disposal information call: (213) 237-1209.

5 Employee & Client Education

Employees can help prevent pollution when you include water quality training in employee orientation and reviews. Promote these Best Management Practices (BMPs):

Storage containers should be regularly inspected and kept in good condition.

- Place materials inside rigid, durable, water-tight and rodent-proof containers with tight fitting covers.
- Store materials inside a building or build a covered area that is paved and designed to prevent runoff from entering storm drains.
- Place plastic sheeting over materials or containers and secure the cover with ties and weighted objects. (Not appropriate for storing liquids.)

Post BMPs where employees and customers can see them. Showing customers you protect the ocean is good public relations.

Explain BMPs to other food businesses through your merchant associations or chambers of commerce.

Raise both employee and customer awareness by stenciling storm drains near the workplace with the City's stencil:

Ocean Pollution Prevention
It's Up to *Us*

Los Angeles has two drainage systems–the sewers and the ***storm drains.*** The storm drain system was designed to prevent flooding by carrying excess rainwater away from city streets out to the ocean.

Because the system contains no filters, it now serves the *unintended* function of carrying urban pollution straight to the ocean.

This pamphlet tells you how to prevent ocean pollution from "stormwater" or "urban runoff."

Rain, industrial and household water mixed with urban pollutants creates stormwater pollution. The pollutants include: oil and other automotive fluids, paint and construction debris, yard and pet wastes, pesticides and litter.

Urban runoff pollution flows to the ocean through the storm drain system–1,500 miles of pipes that take water and debris straight from Los Angeles streets to the ocean. Each day, 100 million gallons of polluted urban runoff enter the ocean untreated, leaving toxic chemicals in our surf and over 4,300 *tons* of trash on our beaches annually.

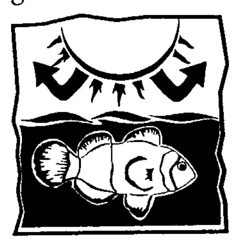
Urban runoff pollution contaminates the ocean, closes beaches, harms aquatic life and increases the risk of inland flooding by clogging gutters and catch basins.

These Best Management Practices (BMPs) will ensure a cleaner ocean and city.

Car Maintenance Problems

Many common car maintenance routines contribute to ocean pollution. Washing the car or pouring used motor oil into a gutter or storm drain pollutes the ocean.

Water runoff from streets, parking lots and driveways picks up oil and grease dripped from cars, asbestos worn from brake linings, zinc from tires and organic compounds and metals from spilled fuels. These chemicals drain into the ocean, harming sea life.



Oil and grease, for example, clog fish gills and block oxygen from entering the water. If oxygen levels in the water become too low, aquatic animals die.

Solutions

❶ Cleaning Work Sites

Do not hose down your shop floor. It is best to sweep regularly. For information about proper disposal of industrial waste, call the

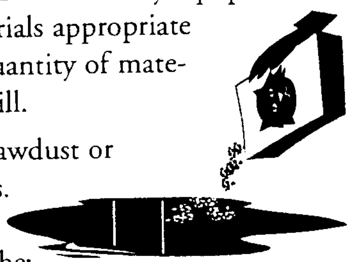
City of Los Angeles
Integrated Solid
Waste Management Office
(213) 237-1444

Use **non-toxic cleaning products.** Baking soda paste works well on battery heads, cable clamps and chrome; mix the soda with a mild, biodegradable dishwashing soap to clean wheels and tires; for windows, mix white vinegar or lemon juice with water.

R0020787

❷ Spills

Prepare and use easy to find spill containment and cleanup kits. Include safety equipment and cleanup materials appropriate to the type and quantity of materials that could spill.



Pour kitty litter, sawdust or cornmeal on spills. For disposal instructions, call the:

City of Los Angeles
Hazardous and Toxic Materials Office
(213) 237-1209

❸ Fluids

Your customer's regular car maintenance prevents fluids from leaking onto streets and washing into storm drains. It is also good for business.

Change fluids carefully. Use a drip pan to avoid spills.

Prevent fluid leaks from stored vehicles. Drain fluids such as unused gas, transmission and hydraulic oil, brake and radiator fluid from vehicles or parts kept in storage.

Implement simple work practices to reduce the chance of spills. Use a funnel when pouring liquids (like lubricants or motor oil) and place a tray underneath to catch spills. Place drip pans under the spouts of liquid storage containers. Clean up spills immediately.

❹ Washing Vehicles

Prevent oil and grease, suspended solids and toxics from washing into storm drains:

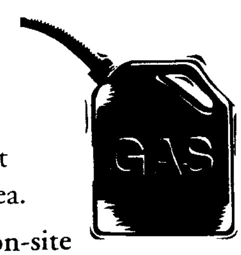
Designate a washing site where water drains to the sewer system. The area must be paved and well marked as a wash area. Post signs prohibiting oil changes and washing with solvents. Train all employees to use the designated area.

Wash vehicles with biodegradable, phosphate-free detergent. Use a bucket (not a running hose) to wash and rinse vehicles. This conserves water and minimizes urban runoff.

❺ Fueling Vehicles

Gas and diesel spills are common when fueling vehicles. To minimize pollution:

Design fueling areas so that all spills are contained and runoff cannot carry spills into storm drains. Spills should be directed to a containment area that allows for proper treatment and disposal.



Cover the fueling area to keep rain from washing away spilled materials. Extend the cover several feet beyond the containment area.

Keep absorbent materials on-site to allow prompt cleanup of all spills.

Post signs instructing people not to overfill gas tanks. Overfilling causes spills and vents gas fumes to the air.

> L.A.M.C. 64.30.B.1(a)— *prohibits the discharge of gasoline...hydrocarbons...kerosene...benzene...etc. to Publicly Owned Treatment Works (P.O.T.W.).*

❻ Recycle

Recycle what you must:

Division 20 of the Health and Safety Code requires motor oil recycling.
Section 66822 of the California Code requires lead acid battery recycling.

Recycle what you can:

- Metal scraps
- Used tires, paper and cardboard
- Container glass, aluminum, and tin
- Water-based paints

Call the referral numbers in this pamphlet for information.

❼ Employee & Customer Education

Educate your employees. Include water quality training in new employee orientations and conduct annual review sessions.

Educate your customers. Raise employee and customer awareness by stenciling storm drains near the work place with the City's stencil:

Ocean Pollution Prevention It's Up to *Us*

Los Angeles has two drainage systems–the sewers and the ***storm drains.*** The storm drain system was designed to prevent flooding by carrying excess rainwater away from city streets out to the ocean.

Because the system contains no filters, it now serves the *unintended* function of carrying urban pollution straight to the ocean.

This pamphlet tells you how to prevent ocean pollution from "stormwater" or "urban runoff."

Rain, industrial and household water mixed with urban pollutants creates stormwater pollution. The pollutants include: oil and other automotive fluids, paint and construction debris, yard and pet wastes, pesticides and litter.

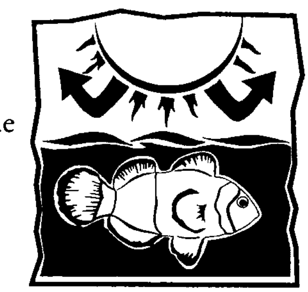
Urban runoff pollution flows to the ocean through the storm drain system–1,500 miles of pipes that take water and debris straight from Los Angeles streets to the ocean. Each day, 100 million gallons of polluted urban runoff enter the ocean untreated, leaving toxic chemicals in our surf and over 4,300 *tons* of trash on our beaches annually.

Urban runoff pollution contaminates the ocean, closes beaches, harms aquatic life and increases the risk of inland flooding by clogging gutters and catch basins.

These Best Management Practices (BMPs) will ensure a cleaner ocean and city.

Heavy Equipment Operation Problems

Soil excavation and grading operations often contribute to urban runoff pollution. By loosening large amounts of soil and sediment, earthmoving activities can cause sediment to flow into gutters, storm drains and the ocean.



Sediment is the most common pollutant washed from work sites, creating multiple problems once it enters the ocean. Sediment clogs the gills of fish, blocks light transmission and increases ocean water temperature, all of which harm sea life, disturbing the food chain upon which both fish and people depend.

Sediment also carries with it other work-site pollutants such as pesticides, cleaning solvents, cement wash, asphalt and car fluids like motor oil, grease and fuel. Thus, poorly maintained vehicles and heavy equipment leaking fuel and oil at the construction site also contribute to ocean pollution.

Solutions

Best Management Practices that include the proper handling, storage and disposal of materials can prevent pollutants from entering the ocean through the storm drain system.

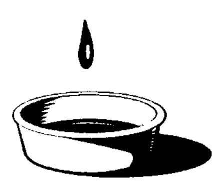
❶ General Business Practices

- Schedule excavation and grading work for dry weather.
- **Use as little water as possible** for dust control.

❷ Vehicle & Equipment Maintenance

- Maintain all vehicles and heavy equipment. **Inspect frequently for leaks.**
- Conduct all vehicle/equipment maintenance and refueling at one location—**away from storm drains.**

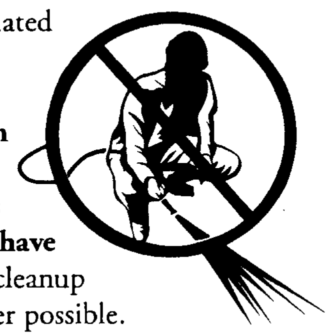
- Perform major maintenance, repair jobs and vehicle/equipment washing off-site.
- Use gravel approaches where truck traffic is frequent to reduce soil compaction and limit the tracking of sediment into streets.
- **Use drip pans or drop cloths to catch drips and spills,** if you drain and replace motor oil, radiator coolant or other fluids on-site. Collect all used fluids, store in separate containers and recycle whenever possible.



- Do not use diesel oil to lubricate equipment or parts.

❸ Cleaning Up

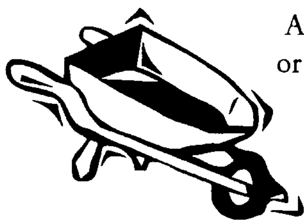
- Sweep up dry spilled materials immediately. Never attempt to bury them or "wash them away" with water.
- Clean up spills on dirt areas by digging up and properly disposing of contaminated soil.
- **Report significant spills to the appropriate spill response agencies immediately.** Use the telephone numbers provided on the back of this pamphlet.
- **Clean up leaks, drips and other spills immediately.** This will prevent contaminated soil or residue on paved surfaces.
- **Never hose down "dirty" pavement or surfaces where materials have spilled.** Use dry cleanup methods whenever possible.



❹ Employee & Client Education

Educate your employees. Include water quality training in new employee orientations and conduct annual review sessions.
Educate your customers. Raise employee and customer awareness by stenciling storm drains near the work place with the City's stencil:

❺ Erosion Prevention



After clearing, grading or excavating, exposed soil poses a clear and immediate danger of stormwater pollution.

Re-vegetation (permanent or temporary) is an excellent form of erosion control for any site.

- Avoid excavation and grading activities during wet weather.
- Construct diversion dikes to channel runoff around the site. Line channels with grass or roughened pavement to reduce runoff velocity.
- Cover stockpiles and excavated soil with secured tarps or plastic sheeting.
- Remove existing vegetation only when absolutely necessary. Large projects should be conducted in phases.

- Consider planting temporary vegetation for erosion control on slopes or where construction is not immediately planned.
- Plant permanent vegetation as soon as possible, once excavation and grading activities are complete.

Ocean Pollution Prevention It's Up to *Us*

Los Angeles has two drainage systems—the sewers and the ***storm drains.*** The storm drain system was designed to prevent flooding by carrying excess rainwater away from city streets out to the ocean.

Because the system contains no filters, it now serves the ***unintended*** function of carrying urban pollution straight to the ocean.

This pamphlet tells you how to prevent ocean pollution from "stormwater" or "urban runoff."

Rain, industrial and household water mixed with urban pollutants creates stormwater pollution. The pollutants include: oil and other automotive fluids, paint and construction debris, yard and pet wastes, pesticides and litter.

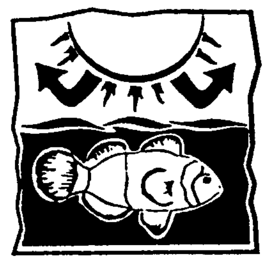
Urban runoff pollution flows to the ocean through the storm drain system—1,500 miles of pipes that take water and debris straight from Los Angeles streets to the ocean. Each day, 100 million gallons of polluted urban runoff enter the ocean untreated, leaving toxic chemicals in our surf and over 4,300 *tons* of trash on our beaches annually.

Urban runoff pollution contaminates the ocean, closes beaches, harms aquatic life and increases the risk of inland flooding by clogging gutters and catch basins.

These Best Management Practices (BMPs) will ensure a cleaner ocean and city.

General Construction Problems

Construction sites are common sources of urban runoff pollution. Materials and wastes blown or washed into a street, gutter or storm drain flow directly to the ocean. Sediment is the most common pollutant washed from work sites, creating multiple problems once it enters the ocean.



Sediment clogs the gills of fish, blocks light transmission and increases ocean water temperature, all of which harm aquatic creatures and disturb the food chain upon which both fish and people depend.

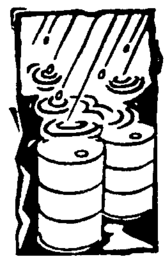
Sediment also carries with it other work site pollutants such as pesticides, cleaning solvents, cement wash, asphalt and car fluids like motor oil, grease and fuel. Thus, poorly maintained vehicles and heavy equipment leaking fuel and oil on the construction site also contribute to ocean pollution.

As a contractor, site supervisor, owner or operator of a site, you may be held responsible for the environmental damage caused by your subcontractors or employees.

Solutions

Best Management Practices such as handling, storing and disposing of materials properly can prevent pollutants from entering storm drains.

❶ General Business Practices

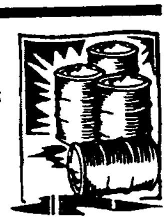


- **Keep pollutants off exposed surfaces.** Place trash cans and recycling receptacles around the site.
- **Cover and maintain dumpsters.** Check frequently for leaks. Place dumpsters under a roof or cover with tarps or plastic sheeting.

Never clean a dumpster by hosing it down on-site!

- **Keep materials out of the rain.** Cover exposed piles of soil or construction materials with plastic sheeting or temporary roofs.
- **Designate one area** for auto parking, vehicle refueling and routine equipment maintenance. The designated area should be well away from gutters or storm drains. Make all major repairs off-site.
- **Make sure portable toilets are in good working order.** Check frequently for leaks.
- **Use as little water as possible** for dust control.

❷ Cleaning Up

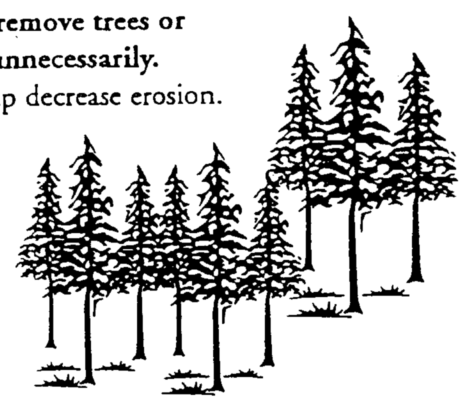


- **Clean up leaks, drips and other spills immediately.** This will prevent contaminated soil or residue on paved surfaces.
- **Never hose down "dirty" pavement or surfaces where materials have spilled.** Use dry cleanup methods whenever possible.

❸ Advanced Planning to Prevent Pollution

An erosion control program, worked out before construction begins, prevents or minimizes most erosion and sedimentation problems.

- **Train your employees and subcontractors.** Make these pamphlets available to everyone working on site. Inform subcontractors about the stormwater requirements and their own responsibilities.
- **Schedule excavation and grading activities** for dry weather periods.
- **Control surface runoff to reduce erosion,** especially during excavation. Use drainage ditches to divert water flow.
- **Use gravel approaches to reduce soil compaction** and limit the tracking of sediments into streets, where truck traffic is frequent.
- **Prevent erosion by planting** fast-growing annual and perennial grasses. These will shield and bind the soil.
- **Do not remove trees or shrubs unnecessarily.** They help decrease erosion.

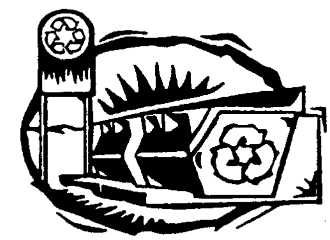


R0020796

4 Handling Materials & Wastes

?ractice Source Reduction - minimize waste vhen ordering materials. Order only the ımounts needed to complete the job.

Jse recycled and recyclable materials whenver possible.



Vever bury waste naterials or leave 1em in the street. ispose of all aste properly.

Aany construction materials, including solvents, water-based paints, vehicle fluids, broken asphalt and concrete, wood, and cleared vegetation can be recycled. Non-recyclable materials must be taken to an appropriate landfill or disposed of is hazardous waste. For disposal information, call the numbers listed in this pamphlet.

5 Disposal Options

Jse a crushing company to recycle cement, phalt and porcelain rather than taking them a landfill. For a listing of companies that ept these materials, call the:

Ocean Pollution Prevention It's Up to *Us*

Los Angeles has two drainage systems–the sewers and the ***storm drains.*** The storm drain system was designed to prevent flooding by carrying excess rainwater away from city streets out to the ocean.

Because the system contains no filters, it now serves the *unintended* function of carrying urban pollution straight to the ocean.

This pamphlet tells you how to prevent ocean pollution from "stormwater" or "urban runoff."

Rain, industrial and household water mixed with urban pollutants creates stormwater pollution. The pollutants include: oil and other automotive fluids, paint and construction debris, yard and pet wastes, pesticides and litter.

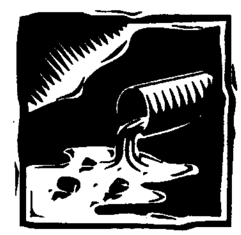
Urban runoff pollution flows to the ocean through the storm drain system–1,500 miles of pipes that take water and debris straight from Los Angeles streets to the ocean. Each day, 100 million gallons of polluted urban runoff enter the ocean untreated, leaving toxic chemicals in our surf and over 4,300 *tons* of trash on our beaches annually.

Urban runoff pollution contaminates the ocean, closes beaches, harms aquatic life and increases the risk of inland flooding by clogging gutters and catch basins.

These Best Management Practices (BMPs) will ensure a cleaner ocean and city.

Roadwork & Paving Problems

Road paving, surfacing and pavement removal activities contribute to urban runoff pollution because they take place right in the street, where urban runoff contamination can result from asphalt, saw-cut slurry or excavated material.



Rain or runoff can carry these toxic substances to the ocean through the storm drain system, posing a hazard to human and sea life.

Extra planning is required to store and dispose of materials properly and guard against stormwater and ocean pollution. As a contractor, site supervisor, owner or operator of a site, *you may be held responsible for the environmental damage caused by your subcontractors or employees.*

Solutions

❶ General Business Practices

- Keep materials out of the rain. Store them under cover, with temporary roofs or plastic sheets, protected from rainfall, runoff and the wind.
- Schedule excavation and grading work for dry weather.
- Develop and implement erosion and sediment control plans for embankments.
- Recycle used oil, concrete, and broken asphalt.

R0020799

❷ Equipment Maintenance

- Maintain all vehicles and heavy equipment. Inspect frequently for leaks.
- Conduct all vehicle/equipment maintenance and refueling at one location—**away from storm drains.**

- Perform major equipment/vehicle repairs and washings off-site.
- Do not use diesel oil to lubricate equipment or parts.

❸ During Construction

- Cover catch basins and maintenance holes when applying seal coat, slurry seal or fog seal.
- Use check dams, ditches or berms to divert runoff around excavations.
- Never wash excess materials from exposed aggregate concrete or similar treatments into a street, gutter or storm drain. Collect and recycle, or dispose to a dirt area.
- Collect and recycle excess abrasive gravel or sand. Call the **Integrated Solid Waste Management Office to order a Construction and Demolition Waste Recycling Guide, (213) 237-1444.**
- Avoid over-application by water trucks for dust control.

❹ Asphalt & Concrete Removal

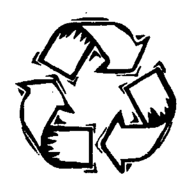
- After breaking up paving, be sure to remove all chunks and pieces. Recycle them at a crushing company. Use the referral numbers listed below.
- Dispose of small amounts of dry concrete in the trash.

- Make sure broken pavement does not come in contact with rainfall or runoff.
- Shovel or vacuum saw-cut slurry and remove from the site. For disposal information contact the Hazardous and Toxic Materials Office at 213-237-1209
- Cover or barricade storm drain openings during saw-cutting.

❺ Asphalt & Concrete Disposal

Use a crushing company to recycle cement, asphalt and porcelain rather than taking them to a landfill. For a listing of companies that accept these materials, call the:

City of Los Angeles
Department of Public Works
1 (800) 974-9794



❻ Spills

- Never hose down dirty pavement or surfaces. Clean up all spills and leaks using "dry" methods (with absorbent materials and/or rags), or dig up and remove contaminated soil. For disposal information contact the Hazardous and Toxic Materials Office at (213) 237-1209.

- Catch drips from pavers with drip pans or absorbent material (cloth, rags, etc.) placed under machine when not in use.

❼ Employee & Customer Education

Educate your employees. Include water quality training in new employee orientations and conduct annual review sessions.

Educate your customers. Raise employee and customer awareness by stenciling storm drains near the work place with the City's stencil:

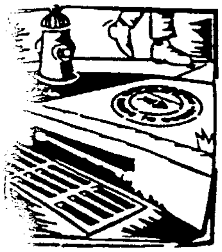
Ocean Pollution Prevention It's Up to *Us*



Los Angeles has two drainage systems—the sewers and the ***storm drains.*** The storm drain system was designed to prevent flooding by carrying excess rainwater away from city streets out to the ocean.

ecause the system contains no filters, it now serves the unintended function of carrying urban pollution straight to the ocean.

his pamphlet tells you how to prevent ocean ollution from "stormwater" or "urban runoff."

Rain, industrial and household water mixed ith urban pollutants creates stormwater pollu- n. The pollutants include: oil and other utomotive fluids, paint and construction bris, yard and pet wastes, pesticides and litter.

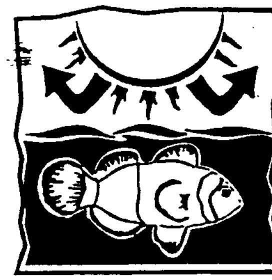
rban runoff pollution flows to the ocean hrough the storm drain system—1,500 miles of pipes that take water and debris straight from os Angeles streets to the ocean. Each day, 100 illion gallons of polluted urban runoff enter e ocean untreated, leaving toxic chemicals in ur surf and over 4,300 *tons* of trash on our eaches annually.

Urban runoff pollution contaminates the ocean, closes beaches, harms aquatic life and ncreases the risk of inland flooding by clogging gutters and catch basins.

These Best Management Practices (BMPs) will nsure a cleaner ocean and city.

Concrete & Mortar Application Problems

Fresh concrete and mortar activities are frequent sources of urban runoff pollution. Materials and wastes blown or washed into a street, gutter or storm drain have a direct impact on the ocean.



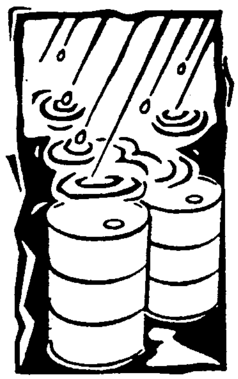
Sediment is the most common pollutant washed from work sites, creating multiple problems once it enters the ocean. Sediment clogs the gills of fish, blocks light transmission and increases ocean water temperature, all of which harm sea life, disrupting the food chain upon which both fish and people depend.

Sediment also carries with it other work site pollutants such as cement wash, gravel, asphalt, pesticides, cleaning solvents, motor oil, grease and fuel. Thus, poorly maintained equipment and vehicles leaking fuel and oil at the work site contribute to ocean pollution.

Solutions

Best Management Practices such as handling, storing and disposing of materials properly can prevent pollutants from entering storm drains.

❶ General Business Practices



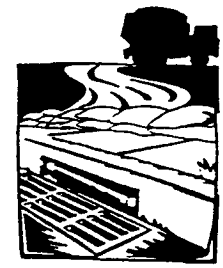
- Schedule projects for dry weather periods.
- **Keep materials out of the rain.** Store both dry and wet materials under cover, protected from rainfall and runoff. Also, protect dry materials from the wind.
- Secure open bags of cement to keep wind-blown cement powder away from streets, gutters, storm drains, rainfall and runoff.

❷ Cleaning Up

- When cleaning up after driveway or sidewalk construction, wash concrete dust onto dirt areas, not down the driveway or into the street or storm drain.
- Wash out concrete mixers and equipment only in designated wash-out areas, where the water flows into containment ponds or onto dirt.

- Recycle cement wash water by pumping it back into cement mixers for reuse.
- Never dispose of cement washout into driveways, streets, gutters, storm drains or drainage ditches.

❸ During Construction



- Place erosion controls (i.e. berms or temporary vegetation) down slope to capture runoff carrying mortar or cement before it reaches the storm drain.
- Do not order or mix up more fresh concrete or cement than you will use.
- Set up and operate small mixers on tarps or heavy drop cloths.
- When breaking up paving (cement or asphalt), be sure to pick up all the pieces. Recycle them at a crushing company. Use the referral numbers listed in this pamphlet.

- Dispose of small amounts of excess dry concrete, grout and mortar in the trash.
- **Never bury waste material.** Recycle or dispose of it as hazardous waste material. For disposal information contact the:

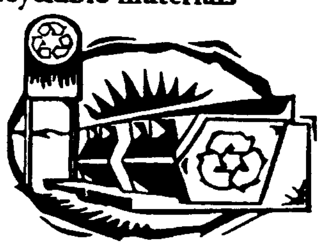
City of Los Angeles
Hazardous and Toxic Materials Office
at (213)-237-1209

R0020804

4 Handling Materials & Wastes

Practice Source Reduction - minimize waste when ordering materials. Order only the amounts needed to complete the job.

Use recycled and recyclable materials whenever possible.



Recycle broken asphalt, concrete, wood and cleared vegetation. Non-recyclable materials must be taken to an appropriate landfill or disposed of as hazardous waste. For disposal information, call the numbers listed on the back of this pamphlet.

5 Disposal Options

'se a **crushing company** to recycle cement, phalt and porcelain rather than taking them › a landfill. For a listing of companies that ıccept these materials, call the:

Best Management Practices

Metal Grinding & Polishing

Keep a bin under your lathe or grinder to capture metal filings. Send uncontaminated filings to a scrap metal recycler for reclamation.

Tenga un recipiente debajo de su maquina de tornear o molinero para colectar rellenos de metal. Mande rellenos no contaminados a un centro de reciclaje de metales para reciclar.

Preventing Leaks and Spills

Place drip pans underneath to capture fluids. Use absorbent cleaning agents instead of water to clean work areas.

Utilice graseras o cazuelas para capturar liquidos de aceite. Selle o quite desaguaderos del piso para prevenir descargo accidental. Use limpiadores absorbentes en lugar de agua para limpiar áreas del trabajo.

Proper Storage of Hazardous Waste

Keep your liquid wastes segregated. Many fluids can be recycled via hazardous waste disposal companies if they are not mixed. Store all materials under cover or inside to prevent contamination by rainwater.

Mantenga sus desechos de liquido separados. Si no estan mezclados, varios liquidos pueden ser reciclados por compañias que especializan en desechos tóxicos. Guarde y cubra todos los materiales dentro de un lugar para prevenir la contaminacion de la agua de la lluvia.

Cleaning Up Spills Immediately

Follow your hazardous materials response plan, as filed with your local fire department or other hazardous materials authority. Be sure that all employees are aware of the plan and are capable of implementing each phase of the plan. Use dry methods for spill cleanup (sweeping, absorbent materials, etc.)

Siga su plan responsivo de materiales tóxicos, como clasificado con su departamento de bomberos local o con la autoridad de materiales tóxicos. Asegure que todos los empleados estén informados y capaz de aplicar cada fase del plan. Use métodos secos para limpiar derramamientos (barriendo, materiales absorbentes, etc.)

Cleaning Auto Parts

Scrape parts with a wire brush or use a bake oven rather than liquid cleaners. Arrange drip pans, drying racks, and drain boards so that fluids are directed back into the sink or the fluid holding tank.

Limpie partes de auto con un cepillo de alambre o use un limpiador de hornos en vez de usar limpiadores de liquido. Arregle las graseras, perchas para secar y tablas de escurrir para que los liquidos sean dirigidos al sumidero o tanque de guardar liquidos.

Proper Disposal of Hazardous Waste

Recycle solvents, oil and used filters, anti-freeze, batteries, lubricants, and metal filings collected from grinding/polishing auto parts. Contact a licensed hazardous waste hauler to dispose of saturated absorbents.

Recicle solventes, aceite de motor usado, filtros de aceite usados, anticongelante, baterias, lubricantes, y rellenos de metal colectados por medio del moliendo y pulimentando partes de auto. Llame a un colector de desechos toxicos para disponer de absorbentes saturados.

ANNOUNCEMENT

NPDES–DEVELOPMENT PLANNING FOR STORMWATER MANAGEMENT

On July 15, 1996, the Regional Water Quality Control Board (RWQCB), Los Angeles Region, adopted Order No. 96-054 ("Permit"). Under the Permit, the County of Los Angeles is designated as the Principal Permittee and the 85 incorporated cities as co-Permittees. In February 2000, the RWQCB adopted a Resolution that established Standard Urban Stormwater Mitigation Plan (SUSMP) criteria for priority projects for the Permittees described in Part A and Part B of the attached table.

The primary objectives are to:

- Effectively prohibit non-stormwater discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the maximum extent practicable

The Los Angeles County Department of Public Works (DPW) is responsible for the implementation of SUSMP requirements in the County unincorporated areas (excluding the Antelope Valley area) and all County-owned facilities. Development and redevelopment projects falling into either Parts A or B of the attached table will be required to obtain SUSMP approvals. Details of facilities and measures that mitigate impacts to water quality must be shown on improvement plans and reviewed as part of those plans.

Information regarding the preparation of SUSMP is available on our website (*link to* SUSMP Plan on www.888CleanLA.com).

SUSMP pertaining to new subdivisions will be reviewed by DPW's Land Development Division. Please call Steve Burger at (626) 458-4943 with any questions (Monday through Thursday).

SUSMP for single-lot developments will be reviewed by DPW's Building and Safety Division. Please contact Mitch Miller at (626) 458-6390 with any questions pertaining to these developments (Monday through Thursday).

In addition, SUSMP for non-residential projects will be reviewed by DPW's Environmental Programs Division. Related questions should be directed to the Industrial Waste Unit of Environmental Programs Division at (626) 458-3517 (Monday through Thursday).

Attachment: SUSMP Project Types, Characteristics and Activities, Parts A and B.

SUSMP Project Types, Characteristics, and Activities
Part A. Type of Proposed Project:
A 10+ home subdivision
A 100,000+ square-foot commercial development[1, 2]
An automotive repair shop (SIC codes 5013, 5014, 5541, 7532-7534, and 7536-7539)[3]
A retail gasoline outlet
A restaurant (SIC code 5812)[4]
A hillside-located single-family dewelling[5]
Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to stormwater runoff
Location within or directly adjacent to or discharging directly to an environmentally sensitive area

Part B. Project Characteristics or Activities:
Automotive or Equipment Repair and/or Maintenance
Automotive or Equipment Washing or Cleaning Area(s)
Gas Station or Fuel Dispensing
Outdoor Material or Waste Handling or Storage
Chemical handling and/or storage of petroleum products, paints, solvents, concrete, or hazardous waste?
Outdoor Equipment or Product Fabrication including welding; cutting; sawing; metal fabrication; assembly; application of paints, coatings, or finishes; pre-cast concrete fabrication, etc.
Outdoor Areas for Equipment or Machinery Repair and/or Maintenance
Dry Cleaning Factory
Food Service
Food Processing Plant
Animal Slaughtering
Animal Confinement, Pet Care Facilities, Stables, Kennels, etc.
10 or More Dwelling Units
Hillside Location[5]

[1] "100,000 Square Foot Commercial Development" means any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas.

[2] "Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car was facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, and public warehouses and other light industrial complexes.

[3] "Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

[4] "Restaurant" means a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812).

[5] "Hillside" means property located in an area with known erosivesoil conditions, where the development contemplates grading on any natural slope that is 25 percent or greater.
