23 pollutants to receiving waters; and if they are found to
24 be a source of pollutants, then EPA gave states the
25 authority to require that MS4 permittees prohibit those

0210

1 discharges to the MS4.

2 So in the past, the Regional Boards have
3 generally handled this effective prohibition on non-storm
4 water discharges through the MS4 using a combination of
5 three different approaches: First, by requiring
6 municipalities to implement what we refer to as the
7 Illicit Discharge Detection and Elimination Program as
8 part of its Stormwater Management Program or minimum
9 control measures, which we'll talk about later this
10 afternoon; second, by conditionally authorizing the list
11 of certain common non-storm water discharges that were
12 identified in the federal regulations where they are not
13 otherwise regulated by a separate NPDES permit. And I
14 want to just explain what this conditional authorization
15 means is that they are only authorized, like I said, if
16 they are not a source of pollutants and that conditions
17 may be imposed to ensure that they aren't a source of
18 pollutants to the MS4 and to receiving waters. And then
19 the third approach that the Regional Water Boards have
20 used is by issuing a number of separate general NPDES
21 permits to cover these types of non-storm water
22 discharges.

23 So as we began developing this section of the
24 new L.A. County MS4 permit, one of the things that we did
25 is we evaluated the current program information as well

0211

1 as monitoring data on dry weather to assess the
2 effectiveness of these existing approaches to controlling
3 non-storm water discharges through the MS4 and then to
4 identify possible modifications to our approaches based
5 on that evaluation.

6 So what we found when we did the evaluation is
7 that, first of all, not too surprisingly, is that there's
8 a widespread presence of persistent dry weather flows or
9 non-storm water discharges that are still occurring
10 despite a relatively extensive screen process that's been
11 happening over the last probably two decades with regard
12 to non-storm water discharges. However, despite the fact
13 that there are these persistent dry weather flows, what
14 we found is that there is a poor understanding of what
15 the sources of those persistent dry weather flows are
16 and, therefore, there have been limited actions to really
17 try to address these persistent dry weather flows to the
18 MS4.

19 One of the solutions, of course, has been the
20 use of low-flow diversions, which has been a very
21 successful approach where the dry weather flow is coming

22 out of the MS4. However, despite this, we do still see a
23 lot of exceedences of water quality standards during dry
24 weather that are likely the result of these persistent
25 dry weather flows, and this is evidenced, of course, by

0212

1 the number of TMDLs that we have that include the dry
2 weather wasteload allocations as well as monitoring data
3 collected under the MS4 permit.

4 So based on this evaluation, we identified the
5 need for a couple things in the new L.A. County MS4
6 permit. Basically, we identified that there needed to be
7 more effective controls on the exempted categories of
8 non-storm water discharges and that these be implemented;
9 that potential impacts from exempted categories needed to
10 be evaluated on a more proactive way; and also, if a
11 non-storm water discharge is identified as a source of
12 pollutants, that appropriate actions needed to be taken
13 to deal with that non-storm water discharge.

14 So now I want to briefly walk through the
15 working proposal that I know you've all had a chance to
16 look through.

17 First of all, with regard to the working
18 proposal, we have included all of the exempted categories
19 of non-storm water discharges that are in the current
20 permit. So those are still included in this working
21 proposal. This list of exempted categories is the same
22 as USEPA's list and it's implementing regulations and
23 these include, among many others, discharges from potable
24 water supplies as well as firefighting flows.

25 Similar to what was done in the Ventura County

0213

1 MS4 permit that was reissued in 2010, staff has proposed
2 a table of specific conditions and BMPs that need to be
3 met for the discharge to be conditionally authorized.
4 In addition, the working proposal explicitly states that
5 the MS4 permittee must be able to ensure that the
6 necessary permits are obtained by the discharger and it
7 also includes a provision to support the MS4 permittees'
8 authority to require the discharger to provide advanced
9 notification, to conduct monitoring, and to implement
10 BMPs to ensure that those authorized discharges are not a
11 source of pollutants to the MS4.

12 We've also included a provision that would
13 require permittees to evaluate monitoring data from the
14 outfall monitoring program that we are proposing and we
15 discussed at the last workshop that many of you listened
16 in on, to assess whether any of these exempted discharges
17 are a source of pollutants and then, if so, we've
18 included a provision that requires permittees to take one
19 of three actions; and those would be to either prohibit
20 the discharge, to impose additional controls and BMPs to
21 basically prevent the discharge of pollutants from that
22 discharge, or to require the discharger to obtain
23 coverage under a separate NPDES permit. And these three

24 actions stem directly from the implementing federal
25 regulations for MS4 permits and are also included in the
0214

1 Ventura County MS4 permit that was recently reissued.

2 One of the significant categories of non-storm
3 water discharges is potable water supply discharges and
4 these are common and frequent discharges and sometimes
5 are very large volume discharges, so I'd like to take a
6 few minutes now to talk about this and how it's addressed
7 in the working proposal that we put out.

8 It is one of the few categories of non-storm water
9 discharges that is often required by state and/or federal
10 regulation and I know that you're going to hear that from
11 some of the water suppliers today.

12 Concerns have been expressed that due to its
13 frequency and the volume of the discharge, that these
14 discharges could cause exceedences of water quality
15 standards in receiving waters for which an MS4 permittee
16 could then be held responsible since the discharge is
17 coming from the MS4.

18 So recognizing that these potable water supply
19 discharges are often required and necessary to maintain
20 reliable water supplies, we've proposed language in the
21 working proposal that if an authorized potable water
22 supply discharge caused an exceedence of a water quality
23 standard, then the MS4 permittee would not be found in
24 violation of the receiving water violations.

25 In order for this provision to be invoked, what
0215

1 the working proposal would require is that the MS4
2 permittee would need to provide a demonstration based on
3 monitoring data from the non-storm water discharge that
4 the discharge was the cause of the exceedance of the
5 water quality standard.

6 If the discharge was found to have caused an
7 exceedance of a water quality standard, the MS4 permittee
8 would be further obligated to take follow-up actions,
9 including one or more of the following, and these would
10 include: An evaluation of the potential long-term
11 effects of that continued discharge on the receiving
12 water; the identification of alternative discharge
13 pathways to potentially less sensitive receiving waters,
14 and that would be in coordination with the discharger;
15 the imposition of additional controls to reduce the
16 pollutants in that category of discharge or the
17 requirement for the discharger to obtain coverage under a
18 separate NPDES permit, as I've mentioned before.

19 So in conclusion -- and I know this is a quick
20 review, but I want us to mainly leave time for the
21 comments that you're going to hear today -- staff's
22 working proposal basically includes three key elements:
23 One is more specific conditions and BMPs for exempted
24 non-storm water discharges similar to what was included
25 in the Ventura County MS4 permit; more explicit

0216

1 procedures for evaluating exempted discharges and then
2 taking certain actions if they are a source of pollutants
3 to the MS4 receiving waters; and then finally, provisions
4 to address some of the concerns that we heard regarding
5 potable water supply discharges and discharges from
6 firefighting flows.

7 And with that, I am going to wrap up my
8 presentation and now we're going to take public comments
9 on the topic of non-storm water discharges.

10 MS. MEHRANIAN: We will go to the speaker cards?

11 MS. PURDY: Yes, and I indicated on there some have
12 specific time allotments which I --

13 MS. MEHRANIAN: Exactly, and I'm going to announce
14 the time limits.

15 MS. PURDY: Okay. Great.

16 MS. MEHRANIAN: L.A. Permit Group, Heather Maloney
17 John Dettle and Joe Bellomo requested 17 minutes. Do you
18 want to come up? Are you going to be dividing the time
19 between the three of you?

20 MS. MALONEY: We are. We'd like to request, if it is
21 possible, to move our time to the end of the Public
22 Comments --

23 MS. MEHRANIAN: Oh, sure.

24 MS. MALONEY: -- for this particular item.

25 MS. MEHRANIAN: Thank you very much. We'll call you

0217

1 again.

2 Shahram Kharaghani, City of Los Angeles,
3 Sanitation. And you requested five minutes; right?

4 MR. KHARAGHANI: Yes. Good afternoon, Madam Chair
5 and Board members. Shahram Kharaghani, City of
6 Los Angeles. My presentation -- I have a brief
7 presentation on the benefits of watershed planning and
8 management. There is a short PowerPoint, three slides
9 that I'd like to go over.

10 As Renee indicated, there are so many pieces in
11 our Stormwater Permit that they come together in an
12 integrated manner in a Watershed Management Plan and I
13 want to just highlight some of the advantages that that
14 Watershed Management Planning has.

15 Obviously, it's going to focus on the highest
16 priorities that we have in the watershed because the full
17 watershed that the City is discharging to have specific,
18 you know, configuration and specific needs, so the
19 watershed planning focuses on the highest priorities and
20 the highest spots that we have.

21 It is also in alignment with the USEPA's latest
22 guidance regarding sequencing and also prioritization of
23 pollutants within the watershed.

24 It provides for efficient and effective
25 approaches. And by that, everyone is working together in

0218

1 the watershed, irrespective of the boundaries, to make

2 sure that receiving water is going to be helped. It
3 encourages, obviously, coordination and collaboration and
4 it also gives flexibility and tailoring and mass
5 customization of some of the programs that we have in our
6 permit.

7 As you know, as quoted, we have a lot of TMDLs
8 in the different watershed. The watershed planning would
9 help to put them all in one place, as opposed to
10 piecemeal implementation, and TMDLs is an important part
11 of our water quality permit that would help for us to get
12 the water quality standards and objectives that we have.

13 Now, as far as -- so those were the benefits.
14 Those benefits are obviously known to everyone and of
15 course it's the most cost-effective as well as leverages
16 all of the resources that we have.

17 How do we implement that approach within our
18 MS4? This is the approach we would -- we are providing
19 that we would create a section, a separate section called
20 Section 8 of your permit that would have all of these
21 pieces of Watershed Planning in it and that plan would be
22 submitted to the Water Board for the E.O. approval.

23 And a sample and outline of what that Watershed
24 Plan would have is before you. I know this is too small
25 to read all of it; but very briefly, if you look at the

0219

1 slide in front of you, it would have Watershed Overview
2 that would have all the TMDLs, all the standards within
3 the given watershed. It identifies all the
4 municipalities. It has all the receiving water
5 limitations, wasteload allocations and schedules. All of
6 them would be a part of what we would call Watershed
7 Planning.

8 Section two talks about all the receiving water
9 data that we have: 303(d) listing, policy with the TMDLs
10 and all the TMDLs that we have within a given watershed
11 and it identifies all the potential sources within the
12 watershed, existing TMDLs, the TMDLs that would be
13 coming, the USEPA-adopted TMDLs, and other TMDLs. That
14 would be section two of what we call Watershed
15 Priorities.

16 Section three would have basically all of what
17 we call the monitoring program or minimum control
18 measures that, you know, we have in our current permit.
19 It provides, again, flexibility and tailoring of those
20 minimum control measures within the watershed because
21 some of our watershed -- let's say they have more septic
22 tanks. I would focus to make sure that I would eliminate
23 the septic planning on that watersheds. Some other
24 watersheds, they may have other facilities that would
25 focus our inspection to make sure that they're all good

0220

1 actors. So that's section three of that watershed.

2 Section four, obviously we want to make sure the
3 watershed is monitoring so there would be integrated

4 monitoring and that everybody knows transparency, that
5 all of these sections are coming together, so that
6 watershed would be shared with your staff Regional Board
7 on a periodic basis to make sure our plan that we have is
8 hitting the targets that we have intended for it.

9 And last but not least, once we have the
10 monitoring, we would be reporting on these plans and our
11 progress on the watersheds that we are involved in on a
12 periodic basis.

13 That concludes my presentation

14 MS. MEHRANIAN: Thank you. Mr. Kharaghani, will you
15 give a copy of your PowerPoint to the staff?

16 MR. KHARAGHANI: I would be happy to, yes.

17 MS. MEHRANIAN: Thank you very much. Thanks for your
18 testimony.

19 James Parsegion, Office of the State Fire
20 Marshal.

21 MR. PARSEGION: Good afternoon. I'm James Parsegion
22 from the Office of the State Fire Marshal. I'm the
23 Deputy State Fire Marshal in charge of the automatic
24 extinguishing systems program for our office.

25 As you may be aware, the office is tasked with
0221

1 promoting and developing ways and means of protecting the
2 life and property of California against fire and panic.
3 To complete this task, Health and Safety Code Section
4 13185 requires the State Fire Marshal to establish a
5 program and control the program to service, test, and
6 maintain all water-based fire suppression systems.

7 Presently, to complete this, the office has
8 adopted NFPA 25, 2002 edition, as our testing
9 requirements. Please remember, these systems have been
10 installed in facilities since the earliest 20th Century
11 and are required to maintain a working order. To do
12 this, periodically they need to have water flowed through
13 the systems. If these systems are not maintained
14 properly, we will have systems failures and have a
15 possibility of loss of life and property.

16 In a proactive attempt to ensure that the water
17 flowed through the systems, the State Fire Marshal
18 establish a task force made up of subject matter experts
19 such as groups such as Public Works departments, private
20 water agencies, staff from the State Water Resource
21 Control Board to municipal utility districts, fire
22 departments, and contractors.

23 This task force met for approximately 18 months
24 and published a set of BMPs called the Water-based Fire
25 Detection Systems Discharge Maintenance Procedures

0222
1 Manual, and I'll provide a copy to you -- okay -- which
2 we hope you will consider adopting by reference for the
3 testing and maintenance of these systems when making your
4 final decision on the L.A. County MS4 permit.

5 In closing, the office will be glad to work with

6 the Los Angeles Regional Water Quality Board to solve
7 this issue. As you are aware, your Regional Board sets
8 up the trend for other Regional Boards in the state and
9 achieving the proper balance between the environment and
10 the fire and life safety of the citizens of California is
11 everyone's goal. Thank you.

12 MS. MEHRANIAN: Thank you.

13 MR. PARSEGION: Do you have any questions?

14 MS. MEHRANIAN: Thank you very much.

15 Kevin Smith, Fire Chief, El Segundo Fire
16 Department.

17 I want to thank you on behalf of the Board for
18 helping the young lady before.

19 MR. SMITH: That's our pleasure and it's our
20 responsibility as well.

21 And beyond that, I'd like to thank the Board for
22 allowing me the opportunity to speak.

23 My name is Kevin Smith. I'm the Fire Chief of
24 the El Segundo Fire Department and I'm here today to
25 represent all of the fire chiefs -- that's 31 of them --

0223

1 within the Los Angeles County area.

2 We are all interested in this matter and we
3 recognize the difficult decisions that you folks have to
4 make and are certainly supportive of clean water; but
5 just as you're mandated to follow rules, so are we. And
6 with that in mind, we have some input into the staff's
7 working proposal. Most of it, I have to say that we
8 agree with and we appreciate staff's working with us to
9 this point and feel that it's been very productive.

10 A couple points to note: One is that we agree
11 with the proposed language for the potable drinking water
12 supply and distribution system releases that apply to
13 public fire hydrant maintenance and fire flow testing,
14 and the reference to the California-Nevada section of the
15 American Water Works Association Best Management
16 Practices for Drinking Water Releases.

17 Additionally, we agree with the draft language
18 regarding discharges associated with emergency
19 firefighting activities.

20 We further agree with table -- I don't know if
21 it's Table X or Table 10, Best Management Practices to
22 Address Discharges From Training Activities Which
23 Simulate Emergency Responses. However, related to that,
24 we would like to confirm with the Regional Board staff
25 that the exemption will be included in the permit

0224

1 language in Sections (a)(iii) and (a)(iv).

2 We further agree with the restrictions placed on
3 washing vehicles and we agree with part of Section
4 (3)(a)(ix), which addressed short-term exceedence for
5 firefighting emergencies. However, we would like to add
6 to that "fire protection system testing and maintenance,
7 as well as training activities."

8 There's one area that we would like to address
9 as well and that follows with Chief Parsegion from the
10 State Fire Marshal's office. We do not agree with there
11 not being any language allowing an exemption from
12 discharges from testing and maintenance of water-based
13 fire protection systems. Basically, these include fire
14 sprinkler systems, fire stand pipe systems, and on-site
15 fire hydrants.

16 We also recommend adopting the California State
17 Fire Marshal's office Water-based Fire Protections
18 Discharge Best Management Practices Manual for Discharges
19 Resulting from Water-based System Testing and
20 Maintenance.

21 And I notice that I'm running out of time. Most
22 of the details that Chief Parsegion addressed are our
23 feelings on that matter as well. Again, I thank you for
24 the partnership and our opportunity to work with you.

25 MS. MEHRANIAN: Thank you. Andy Bill, 24/7 Fire
0225

1 Protection.

2 MR. BILL: Good afternoon and thank you for the time.
3 My name is Andrew Bill. I'm president of 24/7 Fire
4 Protection Services, Incorporated, a California state
5 licensed fire protection contractor. I also represent
6 Fire Sprinkler Contractors Association of Southern
7 California.

8 After reviewing the staff working proposal, we
9 take exception to the Footnote 10, which specifically
10 prohibits the discharge of water from maintenance and the
11 testing of fire protection systems.

12 Water-based fire protection systems, as
13 previously mentioned, are required under statute to be
14 routinely tested. For more than 100 years, the majority
15 of water-based fire protection systems have been
16 constructed with no provisions for on-site water
17 collection or discharge into a sanitary line. The
18 financial burden that would have to be shouldered by
19 property owners to collect discharge water and then
20 transport to a remote location for disposal would be
21 tremendous.

22 Considering the thousands of citizens that are
23 required to be tested minimally in some manner annually,
24 the inability to discharge water into the MS4 could
25 easily result in millions and millions of dollars of

0226
1 unexpected additional costs to L.A. County building and
2 property owners. For these reasons, I urge the committee
3 to adopt California State Fire Marshal's BMPs for water
4 discharge, the fire protection systems; and please keep
5 in mind that the water-based fire protection systems are
6 designed and installed for the continuous protection of
7 human life and property; and without a reasonable plan in
8 place to accommodate routine testing and maintenance, the
9 reliability of these systems will suffer and could result

10 in dire consequences.

11 Thank you for your time.

12 MS. MEHRANIAN: Ray Tahir.

13 MR. UNGER: Sir, do you have any comments to leave,
14 sir? Do you have any comments to leave?

15 MR. BILL: Yes, I do.

16 MR. UNGER: Thank you.

17 MR. TAHIR: Before I begin, I prepared for each one
18 of the Board members a packet containing the PowerPoint
19 presentation that is going to be shown to you in a
20 moment, along with other relevant documents.

21 Good afternoon. My name is Ray Tahir and I
22 represent a number of cities in Los Angeles County.

23 MS. MEHRANIAN: Is this it (indicating)?

24 MR. TAHIR: And I'd like to -- I don't know if I
25 mentioned it earlier. I would like it entered into the

0227

1 public record, please.

2 Once again, I represent a number of cities on
3 storm water matters in Los Angeles County, and I'm
4 looking for my pointer right now. I'll use this one.

5 That's the list of districts, by the way.

6 The proposed non-storm water discharge
7 requirements are excessive given that there is no outfall
8 data from permittee MS4s to characterize non-storm water
9 discharge related issues. The Regional Board does not
10 have federal legal authority to comply with proposed
11 new -- for cities to comply with the proposed new
12 non-storm water discharge requirements.

13 The working non-storm water discharge proposal
14 does not include other pieces that are needed to evaluate
15 their content and impact on permittees, including a
16 definition of a WQBEL. Staff incorrectly uses it
17 interchangeably with a water quality standard.

18 Receiving water limitation language is absent.
19 The question is, is it the same as it is in the current
20 permit or will the next permit contain different
21 language?

22 Outfall monitoring requirements for non-storm
23 water and how it will be used to determine if a non-storm
24 water discharge is a pollutant source requiring
25 prohibition as an illicit discharge or coverage under a

0228

1 separate NPDES permit.

2 I have to disagree with Renee. There is no --
3 there was never any non-storm water discharge outfall
4 monitoring ever conducted. That monitoring was based on
5 receiving monitoring. Federal regulations require
6 outfall monitoring for compliance purposes, not receiving
7 water monitoring.

8 Currently, the staff is proposing to require
9 currently exempted non-storm water discharges to comply
10 with receiving water limitations and WQBELs. If a single
11 outfall monitoring sample reveals an exceedence of a

12 non-storm water discharge detected through outfall
13 monitoring, permittees would to have either, one,
14 prohibit the discharge or, two, require the discharge to
15 be covered under an NPDES permit. That's all federal
16 regulations require.

17 Problem one: One round of outfall monitoring is
18 not enough to determine whether an exceedence or an
19 exempted the non-storm water discharge requires
20 prohibition or coverage under a separate MS4 permit or
21 NPDES permit. There is an inherent difficulty to
22 distinguish non-storm water discharges from an outfall or
23 other sampling point within the MS4 to locate the origin
24 of the non-storm water discharge or source from the time
25 the exceedence is detected.

0229

1 Nonstormwater discharges generally do not
2 contain pollutants that are likely to exceed water
3 quality standards in receiving water with a possible
4 exception of chlorine and excessive sediment. This is
5 exactly why Congress exempted those discharges.

6 Monitoring of such discharges over the five-year
7 term of the permit is needed to have more datapoints to
8 conclude if such discharges are, in fact, sources of
9 pollutants. Landscape irrigation and residential car
10 washing are examples.

11 Monitoring on a pilot basis should be done for
12 specific non-storm water discharge sources. For example,
13 residential sources for landscaping, overspray and
14 residential car washing.

15 Regional Board should also be aware that
16 non-storm water discharges from cities located upstream
17 of a spreading ground are likely not to cause impairments
18 to a downstream beneficial use, and here is an example:
19 That's the Rio Hondo spreading grounds that is located in
20 Reach 2 of the Rio Hondo River into which about 16 or 17
21 cities discharge. Any non-storm water discharges
22 entering this facility would not cause any problems.

23 Problem two: Regional Board staff proposes to
24 impose additional conditions on already exempt or
25 conditionally exempt discharges. For example: All

0230

1 non-storm water discharge categories are to evaluate
2 alternative means of disposal; for example, sanitary
3 reclamation and reuse.

4 Segregate authorized -- and we're not quite sure
5 what this really means, what "segregation" means -- of
6 non-storm water discharges from potential sources of
7 pollutants to prevent the introduction of pollutants to
8 the MS4 and receiving water. But Regional Board staff
9 has no data to base these increased requirements on.

10 Once again, non-storm water outfall monitoring
11 needs to be done to justify adding conditions; need to do
12 non-storm water discharge outfall monitoring over the
13 five-year term of the permit to see if these conditions

14 are -- these added conditions are justified. In other
15 words, staff is being arbitrary.

16 Problem three: Staff proposes to make a
17 non-storm water discharge exceedance of a water quality
18 standard -- this includes TMDLs -- a receiving water
19 violation. Here's the clip from the working proposal.

20 "If a permittee demonstrates that a
21 specific non-storm water discharge from a
22 potable water supply or distribution system
23 not otherwise regulated by a separate NPDES
24 permit, but required by state or federal
25 statute and/or regulation, caused" -- and

0231

1 the definition here wasn't identified -- "a
2 short-term exceedance of applicable
3 receiving water limitations and/or water
4 quality based effluent limitations during a
5 specific sampling event, the permittee shall
6 not be found in violation of applicable
7 receiving water limitations and/or WQBELs
8 for that sampling event."

9 But here's the deal: The permittee would be in
10 violation if these requirements are not complied with,
11 and there's no federal authority to compel that kind
12 of -- impose that kind of requirement on a permittee.

13 Problem three, continued: Permittees cannot be
14 held responsible if a non-storm water discharge
15 exceedance occurs because the Regional Board doesn't have
16 the authority to compel compliance.

17 Problem four: Staff proposes to mandate that an
18 authorized non-storm water discharge shall not cause or
19 contribute to a violation of an applicable receiving
20 water limitation and/or water quality based effluent
21 limitations.

22 Regional Board doesn't have the legal authority
23 under federal regulations to impose this requirement on
24 permittees which in effect would make a municipality
25 responsible for assuring that non-storm water discharges

0232

1 do not exceed water quality standards. Staff confuses,
2 by the way, WQBELs with the water quality standards.
3 They're two separate issues.

4 Why Regional Board staff cannot impose stringent
5 non-storm water discharge requirements on permittees:

6 Congress, under Section 402(p) of the Clean
7 Water Act, created two sets of standards, one for storm
8 water and another one for non-storm water. Stormwater
9 pollution is to be reduced, not eliminated, from the MS4
10 to the maximum extent practicable through control
11 measures. "From the MS4" and "to the MS4" have two
12 distinct meanings under federal law.

13 Nonstormwater discharges are only to be
14 prohibited to the MS4. The two standards are very
15 different in terms of compliance expectations.

16 California MS4 permits, except Ventura and L.A., and
17 federal regulations use "from the MS4" to mean storm
18 water while "to the MS4" applies only to non-storm water;
19 must be emphasized that the MS4 permit is a storm water
20 permit, not a non-storm water permit. Staff has not made
21 this important distinction.

22 Nonstormwater discharges require a different
23 compliance standard than storm water discharges.
24 Congress intended non-storm water only to be prohibited
25 to the MS4, with the exception of 18 exempted discharges.

0233

1 Potable water, landscape irrigation, and residential car
2 washing are among them.

3 Prohibited non-storm water discharges are known
4 as "illicit discharges." Certain exempted discharges
5 have been conditioned on BMPs. Charitable car washes
6 should prevent wash water from entering catch basins, and
7 that's okay.

8 Regional Board doesn't have legal authority to
9 require permittees to prevent or prohibit non-storm water
10 discharges from exceeding water quality standards in the
11 receiving water or outfall. Congress intended the
12 elimination of nonexempted non-storm water discharges to
13 be achieved through the Illicit Discharge and Connection
14 Detection and Elimination Program by requiring permittees
15 to: Encourage public reporting of discharges through a
16 hotline; respond to reports of illicit discharges; take
17 enforcement action against those who cause illicit
18 discharges; force the removal of illicit connections, a
19 connection through which an illicit discharge passes;
20 establish legal authority to compel sources of illicit
21 discharges and connections to eliminate them; require
22 exempted discharges to be conditioned on BMPs if a
23 municipality determines that they are a source of
24 pollutants or that these and other non-storm water
25 discharges be permitted by the permitting agency, the

0234

1 State Board or Regional Water Control Boards.

2 Regional Board staff is proposing to override
3 Congress's mandate by revising permit language to require
4 each permittee, within its respective jurisdiction,
5 effectively prohibit non-storm water discharges into the
6 MS4 and from the MS4 to receiving waters except where
7 such discharges are either specifically authorized by a
8 separate individual or general NPDES permit or
9 conditionally authorized.

10 Federal regulations only require a prohibition
11 on non-storm water discharges to the MS4, not from it and
12 not to a receiving water.

13 Other Regional Boards in the state abide by this
14 requirement. This includes MS4 permits issued by
15 Santa Ana Regional Board to the counties of Orange, North
16 Orange County, Riverside, and San Bernardino counties;
17 also includes MS4 permits issued by the San Diego

18 Regional Board to South Orange County and San Diego
19 County.

20 Now, you have all this information in this
21 packet; but as you can see, they all say "from the MS4."
22 Up here, it says, "from the MS4 to receiving waters."
23 That's the proposed language, but in the language from
24 the other permits adopted by the other regions, they all
25 say "entering into the MS4," "from their respective MS4."

0235

1 That means the same thing. "From entering the MS4."
2 They all say the same thing, and "MS4" means streets,
3 catch basins, storm drains and any conveyance -- a
4 channel, rather, manmade that operates to convey
5 non-storm water runoff to receiving water.

6 Now, this is also -- this view of the limitation
7 of non-storm water discharge prohibition has also been
8 confirmed by the Office of Chief Counsel.
9 Catherine Hagan of the Office of Chief Counsel wrote to
10 the chairman of the San Diego Regional Board in 2009 the
11 following: MS4 permits shall include a requirement to
12 effectively prohibit non-storm water discharges into the
13 MS4. It doesn't say to -- "from the MS4 and to the
14 receiving water."

15 There are two separate standards required for
16 MS4 permits: one to prohibit non-storm water discharges
17 to the MS4; the other to use controls -- that is BMPs --
18 to reduce pollutants in storm water discharges from the
19 MS4; and from the MS4 is the outfall. That is the end of
20 the line as a point source. MS4 permits are point
21 sources. Cities have no ability -- no legal
22 authority to control discharges to a receiving water.

23 Federal regulations require the MS4 programs to
24 include an element to detect and remove illicit
25 discharges and improper disposal into the storm sewer.

0236

1 "Into the storm sewer," that means the same as MS4; again
2 not from it and not to a receiving water.

3 Prohibiting a non-storm water discharge that
4 causes or contributes to a receiving water exceedance is
5 extra-legal because non-storm water discharges are only
6 prohibited to the MS4 and not into a receiving water and,
7 therefore, should be removed.

8 Prohibiting a non-storm water discharge that
9 exceeds a water quality based effluent limit is not
10 possible because a WQBEL only applies to storm water, not
11 non-storm water.

12 A WQBEL is a BMP, and you can see the document
13 that's included in your packet, or a surrogate parameter.
14 If it is a numeric WQBEL, per USEPA's 2010 guidance
15 memorandum, it is not a water quality standard. This is
16 confirmed in this legal decision that's included in your
17 packet.

18 The bottom line is the Regional Board staff
19 should eliminate the proposed non-storm water revisions

20 that extend the prohibition to "from the MS4" and require
21 nothing else other than prohibiting illicit discharges.
22 However, it is recommended that non-storm water discharge
23 prohibition language be revised to be read as follows:

24 "The permittees shall effectively
25 prohibit non-storm water discharges into the

0237

1 MS4 and directly into a receiving water."

2 This language is proposed because permittees
3 need the legal authority to prohibit non-storm water
4 discharges from private property that do not enter the
5 MS4, but do enter a receiving water directly through an
6 on-site connection, through a catch basin or other drain.

7 Regional Board staff should not further
8 condition already exempted discharges until the
9 Nonstormwater Discharge Outfall Monitoring Program is
10 performed over the term of the next permit, and delete
11 any reference to non-storm water discharge compliance
12 with receiving water limitations and WQBELs. They are
13 not applicable to non-storm water prohibitions. However,
14 it is recommended that the non-storm water discharge -- I
15 think I already said that.

16 Let me back up here.

17 That language is needed because as you see here
18 (indicating), this is a catch basin and it's directly
19 connected to this outfall. Cities need the legal
20 authority to prohibit those kinds of discharges. That's
21 directly to the receiving water. If it was private
22 property and it went into a catch basin or a storm drain,
23 that would be a different ball game, but this discharge
24 goes directly into receiving water and once again, cities
25 need legal authority to prohibit those discharges.

0238

1 Okay. With respect to minimum control measures,
2 we support L.A. Stormwater Permit's position on these, on
3 this matter. They are the heart of the MS4 program and
4 more time is needed to discuss and revise proposed
5 requirements. Many of these minimum control measures
6 propose additional requirements that are justified by
7 storm water -- that are not justified by storm water
8 monitoring at the outfall. Requiring infiltration for
9 groundwater storage is not a storm water program issue.
10 It is a conservation-related issue and, therefore, should
11 not be reflected in the permit.

12 And how about that? I know I stuttered along
13 the way. It's Renee's fault. I needed the full 25
14 minutes. Anyway, I think I got it all in there. Thank
15 you very much for your patience.

16 MS. MEHRANIAN: Thank you. Thank you, Mr. Tahir.

17 In the interest of time -- first of all, the
18 next speaker is Bart Koch, Metropolitan Water District.
19 But in the interest of time, I'd like to suggest that we
20 shorten the time and please do not go more than -- we
21 want to limit it to three minutes for each.

22 MR. KOCH: Good afternoon, staff and members of the
23 Board. I am Bart Koch, Safety Environmental Services
24 Section Manager for Metropolitan Water District.

25 Metropolitan is a consortium of 26 cities and
0239

1 water districts that provides drinking water from the
2 Colorado River and Northern California to nearly 19
3 million people in parts of Los Angeles, Orange,
4 San Diego, Riverside, San Bernardino, and Ventura
5 Counties.

6 Metropolitan's 5200 square miles of service area
7 include water conveyance and delivery systems that
8 traverse Los Angeles County within the jurisdiction of
9 the Board.

10 As an introduction to my comments, I want to
11 convey to you Metropolitan's mission statement, because
12 it underlies the nature of the comments I will be
13 providing to you today regarding our operations
14 maintenance and discharge needs -- and the mission
15 statement is right above there. It is:

16 "To provide Metropolitan's service area
17 with adequate and reliable supplies of
18 high-quality water to meet present and
19 future needs in an environmentally and
20 economically responsible way."

21 Metropolitan's western region conveyance and
22 distribution's service area lies within the Board's
23 jurisdiction. This portion of the area includes 35
24 pipelines with over 435 linear miles of pipeline, 2500
25 structures such as turn-out structures; 180 service

0240
1 connections, 19 pressure control structures, 8
2 hydroelectric plants and 4 reservoirs; 2 treated water
3 and 2 raw water.

4 To ensure reliable and high-quality water
5 supplies, Metropolitan maintains a proactive
6 refurbishment and replacement program for its facilities,
7 including its pipelines, ranging in age from 21 to 76
8 years. These pipelines, which range from 16 inches to 20
9 and a half feet in diameter, must be dewatered prior to
10 Metropolitan crews conducting inspections and performing
11 preventive or corrective maintenance. These inspections
12 and repairs are essential to prevent pipe failure and
13 subsequent damage from high pressure water release.

14 We typically conduct these dewatering during the
15 wet weather months. Many of these pipelines are very
16 large so the water volumes are considerably greater than
17 can be captured or managed for reuse. Typical dewatering
18 amounts range from 40- to 50 acre-feet to 0.1 to 40
19 acre-feet, and an acre-foot is 325,851 gallons.

20 So we are currently covered under the MS4
21 exception and we appreciate the efforts that we've had.
22 We've had a recent meeting with the Board staff in
23 discussing our concerns and how to provide provisions for

24 our dewatering.

25 And in the interest of time, I thank you for the
0241

1 opportunity to speak today.

2 MS. MEHRANIAN: Thank you very much.

3 Katherine Rubin, Los Angeles Department of Water
4 and Power.

5 MS. RUBIN: Marty Adams --

6 MS. MEHRANIAN: Marty Adams, Los Angeles Department
7 of Water and Power.

8 MR. ADAMS: Thank you very much. My name is
9 Marty Adams. I'm the Director of Water Operations for
10 LADWP and like our friends from Met, we share a lot of
11 similarities. As a matter of fact, I was going to talk
12 about our mission statement, but it's almost what's on
13 the board with a few changes.

14 But I would like to take a second to introduce
15 you to L.A. Water and Power and let you know about what
16 our responsibilities are and how the MS4 permit pertains
17 to that.

18 L.A. Water and Power is the nation's largest
19 municipal utility. We have about four million customers
20 right here in L.A. As opposed to Metropolitan Water
21 District where they are a wholesaler, we get down to much
22 smaller pipes and deal directly with our individual
23 customers. We have over 700,000 service connections over
24 our 470 square-mile service area, and we do buy water
25 from Metropolitan Water District, which comes from the

0242
1 Colorado River and the State Water Project, as well as we
2 operate our own aqueducts from the Owens Valley and
3 Mono Basin and have local groundwater wells that have
4 been the long-term historical supply for Los Angeles.

5 The water system in Los Angeles is very
6 complicated. It's regarded by many as one of the most
7 complicated systems in the country, if not the world. We
8 have over 126 pressure zones, 88 pump stations. We have
9 over 100 tanks and reservoirs, almost all those in the
10 City of L.A. boundaries. We have over 260
11 pressure-regulating stations and over 7,200 miles of
12 pipeline, almost all of that predominantly in the City of
13 L.A., and that pipe flow ranges from 6 inches with small
14 distribution mains up to now 8-foot diameter pipes in the
15 city streets.

16 So as you can imagine, when there's a break in a
17 pipe or a service change in a connection or a valve needs
18 to be fixed or there's a repair, with an 8-foot diameter
19 pipe, no matter how short the shutdown length is, it's a
20 lot of water to deal with. So it's very appropriate that
21 we're covered, appropriately, under the permitting that
22 you're considering today.

23 We do take about 25,000 water samples a year to
24 make sure that we have good, quality water to our
25 customers, performing over 250,000 field and lab tests

0243

1 every year; and water quality is one of the predominant
2 drivers of our business and all the rest of the water
3 purveyors who are here today.

4 As we look at our system, one of the key
5 components for us is flushing of water mains. We have
6 over 8,000 water mains that are considered dead-end mains
7 where water quality could be jeopardized if it's not
8 flushed on a regular basis. So, annually, we try to get
9 to those 8,000 dead end mains. We've gone and done an
10 average of about 5400 gallons per flush of those mains;
11 and when we do those flushing operations, we do follow
12 the best management practices. We have our own
13 guidelines that are consistent with the American Water
14 Works Association guidelines, and all those guidelines
15 and practices have been worked out with your staff to
16 make sure that we are doing the proper things we need to
17 to dechlorinate the water, to make sure it's possible to
18 sweep the water away, so that's being done as well, and
19 then we're taking every precaution to make sure that the
20 environment is protected.

21 We do also have to drain tanks and reservoirs on
22 occasion. Most notably, a lot of folks might remember
23 Silver Lake Reservoir was drained of almost 600 million
24 gallons. That was a mammoth undertaking in response --
25 I'll hurry -- to a water quality issue in the city of

0244

1 Los Angeles and we worked very closely with your staff
2 for successful resolution of that and we are -- it's very
3 important to us that we protect water quality not only
4 for the drinking water, but also for the discharge water
5 quality at all times.

6 We've had -- as was mentioned, we have had
7 recent meetings with your staff on the MS4 permit. We
8 think that there are -- that the discharges we have are
9 appropriate. Under the MS4 permit, there's also
10 discussions of possibly a permit, particularly dealing
11 with the drinking water industry. We think that that is
12 another way to go that may be advantageous in the
13 future --

14 MS. MEHRANIAN: Can you please wrap up, because your
15 time is up?

16 MR. ADAMS: Most importantly, we do think that what
17 we've had in the MS4 permit and the exceptions given to
18 the drinking water and the regular work we do is
19 appreciated and is appropriate, and we appreciate your
20 time today. Thank you.

21 MS. MEHRANIAN: Katherine Rubin.

22 MS. RUBIN: I'll pass.

23 MS. MEHRANIAN: Jason Wen, City of Downey.

24 MR. WEN: Good afternoon, Madam Chair and members of
25 the Board and staff. Thanks for the opportunity to come

0245

1 in here. My name is Jason Wen. I'm from the City of

2 Downey. I can tell you I am 100 percent representing
3 myself; probably only 50 percent about the City because I
4 didn't talk to my boss about the presentation.

5 I just want to share with you real life.
6 Something always needs a title for a presentation and,
7 you know, I put a couple of slides up. It's like a look
8 at the real word and share that with you.

9 For the last ten years, I am a superintendent of
10 the City of Downey. I'm in charge of water operations,
11 the treatment of water. So also recently, I'm in charge
12 a little bit of MS4. Now I'm the representative of a
13 midsize city on both sides.

14 Next, slide. Oh, I can do it here.

15 Real life: This is a picture taken two weeks
16 ago. This is the water we're dealing with. This hydrant
17 got hit. You know, basically, citywide, we have over
18 1800 fire hydrants. So the reason I say that is because
19 a lot of the discharge from our drinking water system is
20 from the hydrants, so we're talking about a lot of water.

21 As a scientist, you know, you're trained to
22 solve the problem; you look at the issue. I'll give you
23 one example here, but it's just a matter of time here.

24 The drinking water stands for the copper. The
25 drinking water is standing at what we call the action

0246

1 level. The copper is at 1300 micrograms per liter. So
2 we sample about 50 sites every three years. That's part
3 of our monitoring. If we have TMDL wet weather standing
4 at roughly for 11 to 17 micrograms per liter, so if we
5 flush every three years, we're talking about 1800 per
6 every three years. So standard-wise, the TMDL wants it
7 118 times lower. This is a real problem. Sampling
8 frequency is 3600 percent more. Costs? I cannot figure
9 it out yet.

10 I steal this slide from the website everybody
11 knows. This is from the summer and we're talking a
12 little bit of costs. This is the facility treating
13 chromium in Glendale that they're starting. If you look,
14 this is about a 500 GPM facility. This is fixed. If you
15 want to treat any water, the copper is similar thing as
16 the chromium and other matters. I understand it's a very
17 advanced treatment process. This is not easily potable.

18 The cost roughly is about 500 to 600 per
19 acre-foot for the treatment process. We are only talking
20 for this kind of matters. Like I had the slide before,
21 the City of Downey, our water cost total is roughly \$600
22 per acre-foot. It's one of the lowest in the area. If
23 you're talking about -- I don't know that, technically,
24 you have a potable system if the fixed system is still
25 double or triple the costs. So a Baker's tank may not be

0247

1 a good solution because the largest Baker's tank we have
2 is about 20,000 gallons. You can lie out the Baker's
3 tanks for 10 to 20 minutes of flushing.

4 Summary? I don't really don't have it. I don't
5 understand one thing. I'm laughing inside as our
6 preacher for our drinking water system. I know I don't
7 have a fighting chance for myself. But, again, I really
8 think we're dealing with the real world and we support
9 the BMPs. We support it, but it creates a lot of legal
10 fights. That's my concern.

11 MS. MEHRANIAN: Thank you.

12 Gary Hildebrand, followed by David Kimbrough.

13 MR. HILDEBRAND: Good afternoon, Madam Chair, Board
14 members. My name is Gary Hildebrand and I'm here on
15 behalf of the L.A. County Flood Control District this
16 afternoon. I have a tough act to follow here.

17 In any case, to keep my comments brief, I just
18 have a few general concerns regarding the non-storm water
19 discharges I'd like to present to you today. We are
20 going to be looking at this in more detail, providing
21 some detailed comments to Sam and his staff, and we will
22 be meeting with them to go over these in more detail.

23 We appreciate the efforts of Sam and his staff.
24 We have had a very amenable meeting with them and we look
25 forward to continuing that relationship.

0248

1 We're pleased to see that all the storm water
2 exempt categories are still continuing to the permit.
3 There are some additional requirements that are being
4 imposed in this particular section and some additional
5 specificity in some cases I think is warranted; in other
6 case, I think there's some specificity that is not quite
7 what we're looking for.

8 In many cases, you need to take a look at the
9 issue that these are exempt discharges, discharges that
10 are being looked at as not having any real environmental
11 effect. So with that particular issue, I think we need
12 to keep that in mind when looking at the additional
13 requirements that are being imposed on permittees as part
14 of this aspect of the program. Some of the additional
15 monitoring, data collection inspection that is being
16 required is rather burdensome for the permittees and
17 those are some of the issues we need to discuss with Sam
18 and his staff.

19 Obviously, illicit discharges need to be
20 eliminated and there's a separate program that deals with
21 those and that's something that we've clearly supported
22 and we've had a very extensive program over the years at
23 the District that's very aggressively looked at our
24 system and dealt with our illicit discharges, and that's
25 something we plan to continue.

0249

1 One particular discharge category that has come
2 up over the past permit term that has been an issue to
3 the District is discharges associated with the EPA's
4 Superfund Cleanup Programs. These are discharges from
5 contaminated groundwater sites that are managed by EPA;

6 and as part of the remedy for those sites that has been
7 pursued by EPA, it does involve the discharge of
8 partially treated or untreated contaminated water into
9 the MS4, and that causes an obvious heartburn to the
10 permittees when these are discharges that under our MS4
11 permit don't meet the exempt category, obviously, and
12 don't meet water quality standards.

13 So we have had discussions with EPA, the
14 Regional Board, and these are ongoing discussions that
15 we're hoping to resolve as part of the process, but we
16 have been placed in a position under the current permit
17 where EPA has been advocating these discharges and has
18 been looking for us to accept discharges from superfund
19 remedy sites. So this is an issue that we do need to
20 further deal with with the Board staff.

21 So with that, thank you.

22 MS. MEHRANIAN: Thank you. Tatiana Gaur,
23 Santa Monica Baykeeper.

24 MR. KIMBROUGH: I thought they called me next. You
25 said Gary Hildebrand and David Kimbrough.

0250

1 MS. MEHRANIAN: Go ahead.

2 MR. KIMBROUGH: Members of the Board, staff, and
3 guests, my name is David Kimbrough I am the Water Quality
4 Manager for the Pasadena Water and Power Department.
5 However, I am here today speaking not just for Pasadena
6 Water and Power, but for the Association of California
7 Water Agencies, the California-Nevada Section of the
8 American Water Works Association, and the California
9 Water Association.

10 Together, these three groups represent the vast
11 majority of community water systems in the state and
12 Los Angeles County. These three groups would like to
13 thank the Board for the opportunity to jointly address
14 the Board on the issue of non-storm water discharges from
15 clean water systems.

16 First, I want to let the Board know that while
17 this presentation is a collaborative effort, the approach
18 reflects the view of many member agencies within the L.A.
19 region, although there are some members who may pursue
20 other solutions as they feel appropriate.

21 We hope the Board reviews these proposals
22 carefully and above all recognizes the importance of
23 community water systems being able to discharge to meet
24 public health requirements.

25 Why do community water systems discharge? Clean

0251

1 water systems are legally obliged to discharge on a
2 regular basis to comply with state regulations, to
3 protect public health, and protect the physical integrity
4 of our infrastructure.

5 Community water systems are regulated under
6 Title 22, which sets up the conditions under which we can
7 operate and can be found in statute and regulation and

8 individual permits.

9 Typically, community water systems have two
10 parts. We have a source, which is commonly a well or a
11 lake or some sort of source like that, and then a
12 distribution system which delivers our water to our
13 customers. In Los Angeles County, the vast majority of
14 clean water systems use wells as at least one of their
15 sources of water. The water may be in storage tanks,
16 pipes, or other contained and pressurized facilities and
17 may be discharged from any of these facilities.
18 Sometimes wells need treatment. That's -- for the most
19 part, they don't.

20 A large -- although a large amount of water does
21 come from surface water such as lakes and rivers, only a
22 small number of community processes actually treat this
23 water. Most of them simply buy it from other water
24 providers such as Metropolitan Water District.

25 This is a small selection of the regulations
0252

1 that cover us, state regulations. I'm not going to read
2 this, but you get the idea that there's a lot of
3 regulations; and a lot of the regulations actually spell
4 out flushing requirements. We are required to have
5 equipment that flushes. Minimum velocities are
6 established. We are -- our employees are required to be
7 trained in flushing and flushing requires discharge.

8 This is a typical flushing operation. This is a
9 fire hydrant being opened. There is a hose and a
10 diffuser and a dechlorinator. This reduces the velocity
11 and it reduces the energy so there's no scouring or
12 undercutting of the pavement. It reduces the sediment
13 generation.

14 Water quality: Discharges from community water
15 sources are generally of very high quality as compared to
16 other discharges.

17 EPA and Water Research Foundation did an
18 extensive study and it's summarized -- our quality of
19 water represented very minor threat to public health and
20 compliance with Clean Water Act.

21 Community water systems are legally obliged to
22 discharge. Now, why is this a problem? Community water
23 systems are coming into conflict with MS4 permittees and
24 the proposed language creates a condition where MS4
25 permittees need to minimize their discharges to comply

0253
1 with the MS4 permit. This puts them in a position where
2 they have to adopt a zero discharge policy. We're
3 included in that discharge. That's their only safe
4 harbor if there is an exceedence.

5 This is sort of a visual summarization of this.
6 There is MS4 requirements on the MS4 permittees. They're
7 looking to minimize discharges of nonstormwaters. We
8 have to discharge; therefore, we are, by nature, in
9 conflict with the MS4 operators. That puts them in

10 conflict with the Regional Board and the MS4 permit.

11 The most difficult component of this is the
12 TMDLs. Right now, there are only a few number of TMDLs
13 in the MS4 permit. In a few more years, there will be
14 over 30 of them. This will create a condition where
15 almost all of L.A. County will be in some sort of --
16 under pressure to achieve a zero non-storm water
17 discharge policy. Conflicts between clean water systems
18 and permittees are bound to occur.

19 In fact, we are already seeing this occurring.
20 Some permittees are fining community water systems for
21 routine discharges. They're being banned from discharge
22 and required to get NPDES permits and waste discharges
23 requirements which declare our waters to be a waste.
24 Declaring our waters to be a waste only creates legal
25 problems for us and this will only get worse in the

0254

1 future.

2 The solution to avoid this is to get some sort
3 of regulatory relief. We are proposing a collaborative
4 approach similar to what's being proposed in the permit
5 where MS4 permittees, the Regional Board, and the
6 community water system all work together. We're using
7 enhanced best management practices to allow MS4
8 permittees to comply, and this is the language -- this is
9 the sort of language we'd like to see where there's a
10 category of legally mandated discharges and those
11 discharges, like the language that's in the proposed
12 language from Board staff, would set -- would allow MS4
13 permittees not to be in violation of the permit if the
14 cause of the permit -- if the exceedence was from one of
15 our discharges.

16 This would create a cooperative rather than a
17 conflicting environment where each of the parties receive
18 some regulatory relief, but in exchange, takes on
19 additional responsibilities. Community water systems
20 would take on additional responsibilities of enhanced
21 best management practices. There would be a memorandum
22 of understanding of some sort of legal agreement between
23 the community water systems and MS4 operators to enforce
24 force that, and that's my presentation.

25 Thank you very much.

0255

1 MS. MEHRANIAN: Thank you. Tatiana Gaur,
2 Santa Monica Baykeeper, and then we have the L.A. Permit
3 Group. And because they represent over 40 cities, I
4 believe, we're going to give them ten minutes. So,
5 please.

6 MS. GARY: Good afternoon, Board members.
7 Tatiana Gaur, staff attorney of Santa Monica Baykeeper.
8 We originally requested, I believe, half an hour which
9 was trimmed and I just want to know, at this point, how
10 many minutes I have at this time for my presentation
11 together with Heal the Bay and NRDC.

12 MS. SMITH: They asked for eight minutes for the
13 non-storm water and I think the remainder for MCM.

14 MR. UNGER: We were going to give them ten; right?

15 MS. MEHRANIAN: I'm sorry.

16 MR. UNGER: We were going to give them ten.

17 MS. MEHRANIAN: Ten for L.A. Permit Group.

18 MR. UNGER: And then for --

19 MS. MEHRANIAN: And you're representing now
20 Santa Monica Baykeeper and other groups?

21 MS. GAUR: We're doing a combined presentation, so
22 it's just --

23 MR. UNGER: She wants to know who you're combining
24 with.

25 MS. GAUR: NRDC and Heal the Bay.

0256

1 MS. MEHRANIAN: Because the card didn't say that.
2 Okay. Go ahead.

3 MS. GAUR: So I'm just going to speak to storm water
4 discharges. And as staff observed in earlier
5 presentations, stated, the same non-storm water
6 discharges to and from the MS4 continue, violations of
7 water quality standards and TMDLs continue, and Regional
8 Board staff itself has observed the MS4 permittees'
9 efforts to eliminate storm water discharges have failed
10 and there's little done to identify the sources and
11 characteristics of non-storm water discharges that
12 continue to impair waters and harm aquatic life and
13 endanger public health.

14 There's plenty of monitoring data which is
15 collected pursuant to the MS4 permit that show that
16 non-storm water exceedences continue to this day caused
17 by non-storm water discharges.

18 So clearly, despite the discharge prohibition in
19 the current permit which requires permittees to
20 effectively prohibit non-storm water discharges,
21 violations go on and so the new MS4 permit must contain
22 clear, easy to apply and enforce requirements to once for
23 all deal with this problem and the resulting exceedences
24 of TMDLs and water quality standards. Without strict
25 regulation of non-storm water discharges, there's no

0257

1 guarantee that the permittees will comply with TMDLs that
2 have -- when we have so many TMDLs currently that
3 regulate dry weather discharges.

4 We support staff's work on clarifying the
5 definitions of non-storm water and storm water as stated
6 in the proposal. Overall, though, the working proposal
7 is very complicated and convoluted, difficult to follow,
8 likely difficult to apply and implement; and the way it's
9 written, it's also hard to determine how the public can
10 ascertain if permittees are actually complying with the
11 permit requirements and with the mandate to effectively
12 prohibit non-storm water discharges.

13 We will be submitting detailed comment, but a

14 few of the major issues are as follows: We are
15 specifically concerned about the great increase in
16 exceptions to -- or exemptions to non- -- to the
17 prohibition on non-storm water discharges. So in the
18 last permit, I counted 12 exceptions. Currently, there's
19 about 25. And at the same time, staff has concluded that
20 non-storm water discharges continue and violations of
21 water quality standards in dry weather continue.

22 So in light of this and the data, what the data
23 shows us, rather than increasing the exceptions, they
24 should actually be limiting the exceptions. And there's
25 some of them that make sense and are truly de minimus,

0258

1 but there's plenty of others for which there are studies
2 that show that they are a source of pollution, and they
3 should be regulated and enforced against by permittees.

4 For example, landscape irrigation was found
5 already by the Region 9 in the Orange County MS4 permit
6 to be a source of pollution and that's no longer part of
7 the list of exempted non-storm water discharges. We
8 believe we're no different. Our region is no different
9 in that respect and landscape irrigation should be
10 excluded, should be regulated, should not be allowed.
11 It's not just a matter of water quality. It's also a
12 matter of water conservation, water supply.

13 Some of the other exceptions -- and I'm not
14 going to go in all the detail that you will see in our
15 letter -- should be further limited. Like, for example,
16 dewatering of decorative fountains is on the list of
17 exceptions. Street and sidewalk wash waters could also
18 be further limited.

19 Another significant issue in staff's proposal
20 for us is the lack of real transparent mechanisms to
21 determine if the condition you've authorized and exempt
22 amounts of discharge do, in fact, contribute to
23 violations of water quality standards. There's no
24 meaningful way at this point. So the language proposed
25 by staff should be strengthened further.

0259

1 And finally, the exceptions and part three
2 (a)(xiii) and (iv) 9, there's no legal authority for
3 that. That's the exemption that was discussed for
4 short-term exceedences of applicable receiving water
5 limitations. Those should be regulated. If there's any
6 anticipated discharge, that should either obtain an NPDES
7 permit or be otherwise regulated.

8 I will conclude. The rest of my time is for my
9 colleagues.

10 MS. MEHRANIAN: Thank you.

11 MR. UNGER: I think we can move on.

12 MS. MEHRANIAN: You're sharing the time? Are you
13 going to speak?

14 MS. GAUR: No. I'm fine.

15 MS. MEHRANIAN: Nobody else?

16 MR. UNGER: Next speaker.

17 MS. MEHRANIAN: L.A. Permit Group, Heather Maloney,
18 John Dettle, Joe Bellomo. They have ten minutes.

19 MS. MALONEY: Good afternoon, Madam Chair and Board
20 members. My name is Heather Maloney, chair of the L.A.
21 Permit Group.

22 First off, I want to thank you for the
23 opportunity to provide comments and thank your staff for
24 all of their work that they've done in reviewing our
25 comments and responding to questions that we've had along

0260

1 the way, especially as related to the different permit
2 provisions.

3 We recognize that this permit has been a long
4 time coming with the goal of improving water quality and
5 we want to reassure you that we do share this common goal
6 and have been achieving actively working with staff to
7 develop a permit that allows these goals to be
8 accomplished in the most strategic and efficient way.

9 With this in mind, the L.A. Permit Group has
10 been actively working since January 2011 to develop
11 comments and constructive feedback regarding development
12 of the L.A. MS4 permit and we look forward to the
13 continued partnership throughout this process.

14 Just for reference, these are the 61
15 municipalities that are voting agencies within the L.A.
16 Permit Group. We do work with a number of other
17 stakeholders; however, these are the 61 voting agencies
18 with which we represent their consensus today.

19 So some our overall themes that we want to just
20 make sure our point of view is understood going into this
21 process be -- and, again, your staff has been great
22 working with us and discussing these as well, but
23 throughout this process, staff proposals have identified
24 several increased standards that permittees will be
25 required to meet; and in general, the L.A. Permit Group

0261

1 has been advocating for permit provisions that will allow
2 us to work towards increased water quality while allowing
3 us to prioritize scarce local resources towards efforts
4 that will have the largest impact to the improved water
5 quality.

6 In order to achieve further water quality
7 improvements, this process needs to set clear goals while
8 allowing flexibility with the programs and BMPs
9 implemented. The way to accomplish this is through
10 integrated planning and monitoring. The strategy has
11 been presented by the L.A. Permit Group as it will allow
12 permittees to look at the larger picture and develop
13 programs and BMPs based on addressing multiple
14 pollutants. In doing so, local resources can be
15 concentrated on the highest priorities. This is the best
16 and most efficient way of working toward the water
17 quality goals.

18 And then we do have a number of detailed
19 comments that we were planning to preview today, but
20 we'll go through them very quickly, but we will have
21 detailed comments in a comment letter that we'll be
22 submitting over the next two weeks, per the deadlines
23 that the staff has set up.

24 So I'll have John Bellomo come up and share some
25 comments specifically related to the non-storm water
0262

1 discharges.

2 MR. BELLOMO: Good afternoon. We met with the
3 community water systems and the fire departments, you
4 know --

5 MS. MEHRANIAN: Yes. Will you please mention your
6 name. State your name for the record.

7 MR. BELLOMO: Joe Bellomo. We met with a group of --
8 the L.A. Permit Group met with community water systems
9 and fire departments and again with these groups and
10 Regional Board staff in trying to hash out how -- you
11 know, the best way forward with potable water discharge,
12 the current situation and where we're going into the
13 future with this new permit and any conditions that are
14 to be set on that, on the potable water discharges.

15 The issue's going to become more problematic as
16 we go forward if there's no regulatory relief model
17 that's workable. And in the current staff's proposal,
18 the L.A. Permit Group is finding the regulatory relief
19 model as it's defined currently as one that we cannot
20 accept. It puts too much responsibility -- it is
21 transferring too much responsibility onto the permittee
22 without a clearly defined problem or need.

23 The burden of proof is still too high. The
24 ability -- the responsibility of the permittee -- the
25 responsibility approved that it's a potable water
0263

1 discharge source is the permittee's responsibility in
2 this permit, as it's defined, not the discharger's, and
3 there's a cost associated, a very large cost associated
4 with that investigation.

5 We're looking for the potable water and fire
6 discharges to be exempt in the permit and we should have
7 regulatory relief for any discharges associated with
8 potable water and firefighting activities that cause or
9 contribute to an exceedence.

10 We're going through, you know, again off the
11 potable water discharges and getting into some of the
12 other categories. In the current permit, there's
13 category, A, B, and C and this -- what we see changing is
14 additional NPDES permits being recognized as part of the
15 process, that a lot of that responsibility is being
16 transferred onto the permittee. So there's a permit
17 issued by the Regional Board, but the responsibility to
18 do enforcement and supervision of that permit is put on
19 the permittee. So then we see a lot of the natural flow;

20 you know, categories being a further condition which we
21 are not necessarily -- we don't necessarily agree with
22 several points and in our written comments, we'll further
23 address those issues. And again, further conditioning on
24 the fire fighting activities, and I'll show you a couple
25 of categories in category C where -- discharges in

0264

1 category C where we do find agreement with staff on the
2 condition of those.

3 So natural springs, this is a perfect example of
4 something that should be unconditionally exempt. It's a
5 natural flow.

6 A flow from riparian habitats and wetlands:
7 again, something that should be further exempt
8 unconditionally.

9 I'm thinking of the Malibu Lagoon. Every time
10 it breaches, there's not going to be a permit issued for
11 that, but are we responsible for the discharge from that
12 lagoon?

13 Stream -- diversion of stream flows: We're
14 asking if there is a permit issued for this type of
15 activity, that we get -- one of the conditions that's
16 spelled out in the NPDES permit is that we get prior
17 notification.

18 Dewatering of lakes, we're going to default to
19 our written comments on that one. There's still some
20 consideration of what that really entails.

21 Rising groundwater: This is one that should
22 also be unconditionally exempt.

23 And then conditions for -- this condition should
24 be removed. There is plant checking spaces also in place
25 already to regulate this type of discharge and where it

0265

1 would be plumbed.

2 Air-conditioning condensate: the condition
3 should be removed.

4 And reclaimed and potable landscape irrigation
5 flow: We're in general agreement with staff on the
6 conditions proposed for this type -- these types of
7 discharges.

8 We're asking for noncommercial car washing by
9 residents and nonprofit organizations to be
10 unconditionally exempt.

11 And that concludes the nonstorm water discharge
12 portion. Thank you.

13 (Whereupon Mr. Yee exited the proceedings)

14 MS. MEHRANIAN: Thank you. This is it for the
15 speakers. I think we have one more presentation by
16 staff. Am I right?

17 MR. UNGER: Yes. We have one more presentation by
18 staff, basically on the minimum control measures, and
19 there are a series of cards there as well.

20 MS. MEHRANIAN: Sure. Shall we start? Are we going
21 to comment on this, what we had, or --

22 MR. UNGER: It's a Board workshop. You're more than
23 happy to comment or question at this point or at the end,
24 whatever you choose. It's the Board's pleasure.

25 MS. MEHRANIAN: Do you want Board questions and
0266

1 comments now or at the end? Now? Okay.

2 Board Member Camacho, you want to start?

3 MS. CAMACHO: No.

4 MS. MEHRANIAN: No? Who wants to start? Would you
5 want to start, Board Member Glickfeld?

6 MS. GLICKFELD: I want to thank everybody. I see how
7 complicated these issues are and I see, on one hand, that
8 there's a lot of disagreement, but I think that the word
9 that I understand -- the positive part that I'm seeing is
10 that there is a willingness of the community water
11 systems and the permittees and the staff to work together
12 on some of these issues.

13 The discussion seems to be about whether or not
14 water that's relatively pure coming out of the ground or
15 out of a hydrant or out of a part of the water system
16 should be considered as exempt or not exempt, and I guess
17 what my concern is is where does that water -- the water
18 that's being discharged and used, there's legitimate
19 reasons to do these things, but the water gets discharged
20 into the street or into other passageways and into
21 conveyances where they pick up pollutants; and if there's
22 a common ground that we can find with the permittees and
23 the municipal water organizations that, yeah, they admit
24 that they have to do these things and we have to admit
25 they have to do these things, but they can think about

0267

1 how and where they discharge it and how we prevent it
2 from getting polluted before it gets into the municipal
3 storm drains, I think that would be really helpful and
4 I'm hoping that staff would work really hard to do that.

5 That was it. Okay.

6 So I just think -- you know, the one issue that
7 some of the -- that I think runs through this that is of
8 concern to me, and it's going to come up in the next
9 section as well, is where we have authority over our
10 permitting topic and we're transferring enforcement
11 responsibilities to the permittees. I just think that's
12 wrong. I think we should not be doing that. We should
13 be asking them to help us with it.

14 I like the idea that we're asking for our
15 permittees to be involved in enforcement task forces with
16 us in other sections of this proposal, but I think we
17 have to -- we cannot just delegate our enforcement
18 authority for our own permits or our own responsibilities
19 to our permittees. That's not right to do that.

20 So I think those are my -- a couple of my
21 comments. I really want to see -- I see that there's a
22 lot that the permit -- the L.A. Permit Group would like
23 to see exempted, but I couldn't support that unless

24 there's some way to ensure that those waters that they
25 think should be exempted -- I can be assured that they're
0268

1 not going to get polluted before they get into the
2 system.

3 One of the areas that I'm really concerned about
4 are our own permits that require -- our own permits that
5 require groundwater that's pumped out of underground
6 garages, because underground garages impact high
7 groundwater. The groundwater's polluted and then that
8 goes into the storm drain system or we -- worst of all,
9 where we have a -- where we have a cleanup requirement if
10 pollutant groundwater, we pump it, we treat it, and then
11 we put it into the storm drain system.

12 This is all wasted water. It's not our job.
13 It's the State Water Board's job to deal with water
14 supply and water conservation measures, but we all have
15 to work -- wake up to the fact that there may be ways in
16 which we can both avoid water quality problems and
17 conserve water.

18 So I've asked our staff to start looking at ways
19 when people have to pump water, can we find out --
20 especially in construction, can we use it on-site? Can
21 we allocate it for toilet use? Can we allocate it to
22 landscape use? Can it be used nearby? We should be
23 doing everything we can to keep that water from going
24 into the storm drain.

25 And I know that this seems like a huge problem
0269

1 to some of you, but I think that we have to do what we
2 can in realistic situations where we have some control,
3 which we don't have on the fire hazard and we don't have
4 over necessary maintenance of our water. We have to do
5 those things. But when we have control over what we're
6 doing when we're pumping out groundwater, we should be
7 doing something useful with the water.

8 So those are my comments.

9 MS. DIAMOND: I just have a couple. I wanted staff
10 to think about how if, in fact, this permit is
11 complicated as one of the -- too complicated for some of
12 the dischargers and some of the NGOs to be able to figure
13 out some of the requirements. That was said I think by
14 the speaker from the Baykeeper.

15 At the same time, the exemptions have been
16 increased and landscape irrigation is no longer an
17 exemption, and I want to know what does that mean in
18 terms of, you know, if there is pesticide or fertilizers
19 that are used? Is there anything we should be concerned
20 about in terms of that impacting our water?

21 And, also, I wanted to know are the
22 responsibility -- is this permit -- is there anything in
23 this part of the permit that is not as -- other than the
24 exemptions, that removes responsibility from the
25 permittees that might be considered backsliding? I just

0270

1 want to make sure that that's not an issue. I don't
2 disagree with having more exemptions, but I just want to
3 know whether we should be concerned about that.

4 And, also, in terms of reuse, what Board Member
5 Glickfeld said, I completely concur with in terms of our
6 being able to increase the amount of local supply of
7 water. Is there -- are there incentives in here for
8 reuse and do the permittees get credit for establishing
9 reuse so that we are saving water and also, at the same
10 time, they are incentivized and given credit for doing
11 that?

12 MS. MEHRANIAN: Thank you.

13 Board Member Munoz, anything you want to add?

14 MS. MUNOZ: One of the words that I heard constantly
15 today was collaboration, working together, partnership,
16 and I think that's wonderful and I'm wondering if there's
17 been any collaboration between, like, the L.A. City group
18 and the environmental organizations; and if there has
19 been, on what points has there been partnership,
20 collaboration, or conversations with each other?

21 MS. PURDY: I don't know if that's something that you
22 want me to answer. It's probably better for the city or
23 the environmental group.

24 MS. MEHRANIAN: Can we ask the L.A. Permit Group?

25 MS. MUNOZ: And Santa Monica Baykeeper, some of the

0271

1 folks that addressed us today. I believe that that's
2 something that's been missing in some of these
3 conversations, because when I think the collaboration, I
4 think of bringing all the parties together that are
5 impacted by policy that's going to be voted on and it
6 seems to me that that would be a good start, if that
7 hasn't happened yet, or Heal the Bay. I see Heal the Bay
8 is here as well.

9 MS. MALONEY: To address your question on
10 collaboration, at this point, our collaboration really
11 has focused on collaboration between permittees; however,
12 as I've mentioned in each of our presentations throughout
13 the different workshops, that we are engaging with other
14 stakeholders quite actively throughout this process.

15 The couple environmental groups that you did
16 mention have not been actively engaged in our process;
17 however, several other environmental groups have,
18 specifically ones -- there's been some that are out in
19 the San Gabriel Valley that have been very active
20 partners coming in and, you know, offering assistance.

21 One specific example of that is the Watershed
22 Council for Health which actually helped us develop the
23 proposal for the Integrated Monitoring Program and wrote
24 a grant on behalf of the cities to actually promote that
25 program and to provide some funding for that effort. We

0272

1 have been working on it.

2 We realize that more collaboration does need to
3 happen. We're just not quite there in all of our steps.
4 So did that address your question?

5 MS. MUNOZ: Yes.

6 MS. MEHRANIAN: Would you want to add something?

7 MS. JAMES: Good afternoon. Kirsten James with Heal
8 the Bay.

9 Definitely all of us in the environmental
10 community are open to collaboration. We've had initial
11 conversations with several cities, including the City of
12 L.A., the City of Santa Monica, and we definitely have
13 our door open. As we get the language and start to have
14 more specific concerns, we definitely will be
15 collaborating at a greater level.

16 MS. GAUR: I would say the same from us. We haven't
17 really collaborated as much as we would like to or
18 should, but we're open to collaboration and we do work
19 with City of L.A. on various issues, especially storm
20 water, pollution, and trash. So I hope that answers your
21 question.

22 MS. MUNOZ: So in --

23 MS. CAMACHO: In that process, the collaboration,
24 what can we do -- maybe directing this to the staff -- in
25 order to see that happen? That's great that doors are

0273

1 open. I love that there's some discussion, but is there
2 a way to have further discussion? I know Mr. Tahir's
3 group, he represents a lot of municipalities as well and
4 so I'm just trying to understand how can we -- if staff
5 can be of assistance or -- I'm not sure, but get all of
6 those discussions and kind of thinking outside the box on
7 how we can achieve what we all want to achieve, but in a
8 way that's actually going to create requirements that
9 actually can be met?

10 MS. PURDY: I would just say -- and, Sam, if you want
11 to jump in, you can. But we have been having numerous
12 conversations and meetings with many, many of the
13 permittees and interested parties, including the
14 environmental organizations, L.A. Permit Group, City of
15 L.A., County of L.A., the water suppliers, and I think
16 that one thing we may be able to do is in some of these
17 meetings now that we have some working proposals perhaps
18 suggest that we -- rather than meeting with one group at
19 a time that we perhaps invite, you know, the L.A. Permit
20 Group and the environmental community to come in and meet
21 with us jointly on some of these issues.

22 MS. MEHRANIAN: Thank you.

23 Anything else?

24 I just want to add one thing, that I just want
25 to go on the record that the reason that the Board

0274

1 extended the MS4 permit deadline was to have these
2 workshops, because as you all heard, the issues are very
3 complicated and when you hear different stakeholders, the

4 environmental community, the L.A. Permit Group, you come
5 to see things from the different angles. And although at
6 the end of the day, it's water quality -- building
7 consensus becomes an important thing. By "building
8 consensus," I don't mean diluting the issues, but bending
9 some of the rules to make new rules where the water
10 quality still prevails. So that's what we had.

11 I know that there is one more presentation and
12 some cards. How long -- how much longer do we have the
13 room? I want us to be cognizant of time.

14 MR. UNGER: I haven't heard specifically for today.
15 Typically, we've used the time until about 6:30.

16 MS. MEHRANIAN: So let's --

17 MR. UNGER: I think our court reporter might need a
18 quick break.

19 MS. MEHRANIAN: Do you need a break? Five minutes?
20 So it's 5:00 now.

21 MR. UNGER: And I think what we're going to do, just
22 for everyone, is we're going to limit people to three
23 minutes unless you're representing a larger group, in
24 which case it will be ten minutes, and I think we can
25 probably make the 6:30.

0275

1 (Recess)

2 MS. MEHRANIAN: We're getting started. We have one
3 hour. We have a presentation for ten minutes and then
4 we'll have the speaker cards.

5 MR. UNGER: And just right before that presentation,
6 we're going to have two minutes from Renee because one of
7 our Board members asked -- essentially stated that
8 there's a bit of -- see if we can encapsulate the
9 previous hour and a half in a sentence or two and so what
10 the issues are. So Renee's going to try to do that.

11 MS. MEHRANIAN: Deb, can I get the speaker cards?

12 MS. SMITH: On your chair.

13 MR. UNGER: And so with that, we'll start with Renee
14 and go to Ivar, and Ivar will be ten minutes.

15 MS. MEHRANIAN: Great.

16 MS. PURDY: Thank you so much. And I don't know if
17 I'll be able to encapsulate everything we heard in the
18 last hour and a half, but I want to touch on some of what
19 I think I heard as some of the key issues and concerns,
20 the first being that we definitely heard that the working
21 proposal seems to impose many new conditions on the
22 previously unconditionally exempted discharges and I
23 think we've heard that from a number of groups and
24 concerns, that this was going to be particularly
25 burdensome on the permittees.

0276

1 And the one thing that I just want to make clear
2 is, first of all, EPA did not say that these should be
3 unconditionally exempted. There was a concern by EPA
4 that these could be a source of pollutants and,
5 therefore, that municipalities needed to have the ability

6 to impose controls on these discharges. So what we've
7 done is basically gone and looked at many of the BMP
8 manuals, some of which you heard referenced today, and
9 we've looked through those and incorporated BMPs, that in
10 many cases, have been imposed by these non-storm water
11 dischargers themselves for their discharges, and we've
12 put those BMPs and those conditions into this permit.
13 And I do want to reiterate again that that is very
14 similar to what we did in the Ventura County MS4 permit
15 just two years ago, I guess it is now.

16 So that's one thing I wanted to mention.

17 The other thing I did hear concern about on the
18 other side is that it seems as though we've expanded the
19 categories of exempted discharges, and I think the
20 confusion there is just that what we've tried to do is
21 list them out very exactly as they were listed out by EPA
22 in the Stormwater Rulemaking, and so they were somewhat
23 grouped before. There is some redundancy in the list so
24 it says "landscape irrigation and lawn watering." So
25 there are some places where clearly there's a little

0277

1 redundancy, which I think is largely the result of just
2 how comments came to EPA in 1990, but we tried to stay
3 true to what is in the implementing regulations in terms
4 of the list. So it looks, I think, a little longer than
5 it's been before; but, in fact, there hasn't really been
6 an expansion of new categories that we're adding in.

7 So I just wanted to make that clear as well on
8 the other side of things, that this is basically the list
9 that has been in the permit from 2001. It's the list
10 that's in the Ventura permit and there hasn't been an
11 expansion of that.

12 So I think that's all I'm going to touch on for
13 now unless anybody else wants to -- oh, actually, sorry.

14 There was one other thing I wanted to mention,
15 which is I heard several of you indicate that you really
16 wanted to see if there's a way to provide incentives or
17 even requirements to look into opportunities for making
18 sure that this water, particularly potable water, isn't
19 wasted and that it's reused, captured in some way,
20 reinfiltrated; and one of the conditions we did put in
21 the working proposal for all of these types of discharges
22 is to consider ways in which the water could be captured
23 or reused or infiltrated. So perhaps we can do a better
24 job of that in the next iteration of the proposal, but we
25 also were thinking about that in trying to see if there

0278

1 were conditions we could put on these non-storm water
2 discharges so that perhaps they can be beneficially used
3 instead of just discharged.

4 And with that, I'm going to turn it over to
5 Ivar.

6 MR. RIDGEWAY: Good afternoon, Chair Mehranian, Board
7 Members, permittees, and stakeholders. I'm Ivar

8 Ridgeway, Unit Chief of the Stormwater Permitting unit,
9 and I'd like to briefly describe some of the requirements
10 for the minimum control measures. I will also go over
11 some of the areas where those measures differ
12 significantly from what's in the current L.A. MS4 permit
13 and for those provisions derived from the Ventura County
14 MS4 permit where they differ from that current
15 Ventura County MS4 permit as well.

16 I'd like to point out the customization language
17 that lies within the General Requirements section.
18 Customization of all or any of the minimum control
19 measures is allowable within the permit on an individual
20 jurisdiction scale, on a watershed scale, or a countywide
21 scale.

22 As I mentioned earlier, just as with the other
23 minimum control measures, permittees will have option to
24 customize their public education program and choose at
25 what scale they want to implement the program.

0279

1 For the public information and participation
2 minimum measure, staff will require permittees to conduct
3 a storm water pollution prevention advertising campaign
4 and distribute storm water pollution prevention materials
5 to such entities such as automotive parts stores and home
6 improvement centers. In addition, staff are requiring
7 that permittees develop and implement, or continue the
8 implementation of a watershed-wide reporting hotline
9 which will serve as the general public reporting contact
10 for reporting illicit discharges/dumping. Permittees can
11 also choose to establish their own hotline if preferred.

12 Though there is some overlap between the state
13 General Industrial Permit and the industrial/commercial
14 control measure, the intent of the industrial/commercial
15 program is to reduce/prevent pollutants discharging into
16 the MS4 system from selected industrial/commercial
17 facilities. The draft permit will continue to relieve
18 permittees of their required inspection obligation if
19 Regional Board staff has inspected a facility within the
20 previous two years. The inspection frequency required is
21 identical to what is in the current L.A. MS4 permit and
22 the current Ventura MS4 permit, two inspections within a
23 five-year period unless a different frequency is proposed
24 by permittees with appropriate justification. The BMP
25 implementation references the 2003 California Stormwater

0280

1 Quality Association Manual, but the more recent version
2 can be used by permittees as well.

3 For the new development and redevelopment
4 minimum measure, staff are incorporating an LID design
5 storm similar to the current Ventura MS4 permit and
6 current L.A. MS4 SUSMP sizing. Designated new
7 development and redevelopment projects would retain
8 on-site the storm water runoff volume resulting from the
9 85th percentile, 24-hour storm or the three-quarter inch

10 24-hour storm, whichever volume is greater. When a
11 permittee finds that the project applicant has
12 demonstrated technical infeasibility to retain storm
13 water on-site, staff is requiring permittees to require
14 off-site mitigation. The project categories are
15 identical to the current Ventura MS4 permit. The minimum
16 control measure customization language will allow
17 municipalities with a robust LID ordinance to implement
18 their own local requirements.

19 For the storm water management options, the
20 preferred option is the on-site retention of the runoff
21 generated from the LID design storm and off-site regional
22 groundwater replenishment projects which provide equal or
23 greater benefit to surface water in the same sub
24 watershed. Off-site regional groundwater replenishment
25 projects must demonstrate an equal benefit to groundwater

0281

1 recharge that could not be achieved on-site.

2 Second tier to these strategies are the off-site
3 infiltration or bioretention of the difference in flow
4 that was unable to be retained on-site and also the
5 retrofit of existing developments with similar land uses
6 or pollutant loadings which address flow which was not
7 retained on-site. Retrofit projects are allowed to use
8 infiltration BMPs, bioretention BMPs, rainfall harvesting
9 or biofiltration BMPs to address the required runoff
10 volume.

11 The least preferred option is the use of
12 biofiltration BMPs sized to treat one and a half times
13 the storm water runoff which could not be retained
14 on-site.

15 While the current L.A. MS4 permit does not
16 contain LID requirements, the differences between the
17 requirements in the draft minimum control measure and the
18 current Ventura County MS4 permit are designated new
19 development and redevelopment projects are required to
20 either retain the 85th percentile, 24-hour storm or the
21 three-quarter inch storm, whichever is greater, whereas
22 the default for the L.A. is the three-quarter inch storm.

23 Biofiltrations have specific design
24 requirements. They have to be designed to accommodate
25 design storm flow with a surface loading no greater than

0282

1 five inches per hour and with a volume equal to
2 75 percent of the required LID runoff volume. The
3 monitoring of treatment BMPs is required in the draft
4 with the number of samples required based on permittee
5 model change results. The draft offers increased
6 compliance options, including the allowance of
7 groundwater replenishment projects and retrofit projects
8 to satisfy low impact development requirements.

9 Hydromodification requirements apply to the
10 natural drainage areas and require one of the following
11 options: Either the on-site retention of the volume of

12 runoff resulting from the 95th percentile, 24-hour
13 storm -- and this is for sites less than 50 acres -- or
14 the volume of runoff generated from the two-year, 24-hour
15 storm, and that's for sites greater than 50 acres.
16 Another compliance option is the implementation of BMPs
17 to result in the matching of pre- and post-development
18 runoff flow. The third option is the demonstration of an
19 erosion potential of 1, based on a Hydromodification
20 Analysis Study, and the equation for that is derived from
21 the current Ventura MS4 permit. Hydrologic modeling is
22 required to demonstrate the matching of the pre- and
23 post-development flows for those sites greater than
24 50 acres.

25 While the current L.A. MS4 permit has very
0283

1 limited requirements mostly considering of a study, the
2 proposed hydromodification requirements were taken from
3 the current Ventura MS4 permit.

4 Staff intend to allow permittees to utilize
5 findings from the recent SMC SCWRP hydromodification
6 study to develop alternate hydromodification studies.

7 For the development construction minimum
8 measure, it's virtually identical to the Ventura MS4
9 permit. Staff require an electronic inventory of grading
10 permits, encroachment permits, and building and
11 construction permits. Prior to issuing a grading or
12 building permit, an Erosion and Sediment Control Plan
13 must be submitted for permittee approval. The Erosion
14 and Sediment Control Plan basically contains the element
15 of a Stormwater Pollution Prevention Plan. Controls for
16 various construction activities are derived from the
17 CASQA handbook or the CalTrans BMP handbook. BMP
18 implementation is tailored to the risk imposed by the
19 project.

20 While the construction requirements differ from
21 the L.A. MS4 permit, the requirements are very similar to
22 those in the current Ventura MS4 permit. Staff require,
23 as I mentioned before, the electronic inventory of the
24 grading permits. No local SWPPP requirement was in the
25 staff's requirements, but the Erosion and Sediment

0284
1 Control Plan can be -- I'm sorry. Erosion and Sediment
2 Control Plan must be submitted for a committee approval
3 prior to land disturbance and a State SWPPP required
4 under the general construction permit could be
5 substituted for that Erosion and Sediment Control Plan.
6 BMPs implementation, as I said before, is based on the
7 size of the project.

8 For example, larger sites are required to
9 implement concrete washouts and stabilize entrances and
10 exits. Watched generally, BMPs don't apply to the
11 smaller projects. Permittee inspection frequency is
12 based on project size and threat to water quality.

13 For the illicit connection/illicit discharges

14 minimum measures, staff are proposing permittees develop
15 and implement protocols for investigating and eliminating
16 illicit connections and discharges. Identification of
17 those illicit priority areas for work on eliminating
18 illicit connections would be based on the non-storm water
19 monitoring of the outfalls. This is in contrast to the
20 requirements in the current L.A. MS4 permit where
21 screening was required for all pipes of a given size.

22 And I'm going to wrap this up really quick with
23 the last one.

24 The public agency activities is basically very
25 similar to what's in the current L.A. MS4 permit. Staff

0285

1 are continuing to require permittees to do such permittee
2 activities such as catch basin cleaning, open channel
3 maintenance, and street sweeping. And the real change
4 for the public agency activities program is the
5 implementation of prescriptive BMPs from the CalTrans
6 manual.

7 So that concludes my presentation; just a little
8 bit over.

9 MS. MEHRANIAN: Thank you.

10 Should we move on to the speaker cards?

11 Holly Schroeder, Building Industry Association.

12 MS. SCHROEDER: Good afternoon, members of the Board.

13 Holly Schroeder with the Building Industry Association.

14 We represent members of the home building industry, all
15 trades associated with home ownership.

16 As you heard from Ivar, the staff proposal is
17 drawing heavily from the Ventura MS4 permit and I know we
18 worked really hard on that over a long time; but in any
19 case, I guess I would disagree a little with what Ivar
20 said. I think it goes beyond what's in the L.A. permit
21 and it does make some pretty significant structural
22 changes and I think that's concerning, because in L.A.
23 County you're talking about a very urbanized area,
24 different types of development, different types of
25 development patterns, and you need to have some

0286

1 flexibility in order to do that, and they've brought in a
2 lot of specific requirements into the permit that were in
3 the Technical Guidance Manual in the Ventura permit.

4 And I think it's really important that -- I know
5 they've expressed a lot of interest about, you know,
6 reuse and water supply issues and these are requirements
7 that will apply to new and redevelopment which, in the
8 housing industry, is less than a quarter percent of the
9 land in a year that's developed in L.A. County. So we're
10 talking about really incremental changes here, so it's
11 very important that we keep the ultimate standard of the
12 Clean Water Act in mind, which is the MEP standard and
13 there's really no mention of MEP or protocol and
14 balancing anywhere in the staff proposal at this point.

15 We think that the detailed nature of some of

16 these requirements is better placed in a Technical
17 Guidance Manual and there's no allowance for that in the
18 staff proposal, and we would ask that you allow for that.

19 This whole field of low impact development is
20 rapidly evolving and the technologies are changing and we
21 think you ought to have the flexibility to make
22 site-specific conditions to do the best type of low
23 impact development that is possible.

24 The grandfathering language is also
25 significantly different than that which was in Ventura

0287

1 and is very problematic because it's going to force
2 costly redesign of projects that are already in the
3 pipeline and it's most effective to do LID if you're
4 doing it early in the design phase.

5 The proposal also has references to numeric
6 levels and benchmarks which seems to be disregarding
7 recent court cases and the national trends around the use
8 of numerics.

9 So we think there's some -- a lot of room for us
10 to work with staff. We heard your comments earlier about
11 collaboration. We think that even though we are not a
12 direct permittee, the requirements that are in here are
13 so strict and so specific, they directly affect industry.
14 We think that industry needs to be at the table and we
15 would be happy to continue those discussions with you.

16 Thank you for your time.

17 MS. MEHRANIAN: Thank you.

18 Tatiana Gaur, followed by Richard Watson.

19 MR. GARRISON: Good evening, members of the Board and
20 Board staff. My name is Noah Garrison. I'm with the
21 National Resources Defense Council. We had split time
22 with Baykeeper and with Heal the Bay, so if you don't
23 mind, I'll take up the speaking at this point.

24 I just want to say, in response to comments made
25 earlier about collaborative process, in fact, many of the

0288

1 sort of founding principles that are in the Ventura
2 permit that are forming the basis now for the Los Angeles
3 permit were worked out in an almost excruciating, I would
4 say, two-year-long-negotiation between the permittee
5 cities in Ventura County and Heal the Bay and NRDC and
6 that was a fantastic and intense process, but
7 unfortunately, we don't really face the same
8 circumstances here.

9 Many of the new Board members, in particular,
10 may not be aware that there's a very long history of
11 litigation associated with the Los Angeles permit. When
12 the permit was adopted in 2001, many of the cities,
13 certainly not all, but many of the permittee cities and
14 the County sued over that permit. They have since sued
15 over TMDLs that were adopted, TMDLs being implemented
16 into the permit, sued over Basin Plan Amendments that are
17 incorporated as water quality standards. There's a

18 fairly acrimonious and unfortunately not collaborative
19 environment that's been created here and we certainly
20 hoped that would change, but it does not really ferment
21 collaboration between the parties and it's unfortunate.

22 That being the case, I just wanted to give a
23 little bit of background history on the permit here, but
24 I do want to talk about a couple of the different
25 provisions and I'll try to be very brief tonight. I'm

0289

1 certain the Board and many of us I know have had a long
2 day.

3 I'd like to start with the project performance
4 criteria. We absolutely support the incorporation of a
5 requirement to retain on-site the 85th percentile storm
6 or the three-quarter inch storm, whichever is greater and
7 we support that as being an on-site requirement.

8 One of the interesting provisions in this permit
9 is the allowance to perform off-site mitigation if you're
10 going to increase groundwater recharge and I think NRDC
11 strongly supports use of storm water capture as a means
12 of increasing the water supply in the area, but with
13 that, there are two concerns we would raise here.

14 First is, the permit makes no actual mention of
15 water supply as the end result or end goal of this
16 off-site provision. It only says "to increase
17 groundwater recharge" and there are, within our region,
18 many areas where you could certainly increase groundwater
19 recharge, but it will not result in an increase in water
20 supply or increase in use of the water, either for
21 contamination, the physical characterization of an
22 aquifer, any number of other reasons. So for that
23 provision, if we really are going to allow off-site
24 mitigation, it should absolutely be to increase water
25 supply and that should be a goal that the Board is

0290

1 putting forward.

2 Second is that while certainly taking water from
3 a site and conveying it elsewhere to recharge it into the
4 ground and you're actually retaining the same parcel of
5 water, just in a different location, doesn't really
6 present any water quality concerns; but if you are
7 shifting to an entirely different location in the
8 watershed or sub watershed, it's very difficult to make
9 any kind of comparison of the water quality benefit you
10 may be getting. You have to have a complete sort of
11 faith that you are actually capturing the same pollutant
12 loading, reducing the same amount of pollutant to the
13 same waterbodies, and it's very difficult to do at a
14 different location. You have different development
15 types, different pollutants of concern, a whole host of
16 different issues, and so -- I'll try to be quick here,
17 but we would be concerned that for anything that allows
18 for shifting it to an entirely different location, that
19 it has to involve some sort of treatment and additional

20 pollutant load requirements to make sure that you
21 actually are achieving equivalent pollutant load
22 reduction.

23 Second (sic), we continue to have concerns over
24 use of biofiltration to substitute for on-site retention.
25 At a minimum, the Ventura principle should be followed,
0291

1 which is 1.5 times the volume of water, but it also, like
2 the Ventura permit, would have to include provision to
3 achieve equivalent water pollutant load reduction, which
4 means that if you are using biofiltration on that
5 1.5 time volume of storm water, you also have to be sure
6 it's achieving the same pollutant load reduction and that
7 is not in the L.A. permit currently.

8 What it basically means is you would have to
9 biofilter a larger volume of water to make sure you
10 achieve the same pollutant load reduction and that's not
11 currently in the permit. We'd like to see that put in.

12 I also question why biofiltration would be
13 allowed for off-site retrofits. If you were going
14 off-site to deal with a technical and feasibility issue,
15 retention should be the standard and biofiltration should
16 not be an option that's allowed.

17 I'm going to sort of skip quickly.

18 Finally, there is a local ordinance provision
19 that allows for the Executive Officer to determine that a
20 local ordinance that may already be in effect is the
21 equivalent in terms of water quality protection or
22 meeting the minimum control measures as what will be in
23 the L.A. MS4 permit and I would submit that that is the
24 core value or core principles that will be in the permit
25 with regard to cleaning up and treating storm water or
0292

1 retaining storm water and that is this Board's
2 responsibility to determine whether those provisions meet
3 MEP. It should not be left to the discretion of the
4 Executive Officer, who certainly can be involved in the
5 discussion, but that's a determination that this Board
6 has to make through a public process. If there is a
7 local ordinance out there that people feel is equivalent
8 in terms of the protection for water quality, the Board
9 has to be the one to make that determination. It can't
10 be just left to the Board staff.

11 With that, I'd like to turn it over to
12 Kirsten James. Thank you for taking the time to hear us
13 late in the evening.

14 MS. JAMES: Good evening. Kirsten James with Heal
15 the Bay.

16 I just wanted to touch on briefly the idea of
17 retrofit. And as Noah talked about, we greatly support
18 the requirements for retaining and capturing water
19 on-site during the new and redevelopment process, you
20 know, with some strengthening points that Noah mentioned,
21 but we really need to move beyond this. Those are

22 appropriate, those are necessary requirements, but we
23 need to take the extra step and go into the realm of
24 retrofit of existing properties because as it is now, the
25 rate of new and redevelopment just isn't great enough to

0293

1 get us to where we need to be with water quality
2 standards attainment. So we need to go that extra step.

3 We've seen this in other MS4s that have gone and
4 been adopted throughout the state, so we really need to
5 take that extra step here as well.

6 Staff has proposed a few requirements that
7 basically make it optional, so the permit proposal right
8 now sets up a process for identifying potential retrofit
9 process projects and prioritizing those projects, but we
10 have no guarantee that any of those projects will
11 actually take place during the life of this permit, which
12 could be ten-plus years as we see with the current
13 permit. So we really need to take that the extra mile.

14 What we've -- we'll be submitting more detailed
15 comments on this, but what we suggest is that you
16 actually take those prioritized projects and require that
17 the permittee create a retrofit program, and specifically
18 this program would be designed to treat a specified
19 volume of storm water within a subdrainage, and they
20 would be doing this using these identified projects that
21 are prioritized.

22 Through this process, they would prioritize
23 on-site retention because that is, you know, the
24 integrated water approach; but these projects need to be
25 specified that they'll actually be completed. We can't

0294

1 give that as an option.

2 So another idea is to have a pilot program where
3 you would implement at least five pilot project retrofit
4 projects within a sub watershed and the permittee would
5 need to demonstrate that this helps to reduce reliance on
6 potable water and that it, in fact, is infiltrating or
7 capturing a specified volume of water.

8 Another idea is to take the green streets to a
9 new level and to require that over a certain threshold,
10 street projects need to be retrofit to infiltrate water.

11 So these are ideas that we really encourage
12 staff to go forward with and take to the next level in
13 order to really, truly get us to where we need to be with
14 water quality standards attainment.

15 Thank you.

16 MS. MEHRANIAN: Thank you. Richard Watson, City of
17 Signal Hill, followed by Mark Grey, Construction Industry
18 Coalition on Water Quality.

19 MR. WATSON: Chair Mehranian, members of the Board,
20 My name is Richard Watson and I am representing today the
21 City of Signal Hill. I will just make a few general
22 comments on the minimum control measures and our written
23 submittal will include more detailed written comments on

24 these measures and on the non-storm water discharge
25 prohibitions.

0295

1 First, I'd like to suggest that the definition
2 section needs to contain definitions of several other
3 terms used in the staff working proposal.

4 Second, the permit should specify -- should
5 specifically recognize true source control and
6 operational source control in the definitions and
7 elsewhere in the permit. True source control needs to be
8 recognized because it's much more efficient and
9 cost-effective to remove pollutants at their true sources
10 than to try to remove them at end of pipe.

11 Next, I have two general comments about the
12 working proposal: First, it's extremely prescriptive and
13 it would be far better for design details to be spelled
14 out in a Technical Guidance Document, as was done in
15 Ventura County. The guidance document could be more
16 easily -- in fact, much more easily corrected, if need
17 be, than the permit could. And if the Board decides to
18 keep the detailed prescriptive language, I remember that
19 the Board members and staff very carefully review the
20 language to avoid unintended consequences.

21 Second, portions of the working proposal are
22 overly broad and could easily lead to unintended and
23 costly consequences. For instance, the public activities
24 program requirements on page 52 contain language
25 requiring permittees to prepare an inventory of existing

0296

1 development for retrofitting opportunities. One of the
2 areas to be addressed is, quote, "areas of existing
3 development that generate pollutants subject to a TMDL
4 for the receiving water." This could be almost
5 everywhere depending on how the term "generate" is
6 defined. Does it include atmospheric deposition, over
7 which permittees have absolutely no legal authority?

8 Two additional specific areas that I think
9 should be carefully reviewed: One is the local ordinance
10 equivalence provision just mentioned. The other is the
11 new development and redevelopment projects options table.
12 The first one appears to be a good idea, but
13 operationally needs further refinement. The options
14 table should be divided into two tables, one for existing
15 development and one for new development.

16 Before closing, I'd like to support the comments
17 of the Building Industry Association, particularly those
18 concerning MEP, the balancing requirements of the Water
19 Code, as well as their comments on biofiltration and the
20 minimum infiltration rate.

21 Lastly, I ask that you really give serious
22 consideration to the comments of all permittees 'cause
23 it's the permittees who have experience in design,
24 construction, operation, and maintenance of BMPs.

25 Thank you.

0297

1 MS. MEHRANIAN: Thank you.
2 Mark Grey, Construction Industry Coalition on
3 Water Quality.

4 MR. GREY: Good evening, members of the Board, Chair
5 Mehranian. My name is Mark Grey. I'm the technical
6 director for the Construction Industry Coalition on Water
7 Quality. I represent six large trade associations in
8 Southern California. They're a management and union
9 contractor workforce. Combined, we build much of
10 Southern California, so this permit directly affects our
11 membership. I've got some brief comments to you today.

12 Ivar presented the minimum control measures and
13 I just want to say in my view, in our view, they're
14 completely different than what we find in Ventura and
15 I've got really -- in the Ventura permit, and I think
16 that should be our baseline to work with.

17 And as others have pointed out, we spent two
18 long years. We spent some very late evenings coming to a
19 collaborative, cooperative approach on that and I'd like
20 to see us use that and build on that and the staff
21 proposal turns that upside down and turns it on its head
22 and pours it all out on the ground. I want to make three
23 points today.

24 The staff proposal tries to redefine what is LID
25 and what is not in order to manage a project storm water

0298

1 quality design volume. The proposal moves away from some
2 very important engineering design elements that are
3 intended to provide margins of safety; and I won't go
4 into those in detail today, but they're very important.
5 Third, the proposal offers a new LID BMP decision
6 selection process that's unlike anything that we see in
7 California right now in MS4 permits and certainly unlike
8 the Ventura permit.

9 The permit limits modern storm water management
10 technology that is considered low impact development,
11 specifically biofiltration. So when you read our comment
12 letter, when you read the summarization of that, please
13 note that and I'll be very descriptive in the nature and
14 how it changes that, especially the definition section
15 that parses bioretention and biofiltration. I'll provide
16 a lot of detail on that and why it's unnecessary to parse
17 that out.

18 The LID infiltration design criteria, of which
19 we are highly supportive, in general -- infiltration in
20 general is the least-cost option available to us in LID,
21 but the design criteria removes margins of safety for
22 designers. It really removes those margins of safety
23 for -- and I won't go into detail -- such as a 24-hour
24 drawdown, which is a drawdown criteria. I'm getting into
25 the weeds and the details. That's way too short given

0299

1 the back-to-back-to-back nature of the storm systems.

2 The selection process and use of preferred
3 medium and least options that's on page 25 and 26 of the
4 staff proposal is simply unworkable and unhelpful and
5 there's an established hierarchy to selecting LID BMPs
6 that we see in the Ventura permit, that we see elsewhere
7 in California. So when you read our comment letter and
8 the summarization of that, I'll be focusing and honing in
9 on that and please accept those comments.

10 In conclusion and very important, there's no
11 mention of economic feasibility anywhere within the
12 selection process for LID BMP implementation. Economics,
13 as we all know now, are a very important part of the
14 decision-making process and we need to explicitly
15 recognize that. And I'll say one thing in leaving, and
16 that is this permit does lack a Technical Guidance Manual
17 and I would highly recommend including that. We could
18 remove some of the detail that's in the staff proposal
19 about biofiltration design, bioretention design, and
20 include a technical manual. And as Rich Watson just
21 pointed out, we have differences in redevelopment and new
22 development. A Technical Guidance Manual is the perfect
23 place for that where we can give designers,
24 engineers/designers the kind of help they need to design
25 these progressive new storm water management solutions.

0300

1 So I appreciate the time and I hope you'll read
2 and reflect on our comments that we'll be submitting.

3 Thank you very much.

4 MS. MEHRANIAN: Thank you, Mr. Grey.

5 Michael Blum, Malibu Surfing Association,
6 followed by Steve Mejia.

7 MR. GARRISON: Mr. Blum unfortunately had to leave.

8 MS. MEHRANIAN: Steve Mejia?

9 Ray Tahir?

10 MR. TAHIR: I think you guys owe me one or two
11 minutes.

12 MR. UNGER: No. One.

13 MS. MEHRANIAN: You have one.

14 MR. TAHIR: Well, it was 20. It was supposed to be
15 part of the other presentation which got truncated.

16 Look, I'm sure as all of you know by now, this
17 is very, very complicated stuff. These minimum control
18 measures effectively form the basis of the MS4 permit
19 program. You can't talk about it within the space of an
20 hour and a half. When we discussed the 2001 permit --
21 Fran, you remember this -- I mean, we discussed it over a
22 year. You know, there's a lot of bugs in this proposal
23 that need to be worked out and they can be worked out.

24 What I need to suggest to you right now is if
25 it's not broken at this point, let's not try to fix it.

0301

1 We have not characterized pollution problems within each
2 of the watersheds and sub watersheds. We have to do that
3 first through outfall monitoring, not through receiving

4 water monitoring. That tells you absolutely nothing. So
5 let's do that first.

6 If we have to do -- you know, if we have to
7 engage in draconian measures, certainly we'll do that to
8 protect water quality. We just don't know at that
9 juncture. So we're following the ready, fire, aim
10 approach and that's entirely wrong.

11 I know NRDC is into water conservation. They
12 wrote an excellent book, "A Cadillac Desert," but we have
13 a storm water permit, not a water conservation or a
14 groundwater recharge permit. If we need to do that, if
15 the State needs to do that, they need to do that through
16 separate legislation. We can't do it through the MS4
17 permit. Thank you very much.

18 MS. MEHRANIAN: Frank Wu, County of L.A.?

19 MR. WU: Hi, Madam Chair, Board members. My name is
20 Frank Wu and I'm representing County of L.A. today and I
21 have three comments today and -- but before I get into
22 them, I'll just say that, like you heard before, the
23 County has been the meeting with Regional Board staff,
24 Sam and his staff, for the last few months and we'll
25 continue to meet with them. We've had a good working

0302

1 relationship, and so next week we'd like to meet with
2 them more to talk about the details of our comments. We
3 will be submitting written comments on the proposal next
4 week, but today I would just like to point out three
5 things.

6 It's really one comment on the permit approach,
7 I would be asking you to think back to Renee's
8 presentation, actually. I was glad she had that slide
9 with the four circles, the four overlapping circles,
10 reminding everybody that this is just one part of the
11 permit. And I know you've heard a lot of details about
12 LID and retrofitting, so I want to keep you -- make sure
13 you keep in mind that this is just one part of the permit
14 and another major part that's coming -- and I hope we
15 have a workshop on this eventually -- is the TMDLs.
16 There are going to be almost 30 TMDLs that are going to
17 be incorporated into this permit and the County believes
18 that the right approach really is to keep the minimum
19 control measures to a manageable size and keep it as
20 simple and as straightforward as possible, because I
21 think TMDLs is really where you'll get your bang for the
22 buck. That's where we're targeting specific pollutants.

23 So our main recommendation is let's keep that
24 idea in mind and let the minimum control measures do
25 their jobs, which is source control, but let's not go too

0303

1 much in that direction, and give the TMDLs a chance to
2 work.

3 And so -- but beyond that main comment, my other
4 two comments are basically just examples of why we think
5 the minimum control measure program is a little bit too

6 extensive. For example, the LID program, L.A. County
7 already has a program that we've been implementing for
8 the last two years or so and that program was endorsed by
9 stakeholders; and based on my initial review, this permit
10 would require us to revise our ordinance. We don't think
11 that's really necessary. We believe this program is a
12 good one, but we'll talk about the details with your
13 staff next week and I won't go into those problems that
14 we see with the proposal today because I think you've
15 heard them already.

16 And this is just another example: the retrofit.
17 You heard Heal the Bay talk about retrofit being a
18 priority and the County's not necessarily opposed to
19 that, but what we're saying is give the TMDLs a chance to
20 work and if we find that, in trying to comply with TMDLs,
21 if we find that retrofitting is a tool that we can use,
22 then we'll do that. But give the permittees the
23 flexibility to choose our tools in the toolbox. Don't
24 prescribe too many tools to us because we have a finite
25 amount of resources.

0304

1 So to wrap up, again, keep the minimum control
2 measures simple. You've heard many times today that it's
3 very complicated and very extensive. So we'll work with
4 staff next week to try to work out the details.

5 Thank you.

6 MS. MEHRANIAN: Sure. Thanks.

7 MR. WU: Oh, I wanted to just say one thing I didn't
8 have on the slide. You talked about collaboration. The
9 topic has come up with meetings with Sam and his staff
10 and the County, we've mentioned there, too, and we'll say
11 it here again that we are open to meeting with any
12 stakeholder who are interested to try to work out these
13 issues before the permit actually comes to you.

14 Thank you.

15 MS. MEHRANIAN: Thank you. We have L.A. Permit
16 Group, the last speaker, Heather Maloney, Joe Bellomo and
17 John Dettle.

18 MS. MALONEY: We do have a couple of slides.

19 Just before we get into our planned slides, I
20 just wanted to thank the Board again for hosting this
21 workshop and this is really helpful. This whole process
22 of the public workshops is I think -- you've mentioned
23 that it is very helpful for you. It's very helpful for
24 us as well to hear what other stakeholders have to say
25 and to hear your responses back to that. It's been very

0305

1 helpful and we'll continue to take that into mind and
2 discuss topics with your staff.

3 The staff working proposals regarding the
4 minimum control measures allows for options to customize
5 based on watershed needs and the L.A. Permit Group is
6 very supportive of this approach, as it will support the
7 proposed integrated planning and monitoring programs that

8 we've proposed at previous workshops. Monitoring results
9 and sound science are needed to determine the most
10 effective and efficient approach to addressing the TMDLs
11 and other pollutants. The integrated planning and
12 monitoring programs will provide additional information
13 needed to establish the best course of action needed to
14 achieve these water quality goals, and as that goes with
15 what the County said in their presentation.

16 Without this ability for the planning and
17 monitoring programs to provide a feedback loop, which is
18 necessary for that iterative approach, scarce local
19 resources will not be used in the most efficient manner.

20 And back to this idea of workshops, you know,
21 collaboration really is the way to head off any or
22 prevent any litigation, by building stakeholder support
23 of the process and stakeholder support of the permit as
24 well; and by that, hopefully we can all gain consensus,
25 which I think you have -- the direction is heading in a

0306

1 good way and we'd be able to create a lot of buy-in for
2 not only the process, but also the permit language
3 itself.

4 So specifically in regards to the minimum
5 control measures, first, we feel that local resources are
6 directed to a number of health, safety, and
7 quality-of-life factors that all require clean water.
8 However, they should not be forced to experience an
9 impairment for the sake of clean water. Rather, all
10 these factors, health, safety, quality-of-life, and clean
11 water need to be developed in balance with each other.
12 This requires a strategic process that will take time to
13 get it right. We urge you to develop the permit
14 conditions based on be a reasonable time frame and
15 balance with the existing economy and other health,
16 safety, regulatory, and quality-of-life factors that
17 local agencies are responsible for. And this idea is
18 reflected back in that integrated TMDL planning,
19 integrated monitoring and that feedback loop which is
20 really represented in that slide that Renee showed at the
21 beginning of the presentation with the different circles.
22 Really having that integrated wholistic program kind of
23 encapsulates all these ideas.

24 I'm going to hand it off to Joe Bellomo, who is
25 going to give more specific comments regarding the

0307

1 minimum control measures.

2 MR. BELLOMO: Joe Bellomo, for the record.

3 We had no significant issues with the public
4 information and participation program. That's not to say
5 that there aren't any, but we're limiting it to major
6 issues at this point. Our written comments for all the
7 sections in the MCMs will provide greater detail on the,
8 you know, more insignificant, I guess, issue that we
9 might have.

10 The Industrial/Commercial Facilities Program:
11 again, a lot of the responsibilities is transferred on to
12 the municipalities, and that's a major issue for us.

13 The Planning and Land Development Program: The
14 threshold of 1,000 square -- of 10,000 square feet of
15 impervious surface for roadway construction is really too
16 low. We support the green streets guidance as proposed
17 in the staff working proposal, but we recommend that you
18 increase the threshold for streets.

19 MS. GLICKFELD: Excuse me. Could I ask for
20 clarification? Could you explain what the threshold is
21 and --

22 MR. BELLOMO: Oh, threshold, anything greater than --
23 equal to or greater than 10,000 square feet of impervious
24 surface for -- you know, the requirement's right there --
25 streets, roads, highways, freeways and so on and so

0308

1 forth, would need to implement green street guidance or
2 BMPs, more or less, to the practical extent practicable.

3 And, again, what we're saying here is that we're
4 in support of the green streets guidance, but the
5 threshold is really too low and that would incorporate
6 things like, you know, intersection modifications and
7 such like that.

8 The good thing about going at the end is you can
9 reference previous slides. So I think a lot of this
10 stuff that BIA, Holly Schroeder, had indicated in her
11 presentation is very applicable and we support that. So
12 I think I can skip over some of this.

13 The one thing I wanted to say on the
14 biofiltration, the 1.5 is punitive. It reduces our
15 ability to explore other options or encourage if it is
16 appropriate. And the one thing we were trying to get at
17 at the last staff-level workshop was the difference
18 between a large project and a very small project and the
19 example we're giving here is a denuded hillside such as a
20 community park or a backyard patio. The tracking system
21 that's being proposed in the staff working proposal would
22 capture -- is intended to capture everything. We don't
23 know if it needs to. We believe it doesn't need to go
24 there, and prior issuance of grading permits needs to
25 be -- has to have an approved Sediment -- Erosion and

0309

1 Sediment Control Plan.

2 Some of this stuff that we had talked about last
3 month is still applicable to here. The Erosion and
4 Sediment Control Plan, as is written into the staff
5 working proposal, applies to all projects and we're again
6 asking for the threshold to be set at 1 -- or at an acre
7 or greater, such as what the general construction permit
8 requires. It was never intended for small construction
9 sites.

10 The inspection process is overburdensome for
11 municipalities. The staff working proposal requires it

12 at five different stages during the construction process.
13 We really feel that it should be limited to grading and
14 land development and then the final stabilization.

15 I'm just skipping through some of this in the
16 interest of time, and I think we've said most of this in
17 our last presentation.

18 Okay. So moving on to the Public Agency
19 Activities Program: Our major issues there are six of
20 them up here -- five. Sorry. The first one is the
21 difference between contract cities and large cities.
22 That's lost inside the requirements in the staff working
23 proposal. I think there's a few suggestions that we'll
24 be providing in written comments that will help address
25 this issue of contract versus large cities, but one

0310

1 example is for corporation yards. A contract city will
2 outsource a lot of their activities, maintenance
3 activities, to a private entity; but the way the permit
4 or the way the staff working proposal is written, it
5 would put the onus on the permittee outsourcing that
6 activity to go in and require retrofits of that private
7 development or the private facility. So we feel that
8 there should -- that's not appropriate and the
9 responsibility of the permittee and the retrofits that
10 are appropriate for that type of facility should be done
11 through the development review process.

12 We're asking for staff to provide for the
13 inventory sections -- there's been several references to
14 that. We're asking for the NAICS and SICs for clarity on
15 which facilities are applicable to that section.

16 We're asking to remove the Existing Development
17 for Retrofitting Opportunities. That section is pretty
18 problematic and, again, our written comments will discuss
19 why.

20 Additional Trash Management Practices: That
21 requirement, we're asking to again to be removed. That
22 undermines the point of a trash TMDL. If a reach was
23 found not to be impaired for trash, then why are we, you
24 know, requiring retrofits, and there's not sufficient
25 off-ramps to suggest alternate options.

0311

1 So, for example, in the city of
2 Westlake Village, there is three primary sections.
3 Two-thirds of that city is not applicable to a trash TMDL
4 because there's no impairment, but we do a lot of
5 alternate activities such as daily drive-bys and pick up
6 trash in the gutters, so on and so forth. There's a lot
7 of different programs that we do. But then the upper
8 one-third is subjected to a trash TMDL because it drains
9 to an alternate water body. So we're putting in a BMP,
10 our structural retrofits on the catch basin inlets.
11 That's at the cost of \$150,000 for a third of the city.
12 We're going to have to duplicate that for the other
13 two-thirds.

14 And then the last point there, the infiltration
15 of sanitary sewer to the MS4 as preventive maintenance,
16 we're asking that section to be removed because SSO
17 regulations will already adjust that.

18 The L.A. Permit Group requests the proposed
19 Nonstormwater Outfall Monitoring Program to be a part of
20 the Integrated Watershed Monitoring Program. There is
21 ample dry weather monitoring in the TMDLs to address the
22 Nonstormwater Outfall-Based Monitoring Programs. We ask
23 for a definition of "outfall" for clarity. Outfall, for
24 the purpose of Nonstormwater Outfall Based Monitoring
25 Program, should be defined as major outfalls 30 inches or

0312

1 greater, pursuant to Clean Water Act 40 CFR 122.26.

2 So the major themes that we wanted to capture
3 here is that, again, provide the requirement and allow
4 the permittees flexibility maybe through alternate plans
5 that weren't discussed today, you know, to implement the
6 objective; and we're asking for the necessary time to
7 comply with the requirements. That wasn't really spelled
8 out in this staff working proposal. I guess that detail
9 will come later, but we'd ask that you take into
10 consideration the time that some of these requirements
11 will take, that they're subjected to a budgeting process
12 as far as contracting agreements and stakeholder
13 involvement.

14 Requirements should be based on clear nexus to
15 water quality benefits. Infiltration is a water supply
16 benefit, not a water quality benefit, and we ask you to
17 consider the cost to comply.

18 Thank you.

19 MS. MEHRANIAN: Thank you. This was the last card.
20 I think we can have a little bit of time for Board
21 members to question, comments.

22 MS. GLICKFELD: Is it possible that the staff may
23 want to respond to some of the testimony and help us a
24 little bit? Is that possible, Madam Chair?

25 MS. MEHRANIAN: Sure. And I had a question of --

0313

1 overall, I thought there was a lot that was said by
2 different stakeholders, environmental community. The
3 staff made a presentation and it's very important to
4 somehow synthesize this information because we've heard a
5 lot and somehow we are wanting to understand in our mind,
6 or I am -- I don't want to speak on everybody's behalf --
7 that we moved to the issue. We moved from point A to
8 point B; we summarized the issues that have been agreed
9 on, and issues that are still standing and somehow
10 conceptualize them and -- so that we can move to the next
11 level of -- or next step or next place. So I don't know.

12 The time's not here now. I know that it
13 requires work, but I just would want to get your reaction
14 to this comment and also anything else that you have to
15 say right now.

16 MS. PURDY: Well, this is Renee Purdy again, and the
17 one thing that I wanted to point out, and there might be
18 other things that Ivar would like to add, but one thing
19 that we did hear in some of the comments that were just
20 provided on the minimum control measures were some things
21 about simplifying, allowing flexibility to customize
22 those given limited resources, and I just want to
23 emphasize again -- and a couple people mentioned that
24 diagram that I put up in the beginning of my
25 presentation -- that that is really our intention.

0314

1 Sometimes there is a downside to putting some
2 working proposals out because you don't get to see the
3 whole before you see some of the detailed parts, and one
4 of the things that we very much intend to do, as Ivar
5 mentioned as well, is allow permittees the option and the
6 flexibility to tailor some of these measures to address
7 their watershed priorities.

8 So I saw one slide where there was MCMs plus
9 TMDLs, but they're really not additive. Many of the
10 requirements under the MCMs, the minimum control
11 measures, can be used to achieve TMDLs. There'll be a
12 significant amount of overlap between those. So I just
13 wanted to -- I think that's a good thing to point out at
14 the end of the day here, that there is a very significant
15 part of the permit that you haven't had the chance to see
16 yet, which is the part that will really bring this all
17 together that we're referring to as the Watershed
18 Management Programs that will give permittees the option
19 to really look at all of these requirements and
20 prioritize, sequence things, customize things to address
21 their priorities in the most cost-effective way and in a
22 coordinated way on a watershed basis. So that's one
23 thing I wanted to say.

24 The other thing that I did want to say with
25 regard to the minimum control measures is that there were

0315

1 some comments made about some of the minimum control
2 measures and that maybe they shouldn't be included.
3 These control measures are all, again, stemming directly
4 from EPA's storm water regulations and the elements that
5 EPA stipulated should be in a Municipalities Management
6 Program.

7 So I think that's -- those are the two
8 big-picture things that I want to leave you with.

9 I don't know if Ivar would like to add anything
10 specific.

11 MR. RIDGEWAY: Hi. Ivar Ridgeway, Stormwater
12 Permitting Unit again.

13 Just two things I'd like to point out about the
14 minimum control measures in particular, the low impact
15 development requirement.

16 When we heard comments about it compared to
17 Ventura, the Technical Guidance Manual is almost an inch

18 and a half, two inches thick and took a year to approve
19 and quite a bit of the specificity that people are
20 complaining about now, it's in -- the difference between
21 the Ventura permit and what staff have put in the
22 proposal is that that Technical Guidance Manual in
23 Ventura contains the specificity, and just this time
24 around we're putting that up-front. So it's -- you see
25 it at the beginning. People see it as part of the permit

0316

1 process.

2 Another issue for the Ventura I'd like to point
3 out, too, is that for off-site mitigation, there was a
4 requirement that's not in the staff's L.A. MS4 permit,
5 this draft. There is a requirement for an infected and
6 impervious area and if you trip the threshold there in
7 Ventura, that off-site mitigation wasn't done on a
8 one-to-one. You have to do that off-site mitigation at
9 one and a half times the volume that wasn't required
10 off-site. To me, I see a lot of similarities with
11 Ventura. It is different, but at the core of it, I think
12 at the flexibility it seems very similar to me.

13 MR. UNGER: Can I add one thing to what Ivar is
14 saying? I think I'd like to put this in the context of
15 essentially just the length and number of requirements
16 that are in this section of the permit, you know.

17 So what you've heard really is there's a lot of
18 commonality and there's a lot of things you didn't hear
19 at all in terms of there was a lot of agreement to what's
20 in there. These requirements have been in place for ten
21 years in L.A., if not longer, these types of
22 requirements; and the changes that we're making are
23 relatively minor with the overall -- if you put it in the
24 context of the overall, I guess, number of requirements
25 that are in this section of the permit.

0317

1 I think some things that I heard from a
2 big-picture standpoint that we really need to be very
3 sensitive to is sort of this issue of shifting
4 responsibility. I think we have to look at what we've
5 done in terms of that. I think that's been very helpful
6 to hear that for staff today. It is one issue.

7 Another issue, too, which we didn't really have
8 much in the Ventura permit is the fact that some cities
9 here have their own yards. Others are contract cities
10 and things like that.

11 I think, from a big-picture standpoint, there
12 were some very good comments that were made, I think.
13 But overall, I mean, I think we have a pretty strong
14 basis from which to work at this point. I don't know if
15 I've missed anything from the big-picture standpoint, but
16 I think we're going to go back and we're going to look at
17 those requirements. Of course, the LID requirements as
18 well. There's a huge difference of opinion there I think
19 between some of the commentators there.

20 So those are the three things I think that we
21 really need to look back at what we have right now in our
22 permit. We're going to need to get the detailed comments
23 of course and look at things, but we have to look through
24 those filters, if you will, contract city versus large
25 city, and this transfer of responsibility, I think, is

0318

1 sort of a big issue as well.

2 MS. MEHRANIAN: Go ahead.

3 MR. UNGER: I don't know if that helps.

4 MS. CAMACHO: No. You just answered or just
5 responded to two of the questions or comments I was going
6 to make, so I'm good. Thank you.

7 MS. GLICKFELD: Well, I want to thank everybody. I
8 still think, you know, we can't make play dates for you,
9 but you really do need to sit down and talk to each other
10 and, you know, I'm going to be very frank. There's
11 some -- there's a good deal of cynicism here and maybe
12 I'm being very Pollyanna-ish.

13 This permit has gone to court over and over and
14 over again and it's been very controversial and there's a
15 long history of people litigating this not only on
16 this -- on the Board's side, but on the stakeholders'
17 side.

18 So I am hoping that by extending the time that
19 we did for this permit, not only for us to hear about
20 this, but for you to have a chance to talk to us, that
21 really, it became completely evident to me that there's
22 no way, even if we held workshops from early in the
23 morning until midnight, would we be able, in this forum,
24 to fix the problems that you're asking to be fixed. You
25 have to fix them together, not only you with our staff,

0319

1 but you with each other.

2 I'm convinced that we can't come up with the
3 really best solutions for you that the stakeholders and
4 the environmental community, in the development community
5 and the industrial community, in the County, the County
6 Flood District and the cities need to be interacting
7 together with our staff and we can't make that happen.
8 We can just suggest it's a really good idea for it to
9 happen.

10 So with that, I wanted to just raise some issues
11 with you. You don't have to -- and some of them are
12 questions that I don't really need to have answered, but
13 I'd like to have all of you sort of think about them,
14 which is something -- this is my first permit in L.A.
15 County. So I actually can't -- when I'm looking at what
16 you're drafting, I can't see what was already in there
17 the last round versus what's in there now, but it just
18 seems to me that what we're trying to do is work off
19 amending the existing permit when we haven't really in
20 any way gotten a "buy" into an overall concept of how
21 we're regulating and how all these pieces fit together.

22 And so I heard Renee say that we'll get there, but I hope
23 we don't get too buried in the details before we realize
24 what the whole piece looks like and how it provides the
25 flexibility that we need.

0320

1 I don't understand why industrial controls are
2 in here when we already have industrial NPDES permits. I
3 don't understand what the industrial permittees have to
4 do with that when we already have that in our regulatory
5 system.

6 And I think, Sam, you're right. You heard right
7 when you heard I don't know why in the world the
8 permittees would have to take over the enforcement of
9 those permits. Those are our permits.

10 Same thing, I don't understand why we have a
11 separate Development and Construction Program. There may
12 be good reasons for it, but I don't understand why we
13 have that when we already have a Construction Permit
14 Program at the Board.

15 So I think that we have to really be able to
16 explain to each other and explain to the stakeholders why
17 we're doing what we're doing here and not just assume
18 that we're adding something incremental on to the prior
19 permit, because we're all looking at -- I'm looking at
20 this. The only person that's looking at this up here as
21 a historical thing is Fran and the rest of us are, you
22 could consider, brand-new and I would guess a lot of the
23 people out there are brand new, too.

24 So here I'm going to get very controversial.
25 I'm concerned that, first of all, we don't have a

0321

1 principal permittee here -- I really wish the Flood
2 Control District and County Public Works was the
3 principal permittee -- and that there are a lot of
4 databases, plans, hydromodification plans, erosion
5 control plans, monitoring.

6 There's tons of stuff here and I'm worried about
7 the 35,000-and-under cities and how they're going to do
8 this. Yeah, you can put them into watershed groups; but
9 if they're in watershed groups of all small cities, who's
10 going to be -- who's going to organize this stuff for
11 them? Who's going to provide the support for them?

12 And I would hope that you could engage with the
13 County. If they're not going to be the principal
14 permittee, maybe they could take on the role of being the
15 database holder and the database creator and develop a
16 Lakewood plan of databases for the County of Los Angeles.
17 I hope that would be an option open to us because I just
18 see it as being incredibly problematic that for all the
19 soft paperwork that we're creating here, there is no
20 single group that can come together.

21 Who knows? Maybe it's the L.A. Permit Group
22 that's going to do that, but I'm very concerned about
23 trying to find the economies of scales with the number of

24 different permits that we have here.

25 I'm not completely sold that LID is the be all
0322

1 and end all that the environmental community and the
2 staff seem to think it is. We have a county that is --
3 especially in the southeast end of the county, it's very
4 developed. It's very slow development. You could have a
5 street that's ten miles long or a mile long with a
6 thousand houses along it and have very little turnover in
7 that. So if we completely rely on LID, a lot of nothing
8 is going to happen except a lot of ordinances. So I want
9 to know why there isn't a way to make LID one option in
10 areas that really will be seeing a lot of development in
11 a nondevelopment, and then have a focused -- green street
12 focus be an option for cities to pick where they're not
13 going to see that and they have to figure out the
14 financing for that or where they provide retrofits, they
15 provide rain barrels in the areas that they're not going
16 to be doing a lot of development.

17 So I think we need to provide a host of
18 different opportunities for cities that are very
19 different. Some of them are at the top of the watershed;
20 they can do source control. Some of them are at the
21 bottom of the watershed and they couldn't do that. Some
22 cities are going to infiltrate where it's going to be
23 possible to add to the water supply. Some cities don't
24 have the possibility of infiltrating. Others infiltrate
25 to someplace it's going to take a hundred years to get

0323

1 into the groundwater basin.

2 So I think we have to be able to somehow capture
3 that variability.

4 I really appreciate, Ivar, that you're trying to
5 make the LID stuff transparent by pulling the stuff from
6 the Technical Manual into the permit, but it's so
7 detailed and so prescriptive that once we get it all
8 there, can we put it back into a Technical Manual
9 afterwards? So good, let's talk about it now so that
10 it's all open, but I don't think all that detail belongs
11 in the permit.

12 So I think that those cover my main comments. I
13 really want to see -- you know, trying to figure out how
14 we can do what the cities are talking about in terms of
15 incorporating the storm water outfall monitoring into the
16 watershed monitoring network, let's figure out how to do
17 all the monitoring in one sense. I'd like to hear what
18 you have to say about Shahram's proposal for a
19 conceptual concept of how this permit ought to work and I
20 would hope the cities and the County would also look at
21 that as a way to organize the permit. I think it's an
22 example. It may not be the only example, but it would
23 really help to have that kind of a high-level
24 understanding of how this permit is going to work. It
25 might be something that people could actually gain

0324

1 consensus on.

2 So those are my comments.

3 MR. UNGER: May I just respond to the very last one,
4 which is the probably the highest level detail of all the
5 comments heard today, that you'll be hearing about it at
6 the next workshop in terms of what we plan to do there.

7 MS. GLICKFELD: Great.

8 MR. UNGER: We have a lot of ideas and we've been
9 meeting with Shahram regularly.

10 MS. SMITH: I also wanted to take the opportunity to
11 mention very slightly, because we don't have much time,
12 but our retrofitting incentive that we have in the permit
13 is exactly for the some of the stuff that you talked
14 about to incentivize green streets.

15 MS. GLICKFELD: But they have to do the LID as a
16 basis and it may not -- I'm questioning, and I might be
17 wrong. I'm questioning whether LID is going to be very
18 helpful for all of these cities and whether or not they
19 might want to be able to take another route. Maybe the
20 idea is to treat and infiltrate the water in the street
21 as opposed to on the site. I know that is heretical and
22 I'm going to get hate mail on this, but I just think that
23 that's something we ought to think about.

24 MS. SMITH: That's what we're thinking about, too.

25 MS. DIAMOND: I'm not going to take a lot of time.

0325

1 Having sat through the other permit ten years
2 ago, I do have a historical perspective and the
3 perspective that I bring to it is that what we're -- what
4 I see coming forward and what I'm looking for is that we
5 are moving to the next level, as I think the Clean Water
6 Act envisions; that when we go to the next permit five
7 years ago, it was supposed to be a new permit, but here
8 we are at ten years, that we certainly should be going to
9 the next level; and I think I've seen a lot of good work
10 that indicates to me that we are and a lot of good
11 comments to me today that indicates that there are some
12 misunderstandings or there are maybe some things that we
13 need to look at, wrinkles to make sure that this is going
14 to work and that people are going to be able to take it
15 to the next limit.

16 But I want to get back to what we talked about
17 before. That was the idea of water reuse and there was
18 some people today that talked about this isn't a -- this
19 is a Stormwater Permit; it's not a Groundwater Permit.
20 But to take it to the next level, the State policy
21 already envisions that groundwater and -- that water
22 supply and water quality are -- there's a nexus and that
23 they're integrated. We're talking about an integrated
24 water approach. Our water has to be integrated because
25 we can't afford, down here in Southern California, to

0326

1 have separate groundwater thinking and separate storm

2 water thinking.

3 Most of the water we have here in our region is
4 storm water and urban runoff and so -- and we can't
5 afford to get more water. It costs more than twice as
6 much as our own local supplies if it's -- if our own
7 local supply obviously is very contam- -- some of it's
8 very contaminated.

9 So we need to be able to do what we can to
10 infiltrate our storm water, our rainwater, to harvest our
11 rainwater and to acknowledge, in this permit, the
12 interconnection between storm water and groundwater.
13 This is how we've operated, actually, with our TMDLs and
14 at this Regional Board. And as I said, it's State Board
15 policy and we need to continue to move in that direction
16 as much as possible because we can't afford to think of
17 it. We do have one water. We don't have separate
18 groundwater, separate storm water. It's all integrated
19 and I just want to acknowledge that that's where we've
20 been going and that's where we need to continue to go as
21 we reuse and acknowledge the interconnection of this
22 integrated water that we have here.

23 MS. MEHRANIAN: Thank you.

24 MS. MUNOZ: I think what I need to do is to find out
25 what worked on the last permit that we approved, what

0327

1 could be better, and what definitely did not work and how
2 we can improve on it, unless that already happened and I
3 was asleep at the wheel. But it just seems to me that --
4 I really agreed with what my colleague Madelyn said
5 about, you know, the cities are different, they have
6 different resources, if you're on top of the watershed or
7 the bottom of the watershed, issues that beach cities
8 have versus inland cities. I know many cities were or
9 still may be on the brink of bankruptcy. You know, how
10 do we handle that, those financial things? And what
11 educational programs do we put together as a whole?

12 I still do believe -- you're talking about
13 someone who has been in many wars and battles regarding
14 environmental inequity and racism and whatnot, but I've
15 had many opportunities to sit down with those people who
16 caused all that to try to find out what common goals we
17 have so we can make things better.

18 And so as Madelyn stated, I do want to strongly
19 encourage the staff to figure out how you can get all the
20 parties together to figure out some of the answers to
21 some of the dilemmas that we have before us, because it
22 would make our jobs a lot easier. I mean, a lot of it is
23 up to you to figure out what you have in common because I
24 think if you sat down at the table, you can figure out
25 certain things that you'd have in common and from there,

0328

1 hopefully start working in a more partnership,
2 collaborative manner.

3 MS. MEHRANIAN: Thank you. I just had one little

4 comment that at the end of the hearing, I am at a point
5 where I do think that although there is a lot in common,
6 there's a lot that has to be worked out.

7 I'm a little concerned with how we're all going
8 to come together. I'm a little concerned. There is
9 differences of methodology of how we're doing this and I
10 was hoping that, you know, we could move this from here
11 to another step where there is maybe a few local and a
12 few regional solutions that can help us, you know, bring
13 this together. Maybe there is, but today after hearing
14 all this, although I see a lot of common ground, I do see
15 that, you know, on certain issues we are far apart and
16 the cities have their unique situations and it needs to
17 be worked out.

18 I just see that there's a lot more work that
19 needs to be done for us to do this in a way that it
20 really helps the water quality and it's not something
21 that we come together, we develop, and then, you know, we
22 have a lawsuit filed against it and it gets hung up and
23 nothing ever gets implemented, which is -- that's the
24 frustration that I see happens over and over again. We
25 can work out the best permits, but if it's not going to
0329

1 be implemented and it's not going to have a smooth, you
2 know, way of getting done, it's going to be a problem.

3 So I encourage and I encourage all the parties
4 to pinpoint the most important things that they think
5 creates the difference and try to bring things a little
6 closer, and let's agree on things that are common and
7 really work towards the differences of methodology and an
8 overall view of the world.

9 So that's what I -- I don't know if I resolved
10 anything or made it a little harder, but I do see that
11 and I do have a little bit of concern.

12 Anything else? It's 6:30.

13 MR. UNGER: I think we're done.

14 MS. GLICKFELD: Congratulate everyone who stayed.

15 MS. MEHRANIAN: Yes. Thank you.

16 Okay. We're adjourned then.

Re: Staff Working Proposal on LA County MS4 Permit (Minimum Control Measures)

Dear Ms. Purdy,

On behalf of Heal the Bay, I submit the following comments and questions regarding the Staff Working Proposal on LA County MS4 Permit (Minimum Control Measures) dated March 21, 2012 (“Staff Proposal”). We appreciate the opportunity to provide comments.

Planning and Land Development Program

Applicability

- The Staff Proposal sets thresholds of 5,000 and 10,000 square feet, depending on the type of development, for new and redevelopment projects that would be included under the Planning and Land Development Program requirements. We urge the Regional Board to modify this threshold to include smaller projects. The City of Los Angeles recently adopted a Low Impact Development Ordinance that establishes that the creation, addition or replacement of **500 square feet** or more triggers requirements. In order to meet the stated purpose of this section and significantly improve water quality, the Regional Board should include all development and redevelopment projects 500 square feet or more.
- The Staff Proposal states that streets, roads, highways and freeway construction of 10,000 square feet or more of impervious surfaces must follow the USEPA Green Streets guidance. In addition, we urge the Regional Board to establish a trigger for when road and alley projects are required to implement post-construction BMPs. Perhaps a certain monetary threshold could trigger this requirement. As an example, the City of Santa Monica recently adopted a Low Impact Development Ordinance that includes the following:

1444 9th Street
Santa Monica CA 90401

ph 310 451 1500
fax 310 496 1902

info@healthebay.org
www.healthebay.org

“Any municipal street, road and alley re-construction project of \$500,000 or more of construction costs, excluding repaving projects of existing roads, shall implement post-construction BMPs for green transportation infrastructure.”

- The Staff Proposal specifies that Newhall Ranch Project Phases I and II will be subject to WDR requirements (yet to be adopted) and not MS4 requirements. Instead the Regional Board should ensure that all phases of the Newhall development meet, *at a minimum*, the MS4’s Planning and Land Development Program requirements, BMP performance criteria requirements and Hydromodification Control Criteria. The WDRs should include requirements that are as strict as the MS4, if not greater.

Performance Criteria

- We strongly support the proposal to require the project to retain on-site the entire Stormwater Quality Design Volume (.75 inch rain event or 85th percentile, whichever is greater), with a prioritization for infiltration, bioretention and/or rainfall harvest and use. This requirement has proven feasible and is consistent with recent local LID ordinances.

We urge the Regional Board to eliminate biofiltration (BMPs with underdrains) as an option for compliance with the Program. Biofiltration does not provide the same water quality and water supply benefits as traditional LID strategies (infiltration, capture for use). If the Regional Board does move forward with the option of biofiltration in cases of infeasibility, it is critical that a multiplier (minimum of 1.5) be used for the treated volume. If the permittee cannot demonstrate that equivalent pollution reduction is met with this volume of water, then a larger multiplier should be required to obtain the same water quality benefit. Blanket claims that biofiltration practices that treat 1.5 times the amount of stormwater volume required to be retained onsite will, as a matter of course, achieve equivalent pollutant load reduction are unfounded. If biofiltration is pursued, the adequate volume to achieve equivalent pollutant load reduction should be determined on a site-by-site basis with proper analysis conducted by a registered professional engineer, geologist, architect, and/or landscape architect.

- Why is biofiltration allowed under retrofit scenarios? If this off-ramp is pursued, traditional LID strategies should be employed.
- The Staff Proposal allows for regional groundwater replenishment opportunities in lieu of onsite requirements, when such a project has been determined to provide an opportunity to replenish groundwater supplies equivalent to or greater than the SWQD and provide equivalent water quality benefits. (Page 25). We strongly support stormwater capture and groundwater replenishment projects. However as this is a water quality permit, the Regional Board must maintain as a top priority that water quality is being improved to the MEP. Once a project is developed, the chances that a retrofit will occur at a later point are very slim. In other words, the potential water quality benefit at this site will not be realized. This is a downside to allowing for alternative groundwater replenishment

1444 9th Street
Santa Monica CA 90401

ph 310 451 1500
fax 310 496 1902

info@healthebay.org
www.healthebay.org

projects. The Regional Board must be certain that the water quality benefit of the proposed project would provide equal or greater water quality benefit.

- Appropriately, the Staff Proposal requires justification for utilizing alternative compliance measures to replenish groundwater at an offsite location. (Page 27). The Staff Proposal should also specify that any offsite project proposal should not be already planned for this purpose. In other words, the Permit should be driving *new* water quality improvement and groundwater recharge possibilities.
- We support the proposal that requires permittees establish local ordinances that address requirements for harvested rainwater, in order to facilitate more projects to move forward. The ordinances should consider both indoor and outdoor non-potable uses. We urge the Regional Board to also consider the applicability of the recently adopted County of Los Angeles Public Health *Guidelines for Harvesting Rainwater, Stormwater, & Urban Runoff for Outdoor Non-Potable Uses, September 2011*.
- The Table on page 25 should clarify that any volume of water (up to the Stormwater Quality Design Volume) that is feasible to be retained on-site should be retained on-site. In other words if any percentage of the SQDV is deemed feasible for on-site retention, then this volume should be retained onsite while the remaining volume is handled in an alternative project. This is somewhat unclear under the “Medium Preferred Options.”
- The Staff Proposal provides the opportunity to consider offsite locations outside of the HUC-12 but within the HUC-10 if there are no opportunities within the HUC-12 or if greater pollutant reductions and/or groundwater replenishment can be achieved at the location within the HUC-10 (Page 28). In order to improve water quality in the reach that is impacted by the project, it is important to keep any offsite project in the same sub-watershed. If the project proponent proposes to do a project within the HUC-10 instead, the Regional Board should require that a 1.5 multiplier be used for the volumes retained. In no case should biofiltration be an option if the project proponent does a project outside of the HUC-12.

Water Quality Mitigation Criteria

- We strongly support the proposal to require treatment of stormwater runoff from the project site, even in cases where offsite projects are pursued. (Page 30). The Staff Proposal should specify that the SQDV be treated.
- The Staff Proposal includes “benchmarks” that are applicable to the new development treatment BMPs. How did staff develop these numbers? We support the concept of BMP performance standards; however, the proposed benchmarks are way too high. As a point of comparison, it is useful to look at the Treatment BMP Performance Standards that were included in the Ventura County MS4 Permit. The TSS range for the actual performance of BMPs (median) is 10-27 mg/l. However, the proposed benchmark is 100

1444 9th Street
Santa Monica CA 90401

ph 310 451 1500
fax 310 496 1902

info@healthebay.org
www.healthebay.org

mg/l. In fact, all of the proposed benchmarks are much greater than the ranges for actual BMP performance. This large difference is not justified.

We support the inclusion of performance standards for additional parameters such as pyrethroids, bacteria and trash.

How does the Regional Board plan to include BMP performance standards for all BMPs implemented to comply with provisions of the permit? As you know, BMP performance standards are included in the Ventura MS4.

Hydromodification Control Criteria

- The Staff Proposal calls for maintaining the project's "pre-project" stormwater runoff flow rates and duration. Instead the Regional Board should require the "pre-development" runoff flow rates and duration, as the existing development may be contributing to hydromodification.

Implementation

- The Staff Proposal includes a "Local Ordinance Equivalence" provision to grandfather in those municipalities with existing LID ordinances. As proposed, the Executive Officer would determine equivalency. This provision is concerning since the LID requirements are a core program under the MS4 and contain a quantitative requirement (retain 100% of the SQDV). It is critical that existing ordinances implement that same or more stringent quantitative requirement and lead to the same water quality benefits.
- We strongly support the proposal to require an operation and maintenance plan and verification of ongoing maintenance provisions for LID practices, Treatment Control BMPs, and Hydromodification Control BMPs. (Page 38). We also strongly support a tracking, inspection and enforcement program for Post-Construction BMPs.

Retrofit

- Although retention and/or capture BMPs are required for new and redevelopment, the current rate of redevelopment will not address water quality problems in a timely manner. Retrofit is necessary to address storm water discharges from existing development that may cause or contribute to a condition of pollution or a violation of water quality standards.
- We strongly support including retrofit requirements in the permit; however, staff's proposal needs to establish retrofit project requirements for the permittees. Appropriately, the proposed retrofit section requires an identification and ranking of potential retrofit projects. However simply asking the permittees to "consider" the results of the ranking in their reasonable assurance programs and off-site mitigation projects

1444 9th Street
Santa Monica CA 90401

ph 310 451 1500
fax 310 496 1902

info@healthebay.org
www.healthebay.org

does not move the ball forward sufficiently on retrofit. Under the current provisions, we could potentially see no retrofit projects happen during this permit cycle.

Specifically, the Regional Board should require that the permittees design a program that treats a specified design storm volume generated in each subdrainage using identified retrofit projects or regional BMPs. Onsite retention should be prioritized over treat and release BMPs for this program.

In addition the Regional Board should require the permittees create a pilot retrofit program that implements at least 5 retrofit projects in each watershed. The permittees should provide project specifications and demonstrate that 1) the project reduces reliance on potable water demand and 2) the project infiltrates or captures for reuse a minimum specified volume storm water. The permittees should conduct appropriate monitoring of these projects to document the water quality benefits achieved.

Miscellaneous

- The inspection schedules require a frequency that is within the “5-year term of the Order.” (Page 11). As this permit is more than five years overdue, the Regional Board should ensure that inspections continue even if the permit is administratively extended.
- The Staff Proposal requires that industrial operators discharging to ESAs implement additional pollutant-specific controls. (Page 18). The Regional Board should also include these additional requirements for discharges draining to 303(d) listed waterbodies.
- Page 27 states that seasonal high groundwater within 5 to 10 feet of the surface may lead to technical infeasibility. Instead this should be within 10 feet or more.

Thank you for your consideration of these comments. Please let me know if you have any questions.

Sincerely,

Kirsten James

IN REPLY PLEASE
REFER TO FILE: WM-9

Ms. Renee Purdy, Chief
California Regional Water Quality
Control Board – Los Angeles Region
Regional Programs Section
320 West Fourth Street, Suite 200
Los Angeles, CA 90013

Dear Ms. Purdy:

COUNTY OF LOS ANGELES COMMENTS STAFF WORKING PROPOSAL ON MINIMUM CONTROL MEASURES

On behalf of the County of Los Angeles, thank you for the opportunity to comment on the draft working proposal for Minimum Control Measures released on March 21, 2012. Enclosed are our comments for your review and consideration.

If you have any questions, please contact me at (626) 458-4300 or ghildeb@dpw.lacounty.gov or your staff may contact Ms. Angela George at (626) 458-4325 or ageorge@dpw.lacounty.gov.

Very truly yours,

GAIL FARBER
Director of Public Works

GARY HILDEBRAND
Assistant Deputy Director
Watershed Management Division

County of Los Angeles Comments
 Staff Working Proposal on Minimum Control Measures

General			
Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
1	Need definitions of terms used throughout the permit language	VI.C.1.c [page 2-3]	<p>The staff working proposal includes a limited set of definitions focused on the Planning and Land Development Program. There are various terms used through the remaining programs that are unclear or vague and need to be clearly defined.</p> <p><u>County Recommendation</u> Include definitions for terms used in all six programs. Specifically, include definitions for "outfall" (per 40 CFR 122.26), "construction" (same as in current permit definition, including that it does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility). "Progressive Enforcement Policy" is discussed in the Industrial/Commercial Facilities Program (pg. 18), but the term is used throughout the working proposal. Please clarify how the Progressive Enforcement Policy is intended to be used. Finally, delete the definition for Effective Impervious Area (EIA) as it is not used within the working proposal.</p>
2	Regulatory responsibility	General	<p>Parts of the minimum control measures appear to require permittees to undertake actions that should be the responsibility of the State Water Board or Regional Board. For example, VI.C.7.d.i. & ii., or Part VI.C.7.d.ii.(b) No Exposure Verification should be done by State Water Board or Regional Board staff, because it is the State Water Board that issues certificates of no exposure.</p>

County of Los Angeles Comments
 Staff Working Proposal on Minimum Control Measures

General			
Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
3	Significant increase in requirements	General	<p>Based on our review, implementation of the proposed minimum control measures program would be significantly more labor and resource intensive than that for the current LA County MS4 Permit and the Ventura County MS4 Permit. At the same time, it is not clear in many instances what water quality improvement would result from implementing the requirements. For example, the proposal requires an detailed inventory of public facilities that would be very resource intensive; however, the intent of this exercise is not clear or how the information would be used.</p> <p>Based on discussions with staff, it appears that some of this is a matter of language interpretation. We would welcome additional meetings with staff to fully understand staff's intent behind the requirements and to assist in crafting language that more clearly reflects staff's intent.</p>

County of Los Angeles Comments
 Staff Working Proposal on Minimum Control Measures

Legal Authority			
Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
1	Quality of stormwater discharged	VI.C.2.a.i [page 4]	<p>The phrase "and control the quality of stormwater discharged from industrial and construction sites" is vague and extraneous.</p> <p><u>County Recommendation</u> Delete this phrase and keep the rest of the sentence. The sentence should read as follows: "Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity."</p>
2	Interagency Agreements	VI.C.2.vii & viii [page 4]	<p>Requiring Permittees to enter into agreements with other agencies is not feasible since Permittees cannot require each other to sign such agreements or agree to take on liability as part of such agreements. Further, "shared MS4" may not be the most suitable language for these items.</p> <p><u>County Recommendation</u> Delete parts vii. and viii. We'd also welcome a meeting to discuss this (and other) issues. Replace the words "shared MS4" with "interconnected MS4".</p>
3	Structural BMPs	VI.C.2.a.xi and xii. [pages 4 - 5]	<p>These sections appear to make permittees responsible for making sure that not only public but also private structural BMPs are operable and maintained. Permittees' role with the operation and maintenance of private post-construction BMPs should be limited to high risk industrial and commercial facilities only. See comment 30 in the Planning and Land Development Program.</p>

County of Los Angeles Comments
 Staff Working Proposal on Minimum Control Measures

Fiscal Resources			
Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
1	Budget line items	VI.C.3.b.ii [page 5]	<p>The intent of this section is not clear. Also, the phrase “budget line items” is vague and should be clarified or replaced. Depending on how the language is interpreted, this requirement can be potentially very problematic for permittees such as the County of LA whose budget is very complex.</p> <p><u>County Recommendation</u> Clarify the intent of this section. Replace “budget line items” with “program area”.</p>
2	Exercise full authority	VI.C.3.a [page 5]	<p>This section requires each Permittee to “exercise its full authority to secure the fiscal resources necessary to meet all requirements of this Order.” The phrase "exercise its full authority" is vague and should be clarified.</p> <p>Every municipality has a budget which must balance various needs including public health and safety. If a municipality determines that it cannot fully fund all aspects of the Permit’s requirements (and seeks relief from the RWQCB from those aspects), could it be found in violation of the Permit for not having exercised its full authority?</p>

County of Los Angeles Comments
 Staff Working Proposal on Minimum Control Measures

Public Information and Participation Program			
Comment #	Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
1	PIPP Implementation	VI.C.6.a.i. [page 6]	<p>This section requires that a PIPP must be implemented “that includes, but is not limited to, the requirements listed in this part.” (emphasis supplied.) This is problematic language, because it purports to state that a PIPP must include unspecified additional requirements that could be found wanting by the RWQCB or a court.</p> <p><u>County Recommendation</u> Modify to read “Each Permittee shall implement a Public Information and Participation Program (PIPP) that includes, but is not limited to <u>at a minimum</u>, the requirements listed in this part.”</p>
2	PIPP Implementation	VI.C.6.b.i.(1) [page 6]	<p>The County of Los Angeles recognizes the cost-effectiveness in participating in a collaborative and coordinated PIPP program, and supports a regional PIPP program as one of the options; however, the County does not have plans to sponsor a countywide PIPP.</p> <p><u>County Recommendation</u> Modify to read “By jointly implementing a regional PIPP program”</p>
3	Residential Outreach	VI.C.6.d.i [page 7]	<p>Same as comment 2.</p> <p><u>County Recommendation</u> Modify to read “Working in conjunction with a regional, watershed-wide, or individual PIPP...”</p>
4	Residential Outreach	VI.C.6.d.i.(3) [page 8]	<p>Same as comment 1.</p> <p><u>County Recommendation</u> Modify to read “Distribute activity specific stormwater pollution prevention public education materials to, but is not limited to <u>at a minimum</u>, the following points of purchase:”</p>

County of Los Angeles Comments
 Staff Working Proposal on Minimum Control Measures

Public Information and Participation Program			
Comment #	Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
5	Develop and Implement Program – Timeline	N/A	<p>If permittees choose to jointly participate in a regional or watershed-wide PIPP, this will take a minimum of 6 months to one year to set up by the time legal agreements and any contracts are developed, adopted and signed. The timeline must acknowledge the time it will take to form partnerships and coordinated multi-permittee programs. Implementation within the first permit year is too aggressive.</p> <p><u>County Recommendation</u> Allow permittees 18 months to develop and implement regional or watershed-wide PIPP.</p>

County of Los Angeles Comments
Staff Working Proposal on Minimum Control Measures

Industrial / Commercial Facilities Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
1	Track Critical Sources - Minimum fields of information	VI.C.7.b.ii.(6) [page 10]	It is not clear what is meant by description of economic activities performed and principal products used. <u>County Recommendation</u> Please clarify the intent of this language.
2	Inspect Critical Sources	VI.C.7.d.i. [page 11-16]	The working proposal limits the applicable BMPs to those from the CASQA handbook as listed in the tables. Provide flexibility to use other equivalent BMPs. <u>County Recommendation</u> Revise to: "At each facility, inspectors shall verify that the operator is implementing the source control BMPs listed in Tables [TBD] and [TBD] <u>or other equivalent BMPs</u> for the corresponding facility type..."
3	Progressive Enforcement	VI.C.7.e.iii.(1) [page 18]	The current MS4 Permit requires follow up inspections to be conducted within 4 weeks of the initial inspection, whereas the working proposal required they be completed within 2 weeks. Four weeks is necessary due to the vast number of facilities required to be inspected by the County. <u>County Recommendation</u> Revise to <u>4 weeks</u> .
4	Investigation of complaints transmitted by Regional Board Staff	VI.C.7.f.iii. (footnote) [page 19]	<u>County Recommendation</u> Allow the initial investigation, including the site visit, to occur within four <u>five</u> business days.

County of Los Angeles Comments
Staff Working Proposal on Minimum Control Measures

Planning and Land Development Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
Draft Permit VI.C.8 (pages 20-40)			
1	Existing ordinances	NA	Permittees that have adopted LID ordinances and corresponding technical documents should be allowed to implement those existing requirements.
2	Reference for drain time (72 hrs) to control vectors is not consistent with current State guidance	Page 21, 8.a.i(6)	Permit should reference current DHS BMP Vector Manual and 96 hr drain time recommendation. See: http://westnile.ca.gov/resources.php
3	Inconsistent criteria for projects subject to post construction BMP requirements.	Page 21, 8.b.i(1)	This provision establishes the scope of development projects subject to post construction controls. The criteria are inconsistent as sometimes the criterion is based on impervious area and other times it's based on surface area. Impervious area is a more accurate surrogate to use for establishing project eligibility and relevant to water quality issues.
4	Inappropriate terminology for project descriptions.	Page 21, 8.b.i(1)	The terms "industrial parks" and "commercial strip malls" are inconsistent with terminology normally used to describe development projects and will create confusion between the project developer and Permittees. Revise to read "industrial projects" and "commercial projects" to provide Permittees with flexibility to include broader coverage.
5	Freeways are covered under the Caltrans MS4 Permit.	Page 21, 8.b.i(1)(g)	County does not construct freeways and has no control over the Caltrans project development process. Delete the word 'freeways'
6	Clarification of redevelopment projects subject to post construction BMPs.	Page 22, 8.b.i(1)(i)	This provision needs to be clarified to remove ambiguity and confusion for the Permittees. Suggest that the term "Redevelopment projects in subject categories" be modified to read "Redevelopment projects in categories 'a through h' above"
7	SWQDv criteria	Page 24, 8.c.i(2)	This provision requires the permittees to select the most stringent SWQDv standard between two standards, a 0.75-inch 24-hour rain event and the 85th percentile 24-hour rain event. Clarify that <i>rainfall depth</i> for the 85th percentile 24-hour rain event is to be determined based on the isohyetal map prepared by the County of Los Angeles. If more than 0.75-inch, this rainfall depth is to be used to determine the SWQDv.

County of Los Angeles Comments
 Staff Working Proposal on Minimum Control Measures

Planning and Land Development Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
8	Reference to 72 hrs is inconsistent with current state guidance	Page 24, 8.c.i)(6)	See Comment No. 2
9	Use of green roofs is not practical on all buildings	Page 24, 8.c.i)(7)	There are a variety of issues to be considered when assessing the viability of green roofs. The structure type (wood frame is not a practical application), and building use are primary factors. Further, green roofs in the LA area will need irrigation. A water budget study and building type study should be performed to determine design guidelines prior to mandating large scale use.
10	Unnecessary BMP analysis	Page 24, 8.c.i)(7) and (8)	Provisions 7 and 8 imply that all projects must analyze green roofs and rain water harvests systems. Projects should only be required to provide this type of analysis if they cannot infiltrate in another fashion. Then they should analyze green roofs and rainwater harvest systems before moving into other alternatives such as biofiltration. Also it is not practical to analyze green roof systems at the tentative development phase of a project. This type of system requires detailed structural building plans and would have to be designed and reviewed at a building permit stage of development.

Planning and Land Development Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
11	California Plumbing Code	Page 25 8.c.iii (8)	Current California Plumbing Code (CPC) adopted by the Building Standards Commission (BSC) is based on the 2009 Uniform Plumbing Code published by IAPMO, not the National Standard Plumbing Code published by PHCC. Also, Building Standards law dictate that no local jurisdiction can lesson any requirement adopted by the BSC. The CPC requires that all plumbing fixtures within the building be served by potable water (601.1 of the CPC). Potable water is defined as water that is satisfactory for drinking, culinary, or domestic purposes that meet the requirements of the California Department of Public Health (218.0 of the CPC). The exception to this is in the case of Non-Potable water systems in Non-Residential buildings, utilizing recycled water (treated to tertiary standards and meets statewide standards of California Department of Public Health) may be used for flushing urinals, water closets, and trap primers for floor drains and floor sinks (1613A.0 of the CPC). In order to introduce such an ordinance at the local level, the BSC would first need to adopt statewide building standards allowing for rainwater re-use systems within the building for the above listed purposes.
12	Alternative compliance process is difficult to follow and will be nearly impossible to administer.	Page 25, 26 and 27, 8.c.ii	The alternative compliance process provided in this working proposal is very complex and convoluted and will be difficult to administer consistently. Please streamline the process and simplify and clarify the language.
13	Impediments to regional groundwater replenishment projects	Pages 25 and 26	If the intent of the permit is allow offsite groundwater replenishment projects as equivalent to on-site retention then the requirement to treat all runoff before it goes to an offsite project is detrimental and unwarranted. As currently structured the project proponent must treat the runoff to a high standard (i.e. water quality objectives) before it can be used for offsite groundwater recharge projects. This will severely limit this "equivalent" alternative. Furthermore the regional groundwater replenishment projects should be limited to private projects unless the Permittee opts to develop public projects. Private projects are acceptable as long as mitigation was completed prior to project occupancy. (i.e. no cash in lieu funds, or project lists)

Staff Working Proposal on Minimum Control Measures**

Planning and Land Development Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
14	Inconsistency in the alternative compliance table	Page 25 and 26	The Medium Preferred Options presented in the table are unclear and confusing as currently presented. There also appears to be some overlap within the Medium Preferred Options and with the Most Preferred offsite regional groundwater recharge option (actually the two options appear to be exactly the same). The table could benefit from streamlining and simplification. Suggest that the medium preferred options be merged into one option and replaced with language similar to that utilized within the Ventura County NPDES MS4 Permit (R4-2010-0108): "Regardless of the methods through which Permittees allow project applicants to implement alternative compliance measures, the result must be at least the same level of water quality protection..." Or, staff may consider replacing the table with a flow chart.
15	Amendment of site soils to improve infiltration properties is not practical in the vast majority of cases. This is not a realistic alternative	Page 27, 8.c.ii(2)(a)	Site soils that have poor infiltration characteristics can not be amended to improve those characteristics for concentrated infiltration BMPs such as bioretention since lower strata soils will still impede infiltration. Eliminate as an alternative.
16	Definition of "smart growth and infill development"	Page 27, 8.c.ii(2)(f)	These terms need to be clearly defined otherwise there will be considerable confusion as to what qualifies as smart growth (e.g. walking trails)
17	If retention is used offsite, then on-site treatment should be waived	Page 27, 8.c.iii	A project that is retaining runoff at an offsite location in the same watershed should not have to also install treatment controls on-site since full treatment will be provided resulting in equal environmental benefit.
18	Equivalent SWQDv criteria	Page 28, 8.c.iii.(1)(c)	See Comment 7.
19	Off site projects - permittee discretion.	Page 28, 8.c.iii.(2) and (3)	Allow Permittees the discretion to chose whether they want to develop an offsite program alternative.

County of Los Angeles Comments
Staff Working Proposal on Minimum Control Measures

Planning and Land Development Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
20	Definition of watershed and subwatershed	Page 28, 8.c.iii.(3)(b)	The Basin Plan (appendix 2) uses the terms "hydrologic unit, hydrologic area, and hydrologic subareas" not HUC-12 or HUC-10. Clarification should be provided to reconcile the different terms. We suggest that the permit use the "hydrologic area" is equivalent to HUC-12 hydrologic area.
21	Indicates that Permittees will oversee the construction of offsite projects for private development - risk to Permittee is unacceptable	Page 29, 8.c.iii(3)(f)	The Permittee cannot be expected to develop a program where the MS4 is responsible for ensuring completion of an offsite mitigation project. The bid climate, unforeseen site conditions and other events that impact construction costs place too much risk on the Permittee to ensure private development mitigation. Private developers may be able to secure an offsite location, but initial and long-term agreements will likely make this a rare case. This type of offsite mitigation is generally not feasible, and should not be relied upon as a viable alternative. Accordingly, the options listed in the Table on page 25 - 26 should be equivalent - not a hierarchy.
22	Time frame for third party petition.	Page 29, 8.c.iii(3)(g)	The schedule for third party petition of offsite projects or EO approval should not be open ended but limited to 30 days.
23	Equivalent SWQDv criteria	Page 30, 8.c.iii(4)	See Comment 7.
24	Projects that treat water offsite through retention, infiltration or use should not also have to treat water onsite.	Page 30, 8.c.iv	Revise to indicate that no onsite treatment is required

**County of Los Angeles Comments
Staff Working Proposal on Minimum Control Measures**

Planning and Land Development Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
25	Cause or contribute to exceedance	Page 30-33, 8.c.iv	<p>Such requirements center on the treatment of stormwater runoff from the project site, including meeting either the pollutant specific benchmarks set forth in the attached table or “ensure that the discharge does not cause or contribute to an exceedance of water quality standards at the Permittee’s downstream MS4 outfall.”</p> <p>We have some concerns with respect to the second requirement. The requirement not to cause or contribute to exceedance of a water quality standard is not contained in the CWA, which only requires permittees to effectively prevent non-stormwater discharges to the MS4 and to take steps to the MEP to address pollutants in discharges from the MS4. Additionally, more clarity is needed on the meaning of “Permittee’s downstream MS4 outfall” and "cause or contribute to".</p>
26	Benchmarks for treatment control BMP performance are unsubstantiated.	Page 31, 8.c.iv.(1)(a)	<p>There are no non-infiltration based BMPs that can reliably achieve sanitary quality and pesticide bench-mark limits 100 percent of the time. Treatment BMPs are not a practical method for the removal of pesticides. Source control of pesticides is by far superior to treatment. The requirements described in this section will place an impractical risk on the developer and the MS4. Monitoring of BMPs by developers will not be an effective use of funds. Pesticides that cause receiving water toxicity must be controlled at the source (such as was done with diazinon).</p>

**County of Los Angeles Comments
Staff Working Proposal on Minimum Control Measures**

Planning and Land Development Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
27	Inappropriate development of BMP performance standards	Page 31, 8.c.iv(2)	This provision is essentially establishing water quality based effluent limits for treatment control BMPs. Furthermore the effluent limits are in fact water quality objectives. There a number of reason why this is inappropriate. To begin with, the current knowledge of BMP performance is limited to establishing technology based performance standard. This is the concept that is imbedded in the Ventura permit and has technical basis for its inclusion. Second the direct application of water quality objectives to the end of pipe effluent quality as shown in the Table on page 31 and 32 does not account for the conditions in the receiving water. When WQBELs are established for wastewater plant, the derivation is based on the receiving water conditions that may allow for dilution/mixing zone, site specific objectives, hardness adjustment, etc. And finally as noted in comment #26 we are unaware of any BMPs that can meet the benchmark levels. This is because in some case we have no performance data (e.g. pyrethroids) and other cases there is no BMPs of the public domain type that can meet the objective (e.g. bacteria).
28	Unreasonable expectations for maintenance agreements	Page 38, 8.d.iii(1)	Requiring maintenance agreements for all LID practices is unrealistic and not commensurate with water quality improvement. Most LID strategies will be implemented at the site level (including individual residents) and to require homeowners to enter into maintenance agreements for their LID practices is impractical and a huge cost implications. Rather the maintenance agreements should be limited regional facilities and/or treatment control BMPs.
29	Inspection of BMPs	Page 40, 8.d.iv(1)(c,d)	BMP inspection based on a fixed time interval is arbitrary and poor use of resources. The Permittee should prioritize inspection based on previous inspection history. Private parties should be allowed the same flexibility if inspection is completed by a certified 3rd party.

**County of Los Angeles Comments
Staff Working Proposal on Minimum Control Measures**

Planning and Land Development Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
30	Post Construction BMPs O&M	Page 40 8.d. iv(d)	"The Permittee shall require annual reports by the other parties demonstrating proper maintenance and operations" This proposed language is not practical and is difficult to enforce on private property owners As an alternative we recommend that private property owners should maintain their records on site, and make them available upon request.

Attachment TBD Bioretention/Biofiltration Design Criteria (pages 74-82)			
1	Biofiltration/Bioretention Design Criteria: provide as guidance	Pages 74 - 79	The specificity of the Biofiltration/Bioretention Criteria should be provided as guidance. The permittees should not be required to adopt the criteria as stated in the attachment. Permittees should be given the ability to adopt guidelines and standards appropriate to the Los Angeles region and reflect the most up-to-date understanding of bioretention/biofiltration pollutant removal effectiveness. Specifications provided as guidance versus a hard and fast requirement will allow for continued experimentation and innovation. The guidelines issued via the Ventura TGM and Bay Area MRP are not yet a year old and it can be expected that these specifications can/will be modified as we gain on-the-ground experience.
2	Biofiltration/Bioretention Design Criteria: submittal requirements	Pages 74 - 79	The submittal requirements for bioretention/biofiltration soils are excessive and supersede other procedures and practices in place that ensure adequate implementation of treatment control BMPs. The submittal requirements are likely to discourage the use of bioretention/biofiltration practices. The Regional Board should allow Permittees to determine compliance through established guidance, plan review, and inspections. Soil mix submittal requirements should be deleted.

Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
3	LID Training	Page 81 J	Requiring "each Permittee shall facilitate implementation of LID by providing key industry, regulatory, and other stakeholders with information regarding LID objectives and specifications through a training program " is not cost effective. There are other methods to providing information on LID implementation short of formal training. Please revise this section to allow Permittees to provide information regarding LID through their websites.

Staff Working Proposal on Minimum Control Measures

Development Construction Program			
Comment #	Identify Permit Element/ Issue/ Concern	Location in Working Proposal	Comment/Recommendation
1	General Comment		This proposed language includes many of the same requirements as the General Construction Permit. A construction project that falls under GCP does not need to also be regulated by the MS4 permit.
2	General Comment	VI.C.9.d. [Page 41]	The proposed language seems to indicate that all soil disturbing activities regardless of size must comply with all the requirements under this program. <u>County Recommendation</u> Clarify that projects under 1 acre only need to comply with a minimum set of BMPs.
3	Inventory/Electronic Tracking	VI.C.9.e. [page 41]	Construction Site Inventory/Electronic Tracking System for all types of permits as listed is nice to do but can be potentially very problematic and costly to implement, and thus should not be mandatory. <u>County Recommendation</u> Allow permittees to use existing non-electronic inventory/tracking systems if they work. Reduce the amount of information required to be tracked, particularly for small projects (under 1 acre).
4	Rain Event Action Plan (REAP)	VI.C.9.f.ii (3)(i) [page 43]	The proposed language seems to indicate that all soil disturbing activities regardless of size must prepare a Rain Event Action Plan. The language should be clarified to indicate that this requirement does not apply to projects under 1 acre. <u>County Recommendation</u> Clarify that projects under 1 acre only need to comply with a minimum set of BMPs.

Public Agency Activities Program			
Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
1	Maintain Inventory and Map Facilities	VI.C.10.c. [pages 53-54]	<p>Inventory, mapping and populating the highly detailed minimum fields of information for all the listed sites is very resource intensive. The list of facilities is very extensive and covers facilities that are already regulated under separate permits. In addition, the County has no jurisdiction over public schools. Annual updating of the inventory and map is unnecessary since municipal facilities do not change as frequently as private businesses.</p> <p><u>County Recommendation</u> Remove from the inventory list schools and facilities that are regulated under separate permits. The map and inventory should be updated once during the permit term. Allow at least 2 years to complete the inventory.</p>
2	Minimum fields of information for municipal facilities inventory	VI.C.10.c.ii. [page 54]	<p>The information required in the inventory is excessive and potentially very resource intensive. For example, determining which MS4 outfalls receive discharge from a facility may require field investigations which would be very resource intensive.</p> <p><u>County Recommendation</u> Revise the first sentence of the section to read: 'Each Permittee <u>should consider</u> shall <u>including</u> the following minimum fields of information...'</p>
3	Inventory of Existing Development for Retrofitting Opportunities	VI.C.10.d. [page 54]	<p>Developing an inventory of retrofitting opportunities that includes municipal, industrial, commercial, and residential areas would be extremely resource intensive. Inventory of existing development should not be required as part of the minimum control measures, but instead, if feasible, part of a larger TMDL implementation strategy.</p> <p><u>County Recommendation</u> Clarify the intent of the inventory, which based on our discussion with staff, appears to be identifying regional treatment opportunities as opposed to parcel level opportunities. This section should be revised to reflect this intent.</p>

Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
4	Implement and maintain the general and activity specific BMPs	VI.C.10.e.iii. Table [TBD] [page 57]	<p>This table lists specific BMPs from the Caltrans Stormwater Quality Handbook Maintenance Staff Guide. Allow flexibility to use alternate equivalent BMPs, such as those in the CASQA Municipal BMP Handbook.</p> <p><u>County Recommendation</u> Include in the table the BMPs from the CASQA Municipal BMP Handbook. Revise the language to read: "Each Permittee shall implement and maintain the general and activity specific BMPs listed in Table [TBD] <u>or other set of equivalent BMPs...</u>"</p>
5	Vehicle and Equipment Washing	VI.C.10.f.i & iii. [page 59]	<p>Clarify this section so that it only applies to permanent vehicle and equipment washing areas.</p> <p><u>County Recommendation</u> Revise to read: "Each Permittee shall implement and maintain the activity specific BMPs listed in Table [TBD] (BMPs for Public Agency Facilities and Activities) for all <u>fixed</u> vehicle and equipment washing;"</p>
6	Landscape, Park, and Recreational Facilities Management - pesticides application	VI.C.10.g. [page 60]	<p>The County is supportive of implementing an integrated pest management program. However, this language does not consider costs associated with such a program. There are instances when application of environmentally friendly pesticides that do not threaten water quality is the least costly method to manage pests. Allow flexibility to continue use of such pesticides so long as it is done according to applicable permits and established guidelines without the need to demonstrate measurable reductions in pesticide use.</p> <p><u>County Recommendation</u> Delete "(7)(c) Demonstrate measurable reductions in pesticide use."</p>

Dear Ms. Purdy:

LOS ANGELES COUNTY FLOOD CONTROL DISTRICT COMMENTS STAFF WORKING PROPOSAL ON MINIMUM CONTROL MEASURES

On behalf of the Los Angeles County Flood Control District, thank you for the opportunity to comment on the draft working proposal for Minimum Control Measures released on March 21, 2012. Enclosed are our comments for your review and consideration. Additionally, we concur with the comments submitted by the County of Los Angeles and submit them by reference.

If you have any questions, please contact me at (626) 458-4300 or ghildeb@dpw.lacounty.gov or your staff may contact Ms. Angela George at (626) 458-4325 or ageorge@dpw.lacounty.gov.

Very truly yours,

GAIL FARBER

Attn: Mrs. Renee A. Purdy, Regional Programs Section Chief

Mr. Ivar Ridgeway, Stormwater Permitting Section Chief

Subject: Comments on Working Proposal of Minimum Control Measures Related to the Los Angeles County Municipal Stormwater Permit

Dear Mrs. Purdy and Mr. Ridgeway:

The City of Vernon appreciates this opportunity to provide comments on the subject proposed Minimum Control Measures (MCMs) for the draft Los Angeles Municipal Stormwater (MS4) permit. With strong support from our City Council and City Administration, both the Health and Environmental Control and Community Services and Water Departments are committed to protecting the environment and appreciate cooperative efforts of the Regional Water Quality Control Board (RWQCB) and its staff in developing this next iteration of the Los Angeles County Municipal Stormwater Permit.

Based on our review of the proposed MCMs, we have several concerns and would like to express the following comments:

1. Section VI.C.2.i., under Legal Authority, specifies that each permittee must:

Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites. This requirement applies both to industrial and construction sites with coverage under an NPDES permit, as well as to those sites that do not have coverage under an NPDES permit. Grading ordinances must be updated and enforced as necessary to comply with this Order;

Exclusively Industrial

Concern- The authority to *control* (which suggests discretionary authority to authorize discharges) the contribution of pollutants from both industrial and construction sites, through an NPDES permit, is bestowed upon the SWRCB and RWQCBs. It appears that although these facilities are under a State General Stormwater Permit which specifically regulates stormwater and prohibits non-stormwater run-off from these sites, this proposed MCM will unlawfully grant each municipal permittee duplicative authority to authorize any contribution of pollutants from NPDES permitted facilities to stormwater.

Proposed solution- The current MS4 permit specifies “*permittees shall possess the necessary legal authority to prohibit non-stormwater discharges to the storm drain system*”. We suggest that the current permit language corresponding to Legal Authority remain unchanged. Furthermore, the authority and responsibility to regulate NPDES permitted industrial and construction sites should remain with the SWRCB and RWQCBs.

2. Sections VI.C.2.a.i., iv., vii., and viii. specify that each permittee must *control* the contribution of pollutants, the discharge of spills, and the contribution of pollutants to its MS4 as well as from one MS4 to another MS4.

Concern- The word “control” erroneously suggests permittees have discretionary authority to authorize the contribution of pollutants, discharge of spills, and the contribution of pollutants to its MS4. In addition, sections also conflict with the Illicit Discharge/Connection Elimination Program.

Proposed solution- Replace the word “control” with the word “prohibit”.

3. Section VI.C.8.c.ii.(2), under New Development/Redevelopment Project Performance Criteria, indicates:

To demonstrate technical infeasibility, the project applicant must demonstrate that the project cannot reliably retain 100 percent of the SWQDv on-site, even with the maximum application of green roofs and rainwater harvest and use, and that compliance with the applicable post-construction requirements would be technically infeasible by submitting a site-specific hydrologic and/or design analysis conducted and endorsed by a registered professional engineer, geologist, architect, and/or landscape architect.

Concern- The City of Vernon was incorporated in 1905 and has since been zoned exclusively industrial. With over a century of heavy industrial land use, soil and groundwater contamination has been a concern in approximately the past 30 years in which the City continues to mitigate. Although many sites have been remediated, determined to pose minimal risk of human health and the environment, and subsequently closed, the remaining soil should not be considered *contaminant or risk free*. Many sites have been closed (requiring no further environmental action) with the strict condition that an impervious cap to remain intact to prevent migration of

Exclusively Industrial

residual contamination to our groundwater aquifers. In our opinion, requiring a project applicant to demonstrate technical infeasibility by submitting a site-specific hydrological design analysis endorsed by a registered engineer for historical contaminated sites would be unnecessary and counterproductive.

Proposed solution- We suggest that an option be provided for MS4 permittees, who have soil remediation oversight authority within their jurisdictional boundaries, to determine technical infeasibility due to potential groundwater contamination. This option should not require a site-specific hydrological design analysis.

4. Section VI.C.3.a., b., and c. under Fiscal Resources states the following;

Each Permittee shall exercise its full authority to secure the fiscal resources necessary to meet all requirements of this Order.

Concern- This MCM assumes the permittees can secure the required fiscal resources necessary to meet all the requirements without consideration to economic challenges and the fact that we have to be mindful that any stormwater fees must be approved under Prop 218. In addition, during the April 5th 2012 RWQCB workshop, Board members commented on being mindful of the current economic challenges and asked Board staff to do the same.

Proposed solution- We recommend that Fiscal Resources language be removed.

5. Section VI.C.8.d.iv.(1)(d), specifies:

For post-construction BMPs operated and maintained by parties other than the Permittee, the Permittee shall require annual reports by the other parties demonstrating proper maintenance and operations.

Concern- This requirement appears to be superfluous and without substance in addition to lacking the technical details required to be included in such a report.

Proposed solution- monitor and regulate the BMP maintenance through the Commercial/Industrial Inspection Program.

6. Section VI.C.9.c. specifies the following;

Each Permittee shall require operators of public and private construction activity within its jurisdiction to select, install, implement, and maintain BMPs that comply with the State Water Board's current General Permit for Discharges of Stormwater Associated with Construction Activity (Construction General Permit).

Concern- The requirements to regulate the selection, installation, implementation, and maintenance of BMPs in accordance with the State Water Board's current

Exclusively Industrial

General Permit for Discharges of Stormwater Associated with Construction Activity should be the direct responsibility of the permitting agency. This MCM unlawfully imposes duplicative enforcement responsibility of Construction General Permitted private construction projects onto the MS4 permittees.

Proposed solution- Enforcement authority for the selection, installation, implementation, and maintenance of BMPs in compliance with the General Construction Permit should remain the responsibility of the permitting authority (SWRCB & RWQCB).

7. Section VI.C.9.f.ii.(1) describes the following:

Prior to issuing a grading or building permit, each Permittee shall require each operator of a construction activity within its jurisdiction to prepare and submit an Erosion and Sediment Control Plan (ESCP) prior to the disturbance of land for the Permittee's review and written approval. The construction site operator shall be prohibited from commencing construction activity prior to receipt of written approval by the Permittee. Each Permittee shall not approve any erosion and sediment control plan unless it contains appropriate site-specific construction site BMPs that meet the minimum requirements of a Permittee's erosion and sediment control ordinance.

Concern- The requirement for construction operators to prepare and submit a site specific Erosion Control Plan for all grading and building projects, regardless of size or scope of work, would likely be an excessive and unnecessary requirement for many under-one-acre projects.

Proposed solution- Based on the Planning and Land Development Program applicability criteria, set the threshold for requiring an ESCP to projects disturbing 5,000 sq. ft. or more of surface area.

8. Section VI.C.9.f.ii.(2) describes the following:

ESCPs must include the elements of a Stormwater Pollution Prevention Plan (SWPPP). SWPPPs prepared in accordance with the requirements of the Construction General Permit can be accepted as ESCPs for construction sites larger than 1 acre.

Concern- For projects disturbing less than one acre of surface area, the requirement to develop and implement an ESCP that must be equivalent to a SWPPP appears to be excessive and may provide marginal value.

Proposed solution- Require minimum BMPs in all ESCPs for projects sizes disturbing 5,000 sq. ft. to one acre. In addition, require supplementary BMPs for "high risk" construction activities such as concrete sawcutting/mixing/paving, wood & material cutting, vehicle tracking, and equipment cleaning.

Exclusively Industrial

9. Section VI.C.9.f.ii. (3) describes the following:

At a minimum, the ESCP/SWPPP must address the following elements:

- (a) Methods to minimize the footprint of the disturbed area and to prevent soil compaction outside of the disturbed area*
- (b) Methods used to protect native vegetation and trees*
- (c) Sediment/Erosion Control*
- (d) Controls to prevent tracking on and off the site*
- (e) Non-stormwater controls (e.g., vehicle washing, dewatering, etc.)*
- (f) Materials Management (delivery and storage)*
- (g) Spill Prevention and Control*
- (h) Waste Management (e.g., concrete washout/waste management; sanitary waste management)*
- (i) Rain Event Action Plan (REAP) when soil disturbance activities will be conducted during the wet-weather season.*

Concern- Based on the current General Construction Activity Stormwater Permit, construction sites disturbing one acre or more of surface area categorized as a Risk Level 1 are not required to develop or implement Rain Event Action Plans. Requiring operators of construction sites disturbing less than one acre of surface area to address requirements reserved for Risk Level 2 and 3 projects appears counter intuitive and unnecessary.

Proposed solution- We suggest omitting the REAP requirement.

10. Section VI.C.9.f.ii.(6) details the following:

Each Permittee shall require that all structural BMPs be designed by a California licensed engineer.

Concern- This requirement erroneously claims that only structural BMPs designed by California licensed engineer are effective. This requirement also asserts that structural BMPs designed by engineers licensed in other states are also inadequate.

Proposed solution- Use the identical language used in Section VI.C.9.g.i. indicating:
BMPs must be consistent with the applicable California Stormwater Quality Association (CASQA) Best Management Practices Handbooks (or the Caltrans Handbook for public transportation related construction projects) tailored to the risks posed by the project.

11. Section VI.C.9.h.ii.1, under Table titled Inspection Frequency, Risk Level 3 construction sites are to be inspected when (1) two or more consecutive days with greater than 50% chance of rainfall are predicted by NOAA, (2) within 48 hours of a ½-inch rain event and at (3) least once every two weeks. This section also indicates that Risk Level 1 & 2 construction sites are to be inspected at least monthly.

Exclusively Industrial

Concern- Regardless of risk level, construction sites of one acre or more are permitted by the State Water Resources Control Board to “Control Stormwater Discharges Associated with Construction and Land Disturbance Activities”. Fees associated with this permit, which are collected by the SWRCB, are intended to support a corresponding construction site inspection program by the permitting agency. Requiring municipal permittees to perform inspections, which should be the responsibility of the permitting agency, at such a frequency is alarming and distressing.

Proposed solution- As the primary enforcement agency for the GCASP, consider having Regional Water Quality Control Board inspection staff perform the inspections in a frequency as described; or, allocate a portion of the GCASP permitting fees to the municipal permittees to support a Inspection Program aimed at assessing compliance with the General Construction Permit.

12. Section VI.C.9.h.ii.(2), mandates each permittee shall inspect all phases of construction as follows;

- a. Prior to Land Disturbance,
- b. Grading and Land Development,
- c. Streets and Utilities,
- d. Vertical Construction,
- e. Final Landscaping and Site Stabilization.

Concern- Again as previously stated, the SWRCB is collecting a substantial fee to permit construction sites of one acre or larger to “control stormwater discharges associated with construction and land disturbance activities”. Permit fees should be sufficient to support an inspection program by the permitting agency. This clear “release” of GCASP inspection responsibility to the MS4 permittees is a gross neglect of permit enforcement obligation of the permitting agency. In addition, during the April 5th 2012 RWQCB workshop, Board members commented on why a shift of responsibility.

Proposed solution- We suggest omitting this MCM and Require the Regional Water Board inspection staff perform the inspections in the frequency described.

13. Section VI.C.9.h.ii.(3), mandates that each permittee develop and implement a progressive enforcement policy to ensure that facilities are brought *into compliance with all stormwater requirements through the following*;

- f. Follow-up Inspections
- g. Enforcement action
- h. Maintenance of records

Exclusively Industrial

Concern- The State General Construction Activity Stormwater Permit, enforced by the Regional Water Boards, in its title states its purpose as, (to) “Control Stormwater Discharges Associated with Construction and Land Disturbance Activities”. Enforcement of stormwater requirements specified in the GCASP is the primary responsibility of the permitting agency. The permitting agency collecting permit fees should be held accountable for the enforcement of its permit. Furthermore, this section of the MCM fails to provide an option to refer violators of the GCASP to the Regional Water board. Moreover, there is no joint enforcement provision despite the heavier penalties for a GCASP violation in comparison to the penalties for a municipal code violation.

Proposed solution- We suggest omitting this MCM and requiring the Regional Water Board inspection staff perform the inspections and enforcement, which is intended to regulate the GCASP, in the frequency described.

14. Section VI.C.9.h.ii.(5), requires each Permittee to develop, implement, and revise as necessary, an Inspection and Enforcement Standard Operating Procedures which includes the following;
- a. Verification of GCASP coverage
 - b. Review of ESCP/SWPPP in addition to inspection of construction sites
 - c. Assessment of compliance, including the implementation and maintenance of minimum BMPs and their effectiveness.
 - d. Assessment of the appropriateness of the planned BMPs and their effectiveness.
 - e. Visual observation and record keeping
 - f. Develop a written or electronic inspection report
 - g. Tracking of the number of inspections for the inventoried construction sites to verify that the sites are inspected at the minimum frequencies required this Order.

Concern- This inspection and enforcement requirement engenders an unnecessary layer of authority and duplicates procedures that should have already been established by the GCASP administering agency.

Proposed solution- We suggest that this MCM be omitted and maintain the Inspection and Enforcement Standard Operating Procedures, intended to monitor compliance with the GCASP, with the RWQCB inspection and enforcement staff.

15. Section VI.C.10.d., mandates that each permittee to develop an inventory of existing development for retrofitting opportunities.

Concern- Although this section is under the Public Agency Activities Program, it requires inventorying of industrial, commercial, and residential developments in addition to municipal developments. Furthermore, this MCM disregards facilities operating under a GIASP. The California State General Industrial Activity

Exclusively Industrial

Stormwater Permit has been in effect since 1992. Since then, the State Water Resources Control Board has collected a substantial quantity of stormwater analysis data from GIASP permittees. Municipalities do not have any site specific data to make an effective evaluation of an existing development.

Proposed solution- We suggest omitting this section or have the SWRCB evaluate the stormwater analysis data collected through the GIASPs to establish a list of prioritized retrofitting opportunities.

16. Section VI.C.10.d.v, indicates each Permittee shall consider the following practices in cooperating with private landowners to retrofit existing development;

(7) Fees for existing discharges to the MS4 and reduction of fees for retrofit implementation.

Concern- This item clearly conflicts with the Illicit Discharge/Connection Elimination Program.

Proposed solution- We suggest omitting item (7).

17. Section VI.C.10.f.ii and iii indicates that each permittee;

shall prevent discharges of wash waters from vehicle and equipment washing by implementing any of the following measures at existing facilities with vehicle or equipment wash areas:

(1) Self-contain, and haul off for disposal; or

(2) Equip with a clarifier or an alternative pre-treatment device and plumb to the sanitary sewer in accordance with applicable waste water provider regulations, and

ensure that any municipal facilities constructed, redeveloped, or replaced shall not discharge wastewater from vehicle and equipment wash areas to the MS4 by plumbing all areas to the sanitary sewer in accordance with applicable waste water provider regulations, or self-containing all waste water/ wash water and hauling to a point of legal disposal.

Concern- This MCM does not provide an option to have vehicles washed at commercial car/truck washes.

Proposed solution- We suggest revising this section to include an option to have vehicles washed at commercial car/truck washes.

18. Section VI.C.10.f.ix requires each Permittee to implement controls and measures to prevent and eliminate infiltration of seepage from sanitary sewers to MS4.

Exclusively Industrial

Concern- This MCM is a redundant and unnecessary requirement considering the Illicit Discharge/Connection Elimination Program and the Monitoring Program.

Proposed solution- We suggest omitting this section.

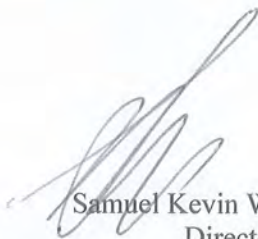

19. Section 4 of the Bioretention/Biofiltration Design Criteria indicates that *waterproof barriers may not be placed on the bottom of the biofiltration unit, as this would prevent incidental infiltration which is critical to meeting the required pollutant load reduction.*

Concern- This particular design criteria apparently does not consider pre-existing soil contamination concerns from historical industrial zones and erroneously assumes that all soil is uncontaminated. Based on our site closure records, despite sites undergoing a successful remediation process and subsequently being issued a No Further Environmental Action approval from a regulatory oversight agency, former soil contaminated sites are not contaminant free.

Proposed solution- Revise the design criteria to allow waterproof barriers to prevent migration of known environmental contaminants to groundwater from infiltration of rainwater.

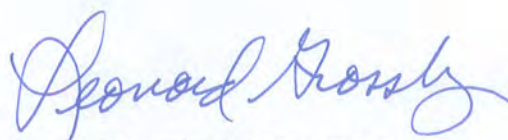

The City of Vernon appreciates the RWQCB's staff efforts in providing frequent workshops with meaningful information and collaboration as we progress with the next iteration of the Los Angeles County Municipal Stormwater Permit. The City will continue to cooperate with the RWQCB to protect the environment. Please contact Mr. Jerrick Torres at (323) 583-8811 ext. 204 if you have any questions or comments.

Sincerely,

Re: Greater Los Angeles County MS4 Permit - New Development/Redevelopment Criteria

Dear Ms. Purdy and Mr. Ridgeway:

Cook Hill Properties, LLC (CHP) is the development partner on several projects within your jurisdiction.

CHP has several concerns regarding the proposed updated Greater Los Angeles County Municipal Separate Storm Sewer (MS4) NPDES Permit Minimum Control Measures. While we certainly agree with the objective of ensuring the implementation of *effective* Best Management Practices (BMPs) at construction sites to reduce the contribution of pollutants to the MS4 from construction activities, we believe that "one size fits all" BMPs are not necessarily the most effective means of controlling pollutants.

In terms of New Development/Redevelopment Criteria, certain BMPs allowed in the MS4 permit for Ventura County should be allowed in the Greater Los Angeles County MS4 Permit. Low Impact Development (LID) is best achieved when it is incorporated early in the design phase of a project and considers the site-specific development context. The permit should allow for different types of LID BMPs to be used because the type of development that occurs in LA County is varied. The best LID design for one type of project may not work in another. Specifically, bio-filtration BMPs should be allowed as they are in the permit issued by the LARWQCB for Ventura County.

While LID can be a good tool, it is never going to achieve the water supply and water balance goals outlined in the staff proposal. The LARWQCB should put its attention into addressing

Ms. Renee A. Purdy
Mr. Ivar Ridgeway
April 13, 2012
Page 2

pollution that emanates from the existing urbanized areas, rather than on incremental development. These new requirements will make redevelopment extremely difficult.

The staff working proposal blatantly ignores recent court decisions and national trends relating to numeric limits and incorporates numeric benchmarks that are legally and scientifically unsubstantiated.

Topographic features in many cases make on-site retention of storm water difficult or impossible, in combination with the applicable grading code, in order to meet slope stability requirements. Immediate off-site options are often limited by government ownership or other restrictions.

Thank you for the opportunity to comment on the proposed Greater Los Angeles County MS4 Permit. Please do not hesitate to contact me with any questions you may have about our comments.

Sincerely,

A handwritten signature in black ink, appearing to read "Norman E. Witt, Jr.", with a stylized flourish at the end.

Comments on Staff Working Proposal for LA County MS4 Permit – Due April 13, 2012

SUBMIT TO: LA Regional Water Quality Control Board

rpurdy@waterboards.ca.gov

iridgeway@waterboards.ca.gov

- The staff working proposal is inflexible and confusing.
- The permit limits modern stormwater management technology that is considered LID; specifically biofiltration. The Staff proposal relegates biofiltration LID to an afterthought in a selection process that is unlike anything in practice currently. The selection process and use of “preferred” options is unnecessary. There is an established hierarchy and we need to stick to that hierarchy.
- The Clean Water Act standard is to reduce pollution to the Maximum Extent Practicable. There is no mention of this anywhere in the staff proposal, and without some balance of technical and economic feasibility, some of the requirements in the staff working proposal will render projects unviable. For example, green roofs and harvesting projects may not be the preferred option for a jurisdiction or a project.
- The staff working proposal regulates a project’s runoff twice: first, it mandates using a very restrictive set of LID BMPs, which when applied won’t allow most projects to manage the water quality volume on-site. For the remaining runoff volume, the project proponent must then install treatment controls on-site and the staff proposal sets pollution benchmarks for that runoff (p 31). And then, the staff proposal requires that the runoff volume which undergoes treatment control on-site be mitigated at an offsite location using LID BMPs. This unnecessarily penalizes a project proponent. Not only do they have to install treatment controls and monitor discharges several times a year, they have to pay to have the volume of runoff managed off-site using LID BMPs...essentially paying twice for the same molecule of water. This combination of requirements goes beyond the authority of the Board.
- A cost analysis needs to be performed to understand what the additional filter and retainage requirements will require.
- Limiting compaction on sights and trying to force people to do infill will limit product choices for the consumers. What impact will this have on the overall economy. There is demand for single family detached housing
- Who will provide education on the requirements – how long will it take to train – what will the training cost to produce and what will it cost to the consumer taking the training
- The inspections that are required to be performed – is that covered in the permit cost or will there be additional costs to have inspections performed.

Comments In Re: Staff Working Proposal Greater Los Angeles County MS4 Permit – Non-Stormwater Discharges and Minimum Control Measures

Generally

The new requirements (viz., requirements that go beyond the current MS4 permit) appear to be “arbitrary” to the extent they are not supported by outfall monitoring relative to water quality standards (WQS), including TMDLs. Staff seems to have ramped-up the requirements for the sake of it.

2. Legal Authority

- a. Each Permittee must establish and maintain adequate legal authority, within its respective jurisdiction, to control pollutant discharges into and from its MS4 through ordinance, statute, permit, contract or similar mean.

This is new requirement to the extent that imposes on permittees the additional responsibility for “controlling” non-discharges into the MS4.

Issue: Federal stormwater regulations do not authorize the “control” of non-stormwater discharge into the MS4. They only require prohibiting illicit discharges to the MS4 and requiring non-stormwater discharges not exempted or allowed to be covered under a separate NPDES permit. Further, State Board Water Quality Order 2001-15 prohibits MS4 permittees to control by way of on-site treatment of non-stormwater discharges to the MS4.

Recommendation: Delete controlling discharges to the MS4.

- i. *Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites. This requirement applies both to industrial and construction sites with coverage under an NPDES permit, as well as to those sites that do not have coverage under an NPDES permit. Grading ordinances must be updated and enforced as necessary to comply with this Order.*

This provision is new and is unclear as to what the difference is between controlling *the contribution of pollutants to its MS4 from stormwater discharge* and controlling the quality of stormwater discharged from industrial and construction sites.

Issue: Poses the problem of how a permittee will be able to require an industrial and construction site covered under general NPDES stormwater permits to control discharges to the MS4. This general requirement is covered under those permits. It is up to the general permittee here – not the municipal permittee – to

control pollutant discharges to the MS4. Further, for those industrial and construction activities that require coverage under general permits will be required to obtain them as condition for a grading permit or other municipal requirement. Further, this provision needs to make a distinction between construction sites that are subject to the general stormwater activity permit and those that are not (viz., those that disturb less than 1 acre of soil by grading, clearing, and excavating).

Recommendation: Discuss this issue with Regional Board industrial and construction permitting staff.

- ii. *Prohibit all non-stormwater discharges not otherwise conditionally allowed pursuant to Part [TBD]*

This is new requirement that is unnecessary and confusing. Conditionally exempt or allowed discharges are not only category of discharges that may enter the MS4.

Issue: There are some NSW discharges that are allowed into the MS4 because they are covered under separate NPDES permits. Those NSW discharges that are not exempted/conditionally exempted (or authorized) under the MS4 permit or a separate NPDES permit are simply illicit discharges. Further, it is redundant under 2.a.iii below.

Recommendation: Delete proposed requirement. The current permit already does this job nicely. It says: *Permittees shall possess the necessary legal authority to prohibit non-storm water discharges to the storm drain system, including, but not limited to ...*

- iii. *Prohibit and eliminate illicit discharges and connections to the MS4*

This is a new requirement in that it requires the elimination of illicit discharges.

Issue: Federal stormwater regulations do not require the elimination of illicit discharges; they only prohibit them. California MS4 permits only require the elimination of illicit connections (connections through which illicit discharges pass) to the MS4 through the illicit connection/discharge detection and elimination program.

Recommendation: Delete this requirement and default to current MS4 language which says to *prohibit illicit discharges and connections and require removal of illicit connections*. There is a difference to prohibiting illicit connections and removing them. Prohibit here means preventing the installation of an illicit connection while eliminating one applies to an existing connection.

- v. *Control the discharge of spills, dumping, or disposal of materials other than stormwater to its MS4*

This is new requirement that imposes on permittees the add burden to “control” discharges to its MS4.

Issue: It is not clear what “control” means here. In any case, controlling a spill or dumping or disposal of materials other than stormwater does not make sense. It suggests that permittees should control illicit discharges by reducing the pollutants contained in them to the maximum extent practicable (MEP), which is how the term “control” is used vis-à-vis stormwater discharges from the MS4. You don’t want this. What you want instead is a definite prohibition of these types of illicit discharges – period -- as is required under federal stormwater regulations. Further, State Board Order 2001-15 prohibits requiring controlling pollutants in non-stormwater discharge to the MS4.

Recommendation: Delete this requirement.

- vi. *Utilize enforcement mechanisms to require compliance to require compliance with applicable ordinances, permits, contracts, or orders*

This is a new requirement it tells permittees to do what they already know what to do.

Issue: Permittees must in any case utilize enforcement mechanisms to enforce legal authority requirements.

Recommendation: Delete this requirement.

- vii. *Control the contribution of pollutants from one portion of the shared MS4 to another portion of the of the MS4 through interagency agreements among Co-permittees.*

This is a new requirement that introduces the term “shared MS4.”

Issue: Without knowing what “shared MS4” means it is not clear what this new legal authority requirement is trying to accomplish.

Recommendation: Provide clarification of what it means and why it is necessary.

- viii. *Control of the contribution of pollutants from one portion of the MS4 through interagency agreements with other owners of the MS4 such as the State of California Department of Transportation*

This is a new requirement whose purpose is also unclear.

Issue: The proposed legal authority requirement does not explain why it is needed and needs to explain how a State agency can be the owner of the MS4 (municipal separate storm sewer system).

Recommendation: Explain the purpose of the requirement or delete it.

- ix. *Carry out all inspections, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with applicable municipal ordinances, permits, contracts and orders, and with the provisions of this Order, including the prohibition of non-stormwater discharges into the MS4*

and receiving waters. This means the Permittee must have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from entities discharging into its MS4

This is new requirement that calls for permittees to have the legal authority prohibit non-stormwater discharges into receiving waters as well as the MS4. It also requires the permittee the authority to enter, *monitor, inspect, take measurements, review and copy records, and require regular reports from entities discharging into its MS4*, which exceeds the equivalent legal authority requirement under the current permit.

Issue: The proposed legal authority requirement exceeds federal stormwater regulations limitation to the extent that it prohibits illicit discharges to receiving waters. Again federal stormwater regulations only prohibit illicit discharges to the MS4. Receiving waters lie outside the regulatory scope of the MS4 permit by virtue of the fact that it is an MS4 permit and not a receiving water permit. Further, if an illicit discharge is prohibited to the MS4 it would be, by extension, prohibited to a receiving water in any case. However, there are some situations where an illicit discharge may be directly discharged into a receiving water by by-passing an MS4 component through direct dumping or by spill from a property to the receiving water. Permittees should have the legal authority to prohibit such discharges but only under these narrow circumstances.

Recommendation: Language should be revised to prohibit illicit discharges to the MS4 and to discharges that by-pass the MS4 and directly enter a receiving water.

- x. *Require the use of control measures to prevent or reduce the discharge of pollutants to achieve water quality standards.*

This provision is vague in that it does not explain whether it applies to stormwater discharges from the MS4 or illicit discharges to the MS4. Further, it is not clear if this requirement is aimed at all dischargers including: industrial and construction with and without permits; all commercial dischargers (not just the ones that are defined in the proposed permit); and/or to residential dischargers.

Issue: This proposed legal authority requirement could force permittees to impose requirements on dischargers not authorized under federal law. It would also make likely make it impossible to determine if a dischargers is not reducing pollutants to achieve water quality standards (narrative and numeric).

Recommendation: Unless staff can explain how this requirement would be complied with it should eliminate it.

- b. *Each Permittee must submit a statement certified by its chief legal counsel that the Permittee has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in 40 CFR §122.26(d)(2)(i)(A-F) and this Order. These statements must include:*

- i. Citation of applicable municipal ordinances or other appropriate legal authorities and their relationship to the requirements of 40 CFR §122.26(d)(2)(i)(A)-(F) and of this Order; and
- ii. Identification of the local administrative and legal procedures available to mandate compliance with applicable municipal ordinances identified in (i) and therefore with the conditions of this Order, and a statement as to whether enforcement actions can be completed administratively or whether they must be commenced and completed in the judicial system.

This provision in general is unnecessarily prescriptive. It specifies that a permittee's "chief" legal counsel must certify legal authority; it must cite relevant portions of 40 CFR §122.26(d)(2)(i)(A)-(F) and of proposed permit; and it dictates to permittees how to implement enforcement actions.

Issues: (1) It should be left up to the permittee to determine whether chief legal counsel or non-chief legal counsel should certify legal authority; (2) citing federal regulations is unnecessary since all is required to justify legal authority requirements to cite the permit which is a reflection of both applicable state and federal regulations; and (3) because CFR §122.26(d)(2)(i)(A)-(F) encompasses so many requirements it would be difficult for City Attorneys to know which provisions therein are applicable.

Recommendation: Delete this requirement and default to existing permit requirements.

8. Planning and Land Development Program

Providing comprehensive comments in connection with this proposed program is not possible because of the short comment period the Regional Board Staff has set. In general terms, the new requirements associated with this program have been proposed without justification. There is no outfall data that would suggest that the existing Development Planning/SUSMP program is not having some affect on reducing pollutant discharges from subject projects.

a.i.1 *Lessen the water quality impacts of development by using smart growth practices such as compact development, directing development towards existing communities via infill or redevelopment, and safeguarding of environmentally sensitive areas.*

Issues: This is too prescriptive. How a permittee addresses stormwater quality impacts should be left to its discretion.

Recommendation: Delete this requirement.

c.i.1 *Minimizing Impervious Area*

Issue: This should not be an end to itself but rather a goal that would be achieved by infiltrating runoff from impervious areas through infiltration controls. An entire

area of project could be impervious but as long as the runoff is infiltrated there should be no issue.

Recommendation: Change language to require minimize impervious area to the extent practicable.

b.i.1 New Development Projects

Issue: No justification is provided for reducing the trigger for requiring post-construction mitigation from 1 acre for industrial and commercial uses to 10,000 square feet. Such a requirement should be based on whether outfall monitoring reveals exceedances for those pollutants in stormwater runoff that can be reduced to the MS4. Further, analysis needs to be provided to estimate how much a given pollutant may be reduced to and from the MS4 by lowering the soil disturbing trigger to 10,000 square feet. To do otherwise would render this requirement arbitrary.

Recommendation: Eliminate requirement or justify its need.

b.i.1.g Streets, roads, highways, and freeway construction of 10,000 square feet or more of impervious surface area shall follow USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets to the maximum extent practicable

Issue: As in the case of the above, there is justification for this new requirement. Such a requirement should not be imposed without piloting it first.

Recommendation: Delete requirement and if outfall monitoring indicates that additional infiltration is needed a pilot demonstration project for infiltrating street runoff should be conducted.

c. New Development/ Redevelopment Project Performance Criteria

Issue: The new requirements proposed here, particularly on-site and off-site retention and benchmarks for treating pollutants through infiltration are not justified. Again, no outfall data is available to demonstrate that these new measures are required. Further, staff should not make groundwater recharge an objective of the new permit. Permittees are only obligated to reduce pollutants in runoff from the MS4 to the maximum extent practicable. It should be noted, nevertheless, that at least 30 permittees situated in Reach 2 of the Rio Hondo and in the Upper San Gabriel River drains into groundwater recharge basins, thereby obviating the need for this requirement.

Recommendation: Discussion of these enhanced post-construction runoff mitigation measures should be postponed until outfall monitoring indicates exceedances for applicable water quality standards. Delete any reference to groundwater recharge as a permit requirement.

9.a.iv Prevents construction site discharges to the MS4 from causing or contributing to a violation of water quality standards.

Issue: This new requirement is excessive because it places the burden on the permittee to prevent construction discharges from causing or contributing to a violation of a water quality standard. Again, permittees are only required to control pollutants in stormwater runoff to the maximum extent practicable.

Recommendation: Delete requirement.

f.ii.1 *Construction Plan Review and Approval Procedures – Erosion Control Plan*

Issue: Requiring an erosion control plan for construction projects under 1 acre is unnecessary and there are too many new plans proposed in the new and old permit as it is. Typically, only a few BMPs are required to control erosion on any construction site: silt fencing placed perpendicular to flow, sand bags (two or three rows high depending on site conditions and when construction will be performed), and covering stockpiled sediment, and perhaps a de-silting basin (which is rarely needed). These BMPs can be prescribed as conditions without the need for a formal plan. This is currently done as minimum BMPs for construction sites.

f.ii.2 *Construction Plan Review and Approval Procedures – Specifying SWPPPs for 1 Acre Construction Sites*

Issue: Specifying SWPPP requirements for 1 acre projects is not necessary because they require a General Construction Activity Stormwater permit which controls.

Recommendation: Delete any specific references to SWPPPs.

f.ii.6 *Each Permittee shall require that for all projects, the landowner or the landowner's agent sign a statement on the Local ESCP/SWPPP ...*

Issue: A local SWPPP is no longer a requirement (talk to Ivar)

Recommendation: Remove this provision.

Renee Purdy
Regional Program Section Chief
Los Angeles Regional Water Quality Control Board
320 4th Street, Suite 210
Los Angeles, CA 90013

RE: City of Malibu Comments - Staff Working Proposal for Provisions Regarding Minimum Control Measures in the Reissuance of the Los Angeles Region Municipal Stormwater Permit

Dear Ms. Purdy:

The City of Malibu thanks the Los Angeles Regional Water Quality Control Board and staff (Regional Board) for allowing the opportunity to review and comment on the proposed minimum control measures for the pending draft municipal storm water permit for the Los Angeles region. Early and ongoing communication is critical to the successful development of a protective but reasonable permit. Therefore, the ongoing dialogue, workshops, and public comment periods are much appreciated.

The City of Malibu, as a participant in the Los Angeles Permit Group (LA Permit Group), would like to express its support for the letter submitted by the LA Permit Group dated April 13, 2012. The comments therein are a balanced compromise of the various permittees' views and representative of the collective concerns of the permittees. The negotiations and consensus building within that group has been vital to this process, and yields workable recommendations for this complex permit. The City encourages the Regional Board to consider the comments in that letter and adjust the proposed permit language accordingly. The City of Malibu would also like to emphasize the following additional comments.

Legal Authority Section VI.C.2.a.vii and VI.C.2.a.viii

In section VI.C.2.a.vii on page 4, the Staff proposal states, that [permittees shall] "control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Co-permittees". In addition to the LA Permit Groups

comments on this section, the intent and scope of this provision is not clear. For example, it is not clear which permittees or which portions of the MS4 this is intended to cover. Please clarify what a "Shared MS4" means, as that is not a defined term. Additionally, if you can please provide some clarification as to what this provision is attempting to accomplish, permittees will be better able to understand if they have the legal authority to comply with this mandate. Without additional information, it is difficult to determine the scope of this proposed requirement.

New Development Projects Section 8.b.i.1.g Regarding Roadways

The City is a strong supporter of green streets and low impact development (LID) strategies, as evidenced by the City's Cross Creek Roadway project (Winner of SCAG Compass Blueprint Recognition for Excellence and Achievement in Planning), Legacy Park Project (winner of 6 awards in 2011 and 2012 including the American Society of Civil Engineers' Project of the Year Award for Region 9, which includes the entire state of California.), and two Proposition 84 funded roadway and drainage retrofit projects currently in design that will include biofiltration and one may include limited infiltration. Therefore, including the recommendation to employ such strategies on new street, road, highway, and freeway construction is sensible and supported by the City. However, it is important that the Regional Board include a clarification that this section does not apply to routine maintenance projects, and the City requests that such language be included in the permit.

New Development and Redevelopment Options for Stormwater Management Design Table

The City would like to emphasize that the preferred option to provide on-site retention of the SWQDv in the table on page 26, will be physically impossible for many projects in Malibu due to high groundwater, geotechnical hazards and geologic instability, or where there are adjacent onsite wastewater treatment systems (OWTS). Under the medium preferred options, offsite infiltration or bioretention most likely will be infeasible since onsite retention is almost impossible in many areas of the City. In other words, there is no other place to put the water in certain areas because the same problematic groundwater and geologic conditions are widespread throughout the City. Groundwater replenishment is definitely not an option in most areas, as the City does not have a viable aquifer due to geological conditions. Retrofitting an existing developed site has limited options, as Malibu already has a high percent of open and undeveloped space and existing developed space that is primarily low density and rural residential, and the City has few existing commercial properties. The only feasible option left for the very limited number of projects that are in the City, which are already heavily regulated by the City's approved Local Coastal Plan, is the on-site biofiltration systems. However, requiring 1.5 times the SWQDv is excessive, arbitrarily assigned, and without any substantiation that treating 1.5 the volume will significantly improve the water quality any more than a design using the SWQDv.

Technical Infeasibility Section 8.c.ii.2.c

The section discussing technical infeasibility to implement options for stormwater management design on page 27 should also include dewatering wells as a justification for technical infeasibility. There are several special geologic hazard assessment areas in the City with dewatering wells to mitigate landslide threats. These wells must continually divert and discharge water to avoid rising groundwater that could cause landslides. Areas requiring dewatering wells should be expressly included as technically infeasible situations for stormwater management by the preferred options.

Alternative Compliance Measures Section 8.c.iii.3.c

The Alternative Compliance Measures detailed starting on page 27 leave projects in the City of Malibu with few alternatives. As previously explained, offsite infiltration or bioretention will rarely be an option. Additionally, groundwater recharge cannot be performed within the City due to high groundwater, geotechnical hazards and geologic instability, or where there are adjacent OWTS.

Water Quality Mitigation Criteria Section 8.c.iv.2.a

The Water Quality Mitigation Criteria section on page 31 lacks a definition for “qualifying storm event”. The City requests that the Regional Board please include a definition for this term, either in this section or in the overall definitions. It is preferred that the qualifying storm event definition match the requirements under the State’s Construction General Permit.

Documentation and Reporting- General

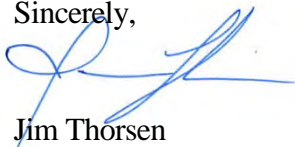

The minimum control measures overall will require an inordinate amount of tracking and documentation, much of which may not lead to a demonstration that water quality is being protected. One such example is the requirement that “Each Permittee shall use an electronic system to inventory grading permits, encroachment permits, demolition permits, building permits, or construction permits”. While an electronic system is ideal, it is not always available to a permittee, is a costly endeavor, and should be an optional method of maintaining records, not mandatory. Further, the permit needs clarification to better describe which types of permits must be reported (i.e. which permits affect water quality). For example, contractors must apply for an encroachment permit to place a temporary office in the public right of way, and building permits are issued for electrical work, neither of which have any relationship to water quality. Yet under the language as proposed, a permittee would still be required to report such permits. The City of Malibu is in the process of developing such an electronic permitting system, but there is no guarantee that it will be completed in time to meet this condition, or that the funding will be available to include *all* of the specifics of this provision. Therefore the City requests that (1) the Regional Board take a closer look at this section and specify what data is of real value to determining compliance and / or water quality protection; and (2) allow for reasonable time frames to comply with these requirements (if an advanced tracking and inventory system remains a requirement).

City of Malibu Comments on Proposed Minimum Control Measures
April 13, 2012
Page 4 of 4

Malibu is appreciative of the Regional Board's efforts to consider the comments from stakeholders and to work collaboratively on this permit reissuance, and understands the inherent challenges in drafting a permit for such a diverse geographic region. Again, the City would like to emphasize the need for flexibility and reasonableness when a one-sized fits all approach is not feasible for various parts of the County. In the end, the permit must identify a method of balancing the need to protect receiving water quality in a manner that accounts for the real, practical challenges that the permittees face. The City continues to support the interactive approach to developing this permit and iterative options for compliance, thanks the Regional Board for the opportunity to comment, and urges the Regional Board to properly address the City of Malibu's comments. If you have any questions regarding this letter, you may contact Jennifer Brown, Senior Environmental Programs Coordinator at (310) 456-2489 x 275 or jbrown@malibucity.org.

Sincerely,

Jim Thorsen
City Manager

Greetings:

TECHNICAL COMMENTS ON LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD STAFF WORKING PROPOSAL FOR THE GREATER LOS ANGELES COUNTY MS4 PERMIT – MINIMUM CONTROL MEASURES

The City of Los Angeles (City) appreciates the opportunity to provide technical comments on the Los Angeles Regional Water Quality Control Board (Regional Board) Staff Working Proposal for the Greater Los Angeles County MS4 Permit. The City appreciates the time your staff has dedicated to meeting with us and the process that has provided the opportunity for substantial engagement and input. The City recognizes that this Working Proposal for Minimum Control Measures (MCMs) is part of the overall process and appreciates your consideration of our comments at this time. The following highlights a few key technical issues. Additional detailed technical comments are also provided in the associated attachments.

Watershed-Based Program

The City supports Regional Board staff's Watershed-Based Program approach. A watershed based program is the quintessential approach allowing for integration of all program elements (referred to by Regional Board staff as "Watershed Management Programs" during the April 5, 2012 workshop) and affords agencies the opportunity to comply with requirements while focusing efforts on the highest priorities for each watershed through customization of MCMs. This approach also considers the current efforts undertaken by agencies to obtain grant funding for water quality projects, for the reason that criteria for many water quality grants are based on watersheds.

Mr. Sam Unger, Executive Officer
Los Angeles Regional Water Quality Control Board
April 13, 2012
Page 2

Finally, this approach supports implementation of TMDLs, which are developed and implemented based on watersheds. The City recognizes that the specific details regarding customization of MCMs have not yet been developed and that this aspect of the Permit will continue to evolve over the next several months. Comments provided herein are intended therefore to inform the process at this point in time. The City looks forward to working with Regional Board staff to continue to develop the Watershed Management Programs.

Timeline

The Staff Working Proposal does not currently provide timelines for the start-up and implementation of the MCMs. This is a key aspect of understanding the feasibility and ease of implementation associated with new requirements. The City requests that the Regional Board staff provide a draft timeline for implementation and phasing-in of the Minimum Control Measure requirements.

Industrial/Commercial Facilities Program

As discussed previously with Regional Board staff, the City maintains a database of facilities that have been inspected over the last decade. The data obtained from inspecting these facilities provides a wealth of information regarding the necessary frequency of inspection. The City would appreciate the opportunity to tailor the Industrial/Commercial program (e.g., establish inspection frequencies) via the Watershed Management Programs using the information from the database and extensive on-the-ground inspection experience.

Additionally, as discussed during the April 5th workshop, Regional Board staff indicated that consideration would be given to streamlining the requirements of the MS4 Permit with general permit requirements. The City requests that the Regional Board consider the streamlining of the Industrial General Permit's (IGP) tracking and inspection activities with those required in the Working Proposal Industrial/Commercial provision. Reducing overlap with inspections conducted by the State and information tracked by SMARTS will allow the City to focus resources on areas that will maximize water quality benefits. In the absence of this proposed streamlining and flexibility to target the most important categories, the additional provisions of this proposed language will put the number of increased inspections outside of our reach.

Planning and Land Development

The City of Los Angeles recently adopted a Low Impact Development (LID) Ordinance which will go into effect in May 2012. The creation of the ordinance included the participation from several stakeholder groups including Regional Board staff. The City requests that Regional Board staff consider referencing the City's LID Ordinance within the Permit as an equivalent mechanism for compliance with the Planning and Land Development MCMs.

Mr. Sam Unger, Executive Officer
Los Angeles Regional Water Quality Control Board
April 13, 2012
Page 3

Although the City recommends that the permit reference the LID Ordinance as equivalent, additional more detailed technical comments on the Planning and Land Development Provision are provided in Attachment A. In particular, the City asks the Regional Board staff to consider allowing biofiltration, including planter boxes as a "Medium Preferred Option." There are numerous physical and site constraints within the highly urbanized Los Angeles Region, limiting the feasibility of infiltration, and rainwater harvesting in certain circumstances. Given that these preferred options will not be available for certain sites, including biofiltration within the "Medium Preferred" category would provide a feasible option in those circumstances.

Additionally, the City requests that Regional Board staff consider revising the water quality standards for development site runoff with a technology-based performance standard as established within the Ventura County NPDES MS4 permit.

Construction Provision

As currently written, the Construction provision applies to "all activities involving soil disturbance..." The City requests that Regional Board staff consider revising the standard to include a minimum threshold, such as 100 cubic yards of soil disturbance. This threshold would appropriately focus the Construction provision requirements on projects that would require grading permits within the City. In addition the proposed language would treat smaller than one-acre sites similarly to the sites that are subject to the Construction General Permit (CGP) which will greatly impact existing construction practices without necessarily improving water quality.

As noted above, during the April 5th workshop, Regional Board staff indicated that consideration would be given to streamlining the requirements of the MS4 Permit with general permit requirements. The City requests that such consideration also include the requirements contained within the GCP, such as the tracking and inspection requirements. The City appreciates the Regional Board staff's consideration as such revisions would result in efficiencies between the CGP and MS4 Permit, helping to provide the City with the flexibility needed to invest resources in the areas and construction sites where it is needed most.

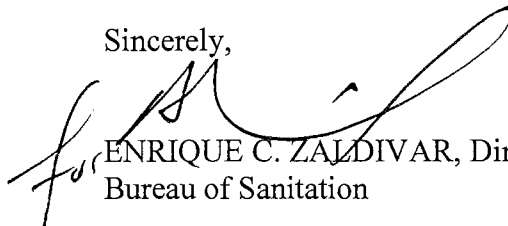

Cause or Contribute Language

Language relating to "cause or contribute to water quality exceedances" is currently utilized throughout the MCMs. This language comes from the Receiving Water Limitations provision of the Permit. For clarity and consistency, the City requests that the "cause or contribute" language be addressed solely within the Receiving Water Limitations provision. In the MCMs, where such language is currently used, the phrase should be replaced with a reference to Part 2 (Receiving Water Limitations).

Mr. Sam Unger, Executive Officer
Los Angeles Regional Water Quality Control Board
April 13, 2012

**ATTCHMENT A:
CITY OF LOS ANGELES TECHNICAL COMMENTS
ON STAFF WORKING PROPOSAL FOR THE GREATER LOS ANGELES COUNTY MS4 PERMIT
(APRIL 13, 2012)**

Minimum Control Measure Definitions			
No.	Page	Citation	Comment
1	2 – 3	1.c	Please consider including all the definitions in a separate chapter as was done under the current Municipal Stormwater Permit (Permit). Include all critical terms and remove terms that are not used. (i.e Effective Impervious Area)
2	3	1.c.xi	Planter boxes are commonly considered biofiltration systems. Please consider allowing their use since for many sites in the City of Los Angeles (City) they would be the only viable option.

Legal Authority			
No.	Page	Citation	Comment
3	4	2.a.i	Since permittees do not have jurisdiction or authority over certain entities such as federal facilities, the City recommends that the following language be modified from “Control contribution of pollutants...associated with industrial and construction activity” to “ensure that industrial and commercial activities control contribution of pollutants to its MS4 through the implementation of NPDES permits, education and outreach and ID/IC program.”
4	5	2.a.xii	Homeowners and other private landowners may find difficulty in documenting the effectiveness of their structural BMPs. The City recommends the following revision: “Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4.”

Public Information and Participation Program			
No.	Page	Citation	Comment
5	8	6.d.i(3)	Please consider removing “pharmacies” from the list. Improper disposal of drugs has already been the focus of municipal wastewater and refuse collection programs. Consider adding paint stores to the list.

Industrial/ Commercial			
No.	Page	Citation	Comment
6	8	7.a.i	The “cause and contribute” language comes from the Receiving Water Limitations provision of the Permit. For clarity and consistency, the City requests that the “cause or contribute” language be addressed solely within the Receiving Water Limitations provision. In the MCMs, where such language is currently used, the phrase should be replaced with a reference to Part 2 (Receiving Water Limitations).
7	9	7.b.i(3)	Please consider removing industrial facilities that are covered under the General Industrial Permit (IGP) or have their own permit (e.g., municipal landfills) since they fall under the State’s purview. However as part of TMDL compliance efforts, the City would utilize data and information from the State’s tracking and inspection efforts.
8	10	7.b.i(4)	This requirement, as written, will apply to all commercial and industrial activities within the City of Los Angeles which account for about 150,000 establishments. Please consider revising this provision in favor of a more narrow criterion as outlined in 7.b.i(5). As indicated in the cover letter, the City’s database of Critical Sources has the on-the-ground information needed to target facilities of concern.
9	10	7.b.ii(10)	As a way of reducing overlap of activities between the RWQCB and the permittees, consider excluding the facilities that are subject to the IGP or individual permits.
10	16	7.d.ii	Please consider adding language that remove industrial facilities as they are covered under the IGP or have their own permit (e.g., municipal landfills) and they fall under the State’s purview. However as part of TMDL compliance efforts, the City would utilize all information from the State’s tracking and inspection efforts.

Planning and Land Development			
No.	Page	Citation	Comment
11	21	8.b	This provision establishes the scope of development projects subject to the post-construction controls. Sometimes the criterion is based on impervious area and other times it is based on surface area. For consistency, please consider revising the criterion so that the impervious surface area is the mechanism for determining applicability as it is an accurate surrogate for establishing project eligibility.
12	21	8.b.i(g)	The threshold of 10,000 sq ft is low for public roads construction. Please consider revising the streets and roads applicability threshold from 10,000 sq ft to 50,000 sq ft.
13	24	8.c.i(7)	Similarly, please consider making green roofs an optional consideration (versus required) so that municipalities and projects have the flexibility to determine if green roofs conflict with water and landscape conservation goals.
14	25-26	Table	Unique challenges to the proposed prioritization and restrictions on stormwater management options would be faced by the Port of Los Angeles. While our Harbor Departments supports LID techniques were feasible, it is concerned that many of infiltration, rainwater harvesting and even biofiltration options are not applicable for the port facilities. This is due to its presence of typical constrains infiltration and rainwater harvesting combined with the limited space and the need for efficiency in a global operation, which in turn reduces air pollution and aerial deposition. In addition the option of offsite mitigations is not allowed due to State Tidelands Trust restrictions which limit Port expenditures outside of the Tidelands Trust jurisdiction. Allowance for treatment technologies that go beyond LID techniques maybe needed in this case.
15	26	8.c.ii(2)	As indicated in Comment #13, green roofs may conflict with water and landscape conservation goals. Please consider providing some flexibility so that permittees and developers can take these goals into account when selecting BMPs.
16	27	8.c.ii(2)(f)	Please consider adding, "Other site or implementation constraints as identified by Permittees" to the list of technical infeasibility criteria. Similar language was provided in the Ventura County's NPDES MS4 Permit and allowed permittees to identify further constraints through the development of their post-construction technical guidance manual.
17	28	8.c.iii(2)(a)	A retrofit project is likely to capture, retain, and treat a mix of land uses. As a result, an offsite project's (i.e., regional retrofit) land uses (and associated EMCs) may not exactly line up with the land use of the new development. The City recommends that this language be revised with more flexible language that requires the applicant to show "equivalent pollutant control."
18	28	8.c.iii(3)(b)	The City requests that the watershed boundaries proposed within this section be aligned with those established in the Integrated Regional Water Management Plan (IRWMP) process. Utilizing the same watershed boundaries will assist in aligning stormwater permit requirements with the goals of IRWMPs and allow municipalities to maximize the opportunities to implement groundwater replenishment projects identified within IRWMPs. This may be distinguished as separate criteria from other alternative compliance options that should occur within the same HUC-12.
19	29	8.c.iii(3)(f)	The four year timeline makes the implementation of regional facilities via an offsite mitigation program difficult due to the length of time it takes to acquire all of the necessary permits. Additionally, it may take several years for a permittee to accumulate the funds necessary for the design, construction and permitting of a regional facility. Instead the City suggests that the language be modified to indicate that four years is the goal for construction of an offsite facility, but that an additional four year extension is available to regional facilities.

Planning and Land Development			
No.	Page	Citation	Comment
20	31	8.c.iv(2)	The use of the proposed monitoring and BMP retrofit requirements for development projects is unprecedented. They introduce uncertainty on what are the required BMPs. In addition, post-construction opportunities for BMP implementations are limited and much more expensive as compared to during the development phase.
21	31-33	8.c.iv(1)(b) & (3)	The “cause and contribute” language comes from the Receiving Water Limitations provision of the Permit. For clarity and consistency, the City requests that the “cause or contribute” language be addressed solely within the Receiving Water Limitations provision. In the MCMs, where such language is currently used, the phrase should be replaced with a reference to Part 2 (Receiving Water Limitations).
22	31	8.c.iv(1) & (2)	Please consider revising the benchmarking tables to reflect a technology-based performance standard as established within the Ventura County NPDES MS4 permit. These performance tables should be provided as guidance and targets, since in designing on-site BMP controls will be based on design standards.
23	33	8.c.v(1)	Please consider alternatives to the Ventura County NPDES MS4 Permit Hydromodification criteria such as “maintain the peak flow control” used in the existing permit and the County of Los Angeles Hydromodification Criteria as outlined in County LID Manual.
24	39	8.d.iv	Please provide a definition for grandfathered projects namely what projects must comply with this order versus those that must comply with the previous one.
25	40	8.d.iv(d)	Alternatively, please consider allowing Permittees to require as part of the BMP Maintenance Agreement that the property owner performs BMP-specific maintenance and keep log of their maintenance and inspections on-site.

Construction			
No.	Page	Citation	Comment
26	41	9.a.iv.	The “cause and contribute” language comes from the Receiving Water Limitations provision of the Permit. For clarity and consistency, the City requests that the “cause or contribute” language be addressed solely within the Receiving Water Limitations provision. In the MCMs, where such language is currently used, the phrase should be replaced with a reference to Part 2 (Receiving Water Limitations).
27	41	9.d	Please consider revising the requirement to include a lower threshold for projects such as 100 cubic yards or 10,000 square feet of soil disturbance.
28	41	9.e.ii	Please consider reducing the overlap between SMARTS and the tracking required under this provision. This could be accomplished by allowing Permittees to access SMARTS for this information versus creating a separate system that tracks similar information.
29	41	9.3.ii(3)	The proximity of a construction site to a waterbody is not always a good indicator of impact. Please consider revising this language to indicate when a site is directly adjacent to, directly upstream from, or on a waterbody.
30	42	9.f.ii	The proposed language treats the Erosion and Sediment Control Plan (ESCP) similarly to the SWPPP required for GCP sites. GCP guidance was never intended for sites smaller than one acre of disturbed soil. An ESCP for sites less than one acre can achieve its goal by requiring the project proponent to show the placement of the BMPs in a narrative form or as part of the construction documents in the form of one to two sheets of the design plans.
31	43	9.f.ii(4)	Please consider revising the language to read “Require that the erosion and sediment control plan include the rationale used for selecting or rejecting BMPs” since quantifying soil loss potential from BMPs is not commonly performed or required for projects permitted under the Construction General Permit (CGP).
32	43	9.f.ii(8)	The US ACOE requires all other permits to be in place prior to issuing the 404 permit. To reduce conflicting requirements, please consider revising this language to read “Require that the ESCP list applicable permits including, but not limited to the State Water Board’s CGP, State Water Board 401 Water Quality Certification, U.S. Army Corps 404 permit, and California Department of Fish and Game 1600 Agreement. Include as a condition of the grading permit that the Operator submit evidence to the MS4 that all permits required for the project have been obtained prior to commencing ground disturbing activities.”
33	43	9.f.ii(4)	In the interest of streamlining requirements, please consider aligning or deferring to CGP requirements. As an example, as currently written, the Construction MCM Provision requires projects that are less than an acre to prepare a REAP which is not a requirement for small projects under the CGP.
34	44	9.f.iv	This section refers to the 2003 version of the California Stormwater BMP Handbook, Industrial Commercial. The City recommends that all references (including fact sheet references within tables) be updated to reference the 2010 version of the CASQA Construction BMP Handbook.
35	44-47	9.g.iv	For clarification, please add the following lead-in sentence for each of the tables: “Each Permittee shall require the implementation of an effective combination of the following BMPs”

Construction			
No.	Page	Citation	Comment
36	48	9.h.ii	<p>Please consider revising inspection frequencies and associated language to reflect requirements in the Ventura County NPDES MS4 Permit (R4-2010-0108):</p> <ul style="list-style-type: none"> Each Permittee shall require that high risk sites shall be inspected by the project proponents Qualified SWPPP Developer or Qualified SWPPP Practitioner or personnel or consultants who are Certified Professional in Erosion and Sediment Control (CPESC) at the time of BMP installation, at least weekly during the wet season and at least once each 24 hour period during a storm event..." (page 71) Each Permittee shall inspect all construction sites for the implementation of stormwater quality controls a minimum of once during the wet season. Concurrently, each Permittee shall ensure that: <ul style="list-style-type: none"> (1) The local SWPPP is reviewed for compliance with local codes, ordinance, and permits. (2) A follow-up inspection takes place within two weeks for inspected sites that have not adequately implemented their local SWPPP." (page 74)
37	48-49	9.h.ii(2)	<p>This provision requires inspection during all phases of the construction. For the City of Los Angeles, this requirement will mean ten of thousands of additional inspections with limited resources. Please consider revising inspection frequency as indicated in the previous comment and limit to the following 2 construction phases: grading phase and prior to the issuance of the Certificate of Occupancy.</p>

Public Agency Activities Program			
No.	Page	Citation	Comment
38	54-56	10.d	<p>Please consider revising this section so that it is limited to public right of way and approved TMDL implementation plans.</p>
39	54	10.d.i	<p>The "cause and contribute" language comes from the Receiving Water Limitations provision of the Permit. For clarity and consistency, the City requests that the "cause or contribute" language be addressed solely within the Receiving Water Limitations provision. In the MCMs, where such language is currently used, the phrase should be replaced with a reference to Part 2 (Receiving Water Limitations).</p>
40	57-59	10.e.iv	<p>To maintain flexibility in BMP selection, please allow for other sources of BMPs from sources other than the Caltrans Stormwater Quality Handbook.</p>
41	60	10.g(7)(c)	<p>The City has an established Integrated Pest Management (IPM) program and as a result, has made significant reductions in pesticides used by the City. The requirement to "demonstrate measureable reductions in pesticide use" will be difficult because reductions have already occurred. Please consider revising the language as follows: "Demonstrate implementation of IPM alternatives where feasible to reduce pesticide use."</p>
42	63	10.vi(3)	<p>Please consider revising the timeline for relabeling storm drains to 180 days to allow the City to bundle the labeling of multiple catch basins together.</p>
43	63	10.vii(1)	<p>Please consider revising the requirement that the revision of catch basin cleanout and inspection schedule be approved by the Executive Officer, to allow Permittees to report and document changes to the schedule within the annual report.</p>
44	65	10.x(3)	<p>Please provide a definition for residual water. For clarification purposes, please provide background or reference information on the basis for the discharge limitations.</p>

Illicit Connection and Illicit Discharge Elimination Program			
No.	Page	Citation	Comment
45	68	11.b	Please modify the section to clarify that mapping requirements apply to Permittee-owned outfalls (18 inches in diameter or greater), open channels, and MS4 pipes due to the significant number of outfalls that the City needs to document. Consider allowing updates for only once during the permit cycle.
46	69	11.c	Based on past surveys, there are approximately 1900 City outfalls discharging directly to Los Angeles River and tributaries; and 1400 into Ballona Creek. In the 1990's, the City performed field screening of dry weather discharges from its outfalls Los Angeles River, Ballona Creek and Dominguez Channel, as required by the previous MS4 permit. It took a crew of 20 inspectors and engineers (dedicated to do field screening only) five years to complete this task. The current MS4 permit draft is asking for an annual re-assessment, which implies that the initial screening should be completed in one year and repeated yearly to determine if there are any changes to the initial observations. Due to the significant number of City outfalls, the City would recommend to be allowed to screen a manageable number of outfalls every year and conduct re-assessment once during the permit cycle.
47	70	11.d.iv(1)	This section states "...require the responsible party to conduct all necessary corrective actions to eliminate the illicit discharge within 48 hours of notification." Please consider revising this language to require elimination within 72 hours. The additional time may be necessary for the Permittee to identify the responsible party or in the event that the discharge occurs on the weekend or during a large public event (i.e. contractors and equipment may not be readily available).

Attachment TBD: Bioretention/ Biofiltration Design Criteria			
No.	Page	Citation	Comment
48	74 – 79	throughout	Please consider making the Bioretention/ Biofiltration Design Criteria Attachment suggested guidelines. The City would appreciate the opportunity to consider guidelines and standards appropriate to the Los Angeles region and reflect the most up-to-date understanding of bioretention/biofiltration pollutant removal effectiveness. This is particularly important as the stormwater field's understanding and knowledge base regarding Low Impact Development practices and soil media specifications evolve.
49	78	5.e	Please consider flexibility in the submittal requirements for bioretention/biofiltration soils. Please consider allowing to Permittees to determine compliance through established guidance, plan review, and inspections.

Subject: Comments on Staff Working Proposal of the Permit Provisions Related to Minimum Control Measures (MCMs) Proposed for the Reissued Los Angeles County MS4 Permit

Dear Ms. Purdy and Mr. Ridgeway:

I am writing on behalf of the City of Signal Hill to provide comments on the Staff Working Proposal of the Part VI permit provisions related to the Minimum Control Measures (MCMs) currently being considered by Regional Water Board staff for inclusion in the reissued Los Angeles County MS4 Permit. Thank you for the opportunity to provide these comments. We will offer a few general comments on the document, followed by detailed comments on Staff Working Proposal language.

General Comments

Staff noted at the beginning of the April 5, 2012 Board Workshop on reissuance of the Los Angeles MS4 Permit that there was a decision last fall to structure the permit to facilitate watershed management. The City of Signal Hill appreciates Staff's efforts and the City of Los Angeles' support for the watershed approach. It could encourage collaboration and could focus resources on the highest priorities, especially if the AB 2554 stormwater fee - with 50% of its funding allocated to watershed efforts approved by the proposed Watershed Authority Groups - is supported by landowners.

However, our experience in organizing the MS4 permittees in the Los Angeles River Watershed to develop, implement, and pay for the Coordinated Monitoring Plan and special studies related to the Los Angeles River Watershed Metals TMDLs has taught us

City of Signal Hill Comments on Staff Working Proposal Regarding Minimum Control Language for Greater Los Angeles County MS4 Permit

13 April 2012

Page 2 of 10

that implementing even a limited watershed program can be very difficult. Some municipalities appear to believe that their contributions to water quality impairments are so minor and their budgets are so stressed that there is no need for them to participate actively in nor financially support a watershed-wide program. In the case of the LA River six of 40 municipalities chose not to participate in supporting special studies. Furthermore, some cities could use watershed programs as camouflage to avoid individual efforts to improve water quality.

We agree with Member Glickfeld that the permit should provide a variety of options. One option that we would like to see is the option for proactive cities, especially those in multiple watersheds, to be recognized as separate, distinct entities within the permit. Such entities could still work with watershed or subwatershed groups through Memoranda of Agreement to address TMDL implementation and other water quality issues. This option could be an alternative to the individual permits sought by a few cities if it were structured to hold the cities responsible for their own discharges while protecting them from joint and several liability requirements.

One overall comment we have about the Working Proposal language is that it is extremely prescriptive. The City of Signal Hill is concerned that, in the current draft form, its prescriptive nature would have the unintended consequence of taking essential monies away from TMDL implementation programs, thereby defeating the purpose of spelling-out detailed design requirements. It would be more appropriate for design details to be presented in a separate Technical Guidance Document as was done in Ventura County. A Guidance Document would be much easier to correct than the permit, if corrections were required after adoption. However, if the Board decides to keep the detailed prescriptive language in the permit, Board members and Staff should carefully review the language to avoid unintended consequences that would have a negative impact on Permittees' ability to protect water quality in the region.

In addition to being prescriptive, the Working Proposal is overly broad. The scope needs to be reduced and terms need to be well defined. The MCMs in the Staff Working Proposal should be minimized to enable Permittees to focus resources on the highest priority areas. The list of Public Activities Program requirements on page 52, for instance, contains the requirement that Permittees prepare an Inventory of Existing Development for Retrofitting Opportunities. One of the areas to be addressed is "Areas of existing development that generate pollutants subject to a TMDL for the receiving water." Does that include atmospheric deposition, over which permittees have no control authority? Depending on how "generate" is defined, these "areas of existing development" could include entire watersheds, and creating an inventory of retrofitting opportunities for an entire watershed would be cost prohibitive and of limited benefit.

Further, the Permit should acknowledge the value of true source control and operational source control and encourage their use in a comprehensive approach to improving water quality. It is much more efficient and cost-effective to remove pollutants through source control than to try to remove them by treatment at the end of pipe. By recognizing true

source control in the reissued permit, the Regional Water Board and Staff would be recognizing the best management practice that provides the most complete removal of pollutants. Stormwater regulators and the regulated community alike need to consistently advocate for true source control and to encourage other regulatory agencies such as the Department of Toxic Substances Control (DTSC), the Department of Pesticide Regulation (DPR), and the Air Boards to consider water quality impacts when they develop and implement regulations. Only if we move forward collectively to bring about True Source Control will we be able to significantly reduce or eliminate the contributions of certain types of pollutants. True Source Control should also be defined in the definition section.

The City of Signal Hill agrees with the LA Permit Group that the costs to implement all of the “minimum control measures” while addressing multiple TMDLs will far exceed the fiscal resources currently available. The situation could be much more manageable if the County’s proposal for a stormwater fee program is passed. However, this permit is proposed to be adopted several months before the fee proposal election is scheduled. Therefore, the new permit should be structured to avoid undue core program costs to permittees. We also agree with the Permit Group that various regulatory requirements, including clean water requirements, need to be developed in a balanced manner. Municipalities constantly have to make choices between conflicting goals and objectives.

In addition, the City of Signal Hill would like to support comments made at the Board Workshop by the Building Industry Association and the Construction Industry Coalition on Water Quality concerning MEP and the balancing requirements of the Water Code, as well as their comments about the use of biofiltration and the minimum infiltration rate.

Lastly, near the end of the Board Workshop, Member Glickfeld stated that she didn’t understand why the Los Angeles MS4 permit has industrial facility and construction components when the State has its own permits for industrial facilities and construction projects. As a municipal Permittee, the City of Signal Hill agrees with her concerns. We have a long list of requirements for which we are responsible and would like to be assured that additional responsibilities that belong to the Regional Board – such as inspections related to enforcement of the State’s Construction General Permit and Industrial General Permit – will not be transferred to us. We also agree with Member Glickfeld that it would be beneficial to see a conceptual framework on how the proposed permit would work.

Specific Comments on Staff Working Proposal Language

Definition Section Should Be Expanded

The City appreciates the inclusion of a Minimum Control Measures Definitions section. However, several revisions should be made to clearly define additional terms used in the Staff Working Proposal and to expand upon current definitions.

- **BMPs** – There is already a definition for BMPs in the definition section, but it should be revised to reference source control. It is beneficial to recognize options, as the Staff Proposal does. However, the current definition leaves out one of the most beneficial options -- true source control. Adding true source control to the list of suggested options would encourage Permittees to keep it in mind as they design their stormwater quality improvement programs.
- **Development** – The definitions of Development, New Development, and Redevelopment should be clearly defined as they are in the existing MS4 permit, except that the 5,000 square foot threshold in the definition of redevelopment should be increased to at least 10,000 square feet.
- **Environmentally Sensitive Areas (ESAs)** – This term should be defined.
- **Green Infrastructure** - This term should be defined. EPA states on the LID page of its website that green infrastructure “is a relatively new and flexible term” that “has been used differently in different contexts.” EPA also states “Green infrastructure can be used at a wide range of landscape scales in place of, or in addition to, more traditional stormwater control elements to support the principles of LID.”
- **MS4 outfalls** – These should be defined and there should be a separate definition for major outfalls, which should be defined as outfalls with a diameter of 36” or greater.
- **Operational Source Control** – This term needs to be clearly identified and utilized throughout the document to differentiate it from True Source Control.
- **Predevelopment conditions** – This term is referred to on page 36 and could be viewed in an overly broad manner unless it is clearly defined in the definition section.
- **Stormwater harvest and use** – Since it may be desirable in the course of implementing TMDLs to harvest stormwater from an existing built-up area to infiltrate or use for irrigation, this term should be defined.
- **True Source Control** – This term needs to be defined. Staff could use the definition from CASQA’s True Source Control Initiative.

Special Provisions

Provision VI.C.1.a. States “each permittee shall implement the requirements in Parts [TBD for each Minimum Control Measure (MCM)] below, or customized actions within

each of these general categories of control measures to achieve equivalent pollutant control...” The concept of customized actions appears beneficial, but permittees need to see actual permit language defining the range of permissible customized actions.

Regarding Provision VI.C.1.b. Timelines for Implementation on page 1, a phase-in period may be necessary. The MCM Permit Language states, “each Permittee shall ensure implementation of the requirements contained in Part VI.C.6 upon the Effective Date of the Order;” however, most implementation programs are not established until the permit is effective. Phasing in permit requirements would allow Permittees to make good faith efforts to move forward in their implementation efforts, while preventing them from being subject to being in immediate non-compliance upon Permit adoption.

Legal Authority Language

It appears that provisions VI.C.2.a.vii. and VI.C.2.a.viii. in the Legal Authority section on page 4 are partly duplicative and should be combined. In addition, the reference to documentation of effectiveness of BMPs in reducing the discharge of pollutants to the MS4 should be deleted from Provision VI.C.2.a.xii on page 5.

Fiscal Resources

Section VI.C.3 of the Working Proposal almost appears to assume the proposed stormwater fee has been approved and is operational. In actuality, municipalities, like the State, are struggling to secure sufficient fiscal resources to maintain current public services. The problem is particularly acute for municipalities that have lost redevelopment agencies. In many cases, redevelopment agencies were making significant contributions to water quality improvements in association with redevelopment projects. It is appropriate to address fiscal resources, but it is not appropriate to assume that a permittee can “exercise its full authority to secure the fiscal resources necessary to meet all requirements of this Order.” The phrase “all requirements of this order” is particularly troublesome because the Regional Board proposes to include TMDL requirements in the Order. The costs to meet TMDL requirements are partially unknown, but are likely to be very high – especially if traditional treatment control BMPs are used to achieve compliance.

To improve water quality in this Region, all parties are going to have to contribute what they can to this effort. However, it is inappropriate for a state agency to assume that municipalities can secure fiscal resources to meet permit requirements when the State cannot secure all the fiscal resources it needs and has taken resources away from municipalities. Furthermore, the proposed annual fiscal analysis will cost money and divert resources away from addressing water quality. It should be eliminated from the Proposed Order.

City of Signal Hill Comments on Staff Working Proposal Regarding Minimum Control Language for Greater Los Angeles County MS4 Permit
13 April 2012
Page 6 of 10

Public Information and Participation Program

Language specifying “pursuant to Part VI.C.6.b” should be added to Provision VI.C.6.a.i on page 6. It should read, “Each Permittee shall implement a Public Information and Participation Program (PIPP) pursuant to Part VI.C.6.b that includes...”

Residential Outreach Program

Provision VI.C.6.d.i (5) on page 8 deals with the residential outreach program as it relates to schools. Public schools ideally would have been subject to the Phase II permit, but were exempted. Recommending outreach materials that public schools would be asked or required to distribute should not be required of Permittees. Schools and school boards are generally not open to curriculum input from cities since curriculum decisions are, in large part, dictated by Sacramento. The State Water Board should work directly with the California Department of Education to make those determinations.

Industrial/Commercial Facilities Program

In Provision VI.C.7.a.i on page 8, the language stating that each Permittee shall implement a program that “prevents” illicit discharges should be changed to read that such a program “is designed to prevent” illicit discharges.

In Provision VI.C.7.a.ii it may be useful to recognize that CASQA is planning to convert the Industrial and Commercial BMP Handbook to a web portal.

Track Critical Sources

In Provision VI.C.7.b.(4) Staff lists as critical sources to be tracked “all other commercial or industrial facilities tributary to a waterbody segment addressed by TMDL provisions in Part 7, where the facility generates pollutants addressed by the TMDL for that waterbody.” This language could be interpreted to refer to *all* commercial and industrial facilities because of the number of waterbody segments for which TMDLs have been adopted or established pursuant to the Consent Decree and the possible interpretation of the term “generate.” Does it include atmospheric deposition? Please revisit this Provision to clarify and to narrow the focus to those that are truly critical sources.

A similar problem exists in Provision VI.C.7.b.ii (9). A broad interpretation of “generates” to include atmospheric deposition of pollutants that are subsequently discharged from a facility site with stormwater discharges could result in virtually all commercial and industrial facilities discharging to a 303(d) listed waterbody being identified as critical sources.

Planning and Land Development Program

The language in Provision VI.C.8.a.i.(5) (pp. 20-21) should be changed to specify minimizing pollutant loadings “through the use of properly designed, technically appropriate BMPs (including true source control BMPs such as materials substitution or product bans and operational source control BMPs such as good housekeeping practices, pet waste clean-up, and pesticide use regulation), LID Strategies, and treatment control BMPs.”

Applicability - New Development Projects

Provision VI.C.8.c.i.(1) on page 23-24 should be modified to also allow biofiltration. The three methods currently specified – infiltration, bioretention, and harvest and use – focus on controlling runoff to eliminate the pollutant transport mechanism, but pollutant reduction through biofiltration is also a useful tool for improving water quality.

Provision VI.C.8.c.i.(2) on page 24 could be simplified by having one standard rather than requiring comparison of two standards and using whichever is greater. Stormwater quality programs across the state have broadly focused on the runoff from the 85th percentile, 24-hour rain event. Therefore, we recommend that the reissued MS4 permit focus on the 85th percentile, 24-hour rain event as the single standard. We also recommend that Provision VI.C.8.c.i.(3) be modified to specify that infiltration BMPs be limited to sites with a demonstrated infiltration rate under saturated conditions of no less than 0.5 inch per hour. A BMP with an infiltration rate as low as 0.15 inch per hour is much more likely to fail than one with an infiltration rate of 0.5 inch per hour.

The New Development and Redevelopment Projects Options for Stormwater Management Design table (pp. 25-26) should be divided into two tables - one for new development and one for redevelopment, and both tables should be designed to provide for more flexibility and to reduce costs. Greenfield development and redevelopment of the built environment are quite different and those differences result in different options for stormwater management.

Green roofs should be added to the Medium Preferred Options table for redevelopment.

Provision VI.C.8.c.ii (2)(a) on page 27 should be changed to an infiltration rate of less than 0.5 inch per hour. An infiltration rate of 0.15 inch per hour is too marginal and could easily result in investment in a BMP that quickly fails.

Provision VI.C.8.C.ii (2)(b) on page 27 should be changed to specify locations “where seasonal high groundwater is within 10 feet of the surface.” Groundwater within 5 feet of the surface does not allow sufficient depth for construction of an in-the-ground infiltration facility and natural filtration of water through the natural soil matrix.

City of Signal Hill Comments on Staff Working Proposal Regarding Minimum Control Language for Greater Los Angeles County MS4 Permit
13 April 2012
Page 8 of 10

With respect to the references to hydrologic areas HUC-10 and HUC-12 in Provision VI.C.8.c (3)(b) on page 28, the City recommends that a map showing the locations of these subwatersheds be included or made available by the Regional Board.

The units for lead, zinc, and copper in the Benchmarks Applicable to New Development Treatment BMPs table on page 32 are listed as mg/L, but in the TMDLs the units of measure are μ /L. To be consistent, the units used in the permit should also be μ /L. In addition, the metals benchmarks in the Hardness Dependent Benchmarks table on p. 33 should be expressed in μ /L.

Provision VI.C.8.c.v.(1)(c)(i)1. on page 35 should be changed to specify runoff from the 85th percentile storm – not the 95th percentile storm. The permit should establish consistent use of the 85th percentile storm.

Provision VI.C.8.d.i appears to be a good idea, but it needs further refinement. How is it to be determined that a local LID ordinance does not fully incorporate the applicable requirements of this Order? How will reasonable assurances be provided? We would appreciate the opportunity to further explore this concept with Staff.

Development Construction Program

Provision VI.C.9.d. on page 41 should be revised to specify a size limit, not “all activities involving soil disturbance with the exception of agricultural activities.” There are some applicability thresholds that should be considered. We recommend changing the language to “all activity meeting applicability thresholds with the exception of agricultural activities.”

Construction Plan Review and Approval Procedures

Provision VI.C.9.f.ii.(1). on page 42 is excessive and inappropriate. Locally required Erosion and Sediment Control Plans should not be required to include all of the elements of a SWPPP prepared in accordance with the requirements of the Construction General Permit. The State has established very detailed requirements for construction projects disturbing one acre or more of soil. It is neither necessary nor appropriate to duplicate these requirements for smaller projects.

Provision VI.C.9.f.ii.(6) on page 43 states “each permittee shall require that all structural BMPs be designed by a California licensed engineer.” Not all structural BMPs need to be designed by a licensed engineer. Some are simple cover and containment operational source control BMPs.

BMP Implementation Level

The language in Provision VI.9.g.i. on pages 43-44 should be changed to read, “BMPs must be consistent with the applicable California Stormwater Quality Association (CASQA) Best Management Practices Handbooks or Portals.”

Public Agency Activities Program

Municipalities do not have the authority to control atmospheric deposition. The City requests that the State Water Board and the Regional Water Board use the authorities granted them by Clean Water Act (CWA) Sections 13146 and 13247, respectively, to compel actions by the California Air Resource Board to control the sources of metals in atmospheric deposition.

Provision VI.C.10.d. (starting on page 54) needs to be rethought and modified. The goal of beginning to address the impacts of existing development through consideration of retrofit projects is worthwhile. In fact, TMDL requirements and state grant programs such as Proposition 84 are driving consideration of retrofit projects. However, this provision as written is likely to be very expensive and divert limited resources away from higher priority projects. The provision could be made more workable and affordable by making Provisions VI.C.10.d.i. and VI.C.10.d.ii apply to a preliminary broad inventory of potential retrofitting opportunities while limiting Provision VI.C.10.d.iii to a limited number of probable projects - perhaps 3-5 during the permit cycle. This would be an affordable way to start the long-term process of retrofitting the existing built environment.

Public Agency Facility and Activity Management

Provision VI.C.10.e.ii.(2) on page 56 should be revised to specify that “Permittee-owned and operated” existing structural flood control facilities should be evaluated to determine feasibility of retrofitting for additional pollutant removal. Inspection of privately owned facilities or those owned and operated by other agencies should not be the responsibility of a city in which these facilities happen to be located.

The title of the table on pages 57-59 should be modified to specify that these are “BMPs for Public Agency Facilities Where Activities are Conducted that Require BMPs.”

Landscape, Park, and Recreational Facilities Management

Provision VI.C.10.g.i. on page 59 calls for Permittees to implement and maintain the activity-specific BMPs listed in the table for all public right-of-ways, flood control facilities, open channels, etc. This should be modified to specify the conditions that would require permittees to implement and maintain BMPs listed in the table.

City of Signal Hill Comments on Staff Working Proposal Regarding Minimum Control Language
for Greater Los Angeles County MS4 Permit
13 April 2012
Page 10 of 10

Biorention/Biofiltration Design Criteria Attachment

This attachment belongs in a separate technical guidance manual.

Developer Technical Information and Guidelines

“All natural drainages” in the Developer Technical Information and Guidelines Attachment 1.i.vi. on page 81 needs to be defined. This term could be interpreted to include such drainages as rills or gullies, but that is not likely what Staff intended.

Conclusion

We appreciate Staff’s comments at the April 5, 2012 Regional Water Board Workshop that Permittees would be allowed to propose customized actions to achieve equivalent pollutant control based on water quality conditions in the area under the Permittee’s jurisdiction. Water quality protection is not a turnkey operation, and this suggestion reflects Regional Board staff’s recognition of this fact. We also appreciate Staff’s inclusion of a tiered BMP approach in certain instances.

We urge Board Staff to give serious consideration to the comments of all permittees regarding the MCM Permit Language in the Staff Working Proposal. It is the permittees who have experience with design, construction, operation, and maintenance of BMPs and the implementation of MS4 permit requirement. Utilizing that experience could significantly enhance the workability of the new MS4 permit. We also strongly suggest that the minimum control measures in the Staff Working Proposal be simplified and better defined in order to allow Permittees to focus their limited resources on the highest priorities for water quality.

Thank you again for the opportunity to provide these comments.

Sincerely,

CITY OF SIGNAL HILL

Steve Myrter
Director of Public Works

Los Angeles, CA 90013

RE: Comments from Building and Construction Industry Representatives Concerning the Staff Working Proposal for the Greater Los Angeles County MS4 Permit, Minimum Control Measures

Dear Mr. Ridgeway:

We appreciate the opportunity to provide comments on the Staff Working Proposal for the Greater Los Angeles County MS4 Permit, Minimum Control Measures (MCM document) that was released for public review on March 21, 2012. The comments provided herein, and as attachments, are those of the following entities, each of which represents the homebuilding industry or related construction and land development industries within the Southern California region that includes Los Angeles County. Specifically, the comments are from:

- Building Industry Association of Southern California, Inc. (BIASC), including its Los Angeles-Ventura Chapter (BIASC/LAV)
- Building Industry Legal Defense Foundation (BILD)
- Construction Industry Coalition on Water Quality (CICWQ)

BIA/SC is a nonprofit trade association representing more than 1,300 member companies, which together have nearly 100,000 employees. BIA/SC's members have, for decades, built the majority of the homes in the region that it serves, and the LAV Chapter works with members building in Los Angeles and Ventura Counties. BILD is a nonprofit mutual benefit corporation and controlled affiliate of BIA/SC. BILD's purposes are to monitor legal and regulatory conditions for the construction industry in Southern California and intervene as appropriate. BILD focuses particularly on litigation and regulatory matters with a regional or statewide significance to its mission. CICWQ is a water quality coalition comprised of representatives from five industry trade associations (in addition to BIA/SC) involved in the development of public and private building, infrastructure and roads throughout California (Associated General Contractors, Engineering Contractors Association, Southern California Contractors Association, Engineering and General Contractors Association, and United Contractors). All of the above trade associations are affected by the post construction runoff control requirements proposed in

the MCM document, and this letter and supporting attachments are intended to provide the LA Regional Board staff with constructive suggestions for improvement.

This comment letter summarizes and highlights comments we make on the MCM document in a 17-page comment matrix, which is also supported by four Attachments.

We appreciate the effort and commitment of the LA Regional Board Staff in evaluating alternatives for the LA County MS4 permit, and proposing Minimum Control Measures (MCMs), including post-construction runoff requirements for new and redevelopment projects meeting specific applicability thresholds. The staff proposal contains some elements found in similar, recently adopted MS4 permits in California, most notably the Ventura County MS4 permit that was considered and adopted by the LA Regional Board in July 2010. In addition, the MCM document recognizes that off-site management of the storm water quality design volume (SWQDv) may offer superior water quality and water supply benefit that on-site management of the same runoff volume, in certain circumstance.

However, the MCM document content deviates from some of the key elements adopted into the Ventura County MS4 permit, and also redefines key terms and modifies established, technically sound processes and engineering design criteria for selecting Low Impact Development (LID) Best Management Practices (BMPs). The proposal moves away from flexible and progressive approaches to hydromodification control found in recently adopted MS4 permits in southern California. And finally, the Staff Working Proposal fails to mention that the Clean Water Act standard is to reduce pollution to the Maximum Extent Practicable, and there is no mention of MEP or the required balancing of multiple factors when evaluating and selecting stormwater management controls, including economics. Given that the draft MCMs severely curtail the stormwater management options available to builders and that implementation of the MCMs occurs in more than 80 individual jurisdictions with different needs and circumstances, the MCMs must be balanced with the MEP standard. These needed improvements, therefore, form the emphasis of our comment matrix and attachments that support it.

The Staff Working Proposal MCM Fundamentally Moves Away from the Process and Practices for Stormwater Management Adopted by the Los Angeles Regional Board for Ventura County in 2010

Significant time and effort was spent by the Los Angeles Regional Board members, its staff, and all stakeholders who participated in the development of the revised Ventura County MS4 permit, which was adopted in 2010. The staff working proposal MCM document for Los Angeles County fundamentally moves away from the process and engineering principles that were agreed upon and adopted by the Los Angeles Regional Board for evaluating and selecting LID BMPs for managing stormwater runoff and for what constitutes an LID BMP. Most notable here is the elimination of biofiltration as a means to meet the on-site runoff volume retention standard, and the redefinition of what is an acceptable LID BMP to meet that standard. These types of changes are confusing to the membership we represent, as the Staff Working Proposal

MCM on page 2 of the 82-page document clearly points out the viability of biofiltration as an LID BMP option in Footnote 1. The new Table [TBD] (page 25 of 82) which presents options for stormwater management design, fundamentally moves away from the LID BMP evaluation and selection process adopted into the Ventura MS4 permit and introduces a zero discharge standard that is technically unsupportable and scientifically unsound. And finally, the Staff Working Proposal introduces a new level of engineering prescription into the LA County MS4 permit language, instead of properly placing design criteria and support in a Technical Guidance Document. The requirement for a Technical Guidance Document is absent, and this should be included in the forthcoming release of a Draft LA County MS4 permit.

The Nature of Los Angeles County Development in the Future Necessitates a Flexible Approach to Stormwater Management that Includes Use of All LID BMP Technologies Available to a Project Designer

Los Angeles County is substantially built-out and a significant portion of new development is predicted to be in the form of re-development of existing properties. Given this fact, the next LA County MS4 permit must allow flexible and adaptive management strategies that facilitate improved water quality. While we appreciate that staff has recognized the value of off-site mitigation options when the entire SWQDv cannot be managed on-site, these offsite options are limited to very small areas and instances at this time. In addition, with more than 80 cities in LA County and competing needs and interests, the viability of these off-site projects is uncertain.

Moreover, LID is best applied when it is incorporated early in the design phase of a project and considers the site-specific development context. The LA County MS4 permit should allow for different types of LID BMPs to be used because the type of development that occurs in LA County is varied, and will include a focus on property redevelopment. The best LID design for one type of project may not work in another. Again, the LID goals must be balanced with other goals, including the desire for increased density, accessibility, and improved streetscapes. Flexible on-site compliance strategies must be afforded to project proponents if needed development and redevelopment is expected to continue at any reasonable rate.

The current MCM document limits LID BMP technologies to only those that retain water on-site and do not allow for any runoff, even after biofiltration or biotreatment. This approach does not facilitate improved water quality outcomes in any meaningful way, especially considering the limited amount of development relative to the amount of land that is already urbanized. While LID can be a good tool for stormwater management, it is never going to achieve the water quality, balance, and supply goals outlined in the staff proposal. The LA Regional Board should place its attention on addressing pollution from the existing urbanized areas, rather than on incremental development. These new requirements found in the Staff Working Proposal MCM will make redevelopment extremely difficult.

Inconsistencies in Project Applicability

The requirement for existing projects in the development pipeline is a very stringent and restrictive project grandfathering clause and will create a significant burden for project developers. The homebuilding and land development community invested significant time and resources during the Ventura County MS4 permit revision process, and the procedure and guidelines that the LA Regional Board adopted and placed into the permit and into the Ventura Technical Guidance Manual have been eliminated. We strongly suggest that the Staff Working Proposal MCM document be revised to be consistent with the grandfathering procedure agreed upon for the Ventura MS4 permit and its Technical Guidance Manual. There is no basis for a different standard in Los Angeles County than in Ventura County.

Retrofitting Existing Development

While we support retrofitting of existing development as a potential off-site opportunity for mitigating the volume of runoff that cannot be technically or economically managed by a suite of LID BMPs on-site, we are cautious of any requirement that makes project approvals contingent on actions outside the control of the project proponent. The Staff's proposal elevates existing development retrofits to a status and hierarchy we are skeptical will ever be achieved or realized. We suggest making existing retrofit of development an option for off-site volume mitigation, but include this process and procedure in a Technical Guidance Manual. We don't believe Staff has considered the enormous economic impact on municipalities to prepare and execute storm water infrastructure retrofit plans. We encourage cities and the Los Angeles Regional Board to incorporate plans for retrofit as part of TMDL implementation and to identify appropriate retrofit opportunities as part of regular stormwater planning activities.

Conclusion

We appreciate the amount of effort that LA Regional Board staff put forth in preparing the MCM document and facilitating a dialogue among interested stakeholders. With the comments contained herein we feel that progressive and flexible LA County MS4 permit conditions can be developed that protect water quality, while at the same time facilitating growth and needed development within Los Angeles County. We look forward to continuing to work with staff, the Regional Board members, and all stakeholders in revising the LA County MS4 permit in the coming months. If you have any questions concerning our comments, please contact Dr. Mark Grey, at mgrey@biasc.org; (951) 781-7310, or (909) 525-0623.

Sincerely

Comments on Staff Working Proposal, Minimum Control Measures, Greater Los Angeles County MS4 Permit Submitted by The Building Industry Association of Southern California, Los Angeles-Ventura Chapter; Building Industry Legal Defense Foundation; and Construction Industry Coalition on Water Quality

Minimum Control Measures Staff Working Proposal Narrative Requirement	BIA/LAV-BILD-CICWQ Comment	Rationale for Change in Staff Working Proposal Minimum Control Measures	BIA/LAV-BILD-CICWQ Suggested Permit Language/Requirement
		<p>Practicable (MEP) – The technology-based permit requirement established by Congress in CWA section 402(p)(3)(B)(iii) that municipal dischargers of storm water must meet. Technology-based requirements, including MEP, establish a level of pollutant control that is derived from available technology or other controls. MEP requires municipal dischargers to perform at maximum level that is practicable. Compliance with MEP may be achieved by emphasizing pollution prevention and source control BMPs in combination with structural and treatment methods where appropriate. The MEP approach is an ever evolving and advancing concept, which considers technical and economic feasibility.</p>	<p><u>Medium Preferred Options</u> <u>Least Preferred Options</u></p> <p>4. VI. Provisions, C. Special Provisions, 8. Planning and Land Development Program, c. New Development/Redevelopment Project Performance Criteria, iii. Alternative Compliance Measures, <u>introductory paragraph and in (3)(e).</u></p> <p>We suggest inserting “<u>and economically</u>” to read “technically and economically infeasible” in the instances noted above, except for Issue No. 3 , where we have suggested text edits found in Attachment 1.</p>
<p>VI. Provisions, C. Special Provisions, 1. General Requirements, c. Minimum Control Measure Definitions:</p> <p>Definition edits needed for:</p> <ul style="list-style-type: none"> ii. Biofiltration iii. Bioretention viii. Infiltration xi. Planter boxes and other flow-through treatment BMPs 	<p>Some definitions provided are inconsistent with established knowledge and practice in infiltration and biotreatment system designs. In addition, we recommend including definitions for “bioinfiltration”, “project” and “total project area.”</p>	<p>There are established definitions in the Ventura County MS4 Permit Technical Guidance Manual that clearly and succinctly define essential permit terms and conditions, in addition to those in the staff proposed MCM.</p>	<p>Biofiltration: A LID BMP that reduces stormwater pollutant discharges by intercepting rainfall on vegetative canopy, and through evapotranspiration, incidental infiltration <u>if feasible</u>, and filtration. As described in the Ventura County Technical Guidance Manual, studies have demonstrated that bioinfiltration <u>biofiltration</u> of 1.5 times the stormwater quality design volume (SWQDv) provides approximately equivalent or greater</p>

¹ Maximum Extent Practicable (MEP) – The technology-based permit requirement established by Congress in CWA section 402(p)(3)(B)(iii) that municipal dischargers of storm water must meet. Technology-based requirements, including MEP, establish a level of pollutant control that is derived from available technology or other controls. MEP requires municipal dischargers to perform at maximum level that is practicable. Compliance with MEP may be achieved by emphasizing pollution prevention and source control BMPs in combination with structural and treatment methods where appropriate. The MEP approach is an ever evolving and advancing concept, which considers technical and economic feasibility (Ventura County MS4 Permit Definition, 2010). Factors that may make off-site systems more consistent with the MEP standard than on-site systems include considerations of: land use planning (i.e., smart growth density goals), economics (i.e., relative cost-benefit of on-site vs. off-site systems for meeting overall watershed goals), long term performance (i.e., institutional management and monitoring of facilities vs. HOA maintenance); more effective management of risks (i.e., lower risks of groundwater contamination), and other factors.

Attachment 2 – Minimum Infiltration Rates in LID Manuals and Ordinances

Review of Minimum Infiltration Rates in LID and Stormwater Management Manuals and Ordinances

Updated: April 11, 2012

Manual/Jurisdiction	Minimum Infiltration Rate for Infiltration BMPs
<p>Ventura Technical Guidance Manual (approved by the Executive Officer of the Los Angeles Regional Board on July 13, 2011)</p>	<p>Infiltration is considered infeasible if infiltration is less than 0.3 inches per hour.</p> <p>Infiltration is considered partially feasible from 0.3 inches to 0.5 inches per hour; bioinfiltration system with elevated underdrain should be used, but infiltration systems without an underdrain are not considered feasible.</p> <p>Infiltration is considered feasible without an underdrain if rates are greater than 0.5 inches per hour</p>
<p>Orange County Technical Guidance Document (approved by the Executive Officer of the Santa Ana Regional Board on May 19, 2011)</p>	<p>Infiltration of the full design capture volume is considered infeasible if the infiltration rate is less than 0.3 inches per hour. A minimum factor of safety of 2.0 must be applied to testing observations before comparing to this criterion. Testing results must indicate 0.6 inches per hour or greater.</p> <p>If infiltration rate is less than 0.3 inches per hour but other infiltration feasibility constraints do not apply, then biotreatment systems must be designed with a sump below the lowest surface discharge point.</p> <p>Infiltration rate must be tested at a horizon 2 feet below the anticipated bottom of the infiltration facility to ensure that the potential benefits of soil amendments are accounted for.</p>
<p>City of Los Angeles SUSMP Infiltration Requirements and Guidance (not dated)</p>	<p>Infiltration BMPs Minimum site soil percolation rate shall be 0.5 inches per hour. Soils with a percolation rate of less than 0.5 in/hr may utilize a biofiltration system that includes an under drain system to prevent extended ponding.</p>

Attachment 2 – Minimum Infiltration Rates in LID Manuals and Ordinances

Manual/Jurisdiction	Minimum Infiltration Rate for Infiltration BMPs
<p>City of Los Angeles Development Best Management Practices Handbook - Part B: Planning Activities (4th edition) (adopted by City of Los Angeles' Board of Public Works, July 2011)</p>	<p>Infiltration is considered infeasible if infiltration is less than 0.3 inches per hour and connectivity to soils with higher infiltration rate is not feasible.</p> <p>Infiltration is considered potentially feasible from 0.3 inches to 0.5 inches per hour; additional design considerations may be needed such as an elevated underdrain to provide redundancy in design.</p> <p>Infiltration is considered feasible without additional features such as an underdrain if rates are greater than 0.5 inches per hour.</p>
<p>LA County SUSMP Manual (September 2002)</p>	<p>Bioretention: "The soil should have infiltration rates greater than 0.5 inches per hour, otherwise an underdrain system should be included."</p> <p>Infiltration Basin: "Soils with an infiltration rate of less than 0.3 inches per hour, are not suitable sites for infiltration basins."</p> <p>Infiltration Trench: "Soil should have infiltration rate greater than 0.3 inches per hour and clay content less than 30 percent."</p>
<p>LA County LID Manual (January 2009)</p>	<p>Infiltration is infeasible in locations with native undisturbed infiltration rate less than 0.5 inches per hour.</p>

Attachment 2 – Minimum Infiltration Rates in LID Manuals and Ordinances

Manual/Jurisdiction	Minimum Infiltration Rate for Infiltration BMPs
CASQA BMP Handbook (2004 revision)	<p>Bioretention: “In areas where the native soil permeability is less than 0.5 in/hr an underdrain should be provided.”</p> <p>Infiltration Trench: “The minimum acceptable hydraulic conductivity as measured in any of the three required test holes is 13 mm/hr (0.5 in/hr). If any test hole shows less than the minimum value, the site should be disqualified from further consideration.”</p> <p>Infiltration Basins: “Infiltration basins require a minimum soil infiltration rate of 0.5 inches/hour, not appropriate at sites with Hydrologic Soil Types C and D.”</p>
Caltrans BMP Technology Report (April 2006)	<p>Infiltration Basins: “Siting Constraints: Infiltration basins can only be placed in areas where soil type is RCS type “A”, “B”, or “C”. Soil shall not have more than 30 percent clay or more than 40 percent clay and silt combined. Minimum infiltration rate of 12 mm/hr [=0.47 in/hr] is preferred.</p> <p>Infiltration Trenches: “An infiltration rate of at least 14 mm/hr [=0.55 in/hr] is desired. This infiltration rate would be found in soils with low silt and clay content.</p>
Eastern Washington Manual/ WA DOE Manuals (2004)	<p>Soil Type (p 5-11): “The permeability of the soil underlying a treatment facility has a profound influence on its effectiveness. This is particularly true for infiltration treatment facilities that are best sited in sandy to loamy sand soils. They are not generally appropriate for sites that have final infiltration rates of less than 0.5 inches per hour.”</p>
City of Seattle Public Utilities Department of Planning and Development Stormwater Manual (released November 2009)	Infiltration is infeasible if the infiltration rate (after factor of safety correction) is less than 0.25 inches per hour. Factors of safety range from 2 to 10. Therefore tested infiltration rate must be at least 0.5 to 2.5 inches per hour for infiltration to be feasible.
State of Michigan (Not Dated)	0.52 inches per hour

Attachment 2 – Minimum Infiltration Rates in LID Manuals and Ordinances

Manual/Jurisdiction	Minimum Infiltration Rate for Infiltration BMPs
Georgia Stormwater Management Manual http://www.georgiastormwater.com/ (August 2001)	<p>Bioretention: “The soil must have an infiltration rate of at least 0.5 inches per hour”</p> <p>Infiltration Trench: “Soil infiltration rate of 0.5 in/hr or greater required”</p>

Case Study: Sensitivity of Infiltration Rate Feasibility Threshold on BMP Sizing Requirements and Associated Costs

Case Study Assumptions		Rationale
85th Percentile Storm Depth, inches	1.0	For illustration purposes, 85th pctl depth ranges from less than 0.75 to more than 1.5 across Los Angeles County
Site Imperviousness	90%	For illustration purposes
Runoff Coefficient	0.82	Based on Los Angeles County Hydrology Manual and LID Manual
Drainage Area, acres	1.0	For illustration purposes
Target Drawdown Time, hours	48	Consistent with Ventura TGM

Case Study System Design Calculations

Assumed Design Infiltration Rate ¹ , inches per hour	System Maximum Effective Depth to Drain in 48 hours, inches	Selected System Effective Depth based on Bioretention Design Criteria ² , inches	BMP Effective Footprint, sq-ft	Approximate BMP Capital Cost ³ , \$	Ranges of Capital Cost from Other Reference Material ⁴ , \$
0.075	3.6	3.6	9,920	170,000	99,000 - 397,000
0.15	7.2	7.2	4,960	84,000	50,000 - 198,000
0.3	14.4	14.4	2,480	42,000	25,000 - 99,000
0.5	24	18	1,980	27,000	20,000 - 79,000
1	48	18	1,980	27,000	20,000 - 79,000

1 - Design rate should be based on applying an appropriate factor of safety to tested value to account for site variability, uncertainty in testing methods, long term clogging, and other factors.

2 - Selected system depth based on the lesser of the depth that will drain in 48 hours and the depth provided using a common bioretention design profile that consists of 12 inch ponding and 2 feet amended soil (0.25 in/in available porosity assumed).

3 - Source: WERF, 2009. Whole Life Cycle Cost Worksheets, Curb Contained Bioretention. Economy of scale may exist that is not reflected here.

4 - Range of estimates from Bannerman et al. (2003), USEPA (2005), and and UFC (2004). Note, range of costs include retrofit and new development applications.

Re: *Comments on Staff Working Proposal for the Los Angeles County MS4 Permit, Minimum Control Measures, March 21, 2012 Draft*

Dear Mr. Unger:

On behalf of the Natural Resources Defense Council (“NRDC”) and our over 150,000 California members and activists, we are writing with regard to the March 21, 2012 Staff Working Proposal for the Los Angeles County MS4 Permit Minimum Control Measures (“Working Proposal”). We appreciate the opportunity to comment on the Working Proposal. We focus our comments here on the Proposal’s Planning and Land Development provisions. While we believe these provisions represent progress compared to the current Los Angeles MS4 permit,¹ now more than ten years old, they still must be strengthened to meet minimum legal requirements. Specifically, in several aspects the Working Proposal fails to meet the requirements of the Clean Water Act’s maximum extent practicable standard, and is otherwise inconsistent with both state and federal law. In this regard, we appreciate the willingness of Regional Board staff to engage in discussion of the Working Proposal’s terms, and look forward to working with staff to revise the Planning and Land Use section.

I. Standards Governing the Adoption of the Los Angeles County MS4 Permit by the Regional Board.

In considering the Los Angeles Municipal Stormwater permit (“Permit”), the Regional Board must not only ensure compliance with substantive legal standards, but it must also ensure that it complies with well-settled standards that govern its administrative decision-making. The Permit’s terms must be supported by evidence that justifies the Regional Board’s decision to include, or not to include, specific requirements. The Regional Board would be abusing its discretion if the Permit ultimately fails to contain findings that explain the reasons why certain control measures and standards have been selected and

¹ Order No. 01-182.

Mr. Sam Unger, Executive Officer
 RWQCB Los Angeles Region
 April 13, 2012
 Page 2

others omitted. Abuse of discretion is established if “the respondent has not proceeded in the manner required by law, the order or decision is not supported by the findings, or the findings are not supported by the evidence.” (Cal. Code Civ. Proc. § 1094.5(b); *see also Zuniga v. Los Angeles County Civil Serv. Comm’n* (2006) 137 Cal.App.4th 1255, 1258 (applying same statutory standard).) “Where it is claimed that the findings are not supported by the evidence, ... abuse of discretion is established if the court determines that the findings are not supported by the weight of the evidence.” (*Phelps v. State Water Resources Control Bd.* (2007) 157 Cal.App.4th 89, 98-99.)

The administrative decision must be accompanied by findings that allow the court reviewing the order or decision to “bridge the analytic gap between the raw evidence and ultimate decision or order.” (*Topanga Ass’n for a Scenic Cmty. v. County of Los Angeles* (1974) 11 Cal.3d 506, 515.) This requirement “serves to conduce the administrative body to draw legally relevant sub-conclusions supportive of its ultimate decision ... to facilitate orderly analysis and minimize the likelihood that the agency will randomly leap from evidence to conclusions.” (*Id.* at 516.) “Absent such roadsigns, a reviewing court would be forced into unguided and resource-consuming explorations; it would have to grope through the record to determine whether some combination of credible evidentiary items which supported some line of factual and legal conclusions supported the ultimate order or decision of the agency.” (*Id.* at 517 n.15.) Currently, the Permit’s terms as presented in the Working Proposal are not supported by the necessary evidence, as discussed below. The lack of substantial evidence to support the Permit terms would render it unlawful as currently drafted. (*See, e.g., Bangor Hydro-Elec. Co. v. F.E.R.C.* (D.C. Cir. 1996) 78 F.3d 659, 664.)

II. Stormwater is a Leading Source of Pollution to Surface Waters and Must be Reduced to the Maximum Extent Practicable

The U.S. Environmental Protection Agency (“U.S. EPA”) considers urban runoff to be “one of the most significant reasons that water quality standards are not being met nationwide.”² As the U.S. EPA has stated:

Most stormwater runoff is the result of the man-made hydrologic modifications that normally accompany development. The addition of impervious surfaces, soil compaction, and tree and vegetation removal result in alterations to the movement of water through the environment. As interception, evapotranspiration, and infiltration are reduced and precipitation is converted to overland flow, these modifications affect not only the characteristics of the developed site but also the watershed in which the development is located. Stormwater has been identified as one

² U.S. General Accounting Office (June 2001) *Water Quality: Urban Runoff Programs*, Report No. GAO-01-679, available at, <http://www.gao.gov/new.items/d01679.pdf>.

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
April 13, 2012
Page 3

of the leading sources of pollution for all waterbody types in the United States. Furthermore, the impacts of stormwater pollution are not static; they usually increase with more development and urbanization.³

Consistent with the federal Clean Water Act, a fundamental goal of all municipal stormwater permits is to ensure that discharges from storm sewers do not cause or contribute to a violation of water quality standards. (33 U.S.C. § 1341.) In addition, for MS4s covered under the National Pollutant Discharge Elimination System (“NPDES”) program, a fundamental requirement is that permits for discharges from municipal storm sewers “shall require controls to reduce the discharge of pollutants to the maximum extent practicable.” (33 U.S.C. § 1342(p)(3)(B)(iii).) As one state hearing board held:

[MEP] means to the fullest degree technologically feasible for the protection of water quality, except where costs are wholly disproportionate to the potential benefits.... This standard requires more of permittees than mere compliance with water quality standards or numeric effluent limitations designed to meet such standards.... The term “maximum extent practicable” in the stormwater context implies that the mitigation measures in a stormwater permit must be more than simply adopting standard practices. This definition applies particularly in areas where standard practices are already failing to protect water quality....

(North Carolina Wildlife Fed. Central Piedmont Group of the NC Sierra Club v. N.C. Division of Water Quality (N.C.O.A.H. October 13, 2006) 2006 WL 3890348, Conclusions of Law 21-22 (internal citations omitted).) The North Carolina board further found that the permits in question violated the maximum extent practicable (“MEP”) standard both because commenters highlighted measures that would reduce pollution more effectively than the permits’ requirements and because other controls, such as infiltration measures, “would [also] reduce discharges more than the measures contained in the permits.” (*Id.* at Conclusions of Law 19.)

III. Planning and Land Development Program

The following sections present our comments on specific provisions within the Planning and Land Development Program section of the Working Proposal.

³ U.S. Environmental Protection Agency (December 2007) *Reducing Stormwater Costs through Low Impact Development (LID) Strategies and Practices*, at v, available at, <http://www.epa.gov/owow/nps/lid/costs07/>.

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
April 13, 2012
Page 4

A. The Applicability Thresholds for Development Projects Are Set Unjustifiably High

1. The Overall Threshold is Unjustifiably Lenient

The Working Proposal establishes the threshold for application of requirements under the Planning and Land Development section for New Development Projects as “All developed projects equal to 1 acre or greater of disturbed area *and* adding more than 10,000 square feet of impervious surface acres.” (Working Proposal, at VI.C.8.b.i.(1)(a) (emphasis added).) This threshold, in particular the requirement that a project disturb 1-acre and *additionally* add 10,000 square feet of impervious surface is unduly lenient in comparison with other Phase I permits in California. For example, the South Orange County MS4 Permit requires any new development projects “that create 10,000 square feet or more of impervious surfaces (collectively over the entire project site)” to comply with the Permit’s Development Planning Component provisions, without any requirement that the site also disturb 1-acre or greater of land.⁴ The San Francisco Bay Region MS4 Permit⁵ sets the same 10,000 square foot threshold for all non-“Special Land Use Category” development, which is set at 5,000 square feet.

More rigorous in its application thresholds for development, the recently adopted Low Impact Development Ordinance for the City of Los Angeles establishes that development creating, adding, or replacing only 500 square feet or more of impervious area may trigger requirements to implement low impact development practices to reduce stormwater runoff and pollution.⁶ The threshold set forth in the Working Proposal,

⁴ San Diego Regional Water Quality Control Board (December 16, 2009) Order No. R9-2009-0002, NPDES Permit No. CAS0108740, The Waste Discharge Requirements for Discharges of Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watershed of the County of Orange, the Incorporated Cities of Orange County, and the Orange County Flood Control District Within the San Diego Region, at F.1.d.(2), available at http://www.waterboards.ca.gov/rwqcb9/water_issues/programs/stormwater/docs/oc_permit/updates_012710/FINAL_R9_2009_0002.pdf.

⁵ San Francisco Regional Water Quality Control Board (October 14, 2009, revised November 28, 2011) Order No. R2-2009-0074, NPDES Permit No. CAS612008, Waste Discharge Requirements and National Pollutant Discharge Elimination System (NPDES) Permit for the discharge of stormwater runoff from the municipal separate storm sewer systems (MS4s) of the . . . San Francisco Bay Municipal Regional Stormwater Permit (MRP), at C.3.b.ii.(1)(a), available at http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/stormwater/Municipal/R2-2009-0074_Revised.pdf.

⁶ City of Los Angeles (Sept. 28, 2011) Low Impact Development Ordinance, at Sec. 64.72.D, available at <http://www.lastormwater.org/siteorg/program/LID/lidintro.htm>.

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
April 13, 2012
Page 5

applying requirements only to development adding 10,000 square feet of impervious surface *and* disturbing greater than one acre can hardly be construed as meeting the MEP standard when multiple other permits and local ordinances have set substantially more stringent limitations.

2. Repaving of Greater than 10,000 Square Feet of Surface Area on Publicly Owned Streets or Parking Lots Should Trigger Requirements to Meet Post-Construction Low Impact Development Standards

While it is critical that the MS4 permit address new and redevelopment projects and prevent the introduction of new or additional sources of pollution to receiving waters, the vast majority of runoff stems from existing development. One of the primary opportunities to address runoff from the existing built environment is through retrofit of existing streets and parking lots. We support the Working Proposal's requirement that new streets, roads, highways, and freeway construction must follow U.S. EPA guidance regarding green streets, and urge the Regional Board to require that roadway construction of this size should be required to meet the Working Proposal's otherwise applicable on-site stormwater runoff retention standards where technically feasible. Further, projects that result in the reconstruction or resurfacing of greater than 10,000 square feet of street, road, highway, freeway, or parking lot surface (or resurfacing of more than 25 parking spaces) should, at minimum, be required to implement post-construction LID BMPs, such as curb cuts, swales, or other retention practices. In combination with requirements to retrofit streets or parking lots undergoing resurfacing, the Regional Board should require permittees to implement a set number of "Green Street Pilot Projects" that incorporate low impact development ("LID") techniques for site design and treatment in accordance with the Working Proposal's otherwise applicable on-site stormwater retention requirements. (See, e.g., San Francisco Bay Regional MS4 Permit, at C.3.b.iii.)

B. The Working Proposal's Performance Criteria Allow for Alternative Performance and Stormwater Mitigation Management Options that do not Meet the Clean Water Act's MEP standard.

We are pleased to see that the Working Proposal establishes requirements for new development and redevelopment projects to retain on-site the runoff from the 85th percentile, 24-hour rain event or the 0.75 inch, 24-hour rain event, whichever is greater. This requirement, resulting in retention of stormwater runoff with no off-site discharge in the vast majority of storms, is consistent with on-site retention requirements of other permits throughout California, as well as in permits and ordinances found in all corners of the United States. For example:

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
April 13, 2012
Page 6

Ventura County: MS4 permit requires on-site retention of ninety-five percent of rainfall from the 85th percentile storm; off-site mitigation allowed if on-site retention is technically infeasible;⁷

South Orange County: MS4 permit requires on-site retention of the 85th percentile storm, off-site mitigation allowed if on-site retention is technically infeasible;⁸

Federal Buildings over 5,000 square feet: manage on-site (*i.e.*, prevent the off-site discharge of) the 95th percentile storm through infiltration, harvesting, and/or evapotranspiration;⁹

West Virginia: Statewide Phase II MS4 permit requires on-site retention of “the first one inch of rainfall from a 24-hour storm” event unless infeasible;¹⁰ and,

Philadelphia, PA: Infiltrate the first one inch of rainfall from all impervious surfaces; if on-site infiltration is infeasible, the same performance must be achieved off-site.¹¹

The retention requirement in the Working Proposal is additionally supported by recent technical analysis by a national stormwater expert, Dr. Richard Horner. The report demonstrates that, for five different types of land use development or redevelopment projects in Southern California, the full 85th percentile, or even the full 95th percentile,

⁷ Los Angeles Regional Water Quality Control Board (July 8, 2010) Ventura County Municipal Separate Stormwater National Pollutant Discharge Elimination System (NPDES) Permit; Order No. R4-2009-0057; NPDES Permit No. CAS004002.

Page 7

24-hour precipitation event could be retained on-site using *only* infiltration practices on sites overlying soils classified as Group C (typically containing 20 to 40 percent clay) under the Natural Resources Conservation Service (NRCS) major soil orders classification scheme.^{12,13} Even for sites overlying Group D soils (typically 40 percent or more clay with substantially restricted water transmissivity) and assuming no infiltration was feasible, greater than 50 percent of the 85th percentile storm could be retained at each development type using only rooftop runoff dispersion or harvest and reuse techniques.¹⁴ Additional retention under these scenarios could be achieved through use of evaporation practices, or, in cases where some infiltration is feasible, use of infiltration BMPs.

While we support the permit's inclusion of a robust stormwater runoff retention requirement, we are concerned by the Working Proposal's framing of alternative compliance for on-site retention of runoff or its "Options for Stormwater Management Design" provisions.

1. The Working Proposal Must Require Biofiltration to Achieve Equivalent Pollutant Load Reduction in Cases of Technical Infeasibility for On-site Retention

NRDC has commented to the Regional Board on numerous prior occasions regarding our support for the use of low impact development ("LID") practices that retain stormwater on-site through infiltration, harvesting and reuse, and evapotranspiration or bioretention.¹⁵ In contrast to these retention practices, which ensure that 100 percent of the pollutant load in the retained volume of runoff does not reach receiving waters, biofiltration practices that treat and then discharge runoff through an underdrain result in the release of pollutants to receiving waters. Indeed, in order to achieve equivalent pollutant load reduction benefits to the use of on-site retention, biofiltration practices would have to be 100 percent effective at filtering pollutants from runoff, which they are invariably not. As a result, we have previously commented that biofiltration practices are not a proper substitute for LID practices that retain water on-site.

This conclusion is borne out by studies by Dr. Richard Horner, which demonstrate that biotreatment systems using an underdrain attenuate only 57 percent of total suspended solids, 80 percent of total copper, 62 percent of total zinc, and 78 percent of total phosphorus in runoff from a site.¹⁶ Further, data presented in the Draft Ventura County Technical Guidance Manual estimates pollutant removal efficiency for total suspended solids to be 54-89 percent, and for total zinc to be 48-96 percent.¹⁷ Biofiltration has additionally been shown to be a particularly ineffective method of pollutant removal for addressing nitrogen or phosphorous, two common contaminants found in stormwater.¹⁸ The Draft Ventura Technical Guidance, for example, indicate that biofiltration achieves pollutant removal efficiency for total nitrogen at between only 21-54 percent,¹⁹ as compared with 100 percent for runoff retained on-site.

¹⁸ Lawn irrigation has been identified as a "hot spot" for nutrient contamination in urban watersheds—lawns "contribute greater concentrations of Total N, Total P and dissolved phosphorus than other urban source areas . . . source research suggests that nutrient concentrations in lawn runoff can be as much as four times greater than other urban sources such as streets, rooftops or driveways." Center for Watershed Protection (March 2003) *Impacts of Impervious Cover on Aquatic Systems* at 69; see also H.S. Garn (2002) *Effects of lawn fertilizer on nutrient concentration in runoff from lakeshore lawns, Lauderdale Lakes, Wisconsin*. U.S. Geological Survey Water- Resources Investigations Report 02-4130 (In an investigation of runoff from lawns in Wisconsin, runoff from fertilized lawns contained elevated concentrations of phosphorous and dissolved phosphorous). In this regard, we note that as a known source of pollutants to the MS4, the category of lawn irrigation runoff as a non-stormwater discharge must be prohibited under 33 U.S.C. § 1342(p)(3)(B)(ii) and 40 C.F.R. § 122.26(d)(2)(iv)(B)(1).

We urge the Regional Board to remove provisions allowing for use of biofiltration to meet the Permit's LID requirements in cases where it is technically infeasible to retain runoff on-site. (See, e.g., Working Proposal, Table [TBD], at 25.) To this end, we support the Working Proposal's requirement that for cases where it is technically infeasible to retain the design volume on-site, a project must perform off-site mitigation and implement on-site stormwater runoff controls. Biofiltration could then be used in place of engineered or conventional controls to meet these otherwise applicable on-site treatment requirements for the design storm volume. In the event the Regional Board determines to allow biofiltration to be substituted for on-site retention in cases of technical infeasibility, we note that the current Working Proposal's provision allowing that "if it is infeasible to retain 100 percent of the SWQDv . . . then on-site biofiltration systems, sized to treat 1.5 times the remaining design stormwater runoff volume, may be used," is not sufficiently protective of water quality and does not meet the Clean Water Act's MEP standard.

This Regional Board has, in fact, already passed more stringent requirements regarding application of biofiltration to meet on-site LID requirements in the MS4 Permit for Ventura County. The Ventura permit requires that biofiltration devices be sized to treat 1.5 times the design storm volume *and* achieve 1.5 times the pollutant load reduction as would on-site retention. Even retention of equivalent pollutant load reduction to on-site retention (let alone 1.5 times the loading), a minimum backstop at the very least, is not guaranteed by a biofiltration system treating 1.5 times the design stormwater runoff volume. Based on treatment efficiencies in the Ventura County Technical Guidance Manual, biofiltration of 1.5 times the design runoff volume could result in as little as 81 percent removal of TSS, 72 percent of total zinc, and 32 percent of total nitrogen. As a result, the Working Proposal should either eliminate biofiltration as an option for compliance, or at a minimum require that sites electing to use biofiltration for on-site compliance in cases of technical infeasibility must demonstrate both treatment of 1.5 times the design stormwater runoff volume *and* pollutant load reduction equivalent to that of retention practices. The 1.5 multiplier would thus set a minimum volume for treatment, but where a site is unable to demonstrate that biofiltration of 1.5 times the design volume will achieve equivalent pollutant load reduction to retention practices, the site would be required to treat a correspondingly larger volume of runoff until equivalent pollutant load reduction is achieved.

2. Biofiltration Should not be Allowed for Projects to Achieve Compliance at Off-site Retrofit Projects

Even if the Regional Board allows the use of biofiltration for compliance on-site in cases of technical infeasibility, there is no justification for the Board's proposal to allow use of biofiltration to achieve compliance off-site at retrofit projects. (See Working Proposal, at VI.C.8.c.iii.(2).) Where on-site retention is infeasible, off-site mitigation through retention of the design storm volume, including at a retrofit project, should be allowed,

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
April 13, 2012
Page 10

coupled with requirements that the project demonstrate equivalent off-site pollutant load reduction and perform on-site treatment of the design stormwater volume. Again, biofiltration could be used to meet the project's on-site treatment requirements, but no credit should be given for a site's off-site application of biofiltration to meet this section's applicable LID requirements.

3. The Working Proposal's Option Allowing for Off-site Mitigation to Increase Groundwater Replenishment Should Require that Mitigation be Tied to Water Supply And Distinguish Between Replenishment Facilities that Convey Runoff From the Project Site and Those that Are Hydrologically Unconnected to The Project Site

NRDC strongly supports efforts to use LID and groundwater recharge or other stormwater capture practices to increase water supplies in California. These initiatives are in line with California's stated policy goals. For example, the State Water Resources Control Board's State Recycled Water Policy establishes a goal of increasing the capture and use of stormwater over the amount used in 2007 by at least 500,000 acre-feet per year by 2020, and by at least one million acre-feet annually by 2030.²⁰ While we are encouraged by the Regional Board's move to incorporate provisions that could promote increased reliance on local, energy efficient water supply strategies such as groundwater replenishment, we are concerned that the Working Proposal would allow projects to perform "off-site regional groundwater replenishment" without requiring a finding that the subsequently recharged groundwater will (or even could), in fact, be used to increase local water supplies. The Working Proposal's groundwater replenishment provisions require only that: 1) the volume of stormwater to be recharged is equal to or greater than the design stormwater runoff volume; 2) equal benefits to groundwater recharge could not be met on-site; and, 3) equal or greater benefits to surface water quality will be provided within the same subwatershed. (Working Proposal, Table [TBD] at 25.) The Proposal does not condition participation in an off-site mitigation project on its connection to an aquifer used for municipal or other groundwater supply.

The provision raises two concerns. First, while the ostensible objective of the groundwater replenishment provision is to promote use of stormwater as an alternative water source through recharge to augment groundwater supplies, the lack of any requirement that recharge be directed to an aquifer actually used for groundwater production undercuts this objective. The Regional Board should include a requirement that, in order to perform off-site mitigation for groundwater replenishment, groundwater recharge must be directed to an aquifer used for water supply, or a purpose related to

²⁰ State Water Resources Control Board (May 14, 2009) State Recycled Water Policy, available at http://www.waterboards.ca.gov/water_issues/programs/water_recycling_policy/docs/recycledwaterpolicy_approved.pdf.

Page 11

preserving groundwater supply (e.g., to prevent saltwater intrusion into a groundwater aquifer used for supply). Further, we suggest that the Regional Board direct the Permittees to assess and prioritize areas within their jurisdiction that, at either the site or regional scale, present opportunities to increase groundwater replenishment specifically for water supply.

Second, the Working Proposal is unclear in its definition of “off-site,” and must provide clarification whether it intends for the term to mean an “off-site” project that is hydrologically unconnected to the project site, or a “regional” project that may receive runoff conveyed to it from the project site.²¹ Conveying runoff from the project site to a regional groundwater replenishment facility that will retain that runoff, albeit at a different location, typically does not implicate significant water quality concerns. Where the same, specific quantum of water is ultimately retained, 100 percent of the pollution contained in that particular volume of water will be prevented from reaching receiving waters. In contrast, where a project, performs off-site mitigation at some other location within the same watershed or sub-watershed, that is not hydrologically connected to the original project site, it raises substantial concerns as to whether the alternate location will “provide equal or greater benefits to surface water quality.” (See Working Proposal, Table [TBD] at 25.) Among the issues presented by this form of off-site mitigation are whether the off-site mitigation will be performed at a similar land use; whether the mitigation project will achieve equivalent pollutant load reduction; and if so, what pollutants it will be monitored for. In practice it may prove exceedingly difficult to assess the equivalency of benefits to surface water quality from retention at one site to the next.

As currently drafted, the Working Proposal would allow a project developer discretion to perform off-site mitigation, without a finding of infeasibility, at a site where it cannot be accurately determined whether equivalent protection of water quality will be achieved, to recharge groundwater that will not serve to increase local water supplies. While regional projects receiving runoff conveyed directly from the project site may raise less concern, the Working Proposal should be revised to allow off-site mitigation at a site hydrologically unconnected to the project site only when it is technically infeasible for the project to retain runoff on-site.

²¹ The provision under the “Options for Stormwater Management Design, Most Preferred Stormwater Management Options” requiring that a project opting to perform off-site groundwater replenishment “Must also provide reduction through treatment of the SWDQv at the project site” implies the former, that projects may perform off-site mitigation at a site hydrologically unconnected to the project within the same sub-watershed. In addition to the concerns described above, we also note our concern, described below, that the Working Proposal’s Water Quality Mitigation Criteria are not adequately protective of water quality and fail to meet the requirements of the Clean Water Act’s MEP standard.

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
April 13, 2012
Page 12

An additional concern raised by the Working Proposal's off-site mitigation provisions is that they would potentially allow for new development discharging polluted runoff to persist in the built environment. A project that is developed during the term of this permit may stand for 60 years or more.²² Yet if the project performs off-site mitigation, the permit would allow for that project to be developed using only conventional, engineered, treat and discharge controls on runoff, which have proven entirely inadequate for the protection of water quality in our urban and suburban environments. Instead, another "off-site" development would theoretically be retrofitted in place of on-site retention, even if that site might otherwise eventually be subject to the permit's (or a local ordinance's) requirements to incorporate LID based controls on a much shorter timeframe; e.g., while the new project will be developed using inferior engineered controls that will persist in the built environment for generations, the off-site project would, independent of its participation in the Working Proposal's off-site program, potentially have been required to implement LID controls within the next 5, 10, or even 20 years, resulting in a substantially faster conversion of development to LID controls. Under the Working Proposal a continuous stream of new projects could be introduced into the built environment without LID based stormwater controls, ensuring that pollution will continue to be discharged to receiving waters.

C. The Working Proposal's Water Quality Mitigation Criteria Are Insufficiently Protective of Water Quality

The Working Proposal contains requirements pertaining to Water Quality Mitigation Criteria for projects that have been approved for off-site mitigation or groundwater replenishment projects. (Working Proposal at 8.c.iv.) While we strongly support requirements to treat on-site runoff when off-site mitigation is performed in-lieu of on-site retention, we are concerned that the two standards contained within the Working Proposal fail to require controls to the MEP under the Clean Water Act.

First, we are concerned that the "pollutant specific benchmarks" contained in the Working Proposal appear insufficiently protective of water quality and do not rise to the level of treatment standards required in other MS4 permits in California, including those required for the Ventura County as detailed in either that county's MS4 Permit or the resulting Ventura County Technical Guidance Manual's "Treatment BMP Performance Standards." The Regional Board should revise the pollutant benchmarks to meet, at a minimum, these more protective requirements.

Second, we are concerned that the Working Proposal's authorization for projects only to "ensure that the discharge does not cause or contribute to an exceedance of water quality standards" would potentially allow for a project to institute *no* controls on stormwater

²² See, e.g., Nelson, Arthur C., 2004, *Toward a New Metropolis: The Opportunity to Rebuild America*, Brookings Institution, available at http://www.brookings.edu/reports/2004/12metropolitanpolicy_nelson.aspx.

April 13, 2012
Page 13

runoff, or to implement only minimal controls that do not reflect what is actually practicable to do. This standard should be removed, or should be required in addition to requirements to meet specific pollution benchmarks or treatment standards.

D. The Working Proposal's Local Ordinance Equivalence Provision Creates a Self Regulatory Scheme in Violation of the Clean Water Act.

The Working Proposal allows for a permittee to submit a local LID ordinance for “The Executive Officer [to] assess whether the Permittee has provided reasonable assurance that the alternative requirements in the local ordinance will provide equal or greater reduction in storm water discharge pollutant loading and volume as would have been obtained through strict conformance with” the permit’s performance criteria or hydromodification provisions. (Working Proposal, at 8.d.1.) But putting such review authority solely in the Executive Officer shields the development of these critical, core permit requirements from oversight and creates a self-regulatory scheme in violation of the Clean Water Act. In *Environmental Defense Center, Inc. v. U.S. E.P.A.*, 344 F.3d 832, 854-56 (9th Cir. 2003), the court explained: “[S]tormwater management programs that are designed by regulated parties must, in every instance, be subject to meaningful review by an appropriate regulating entity. . . . Congress identified public participation rights as a critical means of advancing the goals of the Clean Water Act in its primary statement of the Act’s approach and philosophy.”

In bypassing the public review process, the Local Ordinance Equivalence provision instead has the potential to exempt development from participation in the Permit’s core requirements to prevent the discharge of pollutants to the MS4 system. These requirements, encompassing the permit’s on-site stormwater controls, LID requirements, alternative performance criteria, hydromodification controls, and other post-construction requirements, are necessarily reviewed in order to determine whether the permit meets the requirements of the Clean Water Act’s MEP standard. This determination lies properly with the Regional Board in the first instance, through the process of public review and hearing. To the extent that any specific provision of a local ordinance imposes more stringent controls than those contained within the Working Proposal, these must be considered additive to the MS4 permit’s requirements; in order to “ensure that each [MS4 permit] program reduces the discharges of pollutants to the maximum extent practicable,” the Local Ordinance Equivalence provision should be removed, and permittees should be required to meet the permit’s applicable requirements.

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region

Page 14

Conclusion

For the aforementioned reasons, Regional Board staff should revise the Working Proposal so that it meets the requirements of state and federal law.

Sincerely,

A handwritten signature in black ink, appearing to read "Noah Garrison". The signature is written in a cursive style with a large, sweeping initial "N".

EXECUTIVE SUMMARY

STUDY DESIGN

A study was performed to investigate the degree to which stormwater management practices, commonly referred to as “low-impact development” methods or “green infrastructure,” can retain urban runoff and meet five possible regulatory standards that could be applied nationally. Retention is defined as preventing the conversion of precipitation to runoff discharging from a development site on the surface, from where it can enter a receiving water. Retaining runoff from impervious and pollutant generating pervious surfaces prevents the introduction of urban runoff pollutants to receiving waters as well as reduces runoff volume to prevent stream channel and habitat damage, flooding, and loss of groundwater recharge. ARCD methods were assessed for their ability to: (1-2) meet standards pertaining to retention of the runoff generated by the 85th and 95th percentile, 24-hour precipitation events; (3) retain 90 percent of the post-development runoff; and (4-5) retain the difference between the post- and pre-development runoff, both with and without a cap at the 85th percentile, 24-hour event. The study assessed five urban land use types (three residential, one retail commercial, and one infill redevelopment), each placed in four climate regions in the continental United States on two regionally common soil types.

Infiltrating bioretention was applied as an initial strategy in the analysis of each case. When the initial strategy could not fully retain post-development runoff, additional methods were applied, involving roof runoff harvesting in the most impervious development cases and roof water dispersion in those with substantial pervious area. Benefits were assessed with respect to reduction of the annual average surface runoff volume from the quantity estimated without any stormwater management practices, the associated maintenance of pre-development groundwater recharge, and water quality improvement achieved through preventing discharge to receiving waters of pollutants generated with developed land uses.

RETENTION AND POLLUTANT REDUCTION CAPABILITIES

The initial strategy of infiltrating bioretention could retain all post-development runoff and pre-existing groundwater recharge, as well as attenuate all pollutant transport, in the three residential land use development types on hydrologic soil group (HSG) B soils, in all cases, in all regions, taking a fraction of the available pervious area to do so. For the more highly impervious commercial retail and redevelopment cases, bioretention would retain about 45 percent of the runoff and pollutants generated and save about 40 percent of the pre-development recharge. Adding roof runoff management measures in these cases would approximately double retention and pollutant reduction for the retail commercial land use and raise it to 100 percent for the redevelopment. Results were generally similar with HSG C soils, although more of the pervious portion of sites was required to equal the retention seen on B soils.

For development on the D soils in all climate regions, use of roof runoff management techniques was estimated to increase runoff retention and pollutant reduction from zero to between about one-third to two-thirds of the post-development runoff generated, depending on the land use case. These strategies would offer little groundwater recharge benefit with this soil condition, but would still have the potential to significantly reduce runoff volume and pollutant loading.

ABILITY TO MEET STANDARDS

The projected ability to meet the five standards identified above was found to vary mostly in relation to soil type (B or C versus D) and the relative imperviousness of development. The ability to meet the five standards varied much less across climate regions. With B and C soils,

the methods considered were projected to meet all five standards in all but 12 of 125 evaluations. With D soils, however, only three standards could be met at all and those only occasionally. However, even on D soils, all cases for Standard 1 (retention of the 85th percentile, 24-hour precipitation event) were able to retain greater than 50 percent of the required runoff volume. Moreover, opportunities to use ARCD practices or site design principles not modeled in this analysis have the potential to further increase runoff retention volume.

Standard 3 (retain 90 percent of the average annual post-development runoff volume) would be the most environmentally protective standard. Meeting or coming as close as possible to meeting, but not exceeding, this standard was estimated to lead to 66-90 percent of total runoff retention and pollutant loading reduction on B and C soils and 37-66 percent runoff retention on D soils. Standard 2 (retain the runoff produced by the 95th percentile, 24-hour precipitation event) would yield equivalent protection on D soils and only slightly less protection with B and C soils. The outcome with this standard would also be more consistent region to region than with the alternative standard 1, based on the 85th instead of the 95th percentile precipitation event. Sites located on B or C soils were able retain the runoff produced by the 85th percentile storm in 24 of 25 cases modeled (in 18 of the 25 cases by using infiltrating bioretention alone), and were able to retain the runoff produced by the 95th percentile storm in 22 of 25 cases modeled.

Standards 4 and 5, based on the differential between pre- and post-development runoff volume, are inconsistent in retaining runoff and reducing pollutants, in that they are relatively protective where pre-development runoff is estimated to be low relative to post-development flow, but result in progressively lower retention and pollutant loading reduction as pre- and post-development volumes converge, such as in several cases on D soils. Standard 5 is especially weak in this regard. The potentially low level of retention and pollutant loading reduction renders these standards based on the change in pre- versus post-development runoff volume poor candidates for national application, at least as formulated in these terms.

In summary, standards 2 and 3 are clearly superior to the other three options from both a volume and pollutant load reduction standpoint. Standard 3 is entirely consistent from place to place in degree of environmental protection, and standard 2 does not deviate much. Analysis of the five development cases on two soil groups in each of four regions demonstrated the two standards are virtually identical in the runoff retention and pollutant loading reduction they would bring about. Of the remaining standards, standard 1 (retention of the runoff produced by the 85th percentile storm event) remains more consistent across regions and more protective of water quality for development on D soils than either standard 4 or 5, and is preferable to those standards in this regard.

INTRODUCTION

GENERAL STUDY DESCRIPTION

Study Design

This purpose of this study was to investigate the degree to which low-impact development (LID)¹ practices can meet or exceed the requirements of various potential stormwater management facility design standards and to determine the environmental benefits that can be realized by applying these techniques. The investigation was performed by estimating the stormwater retention possible with full application of low-impact options under a range of conditions broadly representative of different regions within the United States and then determining the implications of the findings for achieving various standards and for providing benefits. Retention is defined as preventing the conversion of precipitation to surface runoff from urbanized land uses through infiltration, evapotranspiration, and/or harvesting for some water supply purpose. Retaining runoff from impervious and pollutant generating pervious surfaces prevents the introduction of urban runoff pollutants to receiving waters as well as reduces runoff volume to prevent stream channel and habitat damage, flooding, and loss of groundwater recharge. Benefits were assessed with respect to reduction of the potential developed land surface runoff volume, the associated maintenance of pre-development groundwater recharge, and water quality improvement achieved through preventing discharge to receiving waters of pollutants generated with developed land uses.

The potential regulatory standards investigated were capture and retention of, at minimum:

- Standard 1—The runoff produced by the 85th percentile, 24-hour precipitation event,² a standard commonly used in California;
- Standard 2—The runoff produced by the 95th percentile, 24-hour precipitation event, the standard adopted under Section 438 of the Energy Independence and Security Act;
- Standard 3—90 percent of the average annual post-development runoff volume;
- Standard 4—The difference between the post- and pre-development³ average annual runoff volumes; and
- Standard 5—The difference between the post- and pre-development runoff volumes for all events up to and including the 85th percentile, 24-hour precipitation event.

Conditions broadly representative of the nation were selected by, first, considering the climate regions defined in USEPA's (1983) Nationwide Urban Runoff Project (NURP) report. For full analysis, climate regions 1 (Northeast-Upper Midwest), 3 (Southeast), 5 (South Central), and 6 (Southwest) were chosen as providing a wide range of climatological conditions and geographic distribution. Once the four regions were picked, a metropolitan area and a specific city in each were chosen to serve as typical models of development circumstances in the general area, as

¹ The National Research Council (NRC, 2009) renamed LID, also known as green infrastructure, as aquatic resources conservation design (ARCD), the term used henceforth in this report.

² The 85th percentile, 24-hour event represents the precipitation quantity in a 24-hour period not exceeded in 85 percent of all events in an extended record.

³ In this study the pre-development state is taken as the typical land cover existing before European settlement of an area.

detailed in the Case Studies discussion below. In addition, region 7 (Pacific Northwest) was identified as an additional location to be discussed. This region is the site of a considerable amount of ARCD application in an area somewhat different climatologically than other selected regions, in having persistent winter rainfall totaling annually, in the major urban areas, intermediately among the other regions. Results of research on ARCD conducted in this region are discussed at several points in this report.

Soils and topography were the next considerations in developing broadly representative conditions. U.S. Department of Agriculture websites were the source of general soil characterizations for the study regions and specific soil survey data in and around the representative metropolitan areas. Soils generally represented some range in textural classes and associated hydraulic conductivities. For each region, a soil type predominating among those representing hydraulic conductivities relatively high and low for the region were selected to serve as a basis for the analyses. The effect of slope was also investigated but ultimately found not to affect results substantially.

Five types of urban development were selected to represent breadth in land use: (1) multi-family residential, (2) small-scale single-family residential, (3) large-scale single-family residential, (4) large-scale commercial, and (5) infill redevelopment. Building permit data from each region were consulted to determine typical distributions of site features for each (e.g., land cover by buildings, parking areas, roadways, walkways, driveways, landscaping).

Case studies thus comprised four climate regions, each with two soil conditions and five land use types, for a total of 40 permutations. For each, the ability of the site to accommodate soil- and vegetation-based ARCD practices was investigated. Runoff quantities were estimated and compared to the five potential regulatory standards. Annual mass loading discharges were estimated for four pollutants: total suspended solids (TSS), total recoverable copper (TCu) and zinc (TZn), and total phosphorus (TP). In any case where soil- and vegetation-based ARCD infiltration techniques appeared not to be able to attenuate all runoff, specific roof runoff management strategies were investigated as possible measures to achieve additional retention. Runoff quantities and pollutant discharges were recalculated based on use of these additional practices in place.

This report covers the methods employed in the investigation, data sources, and references for both. It then presents the results, discusses their consequences, draws conclusions, and makes recommendations relative to the feasibility of utilizing low-impact development practices to meet the respective potential regulatory standards.

AQUATIC RESOURCES CONSERVATION DESIGN PRACTICES

General Description

As the stormwater management field developed, it passed through several stages. First, it was thought that the key to success was to match post-development with pre-development peak flow rates, while also reducing a few common pollutants (usually, TSS) by a set percentage. Finding that these efforts generally required large ponds, but that they did not forestall impacts, stormwater managers next deduced that runoff volumes and high discharge durations would also have to decrease. Almost simultaneously, although not necessarily in concert, the idea of low-impact development arose to offer a way to achieve actual avoidance, or at least minimization, of discharge quantity and pollutant increases reaching far above pre-development levels. These methods reduce storm runoff and its contaminants by decreasing their generation

at sources, infiltrating into the soil or evaporating or transpiring⁴ storm flows before they can enter surface receiving waters, and treating flow remaining on the surface through contact with vegetation and soil, or a combination of these strategies.

The National Research Council (“NRC”) (2009) renamed LID as Aquatic Resources Conservation Design (ARCD) for several reasons. First, this term signifies that the principles and many of the methods apply not only to building on previously undeveloped sites, but also to redeveloping and retrofitting existing development. Second, incorporating aquatic resources conservation in the title is a direct reminder of the central reason for improving stormwater regulation and management. ARCD encompasses the complete range of practices to counteract all negative urban runoff impacts; i.e., the full suite of practices that emphasize and accomplish retention as defined above. These practices aim at decreasing surface runoff peak flow rates, volumes, and elevated flow durations, as well as avoiding or at least minimizing the introduction of pollutants to any surface runoff produced. Reducing the concentration of pollutants, together with runoff volume decrease, cuts the cumulative mass loadings (mass per unit time) of pollutants entering receiving waters over time.

The menu of ARCD practices begins with conserving, as much as possible, existing trees, other vegetation, and soils, as well as natural drainage features (e.g., depressions, dispersed sheet flows, swales). Clustering development to affect less land is a fundamental practice advancing this goal. Conserving natural features would further entail performing construction in such a way that vegetation and soils are not needlessly disturbed and soils are not compacted by heavy equipment. Using less of polluting materials, isolating contaminating materials and activities from contact with rainfall or runoff, and reducing the introduction of irrigation and other non-stormwater flows into storm drain systems are essential. Many ARCD practices fall into the category of minimizing impervious areas through decreasing building footprints and restricting the widths of streets and other pavements to the minimums necessary. Another important category of ARCD practices involves directing runoff from roofs and pavements onto pervious areas as sheet flow, where all or much of the runoff can infiltrate or evaporate in many situations.

Water can be harvested from impervious surfaces, especially roofs, and put to use for irrigation, non-potable indoor water supply. Harvesting is a standard technique for Leadership in Energy and Environmental Design (LEED) buildings (U.S. Green Building Council, 2008). Many successful systems of this type are in operation, with examples such as the Natural Resources Defense Council offices (Santa Monica, CA), the King County Administration Building (Seattle, WA), and two buildings on the Portland State University campus (Portland, OR). Harvesting is feasible at the small scale using rain barrels and at larger scales using larger collection cisterns and piping systems. These small-scale applications have been used throughout the world for centuries and are rapidly spreading in the United States today (See, e.g., Texas Water Development Board, 2005; Georgia Department of Community Affairs, 2009).

If these practices are used but runoff is still produced, ARCD offers an array of techniques to retain it on-site through infiltration and evapotranspiration (ET). The bioretention cell (rain garden) is the workhorse practice in this category, but swales conveying flow slowly, filter strips set up for sheet flows, and other modes are also important. Relatively low traffic areas can be constructed with permeable surfaces such as porous asphalt, open-graded Portland cement concrete, coarse granular materials, concrete or plastic unit pavers, or plastic grid systems to allow for infiltration.

⁴ Transpiration refers to vaporization of water from plant tissue, while evaporation applies to vaporization from a liquid (e.g., pool) or solid (e.g., leaf) surface. The terms are often combined to form the compound evapotranspiration (ET).

ARCD practices should be selected and applied as close to sources as possible to stem runoff and pollutant production near the point of potential generation. However, these practices must also work well together and, in many cases, must be supplemented with strategies operating farther downstream. For example, the City of Seattle, in its “natural drainage system” retrofit initiative, built serial bioretention cells flanking relatively flat streets. “Cascades” of vegetated stepped pools created by weirs were installed along more sloping streets. In some cases the cells drain to downstream cascades. The upstream components are highly effective in attenuating most or even all runoff. Flowing at higher velocities on sloped surfaces, the cascades do not perform at such a high level, although under favorable conditions they can still infiltrate or evapotranspire the majority of the incoming runoff (Chapman 2006, Chapman and Horner 2010). Even if not as impressive statistically, cascades can actually decrease storm discharge to streams more than the cells do, because of their generally greater size. Also, the cascades extract pollutants from remnant runoff through mechanisms mediated by vegetation and soils. The success of Seattle’s natural drainage systems demonstrates that well designed ARCD practices can mimic natural landscapes hydrologically, and thereby avoid raising discharge quantities.

A watershed-based program emphasizing ARCD practices would convey significant benefits beyond greatly improved stormwater management. ARCD techniques overall would advance water conservation, and infiltrative practices would increase recharge of groundwater resources. ARCD practices can be made attractive and thereby improve neighborhood aesthetics and property values. Retention of more natural vegetation can both save wildlife habitat and provide recreational opportunities. Municipalities could use the program in their general urban improvement initiatives, giving incentives to property owners to contribute to goals in that area while also protecting water resources.

A Catalogue of ARCD Practices

ARCD practices are numerous and expanding as existing configurations are applied in new ways. Table 1 presents a catalogue adapted from USEPA (2007) and NRC (2009). This catalogue contains practices that are not equally applicable in all settings; e.g., nevertheless, each category offers practices applicable in a broad variety of circumstances.

The best strategy for choosing among and implementing these practices is a decentralized, integrated one; i.e., selecting practices that fit together as a system, starting at or near sources and working through the landscape until management objectives are met. This strategy makes maximum possible use of practices in the first three categories, which prevent stormwater quantity and quality problems, and then selects among the remaining classifications in relation to the localized and overall site conditions. Source control and preservation of existing vegetation and soils obviously avoid post-development runoff quantity and pollutant increases from any portion of the site that can be so treated. Among all strategies, these best maintain natural infiltration and ET patterns and yield of materials flowing from the site. This preventive strategy is supplemented by strategies to create as little impervious cover as possible. The remaining practices then contend with the excess runoff and pollutants over pre-development levels generated by the development.

For the practices that infiltrate water, a site’s soil characteristics and depth to groundwater can and should be determined through infiltration rate testing and excavation to determine the infiltration capability. Because of the often substantial variability of conditions around a site, these determinations should be made at multiple points. If the natural infiltration rate is low, generally < 0.5 inch/hour (< 1.25 cm/h, Geosyntec 2008), in many situations the soil can be amended, usually with organic compost, to apply an infiltrative practice.

In addition to soil characteristics, the position of the groundwater table is a crucial determinant of whether or not stormwater infiltration should be promoted by applying ground-based ARCD

practices. A seasonal high water table too close to the surface results in rapid saturation of a thin soil column and retarded infiltration. Ponding water longer than 72 hours can permit mosquito growth, damage vegetation, and promote clogging of the facility by microorganism growths and polysaccharide organic materials that form in the reduced-oxygen environment accompanying excessive ponding time (Mitchell and Nevo 1964, Ronner and Wong 1996). Also, storm runoff flow through a short soil column or very rapidly through a coarse-textured soil can convey contaminants to groundwater.

Evidence gathering from available performance data is that evapotranspiration (ET) can be a substantial factor in water retention (discussed below) but may be difficult to quantify at a given site without more research. A conservative approach is to design on the basis of infiltration rate, calculated to include consideration of soil amendments, if any. Together with careful investigation of soils and hydrogeologic conditions, this means of proceeding is very likely to produce facilities that retain at least as much runoff as predicted, and almost certainly more as a result of unquantified ET.

Table 1. A Catalogue of Aquatic Resources Conservation Design Practices (USEPA [2007] and NRC [2009])

Category	Definition	Examples
Source control	Minimizing pollutants or isolating them from contact with rainfall or runoff	<ul style="list-style-type: none"> ● Substituting less for more polluting products ● Segregating, covering, containing, and/or enclosing pollutant-generating materials, wastes, and activities ● Avoiding or minimizing fertilizer and pesticide applications ● Removing animal wastes deposited outdoors ● Conserving water to reduce non-stormwater discharges
Conservation site design	Minimizing the generation of runoff by preserving open space and reducing the amount of land disturbance and impervious surface	<ul style="list-style-type: none"> ● Clustering development ● Preserving wetlands, riparian areas, forested tracts, and porous soils ● Reducing pavement widths (streets, sidewalks, driveways, parking lot aisles) ● Reducing building footprints
Conservation construction	Retaining vegetation and avoiding removing topsoil or compacting soil	<ul style="list-style-type: none"> ● Minimizing site clearing ● Minimizing site grading ● Prohibiting heavy vehicles from driving anywhere unnecessary
Runoff harvesting	Capturing rainwater, generally from roofs, for a beneficial use	<ul style="list-style-type: none"> ● Using storage and distribution systems (rain barrels or cisterns) for irrigation and/or indoor supply for public and private buildings
Natural runoff conveyance practices	Maintaining natural drainage patterns (e.g., depressions, natural swales) as much as possible, and designing drainage paths to increase the time before runoff leaves the site	<ul style="list-style-type: none"> ● Emphasizing sheet instead of concentrated flow ● Eliminating curb-and-gutter systems in favor of natural drainage systems ● Roughening land surfaces ● Creating long flow paths over landscaped areas ● When flow must be concentrated, using vegetated channels with flow controls (e.g., check dams)
Practices for temporary runoff storage followed by infiltration and/or evapotranspiration ^a	Use of soil pore space and vegetative tissue to increase the opportunity for runoff to percolate to groundwater or vaporize to the atmosphere	<ul style="list-style-type: none"> ● Bioretention cells (rain garden) ● Vegetated swales (channel flow) ● Vegetated filter strips (sheet flow) ● Planter boxes ● Tree pits ● Infiltration basins ● Infiltration trenches ● Roof downspout surface or subsurface dispersal ● Permeable pavement ● Vegetated (green) roofs
ARCD landscaping ^b	Soil amendment and/or plant selection to increase storage, infiltration, and evapotranspiration	<ul style="list-style-type: none"> ● Organic compost soil amendments ● Native, drought-tolerant plantings ● Reforestation ● Turf conversion to meadow, shrubs, and/or trees

^a Some of these practices are also conventional stormwater BMPs but are ARCD practices when ARCD landscaping methods are employed as necessary to maximize storage, infiltration, and evapotranspiration. The first five examples can be constructed with an impermeable liner and an underdrain connection to a storm sewer, if full retention is technically infeasible (see further discussion later). Vegetated roofs store and evapotranspire water but offer no infiltration opportunity, unless their discharge is directed to a secondary, ground-based facility.

^b Selection of landscaping methods depends on the ARCD practice to which it applies and the stormwater management objectives, but amending soils unless they are highly infiltrative and planting several vegetation canopy layers (e.g., herbaceous growth, shrubs, and trees) are generally conducive to increasing storage, infiltration, and evapotranspiration.

Application of ARCD Practices in This Study

The investigation performed for this study first assessed the capacity of each case study site to infiltrate the full average annual post-development storm runoff volume and thereby reduce pollutant releases to zero. The report terms this initial evaluation as the “Basic ARCD Analysis”. The means of infiltration was not distinguished at this level of analysis. For example, it was not specified if runoff would be distributed in sheet flow across a pervious area or channeled into a rain garden. As detailed later in the Methods of Analysis section, this analysis was limited to the estimated infiltration capacity of the case study soil type, possibly compost-amended, and the available pervious area.

Critically, there was no attempt to estimate the loss of surface runoff through ET in the Basic ARCD analysis (ET is considered, to address rooftop runoff only, as part of our “Full ARCD analysis,” discussed below). In general, the estimated mean annual evapotranspiration in the Southeast is about 70 percent of the precipitation, or roughly 35 inches per year. For large areas of the Southwest, evapotranspiration is virtually equal to 100 percent of the precipitation, which is only about 10 inches per year. The ratio of estimated mean annual evapotranspiration to precipitation is least in the mountains of the Pacific Northwest and New England where evapotranspiration is about 40 percent of the precipitation (Hanson, 1991). By leaving out these substantial losses, generally 40 percent of precipitation or more, the retention estimates in this study can be considered quite conservative.

Additionally, there was no consideration of many ARCD practices in the Table 1 catalogue that could be applied in site-specific design. For example, there were no refinements of the prevailing building standards to reduce street widths or cluster buildings and reduce their footprints. Further, green roofs were not considered in this study, although they are already making a contribution to runoff reduction around the nation and reflect a significant additional opportunity to retain runoff on-site. The U.S. EPA has stated that “a 3.5-4 in. (8 -10 cm) deep green roof can retain 50% or more of the annual precipitation.” (U.S. EPA, 2009a). For water quality, we did not assume any source control implementation. Thus, actual site design could take advantage of substantial additional capabilities not considered in this study.

In cases where the practices incorporated in the initial level of analysis (infiltration through bioretention) did not, according to the estimates, fully attenuate post-development pollutant discharges, specific attention was directed at ways of extracting additional water from surface discharge by managing roof runoff. This assessment is called the “Full ARCD Analysis” in the report. The options broadly divide into harvesting water for a purpose such as irrigation and/or non-potable indoor supply, or making special provisions to infiltrate or evapotranspire roof runoff even if soil conditions are limiting. Harvesting applies best to relatively large developments having sufficient demand for the collected water. While single-family residences can harvest water into rain barrels or cisterns for lawn and garden watering, these containers may be small in volume relative to runoff production; and though opportunity exists, no credit was taken for them in this study. However, even in poorly infiltrating soils, options exist to disperse house roof runoff as sheet flow for storage in vegetation and soil until evapotranspiration and some infiltration occurs.

CASE STUDIES

CLIMATE REGIONS

Basis of Selection

The Nationwide Urban Runoff Project divided the nation into nine regions based on differences in volume, intensity, and duration of precipitation and interval between precipitation events (USEPA 1983). For broad representation of the U.S. generally this study chose regions 1 (Northeast-Upper Midwest), 3 (Southeast), 5 (South Central), and 6 (Southwest) for analysis. Table 2 provides the annual precipitation statistics from the NURP compilation.

Table 2. Precipitation Statistics (Means) for Four NURP Regions Selected for Study (USEPA 1983)

Region	Volume (inch)	Intensity (inch/hour)	Duration (hours)	Interval (hours)
1—Northeast-Upper Midwest	0.26	0.051	5.8	73
3—Southeast	0.49	0.102	5.2	89
5—South Central	0.33	0.080	4.0	108
6—Southwest	0.17	0.045	3.6	277

The selected regions represent a volume differential of about a factor of three, intensity variation of approximately two times, and inter-storm interval varying by almost four times. The NURP report shows coefficients of variation (mean/standard deviation) of greater than 1.0 for all of these means, indicating an overall high degree of dispersion.

Figure 1 visually depicts variation in mean annual precipitation across the continental United States. It shows that the selected regions are overall representative of the broadly prevailing range across the nation, particularly its major urban and still urbanizing areas.

Region 7 (Pacific Northwest) was also identified for discussion of research results on ARCD, although not full analysis. It has less intense (mean 0.024 inch/hour) but much more extended (mean 20.0 hours) precipitation compared to any other region in the nation. Mean storm volume ranks with region 3 (mean 0.48 inch); but fewer storms, especially in the summer, yield overall less total annual precipitation in lowland areas holding all urban development in region 7. It was of interest because of the already occurring use of ARCD techniques in a relatively rainy part of the country.

Representative Metropolitan Areas and Cities

Once the regions were identified, a metropolitan area within each area was chosen as a basis for assigning specific precipitation and development characteristics. The areas considered were USEPA-designated Urban Areas: "An urbanized area is a land area comprising one or more places – central place(s) – and the adjacent densely settled surrounding area – urban fringe – that together have a residential population of at least 50,000 and an overall population density of at least 1,000 people per square mile" (USEPA 2007). Stormwater regulations would have the most impact in areas that are being quickly developed, redeveloped, or both. Five of the twenty fastest growing counties in the nation from 2000 to 2009 were near Atlanta, GA and five were in the state of Texas (U.S. Census Bureau 2010). These statistics factored into the decision to focus on records from these regions.

Each selected metropolitan area is generally representative of its region in precipitation and development characteristics. Each is also undergoing relatively active new development and redevelopment, offering candidate locations where a prospective stormwater standard would frequently be applied. These metropolitan areas are: region 1—Boston, MA, region 3—Atlanta, GA, region 5—Austin, TX, and region 6—San Diego, CA

Figure 1. Precipitation of the Conterminous States of the United States, National Atlas of the United States, 2011.

Finally, a city with a high rate of development (and often redevelopment) was picked in each metropolitan area for investigation of building patterns and standards. The intent was to match regional patterns of climate, soils (see discussion on physiographic data, below), and land use and land cover realistically. After substantial investigation, the conclusion was that building standards, how land is used, and the relative allocation of impervious and pervious lands do not vary in any systematic way across the nation and cannot be regionally distinguished. Therefore, the variables of interest came down to precipitation and soils.

Alpharetta, about 30 miles north of Atlanta, represents that metropolitan area. In 1981 it was a small town of approximately 3,000 residents but grew to 51,243 by 2007. During the workday, the city swells to more than 120,000 residents, workers, and visitors. Alpharetta is home to large corporations such as AT&T (3500 employees), Verizon Wireless (3000 employees), and ADP, Inc./National Account Services (2100 employees). Infill redevelopment projects are anticipated in the downtown area (City of Alpharetta, 2011).

Round Rock is a typical developing city located 15 miles to the north of Austin, TX. In 1970 there were only 2,700 residents in this town, while today the population exceeds 100,000. Round Rock is the eighth-fastest growing city in the nation and the location of several large corporate campuses.

The Town of Framingham, 20 miles west of Boston, represents the northeastern climate zone. At nearly 67,000 inhabitants, Framingham is the largest entity designated as a "town" in the Commonwealth of Massachusetts. It is home to three large corporations and overall 2200 businesses providing 45,000 jobs. Differing greatly from the representative communities in

other regions, Framingham was incorporated in 1700 and developed early in the nation's history. Today's activity includes redevelopment of brownfields and downtown revitalization, although some agricultural land still remains within the town limits (Town of Framingham, 2011).

San Marcos, representing the San Diego area and located about 35 miles north of the city, grew from a population of 17,479 in 1980 to 82,743 by 2008. Major institutions in the city include California State University San Marcos and Palomar Community College. At this stage the city is only approximately 72 percent built out, and thus new development continues (City of San Marcos, 2011).

Precipitation Data

Average monthly precipitation data were obtained from the NOAA Hourly Precipitation Data Rainfall Event Statistics⁵ for one station with a long-term record in each region: Southeast—Atlanta/Hartsfield International Airport (Station #90451), South Central—Austin/Robert Mueller Municipal Airport (410428), Northeast—Boston/Logan International Airport (190770), and Southwest—San Diego/San Diego International Airport (Lindbergh Field) (47740). Atlanta receives the most precipitation, averaging about 49 inches per year, followed by Boston (47 inches/year), Austin (33 inches/year), and San Diego (10 inches/year). Figure 2 depicts precipitation variations over more than 50 years.

Values for either the 85th and 95th percentile, 24-hour storms were available in a number of state-specific resources, including the Georgia Stormwater Standards Supplement (Center for Watershed Protection 2009) and the Integrated Stormwater Management Program (North Central Texas Council of Governments 2010), as well as national publications such as an USEPA's technical guidance documents (USEPA 2009). However, few references had values for both 85th and 95th percentile storms. Therefore, these values were calculated following the methodology outlined in the USEPA's Technical Guidance on Implementing the Stormwater Runoff Requirements (USEPA 2009, page 30). Daily precipitation and temperature data from the National Climatic Data Center's TD Summary of the Day data set were collected and analyzed for the four stations over a time period of 60 years, January 1, 1950 to January, 31 2010.

⁵ National Climatic Data Center, Hourly Precipitation Data Rainfall Event Statistics (<http://cdo.ncdc.noaa.gov/cgi-bin/HPD/HPDStats.pl>, last accessed December 15, 2011).

Figure 2. Average Annual Precipitation for Four Climate Regions over the Latter Part of the Twentieth Century (from NOAA Hourly Precipitation Data Rainfall Event Statistics, <http://cdo.ncdc.noaa.gov/cgi-bin/HPD/HPDStats.pl>)

For snowfall days, snow water equivalent (SWE) was calculated according to the guidelines provided by a National Climate Data Center’s (NCDC) document, Estimating the Water Equivalent of Snow, utilizing the reported mean temperature for the day (National Climatic Data Center, accessed December 16, 2011). The NCDC tables calculate that the SWE is at most, about 10 percent of the total snowfall depth. In the methodology for determining the 85th and 95th percentile events, all days with < 0.1 inch precipitation are removed, lowering the impact of snow on the results. Snowfall had no effect in the Southwest region, a very minor effect in the Southeast and South Central, and still a relatively small effect in the Northeast, as follows: San Diego—0 snow days; Atlanta—74 of 4600 total days having ≥ 0.1 inch (1.6 percent), with a contribution ranging 0.01-0.79 inch precipitation; Austin—32 of 2418 days (1.3 percent), contributing 0.01-0.50 inch; and Boston—993 of 4783 days (20.8 percent), contributing 0.01-2.24 inch. Since snow does add to runoff that must be managed in a location like the Northeast, these snow water equivalents were left in the records. Table 3 summarizes precipitation data used in the analyses for the four regions.

Table 3. Precipitation Summary for Study Regions

Region	Average Annual Precipitation (inches)	85 th Percentile, 24-Hour Event		95 th Percentile, 24-Hour Event	
		Depth (inch) ^a	Fraction Covered ^b	Depth (inch) ^a	Fraction Covered ^b
Southeast	49.02	1.13	0.63	1.79	0.87
South Central	32.67	1.19	0.58	1.99	0.82
Northeast	47.03	1.07	0.81	1.72	0.89
Southwest	9.68	0.76	0.62	1.26	0.83

^a Calculated from National Climatic Data Center’s TD Summary of the Day, for all precipitation days >0.1 inch for period January 1, 1950 – December 31, 2009

^b Fraction of total annual precipitation covered by event standard

Physiographic Data

General Methods

This section of the report covers the soils, groundwater, and topographic data underlying the analyses. Soil characteristics are largely a product of climate, geology and topography. The characteristics of most interest for this study were those controlling infiltration of surface water and percolation to an aquifer. Although there is variation within each climate region, the major soil orders can be used to identify regional characteristics. The Natural Resources Conservation Service (NRCS) website⁶ describing the major soil orders and their locations was the initial source of these data. Maps generated by Miller and White (1998) gave information from the State Soil Geographic Database (STATSGO), including characteristics such as soil texture and hydrologic soil group. These resources were employed to gain a broad view of the soils in each of the four regions.

To extend the scope of the study, soils were investigated in the Upper Midwest, in addition to the Southeast, South Central, Northeast, and Southwest climate regions. Upper Midwest and Northeast soils share general similarities. Both regions also have temperate, seasonal, humid climates. While average annual precipitation is overall somewhat greater in the Northeast compared to the Upper Midwest, the two regions were deemed similar enough physiographically and climatologically to be considered together. This report henceforth groups them as the Northeast – Upper Midwest climate region.

To validate the regional patterns emerging from the general sources, custom “soil resource” reports for four cities were generated using the NRCS Web Soil Survey⁷ tool. These reports collected characteristics related to infiltration rates and runoff including soil texture, hydrologic soil group, drainage classification, representative slope, and depth to water table. Using this tool requires selecting an “area of interest”. This examination utilized a size of at least 8,000 acres (10,000 acres is the maximum allowed) to insure a representative sample of soil and related conditions.

Hydrologic soil group assignment is a means of generally categorizing soils according to their tendency to admit and transmit water. The hydrologic soil group (HSG) is determined with respect to the water-transmitting soil layer with the lowest saturated hydraulic conductivity and depth to any layer that is more or less water impermeable (such as a fragipan or duripan) or depth to a water table. Box 1 summarizes the characteristics of the four HSGs (NRCS 2007).

The position of the groundwater table is a crucial determinant of whether or not stormwater infiltration should be promoted by applying ground-based ARCD practices. A seasonal high water table too close to the surface results in rapid saturation of a thin soil column and retarded infiltration. Ponding water longer than 72 hours can permit mosquito growth, damage vegetation, and promote clogging of the facility by microorganism growths and polysaccharide organic materials that form in the reduced-oxygen environment accompanying excessive ponding time (Mitchell and Nevo 1964, Ronner and Wong 1996). Also, storm runoff flow through a short soil column or very rapidly through a coarse-textured soil can potentially convey contaminants to groundwater. To avoid entertaining stormwater management strategies threatening development of these problems, data on depth to groundwater was obtained from the U.S. Geological Survey’s (USGS) Groundwater-Level Annual Statistics (USGS 2011).

⁶ Natural Resources Conservation Service, Distribution Maps of Dominant Soil Orders (<http://soils.usda.gov/technical/classification/orders/>, last accessed December 16, 2011).

⁷ Natural Resources Conservation Service, 2011, Web Soil Survey (<http://websoilsurvey.nrcs.usda.gov/app/HomePage.htm>).

Topographic slope influences runoff production by setting incident precipitation in motion downslope, thus producing a horizontal component of velocity vector partially counteracting the tendency to penetrate the soil vertically. This study investigated that importance of that effect by considering two slopes typical of urban development sites. As discussed during the presentation of results, below, this factor did not have a large effect on the analysis.

Box 1. Summary of Hydrologic Soil Groups (NRCS 2007)

Group A—Soils in this group have low runoff potential when thoroughly wet. Water is transmitted freely through the soil. Group A soils typically have less than 10 percent clay and more than 90 percent sand or gravel and have gravel or sand textures. Some soils having loamy sand, sandy loam, loam or silt loam textures may be placed in this group if they are well aggregated, of low bulk density, or contain greater than 35 percent rock fragments. The saturated hydraulic conductivity of all soil layers exceeds 5.67 inches per hour. The depth to any water-impermeable layer is greater than 20 inches. The depth to the water table is greater than 24 inches. Soils deeper than 40 inches to a water-impermeable layer are in group A if the saturated hydraulic conductivity of all soil layers within 40 inches of the surface exceeds 1.42 inch per hour.^a

Group B—Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded. Group B soils typically have between 10 percent and 20 percent clay and 50 percent to 90 percent sand and have loamy sand or sandy loam textures. Some soils having loam, silt loam, silt, or sandy clay loam textures may be placed in this group if they are well aggregated, of low bulk density, or contain greater than 35 percent rock fragments. The saturated hydraulic conductivity in the least transmissive layer between the surface and 20 inches ranges from 10.0 1.42 to 5.67 inches per hour. The depth to any water-impermeable layer is greater than 20 inches. The depth to the water table is greater than 24 inches. Soils deeper than 40 inches to a water-impermeable layer or water table are in group B if the saturated hydraulic conductivity of all soil layers within 40 inches of the surface exceeds 0.57 inch per hour but is less than 1.42 inch per hour.

Group C—Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted. Group C soils typically have between 20 percent and 40 percent clay and less than 50 percent sand and have loam, silt loam, sandy clay loam, clay loam, and silty clay loam textures. Some soils having clay, silty clay, or sandy clay textures may be placed in this group if they are well aggregated, of low bulk density, or contain greater than 35 percent rock fragments. The saturated hydraulic conductivity in the least transmissive layer between the surface and 20 inches is between 0.14 and 1.42 inch per hour. The depth to any water-impermeable layer is greater than 20 inches. The depth to the water table is greater than 24 inches. Soils deeper than 40 inches to a restriction or water table are in group C if the saturated hydraulic conductivity of all soil layers within 40 inches of the surface exceeds 0.06 inch per hour but is less than 0.57 inch per hour.

Group D—Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted. Group D soils typically have greater than 40 percent clay, less than 50 percent sand, and have clayey textures. In some areas, they also have high shrink-swell potential. All soils with a depth to a water-impermeable layer less than 20 inches and all soils with a water table within 24 inches of the surface are in this group, although some may have a dual classification if they can be adequately drained. For soils with a water-impermeable layer at a depth between 20 and 40 inches, the saturated hydraulic conductivity in the least transmissive soil layer is less than or equal to 0.14 inch per hour. For soils deeper than 40 inches to a restriction or water table, the saturated hydraulic conductivity of all soil layers within 40 inches of the surface is less than or equal to 0.06 inch per hour.

^a While Group A soils are present across large areas of the country, our analysis considers only Group B, C, and D soils to provide a conservative assessment of infiltration potential in urban areas, and to account for potential issues such as soil compaction that may occur for lawn and other landscaping in urban and suburban development.

Southeast Climate Region

The major soil order found throughout the southeastern United States is Ustisols, sub-order Udufts. The humid climate with frequent rainfall gives the soils an udic moisture regime; soils are rarely dry for more than 45 consecutive days. Ustisols are highly weathered and are deficient in calcium and other bases. Georgia is known for its red soils, which are the unhydrated iron oxides left in the weathered material. Pre-European contact, these soils supported mixed conifer and deciduous woodlands. Due to its relatively flat topography and warmer temperatures, Florida has primarily Spodosols, Alphisols and Histosols (Soil Survey Staff, NRCS 2011).

This region has a variety of soil textures, ranging from sand and sandy loam throughout Mississippi, Alabama, and Georgia; silty loam soils near the Appalachian Mountains; and some areas with significant organic materials in Florida. The major soil hydrologic groups of the region are varied as well, with C and D soils dominating the Georgia coastline and most of Florida. Group A and B soils are more prevalent in the interior parts of the region, in central Georgia and Alabama (Miller and White 1998).

A NRCS web soil survey was conducted for an area of interest (AOI) centered in Alpharetta, GA. The selected AOI did not have complete soil survey coverage, and findings were compared with another AOI of 8990.5 acres north of the city in Fulton County. In both AOIs, the leading HSG is B (86 percent of AOI), followed by group C (11 percent of AOI). Approximately 97 percent of the AOI has a sandy loam soil texture. The leading drainage classification was well drained (86 percent of AOI), followed by somewhat poorly drained (10 percent of AOI). The selected AOI was moderately steep, with approximately 70 percent of the AOI having slopes between 8 and 12 percent.

Fulton County, Georgia has four wells in the USGS record, three with depth-to-groundwater data. Two wells have only one recorded depth: site 08CC08 had a depth of 2.447 ft in 1986, and site 10DD01 had a depth of 16.131 ft in 1968. Site 10DD02 has been monitored annually from 1977-2010 and has an annual well-depth average in this time period of 6.292 ft.

South Central Climate Region

The major soil order in Texas is Mollisols, sub-order ustolls. These soils span the sub-humid and semiarid climate zones, and are common on the western Great Plains and throughout the Rocky Mountain States. These soils originally supported grasslands and (in mountainous regions) forests, and now are ranched or farmed. Houston black soils are also characteristic of the region and are important in agriculture and urban areas, occurring throughout central Texas. Dry soils in the Order Aridisols, sub-orders Argids and Calcids, are found in west Texas and large portions of New Mexico as well. These soils were formerly sparsely vegetated areas, now used for rangeland or wildlife habitat (Soil Survey Staff, NRCS 2011).

Soil characteristic maps generated by Miller & White (1998) indicate that the majority of soil types in the South Central climate region are diverse: sandy loam and clay dominate eastern Texas, clay soils are prevalent in central parts of the state and loam soils are in western Texas and New Mexico. Most soils tend to be in the C and D hydrologic groups, however B soils are found in bands in New Mexico (Miller & White, 1998).

A web soil survey was conducted for an area of interest of 8267.5 acres centered in Round Rock, TX. The leading HSG is D (68 percent of AOI), followed by group C (22 percent of AOI) and group B (10 percent). Primary soil textures are clay (33 percent), silty clay (27 percent), extremely stony clay (17 percent), and silty clay loam (10 percent). The leading drainage classification is well drained (79 percent of AOI) followed by moderately well drained (21

percent). The selected AOI is relatively flat; approximately 70 percent of the AOI has slopes under 2 percent, and 20 percent has slopes of 3-4 percent.

Travis County, Texas had three wells that were measured in 2003 and recorded by USGS (site YD-58-50-216) and 2004 (sites YD-58-50-216 and YD-58-25-907). Groundwater is very deep in each location, averaging 220 ft below the ground surface.

Northeast – Upper Midwest Climate Region

This climate region has significant variation in dominant soil orders. The Spodosols order, sub-order Orthods, dominates the northern portions (northern Minnesota, Wisconsin, Michigan, Vermont, and Maine) and is generally considered infertile without soil amendments. Inceptisols, sub-order Udepts, are also prevalent in the region, especially in New England states, through the Appalachian Mountains and northeastern Minnesota. Alfisols, sub-order Udalfs, too are prevalent in the region, extending from Minnesota east to New York. These two soils both have an udic moisture regime, and are rarely dry for more than 45 consecutive days due to the year-round precipitation in the area (Soil Survey Staff, NRCS 2011). The state soil of Massachusetts is the Paxton fine sandy loam and also extends into New Hampshire, New York and Vermont. These deep soils were formed in acid subglacial till and are derived from schist, gneiss and granite (NRCS undated).

Based on maps generated by Miller and White (1998), sandy loam and silt loam soils tend to dominate the region, with small areas of clay and silty clay soils. Hydrologic soil group B is most prevalent in the Midwestern states (Minnesota, Wisconsin, Illinois), and Group C is most common in the rest of the region, spanning from Indiana to Maine. The region primarily supported forest ecosystems before development.

A web soil survey was conducted for an area of interest centered in Framingham, MA with an AOI of 8645.6 acres. The region has relatively equal amounts of each HSG: 20 percent of the AOI in Group A, 19 percent in group B, 20 percent in Group C, and 24 percent in Group D. Soil textures represented are fine sandy loam (49 percent), muck (10 percent), loamy sand (9 percent), and moderately decomposed plant material (8 percent). The leading drainage classification is well drained (32 percent of AOI) followed by very poorly drained (16 percent), somewhat excessively drained (12 percent), and moderately well drained (11 percent). Fourteen percent of the AOI has slopes of 1 percent or less, with 18 percent at 2-5 percent, 23 percent at 6-8 percent, and another 23 percent at 8-12 percent slopes.

There are three wells in the USGS record for Middlesex County, MA including 5 years of record for an Acton well averaging 17.75 ft, 6 years for the Wakefield well with an average depth of 6.59 ft, and 11 years at the Wilmington well with an average of 8.09 ft.

Southwest Climate Region

There are multiple soil orders in California due to its variation in climate, topography and geologic history. Entisols occur in the southern parts of the state; sub-order Psamments is a frequently found sandy soil that makes productive rangeland. Order Mollisols, sub-order Xerolls, are freely drained and dry soils found in the Mediterranean climate along the coast of California. Pre-settlement ecosystems supported by these soils include oak savanna, grasslands, and chaparral. Current soils may be used as cropland or rangeland (Soil Survey Staff, NRCS 2011).

A web soil survey was conducted for an 8267.5-acre area of interest centered in San Marcos, CA. The leading HSG is D (58 percent of AOI), followed by group C (26 percent) and group B (14 percent). Soil texture include sandy loam (19 percent), coarse sandy loam (17 percent), silt loam (15 percent), very fine sandy loam (14 percent), loamy fine sand (12 percent), loam (7

percent), and clay (5 percent). The leading drainage classification is well drained (51 percent of AOI), followed by moderately well drained (34 percent). Approximately 10 percent of the AOI has slopes \leq 5 percent, and 66 percent has slopes of 5-10 percent.

There are no groundwater records for San Diego County available on the USGS website. Data were collected from the California Department of Water Resource Water Data Library⁸. Ten wells west of San Marcos near Escondido were sampled in 1987. The depth to groundwater ranged from 2.0 to 28.1 ft for an average of 11.6 ft.

Summary of Physiographic Characteristics

Due to the large area of land encompassed in each climate region, it is difficult to select one location that is truly “representative” of the entire region. By selecting four cities that are spaced throughout the country with different climate and soil characteristics, however, this study can demonstrate the different potential for ARCD strategies in regions around the nation. Table 4 summarizes the major soils, groundwater, and topographic characteristics for these regions. Figure 3 shows the distributions of hydrologic soil groups in areas of interest investigated in the four metropolitan areas.

Table 4. Summary of Physiographic Data

Characteristic	Southeast	South Central	Northeast – Upper Midwest	Southwest
Main soil types	Sandy loam	Clay, clay loam	Sandy loam, silt loam	Sandy loam, loam
Hydrologic soil group near study site	B (GA, AL, SC)	D (TX)	C (Northeastern states)	D
Other hydrologic soil group in climate region	D (FL)	C (NM)	B (MN, WI, IL, MI)	C
Predominant pre-development land cover	Woods	Semi-arid herbaceous	Woods	Narrow-leaved chaparral
Predominant slopes	70% @ 8-12%	90% < 4%	65% < 12%	76% < 10%

LAND USE CASES

Five cases were selected to represent a range of urban development types considered to be representative of the nation. These cases involved: a multi-family residential complex (MFR), a relatively small-scale (23 homes) single-family residential development (Sm-SFR), a relatively large (1000 homes) single-family residential development (Lg-SFR), a sizeable commercial retail installation (COMM), and an urban redevelopment (REDEV).

Building permit records from the City of San Marcos in San Diego County, California provided data on total site areas for the first three cases, including numbers of buildings, building footprint areas (including porch and garage for Sm-SFR), and numbers of parking spaces associated with the development projects. Information was not as complete for cities in other regions, but what data was available indicated no substantial difference in these site features. Therefore, the San Marcos data were used for all regional case studies. This uniformity had the advantage of placing comparisons completely on the basis of the major variables of interest, climatological and soils characteristics.

Figure 3. Distribution of Hydrologic Soil Groups in Four Study Cities

The REDEV case was taken from an actual project in Berkeley, California involving conversion of an existing structure, built originally as a corner grocery store, to apartments and addition of a new building to create a nine-unit, mixed-use, urban infill project. Space remained for a large side yard.

Larger developments were not represented in the sampling of building permits from the San Marcos database. To take larger development projects into account in the subsequent analysis, the two larger scale cases were hypothesized. The Lg-SFR scenario scaled up all land use estimates from the Sm-SFR case in the ratio of 1000:23. The hypothetical COMM scenario consisted of a building with a 2-acre footprint and 500 parking spaces. As with the smaller-scale cases, these hypothetical developments were assumed to have roadways, walkways, and landscaping, as described below.

While the building permit records made no reference to features such as roadways, walkways, and landscaping normally associated with development projects, these features were taken into account in the case studies using assumptions described herein. Parking spaces were estimated to be 176 square ft in area, which corresponds to 8 ft width by 22 ft length dimensions. Code requirements vary by jurisdiction, with the tendency now to drop below the traditional 200 square ft average. About 180 square ft is common, but various standards for full- and compact-car spaces, and for the mix of the two, can raise or lower the average (Gibbons, 2009). The 176 square ft size is considered to be a reasonable value for conventional practice.

Roadways and walkways assume a wide variety of patterns. Exclusive of the two SFR cases, simple, square parking lots with roadways around the four sides and square buildings with walkways also around the four sides were assumed. Roadways and walkways were taken to be 20 ft and 6 ft wide, respectively.

Each single-family residences (SFR) was assumed to have a lot area of 5749 square ft., and a driveway 20 ft wide and 30 ft long. Assuming a square lot, each would have a sidewalk 76 feet by 4 feet wide, and a walkway that is 40 feet by 4 feet. .

Exclusive of the COMM case, the total area for all of these impervious features was subtracted from the total site area to estimate the pervious area, which was assumed to have conventional landscaping cover (grass, small herbaceous decorative plants, bushes, and a few trees). For the COMM scenario, an additional 10 percent was added to the building, parking lot, access road, and walkway area to represent the landscaping, on the belief that a typical retail commercial establishment would be mostly impervious.

Table 5 summarizes the characteristics of the five land use cases. The table also provides the recorded or estimated areas in each land use and cover type.

Table 5. Summary of Cases with Land Use and Land Cover Areas

	MFR ^a	Sm-SFR ^a	Lg-SFR ^a	COMM ^a	REDEV ^a
No. buildings	11	23	1000	1	2
Total area (ft ²)	476,982	132,227	5,749,000	226,529	5,451

METHODS OF ANALYSIS

AVERAGE EVENT AND ANNUAL STORMWATER RUNOFF VOLUMES

Calculation Methods

Surface runoff volumes produced were estimated for both pre- and post-development conditions for each case study. The pre-development state was considered to be the predominant land cover for each region prior to European settlement.

For impervious areas, average event and annual runoff volumes were computed as the product of event or average annual precipitation, contributing drainage area, and a runoff coefficient (ratio of runoff produced to precipitation received) according to the familiar Rational Method equation. The runoff coefficient was determined from the equation $C = (0.009) I + 0.05$, where I is the impervious percentage. This equation was derived by Schueler (1987) from Nationwide Urban Runoff Program data (USEPA 1983). With $I = 100$ percent for fully impervious surfaces, C is 0.95.

The basis for pervious area runoff coefficients, for both the pre-development state and landscaped areas in developments, was the NRCS's Urban Hydrology for Small Watersheds (NRCS 1986, as revised from the original 1975 edition). This model estimates storm event runoff (R , inch) as a function of precipitation (P , inch) and a variable representing land cover and soil, termed the curve number (CN , dimensionless). CN enters the calculation via a variable S , which is the potential maximum soil moisture retention after runoff begins. The equations for English units of measurement are:

$$R = \frac{(P - 0.2S)^2}{P + 0.8S} \qquad S = \frac{1000}{CN} - 10$$

The runoff equation is valid for $P > 0.2S$, which represents the initial abstraction, the amount of water retained before runoff begins by vegetative interception and infiltration (NRCS 1986). According to this model, larger events are forecast to produce a greater amount of runoff in relation to amount of precipitation, because they more fully saturate the soil. Therefore, use of the model to estimate annual runoff requires selecting some event or group of events to compute an average runoff coefficient representing the year.

Average pre- and post-development pervious area average runoff coefficients were derived by computing runoff from a series of precipitation events ranging from 0.1 inch up to the 95th percentile, 24-hour event for the respective metropolitan areas, dividing by the associated precipitation, and averaging for all event amounts $> 0.2S$. Average annual runoff volumes for pervious areas were estimated based on these runoff coefficients and average annual precipitation quantities recorded at the respective gauging locations.

Curve Number Selection

Pre-development curve numbers were determined from existing studies and NRCS (1986) CN tables based on pre-European settlement land cover. Before development, woods predominated in Georgia and Massachusetts. Pre-development Texas had principally arid and semi-arid range with herbaceous cover. Chaparral was the predominant land cover in the San Diego area, however, this land cover type is not listed in the NRCS tables. For that region the selection came from a study by Easterbrook (undated) on curve numbers and associated soil hydrologic groups in an investigation of mainly chaparral lands before and after wildfires in the San Diego area.

Conversion to landscaping typical of development modifies soil and water infiltration characteristics by removing topsoil and even subsoil, compacting the remaining soil, and changing the vegetative cover. For pervious landscaping after development, CN was based on 1/8-acre urban development for all building types.

To demonstrate a range of results, runoff estimates were made for two soils in each region falling in B and C, B and D, or C and D HSGs. The more infiltrative soil was assumed to be in “good” condition and the less permeable one in “poor” condition, differentiations made in the NRCS tables. Table 6 summarizes the curve numbers used in the analyses. The paragraphs following the table detail how the selections were made for each region.

Table 6. Summary of Curve Numbers for Study Regions

Hydrologic soil group-condition	Southeast		South Central		Northeast – Upper Midwest		Southwest	
	B-good	D-poor	C-good	D-poor	B-good	C-poor	C-good	D-poor
Pre-development	55	83	74	93	55	77	77	90
Post-development	85	92	90	93	85	90	91	93

The Georgia Stormwater Manual Supplement recommends that watershed managers select curve numbers proposed by the NRCS based on hydrologic soil groups A through D and hydrologic condition of the site (Center for Watershed Protection 2009). As aforementioned, the pre-European land cover of the southeastern United States was forested. A study by Dyke (2001) in Forsyth and Hall Counties northeast of Atlanta confirmed that, immediately prior to development, approximately 50 percent of urban lands were forested, with 22 percent in agricultural use.

Because the region includes B soils in the interior of Alabama and Georgia, and poorly draining D soils in Florida and along the coasts, it was decided, for the purpose of demonstrating a range of results, to base NRCS Curve number values on B soils in good condition and D soils in poor condition. The corresponding pre- and post-development curve numbers are 55 and 83 and 85 and 92, respectively.

Prior to human development, approximately 80 percent of Texas, mostly in the central part, was covered in short and tall grassland communities; the western 10 percent of the state was desert grassland; and the eastern 10 percent was forested (University of Texas 2000). McLendon (2002) conducted a study on the observed and predicted curve numbers in 107 watersheds in Texas. For rural watersheds the CNs ranged from 48 to 88. The range in Austin was 49-89 and in Dallas 60-90. The Texas Department of Transportation’s (2001) Hydraulic Design Manual Section 7 lists values for pre-development curve numbers for arid and semi-arid rangelands. Based on these sources, the respective pre- and post-development CN choices were 74 (C—good soil) and 93 (D—poor soil) and 90 (C—good soil) and 93 (D—poor soil).

Before European development, most of the Northeast – Upper Midwest region was covered in mixed hardwood and coniferous forests. A recent USGS report confirms that most urban development in the region from 1973 to 2000 has converted forestland (47 percent of all changes), followed by farmland (11 percent) (Auch undated). For this study’s pre-development curve number, the woods cover type, soil group B in good condition and C soil in poor condition gave corresponding curve numbers of 55 and 77, respectively. Post-development curve numbers for these soil types at 1/8-acre development size were 85 and 90 for the good B and poor C soils, respectively. These post-development curve numbers are similar to a recent study in the Aberjona River watershed, an urban catchment northwest of Boston, where the authors used an overall CN of 89 to represent the more impervious parts of the watershed (Perez-Pedini et al. 2005).

With the lack of NRCS data for chaparral, CN selection for the San Diego area was based on an analysis performed in the area of the 2003 Cedar Fire in San Diego County by Easterbrook (undated). For pre-development C soils in good condition and D soils in poor condition, the choices were 77 and 90, respectively. Post-development curve numbers were selected from Easterbrook's estimation of CN after a high-burn fire; for good C soils CN = 91, and for poor D soils CN = 93.

Effect of Slope on Curve Number

NRCS documents developing the curve number concept and associated methods did not cover the effect of land slope. Independent researchers have given some attention to the question though. Sharpley and Williams (1990) introduced the empirical equation that has been most often used to adjust CN relative to slope:

$$CN_s = 0.333(CN_w - CN)(1 - 2e^{-13.86s}) + CN$$

where CN is the curve number reported in NRCS tables for an average soil moisture condition and assumed slope ≤ 5 percent, CN_s = slope-adjusted CN, CN_w = CN in an initially wet soil condition, and s = slope (ft/ft). Ward and Trimble provided factors to adjust tabulated CN values to obtain CN_w . Carrying through the analysis in this manner demonstrated that results deviated between two assessed slopes (5 and 10 percent) by only around 2-6 percent. This small difference was considered minimal in the context of the approximations and assumptions inherent in the modeling process. While the results presentation gives some additional data on slope effects, full coverage is given only for 5 percent, the topographic basis of the NRCS model and by far the subject of its greatest application.

ESTIMATING INFILTRATION CAPACITY OF THE CASE STUDY SITES

Infiltration Rates

Infiltrating sufficient runoff to maintain pre-development hydrologic characteristics and prevent pollutant transport is the most effective way to protect surface receiving waters. Successfully applying infiltration requires soils and hydrogeological conditions that will pass water sufficiently rapidly to avoid overly-lengthy ponding, while not allowing percolating water to reach groundwater before the soil column captures pollutants.

The study assumed that infiltration would occur in surface facilities and not in below-ground trenches. The use of trenches is certainly possible. However, the intent of this investigation was to determine the ability of pervious areas to manage the site runoff, and their exclusion is consistent with the conservative approach to modeling taken in this analysis. This inquiry was accomplished by evaluating the ability of the predominant soil types identified for each region to provide an infiltration rate of at least 0.5 inch/hour, the rate often regarded in the stormwater management field as the minimum for the use of infiltration practices (e.g., Geosyntec Consultants 2008). The assessment considered soils that either would provide this rate, at a minimum, in their original condition or could be organically amended to augment soil water storage and increase infiltration, while also safeguarding groundwater. Therefore, prevailing groundwater depths were assessed in relation to runoff percolation times generally regarded as safe.

Infiltration rates were based on saturated hydraulic conductivities (obtained from Leij et al. 1996) typical of the basic soil types incorporated in the U.S. Department of Agriculture (USDA, 1987) soil textural triangle. Sand, loamy sand, sandy loam have conductivities well above 0.5 inch/hour. As Table 4 indicates, three of the four regions have a sandy loam as the dominant soil type. For such a soil in the B HSG in these regions, the infiltration rate was taken as 1.74

inch/hour (Leij et al. 1996). Other textures represented that would generally fall in the C group are mostly loam and silt loam. These soil types either have conductivities in excess of 0.5 inch/hour or, in the first author's experience, can be and have been successfully organically amended to produce such a rate and infiltrate accumulated water within 72 hours, and usually less time. The D soils in some study regions, silty clay and clay, were regarded as not amendable to reach 0.5 inch/hour conductivity to host conventional or ARCD-type facilities designed specifically for infiltration. Still, locations with these soils could distribute sheet flow over pervious areas for evapotranspiration and some infiltration at slow rates and could utilize roof downspout surface or subsurface dispersal.

Groundwater Protection Assessment

Avoidance of groundwater contamination was assessed by assuming a hydraulic conductivity generally regarded as the maximum rate for the use of infiltration practices, 2.4 inches/hour (e.g., Geosyntec Consultants 2008), and a minimum spacing to seasonal high groundwater from the bed of an infiltration facility of 4 ft. These conditions would provide a travel time of 20 hours, during which contaminant capture would occur through soil contact. This 20-hour travel time was regarded as a minimum for any soil type. For example, infiltrating on loamy sand with a hydraulic conductivity of 5.7 inches/hour would require minimum spacing from the infiltration surface to groundwater of 10 ft. This consideration did not actually become an issue for analyses in any region in this study, because all predominant soil types have infiltration rates under 2.4 inches/hour and groundwater spacings that exceed 4 ft.

Site Infiltration Capacities

Runoff volumes were estimated for the 85th and 95th percentile, 24-hour events as described previously. Bioretention cell surface area to accommodate these volumes was calculated based on a method in the City of Santa Barbara's Storm Water BMP Guidance Manual (Geosyntec Consultants 2008) (adapted from the Georgia Stormwater Manual (Atlanta Regional Commission, 2001)):

$$A = \frac{(V_{\text{design}})(l)}{(t)(k_{\text{design}})(d + l)}$$

where:

V_{design} = design volume of runoff to be infiltrated (ft³);

k_{design} = design infiltration rate (in/hr), taken as 0.5 times the typical rate for the soil type naturally or amended as a safety factor;

d = ponding depth (ft), assumed as 0.25 ft for a shallow landscape feature on the recommendation of the Georgia manual;

l = depth of planting media (ft), assumed as 4 ft on the recommendation of the Georgia manual;

t = required drawdown time (hr), taken as 48 hours.

The design variable selections are conservative in applying a safety factor to hydraulic conductivity, using minimum depths for economy and limiting site disruption, and applying a drain time lower than the maximum of 72 hours.

In considering the long-term capacity of a facility designed to infiltrate, the potential for groundwater mounding below or aside the unit is a concern. To avoid this problem a basic analysis was made using a groundwater rise equation from Zomorodi (2005):

$$\text{Rise} = 0.86 \frac{(K_v)(W)}{(K_h - K_v)}$$

where:

Rise = mounding occurring in a year of use (ft);

K_v = vertical saturated hydraulic conductivity (ft/year);

W = bioretention cell width (ft); and

K_h = horizontal saturated hydraulic conductivity (ft/year).

This equation was solved for K_v for computation of the allowable annual infiltration rate, assuming a rise limited to 1 ft. It was assumed that the bioretention surface area would be broken up to have no more than one basin for each 5 acres of total site area, another measure safeguarding against groundwater mounding. Also assumed was a square cell (i.e., W was computed as the square root of the surface area calculated according to the equation for A above). Horizontal hydraulic conductivities for loams such as represented among the B and C soils in the study regions tend to run in the range of 10 to 1000 meters/year (0.1 to 9 ft/day). A conservative value of 3 ft/day was used in the analysis.

The yearly rate of infiltration from a bioretention cell can be expressed in terms of volume of runoff per unit infiltrating surface area, acre-ft/acre-year, which is equivalent to K_v expressed as ft/year. The K_v value avoiding groundwater monitoring was therefore used to assess maximum annual infiltration capacity by multiplying by the total available pervious surface area. However, the K_v value was capped at a rate found in a study of infiltration capacity and benefits for Los Angeles' San Fernando Valley by Chralowicz et al. (2001). The Los Angeles study posited providing 0.1-0.5 acre for infiltration basins to serve each 5 acres of contributing drainage area. At 2-3 ft deep, it was estimated that such basins could infiltrate 0.90-1.87 acre-ft/year of runoff in San Fernando Valley conditions. Three types of soils predominate in the study area: sandy loams (35 percent of the area), a clay loam (23 percent), and a silty clay loam (29 percent). The balance of 13 percent includes small amounts at both ends of the textural spectrum, a clay and loamy sands. Infiltration rates are in the approximate range of 0.5-2.0 inches/hour, within the span generally regarded as ideal for successful infiltration without threatening groundwater. Computing the ratios of the rate and basin size data of Chralowicz et al. (2001), K_v maximized at approximately 20 acre-ft of runoff/acre infiltration surface-year under the most limiting conditions of soils and basin dimensions. This value was applied in this study if calculated rates were higher, another conservative feature to obtain the most realistic projections of infiltration potential.

In some cases analyzed, the maximum annual infiltration capacity was estimated at greater than post-development runoff volume production. In these instances complete retention would be possible with excess capacity left, and only a fraction of the available pervious area would have to be devoted to bioretention. That fraction was expressed as the ratio of annual runoff production to infiltration capacity.

STORMWATER RUNOFF VOLUME AND POLLUTANT DISCHARGES

Urban Land Use Pollutant Yields

Annual pollutant mass loadings prior to application of any stormwater management practices were estimated as the product of annual runoff volumes produced by the various land use and cover types and pollutant concentrations typical of those areas. General land use types (e.g., single-family residential, commercial) have typically been the basis for measuring and reporting stormwater pollutant data. However, an investigation of ARCD practices of the type of interest in this study demands data on specific land coverages. The literature offers few data on this basis. Those available and used herein were assembled by a consultant to the City of Seattle for a project in which the author participated. They appear in Attachment A (Herrera Environmental Consultants, Inc. undated). Table 7 summarizes the representative values used in the analysis.

Table 7. Pollutant Concentrations in Runoff from Developed Land Uses (after Herrera Environmental Consultants, Inc. undated)

Land Use	Total Suspended Solids (mg/L)	Total Copper (µg/L)	Total Zinc (µg/L)	Total Phosphorus (µg/L)
Residential roof	25	13	159	110
Commercial roof	18	14	281	140
Access road/driveway	120	22	118	660
Parking	75	36	97	140
Walkway	25	13	59	110
Landscaping	213	13	59	2040

Pollutant concentrations expected to occur typically in the mixed runoff from the several land use and cover types making up a development were estimated by mass balance; i.e., the concentrations from the different areas of the sites were combined in proportion to their contribution to the total runoff.

Estimating Retention

The principal interest of this study was to estimate how much of the post-development runoff volume for the various land use cases could be retained by ARCD measures and prevented from discharging from the site on the surface. The analyses initially evaluated the runoff volume that could potentially be infiltrated by using a portion or all of the available pervious area for bioretention facilities. In some instances judicious use of the pervious area could infiltrate the full volume. In other cases use of the pervious area for as much infiltration as possible plus special management of roof runoff would fully attenuate post-development runoff.

Complete retention would, of course, exceed any ordinary regulatory standard intended to govern discharge quantity and quality. To the extent that full retention could not be expected, the study was interested in assessing the degree to which bioretention and roof runoff management could meet the specific potential standards outlined earlier. Performance was estimated in terms of volume retained versus released, the extent to which pre-development groundwater recharge would be preserved, and the pollutant loading reduction accompanying volume retention in comparison to the quantities that would enter receiving waters with no stormwater management actions. These measures expressed in equation form are:

$$\text{Runoff retention (\%)} = \frac{(\text{Volume with no practices} - \text{Volume with ARCD practices})}{\text{Volume with no practices}} \times 100$$

(expresses amount of the theoretical maximum post-development runoff prevented from discharging by ARCD)

$$\text{Recharge retention (\%)} = \left[1 - \frac{(\text{Predevelopment recharge} - \text{Postdevelopment recharge with ARCD})}{\text{Predevelopment recharge}} \right] \times 100$$

Pre-development recharge = Rainfall volume – Predevelopment runoff volume

Post-development recharge = The smaller of rainfall volume or post-development infiltration volume

$$\text{Loading reduction (\%)} = \frac{(\text{Loading with no practices} - \text{Loading with ARCD practices})}{\text{Loading with no practices}} \times 100$$

It should be noted that runoff retention and recharge retention express different quantities and are not equal numerically.

When infiltration alone (Basic ARCD) could not accomplish full retention, roof runoff management strategies were selected as appropriate for the land use case (Full ARCD). For the retail commercial development (COMM), roof runoff management was assumed to be accomplished by harvesting, temporarily storing, and applying water to use in the building. To this end, the assumption was made that the commercial development would be able to manage and would have capacity to store and make use of the entire roof runoff volume. While this particular assumption is, on its own, speculative, the commercial development would, as discussed in the section on Application of ARCD Practices, earlier, see a reduction in runoff as a result of evapotranspiration, and would have the option to employ ARCD site design principles to reduce impervious surface area, to install a green roof to retain runoff, or to implement any of a number of other ARCD practices designed to reduce runoff volume and pollutant loading. As a result, the overall analysis of the commercial site remains conservative in its assessment of the potential to retain runoff onsite.

In the three multi-family and single-family residential cases it was assumed that the roof water would be dispersed on or within the pervious area according to accepted and standardized practices. For example, the Washington Department of Ecology's (2005) Stormwater Management Manual for Western Washington provides design criteria for two methods: splash blocks followed by vegetated dispersion areas and gravel-filled trenches. These devices can be used wherever space is sufficient regardless of infiltration rates, as they operate by evapotranspiration and slow infiltration. Even clay can infiltrate at an approximate rate of 0.2 inch/hour or higher (Leij et al. 1996; Pitt, Chen, and Clark 2002). Care was taken to assure that pervious area already allocated to infiltration would not also be counted upon for dispersion. While dispersion was assumed for simplification of the study analyses, in reality a site designer would have the option of using rain barrels, cisterns, and/or green roofs instead of or along with ground dispersion to manage roof water. Analyses for the final case, the redevelopment scenario (REDEV), assumed dispersion and/or small-scale harvesting of roof runoff above whatever level of infiltration could be accomplished given the soil condition.

Additional Analyses When Full Retention Cannot Be Expected

Retaining runoff from impervious and pollutant generating pervious surfaces is the best stormwater management policy, because it prevents the introduction of urban runoff pollutants

to receiving waters as well as serves quantity discharge control requirements. Maintaining pre-development peak flow rates, volumes, and elevated flow durations prevents stream channel and habitat damage, flooding, and loss of groundwater recharge. When conditions were expected to render full retention technically infeasible for the study cases, estimates were made of the volume and pollutant loadings that would be discharged assuming the remaining surface runoff is released to a receiving water with and without treatment. Treatment was assumed to be provided by bioretention discharging either directly on the surface or via an underdrain. While not as environmentally beneficial as retention, such treatment is superior to conventional stormwater management practices like ponds and sand filters. It captures pollutants through a number of mechanisms as contaminants are held for a time in the facility and contact vegetation and soil, such as sedimentation, filtration by plants, and adsorption and ion exchange in soil.

The effectiveness of bioretention in removing pollutants from surface runoff was estimated according to measurements by Chapman and Horner (2010). This study was performed on a linear bioretention device located on a slope and made up of a number of cells separated by weirs (termed a “cascade”). While an estimated 74 percent of all entering runoff infiltrated or evapotranspired before discharging, the flows reaching the end in the larger storms would have less residence time in the facility than in a unit on flat ground percolating water through soil before surface discharge via an underdrain. Therefore, pollutant concentrations exiting such a unit could be less yet. On the other hand, some bioretention facilities bypass the relatively rare higher flows, affording no treatment, while the cascade was designed to convey all runoff, even beyond its water quality design storm flow, and provide some treatment. On balance between the advantage and disadvantage of the facility providing the data, the discharge concentrations are considered to be representative of bioretention.

Chapman and Horner (2010) computed volume-weighted average discharge pollutant concentrations by multiplying concentrations times flow volumes for each monitored storm, summing, and dividing by total volume. The resulting values for the contaminants considered in this study are: total suspended solids (TSS)—30 mg/L, total copper—6.3 µg/L, total zinc—47 µg/L, and total phosphorus—133 µg/L. In a few instances these concentrations are higher than those in Table 7, an expression of the observation sometimes made in stormwater management that treatment cannot reduce concentrations in relatively “clean” flows below certain minimum values. In these situations the concentrations in Table 8 were also used in computing discharge loadings; i.e., no concentration reduction was applied in estimating discharge loadings, although flow volume would still be decreased to the extent infiltration could occur.

RESULTS OF THE ANALYSIS

ASSESSMENT OF MAXIMUM ARCD CAPABILITIES

Runoff Retention and Groundwater Recharge

Basic ARCD

One goal of this exercise was to determine if ARCD practices could eliminate post-development runoff production, and the pollutants it transports, and maintain pre-development groundwater recharge. The first assessment, termed the Basic ARCD analysis in this report, was to estimate if each site's pervious area is sufficient for full infiltration if given to this purpose to the extent necessary without compromising other uses. Accordingly, shallow, unobtrusive bioretention cells (i.e., rain gardens) are envisioned, dispersed through sites at no more than one for each 5 acres. It bears reemphasis that no credit was taken for water loss through evapotranspiration in this assessment, although a substantial, but not necessarily easily quantifiable, amount would undoubtedly occur. Estimates of runoff retention are therefore conservative.

Table 8 presents comparisons, for the Southeast climate region, between estimated annual runoff volumes generated before development and then post-development with and without Basic ARCD stormwater management. The table also gives annual groundwater recharge estimates for these same conditions.

^b Proportion of the total pervious area on the site required for bioretention to achieve given results

In all cases the majority of the infiltration that would recharge groundwater in the undeveloped state would be lost to surface runoff after development. These losses would approach 90 percent in the most impervious developments. The greatly increased surface flow would raise peak flow rates and volumes in receiving water courses, increase flooding risk, and transport pollutants.

Basic ARCD could retain all post-development runoff and pre-existing groundwater recharge in the three residential cases on the B soils, using from less than one-fourth to just over one-third of the available pervious area for bioretention cells. Taking all available pervious area for the more highly impervious COMM and REDEV cases on B soil, bioretention would retain about 45 percent of the runoff generated and save about 40 percent of the pre-development recharge. To illustrate the relatively small role that slope increase from 5 to 10 percent plays in runoff retention, full retention would still be expected in the three residential cases and for the remaining two cases (COMM and REDEV) would decrease from 44-45 percent only slightly to 40-41 percent (not shown in table).

On the D soil, infiltrating bioretention may not be technically feasible and was not relied upon for retention estimates. Without the use of additional measures in the Full ARCD category, only incidental post-development runoff would be retained; and most pre-development recharge would be lost.

Tables 9-11 are companions to Table 8 for the South Central, Northeast – Upper Midwest, and Southwest climate regions, respectively. Results for the Northeast - Upper Midwest B soil are very close to those for the Southeast B soil, as would be expected given the similar precipitation quantities and soil characteristics. In the three regions having C soils, Basic ARCD can retain all runoff for the MFR, Sm-SFR, and Lg-SFR residential cases. With these soils, except in the Southwest, achieving full retention requires more of the available pervious area than with B soils, up to 69 percent, but is still fully attainable.

The effect of lower rainfall is evident in the South Central and, especially, the Southwest regions. In the latter location, not only the residential cases but also the COMM and REDEV scenarios can achieve full runoff retention with Basic ARCD on the C soil. The residential cases need much smaller percentages of the available pervious area for bioretention than for the same cases on C and even B soils elsewhere. Applying Basic ARCD to the South Central, C soil, REDEV case results in higher runoff retention than for the B soil cases in higher rainfall regions.

The study cases demonstrated two interesting points about groundwater recharge. First, with effective infiltrating bioretention it is possible for post-development annual recharge to exceed the pre-development quantity. This phenomenon is most evident in comparing the two amounts for cases with 100 percent runoff retention on C soils, which in the natural state produce much less recharge in relation to runoff than B soils. The B soils have a recharge-to-runoff ratio of about 500, whereas that ratio is only 4-6 for the C soils studied. One reason for higher post-compared to pre-development recharge is that bioretention is set up to hold water, increasing the time for infiltration to occur, instead of letting it run off. Another is that soils, especially in the C HSG, are often improved by organic amendments to yield both more water storage capacity and higher infiltration rates than the pre-existing soils.

A related point is that the percentage of pre-development recharge retained after development can be higher with C than B soils. This situation can best be seen in cases without full runoff retention, COMM and sometimes REDEV. In terms of recharge, installing bioretention conveys a greater advantage to the C than the B soils, which already have more pore space for water storage and higher infiltration and recharge rates.

Full ARCD

Infiltration is one of a wide variety of ARCD-based source reduction techniques. Where site conditions such as soil quality or available area limit a site’s infiltration capacity, other ARCD measures can enhance a site’s runoff retention capability. Such practices can also be used where infiltration capacity is adequate, but the developer desires greater flexibility for land use on-site. Among those techniques, this study considered special management of roof water in those cases where bioretention could not infiltrate all post-development runoff.

Specifically, water harvesting for supply of irrigation and/or non-potable indoor uses was investigated for the retail commercial development. In residential cases with insufficient capacity for infiltrative bioretention but remaining space not already devoted to infiltration, efficiently directing roof runoff into the soil through downspout dispersion systems was the method of choice. Such cases invariably occurred with HSG D soils. The Full-ARCD scenario applied to the redevelopment case was roof water dispersion, harvesting, or a combination of the two practices. Generally speaking, infiltration consumed all available pervious area in the REDEV cases on B and C soils, making roof runoff harvesting the mechanism to retain more water. With no bioretention facility on D soil, the pervious area would be available for dispersion. Of course, harvesting could be applied instead of or along with dispersion. Again, it was assumed that the commercial and, as needed, redevelopment sites had capacity to harvest and make use of the full volume of roof runoff generated, however, the analysis remains conservative in terms of the potential for onsite retention as it does not consider the use of ARCD site design principles to reduce impervious surfaces, green roofs, and evaporation/evapotranspiration from surfaces other than rooftops.

Table 12 gives Southeast climate region results with the addition of Full ARCD techniques: roof runoff management, consisting of harvesting for reuse in the COMM case, dispersion on or within pervious land for the three residential cases, and a combination of these measures for REDEV. On the B soil runoff retention would approximately double for the retail commercial

land use and reach 100 percent for the redevelopment. Groundwater recharge would not be expected to increase over the Basic ARCD case, though; because harvesting still keeps water out of the soil system.

For development on the D soil, use of roof runoff management techniques was estimated to increase runoff retention from zero to about one-third to two-thirds of the post-development runoff generated, depending on the land use case. Groundwater recharge would not materially benefit, however; because harvest does not contribute to it. Also, no recharge credit was taken for dispersion, since infiltration is restricted and loss by ET would tend to occur before infiltration. Some small amount of recharge would still be likely though. To illustrate further the small role of topography, in this D soil, Full ARCD scenario runoff retention is forecast to decrease by only 1-2 percent at a 10 percent slope compared to a 5 percent slope (not shown in table).

^b Proportion of the total pervious area on the site required for bioretention to achieve given results

Tables 13-15 give data analogous to Table 12 for the South Central, Northeast – Upper Midwest, and Southwest climate regions, respectively. Results are similar to those reported for the Southeast region. Full ARCD can approximately double runoff retention from the Basic ARCD level for the COMM case and extend runoff retention to 100 percent for the redevelopment on both B and C soils. Once again, application of Full ARCD to the D soil cases increases runoff retention from zero to one-third to two-thirds of the volume produced, depending on land use case.

Pollutant Loading Reductions

The examination of maximum ARCD capabilities considered the reductions of annual mass loadings of four water pollutants that would accompany runoff retention. Since retention means no surface discharge, these loading reductions are, at a minimum, equal to the percentages of runoff retention. In those cases with less than full runoff retention, there is good reason to expect pollutant loading reductions higher than the percentage of runoff retained. The early runoff ("first flush"), occurring when the soils are least saturated, is more likely to be retained than later runoff. It is frequently observed that the first flush has higher pollutant concentrations than later runoff, particularly in the wash off after relatively extended dry periods.

For the B and D soil and the residential cases on C soils, the reductions were very consistent among regions:

- B and C soils, Basic ARCD, residential cases—100%;
- B soil, Basic ARCD, COMM and REDEV cases—44-45%;
- B soil, Full ARCD, COMM and REDEV cases—86-100%;
- D soil, Full ARCD, SFR and COMM cases—38-41%;
- D soil, Full ARCD, MFR case—50%; and
- D soil, Full ARCD, REDEV case—66%.

For the most highly impervious cases, COMM and REDEV, on C soils reduction was variable and dependent on precipitation. With Basic ARCD the range was from 25 to 100 percent, going from relatively high to low precipitation. Full ARCD is expected to raise the lowest reductions to 100 percent for REDEV and at least 66 percent for COMM.

Therefore, taking the greatest advantage of what ARCD offers could prevent the addition to receiving waters of all or almost all pollutant mass that would otherwise discharge from a range

of urban developments on B and C soils. With D soils, Full ARCD can accomplish loading reductions approaching or somewhat exceeding 50 percent.

ABILITY TO MEET POTENTIAL STANDARDS

General Summary

This section evaluates the ability of the Basic and Full ARCD strategies to meet each of the five potential stormwater management standards enumerated in the beginning of the report. It also examines the extent of pollutant loading reduction if the standards are just met; i.e., if runoff is retained at the minimum needed to meet the standard. It has already been demonstrated that retention of all post-development runoff and full pollutant attenuation is possible in some circumstances. Table 16 summarizes the results for all regions and cases and both ARCD strategies.

Ability to Meet Standards

The projected ability to meet the standards overall varies mostly in relation to soil type (B or C versus D) and the relative imperviousness of development, and much less across climate regions. The one exception to this generality is that implementing Basic ARCD practices on the Southwest region C soil would meet all five standards. This uniformity does not occur elsewhere on either B or C soils, and is apparently primarily a function of the relatively low precipitation in the region.

Setting aside the Southwest region, success in complying with standards is mostly comparable among the various B and C soils, with a small number of instances where a development type meets a standard on B but not on C soil. Basic ARCD methods invariably can meet all standards on B and C soils for the residential development cases (MFR and Sm- and Lg-SFR). Full ARCD practices are forecast to meet all standards for the redevelopment case on B soils but only standards 1 and 5 consistently on C soils. The combination of infiltration and roof runoff management applied to the retail commercial development allows meeting these same two standards on B soils but only the latter on both of the C soils occurring outside the Southwest region. The only standards that cannot be met on B and C soils by the ARCD methods considered are standards 2-4 for the COMM case. Therefore, of the 125 standards assessments, ARCD practices are projected to meet 113 (90.4 percent) with B and C soils.

The ability to meet these standards is much reduced on D soils. Standard 1 can be met occasionally with Full ARCD used in the redevelopment. All cases with Full ARCD comply with standard 4 on this soil where pre-development runoff is estimated to be relatively high, reflecting a low overall requirement for retention volume. Standard 5 can be met with Full ARCD with the exception of one COMM case. Standards 2 and 3 were never estimated to be met in any D soil case. All in all, with this soil 26 of the 75 scenarios (34.7 percent) are expected to meet a standard.

Effectiveness of Standards in Environmental Protection

Standard 3 (retain 90 percent of the average annual post-development runoff volume) would be the most protective standard. Meeting or coming as close as possible to meeting, but not exceeding, this standard is estimated to lead to 66-90 percent runoff retention and pollutant loading reduction on B and C soils and 37-66 percent on D soil. Standard 2 (retain the runoff produced by the 95th percentile, 24-hour precipitation event) would yield only slightly less protection with B and C soils and, with D soil, retention and loading reduction equivalent to standard 3.

Standards 4 and 5, based on the differential between pre- and post-development runoff volume, are highly inconsistent in retaining runoff and reducing pollutants, in that they are relatively protective where pre-development runoff is estimated to be very low relative to post-development flow, but result in progressively lower retention and pollutant loading reduction as pre- and post-development volumes converge, such as in several cases on D soils. Standard 5 is especially weak in this regard. The potentially low level of retention and pollutant loading reduction renders these standards based on the change in pre- versus post-development runoff volume poor candidates for national application, at least as formulated in these terms.

Fully meeting standard 1 (retain the runoff produced by the 85th percentile, 24-hour precipitation event) would yield runoff retention and pollutant mass reduction ranging from 58 to 81 percent, depending on climate region. This level of inconsistency decreases the utility of this standard for widespread use. Standard 2, based on the 95th percentile event, is much better in this respect, with variability in runoff retention and loading reduction across the nation in the much narrower 82-89 percent range. However, standard 1 remains more consistent across regions, and more protective of water quality for development on D soils than either standard 4 or 5, and is preferable to those standards in this regard.

In summary, standards 2 and 3 are clearly superior to the other three options. Standard 3 is entirely consistent from place to place in degree of environmental protection, and standard 2 does not deviate much. Analysis of the five development cases on two soil groups in each of four regions demonstrated the two standards are virtually identical in the runoff retention and pollutant loading reduction they would bring about.

Management of Runoff in Excess of Standards Requirements

All of the analysis reported above assumed that any remaining runoff after the application of ARCD and meeting, or coming as close as possible to meeting a standard, would discharge with no treatment. In fact, additional treatment could further decrease pollutant loadings. Treatment without further runoff retention could be accomplished by many conventional or ARCD methods designed to lower contaminant concentrations. The most effective of the alternatives is probably bioretention discharging non-retained runoff either on the surface or through an underdrain, assumed in the analysis conducted for this study according to the methods cited above. Treatment of all remaining runoff with underdrained bioretention cells where space remains but all infiltration capacity is used can raise the pollutant removals given in Table 16 to the levels in Table 17. These estimates apply to the four pollutants considered, TSS and total copper, zinc, and phosphorus. Space would most likely be available in the three MFR and SFR cases but not the COMM and REDEV scenarios.

While there is substantial variability in these results, they demonstrate that discharging effluent of relatively consistent, high quality can be accomplished with a comprehensive ARCD strategy. This strategy would embrace, first, retaining as much urban runoff as possible and then utilizing treatment based on soil and vegetative media to capture contaminants from the remainder.

Table 17. Estimated Pollutant Loading Reduction Benefits of Bioretention Treatment of Runoff Remaining After ARCD Implemented to Meet or Approach Standards

Range of Table 16 Values (%)	Approximate Pollutant Removal Increase (%)	Total Estimated Pollutant Removal Range (%)
35-45	30-45	65-90
45-55	25-35	70-90

65-75	15->20	80->95
75-85	10->15	85->95
>85	5->10	90->95

SUMMARY AND CONCLUSIONS

STUDY DESIGN

This study was performed to investigate the degree to which low-impact development ARCD practices can meet or exceed the requirements of various potential stormwater management facility design standards and the resulting environmental benefits. The investigation was performed by estimating the stormwater retention possible with full application of ARCD practices to five land use cases in four representative climatic regions in the United States on two prominent soil types in each region. Retention is defined as preventing the conversion of precipitation to surface runoff. Retaining runoff from impervious and pollutant generating pervious surfaces prevents the introduction of urban runoff pollutants to receiving waters as well as reduces runoff volume to prevent stream channel and habitat damage, flooding, and loss of groundwater recharge. Infiltrating bioretention was first applied in the analysis of each case, a strategy termed Basic ARCD. When Basic ARCD could not fully retain post-development runoff, a Full ARCD strategy was added, involving roof runoff harvesting in the most impervious development cases and roof water dispersion in those with substantial pervious area. Benefits were assessed with respect to reduction of the annual average surface runoff volume from the quantity estimated without any stormwater management practices, and associated maintenance of pre-development groundwater recharge and water quality improvement through preventing discharge to receiving waters of pollutants generated with developed land uses.

A number of conservative assumptions were built into the analysis to ensure that the capabilities and benefits of ARCD would not be over-estimated. In summary, these assumptions are:

- No retention credit for evapotranspiration in the Basic ARCD strategy, although generally a substantial amount would occur, and consideration of evapotranspiration only for roof runoff in the Full ARCD strategy;
- Letting aside many available ARCD practices and site design principles that could be employed to reduce the runoff quantity, and the pollutants it transports, by reducing impervious surface area or directing the runoff to bioretention, harvesting, and dispersion facilities;
- The assumption of no infiltration on hydrologic soil group D soils, although some infiltration occurs at finite rates even on clay;
- Application of a safety factor to estimated infiltration rates;
- Minimum bioretention cell depths, so that these facilities would not be disruptive to site design and could be put to other uses;
- Requiring a 48-hour drawdown time for bioretention, instead of the 72-hour maximum;
- An analysis to guard against groundwater mounding under bioretention cells, with conservative assumptions for horizontal and vertical hydraulic conductivity rates; and
- An analysis demonstrating that doubling topographic slope changes results by only a few percent.

CAPABILITIES OF FULL ARCD APPLICATION

Comparison of estimated runoff production in the pre- and post-development states demonstrated that the majority of the infiltration that would recharge groundwater in the undeveloped state would be lost to surface runoff after development with no stormwater management practices. These losses would approach 90 percent in the most impervious developments. These observations apply in all climate regions and with the full range of soil conditions.

Basic ARCD could retain all post-development runoff and pre-existing groundwater recharge, as well as attenuate all pollutant transport, in the three residential cases on B soils in the two climate regions where these soils were analyzed. Bioretention cells to accomplish this retention would use from less than one-fourth to just over one-third of the available pervious area for infiltration. Taking all available pervious area for the more highly impervious COMM and REDEV cases, bioretention would retain about 45 percent of the runoff and pollutants generated and save about 40 percent of the pre-development recharge. Adding Full ARCD measures in these cases would approximately double retention and pollutant reduction for the retail commercial land use and raise it to 100 percent for the redevelopment. Groundwater recharge would not increase, however, because the additional retention is accomplished by harvesting or dispersion.

In the three regions having C soils, Basic ARCD can again retain all runoff and reduce urban runoff pollutant mass loading to zero for the MFR and Sm-SFR and Lg-SFR residential cases, although generally requiring more of the available pervious area to do so than in B soil cases. The effect of lower rainfall is evident in the South Central and, especially, the Southwest regions. In the latter location, not only the residential cases but also the COMM and REDEV scenarios can achieve full runoff and groundwater recharge retention and pollutant loading attenuation with Basic ARCD on C soil. Full ARCD can approximately double runoff retention and pollutant removal from the Basic ARCD level for the COMM case and extend these measures to 100 percent for the redevelopment.

For development on the D soils in all climate regions, use of roof runoff management techniques was estimated to increase runoff retention and pollutant reduction from zero to between about one-third to two-thirds of the post-development runoff generated, depending on the land use case. These strategies would offer little groundwater recharge benefit with this soil condition, but would still have the potential to significantly reduce runoff volume and pollutant loading.

Therefore, taking the greatest advantage of what ARCD offers is expected to retain the great majority of post-development runoff and pre-development groundwater recharge. This strategy would also prevent the addition to receiving waters of all or almost all pollutant mass that would otherwise discharge from a range of urban developments on B and C soils. With D soils, Full ARCD can accomplish runoff retention and loading reductions approaching or somewhat exceeding 50 percent, and opportunities to use ARCD practices or site design principles not modeled in this analysis can further increase runoff retention volume.

ABILITY TO MEET STANDARDS

ARCD methods were assessed for their ability to meet five potential regulatory standards, the first two pertaining to retention of the 85th and 95th percentile, 24-hour precipitation events, the third to retain 90 percent of the post-development runoff, and the last two to retain the difference between the post- and pre-development runoff, the final standard capped at the 85th percentile, 24-hour event. The projected ability to meet the five standards varies mostly in relation to soil type (B or C versus D) and the relative imperviousness of development, and much less across climate regions, except for the relatively arid Southwest.

The only standards that cannot be fully met on B and C soils by the ARCD methods considered are standards 2-4 for the COMM case. Of the 125 standards assessments, ARCD practices are projected to meet 113 (90.4 percent) with B and C soils. The ability to meet these standards is much reduced on D soils. Only standards 1 (85th percentile, 24-hour precipitation event, and 4 and 5 (related to the difference between the post- and pre-development runoff) can be met occasionally and under limited conditions using Full ARCD methods. However, even on D soils, all cases for Standard 1 were able to retain greater than 50 percent of the required runoff volume.

Standard 3 (retain 90 percent of the average annual post-development runoff volume) would be the most environmentally protective standard. Meeting or coming as close as possible to meeting, but not exceeding, this standard was estimated to lead to 66-90 percent runoff retention and pollutant loading reduction on B and C soils and 37-66 percent on D soil. Standard 2 (retain the runoff produced by the 95th percentile, 24-hour precipitation event) would yield equivalent protection on D soils and only slightly less protection with B and C soils.

Standards 4 and 5, based on the differential between pre- and post-development runoff volume, are very inconsistent in retaining runoff and reducing pollutants. They are highly protective where pre-development runoff is estimated to be very low relative to post-development flow, and then to result in progressively lower retention and loading reduction as pre- and post-development volumes converge. Standard 5 is especially weak in this regard. This inconsistency makes these standards poor candidates for national application, at least as formulated in these terms.

Fully meeting standard 1 (retain the runoff produced by the 85th percentile, 24-hour precipitation event) would yield runoff retention and pollutant mass reduction ranging from 58 to 81 percent, depending on climate region. This level of inconsistency decreases the utility of this standard to some degree. Standard 2, based on the 95th percentile event, is much better in this respect, with variability in runoff retention and loading reduction across the nation in the much narrower 82-89 percent range. However, standard 1 remains more consistent across regions, and more protective of water quality for development on D soils than either standard 4 or 5, and is preferable to those standards in this regard.

In summary, standards 2 and 3 are clearly superior to the other three options. Standard 3 is entirely consistent from place to place in degree of environmental protection, and standard 2 does not deviate much. Analysis of the five development cases on two soil groups in each of four regions demonstrated the two standards are virtually identical in the runoff retention and pollutant loading reduction they would bring about.

All five standards are based on some stipulated runoff retention. Pollutant mass loading reduction is at least equal to the amount of retention that occurs. It is possible to decrease loadings further by treating excess runoff. Analysis showed that subjecting that runoff to bioretention treatment before discharge could reduce loadings of TSS and total copper, zinc, and phosphorus by at least two-thirds and as much as over 95 percent. This conclusion applies to all climate regions and soil types for land use cases where space is available for the additional bioretention cells. The three residential cases are in this group but not the COMM or REDEV cases, where all pervious land would have already been used for retentive or roof water dispersion practices.

Notes:

Representative values are weighted means of collected data. Italicized values were omitted from these calculations.

- 1 - Grab samples from residential, commercial/institutional, and industrial rooftops. Values represent mean of DETECTED concentrations
- 2 - Flow-weighted composite samples, geometric mean concentrations
- 3 - Geometric mean concentrations
- 4 - Citation appears to be erroneous - original source of data is unknown. Not used to calculate representative value
- 5 - Median concentrations. Not used to calculate representative values due to site location and variation from other values.
- 6 - Mean concentrations from simulated rainfall study
- 7 - Mean concentrations. Not used to calculate representative values due to transportation nature of land use.

INITIAL INVESTIGATION OF THE FEASIBILITY AND BENEFITS OF LOW-IMPACT SITE DESIGN PRACTICES (“LID”) FOR THE SAN FRANCISCO BAY AREA

Richard R. Horner[†]

ABSTRACT

The Clean Water Act NPDES permit that regulates municipal separate storm sewer systems (MS4s) in the San Francisco Bay Area, California will be reissued in 2007. The draft permit includes general provisions related to low impact development practices (LID) for certain kinds of development and redevelopment projects. Using six representative development project case studies, based on California building records, the author investigated the practicability and relative benefits of LID options for the majority of the region having soils potentially suitable for infiltration either in their natural state or after amendment using well recognized LID techniques. The results showed that (1) LID site design and source control techniques are more effective than conventional best management practices (BMPs) in reducing runoff rates; and (2) in each of the case studies, LID methods would reduce site runoff volume and pollutant loading to zero in typical rainfall scenarios.

INTRODUCTION

The Assessment in Relation to Municipal Permit Conditions

This purpose of this study is to investigate the relative water quality and water reuse benefits of three levels of storm water treatment best management practices (BMPs): (1) basic “treat-and-release” BMPs (e.g., drain inlet filters, CDS units), (2) commonly used BMPs that expose runoff to soils and vegetation (extended-detention basins and biofiltration swales and filter strips), and (3) low impact development (LID) practices. The factors considered in the investigation are runoff volume, pollutant loading, and the availability of water for infiltration or other reuse. In order to assess the differential impact of storm water reduction approaches on these factors, this study examines six case studies typical of development covered by the proposed Municipal Regional Urban Runoff Phase I NPDES Stormwater Permit (MRP).

This report covers locations in the Bay Area most amenable to soil infiltration of stormwater runoff, those areas having soils in Natural Resources Conservation Service (NRCS) Hydrologic Soil Groups A, B, or C as classified by the Natural Resources Conservation Service (<http://websoilsurvey.nrcs.usda.gov/app/WebSoilSurvey.aspx>). Depending on site-specific conditions, A and B soils would generally effectively infiltrate water without modification, whereas C soils could require organic amendments according to now standard LID methods. This report does not cover locations with group D soils, which are generally not amenable to infiltration, again depending on the specific conditions on-site. A subsequent report will examine options in these locations, which include other LID techniques (e.g., roof runoff harvesting for irrigation or gray water supply) and state-of-the-art conventional stormwater

management practices. A minority but still substantial fraction of the Bay Area has group D soils (39.3, 68.0, 18.3, and 50.1 percent of the mapped areas of Alameda, Contra Costa, San Mateo, and Santa Clara Counties, respectively). Regarding any mapped soil type, it is important to keep in mind that soils vary considerably within small distances. Characteristics at specific locations can deviate greatly from those of the major mapped unit, making infiltration potential either more or less than may be expected from the mapping.

Low impact development methods reduce storm runoff and its contaminants by decreasing their generation at sources, infiltrating into the soil or evaporating storm flows before they can enter surface receiving waters, and treating flow remaining on the surface through contact with vegetation and soil, or a combination of these strategies. Soil-based LID practices often use soil enhancements such as compost, and thus improve upon the performance of more traditional basins and biofilters. The study encompassed vegetated swales (channels for conveyance at some depth and velocity), vegetated filter strips (surfaces for conveyance in thin sheet flow), and bioretention areas (shallow basins with a range of vegetation types in which runoff infiltrates through soil either to groundwater or a subdrain for eventual surface discharge). Application of these practices in a low impact site design mode requires either determination that existing site soils can support runoff reduction through infiltration or that soils will be amended using accepted LID techniques to attain this objective. Finally, the study further broadened implementation options to include water harvesting (collection and storage for use in, for example, irrigation or gray water systems), roof downspout infiltration trenches, and porous pavements.

The investigation also considered whether typical development patterns and local conditions in the Bay Area would enable LID implementation as required by a new standard proposed for the 2007 Ventura County Municipal Storm Water Permit. This standard requires management of effective impervious area (EIA), limiting it to 5%, as well as other impervious area (what might be termed Not-Connected Impervious Area, N CIA), and pervious areas.

Where treatment control BMPs are required to manage runoff from a site, Volume or Flow Hydraulic Design Bases commonly used in California were assumed to apply. The former basis applies to storage-type BMPs, like ponds, and requires capturing and treating either the runoff volume from the 85th percentile, 24-hour rainfall event for the location or the volume of annual runoff to achieve 80 percent or more volume treatment. The calculations in this analysis used the 85th percentile 24-hour rainfall event basis. The Flow basis applies to flow-through BMPs, like swales, and requires treating the runoff flow rate produced from a rain event equal to at least 0.2 inches per hour intensity (or one of two other approximately equivalent options).

Scope of the Assessment

With respect to each of the six development case studies, three assessments were undertaken: a baseline scenario incorporating no stormwater management controls; a second scenario employing conventional BMPs; and a third development scenario employing LID stormwater management strategies.

To establish a baseline for each case study, annual stormwater runoff volumes were estimated, as well as concentrations and mass loadings of four pollutants: (1) total suspended solids (TSS), (2) total recoverable copper (TCu), (3) total recoverable zinc (TZn), and (4) total phosphorus (TP). These baseline estimates were based on the anticipated land use and cover with no stormwater management efforts.

Two sets of calculations were then conducted using the parameters defined for the six case studies. The first group of calculations estimated the extent to which basic BMPs reduce runoff volumes and pollutant concentrations and loadings, and what impact, if any, such BMPs have on recharge rates or water retention on-site.

The second group of calculations estimated the extent to which commonly used soil-based BMPs and LID site design strategies ameliorate runoff volumes and pollutant concentrations and loadings, and the effect such techniques have on recharge rates. When evaluating LID strategies in the context of the EIA concept employed in the draft Ventura County MS4 permit, it was presumed that EIA would be limited to three percent. It was also assumed that pervious surfaces on a site receiving runoff from other areas on the site would be sized and prepared to manage (through infiltration or storage) the volume directed there in addition to precipitation falling directly on those areas. The assessment of basins, biofiltration, and low impact design practices analyzed the expected infiltration capacity of the case study sites. It also considered related LID techniques and practices, such as source reduction strategies, that could work in concert with infiltration to serve the goals of: (1) preventing increase in annual runoff volume from the pre- to the post-developed state, (2) preventing increase in annual pollutant mass loadings between the two development states, and (3) avoiding exceedances of the Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) criteria for copper and zinc.

The results of this analysis show that:

- A full-range of typical development categories common in the Bay Area, from single family residential to restaurants, housing developments, and commercial uses like office buildings, can feasibly implement standard LID techniques to achieve no stormwater discharge during rain events equal to, and in some cases greater than, design storm conditions. This conclusion is based on an analysis that used actual building records in California and annual rainfall records in two rainfall zones in the Bay Area to show that site conditions support this level of performance. In addition, site conditions typical at a wide range of development projects are more than sufficient to attain compliance with a three percent EIA limit, as is being contemplated in other MS4 re-issuance proceedings in California presently.
- Developments implementing no post-construction BMPs result in storm water runoff volume and pollutant loading that are substantially increased, and recharge rates that are substantially decreased, compared to pre-development conditions.
- Developments implementing basic post-construction treatment BMPs achieve reduced pollutant loading compared to developments with no BMPs, but stormwater runoff volume and recharge rates are similar to developments with no BMPs.
- Developments implementing traditional basins and biofilters, and even more so low impact post-construction BMPs, achieve significant reduction of pollutant loading and runoff volume as well as greatly enhanced recharge rates compared to both developments with no BMPs and developments with basic treatment BMPs.

This report covers the methods employed in the investigation, data sources, and references for both. It then presents the results, discusses their consequences, draws conclusions, and makes recommendations relative to the feasibility of utilizing low-impact development practices in Bay Area developments.

CASE STUDIES

Six case studies were selected to represent a range of urban development types considered to be representative of the Bay Area. These case studies involved: a multi-family residential complex (MFR), a relatively small-scale (23 homes) single-family residential development (Sm-SFR), a restaurant (REST), an office building (OFF), a relatively large (1000 homes) single-family residential development (Lg-SFR), and a single home (SINGLE).¹

Parking spaces were estimated to be 176 sq ft in area, which corresponds to 8 ft width by 22 ft length dimensions. Code requirements vary by jurisdiction, with the tendency now to drop below the traditional 200 sq ft average. About 180 sq ft is common, but various standards for full- and compact-car spaces, and for the mix of the two, can raise or lower the average.² The 176 sq ft size is considered to be a reasonable value for conventional practice.

Roadways and walkways assume a wide variety of patterns. Exclusive of the two SFR cases, simple, square parking lots with roadways around the four sides and square buildings with walkways also around the four sides were assumed. Roadways and walkways were taken to be 20 ft and 6 ft wide, respectively.

Single-family residences were assumed each to have a driveway 20 ft wide and 30 ft long. It was further assumed that each would have a sidewalk along the front of the lot, which was calculated to be 5749 sq ft in area. Assuming a square lot, the front dimension would be 76 ft. A 40-ft walkway was included within the property. Sidewalks and walkways were taken to be 4 ft wide. For each case study the total area for all of these impervious features was subtracted from the total site area to estimate the pervious area, which was assumed to have conventional landscaping cover (grass, small herbaceous decorative plants, bushes, and a few trees).

¹ Building permit records from the City of San Marcos in San Diego County provided data on total site areas for the first four case studies, including numbers of buildings, building footprint areas (including porch and garage for Sm-SFR), and numbers of parking spaces associated with the development projects. While the building permit records made no reference to features such as roadways, walkways, and landscaping normally associated with development projects, these features were taken into account in the case studies using assumptions described herein. Larger developments and redevelopment were not represented in the sampling of building permits from the San Marcos database. To take these types of projects into account in the subsequent analysis, the Lg-SFR scenario scaled up all land use estimates from the Sm-SFR case in the ratio of 1000:23. The single home case (SINGLE) was derived from Bay Area records obtained at http://www.ppic.org/content/other/706EHEP_web_only_appendix.pdf, which showed 8000 ft² as a rough average for a single home lot in the region. As with the other cases, these hypothetical developments were assumed to have roadways, walkways, and landscaping, as described herein.

METHODS OF ANALYSIS

Annual Stormwater Runoff Volumes

Annual surface runoff volumes produced were estimated for both pre- and post-development conditions for each case study site. Runoff volume was computed as the product of annual precipitation, contributing drainage area, and a runoff coefficient (ratio of runoff produced to rainfall received). For impervious areas the following equation was used:

$$C = (0.009) I + 0.05$$

where I is the impervious percentage. This equation was derived by Schueler (1987) from Nationwide Urban Runoff Program data (U.S. Environmental Protection Agency 1983). With $I = 100$ percent for fully impervious surfaces, C is 0.95.

The basis for pervious area runoff coefficients was the Natural Resource Conservation Service's (NRCS) Urban Hydrology for Small Watersheds (NRCS 1986, as revised from the original 1975 edition). This model estimates storm event runoff as a function of precipitation and a variable representing land cover and soil, termed the curve number (CN). Larger events are forecast to produce a greater amount of runoff in relation to amount of rainfall because they more fully saturate the soil. Therefore, use of the model to estimate annual runoff requires selecting some event or group of events to represent the year. The 85th percentile, 24-hour rainfall event was used in the analysis here for the relative comparison between pre- and post-development and applied to deriving a runoff coefficient for annual estimates, recognizing that smaller storms would produce less and larger storms more runoff.

A memorandum titled Rainfall Data Analysis and Guidance for Sizing Treatment BMPs (http://www.cccleanwater.org/construction/Publications/CCCWPBasinSizingMemoFINAL_4-20-05.pdf) prepared for the Contra Costa Clean Water Program demonstrated a linear relationship between unit basin storage volume for 80 percent capture (which is related to the 85th

percentile event) and mean annual precipitation. Rainfall for Bay Area 85th percentile, 24-hour events could thus be determined from locations where events have been established in direct proportion to mean annual rainfall.

In order to obtain appropriate regional estimates of annual precipitation, rainfall records were obtained from a number of sites in the four counties, plus the city of Vallejo, covered by the permit.³ The mean annual range is from 13.73 to 24.30 inches, with quantities close to either 14 or 20 inches predominating. The study was performed for both of these rainfall totals. These figures were used in conjunction with 85th percentile, 24-hour event amounts of 0.75 for Los Angeles and 0.92 for Santa Rosa (<http://ci.santa-rosa.ca.us/pworks/other/SW/SRSWManualFinalDraft.pdf>), respectively, and mean annual totals of 12 and 31 inches for the respective cities to estimate 85 percentile, 24-hour event quantities of 0.77 and 0.82 inch for the 14 and 20-inch Bay Area rainfall zones, respectively.

Pre- and post-development runoff quantities were computed with selected CN values and the 0.77- and 0.82-inch rainfalls. The CN choices based on tabulated data in NRCS (1986) and professional judgment were 83 before development and 86 after land modification. Estimate runoff amounts were then divided by the rainfall totals to obtain runoff coefficients. The results were about the same for the two rainfall zones at 0.07 and 0.12 before and after development, respectively. Finally, total annual runoff volumes were estimated based on the two average annual precipitation figures.

Stormwater Runoff Pollutant Discharges

Annual pollutant mass discharges were estimated as the product of annual runoff volumes produced by the various land use and cover types and pollutant concentrations typical of those areas. Again, the 0.75-inch precipitation event was used as a basis for volumes. Stormwater pollutant data have typically been measured and reported for general land use types (e.g., single-family residential, commercial). However, an investigation of low impact development practices of the type this study sought to conduct demands data on specific land coverages. The literature offers few data on this basis. Those available and used herein were assembled by a consultant to the City of Seattle for a project in which the author participated. They appear in Attachment A (Herrera Environmental Consultants, Inc. undated).

Pollutant concentrations expected to occur typically in the mixed runoff from the several land use and cover types making up a development were estimated by mass balance; i.e., the concentrations from the different areas of the sites were combined in proportion to their contribution to the total runoff.

The Effect of Conventional Treatment BMPs on Runoff Volume, Pollutant Discharges, and Recharge Rates

The first question in analyzing how BMPs reduce runoff volumes and pollutant discharges was, What BMPs are being employed in Bay Area developments under the permit now in force? These county permits provide regulated entities with a large number of choices and few fixed requirements regarding the selection of stormwater BMPs. (See Contra Costa County NPDES Municipal Stormwater Permit, Order No. 99-058; see also Santa Clara County NPDES Municipal Stormwater Permit, Order No. 01-024, at C.3.a.). Clean Water Program Available options presumably include manufactured BMPs, such as drain inlet inserts (DIIs) and continuous deflective separation (CDS) units. Developments may also select such non-

proprietary devices as extended-detention basins (EDBs) and biofiltration swales and filter strips. EDBs hold water for two to three days for solids settlement before releasing whatever does not infiltrate or evaporate. Biofiltration treats runoff through various processes mediated by vegetation and soil. In a swale, runoff flows at some depth in a channel, whereas a filter strip is a broad surface over which water sheet flows. Each of these BMP types was applied to each case study, although it is not clear that these BMPs, in actuality, have been implemented consistently within the Bay Area to date.

The principal basis for the analysis of BMP performance was the California Department of Transportation's (CalTrans, 2004) BMP Retrofit Pilot Program, performed in San Diego and Los Angeles Counties. One important result of the program was that BMPs with a natural surface infiltrate and evaporate (probably, mostly infiltrate) a substantial amount of runoff, even if conditions do not appear to be favorable for an infiltration basin. On average, the EDBs, swales, and filter strips lost 40, 50 and 30 percent, respectively, of the entering flow before the discharge point. DIIIs and CDS units do not contact runoff with a natural surface, and therefore do not reduce runoff volume.

The CalTrans program further determined that BMP effluent concentrations were usually a function of the influent concentrations, and equations were developed for the functional relationships in these cases. BMPs generally reduced influent concentrations proportionately more when they were high. In relatively few situations influent concentrations were constant at an "irreducible minimum" level regardless of inflow concentrations.

In analyzing the effects of BMPs on the case study runoff, the first step was to reduce the runoff volumes estimated with no BMPs by the fractions observed to be lost in the pilot study. The next task was estimating the effluent concentrations from the relationships in the CalTrans report. The final step was calculating discharge pollutant loadings as the product of the reduced volumes and predicted effluent concentrations. As before, typical pollutant concentrations in the mixed runoff were established by mass balance.

Estimating Infiltration Capacity of the Case Study Sites

Infiltrating sufficient runoff to maintain pre-development hydrologic characteristics and prevent pollutant transport is the most effective way to protect surface receiving waters. Successfully applying infiltration requires soils and hydrogeological conditions that will pass water sufficiently rapidly to avoid overly-lengthy ponding, while not allowing percolating water to reach groundwater before the soil column captures pollutants.

The study assumed that infiltration would occur in surface facilities and not in below-ground trenches. The use of trenches is certainly possible, and was judged to be an approved BMP by CalTrans after the pilot study. However, the intent of this investigation was to determine the ability of pervious areas to manage the site runoff. This was accomplished by determining the infiltration capability of the pervious areas in their original condition for each development case study, and further assessing the pervious areas' infiltration capabilities if soils were modified according to low impact development practices.

The chief basis for this aspect of the work was an assessment of infiltration capacity and benefits for Los Angeles' San Fernando Valley (Chralowicz et al. 2001). The Chralowicz study posited providing 0.1-0.5 acre for infiltration basins to serve each 5 acres of contributing drainage area. At 2-3 ft deep, it was estimated that such basins could infiltrate 0.90-1.87 acre-ft/year of runoff in San Fernando Valley conditions. Soils there are generally various loam textures with infiltration rates of approximately 0.5-2.0 inches/hour. Loams are also common formations in the portion of the Bay Area covered by this report, those areas with Hydrologic

Soil Groups A, B, and C,⁴ thus making the conclusions of the San Fernando Valley study applicable for these purposes. This information was used to estimate how much of each case study site's annual runoff would be infiltratable, and if the pervious portion would provide sufficient area for infiltration. For instance, if sufficient area were available, the infiltration configuration would not have to be in basin form but could be shallower and larger in surface area. This study's analyses assumed the use of bioretention areas rather than traditional infiltration basins.

Volume and Pollutant Source Reduction Strategies

As mentioned above, the essence of low impact development is reducing runoff problems before they can develop, at their sources, or exploiting the infiltration and treatment abilities of soils and vegetation. If a site's existing infiltration and treatment capabilities are inadequate to preserve pre-development hydrology and prevent runoff from causing or contributing to violations of water quality standards, then LID-based source reduction strategies can be implemented, infiltration and treatment capabilities can be upgraded, or both.

Source reduction can be accomplished through various LID techniques. Soil can be upgraded to store runoff until it can infiltrate, evaporate, or transpire from plants through compost addition. Soil amendment, as this practice is known, is a standard LID technique.

Upgraded soils are used in bioretention cells that hold runoff and effect its transfer to the subsurface zone. This standard LID tool can be used where sufficient space is available. This study analyzed whether the six development case study sites would have sufficient space to effectively reduce runoff using bioretention cells, assuming the soils and vegetation could be amended and enhanced where necessary.

Conventional pavements can be converted to porous asphalt or concrete or replaced with concrete or plastic unit pavers or grid systems. For such approaches to be most effective, the soils must be capable of infiltrating the runoff passing through, and may require renovation.

Source reduction can be enhanced by the LID practice of water harvesting, in which water from impervious surfaces is captured and stored for reuse in irrigation or gray water systems. For example, runoff from roofs and parking lots can be harvested, with the former being somewhat easier because of the possibility of avoiding pumping to use the water and fewer pollutants. Harvesting is a standard technique for Leadership in Energy and Environmental Design (LEED) buildings.⁵ Many successful systems of this type are in operation, such as the Natural Resources Defense Council office (Santa Monica, CA), the King County Administration Building (Seattle, WA), and two buildings on the Portland State University campus (Portland, OR). This investigation examined how water harvesting could contribute to stormwater management for case study sites where infiltration capacity, available space, or both appeared to be limited.

RESULTS OF THE ANALYSIS

1. "Base Case" Analysis: Development without Stormwater Controls

Comparison of Pre- and Post-Development Runoff Volumes

Table 2 presents a comparison between the estimated runoff volumes generated by the respective case study sites in the pre- and post-development conditions, assuming implementation of no stormwater controls on the developed sites. On sites dominated by impervious land cover, most of the infiltration that would recharge groundwater in the undeveloped state is expected to be lost to surface runoff after development. This greatly increased surface flow would raise peak flow rates and volumes in receiving water courses, raise flooding risk, and transport pollutants. Only the office building, the plan for which retained substantial pervious area, would lose less than 40 percent of the site's pre-development recharge.

Table 2. Pre- and Post-Development without BMPs: Distribution of Surface Runoff Versus Recharge to Groundwater (annual volume in acre-ft)

Pollutant Concentrations and Loadings

Table 3 presents the pollutant concentrations from the literature and loadings calculated as described for the various land use and cover types represented by the case studies. Landscaped areas are expected to release the highest TSS concentration, although relatively low TSS mass loading because of the low runoff coefficient. The highest copper concentrations and loadings are expected from parking lots. Roofs, especially commercial roofs, top the list for both zinc concentrations and loadings. Landscaping would issue by far the highest phosphorus, although access roads and driveways would contribute the highest mass loadings. With expected concentrations being equal in the two rainfall zones, mass loadings in the 20 inches/year zone would be higher than those in the 14 inches/year zone in the same proportion as the ratio of rainfall quantities.

Table 3. Pollutant Concentrations and Loadings for Case Study Land Use and Cover Types

The Basin Plan freshwater acute criteria for copper and zinc are 0.013 mg/L and 0.120 mg/L, respectively (http://www.swrcb.ca.gov/rwqcb2/basinplan/web/BP_CH3.html). All developed land uses are expected to discharge copper at or above the criterion, based on the mass balance calculations using concentrations from Table 3. Any surface release from the case study sites would just meet or violate the criterion at the point of discharge, although dilution by the receiving water would lower the concentration below the criterion at some point. Even if copper mass loadings are reduced by BMPs, any surface discharge would equal or exceed the criterion initially, but it would be easier to dilute below that level. In contrast, runoff from land covers other than roofs would not violate the acute zinc criterion. Because of this difference, the evaluation considered whether or not the zinc criterion would be exceeded in each analysis, whereas there was no point in this analysis for copper. There are no equivalent water quality criteria for TSS and TP; hence, their concentrations were not further analyzed in the different scenarios.

Table 4 shows the overall loadings, as well as zinc concentrations, expected to be delivered from the case study developments should they not be fitted with any BMPs. As Table 4 shows, all cases are forecast to exceed the 0.120 mg/L acute zinc criterion. Because of its size, the large residential development dominates the mass loading emissions.

2. “Conventional BMP” Analysis: Effect of Basic Treatment BMPs

Effect of Basic Treatment BMPs on Post-Development Runoff Volumes

The current set of regional permits allows regulated parties to select from a range of BMPs in order to treat or infiltrate a given quantity of annual rainfall. The administrative draft of the proposed MRP is also non-specific regarding the role of LID in satisfying permit conditions. The range of BMPs includes drain inlet inserts, CDS units, and other manufactured BMPs, detention vaults, and sand filters, all of which isolate runoff from the soil; as well as basins and biofiltration BMPs built in soil and generally having vegetation. Treatment BMPs that do not permit any runoff contact with soils discharge as much stormwater runoff as equivalent sites with no BMPs, and hence yield zero savings in recharge. As mentioned above, the CalTrans (2004) study found that BMPs with a natural surface can reduce runoff by substantial margins (30-50 percent for extended-detention basins and biofiltration).

With such a wide range of BMPs in use, runoff reduction ranging from 0 to 50 percent, and a lack of clearly ascertainable requirements, it is not possible to make a single estimate of how much recharge savings are afforded by maximal implementation of the current permits or the Municipal Regional Permit (MRP), if issued as now proposed. We made the following assumptions regarding implementation of BMPs. Assuming natural-surface BMPs perform at the average of the three types tested by CalTrans (2004), i.e., 40 percent runoff reduction, the estimate can be bounded as shown in Table 5. The table demonstrates that allowing free choice of BMPs without regard to their ability to direct water into the ground forfeits substantial groundwater recharge benefits when hardened-surface BMPs are selected. Use of soil-based conventional BMPs could cut recharge losses from half or more of the full potential to about one-quarter to one-third or less, except with the highly impervious commercial development. This analysis shows the wisdom of draining impervious to pervious surfaces, even if those surfaces are not prepared in any special way. But as subsequent analyses showed, soil amendment can gain considerably greater benefits.

Table 5. Pre- and Post-Development with Conventional BMPs: Distribution of Surface Runoff Versus Recharge to Groundwater (annual volume in acre-ft)

^a MFR—multi-family residential; Sm-SFR—small-scale single-family residential; REST—restaurant; OFF—office building; Lg-SFR—large-scale single-family residential; SINGLE—single family home; CDS—continuous defective separation unit; EDB—extended-detention basin

When treated with extended-detention basins, swales, or filter strips, effluents from each development case study site are expected to fall below the Basin Plan acute zinc criterion. These natural-surface BMPs, if fully implemented and well maintained, are predicted to prevent the pollutant masses generated on the six case study development sites from reaching a receiving water in both rainfall zones, which do not differ appreciably. Only total phosphorus reduction falls below 50 percent for three case studies. Otherwise, mass loading reductions range from about 60 to above 80 percent for the EDB, swale, and filter strip. These data indicate that draining impervious to pervious surfaces, even if those surfaces are not prepared in any special way, pays water quality as well as hydrologic dividends.

3. LID Analysis

(a) Hydrologic Analysis

The LID analysis repeats the analysis above, focusing here on the performance of LID techniques in reducing or eliminating runoff from the six development case studies. In addition to assessing the total runoff that would be expected, the analysis also considered whether LID techniques would be sufficient to attain compliance with a performance standard being

considered by the Los Angeles Regional Water Quality Control Board for Ventura County, California. This standard limits EIA (Effective Impervious Area) to five percent (but our analysis further assumed EIA would be ultimately reduced to three percent). All runoff from NCIA (Not-Connected Impervious Area) was assumed to drain to vegetated surfaces.

One goal of this exercise was to identify methods that reduce runoff production in the first place. It was hypothesized that implementation of source reduction techniques could allow all of the case study sites to infiltrate substantial proportions, or all, of the developed site runoff, advancing the hydromodification mitigation objective of the Draft Permit. When runoff is dispersed into the soil instead of being rapidly collected and conveyed away, it recharges groundwater, supplementing a resource that maintains dry season stream flow and wetlands. An increased water balance can be tapped by humans for potable, irrigation, and process water supply. Additionally, runoff volume reduction would commensurately decrease pollutant mass loadings.

Accordingly, the analysis considered the practicability of more than one scenario. In one option, all roof runoff is harvested and stored for some beneficial use. A second option disperses runoff into the soil via roof downspout infiltration trenches. The former option is probably best suited to cases like large commercial and office buildings, while distribution in the soil would fit best with residences and relatively small commercial developments. The analysis was repeated with the assumptions of harvesting OFF roof runoff for some beneficial use and dispersing roof runoff from the remaining four cases in roof downspout infiltration systems.

Expected Infiltration Capacities of the Case Study Sites

The first inquiry on this subject sought to determine how much of the total annual runoff each property is expected to infiltrate, since infiltration is a basic (although not exclusive) LID technique. Based on the findings of Chralowicz et al. (2001), it was assumed that an infiltration zone of 0.1-0.5 acres in area and 2-3 ft deep would serve a drainage catchment area in the size range 0-5 acres and infiltrate 0.9-1.9 acre-ft/year. The conclusions of Chralowicz et al. (2001) were extrapolated to conservatively assume that 0.5 acre would be required to serve each additional five acres of catchment, and would infiltrate an incremental 1.4 acre-ft/year (the midpoint of the 0.9-1.9 acre-ft/year range). According to these assumptions, the following schedule of estimates applies:

<u>Pervious Area Available for Infiltration</u>	<u>Catchment Served acres</u>	<u>Infiltration Capacity</u>
0.5 acres	0-5 acres	1.4 acre-ft/year
1.0 acres	5-10 acres	2.8 acre-ft/year
1.5 acres	10-15 acres	4.2 acre-ft/year
(Etc.)

As a formula, infiltration capacity $\approx 2.8 \times$ available pervious area. To apply the formula conservatively, the available area was reduced to the next lower 0.5-acre increment before multiplying by 2.8.

As shown in Table 7, in both rainfall zones all six of the sites have adequate or greater capacity to infiltrate the full annual runoff volume expected from NCIA and pervious areas where EIA is limited to three percent of the total site area. Indeed, five of the six development types have sufficient pervious area to infiltrate *all* runoff, including runoff from EIA areas. These results are based on infiltrating in the native soils with no soil amendment. For any development project at which infiltration-oriented BMPs are considered, it is important that infiltration potential be carefully assessed using site-specific soils and hydrogeologic data. In the event such an investigation reveals a marginal condition (e.g., hydraulic conductivity, spacing to groundwater) for infiltration basins, soils could be enhanced to produce bioretention zones to assist infiltration. Notably, the five case studies with far greater than necessary infiltration capacity would offer substantial flexibility in designing infiltration, allowing ponding at less than 2-3 ft depth.

Table 7. Infiltration and Runoff Volume (With 3 Percent EIA and All NCIA Draining to Pervious Areas)

^c Compare runoff production from NCIA + pervious area (row 3) with estimated infiltration capacity (row 6)

As Table 7 shows, each of the six case study sites have the capacity to infiltrate *all* or substantially all of the runoff produced onsite annually by draining impervious surfaces to pervious areas on native soils or, in some soil regimes, soils amended with organic matter. If these sites were designed as envisioned in this analysis, no runoff discharge is expected in storms as large as, and probably larger than, the design storm event—using infiltration only. Discharge would be anticipated only with exceptionally intense, large, or prolonged rainfall that saturates the ground at a faster rate than water can infiltrate or evaporate. Even runoff from the area assumed to be EIA could be infiltrated in most cases based on the amount of pervious area available in typical development projects. Therefore, this analysis shows that the EIA performance standard being considered for Ventura County, California, or one more stringent, can be met readily in development projects occurring on A, B, and C soils in the San Francisco Bay Area.

Additional Source Reduction Capabilities of the Case Study Sites: Water Harvesting Example

As noted, infiltration is one of a wide variety of LID-based source reduction techniques. Where site conditions such as soil quality or available area limit a site's infiltration capacity, other source LID measures can enhance a site's runoff retention capability. For example, soil amendment, which improves infiltration, is a standard LID technique. Water harvesting is another. Such practices can also be used where infiltration capacity is adequate, but the developer desires greater flexibility for land use on-site. Table 8 shows the added LID implementation flexibility created by subtracting roof runoff by harvesting it or efficiently directing it into the soil through downspout dispersion systems, further demonstrating the feasibility and robust performance of LID options for reducing or eliminating runoff in most expected conditions. Specifically, all development types studied could readily infiltrate and/or retain all expected annual precipitation.

Effect of Full LID Approach on Recharge

Table 9 shows the recharge benefits of preventing roofs from generating runoff and infiltrating as much as possible of the runoff from the remainder of the case study sites. The data show that LID methods offer significant benefits relative to the baseline (no stormwater controls) in all cases. These benefits are particularly impressive in developments with relatively high site imperviousness, such as in the MFR case.

^b Quantity of water infiltrating the soil; the difference between precipitation and runoff

^c Water either entirely infiltrated in BMPs and recharged to groundwater or partially harvested from roofs and partially infiltrated in BMPs. EIA was not distinguished from the remainder of the development, because these sites have the potential to capture all runoff.

(b) Water Quality Analysis

It was assumed that any site discharges would be subject to treatment control. For purposes of the analysis, treatment control was assumed to be provided by conventional sand filtration. This choice is appropriate for study purposes for two reasons. First, sand filters can be installed below grade, and land above can be put to other uses. Pervious area should be reserved for receiving NCIA drainage, and using sand filters would not draw land away from that service or other site uses. A second reason for the choice is that sand filter performance data equivalent to the data used in analyzing other conventional BMPs are available from the CalTrans (2004) work. Sand filters may or may not expose water to soil, depending on whether or not they have a hard bed. This analysis assumed a hard bed, meaning that no infiltration would occur and thus there would be no additional recharge in sand filters. Performance would be even better than shown in the analytical results if sand filters were built in earth.

Pollutant Discharge Reduction Through LID Techniques

The preceding analyses demonstrated that in each of the six case studies, *all* stormwater discharges could be eliminated at least under most meteorological conditions by dispersing runoff from impervious surfaces to pervious areas. Therefore, pollutant additions to receiving waters would also be eliminated.

SUMMARY AND CONCLUSIONS

This paper demonstrated that common Bay Area residential and commercial development types subject to the Municipal NPDES Permit are likely, without stormwater management, to reduce groundwater recharge from the pre-development state by approximately half in most cases to a much higher fraction with a large ratio of impervious to pervious area. With no treatment, runoff from these developments is expected to exceed Basin Plan acute copper and zinc criteria at the point of discharge and to deliver large pollutant mass loadings to receiving waters.

Conventional soil-based BMP solutions that promote and are component parts of low impact development approaches, by contrast, regain about 30-50 percent of the recharge lost in development without stormwater management in Bay Area locations having NRCS Hydrologic Soil Groups A, B, and C. It is expected the soil-based BMPs generally would release effluent that meets the acute zinc criterion at the point of discharge, although it would still exceed or just barely meet the copper limit. Excepting phosphorus, it was found that these BMPs would capture and prevent the movement to receiving waters of the majority of the pollutant loadings considered in the analysis.

It was found that by draining all site runoff to pervious areas with A, B, or C soil types, runoff can be eliminated entirely in most development categories. It follows that a three percent Effective Impervious Area standard can be met in typical developments, as well. This result was reached assuming the use of native soils or well recognized soil enhancement techniques (typically, with compost). Draining impervious surfaces onto these soils, in connection with limiting directly connected impervious area to three percent of the site total area, should eliminate storm runoff from some development types and greatly reduce it from more highly impervious types. Adding roof runoff elimination to the LID approach (by harvesting or directing it to downspout infiltration trenches) provides an additional tool, increasing flexibility and confidence that no discharge in most meteorological conditions is a feasible performance expectation. Even in the development scenarios involving the highest relative proportion of impervious surface, losses of rainfall capture for beneficial uses could be reduced from the untreated scenario when draining to pervious areas was supplemented with water harvesting. These results demonstrate the basic soundness of the concept of using LID techniques to reduce stormwater pollution in the Bay Area, and further show that limiting directly connected impervious area and draining the remainder over pervious surfaces, as contemplated by some Regional Water Boards in California, is also feasible.

Notes:

Representative values are weighted means of collected data. Italicized values were omitted from these calculations.

- 1 - Grab samples from residential, commercial/institutional, and industrial rooftops. Values represent mean of DETECTED concentrations
- 2 - Flow-weighted composite samples, geometric mean concentrations
- 3 - Geometric mean concentrations
- 4 - Citation appears to be erroneous - original source of data is unknown. Not used to calculate representative value
- 5 - Median concentrations. Not used to calculate representative values due to site location and variation from other values.
- 6 - Mean concentrations from simulated rainfall study
- 7 - Mean concentrations. Not used to calculate representative values due to transportation nature of land use.

SUPPLEMENTARY INVESTIGATION OF THE FEASIBILITY AND BENEFITS OF LOW-IMPACT SITE DESIGN PRACTICES (“LID”) FOR THE SAN FRANCISCO BAY AREA

Richard R. Horner[†]

ABSTRACT

The Clean Water Act NPDES permit that regulates municipal separate storm sewer systems (MS4s) in the San Francisco Bay Area, California will be reissued in 2007. The draft permit includes general provisions related to low impact development practices (LID) for certain kinds of development and redevelopment projects. Using eight representative development project case studies, based on California building records, the author investigated the practicability and relative benefits of LID options for the portion of the region having soils potentially limiting to infiltration. The principal LID option applicable in this situation is roof runoff harvesting, supplement by dispersion of the roof water in single-home sites. Other site runoff would be treated by conventional stormwater best management practices (BMPs), as specified in the permit. The results showed that effectively managing roof runoff and treating the remainder with conventional BMPs can: (1) reduce annual runoff volumes by almost half to more than 3/4, depending on land use characteristics, with much of the water saved available for a beneficial use; and (2) decrease mass loadings of pollutants to receiving waters by 63 to over 90 percent, depending on pollutant and land use.

Adjunct Associate Professor, University of Washington Center for Urban Horticulture

INTRODUCTION

Background

A report titled Initial Investigation of the Feasibility and Benefits of Low-Impact Development Practices (“LID”) for the San Francisco Bay Area used six representative development project case studies, based on California building records, to investigate the practicability and relative benefits of LID options for the majority of the region having soils potentially suitable for infiltration either in their natural state or after amendment using well recognized LID techniques. The results demonstrated that: (1) LID site design and source control techniques are more effective than conventional best management practices (BMPs) in reducing runoff rates; and (2) in each of the case studies, LID methods would reduce site runoff volume and pollutant loading to zero in typical rainfall scenarios.

For a broad regional assessment of relatively large scale use of soil-based, infiltrative LID practices, the initial report covered areas having soils in Natural Resources Conservation Service (NRCS) Hydrologic Soil Groups A, B, or C as classified by the Natural Resources Conservation Service (<http://websoilsurvey.nrcs.usda.gov/app/WebSoilSurvey.aspx>). Depending on site-specific conditions, A and B soils would generally effectively infiltrate water without modification, whereas C soils could require organic amendments according to now standard LID methods. This supplementary report covers locations with group D soils, which are generally not amenable to infiltration, again depending on the specific conditions on-site. A minority but still substantial fraction of the Bay Area has group D soils (39.3, 68.0, 18.3, and 50.1 percent of the mapped areas of Alameda, Contra Costa, San Mateo, and Santa Clara Counties, respectively). Regarding any mapped soil type, it is important to keep in mind that soils vary considerably within small distances. Characteristics at specific locations can deviate greatly from

those of the major mapped unit, making infiltration potential either more or less than may be expected from the mapping. The soil survey data are regarded as appropriate for use in broad-scale assessments such as underlie this and the initial report, but once site-specific implementation begins, it is important to verify site conditions.

General Assessment Methods

The assessment for group D soils reported herein emphasizes the use of LID practices appropriate in areas with relatively restrictive soils to the greatest possible extent, supplemented by conventional stormwater management practices implemented at fully practicable, high levels of effectiveness. The assessment was performed in a manner analogous to the analysis for the other soil groups and as described in the initial report. To recap briefly, with respect to each of several development case studies, three assessments were undertaken: a baseline scenario incorporating no stormwater management controls; a second scenario employing conventional BMPs; and a third development scenario employing LID stormwater management strategies. In each assessment, annual stormwater runoff volumes were estimated, as well as concentrations and mass loadings (the products of concentrations times flow volumes) of four pollutants: (1) total suspended solids (TSS), (2) total recoverable copper (TCu), (3) total recoverable zinc (TZn), and (4) total phosphorus (TP). The results of the second and third assessments were expressed in terms of the extent to which the management practices would reduce pollutant concentrations and loadings and runoff volumes, converting stormwater discharge a potential beneficial use (direct consumption or, in the case of group A, B, C soil areas, groundwater recharge).

Six case studies were selected to represent a range of urban development types considered to be representative of the Bay Area. These case studies involved: a multi-family residential complex (MFR), a relatively small-scale (23 homes) single-family residential development (Sm-SFR), a restaurant (REST), an office building (OFF), a relatively large (1000 homes) single-family residential development (Lg-SFR), and a single home (SINGLE). The land cover types for these various land uses were derived from building permit and other public records from the Bay Area or elsewhere in California.

Adaptation of Methods for Areas with Group D Soils

A key LID technique in a setting with soils relatively restrictive to infiltration is water harvesting, which can be applied at larger scales in commercial and light industrial developments and at smaller residential scales using cisterns or rain barrels. Harvesting has been successful in reducing runoff discharged to the storm drain system and conserving water in applications at all scales. For example, in downtown Seattle the King County Government Center collects enough roof runoff to supply over 60 percent of the toilet flushing and plant irrigation water requirements, saving approximately 1.4 million gallons of potable water per year (http://www.psat.wa.gov/Publications/LID_studies/rooftop_rainwater.htm, http://dnr.metrokc.gov/dnrp/ksc_tour/features/features.htm). A much smaller public building in Seattle, the Carkeek Environmental Learning Center, drains roof runoff into a 3500-gallon cistern to supply toilets (<http://www.harvesth2o.com/seattle.shtml>). Collecting drainage from individual dwellings for household use is a standard technique around the world, particularly in areas deficient in rainfall and without affordable alternative sources.

An additional general category of LID practices for poorly infiltrating locations, applicable especially at single homes and other relatively small-scale developments, is runoff dispersion for storage in vegetation and soil until evapotranspiration and some infiltration occurs. Section C.3.c of the California Regional Water Quality Control Board San Francisco Bay Region "Administrative Draft" NPDES Municipal Regional Stormwater Permit ("the Permit") requires all single-family home projects that create and/or replace 5,000 square feet or more of impervious surface to implement one or more stormwater lot-scale BMPs from a selection of: (1) diverting roof runoff to vegetated areas; (2) directing paved surface runoff flow to vegetated areas; and/or (3) installing driveways, patios, and walkways with pervious material such as pervious concrete or pavers. Another way of distributing and dissipating roof runoff used successfully in varied soils in the state of Washington is the downspout dispersion system, consisting of a splash block or gravel-filled trench serving to spread roof runoff over a vegetated area (Washington Department of Ecology 2005 [Volume III, Section 3.1.2]).

The basis of the group D soils assessment was harvesting roof runoff to the maximum possible degree, supplemented in smaller-scale developments by runoff dispersion methods. The report asserts that, through these LID BMPs, it is practicable to prevent the entrance of any roof runoff into the municipal storm drain system in any soils setting in the Bay Area. In group D soils, infiltration likely cannot be relied upon to reduce runoff from other portions of developments, such as walkways, driveways, parking lots, access roads, and landscaping. Some water loss would undoubtedly occur, especially through evapotranspiration and at least some infiltration of runoff generated on or directed to landscaping. The analysis presented in this report does not take account of these losses and hence is somewhat conservative in estimating benefits.

As required by the Permit, any runoff not attenuated by harvest, evapotranspiration, or infiltration would be subject to quantity and quality controls. The analysis assumes that extended-detention basins (EDBs) with water residence times up to 72 hours would provide this control. EDBs are one of several general-purpose, conventional stormwater BMPs available for this service, others being wet ponds, constructed wetlands, sand or other media filters, and biofiltration swales and filter strips. The California Department of Transportation (Caltrans, 2004) tested the performance of all of these practices in its BMP Retrofit Pilot Program, conducted in San Diego and Los Angeles Counties. The initial report investigating LID for A, B, and C soils presented estimates of benefits for EDBs, swales, and filter strips, along with continuous deflective separation (CDS) units, a practice that effectively captures only large particulate pollutants. For brevity, this follow-up report focuses on just EDBs as the supplement to LID. In performance, EDBs tend to fall between swales and filter strips for total suspended solids, slightly lower than the other two BMP types for metals, and either between the two or comparable to swales for total phosphorus.

These practices were applied to the same six case studies used in the initial analysis and described in Table 1 of the first report. Two additional case studies were defined for the assessment reported here: a sizeable commercial retail installation (COMM) and an urban redevelopment (REDEV). The hypothetical COMM scenario consists of a building with a 2-acre footprint and 500 parking spaces. Parking spaces were estimated to be 176 sq ft in area, which corresponds to 8 ft width by 22 ft length dimensions. A simple, square parking lot with roadways around the four sides and a square building with walkways also around the four sides were assumed. Roadways and walkways were taken to be 20 ft and 6 ft wide, respectively. The REDEV case was taken from an actual project in Berkeley involving a remodel of an existing structure, built originally as a corner grocery store with apartments above and a large side yard, and the addition of a new building on the same site to create a nine-unit, mixed-use, urban infill project. Table 1 summarizes the characteristics of these two case studies. The table also provides the recorded or estimated areas in each land use and cover type.

Table 1. Characteristics and Land Use and Land Cover Areas of Added Case Studies

	COMM ^a	REDEV ^a
No. buildings	1	1
Total area (ft ²)	226,529	5,451

No. parking spaces	500	2 uncovered
Parking area (ft ²)	88,000	316 uncovered
Access road area (ft ²)	23,732	-
Walkway area (ft ²)	7,084	350
Driveway area (ft ²)	-	650
Landscape area (ft ²)	20,594	700

^a COMM—retail commercial; REDEV—commercial/residential infill

The assessment for group D soils employed the same methods as the earlier analysis to estimate annual stormwater runoff volumes and pollutant discharges. Please refer to the initial report for details on those

methods. The Natural Resource Conservation Service (NRCS, 1986) methodology cited in that report was applied to estimate that infiltration in group D soils would be roughly 60 percent of the amount through landscaping or the bed of a conventional BMP in C soils, which were the basis for establishing runoff coefficients in the first analysis. While that initial analysis was performed for both 14- and 20-inch average annual runoff zones, typical of different Bay Area locations, this supplementary work covered only the former condition. This simplification was made in the interest of brevity in this report, given that the first analysis showed almost no difference in conclusions between the two situations.

RESULTS OF THE ANALYSIS

Table 2 provides a comprehensive summary of the results. Rows shaded in gray compare runoff and pollutant discharges with and without treatment by CDS units, which can capture relatively large solids but have no mechanisms for dissolved substances and the finer particles. Having no soil contact and very limited residence time for evaporation, this BMP cannot reduce runoff volume at all. It can achieve some substantial reductions in TSS and TP for land uses relatively high in landscaped area but little removal of metals, especially copper.

The blue-shaded rows show the performance of conventional EDBs. In the group D soils considered in this analysis, they were estimated to reduce annual runoff volumes by 13-23 percent, the higher values for land uses with relatively small impervious footprints (OFF and REST). These BMPs can capture the majority of the long-term mass loading of most pollutants from most land uses in these soils, falling below 50 percent in reducing metals in stormwater flowing from residential developments.

Rows shaded in green present the results of applying LID BMPs appropriate for group D soils, roof runoff harvesting supplemented by dispersion in single-home land uses, plus treating the remaining runoff with EDBs. Comparing annual runoff volumes with and without LID, it can be seen that removing roof runoff from the storm drain system affords very significant benefits in reducing surface discharge and putting much of that water to productive use. Compared to directing all site runoff to EDBs, LID is expected to reduce volume by almost 10 times in the REDEV case, by about five times for the various residential land uses, 3.6 times for the large commercial development, and around twice for the OFF and REST cases. This management strategy can recover over 3/4 of the stormwater that would otherwise go down the drain in the intense redevelopment case, approximately 2/3 for the multi- and single-family residential cases, over half in the COMM development, and almost half in the office and restaurant cases with relatively small roof footprints.

Reduction of volume translates to decreases in pollutant loadings also. The combination of LID and EDB treatment is estimated to raise copper and zinc reductions to about 70 to over 90 percent in all except the developments with relatively low roof proportions (60-65 percent in these cases). TSS predictions come in at a quite consistent 75-82 percent across land uses. Total phosphorus estimates are a similarly consistent 63-71 percent, a bit higher in the highly impervious REDEV case.

Effectively managing roof runoff gives a way out of the dilemma posed by group D soils in the Bay Area. The analysis has demonstrated that harvesting this runoff stream, supplemented by ground dispersion techniques with sufficient space, shows strong promise to reduce the majority of flow inputs to municipal storm drain systems while conserving water. Moreover, this strategy can also stem the majority of solids, copper, zinc, and phosphorus transport to receiving waters.

Table 2. Runoff Volume and Pollutant Loading Reductions with Conventional and Low-Impact Development (LID) Best Management Practices (BMPs) for Eight Land Use Case Studies in Hydrologic Group D Soils

	COMM ^a	OFF ^a	REST ^a	REDEV ^a	MFR ^a	Lg-SFR ^a	Sm-SFR ^a	SINGLE
Total annual runoff with no BMPs (ac-ft)	5.29	0.80	0.47	0.12	8.57	75.66	1.74	0.10
Total annual runoff with CDS units ^b (reduction)	5.29 (0.0%)	0.80 (0.0%)	0.47 (0.0%)	0.12 (0.0%)	8.57 (0.0%)	75.66 (0.0%)	1.74 (0.0%)	0.10 (0.0%)
Total annual runoff with EDBs ^b (reduction)	4.43 (16.3%)	0.63 (21.3%)	0.36 (23.2%)	0.11 (8.1%)	7.48 (12.7%)	65.27 (13.7%)	1.50 (13.7%)	0.09 (13.3%)
Total annual runoff with LID ^b (reduction)	2.22 (58.0%)	0.44 (45.0%)	0.28 (40.4%)	0.03 (78.9%)	2.80 (67.3%)	26.72 (64.8%)	0.61 (64.8%)	0.04 (65.7%)
CDS TSS reduction ^{b, c}	19.4%	44.8%	33.9%	22.1%	27.1%	37.1%	37.1%	37.7%
CDS TCu reduction ^{b, c}	0.4%	11.0%	4.2%	0.9%	2.7%	7.3%	7.3%	7.6%
CDS TZn reduction ^{b, c}	25.3%	29.1%	25.5%	25.5%	24.1%	25.6%	25.6%	25.9%
CDS TP reduction ^{b, c}	25.9%	63.7%	54.3%	35.7%	46.7%	57.6%	57.6%	58.2%
EDB TSS reduction ^{b, c}	64.7%	78.1%	74.9%	66.5%	62.8%	70.3%	70.3%	70.9%
EDB TCu reduction ^{b, c}	57.9%	51.6%	56.4%	53.2%	51.4%	43.5%	43.5%	43.6%
EDB TZn reduction ^{b, c}	57.6%	49.6%	48.9%	58.1%	48.5%	47.7%	47.7%	48.0%
EDB TP reduction ^{b, c}	44.4%	67.6%	63.3%	52.8%	56.3%	64.4%	64.4%	64.7%
LID + EDB TSS reduction ^{b, c, d}	74.6%	80.3%	77.0%	81.5%	79.4%	81.3%	81.3%	81.8%
LID + EDB TCu reduction ^{b, c, d}	71.9%	60.3%	62.2%	82.3%	73.8%	68.9%	68.9%	69.5%
LID + EDB TZn reduction ^{b, c, d}	79.7%	65.1%	60.9%	92.3%	78.9%	76.4%	76.4%	77.0%
LID + EDB TP reduction ^{b, c, d}	63.1%	69.8%	66.0%	75.2%	69.4%	70.8%	70.8%	71.1%

^a COMM—retail commercial; OFF—office building; REST—restaurant; REDEV—commercial/residential redevelopment; MFR—multi-family residential; Lg-SFR—large-scale single-family residential; Sm-SFR—small-scale single-family residential; SINGLE—single family home

^b CDS—continuous deflective separation; EDBs—extended-detention basins; reduction—comparison with no BMPs

^c TSS—total suspended solids; TCu—total recoverable copper; TZn—total recoverable zinc; TP—total phosphorus

^d LID + EDB—roof runoff harvesting for COMM, OFF, REST, REDEV, AND MFR; harvesting supplemented by dispersion of roof runoff for Lg-SFR, Sm-SFR, and SINGLE; treatment of remaining runoff by EDBs

SUBJECT: Technical Comments on Los Angeles Regional Water Quality Control Board Staff Working Proposals for the Greater Los Angeles County MS4 Permit (Permit) – Minimum Control Measures and Non-Stormwater Discharges

Dear Ms. Purdy and Mr. Ridgeway:

The Los Angeles Permit Group would like to take this opportunity to provide comments on the working proposals for Minimum Control Measures (MCMs) and prohibitions for non-stormwater discharges. These documents were posted on the Regional Board website on March 21 and March 28, 2012 respectively. The LA Permit Group appreciates the Regional Board staff's effort to develop the next NPDES stormwater permit and their commitment to meet with various stakeholders including our group. We look forward to continuing the dialogue with the Board staff on this very important permit. Our overarching comments on the MCMs and non-stormwater discharges are highlighted in this letter. Detailed comments regarding the Staff Working Proposal for MCMs are attached. Detailed comments related to Non-stormwater Discharges will be submitted next week.

Watershed-Based Program and Maximum Extent Practical Standard

In order to achieve further water quality improvements, the Permit needs to set clear goals, while allowing flexibility with the programs and BMPs implemented. The way to accomplish this is through integrated watershed planning and monitoring. This strategy has been presented by the LA Permit Group as it will allow permittees to look at the larger picture and develop programs and BMPs based on addressing multiple pollutants. In doing so, limited local resources can be concentrated on the highest priorities. The LA Permit Group has on numerous occasions expressed our support of a watershed based approach to stormwater management. It would appear in Provision VI.C.1.a that the Board proposal also supports this approach.

The permit should allow permittees to tailor actions as part of a Watershed Plan.. The permit should clearly indicate that permittees have the option of either adopting the MCMs as they are laid out within the permit or pursue a Watershed Plan that provides permittees with the flexibility to customize the MCMs. The opportunity for a municipality to customize the MCMs to reflect the jurisdiction's water quality conditions is absolutely critical if municipalities are to

develop and implement stormwater programs that will result in achievement of water quality standards and environmental improvement. We, however, feel the MCMs are overly prescriptive and suggest that the permit ultimately establish a criterion that will be used to support any customization of MCMs. The criteria should be comprehensive but flexible. We suggest flexibility in the criteria because the management of pollutants in stormwater is a challenging task and the science and technology to help guide customizing MCMs are still developing. Furthermore, the municipal stormwater performance standard to reduce pollutants to the maximum extent practicable is not well defined and will depend on a number of factors¹. This constraint, as well as USEPA position² that the iterative/adaptive process is the basis for good stormwater management, supports the need to provide flexibility in defining the criteria for customizing actions.

We anticipate having further comments related to the MCMs once further information has been released regarding the permit structure and how the various aspects of the permit will work together. For example, it is difficult to fully comment on the MCMs until we are able to see them in the context of the compliance structure and the Watershed Plan section of the Permit.

Timeline and Fiscal Resources

The Staff Working Proposal does not provide timelines for the start-up and implementation of the MCM requirements. It is fair to say that there will be a transition period between the time the Permit becomes effective and the time that the municipalities will have to modify their current stormwater management programs to be in compliance with the new Permit provisions. At the same time, consideration should be given to the time required to develop watershed based “customized” programs. The LA Permit Group requests that the Regional Board provide a draft timeline for implementation and phasing-in of the MCM requirements.

Regarding fiscal resources, the LA Permit Group would like to recognize the parameters in which municipalities operate. The Staff Working Proposal requires municipalities to exercise its authority to secure fiscal resources necessary to meet all of the requirements of the Permit (page 5). However, we have a limited amount of funds that are under local control. Any additional funds needed for stormwater programs would need to come from increased/new stormwater fees and grants. New fees for stormwater are regulated under the State’s Prop 218 regulations, and require a public vote so this is an item that is not under direct control of the municipalities – the Regional Board must take this into consideration and this provision should be removed from the permit. Furthermore in addition to clean water, local resources are also directed to a number of health, safety and quality of life factors. Thus, all these factors need to be developed in balance with each other. This requires a strategic process and that will take time to get right. We urge you to develop the permit conditions based on a reasonable timeframe in balance with the existing economy and other health, safety, regulatory and quality of life factors that local agencies are responsible for.

Shifting of State Responsibility to the MS4 Permittees

The Staff Working Proposal shifts much of the State responsibilities to the Municipalities regarding the State’s General Permits for Construction Activities (CGP), Industrial Activities (IGP) and NPDES permits issued for non-stormwater discharges. Such examples are noted in our attached detailed comments.

In addition, there are requirements outlined in the Staff Working Proposal that exceed those required in the CGP and IGP. For example, the CGP compared to Provision 9.f which requires a ESCP for construction sites of all sizes. A few examples of where the Staff Working Proposal either shifts the responsibility or actually exceeds the requirements of the CGP are listed below:

¹ See E. Jennings 2/11/93 memorandum to Archie Mathews, State Water Resources Control Board.

² See Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 FR 43761 (Aug. 26, 1996).

- Maintaining a database that overlaps with the State's own SMARTS database. Asking Permittees to collect the same data adds unnecessary time and expense with no benefit to water quality.
- Maintaining a database for all types of permits is excessive and includes building permits that have little or no relevance to water quality protection.
- Requiring the development of a Rain Event Action Plan for small sites under 1 acre or for sites that would be categorized as Risk Level 1 under the CGP.

Those elements that shift State responsibility should be eliminated and the MCMs should be coordinated with other state and federal requirements, with particular attention to CGP and IGP requirements.

MCMs Should Reflect Effective Current Efforts

The LA Permit Group understands that the new Permit must reflect current efforts of stormwater management and water quality issues. Where the current stormwater management effort is assessed to be inadequate, then additional efforts are warranted. However, when permittees' current efforts are assessed to be adequate for protecting water quality, then the MCMs should reflect permittees' current efforts. One significant area where the LA Permit Group believes that the current effort is protective of water quality is in the new development program. Both the City and County of Los Angeles have developed and adopted Low Impact Development Ordinances and significant work, technical analysis, and public input have gone into the development of these ordinances. Rather than developing more stringent standards, the Permit should use these pre-established Ordinances as a reference for the type of program and flexibility needed to accommodate the unique and vastly varying characteristics throughout the County. Instead of providing detailed information in the text of the Permit, the LID provisions should outline general requirements of the program, and the details contained in a technical guidance manual. This point was reiterated by several speakers at the April 5, 2012 workshop, including BIA and supported by several Regional Board Members.

"MCMs for New Development"

Notwithstanding our comments above, the LA Permit Group has a number of concerns with the New Development provision of the MCMs. While the LA Permit Group has concerns and requests clarification with the other MCMs, we find the New Development MCMs the most challenging and unsupportable. These provisions are difficult to follow and the BMP selection hierarchy is confusing and at times in conflict. The LA Permit Group believes this provision should be redrafted. We have significant concerns with the following parts of the New Development MCMs:

- Selection hierarchy
- Infeasibility criteria
- Treatment Control Performance benchmarks (water quality based versus technology based)
- BMP tracking
- Inspection program
- BMP specificity

"MCMs for Public Agency Activities"

The Staff Working Proposal identifies, in a number of provisions, requirements to address trash regardless of whether the area is subject to a trash TMDL. We take exception to this approach, as on the one hand the MCMs requires prioritization, cleaning and inspection of catch basins as well as street sweeping and some other management control measures to address trash at public events. And then, even if the municipality is controlling trash through these control measures, the municipality must still install trash excluders (see page 63 regarding "additional trash management practices"). This makes little sense and the LA Permit Group would submit that if the initial control measures are successful, then the "additional trash management practices" are unnecessary (as evident by the lack of a TMDL).

“MCMs for ID/IC”

The Staff Working Proposal identifies a significant non-stormwater outfall based monitoring program. The LA Permit Group submits that TMDLs monitoring programs have already identified, to a large extent, a comprehensive non-stormwater monitoring program. As such we suggest that the TMDL monitoring program be the basis for the “non-stormwater outfall based monitoring program” and both should be identified in an Integrated Watershed Monitoring Program.

The other critical issue in the ID/IC program is clarifying the responsibilities of the municipalities and the Regional Board. This is particularly important when dealing with ongoing illicit discharges (see page 71). When this type of discharge occurs, the ultimate responsibility in correcting the illicit discharge lies with the discharger. The municipalities and the Regional Board may need to work in tandem to address a recalcitrant discharger, but the fiscal responsibility should lie with the discharger and not the municipality or Regional Board.

Non-Stormwater Prohibitions

The two overriding concerns associated with the proposed non-stormwater prohibition requirements is 1) the assumption that certain non-stormwater discharges should be conditioned to be allowed and 2) the need for further discussion and collaboration regarding potable water and fire operations and training activities discharges to MS4s. In the first case the LA Permit Group would submit that the monitoring data to support these conditions is lacking and should be the focus of the next Permit term. The LA Permit Group supports the need to place certain conditions on non-stormwater discharges when it has been shown that the discharge is an issue in the receiving water. Anything less than such a demonstration calls into question the water quality benefit for the additional cost to implement the conditions. Regarding our second observation, the LA Permit Group has worked closely with a group of community water systems and Fire Chiefs to discuss how potable water discharges should be addressed. While we have reached consensus on certain aspects, additional discussion and time is needed to work towards consensus.

In particular, the permit should differentiate between natural flows such as stream diversions, natural springs, uncontaminated groundwater and flows from riparian habitats and wetlands and urban discharges. Natural flows should not be held to a standard equal to urban discharges. The requirements to conduct appropriate monitoring and explore alternatives for the discharge are not commensurate with water quality concerns. Natural sources should not be conditioned in order to be allowed. The LA Permit Group recommends that the Regional Board continue the current permit format of categorizing natural sources separately from urban activity discharges.

Thank you for the opportunity to comment on the working proposals and we look forward to meeting with you to discuss our comments and to explore alternative approaches. Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,

Heather Maloney
Chair, LA Permit Group

**LOS ANGELES PERMIT GROUP COMMENTS
 MINIMUM CONTROL MEASURES – 3/28/2012 STAFF WORKING PROPOSAL
 LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
General			
1	2	C.1.c	<p>The Definition of: "Development", "New Development" and "Re-development" should be added. The definitions in the existing permit should be used:</p> <p><i>“Development” means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i></p> <p><i>“New Development” means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.</i></p> <p><i>“Redevelopment” means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i></p> <p>The last of the three "routine maintenance" activities listed above should exclude projects related to existing streets since typically you are not changing the "purpose" of the street to carry vehicles and should not be altered.</p>
Legal Authority			
2	4	2.a.i	<p>Staff proposal states: "Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites."</p> <p>It appears the intent of this language is to transfer the State's inspection and enforcement responsibilities to municipalities through the MS4 permit. When a separate general NPDES permit is issued by the Regional or State Board it should be the responsibility of that agency collecting such permit fees to control the contribution of pollutants, not MS4 permittees.</p>

**LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

3	4	2.a.vii	<p>Staff proposal states: "Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Co-permittees."</p> <p>The intention of this statement is unclear and should be explained, and a definition of "shared MS4" should be provided. How would an inter-agency agreement work with an upstream and downstream agency? This is not practical - this agreement should have been done before the interconnection of MS4 systems occurred. An example of this agreement should be provided within the Permit. The permittee will not agree to the responsibility of an exceedance without first having evidence of the source and its known origin (in other words, an IC/ID is a private "culprit" and not the cause of the City).</p>
4	4	2.a.xi	<p>Staff proposal states: "Require that structural BMPs are properly operated and maintained."</p> <p>MS4 agencies can control discharges through an illicit discharge program, and conditioning new/redevelopment to ensure mitigation of pollutants. Unless the existing development private property owners/tenants are willing or in the process of retrofitting its property, the installation and O&M of BMPs is not practical and cannot be legally enforceable against an entity that does not own or control the property, such as a municipal entity.</p>
5	5	2.a.xii	<p>Staff proposal states: "Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4."</p> <p>It is difficult, if not impossible; to accurately quantify the exact effectiveness of a particular set of BMP's in reducing the discharge of pollutants. Some discharges may be reduced over time given reductions in industrial activity, population in a particular portion of the community feeding into the MS4, or for other reasons not directly related to implementation of structural BMPs. Given that the County of LA is generally urbanized and thus impervious, a lethargic economic climate (meaning development and redevelopment is not occurring in an expeditious manner), and that several pollutants do not have known BMPs effective at removing/reducing the content (i.e., metals, toxics, pesticides), the effectiveness of BMPs should not be required and instead should only be used for research, development, and progress of BMP testing.</p>
Fiscal Resources			
6	5	3	<p>The staff proposal includes a section on Fiscal Resources. Most MS4's do not have a storm water quality funding source, and even those that do have a funding source are not structured to meet the requirements of the proposed MS4 requirements (for instance, development funds may be collected to construct an extended detention basin, but not for street sweeping, catch basin cleaning, public right-of-way structural BMPs, etc).</p>

**LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

7	5	3.a	<p>Staff proposal states: "Each permittee shall exercise its full authority to secure fiscal resources necessary to meet all requirements of this Order"</p> <p>This sentence has no legally enforceable standard. What exactly does the exercise of "full authority" mean, when the exercise of a city's right to tax comes with consequences and no guarantee of success. Municipal entities must adjust for a variety of urgent needs, some federally mandated in a manner that cannot be ignored. So, if we seek the fiscal resources to fund the programs required in the permit and the citizens say "No", then a municipality will have a limited ability to comply with "all requirements of this Order".. Can the language be changed to state: "Each permittee shall make its best efforts given existing financial and budget constraints to secure fiscal resources necessary to meet all requirements of this Order"?</p>
Public Information and Participation Program			
8	6	6.a.iii	<p>Staff proposal states: "To measurably change the waste disposal and stormwater pollution generation behavior of target audiences..."</p> <p>Define the method to be used to measure behavior change. As written, this requirement is vague and open to interpretation.</p>
9	7	6.d.i.2.b	<p>Staff proposal states: "... including personal care products and pharmaceuticals)"</p> <p>The stormwater permit should pertain only to stormwater issues. Pharmaceuticals getting into waters of the US are typically a result of waste treatment processes. All references to pharmaceuticals should be removed from this MS4 permit.</p>
10	8	6.d.i.3	<p>The Regional Board assumes that all of the listed businesses will willingly allow the City to install displays containing the various BMP educational materials in their businesses. If the businesses do allow the installations then the City must monitor the availability of the handouts because the business will not monitor or keep the display full or notify the City when the materials are running out. If the business will not allow the City to display the educational material must we document that denial? Will that denial indicate that the City is not in compliance?</p>
Industrial/Commercial Facilities Program			
11	10	7.b.i.4	<p>Staff proposal states: "All other facilities tributary to waterbody segment addressed by a TMDL..."</p> <p>As written, this category is so vague that it could mean every single industrial or commercial facility. Please clearly define or revise this requirement. In this context, "commercial" refers to a currently unspecified category of facilities beyond those listed in VI.C.7.b.i.1 (page 9). Provide a precise definition for a commercial facility, or specify the extended category (or NAICSs/SICs) of facilities to be considered. Also, clarify how the Permittees will initially determine the pollutants generated for these facilities. A method that will promote consistency among Permittees is preferred, such as a table of potential pollutants based on business type or activities.</p>

LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT

12	10	7.b.ii.6	<p>Staff proposal states: "A narrative description that describes the economic activities performed and principal products used at each facility"</p> <p>Since "economic activities" is an invasive question to ask of a facility, we suggest the following: "A narrative description of activities performed and/or principal products of each facility."</p>
13	11	7.d-f	<p>These sections pertain to inspecting critical source facilities where it appears the intent is to transfer the State's Industrial General Permit inspection and enforcement responsibilities to municipalities through the MS4 permit. We request eliminating these sections OR revise to exclude all MS4 permittee responsibility for NPDES permitted industrial facilities.</p>
14	17	7.e.i	<p>Staff proposal states: "...in the event a Permittee determines that a BMP is infeasible, Permittee shall require implementation of similar BMPs..." Judging a BMP to be "infeasible or ineffective" is subjective. Please delete this requirement.</p>
15	17	7.e.i	<p>Staff report states: "Facilities must implement the source control BMPs identified in the California Stormwater BMP Handbook, Industrial and Commercial, unless the pollutant generating activity does not occur. In the event that a Permittee determines that a BMP is infeasible at any site, the Permittee shall require implementation of similar BMPs that will achieve the equivalent reduction of pollutants in the stormwater discharges. Likewise, for those BMPs that are not adequately protective of water quality standards, a Permittee may require additional site-specific controls." It is not clear when source control BMPs would need to be implemented. Further, if the City implements low-flow diversions and an enhanced street sweeping program, it would not make sense to still require BMP retrofits to those catchment areas.</p>
Development Planning			
16	21	8.b.1	<p>This permit update would be a good opportunity to examine the type of developments that are subject to the permit. There should be a link between the selected categories and the water quality objectives. Perhaps a reworking of this section could provide that clear nexus.</p>
17	21	8.b.i.1.g	<p>Roadway construction projects that are part of a large development (i.e. track-home development) can be subjected to the associated residential or commercial/industrial development, making this requirement difficult to implement.</p>
18	21	8.b.i.1.g	<p>The proposed limit is too low for street construction projects by using the typical 10,000 square foot number that is used in several development projects. A street project that proposes to build 10,000 sq. ft. is an extremely small street project, as the requirement calls out overall area. It might consist of a one block extension of a street 60 feet wide by 166 feet long. When cities propose street extensions it is usually in terms of half mile or mile-long segments which involve more than 150,000 square feet (sq. ft.). For public works projects, the area of 50,000 sq. ft. is a more correct and appropriate threshold. Please delete this requirement.</p>
19	21	8.b.i.1.g	<p>Public Works roadway maintenance projects including the ones that expand the roadway capacity should not be subject to these provisions because of the limited opportunities for BMP incorporation. Existing roads incorporate a large number of utilities within them that limits the opportunities for BMP incorporation.</p>

**LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

20	21	8.b.i.1.g	We support the use of opportunity-based BMP guidance for roadway projects such as the referenced USEPA's "Green Infrastructure: Green Streets", however calling for this implementation to the maximum control possible is contradictory.
21	24	8.c.i.1	It appears based on the language that the project performance criteria of c. is intended to apply to all categories of new development and redevelopment projects as listed in b.i and b.ii. Please clarify whether this is meant to apply to single family hillside homes with no size limit? A new definition of single family hillside home has not been provided in this working draft, so it is unclear whether this is the case. If the intention was to only require the narrative measures for single-family hillside homes as listed in 8.b.i.(1)k)-v, and not require to retain the design volume onsite, then that should be clarified by excluding them from the 8.c.i(1) statement.
22	24	8.c.i.2	The SWQDv definition should be modified to better reflect the purpose of the regulation as stated in 8.a.i(3) "... designing projects to minimize the impervious area footprint, and employing Low Impact Development (LID) design principles to mimic predevelopment water balance...". Modify as follows: "... the Stormwater Quality Design Volume (SWQDv) defined as the runoff from all impervious surfaces that are generated by a:..."
23	24	8.c.i.2.c	The "whichever is greater" requirement is unnecessary since both criteria are deemed to be equivalent. This requirement will only increase design time by having engineering staff perform multiple analyses.
24	24	8.c.i.5	Please define the term "wet-weather season".
25	24	8.c.i.5	The only reasonable and still beneficial rainwater harvesting approach would require the storage of the seasonal (winter-time) runoff for use when needed (spring and summer). This would increase the size of the rainwater harvesting BMPs. RWQCB should acknowledge that rainwater harvesting is both economically and technically infeasible for the vast majority of development projects in arid Los Angeles region climates.
26	24	8.c.i.6	The 72 hour drawdown requirement is counterproductive. Most irrigation practices do not irrigate landscaping within 72 hours after heavy/medium rainfall events because the ground could be saturated and the plants do not require water. Irrigating saturated ground could result in increase dry weather runoff because the water will not percolate into the saturated soil quick enough.
27	25-26	Table	The table provided lacks clarity and the use of M_v parameter is not clear and is not defined. However it appears to require projects that cannot retain runoff on-site to seek alternative locations to retrofit. We anticipate that this requirement will be unfeasible for a number of legal, logistical and technical reasons and as a result the "Least Preferred Option" will be exercised in most cases. The "Least Preferred Option" requires the over-sizing of the biofiltration systems by a factor of 1.5. We recommend that any design be consistent with established design standards (i.e. California Stormwater Quality Association) for consistency and ease in its implementation.
28	25-26	Table	The requirements that are provided in this table seem to be overly prescriptive. The requirements are not water-quality driven but rather groundwater-recharge driven. A more balanced approach will allow the use of multiple BMP options and not excluding effective treatment technologies.
29	28	8.c.iii.3.b	The proposed language uses terms that may be understood by hydrologists, but most city engineers and development engineers would not know what a HUC-10 or an HUC-12 Hydrologic Area is. Please define these terms if they are going to be used in this regulatory permit.

**LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

30	29	8.c.iii.3.c	The federal stormwater regulation place importance on water quality. Groundwater recharge is outside the purview of this permit. The requirement to prove equal benefit should be removed.
31	29	8.c.iii.3.g	This section introduces an arbitrary delay if a project opponent petitions the Executive Officer to review a projects off-site mitigation. The project proponent deserves to receive a response in a reasonable time when an appeal is filed with the Executive Officer. We respectfully request that lines of communications be opened between the Executive Officer and the project proponent within 15-days when a third party files an appeal of the local jurisdictions decision on a project.
32	30	8.c.iii.4	Requiring biofiltration systems to treat 1.5 times the SWQDv will not improve water quality during a 85th percentile storm event. The concentration leaving the system will not improve if the system is 50% larger. Biofilters are typically size by increasing the surface area as the flow increases. If the flow is lower than the design flow a small area of the system is utilized. The removal efficiency is the same for all flow rates below the design flow and therefore the concentration is the same for the design flow or below.
33	30	8.c.iii.5.b	Biofilters are not designed with detention volume. They are designed on a flow rate basis. The last portion of the paragraph regarding pore spaces and re-filter should be removed.
34	30	8.c.iv.1	New development/redevelopment project that are upstream of an offsite water quality mitigation project should be exempt from the requirements of this subsection. Requiring a project to mitigate their pollutant load twice is unnecessary. This subsection should only apply if the project would discharge to the receiving water without first draining to an offsite project.
35	31	8.c.iv - Table	The presence of benchmark tables, even for the projects that implement offsite mitigation is inappropriate. These standards for the great part are not attainable by existing technologies. Development projects instead should only be subject to design standards not performance standards. The idea of upgrading the treatment system to achieve compliance introduces unnecessary uncertainties to future development activities in our region.
36	33	8.c.v.1	Alternatives to the Ventura County Permit Hydromodification criteria should be considered such as those identified in the Los Angeles County Low Impact Development Standards Manual or maintain the "peak flow control" requirements as appear in the existing permit. Los Angeles County watersheds are significantly different than those of Ventura County. Los Angeles County has limited areas draining into natural drainage systems.
37	33	8.c.v.1.a	The use of Erosion Potential (E_p) as a sole method for determining hydromodification impacts is inappropriate because of its limited use and difficulty to use. The existing Los Angeles County requirement to conduct hydrology and hydraulic analysis for SUSMP, 2-, 5-, 10-, 25-, and 50-year storm events and fully mitigate drainage impacts from these flow regimes is better understood.
38	37	8.c.vi	The Regional Board proposes an Annual Report item for each project that is approved with off-site mitigation. The calculations for the off-site mitigation should be easy to document, but the project performance without alternative compliance is not so clear. Please provide the information necessary to complete the annual report.
39	38	8.d.i	The proposed language as written would not accept existing LID Ordinances to be compliant with the applicable provisions of this Order. Please provide language that allows flexibility for existing LID ordinances and also provide criteria determining equivalency.
40	39	8.d.iv	It should be clarified that previously approved projects will not be subject to these requirements.

**LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

41	40	8.d.iv.b	This requirement should be limited to the sites already visited as part of the “critical sources” program. Allow a self-inspection program where the property owners will be required to maintain their BMPs based on their type and maintenance needs. These requirements can be incorporated in the Covenant and Agreement (C & A). Property owners will be required to keep records of maintenance performed on these BMPs. Municipalities lack the resources to conduct the inspection. Municipalities can perform instead a review of the inspection records on a random and as-needed limited basis.
Development Construction			
42	41	9.d	Requiring this on all projects regardless of size is excessive. Small project will have minimal if any impact on water quality. A lower limit needs to be set for applicability such as 100 cubic yards of disturbed soil. It may be appropriate for projects to install a minimum set of BMPs without the need for a plan.
43	41	9.e.1.i	Maintaining the required database for all types of permits issued by the municipalities is excessive since not all permits require this type of information. In the City of Los Angeles for example about 35,000 building permits are issued annually.
44	42-43	9.f.ii	The number of elements for the ESCP should not be the same as those of the State SWPPP as required by the General Construction Permit. Existing Erosion Control Plans require the identification and placement of the BMPs in the engineering drawings and this has been identified as adequate.
45	43	9.f.ii.3.i	An example of how excessive it is to require these elements for the smaller sites is the requirement to prepare a Rain Event Action Plan (REAP). Under the Construction General Permit, a REAP is not required until the project reaches a Risk Level 2 status. It is not justifiable to say that a grading project, that does not disturb more than an acre and is not subject to a CGP, should be required to prepare a REAP.
46	43	9.f.ii.4	The requirement to discuss the rationale for the selection and design of the proposed BMPs (including soil loss calculations for the non-selected BMPs) is excessive and it dramatically increases the engineering costs of small construction projects. Please delete this requirement.
47	43	9.f.ii.5	The proposed language shifts much of the State responsibilities for sites greater than one acre to the Municipal Permittees without shifting the corresponding funding. Please consider setting-up a mechanism for the municipalities to operate the registration, fee collection, and inspection for sites that are under GCP coverage or revise the language so that Municipal Permittees are not made responsible parties for this activity.
48	43	9.f.ii.8	The proposed language asks cities to verify the approvals of the Army Corps of Engineers, Department of Fish and Game and the Regional Water Boards prior to the issuance of a grading or building permit. This requirement should not be implemented unless the Regional Board can provide a simple, easy to use system to accomplish the check. Furthermore, many projects reviewed every day do not require a 401, 404 or a 1600 certification to be allowed to grade on their site. The few cases where these certifications are required, they are taken care of in the EIR process rather than the Building or Grading permit process. This restriction should cite the Planning process rather than the building or grading process.
49	43-44	9.g.i	The Regional Board should not write this MS4 permit to overlap the CGP. A project that is required to have coverage under the CGP will deal with the Risk levels and apply the appropriate provisions of the CGP. Smaller sites that do not require coverage under the CGP should have lesser requirements than Risk Level 1 provisions.

**LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

50	44	9.g.iv	The Regional Board is referring to an outdated set of BMP tables by referring to the 2003 version of the CASQA Manuals. CASQA has updated the manuals in 2010 and these are the manuals that should be referenced.
51	44-47	Tables	It appears that the Regional Board is taking the BMP tables from the CGP, without the language contained in the CGP that states that to avoid duplication each subsequent table needs to include or be added to the BMPs shown in the earlier list. Please include this language so that unfamiliar engineering, plan-checking, or inspection staff does not overlook the intent of the CGP.
52	48	Table	The proposed language would require municipalities to inspect GCP sites at least monthly. This constitutes a large increase in the inspection responsibilities for the municipalities for State responsibilities. Please delete or revise this requirement.
53	48	9.h.ii.2	The requirement to perform five inspections during the construction phase of a project, no matter how small, is excessive and serves no benefit. The only reasonable inspection would be during the grading phase and upon project completion as part of existing inspections.
54	50	9.h.ii.5.b	The language is all inclusive for the inspection portion of the permit. By asking the field inspector to "determine whether all BMPs have been selected, installed, implemented and maintained according to the approved plans." the Board is placing responsibility on the inspector which rightly should be the responsibility of the plan reviewer. If an inspector is having a dispute with the Contractor or builder of a project, the inspector can improperly raise the issue of BMP selection and cause great expense to the project. The Plan Reviewer should determine what BMPs are appropriate for the site and verify that they are properly designed. The inspector should verify that BMPs are install properly, and are being implemented and maintained as required by the field conditions; however, to allow the inspector to evaluate selection is overstepping his training and authority.
55	51	9.j	A more effective approach would be through a State mandate for a Statewide training program perhaps through the use of the contractor's license board. Because of their nomadic nature of construction activity, contractors move from City to City at will. For a City to be responsible for training the contractors that work within their city is not possible. This should either be a State responsibility, much like the QSD/QSP programs currently run by the State.
56	54	10.d	If there is a specific pollutant to address, retrofitting or any other BMP would best be accomplished through a TMDL, which is for the Permittees to determine rather than a prescribed blanket approach. As written, this is too broad of a requirement with unknown costs that is attempting to solve a problem before there is a problem. Please delete this VI.C.10.d.

**LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

57	54	10.d	<p>Staff proposal states: "Each Permittee shall develop an inventory of retrofitting opportunities that meets the requirements of this Part. The goals of the existing development retrofitting inventory are to address the impacts of existing development through retrofit projects that reduce the discharges of stormwater pollutants into the MS4 and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards."</p> <p>This process would require land acquisition, a feasibility analysis, no impacts to existing infrastructure, proper soils, and support of various interested stakeholders. Additionally, if a property or area is being developed/redeveloped, retrofitting the site for water quality purposes makes sense, but not for an area where no development/redevelopment is planned. Finally, the LID provisions have already included provisions for off-site mitigation, in which we recommend that regional water quality projects be considered in lieu of local-scale water quality projects that will prove difficult to upkeep, maintain, and replace, let alone have existing sites evaluated as feasible. For these reasons, this requirement should be removed.</p>
58	56	10.d.v	<p>Any retrofit activities should be the result of either an illicit discharge investigation or TMDL monitoring follow-up and will need to be addressed on a site-by-site basis. A blanket effort as proposed in a highly urbanized area is simply not feasible at this time.</p>
59	56	10.e.ii	<p>Staff proposal states: "Each Permittee shall implement the following measures for flood management projects"</p> <p>Flood management projects need to be clearly defined.</p>
60	60	10.g.ii.7	<p>Staff proposal states: "Policies, procedures, and ordinances shall include commitments and a schedule to reduce the use of pesticides that cause impairment of surface waters..."</p> <p>The method which a pesticide that causes "impairment" to waterbodies needs to be defined.</p>
61	62	10.h.iv.1.c	<p>Staff proposal states: "Provide clean out of catch basins... 24 hours after event"</p> <p>Many public events happen on the weekends (i.e. Saturday). To avoid excessive overtime costs, please change the requirement to "next business day after the event" or "next business day."</p>
62	63	10.h.vii.1	<p>This requirement appears to be an "end-run" around the lack of catch basin structural BMPs in areas not covered by Trash TMDLs. The requirement has the potential to be extraordinarily economically burdensome. If an area is NOT subjected to a Trash TMDL, then the need for any mitigation devices is baseless. The MS4 permit requirements should not circumvent nor minimize the CWA 303(d) process.</p>
63	64	10.h.ix	<p>Staff proposal requires: "Infiltration from Sanitary Sewer to MS4 / Preventive Maintenance...."</p> <p>The State Water Board has implemented a separate permit for sewer maintenance activities. Additional sewer maintenance requirements are redundant and unnecessary. Please delete this requirement.</p>

**LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

Illicit Connection and Illicit Discharge Elimination Program			
64	-	11	In general the LA Permit Group would like the flexibility to determine where (i.e. outfall vs. receiving water) monitoring is conducted and how the program is developed. This flexibility is necessary due to the variability in the physical makeup from one watershed to the next, and perspectives/philosophy of one permittee to the next. The Group proposes to do “non-stormwater outfall-based monitoring program” as part of an Integrated Watershed Monitoring Program. There is ample dry weather monitoring in the TMDLs to address a “non-stormwater outfall-based monitoring program”. Please revise each mention of “ <i>Each Permittee</i> ” to “Permittee/Permittees” to allow the flexibility of doing a Watershed or by individual city program, and sufficient program flexibility for receiving waterbody monitoring in-lieu of outfall monitoring.
65	-	11	A definition of “outfall” is required for clarity. An “outfall” for purposes of “non-stormwater outfall-based monitoring program” should be defined as “major outfall” pursuant to Clean Water Act 40CFR 122.26. Please revise each mention of “ <i>outfall</i> ” to read “major outfall” when discussing “non-stormwater outfall-based monitoring program”.
66	68	11.a	Some small cities do not have digital maps. In the “General” category of Section 11, please provide a 1 year time schedule for cities to create digital maps OR provide the municipality the ability to develop comprehensive maps of the storm sewer system in any format.
67	68	11.b.i.1	Omit the comment, “ <i>Each mapped MS4 outfall shall be located using geographical positioning system (GPS) and photographs of the outfall shall be taken to provide baseline information to track operation and maintenance needs over time.</i> ” This requirement is cost prohibitive and of little value because many City outfalls are underground and could not be accurately located or photographed. Photographs of outfalls in channels have little value since data required is already included on “As-Built” drawings. Geographic coordinates can easily be obtained using Google Earth or existing GIS coordinate systems. “The contributing drainage area for each outfall should be clearly discernable...” The scope of this requirement would involve thousands of records of drainage studies. The Regional Board should be aware that this requirement would be very labor intensive, time consuming, and very costly.
68	69	11.b.i.3	Storm drain maps should show watershed boundaries which by definition provide the location and name of the receiving water body. Please revise (3) to read “The name of all receiving water bodies from those MS4 major outfalls identified in (1).”
69	69	11.c.i	The LA Permit Group proposes “non-stormwater outfall-based monitoring program” to be flow based monitoring. Please revise item (4) of 11., c. i. to read “(4) monitoring flow of unidentified or authorized non-stormwater discharges, and...”
70	69	11.c.i.4	“Monitoring of unknown or authorized discharges” “Authorized” discharges are exempted or conditionally exempted for various reasons. Monitoring authorized discharges is monitoring for the sake of monitoring and offers no clear goal or water quality benefit. Please delete this requirement. If the source of a discharge is unknown, then monitoring may be used as an optional tool to identify the culprit.
71	70	11.d.i	Please revise the proposed language to “Permittee/Permittees shall develop written procedures for conducting investigations to identify the source of suspected illicit discharges, including procedures to eliminate the discharge once source is located.” It is not know if a discharge is illicit until the investigation is completed.

LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT

72	70	11.d.ii	Please revise the proposed language to “At a minimum, each Permittee/Permittees shall initiate an investigation(s) to identify and locate the source within 48 hours of becoming aware of the suspected illicit discharge.” Due to the intermittent nature of illicit discharges, it is may not be possible to conduct the investigation within 48 hours.
73	70	11.d.iii.1	“Illicit discharges suspected of sanitary sewage... shall be investigated first.” ICID inspectors should be allowed to make the determination of which event should be investigated first. For example, a toxic waste spill or a truck full of gasoline spill should take precedence over a sewage spill. This requirement should be amended to the “most toxic or severe threat to the watershed” shall be investigated first.
74	70	11.d.iii.4	Please revise the proposed language to “If the source of the discharge is found to be authorized under a NPDES permit....” If the discharge is permitted, then it is not “illicit”.
75	70	11.d.iv.1	Please revise the first sentence of the proposed language to “If the source of the illicit discharge has been determined to originate within a Permittee’s jurisdiction, the Permittee shall immediately notify the responsible party of the problem, and require the responsible party to conduct all necessary corrective actions to eliminate the illicit discharge within 48 hours of notification.” “Non-stormwater” discharges do not equate to “illicit” discharges.
76	70	11.d.iv.2	Please revise the first sentence of the proposed language to “If the source of the suspected illicit discharge has been determined to originate within an upstream jurisdiction, the Permittee shall...” Unknown discharges are suspected of being illicit discharges, but may in fact prove to be authorized discharges.
77	71	11.d.v	<p>Please revise the proposed language <i>“the Permittee shall work with the Regional Water Board to provide diversion of the entire flow to the sanitary sewer or provide treatment. In either instance, the Permittee shall notify the Regional Water Board in writing within 30 days of such determination and shall provide a written plan for review and comment that describes the efforts that have been undertaken to eliminate the illicit discharge, a description of the actions to be undertaken, anticipated costs, and a schedule for completion.”</i> To “the Permittee shall work with and provide support to the Regional Water Board to continue Progressive Enforcement Policy of the Regional Board.”</p> <p>In the case that an Illicit Discharge is ongoing, then the discharger can be identified and the responsibility to clean up and eliminate the discharge lies with the discharger. Any illicit discharge for which the Permittee has exhausted their Progressive Enforcement Policy should be deferred to the Regional Water Quality Control Board for additional Progressive Enforcement or permitting.</p>
78	71	11.e.i	Please revise the first sentence to “Permittee/Permittees, upon discovery or upon receiving a report of a suspected illicit connection, shall initiate an investigation within 21 days...” The process to determine the source of an illicit connection or responsible party may take a considerable time should the suspected source be an unoccupied site.
79	71	11.e.ii	Please revise the “days of completion” from 90 to 180 days. Illicit connections need to be disconnected from the storm drain system in the street Right of Way, which will require plans and permitting. Permitting with in State Right of Way can take on average 60 to 120 days.

**LOS ANGELES PERMIT GROUP COMMENTS
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

80	71	11.f.i	Revise the proposed first sentence to “Permittee/Permittees shall promote, publicize and facilitate public reporting of illicit discharges or water quality impacts associated with discharges into the MS4s through a central contact point...” It is not possible to distinguish authorized discharges from illicit discharges at the outfalls.
81	71 & 72	11.f.ii.1&2	Revise “PIPP” to “Hotline”. The subject of this item is “reporting hotline requirements”.
82	72	11.f.iii	Omit this section. “No Dumping” signs have already been posted at open channels.
83	72	11.f.iv	Omit the second sentence, “The procedures shall be evaluated annually to determine whether changes or updates are needed to ensure that the procedures accurately document the methods employed by the Permittee.” This is an unnecessary and burdensome requirement. Procedures should be updated and documented as needed.
84	73	11.h.i	Please revise this section to “Permittee/Permittees must continue to implement a training program regarding or require contractors to implement training for the identification of IC/IDs for all municipal field staff who as part of their normal job responsibilities (e.g. street sweeping, storm drain maintenance, collection system maintenance, road maintenance), may come into contact with or otherwise observe an illicit discharge or illicit connection to the storm drain system. Training program documents must be available for review by the permitting authority.” Cities can require contractors to train their staff, but should not be directing contractor staff. The requirement to put notification procedures in fleet vehicles is unnecessary and is covered by the required training.
85	74	"Attachment	On page 74, reference is made to Bioretention/Biofiltration Design Criteria and the Ventura County Technical Guidance Manual. This criterion is likely not fit for LA County given that soils, impervious surface amounts, engineered channels, and agricultural practices are completely different in one county versus the other.

April 13, 2012

Renee A. Purdy; Chief
Regional Programs Section
Los Angeles Regional Water Quality Control Board

Subject: Comments on Staff Working Proposal – Los Angeles Region MS4 Permit

Dear Ms. Purdy,

Thank you for the opportunity to comment on the staff working proposal of the minimum control measure section of the Greater Los Angeles County MS4 Permit. As written, the proposal does incorporate key components of a low impact development based approach to stormwater management, but could be improved significantly in ways that more directly speak to the local needs of Los Angeles County. This letter contains specific recommendations for improving the draft permit in four areas:

- Treat rainwater as a resource by making BMPs that retain rainwater for future use within the watershed and within a reasonable time frame the most preferred post construction stormwater management approach
- Provide incentives for retrofit of the built environment to accelerate TMDL compliance
- Lower feasibility thresholds for Green Infrastructure BMPs to encourage their use
- Remove prescriptive post construction BMP design guidance from the permit and replace with clear performance standards

Treat Stormwater as a Resource

Los Angeles County is a net importer of water from as far away as the Sacramento Bay Delta and the Colorado River. This reliance on external sources of potable water is unsustainable and expensive compared to tapping local supplies. Conservation is a crucial component of our local water security plan, but thriving landscapes of native plants are also important for habitat, temperature buffering, recreation and aesthetics. Landscapes do require water as do buildings, cooling systems, fire suppression systems. The Los Angeles County permit should drive project proponents toward designs that capture rainwater and use it within the watershed as the top priority. Such an approach is consistent with the EPA definition of LID which states that “LID employs principles... that treat stormwater as a resource rather than a waste product.”¹

Recommendation:

The current hierarchy of management approaches should be revised as follows:

- 1. Most Preferred: Rainwater capture for beneficial use (i.e. rainwater harvest for indoor non-potable use, irrigation and other uses that offset potable water demand) or infiltration to groundwater where that water will be recovered in a reasonable amount of time (<5 years) either on site or in regional facilities within the same watershed**
- 2. Second Tier – Retention of water on site or off site through infiltration where that water will not be available for extraction within a reasonable time frame (>5 years)**
- 3. Third tier – Biofiltration through amended soils designed to produce at least a 90% reduction in TSS, 50% Phosphorus reduction, 50% reduction in soluble Zinc and 40% reduction in soluble copper. Where feasible these systems should allow incidental infiltration and should incorporate an anoxic subsurface storage zone for nitrogen removal.**

¹ From: <http://www.epa.gov/owow/NPS/lid/>

The current proposal does include the first tier option of discharging treated water from a site to a regional collection facility which is commendable. Operation and maintenance can be much more reliable and economical at regional facilities compared to on-site LID facilities which have been documented to have very high (~50%) failure rates within the first few years of operation due to improper construction and/or maintenance. In Los Angeles where nearly all developable land is already developed, regional facilities can typically retain runoff at a much lower cost. Recovery and distribution of captured water, through groundwater extraction or direct treatment and use of stormwater runoff can also be more cost effective per gallon recovered compared to small scale decentralized facilities.

Onsite infiltration of water also makes sense where it does not cause structural or pollutant transport issues. However, infiltrating water onsite where that infiltrated water has no connection to larger groundwater tables squanders our rainfall resources. It would be better to capture and store that water for later use to offset potable water demand.

Retrofit of built environment

With approximately 1% of the Los Angeles County area being developed annually, even the most stringent regulation of new development and redevelopment during the permit term will probably not make significant progress toward restoring beneficial uses of our rivers, streams and bays. The numerous TMDLs set to be incorporated into the permit are evidence that the region has significant unresolved problems that are the result of existing development. Understandably, retrofit of the built environment is a difficult proposition financially and politically. Retroactive requirements for existing land owners would be extremely unpopular especially in the current climate of depreciating real estate values. However, the owners and operators of MS4s in the County will be responsible for ultimately meeting load allocations set in those TMDLs. This permit should provide clear requirements for identification, prioritization and initiation of municipal redevelopment projects that compliment current efforts like Los Angeles River revitalization planning and Integrated Regional Water Management Planning. It should also incentivize redevelopment of private property. The alternative mitigation program is one opportunity to do this.

Recommendation:

Within each watershed, retrofit projects should be initiated that preferably harvest and use rainwater either through cistern type systems or through recharge of recoverable groundwater systems. At a minimum these projects should retain water on site. These projects should be initiated as soon as possible, with ongoing monitoring of the actual water harvest and runoff reduction amounts. Where projects in the same watershed enroll in the alternative compliance program due to infeasibility of on-site retention, an alternative compliance fee paid by the developer would be applied toward constructed project costs as a rebate to the funders of those projects. Projects enrolling in the alternative mitigation program must still provide adequate treatment for the portion of the design storm that leaves the project site. The permit should specify a minimum number of new redevelopment projects or a minimum retention volume per watershed to be completed within the permit term.

Eliminate prescriptive BMP design requirements and strengthen performance standards

Government and private industry work together best when clear, progressive performance standards are set by government and private industry is challenged to innovate to create the most cost effective and desirable means of achieving those standards. This permit clearly establishes retention of the 85th percentile design storm as the top tier performance standard. Where that is infeasible, biofiltration is allowed. However, there are no performance objectives given for biofiltration in terms of a pollutant load reduction required or a volume of annual runoff to be reduced. Presumably these are exactly the benefits that prescriptive design requirements regarding storage volume, incidental infiltration, media depth are intended to produce. The lack of a clear performance standard in combination with design requirements virtually eliminates the opportunity for innovation. These design details should be given in a technical

manual to accompany the permit, but as suggested, not required methods of satisfying permit requirements. Engineers must also be given the option to select a different design that has been demonstrated to provide equivalent performance. There are several nationally recognized stormwater BMP verification programs that can serve as independent auditors of system performance.

Recommendation:

Prescriptive BMP design requirements should be stripped from the permit and should be collected in a technical guidance manual to be completed after permit adoption. For each tier of preference, the permit must articulate specific, measurable performance standards relating to pollutant load reduction and runoff reduction.

Lower feasibility thresholds for Green Infrastructure BMPs to encourage their use

Green infrastructure BMPs are a subset of BMPs that infiltrate, evapotranspire or harvest stormwater on-site. In Los Angeles, there are many sites where retention of the entire water quality volume will not be feasible. The current draft appears to set a feasibility threshold of 100% capture of the SWQDv for each technology which is far too high. Setting the feasibility threshold at 40% annual capture for infiltration and rainwater harvest would encourage more widespread implementation of these BMPs. The rainwater harvest feasibility threshold should be modeled after the Orange County Technical Guidance Document² guidance which requires consideration of the 30 day demand on site and allows water to be applied to the landscape at the native soil infiltration rate instead of the agronomic demand of the landscape vegetation. Feasibility criteria for the various BMPs do not need to be included in the Permit, but should be detailed in an accompanying technical manual.

Recommendation:

Set the feasibility threshold for green infrastructure BMPs at 40% annual runoff capture. Require consideration of the 30 day non-potable water demand on site for rainwater harvesting system feasibility assessment. Allow captured rainwater to be delivered to the landscape at up to the native soil infiltration rate.

With these changes, the proposal will be more protective and more tailored to the unique conditions of Los Angeles County. I would welcome the opportunity to review them in more detail at your convenience. In addition, attached is a summary of specific language change recommendations that address other important issues. I look forward to reviewing the draft permit in its entirety.

Sincerely,

A handwritten signature in black ink, appearing to read "Vaikko", written over a light blue rectangular background.

Section	Proposed Change or Comment	Justification
C.1.c.ii	Change biofiltration definition to allow incidental infiltration where feasible instead of requiring that all biofiltration systems include a means for infiltration. Planter boxes should also be added to the definition of biofiltration.	Biofiltration should only be applicable where the lower infiltration rate threshold is not met. That threshold is currently 0.15"/hr. Therefore incidental infiltration during the storm event will be minimal. As written, aside from rainwater harvest and evapotranspiration, there are no allowable options for sites where there are technical reasons that infiltration is not suitable, for example close proximity to groundwater, wells or contaminated soils. This permit should make it clear that biofiltration without an underdrain is a suitable treatment technology in such circumstances without requiring enrollment in the alternative compliance track
C.1.c.iii	No change needed	The elimination of an underdrain in bioretention facilities is a good idea since it will result in prolonged pooling of water where the infiltration rate of native soils is compromised. This is a good indicator that corrective action is needed.
C.1.c.iv	Remove Bioswale from this section	Bioswales and filter strips are not acceptable as stand alone treatment systems. According to the International BMP Database, they are comparatively ineffective in removing important pollutants like bacteria, nutrients, sediment and metals.
C.8.a.i.(7)	Amend the order of preference to the following: (a) BMPs that retain water for subsequent use or evapotranspiration; (b) BMPs that retain water on site or in regional facilities where it is not recoverable within 5 years; (c) On site biofiltration (including planter boxes)	Given the persistent drought conditions in Southern California and our reliance on water from Northern California and the Colorado river, stormwater is a valuable resource that should be harvested and used to offset potable water demand. This can be done either on site or off site within the watershed with the same water supply and water quality benefit.
C.8.c.i.(2)	Add subsection (c): the volume of runoff required to be stored to reduce runoff by at least 80% on an annual basis given the BMP drawdown time	Rainwater harvest systems and infiltration systems over low permeability soils may take greater than 48 hours to drain down completely. When drawdown times are longer, it may be necessary to increase the storage volume of the BMP to achieve performance on par with systems retaining the 85th percentile storm with a drawdown time of 48 hours or less.

Section	Proposed Change or Comment	Justification
C.8.c.i.(3)	Change lower infiltration rate threshold to 0.5" per hour.	The lower infiltration rate threshold of 0.15 inches per hour is extremely low. A 0.5 inch per hour lower rate would be more consistent with other permits in Southern California. Typically, factors of safety between 2 and 8 are applied to the measured infiltration rate to produce a design infiltration that is used to size the infiltration BMP. This factor of safety combined with a target infiltration rate of 48 hours could result in very large systems with allowable effective depths of as little as one inch.
C.8.c.i.(5)	Remove "worse case scenario" language with requirement that estimate of effectiveness be based on the average annual runoff reduction as demonstrated through daily continuous simulation modeling.	Section XII.B.4 contains water quality design storm requirements. It does not specify any level of treatment that is required by BMPs treating this design storm. This addition is needed to ensure that BMPs are effective in controlling the pollutants that are expected on site.

My name is Jack Thacker, I'm a Fire Protection Engineer and I have been in the fire protection industry for over 50 years. I recently served on the State Fire Marshal's Task Force that developed the "Water Based Fire Protection Systems Discharge Best Management Practices Manual" dated April 19, 2011.

This document was presented at your April 5th Work Shop held at MWD by Mr. James Parsegian of the California State Fire Marshal's office. The document was developed over 18 months by a Task Force consisting of Fire Departments, Water Purveyors, and C-16 Contractors, the entities that are performing the testing and maintenance of fire protection systems.

The reasoning behind the development of the document was to provide guidance to those fire protection contractors who are performing inspection, testing and maintenance (ITM) on fire protection systems as mandated by the adoption of NFPA 25 where water discharge would be considered a problem to certain Regional Water Quality Boards.

Please see Attachment "A" which lists the Task Force Members and of particular notice should be made that Bill Hereth of the State Water Control Board, played a significant part in the developed of the BMP's.

Obviously, the April 5th Work Shop was not the proper venue to review the State Fire Marshal's BMP's but I feel that needs to take place. Of particular concern in your document is footnote 10 on page 4 which precludes any fire protection discharge, regardless of volume or quality of water, from being discharged to the MS4. This is exactly where the State Fire Marshal's Task Force began but after each stakeholder became familiar with the issues, and the concerns of each other were addressed, it was obvious that all discharges need not be precluded.

I believe the proper thing to do would be to have our Task Force meet with Los Angeles Regional Quality Board to reach the common goal of the issues related to non-storm water discharge.

Sincerely,

ALLAN AUTOMATIC SPRINKLER CORPORATION OF SO. CAL.

Subject: LA County MS4 Permit - Non-Storm Water Discharge

I am writing in regards to the proposed Los Angeles County Municipal Separate Storm Sewer System National Pollution Discharge Elimination System permit (MS4 Permit) - Non-Storm Water Discharge Prohibitions. The MS4 Permit is important for the protection of our critical water resources and we support the continued advancement of this effort. However, as a water retailer, we are quite concerned about the implications of some of the changes being proposed and that, in general, the text is often not clear and difficult to interpret.

Specifically our concerns are:

1) Paragraph 3 (pages 1 - 4) describe which Non-Storm Water (NSW) discharges do not have to be banned by MS4 permittees (i.e. an Authorized Non-Storm Water) when the MS4 permittee does not discharge into an Area of Special Biological Significance (ASBS). The paragraph is divided into two sections; those authorized NSW discharges which are covered by an existing NPDES Permit and those that are not so covered. The comments are these:

- a. In sub-section ix unplanned discharges from CWSs such as broken mains and sheared hydrants should be included.
- b. In sub-section xvi non-emergency fire flows such as training should be included to match the language found in Table X.
- c. In footnote 10, the ban on "building fire suppression system maintenance" should be removed.

2) Paragraph 5 (pages 5 - 6) requires MS4 permittees "develop and implement procedures to ensure" that all of the Authorized NSWs in Paragraphs 3 & 4 comply with the requirements in Table X. In subsection a. it states that MS4 permittees ensure that "all necessary permits and water quality certifications are obtained by a discharger prior to discharge to the MS4..."

- a. It is not clear what this means. The phrase "necessary permits and water quality certifications" appears several times in the text, including Table X, but is undefined. Paragraph 5 appears to apply to all authorized NSW discharges but in Table X it only appears in two discharge categories, "flows from riparian habitats and wetlands" and "diverted stream flows". If it is only for these two NSW flows, the text should say so clearly and if not, that should be clear as well. The phrase should also be defined.

3) Paragraph 7 (on pages 6 - 7) requires permittees to evaluate outfall monitoring data required in Table X. If the permittee determines that a "category" of authorized NSWs is causing an exceedance, then the entire category has be either prohibited, have additional discharge conditions applied, or require the discharger to obtain an NPDES permit.

- a. The language uses the term "category" and "discharger" interchangeably but there may be several dischargers in a given category. It seems unreasonable to require all dischargers in any one category to have to take remedial actions if only one discharger is causing the exceedance.
- b. Not all discharges from a single discharger are necessarily the same. In the case of CWSs, different wells have different water qualities. If only one particular discharge location is causing a problem, it does not seem reasonable that all discharge locations and dischargers in given category should be forced to take remedial actions
- 4) Paragraph 8 (pages 7 - 8) is the key section for CWSs. In it, it says that if there is an exceedance which is caused by a discharge from a CWS, then the MS4 permittee is not in violation of the permit (which means that the RWQCB cannot issue an NOV and they cannot be sued by third parties) and so they would have no reason to limit or ban our discharges. However, MS4 permittees would then have to take at least one of the following actions: A) Evaluate the long-term impact of the discharger; B) Identify alternative discharge routes; C) Impose additional conditions to those found in Table X; D) Require the CWS to obtain an NPDES Permit.
- a. This paragraph is limited to dischargers who are "not otherwise regulated by a separate NPDES permit", i.e. discharges covered under an NPDES permit are not given regulatory relief. There does not appear to be any particular reason for this limitation. This would not eliminate the conflict between CWSs and MS4 permittees when there is an NPDES permit involved and provide further disincentives for CWSs to obtain NPDES permits.
- b. This is confusing. Consider a CWS with two wells, one with an NPDES permit and one without. Discharges from the one well and the distribution system would enjoy "regulatory relief" but the other well would not?
- c. Is this a "single-pass" process? It can be read that the MS4 permittee only receives regulatory relief the first time that an exceedance is found to have been caused by discharge from a CWS, not afterwards.
- d. Can an MS4 permittee legally require a CWS to obtain an NPDES Permit? What would be the enforcement mechanism? It implies that each MS4 permittee would have to require CWSs obtain a local discharge permit to operate within that particular jurisdiction.
- e. Each time an MS4 permittee required a CWS to obtain an NPDES permit, the MS4 permittee would lose more regulatory relief.
- f. Which NPDES Permit would be required? This would create a complex patchwork situation with each MS4 permittee requiring different permits and with other requiring none.
- g. This would create a crazy patchwork approach with each MS4 permittee taking completely different approaches. CWSs operating in several jurisdictions would face multiple and conflicting requirements.
- h. Liability for MS4 permittees in a watershed is "joint and several" which means all MS4 permittees share the liabilities equally, they face the same fines no matter how much water they discharge. They thus have a vested interest in approaching this issue in a uniform fashion. This permit does not allow for this approach.
- i. The provisions for advanced notification and record keeping and sharing only work on a watershed basis. Having 200 plus CWSs notifying 80 plus CWSs about planned discharges and sharing records

would be chaotic and overwhelming except on a watershed basis.

j. Being required to obtain an NPDES permit is exactly what the vast majority of CWSs do not want to do.

5) Non-emergency fire flows need to be mentioned in Paragraph 9.

Thank you very for the opportunity to submit these comments.

**Re: Los Angeles County MS4 Permit - Comments on Staff Working
Proposal on Non-Storm Water Discharge Provisions**

Dear Ms. Purdy and Mr. Ridgeway:

We represent the Public Water Agencies Group (the "Group"), an association of seventeen public water suppliers located throughout Los Angeles County (fifteen of which are located in the Los Angeles Region).¹ We also represent California Domestic Water Company, Lincoln Avenue Water Company, Rubio Cañon Land and Water Association, Tract 349 Mutual Water Company and Valencia Heights Water Company, mutual water companies that provide water service in various communities within the Los Angeles Region (collectively, the "Companies").

Pursuant to your March 28, 2012 transmittal letter concerning the above-referenced Staff Working Proposal, this letter sets forth the Group's and Companies' comments to that proposal.

- A. Section 3(b)(ix) (page 3): unplanned discharges, including, but not limited to, broken water mains and sheared fire hydrants, should be added to subdivision (ix).
- B. Section 3(b)(xvi) (page 4): based on the statements made at the April 5, 2012 Board workshop on these non-storm water discharge issues, non-

¹ The fifteen Public Water Agencies Group members located within the Los Angeles Region are: Crescenta Valley Water District, Kinneloa Irrigation District, La Habra Heights County Water District, La Puente Valley County Water District, Newhall County Water District, Orchard Dale Water District, Pico Water District, Rowland Water District, San Gabriel County Water District, San Gabriel Valley Municipal Water District, Sativa-Los Angeles County Water District, South Montebello Irrigation District, Three Valleys Municipal Water District, Valley County Water District and Walnut Valley Water District.

Ms. Renee Purdy
Mr. Ivar Ridgeway
Los Angeles Regional Water Quality Control Board

Page 2

emergency fire flows, such as discharges for fire department training purposes, should be added to subdivision (xvi). In addition, footnote 10 on page 4 should be deleted and discharges from building fire suppression maintenance (i.e., sprinkler line flushing) should also be added to subdivision (xvi).

- C. Section 5(a) (page 5): in the first two lines of that subdivision, the phrase “all necessary permits and water quality certifications” is undefined and thus is vague. Thus, that phrase needs to be defined and/or further expanded, and, at a minimum, “if required” must be added after “all necessary permits.” That phrase also appears in Table X as a condition/BMP applicable to only two discharge categories: “flows from riparian habitats and wetlands” and “diverted stream flows.” The inclusion of that phrase as to only those two categories creates uncertainty and potential confusion with respect to application of Section 5(a) – i.e., does it only apply to those two discharge categories, or does it apply to all discharge categories? That needs to be clarified in the text of Section 5(a).
- D. Section 6 (page 6): advance notification is not possible for unplanned discharges. Thus, a carve-out from that advance notification requirement needs to be added to Section 6 for such unplanned discharges. That could be accomplished by adding “where feasible” in the second line between “in this Order,” and “the Permittee.”
- E. Section 7 – second paragraph (pages 6 and 7): as drafted, Section 7 states it applies to the “category” of the discharge. Thus, that section’s requirements would apply to an entire category of discharges, even if the “category” of discharge is generally innocuous and the exceedance identified is a one-time abnormal occurrence resulting from one discharger’s discharge. Such a structure may unfairly penalize other dischargers who had no role in the subject exceedance, by subsequently prohibiting those dischargers’ discharges or requiring those other dischargers to comply with potentially more onerous conditions. We therefore believe it is not appropriate or reasonable to have an entire “category of discharge” be the trigger for a Permittee’s subsequent remedial actions.
- F. Section 8 – first paragraph (page 7): this section distinguishes between a potable water supply and distribution system that is not otherwise regulated under a separate NPDES permit and one that is. However, that

Ms. Renee Purdy
Mr. Ivar Ridgeway
Los Angeles Regional Water Quality Control Board
April 18, 2012
Page 3

distinction ignores the fact that in a given system, some facilities may be operating under an NPDES permit, while other facilities are not. Thus, we do not believe that distinction is justified, and it, in fact, penalizes community water systems that are regulated under a separate NPDES permit by making them ineligible for the regulatory relief provided to other non-NPDES permitted community water systems. Whether or not a community water system has a separate NPDES permit in place should not impact its eligibility for the regulatory relief otherwise provided under Section 8. In addition, the scope of the regulatory relief should also be expanded to include unplanned (i.e., accidental) discharges from community water system facilities, which are beyond the control of the community water system.

Another concern we have is that Section 8, as initially drafted, also would likely create a patchwork of regulation, where a community water system operating in more than one city/MS4 Permittee may be subjected to different requirements from another city/MS4 permittee. Section 8 needs to be revised to address these issues, and those revisions should include applying that regulatory relief to NPDES permit holders.

Lastly, it appears that the regulatory relief provided under Section 8 is a one-time only relief and that in the event of any short-term exceedance from a legally required discharge (see above regarding the need to include unplanned/accidental discharges among those to receive the regulatory relief) will result in the Permittee being required (i.e., use of the term "shall") to take one of the alternative actions regardless of the circumstances underlying the exceedance. The Permittee should have discretion in reviewing the facts and circumstances of a given exceedance to ascertain the appropriate steps to then take.

- G. Section 8(a)(iv) (page 8): subdivision (a)(iv) should be deleted. While we believe it is appropriate for Permittees to be empowered to take some remedial actions under the MS4 permit provisions (i.e., those listed in subdivisions (i), (ii) and (iii) of Section 8), authorizing a Permittee to require a community water system to obtain coverage under a separate NPDES permit raises a host of issues, including, but not limited to, how that Permittee would determine the appropriate type of permit and what conditions should be included in that permit. That authority would also create situations where a community water system could be required to

Ms. Renee Purdy
Mr. Ivar Ridgeway
Los Angeles Regional Water Quality Control Board
April 18, 2012
Page 4

obtain different permits by different Permittees within whose jurisdiction its system discharges. A more certain and uniform system is needed.

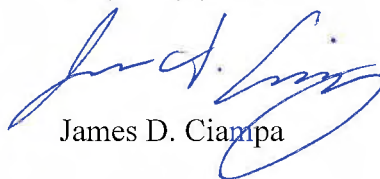

- H. Section 9 (page 8): non-emergency fire flows, such as discharges for training purposes, should be added to Section 9, as should discharges from building fire suppression maintenance (i.e., sprinkler line flushing).
- I. Table X: As a general comment, we believe it is more efficient to incorporate by reference industry-standard BMPs into the permit, rather than listing various conditions and BMPs in the permit itself. Thus, if changes are made in the future (e.g., new BMPs are established or existing BMPs are revised), the permit will not need to be amended. We also offer the following specific comments to items in Table X:
1. “All Discharge Categories” (page 9): It is not in the best interests of community water systems to waste the water they deliver. Unfortunately, however, in most cases, capturing their non-storm water discharges for recharge or reuse simply is not economically or technically feasible. Also, disposal to the sanitary sewer is itself a complicated and costly process and the sanitary sewer system operators typically disfavor accepting non-waste water. Similarly, it is not feasible to conclusively “segregate” community water systems’ non-storm water discharges from potential sources of pollutants, which can be interpreted very broadly. That condition/BMP should be revised to require a discharger to use its best efforts, or act “to the maximum extent practical.”
 2. “Potable Drinking Water Supply and Distribution Releases” (pages 13 and 14):
 - (a) With respect to advance notification on page 13, 72 hours may not be a practical period for such notification in some planned discharge circumstances. We suggest revising the required notification to “at least 24 hours’ notice” for a planned discharge.
 - (b) Concerning mobilization of pollutants on page 13, the provision should identify the appropriate party (we believe it should be the Permittee) to ensure those monitoring procedures.

Ms. Renee Purdy
Mr. Ivar Ridgeway
Los Angeles Regional Water Quality Control Board
April 18, 2012
Page 5

- (c) Concerning the “to be determined” volume to trigger record-keeping on pages 13 and 14, we recommend that Regional Board staff meet with community water system representatives to discuss an appropriate level to trigger those record-keeping requirements. In addition, the practicality of some of the other listed conditions can also be discussed to ensure those conditions are economically and technically feasible.
- (d) With respect to the cleaning out of MS4 inlets and outlets on page 14, further discussion with the L.A. Permit Group and community water systems’ work group should occur to ensure that consensus is reached on this issue.

Thank you for the opportunity to provide the foregoing comments on the Group’s and Companies’ behalf. Please let me know if you have any questions on them. We look forward to continuing to work with you to develop appropriate permit language that ensures that Los Angeles County’s MS4 operators, community water systems and fire departments are able to continue to meet their statutory and regulatory requirements in a cost-effective environmentally prudent manner, while also addressing the Regional Board’s concerns.

Very truly yours,

Subject: Comments on the Staff Working Proposals 3/28/12 for Non-Stormwater Discharges

Dear Ms. Purdy and Mr. Ridgeway:

The City of Downey would like to again thank you for the opportunity to provide comments on the staff working drafts of the next MS4 permit. Similar to the comments on the Minimum Control Measures, the City's comments below are limited to the Non-Stormwater Discharge Staff Working Proposal.

1. As you know, the City of Downey has submitted its own Report of Waste Discharge. As such, the City intends to develop its own outfall or storm drain monitoring plan. The City of Downey is effectively situated between three watersheds and has very little flow-through runoff from other jurisdictions. The City does not wish to be included in the same "generic" outfall monitoring requirements as other MS4 cities. Provisions for any approved monitoring plan prepared and submitted by the City of Downey and subsequently approved by the Regional Board's Executive officer must be able to supersede "generic" MS4 permit provisions.
2. Part III.A.5 Page 5 indicates that Permittees shall develop procedures to ensure that all conditionally authorized non-storm water discharges comply with applicable conditions. How does the Regional Board intend to ensure that School Districts, General Construction and General Industrial sites, and other facilities that may be outside the jurisdictional control of the Permittees (i.e., City of Downey) abide by the same requirements?
3. Similar to comment 3 above, the City understands that there are considerable discussions taking place regarding the requirements of the State Department of Public Health for water purveyors to flush their lines and perform other operational discharges on a regular basis. It is critical that the Regional Board resolve this issue in a way that allows water purveyors to meet Health Department regulations while at the same time does not place Permittees in jeopardy if these discharges do not meet TMDL or other MS4 monitoring provisions. This provision must also extend to accidents (i.e. sheared fire hydrants, other) and water pipeline leaks which occur from time to time.

April 19, 2012

Page 2

4. Part III.A.8 – Under the current proposal the City is both a Permittee as well as a water purveyor which operates its own water system consisting of approximately 300 miles of water mains and 20 active groundwater wells. Flushing as part of water distribution system construction, maintenance, and testing as well as for groundwater well purging and rehabilitation is absolutely paramount for the City to ensure the delivery of safe drinking water to its more than 110,000 customers. As both a Permittee and water purveyor, the City appreciates the recent efforts by the Regional Board in working with cities and water purveyors to allow for TMDL exceedances by the Permittee where such exceedances are the result of necessary water purveyor activities. However, Parts III.A.8.a. and III.A.8.b. currently require the Permittee to impose conditions to eliminate such exceedances once one has occurred. Being that flushing by water purveyors is primarily routine and necessary to properly maintain a water system and TMDLs for some constituents are set even lower than what water purveyors are required to serve to the human population, it is both impractical and cost prohibitive to the tax paying citizens to require such conditions. Such requirements also defeat the purpose of exempting Permittees and water purveyors from these exceedances, since once one occurs, the water purveyor will no longer be able to operate its water system in the same fashion regardless of what BMPs are being implemented. The City requests that Parts III.A.8.a. and III.A.8.b. be removed in their entirety leaving only Section III.A.8. which could use some modification to streamline documentation requirements.
5. There is mention of recycled water irrigation runoff in the working draft but no mention of recycled water distribution system flushing resulting from construction, maintenance, and operation. Recycled water received by and used in the City is of high quality; both tertiary treated and disinfected. There has been increasing focus by stakeholders including regulatory agencies to maximize the use of this alternative water source in order to meet State mandated water conservation goals by streamlining the approval process. Given the amount of costly treatment already provided to this water source and the importance in maximizing its use, it is important that the Regional Board treat recycled distribution discharges in the same fashion as potable discharges by exempting Permittees from any resulting exceedances. Doing so will also minimize impacts to rate payers which would otherwise shoulder the burden of the City having to implement cost prohibitive recycled water discharge control measures.

As these comments are provided in reference to the "Staff Working Proposal", the city may have additional comments in the future as the permit process progresses. Thank you again for the opportunity to comment. Please contact me if you have any questions.

Sincerely,

John Oskoui, P.E.

Assistant City Manager/Director of Public Works

RE: Los Angeles County Municipal Separate Storm Sewer System (“MS4”) Permit – Staff Working Proposal on Non-Storm Water Discharge Prohibitions (March 28, 2012)

Dear Ms. Purdy and Mr. Ridgeway,

Santa Monica Baykeeper (“Baykeeper”) has reviewed the Los Angeles Regional Water Quality Control Board (“Regional Board”) staff’s working proposal on the new Los Angeles County (“LA County”) MS4 Permit’s non-storm water discharge provisions, dated March 28, 2012.

While we support the proposed definitions of non-storm water and storm water and staff’s attempt to list all individual and general NPDES permits regulating non-storm water discharges, we oppose the proposed list of “conditionally authorized” non-storm water discharges and the continued inclusion of landscape irrigation flows in that list. Moreover, we urge staff to abandon the proposed “safe harbor” for violations of Receiving Water Limitations (“RLWs”) and/or Water Quality Based Effluent Limitations (“WQBELs”) caused by a so-called “short-term exceedance” resulting from a non-storm water discharges from a potable water supply or distribution system because it is unlawful. Baykeeper appreciates the opportunity to provide staff with our comments on the working proposal.

I. The New LA County MS4 Permit Must Contain Clear Requirements to Effectively Prohibit Non-Storm Water Discharges

More than two decades after the first LA County MS4 Permit was issued and despite the Clean Water Act’s clear requirement to “effectively prohibit non-storm water discharges,” 33 U.S.C. § 1342 (p)(3)(B), non-storm water discharges to and from the MS4 continue to be a daily occurrence in LA County. While numerous TMDLs specifically directed at reducing and eliminating the dry weather violations of water quality standards in LA County waterbodies have been adopted by the Regional Board and the EPA in the last ten years, monitoring data demonstrates that TMDLs and water quality standards are persistently exceeded in days with no precipitation. *See e.g.* April 5, 2012 LA County MS4 Permit Workshop, Regional Board Staff Presentation, Slide 8. As Regional Board staff itself

observed, LA County MS4 Permittees' efforts to eliminate non-stormwater discharges have failed and there is "little done to identify the sources and characteristics" of non-stormwater discharges that persistently impair our waters, harm aquatic life and endanger public health. *Id.*; December 15, 2011 LA County MS4 Permit Workshop, Regional Board Staff Presentation, Slide 5.

In light of this persistent problem, the new LA County MS4 Permit's non-storm water discharge provisions must ensure that non-storm water discharges are eliminated as required by the Clean Water Act's mandate to effectively prohibit non-storm water discharges. Rather than eliminating non-storm water discharges, however, staff proposes a significant increase from the current LA MS4 Permit in the number of exempted non-storm water discharges from 12 to roughly 25.

Further, staff's working proposal fails to provide legal support for its claim that the Clean Water Act's prohibition of non-stormwater discharges does not apply to "discharges [that] are either specifically authorized by a separate individual or general NPDES permit or conditionally authorized in accordance with sections A.3 through A.6." Staff's Working Proposal on LA County MS4 Permit Non-Storm Water Discharge Prohibitions ("Staff's Working Proposal") at 1. Neither section 402(p) of the Clean Water Act, nor its implementing regulations under 40 C.F.R. § 122.26(d)(2)(iv)(B)(1) allow or create exemptions from the prohibition against non-stormwater discharges. In fact, even the legal authority cited in staff's working proposal as support for "conditionally authorizing" more than two dozen types of non-storm water discharges, clearly states that "[u]ltimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit." 55 Fed. Reg. 47990, 47995. Consequently, the new LA County MS4 Permit may not contain any conditional exemptions to the Clean Water Act's directive to effectively prohibit non-storm water discharges.

II. Landscape Irrigation Should Be Removed From the List of Conditionally Authorized Discharges

Though we believe the Regional Board does not have authority to exempt specific non-storm water discharges for section 402(p)'s prohibition on non-storm water discharges, we are specifically concerned with the proposed wholesale exemption of such non-storm water flows as dewatering of decorative fountains and pool /spa discharges and, especially, landscape irrigation. Lawn irrigation has been identified as a "hot spot" for nutrient contamination in urban watersheds—lawns "contribute greater concentrations of Total N, Total P and dissolved phosphorus than other urban source areas ... source research suggests that nutrient concentrations in lawn runoff can be as much as four times greater than other urban sources such as streets, rooftops or driveways."¹ The fact that landscape

¹ Center for Watershed Protection (March 2003) *Impacts of Impervious Cover on Aquatic Systems* at 69; see also H.S. Garn (2002) *Effects of lawn fertilizer on nutrient concentration in runoff from lakeshore lawns, Lauderdale Lakes, Wisconsin*. U.S. Geological Survey Water-Resources Investigations Report 02-4130 (In an investigation of runoff from lawns in Wisconsin, runoff from fertilized lawns contained elevated concentrations of phosphorous and dissolved phosphorous); Orange County Watershed and Coastal Resources Division (August 18, 2006) Model Aliso Creek

irrigation was recently removed from the list of exempted discharges in the Orange County MS4 Permit, Order No. R9-2009-0002, NPDES Permit No. CAS0108740, a permit regulating MS4 discharges in a region which is very similar to LA County, is a clear indication that landscape irrigation is a source of pollutants and should no longer be exempted in the new LA County MS4 Permit.

III. There Is No Legal Authority for the Proposed Exemption From Liability for “Short Term Exceedance” of Applicable RWLs and/or WQBELs Resulting From A Non-Storm Water Discharge from A Potable Water Supply or Distribution System

In addition to significantly expanding the list of “conditionally authorized” non-stormwater discharges, staff also proposes an exemption from liability for “short-term exceedance” of RWLs and/or WQBELs caused by non-storm water discharge from a potable water supply or distribution system “not otherwise regulated by a separate NPDES permit, but required by state or federal statute and/or regulation.” Staff’s Working Proposal at 7. Apart from the obvious difficulties associated with defining “short-term exceedance,” and the additional layer of complicated requirements associated with this “exemption” added to an already complicated and confusing permit, staff’s proposal directly contradicts the Clean Water Act’s requirements and EPA regulations.

Non-storm water discharges must be effectively prohibited. 33 U.S.C. § 1342 (p)(3)(B). Such discharges must either be removed from the MS4 system or “become subject to an NPDES Permit.”⁵⁵ Fed. Reg. at 47995. Non-storm water discharges through the MS4 not covered by an NPDES permit are by definition “illicit discharges.” *Id.* There is no authority for exempting violations of water quality standards or TMDL or the Clean Water Act’s prohibition on non-storm water discharges caused by such “illicit discharges.” The Regional Board has only two options for regulating such discharges – to prohibit them or to issue an NPDES permit prescribing specific requirements for these discharges.

///
///
///

Watershed Action Plan, at 2-13 (“Based on other studies performed in Orange County, it is suspected that organophosphate pesticides may be a significant component of aquatic toxicity in the Aliso Creek storm samples.”)

IV. Conclusion

Staff's working proposal on the LA County MS4 Permit non-storm water discharge prohibitions does not fully comport to the letter and spirit of the Clean Water Act. The proposal should be significantly revised to ensure the new LA County MS4 Permit is lawful and finally implements the Clean Water Act's mandate to eliminate non-storm water discharges to and from the MS4. Only then can the Regional Board ensure that water quality standards and TMDLs in the Los Angeles Region are met and our precious water resources are protected.

We are looking forward to working together with the Regional Board in this endeavor.

Sincerely,

Tatiana Gaur
Staff Attorney
Santa Monica Baykeeper

Subject: Comments on Proposed Non-Stormwater Discharge Language for Reissued Los Angeles County MS4 Permit

Dear Ms. Purdy:

I am writing on behalf of the City of Signal Hill to provide comments on the non-stormwater discharge prohibition language currently being considered by Regional Water Board staff for inclusion in the reissued Los Angeles County MS4 Permit. Thank you for the opportunity to provide these comments. Signal Hill has applied for a separate MS4 permit similar to the City of Long Beach. We are providing comments based on the precedent setting nature of your proposal.

The City is both an MS4 permittee and a water purveyor. The City of Signal Hill's Water Operations program is a utility program responsible for the production, distribution, administration, and customer service of the water system. The program is responsible for the operation and maintenance of approximately 50 miles of pipeline, three reservoir facilities, and two wells. We are impacted both by MS4 permit requirements and requirements placed on municipal water service providers.

Since we do have our own water operations, we are particularly concerned with the conflicts between the proposed requirements for discharges of potable water and the legal operation of a water system in Los Angeles County. We also have concerns regarding conditional discharges, particularly related to fire protection services and landscape irrigation. However, first we have a general observation about the excessive discharge prohibition language in the March 28, 2012 Staff Working Proposal.

Proposed Permittee Requirements Exceed the Clean Water Act Mandate

Staff's intent of reducing non-stormwater discharges is good. However, the language proposed for the reissued MS4 permit goes beyond the mandate in the Clean Water Act (CWA) and the Code of Federal Regulations to effectively eliminate non-stormwater discharges into the storm drain system in two ways. First, it inappropriately extends the effective prohibition of non-stormwater discharges to discharges from the MS4. Both the CWA and the regulations restrict the effective prohibition of non-stormwater discharges to discharges into the storm drain system (MS4). Congress very clearly specified that discharges from the MS4 are to be controlled to the maximum extent practicable (MEP). All references to effectively prohibiting non-stormwater discharges from the MS4 should be removed from the draft permit language.

Secondly, the proposed language places severe restrictions on requirements for water services and firefighting services mandated by other existing laws, which puts cities in jeopardy. We believe that Board staff does not intend to construct permit requirements in a manner that will place cities in violation of other health and safety laws, but that is currently the case.

Potable Water

The City of Signal Hill agrees with the LA Permit Group's assertion in its April 13, 2012 comment letter that there should be further discussion and collaboration regarding how potable water is treated in the proposed non-stormwater discharge prohibition part of the permit. As was apparent at the April 5, 2012 workshop, water purveyors are concerned that the proposed regulations are overly prescriptive and could have a detrimental impact on legitimate and necessary operations of potable water service providers. It is absolutely necessary for water supply agencies to be able to flush water lines and test fire hydrants without undue restrictions or conditions to be able to operate in accordance with State Health Department requirements.

Other Detailed Comments

- Section III.A.1.c – The definition of illicit discharges should also exempt authorized non-stormwater discharges as defined in Section III.A.1.d.
- Section III.A.3 – Fire hydrant testing should be specifically exempted from effective prohibition because it is both a necessary water system operational practice and a safety practice required for effective fire fighting preparedness.
- Section III.A.5 – The first sentence of this section should be revised to read, "Each permittee shall develop and implement procedures designed to ensure..." The second sentence should be rewritten to remove "and from the MS4 into the receiving waters."

City of Signal Hill Comments on Staff Working Proposal
Regarding Non-Stormwater Discharge Language for
Greater Los Angeles County MS4 Permit
18 April 2012
Page 3 of 3

- Section III.A.5.b – This provision should be rewritten to make clear that the requirement to explore and consider alternatives to the discharges to the MS4 does not apply to natural flows.
- Section III.5.c – Should be rewritten to recognize that municipalities have no direct control over schools and cannot legally implement procedures to minimize their discharge of landscape irrigation water into the MS4.
- Table X – The proposed requirement to “Segregate authorized non-stormwater discharges from potential sources of pollutants to prevent introduction of pollutants to the MS4 and receiving waters” (page 9) specified for all discharge categories and natural springs is overly broad and may be impossible in some cases. We would appreciate the opportunity to discuss this with staff in order to understand the intent and develop workable substitute language.
- Table X – The conditions specified for landscape irrigation using potable water (page 12) should be reconsidered. The General Condition requiring implementation of an ordinance specifying water efficient landscape standards as well as outreach and education are reasonable. However, the Board needs to recognize that it will be virtually impossible to eliminate all discharges of landscape irrigation water and that even to minimize such discharges will take a long time. Many irrigation systems are old and will need to be rebuilt to minimize discharges. In addition, the proposed condition to utilize delivery rates that do not exceed the infiltration rate of the soil should be deleted. This might work for new installations, but it is impractical for existing irrigation systems where the infiltration rates of the soil are unknown.

Thank you again for the opportunity to provide these comments.

Sincerely,

CITY OF SIGNAL HILL

Steve Myrter, P.E.
Director of Public Works

PASADENA WATER AND POWER

April 18, 2012

Ms. Renee Purdy, Section Chief
California Regional Water Quality
Control Board – Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, California 90013

Subject: Los Angeles County MS4 Permit

Dear Ms. Purdy:

Please find below comments from Pasadena Water and Power in regards to the proposed language for the Los Angeles County Municipal Separate Storm Sewer System (MS4) National Pollutant Discharge Elimination System (NPDES) Permit. The comments are broken up into four parts, a statement of the problem that Community Water Systems (CWSs) face because of the MS4 Permit, a proposed solution, general comments on the overall structure of the regulatory scheme to resolve those problems, and then specific comments on particular elements.

1) Statement of Problem

- a. The existing and proposed language in the MS4 Permit puts a large incentive on MS4 Permittees to achieve an objective of "Zero Discharge of Non-Stormwaters" (NSW). MS4 Permittees operate under threat of Notice of Violations (NOVs) from the Regional Water Quality Control Board (RWQCB) and third party lawsuits (TPLs), which have the potential for large penalties if they fail to comply with the MS4 NPDES Permit. The only secure "Safe Harbor" that an MS4 Permittee has when confronted with an exceedance in a receiving water is to demonstrate that no discharges had occurred. This can only be achieved if in fact there have been no NSW discharges.
- b. Discharges from CWSs and Fire Departments (FDs) are legally required to occur by Federal and State statute, regulation, and permit. As such, the discharges from CWSs and FDs prevent MS4 Permittees from complying with MS4 Permit and place them in jeopardy of NOVs and TPLs. As a result, MS4 Permittees have taken actions against CWSs to curtail or eliminate discharges. Examples of this include CWSs being fined by

MS4 Permittees, having their discharges banned by MS4 Permittees and being required to obtain NPDES permits and Waste Discharge Requirements. This puts CWSs and FDs in double jeopardy, failing to discharge would place them in violation of the Safe Drinking Water Act, but discharging would place them in violation of the local requirements for achieving compliance with the Clean Water Act.

2) Proposed Solution

- a. The key to resolving this conflict is for the MS4 Permit to give regulatory relief to MS4 Permittees for those situations where an exceedance in a receiving water was caused by or contributed to by a discharge from a CWS or FD. In exchange for this relief, MS4 Permittees would take on additional responsibilities – specifically ensuring that CWSs and FDs complied with enhanced Best Management Practices (BMPs).
- b. CWSs and FDs would get regulatory relief from the MS4 Permittees for their discharges.
- c. In exchange for this relief CWSs would put into practice enhanced BMPs. MS4 Permittees and CWSs would sign a Memorandum of Understanding (MOU) binding them to the practice of these enhanced BMPs. The MOU would be the tool MS4 Permittees would use to enforce its new responsibilities.
- d. These BMPs include Advanced Notification to MS4 Permittees by CWSs of Planned Discharges, Dechlorination of Discharges, Sediment Control Procedures, Record Keeping and Record Sharing. This will provide a mechanism for helping MS4 Permittees track flows and hopefully prevent difficulties complying with the MS4 Permit.
- e. For this proposal to work, it must be organized on a watershed basis.
 - i. Liability for compliance with Total Maximum Daily Loads (TMDLs) and Water Quality Based Effluent Limitations (WQBELs) is “joint and several”, which means that all MS4 Permittees in a given watershed are equally liable for any exceedance of a Receiving Water Limitation (RWL). The information collected under and provided for under the MOU and BMPs would be needed by all MS4 Permittees in a given watershed.
 - ii. There are scores of MS4 Permittees, FDs, and CWSs in Los Angeles County. It is simply impractical for all CWSs and FDs to provide advanced notification and share records with all MS4 Permittees and undesirable for MS4 Permittees to receive advance notification and records from all FDs and CWSs.
 - iii. The requirements that might be needed in a BMP Manual in one watershed might not be needed in another watershed.

3) General Comments

- a. All references to paragraphs and page numbers are to the document entitled “LA County MS4 Permit – Non-Storm Water Discharge (NSW) Prohibitions”.
- b. The basic elements of the above proposed solution are present in the proposed permit language, but they are not presented in a clear and accessible fashion and are scattered about in the permit. The solution is more implicit and vague. What is needed is an explicit and organized arrangement of these elements.
- c. The proposed language, on Paragraph 3 (pages 1 – 4) describes NSW discharges that do not have to be banned by MS4 Permittees (i.e. an Authorized NSWs) when the MS4 Permittee does not discharge into an Area of Special Biological Significance (ASBS). The paragraph is divided into two sections; those authorized NSW discharges, which are covered by an existing NPDES permit and those that are not so covered. This division does not serve any useful purpose.
 - i. MS4 Permittees can be placed in a position of receiving NOVs and TPLs by discharges from CWSs and FDs whether there is an NPDES permit present or not. Los Angeles County Flood Control District (“the District”) was recently sued by the Natural Resources Defense Council (NRDC) and Heal the Bay for failing to comply with the MS4 Permit. The District had argued that while RWL had indeed been exceeded, they were not liable for those exceedances because the District was not the source of pollutants. The pollutants had been added to the receiving waters by other “upsewer” dischargers, which had NPDES permits.
 - ii. The Ninth Circuit Court of Appeals ruled against the District on this issue and wrote: “...the District argues that merely channeling pollutants created by other municipalities or industrial NPDES Permittees should not create liability because the District is not an instrument of ‘addition’ or ‘generation’, the Clean Water Act (CWA) does not distinguish between those who add and those who convey what is added by others — the CWA is indifferent to the originator of water pollution.” While the District is appealing the ruling, it is not appealing this part of the ruling. No matter how the Supreme Court rules, the legal principle that just because a discharge with enough pollutant to cause a RWL exceedance was released by an entity with an NPDES permit flows into MS4, the MS4 Permittee is still liable and subject to NOVs and TPLs, is now established. As such, any separation of permitted from non-permitted discharges into MS4s is meaningless in the context of compliance with the MS4 Permit.

<http://www.scotusblog.com/case-files/cases/los-angeles-county-flood-control-district-v-national-resources-defense-council/>

- iii. It might be more effective to create a category of “Legally Mandated Discharges” which could include:
 1. Discharges from potable water sources, including but not limited to water line flushing (supply and distribution system releases), tank dewatering, well to waste operations, sheared fire hydrants, broken mains, etc. including planned, unplanned, and emergency discharges.
 2. Discharges resulting from firefighting training activities, which simulate emergency responses, valve exercises, and other related activities.
 3. Flows from emergency firefighting activities (i.e., flows necessary for the protection of life or property).
 4. Discharges from building fire suppression system maintenance (e.g. sprinkler line flushing).
- d. Paragraph 8 (pages 7 – 8) is the key section for CWSs. In it, it says that if there is an exceedance, which is caused by a discharge from a CWS, then the MS4 Permittee is not in violation of the MS4 Permit (which means that the RWQCB cannot issue an NOV and they cannot be sued by third parties) and so they would have no reason to limit or ban CWS discharges. However, MS4 Permittees would then have to take at least one of the following actions: A) Evaluate the long-term impact of the discharger; B) Identify alternative discharge routes; C) Impose additional conditions to those found in Table X; D) Require the CWS to obtain an NPDES permit.
 - i. This paragraph is limited to dischargers who are “not otherwise regulated by a separate NPDES permit”, i.e. discharges covered under an NPDES permit are not given regulatory relief. There does not appear to be any particular reason for this limitation. This would not eliminate the conflict between CWSs and MS4 Permittees when there is an NPDES permit involved and provide further disincentives for CWSs to obtain NPDES permits.
 - ii. This is confusing. Consider a CWS with two wells, one with an NPDES permit and one without. Discharges from the one well and the distribution system would enjoy “regulatory relief”, but the other well would not.
 - iii. It is not clear who decides which combination of these four options is to be implemented, the MS4 Permittee or the RWQCB.
 - iv. This paragraph creates the impression that this is a “single-pass” process. It can be read that the MS4 Permittee only receives regulatory relief the first time that an exceedance is found to have

been caused by discharge from a CWS, not afterwards. It would appear, that once, at least one of the four listed options is implemented, there is no additional regulatory relief.

- v. The fourth option, requiring a discharger to obtain an NPDES permit is particularly troublesome.
 - 1. Can an MS4 Permittee legally require a CWS to obtain an NPDES Permit? What would be the enforcement mechanism? It implies that each MS4 Permittee would have to require CWSs to obtain a local discharge permit to operate within that particular jurisdiction.
 - 2. As currently written, each time an MS4 Permittee requires a CWS or FD to obtain an NPDES permit, the MS4 Permittee would lose more regulatory relief.
 - 3. Which NPDES Permit would be required? This would create a complex patchwork situation with each MS4 Permittee requiring different permits and with other requiring none.
- vi. Requiring MS4 Permittees to require CWSs to obtain NPDES permits would create a patchwork approach with each MS4 Permittee taking completely different approaches. CWSs operating in several jurisdictions would face multiple and conflicting requirements. This would be contradictory to the need to address these issues on a watershed-wide basis.
- vii. Being required to obtain an NPDES permit creates a variable of problems for CWSs:
 - 1. These permits are costly and complex to obtain and maintain for routine operational discharges.
 - 2. They open CWSs to TPLs.
 - 3. They would establish that the water delivered by CWS is a waste under California law, which creates a wide range of legal difficulties.
- viii. Alternative language could read as follows:
 - 8. If a Permittee demonstrates that a specific non-storm water Legally Mandated Discharge caused a short-term exceedance of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations during a specific sampling event, the Permittee shall not be found in violation of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations for that specific sampling event. Such demonstration must be based on relevant information regarding the location, date, time and duration of the discharge, the discharge pathway and receiving water(s) of

the flows, and an estimate of the volume of the Legally Mandated non-storm water discharge. Permittees in a given watershed must establish a uniform, watershed-wide BMPs Manual that all dischargers shall comply with.

- a. The BMP Manual shall be consistent with the requirements identified in Table X.
 - b. The Permittees in each watershed shall have necessary legal authority to require the use of these BMPs by the Legally Mandated Dischargers in their respective watershed, e.g. a MOU.
 - c. The instrument of legal authority and written BMP Manual are subject to approval by the Regional Water Board Executive Officer.
- e. Paragraph 9 address emergency fire flow discharges. It might be more useful to combine all legally mandated discharges into Paragraph 8, both emergency and non-emergency. How these would differ in terms of BMPs might be better addressed in the MOU and BMP Manual rather than the permit language itself.

4) Specific Comments

- a. Paragraph 5 (pages 5 – 6) requires MS4 Permittees “develop and implement procedures to ensure” that all of the Authorized NSWs in Paragraphs 3 & 4 comply with the requirements in Table X. In subsection a. it states that MS4 Permittees ensure that “all necessary permits and water quality certifications are obtained by a discharger prior to discharge to the MS4...”.
 - i. It is not clear what this means. The phrase “necessary permits and water quality certifications” appears several times in the text, including Table X, but is undefined.
 - ii. Paragraph 5 appears to apply to all authorized NSW discharges, but in Table X it only appears in two discharge categories, “flows from riparian habitats and wetlands” and “diverted stream flows”. This would suggest that the phrase “necessary permits and water quality certifications” has to do with the Corps of Engineers and the California Department of Fish and Game.
 - iii. If it is only for these two NSW flows, the text should clearly say so otherwise it could be misconstrued to applied to all NSW flows. The phrase “necessary permits and water quality certifications” should also be defined.

Los Angeles County MS4 Permit

April 18, 2012

Page 7 of 7

- b. Paragraph 7 (on pages 6 – 7) requires permittees to evaluate outfall monitoring data required in Table X. If the Permittee determines that a “category” of authorized NSWs is causing an exceedance, then the entire category has to be either prohibited, have additional discharge conditions applied, or require the discharger to obtain an NPDES permit.
 - i. The language uses the term “category” and “discharger” interchangeably, but there may be several dischargers in a given category. It seems unreasonable to require all dischargers in any one category to have to take remedial actions if only one discharger is causing the exceedance.
 - ii. Not all discharges from a single discharger are necessarily the same. In the case of CWSs, different wells have different water qualities. If only one particular discharge location is causing a problem, it does not seem reasonable that all discharge locations and dischargers in a given category should be forced to take remedial actions
- c. Some of the BMPs in the Table X are overly detailed. These requirements will often be watershed specific and would best be spelled out in the context of a regional MOU and BMP Manual rather than in the Permit itself. Examples include.
 - i. 72 hour notification is probably a good objective unrealistic in many cases.
 - ii. pH adjustment is probably not really necessary, it is highly unlikely that a routine discharge would have pH outside of the specified range and bringing tanks of sulfuric acid or caustic soda to field for adjustment is probably not very practical. The exception to this might be in cases where an NPDES permit would be required, such as hydrostatic testing or well development. However, those permits already have pH adjustment requirements.

In summary, PWP believes that the basic ideas put forth in the proposed language by Board staff for dealing with NSW discharges capture the needed elements to resolve conflicts between CWSs, FDs, and MS4 Permittees. However, the process for this to occur must be on a watershed wide basis, must be clear and explicit, and requirements for MS4 Permittees to require CWSs and FDs to obtain NPDES permits are counter-productive.

Sincerely,

David E. Kimbrough

Attention: Ms. Renee Purdee

Subject: Comments on Non-Storm Water Discharges for
LA County MS4 Permit

Dear Mr. Unger:

The Los Angeles Department of Water and Power (LADWP) appreciates the opportunity to comment on the Los Angeles Regional Water Quality Control Board (LARWQCB) staff working document on non-storm water discharges for the renewal of the Municipal Storm Water Separate Sewer System (MS4) permit. The authority to discharge potable water, a non-storm water discharge, will have a significant impact to LADWP. LADWP is the largest municipal water utility in the nation that serves over 4.1 million customers. Its mission is to deliver a dependable supply of safe, quality water in an efficient, cost effective, and environmentally responsible manner.

Currently LADWP's water system has approximately 716,000 service connections in an area of nearly 470 square miles. Raw water for drinking water is received through various sources including the Mono and Owens River basins, the San Fernando Valley and Central groundwater basins through local wells, and the State Water Project and the Colorado River. The percentage of each source over a 10-year average is approximately 42% from the Owens Valley, 45% from the State Water Project, and 13% from local ground water wells.

In addition, LADWP's service area distribution system has 126 pressure zones, 88 pumping stations, over 100 storage facilities including tanks and reservoirs, 260 regulator stations and over 7,200 miles of pipeline. The distribution mains are 12 inches and less in diameter and transmission mains are 16" – 12 feet in diameter. In an effort to assess water quality and ensure the safety of our customers, approximately 250,000 field and laboratory tests are conducted on 25,000 water quality samples each year.

Water and Power Conservation ... a way of life

111 North Hope Street, Los Angeles, California 90012-2607 Mailing address: Box 51111, Los Angeles 90051-5700
Telephone: (213) 367-4211 Cable address: DEWAPOLA

Mr. Sam Unger
Page 2
April 18, 2012

LADWP's water system is large and dynamic, through operating permit requirements, and federal and state regulations, the system requires periodic flushing and draining for maintenance and monitoring to ensure the delivery of reliable and safe water of high quality to its customers.

When possible, discharges are typically done before the spring and summer seasons. The volumes of water associated with the discharge of the distribution mains are approximately 9,000 gallons per flush. Those discharges from the transmission lines are typically larger and last over a period of two days to one week; and the reservoir discharges are also larger and can last up to three to four weeks.

Historically these potable water discharges have been covered under the MS4 permit as a categorical exception. Per the current MS4 permit, for larger potable water discharges such as a typical reservoir draining, LADWP notifies and obtains approval from the Regional Board. LADWP also notifies either or both the County and City of Los Angeles of its intent to discharge. LADWP implements both the monitoring program required by the Regional Board and Best Management Practices (BMPs) as stipulated in LADWP's Water System Discharge Handbook, which is based on the AWWA guidelines, to further mitigate any impacts and/or pollutants. The BMPs are similar as those outlined in AWWA guidelines and BMP handbook, such as dechlorination, sweeping the path of discharge if practical, and flow rate control to prevent erosion and sediment re-suspension.

In recent years LADWP has pulled back on its flushing activities in an effort to conserve water. This reduced flushing program has saved millions of gallons of water but still maintains the safety and efficiency of the water distribution system. Since LADWP curtailed the flushing program for water conservation purposes, most potable water discharges are for large storage and facilities and mains on an infrequent basis. LADWP is proposing that a threshold be established for determining notification and other actions that may be necessary for these types of large scale discharges.

For decades, potable water has been discharged to local municipal storm drain systems when periodic flushing and draining activities have been necessary. Studies such as the American Water Works Association Research Foundation report on the environmental impacts of untreated potable water discharges to receiving waters completed in 2007 have concluded that there are no impacts from potable water discharges to the environment. Based on this long standing history of potable water discharges not posing a threat to receiving waters, LADWP believes that potable water discharges to the MS4 system are appropriate and protective of water quality standards.

In reviewing the staff working proposal for non-storm water discharges, LADWP has worked with the Metropolitan Water District to revise the language to produce an amended version that provides water quality protections, and also provides a framework in which our ongoing operations can function. We are proposing the addition of a newly

Mr. Sam Unger
Page 3
April 18, 2012

defined conditionally exempted non-storm water discharge which would be defined to include both routine potable water discharges and firefighting activities. This discharge would be called Conditionally Exempt Essential Non-Storm Water discharge. Since these discharges are both related to public safety and life safety, we believe these flows should be conditionally exempted and allowed to be discharged into the MS4 system, especially since there is no other viable option for the release of these types of discharges. The conditions which would be placed on these flows are that the discharges would need to comply with the use of BMPs based on either the AWWA standards or the State Fire Marshal standards as developed and as appropriate.

The non-storm water discharge language has also been modified to conform to the existing language of the Ventura County MS4 permit and allows for the potable water discharges to remain in the MS4 permit until such time as a specific general permit or other options may be developed for these discharges. A copy of the revised non-storm water discharge language is enclosed for your review and consideration (Enclosure 1).

LADWP and MWD recently met with the Regional Board staff to understand how the evolving standards and LADWP's needs can best be addressed and still provide the best environmental protection. We appreciated the Regional Board's openness and willingness to work with the various stakeholders and commend them for doing so. We look forward to future meetings as we move forward in developing a solution which, as mentioned above, could include interim coverage under the MS 4 as modeled in the Ventura County MS 4 permit and a possible future general permit or other avenues of compliance.

LADWP thanks the Regional Board for the opportunity to comment and looks forward to a workable solution for everyone. If you have any questions, please feel free to contact Mr. Michael Hanson of my staff at 213-367-0634.

Sincerely,

Katherine Rubin
Manager of Wastewater Quality and Compliance Group

Clean Copy of MWD & LADWP Edits to Staff Working Proposal – NSD Provisions
03/28/12

TFWRI GR OA

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

FINDINGS

F. Implementation

This Order references industry standard BMP guidance documents to ensure that Conditionally Exempt Essential Non-Storm Water Discharges are not a source of pollutants to the MS4. The BMPs referenced in the guidance documents are for the purpose of dechlorination and/or for prevention of erosion and sediment loss, or to reduce other harmful pollutants during the discharge of conditionally exempt essential non-storm water discharges to the MS4. The referenced BMP guidance documents for potable water discharges include the *American Water Works Association A WWA Guidelines For The Development Of Your Best Management Practices (BMP) Manual For Drinking Water System Releases Developed by the CA -NV A WWA Environmental Compliance Committee (2005)* which serves as an industry standard for California, from the results of studies directed by the Los Angeles Water Board, - *Evaluation of Non-Storm Water Discharges to California Storm Drains and Potential Policies for Effective Prohibition Methods, Final Report*, University of California, Los Angeles, Contract No. 5-104-140-0 (1997), and *Water Quality Concerns and Regulatory Controls for Non Storm Water Discharges to Storm Drains*, Duke L.D. and M. Kihara, Journal of the American Water Resources Association, Vol. 34: 661-676, (1998), and from the Water Boards' experience of controlling authorized non-storm discharges to the MS4 since 1990. The referenced BMP guidance documents for flows from fire fighting activities include (*insert reference to State Fire Fighting BMP Guidance Manual*). The BMP guidance documents include technically feasible, practicable, and cost-effective BMPs. The implementation of measures set forth in this Order are reasonably expected to reduce the discharge of minimal pollutants to the maximum extent practicable from conditionally exempt essential non-storm water discharges. At this time it is impractical and economically infeasible for Conditionally Exempt Essential Non-Storm Water Discharges including fire fighting and potable water discharges from conveyance and distribution systems to provide treatment methods beyond appropriate industry standard BMPs and control measures.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Part III. DISCHARGE PROHIBITIONS

A. Non-Storm Water Discharges

1. General Definitions

- a. **Non-Storm Water Discharge:** Any discharge into the MS4 or from the MS4 into a receiving water that is not composed entirely of storm water.
- b. **Storm Water:** Storm water runoff, snow melt runoff, and surface runoff and drainage related to precipitation events (pursuant to 40 CFR § 122.26(b)(13); 55 *Fed. Reg.* 47990, 47995 (16 November 1990)).
- c. **Illicit Discharge:** Any discharge into the MS4 or from the MS4 into a receiving water that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes any non-storm water discharge, except authorized non-storm water discharges regulated by an individual or general NPDES permit; conditionally authorized non-storm water discharges specifically identified in Part III.A.3 of this Order; and essential non-storm water discharges specifically identified in Part III.A.4 (pursuant to 40 CFR § 122.26(b)(2)).
- d. **Authorized Non-Storm Water Discharge:** Authorized non-storm water discharges include all discharges that are regulated by an individual or general NPDES permit and are allowed by the LARWQCB to discharge to the MS4 when in compliance with all NPDES permit conditions.
- e. **Conditionally Authorized Non-Storm Water Discharge:** Conditionally authorized non-storm water discharges are certain categories of discharges that are either not sources of pollutants or may contain only minimal amounts of pollutants and when in compliance with specified BMPs do not result in significant environmental effects. (See 55 *Fed. Reg.* 47990, 47995 (16 November 1990)).
- f. **Conditionally Exempt Essential Non-Storm Water Discharge:** Conditionally exempt essential non-storm water discharges include the following categories of discharges that are allowed by the Regional Water Board to discharge to the MS4, if in compliance with all specified requirements, are not otherwise regulated by an individual or general NPDES permit, and are essential public services and/or are directly or indirectly required by other State or Federal statute and/or regulation. Conditionally exempt essential non-storm water discharges may contain only minimal amounts of pollutants, however, when in compliance with industry standard BMPs and control measures do not result in significant environmental effects. (See 55 *Fed. Reg.* 47990, 47995 (16 November

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

1990)).

- Discharges from Fire Fighting Activities¹ provided appropriate BMPs are implementation based on the (*insert reference to State Fire Fighting BMP Guidance Manual*); and
 - Discharges from Potable Water Sources², where not otherwise regulated by an individual or general NPDES permit, provided appropriate BMPs are implemented based on the AWWA Guidelines for the Development of Your Best Management Practices Manual for Drinking Water System Releases
- a. **Receiving Water:** A “water of the United States” into which waste and/or pollutants are or may be discharged.

2. Prohibition of Non-Storm Water Discharges. Each Permittee shall, within its respective jurisdiction, effectively prohibit non-storm water discharges into the MS4 and from the MS4 to receiving waters except where such discharges are either specifically: 1) authorized non-storm water discharges that are regulated by an individual or general NPDES permit as identified in section A.3.a; 2) conditionally authorized non-storm water discharges in accordance with section A.3.b; or 3) conditionally exempt essential non-storm water discharges in accordance with section A.3.c.

3. Exemptions from Effective Prohibition of Non-Storm Water Discharges. The following categories of non-storm water discharges are allowed by the Regional Water Board provided they meet all required conditions specified below, or as otherwise approved by the Regional Water Board Executive Officer. Additionally, these dischargers must explore and consider alternative methods of disposal, such as water conservation, reuse of water and groundwater recharge, and determine prior to discharge that no feasible or economical alternative method of disposal exists. Pursuant to Section 2 of Article X of the California Constitution, water resources of the State shall be put to beneficial use to the fullest extent of which they are capable.

- a. **Authorized Non-Storm Water Discharges:** Those that are regulated by an individual or general NPDES permit for non-storm water discharges, including, but not limited to:

¹ This includes emergency fire fighting and fire fighting training activities, which simulate emergency responses.

² The required larger volume periodic releases from the wholesale and/or larger water purveyors are included until such time as a General Permit or other compliance measures are established that specifically addresses these types of releases.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

- i. Discharges of non-process waste water regulated by NPDES Permit No. CAG994003, including, but not limited to:
 - (a) Air conditioning condensate;
 - (b) Swimming pool filter backwash water;
 - (c) Swimming pool drainage, where the discharge is not authorized below or is otherwise prohibited by a Permittee; and
 - (d) Groundwater seepage.
- ii. Discharges of low threat hydrostatic test water³ regulated by NPDES Permit No. CAG674001;
- iii. Discharges of ground water from construction and project dewatering⁴ regulated by NPDES Permit No. CAG994004;
- iv. Discharges of ground water from potable water supply wells⁵ regulated by NPDES Permit No. CAG994005;
- v. Discharges of treated ground water from investigation and/or cleanup of volatile organic compound (VOC) contaminated sites regulated by NPDES Permit No. CAG914001;
- vi. Discharges of treated ground water and other waste waters from investigation and/or cleanup of petroleum fuel contaminated sites regulated by NPDES Permit No. CAG834001;
- vii. Short-term, intermittent discharges from utility vaults and underground structures regulated by NPDES Permit No. CAG990002.

³ Low threat hydrostatic test water means discharges resulting from the hydrostatic testing or structural integrity testing of pipes, tanks, or any storage vessels using domestic water or from the repair and maintenance of pipes, tanks, or reservoirs.

⁴ Discharges of ground water from construction and project dewatering include treated or untreated waste water from permanent or temporary construction dewatering operations; ground water pumped as an aid in the containment and/or cleanup of a contaminant plume; ground water extracted during short-term and long-term pumping/aquifer tests; ground water generated from well drilling, construction or development and purging of wells; equipment decontamination water; subterranean seepage dewatering; incidental collected storm water from basements; and other process and non-process waste water discharges that meet the eligibility criteria and could not be covered under another specific general NPDES permit.

⁵ Discharges covered by this permit include ground water from potable water supply wells generated during the following activities: ground water generated during well purging for data collection purposes; ground water extracted from major well rehabilitation and redevelopment activities; and ground water generated from well drilling, construction, and development.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

- b. Conditionally Authorized Non-Storm Water Discharges:** Those that fall within one of the categories below and meet all required conditions specified in Table X, or as otherwise specified or approved by the Regional Water Board Executive Officer:
- i. Natural springs;
 - ii. Flows from riparian habitats and wetlands;
 - iii. Diverted stream flows, authorized by the State or Regional Water Board;
 - iv. Dewatering of lakes;
 - v. Rising ground waters, where ground water seepage is not otherwise regulated by a separate NPDES permit⁶;
 - vi. Uncontaminated ground water infiltration⁷;
 - vii. Uncontaminated pumped ground water, where not otherwise regulated by a separate NPDES permit⁸;
 - viii. Landscape irrigation;
 - ix. Gravity flow from foundation drains, footing drains, and crawl space pumps, where ground water seepage is not otherwise regulated by a separate NPDES permit;
 - x. Air conditioning condensate, where not otherwise regulated by a separate NPDES permit;
 - xi. Dechlorinated/debrominated swimming pool/spa discharges,⁹ where not otherwise regulated by a separate NPDES permit;
 - xii. Dewatering of decorative fountains;

⁶ A NPDES permit for discharges associated with ground water dewatering is required within the Los Angeles Region.

⁷ Uncontaminated ground water infiltration is water other than waste water that enters the MS4 (including foundation drains) from the ground through such means as defective pipes, pipe joints, connections, or manholes. Infiltration does not include, and is distinguished from, inflow. (See 40 CFR § 35.2005(20).)

⁸ Ibid.

⁹ Authorized dechlorinated/debrominated swimming pool/spa discharges do not include swimming pool/spa filter backwash or swimming pool/spa water containing bacteria, detergents, wastes, algacides, or cyanuric acid in excess of 50 parts per million, or any other chemicals including salts from pools commonly referred to as "salt water pools" in excess of applicable water quality objectives.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

xiii. Non-commercial car washing by residents or by non-profit organizations;

xiv. Street/sidewalk wash water¹⁰.

xv.

c. Conditionally Exempt Essential Non-Storm Water Discharges: Those that fall within one of the categories below, meet all required BMPs as specified, are essential public services discharge activities, and/or are otherwise required by other state or federal statute and/or regulation, including:

- i. Discharges from Fire Fighting Activities provided appropriate BMPs are implemented based on the *(insert reference to State Fire Fighting BMP Guidance Manual)* and;
- ii. Discharges from Potable Water Sources, where not otherwise regulated by an individual or general NPDES permit, provided appropriate BMPs are implemented based on the AWWA Guidelines for the Development of Your Best Management Practices Manual for Drinking Water System Releases.

4. Exemptions from Effective Prohibition within an ASBS. The following non-storm water discharges to the MS4 and from the MS4 directly to an ASBS are conditionally authorized pursuant to the California Ocean Plan as specified below, provided that:

- a. The discharges are for essential public service, or for emergency response purposes, structural stability, slope stability or occur naturally, including the following discharges:
 - a. Foundation and footing drains;
 - b. Water from crawl space or basement pumps;
 - c. Hillside dewatering;

¹⁰ Authorized non-storm water discharges of street/sidewalk wash water only include those discharges resulting from use of high pressure, low volume spray washing using only potable water with no cleaning agents at an average usage of 0.006 gallons per square feet of sidewalk area in accordance with Regional Water Board Resolution No. 98-08. Authorized non-storm water discharges of street/sidewalk wash water do not include hosing of any sidewalk or street with a garden hose with a pressure nozzle.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

- d. Naturally occurring groundwater seepage via a storm drain; and
 - e. Non-anthropogenic flows from a naturally occurring stream via a culvert or storm drain, as long as there are no contributions of anthropogenic runoff.
- b. The discharges fall within one of the specified categories in sub-part A.3.
- c. Authorized non-storm water discharges shall not cause or contribute to an exceedance of the water quality objectives in Chapter II of the Ocean Plan or alter natural ocean water quality in an ASBS.
- 5. Permittee Requirements.** Each Permittee shall:
- a. Promote measures that minimize runoff and pollutant loading from excess irrigation by promoting and/or working with potable water purveyors to promote conservation programs to minimize the discharge of landscape irrigation water into the MS4.
 - i. In addition, the Permittee may coordinate with the local water purveyor(s), where applicable, to promote landscape water use efficiency requirements for existing landscaping, use of drought tolerant, native vegetation, and the use of less toxic options for pest control and landscape management.
 - ii.
 - b. Develop and implement a work plan that results in a coordinated outreach and education program to minimize the discharge of irrigation water and pollutants associated with irrigation water consistent with Part VI.C. of this Order (Public Information and Participation Program).
 - c. If the discharger¹¹ of the conditionally exempt essential non-storm water discharge is not a named Permittee in this Order, the Regional Water Board shall require the discharger to provide advanced notification to the Permittee of the discharge. The Regional Water Board shall evaluate the monitoring data collected pursuant to Attachment X (Monitoring and

¹¹ Dischargers not named a Permittee in this Order may include, but are not limited to, potable water supply and distribution agencies, wastewater treatment agencies/sanitation districts, and other Federal, State, and local governmental entities.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Reporting Program - Non-Storm Water Outfall Based Monitoring), and any other relevant information, and determine whether any of the conditionally authorized non-storm water discharges identified in sections A.3.b are a source of pollutants that maybe causing an exceedance of an applicable water quality objective for the receiving water.

- d. If the Regional Water Board determines that any one of the categories of conditionally authorized non-storm water discharges identified in sections A.3.b are a source of pollutants that maybe causing an exceedance of an applicable water quality objective for the receiving water, the Regional Water Board may:
 - i. Impose conditions in addition to those in Table X on the conditionally authorized non-storm water discharge category for the receiving water; or
 - ii. Require the conditionally authorized non-storm water discharger to obtain coverage under a separate individual or general NPDES permit prior to discharge to the MS4.

6. Notwithstanding the above, the Regional Water Board Executive Officer, based on a comprehensive analysis and evaluation of monitoring data and other relevant information for specific categories of discharges, may modify a category or remove categories of conditionally authorized non-storm water discharges from sections A.3.b, or require that a discharger obtain coverage under a separate individual or general State or Regional Water Board permit for non-storm water discharges.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Table X. Required Conditions for Authorized and Conditionally Authorized Non-Storm Water Discharges

Discharge Category	General Conditions Under Which Discharge to the MS4 is Allowed	Applicable NPDES Permit for Which Coverage is Required Prior to Discharge to the MS4 and/or Receiving Waters ¹²	Conditions/BMPs that are Required to be Implemented Prior to Discharge to the MS4 and Receiving Waters
All Discharge Categories	See discharge specific conditions below.		<p>Explore and evaluate alternative means of disposal (e.g., sanitary sewer, land disposal) or opportunities for water conservation, capture, reclamation, groundwater recharge, and reuse to determine if any feasible or economical alternative methods of disposal exist. Pursuant to Section 2 of Article X of the California Constitution, water resources of the State shall be put to beneficial use to the fullest extent of which they are capable.</p> <p>Segregate authorized non-storm water discharges from potential sources of pollutants to prevent introduction of pollutants to the MS4 and receiving water.</p> <p>Whenever there is a discharge of 500,000 gallons or more into the MS4, the discharger shall contact the appropriate Permittee(s) with jurisdiction over the MS4, including but not limited to the Los Angeles County Flood Control District, within 24 hours of the discharge.</p>
Natural Springs	N/A	N/A	<p>Segregate authorized non-stormwater discharges from potential sources of pollutants to prevent introduction of pollutants to the MS4 and receiving water.</p>

¹² The general orders/NPDES permits identified are those currently available to dischargers under which authorization to discharge could be provided. Alternatively, a discharger could seek authorization for the non-storm water discharge under an individual NPDES permit.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Discharge Category	General Conditions Under Which Discharge to the MS4 is Allowed	Applicable NPDES Permit for Which Coverage is Required Prior to Discharge to the MS4 and/or Receiving Waters	Conditions/BMPs that are Required to be Implemented Prior to Discharge to the MS4 and Receiving Waters
Flows from riparian habitats and wetlands	Discharge allowed only if all necessary permits/water quality certifications for water diversions are obtained prior to discharge.	N/A	All necessary permits and water quality certifications must be obtained prior to diverting flows to the MS4. Discharges shall comply with all conditions specified in permits and water quality certifications.
Diverted stream flows	Discharge allowed only if authorized by the State or Regional Water Board.	N/A	Discharges shall comply with all conditions specified by the State or Regional Water Board.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Discharge Category	General Conditions Under Which Discharge to the MS4 is Allowed	Applicable NPDES Permit for Which Coverage is Required Prior to Discharge to the MS4 and/or Receiving Waters	Conditions/BMPs that are Required to be Implemented Prior to Discharge to the MS4 and Receiving Waters
Dewatering of lakes (this does not include discharges from potable or raw water reservoirs and tanks)	Discharge allowed only if all necessary permit/water quality certifications for dredge and fill activities, including water diversions, are obtained prior to discharge.	N/A	<p>All necessary permits and water quality certifications must be obtained prior to dewatering.</p> <p>Provide advanced notification by the lake owner / operator to the Permittee(s).</p> <p>Immediately prior to discharge, visible trash on the shoreline or on the surface of the lake shall be removed and disposed of in a legal manner.</p> <p>Immediately prior to discharge, the MS4 inlet to which the discharge is directed, and the MS4 outlet from which the water will be discharged to the receiving water, shall be inspected and cleaned out.</p> <p>Discharges shall be volumetrically and velocity controlled to prevent resuspension of sediments.</p> <p>Measures shall be taken to stabilize lake bottom sediments.</p> <p>As applicable, monitor for pollutants of concern¹³ in the lake.</p> <p>Record-keeping of lake dewatering shall be maintained by the lake owner / operator.¹⁴</p>

¹³ Pollutants of concern include, at a minimum, trash and debris, including organic matter, TSS, and any pollutant for which there is a Water Quality Based Effluent Limitation in Part VI. for the lake and/or receiving water.

¹⁴ Permittees shall require that the following information is maintained by the lake owner / operator: name of discharger, date of notification, method of notification, location of discharge, discharge pathway, receiving water, date of discharge, time of the beginning and end of the discharge, duration of the discharge, flow rate or velocity, total number of gallons discharged, type(s) of sediment controls used, pH of discharge, type(s) of volumetric and velocity controls used, and field monitoring data. Records shall be made available upon request by the Permittee or Regional Water Board.

April 18, 2012
 File No. 31-370-40.4A

Ms. Renee A. Purdy
 California Regional Water Quality Control Board
 Los Angeles Region
 320 W. 4th Street, Suite 200
 Los Angeles, CA 90013

Dear Ms. Purdy:

Comments on the LA County MS4 Permit Non-Storm Water Discharge Provisions

The County Sanitation Districts of Los Angeles County (Sanitation Districts) appreciate the opportunity to submit comments to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board) on the Staff Working Proposal of the LA County MS4 Permit for Non-storm Water Discharge Provisions (Proposed Discharge Provisions). The Sanitation Districts have reviewed the Proposed Discharge Provisions pertaining to recycled water and support the Regional Board's inclusion of landscape irrigation using reclaimed or recycled water and flows from fire fighting activities in the table of Authorized Non-Storm Water Discharges. However, we would like to take this opportunity to provide some additional input regarding the specific wording used to describe fire fighting activities, as detailed below.

The Sanitation Districts agree that landscape irrigation using reclaimed or recycled water should be included in the LA County MS4 Permit as an authorized non-storm water discharge. Incidental runoff, such as over-spray from sprinklers, may escape the recycled water usage area and should not constitute an unacceptable non-storm water discharge. Recycled water is an important resource and the Sanitation Districts believe that the LA County MS4 Permit should not contain requirements that impede its use. The Regional Board itself acknowledged the importance of recycled water use by identifying the encouragement of water recycling as a 2011-2013 Basin Plan Triennial Review priority project. Therefore, the LA County MS4 Permit should continue to accommodate recycled water usage to be consistent with this objective and encourage water recycling in general.

Another aspect of the Proposed Discharge Provisions that affects the usage of recycled water is the exclusion for fire fighting activities. At times, the fire department utilizes recycled water for emergency and training purposes, and it is important for them to be able to continue to do so, since potable water may not be readily available in certain areas. Again, the Sanitation Districts agree with the Regional Board's proposal to include flows from fire fighting activities as a prohibition exception; however, several portions of the proposed text refer only to "emergency fire fighting activities". The Sanitation Districts request that the word "emergency" be removed from all references to fire fighting

activities, since these citations must also include training activities. Furthermore, this modification is consistent with the language in CFR §122.26(b)(2), which states “Illicit discharges mean any discharge to a municipal separate storm sewer that is not composed entirely of storm water except...discharges resulting from fire fighting activities.” Since the Code of Federal Regulations does not differentiate between emergency and non-emergency discharges resulting from fire fighting activities, and the Sanitation Districts consider both emergency and training fire fighting activities to be a beneficial use of recycled water, we recommend that the LA County MS4 Permit be revised to oblige such usage.

In summary, the Sanitation Districts support the inclusion of landscape irrigation using recycled water as an authorized non-storm water discharge in the LA County MS4 Permit and request the removal of “emergency” from all fire fighting activity references. If you have any questions, please contact Shannon Bishop of my staff at (562) 908-4288, extension 2843.

Very truly yours,

Grace Robinson Chan

LTS541_March 2012 Proposal.docx

Enc.

**Comments on the Municipal Separate Storm Sewer System
National Pollutant Discharge Elimination System Permit Provisions
Related to Non-Storm Water Discharge Prohibitions
in the March 28, 2012, Staff Working Proposal**

The Los Angeles County Waterworks District Nos. 21 (Kagel Canyon), 36 (Val Verde), 37 (Acton), 29 (Malibu) and Marina del Rey Water System (Districts) have the following comments on the working proposal of the permit provisions related to the non-storm water discharge prohibitions.

- Part III.A.3.b of the working proposal listed the exempted categories of non-storm water discharges to the Municipal Separate Storm Sewer System (MS4) from the discharge prohibitions, including potable water discharges, provided that they are not a source of pollutants that causes or contributes to an exceedance of applicable Receiving Water Limitations and/or Water Quality Effluent Limitations. The Districts request that such water quality conditions for potable water discharges be removed because they already meet very high drinking water quality standards.
- Discharges from potable water sources must be included in the exempted categories of non-storm water discharges from the discharge prohibitions within an Area of Special Biological Significance (ASBS). No water quality conditions for discharges essential for emergency response purposes and protection of public health, and for natural flows should be imposed. Therefore, the Districts request that Part III.A.4 be modified as follows:

4. Exemptions from Effective Prohibition within an ASBS. The following non-storm water discharges to the MS4 and from the MS4 directly to an ASBS are conditionally authorized pursuant to the California Ocean Plan as specified below:

- a. The discharges are essential for structural stability or slope stability, including the following discharges:
 - i. Foundation and footing drains;
 - ii. Water from crawl space or basement pumps; and
 - iii. Hillside dewatering;

The above non-storm water discharges shall not cause or contribute to a violation of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations in this Order or the water quality objectives in Chapter II of the Ocean Plan or alter natural ocean water quality in an ASBS.

- b.** The discharges are essential for emergency response purposes, protection of public health, or occur naturally, and include the following discharges:
 - i.** Discharges associated with emergency fire fighting activities (i.e., flows necessary for the protection of life or property);
 - ii.** Discharges from potable water sources;
 - iii.** Naturally occurring groundwater seepage via a storm drain; and
 - iv.** Non-anthropogenic flows from a naturally occurring stream via a culvert or storm drain, as long as there are no contributions of anthropogenic runoff.

Discharge Prohibitions			
Comment #	Permit Element/ Issue/ Concern	Location in Draft Permit	Comment/Recommendation
1	General approach	NA	<p>The working proposal would add tremendous burden on MS4 permittees to address what are authorized nonstormwater discharges. These discharges are generally perceived to be low risk. If the Regional Board has evidence that any authorized discharge poses significant risk to receiving water quality, then Regional Board should issue separate individual or general NPDES permits to address those discharges.</p> <p><u>Recommendation</u> Staff should consider a less prescriptive approach. For example, significantly simplifying Table X to address authorized non-stormwater discharges would be advisable. We would be happy to meet with staff to further discuss these issues, including a BMP-based approach for addressing non-stormwater discharges.</p>
2	Effective Prohibition of Non-Storm Water Discharges into MS4 and from MS4 into Receiving Water	<p>III.A.1.a, c.; III.A.2. [Page 1]</p>	<p>The proposed language refers to the "effective prohibition of non-storm water discharges..." throughout the document, and defines such discharges as "discharges into the MS4 and from the MS4 into receiving waters."</p> <p>This definition is clearly not authorized by the Clean Water Act (CWA).</p> <p>33 U.S.C. § 1342 (p)(3)(B)(ii) requires that municipal permittees "effectively prohibit" the discharge of non-stormwater into the MS4. It does not require the effective prohibition of non-storm water discharges from the storm sewers (MS4) to the receiving water.</p> <p>33 U.S.C. § 1342(p)(3)(iii) requires municipalities to "reduce the discharge of pollutants to the maximum extent practicable (MEP). 33 U.S.C. § 1362(12) defines "discharge of pollutants" not to include discharges into the MS4, but rather "any addition of any pollutant to navigable waters from any point source..."</p>

Discharge Prohibitions			
Comment #	Permit Element/ Issue/ Concern	Location in Draft Permit	Comment/Recommendation
2 cont.	Effective Prohibition of Non-Storm Water Discharges into MS4 and from MS4 into Receiving Water		<p>It also raises significant proof and enforcement issues. A municipality can identify individual dischargers to its MS4 and control that discharge through its ordinances, permitting authority or other enforcement mechanisms. However, given the mixing of discharges in the MS4 system from multiple sources (e.g., flows from individual and General NPDES permittees, POTWs, other municipal runoff, and other discharges authorized or exempted by the State or Regional Board, etc.), as well as the fact that the inlet to the MS4 may be operated by a different entity than the outlet of the MS4 to the receiving waters, it is very difficult for a permittee to take effective action to address non-stormwater discharges from the MS4.</p> <p>The Regional Board should acknowledge that certain activities that generate pollutants present in urban runoff may be beyond the ability of the permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear and leaching of naturally occurring minerals from local geography.</p> <p><u>Recommendation</u> Remove "and from the MS4 into receiving waters" throughout the document.</p>
3	Definition of "Storm Water"	III.A.1.b. [Page 1]	<p>The definition of "storm water" does not follow the regulatory definition, which does not include the words "related to precipitation events."</p> <p><u>Recommendation</u> Delete "related to precipitation events."</p>

Discharge Prohibitions			
Comment #	Permit Element/ Issue/ Concern	Location in Draft Permit	Comment/Recommendation
4	Definition of "Illicit Discharge"	III.A.1.c. [Page 1]	<p>The definition of "illicit discharge" does not follow the federal regulations 40 CFR § 122.26(b)(2): "Illicit discharge means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer and discharges resulting from any fire fighting activities." The proposed definition improperly refers to discharges "from the MS4 into a receiving water." Also, there is no limitation of firefighting activities to "emergency" firefighting activities.</p> <p><u>Recommendation</u> Delete "from the MS4 into a receiving water" and "emergency".</p>
5	Responsibility to regulate individual and general NPDES permits.	III.A.3.a.; III.A.5., a. & b.; Table X [Page 2; 5]	<p>The proposed language suggests that MS4 Permittees are responsible for ensuring non-stormwater discharges regulated by a separate individual or general NPDES permit comply with those permits. If true, this places the burden to regulate such discharges on the MS4 Permittees when such responsibilities lie with the Regional Board.</p> <p>The individual and general permits issued by the Regional Board should include the requirement for dischargers to explore and consider alternatives to discharge to the MS4 . Dischargers should have already considered other options prior to requesting approval from MS4 Permittees to discharge to the MS4.</p> <p><u>Recommendation</u> "5. Each Permittee shall develop and implement procedures to <u>require that dischargers obtain all necessary permits and water quality certifications prior to discharge to the MS4.</u> ensure all conditionally authorized non-storm water discharges into the MS4 and from the MS4 into receiving waters identified in sections A.3 and A.4 above comply with the applicable conditions. These procedures shall include, at a minimum, the following:"</p> <p>Delete 'III.A.5.a. & b.'</p>

Discharge Prohibitions			
Comment #	Permit Element/ Issue/ Concern	Location in Draft Permit	Comment/Recommendation
6	Natural flows	III.A.3.b, Table X [Page 3]	As currently proposed, natural flows are not allowed to cause or contribute to exceedances of applicable standards. MS4 permittees should not be responsible for natural flows. <u>Recommendation</u> Create a separate authorized discharges category for natural discharges, ie. natural springs, flows from riparian habitats and wetlands, diverted stream flows authorized by the State or Regional Water Board, uncontaminated groundwater infiltration, and uncontaminated pumped groundwater not regulated by a separate NPDES permit. Remove the above discharges from Table X.
7	Regulatory consistency	III.A.8., III.A.9. [Pages 7, 8]	As proposed, potable water discharges required by state or federal law and discharges from emergency fire fighting activities would be allowed to <i>contribute</i> to short-term exceedances of applicable standards. This is a lower standard compared to that for MS4 Permittees, who are required to meet the "cause or contribute" standard. Discharges entering the MS4 should be held to the same standard as discharges from the MS4. <u>Recommendation</u> Consistently use "cause or contribute" throughout the Permit.
8	Landscape irrigation	III.A.3.b.viii., III.A.5.c., Table X [Pages 3, 6, and 12]	The County of Los Angeles has an existing ordinance addressing landscape irrigation. The permit should allow permittees to continue to implement their existing ordinances if they are deemed equivalent. The proposed language, especially in Table X, is too prescriptive. <u>Recommendation</u> Allow permittees to continue implement their existing ordinances that prohibit excessive landscape irrigation runoff.

Discharge Prohibitions			
Comment #	Permit Element/ Issue/ Concern	Location in Draft Permit	Comment/Recommendation
9	ASBS	III.A.4 [Page 5]	<p>As currently proposed, all authorized discharges into the ASBS are required to meet RWLs and WQBELs.</p> <p>These requirements go beyond the ASBS Special Protections, which provide that authorized non-stormwater discharges only “shall not cause or contribute to a violation of the water quality objectives in Chapter II of the Ocean Plan nor alter natural ocean water quality in an ASBS.” Since these requirements apply specifically to discharges to the ASBS, the reference to RWLs and WQBELs should be deleted.</p> <p>Finally, the proposed language is confusing and appears to require separate and specific authorization for each and every discharge in sub-part A.3.</p> <p><u>Recommendation</u> Revise Section III.A.4.b. as follows: "The discharges fall within one of the categories in sub-part A.3 and are specifically authorized by the Los Angeles Water Board." Also, delete the reference to RWLs and WQBELs in Section III.A.4.c.</p>
10	Dischargers not MS4 Permittee	III.A.6 [Page 6]	<p>As proposed, Permittees must require dischargers not named in the MS4 permit to provide advanced notification to the Permittee of its non-stormwater discharge, obtain local permits, conduct appropriate monitoring, and implement additional BMPs or control measures as a condition of discharges into the Permittee’s MS4.</p> <p>As written, the language can be interpreted more broadly than Regional Board staff may have intended. While a footnote to this provision names such parties as POTW operators, potable water supply and distribution agencies and other governmental entities, it presumably could apply to any private company or individual as well. While this provision appears to shift to the discharger responsibility for controlling its discharge, the Permittee will incur administrative costs. Also, is this requirement applicable to discharges such as irrigation runoff, car washing, and other occasional, but repetitive activities conducted by non-institutional dischargers?</p> <p><u>Recommendation</u> Clarify that this provision only applies to significant institutional discharges.</p>

Discharge Prohibitions			
Comment #	Permit Element/ Issue/ Concern	Location in Draft Permit	Comment/Recommendation
11	Monitoring data evaluation	III.A.7 [Pages 6-7]	<p>The proposed language requires that Permittees evaluate monitoring data from the Non-Storm Water Outfall-Based Monitoring Program to determine whether any categories of non-storm water discharges are a source of pollutants that causes or contributes to an exceedance of applicable Receiving Water Limitations (RWLs) or Water Quality Based Effluent Limitations (WQBELs). If the Permittee determines that a category of non-storm water discharges is a source of pollutants that causes or contributes to an exceedance of applicable RWL or WQBELs, the Permittee shall report its findings to the Regional Water Board in the annual report, and either prohibit the discharge from either entering the MS4 or the receiving waters, impose conditions in addition to those set forth in Table X or require the discharger to require coverage under a separate “state or Regional Water Board permit prior to discharge to the MS4.”</p> <p>It is difficult to provide comments on any activities related to the monitoring program, RWLs, or WQBELs when the definitions and specifics of these programs have not been provided. At minimum, the Permittees should not be responsible for evaluating the monitoring data for discharges covered under another NPDES Permit, as explained earlier in Comment 5. Permittees can assist the Regional Board in making such evaluations by providing available information. If a discharge is found to be a source of pollutants, the Regional Board should prohibit the discharge, impose additional conditions, or require coverage under another Permit.</p> <p><u>Recommendation</u> Remove Section III.A.7, with the understanding that the integrated monitoring program and an adaptive management approach will result in prioritized investigations of exceedances.</p>

Discharge Prohibitions			
Comment #	Permit Element/ Issue/ Concern	Location in Draft Permit	Comment/Recommendation
12	Regulatory relief	III.A.8. [Page 7]	<p>The proposed language provides that if a Permittee demonstrates that a specific non-storm water discharge from a potable water supply or distribution system not otherwise regulated by a separate NPDES permit, but required by state or federal statute and regulation, caused [to be defined] a short-term exceedance of applicable RWLs and/or WQBELs during a specific sampling event, the Permittee shall not be found in violation for that specific sampling event. Demonstration must be based on monitoring data from the specific discharge, other relevant information (refer to Table X), and documentation of the statutes/regulations requiring such discharges, and the conditions under which the discharge was required.</p> <p>It is difficult to provide comments when the definition of "caused" and the specifics of "RWLs", "WQBELs", and the burden of proof are not provided. It is also possible that multiple discharges could occur concurrently that could cumulatively cause or contribute to an exceedance. Permittees are also concerned about the extensive and widespread monitoring that may be required to provide that burden of proof.</p> <p><u>Recommendation</u> Revise the regulatory relief language so the burden of proof is not put on MS4 permittees.</p>
13	Table X	Table X	<p>The working proposal would add tremendous burden on MS4 permittees to address authorized nonstormwater discharges which are generally perceived to be low risk. Specifically, Section III.A.5 combined with Table X, would require permittees to develop and implement procedures to ensure discharges meet very prescriptive and often highly resource intensive BMPs. For example, to address dewatering of lakes, swimming pools, and decorative fountains, permittees must ensure that MS4 inlets and outlets are inspected and cleaned immediately prior to discharge. This and many other similar requirements in Table X are not feasible in practice and not necessary.</p> <p><u>Recommendation</u> See Comments 1 and 5. We welcome the opportunity to meet with staff to discuss how to revise Table X so that it is more implementable.</p>

Attn: Renee A. Purdy, Regional Programs Section Chief
 Ivar Ridgeway, Stormwater Permitting Section Chief

RE: COMMENTS ON STAFF WORKING PROPOSAL ON LOS ANGELES COUNTY MS4 PERMIT – NON-STORM WATER DISCHARGE PROVISIONS

Dear Ms. Purdy and Mr. Ridgeway:

The City of Vernon appreciates the opportunity to provide comments on the subject matter referenced above. The City of Vernon is committed to protecting the environment and appreciates the cooperative efforts of the Regional Water Quality Control Board (RWQCB) and its staff in developing the updated Los Angeles County Municipal Stormwater Permit (MS4).

Quantifiable data evidencing that non-storm water discharges are a cause or contribution to the degradation of water quality is lacking. As such, the RWQCB should be tasked with performing a comprehensive study to determine which, if any of the non-storm water flows are contributing to the degradation of the water quality before any costly prohibitions or restrictions are placed on these flows.

Notwithstanding the above, the City of Vernon has concerns with the proposed non-storm water discharge provisions as described in the Staff Working Proposal dated March 28, 2012, and respectfully provides the following comments for your consideration:

1. Part III.A.2 specifies the following:

Each Permittee shall, within its respective jurisdiction, effectively prohibit non-storm water discharges into the MS4 and from the MS4 to receiving waters except where such discharges are either specifically authorized by a separate individual or general National Pollutant Discharge Elimination System (NPDES) permit or conditionally authorized in accordance with sections A.3 through A.6 below.

Exclusively Industrial

Concern- This prohibition conflicts with the Sections VI.C.2.i, VI.C.2.a.(i, iv., vii., and viii.) of the proposed Minimum Control Measures which indicates each permittee must **control the contribution of pollutants** and the discharge of spills to its MS4.

Proposed solution- Ensure that all sections of the proposed municipal stormwater permit are clear and consistent.

2. Part III A.3.b.xvi. Exemptions from Effective Prohibition

Flows from emergency firefighting activities (i.e., flows necessary for the protection of life or property). Footnote 10 states that discharges from vehicle washing, building fire suppression system maintenance (e.g., sprinkler line flushing), and other routine maintenance activities are not authorized to be discharged to the MS4.

Concern: The State Fire Marshall mandates that sprinkler line systems be serviced every five years. As such, this prohibition is impractical.

Proposed Solution: Authorize discharges with conditions on the discharger to implement BMPs as prescribed in the State Fire Marshall's BMP Manual of sprinkler line flushing.

3. Part III.A.5. indicates the following:

Each Permittee shall develop and implement procedures to ensure all conditionally authorized non-storm water discharges into the MS4 and from the MS4 into receiving waters.....

Concern- "Conditions" for authorized non-stormwater discharges are imposed by the Regional Water Quality Control Board on to the discharger. Therefore, the burden to "ensure all conditionally authorized non-stormwater discharges" should rationally remain with the RWQCB. All risks (compliance or otherwise) posed by the RWQCB's decision to authorize a discharge should not be at the sole expense of the municipal permittees.

Proposed Solution- We suggest omitting this requirement.

4. Part III A.3.b.xvi. Exemptions from Effective Prohibition

Flows from emergency firefighting activities (i.e., flows necessary for the protection of life or property). Footnote 10 states that discharges from vehicle washing, building fire suppression system maintenance (e.g., sprinkler line flushing), and other routine maintenance activities are not authorized to be discharged to the MS4.

Concern: The State Fire Marshall mandates that sprinkler line systems be serviced every five years. As such, this prohibition is impractical.

Proposed Solution: Authorize discharges with conditions on the discharger to implement BMPs as prescribed in the State Fire Marshall's BMP Manual of sprinkler line flushing.

5. Part III.A.5.b advises permittees to develop procedures for:

ensuring a discharger has explored and considered alternatives to discharge to the MS4, including for example, water conservation, reuse of water and ground water recharge, and has determined no feasible or economical alternative to discharge to the MS4 exists.

Concern- This permit requirement language suggests that the Municipal Stormwater Permit not only imposes onto permittees the responsibility of improving water quality, but also the added

responsibility of water conservation. Although this requirement can be arguably supported by “good intentions”, it imposes supplementary objectives unnecessary for the improvement of water quality standards.

Proposed solution- Defer water conservation responsibilities to the appropriate water purveyor(s).

6. Part III.A.5.c imposes the following onto Permittees:

c. Procedures to minimize the discharge of landscape irrigation water into the MS4. For landscape irrigation water to be discharged, each Permittee shall, within its respective jurisdiction:

i. Enact a municipal ordinance that specifies landscape irrigation standards to minimize irrigation runoff and eliminate irrigation overspray. The Permittee shall have legal authority to enforce the ordinance and levy fines. In addition, the Permittee may coordinate with the local water purveyor(s), where applicable, to enforce landscape water use efficiency requirements for existing landscaping.

ii. Coordinate with the water purveyor(s) within its jurisdiction to develop and implement a work plan that results in a coordinated outreach and education program to minimize the discharge of irrigation water and pollutants associated with irrigation water consistent with Part VI.C. of this Order (Public Information and Participation Program).

Concern- The discharge authorization for landscape irrigation is granted from the RWQCB to the discharger. The requirement for municipal permittees to expend limited public resources for what the RWQCB authorizes is clearly is inappropriate.

Proposed Solution- Based on the premise that this authorization is granted from the RWQCB to the discharger, procedures to minimize the discharge should remain with the RWQCB.

7. Part III A.7. – Each Permittee shall evaluate the monitoring data collected pursuant to Attachment X (Monitoring and Reporting Program – Non-Storm Water Outfall Based Monitoring), and any other relevant information, and determine whether any of the *categories* of non-storm water discharges identified in Section A.3 and A.4 above is a source of pollutants that causes or contributes to an exceedance of applicable Receiving Water Limitations in Part V. and/or Water Quality Based Effluent Limitations in Part VI.D.... Based on this determination, the Permittee shall also either:
7.a. Prohibit the non-storm water discharge *category* from entering the MS4 or receiving waters;...

Concern: The word *category(ies)* implies that in a city that has more than one community water system and if it is determined to be a source of pollution, this prohibition would penalize all the community water systems in said city.

Proposed Solution: Clearly define prohibition to limit respective discharger.

8. Part III.A.8. describes the following:

If a Permittee demonstrates that a specific non-storm water discharge from a

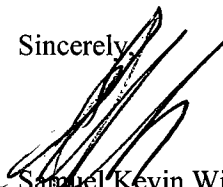

potable water supply or distribution system not otherwise regulated by a separate NPDES permit, but required by state or federal statute and/or regulation, caused [further definition to be provided] a short-term exceedance of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations during a specific sampling event, the Permittee shall not be found in violation of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations for that specific sampling event. Such demonstration must be based on monitoring data from the specific non-storm water discharge, other relevant information regarding the specific non-storm water discharge as identified in Table X, and documentation of the state or federal statute and/or regulation requiring such non-storm water discharge, including the conditions under which the specific discharge was required.

Concern- This section limits regulatory relief for permittees only for potable water supplies despite the several other categories of discharges authorized by the RWQCB.

Proposed solution- Expand the list of discharge categories, allowing for Permittee regulatory relief, to include all of the categories authorized by the RWQCB.

The City of Vernon appreciates your efforts and will continue to work with the RWQCB staff to protect the environment. Please contact Claudia Arellano at 323-583-8811 extension 258 or Jerrick Torres at 323-583-8811 extension 204 of the City of Vernon staff if you have any questions or comments.

Sincerely,

Samuel Kevin Wilson, P.E.

TECHNICAL COMMENTS ON LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD STAFF WORKING PROPOSAL FOR THE GREATER LOS ANGELES COUNTY MS4 PERMIT – NON-STORMWATER DISCHARGES

The City of Los Angeles (City) appreciates the opportunity to provide technical comments on the Los Angeles Regional Water Quality Control Board (Regional Board) Staff Working Proposal for the Greater Los Angeles County MS4 Permit. The City appreciates the time your staff has dedicated to meeting with us and the process that has provided the opportunity for substantial engagement and input. The City recognizes that this Working Proposal for Non-stormwater Discharges is part of the overall process and appreciates your consideration of our comments at this time. The following highlights a few key technical issues. Additional detailed technical comments are also provided in the associated attachments.

Watershed-Based Program

The City supports Regional Board staff's Watershed-Based Program approach. A watershed based program is the quintessential approach allowing for integration of all program elements (referred to by Regional Board staff as "Watershed Management Programs" during the April 5, 2012 workshop) and affords agencies the opportunity to comply with requirements while focusing efforts on the highest priorities for each watershed through customization. This approach also considers the current efforts undertaken by agencies to obtain grant funding for water quality projects, for the reason that criteria for many water quality grants are based on watersheds. Finally, this approach supports implementation of TMDLs, which are developed

and implemented based on watersheds. The City recognizes that the specific requirements regarding the Watershed Management Programs have not yet been developed and that this aspect of the Permit will continue to evolve over the next several months. Comments provided herein are intended therefore to inform the process at this point in time. The Bureau looks forward to working with Regional Board staff to continue to develop the Watershed Management Programs.

Natural Flows

Non-stormwater discharges that can be categorized as natural flows (e.g., natural springs, uncontaminated groundwater infiltration) are inherently different than the other categories of authorized discharges. Such discharges should not be conditioned for discharge and be subject to additional targeted monitoring. For example, the conditions presented in Table X require (1) MS4s to evaluate alternative means of disposal for natural springs and (2) the segregation of flow for natural springs from potential sources of pollutants, which interpreted literally could include the very geological formations from which the springs originate. The City therefore requests that natural flows are identified and conditions related to such discharges are removed.

Permittee Requirements

The requirements in this section apply universally to all of the listed authorized non-stormwater discharges regardless of the type and amount. However, particular requirements may not be relevant for certain types of discharges. For example, requirements for notifying the Permittee in advance and ensuring the discharger has explored alternatives prior to discharge do not seem relevant for certain discharges, such as residential car washing, sidewalk washing, and fire fighting. The City requests that Regional Board staff review and refine these requirements for applicability and feasibility, considering all discharge categories.

Table X

Table X includes a column for general conditions under which a discharge is allowed and a separate column for conditions that are required to be implemented prior to discharge. The distinction between the two columns is not clear. Additionally, since many discharge categories include phrasing such as “where possible” and “should be,” it is unclear if the last column (conditions required to be implemented) is intended to be an enforceable condition or if the identified BMPs are suggestions to mitigate any possible impacts. For example, under residential car washing, the last column includes the following:

“Where possible, wash cars on permeable surface where wash water can percolate into the ground (e.g., gravel or grassy areas).”

“Use biodegradable, phosphate free detergents and non-toxic cleaning products.”

The column heading seems to imply that all of the conditions are required prior to discharge, including the requirement that residents to use biodegradable, phosphate free detergents for car washing. However, the included list of conditions appears to be intended as suggestions to mitigate any possible impacts. The City requests that clarity is provided to distinguish between (1) the intent of the second and fourth columns and (2) the conditions that are enforceable and required prior to discharge and those items that are suggestions to mitigate possible impacts.

Renee Purdy and Ivar Ridgeway, LARWQBC

April 18, 2012

Page 3

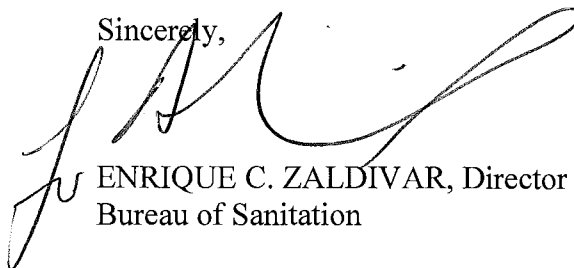

Attached is a list of detailed comments for the various discharges listed in Table X.

Cause or Contribute Language

Consistent with comments provided by the Bureau in the April 13, 2012 comment letter on the Working Proposal for Minimum Control Measures, language relating to "cause or contribute to water quality exceedances" should be addressed solely within the Receiving Water Limitations provision of the Permit.

Thank you for considering our technical comments on the Working Proposal. We look forward to continuing to work with you and your staff. If there are any questions, please contact Dr. Shahram Kharaghani, Stormwater Program Manager, at (213) 485-0587.

Sincerely,

A handwritten signature in black ink, appearing to read 'Enrique C. Zaldivar', is written over the typed name and title.

Table X Comments

Discharge Category	Comment
Natural Springs	The proposed requirement to segregate flows would be more appropriate to appear when discussing the “authorized non-stormwater” flows as to eliminate confusion.
Flows form riparian habitats and wetlands	Clarify that these flows do not apply to constructed wetlands or BMPs. The conditions for exemption are more understandable for constructed wetlands than natural wetlands and riparian habitats. Please consider removing the proposed conditions.
Dewatering of lakes	Clarify that these provisions would not apply if the purpose of these work is improve the water quality of the lake or the discharging waterbody. A number of our proposition O projects may not comply with these conditions; however they will have lasting water quality benefit. For these projects the City will take every necessary precaution to avoid re-suspension of sediments. However, please understand that any agitation from dewatering equipment, even the slightest, will cause resuspension.
Rising ground waters	Consider renaming the discharges that are covered under the NPDES Permit No. CAG994003.
Uncontaminated pumped ground vault	We anticipate that in addition to the discharges that are covered under the three cited general permits, there are many additional discharges. Besides being an unmanageable number of discharge points, these flows (outside of the three cited general permits) should also be viewed similarly to uncontaminated groundwater infiltration.
Landscape irrigation using potable water	The City supports the proposed general conditions for this type of discharge. The City will work with its Department of Water and Power to ensure that these provisions can be easily met. Consider replacing the proposed IPM requirement with a broader requirement for the municipalities to encourage proper pesticide use by their residents and businesses.
Gravity flows from foundation drains, footing drains, and crawl space pumps	There is an incredibly large number of this type of discharges. We do not believe the vast majority of these discharges are currently covered by the cited NPDES permit. Buildings constructed before the advent of stormwater regulations are piped to discharge (from said drains) directly to the storm drain system. Many of these buildings have operated (and discharged) without an individual or general NPDES permit. To require building owners or operators to do so will be cumbersome. Moreover, ensuring and regulating that each operator obtains a permit will be difficult for the City. Please consider exempting this category without conditions similarly to the uncontaminated groundwater infiltration.
Air conditioning condensate	Air conditioning condensate has purity equivalent to that of distilled water, and its discharge, therefore, should not be regulated under an NPDES permit. Harvesting air conditioning condensate is being used in other states for infiltration or reuse. Please consider exempting this category without conditions.

Dechlorinated/ debrominated swimming pool/spa discharges	The testing required for residential pool/spa owners prior to discharging dechlorinated/debrominated pool water is cumbersome and much too sophisticated for them to conduct. In addition, in Los Angeles County alone, there are 16,000 public pools which will be subject to this testing prior to discharge. The cost of testing kits or laboratory analysis will pose a huge burden on the homeowners, as well as recreation and parks departments within the City and County. Please consider deleting this condition. Finally, there is no sediment build-up in pools. Please consider deleting the resuspension condition.
Dewatering of decorative fountains	These are minor discharges that we do not foresee impacting water quality. Please consider removing all the proposed conditions.
Non-commercial car washing by residents or by non-profit organizations	The use of berms and pumps seem to be impractical measures. Blocking the storm drain could create a liability for the City or other municipality if sand bags are left after the car washing activity and cause flooding of the streets. Please consider revising the proposed BMPs.
Street/sidewalk wash water	The transient population is dense in downtown Los Angeles. Some congregate close to the Missions while many others are spread out in downtown. As a result, the unsanitary conditions of the sidewalk and streets is a widespread problem. Store owners take to daily hosing down store front areas and parking lots to clean their respective territories. As such, collection and diversion of street and alley wash water to the sanitary sewer will be a difficult and cumbersome measure to implement; no citizen will take this amount of time to do so. The City, on the other hand, may be able to do so of its own street washing activities, whenever practicable. Please specify the use of this BMP as a condition that should apply solely to City street/sidewalk washing activities, and only whenever practicable.
Flows from fire fighting activities (nonemergency)	It may be more feasible to place this type of discharge under a general NPDES permit, with conditions that have been negotiated with all fire departments in Los Angeles County. The BMPs specified for discharges from training activities are impractical and cumbersome. We would like instead to work with our fire department and other fire departments across the county in developing and proposing a set of more practicable BMPs.

Subject: **Comment Letter on LARWQCB's Staff Working Proposal on LA County MS4 Permit- Non-Storm Water Discharge Provisions**

Dear Ms. Purdy and Mr. Ridgeway:

The Water Replenishment District of Southern California (WRD) appreciates this opportunity to submit comments on the Los Angeles Regional Water Quality Control Board (LARWQCB)'s staff working proposal on Los Angeles County Municipal Separate Storm Sewer (MS4) permit- non-storm water discharge provisions, dated March 28, 2012. WRD manages the groundwater supply for nearly four million residents in 43 cities of Southern Los Angeles County. Our groundwater replenishment activities include supplementing local groundwater supplies with recycled water in the Central Basin and West Coast Basin via the Montebello Forebay Spreading Grounds and the injection projects at the West Coast, Dominguez Gap and Alamitos Gap Seawater Barriers.

In order to accomplish our regional groundwater monitoring and to comply with monitoring requirements under the water recycling permits issued by the LARWQCB (namely, Orders No. R4-2005-0061, CI-8956; No. R4-2003-0134, CI-8654; and No. 91-100, File No. 71-67), WRD has sought coverage under the general National Pollutant Discharge Elimination System (NPDES) Permit (CAG994005 Order No. R4-2003-0108) for the discharge of groundwater associated with well purging, a necessary step prior to well sampling.

Based on a phone conversation with Mr. Ridgeway on April 16, 2012, we understand that the Permittee requirements described in provisions 5 through 7 (including but not limited to requiring dischargers of non-storm water discharges to provide advanced notification to the Permittee, obtain local permits, conduct appropriate monitoring, etc.) are intended specifically for the conditionally authorized non-storm water discharges not otherwise covered under a separate NPDES permit (i.e. for those listed under Part III.A.3.b). However, this intent is not clearly conveyed in the staff working proposal (March 28th version). We are concerned that this lack of clarity may subject our currently permitted discharges to additional regulatory burdens placed by local agencies, jeopardize our ability to discharge monitoring-related groundwater, and thus compromise our future compliance with the permits issued by the LARWQCB.

Ms. Renee Purdy & Mr. Ivar Ridgeway
LARWQCB

April 18, 2012

As a solution, we propose the following revisions (insertions underlined, deletions stricken through):

3. ~~“Exemptions from Effective Prohibition. The following categories of non-storm water discharge are conditionally authorized as specified below in all areas regulated by this Order with the exception of direct discharges to Areas of Special Biological Significance (ASBS) within Los Angeles County. Exemptions from the effective prohibition on non-storm water discharges into the MS4 and from the MS4 directly to an ASBS are identified in section A.4 below. The Permittee shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges:~~
 - a. Are covered by a separate individual or general NPDES permit for non-storm water discharges; or Those that are regulated by a separate individual or general NPDES permit for non-storm water discharges, including, but not limited to: (also, remove the list of general NPDES permits)
 - b. ~~Those that~~ Fall within one of the conditionally authorized categories of non-storm water specified below, with the exception of direct discharges to Areas of Special Biological Significance (ASBS) within Los Angeles County, provided they are not a source of pollutants that causes or contributes to an exceedance of applicable Receiving Water Limitations in Part V, and/or Water Quality Based Effluent Limitations in Part VI.D., and meet all required conditions specified in Table X or as otherwise specified or approved by the Regional Water Board Executive Officer:
 - i. Natural springs;
 - ix. Discharges from potable water sources, including water line flushing (supply and distribution system releases), where not otherwise regulated by a separate NPDES permit;....”
6. “If the discharger of the conditionally authorized non-storm water discharge is not a named Permittee in this Order....”
7. “Each Permittee shall evaluate...in Part VI.D.

If the Permittee determines that any one of the categories of conditionally authorized non-storm water discharges identified in sections A.3.b and A.4.a and A.4.c above is a source of pollutants that causes or contributes to an exceedance...the Permittee shall also either:

- a. Prohibit the conditionally authorized non-storm water discharge category from entering the MS4 or receiving waters; or...
- b. Impose conditions in addition to those in Table X, subject to approval by the Regional Board Executive Officer, on the conditionally authorized non-storm water discharge category...”

We thank you in advance for your careful consideration of these comments. Should you have any questions concerning this letter or need assistance in reviewing future draft changes pertaining to these comments, please feel free to contact the undersigned at (562) 275-4245 or cchang@ wrd.org.

Very truly yours,

Subject: **Comment Letter on LARWQCB's Staff Working Proposal on LA County MS4 Permit- Minimum Control Measures Provisions (Dated March 21, 2012)**

Dear Ms. Purdy and Mr. Ridgeway:

Water Replenishment District of Southern California (hereinafter, WRD or District) was established by the State of California in 1959 to manage the Central Basin and West Coast Basin (CBWCB), which serve the water needs for nearly four million residents in 43 cities of southern Los Angeles County. We are involved with projects and activities to manage the infiltration of water into the groundwater basins and protect and improve groundwater quality. Infiltration of water into the basins is very important since infiltration facilitates groundwater recharge and supports pumping from the basins. WRD implements a proactive monitoring program for water recharged by the District to evaluate its impact on the quality and the level of groundwater.

We have reviewed the Los Angeles Regional Water Quality Control Board (LARWQCB)'s staff working proposal on Los Angeles County Municipal Separate Storm Sewer (MS4) permit - Minimum Control Measures provisions, dated March 21, 2012. WRD recognizes and appreciates the environmental benefits of low-impact development and the goals of reducing pollution caused by urban runoff. However, infiltration of urban runoff needs to be implemented carefully so that the water infiltrated into the ground does not negatively impact groundwater quality.

The following comments and concerns address the stormwater infiltration requirements under the New Development/ Redevelopment Project Performance Criteria section (pages 23 to 37). First and foremost, we are pleased to see the inclusion of offsite regional groundwater replenishment as an alternative compliance method under "most preferred stormwater management options" alongside with on-site retention of stormwater. Planned regional recharge facilities offer many advantages in that they have already considered factors important to safe and efficient infiltration of water, such as suitability of location (based on hydrogeology, water supply sources, conveyance systems, locations of contaminant sites, etc.), long-term operation and maintenance, necessary monitoring, institutional oversight and funding.

Ms. Renee Purdy & Mr. Ivar Ridgeway
LARWQCB

April 18, 2012

However, we are concerned about the lack of language or the minimum requirements necessary to ensure that the stormwater infiltration activities required in the staff working proposal do not cause a groundwater quality problem. Minimum requirement should include but are not limited to:

- Required planning review process by Permittees with respect to planned land use and proposed treatment design to verify that installed stormwater treatment systems with no under-drain, and at the same time, function primarily as infiltration device, should not cause or contribute to groundwater degradation at project site;
- Minimum setbacks (e.g. 100 feet) for structural infiltration BMPs from drinking water wells, septic systems, and underground storage tanks with hazardous materials;
- Minimum vertical distance (e.g. 10 feet) from the bottom of the infiltration system (rather than from the ground surface) to the seasonal high groundwater mark;
- Prohibition to protect against illegal dumping;
- Implementation of pollution prevention and source control measures to protect groundwater at the project site;
- Implementation of necessary pretreatment for certain categories of projects (e.g. areas of industrial or light industrial activity; areas subject to high vehicular traffic; automotive repair shops; car washes; fleet storage areas; nurseries; and other land uses that pose a high threat to water quality);
- Implementation of adequate maintenance of the infiltration devices to maximize pollutant removal capabilities; and
- A comprehensive monitoring system to assess impacts on groundwater quality.

Similar groundwater protection requirements appear in the MS4 permits issued by several Regional Boards in California, including Regions 2 (San Francisco Bay), 5 (Central Valley), 8 (Santa Ana), and 9 (San Diego). For reference, the following documents/sections contain relevant language on groundwater protection or limitations on structural stormwater infiltration devices:

- San Francisco Bay Region MS4 Permit (Order No. R2-2009-0074, as amended by Order No. R2-2011-0083, pages 31-32)
- East Contra County MS4 Permit (Order No. R5-2010-0102, pages 36-37)
- Orange County MS4 Permit (Order No. R8-2009-0030 as amended by Order No. R8-2010-0062, section XII.B.5, page 52)
- Riverside County MS4 Permit (Order No. R9-2010-0016, section F.1.c. (6) Infiltration and Groundwater Protection, pages 29 - 30).

We urge you to develop a similar set of groundwater protection requirements to accompany the stormwater infiltration provision.

We are also concerned with a couple of perceived restrictions or disincentives to implementing offsite regional groundwater replenishment option- i.e. requirements to: 1) achieve equal or greater benefit to surface water quality in the same subwatershed as the proposed project; and 2) provide onsite pollutant reduction (through treatment of the SWQDv¹ at the project site), which appears top of page 26. We feel that requiring those who implement offsite regional recharge option to achieve equal or greater benefit to surface water quality is important, but to limit it to the same subwatershed is deemed too limiting, which means either the offsite regional recharge facility should be located in the same subwatershed as the project or onsite treatment is required in addition to the participation in an offsite regional recharge. We advocate for greater flexibility by expanding the application of "equal or greater benefit to surface water

¹ Defined in the March 21, 2012 staff working proposal as "runoff from the 0.75 inch, 24-hour storm event or the 85th percentile storm, whichever is greater"

Ms. Renee Purdy & Mr. Ivar Ridgeway
LARWQCB

April 18, 2012

quality” to be attained in the same watershed, rather than same subwatershed, especially since regional groundwater recharge facilities are not numerous in the Los Angeles/Ventura region. Also, we request that the onsite pollutant reduction be required only in cases where offsite regional recharge (the portion contributed by the project sponsor) does not completely offset the estimated pollutant reduction afforded by onsite retention/treatment of SWQDv, and only for the incremental difference in the pollutant loads from the two systems (i.e. offsite regional vs. onsite).

Furthermore, we believe that the proposed permit should require large stormwater infiltration projects be coordinated with and the prioritized list of offsite mitigation, groundwater replenishment and/or retrofit projects (to be developed by Ms4 Permittees, per section c.iii.3(d) on page 29 of the staff working proposal) be reviewed by the local groundwater management agencies, such as WRD.

We thank you in advance for your careful consideration of these comments. Should you have any questions concerning this letter or need assistance in reviewing future draft changes concerning these comments, please feel free to contact the undersigned at (562) 275-4245 or cchang@wrd.org.

Very truly yours,

Dr. Cathy Chang, P.E, D.Env
Water Quality Program Manager

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

KEY TO MARKUP/COMMENTS

- B. [Language in blue font is from the current Ventura County MS4 Permit](#)
- C. [Revisions in reddish brown/strikeouts are comments provided by MWD & LADWP \(4/18/12\)](#)

STAFF WORKING PROPOSAL

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

FINDINGS

F. Implementation

This Order ~~references industry standard incorporates BMPs guidance to documents to~~ ensure that ~~Conditionally Exempt Essential authorized~~ Non-Storm Water Discharges are not a source of pollutants to the MS4, ~~Table 1 (Required' Conditions for Non-Storm Water Discharges)~~. The BMPs ~~referenced in the guidance documents included~~ are for the purpose of dechlorination and/or for prevention of erosion and sediment loss, or to reduce other harmful pollutants during the discharge of ~~conditionally exempt essential authorized~~ non-storm water discharges to the MS4, The ~~referenced BMPs guidance documents for potable water discharges include listed in part 1.A of the Order were selected from~~ the American Water Works Association A WWA Guidelines For The Development Of Your Best Management Practices (BMP) Manual For Drinking Water System Releases Developed by the CA -NV A WW A Environmental Compliance Committee (2005) which serves as an industry standard for California, from the results of studies directed by the Los Angeles Water Board, - *Evaluation of Non-Storm Water Discharges to California Storm Drains and Potential Policies for Effective Prohibition Methods, Final Report*, University of California, Los Angeles, Contract No. 5-104-140-0 (1997), and *Water Quality Concerns and Regulatory Controls for Non Storm Water Discharges to Storm Drains*, Duke L.D. and M. Kihara, Journal of the American Water Resources Association, Vol. 34: 661-676, (1998), and from the Water Boards' experience of controlling authorized non-storm discharges to the MS4 since 1990. ~~The referenced BMP guidance documents for flows from fire fighting activities include (insert reference to State Fire Fighting BMP Guidance Manual)~~. The BMPs ~~guidance documents identified in the Table are include~~ technically feasible, practicable, and cost-effective ~~BMPs~~. ~~Where an identified BMP maybe impracticable, this Order includes a provision to select and implement an alternative BMP; through the BMP substitution provisions in subpart 4.A.2.~~ The implementation of measures set forth in this Order are reasonably expected to reduce the discharge of minimal pollutants to the maximum extent practicable from conditionally exempt essential non-storm water discharges. ~~At this time it is impractical and economically infeasible for Conditionally Exempt Essential Non-Storm Water Discharges including fire fighting and potable water discharges from conveyance and distribution systems to provide treatment methods beyond appropriate industry standard BMPs and control measures.~~

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Part III. DISCHARGE PROHIBITIONS

A. Non-Storm Water Discharges

1. General Definitions

- a. **Non-Storm Water Discharge:** Any discharge into the MS4 or from the MS4 into a receiving water that is not composed entirely of storm water.
- b. **Storm Water:** Storm water runoff, snow melt runoff, and surface runoff and drainage related to precipitation events (pursuant to 40 CFR § 122.26(b)(13); 55 *Fed. Reg.* 47990, 47995 (16 November 1990)).
- c. **Illicit Discharge:** Any discharge into the MS4 or from the MS4 into a receiving water that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes any non-storm water discharge, except ~~authorized~~ non-storm water discharges regulated by an ~~individual or general~~ separate NPDES permit; ~~conditionally authorized~~ non-storm water discharges specifically identified in Part III.A.3 of this Order; and ~~essential~~ non-storm water discharges ~~specifically identified in Part III.A.4~~ ~~resulting from emergency fire fighting activities~~ (pursuant to 40 CFR § 122.26(b)(2)).
- d. **Authorized Non-Storm Water Discharge:** Authorized non-storm water discharges include all discharges that are regulated by an individual or general NPDES permit and are allowed by the LARWQCB to discharge to the MS4 when in compliance with all NPDES permit conditions.
- e. **Conditionally Authorized Non-Storm Water Discharge:** Conditionally a Authorized non-storm water discharges are certain categories of discharges ~~that are either not sources of pollutants or may contain only minimal amounts of pollutants and when in compliance with specified BMPs that are not composed entirely of storm water but contain only minimal amounts of pollutants and therefore~~ do not result in significant environmental effects. (See 55 *Fed. Reg.* 47990, 47995 (16 November 1990)).
- f. **Conditionally Exempt Essential Non-Storm Water Discharge:** Conditionally exempt essential non-storm water discharges include the following categories of discharges that are allowed by the Regional Water Board to discharge to the MS4, if in compliance with all specified requirements, are not otherwise regulated by an individual or general NPDES permit, and are essential public services and/or are directly or indirectly required by other State or Federal statute and/or regulation. Conditionally exempt essential non-storm water discharges may contain

Comment [u1]: New Category of discharges for all NPDES Permitted sources discharging to the MS4.

Comment [u2]: Separate category for discharges related to incidental urban activities.

Comment [u3]: New Category of exempt discharges for essential public services discharges (fire fighting and drinking water providers)

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

only minimal amounts of pollutants, however, when in compliance with industry standard BMPs and control measures do not result in significant environmental effects. (See 55 Fed. Reg. 47990, 47995 (16 November 1990)).

- Discharges from Fire Fighting Activities¹ provided appropriate BMPs are implementation based on the (insert reference to State Fire Fighting BMP Guidance Manual); and
- Discharges from Potable Water Sources², where not otherwise regulated by an individual or general NPDES permit, provided appropriate BMPs are implemented based on the AWWA Guidelines for the Development of Your Best Management Practices Manual for Drinking Water System Releases

a. **Receiving Water:** A “water of the United States” into which waste and/or pollutants are or may be discharged.

2. Effective Prohibition of Non-Storm Water Discharges. Each Permittee shall, within its respective jurisdiction, effectively prohibit non-storm water discharges into the MS4 and from the MS4 to receiving waters except where such discharges are either specifically: 1) authorized non-storm water discharges that are regulated by an individual or general NPDES permit as identified in section A.3.a; authorized by a separate individual or general National Pollutant Discharge Elimination System (NPDES) permit or 2) conditionally authorized non-storm water discharges in accordance with sections A.3.b through A.6 below; or 3) conditionally exempt essential non-storm water discharges in accordance with section A.3.c.

3. Exemptions from Effective Prohibition of Non-Storm Water Discharges. The following categories of non-storm water discharges are conditionally authorized-allowed by the Regional Water Board as specified below provided they meet all required conditions specified below, or as otherwise approved by the Regional Water Board Executive Officer. in all areas regulated by this Order with the exception of direct discharges to Areas of Special Biological

¹ This includes emergency fire fighting and fire fighting training activities, which simulate emergency responses.

² The required larger volume periodic releases from the wholesale and/or larger water purveyors are included until such time as a General Permit or other compliance measures are established that specifically addresses these types of releases.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

~~Significance (ASBS) within Los Angeles County. Exemptions from the effective prohibition on non-storm water discharges into the MS4 and from the MS4 directly to an ASBS are identified in section A.4 below. Additionally, these dischargers must explore and consider alternative methods of disposal, such as water conservation, reuse of water and groundwater recharge, and determine prior to discharge that no feasible or economical alternative method of disposal exists. Pursuant to Section 2 of Article X of the California Constitution, water resources of the State shall be put to beneficial use to the fullest extent of which they are capable.~~

~~2.~~

- a. **Authorized Non-Storm Water Discharges:** Those that are regulated by an ~~an~~ **separate** individual or general NPDES permit for non-storm water discharges, including, but not limited to:
- i. Discharges of non-process waste water regulated by NPDES Permit No. CAG994003, including, but not limited to:
 - (a) Air conditioning condensate;
 - (b) Swimming pool filter backwash water;
 - (c) Swimming pool drainage, where the discharge is not authorized below or is otherwise prohibited by a Permittee; and
 - (d) Groundwater seepage.
 - ii. Discharges of low threat hydrostatic test water³ regulated by NPDES Permit No. CAG674001;
 - iii. Discharges of ground water from construction and project dewatering⁴ regulated by NPDES Permit No. CAG994004;

³ Low threat hydrostatic test water means discharges resulting from the hydrostatic testing or structural integrity testing of pipes, tanks, or any storage vessels using domestic water or from the repair and maintenance of pipes, tanks, or reservoirs.

⁴ Discharges of ground water from construction and project dewatering include treated or untreated waste water from permanent or temporary construction dewatering operations; ground water pumped as an aid in the containment and/or cleanup of a contaminant plume; ground water extracted during short-term and long-term pumping/aquifer tests; ground water generated from well drilling, construction or development and purging of wells; equipment decontamination water; subterranean seepage dewatering; incidental collected storm water from basements; and other process and non-process waste water discharges that meet the eligibility criteria and could not be covered under another specific general NPDES permit.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

- iv. Discharges of ground water from potable water supply wells⁵ regulated by NPDES Permit No. CAG994005;
 - v. Discharges of treated ground water from investigation and/or cleanup of volatile organic compound (VOC) contaminated sites regulated by NPDES Permit No. CAG914001;
 - vi. Discharges of treated ground water and other waste waters from investigation and/or cleanup of petroleum fuel contaminated sites regulated by NPDES Permit No. CAG834001;
 - vii. Short-term, intermittent discharges from utility vaults and underground structures regulated by NPDES Permit No. CAG990002; ~~or~~
- b. **Conditionally Authorized Non-Storm Water Discharges:** Those that fall within one of the categories below, ~~provided they are not a source of pollutants that causes or contributes to an exceedance of applicable Receiving Water Limitations in Part V. and/or Water Quality Based Effluent Limitations in Part VI.D.,~~ and meet all required conditions specified in Table X, or as otherwise specified or approved by the Regional Water Board Executive Officer:
- i. Natural springs;
 - ii. Flows from riparian habitats and wetlands;
 - iii. Diverted stream flows, authorized by the State or Regional Water Board;
 - iv. Dewatering of lakes;
 - v. Rising ground waters, where ground water seepage is not otherwise regulated by a separate NPDES permit⁶;
 - vi. Uncontaminated ground water infiltration⁷;

⁵ Discharges covered by this permit include ground water from potable water supply wells generated during the following activities: ground water generated during well purging for data collection purposes; ground water extracted from major well rehabilitation and redevelopment activities; and ground water generated from well drilling, construction, and development.

⁶ A NPDES permit for discharges associated with ground water dewatering is required within the Los Angeles Region.

⁷ Uncontaminated ground water infiltration is water other than waste water that enters the MS4 (including foundation drains) from the ground through such means as defective pipes, pipe joints, connections, or manholes. Infiltration does not include, and is distinguished from, inflow. (See 40 CFR § 35.2005(20).)

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

- vii. Uncontaminated pumped ground water, where not otherwise regulated by a separate NPDES permit⁸;
- viii. Landscape irrigation;
- ~~ix. Discharges from potable water sources, including water line flushing (supply and distribution system releases), where not otherwise regulated by a separate NPDES permit⁹;~~
- ~~x-ix.~~ Gravity flow from foundation drains, footing drains, and crawl space pumps, where ground water seepage is not otherwise regulated by a separate NPDES permit;
- ~~xi-x.~~ Air conditioning condensate, where not otherwise regulated by a separate NPDES permit;
- ~~xii-xi.~~ Dechlorinated/debrominated swimming pool/spa discharges,¹⁰ where not otherwise regulated by a separate NPDES permit;
- ~~xiii-xii.~~ Dewatering of decorative fountains;
- ~~xiv-xiii.~~ Non-commercial car washing by residents or by non-profit organizations;
- ~~xv-xiv.~~ Street/sidewalk wash water¹¹; ~~and~~

⁸ Ibid.

~~⁹ Potable water distribution system releases means sources of flows from drinking water storage, supply and distribution systems (including flows from system failures), pressure releases, system maintenance, distribution line testing, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and minor non-invasive well maintenance activities not involving chemical addition(s) where not otherwise regulated by NPDES Permit No. CAG674001 or NPDES Permit No. CAG994005. Releases from potable water supplies or distribution systems not otherwise regulated by an existing NPDES permit shall be allowed with the implementation of appropriate and effective BMPs (as specified in Table X and consistent with American Water Works Association guidelines, and/or as required by the Regional Water Board Executive Officer) until such time as a general NPDES permit is adopted that addresses those types of releases.~~

¹⁰ Authorized dechlorinated/debrominated swimming pool/spa discharges do not include swimming pool/spa filter backwash or swimming pool/spa water containing bacteria, detergents, wastes, algaecides, or cyanuric acid in excess of 50 parts per million, or any other chemicals including salts from pools commonly referred to as "salt water pools" in excess of applicable water quality objectives.

¹¹ Authorized non-storm water discharges of street/sidewalk wash water only include those discharges resulting from use of high pressure, low volume spray washing using only potable water with no cleaning agents at an average usage of 0.006 gallons per square feet of sidewalk area in accordance with Regional Water Board Resolution No. 98-08. Authorized non-storm water discharges of street/sidewalk wash water do not include hosing of any sidewalk or street with a garden hose with a pressure nozzle.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

~~xvi.xv. Flows from emergency fire fighting activities (i.e., flows necessary for the protection of life or property).¹²~~

c. Conditionally Exempt Essential Non-Storm Water Discharges: Those that fall within one of the categories below, meet all required BMPs as specified, are essential public services discharge activities, and/or are otherwise required by other state or federal statute and/or regulation, including:

i. Discharges from Fire Fighting Activities provided appropriate BMPs are implemented based on the (insert reference to State Fire Fighting BMP Guidance Manual) and;

i.ii. Discharges from Potable Water Sources, where not otherwise regulated by an individual or general NPDES permit, provided appropriate BMPs are implemented based on the AWWA Guidelines for the Development of Your Best Management Practices Manual for Drinking Water System Releases.

4. Exemptions from Effective Prohibition within an ASBS. The following non-storm water discharges to the MS4 and from the MS4 directly to an ASBS are conditionally authorized pursuant to the California Ocean Plan as specified below, provided that:

a. The discharges are for essential public service, or for emergency response purposes, structural stability, slope stability or occur naturally, including the following discharges:

~~a. Discharges associated with emergency fire fighting activities (i.e., flows necessary for the protection of life or property)¹³;~~

~~b.a. Foundation and footing drains;~~

~~e.b. Water from crawl space or basement pumps;~~

~~d.c. Hillside dewatering;~~

~~e.d. Naturally occurring groundwater seepage via a storm drain; and~~

¹² ~~Discharges from vehicle washing, building fire suppression system maintenance (e.g., sprinkler line flushing), and other routine maintenance activities are not authorized to be discharged to the MS4.~~

¹³ ~~-Ibid.~~

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

~~f.e.~~ Non-anthropogenic flows from a naturally occurring stream via a culvert or storm drain, as long as there are no contributions of anthropogenic runoff.

- b. The discharges fall within one of the specified categories in sub-part A.3-a ~~and are specifically authorized by the Los Angeles Water Board.~~
- c. Authorized non-storm water discharges shall not cause or contribute to an exceedance violation of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations in this Order of the water quality objectives in Chapter II of the Ocean Plan or alter natural ocean water quality in an ASBS.

- 5. Permittee Requirements.** Each Permittee shall: ~~develop and implement procedures to ensure all conditionally authorized non-storm water discharges into the MS4 and from the MS4 into receiving waters identified in sections A.3 and A.4 above comply with the applicable conditions specified in Table X. These procedures shall include, at a minimum, the following:~~

~~Procedures for ensuring that all necessary permits and water quality certifications are obtained by a discharger prior to discharge to the MS4 as specified in Table X.~~

~~Procedures for ensuring a discharger has explored and considered alternatives to discharge to the MS4, including for example, water conservation, reuse of water and ground water recharge, and has determined no feasible or economical alternative to discharge to the MS4 exists.~~

- a. Promote measures that minimize runoff and pollutant loading from excess irrigation by promoting and/or working with potable water purveyors to promote conservation programs ~~Procedures to minimize the discharge of landscape irrigation water into the MS4. For landscape irrigation water to be discharged, each Permittee shall, within its respective jurisdiction:~~
 - i. Enact a municipal ordinance that specifies landscape irrigation standards to minimize irrigation runoff and eliminate irrigation overspray. The Permittee shall have legal authority to enforce the ordinance and levy fines. ~~In addition, the Permittee may coordinate with the local water purveyor(s), where applicable, to ~~promote/enforce~~ landscape water use efficiency requirements for existing landscaping, use of drought tolerant, native vegetation, and the use of less toxic options for pest control and landscape management.~~

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

ii.

~~Coordinate with the water purveyor(s) within its jurisdiction to~~
Ddevelop and implement a work plan that results in a coordinated outreach and education program to minimize the discharge of irrigation water and pollutants associated with irrigation water consistent with Part VI.C. of this Order (Public Information and Participation Program).

b.

If the discharger¹⁴ of the conditionally exempt essential non-storm water discharge is not a named Permittee in this Order, the Regional Water Board Permittee shall require the discharger to provide advanced notification to the Permittee of the discharge, ~~obtain local permits, conduct appropriate monitoring, and/or implement additional BMPs and/or control measures as a condition of the approval to discharge into the Permittee's MS4, according to its local authorities.~~

c. ~~The Regional Water Board~~ Each Permittee shall evaluate the monitoring data collected pursuant to Attachment X (Monitoring and Reporting Program - Non-Storm Water Outfall Based Monitoring), and any other relevant information, and determine whether any of the conditionally authorized categories of non-storm water discharges identified in sections A.3.b and A.4 above ~~is are~~ a source of pollutants that maybe causing an exceedance of an applicable water quality objective for the receiving water.

~~6. causes or contributes to an exceedance of applicable Receiving Water Limitations in Part V. and/or Water Quality Based Effluent Limitations in Part VI.D.~~

d. If the Regional Water Board Permittee determines that any one of the categories of conditionally authorized non-storm water discharges identified in sections A.3.b and A.4 above are a source of pollutants that maybe causing an exceedance of an applicable water quality objective for the receiving water ~~is a source of pollutants that causes or contributes to an exceedance of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations, the Permittee shall report its findings to~~

¹⁴ Dischargers not named a Permittee in this Order may include, but are not limited to, potable water supply and distribution agencies, wastewater treatment agencies/sanitation districts, and other Federal, State, and local governmental entities.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

~~the Regional Water Board in its annual report. Based on this determination, the Regional Water Board Permittee may~~ shall also either:

- ~~d. Prohibit the non-storm water discharge category from entering the MS4 or receiving waters; or~~
- ~~i. Impose conditions in addition to those in Table X, subject to approval by the Regional Water Board Executive Officer, on the conditionally authorized non-storm water discharge category such that the discharge category will not be a source of pollutants that causes or contributes to an exceedance of applicable for the receiving water Receiving Water Limitations and/or Water Quality Based Effluent Limitations; or~~
- ~~ii. Require the conditionally authorized non-storm water discharger to obtain coverage under a separate individual or general State or Regional Water Board NPDES permit prior to discharge to the MS4.~~

~~7. If a Permittee demonstrates that a specific non-storm water discharge from a potable water supply or distribution system not otherwise regulated by a separate NPDES permit, but required by state or federal statute and/or regulation, caused [further definition to be provided] a short-term exceedance of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations during a specific sampling event, the Permittee shall not be found in violation of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations for that specific sampling event. Such demonstration must be based on monitoring data from the specific non-storm water discharge, other relevant information regarding the specific non-storm water discharge as identified in Table X, and documentation of the state or federal statute and/or regulation requiring such non-storm water discharge, including the conditions under which the specific discharge was required.~~

~~d. Upon a demonstration that such a discharge has caused a short-term exceedance of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations during a specific sampling event, the Permittee shall immediately take actions to:~~

- ~~a. Evaluate the potential long-term effects of such continued discharges on the receiving water;~~
- ~~b. Identify alternative discharge pathways to less sensitive receiving waters in coordination with the discharger;~~
- ~~c. Impose conditions in addition to those identified in Table X, subject to approval by the Regional Water Board Executive Officer, on the~~

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

~~discharge such that it will not be a source of pollutants that causes or contributes to an exceedance of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations; and/or~~

~~d. Require the discharger to obtain coverage under a separate State or Regional Water Board permit prior to discharge to the MS4.~~

~~e. The Permittee shall provide the results of its evaluation and follow up actions to the Regional Water Board in its annual report.~~

~~8. If a Permittee demonstrates that a specific non-storm water discharge from emergency fire fighting activities caused [further definition to be provided] a short-term exceedance of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations during a specific sampling event, the Permittee shall not be found in violation of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations for that specific sampling event. Such demonstration must be based on relevant information regarding the location, date, time and duration of the emergency fire fighting activity, the discharge pathway and receiving water(s) of the fire fighting flows, and an estimate of the volume of the non-storm water discharge.~~

~~9-6. Notwithstanding the above, the Regional Water Board Executive Officer, based on a comprehensive analysis ~~his or her own and~~ evaluation of monitoring data and other relevant information for specific categories of discharges, may modify a category or remove categories of conditionally authorized non-storm water discharges from sections A.3 b and A.4 above in consideration of antidegradation policies and/or TMDLs, or if the Executive Officer determines that a discharge category is a source of pollutants that causes or contributes to an exceedance of applicable Receiving Water Limitations and/or Water Quality Based Effluent Limitations. The Executive Officer may also require that a discharger obtain coverage under a separate individual or general State or Regional Water Board permit for non-storm water discharges to the MS4 or from the MS4 to receiving waters.~~

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Table X. Required Conditions for **Authorized and Conditionally Authorized** Non-Storm Water Discharges

Discharge Category	General Conditions Under Which Discharge to the MS4 is Allowed	Applicable NPDES Permit for Which Coverage is Required Prior to Discharge to the MS4 and/or Receiving Waters ¹⁵	Conditions/BMPs that are Required to be Implemented Prior to Discharge to the MS4 and Receiving Waters
All Discharge Categories	See discharge specific conditions below.	--	<p><u>Explore and Evaluate</u> alternative means of disposal (e.g., sanitary sewer, land disposal) or opportunities for <u>water conservation</u>, capture, reclamation, <u>groundwater recharge</u>, and reuse <u>to determine if any feasible or economical alternative methods of disposal exist</u>. Pursuant to Section 2 of Article X of the California Constitution, <u>water resources of the State shall be put to beneficial use to the fullest extent of which they are capable</u>.</p> <p>Segregate authorized non-storm water discharges from potential sources of pollutants to prevent introduction of pollutants to the MS4 and receiving water.</p> <p><u>Whenever there is a discharge of 500,000 gallons or more into the MS4, the discharger shall contact the appropriate Permittee(s) with jurisdiction over the MS4, including but not limited to the Los Angeles County Flood Control District, within 24 hours of the discharge.</u></p>
Natural Springs	N/A	N/A	Segregate authorized non-stormwater discharges from potential sources of pollutants to prevent introduction of pollutants to the MS4 and receiving water.

¹⁵ The general orders/NPDES permits identified are those currently available to dischargers under which authorization to discharge could be provided. Alternatively, a discharger could seek authorization for the non-storm water discharge under an individual NPDES permit.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Discharge Category	General Conditions Under Which Discharge to the MS4 is Allowed	Applicable NPDES Permit for Which Coverage is Required Prior to Discharge to the MS4 and/or Receiving Waters ¹⁵	Conditions/BMPs that are Required to be Implemented Prior to Discharge to the MS4 and Receiving Waters
Flows from riparian habitats and wetlands	Discharge allowed only if all necessary permits/water quality certifications for water diversions are obtained prior to discharge.	N/A	All necessary permits and water quality certifications must be obtained prior to diverting flows to the MS4. Discharges shall comply with all conditions specified in permits and water quality certifications.
Diverted stream flows	Discharge allowed only if authorized by the State or Regional Water Board.	N/A	Discharges shall comply with all conditions specified by the State or Regional Water Board.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Discharge Category	General Conditions Under Which Discharge to the MS4 is Allowed	Applicable NPDES Permit for Which Coverage is Required Prior to Discharge to the MS4 and/or Receiving Waters ¹⁵	Conditions/BMPs that are Required to be Implemented Prior to Discharge to the MS4 and Receiving Waters
<p>Dewatering of lakes (<u>this does not include discharges from potable or raw water reservoirs and tanks</u>)</p>	<p>Discharge allowed only if all necessary permit/water quality certifications for dredge and fill activities, including water diversions, are obtained prior to discharge.</p>	<p>N/A</p>	<p>All necessary permits and water quality certifications must be obtained prior to dewatering.</p> <p>ProvideEnsure procedures for advanced notification by the lake owner / operator to the Permittee(s) within 72 hours of planned discharge.</p> <p>Immediately prior to discharge, visible trash on the shoreline or on the surface of the lake shall be removed and disposed of in a legal manner.</p> <p>Immediately prior to discharge, the MS4 inlet to which the discharge is directed, and the MS4 outlet from which the water will be discharged to the receiving water, shall be inspected and cleaned out.</p> <p>Discharges shall be volumetrically and velocity controlled to prevent resuspension of sediments.</p> <p>Measures shall be taken to stabilize lake bottom sediments.</p> <p>Ensure procedures for water qualityAs applicable, monitoring for of pollutants of concern¹⁶ that may be mobilized by in the lake dewatering through the MS4 to a receiving water.</p> <p>Ensure rRecord-keeping of lake dewatering <u>shall be maintained</u> by the lake owner / operator.¹⁷</p>

¹⁶ Pollutants of concern include, at a minimum, trash and debris, including organic matter, TSS, and any pollutant for which there is a Water Quality Based Effluent Limitation in Part VI. for the lake and/or receiving water.

¹⁷ Permittees shall require that the following information is maintained by the lake owner / operator: name of discharger, date of notification, method of notification, location of discharge, discharge pathway, receiving water, date of discharge, time of the beginning and end of the

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Discharge Category	General Conditions Under Which Discharge to the MS4 is Allowed	Applicable NPDES Permit for Which Coverage is Required Prior to Discharge to the MS4 and/or Receiving Waters ¹⁵	Conditions/BMPs that are Required to be Implemented Prior to Discharge to the MS4 and Receiving Waters
Rising ground waters	Discharge from ground water seepage allowed only if authorized under a separate NPDES permit.	NPDES Permit No. CAG994003 – Discharges of Nonprocess Wastewater to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties	Discharges shall comply with all NPDES permit conditions for the discharge.
Uncontaminated ground water infiltration	N/A	N/A	None
Uncontaminated pumped ground water	Discharge is allowed only if authorized under a separate NPDES permit.	NPDES Permit No. CAG994003 – Discharges of Nonprocess Wastewater to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties NPDES Permit No. CAG994004 – Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties NPDES Permit No. CAG990002 – Discharges from Utility Vaults and Underground Structures to Surface Waters	Discharges shall comply with all NPDES permit conditions for the discharge. Pursuant to NPDES Permit No. CAG990002, whenever there is a discharge of 50,000 gallons or more from utility vaults and underground structures to the MS4, the discharger (i.e., utility company) shall contact the appropriate Permittee(s) with jurisdiction over the MS4, including but not limited to the Los Angeles County Flood Control District, within 24 hours of the discharge.

Comment [u4]: Deleted because this is a permit condition of the Vault Dewatering General NPDES Permit (CAG990002) so it does not need to be repeated here, which is consistent with the rest of Table X.

discharge, duration of the discharge, flow rate or velocity, total number of gallons discharged, type(s) of sediment controls used, pH of discharge, type(s) of volumetric and velocity controls used, and field monitoring data. Records shall be made available upon request by the Permittee or Regional Water Board.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Discharge Category	General Conditions Under Which Discharge to the MS4 is Allowed	Applicable NPDES Permit for Which Coverage is Required Prior to Discharge to the MS4 and/or Receiving Waters ¹⁵	Conditions/BMPs that are Required to be Implemented Prior to Discharge to the MS4 and Receiving Waters
Landscape irrigation using potable water	Discharge allowed if potable landscape irrigation due to runoff is minimized through the implementation of an ordinance specifying water efficient landscaping standards, as well as an outreach and education program focusing on water conservation and landscape water use efficiency.	N/A	<p>Implement BMPs, including Integrated Pest Management (IPM), to minimize runoff and prevent introduction of pollutants to the MS4 and receiving water.</p> <p>Implement water conservation programs to methods to minimize discharge by using less water.</p> <p>Utilize water delivery rates that do not exceed the infiltration rate of the soil.</p> <p>Promote erosion repair (i.e., cover or repair areas of exposed soils in yards/landscaping).</p>
Landscape irrigation using reclaimed or recycled water	Discharge of reclaimed or recycled water runoff from landscape irrigation is allowed if the discharge is in compliance with the producer and distributor operations and management (O&M) plan, and all relevant portions thereof, including the Irrigation Management Plan.	N/A	Discharges must comply with applicable O&M Plans, and all relevant portions thereof, including the Irrigation Management Plan.

LA County MS4 Permit – Non-Storm Water Discharge Prohibitions

Discharge Category	General Conditions Under Which Discharge to the MS4 is Allowed	Applicable NPDES Permit for Which Coverage is Required Prior to Discharge to the MS4 and/or Receiving Waters ¹⁵	Conditions/BMPs that are Required to be Implemented Prior to Discharge to the MS4 and Receiving Waters
Potable drinking water supply and distribution system releases	<p>Discharge of ground water from potable water supply wells is allowed only if authorized under a separate NPDES permit (see below).</p> <p>Discharge of other potable drinking water supply and distribution releases allowed after implementation of specified BMPs.</p>	N/A	<p>Implement BMPs to prevent introduction of pollutants to potable water supply or distribution system release prior to discharge to the MS4 and receiving water. BMPs shall be consistent with CA-NV American Water Works Association BMP Manual for Drinking Water System Releases and other applicable guidelines.¹⁸</p> <p>Ensure procedures for advanced notification by the water supplier to the Permittee(s) within 72 hours of planned discharge and as soon as possible after an unplanned discharge.</p> <p>Ensure procedures for monitoring of pollutants of concern¹⁹ that may be mobilized by the potable water supply release through the MS4 to a receiving water.</p> <p>Ensure record keeping by water supplier(s) for all discharges greater than [volume to be determined].²⁰</p>

Comment [u5]: All these BMPs and more are included in the AWWA Guidance Manual for Potable Water Discharges so it is more appropriate to reference the AWWA Manual in its entirety.

¹⁸ See, for example, Awwa Research Foundation and US EPA. Environmental Impacts of Non-Treatment Discharges from Drinking Water Utilities. Prepared by Narasimham Consulting, Inc. (2007); Golden State Water Company Water Pollution Control Program – Potable Water Distribution System Releases for Unincorporated Areas of Los Angeles County (last updated June 2007) and City of Los Angeles Department of Water and Power Pollution Prevention Plan for Water System Discharges (last updated April 2008).

¹⁹ Pollutants of concern include, at a minimum, trash and debris, including organic matter, TSS, and any pollutant for which there is a Water Quality Based Effluent Limitation in Part VI. for the receiving water.

²⁰ Permittees shall require that the following information is maintained by the water supplier(s) for all discharges (planned and unplanned) greater than [volume to be determined]: name of discharger, date of notification (for planned discharges), method of notification, alternatives to discharge considered and justification for finding of infeasibility of capture and reuse or ground water infiltration, location of discharge, discharge pathway, receiving water, date of discharge, time of the beginning and end of the discharge, duration of the discharge, flow rate or velocity, total number of gallons discharged, total number of gallons captured for reuse or infiltrated to ground water, type of dechlorination equipment used, type of

STAFF WORKING PROPOSAL

**LOS ANGELES PERMIT GROUP COMMENTS
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
1	1	III.A.1.a and III.A.2	<p>RB staff proposed language requires the permittees to “effectively prohibit non-stormwater discharges into the MS4 and from the MS4 to receiving waters” except where authorized by a separate NPDES permit or conditionally authorized in sections III.A.3-6.</p> <p>This may overstep the required legal authority provisions in the federal regulations since 40CFR122.26 (d)(1)(ii) requires legal authority to control discharges to the MS4 but not from the MS4. Additionally, with respect to the definition of an illicit discharge at 40CFR122.26(b)(2), an illicit discharge is defined as “a discharge to the MS4 that is not composed entirely of stormwater”. In issuing its final rulemaking for stormwater discharges on Friday, November 16, 1990¹, USEPA states that:</p> <p style="padding-left: 40px;"><i>Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT) and the Best Conventional Pollutant Control Technology (BCT) and where necessary, water quality-based controls), but permits for discharges from municipal separate storm sewer systems must require controls to the maximum extent practicable, and where necessary water quality-based controls, and must include a requirement to effectively prohibit non-stormwater discharges into the storm sewers.</i></p> <p>This is further illuminated by the section on Effective Prohibition on Non- Stormwater Discharges²:</p> <p style="padding-left: 40px;"><i>“Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water</i></p>

¹ 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

² 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

LOS ANGELES PERMIT GROUP COMMENTS
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT

No.	Page	Citation	Comment
			<p><i>discharges into the storm sewers. Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather, an 'effective prohibition' would require separate NPDES permits for non-storm water discharges to municipal storm sewers"</i></p> <p>The rulemaking goes on to say that the permit application:</p> <p><i>"requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems."</i></p> <p>Nowhere in the rulemaking is the subject of prohibiting discharges <i>from</i> the MS4 discussed.</p> <p>Furthermore, USEPA provides model ordinance language on the subject of discharge prohibitions: http://www.epa.gov/owow/NPS/ordinance/mol5.htm. Section VII Discharge Prohibitions of this model ordinance provides discharge prohibition language as follows:</p> <p><i>No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.</i></p> <p>Thus we recommend that staff eliminate the "from" language at both Part III.A.1.a. and Part III.A.2.</p>
2	3	III.A.3.b	<p>This provisions outlined in this section are not clear. The provisions may be interpreted as the discharge being "exempt" as long as Table "X" does not contain an issue that is highlighted. Requiring the Permittees to look to Part V or Part VI.D or contact the Executive Officer to verify that there is no new information that will change the original permit determination is confusing.</p>

LOS ANGELES PERMIT GROUP COMMENTS
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT

No.	Page	Citation	Comment
			We'd suggest that Table "X" be revised to include specific sections in Part V or VI.D that may modify the exempt determination. We'd respectfully request that, based on the Executive Officer's determination of a problem, a reopener clause is added so the Permit may be amended to account for changes exempt/conditionally exempt status.
3	3	III.A.3.b.i and III.A.3.b.ii	MS4 Permittees do not have the legal authority to divert and/or treat water from natural springs or riparian wetlands (including those which are spring fed) before they enter the MS4. We believe such flows should be unconditionally exempt from the discharge prohibitions.
4	3	III.A.3.b.iii	MS4 Permittees do not have the legal authority to override State or Regional Board authorized discharges from stream diversions. Once the State or Regional Board authorizes a discharge, the State or Regional Board becomes responsible for any pollutants in that discharge. For MS4 Permittees, this discharge should be unconditionally exempt.
5	4	III.A.3.b.x	The combination of gravity flow and a pumped flow is not appropriate. Gravity flow is not dewatering while pumped flow is dewatering. Please separate the two types of discharge. The installation of drain piping around a below grade foundation wall is intended to provide safety so that water pressure does not build up against a below grade wall. If the built-up water, which is generally not ground water but rather infiltrating rain water, then it can be drained by gravity which is not dewatering and therefore should not require an NPDES permit.
6	4	III.A.3.b.xv	The conditional exemption of street/sidewalk water is inconsistent with the requirement in the industrial/commercial MCM section that street washing must be diverted to the sanitary sewer. Sidewalk water should be conditionally exempt, but so also should patios and pool deck washing. If street washing has to be diverted to the sanitary sewer for industrial/commercial facilities, then it should for all facilities and so should parking lot wash water as they are similar in their pollutant loads.
7	4	III.A.3.b.xvi	Emergency fire fighting flows should be unconditionally exempt since they are necessary to protect life and property, regardless of whether or not they cause or contribute to an exceedance of RWL and/or WQBEL. To be consistent with the Ventura county permit, and because of the close link between emergency and non-emergency fire-fighting flows, we request all fire-fighting flows be unconditionally exempt or at minimum consider revising some of the proposed conditions of Table X to be more practicable and flexible.
8	4	III.A.3.b.xvi	Footnote No.10 which expressly prohibits building fire suppression system maintenance (e.g. fire line flushing) discharges to the MS4. With no viable alternative than discharging to the MS4, this prohibition directly conflict with California Health and Safety Code and the State Fire Marshall on the necessity to flush the system. Please delete this explicit prohibition.
9	6	III.A.5.c.i	The requirement to "eliminate irrigation overspray" is impossible to attain. An ordinance that

LOS ANGELES PERMIT GROUP COMMENTS
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT

No.	Page	Citation	Comment
			requires Permittees to levy monetary fines against residents is overreach. Please delete this requirement.
10	6	III.A.6	The provision to require dischargers to notify the Permittee of the discharge, obtain local permits and implement BMPs may not be feasible for many dischargers such as car washing and sidewalk washing. Alternatively municipalities can be required to implement ordinances that require anyone within their jurisdiction to comply with a series of conditions when performing those tasks.
11	6	III.A.7	The requirement to determine whether any of the conditionally exempted non-stormwater discharges is a source of pollutants is a requirement to monitor every non-stormwater discharge. This requirement is overly burdensome on Permittee staff, very costly, and a responsibility that will come into question. Please delete this requirement.
12	7	III.A.8	The requirement of the Permittee to demonstrate that a specific non-stormwater discharge from a potable water supply caused an exceedance is a requirement to monitor every potable water supply discharge. This requirement places all the responsibility on the MS4 Permittees to monitor and test the samples. The burden of proof is placed on the Permittee for any exceedance until proven innocent by way of the monitoring results. Like emergency fire fighting discharges, potable water discharges should be exempt.
13	4	III.A.8	We support an exemption for a Permittee from a violation of RWL and or WQBELs caused by a non-stormwater discharge from a potable water supply or distribution system not regulated by an NPDES permit but required by state or federal statute. This should clearly apply to all NPDES permits issued to others within, or flow through, the MS4 Permittees jurisdiction. We would request that emergency releases caused by potable water line breaks, which are unexpected, and have to be dealt with as an emergency. MS4 permittees should be exempt from RWL or WQBEL violations associated with any permitted NPDES discharges that are effectively authorized by LARWQCB under the Clean Water Act.
14	8	III.A.9	The requirement of the Permittee to demonstrate that a specific non-stormwater discharge from a fire fighting activity caused an exceedance is a requirement to monitor every fire fighting activity, including location, date, time, duration, discharge pathway, and flow volume. This requirement places all the responsibility on the MS4 Permittees to monitor and test the samples, which is both labor intensive with limited personnel and extraordinarily costly. The burden of proof is placed on the Permittee for any exceedance until proven innocent by way of the monitoring results. It should be acknowledged by the Regional Board that fire fighting activity causes pollutants to be discharged. Discharges from all fire fighting activities should be unconditionally exempt, as protection of life and property is paramount.

LOS ANGELES PERMIT GROUP COMMENTS
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT

No.	Page	Citation	Comment
15	Table X	General	Enforcing NPDES permits issued for the various NSWDS referenced in this table should be the responsibility of the State/Regional Board, not the MS4 permittee. Therefore, it is inappropriate to include a condition that places a responsibility on the MS4 permittee to ensure requirements of NPDES permits are being implemented or effective in order for the pertaining NSWDS category to be exempt. Proper enforcement of the various NPDES permits mentioned in this table should ensure impacts from these discharges are negligible.
16	Table X	Rising Groundwater	The condition that an NPDES permit is required when rising groundwater occurs where a sump pump is necessary in basement of residential buildings may become a significant burden to the LARWQCB—the number of such occurrences in the LA Basin will be very large.
17	Table X	Landscape Irrigation	Conditions should distinguish new landscape installation from retrofits. These conditions are much easier to require on new landscapes than on existing landscapes.
18	Table X	Swimming Pool/spa dischargers	By imposing additional criteria for the proper discharge of swimming pool water, it greatly increases the complexity for the thousands of homeowners in Los Angeles county to comply with these conditions and may result in fewer amounts of these flows from being dechlorinated. Consider simplifying the proposed conditions.

LENNAR®

Mr. Ivar Ridgeway, Chief, Storm Water Permitting

Re: Comments on Staff Working Proposal for Provisions Regarding Minimal Control Measure for the Greater LA County Municipal Separate Storm Sewer Permit

Dear Mr. Ridgeway:

Thank you for this opportunity to submit written comments on the staff working proposal for provisions regarding the minimal control measures for the LA County Municipal Separate Storm Sewer Permit.

Lennar is one of the largest homebuilders in the Los Angeles region. We are concerned about the proposed requirements for new development and redevelopment; they are exceedingly rigid and restrictive. We submit the following comments:

The staff working proposal is inflexible and confusing.

The permit limits modern stormwater management technology that is considered LID; specifically biofiltration. The Staff proposal relegates biofiltration LID to an afterthought in a selection process that is unlike anything in practice currently. We believe the selection process and use of "preferred" options is unnecessary. The established hierarchy should be adhered to.

The Clean Water Act standard is to reduce pollution to the Maximum Extent Practicable. There is no mention of this anywhere in the staff proposal, and without some balance of technical and economic feasibility, some of the requirements in the staff working proposal will render projects unviable. For example, green roofs and harvesting projects may not be the preferred option for a jurisdiction or a project.

The staff working proposal regulates a project's runoff twice: first, it mandates using a very restrictive set of LID BMPs, which when applied won't allow most projects to manage the water

LENNAR®

quality volume on-site. For the remaining runoff volume, the project proponent must then install treatment controls on-site and the staff proposal sets pollution benchmarks for that runoff (p 31). And then, the staff proposal requires that the runoff volume which undergoes treatment control on-site be mitigated at an offsite location using LID BMPs. This unnecessarily burdens a project proponent. Not only do they have to install treatment controls and monitor discharges several times a year, they have to pay to have the volume of runoff managed off-site as well.

We respectfully request staff consider our comments and revise the proposed minimum control measures for new development and redevelopment.

Sincerely,

Bob Tummolo

Los Angeles Regional Water Quality Control Board

New Revised
Notice of Public Meeting
Thursday, May 3, 2012
9:00 a.m.

Meeting Location:

California Science Center (CSC)
(Loker Conference Center)
700 Exposition Park Drive (39th & Figueroa Street)
(Paid parking is available at entrance to CSC, 39th and Figueroa Street)
Los Angeles, California

Agenda

The Regional Board strives to conduct an accessible, orderly, and fair meeting. During the meeting, the Chair will conduct the meeting and establish appropriate rules and time limitations for each item. The Board will only act on items designated as action items. Action items on the agenda are staff proposals, and may be modified by the Board as a result of public comment or Board member input. Additional information about Regional Board meeting procedures is included after the last agenda item.

To ensure a fair hearing and that the Regional Board Members have an opportunity to fully study and consider written material, unless stated otherwise, written materials must be provided to the Executive Officer **not later than 5:00 p.m. on April 19, 2012. Please consult the agenda description for specific items, because certain items may have an earlier deadline for written submissions. If you are considering submitting written materials, please consult the notes at the end of the agenda. Failure to follow the required procedures may result in your materials being excluded from the hearing record; however, failure to timely submit written materials does not preclude a person from testifying before the Board.**

INTRODUCTORY ITEMS

(Items 5.a, and 7 were slated to be heard in the afternoon, but are now scheduled for the morning session of the meeting prior to the MS4 Permit Workshop.)

1. **Roll Call.**
2. **Order of Agenda.** The agenda items are numbered for identification purposes only and may not necessarily be considered in this order.
3. **Approval of draft meeting Minutes for the April 5, 2012 Board meeting.**
[Ronji Moffett, (213) 576-6612]
4. **Board Member Communications.**

Los Angeles Water Board Meeting Agenda

- 4.a. Ex Parte Disclosure. Board Members will identify any discussions they may have had requiring disclosure pursuant to Government Code section 11430.40.
- 4.b. Board Member Reports. The Board Members may discuss communications, correspondence, or other items of general interest relating to matters within the Board's jurisdiction.
- 5.a. **Executive Officer's Report.** [Sam Unger, (213) 576-6605]
- 6. **Update from State Board.** [Fran Spivy-Weber, (916) 341-5607]
- 7. **Public Forum.** Any person may address the Board regarding any matter within the Board's jurisdiction provided the matter does not appear elsewhere on this agenda, has not been scheduled to appear on a future agenda, and is not expected to be imminently scheduled for the Board's consideration. Remarks will be limited to three (3) minutes, unless otherwise directed by the Chair. If a person intends to use a PowerPoint presentation or other visual aid, you must contact Ronji Moffett, (213) 576-6612, at the Regional Board at least 48 hours prior to the meeting to arrange for equipment use and be prepared to load any PowerPoint presentation on the computer prior to the meeting to assure the orderly conduct of the meeting.

UNCONTESTED ITEMS

(Items marked with an asterisk are expected to be routine and noncontroversial. The Board will be asked to approve these items at one time without discussion. Any Board member or person may request that an item be removed from the uncontested calendar. The Chair will determine the appropriate time to consider an item removed from the consent calendar.)

- *11. Port of Long Beach, Toyota Expansion Parcel, Order No. 93-067, File No. 77-047; Wilmington (Comment submittal deadline April 16, 2012.) [Douglas Cross, (213) 620-2246]
- *12. Port of Long Beach, TCL Consent Order Study Area, Order No. 96-022, File No. 65-121; Wilmington (Comment submittal deadline was April 16, 2012.) [Douglas Cross, (213) 620-2246]
- *13. Port of Long Beach, Pier G/S Terminal Redevelopment Project, Order No. R4-2006-0084; File No. 01-009; Long Beach (Comment submittal deadline was April 13, 2012) [Michael Lyons, (213) 576-6718]
- *14. Port of Long Beach, Former Long Beach Naval Complex Installation Restoration Site 7 Dredging Project, Order No. R4-2010-0164, File No. 08-133; Long Beach (Comment submittal deadline was April 13, 2012) [Michael Lyons, (213) 576-6718]
- *15. Port of Los Angeles, Maintenance Dredging Project, Order No. R4-2004-0091, File No. 04-063; San Pedro (Comment submittal deadline was April 13, 2012) [Michael Lyons, (213) 576-6718]
- *16. Port of Los Angeles, Cabrillo Way Marina Project, Order No. R4-2008-0052, file No. 08-076; San Pedro (Comment submittal deadline was April 13, 2012) [Michael Lyons, (213) 576-6718]
- *17. Port of Los Angeles, berths 145-147 Wharf Improvement Project, Order No. R4-2008-0061, File No. 08-081; San Pedro (Comment submittal deadline was April 13, 2012) [Michael Lyons, (213) 576-6718]

ACTION ITEMS

- 18. **Waste Discharge Requirements that Serve as Individual NPDES Permits**
Renewal-
 BP West Coast Products, LLC, BP Wilmington Calciner, Wilmington; NPDES No. CA0059153 (Comment submittal deadline was April 2, 2012) [Rosario Aston, (213) 576-6653] **(This item is being continued to a future meeting.)**

Los Angeles Water Board Meeting Agenda

Workshop

19. Workshop on the issuance of a new Los Angeles County Municipal Separate Storm Sewer System (MS4) NPDES Permit. Staff will make a presentation on provisions related to watershed planning and implementation, TMDL related requirements, and receiving water limitations. Permittees and other interested persons will have the opportunity to make oral comments subject to time limits. (The Board may provide general feedback to staff on development of the permit; however, no action or voting will take place at this workshop.) [Renee Purdy, (213) 576-6622; Ivar Ridgeway, (213) 620-2150]

INFORMATION *(This matter is for informational purposes only. No voting will take place on this matter.)*

20. Informational overview by the City of Signal Hill's on the City's illicit Connection/illicit Discharge program, sediment control procedures, and treatment control Best Management Practices (BMPs) to comply with the existing Los Angeles County MS4 Permit. [Mr. Steve Minor, City of Signal Hill] **(This item was continued from the April 5, 2012 meeting.)**
21. Update on Status of Implementation of SB 346 (Brake Pad Bill). [Mr. Richard Watson, Richard Watson Associates, (949) 855-6272]

CLOSED SESSION

22. As authorized by the Government Code section 11126, the Regional Board will be meeting in closed session. Closed session items are not open to the public. Items the Board may discuss include the following: [Jennifer Fordyce (JF) (916) 324-6682; Frances McChesney (FM) (916) 341-5174]
- 22.1 *State Department of Finance, State Water Resources Control Board and Los Angeles Regional Water Quality Control Board v. Commission on State Mandates*, Los Angeles County Superior Court Case No. BS130730. [Challenging the Commission's decision that portions of the LA MS4 permit created unfunded State mandates]. (JF)
- 22.2 *In re Halaco Engineering Company*, United States Bankruptcy Court, Central District of California, Northern Division, No. ND-02-12255 RR [Regarding a CDO and CAO at the Oxnard Property]. (JF)
- 22.3 *In re: Los Angeles Region Water Permit- Ventura County*, Commission on State Mandate Test Claim No. 11-TC-01 [Regarding a test claim filed by Ventura County Watershed Protection District and the County of Ventura alleging that portions of Order No. R4-2010-0108 created an unfunded state mandate]. (JF)

Los Angeles Water Board Meeting Agenda

- 22.4 *In re: Petition of City of Redondo Beach for Review of Administrative Civil Liability Order No. R4-2008-0058-M, SWRCB/OCC File A-2124* [Challenging assessment of mandatory minimum penalties for violations of Order Nos. 99-057 and R4-2005-0016]. (FM)
- 22.5 *In re: Petition of Signal Hill, Downey, et al, for Review of Order No. R4-2009-0130, SWRCB/OCC File A-2071* [Challenging the incorporation into the MS4 Permit of the Waste Load Allocations from the Los Angeles River Watershed Trash TMDL.] (JF)
- 22.6 *In re: Kinder Morgan, Inc., Chevron Corp., et al for Review of Revised Cleanup and Abatement Order No. R4-2008-0006, SWRCB/OCC File A-2085* [Challenging the revised cleanup goals in the order]. (FM)
- 22.7 *In re: Upper Santa Clara River Chloride Total Maximum Daily Load Requirements Imposed by the Los Angeles Regional Water Quality Control Board in Resolution R4-2008-0012.* Commission on State Mandates Test Claim No. 10-TC-09 [Regarding a test claim filed by the Santa Clarita Valley Sanitation District of Los Angeles County alleging that portions of Resolution R4-2008-0012 created an unfunded state mandate]. (JF)
- 22.8 *Joan C. Lavine v. State Water Resources Control Board and Los Angeles Regional Board,* Los Angeles County Superior Court Case No. BS128989 [Challenging the Basin Plan Amendment prohibiting on-site wastewater disposal systems in the Malibu Civic Center Area]. (FM)
- 22.9 *Charles Conway et al. v. State Water Resources Control Board and Los Angeles Regional Water Quality Control Board,* Ventura County Superior Court Case No. 56-2011-00399391-CU-WM-VTA [Challenging the McGrath Lake TMDL for polychlorinated biphenyls (PCBs), pesticides, and sediment toxicity]. (JF)
- 22.10 *In re: Petition of Santa Monica Baykeeper and Heal the Bay, SWRCB/OCC File A-2175* [Challenging the Memorandum of Understanding between the City of Malibu, the Los Angeles Regional Board, and the State Water Resources Control Board regarding phased implementation of the Basin Plan amendment prohibiting on-site wastewater disposal systems in the Malibu Civic Center area]. (FM)
- 22.11 Consultation with counsel about:
- (a) A judicial or administrative adjudicatory proceeding that has been formally initiated to which the Regional Board is a party;
 - (b) A matter that, based on existing facts and circumstances, presents significant exposure to litigation against the Regional Board;
 - (c) A matter which, based on existing facts and circumstances, the Regional Board is deciding whether to initiate litigation. (JF/FM)
- 22.12 Consideration of the appointment, employment, or evaluation of performance about a public employee. (JF/FM)
23. **Adjournment of Current Meeting.** The next meeting will be held on June 7, 2012 beginning at 9:00 a.m. at the City of Simi Valley Council Chambers, located at 2929 Tapo Canyon Road, Simi Valley, California.

Los Angeles Water Board Meeting Agenda

**

NOTICE

Ex Parte Communications: An ex parte communication is a communication to a board member from any person, about a pending matter, that occurs in the absence of other parties and without notice and opportunity for them to respond. The California Government Code prohibits the board members from engaging in ex parte communications during permitting, enforcement, and other “quasi-adjudicatory” matters. The Regional Board discourages ex parte communications during rulemaking and other “quasi-legislative” proceedings. The ex parte rules are intended to provide fairness, and to ensure that the board’s decisions are transparent, based on the evidence in the administrative record, and that evidence is used only if stakeholders have had the opportunity to hear and respond to it. Ex parte rules do not prevent anyone from providing information to the water boards or requesting that the water boards take a particular action. They simply require that the information come into the record through proper channels during a duly noticed, public meeting. A board member who has engaged or been engaged in a prohibited ex parte communication will be required to publicly disclose the communication on the record and may be disqualified from participating in the proceeding. For more information, please look at the ex parte questions and answers document found at www.waterboards.ca.gov/laws_regulations/docs/exparte.pdf

Procedures: The Regional Board follows procedures established by the State Water Resources Control Board. These procedures are established in regulations commencing with section 647 of title 23 of the California Code of Regulations. The Chair may establish specific procedures for each item, and consistent with section 648, subdivision (d) of title 23 of the California Code of Regulations may waive nonstatutory provisions of the regulations. Generally, all witnesses testifying before the Regional Board must affirm the truth of their testimony and are subject to questioning by the Board Members. The Board does not, generally, require the designation of parties, the prior identification of witnesses, or the cross examination of witnesses. Generally, speakers are allowed three minutes for comments. Any requests for an alternate hearing process, such as requesting additional time to make a presentation, should be made to the Executive Officer in advance of the meeting, and under no circumstances later than 5:00 p.m. on the Thursday preceding the Board meeting. The provisions of this paragraph shall be deemed superseded to the extent that they are contradicted by a hearing notice specific to a particular agenda item.

Written Submissions: Written materials (whether hand-delivered, mailed, e-mailed, or facsimiled) ***must be received prior to the relevant deadline*** established in the agenda and public notice for an item. If the submitted material is more than 10 pages or contains foldouts, color graphics, maps, or similar items, 12 copies must be submitted prior to the relevant deadline.

Failure to comply with requirements for written submissions is grounds for the Chair to refuse to admit the proposed written comment or exhibit into evidence. (Cal. Code Regs. tit. 23, § 648.4(e).) The Chair may refuse to admit written testimony into evidence unless the proponent can demonstrate why he or she was unable to submit the material on time or that compliance with the deadline would otherwise create a hardship. If any other party demonstrates prejudice resulting from admission of the written testimony, the Chair may refuse to admit it.

Los Angeles Water Board Meeting Agenda

Administrative Record: Material presented to the Board as part of testimony that is to be made part of the record must be left with the Board. This includes photographs, slides, charts, diagrams, etc. All Board files pertaining to the items on this Agenda are hereby made a part of the record submitted to the Regional Board by staff for its consideration prior to action on the related items.

Accessibility: Individuals requiring special accommodations or language needs should contact Dolores Renick at (213) 576-6629 or drenick@waterboards.ca.gov at least ten working days prior to the meeting. TTY/TDD Speech-to-Speech users may dial 7-1-1 for the California Relay Service.

Availability of Complete Agenda Package: A copy of the complete agenda package is available for examination at the Regional Board Office during regular working hours (8:00 a.m. to 5:00 p.m. Monday through Friday) beginning 10 days before the Board meeting. Questions about specific items on the agenda should be directed to the staff person whose name is listed with the item.

Continuance of Items: The Board will endeavor to consider all matters listed on this agenda. However, time may not allow the Board to hear all matters listed. Matters not heard at this meeting may be carried over to the next Board meeting or to a future Board meeting. Parties will be notified in writing of the rescheduling of their item. Please contact the Regional Board staff to find out about rescheduled items.

Challenging Regional Board Actions: Pursuant to Water Code section 13320, any aggrieved person may file a petition to seek review by the State Water Resources Control Board of most actions taken by the Regional Board. A petition must be filed within 30 days of the action. Petitions must be sent to State Water Resources Control Board, Office of Chief Counsel; ATTN: Phil Wyels, Assistant Chief Counsel; 1001 "I" Street, 22nd Floor; Sacramento, CA 95814.

SECRETARY FOR
ENVIRONMENTAL PROTECTION

Los Angeles Regional Water Quality Control Board

TO: Los Angeles County MS4 Permittees and Other Interested Persons

FROM: Renee A. Purdy, Chief *Renee A. Purdy*
Regional Programs Section

DATE: April 23, 2012

SUBJECT: TRANSMITTAL OF STAFF WORKING PROPOSALS ON LA COUNTY MS4 PERMIT -
PROVISIONS RELATED TO WATERSHED MANAGEMENT PROGRAMS, TMDLS AND
RECEIVING WATER LIMITATIONS

As staff committed to in previous workshops on the renewal of the Los Angeles County MS4 Permit, attached are working proposals of the permit provisions related to the **Watershed Management Programs, Total Maximum Daily Loads (TMDLs), and Receiving Water Limitations**. Staff of the Los Angeles Regional Water Quality Control Board (Los Angeles Water Board) is distributing to Los Angeles County MS4 Permittees and other interested persons the attached staff working proposals for preliminary review and discussion purposes only.

Please note the following: Staff will accept both written and oral comments on these working proposals. Please be advised, however, that these staff working proposals neither constitute a "draft permit" or a "proposed permit" as defined in Title 40 Code of Federal Regulations (40 CFR) sections 122.2 or 124.6. Further, distribution of these staff working proposals for review and discussion does not constitute a public comment period pursuant to 40 CFR sections 124.10 or 124.17. Accordingly, while staff will accept and consider written comments on these working proposals, staff does not intend to formally respond to written comments received that pertain to the working proposals. In addition to, or in lieu of, written comments, Permittees and interested persons are also encouraged to make oral comments to staff during telephone conversations, in-person meetings, and/or at the upcoming board workshop on May 3, 2012. Staff looks forward to input on this working proposal from Permittees and other interested persons.

For written and oral comments on these working proposals to be considered by staff in preparing the forthcoming draft Los Angeles County MS4 Permit, comments need to be made and/or submitted no later than **May 11, 2012**. Written comments should be submitted by e-mail to LAMS42012@waterboards.ca.gov.

MARIA MEHRANIAN, CHAIR | SAM UNGER, EXECUTIVE OFFICER

Written comments received will be included in the administrative record for the renewal of the Los Angeles County MS4 Permit, but will not be provided to the individual Los Angeles Water Board members. When a draft permit is released, interest persons will be provided an opportunity to submit written comments in compliance with 40 CFR sections 124.10 or 124.17. Consistent with federal regulations, staff will prepare responses to significant comments received on the draft permit submitted in compliance with the public notice and will make comments and responses available to the Los Angeles Water Board members.

Staff looks forward to further discussions on this working proposal. Please do not hesitate to contact Mr. Ivar Ridgeway, Chief, Storm Water Permitting at (213) 620-2150 or myself at (213) 576-6622 if you wish to schedule a meeting with us or if you have any questions or comments.

Attachments

LA County MS4 Permit – Watershed Management Program

VI. PROVISIONS

C. Special Provisions: Watershed Management Programs

1. General

- a. The purpose of this Part is to allow Permittees to develop Watershed Management Programs to implement the requirements of this Order on a watershed scale through customized strategies, control measures, and BMPs.
- b. Participation in a Watershed Management Program allows a Permittee to customize the requirements in Part VI.D [Special Provisions: Minimum Control Measures] to address the highest watershed priorities, including achieving compliance with the requirements of Part VI.E and Attachments X through X [Special Provisions: TMDL Provisions].
- c. Customized strategies, control measures, and BMPs shall be implemented on a watershed basis, where applicable, through each Permittee's storm water management program and/or collectively by all participating Permittees through the Watershed Management Program.
- d. The goal of the Watershed Management Programs is to ensure that discharges from the Los Angeles County MS4 (i) achieve applicable water quality based effluent limitations in Part VI.E and Attachments X through X [TMDL Provisions], (ii) do not cause or contribute to exceedances of receiving water limitations in Parts V.A and VI.E and Attachments X through X [Receiving Water Limitations and TMDL Provisions], and do not cause exceedances of non-storm water action levels in Part [TBD – MRP].
- e. Watershed Management Programs shall be developed using the Regional Water Board's Watershed Management Areas. Where appropriate, Watershed Management Areas may be separated into subwatersheds to focus water quality prioritization and implementation efforts by receiving water.
- f. Each Watershed Management Program shall:
 - i. Prioritize water quality issues resulting from storm water and non-storm water discharges from the MS4 to receiving waters within each Watershed Management Area,

LA County MS4 Permit – Watershed Management Program

- ii. Identify and implement strategies, control measures, and BMPs to achieve applicable water quality based effluent limitations, receiving water limitations, and/or non-storm water action levels consistent with corresponding compliance schedules in this Order,
- iii. Execute a monitoring and assessment program to determine progress towards achieving applicable limitations and/or action levels in Part VI.C.1.f. ii, and
- iv. Revise strategies, control measures, and BMPs as necessary to maintain progress towards achieving applicable limitations and/or action levels in Part VI.C.1.f.ii.

2. Process

a. Timelines for Implementation

- i. Each Permittee shall ensure implementation of the following requirements per the schedule specified in Table [TBD] below:

Table [TBD]

Part	Provision	Due Date
VI.C.2.b	Notify Regional Water Board of intent to develop Watershed Management Program	6 months after Order adoption
VI.C.2.b	Submit draft plan to Executive Officer	1 year after Order adoption
VI.C.2.c	Submit final plan to Executive Officer	3 months after receipt of Regional Water Board comments on draft plan
VI.C.4	Begin implementation of Watershed Management Program	Upon submittal of final plan
VI.C.6.a.ii	First evaluation of Watershed Management Program and submittal of revisions to plan	1½ years after submittal of final plan
VI.C.6.a.ii	Second evaluation of Watershed	180 days prior to expiration

LA County MS4 Permit – Watershed Management Program

Management Program and submittal of revisions to plan	date of Order
--	---------------

- b. Permittees that elect to develop a Watershed Management Program must notify the Regional Water Board no later than six months after the adoption of this Order.
- c. Permittees that elect to develop a Watershed Management Program shall submit a draft plan to the Executive Officer no later than one year after the adoption of this Order.
- d. Permittees that do not elect to develop a Watershed Management Program shall be subject to the baseline requirements in Part VI.D [MCMs] and shall demonstrate compliance with applicable water quality based effluent limitations in Part VI.E [TMDL] pursuant to subparts VI.E.4 or VI.E.5.

3. Program Development

a. Identification of Water Quality Priorities

Permittees shall identify the water quality priorities within each Watershed Management Area that will be addressed by the Watershed Management Program. At a minimum, these priorities shall include achieving applicable water quality based effluent limitations and/or receiving water limitations established pursuant to TMDLs, as set forth in Part VI.E and Attachments [TBD] through [TBD] of this Order.

- i. Water Quality Characterization. Each plan shall include an evaluation of existing water quality conditions, including characterization of storm water and non-storm water discharges from the MS4 and receiving water quality, to support identification and prioritization/sequencing of management actions.
- ii. Waterbody-Pollutant Classification. On the basis of the evaluation of existing water quality conditions, waterbody-pollutant combinations shall be classified into one of the following four categories:
 - (1) Category 1 (Highest Priority): Waterbody-pollutant combinations for which water quality based effluent limitations and/or receiving water limitations are

LA County MS4 Permit – Watershed Management Program

established in Part VI.E and Attachments [TBD] to [TBD] of this Order.

- (2) Category 2 (High Priority): Pollutants for which data indicate water quality impairment in the receiving water according to the State's Listing Policy.
 - (3) Category 3 (Medium Priority): Pollutants for which there are insufficient data to indicate water quality impairment in the receiving water according to the State's Listing Policy, but which exceed applicable water quality standards.
 - (4) Category 4 (Low Priority): Pollutants for which data do not indicate any exceedances of applicable water quality standards.
- iii. Source Assessment. Utilizing existing information, potential sources within the watershed for the pollutants in Categories 1 and 2 shall be identified.
- (1) Permittees shall identify known and suspected storm water and non-storm water pollutant sources in discharges to the MS4 and from the MS4 to receiving waters and any other stressors related to MS4 discharges causing or contributing to the highest water quality priorities (Categories 1 and 2). The identification of known and suspected sources of the highest water quality priorities shall consider the following:
 - (a) Review of available data, including but not limited to:
 - (i) Findings from the Permittees' illicit discharge detection and elimination programs;
 - (ii) Findings from the Permittees' commercial/industrial facilities pollutant control programs;
 - (iii) Findings from the Permittees' development construction programs;
 - (iv) Findings from the Permittees' public agency activities;
 - (v) TMDL source assessments;

LA County MS4 Permit – Watershed Management Program

- (vi) Watershed model results;
 - (vii) Findings from the Permittees' monitoring programs, including but not limited to TMDL compliance monitoring and receiving water monitoring, and
 - (viii) Any other pertinent data, information, or studies related to pollutant sources and conditions that contribute to the highest water quality priorities.
- (b) Locations of the Permittees' MS4s, including, at a minimum, all MS4 major outfalls and major structural controls for storm water and non-storm water that discharge to receiving waters;
- (c) Other known and suspected sources of pollutants in non-storm water or storm water discharges from the MS4 to receiving waters within the Watershed Management Area.
- iv. Prioritization.** Based on the findings of the source assessment, the issues within each watershed shall be prioritized and sequenced. Watershed priorities shall include at a minimum:
- (1) TMDLs
 - (a) Controlling pollutants for which there are water quality based effluent limitations and/or receiving water limitations with interim or final compliance deadlines within the permit term, or TMDL compliance deadlines that have already passed and limitations have not been achieved.
 - (b) Controlling pollutants for which there are water quality based effluent limitations and/or receiving water limitations with interim or final compliance deadlines between September 6, 2012 and September 6, 2017.
 - (2) Other Receiving Water Considerations
 - (a) Controlling pollutants for which data indicate impairment in the receiving water and the findings from the source assessment implicates discharges

LA County MS4 Permit – Watershed Management Program

from the MS4 shall be considered the second highest priority.

- b. Selection of Watershed Control Measures
- i. Permittees shall identify strategies, control measures, and BMPs to implement through their individual storm water management programs, and collectively on a watershed scale, with the goal of creating an efficient program to focus individual and collective resources on watershed priorities.
 - ii. The objectives of the Watershed Control Measures shall include:
 - (1) Prevent or eliminate non-storm water discharges to the MS4 that are a source of pollutants from the MS4 to receiving waters.
 - (2) Implement pollutant controls necessary to achieve all applicable interim and final water quality based effluent limitations and/or receiving water limitations pursuant to corresponding compliance schedules.
 - (3) Ensure that discharges from the MS4 do not cause or contribute to exceedances of receiving water limitations.
 - iii. Watershed Control Measures may include:
 - (1) Structural and/or non-structural controls and operation and maintenance procedures that are designed to achieve applicable water quality based effluent limitations and/or receiving water limitations in Part VI.E and Attachments X through X;
 - (2) Retrofitting areas of existing development known or suspected to contribute to the highest water quality priorities with regional or site-specific controls or management measures; and
 - (3) Stream and/or habitat rehabilitation or restoration projects where stream and/or habitat rehabilitation or restoration are necessary for, or will contribute to demonstrable improvements in the physical, chemical, and biological receiving water conditions and restoration and/or protection of water quality standards in receiving waters.

LA County MS4 Permit – Watershed Management Program

iv. The following provisions of this Order shall be incorporated as part of the Watershed Management Program:

(1) Minimum Control Measures

(a) Permittees shall assess the minimum control measures (MCMs) as defined in Part VI.D.4 to Part VI.D.9 this Order to identify opportunities for focusing resources on the high priority issues in each watershed. For each of the following minimum control measures, Permittees shall identify potential modifications that will address watershed priorities:

- (i) New Development/ Redevelopment Program
- (ii) Development Construction Program
- (iii) Industrial/Commercial Program
- (iv) Illicit Connection/Illicit Discharge Detection and Elimination Program
- (v) Public Agency Activities Program
- (vi) Public Information and Participation Program

(b) At a minimum, the Watershed Management Program shall include management programs consistent with 40 CFR section 122.26(d)(2)(iv)(A)-(D).

(c) If the Permittee(s) elects to eliminate a control measure identified in Part VI.D.4 to Part VI.D.9, the Permittee(s) shall provide a justification for its elimination.

(d) Such customized actions, once approved as part of the Watershed Management Program, shall replace in part or in whole the requirements in Part VI.D.4 to Part VI.D.9 for participating Permittees.

(2) Non-Storm Water Discharge Measures. Where Permittees identify non-storm water discharges from the MS4 as a source of pollutants in the source assessment, the Watershed Control Measures shall include strategies, control measures, and/or BMPs that must be implemented to effectively eliminate the source of

LA County MS4 Permit – Watershed Management Program

pollutants consistent with Parts III.A [Discharge Prohibitions – Non-Storm Water Discharges] and VI.D.9 [Special Provisions: Minimum Control Measures – Illicit Connection and Illicit Discharge Elimination Program]. These may include measures to prohibit the non-storm water discharge to the MS4, additional BMPs to reduce pollutants in the non-storm water discharge or conveyed by the non-storm water discharge, diversion to a sanitary sewer for treatment, or strategies to require the non-storm water discharge to be separately regulated under a general NPDES permit.

- (3) TMDL Control Measures. Permittees shall compile control measures that have been identified in TMDLs and corresponding implementation plans. If not sufficiently identified in previous documents, or if implementation plans have not yet been developed (e.g., EPA established TMDLs), the Permittees shall evaluate and identify control measures to achieve water quality based effluent limitations and/or receiving water limitations established in this Order pursuant to these TMDLs.
- (a) TMDL control measures shall include where necessary control measures to address both storm water and non-storm water discharges from the MS4.
- (b) TMDL control measures may include baseline or customized activities covered under the general MCM categories in Part VI.D as well as BMPs and other control measures covered under the non-storm water discharge provisions of Part III.A of this Order.
- (c) The plan shall include, at a minimum, those actions that will be implemented during the permit term to achieve interim and/or final water quality based effluent limitations and/or receiving water limitations with compliance deadlines within the permit term.
- (4) Each plan shall include the following components:
- (a) Identification of specific structural controls and non-structural best management practices, including operational source control and pollution prevention, and any other actions or programs to achieve all

LA County MS4 Permit – Watershed Management Program

- water quality-based effluent limitations and receiving water limitations contained in this Part and Attachments X through X to which the Permittee(s) is subject;
- (b) For each structural control and non-structural best management practice, the number, type, and location(s) and/or frequency of implementation;
 - (c) At a minimum, structural controls shall be sized to treat the volume of stormwater runoff from the 85th percentile, 24-hour storm specific to the watershed in question;
 - (d) For any pollution prevention measures, the nature, scope, and timing of implementation;
 - (e) For each structural control and non-structural best management practice, interim milestones and dates for achievement to ensure that TMDL compliance deadlines will be met;
 - (f) The plan shall clearly identify the responsibilities of each participating Permittee for implementation of watershed control measures.
- (5) Permittees shall conduct a Reasonable Assurance Analysis for each TMDL as follows:
- (a) Permittees shall conduct an assessment (through a quantitative analysis / modeling effort) to demonstrate that the activities and control measures identified in the Watershed Control Measures will achieve applicable water quality based effluent limitations and/or receiving water limitations with compliance deadlines during the permit term.
 - (b) Where the TMDL Provisions in Part VI.E and Attachments X through X do not include interim or final water quality based effluent limitations and/or receiving water limitations with compliance deadlines during the permit term, Permittees shall identify interim milestones and dates for their achievement to ensure adequate progress toward achieving interim and final water quality based effluent limitations and/or receiving water limitations with deadlines beyond the permit term.

LA County MS4 Permit – Watershed Management Program

- (6) Permittees shall provide documentation that it has the necessary legal authority to implement or compel implementation of the Watershed Control Measures identified in the plan.

- c. Compliance Schedules

Permittees shall incorporate compliance schedules in Attachments [TBD] to [TBD] into the plan and, where necessary develop interim milestones and dates for their achievement. Compliance schedules and interim milestones and dates for their achievement shall be used to measure progress towards addressing the highest water quality priorities and achieving applicable water quality based effluent limitations and/or receiving water limitations.

- i. Schedules must be adequate for measuring progress on a watershed scale twice during the permit term.
- ii. Schedules must be developed for both the strategies, control measures and BMPs implemented by each Permittee within its jurisdiction and for those that will be implemented by multiple Permittees on a watershed scale.
- iii. Schedules shall incorporate the following:
 - (1) Compliance deadlines occurring within the permit term for all applicable interim and/or final water quality based effluent limitations and/or receiving water limitations in Part VI.E and Attachments X through X of this Order,
 - (2) Interim milestones and dates for their achievement within the permit term for any applicable final water quality based effluent limitation and/or receiving water limitation in Part VI.E and Attachments X through X, where deadlines within the permit term are not otherwise specified.
 - (3) For watershed priorities related to addressing exceedances of receiving water limitations in Part V.A and not otherwise addressed by Part VI.E:
 - (a) Milestones based on measureable criteria or indicators, to be achieved in the receiving waters and/or MS4 discharges,

LA County MS4 Permit – Watershed Management Program

- (b) A schedule with dates for achieving the milestones as soon as possible, and
- (c) A final date for achieving the receiving water limitations within the permit term.
- (d) The milestones and implementation schedule in (a)-(c) fulfill the requirements in Part V.A.3.a to prepare a Receiving Water Limitations Compliance Report.

4. Watershed Management Program Implementation

Each Permittee shall implement the Watershed Management Program immediately upon approval of the plan by the Regional Water Board Executive Officer.

5. Integrated Watershed Monitoring and Assessment

Permittees in each Watershed Management Area shall develop an integrated program to assess progress toward achieving the water quality based effluent limitations and/or receiving water limitations per the compliance schedules, and progress toward addressing the highest water quality priorities for each Watershed Management Area. The integrated watershed monitoring and assessment program shall be consistent with the general monitoring and assessment requirements of Part [TBD – MRP].

6. Adaptive Management Process

- a. Watershed Management Program Adaptive Management Process
 - i. Permittees in each Watershed Management Area shall implement an adaptive management process, at least twice during the permit term, adapting the Watershed Management Program to become more effective, based on, but not limited to the following:
 - (1) Progress toward achieving interim and/or final water quality based effluent limitations and/or receiving water limitations in Part VI.E and Attachments X through X, according to established compliance schedules;
 - (2) Progress toward achieving improved water quality in MS4 discharges and achieving receiving waters limitations through implementation of the watershed control measures

LA County MS4 Permit – Watershed Management Program

based on an evaluation of outfall-based monitoring data and receiving water monitoring data;

- (3) Achievement of interim milestones;
 - (4) Re-evaluation of the highest water quality priorities identified for the Watershed Management Area based on more recent water quality data for discharges from the MS4 and the receiving water(s) and a reassessment of sources of pollutants in MS4 discharges;
 - (5) Availability of new information and data from sources other than the Permittees' monitoring program(s) within the Watershed Management Area that informs the effectiveness of the actions implemented by the Permittees;
 - (6) Regional Water Board recommendations; and
 - (7) Recommendations for modifications to the Watershed Management Program solicited through a public participation process.
- ii. Based on the results of the adaptive management process, Permittees shall report any modifications, including where appropriate new compliance deadlines and interim milestones, necessary to improve the effectiveness of the Watershed Management Program in the Annual Report required pursuant to Part [TBD], or as part of the Report of Waste Discharge (ROWD) required pursuant to Part [TBD].
- (1) The adaptive management process fulfills the requirements in Part V.A.4 to address continuing exceedances of receiving water limitations.
- iii. Permittees shall implement any modifications to the Watershed Management Program upon acceptance by the Regional Water Board Executive Officer.
- b. Jurisdictional Storm Water Management Program Adaptive Management Process
- i. Permittees in the Watershed Management Area shall implement the adaptive management process at least annually with regard to its jurisdictional storm water management program to improve its effectiveness, based on, but not limited to the following:

LA County MS4 Permit – Watershed Management Program

- (1) Measurable or demonstrable reductions of illicit discharges to the MS4 based on an evaluation of outfall-based monitoring data;
 - (2) Measurable or demonstrable reductions of pollutants in storm water discharges from the Permittee's MS4 through implementation of the storm water management program based on an evaluation of outfall-based monitoring data;
 - (3) Efficiency in implementing the Watershed Management Program; and
 - (4) Progress toward achieving interim and/or final water quality based effluent limitations and/or receiving water limitations in Part VI.E and Attachments X through X, according to established compliance schedules;
 - (5) Progress toward achieving receiving waters limitations through implementation of the storm water management program based on an evaluation of outfall-based monitoring data and receiving water monitoring data;
 - (6) Regional Water Board recommendations during program and/or site inspections.
- ii. Based on the results of the adaptive management process, the Permittee shall report any modifications, including where appropriate new compliance deadlines or interim milestones, necessary to improve the effectiveness its jurisdictional storm water management program in the Annual Report required pursuant to Provision [TBD], or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision [TBD].
- (1) The adaptive management process fulfills the requirements in Part V.A.4 to address continuing exceedances of receiving water limitations.
- iii. The Permittee shall implement any modifications to its jurisdictional storm water management program upon acceptance by the Regional Water Board Executive Officer.

LA County MS4 Permit – General TMDL Provisions

E. Special Provisions: Total Maximum Daily Load Provisions

1. The provisions of this Part implement and are consistent with the assumptions and requirements of all waste load allocations (WLAs) established in TMDLs for which some or all of the Permittees in this Order are responsible.
 - a. Part VI.E of this Order includes provisions that are designed to assure that Permittees achieve WLAs and meet other requirements of TMDLs covering receiving waters impacted by the Permittees' MS4 discharges. TMDL provisions are grouped by Watershed Management Area (WMA) in Attachments X through X.
 - b. The Permittees subject to each TMDL are identified in Attachment I.
 - c. The Permittees shall comply with the applicable water quality-based effluent limitations and/or receiving water limitations contained in Attachments X through X, consistent with the assumptions and requirements of the WLAs established in the TMDLs, including implementation plans and schedules, where provided for in the State adoption and approval of the TMDL (40 CFR §122.44(d)(1)(vii)(B); Cal. Wat. Code §13263(a)).
 - d. A Permittee may comply with water quality-based effluent limitations and/or receiving water limitations in Attachments X through X using any lawful means.
2. Compliance Determination
 - a. General
 - i. A Permittee shall demonstrate compliance at compliance monitoring points established in each TMDL or an approved TMDL monitoring plan or in accordance with an approved integrated monitoring plan per Attachment X [Monitoring and Reporting Program] and Part VI.C.5 Integrated Watershed Monitoring and Assessment.
 - ii. Compliance with water quality-based effluent limitations shall be determined as described in Parts VI.E.2.d and VI.E.2.e, or for trash water quality-based effluent limitations as described in Part VI.E.5.b, or as otherwise set forth in TMDL specific provisions in Attachments X through X.
 - iii. Pursuant to Part VI.C, a Permittee may, individually or as part of a watershed-based group, develop and submit for approval by the Executive Officer a Watershed Management Program that addresses all water quality-based effluent limitations and receiving

LA County MS4 Permit – General TMDL Provisions

water limitations to which the Permittee is subject pursuant to established TMDLs.

b. Commingled Discharges

- i. A number of the TMDLs establish WLAs that are assigned jointly to a group of Permittees whose storm water and/or non-storm water discharges are or may be commingled in the MS4 prior to discharge to the receiving water subject to the TMDL.
- ii. In these cases, pursuant to 40 CFR section 122.26(a)(3)(vi), each Permittee is only responsible for discharges from the MS4 for which they are owners and/or operators.
- iii. Where Permittees have commingled discharges to the receiving water, compliance at the outfall to the receiving water or in the receiving water shall be determined for the group of Permittees as a whole unless an individual Permittee demonstrates that its discharge did not cause or contribute to the exceedance.
- iv. For purposes of compliance determination, each Permittee is responsible for demonstrating that its discharge did not cause or contribute to an exceedance of an applicable water quality-based effluent limitation(s) at the outfall or receiving water limitation(s) in the target receiving water.
- v. A Permittee may demonstrate that its discharge did not cause or contribute to an exceedance of an applicable water quality-based effluent limitation or receiving water limitation in any of the following ways:
 1. Demonstrate that there is no discharge from the Permittee's MS4 into the applicable receiving water; or
 2. Demonstrate that the discharge from the Permittee's MS4 is treated to a level that does not exceed the applicable water quality-based effluent limitation; or
 3. Demonstrate through a source investigation pursuant to protocols established under Water Code section 13178 or other accepted source identification protocols that pollutant sources within the jurisdiction of the Permittee or the Permittee's MS4 have not caused or contributed to the exceedance of the Receiving Water Limitation(s).

c. Receiving Water Limitations Addressed by a TMDL

LA County MS4 Permit – General TMDL Provisions

- i. For Receiving Water Limitations in Part V.A. associated with waterbody-pollutant combinations addressed in a TMDL, Permittees shall achieve compliance with the Receiving Water Limitations in Part V.A. as outlined in this Part and Attachments X through X of this Order.
 - ii. A Permittee shall not be considered in violation of a Receiving Water Limitation in Part V.A., if it is in compliance with the applicable TMDL requirement(s), including compliance schedules, of this Part and Attachments X through X.
 - iii. A Permittee shall not be considered in violation of a Receiving Water Limitation in Part V.A., if it is in compliance with the applicable TMDL requirements contained in a time schedule order.
- d. Interim Water Quality-Based Effluent Limitations and Receiving Water Limitations**
- i. A Permittee shall be considered in compliance with an applicable interim water quality-based effluent limitation and/or interim receiving water limitation for the pollutant(s) associated with a specific TMDL if any of the following is demonstrated:
 - 1. There are no violations of the interim water quality-based effluent limitation for the pollutant(s) associated with a specific TMDL at the Permittee's applicable MS4 outfall(s),¹ including an outfall to the receiving water that collects discharges from multiple Permittees' jurisdictions;
 - 2. There are no exceedances of the applicable receiving water limitation for the pollutant(s) associated with a specific TMDL in the receiving water(s) at, or downstream of, the Permittee's outfall(s);
 - 3. There is no direct or indirect discharge from the Permittee's MS4 to the receiving water during the time period subject to the water quality-based effluent limitation and/or receiving water limitation for the pollutant(s) associated with a specific TMDL; or
 - 4. The Permittee has submitted and is fully implementing an approved Watershed Management Program pursuant to Part VI.C.
 - a. To be considered fully implementing an approved Watershed Management Program, a Permittee must

¹ An outfall may include a manhole or other point of access to the MS4 at the Permittee's jurisdictional boundary.

LA County MS4 Permit – General TMDL Provisions

be implementing actions consistent with the approved program and applicable compliance schedules, including structural BMPs.

- b. Structural storm water BMPs must be designed and maintained to treat storm water runoff from the 85th percentile, 24-hour storm, and maintenance records must be up-to-date and available for inspection by the Los Angeles Water Board.
- c. A Permittee that does not implement the Watershed Management Program in accordance with the milestones and compliance schedules shall demonstrate compliance with its interim water quality-based effluent limitations and/or receiving water limitations pursuant to subpart VI.E.2.d.i.1-3, above.

e. Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations

- i. A Permittee shall be deemed in compliance with an applicable final water quality-based effluent limitation and/or final receiving water limitation for the pollutant(s) associated with a specific TMDL if any of the following is demonstrated:
 - 1. There are no violations of the final water quality-based effluent limitation for the specific pollutant at the Permittee's applicable MS4 outfall(s)²;
 - 2. There are no exceedances of applicable receiving water limitation for the specific pollutant in the receiving water(s) at, or downstream of, the Permittee's outfall(s); or
 - 3. There is no direct or indirect discharge from the Permittee's MS4 to the receiving water during the time period subject to the water quality-based effluent limitation and/or receiving water limitation for the pollutant(s) associated with a specific TMDL.

3. USEPA Established TMDLs

TMDLs established by the USEPA, to which Permittees are subject, do not have an implementation schedule adopted pursuant to Cal. Water Code section 13242. Therefore, a compliance schedule for attaining the water quality-based effluent limitations and/or receiving water limitations is not provided within this Order. However, any Permittee that is subject to water

² Ibid.

LA County MS4 Permit – General TMDL Provisions

quality-based effluent limitations and/or receiving water limitations to implement a USEPA established TMDL may [insert timeframe] request a time schedule order (TSO) pursuant to Cal. Water Code section 13300 for the Regional Water Board's consideration.

- a. Permittees may either individually request a TSO, or may jointly request a TSO with all Permittees subject to the water quality-based effluent limitations and/or receiving water limitations, to implement the WLAs in the USEPA established TMDL.
- b. At a minimum, a request for a TSO shall include the following:
 - i. Data demonstrating the current quality of the MS4 discharge(s) in terms of concentration and/or load of the target pollutant(s) to the receiving waters subject to the TMDL;
 - ii. A detailed time schedule of specific actions the Permittee will take in order to achieve the water quality-based effluent limitations and/or receiving water limitations;
 - iii. A demonstration that the time schedule requested is as short as possible, taking into account the technological, operation, and economic factors that affect the design, development, and implementation of the control measures that are necessary to comply with the water quality-based effluent limitation(s); and
 - iv. If the requested time schedule exceeds one year, the proposed schedule shall include interim requirements and the date(s) for their achievement. The interim requirements shall include both of the following:
 - a. Effluent limitation(s) for the pollutant(s) of concern; and
 - b. Actions and milestones leading to compliance with the effluent limitation(s).
- c. A Permittee that is in compliance with the requirements of a Regional Water Board issued TSO is not considered in violation of the applicable final receiving water limitations and/or water quality-based effluent limitations for the pollutant(s) subject to the provisions in this Part and Attachments X through X.

4. State Adopted TMDLs where Final Compliance Deadlines have Passed

- a. Permittees shall comply immediately with water quality-based effluent limitations and/or receiving water limitations to implement WLAs in state-adopted TMDLs for which final compliance deadlines have passed pursuant to the TMDL implementation schedule.

LA County MS4 Permit – General TMDL Provisions

- b.** Where a Permittee believes that additional time to comply with the final water quality-based effluent limitations and/or receiving water limitations is necessary, a Permittee may [insert timeframe] request a time schedule order (TSO) pursuant to Cal. Water Code section 13300 for the Regional Water Board's consideration.
- c.** Permittees may either individually request a TSO, or may jointly request a TSO with all Permittees subject to the water quality-based effluent limitations and/or receiving water limitations, to implement the WLAs in the state-adopted TMDL.
- d.** At a minimum, a request for a TSO shall include the following:

 - i.** Data demonstrating the current quality of the MS4 discharge(s) in terms of concentration and/or load of the target pollutant(s) to the receiving waters subject to the TMDL;
 - ii.** A detailed description and chronology of structural controls and source control efforts, since the effective date of the TMDL, to reduce the pollutant load in the MS4 discharges to the receiving waters subject to the TMDL;
 - iii.** Justification of the need for additional time to achieve the water quality-based effluent limitations and/or receiving water limitations;
 - iv.** A detailed time schedule of specific actions the Permittee will take in order to achieve the water quality-based effluent limitations and/or receiving water limitations;
 - v.** A demonstration that the time schedule requested is as short as possible, taking into account the technological, operation, and economic factors that affect the design, development, and implementation of the control measures that are necessary to comply with the effluent limitation(s); and
 - vi.** If the requested time schedule exceeds one year, the proposed schedule shall include interim requirements and the date(s) for their achievement. The interim requirements shall include both of the following:

 - a.** Effluent limitation(s) for the pollutant(s) of concern; and
 - b.** Actions and milestones leading to compliance with the effluent limitation(s).
- e.** A Permittee that is in compliance with the requirements of a Regional Water Board issued TSO is not considered in violation of the applicable final receiving water limitations and/or water quality based effluent

LA County MS4 Permit – General TMDL Provisions

limitations for the pollutant(s) subject to the provisions in this Part and Attachments X through X.

5. Water Quality-Based Effluent Limitations for Trash

Permittees assigned a Waste Load Allocation in a trash TMDL shall comply as set forth below.

a. Effluent Limitations: Permittees shall comply with the interim and final water quality-based effluent limitations for trash set forth in Attachments X through X for the following Trash TMDLs:

- i. Lake Elizabeth Trash TMDL
- ii. Santa Monica Bay Nearshore and Offshore Debris TMDL
- iii. Malibu Creek Watershed Trash TMDL
- iv. Ballona Creek Trash TMDL
- v. Machado Lake Trash TMDL
- vi. Los Angeles River Trash TMDL
- vii. Legg Lake Trash TMDL
- viii. Peck Road Park Lake Trash TMDL
- ix. Echo Park Lake Trash TMDL
- x. Lincoln Park Lake Trash TMDL

b. Compliance

i. Pursuant to Water Code section 13360(a), Permittees may comply with the trash effluent limitations using any lawful means. Such compliance options are broadly classified as *full capture*, *partial capture*, *institutional controls*, or *minimum frequency of assessment and collection*, as described below, and any combination of these may be employed to achieve compliance:

(1) Full Capture Systems:

- (a) The Los Angeles Region's Basin Plan authorizes the Executive Officer to certify *full capture systems*, which are systems that meet the operating and performance requirements as described in this Order, and the procedures identified in "Procedures and Requirements for Certification of a Best Management Practice for Trash Control as a Full Capture System." (See Appendix X)³

³ The Los Angeles Water Board currently recognizes eight *full capture systems*. These are: Vortex Separation Systems (VSS) and seven other Executive Officer certified *full capture systems*, including specific types or designs of trash nets; two gross solids removal devices (GSRDs); catch basin brush inserts and mesh screens; vertical and horizontal trash capture screen inserts; and a connector pipe screen device.

LA County MS4 Permit – General TMDL Provisions

- (b) Permittees are authorized to comply with their effluent limitations through certified *full capture systems* provided the requirements of paragraph (c), immediately below, and any conditions in the certification, continue to be met.
- (c) Permittees may comply with their effluent limitations through progressive installation of *full capture systems* throughout their jurisdictional areas until all areas draining to Lake Elizabeth, Malibu Creek, Ballona Creek, Machado Lake, the Los Angeles River system, Legg Lake, Peck Road Park Lake, Echo Park Lake, and/or Lincoln Park Lake are addressed. For purposes of this Order, attainment of the effluent limitations shall be conclusively presumed for any drainage area to Lake Elizabeth, Malibu Creek (and its tributaries), Ballona Creek (and its tributaries), Machado Lake, the Los Angeles River (and its tributaries), Legg Lake, Peck Road Lake, Echo Park Lake, and/or Lincoln Park Lake where certified *full capture systems* treat all drainage from the area, provided that the *full capture systems* are adequately sized and maintained, and that maintenance records are up-to-date and available for inspection by the Regional Water Board.
- (i) A Permittee shall be deemed in compliance with its final effluent limitation if it demonstrates that all drainage areas under its jurisdiction and/or authority are serviced by appropriate certified *full capture systems* as described in paragraph (1)(c).
- (ii) A Permittee shall be deemed in compliance with its interim effluent limitations, where applicable:
1. By demonstrating that *full capture systems* treat the percentage of drainage areas in the watershed that corresponds to the required trash abatement.
 2. Alternatively, a Permittee may propose a schedule for installation of *full capture systems* in areas under its jurisdiction and/or authority within a given watershed, targeting first the areas of greatest trash generation, for the Executive Officer's approval. The Executive Officer shall not approve any such schedule that does not result in timely compliance with the final effluent limitations, consistent with the established TMDL implementation schedule and applicable State policies. A Permittee shall be deemed in compliance with its interim effluent limitations provided it is fully in compliance with any such approved schedule.
- (2) Partial Capture Devices and Institutional Controls: Permittees may comply with their interim and final effluent limitations through the

LA County MS4 Permit – General TMDL Provisions

installation of *partial capture devices* and the application of *institutional controls*.⁴

- (a) Trash discharges from areas serviced solely by *partial capture devices* may be estimated based on demonstrated performance of the device(s) in the implementing area.⁵ That is, trash reduction is equivalent to the *partial capture devices*' trash removal efficiency multiplied by the percentage of drainage area serviced by the devices.
- (b) Except as provided in subdivision (c), immediately below, trash discharges from areas addressed by *institutional controls* and/or *partial capture devices* (where site-specific performance data is not available) shall be calculated using a mass balance approach, based on the daily generation rate (DGR) for a representative area.⁶ The DGR shall be determined from direct measurement of trash deposited in the drainage area during any thirty-day period between June 22nd and September 22nd exclusive of rain events⁷, and shall be re-calculated every year thereafter unless a less frequent period for recalculation is approved by the Executive Officer. The DGR shall be calculated as the total amount of trash collected during this period divided by the length of the collection period.

DGR = (Amount of trash collected during a 30-day collection period⁸) / (30 days)

The DGR for the applicable area under the Permittees' jurisdiction and/or authority shall be extrapolated from that of the representative drainage area(s). A mass balance equation shall be used to estimate the amount of trash discharged during a storm event.⁹ The *Storm Event Trash Discharge* for a given rain event in the Permittee's drainage area shall be calculated by multiplying the number of days since the last street sweeping by the DGR and subtracting the amount of any trash recovered in the catch basins.¹⁰ For each day of a storm event that generates precipitation greater than 0.25 inch, the Permittee shall calculate a *Storm Event Trash Discharge*.

⁴ While interim effluent limitations may be complied with using *partial capture devices*, compliance with final effluent limitations cannot be achieved with the exclusive use of *partial capture devices*.

⁵ Performance shall be demonstrated under different conditions (e.g. low to high trash loading).

⁶ The area(s) should be representative of the land uses and activities within the Permittees' authority and shall be approved by the Executive Officer prior to the 30-day collection period.

⁷ Provided no special events are scheduled that may affect the representative nature of that collection period.

⁸ Between June 22nd and September 22nd

⁹ Amount of trash shall refer to the uncompressed volume (in gallons) or drip-dry weight (in pounds) of trash collected.

¹⁰ Any negative values shall be considered to represent a zero discharge.

LA County MS4 Permit – General TMDL Provisions

Storm Event Trash Discharge = [(Days since last street sweeping*DGR)] – [Amount of trash recovered from catch basins]¹¹

The sum of the *Storm Event Trash Discharges* for the storm year shall be the Permittee's calculated annual trash discharge.

Total Storm Year Trash Discharge = Σ Storm Event Trash Discharges from Drainage Area

- (c) The Executive Officer may approve alternative compliance monitoring approaches for calculating total storm year trash discharge, upon finding that the program will provide a scientifically-based estimate of the amount of trash discharged from the Permittee's MS4.

(3) Combined Compliance Approaches:

Permittees may comply with their interim and final effluent limitations through a combination of *full capture systems*, *partial capture devices*, and *institutional controls*. Where a Permittee relies on a combination of approaches, it shall demonstrate compliance with the interim and final effluent limitations as specified in (1)(c) in areas where *full capture systems* are installed and as specified in (2)(b) in areas where *partial capture devices* and *institutional controls* are applied.

(4) Minimum Frequency of Assessment and Collection Approach:

If allowed in a trash TMDL and approved by the Executive Officer, a Permittee may alternatively comply with its effluent limitations by implementing a program for *minimum frequency of assessment and collection* (MFAC) in conjunction with BMPs. To the satisfaction of the Executive Officer, the MFAC/BMP program must meet the following criteria:

- (a) The MFAC/BMP Program includes an initial minimum frequency of trash assessment and collection and suite of structural and/or nonstructural BMPs. The MFAC/BMP program shall include collection and disposal of all trash found in the receiving water and shoreline. Permittees shall implement an initial suite of BMPs based on current trash management practices in land areas that are found to be sources of trash to the water body. The initial minimum frequency of trash assessment and collection shall be set as specified in the following TMDLs:

- (i) Malibu Creek Watershed Trash TMDL

¹¹ When more than one storm event occurs prior to the next street sweeping the discharge shall be calculated from the date of the last assessment.

LA County MS4 Permit – General TMDL Provisions

- (ii) Machado Lake Trash TMDL
 - (iii) Legg Lake Trash TMDL
 - (b) The MFAC/BMP Program includes reasonable assurances that it will be implemented by the responsible Permittees.
 - (c) MFAC protocols may be based on SWAMP protocols for rapid trash assessment, or alternative protocols proposed by Permittees and approved by the Executive Officer.
 - (d) Implementation of the MFAC/BMP program should include a Health and Safety Program to protect personnel. The MFAC/BMP program shall not require Permittees to access and collect trash from areas where personnel are prohibited.
 - (e) The Executive Officer may approve or require a revised assessment and collection frequency and definition of the critical conditions under the MFAC:
 - (i) To prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections;
 - (ii) To reflect the results of trash assessment and collection;
 - (iii) If the amount of trash collected does not show a decreasing trend, where necessary, such that a shorter interval between collections is warranted; or
 - (iv) If the amount of trash collected is decreasing such that a longer interval between collections is warranted.
 - (f) At the end of the implementation period, a revised MFAC/BMP program may be required if the Executive Officer determines that the amount of trash accumulating between collections is causing nuisance or otherwise adversely affecting beneficial uses.
 - (g) With regard to (4)(e)(i), (4)(e)(ii), or (4)(e)(iii), above, the Executive Officer is authorized to allow responsible Permittees to implement additional structural or non-structural BMPs in lieu of modifying the monitoring frequency.
- ii.** If a Permittee is not in compliance with its applicable interim and/or final effluent limitation as identified in Attachments X through X, then it shall be in violation of this Order.
- (1) A Permittee relying on *partial capture devices* and/or *institutional controls* that has violated its interim and/or final effluent limitation(s) shall be presumed to have violated the applicable limitation for each day of each storm event that generated precipitation greater than 0.25 inch during the applicable storm year, except those storm

LA County MS4 Permit – General TMDL Provisions

days on which it establishes that its cumulative Storm Event Trash Discharges has not exceeded the applicable effluent limitation.

(2) If a Permittee relying on *full capture systems* has failed to demonstrate that the *full capture systems* for any drainage area are adequately sized and maintained, and that maintenance records are up-to-date and available for inspection by the Regional Water Board, and that it is in compliance with any conditions of its certification, shall be presumed to have discharged trash in an amount that corresponds to the percentage of the baseline waste load allocation represented by the drainage area in question.

(a) A Permittee may overcome this presumption by demonstrating (using any of the methods authorized in this Part B(1)(b)) that the actual or calculated discharge for that drainage area is in compliance with the applicable interim or final effluent limitation.

iii. Each Permittee shall be held liable for violations of the effluent limitations assigned to their area. If a Permittee's compliance strategy includes *full or partial capture devices* and it chooses to install a full or partial capture device in the MS4 physical infrastructure of another public entity, it is responsible for obtaining all necessary permits to do so. If a Permittee believes it is unable to obtain the permits needed to install a full capture or partial capture device within another Permittee's MS4 physical infrastructure, either Permittee may request the Executive Officer to hold a conference with the Permittees. Nothing in this Order shall affect the right of that public entity or a Permittee to seek indemnity or other recourse from the other as they deem appropriate. Nothing in this subsection shall be construed as relieving a Permittee of any liability that the Permittee would otherwise have under this Order.

c. Monitoring and Reporting Requirements (pursuant to Water Code section 13383)

i. Each Permittee shall submit a TMDL Compliance Report as part of its Annual Report detailing compliance with the applicable interim and/or final effluent limitations. Reporting shall include the information specified below. The report shall be submitted on the reporting form specified by the Regional Water Board Executive Officer. The report shall be signed under penalty of perjury by the Permittee's Director or other agency head (or their delegee) that is responsible for ensuring compliance with this Order. Each Permittee shall be charged with and shall demonstrate compliance with its applicable effluent limitations beginning with its October 31, 2012 TMDL Compliance Report.

(1) Reporting Compliance based on Full Capture Systems: Permittees shall provide information on the number and location of full capture

LA County MS4 Permit – General TMDL Provisions

installations, the sizing of each full capture installation, the drainage areas addressed by these installations, and compliance with the applicable interim or final effluent limitation, in its TMDL Compliance Report. The Los Angeles Water Board will periodically audit sizing, performance, and other data to validate that a system satisfies the criteria established for a *full capture system* and any conditions established by the Executive Officer in the certification.

(2) Reporting Compliance based on Partial Capture Systems and/or Institutional Controls:

(a) Using Performance Data Specific to the Permittee's Area: In its TMDL Compliance Report, a Permittee shall provide: (i) site-specific performance data for the applicable device(s); (ii) information on the number and location of such installations, and the drainage areas addressed by these installations; and (iii) calculated compliance with the applicable effluent limitations.

(b) Using Direct Measurement of Trash Discharge: Permittees shall provide an accounting of DGR and trash removal via street sweeping, catch basin clean outs, etc., in a database to facilitate the calculation of discharge for each rain event. The database shall be maintained and provided to the Regional Water Board for inspection upon request. In its TMDL Compliance Report, a Permittee shall provide information on its annual DGR, calculated storm year discharge, and compliance with the applicable effluent limitation.

(3) Reporting Compliance based on Combined Compliance Approaches:

Permittees shall provide the information specified in subsection (a) for areas where *full capture systems* are installed and that are specified in subsection (b)(1) or (b)(2), as appropriate, for areas where *partial capture devices* and *institutional controls* are applied. In its TMDL Compliance Report, a Permittee shall also provide information on compliance with the applicable effluent limitation based on the combined compliance approaches.

(4) Reporting Compliance based on an MFAC/BMP Approach:

The MFAC/BMP Program includes a Trash Monitoring and Reporting Plan, and a requirement that the responsible Permittees will self-report any non-compliance with its provisions. The results and report of the Trash Monitoring and Reporting Plan must be submitted to Regional Board with the Permittee's Annual Report.

- ii. Violation of the reporting requirements of this Part shall be punishable pursuant to, inter alia, California Water Code section 13385, subdivision (a)(3), and/or section 13385.1, subdivision (a)(1).

ATTACHMENT I. PERMITTEES AND TMDLS MATRIX

WORKING PROPOSAL

LA County MS4 Permit – TMDL Provisions for the Santa Clara River WMA

A. TMDLs in the Santa Clara River Watershed Management Area (WMA)

1. Santa Clara River Nitrogen Compounds TMDL

- a) Permittees subject to the provisions below are identified in Table A.
- b) Permittees shall comply with the following water quality-based effluent limitations for discharges to the Santa Clara River Reach 5¹ as of the effective date of this Order:

Constituent	Effluent Limitations (mg/L)	
	1-hour Average	30-day Average
Total Ammonia as Nitrogen	5.2	1.75
Nitrate as Nitrogen plus Nitrite as Nitrogen	--	6.8

2. Upper Santa Clara River Chloride TMDL

- a) Permittees subject to the provisions below are identified in Table A.
- b) Permittees shall comply with the following water quality-based effluent limitation for discharges to the Santa Clara River Reaches 5 and 6 as of the effective date of this Order:

Constituent	Effluent Limitation Instantaneous Maximum (mg/L)
Chloride	100

3. Lake Elizabeth Trash TMDL

- a) Permittees subject to the provisions below are identified in Table A.
- b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Lake Elizabeth no later than March 6, 2016 and every year thereafter.
- c) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged to Lake Elizabeth, per the schedule below:

Deadline	Effluent Limitation	
	Drainage Area covered by Full Capture Systems (%)	Annual Trash Discharge (gal/yr)
Baseline	0	529
March 6, 2012	20	423
March 6, 2013	40	317
March 6, 2014	60	212
March 6, 2015	80	106
March 6, 2016	100	0

¹ The Basin Plan Chapter 7-9 Santa Clara River Nitrogen Compounds TMDL uses the USEPA Santa Clara River reach designations. The USEPA's Santa Clara River Reach 7 corresponds to Santa Clara River Reach 5 in the Los Angeles Region's Basin Plan Chapter 2.

LA County MS4 Permit – TMDL Provisions for the Santa Clara River WMA

- d) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [Permit Provisions to Implement Trash TMDLs].

4. Santa Clara River Indicator Bacteria TMDL

- a) Permittees subject to the provisions below are identified in Table A.
- b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to the Santa Clara River Reaches 5, 6 and 7 during dry weather no later than March 21, 2023 and during wet weather² no later than March 21, 2029:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
E. coli	235/100 mL	126/100 mL

c) Receiving Water Limitations

- (1) Permittees shall comply with the following grouped interim bacteria receiving water limitations for the Santa Clara River Reaches 5, 6, and 7:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)		Deadline
	Daily Sampling	Weekly Sampling	
Dry Weather	17	3	March 21, 2016
Wet Weather	61	9	March 21, 2016

- (2) Permittees shall comply with the following grouped final bacteria receiving water limitations for the Santa Clara River Reaches 5, 6, and 7:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)		Deadline
	Daily Sampling	Weekly Sampling	
Dry Weather	5	1	March 21, 2023
Wet Weather	16	3	March 21, 2029

- (3) Permittees shall comply with the following geometric mean receiving water limitation for the Santa Clara River Reaches 5, 6, and 7 during dry weather no later than March 21, 2023 and during wet weather no later than March 21, 2029:

Constituent	Geometric Mean (MPN or cfu)
E. coli	126/100 mL

² Wet weather is defined as days with 0.1 inch of rain or more and the three days following the rain event.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

B. TMDLs in the Santa Monica Bay Watershed Management Area

1. Santa Monica Bay Beaches Bacteria TMDL

- a) Permittees subject to the provisions below are identified in Table B-1.
- b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Santa Monica Bay beaches during dry weather as of the effective date of this Order and during wet weather no later than July 15, 2013¹:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

c) Receiving Water Limitations

- (1) If an approved Integrated Water Resources Approach is implemented, each defined jurisdictional group shall comply with the interim single sample bacteria receiving water limitations for shoreline monitoring stations within their jurisdictional area during wet weather, per the schedule below:

Deadline	Cumulative percentage reduction from the total exceedance day reductions required for each jurisdictional group as identified in Table 1
July 15, 2013	25%
July 15, 2018	50%

¹ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

Table 1: Interim Single Sample Bacteria Receiving Water Limitations by Jurisdictional Group

Jurisdiction Group	Primary Jurisdiction	Additional Responsible Jurisdictions & Agencies*	Subwatershed(s)	Monitoring Site(s)	Interim Single Sample Bacteria Receiving Water Limitations as Maximum Allowable Exceedance Days during Wet Weather (days)		
					10% Reduction Milestone	25% Reduction Milestone	50% Reduction Milestone

Jurisdiction Group	Primary Jurisdiction	Additional Responsible Jurisdictions & Agencies*	Subwatershed(s)	Monitoring Site(s)	Interim Single Sample Bacteria Receiving Water Limitations as Maximum Allowable Exceedance Days during Wet Weather (days)		
					10% Reduction Milestone	25% Reduction Milestone	50% Reduction Milestone
7	Rancho Palos Verdes	City of Los Angeles Palos Verdes Estates Redondo Beach Rolling Hills Rolling Hills Estates Torrance County of Los Angeles	Palos Verdes Peninsula	SMB 7-1 [#] , SMB 7-2 [#] , SMB 7-3 [#] , SMB 7-4 [#] , SMB 7-5 [#] , SMB 7-6 [#] , SMB 7-7, SMB 7-8 [#] , SMB 7-9 [#]	36	36	36

For those beach monitoring locations subject to the antidegradation provision, there shall be no increase in exceedance days during the implementation period above that estimated for the beach monitoring location in the critical year as identified below in Section B.1.c)(4).

* The California Department of Transportation (Caltrans) is a responsible agency in each Jurisdiction Group. Caltrans will be required under the Statewide Storm Water Permit for State of California Department of Transportation to jointly complying with the allowable number of exceedance days.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- (2) Permittees shall comply with the following grouped² final single sample bacteria receiving water limitations for all shoreline monitoring stations along Santa Monica Bay beaches, except for those monitoring stations subject to antidegradation provision, during dry weather as of the effective date of this Order and during wet weather no later than July 15, 2013³:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily Sampling	Weekly Sampling
Summer Dry-Weather (April 1 to October 31)	0	0
Winter Dry-Weather (November 1 to March 31)	3	1
Wet Weather ⁴	17	3

- (3) Permittees shall comply with the following grouped² final single sample bacteria receiving water limitations for shoreline monitoring stations along Santa Monica Bay beaches subject to the antidegradation provision as of the effective date of this Order:

Station ID	Beach Monitoring Location	Annual Allowable Exceedance Days of the Single Sample Objective (days)			
		Winter Dry Weather (November 1 – March 31)		Wet Weather (November 1 – October 31)	
		Daily Sampling	Weekly Sampling	Daily Sampling	Weekly Sampling
SMB 1-4	Trancas Creek at Broad Beach	0	0	17	3
SMB 1-5	Zuma Creek at Zuma Beach	0	0	17	3
SMB 2-13	Imperial Highway storm drain	2	1	17	3
SMB 3-8	Windward Ave. storm drain at Venice Pavilion	2	1	13	2
SMB 4-1	San Nicholas Canyon Creek at Nicholas Beach	0	0	14	2
SMB 5-1	Manhattan Beach at 40th Street	1	1	4	1
SMB 5-2	28th Street storm drain at Manhattan Beach	0	0	17	3
SMB 5-3	Manhattan Beach Pier	1	1	5	1
SMB 5-4	Hermosa City Beach at 26th St.	3	1	12	2
SMB 5-5	Hermosa Beach Pier, southern drain	2	1	8	2
SMB 6-2	Redondo Municipal Pier- 100 yards south	3	1	14	2
SMB 6-5	Avenue I storm drain at Redondo Beach	3	1	6	1
SMB 6-6	Malaga Cove, Palos Verdes Estates	1	1	3	1

² The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 permittees and Caltrans.

³ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

⁴ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

		Annual Allowable Exceedance Days of the Single Sample Objective (days)			
Station ID	Beach Monitoring Location	Winter Dry Weather (November 1 – March 31)		Wet Weather (November 1 – October 31)	
		Daily Sampling	Weekly Sampling	Daily Sampling	Weekly Sampling
SMB 7-1	Malaga Cove, Palos Verdes Estates	1	1	14	2
SMB 7-2	Bluff Cove, Palos Verdes Estates	1	1	0	0
SMB 7-3	Long Point, Rancho Palos Verdes	1	1	5	1
SMB 7-4	Abalone Cove, Rancho Palos Verdes	0	0	1	1
SMB 7-5	Portuguese Bend Cove, Rancho Palos Verdes	1	1	2	1
SMB 7-6	White's Point, Royal Palms County Beach	1	1	6	1
SMB 7-8	Point Fermin/Wilder Annex, San Pedro	1	1	2	1
SMB 7-9	Outer Cabrillo Beach	1	1	3	1

- (4) Permittees shall comply with the following geometric mean receiving water limitations for all shoreline monitoring stations along Santa Monica Bay beaches during dry weather as of the effective date of this Order and during wet weather no later than July 15, 2013⁵:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

2. Santa Monica Bay Nearshore and Offshore Debris TMDL

- a) Permittees subject to the provisions below are identified in Table B-1.
- b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged into water bodies within the Santa Monica Bay WMA and then into Santa Monica Bay or on the shoreline of Santa Monica Bay no later than March 20, 2020, and every year thereafter.
- c) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged into Santa Monica Bay or on the shoreline of Santa Monica Bay, per the schedule below:

Permittees	Baseline	Mar 20, 2016 (80%)	Mar 20, 2017 (60%)	Mar 20, 2018 (40%)	Mar 20, 2019 (20%)	Mar 20, 2020 (0%)
		Annual Trash Discharge (gals/yr)				

⁵ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

- d) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [*Permit Provisions to Implement Trash TMDLs*].

3. Santa Monica Bay TMDL for DDTs and PCBS (U.S. EPA established)

- a) Permittees subject to the provisions below are identified in Table B-1.
- b) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order, expressed as an annual loading of pollutants from the sediment discharged to Santa Monica Bay:

Constituent	Annual Mass-Based Effluent Limitations (g/yr)
DDT	27.08
PCBs	140.25

- c) Compliance shall be determined based on a three-year averaging period.

4. TMDLs in the Malibu Creek Subwatershed

- a) Malibu Creek and Lagoon Bacteria TMDL

- (1) Permittees subject to the provisions below are identified in Table B-1.

⁶ Permittees shall be deemed in compliance with the water quality-based effluent limitation for trash established by the Santa Monica Bay Nearshore and Offshore Debris TMDL, if the Permittee is in compliance with the water quality-based effluent limitations established by the Malibu Creek Watershed Trash TMDL.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

(2) Water Quality-Based Effluent Limitations

- (i) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Malibu Lagoon during dry weather as of the effective date of this Order, and during wet weather no later than January 24, 2016:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

- (ii) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Malibu Creek and its tributaries during dry weather as of the effective date of this Order, and during wet weather no later than January 24, 2016:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
E. coli	235/100 mL	126/100 mL

(3) Receiving Water Limitations

- (i) Permittees shall comply with the following grouped⁷ final single sample bacteria receiving water limitations for Malibu Creek, its tributaries, and Malibu Lagoon during dry weather as of the effective date of this Order, and during wet weather no later than January 24, 2016⁸:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily Sampling	Weekly Sampling
Summer Dry-Weather (April 1 to October 31)	0	0
Winter Dry-Weather (November 1 to March 31)	3	1
Wet Weather ⁹	17	3

- (ii) Permittees shall comply with the following geometric mean receiving water limitations for discharges to Malibu Lagoon during dry weather

⁷ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 permittees, Ventura MS4 permittees and Caltrans.

⁸ The Regional Water Board may extend the wet weather compliance date up to July 15, 2021, at the Regional Water Board's discretion.

⁹ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

as of the effective date of this Order, and during wet weather no later than January 24, 2016:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

(iii) Permittees shall comply with the following geometric mean receiving water limitation for discharges to Malibu Creek and its tributaries during dry weather as of the effective date of this Order, and during wet weather no later than January 24, 2016:

Constituent	Geometric Mean (MPN or cfu)
E. coli	126/100 mL

b) Malibu Creek Watershed Trash TMDL

- (1) Permittees subject to the provisions below are identified in Table B-1.
- (2) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Malibu Creek from Malibu Lagoon to Malibu Lake, Malibu Lagoon, Malibu Lake, Medea Creek, Lindero Creek, Lake Lindero, and Las Virgenes Creek in the Malibu Creek Watershed no later than July 7, 2017 and every year thereafter.
- (3) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged to the Malibu Creek, per the schedule below:

Permittees	Baseline	July 7, 2013 (80%)	July 7, 2014 (60%)	July 7, 2015 (40%)	July 7, 2016 (20%)	July 7, 2017 (0%)
	Annual Trash Discharge (gals/yr)					
Agoura Hills	1810	1448	1086	724	362	0
Calabasas	673	539	404	269	135	0
Hidden Hills	71	57	43	28	14	0
Los Angeles County	1117	894	670	447	223	0
Malibu	226	181	136	91	45	0
Westlake Village	143	114	86	57	29	0

- (4) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [Permit Provisions to Implement Trash TMDLs].

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- c) Malibu Creek Watershed Nutrients TMDL (USEPA established)
 - (1) Permittees subject to the provisions below are identified in Table B-1.
 - (2) Permittees shall comply with the following grouped¹⁰ water quality-based effluent limitations as of the effective date of this Order for discharges to Westlake Lake, Lake Lindero, Lindero Creek, Las Virgenes Creek, Medea Creek, Malibou Lake, Malibu Creek and Malibu Lagoon and its tributaries. Tributaries to Malibu Creek and Lagoon, include the following upstream water bodies; Triunfo Creek, Palo Comado Creek, Cheesebro Creek, Strokes Creek and Cold Creek.

Time Period	Effluent Limitations	
	Nitrate as Nitrogen plus Nitrite as Nitrogen	Total Phosphorus
	Daily Maximum	Daily Maximum
Summer (April 15 to November 15)	3 lbs/day	0.3 lbs/day
Winter (November 16 to April 14)	8 mg/L	n/a

5. TMDLs in the Ballona Creek Subwatershed

- a) Ballona Creek Trash TMDL
 - (1) Permittees subject to the provisions below are identified in Table B-2.
 - (2) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Ballona Creek no later than September 30, 2015 and every year thereafter.
 - (3) Permittees shall comply with the interim and final water quality-based effluent limitations for trash discharged to Ballona Creek, per the schedule below:

Ballona Creek Subwatershed Trash Effluent Limitations per Storm Year¹¹ (pounds of drip-dry trash)

Permittees	Baseline	Sept 30, 2012	Sept 30, 2013	Sept 30, 2014	Sept 30, 2015 ¹²
		(20%)	(10%)	(3.3%)	(0%)
Annual Trash Discharge (pounds of trash)					
Beverly Hills	79,914	15,983	7,991	2,637	0
Culver City	36,509	7,302	3,651	1,205	0
Inglewood	21,564	4,313	2,156	712	0
Los Angeles, City of	950,238	190,048	95,024	31,358	0

¹⁰ USEPA was unable to specifically distinguish the amounts of pollutant loads from allocation categories associated with areas regulated by the storm water permits. Therefore, allocations for storm water permits are grouped.

¹¹ Storm year is defined as October 1 to September 30 herein.

¹² Permittees shall achieve their final effluent limitation of zero trash discharge for the 2014-2015 storm year and every year thereafter.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

Los Angeles, County of	57,920	11,584	5,792	1,911	0
Santa Monica	2,299	460	230	76	0
West Hollywood	13,018	2,604	1,302	430	0

Ballona Creek Subwatershed Trash Effluent Limitations per Storm Year (gallons of uncompressed trash)

Permittees	Baseline	Sept 30, 2012 (20%)	Sept 30, 2013 (10%)	Sept 30, 2014 (3.3%)	Sept 30, 2015 (0%)
		Annual Trash Discharge (pounds of trash)			
Beverly Hills	79,914	15,983	7,991	2,637	0
Culver City	36,509	7,302	3,651	1,205	0
Inglewood	21,564	4,313	2,156	712	0
Los Angeles, City of	950,238	190,048	95,024	31,358	0
Los Angeles, County of	57,920	11,584	5,792	1,911	0
Santa Monica	2,299	460	230	76	0
West Hollywood	13,018	2,604	1,302	430	0

- (4) Seventy-two (72) hours after each rain event, Permittees shall clean out and measure trash retained.
- (5) Every 3 months during dry weather, Permittees shall clean out and measure trash retained.
- (6) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in a)(2) and a)(3) above per the provisions in Part 7.X [*Permit Provisions to Implement Trash TMDLs*].

b) Ballona Creek Estuary Toxic Pollutants TMDL

- (1) Permittees subject to the provisions below are identified in Table B-2.
- (2) Permittees shall comply with the following final water quality-based effluent limitations no later than January 11, 2021, expressed as an annual loading of pollutants from the sediment discharged to Ballona Creek Estuary:

Constituent	Effluent Limitations	
	Annual	Units
Cadmium	8.0	kg/yr
Copper	227.3	kg/yr
Lead	312.3	kg/yr
Silver	6.69	kg/yr
Zinc	1003	kg/yr
Chlordane	3.34	g/yr

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

DDTs	10.56	g/yr
Total PCBs	152	g/yr
Total PAHs	26,900	g/yr

- (3) Permittees shall comply with interim and final water quality-based effluent limitations for pollutant loads from sediments discharged to Ballona Creek Estuary, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the water quality-based effluent limitations (%)
January 11, 2013	25
January 11, 2015	50
January 11, 2017	75
January 11, 2021	100

c) Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL

- (1) Permittees subject to the provisions below are identified in Table B-2.
 (2) Water Quality-Based Effluent Limitations

- (i) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Ballona Creek Estuary; Ballona Creek Reach 2 at the confluence with Ballona Creek Estuary; and Centinela Creek at the confluence with Ballona Creek Estuary during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

- (ii) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Sepulveda Channel during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
E. coli	235/100 mL	126/100 mL

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- (iii) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Ballona Creek Reach 2; Ballona Creek Reach 1 at the confluence with Ballona Creek Reach 2; and Benedict Canyon Channel at the confluence with Ballona Creek Reach 2 during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
E. coli	576/100 mL	126/100 mL

- (iv) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Ballona Creek Reach 1 during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
Fecal coliform	4000/100 mL	2000/100 mL

(3) Receiving Water Limitations

- (i) Permittees shall comply with the following grouped¹³ single sample bacteria receiving water limitations for Ballona Creek Estuary; Ballona Creek Reach 2 at the confluence with Ballona Creek Estuary; Centinela Creek at the confluence with Ballona Creek Estuary; Ballona Creek Reach 2; Ballona Creek Reach 1 at the confluence with Reach 2; Benedict Canyon Channel at the confluence with Ballona Creek Reach 2; and Sepulveda Channel:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective		Deadline
	Daily Sampling	Weekly Sampling	
Summer Dry-Weather (April 1 to October 31)	0	0	April 27, 2013
Winter Dry-Weather (November 1 to March 31)	3	1	April 27, 2013
Wet Weather ¹⁴	17*	3	April 27, 2017 ¹⁵

* In Ballona Creek Reach 2 and at the confluence with Reach 2, the greater of the allowable exceedance days under the reference system approach or high flow suspension shall apply.

- (ii) Permittees shall not exceed the single sample bacteria objective of 4000/100 ml in more than 10% of the samples collected from

¹³ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees and Caltrans.

¹⁴ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

¹⁵ The Regional Water Board may extend the wet weather compliance date up to July 15, 2021, at the Regional Water Board's discretion.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

Ballona Creek Reach 1 during any 30-day period. Permittees shall achieve compliance with this receiving water limitation during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017.

- (iii) Permittees shall comply with the following geometric mean receiving water limitations for discharges to Ballona Creek Estuary; Ballona Creek Reach 2 at the confluence with Ballona Creek Estuary; and Centinela Creek at the confluence with Ballona Creek Estuary during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

- (iv) Permittees shall comply with the following geometric mean receiving water limitation for discharges to Ballona Creek Reach 2; Ballona Creek Reach 1 at the confluence with Ballona Creek Reach 2; Benedict Canyon Channel at the confluence with Ballona Creek Reach 2; and Sepulveda Channel during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Geometric Mean (MPN or cfu)
E. coli	126/100 mL

- (v) Permittees shall comply with the following geometric mean receiving water limitation for discharges to Ballona Creek Reach 1 during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Geometric Mean (MPN or cfu)
Fecal coliform	2000/100 mL

d) Ballona Creek Metals TMDL

- (1) Permittees subject to the provisions below are identified in Table B-2.
- (2) Final Water Quality-Based Effluent Limitations

- (i) Permittees shall comply with the following dry weather¹⁶ water quality-based effluent limitations no later than January 11, 2016, expressed as total recoverable metals discharged to Ballona Creek and Sepulveda Channel:

¹⁶ Dry weather is defined as any day when the maximum daily flow in Ballona Creek is less than 40 cubic feet per second (cfs) measured at Sawtelle Avenue.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

Constituent	Effluent Limitation Daily Maximum (g/day)	
	Ballona Creek	Sepulveda Channel
Copper	807.7	365.6
Lead	432.6	196.1
Selenium	169	76
Zinc	10,273.1	4,646.4

- (ii) In lieu of calculating loads, Permittees may demonstrate compliance with the following concentration-based water quality-based effluent limitations during dry weather¹⁷ no later than January 11, 2016, expressed as total recoverable metals discharged to Ballona Creek and Sepulveda Channel:

Constituent	Effluent Limitation Daily Maximum (µg/L)
Copper	24
Lead	13
Selenium	5
Zinc	304

- (iii) Permittees shall comply with the following wet weather¹⁸ water quality-based effluent limitations no later than January 11, 2021, expressed as total recoverable metals discharged to Ballona Creek and its tributaries:

Constituent	Effluent Limitation Daily Maximum (g/day)
Copper	1.70×10^{-5} x daily storm volume (L)
Lead	5.58×10^{-5} x daily storm volume (L)
Selenium	4.73×10^{-6} x daily storm volume (L)
Zinc	1.13×10^{-4} x daily storm volume (L)

¹⁷ *Ibid.*

¹⁸ Wet weather is defined as any day when the maximum daily flow in Ballona Creek is equal to or greater than 40 cubic feet per second (cfs) measured at Sawtelle Avenue.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- (3) Permittees shall comply with interim and final water quality-based effluent limitations for metals discharged to Ballona Creek and its tributaries, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the water quality-based effluent limitations (%)	
	Dry weather	Wet weather
January 11, 2012	50	25
January 11, 2014	75	--
January 11, 2016	100	50
January 11, 2021	100	100

- e) Ballona Creek Wetlands TMDL for Sediment and Invasive Exotic Vegetation (USEPA established)

- (1) Permittees subject to the provisions below are identified in Table B-2.
- (2) Permittees shall comply with the following grouped¹⁹ water quality-based effluent limitations as of the effective date of this Order for discharges of sediment into Ballona Creek Wetlands:

Constituent	Annual Effluent Limitation (m ³ /yr)
Total Sediment (suspended sediment plus sediment bed load)	44,615

6. TMDLs in Marina del Rey Subwatershed

- a) Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL

- (1) Permittees subject to the provisions below are identified in Table B-2.
- (2) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Marina del Rey Harbor Beach and Back Basins D, E, and F during dry weather as of the effective date of this Order, and during wet weather no later than March 18, 2014²⁰:

¹⁹ The water quality-based effluent limitation is group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees and Caltrans.

²⁰ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

(3) Receiving Water Limitations

- (i) Permittees shall comply with the following grouped²¹ final single sample bacteria receiving water limitations for all monitoring stations at Marina Beach and Basins D, E, and F, except for those monitoring stations subject to the antidegradation provisions, during dry weather as of the effective date of this Order and during wet weather no later than March 18, 2014²².

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily Sampling	Weekly Sampling
Summer Dry-Weather (April 1 to October 31)	0	0
Winter Dry-Weather (November 1 to March 31)	3	1
Wet Weather ²³	17	3

- (ii) Permittees shall comply with the following grouped²⁴ final single sample bacteria receiving water limitations for monitoring stations in Marina del Rey subject to the antidegradation provision as of the effective date of this Order:

Station ID	Monitoring Location	Annual Allowable Exceedance Days of the Single Sample Objective (days)			
		Winter Dry Weather (November 1 – March 31)		Wet Weather (November 1 – October 31)	
		Daily Sampling	Weekly Sampling	Daily Sampling	Weekly Sampling
MdRH-9	Basin F, center of basin	3	1	8	1

²¹ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees and Caltrans.

²² If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

²³ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

²⁴ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees and Caltrans.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- (iii) Permittees shall comply with the following geometric mean receiving water limitations for monitoring stations at Marina Beach and Basins D, E, and F during dry weather as of the effective date of this Order, and during wet weather no later than March 18, 2014²⁵:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

b) Marina del Rey Harbor Toxic Pollutants TMDL

- (1) Permittees subject to the provisions below are identified in Table B-2.
- (2) Permittees shall comply with the following final water quality-based effluent limitations no later than March 22, 2016²⁶, expressed as an annual loading of pollutants from the sediment discharged to Marina del Rey Harbor Back Basins D, E, and F:

Constituent	Effluent Limitations	
	Annual	Units
Copper	2.01	kg/yr
Lead	2.75	kg/yr
Zinc	8.85	kg/yr
Chlordane	0.0295	g/yr
Total PCBs	1.34	g/yr

- (3) Permittees shall comply with interim and final water quality-based effluent limitations for pollutant loads from sediments discharged to Marina del Rey Harbor Back Basins D, E, and F, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the effluent limitations (%)
March 22, 2014	50
March 22, 2016	100

- (4) If an approved Integrated Water Resources Approach is implemented, Permittees shall comply with interim and final water quality-based effluent

²⁵ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

²⁶ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented then the Permittees shall comply with the final water quality-based effluent limitations no later than March 22, 2021.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

limitations for pollutant loads from sediments discharged to Marina del Rey Harbor Back Basins D, E, and F, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the effluent limitations (%)
March 22, 2013	25
March 22, 2015	50
March 22, 2017	75
March 22, 2021	100

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

C. TMDLs in Dominguez Channel and Greater Harbor Waters Watershed Management Area

1. Los Angeles Harbor Bacteria TMDL (Inner Cabrillo Beach and Main Ship Channel)
 - a) Permittees subject to the provisions below are identified in Table C.
 - b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to the Los Angeles Harbor Main Ship Channel, Los Angeles and Long Beach Inner Harbor, and Inner Cabrillo Beach as of the effective date of this Order:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

- c) Receiving Water Limitations
 - (1) Permittees shall comply with the following final single sample bacteria receiving water limitations for the Los Angeles Harbor Main Ship Channel and Inner Cabrillo Beach:

Time Period	Receiving Water	Compliance Monitoring Location	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
			Daily sampling	Weekly sampling
Summer Dry-Weather (April 1 to October 31)	Inner Cabrillo Beach	CB1 & CB2	0	0
	Main Ship Channel	HW07	0	0
Winter Dry-Weather (November 1 to March 31)	Inner Cabrillo Beach	CB1 & CB2	0	0
	Main Ship Channel	HW07	3	1
Wet Weather ¹	Inner Cabrillo Beach	CB1 & CB2	0	0
	Main Ship Channel	HW07	15	3

- (2) Permittees shall comply with the following geometric mean receiving water limitations for the Los Angeles Harbor Main Ship Channel, Los Angeles and Long Beach Inner Harbor, and Inner Cabrillo Beach at all times:

¹ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

Constituent	Geometric Mean
Total coliform	1,000 MPN/100 mL
Fecal coliform	200 MPN/100 mL
Enterococcus	35 MPN/100 mL

2. Machado Lake Trash TMDL

- a) Permittees subject to the provisions below are identified in Table C.
- b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Machado Lake no later than March 6, 2016, and every year thereafter.
- c) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged to Machado Lake, per the schedule below:

Machado Lake Trash Water Quality-Based Effluent Limitations (gallons of uncompressed trash per year)

Permittees	Baseline ²	3/6/2012 (80%)	3/6/2013 (60%)	3/6/2014 (40%)	3/6/2015 (20%)	3/6/2016 ³ (0%)
		Annual Trash Discharge (gallons/yr)				
Carson	8141.47	6513.18	4884.88	3256.59	1628.29	0
Lomita	9392.99	7514.39	5635.79	3757.20	1878.60	0
City of Los Angeles	12331.17	9864.94	7398.70	4932.47	2466.23	0
Los Angeles County	8304.02	6643.22	4982.41	3321.61	1660.80	0
Los Angeles County Flood Control District	16.41	13.13	9.85	6.56	3.28	0
Palos Verdes Estates	1976.33	1581.06	1185.80	790.53	395.27	0
Rancho Palos Verdes	5226.71	4181.37	3136.03	2090.68	1045.34	0
Redondo Beach	18.16	14.53	10.90	7.26	3.63	0
Rolling Hills	3001.09	2400.87	1800.65	1200.44	600.22	0
Rolling Hills Estates	6498.83	5199.06	3899.30	2599.53	1299.77	0
Torrance	34808.97	27847.18	20885.38	13923.59	6961.79	0

- d) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 2(b) and 2(c) above per the provisions in Part 7.X [*Permit Provisions to Implement Trash TMDLs*].
- e) If a Permittee opts to derive a site specific trash generation rate through its Trash Monitoring and Reporting Plan (TMRP), the baseline limitation will be calculated by multiplying the point source area(s) by the derived trash generation rate(s).

² The Regional Water Board has determined the following baseline water quality-based effluent limitations for the Permittees based on the estimated trash generation rate of 5334 gallons of uncompressed trash per square mile per year.

³ Permittees shall achieve their final effluent limitation of zero trash discharge for the 2015-2016 storm year and every year thereafter.

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

3. Machado Lake Nutrient TMDL

- a) Permittees subject to the provisions below are identified in Table C.
- b) Permittees shall comply with the following interim and final water quality-based effluent limitations for discharges to Machado Lake:

Deadline	Interim and Final Effluent Limitations	
	Monthly Average Total Phosphorus (mg/L)	Monthly Average Total Nitrogen (TKN+NO ₃ -N+NO ₂ -N) (mg/L)
As of the effective date of this Order	1.25	3.5
March 11, 2014	1.25	2.45
September 11, 2018	0.10	1.0

c) Compliance Determination

- (1) Permittees may be deemed in compliance with the water quality-based effluent limitations by actively participating in a Lake Water Quality Management Plan (LWQMP) and attaining the receiving water limitations for Machado Lake. The City of Los Angeles has entered into a Memorandum of Agreement with the Regional Water Board to implement the LWQMP and reduce external nutrient loading to attain the following receiving water limitations:

Deadline	Interim and Final Receiving Water Limitations	
	Monthly Average Total Phosphorus (mg/L)	Monthly Average Total Nitrogen (TKN+NO ₃ -N+NO ₂ -N) (mg/L)
As of the effective date of this Order	1.25	3.5
March 11, 2014	1.25	2.45
September 11, 2018	0.10	1.0

- (2) Permittees may be deemed in compliance with water quality-based effluent limitations by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee's drainage area. The annual mass-based allocation shall be equal to a monthly average concentrations of 0.1 mg/L total phosphorous and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees must demonstrate total nitrogen and total phosphorous load reductions to be achieved in accordance with a special study work plan approved by the Executive Officer.

- (i) The County of Los Angeles submitted a special study work plan, which was approved by the Executive Officer, and established the following annual mass-based water quality based effluent limitations:

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

Deadline	Interim and Final Effluent Limitations	
	Annual Load Total Phosphorus (kg)	Annual Load Total Nitrogen (TKN+NO ₃ -N+NO ₂ -N) (kg)
March 11, 2014	887	1739
September 11, 2018	71	710

- (ii) The City of Torrance submitted a special study work plan, which was approved by the Executive Officer, and established the following annual mass-based water quality based effluent limitations:

Deadline	Interim and Final Effluent Limitations	
	Annual Load Total Phosphorus (kg)	Annual Load Total Nitrogen (TKN+NO ₃ -N+NO ₂ -N) (kg)
March 11, 2014	3,760	7,370
September 11, 2018	301	3008

4. Machado Lake Pesticides and PCBs TMDL

- a) Permittees subject to the provisions below are identified in Table C.
- b) Permittees shall comply with the following water quality-based effluent limitations for discharges of suspended sediments to Machado Lake, applied as a 3-year average no later than September 30, 2019:

Pollutant	Effluent Limitations for Suspended Sediment-Associated Contaminants (µg/kg dry weight)
Total PCBs	59.8
DDT (all congeners)	4.16
DDE (all congeners)	3.16
DDD (all congeners)	4.88
Total DDT	5.28
Chlordane	3.24
Dieldrin	1.9

5. Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters Toxic Pollutants TMDL

- a) Permittees subject to the provisions below are identified in Table C.
- b) Permittees shall comply with the following interim water quality-based effluent limitations for discharges to Dominguez Channel and Torrance Lateral listed below as of the effective date of this Order:
 - (1) Dominguez Channel Freshwater – Wet Weather

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

- (i) Freshwater Toxicity Interim Effluent Limitation shall not exceed the monthly median of 2 TUc.
- (ii) Permittees shall comply with the following interim metals water quality-based effluent limitations for discharges to the Dominguez Channel and Torrance Lateral:

Metals	Interim Effluent Limitation Daily Maximum (µg/L)
Total Copper	207.51
Total Lead	122.88
Total Zinc	898.87

- (2) Permittees shall comply with the following interim concentration-based water quality-based effluent limitations for pollutant concentrations in the sediment discharged to the Dominguez Channel Estuary and Greater Los Angeles and Long Beach Harbor Waters:

Water Body	Interim Effluent Limitations Daily Maximum (mg/kg sediment)					
	Copper	Lead	Zinc	DDT	PAHs	PCBs
	Dominguez Channel Estuary	220.0	510.0	789.0	1.727	31.60
Long Beach Inner Harbor	142.3	50.4	240.6	0.070	4.58	0.060
Los Angeles Inner Harbor	154.1	145.5	362.0	0.341	90.30	2.107
Long Beach Outer Harbor (inside breakwater)	67.3	46.7	150	0.075	4.022	0.248
Los Angeles Outer Harbor (inside breakwater)	104.1	46.7	150	0.097	4.022	0.310
Los Angeles River Estuary	53.0	46.7	183.5	0.254	4.36	0.683
San Pedro Bay Near/Off Shore Zones	76.9	66.6	263.1	0.057	4.022	0.193
Los Angeles Harbor - Cabrillo Marina	367.6	72.6	281.8	0.186	36.12	0.199
Los Angeles Harbor - Consolidated Slip	1470.0	1100.0	1705.0	1.724	386.00	1.920
Los Angeles Harbor - Inner Cabrillo Beach Area	129.7	46.7	163.1	0.145	4.022	0.033
Fish Harbor	558.6	116.5	430.5	40.5	2102.7	36.6

- c) Permittees shall comply with the final water quality-based effluent limitations as listed below no later than March 23, 2032, and every year thereafter:

- (1) Dominguez Channel Freshwater – Wet Weather
 - (i) Freshwater Toxicity Effluent Limitation shall not exceed the monthly median of 1 TUc.
 - (ii) Permittees shall comply with the following final metals water quality-based effluent limitations for discharges to Dominguez Channel and all upstream reaches and tributaries of Dominguez Channel above Vermont Avenue:

Metals	Water Column Mass-Based Final Effluent Limitation

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

	Daily Maximum (g/day)
Total Copper	1,300.3
Total Lead	5,733.7
Total Zinc	9,355.5

(2) Torrance Lateral Freshwater and Sediment – Wet Weather

- (i) Permittees shall comply with the following final metals water quality-based effluent limitations for discharges to the Torrance Lateral:

Metals	Water Column Effluent Limitation Daily Maximum (unfiltered, µg/L)
Total Copper	9.7
Total Lead	42.7
Total Zinc	69.7

- (ii) Permittees shall comply with the following final concentration-based water quality-based effluent limitations for pollutant concentrations in the sediment discharged to the Torrance Lateral:

Metals	Concentration-Based Effluent Limitation Daily Maximum (mg/kg dry)
Total Copper	31.6
Total Lead	35.8
Total Zinc	121

(3) Dominguez Channel Estuary and Greater Los Angeles and Long Beach Harbor Waters

- (i) Permittees shall comply with the following final mass-based water quality-based effluent limitations, expressed as an annual loading of pollutants in the sediment discharged to Dominguez Channel Estuary, Los Angeles River Estuary, and the Greater Los Angeles and Long Beach Harbor Waters:

Water Body	Final Effluent Limitations Annual (kg/yr)			
	Total Cu	Total Pb	Total Zn	Total PAHs
Dominguez Channel Estuary	22.4	54.2	271.8	0.134
Consolidated Slip	2.73	3.63	28.7	0.0058
Inner Harbor	1.7	34.0	115.9	0.088
Outer Harbor	0.91	26.1	81.5	0.105
Fish Harbor (POLA)	0.00017	0.54	1.62	0.007
Cabrillo Marina (POLA)	0.0196	0.289	0.74	0.00016
San Pedro Bay	20.3	54.7	213.1	1.76

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

LA River Estuary	35.3	65.7	242.0	2.31
------------------	------	------	-------	------

- (ii) Permittees shall comply with the following final concentration-based water quality-based effluent limitations for pollutant concentrations in the sediments discharged to the Dominguez Channel Estuary, Consolidated Slip, and Fish Harbor:

Water Body	Effluent Limitations Daily Maximum (mg/kg dry sediment)		
	Cadmium	Chromium	Mercury
Dominguez Channel Estuary	1.2	--	--
Consolidated Slip	1.2	81	0.15
Fish Harbor	--	--	0.15

- (4) Permittees shall comply with the following final mass-based water quality-based effluent limitations, expressed as an annual loading of total DDT and total PCBs in the sediment discharged to Dominguez Channel Estuary, Los Angeles River Estuary, and the Greater Los Angeles and Long Beach Harbor Waters:

Water Body	Final Effluent Limitations Annual (g/yr)	
	DDT total	PCBs total
Dominguez Channel Estuary	0.250	0.207
Consolidated Slip	0.009	0.004
Inner Harbor	0.051	0.059
Outer Harbor	0.005	0.020
Fish Harbor	0.0003	0.0019
Cabrillo Marina	0.000028	0.000025
Inner Cabrillo Beach	0.0001	0.0003
San Pedro Bay	0.049	0.44
LA River Estuary	0.100	0.324

d) Compliance Determination

- (1) Permittees shall be deemed in compliance with the interim concentration-based water quality-based effluent limitations for pollutant concentrations in the sediment as listed above in part 5.b)(2) by meeting any one of the following methods::
 - (i) Demonstrate that the sediment quality condition of *Unimpacted* or *Likely Unimpacted* via the interpretation and integration of multiple lines of evidence as defined in the SQO Part 1, is met; or
 - (ii) Meet the interim water quality-based effluent limitations in bed sediment over a three-year averaging period; or

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

- (iii) Meet the interim water quality-based effluent limitations in the discharge over a three-year averaging period.
- (2) Permittees shall be deemed in compliance with the final fresh water metals water quality-based effluent limitations for discharges to Dominguez Channel and Torrance Lateral as listed above in parts 5.c)(1)(ii) and 5.c)(2)(i) by meeting any one of the following methods:
 - (i) Final metals water quality-based effluent limitations are met; or
 - (ii) CTR total metals criteria are met instream; or
 - (iii) CTR total metals criteria are met in the discharge.
- (3) Permittees shall be deemed in compliance with the final water quality-based effluent limitations for pollutants in the sediment as listed above in parts 5.c)(3)(i) and (ii) by meeting any one of the following methods:
 - (i) Final water quality-based effluent limitations for pollutants in the sediment are met; or
 - (ii) The qualitative sediment condition of *Unimpacted* or *Likely Unimpacted* via the interpretation and integration of multiple lines of evidence as defined in the SQO Part 1, is met, with the exception of chromium, which is not included in the SQO Part 1; or
 - (iii) Sediment numeric targets are met in bed sediments over a three-year averaging period.
- (4) Permittees shall be deemed in compliance with the final water quality-based effluent limitations for total DDT and total PCBs in the sediment as listed above in part 5.c)(4) by meeting any one of the following methods:
 - (i) Fish tissue targets are met in species resident to the specified water bodies⁴; or
 - (ii) Final water quality-based effluent limitations for pollutants in the sediment are met; or
 - (iii) Sediment numeric targets to protect fish tissue are met in bed sediments over a three-year averaging period; or
 - (iv) Demonstrate that the sediment quality condition protective of fish tissue is achieved per the Statewide Enclosed Bays and Estuaries Plan.

⁴ A site-specific study to determine resident species shall be submitted to the Executive Officer for approval.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

D. TMDLs in Los Angeles River Watershed Management Area

1. Los Angeles River Watershed Trash TMDL
 - a) Permittees subject to the provisions below are identified in Table D.
 - b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to the Los Angeles River no later than September 30, 2016 and every year thereafter.
 - c) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged to the Los Angeles River, per the schedule below:

**Los Angeles River Watershed Trash Effluent Limitations¹ per Storm Year²
(gallons of uncompressed trash)**

Permittees	2012 (30%)	2013 (20%)	2014 (10%)	2015 (3.3%)	2016 ³ (0%)

Temple City	9546	6364	3182	1050	0
Vernon	20044	13363	6681	2205	0

d) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [Permit Provisions to Implement Trash TMDLs].

2. Los Angeles River Nitrogen Compounds and Related Effects TMDL

- a) Permittees subject to the provisions below are identified in Table D.
- b) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Water Body	NH ₃ -N (mg/L)		NO ₃ -N (mg/L)	NO ₂ -N (mg/L)	NO ₃ -N+NO ₂ -N (mg/L)
	One-hour Average	Thirty-day Average	Thirty-day Average	Thirty-day Average	Thirty-day Average
Los Angeles River above Los Angeles-Glendale WRP (LAG)	4.7	1.6	8.0	1.0	8.0
Los Angeles River below LAG	8.7	2.4	8.0	1.0	8.0
Los Angeles Tributaries	10.1	2.3	8.0	1.0	8.0

3. Los Angeles River and Tributaries Metals TMDL

- a) Permittees subject to the provisions below are identified in Table D.
- b) Final Water Quality-Based Effluent Limitations
 - (1) Permittees shall comply with the following grouped⁷ dry weather⁸ water quality-based effluent limitations no later than January 11, 2024, expressed as total recoverable metals.

Waterbody	Effluent Limitations Daily Maximum (kg/day)		
	Copper	Lead	Zinc
LA River Reach 6	0.53	0.33	---
LA River Reach 5	0.05	0.03	---
LA River Reach 4	0.32	0.12	---
LA River Reach 3	0.06	0.03	---
LA River Reach 2	0.13	0.07	---
LA River Reach 1	0.14	0.07	---

⁷ The dry weather water quality-based effluent limitations are grouped-based and shared by the MS4 Permittees, which includes LA MS4 Permittees, Long Beach MS4 Permittee and Caltrans.

⁸ Dry weather is defined as any day when the maximum daily flow in the Los Angeles River is less than 500 cfs measured at the Wardlow gage station.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Bell Creek	0.06	0.04	---
Tujunga Wash	0.001	0.0002	---
Burbank Channel	0.15	0.07	---
Verdugo Wash	0.18	0.10	---
Arroyo Seco	0.01	0.01	---
Rio Hondo Reach 1	0.01	0.006	0.16
Compton Creek	0.04	0.02	---

- (2) In lieu of calculating loads, Permittees may demonstrate compliance with the following concentration-based water quality-based effluent limitations during dry weather no later than January 11, 2024, expressed as total recoverable metals:

Waterbody	Effluent Limitations Daily Maximum (µg total recoverable metals/L)		
	Copper	Lead	Zinc
LA River Reach 5, 6 and Bell Creek	30	19	---
LA River Reach 4	26	10	---
LA River Reach 3 above LA-Glendale WRP and Verdugo Wash	23	12	---
LA River Reach 3 below LA-Glendale WRP	26	12	---
Burbank Western Channel (above WRP)	26	14	---
Burbank Western Channel (below WRP)	19	9.1	---
LA River Reach 2 and Arroyo Seco	22	11	---
LA River Reach 1	23	12	---
Compton Creek	19	8.9	---
Rio Hondo Reach 1	13	5.0	131

- (3) Permittees shall comply with the following grouped⁹ wet weather¹⁰ water quality-based effluent limitations no later than January 11, 2028, expressed as total recoverable metals discharged to all reaches of the Los Angeles River and its tributaries:

Constituent	Effluent Limitation Daily Maximum (kg/day)

⁹ The wet weather water quality-based effluent limitations are grouped-based and shared by the MS4 Permittees, which includes LA MS4 Permittees, and Long Beach MS4 Permittee.

¹⁰ Wet weather is defined as any day when the maximum daily flow in the Los Angeles River is equal to or greater than 500 cfs measured at the Wardlow gage station.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Cadmium	2.8×10^{-9} x daily volume (L) – 1.8
Copper	1.5×10^{-8} x daily volume (L) – 9.5
Lead	5.6×10^{-8} x daily volume (L) – 3.85
Zinc	1.4×10^{-7} x daily volume (L) – 83

- c) Permittees shall comply with interim and final water quality-based effluent limitations for metals discharged to the Los Angeles River and its tributaries, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the water quality-based effluent limitations (%)	
	Dry weather	Wet weather
January 11, 2012	50	25
January 11, 2020	75	--
January 11, 2024	100	50
January 11, 2028	100	100

4. Los Angeles River Watershed Bacteria TMDL

- a) Permittees subject to the provisions below are identified in Table D.
- b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to the Los Angeles River and its tributaries during dry weather according to the schedule in Table 1, and during wet weather no later than March 23, 2037:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
<i>E. coli</i>	235/100 mL	126/100 mL

- c) Permittees shall comply with the following grouped¹¹ interim dry weather single sample bacteria water quality-based effluent limitations for specific river segments and tributaries as listed in the table, below, according to the schedule in Table 1:

River Segment or Tributary	Daily Maximum <i>E. coli</i> Load (10 ⁹ MPN/Day)
Los Angeles River Segment A (Willow to Rosecrans)	301

¹¹ The interim dry weather water quality-based effluent limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees, Long Beach MS4 Permittees, and Caltrans.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Los Angeles River Segment B (Rosecrans to Figueroa)	518
Los Angeles River Segment C (Figueroa to Tujunga)	463
Los Angeles River Segment D (Tujunga to Balboa)	454
Los Angeles River Segment E (Balboa to headwaters)	32
Aliso Canyon Wash	23
Arroyo Seco	24
Bell Creek	14
Bull Creek	9
Burbank Western Channel	86
Compton Creek	7
Dry Canyon	7
McCoy Canyon	7
Rio Hondo	2
Tujunga Wash	10
Verdugo Wash	51

d) Receiving Water Limitations

- (1) Permittees shall comply with the following grouped¹² final single sample bacteria receiving water limitations for discharges to the Los Angeles River and its tributaries during dry weather according to the schedule in Table 1, and during wet weather no later than March 23, 2037:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily Sampling	Weekly Sampling
Dry Weather	5	1
Non-HFS ¹³ Waterbodies Wet Weather	15	2
HFS Waterbodies Wet Weather	10 (not including HSF days)	2 (not including HSF days)

- (2) Permittees shall comply with the following geometric mean receiving water limitation for discharges to the Los Angeles River and its tributaries

¹² The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4, Long Beach MS4, and Caltrans.

¹³ HFS stands for high flow suspension as defined in Chapter 2 of the Basin Plan.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

during dry weather according to the schedule in Table 1, and during wet weather no later than March 23, 2037:

Constituent	Geometric Mean (MPN or cfu)
<i>E. coli</i>	126/100 mL

Table 1: Los Angeles River Bacteria Implementation Schedule for Dry Weather
Italics in this Table refer to Permittees using an alternative compliance plan instead of an LRS.

Implementation Action	Responsible Parties	Deadline
SEGMENT B (upper and middle Reach 2 – Figueroa Street to Rosecrans Avenue)		
First phase – Segment B		
Submit a Load Reduction Strategy (LRS) for Segment B (<i>or submit an alternative compliance plan</i>)	MS4 Permittees discharging to Segment B	September 23, 2014
Complete implementation of LRS	MS4 Permittees discharging to Segment B, if using LRS	March 23, 2019
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment B, if using LRS	March 23, 2022
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment B, if using alternative compliance plan</i>	<i>March 23, 2022</i>
Second phase, if necessary – Segment B for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment B	March 23, 2023
Complete implementation of LRS	MS4 Permittees discharging to Segment B, if using LRS	September 23, 2026
Achieve final water quality-based effluent limitations in Segment B or demonstrate that non-compliance is only due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment B, if using LRS	September 23, 2028
SEGMENT B TRIBUTARIES (Rio Hondo and Arroyo Seco)		
First phase – Segment B Tributaries (Rio Hondo and Arroyo Seco)		
Submit a Load Reduction Strategy (LRS) for Segment B tributaries (<i>or submit an alternative compliance plan</i>)	MS4 Permittees discharging to Segment B tributaries	March 23, 2016

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Implementation Action	Responsible Parties	Deadline
Complete implementation of LRS	MS4 Permittees discharging to Segment B tributaries, if using LRS	September 23, 2020
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment B tributaries, if using LRS	September 23, 2023
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is only due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment B tributaries, if using alternative compliance plan</i>	<i>September 23, 2023</i>
Second phase, if necessary – Segment B Tributaries (Rio Hondo and Arroyo Seco) for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment B tributaries	September 23, 2024
Complete implementation of LRS	MS4 Permittees discharging to Segment B tributaries, if using LRS	March 23, 2028
Achieve final water quality-based effluent limitations Segment B tributaries or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment B tributaries, if using LRS	March 23, 2030
SEGMENT A (lower Reach 2 and Reach 1 – Rosecrans Avenue to Willow Street)		
First phase – Segment A		
Submit a Load Reduction Strategy (LRS) for Segment A (or submit an alternative compliance plan)	MS4 Permittees discharging to Segment A	September 23, 2016
Complete implementation of LRS	MS4 Permittees discharging to Segment A, if using LRS	March 23, 2021
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment A, if using LRS	March 23, 2024
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment A, if using alternative compliance plan</i>	<i>March 23, 2024</i>
Second phase, if necessary – Segment A for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment A	March 23, 2025

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Implementation Action	Responsible Parties	Deadline
Complete implementation of LRS	MS4 Permittees discharging to Segment A, if using LRS	September 23, 2029
Achieve final water quality-based effluent limitations in Segment A or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment A, if using LRS	September 23, 2031
SEGMENT A TRIBUTARY (Compton Creek)		
First phase – Segment A Tributary		
Submit a Load Reduction Strategy (LRS) for Segment A tributary (or submit an alternative compliance plan)	MS4 Permittees discharging to Segment A tributary	March 23, 2018
Complete implementation of LRS	MS4 Permittees discharging to Segment A tributary if using LRS	September 23, 2022
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment A tributary if using LRS	September 23, 2025
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment A tributary, if using alternative compliance plan</i>	<i>September 23, 2025</i>
Second phase, if necessary – Segment A Tributary for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment A tributary	September 23, 2026
Complete implementation of LRS	MS4 Permittees discharging to Segment A tributary, if using LRS	March 23, 2030
Achieve final water quality-based effluent limitations in Segment A tributary or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment A tributary, if using LRS	March 23, 2032
SEGMENT E (Reach 6 – LA River headwaters [confluence with Bell Creek and Calabasas Creek] to Balboa Boulevard)		
First phase – Segment E		
Submit a Load Reduction Strategy (LRS) for Segment E (or submit an alternative compliance plan)	MS4 Permittees discharging to Segment E	September 23, 2017

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Implementation Action	Responsible Parties	Deadline
Complete implementation of LRS	MS4 Permittees discharging to Segment E, if using LRS	March 23, 2022
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment E, if using LRS	March 23, 2025
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment E, if using alternative compliance plan</i>	<i>March 23, 2025</i>
Second phase, if necessary –Segment E for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment E	March 23, 2026
Complete implementation of LRS	MS4 Permittees discharging to Segment E, if using LRS	September 23, 2029
Achieve final Water quality-based effluent limitations in Segment E or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment E, if using LRS	September 23, 2031
SEGMENT E TRIBUTARIES (Dry Canyon Creek, McCoy Creek, Bell Creek, and Aliso Canyon Wash)		
First phase – Segment E Tributaries		
Submit a Load Reduction Strategy (LRS) for Segment E tributaries (or submit an alternative compliance plan)	MS4 Permittees discharging to Segment E tributaries	September 23, 2021
Complete implementation of LRS	MS4 Permittees discharging to Segment E tributaries if using LRS	March 23, 2026
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment E tributaries, if using LRS	March 23, 2029
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment E tributaries, if using alternative compliance plan</i>	<i>March 23, 2029</i>
Second phase, if necessary – Segment E Tributaries for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment E tributaries	March 23, 2030

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Implementation Action	Responsible Parties	Deadline
Complete implementation of LRS	MS4 Permittees discharging to Segment E tributaries, if using LRS	September 23, 2033
Achieve final water quality-based effluent limitations in Segment E tributaries or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment E tributaries, if using LRS	September 23, 2035
SEGMENT C (lower Reach 4 and Reach 3 – Tujunga Avenue to Figueroa Street) SEGMENT C TRIBUTARIES (Tujunga Wash, Burbank Western Channel, and Verdugo Wash) SEGMENT D (Reach 5 and upper Reach 4 – Balboa Boulevard to Tujunga Avenue) SEGMENT D TRIBUTARIES (Bull Creek)		
First phase – Segment C, Segment C Tributaries, Segment D, Segment D tributaries		
Submit a Load Reduction Strategies (LRS) for Segment C, Segment C tributaries, Segment D, Segment D tributaries (<i>or submit an alternative compliance plan</i>)	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries	March 23, 2023
Complete implementation of LRS	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries, if using LRS	September 23, 2027
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries, if using LRS	September 23, 2030
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries, if using alternative compliance plan</i>	<i>September 23, 2030</i>
Second phase, if necessary - Segment C, Segment C Tributaries, Segment D, Segment D Tributaries for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries	September 23, 2031
Complete implementation of LRS	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries if using LRS	March 23, 2035
Achieve final water quality-based effluent limitations in Segment C, Segment C tributaries, Segment D, Segment D tributaries or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries if using LRS	March 23, 2037

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

- e) Compliance Determination
- (1) Permittees may demonstrate compliance with the final dry weather limitations by demonstrating that final receiving water limitations are met in the receiving waters or by demonstrating one of the following conditions at outfalls to the receiving waters:
 - (i) Flow-weighted concentration of *E. coli* in MS4 discharges during dry weather is less than or equal to 235 MPN/100mL, based on a weighted-average using flow rates from all measured outfalls; or
 - (ii) Zero discharge during dry weather.
 - (2) In addition, individual Permittees or subgroups of Permittees may differentiate their dry weather discharges from other dischargers or upstream contributions by demonstrating one of the following conditions at outfalls to the receiving waters or at segment, tributary or jurisdictional boundaries:
 - (i) The flow-weighted concentration of *E. coli* in a Permittee's individual discharge or in a group of Permittees' collective discharge during dry weather is less than or equal to 235 MPN/100mL, based on a weighted-average using flow rates from all measured outfalls; or
 - (ii) Zero discharge from a Permittee's individual outfall(s) or from a group of Permittees' outfall(s) during dry weather; or
 - (iii) Demonstration that the MS4 loading of *E. coli* to the segment or tributary during dry weather is less than or equal to the calculated loading rate that would not cause or contribute to exceedances based on the loading capacity representative of conditions in the River at the time of compliance.
 - (3) The interim dry weather water quality-based effluent limitations are group-based, shared among all MS4 Permittees that drain to a segment or tributary. However, the interim dry weather water quality-based effluent limitations may be distributed based on proportional drainage area, upon approval of the Executive Officer.
 - (4) By March 23, 2022, Permittees shall submit an implementation plan for wet weather with interim milestones.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

- 5. Long Beach City Beaches and Los Angeles River Estuary Bacteria TMDL
 - a) Permittees subject to the provisions below are identified in Table D.
 - b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to the Los Angeles River Estuary as of the effective date of this Order:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

- c) Receiving Water Limitations
 - (1) Permittees shall comply with the following grouped¹⁴ final single sample bacteria receiving water limitations for the Los Angeles River Estuary as of the effective date of this Order:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily sampling	Weekly sampling
Summer Dry-Weather (April 1 to October 31)	0	0
Winter Dry-Weather (November 1 to March 31)	9	2
Wet Weather ¹⁵	17	3

- (2) Permittees shall comply with the following geometric mean receiving water limitations for all monitoring stations in the Los Angeles River Estuary as of the effective date of this Order:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

- d) Compliance Determination
 - (1) Permittees may demonstrate compliance with the final dry or weather limitations by demonstrating that final receiving water limitations are met

¹⁴ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees, Long Beach MS4 Permittees, and Caltrans.

¹⁵ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

in the receiving waters or by demonstrating one of the following conditions at outfalls to the receiving waters:

- (i) Flow-weighted concentration of bacterial indicators in MS4 discharges during dry or wet weather is less than or equal to the water quality-based effluent limitations in part 5.b. above, based on a weighted-average using flow rates from all measured outfalls; or
 - (ii) Zero discharge during dry weather.
- (2) In addition, individual Permittees or subgroups of Permittees may differentiate their dry or wet weather discharges from other dischargers or upstream contributions by demonstrating one of the following conditions at outfalls to the receiving waters or at segment, tributary or jurisdictional boundaries:
- (i) The flow-weighted concentration of bacterial indicators in a Permittee’s individual discharge or in a group of Permittees’ collective discharge during dry or wet weather is less than or equal to the water quality-based effluent limitations in part 5.b. above, based on a weighted-average using flow rates from all measured outfalls; or
 - (ii) Zero discharge from a Permittee’s individual outfall(s) or from a group of Permittees’ outfall(s) during dry weather.

6. Los Angeles Area Lakes TMDLs

a) Lake Calabastas Nutrient TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee’s drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorus and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the annual mass allocation based on current flow conditions as of the effective date of this Order:

Permittee	Total Phosphorus (lb-P/yr) ^{16,17}	Total Nitrogen (lb-N/yr) ^{16,17}
City of Calabastas	48.5	220

- (3) The following concentration based water quality-based receiving water limitations apply during both wet and dry weather if:

¹⁶ Measured as a summer average (May – September) and annual average.

¹⁷ Measured at the point of discharge.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

- The responsible jurisdiction requests that the concentration-based receiving water limits apply and provides to U.S. EPA and the Los Angeles Water Board a Lake Management Plan describing actions that will be implemented and cause the applicable water quality criteria for ammonia, dissolved oxygen, and pH targets to be met.
- The Los Angeles Water Board Executive Officer approves the request. The concentration-based receiving water limitations are not to be exceeded as a summer average (May-September) and annual average.
- U.S. EPA does not object to the Los Angeles Water Boards decision within sixty days of receiving notice.
- The concentration-based receiving water limits must be met in the lake. However, if the applicable water quality criteria for ammonia, dissolved oxygen, pH, and the chlorophyll a targets are met, then the total phosphorus and total nitrogen limits are considered attained.

Permittee	Total Phosphorus Monthly Average (mg-P/L) ^{18,19}	Total Nitrogen Monthly Average (mg-N/L) ^{18,19}
City of Calabasas	0.1	1.0

b) Echo Park Lake Nutrient TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee’s drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorus and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the annual mass allocation based on current flow conditions as of the effective date of this Order:

Subwatershed	Permittee	Total Phosphorus (lb-P/yr) ^{19,20}	Total Nitrogen (lb-N/yr) ^{19,20}
Northern	City of Los Angeles	24.7	156
Southern	City of Los Angeles	7.129	49.69

¹⁸ Measured as an in-lake concentration.

¹⁹ Measured as a summer average (May – September) and annual average.

²⁰ Measured at the point of discharge.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

- (3) In assessing compliance with wasteload allocations, responsible jurisdictions assigned both northern and southern subwatershed allocations may have their allocations combined.

c) Echo Park Lake PCBs TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Subwatershed	Permittee	Total PCBs associated with Suspended Sediment (ug/kg dry weight) ^{21,22}	Total PCBs in the Water Column (ng/L) ^{21,22}
Northern	City of Los Angeles	1.77	0.17
Southern	City of Los Angeles	1.77	0.17

- (3) Permittees may comply with the following alternative effluent limitations if the responsible jurisdictions submit to U.S. EPA and the Regional Board material describing that the fish tissue target of 3.6 ppb wet weight has been met for the preceding three or more years. A demonstration that the fish tissue target has been met in any given year must at a minimum include a composite sample of skin of fillets from at least five common carp each measuring at least 350 mm in length and it is approved by the Los Angeles Water Board Executive Officer and U.S. EPA does not object within 60 days of receiving notice:

Subwatershed	Permittee	Total PCBs associated with Suspended Sediment (ug/kg dry weight) ^{22,23}	Total PCBs in the Water Column (ng/L) ^{21,22}
Northern	City of Los Angeles	59.8	0.17
Southern	City of Los Angeles	59.8	0.17

d) Echo Park Lake Chlordane TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

²¹ Applied as an annual average.
²² Measured at the point of discharge.
²³ Applied as a 3-year average.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Subwatershed	Permittee	Total Chlordane associated with Suspended Sediment (ug/kg dry weight) ^{24,25}	Total Chlordane in the Water Column (ng/L) ^{24,25}
Northern	City of Los Angeles	2.10	0.59
Southern	City of Los Angeles	2.10	0.59

- (3) Permittees may comply with the following alternative effluent limitations if the responsible jurisdictions submit to U.S. EPA and the Regional Board material describing that the fish tissue target of 3.6 ppb wet weight has been met for the preceding three or more years. A demonstration that the fish tissue target has been met in any given year must at a minimum include a composite sample of skin of fillets from at least five common carp each measuring at least 350 mm in length and it is approved by the Los Angeles Water Board Executive Officer and U.S. EPA does not object within 60 days of receiving notice:

Subwatershed	Permittee	Total Chlordane associated with Suspended Sediment (ug/kg dry weight) ^{24,26}	Total Chlordane in the Water Column (ng/L) ^{24,25}
Northern	City of Los Angeles	3.24	0.59
Southern	City of Los Angeles	3.24	0.59

e) Echo Park Lake Dieldrin TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
(2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Subwatershed	Permittee	Dieldrin associated with Suspended Sediment (ug/kg dry weight) ^{24,25}	Dieldrin in the Water Column (ng/L) ^{24,25}
Northern	City of Los Angeles	0.80	0.14
Southern	City of Los Angeles	0.80	0.14

- (3) Permittees may comply with the following alternative effluent limitations if the responsible jurisdictions submit to U.S. EPA and the

²⁴ Measured at the point of discharge.

²⁵ Applied as an annual average.

²⁶ Applied as a 3-year average.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Regional Board material describing that the fish tissue target of 3.6 ppb wet weight has been met for the preceding three or more years. A demonstration that the fish tissue target has been met in any given year must at a minimum include a composite sample of skin of fillets from at least five common carp each measuring at least 350 mm in length and it is approved by the Los Angeles Water Board Executive Officer and U.S. EPA does not object within 60 days of receiving notice:

Subwatershed	Permittee	Dieldrin associated with Suspended Sediment (ug/kg dry weight) ^{27,28}	Dieldrin in the Water Column (ng/L) ^{27,29}
Northern	City of Los Angeles	1.90	0.14
Southern	City of Los Angeles	1.90	0.14

f) Echo Park Lake Trash TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees shall comply with the following water quality-based effluent limitation as of the effective date of this Order:

Permittee	Trash (Gal/year)
City of Los Angeles	0

g) Peck Road Park Lake Nutrient TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee’s drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorus and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the annual mass allocation based on current flow conditions as of the effective date of this Order:

Subwatershed	Permittee	Total Phosphorus (lb-P/yr) ^{27,29}	Total Nitrogen (lb-N/yr) ^{27,29}
Eastern	Arcadia	383	2,320
Eastern	Bradbury	497	3,223
Eastern	Duarte	1,540	9,616

²⁷ Measured at the point of discharge.

l) Peck Road Park Lake Trash TMDL

- (1) Permittees subject to the provisions below are identified in Table D.

⁴⁰ Measured at the point of discharge.

⁴¹ Applied as a 3-year average.

⁴² Applied as an annual average.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

- (2) Permittees shall comply with the following water quality-based effluent limitation as of the effective date of this Order:

Permittee	Trash (gal/year)
Arcadia	0
Bradbury	0
Duarte	0
El Monte	0
Irwindale	0
County of Los Angeles	0
Monrovia	0
Sierra Madre	0

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

E. TMDLs in San Gabriel River Watershed Management Area

1. San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL (USEPA established)

- a) Permittees subject to the provisions below are identified in Table E.
- b) Permittees shall comply with the following grouped¹ wet weather² water quality-based effluent limitations as of the effective date of this Order, expressed as total recoverable metals discharged to all upstream reaches and tributaries of the San Gabriel River Reach 2 and Coyote Creek:

Water Body	Effluent Limitation Daily Maximum (kg/day)		
	Copper	Lead	Zinc
San Gabriel Reach 2	---	81.34 x daily storm volume (L)	---
Coyote Creek	24.71 x daily storm volume (L)	96.99 x daily storm volume (L)	144.57 x daily storm volume (L)

- c) Permittees shall comply with the following grouped¹ dry weather water quality-based effluent limitations as of the effective date of this Order, expressed as total recoverable metals discharged to San Gabriel River Reach 1, Coyote Creek, San Gabriel River Estuary, and San Jose Creek Reach 1 and Reach 2:

Water Body	Effluent Limitation Daily Maximum	
	Copper	Selenium
San Gabriel Reach 1	18 ug/L	---
Coyote Creek	0.941 kg/day	---
San Gabriel River Estuary	3.7 ug/L	---
San Jose Creek Reach 1 and 2	---	5 ug/L

2. Legg Lake Trash TMDL

- a) Permittees subject to the provisions below are identified in Table E.
- b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Legg Lake no later than March 6, 2016.
- c) If the Permittees choose to comply with the water quality-based effluent limitations by implementing an Executive Officer certified full capture system on conveyances that discharge to Legg Lake through a progressive

¹ The wet weather and dry weather water quality-based effluent limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees, Long Beach MS4 Permittees, Orange County MS4 Permittees and Caltrans.

² In San Gabriel River Reach 2, wet weather TMDLs apply when the maximum daily flow of the river is equal to or greater than 260 cfs as measured at USGS station 11085000, located at the bottom of Reach 3 just above the Whittier Narrows Dam. In Coyote Creek, wet weather TMDLs apply when the maximum daily flow in the creek is equal to or greater than 156 cfs as measured at LACDPW flow gauge station F354-R, located at the bottom of the creek, just above the Long Beach WRP.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

implementation schedule of full capture devices, they will be deemed in compliance with the water quality-based effluent limitations.

- d) Permittees that choose to comply via a full capture compliance strategy must demonstrate a phased implementation of full capture devices attaining interim effluent limitations over the following 8-year period until the final effluent limitation of zero is attained:

Deadline	Effluent Limitation	
	Drainage Area covered by Full Capture Systems (%)	
March 6, 2008	0	
March 6, 2012	20	
March 6, 2013	40	
March 6, 2014	60	
March 6, 2015	80	
March 6, 2016	100	

Legg Lake Trash Effluent Limitations³ (gallons of uncompressed trash per year)

Permittees	Baseline ⁴ (100%)	3/6/2012 (80%)	3/6/2013 (60%)	3/6/2014 (40%)	3/6/2015 (20%)	3/6/2016 ⁵ (0%)
Los Angeles County	2400.03	1920.02	1440.02	960.01	480.01	0
Los Angeles County Flood Control District	24.05	19.24	14.43	9.62	4.81	0
City of El Monte	509.48	407.58	305.69	203.79	101.90	0
City of South El Monte	3896.76	3117.41	2338.06	1558.70	779.35	0

³ Water quality-based effluent limitations are expressed as allowable trash discharge relative to baseline Waste Load Allocations specified in Table XX of the Basin Plan.

⁴ The Regional Water Board has determined the following baseline water quality-based effluent limitations for the Permittees based on the estimated trash generation rate of 6677 gallons of uncompressed trash per square mile per year.

⁵ Permittees shall achieve their final effluent limitation of zero trash discharge for the year and every year thereafter.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

- e) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 2(b) and 2(c) above per the provisions in Part 7.X [Permit Provisions to Implement Trash TMDLs].
- f) If a Permittee opts to derive site specific trash generation rates through its Trash Monitoring and Reporting Plan (TMRP), the baseline limitation shall be calculated by multiplying the point source area(s) by the derived trash generation rate(s).
3. Los Angeles Area Lakes TMDLs⁶ (USEPA in progress)
- a) Legg Lake System Nutrient TMDL
- (1) Permittees subject to the provisions below are identified in Table E.
 - (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee's drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorus and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the following annual mass allocation based on current flow conditions as of the effective date of this Order:

Subwatershed	Permittee	Flow (ac-ft/yr)	Total Phosphorus (lb-P/yr) ^{7,8}	Total Nitrogen (lb-N/yr) ^{7,8}
Northwestern	County of Los Angeles	33.5	53.6	148.7
Northwestern	South El Monte	308	526.3	1,500.6
Northeastern	El Monte	122	226.6	590.3
Northeastern	County of Los Angeles	8.18	12.8	39.2
Northeastern	South El Monte	287	498.7	1,394.8

- (3) The following concentration based water quality-based receiving water limitations apply during both wet and dry weather if:

- The responsible jurisdiction requests that the concentration-based receiving water limits apply and provides to U.S. EPA and the Los Angeles Water Board a Lake Management Plan describing actions that will be implemented and cause the applicable water quality criteria for ammonia, dissolved oxygen, and pH targets to be met.

⁶ Los Angeles Area Lakes TMDL includes multiple watershed management areas.

⁷ Measured as a summer average (May – September) and annual average.

⁸ Measured at the point of discharge.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

- The Los Angeles Water Board Executive Officer approves the request. The concentration-based receiving water limitations are not to be exceeded as a summer average (May-September) and annual average.
- U.S. EPA does not object to the Los Angeles Water Boards decision within sixty days of receiving notice.
- The concentration-based receiving water limits must be met in the lake. However, if the applicable water quality criteria for ammonia, dissolved oxygen, and pH targets are met, then the total phosphorus and total nitrogen limits are considered attained.

Subwatershed	Permittee	Total Phosphorus Monthly Average (mg-P/L) ^{9,10}	Total Nitrogen Monthly Average (mg-N/L) ^{9,10}
Northwestern	County of Los Angeles	0.1	1.0
Northwestern	South El Monte	0.1	1.0
Northeastern	El Monte	0.1	1.0
Northeastern	County of Los Angeles	0.1	1.0
Northeastern	South El Monte	0.1	1.0

b) Puddingstone Reservoir Nutrient TMDL

- (1) Permittees subject to the provisions below are identified in Table E.
- (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee's drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorus and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the annual mass allocation based on current flow conditions as of the effective date of this Order:

Subwatershed	Permittee	Total Phosphorus (lb-P/yr) ^{10,11}	Total Nitrogen (lb-N/yr) ^{10,11}
Northern	Claremont	169	745
Northern	County of Los Angeles	741	829
Northern	La Verne	2,772	11,766
Northern	Pomona	6.30	28.3
Northern	San Dimas	31.1	137

⁹ Measured as an in-lake concentration.

¹⁰ Measured as a summer average (May – September) and annual average.

¹¹ Measured at the point of discharge.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

(3) The following concentration based water quality-based receiving water limitations apply during both wet and dry weather if:

- The responsible jurisdiction requests that the concentration-based receiving water limits apply and provides to U.S. EPA and the Los Angeles Water Board a Lake Management Plan describing actions that will be implemented and cause the applicable water quality criteria for ammonia, dissolved oxygen, and pH targets to be met.
- The Los Angeles Water Board Executive Officer approves the request. The concentration-based receiving water limitations are not to be exceeded as a summer average (May-September) and annual average.
- U.S. EPA does not object to the Los Angeles Water Boards decision within sixty days of receiving notice.
- The concentration-based receiving water limits must be met in the lake.

Subwatershed	Permittee	Total Phosphorus Monthly Average (mg-P/L) ^{12,13}	Total Nitrogen Monthly Average (mg-N/L) ^{12,13}

Northern	San Dimas	0.1	1.0

c) Puddingstone Reservoir Mercury TMDL

- (1) Permittees subject to the provisions below are identified in Table E.
- (2) Permittees shall comply with the following water quality-based effluent limitations during both wet and dry weather as of the effective date of this Order:

Subwatershed	Permittee	Total Mercury (g-Hg/yr) ^{14,15}
Northern	Claremont	0.674
Northern	County of Los Angeles	2.79
Northern	La Verne	10.6
Northern	Pomona	0.026
Northern	San Dimas	0.109

¹² Measured as an in-lake concentration.

¹³ Measured as a summer average (May – September) and annual average.

¹⁴ Measured at the point of discharge.

¹⁵ Applied as an annual average.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

d) Puddingstone Reservoir PCBs TMDL

- (1) Permittees subject to the provisions below are identified in Table E.
- (2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Subwatershed	Permittee	Total PCBs associated with Suspended Sediment (ug/kg dry weight) ^{16,18}	Total PCBs in the Water Column (ng/L) ^{16,18}
Northern	Claremont	0.59	0.17
Northern	County of Los Angeles	0.59	0.17
Northern	La Verne	0.59	0.17
Northern	Pomona	0.59	0.17
Northern	San Dimas	0.59	0.17

- (3) Permittees may comply with the following alternative effluent limitations if the responsible jurisdictions submit to U.S. EPA and the Regional Board material describing that the fish tissue target of 3.6 ppb wet weight has been met for the preceding three or more years. A demonstration that the fish tissue target has been met in any given year must at a minimum include a composite sample of skin of fillets from at least five common carp each measuring at least 350 mm in length and it is approved by the Los Angeles Water Board Executive Officer and U.S. EPA does not object within 60 days of receiving notice:

Subwatershed	Permittee	Total PCBs associated with Suspended Sediment (ug/kg dry weight) ^{16,17}	Total PCBs in the Water Column (ng/L) ^{16,18}
Northern	Claremont	59.8	0.17
Northern	County of Los Angeles	59.8	0.17
Northern	La Verne	59.8	0.17
Northern	Pomona	59.8	0.17
Northern	San Dimas	59.8	0.17

e) Puddingstone Reservoir Chlordane TMDL

- (1) Permittees subject to the provisions below are identified in Table E.
- (2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Subwatershed	Permittee	Total Chlordane associated with	Total Chlordane in the Water
--------------	-----------	---------------------------------	------------------------------

¹⁶ Measured at the point of discharge.

¹⁷ Applied as a 3-year average.

¹⁸ Applied as an annual average.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

Northern	Pomona	5.28	0.59
Northern	San Dimas	5.28	0.59

²⁵ Measured at the point of discharge.

²⁶ Applied as a 3-year average.

²⁷ Applied as an annual average.

LA County MS4 Permit – TMDL Provisions for the Los Cerritos Channel and Alamitos Bay WMA

F. TMDLs in Los Cerritos Channel and Alamitos Bay Watershed Management Area

1. Los Cerritos Channel Metals TMDL (USEPA established)

- a) Permittees subject to the provisions below are identified in Table F.
- b) Permittees shall comply with the following dry weather¹ water quality-based effluent limitations as of the effective date of this Order, expressed as total recoverable metals discharged to Los Cerritos Channel:

Constituent	Effluent Limitation Daily Maximum (g/day)
Copper	67.2

- c) Permittees shall comply with the following wet weather² water quality-based effluent limitations as of the effective date of this Order, expressed as total recoverable metals discharged to Los Cerritos Channel:

Constituent	Effluent Limitation Daily Maximum (g/day)
Copper	$4.709 \times 10^{-6} \times \text{daily storm volume (L)}$
Lead	$26.852 \times 10^{-6} \times \text{daily storm volume (L)}$
Zinc	$46.027 \times 10^{-6} \times \text{daily storm volume (L)}$

2. Colorado Lagoon OC Pesticides, PCBs, Sediment Toxicity, PAHs, and Metals TMDL

- a) Permittees subject to the provisions below are identified in Table F.
- b) Permittees shall comply with the following interim water quality-based effluent limitations as of the effective date of this Order, for sediments within Colorado Lagoon:

Constituent	Interim Concentration-based Effluent Limitations Monthly Average ($\mu\text{g/dry kg}$)
Chlordane	129.65
Dieldrin	26.20
Lead	399,500
Zinc	565,000
PAHs	4,022
PCBs	89.90
DDT	149.80

¹ Dry weather is defined as any day when the maximum daily flow in Los Cerritos Channel is less than 23 cubic feet per second (cfs) measured at Stearns Street Monitoring Station.

² Wet weather is defined as any day when the maximum daily flow in Los Cerritos Channel is equal to or greater than 23 cfs measured at Stearns Street Monitoring Station.

LA County MS4 Permit – TMDL Provisions for the Los Cerritos Channel and Alamitos Bay WMA

- c) Permittees shall comply with the following final water quality-based effluent limitations no later than July 28, 2018, for sediments within Colorado Lagoon:

Constituent	Final Concentration Based Effluent Limitations Monthly Average ($\mu\text{g}/\text{dry kg}$)
Chlordane	0.50
Dieldrin	0.02
Lead	46,700
Zinc	150,000
PAHs	4,022
PCBs	22.70
DDT	1.58

- d) The mass-based water quality-based effluent limitations are shared by the MS4 Permittees, which includes LA MS4, Long Beach MS4 and Caltrans. Permittees shall comply with the following grouped final water quality-based effluent limitations no later than July 28, 2018, expressed as an annual discharge of sediment to Colorado Lagoon:

Constituent	Annual Mass-based Effluent Limitations (mg/yr)				
	Project 452	Line I	Termino Ave	Line K	Line M
Chlordane	5.10	3.65	12.15	1.94	0.73
Dieldrin	0.20	0.15	0.49	0.08	0.03
Lead	476,646.68	340,455.99	1,134,867.12	181,573.76	68,116.09
Zinc	1,530,985.05	1,093,541.72	3,645,183.47	583,213.37	218,788.29
PAHs	41,050.81	29,321.50	97,739.52	15,637.89	5,866.44
PCBs	231.69	165.49	551.64	88.26	33.11
DDT	16.13	11.52	38.40	6.14	2.30

- e) Compliance with the concentration-based water quality-based effluent limitations shall be determined by pollutant concentrations in the sediment in Colorado Lagoon at points in the West Arm, North Arm and Central Arm that represent the cumulative inputs from the MS4 drainage to the lagoon.

LA County MS4 Permit – TMDL Provisions for the Middle Santa Ana River WMA

G. Middle Santa Ana River Watershed Management Area (Santa Ana Region TMDL)

1. Middle Santa Ana River Watershed Bacteria Indicator TMDL
 - a) Permittees subject to the provisions below are identified in Table G.
 - b) Permittees shall comply with the following final effluent limitations for discharges to San Antonio Channel during dry weather no later than December 31, 2015, and during wet weather no later than December 31, 2025:
 - (1) Fecal coliform¹: log mean less than 200 organisms/100 mL based on five or more samples per 30 day period, and not more than 10% of the samples exceed 400 organisms/100 mL for any 30 – day period.
 - (2) *E. coli*: log mean less than 126 organisms/100 mL based on five or more samples per 30 – day period, and not more than 10% of the samples exceed 235 organisms/100mL for any 30 day period.
 - c) Permittees shall comply with the following receiving water limitations for discharges to San Antonio Channel during dry weather no later than December 31, 2015, and during wet weather no later than December 31, 2025:
 - (1) Fecal coliform²: 5 sample/30 – day logarithmic mean less than 180 organisms/100 mL, and not more than 10% of the samples exceed 360 organisms/100 mL for any 30 – day period.
 - (2) *E. coli*: 5 sample/30 – day logarithmic mean less than 113 organisms/100 mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30 day period.
 - d) Permittees may demonstrate compliance with the receiving water limitations by developing for approval by the Regional Water Board a Comprehensive Bacteria Reduction Plan (CBRP) describing, in detail, the specific actions that have been taken or will be taken to achieve compliance with the water quality-based effluent limitations.

¹ The fecal coliform effluent limitations become ineffective upon the replacement of the REC1 fecal coliform objectives with REC1 *E. coli* objectives in the Santa Ana Region Basin Plan.

² The fecal coliform receiving water limitations become ineffective upon the replacement of the REC1 fecal coliform objectives with REC1 *E. coli* objectives in the Santa Ana Regional Basin Plan.

LA County MS4 Permit – List of TMDLs by Watershed Management Area

TOTAL MAXIMUM DAILY LOADS (TMDL) BY WATERSHED MANAGEMENT AREA (WMA)

- A. Santa Clara River Watershed Management Area
 - 1. Santa Clara River Nitrogen Compounds TMDL
 - 2. Upper Santa Clara River Chloride TMDL
 - 3. Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL (*Lake Elizabeth only*)
 - 4. Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL

- B. Santa Monica Bay Watershed Management Area
 - 1. Santa Monica Bay Beaches Bacteria TMDL
 - 2. Santa Monica Bay Nearshore and Offshore Debris TMDL
 - 3. Santa Monica Bay TMDL for DDTs and PCBs (*USEPA established*)

 - 4. Malibu Creek Subwatershed
 - a. Malibu Creek and Lagoon Bacteria TMDL
 - b. Malibu Creek Watershed Trash TMDL
 - c. Malibu Creek Watershed Nutrients TMDL (*USEPA established*)

 - 5. Ballona Creek Subwatershed
 - a. Ballona Creek Trash TMDL
 - b. Ballona Creek Estuary Toxic Pollutants TMDL
 - c. Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL
 - d. Ballona Creek Metals TMDL
 - e. Ballona Creek Wetlands TMDL for Sediment and Invasive Exotic Vegetation (*USEPA established*)

 - 6. Marina del Rey Subwatershed
 - a. Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL
 - b. Marina del Rey Harbor Toxic Pollutants TMDL

- C. Dominguez Channel and Greater Harbors Waters Watershed Management Area
 - 1. Los Angeles Harbor Bacteria TMDL (Inner Cabrillo Beach and Main Ship Channel)
 - 2. Machado Lake Trash TMDL
 - 3. Machado Lake Nutrient TMDL
 - 4. Machado Lake Pesticides and PCBs TMDL
 - 5. Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters Toxic Pollutants TMDL

- D. Los Angeles River Watershed Management Area
 - 1. Los Angeles River Watershed Trash TMDL
 - 2. Los Angeles River Nitrogen Compounds and Related Effects TMDL
 - 3. Los Angeles River and Tributaries Metals TMDL
 - 4. Los Angeles River Watershed Bacteria TMDL
 - 5. Long Beach City Beaches and Los Angeles River Estuary Bacteria TMDL (*USEPA established*)
 - 6. Los Angeles Area Lakes TMDLs¹ (*USEPA established for Lake Calabasas, Echo Park Lake, and Peck Road Park Lake*)

¹ Los Angeles Area Lakes TMDL includes multiple watershed management areas.

LA County MS4 Permit – List of TMDLs by Watershed Management Area

- E. San Gabriel River Watershed Management Area
 - 1. San Gabriel River and Impaired Tributaries Metals and Selenium TMDL (*USEPA established*)
 - 2. Legg Lake Trash TMDL
 - 3. Los Angeles Area Lakes TMDLs¹ (*USEPA established for Legg Lake and Puddingstone Reservoir*)

- F. Los Cerritos Channel and Alamitos Bay Watershed Management Area
 - 1. Los Cerritos Channel Metals TMDL (*USEPA established*)
 - 2. Colorado Lagoon OC Pesticides, PCBs, Sediment Toxicity, PAHs, and Metals TMDL

- G. Middle Santa Ana River Watershed Management Area (Santa Ana Region TMDL)
 - 1. Middle Santa Ana River Watershed Bacteria Indicator TMDL

¹ Los Angeles Area Lakes TMDL includes multiple watershed management areas.

LA County MS4 Permit – Receiving Water Limitations

V. RECEIVING WATER LIMITATIONS¹

A. Receiving Water Limitations

1. Discharges from the MS4 that cause or contribute to the violation of Receiving Water Limitations are prohibited.
2. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible², shall not cause or contribute to a condition of nuisance.
3. The Permittees shall comply with Sections V.A.1 and V.A.2 through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the storm water management program and its components and other requirements of this Order including any modifications. The storm water management program and its components shall be designed to achieve compliance with Receiving Water Limitations. If exceedances of Receiving Water Limitations persist, notwithstanding implementation of the storm water management program and its components and other requirements of this Order, the Permittee shall assure compliance with discharge prohibitions and Receiving Water Limitations by complying with the following procedure:
 - a. Upon a determination by either the Permittee or the Regional Water Board that discharges from the MS4 are causing or contributing to an exceedance of an applicable Receiving Water Limitation, the Permittee shall promptly notify³ and thereafter submit a Receiving Water Limitations (RWL) Compliance Report (as described in the Program Reporting Requirements, Section [TBD] of the Monitoring and Reporting Program) to the Regional Water Board for approval. The RWL Compliance Report shall describe the BMPs that are currently being implemented by the Permittee and additional BMPs, including modifications to current BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of Receiving Water Limitations. The RWL Compliance Report shall include an implementation schedule. This RWL Compliance Report may be incorporated in the annual Storm Water Report and Assessment unless the Regional Water Board directs an earlier submittal. The Regional Water Board may require modifications to the RWL Compliance Report.

¹ **Receiving Water Limitation:** Any applicable numeric or narrative water quality standard, or limitation to implement the applicable water quality standard, for the receiving water as contained in the *Water Quality Control Plan for the Los Angeles Region* (Basin Plan), water quality control plans or policies adopted by the State Water Resources Control Board, or federal regulations, including but not limited to, 40 CFR § 131.38.

² Pursuant to 40 CFR § 122.26(a)(3)(vi), a Permittee is only responsible for discharges of storm water and non-storm water from the MS4 for which it is an owner or operator.

³ Within 30 days of receipt of analytical results from the sampling event.

LA County MS4 Permit – Receiving Water Limitations

- b.** The Permittee shall submit any modifications to the RWL Compliance Report required by the Regional Water Board within 30 days of notification.
 - c.** Within 30 days following the Executive Officer's approval of the RWL Compliance Report, the Permittee shall revise the storm water management program and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, an implementation schedule, and any additional monitoring required.
 - d.** The Permittee shall implement the revised storm water management program and its components and monitoring program according to the approved implementation schedule.
- 4.** So long as the Permittee has complied with the procedures set forth in Section V.A.3. above and is implementing the revised storm water management program and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Water Board to modify current BMPs or develop additional BMPs.

Theresa Rodgers - CLARIFICATION OF THE MAY 3, 2012 PUBLIC WORKSHOP ON THE LA COUNTY MS4 PERMIT

From: <lyris@swrcb18.waterboards.ca.gov>
To: Theresa Rodgers <trodgers@waterboards.ca.gov>
Date: 4/26/2012 12:16 PM
Subject: CLARIFICATION OF THE MAY 3, 2012 PUBLIC WORKSHOP ON THE LA COUNTY MS4 PERMIT
Attachments: 05-03-12.pdf

Please see revised Agenda clarifying the location of the May 3, 2012 Regional Board Public Workshop at the California Science Center.

Los Angeles Regional Water Quality Control Board

TO: Board Members

FROM: Samuel Unger, P.E.
Executive Officer

DATE: April 24, 2012

SUBJECT: MATERIALS FOR MAY 3, 2012 BOARD WORKSHOP ON LA COUNTY MS4 PERMIT

As you recall, at the last board workshop held on April 5, 2012, staff discussed working proposals for permit provisions addressing (1) non-storm water discharges to the MS4 and (2) the minimum control measures that comprise Permittees' baseline storm water management programs. We are currently evaluating the working proposals in light of the oral and written comments that we received. The tentative Order will reflect revisions to the working proposals based on our consideration of these comments.

Enclosed herein are working proposals for the remaining major parts of the LA County MS4 Permit, which staff will discuss at the upcoming board workshop on May 3, 2012. The three working proposals include:

- Permit provisions for the development and implementation of Watershed Management Programs;
- Permit provisions to implement all applicable wasteload allocations from total maximum daily loads (TMDLs); and
- Permit provisions for Receiving Water Limitations consistent with the State Water Board's precedential order, Order WQ 99-05.

These working proposals have been distributed to Permittees and other interested persons for their review.

As was noted at the last board workshop, the provisions for the development and implementation of Watershed Management Programs integrate many of the other components of the permit. The release of these three working proposals in conjunction with the two previous working proposals will allow Permittees and interested persons to see how all the major parts of the permit will work together.

The upcoming board workshop on May 3, 2012 will operate in similar fashion to the previous two board workshops. Staff will provide an overview of the three working proposals and then Permittees and interested persons will have the opportunity to provide comments. If you have any questions in advance of the board workshop, please do not hesitate to contact me or Renee Purdy, Chief, Regional Programs Section at (213) 576-6622 or via e-mail at rpurdy@waterboards.ca.gov.

MARIA MEHRANIAN, CHAIR | SAMUEL UNGER, EXECUTIVE OFFICER

320 West 4th St., Suite 200, Los Angeles, CA 90013 | www.waterboards.ca.gov/losangeles

Table of Contents for Item 19 on the Agenda of the 556th
Regular Board Meeting of the California Regional Water Quality Control Board
Los Angeles Region

Workshop on the issuance of a new Los Angeles County Municipal Separate Storm Sewer System (MS4) NPDES Permit. Staff will make a presentation on provisions related to watershed planning and implementation, TMDL related requirements, and receiving water limitations.

1. Working Proposal of Watershed Management Program Provisions	19-1
2. Working Proposal of TMDL Provisions	19-14
Proposals List	19-27
a. List of TMDLs by Watershed Management Area	19-28
b. Permittees and TMDLs Matrix	19-30
c. TMDLs Provisions for Santa Clara River WMA	19-48
d. TMDLs Provisions for Santa Monica Bay WMA	19-50
e. TMDLs Provisions for Dominguez Channels and Harbors WMA	19-69
f. TMDLs Provisions for Los Angeles River WMA	19-77
g. TMDLs Provisions for San Gabriel River WMA	19-101
h. TMDLs Provisions for Los Cerritos Channel WMA	19-110
i. TMDLs Provisions for Santa Ana River WMA	19-112
3. Working Proposal of Receiving Water Limitation Provisions	19-113

LA County MS4 Permit – Receiving Water Limitations

V. RECEIVING WATER LIMITATIONS¹

A. Receiving Water Limitations

1. Discharges from the MS4 that cause or contribute to the violation of Receiving Water Limitations are prohibited.
2. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible², shall not cause or contribute to a condition of nuisance.
3. The Permittees shall comply with Sections V.A.1 and V.A.2 through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the storm water management program and its components and other requirements of this Order including any modifications. The storm water management program and its components shall be designed to achieve compliance with Receiving Water Limitations. If exceedances of Receiving Water Limitations persist, notwithstanding implementation of the storm water management program and its components and other requirements of this Order, the Permittee shall assure compliance with discharge prohibitions and Receiving Water Limitations by complying with the following procedure:
 - a. Upon a determination by either the Permittee or the Regional Water Board that discharges from the MS4 are causing or contributing to an exceedance of an applicable Receiving Water Limitation, the Permittee shall promptly notify³ and thereafter submit a Receiving Water Limitations (RWL) Compliance Report (as described in the Program Reporting Requirements, Section [TBD] of the Monitoring and Reporting Program) to the Regional Water Board for approval. The RWL Compliance Report shall describe the BMPs that are currently being implemented by the Permittee and additional BMPs, including modifications to current BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of Receiving Water Limitations. The RWL Compliance Report shall include an implementation schedule. This RWL Compliance Report may be incorporated in the annual Storm Water Report and Assessment unless the Regional Water Board directs an earlier submittal. The Regional Water Board may require modifications to the RWL Compliance Report.

¹ **Receiving Water Limitation:** Any applicable numeric or narrative water quality standard, or limitation to implement the applicable water quality standard, for the receiving water as contained in the *Water Quality Control Plan for the Los Angeles Region* (Basin Plan), water quality control plans or policies adopted by the State Water Resources Control Board, or federal regulations, including but not limited to, 40 CFR § 131.38.

² Pursuant to 40 CFR § 122.26(a)(3)(vi), a Permittee is only responsible for discharges of storm water and non-storm water from the MS4 for which it is an owner or operator.

³ Within 30 days of receipt of analytical results from the sampling event.

LA County MS4 Permit – Receiving Water Limitations

- b.** The Permittee shall submit any modifications to the RWL Compliance Report required by the Regional Water Board within 30 days of notification.
 - c.** Within 30 days following the Executive Officer’s approval of the RWL Compliance Report, the Permittee shall revise the storm water management program and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, an implementation schedule, and any additional monitoring required.
 - d.** The Permittee shall implement the revised storm water management program and its components and monitoring program according to the approved implementation schedule.
- 4.** So long as the Permittee has complied with the procedures set forth in Section V.A.3. above and is implementing the revised storm water management program and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Water Board to modify current BMPs or develop additional BMPs.

LA County MS4 Permit – List of TMDLs by Watershed Management Area

TOTAL MAXIMUM DAILY LOADS (TMDL) BY WATERSHED MANAGEMENT AREA (WMA)

- A. Santa Clara River Watershed Management Area
 - 1. Santa Clara River Nitrogen Compounds TMDL
 - 2. Upper Santa Clara River Chloride TMDL
 - 3. Lake Elizabeth, Munz Lake, and Lake Hughes Trash TMDL (*Lake Elizabeth only*)
 - 4. Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL

- B. Santa Monica Bay Watershed Management Area
 - 1. Santa Monica Bay Beaches Bacteria TMDL
 - 2. Santa Monica Bay Nearshore and Offshore Debris TMDL
 - 3. Santa Monica Bay TMDL for DDTs and PCBs (*USEPA established*)

 - 4. Malibu Creek Subwatershed
 - a. Malibu Creek and Lagoon Bacteria TMDL
 - b. Malibu Creek Watershed Trash TMDL
 - c. Malibu Creek Watershed Nutrients TMDL (*USEPA established*)

 - 5. Ballona Creek Subwatershed
 - a. Ballona Creek Trash TMDL
 - b. Ballona Creek Estuary Toxic Pollutants TMDL
 - c. Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL
 - d. Ballona Creek Metals TMDL
 - e. Ballona Creek Wetlands TMDL for Sediment and Invasive Exotic Vegetation (*USEPA established*)

 - 6. Marina del Rey Subwatershed
 - a. Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL
 - b. Marina del Rey Harbor Toxic Pollutants TMDL

- C. Dominguez Channel and Greater Harbors Waters Watershed Management Area
 - 1. Los Angeles Harbor Bacteria TMDL (Inner Cabrillo Beach and Main Ship Channel)
 - 2. Machado Lake Trash TMDL
 - 3. Machado Lake Nutrient TMDL
 - 4. Machado Lake Pesticides and PCBs TMDL
 - 5. Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters Toxic Pollutants TMDL

- D. Los Angeles River Watershed Management Area
 - 1. Los Angeles River Watershed Trash TMDL
 - 2. Los Angeles River Nitrogen Compounds and Related Effects TMDL
 - 3. Los Angeles River and Tributaries Metals TMDL
 - 4. Los Angeles River Watershed Bacteria TMDL
 - 5. Long Beach City Beaches and Los Angeles River Estuary Bacteria TMDL (*USEPA established*)
 - 6. Los Angeles Area Lakes TMDLs¹ (*USEPA established for Lake Calabasas, Echo Park Lake, and Peck Road Park Lake*)

¹ Los Angeles Area Lakes TMDL includes multiple watershed management areas.

LA County MS4 Permit – List of TMDLs by Watershed Management Area

- E. San Gabriel River Watershed Management Area
 - 1. San Gabriel River and Impaired Tributaries Metals and Selenium TMDL (*USEPA established*)
 - 2. Legg Lake Trash TMDL
 - 3. Los Angeles Area Lakes TMDLs¹ (*USEPA established for Legg Lake and Puddingstone Reservoir*)

- F. Los Cerritos Channel and Alamitos Bay Watershed Management Area
 - 1. Los Cerritos Channel Metals TMDL (*USEPA established*)
 - 2. Colorado Lagoon OC Pesticides, PCBs, Sediment Toxicity, PAHs, and Metals TMDL

- G. Middle Santa Ana River Watershed Management Area (Santa Ana Region TMDL)
 - 1. Middle Santa Ana River Watershed Bacteria Indicator TMDL

¹ Los Angeles Area Lakes TMDL includes multiple watershed management areas.

ATTACHMENT I. PERMITTEES AND TMDLS MATRIX

Note: For all tables in this Attachment, Permittees listed in *italics* are Multi-Watershed Permittees.

WORKING PROPOSAL

LA County MS4 Permit – TMDL Provisions for the Middle Santa Ana River WMA

G. Middle Santa Ana River Watershed Management Area (Santa Ana Region TMDL)

1. Middle Santa Ana River Watershed Bacteria Indicator TMDL
 - a) Permittees subject to the provisions below are identified in Table G.
 - b) Permittees shall comply with the following final effluent limitations for discharges to San Antonio Channel during dry weather no later than December 31, 2015, and during wet weather no later than December 31, 2025:
 - (1) Fecal coliform¹: log mean less than 200 organisms/100 mL based on five or more samples per 30 day period, and not more than 10% of the samples exceed 400 organisms/100 mL for any 30 – day period.
 - (2) *E. coli*: log mean less than 126 organisms/100 mL based on five or more samples per 30 – day period, and not more than 10% of the samples exceed 235 organisms/100mL for any 30 day period.
 - c) Permittees shall comply with the following receiving water limitations for discharges to San Antonio Channel during dry weather no later than December 31, 2015, and during wet weather no later than December 31, 2025:
 - (1) Fecal coliform²: 5 sample/30 – day logarithmic mean less than 180 organisms/100 mL, and not more than 10% of the samples exceed 360 organisms/100 mL for any 30 – day period.
 - (2) *E. coli*: 5 sample/30 – day logarithmic mean less than 113 organisms/100 mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30 day period.
 - d) Permittees may demonstrate compliance with the receiving water limitations by developing for approval by the Regional Water Board a Comprehensive Bacteria Reduction Plan (CBRP) describing, in detail, the specific actions that have been taken or will be taken to achieve compliance with the water quality-based effluent limitations.

¹ The fecal coliform effluent limitations become ineffective upon the replacement of the REC1 fecal coliform objectives with REC1 *E. coli* objectives in the Santa Ana Region Basin Plan.

² The fecal coliform receiving water limitations become ineffective upon the replacement of the REC1 fecal coliform objectives with REC1 *E. coli* objectives in the Santa Ana Regional Basin Plan.

LA County MS4 Permit – TMDL Provisions for the Los Cerritos Channel and Alamitos Bay WMA

F. TMDLs in Los Cerritos Channel and Alamitos Bay Watershed Management Area

1. Los Cerritos Channel Metals TMDL (USEPA established)

- a) Permittees subject to the provisions below are identified in Table F.
- b) Permittees shall comply with the following dry weather¹ water quality-based effluent limitations as of the effective date of this Order, expressed as total recoverable metals discharged to Los Cerritos Channel:

Constituent	Effluent Limitation Daily Maximum (g/day)
Copper	67.2

- c) Permittees shall comply with the following wet weather² water quality-based effluent limitations as of the effective date of this Order, expressed as total recoverable metals discharged to Los Cerritos Channel:

Constituent	Effluent Limitation Daily Maximum (g/day)
Copper	$4.709 \times 10^{-6} \times$ daily storm volume (L)
Lead	$26.852 \times 10^{-6} \times$ daily storm volume (L)
Zinc	$46.027 \times 10^{-6} \times$ daily storm volume (L)

2. Colorado Lagoon OC Pesticides, PCBs, Sediment Toxicity, PAHs, and Metals TMDL

- a) Permittees subject to the provisions below are identified in Table F.
- b) Permittees shall comply with the following interim water quality-based effluent limitations as of the effective date of this Order, for sediments within Colorado Lagoon:

Constituent	Interim Concentration-based Effluent Limitations Monthly Average ($\mu\text{g}/\text{dry kg}$)
Chlordane	129.65
Dieldrin	26.20
Lead	399,500
Zinc	565,000
PAHs	4,022
PCBs	89.90
DDT	149.80

¹ Dry weather is defined as any day when the maximum daily flow in Los Cerritos Channel is less than 23 cubic feet per second (cfs) measured at Stearns Street Monitoring Station.

² Wet weather is defined as any day when the maximum daily flow in Los Cerritos Channel is equal to or greater than 23 cfs measured at Stearns Street Monitoring Station.

LA County MS4 Permit – TMDL Provisions for the Los Cerritos Channel and Alamitos Bay WMA

- c) Permittees shall comply with the following final water quality-based effluent limitations no later than July 28, 2018, for sediments within Colorado Lagoon:

Constituent	Final Concentration Based Effluent Limitations Monthly Average ($\mu\text{g}/\text{dry kg}$)
Chlordane	0.50
Dieldrin	0.02
Lead	46,700
Zinc	150,000
PAHs	4,022
PCBs	22.70
DDT	1.58

- d) The mass-based water quality-based effluent limitations are shared by the MS4 Permittees, which includes LA MS4, Long Beach MS4 and Caltrans. Permittees shall comply with the following grouped final water quality-based effluent limitations no later than July 28, 2018, expressed as an annual discharge of sediment to Colorado Lagoon:

Constituent	Annual Mass-based Effluent Limitations (mg/yr)				
	Project 452	Line I	Termino Ave	Line K	Line M
Chlordane	5.10	3.65	12.15	1.94	0.73
Dieldrin	0.20	0.15	0.49	0.08	0.03
Lead	476,646.68	340,455.99	1,134,867.12	181,573.76	68,116.09
Zinc	1,530,985.05	1,093,541.72	3,645,183.47	583,213.37	218,788.29
PAHs	41,050.81	29,321.50	97,739.52	15,637.89	5,866.44
PCBs	231.69	165.49	551.64	88.26	33.11
DDT	16.13	11.52	38.40	6.14	2.30

- e) Compliance with the concentration-based water quality-based effluent limitations shall be determined by pollutant concentrations in the sediment in Colorado Lagoon at points in the West Arm, North Arm and Central Arm that represent the cumulative inputs from the MS4 drainage to the lagoon.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

E. TMDLs in San Gabriel River Watershed Management Area

1. San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL (USEPA established)

- a) Permittees subject to the provisions below are identified in Table E.
- b) Permittees shall comply with the following grouped¹ wet weather² water quality-based effluent limitations as of the effective date of this Order, expressed as total recoverable metals discharged to all upstream reaches and tributaries of the San Gabriel River Reach 2 and Coyote Creek:

Water Body	Effluent Limitation Daily Maximum (kg/day)		
	Copper	Lead	Zinc
San Gabriel Reach 2	---	81.34 x daily storm volume (L)	---
Coyote Creek	24.71 x daily storm volume (L)	96.99 x daily storm volume (L)	144.57 x daily storm volume (L)

- c) Permittees shall comply with the following grouped¹ dry weather water quality-based effluent limitations as of the effective date of this Order, expressed as total recoverable metals discharged to San Gabriel River Reach 1, Coyote Creek, San Gabriel River Estuary, and San Jose Creek Reach 1 and Reach 2:

Water Body	Effluent Limitation Daily Maximum	
	Copper	Selenium
San Gabriel Reach 1	18 ug/L	---
Coyote Creek	0.941 kg/day	---
San Gabriel River Estuary	3.7 ug/L	---
San Jose Creek Reach 1 and 2	---	5 ug/L

2. Legg Lake Trash TMDL

- a) Permittees subject to the provisions below are identified in Table E.
- b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Legg Lake no later than March 6, 2016.
- c) If the Permittees choose to comply with the water quality-based effluent limitations by implementing an Executive Officer certified full capture system on conveyances that discharge to Legg Lake through a progressive

¹ The wet weather and dry weather water quality-based effluent limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees, Long Beach MS4 Permittees, Orange County MS4 Permittees and Caltrans.

² In San Gabriel River Reach 2, wet weather TMDLs apply when the maximum daily flow of the river is equal to or greater than 260 cfs as measured at USGS station 11085000, located at the bottom of Reach 3 just above the Whittier Narrows Dam. In Coyote Creek, wet weather TMDLs apply when the maximum daily flow in the creek is equal to or greater than 156 cfs as measured at LACDPW flow gauge station F354-R, located at the bottom of the creek, just above the Long Beach WRP.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

implementation schedule of full capture devices, they will be deemed in compliance with the water quality-based effluent limitations.

- d) Permittees that choose to comply via a full capture compliance strategy must demonstrate a phased implementation of full capture devices attaining interim effluent limitations over the following 8-year period until the final effluent limitation of zero is attained:

Deadline	Effluent Limitation	
	Drainage Area covered by Full Capture Systems (%)	
March 6, 2008	0	
March 6, 2012	20	
March 6, 2013	40	
March 6, 2014	60	
March 6, 2015	80	
March 6, 2016	100	

Legg Lake Trash Effluent Limitations³ (gallons of uncompressed trash per year)

Permittees	Baseline ⁴ (100%)	3/6/2012 (80%)	3/6/2013 (60%)	3/6/2014 (40%)	3/6/2015 (20%)	3/6/2016 ⁵ (0%)
Los Angeles County	2400.03	1920.02	1440.02	960.01	480.01	0
Los Angeles County Flood Control District	24.05	19.24	14.43	9.62	4.81	0
City of El Monte	509.48	407.58	305.69	203.79	101.90	0
City of South El Monte	3896.76	3117.41	2338.06	1558.70	779.35	0

³ Water quality-based effluent limitations are expressed as allowable trash discharge relative to baseline Waste Load Allocations specified in Table XX of the Basin Plan.

⁴ The Regional Water Board has determined the following baseline water quality-based effluent limitations for the Permittees based on the estimated trash generation rate of 6677 gallons of uncompressed trash per square mile per year.

⁵ Permittees shall achieve their final effluent limitation of zero trash discharge for the year and every year thereafter.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

- e) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 2(b) and 2(c) above per the provisions in Part 7.X [*Permit Provisions to Implement Trash TMDLs*].
- f) If a Permittee opts to derive site specific trash generation rates through its Trash Monitoring and Reporting Plan (TMRP), the baseline limitation shall be calculated by multiplying the point source area(s) by the derived trash generation rate(s).
3. Los Angeles Area Lakes TMDLs⁶ (USEPA in progress)
- a) Legg Lake System Nutrient TMDL
- (1) Permittees subject to the provisions below are identified in Table E.
 - (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee's drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorous and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the following annual mass allocation based on current flow conditions as of the effective date of this Order:

Subwatershed	Permittee	Flow (ac-ft/yr)	Total Phosphorus (lb-P/yr) ^{7,8}	Total Nitrogen (lb-N/yr) ^{7,8}
Northwestern	County of Los Angeles	33.5	53.6	148.7
Northwestern	South El Monte	308	526.3	1,500.6
Northeastern	El Monte	122	226.6	590.3
Northeastern	County of Los Angeles	8.18	12.8	39.2
Northeastern	South El Monte	287	498.7	1,394.8

- (3) The following concentration based water quality-based receiving water limitations apply during both wet and dry weather if:

- The responsible jurisdiction requests that the concentration-based receiving water limits apply and provides to U.S. EPA and the Los Angeles Water Board a Lake Management Plan describing actions that will be implemented and cause the applicable water quality criteria for ammonia, dissolved oxygen, and pH targets to be met.

⁶ Los Angeles Area Lakes TMDL includes multiple watershed management areas.

⁷ Measured as a summer average (May – September) and annual average.

⁸ Measured at the point of discharge.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

- The Los Angeles Water Board Executive Officer approves the request. The concentration-based receiving water limitations are not to be exceeded as a summer average (May-September) and annual average.
- U.S. EPA does not object to the Los Angeles Water Boards decision within sixty days of receiving notice.
- The concentration-based receiving water limits must be met in the lake. However, if the applicable water quality criteria for ammonia, dissolved oxygen, and pH targets are met, then the total phosphorus and total nitrogen limits are considered attained.

Subwatershed	Permittee	Total Phosphorus Monthly Average (mg-P/L) ^{9,10}	Total Nitrogen Monthly Average (mg-N/L) ^{9,10}
Northwestern	County of Los Angeles	0.1	1.0
Northwestern	South El Monte	0.1	1.0
Northeastern	El Monte	0.1	1.0
Northeastern	County of Los Angeles	0.1	1.0
Northeastern	South El Monte	0.1	1.0

b) Puddingstone Reservoir Nutrient TMDL

- (1) Permittees subject to the provisions below are identified in Table E.
- (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee's drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorus and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the annual mass allocation based on current flow conditions as of the effective date of this Order:

Subwatershed	Permittee	Total Phosphorus (lb-P/yr) ^{10,11}	Total Nitrogen (lb-N/yr) ^{10,11}
Northern	Claremont	169	745
Northern	County of Los Angeles	741	829
Northern	La Verne	2,772	11,766
Northern	Pomona	6.30	28.3
Northern	San Dimas	31.1	137

⁹ Measured as an in-lake concentration.

¹⁰ Measured as a summer average (May – September) and annual average.

¹¹ Measured at the point of discharge.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

(3) The following concentration based water quality-based receiving water limitations apply during both wet and dry weather if:

- The responsible jurisdiction requests that the concentration-based receiving water limits apply and provides to U.S. EPA and the Los Angeles Water Board a Lake Management Plan describing actions that will be implemented and cause the applicable water quality criteria for ammonia, dissolved oxygen, and pH targets to be met.
- The Los Angeles Water Board Executive Officer approves the request. The concentration-based receiving water limitations are not to be exceeded as a summer average (May-September) and annual average.
- U.S. EPA does not object to the Los Angeles Water Boards decision within sixty days of receiving notice.
- The concentration-based receiving water limits must be met in the lake.

Subwatershed	Permittee	Total Phosphorus Monthly Average (mg-P/L) ^{12,13}	Total Nitrogen Monthly Average (mg-N/L) ^{12,13}
Northern	Claremont	0.1	1.0
Northern	County of Los Angeles	0.1	1.0
Northern	La Verne	0.1	1.0
Northern	Pomona	0.1	1.0
Northern	San Dimas	0.1	1.0

c) Puddingstone Reservoir Mercury TMDL

- (1) Permittees subject to the provisions below are identified in Table E.
- (2) Permittees shall comply with the following water quality-based effluent limitations during both wet and dry weather as of the effective date of this Order:

Subwatershed	Permittee	Total Mercury (g-Hg/yr) ^{14,15}
Northern	Claremont	0.674
Northern	County of Los Angeles	2.79
Northern	La Verne	10.6
Northern	Pomona	0.026
Northern	San Dimas	0.109

¹² Measured as an in-lake concentration.

¹³ Measured as a summer average (May – September) and annual average.

¹⁴ Measured at the point of discharge.

¹⁵ Applied as an annual average.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

d) Puddingstone Reservoir PCBs TMDL

- (1) Permittees subject to the provisions below are identified in Table E.
- (2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Subwatershed	Permittee	Total PCBs associated with Suspended Sediment (ug/kg dry weight) ^{16,18}	Total PCBs in the Water Column (ng/L) ^{16,18}
Northern	Claremont	0.59	0.17
Northern	County of Los Angeles	0.59	0.17
Northern	La Verne	0.59	0.17
Northern	Pomona	0.59	0.17
Northern	San Dimas	0.59	0.17

- (3) Permittees may comply with the following alternative effluent limitations if the responsible jurisdictions submit to U.S. EPA and the Regional Board material describing that the fish tissue target of 3.6 ppb wet weight has been met for the preceding three or more years. A demonstration that the fish tissue target has been met in any given year must at a minimum include a composite sample of skin of fillets from at least five common carp each measuring at least 350 mm in length and it is approved by the Los Angeles Water Board Executive Officer and U.S. EPA does not object within 60 days of receiving notice:

Subwatershed	Permittee	Total PCBs associated with Suspended Sediment (ug/kg dry weight) ^{16,17}	Total PCBs in the Water Column (ng/L) ^{16,18}
Northern	Claremont	59.8	0.17
Northern	County of Los Angeles	59.8	0.17
Northern	La Verne	59.8	0.17
Northern	Pomona	59.8	0.17
Northern	San Dimas	59.8	0.17

e) Puddingstone Reservoir Chlordane TMDL

- (1) Permittees subject to the provisions below are identified in Table E.
- (2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Subwatershed	Permittee	Total Chlordane associated with	Total Chlordane in the Water
--------------	-----------	---------------------------------	------------------------------

¹⁶ Measured at the point of discharge.

¹⁷ Applied as a 3-year average.

¹⁸ Applied as an annual average.

LA County MS4 Permit – TMDL Provisions for the San Gabriel River WMA

		Suspended Sediment (ug/kg dry weight)^{19,20}	Column (ng/L)^{19,20}
Northern	Claremont	0.75	0.57
Northern	County of Los Angeles	0.75	0.57
Northern	La Verne	0.75	0.57

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

D. TMDLs in Los Angeles River Watershed Management Area

1. Los Angeles River Watershed Trash TMDL
 - a) Permittees subject to the provisions below are identified in Table D.
 - b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to the Los Angeles River no later than September 30, 2016 and every year thereafter.
 - c) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged to the Los Angeles River, per the schedule below:

**Los Angeles River Watershed Trash Effluent Limitations¹ per Storm Year²
(gallons of uncompressed trash)**

d) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [Permit Provisions to Implement Trash TMDLs].

2. Los Angeles River Nitrogen Compounds and Related Effects TMDL

- a) Permittees subject to the provisions below are identified in Table D.
- b) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Water Body	NH ₃ -N (mg/L)		NO ₃ -N (mg/L)	NO ₂ -N (mg/L)	NO ₃ -N+NO ₂ -N (mg/L)
	One-hour Average	Thirty-day Average	Thirty-day Average	Thirty-day Average	Thirty-day Average
Los Angeles River above Los Angeles-Glendale WRP (LAG)	4.7	1.6	8.0	1.0	8.0
Los Angeles River below LAG	8.7	2.4	8.0	1.0	8.0
Los Angeles Tributaries	10.1	2.3	8.0	1.0	8.0

3. Los Angeles River and Tributaries Metals TMDL

- a) Permittees subject to the provisions below are identified in Table D.
- b) Final Water Quality-Based Effluent Limitations
 - (1) Permittees shall comply with the following grouped⁷ dry weather⁸ water quality-based effluent limitations no later than January 11, 2024, expressed as total recoverable metals.

Waterbody	Effluent Limitations Daily Maximum (kg/day)		
	Copper	Lead	Zinc
LA River Reach 6	0.53	0.33	---
LA River Reach 5	0.05	0.03	---
LA River Reach 4	0.32	0.12	---
LA River Reach 3	0.06	0.03	---
LA River Reach 2	0.13	0.07	---
LA River Reach 1	0.14	0.07	---

⁷ The dry weather water quality-based effluent limitations are grouped-based and shared by the MS4 Permittees, which includes LA MS4 Permittees, Long Beach MS4 Permittee and Caltrans.

⁸ Dry weather is defined as any day when the maximum daily flow in the Los Angeles River is less than 500 cfs measured at the Wardlow gage station.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Bell Creek	0.06	0.04	---
Tujunga Wash	0.001	0.0002	---
Burbank Channel	0.15	0.07	---
Verdugo Wash	0.18	0.10	---
Arroyo Seco	0.01	0.01	---
Rio Hondo Reach 1	0.01	0.006	0.16
Compton Creek	0.04	0.02	---

- (2) In lieu of calculating loads, Permittees may demonstrate compliance with the following concentration-based water quality-based effluent limitations during dry weather no later than January 11, 2024, expressed as total recoverable metals:

Waterbody	Effluent Limitations Daily Maximum (µg total recoverable metals/L)		
	Copper	Lead	Zinc
LA River Reach 5, 6 and Bell Creek	30	19	---
LA River Reach 4	26	10	---
LA River Reach 3 above LA-Glendale WRP and Verdugo Wash	23	12	---
LA River Reach 3 below LA-Glendale WRP	26	12	---
Burbank Western Channel (above WRP)	26	14	---
Burbank Western Channel (below WRP)	19	9.1	---
LA River Reach 2 and Arroyo Seco	22	11	---
LA River Reach 1	23	12	---
Compton Creek	19	8.9	---
Rio Hondo Reach 1	13	5.0	131

- (3) Permittees shall comply with the following grouped⁹ wet weather¹⁰ water quality-based effluent limitations no later than January 11, 2028, expressed as total recoverable metals discharged to all reaches of the Los Angeles River and its tributaries:

Constituent	Effluent Limitation Daily Maximum (kg/day)

⁹ The wet weather water quality-based effluent limitations are grouped-based and shared by the MS4 Permittees, which includes LA MS4 Permittees, and Long Beach MS4 Permittee.

¹⁰ Wet weather is defined as any day when the maximum daily flow in the Los Angeles River is equal to or greater than 500 cfs measured at the Wardlow gage station.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Cadmium	2.8×10^{-9} x daily volume (L) – 1.8
Copper	1.5×10^{-8} x daily volume (L) – 9.5
Lead	5.6×10^{-8} x daily volume (L) – 3.85
Zinc	1.4×10^{-7} x daily volume (L) – 83

- c) Permittees shall comply with interim and final water quality-based effluent limitations for metals discharged to the Los Angeles River and its tributaries, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the water quality-based effluent limitations (%)	
	Dry weather	Wet weather
January 11, 2012	50	25
January 11, 2020	75	--
January 11, 2024	100	50
January 11, 2028	100	100

4. Los Angeles River Watershed Bacteria TMDL

- a) Permittees subject to the provisions below are identified in Table D.
- b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to the Los Angeles River and its tributaries during dry weather according to the schedule in Table 1, and during wet weather no later than March 23, 2037:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
<i>E. coli</i>	235/100 mL	126/100 mL

- c) Permittees shall comply with the following grouped¹¹ interim dry weather single sample bacteria water quality-based effluent limitations for specific river segments and tributaries as listed in the table, below, according to the schedule in Table 1:

River Segment or Tributary	Daily Maximum <i>E. coli</i> Load (10 ⁹ MPN/Day)
Los Angeles River Segment A (Willow to Rosecrans)	301

¹¹ The interim dry weather water quality-based effluent limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees, Long Beach MS4 Permittees, and Caltrans.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Los Angeles River Segment B (Rosecrans to Figueroa)	518
Los Angeles River Segment C (Figueroa to Tujunga)	463
Los Angeles River Segment D (Tujunga to Balboa)	454
Los Angeles River Segment E (Balboa to headwaters)	32
Aliso Canyon Wash	23
Arroyo Seco	24
Bell Creek	14
Bull Creek	9
Burbank Western Channel	86
Compton Creek	7
Dry Canyon	7
McCoy Canyon	7
Rio Hondo	2
Tujunga Wash	10
Verdugo Wash	51

d) Receiving Water Limitations

- (1) Permittees shall comply with the following grouped¹² final single sample bacteria receiving water limitations for discharges to the Los Angeles River and its tributaries during dry weather according to the schedule in Table 1, and during wet weather no later than March 23, 2037:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily Sampling	Weekly Sampling
Dry Weather	5	1
Non-HFS ¹³ Waterbodies Wet Weather	15	2
HFS Waterbodies Wet Weather	10 (not including HSF days)	2 (not including HSF days)

- (2) Permittees shall comply with the following geometric mean receiving water limitation for discharges to the Los Angeles River and its tributaries

¹² The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4, Long Beach MS4, and Caltrans.

¹³ HFS stands for high flow suspension as defined in Chapter 2 of the Basin Plan.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

during dry weather according to the schedule in Table 1, and during wet weather no later than March 23, 2037:

Constituent	Geometric Mean (MPN or cfu)
<i>E. coli</i>	126/100 mL

Table 1: Los Angeles River Bacteria Implementation Schedule for Dry Weather
Italics in this Table refer to Permittees using an alternative compliance plan instead of an LRS.

Implementation Action	Responsible Parties	Deadline
SEGMENT B (upper and middle Reach 2 – Figueroa Street to Rosecrans Avenue)		
First phase – Segment B		
Submit a Load Reduction Strategy (LRS) for Segment B (<i>or submit an alternative compliance plan</i>)	MS4 Permittees discharging to Segment B	September 23, 2014
Complete implementation of LRS	MS4 Permittees discharging to Segment B, if using LRS	March 23, 2019
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment B, if using LRS	March 23, 2022
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment B, if using alternative compliance plan</i>	<i>March 23, 2022</i>
Second phase, if necessary – Segment B for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment B	March 23, 2023
Complete implementation of LRS	MS4 Permittees discharging to Segment B, if using LRS	September 23, 2026
Achieve final water quality-based effluent limitations in Segment B or demonstrate that non-compliance is only due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment B, if using LRS	September 23, 2028
SEGMENT B TRIBUTARIES (Rio Hondo and Arroyo Seco)		
First phase – Segment B Tributaries (Rio Hondo and Arroyo Seco)		
Submit a Load Reduction Strategy (LRS) for Segment B tributaries (<i>or submit an alternative compliance plan</i>)	MS4 Permittees discharging to Segment B tributaries	March 23, 2016

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Implementation Action	Responsible Parties	Deadline
Complete implementation of LRS	MS4 Permittees discharging to Segment B tributaries, if using LRS	September 23, 2020
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment B tributaries, if using LRS	September 23, 2023
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is only due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment B tributaries, if using alternative compliance plan</i>	<i>September 23, 2023</i>
Second phase, if necessary – Segment B Tributaries (Rio Hondo and Arroyo Seco) for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment B tributaries	September 23, 2024
Complete implementation of LRS	MS4 Permittees discharging to Segment B tributaries, if using LRS	March 23, 2028
Achieve final water quality-based effluent limitations Segment B tributaries or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment B tributaries, if using LRS	March 23, 2030
SEGMENT A (lower Reach 2 and Reach 1 – Rosecrans Avenue to Willow Street)		
First phase – Segment A		
Submit a Load Reduction Strategy (LRS) for Segment A (or submit an alternative compliance plan)	MS4 Permittees discharging to Segment A	September 23, 2016
Complete implementation of LRS	MS4 Permittees discharging to Segment A, if using LRS	March 23, 2021
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment A, if using LRS	March 23, 2024
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment A, if using alternative compliance plan</i>	<i>March 23, 2024</i>
Second phase, if necessary – Segment A for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment A	March 23, 2025

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Implementation Action	Responsible Parties	Deadline
Complete implementation of LRS	MS4 Permittees discharging to Segment A, if using LRS	September 23, 2029
Achieve final water quality-based effluent limitations in Segment A or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment A, if using LRS	September 23, 2031
SEGMENT A TRIBUTARY (Compton Creek)		
First phase – Segment A Tributary		
Submit a Load Reduction Strategy (LRS) for Segment A tributary (or submit an alternative compliance plan)	MS4 Permittees discharging to Segment A tributary	March 23, 2018
Complete implementation of LRS	MS4 Permittees discharging to Segment A tributary if using LRS	September 23, 2022
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment A tributary if using LRS	September 23, 2025
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment A tributary, if using alternative compliance plan</i>	<i>September 23, 2025</i>
Second phase, if necessary – Segment A Tributary for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment A tributary	September 23, 2026
Complete implementation of LRS	MS4 Permittees discharging to Segment A tributary, if using LRS	March 23, 2030
Achieve final water quality-based effluent limitations in Segment A tributary or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment A tributary, if using LRS	March 23, 2032
SEGMENT E (Reach 6 – LA River headwaters [confluence with Bell Creek and Calabasas Creek] to Balboa Boulevard)		
First phase – Segment E		
Submit a Load Reduction Strategy (LRS) for Segment E (or submit an alternative compliance plan)	MS4 Permittees discharging to Segment E	September 23, 2017

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Implementation Action	Responsible Parties	Deadline
Complete implementation of LRS	MS4 Permittees discharging to Segment E, if using LRS	March 23, 2022
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment E, if using LRS	March 23, 2025
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment E, if using alternative compliance plan</i>	<i>March 23, 2025</i>
Second phase, if necessary –Segment E for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment E	March 23, 2026
Complete implementation of LRS	MS4 Permittees discharging to Segment E, if using LRS	September 23, 2029
Achieve final Water quality-based effluent limitations in Segment E or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment E, if using LRS	September 23, 2031
SEGMENT E TRIBUTARIES (Dry Canyon Creek, McCoy Creek, Bell Creek, and Aliso Canyon Wash)		
First phase – Segment E Tributaries		
Submit a Load Reduction Strategy (LRS) for Segment E tributaries (or submit an alternative compliance plan)	MS4 Permittees discharging to Segment E tributaries	September 23, 2021
Complete implementation of LRS	MS4 Permittees discharging to Segment E tributaries if using LRS	March 23, 2026
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment E tributaries, if using LRS	March 23, 2029
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment E tributaries, if using alternative compliance plan</i>	<i>March 23, 2029</i>
Second phase, if necessary – Segment E Tributaries for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment E tributaries	March 23, 2030

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Implementation Action	Responsible Parties	Deadline
Complete implementation of LRS	MS4 Permittees discharging to Segment E tributaries, if using LRS	September 23, 2033
Achieve final water quality-based effluent limitations in Segment E tributaries or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment E tributaries, if using LRS	September 23, 2035
SEGMENT C (lower Reach 4 and Reach 3 – Tujunga Avenue to Figueroa Street) SEGMENT C TRIBUTARIES (Tujunga Wash, Burbank Western Channel, and Verdugo Wash) SEGMENT D (Reach 5 and upper Reach 4 – Balboa Boulevard to Tujunga Avenue) SEGMENT D TRIBUTARIES (Bull Creek)		
First phase – Segment C, Segment C Tributaries, Segment D, Segment D tributaries		
Submit a Load Reduction Strategies (LRS) for Segment C, Segment C tributaries, Segment D, Segment D tributaries (<i>or submit an alternative compliance plan</i>)	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries	March 23, 2023
Complete implementation of LRS	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries, if using LRS	September 23, 2027
Achieve interim (or final) water quality-based effluent limitations and submit report to Regional Water Board	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries, if using LRS	September 23, 2030
<i>Achieve final water quality-based effluent limitations or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board</i>	<i>MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries, if using alternative compliance plan</i>	<i>September 23, 2030</i>
Second phase, if necessary - Segment C, Segment C Tributaries, Segment D, Segment D Tributaries for LRS approach only		
Submit a new LRS	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries	September 23, 2031
Complete implementation of LRS	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries if using LRS	March 23, 2035
Achieve final water quality-based effluent limitations in Segment C, Segment C tributaries, Segment D, Segment D tributaries or demonstrate that non-compliance is due to upstream contributions and submit report to Regional Water Board	MS4 Permittees discharging to Segment C, Segment C tributaries, Segment D, Segment D tributaries if using LRS	March 23, 2037

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

e) Compliance Determination

- (1) Permittees may demonstrate compliance with the final dry weather limitations by demonstrating that final receiving water limitations are met in the receiving waters or by demonstrating one of the following conditions at outfalls to the receiving waters:
 - (i) Flow-weighted concentration of *E. coli* in MS4 discharges during dry weather is less than or equal to 235 MPN/100mL, based on a weighted-average using flow rates from all measured outfalls; or
 - (ii) Zero discharge during dry weather.
- (2) In addition, individual Permittees or subgroups of Permittees may differentiate their dry weather discharges from other dischargers or upstream contributions by demonstrating one of the following conditions at outfalls to the receiving waters or at segment, tributary or jurisdictional boundaries:
 - (i) The flow-weighted concentration of *E. coli* in a Permittee's individual discharge or in a group of Permittees' collective discharge during dry weather is less than or equal to 235 MPN/100mL, based on a weighted-average using flow rates from all measured outfalls; or
 - (ii) Zero discharge from a Permittee's individual outfall(s) or from a group of Permittees' outfall(s) during dry weather; or
 - (iii) Demonstration that the MS4 loading of *E. coli* to the segment or tributary during dry weather is less than or equal to the calculated loading rate that would not cause or contribute to exceedances based on the loading capacity representative of conditions in the River at the time of compliance.
- (3) The interim dry weather water quality-based effluent limitations are group-based, shared among all MS4 Permittees that drain to a segment or tributary. However, the interim dry weather water quality-based effluent limitations may be distributed based on proportional drainage area, upon approval of the Executive Officer.
- (4) By March 23, 2022, Permittees shall submit an implementation plan for wet weather with interim milestones.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

- 5. Long Beach City Beaches and Los Angeles River Estuary Bacteria TMDL
 - a) Permittees subject to the provisions below are identified in Table D.
 - b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to the Los Angeles River Estuary as of the effective date of this Order:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

- c) Receiving Water Limitations
 - (1) Permittees shall comply with the following grouped¹⁴ final single sample bacteria receiving water limitations for the Los Angeles River Estuary as of the effective date of this Order:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily sampling	Weekly sampling
Summer Dry-Weather (April 1 to October 31)	0	0
Winter Dry-Weather (November 1 to March 31)	9	2
Wet Weather ¹⁵	17	3

- (2) Permittees shall comply with the following geometric mean receiving water limitations for all monitoring stations in the Los Angeles River Estuary as of the effective date of this Order:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

- d) Compliance Determination
 - (1) Permittees may demonstrate compliance with the final dry or weather limitations by demonstrating that final receiving water limitations are met

¹⁴ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees, Long Beach MS4 Permittees, and Caltrans.

¹⁵ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

in the receiving waters or by demonstrating one of the following conditions at outfalls to the receiving waters:

- (i) Flow-weighted concentration of bacterial indicators in MS4 discharges during dry or wet weather is less than or equal to the water quality-based effluent limitations in part 5.b. above, based on a weighted-average using flow rates from all measured outfalls; or
 - (ii) Zero discharge during dry weather.
- (2) In addition, individual Permittees or subgroups of Permittees may differentiate their dry or wet weather discharges from other dischargers or upstream contributions by demonstrating one of the following conditions at outfalls to the receiving waters or at segment, tributary or jurisdictional boundaries:
- (i) The flow-weighted concentration of bacterial indicators in a Permittee’s individual discharge or in a group of Permittees’ collective discharge during dry or wet weather is less than or equal to the water quality-based effluent limitations in part 5.b. above, based on a weighted-average using flow rates from all measured outfalls; or
 - (ii) Zero discharge from a Permittee’s individual outfall(s) or from a group of Permittees’ outfall(s) during dry weather.

6. Los Angeles Area Lakes TMDLs

a) Lake Calabastas Nutrient TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee’s drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorus and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the annual mass allocation based on current flow conditions as of the effective date of this Order:

Permittee	Total Phosphorus (lb-P/yr) ^{16,17}	Total Nitrogen (lb-N/yr) ^{16,17}
City of Calabastas	48.5	220

- (3) The following concentration based water quality-based receiving water limitations apply during both wet and dry weather if:

¹⁶ Measured as a summer average (May – September) and annual average.

¹⁷ Measured at the point of discharge.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

- The responsible jurisdiction requests that the concentration-based receiving water limits apply and provides to U.S. EPA and the Los Angeles Water Board a Lake Management Plan describing actions that will be implemented and cause the applicable water quality criteria for ammonia, dissolved oxygen, and pH targets to be met.
- The Los Angeles Water Board Executive Officer approves the request. The concentration-based receiving water limitations are not to be exceeded as a summer average (May-September) and annual average.
- U.S. EPA does not object to the Los Angeles Water Boards decision within sixty days of receiving notice.
- The concentration-based receiving water limits must be met in the lake. However, if the applicable water quality criteria for ammonia, dissolved oxygen, pH, and the chlorophyll *a* targets are met, then the total phosphorus and total nitrogen limits are considered attained.

Permittee	Total Phosphorus Monthly Average (mg-P/L) ^{18,19}	Total Nitrogen Monthly Average (mg-N/L) ^{18,19}
City of Calabasas	0.1	1.0

b) Echo Park Lake Nutrient TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee’s drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorus and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the annual mass allocation based on current flow conditions as of the effective date of this Order:

Subwatershed	Permittee	Total Phosphorus (lb-P/yr) ^{19,20}	Total Nitrogen (lb-N/yr) ^{19,20}
Northern	City of Los Angeles	24.7	156
Southern	City of Los Angeles	7.129	49.69

¹⁸ Measured as an in-lake concentration.

¹⁹ Measured as a summer average (May – September) and annual average.

²⁰ Measured at the point of discharge.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

- (3) In assessing compliance with wasteload allocations, responsible jurisdictions assigned both northern and southern subwatershed allocations may have their allocations combined.

c) Echo Park Lake PCBs TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Subwatershed	Permittee	Total PCBs associated with Suspended Sediment (ug/kg dry weight) ^{21,22}	Total PCBs in the Water Column (ng/L) ^{21,22}
Northern	City of Los Angeles	1.77	0.17
Southern	City of Los Angeles	1.77	0.17

- (3) Permittees may comply with the following alternative effluent limitations if the responsible jurisdictions submit to U.S. EPA and the Regional Board material describing that the fish tissue target of 3.6 ppb wet weight has been met for the preceding three or more years. A demonstration that the fish tissue target has been met in any given year must at a minimum include a composite sample of skin of fillets from at least five common carp each measuring at least 350 mm in length and it is approved by the Los Angeles Water Board Executive Officer and U.S. EPA does not object within 60 days of receiving notice:

Subwatershed	Permittee	Total PCBs associated with Suspended Sediment (ug/kg dry weight) ^{22,23}	Total PCBs in the Water Column (ng/L) ^{21,22}
Northern	City of Los Angeles	59.8	0.17
Southern	City of Los Angeles	59.8	0.17

d) Echo Park Lake Chlordane TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

²¹ Applied as an annual average.
²² Measured at the point of discharge.
²³ Applied as a 3-year average.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Subwatershed	Permittee	Total Chlordane associated with Suspended Sediment (ug/kg dry weight) ^{24,25}	Total Chlordane in the Water Column (ng/L) ^{24,25}
Northern	City of Los Angeles	2.10	0.59
Southern	City of Los Angeles	2.10	0.59

- (3) Permittees may comply with the following alternative effluent limitations if the responsible jurisdictions submit to U.S. EPA and the Regional Board material describing that the fish tissue target of 3.6 ppb wet weight has been met for the preceding three or more years. A demonstration that the fish tissue target has been met in any given year must at a minimum include a composite sample of skin of fillets from at least five common carp each measuring at least 350 mm in length and it is approved by the Los Angeles Water Board Executive Officer and U.S. EPA does not object within 60 days of receiving notice:

Subwatershed	Permittee	Total Chlordane associated with Suspended Sediment (ug/kg dry weight) ^{24,26}	Total Chlordane in the Water Column (ng/L) ^{24,25}
Northern	City of Los Angeles	3.24	0.59
Southern	City of Los Angeles	3.24	0.59

e) Echo Park Lake Dieldrin TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order:

Subwatershed	Permittee	Dieldrin associated with Suspended Sediment (ug/kg dry weight) ^{24,25}	Dieldrin in the Water Column (ng/L) ^{24,25}
Northern	City of Los Angeles	0.80	0.14
Southern	City of Los Angeles	0.80	0.14

- (3) Permittees may comply with the following alternative effluent limitations if the responsible jurisdictions submit to U.S. EPA and the

²⁴ Measured at the point of discharge.

²⁵ Applied as an annual average.

²⁶ Applied as a 3-year average.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

Regional Board material describing that the fish tissue target of 3.6 ppb wet weight has been met for the preceding three or more years. A demonstration that the fish tissue target has been met in any given year must at a minimum include a composite sample of skin of fillets from at least five common carp each measuring at least 350 mm in length and it is approved by the Los Angeles Water Board Executive Officer and U.S. EPA does not object within 60 days of receiving notice:

Subwatershed	Permittee	Dieldrin associated with Suspended Sediment (ug/kg dry weight) ^{27,28}	Dieldrin in the Water Column (ng/L) ^{27,29}
Northern	City of Los Angeles	1.90	0.14
Southern	City of Los Angeles	1.90	0.14

f) Echo Park Lake Trash TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees shall comply with the following water quality-based effluent limitation as of the effective date of this Order:

Permittee	Trash (Gal/year)
City of Los Angeles	0

g) Peck Road Park Lake Nutrient TMDL

- (1) Permittees subject to the provisions below are identified in Table D.
- (2) Permittees may be deemed in compliance with water quality-based effluent limitations during both wet and dry weather by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee’s drainage area. The annual mass-based allocation shall be equal to monthly average concentrations of 0.1 mg/L total phosphorus and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees shall comply with the annual mass allocation based on current flow conditions as of the effective date of this Order:

- (3) Permittees may comply with the following alternative effluent limitations if the responsible jurisdictions submit to U.S. EPA and the Regional Board material describing that the fish tissue target of 3.6 ppb wet weight has been met for the preceding three or more years. A demonstration that the fish tissue target has been met in any given year must at a minimum include a composite sample of skin of fillets from at least five common carp each measuring at least 350 mm in length and it is approved by the Los Angeles Water Board Executive Officer and U.S. EPA does not object within 60 days of receiving notice:

l) Peck Road Park Lake Trash TMDL

- (1) Permittees subject to the provisions below are identified in Table D.

⁴⁰ Measured at the point of discharge.

⁴¹ Applied as a 3-year average.

⁴² Applied as an annual average.

LA County MS4 Permit – TMDL Provisions for the Los Angeles River WMA

- (2) Permittees shall comply with the following water quality-based effluent limitation as of the effective date of this Order:

Permittee	Trash (gal/year)
Arcadia	0
Bradbury	0
Duarte	0
El Monte	0
Irwindale	0
County of Los Angeles	0
Monrovia	0
Sierra Madre	0

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

C. TMDLs in Dominguez Channel and Greater Harbor Waters Watershed Management Area

1. Los Angeles Harbor Bacteria TMDL (Inner Cabrillo Beach and Main Ship Channel)
 - a) Permittees subject to the provisions below are identified in Table C.
 - b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to the Los Angeles Harbor Main Ship Channel, Los Angeles and Long Beach Inner Harbor, and Inner Cabrillo Beach as of the effective date of this Order:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

- c) Receiving Water Limitations
 - (1) Permittees shall comply with the following final single sample bacteria receiving water limitations for the Los Angeles Harbor Main Ship Channel and Inner Cabrillo Beach:

Time Period	Receiving Water	Compliance Monitoring Location	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
			Daily sampling	Weekly sampling
Summer Dry-Weather (April 1 to October 31)	Inner Cabrillo Beach	CB1 & CB2	0	0
	Main Ship Channel	HW07	0	0
Winter Dry-Weather (November 1 to March 31)	Inner Cabrillo Beach	CB1 & CB2	0	0
	Main Ship Channel	HW07	3	1
Wet Weather ¹	Inner Cabrillo Beach	CB1 & CB2	0	0
	Main Ship Channel	HW07	15	3

- (2) Permittees shall comply with the following geometric mean receiving water limitations for the Los Angeles Harbor Main Ship Channel, Los Angeles and Long Beach Inner Harbor, and Inner Cabrillo Beach at all times:

¹ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

Constituent	Geometric Mean
Total coliform	1,000 MPN/100 mL
Fecal coliform	200 MPN/100 mL
Enterococcus	35 MPN/100 mL

2. Machado Lake Trash TMDL

- a) Permittees subject to the provisions below are identified in Table C.
- b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Machado Lake no later than March 6, 2016, and every year thereafter.
- c) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged to Machado Lake, per the schedule below:

Machado Lake Trash Water Quality-Based Effluent Limitations (gallons of uncompressed trash per year)

Permittees	Baseline ²	3/6/2012 (80%)	3/6/2013 (60%)	3/6/2014 (40%)	3/6/2015 (20%)	3/6/2016 ³ (0%)
		Annual Trash Discharge (gallons/yr)				
Carson	8141.47	6513.18	4884.88	3256.59	1628.29	0
Lomita	9392.99	7514.39	5635.79	3757.20	1878.60	0
City of Los Angeles	12331.17	9864.94	7398.70	4932.47	2466.23	0
Los Angeles County	8304.02	6643.22	4982.41	3321.61	1660.80	0
Los Angeles County Flood Control District	16.41	13.13	9.85	6.56	3.28	0
Palos Verdes Estates	1976.33	1581.06	1185.80	790.53	395.27	0
Rancho Palos Verdes	5226.71	4181.37	3136.03	2090.68	1045.34	0
Redondo Beach	18.16	14.53	10.90	7.26	3.63	0
Rolling Hills	3001.09	2400.87	1800.65	1200.44	600.22	0
Rolling Hills Estates	6498.83	5199.06	3899.30	2599.53	1299.77	0
Torrance	34808.97	27847.18	20885.38	13923.59	6961.79	0

- d) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 2(b) and 2(c) above per the provisions in Part 7.X [*Permit Provisions to Implement Trash TMDLs*].
- e) If a Permittee opts to derive a site specific trash generation rate through its Trash Monitoring and Reporting Plan (TMRP), the baseline limitation will be calculated by multiplying the point source area(s) by the derived trash generation rate(s).

² The Regional Water Board has determined the following baseline water quality-based effluent limitations for the Permittees based on the estimated trash generation rate of 5334 gallons of uncompressed trash per square mile per year.

³ Permittees shall achieve their final effluent limitation of zero trash discharge for the 2015-2016 storm year and every year thereafter.

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

3. Machado Lake Nutrient TMDL

- a) Permittees subject to the provisions below are identified in Table C.
- b) Permittees shall comply with the following interim and final water quality-based effluent limitations for discharges to Machado Lake:

Deadline	Interim and Final Effluent Limitations	
	Monthly Average Total Phosphorus (mg/L)	Monthly Average Total Nitrogen (TKN+NO ₃ -N+NO ₂ -N) (mg/L)
As of the effective date of this Order	1.25	3.5
March 11, 2014	1.25	2.45
September 11, 2018	0.10	1.0

c) Compliance Determination

- (1) Permittees may be deemed in compliance with the water quality-based effluent limitations by actively participating in a Lake Water Quality Management Plan (LWQMP) and attaining the receiving water limitations for Machado Lake. The City of Los Angeles has entered into a Memorandum of Agreement with the Regional Water Board to implement the LWQMP and reduce external nutrient loading to attain the following receiving water limitations:

Deadline	Interim and Final Receiving Water Limitations	
	Monthly Average Total Phosphorus (mg/L)	Monthly Average Total Nitrogen (TKN+NO ₃ -N+NO ₂ -N) (mg/L)
As of the effective date of this Order	1.25	3.5
March 11, 2014	1.25	2.45
September 11, 2018	0.10	1.0

- (2) Permittees may be deemed in compliance with water quality-based effluent limitations by demonstrating reduction of total nitrogen and total phosphorous on an annual mass basis measured at the storm drain outfall of the Permittee’s drainage area. The annual mass-based allocation shall be equal to a monthly average concentrations of 0.1 mg/L total phosphorous and 1.0 mg/L total nitrogen based on approved flow conditions. Permittees must demonstrate total nitrogen and total phosphorous load reductions to be achieved in accordance with a special study work plan approved by the Executive Officer.
 - (i) The County of Los Angeles submitted a special study work plan, which was approved by the Executive Officer, and established the following annual mass-based water quality based effluent limitations:

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

Deadline	Interim and Final Effluent Limitations	
	Annual Load Total Phosphorus (kg)	Annual Load Total Nitrogen (TKN+NO ₃ -N+NO ₂ -N) (kg)
March 11, 2014	887	1739
September 11, 2018	71	710

- (ii) The City of Torrance submitted a special study work plan, which was approved by the Executive Officer, and established the following annual mass-based water quality based effluent limitations:

Deadline	Interim and Final Effluent Limitations	
	Annual Load Total Phosphorus (kg)	Annual Load Total Nitrogen (TKN+NO ₃ -N+NO ₂ -N) (kg)
March 11, 2014	3,760	7,370
September 11, 2018	301	3008

4. Machado Lake Pesticides and PCBs TMDL

- a) Permittees subject to the provisions below are identified in Table C.
- b) Permittees shall comply with the following water quality-based effluent limitations for discharges of suspended sediments to Machado Lake, applied as a 3-year average no later than September 30, 2019:

Pollutant	Effluent Limitations for Suspended Sediment-Associated Contaminants (µg/kg dry weight)
Total PCBs	59.8
DDT (all congeners)	4.16
DDE (all congeners)	3.16
DDD (all congeners)	4.88
Total DDT	5.28
Chlordane	3.24
Dieldrin	1.9

5. Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters Toxic Pollutants TMDL

- a) Permittees subject to the provisions below are identified in Table C.
- b) Permittees shall comply with the following interim water quality-based effluent limitations for discharges to Dominguez Channel and Torrance Lateral listed below as of the effective date of this Order:
 - (1) Dominguez Channel Freshwater – Wet Weather

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

- (i) Freshwater Toxicity Interim Effluent Limitation shall not exceed the monthly median of 2 TUc.
- (ii) Permittees shall comply with the following interim metals water quality-based effluent limitations for discharges to the Dominguez Channel and Torrance Lateral:

Metals	Interim Effluent Limitation Daily Maximum (µg/L)
Total Copper	207.51
Total Lead	122.88
Total Zinc	898.87

- (2) Permittees shall comply with the following interim concentration-based water quality-based effluent limitations for pollutant concentrations in the sediment discharged to the Dominguez Channel Estuary and Greater Los Angeles and Long Beach Harbor Waters:

Water Body	Interim Effluent Limitations Daily Maximum (mg/kg sediment)					
	Copper	Lead	Zinc	DDT	PAHs	PCBs
Dominguez Channel Estuary	220.0	510.0	789.0	1.727	31.60	1.490
Long Beach Inner Harbor	142.3	50.4	240.6	0.070	4.58	0.060
Los Angeles Inner Harbor	154.1	145.5	362.0	0.341	90.30	2.107
Long Beach Outer Harbor (inside breakwater)	67.3	46.7	150	0.075	4.022	0.248
Los Angeles Outer Harbor (inside breakwater)	104.1	46.7	150	0.097	4.022	0.310
Los Angeles River Estuary	53.0	46.7	183.5	0.254	4.36	0.683
San Pedro Bay Near/Off Shore Zones	76.9	66.6	263.1	0.057	4.022	0.193
Los Angeles Harbor - Cabrillo Marina	367.6	72.6	281.8	0.186	36.12	0.199
Los Angeles Harbor - Consolidated Slip	1470.0	1100.0	1705.0	1.724	386.00	1.920
Los Angeles Harbor - Inner Cabrillo Beach Area	129.7	46.7	163.1	0.145	4.022	0.033
Fish Harbor	558.6	116.5	430.5	40.5	2102.7	36.6

- c) Permittees shall comply with the final water quality-based effluent limitations as listed below no later than March 23, 2032, and every year thereafter:

- (1) Dominguez Channel Freshwater – Wet Weather
 - (i) Freshwater Toxicity Effluent Limitation shall not exceed the monthly median of 1 TUc.
 - (ii) Permittees shall comply with the following final metals water quality-based effluent limitations for discharges to Dominguez Channel and all upstream reaches and tributaries of Dominguez Channel above Vermont Avenue:

Metals	Water Column Mass-Based Final Effluent Limitation
--------	--

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

	Daily Maximum (g/day)
Total Copper	1,300.3
Total Lead	5,733.7
Total Zinc	9,355.5

(2) Torrance Lateral Freshwater and Sediment – Wet Weather

(i) Permittees shall comply with the following final metals water quality-based effluent limitations for discharges to the Torrance Lateral:

Metals	Water Column Effluent Limitation Daily Maximum (unfiltered, µg/L)
Total Copper	9.7
Total Lead	42.7
Total Zinc	69.7

(ii) Permittees shall comply with the following final concentration-based water quality-based effluent limitations for pollutant concentrations in the sediment discharged to the Torrance Lateral:

Metals	Concentration-Based Effluent Limitation Daily Maximum (mg/kg dry)
Total Copper	31.6
Total Lead	35.8
Total Zinc	121

(3) Dominguez Channel Estuary and Greater Los Angeles and Long Beach Harbor Waters

(i) Permittees shall comply with the following final mass-based water quality-based effluent limitations, expressed as an annual loading of pollutants in the sediment discharged to Dominguez Channel Estuary, Los Angeles River Estuary, and the Greater Los Angeles and Long Beach Harbor Waters:

Water Body	Final Effluent Limitations Annual (kg/yr)			
	Total Cu	Total Pb	Total Zn	Total PAHs
Dominguez Channel Estuary	22.4	54.2	271.8	0.134
Consolidated Slip	2.73	3.63	28.7	0.0058
Inner Harbor	1.7	34.0	115.9	0.088
Outer Harbor	0.91	26.1	81.5	0.105
Fish Harbor (POLA)	0.00017	0.54	1.62	0.007
Cabrillo Marina (POLA)	0.0196	0.289	0.74	0.00016
San Pedro Bay	20.3	54.7	213.1	1.76

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

LA River Estuary	35.3	65.7	242.0	2.31
------------------	------	------	-------	------

- (ii) Permittees shall comply with the following final concentration-based water quality-based effluent limitations for pollutant concentrations in the sediments discharged to the Dominguez Channel Estuary, Consolidated Slip, and Fish Harbor:

Water Body	Effluent Limitations Daily Maximum (mg/kg dry sediment)		
	Cadmium	Chromium	Mercury
Dominguez Channel Estuary	1.2	--	--
Consolidated Slip	1.2	81	0.15
Fish Harbor	--	--	0.15

- (4) Permittees shall comply with the following final mass-based water quality-based effluent limitations, expressed as an annual loading of total DDT and total PCBs in the sediment discharged to Dominguez Channel Estuary, Los Angeles River Estuary, and the Greater Los Angeles and Long Beach Harbor Waters:

Water Body	Final Effluent Limitations Annual (g/yr)	
	DDT total	PCBs total
Dominguez Channel Estuary	0.250	0.207
Consolidated Slip	0.009	0.004
Inner Harbor	0.051	0.059
Outer Harbor	0.005	0.020
Fish Harbor	0.0003	0.0019
Cabrillo Marina	0.000028	0.000025
Inner Cabrillo Beach	0.0001	0.0003
San Pedro Bay	0.049	0.44
LA River Estuary	0.100	0.324

d) Compliance Determination

- (1) Permittees shall be deemed in compliance with the interim concentration-based water quality-based effluent limitations for pollutant concentrations in the sediment as listed above in part 5.b)(2) by meeting any one of the following methods::
 - (i) Demonstrate that the sediment quality condition of *Unimpacted* or *Likely Unimpacted* via the interpretation and integration of multiple lines of evidence as defined in the SQO Part 1, is met; or
 - (ii) Meet the interim water quality-based effluent limitations in bed sediment over a three-year averaging period; or

LA County MS4 Permit – TMDL Provisions for the Dominguez Channel and Greater Harbor Waters WMA

- (iii) Meet the interim water quality-based effluent limitations in the discharge over a three-year averaging period.
- (2) Permittees shall be deemed in compliance with the final fresh water metals water quality-based effluent limitations for discharges to Dominguez Channel and Torrance Lateral as listed above in parts 5.c)(1)(ii) and 5.c)(2)(i) by meeting any one of the following methods:
 - (i) Final metals water quality-based effluent limitations are met; or
 - (ii) CTR total metals criteria are met instream; or
 - (iii) CTR total metals criteria are met in the discharge.
- (3) Permittees shall be deemed in compliance with the final water quality-based effluent limitations for pollutants in the sediment as listed above in parts 5.c)(3)(i) and (ii) by meeting any one of the following methods:
 - (i) Final water quality-based effluent limitations for pollutants in the sediment are met; or
 - (ii) The qualitative sediment condition of *Unimpacted* or *Likely Unimpacted* via the interpretation and integration of multiple lines of evidence as defined in the SQO Part 1, is met, with the exception of chromium, which is not included in the SQO Part 1; or
 - (iii) Sediment numeric targets are met in bed sediments over a three-year averaging period.
- (4) Permittees shall be deemed in compliance with the final water quality-based effluent limitations for total DDT and total PCBs in the sediment as listed above in part 5.c)(4) by meeting any one of the following methods:
 - (i) Fish tissue targets are met in species resident to the specified water bodies⁴; or
 - (ii) Final water quality-based effluent limitations for pollutants in the sediment are met; or
 - (iii) Sediment numeric targets to protect fish tissue are met in bed sediments over a three-year averaging period; or
 - (iv) Demonstrate that the sediment quality condition protective of fish tissue is achieved per the Statewide Enclosed Bays and Estuaries Plan.

⁴ A site-specific study to determine resident species shall be submitted to the Executive Officer for approval.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

B. TMDLs in the Santa Monica Bay Watershed Management Area

1. Santa Monica Bay Beaches Bacteria TMDL

- a) Permittees subject to the provisions below are identified in Table B-1.
- b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Santa Monica Bay beaches during dry weather as of the effective date of this Order and during wet weather no later than July 15, 2013¹:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

c) Receiving Water Limitations

- (1) If an approved Integrated Water Resources Approach is implemented, each defined jurisdictional group shall comply with the interim single sample bacteria receiving water limitations for shoreline monitoring stations within their jurisdictional area during wet weather, per the schedule below:

Deadline	Cumulative percentage reduction from the total exceedance day reductions required for each jurisdictional group as identified in Table 1
July 15, 2013	25%
July 15, 2018	50%

¹ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

For those beach monitoring locations subject to the antidegradation provision, there shall be no increase in exceedance days during the implementation period above that estimated for the beach monitoring location in the critical year as identified below in Section B.1.c)(4).

* The California Department of Transportation (Caltrans) is a responsible agency in each Jurisdiction Group. Caltrans will be required under the Statewide Storm Water Permit for State of California Department of Transportation to jointly complying with the allowable number of exceedance days.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- (2) Permittees shall comply with the following grouped² final single sample bacteria receiving water limitations for all shoreline monitoring stations along Santa Monica Bay beaches, except for those monitoring stations subject to antidegradation provision, during dry weather as of the effective date of this Order and during wet weather no later than July 15, 2013³:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily Sampling	Weekly Sampling
Summer Dry-Weather (April 1 to October 31)	0	0
Winter Dry-Weather (November 1 to March 31)	3	1
Wet Weather ⁴	17	3

- (3) Permittees shall comply with the following grouped² final single sample bacteria receiving water limitations for shoreline monitoring stations along Santa Monica Bay beaches subject to the antidegradation provision as of the effective date of this Order:

Station ID	Beach Monitoring Location	Annual Allowable Exceedance Days of the Single Sample Objective (days)			
		Winter Dry Weather (November 1 – March 31)		Wet Weather (November 1 – October 31)	
		Daily Sampling	Weekly Sampling	Daily Sampling	Weekly Sampling
SMB 1-4	Trancas Creek at Broad Beach	0	0	17	3
SMB 1-5	Zuma Creek at Zuma Beach	0	0	17	3
SMB 2-13	Imperial Highway storm drain	2	1	17	3
SMB 3-8	Windward Ave. storm drain at Venice Pavilion	2	1	13	2

SMB 5-2	28th Street storm drain at Manhattan Beach	0	0	17	3
SMB 5-3	Manhattan Beach Pier	1	1	5	1
SMB 5-4	Hermosa City Beach at 26th St.	3	1	12	2
SMB 5-5	Hermosa Beach Pier, southern drain	2	1	8	2
SMB 6-2	Redondo Municipal Pier- 100 yards south	3	1	14	2
SMB 6-5	Avenue I storm drain at Redondo Beach	3	1	6	1
SMB 6-6	Malaga Cove, Palos Verdes Estates	1	1	3	1

² The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 permittees and Caltrans.

³ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

⁴ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

		Annual Allowable Exceedance Days of the Single Sample Objective (days)			
Station ID	Beach Monitoring Location	Winter Dry Weather (November 1 – March 31)		Wet Weather (November 1 – October 31)	
		Daily Sampling	Weekly Sampling	Daily Sampling	Weekly Sampling
SMB 7-1	Malaga Cove, Palos Verdes Estates	1	1	14	2
SMB 7-2	Bluff Cove, Palos Verdes Estates	1	1	0	0
SMB 7-3	Long Point, Rancho Palos Verdes	1	1	5	1
SMB 7-4	Abalone Cove, Rancho Palos Verdes	0	0	1	1
SMB 7-5	Portuguese Bend Cove, Rancho Palos Verdes	1	1	2	1
SMB 7-6	White's Point, Royal Palms County Beach	1	1	6	1
SMB 7-8	Point Fermin/Wilder Annex, San Pedro	1	1	2	1
SMB 7-9	Outer Cabrillo Beach	1	1	3	1

- (4) Permittees shall comply with the following geometric mean receiving water limitations for all shoreline monitoring stations along Santa Monica Bay beaches during dry weather as of the effective date of this Order and during wet weather no later than July 15, 2013⁵:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

2. Santa Monica Bay Nearshore and Offshore Debris TMDL

- a) Permittees subject to the provisions below are identified in Table B-1.
- b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged into water bodies within the Santa Monica Bay WMA and then into Santa Monica Bay or on the shoreline of Santa Monica Bay no later than March 20, 2020, and every year thereafter.
- c) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged into Santa Monica Bay or on the shoreline of Santa Monica Bay, per the schedule below:

Permittees	Baseline	Mar 20, 2016 (80%)	Mar 20, 2017 (60%)	Mar 20, 2018 (40%)	Mar 20, 2019 (20%)	Mar 20, 2020 (0%)
		Annual Trash Discharge (gals/yr)				

⁵ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

- d) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [*Permit Provisions to Implement Trash TMDLs*].

3. Santa Monica Bay TMDL for DDTs and PCBS (U.S. EPA established)

- a) Permittees subject to the provisions below are identified in Table B-1.
- b) Permittees shall comply with the following water quality-based effluent limitations as of the effective date of this Order, expressed as an annual loading of pollutants from the sediment discharged to Santa Monica Bay:

Constituent	Annual Mass-Based Effluent Limitations (g/yr)
DDT	27.08
PCBs	140.25

- c) Compliance shall be determined based on a three-year averaging period.

4. TMDLs in the Malibu Creek Subwatershed

- a) Malibu Creek and Lagoon Bacteria TMDL

- (1) Permittees subject to the provisions below are identified in Table B-1.

⁶ Permittees shall be deemed in compliance with the water quality-based effluent limitation for trash established by the Santa Monica Bay Nearshore and Offshore Debris TMDL, if the Permittee is in compliance with the water quality-based effluent limitations established by the Malibu Creek Watershed Trash TMDL.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

(2) Water Quality-Based Effluent Limitations

- (i) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Malibu Lagoon during dry weather as of the effective date of this Order, and during wet weather no later than January 24, 2016:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

- (ii) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Malibu Creek and its tributaries during dry weather as of the effective date of this Order, and during wet weather no later than January 24, 2016:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
E. coli	235/100 mL	126/100 mL

(3) Receiving Water Limitations

- (i) Permittees shall comply with the following grouped⁷ final single sample bacteria receiving water limitations for Malibu Creek, its tributaries, and Malibu Lagoon during dry weather as of the effective date of this Order, and during wet weather no later than January 24, 2016⁸:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily Sampling	Weekly Sampling
Summer Dry-Weather (April 1 to October 31)	0	0
Winter Dry-Weather (November 1 to March 31)	3	1
Wet Weather ⁹	17	3

- (ii) Permittees shall comply with the following geometric mean receiving water limitations for discharges to Malibu Lagoon during dry weather

⁷ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 permittees, Ventura MS4 permittees and Caltrans.

⁸ The Regional Water Board may extend the wet weather compliance date up to July 15, 2021, at the Regional Water Board's discretion.

⁹ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

as of the effective date of this Order, and during wet weather no later than January 24, 2016:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

- (iii) Permittees shall comply with the following geometric mean receiving water limitation for discharges to Malibu Creek and its tributaries during dry weather as of the effective date of this Order, and during wet weather no later than January 24, 2016:

Constituent	Geometric Mean (MPN or cfu)
E. coli	126/100 mL

b) Malibu Creek Watershed Trash TMDL

- (1) Permittees subject to the provisions below are identified in Table B-1.
- (2) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Malibu Creek from Malibu Lagoon to Malibu Lake, Malibu Lagoon, Malibu Lake, Medea Creek, Lindero Creek, Lake Lindero, and Las Virgenes Creek in the Malibu Creek Watershed no later than July 7, 2017 and every year thereafter.
- (3) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged to the Malibu Creek, per the schedule below:

Permittees	Baseline	July 7, 2013 (80%)	July 7, 2014 (60%)	July 7, 2015 (40%)	July 7, 2016 (20%)	July 7, 2017 (0%)
	Annual Trash Discharge (gals/yr)					
Agoura Hills	1810	1448	1086	724	362	0
Calabasas	673	539	404	269	135	0
Hidden Hills	71	57	43	28	14	0
Los Angeles County	1117	894	670	447	223	0
Malibu	226	181	136	91	45	0
Westlake Village	143	114	86	57	29	0

- (4) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [*Permit Provisions to Implement Trash TMDLs*].

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- c) Malibu Creek Watershed Nutrients TMDL (USEPA established)
 - (1) Permittees subject to the provisions below are identified in Table B-1.
 - (2) Permittees shall comply with the following grouped¹⁰ water quality-based effluent limitations as of the effective date of this Order for discharges to Westlake Lake, Lake Lindero, Lindero Creek, Las Virgenes Creek, Medea Creek, Malibou Lake, Malibu Creek and Malibu Lagoon and its tributaries. Tributaries to Malibu Creek and Lagoon, include the following upstream water bodies; Triunfo Creek, Palo Comado Creek, Cheesebro Creek, Strokes Creek and Cold Creek.

Time Period	Effluent Limitations	
	Nitrate as Nitrogen plus Nitrite as Nitrogen	Total Phosphorus
	Daily Maximum	Daily Maximum
Summer (April 15 to November 15)	3 lbs/day	0.3 lbs/day
Winter (November 16 to April 14)	8 mg/L	n/a

5. TMDLs in the Ballona Creek Subwatershed

- a) Ballona Creek Trash TMDL
 - (1) Permittees subject to the provisions below are identified in Table B-2.
 - (2) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Ballona Creek no later than September 30, 2015 and every year thereafter.
 - (3) Permittees shall comply with the interim and final water quality-based effluent limitations for trash discharged to Ballona Creek, per the schedule below:

Ballona Creek Subwatershed Trash Effluent Limitations per Storm Year¹¹ (pounds of drip-dry trash)

Permittees	Baseline	Sept 30, 2012	Sept 30, 2013	Sept 30, 2014	Sept 30, 2015 ¹²
		(20%)	(10%)	(3.3%)	(0%)
Annual Trash Discharge (pounds of trash)					
Beverly Hills	79,914	15,983	7,991	2,637	0
Culver City	36,509	7,302	3,651	1,205	0
Inglewood	21,564	4,313	2,156	712	0
Los Angeles, City of	950,238	190,048	95,024	31,358	0

¹⁰ USEPA was unable to specifically distinguish the amounts of pollutant loads from allocation categories associated with areas regulated by the storm water permits. Therefore, allocations for storm water permits are grouped.

¹¹ Storm year is defined as October 1 to September 30 herein.

¹² Permittees shall achieve their final effluent limitation of zero trash discharge for the 2014-2015 storm year and every year thereafter.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

Los Angeles, County of	57,920	11,584	5,792	1,911	0
Santa Monica	2,299	460	230	76	0
West Hollywood	13,018	2,604	1,302	430	0

Ballona Creek Subwatershed Trash Effluent Limitations per Storm Year (gallons of uncompressed trash)

Permittees	Baseline	Sept 30, 2012 (20%)	Sept 30, 2013 (10%)	Sept 30, 2014 (3.3%)	Sept 30, 2015 (0%)
		Annual Trash Discharge (pounds of trash)			
Beverly Hills	79,914	15,983	7,991	2,637	0
Culver City	36,509	7,302	3,651	1,205	0
Inglewood	21,564	4,313	2,156	712	0
Los Angeles, City of	950,238	190,048	95,024	31,358	0
Los Angeles, County of	57,920	11,584	5,792	1,911	0
Santa Monica	2,299	460	230	76	0
West Hollywood	13,018	2,604	1,302	430	0

- (4) Seventy-two (72) hours after each rain event, Permittees shall clean out and measure trash retained.
- (5) Every 3 months during dry weather, Permittees shall clean out and measure trash retained.
- (6) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in a)(2) and a)(3) above per the provisions in Part 7.X [*Permit Provisions to Implement Trash TMDLs*].

b) Ballona Creek Estuary Toxic Pollutants TMDL

- (1) Permittees subject to the provisions below are identified in Table B-2.
- (2) Permittees shall comply with the following final water quality-based effluent limitations no later than January 11, 2021, expressed as an annual loading of pollutants from the sediment discharged to Ballona Creek Estuary:

Constituent	Effluent Limitations	
	Annual	Units
Cadmium	8.0	kg/yr
Copper	227.3	kg/yr
Lead	312.3	kg/yr
Silver	6.69	kg/yr
Zinc	1003	kg/yr
Chlordane	3.34	g/yr

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

DDTs	10.56	g/yr
Total PCBs	152	g/yr
Total PAHs	26,900	g/yr

- (3) Permittees shall comply with interim and final water quality-based effluent limitations for pollutant loads from sediments discharged to Ballona Creek Estuary, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the water quality-based effluent limitations (%)
January 11, 2013	25
January 11, 2015	50
January 11, 2017	75
January 11, 2021	100

c) Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL

- (1) Permittees subject to the provisions below are identified in Table B-2.
 (2) Water Quality-Based Effluent Limitations

- (i) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Ballona Creek Estuary; Ballona Creek Reach 2 at the confluence with Ballona Creek Estuary; and Centinela Creek at the confluence with Ballona Creek Estuary during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

- (ii) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Sepulveda Channel during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
E. coli	235/100 mL	126/100 mL

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- (iii) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Ballona Creek Reach 2; Ballona Creek Reach 1 at the confluence with Ballona Creek Reach 2; and Benedict Canyon Channel at the confluence with Ballona Creek Reach 2 during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
E. coli	576/100 mL	126/100 mL

- (iv) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Ballona Creek Reach 1 during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
Fecal coliform	4000/100 mL	2000/100 mL

(3) Receiving Water Limitations

- (i) Permittees shall comply with the following grouped¹³ single sample bacteria receiving water limitations for Ballona Creek Estuary; Ballona Creek Reach 2 at the confluence with Ballona Creek Estuary; Centinela Creek at the confluence with Ballona Creek Estuary; Ballona Creek Reach 2; Ballona Creek Reach 1 at the confluence with Reach 2; Benedict Canyon Channel at the confluence with Ballona Creek Reach 2; and Sepulveda Channel:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective		Deadline
	Daily Sampling	Weekly Sampling	
Summer Dry-Weather (April 1 to October 31)	0	0	April 27, 2013
Winter Dry-Weather (November 1 to March 31)	3	1	April 27, 2013
Wet Weather ¹⁴	17*	3	April 27, 2017 ¹⁵

* In Ballona Creek Reach 2 and at the confluence with Reach 2, the greater of the allowable exceedance days under the reference system approach or high flow suspension shall apply.

- (ii) Permittees shall not exceed the single sample bacteria objective of 4000/100 ml in more than 10% of the samples collected from

¹³ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees and Caltrans.

¹⁴ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

¹⁵ The Regional Water Board may extend the wet weather compliance date up to July 15, 2021, at the Regional Water Board's discretion.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

Ballona Creek Reach 1 during any 30-day period. Permittees shall achieve compliance with this receiving water limitation during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017.

- (iii) Permittees shall comply with the following geometric mean receiving water limitations for discharges to Ballona Creek Estuary; Ballona Creek Reach 2 at the confluence with Ballona Creek Estuary; and Centinela Creek at the confluence with Ballona Creek Estuary during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

- (iv) Permittees shall comply with the following geometric mean receiving water limitation for discharges to Ballona Creek Reach 2; Ballona Creek Reach 1 at the confluence with Ballona Creek Reach 2; Benedict Canyon Channel at the confluence with Ballona Creek Reach 2; and Sepulveda Channel during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Geometric Mean (MPN or cfu)
E. coli	126/100 mL

- (v) Permittees shall comply with the following geometric mean receiving water limitation for discharges to Ballona Creek Reach 1 during dry weather no later than April 27, 2013, and during wet weather no later than April 27, 2017:

Constituent	Geometric Mean (MPN or cfu)
Fecal coliform	2000/100 mL

d) Ballona Creek Metals TMDL

- (1) Permittees subject to the provisions below are identified in Table B-2.
 (2) Final Water Quality-Based Effluent Limitations
- (i) Permittees shall comply with the following dry weather¹⁶ water quality-based effluent limitations no later than January 11, 2016, expressed as total recoverable metals discharged to Ballona Creek and Sepulveda Channel:

¹⁶ Dry weather is defined as any day when the maximum daily flow in Ballona Creek is less than 40 cubic feet per second (cfs) measured at Sawtelle Avenue.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

Constituent	Effluent Limitation Daily Maximum (g/day)	
	Ballona Creek	Sepulveda Channel
Copper	807.7	365.6
Lead	432.6	196.1
Selenium	169	76
Zinc	10,273.1	4,646.4

- (ii) In lieu of calculating loads, Permittees may demonstrate compliance with the following concentration-based water quality-based effluent limitations during dry weather¹⁷ no later than January 11, 2016, expressed as total recoverable metals discharged to Ballona Creek and Sepulveda Channel:

Constituent	Effluent Limitation Daily Maximum (µg/L)
Copper	24
Lead	13
Selenium	5
Zinc	304

- (iii) Permittees shall comply with the following wet weather¹⁸ water quality-based effluent limitations no later than January 11, 2021, expressed as total recoverable metals discharged to Ballona Creek and its tributaries:

Constituent	Effluent Limitation Daily Maximum (g/day)
Copper	1.70×10^{-5} x daily storm volume (L)
Lead	5.58×10^{-5} x daily storm volume (L)
Selenium	4.73×10^{-6} x daily storm volume (L)
Zinc	1.13×10^{-4} x daily storm volume (L)

¹⁷ *Ibid.*

¹⁸ Wet weather is defined as any day when the maximum daily flow in Ballona Creek is equal to or greater than 40 cubic feet per second (cfs) measured at Sawtelle Avenue.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- (3) Permittees shall comply with interim and final water quality-based effluent limitations for metals discharged to Ballona Creek and its tributaries, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the water quality-based effluent limitations (%)	
	Dry weather	Wet weather
January 11, 2012	50	25
January 11, 2014	75	--
January 11, 2016	100	50
January 11, 2021	100	100

- e) Ballona Creek Wetlands TMDL for Sediment and Invasive Exotic Vegetation (USEPA established)
- (1) Permittees subject to the provisions below are identified in Table B-2.
 - (2) Permittees shall comply with the following grouped¹⁹ water quality-based effluent limitations as of the effective date of this Order for discharges of sediment into Ballona Creek Wetlands:

Constituent	Annual Effluent Limitation (m ³ /yr)
Total Sediment (suspended sediment plus sediment bed load)	44,615

6. TMDLs in Marina del Rey Subwatershed

- a) Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL
- (1) Permittees subject to the provisions below are identified in Table B-2.
 - (2) Permittees shall comply with the following final water quality-based effluent limitations for discharges to Marina del Rey Harbor Beach and Back Basins D, E, and F during dry weather as of the effective date of this Order, and during wet weather no later than March 18, 2014²⁰:

¹⁹ The water quality-based effluent limitation is group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees and Caltrans.

²⁰ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

Constituent	Effluent Limitations (MPN or cfu)	
	Daily Maximum	Geometric Mean
Total coliform*	10,000/100 mL	1,000/100 mL
Fecal coliform	400/100 mL	200/100 mL
Enterococcus	104/100 mL	35/100 mL

* Total coliform density shall not exceed a daily maximum of 1,000/100 mL, if the ratio of fecal-to-total coliform exceeds 0.1.

(3) Receiving Water Limitations

- (i) Permittees shall comply with the following grouped²¹ final single sample bacteria receiving water limitations for all monitoring stations at Marina Beach and Basins D, E, and F, except for those monitoring stations subject to the antidegradation provisions, during dry weather as of the effective date of this Order and during wet weather no later than March 18, 2014²².

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)	
	Daily Sampling	Weekly Sampling
Summer Dry-Weather (April 1 to October 31)	0	0
Winter Dry-Weather (November 1 to March 31)	3	1
Wet Weather ²³	17	3

- (ii) Permittees shall comply with the following grouped²⁴ final single sample bacteria receiving water limitations for monitoring stations in Marina del Rey subject to the antidegradation provision as of the effective date of this Order:

Station ID	Monitoring Location	Annual Allowable Exceedance Days of the Single Sample Objective (days)			
		Winter Dry Weather (November 1 – March 31)		Wet Weather (November 1 – October 31)	
		Daily Sampling	Weekly Sampling	Daily Sampling	Weekly Sampling
MdRH-9	Basin F, center of basin	3	1	8	1

²¹ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees and Caltrans.

²² If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

²³ Wet weather is defined as days with 0.1 inch of rain or greater and the three days following the rain event.

²⁴ The final receiving water limitations are group-based and shared among all MS4 Permittees, which includes LA MS4 Permittees and Caltrans.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

- (iii) Permittees shall comply with the following geometric mean receiving water limitations for monitoring stations at Marina Beach and Basins D, E, and F during dry weather as of the effective date of this Order, and during wet weather no later than March 18, 2014²⁵:

Constituent	Geometric Mean (MPN or cfu)
Total coliform	1,000/100 mL
Fecal coliform	200/100 mL
Enterococcus	35/100 mL

b) Marina del Rey Harbor Toxic Pollutants TMDL

- (1) Permittees subject to the provisions below are identified in Table B-2.
- (2) Permittees shall comply with the following final water quality-based effluent limitations no later than March 22, 2016²⁶, expressed as an annual loading of pollutants from the sediment discharged to Marina del Rey Harbor Back Basins D, E, and F:

Constituent	Effluent Limitations	
	Annual	Units
Copper	2.01	kg/yr
Lead	2.75	kg/yr
Zinc	8.85	kg/yr
Chlordane	0.0295	g/yr
Total PCBs	1.34	g/yr

- (3) Permittees shall comply with interim and final water quality-based effluent limitations for pollutant loads from sediments discharged to Marina del Rey Harbor Back Basins D, E, and F, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the effluent limitations (%)
March 22, 2014	50
March 22, 2016	100

- (4) If an approved Integrated Water Resources Approach is implemented, Permittees shall comply with interim and final water quality-based effluent

²⁵ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented, then the Permittees shall comply with the final water quality-based effluent limitations during wet weather no later than July 15, 2021.

²⁶ If an Integrated Water Resources Approach is approved by the Regional Water Board and implemented then the Permittees shall comply with the final water quality-based effluent limitations no later than March 22, 2021.

LA County MS4 Permit – TMDL Provisions for Santa Monica Bay WMA

limitations for pollutant loads from sediments discharged to Marina del Rey Harbor Back Basins D, E, and F, per the schedule below:

Deadline	Total Drainage Area Served by the MS4 required to meet the effluent limitations (%)
March 22, 2013	25
March 22, 2015	50

LA County MS4 Permit – TMDL Provisions for the Santa Clara River WMA

A. TMDLs in the Santa Clara River Watershed Management Area (WMA)

1. Santa Clara River Nitrogen Compounds TMDL

- a) Permittees subject to the provisions below are identified in Table A.
- b) Permittees shall comply with the following water quality-based effluent limitations for discharges to the Santa Clara River Reach 5¹ as of the effective date of this Order:

Constituent	Effluent Limitations (mg/L)	
	1-hour Average	30-day Average
Total Ammonia as Nitrogen	5.2	1.75
Nitrate as Nitrogen plus Nitrite as Nitrogen	--	6.8

2. Upper Santa Clara River Chloride TMDL

- a) Permittees subject to the provisions below are identified in Table A.
- b) Permittees shall comply with the following water quality-based effluent limitation for discharges to the Santa Clara River Reaches 5 and 6 as of the effective date of this Order:

Constituent	Effluent Limitation Instantaneous Maximum (mg/L)
Chloride	100

3. Lake Elizabeth Trash TMDL

- a) Permittees subject to the provisions below are identified in Table A.
- b) Permittees shall comply with the final water quality-based effluent limitation of zero trash discharged to Lake Elizabeth no later than March 6, 2016 and every year thereafter.
- c) Permittees shall comply with interim and final water quality-based effluent limitations for trash discharged to Lake Elizabeth, per the schedule below:

Deadline	Effluent Limitation	
	Drainage Area covered by Full Capture Systems (%)	Annual Trash Discharge (gal/yr)
Baseline	0	529
March 6, 2012	20	423
March 6, 2013	40	317
March 6, 2014	60	212
March 6, 2015	80	106
March 6, 2016	100	0

¹ The Basin Plan Chapter 7-9 Santa Clara River Nitrogen Compounds TMDL uses the USEPA Santa Clara River reach designations. The USEPA's Santa Clara River Reach 7 corresponds to Santa Clara River Reach 5 in the Los Angeles Region's Basin Plan Chapter 2.

LA County MS4 Permit – TMDL Provisions for the Santa Clara River WMA

- d) Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [Permit Provisions to Implement Trash TMDLs].

4. Santa Clara River Indicator Bacteria TMDL

- a) Permittees subject to the provisions below are identified in Table A.
- b) Permittees shall comply with the following final water quality-based effluent limitations for discharges to the Santa Clara River Reaches 5, 6 and 7 during dry weather no later than March 21, 2023 and during wet weather² no later than March 21, 2029:

Constituent	Effluent Limitation (MPN or cfu)	
	Daily Maximum	Geometric Mean
E. coli	235/100 mL	126/100 mL

c) Receiving Water Limitations

- (1) Permittees shall comply with the following grouped interim bacteria receiving water limitations for the Santa Clara River Reaches 5, 6, and 7:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)		Deadline
	Daily Sampling	Weekly Sampling	
Dry Weather	17	3	March 21, 2016
Wet Weather	61	9	March 21, 2016

- (2) Permittees shall comply with the following grouped final bacteria receiving water limitations for the Santa Clara River Reaches 5, 6, and 7:

Time Period	Annual Allowable Exceedance Days of the Single Sample Objective (days)		Deadline
	Daily Sampling	Weekly Sampling	
Dry Weather	5	1	March 21, 2023
Wet Weather	16	3	March 21, 2029

- (3) Permittees shall comply with the following geometric mean receiving water limitation for the Santa Clara River Reaches 5, 6, and 7 during dry weather no later than March 21, 2023 and during wet weather no later than March 21, 2029:

Constituent	Geometric Mean (MPN or cfu)
E. coli	126/100 mL

² Wet weather is defined as days with 0.1 inch of rain or more and the three days following the rain event.

LA County MS4 Permit – Watershed Management Program

VI. PROVISIONS

C. Special Provisions: Watershed Management Programs

1. General

- a. The purpose of this Part is to allow Permittees to develop Watershed Management Programs to implement the requirements of this Order on a watershed scale through customized strategies, control measures, and BMPs.
- b. Participation in a Watershed Management Program allows a Permittee to customize the requirements in Part VI.D [Special Provisions: Minimum Control Measures] to address the highest watershed priorities, including achieving compliance with the requirements of Part VI.E and Attachments X through X [Special Provisions: TMDL Provisions].
- c. Customized strategies, control measures, and BMPs shall be implemented on a watershed basis, where applicable, through each Permittee's storm water management program and/or collectively by all participating Permittees through the Watershed Management Program.
- d. The goal of the Watershed Management Programs is to ensure that discharges from the Los Angeles County MS4 (i) achieve applicable water quality based effluent limitations in Part VI.E and Attachments X through X [TMDL Provisions], (ii) do not cause or contribute to exceedances of receiving water limitations in Parts V.A and VI.E and Attachments X through X [Receiving Water Limitations and TMDL Provisions], and do not cause exceedances of non-storm water action levels in Part [TBD – MRP].
- e. Watershed Management Programs shall be developed using the Regional Water Board's Watershed Management Areas. Where appropriate, Watershed Management Areas may be separated into subwatersheds to focus water quality prioritization and implementation efforts by receiving water.
- f. Each Watershed Management Program shall:
 - i. Prioritize water quality issues resulting from storm water and non-storm water discharges from the MS4 to receiving waters within each Watershed Management Area,

LA County MS4 Permit – Watershed Management Program

- ii. Identify and implement strategies, control measures, and BMPs to achieve applicable water quality based effluent limitations, receiving water limitations, and/or non-storm water action levels consistent with corresponding compliance schedules in this Order,
- iii. Execute a monitoring and assessment program to determine progress towards achieving applicable limitations and/or action levels in Part VI.C.1.f. ii, and
- iv. Revise strategies, control measures, and BMPs as necessary to maintain progress towards achieving applicable limitations and/or action levels in Part VI.C.1.f.ii.

2. Process

a. Timelines for Implementation

- i. Each Permittee shall ensure implementation of the following requirements per the schedule specified in Table [TBD] below:

Table [TBD]

Part	Provision	Due Date
VI.C.2.b	Notify Regional Water Board of intent to develop Watershed Management Program	6 months after Order adoption
VI.C.2.b	Submit draft plan to Executive Officer	1 year after Order adoption
VI.C.2.c	Submit final plan to Executive Officer	3 months after receipt of Regional Water Board comments on draft plan
VI.C.4	Begin implementation of Watershed Management Program	Upon submittal of final plan
VI.C.6.a.ii	First evaluation of Watershed Management Program and submittal of revisions to plan	1½ years after submittal of final plan
VI.C.6.a.ii	Second evaluation of Watershed	180 days prior to expiration

LA County MS4 Permit – Watershed Management Program

Management Program and submittal of revisions to plan	date of Order
--	---------------

- b. Permittees that elect to develop a Watershed Management Program must notify the Regional Water Board no later than six months after the adoption of this Order.
- c. Permittees that elect to develop a Watershed Management Program shall submit a draft plan to the Executive Officer no later than one year after the adoption of this Order.
- d. Permittees that do not elect to develop a Watershed Management Program shall be subject to the baseline requirements in Part VI.D [MCMs] and shall demonstrate compliance with applicable water quality based effluent limitations in Part VI.E [TMDL] pursuant to subparts VI.E.4 or VI.E.5.

3. Program Development

a. Identification of Water Quality Priorities

Permittees shall identify the water quality priorities within each Watershed Management Area that will be addressed by the Watershed Management Program. At a minimum, these priorities shall include achieving applicable water quality based effluent limitations and/or receiving water limitations established pursuant to TMDLs, as set forth in Part VI.E and Attachments [TBD] through [TBD] of this Order.

- i. **Water Quality Characterization.** Each plan shall include an evaluation of existing water quality conditions, including characterization of storm water and non-storm water discharges from the MS4 and receiving water quality, to support identification and prioritization/sequencing of management actions.
- ii. **Waterbody-Pollutant Classification.** On the basis of the evaluation of existing water quality conditions, waterbody-pollutant combinations shall be classified into one of the following four categories:
 - (1) **Category 1 (Highest Priority):** Waterbody-pollutant combinations for which water quality based effluent limitations and/or receiving water limitations are

LA County MS4 Permit – Watershed Management Program

established in Part VI.E and Attachments [TBD] to [TBD] of this Order.

- (2) Category 2 (High Priority): Pollutants for which data indicate water quality impairment in the receiving water according to the State's Listing Policy.
 - (3) Category 3 (Medium Priority): Pollutants for which there are insufficient data to indicate water quality impairment in the receiving water according to the State's Listing Policy, but which exceed applicable water quality standards.
 - (4) Category 4 (Low Priority): Pollutants for which data do not indicate any exceedances of applicable water quality standards.
- iii. Source Assessment. Utilizing existing information, potential sources within the watershed for the pollutants in Categories 1 and 2 shall be identified.
- (1) Permittees shall identify known and suspected storm water and non-storm water pollutant sources in discharges to the MS4 and from the MS4 to receiving waters and any other stressors related to MS4 discharges causing or contributing to the highest water quality priorities (Categories 1 and 2). The identification of known and suspected sources of the highest water quality priorities shall consider the following:
 - (a) Review of available data, including but not limited to:
 - (i) Findings from the Permittees' illicit discharge detection and elimination programs;
 - (ii) Findings from the Permittees' commercial/industrial facilities pollutant control programs;
 - (iii) Findings from the Permittees' development construction programs;
 - (iv) Findings from the Permittees' public agency activities;
 - (v) TMDL source assessments;

LA County MS4 Permit – Watershed Management Program

- (vi) Watershed model results;
 - (vii) Findings from the Permittees' monitoring programs, including but not limited to TMDL compliance monitoring and receiving water monitoring, and
 - (viii) Any other pertinent data, information, or studies related to pollutant sources and conditions that contribute to the highest water quality priorities.
- (b) Locations of the Permittees' MS4s, including, at a minimum, all MS4 major outfalls and major structural controls for storm water and non-storm water that discharge to receiving waters;
- (c) Other known and suspected sources of pollutants in non-storm water or storm water discharges from the MS4 to receiving waters within the Watershed Management Area.
- iv. Prioritization.** Based on the findings of the source assessment, the issues within each watershed shall be prioritized and sequenced. Watershed priorities shall include at a minimum:
- (1) TMDLs
 - (a) Controlling pollutants for which there are water quality based effluent limitations and/or receiving water limitations with interim or final compliance deadlines within the permit term, or TMDL compliance deadlines that have already passed and limitations have not been achieved.
 - (b) Controlling pollutants for which there are water quality based effluent limitations and/or receiving water limitations with interim or final compliance deadlines between September 6, 2012 and September 6, 2017.
 - (2) Other Receiving Water Considerations
 - (a) Controlling pollutants for which data indicate impairment in the receiving water and the findings from the source assessment implicates discharges

LA County MS4 Permit – Watershed Management Program

from the MS4 shall be considered the second highest priority.

- b. Selection of Watershed Control Measures
- i. Permittees shall identify strategies, control measures, and BMPs to implement through their individual storm water management programs, and collectively on a watershed scale, with the goal of creating an efficient program to focus individual and collective resources on watershed priorities.
 - ii. The objectives of the Watershed Control Measures shall include:
 - (1) Prevent or eliminate non-storm water discharges to the MS4 that are a source of pollutants from the MS4 to receiving waters.
 - (2) Implement pollutant controls necessary to achieve all applicable interim and final water quality based effluent limitations and/or receiving water limitations pursuant to corresponding compliance schedules.
 - (3) Ensure that discharges from the MS4 do not cause or contribute to exceedances of receiving water limitations.
 - iii. Watershed Control Measures may include:
 - (1) Structural and/or non-structural controls and operation and maintenance procedures that are designed to achieve applicable water quality based effluent limitations and/or receiving water limitations in Part VI.E and Attachments X through X;
 - (2) Retrofitting areas of existing development known or suspected to contribute to the highest water quality priorities with regional or site-specific controls or management measures; and
 - (3) Stream and/or habitat rehabilitation or restoration projects where stream and/or habitat rehabilitation or restoration are necessary for, or will contribute to demonstrable improvements in the physical, chemical, and biological receiving water conditions and restoration and/or protection of water quality standards in receiving waters.

LA County MS4 Permit – Watershed Management Program

iv. The following provisions of this Order shall be incorporated as part of the Watershed Management Program:

(1) Minimum Control Measures

(a) Permittees shall assess the minimum control measures (MCMs) as defined in Part VI.D.4 to Part VI.D.9 this Order to identify opportunities for focusing resources on the high priority issues in each watershed. For each of the following minimum control measures, Permittees shall identify potential modifications that will address watershed priorities:

- (i) New Development/ Redevelopment Program
- (ii) Development Construction Program
- (iii) Industrial/Commercial Program
- (iv) Illicit Connection/Illicit Discharge Detection and Elimination Program
- (v) Public Agency Activities Program
- (vi) Public Information and Participation Program

(b) At a minimum, the Watershed Management Program shall include management programs consistent with 40 CFR section 122.26(d)(2)(iv)(A)-(D).

(c) If the Permittee(s) elects to eliminate a control measure identified in Part VI.D.4 to Part VI.D.9, the Permittee(s) shall provide a justification for its elimination.

(d) Such customized actions, once approved as part of the Watershed Management Program, shall replace in part or in whole the requirements in Part VI.D.4 to Part VI.D.9 for participating Permittees.

(2) Non-Storm Water Discharge Measures. Where Permittees identify non-storm water discharges from the MS4 as a source of pollutants in the source assessment, the Watershed Control Measures shall include strategies, control measures, and/or BMPs that must be implemented to effectively eliminate the source of

LA County MS4 Permit – Watershed Management Program

pollutants consistent with Parts III.A [Discharge Prohibitions – Non-Storm Water Discharges] and VI.D.9 [Special Provisions: Minimum Control Measures – Illicit Connection and Illicit Discharge Elimination Program]. These may include measures to prohibit the non-storm water discharge to the MS4, additional BMPs to reduce pollutants in the non-storm water discharge or conveyed by the non-storm water discharge, diversion to a sanitary sewer for treatment, or strategies to require the non-storm water discharge to be separately regulated under a general NPDES permit.

- (3) TMDL Control Measures. Permittees shall compile control measures that have been identified in TMDLs and corresponding implementation plans. If not sufficiently identified in previous documents, or if implementation plans have not yet been developed (e.g., EPA established TMDLs), the Permittees shall evaluate and identify control measures to achieve water quality based effluent limitations and/or receiving water limitations established in this Order pursuant to these TMDLs.
- (a) TMDL control measures shall include where necessary control measures to address both storm water and non-storm water discharges from the MS4.
- (b) TMDL control measures may include baseline or customized activities covered under the general MCM categories in Part VI.D as well as BMPs and other control measures covered under the non-storm water discharge provisions of Part III.A of this Order.
- (c) The plan shall include, at a minimum, those actions that will be implemented during the permit term to achieve interim and/or final water quality based effluent limitations and/or receiving water limitations with compliance deadlines within the permit term.
- (4) Each plan shall include the following components:
- (a) Identification of specific structural controls and non-structural best management practices, including operational source control and pollution prevention, and any other actions or programs to achieve all

LA County MS4 Permit – Watershed Management Program

- water quality-based effluent limitations and receiving water limitations contained in this Part and Attachments X through X to which the Permittee(s) is subject;
- (b) For each structural control and non-structural best management practice, the number, type, and location(s) and/or frequency of implementation;
 - (c) At a minimum, structural controls shall be sized to treat the volume of stormwater runoff from the 85th percentile, 24-hour storm specific to the watershed in question;
 - (d) For any pollution prevention measures, the nature, scope, and timing of implementation;
 - (e) For each structural control and non-structural best management practice, interim milestones and dates for achievement to ensure that TMDL compliance deadlines will be met;
 - (f) The plan shall clearly identify the responsibilities of each participating Permittee for implementation of watershed control measures.
- (5) Permittees shall conduct a Reasonable Assurance Analysis for each TMDL as follows:
- (a) Permittees shall conduct an assessment (through a quantitative analysis / modeling effort) to demonstrate that the activities and control measures identified in the Watershed Control Measures will achieve applicable water quality based effluent limitations and/or receiving water limitations with compliance deadlines during the permit term.
 - (b) Where the TMDL Provisions in Part VI.E and Attachments X through X do not include interim or final water quality based effluent limitations and/or receiving water limitations with compliance deadlines during the permit term, Permittees shall identify interim milestones and dates for their achievement to ensure adequate progress toward achieving interim and final water quality based effluent limitations and/or receiving water limitations with deadlines beyond the permit term.

LA County MS4 Permit – Watershed Management Program

- (6) Permittees shall provide documentation that it has the necessary legal authority to implement or compel implementation of the Watershed Control Measures identified in the plan.

- c. Compliance Schedules

Permittees shall incorporate compliance schedules in Attachments [TBD] to [TBD] into the plan and, where necessary develop interim milestones and dates for their achievement. Compliance schedules and interim milestones and dates for their achievement shall be used to measure progress towards addressing the highest water quality priorities and achieving applicable water quality based effluent limitations and/or receiving water limitations.

- i. Schedules must be adequate for measuring progress on a watershed scale twice during the permit term.
- ii. Schedules must be developed for both the strategies, control measures and BMPs implemented by each Permittee within its jurisdiction and for those that will be implemented by multiple Permittees on a watershed scale.
- iii. Schedules shall incorporate the following:
 - (1) Compliance deadlines occurring within the permit term for all applicable interim and/or final water quality based effluent limitations and/or receiving water limitations in Part VI.E and Attachments X through X of this Order,
 - (2) Interim milestones and dates for their achievement within the permit term for any applicable final water quality based effluent limitation and/or receiving water limitation in Part VI.E and Attachments X through X, where deadlines within the permit term are not otherwise specified.
 - (3) For watershed priorities related to addressing exceedances of receiving water limitations in Part V.A and not otherwise addressed by Part VI.E:
 - (a) Milestones based on measureable criteria or indicators, to be achieved in the receiving waters and/or MS4 discharges,

LA County MS4 Permit – Watershed Management Program

- (b) A schedule with dates for achieving the milestones as soon as possible, and
- (c) A final date for achieving the receiving water limitations within the permit term.
- (d) The milestones and implementation schedule in (a)-(c) fulfill the requirements in Part V.A.3.a to prepare a Receiving Water Limitations Compliance Report.

4. Watershed Management Program Implementation

Each Permittee shall implement the Watershed Management Program immediately upon approval of the plan by the Regional Water Board Executive Officer.

5. Integrated Watershed Monitoring and Assessment

Permittees in each Watershed Management Area shall develop an integrated program to assess progress toward achieving the water quality based effluent limitations and/or receiving water limitations per the compliance schedules, and progress toward addressing the highest water quality priorities for each Watershed Management Area. The integrated watershed monitoring and assessment program shall be consistent with the general monitoring and assessment requirements of Part [TBD – MRP].

6. Adaptive Management Process

- a. Watershed Management Program Adaptive Management Process
 - i. Permittees in each Watershed Management Area shall implement an adaptive management process, at least twice during the permit term, adapting the Watershed Management Program to become more effective, based on, but not limited to the following:
 - (1) Progress toward achieving interim and/or final water quality based effluent limitations and/or receiving water limitations in Part VI.E and Attachments X through X, according to established compliance schedules;
 - (2) Progress toward achieving improved water quality in MS4 discharges and achieving receiving waters limitations through implementation of the watershed control measures

LA County MS4 Permit – Watershed Management Program

based on an evaluation of outfall-based monitoring data and receiving water monitoring data;

- (3) Achievement of interim milestones;
 - (4) Re-evaluation of the highest water quality priorities identified for the Watershed Management Area based on more recent water quality data for discharges from the MS4 and the receiving water(s) and a reassessment of sources of pollutants in MS4 discharges;
 - (5) Availability of new information and data from sources other than the Permittees' monitoring program(s) within the Watershed Management Area that informs the effectiveness of the actions implemented by the Permittees;
 - (6) Regional Water Board recommendations; and
 - (7) Recommendations for modifications to the Watershed Management Program solicited through a public participation process.
- ii. Based on the results of the adaptive management process, Permittees shall report any modifications, including where appropriate new compliance deadlines and interim milestones, necessary to improve the effectiveness of the Watershed Management Program in the Annual Report required pursuant to Part [TBD], or as part of the Report of Waste Discharge (ROWD) required pursuant to Part [TBD].
- (1) The adaptive management process fulfills the requirements in Part V.A.4 to address continuing exceedances of receiving water limitations.
- iii. Permittees shall implement any modifications to the Watershed Management Program upon acceptance by the Regional Water Board Executive Officer.
- b. Jurisdictional Storm Water Management Program Adaptive Management Process
- i. Permittees in the Watershed Management Area shall implement the adaptive management process at least annually with regard to its jurisdictional storm water management program to improve its effectiveness, based on, but not limited to the following:

LA County MS4 Permit – Watershed Management Program

- (1) Measurable or demonstrable reductions of illicit discharges to the MS4 based on an evaluation of outfall-based monitoring data;
 - (2) Measurable or demonstrable reductions of pollutants in storm water discharges from the Permittee's MS4 through implementation of the storm water management program based on an evaluation of outfall-based monitoring data;
 - (3) Efficiency in implementing the Watershed Management Program; and
 - (4) Progress toward achieving interim and/or final water quality based effluent limitations and/or receiving water limitations in Part VI.E and Attachments X through X, according to established compliance schedules;
 - (5) Progress toward achieving receiving waters limitations through implementation of the storm water management program based on an evaluation of outfall-based monitoring data and receiving water monitoring data;
 - (6) Regional Water Board recommendations during program and/or site inspections.
- ii. Based on the results of the adaptive management process, the Permittee shall report any modifications, including where appropriate new compliance deadlines or interim milestones, necessary to improve the effectiveness its jurisdictional storm water management program in the Annual Report required pursuant to Provision [TBD], or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision [TBD].
- (1) The adaptive management process fulfills the requirements in Part V.A.4 to address continuing exceedances of receiving water limitations.
- iii. The Permittee shall implement any modifications to its jurisdictional storm water management program upon acceptance by the Regional Water Board Executive Officer.

LA County MS4 Permit Outline

Section III. Discharge Prohibitions

Existing **Part 1**

- **Non-Storm Water Discharge Prohibition**✓

Section IV. Effluent Limitations

Existing **Part 7**

- **TMDL Water Quality Based Effluent Limitations (see “TMDL Provisions” below)**✓

Section V. Receiving Water Limitations

Existing **Part 2**

- **Applicable Water Quality Standards for the receiving water**✓

Section VI. Special Provisions

Existing **Part 4**

- **Watershed Management Programs**✓
- **Minimum Control Measures**✓
- **TMDL Provisions**✓

Section VI. Standard Provisions

Existing **Part 6**

Attachment: Monitoring and Reporting Provisions

Existing **Attachment**

Workshop Outline

- Watershed Management Program Provisions
 - Purpose and Scope
 - Development Process
 - Elements
 - Implementation
 - Monitoring, Assessment and Adaptive Management
- Total Maximum Daily Load (TMDL) Provisions
 - Water Quality Based Effluent Limitations and Receiving Water Limitations
 - Compliance Determination
- Receiving Water Limitations Provisions

Terminology

Water Quality Based Effluent Limitation

A restriction on the quantity or concentration of a pollutant that may be discharged necessary to achieve a water quality standard

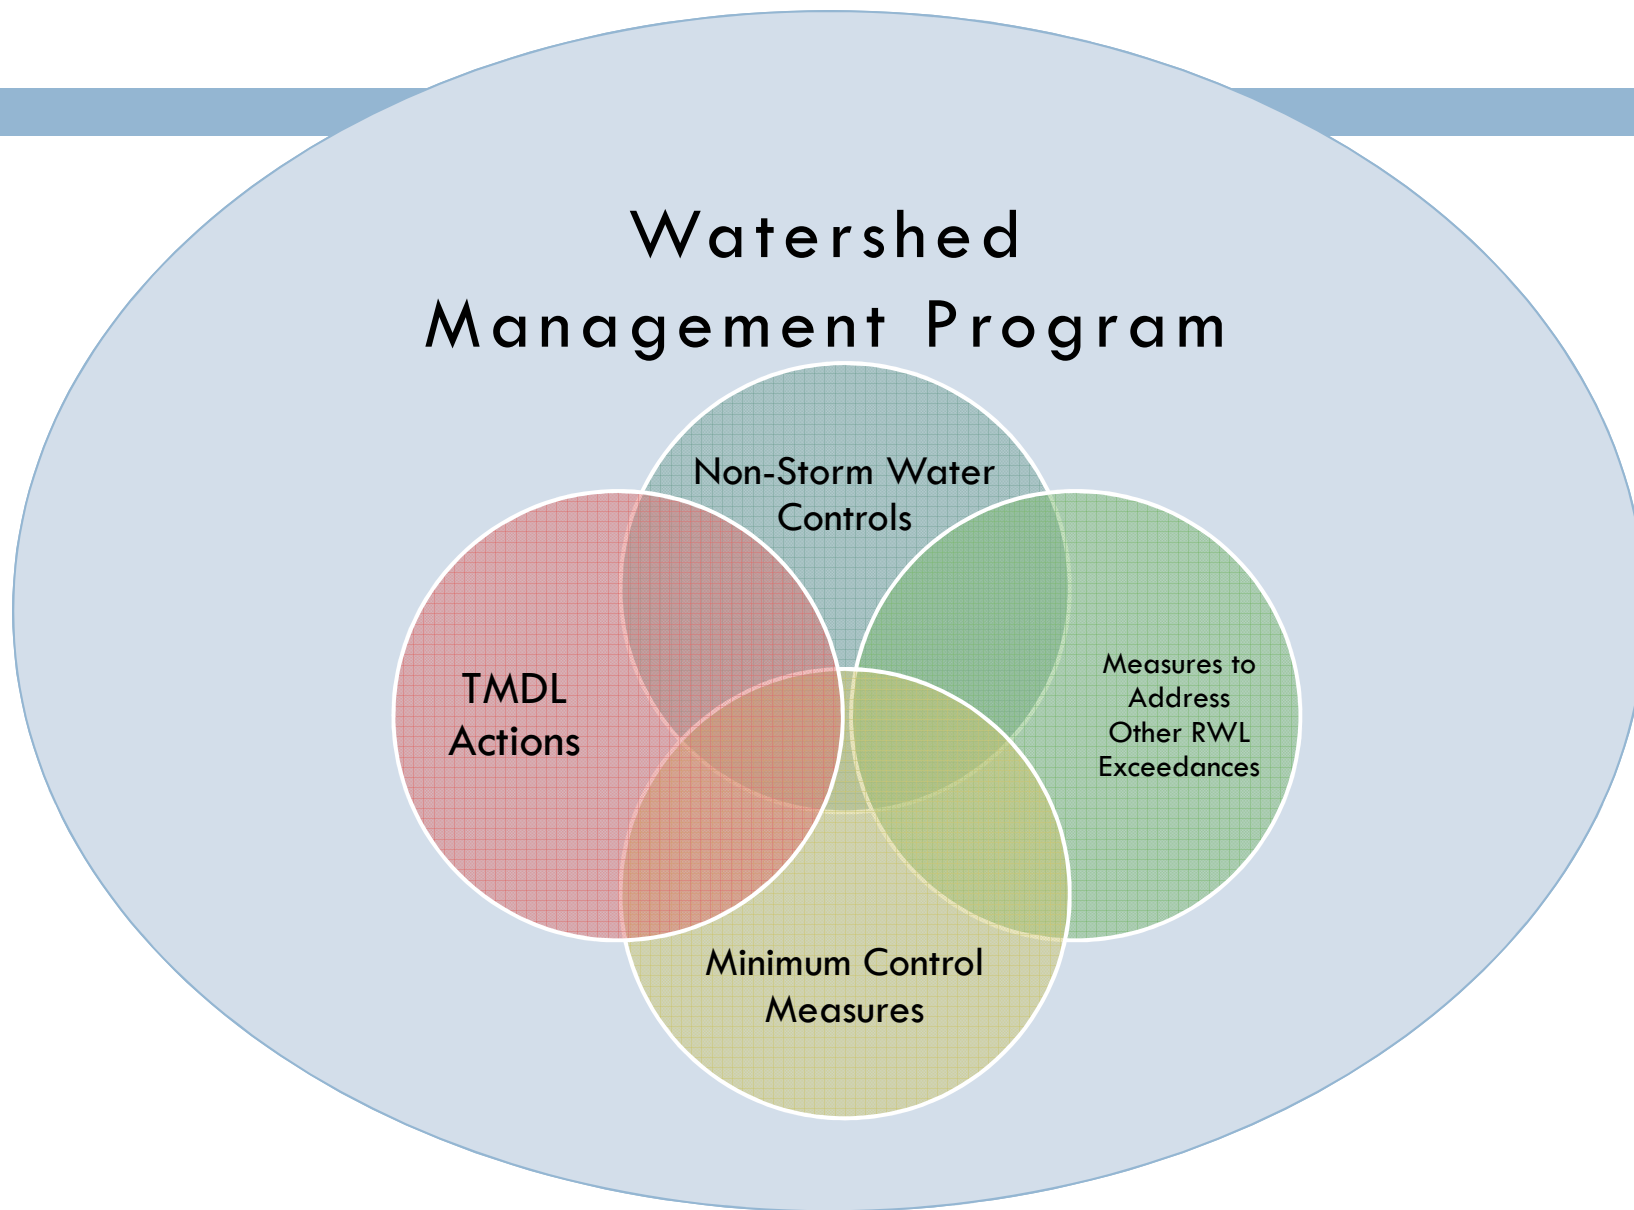

Receiving Water Limitation

Any applicable numeric or narrative water quality standard, or limitation to implement the applicable WQS, for the receiving water

Watershed Management Programs (WMPs)

- Organizing framework for permit provisions and storm water management programs
- Water quality priorities, particularly TMDL requirements, are driver for selecting and implementing pollutant controls
 - ▣ Allows flexibility to customize some core permit requirements/sequence implementation actions to achieve equal or greater pollutant control and meet TMDL compliance deadlines

PERMIT STRUCTURE

Scope of WMPs

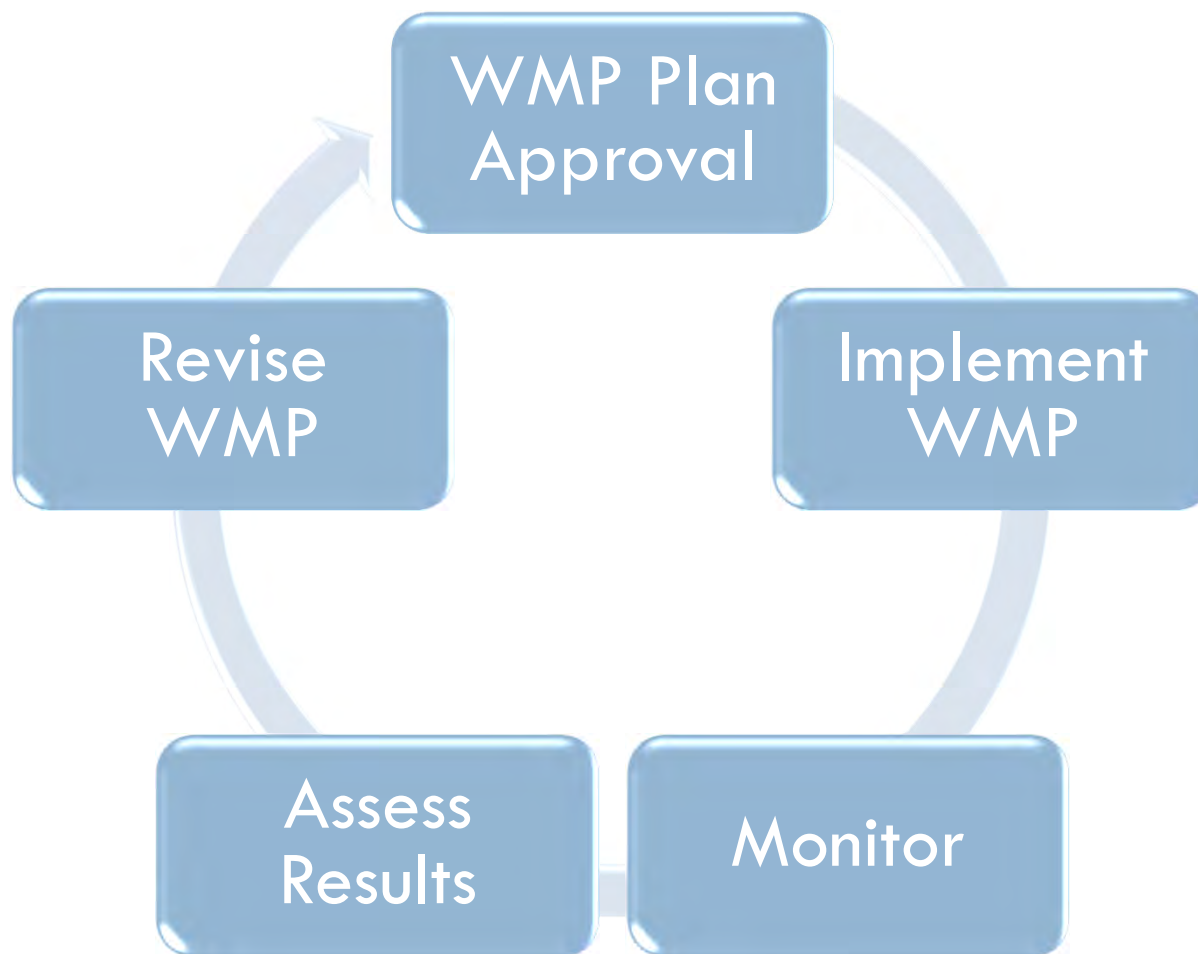

- Seven Watershed Management Areas
 - ▣ Further subdivision based on subwatersheds, e.g. WQFI subwatersheds
- Individual vs. Group programs
 - ▣ Encourage cooperative programs among all Permittees within WMA
 - ▣ Permittees may participate in more than one WMP
 - Individual requirements from each WMP compiled in Permittee's jurisdictional storm water management program
 - ▣ An individual Permittee may develop its own WMP for each WMA within its jurisdiction
 - Not preferred - Ramifications for plan development, monitoring, collaboration on regional controls

Watershed Management Areas

Watershed Management Areas in Los Angeles County

Watershed Management Program Implementation Cycle

Watershed Management Program Process Timeline

Part	Provision	Due Date
VI.C.2.b	Notify Regional Water Board of intent to develop Watershed Management Program	6 months after Order adoption
VI.C.2.b	Submit draft plan to Executive Officer	1 year after Order adoption
VI.C.2.c	Submit final plan to Executive Officer	3 months after receipt of Regional Water Board comments on draft plan
VI.C.4	Begin implementation of Watershed Management Program	Upon submittal of final plan
VI.C.6.a.ii	First evaluation of Watershed Management Program and submittal of revisions to plan	1 ½ years after submittal of final plan
VI.C.6.a.ii	Second evaluation of Watershed Management Program and submittal of revisions to plan	180 days prior to expiration date of Order

Watershed Management Program Plan Development

Identify Watershed Priorities

- Water quality characterization
- Waterbody-pollutant classification
- Source assessment
- Prioritization

Select Watershed Control Measures

- Customize Minimum Control Measures
- Target non-storm water discharge controls
- Compile TMDL implementation actions from Implementation Plans
- Identify individual Permittee responsibilities

Conduct Reasonable Assurance Analysis

- Quantitative analysis/modeling of control measures
- Focus on deadlines within permit term and progress toward achieving final WQBELs
- Documentation of legal authority to implement selected control measures

Identification of Water Quality Priorities

- Highest priority (*Category 1*) – Waterbody/pollutant combinations subject to TMDLs
- High priority (*Category 2*) – Waterbody/pollutant combinations identified on Section 303(d) List as impaired, but no TMDL yet
- Medium – Waterbody/pollutant combinations with exceedances of WQS, but not listed as impaired
- Low priority – Waterbody/pollutant combinations for which data do not indicate exceedances of WQS

Source Assessment

- Focus on Category 1 and 2
- Review available data from
 - Storm water management programs:
 - Illicit discharge detection and elimination programs
 - Commercial / industrial facilities control programs
 - Development construction programs
 - Public agency activities
 - TMDL source analysis
 - Watershed modeling
 - Monitoring programs
- Identify MS4 outfalls discharging to waterbodies in Categories 1 and 2

MS4 Prioritization

- Based on water quality priorities and MS4 source assessment
- TMDLs
 - ▣ First priority: Address WQBELs and receiving water limitations with interim or final compliance dates within the permit term; past deadlines
 - ▣ Second priority: Begin addressing WQBELs and receiving water limitations with compliance deadlines between 2012-2017
- Other Receiving Water Considerations
 - ▣ Address MS4 discharges that may have caused or contributed to exceedances of water quality standards (not otherwise covered by a TMDL)

Selection of Watershed Control Measures

- Objectives
 - Create efficient and effective program to focus individual and collective resources on watershed priorities
 - Focus on Categories 1 and 2
 - Prevent or eliminate non-storm water discharges through the MS4 that are a source of pollutants
 - Implement controls to achieve interim and final WQBELs and receiving water limitations – focus on deadlines during permit term
 - Ensure that MS4 discharges do not cause or contribute to exceedances of other WQS not yet addressed by TMDLs

Permit Provisions Addressed in WMP

- SWMP Minimum Control Measures
 - ▣ Identify opportunities to focus resources on Categories 1 and 2
 - ▣ Management programs consistent with 40 CFR § 122.26(d)(2)(iv)(A)-(D)
 - ▣ Justification for modifications
 - ▣ Customized actions replace, in relevant part, the baseline permit requirements in Section VI.D
- Non-Storm Water Discharge Measures
 - ▣ Effectively prohibit non-storm water discharges
 - ▣ Implement additional BMPs
 - ▣ Divert to sanitary sewer

Permit Provisions Addressed in WMP

- TMDL Control Measures
 - ▣ Actions identified in Basin Plan amendment and/or TMDL Implementation Plans submitted by Permittees
 - Controls to address storm water and non-storm water discharges, where necessary
 - At a minimum, actions to be taken during permit term to achieve interim and/or final WQBELs and receiving water limitations
 - May include baseline or customized activities under MCMs
 - May include controls under non-storm water discharge provisions

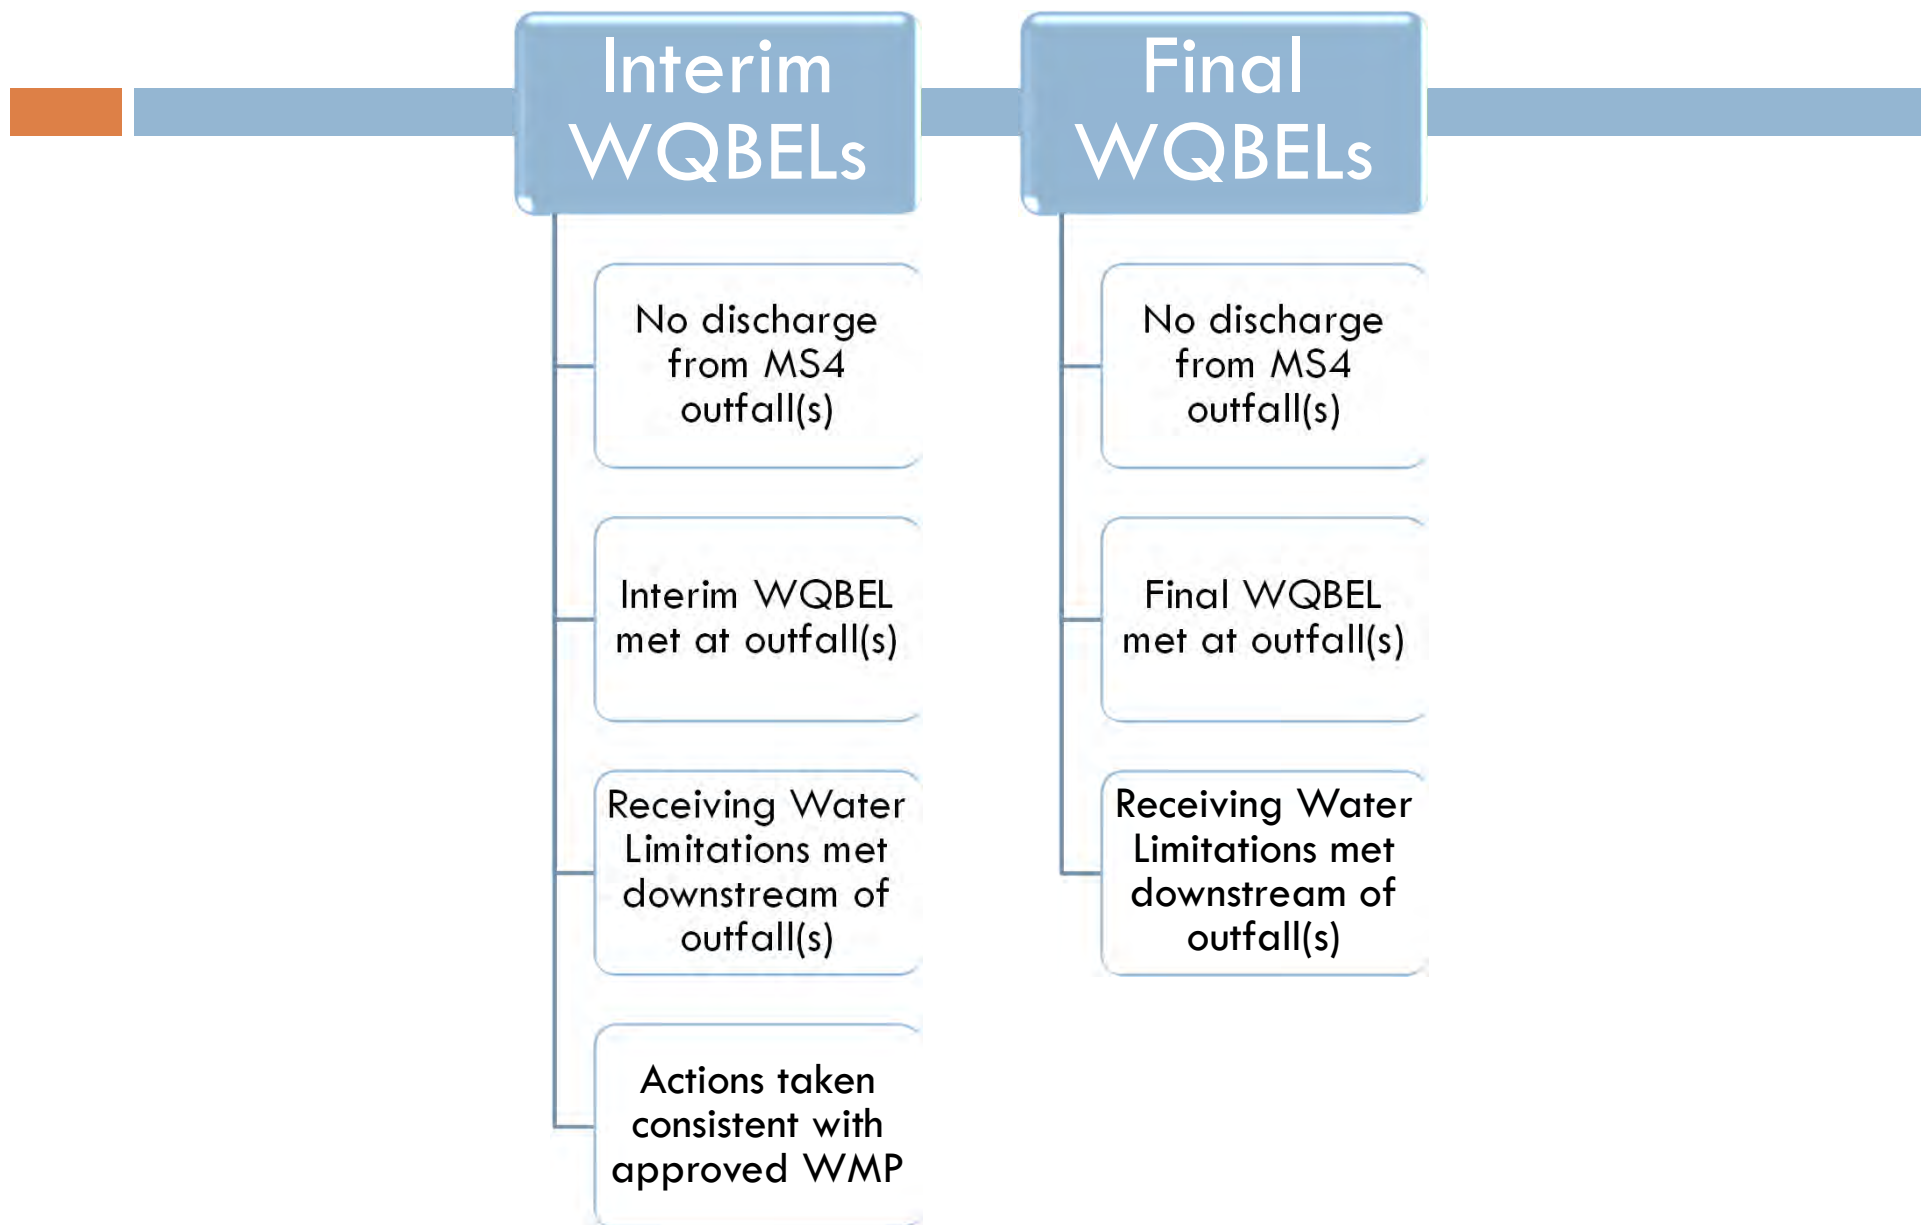

Reasonable Assurance Analysis

- WMP must include quantitative analysis demonstrating that watershed control measures are likely to achieve applicable WQBELs with deadlines during permit term
- If deadlines fall outside of permit term, must include interim milestones and dates for achievement
- Must include documentation of legal authority to implement, or compel implementation of, the control measures relied upon

TMDL Provisions

- Requirements to implement 33 TMDLs
- Matrices identifying individual Permittees subject to each TMDL
- Attachment for each Watershed Management Area
 - ▣ Numeric Water Quality Based Effluent Limitations established to implement each TMDL WLA
 - ▣ Specific Receiving Water Limitations included, where consistent with WLAs (e.g. exceedance days for bacteria TMDLs)
- Trash TMDL provisions based on existing LA River Trash TMDL requirements

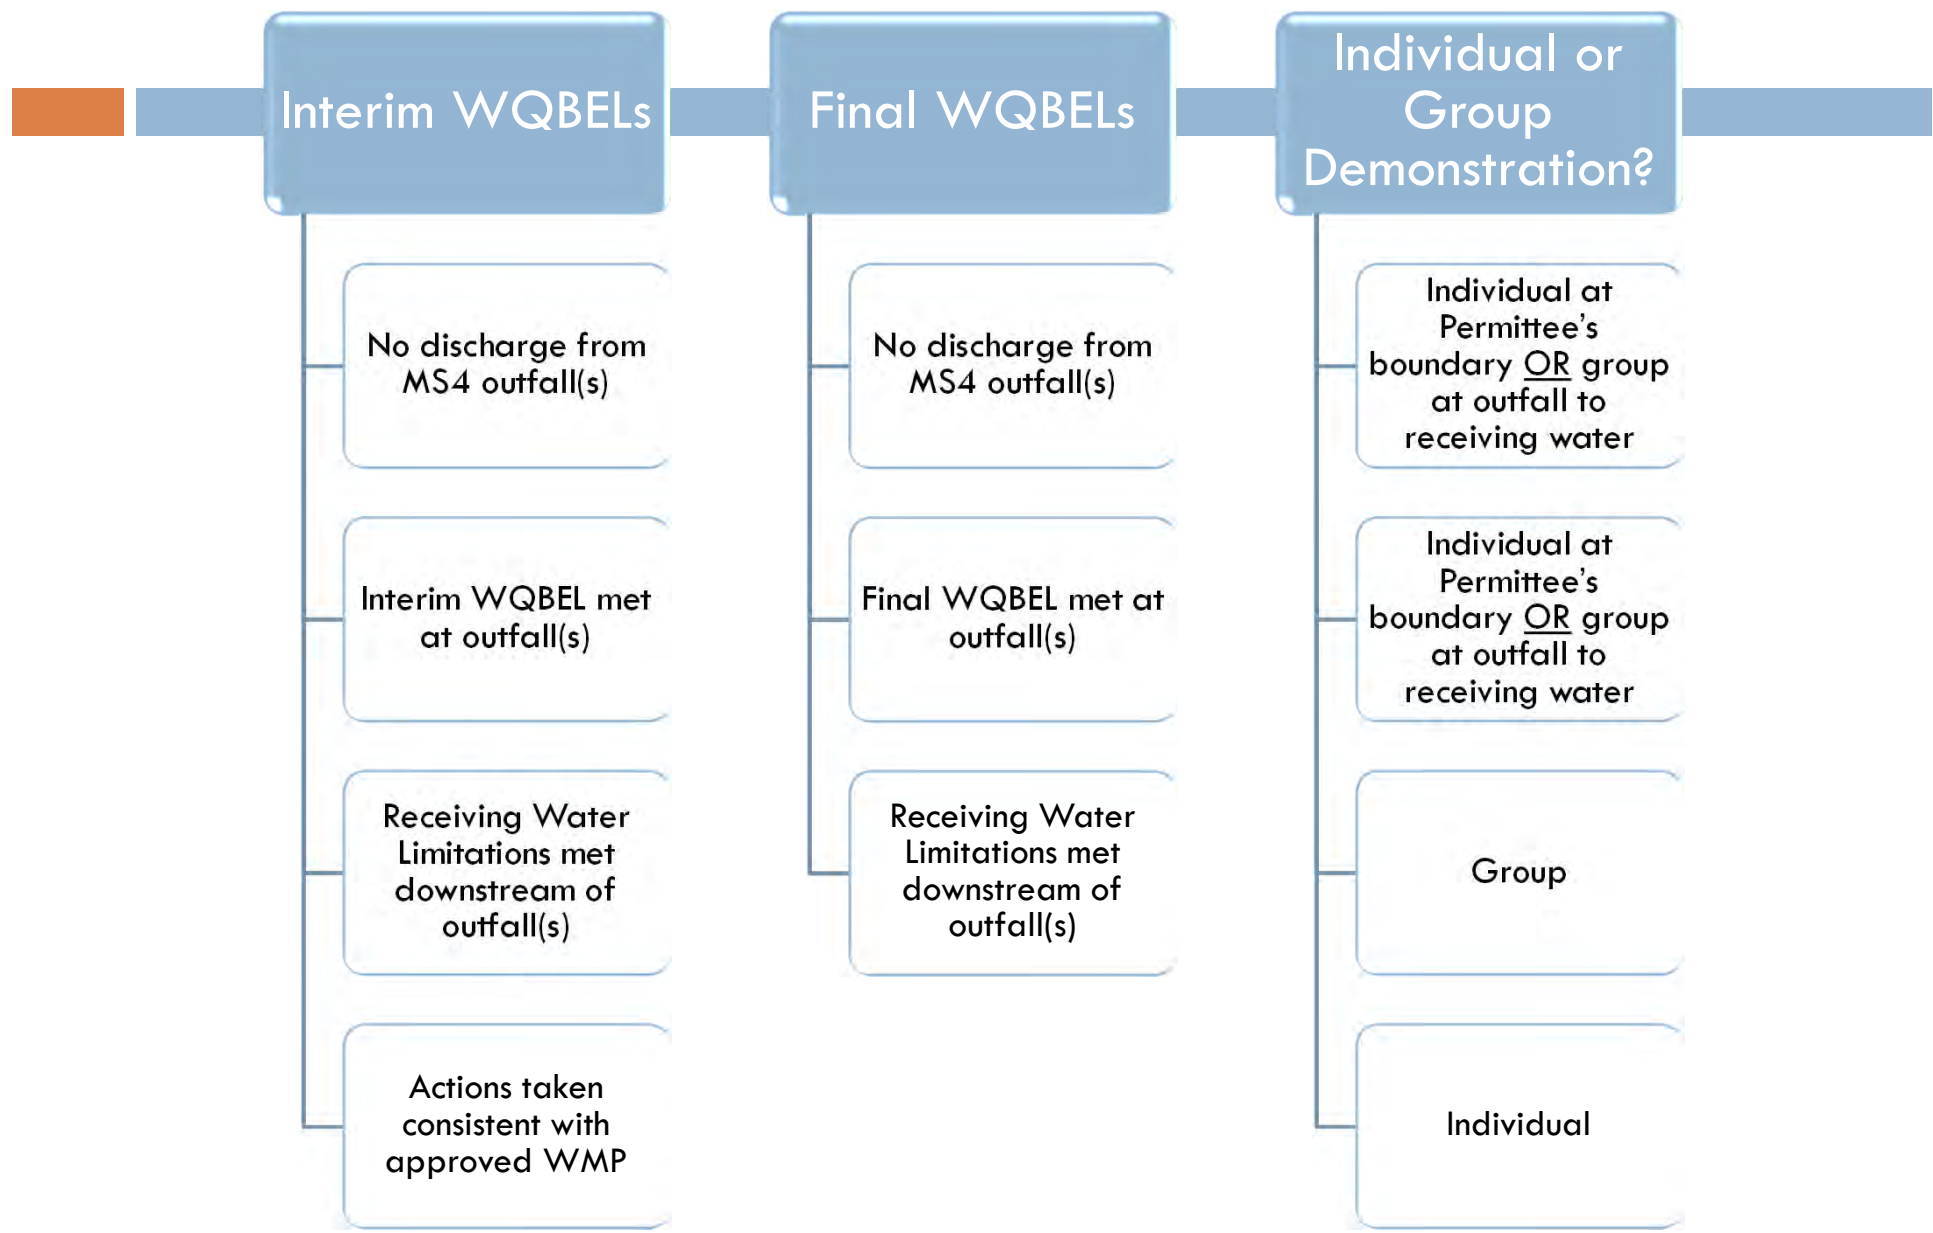

Compliance Demonstration Alternatives

Compliance Determination for Commingled Discharges

- Each permittee is only responsible for discharges from the MS4 for which it is owner/operator
- However, many TMDL WLAs are assigned jointly to a group of permittees because discharges commingle in MS4 prior to discharge to receiving water
- Where permittees have commingled discharges, compliance is determined for the group as a whole unless an individual permittee demonstrates compliance for its discharge individually

Compliance Demonstration Alternatives

TMDL Provisions (cont.)

- Compliance schedules
 - Equal to state-adopted TMDL implementation schedules
 - Approach to final compliance deadlines that have passed
 - Approach to EPA established TMDL without an implementation plan

Time Schedule Orders to Comply

EPA TMDLs

- Time schedule of actions
- Demonstration that schedule is as short as possible
- Interim requirements and dates for achievement

State-adopted TMDLs

- Chronology of actions taken since effective date of TMDL
- Justification of need for additional time
- Time schedule of proposed actions
- Demonstration that schedule is as short as possible
- Interim requirements and dates for achievement

Receiving Water Limitations (RWLs)

- RWL = Applicable Water Quality Standards
- Ensure that discharges from the MS4 do not cause or contribute to exceedances of applicable WQS; protect beneficial uses
- Language based on State Water Board precedential order, Order WQ 99-05; same as 2001 Permit and 2010 Ventura MS4 Permit
- Relationship between Receiving Water Limitations and “iterative [BMP implementation] process”
- Relationship to TMDL provisions - Achieve compliance with RWLs for specific waterbody-pollutant combinations as outlined in TMDL provisions, pursuant to applicable compliance schedules

Comments on the Development of the Greater LA County MS4 NPDES Permit

May 3, 2012
LARWQCB Workshop

LA PERMIT GROUP

*A collaborative effort to negotiate the
Los Angeles County MS4 NPDES Permit*

History

- * Los Angeles Stormwater Quality Partnership (LASQP)
 - * Members from throughout the County
- * LA Permit Group
 - * began January 2011
 - * 62 municipalities

LA PERMIT GROUP

*A collaborative effort to negotiate the
Los Angeles County MS4 NPDES Permit*

LA Permit Group

62 Voting Agencies

- * Agoura Hills
- * Alhambra
- * Arcadia
- * Artesia
- * Azusa
- * Baldwin Park
- * Bell
- * Bell Gardens
- * Bellflower

LA Permit Group Structure

LA Permit Group
*(Heather Maloney, Chair
City of Monrovia)*

Negotiating Committee
*Heather Maloney, LA River • Heather Merenda, Santa Clara River
John Dettle, Santa Monica Bay • John Hunter, LA River
Joe Bellomo, Malibu Creek/Rural Watersheds •
Patricia Elkins, Dominguez Channel • Ray Tahir, San Gabriel River*

Technical Sub-Groups

Development Programs
(Kosta Kaporis, City of Los Angeles)

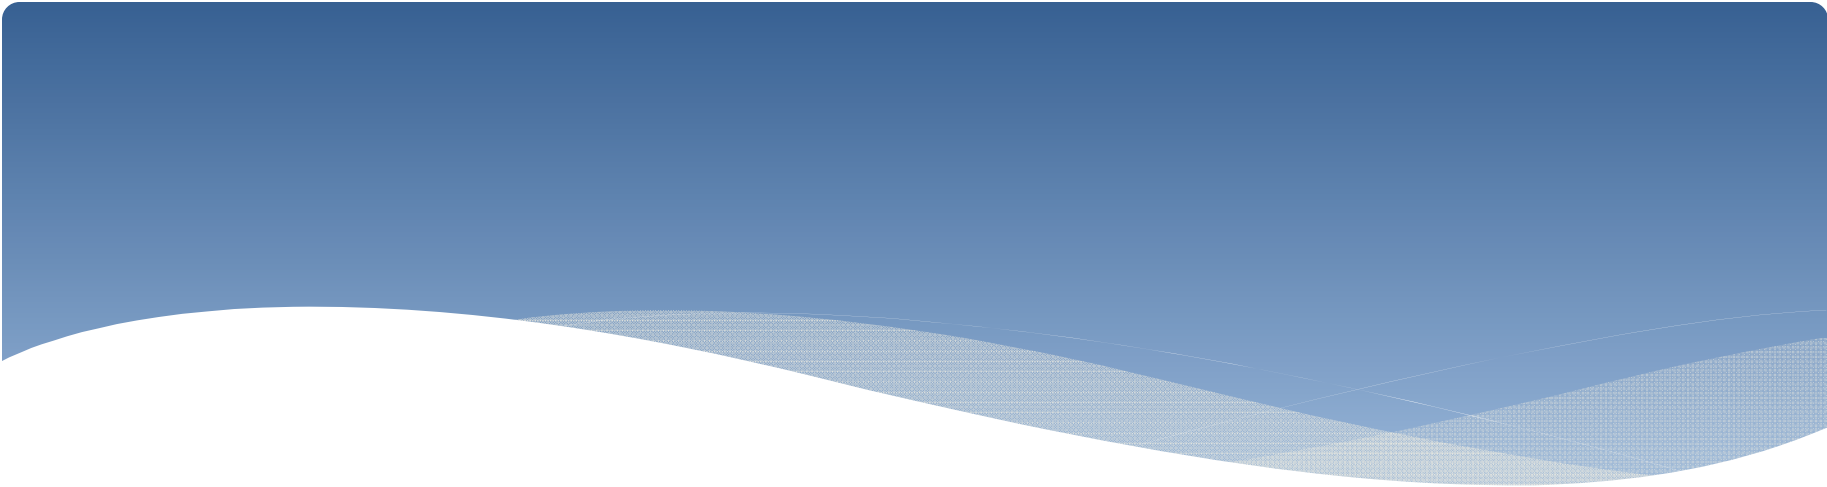

Monitoring
(John Dettle, City of Torrance)

Reporting & CORE Programs
(Joe Bellomo, Westlake Village & Agoura Hills)

TMDLs
(Heather Merenda, City of Santa Clarita)

Overall Themes

- * What is the best way of achieving progress towards the water quality goals?
 - * Integrated, regional planning
 - * Integrated, regional monitoring
 - * Prioritization
 - * Sustainability

“A policy’s value must be measured not only in terms of it’s appeal, but also in light of its implementability”

- Jeffrey L. Pressman and Aaron Wildavsky

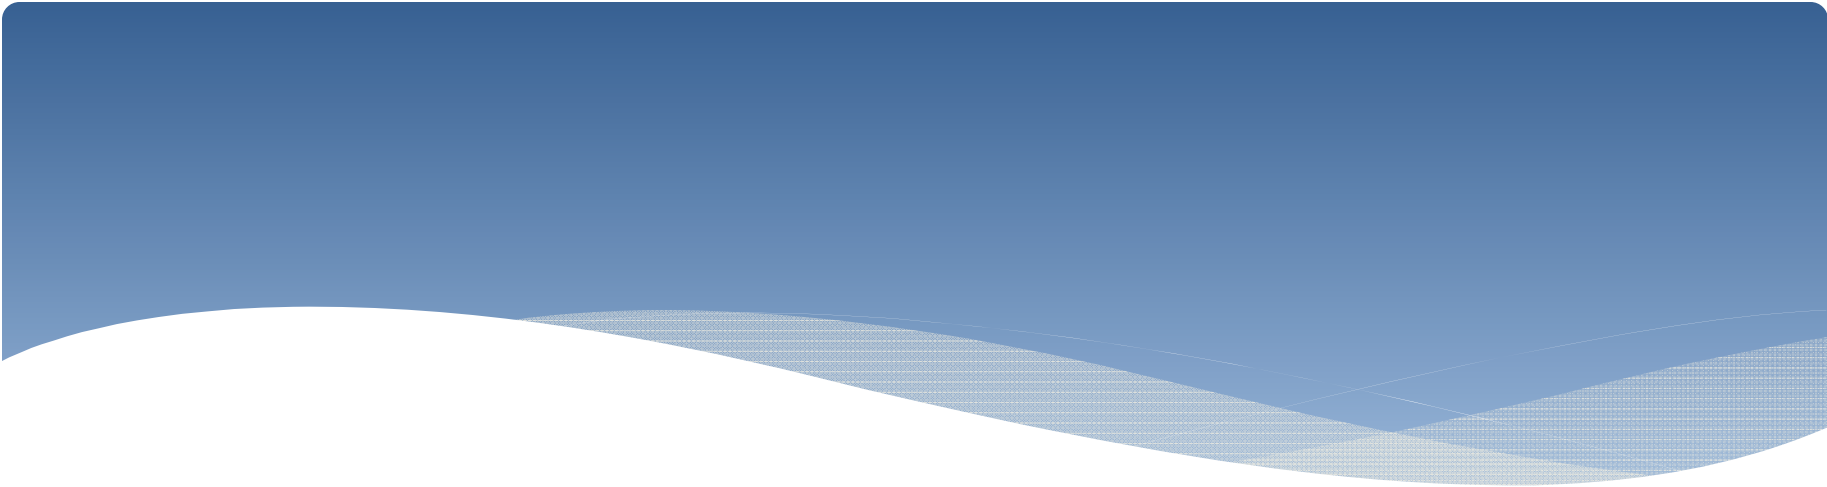

Fiscal Resources

- * Limited control to increase stormwater fees (Prop 218)
- * MCMs + TMDLs goes beyond resources municipalities currently have available
- * Health, Safety, Quality of Life, other regulatory requirements and clean water all need to be developed in balance of each other

Permit Development Timeline

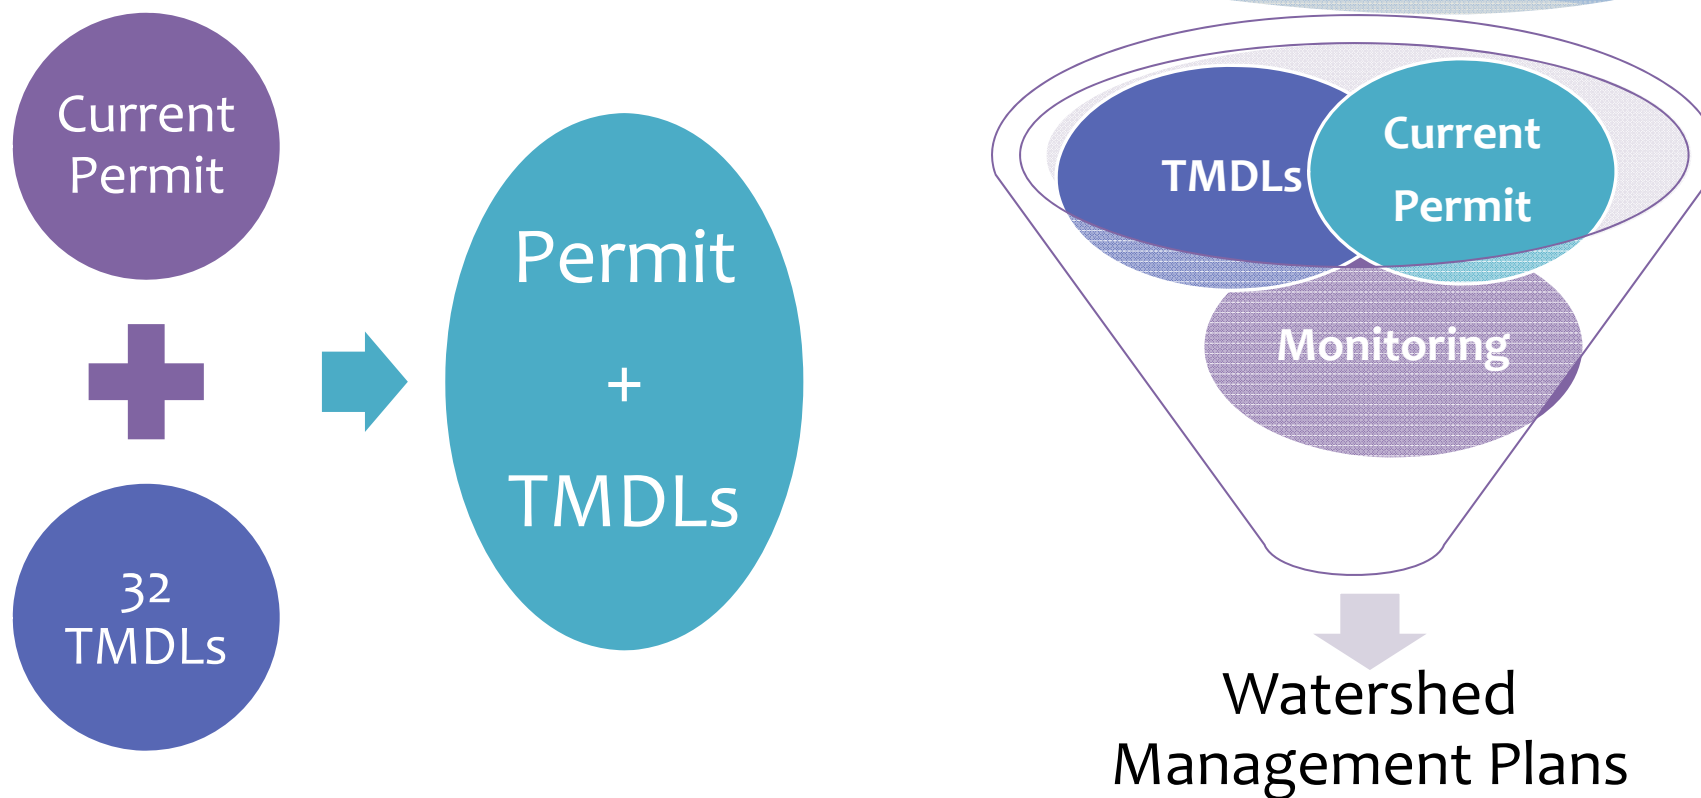

- * Review time limited
- * Administrative Draft requested prior to Tentative Permit
 - * Need to see the whole permit together
 - * Remaining Permit Sections – Monitoring Program and Reporting
 - * Significant comments provided in past Workshops
- * Workshop on Administrative Draft in order to discuss whole permit

“Implementation must not be conceived as a process that takes place after, independent of , the design of policy... programs must be design by gearing programs more directly to the demands of executing them”

- Jeffry L. Pressman and Aaron Wildavsky

Paradigm Shift

Receiving Water Limitations

Receiving Water Limitations

- * RWL should support the adaptive management approach discussed in the Watershed Management Plans
 - * Currently RWL conflicts with Watershed Planning
 - * Proposed language exposes the municipalities to enforcement action (and third party law suits) **even when** the municipality is engaged in an adaptive management approach to address the exceedance.

Adaptive Management

- * The Adaptive Management Approach should be used to provide a consistent standard throughout Permit
- * We recommend that the Regional Board work with the State Board on this very important issue

Watershed Management Program

Watershed Management Program

- * Overall the LA Permit Group supports the Regional Board's proposed approach to address high priority water quality issues by the development and implementation of a watershed management plan
- * The working proposal supports flexibility by providing sufficient detail to guide the development of the watershed plan without being overly prescriptive and constraining

Watershed Management Program

- * The monitoring program should be directly integrated into the Watershed Management Program

- * The Watershed Management Program should include options for streambed restoration, enhanced biological range and more rigorous ecosystem health

Watershed Management Program

- * Adequate Timeline is needed for the development of the Watershed Management Program
- * Plan should be based on monitoring data to provide reasonable assurance

Provision	Due Date
Notice of Intent	6 month after Order adoption
Draft Plan	1-year after Order adoption
Final Plan	3-months after RB comments
Implement Final Plan	Upon submittal of Final Plan
First Evaluation & submittal of revised Plan	1 ½ years after Final Plan submittal
Second Evaluation	180 prior to Order expiration

Watershed Management Program

- * Clarify compliance during the interim period while developing Watershed Management Program
 - * Continue current Stormwater Quality Management Plan
 - * Continue existing TMDL implementation plans

- * Streamlined Reporting and Assessments

Watershed Management Program

- * Technical and financial feasibility of complying with water quality standards should be included in the Watershed Management Program criteria
- * Clarification should be added to acknowledge some pollutant sources are outside the permittees' authority or control
 - * Examples - aerial deposition, natural sources, permitted sources, upstream contributions, etc.

Total Maximum Daily Loads

TMDL Section - Complexity

- * **Complexity:** This NPDES permit proposes to incorporate more TMDLs than any other permit in California issued to date
 - * This effort should be done right considering the magnitude
 - * Rushing through will only cause more problems down the road for an already complex and difficult permit
- * There are fundamental policy decisions that will affect the stormwater programs and legal landscape for years to come that should not be rushed
- * Provide flexibility to achieve water quality improvements that are more efficient and effective

TMDL Section – Uncertainty

- * **Uncertainty:** The sophistication of the TMDLs vary widely and not all TMDLs are created equal
 - * uncertainty in science regarding knowledge of the pollutant sources,
 - * confidence in the technical analysis is low based on the lack of source data,
 - * uncertain source problem results in uncertain selection of control measures to address the pollutant
 - * Reopeners were placed into the TMDLs to address this uncertainty

TMDL Section – Flexibility and Time

- * **Flexibility**: Uncertainty in TMDLs can be reduced by selecting a flexible approach
- * Regulations and EPA guidance provide discretion to the Regional Board to address TMDL WLAs. Compliance with the TMDLs should be through implementing BMPs defined in the watershed management plan for both interim limits and final limits
 - * WLA compliance can be determined through implementing BMPs or through meeting the numeric effluent limits
 - * Strict numeric final limits are not required, but the working proposal requires strict compliance with numeric final limits
 - * Working proposal allows compliance with numeric interim limits through the implementation of BMPs specified in the watershed management plan

Fundamental Policy Decisions EPA Developed TMDLs

- * Fundamental policy decision by the Regional Board
 - * No implementation plan/compliance schedule identified in the USEPA TMDLs

- * Time Schedule Orders should be the last resort. Rather, the State's compliance policy should be used to establish the framework for moving forward

- * TMDL compliance schedule alignment with Watershed Management Program would allow an integrated approach

Fundamental Policy Decision TMDL Compliance Dates Passed

- * Past due TMDLs should be reopened to incorporate implementation schedules in the watershed management program
 - * Reopeners in the TMDLs have not occurred or are being rushed
 - * These TMDLs have reopeners to reflect the uncertainty during their development

Cities Working Hard for Clean Water

Sufficient time is needed to travel the road ahead so that we accomplish clean water and reach the finish line together

In this scenario, everyone wins with clean water

Receiving Water Limitation Language
Watershed Management Plans
Total Maximum Daily Loads
in Next Round of Los Angeles County
MS4 Permits

*Cities of Azusa, Baldwin Park, Carson, Claremont, Compton, Duarte,
El Monte, Gardena, Glendora, Irwindale, Lawndale, Lomita, Pico
Rivera, San Fernando, San Dimas, San Gabriel, South El Monte, and
West Covina*

RWLs

- Receiving Water Limitation Language is Required in all MS4 Permits
 - Has remained the same since 2001
 - Most RWL in California permits are pretty much the same
 - Staff's versions does not fully comply with State Board Order WQ-99-05 adopted by the State Water Board on June 17, 1999 which applies to all Permittees
 - Proposed RWLs are different, unnecessary, and confusing
 - Staff said that the L.A. permit was to be modeled on Ventura Permit
 - This is not the case with RWL language (the proposed permit is totally different)

RWLs

- Standard RWL Language
 - RWL provides compliance instructions for water quality standards/TMDL WLAs
 - Stormwater discharges shall not cause or contribute to an exceedance above a water quality standard (includes TMDLs) from the MS4 to a receiving water (**applies only to stormwater discharges**)
 - Permittees shall only be responsible for discharges over which they have control
 - Discharges from the MS4 of storm water, or non-storm water shall not cause or contribute to a condition of **nuisance** (this is California Water Code language not CWA – non-stormwater discharges from the MS4 only relate to nuisance)

RWLs

➤ RWL Nuisance

- Not an issue because a nuisance issue rarely arises -- only when three nuisance criteria must be met (specified in the California Water Code)
- But staff has added a new provision based on an “interpretation” of a fed. regulation (40 CFR §122.26(a)(3)(vi)
 - “A permittee is only responsible for discharges of stormwater and non-storm from the MS4 for which it is an owner/operator”

RWLS

Staff Interpretation of CFR 40 §122.26(a)(3)(vi.)	What the Reg. Actually Says
<ul style="list-style-type: none"> A permittee is only responsible for discharges of stormwater and non-storm from the MS4 for which it is an owner/operator 	<ul style="list-style-type: none"> Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers (MS4) for which they are operators.
<p>Difference Between Interpretation and Actual Regulation</p>	
<ul style="list-style-type: none"> Makes a permittee or co-permittee) both an operator and owner Makes a permittee responsible for all discharges from and to the MS4 (a more expansive and broad requirement because it would make permittees responsible for all discharges over including those it has no control (e.g., school districts) 	<ul style="list-style-type: none"> Permittee is only an operator (you can be an operator of MS4 component but not always an owner) Permittee need only comply with permit conditions (limits it to discharges over which it has control) Permit need only comply with discharges from the MS4 (means stormwater not non-stormwater discharges)

RWLs

➤ Nuisance Language

- Recommendation: Delete reference to staff's interpretation of CFR 40 §122.26(a)(3)(vi)
 - Will eliminate “regulatory creep” and make it unnecessary to challenge it later

RWLs

- Staff Proposed RWL Language Change
 - Existing Language: *Discharges from the MS4 that cause or contribute to the violation of **Water Quality Standards or water quality objectives** (includes TMDL/WLAs) are prohibited.*
 - Proposed Language: *Discharges from the MS4 that cause or contribute to the violation **of a receiving water limitation** are prohibited.*
 - Defines RWL (as a footnote) *any applicable numeric or narrative water quality standard, or limitation to **implement** the applicable water quality standard, for the receiving water as contained in the water quality control plan for the Los Angeles Region (Basin Plan), water quality **control plans, or policies approved by the State Water Resources Control Board**, or federal regulations, including but not limited 40 CFR 131.38.*

RWLs

➤ Staff Proposed RWL Language Change

- What's the big deal?
 - All NPDES permits are about complying with water quality standards that are necessary to protect a beneficial use of a receiving water
 - Water quality standards (including TMDLs) are part of the L.A. basin plan (if you comply with standards you comply with the plan)
 - Referencing State Board plans and policies are not necessary because the L.A. Board is only obligated to comply with L.A. Basin Plan requirements that are approved by the State Board
 - For example: State policies such as the anti-degradation is *a key element of California's water quality standards* are already in the L.A. Basin plan

RWLs

- Staff Proposed RWL Language Change
 - What's the big deal? -- continued
 - Including federal regulations including 40 CFR §131.38 (the California Toxics Rule) is also superfluous because the TMDLs that were developed in response to the rule are incorporated in the basin plan
 - Staff is trying to fix something that is not broken
 - The fix would require permittees to revamp their stormwater ordinances unnecessarily
 - And the fix would only create confusion and make it difficult for permittees to enforce water quality standards against those dischargers over which they have control (e.g., because the new compliance standard is over-broad)

RWLs

- Staff Proposed RWL Language Change
 - Recommendation:
 - Don't fix it
 - Use the RWL language developed by the San Diego Regional Board

RWLs

➤ Maximum Extent Practicable Missing

- MEP must be in all MS4 permits
- *Pursuant to CWA section 402(a)(2), NPDES permits must prescribe conditions to assure compliance with CWA section 402(p)(3)(B) and 40 CFR 122.26(d)(2)(iv)(B). This Order prescribes conditions to assure compliance with the CWA requirements for owners and operators of MS4s to effectively prohibit non-storm water discharges **in to the MS4s** and require controls to reduce the discharge of pollutants in storm water from the MS4s to **MEP***

RWLS

➤ Maximum Extent Practicable Missing (continued)

▪ Use Phase II USEPA Permit Definition of MEP

*The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and **economic feasibility**. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses.*

*MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the **“iterative approach.”***

RWLs

- Iterative Process is also missing
 - State Water Resources Control Board requires inclusion of iterative Process in MS4 permits (State Board Order 2001-15):
 - *we will generally not require ‘strict compliance’ with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards*

RWLS

➤ Recommendations

- Use existing RWLS in current permit and
- Add MEP (preferably from the Phase II MS4 permit)
- Add iterative process using South Orange County MS4 permit as a model

Watershed Management Program

Watershed Management Plan

➤ WMP Is Unjustifiably Stringent

- Staff proposes a watershed management plan that permittees must implement or, in the alternative, implement minimum control measures (discussed at the last workshop)
- This becomes a matter of picking your poison because both require compliance with numeric limitations on pollutants – which if not met could place the permittee into a state of non-compliance
- But federal regulations do not authorize the use of strict numeric limitations as proposed by staff
- State Board is not in favor of numeric limitations – just mentioned
- We know of no other permit adopted by other Regional Boards in the State that require such stringent permit conditions
- Even if federal regulations sanctioned their use it would be premature to impose them because (1) there has been **no effluent monitoring** at the outfall or (2) **true ambient monitoring** in the receiving water before or after a storm event

Watershed Management Plan

➤ WMP Is Unjustifiably Stringent - continued

Watershed Management Plan

- Issues - continued
 - You can't develop a watershed management plan (which is due six months after the permit's adoption) without outfall and ambient data
 - WMP also requires prioritizing water quality issues – how do you do this, what criteria do you use to set high, medium and low priorities (this will require guidance documents)?
 - WMP requires developing interim milestones towards addressing priorities – what criteria do you use to determine milestones relative to priorities?

Watershed Management Plan

Ambient Receiving
Water Condition
(RB bases ambient on
48 hours after a storm)
This is when ambient
monitoring is supposed
to be done

Watershed Management Plan

➤ Issues - continued

- WMP provides for an **adaptive management** procedure that is not explained (is this supposed to be a replacement for the **iterative process** that is required by the State Water Resources Control Board?)
- WMP for measurable and demonstrable reductions of illicit discharges to the MS4 (federal regulations only require prohibiting illicit discharges from the MS4 or requiring discharges to obtain coverage under a separate NPDES permit)
- Not enough time to find the *devil in the details*

TMDL Compliance

TMDL Compliance

- TMDL Issues
 - Staff interprets TMDLs to be the same as WLAs (e.g., the WLA for copper is the WQBEL permittees must be comply with: 17 micrograms per liter)
 - A WQBEL is a type of WLA but when applied to effluent discharged from the outfall it must be adjusted
 - In other words a WQBEL and WLA can't be the same

TMDL Compliance

➤ Issues

- Federal regulations and USEPA guidance -- WQBELs express WLAs either as BMPs or **numeric effluent limitations**
- The **BMP WQBEL** type achieves compliance with the WLA if it is implemented fully and in a timely manner – even if the WLA is exceeded at the outfall
- Why? – Because other sources besides municipal permittees discharge from an outfall (public education facilities, state and federal facilities, permitted construction sites, and permitted and un-permitted industrial facilities, various general NPDES permits)

TMDL Compliance

➤ Issues – continued

- A numeric limitation WQBEL may be used but federal regulations require a procedure for determining if it is needed which involves asking: (1) has the discharge caused or contributed to an excursion above a water quality standard (need outfall and ambient monitoring data) been done?; and (2) has modeling been done to take into account the affect of dilution on the effluent discharges to the receiving water? (from NPDES Writers Manual)
- The answer is NO because stormwater (unlike sewage discharges) is more complicated and a reasonable potential analysis is labor intensive; this is why USEPA has said repeatedly *that only rarely will numeric limitation WQBELs will be used*

TMDL Compliance

*EPA's policy recognizes that because storm water discharges are due to storm events that are **highly variable in frequency and duration and are not easily characterized**, only in rare cases will it be feasible or appropriate to establish numeric limits for municipal and small construction storm water discharges. The variability in the system and minimal data generally available make it difficult to determine with precision or certainty actual and projected loadings for individual dischargers or groups of dischargers. **Therefore, EPA believes that in these situations, permit limitations typically can be expressed as BMPs**, and that numeric limits will be used only in rare instances. (From 2002 USEPA Guidance Memo on TMDLs)*

TSOs and TMDL Compliance

- Staff proposes to Comply with USEPA and State adopted TMDLs through a time schedule order (TSO)
 - Several TMDLs contain compliance schedules which if placed into the MS4 Permit would put permittees into an instant state of non-compliance (e.g., permittees subject to the LA River metals TMDL would be out of compliance based on recent metals monitoring data)
 - USEPA TMDLs adopted in March could also place permittees in non-compliance with their WLA requirements
 - Staff proposes to prevent permittees from being in violation with the TMDLs by using TSO to provide additional time for compliance

TSOs and TMDL Compliance

- Problem: A Time Schedule Order is an enforcement action under Porter-Cologne (the State's water code)

CHAPTER 5. ENFORCEMENT AND IMPLEMENTATION

ARTICLE 1. ADMINISTRATIVE ENFORCEMENT AND REMEDIES BY REGIONAL BOARDS

§ 13300. Time schedules

Whenever a regional board finds that a discharge of waste is taking place or threatening to take place that violates or will violate requirements prescribed by the regional board, or the state board, or that the waste collection, treatment, or disposal facilities of a discharger are approaching capacity, the board may require the discharger to submit for approval of the board, with such modifications as it may deem necessary, a detailed time schedule of specific actions the discharger shall take in order to correct or prevent a violation of requirements.

TSOs and TMDL Compliance

- TSO is Not Warranted and Unnecessary
 - It is essentially an enforcement action
 - Not justified because a TMDL WLA violation must first occur
 - A violation can only occur if (1) the TMDL is placed into the permit; (2) an exceedance at the outfall (not the receiving water) is detected; and (3) the numeric WQBEL to determine compliance has been set (has not because a reasonable potential analysis has not been done to validate if the permittee's effluent discharge at the outfall has caused an exceedance of an ambient WQS in the receiving water)
 - Compliance therefore need only be achieved by the implementation of appropriate WQBELs that translate the WLAs into BMPs
 - BMPs can be proposed in the stormwater quality management plan for implementation after the permit's adoption

WQBELS and TMDLs

- Stormwater NPDES Permit Requires Compliance with WQS and TMDLs
 - Achieved through BMP or Numeric WQBELS
 - Compliance with MS4 WQS/TMDL WLAs THROUGH WQBELS must be at the outfall and only the outfall – NOT IN THE RECEIVING WATER
 - Federal regulations compel expressing a TMDL WLA (and any other WQS) as a **water quality based effluent limitation (WQBEL)**
 - According to federal regulations "effluent limitation" *means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters (waters of the U.S. which also means receiving waters) (CWA, Section 502)*
 - And, 40 CFR 122.26 specifies the **outfall** as a **point source** for municipal discharges – but again there's been no outfall monitoring

WQBELs and TMDL Compliance

- Even sewage treatment plants have WQBELs (actually they were the first type of NPDES discharger to be subject to WQBELs
 - The NPDES permit for the Hyperion sewage treatment plant has effluent limitations that are monitored for compliance upstream of its outfall (actually from a sampling point within the Hyperion Plant)
 - No compliance monitoring is required in the receiving water
 - The RB's sewage NPDES folks can validate this

USEPA TMDL Compliance

- Staff proposes to include USEPA adopted TMDLs into permit
 - Problem: there has been no discussion of the TMDLs before or after USEPA adopted them
 - There has been no opportunity for review and comment by permittees
 - Permittees have not provided input on how USEPA TMDL WLAs are to be translated into WQBELs
 - Another workshop to explain this and USEPA adopted TMDLs

USEPA and RB TMDL Compliance

➤ Solution:

- Do not incorporate these TMDLs into the permit; instead append them to the permit
- The permit can translate all of the TMDLs into WQBELs that would be met by a continuation of the permittees Storm Water Quality Management Plan's
- This would provide time to figure-out how best to comply with the last minute TMDLs – specifically how to structure specific WQBELs
- Discussion could take place within one year after the permit's adoption and new WQBELs could be placed into the permit through the iterative process – there would be no need to re-open the permit

Trash TMDL Compliance

- Staff proposes Minimum Frequency of Assessment and Collection Approach to Comply with Other Adopted Trash TMDLs
 - Problem: This is a new TMDL compliance approach for trash that has not been explained
 - This is the first time permittees have seen it
 - Why is it needed?
 - How does it differ with other trash TMDLs?
 - Seems to require trash clean-up outside of the MS4 (this is not authorized under federal regulations)
 - Will it also require trash debris excluders?
 - Do not contemplate inclusion into permit until it has been presented by staff for review and comment

Trash TMDL Compliance

- Los Angeles River trash TMDL has not been expressed as a WQBEL
 - Was adopted in 2001, prior to USEPA's TMDL guidance memoranda on WQBELs
 - Needs to go undergo a bona fide WQBEL setting process (because it would be impossible to install screens in all county and city catch basins unless the stormwater quality fee initiative succeeds)
 - Seems to require trash clean-up outside of the MS4 (this is not authorized under federal regulations)
 - Will it also require trash debris excluders?
 - Staff needs another workshop(s) to explain this and USEPA adopted TMDLs

TMDL Compliance

- Proposed placement of Middle Santa River Regional Board Bacteria into Next MS4 Permit
 - Adopted by the Santa Ana Regional Board
 - TMDL affects the cities of Claremont and Pomona
 - Staff did not discuss this with affected cities
 - Legality is in question -- can the RB impose a TMDL adopted by another RB jurisdiction?
 - Has staff proposed to the Santa Ana Regional Board that it comply with the Coyote Creek metals TMDL for the San Gabriel River?

END OF PRESENTATION

Thanks

One Last Thing

- Cities of El Monte and South El Monte would like the Regional Board to convene a workshop at the City of South El Monte on the 3rd or 4th Friday in June
- Included is a tour of segments of Reach 2 of the Rio Hondo
 - See what an outfall is
 - See a soft and hard bottomed segment of the river
 - See the Rio Hondo spreading ground (used for groundwater recharge)
 - Good for the next board members get a sense of “context” of what we have been talking about relative to the development of the new MS4 permit and TMDLs
- Enviro-NGOs should also attend to see that these cities – as many others – are not for “dirty water” or for a permit that is going to moon-walk on water quality

Los Angeles County Municipal Separate Storm Sewer System (MS4) NPDES Permit Renewal

Heal the Bay

Goal: Protect Human Health

Beneficial Use: Water Contact Recreation

Santa Monica Bay Epi Study

- First epidemiological study on swimmers in urban- runoff contaminated waters
- Designed to answer two questions:
 - Is distance of swimming from storm drain associated with risk of adverse health outcomes?
 - Do bacteria indicators predict risk of adverse health outcomes?

Major Findings of the Epi Study

- Correlation between incidence of adverse health effects (gastroenteritis and upper respiratory infections) and swimming in water with high indicator densities
- Those who swam in front of flowing drain are twice as likely to get sick than those 400 yards away

Demographic Breakdown

Of the people surveyed:

At the drain (polluted)

60% Latino

33% Caucasian

Within 50 yards of the drain (??)

47% Latino

41% Caucasian

400 yards away (clean)

39% Latino

49% Caucasian

Goal: Protect Aquatic Life

Photo: Whale Rescue Team

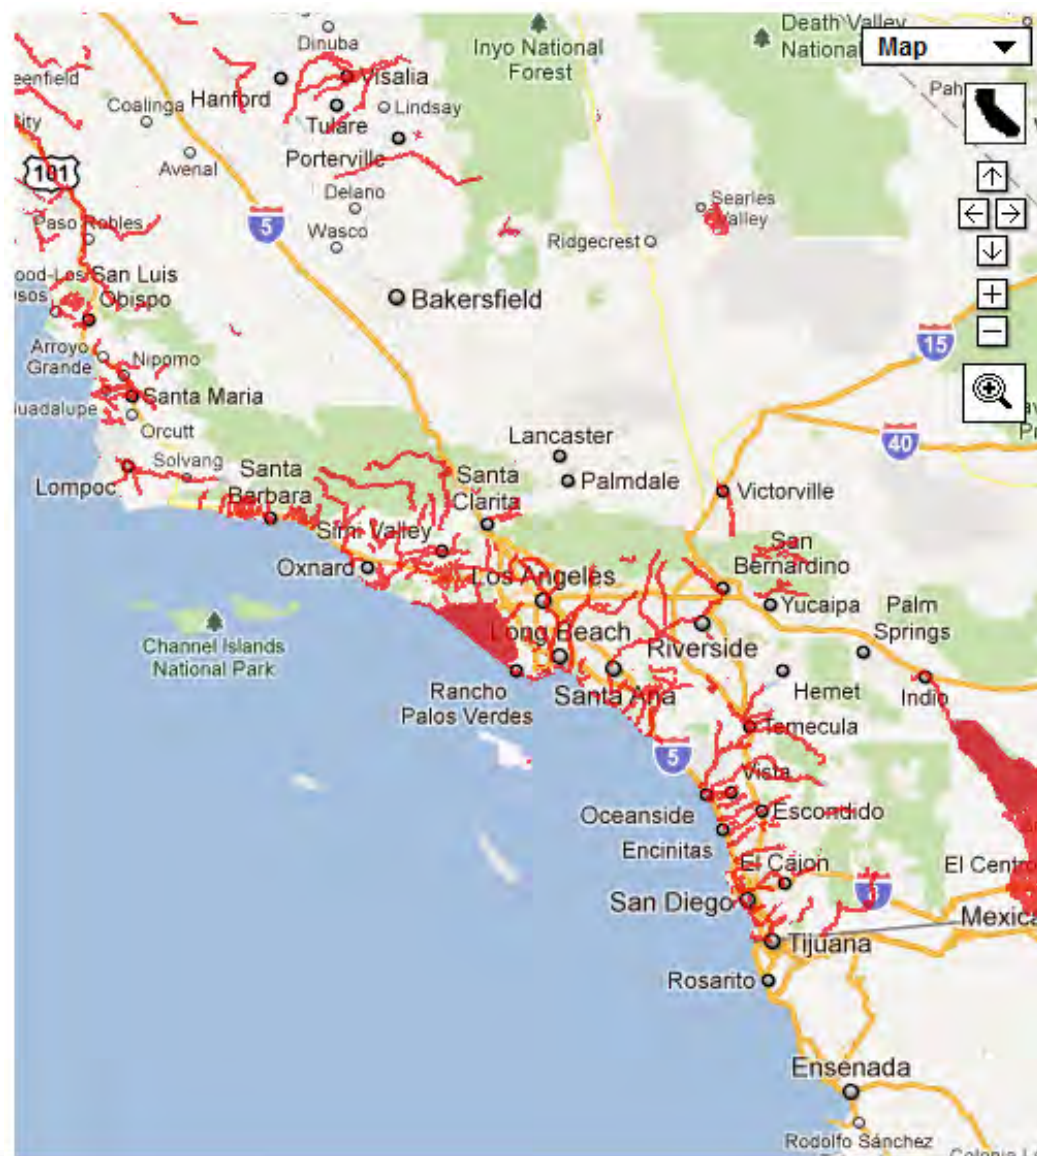

Beneficial Uses: Marine Habitat and Wildlife Habitat

Goal: Protect Public Health

Beneficial Use: Commercial and Sport Fishing

2010 303(d) List (Impaired Uses)

EPA and LA Water Board Set Strict New Pollution Reduction Plans for 175 Waterways in Los Angeles Area

Action Culminates 13 Year Effort, Eliminating Beach Closures, Reducing Trash and Toxic Chemicals in Waters

LOS ANGELES – The U.S. Environmental Protection Agency and the Los Angeles Regional Water Quality Control Board today announced the latest in a series of pollution reduction plans designed to restore 175 water bodies in Los Angeles and Ventura Counties. The pollution targets set by these plans will improve water quality, restore ecosystems, and protect the public by eliminating beach closures due to bacteria and improving the health of fish used for consumption....

Types of TMDLs Adopted

- Ballona Creek (Metals, Bacteria, Toxics, Trash, Bacteria)
- Colorado Lagoon (Pesticides, PAHs, PCBs, Metals, etc.)
- Machado Lake (Toxics, Nutrients, Trash)
- Lakes Legg, Elizabeth, Munz, Hughes (Trash)
- Los Angeles Harbor (Bacteria, Toxics)
- Los Angeles River (Metals, Trash, Nitrogen, Bacteria)
- Malibu Creek (Trash)
- Marina del Rey (Bacteria, Toxics)
- Santa Clara River (Bacteria, Nitrogen)
- Santa Monica Bay (Bacteria, Debris)

Types of TMDLs Adopted

- Ballona Creek (Metals, Bacteria, Toxics, Trash, Bacteria)
- Colorado Lagoon (Pesticides, PAHs, PCBs, Metals, etc.)
- Machado Lake (Toxics, Nutrients, Trash)
- Lakes Legg, Elizabeth, Munz, Hughes (Trash)
- Los Angeles Harbor (Bacteria, Toxics)
- Los Angeles River (Metals, Trash, Nitrogen, Bacteria)
- Malibu Creek (Trash)
- Marina del Rey (Bacteria, Toxics)
- Santa Clara River (Bacteria, Nitrogen)
- Santa Monica Bay Bacteria

- Jul 15- Santa Monica Bay Beaches TMDLs take effect: The first bacteria TMDLs in California

2006

- Jul 15- LA beaches mandated to meet Summer dry-weather TMDL
- Sep 14- language of SM Bay Bacteria TMDL incorporated into LA MS4 Permit
- County petitioned to hold permit in abeyance
- 5-year permit term is up
- 181 TMDL Violations

2007

- Aug 9- LA MS4 Permit Reopened to include Marina Del Rey summer dry weather TMDL
- 533 TMDL Violations

Beach Bacteria TMDL Timeline

2008

- 663 TMDL Violations
- LA Regional Board sends NOV's to 20 cities
- County took revised MS4 permit out of abeyance for State Board review

2009

- 587 TMDL Violations
- By July 15, LA Beaches must meet 3 max allowable violations during winter dry period
- Aug 4- state Board upheld Regional Board's order and denied the County's Petition
- Regional Board sends second round NOV letters to 20 cities

2010

- 526 TMDL Violations
- Adopted Ventura MS4 Permit includes all applicable TMDL limits and requirements, along with year-round monitoring at 10 beaches
- CA Superior Court set aside MS4 incorporating TMDLs due to attorney error

2011

- 879 TMDL Violations
- Mar 14- Bacteria TMDLs removed from municipal stormwater permit
- Regional Board agrees to put TMDLs back into permit by next beach season

2012

- June- Bacteria TMDL Reopener
- Sept- LA MS4 Permit Renewal

Efforts

VENTURA COUNTY MS4

“This Order incorporates applicable WLAs that have been adopted by the Regional Water Board and have been approved by the OAL and the U.S.EPA.”

“Part 5 of this Order incorporates provisions to assure that Ventura County MS4 Permittees comply with WLAs and other requirements of TMDLs....”

“Each Permittee shall attain the stormwater WLAs incorporated into this Order...”

-Order No. R4-2010-0108, pages 14 & 88

TMDL Provisions Must Comply with State & Federal Regulations

- Consistent with the assumptions and requirements of any available waste load allocation (40 C.F.R. 122.44(d)(1)(vii)(B))
- Compliance schedule requirements (40 C.F.R. 122.47(a))
- California Toxics Rule deadlines
- Consistent with state policies and regulations

Receiving Water Limitations

- Discharge Prohibitions/Receiving Water Limitations – Leave As Is
 - Successful provisions legally upheld over time
 - State Court
 - Federal Court
 - Required by CWA § § 1313, 1342(p); 40 C.F.R. § 122.44(d)(1)
 - Consistent with Regional Board's longstanding position

Watershed Management Programs

33 U.S.C. 1342(p)(3)(B)(iii)

“[Municipal Permits] shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants”

Watershed Management Programs

Environmental Defense Center Inc. v. U.S. E.P.A.

“[S]tormwater management programs that are designed by regulated parties must, in every instance, be subject to meaningful review by an appropriate regulating entity Congress identified public participation rights as a critical means of advancing the goals of the Clean Water act”

344 F.3d 832, 854-56 (9th Cir. 2003)

MS4 Permits - LID Standards

~~North Orange County~~ Permitt

The permittees shall reflect in the WQMP and otherwise require that each LID BMPs shall be sized and designed to ensure onsite retention without runoff, of the volume of runoff produced from a 24-hour 85th percentile storm event, as determined from the County of Orange's 85th Percentile Precipitation Map¹⁴ ("design capture volume");
percent or less of the total project area.

City of Downey

Comments on General TMDL Provisions

May 3, 2012

Background

The City of Downey has over 1,000 parcels with Low Impact Development (LID) systems implemented.

N/W Quadrant of the City

- **Green dot = LID**

Each green dot represents one LID system.

What do these LID devices look like?

Treats 60 Acres

What do these LID devices look like?

Steve Horn Way

Our Comments

1. Generally, we support the Board's staff efforts for a (sub) watershed plan. This allows efforts to be tailored to individual situations.

Our Comments

2. Grouped effluent limitations¹

Downey can support grouped implementation efforts, but cannot support non-voluntary grouped compliance.

(Please do not force unwillingly permittees to work together)

¹ Example: San Gabriel River Watershed Management Area (E1.C)

Our Comments

- 3a. Water quality based effluent limitations should be based on BMPs.
- 3b. Load based allocations (grams/day) should be available to permittees, not just concentrations (grams/day/liter).

Example: SGR Reach 1 for copper.

Our Comments

4a. A need for a realistic compliance target.

Downey installed nearly 400 full capture catch basin inserts (89%). The remaining 11% could not be retrofitted due to physical limitations.

Our Comments

4b. Even after 1,000 parcels with LID and 89% of the City's catch basins with full capture catch basin inserts installed we still have "zero" as the effluent limit.

What else can we do?

1 Los Angeles, California, Thursday, May 3, 2012
 2 9:00 a.m.
 3
 4
 5 MR. STRINGER: Good morning everybody. Welcome to
 6 the Los Angeles Water Quality Regional Control Board.
 Page 3

May 3 MS4workshop

7 We're going to get started now. We have one board
8 member that's running a little late. He's taking public
9 transportation. I think we'll get going now. We have a
10 full agenda, and we'd like to have enough time for
11 comprehensive discussion during our workshop today.

12 We typically start with the pledge of allegiance.
13 But given that there's no flag here, I think we'll skip
14 past that one. I don't want anyone to get the wrong
15 idea. This is my first time chairing a Board and
16 probably the first time we haven't done the pledge.
17 There's no correlation. We'll start with the role call.
18 Ronji?

19 MS. MOFFETT: Ms. Camacho?

20 MS. CAMACHO: Present.

21 MS. MOFFETT: Ms. Diamond?

22 MS. DIAMOND: Present.

23 MS. MOFFETT: Ms. Glickfield?

24 MS. GLICKFIELD: Present.

25 MS. MOFFETT: Ms. Lutz?

0008

1 MS. LUTZ: Present.

2 MS. MOFFETT: Ms. Mehranian? Ms. Munoz?

3 MS. MUNOZ: Present.

4 MS. MOFFETT: Mr. Stringer?

5 MR. STRINGER: Here.

6 MS. MOFFETT: Mr. Yee?

7 MR. STRINGER: Sam?

8 MR. UNGER: The agenda is as posted. I would just
9 like to make some clarifications that we will do the
10 full item four, both ex-parte and other board member
11 reporting in order. That is this morning. We'll also
12 do the executive officer report this morning, and public
13 forum will also be this morning. And so that is the
14 order we'll be going now without the previously noted
15 changes to that agenda.

16 MR. STRINGER: Great. Thank you. The next item on
17 the agenda is the approval of minutes from our last
18 meeting. Do we have a motion?

19 MS. CAMACHO: Yes.

20 MR. STRINGER: And I will be abstaining. All those
21 in favor?

22 MS. LUTZ: Aye.

23 MS. MUNOZ: Aye.

24 MS. GLICKFIELD: Aye.

25 MS. DIAMOND: Aye.

0009

1 MR. STRINGER: And one abstention, for the record.
2 Board member communications. We'll start with you,
3 Maria.

4 MS. CAMACHO: I have none.

5 MS. DIAMOND: I just wanted to report that a couple
6 of weeks ago I had the privilege of meeting the U.S.
7 Administrative for the U.S. EPA, Lisa Jackson, and had a
8 few moments to speak with her. And she told me that
9 she's encouraging about the upcoming stormwater permit,
10 and she talked a lot about the Clean Water Act. It was
11 very inspirational.

12 I just encourage everybody who has a chance to ever
13 listen to her speak. She kind of reminds you why we all
14 are involved with water quality and how important it is.
15 So I just wanted to report that because I was, even
16 after all these years, inspired once again.

17 MR. STRINGER: Thank you.

May 3 MS4workshop

18 MS. GLICKFIELD: I have nothing to report.

19 MS. MUNOZ: I took a tour of the Santa Susanna
20 plant with representatives last week. It was quite
21 amazing tour and very promising.

22 MS. LUTZ: Hi. Good morning. In my other hat as
23 the mayor of the City of Monrovia, I attended the
24 mayor's water council which is a committee of the U.S.
25 conference of mayors in Indianapolis last month and it

0010

1 was a fascinating conversation about water quality and
2 storm water, and we had several representatives from
3 U.S. EPA.

4 We also had a representative from the Office of the
5 President with us, and I'm going to pass out a directive
6 to my colleagues and I have some for our city staff as
7 well from the Office of the President regarding
8 regulatory water, air quality and the issue of the
9 emphasis and looking at the prospectives regarding the
10 economic basis of the regulations. So it was a very
11 informative document, and I thought it would be
12 something that everybody here could use; so I have many
13 copies. This is for our staff. Thank you.

14 MS. CAMACHO: I apologize. I did too attend -- I
15 don't think I've had enough coffee this morning. I did
16 attend, along with my colleague Irma Munoz, the Santa
17 Susanna tour. I did kind of a separate tour because I
18 literally was there for 30 minutes; so I quickly zipped
19 around. It was quite interesting to see the work being
20 done there. So I did attend that as well.

21 MR. STRINGER: And nothing for me. That's it?
22 Thank you. So, Sam, EO report.

23 MR. UNGER: Good morning, Vice Chair Stringer,
24 members of the Regional Board. I want to provide a
25 brief EO report on some matters that I usually report

0011

1 out on and a couple other items as well; so I'll start
2 with our two largest clean up sites.

3 First, the Kast site at the Carousel neighborhood
4 in Carson. And as I reported to you last month, field
5 work at the Kast site has started up again. We are
6 focused really on two areas of investigation. One is to
7 continue the work on the indoor air assessment. I
8 reported that the low percentage of homes have been
9 tested for indoor air, and the other is to evaluate
10 remediation technologies that could be used at the site.

11 On the indoor air testing, Shell's contractors are
12 testing four homes per week now through September, and
13 the initial results from these tests is that the air
14 quality is equivalent to outdoor air quality and so at
15 this point the results show that the indoor air quality
16 is -- there's no measurable vapor intrusion from the
17 subsurface.

18 On the remediation front there have been several
19 lab scale tests and field tests for both technologies
20 and different excavation techniques. We are working
21 closely with the City of Carson on excavation permits
22 and siting and mitigation of equipment that will be
23 sited in the neighborhood to mitigate noise impacts and
24 other impacts that may disturb the residents. We are
25 hoping to have this work evaluated later this year, and

0012

1 then we'll be formulating plans for the full scale
2 cleanup.

May 3 MS4workshop

3 On the former Athens tank farm otherwise known as
4 the Ujima site, as you know, the investigation is
5 ongoing and we are focussing our attention on several
6 areas. First, the off site investigation as I reported
7 -- well, first, the off site investigation and we're
8 also looking at the SV pilot test and relocation of the
9 day care center.

10 Regarding the off site investigation, as I reported
11 last month, the data showed that the vapor plume has
12 migrated to the east of the regional park and beneath
13 the residential neighborhood with depths of hydrocarbon
14 at about 35 feet below grade at highest concentrations.
15 Consequently, we have ordered the human health screening
16 analysis and work plan which was approved by us last
17 month.

18 We're hoping to get access agreements so that Exxon
19 and the contractor can go into either the homes or the
20 crawl spaces beneath the homes -- these homes are not
21 built on slabs as they are in the Carousel neighborhood
22 -- to conduct specific testing at those homes.

23 In terms of the day care relocation, I'm actually
24 pleased to report to you that there's been an exchange
25 of letters between the county and Exxon-Mobil in general

0013

1 agreement to day care relocation. At this point, in
2 fact, the Exxon letter was just sent earlier this week,
3 and the next step is for the county and Exxon to meet
4 and develop a schedule and any other formalized plans.
5 So I'm hoping next month I'll be able to report back to
6 you on further developments there. We intend to stay in
7 a facilitation role, and both parties have recognized
8 the role of the Board is finally bringing the two
9 parties together to work on the relocation of the day
10 care center.

11 Finally, staff is preparing for a community meeting
12 on May 16 at Enterprise Park. It will be held in the
13 evening between 6:00 and 8:00. We are working with
14 State Board, Cal EPA, and the county to have
15 presentations and a presence there. We're looking for
16 facilitation assistance from Cal EPA, and we are now
17 developing fact sheets for that which will be translated
18 into Spanish as well.

19 And, finally, before I leave this, just to remind
20 you that board member Glickfield requested last month
21 that we initiate an investigation to try to identify old
22 tank farms that might be in the region that we haven't
23 yet found.

24 I want to report to you that that effort is under
25 way. Paula has taken the lead on that. RT and YR are

0014

1 supporting her, and we hope to have a report to you in
2 the next several months of findings of historical
3 (inaudible) of other areas that may be in the same
4 situation that the Kast and Ujima sites are.

5 I want to report out some further developments on
6 fracking. As follow up to our report last month, we're
7 working several issues there. Basically specifically
8 focussed on the Baldwin Hills areas, we're working on
9 two fronts.

10 One is to review and revise two permits that the
11 board has issued to the oil field operator there
12 regarding land farm operations and storm water runoff.
13 Our second front is to meet with various groups and

May 3 MS4workshop

14 agencies on oil field operations in general and to gain
15 more information about the potential impacts to ground
16 water quality.

17 Regarding the permits, staff has initiated
18 discussions with PSP, the current owner and operator,
19 and is planning to conduct site visits later this month.
20 We hope to bring you these reissued permits for your
21 consideration later this year.

22 Regarding the stakeholders, we met with Tim Custik,
23 who is the executive director of the state's division of
24 oil, gas, geothermal resources at their office in
25 Cypress. That's DOGGR. And we've also met with

0015

1 community members from NRDC and have attended the
2 multiple agency coordinating committee which will be a
3 standard practice for us from this point forward.

4 And I can provide more details on that. But in the
5 interest of time, I'll go a little short except to
6 inform you that Tim Custik, the director of DOGGR has
7 offered to speak to the Board either on an information
8 item or in any other forum if you have questions about
9 their agency. And if you think you'd like to extend
10 that invitation to him, I'd be happy to relay it and get
11 him here. He's quite clearly very knowledgeable about
12 oil field operations and fracking in general.

13 So in the meantime we're planning on continuing our
14 meetings with DOGGR staff. We found our first meeting
15 with them was very helpful in terms of understanding the
16 technologies in the oil field, that is, using the
17 fracking techniques and their permitting process as well
18 and how it can jive with ours or interact with ours. So
19 we're going to be continuing monthly meetings with DOGGR
20 staff on a staff to staff basis alternating between
21 their office in Cypress and our office in downtown. Are
22 there any questions?

23 MS. DIAMOND: I was going to ask questions when you
24 had finished your report.

25 MR. UNGER: Sure. There was a question last month

0016

1 about the former (inaudible) site in the Los Angeles
2 harbor. And just to provide some brief information on
3 that, that site is a former tank farm that contained
4 four above ground fuel storage tanks. It's been under
5 our jurisdiction for a number of years. Three tanks
6 have been removed, and one tank was left in place and
7 remains in operation. Also one new tank has been
8 installed.

9 There was a fuel release way back in 1994 which
10 contaminated soil and ground water at the site. A
11 cleanup and abatement order was issued in 1998, and
12 remedial actions have included extraction, excavation of
13 petroleum packet soils and soil ground water
14 investigations.

15 At this point there's no (inaudible) and the ground
16 water plume appears to be stable. The cleanup and
17 abatement order is still in place and quarterly ground
18 water and surface water sampling is conducted.

19 Although we have not found detectable
20 concentrations of TPH associated waste, there have been
21 detections in surface water of other volatile organic
22 compounds. The origin of these detected VOC's in
23 subsurface water is uncertain at this time and there are
24 multiple potential sources in the site vicinity, and

May 3 MS4workshop

25 staff now is developing appropriate investigative

0017

1 workers and possibly cleanup orders to address those off
2 site areas.

3 And finally, two things. Well, one is I wanted to
4 just report out to you on water recycling initiatives.
5 There have been a number of legislative, regulatory, and
6 policy discussions occurring on the issue of recycled
7 water at the present time.

8 California Department of Public Health is working
9 on revised regulations, and the state board's recycled
10 water policy promotes water recycling also requires
11 certain actions that the regional board is taking under
12 the salt management planning efforts.

13 We held a meeting with the stakeholders earlier
14 this month to become apprised of their progress in
15 developing these salt management plans.

16 There's also some legislative activity underway
17 that has studied the issue in very broad ways that could
18 affect our board's authorities, and we are tracking all
19 of these efforts and hope to see the right balance in
20 promoting recycled water and protection of our local
21 water resources.

22 I would say Deb has been very involved in these
23 discussions, and she's taking the lead on integrating
24 these various facets and we hope to be reporting back to
25 you in the near future.

0018

1 And finally on staffing, I've been reporting to
2 you. Since the beginning of the year we've been able to
3 add about 15 staff across many of our programs. It's
4 been very successful in terms of back filling some
5 positions, number one, and increasing our administrative
6 support. Nearly every program has had staff, and the
7 staff are making contributions to the board as well. So
8 we've been able to really augment our staff position.

9 The bad side of it is basically those days are over
10 now. We have the three offers that are still in the
11 works that we hope to bring on board, and then after
12 that our hiring is essentially finished for rest of the
13 fiscal year. So with that, that's my report.

14 MR. STRINGER: Thank you.

15 MS. DIAMOND: Sam, I had just a couple of questions
16 about the Ujima site just to clarify a couple things
17 that you said I wasn't sure I totally understood. You
18 mentioned there was an exchange of letters on the issue
19 of the day care relocation between the county and Exxon.

20 MR. UNGER: Yes.

21 MS. DIAMOND: And I was just wondering if there
22 was -- if you had privy to the letters if they were
23 public and if, in fact, those letters showed some common
24 interest and a way that --

25 MR. UNGER: I will -- yes. I have the letters. I

0019

1 will distribute them to you. I apologize for not having
2 done that. Yes. The letters do indicate a very strong
3 common interest in having the day care center relocated
4 to the parcel that the county had identified several
5 months ago on 117th and Holmes Avenue in South Central
6 Los Angeles.

7 MS. DIAMOND: Was Exxon interested in -- what was
8 Exxon's interest in that property?

9 MR. UNGER: Exxon's interest in the property where

May 3 MS4workshop

10 the day care sits right now is to essentially stage
11 their remediation equipment. Exxon has a good
12 understanding that the size of this plume is still yet
13 to be fully delineated and it's going to require
14 substantial remediation effort. They're going to be out
15 there several years at a minimum doing this remediation.

16 The site where the day care is now located has
17 utilities, power, and they think this would be a great
18 place for them to stage their equipment and work on the
19 site for the remediation.

20 MS. DIAMOND: What about the day care center?
21 Where would that go?

22 MR. UNGER: The day care center would be moved to
23 the property that has been identified by the county on
24 117th and Holmes. It's nearby the vicinity. It's
25 slightly north of there. It's in the general vicinity

0020

1 of the Drew Medical Center but not quite there, and it's
2 county owned land right now. And the details of the
3 land transaction are still being worked out at this
4 point. But it was a very good -- it's the first
5 positive step, I think, in a long time that we've seen
6 it. There is common interest in making this relocation
7 reality.

8 MS. DIAMOND: If this were to become a reality,
9 could it be sometime this year, do you think?

10 MR. UNGER: I don't have a schedule yet. I've
11 asked for a schedule. I think at this point that is the
12 next step. Both parties have indicated to me that they
13 need to meet to determine the schedule.

14 Apparently the legal considerations are somewhat
15 complicated in working this whole arrangement, and I
16 think that's the biggest issue at the present time in
17 this whole relocation.

18 Rough plans have already been drawn up for the day
19 care center at the relocation. Of course, permitting
20 has to happen. Construction itself will be relatively
21 quick. So we have ideas about the duration of each of
22 the key steps along this relocation activity will take.
23 I think what's unknown now is the finalization of the
24 agreements for the financial considerations and for
25 Exxon and for the county to transfer the land to the day

0021

1 care owner.

2 MS. DIAMOND: I had one other --

3 MR. UNGER: I hope it is within this year.

4 MS. DIAMOND: So do we.

5 MR. UNGER: Yes.

6 MS. DIAMOND: You mentioned a community meeting,
7 and I wasn't clear where that was and what the issue in
8 that particular community is.

9 MR. UNGER: Well, there are several issues in the
10 community.

11 MS. DIAMOND: Which community are we talking about?

12 MR. UNGER: We're talking about the community where
13 -- essentially right in the vicinity of the former Ujima
14 apartment complex; so basically it's going to be held at
15 Enterprise Park, which is just across El Segundo
16 Boulevard. We've held other community meetings over the
17 years there.

18 It's been a while since we've posted a meeting,
19 nearly a year. Although as I've reported out to you
20 previously, we've attended county meetings. We've met

May 3 MS4workshop

21 with the day care parents. We've met with other more
22 limited stakeholder groups, things like that. So we're
23 planning that meeting now.

24 We're going to have support both in translation
25 services from state board and Cal EPA. There's going to

0022

1 be facilitation brought from Cal EPA, and we're actually
2 having a community outreach expert from DTSC also help
3 us.

4 We expect that DTSC and the board will be taking
5 the major lead in this outreach effort. I don't expect
6 that we're going to get a whole lot of participation
7 from contractors, people like that because there's
8 litigation that's ongoing.

9 MS. DIAMOND: Thank you.

10 MS. CAMACHO: When is that meeting?

11 MR. UNGER: May 16, 6:00 P.M. in the evening. We
12 hope very early, next week at the very latest, if not
13 tomorrow that we have notices posted on our website.
14 We've already sent out a mailing to about 2,000 homes
15 within a one-mile radius of the (inaudible) park. We'll
16 take further steps to notify the public of the meeting.

17 MR. STRINGER: Thank you. Any more questions.

18 MS. GLICKFIELD: Yeah. I have a couple questions
19 on unrelated matters. I forgot to report ex parte I
20 did -- I actually did communicate with the new council
21 member in the City of Malibu and Sam and Mr. Corson, who
22 is the city manager and asked him to -- asked Sam to
23 meet with the new city council people on this sewer
24 plan. I think that's essential for us to continue to
25 move forward.

0023

1 And I'm hoping -- it's my request that, since it's
2 been -- in June it will be a year since we passed the
3 MRU, that you bring back the reports. They're doing a
4 meeting there on the milestones.

5 MR. UNGER: Certainly. I can ask Mr. Corson to
6 come in. Just to let you know that to date all the
7 milestones have been met by the county.

8 MS. GLICKFIELD: City.

9 MR. UNGER: Thank you. The City of Malibu. They
10 have done some test wells actually as well and the
11 reports are looking promising in terms of in the areas
12 of excess water that's produced by the centralized
13 system. And the meeting is -- I just can't remember
14 which day it is but sometime next week.

15 MS. GLICKFIELD: I believe their deadline date is
16 the 25th; so we have three years to go.

17 MR. UNGER: Yes.

18 MS. GLICKFIELD: I want to figure out how to get
19 from your test wells to an actual system.

20 MR. UNGER: I'll report out on that then.

21 MS. GLICKFIELD: The other thing is that -- this is
22 for my colleagues as well. All of us were invited to
23 the Southern California Water Replenishment District
24 workshop, and it was very, very interesting. And I
25 think their work and the issues that they're having with

0024

1 their water purveyors in the cities in terms of how
2 cities can get storm water into ground water and have it
3 right to benefit from getting it back out again is
4 really critical. So I've asked Sam to invite the
5 general manager of the district here to talk about these

May 3 MS4workshop

6 issues, and I think that they are certainly a key
7 stakeholder as they have all the water rights, most of
8 the water rights in the central and the west basin.
9 They're a key player in trying to help us succeed in
10 getting storm water infiltrated.

11 MR. STRINGER: Irma?

12 MS. MUNOZ: Thank you for your report. For the May
13 meeting I put on my calendar when you first mentioned
14 so I will be attending. I want to ask you about the
15 letter that was sent out to notify the local residents
16 who sat in the English into Spanish or just English.

17 MR. UNGER: I think at this point that was only in
18 English. At this point we're having it translated right
19 now, and we'll have it out next week. State board is
20 working on the translation for us.

21 MS. MUNOZ: I think it's important that we know
22 that there is other languages spoken or people are
23 bilingual that we make sure the notifications are sent
24 out in their language so it encourages participation
25 from the community.

0025

1 Let's see. Regarding the oil field, I would like
2 to request that the DOGGR representative come to our
3 June or July meeting depending on what our agenda looks
4 like presentation from them. I also would like to be
5 invited to the (inaudible) PXP if that is possible. I'm
6 not sure if it would be strategically good for me to
7 attend, but I'd like to, if possible.

8 MR. UNGER: I'll check with Frances and Jennifer.
9 Basically our direct meetings with PXP are specifically
10 focused on the permits. I'll have to get some
11 clearance.

12 MS. MUNOZ: Then I'll excuse myself in the permits
13 process. Thank you so much for your efforts on taking
14 the lead on fracking issues because it is a big concern
15 for us and I'm hoping that this regional water board
16 does take the lead to provide champion fracking because
17 it's (inaudible).

18 MR. UNGER: I can't express essentially how much
19 our staff has learned in the last month since we've
20 started this effort really. Oil exploration is a big
21 part of the industrial activities in this region and
22 it's going to continue to be for quite a while. So it's
23 appropriate that we take some closer look at it.

24 So staff is well prepared. The meetings that we've
25 had with DOGGR have been really productive, very

0026

1 productive, good interchange. DOGGR staff used to work
2 at the water board; so there's been a lot of information
3 and our staff is getting up to speed very quickly.

4 MS. MUNOZ: This reminds me of other ex parte
5 communication that I overlooked.

6 MS. GLICKFIELD: I'm glad I'm not the only one.

7 MS. MUNOZ: I almost have to calendar this stuff.
8 I did meet with a representative from Congressman
9 (inaudible) where we did discuss the fracking issues,
10 and I did on behalf of my neighbor ask for a hearing on
11 behalf of fracking; so that will be pending. I did tell
12 her the engagement that the water board was having with
13 the plume. You may be getting communications from them
14 as well.

15 MS. LUTZ: I'm sorry. Just like everybody else,
16 your report reminded me of another event that I had

May 3 MS4workshop

17 attended. I was really proud and privileged to attend
18 the West Covina Upper San Gabriel Water District's
19 presentation for their recycled water program that they
20 have been working many years to put together.
21 West Covina has a field of dreams project over the
22 BKK landfill site; so this is a very important site that
23 has been -- it's being used now for good. And when they
24 built the field of dreams, the City of West Covina
25 included the purple pipes for recycling water, and upper

0027

1 San Gabriel water district is now turned on and working.
2 And this is all done through a grant to the state water
3 board as well and a low interest loan at the same time.
4 So it really does relate to what we do, and it's quite a
5 remarkable project.

6 MR. STRINGER: Thank you. Mr. Yee, do you have
7 anything?

8 MR. YEE: No.

9 MR. STRINGER: Thank you. Let the record reflect
10 that Larry is here.

11 MS. DIAMOND: I was just going to say I also met
12 with Jarod Bloomenfeld, Region 9, U.S. EPA director, and
13 he specifically said that he would love to come to one
14 of our meetings to talk about California regional water
15 issues and what's going on and how big a part we play in
16 that.

17 And so I just mention that to staff so that you can
18 follow up with him and invite him to come to one of the
19 appropriate upcoming meetings because he said he would
20 love to do that. He never gets invited by anyone, not
21 just from our regional boards. He said that nobody
22 thinks about it. I said, "Well, we'll invite you."

23 MR. UNGER: We'll be happy to extend that
24 invitation.

25 MR. STRINGER: Great. Thank you. Thank you, Sam.

0028

1 The next item on our agenda is the update from the state
2 board. Fran Spivy-Weber, are you here? We'll move
3 past that agenda item. If Fran shows up, we may circle
4 back to it. As Sam said, initially we're moving the
5 public forum to after the workshop. So next on the
6 agenda --

7 MR. UNGER: I was unclear. What I meant to say is
8 that the public forum will be held now. I think it's
9 fairly short.

10 MR. STRINGER: I'm sorry. I was reading my notes
11 here.

12 MR. UNGER: It was changing daily.

13 MR. STRINGER: Yea. Sorry. Do you want me to go
14 through all the speaker cards?

15 MR. UNGER: Yeah. With the three-minute time
16 period.

17 MR. STRINGER: Right. Okay. First up is Jason Wen
18 and John Hunter from the City of Downey.

19 SPEAKER: It was for Item 19.

20 MR. STRINGER: I apologize for the confusion.
21 First is Grace Chan from the sanitation districts for
22 L.A. County.

23 MS. CHAN: Good morning, Vice Chair Stringer and
24 board members. I'm Grace Chan. I'm the relatively new
25 chief engineer and general manager of the sanitation

0029

1 districts and I wanted to come to you today just briefly

May 3 MS4workshop

2 to update you on some activities we're involved in on
3 the -- relative to the chloride TMDL in the Santa
4 Clarita Valley.

5 I know that at your last meeting you heard a
6 presentation by Mike Solomon of the United Water
7 Conservation District recounting some of the history,
8 and I don't want to rehash that here today. I just want
9 to give you an update in what we're currently involved
10 in.

11 We are about a few months away from completing the
12 preparation of a draft environmental impact report and a
13 draft facilities plan to meet the 100 milligrams per
14 liter limit that's in the TMDL at our point of our
15 discharge, and we undertook this specifically at the
16 direction of our board last year to begin planning
17 preliminary engineering on a project that would comply
18 with the 100 milligrams per liter.

19 We retained a consultant to prepare the EIR who is
20 under contract for about \$750,000. We also retained a
21 separate consultant for the facilities plan at about a
22 \$1 million contract.

23 We also broadened our scope of public outreach
24 specifically with regard to this project and hired a
25 consultant to help us do that. We had a 40-day scoping

0030 1 period at the beginning of the year. We had public
2 meetings at that time.

3 We've since been having meetings with stakeholders,
4 various community groups and associations. We've had 16
5 of those meetings. We've got another 30 plus already
6 scheduled to follow up with other folks.

7 And so with regard to the overall schedule, as I
8 mentioned, we expect the draft documents to be completed
9 this summer sometime. Those will be released for a
10 60-day public review period. We'll also head meetings
11 during that time of course.

12 And following the review period, we will respond to
13 comments, prepare the final EIR and final facilities
14 plan and hope to bring that back to our board for
15 certification in consideration of a project around the
16 end of the year.

17 And with approval of a project and a certification
18 of the EIR, we would then immediately begin a rating
19 process to support that project. So that's where we
20 stand today.

21 I did want to make one comment in response to
22 Mr. Solomon's remarks. I did review the transcript, and
23 it just seemed like to me that he downplayed the impact
24 of our program to remove the automatic water softeners.

25 It's not a small thing for us. We removed almost

0031 1 8,000 water softeners with an associated chloride
2 reduction of about 50 milligrams per liter. So we do
3 view that as a successful program and something that's
4 significant. With that, that concludes my remarks. I'd
5 be happy to answer any questions.

6 MR. STRINGER: Thank you. Any questions? Thank
7 you very much. That was very helpful. Robert
8 Vandehook.

9 MR. VANDEHOOK: Good morning, ladies and gentlemen
10 and board members. My name is Roy Vandehook or Robert
11 Vandehook, and I'm a biologist and a geographer trained
12 at Cal State Northridge and have worked for the federal

May 3 MS4workshop

13 government for 10 years in wildlife as a wildlife
14 biologist and hydrologist technician and I currently
15 work for L.A. County Parks and Recreation in my day job
16 but I don't represent them. I have to work the night
17 shift today.

18 I also am a volunteer with a bionic institute and
19 the weapons defense fund where I'm their science
20 director and volunteer and board member and work for
21 them gratis, unpaid.

22 It was back in the 1950's when the water was so
23 polluted at the L.A. river where it meets the ocean and
24 Dominguez Creek near Wilmington that sailboats that
25 would have barnacles and algae from the ocean when

0032

1 they're out in the sea attach to their boats, they would
2 go into that area of the Dominguez river mouth in
3 Wilmington and just leave their boats there for 48 hours
4 and it would kill all life on their boat. That was 60
5 years ago.

6 Now if you take a boat there, the marine life
7 doesn't die when it's attached to your boat anymore
8 because the Clean Water Act has been successful and
9 cleaned up the major pollutants that caused death to
10 marine life and estuary life.

11 The point I want to make is that fish live, animal
12 life live unaffected now and very healthy, not just
13 there but at Malibu Lagoon, at the Biona Creek wetlands
14 because the federal law, not a county law or city law,
15 because as you all know cities and counties fought to
16 have a federal law of the Clean Water Act and they
17 fought state government because you, ladies and
18 gentlemen, are the regulators of water quality.
19 You're not the managers. You have to control those
20 managers because managers will get away with whatever
21 they can.

22 Think of yourselves driving your car today here.
23 You were not a regulator. You were a manager of
24 yourself in driving your car. As you drove, some of you
25 -- I'm not saying you per se, but some of you, others

0033

1 may have thrown a cigarette out the window. They made a
2 management decision to do that, throw trash out. You
3 may have decided to extra fast which mean you have to
4 push the brakes more which means metals come off your
5 brake shoes. That was a management decision to drive
6 fast and those kinds of actions.

7 So regulators and managers are two distinct
8 differences. And after you got here with your car, you
9 became a regulator right now as you sit here on the
10 board.

11 And managers, whether they're private companies or
12 even government agencies -- state parks, county parks,
13 national parks -- is that my time? -- Have to be
14 watchdogs by you all the time including problems with
15 the sewer issue in Malibu. Maybe next month I'll talk
16 about that. Thank you.

17 MR. STRINGER: Thank you. Marsha Hansen.

18 MS. HANSEN: Honorable board members, Marsha Hansen
19 with the Wetlands Defense Fund. I want to talk a little
20 bit about habitat and wildlife. I haven't really been
21 to this board more than a couple of times, partly
22 because when we were fighting the (inaudible)
23 development, we found out that the fresh water marsh

May 3 MS4workshop

24 there was going to be double counted by this agency for
25 both mitigation for water quality and habitat.

0034

1 And when I learned that your regulations are
2 different than some of the other water boards in the
3 state like San Francisco where they would never do that,
4 I thought, you know, it seems like this board just deals
5 with human health and not with wildlife; so I just kind
6 of steered clear. And not that human health is not
7 important. It's very, very important. But the wildlife
8 habitat is important too.

9 After two years of trying to educate people and
10 appeal to agencies about permits you and others approved
11 for the Malibu Lagoon project, a very misguided, extreme
12 engineering overhaul of one of the few naturally
13 functioning coastal wetlands in Southern California, a
14 regime that has tidal waters closing to the lagoon only
15 half of the year allowing thriving endangered tide water
16 gobies and many other species that depend on less saline
17 environment, a slow still movement of water, which is
18 what the tide water goby needs according to fish and
19 wildlife service endangered species regulations, I
20 decided we have to come back here because this project
21 is proposed to begin June 1st. And when I read the TMDL
22 regulations that the EPA gave you all in a memo, it said
23 that if the bacteria counts were found to be from
24 something natural other than human sources, that your
25 standards need to be reviewed again and redone. And

0035

1 guess what? That's what the city of Malibu and the U.S.
2 Geological survey has now found. They've now done DNA
3 analysis on the bacteria that was not able to be done
4 five years ago, and that DNA says that it is now by
5 Lawrence Berkeley Laboratories, it's shown that it's
6 from natural recurring regenerative bacteria. It's not
7 from humans. Now, it was 15 years ago.

8 But the Clean Water Act is working. It's because
9 some of the things that you have done like the tapia
10 rerouting that you now do not allow them to and you are
11 enforcing that Tapia is not allowed to discharge their
12 extra nutrients and extra bacteria during the seven
13 months of the year.

14 And you've also required a lot of the businesses
15 and residents in the area to upgrade their waste water
16 -- on site waste water treatment systems. The Clean
17 Water Act's working and so we need to have you relook at
18 this permit.

19 We would ask that Tom Hayden, who represented this
20 area for 18 years, just issued a statement this week
21 saying that we really need to look at this. The bond
22 money is not being used for the grant purposes that the
23 state water board gave it for; that there are a number
24 of misrepresentations in those applications and that
25 this all needs to be relooked at.

0036

1 So I would urge you to take that permit and ask
2 them to put this project on hold until we can make sure
3 that the habitat is protected as well. Thank you.

4 MR. STRINGER: Thank you very much. I have one
5 more card, Jessie, and I'm going to mispronounce the
6 last name, Turillo? Mr. Turillo, what agenda item are
7 you --

8 MR. TURILLO: Heal the Bay and the disposal of the

May 3 MS4workshop

9 waste to the Oceans.
 10 MR. STRINGER: Is that on the workshop?
 11 MR. UNGER: I think you want to speak on item 19,
 12 which is the MS-4 permit workshop.
 13 MS. STRINGER: We're holding that until after the
 14 workshop.
 15 MR. TURILLO: Sorry.
 16 MR. UNGER: Let me take your card.
 17 MR. STRINGER: We'll put this in the post workshop
 18 file if that's okay.
 19 MR. TURILLO: Okay.
 20 MR. STRINGER: Okay. Thank you.
 21 MS. MOFFETT: We have one more speaker.
 22 MR. STRINGER: For public comment? Okay. That's
 23 fine.
 24 MR. DUNN: Thank you.
 25 MR. STRINGER: Please introduce yourself.

0037

1 MR. DUNN: Thank you, board members, for this
 2 opportunity to speak to you. My name is Steven Dunn.
 3 And I'm not affiliated with any organization or agency.
 4 I have surfed in Malibu for over 50 years, and I know
 5 that the last 10 years the water quality was much worse
 6 than it is today.
 7 The discharge from this Malibu Lagoon construction
 8 project needs to be revised for the protection of the
 9 surfers and the general public. The discharge pipe to
 10 the open ocean that needed testing or monitoring is
 11 being conducted with regard to this project. This could
 12 pose a serious health hazard to the public. We ask the
 13 board to amend this waste discharge permit. Thank you.
 14 MR. STRINGER: Thank you. I believe there was one
 15 more. Just make sure you put speaker cards in for the
 16 record.
 17 MS. WERNER: We did. I don't know what happened.
 18 Members of the board, thank you. My name is Wendi
 19 Werner, and I have actively followed the water quality
 20 issues related to Malibu mainly because my husband is a
 21 surfer and I am a beach goer.
 22 Many of us are concerned with the current proposed
 23 waste discharge permit of the Malibu Lagoon construction
 24 project. We respectfully request that the executive
 25 officer works with the city -- with the Malibu city

0038

1 manager in revising the waste discharge permit that was
 2 issued in 2008 to be more protective to the surfers,
 3 swimmers, and beach goers.
 4 Currently the City of Malibu is requesting a stay
 5 of the project until more protective measures and new
 6 science can be reviewed with regard to public safety. I
 7 have handed you the letter of requested conditions
 8 pertaining to water quality and monitoring and the
 9 responses from state parks and ask you to review it. We
 10 have a narrow window of opportunity to amend the waste
 11 discharge permit as the project is less than 30 days
 12 out.
 13 Busloads of children will be brought to Malibu
 14 beach this year. It is one of the busiest beaches in
 15 the world. And from that discharge pipe to the open
 16 ocean that water from 1.3 million gallons a day that is
 17 going to be discharged into the open ocean is not being
 18 tested or monitored, and we are asking the board and the
 19 executive director to please meet with the city manager,

May 3 MS4workshop

20 discuss revising and updating this permit. It's very
21 important to all of us. We understand that water
22 quality issues have been amended. The water is much
23 better and we just ask to have this looked at. Thank
24 you very much.

25 MR. STRINGER: Thank you. I see that Fran

0039

1 Spivy-Weber is now in the house. Did you want to say
2 something, Sam?

3 MR. UNGER: I want to make sure we receive a copy
4 of the letter that you received.

5 MR. STRINGER: Yes. We have it. Thank you very
6 much for your comments. Maria has a question.

7 MS. CAMACHO: Sorry. Sam, can you explain what the
8 status is of this discussion with the city if there's
9 anything going on.

10 MR. UNGER: Not very clearly. Actually without
11 context by the speakers, I surmise that it's about a
12 lagoon restoration project. I'll have to read this
13 letter in detail to educate myself about the discharge.
14 It so happens though that I speak with the city manager
15 and will be meeting with him as we meet the new city
16 council people either this week or the week after. So
17 I'll take a look at this letter. I'll bring it up with
18 him and I'll report to you next time.

19 MR. STRINGER: Thank you, Sam.

20 MS. CAMACHO: Thank you very much.

21 MR. STRINGER: Okay. We're going to circle back to
22 the update from the state board now that Fran
23 Spivy-Weber is here. Fran?

24 MS. SPIVY-WEBER: Sorry to be late.

25 MR. STRINGER: No problem.

0040

1 MS. SPIVY-WEBER: I will be very brief in my
2 remarks. One is the budget situation is still not good,
3 and the receipts from our April taxes haven't been at
4 the height that we expected and so the budget in general
5 will be given a very detailed look over. I don't think
6 it will affect the water boards too much. Probably
7 there will be some effect but not too much because we
8 are so reliant now on fees and so that may be the good
9 news/bad news situation.

10 There is going to be a -- I don't see Maria here,
11 but there is going to be a chair (inaudible) on Monday.
12 And if she's not here, Charlie, if you could join.

13 MR. STRINGER: Right.

14 MS. SPIVY-WEBER: We will be discussing the WQCC,
15 the water Quality Coordinating Committee, which involves
16 all of you will be meeting on the first and second of
17 November. That's a Thursday Friday; so be sure to put
18 that in your calendar. And we're considering a tour of
19 the Delta as a component of that meeting. I'm not sure
20 if it will be before or during or after. But that is
21 something that we're going to be looking at because
22 several people mentioned it.

23 Also, I wanted to make sure that you know that at
24 the request of Madelyn there will be an infrastructure
25 funding fair in Los Angeles. It will be on June 12 at

0041

1 the L.A. County Department of Public Works, Conference
2 Room A. The check in is from 9:00 to 9:30.
3 Presentations on the funding that is available from
4 federal and state agencies will be presented between

May 3 MS4workshop

5 9:30 and 11:45. And then for those stakeholders who
6 have requests, they can get one-on-one counseling as to
7 exactly what to do and how best to go about getting
8 funding from the various pots of money that are
9 available in the afternoon.

10 So we have these every year. A year ago we did one
11 in Los Angeles. This year we were doing one in San
12 Diego and in Riverside. And Madelyn looked at the list,
13 and she said, "My goodness. We have to have one in
14 L.A." So we do. And thank you, Madelyn. That was a
15 good catch. And we will definitely do it.

16 We adopted at the state board level on Tuesday the
17 low threat underground storage tank policy. It has to
18 go through the normal channels, but I expect that it
19 will be on the implementation phase very quickly because
20 there's been some work done on that prior to the
21 adoption. So that has been done, and it should be a
22 relief both to the regional boards as well as to the
23 state board.

24 And a redirection of funding is not a cost cutting
25 measure. We have the money, but we will be focussing

0042

1 that money on areas that we are sure really need the
2 money and are the highest threats to public health.

3 We had a hearing yesterday on the septic policy.
4 We'll be voting on that in June. The comment period
5 closes at noon on Friday. There were folks there from
6 the City of Los Angeles. There were a number of
7 environmental groups from the L.A. area who were talking
8 about it and who have been asked to work with some of
9 the local county public health officials to improve the
10 policy. There is time to do that, and so I am hopeful
11 that the outcome will be something that we can adopt.
12 But it's still in flux and so, if you want to get a
13 report on that in the future, definitely let us know
14 because certainly the staff knows about this as well.

15 And for those of you who are checking the website
16 for the water board, the executive director's report
17 which is posted on the second meeting of every -- of the
18 two board meetings that we have once a month, the
19 executive directors report from the end of April has a
20 long, long, long list of policies and permits that we
21 are working on.

22 We also are working on storm water permits. We
23 have three that are in the works, one that's out in
24 public now, two that are going through final review and
25 will be out within a month or so. And we will be having

0043

1 workshops and hearings on those, and the vote will be
2 probably in September, October, November, possibly
3 August, September, October. But I think it will
4 probably be August, September, October, November.
5 That's for small communities, for Caltrans, and
6 industrial.

7 We'll also be updating the -- making some changes
8 that the courts asked us to make in the construction
9 storm water permit. We will be removing the numeric
10 effluent limits because the courts told us we had to.
11 So that's it for my report and glad to see all of you
12 here today.

13 MR. STRINGER: Great. Thank you, Fran.
14 Any questions for Fran?

15 MR. YEE: The funding fair is on June 12?

May 3 MS4workshop

16 MS. SPIVY-WEBER: June 12 and check in is between
17 9:00 and 9:30. This is a very, very popular activity in
18 these funding poor days; so encourage your networks to
19 pay attention if they are looking for money. New things
20 are coming up all the time. So if they went to the
21 funding fair last year, they should go this year because
22 there is new money.

23 MR. STRINGER: Thank you.

24 MS. GLICKFIELD: I also asked Sam if he would post
25 this on our web site and notify -- I guess almost

0044

1 everybody who cares is here today, but just the same,
2 notify all the stakeholders who might be eligible for
3 this funding.

4 MR. STRINGER: Thank you. Next we move to
5 uncontested items.

6 MR. UNGER: The uncontested calendars is item 8,
7 10, 11, 12, 13, 14, 15, 16, and 17. Item No. 9 will be
8 continued to a future meeting.

9 MS. LUTZ: I move 8, 10, 11, 12, 13, 14, 15, 16,
10 17, approval.

11 MR. YEE: Second.

12 MR. STRINGER: All those in favor?

13 MS. MUNOZ: Aye.

14 MS. GLICKFIELD: Aye.

15 MS. DIAMOND: Aye.

16 MR. STRINGER: Motion carries. The next item on
17 our agenda is the workshop and the issuance of the new
18 L.A. County separate storm sewer system otherwise known
19 as MS-4.

20 we'll begin today's workshop with staff presenting
21 it's current working proposal on provisions related to
22 receiving water limitations, TMDL's, and watershed
23 management program. Then we'll have comments from
24 permittees and interested persons on working proposals
25 which will be subject to time limits. Some speakers and

0045

1 commentators we've agreed to give extended time to to
2 make sure we have the benefit of their deeper thinking
3 on the issues.

4 If board members want to make statements and/or
5 have questions on anything that they're hearing, I ask
6 that they hold those to the end just to keep things
7 organized and moving along.

8 And I just want to remind the board and everyone
9 present that although quorum is present, this is not a
10 hearing and we are here to hear from you all and further
11 educate ourselves on what we know will be a significant
12 decision we'll be making later this year. So we will
13 not be taking any action today. Thank you.

14 Sam? One further item just for the record, Mary
15 Ann Lutz has left the room for the workshop because
16 she's recused from participating in this particular
17 decision that the board is preparing to make.

18 MR. UNGER: Before I turn it over to Renee, I would
19 like to -- as we open this workshop, I would just like
20 to provide a brief summary of where we have been and
21 where we are now with the development of the reissued
22 MS-4 permit. Some of this is for the benefit of our
23 newer board members as well, and I hope it's useful.

24 It was nearly one year ago today that staff
25 announced that it was undertaking the reissuance of the

0046

May 3 MS4workshop

1 Los Angeles County MS-4 permit. Since that time work
2 staff has met with stakeholders many, many times and
3 we've held staff workshops to understand stakeholder
4 concerns and we've held three workshops before the
5 board.

6 As you well know by now, the existing permit was
7 issue in 2001 and our understanding of storm water and
8 urban runoff discharges through the MS-4 has greatly
9 improved over the last decade.

10 The first workshop that we held before the board
11 was last November. Staff had been working on the permit
12 for several months at that time, and there were some key
13 decisions that had to be made in terms of the
14 permit structure.

15 Initially staff was challenged by the basic
16 structure of the permit in which 84 cities, the county,
17 and county flood control district were noted as
18 permittees and the flood control district notes as a
19 principal permittee.

20 We informed the board at that time that we received
21 ROWD's, reports of waste discharge, which essentially
22 served as permit applications from some of the
23 municipalities and from the flood control district.

24 At the workshop in November staff presented the
25 board a survey that was conducted of the permittees as

0047

1 to different options for permit structures and their
2 preferences. The majority of the permittees favored
3 single permit as it provided equity and fairness and a
4 strong preference for recognizing the advantages that a
5 watershed approach could provide to storm water
6 management. There was also recognition that there were
7 a number of TMDL's that had to be incorporated into the
8 permit.

9 So what I have before you on the slide here is
10 basically the outline of the 2001 permit, the permit
11 that's currently in force and we're working with. And
12 because most of the issues that we've been dealing with
13 over the past several months fall into these areas of
14 the permit, discharge prohibitions which have a lot to
15 do with some of the dry weather discharges that are
16 prohibited from entering the MS-4 system, the receiving
17 water limitations, a section which is controversial, as
18 you know. There are special provisions and a special
19 provisions section is now -- we refer to that and you
20 folks refer to that as the minimum control measures.
21 They include areas of public participation --
22 requirements for the permittees to engage in
23 participation, to inspect and regulate the commercial
24 facilities within their jurisdictions, requirements for
25 development planning within the jurisdictions and

0048

1 development construction within the jurisdictions.
2 There's public agency activities such as cleaning storm
3 drains and cleaning catch basins and maintaining the
4 storm with the MS-4 system, and finally under what is
5 the special provisions there's a program or requirement
6 for illicit connections and illicit discharges.

7 The permittees have been carrying out these
8 activities under the existing permit. And as we
9 discussed, one of the more contentious issues deals with
10 development planning and low impact development
11 requirements. We have discussed that at an earlier

May 3 MS4workshop

12 workshop.

13 So with this I want to just go through what we've
14 accomplished over the past several months. And the next
15 slide, please, Alex. What I have didn't come out in
16 color as well as I'd wanted it. But essentially what we
17 discussed in the March workshop were the minimum control
18 measures. So you see that in red in the special
19 provisions and the monitoring requirements.

20 Again, the minimum control measures that we were
21 talking about are based on existing permits and existing
22 permits that this board adopted in Ventura except for
23 the area of development planning and the low impact
24 development. There is some differences there. The
25 permittees have been carrying out these activities under

0049

1 the existing permit.

2 And we also talk a bit about monitoring. The
3 current permit requires monitoring of receiving waters
4 and tributaries. In monitoring we discussed with you in
5 March several issues. The first two incorporate the
6 TMDL monitoring into this permit and the second being
7 the need for outfall monitoring. And just as a
8 reminder, outfall monitoring was included in the Ventura
9 MS-4 permit.

10 The April workshop which -- next slide, please.
11 Different color just to indicate to you which items in
12 the permit we talked about in April, we furthered our
13 discussion of the minimum control measure and special
14 provisions because, as you know, again, that's a large
15 part of the activities of the jurisdictions are
16 currently undertaking, the permittees are currently
17 undertaking. We also introduced the concept of
18 discharge prohibitions. And some of these flows, as we
19 reported to you, naturally occur and come from urban
20 operations. Over the past 10 years there have been a
21 number of BMP's that have come on line that can possibly
22 mitigate the effect of these discharges. And we've been
23 meeting, as you last saw in the workshop in April, with
24 the fire fight community and the municipal water
25 community to generate the proposed language that we are

0050

1 now working with in our proposed documents.

2 We also started discussions with WQBELs, water
3 quality based effluent limits, and again there is some
4 controversy on this issue and about whether they can be
5 expressed as BMP's or numeric levels, and you've seen
6 how we have addressed that in our proposed document.

7 So this brings us to today, the workshop today.
8 And today we're discussing receding water limitations.
9 So that brings us to essentially the point which I'm
10 trying to make is that we've discussed all of the major
11 areas of the permit but what you had in your working
12 proposals is two other areas in green that we've added
13 which essentially updates the permit in terms of the
14 TMDL's that this board has adopted over the past 10
15 years and our greater understanding of storm water
16 quality management.

17 And so what you see there, we're talking today we
18 have proposals for receiving water limitations, TMDL
19 provisions which are quite lengthy. But because there
20 are so many TMDL's we describe how we're going to be
21 managing the requirements of those TMDL's through this
22 permit and finally the watershed management provisions

May 3 MS4workshop

23 which is essentially a whole new section in this permit.

24 There may be other regions that are taking this
25 approach. We think we're one of the first ones, if not

0051

1 the first region to be headed down a watershed
2 management approach in this permit.

3 So the point I'm getting to before I turn it over
4 to Renee now is that we've work shopped essentially all
5 the major issues of this permit. The board has had an
6 opportunity to see what staff is thinking and proposing
7 at this point. We've had discussions, and we look
8 forward to receiving your input as well as input from
9 the regulated community and other stakeholders in
10 today's workshop.

11 MR. STRINGER: Sam, just a question for point of
12 clarification.

13 MS. GLICKFIELD: I just wanted to ask whether or
14 not this is a really good overview of where we are. Is
15 this a completely new permit or is this a rewrite of the
16 prior permits?

17 MR. UNGER: Well, that's --

18 MS. GLICKFIELD: Maybe you don't have the answer.

19 MR. UNGER: I would say the answer is yes. It's
20 both. I mean certainly what you saw, if you can go back
21 to the last slide, certainly the watershed management is
22 entirely a whole cloth rewrite. The TMDL's is whole
23 cloth rewrite. We have a little bit of input from our
24 Ventura permit because we dealt with TMDL's in that as
25 well. But other than that, those are essentially new

0052

1 provisions and whole new sections of the permit.

2 The other is based largely on what is in place or
3 at least you can use that as a framework for
4 understanding the requirement under the special
5 provisions definitions, things like that.

6 MS. GLICKFIELD: So we shouldn't assume that
7 everything in here is new.

8 MR. UNGER: Today you should assume that. There
9 are receiving water limitations in the existing permit;
10 so I would certainly say the TMDL provisions and the
11 watershed provisions today are new in terms of this
12 permit. So with that I'd like to turn it over to the
13 person that's done most of this work.

14 MS. CAMACHO: Sam, I just want to thank you. That
15 was really helpful to go through that.

16 MS. PURDY: Good morning. My name is Renee Purdy,
17 and I'm the chief of the regional program section. And
18 it was a helpful overview for me too just to remind me
19 of what all we've done so far. I do want to say that I
20 haven't done nearly all of the work. I've had a
21 fantastic team of people working with me on this
22 certainly starting with Sam and Deb and also our
23 attorneys Jennifer and Frances and also Ira Ridgeway who
24 is the unit chief of the storm water permit unit as well
25 as Rebecca and Nick who have been -- they're in the

0053

1 storm water permitting unit and they've been helping on
2 the incorporation of the TMDL provisions; so I can't
3 take nearly all the credit for this. It's been a
4 really, really fantastic team effort not only with those
5 of us at the regional board and with your support but
6 also in the many meetings that we've had with permittees
7 and with other stakeholders over the last year. So a

May 3 MS4workshop

8 lot of work has happened, and it's been the result of a
9 lot of support from everybody. So I just want to start
10 out with that.

11 Today's workshop, as Sam mentioned to you, is the
12 third board workshop that we've had on this and it's
13 actually the seventh workshop that we've had in the past
14 year, a little less than a year actually. The first one
15 was back on May 25, I believe, if I'm recalling
16 correctly. That was the kickoff workshop that we had on
17 the development of the permit.

18 As with the last board workshop in April, as Sam
19 said, in preparation for this workshop staff distributed
20 to permittees and interested stakeholders and you also
21 have copies of working proposals for the three sections
22 of the permit that we're going to be talking about
23 today.

24 And we've done this, the two working proposals that
25 we issued before and the three that we've issued prior

0054

1 to this workshop in hopes that this will really help
2 facilitate a very thoughtful and detailed and productive
3 discussion about these parts of the permit prior to us
4 putting out the tentative order.

5 These working proposals do represent our current
6 staff thinking based on our internal deliberations as
7 well as much input received from previous workshops and
8 one-on-one meetings with lots of permittees as well as
9 environmental organizations over the past six months.

10 And today I just want to let you know that we're
11 here to listen to all public comments as well as your
12 input and will consider all of this prior to issuing the
13 tentative permit which right now we're hoping to do by
14 the end of this month.

15 Based on the input that we received from the
16 previous two work proposals, we definitely think this
17 has been a valuable process and I think it's going to
18 allow us to resolve a number of issues prior to us
19 issuing the tentative order.

20 So today we're going to be discussing, as Sam said,
21 three what are actually very inner related, closely
22 inner related sections of the permit. And, therefore,
23 we're not going to divide the permit up -- or the
24 workshop up as we've done in the past. I'm just going
25 to cover all the topics at once and then we'll have

0055

1 public comments on all of those because they are so
2 closely related. We believe that's going to be the best
3 way to get a full picture of how these sections work
4 together.

5 So this is a little bit similar to a slide that Sam
6 just showed you. And I apologize. It's a little bit on
7 the light side. I don't know if it would be helpful to
8 dim the lights at all. I don't know if it's possible.

9 I showed you this last slide at the April board
10 workshop, and this is basically a simple outline of the
11 developing permit. And for those of you that are
12 familiar with the numbering in the current permit, on
13 the right-hand side, I'll show you here, is the
14 numbering that's used in current permit and then on the
15 left-hand side is the current new numbering of the
16 permit.

17 And as you recall, as, again, Sam gave me a good
18 introduction, but during the April board workshop we

May 3 MS4workshop

19 discussed working proposals for permit provisions
20 introducing nonstorm water discharges through the MS-4
21 and the six so-called minimum control measures. And
22 those have historically made up the permittees'
23 basically core or baseline storm water management
24 program which we've referred to as the SWMP.

25 These parts of permit are shown in kind of the gray

0056

1 or beige color on the slide, and today we're going to be
2 discussing the parts of the permit that are on the slide
3 in orange including the TMDL provisions which also
4 includes water quality based effluent limitations, or
5 WQBELs, to implement those TMDL wasteload allocations,
6 the receiving water limitation provisions, as well as
7 the watershed management program provisions.

8 We have discussed some of these topics before, as
9 Sam mentioned to you. You might recall, for example,
10 during March when we had a workshop, it was actually a
11 staff level workshop immediately following the board
12 meeting, and we discussed WQBELs and what those are and
13 how we use those in the permit. I'll touch on that a
14 little bit today just as a reminder.

15 During last month's workshop I introduced the
16 concept of watershed management programs as a way of
17 integrating many of the permit provisions. And so today
18 we're going to talk about those in much more detail and
19 how they can be an effective way of meeting the
20 requirements of this permit.

21 So because the watershed management programs are
22 intended to be integrative, I'm going to actually begin
23 with them even though they don't really fall in that
24 order on the outline that I just showed you.

25 Next I'm going to discuss the TMDL provisions

0057

1 including the inclusion of numeric water quality based
2 effluent limitations and receiving water limitations
3 based on available TMDL wasteload allocations, and I'll
4 walk through the various means of determining compliance
5 with these WQBELs under different circumstances
6 including distinctions between how we are going to
7 propose to allow compliance determination for interim
8 water quality based effluent limitations and water
9 quality based effluent limitations as well as how
10 compliance determination can be addressed in situations
11 where discharges commingle within the MS-4 prior to
12 discharge to the receiving water.

13 I'm also going to discuss staff's working proposal
14 to address EPA established TMDL's that don't include an
15 implementation schedule under state law and to address
16 state adopted TMDL's where in some cases final
17 compliance states have already passed.

18 Finally, I'm going to be discussing staff's working
19 proposal on the receiving water limitation provisions of
20 the permit.

21 So before I go on, there are two terms that I'm
22 going to be using a lot today and I'm guessing that many
23 of the public comments you will be hearing will use
24 these terms a lot too. And I apologize. These aren't
25 in the printed copy of the slides that you have before

0058

1 you.

2 There are two terms I wanted to define before we go
3 on. One is water quality based effluent limitation, and

May 3 MS4workshop

4 I did define this in a previous workshop. But, again,
5 just for clarity, that is a restriction on the quantity
6 or concentration of a pollutant that may be discharged
7 that's necessary to achieve a water quality standard.
8 And by definition, a water quality based effluent
9 limitation must be set at a level that will achieve the
10 applicable water quality standard in the receiving
11 water.

12 The other term that I want to define for you before
13 I go on is receiving water limitation. And this is also
14 included as a footnote in your packet. I think it's
15 section 19-3, and it's on the first page, footnote one,
16 that provides a definition of receiving water
17 limitation. It's any applicable numeric or narrative
18 water quality standard or limitation to implement the
19 applicable water quality standard that applies to the
20 receiving water in question.

21 And I take the time to do that because I'm going to
22 be saying those terms more times than I can count today.
23 So I thought it would be good to define them up front
24 and make sure everybody understands what those terms
25 mean.

0059

1 So next what I'd like to do is turn to the
2 watershed management programs specifically in those
3 provisions that are in the working proposal. The
4 purpose of the watershed management programs is to
5 provide a framework for permittees to work
6 collaboratively to implement individual as well as
7 collective best management practices and other types of
8 watershed control measures to address the highest
9 watershed priorities.

10 The watershed management programs are intended to
11 provide permittees with flexibility to customize some of
12 the core permit requirements as I discussed at the last
13 board workshop we had and sequence some of the
14 implementation actions to reduce pollutants in MS-4
15 discharges in the most effective way possible while
16 achieving these water quality based effluent limitations
17 and receiving water limitations that I just defined.

18 Staff intends for these watershed management
19 programs to be focussed in large part on pollutant
20 control strategies that will be necessary to achieve
21 TMDL's and those that may be necessary to address
22 persistent exceedances of receiving water limitations
23 that might not be covered by a TMDL at this point.

24 This is another slide that I showed you at the last
25 workshop which illustrates how staff intends for these

0060

1 watershed management programs to serve as the integrated
2 framework for the various individual parts of the
3 permit.

4 And what's noteworthy here is that there will be
5 significant overlap in the strategies, the control
6 measures, the BMP's that are implemented in each of the
7 four major areas or parts of the permit shown on the
8 slide. These are not completely distinct additive
9 requirements. There will be a lot of overlap and
10 commentary among these.

11 For example, controls to address non storm water
12 discharges through the MS-4, which we've talked about
13 previously, will in many cases be the very same controls
14 that are needed to achieve dry weather wasteload

May 3 MS4workshop

15 allocations from TMDL's that we have in effect for Los
16 Angeles County.

17 Similarly, measures to eliminate exceedances of
18 water quality standards that are not currently addressed
19 by a TMDL will often fall within one of the categories
20 of the minimum control measures which we've also
21 discussed at previous workshops, and it may be that
22 these measures just need to be enhanced in a certain
23 geographical area or focused on a certain pollutant
24 source.

25 And we actually have some examples of situations

0061

1 where customization has already been happening through
2 the implementation of TMDL implementation plans.

3 For example, in some of the south bay cities of
4 Santa Monica Bay they've been implementing a restaurant
5 education and BMP certification program to address
6 pollutants specifically from commercial restaurant
7 establishments.

8 And one of the things that I just want to say
9 before going on is we think with these watershed
10 management programs where we have examples of this
11 customization already, that these watershed management
12 programs are intended to provide even more flexibility.

13 So next I want to talk about the scope of the
14 watershed management programs. Specifically in the
15 working proposal we've identified the regional water
16 board seven watershed areas within the Los Angeles
17 County as the recommended geographic areas of focus.

18 These are the same watershed areas that staff has
19 used in the development of the TMDL's for Los Angeles
20 County and, therefore, they provide a good geographical
21 scope for watershed management programs and control
22 measures to address those TMDL requirements.

23 However, I do want to note that we are proposing to
24 allow flexibility within the scope of the watershed
25 management areas covered by a watershed management

0062

1 program. And in particular I bring this up because, as
2 we all are well aware, there is a county water quality
3 funding initiative that is underway and that we're all
4 hoping passes soon and that watershed management or the
5 water quality funding initiative does have slightly
6 different watershed boundaries. Specifically they break
7 the seven watershed boundaries that we have and we've
8 used in the regional board slightly further than that.

9 For example, there's an upper and lower Los Angeles
10 River. There's an upper and lower San Gabriel River.
11 Santa Monica Bay is further subdivided such that Biona
12 Creek is separated out.

13 So the permit provisions would allow the
14 flexibility to develop a watershed management program on
15 the basis of what the funding initiative refers to as
16 the watershed authority groups or WAGs.

17 Staff strongly encourages permittees to work
18 collaboratively on these watershed management programs
19 as a group to develop and implement the watershed
20 control measures.

21 Some permittees may end up participating in more
22 than one watershed program where their jurisdictions
23 cross watershed management boundaries. In these cases,
24 the watershed management program would include both
25 individual actions taken by individual permittees within

May 3 MS4workshop

0063

1 their jurisdictions as well as actions that could be
2 taken by permittees collectively on a sub watershed or
3 watershed scale.

4 I do want to say while staff does strongly
5 encourage permittees to work collaboratively and as a
6 group on these programs, at present the working proposal
7 does not preclude an individual permittee from
8 developing an individual watershed management program
9 for each watershed within its jurisdiction.

10 I would say, however, that working individually in
11 such a manner would have ramifications on the resources
12 available for planned development, the suitable
13 monitoring approaches if it was just an individual
14 watershed management approach as well as opportunities
15 for collaboration on regional controls.

16 This is just a diagram that I wanted to show you of
17 the seven watershed management areas included in the
18 working proposals. And, again, as I said, these could
19 be further subdivided consistent with the funding
20 initiatives water quality -- excuse me -- WAGs or
21 watershed authority groups.

22 So next I just want to talk about generally what we
23 view as the implementation cycle that would occur in
24 these watershed management programs. At present staff
25 is proposing in the working proposals that thus

0064

1 implementation cycle which includes, first, the planned
2 development itself, then implementation of the plan and
3 during that implementation monitoring of the plan and
4 then an assessment of the effectiveness of the results
5 and then revisions to the program based on that
6 monitoring assessment would be completed twice during
7 the permit term at approximately 18-month intervals.

8 I'll go over this a little bit more on this next
9 slide. And this is on page 19-2 of your board agenda
10 package. So if you'd like to see a somewhat clearer
11 version of this table, it's just copied from your agenda
12 package.

13 It provides the timeline for the development,
14 implementation, and evaluation and revision of the
15 watershed management program. First, staff is proposing
16 that permittees must notify the board of their intent to
17 pursue a watershed management program within six months
18 of permit adoption.

19 And this is included because whether or not a
20 permittee chooses to pursue a watershed management
21 program may have some ramifications for implementation
22 timeframes for other permit provisions. So if they
23 choose to just follow the default permit provisions,
24 they won't need the additional time that it takes to
25 develop the watershed management plan.

0065

1 Staff understands that plan development, this
2 particularly, watershed plan development may take
3 sometime particularly in the case where multiple
4 permittees are working together collaboratively to
5 develop one watershed management program.

6 Though staff also recognizes that in many cases a
7 foundation for these watershed management programs has
8 already been laid through the development of some TMDL
9 implementation plans.

10 So balancing these two things staff has proposed to

May 3 MS4workshop

11 provide permittees with one year from the date of permit
12 adoption for permittees to submit a draft watershed
13 management plan to the regional board.

14 Plans would be subject to executive officer review
15 and approval, and then staff proposes that permittees
16 would submit a final plan within three months of
17 receiving comments from the executive officer on the
18 plan.

19 Implementation would begin immediately upon
20 submittal of the final plan to the regional board, and
21 this likely would occur about one and a half years into
22 the permit term or around March 2014.

23 The first assessment would occur approximately
24 three years into the permit term, and then the second
25 would occur basically as part of the ROWD or report of

0066

1 waste discharge process about four and a half years into
2 the permit term.

3 And we propose the somewhat extended reporting
4 cycle. Typically the permit in the past has had an
5 annual reporting cycle. We're proposing a slightly
6 longer timeframe to report on the effectiveness of the
7 watershed management programs because of the
8 coordination and the effort that it will take to really
9 do a very comprehensive evaluation of how effective the
10 program is.

11 Next I want to describe some of the steps in
12 developing the watershed management program plan, and I
13 won't go into these in a huge amount of detail because
14 you've seen them in your working proposal.

15 But generally these include the identification of
16 watershed priorities and then the selection of watershed
17 control measures to address those watershed priorities.
18 And then one thing that I have talked about previously
19 is a reasonable assurance analysis that would
20 demonstrate that the watershed control measures that are
21 selected and included in the watershed management
22 program are likely to achieve the water quality based
23 effluent limits and receiving water limitations required
24 by the TMDL's.

25 So with regard to the identification of the water

0067

1 quality priorities, as I said earlier, we expect that
2 the drivers for these watershed management programs will
3 primarily be TMDL's and TMDL requirements. We have a
4 number of TMDL's, as you all well know, within the
5 region and those in large part will drive watershed
6 control measures that will be undertaken as part of
7 these programs.

8 These we consider to be the highest priority water
9 quality issues that should be addressed in the watershed
10 management program, and we're referring to these as
11 category one.

12 Another priority area which I mentioned earlier
13 would be water bodies that have persistent exceedances
14 of water quality standards that are not yet covered by a
15 TMDL, and right now I'm referring to these in the
16 working proposal as category two.

17 So after identifying these water quality
18 priorities, the next step in the planned development
19 would be to conduct a source assessment to identify
20 potential sources of pollutants to the MS-4 that might
21 be causing or contributing to the water quality problems

May 3 MS4workshop

22 that were identified in these category one and two water
23 body pollutant combinations.

24 Staff expects that this source assessment would
25 include a review of available data from a number of

0068

1 sources. One key source would be each individual
2 permittee storm water management program and then in
3 particular there's a lot of information that permittees
4 have gathered on an individual jurisdictional basis from
5 programs such as their illicit detection, detection and
6 elimination program, the commercial industrial
7 facilities inspection program, the development
8 construction program, as well as their own public agency
9 activities program in terms of where some of these
10 pollutant sources are occurring within their
11 jurisdictions.

12 Additionally, with each TMDL that's developed we do
13 a TMDL source analysis, and that's another potential
14 source of information for permittees to look to to do
15 this source analysis.

16 Also watershed modeling is another tool that can be
17 used in a number, and a number of the permittees have
18 developed very detailed watershed models that can be
19 used to identify priority areas with regard to pollutant
20 loading.

21 And finally, of course, the results of the
22 monitoring program, those that the permittees have
23 conducted as well as any other monitoring program data
24 that are available.

25 The other part of the source assessment -- and this

0069

1 is also consistent with other requirements within some
2 of the minimum control measures -- would be to ensure
3 that all MS-4 outfalls that are discharging to water
4 bodies in categories one and two would be identified as
5 part of that source assessment.

6 So based on the water quality priorities, the water
7 body pollutant combinations that have been identified as
8 priorities as well as the source assessment, there would
9 then be a final prioritization of where the
10 jurisdiction's efforts and the watershed permittee's
11 efforts would be directed.

12 And, of course, the first priority would be to
13 address TMDL's and the water quality based effluent
14 limits and receiving water limitations that in
15 particular have interim or final compliance deadlines
16 within the coming permit term; so basically compliance
17 deadlines from 2012 until 2017.

18 The second priority would be to begin addressing
19 water quality based effluent limitations and receiving
20 water limitations that have compliance deadlines that
21 are going to be falling within the next permit term.

22 And then next would be addressing other receiving
23 water considerations. And this would be, as I mentioned
24 before, some of those potentially persistent exceedances
25 of standards that aren't yet covered by a TMDL. Because

0070

1 we have so many TMDL's in this region, I think this is
2 not going to be a large category of waters.

3 Based on this prioritization, the next step and
4 really the key here is the selection of the watershed
5 control measures. And the objectives of these watershed
6 control measures is, as I mentioned before, we're trying

May 3 MS4workshop

7 to create an efficient and effective program to focus
8 both the individual permittee's resources as well as the
9 collective resources of permittees within a watershed
10 area on the highest priorities.

11 And, again, it would be focused on those categories
12 one and two that I mentioned earlier. And specifically
13 we'd be looking for control measures that are, one,
14 going to address nonstorm water discharges that are
15 coming through the MS-4.

16 As I mentioned in a previous workshop, we do have a
17 lot of exceedances of dry weather -- of water quality
18 standards during dry weather and a lot of dry weather
19 wasteload allocations that would need to be implemented.

20 It would also be focused on implementing controls
21 to achieve interim and final effluent limitations and
22 receiving water limitations that have deadlines in this
23 permit term and then, related to the receiving water
24 limitations, to ensure that MS-4 discharges do not cause
25 or contribute to exceedances of other water quality

0071
1 standards not yet addressed by TMDL's.

2 So I want to just make the linkage now as I did at
3 the last workshop between these watershed management
4 programs and some of the other provisions like the
5 minimum control measures that we've talked about
6 previously because we see that these watershed control
7 measures that would be selected through the development
8 of the plan are in many cases going to be some of those
9 very same provisions that we talked about in the minimum
10 control measures but they might be customized or
11 sequenced in such a way to address watershed priorities.

12 So part of the selection process will be to
13 identify opportunities to focus resources within the
14 minimum control measures on the category one and two
15 areas. The programs still do need to be consistent with
16 what federal regulations say needs to be included in a
17 storm water management program, and so there needs to be
18 some justification for any modifications to the minimum
19 control measures. And there may be some minimum control
20 measures such as the planning and land development that
21 we may not want to see customized or modified too much
22 because those programs are really trying to prevent
23 pollutants from leaving a site, and so I think whatever
24 the watershed priorities are, those are going to be
25 effective programs to continue to include in the

0072
1 watershed management program.

2 The customized actions, once they've been
3 identified, would basically be used in lieu of the core
4 minimum control measures that we've talked about in
5 previous workshops. So they would substitute for those.

6 The other aspect of the permit that we talked about
7 before which could be customized as part of this
8 watershed management program is the non storm water
9 discharge measures, and we talked about those discharge
10 prohibitions where there's a provision both in the Clean
11 Water Act and then corresponding in federal regulations
12 that non storm water discharges through the MS-4 are to
13 be effectively prohibited.

14 So where there are TMDL's with dry weather
15 wasteload allocations and, therefore, in this permit
16 water quality based effluent limitations addressing dry
17 weather discharges through the MS-4, this would be an

May 3 MS4workshop

18 opportunity to customize some of these actions to
19 address those particular priorities.

20 The other part that will be included in these
21 control measures is actions that have been identified in
22 the basin plan amendments adopting TMDL's and then
23 subsequently in TMDL implementation plans that have been
24 developed by permittees to implement the TMDL's.

25 So this is something that I wanted to emphasize

0073

1 because, as I kind of touched on earlier, there has been
2 in many cases groundwork done by many permittees to
3 develop TMDL implementation plans in response to the
4 adoption by this board of TMDL's.

5 And so we expect what will happen with these large
6 management programs is the actions that have been
7 identified through those often pollutant specific TMDL
8 implementation plans will be compiled into one place and
9 will then come under this watershed management program
10 and will be measures that would be implemented through
11 this watershed management program.

12 As I mentioned, again, we expect at a minimum the
13 actions would be included that are necessary to achieve
14 any deadlines within this permit term, but there should
15 also be thought forward to the next permit term about
16 what actions should be taken to ensure that there's
17 adequate progress so that deadlines in the next term
18 will be able to be met.

19 Finally, as I mentioned, the plan development needs
20 to include what we're referring to as a reasonable
21 assurance analysis. I've gone back and forth on what
22 I'm calling this; so I apologize for changing
23 terminology on everybody.

24 But basically the concept here is that there needs
25 to be a quantitative analysis -- it could be done

0074

1 through modeling or other quantitative ways -- that
2 demonstrates that those watershed control measures that
3 I just talked about, TMDL control measures, control
4 measures under the minimum control measure of
5 provisions, nonstorm water measures, that all of those
6 are likely to achieve the applicable water quality based
7 effluent limits during -- that have deadlines within the
8 permit term.

9 So we want to make sure that we have this analysis
10 because, as I've discussed before and I'm going to talk
11 about a little later, staff proposes to allow a
12 compliance with interim effluent limitations using a BMP
13 based or action based approach, but we need to have the
14 assurance that those actions are actually going to have
15 the water quality outcomes that we expect they will
16 have. So that's what this reasonable assurance analysis
17 business is intended to do is provide us with the
18 necessary support that these are the appropriate control
19 measure to be undertaking.

20 So next I'd like to turn to a discussion of the
21 TMDL provisions in the working proposal for the TMDL
22 provisions. Generally what we've done in the working
23 proposal is we have up front, as you've seen, some
24 general provisions that relate to the implementation of
25 water quality based effluents and receiving water

0075

1 limitations to achieve TMDL's, and then what we've done
2 is we've included a number of attachments.

May 3 MS4workshop

3 We have, first of all, a very detailed matrix that
4 indicates which permittees are subject to which TMDL's
5 because there are so many. And then what we have is we
6 have an attachment, one attachment for each watershed
7 management area. And then every TMDL that is within
8 that watershed management area, the provisions to
9 implement that, specifically the numeric water quality
10 based effluent limits and any specific receiving water
11 limitations applicable to that TMDL are included under
12 that attachment.

13 So a permittee can look at that first master
14 matrix, see which TMDL's it's subject to and then go to
15 that attachment and see all of its numeric water quality
16 based effluent limitations and other TMDL provisions
17 that it needs to be following.

18 So the one other thing I did want to point out
19 which I have at the bottom of the slide here is in the
20 general TMDL provisions, for trash TMDL's in particular
21 for those of you that were on the board, you know that
22 we went through a reopener of the L.A. County MS-4
23 permit and we took a lot of time in crafting language to
24 implement the trash TMDL for the L.A. river and because
25 we have taken a lot of time to do that, we are basically

0076

1 using that very same approach to implement all other
2 trash TMDL's within the working proposal before you now.
3 So that language is included up front. So there is
4 consistency with how we've done L.A. river trash, and
5 we're just relying on essentially that same language for
6 the rest. I think there are about 10-- nine other trash
7 TMDL's that are being included in this permit.

8 So before I go on, I do want to talk -- actually,
9 I'm going to back up. I'm not going to go to that next
10 slide yet. I want to talk a little bit about the
11 inclusion of numeric water quality based effluent
12 limitations in the permit. I talked about this before.
13 And, as I mentioned, we were intending to and we have
14 included numeric water quality based effluent
15 limitations to implement TMDL's. That is the only place
16 in the permit right now in the working proposal where we
17 have numeric water quality based effluent limitations to
18 implement the TMDL wasteload allocations.

19 And we've done that because the implementing
20 regulations for the Clean Water Act state that each MPS
21 permit needs to include any requirements in addition to
22 or more stringent than any of the technology based
23 requirements to achieve water quality standards.

24 And more specifically the water quality based
25 effluent limitations are required for discharges where

0077

1 the permitting agency has determined that there's a
2 reasonable potential that that discharge could cause or
3 contribute to an exceedance of standards.

4 In this case, because we have TMDL's and TMDL's are
5 developed because you have an impairment of water
6 quality standards and we've identified that MS-4
7 discharges are one of the sources that are contributing
8 to that, we found that it's necessary to include numeric
9 water quality based effluent limitations in order to
10 achieve water quality standards in this permit.

11 I keep wanting to go on but not quite because I
12 have something else I want to say about this. In the
13 working proposal basically staff has translated all

May 3 MS4workshop

14 available wasteload allocations into either numeric
15 water quality based effluent limitations, actually in
16 allocations into numeric water quality based effluent
17 limitations and then in some cases also into specific
18 receiving water limitations.

19 And this is somewhat -- the latter is somewhat
20 unique to our bacteria TMDL's because in our bacteria
21 TMDL's, as many of you know, we have requirements for an
22 allowable number of exceedance stays of the bacteria
23 standards and that's really a receiving water
24 limitation. It's a limitation that applies in the
25 receiving water.

0078

1 So in the case of bacteria TMDL's, we have both the
2 numeric water quality based effluent limitations which
3 apply to the discharge at the outfall itself as well as
4 these receiving water limitations that apply in the
5 receiving water in terms of the number of allowable
6 exceedance stays that we can have and still be
7 protective of beneficial uses.

8 Now I am going to move onto the next slide which is
9 with regard to how we're proposing to demonstrate
10 compliance with both the interim water quality based
11 effluent limitations and the final, and I want to walk
12 you through each of these.

13 For the interim water quality based effluent
14 limitations, we're basically in the working proposal
15 saying that there are four different ways that
16 permittees can demonstrate compliance with the interim
17 water quality based effluent limitations.

18 The first is to show there's no discharge from the
19 MS-4 outfalls that are subject to the water quality
20 based effluent limitations. The second is to show that
21 those water quality based effluent limitations are met
22 at the outfall. The third is to show that the receiving
23 water limitations are met in the receiving water, for
24 example, the number of allowable exceedance stays is
25 achieved. And the fourth, which is special to the

0079

1 interim water quality based effluent limitations is the
2 action based compliance pathway that I've previously
3 described whereby based on the watershed control
4 measures that were identified in an approved watershed
5 management plan, then permittees instead of showing
6 compliance directly with the numeric effluent
7 limitation, they can document that they have conducted
8 the actions per the schedule that was approved in this
9 watershed management program, and during these interim
10 deadlines they can demonstrate compliance using that
11 action base approach.

12 For the final water quality based effluent
13 limitations the first three options are available in
14 that case, and that is there's no discharge from the
15 outfall, that the discharge meets the water quality
16 based effluent limitations, or that the receiving water
17 limitations are met in the water body.

18 The action based approach we have not provided as
19 an option at the final compliance deadline. And really
20 the reason for that is because with the reasonable
21 assurance analysis that I described previously, there
22 should be -- there's an expectation that the final
23 numeric limitations will be able to be met by those
24 control measures.

May 3 MS4workshop

25 And in order to ensure accountability and that that
0080

1 does happen and water quality standards are achieved, we
2 did not provide that last option. And we feel like it's
3 necessary to just demonstrate at that final deadline
4 that compliance with the final effluent limitations and
5 receiving water limitations is achieved based on looking
6 at monitoring data and comparing that with what the
7 requirements are.

8 One thing I want to talk about briefly before --
9 I'm going to go back to that slide in a minute, but I do
10 want to take a minute to talk about the fact as we all
11 know, because we have 88 permittees and many of the
12 permittees have commingled discharges within the MS-4
13 before they are discharged to the receiving water, I
14 want to talk a little bit about each individual
15 permittee's responsibility as well as collective
16 responsibility when there are commingled discharges.

17 Federal regulation does say each permittee is only
18 responsible for discharges from the MS-4 for which it is
19 the owner or operator.

20 In L.A. we have a difficult situation where,
21 because it's such an urbanized area, we do have
22 situations where there are discharges from multiple
23 permittees that commingle within the system before they
24 reach the receiving water.

25 And so because of this, in many of our TMDL's, the
0081

1 wasteload allocations are assigned jointly to a group of
2 permittees because these discharges do commingle before
3 they're discharged to the receiving water.

4 So where permittees have commingled discharges
5 compliance is determined for the group as a whole unless
6 an individual permittee can demonstrate that it achieved
7 compliance for its discharge individually.

8 This individual demonstration can be done in a
9 couple of ways. First of all, as I mentioned before, a
10 permittee could demonstrate that there was no discharge
11 from its MS-4. So it could look at its jurisdictional
12 boundary and it could basically document that there was
13 not a discharge or there was not a discharge that
14 exceeded the water quality based effluent limitations
15 that came from its jurisdiction. So those are two ways
16 that it could do that.

17 It could also conduct -- and this is somewhat
18 unique to the bacteria standards, but it could conduct a
19 source investigation to basically show that it did not
20 have sources of that pollutant that were coming from
21 that particular part of its MS-4 into the receiving
22 water. So there are a couple ways that an individual
23 permittee can address its individual responsibility.

24 And so when I talk about outfalls -- and outfall
25 traditionally we think of as an outfall to the receiving
0082

1 water. But if a permittee was looking at its individual
2 compliance, that outfall might actually be a location at
3 the permittee's jurisdictional boundary where it could
4 separate its contributions to the MS-4 from that of
5 other permittees.

6 So I just wanted to return to this slide about
7 compliance demonstration and the alternatives. And what
8 I've done here, I've basically just indicated over here
9 whether these different compliance demonstration

May 3 MS4workshop

10 alternatives could be used by an individual permittee or
11 by a group of permittees.

12 If you kind of read the chart from left to right,
13 you can basically see that the first two could be used
14 either by an individual permittee or by a group of
15 permittees. The mechanism by which you would
16 demonstrate compliance in the receiving water would most
17 likely be used by a group of permittees to demonstrate
18 that all the permittees discharging from that outfall
19 were achieving the receiving water limitations.

20 And then the last option for the interim water
21 quality based effluent limitations which is action based
22 obviously could be an individual permittee
23 demonstration.

24 And one of the things that I meant to mention with
25 regard to the watershed management programs and the

0083

1 control measures is one element of the plan, if it is a
2 plan that's developed by multiple permittees, will be a
3 requirement to include what are each permittee's
4 responsibility so it's very clear what the individual
5 roles and responsibilities are in a collective watershed
6 management plan. So when we come to looking at
7 compliance, we know what each permittee has done and
8 whether they've met their obligations under the plan.

9 The next thing that I want to talk about is
10 compliance schedules. And specifically what we've done
11 in the working proposal is the compliance schedules that
12 we have included for TMDL's are equivalent to the TMDL
13 implementation schedules that were adopted as part of
14 the TMDL itself in the case of state adopted TMDL's.

15 So when you adopt a TMDL, you adopt some numbers in
16 terms of wasteload allocations but you're also adopting
17 a limitation schedule to come into compliance with those
18 numbers understanding that that's going to take
19 sometime.

20 So in the case where we do have a state adopted
21 TMDL with an implementation schedule, we have included
22 schedules that are consistent with that.

23 The other two situations that we have are, first of
24 all, some cases where the compliance deadlines have
25 already passed as well as some cases where we have EPA

0084

1 established compliant or -- excuse me -- TMDL's that
2 don't have implementation schedules in them.

3 We have thought long and hard about these two
4 situations and what we should do when we don't currently
5 have the authority to include compliance schedules
6 within the permit itself in these latter two cases.

7 And as I said, one of these is EPA established
8 TMDL's, and that's because EPA established TMDL's do not
9 have implementation plans or schedules adopted as part
10 of them. EPA doesn't have that authority and,
11 therefore, we don't have a schedule within our state
12 water quality regulations that we can then carry over
13 into the permit.

14 And then the second case, as I mentioned, is the
15 fact that we do have some TMDL's for which final
16 compliance states have passed. These are at this point
17 primarily related to some of our bacteria TMDL's and
18 particularly to some of the dry weather wasteload
19 allocations requirements of those TMDL's.

20 In the case of those, the latter where we have

May 3 MS4workshop

21 deadlines that have passed, basically because those
22 schedules are in the basin plan amendment, right now the
23 regional board doesn't have the ability to extend those
24 deadlines because those are part of our water quality
25 regulation and, therefore, the permit needs to be

0085

1 consistent with those implementation schedules that are
2 included in the basin plan.

3 So what we've done is we've looked for tools that
4 we've had. We've consulted with our attorneys about
5 this, and we've identified the time schedule orders are
6 an appropriate tool potentially in either one of these
7 situations where appropriate.

8 What we could do with a time schedule order is
9 basically provide additional time, and particularly in
10 the case of TMDL's we have a number of EPA TMDL's that
11 have just been adopted by EPA in the last few months,
12 actually in the end of March.

13 We have four new EPA established TMDL's where
14 immediate compliance with the wasteload allocations in
15 those TMDL's would be in most cases very difficult to
16 achieve. And so a time schedule order provides us with
17 a way of giving permittees time to come into compliance
18 with those water quality based effluent limitations that
19 will be necessary to implement the EPA established
20 TMDL's.

21 In the second case, as I said, there's some state
22 adopted TMDL's where the final deadlines have passed.
23 And in these cases what we would do is we would have
24 permittees actually in both cases request a time
25 schedule order from us. We would evaluate the request

0086

1 for the time schedule order to determine whether it was
2 appropriate and justified. And then, if it was, we
3 would prepare a time schedule order to be adopted by the
4 board.

5 And let me just turn to the next slide. For the
6 time schedule orders what we're intending is different
7 types of information would need to be provided for the
8 EPA TMDL's versus for the state adopted TMDL's.

9 For the EPA TMDL's, because there has not been any
10 effort at this point because they are so new to start
11 implementing those TMDL's, we would not have quite as
12 high of a threshold of the information that would be
13 needed to request time for that.

14 It would basically require that they include in the
15 request a time schedule of the actions, they would take
16 a demonstration of the schedule as short as possible and
17 interim requirements and deadlines for their achievement
18 within the permit term.

19 For the state adopted TMDL's, because in many cases
20 these deadlines are somewhat long passed, we would
21 require additional information including a chronology of
22 all the actions that have been taken since the TMDL went
23 into effect to achieve the water quality based effluent
24 limitations, and also we would require a justification
25 for the need for additional time beyond that which was

0087

1 already provided in the state adopted TMDL
2 implementation schedule. And then the rest of the
3 requirements would follow along the lines of those
4 required for EPA TMDL's.

5 So we know this is a difficult issue and I think

May 3 MS4workshop

6 one that you'll hear about today and one that is, I
7 think, causing some consternation among permittees, the
8 use of the time schedule order.

9 However, we do feel like it is an appropriate tool
10 and a valuable tool that would provide additional time
11 where the request is justified and warranted. So that
12 is all I'll say about that, and I'm happy to answer
13 questions, of course, more specifically about that as we
14 get into discussion.

15 The last thing that I wanted to do is talk about
16 the receiving water limitation provisions in the permit.
17 And I want to start out by saying that the receiving
18 water limitations are in every MPS permit that comes
19 before you, not just MS-4 permits but receiving water
20 limitations are included in all MPS permits.

21 And they're essentially equivalent, as I mentioned
22 at the beginning at the presentation, to the applicable
23 water quality standards for the receiving water. And I
24 mentioned there's a definition in your working proposal.

25 Their purpose is to ensure that the permitted

0088

1 discharges and in this case both the individual and the
2 collective discharges from the MS-4 do not cause or
3 contribute to exceedances of applicable water quality
4 standards that are necessary to protect beneficial uses
5 in the receiving water.

6 And the Clean Water Act and the implementing
7 regulations in 40 CFR require that there are permit
8 conditions necessary to achieve water quality standards.
9 The language that we're proposing in the receiving water
10 limitations is not new, and it's not significantly
11 changed from what's in the 2001 permit or what was
12 adopted in the Ventura 2010 MS-4 permit.

13 The language that is in the working proposal and
14 also in the 2001, the current permit and Ventura is
15 based on the state water board's precedential orders
16 9801 and 91905 whereby the state water board provided
17 instructions to the regional boards regarding receiving
18 water limitations language to be included in all MS-4
19 permits throughout the state.

20 And the state board adopted this language in
21 response to some of objections by U.S. EPA sometime ago.
22 I think it was primarily during 1998 on the receiving
23 water limitations provisions of several MPS permits,
24 MS-4 permits that had been adopted by other regional
25 boards.

0089

1 The language that is in the receiving water
2 limitations provisions essentially includes three main
3 parts. The first is a provision that discharges from
4 the MS-4 may now cause or contribute to exceedances of
5 receiving water limitations. The second is basically a
6 parallel requirement that discharges may not cause or
7 contribute to a condition of nuisance in the receiving
8 water. And the third is a provision that establishes a
9 process by which permittees are to come into compliance
10 with the first two provisions within the receiving water
11 limitation provisions.

12 And basically this is a process to address any
13 failures, like I said, to achieve those first two
14 provisions. And a lot of times what we've done is we've
15 referred to this as the iterative process in the past or
16 the iterative BMP implementation process.

May 3 MS4workshop

17 while each of these provisions is independently
18 applicable, the third provision, as I said, is intended
19 to ensure that the necessary storm water management
20 programs and controls are in place and that they are
21 modified by MS-4 permittees in a timely fashion when
22 necessary to achieve those first two provisions.

23 So I wanted to take just a couple more minutes to
24 talk about this issue some more because it's been a
25 long-standing issue as part of the 2001 permit between

0090

1 the regional board and several permittees as to whether
2 compliance with the iterative process shields a
3 permittee from violations of receiving water
4 limitations. And a lot of people have referred to this
5 as whether there's a safe harbor in the permit. The
6 regional board has contended that there is not this safe
7 harbor. Well, several permittees have interpreted the
8 provisions in this section to include a safe harbor.

9 This issue with respect to the receiving water
10 limitation provisions in the 2001 permit has been
11 litigated twice, first in 2005 in state court litigation
12 challenging the 2001 MS-4 permit, the current permit,
13 and second in 2011 when NRDC and Santa Monica Baykeeper
14 filed the citizens' suit in Federal court against the
15 County of Los Angeles and the Los Angeles County Flood
16 Control District.

17 In both cases the courts upheld that the regional
18 board's position that receiving water limitation
19 language in the 2001 permit does not provide a safe
20 harbor and that the first two provisions are
21 independently applicable from the third provision that
22 establishes the iterative process requirements.

23 In drafting the new permit, staff did think a long
24 time about whether it would recommend changing or
25 modifying this section of the permit or including some

0091

1 sort of safe harbor for all of the exceedances of
2 standards.

3 And after much thought, as you see in staff's
4 current working proposal, we're recommending that the
5 receiving water limitations language in the 2001 permit
6 essentially be carried over to the new permit.

7 However, staff's current working proposal does
8 provide a safe harbor for certain exceedances of water
9 quality standards where a TMDL provides time to comply
10 with water quality standards.

11 Specifically what we've done, because we've
12 included 33 TMDL's in this permit and these TMDL's
13 address many water body pollutant combinations and we
14 also understand that compliance with these can't be
15 achieved immediately in the receiving water, that's why
16 we included implementation schedules for these;
17 therefore, the working proposal provides basically in
18 the TMDL provisions that an MS-4 permittee would not be
19 found in violation of receiving water limitations in
20 this part 5(a) that's in the receiving water limitation
21 provisions if it is in full compliance with the
22 applicable TMDL's requirements pursuant to compliant
23 schedules in those TMDL's.

24 So we felt like that was a valuable and necessary
25 addition within the TMDL provisions to provide that time

0092

1 to be consistent with time that the board has provided

May 3 MS4workshop

2 in the TMDL implementation schedules to comply with
3 those specific receiving water limitations.

4 I just want to say with regard to this, we're still
5 hearing comments on this. I know you'll hear a lot of
6 comments today. It is a difficult issue. We're
7 continuing to listen to what people have to say about
8 this and try to work with permittees as well as
9 environmental organizations on this issue to try to find
10 the best solution and ultimately work towards our goal
11 of achieving receiving water limitations in all the
12 waters. With that I'm going to stop my presentation and
13 hand it over for public comments.

14 MR. STRINGER: Thank you very much.

15 Extraordinarily helpful. Thank you. I think we'll take
16 a -- excuse me. I think what we'll do in looking at
17 this stack of speaker cards here is take a 10-minute
18 break now and then come back and hear two lengthy
19 presentations, one from Heal the Bay and then the next
20 one after that will be from the L.A. Permit Group. That
21 will comprise about an hour and a half total. And then
22 we'll break for lunch, and then we'll come back and hear
23 a couple of additional longer presentations and then a
24 series of three-minute public comments. You want to
25 add?

0093

1 MR. UNGER: I was just going to add board member
2 Mary Ann Lutz is still waiving --

3 MR. STRINGER: I understand. I spoke to her about
4 it. So we'll tell her we're behind where we thought
5 we'd be but hopefully not too much. So 10 minutes now.
6 We'll be back here at 11:15, 11:20, and we'll start
7 right on time. Thank you.

8 (Brief recess.)

9 MR. STRINGER: Thank you all for staying relatively
10 on time. We're going to change things up a little bit
11 from what I said before the break. Because of some time
12 limitations we have and also because of executive
13 session we have to do at 12:30 and also and most
14 importantly because we all want to get out of here at
15 5:00. If I do the math, there's no way we're going to
16 get through all the cards.

17 What we're going to do because people have a number
18 of things to do other than sit here all day, we're going
19 to take the shorter commenters first. And typically we
20 allow three minutes for those comments, but we're going
21 to limit those to two minutes today.

22 And we ask that, if there are groups of people who
23 have similar comments, that they come up to the podium
24 together or raise their hands or stand when folks who
25 are saying things that they also would say do it that

0094

1 way so that we can be as efficient as possible.

2 We want to hear from all of you obviously, but we
3 also have a very full agenda today. And no matter what
4 happens, we have to leave by 5:00. So thank you for
5 your patience as we work through the logistics of this
6 and make sure we all get the benefit of all of your
7 important comments. The first person up is Sharom
8 Kerajani from L.A. City Sanitation.

9 MR. KERAJANI: Good morning Mr. Chair, board
10 members. Sharom Kerajani, Bureau of Sanitation. Just
11 very briefly I'm here in support of the watershed
12 management plan that Ms. Purdy gave her presentation on.

May 3 MS4workshop

13 we believe that this is the most cost effective manner
14 for us to (inaudible) the watershed because it gives us
15 the opportunity for us to focus on the most prioritized
16 (inaudible), the most collaboration among the agencies.
17 It's most cost effective, and it does provide us
18 flexibility among the watershed because (inaudible) as
19 far as scientific investigation. I wanted to also thank
20 Mr. Unger, Ms. Smith, Ms. Purdy and Mr. Ridgeway for the
21 opportunity of providing this workshop that I find very
22 informative. Thank you so much.

23 MR. STRINGER: Thank you. Meredith McCarthy. I'm
24 going to read a couple names at once so the next one
25 knows who's on deck. On deck is Steven M-e-j-i-a.

0095

1 MS. MCCARTHY: My name is Meredith McCarthy. I am
2 a local scuba diver instructor and A mother of two young
3 boys, and I just wanted to come here today to tell you a
4 little quick story.

5 We were celebrating Earth month April with my sons
6 in the Los Angeles River, and he went barreling down to
7 the river to, of course, dive head first into the river
8 and I said, "whoa. where are you going?" He's like,
9 "We're here. Look. This is so great." I said, "You
10 can't get in the water." He said, "why can't I get in
11 the water?" I said, "It's not clean enough." And he
12 said, "well, we're here to clean it today. Can I come
13 back when it's clean?"

14 And in that five-year-old logic it seems so
15 reasonable like, of course, we're going to come back
16 when it's clean because I believe we can make it clean.
17 I believe that together with the limits of this permit
18 that this water can get better.

19 I'm so encouraged by the county's fee permit which
20 is going to the board at the end of the month to help
21 the cities get the funding they need to do the projects
22 that will get the water clean so that so much of our
23 region can touch the water. It seems like such a simple
24 thing.

25 So I'm here today to encourage you to set strong

0096

1 pollution limits, as strong as you possibly can.
2 You are the trigger that will help cities create jobs.
3 Generation water is standing by training youth. For
4 every million dollars we spend, we create hundreds of
5 jobs. And so together you hold that power. But it only
6 makes sense if the limits make sense. So thank you for
7 the time. Thank you very much.

8 MR. STRINGER: Thank you. Steven. And wendi
9 werner and then Matthew King.

10 MS. WERNER: Thank you. I'm here to speak about
11 the natural bacteria in the TMDL exceedances. The
12 beaches especially, the ones persistent with bacteria
13 exceedances are filled with mounds of kelp rack and sea
14 grass that have lots of bird and brine feces are not
15 being accounted for in the bacteria TMDL discussion.
16 Beaches with high level of rack, suspended rack,
17 obviously seaweed, suspended in the water column may
18 persist for longer than FID and near shore beaches where
19 there is no rack and those affect the violation of clean
20 water standards

21 Although there is a potential role for kelp to
22 adversely affect beach water quality with concentrations
23 of high bacteria, it should be noted that rack plays an

May 3 MS4workshop

24 important role in the beach ecosystem by providing
25 nutrients to the beach food and the web chain. The sea
0097

1 birds, the invertebrate, the insects -- and insects all
2 rely on kelp as a food source.

3 Beach grooming to remove standard kelp has been
4 shown to adversely impact the beach ecosystem. This was
5 a study done from Dugan and Hubbard in 2010. Thus a
6 decision to remove rack from the beach should be only
7 undertaken after careful consideration of both water
8 quality and ecosystem needs.

9 I understand that there are water quality
10 exceedances and this whole TMDL thing is obviously
11 greatly appreciated for all of us. But we have to
12 understand that there are exceedances that are bacteria
13 exceedances that are from nature that absolutely cannot
14 be ignored. There's human shedding that occurs when
15 people come to the beach. Human shedding creates staph.
16 It's going to create a bacteria exceedance. It's
17 something that has to be implemented in these TMDL
18 overloads. And I thank you for listening.

19 MR. STRINGER: Thank you. Matthew King. Rick
20 walker.

21 MR. KING: Hello. My name is Matthew King. I'm
22 from Santa Monica. My father spent 30 years as an L.A.
23 County lifeguard. He dedicated his professional life to
24 protecting L.A.'s residents when they stepped into our
25 local oceans. As you debate the storm water permit,

0098
1 it's my sincere hope that you will show the same level
2 of concern for public health and safety as my father
3 did. People need to know that a day at the beach isn't
4 going to make them sick.

5 Before he died, my father was heartened to see a
6 vast improvement in ocean water quality from the 1970's.
7 As a lifeguard out in the water, he saw firsthand all
8 the dead zones in the bay.

9 Fortunately, those days are long gone. Water
10 quality has been subtly improving thanks to effective
11 TMDL's that you guys have helped implement. Now is the
12 time for stronger projections, not weaker ones. Let's
13 not go backwards. Please make sure you have the
14 strongest limits possible and make sure they're included
15 in the permit. No more foot dragging. Thank you.

16 MR. STRINGER: Thank you. Rick Blocker and Ana
17 Louisa Ager.

18 MR. BLOCKER: My name is Rick Blocker. I want to
19 thank you for listening and let you know that I'm
20 terrified because I've never been to anything quite like
21 this before. I want to thank you for taking such
22 concern for our health and safety.

23 I come because I'm a lifelong surfer. I started
24 surfing in 1960 at the reef in the bay at Santa Monica
25 and continue to do so up until yesterday anyway. And

0099
1 I'd like to just let you know that the water is such a
2 wonderful place for us and it's been a tremendous place
3 for me. And the safety and the health that I experience
4 through it is very, very important.

5 I listened for a long time, and I didn't know a lot
6 about what it is you were talking about. I'm really
7 happy that you're here taking care of our interests.

8 I was a 10-year-old boy when I started surfing. I

May 3 MS4workshop

9 spent my entire life going into that ocean, if not
10 weekly, daily. And I hear the younger surfers and the
11 younger people that go down to the water talk about
12 ailments that they experience, and I don't believe that
13 I ever have gotten any ailments. I believe that maybe
14 I'm immune due to the longevity.

15 But the fact is when I started there weren't any
16 regulations, and I'm grateful that today there are and
17 it's due to your efforts. And we want to continue to
18 have the strongest regulations that we can to protect
19 humans and their ability to enjoy the ocean. So thank
20 you.

21 MR. STRINGER: Thank you, Mr. Blocker. Ana Louisa,
22 Tatiana Gower.

23 MS. AGER: Hi. Thank you for hearing us today. My
24 name is Ana Louisa Ager. I live in Venice. I'm here as
25 a diver and a reef check volunteer. I spent a lot of

0100

1 time living in Central America and Honduras doing reef
2 check surveys and have seen firsthand the difference
3 between a place that doesn't have these kinds of limits,
4 these checks on pollutants in the waterway. There's
5 trash all over the reefs. There was sedimentation from
6 deforestation and construction and development that was
7 suffocating the corals and these very delicate ocean
8 ecosystems that they have there.

9 And I have seen a difference here where we have
10 these regulations and the water is much cleaner, much
11 healthier. The ecosystem is in much better shape. And
12 I want to thank you for that, and I also want to urge
13 you to please continue to protect the water quality and
14 the Santa Monica Bay. It's important for all of us.
15 It's important for the economy of California, and I just
16 want to say please continue with strong regulations.
17 Thank you.

18 MR. STRINGER: Thank you. Tatiana Gower. Dulce
19 Stern or Stein.

20 MS. GOWER: Good morning Mr. Chair, members of the
21 board. My name is Tatiana Gower. I am actually here to
22 speak in my capacity as a resident of Culver City who
23 lives a block away from Biona Creek and sees daily the
24 impacts of the polluted storm water and also water
25 discharges flowing to the creek and also as the mother

0101

1 of two young children who, unfortunately, I don't let
2 get in the ocean because I'm concerned with the poor
3 water quality and I'm, frankly, worried that they will
4 get sick.

5 This year, as most of you know, we are celebrating
6 this 40th anniversary of the passing of the Clean Water
7 Act, and there's a lot to celebrate. And also it gives
8 us an opportunity to remind ourselves that even though
9 we've gone a long way, we have a lot more to achieve to
10 get to the goals -- to achieve the goals of the Clean
11 Water Act, the fishable and swimmable waters.

12 Numerous studies and mountains of evidence and data
13 show that storm water, non storm water pollution reduces
14 the water quality of our rivers and creeks that we all
15 want to use and that's why what the board does today
16 with this permit and in the future with this permit is
17 so crucial and important because even though you've
18 heard water quality standards and TMDL's and these water
19 quality standards and TMDL's were adopted by this board,

May 3 MS4workshop

20 what matters is how they implement them, what matters is
21 how we enforce them. And that's what's going to
22 determine whether we can reclaim our waters and make
23 them truly fishable and swimmable.

24 I'm urging you today as a mother and as somebody
25 who wants to enjoy Biona Creek -- that's why I have my

0102

1 house there -- to really adopt the strongest possible
2 standards, to require these standards to be met as soon
3 as possible. Thank you.

4 MR. STRINGER: Thank you. I see that Mr. Stein
5 provided written comments; so I assume there isn't a
6 desire to speak. We'll put these in the record.
7 Marille Barr, and Joe Geever is on deck.

8 MS. BARR: Hello. High name is Marille Barr, and
9 I'm here today as a concerned resident of Los Angeles
10 and also as an advocate for all the critters in our
11 creeks, bays, streams, wetlands and oceans.

12 I'm here to ask you to include the strongest
13 possible protections in the storm water permits. As a
14 concerned lover of the oceans and tide pools, clean
15 water is especially important to me because those
16 critters are not able to come here and speak for
17 themselves.

18 I actually like to eat some much those critters,
19 and so do thousands of other people who fish in our
20 local waterways. However, many of these fish are too
21 toxic to consume and yet they eat them anyway.

22 To protect myself as an educated person, I actually
23 refer to the Monterey Bay Aquarium seafood watch cart
24 and yet I still get it wrong and I'm a knowledgeable
25 person. So how can you expect everybody else to get it

0103

1 right when somebody who cares about this so passionately
2 still has a hard time with all of these fine prints on
3 what you can and can't eat and what you have to avoid?
4 And, by the way, this is the shortcut menu of them
5 because other ones say you can eat it if it's less than
6 this big. Because after it gets past six inches or past
7 a foot, it's then consumed too many other things and the
8 toxins have built up in it because it's now this big and
9 it's consumed so many other little fish that have all
10 these toxins in them. So it gets rather confusing.

11 So I please, please, please ask you to protect our
12 future water and our future resources and our future
13 food and our children who eat this food. Please, like I
14 said, please include the strongest possible protections
15 in our storm water protections, in our permits that then
16 go straight out to our ocean and into our food chain.
17 Thank you.

18 MR. STRINGER: Thank you. Joe's Geever, Sara
19 Godvey.

20 MR. GEEVER: Mr. Chair and board members, my name
21 is Joe Geever, and I'm the national water programs
22 manager for Surfrider Foundation, and I want to address
23 the issue of TMDL compliance deadlines. We often
24 advocate (inaudible) spending their limited staff and
25 financial resources on programs and projects to

0104

1 eliminate pollution rather than fines and litigation.

2 But in this case I was around for the decision to
3 incorporate the bacteria TMDL's into the MS-4 permit.
4 At the time dischargers took an integrated management

May 3 MS4workshop

5 approach to compliance and they got more time for
6 compliance and we supported that.

7 So while I want to recognize that some cities made
8 some progress, we believe even the best actors have
9 fallen short and the worst case has done little to
10 nothing to come into compliance with commitments made
11 over six years ago.

12 So while I wish I could support time extensions and
13 recognitions of efforts made in good faith, I can't.
14 We're obviously sick and tired of getting sick and tired
15 when we swim and surf.

16 But there's a much larger picture to keep in mind.
17 The state is developing policies to encourage integrated
18 water management yet I don't see the necessary
19 coordination of agencies responsible for water supply,
20 pollution prevention, waste water treatment, flood
21 control. I do see some great examples of green street
22 pilots and marginal improvements in landscape retrofits
23 and even the beginnings of treatment wetland networks
24 and recycled waste water but not enough, not even close.

25 And I'll add that given that there hasn't, in my

0105

1 humble opinion, been a good faith effort to come into
2 compliance with these TMDL's and the deadlines agreed to
3 10 years ago, extending these deadlines actually creates
4 some incentives to stall even longer.

5 So we urge you to adopt the compliance schedules
6 agreed to over 10 years ago and the TMDL's and start
7 enforcing those compliance schedules even if it means
8 immediate noncompliance.

9 Dischargers can't make a compelling argument they
10 weren't on notice this day would come. They were at the
11 decision hearing 10 years ago just like we were.
12 Timelines were negotiated and commitments were made.

13 We've been waiting and time is up. Thank you very much.

14 MR. STRINGER: Thank you, Mr. Geever. Sara Godvey.
15 Ellen Bravo.

16 MS. GODVEY: Hi. My name is Sara Godvey, and I
17 live here in Los Angeles just a little bit north in a
18 neighborhood called Pico Union. And although I do not
19 live close to the beach, I love to swim and I try to go
20 out there mainly in the summer but also during the
21 winter when, as you know, that's when a lot of storm
22 water pollution is making its way out to the ocean.

23 When I make it to the beach, I do not want to worry
24 about bacteria levels or other pollutants in the water.
25 It's up to you guys here to help protect me and my

0106

1 family by adding strong pollution limits with clear
2 language and deadlines (inaudible) into the storm water
3 permits. You've already created the language. You've
4 already done the work to make the TMDL's. Now we're
5 just asking that it's in the permit.

6 And also I want to make sure that you have
7 deadlines with substance because, as the past person
8 just said, polluters have had over 10 years to meet
9 these TMDL limits and 10 years is plenty of time for
10 innovation. Six years since the deadline is plenty of
11 time for innovation.

12 You know, 10 years ago, 2002, I've gotta say I did
13 not think I would have an iPhone where I could do
14 everything in the world. They've had the time to create
15 tons of new ideas.

May 3 MS4workshop

16 So we need action so that, when I take my nephew,
17 who is about to be born in just a few months, to the
18 beach that I can feel safe about that decision. And
19 these permits are a way for you to hold any polluters or
20 dischargers accountable. So I entrust in you that you
21 will make these permits as strong as possible. Thank
22 you.

23 MR. STRINGER: Thank you. Evelyn Bravo. Olga
24 Ayalla.

25 MS. BRAVO: Good morning. My name is Evelyn Bravo.

0107

1 I'm here today as an inner city homeowner to ask the
2 regional board to include strong protections in the
3 proposed municipal storm water permit. As a community
4 member in the inner city, clean water running through my
5 creeks and streets near my neighborhood are especially
6 important to me and I'm here because often unrepresented
7 families and undervalued homes that are equally
8 deserving of safe environments and clean water can
9 easily go overlooked. So I'm here gladly representing
10 them.

11 Beaches at the mouth of Biona Creek, which is the
12 creek that runs nearest to my house, are among the most
13 used with millions of annual visitors that swim, fish,
14 and recreate there but that also continue to get sick
15 from the bacteria from the storm water pollution.

16 As a child my family in Compton depended on local
17 fishing that I came to find out was too toxic to consume
18 and yet we always did.

19 I know that TMDL's are pollution limits in place
20 for our beaches and fish to be protected. And I know
21 that these TMDL pollution limits are critical for
22 putting our region on the path for clean water and
23 healthier oceans.

24 So I ask you today to please support the call as it
25 is critical that these numeric TMDL pollution limits are

0108

1 put into the storm water permit with strict compliance
2 deadlines. I ask that you remember that it is your
3 responsibility as the board to protect our water
4 quality; so I urge that you include these TMDL pollution
5 limits into the permit and make these regulations
6 effective in attaining the clean water goals that we
7 seek. Thank you so much for your time.

8 MR. STRINGER: Thank you. Olga Ayalla. Blanket
9 apology for mispronouncing names.

10 MS. AYALLA: No problem. I can face that. Olga
11 Ayalla. See. Thank you so much. I trust that you guys
12 are doing an awesome, awesome job; so keep it up. Thank
13 you. I support it. Thank you.

14 MR. STRINGER: Marsha Matts. Ann Bergman.

15 MS. MATTS: Good morning. My name is Marsha Matts.
16 I am a resident of Santa Monica and for years have loved
17 to swim in the ocean. It is a true joy in me, and I'm
18 sure I share that with many of you and many, many others
19 who flock to the beaches.

20 As a local resident, I'm concerned about the
21 quality of the water and the access for my community to
22 be able to enjoy what we have. We're so lucky to live
23 close to the ocean.

24 Beyond being a local resident, I know that it's a
25 tremendous source of revenue to my community. People

0109

May 3 MS4workshop

1 come, the whole tourist industry, the taxi cabs, the
2 restaurateurs, the service industry, the taxi cabs, the
3 hotels. If our waters aren't clean, tourists will go
4 elsewhere. This also impacts real estate and the school
5 system. I mean it's tremendous triple down effect. So
6 both for reasons practical and emotional I'm asking you,
7 I'm pleading with you to please use the strongest
8 possible guidelines to prevent pollution so we all can
9 enjoy what we are so fortunate to have. Thank you.

10 MR. STRINGER: Thank you for your comments. Ann
11 Bergman. Amanda Crisbach.

12 MS. BERGMAN: Hello. My name is Ann Bergman, and I
13 live in the Van Nuys, Sherman Oaks area, which is not as
14 far away from the ocean as it sounds. I'm here to
15 represent my children, Henry, who is almost 11, and
16 Ella, who is seven. We're all ocean lovers, and we've
17 escaped the valley heat many times over the years to
18 head to the beach together. And my kids like to do what
19 they call the happy feet dance when they finally get to
20 the water.

21 I know that pollution limits have helped them to
22 keep safe and from getting sick on those happy feet
23 days. And I ask that this strong TMDL pollution limit
24 and storm water permits be included with strict
25 compliance deadlines. I don't want my kids or anyone

0110
1 else's kids to ever get sick from playing or swimming in
2 our local waters. Thank you.

3 MR. STRINGER: Thank you. Amanda Crisbach. Jason
4 Wen and John Hunter on deck.

5 MS. CRISBACH: Hi. My name is Amanda Crisbach, and
6 I'm a resident of West Hollywood. And I would like to
7 encourage you to please, please put the bacteria TMDL's
8 into the storm water permits. It's super important for
9 our water quality, our tourism as a bunch of people have
10 said. I'm not going to take too much of your time, but
11 please I urge you to include the strictest guidelines
12 and timelines for those regulations. Thank you.

13 MR. STRINGER: Thank you. Jason Wen and John
14 Hunter.

15 MR. WEN: Good morning. My name is Jason Wen from
16 the City of Downey. I love to go to the beach. I see
17 everybody knows the issue is not (inaudible). This is
18 how to deliver it. So the hard work to balance the
19 resources, hard work to make a sustainable approach.
20 Now I have my counsel cover it.

21 MR. HUNTER: Thank you. We have a short slide
22 presentation. We tried to make it for exactly three
23 minutes; so I'll try to speed it up as best I can.

24 MR. STRINGER: It's okay.

25 MR. HUNTER: Some background before I get to my

0111
1 comments, Downey has over 1,000 parcels right now with
2 low impact development systems already implemented. I
3 was afraid I wouldn't be able to get the entire city in;
4 so I just got the northwest quadrant of the city. Each
5 one of those green dots represents a parcel that is
6 served with a low impact development system. On the
7 large size -- and most of the board members have seen
8 this before -- we do have a one acre LID site,
9 infiltration site, that treats over 60 acres of runoff.
10 On the small side we have a site like this where you can
11 see the water runs across pervious river rocks and then

May 3 MS4workshop

12 into a depressed basin with a vegetation filter and
13 infiltrates. So that's in over 1,000 sites through the
14 city.

15 Our comments are basically generally we're in
16 support of the regional board's effort to have a sub
17 watershed plan as long as it can be tailored to
18 individual cities and individual situations. We think
19 that gives cities a better chance to -- my slide is not
20 working. There we go. Anyway, we do support the effort
21 to do that plan.

22 As far as group effluent limitations, we can
23 support working together, and Downey does with a number
24 of groups. But we don't want to support any
25 nonvoluntary group compliance. Basically we don't want

0112
1 unwilling permittees to be forced to work together.
2 Everything should be voluntary. And that was just a
3 comment from one of the TMDL sections.

4 Water quality based effluent limitations should be
5 based on BMP's. For example, we just showed you 1,000
6 sites in the city that have BMP's. We think BMP
7 implementation should be sufficient.

8 We also would like to make a comment on load based
9 allocations. For example, grams per day should be
10 available. In most of the TMDL's that are out, you give
11 us a choice of either grams per day or grams per day per
12 liter.

13 For example, the San Gabriel river TMDL for copper
14 and Coyote Creek is a total amount how many pounds per
15 day or kilograms per day. And in the reefs that we
16 discharge to just upstream, it's in concentration base.
17 And if we reduce the amount of flow, we think we should
18 get credit for that.

19 Then we need realistic compliance targets. Downey
20 has installed nearly 400 full capture catch basin
21 inserts. This is for the trash TMDL. This represents
22 89 percent of the city's area. That remaining 11
23 percent could not be retrofitted due to physical
24 limitations. If you want to put the full capture
25 screens in those catch basins, we basically have to

0113
1 destroy the catch basin and rebuild a new one. We do
2 want some credit considering we have 1,000 of the LID
3 systems and other BMP's, street sweeping, et cetera.
4 It's going to be extraordinarily expensive to get that
5 last 11 percent done. And that basically is my final
6 comment. Even after 1,000 parcels, 89 percent of the
7 city's catch basins full capture, how are we going to
8 get to zero? I mean the last 11 percent is going to be
9 the most costly trash cleanup ever. So that concludes
10 our presentation. Thank you.

11 MR. STRINGER: Thank you very much. Steven Dunn,
12 Marsha Hansen.

13 MR. DUNN: Thank you, Board, for this opportunity.
14 I was going to read a letter from Dr. Jeff Harris from
15 Malibu, but it's too long winded. I've been a surfer in
16 Malibu for over five decades. I've actually followed
17 all the water quality issues related to Malibu because
18 of my love of surfing. I'm particularly interested in
19 water quality. I anxiously await the results of the
20 Pacific Coast water quality epidemiological study
21 because it was conducted using the most up-to-date
22 methodologies before making any final decisions on the

May 3 MS4workshop

23 bacteria regulations and the bacteria reopener that will
24 be incorporated into the new NTDES permit eventually.
25 Unless the board directs staff to allow all relevant

0114

1 information to be part of the hearing deliberation and
2 discussion making process, the board will not learn what
3 scientists and public health officials have learned in
4 the past 10 years. The reason people get rashes, ear
5 and eye infections, staph infections and
6 gastrointestinal effects after going to the beach has
7 little to do with storm water or urban runoff. It's
8 primarily what beach goers bring onto their skin to the
9 beach. They sit and walk on the sand and go in the
10 water. This starts the bacteria fungi staphylococcus
11 aureus, and that (inaudible) staphylococcus was never
12 considered in the 2002 and 2003 permit deliberations.

13 I want to be very, very clear. Scientists believe
14 that the increase of these disease causing sources is
15 primarily, if not exclusively, human shedding, not from
16 waste water discharge or leakage of storm water. The
17 results are directly correlated to the number of beach
18 goers using limited space at a popular beach, my fellow
19 surfers and fellow beach goers. Thank you.

20 MR. STRINGER: Thank you. Marsha Hanskowit, Trevor
21 Benda.

22 MS. HANSKOWIT: Honorable board members, Marsha
23 Hanskowit. I'm representing the Wetlands Defense Fund,
24 Biona Institute, and Sierra Club. I specifically want
25 to talk about the Biona wetlands TMDL's that have been

0115

1 adopted by EPA and I presume are going to be
2 incorporated into this because as part of the litigation
3 settlement with Heal the Bay and baykeeper, they are
4 undoubtedly, these TMDL's, going to be used to justify a
5 massive destruction and bulldozing of 600 acres of the
6 Biona wetlands ecosystem that many people work very hard
7 to protect just like what is happening at Malibu, and
8 it's based on erroneous and inaccurate statements and
9 presumptions.

10 Well, how do I know? I went to the EPA meeting,
11 and at the EPA meeting they gave us these documents that
12 had all sorts of inaccurate information about the
13 geography, the hydrology, and all of this related to
14 Biona wetlands. Bay Commission had put this forward,
15 and the Bay Commission, I'm sorry to say, has a lot of
16 inaccurate information coming from their staff.

17 We put forward a report by Dr. Travis Law and
18 Dr. David Jacobs that showed that the coastal wetlands
19 restorations that have been happening have been based on
20 erroneous T sheet typographic interpretations. They are
21 suggesting that all of our coastal wetlands were
22 supposed to be open to the sea around, and that's just
23 not the case.

24 So we are very, very concerned that, you know,
25 while you talk about strong and appropriate TMDL

0116

1 measures, that you not look at -- that you really go
2 backwards in time. You really have to look at what are
3 those things based on. Yes, we want things to be strong
4 to protect people at the beach. But these TMDL
5 standards for Biona wetlands have nothing to do with
6 health hazards. They have to do with removing mud,
7 marsh mud that was put there when the marina was built.

May 3 MS4workshop

8 And they're justifying a big engineering plan, and that
9 is wrong.

10 And the only reason I decided to look at that was
11 because we saw what was happening in Malibu Lagoon and
12 how some of those TMDL standards are not applicable any
13 longer.

14 So we would like you to see you address more
15 pollution standards upstream, not be spending all of
16 this money and effort to work on -- I mean really just
17 leave our coastal wetlands alone. There's habitat
18 there, one of the few places we have nature left in Los
19 Angeles.

20 And all of this receiving water limitation and
21 storm water diversion is also going to harm the wildlife
22 that we have left in Los Angeles. Nobody is looking at
23 that. You are taking away water that would have been
24 underneath the surface. Yes. We don't have our
25 underground water systems anymore because we've diverted

0117
1 it the way we unfortunately have and you're going to
2 actually put the final nail in the coffin on all of the
3 wildlife.

4 So my point, you have to have some wildlife
5 biologists starting to look at this and geography
6 experts, not just water quality TMDL chemistry experts.
7 Thank you.

8 MR. STRINGER: Thank you. Robert Van Oak. Jason
9 Winer.

10 MR. WINER: Good afternoon. Jason Winer, associate
11 director and staff attorney with (Inaudible) Foundations
12 Ventura Coast Keeper program. On behalf of our
13 organization, our members, it's imperative that the L.A.
14 MS-4 permits efficiently protects not only L.A. waters
15 but Ventura County waters, Ventura County's coast and
16 especially also the Santa Clara river, which lies
17 downstream of the Los Angeles/Ventura County line.

18 The ecological, cultural, agricultural,
19 recreational and all the other official uses are just
20 too important to not have this L.A. County MS-4 permit
21 be protective of water quality. Thus in regards to TMDL
22 requirements in L.A. and the (inaudible), we want to
23 emphasize the importance of, one, the full adoption of
24 all L.A. County TMDL's into the L.A. County MS-4 permit
25 and, two, the MS-4 permit adopting and requiring full

0118
1 and immediate compliance with the numeric effluent
2 limits in the TMDL's including, one, immediate
3 compliance with the numeric wasteload allocations and,
4 two, immediate compliance of protective numeric
5 (inaudible) limits that should be adopted before numeric
6 wasteload allocations are established. And we'd also
7 like to voice our full support for the receiving water
8 limitations as currently proposed. Thank you.

9 MR. STRINGER: Thank you very much. Richard
10 Watson. Six minutes.

11 MR. WATSON: Vice Chair, I believe I was granted a
12 six-minute presentation.

13 MR. STRINGER: Yeah. That's what I said.

14 MR. WATSON: Okay. Thank you. Vice Chair Stringer
15 and members of the board, my name is Richard Watson.
16 I'm before you today representing the cities of Cerritos
17 and Signal Hill. My comments today focus primarily on
18 the special provisions for the watershed management

May 3 MS4workshop

19 programs and related TMDL provisions, and our written
20 submission will be with other subjects.

21 Both Cerritos and Signal Hill are vitally
22 interested in watershed planning. In fact, each city
23 participates in two separate TMDL watershed management
24 organizations pursuant to memoranda of understanding.
25 They worked together on the Los Cerritos Channel since

0119

1 2008, first in negotiating elements of the metals TMDL
2 established by EPA and then in developing an
3 implementation plan and working with the regional board
4 on a basic (inaudible) amendment to appropriately
5 incorporate the TMDL (inaudible).

6 The cities are particularly intrigued by the
7 provisions of the working proposal that encourage
8 watershed management program by allowing permittees to
9 customize control measures, strategies and BMP's to
10 address the highest priorities. This, I think, is very
11 good. And we trust that customization will foster
12 creativity and allow experimentation.

13 For instance, with the metals TMDL's, we believe
14 that to be successful in meeting water quality standards
15 over the long term, we need to address the sources of
16 metals deposited on watershed through atmospheric
17 deposition, and in that case we're going to need the
18 help of other regional and state agencies.

19 The cities also appreciate the fact that watershed
20 management areas may be subdivided into sub watersheds
21 as well as the opportunity for individual municipalities
22 to establish their own water management programs for
23 subterranean (inaudible).

24 Further we appreciate the provision on page 9 that
25 specifies that water management program plans shall

0120

1 "clearly identify the responsibilities of each
2 permitting or participating permittee for implementation
3 of water quality control measures." We trust this
4 provision in combination with a provision in the federal
5 codes which states the (inaudible) only comply with
6 permit conditions related to discharges from municipal
7 storms sewers for which they are operators will protect
8 conscientious permittees from being held liable for the
9 actions or inactions of other permittees.

10 We do have one area of major concern, which was
11 partially addressed earlier, and that's the compliance
12 schedule portion of the watershed management program.
13 While we appreciate staff's action based approach
14 explained earlier for the interim milestones, it's not
15 really been clearly articulated or explained in the
16 permit or the attachments.

17 The current section appears to assume that the
18 permit needs to incorporate numeric water quality based
19 effluent limitations or WQBELS based on wasteload
20 allocations in the TMDL's, and that's not really the
21 case.

22 Federal regulations in both the 2002 and the 2010
23 EPA guidance memo clearly require that permits contained
24 WQBELS consistent with the assumptions and requirements
25 of the wasteload allocations in applicable TMDL's, but

0121

1 they also clearly allow WQBELS and permits to be
2 expressed numerically or in the form of BMP's; so
3 there's a choice.

May 3 MS4workshop

4 The 2010 memo also says that when WQBELS are
5 expressed in the form of BMP's, quote, the permit should
6 contain objectives and measurable elements and gives
7 example of those.

8 The cities of Cerritos and Signal Hill strongly
9 urge the board to direct staff to follow this approach
10 and incorporate narrative BMP action based WQBELS in the
11 permit consistent with wasteload allocations in the
12 TMDL's, especially for the interim milestones.

13 This approach will facilitate the use of a deemed
14 compliance approach as was done in the L.A. river and
15 Biona Creek trash TMDL's with the approval of full
16 capture devices. It would also allow credit for
17 compliance approach where credit could be given for
18 pollution prevention programs which target the true
19 sources of pollutants over which permittees have little
20 or no regulatory authority.

21 Integrating WQBELS into the next generation of MS-4
22 permits in the form of BMP's will encourage
23 experimentation, strong pollution prevention efforts in
24 a cost effective manner.

25 And I have an example from the L.A. rivers metals

0122

1 TMDL. One of the provisions says each jurisdiction
2 group shall demonstrate that 75 percent of the group's
3 total drainage area served by the storm drain system is
4 effectively meeting dry weather WLA's.

5 This could be expressed in permit consistent with
6 federal regulations in the following way. Permittees
7 shall demonstrate that source control measures and
8 treatment controls designed to effectively meet dry
9 weather WLA's have been implemented and maintained in 75
10 percent of the total area served by the storm drain
11 system.

12 In most cases converting wasteload allocations to
13 WQBELS expressed as BMP's should not be time consuming.
14 Having BMP implementation targets is understandable and
15 a management task for cities.

16 On the other hand, meeting numeric WQBELS
17 particularly in a short timeframe can be frustrating and
18 potentially paralyzing and could cause more money to be
19 spent on lawyers than on BMP's and drill majors. I urge
20 you to direct staff to use the approach of expressing
21 WQBELS in a BMP manner in both the watershed management
22 program and the TMDL provisions of the permit. Thank
23 you.

24 MR. STRINGER: Thank you very much. Next we have
25 Gary Hildebrand with L.A. County who's been allotted 15

0123

1 minutes.

2 MR. HILDEBRAND: Good afternoon Vice Chair, board
3 members. My name is Gary Hildebrand. I'm with the L.A.
4 County Department of Public Works, and I'm here today on
5 behalf of the County of L.A. and the L.A. County Flood
6 Control District.

7 First off, I'd like to say relative to the
8 watershed management program that's been proposed by the
9 board staff that we do see the approach as being very
10 beneficial. We are supportive of that approach. We do
11 recognize the flexibility that the approach provides in
12 dealing with the prioritization of TMDL's and the
13 efforts needed to comply with those.

14 we also appreciate the opportunity as part of that

May 3 MS4workshop

15 approach to be able to prioritize the efforts that are
16 required under the minimum control measures.

17 And as part of the watershed management program the
18 adaptive management process that's included in there
19 really recognizes the sort of evolutionary process that
20 developing and implementing BMP's will occur over many
21 years.

22 As we continue to learn more on the BMP
23 implementation and design and the monitoring efforts, I
24 think the management process has us revisit what's been
25 learned during that time period to be able to modify our

0124 plans to better reach the ultimate goals.

1 But looking at that, I think the receiving water
2 limitation approach that's being proposed doesn't really
3 I think meet the spirit of the watershed management
4 program in the adaptive management process.

5 As is mentioned by the staff, there are actually
6 two approaches for receiving water limitation
7 compliance, one for constituents that are part of a
8 TMDL. For those constituents, if there's a receiving
9 water quality exceedance, the permittees need to
10 demonstrate full implementation of the watershed
11 management program and with proof of that
12 implementation, they are then no longer considered in
13 violation of future water quality exceedances.

14 However, for efforts that are implemented as part
15 of the minimum control measures, that same standard is
16 not there. You have a situation where you can have two
17 watersheds with the same constituent, bacteria, for
18 example. One watershed can have a TMDL with the
19 compliance for that constituent and with the TMDL under
20 the exceedances. The permittee merely needs to
21 demonstrate full implementation of the watershed
22 management program.

23 Another watershed with that same constituent you
24 can have an exceedance and the permittee can, again, be

0125 fully implementing the watershed management program and
1 not be protected from being considered in violation for
2 future exceedances.

3 So I think in the spirit of the watershed
4 management approach that's being proposed, there needs
5 to be a consistent level of compliance in the permit for
6 constituents as part of the receiving water limitations.
7 And we request that the same standard be applied to all
8 constituents across the board irregardless of whether
9 it's part of the TMDL or part of the minimum control
10 measures.

11 The purpose here is to on a watershed basis
12 prioritizing and integrating the various pollutants and
13 proposing the best approach. To do that I think we need
14 to have a common standard of compliance apply to all of
15 the constituents, something that's allows the permittees
16 to demonstrate compliance and demonstrate the good faith
17 efforts that we are implementing over the course of the
18 program.

19 Moving on to the TMDL requirement portion, we
20 appreciate the fact that as part of the interim effluent
21 limitations, the adaptive management process is part of
22 that compliance.

23 However, we are concerned about the fact that for
24 the final effluent limitations that adaptive process is

May 3 MS4workshop

0126

1 not included as part of the compliance determination.
2 And what I'm proposing here today is that, as was shown
3 by the staff, as part of the interim wasteload
4 allocation compliance, you have that last step to take a
5 look at the adaptive process. And as part of the
6 watershed management program, we're being required to
7 assess our efforts over the course of the permit period
8 through the adaptive management process.

9 I think prior to the approaching of the final
10 effluent limitation deadline for TMDL, I propose that
11 there be included in the permit a provision that there
12 is a reassessment of the activities undertaken as part
13 of that particular TMDL, monitoring efforts, (inaudible)
14 and based on that assessment that a TMDL be reopened and
15 the compliance dates reevaluated based on this
16 information that's gathered over the life of the permit.

17 Again, I think the whole purpose here is that
18 permittees are being provided the opportunity to
19 demonstrate in good faith that they're implementing the
20 programs, and the fact that storm water permit
21 implementation, BMP implementation is not an exact
22 science, the adaptive management process recognizes that
23 and we are wanting the ability to fully embrace the use
24 of that process in both the TMDL implementation
25 determinations and also the non storm water discharges.

0127

1 And with that thank you.

2 MR. STRINGER: Great. Thank you very much. Our
3 three additional speaker cards all are likely
4 presentations; so I think we'll break now for lunch and
5 hopefully get a court reporter.

6 MR. UNGER: We still have an audio recording, do we
7 not, Al?

8 MR. STRINGER: Do we have audio without a court
9 reporter here? So worst case scenario, we'll at least
10 have audio.

11 MR. UNGER: That's what I'm trying to say. Yeah.

12 MR. STRINGER: We'll talk about whether it's okay
13 to do it that way.

14 MS. MUNOZ: Is it possible to get a copy of the
15 presentations that were given to us from the city of
16 Downey and others that read from comments? I would like
17 copies of those, if possible.

18 MR. STRINGER: Yes, of course.

19 MR. STRINGER: We're going into closed session.

20 MR. UNGER: There's one more short card we can take
21 right now before we break.

22 MR. STRINGER: Okay. Great. I'm sorry. I didn't
23 have this one. James Alameo.

24 MR. ALAMEO: Thank you for the opportunity to
25 speak. My name is James Alameo. I'm here representing

0128

1 as a resident of the Culver City and as a parent in
2 particular asking the regional board to include strong
3 protections in the proposed municipal storm water
4 permit. And what do parents like to do besides talk
5 about their kids; right? And so you as a board are
6 parents to 87 cities, for lack of a better word. There
7 may be one or two in here that we're missing.

8 But basically what we like to do beyond talk about
9 our kids is how we raise our kids. So as parents it is
10 our responsibility to make sure that our kids do what

May 3 MS4workshop

11 they need to do to be healthy and to grow strong and
 12 what that means sometimes is you need to eat your
 13 vegetables, you need to brush your teeth, and you need
 14 to clean up after themselves. And we as parents need to
 15 be vigilant in making sure that these items get done on
 16 a daily basis, and it can be tiring especially when our
 17 kids whine and complain and throw tantrums about
 18 complying with, in this case, water quality standards.

19 And worse yet is when our kids get older and get
 20 wise and try to play us for fools. And that can be very
 21 frustrating, and at that point at some point we say to
 22 ourselves enough is enough and we threaten the
 23 consequences or loss of privileges or fines in terms of
 24 loss of allowance.

25 If you don't follow through with those threats,

0129

1 then what happens with our kids? Our kids begin to then
 2 take over and not necessarily respect what we need done
 3 and have them to do. Finally so you as parents have
 4 asked your kids time and time again to clean up their
 5 rooms. In 1990, '96, 2002, 2012 you passed or you're
 6 about to pass the four iterative of the municipal storm
 7 water permit. In 1998 -- time? Okay.

8 MR. STRINGER: A few more seconds to wrap up.

9 MR. ALAMEO: A few more things. So in 1998 528
 10 was passed. 2002 bacteria TMDL's. 2003 SB72. 2008
 11 (inaudible) extension. 2008 NOB's were sent out. 2012
 12 NOB's were sent out. What I'm trying to get to is you
 13 have the opportunity to include critical numeric TMDL
 14 limits in this storm water permit with respective
 15 compliance deadlines and you should because you said it
 16 enough times. Thank you very much.

17 MR. STRINGER: Thank you very much. And I
 18 apologize to Jesse Trujillo. Did you want to make a
 19 comment now? This is an opportunity for a two-minute
 20 comment before we break for lunch. I apologize. I
 21 forgot.

22 MR. TRUJILLO: Thank you Mr. Chair, board.
 23 Yes. My name is Jesse Trujillo. I'm a diver,
 24 scientific diver as well as I am a volunteer with Heal
 25 the Bay, with MTA Watch. So walking along these beaches

0130

1 and coastlines, I do witness the point source of
 2 activity being discharged onto and off of the cliff
 3 sides and directly into the Oceans. What I'm
 4 understanding and hearing is we have bacteria versus
 5 we're trying to actually permit these limitations. So
 6 which one of the two? We have bacteria entering the
 7 oceans which is depleting the oxygen levels inside the
 8 ocean itself versus we can apply these limitations to
 9 the permit and hopefully decrease that activity.

10 Bacteria. Bacteria consumes oxygen that's in the
 11 ocean water. If we don't implement these limitations
 12 now, we're going to have to implement an aeration system
 13 into our oceans in order to give back or create more
 14 oxygen levels in order for the organisms and marine life
 15 to sustain their habitats. Including that will deplete
 16 the sickness and the involvement of surfers, divers,
 17 beach goers and including the marine life itself. We
 18 have to have these limitations implemented now or we're
 19 going to have to implement more into our oceans.

20 Looking into the future I see we have a 2012 to
 21 2021 electric submersible submarines and electric boats

May 3 MS4workshop

22 to become. If we include these limitations now, we will
 23 sustain and hopefully restore and keep our oceans
 24 healthy before we have to take further actions into our
 25 oceans itself. Thank you for listening.

0131

1 MR. STRINGER: Thank you very much. Okay. I
 2 apologize for that. We'll now head into closed session.

3 MS. FORDYCE: The Regional Board discussed items
 4 22.8, 22.10, 22.11(b), and 22.12.

5 MR. STRINGER: We'll reconvene here properly at
 6 1:30. See you back here. Thanks very much.

7 (Proceedings suspended at 12:20 P.M.)

8 (Whereupon Katrina Woyjeck, CSR No. 13603
 9 reported the remainder of the proceedings,
 10 resuming at 1:33 p.m.)

11 MR. STRINGER: Thank you everybody for being so
 12 prompt. I hope you had a good lunch. We're going to
 13 get right back into our MS4 workshop.

14 One point of information: Those that are here for
 15 the information items, items 20 and 21, we had two
 16 speaker cards, and we looked at the schedule. I don't
 17 see how we're going to get to those items today given
 18 the fact that we have to get out of here at 5:00.

19 So I've decided to just tell you now that those
 20 information items are going to be continued to the next
 21 meeting in case you don't want to stay around or -- just
 22 thought we'd let you know that now.

23 And thank you for accommodating the moving target
 24 here of our agenda. It's a lot to get through in a
 25 short period of time. So we have three more

0132

1 presentations.

2 All have asked for extended periods to make their
 3 comments in and all have been asked to really keep their
 4 comments within 30, 40 minutes if they can and just be
 5 efficient.

6 And the Board really wants to have time to ask
 7 questions and make comments of its own, and the more
 8 time we have to do that, I think the more informed we
 9 will all become. We don't have opportunities at having
 10 these conversations given our ex parte limitations, so
 11 we really want to take advantage of the time we have
 12 today.

13 First up is Heal the Bay.

14 MS. JAMES: Good afternoon. My name is Kirstin
 15 James, and I'm the water quality director with Heal the
 16 Bay. I'm going to start off today and then my
 17 colleagues at Santa Monica Baykeeper will follow with
 18 similar specific comments. I did have a presentation.

19 And we're going focus today on two of the sections
 20 mainly, and that's the TMDL provision section and the
 21 watershed management program provisions. And what I'm
 22 going to do is set the stage a bit for the importance of
 23 strong requirements in these sections and the elements
 24 that are critical to keep in mind as these provisions
 25 are both discussed and developed.

0133

1 So the charge of you as water board members are to
 2 develop and enforce water quality objectives. This is
 3 stated on your web page. And I think it's a fairly
 4 clear mandate and given that, there are a few things I
 5 want go to go over and to help set the stage and things
 6 that should be kept in mind through this entire process.

May 3 MS4workshop

7 And the first is up here. The goal of protecting
8 human health. No one should get sick from swimming at
9 their favorite beach. In Santa Monica Bay back in 1995
10 an epi -- epidemiological study was conducted, and
11 basically this was the first epi study conducted in
12 urban runoff contaminated waters.

13 And the purpose of this study was to answer two
14 questions. First, is the distance of swimming from a
15 storm drain associated with risk of adverse health
16 outcomes? And two, is bacteria an indicator to predict
17 risk of adverse health outcomes?

18 And what the major findings of the epi study shows is
19 that yes, there was a correlation between incidents of
20 adverse health effects and swimming in water with high
21 indicator densities. And also, those who swam in front
22 of a flowing storm drain are twice as likely to get sick
23 than those 400 yards away.

24 Another interesting component of this study was the
25 demographic breakdown. And I've put this up here

0134

1 because it really shows that all Angelenos are impacted
2 by dirty water at the beaches and not all are not
3 impacted in the same way. But the bottom line is that
4 they all deserve protection.

5 And unfortunately the goal of fully protecting public
6 health is not being met at our beaches all the time.
7 Another goal that you are all charged with protecting
8 aquatic life.

9 Pollution should not impact our habitat and our
10 species. And for anyone who has participated in Heal
11 the Bay or Baykeeper Beach or Creek Cleanup, you know
12 that this is not the case at all times, and our goal
13 here is not being met. We see trash littering our
14 beaches and impacting our habitats.

15 Again, back to the protection of public health, a
16 goal that your Board is charged with protecting here.
17 Unfortunately, fisherman including subsistent fisherman
18 that fish for their families, you know, every day of the
19 week, should not have to worry about toxins that are in
20 the fish they eat.

21 But again, unfortunately, we have many fish
22 advisories in place in our region and we need Heal the
23 Bay Angler Outreach team that you've heard about before
24 to educate these people about the toxins, so that they do
25 not eat these fish.

0135

1 But unfortunately, again in this case our goal of
2 public health protection is not being met all of the
3 time. So unfortunately, many of these goals including
4 the three I just mentioned aren't being met.

5 Here is our 303D list. As we see, unfortunately
6 there's a lot of red up there on the screen. We have an
7 extensive list of 303D impaired water bodies in our
8 region as you well know. But the promising and good
9 news is that we have tools that can get us on track for
10 cleaning up these waters. And TMDLs are the tools that
11 are putting us on this track.

12 Here's a recent press release from USEPA that many of
13 you probably saw a month or so ago. Your chair is
14 quoted in the piece. And basically it's touting the
15 accomplishments done by your board and EPA jointly where
16 175 water bodies in LA and Ventura counties now have
17 TMDLs. And these TMDLs are going to hopefully put us on

May 3 MS4workshop

18 track for making progress and reaching our goals at the
19 end of the day.

20 So we obviously have an extensive list of TMDLs that
21 have already been adopted. We have TMDLs to clean up
22 our beaches, TMDLs to clean up our trash, ridding creeks
23 and beaches, TMDLs to clean up our contaminated fish,
24 among many others.

25 And I'm going to provide just a few minutes on one
0136

1 example of TMDL that we all know very well, and that's
2 the Santa Monica Bay beach bacteria TMDL, just to get a
3 little perspective on how these TMDLs actually have come
4 in place and are being worked on now.

5 So I apologize if this is a little small, but what
6 we're trying to do here is set the stage for the
7 extensive amount of time that permittees have been on
8 notice to clean up our beaches and to clean up our
9 waters.

10 Back in 2003, we have this Santa Monica Bay Beaches
11 TMDL that was in effect, and this was a notice to
12 permittees that cleanup was going to need to occur to
13 make sure that water quality standards are met at our
14 beaches and that public health is not compromised.

15 In 2006, we had the compliance deadline for the TMDL
16 summer dry weather period. That means that these
17 permittees were on the hook for ensuring that public
18 health was in fact protected. And at the same time that
19 year -- it was an eventful year -- we also had the TMDLs
20 put into the stormwaters permit.

21 So moving forward a bit, in 2008, your board sent
22 another notice, so to speak, of actions that were not
23 sufficient by sending NOVs and asking for more
24 information because some of these beaches were not
25 meeting these compliance deadlines. So a list of NOVs

0137
1 were sent out in 2008, again, another notice that
2 cleanup is needed.

3 And then in 2010, we saw the TMDLs taken out of the
4 permit in effect due to attorney error, but the TMDL
5 itself was still in effect. So it is a long extensive
6 history and permittees had plenty of notice that they
7 were on the hook for cleaning up our beaches.

8 So we should note that there are some positive
9 stories and there have been some efforts made. Here's a
10 map full of low flow diversions that folks like the city
11 of LA have put into place to try and comply with the
12 beaches bacteria TMDLs. You know, just of note,
13 environmental groups have been very supportive of these
14 efforts and have actually helped secure funding through
15 the clean beach initiative for these.

16 Here's an example using our Heal the Bay beach report
17 card of the Santa Monica pier and some progress is being
18 there as well. We've seen grades that have jumped up to
19 A grades after being on the beach (inaudible) list for a
20 very long time and being chronically polluted. So we
21 have seen some progress there.

22 However, across the board, unfortunately, there
23 hasn't been enough done and these totals I've shown you
24 before; they're quite staggering.

25 So here we have just since 2006 when that initial

0138
1 date which I mentioned the compliance period for the
2 Santa Monica Bay beaches dry summer weather TMDL was

May 3 MS4workshop

3 supposed to be complied with. At that point, we had
4 181 exceedances. Come up to today, and you see over
5 3,000 exceedances.

6 So what does that mean? That means our goal of
7 public health protection is not being met at the
8 beaches. And that means that six years of violations
9 and public health threats have been accumulating. And
10 this is just simply unacceptable. TMDLS give us the
11 path to clean up beach water bodies and to meet these
12 goals and to meet the charge of your water board here.
13 And they need to be taken seriously.

14 So with that, I'm going to turn the stage over to
15 Liz Crosson of Santa Monica Heal the Baykeeper. And
16 she's going to talk about some of those specific
17 concerns we have with the TMDL provisions. Thank you.

18 MS. CROSSON: Good afternoon, members of the Board.
19 Thank you for the opportunity to speak today. So in
20 this long history of exceedances which threaten public
21 health, that is exactly why we do have some serious
22 concerns with staff proposal for TMDLS.

23 In particular, we're concerned at the proposal that
24 actually backed by previous permits as well as previous
25 provision this board has taken.

0139

1 So I'm going to discuss our issues with the TMDLS
2 section in four sections. One, the inclusion of time
3 schedule orders and the languages of permits; two, the
4 treatment of long overdue TMDLS and this includes TMDLS
5 developed both by the regional board and EPA; three, the
6 lack of clear interim TMDL requirements; and four, the
7 need to comply with federal and state regulations.

8 So first and foremost, the inclusion of an option for
9 time schedule orders in the permit is inappropriate.
10 Time schedule orders are actions within the
11 prosecutorial instruction of the Board pursuant to the
12 water code. This is an action to enforce permit
13 requirements, not an actual permit provision itself.
14 This unnecessarily complicates the permit.

15 The permit instead should have those limitations and
16 the requirements (inaudible) provided this option of
17 time schedule order in cases where its necessary. If
18 the Board really feels like it needs to clearly
19 articulate that the time schedule order is an option, in
20 addition to where it's stated in the clean water code --
21 in the California water code, then, you know,
22 potentially mentioning it in a fact sheet would be a
23 much more appropriate place to have information like
24 that.

25 However, our concerns do not stop with just the

0140

1 inclusion of the TSO provisions in the permit. We are
2 also concerned with the appearance that the Board's
3 intentions grant additional time through the TSO for the
4 TMDLS that are way past their compliance dates.

5 So I'm going to talk about these past due TMDLS in
6 two different categories the way that the working
7 proposal does. TMDLS are issued by the regional board
8 and are also issued by the EPA. But I'd like to note
9 that this distinction is somewhat irrelevant in my mind
10 when we're talking about TMDLS that are five to ten years
11 overdue -- passed due.

12 So whether it's an EPA TMDL or a regional board TMDL,
13 we're talking about really old TMDLS. So as you can see

May 3 MS4workshop

14 in this slide, and I apologize if it's too small, but
15 there are just a handful of passed due TMDLs.

16 Thirty-three TMDLs are going to be incorporated into
17 this permit. But they are critically important, and the
18 majority of them are bacteria TMDLs. So they're dry
19 weather bacteria TMDLs at beaches intending to protect
20 public health.

21 And as Kirsten pointed out, the TMDLs are based on
22 data, you know, back -- over a decade ago demonstrating
23 that bacteria is carried by stormwater and is a serious
24 threat. We have the data, we have proving TMDLs in
25 2003, 2004, 2005. Some are dry weather requirements and

0141 became effective in 2004, 2006, and 2007.

1 I mean, these are things that have been in place for
2 quite a long time that are meant to protect those
3 swimmers and surfers that you heard testifying this
4 morning.

5 So again, Kirsten mentioned this. This takes us down
6 all the way to that period TMDLs. It was approved in
7 2003. It became effective in 2006. It was incorporated
8 into the permit, and we did see improvements. And that
9 is something that I think is really important to think
10 about, is that those requirements, having them
11 enforceable in the permit really did compel
12 municipalities to take action, for permittees to take
13 action. And we saw some great progress. And not
14 everyone, not every permittee made those steps, but many
15 of them did, and that's a clear example of why we need
16 these strong permit limitations in the permit.

17 So staff's proposal that municipalities may request a
18 time schedule order for an extension of time to comply
19 with almost ten-year-old standards is unacceptable.
20 Furthermore, there is no time limitation suggested. We
21 could be looking at a TSO approved, like, a year from
22 now with, what? Five, ten-year extension. It really -- we
23 don't know. And the TMDL based on years of data and the
24 public health risks wouldn't actually be enforceable on

0142 that date until what? 2023?

1 The beach bacteria TMDL has been in place since 2003.
2 That's 20 years later. There are millions of people
3 that visit our beaches ever year. According to lifeguard
4 data, 56 million people visited the Santa Monica Bay
5 beaches in 2010.

6 The Santa Monica Bay beach bacteria TMDL provides
7 protection for over 50 beaches in our region. This is a
8 critical piece of regulation that you are required
9 (inaudible) to use and protect, and it's a fantastic
10 tool to actually making progress.

11 The same is true for EPA TMDLs. I have included all
12 eight of the EPA TMDLs. These are just a handful.
13 These are three. And you can see that the effective
14 date of these TMDLs are 2003 and 2007.

15 So we're not talking about the EPA TMDLs from 2012.
16 We're talking about almost ten years old in some of
17 these cases. Permittees will note that these are
18 requirements that they need to comply with and the
19 permit needs to reflect that.

20 So the third point that I would like to talk about is
21 the interim. The interim deadlines and the TMDLs and
22 the fact that we need some clear ways to track progress.
23 So right now there is an action-based alternative into a

May 3 MS4workshop

25 working proposal.

0143

1 And while we support implementation of (inaudible) to
2 reach those final effluent limitations, there needs to
3 be numeric interim as well to track compliance. That's
4 the only way that we are actually going to be able to
5 reach those end dates.

6 So we've got these water quality based effluent
7 limitations or we've got receiving water limitations at
8 the end of the day, but there has got to be some numeric
9 in between, so that we make sure that we get there.

10 I think this would also provide a much easier way for
11 your overextended staff to reach the goals that they
12 need and to make sure that these ADA permittees are
13 actually on track and they are actually going to comply
14 with the permit at the end of the day.

15 And my -- the fourth point I want to make about the
16 TMDL section is we need to ensure that the TMDL section
17 complies with federal and state regulations. So there
18 are regulations that say that the provisions need to be
19 consistent with the wasteload allocations.

20 And I will note that also includes (inaudible)
21 allocations that are past due. So things like
22 Santa Monica Bay bacteria TMDLs, those are past due
23 allegations, and this permit needs to comply with those.

24 Secondly, there are -- CFR, Code of Federal
25 Regulations provisions that (inaudible) compliance

0144

1 schedule. And that same compliance schedule that's
2 incorporated into this permit needs to comply with those
3 criteria, which are things like as soon as possible,
4 there has to be interim dates if it's longer than one
5 year.

6 There needs to be clear requirements step-by-step and
7 only when necessary. There are also California toxic
8 rules deadlines that need to be considered when you're
9 talking about things like metals TMDLs. That's going to
10 be a critical part of determining when compliance is
11 required.

12 And lastly, any state policies, regulations dealing
13 with compliance schedules also need to be complied with.
14 And then to kind of jump into another section in the
15 receiving water limitation section, we do support
16 retaining the language as it is in the receiving water
17 limitations.

18 Renee Purdy clearly laid out that the legal
19 justification for that is been -- this language has been
20 upheld in state courts in federal court. And I would
21 also note that the regional board itself has provided
22 (inaudible) in one of our cases where the regional board
23 also took the position of being with -- (inaudible)
24 being stand-alone requirements that are enforceable
25 under the permit. So I would urge you to (inaudible).

0145

1 And now I'll introduce Noah Garrison from NRDC.
2 Thank you.

3 MR. GARRISON: Good afternoon, Mr. Vice Chair and
4 members of the Board. Thank you again for taking time
5 to hear our testimony here. I want to absolutely
6 support the statements that were made by my colleges at
7 Heal the Bay and Baykeeper and point out that the TMDLs
8 are really the backstop in the permit.

9 These form a safety where our waters are failing to

May 3 MS4workshop

10 meet (inaudible) pollution. The TMDLs are there to
11 protect public health, to protect the environment, to
12 protect our coastal and inland water-dependent economy,
13 so these are something absolutely critical for the
14 permit. And making sure that the limitations are in the
15 permit and enforceable is something that absolutely
16 should be enforced by the Board.

17 (Inaudible) to the discussion of the watershed
18 management program. And the first thing that I would
19 say to that is we absolutely support collaboration by
20 the permittees in terms of pulling our programs
21 together. And we also do agree that there are
22 circumstances in which flexibility may be appropriate,
23 particularly for new control measures such as education
24 or public participation.

25 It may vary widely by different jurisdictions, but

0146

1 the first thing I would say is that for the watershed
2 management programs, requirements independently can meet
3 TMDL standards or (inaudible) cannot be replaced or in
4 effect excused by participation or (inaudible) in the
5 watershed management program. These are independently
6 enforceable provisions, and they need to remain that way.

7 As a sort of related point to that, but sort of a
8 following we find with the way the watershed management
9 program is derived right now, I want to turn sort of the
10 overall structure for adopting a permit and the
11 requirements for a permit. And particularly the
12 watershed management program states that permittees can
13 effectively draft their own minimum control measures, or
14 augment the minimum control measures.

15 So I'll point out that the first part is the initial
16 permit requires that discharge of pollutants is reduced
17 to the maximum extent practicable. So that's the
18 overarching standard generally for the minimum control
19 measures is it has to be reduced to be maximum extent
20 practicable.

21 With that, the Ninth Circuit in (inaudible) vs.
22 (inaudible) pointed out that in making that
23 determination, programs like this that are (inaudible)
24 evaluated permittees as the watershed management
25 programs board have to in every instance be subject to

0147

1 meaningful review by an appropriate regulating entity.
2 And in this case, that's the full board.

3 The way the watershed management program is currently
4 designed is that the program would be noticed and
5 submitted for review and approval by the executive
6 officer. And unfortunately, that's an improper
7 delegation of authority that this board has. The
8 watershed (inaudible) measurement programs to the extent
9 that they are making any determination as to what the
10 maximum percent practicable provisions or other
11 requirements the permit will be has to be reviewed by
12 this board and also the court pointed out that public
13 participation is an integral part of that.

14 So it has to be subject to notice and time by the
15 public, and we would suggest put forward by the Board
16 for a hearing. That would be our primary position on
17 this is that it really needs to be board (inaudible)
18 entity for any changes that are made to permit requirements
19 that invoke minimal control measures.

20 Following further from that -- and I would like to

May 3 MS4workshop

21 thank Renee Purdy for pointing this out -- but when we
 22 start getting to the planning and development of
 23 planning the land use provisions of the permit
 24 requirements that new development or redevelopment
 25 projects in hydromodification controls these specific

0148

1 numeric controls.

2 In particular, these are effectively practicable. It
 3 seems it would be improper to allow a program that would
 4 alter anything or provide anything below which are required
 5 in these (inaudible) permit. (Inaudible) as practicable
 6 requirement to retain 85th percentile storm onsite for new
 7 development or redevelopment. This is the Ventura permit,
 8 and it requires that, though using slightly different
 9 language stating that it will result in the effective
 10 permit area, that the (inaudible) is retaining 85th
 11 percentile storm onsite as this permit does in its drafted
 12 provisions. The same provisions are required in the
 13 Orange County permit which states and the South Orange
 14 County permit as well as in permits for Riverside County,
 15 San Bernardino County, the San Francisco area, outside of
 16 California.

17 This is in permits in west Virginia, in the city of
 18 Philadelphia, Portland, the State of Pennsylvania,
 19 federal buildings, all have standards similar to this.
 20 And it would be improper to allow alterations to this
 21 that would require anything less than retention of this
 22 storm.

23 If the permittees want to collaborate and augment
 24 this standard in particular who apply for requirements,
 25 where we can start getting at the existing requirement

0149

1 and significant resettlement projects, we absolutely
 2 support that, but this has to form a floor, and we don't
 3 think there's any watershed program. With that, I'd
 4 again -- I'd like to support. Thank the Board very much
 5 for --

6 MR. STRINGER: Thank you very much. We next have the
 7 LA Permit Group. Heather Maloney and Heather Miranda.
 8 How much time do you think you'll need?

9 MS. MALONEY: We think about 30 minutes.

10 MR. STRINGER: Great. Thank you.

11 MS. MALONEY: We'll try to go as quickly as possible.

12 MR. STRINGER: Quickly, but not too quick.

13 MS. MALONEY: Does the clicker work? Oh, fantastic.

14 Good afternoon, board members and Chair. My name is
 15 Heather Maloney, and I'm the Chair of the LA Permit
 16 Group.

17 First off, I wanted to thank you again for continuing
 18 these workshops and this public forum. I think it's
 19 very beneficial for the permittees, and as I know you've
 20 expressed, it's beneficial for you as well.

21 And we recognize that this permit has been a long
 22 time coming, and about a theme that's kind of overarched
 23 a lot of comments today. And we want to reassure you
 24 that we share the common goals that have been expressed
 25 today as as far as water quality and human health, and

0150

1 we want to see those accomplished through comments.

2 we look forward to continuing partnership throughout
 3 the development of this permit as well. And to be
 4 utmost clear, we do share these common goals in
 5 improving the water quality. And we want to make sure

May 3 MS4workshop

6 that the permit keeps the big picture in focus as we
7 move forward.

8 And the general concept of staff's presentations have
9 done this especially in terms of the watershed
10 management program. And they describe a progressive
11 process so permittees can work towards improving water
12 quality especially with the integration of the TMDLs and
13 with the watershed program.

14 I'm going to flip through some of these for the sake
15 of time. Just for a quick notice here again, these are
16 all the cities that are voting agencies of the LA Permit
17 Group. We have an additional member as of our last
18 presentation, so we do, as a note, we do have 62 voting
19 agencies of the LA Permit Group.

20 And you've all seen that one, so I'm going flip
21 through that. And throughout this process of -- staff
22 proposals have identified several increased standards of
23 permits people who -- will be required to meet.

24 In general, the LA Permit Group has been advocating
25 for permit provisions that allow us to work towards

0151

1 increased water quality while allowing us to prioritize
2 (inaudible) towards efforts that will have the largest
3 impact to improved water quality.

4 In this vein, we want do want to address the
5 impression by some of the stakeholders that this permit
6 will be rolling back requirements. This cannot be
7 further from the truth. Rather, the proposed provision
8 presented by staff in prior presentations and in this
9 one are very progressive and propose requirements that
10 set the framework for a strategic process which will
11 meet the further improvements in the water quality.

12 In order to achieve further water quality
13 improvements, this process needs to set clear goals
14 while (inaudible) flexibility with the program and
15 (inaudible). We feel that this is done through the
16 watershed management program, and the way we approach it
17 is through that integrated planning approach that
18 integrates TMDLs monitoring and the planning
19 programming.

20 And this is really the only way that we're going to
21 be able to effectively address multiple pollutants
22 through a permit process.

23 Again, as I expressed at the the beginning of the
24 presentation, we are extremely thankful for these
25 workshops, and we feel that they are very helpful for us

0152

1 in developing the concept of the permit and being able
2 to get feedback from you as board members as well as
3 other stakeholders.

4 And we do want to request -- because Renee outlined
5 that there was several portions of the permit that have
6 been presented throughout the process and the
7 stakeholders, specifically the permittees, have given
8 very specific and lengthy comments on all those.

9 We have -- some of those we have not had the
10 opportunity to see revisions. So we do request that we
11 see an administrative permit or at the very least
12 another workshop that discusses the entire permit as a
13 whole so we get that holistic view of what all the
14 pieces really look like together prior to a tentative
15 permit release.

16 And this new permit will be significantly more

May 3 MS4workshop

17 complex. As we've heard throughout the day, there are a
18 a number of TMDLs that are being integrated, 32 overall,
19 where we have just a couple in our permit now.

20 So this really requires a completely different
21 approach in looking at this permit. We need to look
22 currently. You know, if we just slide the TMDLs into
23 the permit, we're really kind of just getting our same
24 old permit with a lot of the same TMDLs.

25 We haven't revolved a lot of issues that have been

0153

1 been discussed with TMDLs and the integration of the
2 programs. So we really need to look at a paradigm shift
3 overall. And taking the TMDLs, the permit provisions as
4 well as monitoring programs, and filtering those all
5 together and looking at them holistically and looking at
6 how can we do things better to get to water quality?

7 Because we've heard existing model doesn't work. We
8 need to look at a different approach. So we really
9 would encourage you to consider this watershed
10 management program.

11 We feel that it does integrate the water in these
12 four elements and it does try to make a paradigm shift
13 that allows us to allocate resources effectively to get
14 the most water quality bang for our buck, basically.

15 And the LA Permit Group is very much in support of
16 the watershed planning approach. This will support the
17 (inaudible) integrating planning and monitoring programs
18 as mentioned.

19 Monitoring (inaudible) time needed to determine the
20 most effective and efficient approach to adopting these
21 TMDLs. The integrated planning and monitoring programs
22 will provide additional information needed to establish
23 the best course of action to achieve those water quality
24 goals.

25 without disabilities for the planning and monitoring

0154

1 programs to provide the feedback and to go into the planning
2 of the watershed plan -- or program which we really don't
3 have this (inaudible) approach and that's very -- that's a
4 very -- to be able to take all these TMDLs and effectively
5 wrap them into a permit.

6 So don't lose sight of the horizon as we move through
7 this process. It is a completely different approach
8 that is being suggested, but ultimately if we stick it
9 through, we, you know, can have a whole different
10 approach and a very effective way of dealing with water
11 quality in this region.

12 And I'm going to start off with some comments on the
13 receiving water limitations and then my colleague,
14 Heather Miranda, is going to get up and speak on
15 comments related to the watershed management program and
16 TMDLs.

17 So the proposed receiving water limitations provisions
18 may actually end up working against the proposed
19 watershed management program in that in the watershed
20 management plan (inaudible) boards are neglecting their
21 highest priority water quality issues.

22 And then we'd either be customizing the control
23 strategies around those issues. In selecting the
24 highest priority, we are considering a lot of
25 information. We have TMDL requirements through 303D

0155

1 listings, frequency of water quality exceedance, and the

May 3 MS4workshop

2 opportunities for controlling other pollutants.

3 However, under the receiving water limitations
4 provision, the MS4 must address every pollutant that
5 causes or contributes to a water quality standard
6 exceedance. In this state, there's no distinction between
7 a pollutant that is an issue with every storm, such as
8 bacteria that has been mentioned in the previous
9 presentation, or some infrequent water quality standards
10 exceedance, but at least we (inaudible) in a different
11 way.

12 There is no filter to address these larger water
13 quality issues versus violations or intermittent issues.
14 As written in the receiving water limitations, they would
15 provide -- depending on the permittee and the violation
16 of the permit, at the onset of these optional permits.
17 We need to be able to work through a process to plan
18 implementation.

19 We need to be able to work through a process
20 approach. The way that those provisions are currently
21 written don't even give us the chance to implement the
22 permit before we would be in violation of it. So we
23 need to have something that's practically useful.

24 So although the watershed management program they
25 call out addressing the receiving water quality standards

0156
1 and the way the (inaudible) language is currently
2 written, and it does not allow the use of adoption
3 management approach to deal with these.

4 Rather, even through -- even though we -- we may have
5 continued -- we may have outlined the pollutant in the
6 watershed management program, we (inaudible) recent
7 permit so that just supports the previous comment that
8 we really want to be able to address all water quality
9 issues in this watershed plan.

10 So we definitely support the approach. However, it
11 is limited as we see it through TMDLs. Now, that's a
12 great approach to the TMDLs, but we want to be able to
13 apply that model to all pollutants and good models that
14 can really get us progress towards water quality in the
15 region.

16 As mentioned by some of the previous stakeholders,
17 the receiving water limitations, as it's written right
18 now, is a statewide issue among permittees, and we
19 really want to encourage this board to work with the
20 state to resolve some of those issues.

21 It's been presented at the state board level and
22 various permittees throughout the state that have
23 similar issues as we do here today.

24 So I'm going to hand it over now for the watershed
25 management program discussion.

0157
1 MS. MIRANDA: Good afternoon. My name is Heather
2 Miranda, and hopefully I won't mess up the PowerPoint
3 too much. I'm not technologically (inaudible.)

4 The watershed management program, as written, we
5 support it obviously. I think we've said that in a
6 couple different ways in parts of our presentation.

7 (Inaudible) has said to us for us to deal with our
8 highest priority issues and it provides us with
9 sufficient flexibility, but it also gives us enough
10 guidance to be able to have our groups work together to
11 come up with a document that's really going to solve our
12 water quality problems without being overly strict

May 3 MS4workshop

13 (inaudible).

14 We do have some recommendations for improvement. We
15 would like to see a closer integration between the
16 program and the TMDL monitoring and the stormwater
17 monitoring. We want to have sufficient time between
18 those -- those elements, as our graphics show, in order
19 to have an effective TDML factor that should really help
20 them to define what's working for them.

21 We'd also like the watershed management program to
22 more prominently include provisions in the more overall
23 habitat restriction, ecosystem health, not just water
24 (inaudible) pollution because it comes up that's also a
25 more integrative approach, and it really gets us to the

0158
1 core of supporting our (inaudible).

2 One of our major concerns, however, with this
3 watershed management program is that there's just not
4 sufficient time for us to develop it. In order to
5 develop a plan that would have our individual assurances
6 succeed, we need a year of developing the plan and
7 monitoring for one year. In collecting the information,
8 calibrating the information for another year in order to
9 really have a reasonable assurance of success.

10 We also need to have some time to go through our own
11 political processes to adopt our plans through our city
12 and through our county. One thing that we noticed was
13 absent is that this is very unclear how we would define
14 with the permit during the interim period while we're
15 developing the watershed management program.

16 We would suggest keeping our current storm management
17 programs and our TMDL limitation plans before cities
18 have a chance to evaluate new things like a minimum
19 control measures (inaudible) as part of the watershed
20 plan.

21 And I think Renee did a good job of explaining the
22 assessment. We think that she's taking a more careful
23 approach to how we would be doing our assets. We would
24 like to see those additional inclusions in the watershed
25 management plan and technical and economical

0159
1 flexibility. They were absent from the criteria.
2 That's something we would like to evaluate.

3 And we'd also like some clarification and some
4 acknowledgement of political sources that are outside
5 the permittees' authority and outside the permittees'
6 control. Examples are aerial deposition, natural
7 sources, permanent sources, things of that nature.

8 We would jump back into language that some sources
9 are going to be outside of our control, we can't do
10 anything about and we are not that accountable for those
11 sources.

12 This MSDS permit -- we're now -- I'm going into the
13 TMDL section. This MSDS permit is doing something
14 that's never been done in the State of California in
15 relationship to the sheer number and magnitude TMDLs
16 that are being incorporated into a single permit.

17 This effort needs to be done correctly given the
18 magnitude of what we're about to try to accomplish.
19 Rushing through this process is only going to cause more
20 problems down the road for an already complex and
21 difficult permit.

22 It's not going to help water quality to rush through
23 it. There's also fundamental policy provisions that

May 3 MS4workshop

24 should remain in the documents that will have
25 implications statewide and for every -- for all storm

0160

1 water programs throughout the state.

2 We would like to have flexibility to achieve those
3 water quality improvements that are more effective and
4 efficient. There's also a lot of uncertainty in these
5 -- in many of these TMDLS.

6 The sophistication of the TMDLS -- of the 32 TMDLS
7 vary widely. And not all TMDLS have been created
8 equally. The data available at the time of many TMDL
9 development was not the best available -- is not the
10 best available data that we have today.

11 We don't have -- we don't have the kind of data to
12 enterprise sources and solve problems that should be
13 used in watershed planning. The TMDLS included
14 re-openers to reflect the certainty of the time the
15 TMDLS were developed. And we would like to make sure
16 that those -- the re-openers are utilized in order to
17 try to make sure that these TMDLS are given us enough
18 time to (inaudible). So we need flexibility and we need
19 time.

20 The regulations, the strict numeric (inaudible) are
21 not required and they're going to be counterproductive
22 to achieving water quality. And the only effort
23 (inaudible). The regulations and the EPA guidance
24 provide this board with the power and the discretion to
25 decide whether or not we will have strict numeric

0161

1 compliance or whether or not compliance could be
2 determined through best management process.

3 You have the power to do that. It's under your
4 discretion. Wasteload allocations can be determined
5 through implementing water management practices or
6 (inaudible) limitations. Certain numeric requirements
7 are not required here. But the working proposal
8 requires strict compliance in the required time limit.

9 The working proposal allows compliance in the interim
10 limits through the state limitation, the best management
11 practices as specified in the watershed management plan.
12 And essentially what we're asking here is the compliance
13 demonstration (inaudible) under a slide, is to add the
14 watershed management plan -- the watershed management
15 plan box to the final -- final allocations (inaudible).

16 The watershed management plans are the way that
17 cities will be accountable. Just because it's not a
18 strict numeric permit doesn't mean that we won't be
19 accountable and that we won't be working hard to achieve
20 water quality.

21 One of the major fundamental policy decisions that
22 you are making in this decision is how to handle EPA
23 developed TMDLS. Do you really want to use the time
24 schedule order to address a TMDL that has not had any
25 compliance -- defined compliance time or period to

0162

1 develop any kind of action, especially when we've seen
2 many of these TMDLS as early as -- the earliest we've
3 seen them is March of this year.

4 Especially when the time schedule order still leaves
5 us open to third party litigation, it just doesn't seem
6 fair. Or it doesn't seem fair. Basin plan amendments
7 are the best way to take the necessary time to do this
8 right due to the magnitude to develop what we're trying

May 3 MS4workshop

9 to accomplish here.

10 The second fundamental policy position is how are we
11 going to incorporate expired TMDLs into a permit. We
12 would respectfully request that we have the re-openers
13 of the TMDLs to allow us to have more time to integrate
14 them with our watershed management plans.

15 (Inaudible) compliance TMDL (inaudible) indication of
16 best management plan and watershed management plan will
17 accomplish the goal of clean water in a more effective
18 and efficient way, and yet will allow to correlate with
19 all the other pollutants that we're going to have to
20 deal with on all these other issues and make sure that
21 what we're doing is effective and efficient that we can
22 create a situation where we're treating many water
23 quality pollutants with one action. That's what we're
24 going to have to do.

25 And we need time to do that. We would like to have

0163

1 the basin plan amendment processed immediately for these
2 expired TMDLs to give us more time and to give us the
3 protection from water quality that we need.

4 So in closing, cities implementing the LAMS4, we're
5 halfway through running a marathon. We're not dragging
6 our feet. We have hundreds of people. We have done
7 close to a billion media -- close to a billion media
8 (inaudible). We have hundreds of thousands of
9 inspections, enforcement actions, thousands of treatment
10 devices, and storm drain conversion.

11 We have been working very hard. This is only a
12 sample of due process body (inaudible) accomplish. The
13 finish line for this route keeps becoming more and more
14 difficult and challenging for (inaudible) policy change.

15 As you all know, public service is a rewarding but
16 difficult job. It may never have been harder than it is
17 now. In the midst of all this difficulty, cities are
18 still working to protect water quality. We are working
19 towards the end point and some of us have even stumbled.

20 The thing about this marathon is that it's a long
21 run. It's going to require endurance and dedication
22 until we cross the finish line for water quality to win.

23 This permit, the policy decisions that you're making
24 today -- or in this permit -- could encourage the
25 runners to keep going in order for us all to reach the

0164

1 finish line of clean water.

2 This permit presents an opportunity to change the
3 paradigm if we work together to cross the finish line.
4 This requires strategic process that will take time to
5 get it right. We urge you to develop the permit
6 conditions based on a reasonable timeframe (inaudible)
7 to the existing economy and other health safety
8 regulatory quality of life factors that local agencies
9 will be held accountable for.

10 A permit tailored to (inaudible) will lead local
11 water quality conditions is the path that will lead us
12 to the finish line. Please use your authority to
13 support all of us crossing the finish line and work to
14 achieve (inaudible.) Thank you for your time.

15 MR. STRINGER: Thank you very much. The last card I
16 have is Ray Tahir. How much time do you think you'll
17 need, sir?

18 MR. TAHIR: I'm asking 40, but I'll try to keep it
19 down to 30.

May 3 MS4workshop

20 MR. STRINGER: Can you do it in 30?
 21 MR. TAHIR: If I go too fast, I'll (inaudible).
 22 MR. STRINGER: Don't go too fast. Great. And could
 23 you identify for us who you're -- who you're
 24 representing today?
 25 MR. TAHIR: It'll be flashed on the next screen.

0165

1 There you have it.
 2 MR. STRINGER: Okay. Is there an overlap between any
 3 of those and the previous speakers?
 4 MR. TAHIR: There is to some extent, but to a small
 5 extent. There are 80 -- I'm sorry. There are 23 cities
 6 that are not part of the LA Stormwater Permit Group.
 7 Several of them are probably listed up there. Beyond
 8 that --
 9 MR. STRINGER: Can you speak into the microphone,
 10 please?

11 MR. TAHIR: Beyond that, I'm going to provide a little
 12 bit more microcosmic detail on some of the issues that
 13 were presented by the permit group. Information that I
 14 think you'll need in order to make a fully-informed
 15 decision here.

16 MR. STRINGER: Great. Thank you.

17 MR. TAHIR: Thank you, sir. Appreciate it.
 18 I'm going to kick off on the receiving water
 19 limitations, you know, language issues. I'm -- I'm
 20 sorry. This is basically -- that's required in all
 21 (inaudible) in the State of California.

22 This line is pretty much remained the same since
 23 2001. Most receiving water language provisions in
 24 California permits are pretty much the same.
 25 Staff's version, however, does not fully comply with

0166

1 the State Board Order 99-05, which was adopted by the
 2 State Board in June of 99. You'll find it also repeats.
 3 But the (inaudible) limitation language is different,
 4 unnecessary, quite frankly confusing.
 5 Staff said that the LA permit was to be modeled by
 6 the Ventura permit. This was last year. However, this
 7 is not the case. The clean water limitation language
 8 that is proposed in this intermission (inaudible) permit
 9 is totally different.

10 Okay. Standard receiving water limitation language
 11 includes provision of compliance instructions for water
 12 quality standards which includes TMDLs. How do you
 13 comply with those standards? Stormwater discharges
 14 shall not cause or contribute from developing water
 15 quality standards. This includes (inaudible) from the
 16 MS4.

17 Now, this provision of the receiving water limitation
 18 language applies only to stormwater, not to non-stormwater.
 19 Permittees shall also be responsible for discharges over
 20 which they have control. And I shall point out there are
 21 a number of sources in cities that don't have control.
 22 They don't have superior jurisdiction over such entities
 23 as public education facilities, school districts.

24 School districts are basically state (inaudible)
 25 discharges from that. That goes for state and state or

0167

1 federal facilities. Discharged from the MS4
 2 post-stormwater (inaudible) provision shall not cause or
 3 contribute a to a condition of nuisance.

4 Now, this is not a Clean Water Act requirement. This

May 3 MS4workshop

5 is a California water Code provision and basically gets
6 that nuisance provision associated with stormwater
7 (inaudible). But in order to violate this particular
8 standard, there are three criteria that all must be met
9 before you can create a nuisance condition.

10 Staff, though, has added a new provision based on
11 interpretation of a federal regulation CFR. And by the
12 way, this information is in a packet that will be given
13 to you after this presentation. So what's happening
14 here is staff is mixing California water code --
15 Porter-Cologne with the Clean Water Act.

16 And this is what -- how staff interprets this
17 provision, Clean Water Act provision. A permittee is
18 only responsible for discharges from stormwater and
19 non-stormwater from the MS4 for which it is an owner
20 slash operator. Put on my glasses.

21 So what I've done is I have broken this regulation in
22 terms of what -- how staff interprets it and what the
23 federal regulation actually says. Okay. Staff's
24 interpretation is "permittee is only responsible for
25 discharges of stormwater and non-stormwater from the

0168

1 MS4 for which it is an owner/operator."

2 what the regulation actually says -- it says use the
3 term "co-permittee" for -- with respect to the MS4
4 permits. Permittee and co-permittee are used
5 interchangeably. Permittees or co-permittees may only
6 comply with permit conditions. That's the difference.
7 Relating to discharges from the municipal public storm
8 services for which they are operated.

9 So it doesn't apply to both stormwater and
10 non-stormwater. It only applies to stormwater. And it
11 doesn't comply with permit conditions. That's something
12 totally different. And not all permittees are owners
13 and operators. There's some that are just operators.
14 So this needs to be changed.

15 The consequence of all this is that if you were to go
16 to the staff interpretation, the permittee and
17 co-permittee, both an operator and an owner. Puts them
18 on the hook for all discharges. Makes the permittee
19 responsible for all discharges from (inaudible) staff
20 law requirements because it would make permittees
21 responsible for all the discharge, including those that
22 haven't been involved. How are you going to know which
23 dischargers are originated by a particular source?

24 However, our view of this is that permittees is -- is
25 only an operator. Again, you can't be both an operator

0169

1 -- you can't be an owner and operator at the same time
2 unless you're the County of LA and a few other
3 permittees.

4 The permittee need only comply with current condition
5 or limited conditions again over the California code.
6 And the permittee need only comply with discharges from
7 the MS4. And from the MS4 means stormwater, not
8 non-stormwater. The federal term into MS4 is used and
9 applied exclusively only to non-stormwater.

10 Okay. So little reminder. You kind of want to
11 loosen this provision or you're going to find it has
12 nothing to do with the price of eggs. It also will make
13 mandatory creek and make it necessary to challenge it
14 later.

15 Okay. staff -- additional staff or changes to the

May 3 MS4workshop

16 (inaudible) of water limitation (inaudible) existing
 17 language. Charges -- discharge from the MS4 that cause
 18 or contribute to the violation of the water quality
 19 standard, water quality objective is basically
 20 prohibited. That's the existing permit.

21 So what staff wants to do is change that to
 22 discharges from the MS4 that cause or contribute to the
 23 violation of an existing water limitation are
 24 prohibited. It's a significant difference here.

25 Okay. So staff defines receiving water limitation in
 0170

1 a footnote in that -- in its proposed change. Any
 2 applicable numeric or metric water quality standard will
 3 implement the typical water quality standard for the
 4 receiving water has been named in the water quality
 5 control plan for the LA basin.

6 water quality control plans or policies approved by
 7 the Statewide Resources Control Board (inaudible)
 8 including, but not limited to (inaudible) and the
 9 California Toxics Group. So it goes back to saying
 10 they're including the kitchen sink under this
 11 definition. It's not necessary.

12 It's like a municipal code saying that every single
 13 family home shall have a smoke detector in living room,
 14 dining room, kitchen, but not -- but not the bathroom.
 15 A better way to say it is that a smoke detector shall be
 16 in every room except a bathroom. It just makes it
 17 unnecessarily complicated.

18 water quality standards are the way -- are connected
 19 to all of these. Basin plans contain water quality
 20 standards. So you don't really need to apply the water
 21 quality standards. You don't need all this other stuff.
 22 It's actually extraneous and confusing. I just
 23 mentioned that.

24 Referencing the State Board policies are not
 25 necessary because the LA Board is only obligated to

0171
 1 comply with LA Basin Plan requirements as approved by
 2 the state. For example, state policies such as the
 3 anti-degradation policy is a California water quality
 4 standard, which are already in the LA Basin.

5 And this has to do with the California (inaudible).
 6 Again, it's not necessary to mention all that because
 7 water quality standards are predicated on the toxics
 8 group. Staff is, I think, trying to fix something that
 9 isn't broken.

10 It basically requires a remand to stormwater
 11 (inaudible). And that is a big deal and that takes a
 12 long time. In particular, it's only created (inaudible)
 13 for permittees to enforce water quality discharge
 14 standards over which they have control because the new
 15 compliance standard is overbroad.

16 Okay. What's the recommendation? Don't fix it. Use
 17 the receiving water limitation plan developed by the
 18 San Diego Regional Board, which I think really addresses
 19 everybody's concerns including making sure that maximum
 20 said practical, which is missing in the staff's proposed
 21 receiving water limitation language.

22 NEP must be in all MS4 permits. This is pursuant to
 23 the Clean Water Act site (inaudible). And just
 24 (inaudible) compliance with Clean Water Act and -- I'm
 25 sorry. Section 402B, blah, blah, blah. This order

0172

May 3 MS4workshop

1 describes conditions to ensure compliance with the Clean
2 Water Act with owners and operators (inaudible).

3 So effectively prohibits non-stormwater discharge in
4 the MS4 and requires control to discharge of stormwater
5 from the MS4 to the maximum extent practicable.

6 It says it right that there and that this MEP standard
7 only applies to stormwater, not to non-stormwater. I
8 should point out that phase two of the USEPA's permit
9 contains the definition of MEP, which staff really should
10 consider including in the -- its proposed permit which
11 it evolves into the receiving water limitation language.

12 Here it says the MBP standards are ever evolving
13 flexible and advancing concepts which considers
14 technical and economic feasibility. TMD development is
15 a dynamic process and may require changes over time of
16 the program (inaudible) and are progresses.

17 This is very, very important. We don't have this kind
18 of language in the current dated MS4 permit. They
19 really need to put it in the next MS4 permit. Basically
20 included in this definition of MEP is a reference to the
21 energy problem.

22 And this is where it goes back to the (inaudible)
23 process. First off, evaluating, revising, or adding new
24 TMDs is commonly referred to as the instant process.

25 Now, the state uses the term "instant process." The

0173

1 feds use the term "instant process slash adaptive
2 management" because sometimes only adaptive management.
3 And I'll tell you why in a moment. Okay.

4 Here's the (inaudible). Now, the state board
5 requires the completion of the other profits (inaudible)
6 as mandated in this water quality board. (Inaudible)
7 says, "We will generally not require strict compliance
8 with water quality standards with the numeric
9 (inaudible) limitations.

10 "And instead, we will continue to follow an (inaudible)
11 approach which seeks compliance over time with water
12 quality standards." In other words, it's going straight
13 compliance with the number.

14 Okay. What's the recommendation here? Use existing
15 receiving water limitations in the current permit and
16 add -- or -- I'm sorry -- use the Orange County permit
17 that I mentioned earlier. Add MEP, which is preferably
18 from the same tune -- add the (inaudible) using the
19 South Orange County MS4 permit as the model. Okay.

20 Now we're going to jump to the watershed management
21 program where it goes step by step. The watershed
22 management plan we're here for is unjustifiably suspicious.
23 Staff proposes a watershed management plan that
24 permittees must implement or the alternative, implement
25 minimum control measures. Discussed at the last

0174

1 workshop.

2 This really becomes a matter of picking our own
3 poison because both require numeric limitations.
4 Pollutants which, if not met, could place the permittees
5 into a state of noncompliance -- into the state of
6 noncompliance. But (inaudible) the use of strict
7 numeric limitations as proposed by staff.

8 (Inaudible) also is not in favor of numeric
9 limitations as just mentioned. We know of no other
10 permit adopted by other regional boards of the state
11 that requires stringent -- such stringent permit

May 3 MS4workshop

12 conditions. Even federal regulations (inaudible) it
13 would be premature to impose them because one, there
14 has been outflow monitoring at the outflow. And two,
15 there has been no true ambient monitoring in the state
16 (inaudible). This is supposed to take place after
17 (inaudible).

18 Now, what am I talking about here? In the Clean
19 water Act, and this is kind of a list of water quality
20 data outflow recommendations I'll get to in a moment,
21 but the Clean Water Act defines (inaudible) as
22 discharges from the outfall or compliances to be
23 determined.

24 And compliances not to be determined here in runoff
25 that occurs during the storm event. This does

0175

1 absolutely nothing. This monitoring from running water
2 during a storm event doesn't tell you anything. What
3 tells you stuff is when you have a tranquil period,
4 preferably two or three days after storm event.

5 What you want to do is compare what's coming out of
6 your outfall with what's ambient in the receiving water.
7 That's telling you where your discharges are relative to
8 that calm standard.

9 So if you're exceeding that standard, then you'll
10 know what you'll have to do to to adjust your BMP in the
11 interim process to get to that number. But there's no
12 requirement absolutely needed. But in any case, we have
13 not any of this. And the reason we haven't done any of
14 this is because the TMDLs weren't around.

15 It was more cost -- and this was the regional board's
16 logic at the time going back to 2001, that it was more
17 cost effective to do receiving water monitors. The
18 County has seven mass emission stations. And the
19 purpose of those stations, and they're located in the
20 stream -- in the water, is to gauge the health of the
21 receiving water relative to its beneficial uses.

22 Now we have TMDLs, it's a whole different ballgame.
23 Now you have to do outflow monitoring because the price
24 of poker is going up. And it's very important. You
25 need to do this. All of my clients, and I'm sure many

0176

1 cities, if not all the cities here, want to know what
2 their contribution is from their MS4.

3 They don't want to be on the hook for discharges in a
4 pool of water body. Okay. You can develop a watershed
5 management plan within six months after the permit is
6 adopted without outfall and without monitoring data.
7 Let's do this first.

8 The watershed management program also requires
9 prioritizing water quality issues. But how do you do
10 this? You know, what (inaudible) do you use to set high
11 (inaudible) and low priorities? This will require
12 guidance documents which begs the question who's going
13 to develop those guidance documents?

14 Now, we first heard about the (inaudible) adopted in
15 2001. The County actually develops stormwater quality
16 management plans. And I forgot to bring them with me,
17 but folks, they are four inches thick.

18 So who's going to be responsible for revising that
19 plan to include the requirements proposed in the
20 watershed management plan? It's going to take forever.
21 The watershed management plan requires developing
22 interim milestones for developing priorities, but what

May 3 MS4workshop

23 criteria do you use to determine milestones for these
24 priorities?

25 Okay. Here is a -- here's a shot of an ambient

0177

1 condition and receiving water. This is the Rio Hondo
2 River. I provide this for content for you. Okay. The
3 watershed management plan provides for an adaptive
4 management procedure that is not explained. The
5 question is, is this supposed to be a replacement for
6 the other process, one that is sanctioned by the State
7 Water Resources Control Board through the water quality
8 order I just mentioned?

9 watershed management plan for measurable and
10 (inaudible) deductions elicit discharge in the MS4 -- by
11 the way, this is inappropriate. (Inaudible) discharges
12 from the MS4 are requiring direct discharges -- or
13 requiring discharges to obtain coverage (inaudible).

14 That's all their responsibility is. And it's not an
15 insignificant one because will -- this procedure here
16 which spells out the stormwater management quality plan
17 (inaudible) under the (inaudible) discharge (inaudible)
18 program will actually reduce elicit discharges.

19 This is not to say the city (inaudible) stormwater
20 discharge away from receiving water. A number of cities
21 are committed to doing that. But there's another way
22 you can do it as well.

23 If you have, for example, an automotive repair shop
24 that's discharging liquids -- fluids from the site into
25 a component of the MS4 and a city pops that facility for

0178

1 that, then what the city would do is warn them. Either
2 stop the discharge or we'll make you do something else.

3 And that something else would be to (inaudible) the
4 municipal services. We already have that authority. So
5 it may be necessary for low flow liquids, which would
6 occur in the MS4; not on private property.

7 Okay. The long and short of it is there's not enough
8 time to list the details. Really, the devil's in the
9 details. Okay. Shifting now to TMDL components. TMDL
10 issues.

11 Now, staff is interpreting TMDLs to be the same as
12 wasteload allocations. For example, wasteload
13 allocations for copper is a W2 that permittees must
14 require which is 17 micrograms a week. Federal
15 regulations say that a W2 is a type of wasteload
16 allocation, but that's it.

17 It's a type, but when applied to F1 discharge from the
18 outfall, it must be adjusted. It must go through a
19 translation mechanism. In other words, a W2 in a waste
20 load allocation cannot be the same.

21 Federal regulations and USEPA guidance with respect
22 to W2 (inaudible) must be expressed either as wasteload
23 allocations -- I'm sorry. W2 (inaudible) must be
24 expressed wasteload allocations either as BMP or
25 numeric limitations. This was mentioned earlier.

0179

1 The BMP W2 type achieves compliance with the wasteload
2 allocation if it's implemented fully and in a timely manner
3 even if the wasteload allocation is exceeded at the outfall.
4 Earlier today someone mentioned safe harbor. There is
5 no safe harbor. You really don't need a safe harbor.

6 All you have to do is implement the BMP that you
7 agreed on implementing during the five-year term of the

May 3 MS4workshop

8 permit, and you're in compliance, notwithstanding the
9 possibility that an exceedance occurs. And even if an
10 exceedance were -- occurred, how do you know who caused
11 it?

12 Okay. Because other sources besides municipal
13 permittees discharge from an outfall. Again, public
14 education facilities are among them along with other
15 state and federal buildings.

16 Permittee construction sites and permitted industrial
17 facilities and there are dozens of various types of
18 general MPS permits that permit you to discharge
19 non-stormwater in the MS4 and certain categories of
20 (inaudible) and stormwater from the MS4 depending on
21 the type of general permit.

22 So how is the city going to know which is which?
23 It's impossible. Okay. Getting back to numeric
24 limitations. A numeric limitation (inaudible) w2 goal
25 may be used with federal regulations require a procedure

0180

1 for determining if it is needed which involves asking,
2 one, has a discharge caused or contributed to the
3 exclusion of water quality standard? In order to even
4 know that, you need outflow ambient monitoring data
5 which has not been done obviously.

6 And two, it requires modeling. Has modeling been
7 done which takes into account the effect of dilution on
8 the outflow discharge in receiving water? This comes
9 from the MPS writers manual. And basically all this
10 stems from section -- Clean Water Act section 301,
11 which was adopted in the early '70s.

12 MPS requirements additionally (inaudible), not small
13 water discharges. This really applies to sewage. The
14 Hyperion Basin Plan, for example, it has translated its
15 wasteload allocations and numeric standards into
16 effectively BMPs, or performance data, which are
17 basically -- which are (inaudible) not in the receiving
18 water, but at a point within the treatment facilities.

19 So what you have to do is actually in many ways, the
20 requirements for sewage treatment facility are more
21 relaxed compared to what staff proposed with this
22 stormwater.

23 Okay. Stormwater -- unlike sewage, stormwater is
24 more complicated in a reasonable potential analysis is
25 labor intensity. This is why USEPA has repeatedly said

0181

1 that only rarely will the numeric (inaudible) will be
2 used.

3 But if staff wants to go with numeric limitations,
4 then it needs to to the reasonable potential analysis.
5 And that's going to involve modeling -- dilution
6 modeling, and it's going to require a great deal of
7 (inaudible) analysis.

8 Okay. What does EPA's policy say? EPA policy
9 recognizes that because stormwater discharges are in
10 due to storm events that are highly variable in
11 frequency and duration and are not easily (inaudible)
12 about.

13 Only a rare (inaudible) feasible or appropriate to
14 establish numeric limitations. (Inaudible) small
15 construction stormwater discharges. The variability
16 (inaudible) in a minimal data generated available which
17 makes it difficult to determine with precision or
18 certainty actual and projected loading for individual

May 3 MS4workshop

19 discharges or groups of dischargers loading (inaudible)
20 wasteload allocations.

21 Therefore, if EPA believes that, in these situations,
22 permit limitations typically can be expressed as BMPs
23 and that numeric limits (inaudible) must only be used in
24 rare instances.

25 Staff proposed to comply with USEPA-adopted TMDL --

0182

1 let me back up a sec. There are -- most metals are
2 associated to (inaudible) TMDLs. Well, because there
3 has been data generated from receiving water monitoring
4 that occurred during a stormwater event are not in
5 compliance. All them are noncompliant with stormwater
6 and most of them are noncompliant with non-stormwater.
7 What's sad is the (inaudible), as I mentioned earlier,
8 is to use a time schedule order to allow those cities
9 that have not met those numeric standards to gain the
10 time -- additional time necessary to comply.

11 Now, this applies not just to the TMDLs adopted by
12 this board, but also by USEPA TMDLs which were adopted in
13 March. Staff is proposing that those TMDLs would also
14 be subject to a time schedule order.

15 Okay. A time schedule order comes right out of
16 Porter-Cologne, right out of California water codes. As
17 you can see right here under section 13300, time
18 schedules, that's under the heading of (inaudible)
19 implementation.

20 So as soon as those TMDLs are incorporated in the MS4
21 permit, those cities that do not comply, for example,
22 with the bacteria TMDL or the metals TMDL or even the
23 bacteria TMDL in Santa Monica Bay Beaches, would be in
24 violation. This is not warranted and is not necessary.

25 Again, it's an enforcement action that's not justified

0183

1 because a TMDL wasteload allocation violation must
2 occur first (inaudible). Simply because you had an
3 exceedance in the receiving water? Well, the receiving
4 water is in the compliancy permit, the outfall.

5 There hasn't been any outfall monitoring. A
6 violation can only occur if the TMDL is placed in the
7 permit, and you don't have to put a TMDL in the permit,
8 by the way. There's no law that says you have to do
9 that.

10 An exceedance at the outfall, that would be receiving
11 water because in exceedance at the outfall, not the
12 receiving water, is where the compliance determinate
13 should be. And three, a numeric (inaudible) to
14 determine compliance has been said although it hasn't
15 gone through a reasonable potential analysis.

16 So there's no way a violation can be created. No
17 way. Compliance therefore needs to be achieved by
18 (inaudible) permit TMDLs that translate the wasteload
19 allocation BMP until we get monitoring data that shows
20 to what extent any given (inaudible) calls and
21 (inaudible) above water quality standards.

22 Now, these BMPs can be proposed in the stormwater
23 quality management plan for implementation after the
24 permit's adoption. Stormwater BMP permit requires
25 compliance with water quality standard TMDLs. We know

0184

1 that.

2 And they are to be achieved through BMP numeric
3 (inaudible). Compliance with the MS4 water quality

May 3 MS4workshop

4 standard wasteload allocations (inaudible) must be
5 adopted at the outfall and only at the outfall and not
6 in the receiving water.

7 Sorry. I'm being redundant about this. Federal
8 regulations (inaudible) TMDL wasteload allocations and
9 any other water quality standard, for that matter. Okay.
10 This is a definition of (inaudible). Any restriction
11 established by state or administrative about the
12 quantities of (inaudible) computation of chemicals,
13 (inaudible) and constituent which are discharged from
14 point sources into navigable waters. And requirement
15 2222.6 testifies if the outfall is a (inaudible)
16 municipal discharges (inaudible).

17 MR. STRINGER: If you can begin to wrap it up --

18 MR. TAHIR: I'll wrap up.

19 MR. STRINGER: Thank you.

20 MR. TAHIR: why don't I just cycle through all of
21 this. Oh, one other problem. There has been the
22 incorporation -- or the suggested incorporation of a
23 TMDL for bacteria that was adopted by the Santa Ana
24 Regional Board. This was effective through Claremont
25 and Pomona.

0185

1 Staff could not discuss this with affected cities.
2 There is legalities in question. Can the regional board
3 impose a TMDL adopted by another regional board
4 jurisdiction?

5 (Inaudible) go to the Santa Ana Regional Board that
6 it complied with the creek TMDL to the San Gabriel
7 River. We're not aware of those. Okay. One final
8 thing here. The cities South El Monte and El Monte
9 would like the regional board to consider doing a
10 workshop at City of South El Monte sometime in June.

11 And the purpose of the workshop is to provide you
12 with some concepts relative to -- and this would
13 necessitate a visit to the Rio Hondo -- reach to the
14 Rio Hondo the south bottom and hard bottom portion
15 several of the outfalls and to see what a sample point is.

16 How outfall monitoring is to be conducted, how
17 ambient monitoring is to be conducted. It would also be
18 good for the environmentalist to attend as well. They
19 need to see that the cities east of the LA River are,
20 in fact, doing a lot of things. They are installing
21 debris excluders. They are requiring (inaudible)
22 developments techniques for subject new and redevelopment
23 projects.

24 And bear in mind that these cities in terms of
25 economic affluence don't even come close to the coastal

0186

1 cities, so it would be a good experience for all of you,
2 especially those that are new to the board and are not
3 familiar with some of these terms.

4 You really need to see what these things look like
5 (inaudible). You ought to see what cities would do in
6 order to determine if there's an elicit discharge from
7 an outfall, from a particular source such as an
8 automotive repair facility or restaurant.

9 You need context and you should do that before you
10 consider adopting the permit in whatever form it
11 eventually will take to be in. And I want to thank you
12 for your patience.

13 MR. STRINGER: Thank you. Thank you very much.
14 well, that concludes public comments in the workshop.

May 3 MS4workshop

15 We've gone through all the speaker cards. Let's take a
16 10-minute break.

17 (Recess)

18 MR. STRINGER: Okay. Thank you. We're back on the
19 record. We're now going to move into an opportunity for
20 board members to ask questions and discuss the issues
21 that we've all been hearing about today and thinking
22 about the last several months and we'll be thinking
23 about the next few months.

24 I want to just remind everybody that this is a
25 workshop. We're not making any decisions today. We're

0187

1 not rendering any opinions. And it's for our
2 information, for staff's information as we move towards
3 making a decision on a very complex matter.

4 So I'm going to start down to my right. I flipped a
5 coin, and you won. Larry, go ahead.

6 MR. YEE: Doggone it. I was going to defer to my
7 veteran mentors on the Board, but it looks like I lost
8 the coin toss.

9 MR. STRINGER: That's fine if you want to pass.

10 MR. YEE: No, I'll stumble into this. That are --

11 MR. STRINGER: Are you sure?

12 MR. YEE: Yes. You know, as a newcomer to the Board,
13 my head is kind of bursting, but I was told that I get
14 to ask dumb questions for a whole year, so I guess I'll
15 start there.

16 I haven't heard too much about any of these workshops
17 about the economics of compliance, and I know we have a
18 lot of variables and great variations between all the
19 permittees and so on. But just -- I'm just kind of
20 interested, you know, what is the cost of the
21 compliance?

22 And if, you know, if people are going to start
23 working on water management plans, what is that going to
24 cost? What are the cost benefits? So that's just
25 something that's just floating around in my head.

0188

1 As I listened to the afternoon presentations, this is
2 what I gleaned from them. Hopefully this is a little
3 bit accurate, that the environmental advocates are
4 mostly saying, "Stop dragging your heels. Urge strict
5 compliance. Protect our children and families and our
6 rivers and beaches," and so on.

7 On the other hand, the LA Permit Group is saying, you
8 know, "We're all working pretty well together. We're
9 all making reasonable efforts. We're running a
10 marathon. You know, don't just stand by. (Inaudible)
11 us from finishing. Be flexible. Be strategic. Urge
12 BMPs," so on.

13 So the question that -- that -- that I'm struggling
14 with -- and I admit I have a lot more to learn; I'm glad
15 we don't have any pressure of making a decision today --
16 is how do we -- how do we make reasonable and balanced
17 progress? I guess that's the question.

18 MR. STRINGER: Thank you. That's -- I think that's
19 something we're all struggling with because
20 philosophically, I don't think there's any disagreement
21 in the room where we're headed. Is there anyone who
22 wants to address Larry's comments?

23 MS. PURDY: Maybe I'll address the first question
24 that you had. This is Renee Purdy. I'm the section
25 chief for the Regional Permit Section, and I just wanted

May 3 MS4workshop

0189

1 to mention that we are looking into cost of compliance.
2 And also just as background, looking at cost
3 considerations is also something that we do during the
4 TMDL development as well. And it's a part of the TMDL
5 adoption process where we look at the costs of achieving
6 the TMDLs.

7 And so there has been a lot of work done to look at
8 costs of complying with TMDLs as part of their initial
9 adoption.

10 And additionally, the permittees do report on the
11 annual costs for TMDLs and stormwatershed programs.
12 And we're currently looking at and evaluating some of
13 those costs and that documentation will be provided as
14 part of the full package when we prepare the tentative
15 order as well as the supporting documentation.

16 MR. STRINGER: You know, as you talk about that, I've
17 been thinking about whether it makes sense to do this
18 more thematically rather than each of us (inaudible).

19 So let's experiment with that and have a discussion
20 about costs because I have some questions about costs.

21 Maria, why don't you go ahead?

22 MS. CAMACHO: So piggybacking off of that, one of the
23 items that was brought up was the -- let's see. I think
24 it was during -- I don't remember who brought it up. It
25 was -- maybe it was the City of Downey who brought up

0190

1 this concern of 11 percent being left because of the
2 re-haul of catch base.

3 So there's an effort to, you know, install different
4 mechanisms that will assist in this goal. But that some
5 of those efforts are tough because of the need to
6 re-haul and create the ability to incorporate such
7 techniques and things.

8 Is that taken into consideration or -- or how -- and,
9 you know, that's part of the cost situation. So how do
10 we get staff to look at that and work with the permittee
11 on such issues?

12 MS. PURDY: So with regard to that, that's, you know,
13 it is somewhat of a specific issue. And one of the
14 things that I would say in response that relates to cost
15 in a certain sense, but it's that for any of the TMDLs
16 there are many ways that permittees can comply with
17 those TMDLs.

18 And that speaker in particular was talking about some
19 challenges with regard to some of the structural
20 controls that they use that we refer to as the full
21 capture devices.

22 For the trash TMDLs, there are other types of
23 compliance strategies including what we refer to as
24 invitational controls, like street sweeping and source
25 control, that sort of thing, as well as what we call

0191

1 partial capture controls. And they can use any
2 combination of those compliance strategies.

3 So we're in a situation where there may actually be
4 physical constraints to using a certain compliance
5 strategy. Then we provide the flexibility to comply
6 with the TMDLs in any manner, any lawful manner.

7 And so they -- in those cases, they can look for other
8 alternatives that would be more cost effective to reach
9 compliance with the requirements.

10 MR. UNGER: And may I -- may I get a word in --

May 3 MS4workshop

11 MS. STRINGER: Sure.

12 MR. UNGER: -- if I might. Costs are reported in the
13 annual report that we get under the term permit now.
14 They're in broad categories. Generally aligned somewhat
15 with the monitoring and the six elements of the memo --
16 or the staff revisions for the -- excuse me -- special
17 provisions for the minimum control measures.

18 Mr. Ridgeway of staff and Renee, Deb, and I, we've
19 all -- and Connie -- we've all been looking at those
20 numbers at this point. We don't have anything to report
21 to you on it at this point.

22 We're just getting familiar with those costs, but
23 there is a lot of information there we're trying to
24 parcel out, you know, what the costs of compliance
25 really are.

0192

1 So we expect we will have more information for you
2 sometime in the near future on that. But we have been
3 looking at the annual reports for the last several years
4 on accomplishing that. Thank you.

5 MR. STRINGER: Fran, did you have any questions about
6 costs?

7 MS. DIAMOND: Yeah. Is it -- can you hear me? I
8 wanted you to be sure also to address the issues which I
9 think Larry alluded to. That the costs -- there are
10 costs of noncompliance and then there are also -- what
11 are the costs to the economy of the -- of the beach
12 tourism? And how much -- I've seen figures. I don't
13 know. It's a couple billion dollars a year in tourism
14 dollars in the coastal areas and beach region of LA.

15 what are the costs of noncompliance? what kind of --
16 in terms of illnesses, when people get sick and can't go
17 to work. I know that -- and one of the experiences of
18 being a board member for so long is I remember this
19 discussion in terms of previous permits and current
20 permits that we have now and TMDLs.

21 what is it, what does it cost us when we have people
22 getting sick, when beaches could be closed, those kinds
23 of numbers that we need to get -- that I saw in the
24 past. And I'm sure they may be somewhat different today
25 because we've had some improvements, a lot of

0193

1 improvements over the course of the last few years. But
2 what are the costs of the economy -- economics, coastal
3 tourism and health, public health?

4 MS. PURDY: And I would say also look at that and --
5 finished -- and as well when -- during TMDL development.
6 And you probably recall us talking about some of those
7 things.

8 For example, way back a decade ago when we were
9 adopting the Santa Monica Bay beaches TMDL, just what
10 the, you know, the tourism -- the size of the tourism
11 economy. And also, as you mentioned, the cost of
12 illness as a result of people going and getting sick and
13 losing workdays and so forth.

14 So that's something that -- that we have looked at
15 and we can go back and look at some of those numbers
16 again.

17 MS. DIAMOND: I think that would be important for us
18 to have in our -- in our process as we go forward in
19 making a decision in this permit.

20 MR. STRINGER: I think -- to just add on to that, I
21 think it's important to -- to look also at costs to

May 3 MS4workshop

22 inland communities, (inaudible). We talk a lot of
23 beaches and beach communities and people going to the
24 beach and getting ill, but I think there's an impact on
25 the inland communities as well with -- potentially it

0194

1 considered. Just piggybacking on that.

2 Madelyn? On the cost issue, do you have any comments
3 or questions?

4 MS. GLICKFELD: I guess my -- my -- the concern that
5 I've been hearing from the permittees since I've been on
6 the Board is you're adopting another TMDL.

7 It's like a big stack of pancakes and the stack keeps
8 on getting higher and higher and higher. And each one
9 of these TMDLs have different deadlines, and they also
10 have been TMDs because they're about different
11 pollutants.

12 And so I think that some of the concern is how much
13 does the -- how much is the accumulative cost of
14 implementing all of these TMDLs together? We've never
15 really looked at that together. We've looked at it
16 separately.

17 And I think it needs to be taken if you could look at
18 it. I think that it's what recommends this watershed
19 approach, I'm hoping. When you are looking at the
20 watershed approach, you have a process of developing a
21 plan for which of the priority pollutants?

22 Have you also thought about ways to look at the
23 watershed management plan? Or what are the best
24 management techniques and technologies that we can use
25 and prevention that we can use to deal with as many of

0195

1 these pollutants as possible? Single techniques.

2 And I kept -- I keep on coming back to the fact that
3 we are requiring people to do the trash -- the trash
4 capture devices, but I don't think we've ever asked
5 anybody to analyze what they're collecting in those
6 trash devices.

7 And I suspect there's more than trash. I suspect
8 that there's some kind of sediment. I suspect there's
9 bacteria in there. So one of the things I hope that our
10 staff would do is to look at the possibility of finding
11 out, in fact, what management techniques are the best,
12 most cost effective, and do address the most pollutants.

13 And doing that with the -- with the stakeholders,
14 doing it with the -- with the environmental groups, and
15 doing it with the cities and the county to find out
16 what, in fact, are the most -- the things -- the kinds
17 of techniques that address multiple pollutants.

18 Have you looked at that at all?

19 MS. PURDY: I would say yes, we have. And in fact,
20 and again, it takes me back to 2002 when we adopted the
21 Santa Monica Bay Beaches bacteria TMDL because at that
22 time we came up with this concept of an integrated water
23 resources approach.

24 And the idea was to try to come up with strategies to
25 address multiple pollutants. And because of us being

0196

1 driven by consent decree requirements and economy and so
2 forth, in some cases we didn't address all pollutants
3 for a watershed at once. We did individual pollutant
4 TMDLs as you just described.

5 But again, the deal with the watershed management
6 program is this: It does give us a chance to bring all

May 3 MS4workshop

7 this together and to look at ways where we can find
8 strategies that would actually address multiple
9 pollutants and would -- all the pollutants that are
10 covered by multiple TMDLs for that watershed.

11 And that's what we anticipate will happen in
12 selecting control measures. We do believe that there
13 are a lot of TMDs out there that will address multiple
14 pollutants.

15 And so you can take one TMD and you'll actually
16 achieve requirements for many of the TMDLs within that
17 watershed management area. And this is the opportunity
18 to really compile the TMDL implementation plans and find
19 out where there are ways where we can just pick one
20 strategy that would address all of these requirements
21 instead of having five strategies, five different
22 strategies.

23 MS. GLICKFELD: So this is an opportunity for us to
24 instead of adding the cumulative costs to have -- to
25 have an opportunity to really look at what are your TMD

0197
1 costs.

2 MS. PURDY: Right. And we don't think that that cost
3 is going to be just purely additive. We think that
4 there will be strategies that can be -- meet multiple
5 requirements.

6 MR. STRINGER: Irma, did you have any questions about
7 costs (inaudible)?

8 MS. MUNOZ: Well, somewhat. You can stop me if I'm
9 on the wrong path. I see that there's a very
10 interesting adventure because we get to listen to what
11 the folks are saying and kind of understand what they're
12 saying, and then we look at the eyes of the audience and
13 see if they agree with what the person's saying.

14 And this has been my conclusion is that you've got to
15 two sides. You've got the beach cities and you've got,
16 I guess, the permittees and people inland. And they're
17 two extremes.

18 And last meeting, I said I want the environmental
19 community -- (inaudible) recommendation. (Inaudible)
20 group to get together with inland cities. And I think
21 one of the best things that came today is a suggestion
22 from Mr. Tahir.

23 I think that we should take up his offer to go visit
24 the City of El Monte and maybe to other cities and have
25 a tour and watch and find what their best practices are

0198
1 and how they did them and challenges that they had in
2 doing, and frustrations that they had, and speak to city
3 managers to find out what the costs are.

4 I want to hear directly from the decision makers,
5 directly from the people who are in charge of the water
6 quality in their cities. A lot of these cities in the
7 inland, San Fernando Valley, have been facing -- have
8 faced in the last couple years being on the verge of
9 bankruptcy.

10 Do we consider that? I mean, for some reason, I feel
11 that many of those cities are being told -- are -- are
12 -- there's an insinuation they haven't done enough.
13 They don't want to do enough.

14 That may be the case with some cities. I can't
15 believe that's the case with the majority of the cities.
16 And so that's the voice for me that's been missing here.

17 And so I would like us to think about doing a tour

May 3 MS4workshop

18 for those board members who want to participate in that.
 19 I just went on a tour. And I hadn't done that. It
 20 opens up your eyes to actually be out in the field and
 21 look at things and have people describe things to you
 22 and make your conclusions not based on what people are
 23 telling you or what you're reading or trying to read on
 24 the PowerPoint presentations, but actually getting that
 25 one-on-one.

0199

1 So I encourage my colleagues then to put this tour
 2 together, I guess in the next 30 to 40 days, so that we
 3 can go out there and ask those questions of the city
 4 managers. I thought the presentation of the City of
 5 Downey very enlightening because to me, part of it is
 6 the intent and your actions following your intent.

7 Have you complied at all, and what have you tried ad
 8 what hasn't worked, and what's frustrated you? And for
 9 me, they have -- they have shown intent and they wanted
 10 that little percent, you know, and they're struggling
 11 with that.

12 And so it has to do with the economy -- they do -- I
 13 agree with Board Member Larry's comments is we haven't
 14 talked about what it's costing. And it's not costing
 15 the cities. It's costing the people who live in the
 16 cities, its residents. And I know a lot of people have
 17 a lot of economic hardships, the impacts to the family.

18 And so we really have to balance a lot of this
 19 conversation and be a little more holistic about the
 20 questions that we ask and the information that we
 21 receive.

22 So I guess, Mr. Unger, I'm asking you if you would
 23 please put together a tour maybe in coordination with
 24 the City of El Monte leadership, the city manager, and
 25 other cities that are appropriate there so that we

0200

1 really get a feel for what's going on in the inland.
 2 Because one of the things I've noticed is that some
 3 folks think that the conversation of watershed ends at
 4 the beach. It ends at the beach. It starts in the
 5 inland. You know, it starts up in the mountains. And
 6 so somehow we have to figure out the connection between
 7 where it starts and what happens in between and where it
 8 ends.

9 MR. UNDER: Comment noted.

10 MR. STRINGER: Thanks. I just have one, I guess, a
 11 question about the cost issue. And that is the
 12 availability of grants for the cities will be doing
 13 under the permit. Do you have a sense of what grants
 14 are available now and to what extent they'll be
 15 available in the future?

16 MS. PURDY: Well, there certainly have been a number
 17 of grants available in the (inaudible) and continue to
 18 be made available through a variety of different state
 19 propositions as well as of course there's been some
 20 local funding available as well through things like
 21 (inaudible) and Measure B in Santa Monica.

22 And then I think that, you know, state sources that
 23 may become willing, and we hope become willing is the
 24 water quality funding which the county is embarking on
 25 which would provide money both for individual permittees

0201

1 as well as for watershed groups to implement many of
 2 these water quality improvement programs for storm

May 3 MS4workshop

3 water. So I honestly can't give you a ballpark number.
4 I don't have that --

5 MR. STRINGER: That's okay.

6 MS. PURDY: -- but we can certainly get more
7 information and details on that for you if you'd like.
8 But there have been a number of grants. The most recent
9 -- we've just been going through a round of grant review
10 for Proposition 84 and there have been a number of storm
11 water grants available through that proposition. And
12 some of our staff have been involved in that. That
13 would be a process for the state board.

14 MR. STRINGER: It just occurred to me that the
15 (inaudible) process is perfect for the regional
16 watershed planning programs that are already out there.
17 So there are grants that exist right now that are
18 available to stormwater.

19 MS. PURDY: Right.

20 MS. FORDYCE: Can I just touch on that? (Inaudible)
21 We went through that this morning. Fran mentioned
22 (inaudible) at this morning's meeting -- I forget the
23 date, but that might be something. We'll put that on
24 the website (inaudible).

25 MR. STRINGER: And I think we all need to think

0202

1 creatively about how this is all going to get paid for.
2 So this isn't -- the contracts are informed of the facts
3 with just a few.

4 Maria, what's your next topic?

5 MS. CAMACHO: Eeny, meeny, miny, mo. I think I was
6 interested in the watershed management program, because
7 I know as we were discussing it in your introduction of
8 the workshop, that it's a newer -- that it's a newer
9 program, that it's something new that we are looking
10 at, which I appreciate.

11 And it sounded in the dialogue today -- it does sound
12 that people are excited about it. So one of the
13 thoughts that I had in looking at the provision, the
14 draft provision was how will it work? There may be --
15 and I think there was discussion of it during one of the
16 presentations -- is if -- if -- in a group, if there are
17 folks who are doing their best to comply and help be a
18 part of that process, that's great.

19 If there's, in that same group, those who aren't really
20 picking up their -- their end of the bargain, that kind
21 of thing, how -- how does that work? I don't know.
22 That's a really broad question.

23 MS. GLICKFELD: (Inaudible)

24 MS. PURDY: Right. I'll try to clarify a little bit
25 about what we're thinking. I mean, one of the things

0203

1 that would be -- and I agree that is 00 that is one of
2 the difficulties that we face with the LA County MS4.
3 It's such a big, interconnected system that coordination
4 is really important, but at the same time we need to have
5 mechanisms for determining individual compliance as
6 well. And so in the case of -- for example, when I
7 talked about the interim permit limitations and the fact
8 that those could be action-based, TMD-based where it
9 would determine compliance based on the actions that a
10 permittee has taken.

11 So in that case, the watershed management program
12 will lead to very clearly laid out what the roles and
13 responsibilities of each individual permittee that's

May 3 MS4workshop

14 participating in that collective program.

15 And so when, you know, when we're looking at
16 compliance from an action-based point of view, we'll
17 be able to look and see what were the individual
18 permittee's responsibilities and did they meet those
19 responsibilities.

20 So it could be that there are, you know, potentially
21 some who have done a better job at meeting the
22 responsibilities per the timelines in the program and
23 others who have fallen somewhat short of that.

24 And so I think we'll be able look at it in that way
25 and it's fairly straightforward with the action-based

0204

1 compliance. There will still be challenges because some
2 of the -- I mean, and somebody said we're still working
3 it all out.

4 And that's true. I mean, we don't have all of the
5 answers today, and there might be some challenging
6 situations where could be a regional TMD that the group
7 commits to then that requires a certain amount of
8 funding and some permittees are able to come up with
9 that funding, other permittees don't come up with it.
10 And as a result, it's difficult for them to implement
11 that regional TMD that was anticipated.

12 And so I think in those cases we'll need to think a
13 little bit more about how we're going to -- how we're
14 going to address that sort of situation. But the
15 important thing will be to really make it clear in the
16 watershed management program what are -- even though
17 it's a collective program, what are the roles and
18 responsibilities of each individual permittee within
19 that program so that we can look at individual
20 compliance.

21 And then the other thing which we didn't really talk
22 about today, and I think a few of the speakers mentioned
23 we need to make sure that the monitoring is integrated
24 with this watershed program and we intend to do that.

25 And I mentioned that some compliance determination

0205

1 can be based on outfall monitoring or monitoring at a
2 permittee's jurisdictional boundary.

3 So that would be another place where we could begin
4 to look at individual responsibility even in a
5 collective program if we have monitoring on a
6 jurisdictional basis.

7 MR. UNGER: I'd like to add -- let me add a little
8 bit to what Renee said directly in response to your
9 question. We have a number of TMDLs that can
10 potentially be very (inaudible) and potentially
11 self-organized on a watershed-type basis. And, actually,
12 some TMDLs call out different jurisdictional groups.

13 And they've done a remarkable job, I think, of
14 self-governing, self-organizing, self-financing. You
15 know, they've made a lot of those decisions themselves.

16 So this isn't anything exactly brand new given the
17 fact that we have (inaudible) initiative (inaudible)
18 various people in different watershed management areas
19 or wags. And again there's precedents that (inaudible)
20 TMDLs (inaudible) several TMDLs in which a member can
21 (inaudible) can potentially join together and
22 self-govern and to implement the requirements.

23 MR. YEE: Mr. Chair, may I?

24 MR. STRINGER: Yeah, of course.

May 3 MS4workshop

25 MR. YEE: So to clear up my understanding, if I'm XYZ
0206

1 permittee out here, do I essentially have three choices?
2 I can join the collaborative efforts to do a watershed
3 management plan. Or as you explained this morning, I
4 could go it alone; right? And the third choice is to
5 not do one at all; correct?

6 MS. PURDY: That is correct, yes. And if you chose
7 the last one, then you would follow just the baseline
8 permit provisions that we have spoken about in previous
9 workshops.

10 MR. UNGER: I have a little bit to add to that, as
11 well. You know, we've -- we've -- just -- just because
12 I know you can relate to the familiarity of Ventura and
13 the agricultural way.

14 we took a similar approach there when we allowed
15 people to either join essentially a countywide group or
16 go it alone if they were willing to (inaudible)
17 relatively.

18 You know, I would say that in terms of the
19 administration of the -- that regulation has been very
20 successful. Most people have found a way to join
21 together with some people that are enrolled as
22 individuals. So we've worked with this paradigm
23 previously.

24 MR. STRINGER: Fran, do you have any questions?

25 MS. DIAMOND: Yeah. Just a couple little things.
0207

1 I'll -- two things I noticed was, and I think they're
2 probably related.

3 One was someone commented that possibly customized --
4 customized actions could replace the baseline permit
5 requirement. So that would be one thing I want to hear
6 you discuss.

7 And one of the commenters said that under the
8 watershed management program that changes to the permit
9 from minimum control measures should come to the Board
10 rather than to -- not the Board.

11 And there was a concern by the same commenter that
12 we -- it's possible to use -- would it be possible to
13 use adaptive management to alter the permit? For
14 example, to be considered less in the 24th percentile or
15 85th percentile storm (inaudible).

16 In other words, what -- what kind of flexibility and
17 customization -- what would customized actions mean in
18 terms of regulations that we've already adopted?

19 MS. PURDY: Okay. I'll start with the -- the first
20 one with regard to the customized actions replacing the
21 baseline. And think I even said that.

22 And we are -- that is one of our intentions is that
23 there could be customized actions. The one thing that
24 I do want to emphasize is that those customized actions
25 would need to be consistent with what the federal
0208

1 regulations say should be included in a permittee
2 stormwater management program.

3 So there -- when we're thinking about customizations,
4 we're not -- we're not talking about eliminating a key
5 stormwater management program element, but we're
6 talking about basically allowing the flexibility to
7 focus that program on the watershed priority.

8 So for example, it may mean focusing on a certain
9 drainage area within a watershed that has a high

May 3 MS4workshop

10 concentration of a certain type of commercial
11 establishment or industry where there's a lot of
12 pollutant loading that needs to be addressed.

13 It could be focusing on a certain type of education
14 and outreach that deals specifically with bacteria. And
15 I mean, even as simple as, you know, picking up after
16 your pet or something like that. There's real concerns
17 about bacteria.

18 So it's -- it's a matter of really using the same
19 types of stormwater management programs, but focusing
20 them on the specific water quality priorities within the
21 watershed.

22 And then once proposed, and then approved through
23 what staff is saying, working proposal would be an EO
24 approval process that that would become the prevailing
25 permit requirements for those minimum control measures

0209

1 instead of the baseline ones in the permit.

2 So we are talking about allowing that flexibility and
3 a number of the permittees have suggested that that
4 would be really valuable to them.

5 City of LA and a number of others have suggested that
6 as a way for them to focus their resources and really
7 address the water quality problems that they're seeing
8 or problems with certain types of sources, pollutant
9 sources within their jurisdiction.

10 So that's what I'd say with regard to the first.
11 with regard to the second, I actually might let Jennifer
12 or Francis answer with regard to your question being
13 should the -- the customized and minimum control
14 measures within the watershed management program come
15 to the Board versus to the EO.

16 We're currently proposing that it would be an EO
17 approval process. Now, there would still be a public
18 process associated with that. There would still be an
19 opportunity to comment on those watershed management
20 programs, which is what we typically do.

21 We still allow, for example, a 30-day comment --
22 public comment period. And before the EO would take
23 action to approve that program, there would be a review
24 and consideration of those public comments that we
25 received on the draft watershed management program.

0210

1 And then we would get back in touch with the
2 permittees if we felt there were changes that were
3 needed in response to either our own internal review or
4 some of the public comments that we received. But with
5 regard to TMD versus board (inaudible), I will defer to
6 Francis.

7 MS. DIAMOND: (Inaudible) actually, there was a
8 comment made by the lawyers. (Inaudible) I wanted to.

9 MS. FORDYCE: (Inaudible) it's look in delegation
10 resolutions that the Board has adopted. But if the
11 board wants to put in the permit that they have to be
12 (inaudible) by the Board. They don't have to be adopted
13 or approved by the executive officer. I think we need
14 to confirm whether the Board can delegate that to the
15 executive officer.

16 I believe pursuant to the water code and WMP
17 resolution, the Board cannot delegate establishment of
18 discharge water. Now, there is a question of whether
19 approving these WMPs would be waste discharge
20 requirements (inaudible).

May 3 MS4workshop

21 MS. DIAMOND: I'd like to thank you.

22 MR. STRINGER: Madelyn.

23 MS. GLICKFELD: Thank you. That was one of my
24 concerns as well. I do think of these watershed
25 management plans as being akin to local basin planning.

0211

1 Looking at the entire basin plan for the management
2 period and looking at the variety of blueprints that we
3 have, if we take all the things of the basin plan, only
4 for a particular watershed here. So I think it has huge
5 policies. And I would be concerned that if it were not
6 done in very public way either through a formal hearing
7 by the staff or by the Board.

8 So that's just my opinion. I think that one of the
9 things I think the Board needs to understand and I think
10 I need to understand is this is a new experiment. This
11 is an experimental option. We won't know how well it
12 turns out until we do it.

13 But I do suggest strongly that you bring the
14 stakeholders in, all of the stakeholders in and go
15 through detailing out what it will be like. It's not
16 like TMDL groups because TMDL groups are all coming
17 together to implement what's in the TMDL.

18 Here you're developing a new plan for how you're
19 going to prioritize, where you're going to put things,
20 and how you're going to view pollutants.

21 And so the question is what -- how many cities within
22 LA County, how many cities in Orange County have to say
23 "yes, we want to do this" before we recognize it as
24 eligible for this? Because we are giving them the
25 flexibility that they wouldn't have. And so what

0212

1 constitutes a viable group if not everybody is
2 participating in it? That would be an issue that I
3 would want to know.

4 The second thing is that talking about costs, we have
5 -- we have permit proofs, we have now the watershed
6 authority groups that are going to be looked at again
7 for the whole process they're supposed to do, they're
8 set up to do plans as well.

9 We have plans coming out of our ears. Now, I would
10 really suggest is that you sit down particularly with
11 the County and the City and look at what the City --
12 they have done and they have negotiated over two years
13 for a government structure there and see how we can fit
14 what we need to do so that it's one process.

15 The process they have to go through to send the money
16 whether it's -- it's also a very good process for
17 planning. And they have set it up for that. So I think
18 there's not very much difference.

19 The biggest problem is that the boundaries are
20 different. They're not only, you know, what you said,
21 but actually the boundaries are different. And theirs
22 are in statute. But I think they're wrong. So I think
23 there's got to be some discussion with the County about
24 how we fix the difference in boundary.

25 The next thing, that's cost, is we have got some cities

0213

1 that are in three different watersheds. We have some
2 cities that are small that are in three different
3 watersheds.

4 If they have one percent of their city in one
5 watershed, and 99 percent in two other watersheds, they

May 3 MS4workshop

6 shouldn't have to be in three watershed groups. And how
7 do we deal with that issue? I -- I'm not not going to
8 (inaudible) the City of LA. You're going to be in all
9 of these watershed groups.

10 But I am concerned about the small cities and whether
11 they can afford to even participate in these watershed
12 programs. So I think that you're going to need to look
13 at the (inaudible). You're going to need to look at the
14 geography, the mapping. You're going to need to look at
15 the threshold of what a group could contribute to be
16 able to be in this group.

17 And then the issue that I think that the
18 environmental community is concerned about is, yeah,
19 what do we get out of -- what's the benefit of having
20 these watershed groups for the environment as well as
21 for the cities?

22 I can see the benefits for the city, but there's got
23 to be a benefit for the environmental community to be
24 able to figure out that it's worth it for them to see
25 the flexibility. I personally think it's really, really

0214

1 needed change, but I think it's also a great excuse to
2 bring the environmental communities and the cities into
3 the same room together to figure out what it would take
4 for them to all make it want to work.

5 MS. PURDY: And I would just say -- I would say we
6 think -- I mean, the benefit to the environment is that
7 we believe that through these watershed management
8 programs, there's going to be developing leverage
9 resources much more than individual permittees working
10 on their own and look for regional solutions that may
11 end up being much more cost effective than everybody
12 doing their own individual solutions.

13 MS. GLICKFELD: well, I think that's (inaudible) for
14 the cities --

15 MS. PURDY: And the environment.

16 MS. GLICKFELD: Anything that is going to be a much
17 more effective way, it's going to be a faster way of
18 meeting the deadlines that we've set for pollutant
19 reduction?

20 MS. PURDY: well, I think faster in the sense that
21 the fact that they're able to leverage resources and
22 look for regional solutions that may be more effective.
23 And one regional solution instead of many, many
24 individual solutions, I think it could be a faster way
25 for achieving the (inaudible).

0215

1 MR. STRINGER: Irma, anything on watershed management
2 planning or program?

3 MS. MUNOZ: No.

4 MR. STRINGER: I just have one sort of set of
5 questions. And it's more about implementation, I think.
6 So I was trying to think through if the group of cities
7 comes in with a plan, and the plan needs modification or
8 goes through a process, what's the -- how does that play
9 out over time?

10 And at what point would or could the Board just say,
11 "Enough. You're not there yet"? I mean, what's the
12 enforcement mechanism behind that program if a group of
13 cities isn't, you know, putting a plan together that's
14 up to the standards that's set forth in the -- I'm just
15 wondering how that would play out.

16 MS. PURDY: well, I would start out by saying that's

May 3 MS4workshop

17 one of the reasons that we have -- if we tie this to
18 TMDL provisions, for example, it's one of the reasons
19 that we're making sure to include the numeric water
20 quality based (inaudible) limitations either for
21 permittees that choose not to participate in the plan at
22 all or for permittees that -- see, just that they might
23 participate in the program, but then they don't follow
24 through with participation in that program.

25 Then we have a mechanism for determining their

0216

1 compliance with the permit provisions.

2 So I -- but I think in terms of, I guess, there are a
3 couple stages. I mean, that's the planned developed and
4 permittees participate in (inaudible) and all actually
5 participating as they should be in the development of
6 that plan where we're basically proposing a timeline to
7 give them first of all the first six months timeline to
8 say, this is our intent to participate.

9 And if they don't let us know within that first six
10 months of their intent to participate, then we would
11 just default to the other mechanisms within the permit
12 for determining compliance.

13 And so there's that stage. And then if along the
14 line, even after that six months, it appears that they're
15 not participating, then I think at any point we could
16 communicate with them and let them know that it appears
17 that this is, you know, they're not going to participate
18 in this plan.

19 And therefore, they'll just subject to the compliance
20 with the provisions of the permit just strictly as
21 they're written. There's also the assessment step of
22 the process. So once the plan is developed and once the
23 plan is approved and limitation has begun, we're
24 thinking of, as I said, an 18 month cycle, basically.

25 And in that cycle, they'll be reporting on what the

0217

1 accomplished during that 18 months. And that would be
2 another opportunity to do either one of two things. I
3 mean, one, if a permittee has not been fulfilling its
4 rolls and responsibilities, then it wouldn't be in
5 compliance with the provisions of the watershed
6 management plan as approved.

7 Additionally, that would be another opportunity to
8 basically say you don't care to be a participating
9 member of this watershed management program. Therefore,
10 we're just going to set your compliance according to the
11 provisions of the permit including the numeric water
12 quality based statute limitations and other provisions.

13 So I think that assessment check-in at that point
14 gives give us another opportunity to look at what's the
15 most appropriate way of treating that individual
16 permittee. Does that answer your question?

17 MR. STRINGER: Yes. That's very helpful. Thank you.
18 So Fran, what's next?

19 MS. DIAMOND: Okay. So what I'd like you to talk to
20 us about is the TMDLs. And I'm just wondering, for
21 example, since the bacteria TMDL for dry weather are the
22 most significant in terms of stormwater pollution at
23 our beaches, and they were approved in 2003. I may have
24 been the only one on the Board.

25 MS. GLICKFELD: You are.

0218

1 MS. DIAMOND: And the compliance should have been in

May 3 MS4workshop

2 2006. And we've had some really great progress, but not
3 all the cities are in compliance. And I know we're
4 involved with many TMDLs and implementation programs.
5 It's a very complicated program, and we are very
6 self-congratulatory -- I think we should be -- for all
7 the TMDLs that we have in our region, by far the most in
8 any region.

9 And I think we've been doing a great job on that.
10 But how does this new permit deal with the fact that we
11 have seven TMDLs where we have some permittees not in
12 compliance with the current permit?

13 Where do we -- how does that work into this new
14 permit? And I'd like to you discuss the issue of the
15 time schedule orders that you -- that you mentioned
16 earlier in your report to us.

17 And what -- and so how are we dealing with the TMDLs
18 that we already -- that we are going to be incorporating
19 and some that we have already incorporated in terms of
20 compliance?

21 And what does that mean in terms of is there
22 backsliding which is something that we can't do,
23 obviously, under the Clean Water Act. So just that
24 general topic. I think you know more of what I'm trying
25 to say than I'm communicating.

0219

1 MS. PURDY: So let me start with I did work the
2 Santa Monica Beaches and Bacteria TMDLs. There are four,
3 probably, of the most concern. It's the Santa Monica Bay
4 beaches, Marina del Rey bacteria, the Malibu Creek
5 bacteria, and then also the (inaudible) beach.

6 All of those summer dry weather allocations are
7 past due. The deadlines are past due. And so to
8 those, really what we're anticipating, first of all, as
9 I said, we -- because those -- those implementation
10 schedules are in the basin plan, we don't have the
11 flexibility to change what those schedules are within
12 the permit itself unless we were to go back and actually
13 change the basin plan.

14 That's what we would need to do in order to lengthen
15 their schedules and then provide those as compliance
16 schedules within the terms of the permits. So that's
17 why we've been applying these time schedule orders where
18 it would be justified.

19 Now, I think what I heard a lot of people's concern
20 is there are -- those TMDLs have been in effect for a
21 long time. The deadlines, in many cases, are long overdue.
22 Santa Monica Bay, like I said, was 2006 when the summer
23 requirements were to be met, and that was six years ago.

24 And so what we're anticipating is not that -- first
25 of all, there needs to be a request for a TSO by the

0220

1 permittees that think they need a TSO because they
2 haven't achieved compliance. In the case of Santa Monica
3 Bay, we don't expect it would be just a blanket TSO
4 necessarily for all permittees and all locations within
5 the Santa Monica Bay.

6 We're seeing TSOs as something that could be a very
7 focused tool for some situations where good efforts have
8 been made. There's been a good faith effort to try to
9 come to compliance, but there may be a few areas where
10 compliance is not yet achieved.

11 And based on an evaluation of all the efforts that
12 have been taken, you know, the chronology of those, and

May 3 MS4workshop

13 in evaluation of what additional conduct we needed, it
14 would be a very focused tool that may be provided only
15 to a subset of permittees essentially.

16 And we would evaluate their requests. And we would
17 -- one of those things that I had on that slide that I
18 showed would be that the permittees would need to
19 provide a chronology of what are all actions they have
20 done to try to come into compliance per the original
21 implementation schedule that was in the TMDL.

22 And so we would evaluate that then before proposing,
23 you know, before staff proposing a time schedule order.
24 And like I said, the time schedule order could be
25 focused -- you know, provided for some permittees and it

0221

1 could be provided just for certain areas within -- you
2 know, Santa Monica Bay you have 57 compliance points
3 within the Santa Monica Bay bacteria TMDL.

4 Not all of those locations need additional time. A
5 number of those are in compliance. And so it could be a
6 very focused tool in that sense. And I think that's
7 something that I want to make sure is clear because I
8 don't want, if that's come across, that we really would
9 look at it not necessarily as a blanket time schedule
10 order for all, you know, all locations and all
11 permittees necessarily.

12 We would look at the individual requests and what's
13 been done by each permittee and see what seemed
14 reasonable. So I don't know -- so that's part -- that's
15 part of the answer, I think, to your questions, and I'm
16 not sure if there are other aspects.

17 MS. DIAMOND: As I said, I think a lot of the
18 permittees have done a great job and we have cleaner
19 beach water quality and more A grades than ever before,
20 but -- and this is just hypothetical -- I don't know.

21 The ones we have seen, there has been a lot of days
22 of noncompliance or exceedance. What if you -- what if
23 there's some permittees that haven't been trying and --
24 we already have six years for some.

25 I'm assuming there must be a handful of noncompliance

0222

1 or perhaps that they're not doing things that are
2 possible. What are we -- are they going to get the benefit
3 of those that are trying and haven't come into
4 compliance yet?

5 MS. PURDY: And I would say the answer would be, no,
6 not necessarily.

7 MS. DIAMOND: (Inaudible).

8 MS. PURDY: (Inaudible). Exactly. I think because
9 we have -- you have a lot of other endorsement tools at
10 your fingertips, and I think that, you know, time
11 schedule orders are a tool to use that we think our
12 permittee is really in need of, and it's justified to
13 provide additional time.

14 And, you know, we developed those implementation
15 schedules with the best information we had available.
16 And we considered a lot of different things. But we've
17 also learned a lot along the way.

18 And there may be some situations where it might be
19 warranted to provide additional time. And certainly we
20 believe that the (inaudible) TMDLs, which are a different
21 situation. We think that it is warranted because many
22 of those TMDLs are in many ways just like our
23 state-adopted TMDLs.

May 3 MS4workshop

24 So we provided implementation schedules for the
25 state-adopted TMDLs whereas the (inaudible) TMDLs don't
0223

1 have those implementation schedules. So it would really
2 be evaluating it on a case-by-case, permittee by
3 permittee basis to look at whether it would be an
4 appropriate and warranted tool to use or not.

5 MS. DIAMOND: I just, you know, I think our TMDLs
6 have been incredibly effective, and I want to make sure
7 that we are still on the cutting edge and not
8 backsliding legally, you know, or even in perception.

9 I think, you know, we don't need to be -- we
10 certainly will not be backsliding legally. None of us
11 -- we wouldn't do that. But we want to also consider we
12 don't want to go backwards in any way when we've had
13 such a successful program. And our staff and our region
14 and our beaches are so incredibly important to us in
15 every way, economically, environmentally, for our health
16 mental and physical.

17 And so I just want to make sure that we are moving in
18 the right direction. I think I said at the last
19 workshop our Clean Water Act and again I started this
20 morning by saying I was so inspired by hearing Lisa
21 Jackson a couple weeks ago.

22 And she talked about the Clean Water Act as being
23 this incredible tool that provides us with a healthy
24 environment and we must move forward. The Clean Water
25 Act is constantly moving forward. And so I just want to
0224

1 be sure that that's what we're doing.

2 MR. STRINGER: Thanks. Larry, do you have any
3 questions or comments on TMDLs?

4 MR. YEE: Well, one on the bacterial TMDL. I heard
5 one of the speakers this morning talk about human
6 shedding. How do you distinguish between that kind of
7 bacterial contamination and other sources? Or do you?

8 MS. PURDY: Well, it's -- yeah, there are ways of
9 determining the -- we refer to them as micro source
10 tracking methods. And so there are ways we can look at
11 what is the source of bacteria. Usually, it's determined
12 as human versus nonhuman.

13 And there's also sanitary -- what we refer to as
14 sanitary surveys. Basically, where you -- in many cases
15 are going up the watershed doing lots of different
16 monitoring at points, collecting samples, and then doing
17 the source tracking to determine what, one, from a
18 geographical point of view, where is that bacteria coming
19 from? And two, what is it? More specific, is it human?
20 Is it nonhuman? If it's nonhuman, is it birds? Is it
21 other types of water life?

22 So there are techniques. There's actually been a lot
23 of advancement in I'd say just the last decade, maybe
24 even less than a decade, in that area. And there still
25 continues to be. And EPA is looking at that nationally
0225

1 and is trying to develop a lot of new methodologies so
2 that we can start to use those much more commonly.

3 They've been fairly specialized and somewhat
4 expensive techniques to use up to this point. But I
5 think it's getting to the point where more and more are
6 commercial laboratories will be able to use those
7 techniques and that sort of thing.

8 MR. UNGER: And also I would like to add one thing to

May 3 MS4workshop

9 that which is the basin plan already has interstate
10 provisions for permittees to look at. So they -- the
11 natural sources exclusion would essentially look at
12 natural sources in a given beach, in a given environment
13 and petition us to, you know, have alternative standards
14 for that particular water body.

15 So no one has taken advantage of that yet. And I
16 think a lot of the reason, as Renee explained, is
17 because science is just getting there right now, but we
18 expect that -- we've anticipated that issue so.

19 MR. STRINGER: Maria, anything?

20 MS. CAMACHO: No.

21 MR. STRINGER: Madelyn.

22 MS. GLICKFELD: Well, my question is a variation on
23 TMDLs. It's about -- you know, I've been on the Board
24 for five years now -- I think five years -- and I still
25 don't know who is complying and who isn't.

0226

1 And we don't have that information for us. I hope
2 you guys know who is and who isn't. You said you get an
3 annual report based on the current permits.

4 But I think if we go through this process and we
5 adopt the new permit and we don't know what the baseline
6 -- what people are already doing to comply, that would
7 be a really big shame because it will not -- it will be
8 starting again as if nothing had happened.

9 And I'm concerned about that. So what can we build
10 into this permit that first of all gives the Board and
11 gives the cities and the counties and the public an idea
12 of who's doing their job, who isn't doing their job,
13 where are they doing -- which pollutants are they doing
14 well on; which pollutants aren't they doing well on.

15 And so we can focus. We can understand where we're
16 starting from. Is there a way that issue of compliance
17 can be addressed? I think -- I have this gut feeling
18 that if we actually look at what people are doing in a
19 much more concentrated way, maybe some members of the
20 public will be -- and some members of the Board,
21 including me, might be more confident about moving
22 forward.

23 MS. PURDY: And I think that is in large part related
24 to the monitoring and reporting program that will
25 develop as part of the this permit. So we've talked

0227

1 about monitoring before. And I think particularly with
2 this permit because we're incorporating so many TMDLs
3 that have water quality-based limitations, we're going
4 to have even more monitoring data, and we will have
5 outflow monitoring data. And I think it will give us a
6 much clearer picture of how permittees are doing. In
7 the past, the way we did monitoring, which was before
8 anyway was, you know, not as -- it wasn't as clear how
9 each individual permittee was doing.

10 But I would just say that we are trying to build in
11 a number of -- of course (inaudible) monitoring --
12 monitoring programs as well as an assessment and
13 reporting program that will show us to really determine
14 how permittees are doing.

15 We do have a sense with, right now through the annual
16 reports, of how permittees are doing. They submitted
17 their annual reports reporting on the programs that
18 they've implemented, the types of actions they've taken,
19 the type of (inaudible) they've done, and that sort of

May 3 MS4workshop

20 thing; the public education.

21 And so we do have a sense of that. And we also have
22 a sense of looking from the TMDL monitoring data that's
23 coming in. And looking at, for example, I know I use
24 the bacteria TMDL a lot, but I've lived with that since
25 2002.

0228

1 But we look at that monitoring, the TMDL compliance
2 monitoring data and we have a sense of how permittees
3 are doing based on the evaluation of the TMDL compliance
4 monitoring. But it really -- it -- I think one of the
5 things that, frankly, I have been thinking about a lot
6 is how can we make sure that our reporting program is
7 effective?

8 And I think it's actually a great concern to the
9 permittees as well. They want to be able to report on
10 what they are doing. And we all want that to be a
11 meaningful report. It's really giving a good picture of
12 what the permittees are doing, what we've heard from
13 them about what they've done, and so we're looking at
14 ways to have the reporting be a more productive process.

15 MS. GLICKFELD: If I can suggest, I think what Downey
16 did was really helpful. And the sense that I can
17 encourage other cities to actually put together a quick
18 synopsis of what you're doing and what kind of coverage
19 you have and what pollutants you're addressing, so that
20 -- and that staff could find a way of assembling, so that
21 we know what's going on. I think -- and that's not only
22 me, but so the public knows this as well.

23 I think that will make a huge difference. And I'm
24 suggesting that you rethink about how you look at
25 compliance in this next five years around so that you

0229

1 get a lot more real data on this instead of discussion
2 and hypotheticals about what people may and may not be
3 doing.

4 MR. YEE: Is it possible to steal from Heal the Bay
5 and issue report cards?

6 MS. GLICKFELD: You want report cards?

7 MS. PURDY: I think we can think about it, how that
8 might work within the reporting program or how to use
9 program reporting data. So we'll think about that.

10 MR. YEE: I think, you know, we need to be able to
11 judge over time how an entity or permittee is doing out
12 there.

13 For instance, if they scored a C today and 10 years
14 from now they're still scoring a C, you know, then
15 obviously they haven't made much progress. But, you
16 know, if someone scores say a D and 10 years from now
17 they're up to a B or an A, then wow, you know. That's
18 terrific.

19 Also it might be a way for, you know, the public to
20 understand how these permittees, you know, are
21 functioning with respect to the residents. I mean, as
22 I'm sitting here today, I'm trying -- I know that --
23 that regulations and enforcement are not going to do it
24 all and, you know, I'm having a little bit of a time
25 adjusting.

0230

1 And I had a career in research education, so I'm
2 having a little bit of a time adjusting to a regular
3 hat; right?

4 But obviously, you know, if we're really going get to

May 3 MS4workshop

5 where we really need to get to, we need to have a
6 certain level of civic engagement and personal
7 responsibility in all of this. Citizens don't know, you
8 know, where they're at and they don't understand --
9 readily understand that it's going to be difficult.

10 MS. MUNOZ: Also, I was hoping there would be an
11 additional benefit by publishing and knowing who's doing
12 well in certain, say, TMDLs because cities who have the
13 same issues might be able to talk to that city and get
14 some guidance or some advice if they shared information.

15 It's not a competition, really. We're all working
16 together to increase water quality. So it seems to me
17 that we would be a vehicle for increased information
18 sharing.

19 And I can't forget I used to do a lot of work in the
20 San Fernando Valley; there were a group of a number of
21 Hispanic parents who had been planning for two months a
22 trip to the beach. And many times, it is a week outing.

23 And they went. And about 15 of them went, majority
24 children. And when I saw them on Monday and asked them
25 how their trip to the beach was since they were so

0231

1 excited about going, it was full of horror stories of
2 oh, my God, you know, the beach was dirty. My kids came
3 back, and I think they got the flu. Some of them were
4 throwing up and it was a horrible experience.

5 And the asked me what can we do here so when we go to
6 the beach next year, we don't have those problems? Is
7 it something we're doing at home?

8 So that was an incredible moment for -- I don't call
9 it watershed education because no one's going to know
10 what that is. I think that people need to know, you
11 know, and if residents knew where the cities were in
12 some of these TMDLs and translated TMDLs where it makes
13 more sense.

14 Because when TMDLs were first introduced to me,
15 (inaudible) treat people and I just thought oh, my God,
16 this is Greek. I don't know what this means. I finally
17 understood it being on the water board.

18 But translating our language to the everyday person
19 so it makes sense to them and simplifying their everyday
20 actions at home and at work to help meet those TMDLs.

21 The other point I have about the TMDLs and what I've
22 heard is, it just seems like just such an administrative
23 nightmare. This is reporting the compliance and
24 certification if the compliance is happening. Does that
25 mean there's going to be a shift in staff priorities? I

0232

1 mean, I know that we recently hired 212 folks, but how
2 large is the staff who's going to be in charge of that
3 piece of it? Because it just a very -- a lot of
4 burdensome paperwork.

5 And so I think you might have the answer to my
6 question because I'm sitting here thinking oh, my God,
7 that is a lot of work.

8 MS. PURDY: Right. It's a lot of administrative work
9 for us, and I would say -- I mean, it's a shift in the
10 workload will be -- we've been spending the (inaudible)
11 the stormwater permit meeting -- and that being said,
12 we've also been spending a huge amount of time
13 stormwater permits.

14 We've spent a huge amount of time over the last
15 several years developing stormwater permits.

May 3 MS4workshop

16 Developing the Ventura permit, developing now the LA
17 permit. And so part of that shift will be under the
18 term permit development which I'm really looking forward
19 to to permit implementation.

20 And so the staff like myself and like Aybar and
21 Rebecca and Nick and others on our stormwater
22 permitting unit will be shifted from working on permit
23 development to really working on reviewing these
24 watershed management program plans, reviewing the
25 assessment reports as they come in, and the monitoring

0233

1 reports.

2 We don't have a big staff. Aybar has basically five
3 -- five staff under you, Aybar? So it's not a large
4 staff. We may also rely on some of our TMDL program
5 staff to do some of the reviews of the watershed
6 management programs because TMDLs are driver for some of
7 these. You're right.

8 There is a big administrative burden and we do hope
9 there will be collaborations so that we get just a few
10 large plans as permittees are working together as a
11 group rather than having lots and lots of individual
12 plans which would be an even greater burden.

13 But we're, you know, I think it's the right direction
14 to go. And we'll do what we need to do to manage that
15 administrative burden.

16 MR. STRINGER: Okay. Thanks. That was really
17 helpful. Maria, did you have something?

18 MS. CAMACHO: Yeah. Sorry. I had one question. In
19 looking at the -- the section 19-15, the commingle
20 discharges section of the TMDL provisions and then in
21 hearing Mr. Tahir talk about and showing that image of
22 the outfall pipe and then the the waterway below it, and
23 I think there was question of where the monitoring --
24 where we capture the -- take the monitoring levels from
25 it.

0234

1 So I was just curious about your take on that. And
2 then in reading the commingle discharger section and
3 hearing Ray bring up the fact which now it makes sense
4 is like for example, the school districts sometimes.
5 That's their own land and cities don't have jurisdiction
6 necessarily over that land.

7 And so how does that come into play in this effort to
8 ensure and showcase, you know, when you're trying to
9 showcase and demonstrate that you did not cause that
10 source of pollutants or pollution. How does all that
11 work?

12 MS. PURDY: First of all, with regard to the first
13 part of your question in commingle discharges, the way
14 that we've laid things out, we're trying to provide a
15 number of different options for permittees in terms of
16 having them demonstrate compliance.

17 And so definitely outflow monitoring is going to
18 become a new and (inaudible) permit that we haven't
19 really had in the past. We do have it in Ventura, as he
20 had mentioned in his introductory remarks. And we do
21 think that that's very important and valuable.

22 So in the case of commingle discharges, you might have
23 different situations. In the picture that Ray showed,
24 you have an outfall. That outfall may be just draining
25 one jurisdiction. That would be the simple scenario.

0235

May 3 MS4workshop

1 And you can just sample at that outfall the actual
2 discharge coming out of the outfall, not in the water
3 body itself, and know that it's coming from that
4 permittee's jurisdiction. And the working proposal that
5 we have allows a permittee to do that. And we'll have
6 the outfall monitoring data to support that kind of
7 determination.

8 If you monitor -- if your group of permittees
9 working together on the watershed plan and you choose
10 to, you can monitor in the water body and you can show
11 that that standard in the water body is achieving water
12 quality standards.

13 And so everybody that's contributing to that water
14 body would then be found in compliance in that case.
15 And so if the group of permittees choose to work that
16 way, then that may be a more efficient way to look at
17 the water quality data.

18 Another situation, of course, is if you've got that
19 outfall and this happens, and I think it's in LA, and
20 then that outfall is actually not just draining one
21 city. But you have one city right after the water body
22 then you have another one upstream of that and another
23 one upstream of that.

24 In that case, it's going to require some monitoring
25 and jurisdictional boundaries if you really want to

0236

1 determine what an individual permittee's responsibility
2 is. And that can be done by finding, you know, a
3 manhole where you can actually access the (inaudible)
4 near the jurisdictional boundary and taking a sample at
5 that point.

6 It is going to mean a much more, I think, complicated
7 monitoring program than we've had in the past. But a
8 lot of this monitoring is starting through the TMDLs
9 compliance monitoring that we have. So that's -- we're
10 allowing for both of those types of monitoring to occur
11 in the working proposal.

12 And then I'm sorry. Now I've lost track of the
13 second part of your question.

14 MS. CAMACHO: The topic of school district.

15 MS. PURDY: Oh, yes. Thank you.

16 So in regard to that, the school districts --
17 actually one of the things that state board is working
18 on right now is a space to -- for a permit -- or a small
19 MS4 permit.

20 And there was some contemplation initially about
21 including school districts up front. At this point,
22 state board isn't proposing to do that, but the regional
23 board has the ability to basically require that school
24 districts enroll in that phase two permit. And in that
25 case, they would be separately regulated and would have

0237

1 their own set of requirements under that -- what will be
2 a state board-issued general MS4 permit for small MS4s.

3 And so -- that's -- I mean, that's just one example
4 of probably a number of other situations that I think
5 Ray mentioned some other ones where there are other
6 general MPS permits that may discharge through the MS4
7 system.

8 And in that case, those MS4 permits contain their own
9 set of permit requirements. And if they -- I would say
10 is an MS4 permittee, one of our (inaudible) MS4
11 permittees identified that as a potential source, then

May 3 MS4workshop

12 that's something that we can then discuss that with
13 them.

14 For example, in the case of school districts, maybe
15 that would be justification for considering whether that
16 school district sold be enrolled in the phase two MS4
17 permit.

18 MS. GLICKFELD: Is there a way of including this kind
19 of process as language in the permit and talking to the
20 permittees about what they do with entities that they
21 don't supervise?

22 So they basically have authority over most private
23 land and they have authority over their own streets, but
24 they don't have authority over school districts.

25 Is there a way to describe this, what happens in the

0238

1 community and what they should be doing to resolve the
2 problem?

3 MS. PURDY: In terms of talking to us about that
4 problem?

5 MS. GLICKFELD: No, in terms of having those other
6 entities being under other permits.

7 MR. UNGER: I think it's just regular jurisdiction.

8 MS. GLICKFELD: (Inaudible)

9 MS. PURDY: I would say I think we probably can put
10 something, if not in the permit itself, then in perhaps
11 in some of the supporting documentation like the fact
12 sheet. We actually do have some of the language in
13 already with regard to non-stormwater discharges
14 because there are a number of general MS4 permits for
15 non-stormwater discharges that end up coming through
16 the MS4.

17 And so I think that there is a way that we can talk
18 about situations where there might be separately
19 permitted discharges that are coming through the MS4 and
20 how those should be dealt with by, you know, school
21 permittees or referred to us if there's a problem with
22 compliance with that particular permit. I think we
23 could find a way to do that.

24 MR. STRINGER: Thanks. So I'm going to jump now and
25 ask a question that opens up a different topic. And I

0239

1 apologize ahead of time. I've got to catch a flight, so
2 I have to leave here at 4:30. When I leave, Fran is
3 going to take over and chair the rest the meeting. I
4 apologize ahead of time. I will slip out unnoticed,
5 hopefully.

6 The issue of numeric standards versus BMPs, we've
7 heard today that we have discretion and we don't have
8 discretion. That's one issue obviously that the
9 (inaudible) can address that. But more broadly than
10 that, if you could help us kind of unpack those issues
11 and help us understand the implications of our decision.
12 That would be very helpful.

13 MS. PURDY: So with regard to the -- yeah, the
14 question of numeric or BMP-based approaches, staff has
15 evaluated this and, you know, looked at what the federal
16 regulations say which is -- and I know I've said this a
17 number of times before, but federal regulations
18 basically require that we have (inaudible) limitations
19 that are consistent with the assumptions and
20 requirements of wasteload allocations from TMDLs.

21 And so given an evaluation of how those wasteload
22 allocations are expressed in our basin plan, of course

May 3 MS4workshop

23 they are (inaudible) numerically, and the fact that
24 basically EPA has stated in both in the federal
25 regulation as well as in more recent guidance that if

0240

1 feasible, then those wasteload allocations should be
2 translated into numeric water quality based (inaudible).

3 And based on staff's analysis, we believe that it is
4 feasible to translate those wasteload allocations into
5 numeric water quality based (inaudible). We think that
6 we have the necessary data.

7 It's consistent with how their wasteload allocations
8 are expressed in our basin plan, and we think that it
9 also provides a, you know, a very important way to
10 ensure accountability and that those wasteload
11 allocations that were developed into TMDLs are actually
12 achieved at the end of the day.

13 The other thing that I do want to say that's kind on
14 the flip side of this is related to whether we can
15 include permit limitations and TMDs instead of numeric
16 water quality based (inaudible) limitations. And what
17 -- basically what EPA says about this is you can use
18 TMDs as permit limitations if you have the assurance
19 that those TMDs are going to achieve your final wasteload
20 allocations.

21 And it's a little bit of -- in some ways an issue of
22 the horse before the cart kind of thing where at this
23 point we're saying develop watershed management programs
24 to show and then make demonstrations that those
25 watershed control measures in your programs are going to

0241

1 achieve the final wasteload allocations in TMDLs.

2 And we don't yet have that information. We don't
3 have that information to put in the record that we know
4 that this is the set of TMDs that we need to achieve
5 those final wasteload allocations. So that's why we've
6 chosen this approach of including the numeric water
7 quality (inaudible) limitations which we believe it's
8 feasible to calculate those and include them in the
9 permit.

10 And then we've provided this dual path at least for
11 the interim water quality based (inaudible) limitations
12 where there's a little more flexibility because the
13 federal regulations don't really say as much about the
14 idea is interim wasteload allocations. That's something
15 that, in many cases, we put in our TMDLs because we have
16 a very long time (inaudible) our TMDLs, and we want to
17 ensure that there's progress along the way.

18 But there's -- there's more -- I would say there's
19 more discretion with regard to how we express the
20 interim water quality based (inaudible) limitations than
21 what we determined that we have for the final water
22 quality based (inaudible) limitations.

23 Because of the fact that, you know, we find it
24 feasible to calculate that it is numerically consistent
25 with how they're expressed in our basin plan. We, you

0242

1 know, we find (inaudible) approach to require the
2 compliance with the final numerics using just that more
3 direct comparison with the numeric (inaudible)
4 limitations (inaudible) approach.

5 And I think with the reasonable assurance analysis
6 with what our expectation is that that should be
7 possible to achieve this numeric. That's the whole

May 3 MS4workshop

8 point of the reasonable assurance analysis is to
 9 basically show that this watershed control measure will
 10 actually achieve the final (inaudible) limitations at
 11 the end of the compliance period.

12 MR. UNGER: Can I?

13 MR. STRINGER: Sure, yes.

14 MR. UNGER: I'd like to add that the proposed
 15 approach that we perform, documents that you've seen for
 16 today's workshop, I think comports quite well with
 17 (inaudible) who is trying to do which things -- which
 18 people are trying to do things and which aren't.

19 So by giving them some latitude, you know, by using
 20 TMDs as (inaudible) said, gives them a chance to
 21 implement certain things, and perfect them, modify them,
 22 and adjust them, things like that, add to them.

23 And they're still making good efforts which we
 24 thought we heard earlier from you that you're interested
 25 in knowing which of those municipalities are making that

0243

1 effort. So it provides an incentive in that sense.
 2 (Inaudible) in terms of achieving water quality
 3 standards. (Inaudible) led us to some degree to the
 4 proposal that you have before you now.

5 MR. STRINGER: Okay. Could you just explain a
 6 little -- (inaudible). I'm trying to understand the
 7 practical implications of going one way or the other to
 8 (inaudible.) It's obviously a big concern, and I'm not
 9 sure I understand yet from a real, practical perspective
 10 the implications of going one way or the other.

11 MS. PURDY: Yeah, I think from a practical point of
 12 view, the BMP-based approach, (inaudible), I think they
 13 in probably deal with this as well, but I think they
 14 feel provides them with a greater amount of certainty.

15 They know if they -- I mean, just as simple, they
 16 know if they implement those actions, then per the
 17 schedule, then they'll be in compliance. Whereas I
 18 think with the numeric there's -- and the use of
 19 monitoring data and the comparison to those numeric
 20 limitations, they feel like there's some greater amount
 21 of uncertainty that they will be found in compliance
 22 that because of some of the variability in the stormwater
 23 that there could be concerns and variability in the
 24 performance of some BMPs that they would be concerned
 25 that they may not be able to demonstrate in all cases

0244

1 compliance with numeric limitations.

2 So I think in a very simple sense that's one of their
 3 greatest concerns from a practical point of view. I
 4 think it's much -- they have a lot more engineering --
 5 maybe engineering isn't the right way to say it.

6 But to say yes, I've done this action that I said I
 7 would do, and I've done it for the schedule is a more
 8 straightforward way for them to demonstrate compliance.
 9 Or a more certain way than to demonstrate compliance, I
 10 think, than they feel using monitoring data in
 11 comparison to numeric limitations would be.

12 MR. STRINGER: (Inaudible) from a water perspective
 13 (inaudible) more certainty.

14 MS. PURDY: Right. Right. Exactly it gives
 15 (inaudible) --

16 MR. STRINGER: The environment.

17 MS. PURDY: (Inaudible) water quality standards are
 18 actually being achieved and the beneficial uses are

May 3 MS4workshop

19 actually being protected.

20 MR. STRINGER: Right.

21 MS. PURDY: Right.

22 MR. STRINGER: Madelyn, you wanted to --

23 MS. GLICKFELD: Sorry. I just wanted to add that
24 certainty means you're not going to be fined. I think
25 the enforcement part is a really big concern to -- for

0245

1 both sides. I think the (inaudible) community wants to
2 see enforcement numerics so that people feel they have
3 to do it.

4 And I think the regulated community is scared to
5 death of enforceable permits because they (inaudible)
6 about the basis they might not be able to meet them. I
7 think that's why it's important. I wanted to talk about
8 the --

9 MR. STRINGER: Hang on one second. Are you changing
10 the topic?

11 MS. GLICKFELD: Yes.

12 MR. STRINGER: Does anyone have any questions about
13 the numerics versus BMP?

14 MS. DIAMOND: I guess I'm still having a hard time
15 understanding if BMPs are -- are the measure, this would
16 be after the reasonable assurance analysis and the
17 reasonable assurance analysis would -- what would that
18 be based on?

19 How would a permittee show that a BMP that they are
20 choosing to comply with the permit limits are going to
21 work? What would that reasonable assurance analysis
22 look like? That's where I'm kind of stuck.

23 MS. PURDY: What we're anticipating for that is a
24 basically a quantitative analysis. Once they have
25 identified all of their watershed control measures,

0246

1 there are a number of sources of information out in the
2 stormwater arena in terms of stormwater research and
3 implementation.

4 There's a very good database, for example, an
5 international BMP database that talks about what's the
6 expected performance of lots of different types of BMPs.
7 There's been a number of research projects and so forth
8 on a lot of these stormwater management measures.

9 So the idea would be that it would be a quantitative
10 analysis based on, you know, assumptions about the
11 performance of the watershed control measures that have
12 been identified to be implemented.

13 So if a lot of the permittees or at least a number of
14 the large permittees developed very technical modeling
15 systems, like the County has one called the watershed
16 Management Modeling System.

17 City of LA has a modeling system where they can
18 actually input what the BMPs are, what they are going to
19 be doing, where they are going to be doing them within
20 the watershed area, and then in the modeling. Okay,
21 what would the water quality outcomes be?

22 And so the reasonable assurance and analysis would
23 largely be based on that type of quantitative analysis
24 based on, you know, some -- some functions, well
25 (inaudible) assumptions about BMP performance.

0247

1 MS. DIAMOND: And then -- I guess my question is
2 always and then -- BMP based that regional board staff
3 looks at and agrees is -- there is a good chance

May 3 MS4workshop

4 basically that these are going to work. And we go so
5 forth and do them.

6 Then there's monitoring to see whether they actually
7 do work. Now, what happens if they don't? We pray that
8 they do, but what happens if they don't? I'm just
9 trying to figure that part out.

10 MS. PURDY: Right. So if they don't, I think one of
11 the questions would be how far away were they from
12 working the way they thought they were going to work?
13 If it's just that they're a little bit away from where
14 they thought they were going to work, then, you know,
15 that will probably just require a little bit of, you
16 know, adaption. Maybe they can be, you know, performance
17 can be optimized, that sort of thing.

18 If they're very far away, then maybe, you know, there
19 was an error in the analysis. And there needs to be an
20 effort to go back to the drawing board and look at what
21 are the appropriate TMDs to be implemented.

22 So you're right. I mean, we might have -- we're
23 hoping that the situation will be that it comes pretty
24 close to what was expected in terms of water quality
25 outcomes and maybe there was just a little bit of

0248
1 difference, and maybe they actually did better than they
2 thought they were going to, but they didn't do as well
3 as they thought. And that is part of what that adoptive
4 management process is supposed to address, also.

5 MS. DIAMOND: So then you go back to the drawing
6 board and figure out what the next steps would be?

7 MS. PURDY: Right. I mean, if it was very far apart
8 from what we expected, then in that case, it may be
9 because the BMPs weren't implemented as intended, maybe
10 they weren't designed properly, maybe they weren't
11 operated or maintained properly.

12 So we'd need to do an evaluation of were the BMPs
13 done in the way that they were supposed to be done? And
14 were they operated and maintained properly? And -- but
15 we would also look at was that really the best BMP to be
16 using in that case or does a different type of BMP need
17 to be used to address that pollutant.

18 MS. DIAMOND: And would the staff then, the executive
19 director and staff have the authority to then say to the
20 permittee, "Look, this isn't" -- whatever. "This needs
21 to be tweaked" or "this isn't working." And direct them
22 to go to the next set of BMPs or -- is that how it's
23 contemplated?

24 MS. PURDY: Yes, it is. So that the review cycle
25 that would happen on about an 18-month period. At least

0249
1 like I said, that's what we're proposing at present,
2 would be the opportunity to look and see do any of the
3 BMPs need to be enhanced? Do they need to be changed?

4 And there will be another review process at that
5 stage and a revision of the watershed control measures
6 and basically of the watershed management program.

7 And so any revisions then would be incorporated into
8 an updated watershed management program. And that would
9 go through the approval process again. And there would
10 definitely be the opportunity, as you just said, for the
11 regional board to provide input and say to the
12 permittees, "You need to implement additional BMPs," and
13 the permittee would have the opportunity to propose what
14 these would be and then would go through the process of

May 3 MS4workshop

15 approving the revised plan.

16 MS. DIAMOND: Would this come to the Board at some
17 point? I'd just like an -- a lot of this doesn't come
18 to the Board. You'll be doing this internally. But it
19 seems to me I would like to know how they're doing.

20 And what -- when there are times that there needs to
21 be changes, what are the changes? what were the
22 results? I think we all want to be educated about the
23 BMPs that are being used and the state of the water
24 quality in the dynamic way as we're moving forward.

25 So that would be important for me to see that we have

0250

1 updates regularly, you know, the 18 month or the 20
2 month, whatever makes sense, but I think we would need
3 to know that.

4 MS. PURDY: Okay.

5 MS. DIAMOND: That's all I have on that issue. You
6 have something you want to say?

7 MS. GLICKFELD: Yeah, I do. I wanted to talk about
8 the receiving water limitations, which is another issue of
9 contention that we heard about today. When Miss Maloney
10 was speaking, she talked about the receiving water
11 limitations.

12 She said the code -- I hope I'm quoting you right.
13 The (inaudible) to liability permit is allocated and
14 that it doesn't -- it holds the municipalities as a
15 group within the watershed that are -- that are
16 discharging to water bodies responsible for those even
17 if one member of the group is complying.

18 On the other hand, I think the (inaudible) said it's
19 really important that you maintain these receiving water
20 limitations. So I -- we are -- we abandon your
21 (inaudible) for mass emissions monitoring in favor of
22 (inaudible) monitoring. Is that pretty clear?

23 MS. PURDY: We're not abandoning mass emissions
24 monitoring. We still have -- we refer to it in the
25 current permit as mass emissions. It's basically

0251

1 monitoring in the receiving water. We'll still have
2 receiving water monitoring. And the specific locations
3 are yet to be determined.

4 There are some potential benefits to maintaining the
5 current mass emissions station from the point of view of
6 having a lot of trend data for these stations. But we
7 will still have receiving water monitoring in the permit.

8 MS. GLICKFELD: So I'm going to take the trash TMDLs
9 as an example because -- making a great example in
10 Orange. It's not -- as I understand the trash TMDL, if
11 the City does the full capture device and they put them
12 on 100 percent (inaudible), no matter if there's trash
13 left in them or not, they're in compliance; is that
14 right?

15 MS. PURDY: Yes. Trash TMDLs are unique.

16 MS. GLICKFELD: Okay. So you're saying that's not a
17 good example. That is not a good example. But here,
18 let's say another example, which is that active outfall
19 monitoring.

20 City A -- let's say you're City A. Fran is City A.
21 Her outfall is 100 percent clean, but downstream where
22 the receiving waters are, there's a pollutant problem.
23 It's exceeding limitations.

24 Is her city held liable along with everybody else at
25 the same time when she doesn't have any TMDL pollutants

May 3 MS4workshop

0252

1 coming out?

2 MS. PURDY: No, because part of the language of the
3 receiving water limitation provision is that there has to
4 be a determination that the MS4 permittee has discharge
5 (inaudible) for permittee jurisdiction is causing or
6 contributing to the exceedance that receiving water
7 limitation.

8 So in that case, Fran's city would not -- if there was
9 outflow monitoring data demonstrating that her discharge
10 was meeting water quality standards, then there would be
11 no basis for making that determination that discharge
12 from that city has caused or contributed to the
13 exceedance.

14 MS. GLICKFELD: So if I might ask Miss Maloney to
15 come up. Is that okay if I ask her to come up? Is that
16 okay, Madam Chair?

17 MS. DIAMOND: Fine with me.

18 MS. GLICKFELD: I think that maybe the problem that
19 cities are seeing with the receiving water limitations
20 may be different than I (inaudible).

21 I want to understand how is it different than -- she
22 said you're -- (inaudible) -- policy you don't have to
23 worry about receiving water limitations. And you say
24 that you're immediately placed in noncompliance as soon
25 as we pass the permit. So what do you mean?

0253

1 MS. MALONEY: Yeah. I think these are fair
2 statements because the way in which they work together
3 is more of where the permittees see the complications.
4 I want to back up just a couple steps to make myself
5 clear.

6 There's a number -- we're still waiting to see the
7 monitoring language. So I think that's part of the
8 question is, how these pieces are going to work
9 together. So we're kind of having to formulate that and
10 guess a little bit as we make these comments. So it
11 really depends on where that longtime compliance point
12 is set within the permit to -- and -- and -- to
13 determine where the compliance is evaluated.

14 And I think Renee outlined a number of different
15 options that would be available for permittees. Looking
16 at EPA TMDLs for example, when the receiving water
17 limitation language is applied to it, those TMDLs are
18 selected immediately upon implementing -- or rolling
19 into --

20 MS. GLICKFELD: You're talking about the new ones?

21 MS. MALONEY: I'm sorry?

22 MS. GLICKFELD: You're talking about the new ones,
23 not the old ones?

24 MR. UNGER: No, the old ones.

25 MS. MALONEY: Well, the ones that -- take the area

0254

1 lakes TMDL for example. Those are newly adopted as of
2 March and would be rolled into the permit the way that
3 they're written. Within the receiving water limitations
4 language, it says the first two sections talk about
5 basically the noncompliance.

6 The third section that's outlined talks about the
7 interim process that permittees could go together. As
8 we've heard, there's been a determination that those two
9 sections are separately assessed. So even though you're
10 going through an iterative process to address that

May 3 MS4workshop

11 pollutant that that you would still be held liable
12 numerically.

13 So when this concept applied to watershed management
14 (inaudible) keeping those EPA TMDLs as an example, if a
15 permittee selects to address all those pollutants within
16 the watershed management plan, that's going to take
17 about, you know, a year to establish.

18 MS. GLICKFELD: Going back to what the second
19 comment. I didn't mean to the --

20 MS. MALONEY: It's a little tough (inaudible).

21 MS. GLICKFELD: It sounds like what you're saying is
22 that there's still a lot of unknowns in the permit and
23 yet some of these might be able to be resolved, and
24 maybe you can provide some written comments on it.

25 MS. MALONEY: We're planning to provide a lot of

0255

1 detailed written comments on that. I think the core of
2 it is that if you're working through this adoptive plan
3 and the management plan, that that BMP approach should
4 be applied to it. And the way the receiving water
5 limitations language is written now, that even though
6 you're working toward (inaudible) plan that you would be
7 in violation of the permit. Does that --

8 MS. GLICKFELD: I understand what you're saying. I'm
9 just not understanding exactly whether or not it's a
10 problem that's already been solved or it's a problem
11 that can be solved. All right. That's it.

12 MS. DIAMOND: Anybody else have anything to say about
13 in that issue? Questions? Irma, do any us four women
14 that are left have anything to say about anything?

15 MS. MUNOZ: Yes.

16 MS. DIAMOND: Irma.

17 MS. MUNOZ: If you could review for us the process
18 that staff takes after meetings such as this one where
19 we've received a lot of input, a lot of questions. I
20 think it was the LA Permit Group who wanted to get the
21 draft at a certain time.

22 When are they going to get the draft? Is it going to
23 be a final draft or is it going to be a draft before the
24 draft and what the timeline is for that and when they
25 get it?

0256

1 You know, because I know that you're meeting with
2 folks; you're going to continue to meeting with folks.
3 I think you have a couple more meetings. So maybe you
4 can provide us that timeline and the steps.

5 MS. PURDY: I'll start, and if you want to jump in at
6 any time, Sam.

7 So currently what we're anticipating in terms of
8 process is that we've heard a lot of the comments today.
9 As I told you at the beginning, we continue to consider
10 and get a lot of comments on working proposals. We're
11 still going through comments we got on the first two
12 working proposals, and we're going to continue -- we've
13 provided a written comment period for these working
14 proposals in addition to today's board workshop.

15 And so as we get those written comments in as well as
16 digesting what we've heard today, we'll be making
17 changes to each of the filed working proposals now that
18 we've discussed with you, and we'll be putting those all
19 together into a formal tentative order.

20 And right now, the plan is for us to put out that
21 final tentative order for public notice. I'm hoping by

May 3 MS4workshop

22 the end of this month, or if not the end of this month,
23 but early next month. But right now, we're shooting for
24 the end of this month for the tentative order because we
25 want to provide a 45-day comment period for -- normally

0257

1 for public comments, we would provide a 30-day comment
2 period, but knowing the magnitude of this, we'll provide
3 a 45-day comment period.

4 And we also need to provide enough time for us to
5 then respond to written comments that we received at the
6 end of comment period and make sure that you have enough
7 opportunity to fully consider the comments and our
8 responses to those comments prior to the Board meeting
9 on September the 6th.

10 So right now, that's our plan. We do have -- will
11 continue to meet with permittees and other interested
12 parties, the environmental organizations, and others
13 during, you know, leading up to the release of that
14 tentative order. We already have some meetings on the
15 books and we'll continue to meet, I'm sure, throughout
16 the public comment period as well on the tentative
17 order. But right now, that's the big picture of what
18 we're looking at in terms of schedules.

19 MS. MUNOZ: Is there any benefit or any plan or
20 thought to bring some of the environmental organizations
21 with those entities that they -- so they can hammer it
22 out and try to figure out -- I think what happens is
23 when they're, like, this in a big room and talk to them.
24 No, I think they might have a lot more in common.

25 They probably can learn from each other so that it

0258

1 isn't, you know, like -- this and -- (inaudible) having
2 such a meeting in the future. Once they get this
3 document, then they can -- you know, I'd like to be a fly
4 in that meeting because I think it might be very
5 interesting and useful. We need (inaudible) between --
6 I don't want to say separate sites, but between both
7 entities, both interest groups.

8 MR. UNGER: Just real briefly. We have recently sent
9 out an invitation to what we think this small group of
10 (inaudible). We've spoken to the LA Permit Group, the
11 environmental groups, to the Los Angeles -- County of
12 Los Angeles, (inaudible). We're hoping we can have that
13 meeting. We're willing to facilitate it. (Inaudible)
14 and out of the room, we're happy to leave the room at
15 that time, and they can state officers and handle what
16 they need to. And we're hoping to get that process
17 started.

18 We're uncertain as to what might come out of it. But
19 certainly we can try. And we we'll wait to hear back on
20 the dates that we put out there that -- that would be
21 available. We'll report back to you on that. Just
22 specifically (inaudible) --

23 MS. GLICKFELD: I just want to say that I think all
24 of us up here really would like these parties to sit
25 down together and work on these issues and try to --

0259

1 because I can tell you from my history as a regulator
2 for a long time before even I got on this board, a board
3 like ours can fix about three things in a particular
4 action at any time.

5 It really can't -- we can't revamp and fix everything
6 at these hearings. You want to have your issues

May 3 MS4workshop

7 addressed, you need to do it together before you come to
8 the hearing. And hope that -- Sam, I hope that you
9 would -- I'll talk to you. I hope that you would
10 identify -- I think there's a lot of very specific
11 issues that you can narrow down to here that will --
12 that can -- that can bring us to a large amount of
13 consensus and then we can debate it at the next public
14 hearing.

15 MS. PURDY: Thank you.

16 MR. UNGER: Madam Chair, I've just been informed
17 that we have about three minutes left before we have to
18 vacate this room.

19 MS. DIAMOND: I just want to take less than one
20 minute to say thank you. First of all to staff, to
21 Renee, Sam, Deb, Paula, our attorneys, everybody who's
22 worked on it. It's been very, very helpful. This
23 workshop in particular. The last one as well.

24 And I want to thank all of the people who have come
25 forward to report to us today to give us information

0260

1 about this permit, your thoughts and ideas about it.
2 And I think it's very useful and thank you all very
3 much.

4 MS. PURDY: Thank you. Thank you for your feedback.

Los Angeles Regional Water Quality Control Board

TO: Los Angeles County MS4 Permittees and Other Interested Parties

FROM: Samuel Unger, P.E.
Executive Officer

*Chief Deputy EO
for*

DATE: May 8, 2012

SUBJECT: NOTICE OF EXTENSION FOR SUBMITTING WRITTEN COMMENTS ON WORKING PROPOSALS FOR LOS ANGELES COUNTY MS4 PERMIT PROVISIONS RELATED TO RECEIVING WATER LIMITATIONS, WATERSHED MANAGEMENT PROGRAMS, AND TMDL PROVISIONS

On April 23, 2012, staff of the California Regional Water Quality Control Board, Los Angeles Region (Regional Water Board) released working proposals of permit provisions related to the Watershed Management Programs, Total Maximum Daily Loads (TMDLs), and Receiving Water Limitations. The original deadline for written comments on these working proposals was May 11, 2012.

Staff presented these working proposals to the Regional Water Board at a workshop on May 3, 2012. During the board workshop, Permittees and interested persons had the opportunity to hear staff's presentation on the working proposals and provide oral comments on the working proposals to the board and staff for their consideration.

The Regional Water Board has received requests to provide a short extension of the comment period. Notice is hereby given that the Regional Water Board is extending the comment period until May 14, 2012. **Written comments on the working proposals must be received by the Regional Water Board no later than 5:00 PM on Monday, May 14, 2012.** Written comments should be submitted electronically to LAMS42012@waterboards.ca.gov.

If you have any questions on the working proposals, please contact Renee Purdy, Section Chief of Regional Programs at rpurdy@waterboards.ca.gov.

Theresa Rodgers - EXTENSION FOR SUBMITTING WRITTEN COMMENTS ON THE WORKING PROPOSAL FOR THE LA COUNTY MS4 PERMIT

From: <lyris@swrcb18.waterboards.ca.gov>
To: Theresa Rodgers <trodgers@waterboards.ca.gov>
Date: 5/8/2012 10:36 AM
Subject: EXTENSION FOR SUBMITTING WRITTEN COMMENTS ON THE WORKING PROPOSAL FOR THE LA COUNTY MS4 PERMIT

Finding, enjoying and maintaining clean beaches

By Jeff Harris MD MPH

Most of us seek out particular beaches by reputation or experience for their recreational attributes, ease of use, costs and safety. Nowadays, reports about getting sick after swimming or surfing at a Malibu beach are rare compared to decades ago and to others worldwide. Thanks goes out to Heal the Bay (HTB), the City of Malibu and many others for our local water quality improvements.

To better judge which Malibu beaches to use one must appreciate and go beyond the limitations of the HTB beach grades. If you avoided Malibu beaches based solely on some bad grades, you would needlessly bypass or worry about enjoying some great beauties and recreation.

What other perspectives can help you judge? How can you simply lower your risks? And finally what should be done for maintaining and monitoring shoreline water quality in cost effective ways?

Our beach illness risks typically trail behind going to parties, concerts, schools etc. where ill people can spread contagious germs called pathogens. Shoreline water risks go up significantly when human fecal bacteria are present from large volume sewage pipe leaks or plant failures and or from significant septic system failures. In contrast, Malibu's small volume septic systems have not been the current causes for bad HTB grades due to high fecal indicator bacteria (FIB) counts at Surfrider, Paradise Cove and Escondido beaches.

Unless the public understands the limitations of relying on FIB reports, they can easily be misled and mis-notified. These tests are meant for screening purposes only not the specific detection of disease causing germs (pathogens) and their sources. The validity of the FIB grades is highest when they are used to show long term trends in order to detect unexpected spikes in counts that require further investigation. "A" grades usually mean clean water trends except in some cases of parasite water borne epidemics. Limitations in testing frequency and timely reporting can also limit the validity of FIB testing. Current FIB tests are often not done daily, more typically weekly or monthly. Reports are often delayed by at least 24 hours to weeks when events can easily change water quality.

Further, the FIB screening tests have not been valid predictors at Malibu and similar sites with unique large natural shorelines and watersheds. This is because there are large numbers of shore birds, sea mammals, soil and sediments, and watershed animals accounting for the high FIB counts. These counts can naturally fluctuate depending on where birds or seals or other wildlife or domestic animals have been, whether lagoons and creeks are draining, where and when kelp and algae harboring the bacteria has been transported and what the tides have done to bring bacteria laden waters in or out. Also, our beaches also feature unique south swell surf when sand and soils sediments are re-suspended and aerosolized by waves elevating FIB counts.

What are the risks from these natural bacteria and other microbes? In our daily lives, we are immersed with millions of bacteria, viruses, parasites, fungi and the like. Most are rarely potential pathogens (human disease causes). In fact, many compete with pathogens and inactivate them or kill them (such as the penicillium mold or pro-biotics to treat or prevent illnesses). But your mother was right, there are sometimes pathogens in soils and sands, so wash your dirty cuts with pathogen killing soap.

Further, recent studies done in Malibu and other locations have indicated that some beach goers bring Staphylococcal bacteria on their skin that can be pathogens. Likewise studies have found probable instances of fecal and urinary bacteria contamination from beach goers. The more people the more likely some of them will carry potential pathogens to the beach.

Be assured that natural forces are also at work to kill off pathogens at the shoreline. Sunlight and drying reduce bacteria counts. Aeration with oxygen from flowing and bubbling water also kill some pathogens as well. And some pathogens die making the transition to and from fresh and salty waters.

You can also make your-self less vulnerable to pathogens. Habits of healthy eating, sleeping and exercise can do wonders to ward off infectious diseases.

To lower your illness risks at any beach simply do the following:

1. Learn its local reputation as to possible current illnesses and other safety threats. If the beach has had consistent A grades, it is likely safe. If it has sporadic bad grades due to natural sources and not high spikes, it is also likely safe.
2. Go to the beach after the sun has had several hours to kill off possible pathogens.
3. Stay away from actively draining lagoons, storm drains and creeks.
4. Shower with soap before and after you go to the beach and encourage others to do the same. Avoid beaches where there are or have been large crowds recently.
5. Avoid water contact after sewage spills or 72 hours of rain events.
6. If you do get sick, seek medical care for proper diagnosis and care.

To help keep your beach waters clean, pick up the litter, report man made unnatural water runoff sources and don't let others open creek berms. Finally, understand and educate your fellow swimmers, surfers and water enthusiasts about the significant limitations of relying solely on FIB as water quality measures. Don't be misled.

A leading water quality researcher points out the dilemmas we face from relying too much on FIB, “ **As a result of the exclusive emphasis on FIB in legislation, monitoring has lost sight of pathogens. A more rational approach to regulating water quality would start with available epidemiological data to identify pathogens of concern in a particular water body, and then use targeted pathogen monitoring coupled with targeted fecal source tracking to**

control them. Baseline monitoring of indicators would become just one tool among many.” 1.

This site based sequential step-by-step illness and pathogen risk based approach is what is necessary in the unique natural settings of Malibu and similar beaches worldwide to evaluate, and properly notify the public of likely risks. Likewise, valid data from this kind of approach can lead to water quality programs that will truly be cost effective and not wasteful of precious government and private resources.

Contrary to what others have stated, the costs to the City of Malibu, LA County and others of helping to develop and apply human and animal specific fecal and pathogen tests will be very worthwhile rather than wasteful. What has too often harmed the capabilities of the City of Malibu and others is to be placed in the untenable position of eradicating harmless natural source bacteria that show up as FIB. This unreasonable federal, state and local goal has been one of the major thrusts of lawsuits that have led to millions of dollars of attorneys' fees, and misdirected staff time; it has even led to the loss of millions of dollars grant funding for Legacy Park that had to be replaced with City of Malibu's general funds. These monies could have been used to implement even more accurate monitoring and water quality improvements.

LAMS42012 - Comments to Los Angeles County MS4 Permit Watershed Management Programs, TMDLs and Receiving Water Limitations due 5.11.2012

From: Joyce Dillard <dillardjoyce@yahoo.com>
To: <LAMS42012@waterboards.ca.gov>
Date: 5/11/2012 4:26 PM
Subject: Comments to Los Angeles County MS4 Permit Watershed Management Programs, TMDLs and Receiving Water Limitations due 5.11.2012

We are concentrating on those Watersheds that are in the City of Los Angeles and may be subject of past litigation.

The Final Signed Order 01-182 amended April 14, 2011, it states:

The objective of the Watershed Management Approach should be to provide a comprehensive and integrated strategy towards water resource protection, enhancement, and restoration while balancing economic and environmental impacts within a hydrologically defined drainage basin or watershed. It emphasizes cooperative relationships between regulatory agencies, the regulated community, environmental groups, and other stakeholders in the watershed to achieve the greatest environmental improvements with available resources.

We do not see this comprehensive and integrated strategy. We see limited testing:

In Receiving Water Limitations

TMDLs in the Santa Monica Bay Watershed Management Area:
Santa Monica Bay Bacteria TMDL

If an approved Integrated Water Resources Approach is implemented, each defined jurisdictional group shall comply with the interim single sample bacteria receiving water limitations for shoreline monitoring stations within their jurisdictional area during wet weather, per the schedule below:

Problem here is that the sampling is only with the shoreline monitoring stations, so contamination can occur, but not to the ocean. You can affect the Public Health and Safety in a park, roadway, school and it does not fall into "discharge."
How are birds and wildlife expected to comply with this order.

You have not taken an integrated approach or involved cooperative relationships.

Missing is the approach to measurement and monitoring within two WMAs, not the Santa Monica Bay Watershed Management Area WMA listed:

- Malibu Creek and Rural Santa Monica Bay WMA
- Ballona Creek and Urban Santa Monica Bay WMA

How do the bacteria levels differ, during what seasons, and with what type of wet weather

since Southern California experiences extreme weather patterns including extremely heavy rainfall in a short period of time. The samples given differ, so is the percentage required for the WMA equal to all sub-areas within both WMAs. That does not make sense.

Are the levels consistent with ALL Beneficial Uses, or maximized with the highest Beneficial Use.

Does that fit into the definition of "reasonably required."

Which approach will result in the reductions demanded by the period indicated:

- Non Source Point Best Management Practices BMPs
- Public Education or
- Source Point Identification

What observations are made to human and animal behavior as an approach to the monitoring process.

TMDLs in the Malibu Creek Subwatershed

Malibu Creek Watershed Nutrients TMDL (USEPA established)

and

TMDLs in the Ballona Creek Subwatershed

Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL

Ballona Creek Wetlands TMDL for Sediment and Invasive Exotic Vegetation (USEPA established)

Same application as above.

TMDLs in the Santa Monica Bay Watershed Management Area:

Santa Monica Bay Nearshore and Offshore Debris TMDL

Missing is the approach to measurement and monitoring within two WMAs, not the Santa Monica Bay Watershed Management Area WMA listed:

- Malibu Creek and Rural Santa Monica Bay WMA
- Ballona Creek and Urban Santa Monica Bay WMA

Your goal is for Zero trash discharge. That completely ignores human behavior.

How does that fit into California Water Code (CWC) §13263(a) "shall take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose."

TMDLs in the Malibu Creek Subwatershed

Malibu Creek Watershed Trash TMDL

and

TMDLs in the Ballona Creek Subwatershed

Ballona Creek Trash TMDL

Same application as above.

Santa Monica Bay TMDL for DDTs and PCBS (U.S. EPA established)

Missing is the approach to measurement and monitoring within two WMAs, not the Santa Monica Bay Watershed Management Area WMA listed:

- Malibu Creek and Rural Santa Monica Bay WMA
- Ballona Creek and Urban Santa Monica Bay WMA

We are concerned about the ministerial approach to the mitigation as compared to the discretionary approach. CEQA will still be needed for projects and this policy should not usurp that impact on a General Plan, Its Elements and Its Community Plans. You are making the assumption that these Monitoring Programs and Compliance Goals will resolve the problem.

How do oil and gas operations, gas storage operations and other industrial uses including military-current and historic-effect the WMAs. One size fits all does not take into consideration the residential from the industrial areas.

TMDLs in the Ballona Creek Subwatershed
Ballona Creek Estuary Toxic Pollutants TMDL
Ballona Creek Metals TMDL
and
TMDLs in Marina del Rey Subwatershed
Marina del Rey Harbor Toxic Pollutants TMDL

Same application as above.

The following are in single WMA, but aspects of the built environment including commercial and industrial uses need to be taken into consideration.

TMDLs in Dominguez Channel and Greater Harbor Waters Watershed Management Area
Los Angeles Harbor Bacteria TMDL (Inner Cabrillo Beach and Main Ship Channel)
Machado Lake Trash TMDL
Machado Lake Nutrient TMDL
Machado Lake Pesticides and PCBs TMDL
Dominguez Channel Estuary and Greater Los Angeles and Long Beach Harbor Waters

And

TMDLs in Los Angeles River Watershed Management Area
Los Angeles River Watershed Trash TMDL
Los Angeles River Nitrogen Compounds and Related Effects TMDL
Los Angeles River and Tributaries Metals TMDL
Los Angeles River Watershed Bacteria TMDL
Long Beach City Beaches and Los Angeles River Estuary Bacteria TMDL
Los Angeles Area Lakes TMDLs
Echo Park Lake Nutrient TMDL
Echo Park Lake PCBs TMDL

Echo Park Lake Chlordane TMDL
Echo Park Lake Dieldrin TMDL
Echo Park Lake Trash TMDL
Peck Road Park Lake Nutrient TMDL
Peck Road Park Lake PCBs TMDL
Peck Road Park Lake Chlordane TMDL
Peck Road Park DDT TMDL
Peck Road Park Lake Dieldrin TMDL
Peck Road Park Lake Trash TMDL

Also missing from this analysis are the age, condition and repair status of storm drains and pipes.

Pipeline Safety is an issue and many pipelines do not have the records needed to see their condition. Other Federal and State regulatory agencies should be included as part of the integrated approach as fuel pipelines, gas pipelines and other utility pipelines can be contributors without a timeline for repair or replacement that even matches the compliance laid out in these documents.

DOGGR Department of Oil and Gas does not issue permits for fracking, yet that runoff has a direct impact on water quality with a proprietary hold on content of fluid used.

Echo Park Lake , a City of Los Angeles Proposition O project for TMDL remediation, demolished a fishery without consideration of quarantine of birds, turtles and fish. That ecosystem, vital to both LA River Watershed and Ballona Creek Watershed was treated without any integration and without concern for disease and the public health and safety of the citizens.

There is no science or scientific evidence applied.

We are also concerned over the approval of the State Board's Underground Storage Tank policy.

This, in essence, allows UST Underground Storage Tanks with low threat, naturally remediate. In other words, contamination may leak, but we will never be able to ascertain the source nor the spread into a plume. The problem may be compounded, not resolved and none of this policy takes into consideration failed aspects of other agency policy.

Industry clusters are not addressed.

Full Capture Systems, again, do not change the fact that the problem may not be one of receiving water limitations, but one of airborne disease with other aspects of Federal oversight such as the Clean Air Act. Any Full Capture System should not contribute to other violations.

There is no integrated approach in this proposal.

Subject: Comments on the April 23, 2012 Staff Working Proposals for TMDL and Receiving Waters

Dear Ms. Purdy:

The City of Downey would like to thank you for the opportunity to provide oral comments at the May 3 2012, Regional Board workshop. The purpose of this letter is to follow-up with additional comments and elaboration.

1) Watershed Management Program (WMP)

At the workshop, the relatively new concept of WMPs was discussed in great detail. As we understand the concept as presented, it will allow permittees with opportunities to customize their MS4 programs to address unique demographic and geographic characteristics. This will also allow permittees to separate themselves from neighboring programs of other permittees.

As mentioned in prior communications, the City of Downey previously submitted an individual Report of Waste Discharge. One of the key factors in the city's decision for that separate submittal was the city's strong concern over the **Joint and Severability** concept in which many cities are grouped together and held jointly responsible for comingled runoff. The city is encouraged by the effort the Regional Board staff has made to allow permittees to separate and customize their programs. However, before the City can fully support this concept, several key issues need to be addressed, including:

- A) The need to inform the Regional Board of intent to pursue this option within six months is too short a time,
- B) Similarly, the twelve month time frame to develop and submit a plan, is also too short
- C) The ability of permittees to separate their responsibility for comingled discharges (while much more detailed than the previous MS4 Permit), still needs to be further refined
- D) Consideration for compliance should be given for permittees that have made an extensive BMP based compliance effort
- E) The Receiving Waters limitations need to be revised (see comment below).

Rene Purdy

Page 2

2) Receiving Waters Limitations (RWL)

The current wording of the Receiving Waters Limitations indiscriminately exposes permittees to 3rd party litigation. As Regional Board staff noted in oral comments, the current language provides no "safe Harbor" for permittees. Downey recognizes the Regional Board is simply following their interpretation of guidelines set forth in SWRCB Order 99-05, but given the recent litigation (National resource defense Council (NRDC) vs. LA County, NRDC vs. the City of Malibu, and the NRDC vs. Stockton) the threat of 3rd party lawsuits is very real and very costly (tax dollars and jobs). The Regional Board needs to work with both the permittees and the State Water Resources Control Board to revise the Receiving Waters Limitations language in order to provide permittees with viable MS4 programs a reasonable degree of protection from 3rd party litigation.

The importance of revising the RWLs is highlighted by the recent response to comments from the State Water Resources Control Board (SWRCB) regarding their intent not to apply Numerical Effluent Limits within the Caltrans General Permit. In that response, the SWRCB stated that:

"In 2005, the State Water Board assembled a blue ribbon panel to address the feasibility of including numeric effluent limits as part of NPDES municipal, industrial, and construction storm water permits. The panel issued a report dated June 19, 2006, which included recommendations as to the feasibility of including numeric limitations in storm water permits, how such limitations should be established, and what data should be required (SWRCB, 2006).

The report concluded that "It is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban discharges. However, it is possible to select and design them much more rigorously with respect to the physical, chemical and/or biological processes that take place within them, providing more confidence that the estimated mean concentrations of constituents in the effluents will be close to the design target."

Among the many impacts of this decision is that the City of Downey will potentially be held accountable for numerical effluent limits in runoff that includes runoff from Caltrans facilities, while Caltrans has no such limitation and no such need to meet specific numerical targets. This would similarly apply to runoff from schools. There is no realistic way to differentiate the contribution from Caltrans or schools since continuously monitoring all freeway and school sites is not feasible. Caltrans and schools could potentially be meeting whatever BMP standards apply to them, while discharging runoff with pollutant level exceeding permittees' MS4 limits, leaving permittees responsible for discharges they have had no control over.

Also, there are several potential pollutants such as sulfates, chlorides, etc., with water quality standards listed in the Basin Plan for water bodies that have not been listed as "impaired" and no TMDLs established. Permittees should not be subject to 3rd party litigation for the sporadic and random exceedances that may be detected by the various monitoring programs. Permittees must be allowed due process to address any significant and continuing exceedances.

3) Time Schedule Orders (TSO)

This is also a relatively new concept and applies solely to US EPA issued TMDLs and has the intent of bridging an implementation gap between the date of the MS4 adoption and a Basin Plan Amendment. This concept will have particular impact to the City of Downey (and other permittees) because Downey discharges to two water bodies (Los Cerritos Channel and San Gabriel River Reach 1) and is therefore subject to two US EPA TMDLs. The City of Downey is therefore "forced" to apply

Rene Purdy
Page 3

for a TSO, which in theory would expire or otherwise become invalid once the Basin Plan is adopted. Downey is very uncomfortable with this process as it will not provide protection from 3rd party litigation prior to the Basin Plan Amendment's adoption.

We encourage the Regional Board to continue working with the permittees over the next several months to arrive at a more satisfactory alternative. We appreciate having Ms. Jenny Newman of the Regional Board staff at the recent Joint meeting of the Los Cerritos Channel and San Gabriel River Reach 1 Technical Committees to discuss the anticipated October 2012 adoption of a Basin Plan amendment to incorporate an Implementation Schedule for this TMDL. We look forward to seeing Ms. Newman at our future meetings.

4) Trash TMDL

During the oral comments, the City voiced concern over how to demonstrate compliance with the Trash TMDL since approximately 11 percent of the catch basins where full capture inserts were intended to be installed but could not be because of flow constraints. The City was appreciative of Regional Board's acknowledgement of Downey's concern and even more appreciative of Regional Board Staff's response that institutional controls can be used to address the remaining 11 percent.

The oral testimony raises a follow-up question regarding this specific issue; will Daily Generation Rate (DGR) and Minimum Frequency Assessment and Collection (MFAC) studies in conjunction with ongoing street sweeping be considered "institutional controls? It is requested that the term "institutional controls" be defined. Also, the MS4 permit should clearly indicate that, when upon sufficient submittal of documentation of institutional controls by a permittee, that the Executive Office has the authority to make a finding that these institutional controls, in combination with full capture devices, constitute attainment of the "zero discharge".

5) San Gabriel River Metals and several other TMDLs

As mentioned during the oral comments, the City of Downey has a significant number of Low Impact development sites and these will substantially reduce the overall amount of runoff and thereby the overall amount of any pollutants transported by within the runoff. This type of volume reduction should be recognized. Mass based TMDL effluent targets that are equivalent to concentration based effluent targets should be developed. An example would be the San Gabriel River Reach 1 which has a proposed dry weather copper concentration based effluent limit of 18 ug/l; while Coyote Creek (under the same US EPA TMDL) has a dry weather copper mass based limitation of 0.941 kg/day.

6) Detailed TMDL comments

6a) For Los Cerritos Channel: The city understands that this is a US EPA approved TMDL and the city appreciates the Regional Board working on a Basin Plan Amendment to allow permittees to follow an Implementation Schedule. This is imperative for dry weather, there are (1) no interim effluent targets, (2) no provision for BMP based compliance measures, and (3) no apportioned allotment. If all permittees but one completely eliminates their copper

Rene Purdy
Page 4

contribution, but the one remaining permittee discharges 67.3 grams per day, it appears from the wording of this section that all permittees would be jointly liable. This inequity needs to be corrected.

For Wet weather, (1) there are no interim limits developed, (2) there is no provision for BMP based compliance and (3) there is no provision for mass-based discharges which would have significant benefit to permittees able to show volume reduction. There must be a mass-based effluent target for permittees that can demonstrate a significant pollutant mass reduction

6b) For Reach 2 of the San Gabriel River, which is also a US EPA adopted TMDL, all of the comments in item 6a above apply. In addition, the sampling point as we understand it is upstream of the city of Downey's discharges into this Reach. It must be clear that permittees downstream of sampling points will not be responsible for corrective actions due to upstream exceedances.

As these comments are provided in reference to the "Staff Working Proposal", the city may have additional comments in the future as the permit process progresses. Thank you again for the opportunity to comment. Please contact me if you have any questions.

Sincerely,

A handwritten signature in black ink, appearing to read "J. Oskoui", with a long horizontal flourish extending to the right.

Re: Technical Comments on Los Angeles Regional Water Quality Control Board Staff Working Proposals for the Greater Los Angeles County MS4 Permit (Permit) – Watershed Management Programs, TMDLs and Receiving Water Limitations

Dear Ms. Purdy and Mr. Ridgeway:

The City of La Verne would like to take this opportunity to provide comments on the working proposals for Watershed Management Programs, Total Maximum Daily Loads, and Receiving Water Limitations. These documents were posted on the Regional Board website on April 23, 2012. The City of La Verne appreciates the Regional Board staff's effort to develop the next NPDES stormwater permit and their commitment to meet with various stakeholders including our City via the LA Permit Group. We look forward to continuing the dialogue with the Board staff on this very important permit. The City's priorities on the Watershed Management Program, TMDLs and Receiving Water Limitations are similar and hereby submitted by reference of those comments provided by the LA Permit Group.

Additionally, the City is extremely concerned with how TMDLs for the San Gabriel River Watershed Management Area are being addressed in the Staff Working Proposal – 4/23/12. The provisions outlined in Section E, "TMDLs in San Gabriel River Watershed Management Area" are not only restrictive, they

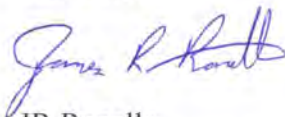

Comments on 4/23 Working Proposal, page 2

will be impossible to meet. Effluent Limitations of things such as PCBs, Chlordane, Dieldrin, and DDT are legacy pollutants that were allowed long before the today's Clean Water Act. Current levels of these pollutants are not being added but are simply already in the sediments and will take numerous years to dissipate. Additionally, Effluent Limitations for Mercury, Phosphorus, and Nitrogen appear to be so restrictive that it would be impossible to ever meet in an urban setting. This is all in consideration of an EPA issued TMDL (not until this March 2012) with no implementation plan schedule or resources to comply in an extremely short timeline. There is a possibility the City will be automatically out of compliance with the adoption of this language in a permit.

Finally, the compliance woes in general are exacerbated due to a large financial shortfall currently being experienced by the City. Not only has the City experienced several years of a multimillion dollar shortage, the City has been constantly reducing staff. The City simply doesn't have the resources, staff, expertise, or the ability to even properly review the issues in the proposed permit. The City requests assistance with exploring how the Regional Board envisions a City such as La Verne would be able to comply with the components of the proposed TMDL section.

On behalf of the City of La Verne, thank you for your consideration and review of the above issues. If you have any questions regarding this letter or if we can be of any assistance please contact me at (909) 596-8741.

Sincerely,

JR Ranells

Attention: Renee Purdy, Regional Programs Section Chief
Ivar Ridgeway, Stormwater Permitting Chief

Dear Mr. Unger:

TECHNICAL COMMENTS ON THE LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD STAFF WORKING PROPOSALS FOR THE GREATER LOS ANGELES COUNTY MS4 PERMIT – TOTAL MAXIMUM DAILY LOADS, WATERSHED MANAGEMENT PROGRAMS, AND RECEIVING WATER LIMITATIONS

The City of Los Angeles (City) Bureau of Sanitation (Bureau) appreciates the opportunity to provide technical comments on the Los Angeles Regional Water Quality Control Board (Regional Board) Staff Working Proposals for the Greater Los Angeles County MS4 Permit. The Bureau appreciates the time your staff has dedicated to meeting with us and the process that has provided the opportunity for substantial engagement and input. The Bureau recognizes that these Working Proposals for Total Maximum Daily Loads (TMDLs), Receiving Water Limitations (RWLs), and Watershed Management Programs (WMPs) are part of the overall process and appreciates your consideration of our comments at this time. Due to the integrated nature of the concepts of the Working Proposals, one comment letter on all three is provided. Comments provided herein are intended to inform the process at this point in time. The Bureau looks forward to continuing to work with Regional Board staff throughout the Permit reissuance process.

Given the complex nature of the comments, key technical issues are identified below while detailed discussions of the key technical issues are provided in Attachment A. Additional and supporting technical comments are provided in Attachments B and C.

Watershed Management Programs

- The Watershed Management Programs are a necessary and significant shift in the implementation of stormwater programs in the Los Angeles region
- The Watershed Management Program should include a monitoring program that is developed in conjunction with the watershed plans and is aimed to evaluate their progress
- Implementation of the Watershed Management Program, including the adaptive management process, should fulfill the Receiving Water Limitations requirements in Part V.A

Samuel Unger, Executive Officer
 LARWQBC
 Atten.: Renee Purdy and Ivar Ridgeway
 May 14, 2012
 Page 2

TMDLs

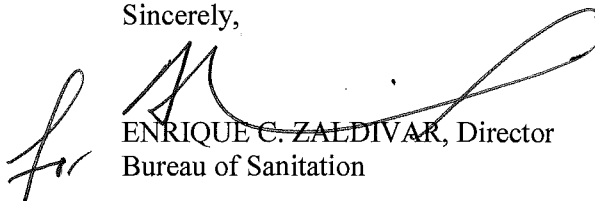

- There are multiple and substantive discrepancies between specific permit provisions and the State adopted and EPA promulgated TMDLs
- The Regional Board should use its discretion and establish Final WLAs based upon implementation of BMPs in addition to numeric effluent limitations
- Basin Plan Amendments should be utilized to address issues related to compliance schedules for State and EPA promulgated TMDLs
- Where TMDL WLAs are based upon receiving waters (i.e., the bacteria exceedance day approach), effluent limitations should not be established
- If water quality objectives are met in the receiving water, permittees should be in compliance with the associated TMDL provisions

Receiving Water Limitations

- The Receiving Water Limitations provisions are inconsistent with the intent of the Watershed Management Program
- Implementation of the Watershed Management Program should be equivalent to the process identified in Part V.A.3 of the Receiving Water Limitations
- Use of "Cause or Contribute" language should be limited to Part V.A

Thank you for considering our technical comments on the Working Proposals. We look forward to continuing to work with you and your staff. If there are any questions, please contact Dr. Shahram Kharaghani, Stormwater Program Manager, at (213) 485-0587.

Sincerely,

ENRIQUE C. ZALDIVAR, Director
 Bureau of Sanitation

List of Attachments:

Attachment A: Detailed Discussion of Key Technical Issues
 Attachment B: Detailed Technical Comment Matrix on Watershed Management Program and TMDL Working Proposal
 Attachment C: Suggested Revisions to the Receiving Water Limitations Working Proposal

ATTACHMENT A
DETAILED DISCUSSION OF KEY TECHNICAL ISSUES

WATERSHED MANAGEMENT PROGRAMS

1. The Watershed Management Programs are a Welcomed, Necessary and Important Shift in the Implementation of Stormwater Programs in the Los Angeles Region

The Bureau supports Regional Board staff's Watershed Management Program approach, with minor modifications. A watershed-based program is the ideal approach, as it allows for integration of all program elements to focus efforts on the highest priorities for each watershed through customization and should also afford agencies the opportunity to comply with requirements. This approach also considers the current efforts undertaken by agencies to obtain grant funding for water quality projects, as many grant criteria are based on coordinated watershed management efforts. Finally, this approach supports implementation of TMDLs, which are developed and implemented at the watershed scale.

2. The Watershed Management Program Needs to Include a Flexible Monitoring Program

As currently written, the Working Proposal does not provide a sufficient link between the Watershed Management Program and the monitoring program section of the Permit. As the watershed priorities and associated control measures will vary from watershed to watershed, so too will the monitoring program vary and need to be customized and flexible to account for watershed-specific issues and support and inform management decisions.

In discussions with Regional Board staff to date, as well as comments provided by Regional Board staff during the MS4 Permit workshop on May 3, 2012, the Bureau understands that the Regional Board intends to provide such flexibility for monitoring as part of the overall Watershed Management Program. Regional monitoring efforts should be designed in conjunction with the Watershed Management Programs and geared towards evaluating their progress. The Bureau will continue to work with Regional Board staff on this concept and will provide additional comments as the monitoring program section is released for comment.

3. Implementation of the Watershed Management Program, including the Adaptive Management Process, should fulfill the Receiving Water Limitations requirements in Part V.A

The intent of the Watershed Management Programs is to focus Permittees' efforts and resources on the highest water quality priorities in each watershed. The Working Proposal includes an adaptive management process whereby assessments and modifications to the Watershed Management Program will be made, including:

Re-evaluation of the highest water quality priorities identified for the Watershed Management Area based on more recent water quality data for discharges from the MS4 and the receiving water(s) and a reassessment of sources of pollutants in MS4 discharges; (Working Proposal for Watershed Management Programs, Part VI.C.6.a.i(4))

The Watershed Management Program concept and review process should fulfill the process identified in Part V.A.3 of the Working Proposal for Receiving Water Limitations. Due to the integrated nature of the three Working Proposals, this comment is more fully addressed under Comment #1 and #2 in the Receiving Water Limitations section of this letter.

TOTAL MAXIMUM DAILY LOAD (TMDLS)

1. There are Multiple and Substantive Discrepancies Between the Specific Permit Provisions and State Adopted and EPA Promulgated TMDLs

The Working Proposals include the specific TMDL provisions in Attachments A through G. There are multiple and substantive discrepancies between the specific TMDL provisions and the TMDLs adopted by the State and promulgated by EPA. For example, the Los Angeles River Bacteria TMDL Basin Plan Amendment states (page 6):

MS4 dischargers can demonstrate compliance with the final dry weather WLAs by demonstrating that the final WLA are met instream or by demonstrating one of the following conditions at outfalls to the receiving waters:

1. Flow-weighted concentration of E. coli in MS4 discharges during dry weather is less than or equal to 235 MPN/100mL, based on a weighted-average using flow rates from all measured outfalls;
2. Zero discharge during dry weather;
3. Demonstration of compliance as specified in the MS4 NPDES permit which may include the use of BMPs where the permit's administrative record supports that the BMPs are expected to be sufficient to implement the WLA in the TMDL, the use of calculated loading rates such that loading of E. coli to the segment is less than or equal to a calculated loading rates that would not cause or contribute to exceedances based on a loading capacity representative of conditions in the River at the time of compliance or other appropriate method.

The third and final method, which provides both BMP based and load based methods for demonstrating compliance, is not provided in the permit. The permit must be consistent with the WLAs as outlined in the Basin Plan Amendment and this method of compliance must therefore be incorporated into the permit. Additional discrepancies are identified and detailed in Attachment B.

Request: The Bureau requests that the Regional Board review and address issues with specific TMDLs as outlined in Attachment B to this letter.

2. The Regional Board Should Use its Discretion and Establish Final WLAs Based Upon Implementation of BMPs and Not Only Numeric Limitations

In the Working Proposals, a BMP-based path to compliance with interim water quality-based effluent limitations and receiving water limitations is provided, via the implementation of an approved Watershed Management Program. The Bureau greatly appreciates and supports this approach as it acknowledges the inherent challenges unique to stormwater management and provides appropriate flexibility to implement the necessary BMPs. However, the same approach is not applied to final WLAs.

State and federal law do not require the use of numeric effluent limitations for MS4 permittees, but rather encourage flexible implementation of best management practices through an iterative process. Specifically, the choice to include either management practices or numeric limitations in MS4 permits is within the regulatory agency's discretion, and on the question of whether MS4 permits must contain numeric effluent limitations, the court upheld EPA's use of iterative BMPs in place of numeric effluent limitations for storm water discharges. (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)¹ Moreover, EPA has indicated that it "expects that most WQBELs for NPDES-regulated

¹ See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

municipal and small construction storm water discharges will be in the form of BMPs, and that numeric limits will be used only in rare instances.”²

In discussions with Regional Board staff to date, staff has indicated that state law, not federal law, require the incorporation of the final WLAs as numeric effluent limitations. The Bureau is aware of no state law that contradicts this principle or otherwise requires numeric effluent limits to be inserted into MS4 permits. Indeed, in 2009, the State Water Board affirmed this approach in a precedential order, stating:

[i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California’s NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether a future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board’s findings *supporting either the numeric or non-numeric* effluent limitations contained in the permit. (Order WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)

Further, during the May 3, 2012 MS4 Permit workshop, Regional Board staff seemed to indicate that the basis for incorporating the final WLAs as numeric effluent limitations is EPA’s 2010 memorandum pertaining to the incorporation of TMDL WLAs in NPDES permits³. This memorandum (which is currently being revised by EPA) states that “EPA recommends that, *where feasible*, the NPDES permitting authority *exercise its discretion* to include numeric effluent limitations as necessary to meet water quality standards.” (emphasis added). This statement highlights the basic principle that the Regional Board has **discretion** in how the WLAs are incorporated into the MS4 Permit. Regional Board staff commented during the workshop that staff have evaluated data and have determined numeric effluent limitations are feasible. However, such a determination directly contradicts the findings of California’s Stormwater Blue Ribbon Panel which was convened specifically to examine the feasibility of incorporating numeric effluent limits in stormwater permits. This panel of national experts ultimately concluded that numeric limits were generally infeasible across all three stormwater activities (municipal, industrial, and construction), with a few exceptions (*The Feasibility of Numeric Effluent Limits Applicable to Discharges of Stormwater Associated with Municipal, Industrial and Construction Activities, June 19, 2006*).

Additionally, during the May 3, 2012 workshop, Charles Stringer (Vice Chair of the Regional Board) asked what the practical implication is regarding how the final WLAs are expressed in the Permit. To illustrate the practical implication for Permittees, take for example Machado Lake where TMDLs have been established for trash, nutrients, and toxics. Currently, the City is implementing the \$100 million Machado Lake Ecosystem Rehabilitation Proposition O Project to restore Machado Lake, including implementation of BMPs to reduce external loadings to the lake (including nutrients, sediment, and pesticides) as well as dredging of accumulated sediment from within the lake to reduce internal loadings. The money to fund the project comes from the \$500 million bond measure approved by voters within the City of Los Angeles. Oversight of the Proposition O projects includes a Citizen’s Oversight Advisory Committee, consisting of nine members, including Francine Diamond (Los Angeles Regional Water Quality Control Board) and Dr. Mark Gold (UCLA, formerly of Heal the Bay). During the period where interim water quality-based effluent limits apply, the City of Los Angeles can comply with the TMDL

² U.S. EPA, *Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, Memorandum from U.S. EPA Director, Office of Wetlands, Oceans and Watersheds Robert H. Wayland, III and Director, Office of Wastewater Management James Hanlon to Water Division Directors, Regions 1-10, (Nov. 22, 2002).

³ U.S. EPA, *Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, Memorandum from U.S. EPA Director, Office of Wastewater Management James A. Hanlon and U.S. EPA Director, Office of Wetlands, Oceans, and Watershed Denise Keehner (Nov. 10, 2010).

provisions by implementing an approved Water Quality Management Program, which would include the Machado Lake Ecosystem Rehabilitation project. However, upon completion of this extensive project, if the restored lake does meet the established final numeric effluent limitations, the City of Los Angeles would be found in violation of the MS4 Permit and subject to third party law suits even though the City may be actively working to improve BMPs.

Request: *The Bureau requests that the Regional Board exercise its discretion and establish final WLAs based upon the implementation of BMPs by adding the following provision to Part VI.E.2.e.i:*

4. *The Permittee has submitted and is fully implementing an approved Watershed Management Program pursuant to Part VI.C.*
 - a. *To be considered fully implementing an approved Watershed Management Program, a Permittee must be implementing actions consistent with the approved program and applicable compliance schedules, including structural BMPs.*
 - b. *Structural storm water BMPs must be designed and maintained to treat storm water runoff from the 85th percentile, 24-hour storm, and maintenance records must be up-to-date and available for inspection by the Los Angeles Water Board.*
 - c. *A Permittee that does not implement the Watershed Management Program in accordance with the milestones and compliance schedules shall demonstrate compliance with its final water quality-based effluent limitations and/or receiving water limitations pursuant to subpart VI.E.2.e.i.1-3, above.*

3. Basin Plan Amendments Should be Utilized to Address Issues Related to Compliance Schedules for State-Adopted TMDLs and EPA Promulgated TMDLs

The Working Proposals identify several TMDLs with expired, or soon to be expired, compliance schedules, as well as several TMDLs promulgated by EPA. For both types of TMDLs, the Bureau requests that the Regional Board pursue Basin Plan Amendments to address compliance schedule issues. As discussed below, the Bureau has identified instances where the Basin Plan Amendment approach should be used in lieu of the Time Schedule Orders (TSO) as identified in the Working Proposal.

Based upon the May 3, 2012 workshop on the MS4 Permit, comments from Regional Board staff seemed to indicate that one reason the TSO approach is being considered is that it will provide the Regional Board with a targeted approach for determining which Permittees have demonstrated good faith efforts in the implementation of the TMDLs and where more time is warranted. However, the same considerations can be included in the development of revised compliance schedules via a Basin Plan Amendment as part of the TMDL reopener process. The Regional Board can request that Permittees provide (1) chronology of actions taken since the effective date of the TMDL and (2) justification for the need for more time, consistent with the current approach identified by the Regional Board for the TSOs. Providing additional time based upon meeting a set of conditions is consistent with the approach in numerous TMDLs previously adopted by the Regional Board (e.g., Santa Monica Bay Nearshore Debris TMDL). This is not to say that TSOs do not have a place in the process; however, as described below they should not be the default and only option utilized.

a. TSOs Unnecessarily Expose the Permittees to Liability and are Less Appropriate than In-Permit Compliance Schedules

The Bureau appreciates the Regional Board's recognition that immediate compliance with the newly imposed requirements will not be feasible, and the inclusion of a provision allowing TSOs to be requested. However, TSOs are a far less appropriate vehicle for addressing the requirements in the permit than the required implementation plans and accompanying compliance schedules. This is particularly true for state-adopted TMDLs with deadlines that have already passed and EPA promulgated TMDLs with no currently adopted implementation schedule.

While there is no limitation on the compliance timeframe that may be authorized in a TSO, protection from mandatory minimum penalties for exceedances of permit limitations is limited to five years. (Water Code section 13385(j)(2)(B)(ii).) Compliance with the numerous and ambitious WLAs being imposed for the first time in the permit will, in some cases, require significantly longer than a five-year period. In addition, TSOs do not satisfy the goal of ensuring that Permittees are not placed into immediate noncompliance. A TSO does not modify the underlying permit, and therefore Permittees will be out of compliance on day one, even for TMDLs that were promulgated by EPA as recently as March 2012. Even for State-Adopted TMDLs, the City's good faith effort have demonstrated the inexactness of the TMDL development assumptions and the complexity of complying with these WLAs. Third parties may seek to judicially enforce these requirements. Yet there will be no practical difference in the water quality benefits to be achieved, given the recognized impossibility of meeting these requirements on day one or in the near term. For all of these reasons, requiring Permittees to request TSOs for all WQBELs and receiving water limitations that require additional time for compliance is less effective than simply adopting new or revised compliance schedules for these standards. The approaches discussed elsewhere in these comments, including the Regional Board reopening TMDLs to revise implementation plans and compliance schedules, adopting implementation plans and compliance schedules for EPA promulgated TMDLs, and exercising the flexibility not to include effluent limits, should be considered as superior alternatives for inclusion in the working proposal and ultimately the revised permit.

***Request:** The Bureau requests that the Regional Board utilize the existing TMDL reopener process for the TMDLs with expired (or soon to be expired) compliance schedules to modify the compliance schedules. For EPA promulgated TMDLs, the Bureau requests that the Regional Board develop Basin Plan Amendments to incorporate implementation and compliance schedules (see Comments #1c and #1d).*

b. It is Unreasonable for the Regional Board to Mandate Immediate Compliance With State-Adopted TMDLs that are Being Incorporated into the Permit for the First Time.

The working proposal provision requiring Permittees to immediately comply with TMDLs for which the implementation schedules have expired is inappropriate and inconsistent with the purposes of a TMDL. The working proposal indicates that Permittees must "comply immediately with water quality based effluent limitations and/or receiving water limitations to implement WLAs in state-adopted TMDLs for which final compliance deadlines have passed pursuant to the TMDL implementation schedule." (Working Proposal at p. 5.) Several existing TMDLs adopted by the Regional Board, such as the Ballona Creek Bacteria TMDL include implementation plans and schedules, the deadlines for which have either already expired or are set to expire in the very near future. When adopted, those TMDLs clearly acknowledged that a reasonable time period was needed to undertake the appropriate control measures and BMPs. Now, the working proposal ignores this reality and would require immediate compliance without the opportunity of utilizing the concepts envisions under this working proposal.

TMDLs are not self-implementing instruments, but instead serve as informational tools. (*Anacostia Riverkeeper, Inc. v. Jackson* (2011) 798 F. Supp. 2d 210, 216, citing *Pronsolino v. Nastri* (2002) 291 F.3d 1123, 1129.) A TMDL is not directly enforceable against dischargers absent a corresponding permit provision, and the TMDL does not become binding on a permit holder until incorporated into the appropriate basin plan and then implemented in an NPDES permit.⁴ The TMDLs identified above, those for which final compliance deadlines have either already expired or will expire in the very near future, have never been incorporated into the Permittees' MS4 permit. Thus, the water quality standards contained in these state-adopted TMDLs are, for the very first time, taking effect in

⁴ Memorandum from Michael Levy, Staff Counsel, to Ken Harris and Paul Lillebo, DWQ, re: The Distinction Between a TMDL's Numeric Targets and Water Quality Standards (June 12, 2002) at p. 1 ("Levy Memorandum".)

this revised MS4 permit. To mandate immediate compliance with these TMDLs sets the Permittees up for failure and does not give each Permittee adequate opportunity to meet compliance deadlines that the Regional Board already deemed appropriate when it first adopted these TMDLs. Although the Regional Board allows the Permittees to request an outside-the-permit TSO to implement the WLAs in a state-adopted TMDL (Working Proposal Section E(4)(b).), for a variety of reasons discussed in greater detail above, a TSO is not the most appropriate mechanism for implementing the MS4 permit requirements. There is no basis for the Regional Board to require Permittees to immediately comply with limitations based on TMDLs that recognized a need for time to comply and that have never before been part of the MS4 permit.

As one alternative, the Regional Board has the authority to re-open these TMDLs to modify the compliance schedules and conform the expired deadlines to reflect the fact that these standards are only now being incorporated into the revised permit. EPA guidance acknowledges the iterative nature of TMDLs, and has endorsed the use of adaptive implementation. “Adaptive implementation is an iterative implementation process that makes progress toward achieving water quality goals while using any new data and information to reduce uncertainty and adjust implementation activities.” (EPA, *Final Phased TMDL Guidance* (August 2, 2006.)) While EPA’s preference is that this type of adaptive approach be included in the original TMDL implementation plan through statements that there will be periodic reviews and revision, the same process of refining implementation, including schedules for attainment, can be accomplished by reopening and revising TMDLs.

For TMDLs adopted by the State with expired (or soon to be expired) compliance schedules, the Regional Board is in the process of re-opening a number of these TMDLs⁵, independent of the renewal of this MS4 permit. The Regional Board can and should include revised compliance schedules in those TMDLs, which in turn would translate to revised compliance schedules required of the Permittees under the MS4 permit. This approach reflects the principle that a TMDL is designed to be a strategy to attain water quality standards, is not directly enforceable against dischargers absent a corresponding permit provision, and serves as a means to an end, not a directly enforceable end in itself.⁶

Request: *The Bureau requests that the Regional Board utilize the existing TMDL reopener process for the TMDLs with expired (or soon to be expired) compliance schedules to modify the compliance schedules.*

c. The Regional Board is Required to Incorporate EPA Promulgated TMDLs Into the Basin Plan Before Incorporating Enforceable Requirements in NPDES Permits

The incorporation of WLAs derived from EPA promulgated TMDLs directly into the MS4 permit, without the Regional Board’s adoption of an appropriate implementation plan and inclusion of that plan in the relevant basin plan, is inconsistent with state and federal law. Specifically, courts have held that “[a]ny EPA-approved TMDLs **must** be incorporated by the state into its continuing planning processes. TMDLs **then** be implemented through the NPDES permitting process to ensure attainment of WQs.” (*Am. Littoral Soc’y v. United States EPA Region* (D.N.J. 2002) 199 F. Supp. 2d 217, 229, citing 33 U.S.C. § 1313(d)(2), (e). 33 U.S.C. § 1311(b)(1)(C); 40 C.F.R. §§ 122.4, 122.44, and 122.62, emphasis added) None of the EPA promulgated TMDLs that serve as the basis for the requirements in the revised permit have been incorporated into the basin plan, as required under federal statutes and regulations. Thus, it is inappropriate for those terms to be included in the revised permit, as contemplated in the working proposal.

⁵ Reconsiderations for the following TMDLs were noticed on March 23, 2012: 1) Santa Monica Bay Beaches; (2) Marina del Rey Harbor, Mothers’ Beach, and Back Basins; (3) Los Angeles Harbor, Inner Cabrillo Beach, and Main Ship Channel; (4) Ballona Creek, Ballona Estuary, and Sepulveda Channel; and (5) Malibu Creek and Lagoon

⁶ See Levy Memorandum at p. 5.

Federal law does not require that NPDES permits incorporate any EPA promulgated TMDL that exists, regardless of whether that TMDL or an associated implementation plan has been adopted into the basin plan through appropriate procedures. The Regional Board relies on 40 C.F.R. § 122.44(d)(1)(vii)(B) for the proposition that federal regulations require permits to be consistent with the assumptions of any available WLAs, including those contained in EPA promulgated TMDLs without implementation schedules, and thus require incorporation of those TMDLs at the next permit cycle regardless of whether the TMDL has been included in the appropriate basin plan.⁷ However, pursuant to federal and state law and guidance, the Regional Board has an obligation to adopt an implementation plan before implementing an EPA promulgated TMDL in an individual NPDES permit.

A variety of sources confirm that the Regional Board's interpretation is incorrect, and that the state has an obligation to create an implementation plan before incorporating an EPA promulgated TMDL into an NPDES permit. First, according to the State Water Board, TMDLs must be formally incorporated into the basin plan to be part of the basis for Regional Board actions, and in California, the State Board has interpreted state law to require that implementation be addressed when TMDLs are incorporated into basin plans.⁸ There is no justification for treating EPA promulgated TMDLs any differently than state-approved TMDLs in this regard. Second, because EPA promulgated TMDLs do not contain implementation plans, if the WLAs contained therein are used as the basis for permit terms without the development of an implementation plan (and accompanying compliance schedule) by the State, a critical element in the process is missing. State Water Board memoranda generally confirm this assessment, noting that "[u]nder federal and state law, the Regional Boards are required to include TMDLs in their basin plans."⁹ Similarly, federal regulations require states to incorporate TMDLs in their State Water Quality Management Plans along with adequate implementation measures to implement all aspects of the plan, including TMDLs.¹⁰ California law and guidance, as well as federal regulations and guidance, all confirm the State is obligated to create an implementation plan before standards in an EPA promulgated TMDL are inserted directly into NPDES permits.

Moreover, the provision relied upon by the Regional Board, 40 C.F.R. section 122.44(d)(1)(vii)(B), states that "[w]hen developing water quality-based effluent limits under this paragraph the permitting authority shall ensure that . . . Effluent limits developed to protect a narrative water quality criterion, a numeric water quality criterion, or both, are consistent with the assumptions and requirements of any available wasteload allocation for the discharge *prepared by the State and approved by EPA* pursuant to 40 CFR § 130.7." (40 C.F.R. § 122.44(d)(vii)(B), emphasis added.) The plain language of the regulations states that this provision applies to WLAs "prepared by the State and approved by EPA." An EPA promulgated TMDL is not prepared by the state, and therefore does not fall under this section. Moreover, other federal regulatory provisions, read as a whole, confirm that regardless of the source, a TMDL must be incorporated into the appropriate water quality management plan before the WLAs may be used as a basis for limitations in an NPDES permit. Specifically, 33 U.S.C. § 1313(d)(2) states that "[i]f the Administrator approves such identification and load, such State *shall incorporate them into its current plan* . . . If the Administrator disapproves such identification and load, he shall . . . establish such loads for such waters . . . and *upon such identification and establishment the State shall incorporate them into its current plan* under subsection (e) of this

⁷ See Los Angeles Regional Board's Response to Comments on the June 22, 2007 Draft Los Angeles River and Tributaries Metals TMDL (Aug. 23, 2007) Response to Comment No. 13.10 at pp. 12-13, emphasis added.

⁸ http://www.swrcb.ca.gov/water_issues/programs/tmdl/background.shtml.

⁹ Memorandum from Sheila Vasey, Office of Chief Counsel, to Stefan Lorenzato, TMDL Coordinator, Division of Water Quality, re: *Economic Considerations in TMDL Development and Basin Planning* at p. 2, citing 33 U.S.C. § 1313(d); 40 C.F.R. § 130.7(d)(2); Wat. Code, § 13050(j); Wat. Code, § 13242.

¹⁰ 40 C.F.R. § 130.6.

section.” Federal regulations also state that, “[i]f the Regional Administrator approves such listing and loadings, *the State shall incorporate them into its current WQM plan.* If the Regional Administrator disapproves such listing and loadings, he shall . . . *transmit the listing and loads to the State, which shall incorporate them into its current WQM plan.*” (40 C.F.R. § 130.7(d)(2), emphasis added.)

The weight of federal statutory and regulatory authority establish that inclusion of a TMDL in the state’s relevant water quality management plan basin plan is a prerequisite to establishing permit conditions, and many of the EPA promulgated TMDLs to be included in the revised MS4 permit pursuant to the working proposal have not been so incorporated. As EPA itself has argued very recently in the context of an EPA promulgated TMDL for the Chesapeake Bay, TMDLs are not regulations, nor are they enforceable or self-implementing. Rather TMDLs rely on other provisions of federal, state, and local law for their implementation.¹¹ By inserting WLAs from the TMDL directly into the MS4 permit, without creating an implementation plan or compliance schedule, the Regional Board is converting these informational tools into a de facto federal implementation plan and circumventing the flexible, adaptive process that is supposed to follow from a TMDL.

Request: *Prior to incorporating WLAs from EPA Promulgated TMDLs into the MS4 Permit, develop and adopt Basin Plan Amendments, including the required implementation plan and associated compliance schedule.*

d. Notwithstanding Comment #3c, If EPA TMDLs are Incorporated into the MS4 Permit, the Regional Board Can and Should Include In-Permit Compliance Schedules for EPA Promulgated TMDLs Before Imposing Limitations.

The Regional Board does not propose to include compliance schedules in the revised MS4 permit for WLAs contained in EPA promulgated TMDLs that are being incorporated into the permit for the first time. Specifically, the working proposal states that “TMDLs established by the USEPA, to which Permittees are subject, do not have an implementation schedule adopted pursuant to Cal. Water Code section 13242. Therefore, a compliance schedule for attaining the water quality-based effluent limitations and/or receiving water limitations is not provided within this Order.” (Working Proposal at p. 4.) As discussed above, we agree that the proper procedure, as required by law, is to establish a compliance schedule as part of the implementation program required by Water Code section 13242. Until this occurs, the limitations cannot be applied in the permit.

EPA has acknowledged there is no “federal statutory or regulatory prohibition against development of TMDL implementation plans, either contemporaneously with *or after* development of a TMDL.” (Chesapeake Bay Brief at p.29.) A TMDL does not, by itself, prohibit or require any implementation actions. (Ibid.) Thus, nothing in federal law exempts the Regional Board from its affirmative obligation under state law to develop implementation plans including a time schedule for actions before imposing permit limitations. (Wat. Code §13242.) The State Water Board’s TMDL Policy anticipates that, in some cases, local programs may substitute for the Basin Plan implementation program. (Resolution 2005-0050, *Water Quality Control Policy for Addressing Impaired Waters: Regulatory Structure and Options* (2005) at p. 8 (allows a TMDL to be implemented through a local regulatory program that will correct the impairment.)

As an alternative to undertaking the required basin plan amendments at this time, the Bureau would accept a permit provision requiring the Permittees to develop an implementation plan and associated compliance schedules, to be approved by the Regional Board and incorporated into the permit. As noted above, there is no federal prohibition on developing the implementation plan subsequent to

¹¹ EPA Memorandum in Opposition to Plaintiffs’ Motion for Summary Judgment, *American Farm Bureau Federation v. United State Environmental Protection Agency*, Case No. 1:11-CV-0067, United States District Court for the Middle District of Pennsylvania (March 27, 2012) (“Chesapeake Bay Brief”).

TMDL adoption, and state law *mandates* development of the plan before regulated entities can be required to comply with TMDLs. This approach would allow the Permittees time to prepare a feasible implementation plan and achievable timeframes, conserve Regional Board resources by allowing Permittees to develop the initial plan, and preserve the Regional Board's authority to approve and/or modify the proposal created by the Permittees if the compliance schedule and implementation plan developed by the Permittees do not represent a sufficiently robust approach. This would avoid the immediate compliance issues referenced above and provide a more complete vehicle for implementation rather than use of a TSO.

Request: *Notwithstanding the request under Comment #3c, add a provision that would require the Permittees to develop an implementation plan and associated compliance schedules, to be approved by the Regional Board and incorporated into the permit. For Permittees that develop Watershed Management Programs, the implementation plan could be a required element of the Watershed Management Program.*

4. Where TMDL WLAs are Based Upon Receiving Waters, Effluent Limitations Should not be Established

Assigning effluent limitations where WLAs are based upon receiving waters is inconsistent with the relevant WLAs in various TMDLs and is an inappropriate method of ensuring that MS4 permittees comply with water quality standards. Given that many of the TMDLs and the WLAs contained therein are expressed in terms of the receiving water and do not necessarily translate to effluent limitations, receiving water limitations are more appropriate under most circumstances. For example, the WLAs for the Bacteria TMDLs are expressed as allowable exceedance days, not as concentration based effluent limitations. Discharges from the MS4 that are greater than the proposed effluent limits could nonetheless result in receiving water concentrations lower than the numeric target and in conformity with the TMDL and WLAs. (See Comment Matrix for additional examples)

Thus, if the permit revision proceeds in this manner, the Regional Board will have established a system whereby a Permittee could be acting in conformity with a relevant TMDL by ensuring it meets all applicable receiving water limitations, yet still be in violation of an effluent limit established in its permit that was supposedly derived from and designed to achieve consistency with that TMDL. We do not believe such a result is intended, and can be addressed by not establishing effluent limits where the relevant WLAs have been expressed as a receiving water limit.

In addition, under the current approach in the Working Proposals, the fact that Permittees will be required to request TSOs also raises the issue of mandatory minimum penalties (MMPs). Pursuant to Water Code section 13385(h) and (i), MMPs are required for certain violations of effluent limitations. It is critical that the implementation of these WLAs in the permit be in the form of receiving water limitations, in order to avoid exposing the Permittees to MMPs for violations that cannot be prevented.

Request: *Ensure that limitations are consistent with the assumptions and requirements of the TMDLs and where appropriate incorporate receiving water limitations.*

5. If Water Quality Objectives are met in the Receiving Water, Permittees Should be in Compliance with the Associated TMDL Provisions

Parts VI.E.2.b, 2.d, and 2.e present the compliance determination provisions that provide multiple mechanisms for demonstrating compliance, which is greatly appreciated. However, some clarification regarding the definition and intent of "receiving water limitation" as used in these provisions is requested. As currently written in the Working Proposal, Parts VI.E.2.d.i.2, and VI.E.2.e.i.2 identify one of several conditions that Permittee's can use to demonstrate compliance as:

There are no exceedances of the applicable receiving water limitation for the specific pollutant(s) in the receiving water(s) at, or downstream of, the Permittee's outfall(s);

It is unclear if Parts VI.E.2.d.i.2, and VI.E.2.e.i.2 (1) limit “receiving water limitations” to those identified in the TMDL provisions, or (2) include applicable water quality objectives per the definition of “receiving water limitations” identified in Part V (Receiving Water Limitations).

As the ultimate end goal of the TMDL is protection of beneficial uses, attainment of water quality objectives/criteria protective of those uses should constitute compliance with the TMDL provisions. Therefore, please either (a) clarify that “receiving water limitations” is synonymous with the definition provided in Part V or (b) modify the language as suggested below.

Request: If the use of “receiving water limitation” in Parts VI.E.2.d.i.2, and VI.E.2.e.i.2 is limited to those identified in the TMDL provisions, modify the language as follows (additions in bold, underlined text):

*There are no exceedances of the applicable receiving water limitation **or water quality objective** for the specific pollutant(s) in the receiving water(s) at, or downstream of, the Permittee’s outfall(s);*

RECEIVING WATER LIMITATIONS

1. The Receiving Water Limitations Provisions are Inconsistent with the Intent of the Watershed Management Program

Part V.A.1 of the Working Proposal states the following:

Discharges from the MS4 that cause or contribute to the violation of Receiving Water Limitations are prohibited.

Per Regional Board staff’s presentation and discussion during the May 3, 2012 workshop, staff are intending that this provision is a stand-alone provision, with the exception of instances where TMDLs are effective with approved compliance schedules. Indeed, Part VI.E.2.c.ii, Part VI.E.2.c.iii, and Part VI.E.2.d.i.4 of the Working Proposal for TMDLs provide for Permittees to be in compliance with the Receiving Water Limitation provisions in Part V.A. by complying with the applicable TMDL provisions, which includes complying with interim water quality-based effluent limitations and receiving water limitations through the implementation of an approved Watershed Management Program.

The Bureau supports providing compliance via the Watershed Management Program for the TMDL pollutants as it comports with the compliance schedule provided in the Basin Plan. However, considering even a single exceedance for a pollutant as a Permit violation where no TMDL is in place, despite the implementation of an approved Watershed Management Program, is inconsistent with the Watershed Management Program concept and provisions.

The intent of the Watershed Management Programs is to focus Permittees efforts and resources on the highest water quality priorities in each watershed. Per the Working Proposal, the highest priorities that will form the basis of each Watershed Management Program are waterbodies with established TMDLs (Category 1) and pollutant-waterbody combinations that are on the State’s 303(d) list (Category 2). In addition, the Watershed Management Program provisions identify an adaptive management process to make the Watershed Management Program more effective, based on assessing (emphasis added):

*“**Progress toward achieving improved water quality in MS4 discharges and achieving receiving waters limitations** through implementation of the watershed control measures based on an evaluation of outfall-based monitoring data and receiving water monitoring data (Working Proposal on TMDLs, Part VI.C.6.a.i(2))*

The implication of the current approach to the Receiving Water Limitations provisions is that in a particular waterbody, where a Watershed Management Program has been developed, approved, and is being implemented, a Permittee would be in violation of the Permit for even a single exceedance in the receiving water, despite the implementation of a fully approved Watershed Management Program.

For example, if Watershed A has a TMDL for copper and Permittees are fully implementing an approved Watershed Management Program, then the Permittees will be in compliance with Part V.A.1 of the Receiving Water Limitations. However, if in Watershed B, there is an exceedance for copper in the receiving water and the frequency of exceedance does not meet 303(d) listing criteria and there is therefore no TMDL in place (Category 3 or 4, per the Watershed Management Programs provisions), the Permittees would be in violation of the Permit.

By considering exceedances for non-TMDL pollutant-waterbody combinations a Permit violation, prioritization via the Watershed Management Programs is not feasible as Permittees would be obligated to treat as equal a random exceedance for a particular pollutant and an impaired waterbody with an effective TMDL. Resources would be expended on addressing the random exceedances, resulting in either diverting funds from the highest priorities or creating additional and unnecessary financial burden on Permittees with no net environmental benefit.

Request: To remedy the inconsistency between the Working Proposals for Receiving Water Limitations and Watershed Management Programs, the Bureau has provided recommended revisions in Attachment C. Due to the integrated nature of the comments on Receiving Water Limitations, all suggested revisions to this Working Proposal are contained in Attachment C.

2. Implementation of the Watershed Management Program Should be Equivalent to the Process Identified in Part V.A.3 of the Receiving Water Limitations

The Watershed Management Program currently provides a cross-reference to Part V.A.4 of the Receiving Water Limitations provisions, which states:

So long as the Permittee has complied with the procedures set forth in Section V.A.3. above and is implementing the revised storm water management program and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Water Board to modify current BMPs or develop additional BMPs.

As the Working Proposal for the Watershed Management Programs provides for an adaptive management process, an additional cross-reference to the Receiving Water Limitations provisions should be provided. Absent the additional cross-reference, the Permittee would be obligated to initiate the process identified in Part V.A.3, including the development and submittal of a Receiving Water Limitations Compliance Report and implementation schedule for BMPs, despite the implementation of an approved Watershed Management Program that addresses the TMDL requirements.

Request: Provide an additional provision in Part V.A. to directly incorporate the Watershed Management Programs as the mechanism for compliance with the Receiving Water Limitations provisions (see Attachment C). If the Regional Board opts to not include such an additional provision, Part VI.A.ii(1) should be modified as follows (additions in bold, underlined text):

*(1) The adaptive management process fulfills the requirements in **Part V.A.3 and** Part V.A.4 to address continuing exceedances of receiving water limitations.*

3. Part V.A.1 and Part V.A.2 of the Receiving Water Limitations Provisions Should not be “Stand-Alone” Provisions

On July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.*¹² (*NRDC v. County of LA*). The court’s opinion addressed the question if the “iterative process” language contained in Part 2.3 of the County of Los Angeles’s MS4 permit constitute a safe

¹² No. 10-56017, 2011 U.S. App. LEXIS 14443, at *1 (9th Cir., July 13, 2011).

harbor from violation of water quality standards. Note that the Court was silent on whether the “iterative process” in general was consistent with the Clean Water Act and only ruled on the specifics of the language in the permit.

For years, municipalities have operated under the premise that implementation of the iterative process as written in the LA County and other permits statewide constituted compliance with Permit provisions related to exceedances of water quality standards. This premise was initially based on State Water Board Order 99-05 and later reconfirmed in Order WQ 2001-15 (BIA Order)¹³. Therefore, the Ninth Circuit Court decision has significant ramifications to all MS4 dischargers, particularly with regard to the implementation of TMDLs. Municipalities have developed implementation plans to achieve compliance with TMDL requirements based on the understanding that the schedule presented within the TMDL represented the timeframe for compliance.

The iterative approach considers the challenges in the management of stormwater, including temporal, spatial, and storm event (size, intensity) variability, yet is still protective of water quality. Indeed, the appropriateness of the iterative process is noted in the BIA Order, which states:

“The iterative approach is protective of water quality, but at the same time considers the difficulties of achieving full compliance through BMPs that must be enforced throughout large and medium municipal storm sewer systems.”

Although the Ninth Circuit Court decision noted that the “cause or contribute” provision was a standalone provision and should be read as such, the Court did not state that the iterative process was not a viable method of compliance. Rather, for the Los Angeles permit in question, the iterative process, as it was presented, did not support compliance in the event of a water quality standards exceedance.

With that in mind, and for consistency with adopted TMDL implementation schedules, the Receiving Water Limitations language should be revised. Absent a revision of the language in the Working Proposal, Permittees would be subject to liability for receiving water exceedances, despite the approaches incorporated into the Working Proposals for TMDLs and Watershed Management Programs.

Request: *The Bureau recommends a two part structural solution (with specific revisions noted in Attachment C), as follows:*

1. *Include additional provisions that specifically state that Permittees will comply with Part V.A.1 through the implementation of the Watershed Management Program and/or implementation of TMDLs per the approved schedules; and,*
2. *Directly reference these provisions in Part V.A.1 by adding the following phrase: “Except as provided in Part V.A.3, Part V.A.4 [Watershed Management Programs], and Part V.A.5 [TMDLs]...”*

4. Use of “Cause or Contribute” Language Should be Limited to Part V.A

Throughout the multiple Working Proposals to date (including the Working Proposals that are the subject of this letter, as well as Working Proposals for Non-Stormwater Discharges and Minimum Control Measures), the language “shall not cause or contribute” is repeated many times. In light of the decision by the Ninth Circuit Court of Appeals (discussed above), the structure of the Permit should be taken into consideration. As the Ninth Circuit Court found the “cause or contribute” provision to be a standalone provision, repeating the exact language throughout the Permit may unintentionally compound liability of the Permittees.

¹³ See *In the Matter of the Petitions of Building Industry Assn. of San Diego County and Western States Petroleum Assn.*, Order WQ 2001-15 (Nov. 15, 2001) (BIA Order), at 7 (“... we point out that our language, similar to U.S. EPA’s permit language discussed in the *Browner* case, does not require strict compliance with water quality standards. Our language requires that storm water management plans be designed to achieve compliance with water quality standards. Compliance is to be achieved over time, through an iterative approach requiring improved BMPs.” Emphasis added.).

Request: To mitigate any structural concerns regarding the “cause or contribute” language, the Bureau requests that the Permit simply refer to the Receiving Water Limitations provisions of the Permit. Such an approach would not change the intent of the Regional Board, but would address the concept of “cause or contribute” in one discrete provision.

Attachment B – Detailed Comment Matrix for Watershed Management Program and TMDL Working Proposal

Watershed Management Program

Additional Comment#	Document Reference:	Issue	Comments
1	VI.C.2.a	Timeline of Implementation	The proposed timeline especially the timeline for the preparation of the draft plan is overly ambitious. For this timeline to be met, it will be at the expense of the quality and comprehensiveness of the plan. Also in the case of the City of Los Angeles, due to its internal policies, the submitted plan may not have enough time to be approved by elected officials, and may be subject to additional changes after it has been submitted to the Regional Board.
2	VI.C.3.a.ii	Waterbody-Pollutant Classification	Categories 3 and 4 of medium and low priority pollutants comprise hundreds of pollutants. Characterizing hundreds of pollutants in multiple receiving waterbodies neither assists in prioritizing resources nor meets the intent of integrating actions to help meet water quality through watershed management plans. We would greatly appreciate further differentiation of the Category 1 (Highest Priority) pollutants since this is the category that we will primarily be focusing to assist us in prioritizing our efforts.
3	VI.C.3.b	Selection of Watershed Control Measures	This subsection seems to indicate that the WMP should contain the TMDL measures that will actually be implemented, including securing funding as opposed to the TMDL measures that are identified in the already submitted “Implementation Plans” that are needed for compliance. If this is the case, the City will need to re-evaluate all existing TMDL Implementation Plans and reprioritize the proposed measures in consideration of the funding availability.
4	VI.C.3.b.iv.6	Legal Authority for implementation of Watershed Control Measures	This requirement suggests that a commitment is needed not just by the Bureau of Sanitation, but also for the City of Los Angeles. Because of the City’s internal practices, the preparation of the Watershed Management Plan and any revisions will require more than the six month and three month periods provided respectively.
5	VI.C.6	Adaptive Management Process	Requiring this process to be repeated every two years is too often. For well thought out plans, not much changes are needed at this frequency. Once during the five year period, to accompany the duration of the permit cycle, will be more appropriate.

Attachment B – Detailed Comment Matrix for Watershed Management Program and TMDL Working Proposal

General TMDL Provisions

Additional Comment#	Document Reference:	Issue	Comments
6	Section E, Part 2.b.v.2 Page 2, Part 2.d.i.2 Page 3, and Part 2.e.i.2 Page 4	Attainment of Water Quality Objectives/Criteria should constitute TMDL compliance	<p>Section E Parts 2.b, 2.d, and 2.e present the compliance determination and allows multiple mechanisms for demonstrating compliance, which is greatly appreciated. As the ultimate end goal of the TMDL is protection of beneficial uses, attainment of water quality objectives/criteria protective of those uses should constitute compliance with the TMDL. However, Section E Parts 2.b.v.2, 2.d.i.2, and 2.e.i.2 limits this concept to applicable receiving water limitations. If water quality objectives/criteria are met in the receiving waters Permittees should be in compliance with the TMDL regardless if the receiving water limitation is explicitly incorporated into the permit.</p> <p>Additionally, the language places upstream dischargers in jeopardy if downstream dischargers cause or contribute to exceedances. The current language indicates that compliance can be demonstrated if there are no exceedances at, or downstream of, the Permittee’s outfall. For example, if a water quality objective is met in Reach 6 of the LA River but not in Reach 2 (over 20 miles downstream and a change in flow of over 80 cfs), those discharging to Reach 6 could be considered out of compliance.</p> <p>Based on these issues, please revise as follows: Section E Part 2.b.v.2 “Demonstrate that the discharge from the Permittee’s MS4 is treated to the level that does not exceed the applicable water quality-based effluent limitation <u>or water quality objective.</u>”</p> <p>Section E Parts 2.d.i.2 and 2.e.i.2 as follows: There are no exceedances of the applicable receiving water limitation <u>water quality objectives</u> for the pollutant(s) associated with the specific TMDL in the receiving water(s) at, or downstream of, the Permittee’s outfall(s).</p>
7	E.2.d.i.1	Note 1 Definition	<p>Suggested text for Note 1: ¹A municipal stormdrain outfall (or conduit) shall have a minimum pipe size of 24-inch diameter where a maintenance hole or other point of access can be built based on hydraulic engineering design standards at the Permittee’s jurisdictional boundary.</p>
8	Section E, Part 2.d.i.4.b	Design Storm for Structural BMPs	<p>This incorporation of such a design standard seems to imply that during larger storms, water quality standards may not have to be met. Also please clarify if this is a recommendation or the intent is to prohibit the implementation of BMPs that will provide partial treatment of this design storm.</p>

Attachment B – Detailed Comment Matrix for Watershed Management Program and TMDL Working Proposal

Additional Comment#	Document Reference:	Issue	Comments
9	Section E, Part 5.	TMDLs should be individually listed as in the Ventura County MS4 Permit	It seems the TMDL provisions from the current Los Angeles County MS4 Permit (i.e., TMDL for Trash in the Los Angeles River Watershed provisions) have been applied to all the trash TMDLs in Los Angeles County with a few minor additions. However, the Los Angeles River Watershed Trash TMDL provisions do not ubiquitously apply to the other TMDLs. This results in a TMDL Provisions Section that does not address the specific intricacies of each trash TMDL. Section E, Part 5 should list the provisions for each TMDL individually as in the Ventura County MS4 Permit. Also consider placing Section E, Part 5 in a appendix for consistency with other TMDLs
10	Section E, Part 5.a.x. Page 7.	There are no trash WLAs in the Lincoln Park Lake TMDL	As stated in the Lincoln Park Lake Trash TMDL (Section 5.4.4.1 page 5-23), there are no point sources of trash to Lincoln Park Lake. As such, the TMDL does not assign WLAs for trash (Section 5.4.6.1 page 5-25). Please remove the trash effluent limitations for Lincoln Park Lake.
11	Section E, Part 5.b.i.(1)(c) Page 8.	There are no trash WLAs in the Lincoln Park Lake TMDL	As stated in the Lincoln Park Lake Trash TMDL (Section 5.4.4.1 page 5-23), there are no point sources of trash to Lincoln Park Lake. As such, the TMDL does not assign WLAs for trash (Section 5.4.6.1 page 5-25). Please remove Lincoln Park Lake from the paragraph in Section E, Part 5.b.i.(1)(c).
12	Section E, Part 5.b.i.(2)(b) Page 9.	Daily Generation Rate (DGR) calculation should not be required	As the requirement to calculate a DGR is not required for all TMDLs listed in Section E, Part 5.a., a DGR should not be required to determine compliance as stated in Section E, Part 5.b.i.(2)(b). Rather, the use of a DGR to determine compliance should be optional similar to the language in Section E, Part 5.b.i.(2)(a). Please change language in Section E, Part 5.b.i.(2)(b) to make the use of a DGR to determine compliance optional.
13	Section E, Part 5.b.i.(3) Page 10.	Partial Capture Device performance should be applicable for determining interim compliance	Section E, Part 5.b.i.(3) states: “Permittees may comply with their interim and final effluent limitations through a combination of <i>full capture systems</i> , <i>partial capture devices</i> , and <i>institutional controls</i> . Where a Permittee relies on a combination of approaches, it shall demonstrate compliance with the interim and final effluent limitations as specified in (1)(c) in areas where <i>full capture systems</i> are installed and as specified in (2)(b) in areas where <i>partial capture devices</i> and <i>institutional controls</i> are applied.” However, this language does not allow for demonstrating compliance using the demonstrated performance of specific devices as detailed in Section E, Part 5.b.i.(2)(a). Please add: “2(a) or” before (2)(b) in Section E, Part 5.b.i.(3).
14	Section E, Part 5.b.ii. Page 11.	Language regarding non-compliance of MFAC Program	Please add the following language, adapted from the Ventura County MS4 Permit, regarding non-compliance of a MFAC Program, after Section E, Part 5.b.ii.(2)(a): “(3) For a Permittee relying on a <i>MFAC/BMP Program</i> , If any WLA is exceeded at a compliance monitoring site, the Permittee shall implement BMPs in accordance with the TMDL Technical Reports, Implementation Plans or as identified as a result of TMDL special studies identified in the Basin Plan Amendment. Following these actions, the Permittee would not be considered in violation of this Order, but Regional Water Board staff could evaluate the need for enforcement if the actions are not deemed to be satisfactory.”

15	Section E, Part 5.b.iii.c.i. Page 12.	TMDL Compliance Report	The required TMDL Compliance Report is redundant as the Regional Board-adopted TMDLs listed in Section E, Part 5.a. require an annual report detailing the information required in subsections (1), (2), (3), and (4) of Section E, Part 5.b.iii.c. Please remove the TMDL Compliance Report requirement.
Section B. TMDLs in the Santa Monica Bay Watershed Management Area			
16	Section B, TMDLs in SMB, Part 1.b Page 1.	Effluent limitations are inconsistent with assumptions of the WLAs	The WLAs in the Santa Monica Bay Beaches Bacteria (SMBBB) TMDL assigned to the MS4 are expressed as allowable exceedance days. The WLAs are not expressed as concentration based effluent limitations. Discharges from the MS4 could be greater than the proposed effluent limits but concentrations in the wave wash could be lower than the numeric target. Furthermore, the TMDL allows for a certain number of exceedances of the single sample maximum, which may also allow for exceedances of the proposed effluent limitations without violating the assumptions of the WLAs. As such, the assignment of effluent limitations as concentration-based limitations is not consistent with the requirements or assumptions of the WLAs and should be removed. Only receiving water limitations are appropriate given that both the TMDL target and the WLAs are expressed in the receiving waters. Additionally, this approach unnecessarily places MS4 permittees in a position to receive mandatory minimum penalties for the exceedance of effluent limits that are not consistent with assumptions of the WLAs. If the interest in providing effluent limitations is to allow discharges to differentiate from other comingled discharges, the interest can be addressed in Part E. Special Provisions by revising b.v, d.i, and e.i to include an additional mechanism for demonstrating compliance that states that a Permittee shall be deemed in compliance if there are no exceedances of applicable water quality objectives at the Permittee's MS4 outfall(s).
17	Section B. TMDLs in SMB (Bacteria)	Bacteria TMDL Reopener	Throughout entire document, bacteria TMDL requirements have not been updated for changes that are proposed by RB in the TMDL reopeners. This will require changes in many areas once the revised TMDLs have been adopted (responsible jurisdictions, interim reduction milestones, IWRA update, sites subject to antidegradation, geometric mean calculation). This applies to Ballona Creek, Marina del Ray and Santa Monica Bay Beaches Bacterial TMDLs. For example the final WLA Compliance date should be July 15, 2021 as approved by the RWQCB staff.
18	Section B, TMDLs in SMB, Part 2.c Page 6.	Interim effluent limits do not reflect possible site specific trash Baseline WLAs	The Santa Monica Bay Nearshore and Offshore Debris TMDL allows the responsible agencies and jurisdictions to calculate a site specific trash Baseline WLA if they elect to not use the default Baseline WLAs assigned in the TMDL. Section B, TMDLs in SMB, Part 2.c provides a compliance schedule and interim and final water quality-based effluent limitations based on the default Baseline WLA from the TMDL. However, as the responsible agencies and jurisdictions may choose to use a site specific Baseline WLA, Section B, TMDLs in SMB, Part 2.c should include language that allows the responsible agencies and jurisdictions the ability to meet the interim effluent limits derived from either the default Baseline WLA or a site specific Baseline WLA based on whichever is chosen.

19	Section B, TMDLs in SMB, Part 2.d	References to other parts of document unclear	Section B TMDLs in SMB, Part 2.d. states: “Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [Permit Provisions to Implement Trash TMDLs].” However, it appears that 3(b) and 3(c) should be 2(b) and 2(c). Please double check to make sure these references are correct.
20	Section B, TMDLs in SMB, Part 5.a.3 Table, Page 10	Trash Generation Baseline Value	Ballona Creek Watershed Trash TMDL- How was the Baseline number of 950,238 gallons per year for the City of Los Angeles derived?
21	Section B, TMDLs in SMB, Part 5.b.2 Page 11.	Effluent limitations are inconsistent with assumptions of the WLAs	The WLAs and corresponding loading capacities for the Ballona Creek Toxics TMDL represent the mass of pollutant associated with the fine-grained sediment that settles in the Estuary, which is a subset of what is discharged. However, the WLAs were incorporated into the permit without consideration that what settles is a subset of what is discharged. As such, the permit is inconsistent with the assumption of the WLAs and requires reductions of loadings well above the intent of the Toxics TMDL. For example, the WLA and corresponding WQBEL for Total DDT is 10.56 g/yr. If a Permittee were required to meet this WQBEL, the resulting fine-grained deposited load would be 1.2 g/yr, which would translate to an overall sediment concentration of 0.17 ug/kg, an order of magnitude lower than the 1.58 ug/kg numeric target for DDT [note: all calculations are based on using data and assumptions provided in the BPA]. As such, the permit should be revised to either 1) utilize the information provided in the TMDL to translate the WQBELs into an allowable mass that may be <u>discharged</u> or 2) the WQBELs should be established as receiving water limitations that clearly indicate that the WQBELs apply to what settles on the bed sediment.

22	Section B, TMDLs in SMB, Part 5.b.2 Page 11 and 12.	Additional mechanisms for demonstrating compliance with assumption of WLAs should be allowed	<p>The goal of the Ballona Creek Toxics TMDL is to protect aquatic life in bed sediments in the estuary. Meeting the State’s Phase I Sediment Quality Objectives or demonstrating that concentrations are met in bed sediment should be alternative methods for demonstrating compliance. These methods are consistent with the assumptions of the WLAs, which are intended to protect aquatic life in bed sediments. The following provides example language that could be included in the permit to demonstrate that a discharge is not causing an impairment or that the Estuary is attaining the Toxics TMDL:</p> <p>Compliance may be demonstrated via any one of the following means:</p> <ol style="list-style-type: none"> 1. Final sediment allocations are met. 2. The qualitative sediment condition of <i>Unimpacted</i> or <i>Likely Unimpacted</i> via the interpretation and integration of multiple lines of evidence as defined in the Phase 1 SQOs is met. 3. The sediment numeric targets are met in bed sediments. 4. Discharge concentrations meet the TMDL sediment targets. <p>The compliance options should also be applicable for meeting the interim goals specified within the Toxics TMDL.</p>
23	Section B, TMDLs in SMB, Part 5.c. Page 12.	The extended schedule for an IWRA is not included	<p>The Ballona Creek Bacteria TMDL allows for the extension of the final wet weather compliance date to 2021 if an Integrated Water Resources Approach (IWRA) is utilized similar to the Santa Monica Bay Beaches Bacteria (SMBBB) TMDL. This extension is already proposed in the revised BPA from the ongoing reopener process. Please include language similar to the SMBBB permit language indicated that the final wet weather compliance date can be extended.</p>
24	Section B, TMDLs in SMB, Part 5.c. Pages 12-14.	Effluent limitations are inconsistent with assumptions of the WLAs	<p>The WLAs in the Ballona Creek Bacteria TMDL assigned to the MS4 are expressed as allowable exceedance days. The WLAs are not expressed as concentration based effluent limitations. Discharges from the MS4 could be greater than the proposed effluent limits but concentrations in the wave wash could be lower than the numeric target. Furthermore, the TMDL allows for a certain number of exceedances of the single sample maximum, which may also allow for exceedances of the proposed effluent limitations without violating the assumptions of the WLAs. As such, the assignment of effluent limitations as concentration based limitations is not consistent with the requirements or assumptions of the WLAs and should be removed. Only receiving water limitations are appropriate given that both the TMDL target and the WLAs are expressed in the receiving waters. Additionally, this approach unnecessarily places MS4 permittees in a position to receive mandatory minimum penalties for the exceedance of effluent limits that are not consistent with assumptions of the WLAs. If the interest in providing effluent limitations is to allow discharges to differentiate from other comingled discharges, the interest can be addressed in Part E. Special Provisions by revising b.v, d.i, and e.i to include an additional mechanism for demonstrating compliance that states that a Permittee shall be deemed in compliance if there are no exceedances of applicable water quality objectives at the Permittee’s MS4 outfall(s).</p>

25	Section B, TMDLs in SMB, Part 5.d.2.ii Page 15.	Compliance determination should include meeting CTR criteria in-stream	The goal of the Ballona Creek Metals TMDL is to meet the CTR criteria in the receiving waters. As such, an additional mechanism for demonstrating compliance should be included within the permit that states “Permittees shall be determined in compliance with the water quality-based effluent limitations for discharges if CTR criteria are met instream.”
26	Section B, TMDLs in SMB, Part 5.e.2 Page 16.	An averaging period should be included in the Permit	The Ballona Creek Wetlands TMDL establishes WLAs for stormborne sediment. As stated in the TMDL (page 74), “Since the current existing discharge of sediment load is not contributing to the listed impairments or otherwise causing a negative impact to Ballona Creek Wetlands, this TMDL establishes WLAs based on existing conditions.” The existing conditions WLAs are set at the estimate of current sediment discharge based on a 10-year average of sediment discharge from Ballona Creek as calculated for the Ballona Creek Estuary Toxics TMDL. The Toxics TMDL based sediment loads and deposition to capture a wide range of storm conditions and flows in the watershed. By setting the effluent limitations on an annual basis without consideration for the natural fluctuation in annual sediment loads, the permit will result in exceedances of the effluent limitations even though Permittees are meeting the assumptions of the WLAs. As such, the City requests that compliance with the effluent limitations be evaluated over a longer averaging period (preferably 10-years to be consistent with TMDL calculations) in order to capture representative temporal variation in sediment loads consistent with the assumptions of the WLAs.
27	Section B, TMDLs in SMB, Part 6.a.2 Page 16 and 17.	Effluent limitations are inconsistent with assumptions of the WLAs	The WLAs in the Marina del Rey Bacteria TMDL assigned to the MS4 are expressed as allowable exceedance days. The WLAs are not expressed as concentration based effluent limitations. Discharges from the MS4 could be greater than the proposed effluent limits but concentrations in the wave wash could be lower than the numeric target. Furthermore, the TMDL allows for a certain number of exceedances of the single sample maximum, which may also allow for exceedances of the proposed effluent limitations without violating the assumptions of the WLAs. As such, the assignment of effluent limitations as concentration based limitations is not consistent with the requirements or assumptions of the WLAs and should be removed. Attachment B – Detailed Comment Matrix for Watershed Management Program and TMDL Working Proposal

Additional Comment#	Document Reference:	Issue	Comments
30	Section C, TMDLs in DC and Greater Harbors, Part 1. Page 1.	Annual Allowable Exceedance Days of Single Objective(days) column	The limits for CB1 & CB2 should be the same as HW07 based on the Harbor bacteria TMDL), but instead the table just has “0” for all CB1 & CB2 limits. Please make corrections.
31	Section C, TMDLs in DC and Greater Harbors, Part 2.c Page 2.	Interim effluent limits do not reflect possible site specific trash Baseline WLAs	The Machado Lake Trash TMDL allows the responsible jurisdictions to calculate a site specific trash Baseline WLA if they elect to not use the default Baseline WLAs assigned in the TMDL. Section C, TMDLs in DC and Greater Harbors, Part 2.c provides a compliance schedule and interim and final water quality-based effluent limitations based on the default Baseline WLA from the TMDL. However, as the responsible jurisdictions may choose to use a site specific Baseline WLA, Section C, TMDLs in DC and Greater Harbors, Part 2.c should include language that allows the responsible jurisdictions the ability to meet the interim effluent limits derived from either the default Baseline WLA or a site specific Baseline WLA based on whichever is chosen.
32	Section C, TMDLs in DC and Greater Harbors, Part 2.c-Table Page 2.	Baseline Value for trash generation	Machado Lake Trash TMDL – The Baseline value for the City of Los Angeles is 12331.17 gallons, but In Appendix III of the Basin Plan, the Baseline value is 14358.39 gallons. This number is a total of trash generation per land use and is a more accurate value. The 12331.17 gallons value was derived using an average trash generation rate of 5334 gallons of uncompressed trash per square mile. This value is less accurate and should not be used. Additionally, the Los Angeles River Trash TMDL also uses a baseline value of trash generation derived using land use trash generation values. This precedent should be followed.
33	Section C, TMDLs in DC and Greater Harbors, Part 2.e Page 2.	Inappropriate trash generation rate and baseline limitation language	The Machado Lake Trash TMDL requires the responsible jurisdictions to establish trash Baseline WLAs and propose a metric (e.g., weight, volume, number of pieces) to measure the amount of trash collected to compare to the Baseline WLAs. In addition, the TMDL requires the responsible jurisdictions to prioritize the implementation of BMPs in areas with high trash generating rates. Section C, TMDLs in DC and Greater Harbors, Part 2.e states: “If a Permittee opts to derive a site specific trash generation rate through its Trash Monitoring and Reporting Plan, the baseline limitation will be calculated by multiplying the point source area(s) by the derived trash generation rate(s).” The language in this sentence does not relate to what the TMDL intends regarding site specific Baseline WLAs or areas with high trash generating rates. Furthermore, the TMDL does not specify how a high trash generating rate is determined nor does it specify how the site specific Baseline WLA should be calculated. For these reasons, Section C, TMDLs in DC and Greater Harbors, Part 2.e should be removed from MS4 Permit.

Attachment B – Detailed Comment Matrix for Watershed Management Program and TMDL Working Proposal

Additional Comment#	Document Reference:	Issue	Comments
34	Section C, TMDLs in DC and Greater Harbors, Part 3.c.1. Page 3.	Attainment of the Basin Plan objectives should constitute compliance with the TMDL	The Machado Lake Nutrient TMDL is intended to address the eutrophic, algae, ammonia, and odor listings. Attainment of Basin Plan objectives for these listings should constitute compliance with the TMDL. Currently the City is implementing the Machado Lake Ecosystem Rehabilitation Prop O Project, and is spending approximately \$100 million to restore Machado Lake, including implementation of BMPs to reduce external loadings of nutrients to the lake as well as dredging of accumulated sediment from within the lake to reduce internal loadings. Furthermore, as noted in the permit, the City has entered into a Memorandum of Agreement with the Regional Board to implement a Lake Water Quality Management Plan (LWQMP) to achieve a healthy lake. Implementation of the Prop O project and the LWQMP will result in the attainment of the beneficial uses and address the eutrophic, algae, ammonia, and odor listings. However, the potential exists that although these extensive efforts may result in meeting the Basin Plan objectives the receiving water limitations may not be met. As the ultimate end goal of the TMDL is protection of beneficial uses, attainment of the Basin Plan objectives protective of those uses should constitute compliance with the TMDL.
35	Section C, TMDLs in DC and Greater Harbors, Part 3.c.2. Page 3 and 4.	Mass-based allocations may affect the ability with QBELs	The permit assigns annual mass-based QBELs to multiple dischargers. While the Bureau feels that this is a valid approach, it could affect the ability of the City to comply with the in-lake receiving water limitations. Additional language should be included in the permit that protects the City's investment in the lake through the Machado Lake Ecosystem Rehabilitation Prop O Project and the LWQMP. It should not be the City's responsibility to evaluate whether upstream dischargers are causing or contributing to exceedances within the lake, particularly if the Regional Board allows those discharges.
36	Section C, TMDLs in DC and Greater Harbors, Part 5.b.1.i. Page 5.	Interim Toxicity Effluent limitation is inconsistent with the TMDL	The interim freshwater toxicity effluent limitation is set as a not to exceed of a monthly median of 2 TUc. However, the BPA (pg 10) states (emphasis added): "The fresh water interim allocation <u>shall be implemented as a trigger</u> requiring initiation and implementation of the TRE/TIE process.... The fresh water interim allocation shall be implemented in accordance with US EPA, State Board and Regional Board resolutions, guidance and policy at the time of permit issuance, modification or renewal." Currently toxicity based effluent limits are implemented as triggers in NPDES permits. The interim allocation should be revised to require the initiation of a TIE/TRE process consistent with current permitting processes consistent with the TMDL requirements.
37	Section C, TMDLs in DC and Greater Harbors, Part 5.c.1.ii. Page 5 and 6.	Final Metals Water Column Mass Based Effluent Limitations for Dominguez Channel are not consistent with the TMDL	The final metals QBELs are set at a fixed flow rate and hardness, which is inconsistent with the WLAs. The footnote associated with the mass based WLAs for the Dominguez Channel TMDL (Page 12) state that "Recalculated mass-based allocations using ambient hardness and flow rate at the time of sampling are considered consistent with the assumptions and requirements of these waste load allocations". As such, the QBELs should be revised to be consistent with the assumptions of the WLAs as presented in the TMDL.

Attachment B – Detailed Comment Matrix for Watershed Management Program and TMDL Working Proposal

Additional Comment#	Document Reference:	Issue	Comments
38	Section C, TMDLs in DC and Greater Harbors, Part 5.c.2.i. Page 6.	Final Metals Water Column Concentration Based Effluent Limitations for Torrance Lateral are not consistent with the TMDL	The final metals WQBELs are set at a fixed hardness, which is inconsistent with the TMDL. The footnote associated with the concentration based WLAs for the Torrance Lateral (Page 12) state that “Recalculated concentration-based allocations using ambient hardness at the time of sampling are considered consistent with the assumptions and requirements of these waste load allocations”. As such, the WQBELs should be revised to be consistent with the assumptions of the WLAs as presented in the TMDL.
39	Section C, TMDLs in DC and Greater Harbors, Part 5.c.3.i. and 5.c.4 Page 6 and 7.	Final mass based WQBELs expressed as annual loading are not consistent with the TMDL	The final mass-based sediment TMDLs for metals, PAHs, total DDT and total PCBs represent the mass of an individual pollutant that could be deposited in bed sediment and meet the calculated loading capacity. As stated in the Regional Board’s response to comments (21.3 page 69): “The assigned mass-based sediment WLAs were developed based on hydrodynamic modeling of the amount of sediment deposited.” Basing compliance with mass-based WLAs at designated discharge points is not only contradictory to the allocations, which are based on an acceptable bed sediment condition rather than a discharge condition, but also causes dischargers to reduce loadings well below a level that would cause or contribute to an impairment. Either the effluent limits should be revised to indicate an allowable discharge load consistent with the assumptions of the WLAs or the WQBELs should be expressed in a manner that indicates that the resulting concentrations in bed sediment as a result of MS4 discharges should not exceed the allowable deposited load.
Section D. TMDLs in Los Angeles River Watershed Management Area			
40	Section D, TMDLs in LA River, Part 1. Page 3.	References to other parts of document unclear	Section D TMDLs in LA River, Part 1.d. states: “Permittees shall comply with the interim and final water quality-based effluent limitations for trash in 3(b) and 3(c) above per the provisions in Part 7.X [Permit Provisions to Implement Trash TMDLs].” However, it appears that 3(b) and 3(c) should be 1(b) and 1(c). Please double check to make sure these references are correct.

Attachment B – Detailed Comment Matrix for Watershed Management Program and TMDL Working Proposal

Additional Comment#	Document Reference:	Issue	Comments
41	Section D, TMDLs in LA River, Part 2. Page 3.	Final WQBELs are not consistent with the Basin Plan Ammonia Objectives	The ammonia effluent limits are set equal to the WLAs in the Los Angeles River Nitrogen Compounds TMDL. The Nitrogen Compounds TMDL became effective in March 2004. Subsequently, the Basin Plan was updated to incorporate an ammonia SSO which became effective in March 2009. From the time the SSO became the effective Basin Plan ammonia water quality objectives for the Los Angeles River, the Bureau has been encouraging Regional Board staff to modify the TMDL targets and allocations to reflect the revised ammonia objectives. Additionally, the Bureau has provided information demonstrating that, using the new Basin Plan objectives, the Los Angeles River is no longer impaired for ammonia and could be delisted in 2012. However, to date, the TMDL revision and/or delisting decision have not been completed. As a result, the ammonia effluent limits are currently set equal to the TMDL WLAs without an adjustment for the effective Basin Plan ammonia objectives. As outlined in the response to the Bureau's comments on the LAG and DCT NPDES permits, the Bureau understands that Regional Board staff do not believe the effluent limits could be changed in the absence of addressing the TMDL. As such, the Bureau requests that Regional Board staff: 1) identify the most appropriate and expeditious approach to address this administrative issue, and 2) identify the earliest possible date that the revisions could be completed and brought before the Regional Board for consideration.
42	Section D, TMDLs in LA River, Part 3.b.1, 2 and 3 Pages 3-5.	Final WQBELs are not consistent with the 2010 BPA	The final WLAs in the 2010 BPA include a WER, currently set to a default of 1. The load based and concentration based WQBELs should be consistent with the 2010 BPA and the WER term and the current WER footnote from the BPA should be included.
43	Section D, TMDLs in LA River, Part 3.b.1, 2 and 3 Pages 3-5.	Compliance determination should include meeting CTR criteria in-stream	The goal of the LA River Metals TMDL is to meet the CTR criteria in the receiving waters. As such, an additional mechanism for demonstrating compliance should be included within the permit that states "Permittees shall be determined in compliance with the water quality based effluent limitations for discharges if CTR criteria are met instream."

Attachment C
Suggested Revisions to Receiving Water Limitations Working Proposal

V. RECEIVING WATER LIMITATIONS¹

A. Receiving Water Limitations

1. Except as provided in Part V.A.3, Part V.A.4, and Part V.A.5 below, Discharges from the MS4 that cause or contribute to the violation of Receiving Water Limitations are prohibited.
2. Except as provided in Part V.A.3, Part V.A.4, and Part V.A.5 below, Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible², shall not cause or contribute to a condition of nuisance.
3. For Permittees not implementing an approved Watershed Management Program pursuant to [cross reference here], The Permittees shall be in compliance³ with Sections V.A.1 and V.A.2 through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the storm water management program and its components and other requirements of this Order including any modifications. The storm water management program and its components shall be designed to achieve compliance with Receiving Water Limitations. If exceedances of Receiving Water Limitations persist, notwithstanding implementation of the storm water management program and its components and other requirements of this Order, the Permittee shall assure compliance with discharge prohibitions and Receiving Water Limitations by complying with the following procedure:
 - a. Upon a determination by either the Permittee or the Regional Water Board that discharges from the MS4 are causing or contributing to an exceedance of an applicable Receiving Water Limitation, the Permittee shall promptly notify³ and thereafter submit a Receiving Water Limitations (RWL) Compliance Report (as described in the Program Reporting Requirements, Section [TBD] of the Monitoring and Reporting Program) to the Regional Water Board for approval. The RWL Compliance Report shall describe the BMPs that are currently being implemented by the Permittee and additional BMPs, including modifications to current BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of Receiving Water Limitations. The RWL Compliance Report shall include an implementation

schedule. This RWL Compliance Report may be incorporated in the annual Storm Water Report and Assessment unless the Regional Water Board directs an earlier submittal. The Regional Water Board may require modifications to the RWL Compliance Report.

b. The Permittee shall submit any modifications to the RWL Compliance Report required by the Regional Water Board within 30 days of notification.

c. Within 30 days following the Executive Officer's approval of the RWL Compliance Report, the Permittee shall revise the storm water management program and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, an implementation schedule, and any additional monitoring required.

d. The Permittee shall implement the revised storm water management program and its components and monitoring program according to the approved implementation schedule.

4. For Permittees implementing an approved Watershed Management Program, compliance with Part V.A.1 and Part V.A.2 shall be achieved as outlined in Part VI [insert cross-reference, Watershed Management Programs]. Implementation of an approved Watershed Management Program, including Part VI.C.6 and Part VI.C.7, fulfills the requirements of Part V.A.3.

5. For Receiving Water Limitations associated with waterbody pollutant combinations addressed in an effective TMDL, the Permittees shall achieve compliance as outlined in Part VI [insert cross-reference, Total Maximum Daily Load Provisions] of this Order.

6. SoAs long as the Permittee has complied with the procedures set forth in Section ~~Part V.A.3, Part V.A.4, Part V.A.5~~ above, as applicable, and is implementing the revised storm water management program and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Water Board to modify current BMPs or develop additional BMPs.

Subject: Information on Establishment of Bed Sediment Wasteload Allocations for the Ballona Creek and LA/LB Harbors Toxics TMDLs
Attachments: DRAFT - Information on Toxics WLAs - 05-21-12-revised.doc

Hi Renee, Rebecca and Nicholas,

The attached memo was developed as a follow up to the conversation we had last week with you about the BC Toxics and Harbors Toxics WQBELs in the Working Proposal. Specifically, the TMDLs established WLAs based on pollutants settling in bed sediment and the WQBELs in the working proposal do not take this into account. This memo provides information clarifying our understanding of the issue as well as to propose an approach.

Please contact me if you have any questions.

Charlie Yu

Information on Establishment of Bed Sediment Wasteload Allocations for the Ballona Creek and LA/LB Harbors Toxics TMDLs

5/21/2012

The Los Angeles Regional Water Quality Control Board (Regional Board) Staff Working Proposals for the Greater Los Angeles County MS4 Permit present language incorporating Total Maximum Daily Load (TMDL) requirements. The following memorandum discusses two TMDLs included in the Staff Working Proposal:

- Ballona Creek Estuary Toxic Pollutants TMDL (BC Toxics TMDL)
- Dominguez Channel and Los Angeles/Long Beach Harbors Toxics TMDL (Harbors TMDL)

Both the BC Toxics and Harbors Toxics TMDLs assign mass-based sediment wasteload allocations (WLAs) to stormwater. The WLAs were developed to address elevated levels of pollutants in bed sediment. The loading capacities and corresponding WLAs in the TMDLs represent the mass of pollutants associated with the sediments that settle on the bottom of the waterbodies, which is a subset of what is discharged. However, MS4 Permittees are typically regulated on what is discharged and the current Working Proposal assign effluent limitations set equal to the TMDL WLAs. As such, the WLAs are incorporated into the Working Proposal without consideration that what settles is a subset of what is discharged and would require reductions of loadings above the intent of the TMDL and assumptions of the WLAs.

The following discusses the approach utilized to develop loading capacities and WLAs based on bed sediments and proposes alternatives to the current Working Proposal effluent limitations based on the information presented in the TMDL Staff Report.

Ballona Creek Toxics TMDL

The BC Toxics TMDL includes targets and allocations in sediments for cadmium, copper, lead, silver, zinc, chlordane, DDT, Total PCBs and Total PAHs. As discussed in the BC Toxics TMDL Staff Report, the mass-based allocations are based on the sediments deposited in the estuary rather than what is discharged to the watershed. Section 5 Linkage Analysis (pg 32) states (emphasis added):

The loading capacity of the sediments was estimated from the **annual average net deposition** of fine-grained material at the mouth of the Ballona Creek Estuary. This was translated into pollutant specific numbers using the sediment targets and an estimate of bulk sediment density of the fine-grained **deposits**. This provides a pollutant-specific estimate of the **maximum load that can be deposited** to the sediments on an annual basis. The pollutant-specific loading capacities were then divided into load and waste load allocations using information provided in Section 4 Source Assessment.

The following information on sediment deposition is provided on page 33 of the BC Toxics TMDL and is based on data from 1991 – 2001:

- Annual average sediment discharge from Ballona Creek = 44,615 m³/year
- Estimated sedimentation rate in Area A = 31,977 m³/year
- Estimated sedimentation rate in Area G = 5,851 m³/year
- Estimated net sedimentation rate for Areas A and G = 37,828 m³/year
- Estimation of sediment discharged beyond harbor estimate = 6,787 m³/year
- Based on the composition of sediments, the estimated fine sediments deposited in Areas A and G = 5,004 m³/year

As described on page 36 of the Staff Report, pollutant specific loading capacity was calculated by multiplying the average annual deposition of fine sediments (5,004 m³/year) by the numeric targets for sediments. The TMDL assumes a bulk sediment density of 1.42 metric tons per cubic meter (mt/ m³). **Table 1** presents the discharged and deposited sediment loads in terms of both cubic meters per year and metric tons per year. Loading capacities are presented in Table 5-2 of the Staff Report and **Table 2** below.

Table 1. Sediment Load Estimates from the Ballona Creek Toxics TMDL

Sediment Category		Sediment Load (m ³ /year)	Sediment Load (mt/year) ¹
Total	Discharged	44,615	63,350
	Deposited	37,828	53,720
Fine-grained	Discharged	8,923	12,670
	Deposited	5,004	7,100

¹ Sediment load was converted from m³/year to metric tons/year using the TMDL bulk sediment density of 1.42 metric tons per cubic meter.

Table 2. Ballona Creek Toxics TMDL Loading Capacities

Metals	TMDL (kg/yr)
Cadmium	8.5
Copper	241.6
Lead	332
Silver	7.1
Zinc	1,066
Organics	TMDL (g/yr)
Chlordane	3.55
Total DDT	11.2
Total PCB	161
Total PAH	28,580

As stated previously, the WLAs and corresponding loading capacities for the BC Toxics TMDL represent the mass of pollutant associated with the fine-grained sediment that settles, which is a subset of what is discharged. **Table 3** and **Table 4** present equivalent loading capacities computed for total discharged sediment, total discharged fine-grained sediment, and total settled

(deposited) sediment based on information provided in the TMDL and presented in **Table 1** above.

Table 3. Metals Loading Capacities for Different Sediment Categories

Sediment Category		Cadmium (g/yr)	Copper (g/yr)	Lead (g/yr)	Silver (g/yr)	Zinc (g/yr)
Total	Discharged	75.8	2,154	2,960	63.3	9,505
	Deposited	64.3	1,827	2,510	53.7	8,059
Fine-grained	Discharged	15.2	430.9	592	12.7	1,901
	Deposited*	8.5	241.6	332	7.1	1,066

*Indicates loading capacity listed in the Ballona Creek Toxics TMDL

Table 4. Organics Loading Capacities for Different Sediment Categories

Sediment Category		Chlordane (g/yr)	Total DDT (g/yr)	Total PCB (g/yr)	Total PAH (g/yr)
Total	Discharged	31.7	99.9	1,435	254,850
	Deposited	26.8	84.7	1,217	216,080
Fine-grained	Discharged	6.33	20.0	287	50,970
	Deposited*	3.55	11.2	161	28,580

*Indicates loading capacity listed in the Ballona Creek Toxics TMDL

The equivalent loading capacities presented in **Table 3** and **Table 4** were calculated by computing the appropriate sediment ratio from the TMDL sediment load estimates (**Table 1**) and equating to a loading capacity ratio.

For example, to calculate the DDT loading capacity for total discharged sediment, the ratio of deposited fine-grained sediment to total discharged sediment (0.11) was equated to the ratio of loading capacity for fine-grained deposited sediment to loading capacity of total discharged sediment as follows:

$$7100 \text{ mt/yr} / 63,350 \text{ mt/yr} = 0.11$$

$$11.2 \text{ g/yr} / 0.11 = 99.9 \text{ g/yr DDT}$$

As presented in **Table 3** and **Table 4**, what could potentially be discharged is significantly higher than the current WLAs and the proposed effluent limitations in the Working Proposal. For example, the current WLA for Total DDT is 11 g/yr. If a Permittee were required to discharge at this allocation, the resulting fine-grained deposited load would be 1.2 g/yr, which would translate to an overall sediment concentration of 0.17 ug/kg, an order of magnitude lower than the 1.58 ug/kg numeric target for DDT. Thus, if the WLAs are incorporated into the MS4 permit as currently proposed, Permittees could be out of compliance with the permit while still meeting the assumptions of the WLAs and goals of the TMDL. The proposed approach to address this issue is to utilize the calculated loading capacities presented in **Table 3** and **Table 4** for total discharged sediments. The calculations are based on information provided in the TMDL used to calculate the WLAs and are therefore, consistent with the assumptions of the WLAs. Alternatively, the WLAs could be incorporated into the permit as receiving water limitations only; however, this limits the ability of MS4 Permittees to distinguish their discharges from one another as well as other permitted sources.

LA/LB Harbors Toxics TMDL

The Harbors Toxics TMDL includes targets and allocations in sediments for copper, lead, zinc, total PAHs, total DDT, and total PCBs. Similar to the BC Toxics TMDL, the mass-based allocations are based on the sediments deposited rather than what is discharged to the watershed. Section 6 of the TMDL Staff Report (TMDLs and Allocations, pg 91) states (emphasis added):

The loading capacity of the contaminated sediments within each waterbody was calculated from multiplying the sediment quality target by the **average annual sediment deposition rate** (Equation 3; See also Appendix III, Part 1).

TMDL = total sediment deposition rate x SQV or BSAF
 where sediment deposition rate = average annual mass of sediment deposited per waterbody

Furthermore, as stated in the Regional Board's response to comments (21.3 page 69): "The assigned mass-based sediment WLAs were developed based on hydrodynamic modeling of the amount of sediment deposited." As discussed in Appendix I of the Staff Report, an LSPC model was used to generate sediment and pollutant loadings from the watershed to receiving waters and then an EFDC model was used to simulate the amount of sediment and pollutants deposited within the receiving waters. However, the technical documentation submitted as part of the TMDL does not appear to present the LSPC total sediment loadings for direct comparison to EFDC sediment deposition rates used to develop the allocations.

Table 4-6 of the Staff Report (page 57) does provide an estimate of the average annual load to bed sediment based on the EFDC model. Additionally, in Appendix II, Appendix B, Tables B-1 through B-8 provide estimated loadings to a waterbody (total discharged) based on the LSPC output. Using copper in the Los Angeles River Estuary as an example, Table B-6 indicates that on average the total load of copper discharged to the Estuary is 26,749 kg/year whereas Table 4-6 indicates that on average the total load of copper that settles in bed sediment in the Estuary is 1,611 kg/year. This indicates that on average only 6% of the total load of copper discharged actually settles within the Estuary. Repeating this calculation for the remainder of the pollutants yields slightly different results in terms of the percentage of pollutant discharged that settles. As expected, the calculations suggest that what is discharged is higher than what settles and if the WLAs are to be incorporated as effluent limitations into the MS4 permit they must be adjusted.

It appears the information is available to appropriately calculate MS4 discharge limitations consistent with the allocations. However, additional analyses or processing of the model outputs is likely needed. To ensure consistency between limitations and the WLAs, we recommend working with the USEPA modeling contractor (Tetra Tech) to extract the modeling information needed to appropriately express the MS4 discharge limitations. Initial contact with Tetra Tech suggests they could turn around the necessary analyses within two weeks, though they need to confirm availability of their EFDC modeling staff.

	Total Sediment Discharged (mt/year)	TMDL Numeric Targets (mg/kg)	Loading Capacity Based on Total Discharged Sediment (kg/yr)	Percent MS4 area in WMA	MS4 WLA Based on Total Discharged Sediment (kg/yr)

RE: City of Malibu Comments - Staff Working Proposal on LA County MS4 Permit - Provisions Related to Watershed Management Programs, TMDLs, and Receiving Water Limitations

Dear Ms. Purdy:

The City of Malibu thanks the Los Angeles Regional Water Quality Control Board and staff (Regional Board) for allowing an opportunity to review and comment on the proposed provisions relating to Watershed Management Programs, Total Maximum Daily Loads (TMDL) and Receiving Water Limitations (RWL) for the pending draft municipal storm water permit for the Los Angeles region. Early and ongoing communication is critical to the successful development of a protective but reasonable permit, as is providing a reasonable review and comment period. Therefore, while the ongoing dialogue, workshops and public comment periods are much appreciated, more time to review and comment on the draft language is requested.

The City of Malibu has a unique perspective as the only city in Los Angeles County that has been subject to a citizen suit based on problematic language in the 2001 MS4 permit. As a result, the City was forced to divert the City's limited resources (both monetary resources and staff time and effort) to legal defense over the past five years. Thus, Malibu knows the importance of carefully crafting the MS4 Permit language and looks forward to working with the Regional Board, staff and other stakeholders to accomplish our common goals of protecting water quality through reasonable and appropriate regulations. Given the City's unique experience, City staff would welcome the opportunity to meet with the Board and any staff to discuss language options that best meet our common goals.

The City of Malibu, as a participant in the Los Angeles Permit Group (LA Permit Group), supports the comment letter submitted by the LA Permit Group dated May 14, 2012 (also commenting on the draft RWL, Watershed Management and TMDL provisions). The comments therein are a balanced compromise of the various permittees' views and representative of the collective concerns of the permittees. The negotiations and consensus building within that group has been vital to this process and yields workable recommendations for this complex permit. The City strongly encourages the Regional Board to consider the comments in that letter and adjust the proposed permit language accordingly. The City of Malibu would also like to emphasize the following additional comments:

I. General Comments

A. Timing of this process has been unreasonably rushed

Given the short time period to comment on the proposed permit language, the City requests that the Regional Board provide an administrative draft of the full permit for review and comment with a review period of not less than 45 days. A minimum of 45 days will provide the cities a better opportunity to understand the complete permit and work with the Regional Board and other stakeholders before the Board considers the final draft.

First, it is unreasonable to expect agencies to provide technical comments in the review period provided for multiple draft MS4 permit sections. Public notice was provided April 23, 2012 at 5:11 PM, with comments originally due May 11 (18 days total). An extension of one working day was provided to allow a May 14 deadline. The City asks that that the Regional Board and staff recognize the relatively short review periods provided for these latest sections. The City appreciates the additional working day provided; however, the extra day did not provide adequate time for the level of detailed review necessary, given the other comment periods that the City was also required to respond to over the past two weeks.

This review period also coincided with the comment period for several TMDL reconsiderations,¹ and an individual Request for Information to the City of Malibu on alleged exceedances of fecal indicator bacteria (FIB) in the receiving waters.² Given the limited time and financial resources, it is becoming difficult for cities to provide simultaneous technical comments to more than one of these important topics at a time. These issues are very technical and require significant time to review and draft comments. Often these comment letters require assistance from consultants (where funding and time allows) to provide meaningful technical analysis on the issues. Small agencies may only have one staff member dedicated to the implementation of the entire water quality program. As this process moves forward, we request that comment periods be coordinated so that city staff can dedicate an appropriate amount of time to each individual request.

Even though the proposed sections of the permit have been released for limited review and comment periods, each section had to be reviewed out of context and with significant pieces of information yet to be determined (such as relevant definitions and how the sections relate to one another). Without a complete picture, it is difficult to determine the scope of the proposed requirements. Given these limitations, the City requests a minimum 45-day review period for a complete administrative draft.

¹ Public Notice was issued March 23, 2012 at 2:30 PM for a total of five TMDLs, and comments were due May 7 (45 days total), leaving little time to develop a scope of work and get City Council approval on a contract for a technical consultant to assist. The City of Malibu is subject to two different major TMDLs that are being reconsidered, but only had time to review and provide technical comments for one.

² The Regional Board's request for information was dated March 29, 2012 with a deadline of April 30 (30 days total by the time the letter was received). The City of Malibu had to respond regarding eight monitoring locations. Similar letters were sent to many other Santa Monica Bay Watershed cities.

B. The final permit language must be clear and precise, to best explain the intention of the permit provisions.

When interpreting the permit, courts will rely on plain language of the permit, *no matter what was intended*. Hearing transcripts, fact sheets or letters from the Board are not equivalent to what the permit says. Therefore, the City requests that the Regional Board carefully consider all of the permittees' concerns over the unintended consequences of unclear permit language.

C. Response to Regional Board Member questions and comments at the May 3, 2012 Board meeting

1) *The Board asked why municipalities have not been able to meet the TMDL objectives after ten years.*

- a. Municipalities cannot meet standards unless all responsible agencies in the same watershed are subject to the same mandatory regulations and enforcement imposed equally (i.e. parks and open space managers, State and Federal agencies, school districts and schools);
- b. Natural sources of constituents must be considered and standards must be adjusted where applicable; and
- c. The regulations must allow for a process to evaluate "non-compliance," evaluate site specific conditions and more accurately assign responsibility before a permittee is deemed in violation of the permit.

2) *The Board asked why non-governmental organizations (NGOs) and municipalities seem so far apart on numeric limits and adaptive management, and if there are any unifying principals that can be applied that still provide a wide margin of safety for public health and aquatic life and incorporate these divergent views.*

Board members wondered why the NGOs testified that only numeric limits should be applied while the municipalities presented arguments why adaptive management (or an iterative approach) is warranted. In concept, the Board viewed these as worlds apart but, in reality, they are not. The two paths are useful and both can be incorporated into a permit, but only if there is unambiguous language in the permit that protects the permittees from being automatically deemed out of compliance if numeric limits and/or exceedance days are exceeded. Most important, however, is the ability of a permittee to address extraordinary conditions that affect monitoring results before opening the door to a costly and time consuming citizen suit. In the real world, no agency can design for, contain or pay for a 50- or 100-year storm or extraordinary environmental conditions or the activities of agencies not under their authority. This type of protection for the permittees to account for sources of constituents outside their control is absent in the

current regulations, and this issue has not been resolved in the proposed new permit provisions (discussed in more detail below).

- 3) *The RWQCB staff and members indicated a preference for integrated watershed management solutions with prioritization based upon adopted TMDLs as the preferred path.*

Watershed management is a good solution. As the Executive Officer indicated, this is not a new concept for LA County Permittees, as the current TMDL jurisdictional groups are often organized by watershed. Participation is voluntary and, so far, only some of the agencies that are specifically named in a TMDL cooperate. The fatal flaw is that only municipalities are held responsible in the NPDES MS4 Phase I permit and TMDL regulations, so there is no incentive for other agencies to participate. Currently, only state and federal park agencies that “have jurisdiction over a beach adjacent to Santa Monica Bay are named as jointly responsible.”³ The new TMDL regulations must expand the definition of “responsible jurisdiction” to include all agencies in a watershed. Parklands are being developed, roadways and parking lots are being paved, and environmentally sensitive habitats are being compromised without oversight or being held to the same conditions and protective actions as permittees, thereby, undermining the permittees’ efforts to protect water quality.

We understand from the Board members comments that individual members believed that cooperation of all responsible agencies would be most cost effective and would help meet clean water standards sooner. However, the Board also learned that local governments have no legal authority over other agencies operating in the watershed and that these other entities are not yet subject to an equivalent NPDES permit, conditional waiver or other order to ensure compliance with the TMDL. Watershed management is most successful when all participating agencies are subject to the same regulations.

- 4) *RWQCB staff stated that the Board has the authority to adopt orders for NPDES MS4 Phase II Small Communities and Non-Traditional entities in the absence of State Water Resources Control Board action.*

The City was very pleased to hear of this possibility. Unless all agencies that control or contribute to the impairment of clean water and natural resource degradation are regulated equally, cities will be unable to achieve compliance with water quality standards.

The City of Malibu and other Malibu Creek Watershed and North Santa Monica Bay rural coastal watershed municipalities have been diligently working on integrated watershed management for the past ten years. The voluntary participation of State and Federal agencies has been minimal or completely absent to date, even when neighboring cities try to engage the agencies in the process, sometimes to the point of offering free

³ Proposed Amendment to the Water Quality Control Plan – Los Angeles Region to Revise the Santa Monica Bay Beaches Bacteria TMDL - Attachment A – Pages 4-8

professional services. We were pleased to hear RWQCB staff explain that a municipality only had to ask the Board to take the necessary steps to address this regulatory inequity.

The City of Malibu requests that NPDES MS4 Phase II Non-Traditional permit procedures be initiated so that the following agencies, which discharge to the watersheds or commingle with facilities in the City, are compelled to meet the Clean Water Act regulations through the NPDES MS4 Phase II Non-Traditional orders:

- California State Parks
- Santa Monica Mountains Conservancy
- Mountains Recreation and Conservation Authority
- Santa Monica Mountains National Recreation Area
- Santa Monica-Malibu Unified School District
- Santa Monica College
- Pepperdine University

In anticipation of a permit for these agencies, the City requests that each of the above agencies be specifically listed as responsible jurisdictions in the TMDL regulations during the reconsiderations, with the Basin Plan and the findings of the new NPDES MS4 permit being amended accordingly.

- 5) *The Board wondered if there is a procedure in place for natural source exclusion, so that municipalities would not be responsible for bacteria or nutrient contributions from environmental influences over which the cities have no control.*

The staff responded that there are new advances in microbial source tracking that make sources of pollutants easier to evaluate. The City's recent submittals⁴ to Regional Board staff provide concrete examples where an agency is held accountable for a natural and uncontrollable source of a pollutant (in this case FIB) even where there is no MS4 discharge.

The 2002 TMDL regulations delineated specific actions for State Parks to help evaluate the natural sources influencing the historically elevated levels of bacteria in Malibu Lagoon and Surfrider Beach. State Parks has not undertaken any of these activities to date. Remember, the Malibu Creek Watershed municipalities have no control over enforcement of those conditions, yet the municipalities are ultimately responsible for the water quality in the watershed. Thus, it is imperative that all responsible agencies be held to the same standard to protect against water quality degradation.

The City is very encouraged to learn that Regional Board staff and the Executive Officer will consider natural source exclusions. The City presented technical suggestions in its May 7, 2012 comment letter (previously referenced) based upon (1) other California Regional Board actions; (2) research from the past ten years; and (3) recommendations

⁴ Technical comments to the Regional Board for the Santa Monica Bay Beaches Bacteria TMDL Reconsideration submitted on May 7, 2012 and the Response to Request for Information on April 30, 2012, incorporated herein by reference.

from the U.S. Environmental Protection Agency on this subject. The City requests a meeting with the Executive Officer and staff to further discuss those suggestions and alternative pathways to compliance that properly account for Natural Sources Exclusion (NSE).

A number of recent Santa Monica Bay studies have further identified and confirmed natural (non-anthropogenic) sources of FIB – including plants, algae, decaying organic matter, beach wrack and bird feces – implicating these as potentially significant contributors to exceedances (Imamura et al 2011, Izbicki 2012b). Beach sand, sediments and beach wrack have been shown to be capable of serving as reservoirs of FIB, possibly by providing shelter from UV inactivation and predation by allowing for regrowth (Imamura et al 2011, Izbicki et al 2012b, Lee et al 2006, Ferguson et al 2005, Grant et al 2001, Griffith 2012, Litton et al 2010, Phillips et al 2011, Jiang et al 2004, Sabino et al 2011, and Weston Solutions 2010). In fact, enterococci include non-fecal or “natural” strains that live and grow in water, soil, plants and insects (Griffith, 2012). Thus, elevated levels of enterococci in water could be related to input from natural sources. Sediments in Malibu Lagoon have also been shown to serve as a reservoir for nutrients (Sutula et al 2004), which, once released, may encourage regrowth of FIB (Weisberg et al 2009 and Surbeck et al 2010).

Without a reasonable path for site-specific objectives or scientifically-based NSE, the waters adjacent to the City of Malibu will always experience “exceedances” due to natural sources. The only options available to combat natural sources would destroy the natural ecosystems that the regulations are intended to protect. No BMP can keep the kelp from dislodging from its continually expanding natural setting in Malibu. Grooming kelp and sea grass off the sand, and preventing birds from foraging in the wrack and out of lagoons, are not appropriate options, despite NGOs arguments that these are acceptable solutions. For example, beach grooming to remove stranded kelp has been shown to adversely impact the beach ecosystem (Dugan & Hubbard, 2010). Thus, a decision to remove wrack from a beach should only be undertaken after careful consideration of both water quality and ecosystem needs (Imamura, 2011). Unfortunately, wrack removal may be the only measure available for mitigating natural sources of FIB at beaches impacted by kelp wrack in Malibu (unless, of course, there is a defined natural source exclusion (NSE) process specifically outlined in the reconsideration and the new NPDES permit.

NSE-based Waste Load Allocations could be consistent with the San Diego Regional Water Quality Control Board’s (SDRWQCB) NSE Basin Plan Amendment (BPA), which was also approved by the State Water Resources Control Board (SDRWQCB 2008)⁵. According to the SDRWQCB NSE Basin Plan Amendment, application of an NSE Approach (NSEA) would require that dischargers: (1) Control anthropogenic sources of FIB to the water body; (2) demonstrate that all anthropogenic sources are

⁵ SDRWQCB, 2008. “San Diego RWQCB NSE Basin Plan Amendment and Tech Report.” http://www.waterboards.ca.gov/sandiego/water_issues/programs/basin_plan/issue_7.shtml

controlled; and (3) demonstrate that the remaining FIB concentrations do not indicate a health risk (SDRWQCB 2008, p.13). The NSE BPA states that the first requirement, to control anthropogenic sources of FIB, “does not mean the complete ‘elimination’ of all anthropogenic sources of bacteria as this is both impractical as well as impossible” due to sources such as re-suspension of bacteria from sediments by swimmers and shedding by swimmers (SDRWQCB 2008, p.21). Rather, dischargers must demonstrate that controls have been implemented such that anthropogenic sources do not cause or contribute to exceedances of water quality objectives, and a weight of evidence approach is recommended in order to demonstrate that the control of anthropogenic sources has been achieved (SDRWQCB 2008, p.21-22). As seen in San Diego, a NSE approach is reasonable and appropriate.

- 6) *Board members wondered about the economic costs for local government to implement the NPDES MS4 and TMDL regulations for the past 10 years and whether there were grants available (in the context of the discussion about what cities can do to address the last “11%” of drains that may cost double of the first 89%).*

The City of Malibu has spent well over \$50 million on water quality, and environmental enhancement and restoration projects and programs Citywide in the past ten years. In order to meet objectives and comply with just two TMDLs,⁶ the City constructed the Civic Center Stormwater Treatment Facility and Legacy Park.⁷ The Civic Center Stormwater Treatment Facility cost \$5,800,000 for design and construction, and Legacy Park cost an additional \$35,125,996 for land acquisition, design and construction. In total, these projects’ annual maintenance costs are approximately \$100,000.

Together, these projects function as a stormwater and urban runoff diversion, treatment and storage facility, and reclaimed water source, which prevents discharge of any dry-weather runoff in the Malibu Civic Center area from any City MS4 drains. Stormwater is detained and disinfected and stored for reuse to the maximum extent feasible. Wet weather treatment exceeds bacteria TMDL limits by over 5 times. The detention pond in Legacy Park is capable of capturing up to 2,600,000 gallons of runoff from a drainage area of 330 acres prior to treatment and use for irrigation. This equates to a cost of \$124,018 per acre to capture and treat water (not counting annual maintenance). Despite the fact that Malibu has captured and treated its stormwater runoff, exceedances of FIB persist in Malibu Lagoon and near shore environment due to natural sources. Also, this is just one example of the City’s efforts to address one beach, although it is responsible for about 22 miles of shoreline impacted by natural sources of FIB.⁸

⁶ The City constructed projects to meet objectives in the Santa Monica Bay Bacteria TMDLs and Malibu Creek and Lagoon Bacteria TMDL.

⁷ Legacy Park has received at 6 awards since 2010, including: American Society of Civil Engineers’ “Project of the Year” Award for Region 9, which includes the entire state of California, and the California Stormwater Quality Association (CASQA) “Outstanding Stormwater Best Management Practice Implementation - Comprehensive Regional Project” award.

⁸ Of note, sources of FIB in the Malibu Lagoon and Surfrider Beach areas are not caused by onsite wastewater treatment systems (OWTS) either. Local microbial source tracking (MST) study results indicate that human fecal contributions are minor or non-existent. Several MST studies have been conducted within North Santa Monica Bay subwatersheds to assess the presence of human fecal contamination during dry weather. Noble et al (2005) sampled from Malibu Creek, Malibu Lagoon and from the discharge of the Lagoon to the beach. Jay et al (2011)

II. Watershed Management Program

Use of a Watershed-based regulatory scheme is a proactive step in the right direction for reasonable and appropriate permit standards. Because the sources of, and measures to control, pollutants in stormwater are complex, the permit must utilize flexible and iterative regulatory mechanisms. The Los Angeles Region MS4 Permit is already a complicated permit. The complexities increase exponentially with the inclusion of 32 different TMDLs that cover overlapping jurisdictions. Thus, prioritizing compliance actions and allocating funding to meet the highest priorities in accordance with mandated deadlines will require a tremendous amount of coordination and strategy amongst all of the watershed permittees.

The current proposal does not provide enough time to develop the watershed management plans necessary to meet the stringent water quality objectives. For example, preparation of the Integrated Implementation Plan for the Malibu Creek Watershed Bacteria TMDL within one year was extremely difficult with eight agencies collaborating on the plan for one TMDL. Other TMDLs with more challenging issues and more agencies will certainly take longer. Therefore, the City requests at least two years to develop the Watershed Management Plans. The permittees will continue to comply with all MS4 permit requirements, including minimum control measures while plans are being developed, so there is no harm in extending the deadline.

Lastly, Watershed Programs need to consider the previously mentioned need for an NSE where a watershed management plan alone will be insufficient to meet water quality objectives.

III. TMDLs

- A. All TMDLs will be incorporated into the MS4 Permit and must have reasonable and appropriate standards. The TMDL reconsiderations must not be limited in scope to the small number of issues originally listed in the TMDLs because pollutant source identification methods and technology to comply with standards have evolved since the TMDLs were developed. A similar concern is also mentioned in the LA Permit Group's letter, stating, "Additionally, the majority of the TMDLs were developed with the understanding that monitoring, special studies, and other information would be gathered during the early years of the TMDL implementation to refine the TMDLs. As such, many MS4 dischargers were told during TMDL adoption that any concerns they may have over inaccuracies in the TMDL analysis would be addressed through a TMDL reopener." Some of those exact concerns are being overlooked in the proposed language for the June 7, 2012 TMDL

collected samples from the Malibu Creek, Malibu Lagoon and Surfrider Beach, and Izbicki et al (2012b) tested Malibu Lagoon and near-shore ocean water. Two of the three studies (Noble et al 2005 and Izbicki et al 2012b) found no detection of human markers in any of the surface water samples tested, and Jay et al found no evidence of human fecal marker HF183 at Surfrider Beach; however, Jay et al did detect low levels of human marker HF183 in several samples (5 out of 80 samples, or 6%) that were collected from lower Malibu Creek and Malibu Lagoon. It was noted that the detected lagoon levels correspond to 0.00005-0.0009% sewage or greater than 5-log (>100,000 times) dilution. Potential sources for human contributions were not identified; however, the Izbicki study specifically investigated the potential for OWTS to serve as sources of human fecal contamination to Malibu Lagoon and did not find evidence linking microbial communities (based on TRFLP [terminal restriction fragment length polymorphism] community analysis) found in these systems to those found in the Lagoon or beach. Furthermore, all 25 groundwater samples were negative (non-detect) for HF183 (Izbicki, 2012a). All of these aforementioned studies were provided to the Regional Board on May 7, 2012 as part of the City's technical response for the Santa Monica Bay Beaches Bacteria TMDL Reconsideration.

Reconsiderations. It appears that staff limited the reconsideration scope to only issues identified almost a decade ago in the original Basin Plan Amendments. That is problematic in that once the TMDL are incorporated into the permit, permittees will be held to outdated objectives based on incorrect assumptions and, in some cases, outdated science.

- B. While the City supports the LA Permit Group letter, there is one point in the detailed spreadsheet of comments attached to the letter that may be understated. In the group's TMDL Working Proposal spreadsheet, Comment 2 regarding Page 5 section B.1.c. (2) of the Regional Board's proposal states, "Data collected at the reference beach since adoption of the TMDL, as tabulated in Table 3 of the staff report of the proposed revisions to the Basin Plan Amendment, demonstrate that natural conditions associated with freshwater outlets from undeveloped watersheds result in exceedances of the single sample bacteria objectives during both summer and winter dry weather on approximately 10% of the days sampled."

The Regional Board staff analysis did indeed make this finding; however, as described in the City's letter dated May 7, 2012, upon close examination, the actual monitoring results do not support the Regional Board staff conclusions. The draft TMDL staff report (top of page 12) states that the summer dry weather allowable exceedance rate of 0% is retained, despite evidence presented on page 11 (Table 2) that a 10% rate would be more appropriate. Regional Board staff rationale for this is there were no exceedances at the Leo Carrillo reference beach for 5 of the past 6 years, between 2004 and 2010, during summer dry weather. However, this is not consistent with the City's review of the data and, in fact, between 2004 (interpreted as November, per TMDL staff report Table 3) and 2010, FIB concentrations at Leo Carrillo have exceeded the single sample limits during summer dry weather in 2005, 2006 and 2008, or for 3 those 6 years.

Therefore, the City requests again (as it did in its May 7, 2012 letter) that the Regional Board account for natural water quality variability by setting the allowed rate to the 90th percentile at the reference beach. This is similar to how the Regional Board deals with setting the number of wet days to account for hydrologic variability (as discussed in Comment #8 of that letter), rather than the average. This is a more consistent approach to assessing natural conditions and variability. The 90th percentile allowable exceedance rates, based on data collected 2003 – 2011 at Leo Carrillo, would then be 20% (not 10%) during summer dry weather, 18% during winter dry weather and 46% during wet weather.

- C. Next, please explain what it means that a receiving water limitation is "group-based and shared among all MS4 permittees?" Is this another way of providing for joint liability for discharges? This group-based concept must be explained better for the permittees to know what it entails, and to assess if it is within the scope of the Clean Water Act.

Under the Federal Regulations of the Clean Water Act, a co-permittee to a system-wide permit covering all, or a portion of all, municipal separate storm sewers in adjacent or interconnected large or medium municipal separate storm sewer systems need only comply

with permit conditions relating to discharges from the MS4 for which they are operators.⁹ Thus, a co-permittee cannot be held responsible for compliance with waste load allocations from separate storm sewers for which it is not an operator. The State Water Resources Control Board also acknowledges that waste load allocations are only enforced for a discharger's own discharges.¹⁰ Permittees should not be jointly liable for bacteria exceedances in the receiving waters; exceedances must be tied to a City's own discharges and activities. It is fundamentally unfair to hold one city responsible for discharges from other jurisdictions over which it has no control just because the cities are in the same watershed.

Accordingly, any proposed permit provisions attempting to impose joint liability for all permittees within a watershed should be removed. It would be in conflict with the Federal Regulations of the Clean Water Act and the Porter-Cologne Water Quality Act, which apply liability only to a discharger's own discharges, not those of others. There is no authority for such a provision under the Federal Clean Water Act and would make it essentially a permit provision more stringent than required by federal law.

- D. Any implementation plan must separate North Santa Monica Bay from South Santa Monica Bay. There is no hydraulic connection between the North and South Santa Monica Bay, and neither the northern nor southern areas share any headwaters.¹¹ Many of the water quality management strategies of the Southern (more urban) watersheds in the Bay are not applicable to the rural coastal watersheds of the Northern Bay. The permit would benefit from dividing these provisions into two sections. To the extent that there are universal applications like FIB standards, the TMDL section can start with a universal discussion, but the tables and reports should delineate the standards for the appropriate portion of the watershed. In other words, all the charts, tables and compliance points should be divided according to the boundaries of the Greater Los Angeles Integrated Regional Water Management Plan so there is some consistency about watershed management that recognizes the geography.

The fact that these watersheds outlet to the same Bay only relates to receiving water standards and does not take into account the watershed management activities, characteristics of contributing land uses, or shared compliance and commingled drains. This may not be the case with other watersheds in the LA Region, but it is a critical point in the Santa Monica Bay TMDLs to distinguish the rural coastal watersheds in the North Santa Monica Bay from the more urban areas in the South Bay.

IV. Receiving Water Limitations Section Comments

- A. One of the biggest issues to address this time around is which entities are responsible for a discharge. The City appreciates the citation to 40 CFR 122.26(a)(3)(vi), which provides that a permittee is only responsible for discharges of stormwater and non-stormwater from the

⁹ 40 CFR 122.26(a)(3)(vi) and 40 CFR 122.26 (b)(1).

¹⁰ SWRCB Resolution No. 2002-0149, paragraph 9.

¹¹ See attached Map. North Santa Monica Bay has a green boundary and South Santa Monica Bay has a purple boundary.

MS4 for which it is an operator; however, please clarify what it means to be an operator of the MS4. Note that the word owner is not used in 40 CFR 122.26(a)(3)(vi) or 122.26(b)(1). For example, Malibu has faced allegations that it was responsible for discharges from an MS4 that it did not own or operate, but where the City may have provided maintenance service or may have stenciled the inlet with a clean water message. Therefore, it is imperative that “operate” be defined in a manner consistent with the Clean Water Act. As we have learned, the more specific the permit language, the less likely it is to unnecessarily broaden.

- B. Next, the Receiving Water Limitations language in the permit (i.e., the language that determines when a permittee is in violation) must contain better protections against unfounded and costly citizen suits and must better explain when a permittee is affirmatively in violation of the permit.

First, the RWL language must include a process that provides some limited protection against unfounded citizen suits if the permittee is acting in good faith to resolve any discharge-related issues. This suggested process is appropriate because an MS4 permittee should not automatically be in violation of the permit if there is an exceedance; the exceedance may not have been caused from an MS4 discharge.¹² The permit must acknowledge that MS4 discharges are not the only source of pollutants in the water and regulate accordingly, as discussed above. If monitoring demonstrates that a particular compliance strategy is not working, through no fault of the discharger, then the discharger must have time to identify and implement a new strategy before being held liable for natural water quality alterations that may be beyond its control.

What follows is suggested language from the Port of Stockton's permit that sets forth when a permittee is in violation and authorizes the Regional Board to initiate an investigation before a permittee is found to be in violation. The State Water Resources Control Board and the EPA have approved use of this permit language. This is also a good example of where the final compliance date is used and allows for implementation and final date modification in the permit.

Receiving water limitations are site-specific interpretations of water quality standards from applicable water quality control plans. As such, they are required to be addressed as part of the permit. However, a receiving water condition not in conformance with the limitation is not necessarily a violation of this Order. The Central Valley Water Board may require an investigation to determine cause and culpability prior to asserting a violation has occurred.

Discharges from MS4s shall not cause the following in receiving waters:

(Mercury TMDL Example RWL)

¹² The City incorporates herein by reference its May 7, 2012 comment letter on the SMBBB TMDL Reconsideration, emailed to Man Voong, and CD with supporting documents hand-delivered to Regional Board offices on the same day. This letter includes multiple examples of natural sources of bacteria (also referenced in Footnote 4 above).

Violation of the methylmercury waste load allocation for the Permittee, by Delta subregion, upon approval of the Delta Mercury Control Program by US EPA and after 2030. The wasteload allocation is:*

- *Central Delta 0.39 grams/year; and*
- *San Joaquin River 0.0036 grams/year*

** The final compliance date for the WLAs is 2030. Compliance with the methylmercury waste load allocation shall be met as soon as possible, but no later than 2030, unless the Central Valley Water Board modifies the Delta Mercury Control Program implementation schedule and final compliance date.*

The following additional suggested language from the same permit also explains what an appropriate iterative approach is for explaining what is not considered a violation:

If the Permittee is found to have discharges notwithstanding the prohibitions in Provision A, or discharges causing or contributing to an exceedance of an applicable benchmark value, water quality objective, waste/wasteload allocation, or receiving water limitation in Provision B, the Port will not be determined to be in violation of this Order unless it fails to comply with the requirement to report such discharge (Provision C.3.a.), and revise its BMPs to include additional and more effective BMPs, and to implement the same (Provision C.3.b-d). Further, the Port may demonstrate in its SWMP that the use of particular benchmark values are not appropriate (e.g., aluminum, electrical conductivity) due to local ambient conditions or other environmental studies (e.g., Water Effect Ratios).

Compliance with Discharge Prohibitions and Receiving Water Limitations

As reflected in the findings, the effect of the Port's storm water discharges on receiving water quality is highly variable. For this reason, this Order requires that, within its geographic jurisdiction, the Permittee shall design its storm water program to achieve compliance with water quality standards over time through compliance with the following, which reflects an iterative approach...

The City is also concerned that the interplay between the Ocean Plan and the MS4 Permit be appropriately explained in the permit. The permit needs to specifically state that the TMDL-based requirements in the permit also provide compliance with the Ocean Plan's similar bacteria objectives to alleviate the argument that TMDL language only covers the bacteria objectives in the Basin Plan, not the (nearly identical) Ocean Plan objectives.

Also, it is not clear if the proposed permit is consistent with the statewide ASBS Exception and Special Protections, issued by the State Water Resources Control Board on March 20, 2012. This new NPDES permit proposes that every single drain in an ASBS natural stream watershed must meet all ASBS special protections. Under that scenario, any Malibu MS4 drain in the entire watershed could be considered an ASBS drain. Only a handful of drains or inlets near the ASBS are Malibu's responsibility under the Exception, and the City can provide staff information on the location of those drains. Therefore, all the drains that

*City of Malibu Comments
Proposed Watershed Management Programs, TMDLs, and RWL
May 14, 2012
Page 13 of 15*

discharge to a natural stream or gully that are separated from the beach by natural vegetation or dilution were not intended to be included. In fact, the SWRCB definition may limit these ancillary contributory drains to ones that are either seaward of Pacific Coast Highway or within 1000 feet of the high tide line. Since the Regional Board will be phased in to manage the Exception and Special Protections for the ASBS at the regional level, it is critical that the City and the Regional Board discuss how to effectively incorporate the ASBS regulations into the permit.

If the overarching considerations the City detailed in this letter are considered and appropriately incorporated in the new permit and TMDL regulations, the methods to reach clean water objectives and prevent degradation become more appropriate and reasonable. Mitigation measures will also cost less in the long run, as costs are spread out or one agency isn't trying to mitigate/overcorrect the actions of another agency. Unless these issues above are addressed, the new NPDES MS4 permit and the TMDL reconsiderations may not meet Board expectations.

Malibu is appreciative of the Regional Board's efforts to consider the comments from stakeholders and to work collaboratively on this permit reissuance, and understands the inherent challenges in drafting a permit for such a diverse geographic region. Again, the City would like to emphasize the need for flexibility and reasonableness when a one-size fits all approach is not feasible for various parts of the County. In the end, the permit must identify a method of balancing the need to protect receiving water quality in a manner that accounts for the real, practical challenges that the permittees face. The City of Malibu continues to support the interactive approach to developing this permit and iterative options for compliance, thanks the Regional Board for the opportunity to comment and urges the Regional Board to properly address the City's comments. If you have any questions regarding this letter, you may contact Jennifer Brown, Senior Environmental Programs Coordinator, at (310) 456-2489, ext. 275, or jbrown@malibucity.org.

Sincerely,

Jim Thorsen
City Manager

Subject: Comments on Receiving Water Limitations, TMDL Provisions, and Watershed Management Program Being Considered for Reissued Los Angeles County MS4 Permit

Dear Ms. Purdy:

I am writing on behalf of the City of Signal Hill to provide comments on the Receiving Water Limitations, TMDL Provisions, and Watershed Management Program being considered by Regional Board staff for inclusion in the Reissued Los Angeles County MS4 Permit. Thank you for the time extension, which allowed us to more thoroughly review the language in these proposed components. We appreciate the opportunity to provide these comments.

General Comments

The City of Signal Hill appreciates the Board's program of staff workshops and Board workshops to present and discuss staff's current thinking about permit provisions. However, we agree with the LA Permit Group that it would be helpful to permittees and other interested parties to have a complete Administrative Draft available for review and comment before the Tentative Order is released to begin the formal comment period. It also would be helpful to have either a staff or Board workshop on an Administrative Draft in order to examine the interrelationships among the various sections of this critical permit. Issuing an Administrative Draft and conducting a workshop should not delay the permit hearing more than one month since staff is currently proposing to release the Tentative Order by the end of this month or the first week of June. Instead, staff could issue an Administrative Draft for review and comment.

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 2 of 12

We also agree with the Permit Group that more flexibility is needed in the proposed permit because of the complexity introduced by the incorporation of 32 sets of total maximum daily load (TMDL) requirements into the permit. In reality, these TMDL requirements include waste load allocations (WLAs) for approximately 500 waterbody/pollutant combinations, and expanded permit activities during the next MS4 permit cycle are going to be driven largely by (TMDL) requirements.

One general issue that impacts municipalities' ability to address both the sources of non-stormwater discharges and the quality of stormwater discharges is their inability to regulate schools. Since the State Water Board has decided to not automatically include schools in the reissued Phase II MS4 Permit, the Regional Board should determine how it could encourage or require school districts to cooperate with municipalities to control non-stormwater discharges and improve the quality of stormwater discharges from school sites. Both the existing Phase II MS4 Permit and the draft next generation permit allow the Regional Board to designate K-12 school districts on a case-by-case basis. If schools are identified as concerns in Watershed Management Programs, municipalities will need the Regional Board's assistance to secure cooperation from schools.

One other general concern is that the elements of the permit that we have seen to date do not acknowledge the opportunity for municipalities to have their own permits. The opportunity for individual municipalities to "develop and submit for approval by the Executive Officer a Watershed Management Program that addresses all water quality-based effluent limitations and receiving water limitations to which the Permittees is subject pursuant to established TMDLs" is welcome. However, we do not understand why municipalities that are willing to bear the extra costs of having their own permits are not allowed to do so. Without a Principal Permittee, it appears that each municipality will have to submit its own Annual Report. Therefore, an annual report for a municipality with its own permit will not put an extra burden on Regional Board staff, especially if the separate permits contain the same basic requirements as the area-wide permit.

The City has requested on numerous occasions that the Board issue an individual permit to the City of Signal Hill. The City would prefer to be responsible for its own actions or inactions, and not those of other jurisdictions. It will continue to participate in watershed activities through current and future MOAs, and is willing to implement a comprehensive monitoring program to measure the effectiveness of its water quality improvement efforts.

We also will continue to work with the City of Long Beach, which was granted a separate permit in 1992. The City has a long, productive working relationship with the City of Long Beach, since our drainage flows through that community to receiving

Ms. Renee Purdy
City of Signal Hill Comments

waters. Specifically, we will continue to work with the City of Long Beach on implementation of the Los Angeles River Metals TMDLs, the Los Angeles River Bacteria TMDL, the Los Angeles River Estuary TMDL, the Los Cerritos Channel Metals TMDLs, and the Harbor Toxics TMDLs.

Receiving Water Limitation Provision

The City of Signal Hill agrees with the LA Permit Group's concern that the receiving water limitation (RWL) language currently in the working proposal creates an unnecessary and counter-productive liability for municipalities. The situation is compounded by the joint and several liability language in TMDLs that assigns joint responsibility to groups of permittees when discharges are or may be comingled in the MS4 prior to discharge to the receiving waters subject to the TMDLs.

With the exception of section references, the language in the working proposal is virtually identical to the receiving water limitation language in the 2001 MS4 Permit that the United States Court of Appeals for the Ninth Circuit interpreted differently than the State Water Board has since Order 99-05 was adopted on June 17, 1999. In this precedential order, the State Water Board substituted receiving water limitation language used by EPA in two EPA-issued permits for language that the State Water Board had included in Order 98-01, to which EPA objected when the language was used in permits issued by the San Francisco Bay and San Diego Regional Water Boards.

Staff has stated that the language in the working proposal has not been changed because the current language was mandated by the State Water Board's precedential order. However, the language in the MS4 permit was not totally consistent with the precedential order issued by the State Water Board. Order 99-05 clearly states that "The Permittees shall comply with Discharge Prohibitions []³ and Receiving Water Limitations [] through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SWMP and other requirements of this permit including any modifications." Footnote 3 directed that appropriate numbers for prohibitions and limitations that implement water quality objectives and water quality standards be inserted in the []. The Order goes on to say that "If exceedances of water quality objectives and water quality standards (collectively, WQS) persist notwithstanding implementation of the SWMP and other requirements of this permit, the permittees shall assure compliance with Discharge Prohibitions [] and Receiving Water Limitations by complying with the following procedure: "... The specified procedure is the procedure that has become known as the iterative process.

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 4 of 12

The working proposal and the 2001 MS4 Permit are both inconsistent with Order 99-05 in that the iterative process is only included in the Receiving Water Limitations part of the permit instead of being included in both the Discharge Prohibition and the Receiving Water Limitations parts of the permit. The Regional Water Board may correct this deficiency by adding iterative process language similar to the language in PART V of the working proposal in Part III of the permit. This correction will make the permit consistent with Order 99-05 and should not require any action by the State Water Board because of the consistency with 99-05. The Regional Board should also specifically reference Watershed Management Programs in Parts III and V in order to better integrate the Watershed Management Program provisions with the iterative process in the Discharge Prohibition Provisions and the Receiving Water Limitation Provisions. In addition to achieving compliance with Order 99-05, such modifications to the proposed permit will foster implementation of the adaptive management process described in the Watershed Management Program provisions and reduce the vulnerability of the permittees to enforcement actions and third-party lawsuits when they are engaged in an iterative (adaptive management) process through an integrated approach and/or a watershed based program to address exceedances of water quality objectives and water quality standards in a prioritized, systematic manner, as the Regional Board is encouraging with the incorporation of the Watershed Management Program provisions into the permit.

Further, the Regional Water Board should work with the State Water Board to consider other ways to strengthen the iterative process mandated by Order 99-05. The magnitude of changes resulting from incorporating the waterbody/pollutant requirements from 32 TMDL documents into the permit will place permittees in almost instant non-compliance with the permit if they do not have the ability to respond to exceedances of water quality standards, including WQBELs, through an orderly adaptive management process.

TMDL Provisions

The issue of how to express water quality-based effluent limitations in NPDES permits has long been debated. On August 26, 1996, EPA gave notice in the Federal Register (61 Fed. Reg. 43761) that it had issued a policy outlining an intensive approach for incorporating water quality-based effluent limitations into stormwater permits. The policy states that stormwater permits do not need to include water quality-based effluent limitations. Instead, the policy focuses on the use of best management practices (BMPs) followed by "expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards." The policy only applies to EPA, but EPA encouraged states to adopt similar policies for stormwater

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 5 of 12

permits. California did so as explained in SWQCB Order 91-03. This policy formed the basis for what was later articulated by the State Water Board in Order 99-05.

In Order 98-01, the State Water Board explained that it has “determined that for municipal separate storm water permits, BMPs constitute valid effluent limitations to comply with both the technology-based and water quality-based effluent limitation requirements.” The State Board also noted that, “In fact, narrative effluent limitations requiring implementation of BMPs are generally the most appropriate form of effluent limitations when designed to satisfy technology requirements, including reduction of pollutants to the maximum extent practicable, and water quality-based requirements of the CWA.” The State Water Board also concluded that “storm water permits must achieve compliance with water quality standards, but they may do so by requiring implementation of BMPs in lieu of numeric water quality-based effluent limitations,” and that “Given the unique nature of storm water discharges, it is reasonable that implementation take place, where appropriate, on a phased basis.” Based on these and other conclusions and as a precedent decision, the State Water Board approved receiving water limitation language to be included in future municipal storm water permits. As explained above, this language was not acceptable to EPA and the State Water Board adopted more rigorous language in Order 99-05.

EPA affirmed the appropriateness of an iterative adaptive management BMP approach for improving water quality over time in its November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs.” This memorandum clarified EPA’s regulatory requirements for, and provided guidance on, establishing waste load allocations for stormwater discharges in TMDLs approved or established by EPA. It also provided guidance on the establishment of water quality-based effluent limits in NPDES permits based on WLAs for stormwater discharges in TMDLs. A key point presented in the memorandum was that “EPA expects that most WQBELs for NPDES-regulated municipal and small construction storm water discharges will be in the form of BMPs, and that numeric limits will be used only in rare instances.”

On November 12, 2010, EPA issued a revised guidance memorandum that indicated a preference for numeric WQBELs and recommended that permitting authorities use numeric effluent limitations in permits for MS4s and/or small construction stormwater discharges, where feasible. However, EPA continued to acknowledge permitting authority discretion concerning whether to use numeric WQBELs or to express WQBELs in the form of BMPs.

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 6 of 12

The 2010 EPA Guidance memo states that when WQBELs are expressed in the form of BMPs, “the permit should contain objectives and measurable elements (e.g., schedule for BMP installation or level of BMP performance).” The City of Signal Hill strongly urges the Regional Water Board to direct staff to follow this approach and incorporate narrative WQBELs in the permit consistent with the WLAs in applicable TMDLs. This would facilitate the creation and use of a deemed compliant approach as was used in the Los Angeles River and Ballona Creek Trash TMDLs with approved full-capture devices. It would also allow a credit toward a compliance approach in which credit could be given for pollution prevention programs, such as SB 346, which target the true sources of pollutants over which permittees have little or no control. Integrating WQBELs into the next generation of MS4 permits in the form of BMPs will encourage experimentation and strong pollution prevention efforts that could lead to achievement of water quality standards in a cost-effective manner. One example of how this could be done is from the Los Angeles River Metals TMDL, which states:

“Each jurisdictional group shall demonstrate that 75% of the group’s total drainage area served by the storm drain system is effectively meeting the dry weather WLAs.”

This requirement could be expressed in the permit as a WQBEL in the form of BMPs, as follows:

Permittees shall demonstrate that source control measures and treatment controls designed to effectively meet dry weather WLAs are being implemented and maintained in 75% of the total area served by the storm drain system.

In most cases, converting waste load allocations to WQBELs expressed as BMPs should not be time consuming, and having BMP implementation targets is an understandable and manageable task if money is available. On the other hand, meeting numeric WQBEL targets can be frustrating and potentially paralyzing and could cause more money to be spent on lawyers than on best management practices and control measures. We urge you to direct staff to use the WQBELs as BMPs approach both in this section and in the TMDL Provisions section of the permit.

The City of Signal Hill supports the premise behind Provision VI.E.1 that provisions of this part of the permit must be consistent with the assumptions and requirements of all waste load allocations (WLAs) established in TMDLs for which some or all of the Permittees in this Order are responsible.” This statement is consistent with the

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 7 of 12

requirement in 40CFR 122.44(d)(1)(vii)(B) which requires that when developing water quality-based effluent limits, the permitting authority shall ensure that:

(B) Effluent limits developed to protect a narrative water quality criteria, a numeric water quality criteria, or both, are consistent with the assumptions and requirements of any available waste load allocation for the discharge prepared by the State and approved by EPA pursuant to 40 CFR 130.7

However, the regulations do not require that WQBELs have to be numeric in order to be consistent with the assumptions and requirements of waste load allocations. In fact, as noted above, 2002 and 2010 EPA guidance memos both clearly allow the WQBELs in permits to be expressed either numerically or in the form of BMPs. It is a decision left to the permitting authority.

The statement to Vice Chair Stringer that permittees think the BMP approach gives more certainty about being in compliance because of the variability in rainfall was an accurate summation of the situation. In the absence of a uniform design storm for TMDL compliance, permittees fear the potential for third-party litigation, especially after a large, high intensity rain event. The situation is compounded by the incorporation of 32 TMDL documents, including requirements for an estimated 500 waterbody/pollutant combinations. Even though permittees are already addressing many of these TMDL requirements on an *ad hoc* basis, the requirements are now going to be grouped together in the permit, and permittees will be exposed to third-party litigation due to the TMDLs now being permit requirements.

The City of Signal Hill requests that the Board recognize the fears of permittees and encourage expedient efforts to address the water quality impairments by including WQBELs expressed in the form of BMPs in the MS4 permits, at least during this permit cycle. Ideally, we would prefer that WQBELs always be expressed in the form of BMPs. However, we acknowledge that both the Board and the environmental community have concerns about the commitment of municipalities to effectively address water quality impairments. We believe that municipalities are more committed to improving water quality than either the Board or environmental groups believe we are. In order to give us a chance to demonstrate our commitment, we ask that you express WQBELs in the MS4 permits for at least the next permit term in the form of BMPs, with the provision that you will review this decision during the development of the next cycle of permits.

The City of Signal Hill also requests that the Board reconsider the use of time schedule orders (TSOs) to provide time to develop implementation plans for EPA-established

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 8 of 12

TMDLs. The working proposal specifies that a Permittee that is in compliance with the requirements of a Regional Board-issued TSO is not considered in violation of the final receiving water limitations and/or water quality-based effluent limitations for pollutants subject to the EPA-established TMDLs being incorporated into the permit. However, we are concerned that the TSO approach does not provide protection against third-party lawsuits while implementation plans and schedules are being developed and approved. Instead, we recommend that the Board develop permit language related to development of implementation plans and schedules to be incorporated into the Basin Plan through Basin Plan Amendments. The schedule should be sufficiently long to allow full compliance with TMDL waste load allocations in a cost effective manner. One possible permit provision to allow preparation of implementation plans and schedules for EPA-established TMDLs is as follows.

A [] TMDL Implementation Plan that will fulfill the applicable requirements of the [] TMDL must be submitted by the [] jurisdictions covered by this order within 18 months of adoption of this order. This Implementation Plan must be implemented upon Regional Board approval. As long as the Implementation Plan is submitted in a timely manner and the Watershed jurisdiction(s) are participating in and implementing the approved Implementation Plan, they will not be in violation of this order with respect to implementing the [] TMDL. In the event that any Watershed jurisdiction does not participate, or if the collaborative approach is not approved or fails to achieve the TMDLs, the Regional Board will exercise its option to issue individual waste discharge requirements.

We would be pleased to work with staff and other interested parties to develop workable language.

Watershed Management Planning

The City of Signal Hill is vitally interested in watershed planning. In fact, the City took a leadership role in organizing 40 cities, Los Angeles County, and Caltrans in the Los Angeles River Watershed to address the monitoring requirements for the Los Angeles River Metals TMDLs. Signal Hill convinced 35 of the cities, the County, and Caltrans to fund critical special studies related to the TMDLs.

The City also organized Jurisdictional Group 1 for the Los Angeles River Metals TMDLs. Upon the withdrawal of the City of Los Angeles and the County of Los Angeles, Signal Hill organized the remaining cities pursuant to MOAs with the Gateway Council of Governments. In addition, the City of Signal Hill organized cities within the Los Cerritos

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 9 of 12

Channel Watershed to work with EPA and with the Regional Water Board. The Los Cerritos Channel work began informally in late 2008 – first on negotiating elements of a Metals TMDL established by EPA. In 2010, the watershed cities formalized this watershed cooperation through a series of MOAs with the Los Angeles Gateway Region Integrated Regional Water Management Joint Powers Authority (Gateway Authority) to develop an implementation plan, work with Regional Board staff on a Basin Plan Amendment to appropriately incorporate the TMDLs into the Basin Plan, conduct special studies, and implement measures to achieve compliance with the Los Cerritos Channel Metals TMDLs.

We are encouraged by the staff's draft provisions in the working proposal that would allow individual cities to customize their strategies, control measures and BMPs to address these customized measures either individually and/or with a larger group of permittees in the Watershed Management Plans. However, we still believe that the proposed permit needs clarification on the joint and several liability issue. We are suggesting that the staff consider inserting language in the permit that would clarify that a permittee would be relieved of the joint and several liability provisions of the permit, if they are implementing both an approved Watershed Management Program and a Jurisdictional Stormwater Management Program Adaptive Management Process.

The City trusts that customization will foster creativity and allow experimentation. For instance, with Metals TMDLs, we believe that to be successful in meeting water quality standards over the long-term, we will need to address the sources of metals deposited on the watershed through atmospheric deposition and get the help of various State and Regional agencies to control these sources.

We agree with the goal of the Watershed Management Program provisions to ensure that discharges from the MS4 achieve applicable water quality-based effluent limitations and do not cause or contribute to exceedances of receiving water limitations. We also recognize that Programs cannot guarantee that either effluent limitations or receiving water limitations are met at all times because of variations in rainfall and the absence of a water quality design storm above which water quality standards would not be enforced on discharges. Requiring achievement of effluent limitations and receiving water limitations for large, rare storms exceeds the maximum extent practicable (MEP) standard for MS4 discharges. The draft permit does specify that structural BMPs should be sized to treat the volume of stormwater runoff from the 85th percentile, 24-hour storm specific to the watershed in question, but the components of the permit currently available do not clearly state that this design storm is also the design storm for permit compliance.

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 10 of 12

The City of Signal Hill requests that the permit be structured to use the runoff from the 85th percentile, 24-hour storm event as a consistent design storm for both BMP design and enforcement of water quality standards. We have seen the Power Point presentation given by Dr. Youn Sim on the development of a water quality design storm at the 2011 CASQA Annual Conference. It builds on the work done by the Regional Board's design storm task force and presents a compelling argument for the 85th percentile, 24-hour design storm for both design and enforcement. Such an action by the Regional Board would help convince municipalities that they are not wasting money by investing in BMPs and other control measures in the absence of a physical limit on the storm size for which they have to meet water quality standards.

The City agrees with the requirement in Provision VI.C.1.c. that, within a Watershed Management Program, customized strategies and BMPs can be implemented through each permittee's stormwater program, and/or collectively by all participating permittees through the Watershed Management Program. We further agree with the requirement in Provision VI.C.1.b.i that permittees identify strategies, control measures, and BMPs to be implemented through their individual stormwater programs, and collectively on a watershed scale, and Provision VI.C.1.b.iv.(4)(f) that the plan clearly identify the responsibilities of each participating permittee for implementation of watershed control measures. This measure should protect conscientious permittees from being held liable for the actions of other permittees. We would appreciate confirmation of our interpretation that the provision provides protection against joint and several liability related to the actions or inactions of "bad actors." Making this clear in the permit will help convince every permittee that it will be held responsible for its own actions or inactions, and that it will not be possible to hide and depend on the actions of other entities for protection.

The City strongly supports the requirements in Provisions VI.C.1.f.ii and VII.C.3.b.i that each Watershed Management Program identify and implement strategies, control measures, and BMPs to achieve applicable water quality-based effluent limitations, receiving water limitations, and/or non-stormwater action levels. It is imperative that permittees and the Regional Board think beyond traditional treatment control BMPs in order to cost-effectively achieve compliance with water quality standards. However, we question the language of Provision VI.C.1.f.iii related to executing a monitoring and assessment program to determine progress toward achieving applicable limitations and/or action levels. We understand that the Regional Board would prefer to have a numeric indicator to monitor progress toward achievement of applicable water quality standards, but we are concerned with the wording of the requirement.

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 11 of 12

Specifically, we believe that the proposed wording is insufficient to prevent diversion due to third-party lawsuits based on temporary exceedances. The wording of the Provision should be modified to state that the monitoring and assessment program should be based on true benchmarks – indicators, rather than compliance points – designed to promote an adaptive management process during the implementation period.

The City is concerned that Provision VI.C.3.b.iii does not sufficiently recognize pollution prevention, including what the California Stormwater Quality Association (CASQA) has described as true source control. Signal Hill, other cities within the region, and the Coalition for Practical Regulation contributed financial support, lobbyist services, and support letters for CASQA's efforts to address the major source of copper brake pad dust through a State legislation control measure, SB 346. The WMP section of the Permit should be re-written to recognize and encourage true source control as a pollution prevention measure that will ensure long-term compliance with water quality standards.

We acknowledge that Provision VI.C.3.b.IV (3) does recognize pollution prevention as a non-structural best management practice that can be included in Watershed Management Plans. However, we believe that true source control, including product substitution and materials substitution, as well as product take-back, needs more emphasis in regional and statewide efforts to improve water quality.

The City also appreciates the fact that watershed management areas may be subdivided into subwatersheds to focus efforts on particular receiving waters, as well as the opportunity for individual municipalities to establish their own watershed management programs for watershed sub-drainages.

Further, the City appreciates the provision on page 9 [Provision VI.C.3.b.iv.(4)(f)] that specifies that the Water Management Program “plans shall clearly identify the responsibilities of each participating Permittee for implementation of watershed control measures.” We trust that this provision, in combination with a provision in the Code of Federal Regulations [40 CFR 122.26(a)(3)(vi)] that states, “co-permittees need only comply with permit conditions related to discharge from municipal storm sewers for which they are operators,” will protect conscientious permittees from being held liable for actions or inactions of other permittees participating in the same Watershed Management Program.

One major area of concern, however, is the Compliance Schedules section on page 10 [Section VI.C.3.c.]. Although the WMP provisions allow a BMP approach for interim

Ms. Renee Purdy
City of Signal Hill Comments
on Sections Being Considered
for Reissued MS4 Permit
May 14, 2012
Page 12 of 12

TMDL milestones, this section appears to assume that the permit needs to incorporate numeric water quality-based effluent limitations (WQBELs) on waste load allocations in TMDLs. This is not the case. Federal regulations and the 2002 and 2010 EPA guidance memos clearly require that permits contain WQBELs consistent with the assumptions and requirements of waste load allocations in applicable TMDLs and also clearly allow the WQBELs in permits to be expressed numerically or in the form of BMPs, as discussed above.

The City of Signal Hill strongly supports the adaptive management process. A formal adaptive management process is specified in the Watershed Management Program section of the working proposal, but we regard the process as an integral element of the entire water quality improvement program. It was incorporated by the State Water Board into the receiving water limitation language adopted in State Board Order 99-05 as what has become known as the "iterative process." It was also recommended in the 2001 National Research Council report, *Assessing the TMDL Approach to Water Quality Management*. The Council's Committee to Assess the Scientific Basis of the Total Maximum Daily Load Approach to Water Pollution Reduction strongly recommended that "TMDL plans should employ adaptive implementation." The Committee defined adaptive implementation as "a cyclical process in which TMDL plans are periodically assessed for their achievement of water quality standards including beneficial uses."

Although adaptive management is a continuous process, having a requirement in the permit to report twice during the permit term could be valuable in focusing on continuous evaluation and improvement of a watershed management program, and on progress toward achieving water quality-based effluent limitations and receiving water limitations. The requirement in Provision III.C.6.iii.b that individual permittees revise their stormwater plans annually will also foster continuous evaluation and adaptation of program elements.

Thank you again for the opportunity to provide these comments.

Sincerely,

CITY OF SIGNAL HILL

Subject: Comments to Working Proposal for Watershed Management Programs, TMDLs, and Receiving Water Limitations Related to the Los Angeles County Municipal Separate Storm Sewer System Permit

Dear Ms. Purdy and Mr. Ridgeway:

The City of Vernon appreciates this opportunity to provide comments on the subject Watershed Management Programs, Total Maximum Daily Loads (TMDLs), and Receiving Water Limitations working proposals for the draft Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit. We recognize and support the Los Angeles Regional Water Quality Control Board (LARWQCB) staff's continued collaborative efforts with the Permittees in developing this next iteration of the MS4.

As we continue through this process of collaboration and review the working proposals, we have the following general requests for the LARWQCB to consider;

- A. The working proposals suggest the next MS4 permit is likely to be impossible for Permittees to comply with. We request the LARWQCB develop a permit that provides Permittees a fair opportunity to achieve compliance.
- B. The working proposals suggest the next MS4 permit will be exponentially more complicated, especially when compared to the current MS4 Permit. We request the LARWQCB develop a permit that is not overly complex or practically impossible for the general public to interpret.
- C. The working proposals suggest the requirements for the next MS4 permit will neglect economic feasibility. We request that the LARWQCB acknowledge the realistic challenge that all public agencies must be accountable for managing limited public funds. The permit requirements should be economically feasible and sustainable.

Exclusively Industrial

May 14, 2012

Page 2

- D. The revised anticipated schedule (September 2012) for adoption of the next MS4 Permit, occurs during the annual reporting period for the current MS4 Permit. We request that the LARWQCB postpone the MS4 adoption process until after MS4 annual reporting period to allow Permittees ample opportunity to review and comment on the draft MS4 Permit.
- E. We request that Waste Load Allocations (WLA) be translated to Water Quality Based Effluent Limitations, expressed as best management practices (BMPs). Additionally, implementation of the BMPs will place the Permittees into compliance with WLA.
- F. We request the LARWQCB establish a compliance standard in the next MS4 Permit that is consistent with (not more stringent than) other current National Pollutant Discharge Elimination System (NPDES) permits located within Los Angeles County.

Additionally, based on our review of the subject working proposals, we have several more specific concerns and would like to express the following comments:

Receiving Water Limitations

1. Part V.A.1 indicates the following;

Discharges from the MS4 that cause or contribute to the violation of Receiving Water Limitations are prohibited.

Concern- The City of Vernon understands this provision is written verbatim from Part 2. of the current MS4; however, based on the United States Ninth Circuit Court of Appeals decision in the case involving National Resource Defense Council (NRDC) vs. County of Los Angeles, this provision was the primary point of contention. As a result of this provision, the plaintiffs in the case were successful at proving an exceedance of water-quality limits is non-compliance with the Clean Water Act. Subsequently, the court ruled in favor of the plaintiffs. This provision is problematic in that it has now been established that numeric limits can be used as evidence under the "citizen litigation" provisions of the federal Clean Water Act to file suit against government agencies for damages. This provision is especially troublesome if you consider that in the five square mile City of Vernon, there are approximately 150 NPDES permitted facilities/entities that discharge to the City's and County storm drain system. Inspection and enforcement, by the LARWQCB, of these permits has been infrequent at best. The subject current provision, along with the LARWQCB's relaxed enforcement of the non-municipal permits exposes the City to unmerited liability. If you expand the scope of the liability to the Los Angeles River Watershed level where there are at least 1,344 industrial, 488 construction, three wastewater treatment plants, and 42 separate incorporated city dischargers (NRDC vs. Los Angeles County) and we will have created a litigation nightmare that will financially debilitate each city including the County of Los Angeles. Depleted public funds will be used for legal defense and not for water quality.

The combination of the proposed Monitoring Program and numeric effluent limits with this subject provision will establish a permit that is impossible for Permittees to comply with. The next MS4 permit must establish a realistic opportunity for a Permittee to achieve and sustain compliance.

This provision fails to establish, consider, or reference a compliance storm intensity. Although Part VI.C.3.b.iv.(4)(c) describes structural controls “shall be sized to treat the volume of stormwater runoff from the 85th percentile, 24-hour storm specific to the watershed”, this part does not clearly translate into an established compliance storm intensity or establish that if storm events that are beyond the capacity of the structural controls will not cause the Permittee to be in violation of this MS4 Permit.

We also would like to reiterate the conclusions of the blue ribbon panel convened in 2005 by the State Water Resources Control Board (SWRCB) which stated “it is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban discharges”.

In addition, although the proposed Part III. Discharge Prohibitions and the current Illicit Discharge/Connection Elimination Program conceptually appears prudent, it is unrealistic to assume that all sources of illicit discharges will be identified and enforcement will take place in a timely manner. The MS4 Permittees will be held liable for intermittent discharges and exceedances that are caused by the recalcitrant public and NPDES permitted operations that have historically been unchecked by the LARWQCB. If the LARWQCB insists on imposing ultimate liability on municipal permittees and ignore NPDES permittees that discharge to the MS4, then those NPDES permits within a municipal permittee’s geographic area serve no purpose.

This provision does not appear to take into consideration the effects of aerial deposition and the “air scrubbing affect” rain has on air pollutants. As you understand, permittees have no control over aerial deposition or authority over air quality.

In terms of compliance with the Bacteria TMDL, this provision does not take into consideration the natural sources of bacteria and the potential of bacteria regrowth.

Furthermore, development of an adequate draft Watershed Management Program may take two years, let alone have it approved by the LARWQCB. This provision would severely hamper efforts to develop an effective Watershed Management Program prior to its approval and implementation.

Proposed solution- We request that the LARWQCB revise this provision to fully consider the complexity and dynamics of the stormwater and non-stormwater discharges and acknowledge the limited authority and resources of the Permittees. This provision should acknowledge there are conditions well beyond a Permittees ability or authority to control. This single permit should not place the ultimate burden of all NPDES permittees on the shoulders of the Municipal Permittees.

2. Part V.A.2 specifies the following;

Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible, shall not cause or contribute to a condition of nuisance.

Concern- Although this provision is written verbatim from Part 2. titled Receiving Water Limitations of the current MS4 permit, it lacks the language that would support a Permittee

in its efforts to identify illicit discharges/connections and perform enforcement. As it is written, if a Permittee successfully identifies and prosecutes an illegal discharger, the MS4 Permittee would still be held legally responsible for the nuisance.

Proposed solution- Consider revising provision V.A.2 to also include, "If the Permittee determines that the nuisance is caused or contributed by a NPDES permitted entity or from an authorized discharge, the MS4 Permittee shall not be in violation of this permit condition."

Special Provisions: Watershed Management Programs

1. Part VI.C.2.a. describes timelines for implementation and requiring permittees to notify the Regional Water Board within six months after Order adoption, of their intent to develop a Watershed Management Program and subsequently submit a draft Watershed Management Program plan no later than 12 months after adoption.

Concern- The proposed compliance schedule does not provide ample time to develop an effective Watershed Management Program plan that would be substantial and agreeable to all permittees in the watershed. In addition, Part VI.3.a. dictates a Watershed Management Plan shall include Water Quality Characterization, Waterbody-Pollutant Classification, Source Assessment, Prioritization, identify strategies/control measures/BMPs to implement, Minimum Control Measures, etc. All elements and data required to be included in the Watershed Management Program will demand substantial time to collect.

Proposed solution- We request that the LARWQCB extend the timelines for the development of the Watershed Management Program plan a minimum of one year to allow collaboration between watershed permittees in the development of a meaningful Watershed Management Program plan.

2. Part VI.C.1.f specifies that each Watershed Management Program shall:

Prioritize water quality issues resulting from storm water and non-storm water discharges from the MS4 to receiving waters within each Watershed Management Area,

Concern- This provision appears to be in conflict with the working proposal for Part III. Discharge Prohibitions, and more specifically, Section A.2. of Part III which states;

Each Permittee shall, within its respective jurisdiction, effectively prohibit non-storm water discharges into the MS4 and from the MS4 to receiving waters except where such discharges are either specifically authorized by a separate individual or general National Pollutant Discharge Elimination System (NPDES) permit or conditionally authorized in accordance with sections A.3 through A.6 below.

In addition, Part V.A1. under Receiving Water Limitations indicates the following;

Discharges from the MS4 that cause or contribute to the violation of Receiving Water Limitations is prohibited.

Based on these proposed provisions, each Permittee is ultimately responsible for their own discharge from their MS4; therefore, why would there be a need for the Watershed Management Program to prioritize and rectify water quality issues from non-stormwater discharges of another Permittee?

Proposed solution- We request that the Discharge Prohibitions and Receiving Water Limitations be revised to provide consistent provisions with the Watershed Management Program and provide Permittees a fair opportunity to comply with the MS4 Permit.

3. Part VI.C.2.d. indicates the following;

Permittees that do not elect to develop a Watershed Management Program shall be subject to the baseline requirements in Part VI.D [MCMs] and shall demonstrate compliance with applicable water quality based effluent limitations in Part VI.E [TMDL] pursuant to subparts VI.E.4 or VI.E.5.

Concern- This provision, conversely, implies that Permittees that elect to develop a Watershed Management Program shall not be subject to Part VI.D [MCMs] and shall not be required to demonstrate compliance with applicable water quality based effluent limitations in Part VI.E [TMDL] pursuant to subparts VI.E.4 or VI.E.5.

Proposed solution- Clarify if permittees elect to develop a Watershed Management Program, they shall not be required to demonstrate compliance with TMDL Provisions described in Part VI.E of this working proposal.

4. Part VI.C.3.a.iii.(1) directs Permittees to perform the following;

Identify known and suspected stormwater and non-stormwater pollutant sources in discharges to the MS4 and from the MS4 to receiving waters by reviewing available data from (ii) commercial/industrial facilities and (iii) development construction programs.

Concern- Water quality data related to stormwater and non-stormwater runoff from industrial and construction facilities are required through the State's General Industrial and Construction Activity Stormwater Permits. The permit dictates that the water quality data be submitted to the SWRCB.

Proposed solution- Allow the LARWQCB to review the data collected through these State General Permits to help them identify and enforce the conditions of the permits. If the LARWQCB has an effective inspection and enforcement program for these General Permits, these dischargers should not be contributing to a violation of Receiving Water Limitations.

Special Provisions: Total Maximum Daily Load Provisions

Will be sent under separate letter.

**RE: COMMENTS ON WORKING PROPOSALS FOR LOS ANGELES COUNTY MS4
 PERMIT PROVISIONS RELATED TO TMDL PROVISIONS**

Dear Ms. Purdy and Mr. Ridgeway:

The City of Vernon appreciates the opportunity to provide comments on the subject matter referenced above. The City of Vernon is committed to protecting the environment and appreciates the cooperative efforts of the Regional Water Quality Control Board (RWQCB) and its staff in developing the updated Los Angeles County Municipal Stormwater Permit (MS4).

The City of Vernon has concerns with the proposed Total Maximum Daily Loads (TMDL) Provisions as described in the Working Proposal dated April 23, 2012, and respectfully provides the following comments for your consideration:

1. Attachment I. Permittees and TMDL Matrix Table H Los Angeles River Watershed Management Area Metals TMDLs by Reach specifies that the City of Vernon is a participating jurisdiction of Reach 1 and Compton Creek and Reach 2, Rio Hondo, Arroyo Seco, and all contributing subwatersheds.

Concern – Please note that the City of Vernon corresponded with the Regional Water Quality Control Board and the Executive Officer concurred that the City of Vernon does not drain into Reach 1. This same concern was relayed to Ms. Purdy via email on February 21, 2012. Copies of the correspondence are attached herewith.

Proposed Solution – Please correct Table H and remove the City of Vernon as a participating jurisdiction of Reach 1 and Compton Creek.

2. Attachment I. Permittees and TMDL Matrix Table H Los Angeles River Watershed Management Area Bacteria TMDL by Reach specifies that the City of Vernon is a participating jurisdiction of Jurisdiction 2 and Compton Creek

Exclusively Industrial

Concern – Please note that the City of Vernon does not drain into Compton Creek. Also note comment #1.

Proposed Solution – Please correct Table H and remove the City of Vernon as a participating jurisdiction of Compton Creek.

3. Page 1, Part E.2. Compliance Determination

Concern – Compliance determination must take into account pollutant sources outside of the Permittees control. This would include aerial deposition, natural sources, etc.

Proposed Solution – Language to be included that clearly does not place the Permittees out of compliance if there is an exceedance(s) due to aerial deposition, natural sources, etc.

4. Page 2, Part E.2.b.iv – Commingled Discharges, states as follows:

For purposes of compliance determination, each Permittee is responsible for demonstrating that its discharge did not cause or contribute to an exceedance of an applicable water quality-based effluent limitation(s) at the outfall or receiving water limitation(s) in the target receiving water.

Concern – If TMDLs are given a WLA for a sub-watershed how can each Permittee conceivably demonstrate that its discharge did not cause or contribute to an exceedance of an applicable WQBEL at the outfall or RWL in the receiving water? Also, need clarification on what exactly the meaning of “its discharge” and “did not cause or **contribute**”.

Proposed Solution – We request clarification.

5. Page 3, Part E.2.c.iii – RWLs Addressed by a TMDL, states as follows:

A Permittee shall not be considered in violation of a Receiving Water Limitation in Part V.A., if it is in compliance with the applicable TMDL requirements contained in a time schedule order.

Concern – What is the timetable of the TSO application process?

Proposed Solution – A definitive timetable detailing the application process for a Time Schedule Order is requested.

6. Page 3, Part E.2.d.i.1 specifies as follows:

There are no violations of the interim water quality-based effluent limitation for the pollutant(s) associated with a specific TMDL at the Permittee’s applicable MS4 outfall(s),¹ including an outfall to the receiving water that collects discharges from multiple Permittees’ jurisdictions.

¹ An outfall may include a manhole or other point of access to the MS4 at the Permittee’s jurisdictional boundary.

Concern – Need to clearly explain the requirement(s).

Proposed Solution – Re-word and include footnote into the requirement.

7. Page 4, Part E.2.e.i. 1-3. Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations, states as follows:

A Permittee shall be deemed in compliance with an applicable final water quality-based effluent limitation and/or final receiving water limitation for the pollutant(s) associated with a specific TMDL if any of the following is demonstrated:
There are no violations of the final water quality-based effluent limitation for the specific pollutant at the Permittee's applicable MS4 outfall(s)²; ...

Concern – Need to clearly explain the requirement(s). Also, language is confusing and it is implied that numeric WQBELs will be inserted into the permit. Opportunity must be provided to Permittees by inserting BMP-based WQBELs along with providing opportunities for source control and research and development.

Proposed Solution – Language should be inserted into the permit that concentrates on the opportunity to Permittees to develop monitoring plans.

8. Page 5, Part E. 4.a. State Adopted TMDLs where Final Compliance Deadlines have Passed, states as follows:

Permittees shall comply immediately with water quality-based effluent limitations and/or receiving water limitations to implement WLAs in state-adopted TMDLs for which final compliance deadlines have passed pursuant to the TMDL implementation schedule.

Concern – The reference made here to comply **immediately** is arbitrary. Opportunity is not provided for a strategic plan that will focus on BMP implementation. This requirement will automatically result in permit violation in addition to fruitless expenditures and resources.

Proposed Solution – Revise language to provide Permittees the opportunity to produce a plan, perform pilot projects and implement BMPs to ensure valuable resources and funds are not being wasted on programs that may not provide the benefits that were initially perceived.

9. Page 6, Part E.4.b. states as follows:

Where a Permittee believes that additional time to comply with the final water quality-based effluent limitations and/or receiving water limitations is necessary, a permittee may (insert timeframe) request a time schedule order (TSO) pursuant to Cal. Water Code section 13300 for the Regional Water Board's consideration.

Concern – A TSO is an enforcement action and requires that the Board make findings of a discharge or threat of a discharge that will violate prescribed requirements. The language implies that the Permittee is admitting guilt. Additionally, TSO's do not protect Permittees from third-party litigation.

Proposed Solution – TSO's need to be interchanged with reopeners and reconsiderations of TMDLs are absolutely necessary so as to re-set the compliance schedules to align with the Watershed Management Plans. This would minimize from any third-party litigation and loss of limited resources by the cities.

10. Page 8, Part E.5.b.(2). WQBELs for Trash Partial Capture Devices and Institutional Controls states as follows:

Permittees may comply with their interim and final effluent limitations through the installation of partial capture devices and the application of institutional controls

Concern – Need clarification of language.

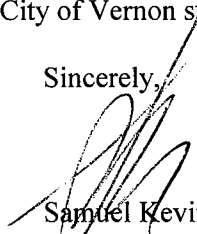

Proposed Solution – Please provide clear definitions of Partial Capture Devices and institutional controls.

Notwithstanding the above, the City of Vernon contends that reopeners and reconsiderations of TMDLs are absolutely necessary so as to re-set the compliance schedules to align with the Watershed Management Plans. This would minimize from any third-party litigation and loss of limited resources by the cities. We recognize that reopeners and reconsiderations will require Basin Plan amendments.

Please note that the City of Vernon is also a voting agency in the Los Angeles Permit Group and is supportive of the Los Angeles Permit Group's comments on the subject matters, submitted to you under separate cover.

The City of Vernon appreciates your efforts and will continue to work with the RWQCB staff to protect the environment. Please contact Claudia Arellano at 323-583-8811 extension 258 or Jerrick Torres at 323-583-8811 extension 204 of the City of Vernon staff if you have any questions or comments.

Sincerely,

LOS ANGELES RIVER METALS TOTAL MAXIMUM DAILY LOAD (TMDL) REACH 1 IMPLEMENTATION PLAN

Dear Mr. Wilson:

The Los Angeles Regional Water Quality Control Board (Regional Board) received your letter dated December 7, 2009, requesting that the City of Vernon be exempt from preparing a Metals TMDL implementation plan for Reach 1 of the Los Angeles River. In your letter, you provided detailed storm drain maps that demonstrate that the portion of the City of Vernon identified by the TMDL as draining to the Los Angeles River Reach 1 actually drains to Reach 2. Regional Board staff has reviewed the storm drain maps and has determined that the City of Vernon does not drain to Reach 1. Therefore, the City of Vernon's request to be exempt from preparing a Reach 1 implementation plan is approved.

Thank you for your commitment to develop an implementation plan for Reach 2 and we look forward to receiving a final implementation plan for Reach 2 by July 11, 2010. If you have any questions, please contact Jenny Newman of my staff at (213) 576-6691 or jnewman@waterboards.ca.gov.

Sincerely,

Tracy J. Egoscue
Executive Officer

California Environmental Protection Agency

Los Angeles, CA 90013

Subject: Los Angeles River Metals TMDL – Implementation Plan - Reach 1

Dear Ms. Escogue:

The City of Vernon has been mistakenly included in Reach 1 for the Los Angeles River Metals TMDL Implementation Plan. The City of Vernon has rechecked the plan from the Regional Board that shows the boundaries of the various reaches and found that the inclusion of the City of Vernon in Reach 1 is incorrect. All drainage systems in the City of Vernon drain to the Los Angeles River. The portion of the City of Vernon that was erroneously shown to drain to Compton Creek, actually drains directly to the Los Angeles River via the East Compton Creek No. 1 storm drain which drains due east to discharge into the Los Angeles River at Southern Avenue in South Gate, just north of the confluence of the Rio Hondo Channel. I have enclosed the County of Los Angeles plans of the East Compton Creek No. 1 storm drain that details the drainage from the City of Vernon to the discharge point on the Los Angeles River. The City of Vernon hereby requests that the Regional Board delete the City of Vernon from Reach 1. Please provide written approval of the request. If you have any questions, please contact me at (323) 583-8811, Ext. 245.

Sincerely,

Samuel Kevin Wilson, P. E.

**Los Angeles County Flood Control District and County of Los Angeles Comments
Staff Working Proposal on Receiving Water Limitations**

Receiving Water Limitations			
Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
1	Compliance with Receiving Water Limitations	V.A. [Pages 1 & 2]	<p>The County and the LACFCD are very concerned about staff’s proposal to keep the Receiving Water Limitations language essentially unchanged from the current permit. This approach would not only render compliance with the permit very difficult if not impossible, it would also inappropriately establish two different compliance standards in the permit.</p> <p>Based on the interpretation of the Regional Board and the Ninth Circuit Court of Appeals, this language essentially requires that stormwater discharges to receiving waters must meet water quality standards at the point of discharge if the receiving water exceeds water quality standard (unless, as discussed below, the receiving waters is being addressed by a TMDL with an implementation schedule). In other words, where a pollutant is not being addressed by a TMDL with an implementation schedule, there is in fact a de facto never-to-be-exceeded Numeric Effluent Limit (NEL) in the permit.</p> <p>The State Water Board’s Blue Ribbon Panel found in 2006 that “[I]t is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban discharges.” In fact, in its response to public comments dated April 27, 2012, regarding the Draft Tentative Order for the renewal of the MS4 permit for the California Department of Transportation (Caltrans), State Water Board staff cited the Blue Ribbon Panel’s findings in defending its decision to not incorporate NELs in the Caltrans permit. State Water Board staff stated, “Consistent with the findings of the Blue Ribbon Panel and precedential State Water Board orders (State Water Board Orders Nos. WQ 91-03 and WQ 91-04), this Order allows the Department [Caltrans] to implement BMPs to comply with the requirements of this Order.” (Page 2 of 110).</p>

**Los Angeles County Flood Control District and County of Los Angeles Comments
Staff Working Proposal on Receiving Water Limitations**

Receiving Water Limitations			
Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
1 (cont.)	Compliance with Receiving Water Limitations	V.A. [Pages 1 & 2]	Based on discussion with Regional Board staff, staff appears to believe that the “de facto NEL” issue is moot because exceedances will be addressed by TMDLs, and that staff is already proposing language to find permittees not in violation of the Receiving Water Limitation if they are “in compliance with the applicable TMDL requirement(s), including compliance schedules...” (Page 3, Staff Working Proposal for General TMDL Provisions). Based on our analysis, however, not all exceedances will be addressed by TMDLs. For example, our review of 2010-11 water quality data found wet weather exceedances of the fecal coliform water quality objective in Dominguez Channel. Because currently there is no bacterial TMDL for Dominguez Channel, permittees discharging into Dominguez Channel potentially could have been found in violation of the Receiving Water Limitations unless they have evidence that their MS4 discharges did not cause or contribute to the receiving water exceedances. On the other hand, because there is a bacterial TMDL for Malibu Creek, permittees in that watershed would not have been in jeopardy if they were implementing BMPs to address the TMDL. During the May 3 workshop, Board Member Glickfeld asked how permittees could be in immediate violation of the Receiving Water Limitation; the Dominguez Channel exceedances would be one such example.

**Los Angeles County Flood Control District and County of Los Angeles Comments
Staff Working Proposal on Receiving Water Limitations**

Receiving Water Limitations			
Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
1 (cont.)	Compliance with Receiving Water Limitations	V.A. [Pages 1 & 2]	<p>This apparent double standard is not appropriate. Congress intended for TMDLs to be a mechanism by which dischargers can prioritize and address the worst water quality problems. The proposed RWL language would have the unintended consequence of nullifying the prioritization process and put permittees in a position of having more legal liability for lower priority (i.e. non-TMDL) water quality issues.</p> <p>It is also inconsistent with the watershed management program that is meant to assist in prioritizing resources in order to devote them to the high priority water quality issues. If a permittee is in violation of the receiving water limitation even though it is implementing a watershed management program or is otherwise in compliance with the iterative process, resources will be directed to addressing those exceedances of receiving water limitations that are not otherwise addressed by the plan, which would be those pollutants that would have been designated as being of lower priority, rather than those of higher priority. This is the opposite of how an effective program should be designed.</p> <p><u>Recommendation</u> Add Section V.A.5 as follows: "If a Permittee is found to have discharges from its MS4 that cause an exceedance of any applicable water quality standard or water quality objective, or has created a condition of nuisance, the Permittee will not be in violation of this Order if the Permittee has complied with the requirements set forth in Part V.A.3 above or is in compliance with a watershed management program that covers the receiving water at issue."</p>
2		V. (footnote 1)	<p>The definition of Receiving Water Limitation in footnote 1 includes any applicable numeric or narrative water quality standard contained in the "Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Resources Control Board, or federal regulations . . ." The reference to "policies" adopted by the State Water Resources Control Board is ambiguous. The State Board adopts water quality objectives in water quality control plans not in policy resolutions. See Water Code § 13170. It is not clear what is meant by "policies." It should be noted that the definition of water quality standards under the current permit does not include a reference to "policies."</p>

Receiving Water Limitations			
Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
2 (cont.)		V. (footnote 1)	<u>Recommendation</u> Strike the words "or policies" from footnote 1.
3		V. (footnote 1)	The definition of Receiving Water Limitation includes any applicable numeric or narrative water quality standard, "or limitation to implement the applicable water quality standard," for the receiving water. Applicable water quality standards are set forth in the Basin Plan. The phrase "or limitation to implement the applicable water quality standard" is undefined and ambiguous. The Basin Plan contains water quality standards, not "limitations" to implement those standards. See Water Code § 13241. It should be noted that the definition of water quality standards under the current permit does not include a reference to a "limitation to implement the applicable water quality standard." <u>Recommendation</u> Strike the words "or limitation to implement the applicable water quality standard," from footnote 1.

Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
1	Incorporating previous comments	General	To the extent that they have not been incorporated, the LACFCD and the County reiterate and incorporate by reference our comments submitted on February 9, 2012.
2	Commingled Discharges	VI.E.2.b [Page 2] VI.E.2.b.ii. & iii. [Page 2]	<p>40 CFR section 122.26(a)(3)(vi) provides that “Co-permittees need only comply with permit conditions relating to discharges for which they are operators.” This section was adopted in anticipation of intra-system, multi- or co-permittee approaches to storm water management, <i>See In re City of Irving, Texas Municipal Separate Storm Sewer System</i>, Environmental Administrative Decisions 111, 128 (EAB 2001), and thus this section applies to commingled discharges. Accordingly, the section on commingled discharges should make clear that where there is a commingled discharge to a receiving water, the permittees who contribute to the commingled discharge are required to work together to assure that the waste load allocation is met, but no one permittee is responsible for meeting the waste load allocation itself or is responsible for addressing pollutants that come from another permittee’s MS4. The section on commingled discharges needs to be clarified to make this principle clear.</p> <p>Subparagraph iii states compliance shall be determined for the group as a whole. This contradicts subparagraph ii and 40 CFR section 122.26(a)(3)(vi) which provide that each Permittee is only responsible for discharges from the MS4 for which they are owners and/or operators. Subparagraph iii needs to be clarified to make clear that it is not intended to conflict with subparagraph ii.</p> <p><u>Recommendation</u> Add the following sentence at the end of subparagraph iii: A determination that the discharge of the group as a whole exceeds a waste load allocation or water quality standard shall not be construed to mean that the discharge of any one permittee is not in compliance with the waste load allocation or water quality standard.</p>

Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
3	Comingled Discharges	VI.E.2.b.iv [Page 2]	<p>This section states that each Permittee is responsible for demonstrating that its discharge did not cause or contribute to an exceedance. For clarification, this section should be modified to provide that where a commingled discharge exceeds an applicable water quality standard, all Permittees that have contributed to the commingled discharge are responsible for determining the source(s) of the pollutants.</p> <p><u>Recommendation</u> For clarification, subparagraph iv should be replaced with, “For purposes of compliance determination all permittees that have contributed to the commingled discharge are responsible for determining the source of the pollutants.</p>
4	Comingled Discharges	VI.E.2.b.v [Page 2]	<p>This subparagraph addresses how a permittee can demonstrate that its discharge did not cause or contribute to an exceedance. Where a permittee, like the Flood Control District, receives commingled discharges from upstream permitted and non permitted sources, the permittee should be allowed to show that its discharge contains pollutants, the sources over which the permittee does not have control.</p> <p><u>Recommendation</u> Add a subparagraph 4 that says, “Demonstrate that its discharge contains contributions from other sources, including but not limited to discharges of other permittees, which have the potential to have caused or contributed to the exceedance at issue.</p>
5	Compliance by Demonstration of No Discharge	VI.E.2.b.v.1. [Page 2]	<p>Item (1) states that compliance may be demonstrated if there is no discharge from the Permittee’s MS4 into the applicable receiving water. This language is not consistent with the sections for Interim WQBELs and/or RWLs or for Final WQBELs and/or RWLs.</p> <p><u>Recommendation</u> Revise to read: “Demonstrate that there is no <u>direct or indirect</u> discharge from the Permittee’s MS4 into the applicable receiving water <u>during the time period subject to the water quality-based effluent limitation and/or receiving water limitation for the pollutant(s) associated with a specific TMDL;</u>”</p>

6	Receiving Water Limitations Addressed by TMDL	VI.E.2.c.iii [Page 3]	<p>This section provides that a permittee shall not be considered in violation of a Receiving Water Limitation if it is in compliance with applicable TMDL requirements in a time schedule order. It should also provide that a permittee is not in violation if it is in compliance with an applicable watershed management program.</p> <p><u>Recommendation</u> Add the words “watershed management program or” before the words “time schedule order.”</p>
7	Final WQBELs and/or Receiving Water Limitations	VI.E.2.e [Page 4]	<p>The County and the LACFCD are very concerned with staff’s proposal to express final TMDL WLAs as strict numeric WQBELs and/or Receiving Water Limitations in the permit. The State Water Board's Blue Ribbon Panel found in 2006 that "it is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban discharges." As mentioned in our comment regarding the proposed RWL language, in its response to public comments dated April 27, 2012, regarding the Draft Tentative Order for the renewal of the Caltrans MS4 permit, State Water Board staff cited the Blue Ribbon Panel’s findings in defending its decision to not incorporate NELs in that permit. State Water Board staff stated, “Consistent with the findings of the Blue Ribbon Panel and precedential State Water Board orders (State Water Board Orders Nos. WQ 91-03 and WQ 91-04), this Order allows the Department [Caltrans] to implement BMPs to comply with the requirements of this Order.” (SWRCB Comment Response Report, for Caltrans MS4 Permit, April 27, 2012, Page 2 of 110).</p>

Comment #	Identify Permit Element/Issue/Concern	Location in Working Proposal	Comment/Recommendation
7 (cont.)	Final WQBELs and/or Receiving Water Limitations	VI.E.2.e [Page 4]	<p>State Water Board staff further noted that “in November 12, 2010, USEPA issued a revision to a November 22, 2002 memorandum in which the USEPA had ‘affirm[ed] the appropriateness of an iterative, adaptive management best management practice (BMP) approach’ for improving stormwater management over time. In the revisions, USEPA recommended that, in the case the permitting authority determines that MS4 discharges have the reasonable potential to cause or contribute to a water quality excursion, the permitting authority, <u>where feasible</u> (<i>emphasis added</i>), include numeric effluent limitations as necessary to meet water quality standards. However, the revisions recognized that the permitting authority’s decision as to how to express water quality based effluent limitations (WQBELs), i.e. as numeric effluent limitations or BMPs, would be based on an analysis of the specific facts and circumstances surrounding the permit. Moreover, USEPA has since invited comment on the revisions to the memorandum and will be making a determination as to whether to ‘either retain the memorandum without change, to reissue it with revisions, or to withdraw it.’” (<i>ibid</i>).</p> <p>The Regional Board is not required to reflect the final WQBELs as numeric effluent limits. 40 CFR 122.44(k)(2) and (3) specifically authorizes the use of BMPs. The State Water Board, in its response to comments on the proposed Caltrans permit, specifically said that it may “impose BMPs for control of storm water discharges in lieu of numeric effluent limitations,” citing section 122.44(k)(2) and (3).</p> <p>It has not been demonstrated that it is feasible to reflect the final WQBELs as numeric effluent limits. In addition, it has not been proven that these final WQBELs can currently be met.</p>

7 (cont.)	Final WQBELs and/or Receiving Water Limitations	VI.E.2.e [Page 4]	<p>In this regard, although Regional Board staff stated during the May 3 workshop that it is feasible to incorporate NELs at this time, staff did not provide evidence to substantiate the feasibility of NELs. In assessing the feasibility of NELs in stormwater permits, the Blue Ribbon Panel based its evaluation on four criteria: (1) The ability of the State Water Board to establish appropriate objective limitations or criteria; (2) how compliance determinations would be made; (3) the ability of dischargers and inspectors to monitor for compliance; and (4) <u>the technical and financial ability of dischargers to comply with the limitations or criteria</u> (<i>emphasis added</i>). In response to a Regional Board member question regarding the cost to comply with TMDLs, staff responded that cost analyses were completed as part of TMDL development. Significantly, the analysis of costs in the TMDLs did not address the question of the financial ability of dischargers to comply with the limitations or criteria. Nor did the analysis include a cost-benefit analysis or address whether the means to comply with the TMDL was cost effective. The analyses in the TMDLs specifically did not include a cost benefit analysis or a determination of whether it was cost effective. It is also important to note that staff's cost analyses were not held to the "reasonable assurance" standard, and no quantitative analyses were done to demonstrate that the BMPs assumptions used by staff would have a reasonable assurance of meeting TMDL standards. In fact, during TMDL development, many permittees made comments to this end regarding staff's cost analyses for TMDLs. The County and the LACFCD agree with State Water Board staff that NELs, numeric WQBELs and/or Receiving Water Limitations currently are not feasible in stormwater permits. Los Angeles Region MS4 dischargers should not be held to enforceable NELs when discharges into the MS4, such as from Caltrans and construction sites, are not being held to the same standard.</p>

7 (cont.)	Final WQBELs and/or Receiving Water Limitations	VI.E.2.e [Page 4]	<p><u>Recommendation</u></p> <p>Add “or” to the end of section E.2.e.i.3, and add section E.2.e.i.4 as follows: “The Permittee has submitted and is fully implementing an approved, revised Watershed Management Program.”</p> <p>Alternatively, insert new section E.2.e.ii, “Two years before the compliance deadline for an applicable final water quality-based effluent limitation and/or final receiving water limitation, Regional Board shall evaluate progress made by Permittees toward compliance with the standard, including review of the results from Permittees’ adaptive management process (VI.C.6.), to determine whether the compliance timeline should remain unchanged, or if the Order should be revised to incorporate a new compliance timeline.”</p>
8	TSOs for USEPA Established TMDLs and State Adopted TMDLs where Compliance Deadlines have Passed	VI.E.3. & 4. [Pages 4-6]	<p>The Time Schedule Order (TSO) is being proposed as a mechanism to address USEPA established TMDLs which do not have implementation schedules. A TSO is an enforcement action and should only be used as a last resort, if at all, to address such TMDLs.</p> <p>It is our understanding that Regional Board staff has been informed that Permittees must immediately comply with USEPA TMDLs that do not have implementation schedules and State TMDLs where compliance dates have passed. This is incorrect. In fact, in the proposed Caltrans MS4 permit the State Board staff addresses the incorporation of TMDLs into that permit by providing that the permit shall be reopened in one year to include TMDL provisions, including allowing the use of BMPs. See proposed Caltrans permit, sections E.4.a and b. No TSO is required. Regional Board staff should follow the same approach here.</p> <p><u>Recommendation</u></p> <p>Permittees can meet the requirements of USEPA TMDLs and State TMDLs where compliance dates have passed through implementation of BMPs or through compliance with BMPs set forth in watershed management programs. Alternatively, follow State Board staff’s lead and incorporate some TMDLs (ie. EPA TMDLs) through a reopener of the permit at a later time.</p>

Re: City of Claremont's Written Comments on Working Proposal for the TMDL Provisions of the Los Angeles County MS4 Permit

Dear Ms. Purdy:

This letter is submitted on behalf of the City of Claremont ("City") in connection with the Los Angeles Regional Board's working proposal for the TMDL provisions of the Los Angeles County MS4 Permit. The focus of the City's written comments is on the manner in which the working proposal seeks to incorporate the Middle Santa Ana River Watershed Bacteria Indicator TMDL ("MSAR TMDL") as an enforceable requirement of the MS4 Permit. The City appreciates the opportunity to submit these written comments and looks forward to working with you to develop a mutually acceptable approach to the MSAR TMDL.

Before providing specific comments on the working proposal, it is important for the Regional Board to understand the City's position regarding the MSAR TMDL. As you know, the MSAR TMDL was adopted by the Santa Ana Regional Board in February of 2005. The City is not located within the jurisdiction of the Santa Ana Regional Board, and, therefore, the Basin Plan adopted by the Santa Ana Regional Board, including the MSAR TMDL, has no application to the City. (See Water Code § 13240 (providing that regional boards "shall formulate and adopt water quality control plans for all areas within the region.") (Emphasis added).)

Because the MSAR TMDL is not applicable to the City, significant legal concerns exist regarding the ability of the Los Angeles Regional Board to include the MSAR TMDL in the MS4 Permit without first going through the legally required Basin Plan amendment process to develop a bacteria TMDL that applies to the City. Since the Los Angeles Regional Board has not so amended its Basin Plan, the Board's legal authority to include the TMDL in the MS4 Permit is suspect. In making these comments, the City does not waive its legal objections to the application of the MSAR TMDL to it.

BEST BEST & KRIEGER
ATTORNEYS AT LAW

Renee Purdy
Section Chief of Regional Board
May 14, 2012
Page 2

Although the City preserves its legal options regarding the MSAR TMDL, the City recognizes that either the Los Angeles or Santa Ana Boards may have the authority, after following all legally required procedures, to extend the MSAR TMDL or similar requirements to the City in a legally enforceable way. For this reason, the City has been participating in the MSAR TMDL Task Force and might be willing to continue to participate in achieving the goals of the MSAR TMDL through the MS4 Permit under acceptable terms and conditions, as expressed in the comments below.

Subject to these caveats, the City has the following three comments on the TMDL provisions of the working proposal related to the MSAR TMDL:

1. The Regional Board should delete the final fecal coliform effluent limitations and receiving water limitations for both dry and wet weather. It is our understanding that the Los Angeles Regional Board's Basin Plan no longer uses fecal coliform as a fresh water Rec-1 objective. Therefore, the Board cannot include such an objective in the MS4 Permit. In addition, as noted in the working proposal, the Santa Ana Board is in the process of replacing the Rec-1 fecal coliform objective with an E. coli objective. Therefore, the final fecal coliform effluent limitations and receiving water limitations should be deleted.
2. The Regional Board should revise the provisions of Section G.1.d of the working proposal to allow the City to use the Comprehensive Bacteria Reduction Plans ("CBRPs") that have already been prepared for the MSAR TMDL and which have already been tentatively approved by staff at the Santa Ana Board. It makes little sense to require the City to "reinvent the wheel" on this issue. For this reason, the City recommends that Section G.1.d of the working proposal be revised to read as follows:

Permittees may demonstrate compliance with the effluent limitations and receiving water limitations by complying with the Comprehensive Bacterial Reduction Plans prepared for the MSAR TMDL.

3. The City would like the proposed Permit language to better reflect how the City's compliance will be measured. This is particularly important to the City because information prepared by the MSAR TMDL Task Force demonstrates that the City does not discharge stormwater or dry weather flows directly to the Chino Basin, including the San Antonio Channel. The City's contribution to flows occurs, if at all, only at the limited points where the City's MS4 connects with the City of Pomona's MS4. For this reason, the City would like to understand (and have the

BEST BEST & KRIEGER
ATTORNEYS AT LAW

Renee Purdy
Section Chief of Regional Board
May 14, 2012
Page 3

permit document) how the City's compliance will be measured. In the City's view, it would be in compliance with the effluent limitations if either (1) compliance existed at the outfall of any MS4 to which the City contributes; or (2) compliance existed at the point at which the City's MS4 connects to the City of Pomona's MS4. If either of these conditions existed, compliance would be obtained. Moreover, the City does not agree with the incorporation of the MSAR TMDL's Waste Load Allocation ("WLA") as a numeric effluent limitations. Particularly as applied to the City, the better approach would be to use a BMP-based approach to achieving compliance with the WLA.

The City appreciates the opportunity to submit these comments. We request the opportunity to discuss them with you and your team by phone or in person.

Very truly yours,

Shawn Hagerty

SUBJECT: Technical Comments on Los Angeles Regional Water Quality Control Board Staff Working Proposals for the Greater Los Angeles County MS4 Permit (Permit) – Watershed Management Programs, TMDLs and Receiving Water Limitations

Dear Ms. Purdy and Mr. Ridgeway:

The Los Angeles Permit Group would like to take this opportunity to provide comments on the working proposals for Watershed Management Programs, Total Maximum Daily Loads, and Receiving Water Limitations. These documents were posted on the Regional Board website on April 23, 2012. The LA Permit Group appreciates the Regional Board staff's effort to develop the next NPDES stormwater permit and their commitment to meet with various stakeholders including our group. We look forward to continuing the dialogue with the Board staff on this very important permit. Our highest priorities on the Watershed Management Program, TMDLs and Receiving Water Limitations are:

- Provide additional time to develop the Watershed Management Program to integrate the 32 TMDLs and prioritize efforts.
- Prior to adopting the Los Angeles MS4 NPDES Permit, reopen TMDLs for reconsideration where final compliance periods have passed and initiate the Basin Plan Amendment process to extend compliance deadlines to coordinate with the Watershed Management Program and consider substantial amounts of new information available. While the TMDL reopeners are pending, an affected Permittee would be in compliance through the implementation of core programs and implementation plans.
- Initiate TMDL reopeners/reconsideration where compliance with a waste load allocation (WLA) is exclusively set in the receiving water to also include compliance at the outfall, or other end-of-pipe; while the TMDL reopener is pending, an affected Permittee would be in compliance with the receiving water WLA through the implementation of core programs and implementation plans.
- Develop Receiving Water Limitation language that supports implementing the Watershed Management Programs without unnecessary vulnerability.

- All compliance points (interim WLA, milestones, and final WLA) for all TMDLs should allow for compliance timelines and actions consistent with the Watershed Management Programs that will be developed, rather than with strict numeric limits to determine compliance.

As noted in discussions with you, the LA Permit Group requested additional time to review the working proposals presented at the May 3, 2012 Regional Board Workshop. Given the brief comment deadline, there are significant, additional concerns that could not be fully explored or analyzed. Prior to issuing a tentative order, a complete administrative draft is needed to provided stakeholders (with a minimum 30 day review period) to allow the permittees to fully see how the various provisions of the permit will work together in order to gain a holistic view of the permit. This is essential in order to address the unprecedented policies and actions anticipated in the Los Angeles MS4 NPDES Permit.

These topics are further highlighted below. Detailed comments are attached for each Watershed Management Program, Receiving Water Limitations and TMDLs.

Watershed Management Programs

Overall, the LA Permit Group supports the Regional Board's proposed approach to address high priority water quality issues through the development and implementation of a watershed management program. We believe the working proposal provides sufficient detail to guide the development of the programs without being overly prescriptive and constraining. However, one of our biggest concerns with the working proposal is the proposed timeline for developing the watershed management programs. As noted in the working proposals and the workshop, municipalities would have only one year to develop a comprehensive watershed management program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate the data, draft the plans, and obtain necessary approvals from political bodies. As a comparison, the City of Torrance required two years to prepare a comprehensive water quality plan that addressed a suite of TMDLs, similar to what is being considered in the watershed management program. The permit should provide that the time schedule for submittal of the Draft Plan be 24 months after permit adoption.

We also offer the following comments regarding the watershed management program (our line item by line item review and comments are attached):

- The working proposal seems to be silent on the critical issue of sources of pollutants outside the authority of MS4 permittees (e. g. aerial deposition, upstream contributions, discharges allowed by another NPDES permit, etc.). We request that permittees be allowed to demonstrate that some sources are outside the permittee's control.
- Reasonable assurance necessitates closer integration with TMDL and storm water monitoring programs. Currently the working proposal does not provide a sufficient tie-in between the monitoring and the watershed program. This lack of tie-in was acknowledged in the workshop by Board staff. It is expected that this tie-in will be addressed once the monitoring provisions are drafted.
- The watershed plan is obviously tied closely with the TMDLs which is reasonable and constructive. But we would suggest that staff broaden the definition of water quality issues to consider protection of and impacts to existing ecosystems in the analysis.
- More careful consideration should be given to the frequency and extent of the reporting and adaptive management assessments. The current proposal results in a significant annual effort and the LA Permit Group members question the value of such an effort. Current reporting appears to overwhelm state staff resources without providing the state with usable feedback on the significant efforts about our programs. We believe that the reporting can be streamlined and that the jurisdictional and watershed reporting should be combined.

- It is unclear how program implementation and TMDL compliance will be handled during the interim period before development of the watershed management program. For those entities that choose to develop a watershed management program, the LA Permit Group requests that current, significant efforts in our existing programs and implementation plans be allowed to continue while we evaluate new MCMs as part of the watershed management program.
- Consideration of the technical and financial feasibility of complying with water quality standards should be included in the watershed management program.

Total Maximum Daily Loads

Of critical importance to this permit and to water quality is the incorporation of TMDLs into the NPDES permit. This NPDES permit proposes to incorporate more TMDLs than any other permit in California issued to date. As a result, the manner in which the TMDLs are incorporated into the permit is a critical issue for the LA Permit Group and will likely set a significant precedent for all future MS4 permits.

The rate of development of TMDLs in the Los Angeles Region was unparalleled in California, and likely the nation. A settlement agreement necessitated the much accelerated time schedule for these TMDLs. The TMDLs were developed based on the information available at the time, not the best information to identify or solve the problem. As a result, the sophistication of the TMDLs vary widely, meaning that not all TMDLs are created equal regarding knowledge of the pollutant sources, confidence in the technical analysis, availability of control measures sufficient to address the pollutant targets, etc. Additionally, the majority of the TMDLs were developed with the understanding that monitoring, special studies, and other information would be gathered during the early years of the TMDL implementation to refine the TMDLs. As such, many MS4 dischargers were told during TMDL adoption that any concerns they may have over inaccuracies in the TMDL analysis would be addressed through a TMDL reopener. The proposed method of incorporating TMDL WLAs, as outlined in the working proposal, does not effectively allow for addressing this phased method of implementing TMDLs, nor does it recognize the time, effort and complexities involved in addressing MS4 discharges, and it places municipalities into immediate compliance risk for permit requirements that have never been incorporated into the MS4 permit previously.

We recognize and appreciate that TMDLs must be incorporated in such a way as to require action to improve water quality. However, the permit should recognize the articulated goal of many of the TMDLs to be adaptive management documents and consider the challenges of trying to address the non-point nature of stormwater. As such, it is imperative to have flexibility in selecting an approach to address the TMDLs and the time frame by which to implement the approach.

Regional Board staff is making three significant policy decisions with regards to incorporating TMDLs into this permit that the LA Permit Group would like staff to reconsider:

1. The inclusion of numeric effluent limitations for final TMDL WLAs.
2. The use of time schedule orders to address Regional Board adopted TMDLs for which the compliance points have passed.
3. The use of time schedule orders for EPA adopted TMDLs with no implementation plans.

The first policy decision of concern is the incorporation of final WLAs solely as numeric effluent limitations in the proposed permit language. Although staff has discretion to include numeric limits, it is not required and the use of numeric limits results in contradictions and compliance inconsistencies with the rest of the permit requirements. Court decisions (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)¹), State Board orders (Order

¹ See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10)² have affirmed that WLAs can be incorporated as non-numeric effluent limitations. Under 40 CFR Section 122.44 (k), the Regional Board may impose BMPs for control of storm water discharges in lieu of numeric effluent limitations when numeric limits are infeasible. It states that best management practices may be used to control or abate the discharge of pollutants when numeric effluent limitations are infeasible. In 2006, the Blue Ribbon Panel made recommendations to the State Water Resources Control Board concluding that it was not feasible to incorporate numeric limits into permits to regulate storm water, and at best there could be some action level, but not numeric waste load allocations. Very little has changed in the technology and the feasibility of controlling storm water pollutants since 2006. What has changed is that a legally compelled, long list of TMDLs has been adopted in the LA Region in a very short time period.

Additionally, during the May 3, 2012 MS4 Permit workshop, Regional Board staff seemed to indicate that the basis for incorporating the final WLAs as numeric effluent limitations is EPA's 2010 memorandum pertaining to the incorporation of TMDL WLAs in NPDES permits³. This memorandum (which is currently being reconsidered by U.S. EPA) states that "EPA recommends that, *where feasible*, the NPDES permitting authority *exercise its discretion* to include numeric effluent limitations as necessary to meet water quality standards" (emphasis added). This statement highlights the basic principle that the Regional Board has **discretion** in how the WLAs are incorporated into the MS4 Permit. Regional Board staff commented during the workshop that staff have evaluated data and have determined numeric effluent limitations are now feasible. However, no information refuting the Blue Ribbon Panel report recommendations has been provided that demonstrates how the appropriateness of using strict numeric limits was determined and why these limits are considered feasible now even though historically both EPA and the State have made findings that developing numeric limits was likely to be infeasible⁴.

Given the discretion available to Regional Board staff and the variability among the TMDLs with respect to understanding of the pollutant sources, confidence in the technical analysis, and availability of control measures sufficient to address the pollutant targets, **it is critical to use non-numeric water quality based effluent limitations for both interim and final WLAs in this permit.** The proposed Watershed Management Program will require quantitative analysis to select actions that will be taken to achieve TMDL WLAs. For the entire length of the TMDL compliance schedule, permittees will be required to demonstrate compliance with interim WLAs by implementing actions that they have estimated to the best of their knowledge will result in achieving the WLAs and water quality standards. Additionally, permittees will be held responsible for compliance with actions to meet the core program requirements of the permit. However, unless final WLAs are also expressed in this permit as action-based water quality based effluent limitations, and if instead strict numeric limits are required for final WLAs, then, at the specified final compliance date, no matter how much the permittee has done, no matter how much money has been spent, no matter how close to complying with the numeric values, and no matter what other information has been developed and submitted to the Regional Board, the permittee will be considered out of compliance with the permit requirements. And because of the structure established in this permit, the Regional Board staff will have to consider all permittees in this situation as being out of compliance with the permit provisions if the strict numeric limits have not been met, regardless of the actions

² "[i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California's NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board's findings *supporting either the numeric or non-numeric* effluent limitations contained in the permit." (Order WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)

³ U.S. EPA, *Revisions to the November 22, 2002 Memorandum "Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, Memorandum from U.S. EPA Director, Office of Wastewater Management James A. Hanlon and U.S. EPA Director, Office of Wetlands, Oceans, and Watershed Denise Keehner (Nov. 10, 2010).

⁴ Storm Water Panel Recommendations to the California State Water Resources Control Board "The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities. June 19, 2006.

taken previously. This approach is inconsistent with the goals of good public policy, fair enforcement and fiscal responsibility.

To address this issue, the LA Permit Group recommends that:

- WLAs be translated into WQBELs, expressed as BMPs and that implementation of the BMPs will place the permittee into compliance with the MS4 Permit
- The WLAs be included as specific actions (BMPs) that will be designed to achieve the WLAs
- Include language that states that compliance with the TMDLs can be achieved through implementing BMPs defined in the watershed management plan

The second major policy decision of concern is the use of Time Schedule Orders for Regional Board adopted TMDLs for which the compliance date has already occurred prior to the approval of the NPDES permit. The ideal phased TMDL implementation process whereby dischargers can collect information, submit it to the Regional Board, and obtain revisions to the TMDL requirements to address data gaps and uncertainties has not occurred. As evidenced by the number of overdue permits, the workload commitments of Regional Board staff are significant and TMDL reopeners seldom occur. Because the majority of the TMDLs have not been incorporated into permit requirements until now, MS4 permittees have been put in the position of trying to comply with TMDL requirements without knowing how compliance with those TMDLs would be determined and without knowing when or if promised considerations of modifications to the TMDL would occur. And now, they are expected to be in immediate compliance with new permit provisions which differ from most precedent and guidance regarding incorporation of TMDLs into MS4 permits, regardless of what actions they have taken to try and meet the TMDL requirements. This is neither fair nor consistent.

The LA Permit Group strongly believes that the adaptive management approach envisioned during TMDL development, whereby TMDL reopeners are used to consider new monitoring data and other technical information to modify the TMDLs, including TMDL schedules as appropriate, is the most straightforward way to address past due TMDLs. Some of the past due TMDLs are currently being considered for modifications and Regional Board staff should use this opportunity to adjust the implementation timelines to reflect the practical and financial reality faced by municipalities. There is no reason why the reopeners cannot reflect information gathered during the implementation period, including information that may be considered in developing the Time Schedule Orders in the future, to selectively modify time schedules in the TMDLs. Additionally, the permit should reflect any modifications to the TMDL schedules made through the reopener process, either through a delay in the issuance of the permit until the modified TMDLs become effective, or by using your discretion to establish a specific compliance process for these TMDLs in the permit. Providing for compliance with these TMDLs through implementation of BMPs defined in the watershed management plans as we have requested for all other TMDLs is a feasible, fair and consistent way to achieve this goal.

The third policy decision of concern is the manner in which EPA adopted TMDLs are being incorporated into the permit. The draft proposal requires immediate compliance with EPA TMDL targets. The effect of this approach is to put MS4 dischargers immediately out of compliance for TMDLs that may have only been adopted in March 2012. However, the Regional Board has the discretion to include a compliance schedule in the permit for EPA adopted TMDLs should they so choose. Federal law does not prohibit the use of an implementation schedule when incorporating EPA adopted TMDLs into MS4 permits. Additionally, State law may be interpreted to require the development of an implementation plan prior to incorporation of EPA adopted TMDLs into permits. Accordingly, the LA Permit Group recommends that the working proposal be modified to include compliance schedules for EPA adopted TMDLs in the permit.

Receiving Water Limitations

The proposed Receiving Water Limitations (RWL) language creates a liability to the municipalities that we believe is unnecessary and counterproductive. The proposed language for the receiving water limitations provision is almost identical to the language that was litigated in the 2001 permit. On July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.*⁵ (NRDC v. County of LA) that determined that a municipality is liable for permit violations if its discharges cause or contribute to an exceedance of a water quality standard.

In light of the 9th Circuit's decision and based on the significant monitoring efforts being conducted by other municipal stormwater entities, municipal stormwater permittees will now be considered to be in non-compliance with their NPDES permits. Accordingly, municipal stormwater permittees will be exposed to considerable vulnerability, even though municipalities have little control over the sources of pollutants that create the vulnerability. Fundamentally, the proposed language again exposes the municipalities to enforcement action (and third party law suits) even when the municipality is engaged in an adaptive management approach to address the exceedance.

The LA Permit Group would like to more fully address Board Member Glickfeld's question raised at the May 3rd workshop about how RWL language as currently written puts cities in immediate non compliance, either individually or collectively. As written, TMDLs as well as water quality standards in the basin plan would have to be specifically met as soon as this permit is adopted. Many of the adopted TMDLs include language that cities are jointly and severably liable for compliance.

While the Regional Board staff has noted that enforcement action is unlikely if the permittees are implementing the iterative process, the reality is that municipalities are immediately vulnerable to third party lawsuits as well as enforcement action by Regional Board staff. In the Santa Monica Bay, cities were sent Notices of Violation that, in essence, stated that all cities in the watershed were guilty until they proved their innocence when receiving water violations were found, in some cases miles away. The "cause and contribute" language was quoted prominently in those NOV's as justification for why the Regional Board could take such action. As another case in point the City of Stockton was sued by a third party for violations of the cause/contribute prohibition even though the City was implementing a comprehensive iterative process with specific pollutant load reduction plans. Cities will have no warning or time to react to any water quality exceedances, but still be vulnerable to third party lawsuits even when cities are diligently working to address the pollutants of concern. This will be disastrous public policy, creating a chilling affect on productive storm water programs.

It is not fair and consistent enforcement to put cities in a vulnerable situation to be determined out of compliance with water quality standards in the basin plan without time to develop a plan of action, develop source identification, and implement a plan to address the concern. With the very recent legal interpretation that fundamentally changes how these permits have been traditionally implemented, please understand that adjusting the Receiving Water Limitations language is a critical issue. Again, the receiving water limitation language must be modified to allow for the integrated approach to address numerous TMDLs within the watershed based program to solve prioritized water quality problems in a systematic way. This is a fair and focused method to enforce water quality standards.

The receiving water limitation provision as crafted in the contested 2001 Los Angeles permit is unique to California. Recent USEPA developed permits (e.g. Washington D.C.) do not contain similar limitations. Thus, we would submit that the decision to include such a provision and the structure of the provision is a State defined requirement and therefore an opportunity exists for the Regional and State Boards to reaffirm the iterative process as the preferred approach for long term water quality improvement.

⁵ No. 10-56017, 2011 U.S. App. LEXIS 14443, at *1 (9th Cir., July 13, 2011).

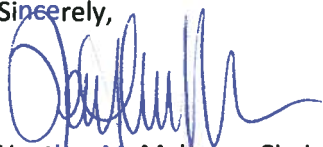

Beyond the legal/liability aspect of the receiving water limitations we would submit that in a practical sense the RWL works against the Watershed Management Program proposal. On the one hand the municipalities will develop watershed management programs that are based on the high priority water quality issues within the watershed. Consistent with the working proposal for the watershed management programs we would expect the focus to be on TMDLs and the pollutants associated with those TMDLs. However, under the current RWL working proposal the municipality will need to direct their resources to any and all pollutants that may cause or contribute to exceedances of water quality standards. Based on a review of other municipal outfall monitoring results in the State there may be occasional exceedances of other non-TMDL pollutants (e.g. aluminum, iron, etc.). These exceedances may only occur once every 10 storms but according to the current RWL proposal, the municipalities must also address these exceedances with the same priority as the TMDL pollutants. The LA Permit Group views this as unreasonable and ineffective use of limited municipal resources.

The RWL language is a critical issue for municipalities statewide and has been highlighted to the State Water Resources Control Board for consideration. Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue.

As previously discussed at the May 3rd workshop, and requested by many Board Members, the economic implications of the many proposed permit requirements are of critical importance. The LA Permit Group will be providing the requested information in a subsequent submittal shortly. However, the short timeframe for commenting on these working proposals has precluded us from assembling the information before the comment deadline on May 14, 2012.

In closing, we thank you for the opportunity to comment on the working proposals and we look forward to meeting with you to discuss our comments and to explore alternative approaches. Furthermore we respectfully request that that the Board provide a complete administrative draft of the Permit to stakeholders prior to the public issuance of the Tentative Order. Overall, the comment deadline was too short to address all the potential issues and concerns with the Watershed Management Program, TMDLs, and Receiving Water Limitation sections and that there are significant, additional concerns that could not be fully explored or analyzed given the comment deadline. Thus it important to review the entire draft permit to better understand the relationship among the various provisions; this is especially true for the monitoring provision and its relationship to the watershed management program. We strongly encourage you to use your discretion on these matters to make the adjustments requested. Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,

Heather M. Maloney, Chair
LA Permit Group

Document Name: TMDL Working Proposal - April 23 2012

Agency/Reviewer: LA Stormwater Permit Group

Comment No.	Doc. Reference Page	Section	Comments	Rvwr (optional)	Author Response
1	5	B.1.c.(2)	Santa Monica Bay Beaches Bacteria TMDL (SMBBB TMDL) is currently being reconsidered. As part of that reconsideration the summer dry weather targets must be revised to be consistent with the reference beach/anti-degradation approach established for the SMBBB TMDL and with the extensive data collected over that past seven years since original adoption of the SMBBB TMDL. This data clearly shows that natural and non-point sources result in 10% exceedances during dry weather. Data collected at the reference beach since adoption of the TMDL, as tabulated in Table 3 of the staff report of the proposed revisions to the Basin Plan Amendment, demonstrate that natural conditions associated with freshwater outlets from undeveloped watersheds result in exceedances of the single sample bacteria objectives during both summer and winter dry weather on approximately 10% of the days sampled.		
1	5	B.1.c.(2)	Thus the previous Source Analysis in the Basin Plan Amendment adopted by Resolution No. 02-004 which stated that "historical monitoring data from the reference beach indicate no exceedances of the single sample targets during summer dry weather and on average only three percent exceedance during winter dry weather" was incorrect and based on a data set not located at the point zero compliance location. Continued allocation of zero summer dry weather exceedances in the proposed Basin Plan Amendment is in direct conflict with the stated intent to utilize the reference beach/anti-degradation approach and ignores the scientifically demonstrated reality of natural causes and non-point sources of indicator bacteria exceedances.		
1	5	B.1.c.(2)	Continued use of the zero summer dry weather exceedance level will make compliance the SMBBB TMDL impossible for the Jurisdictional agencies. This is also in conflict with the intent of the Regional board as expressed in finding 21 of Resolution 2002-022 "that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas".		

2		B.1.	<p>The SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) was approved by the Regional Board staff and that CSMP should be incorporated into the TMDL monitoring requirements of the next MS4 Permit. The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week, thus it is highly confusing and misleading to refer to "daily monitoring". The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week.</p>		
3		B.1.	<p>The SMBBB TMDL is currently being reconsidered at a hearing scheduled for June 7, 2012. The 4th term MS4 Permit should incorporate the revised waste load allocations which are to be adopted at that hearing, rather than the previous basin plan amendments.</p>		
4	5	B.1.c.(3)	<p>Description of SMB 5-5 under Beach Monitoring Location is incorrect (and seems to have been switched with the description of SMB 5-3). SMB 5-5 is a historic monitoring location "50 yards south of the Hermosa Pier" as described in the adopted basin plan amendment and in the Regional Board approved Coordinated Shoreline Monitoring Plan. Whereas SMB 5-3 has been relocated from the historic location 50 yards south of the Manhattan Beach Pier to the zero point of the southern storm drain outfall against the strand wall under the Pier, thus an apt description of that location would be: "Manhattan Beach Pier, southern drain".</p>		
5	1-6	B.1 throughout	<p>This discussion in this section devoted to the SMBBB TMDL seems to create confusion regarding the meaning of the terms "water quality objectives or standards, and "receiving water limitations" and "water quality-based effluent limitations". Water quality objectives or water quality standards are those that apply in the receiving water. Water Quality Effluent Based Limits apply to the MS4. So the "allowable exceedance days" for the various conditions of summer dry weather, winter dry weather and wet weather should be referred to as "water quality-based effluent limitations" since those are the number of days of allowable exceedances of the water quality objectives that are being allowed for the MS4 discharge under this permit. While the first table that appears under this section at B.1 (b) should have the heading "water quality standards" or "water quality objectives" rather than the term "effluent limitations".</p>		

6	5	B.1.c(3)	While it makes sense for the Jurisdictional Groups previously identified in the TMDLs to work jointly to carry out implementation plans to meet the interim reductions, only the responsible agencies with land use or MS4 tributary to a specific shoreline monitoring location can be held responsible for the final implementation targets to be achieved at each individual compliance location. An additional table is needed showing the responsible agencies for each individual shoreline monitoring location.		
7	6-7	B.2.	Santa Monica Bay Nearshore and Offshore Debris TMDL: An alternate compliance schedule is needed for responsible agencies that adopt local ordinances banning plastic bags, smoking in public places, and single-use expanded polystyrene by three years from the adoption date, or by November 4, 2013. Those agencies are to have a three year extension of the final compliance date, until March 20, 2023 to meet the final waste load allocations.		
8	7	B.3.	The Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4 based on estimates from limited data on existing stormwater discharges which resulted in a waste load allocation for stormwater that is lower than necessary to meet the TMDL targets, in the case of DDT far lower than necessary. EPA stated that "If additional data indicates that existing stormwater loadings differ from the stormwater waste load allocations defined in the TMDL, the Los Angeles Regional Water Quality Control Board should consider reopening the TMDL to better reflect actual loadings." [USEPA Region IX, SMB TMDL for DDTs and PCBs, 3/26/2012]		
8	7	B.3.	In order to avoid a situation where the MS4 permittees would be out of compliance with the MS4 Permit if monitoring data indicate that the actual loading is higher than estimated and to allow time to re-open the TMDL if necessary, recommend as an interim compliance objective WQBELs based on the TMDL numeric targets for the sediment fraction in stormwater of 2.3 ug DDT/g of sediment on an organic carbon basis, and 0.7 ug PCB/g sediment on an organic carbon basis.		

9	7	B.3	<p>Although the Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4, they should be translated as WQBELs in a manner such that watershed management areas, subwatersheds and individual permittees have a means to demonstrate attainment of the WQBEL. Recommend that the final WLAs be expressed as an annual mass loading per unit area, e.g., per square mile. This in combination with the preceding recommendation for an interim WQBEL will still serve to protect the Santa Monica Bay beneficial uses for fishing while giving the MS4 Permittees time to collect robust monitoring data and utilize it to evaluate and identify controllable sources of DDT and PCBs.</p>		
10	3	C.2.c)	<p>The Machado Lake Trash WQBELs listed in the table at C.2.c) in the staff working proposal appear to have been calculated from preliminary baseline waste load allocations discussed in the July 11, 2007 staff report for the Machado Lake Trash TMDL, rather than from the basin plan amendment. In some cases the point source land area for responsible jurisdictions used in the calculation are incorrect because they were preliminary estimates and subsequent GIS work on the part of responsible agencies has corrected those tributary areas. In other cases some of the jurisdictions may have conducted studies to develop a jurisdiction-specific baseline generation rate. The WQBELs should be expressed as they were in the adopted TMDL WLAs, that is as a percent reduction from baseline and not assign individual baselines to each city but leave that to the individual city's trash reporting and monitoring plan to clarify.</p>		

11	3	C.2.c)	<p>The WLAs in the adopted Machado Lake Trash TMDL were expressed in terms of percent reduction of trash from Baseline WLA with the note that percent reductions from the Baseline WLA will be assumed whenever full capture systems are installed in corresponding percentages of the conveyance discharging to Machado Lake. As discussed in subsequent city-specific comments, there are errors in the tributary areas originally used in the staff report, but in general, tributary areas are available only to about three significant figures when expressed in square miles. Thus the working draft should not be carrying seven significant figures in expressing the WQBELs as annual discharge rates in uncompressed gallons per year. The convention when multiplying two measured values is that the number of significant figures expressed in the product can be no greater than the minimum number of significant figures in the two underlying values. Thus if the tributary area is known to only three or four significant figures, and the estimated trash generation rate is known to four significant figures, the product can only be expressed to three or four significant figures. Thus there should be no values to the right of the decimal place and the whole numbers should be rounded to the correct number of significant figures.</p>		
12	3	C.2.c)	<p>The Regional Board's preliminary baseline trash generation rate for the City of Rolling Hills Estates was based on an assumed area of 1.22 square miles multiplied by the estimated trash generation rate of 5334 gallons of uncompressed trash per square mile per year. However as explained in the City's Trash Monitoring and Reporting Plan, subsequent GIS work performed by City and County of Los Angeles and confirmed by the City of Rolling Hills Estates' consultant identified a 2.76 square mile drainage area tributary to Machado Lake from the City of Rolling Hills Estates. Using this corrected area and the default trash generation rate of 5334 gallons of uncompressed trash per square mile per year would result in a corrected baseline of 14,700 gallons per year.</p>		
13	3	C.2.c)	<p>The Regional Board's preliminary baseline trash generation rate for the City of Rolling Hills was based on an assumed area of 0.56 square miles multiplied by the estimated trash generation rate of 5334 gallons of uncompressed trash per square mile per year. However as explained in the City's Trash Monitoring and Reporting Plan, subsequent GIS work performed by City and County of Los Angeles and confirmed by the City of Rolling Hills' consultant identified a 1.313 square miles drainage area tributary to Machado Lake from the City of Rolling Hills. Using this corrected area and the default trash generation rate of 5334 gallons of uncompressed trash per square mile per year would result in a corrected baseline of 7004 gallons per year.</p>		

14	3	C.3	The Machado Lake Nutrient TMDL provides for a reconsideration of the TMDL 7.5 years from the effective date prior to the final compliance deadline. Please include an additional statement as item: 3.c)(3)"By September 11, 2016 Regional Board will reconsider the TMDL to include results of optional special studies and water quality monitoring data completed by the responsible jurisdictions and revise numeric targets, WLAs, LAs and the implementation schedule as needed."		
15	4	C.5.a)	Table C is not provided in the section on TMDLs for Dominguez Channel and Greater LA and Long Beach Harbors Toxic Pollutants. Please clarify and reference that Attachment D Responsible Parties Table RB4 Jan 27, 12 which was provided to the State Board and responsible agencies during the SWRCB review of this TMDL, and is posted on the Regional Board website in the technical documents for this TMDL, is the correct table describing which agencies are responsible for complying with which waste load allocations, load allocations and monitoring requirements in this VERY complex TMDL. Attachment D should be included as a table in this section of the MS4 Permit.		
16	4-8	C.5.	The Dominguez Channel and Greater LA and Long Beach Harbor Waters Toxic Pollutants TMDL provides for a reconsideration of the TMDL targets and WLAs. Please include an additional statement as item: 4.e) "By March 23, 2018 Regional Board will reconsider targets, WLAs and LAs based on new policies, data or special studies. Regional Board will consider requirements for additional implementation or TMDLs for Los Angeles and San Gabriel Rivers and interim targets and allocations for the end of Phase II."		
17	1, 3, 15	Attach I	City of Hermosa Beach is only within one watershed, the Santa Monica Bay Watershed, and so should not be shown in italics as a multi-watershed permittee		
18	2	E.2.b.v.1.	Recommend using the same language from E.2.d.i.3 to describe the demonstration. Therefore substitute this for the current language at E.2.b.v.1: "Demonstrate that there is no direct or indirect discharge from the Permittee's MS4 to the receiving water during the time period subject to the water quality-based effluent limitation and/or receiving water limitation for the pollutant(s) associated with a specific TMDL."		

19	3	E.2.d.i.1.	Recommend clarifying this item by incorporating the footnote into the text and modifying this item to read as follows: "There are no violations of the interim water quality-based effluent limitation for the pollutant(s) associated with a specific TMDL at the Permittee's applicable MS4 outfall(s) which may include: a manhole or other point of access to the MS4 at the Permittee's jurisdictional boundary, a manhole or other point of access to the MS4 at a subwatershed boundary that collects runoff from more than one Permittee's jurisdiction, or may be an outfall at the point of discharge to the receiving water that collects runoff from one or more Permittee's jurisdictions."		
20	4	E.2.d.i.4.b.	Is this in effect setting a design storm for the design of structural BMPs to address attainment of TMDLs, or is it simply referring to SUSMP/LID type structural BMPs? If it is in effect setting a design storm, there needs to be some sort of exception for TMDLs in which a separate design storm is defined, e.g., for trash TMDLs where the 1-year, 1-hour storm is used.		
21	8	E.5.b.(c)	Recommend not listing specific water bodies in E.5.b.(c) because then it risks becoming obsolete if new TMDLs are established for trash, or if they are reconsidered. Furthermore, it is not clear why Santa Monica Bay was left out of this list since the Marine Debris TMDL allows for compliance via the installation of full capture devices.		
22	7	E.5.a.i-x	Recommend not listing specific waterbody/trash TMDLs here, but simply leave the reference to Attachments X through X to identify the Trash TMDLs. Otherwise this may have to be revised in the future. Again, Santa Monica Bay Marine Debris TMDL was not included in this list, not sure whether it was an oversight or intentional?		
23	2	E.2.b.ii	Not clear on what "discharges from the MS4 for which they are owners and/or operators" means.		
24	2	E.2.b.iii	For the "group of Permittees" having compliance determined as a whole, this should only be the case if the group of Permittees have moved forward with shared responsibilities (MOAs, cost sharing, a Watershed Management Program). It would not be fair to have one entity not be a part of the "group" and be the main cause of exceedances/violations.		

26	3	E.2.c.iii	For time schedule orders, the Burbank Water Reclamation Plant required a TSO since its interim permit limits expired, with the TSO bridging the gap between the time when the interim limits expired and when the new BWRP NPDES permit became effective. It should be noted that the Water-Effects-Ratio study was submitted in 2008 and it took the Regional Board nearly 2 years to complete its review of the study, which as a result required Burbank to request 2 1-year TSOs. Our concern with TSOs in the MS4 permit is that various efforts will be made to comply with the permit provisions and permit limits, including special studies for reopener purposes, and yet the TSO requests can either be delayed, or be limited to 1-year TSOs, placing extra burden on MS4 permittees to apply each year for the TSO, which requires a Regional Board hearing for adoption/approval.		
28	5	E.4.a	This provision states "A Permittee shall comply immediately ... for which final compliance deadlines have passed pursuant to the TMDL implementation schedule." This provision is unreasonable. First, various brownfields/abandoned toxic sites exists, some of which were permitted to operate by State/Federal agencies - nothing has or will likely be done with these sites that contribute various pollutants to surface and sub-surface areas. Additionally, this permit is going to require a regional monitoring program - this program will yield results on what areas are especially prone to particular pollutants. Until these results are made known, MS4 Permittees will have a hard time knowing where to focus its resources and particularly, the placement of BMPs to capture, treat, and remove pollutants. For these reasons, this provision should be revised to first assess pollutant sources and then focus on compliance with BMP implementation.		
29	12-13	E.5.c.i(1)	For reporting compliance based on Full Capture Systems, what is the significance of needing to know "the drainage areas addressed by these installations?" Unfortunately, record keeping in Burbank is limited to the location and size of City-owned catch basins. A drainage study would need to be done to define these drainage areas. As such, we do not believe this requirement serves a purpose in regards to full capture system installations and their intended function.		
30	7	E.5	Please clarify that cities are not responsible for retrofitting.		
31	4	E. 2. e	Please add the language from interim limits E.2.d.4 a - c to the Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations to ensure sufficient coordination between all TMDLs and the timelines and milestones that will be implemented in the Watershed Management Program.		

32	4	E.3	Instead of TSO, please include mechanisms that allow for time to complete Basin Plan Amendments for EPA Established TMDLs. This will protect cities from unnecessary vulnerability and allow for these TMDLs to be incorporated into the Watershed Management Programs. Incorporate permit language that will reopen the LA MS4 upon completion of the Basin Plan Amendments necessary for coordination with these programs.		
33	Santa Clara River	A. 4 c)	Please change the Receiving Water Limitations for interim and final limits to the TMDL approved table. There should be no interpretation of the number of exceedance days based on daily for weekly sampling with, especially with no explanation of the ratio or calculations, and no discussion of averaging. Please revert to the original TMDL document.		
34		1 E.2	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions		
35			Santa Ana River TMDLs should be removed; this TMDL is eliminated		
36	9	5.b.ii.2	Define "partial capture devices", define "institutional controls". Permittees need to have clear direction of how to attain the "zero" discharges which will have varying degrees of calculations regardless of which compliance method is followed. Explain the Regional Board's approval process for determining how institutional controls will supplement full and partial capture to attain a determination of "zero" discharge.		
37	10	5.b.ii.(4)	MFAC and TMRP should be an option available to the Los Angeles River.		
38	1 of 19	B	Substantial comments have been submitted for the Reopener of the SMBBB. Rather than restate these comments, please address these comments in the MS4.		
39	3 of 24	3.a)1	For the LA River metals. Some permittees have opted out of the grouped effort. This section needs to detail how these mass-based daily limitations will be reapportioned.		
40	6 of 24	4.d	Why are "receiving Water Limitations" being inserted here? None of the other TMDLs seem to follow that format.		
41	1 of 9	1.b	It is the permittees understanding that the lead impairment of Reach 2 of the San Gabriel River has been removed. It should be removed from the MS4 permit.		
42	1 of 9	1.c	Permittees under the new MS4 permit (those in LA County) need to be able to separate themselves from Orange County cities. Since the 0.941 kg/day is a total mass limit, it needs to be apportioned between the two counties. Also, The MS4 permit needs to contain language allowing permittees to convert grouped-base limitations to individual permittee based limitations.		

43	1	G	Please remove, in its entirety, the Santa Ana River TMDLs		
44	general	general	Any TMDL, for which compliance with a waste load allocation (WLA) is exclusively set in the receiving water, shall be amended by a re-opener to also include compliance at the outfall, or other end-of-pipe, that shall be determined by translating the WLA into non-numeric WQBELs, expressed as best management practices (BMPs). While the TMDL re-opener is pending, an affected Permittee shall be in compliance with the receiving water WLA through the implementation of core programs.		
45	4 of 8	C.5.b.1	For the Freshwater portion of the Dominguez Channel: There are no provisions for BMP implementation to comply with the interim goals. The wording appears to contradict Section E.2.d.i.4 which allows permittees submit a Watershed Management Plan or otherwise demonstrate that BMPs being implemented will have a reasonable expectation of achieving the interim goals.		
46	4 of 8	C.5.b.2	For Greater LA Harbor: Similar to the previous comment regarding this section. The Table establishing Interim Effluent Limitations, Daily Maximum (mg/kg sediment), does not provide for natural variations that will occur from time to time in samples collected from the field. Given the current wording for the proposed Receiving Waters Limitations, even one exceedance could potentially place permittees in violation regardless of the permittees level of effort. Reference should be made in this section to Section E.2.d.i.4 which will provide the opportunity for Permittee to develop BMP-based compliance efforts to meet interim goals.		
47	4 of 8	C.5.b.2	For the freshwater portion of the Dominguez Channel: the wording should be clarified. Section 5.a states that "Permittees subject to this TMDL are listed in Table C." Then the Table in Section C.5.b.2 Table "Interim Effluent Limitations-- Sediment", lists all permittees except the Fresh water portion of the Dominguez Channel. For clarification purposes, we request adding the phase to the first row: "Dominguez Channel Estuary (below Vermont)"

1	4	(4)		Pollutants in category 4 should not be included in this permit term, request elimination of any evaluation of category 4. Request elimination of category 3, as work should focus on the first two categories at this point		
2	2, 11, 13	various		The Table (TBD) on page 2 states implementation of the Watershed Program will begin upon submittal of final plan. Page 11, section 4 Watershed Management Program Implementation states each Permittee shall implement the Watershed Management Program upon approval by the Executive Officer. Page 13 section iii says the Permittee shall implement modifications to the storm water management program upon acceptance by the Executive Officer. All three of these elements should be consistent and state upon approval by the Executive Officer. The item on page 13 should be changed to reflect the Watershed Management Program, or clarify that the Watershed Management Program is the storm water management program.		
3	2, 3	Table and C.2.a - d		Please allow 24 months for development of the Watershed Management Program to provide sufficient time for calibration and the political process to adopt these programs		
4	4	C.3.a.iii		Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions		
5	9	(5)		Reasonable assurance analysis and the prioritization elements should also include factors for technical and economic feasibility		
6	2	C.2		Please clarify that Permittees will only be responsible for continuing existing programs and TMDL implementation plans during the interim 18 month period while developing the Watershed Management Program and securing approval of those programs		

7	9	(4)(c)	<p>While it may be appropriate to have an overall design storm for the NPDES Permit and TMDL compliance, this element seems to address individual sites. Recommend developing more prominently in the areas of the Permit that deals with compliance that the overall Watershed Management Program should deal with the 85th percentile storm and that beyond that, Permittees are not held responsible for the water quality from the much larger storms. However, requiring individual projects to meet this standard is limiting as there may be smaller projects implemented that individually would not meet 85th percentile, but collectively would work together to meet that standard. Please clearly indicate cities are only responsible for the 85th percentile storm for compliance and that individual projects may treat more of less than than number.</p>

1	1 - 2	all	Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue

RE: *Los Angeles County Municipal Separate Storm Sewer System (“MS4”) Permit – Staff Working Proposal on Total Daily Maximum Loads, Receiving Water Limitations, Watershed Management*

Dear Mr. Unger,

On behalf of the Natural Resources Defense Council (“NRDC”), Santa Monica Baykeeper (“Baykeeper”), and Heal the Bay (collectively, “Environmental Groups”), we are writing with regard to the April 23, 2012, Staff Working Proposal for the Los Angeles County MS4 Permit Watershed Management Programs, Total Maximum Daily Loads (“TMDLs”), and Receiving Water Limitations sections (“Working Proposal”). We appreciate the opportunity to comment on the Working Proposal. We are concerned that the Working Proposal, as currently drafted, fails to properly implement both state and federal law, and is otherwise insufficiently protective of water quality in the region. In this regard, we appreciate the willingness of Regional Board staff to engage in discussion of the Working Proposal’s terms, and look forward to working with staff to revise the permit sections discussed herein.

I. TMDL Working Proposal—Background Information

The Clean Water Act mandates that states and the U.S. Environmental Protection Agency (“U.S. EPA”) establish water quality standards for all waters within their boundaries which set the level of water quality to be attained or maintained. (33 U.S.C. § 1313.) In setting the standards, states and U.S. EPA must meet or exceed minimum federal requirements and abide by federally-mandated procedures and obligations. The standards contain three required elements: (1) designated uses, such as “contact recreation” and “commercial and sport fishing”; (2) water quality criteria to protect the established designated uses; and (3) a state antidegradation policy consistent with federal standards. (40 C.F.R. §§ 131.6, 131.10, 131.11, 131.12.) Dischargers are then required to comply with effluent limitations, which restrict the quantities, rates, and

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
May 14, 2012
Page 2

concentrations of discharged pollutants, in order to meet water quality standards. (33 U.S.C. § 1362(11).)

When a water body does not attain established water quality standards, the state must identify the water as impaired and establish a TMDL for the pollutants impairing the water body, to be submitted for approval to the U.S. EPA. (33 U.S.C. § 1313(d); 40 C.F.R. §§ 130.2, 130.7.) Waste load allocations in existing TMDLs must be incorporated into National Pollutant Discharge Elimination System (“NPDES”) permits, and thus become enforceable water-quality based effluent limitations. (*See, City of Arcadia v. U.S. EPA* (N.D. Cal. 2003) 265 F. Supp. 2d 1142, 1144 (*aff’d*, 411 F.3d 1103 (9th Cir. 2005)).)

The Los Angeles Regional Water Quality Control Board (“Regional Board”) and U.S. EPA have adopted TMDLs for 175 waterways in the Los Angeles area over the past thirteen years, more than in any other region in the State of California. These TMDLs are due in large part to a 1998 Clean Water Act citizen action by Heal the Bay, NRDC and Santa Monica Baykeeper, which resulted in a consent decree with U.S. EPA setting the deadlines for the adoption of specified TMDLs. TMDLs are in effect for many different types of pollutants, including bacteria, metals, toxics, trash, and nutrients, that still impair Los Angeles waterways. Many additional waterbody-pollutant combinations remain on the state’s 303(d) list of impaired waterbodies, with no TMDL yet in effect.

Of the numerous TMDLs established to protect our rivers, creek and ocean in the last 10 years, one group merits special attention because of the significant public health risks it addresses—bacteria TMDLs—adopted specifically to protect swimmers, surfers, waders and beachgoers from the proven harmful impacts of waterborne fecal bacteria. Perhaps the most important of these, both in terms of its territorial reach and the magnitude of public health protection it provides, is the Santa Monica Bay Beaches Bacteria TMDL for dry weather.

Epidemiological studies, such as the 1995 Santa Monica Bay Epidemiological study conducted at Santa Monica Bay beaches, demonstrate that recreating in polluted runoff causes an increased health risk to swimmers.¹ The most commonly observed health impact associated with recreation in water contaminated with fecal bacteria is gastroenteritis or stomach flu. Santa Monica Bay beaches are among the most heavily used beaches in the world, with 55 million visitors annually. One of the first sets of TMDLs to be developed in the Region was the Santa Monica Bay beaches dry weather and wet weather bacteria TMDLs. These TMDLs went into effect on July 15, 2003, with a three-year compliance deadline for meeting the summer dry-weather TMDL (July 15, 2006). The final winter dry-weather TMDL compliance deadline followed three years later (July 15, 2009). Some notable efforts, such as the installation of low flow diversion projects, have been made by some responsible parties. Of note, the environmental community helped municipalities secure funding for many of these projects.

¹ *See, Haile, R.W., et al., 1996, An Epidemiological Study of Possible Adverse Health Effects of Swimming in Santa Monica Bay, Santa Monica Bay Restoration Project.*

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
May 14, 2012
Page 3

However, data show that exceedances of water quality standards and TMDL violations are still occurring. (Table 1.) The Regional Board sent Notices of Violation to 20 responsible parties under the current MS4 Permit in 2009 but, despite continuing threats to public health, no further enforcement action has been taken to date.

II. Permit Conditions and Compliance Schedules Must Comply with State and Federal Requirements

Environmental Groups support the Working Proposal's inclusion of final numeric waste load allocations. This is critical to ensure that the water quality objectives for each impaired waterbody are eventually achieved. Federal regulations also require the terms of the renewed MS4 Permit to be consistent with the assumptions and requirements of each TMDL's waste load allocations. (40 C.F.R. 122.44(d)(1)(vii)(B).) Thus, the MS4-related waste load allocations for TMDLs adopted in the Los Angeles Region *must* be properly reflected in the MS4 Permit.

Further, any compliance schedules included in the MS4 Permit must also be consistent with all applicable federal and state requirements,² including those regulations applicable to NPDES permits and compliance schedules. (*See, Communities for a Better Environment v. State Water Resources Control Board* (2005) 132 Cal.App.4th 1313, 1334-36 (NPDES compliance schedule based on development of a TMDL was proper because the schedule met the federal requirements).) Otherwise, the compliance schedules cannot legally be included in the permit. (*See, Citizens for a Better Environment v. Union Oil Co. of Cal.* (9th Cir. 1996) 83 F.3d 1111, 1120 (extension of compliance deadline would have been improper if included in the NPDES permit because the extension would have violated federal regulations).)

Moreover, any compliance schedules incorporated into the MS4 Permit must lead to compliance "as soon as possible," (40 C.F.R. § 122.47(a)(1)), and must comply with specific requirements including: (1) if the compliance schedule exceeds one year, it must include interim compliance deadlines; (2) interim deadlines must be no more than one year apart; and (3) if the time necessary for completion of any interim requirement is more than one year and is not readily divisible into stages for completion, the permit shall specify interim dates for the submission of reports of progress toward completion of the interim requirements and indicate a projected completion date. (40 C.F.R. § 122.47(a)(3); *see also*, discussion in Section IV, below.)

Waste load allocations and compliance schedules in the MS4 Permit must also be consistent with other state water quality control plans and statutory deadlines. For example, waste load allocations in metals TMDLs in Los Angeles are based on the California Toxics Rule ("CTR") criteria and compliance schedules for CTR-based limits are authorized through the

² State Water Resources Control Board ("State Board") Final Staff Report, Resolution No. 2008-0025 at 9; *see also* February 10, 2004 Letter from EPA Approving Los Angeles Regional Board Compliance Schedule Policy at 3, n.1 ("when granting compliance schedules . . . the federal regulations at 40 C.F.R. 122.47 . . . continue to apply as well.").

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
May 14, 2012
Page 4

Inland Surface Water Plan (“ISWP”). The ISWP only authorized compliance schedules for a maximum of 10 years from the time CTR criteria were promulgated and stated that no discharger can be given a compliance schedule to meet CTR criteria after May 6, 2010.³

III. The TMDL Sections of the Renewed MS4 Permit Cannot Include Time Schedule Order Provisions

Over the last decade, the Regional Board, EPA and the environmental community have systematically attempted to address our region’s impaired waters through the adoption of TMDLs, a necessary regulatory mechanism to help achieve water quality standards in Los Angeles’ waters. Through this process, the Regional Board was successful in establishing some of our region’s most important water quality protections for public health and ecological integrity at our beaches and in our waterways. Despite the Regional Board’s successes in approving TMDLs, however, the Working Proposal for TMDLs suggests that permittees, through Time Schedule Orders (“TSOs”), can request additional time to reach compliance with past due TMDLs and TMDLs issued by EPA. The Working Proposal’s inclusion of provisions related to Time Schedule Orders, however, is misplaced, illegal, and confusing.

First, the MS4 Permit cannot include options for additional time where compliance deadlines set forth in the TMDL implementation plan have passed. TSOs are enforcement actions within the prosecutorial discretion of the Board pursuant to the California Water Code. (Cal. Water Code § 13300). TSOs are issued, after public notice and comment and Regional Board approval, to impose a strict schedule to quickly comply with permit requirements; a TSO is an action to enforce permit requirements—it is not a permit provision itself.

Second, including TSOs as an “option” for permittees is redundant with California Water Code provisions that clearly describe the TSO process. (*See*, Cal. Water Code § 13300.) The Working Proposal terms inappropriately suggest that permittees failing to comply with five to ten year old requirements are eligible for an extension of deadlines set to protect public health at our beaches and in our waterways. Specifically, many of the past due TMDLs relate to bacteria limits at beaches during summer dry weather—when millions of Los Angeles residents and visitors are swimming, surfing, and enjoying our world famous coastline. The renewed MS4 Permit must reflect the Regional Board’s charge and intention to achieve water quality standards meant to prevent the public from getting sick in our waters. Provisions that encourage a process to grant time extensions do not do so.

The Working Proposal also illegally attempts to include a “safe harbor” from permit requirements where a Time Schedule Order has been issued. (Working Proposal at §§ E(2)(c)(iii); E(3)(c); E(4)(e).) A TSO is, by definition, a response to *violations* of regulatory requirements. (Cal. Water Code § 13300). Under a TSO, a discharger “shall take [specific actions] in order to correct or prevent a violation of requirements.” (*Id.*) However, a TSO

³ Inland Surface Water Plan, at 19.

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
May 14, 2012
Page 5

cannot excuse a violation of the permit. Instead, it is an enforcement action within the prosecutorial discretion of the Regional Board that mandates a specific set of actions intended to reach compliance with provisions the permittee is currently violating.

The Working Proposal's provisions related to TSOs also unnecessarily complicate the permit. The process of demonstrating a Permittee's eligibility for a time extension is vague and unsupported by the California Water Code and federal regulations. For example, the lists of criteria in Sec. E(3)(b) and Sec. E(4)(d) make an arbitrary distinction between past due Regional Board TMDLs and past due EPA TMDLs. The agency responsible for a TMDL's approval is irrelevant to evaluating a permittee's compliance with pollution limits. This is especially true for TMDLs approved five to ten years ago, where permittees have long been on notice that compliance would be required through a renewed MS4 Permit. In fact, many permittees under the existing MS4 Permit were subject to bacteria TMDL requirements for several years under the Santa Monica Bay Beaches Bacteria TMDL, or currently under the Marina Del Rey/Mothers Beach Bacteria TMDL.⁴ Thus, there is no room to argue that permittees are unprepared or unaware of past due pollution limits.

Six Regional Board TMDLs related to bacteria and nutrients were established between 2003 and 2006.⁵ Each of these TMDLs has at least one compliance date that has passed—many as long ago as 2004, 2006, and 2007. Awarding more time to permittees for reaching compliance with pollution limits set this long ago is unacceptable. Permittees have been aware of, and in some cases, subject to these TMDLs for years. Similarly, the TMDL Working Proposal suggests that permittees may request TSOs for past due EPA TMDLs. Although EPA TMDLs do not include compliance schedules, and therefore compliance is mandated from the date of incorporation into the MS4 Permit, several of these TMDLs were also established and became effective many years ago. As a result, Permittees have been on notice about the need to comply with these TMDLs for several years and have had time to work on the measures necessary to bring them into compliance in the future. Consequently, there is no justification for granting more time to achieve compliance with EPA TMDLs that have been in place and effective since 2003 and 2007.⁶ Instead, the Regional Board should require timely compliance with necessary water quality protections aimed to improve public health and ecological integrity.

⁴ See, Los Angeles Regional Water Quality Control Board, Order No. 01-182 (as amended by Orders R4-2006-0074 and R4-2007-0042), NPDES Permit No. CAS004001, August 23, 2007.

Page 6

IV. Interim TMDL Requirements Must Include Numeric Benchmarks to Properly Track Compliance

In addition to incorporating final numeric waste load allocations for TMDLs, it is imperative that the renewed MS4 Permit also includes interim numeric benchmarks that are consistent with federal regulations in order to track compliance and ensure that final objectives are met.

Rather than allowing for implementation of Watershed Management Programs to serve as the sole compliance measure, each TMDL requirement in the Permit with a future final compliance deadline should include interim numeric benchmarks throughout the process of implementation. This is the only way to track a Permittee's progress and evaluate BMPs and progress toward final compliance along the way, and is consistent with the requirements that compliance schedules include interim deadlines (40 C.F.R. § 122.47(a)(3).) For this reason, the renewed MS4 Permit should mirror the process already adopted by the Regional Board in the Ventura MS4 Permit. In the Ventura MS4 Permit, Permittees must meet both interim and final compliance milestones, consistent with the adopted TMDL.⁷ Likewise, Los Angeles MS4 permittees should be required to monitor and evaluate methodologies, adapt accordingly, and report progress via numeric benchmarks in order to ensure that final numeric benchmarks will be met when required. (40 C.F.R. § 122.47(a)(3).)

In addition, each permittee should be required to report on BMP implementation, BMP maintenance activities, and water quality monitoring results (which some TMDLs require independently)⁸ on an annual basis to the Regional Board. The Working Proposal's requirement that this information merely be available for inspection by the Regional Board is insufficient to ensure that the public can access information related to permit implementation and compliance.

V. Receiving Water Limitations in the Current MS4 Permit Must Remain As They Are

Environmental Groups support maintaining the Receiving Water Limitations ("RWLs") in the current, 2001 MS4 Permit as they are. The RWL provisions in the current permit contain clear, appropriate, and enforceable language that complies with the Clean Water Act and has

⁷ Los Angeles Regional Water Quality Control Board, Ventura County Municipal Separate Stormwater National Pollutant Discharge Elimination System (NPDES) Permit; Order No. R4-2010-0108; NPDES Permit No. CAS004002, July 8, 2010.

⁸ See, e.g., The Ballona Creek Metals TMDL (requiring ambient and effectiveness monitoring and special studies) (Amendment to the Water Quality Control Plan - Los Angeles Region to incorporate the Ballona Creek Metals TMDL, Resolution No. R2007-015, in effect October 29, 2008.

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region

Page 7

stood the test of administrative, judicial, and enforcement challenges.⁹ This section of the permit has now been upheld by state and federal courts, and has been strongly supported by the Regional Board through its Amicus Brief submitted to the Ninth Circuit Court of Appeals, provided as Exhibit A. To avoid confusion, the language of the Receiving Water Limitations section should remain unchanged.

VI. The Watershed Management Programs Create a Self-Regulatory Scheme in Violation of the Clean Water Act

NRDC has previously stated its concern regarding a provision of staff's March 21, 2012 working proposal for the permit's Minimum Control Measures, which allows for Permittees to avoid public input and potentially substitute the requirements of a Permittee's local ordinance for certain permit provisions relating to on-site stormwater controls, LID requirements, alternative performance criteria, hydromodification controls, and other post-construction requirements.¹⁰ NRDC noted that the "Local Ordinance Equivalence" provision would create a self regulatory scheme, violating the Clean Water Act's requirements that permittee-derived controls for these programs must be subject to "meaningful review" by the regulating entity, and that this process would allow permittees to bypass critical procedures allowing for public review. Environmental Groups note that Section VI, the proposed "Special Provisions: Watershed Management Programs" raises exactly the same concerns, with potentially far broader application.

The Working Proposal states that "Participation in a Watershed Management Program allows a Permittee to customize the requirements in Part VI.D [Special Provisions: Minimum Control Measures] to address the highest watershed priorities, including achieving compliance with the requirements of Part VI.E and Attachments X through X [Special Provisions: TMDL Provisions]." (Working Proposal at § VI.C.1.b.) The Plans, which could allow for the permittees to effectively re-draft large sections of the permit's core provisions and TMDL implementation requirements, are to be submitted to the Executive Officer for review and approval. (*Id.* at § VI.C.2.) But placing such review authority solely in the Executive Officer shields from public process the development of these critical, core permit requirements and creates a self-regulatory scheme in violation of the Clean Water Act. In *Environmental Defense Center, Inc. v. U.S. E.P.A.*, ((9th Cir. 2003) 344 F.3d 832, 854-56), the court explained the vital need for both public process and regulatory oversight: "[S]tormwater management programs that are designed by regulated parties must, in every instance, be subject to meaningful review by an appropriate regulating entity. . . . Congress identified public participation rights as a critical means of advancing the goals of the Clean Water Act in its primary statement of the Act's approach and philosophy."

⁹ See, e.g., *In re L.A. County Mun. Storm Water Permit Litigation.*, No. BS 080548 at 4-7 (L.A. Super. Ct. Mar. 24, 2005); Exhibit A (Regional Board Amicus Brief).

Mr. Sam Unger, Executive Officer
RWQCB Los Angeles Region
May 14, 2012
Page 8

In bypassing the public review process, the Watershed Management Programs provision instead has the potential to exempt development from participation in the Permit's core requirements to prevent the discharge of pollutants to and from the MS4 system. These requirements, which are an important part of the Permit's requirements to meet the Clean Water Act's Maximum Extent Practicable standard (*See*, 33.U.S.C. § 1342(p)(3)(B)(iii)), are properly reviewed by the Regional Board, not its staff, and must be vetted through the process of public review and hearing.

Environmental Groups recognize that there are many benefits for permit implementation and for improving water quality to be gained through joint efforts between the Permittee cities, and encourage cooperative efforts by the Permittees to implement many of the Permit's terms and to ultimately control and eliminate sources of storm water and non-storm water pollution. Further, Environmental Groups agree that there may be elements of the Minimum Control Measures, such as for Public Information and Participation, inspection programs, or other provisions, for which flexibility in establishing permit requirements may allow for greater protection or improvement of water quality. However, the Watershed Management Program component is overbroad in its allowance for Permittees to potentially manipulate the adopted core provisions of the Permit. For example, in designing a program to implement the Permit's required Planning and Land Use requirements, including the Permit's LID requirements and on-site retention standard for stormwater runoff, the Board must note that, similar to the March 21, 2012 Working Proposal for MCM's, there are at least six Phase I MS4 permits in California that require retention of the 85th percentile storm unless technically infeasible.¹¹ While limited room for variation from permit to permit may exist, such as allowing the use of regional or other projects that capture and retain stormwater runoff for beneficial use as proposed in the March 21st Working Proposal, the widespread implementation of this retention standard throughout the state, and of similar standards in numerous other locations throughout the country,¹² demonstrates that such a standard is presumptively MEP. Permittees are surely authorized, and encouraged, to add requirements over and above this standard, such as incorporating programs for LID retrofits or green streets, but they are not authorized to deviate below it. These

Page 9

provisions of the permit should therefore not be included under the selection of alterable provisions covered by the Watershed Management Programs.

Further, it should be made clear that while the purpose of the Watershed Management Programs provision is to *ensure* compliance with the Permit's independently enforceable Receiving Water Limitations and final TMDL limits, implementation of a watershed management program does not measure or *excuse* compliance with these standards.¹³ As discussed above, TMDLs and water quality standards form the ultimate backstop in the Permit for protection of water quality. TMDLs, for example, are adopted to protect the public health, environment, and our coastal and inland water-dependant economies for waters that are failing to meet scientifically derived limitations on hazardous pollutants. While we support the Working Proposal's requirement that Permittees must meet final TMDL limitations incorporated into the permit,¹⁴ due to the critical nature of TMDLs for protecting our resources, the Permit should likewise require compliance with interim TMDL limits under an approved watershed management program.

¹³ Several Permittees at the May 3, 2012 Regional Board hearing suggested that the Board should excuse compliance with the Permit's independently enforceable Receiving Water Limitations for those cities choosing to implement a watershed management program. Any such action would be unlawful and threaten water quality in the region, and would in any event be contrary to longstanding Regional Board policy, as well as the Board's stated position in litigation over the previous iteration of this Permit. As a result, the Board should decline this invitation to circumscribe application of the Receiving Water Limitations.

¹⁴ See Working Proposal at § VI; Staff Presentation from the May 3, 2012 Regional Board Meeting, at 20. Under 40 C.F.R. § 122.44(d)(vii)(B) Permit terms must be consistent with the waste load allocations adopted in each TMDL, including, unless infeasible, compliance with numeric limitations.

INTRODUCTION

1
2 The California Regional Water Quality Control Board, Los Angeles Region
3 (Regional Board) is filing this amicus curiae brief to address issues regarding the
4 interpretation of the Los Angeles County Municipal Storm Water National
5 Pollutant Discharge Elimination System (NPDES) Permit (the Permit), which the
6 Regional Board issued and implements.¹ The Regional Board is concerned that
7 Defendant City of Malibu (the City) has taken positions that are inconsistent with
8 the Permit as adopted, interpreted, and implemented by the Regional Board.²

9 The Regional Board submits this brief because the Permit is critical to the
10 Board's efforts to protect water quality in the Los Angeles Region. Storm water and
11 urban runoff are among the principal threats to water quality in the region. See
12 Regional Board's Request for Judicial Notice (RB RJN), Exhibit A, Permit, at pp.
13 5-6 ¶ B.1 to B.6. NPDES permits, such as the Permit, bridge the gap between water
14 quality and regulatory requirements. The Supreme Court has described NPDES
15 permits as serving "to transform generally applicable effluent limitations and other
16 standards including those based on water quality into the obligations . . . of the
17 individual discharger." *Environmental Protection Agency v. California ex rel. State*
18 *Water Resources Control Bd.* 426 U.S. 200, 205, 96 S.Ct. 2022, 2025 (1976); *see*
19 *also* Cal.Wat. Code, § 13370. Here, the Permit "transforms" the water quality
20 standards specified in the Los Angeles Basin Plan (*see* California Water Code
21 section 13240) and the California Ocean Plan (*id.* at section 13170.2) into
22 compliance obligations of the City and other co-permittees.

23
24
25 ¹ Issued in 2001, the Permit was Regional Board Order No. 01-182. It has
been amended twice.

26 ² Timing considerations have precluded the Regional Board from filing an
27 amicus brief in the companion case, *NRDC et al v. County of Los Angeles, et al*,
28 Case Number 08-1467 -AHM (PLAx), where many of the same issues appear. The
Court may consider the positions conveyed here in the companion case.

1 Ironically, by invoking the “permit as shield” doctrine, the City itself
2 demonstrates the importance of interpreting the Permit in a manner that preserves
3 its enforceability in both this action and administrative actions before the Regional
4 Board.³ The permit shield provision states that for purposes of enforcement,
5 compliance with an NDPEs permit is deemed compliance with sections of the
6 Clean Water Act upon which those provisions are based. 33 U.S.C. § 1342(k). But
7 “compliance” means compliance with the entire Permit. It is not the case that there
8 is a one-to-one correlation between statutory requirements and permit provisions
9 such that a permittee can insulate itself from direct liability under the statute by
10 complying with selected permit provisions. Any regulatory permit, particularly one
11 as necessarily complex as a system-wide municipal separate storm sewer system
12 (MS4) permit, represents an overall approach to the problem.

13 This brief discusses three aspects of the Permit put at risk and potentially
14 nullified by the City’s positions in this litigation. First, the Permit’s prohibition of
15 discharges that cause or contribute to an exceedance is an enforceable Permit
16 requirement. There is no “safe harbor” provision allowing permittees to escape
17 liability with partial compliance. Second, the Permit envisions a system of self-
18 monitoring and reporting: the permittees must identify an exceedance or other
19

20 ³ City’s Response to Plaintiff’s MSJ at 5, fn. 7. The permit shield provision can be
21 overstated, however, as it does not shield a permittee from all claims that the
22 permittee has violated the Clean Water Act. Nor does the provision mean that
23 compliance with part of the permit means compliance with the whole permit, or that
24 “good faith” is a factor in determining permit violations. It certainly does not mean
25 that if a permittee argues that it has no legal duty to comply, it can use its
26 possession of a permit to avoid liability. Instead, if polluters subject to other
27 sections (33 U.S.C. §§ 1311, 1312, 1316, 1317 and 1343) have a permit issued
28 under section 1342, then compliance with the 1342 permit shall be deemed
compliance with those other sections. (64 Fed.Reg. 68,722, 68,770 (Dec. 8, 1999).)

1 violation, and then take corrective action. Because there are multiple permittees,
2 they must work collaboratively to determine which permittees are causing or
3 contributing to the exceedance. It does not fall to the Regional Board, the United
4 States Environmental Protection Agency (U.S. EPA) or citizens to investigate all
5 potential causes of pollution before any individual permittee's obligations begin.
6 Third, the provisions of the Ocean Plan, including its discharge prohibition, like the
7 provisions of any other Water Quality Control Plan, are incorporated into and
8 enforceable through the Permit.

9 10 ARGUMENT

11 **I. THE COURT SHOULD NOT REFRAIN FROM ADJUDICATING THESE** 12 **MATTERS BASED UPON THE LOS ANGELES SUPERIOR COURT'S** 13 **DECEMBER 24, 2009 STAY OF CERTAIN PERMIT PROVISIONS.**

14 The Regional Board disagrees with the stay issued by the Los Angeles
15 Superior Court on December 24, 2009 and will vigorously defend the Permit
16 modifications that are the subject of the Superior Court litigation. The court's stay
17 affects only a few provisions of the Permit that are the subject of this citizen suit,
18 and only until June 2, 2010. Even with respect to those few provisions, the
19 Regional Board contends that violations of the Permit predating the stay are still
20 enforceable.

21 **II. VIOLATIONS OF WATER QUALITY STANDARDS ARE VIOLATIONS OF THE** 22 **PERMIT.**

23 The Regional Board disagrees with the City's contention that compliance with
24 the Permit's "iterative process" satisfies all the Permit's water quality standards
25 requirements. In particular, the City argues that if it is complying with the
26 "iterative process," it is fully complying with the Permit and cannot be held liable
27 for any exceedances of water quality standards. *See, e.g.* City's P&As in Support
28 of Motion for Judgment on the Pleadings and Cross-Motion for Summary

1 Judgment, at 12-14, 4:19-20, and 5:6-9; 23-24; *see also* City's Response to
2 Plaintiff's Motion for Summary Judgment at 10.

3 **A. Parts 2.1 and 2.2 Require Compliance with Water Quality**
4 **Standards And Are Enforceable .**

5 The Regional Board issued the Permit as required by the Clean Water Act.
6 *See* 33 U.S.C. § 1342(p)(3). As part of issuing the Permit, the Regional Board
7 considered tens of thousands of pages of reports and data and concluded that
8 municipal storm water discharges are the principal cause of beach closures and
9 water quality impairments. RB RJN, Exhibit A, at 3-7. The Regional Board
10 considered the record and, exercising its authority under Section 402(p)(3)(B)(iii),
11 included permit provisions to prevent MS4 discharges that cause or contribute to
12 exceedances of water quality standards. *See* 33 U.S.C. § 1342(p)(3)(B)(iii); *see*
13 *also County of Los Angeles v. California State Water Resources Control Bd.*, 143
14 Cal.App.4th 985 (2006). To this end, the Permit provides:

- 15 1. Except as provided in Part 2.5 and 2.6 below, discharges from the MS4
16 that cause or contribute to the violation of Water Quality Standards or
17 water quality objectives are prohibited.
- 18 2. Discharges from the MS4 of storm water, or non-storm water, for which
19 a Permittee is responsible for, shall not cause or contribute to a condition
20 of nuisance.

21 Exhibit A at 25, Part 2 ("Receiving Water Limitations").

22 The plain meaning of these provisions is clear: they prohibit discharges that
23 cause or contribute to a "violation of Water Quality Standards" or to a condition of
24 nuisance. The only "exceptions" concern even more explicit requirements provided
25 in Parts 2.5 and 2.6 for protecting certain beaches during the summer dry weather
26 months.⁴ As Permit requirements, these provisions are separately enforceable from

26 ⁴ Those "exceptions" are the subject of the Los Angeles Superior Court's
27 stay, issued on December 24, 2009. To the extent those newer provisions are
28 stayed after December 24, 2009, then what remains are the general, pre-existing
prohibitions of Parts 2.1 and 2.2.

1 other programs outlined within the Permit. *See* 40 C.F.R. § 122.41(a) (“Any permit
2 noncompliance constitutes a violation of the Clean Water Act and is grounds for
3 enforcement action.”)

4 In 2001, precisely because they understood Parts 2.1 and 2.2, the permittees
5 filed administrative and judicial challenges to the Permit. The permittees claimed
6 then that they could not comply with what they now argue the Permit does not
7 mean. *See County of Los Angeles, supra*, 143 Cal.App.4th at 985. The Los Angeles
8 Superior Court and the California Court of Appeal upheld the Permit, the
9 permittees’ concerns about Parts 2.1 and 2.2 notwithstanding. In response, the
10 County of Los Angeles and Los Angeles County Flood Control District (the
11 Principal Permittee for the Permit) summarized the Permit in a petition for review
12 to the California Supreme Court, “[A]ccording to the Regional Board, the County
13 must comply with Parts 2.1 and 2.2[.]” *See* RB RJN, Exhibit G, County’s Petition
14 for Review at 257. Further, the County entities argued that “[t]he Regional Board
15 adopted a Permit requiring compliance with those water quality standards, terms
16 that were ‘absolute and unconditioned.’ The Court of Appeal erred in not holding
17 such action to be an abuse of discretion.” *Id.* at 258. The Supreme Court declined
18 to review the Court of Appeal’s decision upholding the Permit and rejecting the
19 Permittees’ pointed challenge to Parts 2.1 and 2.2. Clearly, the permittees did not
20 believe they had prevailed on their claims that Parts 2.1 and 2.2 cannot stand alone.

21 Despite this prior acknowledgement by the permittees, the City now asserts
22 that Parts 2.1 and 2.2 of the Permit cannot be enforced separately from the iterative
23 process provisions that begin with Part 2.3. *See, e.g.* City’s P&As in Support of
24 Motion for Judgment on the Pleadings and Cross-Motion for Summary Judgment at
25 4:19-20. The City’s contention is contradicted by both the plain meaning of the
26 Permit and the Principal Permittee’s previous position. Further, the City’s own
27 papers demonstrate that even *if* it was complying with the “iterative process,” this
28 has not been enough to eliminate discharges of pollutants. *See, e.g.* Thorsen

1 Declaration in Support of City's Motion for Judgment on the Pleadings and Cross
2 Motion for Summary Judgment, Exhibit A at 15 (claiming 160 violations of dry-
3 weather fecal indicator bacteria limits in the period 2008-2009).

4 **B. Reviewing Courts Have Concurred that Parts 2.1 and 2.2 of the**
5 **Permit are Enforceable.**

6 The argument, made by the City and others that Congress intended to prohibit
7 implementing agencies from requiring MS4 dischargers to "strictly comply with
8 promulgated water quality standards" has been rejected by several courts, including
9 the decisions relied upon by the City. City's P&As in Support of Motion for
10 Judgment on the Pleadings and Cross-Motion for Summary Judgment at 12-14.

11 As addressed above, in their judicial challenges to the Permit, the permittees
12 articulated the very interpretations of the Permit the City now attacks. They
13 presented that theory as overreaching by the Regional Board. The reviewing courts,
14 however, neither rejected the Regional Board's interpretation nor overturned the
15 Permit.

16 At the time the permittees brought their challenge to the 2001 version of the
17 Permit, the principal case arguably on point was *Defenders of Wildlife v. Browner*,
18 191 F.3d 1159, 1165 (9th Cir. 1999), upon which the City continues to rely.
19 *Defenders*, however, held that while "Congress did not require municipal storm-
20 sewer discharges to comply strictly with" water quality standards, "the [U.S. EPA]
21 has the authority to determine that ensuring strict compliance with state water-
22 quality standards is necessary to control pollutants." 191 F.3d at 1166. The latter
23 holding, although arguably dicta, undermines any contention, in this judicial circuit,
24 that Congress intended to prohibit U.S. EPA or state authorities from requiring
25 MS4 owners and operators to comply with water quality standards.

26 Similarly, in *Building Industry Association of San Diego County v. State*
27 *Water Resources Control Board*, 124 Cal.App.4th 866 (2004) (*BIA*), the California
28 Court of Appeal reviewed an MS4 permit issued by the California Regional Water

1 Quality Control Board, San Diego Region. The permit included terms similar to
2 the Permit in question here. It prohibited the discharge of pollutants that caused or
3 contributed to exceedances of receiving water objectives and/or caused or
4 contributed to the violation of water quality standards and included an iterative
5 process for responding to violations of water quality standards. *Id.* at 876-77. The
6 issue on appeal was “narrow”: whether a regulatory agency could prohibit
7 discharges that caused or contributed to exceedances of water quality standards, or
8 whether the “maximum extent practicable” standard was the limit of permit controls.
9 *Id.* at 880.

10 The *BIA* court noted that Congress and the courts had long held that agencies
11 should use water quality standards to supplement, not supplant, effluent limitations
12 and conditions to prevent water quality from declining. *BIA*, 124 Cal.App.4th at
13 883-884 (citing *Environmental Protection Agency v. State Water Resources Control*
14 *Bd., supra*, 426 U.S. at 205 fn. 12; *PUD No. 1 of Jefferson County v. Washington*
15 *Dept. of Ecology*, 511 U.S. 700, 715; *Northwest Environmental Advocates v.*
16 *Portland*, 56 F.3d 979, 987 (9th Cir. 1995). Municipal permits, too, were intended
17 to strengthen, not weaken, the Clean Water Act in this regard. *BIA*, at 884. The
18 *BIA* court upheld the permit’s inclusion of prohibitory receiving waters language, in
19 addition to provisions requiring controls to the maximum extent practicable. *Id.* at
20 885-886. It found that *Defenders* agreed with this approach. *Id.* at 886-887.
21 “Although dicta, this conclusion reached by a federal court interpreting federal law
22 is persuasive and is consistent with our independent analysis of the statutory
23 language.” *Ibid.*; see also, *City of Rancho Cucamonga v. Regional Water Quality*
24 *Control Board—Santa Ana Region*, 135 Cal.App.4th 1377, 1388-1389 (2006)
25 (citing *BIA* to find that Water Boards are not limited to “maximum extent
26 practicable” standard in MS4 permits, but may require compliance with water
27 quality standards).

28

1
2 **C. The Permit Does Not Include a Safe Harbor or “Good Faith”**
3 **Exception to Permit Compliance.**

4 Permittees would like to read a “safe harbor” into the Permit: if a permittee
5 was in compliance with the iterative process specified in Sections 2.3 and 2.4 of the
6 Permit, it would be in compliance with the Permit, regardless of whether water
7 quality standards are met. *See, e.g.*, City’s P&As in Support of Motion for
8 Judgment on the Pleadings and Cross-Motion for Summary Judgment at 12-14;
9 City’s Response to Plaintiff’s MSJ at 10. In other words, if a permittee is *trying* to
10 meet water quality standards, it would be the same as meeting them. The Regional
11 Board did not include a safe harbor in the Permit and, under California law, could
12 not have done so. Further, the City now makes the same argument rejected in the
13 permittees’ challenge to the 2001 Permit.

14 In 1998, the State Water Resources Control Board (State Board) did, in fact,
15 approve an MS4 permit with the type of “safe harbor” provision the City wants to
16 read into the Permit. RB RJN, Exhibit E, State Board WQ Order 98-01, at 219.
17 The permit in question included the following language: “The permittees will not
18 be in violation of this provision so long as they are in compliance with [the iterative
19 process set forth in the permit].” *Ibid.*

20 The U.S. EPA, however, objected to that safe harbor provision and issued its
21 own permit, in effect mooting the state-issued permit. RB RJN, Exhibit F, State
22 Board Order 99-05, at 229. In this manner, U.S. EPA supplanted three state-issued
23 permits containing the improper safe harbor provision. *Ibid.* The State Board, in
24 turn, issued a new Water Quality Order, amending its prior order, and directing the
25 Regional Boards to include the language devised by EPA – with no safe harbor
26 provision – in all future MS4 permits. The State Board specifically invoked its
27 authority to issue precedential, *i.e.* binding, decisions. *Id.* at 230. (In Resolution
28 96-01, the State Board exercised its authority under Government Code section

1 11425.60 to designate its water quality orders, such as State Board Order WQ 99-
2 05 as precedential.)

3 Notwithstanding the directives from the State Board and U.S. EPA, in 2001,
4 the City and other permittees included a safe harbor provision in their MS4 permit
5 application to the Regional Board. RB RJN, Exhibit D, Report of Waste Discharge
6 for Municipal Stormwater and Urban Runoff Discharges in the County of Los
7 Angeles (Order No. 96-054, NPDES No. CAS614001). The permittees proposed
8 that the provision read as follows: “Timely and complete implementation by a
9 Permittees(s) of the stormwater management programs prescribed in this Order
10 shall satisfy the requirements of this section and constitute compliance with
11 receiving water limitations.” *Id.* at 159.)

12 As required by State Board Order 99-05, the Regional Board did not include
13 the safe harbor provision in the final permit. RB RJN, Exhibit A, at 23-24 & 14, ¶
14 24 (intending the Permit’s receiving waters limitations language to be consistent
15 with State Board Water Quality Order 99-05 and *Defenders of Wildlife*.) The
16 Regional Board’s position then, as now, is that the Permit cannot be read so as to
17 excuse exceedances of water quality standards. A permittee cannot shield itself
18 from liability for causing exceedances of water quality standards simply by
19 invoking the iterative process. The permittees are well aware of this fact.

20 The permittees have already complained that the Court of Appeal has upheld
21 the Regional Board’s decision to omit a safe harbor provision from the Permit. In
22 its petition for review with the California Supreme Court, the Principal Permittee
23 equated the absence of a safe harbor with going beyond what it contended was the
24 Congressionally mandated Maximum Extent Practicable standard (MEP). It argued
25 that the Court of Appeal had erred by allowing the Regional Board to require the
26 “impossible” by requiring compliance with Parts 2.1 and 2.2 and not be limited to
27 the MEP standard. RB RJN, Exhibit E, at 226. As has been noted, despite these
28 arguments, the Supreme Court denied review. The permittees’ petition to the

1 Supreme Court, and their arguments in support of that petition, eviscerate the City's
2 claim that any court has read a "safe harbor" into the Permit.

3 In sum, the iterative process is a means of addressing violations, not a
4 defense to them. The process requires a permittee to identify violations and correct
5 them. It requires a permittee to assess the inadequacy of its best management
6 practices and develop new measures. The provisions also allow the Regional Board
7 to assess a permittee's best management practices and determine whether to require
8 further, specific, actions to resolve the violations. Information gathered through a
9 permittee's self-evaluation and reporting process may also assist the Regional
10 Board in determining whether penalties or other enforcement actions are required.
11 Nothing within the Permit, however, limits the Regional Board's enforcement
12 authority to only require permittees to engage in this iterative process or its ability
13 to enforce the prohibitions of Parts 2.1 and 2.2 directly. *See also City of Rancho*
14 *Cucamonga, supra*, 135 Cal.App.4th at 1388 (holding that there is no statutory right
15 to a safe harbor provision stating that a permittee is in compliance with its permit if
16 in full compliance with the terms and conditions of its permit).

17 **III. PERMITTEES ARE RESPONSIBLE FOR DISCHARGES FROM THEIR STORM**
18 **SEWERS; REQUIRING THE REGIONAL BOARD TO DISENTANGLE**
19 **PERMITTEES' COLLECTIVE REPORTING AND DISCHARGES WOULD**
20 **RENDER THE PERMIT VIRTUALLY UNENFORCEABLE**

21 The City takes the position that the plaintiffs have not met their burden of
22 showing that the City in particular is liable for the exceedances observed adjacent to
23 the City's discharges. *See City's Response to Plaintiff's MSJ* at 9, 12. It suggests
24 that until there is a formal determination that the *City* is responsible for discharges
25 that cause or contribute to the exceedance of water quality standards, it need not
26 examine monitoring data, inspect its own discharges, or determine whether it is
27 responsible for poisoning receiving waters with bacteria, toxic metals, sediment or
28 other pollutants. *City's P&As in Support of Motion for Judgment on the Pleadings*

1 and Cross-Motion for Summary Judgment at 24; *see also* City’s Response to
2 Plaintiff’s MSJ at 17. Again, the Regional Board disagrees.

3 **A. The Permit Prohibits Violations of Water Quality Standards,
4 but also Requires the City to Identify and Correct Discharges
5 that Cause or Contribute to Exceedances of Water Quality
6 Standards.**

7 The Permit makes the permittees responsible for complying with water quality
8 standards. RB RJN, Exhibit A, at 25, Part 2.1. The Permit requires the permittees,
9 including the City, to develop a program “designed to achieve compliance with
10 receiving water limitations.” RB RJN, Exhibit A at 25, Part 2.3. Further, the
11 Permit specifies that:

12 If exceedances of Water Quality Objectives or Water Quality Standards
13 (collectively, Water Quality Standards) persist, notwithstanding
14 implementation of the [Storm Water Quality Management Plan] and its
15 components and other requirements of this permit, *the Permittee shall*
16 *assure* compliance with discharge prohibitions and receiving water
17 limitations.

18 *Ibid.* (emphasis added). The Regional Board squarely placed upon the *permittees*
19 the responsibility for assuring compliance. The City’s arguments are wrong
20 because they shift that responsibility away from the permittees.

21 In further discussing the permittees’ responsibilities, Part 2.3.a grants the
22 Regional Board the authority to trigger the iterative process, but this does not erode
23 the permittees’ responsibilities in the first instance. Part 2.3.a specifies that
24 “[u]pon a determination *by either* the Permittee or the Regional Board that
25 discharges are causing or contributing to an exceedance of an applicable Water
26 Quality Standard,” the permittee shall undertake a further sequence of actions
27 designed to bring the permittee into compliance with the prohibitions. RB RJN,
28 Exhibit A, at 25, Part 2.3.a (emphasis added). First, this language must be read in
the context of Part 2.3, which places responsibility on the permittees for assuring
compliance. Nothing in Part 2.3.a diminishes the City’s obligation to assure
compliance with water quality standards. Second, the language merely ensures that

1 *in addition* to the City’s obligation to identify exceedances and direct the permittees
2 to take further actions, the Regional Board can determine that there are exceedances
3 and direct the permittees to take further actions. This makes perfect sense. The
4 agency primarily responsible for enforcing the Clean Water Act in the Los Angeles
5 Region can force the permittees to comply with the Permit. As discussed in greater
6 detail below, Part 2.3.a cannot be read to excuse the City from making the required
7 determination and assuring compliance with water quality standards.

8 **B. The Monitoring and Self-Reporting Provisions of the Permit**
9 **Place the Burden on Permittees to Respond to an Exceedance of**
10 **Water Quality Standards; They Cannot Wait For A Formal**
11 **Determination of Liability before Self-Reporting and Analysis**
12 **Begins.**

13 While the City relies upon its alleged “good faith” compliance with the
14 iterative process, it also argues that these Permit provisions are triggered only upon
15 a formal request by the Regional Board. City’s P&As in Support of Motion for
16 Judgment on the Pleadings and Cross-Motion for Summary Judgment at 5:6-9 &
17 23-24. The error in the City’s arguments is best understood by starting with the
18 Clean Water Act’s fundamental premise: no one may discharge pollutants from a
19 point source. 33 U.S.C. § 1311(a). This prohibition is the cornerstone of the Act.
20 The only means to avoid the total prohibition is to possess a permit issued under the
21 NPDES program. 33 U.S.C. §§ 1311(a); 1342. Permits are intended to impose
22 effective enough controls upon dischargers that they may be allowed to discharge,
23 rather than be held to account under the total prohibition. *See Natural Res. Def.*
24 *Council v. Costle*, 568 F.2d 1369, 1375 (D.C. Cir. 1977) (noting that a permitting
25 agency has discretion to issue a permit or leave the discharge subject to section
26 1311’s total bar). Indeed, the Clean Water Act is intended to “restore and maintain
27 the chemical, physical, and biological integrity of the Nation’s waters,” not to
28 create a means for polluters to discharge pollution. *See* 33 U.S.C. § 1251(a). There

1 is no right to discharge waste. Cal.Wat. Code, § 13263 (“All discharges of waste
2 into waters of the state are privileges, not rights.”).

3 When a permittee applies for, and receives, an NPDES permit, it implicitly
4 agrees to comply with a host of regulations and requirements. Among these is the
5 need to establish and maintain records, sample and monitor discharges and report
6 the results to the permitting agency. *See* 33 U.S.C. § 1318(a); 40 C.F.R. §§
7 122.41(j); 122.48 & 123.25. This system of self-reporting is critical to the NPDES
8 program, which “fundamentally relies” upon it. *U.S. v. Brittain*, 931 F.2d 1413,
9 1416 (10th Cir. 1991).⁵ The data provided through accurate and complete
10 monitoring reports serve as conclusive evidence as to whether permit violations
11 exist. *Ibid.*; *see also* 40 C.F.R. §§ 122.26(d)(1)(iv)(B) (permit application must
12 describe program to sample and analyze discharges); (d)(1)(iv)(E) (sampling points
13 must be “appropriate for representative data collection”); 122.41(j) (samples should
14 represent monitored activity); 122.44(i)(l) (permits must use monitoring to assure
15 permit compliance). The reports do not exist in a vacuum; it is the very process of
16 reliable information-gathering and analysis required by these reports through which
17 NPDES permits meet their goals of reducing or eliminating the discharge of
18 pollutants.

19 Given the importance of self-monitoring, analysis and reporting to NPDES
20 permits—and, specifically to this Permit’s requirements—the City cannot wait until
21 the Regional Board formally declares the City’s discharges to cause or contribute to
22 exceedances before the City bears the responsibility to engage in self-analysis and

23 ⁵ The need for this self-monitoring and assessment explains why a
24 municipality cannot obtain a permit at all without proposing a monitoring program
25 for representative data collection. *See, e.g.*, 42 C.F.R. § 122.26(d)(2)(iii)(D).
26 Recognizing that administrative agencies rely upon monitoring and other reports to
27 set permit conditions and enforce their terms, federal regulations require that these
28 documents be signed and certified. 40 C.F.R. §§ 122.22; 122.26(d)(2)(iii)(A)(4).
A permittee faces civil and/or criminal penalties for submitting false or incomplete
information. 40 C.F.R. §§ 122.22(d); 122.41(l)(8). A permitting agency may even
terminate a permit or refuse to issue a new one if a permittees misrepresents facts at
any time. 40 C.F.R. § 122.64(a).

1 reporting. The City cannot shift the initial determination of liability from a straight
2 look at objective monitoring data (asking whether levels of a given pollutant are
3 greater than the applicable water quality standard) to instead require a subjective
4 investigation as to the liability of each and every discharger potentially responsible
5 for an exceedance of water quality standards before presuming that some, or all, of
6 them bear responsibility. Under the latter regime, the regulatory agency would
7 need to formally establish that the particular municipality caused or contributed to
8 an exceedance in order to obtain the very information needed to make that
9 determination in the first place. The argument is circular.

10 To accept the City's argument, along with its arguments elsewhere, would
11 create a nonsensical permit implementation scheme that completely violates public
12 policy and contradicts the purpose of the Clean Water Act. The scheme would be
13 this: the permittees would perform sampling and monitoring; they may become
14 aware of violations of water quality standards; their own MS4s could be responsible
15 for the violations; they could choose to ignore the violations or, choose not to report
16 on such violations until the Regional Board ordered an investigation; if the
17 Regional Board did not do so, then the permittee could do nothing; but if the
18 Regional Board or a citizen's group attempted enforcement without the information
19 the permittee should have provided in the report, the permittee could shield itself
20 from liability by claiming that the enforcing party did not have sufficient
21 information to enforce the Permit.

22 Such a scheme would be inconsistent with the Clean Water Act's requirement
23 for monitoring that is sufficient to determine compliance with water quality
24 standards and its assumption that permittees will not hide from or turn a "blind-
25 eye" (whether willful or not) to violations. Indeed, under the City's read of the
26 Permit and supporting law, no permittee would ever want to know of potential
27 Permit violations or water quality exceedances. And, if they knew of violations or
28

1 exceedances, they would not attempt to investigate whether the source of the
2 discharges was theirs.

3 In contrast to the City's suggested implementation scheme, the effectiveness
4 of the permittees' storm water and other programs depends upon their honest
5 participation; otherwise, the NPDES program does not function to reduce and
6 eliminate the discharge of pollutants. Compliance should not turn on whether a
7 permittee gets caught violating the Permit. It is the permittee, not the Regional
8 Board, which bears the burden of catching problems with its system and, more
9 importantly, reporting and addressing them. RB RJN, Exhibit A, at 73, ¶ 6.A.2; see
10 also 40 C.F.R. §122.41(l)(8).

11 For example, every year, permittees must provide the Principal Permittee with
12 "Individual Annual Reports," which must summarize their storm water
13 management programs' effectiveness.⁶ RB RJN, Exhibit B, Monitoring and
14 Reporting Program, at 81, § I.A.3; Exhibit C, Individual Annual Report Form, at
15 139. The summary should include an assessment of compliance with permit
16 requirements, the strength and weaknesses of the management program and how
17 cities have coordinated in support of those programs. *Ibid.* Without effective
18 monitoring and self-assessment, permittees cannot perform this analysis and
19 reporting. Any failure to provide such complete reports creates a further problem:
20 the Principal Permittee is required to submit a monitoring report every year based
21 upon the Individual Annual Reports. RB RJN, Exhibit B, at 82. The report must
22 provide data and results of water quality monitoring. *Ibid.* It must analyze,

23
24 ⁶ The permittees' Individual Annual Report Form asks whether a permittee is
25 aware, or has been informed, that its MS4 has caused or contributed to a violation
26 of water quality standards or condition of nuisance. RB RJN, Exhibit C, Permit at
27 106. It also asks the permittee if the Regional Board has advised it that its MS4 has
28 caused or contributed to an exceedance of water quality standards. *Ibid.* Under
either situation, the permittee must attach a Receiving Water Limitations
Compliance Report to its annual report. *Ibid.* This requirement stands in contrast
to the City's read of Part 2.3 as allowing it to wait for the Regional Board to issue
orders before reporting on exceedances of water quality standards.

1 identify, and prioritize water quality problems. *Ibid.* It must identify potential
2 sources of the problems and recommend future monitoring and programs to identify
3 and address sources of pollutant discharges. *Id.* at 82-83. Thus, the determination
4 of whether the Permit adequately controls the discharge of pollutants, why it does
5 not adequately control the discharge of pollutants and how to prevent such
6 discharges, rests upon the permittees to faithfully implement the Permit's terms.

7 The permittees are best situated to perform this analysis. It only makes sense,
8 therefore, that they cannot shield themselves from self-analysis and reporting
9 obligations by shifting the burden to enforcing parties to prove that the City is liable
10 for the discharge before these obligations arise.⁷ All permittees are expected to
11 report any discharges that cause or contribute to exceedances of water quality
12 standards or other instances of non-compliance. RB RJN, Exhibit A, at 73 ¶ 6.A.3.

13 **C. The Systemwide Basis for the Permit Creates The Presumption**
14 **that Municipalities Upstream of an Exceedance Share Liability**
15 **for Exceedances.**

16 The Clean Water Act allows the Regional Board to issue MS4 permits on a
17 system-wide basis, as it did for the City and its co-permittees. See 40 C.F.R. §
18 122.26(a)(1)(v) & (a)(3)(ii) (permitting agency may issue permit for categories of
19 discharge, such as by municipality, by watershed, by system, or by jurisdictions).
20 This was the type of permit the City and 82 co-permittees sought, including the
21 County of Los Angeles and the lead permittee, the Los Angeles County Flood
22 Control District. RB RJN, Exhibit D, at 149-155. This was the type of permit they
23 received.

24 _____
25 ⁷ As another example, for the Bacteria TMDL provisions incorporated into
26 Part 2.5 and 2.6, the Regional Board advises that if Receiving Waters Limitations
27 are exceeded, it "will generally" issue an order requesting investigation. RB RJN
28 19, ¶ 37. But "generally" suggests that this may not always occur and, when read
with the Permit's other requirements, means that permittees cannot wait for
Regional Board notification before beginning the self-evaluation and analysis
necessary to correct exceedances.

1 The City's argument—that it can act as if it is the only permittee—
2 misunderstands the operation of MS4 permits. The word “municipal” in MS4
3 refers to the type of discharger and does not imply that the permit has issued to a
4 single municipality. Final Rule, National Pollutant Discharge Elimination System
5 Permit Application Regulations for Storm Water Discharges, 55 Fed.Reg. 47,990,
6 48,040-41 (Nov. 15, 1990). The City could have applied for its own permit. 40
7 C.F.R. § 122.26(f). It chose not to do so. Thus, it became part of a larger system
8 that must recognize the physical reality of the sewer systems' interconnectedness.

9 For this Permit—and for MS4 permits in general—co-permittees have an
10 enforceable obligation to cooperate with day-to-day obligations and in response to
11 observed exceedances. RB RJN, Exhibit A, at 27-29. As a general matter, each
12 MS4 owner or operator is responsible for pollutants discharged from its system. *Id.*
13 at 5, 20-21. In addition, by accepting a permit based on system-wide discharges,
14 the City agreed to accept the additional roles and responsibilities necessary to
15 control, and reduce the discharge of pollutants in, comingled discharges. *See, e.g.*
16 40 C.F.R. § 122.26(d)(2)(iv) (permit applicants propose management programs and
17 controls showing plan for inter-government coordination to reduce the discharge of
18 pollutants through management practices and controls), (d)(2)(vii)(when more than
19 one legal entity applies for a permit, they agree to accept the roles and
20 responsibilities necessary to ensure effective coordination) & (d)(2)(i)(D)(permittee
21 must have legal authority and agreement with other dischargers to control
22 contribution of pollutants from one portion of the MS4 to another). This
23 responsibility is the only meaningful way to read the requirements for a system-
24 wide permit. If a permittee desires to opt out of this system-wide responsibility, it
25 may submit its own distinct permit application which only covers discharges from
26 its own MS4. 40 C.F.R. § 122.26(a)(3)(iii)(B). Until then, it is part of a larger
27 system.
28

1 The Permit recognizes that the inter-connected nature of the system means that
2 it may be difficult to determine exactly where pollutant originated within the
3 MS4. This does not mean, however, that the Permit assumes only one permittee
4 may be responsible. Instead, it recognizes that in such an integrated storm sewer
5 system, “one or more Permittees” may have caused or contributed to violations.
6 RB RJN, Exhibit A, at 19, ¶ 37(d).

7 With respect to Parts 2.5 and 2.6 of the Permit (the Dry-Weather Bacteria
8 TMDL provisions), the Permit provides a means for the Regional Board to “rule
9 out” potential contributors pollutants to the system. Once the permittee or Regional
10 Board has data that show such exceedances, the permittee must provide information
11 on its system. Based upon this information, the Regional Board may determine that
12 no enforcement is warranted against the permittee. For example, if the Regional
13 Board determines that the permittee could not have caused or contributed to the
14 exceedance, the permittee will not be held liable for the water quality violation. RB
15 RJN, Exhibit A, at 19, ¶ 37. Once data indicate that a violation of water quality
16 standards is occurring, the Permit requires the permittees to undertake the necessary
17 inquiry and develop information to either demonstrate that its discharges are not the
18 source of the exceedances or, if they are the source, they must correct the problem.
19 At this time, the City has not conducted the required inquiry and provided the
20 Regional Board with the necessary information. The Regional Board has not
21 determined that the City is not liable.

22 Having constructed a joint storm sewer system that, by design, co-mingles the
23 cities’ discharges, they cannot avoid enforcement because one cannot determine the
24 original source of pollutants in the waste stream. Moreover, the Permit
25 incorporates the type of monitoring scheme that the permittees’ expressly requested
26 in their permit application. RB RJN, Exhibit D, at 195-204. That scheme
27 determines compliance not at any city’s individual outfalls, but in-stream at “mass
28 emissions stations” or at beach compliance monitoring sites, where waste has

1 already co-mingled. In other words, the monitoring program that the permittees
2 requested (and were granted) does not readily generate the permittee-by-permittee
3 outfall data that the City would require as a precondition to enforcement.

4 Therefore, any attempt to enforce the receiving water limitations would require an
5 extensive and expensive investigation. It would require the Regional Board to
6 know all potential legal and illicit sources of discharge within a permittees' system
7 and jurisdiction. It further would require the Regional Board to distinguish
8 between molecules of pollutants as to whether they came from one city's MS4 or
9 another's. The Regional Board does not agree with the City that this burden rests
10 upon the enforcing entity before violations are proven.

11 The City's proposed burden-shifting undermines the enforceability of a
12 system-wide-based Permit. On the contrary, the Clean Water Act seeks to
13 encourage, not impede, enforcement efforts and does not impose a heavy burden
14 upon those who seek to hold violators accountable:

15 One purpose of these new requirements is to avoid the necessity of
16 lengthy fact finding, investigations at the time of enforcement.
17 Enforcement of violations of requirements of this Act should be based
18 on relatively narrow fact situations requiring a minimum of
19 discretionary decision making or delay.

20 *U.S. v. Brittain, supra*, 931 F.2d at 1416-1417 (citing legislative history for Clean
21 Water Act). In the context of citizens' suits, allowing a permittee that knows of
22 water quality violations to wait for the government to fully investigate discharges,
23 and use any failure to perform such an investigation to shield itself from liability,
24 would contradict the need to ensure that environmental laws are enforced. *See, e.g.,*
25 *Sierra Club v. Union Oil Co. of Cal.*, (N.D. Cal. 1988) 716 F.Supp. 429, 436
26 (allowing citizens' suits to enforce environmental laws absent state enforcement,
27 rather than finding that government has "acquiesced" to permit violations by not
28 investigating).

1 The Clean Water Act puts the onus on the permittee to have sufficient control
2 over its system to prevent discharges that are not compliant. See, e.g, 40 C.F.R. §
3 122.26(d)(2)(iv)(B)(3) (application for permit must show how permittees will
4 investigate any part of their system with a reasonable potential for contributing
5 pollutants into the system from other sources). The Permit is in accord. RB RJN,
6 Exhibit A, at 30-31 (permittees must have legal authority to inspect and monitor
7 industrial sources within their jurisdiction that have the potential to discharge
8 polluted storm water to the MS4). The Act requires permittees to know their
9 systems and to constantly evaluate the sufficiency of their storm water programs.

10 Finally, should any permittee determine that it no longer wishes to be
11 permitted under a system-wide regime, it has multiple opportunities to seek to have
12 the permit modified or opt out of the permit. Permits issued on a jurisdiction-wide,
13 system-wide watershed or other basis may specify different conditions relating to
14 different discharges. 40 C.F.R. § 122.26(a)(3)(v). So, if a permittee is unable or
15 unwilling to cooperate with adjacent jurisdictions within the structures created by
16 the Permit, it could ask for particular situations/discharges to have their own
17 conditions imposed. It may also seek its own permit with permit terms that are
18 specific to its own MS4. 40 C.F.R. § 122.26(a)(3)(iii)(B). Or, conceivably, the
19 MS4 operator who neither desires to work with other operators on a system-wide
20 basis, nor wants responsibility for its own permit, could be denied a permit entirely.
21 *See Natural Res. Def. Council v. Costle*, 568 F.2d at 1375. “The use of the word
22 ‘may’ in [33 U.S.C. § 1342] means only that the Administrator has discretion either
23 to issue a permit or to leave the discharger subject to the total proscription of [§
24 1311]. This is the natural reading, and the one that retains the fundamental logic of
25 the statute.” (*Ibid.* (emphasis added).)

1 **IV. A VIOLATION OF THE OCEAN PLAN DISCHARGE PROHIBITION IS A**
2 **VIOLATION OF THE PERMIT.**

3 The City argues that the Ocean Plan's prohibition of discharging waste into an
4 Areas of Special Biological Significance (ASBS) is not incorporated into the
5 Permit. The Regional Board does not agree.

6 As noted above, the Permit incorporates Water Quality Standards from two
7 Water Quality Control Plans: the Basin Plan for the Los Angeles Region and the
8 statewide Ocean Plan. RB RJN, Exhibit A, Part 5 at 72 ("Water Quality Standards
9 and Water Quality Objectives' means water quality criteria contained in the Basin
10 Plan [and] the California Ocean Plan"); Cal.Wat. Code § 13050. The Permit
11 does not make any distinction between the force and effect of the two plans. Indeed
12 the findings note that the "Ocean Plan contains water quality objectives *which*
13 *apply to all discharges to the coastal waters of California.*"⁸ RB RJN, Exhibit A, at
14 13 (emphasis added).

15 The Ocean Plan is required by Water Code section 13170.2, which directs the
16 State Board to update the plan triennially. The prohibition on discharges of waste
17 into ASBS is one such Water Quality Standard. RB RJN, Exhibit I, Ocean Plan, at
18 307-308 & 310; *In re Cal. Dep't of Transp.*, Order WQ 2001-08 at 8-9 (Apr. 26,
19 2001) (*CalTrans*) ("The Ocean Plan discharge prohibition is a water quality
20 standard.")

21 The discharge prohibition is self-implementing and incorporated into the
22 Permit. Nothing in the language of the prohibition itself—"Waste shall not be
23 discharged to designated Areas of Special Biological Significance except as
24 provided in [the implementation provisions]."—or in those implementation
25 provisions—"Discharges shall be located a sufficient distance from such designated
26 areas to assure maintenance of natural water quality conditions in these areas"

27 ⁸ A similar provision was included in the Permittees' permit application. RB
28 RJN, Exhibit D, at 152.

1 suggests that any additional agency action is needed to effectuate the prohibition.
2 RB RJN, Exhibit I, Ocean Plan, at 307-308 & 310. On the contrary, the Ocean
3 Plan establishes procedures for the State Board and the regional boards,
4 respectively, to give permanent and temporary exceptions to the discharge
5 prohibition. RB RJN, Exhibit I, Ocean Plan, at 307-308 & 310. Neither provision
6 would be necessary if the prohibition was subject to an implementation process of
7 the sort the City suggests.

8 The Permit requires compliance with the ASBS discharge prohibition. Here
9 again, this is not a question of the Regional Board's discretion. Rather, the State
10 Board's determination in *CalTrans* that the discharge prohibition is a water quality
11 standard is binding on the Regional Board. Accordingly, the Permit itself
12 references the *CalTrans* decision "The State Board in In Re: California Department
13 of Transportation (State Board Order WQ 2001-08), determined that the discharge
14 of storm water to ASBS is subject to the prohibition in the Ocean Plan against the
15 discharge of wastes to an ASBS."⁹ RB RJN, Exhibit A, at 13.

16 In *CalTrans*, the California Department of Transportation (CalTrans)
17 challenged a Cease and Desist Order, in which the Santa Ana Regional Board had
18 directed the agency to cease discharging stormwater into an ASBS. The State Board
19 held first that that "the discharge prohibition in the current Ocean Plan applies to
20 storm water runoff." RB RJN, Exhibit H, State Water Resources Control Board,
21 Order WQ 2001-09 at 271-272. The State Board then addressed *CalTrans*'
22 contention that its State-Board-issued municipal storm water permit shielded it
23

24 ⁹ This provision appeared in the Permit as issued in 2001. See
25 http://www.waterboards.ca.gov/losangeles/water_issues/programs/stormwater/municipal/ms4_permits/los_angeles/01-182_LosAngelesMS4Permit.pdf.

26 The State Board issued its *CalTrans* order in April 2001; the Regional Board
27 issued the 2001 Permit in December 2001. That a former employee of the Regional
28 Board, Dr Xavier Swamikannu, in his deposition, did not recall that the CalTrans
decision predated the Permit is of no consequence.

1 from compliance with the discharge prohibition.¹⁰ The State Board held there was
2 no inconsistency because the CalTrans' permit incorporated the Discharge
3 Prohibition. RB RJN, Exhibit H, at 272-273 ("Receiving Water Limitation C-1-2
4 [sic.] prohibits discharges in violation of water quality standards. The Ocean Plan
5 discharge prohibition is a water quality standard.")¹¹

6 It is precisely because most Clean Water Act enforcement proceedings are
7 based on violations of NPDES permits, as Malibu (and CalTrans) acknowledge,
8 that water quality standards are incorporated wholesale rather than individually.
9 *EPA v. State Bd.*, *supra*, 426 U.S. 200 at 205 ("With few exceptions, for
10 enforcement purposes a discharger in compliance with the terms and conditions of
11 an NPDES permit is deemed to be in compliance with those sections of the
12 Amendments on which the permit conditions are based") In the case of the
13 Permit, as upheld by the California Court of Appeal, it incorporated and
14 transformed the water quality standards into an enforceable prohibition on causing
15 or contributing to exceedances of water quality standards. The City's interpretation
16 of the Permit's Receiving Water Limitations, such as section 2.1 of the Permit,
17 would undermine, rather than "transform," water quality standards if dischargers
18 were shielded from every such standard not explicitly incorporated into the permit.

19 //

20 //

21 //

22 //

23 _____
24 ¹⁰ Although not a municipality under state law, because it owns and manages
25 a municipal separate storm sewer system as defined by the Clean Water Act,
CalTrans is required to obtain a "municipal" storm water permit. 40 C.F.R. §
122.26(b)(8).

26 ¹¹ The Receiving Water Limitations in the present Permit and in the CalTrans
27 permit are virtually identical. The applicable provision of the CalTrans permit is C-
28 1-1; the reference in the CalTrans decision to Receiving Water Limitation C-1-2
appears to be a typographical error.

CONCLUSION

As stated above, the California Regional Water Quality Control Board, Los Angeles Region, disagrees with the arguments asserted by the City of Malibu with respect to the Regional Board's Permit. The Regional Board therefore respectfully asks this Court to consider the Regional Board's positions, as stated within this amicus curiae brief, and would be pleased to provide any other assistance to the Court.

Dated: January 29, 2010

Respectfully submitted,
EDMUND G. BROWN JR.

CERTIFICATE OF SERVICE

Case Name: **Natural Resources Defense Council, et al. v. County of Los Angeles, et al.** No. **CV08-01467 GHK (RCx)**

I hereby certify that on January 29, 2010, I electronically filed the following documents with the Clerk of the Court by using the CM/ECF system:

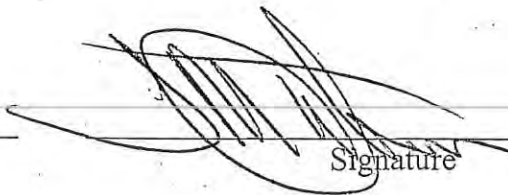

- 1) **Request for Judicial Notice by Amicus Curiae California Regional Water Quality Control Board, Los Angeles Region, in Support of Plaintiffs' Motion for Partial Summary Judgment and Opposing Defendant's Motion for Judgment on the Pleadings; Declaration of Jennifer F. Novak**
- 2) **Ex Parte Application of California Regional Water Quality Control Board, Los Angeles Region to File Amicus Curiae Brief in Support of Plaintiffs' Motion for Partial Summary Judgment and Opposition to Defendant's Motion for Judgment on the Pleadings**
- 3) **Brief of Amicus Curiae California Regional Water Quality Control Board, Los Angeles Region, in Support of Plaintiffs' Motion for Partial Summary Judgment and Opposing Defendant's Motion for Judgment on the Pleadings**

I certify that **all** participants in the case are registered CM/ECF users and that service will be accomplished by the CM/ECF system.

I declare under penalty of perjury under the laws of the State of California the foregoing is true and correct and that this declaration was executed on January 29, 2010, at Los Angeles, California.

Subject: Comments In Re: WMP, TMDL, and RWL Working Proposals

Dear Sam:

Thank you for the opportunity to provide written comment on staff's proposed watershed management plan (WMP), total maximum daily loads (TMDL), and receiving water limitation (RWL) language. Additional comments are also made on behalf of my clients¹ in the attached comments in re: TMDL provisions; and in the attached presentation that was made to the Regional Board on May 3rd.

For now, I would like to make salient a few points that must be taken into consideration in shaping the next MS4 permit and its implementation of TMDL waste load allocations (WLA).

- *Compliance with TMDL WLAs Can Only Be Achieved through WQBELs*

As you are aware, I have been making this argument for over a year now. I am pleased to see that draft permit language recognizes WQBELs as a compliance action. However, it still falls short of what federal stormwater regulations actually require. To begin with, allowing compliance with WLA in the receiving water is not sanctioned under federal regulations. Federal regulations make it clear that TMDL WLAs must be addressed through WQBELs and only WQBELs. WQBELs can only apply to the discharge (the effluent) from the receiving water, not in it. According to Clean Water Act Section 502:

The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical,

¹Azusa, Baldwin Park, Carson, Compton, Claremont, Duarte, Gardena, El Monte, Glendora, Inglewood, Irwindale, Lawndale, Lomita, Pico Rivera, San Dimas, San Gabriel, San Fernando, South El Monte, West Covina

*physical, biological, and other constituents which are **discharged from point sources into navigable waters**, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

And, once again, “point source” per federal regulations means outfall. Therefore, compliance with a WQBEL cannot be determined in the receiving water. Receiving water monitoring is performed only to set an allowable ambient concentration for a pollutant. In other words, it establishes the target that the MS4 permittee must strive to achieve. But it is outfall monitoring that determines to what extent the MS4 is causing or contributing an excursion above the target ambient standard in the receiving water. That of course has not happened. As you know there has been no outfall monitoring and an “ambient” (normal) standard has not been set. For reasons that are not fully understood, the Regional Board adopted TMDLs that have required only wet weather monitoring during storm events, which is non-ambient.

In consideration of the foregoing it is recommended that Regional Board staff re-open all TMDLs that set the compliance point in the receiving water and remove any reference to compliance monitoring therein. It is also recommended that such TMDLs include a provision that references WQBELs and their translation into best management practices (BMPs) similar to what the San Diego and Santa Ana Regional Boards have done relative to bacteria TMDLs. It is also recommended that the implementation schedules be removed. Language could be inserted to defer implementation of TMDLs to the MS4 permit through its stormwater quality management plan.

Further, Regional Board staff should remove from any of its “working proposals” references to complying with receiving water limitations as they relate to TMDLs.

- *Numeric WQBELs Are Not Justified*

Regional Board staff has proposed in various places that numeric WQBELs can only be used to comply with TMDL WLAs. It has, in the TMDL working proposal, treated a WQBEL to mean the same as WLA. It has, for example, explained in the TMDL working proposal:

For purposes of compliance determination, each Permittee is responsible for demonstrating that its discharge did not cause or contribute to an exceedance of an applicable water quality-based effluent limitation(s) at the outfall or receiving water limitation(s) in the target receiving water.

It has defined a numeric WQBEL, apparently, to mean the same as a WLA. There are two problems with this interpretation. First, a numeric WQBEL does not mean absolute compliance with a WLA. For a number of reasons it

could never mean that. Second, a numeric WQBEL, as explained in USEPA's 2010 guidance memorandum on TMDL compliance, numeric WQBELs includes surrogate parameters such as flow or impervious cover reduction that would be achieved by setting a target for reducing flow or impervious cover that would be implemented over the term of the permit. BMPs such as low impact development techniques would be employed to achieve such targets. What is important to note, however, is that it is the MEANS of meeting the number that determines compliance; not meeting the actual number.

In any case, requiring strict compliance with a numeric WQBEL expressed as a WLA is impossible. As several USEPA guidance memoranda point out, numeric WQBELs would only rarely be used. Supporting a numeric WQBEL over a BMP-WQBEL would require compliance with CFR §122.44.b.3.d.1.ii, which states:

When determining whether a discharge causes, has the reasonable potential to cause, or contributes to an in-stream excursion above a narrative or numeric criteria within a State water quality standard, the permitting authority shall use procedures which account for existing controls on point and nonpoint sources of pollution, the variability of the pollutant or pollutant parameter in the effluent, the sensitivity of the species to toxicity testing (when evaluating whole effluent toxicity), and where appropriate, the dilution of the effluent in the receiving water.

USEPA has provided detailed instructions on how to determine reasonable potential in its *NPDES Permit Writer Manual*. It calls for a "reasonable potential analysis." Of course, that has not happened. There has been no outfall monitoring because the Regional Board has not required it. Without this data the next steps cannot be performed: determining the need for parameter-WQBELs and calculating parameter specific WQBELs. Without effluent monitoring at the outfall an analysis cannot be conducted that takes into the variability of pollutant/pollutant parameter in the effluent. Further, it would seem that a dilution study using, for example, a CORMIX (dilution) model would be appropriate to calculate the WQBEL. This is what POTWs are required to do so relative to sewer discharges to receiving waters.

Then there is the issue of feasibility. Federal regulations say that numeric WQBELs can only be established if feasible. According to a State Water Resources Control Board Blue Ribbon Panel, numeric effluent limitations are not feasible. Based on this conclusion, the State Water Resources Control Board is not requiring numeric WQBELs for the next Caltrans MS4 permit.²

² Consistent with the findings of the Blue Ribbon Panel and precedential State Water Board orders (State Water Board Orders Nos. WQ 91-03 and WQ 91-04), this Order allows the Department to implement BMPs to comply with the requirements of the Order.

It is recommended, therefore, that Regional Board staff eliminate numeric WQBELs to express TMDL WLAs and, instead, rely on BMP-WQBELs.

- *Commingled Discharges*

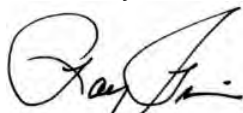

Commingled discharges from the outfall should not be a compliance issue. For one thing, it would be impossible for an MS4 permittee to prove that it did not cause or contribute to an exceedance, based on future outfall monitoring data. The reason is that several discharges can enter into an MS4 over which a permittee has no control. These include discharges from superior jurisdictions (State and federal). For example, discharges from Caltrans, State water districts, and industrial and construction activities, which are subject to stormwater NPDES permit coverage, are not subject to municipal control. Each of these dischargers has permits that do not require compliance with numeric WQBELs expressed as WLAs. They are allowed to use BMPs instead. Discharges from public education institutions (school districts, community colleges and state universities) are not even required to be covered under Phase II MS4 permits³, and, therefore, are not subject to TMDLs. The question is how is one going to know if an MS4 permittee or other discharger (permitted or non-permitted) is causing or contributing to an exceedance?

One thing should be clarified about commingled discharges. Compliance for each MS4 can be determined at a man-hole point upstream of an outfall that does not include discharges from other MS4s. For example, if City A's storm drain is upstream of City B's storm drain, a sample taken at the end of City A's storm drain should only pick-up pollutants from that system segment. In the case of City B, the pollutant concentrations recorded from City A monitoring at the last point of discharge could be deduced to produce a "net" pollutant concentration from its system.

The reference to commingled compliance should be eliminated.

Please feel free to respond to any of the foregoing comments. Should you have any questions or require additional information regarding this matter please call me.

Sincerely,

Ray Tahir

³ Regional Boards have had the discretion to require public education facilities to obtain coverage under the Phase II stormwater program but has largely chosen not to.

Comments on General Total Maximum Daily Load (TMDL) Provisions

1. Questions to Regional Board Staff

The TMDL working proposal is in need of clarification in several places as is more particularly explained below.

- i. Section E.1, says that *provisions of this Part are consistent with assumptions and requirements of all waste load allocations (WLAs) established in TMDLs for which some or all of the Permittees in this Order are responsible.*

Questions:

1. How were provisions here determined to be *consistent with assumptions and requirements of all waste load allocations (WLAs) established in TMDLs?*
2. What are the assumptions and requirements for each WLA relative to requiring (a) compliance with numeric WQBELs; and (b) compliance with receiving water limitations?
- ii. Under E.1(a) a reference is made *to achieve WLAs and meet other requirements of TMDLs covering receiving waters impacted by the Permittees.*

Questions:

1. What does “and meet other requirements of TMDLs” mean?
2. Should not meeting the WLA be sufficient?
- iii. Under E.1(a) a reference is made Attachments X through X.

Questions:

1. Where is attachment X through X?
2. Has Regional Board staff made attachment x through x available?
- iv. Under E.1(c) its says that *Permittees shall comply with applicable water quality based limitations and/or receiving water limitations contained in Attachments X through X, consistent with the assumptions and requirements of the WLAs established in the TMDLs, including*

implementation plans and schedules where provided for in the State adoption and approval of the TMDL (40 CFR §122.44(d)(1)(vii)(B); Cal. Wat. Code 13263(a)

Questions:

1. What does “applicable” mean within the context of a water quality based effluent limitation?
 2. Must Permittees comply with just numeric water quality based effluent limitations or with non-numeric ones as well?
 3. *40 CFR §122.44(d)(1)(vii)(B) deals with effluent limits to protect narrative and numeric water quality criteria or both.* There does not appear to be a connection between this citation and TMDL implementation plans and schedules. Could staff please explain?
 4. *CWC 13263(a)* is general requirement for discharges in a disposal area or receiving waters and does not speak specifically to TMDLs. Why is referencing it necessary?
- v. *According to section E.1(d): A Permittee may comply with water quality based effluent limitations and/or receiving water limitations in Attachments X through X using any lawful means.*

Questions:

1. Can a Permittee comply with a non-numeric as well as a numeric water quality based effluent limitation?
 2. How can a TMDL WLA be obtained in a receiving water through an MS4 permit?
 3. Don't federal regulations require a TMDL WLA to be exclusively complied with in the effluent (discharge) from the outfall (or end-of-pipe) by translating the WLA into WQBELs and not with WLA in the receiving water?
 4. Could staff please cite the appropriate legal authority either under the Clean Water Act, California Water Code, or State Board order that allows the Regional Board to compel Permittee compliance with a WLA in a receiving water?
 5. What does *using any legal means* mean?
- vi. *According to E.2.a.i: A Permittee shall demonstrate compliance at compliance monitoring points established in each TMDL or an approved TMDL monitoring plan or in accordance with an approved*

integrated monitoring plan per Attachment X [Monitoring and Reporting Program] and Part VI.C.5 Integrated Watershed Monitoring and Assessment.

1. What does monitoring point mean? Does it mean an outfall/end-of-pipe or does it mean an in-stream monitoring station. Or, does it mean both?
 2. What is the difference between a monitoring point in each TMDL and an approved TMDL monitoring plan in accordance with an approved integrated monitoring plan?
 3. What is the general difference between an approved monitoring plan and an approved integrated monitoring plan? Again, without seeing attachment X, which is not made available, it is impossible to understand the differences.
- vi. According to E.2.a.ii: *Compliance with water quality-based effluent limitations shall be determined as described in Parts VI.E.2.d and VI.E.2.e, or for trash water quality-based effluent limitations as described in Part VI.E.5.b, or as otherwise set forth in TMDL specific provisions in Attachments X through X.*

Questions:

1. Where can Parts VI.E.2.d and VI.E.2.e be found? It is impossible to understand this section without seeing them.
- vii. According to E.2.a.iii: *Pursuant to Part VI.C, a Permittee may, individually or as part of a watershed-based group, develop and submit for approval by the Executive Officer a Watershed Management Program that addresses all water quality-based effluent limitations and receiving water limitations to which the Permittee is subject pursuant to established TMDLs.*

Questions:

1. How are all water quality based effluent limitations and receiving water limitations to be met? Again, why does a Permittee need to address both water quality based effluent limitations and receiving water limitations (viz., meeting a WLA or other water quality standard in the receiving water) when the former are required by federal regulations and the latter are not?

viii. According to E.2.b.i: *A number of the TMDLs establish WLAs that are assigned jointly to a group of Permittees whose storm water and/or non-storm water discharges are or may be commingled in the MS4 prior to discharge to the receiving water subject to the TMDL.*

Questions:

1. Are permittees that are subject to a group WLA required to comply with that WLA in the receiving water or can they opt for compliance in the discharge from the outfall to the receiving water? If the WLA is met, based on receiving water monitoring data, would each permittee that is part of the group be in violation for the “group” exceedance?
 2. If permittees choose or are required to comply with the WLA in the receiving water, what happens if monitoring shows a cumulative exceedance for that portion of the receiving water? Would all of the permittees be in an instant state of non-compliance; or would they continue to be in compliance, notwithstanding the exceedance, provided that they can demonstrate complete and timely implementation of best management practices (BMPs) that address the WLA; and will there be a need for a ramping up of BMPs, through an iterative process?
 3. Regarding commingling of discharges, can't this issue be avoided by simply requiring an MS4 permittee to sample at its last point of discharge, upstream of the outfall, which would, thereby, avoid commingled discharges? If so, the issue of commingled discharges should go away – shouldn't it?
- vii. According to E.2.b.iii: *Where Permittees have commingled discharges to the receiving water, compliance at the outfall to the receiving water or in the receiving water shall be determined for the group of Permittees as a whole, unless an individual Permittee demonstrates that its discharge did not cause or contribute to the exceedance.*

Questions

1. On what legal authority is staff relying to compel a Permittee to comply with the requirement that its discharges do not cause or contribute to an exceedance (presumably an exceedance of a WLA)?
- viii. According to E.2.b.iv: *For purposes of compliance determination, each Permittee is responsible for demonstrating that its discharge did not cause or contribute to an exceedance of an applicable water*

quality-based effluent limitation(s) at the outfall or receiving water limitation(s) in the target receiving water.

1. How can a water quality based effluent limitation be exceeded? A WQBEL is a translation of a WLA into specific actions intended to address a WLA? Even if staff can provide the necessary justification to show that equating a numeric WQBEL with a WLA is feasible, the WQBEL must be translated into actions that meet the WLA. It appears that staff is using the terms WLA and WQBEL interchangeably. Please explain.
 2. Given that other discharges enter a Permittee's MS4, which are either permitted, not permitted, or are beyond the Permittee's jurisdiction (includes State facilities such as school districts, community college districts, and universities and federal facilities) Permittee demonstrate that those discharges caused or contributed to an exceedance?
- ix. According to E.2.b.v: *A Permittee may demonstrate that its discharge did not cause or contribute to an exceedance of an applicable water quality-based effluent limitation or receiving water limitation in any of the following ways:*
1. Demonstrate that there is no discharge from the Permittee's MS4 into the applicable receiving water; or
 2. Demonstrate that the discharge from the Permittee's MS4 is treated to a level that does not exceed the applicable water quality-based effluent limitation; or
 3. Demonstrate through a source investigation pursuant to protocols established under Water Code section 13178 or other accepted source identification protocols that pollutant sources within the jurisdiction of the permittee or the Permittee's MS4 have not caused or contributed to the exceedance of the Receiving Water Limitation(s).

Questions

1. Regarding 2, what does treatment mean in terms of structural controls? And, if outfall monitoring shows no exceedance then why would it be necessary to even discuss treatment? Once again, how can a WQBEL be exceeded if it is supposed to be a method of compliance with the WLA? Further, does staff plan on conducting a "reasonable potential analysis" which is required federal stormwater regulations to determine if a discharge causes or contributes to an excursion above a water quality standard?

2. The reference to CWC 13178 appears only to apply bacteria. But the provision here appears to apply to all pollutant sources. Could staff please explain? Further, how will the protocols be explained in guidance documents – or will there be guidance documents and, if so, who will develop them?

Questions:

- i. Why is it necessary to have as a separate compliance standard, receiving water limitations to comply with a TMDL WLA? RWLs encompass in addition to WLAs, other water quality standards and water quality objectives in the basin plan. Wouldn't it be simpler and less confusing just to require compliance with the WLA as a specific water quality standard, instead of having both a WLA and receiving water limitation, which is broad?
- x. According E.2.c, *Receiving Water Limitations Addressed by a TMDL*:
 - i. For Receiving Water Limitations in Part V.A. associated with water body-pollutant combinations addressed in a TMDL, Permittees shall achieve compliance with the Receiving Water Limitations in Part V.A. as outlined in this Part and Attachments X through X of this Order.
 - ii. A Permittee shall not be considered in violation of a Receiving Water Limitation in Part V.A., if it is in compliance with the applicable TMDL requirement(s), including compliance schedules, of this Part and Attachments X through X.
 - iii. A Permittee shall not be considered in violation of a Receiving Water Limitation in Part V.A., if it is in compliance with the applicable TMDL requirements contained in a time schedule order.

Questions:

- i. Where are attachments X through X?

Does not the CWC say that the regional board cannot dictate compliance?

- ii. Why is staff trying to create a separate compliance standard using the receiving water as the point of compliance when federal regulations require compliance with any water quality standard through an MS4 permit is to be achieved at the outfall? Is it because staff does not want to re-open each of the TMDLs that set the compliance point in the receiving water?

Subject: Amendment to Water Code section 13207
Attachments: Lutz 13207 conflict Final MEMO (7-6-12).pdf

Hello Board Members,

As you know, the California Water Code was recently amended in several respects regarding Regional Board members. I am providing a short memo to you regarding the revisions to Water Code section 13207(a) regarding conflicts. As explained in the memo, the change in the law means that Board Member Lutz no longer has a conflict with respect to the Los Angeles County MS4 permit due to her position as a mayor of the City of Monrovia. Board Member Lutz may attend workshops scheduled for the LA MS4 permit. The Office of Chief Counsel will be reviewing whether Board Member Lutz participation in the board hearing for the LA MS4 permit is affected by any other legal requirements, but the 13207 conflict no longer applies. The laws regarding ex parte communications and common law bias were not affected by the change to section 13207 and continue to apply. If you have any questions, please let me know.

See you Thursday

Frances McChesney

Los Angeles Regional Water Quality Control Board

FROM: 
Frances McChesney, Attorney IV
OFFICE OF CHIEF COUNSEL

DATE: July 6, 2012

SUBJECT: AMENDMENT TO WATER CODE SECTION 13207(a)

The purpose of this Memorandum is to inform you that on June 27, 2012, amendments to the Porter-Cologne Water Quality Control Act that affect the participation of board members in the adoption of waste discharge requirements, waivers of waste discharge requirements, NPDES permits, and certain other decisions, became effective.

Under the former California Water Code section 13207(a) board members could not participate in matters in which they were waste dischargers or where they were connected to a waste discharger as a director, officer, or employee or where the board member had a disqualifying financial interest in the decision. The recent amendments deleted the conflict of interest provisions directed at waste dischargers and those board members connected to waste dischargers.¹ Under the new law, board members with a disqualifying financial interest in the decision may still not participate in a decision affecting their financial interest, but board members are no longer subject to the "waste discharger" conflict of interest.

¹ § 13207. Conflict of interest (a) No member of a regional board shall not participate in any board action pursuant to Article 4 (commencing with Section 13260) of Chapter 4, this chapter, or Article 1 (commencing with Section 13300) of Chapter 5, of this division which involves himself or herself or any waste discharger with which he or she is connected as a director, officer or employee, or in which he or she has a disqualifying financial interest in the decision within the meaning of Section 87103 of the Government Code.

This change in the law affects the Los Angeles County MS4 permit adoption. Based on the previous law, Board Member Lutz could not participate in the permit because she was connected to a waste discharger – the City of Monrovia – as an officer. Under the new law, Board Member Lutz is not prohibited from participating as a discharger because the new law deletes that conflict provision. Board members who are dischargers or connected to a discharger may participate in matters so long as they do not have a disqualifying financial interest in the decision.² Additionally, board members continue to be subject to laws regarding ex parte communications and common law bias, which could disqualify them from participating in a decision.

If you have any questions about the new law and its application to any matter before you, please contact Frances McChesney by email at fmcchesney@waterboards.ca.gov, or by phone at (916) 341-5174.

cc: **[Via email only]**

Jennifer Fordyce, Attorney

Nicole Johnson, Attorney

² In addition, Board Member Lutz does not have a disqualifying financial interest in the matter because her city pay of \$400 per month is not subject to the financial conflict requirements of the Fair Political Practices Act.

DATE: June 19, 2012

SUBJECT: NOTICE OF STAFF LEVEL PUBLIC WORKSHOP ON THE DEVELOPMENT OF THE UPDATED GREATER LOS ANGELES COUNTY MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) NPDES PERMIT

On July 9, 2012, Board staff will hold a public workshop to discuss requirements proposed in the Tentative Los Angeles County MS4 Permit. MS4 permittees and interested persons are invited to the staff level public workshop on:

Monday, July 9, 2012
1:00 - 3:30 PM
The Los Angeles Regional Water Board
Carmel Room
320 West Fourth Street, Los Angeles, CA

A quorum of Los Angeles Water Board members may be present during the workshop. However, no action or voting will take place at the workshop.

The primary focus of the workshop is to have Board staff answer questions from MS4 permittees and interested persons regarding the Tentative Order. The discussion may include but is not limited to the following topics:

- TMDL Provisions
- Monitoring requirements
- Tentative permit requirements for the following minimum control measures comprising co-permittees' core stormwater management program:
 - Development Construction Program
 - Planning and Land Development Program
 - Public Agency Activities Program
 - Industrial/Commercial Facilities Control Program
 - Public Information and Participation Program
 - Illicit Connections and Illicit Discharges Detection and Elimination Program

MARIA MEHRANIAN, CHAIR | SAMUEL UNGER, EXECUTIVE OFFICER

320 West 4th St., Suite 200, Los Angeles, CA 90013 | www.waterboards.ca.gov/losangeles

Permittees and interested persons will have an opportunity to ask questions of Los Angeles Water Board staff and provide initial feedback. Please contact me at (213) 576-6622 or rpurdy@waterboards.ca.gov or, alternatively, Mr. Ivar Ridgeway at (213) 620-2150 or iridgeway@waterboards.ca.gov with questions.

Los Angeles Regional Water Quality Control Board

June 5, 2012

The Honorable Andre Quintero
Mayor, City of El MonteThe Honorable Mayor Luis Aguinaga
Mayor, City of South El Monte**Subject: Stormwater Workshop and Tour Invitation**

Dear Mayors Quintero and Aguinaga:

On behalf of Chair Maria Mehranian and the Los Angeles Water Quality Control Board (Regional Board), I am writing to thank you for inviting Regional Board members to the municipal separate storm sewer system (MS4) workshop and tour you are planning on June 22, 2012. The Regional Board members and I fully understand the importance of the Los Angeles County MS4 permit to municipalities and county agencies. The Regional Board also appreciates the MS4 programs developed by the Cities of El Monte and South El Monte and other cities to protect water quality in Los Angeles County.

As you know, the Los Angeles County MS4 permit is a pending matter before the Regional Board, and, therefore, the Board must follow the Bagley-Keene Open Meeting Act and other due process requirements, including the rule prohibiting ex parte communications for pending adjudicative proceedings. Consequently, the Board members may only attend a tour and workshop that is publicly noticed by the Board and otherwise follows the applicable due process requirements. Accordingly, the Regional Board members will unfortunately not be able to attend your tour and workshop on June 22, 2012 as their attendance would violate applicable due process requirements, including the ex parte rules.

At the Regional Board's May 2012 workshop, several Board members expressed interest in attending a tour of portions of the Los Angeles County MS4 prior to considering a tentative permit for adoption in September 2012. To afford Regional Board members an opportunity to view areas of the MS4 system, I have been directed by Chair Mehranian to organize a tour of portions of the Los Angeles County MS4 prior to permit consideration. I have been directed to coordinate with the key stakeholder groups, including the Cities of El Monte and South El Monte, in organizing the tour and in choosing locations. Board staff will then publicly notice the

MARIA MEHRANIAN, CHAIR | SAMUEL UNGER, EXECUTIVE OFFICER

320 West 4th St., Suite 200, Los Angeles, CA 90013 | www.waterboards.ca.gov/losangeles

The Honorable Andre Quintero
The Honorable Luis Aguinaga

- 2 -

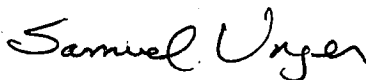

June 5, 2012

tour in accordance with state requirements so that all due process requirements are adhered to and all permittees and interested persons are invited to attend. I will ensure that you receive notice of any such tour.

The Regional Board believes that the views of all permittees and interested persons of the pending MS4 permit are important. As such, the Regional Board has provided many opportunities for permittees and interested parties, including the Cities of El Monte and South El Monte, to express their thoughts and concern to the Board and/or Board staff. The Board has held four public Board-level and staff-level workshops since November 2011, and staff has been meeting with your representatives on a frequent basis since last summer to hear and understand your cities' concerns. Regional Board staff has also provided permittees and interested persons opportunities to submit written comments on pre-draft working proposals. Any day now, Regional Board staff will be releasing the full tentative MS4 permit and allow a 45-day written comment period. The Regional Board will also hold a hearing this fall and will provide all permittees and interested persons an opportunity to provide oral comments on the Los Angeles County MS4 permit prior to its consideration by the Regional Board. Your cities will, have the opportunity to raise to the Regional Board in writing and orally at the hearing the issues you intended to cover in your June 22, 2012 workshop.

Thank you once again for your commitment to stormwater quality and the benefit it provides to all residents and businesses of Los Angeles County. Please call me at (213) 576-6605 if you or your staffs have any questions regarding this letter or the pending Los Angeles County MS4 permit.

Sincerely,

Samuel Unger
Executive Officer

Los Angeles Regional Water Quality Control Board

NOTICE OF SPECIAL MEETING BOARD MEMBER FIELD TOUR OF PORTIONS OF THE LOS ANGELES COUNTY MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4)

Tuesday, July 31, 2012
9:00 AM

Meeting Location:
El Monte Community Center
3130 Tyler Avenue
El Monte, CA 91731

A quorum of the Los Angeles Regional Water Quality Control Board (Los Angeles Water Board) may be present at a Board Member field tour of portions of the Los Angeles County MS4 that will begin at 9:00 AM at the El Monte Community Center on July 31, 2012. While a quorum of the Los Angeles Water Board may be in attendance, there will be no action or voting taking place during the tour.

Los Angeles Water Board staff will review procedures for the tour and provide a brief overview of the locations that will be included in the tour. Board Members will then visit various MS4 locations with presentations by Board staff and staff of the Los Angeles County Flood Control District at each stop. To ensure adequate time is provided to visit diverse portions of the Los Angeles County MS4, tour stops will be in the general vicinity of the El Monte Community Center within the upper San Gabriel River watershed. An itinerary of the specific tour stops will be provided in advance of the tour.

Interested persons are invited to attend. Interested persons wishing to participate in the tour will be responsible for providing their own transportation to stops along the tour route. Information on and directions to the tour stops will be provided to interested persons at the El Monte Community Center. Due to possible parking constraints, the Los Angeles Water Board encourages participants to carpool if possible.

To ensure a productive and efficient tour, and to ensure that adequate parking capabilities is arranged in advance for all participants, members of the public wishing to join the tour should RSVP by **5:00 PM on Tuesday, July 24, 2012**. To RSVP, please send an email (preferred) with the subject line "LA MS4 Tour RSVP" to Theresa Rodgers at trodgers@waterboards.ca.gov. In the body of the email, please include a contact phone number along with the number of persons who will participate and the number of vehicles. Alternatively, you may call Ms. Rodgers at (213) 576-6789. Individuals who require special accommodations are also requested to contact Ms. Rodgers at the contact information above.

Questions concerning this notice may be directed to Ivar Ridgeway at iridgeway@waterboards.ca.gov or (213) 620-2150.

Los Angeles Regional Water Quality Control Board**ITINERARY FOR BOARD MEMBER FIELD TOUR OF PORTIONS OF THE
LOS ANGELES COUNTY MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4)****Tuesday, July 31, 2012**

9:00 a.m.

Meeting Location:

El Monte Community Center
3130 Tyler Avenue
El Monte, CA 91731

On July 19, 2012, the Los Angeles Regional Water Quality Control Board (Los Angeles Water Board) provided notice to permittees and interested persons that a quorum of the Los Angeles Water Board may be present at a Board member field tour of portions of the Los Angeles County MS4 beginning at 9:00 a.m. at the El Monte Community Center on July 31, 2012. As previously indicated there will be no Board action or voting taking place during the tour.

Los Angeles Water Board staff has worked with the Los Angeles County Flood Control District and other permittees, including the City of El Monte, in choosing appropriate tour locations. The locations selected by Los Angeles Water Board staff are representative of some aspects of the greater Los Angeles County MS4 that may be referenced at the upcoming September Board hearing.

Subsequent to the July 19, 2012 notice, Los Angeles Water Board staff has learned that a representative of the City of El Monte will be conducting a separate tour of the El Monte MS4 also beginning at 9:00 a.m. at the El Monte Community Center on July 31, 2012; a separate notice for that tour and a workshop to follow the tour was distributed by the City's representative. For clarification, Board members will be attending the tour organized by the Los Angeles Water Board staff that was publicly noticed on July 19, 2012, which will still be departing from the El Monte Community Center at 9:00 a.m. The Los Angeles Water Board members will not be attending the City of El Monte's tour, or the workshop that the City of El Monte will be conducting after their tour.

Participants on the tour should wear comfortable walking shoes and business casual attire suitable for warm weather. Due to possible parking constraints, the Los Angeles Water Board encourages participants to carpool from the El Monte Community Center to tour stops if possible. Questions concerning the Board member field tour may be directed to Ivar Ridgeway at iridgeway@waterboards.ca.gov or (213) 620-2150.

Tour Itinerary

- 9:00 a.m. Meet at El Monte Community Center, 3130 Tyler Avenue, El Monte, CA
- *Opening Remarks by Executive Officer*
 - *Tour Information and Procedures*
 - *Tour Site Location Map (Note: Maps and driving directions will be provided to participants.)*

(Timing of tour stops is approximate.)

- 9:30 a.m. Depart from El Monte Community Center

Discussion at the tour stops will be led by Los Angeles Water Board staff and staff of the Los Angeles County Flood Control District.

- 9:50 a.m. Meet at the Rio Hondo Spreading Grounds for discussion of:
- *The Role of Spreading Grounds and Operational Information*
 - *The History of Modification of River Channels and Discussion of their Multiple Uses*

- 10:50 a.m. Depart from the Rio Hondo Spreading Grounds

- 11:00 a.m. Meet at the San Gabriel Coastal Basin Spreading Grounds for discussion of:
- *Spreading Grounds (continuation of discussion from Stop 1)*
 - *The Function and Value of Soft Bottom and Natural Channels*
 - *Storm Drain Outfalls and Monitoring Considerations*

- 12:00 p.m. The tour will conclude at approximately noon at the San Gabriel Coastal Basin Spreading Grounds.

Prohibition on Ex Parte Communications

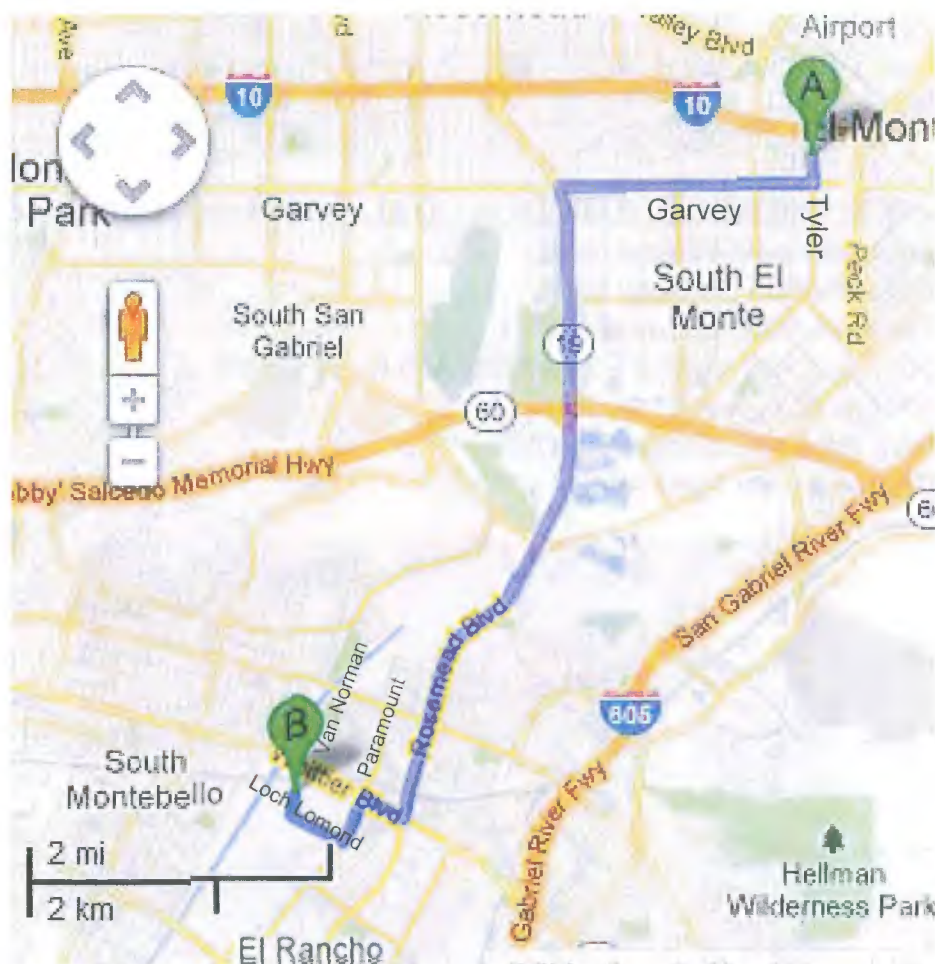

An ex parte communication is a communication to a board member from any person, about a pending matter, that occurs in the absence of other parties and without notice and opportunity for them to respond. The California Government Code prohibits the board members from engaging in ex parte communications during permitting, enforcement, and other “quasi-adjudicatory” matters. These ex parte rules are intended to provide fairness, and to ensure that the Board’s decisions are transparent, based on the evidence in the administrative record, and that evidence is used only if stakeholders have had the opportunity to hear and respond to it.

Please be advised that the tentative Los Angeles County MS4 permit is a quasi-adjudicative matter that is currently pending before the Los Angeles Water Board. To comply with state law regarding ex parte communications, individual or private conversations with Los Angeles Water Board Members are not allowed before, during, or after the tour.

TOUR DRIVING DIRECTIONS

EL MONTE COMMUNITY CENTER TO RIO HONDO SPREADING GROUNDS

- Head south on Tyler Ave. toward Bodger St.
- Turn right onto Garvey Ave.
- Turn left onto CA-19/Rosemead Blvd.
- Turn right onto Whittier Blvd.
- Turn left onto Paramount Blvd.
- Turn right onto Loch Lomond Dr.
- Turn left at Van Norman into the spreading grounds

RIO HONDO S.G. TO SAN GABRIEL COASTAL BASIN S.G.

- Turn right onto Loch Lomond Dr.
- Turn right onto Paramount Blvd.
- Take the 3rd left onto Mines Ave.
- Go straight into the San Gabriel Coastal Basin Spreading Grounds

SAN GABRIEL COASTAL BASIN S.G. TO EL MONTE COMMUNITY CENTER

- Turn right onto Whittier Blvd.
- Take the 605 Freeway north
- Take CA-60 Freeway west
- Take exit 10B toward Santa Anita Ave./S. El Monte
- Merge onto Fawcett Ave.
- Turn right onto Santa Anita Ave.
- Continue onto Tyler Ave.

Site Location Map

Rio Hondo Spreading Grounds and San Gabriel Coastal Spreading Grounds

MS4

Defined by USEPA:

1. Municipal Streets and appurtenant drainage systems (curbs, gutters, catch basins, and ditches)
2. Stormdrains and man made channels

Total MS4 Length: approx. 31,545 miles

LACFCD's MS4 portion: 2,940 miles (9.3%)

Legend

-  LACFCD's MS4

**Municipal Seperate Storm Sewer System (MS4)
Subject to MS4 Permits in the Los Angeles Area**

Los Angeles Regional Water Quality Control Board

TO: Administrative Record – Los Angeles County MS4 Permit

FROM: Renee Purdy
Section Chief, Regional Programs

DATE: August 27, 2012

SUBJECT: JULY 31, 2012 BOARD MEMBER FIELD TOUR OF PORTIONS OF THE LOS ANGELES COUNTY MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) AND RECEIVING WATERS IN THE UPPER SAN GABRIEL VALLEY

Board members present:

Maria Mehranian, Chair
 Maria Camacho
 Francine Diamond
 Madelyn Glickfeld
 Mary Ann Lutz
 Irma Muñoz

Board staff present:

Samuel Unger, Executive Officer
 Deborah Smith, Chief Deputy Executive Officer
 Paula Rasmussen, Assistant Executive Officer
 Renee Purdy, Section Chief, Regional Programs
 Ivar Ridgeway, Unit Chief, Storm Water Permitting
 Rebecca Christmann, Storm Water Permitting
 Jennifer Fordyce, Attorney
 Nicole Johnson, Attorney

On July 31, 2012, the Los Angeles Water Board conducted a tour of selected portions of the Los Angeles County MS4 and receiving waters in the Upper San Gabriel Valley. The tour commenced at the El Monte Community Center where Los Angeles Water Board staff introduced the Board members present and reviewed field tour logistics and procedural guidelines related to communications with Board members.

At the first stop, participants viewed the Rio Hondo Spreading Grounds, a major outfall, and a portion of the Rio Hondo, which is an engineered trapezoidal hard-bottom channel. The field tour included an overview of the history surrounding the creation of the Los Angeles County flood control and water conservation system, which was given by Gary Hildebrand of the Los Angeles County Department of Public Works. Mr. Hildebrand referred to 3 enlarged maps depicting the Flood Control Facilities which the Los Angeles County Flood Control District is responsible for maintaining, a map of the entire Los Angeles County Flood Control District MS4 system, and a map of Debris Basins owned by the Los Angeles County Flood Control District. Mr. Hildebrand also described the two principal objectives underlying the creation of the flood control district – flood control and water conservation. Mr. Hildebrand also spoke about the Los Angeles County Drainage Area (LACDA) Project, which was a project to increase the flood carrying capacity of the Rio Hondo and lower Los Angeles River. Mr. Hildebrand also described the operation of the 27 spreading grounds throughout the Los Angeles County Flood Control District, and their importance to groundwater recharge.

Los Angeles Water Board members and participants asked Mr. Hildebrand several questions regarding purpose and operation of the spreading grounds, including whether spreading grounds are considered a best management practice (BMP). Mr. Hildebrand responded that spreading grounds are not a BMP as they are drawing water that was initially in a receiving water such as the Rio Hondo. Mr. Hildebrand also generally described the different types of modifications to receiving waters based on the size of storm flows and engineering needs. These types of modifications were generally described as concrete-lined box channels, concrete-lined trapezoidal channels, and soft-bottom and hard-bottom channels with varying degrees of armoring on the sides. Participants also viewed a major outfall from the MS4 to the Rio Hondo and discussed provisions in the draft tentative Los Angeles County MS4 Permit relating to the storm water conveyance system and outfall monitoring.

Los Angeles Water Board members also asked about multi-benefit projects and BMPs in the area to address storm water such as the Sun Valley project. Representatives of the cities of Glendora, Vernon and South El Monte described the status of their efforts to install catch basin inserts, and a representative of the City of South Gate described the city's experience with five Filterra® bioretention systems.

At the second stop, participants toured the San Gabriel Coastal Spreading Grounds, viewed a soft bottom portion of the San Gabriel River, and a rubber dam designed to divert storm water flow to spreading grounds for infiltration. At this location, Mr. Hildebrand further described the operation of the spreading grounds and their importance to groundwater recharge. At this stop, the operation of the rubber dam used to divert channel runoff to the spreading grounds was also discussed. The value of soft bottom and natural channels was also discussed. Los Angeles Water Board members and participants asked Mr. Hildebrand several questions regarding the operation of the San Gabriel Coastal Spreading Grounds and its importance to groundwater replenishment in the region.

Los Angeles Water Board members also asked about the implementation of low impact development BMPs, including green streets and specifically the Elmer Avenue Green Street Project implemented by the City of Los Angeles.

The field tour concluded at approximately noon at the San Gabriel Coastal Spreading Grounds.

Attached to this memo are the following:

- Photographs taken by Board staff during the tour
- Notice of Special Meeting – Board Member Field Tour of Portions of the Los Angeles County MS4
- Itinerary for Board Member Field Tour of Portions of the Los Angeles County MS4
- Sign-in Sheet
- 3 maps, including a map of Flood Control Facilities which the Los Angeles County Flood Control District is responsible for maintaining, a map of the entire Los Angeles County Flood Control District MS4 system, and a map of Debris Basins owned by the Los Angeles County Flood Control District.

Ms. Olivia Lee, Rep. Assembly. Mike Eng	

The Los Angeles Water Board conducted a tour of selected portions of the Los Angeles County MS4 and receiving waters in the Upper San Gabriel Valley. The tour commenced at approximately 9:00 a.m. at the El Monte Community Center located at 3130 Tyler Avenue in the City of El Monte. Prior to departing, Los Angeles Water Board staff introduced the Board

Meeting Minutes – July 31, 2012

members present and reviewed field tour logistics and procedural guidelines related to communications with Board members.

At the first stop, participants viewed the Rio Hondo Spreading Grounds, a major outfall, and a portion of the Rio Hondo, which is an engineered trapezoidal hard-bottom channel. Discussion at the tour stop was led by Gary Hildebrand of the Los Angeles County Department of Public Works concerning:

- An overview of the history surrounding the creation of the Los Angeles County flood control and water conservation system
- The role and operation of spreading grounds throughout the Los Angeles County Flood Control District and their importance to groundwater recharge
- A general description of the different types of modifications to receiving waters based on the size of storm flows and engineering needs

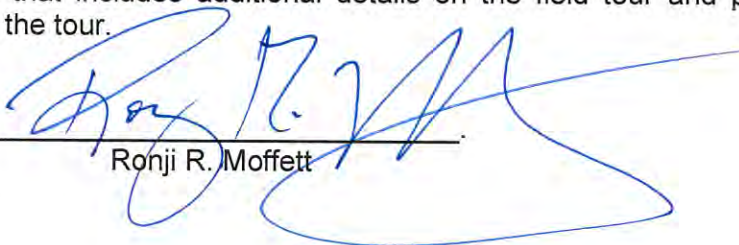

At the second stop, participants toured the San Gabriel Coastal Spreading Grounds, viewed a soft bottom portion of the San Gabriel River, and a rubber dam designed to divert storm water flow to spreading grounds for infiltration. Mr. Hildebrand further discussed:

- The operation of the spreading grounds and their importance to groundwater recharge
- The operation of the rubber dam used to divert channel runoff to the spreading grounds
- The function and value of soft bottom and natural channels

The field tour concluded at approximately noon at the San Gabriel Coastal Spreading Grounds.

A memorandum to the administrative record for the Los Angeles County MS4 permit was prepared by Renee Purdy that includes additional details on the field tour and photographs taken by Board staff during the tour.
